Society of Arts.

AN

✦ ILLUSTRATED ✦ WEEKLY ✦ MAGAZINE ✦

FOR THE

ARCHITECT, ENGINEER, ARCHÆOLOGIST, CONSTRUCTOR,  
SANITARY REFORMER, AND ART-LOVER.

CONDUCTED BY

H. H. STATHAM,

FELLOW OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

"Every man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruiting, the comfortablest part of his own life, the noblest of his soune's inheritance, a kinde of private princedom, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."

"Architecture can want no commendation, where there are noble men, or noble mindes."—SIR HENRY WOTTON.

"Our English word TO BUILD is the Anglo-Saxon Bylðan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY.

"Always be ready to speak your mind, and a base man will avoid you."—WILLIAM BLAKE.

---

VOLUME LIX.—JULY TO DECEMBER, 1890.

---

OFFICE: No. 46, CATHERINE STREET, COVENT GARDEN, LONDON, W.C.

# INDEX TO VOLUME LIX.

JULY TO DECEMBER, 1890.

## CONTENTS.

Articles and Reviews . . . . .	iii	Correspondence: Writers of Letters . . . . .	viii

Earthwork Slips and Subsidence upon Public Works.\*

It is not very long since the students in engineering at King's College, on perusing their examination paper, found the following question amongst the ten which they had to answer in three hours:—"Illustrate by sketches how to prevent slips in railway cuttings, and how to provide for the drainage of the line."

A considerable part of the 225 pages which Mr. Newman has devoted to the subject named at the head of this article is expended on solving the question put by the examiner to the students, and if either the examiner on the one hand, or the students on the other, were fully aware of the extent and variety of the preventive measures which have to be considered and brought under review in dealing with slips in cuttings and the drainage of a line of railway, the hairs of both parties might well have been expected to slightly rise; for it is manifest,—or, at all events, it is manifested by Mr. Newman,—that long before the close of the three hours, it would have become apparent to them that full credits to such a question were wholly unattainable.

But even Mr. Newman does not attempt to solve this question by illustrative sketches, nor do we very clearly see how, unless a special case is stated, preventive measures are to be so illustrated, whatever might be the case with remedial measures.

We are not, however, concerned now with the examinations at King's College, but with

\* "Earthworks," &c. By John Newman. London: E. & F. N. Spon. 1890.

Mr. Newman's book on slips in earthworks, and we gladly welcome it as an important contribution to a right comprehension of such matters. There are few things more annoying or more calculated to vex the soul of an engineer, whether he be engaged on railway, water, dock, or other works, than the failures which, with all his care, and often with a most extensive stock of experience and good reputation, will sometimes happen to the works he has executed, or is in the course of executing; but there is much in this book which will at all events guide the mind of the student to the points, and there are many of them, which have to be weighed by designers of engineering works, and which, if attended to, and fixed on the memory, will certainly guard them against probable if not against possible slips in earthworks.

It is very easy to blame the engineer when such things happen, and when anything with which he is connected goes wrong.

A case which is referred to by the author is here given, and, though it seems almost too good to be true, is one which we presume is actually a fact, for it appears between inverted commas as a quotation from a report. It is from the report of a local committee, formed to declare the best means of preventing floods in a district. After deep consideration they reported as follows:—

"That the committee were of opinion the floods would be permanently removed provided the engineer diverts all rivers, streams, watercourses, and ditches to the next valley, and closes the upstream hole in the hill, and causes the water to be discharged into the next valley, or elsewhere, and reduces the rainfall within the limits required by the inhabitants of the district."

It has been surmised that the operations of the Arab and the sword have had a certain effect in reducing the rainfall in some portions of the globe, by reason of the neglect and decrease of vegetation under certain con-

ditions, but it is hard for the engineer to be bracketed with the Arab, and to be called on to interfere with that which is usually considered to be a providential arrangement. Doubtless he could have stopped the "upstream hole in the hill," and caused the water to be discharged into the next valley or elsewhere, and, if necessary, have removed mountains, but the local committee would probably have looked somewhat aghast when the estimates were laid before them.

The points which Mr. Newman more particularly insists on (and so frequently refers to in the course of the work under review, that unless we were assured that this repetition must be for the express object of hammering them into the mind, we should feel inclined to say that it was unnecessary), are, firstly, that water is the cause of nearly all the slips, and, secondly, that the properties belonging respectively to the various kinds of rocks and soils should be fully considered. He enters very minutely, not to say microscopically, into this analysis of soils, taking consecutively the chalks, marls, clays, gravels, and sands, &c.; explains the proportions of water which each kind is capable of absorbing, their relative weights when in a wet or in a dry state, their natural angles of repose when kept dry and when saturated, the frictional powers possessed by the particles of which each kind of soil is composed for resisting its tendency to slip, and so on. There is much to read, and read carefully, on all these points, as well as on the contraction of ground under pressure (such as that of an embankment) when well drained. The author prominently exhibits the (bump of caution when he says that it is impossible (and the use of such a word is generally objectionable) "to determine any rules even for a particular soil." Still, we may expect to receive evidence of their general behaviour under the different conditions to which they are ex-

posed by such causes as those of the atmosphere combined with the band of man, and it has become a habit with us to say, "as a rule, such and such a thing happens"; and as the author gives lists of the slopes which have "as a rule" been found most appropriate and safest for various soils under various conditions, and gives detailed accounts of a good many effects which are found generally to occur in practice from ascertained causes, it is rather superfluous to say that it is "impossible to determine rules." What is the use of a book of this kind if it is not to furnish us with rules for our guidance, to save our time, and to tell us something of which we were previously ignorant? It is not improbable that many engineers who have been much engaged in field practice have met, at some time or other in the course of their work, with most of the peculiarities mentioned by the author in the behaviour of earth, and have had to exercise what is called their "common sense." It is, perhaps, a proper pride which leads so many of us to treat with indignation the suggestion that we are not highly endowed with that merit (or virtue), but even to those who do possess it, the rapidity with which a right conclusion may arrive to that commonly sensible mind must vary with individuals, and one object in a book of this kind must be to save the time of the more slowly-revolving brains of those who are frequently called "practical" men by supplying them with the boiled-down experiences of others in the shape of rules.

There may be other causes than those mentioned by the author which conduce to slips and subsidences in cuttings, but he presents us with thirty-one heads of the chief causes, the first ten of which he classes as natural, and the remainder as artificial. Similarly, he gives us thirty-eight separate heads of the chief causes of slips and subsidences in embankments, of which seven are classed as natural. The definition of natural is intended to apply to those which are "beyond the power of man to entirely prevent," and that of artificial to those which are "in some degree to be prevented, unless obviously the result of the unavoidable exigencies of construction." We have no desire to be considered hypercritical, but we must bear in mind that the avoidable exigencies of construction are those which can be anticipated by a combination of various qualities, such as knowledge, care, and the aforesaid common sense; and when slips occur in consequence of an insufficiency of those qualities on the part of engineers or others, then such slips and subsidences can scarcely be termed unavoidable. It is with the help of such a hook as this that the number of cases ought to be greatly increased in which slips can be avoided by exigencies being anticipated.

10. There is considerable identity in the causes of slips in cuttings and embankments respectively, such as the action of rain, snow, and frost on the several parts of a slope, and more especially on the toes and feet of slopes, the insufficiency or neglect of suitable drainage of the ground immediately at the back of the faces, and of the ground adjacent to slopes, honeycombing by rodents, vibration, excess of slopes, &c. With respect to cuttings, he assigns more particularly (in addition to the above named) the removal of support against the action of sliding (especially on "side-long" ground); the heaving of laminated rock dipping at a considerable angle towards a cutting in the side of a hill; the neglect to fill up, or otherwise remedy, cracks or fissures in the slopes; and, with respect to embankment, unequal loading, want of adhesion between the surface of the ground upon which an embankment is tipped and the deposited material; tipping the central part first, and completing the width and slope by side deposition after some time has elapsed; the backing up of water behind a retaining wall, or the failure to provide for its removal from the bottoms of hencches, &c.

He then presents us with sixteen maxims, to be observed, where practicable, in the consideration of the location of earthworks

(hints as to what should be avoided, which are of considerable value); but unfortunately other considerations almost invariably outweigh these points except in a minor degree, though the capital cost of a work and the cost of its maintenance may both be very sensibly reduced by attention to all the points alluded to by the author.

Referring to tunnelling in clay, the author reminds us of "the enormous force clay possesses upon swelling, and its contraction upon drying," causing them to be risky undertakings, and that especial care should be taken to allow for this "by reducing the uncovered lengths to the least dimensions, having dry, yet hard and compressible filling between the arch and the walls and the clay, using material with great compressive strength for the lining, leaving plenty of weeper-holes, and draining away all water as it exudes." Suggestions which, of course, sound commonplace to a practised engineer, but are useful to the student.

In the chapter on the treatment of slipped earth he gives, as aids to memory, the following four questions, which have to be determined when a slip has occurred:—

1. Should the whole or part of the earth that has slipped be removed?
2. How are the voids to be filled that have been caused by the slips?
3. Can the disturbed material be again used?
4. What protective measures should be adopted?

We should be disposed to suggest an addition to such questions, as follows:—  
What time is available for the execution of this work?

We do not quite follow the author in his suggestion (p. 75) that it "may be advisable to allow the overflow waters of a river, when the extreme flood level is known, to gently pass over a line of railway, it being kept at such a level as not to impede free working, and to ensure that any back water is not prevented from escaping." Nor can we agree with the conclusion at which he arrives if this be not allowed.

The advice given in the chapter on Methods of Draining is sound and good, though it seems scarcely necessary to bring so repeatedly before the reader, both here and elsewhere, the fact that water percolates with facility through sand, and does not do so through clay.

Speaking of culverts, the author says:—

"In some countries having a severe climate, or in high mountainous districts where the soil is rock, and a heavy discharge of flood-water occurs, instead of piling a culvert and gathering the waters at or about the level of the toe of an embankment, in deep hillsides or ravines an unlined tunnel is made under the embankment in the rock, thus avoiding a masonry or brickwork structure, which could only be set in the summer months, and preventing the waters touching the seat of an embankment and promoting a slip."

We do not know of any such cases, and we should take the strongest objection to such an arrangement. If the time of year was unsuitable for making a masonry culvert, it would be equally unsuitable for making a tunnel; the tunnel would have to be a much greater length than the culvert, it would be a great deal more expensive, more easily blocked by rocks and trees, and, if blocked, place the embankment in a position of great risk. A half-sunk culvert, with a basin on the upper side, would, in such a case, be distinctly preferable. It is an entirely different case to that of a discharge-outlet from a reservoir.

In the chapter on the safe maximum load upon different earths and on normal pressures, we find some useful tables of an accuracy generally sufficient, but the author is wisely careful in enumerating half a dozen or more saving clauses which affect the figures given in those tables, the most important of which is perhaps the "comparative dry or wet state of the earth." But he generalises in a manner which is very common and very misleading in his table on the weights of substances, by giving fixed weights to certain classes of rocks and soils, such as granite 2·10 tons to the cubic yard, whilst, as a matter of fact, some granites are at least 12 per cent.

heavier than others. He is also not sufficiently accurate in giving sandstone from 1·70 to 1·95 tons to the yard, the actual range giving a difference of about 70 per cent. between one kind and another. There are also useful tables of reference of the general range of slopes in many kinds of soil, and of the co-efficients of friction, and the author shows with sufficient clearness the inexpediency of cutting diagonal or transverse trenches in the surface of the slope, as tending to disturb and destroy the continuity of supports of the surface, and do more harm than good if by any means such trenches got choked.

We are glad to see that the author enters at some length into the subject of the due provision of drainage at the backs of retaining walls, a matter so often neglected or overlooked, and carries this subject to a far larger one, the causes which tend to disturb the repose of dock walls. His remarks on these matters are well worthy of consideration, and are thoroughly practical, and the items which have to be taken into account in the necessary statical calculations very well introduced.

We were not, however, aware, nor are we prepared to allow the accuracy of his statement, that "there are few extensive docks that have been constructed in any but the firmest earth that have been free from such a mishap," i.e., "masses of the wall sliding forward from want of sufficient depth of foundation or hold on the ground." The construction of walls for wet docks which will stand all right when once the water has been let in is comparatively a simple matter, but the difficulties lie and the failures have occurred before that all-important time has arrived; and unless it is recognised that as dock walls are raised, so should advantage be taken of the thrust of water against them, and of the weight of water over that portion of the bottom of the dock which lies immediately in front of the bottom of the wall, it is not improbable that failures will continue to occur, failures whose importance in cost is in no way measured by the actual cost of the work of repair.

A little hint is given by the author which is very useful to bear in mind, though sometimes from motives of so-called economy disregarded, it is that "anything tending to make a wall of varying strength, unless exceptionally required, should be avoided; such as the junction of lime concrete with Portland cement concrete, or the employment of the hardest and strongest bricks or stones and their connection by means of a weak mortar."

In the chapter on the "Foundations of a Tidal Embankment," the author introduces us to a few calculations (pages 182 to 184); but it is unfortunate that he should in several cases have miscomputed the volumes of some of the masses of embankment, as these form the bases of the calculations, and the results arrived at are, consequently, in one case, at least, entirely erroneous. As no diagrams are given, to which the reader can refer, it is still more puzzling to follow him in these calculations; but the error is sufficiently apparent,—one, perhaps, that a schoolboy might make, but which ordinary care should have prevented from being committed in a work of this nature,—viz., that the area of a right-angled triangle is not the sum, but half the sum of the perpendicular and the base.

In conclusion, we may say that there is plenty of good, useful information to be obtained from this work, which touches a subject possessing an exceedingly scanty vocabulary; but it is a work not without hlemish; the style is tedious, and the language often involved; commas and semicolons are frequently stuck in wrong places, necessitating a re-reading of a paragraph, and consequent waste of time before the sense of a sentence can be detected. If the work reaches a second edition, these defects may perhaps be rectified, but even with those defects, it is a book containing an immense deal of matter, which must be swallowed sooner or later by every one who desires to be a good engineer, not excluding the students of King's College.

UNCONTRACTING IN THE BUILDING TRADE.

BY EDWD. C. ROBINS, F.S.A.

**A**BSENCE from town prevented my taking part in the discussion of this subject which took place at the Council of the Institute on the 17th ult., but its importance cannot be exaggerated, and it is to be hoped that the relations between the architect, the contractor, and his subordinates will receive that careful consideration which the President promised.

The root of all the evils complained of is the spirit of unrighteous competition with which this age is cursed. The unprincipled class of the general public cares nothing about consequences to others,—it is only concerned about itself; the convenience and profit of competitive exactions is too great to be sacrificed for such commonplace things as principle and justice.

The virtuous public argues in this manner: Charity begins at home. I want a building to suit my needs at the least possible cost; therefore, since it would cost money to go right to an architect for a design, I will advertise for one that will not only cost me nothing, but will set twenty architects to struggle which can outbid the other in anticipating my wishes. Having got twenty designs to select from, I shall make it a condition that my acceptance of one of them shall be dependent on its being built for a sum not exceeding ten per cent. of the architect's estimate, by which means I shall utilise his wits in my interest to the uttermost.

"I shall next get up a competition between the builders by inviting some dozen to give me tenders for the execution of the work. I will then accept the lowest estimate and rely upon my architect to get the best material and workmanship out of the contractor he possibly can, who shall be bound to carry out the works to his satisfaction within the stipulated time, under heavy penalties. It matters little to me who does the work, so that I have a responsible man as contractor, who, if he loses over my contract, may repay himself out of another where the competition has been less keen,—while my architect, for his own credit's sake, will see me safely through, 'doing it all in a legal way.' Public opinion is not sufficiently enlightened to question my action or my motives; moreover, is it not the common custom, and therefore not to be considered reprehensible in any way?"

Under such circumstances, is it any wonder that builders slyly to secure themselves from loss? The system is one of diamond cut diamond from beginning to end. How is the selfish public to be taught better, where every encouragement is given it to do worse, and not only commit the transgression, but to shut its eyes to the almost inevitable consequences?

As an editor, you say "that we live in an age where there is no time to consider this, and everyone must go the pace or drop out," but you "would welcome an effort to stem the torrent."

That effort has been made at the School Board and at the County Council, and as a consequence underselling builders are not to be invited to tender. General public competition is to be tabooed, and only selected men are to be suffered to compete. This is a step in advance and the very least that should be done. A fair price for good work is desired to be given, as the cheapest in the end, and subtlety may fairly be expected to cease among batches of builders who compete with one another on the previous and precise understanding that sweating prices are to be disallowed.

But why must we continue to insist on the one man system? The masterpieces of the middle ages were not so raised. The "Prentice Pillar" of Rosslyn Chapel was not the work of a chance journeyman of a great contractor.

Mr. Macvicar Anderson, like many more of us, finds it needful to make special terms with specialists for special work required to be

specially well done, and such estimates may be included in the general contractor's lump-sum contract when that is a necessity, but it is better that he should be separately contracted with and his credit for his portion of the work equally shared with his colleagues.

Mr. Aitchison thinks it would give more trouble to the architect. I doubt it. The trouble is how to get good work done at all when there is no personal interest in doing it, except as a means of livelihood; whereas, were there to be masters in each trade, and were these masters to be separately responsible, there would then be some one to look to, whose pride in his craft and knowledge of all its details would enable him to rear apprentices and bring his own skilled workman to bear upon his portion of the work to his done.

There might still be one to provide scaffolds and service of all trades and things of common nature.

The "universal provider" system now in vogue is destructive of all personal relations between the employer and the employed. A huge company possessed of neither body nor soul, a sort of calculating machine or financial centre, is substituted for the honourable master-craftsman and his army of respectful disciples.

The spirit of the age is in favour of co-operative concentrativeness, and to such an extent is this carried, that soon no private business will be found competent to compete with the capitalist whose capital is concentrated in the hands of a few, for the so-called benefit of the many, but really for their own aggrandisement. Looming in the distant future is the great confederacy, the monster monopoly of a ring of universal providers and mighty companies; and the extinction of all individuality and independent worth and enterprise, unless cut short by the realisation of Mr. Bellamy's State organisation, foreshadowed in "Looking Backward."

We may, however, as has been shown, do something to avert these evils, if only we can recognise them as evils and work against them. We may help to raise the tone and character of Trade Unions and give the sympathy of the profession with the leaders of the movement, and help to make public opinion fairer, so that good, capable workmen may be delivered from the oppression of the incompetent, and not bound to work down to the level of their fellows' incapacity, and be content with the same terms and pay.

Some mode of improving the condition of the deserving should be developed,—by rewarding the already competent by a system of remuneration in which merit shall meet its due reward in corresponding emolument. "These are the men to whom 'profit sharing' would not be demoralising, but an encouragement in well doing. We cannot suppose that the great contractor is alone disinterested and honest enough to give the best materials and workmanship; his best men will be ready to follow his lead, and to maintain the reputation of the firm which is their commonwealth, if mutual confidence is established and maintained.

E. C. R.

SUBMERGED BUOYANT BRIDGES.

**T**HROUGH railway communication between all the great European towns at the present day is only prevented by the great expenditure entailed in bridging over, or tunnelling under, the many large rivers and channels which now interrupt through traffic, and, although in some cases objections might arise from military considerations, yet it is nearly always financial, and not engineering or military, difficulties that have to be surmounted.

The easiest method of overcoming this interruption to through traffic is generally by means of a bridge, for so great is the progress made during recent years in the science of bridge building, owing chiefly to the introduction of mild steel, that in nearly all cases this method is to be preferred.

When, however, the river or channel to be crossed is so deep as to render the formation of piers a very difficult operation, or the

shipping interests demand great headroom and very large spans to be allowed, a tunnel may be more suitable, although the experience gained by most sub-aqueous tunnels teaches the engineer, if possible, to avoid them.

During the last few years several schemes have been proposed as substitutes for the ordinary bridge and tunnel referred to, the chief advantages of which are stated to be, firstly, that they do not, like ordinary bridges, interfere with the navigation of the channel crossed, and secondly, their construction is much more simple than a tunnel, and consequently more economical.

Such schemes as these are generally described as "Submerged buoyant bridges," and consist of a water-tight tubular structure through which the roadway is made. Such tubes would be submerged at any convenient depth, and, having considerable buoyancy, it would be necessary to hold them in position, both vertically and horizontally, by ties and anchors.

Mr. James Maxton, M.I.N.A., in an essay originally read as a paper at the Belfast Natural History and Philosophical Society last April, proposes such a scheme for a bridge between Ireland and Scotland, to be placed between Donaghadee and Portpatrick, a distance of nineteen nautical miles. The maximum depth of water along this route is about 900 ft.

Mr. Maxton, in his paper, does not enter into any great detail of his scheme, the description being intentionally more or less popular, so that it is not possible to criticise his methods of overcoming the difficulties that would arise should such a scheme ever be seriously entertained, but it is our opinion there is no possibility of a work of this nature ever being carried out.

A structure depending on anchorages, which in the majority of cases could never be inspected even when first laid down, is not likely to obtain the confidence of the public, if even responsible contractors could be found who would be willing to undertake its construction in such an exposed position for any sum within measurable distance of Mr. Maxton's estimate of 5½ millions sterling.

It is curious that Mr. Maxton, in working out his scheme for connecting the railways of Ireland and Scotland, has, without knowing it, suggested a structure almost identical with that proposed by Sir E. J. Reed, who in 1886 patented "a system of connecting railways which are separated by rivers or other waters." Near the end of his paper, Mr. Maxton suggests that "in those cases where the conditions are favourable, the tubes forming the bridge could rest on submerged piers, thereby dispensing with anchors and cables, the buoyancy being resisted by any suitable means, such as filling in the space between the shells of the tubes with concrete."

This idea is certainly more practical, and such a method of constructing a submerged bridge was proposed (vide *Engineering*, May 24, 1889) and worked out in considerable detail by Mr. R. Lilljevist, a Swedish Engineer, for crossing the Sound between Elsinore and Helsingborg to connect the railway systems of Sweden and Copenhagen.

COMPETITIONS.

SOUTH LONDON POLYTECHNIC INSTITUTES.

The following architects have been invited to submit designs in the preliminary competition for the proposed Battersea Institute:—Mr. J. Belcher, F.R.I.B.A.; Mr. C. A. De Boinville; Mr. H. C. Boyes, F.R.I.B.A.; Mr. H. H. Bridgman, F.R.I.B.A.; Mr. T. Chatfield Clarke, F.R.I.B.A.; Messrs. Henman & Harrison, A.R.I.B.A.; Mr. George Hubbard; Mr. J. M. MacLaren; Mr. E. W. Mountford, A.R.I.B.A.; Mr. Seth Smith; Mr. J. Osborne Smith, A.R.I.B.A.; Messrs. Roger Smith, Son, & Gale; Mr. Sidney R. Smith, A.R.I.B.A.; Mr. E. J. Tarver, F.R.I.B.A.; Mr. James Weir, F.R.I.B.A. The first set of designs are to be drawn to 1/4" in scale, and from among the authors of these, six will be selected to take part in the final competition, when drawings to 1/8" in scale are to be sent in. The preliminary designs are to be sent in on September 22. Mr. Rowland Plumbe is the assessor.

## NOTES.

**MR MICHAEL HICKS - BEACH** stated in the House of Commons last week that it did not appear very probable that Parliament would be in a position to legislate further on railway rates this session, so much time having been occupied by the Board of Trade Inquiry. This was, of course, somewhat disappointing to those who were hoping for a speedy settlement of this question, but it is understood that Lord Balfour and Mr. Boyle are actively engaged in considering the evidence and other information gained during the inquiry, and that they hope to complete their two principal schedules by the middle of the present month. These will be based upon the two model schedules submitted by the London and North-Western and Great Western Companies, to whom they will be handed,—in accordance with the provisions of the Act,—for approval or otherwise. It may be taken for granted that such modifications as were agreed upon by both sides after the introduction of the schedules will be given effect to in the revised tables now being prepared by the Board of Trade. The latter are very anxious that their labours may bear fruit this session, but this result depends upon the amount of favour with which their schedules are received by the parties interested. It appears that there is still the possibility that legislation may be proceeded with this session.

**THE** London County Council, at their meeting on Tuesday last, abandoned the Strand Improvement Bill. The first attempt by this body to carry through an important and urgently-needed metropolitan improvement has thus ended in failure. That the improvement will be made sooner or later cannot be doubted, but, at the same time, this failure is not to the credit of the existing Council. By introducing the principle of heterment in the Bill, they risked the carrying through of a much-needed improvement. If the principle is to be adopted, it must be adopted in all the cities of the kingdom, and should be established by a general and not by a local Act. If the County Council had proceeded on well-known lines, and had made use of the experience and intelligence of able and well-known surveyors, they might have been in a position to make the Strand improvement question a creditable one for their administration, instead of having to admit that the first attempt is a failure.

**AS** will be seen by our report of the meeting of the London County Council, that body has adopted the recommendations of its Building Act Committee as to the emoluments and status of District Surveyors to be hereafter appointed. As we said a fortnight ago, we doubt the wisdom of these changes, especially in the absence of any adequate attempt to re-cast the Metropolitan Building Act. From all that we can hear, some of the District Surveyors are themselves partially to blame for the outcry that has been raised against them as a body. Even Councillor Edis, who made a most able speech in defence of the District Surveyors, was constrained to admit that the system of "devising" was felt to be a crying evil by many architects, builders, and building owners, who were willing to argue a point with a Surveyor, but not with his clerk. Other defenders of the District Surveyors urged that the dead-set which has been made against those officials in many quarters is due to their determination to see that the law is enforced without fear or favour,—that, in short, the opponents of the District Surveyors are those who have broken the law or have been hankled in attempts to do so. There is no doubt something in this view of the case.

**IN** the July number of the *Nineteenth Century* Mr. James Knowles, the editor, contributes a short and forcible article commending the idea of adding a monumental chapel to Westminster Abbey, returning to

the proposition he has formerly supported, that there is plenty of space in the cloisters for memorial-tablets, and that the cloister is really an integral portion of the Abbey and shares in its associations, which of course no new monumental erection, tacked on in modern times, could be. Referring to the objections previously made, that the cloister wall space was already fully occupied, he gives a sheet of elevations of the four cloister walls, showing the position and size of all the existing tablets, and showing that there is actually three-fourths of the cloister wall space unoccupied: "about 1,700 superficial feet are covered by existing monuments, and more than 5,000 superficial feet are vacant. This is more than three times the total wall-space of Poet's corner!" It may be partially objected to this that many of the present tablets are so placed as to cut up the wall space into a number of small irregular patches not very available for additional tablets; but this is only the case in a minority of the bays. Mr. Knowles's article and illustrations are exceedingly well-timed, and appear to us conclusive against the necessity or reasonableness of adding a modern chapel to the Abbey, even apart from reasons of sentiment which point against such a proposal. It may be asked, if Mr. Knowles is so clear on the subject, why did he give so much space in his magazine to the preposterous proposals of Mr. Shaw-Lefevre, who is one of the least competent persons that could be found to deal with such a subject?

**IN** connexion with the Architectural Exhibition to be held at Turin in September, the municipal authorities of Berlin have formally requested to sanction an exhibition of models, drawings, &c., of such public works in the capital as have been erected under their supervision during the last ten years. After due consideration of the question, the authorities have determined to send the plans and elevations of a certain number of lately-completed buildings, but will abstain from sending in any models. Has our County Council received any similar request from the Managing Committee at Turin? If so, we hope that the visitors to this exhibition may see English work better represented than those did who entered the hall of the "exhibition of works pertaining to the housing, &c., of criminals" held at St. Petersburg last month, in connexion with the "Congress," and at which, we hear, England had but a poor show in comparison to Germany, Austria, Italy, &c., not to speak of France.

**THE** Report of the British School at Athens, read at the annual meeting on Wednesday, gives a most satisfactory account of the work that has been done, and it is very gratifying to learn from the report of the Director, Mr. Gardner, that though we were late in the field the British School at Athens is twice as numerously attended as any of the others. Mr. Gardner gave an account of the work carried on by various gentlemen connected with the school, Mr. Loring, Mr. Bickford Smith, Mr. Schultz, Mr. Barnsley, and others; Mr. Tubbs read his report of work at Cyprus, and Mr. Loring that on his work at Megalopolis. The unsatisfactory part of the matter is the want of adequate assistance in the way of funds towards all this interesting work of exploration, which may be said to be carried on in the teeth of absolute poverty of financial means. Surely, for the credit of England, some public money should be voted to assist in these explorations, carried on with so much spirit, and which are so valuable in an artistic and historical sense.

**THE** competition for a "Soldier's Monument" to be placed on the summit of the historical Kyffhäuser has been decided this week, and we again find the talented "monument specialist," Herr Bruno Schmitz, the winner of the first prize, this time with a Medieval tower-shaped erection, placed on a scheme of terraces, and brought into connexion with an

equestrian statue of the Monarch who is to be memorialised, together with a legendary representation of King Frederic Barbarossa sitting in an open niche. Although very fair prizes were offered, this competition was by no means of a high standard; of the twenty-eight designs sent in some showed most wretched work, both in composition and technique, and one or two (especially design No. 4) might have been thought to have emanated from a lunatic asylum. The designs classed second and third are both based on the similar idea to that of the first one, and the outward resemblance of these three pieces of work will be sure to strike most visitors. A characteristic incident in connexion with the competition is that the young Emperor, on the 24th inst., visited the hall in which the competition designs had been placed for inspection by the jury, and that, after spending some time in examining the models and drawings, he called the members of the jury together and gave these gentlemen his ideas on the subject, going so far as to even mention those designs which, according to his view, alone merited consideration. As in Germany it is still pretty well the case that the Emperor's will is law,—people may grumble, but they do not run counter to edicts from high places,—it may be imagined how far the jury were likely to be unfettered in their choice. We may certainly congratulate ourselves that we are emancipated from this kind of thing in England.\*

**THE** annual "Academy Exhibition" of Berlin, held this year in the well-lighted buildings of the Landes Ausstellungen Park, was opened on Sunday last, the private view having taken place the afternoon before. This exhibition has, since the organisation of a similar one at Munich, been by no means a fair representation of German art, the works of South German artists being very scarce in comparison to those of the North Germans, and more especially the Berlin School, who are here master of the situation as regards quantity, although, as is well known, they are not in the same position as to quality. The proportion of the works sent in for consideration to those afterwards accepted was as four to three, and it is to be feared that the jury thought more of filling the extensive wall-space than of securing a high standard of work. The catalogue shows 1,549 numbers, of which 1,016 are oil paintings, 260 water-colours, 181 sculptures, 66 black and white, and only 25 architectural. There may be some consolation for English architects in knowing that the German architectural room is here treated in a far worse way than our London one, the few designs being hung in a kind of secondary connecting passage between two halls; but even this position is too good for the wretched show of designs. Of the 25 numbers in the room, eight are appended to various church designs by Professor Otzen, whose style we had occasion to see this spring; these have their merits in regard to design and drawing, though few English architects will admire their style. Only one other sheet is worthy of special mention, and this is the one signed by Prof. Schäfer and Reg.-Baumeister Hartung, on which we find the elevation of a very original design for a private residence.

**THE** Lineff system of electric traction, for tramways and railways, is now being shown in operation on a short length of line laid down at the depot of the West Metropolitan Tramway Company, Chiswick. The great difficulty hitherto experienced in propelling tramcars by electric power, has been that of getting the power into the car. A motor is geared directly to the wheels, and

\* Since this comment was written, we hear that the Special Committee of Members of the Reichstag has just decided that both choice of site and form of monument should be left entirely to the Emperor. The leader of the opposition, Herr Richter, wished to have the opinions of competent judges laid before a Committee; an animated discussion ended by the above decision receiving 13 votes to 1.—So much for art and autocracy!

urrent is supplied to it in one of two ways: secondary cells can be placed in the car itself, and an ordinary track used, but the cost of working such a system is high, owing to the great weight of the cells which have always to be carried, and the delays caused by the re-charging that has to be done two or three times a day; in other systems, a dynamo-machine is placed in some convenient position, and the conductors from it carried overhead, or underground, like telegraph wires, a sliding contact attached to the car pressing against the conductors and leading the current to the motor in both cases. The objections and risks inevitable with overhead wires are self-evident; and a continuous slot in the road, into which the contacts from the car dip, to touch the conductors, is hardly less objectionable, as water and mud are constantly getting into the channel. The special feature in the Lineff system is the ingenious means by which the current is conveyed to the motor in the tramcar. One terminal of both the dynamo and motor is connected to the ordinary rails,—that is, an earth return is used; the lead from the other terminal of the dynamo is a bare cable laid in a trough of earthenware, or other suitable insulating material, sunk below the level of the road in a channel, running parallel to, and a few inches from one of its rails. On the top of the bare cables, in contact with it throughout its whole length, a flexible ribbon made of short lengths of hoop-iron rivetted together. Recessed into the road immediately above this ribbon are plates of iron a few inches across and 3 ft. long, placed end to end, insulated from one another, and with their upper surfaces exposed in the road. The tramcar carries a powerful electro-magnet, with its two pole pieces placed immediately over the iron slabs, and so far apart that the poles are always over two of them, these latter become magnetised by induction, and pull up the hoop-iron into contact with their lower sides. As, therefore, the car passes along the track, the pieces of iron immediately under it are in direct metallic connexion with the conductor from the dynamo, and the current is taken to the motor by travelling brushes attached to the two ends of the car, and resting on the iron in the roadway. Nothing could be much simpler than such an arrangement, and it will be interesting to see how the system will work on a longer track. In wet weather there will evidently be considerable leakage over the surface of the road, and should water get into the channel containing the conductor it seems as though it would be fatal to successful running.

THE London Overhead Wires Bill was defeated last week by a majority of three; it is surprising the majority was not larger. To seek to give new and rather despotic powers to companies for the fixing of posts and wires on private houses, at a time when it has become obvious that the reign of overhead wires must shortly be put an end to, seems a somewhat preposterous piece of legislation.

A PLAN has been prepared by Mr. Joseph Boulton, a well-known Liverpool architect, for a special harbour and breakwater near the north end of Liverpool Docks, to allow of first-class ocean-steamers landing their passengers and cargoes without the intervention of "tenders." It would no doubt be a great convenience, but how would it affect the scour of the river and the tendency (already formidable) to the further development of the bar at the mouth of the Mersey?

WE have previously referred (May 17, p. 353) to the various new waterway communications now being planned in Germany. We purposely avoided mentioning the Berlin Sea Canal scheme which has been often talked about, and has of late been busying some minds, chiefly through from the theoretical technical point of view, whilst the financial side has been somewhat neglected. Now, however, that the idea of this "sea canal" seems to be gaining ground, and is likely also

to afford interest to non-German engineers, it may be well to mention that those working out the question have, as yet, not been able to come to a definite conclusion as to the advisability of having a connexion direct to the North Sea on the one side, or direct to the Baltic on the other, and that hence a working out of special routes has only to be done in a rough form. As far as we can ascertain, the most competent judges are in favour of but one route,—from Berlin by Eberswalde and Stettin to the Baltic,—rather than the two ways of reaching the North Sea, i.e., either via Harburg or via Homburg. To give an idea of the dimensions of the scheme, it may be mentioned that the Berlin-Baltic Canal would be some 158 km. in length, and would cost some 8,000,000*l.*; that a canal via Homburg would have a length of some 273 km., would require the removal of 115,000,000 cubic metres of ground, and is estimated at 12,000,000*l.*; and that a similar canal via Harburg, 269 km. long, with a removal of 145,000,000 cubic metres, would require some 14,000,000*l.*

WE understand that the Metropolitan Railway Company have purchased Wembley Park, between Neasden and Harrow, and are about to build a station there, and "develop" the property for building purposes. The position of the Metropolitan Railway differs in one respect from that of any other line in the kingdom, for this railway has a "surplus land stock," the dividends on which arise from rents and profits on the sale of so-called surplus lands. It is a little difficult to understand how Parliament came to sanction the taking of so much land, which could never be required for the purposes of a railway alone, or allow powers to be inserted in the Act to enable the Company to purchase property for building purposes. The fact is, that the Metropolitan Railway is not only a railway company, but also a land company. In the colonies it has not been uncommon for grants of land to be made to railway companies, but the practice has never been usual in this country; but as railway enterprise has in England but little new ground open to it, the instance of the Metropolitan Railway is of little value as a precedent, and is rather a curiosity of railway law and practice than anything else. But the shareholders in this line may be thankful that the promoters obtained the extensive powers in this respect which they did, for it was only by means of the surplus land that this line paid dividends of four and five per cent. before the division of the stocks into railway ordinary and surplus land stocks.

NOTHING is more noticeable at the present time than what may be termed the competition of watering-places. A short time ago we took note of the fact that the authorities at Eastbourne had established a system of sanitary certificates for lodging-houses. We have now to record the fact that last week the Corporation of Scarborough opened, under the auspices of the Duke of Clarence, the new sea wall, promenade, and gardens, on the north side of the Castle Hill. This is a work which the inhabitants may well regard with satisfaction, being not only an attraction to visitors, but a solid and permanent piece of engineering work, which will primarily serve to prevent the encroachment of the sea. Those who prefer nature to art will hear with regret that it is proposed some day to continue this work round the head, and so connect the north and south parts of Scarborough by one sea wall and promenade; for the ragged bit of head to the north of the harbour is about the only piece of nature to be found in Scarborough itself. However, there is plenty of fine, unconventional scenery in the valleys and moors at the back of Scarborough and along the coast-line for those who dislike the madding crowd; and it must be admitted that the constructive and sanitary state of Scarborough well justifies the local pride of its inhabitants. They have only to follow the example of Eastbourne,

and have the lodging-houses certificated for sanitary purposes, to still further increase the popularity of the place and its healthfulness as a seaside resort.

YET another of the City churches is marked for speedy destruction. All Hallows-the-Great-and-Less, in Upper Thames-street, has remained closed during some while past, by order, we gather, of the Commissioners of Sewers, who found that the substructure is in an unsanitary condition. We read in the *St. James's Gazette* that, pending the result of a commission already issued by the Bishop of London for uniting these two parishes with one adjoining, the necessary works will not be undertaken; and there is every likelihood that this church will not survive, following in the fate of its former neighbours St. Michael Queenhithe and St. Mary Somerset. It was built by one William Hamon, mason, says Hutton, after the designs of Wren, at a cost of 5,641*l.* 9s. 9d., and was completed in 1683. "The interior of the church," writes the late George Godwin, "is neither square nor parallel, resulting probably from the endeavours of the architect to use such of the old walls as were available; nor has it much architectural character. . . . The exterior has no feature of beauty or interest: the square massive tower, crowned by a cornice and open parapet, was probably intended to receive a spire at a future opportunity, and has an unfinished appearance about it." The tower has since been pulled down to widen the thoroughfare. The altar-piece is decorated with a Corinthian order, and has stone figures of Moses and Aaron. Another stone figure of Gabriel supports the communion-table. The church contains a carved oak choir-screen, with two side pediments and a larger central pediment, which bears an eagle and the Royal arms. This fine piece of work was made in Hamburg, and given, it is believed, *temp.* Queen Anne, by some Hanse merchants in commemoration of their former settlement in the neighbouring Steel-yard.\* The organ was built by Glyn and Parker. Boyce was for some years organist to this church.

THE sale of Gibson's "tinted Venus" on Saturday last at Christie's, does not appear to have attracted much notice; it went for 1,837*l.* 10s., not much of a price for a work which was once regarded as the leading production of the leading English sculptor of the time. We had not an opportunity of seeing it on this occasion; but if it is, as the *Times* description gives it, coloured only in the hair and eyes and parts of the drapery, the colour on the nude parts of the figure must have faded; it certainly was there once, a very delicate warm stain, just suggestive of flesh-tint, and not obscuring the crystalline surface of the marble. That the nude portions of a statue should not be left raw white marble, but be artificially warmed in tone by a stain, was one of the points on which Gibson strongly insisted, and he would certainly not have made such a blunder as to colour the hair and eyes of a statue left otherwise in the raw marble. The statue was bought, it is said, for Messrs. Pears, the well-known soap manufacturers. *Sic transit gloria!*

THE paintings by the Russian artist, Ivan Aivazovsky, now on view at the Goupil Gallery in New Bond-street, are undoubtedly powerful in their way, but it is not a good way. They are mostly landscapes and seapieces giving peculiar effects of light and colour, many of which savour more of scenic effect than of the study of nature. The two coast views at Biarritz (Nos. 1 and 4) are among the best, and two studies of calm sea with cumulus clouds hanging over the sea in piled-up masses, are fine and less staid than others of the paintings. The shipwreck scene, "The Supreme Moment," is indeed tremendous in its way; but waves on such a scale as this (having reference to the size of the masts, &c. of the sinking ship), were

\* For "The Hansards of the Steel-yard," see the *Builder*, October 27, 1888.

never seen in the modern period of this planet, except perhaps in the case of the waves developed by the earthquake and eruption of Krakatoa.

THE President of the Royal Institute of British Architects (Mr. Alfred Waterhouse, R.A.) has issued cards for his *Soirée* at the Natural History Museum, South Kensington, on Tuesday next, by permission of the Trustees of the British Museum. Judging from the programme, and from recent *conversations* of learned societies which have been held in the same building, the Institute *Soirée* is likely to be a great success.

#### LETTER FROM PARIS.

The two rival Salons have closed their doors, and the Palais d'Industrie is already undergoing the necessary transformation for an approaching Industrial Exhibition. The Palais des Beaux-Arts remains for the present awaiting what will be done with the whole Champ de Mars site. Many persons still regret very much the decision to retain the comparatively ephemeral and showy buildings at the lower end of the Champ de Mars, which have only a temporary interest or utility; and think it would have been far preferable to preserve only the more monumental and architectural buildings of the Palais des Beaux-Arts and Palais des Arts Libéraux, which would moreover have grouped admirably with the Palais de l'École Militaire, one of Gabriel's best works. On the other hand, every one will be pleased to see the proposed transformation of the Champ de Mars area into a great square ornamented with statues, the formation of which will have the effect also of raising the status and value of some of the adjacent habitable quarters of Paris.

The Ministry of Fine Arts has been occupied with the annual awards to artists, and M. Antonin Proust, acting as champion of the new Salon, has fulfilled his intention of demanding that the funds for the travelling studentships and the Prix du Salon should be applied differently to both Salons. Naturally such a proposition has met with some strong opposition by those who urge that the Société des Artistes Français has for some years past rendered great services to art, and to artists in need of assistance; and in the end this view has prevailed, and in spite of M. Proust's protestations, the funds for the awards above referred to are to be entirely retained as formerly, by the old Salon. M. Félix Charpentier has obtained the Prix du Salon. He is a young sculptor, author of a group, "Les Lutteurs," which has been much admired this year. The municipality purchased from him, some years ago, the marble fawn which is now in the Parc Monceau.

The travelling studentships in Architecture have been awarded to M. Alphonse Conin, M. Chas. Broffendille, M. Fernand Dupuis, and M. Emmanuel le Roi. An active campaign has been made this year by the landscape-painters for the Médaille d'Honneur in painting, which has been successful, and the medal has been awarded to M. François. This is the first time a landscape-painter has obtained this honour, which was never awarded to either Corot, Daubigny, or Dupré. M. François is the senior French landscape-painter now living, being seventy-five years of age. He exhibited this year a "Vue de la Sèvres à Clisson" and "Matinée Breumese." He is not only an artist of considerable power, but esteemed also as a man of very generous character, and who has been a friend to many artists in distress. In sculpture no medal of honour has been awarded. In Architecture M. Redon has carried off the medal by 41 out of 71 votes.

The Committee of Painting has also awarded two special prizes, the one founded by the Italgécourt-Goyon family in memory of the late Comtesse de Goyon, and the other by Marie Tashkirtseff, the young Russian artist who died two years ago, and whose remarkable posthumous memoirs have given her more fame than she lived to acquire by her paintings. The first of these prizes has been awarded to M. Armand Gury, the second to M. Paulin Bertrand.

Among noteworthy exhibitions is that of the *œuvres* of Châteneau the animal painter, in which we cannot avoid expressing our astonishment at this result. Most English critics, we believe, would consider that landscape in the Salon was rather weak this year, and the sculpture inconspicuously the finest portion of the Exhibition.—Ed.

the Boulevard Poissonnière, and that of a painting by Roybet in the Georges Petit Gallery. The latter has attracted great attention during the month by its power and originality of the one work, and the painter's absolute disconnection from the current fashions of painting. The painting represents Charles the Bold at Nèfle, commanding the massacre of the populace who had taken refuge in a church. This painting of a scene of carnage is a masterly work, showing artistic qualities of the highest order, but it is confused in effect for want of a sufficiently marked central point in the composition.

The Company of the Chemin de Fer de l'Ouest has made a happy innovation in decorating the large hall of St. Lazare station with a series of oil and water-colour paintings of the watering-places of Normandy and Brittany. These are painted by M. Eugène Bourgeois, a young artist who has often exhibited in the Salon, and they form a welcome contrast to the vulgar transparencies exhibited by the company last year.

M. Antonin Proust, who must be credited with a real if not always well-directed zeal in matters artistic, has proposed to the Chambers the formation of a museum fund (Caisse des Musées) to facilitate the purchase of works for museums in Paris and in the provinces. The fund would be administered by an honorary committee presided over by the Minister of Fine Arts, and would receive an annual grant of 500,000 francs. Anything not expended in one year would be carried over to the next, so that an accumulation might be formed which could be utilised on occasion to secure for France important works, which might otherwise go out of the country. This proposition, supported by a strong group of Deputies, will shortly come under discussion.

The Louvre continues to receive new contributions; the last was a very fine portrait by Ricard, left to the Museum by the late M. Heilbuth, who also left to it one of the best of his own works. This, however, according to the rules of the Louvre, will have to be deposited in the Luxembourg until the expiration of the ten years which constitute a deceased painter an "old master." There has also arrived at the Louvre a very fine example of Corot, not from the Luxembourg, but from the Château of Compiègne, where the "Direction des Bâtimens Civils" had forgotten it.

Among the works now going on at the Louvre is the preparation for definitely installing the Dieulafoy collection in the Gallery of Persian Antiquities. This gallery, which has been decorated by MM. Rude and Chaperon, will contain among other curiosities the reduced model of the Assyrian Palace, the Apadana, which was exhibited in the Palais des Arts Libéraux last year.

A new gallery of casts has been opened in the museum of comparative sculpture at the Trocadéro. This gallery, the contents of which are of the highest interest, occupies the west wing of the Trocadéro palace, given up last year to the interesting loan collection of Medieval art. The contents of the completed gallery of comparative sculpture, in the east wing, were described at some length in an article in the *Builder* of August 10, 1889. The new collection in the west wing is arranged as follows: it is divided into six compartments, symmetrical with those of the opposite wing. The first five are devoted to works dating from the eleventh to the eighteenth century. The sixth compartment is devoted to specimens of Cambodian architecture and sculpture brought home by the Delaporte mission. The compartments are divided by reproductions of ancient gateways, which were already in place there last year, and were described at the same time as the contents of the east gallery.

This installation in his building ought to be a satisfaction to M. Bourdais, the architect of the Trocadéro, who however is not happy, because the neighbourhood of the Eiffel Tower will not let him rest. He also had his scheme for a 300 metre tower which has not been accepted, and in despair of that, he is now exhibiting to the tradespeople of the Palais Royal a design for a tower 100 metres high in stone and crystal. This new edifice, which no one wants, he proposes to construct at one end of the Palais Royal, with all the apparatus of restaurants, fountains, and coloured lights in connexion with it. He urges that this will give new life and prosperity to a quarter now almost deserted as far as evening amusements and fêtes are concerned. It is not likely however

that M. Bourdais' tower would do much to avert what seems the tendency of all Parisian life to flow westwards.

This same westward tendency has increased so much that this quarter of Paris is getting inconveniently crowded, being, so to speak, compressed against the old fortification line; and the deputies of Paris, with M. Georges Berger at their head, have renewed the representations to the Minister of War, made already in 1883, for the entire removal of the fortification place which the matter being advanced, thanks to the *inertie* of the military mind. While it is recognised now that these fortifications do not in any way meet the requirements of works to stand against modern artillery, and that since the construction of the new forts they are really of no use, still the Comité Supérieur de Défense puts its veto on all attempts to remove them.

This time however there seems some chance of success, as one of the promoters of the attack on them M. Guyot, is now Minister of Public Works, and his assistance therefore may be counted on; and the demand now made is not for the dismantling of the whole, but only for the portion between the Seine and St. Ouen. The river takes at this point a curve parallel to the line of the fortifications, and constitutes a natural defence protected by the forts of Issy and Valérien; and by removing the fortifications at this point the limits of Paris would be extended to the river. This operation would give an area of 15 hectares where the population of Paris could find new and healthy and cheap sites for habitations. This is therefore a matter of great interest in regard to the three-fold question of hygiene, construction, and public economy; and the Minister who can get round the routine of the military engineers will earn the thanks of Paris.

The candidates for the place in the Institut left vacant by the death of Robert-Fleury are M. François, M. Dédaille, M. Emil Lévy, M. Joseph Blanc, and M. Jules Lefebvre. The Académie has added to these names that of M. Benjamin Constant, M. Olivier Merson, and M. Harpignies. The Académie des Beaux-Arts has also to fill the vacancy in the ranks of its corresponding members left vacant by the death of Mr. Herbert. The following candidates were proposed: Mr. John Burn; M. Pradilla, of Madrid; M. Kroyer, of Copenhagen; Mr. Herkomer; and M. Valbez, of Stockholm. Mr. Herkomer was elected.

The Academy has proposed M. Eugène Gaillanne to the Government, to succeed M. Hébert at the Villa Médicis, the term of office of the latter artist expiring on January 1 of next year.

The École des Beaux-Arts has just decided the competition of the first class in architecture, the subject being a palace of national archives.\* Among seventy-six designs, second medals were awarded to M. Monjaux (pupil of MM. Gerhardt and Rédon), M. Duquesne (pupil of M. Pascal), and M. Baille (pupil of MM. André and Lalou).

M. Roger Ballu, the son of the eminent architect, has been named a member of the Committee on Works of Art, in place of the late M. Ph. Burty, who recently died suddenly of apoplexy. He was one of the most able art critics of the day and one of those whose work had most weight. He (like a good many other critics) commenced as a painter and gave himself up subsequently to art criticism, to which he brought rare faculties both of style and judgment. He was a contributor to many reviews, French and foreign, and besides published a good many separate treatises. He was Chevalier of the Legion, Inspector of Fine Arts, and Member of the Committee of the Société des Gens de Lettres; and was also a great collector, with a passion for Japanese art, which he did much to popularise.

THE ROYAL SCOTTISH ACADEMY, EDINBURGH.—Mr. William McEwan, M.P., has given 5,000 to Sir William Pettes Douglas, President of the Royal Scottish Academy, for the purchase of a picture or pictures for the Scottish National Gallery. It has been, for some time, the desire of Mr. McEwan to procure for the gallery an example of Rembrandt, and it will be the endeavour of the President to secure a work of that master.

WAGES IN THE BUILDING TRADE AT HANLEY.—At a meeting of master builders, in Hanley, on June 26, it was resolved to grant an advance of wages of  $\frac{1}{2}$ d. per hour.

\* One hectare = 2.4738 acres.

THE MONTPELLIER BATHS COMPETITION, HARROGATE.

THE action which the Corporation of Harrogate is taking in extending the bathing accommodation of the town is one for which there is every need; and as the steady increase in the number of bathers has rendered the accommodation of the Victoria Baths quite inadequate, the Corporation has decided to build premises containing vapour, air, and douche baths; cooling, pulverisation, and inhalation rooms; Turkish baths and massage-rooms; with spacious Winter Garden and concert-room attached. It is intended that the new building should provide a bathing establishment surpassing all others in excellence.

In the competition which has just been decided, every effort has apparently been made to secure impartiality, and the result may be considered satisfactory.

The plans which have been accepted are likely to provide the town of Harrogate with buildings designed with every care and consideration for the objects in view.

The competition was divided into preliminary and final portions, and out of the authors of the twenty-six sets of sketch-designs four were selected to prepare more elaborate designs.

The Assessor, Mr. Corson, of Leeds, completed his scrutiny of the four sets of designs, and awarded the order of merit as follows:—Messrs. Baggallay & Bristowe, London; Messrs. T. & F. Verity & W. Phipson, London; Messrs. Ellison & Son, Liverpool; Messrs. Morley & Woodhouse, Bradford.

We are entirely in accord with Mr. Corson's decision, and careful examination of the drawings will show that the award is a wise one, and that the best design submitted has every probability of being carried out.

The site is of irregular four-sided shape, and the levels of the surrounding roads vary to a large extent. It is greatly to be hoped that the Corporation will see their way to carry out their suggestion by removing the row of shops occupying a corner of the site; such a step would greatly improve the aspect of the gardens and would give room for a slight expansion of the plan in this region, which would be in several respects most desirable.

The four final competitors have all placed the primary front entrance in the Crescent-road, and have also wisely confined the building to this side of the site, placing the Winter Garden against this block, so as to occupy a central position on the site and still to leave a considerable space behind to be laid out as grounds.

Many of the other competitors have crowded the site by providing too extensive a Winter Garden.

The preliminary instructions to competing architects deserve a word of notice. The information given was confined to as few leading points as possible, and much was left to the individual ingenuity of the architect. This arrangement is in striking contrast to some instructions, which are hit too often a har to the designing of a really good building.

Messrs. Baggallay & Bristowe, who, by the resolution of the Corporation, have been appointed architects to the building, have carefully grouped their plan around a central hall placed well in the centre of the block and surrounded by doctor's consulting-room, manager and porters' rooms, gentlemen's waiting-room, &c. The principal entrance, with dome over, occupies the centre of the Crescent-road frontage and leads straight into one end of the central hall. At the opposite end of the hall, a vestibule, with refreshment and reading rooms on either side, leads to the Winter Garden, running along the back of the building and at right angles to the vestibule. In the centre of the gardens and in line with the central hall, an octagonal domed pump-room is placed, with a covered way from the Winter Garden.

The ladies' baths are placed on the left of central hall, and the gentlemen's baths on the opposite side. Each section is approached by corridors at right angles from centre of hall.

The provision of large areas in each of the last-named blocks gives facilities for external lighting and for placing the water-closets and lavatories against external walls—a point which has not been so ably treated by the other competitors.

One of Messrs. Baggallay & Bristowe's special features is the straight corridor running from Montpellier-road to the central hall. A slight incline from the hall would give easy access for

bath-chairs to the central hall, and thence to all parts of the building.

The planning of the building on one floor cannot be too highly commended, and the advantage of this arrangement is at once apparent by comparison with the three other designs, each of which places some portion of the department on a first floor.

The corridor last mentioned, running parallel with the Winter Garden, has pulverisation, cooling, and inhalation rooms on the south-east side, whilst the Turkish bath is placed in the south-east angle, adjoining Parliament-street entrance and Winter Garden.

The lighting of the Turkish bath will, of course, be from the top, but there is nothing to indicate this on the plans. The steps between the rooms are a questionable advantage, and we should think, might be easily dispensed with.

The stipulation that the height of dressing and bath-rooms be not less than 15 ft., has been taken advantage of to give external light over the corridors, which have been kept low, and this treatment has been most successfully carried out by Messrs. Baggallay & Bristowe. The competitors have, without exception, adopted a Renaissance style. Messrs. Baggallay and Bristowe's treatment is fairly successful. Domes form prominent features, and the square towers rising from the centre of the buildings are gracefully designed and serve a double purpose in the position assigned to them, being used for storage tanks and for smoke and ventilation shafts.

It is to be hoped that in the execution of this building some decided effort will be made to introduce colour into the elevations; the dull aspect of the buildings of Harrogate built with the local stone is most conspicuous and depressing.

The designs placed second, prepared by Messrs. T. & F. Verity and W. Phipson, of London, deserve all credit for the care with which they have been drawn, and for the grace of the elevations. The plan, though good in parts, cannot, however, be compared to the simplicity of the plan of Messrs. Baggallay and Bristowe. The corridors are involved, and are not straight from the central hall. Advantage has been taken of the height, previously mentioned, of the Turkish and dressing-rooms, but the advantage gained by placing the water-closets, lavatories, and urinals against external walls, even though of internal areas, cannot be too much insisted upon, and the expedient of closets opening direct from dressing-rooms is a questionable one. The areas provided are much too small for their purpose.

The provision of some portion of the establishment on the first floor is a disadvantage. Messrs. Verity provide ladies and gentlemen's roosting-rooms over the entrance, and a gallery surrounding the central hall leads to massage-rooms on each side. A large staircase gives access to this portion of the building from ground floor.

The elevations are distinctly the best part of this design, and are far in front of the two remaining designs in every respect.

The design placed third, submitted by Messrs. Ellison & Son, of Liverpool, differs from the two previous ones in several important respects, and though the elevations cannot be commended, the idea of the plans has been methodically worked out.

Unlike the others, Messrs. Ellison & Son have placed the principal entrance at the corner of Crescent-road and Montpellier-road.

A feature of this entrance is a covered carriage shelter, with double doors at each end for closing, if required for special cases, and a long incline for bath chairs.

A large hall behind the entrance has staircase and lift on right-hand side, and on the left two straight and parallel corridors branch off towards Parliament-street, and parallel to Crescent-road (which is straighter than its name implies). A large area between them gives the necessary light and air.

The Turkish bath has been placed in the Crescent-road front, and the rest of the space is occupied by the gentlemen's bath.

From the second corridor already mentioned, a corridor at right angles leads directly into the Winter Garden, which is at right angles to the block, and runs across behind the existing shops in Parliament-street. The pump-room has been placed in the centre of the Montpellier-road front, and a covered colonnade runs from this point in front of the Winter Garden. The design of this colonnade is exceedingly poor.

The first floor, approached by staircases and lift, contains the ladies' baths. The corridor has been extended at great trouble, and carried through to form a communication with the gallery of Winter Garden. The advantage of this is not very apparent.

Smoking and billiard rooms are provided on this floor, but we cannot admire the arrangement of reading and writing rooms leading out of one another, and ultimately to a lavatory, urinal, and water-closet, to which there is no other access.

The position of the tower at the corner of Crescent and Montpellier-road cannot be said to improve the design.

The detail of this design is disappointing; the stone balustrades to parapet are especially weak and poor in character.

The elevations of the design submitted by Messrs. Morley & Woodhouse, of Bradford, are in some respects of better character than those of Messrs. Ellison & Sons. The frontage to Crescent-road is very flat, and sadly needs relief. The provision of a carriage shelter is a good suggestion, though examination of the existing shelter to the Victoria Baths shows that the use of this accommodation is almost entirely ignored by both visitors to the baths and drivers.

Messrs. Morley & Woodhouse have set their lines of frontage back from the road some distance, and if this would save some of the trees which abundantly cover the site the thanks of the inhabitants would have been gained.

The entrance, in the centre of Crescent-road, leads directly into a waiting-room or lounge, and a cooling-room. From the latter the ladies' and gentlemen's baths are reached, and the inhalation and pulverisation rooms intended for the use of both sexes. The Turkish baths have been placed in the corner by Parliament-street, with separate entrance from the grounds.

The Winter Garden is placed at the back, parallel to Crescent-road, with large pump-room at one end, occupying the centre of Montpellier-road.

A tower at the corner of Crescent-road and Montpellier-road adds but little to the harmony of the design.

The arrangements for ventilation and drainage are but barely indicated upon this set of plans. This is in striking contrast to the fullness of details given by Messrs. Baggallay & Bristowe to these most important points.

The sketch-plans which were submitted, but never developed, are not without interest.

A very bold design may be mentioned, with the entrance at the corner of Parliament-street and Crescent-road. An octagon hall, with elliptical waiting and reading-room behind, ultimately leads into a central pavilion of the Winter Garden, with semi-circular colonnades on each side. The disposition of the baths behind the circular colonnade, and facing Crescent-road and Parliament-street, is thoroughly original.

The decision of the Assessor, Mr. Corson, will be endorsed, we think, by all who will bestow upon these designs a careful examination.

A SMOKE ANNIHILATOR.

ACTS of Parliament have been passed and fines inflicted for the production of smoke nuisances, but for all that smoke prevails; and the prosecutions are not actively waged, mainly because—if the truth may be spoken—it is tacitly admitted as rather hard, if not actually unjust, to fine for a nuisance when the offender cannot be directed to any certain or efficient remedy. Good stoking has so far been the best remedy, but as good stokers cannot always be relied upon, there is need for some reliable mechanism which will neither tire nor fail in its operation. In the pretty country town of Newbury in Berkshire, an important industry establishment of Mr. S. Elliott, where a large amount of admirable artistic work has been turned out, and which has already gained gold medals from five public exhibitions of note. Steam power had to be employed for these works to dry the wood and drive machinery. The saw-dust, shavings, and other waste had to be got rid of, and the easiest and cheapest mode of course was to burn them as fuel. The inhabitants objected to this process, and the energetic proprietor was fined. It was not to be expected he would cease the consumption of this class of fuel, but it was not

The Old Church House, Chelsea.

agreeable\* to be in antagonism to his neighbours. So Mr. Elliott struck out a course for himself—an original, simple, and effective one. He seizes the black smoke as it comes away from the furnace, and washes it clean before he lets it go into the atmosphere. To do this, he stops the smoke in the chimney by a trap. He then draws the smoke away by a rapidly revolving fan and delivers it into a closed tank of water, through a central perforated revolving tube, carrying several beaters which expeditiously commingle the water and the smoke. The carbon and solids are precipitated and the sulphurous and other acids absorbed by the water. The heat of the smoke converts a portion of the water into steam; and there passes off from the tank funnel only the vapour thus caused and the thoroughly cleansed nitrogen and partially consumed air, which has passed through the furnace. This vaporous mixture is absolutely inodorous, and a white handkerchief held in it will neither become impregnated with fumes nor stained by smuts.

A very numerous party of engineers and experts inspected last week the invention attached to a 100 horse-power boiler in Mr. Elliott's works; and all concurred that the apparatus was justly entitled to the name of "smoke annihilator" which the inventor has applied to it. Dense columns of smoke were allowed to arise in the ordinary way from the chimney. Then the apparatus was switched on, and the black smoke ceased, an equal volume of pure white steam supplanting it. This quickly dispersed like the steam from a locomotive on a hot summer day. The carbonaceous and other products may be from time to time removed from the water and applied, if worth the trouble, to some economical purpose. Numerous specimen-boards were shown, painted in various greys, greens, and browns, both in flat and varnished. The carbon thus obtained is exceedingly fine, and may probably be on a par with the finest lampblack. We are not inclined, however, to lay any stress upon the commercial value of these bye-products, which, if turned into the drains, can do no harm and may do good in proportion to the quantities of smoke washed and the amount of materials extracted. The annihilating apparatus neither occupies much space nor is it costly. The dimensions of the tank in the present instance are 4 ft. in length, 4 ft. 6 in. high, and 2 ft. 6 in. broad. The fan is a small one, adapted to its duty, and runs at about 2,000 revolutions per minute, whilst the beaters run at about 200 revolutions. About  $\frac{1}{4}$  horse-power is probably the extent of steam drawn from the boiler for working the fan and the beaters,—so the expense of running the apparatus is slight. On the other hand, the fan acts as an exhaust to draw through the furnace a regular and good supply of air, and as a consequence the combustion is improved to the extent, as has been tested, of 4 per cent. of the fuel required. Another point is worthy

of notice. The iron chimney which was 80 ft. high previously has been reduced by 40 ft. The Mayor and several members of the Corporation of Newbury were present, and gave satisfactory testimony to the local appreciation of the invention. It would be, indeed, a pity if the increasing developments of industries should be incompatible with the retention of rurality by the town; but by this novel smoke-washing process the untarnished beauty of the country and the welcome profits of industry may, seemingly, thrive side by side without antagonism. On shipboard the new process may well receive attention, for the smoke of steamers on the water is scarcely a less nuisance than the smoke of factories on the land—from the smallest launch on the river to the finest "greyhound" liner adrift on the seas. To the naval levitian and the swift torpedo boat the desirability of getting rid of their smoke is equally obvious and important.

#### THE OLD CHURCH-HOUSE, CHELSEA.

THE above sketch shows this house, at present used as a Sunday-school, but which we are told is now so much dilapidated that it has been condemned as unsafe. The Rev. R. H. Davies, the incumbent of Chelsea, proposes to rebuild it, utilising as far as possible the original facing bricks on the exterior, and, in fact, erecting the face of the old building with a substantial backing. It is hoped that some readers of the *Builder* may be able to contribute something towards this praiseworthy attempt to preserve the soul of an old house, while giving it a more substantial and durable body.\*

#### ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS: MEETING IN LIVERPOOL.

THE annual meeting of the Association of Municipal and Sanitary Engineers and Surveyors was opened in the Town Hall, Liverpool, on Thursday in last week, when a large number of the Association's members attended. There were present:—Mr. H. P. Bounois, City Engineer of Liverpool, and President of the Association; Mr. George F. Deacon, Water Engineer of Liverpool, and Past-President; Colonel Jones, V.C., Wrexham; Messrs. H. T. Wakeham (Garston), T. Marks (Llandudno), T. C. Thorburn (Birkenhead), J. T. Eayrs (West Bromwich), T. de C. Meade (Hornsey), E. Pritchard, Past-President (Birmingham and Westminster), F. Ashmead (Bristol), Charles Jones (Ealing), Joseph Lobley (Hanley), A. W. Parry (Reading), H. McKie (London), A. T. Davis (Shrewsbury), P. S. Platt (Rochdale), E. G. Mawbey (Leicester), J. Cartwright (Bury), Rhys

The general meeting of the Association was held in the Council Chamber, and Mr. T. Holder, Deputy-Mayor, in welcoming the members, regretted that the Mayor was absent in London on important business connected with the city. It was a source of gratification to them in that city to know that their respected City Engineer, Mr. Bounois, was filling the high position of President, and he had great pleasure in asking that gentleman to take the chair.

Mr. T. Cole (Secretary) then read the seventeenth annual report of the Council, from which it appeared that there were now 419, compared with 371 members at the end of the previous year.

The report having been adopted, The President said he had much pleasure in presenting to the successful writers premiums which had been voted by the Association for essays on certain subjects. The winner of the first premium of 10*l.* was Mr. E. J. Silcock, King's Lynn, for his essay on "Electric Lighting," and of the second, of 5*l.*, Mr. A. E. White, Hull; these two gentlemen having selected several books as the shape which they wished the premium to assume.

#### The President's Address.

The President, in his annual address, after thanking the members for re-electing him to the presidency of the Association, referred to the benefit which the members derived from attending the district meetings during the year. The inspection of municipal and other works in the various cities and towns could not but enlarge their professional knowledge, which was, without doubt, of the greatest value to the towns where the members were employed, and he thought that, in justice, some arrangements might be made by the corporations and the boards of the towns that the expense falling on their officers should not be entirely defrayed by the officer attending such meetings. A few corporations had already adopted measures whereby the cost did not fall on the officer, grants being allowed towards his expenses in attending meetings of the Association. He referred to the fact that an engineer's profession was one which depended so much upon the knowledge of what others were doing, in order to achieve complete success and avoid failures in his multifarious duties. In all his duties, however, the meetings of the Association instructed the member. The President then entered technically into one or two questions of engineering work, saying that in water engineering the members had had opportunities of visiting some of the largest works in the kingdom, among them that magnificent feat of modern engineering the Vyrnwy dam and artificial lake, which he was proud to say had been carried out by one of their members, Mr. George F. Deacon. Continuing, the President said he believed their proposed registration and the alteration of their title to that of the Incorporated Association of Municipal and County Engineers would give them even a better position than they now held, and would give them a *locus standi* in many new matters. One of their objects was the promotion of the professional interests of the members of the Associa-

Fawcett's Floor, with provision for Ventilation, as fixed at the New Buildings for the Children's Hospital, Great Ormond-street.

SHEFFIELD MUNICIPAL BUILDINGS DESIGN.

WE publish this week the perspective view and two plans of the design submitted by Mr. H. T. Hare in the second competition, and on which we have already commented in our general article on the designs last week. Mr. Hare wishes to point out that the general idea of the plan was based upon the conviction that the General Offices of the Borough Accountant and Waterworks Department were of too great area in proportion to their height to be satisfactorily lighted by windows only. They were therefore placed in the centre of the building, with top-lights over the greater portion. A direct entrance for the public was provided from Surrey-street, leaving the main entrance and staircase for state purposes only. The plans are so arranged that the business and state portions of the building may be entirely cut off from each other when required.

The following additional notes from his report are furnished to us by Mr. Hare:—

"The walls were proposed to be faced with Hindersfield stone on the external elevations, the areas being lined with white glazed bricks. The roofs to be covered with green Westmoreland slates. The turrets and tower-roof to be covered with copper. The whole of the construction, both as regards floors and roofs, to be fireproof on Lindsay's system, with trussed steel joists and punice concrete.

The windows throughout were proposed to be glazed with lead lights in squares, about 6 in. by 9 in., with iron casements when required to open. The windows in the state apartments to have armorial bearings and devices introduced, and to be treated generally in a more ornate manner.

The council-chamber and reception-rooms to be panelled in dark oak and teak to the height of 12 ft. above the floor. The walls in council-chamber to be faced above the panelling with Ancaster stone, and in the reception-rooms to be covered with enriched plaster-work. The floors to be in oak parquetry.

The entrance-hall and staircase to be paved with mosaic. The steps being in Hopton-wood stone, and the walls faced with Ancaster stone. Polished Hopton-wood stone and various marbles were proposed to be used in dadoes, balustrades, &c.

The ceilings of all the above apartments to be panelled and enriched in plaster.

The large general offices were to be paved with wood-block flooring, and the other offices with pitch-pine 4 in. widths, secret nailed.

The walls in lavatories to be lined with tiles to a height of 6 ft. above the floor, and above finished in plaster for painting.

The whole of the w.c. apparatus throughout were to be on the "Pedestal" system, without enclosing woodwork, and the lavatories of the "tip-up" type.

The heating was to be by hot-air in the State apartments, entrance-hall, and general offices, the air being drawn down to the basement by a 6 ft. diameter fan from a point above the roofs, and heated in chambers placed as nearly as possible under the apartments which they were to warm. Other portions of the building to be heated by hot-water coils placed, in most cases, in the window backs, with fresh-air inlets into the coil-cases.

The extract ventilation was sub-divided into several systems, the upward currents being assisted in all cases by small hot-water coils.

The estimate was 79,950*l.*, but this amount was not, in my opinion, sufficient to carry out the building in an adequate manner."

SCULPTURE: "VELASQUEZ."

THIS equestrian statue, by the well-known French sculptor M. Frémiet, was one of the central works in this year's Salon. The object seems to have been to give a portrait statue of the great Spanish painter riding on the heavy type of charger-looking horse, represented in his own pictures, and ensconced in the voluminous saddle of the period, which would justify a modern horseman, but which possibly conduced to that extreme gravity and stiffness of

department in the saddle which characterises the mounted grandees of Velasquez's paintings.

The figure is characteristic, though the costume certainly does not lend itself well to sculpture, and perhaps we shall not be wrong in concluding that the horse was, after all, the main object of interest with the sculptor.

THE PROPOSED "EIFFEL TOWER" FOR LONDON.

WE give this week an illustration of the first promiated design for this proposed 1,200 ft. tower, by Messrs. Stewart, Maclaren, and Dunn.

The design was accompanied by a full and very well-written report going into the whole subject of the design and construction of the tower. From this we have only space to give such extracts as will sufficiently explain the general intention of the designers:—

Extracts from Report.

"The dimensions of the tower are 300 ft. across at the base, tapering to 40 ft. across at a height of about 1,100 ft.

A structure rising to so great a height must be artistically independent of its surroundings from all points of view except those in the immediate neighbourhood; but its effect would be greatly enhanced from a closer prospect by a suitable base, and we have suggested on the general drawing a screen wall (which might form the façade of the exhibition or grounds of which the tower will be the centre) of sufficient mass and extent to form a proportionate pedestal. Such an adjunct must, however, remain a suggestion merely, until a site is secured, and the general question of its environment determined.

The style of this screen and the tower itself is of an Eastern character, the authors feeling that to be governed by the strict rules of European art would be a mistake. There is, moreover, something allied to Oriental magnificence in the scale and dimensions of the structure. The freedom in design and the richness in decoration which this style permits make it specially suitable for the purpose.

In designing a structure of this size, enclosed in a steel frame such as this, the nature of the walling must be considered in regard to the expansion and contraction of the frame. Ordinary brick walls would soon show perceptible cracks, and iron frames covered with iron plates, which would expand in the same ratio as the tower, would be found too cold in winter and too warm in summer for comfort.

The special method which we propose is that of forming the outer walls of three thicknesses of plaster on wire netting fixed to iron studding, forming two distinct air spaces. The outer coating would be of cement, rough-cast, of good colour.

The elasticity of these walls would meet any expansion or contraction of the tower; their lightness is of great importance, and the speed and economy with which they could be erected is a further recommendation, for the material would be prepared in the workshop and sent up in large slabs, requiring only a few screws and joints for fixing. As the floors would be constructed throughout of concrete and steel, it will be observed that the structure would be, if not fireproof in the strict sense of the word, eminently fire-resisting.

With the exception of the stair not intended for public use, from the fourth stage to the electric light in the lantern, the whole of the steps are arranged in straight flights, round a central well, without winders.

The two staircases passing up the legs of the tower to the 200 and 272 ft. landings, as well as the direction of turning is made, three times in the height; a provision intended to guard against giddiness from turning in one direction. . . . In the construction of these stairs we propose to use Hawksley's patent treads (formed of small cubes of wood set in iron frames) on iron carriages.

The tower has eight legs from bottom to top, placed so as to form a regular octagon in plan. The whole of the steelwork is to be made in the Siemens-Martin 'open-hearth' system, and is to have an ultimate tensile strength not less than 30 tons, or more than 33 tons per square inch of section, with an elongation of at least 20 per cent. on a length of 8 in. The precautions now usually adopted in

on, and in reference to that he would like to say something. Sanitary engineering, as a profession, was only forty years old, and at present no diploma was necessary to distinguish a man fitted to hold the post of chief engineer to a corporation from a man who was not fit. Very often a plumber would put after his name the title "sanitary engineer," thus giving a very misleading notion as to what a sanitary engineer really was. If the line of action pursued by the Association was properly supported, the certificate of competency they granted would be regarded as a diploma under which an individual might be recognised as really a sanitary engineer competent to hold municipal office. He was also of opinion that municipal officers should be entitled to a pension after a certain number of years' service. A system might easily be arranged under which a fair percentage of an officer's salary should be placed in a superannuation fund, which could be increased by the corporation or local board out of the rates. Such a system would go far to cement the good feeling which ought to exist between municipal officers and the corporation or boards they served. Manchester had applied for an Act of Parliament empowering them to form a superannuation fund, and the Corporation of Liverpool, which had at present an incomplete Act, under which it did not appear that any pension could be granted to officers who had joined the service since a certain date, although a percentage of their salaries was stopped for the purpose, would no doubt obtain an Act to change such an anomaly. He was also of opinion that municipal officers should be appointed on a sliding scale. In conclusion, the President said he would do all he could to further the interests of the Association.

We will give some further notes of the meeting in our next.

FLOOR SECTION AT CHILDREN'S HOSPITAL, GREAT ORMOND-STREET.

THE accompanying diagram (see above) shows the manner in which Fawcett's fire-proof flooring is being utilised by Mr. C. Barry at the new buildings for the Children's Hospital in Great Ormond-street, as a means of finding space for flues admitting fresh air to the stoves. Mr. Barry proposes to place "Tobin tubes" against internal walls and supply them with air in the same way as the stoves are supplied, through the tubular lintels used in the construction of the fire-proof floors.

Illustrations.

PAVILION OF CATHERINE DE MEDICIS, BLOIS.\*

THE Pavilion of Catherine de Medicis at Blois forms a detached portion of the chateau known as the Tour de Foix, situated at the south-west corner overlooking the river and church of St. Nicholas. Together with the Salle des États and the Tour de Donjon, it forms one of the most ancient parts of the castle, and probably dates from the thirteenth century, although the details of the octagonal turret rather resemble flamboyant work. The illustration is from a drawing by Mr. Herbert Railton.

\* Some description of this pavilion was given in the Builder of June 5, 1847, in the report of a paper on the decoration of Blois and Chambord, by the late Mr. Craze.

steel structures would be taken here, to ensure that all material was of quality specified.

The lowest or first story extends from the level of the ground to the floor of the central hall. At the base, the diameter of the circle, passing through the centres of the eight legs, is 300 ft., and at the top 290 ft. The inward slope of the legs is thus 1 horizontal to 4 vertical, or the inclination to the horizon towards the centre is 75 deg. 58 min. The most favourable angle to prevent bending stresses on the legs from partial loading, wind, and temperature is fully discussed under the heading of stresses. The legs are in sectional plan 20 ft. square outside, and consist of four massive corners, braced together as shown. The depth of the bracing is 18 in., leaving an inside clear space of 17 ft., and thus ample provision is made to prevent deformation of the square.

By adopting these large dimensions, it becomes unnecessary to brace the legs together. The maximum shearing stress these legs produce on the masonry is only 2 or 3 per cent. of the weight, and the friction of the steel and masonry would alone be sufficient to prevent sliding.

As an additional security, the steel work of each leg will be bolted to the concrete or masonry with six bolts, 2½ in. in diameter, carried to a depth of 18 in. These bolts will assist in supporting the legs during construction.

At the base of each leg a ring girder is placed, 5 ft. in depth, resting on a base plate ¼ in. in thickness. The pressure, acting on the corners, will thus be spread over an area of 400 superficial feet of concrete or masonry, giving the moderate direct pressure of about 9 tons per foot.

At the top of the first story, the platform and balcony are supported by a series of ring and radial girders, as shown. The girders are used only for their own weight, the flooring, furniture, and the crowd of people (estimated at a maximum of 1 cwt. per square foot), but also to prevent bending of the legs. For the latter purpose they are made 36 ft. deep at their junction with the legs, and 18 ft. in the centre. Four of the eight legs will be arranged for lifts, and two will have staircases fitted within them. At a height of from 54 to 72 ft. above the base of the second story, a strong ring girder will be erected, 20 ft. wide and 18 ft. in depth, from which the hotel will be suspended by a series of angle-iron ties. This ring girder also forms a support to the roof of the central hall, and gives lateral stiffness to the lower bay of the second story, instead of the ordinary diagonal bracing.

The roof over the central hall is designed to carry the machinery hereinafter described to wind the upper lifts, a portion of the lift-cases, wind pressure, its own weight, and a covered way from the centre to each of the legs. From this point for a height of 830 ft. a central lift-case is provided, to work three independent lifts, and to support a staircase. The lift-case is 27 ft. 6 in. square, and divided into bays or panels every 17 ft. There are thus nine vertical posts, and the six faces are double braced. Each of the posts and bracings are of such dimensions that they form practically rigid struts, and are capable of bearing wind-pressure, load, and any stress that may be produced by the sudden stoppage of the lifts. The weight of the lift case is transferred at frequent intervals to the legs of the tower, and the supports are so arranged that they both assist in resisting the lateral action of the wind, and prevent the deformation of the regular octagon.

In the third and fourth story, when the diameter of the tower is less, the form of the section of the legs changes, but is always of ample width, and care has been taken to provide ample ring bracing, both horizontal and diagonal, to prevent deformation and resist the action of storms of wind.

The weight of the various platforms together with the hotel, lift-casing, machinery, &c., is supported ultimately by the legs of the octagon.

The tower, above the masonry, as designed, has been estimated to weigh 15,000 tons, which includes an ample margin; it is equally supported by the legs, so that the direct vertical pressure on each at its junction with the masonry is 1,875 tons, the actual pressure in direction of the legs being 1,933 tons.

All the platforms, staircases, public rooms in hotel, &c., are designed to carry 1 cwt. per square foot of area, and the bedrooms in hotel 50 lbs. per square foot.

Careful consideration has been given to partial loading; the total live load provided for amounts to 6,000 tons; and, as will be seen further on, the extreme case of 3,000 tons of live load placed on one side of a vertical plane passing through the axis of the tower, the other side being unloaded, has been considered and provided for.

The tower consists of open lattice work, and a question arises as to the extent of surface on which to calculate the normal wind-pressure of 50 lbs. If the tower were cylindrical or conical and plated all over, that surface would be one half the area seen in elevation, and this would be nearly true for an octagonal cone.

In an open work structure, the wind passing through strikes the concave side with reduced velocity, and the total pressure may be increased beyond that upon a closed surface. Allowing for this, and observing that the structure is more closely braced at the top, we have taken for the

upper 350 ft., 75 per cent. of the area contained between the outer lines of the tower where open, and 50 per cent. where closed in; for the next 300 ft., 65 per cent.; the next 350 ft., 55 per cent. of the open work; and for the lower 200 ft., the area of the surface exposed in each leg in direct elevation multiplied 8 times.

Taking each of these areas so reduced we obtain the following pressures—

4th or upper stage .....	250 tons.
3rd .....	340 "
2nd .....	340 "
1st .....	600 "
Total .....	1,530 tons.

Multiplying each of these by the respective heights of their centres of pressure above the base of the steel-work of the tower, the overturning moment is 738,300 foot tons; and as the weight without any live load is 14,500 tons the centre of pressure is removed 738,300 ÷ 14,500 = 51 ft. within a base of 300 ft.

It would thus require three times 55 lbs. per square foot of pressure to upset the tower, a steeling it were not bolted to the masonry. . . . The expansion and contraction of a cast bar 300 ft. long is about 1 in. in this country, at extremes of temperature. In the hottest weather, if the tower were free at the base, the radius of a circle passing through the base of the legs of the tower would expand ½ in. But the legs are fixed at their base by friction and bolts to the masonry. A force is thus set up sufficient to draw each leg inwards to the extent of ½ in.

As the top of the legs is practically fixed also, it is necessary to find what force at half the height of the legs, 82 ft., acting horizontally, would bend the legs ½ in.; this can be calculated, and is ascertained to be 27 tons. A bending moment is produced, increasing the stress on one side of a leg and diminishing the other to the extent of ½ ton per inch, and on the bracing, a tension and compression of ½ ton per square inch; if the legs were braced together these forces would be largely increased.

From these calculations, it appears that so far as wind-pressure alone is concerned, the slope of the legs should be somewhat greater; but for its own weight and for partial bending and temperature, a steeper slope would reduce the bending stresses.

An inclination, therefore, of 1 in 4 gives about the best slope under a combination of the actions. The cost of the tower above the foundations the authors estimate as follows—

1. Steel-work, 10,573 tons at	£290,757
£27. 10s. . . . .	26,000
2. Hotel, landings, &c. . . . .	25,215*
3. Lifts and appliances . . . . .	8,750
4. Electric lighting . . . . .	1,500
5. Lightning precautions, &c. . . . .	2,352,222
Total . . . . .	2,352,222

The price of steel-work includes the supplying, planing, drilling, fitting, and erecting of the whole of the steel-work in the tower, and forms the largest part of the cost.

We are confident the work can be done for the price stated, our views as to the cost of the various items in the above estimate having been confirmed by contractors of large experience in the various departments.

THE VICTORIA HOTEL, MILFORD-ON-SEA HANTS.

This building is now approaching completion, it being intended for a residential Hotel at this new seaside resort of Milford-on-Sea, which should not be confounded with Milford Haven, in Wales, as this place is in Hampshire, four miles west of Lymington, and twelve miles east of Bournemouth.

The walls have, to prevent damp, been built "bollow," of local red bricks, relieved with Bath stone dressings, and the roofs are covered with dark Staffordshire tiles.

The accommodation comprises thirty bed-rooms on the first and second floors; and on the ground floor, dining, drawing, coffee and billiard rooms, also private sitting-rooms; and in the basement extensive cellars.

There are also large lively stables attached and a large refreshment-room for day visitors.

The view from the verandah and balconies of the hotel is very fine, there being a long stretch of gorse as a foreground, and at the distance of four miles looking south the picturesque view of the Needle rocks at the west end of the Isle of Wight; to the east, Hengistbury Head, and to the west Hurst Castle and the Solent.

The architect is Mr. W. Charles Evans, of Milford-on-Sea, and London, and the builders are Messrs. Hasleley Bros., Lymington, Hants.

\* Messrs. Archibald Smith & Stevens ask us to state that a complete scheme of lifts was prepared by them in accordance with the requirements of the designers, and embodying some novel features.

THE LONDON COUNTY COUNCIL.

The ordinary weekly meeting of this Council was held on Tuesday afternoon, Lord Rosebery in the chair.

The Chairman said a few words expressing regret at the death of Lord Magheramorne, the Chairman of the late Metropolitan Board of Works, and it was agreed to send to the family of the deceased an expression of condolence.

*District Surveyors and their Tenure of Office.*—The adjourned report of the Building Act Committee on this subject was now considered. We gave the full text of the report in the *Builder* for June 21, p. 450, so now only repeat the recommendations of the Committee, viz.,—

"1. That no person shall be accepted as a candidate for the appointment of District Surveyor unless he shall have attained twenty-eight years of age, and be under fifty years of age, and that every such candidate shall deliver with his application satisfactory evidence of his age.

"2. That every candidate shall be required to sign a declaration and deliver it with his application that he becomes a candidate, and will accept the appointment if he should be appointed on the following understanding:—(a) That he will personally discharge the duties of his office subject to section 35 of the Metropolitan Building Act, 1855. (b) That he will give his whole time to the duties of his office. (c) That he will not during his continuance in office (except in the discharge of the duties thereof) carry on business as an architect, surveyor, or builder, or directly or indirectly as a partner or otherwise be interested in such business. (d) That he will furnish the Council with information of those cases in his district in which the orders of the Council or the resolutions of the Metropolitan Local Management Acts with regard to the width of streets, or to any building, structure, or erection, or projection therein exceed the general rule of buildings are not complied with. (e) That he will give no date for completion in case a diminution of his income shall at any time hereafter arise. (f) That he will keep his District Office open from Monday to Friday (both inclusive) between the hours of 9.30 a.m. and 5 p.m., and on Saturday from 9.30 a.m. to 2 p.m., and give his personal attendance there daily from 9.30 a.m. to 11 a.m., and (except Saturdays) from 4 to 5 p.m. (g) That he will retire if desired to do so on attaining the age of sixty-five, or at any date subsequent to his attaining that age.

"3. That the aforesaid declaration of the appointed candidate shall on his appointment be entered on the Council's minutes.

"4. That the Districts be re-arranged by the Building Act Committee as opportunities may occur, so that the average of the fees received may in no case amount to less than 500L per annum.

"The Council reserves to itself the exercise of its powers of dismissal, if the District Surveyor so appointed should not act consistently with the understanding above set forth in any of the matters referred to therein, or for other sufficient reasons."

Councillor Hutton, in moving the reception of the report, recapitulated the reasons of the report, and the *Builder* for June 21, p. 450) for the proposed changes, and in support of these reasons quoted some passages from a paper read by Mr. John Slater at the Royal Institute of British Architects a few months ago. Councillor Hutton spoke strongly in deprecation of the system of "devilving" which was usual in connexion with the office of District Surveyor, and contended that such "devilving" was contrary to the Building Act, which he thought clearly contemplated the personal discharge of the duties of the office.

The motion having been adopted, Councillor Arter moved to add at the end of paragraph 1 words excepting from the limits of age therein stated (1) any candidates who had served more than fifteen years in the office of a District Surveyor, or (2) any District Surveyor who sought to be transferred from one District to another.

This amendment was seconded by Councillor Hughes, but was lost on being put. Clause 1 of the Committee's recommendation was then agreed to, and sub-clause *a* of clause 2.

Councillor R. W. Edis moved the following amendment to sub-clause *c* of the second recommendation, viz.,—

"That during the continuance in office he be prohibited from carrying on the business of an architect, surveyor, or builder, or be not concerned, directly or indirectly, as a partner or otherwise, in a business within his own district."

He said he thought this would meet all the requirements of the case, and deprecated the other changes proposed by the Committee. In support of his contention that the changes were undesirable and inexpedient he read the following letters:—

"London County Council, Spring Gardens, S.W. October 22, 1889.

SIR,—The Council has under its consideration the general question of the appointment of District Surveyors, and in particular the question whether they should in nature be appointed at a fixed salary of a substantial amount, in order that they may devote the whole of their time to the duties of their office and not engage in private practice. The present mode of payment of the District Surveyors, as you are aware, by fees, and no restriction exists as to private practice except in their own districts.

The committee to which the subject has been referred would be obliged if you would favour them with the opinion of each district upon these questions, and with any other observations on the subject which may occur to them.

I am desired by the Chairman of the Committee to tender to you the views which the following views appeared to be generally approved by the Committee provided any change is made in the appointment of District Surveyors.

1. The elevation of the office of District Surveyor is desired.

2. The examination at present adopted appears satisfactory.

3. The change in the character of the appointment would probably be made only as vacancies occur.

4. The enlargement of the districts would most likely result.—I am, Sir, your obedient servant.

(Signed) H. DE LA HOOKE, Clerk of the Council.

W. H. White, Esq., Secretary, Royal Institute of British Architects, 4, Conduit-street, W.

"The Royal Institute of British Architects, No. 3, Conduit-street, Hanover-square, London W.

November 13, 1889.

SIR.—We have the honour to inform you that your letter of the 22nd ultimo, on the subject of the appointment of District Surveyors in London, was duly laid before the Council of the Royal Institute of British Architects, and that careful consideration has been given to the points upon which they understand that the London County Council desire from them an expression of opinion.

The conditions under which the District Surveyor is appointed, and the nature of the duties imposed upon him, render it undesirable that he should be paid by a fixed salary, and required to devote his whole time to the office, or be precluded from engaging in private practice, except for buildings within his own district. The interests of the public in this matter are clearly best served by being in charge of a skilled practitioner acquainted with the current improvements in building methods and employment of materials, rather than in that of an official who necessarily would have less opportunity of acquiring such knowledge, and who has no practical experience of the difficulties which arise from time to time—difficulties which are now often solved by the District Surveyor from the results of experience gained in his private practice.

The defects that may now exist would not be unrelieved, nor would the deficiencies of controlling power peculiar to the office, as at present constituted, be removed by any mere variation in the conditions under which the District Surveyor is appointed; and, as you are good enough to state that the Committee of the County Council are desirous of receiving further observations on the subject from the Council of the Royal Institute of British Architects, we are to add that, in your opinion, the powers conferred on the District Surveyor by the Metropolitan Building Act and the by-laws made thereunder are insufficient to secure good building, or such compliance with the essential principles of construction and sanitation as is necessary to eradicate evils long the subject of public condemnation.

The Metropolitan Building Act, 1855, which was primarily intended to avert danger from fire, to communicate from one building to another, does not meet the necessities of the present day; nor does it secure, by the limited authority it gives to the District Surveyor, the erection of well-ventilated dwellings. In many most important particulars of construction he is absolutely powerless, while in others his authority is so limited that it can hardly be exercised to advantage.

Should the legislature, by extending the scope of the Metropolitan Building Act and other Acts relating to constructions, as well as of other local building Acts, confer more complete powers upon the District Surveyor in London, and other building officers under local authorities, with a view to the thorough control of buildings, the Royal Institute of British Architects would be willing to develop and extend the statutory examinations it now holds, and thus secure an adequate examination of the part of such officers with those details of professional knowledge which are essential to the satisfactory execution of their important duties.

Great and careful attention has been given for many years to the examination of persons desirous of qualifying for candidature as District Surveyors in London, and our Council are gratified to learn from your letter that, in the opinion of the London County Council, the examination, as at present conducted, appears to them satisfactory.—We remain, Sir, your obedient servants.

(Signed) ASTON WEBB, Hon. Secretary, WILLIAM H. WHITE, Secretary, The Clerk, London County Council.

Councillor Marsland seconded the amendment, which after a long discussion was lost, and the other recommendations were agreed to without discussion.

**The Strand Improvement Bill.**—The Parliamentary Committee presented the following report with reference to the London Streets (Strand Improvement) Bill, 1890:—"This Bill proposed to provide for an important metropolitan improvement in the widening of the Strand between the churches of St. Mary-le-Strand and St. Clement Danes. For that purpose the Bill proposed to carry out the improvement according to the plans and sections shown on the deposited plans, which involved the removal of the houses in the block of buildings between Holywell-street and the Strand and other houses fronting the Strand, and to throw their sites into the public road, making a wide street at this point. The limits of deviation in the deposited plans included the property between Wych-street and the Strand and other property in the neighbour-

hood, and the Bill gave to the Council the usual powers to take the property within the limits of deviation by compulsion. The limits of deviation were not fixed with reference to recoupment, but were confined to such extent as was absolutely necessary to carry out the works. The Bill has been passed by the Select Committee of the House of Commons (to which it was referred on March 18 last), consisting of nine members, five nominated by the House and four by the Committee of Selection, and the Committee in reporting to the House made, and were invited to make, no alteration in the clauses relating to the execution of the works, according to the deposited plans and limits of deviation. Those clauses leave the Committee in the same state as submitted by the Council, and with the same modifications proposed by the Council with reference to certain particular large premises comprising printing works having access to the Strand, and the access to the Opera Comique Theatre.

In accordance with the resolutions of the Council the Bill contained two important clauses of principle in reference to the cost of carrying the works into execution.

The first related to the principle which the Royal Commission on the Housing of the Working Classes in 1885, defined as follows:—

"That rates should be levied in a higher measure upon the property which derives a distinct and direct advantage from an improvement, instead of upon the community generally, who have only the advantage of the general amelioration in the health of the district. American legislation has adopted the principle that where public improvements are effected by the local authority, they ought to be able to bring in aid of the cost of the improvement any additional value conferred on the adjoining property by reason of the improvement."

The first principle was recognised in the Chairman's draft report, paragraphs 8 and 9, page xi, but the majority of the Committee expunged these paragraphs, and the betterment provisions have been struck out of the Bill.

Secondly, it was proposed by the 12th section of the Bill to incorporate into this scheme the provisions in Cross's Acts applicable to the purchase of lands for artisans' dwellings, viz.:—

"In settling any question of disputed purchase-money or compensation under this Act, the arbitrator, umpire, or jury determining the amount of purchase-money or compensation shall base the same upon what in their opinion would have been the fair market value of the lands or premises if the improvement had not been contemplated, the regard being had to the nature and condition of the property, and the probable duration of the buildings in their then state, and to the state of repair thereof, and all circumstances affecting such value. But no sum of money shall be awarded for or in respect of any improvement, alteration, or building which in the opinion of the arbitrator, arbitrators, umpire, or jury shall have been made or created with a view to obtaining or increasing compensation under this Act."

On the second principle the Special Committee have modified the clause as to the method of assessing compensation, and settled it as follows:—

"In settling any question of disputed purchase-money or compensation under this Act, the arbitrator, arbitrators, umpire, or jury, determining the amount of purchase-money or compensation, shall not award any sum of money for or in respect of any improvement, alteration, or building which, in the opinion of the arbitrator, arbitrators, umpire, or jury, shall have been made or created with a view to obtaining or increasing compensation under this Act."

The Select Committee have made a special report, a copy of which and of the proceedings of the Committee will be forwarded to each member of the Council.

We desire to have the instructions of the Council, as to the further prosecution of the Bill, and we recommend,—

"That the Bill, as reported to the House of Commons be proceeded with."

Councillor Costelloe moved as an amendment:—

"That it be an instruction to the Committee that the Bill be no further proceeded with this session."

This was seconded by Councillor Leon, and, after a long discussion, was carried, on a division, by 49 to 39, and the Council shortly afterwards adjourned.

**THE "DEVIL" DISINTEGRATOR.**—The Hardy Patent Pick Company, of Sheffield, have, we hear, obtained the first prize for disintegrators in the Royal Agricultural Society's special competition. It is claimed for the "Devil" disintegrator, grinder, and mixer, that it will grind to powder, granulate, or shred any material,—animal, vegetable, or mineral,—at one operation. It is capable of grinding cement-clinker, clay, ashes, mortar, paint, glass, broken pottery, &c.

ARCHEOLOGICAL SOCIETIES.

**BRITISH ARCHEOLOGICAL ASSOCIATION.**—The forty-seventh congress will begin at Oxford on Monday next, July 7. The arrangements for holding the meeting have been sadly interfered with by the lamented death of Lord Carnarvon, the elected President for the year, and efforts were made to postpone the gathering. It was found, however, that it was impossible to do so, owing to the issue of tickets, the entering into of contracts, and so forth. The President of the past year, the Earl of Winchelsea and Nottingham, has kindly promised to act again for the meeting and for the ensuing year, and he will read the inaugural address. The proceedings will be opened at 1.30 on Monday at the Town-hall, where the party will be received by the Mayor and Corporation. Afterwards, many of the University buildings will be visited, including the Bodleian Library, and the Ashmolean Museum. Tuesday will be devoted to a further survey of the antiquities of Oxford; Wednesday to visits to Broughton Castle, Bloxam, &c.; and during the week other objects of interest will be inspected in the city and its locality.

**LANCASHIRE AND CHESHIRE ANTIQUARIAN SOCIETY.**—On Saturday afternoon members of the Lancashire and Cheshire Antiquarian Society visited Oldham, and, conducted by Mr. Samuel Andrew, inspected Werneth Old Hall, now the property of Alderman S. R. Platt, and formerly the seat of the lord of the manor of Oldham; Chamber Hall; Cash Gate Cottage, a specimen of the ancient habitation of the "common people"; and Hathershaw Hall, for many generations the home of the Sandifords. Mr. Samuel Andrew read an interesting paper on archaeological Oldham.

**WORCESTER ARCHITECTURAL AND ARCHEOLOGICAL SOCIETY.**—The first excursion for the season of this society was held on Tuesday in the last week, when some of the members and friends took train to Birmingham, and inspected Aston Church and Hall, where descriptive papers were read by Mr. Noske, after which the party proceeded to the Colonnade Hotel for luncheon. On the return journey a halt was made at Kings Norton, where the company inspected the old church, the ancient school-house, and the seventeenth-century parochial library, upon all of which papers were read by Mr. Salt-Brassington, of Mosley.

**SUFFOLK INSTITUTE OF ARCHEOLOGY.**—Last week the members of the Suffolk Institute of Archeology and Natural History made an excursion to Dunwich and the neighbourhood between that old town and Saxmundham. Besides Dunwich, they also visited Leiston Abbey, which was described by Mr. W. H. St. John Hope, Theberton Church, and Westleton Church. A long report of the outing appears in the *Suffolk Chronicle* for the 28th of June.

Books.

*Encyclopédie de l'Architecture et de la Construction.* Directeur, P. PLANAT. Vol. III. 2me fascicule. Paris: Dejean et Cie.

 GREAT proportion of the last published part of M. Planat's Encyclopædia is occupied by his own article on the very large subject of "Construction," which would make a respectable separate essay in itself. No one who studies the article will regret the length of it; it is probably the most valuable article that has yet appeared in the Encyclopædia. M. Planat commences by a little philosophising on the different conditions of art and construction; art undergoes transformations which are not necessarily progress; construction on the other hand is essentially progressive. The different materials used in construction are then briefly classified, and the special form of resistance to external force which they supply. The article then passes into review, historically, the forms of construction among various peoples, accompanied by a large number of illustrative diagrams. Greek construction and Gothic vaulting are very well and fully treated, considering the limits imposed in an encyclopædia even on a large scale; the writer is not, like most of his contributors, ignorant of English work, but supplies various examples from it. Timber roofs are treated of and illustrated at some length. Among the illustrations to the article are two very useful double sheets of small section of various vaulted and domed build-

ings of the world, drawn to scale for the sake of comparison. Iron construction also has full attention and illustration, in proportion to the other branches of the article, but the author sums up with a strongly expressed disapproval of the modern habit (perhaps more prevalent in France than even in England) of falling back on iron ties and supports to get over difficulties of construction. "Aujourd'hui, la moindre difficulté se présente, on passe un double filet, comme disent les serruriers, on glisse un calson, un poitrail, une forte poutre. Avec le for cela tient toujours," dit la sentence moderne; et tout est dit. Cette tendance, chaque jour plus marquée, nous paraît regrettable; avec de pareils procédés, il n'y a plus d'art véritable." The italics are ours; the same thing has often been said in this journal, and we are glad to find M. Planat in accord with us. The whole article is an admirable summary of the subject, with some special points of its own (e.g., the remarks on the statics of the flying buttress), and ought to be put in the catalogue of books for students entering for the preliminary examination of the Institute.

"Cloître," "Colonne," and "Commemoratif," are the other most important articles in the volume; the latter deals with commemorative architecture (monuments) and is illustrated by a number of engravings of various typical forms of monument.

*The Railways of Scotland, their present position; with a glance at their past and a forecast of their future.* By W. M. ACWORTH. London: John Murray. 1890.

MR. ACWORTH'S work on "the Railways of England" has been such a success that it is not surprising that a kind of *encore* to it should be demanded, though it is not very easy to see why the Railways of Scotland should claim a separate treatment as a different problem. The reasons that might be urged are, no doubt, the rather exceptional nature of the ground over which some of them are carried, and the fact that some of them may be regarded rather as holiday lines than railways for ordinary business traffic. However, the book, of much smaller dimensions than its predecessor, is as readable in its way, and contains the same evidence of special acquaintance with the subject. A good deal of the work is occupied with the Forth Bridge and its possible results on northern railway traffic. Mr. Acworth calls attention to the fact that the speed of trains across the Tay Bridge is at present limited to 25 miles an hour, and asks pertinently whether this limitation is to be perpetual, whether a similar limitation will be thought necessary in regard to the Forth Bridge, and if so, whether the gain over the whole journey can be as great as was promised and expected. We have seen no record of the speed at which trains are run over the Forth Bridge, but we should be prepared to find that no reduction of speed would be necessary. The author remarks that in one respect Scotland is in advance of England, two of the leading Companies having begun to experiment on heating their carriages with a less primitive method than the English hot-water tin. One of these is a utilisation of waste heat from the roof-lumps of the carriages, which, by the aid of a small boiler placed over each lamp, and connected with a reservoir beneath the seat of the carriage, sets up a circulating system, the hot water being driven down into the reservoir and the cold rising to supply its place. If the action is really kept up in this way, it is, of course, not on the same system as that of an ordinary hot water circulation, which is actuated by the tendency of heated particles of water to rise above the colder ones. The action of the circulation described must be a purely mechanical one; the hot water boils over and drives the rest before it. But we should rather doubt the efficiency of the system.

Travellers "going North" for the autumn will find a practical interest in the book, or should do so. It is a good book for reading on a Scotch railway; instruction and amusement combined.

*Practical Perspective:* By A. DRAUGHTSMAN. Hammersmith: Ferguson & Co.

THIS "book" consists of three large folded sheets of diagrams, written all over with directions for the learner. One sheet contains a number of small problems; another the lines and setting out for a perspective of a rather elaborately-gabled house, and the third shows

the same house developed into an artistic drawing. It is well done, and as a practical exemplification of the subject it should be of use to beginners. A case should be supplied for the sheets.

*Knight's New Perspective Guide.* By J. P. KNIGHT. London: Simpkin, Marshall, & Co.; Bristol: John Wright & Co.

A SMALL shilling book containing practical diagrams of various problems in perspective, for beginners only. Directions are given on the facing page of each plate. These are very clearly worded; but there are one or two mistakes in principle: about 35 degrees, not 60, is the average angle that can be advantageously included in a perspective drawing; and to use French curves to draw in the various portions of a circle in perspective is very bad advice. French curves, for this kind of work, at all events, are a delusion and a snare; the curves in them will never entirely fit the case; no good draughtsman would use them for the purpose, and to one will ever become a good draughtsman by using them. The eye and hand can alone supply the delicate gradations required in perspective curves, and must be trained to do so.

## Correspondence.

To the Editor of THE BUILDER.

### THE ARCHITECTURAL ASSOCIATION.

SIR,—I am rather surprised at the articles which have appeared in the *Builder* relative to the suggested alteration in the constitution of the Architectural Association in which certain members are characterised as "the opposition." I think it only fair to those gentlemen who hold the same views as myself to say that, whatever may be our individual opinions as to the scheme suggested by the Education Committee, we are very desirous that no serious alteration shall take place in the objects and working of the Association, without the opportunity being afforded to all members to express their opinion thereon.

After so many years of membership and work in connexion with the Association, during which there has been a gradual increase in the number of members and attendance at the classes, lectures, &c., I claim at least as much interest in its welfare as those who are comparatively young in its service, and naturally I am jealous lest an untried, and I believe not a popular scheme, should upset or even check its admitted usefulness and success.

If a majority of the members, or I would even say of those under twenty-five years of age (who may be assumed to take the most lively interest in the Association at the present time), should express themselves in favour of the proposed alteration, I would readily accept the decision.

It has always been the pride of the Association that by its constitution it could adapt itself to the requirements of the day, and I can see no reason why the desires of the Education Committee cannot be carried out without any alteration of the rules as is the case with the courses of lectures and classes which have been formed from time to time.

I trust that, although there may be differences of opinion amongst the members, each may give credit to the other for the best motives to promote the welfare of the Association, and earnestly hope that it may continue free from cliques and parties which it has been the work of years to prevent, as "a house divided against itself cannot stand."

July 2, 1890.

J. DOUGLASS MATHEWS.

SIR,—In your editorial note last week, referring to the recent proceedings at the Association, you speak of certain members "who have carried on so determined an opposition to the scheme of the Committee." As a matter of fact, there has been very little opposition at all, and I am afraid that which your reports have been derived, in the absence of your own reporter, has somewhat involved you.

A number of members for some time past have been of opinion that votes on important changes in rules should be taken by means of papers sent to every member. The changes now proposed are very radical and it is highly desirable that they should not be passed by the votes of a mere handful of members at a meeting held in the vacation. Accordingly a proposal was made at the adjourned ordinary meeting on June 13, in a perfectly constitutional manner and after notice had been given to the President, to alter the rule relating to voting,

and it was distinctly stated by the mover of the alteration that it was not intended in any way to express any opinion for or against the new scheme. If the proposal had been accepted by the Committee the papers might have been issued at once for voting on their scheme; but so much opposition was shown, so much odium thrown on those who had signed the requisition in favour of voting by papers (who were told that if their resolution were carried it would result in rescinding everything that had been done, an argument that did not say much for the popularity of the scheme), and so little inclination to reasonably discuss the proposal and come to a speedy decision that the only thing that could be done was to adjourn everything to next session. It is clearly the Committee who are answerable for the delay, not those who want to vote by papers.

W. J. H. LEVERTON.

\*\* We believe the account of the proceedings at the last meeting was correct as to facts. Our opinion as to the mistaken nature of the opposition to a very spirited scheme of progress was formed long before the holding of the last two meetings. Our own reporter was absent from these because it is not usual to report purely domestic matters such as the revision of rules or by-laws of societies. We had previously reported at very considerable length two meetings of the Association at which the points at issue were fully discussed.

### PUBLIC SURVEYORSHIPS.

SIR,—I have noticed lately a prevalent and growing disposition on the part of local authorities, when advertising for a surveyor, to make a compulsory condition that candidates should submit a large number of printed testimonials with their application.

I emphatically protest against this practice, which is most unreasonable, and should be discouraged by all possible means, as it is a serious source of expense to competitors, and debars many from entering the lists.

Only in your last issue a public appointment was verified, the printed matter for which will cost each competitor, say, at the least a guinea, thus showing the entirely unnecessary and heavy expense to which applicants are put, as, of course, only one candidate can be successful.

If printed testimonials are required for the convenience of individual members of authorities, I think the expense should be borne by them, and not by the candidates. SURVEYOR.

\*\* We have received another letter on the same subject and in the same strain. We fear our correspondent's proposal would only lead to multiplying the number of inefficient candidates in such cases.

### WOODEN "WATER-PIPES."

SIR,—Having noticed what has lately appeared in the *Builder* respecting the above, I am reminded of the same kind of contrivance which was quite common in my native place (a large village in Herts) sixty years ago; and I should not be surprised if some are still in existence. The principal water-supply was obtained from wells, of which there were a large number, by means of pumps; and with various exceptions the pipes for these pumps were composed of "elm tree," with a bore, as near as I can remember, of about 3 in. or 3½ in., and joined together exactly as shown in the diagram, page 455 of the *Builder* for June 21; "the ends of the trees were roughly hewn square, the upper section shaped to form the framework of the pump."

I have occasionally, when a boy, seen the operation of boring a tree going on in the builder's yard, —presumably to replace one that had become decayed. The tool for boring was of the same form and made as an ordinary carpenter's auger, enlarged to the size and length required, and took two or three men to work it, the tree being elevated horizontally upon trestles, and a framework of corresponding height to support the tool, which worked in wood bearings, in a similar manner to machine shafting, to keep it in position.

J. WOOLLEY.

DISCOVERIES AT SELBY ABBEY.—The *Leeds Mercury* of June 27 reports that within the past few days two most interesting discoveries have been made in connexion with the restoration of the south wall. The first was the discovery of a part of an old gravestone bearing the date of 1716. "This clearly shows," says the *Mercury*, "that part of the church which was destroyed by the fall of the tower in 1490 was rebuilt towards the end of the last century, and not in 1702, as was generally supposed. The tombstone bears the name 'Merebeck.' The later discovery, however, is still more interesting. Certain foundations have been discovered, indicating the existence of an apsidal chapel extending eastward from the old Norman south transept. The work on this part of the restoration has been suspended for a few days, until Mr. Scott, the architect, is able to inspect the foundations. There are indications of the Norman, the Decorated, the Perpendicular, and modern work in the foundations of the south wall, the present restoration being evidently the fifth that has taken place in that particular portion of the ancient edifice."

The Student's Column.

HOT-WATER SUPPLY FOR BATHS, LAVATORIES, AND OTHER DOMESTIC AND GENERAL PURPOSES.—I.

PREFATORY.

**S**UPPLY of hot water throughout a house is no longer considered a luxury, but merely a common comfort, a necessary, and expected as a matter of course by the majority of tenants of property at as low a rental as 30*l*.

This subject, however, is, of the various trades called into request in house construction, perhaps one of the most difficult for professional men to obtain reliable information upon, owing to several causes; the chief difficulty being that, as little information has been written or published on this work, knowledge can only be gained by actual experience.

The number of failures that occur in this work is greatly in excess of those in most other trades, by reason of its success or non-success (except in simple every-day jobs) being greatly dependent upon an acquaintance with natural laws, and it is unfortunately obvious that the majority of our mechanics have little knowledge in this direction.

CIRCULATION.

It is but a comparatively short time ago that an attempt to utilise hot water for heating purposes was made by connecting a pipe or series of single pipes with a boiler, the hot water (from the boiler) being allowed to run into the pipes, and this was found to be a success in a limited way, as the water did not appear to grow cold as might have been anticipated.

The good results obtained were due to the fact that water will circulate in a single pipe, as any one sufficiently interested can quickly determine by experiment, and it will be found that if the pipe be carried in a vertical direction from the boiler there will (supposing heat to be applied) at once set in two distinct movements in the water, that in the centre ascending, and that nearest the surface descending, or if the pipe be carried in a slanting direction the water nearest the top of the pipe will be found travelling from the boiler, and that at the bottom of the pipe towards the boiler.

Possibly when this attempt was first made it was expected that the heat generated in the boiler would be transferred to and along the water in the pipes by conduction, as would be rightly anticipated if heat were applied to one end of a rod of metal; but as water is an extremely poor conductor of heat the result obtained in the transference of heat from the boiler throughout the length of pipe or pipes was soon ascertained to be from another cause, viz., convection, and it is with this property that water possesses that we have to deal, as without it a hot-water circulating apparatus could not exist.

The single pipe system was but short-lived, it being almost immediately ascertained that by providing two pipes and connecting them at the extremity a more rapid and efficient circulation resulted, as it did not necessitate a flow of water in two directions within one pipe, and it is from this early arrangement of two pipes that all our systems of hot-water circulation for heating and for domestic supply purposes have been developed.

Water is composed of two gases which exist in chemical combination (H<sup>2</sup>O) forming molecules, and water, therefore, consists of a vast number of extremely minute particles, we might say like a heap of sand, but differing from this substance by the fact that the particles have the property of gliding over, under, or around one another (when agitated) practically without the least friction or resistance. Of course water differs from sand also in the fact that we could not have a heap of it, as water, unless confined, instantly distributes itself in all directions; but the comparison is used to make it understood that water is composed of particles or grains (molecules).

When a boiler or vessel is filled with cold water and left undisturbed the particles may be considered to be quite stationary, but immediately heat is applied below the particles nearest the heated surface become warm, and they, like all other substances, are expanded by the heat, and as an expanded particle does not gain in weight as well as size it naturally is made lighter, bulk for bulk, than its fellows.

Immediately, therefore, the particles nearest the heated surface become expanded they are caused to rise by the superior weight of the cold particles surrounding them, and the cold particles that then come in contact with the heated surface become warmed and expanded

FIG 1

and rise also, and so the action continues; so long as heat is applied a continuous stream of heated particles rising and a continuous stream of colder particles replacing them, and this is the process of convection.

When the fire is applied to a boiler having a system of circulating pipes in connection with it, the heated particles rise to the top of the boiler, and finding an opening (pipe) there, con-

FIG 2

time rising up within it until they reach the highest point in the circulating apparatus, above which they cannot rise, and it can be readily understood that for every particle that travels up the flow pipe there must be a corresponding particle come down the return pipe to replace it; the action is the same as in the boiler alone; a stream of heated and lightened particles rising until it is impossible for them to rise further, and a corresponding stream of colder particles travelling downwards to replace

the heated ones, until they come within the heated area, when they are expanded, and at once reverse their direction, and follow their predecessors. This circulation proceeds at a much higher speed than is commonly imagined; when first started the heated particles travel about 12 in. per second, and afterwards, when the water is well heated, at about double this rate.

The earliest description of pipe apparatus to supply hot water for draw-off purposes above the level of the boiler was merely a large boiler in the kitchen range, a pipe from the house cistern down to the boiler, and a pipe from the boiler to above the level of the house cistern (Fig. 2); from this latter pipe the draw-off services were taken, and it will be readily understood that (water always finding its own level) a draw-off service could be connected and hot water obtained at any point below the house cistern.

There were several insurmountable objections to this arrangement; in the first place, a very large boiler was necessary, as no tank could be used, and the largest boiler in an old open range could hardly exceed sixteen gallons capacity, a very insufficient quantity for a store of hot water, as can be judged by the fact that a tank of such small capacity is now never used for even the smallest of hot-water supply purposes. A second objection was that with a long single service-pipe a great quantity of cold water had to be drawn off before hot was obtained, and there were several other objections; but, no doubt, amongst the chief reasons for the discontinuance of this system was the fact that these large boilers were very costly, and as, with the best provision, they were very difficult to clean out, they frequently became fractured, creating no small annoyance and expense, and as soon as it was understood that a smaller boiler and smaller fire (with the addition of a tank) would provide a much more reliable and abundant supply of hot water, the old system naturally fell into disuse.

SURVEYORSHIPS.

**CHELMSFORD.**—At a meeting of the Chelmsford Town Council, on June 25, the Special Purposes Committee recommended that the resignation of Mr. C. Pertwee, the Borough Surveyor, already mentioned in the *Builder*, be accepted, the resignation to take effect on the day on which the new Surveyor enters upon his duties. According to the *Essex County Chronicle*, they also unanimously recommended the Council to appoint a Surveyor who should devote his whole time to the duties of his office and not be engaged in private practice, and that his salary be fixed at 250*l*. per annum in addition to the salary paid to him by the Joint Sewerage Committee. They also recommended that an office be provided for him. They thought it was highly desirable that the newly-appointed Surveyor should be also the chief sanitary officer of the borough, and that the inspector of nuisances report to him at once all matters requiring attention in respect of which no order from the Council is necessary to authorise immediate action.—In reply to Mr. Maskell, the Mayor said that the salary of the Surveyor for the Joint Sewerage Committee was 20*l*. The report was adopted.

**KENT.**—On the 27th ult. a number of the friends of Mr. A. F. Ginn, late Surveyor of Highways and Sanitary Inspector to the Chelmsford Rural Sanitary Authority, met at Chelmsford, to present him with a handsome gold watch, on his leaving the district for an appointment as District Surveyor to the Kent County Council.

OBITUARY.

**THE EARL OF CARNARVON** died on Saturday last. He was for seven years (till 1855) President of the Society of Antiquaries, and a member of the Historical MSS. Commission in 1852. He had intended to preside over the meeting of the British Archaeological Association at Oxford next week.

**LORD MAGHERAMORNE**, who will be better remembered as Sir James McGarel-Hogg, Chairman for many years of the late Metropolitan Board of Works, died on Sunday last.

**SIR JAMES GOWANS.**—Sir James Gowans, Dean of Guild of Edinburgh, died last week, at the age of 69 years. Sir James Gowans was a son of the late Walter Gowans, of Gowan Bank, Linlithgowshire, and received his education principally at Hamilton-place Academy, Edinburgh. Sir James was educated for the profession of an architect, but his attention was diverted from that course by the great opening for energy consequent upon the call for workers in the construction of railways. In the capacity of a railway engineer and contractor he was engaged in carrying out some of the most extensive and important railways in Scotland, the most difficult of which to deal with was the 35 miles of the Highland Railway through

mountainous localities. Edinburgh has never had a more able and energetic Deane than Sir James Gowans. He displayed great firmness in resisting the influences which are brought to bear upon the holder of that office by interested parties, and as Chairman of the Health Committee of the Town Council he was instrumental in carrying out several sanitary improvements in the city. He was knighted in 1856 in connexion with his work in promoting the Edinburgh Exhibition of that year.

SIR WASHINGTON W. SMYTH, F.R.S.—Speaking of the death of Sir Washington Smyth, F.R.S., the *Mining Journal* says:—Cornwall has lost another thoroughly familiar face by the death of Sir Washington W. Smyth, so long the chief officer of the Crown Mines in the kingdom. He was one of the last survivors among the younger group of the great hand of pioneer geologists and mineralogists who made the name of England famous, combining practice with science to the highest degree.

MR. J. L. RANDAL, Architect to the Shrewsbury School Board, died last week, after a long illness.

MR. W. H. STEUBS, C.E.—The death is announced at Blackpool of Mr. W. H. Stubbs, M.Inst.C.E., formerly Engineer of the North Staffordshire Railway, but recently Chief Engineer of the Manchester, Sheffield, and Lincolnshire Railway Company.

#### GENERAL BUILDING NEWS.

THE CHURCH HOUSE, WESTMINSTER.—At the annual general meeting of the Corporation of the Church House, held last week, a resolution affirming the desirability of immediately commencing the permanent building for the Church House was adopted. The Bishop of London, in seconding the motion, said that the Corporation had already 9,200, which they intend to devote to building schools. They proposed to build the great hall for meetings, and rooms for the Houses of Convocation and the House of Laymen, besides other offices, and therefore they were making a real beginning of the actual working part of the Church House. They needed altogether 35,000.

MIDLAND RAILWAY GOODS DEPOTS, BIRMINGHAM.—The new goods depot which is slowly transforming the Suffolk and Severn Street-square from the most disreputable district of Birmingham into the busiest and most commercial (according to the *Birmingham Gazette*) only one of several signs that the Midland Railway Company have determined to reorganise and develop their midland counties traffic. Something like 150,000, is to be spent in improving the Lawley-street depot; a loop line will almost immediately be constructed between the main, running through King's Heath, and the Suburban, running to King's Norton; and the engineers of the Company are now devising plans for bringing the canal at Worcester Wharf into direct touch with the railway service by means of a huge hydraulic lift, which will be able to carry loaded trucks from the line level to the canal bank, and so render transfer from boat to truck and truck to boat a matter of minutes rather than hours. The basement of the Suffolk-street depot has been nearly completed by the contractor, Mr. Firbank, who will soon, it is said, put a large number of masons to work on the superstructure.

BOROUGH-ROAD POLYTECHNIC INSTITUTE.—The executive of the South London Polytechnic Institutes have obtained possession of the buildings in the Borough-road formerly occupied by the British and Foreign School Society, which will be altered and transformed into the Borough-road Polytechnic Institute. Mr. Rowland Plunbe, the architect appointed to carry out the work at the latter Institute, is now preparing the necessary working drawings.

CHAPTER-HOUSE, ST. MARY'S CATHEDRAL, EDINBURGH.—A provision was made by the late Mr. Hugh J. Rollo, Writer to the Signet, in his settlement for the completion of the Chapter-House of St. Mary's Cathedral, Edinburgh, and Mr. J. Oldrid Scott has been preparing plans for it. The building is to be square on plan, but with an octagonal upper stage, and will have a groined vaulting springing from a central pier of polished granite. The cost of the work will be about 5,000. Messrs. Morgan & Sons, of Glasgow, are the builders.

CAMDEN PARK ESTATE, CHISLEHURST.—We are informed that Camden-place and Park, Chislehurst, the late residence of the Empress Eugénie, has been purchased by W. Willeit, builder, of London and Brighton, who proposes to develop it as a building estate.

PROPOSED NEW POST OFFICE FOR LIVERPOOL.—On Thursday in last week a deputation, comprising the Mayor of Liverpool, several local members of Parliament, and members of the City Council, waited upon the Postmaster-General to lay before him the inadequacy of the present accommodation at the Liverpool General Post Office, and to urge that steps should be taken to acquire a site in Victoria-street. Mr. Baikes, the Postmaster-General, said a site had been offered in Lincolns-street, but he promised to consider the views of the deputation.

THE CHAPTER-HOUSE, DURHAM CATHEDRAL.—Dr. Lake, Dean of Durham, appeals for funds for the complete restoration of the Chapter-house of the Cathedral of Durham, as a memorial to the late Bishop Lightfoot.

THE PRIORY CHURCH, LEOMINSTER.—The western tower of the grand Priory Church at Leominster, which has been in a dangerous condition for some considerable time, is to be repaired at once. The architects, Messrs. Kempton & Fowler, of Leamford, have in their work a most important and responsible commission, for the construction, as described in their elaborate report to the Committee, is of a most unusual character, and the dilapidations are of long standing.

PUBLIC BUILDINGS FOR SOUTH STOCKTON.—At a special meeting of the South Stockton Local Board, held on the 25th ult., the Board accepted the tender of Mr. W. C. Atkinson, of Stockton, for the erection of new Public Offices for the Board, at the sum of 3,327*l.* Mr. J. M. Garry, of West Hartlepool, is the architect.

CHURCH OF ST. PAUL, LONGRIDGE.—The new Church of St. Paul, Longridge, near Preston, was opened on Thursday last. The church has been built at a cost of over 8,000*l.* from the designs of Mr. Ewan Christian, architect to the Ecclesiastical Commissioners.

ROYAL HOTEL, CARDIFF.—It has been resolved to considerably enlarge this hotel, from plans prepared by Mr. J. P. Jones, architect, Cardiff. The contract for the ironwork has been let to Mr. Archibald D. Dawney, of London. The work is estimated to cost 25,000*l.* of which 19,400*l.* is the amount of the builder's contract, the builders being Messrs. C. Sheppard & Son, of Cardiff. The carving will be executed by Mr. Wormalight, of Cardiff. The adamant mosaic floors will be supplied by Messrs. J. & H. Patteson, of Oxford and Manchester.

BOARD SCHOOLS, BARKING.—At a recent meeting of the Barking School Board the General Management Committee reported that Mr. C. J. Dawson had presented preliminary designs for the new schools. The committee recommended that schools be erected to provide for an additional 350 children, making in all 1,350. The report was adopted, and the architect was requested to prepare the necessary plans for the Education Department.

UNITARIAN CHAPEL, DURHAMFIELD.—The Old Chapel congregation (Unitarian), Durhamfield, having just celebrated their jubilee year, have determined to memorialise the event by spending the sum of 2,000*l.* on internal and external improvements. A new west end will be added to the chapel in order to complete the original design.

NEW SPA-ROOM, &c., BUXTON, DERBYSHIRE.—At the fortnightly meeting of the Buxton Local Board, on the 27th ult., Mr. C. P. Barnard reported the result of the interview with Mr. G. Drewry, the Duke of Devonshire's agent, as to the erection of a new Spa-room, the providing of a cemetery, and the opening-out of a new road from Dale-terrace, in Higher Buxton, to Ashwood Dale. The Spa-room question, the Chairman said, was decided at once as far as Mr. Drewry was concerned. Plans were now in the hands of Mr. Curry, the Duke's architectural adviser, and, if he was satisfied as to the site, the question would no doubt be settled.

PRESBYTERIAN CHURCH, WIMLEDDON.—The memorial stone of this new church was laid on June 21 by Mr. Samuel Smith, M.P. The cost of the building will be 5,000.

BEALBY CHURCH, LINCOLNSHIRE.—The parish church of the village of Bealby, situated on the north wolds of the County of Lincoln, has just had its church restored, and the opening services took place on the 1st inst., the Lord Bishop of the Diocese preaching on the occasion. The church consists of a nave chancel, vestry on the south side, and south porch; the old nave arcades, of three arches on each side, and of early character, have been rebuilt, and form a good feature internally. Some old fragments of fourteenth century character found in the walls induced the architect to adopt the style of that period for his work, and these have been rebuilt in the walls; the roofs are of the interlaced type, of solid construction, boarded, and left unstained; the fittings are of deal, and varnished; the old seventeenth century pulpit has been retained and restored; the old tower arch is again doing duty, and has a three-light window over it, the west gable being finished with a well-designed bell gable with spiral terminal. The old west tower of Norman work was found buried under a mound of earth 6 ft. high, and on the removal of this the two lower courses were found in good condition; the tower had evidently been burned down. The architect is Mr. James Fowler, of Leeds, and the work has been done by Mr. C. Baines, of Newark, and Mr. West, of Bealby. The east window, of three lights, with fine flowing tracery, has been filled with stained glass representing the Ascension.

SOCIETY OF ARTS.—The annual *congregations* of the Society of Arts was held on the 27th ult., at the Natural History Museum, South Kensington. There was a very large attendance, the number of guests being estimated at between three and four thousand. They were received in the Great Hall by the Duke and Duchess of Abercorn, the Duke being the Chairman of the Council of the Society. While mentioning the Society of Arts, we may say that on Monday last, at Windsor, the Queen conferred the honour of knighthood upon the Secretary, Mr. (now Sir) H. Truman Wood.

#### SANITARY AND ENGINEERING NEWS.

WATER SUPPLY IN SOUTH-WEST DURHAM.—On June 25, at the Barnard Castle Police-court, three men were prosecuted for trespass on the Lynessack Farm, in the South-West Durham colliery district. The defence was that the defendants were absolutely compelled to trespass in search of water, as a positive famine existed. A fine was inflicted in each case.—Subsequently at a meeting of the Leeds Rural Sanitary Board, Mr. Shipley, the manager of the Woodland Colliery Company, said that the colliers were drinking water from hedge-drains and ditches, and the workmen would not live in the district owing to the dearth of water. Mr. W. T. Scarth said the colliery companies had tapped the whole of the springs in their workings, and the question was, who should be called upon for restitution. Mr. Robinson, C.E., produced plans for the extensive Colliery district water supply, which were approved. The estimated cost was 3,322*l.*; and it was resolved to apply for the sanction of the Local Government Board to borrow 4,000*l.* to carry out the scheme.

DEFECTS IN DRAINAGE OF SUNDERLAND HOUSES.—At the last meeting of the Health Committee of the Sunderland Town Council, Mr. Frank Caws, architect, reported that he had discovered a defect from soil-pipes into the foundations of houses, instead of into the sewer. He stated that he had discovered the defect in two or three houses, and he was afraid that it existed in a great many. Diagrams were produced, and Mr. Caws explained a part of his report to the committee. (See *The Builder* for June 14, p. 137.) The committee, in conveying the thanks of the Committee to Mr. Caws, expressed a hope that the members of the Health Committee who were also members of the Building Committee would endeavour to carry out the ideas suggested by Mr. Caws.

#### STAINED GLASS AND DECORATION.

ST. SERIO'S CHURCH, PENMAENMAWR.—A two-light memorial window has just been erected in St. Serio's Church, Penmaenmawr. The subject represented is the Nativity. The work has been designed and executed by Messrs. Mayor & Co.

LITTON COLLEGE CHAPEL has recently been enriched with mosaic. The mosaic pavement in the apse is decorative, and contains one figure only, that of the sower going forth to sow his seed. This mosaic is of marble, and was made and laid down by Italian workmen. The mosaic picture above the communion-table is from a painting by Mr. W. Holman Hunt, which he made in 1857, to be reproduced in this manner for the Gilbert School. The work has been produced in England by English workmen in the employ of Messrs. Powell, of Whitefriars. The mosaic picture and roses are the gift of the Head-Master.

THE DURHAM MEMORIAL WINDOW, OXFORD.—The subject of this window, which it is proposed to erect in St. Mary-the-Virgin Church, and which has been designed by Mr. C. E. Kempe, M.A., is, according to the *Oxford Journal*, "a Jesse Tree." At the base of the window, which is a good deal obscured by the west gallery, are shown the heraldry of the members of the college, supported by angels; above this the central Jesse reclines, with the two of the Judah kings on each side, and the four Evangelists writing their Gospels. The design came before the Hebdomadal Council on Monday week, and was approved.

#### FOREIGN AND COLONIAL.

STUTTGART.—It has been decided to erect a group of buildings, comprising an infirmary, poor-house, and workhouse, on an extensive site outside the northern suburb of the town. In the infirmary, room for some 350 inmates will be found; the poor-house will have accommodation for 100 families and 150 single persons; and the workhouse will have a night ward for 100 inmates, a competition, open to German architects only, has been arranged by the Corporation, and the programme shows that three premiums, of a total value of some 600*l.*, will be given away.

BERLIN.—Some time ago the report circulated in the local papers that the Emperor had expressed his intention of seeing the old St. Mary's Church (situated at no great distance from his palace) surrounded by a dignified tower. We now hear that the Architectural Verein has of its own accord opened a competition to its members for designs for such a spire. The spire is to be of brick, and about 250 ft. in height.—The annual election at the German "Academy" (Academy der Kunstler, Berlin) shows that Professor Karl Becker, who has held the post of president since 1880, will remain in office, and that the eminent architect, Professor Endo, will be the vice-president of the year. Karl Becker will attain his seventieth year next December, and the forty-fourth consecutive one of his residence in the capital. Professor Endo (hon. cor. member to the B.A.A.) has been able to again take up his usual lecture at the Royal Technical College, this term, after having taken a year's leave of absence on account of ill-health.

**STOCKHOLM.**—We hear that the building belonging to the Architectural and Technical College have been destroyed by fire, and that the valuable collection of model copies, &c. (some 10,000 numbers), have been lost. The building showed the date 1863, and had been erected by Professor Scholander.

**REMARKABLE SWEDISH COMPENSATION CASE.**—A very remarkable compensation case is now before the Swedish Parliament. The builder of the new Upsala University, Herr Hallerstrom, found that his speculation, through various causes, resulted in loss to him of about 33,500*l.*, and this sum, or if not the whole, part of it, he has petitioned the Crown to make good, and the latter has met the prayer of the unfortunate *entrepreneur* so far as to actually propose to the Parliament that he be paid 2,800*l.* in cash, and a life pension of 170*l.* Naturally, this extraordinary piece of benevolence has attracted much notice, particularly as it is open to doubt whether the *entrepreneur* would have returned any money had he made an excessive profit out of his speculation.

**INFORMATION FOR EMIGRANTS TO THE COLONIES.**—The July circulars, the annual pony handbooks, and each of the present Circulars, Emigrants' Statutes and Professional Handbooks price 3*s.* each (the whole being also bound together price 2*s.*), issued by the Emigrants' Information Office, 31, Broadway, Westminster, S.W., show the present prospects of emigration to the Colonies. Male and female emigrants for Queensland, Western Australia, the Cape and Natal, may in certain cases obtain through friends or employers of labour in those Colonies, passage at reduced rates. Queensland also offers free and assisted passages to unmarried female servants, sempstresses, miners, navvies, and farm labourers (but for male labour there is just now no demand in the Colony). Miners are wanted in Tasmania and New Zealand. There is no special inducement for mechanics in some few localities, as for carpenters and bricklayers in Natal. The demand for mechanics in Cape Colony, to which attention was drawn last April, has since slackened, owing to the depression at the Transvaal Gold-fields and consequent return of large numbers of workmen to Cape Colony and Natal. Emigration to the Transvaal under present circumstances is not advised. It should be noted that it is too late in the year for men to go to Canada, unless they go to friends or have enough money to keep them through the winter.

MISCELLANEOUS.

**NEW PARKS FOR SOUTH SHIELDS.**—On June 25, South Shields was *en fete* on the occasion of the opening of the Marine Parks and the unveiling of the Queen's Jubilee and Lifboat Memorial. The parks have been laid out from designs by Mr. M. Hall, C.E., Borough Surveyor. The two parks have cost 422,000*l.*

**ARCHAEOLOGICAL EXPLORATIONS AT KENILWORTH.**—The work of opening up the long-hidden remains of the old Priory Church and the adjoining monastic buildings at Kenilworth has begun. According to the *Birmingham Gazette*, the place for the start was chosen by Mr. T. W. Whitley, of Coventry. About sixteen yards west of the spot where the preliminary boring showed the situation of the western entrance-door, the ground rises abruptly and is at a higher level than any other point in the churchyard. Here operations were begun. The entrance to the monastery was soon found, the door opening being of massive proportions and about 9ft. wide. The line of walling was then traced out, and the excavators found themselves within the walls of a spacious room about 16 ft. in width. This, it is said, originally formed the main entrance to the monastery and cloisters. The removal of the interior brought to the surface a considerable quantity of finely-worked stone, the supporters of the groined arched roof, and a couple of central keystones with splendidly-carved bosses, as cleanly cut and as crisp in outline as when first made. Two massive corbels, with circular worked caps and fluted brackets, have also been bared. Further on a door was found leading into an outer court, and in close proximity to the church door (west).

**THE MIDDLETON TOWERS ESTATE.**—This estate, which was sold at auction a few weeks since for 23,000*l.*, is again placed in the market. We advertised this property in a "Note" on August 17 last. The fifteenth century gateway of Lord Scoble's Castle and a good oriel window were preserved at the rebuilding of thirty years ago.

**NO. 18, ST. JOHN'S WOOD ROAD.**—In the course of this month will be put up for sale, at the Mart, 23, Abchurch Lane, for several years was occupied by Sir Edwin Landseer, and in which he died. The house was arranged internally by Sir Edwin to meet his own requirements as a painter.

**IRON.**—The July number of the *English Illustrated Magazine* contains a double article on Eton, by Mr. Maxwell Lyte and the Hon. A. Lyttonell, with a number of sketches of various parts of the school buildings, by Mr. Alfred Norman.

**THE DUBLIN CARPENTERS' STRIKE** has terminated. The 54 hours' week is to be commenced on Oct. 1, at 3*s.* per week. The 57 hours' week will continue in the interim.

**DRAWINGS OF ANCIENT NORTHERN ARCHITECTURE.**—An interesting work is making its appearance in Copenhagen, entitled "Drawings of Ancient Northern Architecture" by O. V. Koch, V. J. Mork-Hansen and Erik Schjodto. The second collection, third series, has just been issued, comprising eighteen plates. The principal are those of the Vadstena castle, in Sweden, the style being a rich Renaissance, and an altar-table from Linköping Cathedral, originally Roman, but with pure Gothic additions. From Norway we have a "Stabur," drawn by A. Mathiesen, one of the curious out-houses in old Norse style, characteristic of that country, since erected by King Oscar in a park at Christiania, whilst plate ten reproduces the southern portal of Velling church, near Ringkøbing, in Denmark, richly ornamented with the fantastic tracings of animals that characterised ancient Scandinavian architecture. The work is supported by a state subsidy.

**EAST OF SCOTLAND ENGINEERING ASSOCIATION.**—The third excursion for the session of this Association took place on Saturday afternoon, when, by permission of the Edinburgh and District Water Trustees, the compensation reservoir at Thripmuir and Harlaw were visited.

**THE PAVIORS' COMPANY.**—The members of this ancient Company dined together at the Guildhall Tavern on the 27th ult., under the chairmanship of Mr. Ex-Sheriff Burt, the Master. The Paviors' Company, although not so prominent as other and better-known City companies, possesses, according to the *City Press*, a good pedigree, for so far back as 1396, in the time of King Edward I.'s reign, it is recorded that one William le Pavour held a tenement within the bar of Newgate, and he left twelvepence by his will towards the repair of London Bridge. Then during following years the Paviors' Company played an important part in the protection of the work of paviors, while there are quaint records of some of the conditions relating to the Paviors' Company. In 1673 the members of the trade subscribed money to obtain a charter for their Company, and the draft of the proposed charter passed the Privy Seal. For reasons not now known the City entered a caveat against the grant, and although the Court of Aldermen were petitioned several times, the application was not successful, and the Company had to rest content with their ancient ordinances of the time of King Edward IV. Although the Paviors do not now exercise control over the trade, the present Court of Assistants are doing all in their power to promote its interests. With this view they, a few months ago, offered two prizes for essays on the best material and manner of laying carriage-way pavements in large cities. They decided in favour of the essay sent in by Mr. E. Spencer Saunders, of Sheffield; while the second best was that sent in by Mr. Nelson F. Dennis (who was not present); and honourable mention was made of that by Mr. J. Tasker (of Holborn).

**WIDENING OF THREADNEEDLE-STREET.**—At the meeting of the City Commission of Sewers on Tuesday last, a sum of 5,000*l.* was ordered to be paid for setting back the premises of 51, Threadneedle-street, to the line of improvement in that thoroughfare.

**THE ENGLISH IRON TRADE.**—The improvement in the English iron market continues, and although this is not so much perceptible in finished iron and steel, the advance in the price of pig-iron, the Cleveland pig, No. 3, has risen 3*s.* per ton from the lowest point, and is steady at its present price. The tendency in the Glasgow warrant market has been upwards during the last two weeks, and this movement has to some extent imparted itself to makers' iron. Higher prices are being obtained for Lancashire, Derbyshire, and Lincolnshire pigs, and rates are also stiffer in Staffordshire. Homesties in the North-west, on the contrary, are still lagging, and no better terms can be obtained by makers of Bessemer iron. The inquiry for finished iron shows a little more life, without, however, stimulating prices. The values of steel are tolerably steady, considering that the demand is still limited. The prospects of shipbuilders are anything but good. Engineers are fairly well employed, but not much new work is offering.—*Iron.*

**BUSINESS CHANGES.**—Mr. J. Williams Dunford has resigned his position as "official architect" to the Salvation Army. We are informed that he has carried out over 80,000*l.* worth of work for that organisation during the last two years. On leaving he was presented by his staff, numbering twenty-nine, with an illuminated address and other interesting souvenirs. He is commencing private practice.—Messrs. Petron & Co., engineers and contractors, of 124, Fenchurch-street, write to inform us that in consequence of the death of J. O. Gardner, of the firm of Gardner, Anderson, & Clarke, 134, Fenchurch-street, London, the affairs of that firm are being wound up. Messrs. Petron & Co. have made arrangements for continuing the business as engineers and contractors for constructional iron and steel work, and have taken over all the late firm's stock and effects, and opened new offices for this purpose at 124, Fenchurch-street.—Mr. W. Charles Evans, F.R.I.B.A., has removed from 34, Post's-corner, Westminster, to 25, Lowther-arcade, Strand, W.C.

**THE ROMAN PAVEMENT AT WOODCHESTER.**—Of the different Roman remains which excavators have brought to light of late years, for beauty of design and richness of colouring the pavement at Woodchester has been unapproached. This has long been acknowledged by those who have read the elaborate description which was published by the late Samuel Lyons, F.S.A., about the beginning of this century or have seen the specimen of the scroll-work which he presented to the British Museum. This pavement is about to be uncovered, and will remain so from Tuesday, July 29, till Monday, August 11, inclusive, during which time it will doubtless be visited by numbers who had not the opportunity of seeing it when it was opened for a short time ten years ago, as well as by many who then saw it and will be glad to visit it again. As it is within two miles of Stroud, on the Great Western line, and only about ten minutes' walk from Woodchester Station, on the Midland branch line, ample means of reaching the spot are provided for those living at a distance.—*Tins.*

**DUNDEE INSTITUTE OF ARCHITECTURE, SCIENCE, AND ART.**—The annual general meeting of this Institute was held on the 26th ult., Mr. T. S. Robertson, the President, in the chair. The report set forth that the roll for the past year contained the names of six honorary members, forty-nine members, and 150 associates. This year it contains seven honorary members, forty-nine members, and 152 associates. The balance in hand at the end of last year was 49*l.* 1*s.* 9*d.*; this year it is 60*l.* 8*s.* The Institute having received a letter from the Master Builders' Association regarding the proposed amendments to the bye-laws, a meeting to delete the strike clause from their building contracts, instructed the Secretary to reply, "that they consider the strike clause, as agreed to between the Dundee Institute of Architecture and the builders of Dundee, in the general conditions of contract, necessary and just in building contracts, and they hope it will not be infringed." The report was adopted, and the officers-hearers for the ensuing session were elected, the President being Mr. Charles Ower, and the Honorary Secretary, Mr. J. J. Henderson.

**THE COUNCIL OF THE INSTITUTION OF CIVIL ENGINEERS** have re-appointed as Treasurer Mr. Hugh Lindsay Atrobus, the senior partner in Messrs. Coats & Co., as Honorary Secretary Dr. William Pole, F.R.S., and as the Secretary Mr. James Forrest, which office he has filled for the past thirty-four years.

**ARTISAN STUDENTS.**—The competition for the Oxford University Extension Scholarship has this year produced some remarkable results. Among the working men competitors were a dyer, a shoemaker, a joiner, several cotton weavers, and a mechanical draughtsman. The best essay on English poetry in the nineteenth century was written by a working plumber at Abergavenny. A capital essay on Stratford was sent in by a machine joiner from Oldham, while the educational influence of the operative industry is perhaps indicated by the fact that two of the best essays were by cotton weavers in the Nutclough Co-operative Factory at Healden Bridge.—*Fall Mall Gazette.*

**"ARCHITECTURE-REVUE."**—In *L'Architecture* for June 28 will be found the whole of the little comedy written by M. Chas. Garnier, under the title "Architecture-Revue," which was played at the Hotel Continental after the annual dinner of the Congress of French Architects.

LEGAL.

EDWARDS V. BARNES.

This was an action tried in the High Court of Justice on the 30th ult., before Mr. Justice Grantham and a common jury, brought by a landlord against a tenant to recover damages for breach of an agreement to keep certain demised premises in repair.

The plaintiff, Sir Henry Edwards, is the owner of a mill called King's Mill, in the parish of Nutfield, in the county of Surrey, and by an agreement in writing, dated November 30, 1834, this mill, with the water-wheel, stables, outbuildings, and two cottages, and a piece of meadow-land adjoining the mill and cottages of about six acres, was let to the defendant for the term of one year at the yearly rent of 60*l.* The agreement contained the following term as to repairs:—"The tenant agrees with the landlord . . . to keep the said mill, cottages, buildings, and premises (including the fixtures) in good repair and condition (damage by fire excepted). The defendant entered into occupation and continued to occupy until September 23, 1889, when the tenancy was terminated by notice. The plaintiff's case was that the defendant had not kept the mill, cottages, and premises in good repair in accordance with the terms of the agreement, and claimed a sum of 7*l.* as damages for the dilapidations. The defence was that the premises were old and out of repair at the commencement of the tenancy, and the defendant paid into Court the sum of 20*l.*, saying that sum was sufficient to satisfy the plaintiff's claim.

Evidence having been given on both sides, at the close of the case,

CONTRACTS AND PUBLIC APPOINTMENTS.

CONTRACTS.

Table with columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, and Tenders to be delivered. Includes entries for hot-water heating, wood pavements, and various construction contracts.

CONTRACTS.—Continued.

Continuation of the Contracts table, listing various engineering and construction projects with their respective architects and tender dates.

PUBLIC APPOINTMENTS.

Table listing public appointments, including roles like Clerk of Works, Inspector of Street Cleansing, and Public Works Committee members, along with their salaries.

TENDERS.

[Communications for insertion under this heading must reach us not later than 12 noon on Thursdays.]

BODMIN.—For additions, &c., to buildings at county lunatic asylum, Bodmin, for the Visiting Justices and Committee. Mr. W. J. Jenkins, architect, Bodmin.—

BROMLEY (Kent).—For constructing a new road at Bromley Common, for the Bromley Local Board. Mr. Hugh S. Cregeen, Surveyor.—

BROMLEY (Kent).—For making up Yester-road, for the Bromley Local Board. Mr. Hugh S. Cregeen, Surveyor.—

BROMLEY (Kent).—For sewer extension in Plaistow-lane, for the Bromley Local Board. Mr. Hugh S. Cregeen, Surveyor.—

FAIRFIELD (Lancashire).—For the erection of a villa residence, conchoidal and flag-stones, for Mr. W. W. Johnston. Mr. J. H. Barton, architect, Ashton-under-Lyne.—

HERTFORD.—For erecting new station hotel, Hertford. Mr. James Farley, architect, Hertford. Quantities by Mr. Theo. P. Petersen, 1st, Euston-road, London.—

HERTFORD.—For decorative work at Farnworth Parish Church.—

LEICESTER.—For erecting St. Leonard's Vicarage, Leicester. Mr. J. C. Traylen, Diocesan Surveyor, architect.—

LEICESTER.—For erecting St. Leonard's Vicarage, Leicester. Mr. J. C. Traylen, Diocesan Surveyor, architect.—

LONDON.—For pulling down and rebuilding "The George and Dragon," New North-street, for Messrs. Matthews & Canning. Messrs. Karstake & Mortimer, architects.—

LONDON.—For rebuilding 46, Kennings-lane-road. Messrs. Hulson & Booth, 17, Goddard-street, E.C., architects. Quantities by Mr. H. Lovegrove, 25, Budge-row, E.C.—

LONDON.—For the supply of 1,500 cubic yards of blue Guernsey granite road metal at Brentford, for the Brentford Local Board. Mr. J. H. Strachan, Surveyor, Clifton House, Boston-road, Brentford.—

LONDON.—For redecoration and other work to Walworth-road Chapel. Mr. John Edward Sears, architect.—

LONDON.—For repairs, painting, &c., to the chapels, lodges, &c., at Footing Cemetery, for the Burial Board of Lambeth. Mr. W. Chatter, surveyor.—

LONDON.—For supplying additional furniture and fittings for the new rooms under the Council Chamber at Spring-gardens, for the London County Council. Mr. Thomas Blashill, architect.—

LONDON.—For the erection of new gateways, &c., at their dispensary, East-street, Marylebone, W., for the Guardians of the Poor of the Parish of St. Marylebone. Mr. H. Saxon Snell, architect, London.—

LONDON.—For alterations and additions to the "Spanish Patriots" tavern, White Conduit-street, Islington, for Messrs. F. J. Newport & Co. Mr. Fred G. Grierson, architect, 9, Old Jewry-chambers, E.C.—

LONDON.—For pulling down and rebuilding "The George and Dragon," New North-street, for Messrs. Matthews & Canning. Messrs. Karstake & Mortimer, architects.—

LONDON.—For the supply of 1,500 cubic yards of blue Guernsey granite road metal at Brentford, for the Brentford Local Board. Mr. J. H. Strachan, Surveyor, Clifton House, Boston-road, Brentford.—

LONDON.—For redecoration and other work to Walworth-road Chapel. Mr. John Edward Sears, architect.—

LONDON.—For repairs, painting, &c., to the chapels, lodges, &c., at Footing Cemetery, for the Burial Board of Lambeth. Mr. W. Chatter, surveyor.—

LONDON.—For supplying additional furniture and fittings for the new rooms under the Council Chamber at Spring-gardens, for the London County Council. Mr. Thomas Blashill, architect.—

LONDON.—For the erection of new gateways, &c., at their dispensary, East-street, Marylebone, W., for the Guardians of the Poor of the Parish of St. Marylebone. Mr. H. Saxon Snell, architect, London.—

LONDON.—For alterations and additions to the "Spanish Patriots" tavern, White Conduit-street, Islington, for Messrs. F. J. Newport & Co. Mr. Fred G. Grierson, architect, 9, Old Jewry-chambers, E.C.—

LONDON.—For pulling down and rebuilding "The George and Dragon," New North-street, for Messrs. Matthews & Canning. Messrs. Karstake & Mortimer, architects.—

LONDON.—For the supply of 1,500 cubic yards of blue Guernsey granite road metal at Brentford, for the Brentford Local Board. Mr. J. H. Strachan, Surveyor, Clifton House, Boston-road, Brentford.—

LONDON.—For redecoration and other work to Walworth-road Chapel. Mr. John Edward Sears, architect.—

Those marked with an Asterisk (\*) are advertised in this Number. Contracts pp ii, xiii., and xlv. Public Appointments, xviii.

LONDON.—For lowering basement and constructing new buffet and various alterations at 122, Newgate-street, E.C., for Messrs. Divlan Bros.—  
Howell J. Williams, Bernadsey-street (accepted) ..... £887 10 0  
[No competition.]

LONDON.—For extra work to be done in connexion with pontoons, grid, dolphin, watermen's steps, &c., at the Woolwich Ferry, for the London County Council, Mr. Binnie, Engineer:—  
John Mowlem & Co. .... £144 0 0  
[Only one tender received.]

MORTLAKE (Surrey).—For the erection of a Conservative Club, for the Mortlake Conservative Club Company, Limited. Mr. Thomas Potter, architect, Sevenoaks:—

	Club and hall.	For gallery.	Time.

\* Accepted subject to deductions.

SALISBURY.—For repairs and alterations at Laverstock Farm-house, near Salisbury, for Mr. Charles Blake. Mr. Fred. Bath, architect, Salisbury:—

J. Rawlings, Salisbury	470 0 0
Gilbert Harris, Salisbury	462 0 0
E. Witt, Salisbury	453 0 0
J. M. Jenkins, Salisbury	401 8 6
T. Grace, Fulford, Winchester	364 18 0
J. Wort, Salisbury	304 0 0
A. & J. R. Curtis, Salisbury	297 0 0

\* Accepted.

SALISBURY.—For alterations and additions to Fisherton National Schools, for the trustees. Mr. Fred. Bath, architect, Salisbury:—

H. J. Rite, Salisbury (accepted) .... £193 0 0

SALISBURY.—For new room at the Maunred Memorial Hall, for the trustees. Mr. Fred. Bath, architect, Salisbury:—

W. J. & C. S. Young ..... £296 0 0

H. J. Rite (accepted) ..... 289 15 0  
(Both of Salisbury.)

SHAMLEY GREEN (near Guildford).—For the erection of entrance-lodge on the estate of Mr. G. D. Hodgson. Mr. F. G. Barratt, architect, Bridge-chambers, Richmond, Surrey:—  
Harvey Brown, Bramley (accepted). £485 0 0

SOUTH SHIELDS.—For the erection of new studio and alterations at No. 8, Ogle-terrace, South Shields, for Mr. Wm. Parry. Mr. Henry Grieves, architect, Albany Chambers, South Shields:—  
William Scott, South Shields ..... £463 7 0  
\* Accepted.

SOUTH STOCKTON.—For the erection of new public offices, for the South Stockton Local Board. Mr. J. M. Garry, architect, West Hartlepool:—  
W. C. Atkinson, Stockton (accepted) £3,327 3 6  
[Seven other tenders: highest, £4,300.]

WOLVERHAMPTON.—For the erection of villa residence, Tettenhall-road, for Mr. Rupert Belcher. Mr. Joseph Lavender, architect, Wolverhampton. Quantities by the architect:—

R. Guest	£992 14 0
Bradney & Co.	912 0 0
H. Gough	870 0 0
T. Hallchurch	764 0 0
G. Dave	675 0 0
C. Ford & Sons (accepted)	350 0 0

[All of Wolverhampton.]

SUBSCRIBERS IN LONDON AND THE SUBURBS by prepaying at the Publishing Office, 19a, per annum (or 4s. 9d. per quarter), can ensure receiving "The Builder" by Friday Morning's post.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied DIRECT from the Office to residents in any part of the United Kingdom at the rate of 7s. per annum *Postpaid*. To all parts of Europe, America, Australia, and New Zealand, 8s. per annum. To India, China, Ceylon, &c. 10s. per annum. Remittances payable to DOUGLAS FOURDRINIER, Publisher, No. 46, Catherine-street, W.C.

PUBLISHER'S NOTICES.

Registered Telegraphic Address, "THE BUILDER, LONDON."

CHARGES FOR ADVERTISEMENTS. SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, TRADE, AND GENERAL ADVERTISEMENTS.

Six lines (about fifty words) or under ..... 4s. 6d.  
Each additional line (about ten words) ..... 6s. 6d.  
Terms for Series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c., may be obtained on application to the Publisher.

SITUATIONS WANTED. FOUR Lines (about thirty words) or under ..... 2s. 6d.  
Each additional line (about ten words) ..... 6s. 6d.

PREPAYMENT IS ABSOLUTELY NECESSARY. \* Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. DOUGLAS FOURDRINIER, Publisher, Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the Office before THREE O'CLOCK P.M. on THURSDAY, but those intended for the front page should be in by the same hour on WEDNESDAY.

SPECIAL ADVERTISEMENTS IN SEPARATE ADVERTISEMENTS OR ORDERS TO DISCONTINUE same must reach the Office before TEN O'CLOCK ON WEDNESDAY MORNINGS.

The Publisher cannot be responsible for DRAWING, TEXT, MORTALS, &c. left at the Office in reply to advertisements, and strongly recommends that of the later COPIES ONLY should be sent.

PERSONS Advertising in "The Builder" may have Replies addressed to the Office, 46, Catherine-street, Covent-garden, W.C. free of charge. Letters will be forwarded if addressed envelopes are sent, together with sufficient stamps to cover the postage.

AN EDITION Printed on THIN PAPER, for FOREIGN and FOREIGN CIRCULATION, is issued every week.

Now ready, NINEPENCE EACH. (By post carefully packed) 1s.

### The Late Sir Edwin Chadwick.

HERE are probably many of our readers, even in that uncertain and variously defined stage of existence called middle life, who have only a very inadequate idea of the important part played in the sanitary reform of modern England by the aged apostle of sanitation who died on Saturday last. Sir Edwin Chadwick's life has been so long a one, and the principal part of the work he did for this country, in awakening it to the disgraceful sanitary state of a considerable portion of the community and to the possibility of immensely improved conditions of life for all, has been so long accomplished and passed into the region of accepted principles, that few people realise now how dire was the fight to bring about this improved state of things, and what an immense debt England owes to Chadwick. If we compare the present state of sanitation in English towns and in private and public buildings with that which existed half a century ago, we find (much as there is yet to be done) a quite extraordinary revolution in the attention given to sanitation and the means employed to ensure it; and the revolution in public and private opinion upon and interest in the subject is still more remarkable. This revolution no doubt must have come sooner or later; but that it came when it did, and that we are not half or a quarter of a century later, is mainly due to the clear perception, the strong will, and the unceasing pertinacity in the cause of sanitary reform of one man.\* Born at the commencement of the century, and entering upon his sanitary campaign in the early part of his life, his principal labours are now so far out of the memory of all but the oldest that it is perhaps difficult to realise what an important figure Chadwick was in the decade between 1835 and 1845. We get a hint of it in an expression in Charles Kingsley's perhaps most characteristic book, "Yeast," which though largely occupied with the question of the

condition of the poor, sanitary and moral, was essentially a popular hook: one speaker remarking that the present century wants its epic poem, his friend replies, "Write one yourself, and call it 'The Chadwickiad':—

'Smells and the Man I sing;'

There's a beginning at once;" in allusion to the *arma virumque cano* of the "Æneid." And Dr. Richardson, in his unfortunately very ill-arranged *résumé* of Chadwick's writings under the title of "The Health of Nations," quotes in his biographical sketch a *Daily News* article of the period, giving an account of the attitude taken by Chadwick at the enquiry, in 1846, into the conduct of the Commissioners of the Poor Law Board, when, although Chief Secretary to the Board, he gave evidence of their disregard of reported abuses and illegal practices. "Chadwick stands alone, dark and terrible as Milton's hero, confronting the three Commissioners, who are waxing more and more vehement. It is not easy to conceive how the hellegerents are to get to meet on terms of truce." The result was as predicted: the Board was dissolved; and in this case Chadwick was probably in the right; though it must be admitted that, like other men with a strong sense of a mission, he had a considerable faculty of quarrelling with those who did not see things in the same light as himself.

The fault about Dr. Richardson's book, of which an abridged edition for more popular use has been since brought out,\* was, as we observed in a review of it some time since, that it was so compiled that it is difficult to make out from it where we are getting Chadwick's *ipsissima verba*, where it is an abridgment giving the substance of them, or where it is Dr. Richardson's own comment; defects which are just as apparent in the abridged edition under the title "National Health." Even the sub-title, "A Review of the Works of Sir E. Chadwick," seems chosen on purpose to puzzle the reader, the word "review" properly signifying, of course, a criticism, rather than an account, and being never used in the sense in which it seems to be used here. It is a great pity that this is the case, because Chadwick's testimony with regard to the subject of his life's work is so scattered among articles, reports, papers at

meetings, &c., that a collection of them in one publication would have been a great convenience to students of the history of sanitation, as well as a desirable monument to Chadwick; but for want of literary method and perception Dr. Richardson, with the best intentions, has so carried out his task as much to diminish its value, and to produce what may be said to be one of the most unreadable books before the public.

The essay which, though in the first instance published anonymously, may be said to have laid the foundation of Chadwick's reputation as a practical philanthropist, contains on its very first page the indication of the line of work which he had marked out for himself, or which his temperament and special abilities marked out for him. This was the essay on "The Means of Insurance against the Casualties of Sickness, Deceitfulness and Mortality," contributed to the *Westminster Review* of April, 1828, and republished under the author's name, with some additional notes, in 1836. Setting out with the position that it is one of the most important duties of a good Government to enable the community to provide, at the least expense, against the casualties of sickness and mortality, "and to avert or dissipate those attendant evils by the apprehension of which life is embittered and impaired," he proceeds to observe "that the most readily attainable means towards this end is the collection of complete information as to the circumstances under which sickness arises, together with accurate accounts of the deaths consequent upon such circumstances . . . Accounts of this description, which perhaps at present a Government alone has the power to obtain in the requisite degree of perfection, would form an invaluable acquisition to science, and would direct the public exertions in removing those circumstances which shorten life, and in promoting those under which it is found to attain its greatest and most happy duration." There is rather a confusion of ideas, if not of grammar, implied in the last three words; what Chadwick meant was increased duration of life under conditions most compatible with happiness; but the sentence we have italicised sums up in brief the main effort of Chadwick's life,—to remove the circumstances which shorten life." To provide that the life thus lengthened should be happy is a matter a little way beyond the reach of Parliamentary statistics and legislation, seeing that it depends very largely on individual tempera-

\* We must be allowed also not to forget the important assistance given to the cause of Sanitary Reform by the late Mr. George Godwin.

\* "National Health": abridged from the "Health of Nations"; a Review of the Works of Sir Edwin Chadwick, K.C.B. By Benjamin Ward Richardson M.D., F.R.S. London: Longmans Green & Co.: 1890.

ment as well as on family and other relations which cannot be affected by Act of Parliament. But to remove the avoidable causes which shorten life is at any rate to provide the first and most indispensable condition for adding to the sum of happiness of human life, that of adding to the extent of life itself. There may be life without happiness, but there cannot be happiness without life.

Chadwick was one of those practical and dogged natures which ask "Why?" to everything, and will be content with nothing short of an exhaustive reply. The particular question which he put to his generation was, "Cannot we live longer?" and he was possessed of that stubbornness of purpose which persists in repeating the question till a full reply is received, or as full a one as existing circumstances permit of. It was this stubborn and uncompromising "why?" of Chadwick's which has more than anything else brought about the sanitary reform which has so materially lengthened the average duration of life in this country during the last fifty years. He was not perhaps so much an initiator of remedies as an exponent of defects; but in such a matter as the healthiness and duration of life, to point out clearly the obstacles to that condition is to do nine-tenths of the work. The whole of mankind desire to be healthy and long-lived, but many of them still, and a far greater proportion half a century ago were, too ignorant and indolent on the subject to give any consideration to the avoidance of conditions inimical to health. Fifty years ago the greater proportion of the upper classes were in the same mental position in regard to questions of sanitation as that in which the majority of the poorer classes still are; they suffered disease and death to prey upon them to an extent that was quite unnecessary and avoidable, and accepted it as a visitation of God, through the indifference of sheer ignorance. Chadwick's persistent "why?" gradually gained a hearing among intelligent people, urged as it was with that pertinacity and one-sidedness which, however it be a defect in character in one sense, is an almost necessary quality for any man who would rouse a whole generation to the perception of a neglected truth. Chadwick attacked however not merely ignorance and indifference, but that kind of wilful ignorance in which rather small-minded people indulge, half-unconsciously, when the facts attempted to be thrust upon them are against their own interests. "The great crime of the class of practical men," he says in the *Westminster Review* essay, "is their dishonest dealing with evidence; shutting their ears to it, and when it is forced upon their perception, depreciating it, conjuring up fictitious obstacles, and exaggerating the force of real ones. When any measure constituting a change is presented to such minds, the question usually asked is not,—"Is the evidence in support of it sound and complete?" but,—"What shall I gain or lose by admitting it?" It was in this spirit that the actuaries of Insurance Societies who were asked to revise their premiums in the public interest, on the ground that the average of life, according to statistics, was lengthening, refused entirely to see the facts. "Of those absurd opinions," said one of them, "which have lately been entertained concerning the improved health and longevity of the human race, I have no disposition to enter into the discussion . . . and I can only express a hope that they will never be suffered to mislead this society" (into reducing its charges to the public). The promised average longevity has been extended beyond what was then suggested, but the most striking fact in connection with this scepticism of Insurance Companies is the practical evidence afforded by the prophet of longevity himself, in his ninety years of vigorous life. It is not always that a sanitary reformer is able to exhibit in his own career such a remarkable corroboration of the truth of his own teaching.

It was in 1838 that the first Sanitary Commission was appointed in England, owing in

the first instance to a direct application made to Chadwick, while still Secretary of the Poor Law Board, by the parochial authorities of Whitechapel, who were greatly alarmed at a severe outbreak of disease in their neighbourhood for which they could not account. The Secretary persuaded the Board to institute a medical Commission of Inquiry, in accordance with what we have already described as the object he continually kept in view, viz., to find out the causes tending to disease. The report issued by this committee, which is before us, gives some idea of the state of things at that period, the statistics more than confirming some of the graphic and picturesque sketches of the then state of the dwellings of the poor given by Kingsley in "Yeast" and elsewhere. As a specimen we may take the following from a report on the sanitary (?) condition of Greenock. Commenting on the number of cases of fever coming from one narrow street, which contained the lowest description of houses, the medical reporter wrote:—

"In one part of the street there is a dunghill—yet it is too large to be called a dunghill. I do not mistake its size when I say it contains a hundred cubic yards of impure filth, collected from all parts of the town. It is never removed; it is the stock-in-trade of a person who deals in dung; he retails it by cartfuls. To please his customers, he always keeps a nucleus, as the older filth is the higher is the price. The proprietor has an extensive privy attached to the concern. This collection is fronting the public street; it is enclosed by a wall; the height of the wall is about 12 feet, and the dung overtops it; the malarious moisture oozes through the wall, and runs over the pavement. The effluvia all round this place is horrible."

This is only a small portion of the description; it may serve to realise how far we have at all events advanced since then, and what was the magnitude of the evils with which the sanitary reformer at that date had to deal.

Among the subjects to which Chadwick turned his attention was that of "The Economic, Social, Educational, and Political Importance of open Competitive Examinations for admission to the Public Service." To a statistical mind it is natural that all the advantages and propertics of this form of appointment would present themselves in their most attractive light, and that the other side of the question, that of the personal quality of the candidate, would be overlooked. For the true statistical mind always regards men in the mass, as a class of beings influenced in a certain direction by certain conditions, and to be dealt with in the mass accordingly. In general and at the time there is no doubt that the competitive examinations gave an impetus to the services in connection with which they were instituted; but it is none the less true that competitive examination is not an infallible way of discovering the best man for a post in which action and self-reliance are required, and that there is a weak side to this method of selection which Chadwick was quite unable to see. His essay, read before the Statistical Society of Manchester, "On the demoralisation and injuries occasioned by the want of proper regulations of labourers engaged in the construction of railways," is not open to any such criticism, and is an admirably-written plea for a class of labourers who appear to have been at that time in a perfectly heathen state of demoralisation as regards their way of life out of working hours, and even as regards the proper execution of their work, owing to the total neglect and indifference to their moral and material interests on the part of the companies employing them. Chadwick had perception enough to see at that time, speaking of railway accidents, that 30 per cent. of these might have been prevented by the proper use of the electric telegraph (then in its infancy); but observed that the directors "do not care to inform themselves" on the subject.

The address on Railway Reform, read at the Social Science Congress of 1865, is a remarkable paper for the time at which it was written, in its endeavour to show (what some railway companies have not even yet

found out) that it was to the interest of the companies to promote the comfort of their passengers of all classes, to consider how much and not how little they could give them; and he was one of the first or perhaps the first to point out the now generally recognised fact that it was from the third class passengers that the bulk of a railway company's income really came. He was also bold enough to say at that date, that if the railway system had been laid out with trunk lines for fast passenger traffic only, it might have been possible to go from London to Liverpool in three hours and a half instead of five and a half (the then time), the reduction of speed being mainly owing to the crowding of a road with mixed traffic. It was too late then (1865) to revise the general system of railway rates of the country, but his advanced ideas as to the speed possible with well-constructed lines and carriages are worth noting.

The treatise on "The Evils of Disunity in Central and Local Administration," published in 1855, and therefore one of the latest works which Chadwick produced, is a remarkably comprehensive sermon on the text, "Always do the same thing in the same way, choosing the best, and always call the same thing by the same name." This idea of unity and homogeneity of administration is the kind of thing that of course forms one of the foibles of the man of statistical mind, and probably Chadwick ignored the fact that this principle of unity, in the wrong hands, is apt to be the parent of a great deal of useless and harassing red-tape legislation; but when secured by wise administration from abuses, there is no doubt that the view here inculcated by Chadwick is the right one. Chadwick gives a telling instance of the advantages of unity of administration in regard to the outbreak of cholera in this country:—

"As an illustration of the large gains derivable from unity, I may state that on the advent of that great epidemic we obtained information of past experience from one practitioner in a remote district, that the advent of the disease was in almost all cases preceded by premonitory symptoms, which were amenable to immediate treatment. This early treatment was as soon as possible adopted throughout the country to meet the epidemic, and it was so, with the result of a proved saving of some 50,000 lives as compared with the death-rate on the Continent, where the treatment had not been heard of, or was neglected. If Scotland had been under a smaller separate administration, it would, in the usual course, have only heard of the treatment some time after it had been adopted in England, and only have adopted it slowly, and executed it with a slower and smaller and feebler administration, and with a delay which would unquestionably have cost some thousands of lives."

This is certainly a case in point, in favour of unity, and which is capable of pretty large application.

The last separate publication of Sir E. Chadwick was, we believe, his criticism on the "Report of the Royal Commission on Sewage Discharge," a publication very typical both of the author's merits and defects as a writer and critic on sanitary matters. It exhibits in a more than usual degree his characteristic inability to state his views in a clear, well-arranged, and logical manner, so that it is necessary to compare all his paragraphs very carefully to find out what he is really driving at in any one passage, and it is not always easy to do so then. When Chadwick wanted to put one main truth in an incisive and concentrated manner, he could do that admirably in a brief pithy sentence that stamped itself on the memory; but the manner in which he leads up to or leads away from his main points is often most irregular and illogical in arrangement; the relation of one argument or statement to another (perhaps quite clear in his own head) is not made clear to the reader, and this makes his writings a provoking kind of study even in their original form, still more in Dr. Richardson's redistribution of them. The critical pamphlet on the Sewage Report is as noteworthy for its trenchant hits in places as for its want of general lucidity. Of the hits there are some that will be heard of again, probably, especially the sentence

which draws attention to the fact (which, if it be a fact, has been curiously overlooked by sanitary skirmishers), that while the purification of the Thames is held up as the great sanitary need of London, there are no statistics to show that the ratio of sickness or mortality near the river is greater than elsewhere. In remarking on this comment of Chadwick's, we are not for a moment suggesting any laxity in the endeavour to get the Thames clear of sewage at the first possible moment; but it may be that the reasons for doing so may be put on different grounds from those which have been sometimes advanced.

Sir E. Chadwick received no little recognition from scientific writers and others of the value of his work. In 1836 was published an elaborate work, well known in legal circles, entitled "Practical Treatise on the Poor Laws," by Mr. William Theobald, of the Inner Temple. It is dedicated to Mr. Chadwick, who was then secretary of the Poor Law Commissioners, and "whose superior powers of investigation," we are told, "probed the evil of past poor-law administration to the core, and developed it in a report worthy to rank with the celebrated article of Targot on Foundations." Dr. Marx, Professor of Medicine at the University of Gottingen, and Dr. Willis, the Librarian to the College of Surgeons, dedicated to Mr. Chadwick their work on the "Decrease of Disease as Affected by the Progress of Civilisation," remarking that "there is no man in this great Empire whose name can be so appropriately placed at the head" of such a work, and expressing the opinion that "your General Report on the sanitary state of towns [1842] is beyond all question one of the most valuable contributions that has lately been made to the noblest department of medical science,—the art of preserving the health of the community,—and will have an influence upon the human family as long as it exists." Dr. B. W. Richardson, in his dedication of that curious and interesting little book, "Hygeia: a City of Health," truly describes Sir Edwin as occupying the pre-eminent position of "the living leader of the sanitary reformation of this century." The late Sir Erasmus Wilson's standard work on Skin Diseases; Sir Robert Rawlinson's "Lectures on Sanitary Questions"; Sir Alfred Power's "Sanitary Rhymes"; Chambers's "Sanitary Economy"; Dr. Robert Pringle's "Asiatic Cholera," and an anonymously-published work in 1888, "The Natural History of Local Boards, or Local Government as it is," are all similarly dedicated to this Sanitary Father, in recognition of his great and lasting labours on behalf of the people.

Among various verses of an epigrammatic character, but in the complimentary sense of the phrase, which were addressed to Chadwick occasionally by friends or sympathisers, the following is worth quoting for its point:—

"If those for whom you life did gain,  
You on the battle-field had slain,  
You would have met with no rebuke,  
And long ere this been made a Duke."

Owing to the causes previously mentioned, it is not likely that Chadwick's writings will retain a permanent place in the English language, except now and then as references for students of the history of the subjects with which they are connected. They are, it must be confessed, dull reading,—more so than need have been even for the unattractive class of subjects with which they deal; and many of them were demonstrations against evils of the moment rather than permanent scientific treatises. These considerations detract nothing from the great and courageous work which Chadwick did in his generation; but they render it the more desirable that some national monument should be erected to him, such as would commemorate to future generations the debt which England owes to a man whose name and whose achievements, in promoting more healthy and just conditions of life among the poorer classes especially, a grateful country ought to record with honour for future generations.

"ARCHITECTURAL STUDIES IN ITALY."

**T**HE memory of the Glasgow architect who was honourably known as "Greek Thomson" has been perpetuated in Glasgow not only by the notable buildings he has left behind him, but by the establishment of an "Alexander Thomson travelling studentship" of architecture, of which Mr. W. J. Anderson, author of the volume whose title is given above, and now president of the Glasgow Architectural Association, was in 1888 the first holder. The conditions of the studentship required a three months' absence and satisfactory evidence of the employment of the time in architectural sketches or measured drawings. This evidence is collected in the handsome folio volume\* containing reproductions from the author's sketches and drawings, not originally made with any intention of publication, which however is quite justified not only by the excellent character of the drawings, but by the fact that some of them illustrate buildings or details which have not yet been worn threadbare by the efforts of the architectural sketched.

A considerable portion of the measured drawings illustrate the work of Baldassare Peruzzi, and among the most interesting of these are the drawings of the Palazzo Albergati at Bologna, two plates of which we reproduce by the author's permission; the third one gives large-size profiles of mouldings to scale. The building, as Mr. Anderson points out, is manifestly incomplete, the left-hand doorway having been evidently intended as the centre of the composition. It would have been a very long and low front when completed, but it is nevertheless a remarkable example of the effect attained by the Italian architects of the Renaissance by the simple and sober repetition of equally spaced windows, with their delicate and refined details standing out from an expanse of plain wall, and the whole dominated by the long and richly decorated cornice, unbroken in its stern horizontal line. The mass of the building is of brick, with stone only for the angles and decorative portions. The character of the details is sufficiently shown in the second of the plates reproduced, where should be noted the curious feature of the battered base crowned by a moulding, which is interrupted and returned upon itself somewhat awkwardly at the points where the doors are inserted. The general outline of this feature, with the proportions of its moulding, has a curious resemblance to the outline of an Egyptian pylon.

Plate xvi. gives a sketch of a house in Siena attributed to Peruzzi, a characteristic specimen of a smaller and non-palatial residence showing the same breadth of treatment; straight lines of windows in a mass of plain wall, and with a wooden cornice of great projection making a deep shadow along the upper portion of the front. Transferred to a northern climate this would look poor and dull enough; it is architecture for a sunlit country. Another of Peruzzi's works of which Mr. Anderson gives careful measured drawings is the more familiar Massimi Palace at Rome, with its rich decorative panels filled with sculpture over the doorheads; a little overweighting the doors, but giving a marked individuality of effect to the building.

The various smaller sketches which are given in the book, some of them of mere fragments of decorative detail, serve to remind one what an amount of variety there was in the Italian work of the Renaissance, a variety on the whole greater than is to be found in any period of Mediaeval architecture. No doubt Mediaeval detail in the best days is purer in taste, it is more consistent in reference to an accepted standard; but there is not the variety of fancy which we find in the free play of the Renaissance work. Among special examples of considerable interest as design are the wooden settee from the Museo Nazionale at Florence (Plate xxv.), and the

\* Published for the author by Maclure & Macdonald, Glasgow.

marble pulpit in the church of Saint Annunziata at Genoa, with its elegantly-designed spiral staircase. Other fine examples among the measured drawings are the marble chimney-piece in the Ducal Palace at Venice, with its sumptuous yet delicate detail, and the bas-relief decoration from a pilaster at Sant'Anastasia, Verona.

The reproductions from pencil sketches show a very good and free style of sketching; some of those reproduced from brush drawings are perhaps a little sketchy for publication. Among the lightly worked ones, however, that of the transept of Como Cathedral is exceedingly effective and gives the variety of texture and tone in the walling very well, without pronouncing it too strongly. The link-line perspective drawing of the Palazzo Prospero at Ferrara, on the other hand, is injured by being over-lined and overshadowed, losing its clearness. It may be pretty confidently affirmed that the complete sludging up of a perspective drawing in pen-line should never be undertaken unless there is the intention to take full time over finishing it with careful execution; and perhaps it is a question even then. A completely shaded drawing in line can, however, be made powerful and effective with adequate labour and finish, but not without; a mass of hastily scored lines to give shadow destroys the sharpness and architectural feeling of an architectural drawing.

Otherwise this is a book which subscribers and purchasers may well be glad to have on their shelves, both for its contents and for the sumptuous manner in which it has been got up in regard to paper and type, while the lithographers are also to be complimented on the style of their reproductions, especially of the pencil and water-colour drawings. The frontispiece to the volume is a reproduction from a perspective view by the author of one of Thomson's latest and best-known works, a church in Glasgow, which was one of the drawings by which the travelling studentship was gained. As we have before said, it may be doubted whether the style which Thomson evolved from Greek architecture can be regarded as altogether successful as a style for a northern Scotch city; the buildings already begin to look rather grim and desolate now that their new quality of surface is dimmed; but Thomson was a remarkable individuality in architecture, and his townsmen are quite right to endeavour to keep his memory in honour. What has been called the sincerest flattery, that of imitation, or of an attempt to further develop his style, as far as we have observed, they do not seem to have paid him.

NOTES.

**T**HE Railway Commissioners delivered judgment last week in two cases of some importance. In one instance an application had been made for an order for the dissection of certain rates at Preston and Greenbank. The object of the applicant (Mrs. Tomlinson) appears to have been to ascertain what proportion was for terminal services, which she performs for the company as owner of the private station at Greenbank. The London and North-Western Company allow her 9d. per ton for these services, an amount which she regards as insufficient. The Commissioners decided that she satisfied the description of a "party interested" in respect of a part of her application but not the whole, consequently only a portion of the information sought will be gained, while no order was made as to costs. The Commissioners seem resolved to discourage what they term "mere fishing inquiries" as to the composition of rates with a view to enable a person to see if he can discover anything to find fault with; and, although it is not suggested that this application was made with any such idle motive, they considered that the applicant had asked for too much. In the other case, the question at issue had been referred to the Commissioners—in accordance with the provisions of a private railway Act of last session,—"as arbitrators," a function

which they do not appear to at all appreciate. Indeed, Mr. Justice Wills stated that he entertained the strongest possible objection to the insertion of clauses in the Special Acts of railway companies, referring points in dispute to the Court in such a capacity, and that he had taken steps which would doubtless effectually prevent their insertion in future. His view is that, if matters are of sufficient importance to be referred to the Commissioners, they ought to be brought before them in their judicial capacity. There is, doubtless, a danger that awkward questions might subsequently arise as to the capacity in which cases were really determined, if this kind of reference were to be at all frequent.

**T**HE Pollution of Rivers Prevention Act of 1876 has been almost a dead letter because of the difficulty of inducing District Sanitary Authorities to put it into force; several causes combined to account for their inaction, — perhaps individual members of authorities were themselves interested in manufactures for the waste products of which the river formed a cheap and useful carrier; perhaps no steps could be taken against manufacturers because the Sanitary (?) Authority itself was chief fowler of the stream by pouring into it untreated sewage; and yet another cause of inaction was the smallness of the portion of river over which any authority had control, and the consequent difficulty of ensuring such concerted action on the part of all the authorities adjoining the river, as would materially improve its condition. But the Local Government Act of 1888 contained a clause which ought to prove of immense benefit to sanitation in this matter of river-pollution; we refer to the clause empowering the various "county" (including borough) authorities watered by any river to constitute a Watershed Board, which will be in a position to deal effectively with the river and its tributaries from source to sea. The advantages of the new scheme are obvious.

**T**HE first application to the Local Government Board for power to form such a Watershed Board as contemplated by the provisions above referred to was recently made by the County Councils of Lancashire and Cheshire, but the Local Government Board replied that the issue of a provisional order for that purpose would be facilitated if all the authorities which were to be included in the district would unite and decide upon the questions of representation, payment of expenses, and the like. In consequence of this reply, a meeting was held at the Manchester Assize Courts on Thursday last week, at which representatives were present from the County Councils of Lancashire and Cheshire, and the Corporations of Manchester, Salford, Bolton, Bury, Oldham, Rochdale, and St. Helen's. The borough of Stockport and the County Council of Derbyshire were not represented, although both are interested in the scheme, as some of the tributaries of the Mersey and Irwell are within their districts. The Right Hon. J. T. Hibbert, Chairman of the Lancashire County Council, presided at the meeting, and delivered an excellent speech in favour of the scheme; he referred to the recent death of a young man from typhoid fever, at Partington, Cheshire, about which the medical officer reported:—"The cottage in which the young man lived abuts upon the River Mersey, which here, as elsewhere, has no other appearance than that of an open sewer. The putrid emanations from the river, and especially from the banks left exposed when the water was low, were the cause of the fever." He also pointed out that the death-rate in Manchester was much higher near the river than in other parts of the town, and stated the length of the Mersey and Irwell, with their tributaries, to be about 300 miles. After some discussion the area of the district was agreed upon, and it was unanimously decided that the board consist of twenty-five members, and that the ratable value be the basis of representation. It

is certainly high time that steps were taken to lessen the filth in these Lancashire streams, and we wish immediate success to the combined authorities in their present application for power to form a Watershed Board, and trust that they will soon be able to make so much improvement in the state of the rivers of their district, that authorities in other parts of the country may be induced to follow their example.

**W**HAT is a "story" of a house? Is it necessarily a space enclosed within four vertical walls? This was the question propounded to the Queen's Bench Division in *Foot v. Hodgson*. The answer which the Bench gave to the question, and which may be found in the current number of the "Law Reports," is that a story need not necessarily be a space within four vertical walls,—one side may consist of a sloping roof. The point arose under the Metropolitan Building Act, 1855,—rule 6, in the schedule of the Act, speaking of "the topmost story," in reference to certain measurements. Surveyors appointed under section 85 of the above Act rightly thought that an attic might be a "story." On appeal to the Judge of the City of London Court, the latter thought that an attic was part of the roof, and not a "story." The Queen's Bench Division have, it will be seen, reversed this judgment, and, as it seems to us, with justice. "It would be unfortunate if such rooms as these were excluded from the important regulations of the schedule." These are Mr. Justice Grantham's words, and we agree with them. But it is also obvious that a "story," in ordinary language, means a space capable of being used as a room. A mere cupboard in the roof would not be a "story," but an attic, we cannot doubt, is a "story."

**T**HE case of the Mayor and Corporation of Salford v. Lever, decided last week by a Divisional Court of the Queen's Bench Division, is very satisfactory in the interests of commercial morality. It arose out of the now notorious Salford gas frauds, and was an action by the Corporation against a coal merchant, who had, through Hunter, the gas manager of the Corporation, obtained contracts for supplying coal at one shilling per ton above the market price. This one shilling per ton was to be given back by Lever to Hunter as the price paid for obtaining the contract. The action was to recover this sum from Lever. It is now well recognised law that secret commission received by an agent contrary to his duty can be recovered back by the principal from the agent. But in the present case the judges have gone a step further and held that the principal can recover from the contractor the excess price which the latter receives over the market price either as damages for a fraud committed against the principal, or, in legal parlance, as money had and received to his use. Therefore, the practical result of the case is that those who give bribes to an agent in order to obtain contracts from his principal may at any moment find themselves mulcted in damages for so doing. Of course there will be found men who will run this risk, nevertheless there can be no doubt that this decision is a blow to dishonest commercial transactions. A question also arose as to the legality of an agreement between the Corporation and Hunter after the frauds of the latter were discovered. But this part of the case was not of the same general importance as that which we have noted above.

**D**URING the consideration of the Housing of the Working Classes Acts Amendment Bill by the Standing Committee of the House of Commons on Law, on Monday last, an amendment to Clause 4 (demolition of obstructive buildings) was proposed by Mr. Ritchie and accepted, to the effect that a building which stops the ventilation of other buildings or conduces to make them dangerous or injurious to health shall be deemed obstructive. This is a very wise amendment,

which would admit of a more extended application.

**M**R. T. H. BICKERTON, oculist to the Liverpool Infirmary, has issued a pamphlet on colour-blindness and defective eyesight in sailors, with a view to inducing the Board of Trade to adopt more accurate tests for such defects than those it employs at present, and which he, in common with all our skilled authorities on the subject, considers worse than useless. The importance of the possession of a normal colour-sense by persons engaged in regulating traffic at sea and on railways by coloured flags and signal-lamps is obvious to every one, but the official mind seems to be remarkably obtuse in this respect, and looks on colour-blindness as a mental eccentricity rather than a serious physical defect of the body. Careful statistical observations show that among men one individual in twenty-five is colour-blind; so that most of us must have a colour-blind person among our acquaintances whose defect has escaped his and our own detection, showing the need there is for the adoption of a scientific rather than what is called a practical test where life is at stake. The necessity for the adoption of proper tests was pointed out by Dr. Wilson, of Edinburgh, as far back as 1855, three years after the adoption of red and green lights on ships, and has been urged again and again since then by many of our leading oculists at the Society of Arts and in the press. Fortunately, the Board of Trade has at last yielded so far as to request the Royal Society to advise it on the subject, and a committee, with Lord Rayleigh as chairman, is now investigating the matter; and there is also a committee of the British Medical Association employed in like manner. If further encouragement were necessary, Mr. Bickerton's arguments and recorded cases of grave accidents resulting from colour-blindness and imperfect eyesight at sea will supply it. The whole subject has, however, been well thrashed out, and the proper tests and the mode of applying them are perfectly known to the specialists, and can be easily acquired by novices, so there is little excuse for further delay in their adoption by the authorities. As might be expected, some of the larger steamship companies have set the Government a good example in this respect by adopting the most approved methods of eliminating from their service all officers and men with defective vision.

**I**N answer to a question from Sir J. Lubbock on Monday evening, in regard to the fate of Ennis Ahbey, Mr. Jackson (for the first Commissioner of Works) stated that Ennis Ahbey was not one of the structures vested in the Board of Works of Ireland for preservation as a national monument, and that such structures did not come under the Ancient Monuments Protection Act. That they do not seem to be mainly the fault of Sir John Lubbock himself, who drew up the Bill on such lines as to confine its operation to pre-historic monuments. We have always been of opinion that this was a mistake, and perhaps Sir J. Lubbock is beginning to find this out.

**S**IR JOSEPH BAZALGETTE'S new Battersea Bridge will, it is stated, be ready for use in the course of this month. In May, 1886, the late Metropolitan Board of Works ratified a contract for 143,000*l.* with Messrs. Williams, Son, & Wallington. On June 18, of the following year, the Duke of Clarence and Avondale laid the memorial stone (his first public function of that kind), and also opened the new suspension bridge at Hammersmith. The mallet and plumb used on that occasion had been made from an oak pile of the earlier bridge. Old Battersea Bridge had been pulled down in the winter of 1855-6, by Messrs. Mowlem & Co. It was

\* For an account of the structure see the *Builder* of August 11, 1883: meetings and visits of the Association of Municipal and Sanitary Engineers and Surveyors.

constructed of wood, in 1771; at a total cost of 15,600*l.*, to replace Chelsea Ferry. The design, which was illustrated in our columns of January 7, 1888, has been attributed to Cheselden, surgeon to Chelsea Hospital. He died, however, in 1752. Chelsea Ferry would appear to have appertained in the eighteenth century to the manor of Battersea and Wandsworth, and thus to have been owned by Sir Walter St. John and his descendants. One of these, his grandson, was the celebrated Lord Bolingbroke, Pope's "St. John," who died in 1751. His nephew and heir, Frederick, third Viscount, sold the manor to the trustees of his wife's cousin, John, first Earl Spencer. It was in favour of Lord Spencer, with certain others, that an Act was passed in 1766 for building the bridge, at their own charges. The ferry then yielded a profit of about 42*l.* a year.

NOW that the notion of lofty iron towers has been started, it is not surprising that various similar schemes should be proposed (whether destined to be accomplished or not), nor that it should be made an essential qualification of each new tower that it should overtop all the preceding ones. The proposed London tower was of course to be higher than the Eiffel; and, its proposed dimensions having become matter of publicity, the city of Chicago now proposes one to overtop both, and to rise to the height of 1,500 ft., with a diameter at the base of 480 ft. The projected design, of which a very rough print was published two or three weeks ago in the *Toronto Globe*, aims at being more architectural in character, in a certain sense, than the Eiffel tower, in that the base is masked by an immense piece of architectural scenery with a number of little cupolas, reminding one somewhat of an Indian pagoda or temple; out of the middle of this rises the immense stalk of the tower, which however appears to crush the whole substructure; and it may be questioned whether the frank display of the construction of the base in the Eiffel tower is not more truly architectural in principle. The architects are Messrs. Charles Kinkle & G. R. Pohl, of Washington, who designed the main building for the Philadelphia exhibition. The cost of the erection is estimated at two million dollars. The tower above the architectural screen is treated in successive stages of about equal height, marked by projecting balconies.

WE read in the *British Medical Journal* that the Apothecaries' Society are minded to dispose of their old "Physick Garden" at Chelsea. This freehold, being rather more than 3 acres in extent, is estimated to be worth upwards of 30,000*l.*, whilst to maintain the botanical garden involves an annual cost of 600*l.* The garden, lying near to the site of the old "Swan" tavern and between the new embankment and Queen's-road (antique Paradise - row) was originally leased by the Company in 1673. In 1721 Sir Hans Sloane conveyed it to them by gift, he having already bought Chelsea Manor of William, second and last Lord Cheyne. Evelyn records his visit, on August 7, 1685, "to see Mr. Wats, Keeper of the Apothecaries Garden of Simples at Chelsea"; he mentions "the tree bearing Jesuits bark" and "the conservatory," probably one of the first hot-houses built in England. The Company set up here Ryshracb's marble statue of Sloane in 1733; of the two once magnificent cedar trees, said to have been planted in 1683, one was blown down thirty-six years ago. The collection of new plants which, in terms of Sloane's conveyance, had to be delivered by the Company in yearly parcels of fifty to the Royal Society, is now incorporated in the Great Herbarium of our Natural History Museum; No. 2,112 in the Society's catalogue for 1764 is described as a "cultivated chrysanthemum." Students of botany and natural science have reason to regard this quarter of the town with reverence. For, besides Sloane, Sir Joseph Banks, and John Martyn, you may recall that at 10, Manor-street, lived William

Jones, entomologist; in Salamanca-place lived A. H. Ilaworth; in Barrosa-place Edward Sydenham, who established the "Botanical Register"; and near to Queen's Elm William Curtis, founder of the *Botanical Magazine*, which Sydenham illustrated, kept a botanical garden. Phillip Miller, author of the "Gardener's Dictionary" was gardener to the Apothecaries' Company for nearly fifty years; his monument, in old St. Luke's churchyard, was erected *e curis* the Horticultural and Linnæan Societies.

THE Marble Hill Estate, Twickenham, is offered for sale by private treaty, with a view to its conversion for building purposes. We adverted to the historical associations of this property in a "Note" of May 5, 1888. At the auction in June of that year it was withdrawn, after a bid of 52,000*l.* Since the death of Lady Alice, widow of General, Peel, the house has, we believe, been untenanted. The *Daily Telegraph* tells us that "in the grounds of Lady Suffolk's villa" Jeanie Deans pleaded for her sister's life to Queen Caroline. Now Scott explicitly lays the scene of their interview in Richmond Park, on the other side of the river. \* If it be true that, as avers our contemporary, thousands have scanned curiously from the deck of a river steamer the so-called "Jeanie Deans's Walk," at Marble Hill, it seems to be full time that wayfarers were undeceived.

THE Soirée given by the President of the Institute of Architects and Mrs. Waterhouse at the Natural History Museum on Tuesday evening was largely attended, and the great hall and galleries (of Mr. Waterhouse's own architecture) form both a convenient and effective evolution ground for the circulation of a number of visitors. The musical portion of the entertainment was especially well arranged, alternating between performances by the string band of the Royal Artillery in the large hall, and some excellent glee singing under the conduct of Mr. James A. Birch in the small hall in the rear, so that there were two contrasted forms of music to relieve each other during the whole evening. If, however, the Natural History Museum is to be frequently made use of for large soirées, it would be a great improvement to have it lighted by electric light, both for the sake of effect and to avoid the heat and odour perceptible in the upstairs galleries from the range of gaslights immediately below the halustrading. The open loggia in the upper story of the small hall would have formed a charming place to listen to the singing from, but for the fumes of the ring of gas-lights; an effective way of lighting as seen from above, but not so desirable when you are below it.

IN commenting on the selected design for the Sheffield Municipal Buildings the other day, we made some criticisms on points in the plan, while expressing our opinion nevertheless that the right choice had been made. As we hear that our adverse criticisms on certain points are being circulated in the local press without the context (we presume in the interests of some other competitor), we beg, in justice to Mr. Mountford, to call attention to the fact that our criticism, taken as a whole, was decisively in support of the selection of his design, and that while seeing some faults in the plan, we saw no design that, as a whole, had a claim to be put before it.

AS an example of the confusion of mind under which some of those who are called practical men are found labouring, a correspondent describing himself as "a Surveyor" writes to us gravely to ask whether the line of sight taken in looking through the telescope of a level is a line following the curvature of the earth, or a level line in space! He is probably related to the man who achieved the art of seeing round a corner.

\* *Vide* Chap. xxix. and the opening sentence of Chap. xxxiv. of "The Heart of Midlothian." In Chap. xxxv. Scott mentions the brick wall and the postern, through which the Duke and Jeanie Deans entered into the park.

IN the last issue of the *Semaine des Constructeurs* M. Malézieux recounts the singular results of his attempts to obtain by phonograph the results of the discussion in the committee on the question of a diploma for architects. The phonograph gave him too much, he says; he wanted a *résumé*, but here was the whole discussion repeated, "et quand arriva la fin, mon phonographe fit entendre un hrouhaha de départ." His patience being exhausted, he put the instrument aside, but happening a few days after to touch it in moving some papers, it started again, the sounds coming as if through the open door after the members had got into the street, as thus—

- 1st voice.—"N—i—n—f . . . . fini!"
- 2nd voice.—"Province . . . . pas . . . . plôme."
- 3rd voice.—" . . . . Congrès . . . . théâtre . . . . journa . . . . titre machine . . . . moi . . . . sans précaution."
- 4th voice.—" . . . . tainement . . . . éminent . . . . voir ça . . . . esprit . . . . toujours . . . . Institut."
- 5th voice.—" . . . . liberté . . . . monopole . . . . jamais! connais pas . . . . architecture . . . . mais . . . . principes . . . . administration . . . . n'honore . . . . enfoncé . . . . plôme . . . . Province . . . . faire loi."
- 6th voice.—" . . . . éloquence . . . . éloquence . . . . iem . . . . ule."
- 7th voice.—" . . . . centrale . . . . école . . . . pulsion . . . . goureuse . . . . y a qu'elle . . . . stéchnique . . . . tiquité."
- 8th voice.—" . . . . moi . . . . Brébant."
- 9th voice.—" . . . . champagne . . . ."
- 10th voice.—"Voilà tranquilles . . . . perous-le . . . ."
- 11th voice.—" . . . . question reviendra . . . . province . . . . caboches . . . . fait rien . . . . viendrous encore . . . . agréable compagnie . . . . mullo . . . . discours nouveau . . . . repoussez-vous . . . . onjours . . . . ça finisse."

After this the phonograph gave a clack, as of a door shutting, and recorded no more.

THE MEETING OF THE LINCOLN AND NOTTS. ARCHITECTURAL SOCIETY AT HOLBEACH.

THE annual meeting of the Lincoln and Notts. Architectural Society was held the week before last, under the genial presidency of the Bishop of Nottingham. The neat and quiet little Fenland town of Holbeach was the headquarters of the Society, from which excursions were made embracing, on the first day, Tydd St. Mary, Long Sutton, Lutton, Gedney, Fleet, Holbeach, Whaplode, Morilton, and Weston St. Mary; and on the second day, the churches of Terrington, Walpole St. Peters, West Walton, and Walsoken in Norfolk, and concluding with that of Wisbeach in Cambridgeshire. Three counties were thus laid under contribution, and no district in England could have supplied a grander and more varied series of churches, more deserving the careful examination of the student of our national architecture.

The first church visited, that of Tydd St. Mary, embowered in fine trees and reached by narrow plank-bridges crossing the fen-drains, lies at the extreme verge of the county of Lincoln, its sister and namesake, Tydd St. Giles, being over the Cambridgeshire border. Tydd, though less remarkable than most of the churches visited, is by no means without interest. It is of the common plan, of nave, with north and south aisles, south porch, chancel, and west tower surmounted by a spire. Like several of its neighbours, the exterior gives little idea of what is to be found within. Decorated walls, with some inserted Perpendicular windows and a clearstory of that date, contain a Transitional arcade, with cylindrical shafts and octagonal capitals supporting plain chamfered pointed arches. Most of the capitals are plain, but a commencement has been made to ornament them with stiff nascent foliage, which deserves attention. In the Decorated chancel is a very pretty double piscina, with ogee heads, its canopy running up above the sill of the window behind it and standing free. To the west is a range of three broad cinquefoiled sedilia, the dividing shafts being provided with bases, but not with capitals. In the north aisle is a good recombent, knightly effigy to one of the family of De Roos, of Gedney. The octagonal font called for more attention than time allowed. The shields on the sides of the basin are

charged with the instruments of the Passion and other subjects. One bears three chalice and as many wafers. There is a late, square-headed, two-light, low side window, much mutilated and blocked. The tower is of mellow red brick, capped with a grey stone spire.

The next church, Long Sutton, a large and stately edifice, 127 ft. in length, also, like Tydd, exhibits externally a Decorated and Perpendicular shell, containing a singularly beautiful arcade and clearstory of Early Transitional date. In the Decorated period, as was usual in this district, very wide aisles were added, much loftier than those they supplanted, entirely concealing the clearstory from outside, and (a later clearstory of very base design having been superimposed) converting it into the semblance of a triforium. The continuous shafted external arcade is to be seen within the aisles, above the nave arcades. Within, the clearstory is not continuous, to the great loss of dignity, only the centre light of each bay being pierced, and set in a somewhat heavy shafted arch. In the second bay from the east, on the south side, this arch has been much widened in a very clumsy fashion, the reason probably being to throw light on an altar in front of the rood-screen. The debased clearstory added in the last century by one Mr. Allen, whose knowledge,—or that of his architect,—was not commensurate with his liberality, is about to be replaced by one designed more in harmony with its surroundings, by Mr. Basset Smith. The long wide aisles, sweeping unbroken almost to the east end, add great dignity to the interior. They open into the chancel by two arches, flattened on the north, sharply pointed on the south, rising from uncomformably tall, lanky octagonal shafts standing on high bases—a piece of decidedly awkward design in this otherwise fine interior. The most remarkable feature of the building is the Early English tower and spire, the whole of one date, all but detached, and only touching the nave at its south-west corner of the widened aisle. This is described by the late Mr. Edmund Sharpe as “one of the earliest and most remarkable designs of the Lanet period in the kingdom, and especially valuable as one of the very few of our early towers which, having escaped fire and decay, shows how they were originally finished.” Originally, when this tower stood clear of the church, on four open arches now blocked, its dignity must have been much enhanced by its isolation. But it is still a most noble steeple, with few rivals in the country. Each angle is strengthened by an octagonal turret, finishing with a tall spirelet, leaning over towards the central spire, as though it were to clasp it in their embrace, and, like it, formed of wood covered with old grey lead. This church also possesses another remarkable feature in the small octagonal vestry of two stories, with a stone pyramidal roof, which projects from the north-east angle of the chancel. The lower story is walled in red brick with stone ribs; the upper chamber is also groined, and has a window-slit looking into the chancel. The adaptation of the responds of the chancel-arch when the Perpendicular chancel was erected, has caused some curious alterations. The church has been well restored, and is evidently lovingly cared for. Some rich stone sedilia, with elaborate canopies, have been set up in memory of the late rector, and a chancel-screen with cross are in preparation. The two side windows of the sanctuary are filled with excellent stained glass by Messrs. Barlison & Grylls, to which the glaring, crowded Crucifixion in the east window forms a painful contrast. The windows of the south aisle exhibit some beautiful old glass, especially a full-length figure of St. George.

Lutton, a short distance to the north, is a good example of a brick church. The whole fabric, which is of no great size, with the exception of the stone spire, is of this material. Even the shafted piers and moulded arches are of brick coated with plaster, a fracture here and there in the casing betraying what is behind. The fabric itself is Late Decorated, showing good flowing tracery windows in the chancel, with Perpendicular aisles and continuous clearstory and western tower. The fifteenth-century wooden tie-beam roof is of singular delicacy and beauty. The beams are finely moulded, each supported by figures enshrined in a niche between the clearstory windows. The belfry-arch is of fine proportions, the mouldings dying into the splayed piers.

Gedney is a church of magnificent propor-

tions and rich detail. It owes its dignity chiefly to the excellent design of the west tower,—rich Early English in the three lower stages,—with a tall Perpendicular belfry story, with two lofty transomed and canopied windows on each face; the lofty Perpendicular clearstory of twelve three-light windows, placed close together, crowned with a battlemented parapet and numerous small pinnacles, and the noble Early Decorated chancel, plain but majestic in its simplicity. But this grand church has been much neglected, and its forlorn and dilapidated condition cries loudly for the hand of a conservative restorer. Happily, this much-needed work has just been partially begun, through the munificence of Dr. Bellamy, the President of St. John's College, Oxford, who is a large landowner in the parish. The south aisle is already under repair, and it is to be hoped that the work, once set on foot, will be continued, and embrace the whole edifice. Immediately before the visit of the Society the removal of the high box-pews with which the whole interior has been cumbered, brought to light a very fine brass of a lady, of the end of the fourteenth century, beneath a triple canopy, with the Apostles in niches on either side, on a slab 8 ft. in length. These last have unfortunately perished, but the effigy is well preserved. The interior is rather disappointing after the stateliness of the exterior. The tallness of the octagonal shafts of the Decorated arcade and the width of the arches, together with the breadth of the aisles, creates an impression of bareness, which is increased by the slightness, almost amounting to emaciation, of the otherwise rich and elaborate tie-beam roof, which, also, it may be added, is in grievous need of thorough repair. The east window of five lights is a beautiful specimen of reticulated tracery. There are magnificent remains of a Jesse window in gorgeous coloured glass at the east end of the north aisle, and some equally good but more scanty relics in the side windows, and there is a fine tall light chancel screen. The pulpit standing against one of the north piers of the nave, is a noble example of the grand three-deckers with spreading sounding-board of the Georgian period, which, we hope, will be retained untouched in any restoration of the church. It is far more dignified than anything our modern architects usually design. Strange to say there is a modern panelled stone altar and stone altar-rails, both by no means good. In the south wall of the chancel there is a square-headed two-light low-side window like the mutilated example at Tydd. We must not omit to mention that a lofty spire was intended, of which only the base was built, on which a small lead-covered spirelet was subsequently set up. The east face of the tower, with the three weather-mouldings, one above the other, tells of the gradual growth of the fabric with unmistakable distinctness.

Fleet, at a very short distance from Gedney, is another very imposing church, remarkable for one of the detached towers characteristic of the marshland. This tower stands perfectly free of the church, some 12 ft. to the south-west. It is a plain composition, of Decorated date, surmounted by a spire. The outline is picturesquely broken by a bold staircase turret at the north-east corner, ending in a spirelet. Within the battlement arch small pinnacles, from which spring pierced flying buttresses to the spire. This church has suffered greatly from the destruction of the original roof, which has been replaced with a barn roof of the coarsest construction at a lower level, completely spoiling the effect of the building both from without and within. We were glad to hear that a new roof was soon to be begun. The Early English arcade is sustained by cylindrical piers of somewhat too slender proportions. The chancel is Decorated. It was designed for side aisles, which were never built, the work being probably suspended by the Black Death. The arches appear in the walls, framing the aisle windows, and a blocked doorway in the eastern buttress of the south aisle of the nave affords a curious evidence of the intended continuation of the wall eastwards. The stonework, like that of nearly all the churches visited, is excellent, and the gabled buttresses ending in knobs of foliage, and the fine base-moulds, give great dignity to the whole building. With a new and appropriate roof its effect will be admirable.

Returning to Holbech, the starting-point, Inceboon was taken and the church visited. This has hardly any rival in a district famous for its spacious and magnificent churches. Its general effect is increased, though its histori-

cal interest is diminished, by its being entirely of one date, rather late in the Decorated period, with the exception of the western tower and spire, which are very Early Perpendicular. The windows are nearly all flowing tracery, chiefly of two patterns, not conspicuous for gracefulness. The east window, of four lights only, is too small for its position, and sorely needs stained glass. The clearstory, of fourteen two-light windows on each side, set close together, sweeping from end to end, is a beautiful feature, but it rather suffers from want of height. The arcade of seven bays with tall, clustered piers on high bays, is of singular stateliness. The timber roofs are new throughout, designed by Mr. Christian, and certainly deserve high praise. In so spacious a church, with so many large windows, the entire absence of stained glass is much felt. A chancel-screen is also greatly wanted. The seating is costly and good. The pulpit, also designed by Mr. Christian, is a very elaborate and costly work. The lower stage of the west tower, opening into the nave by a fine arch, has on each of its three sides a large window of singular and, we must add, of very ungraceful design. It may be described as a window set within a window, the whole being of five lights, the inner window of three, divided by vertical mullions without any tracery or cusplation. These mullions and that which bound the inner arch, are carried up vertically to the outer arch, the intervening spaces being fashioned into trefoils and cinquefoils. As an example of the passage of Decorated into Perpendicular the design is interesting, but it certainly does not deserve imitation. Both the porches are remarkable compositions. That to the south has an outer arch of a very narrow and acute form, rather awkwardly squeezed up under a flatish gable. The inner doorway has exquisite Decorated mouldings. The north porch is so unlike ecclesiastical work that it has been suggested that it was not originally designed for its present position, but was brought from a destroyed manor house in the vicinity. The outer doorway, with rich, hanging tracery, is flanked by massive cylindrical turrets, one of which contains a novel stair leading to the room above; the other appears to have been used as a porter's lodge. At the west end is a rich shallow porch, with a groined roof and canopy running up above the window-sill. The altar tomb of Sir Humphrey Littlebury, born 1346, is a magnificent work. The recumbent effigy is of great size and fine workmanship. The head rests on a tilting helm, having as crest the singular device of a man's head (a Blackamoor's?) enclosed in a net. The canopied recesses along the flanks are of very unusual depth.

Whaplode, the church next visited, proved one of the most interesting of the whole two days' excursion. It has been reduced to a half-ruined state by long-continued neglect or barbarous usage. The roofs have been lowered throughout, leaving the gables gaunt and bare, protesting against their mutilation. Nearly all the windows have been robbed of their tracery, and otherwise disfigured, while the mean repairs of the chancel and north transept (the latter being converted into a school-room with a red brick chimney run up through the centre of the great window) have robbed them of almost every trace of antiquity. The church is to be restored by Mr. Pearson as soon as funds can be raised; it is to be hoped this will not be carried to the length of making a new church of it. The earliest part of the church, which is 150 ft. in length, is of Late Norman. Of this date we have the enriched chancel arch and the first four bays of the nave. The piers are partly short, stout cylinders, partly compound piers, bearing arches of disproportionate width and slightness, leaving so much of the upper surface of the capital unoccupied. The clearstory externally shows a continuous circular-headed arcade, pierced at intervals for windows, with, originally, a corbel-table above. The three western bays of the nave are of Late Transitional date, on the same general plan as the Norman part, but with very instructive points of contrast. The west front, in which the Early English style reigns uncontrolled, must have been a very vigorous composition. The west doorway is a fine specimen of the style in its greatest purity. The richly-moulded soffits rise from a

\* By the "Ordnance of the Vicarage," on the appropriation of the revenues of this and other churches to the Bishop's Table, in 1340, the Bishop was ordered to completely rebuild the chancel *de novo*. This gives us the approximate date of the fabric.

double row of eight detached shafts on each side, set one behind the other, with capitals of foliage. The tower, four stages in height, occupies an unusual position, as a kind of southern transept. It is a very striking design, the three lower stages Early English, with attached arcades; the fourth storey Decorated, with a battlemented parapet. At the west end of the south aisle is a very fine altar tomb, under a classical canopy supported by ten pillars, of the early part of the seventeenth century, bearing the effigies of St. Anthony Irby (d. 1593) and his wife Elizabeth. The excellence of the sculpture led the late Mr. Matthew Bloxam to attribute them to Nicholas Stone.

Moulton Church is a very fine edifice, its leading portions being of very late Transitional date, with widened Decorated aisles, and Perpendicular chancel, but its most striking feature is the noble western tower and spire, of the earliest years of the Perpendicular period, the exquisite proportions of which are absolutely unsurpassed. It gains much by being all of one design, *d'un seul jet*; battering gradually from the moulded base to the summit. The spire is of precisely the right height and diameter for harmony of effect, and is happily united to the pinnacles by well-proportioned flying buttresses. The arcade has pointed arches of two played orders. The piers are partly circular, partly clustered, the capitals displaying a series of stiff engaged leaves, all inclined one way. The two sides of the clearstory differ. That to the south has round-headed arches, and is not quite continuous. That to the north exhibits pointed arches and is continuous. The interior abounds in battlemented brackets projecting from the walls and piers, once bearing images. There are singular traces of an altar, with piscina and bracket, in the sill of a window of the south aisle, immediately to the west of the south porch.

The first day's excursion closed with Weston St. Mary, a lovely little gem of pure Early English architecture, with Decorated transepts and Perpendicular west tower. The piers are low, and shafted with capitals of stiff foliage, surmounted by the sweeping circular abacus common to the district. The clearstory is not continuous; it has small lights shafted externally, one between each two of the nave arches. The chancel arch is of admirable proportions. The chancel itself has tall single lancets in the side-walls, and three unequal lancets in the east wall, all divided by tall, slender buttresses. The east gable, with its vestian, belongs to the first restoration, carefully carried out by its former vicar, the late Prebendary Moore, vicar of Spalding. We agree with Mr. Sharpe in deeming it "one of the best examples we have of the east end of a small parish church." The restoration was carried to a conclusion, including the raising of the nave roof to its original pitch, under Mr. Pearson's directions, by the retiring vicar, the Rev. E. M. Sanderson, vicar of Huyton. The south porch is of much dignity. Within, each wall shows an arcade on detached shafts. At the entrance are the red granite memorial slabs of Prebendary and Mrs. Moore. The Early English font is of great dignity. It stands at the west end of the nave, on a high octagonal flight of steps, with a broad platform for the priest. The octagonal basin bears conventional Early English foliage on each face. The modern glass in the chancel windows is excellent. Altogether Weston is a delightful example of a small sober parish church of the best style of English architecture.

The second day's excursion took the Society across the border into Norfolk. The churches visited were Terrington St. Clements, Walpole St. Peters, "the Lady of Marshlow," West Walton, Walsoken, and the Cambridgeshire church of Wisbech. The space allotted to us forbids our attempting any description of these churches. Suffice it to say that they are among the largest and most magnificent examples of ecclesiastical architecture anywhere in England. All having been sufficiently, but, as a rule, not too much restored, with one lamentable exception, are in good condition. The exception is West Walton, the forlorn and dilapidated condition of which called out the indignant protests of the members of the Society, with expressions of astonishment that the parochial authorities, especially the rector of the church (who is living stands in "Crockford" at 1,374, and 1,112, net), and the parishioners generally, should tamely allow the priceless inheritance received from the piety of their forefathers to

sink into ruin without a sustained and vigorous effort for its preservation. The roof is in an unsafe and leaky condition, the light shining through in every part; its walls are hulking, cracks are opening, and it looks as if it only needed a strong wind, such as often blows across these exposed marshes, to bring the whole to the ground. We earnestly hope that the visit of the Lincolnshire Society may lead to vigorous action being taken towards its repair. The first step to this would be to call in some experienced architect to report on the condition of the church, and the sum required for the substantial repair needed for its preservation from inevitable destruction. If the architect were to counsel the entire removal of the inordinately wide and high north aisle, so unhappily substituted in the Decorated period for the original narrow Early English aisle, and the restoration of this latter, whatever the Society for the Preservation of Ancient Buildings might say, we should accept this counsel as sound. This aisle has now lost every architectural feature, and has become a mere ugly lean-to shed, utterly destroying the proportions of the church, and blocking up and all but entirely hiding the fine Early English arcade clearstory. The south aisle is also unbaptly wide, but it preserves its old windows, some of which are of great beauty. The detached Early English bell-tower, standing, like those at Evesham and Bury St. Edmunds, as an entrance to the churchyard, is probably the most beautiful example of this arrangement, so unusual in England, to be found anywhere. In its proportions, its design, and its detail it is as near perfection as possible. We hope its substantial repair may be much better than that of the church. But neglect is a spreading evil, and solitary examples of it seldom occur.

It is an interesting evidence of the prevalence of a local fashion that while detached bell-towers are generally so unfrequent with us, this corner of England should show as many as four towers completely detached.—Tydd St. Giles, Fleet, Terrington, and West Walton,—and two others, Long Sutton and Wisbech, virtually so. There is a similar group in Herefordshire, seven in number—viz., Ledbury, Bosbury, Garway, Holmer, and Richard's Castle, and the dove-cote-like erections at Pembridge and Yarpole. Other examples occur at Berkeley, East Dereham, Beccles, Kirkoswald, Brookland, Warmworth, and other places, especially Chichester Cathedral, New College, and Magdalen College, Oxford. The *raison d'être* of these isolated campaniles has yet to be fully investigated. At Wisbech the detached tower was erected in late Perpendicular times, when the original western tower at the end of the Transition nave had fallen and crushed the southern arcade, for which a singularly slight arrangement of slender piers and wide arches was substituted. One other peculiarity may be mentioned. At Walpole St. Peter's, the eastern bay of the magnificent chancel, one of the noblest examples of Perpendicular in its earliest and best form, is elevated considerably above the general level, and the altar is reached by a lofty flight of steps, which, on our visit, were ornamented with greenhouse plants. This arrangement was rendered necessary by the existence of an old right-of-way through the churchyard passing by a groined passage beneath the chancel.

#### PLAS NEWYDD, LLANGOLLEN.

AMONG the many interesting country places which are announced as about to pass under the auctioneer's hammer, few enjoy more pleasant associations than Plas Newydd, the romantic home of those two famous recluses, the "Ladies of Llangollen."

Llangollen is a very lovely old town, situated on the river Dee, on the borders of Denbighshire and Merionethshire. It is a railway-station on the line between Wrexham and Bala, and a well-known haunt of the brethren of the angle, and fifty years ago or more it was one of the places where the Royal mail between Shrewsbury and Holyhead always stopped to change horses. It nestles on a slope at the foot of the Berwyn Mountains, which rise on the south and west, and the cloud-capped summit of Dinas Bran frowns down upon it from the north. Three miles off to the north-west are the well-known ruins of Valle Crucis Abbey.

Being on the high road between Dublin and London, it is no wonder that the charms of the Vale of Llangollen should have arrested the attention of many of the sons and daughters of

the sister isle. Some hundred and twenty years ago this had been the case with the Lady Elizabeth Butler, a native of Kilkenny, a sister of the Earl of Ormonde, who had travelled through it on her way to be presented at Court at St. James's; and when, a few years later, she formed a romantic friendship with the Hon. Miss Ponsoby, the daughter of a neighbouring squire, the two fair ladies eloped together from their homes in the south of Ireland, and resolved to fix their tent here. A small cottage on the crown of a hill, in the upper part of the town, with a few acres of ground, as it happened, was to be "sold or let." The place had a pleasant aspect, and commanded fine views. They took it at first on a short lease, and afterwards they bought the freehold. Horace Walpole had lately made Strawberry Hill famous by converting it into a semi-Gothic mansion, and filling it with knick-knacks from Italy and Spain; and Lady Elizabeth and her friend resolved that "Plas Newydd," as they named their house, should be equally famous as a semi-Gothic cottage. They saw that the Gothic taste was becoming a popular "fad," and they resolved to be beforehand with it.

Accordingly they enlarged the little house by additional rooms on the ground-floor, and by building two sleeping-apartments above. These they adorned with panels of old oak, partly Ecclesiastical and partly Classical in pattern, and they surrounded their unpretentious dwelling with an ornamental wooden palisade. They laid out their garden with taste and skill, and on the opposite side of the roadway they constructed a dairy, in a little grove or shrubbery, which they called after the Duke of Wellington's name when he came to see them during one of his visits to Denbighshire, while staying with his relatives, the Trevors, Lord Dungannon, at Brinkinall, a few miles off.

Plas Newydd, like Strawberry Hill, now became, through the fame of the fair recluses and the mystery in which they enshrouded themselves, quite an object of pilgrimage in the western counties. But the ladies were shy of admitting strangers; indeed, they refused to see visitors unless they wrote to them beforehand to announce their intention of making a call, or asking permission to do so. This gave them time to prepare their rooms, and to perfume them with pastilles, which "they kept in bronze censers."

Among their visitors were Lord Castleragh, the unfortunate Lord Edward Fitzgerald (when a price of 1,000*l.* was put on his head for his share in the Irish Rebellion of '98) and his wife Pamela, Madame de Genlis and her pupil, Mlle. d'Orleans, Bishop Heber of Calcutta, the poet Wordsworth, and the Duke of Wellington.

The ladies wore a decoration of which they were very proud, a blue sash with the barp and crown of Erin, given to them by a Lord-Lieutenant of Ireland; and others conferred on them by the Duke of Orleans.

Down to 1810 they held their cottage on lease, but in that year their old Irish servant, Mary Carrol, died, and left them her savings, with which they purchased the freehold. The faithful creature was buried in Llangollen Churchyard, and the ladies raised over her remains a stone monument with three sides, on one of which they placed her epitaph, inscribing the other sides with their own names, and leaving vacant spaces for the dates of their deaths. The ladies survived her twenty years, dying respectively in 1829 and 1831.

In 1832 the place was brought to the hammer by George Robins, who held an eight days' sale of their effects, when many of their cherished treasures were bought by friends and neighbours as souvenirs.

The house itself, by the irregularity of its construction, tells its own tale. It is simply a cottage enlarged by successive additions till it has reached the size of a country rectory or vicarage. It originally comprised only three or four rooms on the ground-floor, to which the ladies added two small bedrooms on an upper story. Then they erected a "vestibule" with an outer and inner doorway, and an "ante-room," in which they took their meals; and they placed two fixed oak settees in the porch, so that they could sit after dinner and take tea or sip coffee out of doors. The porch is made almost entirely out of old oak and the churches of Llantsyllio and Llangollen, mixed up with grotesque carved beads of Queen Anne's time from Northumberland House in the Strand. This and most of the other oaken fittings were put together by native workmen. This porch still stands perfect in all its details.

The "Oak Room" is so called from carvings which cover the walls, the intervals between each being filled up with richly-embossed leather of the sixteenth century. In it are two curious seats or "thrones;" the one called the Confessional "Throne" came from a Spanish monastery. It bears a figure with a mask, with open mouth and ears for communication between the priest and his penitent. The other, or "Washington Throne," equally quaint in its adornments, is so called because it is made out of an old oak tree at Sulgrave, in Northamptonshire, the residence of George Washington's ancestors. The window recess is panelled with oak taken from the pew in Llangollen Church, in which the ladies sat Sunday after Sunday, and is diversified with a classical sculpture, "The Flaying of Marsyas," and by the bronze handle of the ladies' alarm bell. The rest of the room is adorned by heads of Queen Mary, Queen Elizabeth, and the Earl of Leicester, a portrait of Mary Queen of Scots on panel, allegorical devices, paintings on copper, bronzes, ivory statuettes, cameras and carvings in alabaster. Here also are the footstools, fire-screens, glass vases, and wooden candlesticks used by the "ladies of Llangollen," and specimens of their needlework in gold and silver thread. The room is little altered from what it was sixty years ago, and the ladies' hat-pegs and coat-pegs still remain *in statu quo* in the vestibule, though the bats and the long coats are gone.

The staircase is a mass of carved oak, of various dates and styles, and it is surmounted by a very handsome reredos, probably taken from some church on the Continent. On the handrail are sculptured a lion, a squirrel, and a mermaid; a panel close by bears the date 1192; but this date may be questioned.

The ante-room on the ground-floor, in which, as already stated, the ladies dined, is now filled with antique furniture, carvings, paintings, and other curiosities of a very miscellaneous character; but many of these have been added since their time. Amongst other curiosities are some steel gauntlets of the time of Richard II., some javelins of the fourteenth century, a bronze stirrup and spur of Cromwell's day, an old "Row-street runner's" staff, a Dutch alewife's scoring-board, some porcupine work-boxes from Ceylon, and three beautiful pieces of needlework in gold, silver, and silk, of the seventeenth century. These are very elaborate, and each bears the silkworm as an emblem for industry; of the snail, for thrift; and of the butterfly, for joy. It may be added that these pieces were for a long time on loan at South Kensington, and were thought by judges not to be surpassed in workmanship or in design. One of them represents Charles I. when Prince of Wales, with Henrietta Maria holding the "loving-cup"; and another, guests waiting for a syllabub-party. The milk, the wine, the bowl, the fruit, and the figures are all wonderfully depicted by the needle. Of the carvings and paintings on the walls, some belonged to the ladies, but others are more recent acquisitions.

The library, which in the time of the ladies was called "The Salon of Minerva," contains a few books and a variety of oil-paintings, of which the most remarkable are "The Owl Preaching Wisdom to the Forest and Flood" (1690), and a large oil-painting by a Welsh artist, named Williams, representing George III. and his Court in Kew Gardens, with the future King, William IV., riding on a dog. There are also to be seen some fine specimens of embroidery in worsted, silk, and satin; and a large collection of carvings in ivory by the last owner of the property, General Yorke, C.B. The tables, the window recess, the shelves, and the cabinets of this room are all filled with curiosities and knick-knacks, to most of which some history is attached.

Lady Eleanor Butler's bedroom remains much as she left it more than sixty years ago. There are the huge tiger-skin made up into a rug; the table-cover of rich tambour-work of the sixteenth century, in white silk; the figures of two angels carrying the armorial bearings of the Ladies of Llangollen, presented to them by an artist in the town; a carving knife and fork, hatted with wood from Old London Bridge; and two "smoothing boards," for folding up the frills worn by ladies and gallants in the days of Queen Elizabeth. Of Miss Ponsonby's bedroom there is little to be said, except that it is adorned in the same eccentric manner, and that it remains very much in the same condition. Nearly all the windows are filled with painted

glass, some old and good, but more modern and poor.

But it must not be supposed that the exterior of this Newydd is unworthy of description. On the contrary, the porch and front door deserve special notice. The outside, as well as the inside, is rich in old oak. The entrance is supported by bed-posts of the time of Charles I., worked deftly into the surrounding woodwork, and bearing the royal arms and texts from sacred and profane sources, warning against all excesses. On the door are carved the emblems of the four Evangelists and other sacred subjects, and by their side are Indian and other Oriental carvings. The frieze is also a true type of the exquisite taste of "the ladies," who were perplexed for years to find a match for the "cat and acorns" till they completed their panel by a "little dog and cakes." On each side of the porch are windows richly canopied with oak carvings, which represent a variety of Eastern, and especially Hindoo, ceremonies—the gifts, it is said, of Harriet, Duchess of St. Albans. Over the Gothic windows is a small tablet, erected by General Yorke to the memory of the two ladies.

On the lawn in front of the house are two ancient stone fountains, the one from Llangollen Church, and the other from Valle Crucis Abbey. In the Rockery is a monk's head, and also a stone coffin-lid, both from Valle Crucis. Near to the Rockery is the Ladies' Bird-cote, and this is the only part of the entire property which is out of repair. In fact, it is speedily falling to decay.

On the road-side wall is a portal composed of old oak from Llangollen Churches; and the gables of the house are decorated with five "Emblems" of the Crown in the time of Charles I. They came from St. Thomas's Church at Newport, near Carisbrooke, in the Isle of Wight.

On the exterior is painted a variety of quotations from the poets in praise, or at all events in celebration of, these ladies and their home. The best known of all, perhaps, though the best worth quoting here, are the lines written by the poet Wordsworth, during a visit which he paid to Llangollen in 1824. They run as follows:—

A stream to mingle with your favourite Doe,  
Along the vale of Meditation flows;  
So styled by those fierce Brians, named to see  
In Nature's face th' expression of repose.  
Or haply there some pious hermit chose  
To live and die, the peace of heaven his aim;  
To whom the wild, sequestered region owes  
At this late day its sanctifying name.

Glyn Cysellgarwch in the Cambrian tongue,  
In ours, "The Vale of Friendship," let this spot  
Be named; where, faithful to a low-roofed cot,  
On Devon's banks ye have abode so long,  
Sisters in love, a love allowed to climb,  
Even on this earth, beyond the reach of time.

It may be interesting to record the fact, although scarcely to the credit of the fair recluses, that "the ladies," so far from being pleased with the lines of the poet who sought to immortalise them, resented his description of this Newydd as a "low-roofed cot," and never asked or allowed him to repeat his visit.

The place, having been for some years or more in the hand of new owners, was bought, in 1876, by General Yorke, C.B.—a Balaklava hero, and a member of the ancient house of Yorke of Erding, Denbighshire, who spent large sums of money in repairing the place and adding to its treasures, and whose death in the early part of the present year has forced this Newydd again into the market. It was he who added close to the entrance-gate the lines from Keble's "Christian Year":—

"Since all that is not Heaven must fade,  
Light be the hand of ruin laid  
Upon the home I love."

#### COMPETITION.

KENSINGTON INFIRMARY ENLARGEMENT.—The Kensington Guardians, with the assistance of Mr. Thomas Worthington, F.R.I.B.A., of Manchester, as assessor, have selected from among the designs sent in for the proposed enlargement of the Infirmary in the Marlborough-road, Design A, sent in by Mr. T. W. Aldwinckle, for the first premium, and that sent in by Mr. Delissa Joseph, for the second premium.

RAILWAYS IN PERSIA.—The *Standard* says that an English engineer recently passed through Tiflis on his way to Persia, under orders to negotiate with the Government about the construction of railways in that country.

#### THE ARCHEOLOGICAL CONGRESS AT OXFORD.

THE forty-seventh congress of the British Archaeological Association was opened on Monday last, July 7, at Oxford, by the Earl of Winchelsea and Nottingham, acting in the place of the late Earl of Carnarvon, who had kindly undertaken to preside over it, but was prevented by the illness which terminated in his death. In spite of the unpromising state of the weather, and of the absence of the Association's genial and learned secretary,—Mr. Loftus Brock,—a fair gathering of members and friends assembled on the occasion, amongst whom were Sir Arthur Hodgson, Colonel Lambert, Mr. George R. Wright, Mr. W. De Gray Birch, Dr. Phérix, the Hon. George Brodrick, D.C.L., Mr. E. G. Bruton, the Rev. G. N. Freeling, and Mr. E. Walford, M.A.

At two o'clock the members were publicly received in the Council Chamber of the Town Hall by the Mayor of Oxford (Mr. J. Hughes), the Sheriff, the Town Clerk, and other members of the Town Council, the Vice-Chancellor of the University, Dr. Bellamy, and the Warden oferton College, &c. The Mayor, in a very brief speech, introduced the Earl of Winchelsea to the meeting, remarking, however, that it was hardly necessary to do so, as he had already presided over the Congress held last year at Lincoln. On the part of the Mayor and Corporation of Oxford, and of his fellow-townsmen, he offered the entire party a hearty welcome to the ancient city, and had no doubt that the University, whose chief officer was present, would do no less. In conclusion, he expressed a hope that the gloomy weather would pass away, so as to make their Congress a pleasant one.

The Earl of Winchelsea and Nottingham, as acting president, said his first duty was to tender the warm thanks of the Association to the Mayor for the kind welcome he had accorded to them, and also to the Vice-Chancellor. He was aware there was a very ancient strife between the two bodies, but they were glad that they were now united, and that the only strife remaining was in the form of a generous emulation to see who could do the most for the well-being of all and for the restoration of those buildings which were the equal glory of the City and of the University. They had to lament the death of an honoured statesman whose place he had been called on unworthily to fill. Lord Carnarvon was High Steward of the University of Oxford, and all would deeply deplore his loss. He began his career at Christ Church, where he worked hard, and obtained a first-class. In 1859 he was appointed High Steward, and he had maintained that position until his death. It would be out of place for him there to refer to his political career except in one particular; the work he had done in promoting the Bill for the confederation of the North American Colonies, which gave them the Dominion of Canada. If he might be permitted to say one thing which would make his name green to posterity, it would be that he possessed many high qualities, and all of rare excellency. Lord Carnarvon was able in an age when party politics ran high to keep an unerring rectitude by the light of his conscience. He was able in an age when respect given to rank was only grudgingly given to keep the affection and respect of his tenants, and to his other qualities must be added a scrupulous regard for religion. The occasion when thirty years ago Lord Carnarvon had presided over a congress, and the address he had then given, was still fresh in the memory of those who heard it. He would not attempt to follow where Lord Carnarvon would have led, but it would be less than his duty if he did not mention one or two things, more especially as they would probably visit the Bodleian Library, where they would find no more interesting collection of MSS. than those bequeathed by an ancestor of his own, and called the Hatton MSS. He had been suddenly seized with a great interest for the ruins at Stanton Harcourt, and studied them with a fair guide who afterwards became his wife. They would not see the ruins under the same interesting circumstances, but then would find there a kitchen—even a kitchen dating back to 1100—had a halo of romance about it—which was one of the most interesting in England, and had been in the family of Harcourt since 1100. It was well worthy to be looked at, and stood alone with Glastonbury, and remained that day

as perfect as the day it was built. There was also Pope's tower, where he wrote some of his poetry, and the church, too, was of great interest. With regard to the ancient history of Oxford little was known of it in Roman times, but in Saxon times it became a place of first-rate importance from its position, commanding as it did the communication to the south over the river Thames. Its position led to many battles, and, in fact, from Reading to Eynsham more battles had taken place than in any other area of the same extent in the United Kingdom. The town had been the chief in Mercia; and now that there was a chance of those ancient divisions being restored, and Mercia having gained Home Rule, Oxford might again be its capital. In Norman times the town was handed over to D'Oili, who built the castle and St. Michael's tower, partly as a tower to the church and partly for the defence of the north wall of the town. It would be impossible to enumerate all the buildings in a short space, but he thought the proper way for them would be to select one good example out of each epoch. He described the boundary of the city in Medieval times, and referred to the portion of the city wall still standing in New College, which had been kept in a state of preservation under an agreement between the college and the city. When they came to the 13th century they came to the time when the colleges began to be founded, and he would select Merton as the only college which could boast of buildings at present which were still as when first erected. For the next hundred years he would select New College, founded and built about 1384, and for the next century Magdalen was *facile princeps*. The object of the society was not so much to be found in Oxford but in the country, where the country clergy wanted the moral support of an association such as theirs, and their visits to such places as Ilfley, Dorchester, or Stanton Harcourt might be of the greatest use, as it would be an irreparable loss if anything happened to them. No efforts that could make would be too much to resist the effects of time on buildings which they could thus make stand for still one further generation. He thought the City and University had done well to receive them kindly, and he trusted they would gain from the buildings a lesson which would enable them to live out the life of their own late President.

Lord Winchelsea having then declared the congress open, the Vice-Chancellor moved a vote of thanks to his Lordship, which was seconded by the Sheriff, and carried unanimously. At the conclusion of the proceedings in the council-chamber, the members and visitors, under the guidance of their indefatigable secretary, Mr. Wright, and Mr. Bruton, F.S.A., made a survey of the chief University (as distinct from collegiate) buildings, making their way first to the Radcliffe Institution (now used as an appendage to the Bodleian), the Sheldonian Theatre in Broad-street, in which the annual commemoration of founders and benefactors is held; the Ashmolean Museum, rich in antiquarian treasures and objects of curiosity; the quadrangle of the old schools, the Divinity School, with its rich and elaborately-carved roof, and lastly, the Bodleian Library itself. Here they were received by the chief librarian, Mr. E. B. Nicholson, who gave the assembled party a brief historical account of the library, from the days when it was located in trunks and boxes in the parvise of St. Mary's Church, down to its first actual establishment by Sir Thomas Bodley in the reign of James I., and then tracing its growth and development to the present time, when it stands about sixth among the public libraries of Europe. He also explained the privileges which the library has enjoyed, and the principles on which it is now administered. He also gave an approximate account of the bulk of its contents, the number of its volumes, its rate of increase, &c., and he concluded by showing to the party the leading pictures and statues which adorn the walls and corridors of the library.

In the evening the archaeologists sat down to dinner in the large room at the Randolph Hotel, but Lord Winchelsea was unable to take the chair, as he had intended, on account of having taken a chill in the course of the morning's proceedings.

On Tuesday, the second day of the Congress, the party assembled soon after breakfast in the Hall of Merton College, when the Warden, the Hon. George C. Brodrick, read before them a most interesting historical paper on the early history of the University down to the middle of the thirteenth century, when it gradually gave

way to the Collegiate system of which Walter de Merton was the undoubted founder. His example was followed by other pious and generous donors, and before long Balliol College, University College, New College, and other Colleges made provision for the morals as well as the education of the rising youth of England. The Warden afterwards showed to the party the ancient College Library, in which some of the original shelves, seats, and benches still remain, after a lapse of six centuries, and also a few of the original chains by which the volumes were fastened and secured. He next pointed out the old "Mob" quadrangle, as it is called, and which still remains almost unaltered since the days of its founder; the College chapel, rich in brasses and painted glass, and in tracery of the Early Decorated period. He also pointed out to them the exquisite iron scroll-work still existing on the hall door, and the repairs which have been carried out in the sacristy, which was used lately as a brew-house. He ended by taking the party into the College garden, and showing them the terraced walk along the top of the southern city wall.

We will say more about the Congress next week.

SUB-CONTRACTING IN THE BUILDING TRADE.

BY A FABIAN.

SIR,—I cannot resist the opportunity of endorsing the admirable opinions expressed by E. C. Robins, F.S.A., in your last issue.

The London County Council and the School Board, "Thanks to the untiring energy of a few representatives of the workers," have shown us how the pernicious system may be scotched and eventually abolished.

My experience as a worker is, the good practical workman, the one who takes a pride in his work, is not the article in demand to-day; but the one who can rush and make a great show in the shortest time, "regardless of the stability of his work," is the one to command a job from the average sub-contractor. The workman is never led to believe his interest is required in the undertaking, consequently the sole ideal of labour is twelve o'clock on Saturday.

Now this abominable system is too deep-rooted to be plucked up at once. The question is, how to bring about a better state of things in the shortest period. The Trades Unions are working from their side, and is it not fair to ask the large employers to work from theirs, to hasten the solution of the difficulty? The interests of both are identical, but through the short-sighted policy in the past they have been antagonistic.

The United Building Trades Committee have secured the services of that eminent Member, Mr. Sydney C. Burton, to bring forward the whole question in the House, and I do not think I am wrong in saying we may rely upon some startling disclosures.

The Co-operative Builders' Company at Brixton is an object lesson for us; there every workman has a direct interest in the business.

The manner in which the trade has increased since Messrs. Curtis allowed their workmen to enter as partners, is a sufficient guarantee of the excellence of their work.

I believe other co-operative builders' companies are in course of formation, the members of whom have a thorough business knowledge, but lack the commercial experience so essential to success. Now is the time for those possessing that qualification to stretch out a helping hand to those anxious to sweep away the present unrighteous custom.

In conclusion, why should not the large firms take the men into their confidence and jointly devise some equitable mode of profit-sharing. The prevention of undue waste on the part of the men, together with the less need of over-lookings, would amply repay both parties.

A. C. H. GRAHAM.

ASSEMBLY ROOMS, BATH.—The proprietors invite tenders for a lease of these rooms, and the adjoining dwelling-house, together with their furniture, &c. The premises include a hall-room, tea-room, and two card-rooms. Originally known as the Upper Assembly Rooms, they were opened in 1771, having been erected at a cost of 20,000*l.*, after the designs, in the Doric mode, of John Wood the younger. The Lower Rooms, near to the Parade, in which Mrs. Piozzi opened a ball on her eightieth birthday, were destroyed by fire in 1820.

UNIVERSITY COLLEGE, LONDON.

AWARDS TO ARCHITECTURAL STUDENTS.

THE following awards have been made:—

ARCHITECTURE, Professor T. Roger Smith, F.R.I.B.A.—*Fine Art*. Donaldson Silver Medal. C. C. Brewer of Finchley. Second Prize. Kotaro Sakurai of Japan. Certificate, 3*l.* Alfred Hale of Birmingham. *Second Class*. F. K. Kendall of Blackheath. *Third Class*. R. M. Whellock of Nunhead.—*Sketches*. Prize. Kotaro Sakurai of Japan.—*Construction*. Donaldson Silver Medal. Kotaro Sakurai of Japan. Second Prize. F. J. Slater of London. *Second Class*. T. A. Brooks of London. E. B. Hoole of London.—*Modern Practice*. Prize. Louis Jacob of New Cross. Certificate, 2*l.* Denny Watney of Croydon. *Second Class*. H. R. Appelbee of London. H. Helsdon of London.

CIVIL ENGINEERING AND SURVEYING, Professor L. F. Vernon-Harcourt, M.A., M.I.C.E.—*Civil Engineering*. Prize. A. P. Head of Newcastle-on-Tyne. *Third Class*. L. C. J. Doxat of Dawlish.—*Surveying*. Prize. A. P. Head of Newcastle-on-Tyne. *Second Class*. J. S. Gomar of Madrid, W. B. K. Ridge of Enfield. *Third Class*. E. Lyon of Valparaiso.

GILCHRIST ENGINEERING SCHOLARSHIPS.—Entrance Scholarship, 35*l.* per annum for two years.—R. D. Hall of London.

THE ASSOCIATION OF MUNICIPAL ENGINEERS AT LIVERPOOL.

WE conclude our notes of the Annual Meeting of the Association of Municipal Engineers and Surveyors, recently held in Liverpool (see p. 8 *ante*).

The London Sewage Question.

Mr. Crawford Barlow, B.A., M. Inst. C.E., read a paper on this subject. In his introductory remarks the author said: The Metropolitan Board of Works' scheme for the main drainage of London, so ably designed by, and constructed under the supervision of, Sir J. Bazalgette, was laid out to deal with the sewage of a population of three millions and a half. That is to say, in designing the system in 1856, provision was made for an increase of population for about twenty years in advance. In 1875 the population of London reached that figure, and since then the system has been over-charged. In addition, the arrangement for the disposal of the sewage by discharging it into the Thames immediately outside the metropolitan area, was only sanctioned on the understanding that a more complete system of disposal was to be arranged as soon as practicable. . . .

The defects of the present sewerage system were anticipated as long ago as 1858 by the referees (Captain Galton and Mr. Simpson) in their reply to Messrs. Bidder, Hawkesley, and Bazalgette's report, in the following words:—

"That the limited provision for rainfall in the sewers proposed by Messrs. Bidder, Hawkesley, and Bazalgette would cause the sewage too frequently to overflow into the Thames within the metropolitan district.

"That the proposition to throw the whole sewage of the metropolis in a concentrated mass into the Thames at Barking, close to the metropolitan boundary, would not prevent the sewage from returning within the metropolitan districts, and would be injurious to those eastern districts of the metropolis which lie adjacent to the Thames, the population of which is rapidly extending, in consequence of the great increase of the commerce of the Port of London."

The author then referred to the facts elicited by the Royal Metropolitan Sewage Discharge Commission, and discussed these recommendations. In conclusion, he submitted for consideration the following suggestions with regard to the London sewage question:—

First, as regards separation. That it is desirable that a partial separation of rain and spring waters from sewage should be made throughout the whole of the Metropolitan district, so as to provide more accommodation for the sewage proper in the present system of sewers, and thus diminish the amount of liquid which has to be pumped and disposed of, and also lessen the amount of sewage which is at present being discharged in rapidly increasing quantities into the river in the centre of the metropolis during rainy weather.

Second, as regards disposal. That, as no chemical treatment has yet been found effective in thoroughly purifying sewage, and as there is great probability of serious complications in regard to the proposal of barging the sludge to the mouth of the Thames, the course proposed

\* Obtained the number of marks qualifying for a Prize.

by the late Metropolitan Board of Works can only be regarded as experimental, and that as the preponderance of scientific evidence, the opinions of the Royal Commission as expressed in their report, and the experience of the two next largest cities, agree that a land treatment is an effective method—investigations coupled with experiments should be made simultaneously with the above, with the view of ascertaining whether a land treatment alone, or precipitation supplemented with land treatment (as recommended by the Commission), would not give better results in disposing of the London sewage.

Colonel Jones, V.C., Consulting Engineer for Wrexham, in proposing a vote of thanks to the reader of the paper, said he entirely agreed with the suggestion regarding separation. Unfortunately, the London County Council had inherited a debt of 1,000,000, on permanent works, and were committed to giving a trial to the works, although he thought they would be found useless.

Mr. Eachus (Edmonton) seconded the motion. He was of opinion that for a system of broad irrigation 40,000 acres of land would be needed, at a cost of 1,000,000. The greater cost would, however, be for the distributing channels, which would cost 4,000,000, and, at 3 per cent., the total sum required would be 150,000 a year. In addition, farming operations would mean 10% per acre, or an annual expenditure of 40,000.

Mr. Charles Jones (Ealing) did not see why the sewage of London should not be dealt with by burning.

Mr. J. Norrington (Fulham) thought the London surveyors would soon give up the idea of burning either ashes or sewage. Irrigation was the most natural process.

Mr. W. H. Savage (East Ham) said he agreed with the importance of separating the rain-water from the sewage.

The president, in summing up the discussion, said the separation system was one of which engineers thought favourably.

The vote of thanks to Mr. Barlow was then put and carried, the meeting then adjourning to the dining-hall, where they had been invited to lunch by the Mayor (Mr. T. Hughes), in whose absence Mr. T. Holder presided.

#### The River Mersey.

Mr. W. Spinks, Assoc. M. Inst. C.E., read a paper on "The River Mersey," dealing with it and its tributaries in their geographical, statistical, commercial, engineering, and sanitary aspects. On the subject of the prevention of floods, he said that, in spite of all the water that is impounded and diverted, there has been, at times of exceptional rainfall, very heavy flooding in the low-lying reaches of the river, which has caused enormous damage both to property and stock; the subject of their prevention has received attention at the hands of many eminent engineers, amongst whom may be mentioned the late Mr. J. F. Bateman. Much has been done to improve the scour of the various rivers by different Corporations, and especially by the Corporation of Manchester on the rivers Irk and Medlock, by keeping the channel confined within substantial walls, and so preventing both erosion and depression. But perhaps the greatest improvement of all has been effected by the adoption of the movable weir as invented by Mr. Francis Wiswall, A.M.I.C.E., at present engineer of the Bridgewater Canals Undertaking of the Manchester Ship Canal Company, and who at the time of the erection of the Throstle Nest Weir, was engineer to the Mersey and Irwell Navigation. The Throstle Nest Weir was erected in 1882 and its success was so complete that it was decided by the Bridgewater Navigation to alter all the fixed weirs between Manchester and Warrington to movable weirs of similar design, but the interposition of the Ship Canal stopped operations after a considerable amount of money had been spent. Throstle Nest Weir consists of a series of fourteen rectangular sluice gates turning on a common axle, and when closed the gates, with the framework which supports them, present a surface to the stream of 1,400 square feet = 140 ft. x 10 ft. wide, which is reduced to 293 ft. or one-fifth of the obstruction when the gates are open. When closed the gates are inclined at an angle of 35 deg. from the perpendicular, and when open they are suspended in a horizontal plane. The gates retain their inclined position until the water of the river rises to 2 ft. 9 in. above its ordinary level, when the back pressure is sufficient to

cause them to tilt automatically and release the impounded water; in addition, drawchains are provided, by which any or all of the gates can be opened at will, and the impounded water gradually released. The river bed is laid with a sheathing of stone and timber, and is perfectly level, the breadth across the river being 140 ft., and length down stream 33 ft. At intervals of 10 ft. centre to centre across the river-bed cast-iron piers have been placed, and these carry a turned shafting on which the sluice-gates hang and turn in lengths of 10 ft. The tilting sluice-gates, which are framed of English oak and planked with pine, are 12 ft. long, 10 ft. wide, and 9 ft. below the axle. To the centre of the foot of each gate a drawchain is attached, and there are two multiple crabs, one on each side of the river, and each connected with seven of the gates, by which the sluices can be raised or lowered separately at will. Referring to the approaching completion of the Manchester Ship Canal, he said it was imperative that no time should be lost in setting about the purifying of the waters it is to receive and retain, otherwise it may, and probably will, become nothing else but a chain of elongated precipitation tanks from Salford the whole way to Eastham—a condition of things which can be very readily imagined, and from which the direct consequences may accrue, not only to the unfortunate residents contiguous to its banks, but to the parties responsible for the offences committed.

Mr. Parry (Reading) proposed a vote of thanks to Mr. Spinks, and Mr. Fowler seconded the vote, and in doing so said the purification of the Ship Canal would be a serious matter. There would be a large amount of still water in the Irwell, and the various locks would become a series of cesspools unless properly looked after. The banks of the Canal would also have much filth deposited on them. It was for the Canal Company to think what would be the effect of bringing men fresh from the Atlantic, and putting them on one of the Irwell cesspools. The paper had been read at a most opportune time.

Mr. Pritchard (Birmingham), in supporting the vote of thanks, remarked that as engineers they would all be glad to see the Ship Canal successfully finished. Although they might have various opinions as to its effects on the prevention of its pollution, Mr. Spinks could not have chosen a more opportune time for his paper.

Mr. G. F. Deacon said the paper of Mr. Spinks was a most useful addition to his (Mr. Deacon's) knowledge of the Mersey. He then proceeded to speak on the change of channel and deposit of silt in the Mersey; and a vote of thanks was heartily accorded to Mr. Spinks for his paper.

Mr. E. P. Hooley, Assoc. M.I.C.E., County Surveyor of Nottinghamshire, read a paper on "The Maintenance of Main Roads and County Management." The system advocated by the reader was the payment of all charges in connexion with main roads by the county authority direct; no profit or loss to be charged by either side, and whatever the county authority would have to expend to maintain the roads if they were in their own hands should be expended by the urban authority, and paid for by the county authority. He thought the County Council should most certainly directly manage all roads that had hitherto been managed by highway boards and parishes. He proceeded to enumerate the amount of labour and material to be expended on roads, and the direction of all the work.

A brief discussion followed, being conducted by Mr. W. Brooke (Richmond), Mr. J. Lubley (Hanley), Mr. Norrington (Fulham), Mr. Silcock (King's Lynn), Mr. Spinks, Mr. Vallance (Notts), Mr. W. H. Savage, and others. A vote of thanks was passed to the reader of the paper.

Mr. J. H. Burton, Surveyor to the Audenshaw Local Board, read a brief paper on "Traction-engines, and their effect on roads and buildings."

A vote of thanks was accorded to Mr. Burton. At the conclusion of the meeting, the president proposed a vote of thanks to the Mayor for his hospitality, and for the use of the Town Hall, and this being seconded by Mr. Charles Jones (Ealing), hon. secretary of the Association, was heartily accorded.

In the evening, the annual dinner of the Association was held in Eberle's Restaurant, Eberle-street. There was a large company

present, the chair being occupied by the President, who was supported by Mr. Alfred Holt (Chairman of the Dock Board), Alderman T. R. Shallcross, Councillor W. Clarkson, Dr. Stopford Taylor (Medical Officer of Health), Mr. W. H. C. Mesurier (Assistant Dock Engineer), Mr. F. M. Evanson, and Mr. T. M. Bellard Reader.

On Friday and Saturday the members of the Association visited the docks and other places of interest to them as engineers and sanitarians.

## Illustrations.

### INTERIOR OF HALIFAX CATHEDRAL, NOVA SCOTIA.

THIS is the interior of the cathedral, designed by Mr. Arthur E. Street, for Halifax, Nova Scotia, the exterior design of which was published in the *Builder* for May 18, 1889, at which time we gave a description of the building, to which it is unnecessary to add anything further.

The drawing from which the illustration is taken is exhibited in the Architectural Room at the Royal Academy.

### SHEFFIELD MUNICIPAL BUILDINGS COMPETITION.

WE publish this week the view and principal plans of the design submitted in the second competition by Messrs. Fleckton & Gibbs, of Sheffield. The plan, as will be seen, differs materially from those hitherto published in the type of arrangement adopted. The following extracts from the architect's report will serve to explain their views and intentions in the design.

"*Treatment of Site.*—The building is placed within the boundaries of the site, having its principal front and main entrance facing directly the large open space, about 225 ft. long and 202 ft. wide, formed by the junction of the five streets, the obelisk in the middle of which is in the central line of the building. The main entrance is thus fixed in the most prominent and convenient position for access from all five streets. The other three fronts have also open spaces between them and Pinstone-street, St. Paul's Churchyard, and Surrey-street, and thus an abundant supply of light and air is secured on all sides, while the building is exceptionally well placed for being reached from all surrounding points. The one-story building in Surrey-street is so comparatively low as not to interfere with those advantages, but rather to enhance the effect of the main building by spreading its base, and giving attachment to the ground. The fine open space or "place," resulting from the street improvements in this locality is by its design turned to the greatest advantage, both to the building and itself.

A considerable plot of land at the Norfolk-street end, sufficient to provide accommodation for three or four additional departments, remains unappropriated.

"*Notes on Internal Arrangements.*—Each set of offices for a department is made complete in itself, the entrance for the public being lute, and by way of the general or inquiry office, from which access is easy and direct to a corridor in which are the private offices. These corridors give the officers the means of communicating with each other without entering the general office, and also with the general office at different points.

The advantages of this plan over the usual arrangement of public corridors consist, not merely in the feature that no facilities are given for the public to seek assistance where they are not wanted, but that the private offices are rendered more quiet and undisturbed, the intercommunication more easy, and the control by the heads of the department more perfect.

The Departments, except the Health Department, are all approached from the central hall with its staircases, which is entered from the outside by the principal doorway. Private entrances and staircases and other means of communication are provided for the officials.

The entrances to the Accountant's and Water Departments are on opposite sides of the central hall; and from the hall can be seen those of the Departments of the Town Clerk and the Borough Surveyor, so that one hall-porter, centrally placed, could control the whole.

The pay office, snail shop, meter testing, weights and measures, and room for sale of infants, also the public waiting-rooms, lavatories, &c., has been thought very desirable to keep outside the main structure, and they are therefore provided in detached buildings.

"*Notes on Accommodation, &c.*—The Borough Accountant's General Office has a counter 78 ft. long, and in addition to accommodation, as shown on the plan, for thirty clerks at desks, there is room for an extension of desks, so as if required to raise

THE ARCHT. GEORGE A. S. J. MARTIN LANE, TORONTO, CANADA.

INTERIOR OF HALIFAX CATHEDRAL, NOVA SCOTIA.—MR. ARTHUR E. STREET, A.R.I.B.A., ARCHTTECT.

No. 1613 Royal Academy Exhibitions, 1870.

This number to forty-four. This and the Waterworks General Office are lighted partly from skylights and partly from windows 5 ft. 6 in. high on each side of the raised central portions, these windows being also available for ventilation.

The Council Chamber is in the form best adapted for speaking and hearing, nearer a square than a semi-circle in proportion, has abundant light, and is in a position free from noise. It will seat more than the present number of members of the Council. . . .

**Net Cubical Contents.**—Foundations, from 10 ft. below present surface up to area level; tower, 12 ft. below present surface up to area level, 122,143; superstructures, from area level to eaves spouts, 1,211,621; roofs, 132,075; dormer windows, chimneys, turrets above eaves, 31,546; tower above eaves, 44,503; area walls, balustrades, steps, &c., 3,661; total, 1,550,539. These works can be carried out for 80,000.

**Explanatory Statement accompanying Design in Final Competition.**

The design of the building is essentially the same as originally submitted, some of the additional drawings being intended for its more complete illustration, and others to show sundry modifications arising out of the remarks of the Assessor and the instructions for the final competition. . . .

The design, as originally submitted, complied in a remarkable degree with seven out of the first eight of these, viz., a, b, d, e, f, g, h, the execution being c, which suggests the provision of one rather than two staircases. The principal staircase was originally a good one, and has been considerably improved, already explained; and the secondary stairs have been retained, as being desirable in addition for convenient and ready access, and communication between, different parts of the building.

With regard to the remark (f), the reception-rooms, &c., with their access from Pinstone-street, are so arranged that they can be cut off from the departmental offices without in any way interfering with the public resorting to these offices, on giving the public for the occasion the use of the turret staircases (ordinarily reserved for officials only), which lead direct from the street to each department, and afford means of inter-communication without in any way interfering with access to, and use of, the reception-rooms, &c. It is presumable, however, that this diversion would not be required for Council or committee meetings, and but seldom for the reception-rooms, as the use of the latter to any extent would be mostly after business hours.

The original design also complied with the remaining eight instructions for the final competition (detached buildings, &c.), except so far as they refer to alternative dimensions and portions of rooms. Four of these (i, j, k, and m) embrace the idea of a concentration of the offices of a "department" with "access through the general office, serving as an inquiry office." For the Accountants' and Waterworks Departments this idea is emphasised, and in these two departments it is most fully developed in the original design. No. 157, special attention having been drawn to the arrangement and its advantages over the usual arrangement of public corridors, in the explanatory statement which accompanied the drawings. The arrangement, though something approaching it has been adopted in the detached buildings, such as the Corporation of Sheffield already used for some of their departments, has, so far as is known, never been adopted in municipal buildings where there is a combination of such departments, so that design No. 157, as originally submitted, is entirely novel in this respect. . . .

The cubical contents and estimate are unaltered. A collateral advantage attending this design is that the exact position of the building may be determined after the site has been cleared, and when the whole can be viewed from every point. This advantage arises from the design having large open spaces on all the fronts within the building-line, thus doing away with the necessity in erecting the building for keeping strictly within that line, which, when laid down for the purposes of the competition, was probably determined with a view to the fronts being built close up to it."

**ELEVATION AND DETAILS OF THE ALBERGATI PALACE, BOLOGNA.**

The measured drawings of this interesting building, attributed to Peruzzi, are reproduced from the collection of "Architectural Studies in Italy," carried out by Mr. W. J. Anderson, architect, of Glasgow, in pursuance of the conditions of the award to him of the "Alexander Thomson Travelling Studentship," and published as a volume of architectural illustrations, of which a notice will be found in another column.

**PROPOSED NEW OPERA-HOUSE IN LONDON.**—The *Financial News* says that a project is on foot to erect a National Opera-house in a central position in London. A site has been secured and the capital is being privately subscribed.

**THE LONDON COUNTY COUNCIL.**

The ordinary weekly meeting of the London County Council was held on Tuesday at Spring-gardens, the Earl of Rosebery in the chair.

**Impending Resignation of the Chairman.**—Lord Rosebery, in reply to a question, said that he would arrange to send in his resignation in time for the Council to choose his successor before the adjournment for the summer recess.

**The Holiday Recess.**—On the motion of Councillor Benn, it was resolved:—

"That the Council at its rising on Tuesday, July 29, do stand adjourned for the summer recess until Tuesday, September 30, and that no Committee do meet after the date of the Council's adjournment until Monday, September 23, unless in a case of urgency which will in the opinion of the Chairman of the Committee not admit of delay; provided that the Chairman of the Council shall have authority to convene a meeting of the Council during the recess if he deem it necessary to do so."

**Proposed Improvement Schemes.**—The Improvement Committee brought up a report stating that in conformity with the resolution of the Council of December 17 last, they had prepared, to submit to the Council at its next meeting, a list of improvements involving application for Parliamentary powers. The proposed improvements were in various districts of London, and were all of more or less urgency. If deferred, some of them would undoubtedly cost much more than the sums now proposed to be expended. As, however, the Committee gathered from the resolution of the Council at its last meeting relative to the Strand Improvements Bill that it was reluctant to sanction any further expenditure for metropolitan improvements until the principle of betterment shall have been conceded by Parliament, the Committee thought it their duty, before taking any further steps, to seek the definite instructions of the Council as to what course they should adopt. In order to facilitate an expression of opinion on the part of the Council, they recommended *pro forma*,—

"That the Improvements Committee be instructed to bring up at the next meeting of the Council details of the schemes of improvement referred to."

This was agreed to, after some little discussion.

**Amendment of the Metropolitan Building Act.**—The first paragraph of the Building Act Committee's report was as follows:—

"The order of reference to the Building Act Committee includes a power that the Committee should report from time to time to the Council as to the desirability of amending the Metropolitan Building Acts. The amendment of these Acts is urgently needed, and what the Committee now propose is that an entire revision should be proceeded with. They accordingly desire to commence the work at once, and for this purpose they feel it necessary that they should have some skilled help. As the Committee is satisfied that the officials of the Building Act branch of the Architect's Department have their time fully occupied with the current work arising under the administration of the various Acts, they deem it necessary to recommend—

"That the Council do authorise the Committee to make arrangements for some extra assistance."

Councillor Hutton, the Chairman of the Committee, in moving the adoption of the report, said that the subject of the amendment of the Metropolitan Building Acts was already before Parliament at the present time, both in the Metropolitan Management Bill and in the General Powers Bill of the Council; but, nevertheless, the whole subject of the amendment and codification of the Metropolitan Building Acts required urgent attention, and would take considerable time and require expert assistance.

Councillor Lawson said he inferred from Mr. Ritchie's remarks in the House of Commons the other evening that Mr. Ritchie had such a Bill in contemplation.

Councillor Hutton said he believed that was so; at any rate, Mr. Ritchie had assured him of his willingness to co-operate with the Council in the matter.

The recommendation was agreed to, and after the transaction of other business, the Council adjourned.

**THE WHITEFRIARS GLASS WORKS.**—The *Pall Mall Gazette* of Monday last contained a report of an interesting interview with Mr. James Powell at these well-known works, which has been in active existence, we are told, since the time of the Great Fire in 1666. Mr. Powell explained in detail to his interviewer the process of making glass mosaic decorations, such as the panel recently made by them for Clifton College Chapel, already noticed in our columns.

**Books.**

*The Voyage of H.M.S. Beagle: Being a Journal of Researches into the Natural History of the Countries visited during the Voyage Round the World of H.M.S. Beagle.* By CHARLES DARWIN, M.A., F.R.S. A New Edition. London: John Murray. 1890.

THIS is a reprint of Darwin's first book, written when as a young man he obtained the appointment of naturalist on the surveying expedition about the Coast of South America (mainly under the command of Captain Fitzroy. The original formed the third volume of the report of the expedition published in four volumes under the title "Voyages of the Adventure and Beagle," a book of great interest, now, we believe, out of print as a whole.

The book, as may be supposed, contains nothing specially relating to the subjects to which our pages are devoted; but as the first publication of so remarkable a man, and as a book full of curious and interesting observation of nature in all her forms, it is one which should be of interest to educated men of all professions.

*A Bibliograph of Tunisia. From the earliest times to the end of 1888.* By H. S. ASHBEE, F.S.A., F.R.G.S. With a map. London: Dulau & Co. 1889.

THIS is in reality merely a list of books in which information on ancient and modern Tunisia may be found; including such information as will throw light on the effects on Tunisia of the Punic Wars, the Roman occupation, the Arab conquest, the expeditions of Louis IX. and Charles V., and the French protectorate. The list makes a considerable volume in itself, and its production must have required no little trouble and research. It is intended, we presume, as a kind of appendix to the joint work by Mr. A. Graham and Mr. Ashbee on Tunisian architecture, which we noticed some little time since. As interest in Tunisia is likely to increase, and its architecture is a field not yet much worked, the book is of considerable practical value to students.

*The Parish Church of St. Mary, Whaplode, in the county of Lincoln.* By W. E. FOSTER, F.S.A. London: Elliot Stock. 1889.

WE refer in another column to the visit of the Lincoln and Notts. Architectural Society to Whaplode during their annual excursion a few days ago, and it is therefore opportune to call attention to this short history of that very interesting church. The book is archaeological rather than architectural, and aims at giving in a small compass a history of the church, together with some historical notes as to the history of the neighbourhood and surrounding families. The author devotes some attention, however, to the architectural features of the church, and gives a plan, engraved so as to show the various dates of different portions, an engraving of a portion of the remarkable Norman chancel arch with its effective decoration, and illustrations of some other features, mouldings and caps, &c. These are not very well executed, and the general view of the church which forms the frontispiece had better have been omitted. The sections of Norman arch, given on page 33, are placed upside down, as we presume the author is aware, but it shows rather careless revision of the proofs that such a glaring error should have been passed over. The book is of value, however, as a record of the history and dates of the church.

*The Anatomy of Pattern.* By LEWIS F. DAY. Second edition, revised. London: Batsford. 1889.

WE have already fully expressed our appreciation of Mr. Day's admirable little illustrated book on this subject. The second edition presents no material difference from the first; but we are glad to find that a second edition was called for.

"Work, an Illustrated Magazine of Practice and Theory for all Workmen, Professional and Amateur," edited by Francis Young (London: Cassell & Co.), is a very useful miscellany. It has recently completed its first yearly volume, which is now before us. It is well printed and freely illustrated, and is very comprehensive in its scope, as may be gathered from its title.

Fig. 3.

Fig. 4.

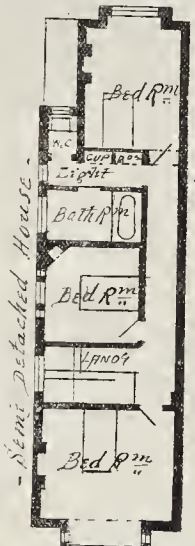

Fig. 5.

First Floor Plans to Mr. Knightley's Proposed Improvements in Six- and Eight-roomed Houses (see p. 399, last vol.).

Workmen of all trades, apprentices, "the handy man," and the boy with a liking for tools, will each and all be able to find something to suit them in the pages of *Work*. But, as generally happens in "technical instructors" of this kind, the "ornamental" designs for "art furniture," &c., are either poor in taste or not well adapted to the purpose they are intended to serve. For instance, the reader is told, and shown by detail illustrations, how to construct a folding screen in "Egyptian" trellis work (*meshrebeeyeh*), but, as the writer admits, such a screen would not shelter a portion of a room from draughts or observation, although, in appearance, it might be a very effective piece of furniture.

Correspondence.

To the Editor of THE BUILDER.

"A PLEA FOR THE IMPROVEMENT OF SIX- AND EIGHT-ROOMED HOUSES."

SIR,—I send you herewith the first-floor plans for my four former house designs [see *Builder* for May 31, p. 399]. I am not attacking any one. I simply ask for these plans to be introduced; if the public choose to avail themselves of them all well and good. I apologise for the delay.

T. E. KNIGHTLEY.

THE ARCHITECTURAL ASSOCIATION.

SIR,—As an old member of this body, I should like to state that I agree with the views of Mr. J. Douglass Mathews, expressed in his letter published in your last issue.

Improvements are necessary, but they must be gradually introduced. The alteration in the amount of the subscription should be abandoned, except for members joining in the future, as the resignations in consequence would be numerous.

HENRY LOVEGROVE.

\* \* We do not believe anything of the kind; and the few members who might resign for so paltry a reason would be better away.—ED.

"EARTHWORK SLIPS AND SUBSIDENCES UPON PUBLIC WORKS."

SIR,—May I ask the favour of a few words respecting your able review of this book in your journal of the 5th inst., for which I tender to you my thanks.

In the last few lines of the notice of pages 182 to 186, it is stated that the volumes of the embankment are "miscomputed," &c. Pardon my saying that the calculations are correct. It is stated in the

book that the cubic contents, A to C, are those of "two inclined portions," i.e., of two slopes. Instead of dividing the perpendicular by two, as usual, and so computing the contents of each slope, the volume of the two slopes is obtained by one operation, producing the same correct result. The diagram was unfortunately misplaced in the "pacing," and too late to permit of my correction. It should have been on p. 182, and not on p. 181.

With reference to flood-water, named in column two, p. 2, of your issue of the 5th inst., the expression "any backwater is not prevented from escaping," is meant to relate to the retention of surface waters after subsidence of a flood. I quite agree my sentence is not as clear as it might be. The system named has been adopted to save expensive outlets in an embankment, which would have been required only at times of flood.

The substitution of an unlined tunnel in rock, in lieu of a masonry culvert, was frequently adopted on the Intercolonial Railway of Canada, in about the year 1870, as it was found to be a cheaper and more expeditious method of construction, as no skilled labour was required, and the work was carried on in any weather, and during periods of cold in which no mortar could be safely used.

J. NEWMAN, Assoc.-M.Inst.C.E.

The Student's Column.

HOT-WATER SUPPLY.—II. BOILERS AND INCrustATION.

INFORMATION upon boilers for hot-water supply must, to make the subject clearly understood, necessarily be preceded by an inquiry into the cause and effects of the incrustated deposit, or "fur," which accumulates so rapidly in these boilers (when what is known as "hard" water is used), as their shape, construction, and general character is, to a great extent, governed by a consideration of this subject.

The origin of the term "hard," as applied to water holding lime in solution, cannot well be traced; but most probably it was first used in contradistinction to the sensation of softness that is experienced with distilled or rain-water, or nearly any water which has but a small percentage of lime in solution.

Our supply of hard water (so far as concerns this paper) may be considered to be limited to that which proceeds either through or from chalk strata, and as this water is usually of a difficultly clearness, it naturally becomes available for the unformed to make it accountable for the hard, stony deposit (limestone, in fact) that incrusts the inner surfaces of these and of steam boilers.

To explain the cause first, the generally accepted theory is as follows:—Water which descends to the earth in the

form of rain comes in contact with, and readily takes up, carbonic acid, either from the air in which this gas is present to a considerable extent, in the vicinity of populated places, or from decaying vegetable matter in the open country. This water, charged with carbonic acid gas, percolates through the earth, and immediately it comes in contact with chalk (carbonate of lime, calcic carbonate) the acid enters into combination with the chalk, producing bicarbonate of lime (calcic bicarbonate), which is highly soluble in water; in fact, might almost be considered as a fluid itself. It is very necessary to notice this peculiar difference between carbonate and bicarbonate of lime, as it is wholly accountable for the trouble now under discussion. The former, which we speak of as chalk, consists of lime having a certain quantity of carbonic acid gas held in combination with it, and this substance is, as just explained, but sparingly soluble in water. Bicarbonate of lime consists of precisely the same materials, but the quantity of acid gas is exactly doubled, and this renders it highly soluble in water.

It will now be understood that the supply of this hard water is confined to districts where chalk abounds in the soil, and the degree of hardness naturally varies with the nature of the ground. In the South of England, including London and many counties south of London, nearly all the water is more or less hard, but in the north of England the water is of quite a different character, and hard water is, to a great extent, unknown.—so much so that vast quantities of boilers (for kitchen ranges) are made without manlids or any means of removing any incrustated deposit.

When a new boiler is first charged with this hard water and sufficient heat is applied, the result is to drive off the proportion of acid gas, which goes to make the carbonate into bicarbonate of lime, and the latter is transformed into the former again, and, being insoluble, it is precipitated, forming a thin film or coating upon the inner surface of the boiler; this precipitation does not wholly take place immediately heat is applied, but proceeds slowly until boiling takes place and steam is formed, when the chief precipitation is effected. It is almost needless to add that the greatest quantity of deposit is found at that part of the boiler where the greatest heat is felt, but this may be more fully entered into when describing boilers.

The deposit which is effected when using a boiler but once is a very minute quantity, but when we remember that the same water does not stay in the boiler (when the apparatus is at work) more than a few moments, and fresh

water is being continually brought to the heated surface by reason of the circulation, we can then understand why the deposit seems to accumulate so rapidly, especially as the heated and (wholly or partially) softened water is being continually drawn off for domestic uses, and entirely fresh takes its place.

This would be a fitting opportunity to explain that with boilers used for heating purposes only the deposit occasions no trouble whatever, as the same water is used over and over again, and a given quantity of hard water will only yield a certain amount of lime deposit, however long it may be boiled; of course, in a heating apparatus there is a certain loss of water by evaporation from the filling cistern, but this does not usually amount to more than about a quart per week, as the water is not allowed to attain boiling temperature. But in a domestic supply apparatus the quantity of water used does not usually come under 400 gallons per week, and in many residences, perhaps, a thousand or more gallons in this time.

The average hardness of London water is about 16 per cent., and a range boiler in regular daily use will have a 1-in. deposit of "fur" within it after six months use. No rule, however, can be laid down to ascertain at what rate the deposit accumulates, as, although it is easy to find out the degree of hardness of the water, the result is chiefly governed by the efficiency or non-efficiency of the boiler in its heating capabilities, whether the water is nearly always boiling, or whether it seldom reaches this temperature; and again greatly by the quantity of water used, as every drop of fresh water introduced (to replace that drawn from the taps) has its portion of lime to deposit.

In the counties south of London, particularly Sussex, the water is very strongly impregnated with lime, so much so that an ordinary-sized boiler will commonly become sufficiently incrustated in from twelve to eighteen months to account for its fracture. See fig. 3, which is the section of a boiler badly furred.

and without the fire, of course, no further damage can be done.

Fig. 4.

There are two remedies for this trouble, one being to soften the water by removing (*i.e.*, precipitating by chemical action) the lime in solution; or, secondly, by having the "fur" removed at regular periods.

The first hardly comes within the province of these papers, yet it might be mentioned that whatever process is adopted, the softening must be done in a separate cistern, as it would not do to have the precipitated lime carried into the service pipes which run from the house cistern, and each supply of fresh water must be operated upon; and it must be borne in mind that softened water is not agreeable for every purpose, although it may be beneficial to boilers.

The best remedy and the least expensive is to employ a workman to clean out the incrustated deposit at regular periods. This remedy is, perhaps, sometimes a source of inconvenience, owing to the fact that when this cleaning takes place the kitchen range cannot be used, and, under the most favourable circumstances, this work cannot be done in less than two hours; with some ranges it takes more than a day. The time occupied is to a great extent governed by the amount of trouble experienced in removing the manlid of the boiler. Special means should be provided to make the lid easy of access and removal; but more than three-fourths of the kitchen ranges in the market have no provision of this kind, and the range has to be dismantled and partly unscrewed for the purpose of exposing the boiler manlid.

In "cleaning a boiler," as it is called, the workman has first to get at the lid of the boiler, then to unfasten and remove it; the "fur" is then loosened with a chisel or other suitable instrument,—workmen often have some fancy tool of their own for this work,—after which it is removed by the hands and the lid repacked and fastened, and whatever parts of the range have been removed, replaced. Of course, the quantity of "fur" that has to be removed will govern the time the work occupies to some extent, but the most troublesome cases seldom take more than two hours after the lid of the boiler is removed.

In London and its suburbs it is found advisable to clean the boilers every six months regularly, in some instances they may be permitted to go twelve months, but it must be borne in mind that the oftener the boiler is cleaned the longer will be its term of life or service, and the less quantity of fuel will be needed to heat the water. A good plan is to have the boiler opened after six months of ordinary use, and a glance will determine whether this period is a proper one for having it cleaned; but in Sussex or in other localities where the water is very hard, the period for first inspection should be reduced to three months; but a person about to build or purchase a house in a district of which he has no experience, can always make profitable inquiry from those already resident there. It should be borne in mind that filtration will not remove lime in solution.

**THE ENGLISH IRON TRADE.**—The English iron market has been somewhat quieter this week, but it has maintained its general steadiness pretty fairly. Pig-iron is not in very active demand. Glasgow warrants and Scotch makers' iron have fairly steady, and the decline in Cleveland pig amounts to only 6d. per ton. The better rates secured for pig-iron in Lancashire and the Midlands are keeping up. Hematite iron in the North-west of England is decidedly quiet, and quotations have dropped 2s. a ton. Finished iron is irregular in price here and there, but, on the whole, steady. There is more depression in steel, the consumption, particularly of ship-plates, having fallen off considerably. The outlook for shipbuilders is not improving. Engineers continue to work steadily. —Iron.

OBITUARY.

**SIR EDWIN CHADWICK.**—Sir Edwin Chadwick died on Saturday last, in his 81st year. In our leading article we have referred at length to his life's labours. The funeral took place on Wednesday at Mortlake Cemetery. The mourners and friends present included Mr. J. L. Kennedy, J.P., D.L. (brother of Lady Chadwick), Mr. and Mrs. Kennedy, nephew and niece), Mr. and Mrs. David Ainsworth, Mr. Albert Greg (nephew), Mrs. A. Greg, Mr. Von Fischer, Mrs. E. W. Mackay, Mr. Leach, Dr. Richardson, and Dr. Marshall, Earl Fortescue, Dr. Richardson, Sir R. Rawlinson, K.C.B., Dr. A. Carpenter, Dr. Gordon Hardie, Major Lamorock Flower, of the River Lea Conservancy, Mr. Hugh Alexander and Mr. S. Legg, representatives of the Association of Public Sanitary Inspectors, of which the deceased was chairman, and Mr. Robert Kempf (private secretary to the deceased). Mr. Osbert Chadwick, son of Sir Edwin, is at present in Hong Kong, engaged on Government engineering works.

**MR. P. B. COGHLAN.**—Mr. P. B. Coghlan, C.E., superintendent of the Waterloo Grain Warehouses, Liverpool, died suddenly a few days ago at his residence, Epsom. Deceased, who was 40 years of age, was formerly Borough Engineer of Sheffield and Margate. He had been in the service of the Mersey Docks and Harbour Board for many years.

GENERAL BUILDING NEWS.

**THE ROYAL COLLEGE OF MUSIC.**—The Prince of Wales, as President of the Royal College of Music, on Tuesday laid the foundation-stone of the new College buildings, to be erected at South Kensington. This step has been rendered possible by the munificent gift of 45,000l. by Mr. Sanson Fox, of the Leeds Forge, and the concession by the Commissioners of the Exhibition of 1851 of a portion of what once formed the grounds of the Horticultural Gardens as a site for the building. The designs have been prepared by Sir Arthur W. Blomfield, A.R.A., in the Renaissance style, freely treated, and the structure will be faced with red brick, with bands and dressings of Weldon stone. The site, which is 200,000 sq. ft. in extent, lies immediately between the Albert Hall and the Imperial Institute, and will have a new road passing its northern front.

**CHEPSTOW CHURCH.**—A Consistory Court has been held at Llandaff Cathedral, before the Worshipful J. E. Ollivant, M.A., Chancellor, to consider an application made by the Rev. E. J. Hensley, vicar of Chepstow, and the churchwardens, who propose, under plans provided by Messrs. Seidon & Carter, to restore the twelfth-century nave and lower it to its original level, to rebuild and extend the chancel, to restore and rebuild the transepts, to build new aisles on the old foundations, to remove the organ to the west gallery and, consequently, to raise the tower arch and west window, together with the external restyling of the tower. The estimated total cost is 4,250l. In granting the faculty the Chancellor sanctioned the removal of two Beaufort monuments, which date from 1649, from the north to the west side.

**THE VAUDEVILLE THEATRE, STRAND.**—We hear that this theatre, which was opened in 1870, is about to be re-fronted, and altogether remodelled as regards its interior, under the direction of Mr. C. J. Phipps.

**THE SPIRE OF ST. CATHERINE'S CHURCH, FOUNTYFRID, about 75 ft. in height, is to undergo extensive restoration. The framework on walls-plates at the bottom having perished, must be reinstated; all the slates removed, framework strengthened, and the whole spire newly slated. Four new stone gables are to be constructed on the lower part of the spire, in which will be placed a clock. The work of restoration, which will require much care, and will cost about 650l., has been entrusted to Messrs. Kumpson & Fowler, architects, Llandaff; Messrs. W. Thomas & Co., West Butte Docks, Cardiff, being the contractors.**

**SCHOOLS, COLESHILL (WARWICKSHIRE).**—The foundation-stone of a girls' school at Colehill was laid on June 26 by Mrs. Wingfield Digby. The estimated cost of the building is 564l. The builder is Mr. Green, of Colehill, and the school will have accommodation for 100 pupils.

**NORFOLK AND NORWICH HOSPITAL.**—At a meeting of the Governors of the Norfolk and Norwich Hospital on the 28th ult., it was announced that a citizen, Mr. B. E. Fletcher, had offered, as a family memorial, to build and furnish a home for convalescent patients who had been treated in the hospital.

**NEW CHURCH AT LLANDAFF YARD.**—The little hamlet of Llandaff Yard (near Cardiff) was in a state of unusual activity the other day, the occasion being the laying of the foundation stone of the new Church of All Saints, by Mrs. Lewis, of the Palace, Llandaff. The Rev. J. B. Buckley, Vicar of Llandaff, presented Mrs. Lewis with a silver trowel, and Mr. Thomas, of the firm of W. Thomas & Co., West Butte Docks, the contractors, handed her a mallet, with which she laid the stone. The building, which is to be completed by November next, is to accommodate 250 persons. The cost will be about 1,600l. complete. Messrs. Kumpson & Fowler are the architects.

Fig. 3.

The ill effects of this furring consist firstly (and most especially) in its causing the boilers to become fractured before about an eighth of their natural life of service has expired; secondly, a comparatively thin coating of deposit will materially lessen the rapidity with which the water heats, as it is such a poor conductor of heat; and, thirdly, the deposit also locates itself in the pipes, at first retarding the circulation, and eventually causing a stoppage, and becoming an element of danger unless attended to.

The deposit partakes of a variable degree of hardness or solidity, that which is the most dense causing the boiler to fall the earliest, and that which is most porous permitting the boiler to render the longest service. With the different London waters the deposit is of a fairly similar character, being very dense and, in many instances, closely resembling ordinary limestone; and when this has become of about 2 in. in thickness (about two years use, usually) it is sufficient to prevent the water having any contact with the boiler-plate, with the result that the iron is destroyed by the action of the fire, the same as if the boiler were empty. In instances where the deposit is of a more porous or of a sealy character, it naturally requires a thicker deposit to bring about this result.

The failure of the boiler always shows itself in the form of a small crack or fissure (fig. 4), not a hole in the common sense of the word; and this fissure is rarely larger than 1 in. in length by 1/16 in. in breadth, for the simple reason that so soon as the fracture takes place water proceeds from it in a greater or less quantity, and this prevents the fire being ignited,

## SUGGESTED NEW HOSPITAL AT MANCHESTER.

At the monthly meeting of the Manchester Infirmary Board on the 30th ult., the minutes of the committee contained a report on the subject of the medical and surgical arrangements, adopted after a conference between a sub-committee of the committee and a sub-committee of the Medical Board. The report stated that the proposals were that piece by piece, the existing Infirmary should be demolished, and in its place that a new hospital should be built capable of containing 500 beds. Nevertheless, the sub-committee of the House Committee believed that, now there was a possibility of a new hospital for 100 or more beds being shortly built adjacent to the Owens College, the moment would be inopportune for appealing to the public for funds for the extension of the Infirmary. The minutes containing the report were adopted.

## CHRIST CHURCH, END-ELL-STREET, ST. GILES.

It will be remembered that this church was struck by lightning while service was proceeding on the night of Wednesday, August 17, 1887. The damage was serious and considerable. The spire was shattered, and, especially any part of the edifice church was insured,—undertook to rebuild the spire, the cost of which work amounted to 1,616*l*. A careful survey of the whole building was made, and it was found that a large sum must be expended to arrest the rapid decay of the fabric and make good the serious dilapidations that existed. An appeal was issued, and over 2,000*l*. were placed in the hands of the Committee. Mr. R. E. Tylor, F.R.I.B.A., was instructed to prepare plans, contracts were obtained and accepted, and the work has been carried out, but 150*l*. is required to extinguish the debt, and for this an appeal is made. The church was reopened on Sunday last.

TOWN HALL, HANLEY.—At a special meeting of the Hanley Town Council on June 24, it was resolved to affix the corporate seal to an application to the Local Government Board for permission to borrow the sum of 3,750*l*. required for the completion of the Town Hall.

SCHOOLS, MIDDLESBROUGH.—On Monday last, after the ordinary business of the Middlesbrough School Board, the foundation stone of the Grange-road Schools was laid by Mr. Alderman Hugh Bell, Chairman of the Board. The buildings, which will cost upwards of 20,000*l*. (including the site), stand upon a rectangular plot of ground, having frontages to Albert, Grange, and Durand roads. Accommodation is provided for 1,228 children. A department for the teaching of cookery is part of the scheme; there is also a caretaker's house. In connexion with each department there are covered playgrounds and private rooms for the teachers. The buildings, which will be fire-proof throughout, are of brick, with pressed brick facings and red stone dressings, from the quarries at Corncockle, in Dumfriesshire. The style adopted is a free treatment of the Renaissance. The ventilation will be by fresh warm-air inlets and exhaust air-pump ventilators. Open fireplaces are provided for auxiliary heating. The grates and mantel-pieces are supplied by the Burnantoff's Works, Leeds. The architect for the buildings is Mr. J. Mitchell Boleman, of Middlesbrough, whose design was selected in competition, under the adjudication of Mr. E. R. Robson, the Clerk of the Works is Mr. T. Todd, and the Contractor for the whole of the works is Mr. Joseph Lord, of Middlesbrough.

## SANITARY AND ENGINEERING NEWS.

## THE SANITARY INSTITUTES' EXAMINATIONS FOR INSPECTORS OF NUISANCES.

—At an examination for Inspectors of Nuisances, held under the auspices of the Sanitary Institute at Bristol on June 27 and 28, sixty-two candidates presented themselves. Questions were set to be answered in writing on the 27th, and the candidates were examined *vis à vis* on the 28th. The following candidates were certified to be competent, as regards their sanitary knowledge, to discharge the duties of Inspector of Nuisances:—Amor, A.; Bath; Baldows, J.; Sheffield; Braley, F.; Leicester; Brook, J.; Stratford-on-Avon; Brown, E.; Burgess Hill; Cook, W. G.; London; Cooper, J. G.; Birmingham; Foad, C.; London; Fitzgerald, W.; Birkenhead; Harroseron, W. W.; London; Hassell, H.; Bristol; Hughes, E. J.; Birkenhead; Johnson, J. E.; Bridgand, James, J. M. W.; London; Jones, S. E.; Newport; Mon.; Kirley, H. J.; Bristol; Knapp, R. W.; Christchurch; Little, W.; Carlisle; Lund, C.; Southampton; Mills, W. S.; Teddington; Pennock, J.; West Hartlepool; Perry, C. W.; London; Roberts, P. J.; Carlisle; Saise, A. J.; Bristol; Suttle, A.; Oley; Szyntman, S.; Bath; Taylor, H. J.; Sturminster Newton; Taylor, H. T.; Liverpool; Thompson, F. W.; Tottenham; Thornley, W. F.; Southsea; Trigg, H. J.; South Hayling; Weeks, A. J.; London; and Willbond, G. B., Nottingham.

## SEWAGE TREATMENT AT LEICESTER.

—We are informed that the Corporation of Leicester have given an order to the International Water and Sewage Purification Company to supply twenty tons of ferrocene per week for precipitating and decolorizing the sewage. This is, we understand, the third year in succession that the complex sewage of this populous centre of manufacturing industries has been treated with ferrocene.

SURVEYORS' INSTITUTION HIGHER SPECIAL SANITARY SCIENCE EXAMINATION.—We understand that out of five candidates for the first of these examinations, Mr. Philip Edward Filditch, of Parliament-street, S.W., was the only one who satisfied the examiners.

ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS.—A home district meeting of this Association is to be held at Croydon on Saturday, July 19. After the transaction of district business, the members will visit the South Norwood Irrigation Farm. They will then proceed to the Addington Hills (covered concrete) Reservoir, and will inspect the interior, which will be lighted for the purpose. They will then drive to Addington Well, where they will inspect the pumping machinery at work. Here a paper by Mr. Walker, upon the "Public Works of Croydon," will be discussed.

## FOREIGN AND COLONIAL.

LAUSANNE.—The authorities consider it advisable to have a complete design for the proposed group of public buildings (mentioned on May 31) worked out in accordance to the ideas shown by M. Demierre, of Paris, whose work was classed third in the late international competition.

ZURICH.—The municipal authorities having notified their intention of presenting the "Theater Actiengesellschaft" with a fine site on the Dufour-place, on which the new theatre will have a very dignified position, and at the same time having directors of the above company have asked a Viennese firm of architects to have the building erected with all possible speed in accordance with designs submitted by them some time ago. According to the contract the building is to be opened in November next.

BERLIN.—The preparatory sketches for the proposed buildings for the Prussian Landtag (see p. 355, ante) are to be worked out at once. A special committee, consisting of members of both the Prussian Houses, has taken the matter in hand. The necessary vote of money is to be asked for next session.—According to the official *Reichs-Zeitung*, the designs for the new museum buildings to be erected on (or in close proximity to) the so-called "Museum Isle" of Berlin are now under consideration of the architectural division of the "Academy of Public Works" (Akademie für Baulichen Arbeiten) after having passed swiftly through the first stages of bureaucratic criticism. The separate buildings are to be erected in connexion with those already in position. The first will hold the antique collections, the second will be known as the Renaissance Museum, and the third will be solely devoted to the extensive collection of casts. Of these three buildings, the first two, designed by Professor F. Wolf and Hofrath Ihne, respectively, will be placed on the island proper; the third will be erected on the other side of the water in accordance with the designs of Baurath Schwechten.—The newly-elected "Rektor" of the Royal Technical College, (Engineering division) entered office on the 1st inst., the usual installation ceremony taking place. Professor Jacobsthal (of the architectural division), who held the post for the year 1889-90, will now be "Professor," Professor Schäfer (Gothic) has been elected head of the architectural school.

CANNES.—Two rival schemes for the sanitation of the town have been submitted to a Sanitary Commission presided over by M. Croddo, Honorary Ingénieur des Ponts et Chaussées. The system proposed by M. Houlier has been accepted. It proposes to use the existing drain system discharging into the bay for the surface water only, and to have a new system of soil drains connected with reservoirs and pumping stations, at which the sewage will be raised and taken by a new line of drains to the sea at a point four kilometres distant from the town.

BREMEN.—The municipal authorities have voted 16,000*l*. towards the erection of a public library building. According to the present catalogue over 60,000 volumes will have to be housed.

NEW BUILDINGS AT BOMBAY.—The Bombay, Baroda, and Central India Railway has hitherto been without a building of its own for its administrative offices. This want is now to be supplied by erecting a handsome edifice on a vacant plot of ground facing the Church Gate Station of that railway. The building will not be as grand nor as better ventilated from its situation in the downdraught of the city. The building is intended to accommodate also the office of the Government Consulting Engineer for Railways.—*Indian Engineering.*

DISCOVERY OF ANCIENT FRESCOS IN DENMARK.—Prof. Kornrup has discovered some interesting ancient frescos on the walls and in the dome of the ancient church of Vigstered in Seeland. The subjects are biblical. There are also two paintings by Knud Lavard, said to be of great historical value.

PARIS.—The Municipal Council has added a subscription of 500 francs towards a monument to General Faidherbe at Barmae.—M. Paul Bresse has brought before a Committee of the Municipality a project for the construction of cheap and sanitary artisans dwellings for Paris.

STOCKHOLM.—The death is announced, at the age of forty-nine, of Professor P. M. R. Isacs, of the Stockholm Technical High College, and one of the foremost architects in Sweden. Herr Isacs was the architect of some of the most prominent buildings erected in the Swedish capital in recent years, and also entrusted with the building of the Great Northern Museum to be raised in Stockholm. He recently sojourned in this country for professional purposes.

RUSSIA.—The Perekop Sea Canal between Asensko and the Black Sea will now be taken in hand. According to the Russian contemporary, the new canal will be 110 works long, will have an average width of 70 ft. and a depth of 12 ft. The capital (nearly 100,000,000 francs) has been raised by a company of Russian and French financiers. The works will take over six years to complete.

GRANT TO A SWEDISH ARCHITECT.—A Government grant has been made to a Swedish architect, Herr A. J. Lindgren, from the funds of the Academy of Fine Arts, for 1,000 kr., in order to study architecture in other countries.

## MISCELLANEOUS.

METROPOLIS MANAGEMENT AND BUILDING ACTS (AMENDMENT) BILL.—In the House of Commons on Wednesday, Sir J. Lubbock, in moving the third reading of this Bill, said that it was a Bill of a highly technical, but happily not of a contentious character. The House would remember that it was referred to in Tuesday's discussion on the County Council (General Powers) Bill by several speakers containing valuable provisions. It was inapposed on second reading, and though being carefully considered by a Committee upstairs, had passed through the Committee of the whole House without amendment. The Bill was read a third time.

THE LONDON COUNTY COUNCIL (OMNIBUS) BILL.—The General Powers Bill, promoted by the London County Council, and through the Committee stage in the House of Commons on Tuesday, and, with the exception of the clauses relating to the representation of the Council on the Thames Conservancy, was agreed to and ordered for third reading. The Bill, as we have already pointed out, provides for a variety of the Acts, among others, the acquisition of a bridge over Bow Creek, for the construction of Brockwell-park, and the amendment of the Metropolitan Building Acts in certain particulars. Mr. R. G. Webster moved an amendment to expunge the building clauses, with a view to their transfer to the Metropolitan Management and Buildings Acts (Amendment) Bill, but the amendment was negatived without a division.

WATER AND SEWER MAINS OF GLASS.—The firm of Messrs. Seume, of Prague, has introduced into the market water and sewer mains manufactured from glass, and having a coating of asphalt, one centimetre in thickness. They are said to be far superior to iron or clay materials, particularly in chemical factories, there being no incrustation.

PROFESSOR HERKOMER AND THE INDUSTRIAL CO-OPERATION.—Mr. Herkomer, R.A., has designed a Certificate of Merit, to be awarded to successful exhibitors in the Home Industries Exhibition, which will be held in connexion with the Third Great National Co-operative Festival at the Crystal Palace in August next. It represents "The Successful building up the warning finger of one hand which it holds the laurel wreath in the other. It rewards (although backed by the Wheel of Fortune) only true merit." These are the artist's own words descriptive of the design, which consists of a single female figure, seated at the portal of a temple, the steps of which form her throne. The certificate has been admirably reproduced in photographs by Messrs. Anson & Swan. For the coming Exhibition the Prize Schedule includes 525 prizes, for men, women, boys, and girls.

THE EXPANSION OF PORTLAND CEMENT.—In the course of some experiments recently made to determine the coefficient of expansion of Portland cement, it was found that an admixture of calcined magnesia and subsequent reburning increased the amount of the expansion to a considerable degree; and this expansion was more rapid in summer than in winter. Samples of the cement were immersed in water containing 0.5 per cent. of sulphate of magnesia (nearly three times as much as in the water of the English Channel), and the expansion was greater than in the case of pure river water. It has been found by a series of comparative experiments made with normally burnt and imperfectly burnt Portland cement, that the former when more rapidly in volume than the latter increased in river water; if, however, a dilute solution of magnesia was substituted, the ratio of expansion was reversed. For fuller particulars on the expansion of Portland cement the reader may refer to the experiments of MM. Léon Durand, Claye and Paul Debry, see *Annales des Ponts et Chaussées*, vol. xiv., p. 510.

CHANGE OF NAME.—As will be seen by an advertisement in our columns, Mr. H. D. Appleton, F.R.I.B.A., past President of the Architectural association, has changed his surname to Searles-Wood.

COMPETITION, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITION.

CONTRACTS.—Continued.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, Application to be in.

Those marked with an asterisk (\*) are advertised in this Number. Competition, p. ii. Contracts pp ii, xi, and xii. Public Appointments, xvi.

LONDON.—For the erection of mission church, hall, &c., at Canterbury-road, Kent-road, S.E., for the Corp. Christ College (Cambridge) Mission, Mr. Richard J. Lovell, architect, 46, Queen Victoria-street, E.C.4.—

Table listing names and amounts for London mission church project.

LONDON.—For alterations and additions at 81, Avenue-road, Regent's Park, N.W., Mr. Richard J. Lovell, architect, 46, Queen Victoria-street, E.C.4.—

Table listing names and amounts for London alterations at 81 Avenue-road.

LONDON.—For erecting St. Matthew's church-room, Warwick-road, Upper Clapton, for the Building Committee. Messrs. Mitchell & Butler, architects.—

Table listing names and amounts for London church-room project.

LONDON.—For alterations to No. 8, High-street, Camden Town. Messrs. Furniss & Thorpe, architects, 60, Kentish Town-road. No quantities.—

Table listing names and amounts for London alterations at No. 8 High-street.

LONDON.—For new stabling and cart-shed, also alterations and repairs at "The Rotunda," Blackfriars-road, for Messrs Alfred Lency & Co., Messrs. Dunk & Bonfield, architects and surveyors, 9, Billiter-square, E.C.4.—

Table listing names and amounts for London stabling project.

LONDON.—For alterations and additions to 72, Grosvenor-road, and 4, Faxon-street, Camden-town, N.W., for the Co-operative Bakery Society, Limited, Mr. E. Stone, architect, 19, Berners-road, Wood-green, N.:—

Table listing names and amounts for London alterations at 72 Grosvenor-road.

LONDON.—For alterations to "Cyrus Villa," Lewin-road, Streatham, for Mr. W. West. Mr. Ernest J. Wellman, architect, Brixton-Hill:—

Table listing names and amounts for London alterations at Cyrus Villa.

LONDON.—For alterations, repairs, &c., at the Broadway, South Hackney, for Mr. M. W. Shaw:—

Table listing names and amounts for London alterations at Broadway.

LONDON.—For alterations at the "Oporto" Stores, Broad-street, Bloomsbury, for Mr. Germain, Messrs. Furniss & Thorpe, architects, 60, Kentish Town-road. No quantities.—

Table listing names and amounts for London alterations at Oporto Stores.

LONDON.—For new show-rooms at Dorset Works, East-road, City-road, for Messrs. Dottridge Bros., Mr. A. G. Collins, architect, 52, Finsbury-pavement, E.C.2.—

Table listing names and amounts for London show-rooms at Dorset Works.

LONDON.—For alterations to No. 98, Southgate-road, N. (Oment.)—

Table listing names and amounts for London alterations at No. 98 Southgate-road.

LONDON.—For alterations to Nos. 16 to 23, Jubilee-street, E. Mr. John Smith, architect.—

Table listing names and amounts for London alterations at Jubilee-street.

LONDON.—For works at 1, Knarsborough-place, W.:—

Table listing names and amounts for London works at Knarsborough-place.

MOUNTAIN ASH (Glamorgan).—For the erection of an infectious diseases hospital, at Mountain Ash, for the Mountain Ash Local Board. Mr. John Williams, surveyor.—

Table listing names and amounts for Mountain Ash hospital project.

NORTH WOOLVICH.—For new buildings and alterations and repairs, also foundations, and flues to boilers, engines, machinery and plant, fence-gates, &c., at the factories of the Fowler-Waring Cables Co., Limited, Messrs. Dunk & Bonfield, architects and surveyors, 9, Billiter-square, E.C.4.—

Table listing names and amounts for North Woolwich project.

SOUTH SHIELDS.—For building potting-house, forcing and greenhouses, at the new Cemetery, Harton, for the South Shields and Westoe Rural Board. Mr. Henry Gueres, architect, Albany-chambers, South Shields:—

Table listing names and amounts for South Shields project.

TOTNES (Devon).—For the construction of small service reservoir, and providing cast-iron mains, &c., at Bridgeton, Totnes, for the Corporation of Totnes. Mr. J. C. Ingils, engineer, 13, Buckland-terrace, Plymouth. Quantities by Mr. E. J. Scown, Plymouth.—

Table listing names and amounts for Totnes reservoir project.

WILLESDEN.—For the construction of a pipe sewer in Canterbury-road, Kilburn, for the Willesden Local Board. Mr. O. Claude Kohson, Engineer:—

Table listing names and amounts for Willesden pipe sewer project.

WATFORD.—For new class-rooms, &c., at Beechen Grove Old Chapel, for the Trustees. Mr. C. P. Ayres, architect:—

Table listing names and amounts for Watford class-rooms project.

WATFORD.—For altering shop-front at No. 100, High-street, for Mr. J. C. Sims. Mr. C. P. Ayres, architect:—

Table listing names and amounts for Watford shop-front project.

WEST DRAYTON (Middlesex).—For erecting new offices and store for the Electrical Engineering Corporation, Limited. Mr. A. H. Heron, architect:—

Table listing names and amounts for West Drayton offices project.

WILLESDEN.—For the construction of a pipe sewer in Canterbury-road, Kilburn, for the Willesden Local Board. Mr. O. Claude Kohson, Engineer:—

Table listing names and amounts for Willesden pipe sewer project.

WATFORD.—For new class-rooms, &c., at Beechen Grove Old Chapel, for the Trustees. Mr. C. P. Ayres, architect:—

Table listing names and amounts for Watford class-rooms project.

WATFORD.—For altering shop-front at No. 100, High-street, for Mr. J. C. Sims. Mr. C. P. Ayres, architect:—

Table listing names and amounts for Watford shop-front project.

WEST DRAYTON (Middlesex).—For erecting new offices and store for the Electrical Engineering Corporation, Limited. Mr. A. H. Heron, architect:—

Table listing names and amounts for West Drayton offices project.

WILLESDEN.—For the construction of a pipe sewer in Canterbury-road, Kilburn, for the Willesden Local Board. Mr. O. Claude Kohson, Engineer:—

Table listing names and amounts for Willesden pipe sewer project.

WILLESDEN.—For the making-up of roadway and formation of pavements, &c., in thirteen new streets, for the Willesden Local Board. Mr. G. Claude Robson, Engineer:—

Table listing contractors and amounts for Willesden roadway work, including T. Adams, Kingsland, and Neave & Son, Paddington.

WOODFORD (Essex).—For proposed alterations and extensions to the existing Churchfield Schools Woodford, for the Woodford School Board. Mr. Edward Tidman, C.E., architect, 31, Victoria-street, Westminster:—

Table listing contractors and amounts for Woodford school alterations, including Oliver & Richardson, New Southgate, and Longley & Co., Oldley, Sussex.

WOLVERHAMPTON.—For building steam laundry, Swetnam street, Wolverhampton, for the Wolverhampton Sanitary Steam Laundry Company, Limited. Mr. G. H. Stanger, architect, Queen's-chambers, North-street, Wolverhampton:—

Table listing contractors and amounts for Wolverhampton laundry, including H. Lovatt, W. Dyerhampton, and M. Willeck, Wolverhampton.

WOLVERHAMPTON.—For the erection of Villa, Newbridge-crescent, for Mr. Thos. Dallow, Wolverhampton. Mr. Joseph Lavender, architect. Quantities by the architect:—

Table listing contractors and amounts for Villa at Newbridge-crescent, including R. Willcock, B. Guest, and C. Cave.

Golf House, Guildford.—We have received a list of tenders for this job, but as it is unaccompanied by sender's name, it is held over.

SUBSCRIBERS IN LONDON AND THE SUBURBS, by preparing at the Publishing Office, 19s. per annum (for 4s. 6d. per quarter) can ensure receiving "The Builder" by Friday Morning's post.

TO CORRESPONDENTS.

G. H. A.—J. E. P. (thanks).—J. D. & Co.—T. H. B. (we have a letter already in type dealing with the subject in the same spirit). "Surveyor" (ought not to have to ask such an absurd question. Of course it is a case of collimation. Cannot you see that if the line of sight followed the curvature of the earth's surface, there would be no arch there as a leading section (see p. A. C. H. G.—"A London Surveyor" and "Observer" (last week)—E. F. (we print another tender was accepted.—M. M. (the first statement you make is given in the article, and in better form than yours. The second diagram, as you ought to have perceived, only represents the first incomplete stage of a circulation system). All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses. Note.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere notices) which have been duplicated for other journals, are NOT DESIRED. All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

Registered Telegraphic Address, "THE BUILDER, LONDON."

THE INDEX and TITLE-PAGE for Volume LVIII. (Jan. to June, 1890), are given as a supplement with the present Number. A COLOURY TITLE PAGE may be had, gratis, on personal application at the office. CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each; also:—

READING CASES (Cloth), with Straps, price 8d. each. THE FIFTY EIGHT VOLUMES of "The Builder" (bound), price 17s. 6d. each. SUBSCRIBERS' VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS. SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, TRADE, AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under. Each additional line (about ten words) Ten for Series of Trade Advertisements, also for Special Advertisements on front page, Competitions, Contracts, Sales by Auction &c., may be obtained on application to the Publisher.

FOUR Lines (about thirty words) or under. Each additional line (about ten words) or under. PREPAYMENT IS ABSOLUTELY NECESSARY. \*Stamps must not be sent, but all small sums should be sent by Cash in Registered Letter or by Money Order, payable at the Post Office, Covent Garden, W.C. DOUGLAS FOUNDRIER, Publisher, Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY, but those intended for the front Page should be in by the same hour on WEDNESDAY. SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS or ORDERS to DISCONTINUE same must reach the Office before TEN o'clock on WEDNESDAY morning. The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to advertisements, and strongly recommends that the latter COPIES ONLY should be sent.

PERSONS Advertising in "The Builder" may have Copies addressed to the Office, 46, Catherine-street, Covent Garden, W.C. (send a copy of charge). Letters will be forwarded if addressed in envelopes are sent, together with sufficient stamps to cover the postage.

AN EDITION Printed on THIN PAPER, for FOREIGN and COLONIAL CIRCULATION, is issued every week.

Now ready. BEADING CASES, NINEPENCE EACH. (By post carefully packed, 1s.)

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied gratis from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum in advance. To all parts of Europe, America, Australia, and New Zealand, 20s. per annum. For India, China, Ceylon, &c., 20s. per annum. Remittances payable to DOUGLAS FOUNDRIER, Publisher, No. 46, Catherine-street, W.C.

## Art in Sardinia and Judæa.

OST readers will probably take up this work by Messrs. Perrot and Chipiez\* with a mental interrogation as to what is the connexion between the two countries principally named in the title of the book, and which we certainly are not accustomed to think of ordinarily in connexion with each other. The answer will be that the link is mainly furnished by the waters of the great inland sea which washes the shores of both countries; the sea which Horace, who knew nothing of the greater wastes of the Atlantic, and to whom the Mediterranean was the ocean, stigmatised as "dissociable," the element which separated mankind and interposed itself in the way of free intercourse. Architecture and archaeology tell a different story, and show that the Mediterranean has been in fact an assimilating agency in regard to the arts of the various peoples who dwelt on its shores, who were really closer together in this sense than if they had been separated by the same extent of dry land, which might have been occupied by tribes that opposed a bar to intercourse, or by jungles or forests far more impassable than the sea-water.

The "plan of campaign" of the authors, in fact, as stated in their opening page, was "to collect on the shores of the Mediterranean the scattered remains of Phœnician art, or rather industry."

The chief interest, however, of the chapters devoted to Sardinia consists in the illustrations of a class of monuments which appear to be peculiar to the island, though a relationship is subsequently traced between these and the form of rude towers still to be found in parts of Italy under the name of Truddi (Latin "Trulli"). Whether these rather similar structures really indicate any close connexion between the Sardinians and tribes living in Italy, the authors consider is a question which could only be solved after a more complete study and knowledge of the class of rude structures in Italy referred to.

As far as we can gather however from the authors' rather desultory and wandering pages, the theory which they have arrived at from a study of Sardinian remains is that there was a fringe of population round the coast of the island, in early times Phœnician, in subsequent times Roman, who left the remains of their art and monuments round the coast, but that there was an older race of inhabitants dwelling at the same time in the centre of the island, a kind of Highlanders, who retained their own customs and arts for a long period unaffected by influence from without. And this early population they regard as having originally crossed over from the African coast, from Libyan territory; the African coast being the nearest mainland to the south portion of Sardinia. In regard to topographical relation, this seems a probable theory, for in days when maritime navigation was tentative and uncertain, it may be pretty safely assumed that the question of distance of voyage was the most important factor in determining the connexion between one coast and another, and that it would be the nearest coast that would receive the earliest attention from an exploring population.

We must confess, however, that the argument as carried on in the book leaves so many points open to discussion, and is so discursive and inconclusive in its character, that it must be regarded rather in the light of interesting and imaginative speculation than of history; and it may be questioned whether in regard to the early history of Sardinia we can ever now get beyond this rather theoretical stage. The existence, at the Roman period or earlier, of a central tribe of inhabitants in Sardinia preserving an aboriginal form of life and of art and monuments, may however be accepted as pretty nearly a certainty; and those monuments, of which many are illustrated, are certainly very curious and interesting. A few of the illustrations we are able to reproduce here by the courtesy of the publishers. We have selected plans and elevations of two, which represent types of the simple and of the more complex forms; figs. 1 and 2, of the Nieddu Nùragh, representing the simpler type; figs. 3 and 4 the more complex; fig. 4, as will be at once perceived, is a restoration of the exterior, by the authors. "Nùragh" is the name by which these towers have long been known in the country, and concerning the derivation and etymology of which there have been controversies, to little purpose; we

quite agree with the authors that it was best to adopt the name in use, in describing them, rather than invent a new one. These nùraghs exist in great numbers in the interior of the island, and have for centuries furnished the peasants with building materials for their huts; a Vandalism of the past, which, the authors add, they regret to say is still going on in the present; a remark which may suggest a new field for the energies of the Society for the Protection of Ancient Buildings. In despite of this spoliation, La Marmora, in his work on Sardinia, estimated that there must be three thousand of these structures still in existence in a more or less ruined state; an estimate which the authors believe to be probably far short of the actual number. The detailed description of these we had better give in the words of MM. Perrot and Chipiez, or rather of the translator:—

The form of a nùragh is that of a truncated cone, built with stone blocks of different size, sometimes very large, narrowing towards the top. It probably terminated in a terrace" [for this there seems to be no evidence beyond the appearance of something like an external staircase in many of the structures; the top is, as far as we can discover, in all cases ruined]. "Some parts of the edifice are built with cut stones; but they are unheun, as a rule, and laid without mortar, the intervening cavities being filled up with earth, apparently thrown in with the hand. The only doorway is on the ground-floor, but so low that a man must creep in as best he can to reach a corridor seven or eight feet high, as low as the entrance in some places.

This occurs where some kind of division or door formerly stood, shown by existing archways which communicated with a circular hall or chamber six or seven metres high." [The section at A fig. 1 shows the meaning of this rather clumsily expressed sentence; there is a high passage, with a low door from the entrance and an almost equally low door into the central compartment. In some cases, however, as appears from other illustrations, the entrance passage, after passing the low external entrance, is continued at a uniform height into the central domed compartment.] The stonework is corbelled [in the central chamber], forming an oblong dome measuring four or five metres at the spring of the arch. This mode of construction is observable in the passage and side chambers, shortly to be described, where the stones slightly overlap each other so as to form an incline. A certain amount of care was bestowed on the [interior] facing, of which the stones are well cut and do not show the joints, enabling the eye to travel from the base of the wall to the extremity of the slope in a continuous line to the top, which is sufficiently narrow to allow of a single stone, sometimes of considerable thickness, to fill up the gap."

Some nùraghs have one story only, others,

\* History of Art in Sardinia, Judæa, Syria and Asia Minor. From the French of Georges Perrot and Charles Chipiez. Translated and edited by I. Gonino. London Chapman & Hall. New York: A. C. Armstrong & Son. 1890.

such as that shown in figs. 1 and 2, a second story, in which the arrangement of the ground plan is repeated above.

Although this appears to be the general scheme, the authors show us enough illustrations to hear out their remark that there is a great deal of variety in the details of the structures, no two plans being exactly alike, though all conforming to the same general type. There are some examples of what may be called agglomerated nuraghs, where the regulation central chamber with its low entrance is combined with other similar dome-like chambers in the same structure. A very peculiar example is the *Losa nuragh*, in which the plan is in the form of a triangle with the angles rounded off and the sides very slightly concave; internally there are three separate vaulted chambers besides the central one, each within a rounded angle of the triangle; but externally these divisions of the plan are not seen, the whole being resolved into this curiously-shaped castle or keep. A far more elaborate plan, of which there is no other similar example, is that of the *Ortu nuragh*, of which we give the plan and the authors' restoration. It consists, as will be seen, of several one-storied nuraghs grouped around a central three-storied one, and has all the appearance of a fortress with an outer range of bastions and a central keep.

What was the use to which these structures were put? It is impossible to look at the section of one of them without thinking of that of the Treasury (so-called) of Atreus, at Mycena, now undoubtedly accepted as a tomb; impossible to compare the one with the other without thinking of the Pelasgi and imagining that here we have their influence in two distant portions of the Mediterranean shores. The nuraghs have been by various writers supposed to be tombs, temples, and dwellings. The temple theory is pretty well disposed of by their number, which would almost give a temple to each family, according to the probable density of population, in some portions of the island. Our authors consider the tomb theory disposed of by the fact that unquestionable tombs, of quite a different type, exist in close proximity with the nuraghs, and argue that it was improbable that two different forms of tomb would be in use by the same people. A negative argument in the same direction is that no skeletons or objects connected with burial have so far been found in any of the nuraghs. Another theory has been that these were dwellings; against which M. Perrot and Chipiez urge that "it is impossible to admit that these natives, even supposing them to have been mere savages, can have submitted to live in houses deprived of air and light, where fires were not to be had with any comfort, since the smoke could only escape as in Greek huts, through the interstices left by the beams; where, summer or winter, no viands could be cooked, and where every time they passed in or out of the doorway, they must have done so on all fours." They therefore conclude that the builders of these towers lived in huts close to them, and used the towers for stores and for places of refuge when attacked. This seems to us a very far-fetched explanation. There is, in the first place, apparently not the slightest vestige of the said huts, which must surely have left some kind of trace behind them if they were so numerous. Secondly, all tribes who erect buildings to defend themselves from violence prefer to live in those buildings, not to keep them as a retreat in case of need; otherwise how are they ever safe from a surprise? And as to their being too rude to live in, anyone who did not know the facts would certainly say the same of the huts of the Esquimaux for instance, and of many other half-savage tribes. Our own conclusion is that these were the abodes of a very rude and savage people, constantly fighting, and each feeling himself unsafe except in a structure in which he was secure from surprise. There is really a strong analogy between the history of these and the early Scotch castles. The square towers of the

Fig. 1.—The Nieddu Nuragh, Sardinia.—Section.

Fig. 2.—The Nieddu Nuragh, Sardinia.—Elevation.

later were most uncomfortable dwellings to our notions, but there is no manner of doubt that those who built them lived in them, and would not have felt safe otherwise. The nuraghs are only the same kind of thing in a more rude and primitive form, and our conviction is that the men who built them built them to live in, and would not have felt safe without them. Probably when they were not confined necessarily within them by a siege or an attack, they would use them only to creep into and sleep, spending the greater part of their lives in the open air. M. Perrot and Chipiez do indeed adduce the example of the towers built by the Italian families in the Middle Ages for security and retreat; but that was in a very different age—an age comparatively civilised. Our conclusion is therefore that these were really fortified dwellings.

The bronze statuettes found in the neighbourhood of the nuraghs may be held by some to militate against this theory; but they are in fact of the rudest and most barbarous description, the merest caricatures of statuettes that were ever illustrated, and so ugly that we hesitated to employ any of our space in reproducing one of them, even for purposes of illustration.

The portion of the book specially dedicated to Judaea includes a restoration by M. Chipiez of the Temple of Jerusalem according to the

description of Ezekiel. The connection of the subject with Sardinia is alluded to in the opening of the chapter. We have followed the Phœnicians, says the author, to the utmost limit of their adventurous track; we retrace our steps towards the Syrian coasts, and in that portion intervening between Phœnicia and the Valley of the Jordan, which we now call Palestine, we find a small people, owning the same blood and speech as the Phœnicians, whose place in the world was but a narrow corner, rendered important by the unparalleled part they played in it. A considerable historical account of the Jews is gone into, in order to realise the circumstances under which the temple of Ezekiel was built. To follow the author (M. Chipiez appears to be solely responsible for this portion of the work) through his reasoning from the description of Ezekiel to his restoration of the temple, would demand in itself a longer disquisition than we have space for. It is of the greatest interest, though we fear it must be accepted as merely problematical in character. The salient features, architecturally, of the restored temple show references both to Egyptian and Phœnician types of architecture; the Egyptian feature of huge and lofty pylons, finished with the Phœnician battlement. The principal illustrations are very finely-executed plates,

enable the reader without difficulty to locate the sites mentioned as he reads.

The hook in its English dress is very well got up, but cannot be said to be very well translated, owing apparently to English not being the native language of the translator, who occasionally uses words which are not English at all, as well as awkward and unidiomatic sentences and constructions. These faults are not very numerous, but these and the want of literary style detract somewhat from the pleasure of reading the hook. In all essentials, however, it is a practically useful and adequate translation, and may bring before a larger circle of readers a treatise of rare interest and learning upon a most interesting section of archaeology.

PATENTS.

**I**F works on the law and practice of letters patent in their technical sense, there is no end, and this last appears to surpass all its predecessors in size and in completeness. A *magnum opus* of this kind\* must always be received with respect and thankfulness. For if both our shelves and our pockets are unable to bear the burden of it, and we have to content ourselves with more moderate works, yet it will find a place in every important legal and technical public library. It contains not only a large mass of technical and legal information; it also deals with the subject historically; and we are thus able not only to find out in its pages the means of taking out new patents, of protecting old ones, and so forth, we are able also to follow by its means the evolution of English patent law. If we were to venture to criticise adversely a production characterised by so much industry, we should be tempted to point out that the book is somewhat prolix. It might have been equally clear and less wordy. Thus in regard to what is popularly called "the benevolent interpretation" of specifications, there appears to be an inclination to undue expansion. The term was invented to describe the tendency of the courts to construe specifications favourably to the patentee. This tendency appears so long ago as 1834, in a case decided by Chief Justice Tindal. It was not till 1876, and again in 1884, that it was reduced to its proper proportions. In this latter year Lord Justice Bowen stated the rules as to the construction of patents, showing clearly that all that was intended by the expression was that excessive formalism or shortness was not to prevail, and in 1886 Mr. Justice Chitty said that a specification "ought to be construed like any other legal document."

We cannot, however, but think that many of the expressions of these judicial ideas might have been passed over by Mr. Edmunds, and that it would have been sufficient to have given *in extenso* only one judicial utterance. Such a one is to be found in the words of Lord Chelmsford in 1876, who said:—"In the construction of a specification, it appears to me that it ought not to be subjected to what has been called a henign interpretation, or to a strict one. The language should be construed according to its ordinary meaning, . . . and if the specification is thus sufficiently intelligible, it performs all that is required of it." This is excellent sense and sound law, and no one patentee or lawyer wants more judicial utterances than this.

The way in which, after fluctuations, the recognised rule of law is arrived at by judicial dicta is well shown in this point of the construction of specifications. The whole subject teems with examples showing how this great body of practical law, as it may be called, has gradually grown up, partly by means of legislative enactments and partly by means of judicial decisions. More especially is this indirect growth noticeable in regard to two elements in the value of a patent, viz., its novelty and utility. Con-

\* The Law and Practice of Letters Patent for Inventions, with Patent Acts, &c. By Lewis Edmunds, Barrister, assisted by A. Wood Renton, Barrister. London: Stevens & Sons, Limited. 1890.

worked out with great care and in minute detail; we may devote some special attention to the restoration on a future occasion; we can only now refer the reader to the work for a chapter full of interest not only in suggestions of restoration, but for the number and variety of illustrations of various ancient architectural remains, which are all brought to hear upon the subject.

The second volume is mainly occupied with sites in Asia Minor, and is a storehouse of curious illustrations of carvings, in which elements both of Assyrian and Greek type seemed to be mixed together. It is from this portion of the work that we extract the interesting illustration of a rock-cut tomb at Alajah (figs. 5 and 6—see next page), which were dis-

covered by Hamilton as far back as 1835. As the authors remark, it is exceedingly difficult to date this monument, as it might either be due to Hellenic influence, or might be a primitive type borrowed by Asiatic Greeks. We should rather incline to the former belief, that it was an influence from Greek architecture, not a source of it. The connexion between Greek Doric and Egyptian is too marked to be mistaken, while on the other hand this shows elements which do not occur in Greek work—the base to the column, and the projecting astragal necking, for instance. From whatever point of view, however, it is a monument of great and curious interest. It would have been a convenient addition if a map of Asia Minor had been attached to the volume, to

Fig. 5.—Rock-cut Tomb of Gherdek-Kavasi, Asia Minor. (See preceding page.)

Fig. 6.—Plan of Gherdek-Kavasi. (See preceding page.)

tinually, year by year, we have been obtaining a clearer idea of the characteristics of these two terms. Nothing is more easy to declare than that in the abstract an invention must be both new and useful, nothing is more difficult than to reduce into everyday use these compendious and elastic terms. For example, when we say that an invention must be a useful one, do we mean that it should be theoretically useful? The law has now laid it down that "utility means an invention better than the preceding knowledge of the trade as to a practical fabric. It does not mean abstract utility." Then again, pecuniary success in the result of the working of an invention is strong evidence of utility; and it must be shown that the subject-matter is vendable, otherwise, of course, the invention will not be used. Here we have some examples of the way in which the term "utility" has been illuminated from time to time. We might give instances of the same kind in regard to the term "novelty,"—where, indeed, the question is more complicated, because there must, to constitute novelty, have been no prior user, and thus we have to ask ourselves for the meaning of prior user

before we can arrive at an accurate view of the term "novelty." Thus it has been debated whether an experiment performed in the presence of others is a prior user of an invention, but it has been decided that it is not. If it had been it is obvious that a blow would have been struck at inventions in this country, for we have arrived at a period in the history of manufactures when most machines are complicated, and many are formed by the junction of new and old arrangements. Hence, semi-public experiments become very necessary. We have in this notice of this important work dwelt on one or two points interesting rather in regard to the history than the practice of patents; since we have from time to time noticed various purely practical works on the subject. The voluminous character of this book has afforded opportunity to point out the great interest and importance of the historical side of the patent law, and the nature of its growth. In these pages we may trace patents for inventions back quite to Medieval times, and see them occupying a large share of the attention of politicians in the seventeenth century. Their public importance has grown

year by year, until they form, it may be said, the basis of our manufacturing power, and a continual monument to the ingenuity of the human race.

NOTES.

**T**HE throwing out of the Central London Railway Bill by the Committee of the House of Lords is a matter of no surprise to us, though in some quarters it appears to have moved both surprise and indignation. The extensive use by the public of a railway under such new circumstances of construction and working, and at such a depth under ground, seems to us exceedingly problematical; and we are inclined to think that the promoters may really be grateful to the Lords Committee for restraining them from risking capital in an ill-advised enterprise. The opinion given in evidence by Mr. Penrose, who is a practical man and not an "aesthete," in regard to the possible effect of the proposed works on the foundation of St. Paul's, is not to be lightly passed over. Mr. Penrose admitted that if the tunnel were kept in the clay there would probably be no danger, but he believed the clay was at a great depth, and that it might prove impossible to keep within it, and if once they began removing the stratum of sand above it the consequences might be serious. Mr. Lewis, C.E., gave evidence as to the injury which had happened to the National Safe Deposit premises from the slipping of the clay itself. On various grounds the scheme seems to us to have been one of very doubtful wisdom, either in the interests of the public or of the promoters, and we think that the Lords Committee has acted for the best in opposing it.

**I**T appears that Sir A. Blomfield's examination of St. Saviour's Church, as now existing, preparatory to making the drawings for the proposed new nave, led to the discovery that a good deal more of the remains of the old nave are in existence than is generally supposed, and that a good deal, if not all, of the old foundations, and a considerable amount of the old walling, will be preserved and used in the new building. This, the architect argues, must settle the plan, and if that is settled the rest follows as a matter of course. This certainly throws a rather different light on the proposal to restore the Gothic nave.

**A**N opportunity occurs just now for making a much-needed improvement in Piccadilly, which may not occur again for a century. The valley through which the Tyburn runs in the form of a large sewer, and the hills on each side, especially the somewhat steep one opposite Half-Moon-street, are a great impediment to the traffic, especially in winter, when the wooden pavement is slippery. Many horses fall, and some serious accidents have occurred, but the chief difficulty is with the heavily-laden market-carts on their way to Covent-garden in the early morning, and which, to avoid the hill, make a detour through the narrow and otherwise quiet streets of Mayfair, much to the annoyance of the residents. Four of the houses in the valley, under one of which the Tyburn sewer passes, are now being demolished to make room for the Junior Constitutional Club-house, and if the ground-floor of the new building were placed sufficiently high to admit of the level of the street being raised about 2 ft. or 3 ft., the valley would practically disappear, and the ascent of the hills would be considerably relieved. The ground floors of the adjoining buildings, viz., the Savile Club, St. James's Club, and Hertford House, are reached by flights of steps, and are sufficiently high to admit of this alteration, and it is the old houses now being removed which have stood in the way of the improvement being made long ago, as is obvious from the raised foot-path on the park side of the street, and the low level of their ground-floors. It is to be hoped that this very obvious and desirable street improvement will not escape the notice

of the architect of the new Club-house and the Vestry of the rich and carriage-going parish of St. George's, Hanover-square. The street-front of the new building will require to be set back somewhat, but this has doubtlessly received proper attention from the local authorities.

WE are glad to hear that, in order to make the Parkes Museum (which is supported by the Sanitary Institute) available to all classes for the purpose of obtaining information on matters relating to hygiene and sanitary appliances, the Council of the Sanitary Institute have resolved to throw the Museum open free at all times, except when meetings or lectures are being held. This is a step in the right direction. The Museum, we may add (for the information of some of our readers) is situate at 74A, Margaret-street, W.

IN a recent case the validity of Ryde's Scale as a customary rate of charge by surveyors was called in question. Although the plaintiff recovered the amount claimed, it was rather on the ground that this particular scale was in the contemplation of the parties as that by which the charges were to be regulated, than because of its validity as a customary charge. The fact is, that practitioners cannot too constantly bear in mind that a professional scale can hardly ever be proved to be valid by custom and apart from contract. It is scarcely ever possible to prove that it is so absolutely universal, so thoroughly recognised, as to be a legal custom. The forgetfulness of this over and over again causes disputes, which can always be avoided if this scale, or that, for example, sanctioned by the Institute, is brought to the employer's attention when the engagement is entered into. Men in every profession become so accustomed to certain common charges that very naturally they are apt to regard them as binding, when in law the only test of the propriety of the charges is their reasonableness. The physician who invariably obtains his guinea naturally, by force of habit, considers it legal, whereas it may be that were a cantankerous patient to dispute the charge and to show that it was more than the services were worth, it might be overthrown. An authorised scale may *prima facie* be regarded as a reasonable one, but the proper way to employ it is to bring it to an employer's notice in the first instance as a recognised rate of payment which he should sanction, and not to delay its use until the bill is being prepared.

A DECISION of the Court of Appeal of interest to patentees will be found in the current number of the "Law Reports" in the case of the American Braided Wire Company v. Thompson. It touches the question of damages when an infringer of a patent has by lowering the price of the pirated article compelled the patentee to reduce the price of his goods. The decision of the Court of Appeal was that the patentee was entitled to recover all the profits which would have been made by him if all the sales made by them and by the infringer had been made by the inventor at their original prices, after making an allowance for the increased sales attributable to the connexion and exertions of the infringer and to the reduction in the prices. By this decision patentees in similar cases will, as far as possible, be placed in a position of security. In a previous case a somewhat different rule was acted on, the patentee not being allowed the value of the original prices, because he had lowered his prices, not to compete only against the infringer, but also against third parties who, though not selling his patented articles, were selling articles which could be used for the same purpose.

MUCH attention is now being paid to the acquisition of ample and good church accommodation for the Berlin citizens, and, thanks to the activity of the newly-formed local "Church Building Society," which is under the immediate patronage of the Empress, numerous churches are being erected in different parts of the town, so that,

if this activity lasts, the church accommodation for the not very numerous church-goers of the German capital will be materially extended. No fewer than ten churches are in course of erection in different parishes, and of this number three have lately had their foundation-stones laid by the Empress with all ceremony, and another will be opened with similar pomp this autumn. Besides these ten, three other erections are already on paper, and two smaller ones for the suburbs will be commenced a couple of months hence. We also hear that the above Society intend erecting a large church in memory of the Emperor William I., and that a competition for the designs of this building will be opened as soon as possible, so that it may be taken in hand next spring.

THE French seem very slow to perceive what one would have thought (in England at least) the most obvious desirabilities of sanitation. *L'Architecture* (which, be it observed, is the organ of the "Société Centrale des Architectes") publishes in its issue for the 12th an illustrated article on "Logements à Bon Marché," or, as we should say, "Artisans' Dwellings." Plans are given of a set in Rue Jean Robert, in which the water-closet opens out of the kitchen, nothing but the single door intervening: truly a delightful arrangement! English builders used habitually to place it in the bath-room, but this is ten times worse. We observe the author of the article seems a little doubtful about it, as he mildly remarks that "Cette disposition prête à la critique." We should think it did.

THE Annual Report for 1889 of the Working Men's College at Melbourne, which is before us, gives the idea that this is a very energetic and flourishing institution. A great variety of subjects are taught, and from the Report it appears that a great majority of the classes are largely attended. In regard to the class for instruction in gas-fitting and plumbing, for instance, we read that the only difficulty experienced has been from overcrowding of the class. Architectural drawing is the subject of one class, in connexion with which a course of lectures on Egyptian, Greek, and Roman architecture have been given. The classes in geometry, building construction, free-hand drawing, mechanical drawing, and modelling are all reported on very favourably.

WHAT is "Sloyd"? It appears from a little new magazine dedicated to the subject, to be a system of teaching the apt and ready use of the hands, preparatory to the acquiring of various handicrafts. Considering the inherent or hereditary clumsiness of the hands in the children of uneducated people, there seems every room for such a training, and it may be doing a very good work in preparing children for technical classes. The magazine, however, does not, so far, explain the system pursued; nor does it give the origin of its rather singular name.

THE Kyrle Society are appealing for funds to enable them to carry on their work of gratuitously decorating the homes of the poor, or rather schools, clubs, and hospitals, frequented by the poor. They say that "at the present moment twenty-two applications for decorative help have been inquired into and sanctioned by the Committee, but that not one of these can be put in hand, not from any lack of able artists and architects to draw up schemes or of workers to carry out their designs, but because the Committee has absolutely no money to grant for the necessary expenses of material and fixing, &c." Possibly their former subscribers are beginning to ask the question which we have asked once or twice, on what principle is gratuitous decoration to be given to the poor any more than gratuitous soup? The most active movers in the Kyrle Society are those who, in relation to such necessities of life as food and clothing, hold strenuously by the principles embodied

\* "Sloyd" or "Hand Craft": a Chronicle of Manual Training. The organ of the Home Sloyd Union.

in the programme of the Charity Organisation Society, viz.: that all mere charity, in the vulgar sense of the word, is demoralising, and only helps to foster the evils it professes to relieve. But if so, on what principle are the luxuries of life to be supplied to the poor gratuitously any more than the necessities? For the good intentions of the Kyrle Society we have every respect, but we fear their position is hopelessly illogical: and there is besides the question, where is this gratuitous decorating to end; where is the line to be drawn? That it must be drawn somewhere is certain.

WE referred last week to the old "Physic Garden" at Chelsea and the proposal of the Apothecaries' Company to sell it. This proposition appears to be regarded with apprehension by some of the inhabitants of Chelsea, who organised a meeting at Chelsea Town-hall for Wednesday evening last, to elect a Committee to attend to the subject and to prevent if possible the loss of an open space, and the sale of the land for building purposes. It is stated that the garden was presented to the Apothecaries' Company in 1721 by Sir Hans Sloane on condition that "it should at all times be continued a physic garden, for the manifestation of the power and wisdom and goodness of God in creation, and that the apprentices might learn to distinguish good and useful plants from hurtful ones," &c. If so, it appears rather contravening the terms of the bequest to sell it unconditionally. It has been suggested that it might be used as a botanic garden for study in connexion with one of the Polytechnic institutions of London, or that at all events it should be preserved as a garden and not built over; a suggestion with which we entirely sympathise. A constant struggle is needed to maintain the existing open spaces of London, and Chelsea is doing well in taking up the subject.

REQUIRED, the grammatical construction and precise meaning of the following extract from a letter signed "Grimthorpe" in the *Times* of Tuesday, about the old gateway of Lincoln's Inn:

"SIR,—The antiquaries and "ancient building protectors" (by letting them go to ruin) are as accurate as usual in the statements they are publishing, wherever they can get a footing, about this gateway, and some chambers on another side of the square which nobody has proposed to meddle with, except Sir Gilbert Scott's general plan for gradually rebuilding Old-square, in which I understand there are not a brick party wall from one end to the other until we rebuilt most of it, not a year too soon; and even now there is none between the gateway and the old buildings."

At the close of his letter the writer speaks of finding "wrath for them (his archaeological opponents) and amusement for myself." To most readers it would appear that Lord Grimthorpe was himself so far in wrath at being foiled in his desire to pull down the Lincoln's Inn gateway that he could not even arrange his sentences intelligibly.

WE have received the following letter from a reader in India, in reference to Mr. Armstead's bas-relief monument now in the Royal Academy, and which was illustrated in the *Builder* for May 31:—

"DEAR SIR,—My little daughter, only just four years of age, but of an eminently practical turn of mind, as you may gather from what follows, has given me a poser, which I think the eminent sculptor concerned should bear of.

After studying for a short time the illustration "Guardian Angel," in your issue of May 31 last, she inquired: "But how did the angel get its clothes on?" And I was forced to confess that I did not know how angels,—this one in particular,—managed with their clothes! I. I. I."

The question might have been added, how were its wings attached? But if the sculptor had shown an angel without either

—The result of the meeting was that a resolution, moved by Mr. Westlake and seconded by Professor Flower, was adopted to the effect that "this meeting of the inhabitants of Chelsea and others, having heard that there is a probability of the old "Physic Garden" on the Chelsea Embankment being no longer kept up by the Apothecaries Company, considers that every effort should be made to keep the garden an open space for public use." Lord Meath, Lord Monkswell, Professor Westlake, &c., and some others were elected as a committee for the purpose of watching the matter.

clothes or wings, would the little critic have believed that it was an angel at all? The child's question, however, is worth putting to sculptors and painters; the conventional idea of an angel as being clad in a nondescript long drapery and with wings mysteriously coming through the drapery is certainly foolish and illogical enough. Can they think of no better way to convey the idea of a superior being?

THE exhibition of sketches and studies at the Society of British Artists throws a curious light on the real nature of the present tendency towards unfinished and sketchy work in painting, which is practised under the name of "impressionism." Putting out of the question the studies by Sir F. Leighton and Mr. Burne Jones, which of course give a special interest to the exhibition, the remainder of the collection consists of sketches for pictures, mostly landscape, by the ordinary run of contributors to this Gallery. Now it is remarkable that while the exhibition of the Society of British Artists has generally been a very dull and uninteresting one, this year it produces the impression of being interesting and bright; and the difference evidently arises from the fact that a great many of the exhibitors can produce effective and interesting sketches, but in the making finished pictures they spoil and reduce to commonplace their own beginnings. And that we take to be the whole mystery of impressionism, which is the work of artists of feeling and perception to a certain extent, who can sketch but cannot finish, and who try to persuade the public that the sketch is the real thing. While alluding to the Exhibition, we should mention the remodel for Harrow Mission Church (502), the figures by Mr. Hamilton Jackson, and the decorative portion by Mr. Leshaby, which is very fine, and which we have already referred to in connexion with a drawing of it in the Academy. Mr. Jackson's cartoons for the Baptistery window St. Albani's, Acton (Green, 513) should also be looked at, and Mr. Walter Crane's fine decorative panel entitled "Luna" (514).

THE circular from which the following quotation is taken, appears to refer to some new kind of extract ventilator (system Herelle-Leruste) patented by a French firm, and in this remarkable language brought by means of traduction before the English public:—

"INTERESTING ADVICE to Messrs. Washers, Dyers, Dressers, Brivers, Distillers, Founders, Owners of Iron, Mills, Directors of Gas-works and of glass-works. In a word, to all owners of establishments where steam vapour, smoke, stench, diffuse itself in of halls.

DISCOVERY NEWLY moveable summit and hats, suck and ventilator removing completely steam vapour, smoke, stench, in halls and workmen.

*System Herelle-Leruste*  
Patented in French and abroad unwaranted of the government.

This newly moveable being at the price very little high, comparatively to all means used till to day, giving very little of results can to apply it to all old and discovery beans, without not any trouble, and can be installed without disturb the workmen working in the establishments, and asking not any repair at a better period.

Jingaze Messrs. manufacturers, to make application of it, they will find a great advantage because all know very well the inconveniences which result of it, when steam vapour, smoke, stench result in halls. Direction, inspection of work very difficult production, be far from satisfactory, the machinery, the materials which be in those halls are always humid and get spoiled it very fast. With this moveable summit, horse hold suffer much less and can respire without to apprehend of absorb gas or all, emanation coming of the different stench. In a word, all the inconveniences vanish the halls are ventilated, and during the winter season it is less cold, than with all the systems used until to day, by against, during summer, heat is more temperate. The summit has not any affinity with these chimneys with funnel which can not that remove all heat of the trough where they are set, very bad and expensive thing, and they renounce not steam vapour which are spreading close by, for these chimneys. I have a moveable hat sparing all driving back."

It is a pity, as this "moveable hat" seems to promise so much in the way of ventilation, that we could not have had an intelligible description of it.

#### SOME RECENT PUBLIC WORKS AT EALING.\*

It is now some six years since I had the pleasure of meeting you in Ealing (shortly after the expiration of my term of office as President of the Association). The paper I then read was entitled "Twenty Years' Development of a London Suburb," and I am free to admit that it was with some degree of satisfaction I was enabled to point to the progress made between the year 1863, when the Board was formed for the better government of a country village, and the date of our meeting, 1881, when the country village had grown into a thriving suburb, its rateable value having gradually worked up from the comparatively small sum of 17,500*l.* to the somewhat more important figures, 118,000*l.* There were some who then felt that Ealing had reached its maximum, and might fairly rest upon the work done; but a London suburb, if it is to maintain its position, can know no rest—"Progress" is ever its motto, "Full steam ahead" the order of the day; and this has been the policy of the governing body of Ealing from the day of its formation to the present hour.

Some five years ago circumstances pointed to the necessity of erecting an isolation hospital, and a very short period elapsed when a building, complete in every respect, was erected. Baths—which might also be used as gymnasium in the winter—next occupied attention, and eighteen months later saw them completed. The necessity for increased staid and store accommodation was felt, and the opportune moment was seized by the Board for carrying out these works. This happened in a most unexpected manner, by the acquisition of the splendid site of land upon which the buildings were to be now assembled: erected; and, I may add, the Liberal owner gave me the opportunity of performing an act which does not often fall to the lot of a Local Board Officer. The land, with main road and side frontages, was valued at 3,000*l.* I was allowed to fix a price at which it should become the property of the Board. I did it by cutting off the last cipher—turning the 3,000 into 300*l.* I need hardly say that, the owner having expressed himself satisfied, the Board were gratified; and even those who did not see the matter quite clear at first, have come to the conclusion that the step was a wise one, the principal factor in this all-round success being the very important one from a ratepayer's point of view, that the rates have not been increased one farthing. With a death-rate, upon a three year average, of only 11.5 per 1,000, with a loan account but slightly over one-half of the rateable value, and with a half-yearly rate of only 1*s.* 6*d.* in the pound (with a halfpenny for the Free Library), we have, to say the least, very much to be thankful for.

Turning now to the more immediate object of our meeting, I will give a short account of the circumstances which more immediately led to the erection of the hall.

No one who was present at the Jubilee celebration last year could well forget the enthusiastic way in which the day's pageant was carried out; few committees could overtravail, and none surpass, Ealing in its unique demonstration. There were not wanting, however, spirits who, satisfied with the demonstration, yet regarded it as of too transient a nature to be satisfactory to the loyalty animating them. Bonfires blazed, fireworks fizzed on that glorious day in June, and the Jubilee celebrations might have been over. But that was not to be. On January 25, 1887, a very large and influential gathering of the inhabitants took place, and E. M. Nelson, Esq., J.P., the Chairman of the Board, who had been elected chairman of the meeting, explained a scheme for the erection of the present building upon land belonging to the Local Board, but which the Local Government Board, who had previously been in communication with them, had said might be utilised for the desired purpose. The result was that a resolution was carried with acclamation that a hall should be erected, and that, as suggested by the Local Government Board, it should be vested in the Local Board, as trustees for the inhabitants of Ealing; that the building should be used for the purpose of public meetings, balls, concerts, &c., and that the proceeds derived therefrom should be divided annually

amongst charitable institutions in the district. A committee having been appointed for the purpose of carrying the resolution into effect, subscriptions for the purpose of raising the necessary funds to build the hall were solicited. Mr. Nelson headed the list with the sum of 500*l.*, and the appeal was heartily responded to by all classes. The committee were consequently able to carry out the desire of the contributors, and in less than two years, viz., in December, 1888, his Royal Highness the Prince of Wales performed the ceremony of publicly opening the Victoria Jubilee Memorial Hall.

Concurrently with the erection of the hall, the Local Board built new public offices, also a suitable home for the free library. The latter institution had been located upon premises which were not so convenient or well placed as might have been desired, and it is a source of congratulation that a new and permanent building has been secured. The inhabitants of Ealing now have, upon one spot, in as near as possible the centre of the district, a block of buildings consisting of the Public Offices of the town, the Free Library, the Victoria Hall, the Baths, the Fire Station, the Stabling, and all other necessary adjuncts to the headquarters of a local authority, such as, it is believed, is scarcely equalled, certainly not surpassed, in any other town in the kingdom.

The New Public Offices, Free Library, and Memorial Hall.—The design of the buildings may be described as English Gothic, freely treated to meet modern requirements, the details of stone-work being mainly based on the geometrical period of Gothic work. The principal entrance, both to the public offices and the Jubilee Hall, is placed in the centre, and above it is a two-storied oriel window, corbelled out from the main wall, and terminated by a pierced parapet, which forms the central feature of the whole design. To the right of this central gable is the tower, which separates the Public Offices from the Free Library wing, the height of the tower from the ground to the top of the final being 135 ft. The Library wing itself is treated in a manner somewhat plainer than the public offices, and terminates in a hipped roof corresponding with a similar roof at the west end of the frontage, thus giving a symmetrical character to the design, as far as the varied requirements of the rooms would permit. The entrance hall has a double stone arched, on red granite shafts, and from this the level of the public hall is reached by the central staircase of massive stone. Turning to the left from the entrance hall is the hall keeper's office, beyond this the general offices, inspector's and surveyor's offices; and on the opposite side the drawing office and two plan rooms, the inner one being fireproof. To the right of the entrance hall are the rate collector's room, office of the Clerk to the Local Board, the Accountant's office, and a private staircase. There is a second entrance to the public offices, at the west end of the building—a stone staircase leading to the hall, gallery, &c. The first floor landing of the main staircase has an arched similar to that below, and on this floor are the Medical Officer's department, drawing office, and three committee rooms, waiting-room, and the board room, a spacious, lofty apartment, 45 ft. by 25 ft., and 21 ft. high. The features of this room are its open trussed roof, walnut dado, tracery windows, and oak boarded floor. In its rear are the members' cloak room, lavatory, &c. Ascending the hack staircase from this floor is the way out to the whole of the roof, and to the record room and tower. The Memorial Hall—100 ft. by 45 ft., and 40 ft. high—has an open trussed, hammer-beam roof, elaborately pierced. From the west end of the building there are two entrances to it, with a staircase on the right, and another on the left. One of these leads to the lower hall, which is 48 ft. by 25 ft., and 14 ft. high, and beyond that to retiring and cloak rooms. In the basement of the offices are the caretaker's rooms, testing rooms, stores, and strong rooms. Here also are the kitchen, office lavatories, &c., and the heating apparatus. The Free Library is approached by a single doorway, similar to the double doorway of the main entrance; on the ground floor are the reference library, the dimensions being 33 ft. by 22 ft.; the lending department, 39 ft. by 20 ft.; and at the north end is the reading-room, 32 ft. by 25 ft. The whole of the area covered by these departments is half-basemented with two large class rooms for the science and art department, the centre being devoted to the library stores,

\* From a paper read by Mr. C. Jones, A.M.I.C.E., Surveyor to the Local Board, Ealing, before the Association of Municipal and Sanitary Engineers and Surveyors at their recent District Meeting at Ealing.

with a lift to the landing department. On the first-floor are two spacious rooms, respectively 23 ft. by 22 ft., and 15 ft. high; and, on the second-floor, a splendid studio, 22 ft. by 50 ft., and 14 ft. high to the ridge, having an open timber roof and abundance of north light. The walls of the buildings are of Kentish Rag, with Douling stone dressings. The major portion of the woodwork used in the interior is polished American walnut and clean stained deal. The flooring of the corridors, hall, and landings is Diespeker's Roman mosaic. The roofing is of red Bangor slate and permanent green bands. Westphal's patent gas-lamps are used for lighting throughout, and the method of heating is by Bacon's high-pressure apparatus. The buildings have been erected by Mr. Hugh Knight, of Morden, Surrey, to the design and under the superintendence of the Surveyor of the Ealing Local Board. The loan raised for the Public Office was 14,000l.; of this sum 7,000l. was paid off within twelve months, from the sale of the Old Offices; Loan for Free Library was 2,000l.; and 400l. for Librarian's cottage. The cost of the Victoria Hall was 5,000l., including furniture.

**The Brigade Station, Stables, &c.**—At the rear of the baths, and parallel to the Great Western Railway, are the various buildings connected with the brigade and stable departments. Facing Longfield-avenue, and adjoining the railway bridge, is a red-brick structure with a tower at north-west corner,—the new Fire Brigade Station, accommodating steamer, manual, and hose-cart. There are rooms for resident fireman, also large bedroom, furnished for two volunteer firemen, who take it in turns to remain at the station during the night; there is an accoutrement-room, also used as a reading-room for the brigade; underneath is a stove-room. In the upper part of the tower is a large cistern; it can also be used as a look-out, and is so constructed as to form a drying-place for the hose, which is drawn up to its full length, and effectually drained after being used.

Adjoining, and forming part of the design of these buildings, is the yard foreman's residence. Passing through the entrance-gates into the yard, you have on the left a long range of buildings, the first are one story high, and consist of painters' and glaziers' shop, next carpenters' shop, and adjoining this the forge,—the latter being a wonderful "economiser" in an establishment of this description. Over these one-story buildings are three 2,000-gallon tanks, which are filled with water from the premises, and are used for flushing and road watering. Adjacent is a two-story building, the first portion of which is occupied by a gas engine, for cutting, chaff, pumping water, &c., also the sewer deodorising apparatus, which has been found very useful in years gone by. Over this department is a bed-room, occupied at night by a stableman, who is also connected with the fire brigade; thus giving a contingent of five men (including the yard foreman), all sleeping on the premises or fire brigade station. This block also comprises a nine-stall stable, plain but substantially built, well ventilated, and fitted with every necessary appliance; the drains are outside the stable. Over these stables are the lofts and corn room. In conjunction with this block is a drying-room, fitted with hot-air stove; in wet weather the collars, wraps, loin cloths, &c., are placed in this room, as soon as the horses come in, and in the morning are found dry and fit for use again. East of and adjoining this is another block—a one-story building, also containing nine stalls; there is one long box in each stable. On the south side of yard as you enter the front gates is the road engine house, and in the rear of it a mortuary; the building, for 5 ft. of its height, is lined with white glazed bricks, and is fitted with the necessary appliances. Adjoining is a range of cart-sheds, a trap-house, and large room where men can cook their meals. I must not omit to call attention to the small paddock at the east end, nearly 200 ft. long, where a horse can be rested for a day or two, and yet remain under the eye of the foreman. This plot of ground also provides ample scope for enlargement of stable premises when the necessity arises. On the paddock stands the unpretentious donkey-shed. Our two familiar friends, who occupy the shed, perambulate the town all day long, performing the duty of street orderlies; they come to the yard five or six times a day, and deliver their loads, which are taken to the farm every morning with the ordinary stable manure. The small cottage adjoining,

and forming part of the block, is the residence of the Librarian of the Free Library. The amount of loan for the whole of stable and Fire Brigade Department was 4,500l.

**The Baths.**—The block of buildings forming the baths is situate at the rear of the Victoria Hall. Being at no great distance from the Great Western Railway, special care had to be taken in order to prevent any difficulty arising from the tremendous vibration caused by the heavy broad-gauge trains. We are pleased to state that, although having to do with a very sandy foundation, no difficulty has been experienced since the opening of the establishment in May, 1886. Three separate swimming-baths are provided, viz., "ladies," "first-class men's," and "third-class men's," the dimensions being as follows:—"Ladies": length, 60 ft., width, 24 ft.; depth, 9 ft.; "First-class men's": length, 90 ft.; width, 30 ft.; depth, 3 ft. 6 in. to 5 ft. 9 in. "Third-class men's": length, 75 ft.; width, 25 ft.; depth, 3 ft. 6 in. to 5 ft. 3 in. Each of the baths is fitted with diving platform, steps, dressing-boxes, with seats, pegs, &c., for the use of the bathers. The doors of the dressing-boxes are half the height of the boxes, the top portion being screened by a curtain, which can be drawn back at will, thus giving a much brighter and lighter appearance than the usual full-height doors. In connexion with the ladies' bath a large retiring-room and lavatory have been provided, which forms a distinct feature of the scheme, and one which is much appreciated, as it is not merely an ordinary waiting-room, but one in which the friends of bathers, or a nurse in charge of children, can pass away the time whilst those whom they accompany are in the bath. By the ticket-office a room is provided in which the various clubs which make these baths their headquarters hold their meetings. The bottoms and sides of the baths are lined with white glazed bricks, relieved by dark blue lines and crosses, the whole having a very pleasing effect. Great care has been taken to guard against leakage, which has been a cause of serious loss and inconvenience at other baths, and for this purpose a bituminous composition was run whilst hot in a cavity between the glazed bricks and concrete wall, forming a lining thoroughly watertight. The passage-ways between the dressing-boxes and the edge of the bath in the men's baths are covered with lead laid on hoarding (this I do not advocate), and finished at the side of the bath with Victoria stone kerb. In the ladies' bath, which has dressing-boxes on one side only, the passage-way is covered with encaustic tiles, and kerbed with Victoria stone. Considering it undesirable to keep the three baths open during the winter months, arrangements were made for using the first-class bath as a gymnasium, the gallery round the same affording accommodation for some 500 persons. There are now two large athletic clubs, who use the gymnasium during the winter months.

The engineering work in connexion with the baths was carried out by Messrs. Thomas Bradford & Co., upon a system which has given great satisfaction in the numerous public baths fitted up by them, and consists in the present instance of two 20 h.p. Cornish steam-boilers fitted in the basement, from which live steam is taken to each of the swimming-baths, and fed, by means of perforated copper pipes (which have the advantage of maintaining a regular heat at any desired temperature), to the entire bulk of water, by keeping up a perfect circulation peculiar to the system, and obviating the unpleasantness of the discoloration of the water. For the convenience of the bathers, and cleanliness, the baths are fitted with brass handrails and spittoons. The dressing-boxes are arranged round the several baths, and are heated by a steam coil passing along the entire length beneath the seats. The heating of the offices and waiting-rooms has been effected by steam radiating coils, which can be easily regulated to give any desired temperature. The laundry in connexion with these baths, used for washing towels, &c., has been carried out by the same firm. The laundry appliances consist of a Bradford's towel-washing machine, with rinsing, wringing, and boiling apparatus, and is worked by a 4-h.p. vertical engine, effecting a great reduction in the expenditure. The drying closet at the end of the wash-house is fitted with Bradford's improved draw-out drying closet horses, and is heated by a coil of cast steam pipe.

Little more than twelve months had passed when it was found necessary to erect slipper baths, and the first block was erected facing

the Longfield-avenue—still leaving ample space on the east side for a corresponding block when necessity shall arise. On the ground-floor there are six slipper baths; on the one pair, four first-class baths, and two rooms set apart for cabinet Turkish bath. There is a commodious waiting-room, and the various appliances for a first-class establishment have been provided. I need hardly say that the swimming-baths, slipper bath, and gymnasium, are very largely used; and the fact that the average takings during the four years that the baths have been in use have amounted to the sum of 875l. per annum, is a tolerably conclusive proof of the necessity for their erection, and the immense boon they are to the community at large. The amount of loan for swimming-baths was 8,800l., and for slipper baths 1,500l. The cost for water is 220l. per annum.

#### THE ARCHEOLOGICAL CONGRESS AT OXFORD.\*

FROM Merton the party made their way through "Logic-lane" and across the High-street to New College, where they were met by the Warden, Dr. Sewell, who addressed them in the College-hall afterwards, explaining the College, its buildings, and its ancient connexion with St. Mary's College at Winchester. He also then round the College-gardens, and pointed out to them two of the remaining bastions of the old city wall, and the tower of New College, which was built for the double purpose of a chapel tower and a beacon on the city wall. Here, too, he showed them the course of the old city ditch on the east side of the town. The party was also shown the pictures and portraits in the Great-hall, the painted windows, and the statues of angels and saints on the screen over the reredos, which are now being gradually filled by presents from old Fellows and former members of the College. The cloisters, which are plain and severe in style, are still in good condition, though they are over four centuries old, and were much admired. As the party left the gates, the Warden pointed out to them the original sculpture of the Annunciation, which has adorned the upper story of the College-tower since the days of the founder, William of Wykeham.

After an interval for luncheon, the party re-assembled in the hall of Christ Church, where Dean Liddell, in spite of his eighty years, was in attendance to show to the party the College-hall built by Wolsley, the newly-restored, or, rather, newly-repaired chapter-house, once belonging to the Monastery of St. Frideswide, and the exterior and interior of the Cathedral. He pointed out in detail the various alterations and improvements in the fabric which had been made during his own tenure of the Deanery, by the removal of heavy wooden screens and opening up the old eastern window. Almost all this work was carried out under the guidance of the late Sir Gilbert Scott, and by Messrs. Bodley & Garner, whose work in raising the tower over the exquisite fan-tracery which covers the entrance to the College-hall he singled out for especial praise. The explanation of St. Frideswide's Chapel itself, and of her shrine or repented shrine, and the alterations made in the north-eastern corner of the Cathedral, he left to Mr. J. Park Harrison to give in detail. But of these changes it is not necessary to say much here, as they have from time to time been recorded more or less fully in our columns. It is only right, however, to add that Mr. Harrison's excavations, bringing to light the triple apse of the old Saxon Church of St. Frideswide, were much approved and admired by the archaeologists.

Later on in the afternoon the party paid a visit to the New Museum of Natural Science in the Park, where the printed programme promised them the guidance and assistance of Sir Henry Acland, an old resident of Oxford.

In the evening two long and interesting papers were read before the Congress in the New Examination Schools, the former by Dr. J. S. Phené, F.S.A., "On some Striking Historical and Linguistic Features Belonging to the First Thousand Years of British History, and attaching to the Neighbourhood of British Roads and Earthworks." The latter paper, by Mr. J. Gilbert, of Oxford, was an essay on the condition of the University of Oxford before the foundation of Colleges within its walls.

On Wednesday, the third day, in spite of a drenching wet morning, over fifty of the

\* Continued from p. 29, ante.

archaeologists went off by railway immediately after breakfast for Banbury, whence they drove in carriages and brakes to Broughton Castle, the seat of Lord Saye and Sele. It is, as is well known, a very fine specimen of a mediæval moated mansion, rising out of the greenest turf, with a noble entrance hall, and a private chapel of the Decorated period. On the roof it has a very singular and, indeed, unique watch-tower. This, it is needless to say, excited great curiosity. From the Castle they made their way to the parish church, which almost adjoins the outer walls of the former, and is particularly rich in monuments to members of the Fiennes and other families. From Broughton, in spite of the rain, they drove on to Bloxham, where they made a hasty examination of the parish church, and afterwards lunched at the hotel. From Bloxham they proceeded by road to Adderbury, and thence to King's Sutton, and, the rain having ceased, they inspected both those churches, which form, along with Bloxham, such a trio of noble and lofty spires as few neighbourhoods in England perhaps can show. At King's Sutton Manor they were entertained at afternoon tea by the resident squire, Mr. Willes. But they had to take their refreshments in haste, as it was necessary to catch the train at Banbury, and they made their return to Oxford in time for dinner; after which they again repaired to the new examination schools, where Mr. J. W. Grover, F.S.A., read a paper on "Sundry Excavations proposed to be carried out at Silchester." This paper was, or rather struck us as, somewhat visionary, as Mr. Grover laid it down that the discovery of a quantity of oyster-shells in the neighbourhood of Silchester, coupled with that of sundry Roman coins hardly, showed the presence of a large Roman settlement; but as some of the members present urged, the coins were an undoubted proof as far as they went, but that the oysters might well have belonged to a more recent date. In the course of his paper Mr. Grover stated that at Silchester the remains of a great temple had been discovered, although little had been done to thoroughly unearth it. He had no doubt that when a further examination had been made of the spot, the temple would in all probability be found to have been dedicated to the god Apollo or the Sun. Mr. Grover also mentioned that the discovery had been made of a house which was supposed to have been the house of a Roman chief magistrate, the remarkable thing about the residence being that it stood near the forum. Alluding amidst applause to the forum at Silchester, Mr. Grover said that they had what nobody had except at Pompeii; the building was 275 ft. across on one side and 313 ft. on the other. In the centre was a market-place 131 ft. by 141 ft., and there was a place in which the people could walk in wet weather, such as they had had that day. On the west side of the building was the basilica like Westminster Hall, but he found that the former was 18 ft. longer than the latter. The reading of this paper gave rise to a discussion, in which Mr. Hurst, Mr. Walford, and Mr. Birch took part.

It should be mentioned here that an account of Broughton Castle will be found in the *Builder* for July, 1888, when it was visited by the Congress of the Royal Archaeological Institute. On Thursday (the fourth day) the party paid a visit to All Souls' College, where, in the absence of the Warden, Sir William Anson, they were met by Mr. Hurst, one of the local secretaries, who read to them a short but carefully drawn-up paper on the history and antiquities of the College, showing that it derived its name from the fact that it was founded as a large "chantry," so to speak, where prayer was forever to be made for those who had perished in the Civil Wars. Mr. Hurst then led the party over the library, hall, and chapel, pointing out some of the antiquities of each, and dwelling at some length on the "hunting of the mallard." He also pointed out the rooms which were occupied by Mr. Gladstone during his visit to Oxford last winter. From All Souls' College the party proceeded next to the ancient Church of St. Peter's-in-the-East, where they inspected its large and curious Norman crypt, and visited the tomb of the celebrated Oxonian antiquary, Thomas Hearne. Their next halting-place was Magdalen College, where they were met by the President (Dr. Warren), Mr. Macrae (of the Bodleian Library), and the venerable Dr. Bloxham, a Fellow of the College, now eighty-five years of age. He is the surviving brother of the late Mr. Matthew H. Bloxham, of Rugby, and himself the chief

Moor Hall, Gloucestershire.

Moor Hall, Gloucestershire.

repository of the history of his College and his University. Old as he is he was able to accompany them through the hall, the common room, the chapel, the library, and the cloisters; and he explained and commented on the various pictures, the books; and he pointed out the tapestry in the State Rooms of the College (formerly occupied by Arthur, Prince of Wales), and enlarged on the beautiful proportions of the College tower. From Magdalen College gates the party drove to St. Bartholomew's Chapel, a sort of grange on the borders of Cowley Marsh, and belonging to Oriel College; but their stay here was short, as they had to drive on to see the very fine Norman Church of Ilfley, a church which is so well known by painting and by photography, that we need not repeat its history or architectural details here. The structure was explained to the party by Mr. Freeman, who kindly acted as their interpreter. After lunch the archaeologists inspected the ancient Saxon mound which now forms the chief feature of the Castle, and also the crypt (called St. George's Crypt) which is under the only surviving tower of the Castle, from one of the windows of which Castle it is said that Queen Maude escaped, and, crossing the Thames on the ice, made her way to Wallingford.

Afterwards the party paid a hasty visit to St. Michael's Church, in the Cornmarket, to inspect its ancient tower, which is now generally admitted to be of Saxon date; and they were led by Mr. Walford to the front of Balliol College, where he pointed out to them the cross in the centre of the street which

traditionally marks the spot where Bishops Cranmer, Latimer, and Ridley were so cruelly burnt at the stake. In the evening a meeting was held at the new Examination Rooms, when Mr. Bruton read a paper on the ancient walls of Oxford.

We will conclude our notes of the Congress in our next.

#### OLD COTTAGE ARCHITECTURE IN GLOUCESTERSHIRE.—IV.

THE two sketches illustrated this week are of Moor, or More Hall, near Randwick, close to Stroud. This is one of the best houses in the neighbourhood, though rapidly hastening to ruin for want of slight but necessary repairs. It is now used as two cottages. The shape of the house is unusual, inasmuch as it has not the customary centre and wings. The reason of this is that a new centre block was built over the ground-floor of the hall that belonged to the earlier wing, where the pinnacles still remain. This gives a large central room on the first-floor, which projects out over the ground-floor wall. The front door is brought out to the line of the new building, but the original windows left deeply recessed. Were it not for indisputable evidence, I should have thought from the detail that the older wing to which I have alluded was of later date than the rest of the house, and this is an example of the caution required in pronouncing on date where there is so little definite variety of detail.

At the side of the house is the pigeon-house

shown in both sketches; as will be seen, on one side it is entered by stone steps, while the room below is entered from the lower side. The house stands on a small plateau, on the side of a large hill, in a magnificent situation. There is some good ironwork to some of the doors, of which I may give some notes. R. N.

THE ROYAL ACADEMY:

ADMISSIONS TO THE ARCHITECTURAL SCHOOL.—The following students have just been admitted to the Architectural School of the Royal Academy, Mr. R. Phené Spiers, Master:—

DENT'S PATENT CASTOR.

We have received a specimen of a new form of castor for chair and table legs, &c., invented and patented by Mr. Dent, of Birkenhead, which, though it is open to criticism in principle, appears to act exceedingly well practically, and constitutes an important improvement on the old form of cylindrical castor mounted in a swivel, which so often gives trouble and causes damage to carpets in moving furniture about. Mr. Dent's castor, of which a full size section is subjoined, consists of a polished steel ball loosely seated in a metal holder, and free to turn in every direction; a portion of the ball projects through a circular opening in the holder, and works on the floor surface. The

holder is screwed into a leg of the furniture in the ordinary manner, and forms a roller which has no tendency to turn in any one plane more than another, but adapts itself to every movement of the furniture. Of course the ball is always exercising friction against the bearing-points on which it works within the holder, but as the surfaces of contact here (see section) are reduced to a minimum, and as a rough surface like that of a carpet has much greater "bite" on the smooth surface of the ball, the greater friction overcomes the lesser, and the ball runs freely. On a polished surface, like that of a marble chimney-piece, the ball has a great tendency to bind instead of turning, but on a carpet it works quite well.

The balls, of the finest tool steel, are first roughly turned by hand in the lathe, and then placed in an emery mill (a gross at a time) and ground together in coarse emery for a certain time, passing through three different stages in this way. The last, which of course is the finest, produces a high, hard finish, and entirely destroys all trace of grain of the steel. The cone cup is made of hardened cast steel.

COMPETITION.

DULWICH BATHS.—The Commissioners of Public Baths for Camberwell have accepted the report of the assessor in this competition, Mr. Charles Barry, who has recommended the design submitted by Messrs. Spalding & Cross

ENGINEERING SOCIETIES.

THE LIVERPOOL ENGINEERING SOCIETY: VISIT TO THE MANCHESTER SHIP CANAL.—On the 9th inst. a party of members of the Liverpool Engineering Society, numbering nearly a hundred, proceeded to Manchester and drove to the site of the Manchester docks, at Pomona, Cornbrook, where they were met by Mr. Leader Williams, the Engineer-in-Chief to the Manchester Ship Canal, who had kindly provided an engine and train of carriages for the convenience of the visitors. The members were at once taken under his charge round the various works connected with the docks now in progress at Manchester. These docks, it may be said, are in a forward condition; the whole of the walls are built up to the water level, and only await the stonework coping to complete them. The party then went up to the site of the Barton swing aqueduct, where the Bridgewater Canal will be carried in a swinging trough, which can be moved so as to allow ships to pass along the Ship Canal, and will be closed to permit of the ordinary canal traffic to be carried on. An examination was made of the lock-gates, in course of construction, which are of a very massive character, formed of immense hanks of greenheart. After showing the party over the works, connected with the first set of locks, gates, &c., Mr. Leader Williams was unfortunately obliged by other engagements to resign the conduct of the party into the hands of his representative engineers, who successively took charge of the train, and described the points of interest along the line of works. A stop was made at the site of the Latchford locks and sluices, near Warrington, which are now in a very forward condition, the whole of the lock floor having been laid, and the walls raised to a considerable height. Several new digging and dredging machines were inspected minutely by the party, more especially a large steam dredger, constructed by Messrs. Fleming & Ferguson, of Glasgow, which was brought in pieces to the site of the works, and there put together. It is now ready for launching into the canal, where it will be used for doing the bottom dredging work. At Wilderspool, near Warrington, the members sat down to luncheon, and entertained as guests the resident engineers of the sections of the Ship Canal between Manchester and Runcorn. Mr. H. H. West, president of the Liverpool Engineering Society, in proposing success to the Manchester Ship Canal and the health of its Engineer, remarked that in a company of professional gentlemen there need be no question raised as to the probable or possible effect of the Manchester Ship Canal upon the trade and commerce of Liverpool or Manchester. They were there to admire the stupendous works which had been designed by the energy and ability of Mr. Leader Williams, which were being carried to a successful issue under the direction of the representatives of Mr. T. B. Walker, the contractor, whose untimely death the whole engineering profession must deplore. He concluded by thanking the Engineer and his staff for the courtesy accorded to the Liverpool Engineering Society upon that occasion. After luncheon, the party remounted the carriages, and after an inspection of the heavy works in connexion with the deviation of the London and North-Western Railway near Moore, proceeded to the site of the crossing of the Mersey by the Vyrnwy aqueduct. Here they examined the provision which is being made for carrying the Vyrnwy aqueduct in a brick culvert underneath the bed of the Manchester Ship Canal, and saw also evidences of the work now being pursued by Messrs. Cochran & Co., at the adjacent crossing of the river Mersey itself. Thence the party moved on to Weston Point, where an examination was made of the arrangements connecting the Weaver Navigation with the Manchester Ship Canal, and also the sluices which have recently been fixed at the mouth of the River Weaver, as the initial step in closing up the Weaver estuary by the Ship Canal. The *Liverpool Daily Post*, from whose report these particulars are condensed, says that it is expected that the canal from Weston Point down to Eastham will be opened in January next.

THE INSTITUTION OF ELECTRICAL ENGINEERS opened their annual three days' meeting in the Edinburgh Exhibition on Tuesday, under the presidency of Dr. J. Hopkinson (London). At a conference held in the forenoon, Professor Walsley read a paper on some of the chief features, mainly electrical, of the Exhibition,

and Mr. A. R. Bennet spoke on foreign currents in telegraph and telephone lines.

THE AMERICAN SOCIETY OF CIVIL ENGINEERS has been holding its Annual Convention, Cresson, Pa., being the scene of its deliberations. Papers on skew and other arches of masonry, and on other subjects, were read. The President, Mr. W. P. Shinn, in the course of his address, gave a review of the year's engineering progress in the States, and gave details of several notable iron bridges completed, in progress, or projected. A detailed report of the proceedings appears in the *Engineering and Building Record*, published in New York.

ARCHAEOLOGICAL SOCIETIES.

THE SOCIETY OF ANTIQUARIES OF LONDON has just issued to its local correspondents a paper of inquiry as to the following points in reference to their respective localities:—1. Have there been any recent important discoveries of inscriptions, coins, or other antiquities, pro-Roman, Roman, Saxon, or Medieval? 2. Are any archaeological researches or excavations in progress? 3. Can you offer a suggestion for the examination of any barrow or ancient site? 4. Are any remains of antiquity in danger of destruction or injury?"

CONGRESS OF ARCHAEOLOGICAL SOCIETIES.—The second annual Congress of Archaeological Societies took place at Burlington House on the 15th inst., in the rooms of the Society of Antiquaries. The report of the Committee on the subject of Parish Registers was presented by the hon. sec., Mr. Ralph Nevill, F.S.A., and was adopted by the meeting. The Committee was reappointed, and a circular containing information and advice as to transcription and publication will shortly be published. It was resolved to take steps to press on Government the desirability of making a slight increase in the allowance made for the inspection of ancient monuments in order to carry on the series of scale models of ancient inscribed stones and other antiquities, of which a most interesting set made by General Pitt-Rivers has been for some time past on view at Burlington House. On the proposal of Mr. Nevill a Standing Committee was appointed, and they were instructed to consider the possibility of preparing and issuing to all societies in union an annual calendar of all the archaeological publications of each year.

ROYAL ARCHAEOLOGICAL INSTITUTE OF GREAT BRITAIN AND IRELAND.—The annual meeting of this Institute is to be held at Gloucester this year, from Tuesday, August 12, to Tuesday, August 19. Sir J. E. Dorman, Bart., M.P., will be the President of the meeting. The President of the Antiquarian Section will be Dr. Edwin Freshfield, F.S.A. The Very Rev. the Dean of Gloucester will preside over the Historical Section. In the Architectural Section the President will be Professor J. H. Middleton, F.S.A., and the Vice-Presidents, Mr. C. J. Ferguson, F.S.A., Mr. J. T. Micklethwaite, F.S.A., and the Rev. Precentor Venables, F.S.A. Excursions will be made by steamboat up the River Severn to Deerhurst Church and Saxon Chapel, and to Tewkesbury. There will also be excursions by road and rail to Sudeley Castle and Spoonley Villa, Prinknash and Painswick, Andoversford, Withington Church, Chedworth Roman Villa, Forsbridge, Northleach Church, Cirencester, Corinium, Museum and Church, and Fairford.

BRISTOL AND GLOUCESTERSHIRE ARCHAEOLOGICAL SOCIETY.—The annual meeting of this Society will be held next week, on the 22nd, 23rd, 24th, and 25th inst. Bristol will be the head-quarters. A good programme has been arranged, including excursions to Wells, Glastonbury, and other places of interest.

KENT ARCHAEOLOGICAL SOCIETY.—The annual meeting of this Society is to be held on Monday and Tuesday next, July 21 and 22, at Canterbury. Some interesting papers are to be read, and on the second day excursions will be made to Chartham, Chilham, Godmersham, Waltham, and Petham.

SURREY ARCHAEOLOGICAL SOCIETY.—The annual excursion of this Society will be to Little Bookham, Great Bookham, Slyfields Manor, and Stoke d'Abernon, on Wednesday next, July 23. Little Bookham Church will be described by Mr. A. J. Style, A.R.I.B.A., and Great Bookham Church by Major Alfred Heales, F.S.A. "Fairfield," now occupied by Mr. Wm. Bousfield, and formerly the residence of Madame D'Arhlay (Fanny Burney), will be visited, and here Mr. Bousfield will read a few notes respecting Madame D'Arhlay's connexion with Great

Bookham. Slyfields Manor-house, famous for its plaster ceilings and handsome staircase, will be described by Mr. Ralph Nevill, F.S.A., F.R.I.B.A. Stoke d'Abernon Church will be described by Mr. Mill Stephenson, F.S.A., one of the honorary secretaries. The brasses and monuments will be described by Mr. J. G. Phillips, F.S.A. By permission of the Rev. F. P. Walker, M.A., the company will visit the Manor House at Stoke d'Abernon, and inspect the picture-gallery, containing a fine collection of Morland's works. As these places have been visited by the Society on former occasions, it may be of interest to those who intend going on the 23rd to know where to find some particulars of former visits. Great Bookham was visited in July, 1867, when a very interesting paper was read in the church by Major Heales, F.S.A., and which will be found printed and illustrated in Vol. V. of the Society's "Transactions." A descriptive account of Slyfields Manor-house, by the late Mr. Charles Barry, architect, will be found in Vol. VII. of the Society's "Transactions." The D'Abernon brasses were illustrated and described by the late Rev. Charles Boutell in Vol. I. of the Society's "Transactions." A history of the D'Abernon family by Mr. Charles Spencer Percival, LL.D., will be found in Vol. V. of the Society's "Transactions." Speaking of the brass of the first Sir John D'Abernon, Mr. Mill Stephenson says, "It is the earliest brass in England" [Sir John died in 1277], "and for a long time was thought to be the earliest known, but an earlier one remains at Verden, in Hanover, to the memory of Bishop Ysowip, who died in 1231." The slab on the north side contains the effigy of the second Sir John D'Abernon (eldest son and heir of the first Sir John); he died in 1327. That on the south side commemorates Sir William D'Abernon, who died in 1358. Of the oldest brass, that of the first Sir John, Mr. Walter says:—"Considered as a work of art, it will be found that the figure is ill-proportioned, but the arrangements of the drapery judiciously contrived; whilst as a production of the burin, this brass is not excelled by any posterior example. Each link of the mail is distinctly represented, and the mere work of graving-up so large a surface must have cost many weeks of patient labour."

**YORKSHIRE ARCHEOLOGICAL AND TOPOGRAPHICAL ASSOCIATION.**—On the 10th inst. the twenty-fourth annual excursion of the Yorkshire Archeological and Topographical Association was made to Coxwold and Byland Abbey. Coxwold is a beautiful little village among the Hambleton Hills, whose slopes, for a large part covered with woods, and well-known to the railway traveller for the large "White Horse" depicted on them, form a very pleasing panorama. Leaving the station, the members journeyed, some on foot and some in conveyances, to Byland Abbey, a distance of about a mile and a half, where Mr. W. H. St. John Hope, the hon. secretary of the British Archeological Society, described the plan of the ruin, and succeeded in restoring, to the imagination, this ancient home of Cistercian monks. He spoke in strong condemnation of the ivy, on account of the injury it is inflicting on the ruin; but, according to the report in the *Leeds Mercury*, some of his audience expressed their dissent from his remarks. After the old gateway had been visited, the party returned to Coxwold, and proceeded to the church, which Mr. J. T. Micklethwaite, F.S.A., described in a very able and interesting lecture. The church is of the fifteenth century, when it replaced an older one. The chancel was added in the seventeenth century, and contains a curious communion-rail, which formerly surrounded the table, when it was more in the middle of the chancel,—a relic of Puritanism. The table has now been moved under the east window, but the rail remains, so that the communicants kneel in two rows, down the chancel, facing one another. Laurence Sterne was vicar of the parish for several years, and it was here that he wrote "Tristram Shandy." Mr. Leadman gave an interesting sketch of Coxwold, Sterne, and Newburgh Priory, to which place the party then proceeded.

**THE BARRACKS BILL** was read a second time in the House of Lords on the 11th inst., on which occasion Earl Brownlow stated that it was intended to build new barracks at Aldershot, the Curragh, Colchester, Belfast, Manchester, and London. Lord Sandhurst urged that the Director of Contracts should see to it that the very best skill and the best material were employed in the great undertakings which the Government would have on hand.

### BEAUVAIS CATHEDRAL.

**S**OME special interest and notice was drawn to this celebrated Cathedral by its being made the object of the principal excursion of the Annual Congress of French Architects two or three weeks ago. On that occasion we gave some notes in regard to the town and Cathedral by a member of the Congress who accompanied the party; and as it is at all events many years since Beauvais was illustrated in our pages, we supplement the French Congress account with a view of the exterior and interior of the Cathedral, reproduced from photographs.

### SHEFFIELD MUNICIPAL BUILDINGS COMPETITION.

We publish the perspective view and plans of the design submitted by Mr. Lindsay, of Glasgow, in the final competition for the Sheffield Municipal buildings.

Mr. Lindsay's design, as will be seen, is very quiet in character, though dignified; it has decided merits of its own as a design, though it is certainly inferior in originality and picturesqueness to several others of the six. We may draw attention, however, to the admirable arrangement of the first-floor plan, which is superior to any other design in this respect. The Council and ante-chamber are admirably placed, the committee-rooms open on a corridor of their own in immediate proximity to a special door of communication with the Council Chamber; the Town Clerk's department is grouped close to these and also close to the public stair; the Town Clerk's private room next to the Mayor's parlour and in a dignified central position facing the main corridor and within easy access to the Council Chamber ante-room. All this is excellent, and no other first-floor plan is so well arranged and so compact.

The author sends us the following notes on his design:—

"Simplicity has been aimed at in the block plan as well as in the lines of corridors, and none of the business rooms obtain light from the two enclosed areas, with exception of the water office, which is top-lighted.

The principal, or Mayor's, entrance is from Pinstone-street, and the general business entrance is from Surrey-street; additional entrances are provided from Norfolk-street, as well as Cheyne-row, and the basement floor next Cheyne-row can be entered on the level from the large open court.

The Water and Accountants' departments are placed on the lower ground-floor, to the right and left of the Surrey-street entrance, the general office, in each case, having ample public and counter space, and serving as an inquiry-room to the various rooms of the officials, which are grouped in view and in front of the counters. The Accountants' department is all on one floor, but the Water department is continued on the upper ground-floor.

The placing of the two principal departments on the lower ground-floor and close to the entrance, would relieve the corridors and staircases of a considerable amount of traffic, which at times will happen in connexion with these departments.

The Council-chamber, together with its suite of six committee-rooms, are so situated that they would all be absolutely free, not only from external disturbing elements, but also from the general business traffic within the building. Access to the Council-chamber can only be had through its ante-room, and also by a doorway from the committee corridor. The sub-committee rooms are centrally placed, and within easy reach of the various departments.

The unusual treatment of the principal stairs has been adopted, so that the Council-chamber should be brought in closer connexion with the Mayor's suite, and the passage connecting the north and south landings, with its balustrade and 19 ft. of open space on one side, is certainly preferable to the usual 10 ft. or 11 ft. corridor.

The cubic contents, measuring from the datum line 252-6, are 1,843,600 cubic feet."

### WOODEN BOSSES, EAST CLOISTER, LINCOLN.

**T**HE reconstruction of the cloisters of Lincoln Minster, rendered necessary by the failure of the foundations, which were of the most imperfect character, recently brought the exquisitely carved bosses of the wooden vaulting to a level with the eye, and afforded an opportunity for their being photographed, of which, as regards those of the eastern walk, adjacent to the Chapter-house, Mr. Hadley, of

Lincoln, has availed himself with excellent skill. Unfortunately the vaulting of the eastern two walks, those to the south and to the west, were reconstructed and the bosses refaced before the idea of photographing them had been suggested. The fourth of the walks, that to the north, adjacent to the Deanery, fell in ruins at some unrecorded date. That Dean Mackworth (1412-1452) pulled it down to erect his stables is a somewhat exaggerated interpretation of one of the counts brought by the Chapter against him.\*

Those that are preserved to us, as will be seen by the accompanying reproduction of Mr. Hadley's photographs, are of singular beauty. The freedom of design and delicacy of execution can hardly be surpassed. The drapery is throughout of exquisite refinement, and the spirit thrown into some of the designs, especially the four representing the months, is very striking. It is much to be lamented that, through the natural progress of decay, the cloisters having been long unglazed, and the woodwork exposed to the damp of some centuries of the mists and drizzle of the Lincolnshire fens, some of the subjects are seriously sullied. Their imperfection, however, does not hinder them from being accurately identified. The most interesting of the series are the four representing the months of October (?), November, December, January, and perhaps February, by the customary conventional symbols drawn from their several occupations. These are found in the northern half of the vaulting. Religious subjects, Our Lord as an Infant on His Mother's knee, Our Lord in Majesty, the Coronation of the Virgin, &c., appear in the southern half. Two of the smaller bosses are of great singularity, representing in very unusual fashion the "living structure" of Ezekiel's vision. Others of this lesser series are conventional grotesques. The whole series is one deserving of attentive study.

A few words seem desirable as to the date of these bosses. It seldom happens that we can fix the period of any architectural work of the kind within such narrow limits. The Cathedral of Lincoln being from the first a College of Secular Canons, a cloister was no necessary part of the structure, as in conventional foundations. It was a luxury which might be added, if the college was rich enough, in any place, and on any plan which suited their convenience, as at old St. Paul's, Salisbury, Wells, Hereford, Chichester, Exeter, and here at Lincoln, or left out altogether as at York, Lichfield, Southwell, Ripon, and Beverley. No cloister entered into the original design of Remigius, nor was such an addition, apparently, suggested till the episcopate of Oliver Sutton, at the close of the thirteenth century—1280-1299. We learn from John of Schallby, who was that prelate's registrar, that the erection of the cloister was due to his influence, and that it was started by a gift of fifty marks from his own purse. By July, 1296, the southern wall had been carried up to a considerable height, and though the Dean at the time,—Philip of Willoughby,—threw obstacles in the way because the northern wall would have to be erected on the wall of his stables,—for which the Bishop told him in courteous language that he ought to be ashamed of himself,—the whole was finished in a short space of time. As was stated at the outset, it was built too hastily to be built securely. There was next to no foundation, and light as the wooden vaulting was, it speedily thrust the walls out of the perpendicular. To remedy this slight buttresses were erected between every set of two bays, and probably at the same time the lower parts of the windows, originally open almost to the ground, were filled up with slabs of stone. The buttresses appear to have been erected after the fall of the northern wall to save the other walls from the same fate, for, on taking them down, they were found to contain fragments of cut and carved stone of the same date and design as the cloister.

The vault of the east walk consists of nine narrow bays of light wooden groining, with a wider bay at the southern extremity, corresponding to the southern walk. A tenth narrow bay at the north end as well as the wider extreme bay, have been swallowed up in Wren's Roman Doric cloister, supporting Dean Honywood's library, of the same design as the side arcades of Neville's Court at Trinity College, Cambridge.

\* See Bishop Wordsworth's Edition of the "Laudum" of Bishop Anlwyck, p. 85, No. 33, and the bosses are lost.

CLOISTERS, LINCOLN MINSTER

(The bosses occur in the building.)

The subjects of the bosses, commencing at the north end, are as follows:—

1. (Much mutilated.) To the right, a man in a long flowing frock, girt round the waist, grasping in his two hands the handle of an axe or some sharp cutting instrument; to the left the stump of a tree on which he is using it. The man has lost his head and legs. Perhaps representing the month of October. The action appears too vigorous for the pruning by which March was commonly symbolised.

2. (Small.) A short, fat man, with long curls depending over his ears, and a close beard, seated with his hands upon his knees, his face indicating a sense of comfort and satisfaction. Possibly representing "cold February," for which a man warming himself at the fire was the usual symbol.

3. November, symbolised by a man sowing corn. He wears a long, loose frock, girt about the waist, and a flat cap, with a muffler protecting his cheeks and chin. On his left side he carries a broad, shallow basket, suspended by a strap passing over his right shoulder, which contains the seeds which he scatters broadcast with his right hand. A sack of corn is behind his right. This figure is very spirited; the action vigorous; the face shows much character.

4. (Small.) Two winged, dragon-like animals fighting; each endeavouring to devour the other.

5. December, symbolised by the killing a fat hog. The pig-killer is an old man with a long beard, his head covered with a close-fitting coif. He wears a loose frock, with a girdle. His right arm is raised in the act of striking the pig, who is contentedly munching acorns. The axe is gone. The hack of the horse represents oak-leaves and acorns, beautifully carved, but out of proportion with the rest of the subject, which is full of vigour. It recalls Tusser's lines—

"When meat is gone,  
Hog falleth a-corn."

6. (Small.) A male lamh scratching his nose with his right hind foot.

7. January, the month of good cheer; the prolongation of the Christmas festival. A man clad in a long, loose tunic; ungirt, that he may be more at his ease, with a broad, flat slouching cap, and a hood reaching up over his head and covering his chin, is sitting cross-legged, holding a drinking horn in his left hand, and a bowl in his right, and resting his elbow on a pitcher. Behind him, to his right, is a cask of ale with a spigot. It recalls Chaucer's line:—

"Janus sits by the fyre with double berd,  
And drinketh of his bugle horn the ale."  
"Franklyn's Tale," l. 516.

The happy "ahandon" of the subject is very characteristic.

8. (Small.) A very singular group of four small, squat, draped figures, the upper part human, the bodies almost non-existent, the extremities those of the ox, the lion, the eagle, and the man. The heads of three are hooded; the fourth wears a peaked cap. All are gazing upwards. The group is evidently meant to represent the four living creatures of Ezekiel's vision.

9. Two dragon-like creatures, winged, in fierce contest, each hitting the other's neck.

10. (Small.) Another subject from Ezekiel's vision, broad for its height, combining the ox and a lion below and the human form above. The being has a female head in a thirteenth-century square headdress, the cheeks and chin covered with a wimple, and long flowing drapery hanging over each ear. The bust is fully vested, the drapery flowing over the breasts. There is no body, but the creature has two sets of extremities, to its right the hooved feet of an ox, and a tail ending in a leaf; to its left the paws and tail of a lion.

11. Our Lord in act of benediction. He is seated on a cushioned throne, the upright supports ending in finials. He is fully vested; the pallium fastened with a diamond-shaped cross; the feet bare. His hair is long and curling; the beard short. The right hand is raised in blessing; the left hand carries the world, represented as a flat disk.

12. (The central boss over the Chapter-house door.) A very solemn-looking rahhit, recalling

\* The photographs, as sent to us, each bore a number, and were arranged for lithography, naturally, in the order of these numbers. Subsequently we learned that these numbers, apparently inserted by the photographer, had no relation to the position of the bosses. It was too late to alter the position of the lithographs, but they are now numbered in the order in which they occur in the building.

"Brer Rahhit," of "Uncle Remus's Tales." His ears are long; his attitude crouching. His head and shoulders are invested with a close-fitting garment, puckered under the chin, with holes for the ears and the eyes.

13. The Virgin and Child throned. An exquisitely-graceful composition. The Virgin, veiled and crowned, is seated, and bears the Holy Child on her left knee. The flowing veil passes under his chin from left to right. Her right hand and the head of Our Lord have been destroyed. He holds a dove in his left hand, and raises His right hand in blessing. A dove of a larger size is seated on the back of the throne to the left.

14. (Small, much mutilated; both the head and the hands gone.) A seated angel, exquisitely draped, holding a crown in his left hand.

15. The enthronement of the Blessed Virgin. Our Lord is seated, with long, flowing hair and bearded, in a long tunic, girt round the waist and reaching to the feet which are bare. The right hand raised in blessing, His left holding the world, appearing in the form of a disk. To His right is seated the Virgin, half turning towards her Son; the head gone. The treatment of this subject is very beautiful, the drapery falling in most graceful folds.

16. (Small, much mutilated.) A grotesque. A tumbler performing his feats holds his right foot on a level with his shoulder. His left hand is on his knee.

17. A large boss of vine-leaves and grapes, exquisitely carved.

18. A calf lying down, scratching its chin with its hind foot.

19. A mitred bishop (Oliver Sutton?) seated on a cushioned throne, his right hand raised in blessing, hearing in his left hand a mutilated crozier.

Of the subjects represented in these bosses, those of the months, and the two from the vision of Ezekiel are the most curious. It would be interesting to know whether examples of a similar treatment of the "four living creatures" occur anywhere else, in carving, stained glass, or in illuminated MSS. The symbols of the months are produced with so much vigour of design and heauty of execution that it is much to be regretted that only four remain. Complete series of these symbolical representations occur in England on the Norman font at Burnham Deepdale, near Hunstanton in Norfolk, described by Dr. Pegge in the *Archæologia*, vol. x., p. 177; on the leaden font, also Norman, at Brookland, Kent, between Rye and Romney, figured and described by the late Mr. Alexander Nesbitt, in the *Archæological Journal*, vol. vi., p. 159; on the Norman doorway of St. Margaret's Church, York, figured in Drake's *Eboracum*, p. 308, and more accurately in 1827 by the late Mr. Browne, of York; in the misericords of Worcester Cathedral, and, though the series is now imperfect, on those of Malvern and Gloucester Cathedrals, and on the lower frieze of the wooden watching-chamber at St. Albans. The most perfect and elaborate series is that on the capitals of the twelve pillars of the choir of Carlisle Cathedral, fully described by Mr. James Fowler, F.S.A., in vol. ii., part ii., pp. 280-296, of the "Transactions of the Cumberland and Westmoreland Antiquarian Society" (1875-6). To the same gentleman we are also indebted for a very learned and exhaustive paper on "The Mediæval Representations of the Months and Seasons," in the *Archæologia*, 1873, which should be consulted by all who desire to pursue this curious and interesting subject. The following verses, from the Sarum Missal, characterising the twelve months, may suitably conclude this paper:—

"Pocula Janus annat; et Februus 'algeos' clamant;  
Martius de vite superflua demit; Aprilis florida prole;  
Frons et flos nemorum Mæis sunt fomes amorum;  
Dati Junius ænas; Jullio resecurat avena;  
Augustus apicæ, September colligit uvæ;  
Seminat October; spoliat virgulta November;  
Quærit amare cibum porcum maculando December."

EDMUND VENABLES.

THE NORTH-WEST LONDON POLYTECHNIC AND RECREATION GROUND.—On the 9th inst. the Prince and Princess of Wales visited Paddington with a view to helping forward this scheme, which has for its objects the purchase of a fine open space of 2½ acres upon which to erect a large central hall, workshops, class-rooms, swimming-baths, and gymnasium; £50,000, is required for the land, but if £25,000, is at once forthcoming it can be secured. — John Aird, M.P., the well-known contractor, is one of the leading promoters of the scheme.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday afternoon last, the Vice-Chairman, Sir John Lubbock, presiding.

**Resignation of the Chairman.**—The Clerk announced that he had received a letter from Lord Rosebery, dated the 14th inst., resigning his position as Chairman of the Council.

The Vice-Chairman, after reading a brief letter from Lord Rosebery, said they all recognised the ability, courtesy, and wisdom with which Lord Rosebery had presided over their deliberations, and the people of London owed him a deep debt of gratitude. They were glad to know that, though they must lose him as Chairman, they would retain him as a colleague. He was sure it would be the wish of the Council to enter upon the minutes some expression of the regret they must feel in losing their Chairman.

Councillor Beal then moved:—

"That the Council receives with the deepest regret the announcement of Lord Rosebery's resignation of the office of Chairman, and tenders to him its hearty thanks for the devotion with which he has discharged the duties of the office, and for the courtesy and kindness he has uniformly displayed. It desires to place on record its high appreciation of the wisdom and ability he has shown alike in presiding over the meetings of the Council and in rendering advice and guidance to individual members and to the Committees in the discharge of their duties."

Councillor Fardell seconded the motion, which was supported by the Deputy-Chairman (Councillor Haggis) and carried unanimously.

The proper legal formalities having been observed, the office was then declared vacant, and it was resolved to proceed with the election of a new Chairman at the meeting on Tuesday next.

**Vacant District Surveyorships.**—The Standing Committee reported as follows:—

"Now that the Council has settled the conditions under which District Surveyors are in future to be appointed and to act, the Building Act Committee wishes to proceed at once with the appointment of the two Surveyors for the vacant Districts of South St. Marylebone and East Islington. The standing order of reference to that Committee, whilst giving to the Committee the necessary control over the District Surveyors, makes no mention of the method by which those officials are to be appointed. We are of opinion that the most satisfactory method would be for the Building Act Committee to make a selection from among the applicants for the office, and to recommend the person selected for appointment by the Council. In order that the Committee may be duly empowered in the matter, we recommend the following addition to its Standing Order of reference:—

"That the necessary measures for filling any vacancy in the office of District Surveyor be taken by the Building Act Committee, and that the Committee do in each case recommend to the Council the person whom they consider the most suitable for the appointment."

This recommendation was unanimously agreed to.

**The Metropolis Management and Building Acts Amendment Bill.**—The Parliamentary Committee, in a report dated July 10, officially informed the Council that "Sir George Trevelyan's Committee have completed the consideration of the Metropolis Management and Building Acts Amendment Bill, and notwithstanding the difficulties under which the Council laboured in consequence of its inability to expend money in the employment of counsel, and expert and other evidence, the Committee have, subject to certain amendments, passed all the clauses of the Bill, except the eighth, which provided that Vestries and District Boards should not be liable for injury to pipes caused by the use of a steam roller not exceeding 10 tons in weight, where the pipes are laid at a less depth than 24 inches from the surface. This clause was strenuously opposed by the gas companies, and was eventually rejected by the Committee, on whose mind the evidence of Mr. Trefnit, Chief Engineer of the Gas Light and Coke Company, of Mr. Bouchier, Chief Inspector of the company, and of Sir J. Bramwell, no doubt made a strong impression. The Bill has since passed through all its stages in the House of Commons, and is waiting introduction into the House of Lords."

**Projected Improvements.**—The Improvements Committee, in compliance with a resolution of the Council passed on December 17 last, submitted a list of such improvements as involve application for Parliamentary powers. They pointed out that the proposals had been selected from north, south, east, and west districts of

the county. The number now brought before the Council did not comprise all which the Committee would have been glad to include in the list had not financial considerations suggested severe economy. While, however, regretting the disappointment to various local bodies resulting from this policy, the Committee ventured to urge upon the Council that street improvement was one of the duties of municipal government, which might not be disregarded without grave injury to the public interests. In the Money Bill of 1888 power was taken to expend the sum of 100,000 in the year 1889, and in the Bill of 1889 power was taken to expend a like sum in the year 1890. Of that amount of 200,000, the sum of 48,105 had been appropriated to improvements agreed to by the Metropolitan Board, and the Council had voted for new improvements only 12,525. The Committee suggest contributions from local authorities in cases where under the system prevailing hitherto such contributions would have been dispensed with. The list of improvements included the widening and improvement of four of the bridges and approaches thereto in the Isle of Dogs, at an aggregate cost of 33,000; the formation of a new street from West India Dock-road to Bridge-road, Poplar, at an estimated cost of 59,800; the widening of Fortess-road, Kentish Town, at the point where that road and Highgate-road enter Kentish Town-road, at an estimated net cost of 28,200; the formation of a new street from Evelyn-street to Creek-road, Deptford, at an estimated net cost of 62,000; the extension of Chelsea Embankment westwards from Battersea Bridge to Lot's-road, at an estimated net cost of 62,000; the widening of Fulham Palace-road and Queen-street at the spot known as "Robin Hood Corner," at an estimated net cost of 8,500; the widening of a part of High-street, Kensington, at an estimated net cost of 47,000; the widening of the Knightsbridge, at St. George's-place, at an estimated cost of 32,067; and the widening of that part of the Albert Embankment, Lambeth, formerly called High-street-Vauxhall, at an estimated cost of 26,600.

The consideration of this important report was postponed for a week, and after the transaction of other business, the Council adjourned.

### Books.

*Treatise on Water Supply, Drainage, and Sanitary Appliances of Residences, &c.* By F. COLYER, M.Inst.C.E. London: E. F. & N. Spon. 1889.

WHEN to the above title is added the fact that the book professes to be written as a guide to architects and surveyors in matters of this kind, one would expect to find a bulky treatise instead of a little duodecimo of under ninety pages. The book is in fact merely a collection of general hints on the subjects named, which seem exceedingly good and useful as far as they go, but are more suited to give a general idea on the subject to ordinary readers, than to form a reference book for architects and surveyors, none of whom ought to be content with this amount of knowledge. As a book for the general reader, on the rudiments of house sanitation, however, it may be recommended.

*Elementary Principles of Ornament.* By JAMES WARD. London: Chapman & Hall. 1890.

THE contents of this book were originally a series of class lectures delivered by the author to the students of the Maclesfield School of Art, of which he is Head-master. In general the principles laid down in the book appear to us to be quite sound; the illustrations are rather coarse, but the author states that originally they were merely blackboard diagrams, and pretend to nothing more than that here. They must, however, have been specially drawn for reproduction in the book, and might have been drawn with more feeling for touch and style.

The author is quite right in his advice to students to cultivate the habit of making small but correct drawings of all kinds of plants; nothing refines the eye and hand more; and we agree with him in condemning that school of designers (whose reign, however, is nearly over) who have thought to find new forms by dissecting plants and making decorations out of them, on somewhat the same principle as "preparations" are made for the microscope. But on the other hand we do not think that the

arrangement of naturalistic leaves and fruits so as to fill a symmetrical shaped space (fig. 102) constitutes "ornament"; something more is necessary than that; ornament in its true sense is essentially an artificial thing, a creation by man on the basis of nature; the mere arrangement of purely natural forms in a symmetrical manner requires no thought or invention, and is a very easy way of designing.

The glossary of terms used in ornament is a very useful addition. We must protest against the extraordinary statement on the last page, in which music is compared to ornament, as an arrangement of sounds which is quite true up to a certain point; but, adds the author, "the imagination, intellect, or deeper feelings are not touched by either." We fear music is a sealed book to Mr. Ward.

*The Clock Jobber's Handy Book: A Practical Manual on Cleaning, Repairing, and Adjusting; embracing information on the Tools, Materials, Appliances and Processes employed in Clockwork.* By PAUL N. HASLUCK. London: Crosby Lockwood & Co. 1889.

THIS is a practical book of directions for repairing clocks, with descriptions and illustrations of the principal tools and the methods of using them. It is of course prefaced by some account of the general history and construction of clock movements, but the usefulness of the book consists in the practical hints from a writer who has acquired a great deal of special knowledge on the subject of tools and the handling of them. Probably an experienced craftsman would gain nothing from it, but it may be a useful help to the beginner.

*The Great Eastern Railway Company's Tourist Guide to the Continent.* edited by Percy Lindley (London: 125, Fleet-street), is the eleventh annual issue of a very readable and very nicely printed little handbook, issued in the interests of the enterprising railway company mentioned on the title-page. It gives in a pleasant, gossip style, a great deal of useful information to the tourist in Belgium, Holland, Germany, and Switzerland, and contains a great many excellently-executed illustrations in the form of picturesque bits of architecture. There is a good deal of new matter in this edition, dealing with some of the less-frequented districts. The book is to be purchased for sixpence, and should be seen by architectural and other tourists who are now thinking-out their plans for the holidays.

*Walks in the Ardennes*, edited by Percy Lindley, and illustrated with pen and ink sketches by J. F. Weedon (London: 125, Fleet-street), is a new edition of a bright little handbook giving particulars of new tours in the Grand Duchy of Luxemburg. At the outset, the editor points out that there are several ways of "walking" in the Ardennes: one is by diligence, another is by steamboat, and a third is by rail, "at a pace suited to the safety of the guard, who swings along the foot-board from carriage to carriage as the train travels, snips your ticket, chats, gesticulates, and even smokes, airily suspended outside by one arm on the rattling-door." Another good way of seeing "this region of forest, rock, and river" is to go on foot, and a final and very pleasant way practicable in at least one portion of the Ardennes, is to scull. Intending voyagers to this part of the Continent should obtain this excellent handbook, which is published for sixpence, and gives useful information not only as to the antiquities of the district covered by it, but as to boating, fishing, cycling, and shooting.

*Ye Olde Corner Postes of Ipswich* is the title of a forthcoming volume by Mr. John Shewell Corder, architect, of Ipswich, who will be known to many of our readers by his "Wayside Notes in East Anglia." The new work will contain a series of twelve large quarto sheets of sketches, illustrating all the old angle-posts at present remaining at Ipswich, and also those removed during the present century. There will be, in addition to the posts themselves, sketches of the old houses of which they form a part, and enlarged details of any striking features. The sketches will be accompanied by full letterpress and descriptive notes, and will form an interesting memento of ancient Ipswich. The edition will be limited to 200 copies, forty of which are already subscribed for. It is hoped the work will be ready the first week in August.—"Architect's Joinery and its Ornament," Part II., by F. A. Hawkes (London: B. T. Baisford, 52, High Holborn), is a useful trade book giving sections and details, dado-rails, picture-rails, mantels, over-mantels, and dado panelling.—*Lightning Conductors, &c.*—From Messrs. Alfred Hands & Co., of 9, Gracechurch-street, we have received a very useful and interesting illustrated catalogue of lightning conductors, vanes, finials, &c. It is well printed, and contains an historical sketch of the invention and practical application of lightning conductors. So far as we have found, the information it contains is correct, and in accordance with the rules laid down in the "Report of the Lightning-Rod Conference" held in this country a few years ago.—*Ventilators, &c.*—Messrs. Baird, Thompson, & Co., of 165, Queen Victoria-street, and Glasgow, send us an illustrated catalogue of their improved patent ventilators and other sanitary appliances. As we announced some time ago, this firm purchased the patent-rights, &c., of the "Æolus Water-spray" ventilators. The catalogue contains other specialties worth attention.—*Safes, Strong-Rooms, &c.*—Mr. John Tann, of 11, Newgate-street, E.C., has just issued a new illustrated price-list of fire-resisting and burglar-proof safes, locks, and doors for strong-rooms, &c.

### Correspondence.

To the Editor of THE BUILDER.

#### THE LONDON COUNTY COUNCIL AND THE DISTRICT SURVEYORS.

SIR,—The action of the London County Council in adopting the report of the Building Act Committee is another instance of the inability of that body to realise the purpose for which it was created. When will the members understand that they are an executive not a legislative body, that they were instituted to carry out certain Acts, not to ignore them, and that they have only power to do such things and make such regulations as they are specially empowered by Act of Parliament to do?

The proposed alterations in the status of District Surveyors will reduce them from being experienced professional men to mere paid officials, in fact a species of inspector of nuisances; perhaps the next regulation will be that they are to wear uniforms.

The proposal is not only contrary to the spirit of the Metropolitan Building Acts, but totally illegal; it is also a gross blunder, and absolutely impracticable.

The only Acts that deal with District Surveyors are the Metropolitan Building Acts, and the London County Council have only such powers with regard to them that the now defunct Metropolitan Board of Works possessed. All these powers are fully set out in the Metropolitan Building Act, 1855.

By sec. 32, (1) They may alter the limits of any district or unite any two or more districts and place such altered district under the supervision of any existing or future District Surveyor with power from time to time to alter any district so made, and do all such matters and things as are necessary for carrying into effect the power hereby given. (2) They may, subject to certain permission, dismiss or suspend any District Surveyor and appoint a temporary substitute. (3) When a vacancy occurs, they may appoint another properly-qualified person. (4) They may pay such amount of compensation as they think fit to any Surveyor who may be deprived of his office in pursuance of the power hereby given of altering the limits of districts.

By sec. 65 they may cause a fixed salary to be paid to any District Surveyor instead of fees, provided such salary be not less than the average fees for the last three years.

By sec. 67 they may provide wholly or partially for the payment of District Surveyors out of the rates, and may abolish or reduce any fees payable to District Surveyors.

But nowhere in this or any other Act is any power granted them to place any restriction whatever upon any District Surveyor. They have no power to restrain him, as they propose, from practising privately as an architect and surveyor, or to compel him to devote his whole time to the office. No power is granted; it is, therefore, illegal to attempt to usurp such power. On the contrary, by sec. 37, provision is made for the case of a District Surveyor being

architect to a building in his own district; it is, therefore, certainly the intention of the Act that the District Surveyors should be practising architects, although the selection is not confined to those so practising provided the candidate holds the certificate of the Royal Institute of British Architects. As no power is granted, and a negative to that power is inferred, any attempt to place a restriction upon the District Surveyors is a breach of the law, and legal action should at once be taken by those interested to let the L.C.C. understand their true position in the matter. And I defy them to point out any clause that in any way empowers them to place the proposed restrictions on the District Surveyors.

Perhaps the members of the L.C.C. are unaware that some twelve years ago the Metropolitan Board of Works introduced a Bill into Parliament to amend the Building Acts, which was referred to a Committee of the House of Commons, and the question of District Surveyors, their duties and appointment, gone into most thoroughly, when many witnesses of experience, including architects, contractors, and others, were examined; the Committee reported favour of the existing system, and, as a result, the Bill was thrown out. The M.B.W. had the good sense to apply to Parliament for the power they desired, but the L.C.C. evidently thinks itself independent of Parliament. Query, can the L.C.C. do a thing for which the M.B.W. applied for power, and was refused? I think not.

The only complaint lodged by the L.C.C. against the District Surveyor is the system of "devilling" said to be practised by some surveyors. Provided this charge is correct, the Council have their remedy, for by sec. 36, if at any time it appears to them that, on account of pressure of business in any district, or on any other account, the surveyor of that district cannot discharge his duties promptly and efficiently, then they may direct any other District Surveyor to assist the surveyor of such district in the performance of his duties, or appoint some other person to give such assistance, and such assistant surveyor shall be entitled to receive all fees payable in respect of the services performed by him.

Again, they seek to impose fixed hours on the District Surveyor, as if he were a clerk or schoolboy and not a professional man, who should use his discretion. He is to be compelled to be in his office from 9.30 till 11, and from 4 till 5, so that he only has from 11 till 4 (less lunch time) to do the real work of his office; and if he is specially called upon important business at any other time, say a case of a dangerous structure, he must keep it waiting until he is allowed out. This certainly was not contemplated by the Act. Neither have the L.C.C. any power to compel a District Surveyor to retire at sixty-five years of age.

There are many districts for which the total fees do not exceed 150*l.* per annum. Out of this the District Surveyor will have to provide clerk, office, and other expenses, leaving himself about 50*l.* as handsome pay for the whole of the services of a skilful and upright surveyor. Is the L.C.C. likely thus to obtain a better man than at present? It is true they recommend that the districts be rearranged as opportunities occur, so that the fees are not less than 500*l.* per annum; but when will this opportunity occur? The districts only become vacant one at a time, and many of the least paying districts have the largest area. Suppose one of these districts should become vacant, the vacancy could not be filled by a new District Surveyor compelled to devote his whole time, as no qualified man could afford to undertake the duties for the small fees; if it were divided among the adjoining districts, the new regulation could not come into force, as it is not proposed to affect the existing surveyors, and the duties of those among whom the vacant district was divided would of course be much increased, so that matters would be worse instead of better. Of course, a new surveyor might be appointed at a salary of 500*l.*, but the L.C.C. do not propose to make any alteration in the mode of payment of District Surveyors; bow, then, do they propose to get over the difficulty?

The whole affair is utterly impracticable, and, by the proposed alteration, a lower class of men would gradually fill the office of District Surveyor, as no man of experience would give up even a decent practice for the uncertainty held out. The L.C.C. would, therefore, have to select from the young men with slight experience and older men who have proved failures.

It will be observed that although the District Surveyor is to contract not to carry on the "business" of an architect, surveyor, or builder, nothing is said as to his not carrying on other businesses, such, for instance, as that of an undertaker, auctioneer, &c. Will the profession submit to this result?

The alterations are proposed by men who have, with one exception only, at most one year's experience, and that very slight, of the working of the Building Acts, and that one exception, Col. R. W. Edis, opposed the motion.

The L.C.C. went through the farce of consulting the Royal Institute of British Architects, the Institution of Surveyors, the District Surveyors' Association, and the Architectural Association, who one and all advised against the proposed change, with the result that their advice was ignored. If the L.C.C. did not intend to be guided by the unanimous advice, why ask for it?

The curious part of the business is that at the discussion the illegality of the alteration seems to have occurred to none of the Councillors. I sincerely hope that they will reconsider the step they are taking, and not hold themselves up to ridicule by attempting that which they have no power to perform.

July 8, 1890. A LONDON SURVEYOR.

SIR,—Seeing that the Council has passed several resolutions to regulate the appointment of future District Surveyors, one is somewhat curious to learn how it proposes to carry them into effect.

Several of the conditions sought to be imposed by the Council would have to be authorised by an Act of Parliament, as they are *ultra vires* with the Metropolitan Building Act, which defines the duties and emoluments of District Surveyors; but it would appear that the Council do not propose to apply to Parliament for power to vary the terms of the appointments. As this is his, so, the Council learn that its functions are to carry out the law as it exists, and not to override it, the better.

London, July 7, 1890. ARCHITECT.

SIR,—It has been decided by the County Council that the District Surveyors elected in the future shall attend at certain fixed times at their offices.

Now, it is difficult to see what good a District Surveyor can do at his office, when he would be better employed on the buildings; but the regulation as it stands prevents his going on the works except between the hours of eleven and four, so that the jerry builders will have from four o'clock each day until eleven o'clock on the next day to do as they like.

We can hardly expect that the same class of men will offer themselves for the future vacancies. The future candidates will be young men, to whom the income will be important, or men between forty and fifty who have not been successful.

A glance through the list of District Surveyors at present holding office will show that men of experience and position have been elected, and it is generally admitted that they have performed their duties to the satisfaction of the public.

OBSERVER.

JARRAH TIMBER AS A FIRE-RESISTING MATERIAL.

SIR,—I note in an article of April 5, on "Safety in Theatres and Places of Public Amusement," that you advise the employment of large balks of elm, oak, or Australian iron bark for flooring purposes.

I venture to recommend that a trial should be made of our Western Australian jarrah, as I feel sure it would prove itself to be far superior to any of the above in its fire-resisting qualities, as I can safely say from a long experience, that in large halls it is almost impossible to consume it. It is, without exception, the most disheartening wood to use for firewood that can be found, as, unless you keep the fire stoked up with deal, &c., it will quickly char and die out. An experiment in an open register in good-sized blocks would soon convince any one.

In the jarrah forests the ground is covered everywhere with logs that have lain for years, and although fierce fires pass over them every year, they still defy them, and remain charred on the surface only.

I would like you to try the experiment of testing it as above, and you might then be able to suggest its employment.

FRANCIS BIRD.

Albany, W. Australia, June 2, 1890.

\* \* \* We are quite of opinion that our correspondent's suggestion is worth attention. Oak has been suggested as a fire-resisting material because it is the hardest and closest-grained English timber. A still harder wood would probably be still more fire-resisting.

"ARCHITECTURAL STUDIES IN ITALY."

SIR,—I owe you my best thanks for your appreciative and kindly review of my book, in last week's issue, but my purpose in troubling you is to point out an inadvertent injustice which you have done my companion, Mr. David B. Burnie, architect, in entitling the subjects as measured and drawn by me alone. Although the drawings are my own, the measurements for the two plates you reproduce, and for three of the most important subjects in the book, were taken in Italy by Mr. Burnie and myself jointly; and it is due to him that the co-operation should be acknowledged, as is done, of course, in the preface to the work.

July 14. WILLIAM J. ANDERSON.  
\* \* \* We went by the title-page, which gave Mr. Anderson's name only.—Ed.

LINCOLN'S INN GATEWAY.

SIR,—Most of us will have heard with the greatest satisfaction that our old friend the Gateway is not to be taken from us. May I suggest to the Benchers that they should now apply soft soap and scrubbing-brushes, and remove some of the filth which covers not only the Gateway but the walls of the adjoining courtyard.

This square is really of very pleasing design, though it is somewhat spoiled by the fact that one of the octagon turrets and the library are sited. Personally, I should like to see this stucco taken off, and the brickwork again exposed to view, if, as I suppose, it is of red brick to match the rest of the work.

RALPH NEVILL, F.S.A.

Rolls Chambers, July 15.

The Student's Column.

HOT-WATER SUPPLY—III.

BOILERS AND INCORUSTATION: continued.

THE subject of incrustation is being dealt with somewhat fully, as it is a question worthy of every consideration in the south of England. It is no exaggeration whatever to say that seven-eighths, or even more, of the fractured wrought-iron boilers in London (and the number is very large), owe their failure to this cause alone. The trouble is greatly aggravated by the fact that very few of the average householders have any knowledge of the subject. The water gives no evidence of having lime in its composition, and the Water Companies, who are clearly responsible, and who ought to issue information upon the question, are silent; and the consumer and user of the water gains experience by paying for it when the boiler cracks.

There are probably from eight to ten thousand pounds sterling spent annually in renewing boilers that have failed from this cause, in the London district alone, and the work is necessarily expensive, as in each and every instance a quite new boiler has to be fitted, it being impracticable to patch or repair the injured plate; and to have a new front, the boiler must be made shorter, which, of course, cannot be thought of.

To still further show how prolific of trouble the "fur" is, it might be asked if anyone has ever seen a boiler, in the London district, for hot-water supply that has failed from actual fair usage, that is to say, really worn out; it may be taken for granted that very few, indeed, have ever seen such a thing.

In concluding this subject, it must be explained that the majority of the north of England waters are more or less soft, and differ in character from those of the south in a remarkable degree; the little deposit some of them precipitate is of a muddy nature, which can be flushed out, and it is therefore usual in these districts to provide a pipe expressly for this purpose at the bottom of the boiler. It can be readily understood that different districts must yield waters having a difference in character, but wherever the deposit does not incrust upon the inner surface of the boiler, very little trouble need be anticipated.

After exposing the troubles consequent on the use of hard water it is only fair to point out that it has one advantageous effect upon iron boilers and pipes of considerable importance, viz., that it has a preservative effect and, most important, the water is never discoloured with rust. In districts where soft water prevails the rust question has caused almost more annoyance than the "fur" in hard-water districts.

Soft water has a very vigorous chemical action upon both lead and iron, with the result that with iron boilers and pipes the water becomes discoloured by rust to such an extent

as to be not only an annoyance but a source of serious trouble, and with lead pipes the result is likely to lead to an epidemic of lead poisoning, as it has done many times, and it is on this account that in the soft-water districts copper boilers, cylinders, &c., have to be resorted to, but, of course, at considerable expense. But one beneficial effect of hard water is that lime is a violent opponent to rust,\* and the thinnest film of carbonate of lime entirely overcomes this trouble, and it is on this account that copper, so largely used in the North, is quite the exception in the South for hot-water purposes.

This peculiarity that lime possesses in opposing the formation of rust can be taken advantage of by coating any form of boiler or iron vessel with lime-white when the vessels in question are inclined to give trouble by discolouring the water with rust, a very common occurrence with the ordinary open-top side boilers of kitchen ranges the first month or two they are used; and more than one cure has been effected to an iron-pipe apparatus, when rusting from the action of soft-water, by running a tolerably strong solution of lime-white through it, and so coating the interior of all the pipes, &c., with lime. This coating must be allowed to get thoroughly dry before charging the apparatus with water.

#### BOILERS.

Boilers for hot-water supply, usually called bath or high-pressure boilers, may be divided into two distinct classes, viz., those that are fixed in and heated by the fire of a kitchen-range, and those that are independent.

Neither of these boilers can be made in any great variety of shapes, like those for heating purposes, on account of the "fur" deposit question and all its drawbacks having to be considered. The advantages and disadvantages of some of the shapes commonly seen in kitchen ranges can be profitably discussed, but it will be found that nearly every range-maker, especially if he be a specialist, has a boiler of his own particular pattern, and for which he naturally claims superiority.

There is one object sought by all makers alike, and that is to obtain the largest possible effective heating surface, and so provide a more abundant or rapid supply of hot water than others; but this cannot be carried to any great extent, as, in the first place, the boiler is most usually made to the range, not the range to the boiler, and, secondly, the interior of the boiler must be tolerably roomy and clear for cleaning purposes,—no tube flues can be permitted, for instance.

If it were not for the trouble that fur occasions, the most efficient and economical form of boiler (?) known could be used, viz., a coil of pipe, which, if properly fitted, is all heating surface (ordinary range boilers have a little more than half their surface untouched by the fire); but with London water a coil fixed in this manner becomes furred up and split in eight or nine months, but even with this objection they are sometimes used, their

FIG. 5.

cost not being great, provided their removal and renewal in an expeditious manner can be arranged for.

\* A most interesting experiment was made at the Royal Institution some time ago with a view to determine whether the presence of carbonic acid in air or water was responsible for the rapid oxidation or rusting that is experienced when iron is exposed to either of these elements in the ordinary way. Two test-tubes were taken and filled with ordinary water, and into each was placed a common sewing-needle; one tube was sealed up in this state, and the other tube was also sealed after having a small piece of quick-lime (oxide of calcium) placed in it. These tubes were placed away for twelve months, and at the expiration of this time examination showed that the needle in the tube of ordinary water was a mass of rust, whereas the needle in the tube of water with lime in it was perfectly free from rust, bright, and equal to new, owing to the lime having taken up the carbonic acid (present in the water) to form carbonate of calcium. This clearly illustrates that hard water has one redeeming feature in connexion with hot-water boilers and apparatus.

The most ordinary form of boiler is of a square shape, with a sloping front, and having an arched flue, as at fig. 5. This is the shape that is almost invariably met with in the cheap makes of ranges,—those used by the speculative builder, who considers lowness in cost of primary importance. It is not intended to convey that all boilers of this shape are necessarily attached to cheap ranges, but that is the shape invariably used in cheap goods of this sort.

This is about the least powerful form of boiler made, as they rarely exceed 10 in. in length from front to back, and whatever the object is in making the front sloping it has a most prejudicial effect in decreasing the size of the fire at the bottom, which results in the accumulation of ash more quickly choking the boiler flue, and the less the body of fire the less bright it burns with less evolution of heat, in fact it must have been originally intended to have this front projection at the top instead of at the bottom of the boiler, for this arrangement would certainly be more effective. Any one may perceive that a heating surface overhanging a fire gives better results than one projecting beneath.

This pattern, which is very frequently (mis) called a saddle boiler, can have its efficiency or heating power increased by adding to its length from front to back, or by adding to its width, so as to give a greater area to the bottom heating surface, but both length and width, particularly the latter, are governed by the construction of the range fire-box.

#### SURVEYORSHIPS.

THE LEATHERSELLERS' COMPANY.—We are informed that out of 150 candidates who made application for the appointment of Surveyor to the Leather-sellers' Company, Mr. Samuel Hill, of the firm of F. W. Porter & Hill, Russell-square, was ultimately chosen for the appointment from seven names specially selected at a previous Court meeting.

BIRMINGHAM.—The Public Works Committee of the Birmingham Corporation, in a report presented to the City Council at its meeting on Tuesday last, state that Mr. Buckley, the Road Surveyor, lately informed the Committee that he was about to apply for the office of Surveyor of Roads to a neighbouring County Council, at a considerably advanced salary, and asked for a testimonial. The Committee, being impressed with the desirability of retaining Mr. Buckley's services, requested him to withdraw his candidature, and undertook to recommend the Council to increase his salary from 400l. to 500l. per annum. To this Mr. Buckley consented, and having regard to the large and increasing amount of work in the road department, to the responsibility of the office, to the economies effected by Mr. Buckley, and to the efficient and conscientious manner in which he discharges his duties, the Committee unanimously recommended that his salary be increased to 500l. per annum from July 1. This was agreed to by a large majority.

#### OBITUARY.

MR. JOHN CLAYTON, for many years Town Clerk of Newcastle-on-Tyne, died on Tuesday last, in his ninety-ninth year. Born in 1792, he succeeded his father in 1824 in the office of Town Clerk. The *Newcastle Chronicle* says of him that he "took part in the councils at the beginning of the industrial epoch which found George Stephenson and his locomotive at its threshold," and "was at the planning of the Newcastle we now know k.f. He was well known as an antiquary, especially in connexion with the excavations he carried on for more than thirty years on the site of the Roman wall, at Homesteads, the Chesters, and Chollerford. Some of the remains discovered were visited by the Archaeological Institute in 1852, and Mr. Clayton's researches in connexion with these remains have been made better known by Dr. Collingwood Bruce's hook on the Roman Wall.

MR. JOHN PAGE, Chief Engineer of the Canadian Government Railways and Canals, died suddenly at Ottawa, Ont., on the 2nd inst. He was seventy-four years old. He went from Scotland to the United States in 1838, and worked in the construction of the Erie Canal, after which he went to Canada. He directed the construction of the St. Lawrence Canal system, and prepared the plans for the canal now being built at Saint Ste. Marie, Ont.

THE ARMOURERS' AND BRASERS' COMPANY.—Mr. J. Franklin Adams, the Master of this Company, writes to say that, encouraged by the success of the Exhibition held in May last, and noticed in our columns at the time, the Armourers' and Brasers' Company propose holding a second Exhibition upon similar lines in May, 1891.

#### GENERAL BUILDING NEWS.

PETERBOROUGH CATHEDRAL.—The Archbishop of York has consented to preach at the reopening of Peterborough Cathedral in October. The work of restoration is far from complete, and the fittings of the Benedictine choir have yet to be provided. Canon Angles has given the pulpit and throne, and fourteen stalls have been promised, and are being executed from the designs of Mr. Pearson, R.A.

A NEW SEMINARY IN SUREBY.—A few days ago the R.C. Bishop of Southwark laid the memorial-stone of a new college, to be erected at Lostford, near Womersley. The architect is Mr. Walters, of London, and the estimated cost is about 23,000l. It is intended to provide accommodation for about 100 students. The work has been entrusted to Messrs. Longley & Co., of Crawley, Sussex. There is a piece of ground immediately adjoining the college, where it is contemplated to erect a chapel. This will not be commenced until the completion of the larger work, and the estimated cost of it is between 2,000l. and 15,000l. The clerk of the works is Mr. J. J. Hoskin.

ALL SAINTS' CHURCH, LLANLWCHAIRN.—This new church, situate near Newtown, Montgomeryshire, was consecrated on the 26th ult. It has been erected at the sole cost of Sir Pryce Pryce-Jones, and consists of chancel, nave, and south aisle, and the possibility of a north aisle having been required, or effect has been duly taken into account. There is also an organ-chamber, and there are vestries for the clergy and the choir. In the nave and aisle is accommodation for about 450 worshippers, and in the chancel provision is made for a choir of 30. The style is simple Pointed, but effect has been sought in proportion and careful detail rather than in ornamental accessories. The stone of the wall is from the quarries at Llanymynech, with Grinshill dressings, and the roof is covered with green Bangor slates. The external wood-work is entirely of oak, and the interior is finished with the tool and unvarnished. At the south-east corner a tower, with octagonal spire, rises to the height of 75 ft. The building is heated throughout on Haden's hot-air system. The font and pulpit, which are of Grinshill stone, were specially designed, and they were executed by Mr. Robert Giff of Welshpool. The altar hangings were supplied by Messrs. Helbrunner & Co., of London, the brass lectern, the credence table, the altar chairs, and the chairs and kneelers for the nave and aisle were supplied by Messrs. Jones & Wills. The site belonged to the Llanochely estate, and was the gift of Mrs. Lovell. The builders were Messrs. Davies & Son, of Newtown. The Clerk of Works during the earlier portion of the time was Mr. Williams, who was succeeded by Mr. Latta. The architect is Mr. Aston Webb, of London. The entire cost has exceeded £3,800.

PROPOSED IMPROVEMENTS AT BLACKPOOL.—Extensive changes were done to the "lower walk" of Claremont Park by the severe storms of last winter. The walk is close upon three quarters of a mile in length, and the hulking which protected it from the sea was entirely washed away during the mid-winter months. The consequence is that the walk has been very considerably encroached upon by the action of the waves, and it is necessary that steps be taken to prevent the further encroachment of the sea, and also for the protection of the terraces of houses on the upper cliff, which (according to the *Liverpool Daily Post*) may be threatened. The Blackpool Town Council, in conjunction with the Land and Building Company, who own the greater portion of the park, have been considering the matter for some time, and they have just arrived at a decision. The Council recommend to the Land Company and the ratepayers of Blackpool generally, that an application be made in the next session of Parliament for powers to spend a sum estimated at between 70,000l. and 80,000l. in carrying out an extensive scheme of improvement which will involve the entire reconstruction of the park and its approaches.

THE CARMELITE PRIORY CHURCH AT SOUTH QUEENSFERRY.—The *Scottishman* reports that the ancient Carmelite Priory at South Queensferry was reopened on the 10th inst. for the conduct of worship, having been restored for that purpose after having been in disuse for fully two centuries and a half. Recently the members of the Episcopal Church Mission, which has been maintained for some years at South Queensferry, on the outlook for a suitable place in which to worship, approached Captain Dundas, the owner of the building, for liberty to use the Priory. Captain Dundas, after consideration, offered the church in perpetuity on condition of its being restored, an offer which was accepted by the Dean and Chapter of St. Mary's Cathedral, Edinburgh. The work of putting the building into good order was not a very serious undertaking, as the chancel, transept, and towers were almost intact, and the massive walls were exceedingly substantial. Under the supervision of Messrs. Seymour & Kinross, architects, Edinburgh, the work of repair was completed about six months ago. The roof of the chancel was renewed, and a temporary roof was placed on the tower. A new roof was placed on the transept, and all the windows were repaired.

**SCHOOLS, WATFORD.**—New schools for the Watford School Board are about to be erected from the designs of Mr. C. P. Ayres, architect, Watford, which were selected in a limited competition.

**ST. MARK'S CHURCH, WORSLEY, CHESTER-LANE, NEAR TOTTENHAM.**—The contract for this work has been let to Messrs. Thompson & Brierley, builders and contractors, of Bury, their estimate being 3,100*l.* The architects for the work are Messrs. Maxwell & Tuke, of Manchester.

**PRESBYTERIAN SCHOOLS, BOLTON.**—The contract for Bowker-street Presbyterian Schools, Bolton, has been let to Mr. Wm. Tomson, builder and contractor, of Bolton, his estimate being 1,000*l.* The architects for the work are Messrs. Maxwell & Tuke, of Manchester.

**PROPOSED EXTENSION OF THE WIGAN PUBLIC LIBRARY.**—On the 9th inst. Colonel W. M. Duxell held an inquiry relative to the Wigan Public Library, application having been made for borrowing power to enable the Corporation to extend the library.

**BRUNSWICK CHAPEL, LEEK,** has been reopened after alterations and re-decoration. Messrs. J. & J. Mathews were the contractors for the woodwork and other builders' works; Mr. G. T. Stevenson for the heating apparatus, and the works have been carried out to the satisfaction of the architects, Messrs. W. Sugden & Son. The *Leek Times* says that the building was built by the father of the Messrs. Mathews to the plans of Mr. Sugden, sen., thirty-five years since.

**WATERWORKS AND GASWORKS AT BARRY DOCK OFFICES.**—The *Western Mail* (Cardiff) understands that the tender of Messrs. John Aird & Sons, London, has been accepted for the erection of extensive new offices, officials' residence, &c., for the Barry and Cadocton Gas and Water Company, on a site to the westward of the gasworks at Barry Dock. The work, which will be commenced at once, is expected to be completed before Christmas. New high and low level reservoirs are likewise being erected at Penycroft and Merthyr Down, under the superintendence of Mr. J. A. B. Williams, C.E., Cardiff, the consulting engineer. The contractors in these instances are also Messrs. Aird & Sons, and the high level reservoir will be completed in the course of a month. Improvements at the gasworks are being carried out under the direction of the permanent engineer, Mr. F. M. Harris.

**NEW BUILDINGS AT LITTLEHAMPTON.**—According to the *Sussex Daily News*, the building prospects of Littlehampton are improving. At the last Local Board meeting considerable time was occupied in discussing plans for business premises and private houses.

**FREE PUBLIC LIBRARY, BARNSELY.**—A free public library and reading-room for Barnsley, the premises for the accommodation of which have been magnificently presented to the town by Mr. Charles Harvey, was opened last week by the Mayor of Barnsley. Under the direction of Mr. J. H. Taylor, the Borough Surveyor, the rooms on the ground-floor have been fitted up as a reading-room, newsroom, general and reference libraries, and so forth. The tables, chairs, and other fittings are in walnut, and were supplied by Messrs. Johnson & Appleyards, of Sheffield. On the next floor there is, besides other rooms, a hall capable of accommodating 2,500 people. On the ground-floor is a range of offices, and the rooms over them are occupied by the Barnsley School of Art.

**GLYN CHURCH, RISCIA.**—It has been decided to rebuild the Glyn Church, Riscia, Mon. Plans are being prepared by Alfred Swash, architect, Newport.

**NEW BANK AT LEEDS.**—A new branch bank is to be built for the Birmingham and Midland Banking Co. in Kirkgate, Leeds, from the designs of Mr. William Bakewell, architect, Leeds.

**HOUGHTON-LE-SPRING SEWERAGE SCHEMES.**—A Local Government Board inquiry by Colonel J. O. Lefevre, R.E., one of the Board's engineering inspectors, has been held at Houghton-le-Spring regarding an application by the Houghton-le-Spring Urban Sanitary Authority for sanction to a loan for two schemes of main sewerage and sewage disposal. The engineer (Mr. D. Balfour, M. Inst. C.E.) explained that the first scheme related to the townships of Hetton-le-Hole, Moorsley, and East Rainton, comprising eleven miles of pipe sewers and twenty-one acres of land for sewage disposal by the system of intermittent land filtration, the total estimated cost, inclusive of land purchase, being 18,875*l.* The second scheme related to the townships of Newbottle, Westley, and Penshaw, and comprised nine miles of pipe sewers, twenty-two acres of land, laid out on the above system, and the total estimated cost, inclusive of land purchase, was 13,875*l.* There being no objections made to the schemes, the inquiry was closed after the inspector expressed his satisfaction of the plans and documents submitted to him.

**GOOLE DRAINAGE.**—At the meeting of the Goole Local Board on the 9th inst. the contract for the construction of drainage in Old Goole by Messrs. Jackson Bros. was signed.

**JUXTA-MURAL INTERMENT.**—It is a striking proof that the simplest elements of sanitary knowledge are unknown, or at all times disregarded, by those who desire to lead in public matters, that another proposal has been made to make a new cemetery close to London. No sooner has a scheme to establish one at Mitcham failed, than a still more objectionable site is seriously offered for the purpose at Wandsworth, close to the Middlesex Asylum. Few spots are more ill-favored, and situated for such a purpose than this, through its proximity to flowing streams and active drainage, or more pressed upon by an increasing population, could have been suggested. With the rapidly-increasing demands of the metropolis and its growing suburbs for space and air, for careful avoidance of all collections of decaying matter, and for the prevention of disease, the erection of a cemetery within twenty-five miles of Charing-cross, at all events on the South side, must now be regarded as little less than a crime.—*British Medical Journal.*

**NORTH-EASTERN SANITARY INSPECTION ASSOCIATION.**—On the 10th inst. the annual meeting of the North-Eastern Sanitary Inspection Association was held in Newcastle. Ald. W. D. Stephens presided. The annual report showed that during the past year the membership had increased from 470 to 600, the receipts from 1,337*l.* to 2,066*l.*, and the balance from 67*l.* to 1,122*l.* The Chairman, in the course of his remarks, said the report spoke for itself. The society now occupied the second position amongst the sanitary inspection societies of the kingdom. The report was adopted.

**BUXTON SEWERAGE.**—On the 15th inst., Mr. Arnold Taylor held an inquiry at the Town Hall, Buxton, respecting the application of the Local Board to borrow 1,060*l.* for sewerage works. Mr. Hague, C.E., Town Surveyor, stated that the district was increasing. The present population was 7,500, and in the season 10,000 to 15,000.

**ALVASTON AND BOULTON SEWERAGE.**—At a special meeting of the Alvaston Local Board, held on the 11th inst., it was decided to instruct Mr. W. H. Radford, C.E., Nottingham, to prepare a scheme for the sewerage of the district. The district to be drained includes a rapidly-increasing suburb of Derby.

**THE NATIONAL REGISTRATION OF QUALIFIED PLUMBERS.**—As will be seen by an advertisement in our columns this week, a public meeting in support of this movement will be held at the Town Hall, Kensington, on Wednesday next, the 23rd inst., under the auspices of the Worslipful Company of Plumbers.

**STAINED GLASS AND DECORATION.** ST. PAUL'S CHURCH, KERALA.—This church, which has been closed for extensive repairs and decoration for six weeks, was reopened on Sunday last. The work has been done by Mr. R. Bennett, of South King-street, Manchester.

**THE DECORATIVE BRANCH OF THE KYRLE SOCIETY.**—An appeal is made on behalf of the funds of the Decorative Branch of the Kyrle Society, whose work is stated to be now almost at a standstill from want of funds, after thirteen years of steadily-increasing efforts in behalf of the decoration of hospital-wards, parish-rooms, working-men's clubs, &c. At the present time twenty-two applications for decorative help have been inquired into and sanctioned by the Committee, but not one of these can be put in hand, not from any lack of able artists and architects to draw up schemes, or of workers to carry out their designs, but because the Committee has absolutely no money to grant for the necessary expenses of materials, fixing, &c. 250*l.* would enable the Committee to execute some of the designs promised them by Messrs. Cole Day, Henry Holliday, James Powell, C. Harrison Townsend, and others. The Committee plead specially for the decoration of the following rooms, whose claims have been under consideration for nearly two years:—1. St. Jude's National Schools,

Southwark. 2. Working Men's Club, Vauxhall. 3. A large mission-hall in the poorest part of Woolwich. In this case help can be obtained in stenciling from workmen in the Arsenal. 4. The Neighbourhood Guild, a boys' and girls' club in Kentish Town. All these rooms will be used for meetings and social gatherings.

**ST. MARK'S CHURCH, WORSLEY.**—The *Birmingham Gazette* says that it has been decided by the parishioners of St. Mark's, Worsley, to erect a stained-glass window in St. Mark's Church in remembrance of the labours of the Rev. the Marquess of Normandy during the eighteen years he was vicar of the parish, prior to his lordship's departure to San Remo, Italy. The rev. marquess undertook upon his duties as chaplain of All Saints' Church, San Remo, in November.

FOREIGN AND COLONIAL.

**FRANCE.**—The Rouen Museum has come into possession of a very curious facade in carved wood, which formed part of the Abbey house of the James de Saint Amand. It dates from the fifteenth century.—At Spinol, in the Vosges district, a competition has been opened for a new lycée, which is to cost nearly two million francs.

A competition has been opened for designs for a building for departmental archives at Melun (Seine-et-Marne).—M. Boeswillwald, Inspecteur Général des Monuments Historiques, has been commissioned by the Ministry of Fine Arts to restore the house where Joan of Arc was born, at Domrémy, to its primitive aspect. The Government proposes to collect in this house the principal works in painting and sculpture which French artists have produced in illustration of Joan of Arc's history.—Paris is not the only city to have a monument to Berlioz. A statue to him, by M. Urbain Basset, is shortly to be erected at Côte Saint André (Isère), his native place.—The monument to Admiral Courbet, the joint work of MM. Falguère and Moreau, is to be inaugurated at Amiens on August 17.—We learn from the *Semaine des Constructeurs* that the competition for designs for a covered market at Provins (Seine-et-Marne) has resulted in the first premium being awarded to M. Léon Majoux, architect, of Paris; the second to M. A. Coguolin, "architecte-expert," and M. Barre, "ingenieur constructeur," both of Paris; the third to M. Théophile Bourgeois "architecte-verification," of Poissy.

**HAMBURG.**—The great bricklayers' strike, which has been of more than nine weeks duration, has come to an end, the men having resumed their work under the former condition of affairs.

**HEIDELBERG.**—We hear that a Committee of Architects and other competent judges is to be elected for the purpose of coming to a conclusion as to the advisability of restoring those parts of the famous old Schloss that are of special architectural merit, and which are at present in a semi-ruinous, although certainly very picturesque state.

**LIÈGE.**—The Belgian architectural, *L'Evolution*, gives a favourable account of an architectural exhibition now being held at Liège, with a considerable number of small reproductions from the drawings exhibited, which include decorative work as well as architecture among the exhibits mentioned with praise are the designs for villas and châteaux in the Renaissance style, by M. Gustave Charlier; the church at Hanefelt and the restoration of the Château Montgussin by M. E. Jamar, an hotel at Liège by M. Chas. Sombro, &c.

**LYON.**—The celebration of the completion of the Cathedral spire went off with all due pomp and ceremony on the last Sunday of June. Among the entertainments were included a historical pageant (with over 1,700 figures), an excellently acted play which had been written for the occasion, a very fine organ recital on the Sunday morning, an illumination of the spire on the night before. The "Dombbaumeister," Professor A. Beyer, was naturally a conspicuous figure on the occasion, and received several orders from different Sovereigns, and an honorary degree from one of the Universities.

**THE "WORLD'S FAIR" AT CHICAGO, 1892.**—This is the name which has been given to the proposed Exhibition at Chicago in 1892. The negotiations which have been going on for some time between the Illinois Central Railroad Company and the World's Fair Directors and the South Park and City officials have reached a culmination. The proposal made by the representatives of all the interests except the railroad is that the railroad should give up all its claims to the lake front, which it has been prosecuting in court; shall help fill in the space required in the basin for the purpose of the fair, and shall pay to the City 1,500,000 dollars. In return for this the railroad is to be given the 300 ft. right of way near the outer edge of the new-made park, which is to be covered over with the tracks will not be seen. In addition to the ground made for park purposes, the railroad will fill in enough land along its right of way, as far south as Twenty-second-street, so that a boulevard can be made along the lake shore, connecting by way of South Park Avenue with Drexel and Grand Boulevards.

SANITARY AND ENGINEERING NEWS.

**SANITARY CONGRESS AT BRIGHTON.**—We have received the preliminary programme of the Twelfth Congress of the Sanitary Institute, which is to be held at Brighton on August 25th to the 30th. The President of the Congress will be Sir Thomas Crawford, K.C.B., M.D. Section I. of the Congress, "Sanitary Science and Preventive Medicine," will be presided over by Dr. C. V. Moore. Section II., "Engineering and Architecture," will have for its President, Professor Roger Smith, F.R.S.B.A., the President of Section III., "Chemistry, Meteorology, and Geology," will be Mr. William Topley, F.R.S. In connexion with the Congress, there will be a Conference of Medical Officers of Health, presided over by Dr. Arthur Newsholme, and a Conference of Inspectors of Nuisances. There will also be a Health Exhibition, to be held in the Royal Exchange, Pavilion Buildings, and Museum (which adjoins each other) from August 25 to September 13.

**THE THIRLMERE WATER SCHEME.**—The *Manchester Courier* reports that the longest tunnel in connexion with the Manchester Waterworks scheme, the Raise Tunnel, which extends from near Towns Green to the striking wall in Thirlmere, and is 5,225 yards long, was completed, so far as boring is concerned, on the night of the 9th inst. The tunnel has been in progress nearly four years.

THE ANNUAL "ART EXHIBITION" of Munich, which is considered to be far superior to the official "Academy" one of Berlin, has been opened by the Prince Regent of Bavaria, attended by a very distinguished suite. The catalogue shows that 1,426 oil paintings have been hung, that the water-colour division shows 135 names, sculpture 182, and architecture 25. The "genre" subjects furnish the greatest contingent. In the foreign room France, the Netherlands, and Scotland occupy the chief space.

#### MISCELLANEOUS.

THE NEW BRIDGE AT BATTERSEA is to be opened on Monday next, at 3 p.m.

THE PROPOSED AMALGAMATION OF SCOTCH RAILWAYS.—The Select Committee of the House of Lords appointed to inquire into the merits of the Bill for amalgamating the Glasgow and South-Western Railway with the North British Railway decided on the 11th inst., at the close of the case for the promoters, that the preamble of the Bill had not been proved. This Bill, which had been sanctioned by the House of Commons, is therefore thrown out.

THE DIRECTORS OF THE NATIONAL GALLERY have just lost an opportunity of supplying a notable omission in their collection. It is absolutely without a single specimen of the great modern French School, whose fame has been established by Decamps, Millet, Delacroix, Fromentin, Troyon, Diaz, and Meissonier. There was some expectation that the collection formed by the late Mr. John Siltzer, of South Kensington, which contained fine specimens of these artists, would be purchased for the nation. They have, however, been bought by a French firm, and will forthwith be removed to Paris.—*Daily News.*

A NEW WHITE LEAD PROCESS.—The evils attending the manufacture of white lead by the Dutch or stack process are too well-known to require insisting on, and were pointed out many years ago. They may be summed up as—expensiveness, tediousness, and serious danger to health. Attempts have been made from time to time to introduce other methods of manufacture, but these, for the most part, have proved failures. Another process for attaining the desired end inexpensively, quickly, and safely has just been brought before the public. This process is the invention of Professor MacIvor, F.R.C., and has been in operation for the past nine months at the experimental works, Clapham-road. In this process of manufacture, the litharge is, according to the *Times*, first made from lead ore and then thoroughly purified by washing. It is then put in a vat which is fitted with stirring apparatus, and a solution of acetate of ammonia is run into the vat upon the litharge. The mixture is then agitated for six hours, so that the lead is fully absorbed into the solution, and it is allowed to settle. The supernatant liquor containing the lead is then pumped over into a second vat, in which it is submitted to the action of carbonic acid gas. By this means the lead is precipitated and the acetate of ammonia recovered for use over again. If the litharge is very pure, the carbonic acid gas is introduced into the first vat, with the result that the white lead is produced direct and the acetate of ammonia separated at the same time. In either case, after the white lead has been precipitated, the mother liquor is drawn off and the unwashed white lead is passed through filter presses to extract from it all the mother liquor. The pressed lead is then put in a washer and agitated by stirrers in cold water. After eight of these agitated washings, the white lead is again passed through the filter presses and through a hydraulic press, from whence it is removed to the drying-room, and, when dry, is ready for use. The result is a pure white lead, free from crystals, and produced in a few hours, the cost of production being also much less. The process and the products have been examined by several leading chemists, who include Professors Crookes and Watson Smith, and Dr. Dupré. All the operations in the manufacture of lead under this process are done in the wet, so that there is no dust, and therefore no danger to health from that source.

CHATELAIN-LE-FRITH CHURCH.—The *Sheffield Independent* says that it would appear that an entirely unlooked-for obstacle has presented itself in connexion with the proposed "Grimthorpe" of Chateaufort-le-Frith Church. The *Antiquary* has the following upon the matter:—"It is not contended, with apparently much reason, that the sum of £2,000, left by the late Mr. Samuel Needham upon trust 'towards repairing, renewing, or restoring the fabric of the Parish Church,' cannot be used for the purpose of demolition. The Vicar has publicly said of the old part of the church, 'Nothing under heaven will ever induce me to alter my determination to pull the chancel down; down it shall come! at all costs, down it shall come!' Is the Vicar, then, going to carry out his miserable policy of the destruction out of his own pocket? This objection has been formally raised by a parishioner, and the Vicar do you see is now being taken. Can the Vicar do as he likes with regard to the chancel without the sanction of the Ecclesiastical Commissioners?"

YORK CASTLE WALLS.—For some time past (according to the local papers) a proposition has been under consideration by the Estates Committee of the Castle wall, in order to open out to view the ancient and historic Clifford's Tower. The Town Clerk, on behalf of the York Corporation, recently sent a communication to the Yorkshire County Committee, intimating that they would consider favourably the following proposals:—That the Corporation remove the wall extending from the end of Clifford-street to Skeldergate-bridge, and dispose of the stone thereof as they saw advisable; that the County Committee give up a strip of ground to be agreed upon hereafter, for the purpose of widening Tower-street; that the York Corporation erect a dwarf wall with fences, railing, and gateways, for enclosing the County Committee's property; and that the public have free access to the open space between the railings and Clifford's Tower. This scheme, however, was opposed by a large number of memorialists, who were of opinion that the suggested improvement would be of very doubtful advantage. The Castle walls were unique in the kingdom, and formed a nation's pride, and any city might be proud to be the custodian. The County Committee, at a meeting just held, agreed with the views of the memorialists, and declined to accede to the propositions of the York Corporation.

PROPOSED MEMORIAL TO "THE SALFORD HERO."—A public meeting was held in the Salford Town Hall last week with a view to a memorial being inaugurated for placing a memorial statue upon the grave of the late Mark Addy, a working man who had gained this appellation of "the Salford Hero," having during his life saved over fifty persons from drowning. A committee was formed with this object. As was pointed out by Alderman Bailey, Addy's bravery was shown not merely by jumping into water to rescue others, but into the water of the "inky Irwell."

PROPERTIES FOR SALE.—(1) Fishibury, Hertfordshire, a sporting property of 550 acres in all, bounded by the river Stort, lying near to Sawbridgeworth. It is commonly stated that the house was built for Sir Walter Milmay, by Inglo Jones; and in the "Dictionary of Architecture" (vol. iv., *sub nom.*) it is included, upon Walpole's authority, amongst Jones's probable works. Yet the house would seem to have been of a rather earlier date, having been sold by Sir Walter's son, Thomas, to Sir Lionel Cranfield, temp. James I. Fishibury, which formerly belonged to the Macnaghtens, Earls of Essex, passed to the Fitzgeralds, and then to the Scropes of Bolton. Henry, Lord Scrope, conveyed it, in trust, to Henry VIII., and Walter Milmay, sheriff of the county in 1590-1, for whom the house was built. (2) Lamport Manor, about 1,700 acres, embracing nearly the whole of Rampton parish, in Nottinghamshire. This estate includes twelve farms situated in the Trent Valley, the whole yielding a rental of nearly 3,000*l.* a year. Rampton has for long been a seat of the Eyre family. In the parish church is a monument to Gervas Eyre, who was killed at the defence of Newark Castle in the civil wars. (3) Tanworth, in the southern portion of Warwickshire, consisting of 1,900 acres, under high cultivation, belonging to Earl Amherst. These will be divided into twenty-eight lots, to meet the convenience of purchasers. The parish church is St. Mary Magdalen, restored during last century, and restored ten years ago, was originally a chapel of Brilles, that had been assigned to the canons at Kenilworth by Roger de Newburgh, Earl of Warwick. Tanworth belonged to the Archer family from the days of Henry II. William, Lord Amherst, at one time Governor-General of India, by his marriage, in 1800, with the daughter and co-heir of Andrew, second and last baron Archer. (4) Boxley, about 612 acres, near Maidstone, including the ruins of a Cistercian abbey. The fine church here was repaired about twenty-five years since; and (5) at Ightham, in that same county, an interesting house, known as the "Town House," standing in the village, and which is believed to have been built in the fifteenth century.

NEW SURFACE FOR PLASTER CASTS.—The attempt to cover plaster casts with a galvanic coating of a permanent character has hitherto failed owing to the difficulty of stopping the pores of the surface so effectually as to prevent the galvanic bath penetrating into the interior of the plaster and there producing first crystallisation and then disintegration. The difficulty seems now to have been overcome by Messrs. Greif & Steingraber, of Munich, who have discovered that saturation in tar not only closes up the pores of the plaster but adds very considerably to its strength. Specimens so prepared have been covered with copper one millimetre thick, a thickness which is not only sufficient to resist atmospheric influences, but permits of the surface being further worked up and finished by hand. The price of a casting coated with copper is said to be one-fifth of the cost of a copper casting. In small pieces so thick a coating would not meet by making the necessary reduction in the plaster.

TECHNICAL EDUCATION ASSOCIATION.—The annual meeting of this Association was held on the 10th inst. at their office in Dean's-yard, Westminster. The report for the year stated that the committee were glad to record a substantial advance in public opinion, and a real beginning of the long neglected work of expanding, improving, and organising the technical and secondary education of the country. They regarded the action that had been taken under the provisions of the Welsh Intermediate Education Act as distinctly encouraging. Mr. Dixon advocated the instruction of factory boys in whatever branch of art or industry they might be engaged. It was an erroneous supposition that the trade unions would raise any objections to this plan; on the contrary, they were very strongly in favour of such teaching.

THE ENGLISH IRON TRADE.—There is no great change in the English iron market, but it has been fairly steady during the week. Pig-iron has been somewhat livelier, but it has not been above the average. Prices of crude metal are generally maintained. The tendency of Scotch pig-iron warrants has been upwards, but makers' prices are steady. The price of Cleveland pig is much the same as last week. In Lancashire, the Henanite pig is quiet. There is more business in finished iron, and greater firmness prevails. Low prices still rule for steel, but the inquiry is on the whole better. The position of shipbuilders is not improving. Engineers are still relatively active.

THE SOCIETY OF CHEMICAL INDUSTRY.—The proceedings in connexion with the annual meetings of the Society of Chemical Industry commenced at Nottingham on the 9th inst. in the large lecture theatre of the Nottingham University College, the chairman being occupied by the President, Sir J. Lowndes Bell. The annual report of the Council stated that the membership of the Society had increased from 2,445 to 2,595, and that there was a balance in the bank of 1,720*l.* The President delivered his inaugural address, the subject of which was "The Status of Iron in Chemically Considered." Mr. E. Rider Cook, of London, was elected President for next year, and Birmingham was selected as the place of meeting.

THE BISHOP PARRY MEMORIAL.—The second meeting of the executive committee for providing a monument to the late Bishop-Suffragan of Dover was held on the 9th inst. at the residence of Mr. James Forsyth, sculptor, attended the committee, and exhibited a clay model of a recumbent figure, and various plans for a base. Suggestions were made by the Archbishop of Canterbury and others as to slight alterations in the figure and to the subjects to be represented on the base. The latter were all unanimously agreed to. The complete model is to be approved later, on a day to be fixed, at the sculptor's studio. The office is to be placed in the nave of Canterbury Cathedral, and to the east of the recumbent figure of Archbishop Sumner. The cost of the monument will be 1,000*l.*

IMPROVEMENT IN VENETIAN BLIND FITTINGS.—We have had an opportunity of seeing in action Andrew Smith's patent Venetian blind fittings, manufactured by Messrs. Smith, Collier, & Co., of Alderbury. The new fittings dispense with the ordinary iron pieces, and they can more easily be fixed for receiving the blind, the latter being instantaneously removable at will, thus doing away with the inconvenience attending those at present in use. Smith's patent fittings can be adapted to all existing blinds at a nominal outlay, and their use will save much annoyance and vexation.

THE LIEBEART MEMORIAL, SOUTH SHIELDS.—The lifeboat memorial at South Shields, which was unveiled on the occasion of the opening of the new marine park, as mentioned in our columns a fortnight ago (p. 179 *ante*), consists of a fountain, which was constructed by Mr. J. B. Farbridge, monumental mason, of South Shields, from the drawings and under the superintendence of Mr. J. H. Morton, F.R.I.B.A., of the same town. The parks, as already stated, were laid out from designs by Mr. Matthew Hall, the Borough Engineer.

THE INVENTOR OF ERASIVE RUBBER.—The question as to who was the inventor of the pencil eraser is one that has caused considerable interest from time to time, and it is only lately that some one in France, who was poring over the history of the Academy of Sciences in Paris for the year 1752, came upon the following passage which explains the matter:—"The inventor who makes use of pencils from lead mines to draw his figures, and so forth, carries over the crumb of bread to rub out the marks of the pencil. M. Magalhães, or, as we spell it, Magellan, member of the Academy, a worthy descendant of the great navigator who discovered the strait south of Patagonia which now has his name, proposed a more effectual and convenient fortification by carrying a piece of rubber which can always be carried about. Rubbing by this new method is found to move satisfactorily remove the marks of the pencil and all other spots that are on the paper."—*New York Times.*

THE QUEEN'S PROMENADE, DOUGLAS, I.M.—This was opened on the 5th inst. The new promenade, which has been constructed by the Douglas Commissioners, replaces old property formerly backing on to the shore, and is nearly 600 yards in length, with wide roadway and footpath separated by grass lawns. It has cost over 5,000*l.*

TERMS OF SUBSCRIPTION. "THE BUILDER" is supplied in paper from the Office to residents in any part of the United Kingdom at the rate of 10s. per annum in advance. To all parts of Europe, America, Australia, and New Zealand, 20s. per annum in advance. Letters, Orders, &c., sent per annum. Remittances payable to DOUGLAS FOURBRAINER, Publisher, No. 46, Catherine-street W.C.

PUBLISHER'S NOTICES.

Registered Telegraphic Address, "THE BUILDER, LONDON." THE INDEX and TITLE-PAGE for Volume LVIII. (Jan. to June, 1890), was given as a Supplement with the last Number (July 19th). A COLOURED TITLE-PAGE may be had, gratis, on personal application at the Office. CLOTH CASES for Binding the Numbers are now ready, price 2s. 6d. each; also READING CASES (cloth), with straps, price 3s. 6d. each. THE FIFTY EIGHT VOLUMES of "The Builder" (bound), price Twelve Shillings and Sixpence, is now ready. SUBSCRIBER'S VOLUMES, on being sent to the Office, will be bound at a cost of 3s. 6d. each.

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, FARMERSHIP, APPRENTICESHIP, TRADE, AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under ..... 4s. 6d. Each additional line (about ten words) ..... 0s. 6d. Terms for Series of Trade Advertisements, also for Special Advertisements on front cover, Competition, Contracts, Sales by Auction &c. may be obtained on application to the Publisher. SITUATIONS WANTED. Four Lines (about fifty words) or under ..... 2s. 6d. Each additional line (about ten words) ..... 0s. 6d. PREPAYMENT IS ABSOLUTELY NECESSARY. \*Stamps must not be sent, but all small sums should be sent by Cash in Registered Letter or by Money Order, payable to the Publisher, Care of Mr. W. L. G. Lamb, 46, Catherine-street, W.C. DOUGLAS FOURBRAINER, Publisher.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY, but those intended for the front Page should be in by the same hour on WEDNESDAY.

SPECIAL ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE SAME DAY NOTICING.

The Publisher cannot be responsible for DRAWING, TESTING, MATERIALS, &c. let at the Office in reply to advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

PERSONS Advertising in "The Builder" may have Letters addressed to the Office, 46, Catherine-street, Covent Garden, W.C. free of charge. Letters will be forwarded if addressed to envelopes are sent, together with sufficient stamps to cover the postage.

AN EDITION Printed on THIN PAPER, for FOREIGN and COLONIAL CIRCULATION, is issued every week.

READING CASES.

By post (carefully packed), 1s.

### The London County Council Improvement Schemes.

It is stated briefly last week, in our usual report of the proceedings of the London County Council, the nature and localities of the street improvements which were recommended,

under circumstances then stated, by the Improvements Committee, and mentioned that the consideration of this report had been adjourned till the next (last Tuesday's) meeting. The results of the debate are given in our usual report in another column; but some of the circumstances of the debate seem to call for some further notice than a mere report.

The Improvements Committee seems to have been placed, it must be confessed, somewhat in the position of the knights-errant of old, who were ordered to—

"Ride abroad redressing human wrongs."

They have been commissioned to suggest improvements in London, and to bring up a schedule of those for which Parliamentary powers were necessary. It may be said that they have executed their task with judgment and moderation, and with a due regard to economy. They admit that there were a good many more schemes which they might well have suggested had not economy been a necessary element in their procedure; but they have endeavoured to distribute their favours equally between the various quarters of London; nor do they appear after all to have adopted the part of benefactor going about with offers of help to parishes in distress. On the contrary, most of their schemes were suggested, according to the Report, by applications from the districts concerned, and others were schemes which had previously formed part of the programme of the Metropolitan Board of Works, but had been for various reasons not carried into execution. They are all of the nature of street improvements, and though the Chairman of the Committee seemed to think that a little special pleading was necessary to prove that street improvements were a portion of the duty of a County Council, we do not know that it is likely that point will be contested. This function is in fact left to the Council as

a legacy from their predecessors, one of the complaints against whom was that they drew out various excellent schemes of street improvement which they never showed any disposition to carry out. The County Council has shown, in its formal procedure, a better spirit than this, for on Tuesday it passed all of these improvement schemes which there was time to discuss, viz., the first three; but that there was not time to dispose of more was due to a prolonged debate, the origin and temper of which were certainly not encouraging to those who look to the County Council as our main agent for the promotion of public improvements in London.

The improvements suggested by the Committee are not all of equal necessity or importance; but the first one on the list, the Isle of Dogs bridges and approaches, is perhaps the most important and the most obviously called for of all. The canal constructed by the Corporation of London in 1799 was taken over by the West India Dock Company and converted into a Dock, with a provision that the Company should construct and maintain bridges to accommodate the traffic. The traffic has long since swelled into proportions never contemplated at the time, and the narrow bridges then constructed are so totally inadequate for the traffic that it is stated (and not denied by the opponents of the measure) that there is a continual block, and that carts are frequently kept waiting half-an-hour for passage-way. When the Poplar District Board, two years ago, attempted to obtain a mandamus against the Dock Company to make bridges commensurate with the present traffic, it was held that the Dock Company were not legally liable for making provision further than was required for the traffic at the time of the original Act of 1799; a decision which, no doubt, we must accept as good in law, though it seems little in accordance with common sense or justice. The traffic is essentially a metropolitan one, and here is therefore created a state of obstruction which has long been a scandal. Yet in the face of this acknowledged state of things, a party of doctrinaires in the County Council moved to decline to receive the Report, on the ground that the incidence of the cost for such improvements must first be settled on a wider and what they considered a more equitable basis; in other words, that the principle of "betterment" should be accepted before any such schemes for local improvement were entertained. One member of this party or clique, at a later period in the

debate, had the good sense to protest against this system of obstruction, affirming that while it would be reasonable to adopt this view in regard to such large schemes as the Strand Improvement scheme, it was perfectly unreasonable to make use of it to block smaller measures of local improvement which were obviously of immediate necessity or value. But this gentleman was the Abdiel of his party, and spoke only for himself. With this exception, the whole opposition was carried on simply on the principle of opposing all votes for improvements until the betterment principle should be adopted. It is satisfactory to find that these obstructionists were in a minority; but the minority was a sufficiently numerous and pertinacious one to furnish the gravest apprehension as to the suitability of such a tribunal as this to legislate for metropolitan improvements. The proceedings during a portion of the debate were little less than disorderly, and it is painfully evident that a considerable proportion of members regard the Council as a debating society for the carrying on of a partisan warfare. It is not in this spirit that practical work of any value can be satisfactorily carried on; and it is to be hoped that those who have to elect representatives on the Council, if they really desire the practical work of the County of London to be efficiently carried on, will bear this in mind for the future, and consider the qualities of business ability and practical sense in a candidate, before the capability of making partisan orations.

The second scheme of the Improvements Committee arises naturally out of the first. It is of only partial benefit to provide for acceleration of traffic over the bridges unless an adequate connexion with the great main avenue of Commercial-road is provided. The application of the Limehouse District Board for a widening of Three Colt-street, which runs in a somewhat westerly direction towards Commercial-road, was condemned by the Council's Engineer on account of the tortuous nature of the street and the perception that the widening of its narrowest parts would not avail to render it a good main thoroughfare. It only required a glance at the plan hung up in the Council-chamber to appreciate the force of this objection. The Improvement Committee propose to provide a route in a more northerly direction, running in a straight line from the bridges up to Commercial-road, which requires a new road, 40 ft. wide, over a part only of the route, cutting at right-angles through two or three

streets which lie at right-angles to the line of the bridges. This would open a straight road to which the only objection, as against the Three Colt-street route, is that it falls into Commercial-street rather further eastwards, and as most of the traffic from the dock goes westward, it is argued that this is taking the traffic round the two shorter sides of an irregular triangle instead of reaching the same point along the longer side. This is a logical objection so far, but the nature of Three Colt-street, already referred to, is such as to overbalance the objection. The Limehouse District Board, however, which offered half the cost of the Three Colt-street route, has declined to contribute anything to the route proposed by the Improvement Committee. This seems to argue a want either of public spirit or of practical insight, and the decision arrived at by the Council, to confirm the scheme subject to the condition of the Limehouse Board contributing one-fourth of the cost, is a reasonable one, which we hope that Board, on further consideration, will see the wisdom of accepting.

Of the other schemes the Fortess-road one, also passed on Tuesday, is of less importance than the two just mentioned; at all events its importance is local rather than metropolitan. This may be said perhaps of the next scheme also, that of the road from Evelyn-street to Creek-road, Deptford; but that this latter is a much-needed local improvement is also manifest at once from the plan exhibited. It provides a straight road for main traffic on the line between London Bridge and Plumstead, through a kind of gridiron of narrow parallel streets placed obliquely across what should be the direct line, traffic having at present to go round two sides of the gridiron. The present arrangement of the streets is one which ought never to have been sanctioned at all. The Greenwich Board were willing to contribute 3,000*l.*, which the Improvement Committee deemed insufficient; and though the Southwark and Deptford Tramways Company, which would greatly benefit by the improvement, were willing to contribute 10,000*l.*, on condition of powers for certain extensions of their tramway system, it was judged better to leave them to deal with the local authorities. The recommendation now stands therefore, with the condition that the Greenwich Board contribute one-fourth of the cost.

The proposed Chelsea Embankment improvement consists in a proposal to carry the embankment westwards from Battersea Bridge to Lots-road, reclaiming from the river about  $3\frac{1}{2}$  acres of mud-banks, the state of which at low tide amounts to a nuisance. The opening of the new Battersea Bridge, which will require improved approaches, furnishes an additional reason for carrying out this improvement, which is a most desirable one. Another improvement which every Londoner has long known to be desirable, and indeed may be said to be a necessity, is the widening of High-street, Kensington. In regard to this the report says:—

"The widening of High-street, Kensington, was also one of the schemes included in the Bill of 1889. The scheme of the Metropolitan Board involved the demolition of all the buildings on the north side of the street, and on the east side of Church-street, at an estimated net cost of 163,000*l.* The subject of this improvement has engaged our attention on many occasions, and has led to considerable correspondence with the Vestry of Kensington. We have no doubt that the widening of this important thoroughfare is much needed. Several schemes have been considered by us, namely:—

1. That of the Metropolitan Board already indicated.
2. The same scheme, omitting Church-street and the corner public-house.
3. The setting back of the buildings on the south instead of the north side of the street.

We have given the preference to the last suggestion, for the reason that the property which would have to be acquired is less valuable than that on the opposite side of the street, and moreover the suggestion, if adopted, would straighten a considerable curve. It must be admitted that this does not complete the improvement, as for this purpose the buildings on the northern side of the street, from the public-house at the corner of Church-street to Brown's-buildings, would have to be set back.

The first section would effect a widening of from about 40 ft., the present width, to 60 ft.; the second section when undertaken would effect a widening of from 36 ft., the present width, to 60 ft. We limit our suggestion at present to the first section, because the property to be acquired is not unlikely to be soon superseded by a better class of buildings, hence the cost would be less now than at any future time, while most of the property on the north side comprised in the second section is of a better and more permanent character, and the risk of increased cost arising from delay is not so great. We would gladly urge the undertaking of the whole improvement at one time, but are deterred purely by financial considerations. The estimated net cost of the portion of the improvement now dealt with is 47,000*l.* Possibly a reconstruction of the street on both sides, providing a greatly-enlarged width of road with broad footways, would add to the attractiveness of Kensington, and also add sensibly to the Vestry's income from rates, and would therefore be a not unprofitable investment. But the Vestry declines to contribute even one-fourth of the net cost, or, indeed, anything, averring that the High-street is the main western road, and that, therefore, the widening of the same should be carried out as a metropolitan improvement. Many accidents occur in this thoroughfare, and for this reason we strongly recommend that the improvement, now suggested, be not postponed, provided the Vestry contributes one-fourth of the net cost."

There is something to be said, no doubt, for the contention of the Vestry that the road is a metropolitan highway, but there can be little question that they will benefit indirectly, if not directly, by its improvement at this point, and if the Vestry becomes convinced that the scheme for widening the road may, by their refusal to contribute, be adjourned *sine die*, it is not improbable that they will reconsider their position.

No unprejudiced critic will have read the report of the Improvements Committee without forming a very favourable idea of the business-like manner in which they have accomplished their task, and the general spirit of fairness which pervades it. The Committee has shown that it merits the confidence of the Council and of the public.

The election of Sir John Lubbock as Chairman of the County Council will probably be generally accepted as a satisfactory one; if there is any doubt in connexion with it, it may be as to his capacity for controlling and keeping to the point an assembly which has exhibited so decided a tendency to wander from business into desultory oratory. For an assembly which really meant business no one could be a better Chairman; but a strong hand is required for the position, and it is not often that we can expect to find a Chairman possessing that union of tact with firmness and decision which was so conspicuously exhibited by Lord Rosebery.

#### LINCOLNSHIRE.

THE recently-issued "Handbook to Lincolnshire"\* may be safely termed one of the very best of the whole series. It is no mere compilation from existing authorities, floated by a little superficial personal observation, but the work of a native of the county, who since leaving it for other duties has kept up his knowledge by frequent visits and by a diligent study of books and periodicals bearing upon its history and topography. The handbook is described by its author as "a careful digest of notes accumulated during several years," "the existing account of every place, wherever it was possible," having been "revised on the spot." From our own point of view the book possesses the great merit of exhibiting a thoroughly adequate knowledge of the architectural branch of the subject. The writer is well up in his subject and knows the meaning of terms, can distinguish between styles, and decide with general correctness as to the period of a building, and the accuracy of his descriptions may be safely trusted.

Non-architectural readers may, perhaps, complain of the large space devoted to the technical accounts of churches. Certainly if these were omitted, there would not be very much left.

\* Handbook for Lincolnshire, with Map and Plans. London: John Murray, Albemarle-street. 1890.

But it must be borne in mind that the churches, with the glorious Minster at their head, constitute the chief attraction of the county to an ordinary tourist. It is true that the popular estimate of Lincolnshire, as "all flats, fogs, and fens," is very far from being correct. The surface is far more undulating and the scenery pleasanter than strangers suppose. But even though those who travel through the country with unprejudiced eyes will probably accept the author's verdict that it is both "pleasant and interesting," though the "pretty bits" are somewhat sparsely scattered over a very wide area, and are hardly such as to invite visitors for their own sake. Its ecclesiastical architecture, in which it stands unrivalled among English counties, it must be confessed, is the chief attraction of Lincolnshire, and to this the handbook will prove a welcome and satisfactory guide. There is hardly a single church in the whole county, if there be one, which has not a word of notice, and that usually the result of personal observation; and even if it be described as "modern and uninteresting," the tourist may be grateful for being forewarned, and thus saved from a needless and disappointing expedition; while if he follows the directions given he will not be likely to pass over anything really deserving examination. The introductory sketch of the architecture of the county, Domestic as well as Ecclesiastical, is clear and full, and by its well-arranged subdivisions points out the leading examples in each of the successive styles, and thus presents a chronological *résumé* of the general subject of the greatest value, while the sections devoted to "Church Furniture," including tombs, brasses, fonts, stained glass, Easter sepulchres, bells, and the like, direct the student of any particular branch of ecclesiology to the objects of interest in his special line. The fine character of the "Towers and Spires" of the county warrant their occupying a separate section. The remarks here show much discrimination. The writer says, with perfect truth, that "in towers alone, without spires, although Boston 'Stump' and Lincoln 'Broad Tower' stand head and shoulders above any other western and central towers in England, Lincolnshire would have to yield at least to Somerset," to which we may add Dorsetshire. It is the spires which crown the towers that constitute the great glory of Lincolnshire. In this respect, as the handbook says, "Northamptonshire, which supplied most of the stone for the best work in both counties, is its chief rival." No spire, however, in that or any other county, with the single exception of that of Salisbury, which stands unquestionably pre-eminently, approaches anywhere near the two famous Lincolnshire spires of Louth and Grantham. Of these, as we are reminded by the handbook, the late Sir G. G. Scott gave the superiority to Grantham, ranking it as "second among English steeples." In this estimate we cannot agree. We must rank ourselves among those ("good critics" the handbook terms them) "who place Louth above Grantham for perfection of outline, even though its detail, from its late date—the steeple having been gradually erected by the parishioners in the first fifteen years of the sixteenth century—is 'far inferior.'" But though these two spires are so pre-eminently for loftiness and beauty, "it is not," as the Handbook remarks, "a case of the rest nowhere," since, even if Grantham and Louth were absent, this county would still possess some of the finest spires in England. In the Kesteven division, in the south-west of the county, especially their abundance and beauty is "most astonishing." Three of the oldest of these spires of Early English date, not "mere conical cappings" are found at Frampton, Raueby, and Sleaford, the last of which, having been injured by a storm, has been recently taken down and rebuilt stone for stone. At Long Sutton the tower and spire are justly described as "of almost unique value" as a perfect and unaltered example of an Early English design, all of one date, and of especial importance, as the late Mr. Edmund Sharpe has said, as "conveying an idea of the

anner in which many of the towers of our cathedrals and parish churches, now deprived of their spires, were originally finished." At Stamford two of its six churches, "five of them of considerable interest," have fine spires. That of All Saints is an excellent example of a Perpendicular design, all of one date, which, as the Handbook says, "affords an instructive comparison with the bolder and stronger work of an earlier date at St. Mary's." Here we have a broach spire of Early Decorated date, of stately beauty, crowning a noble western tower of the preceding style enriched with five tiers of arcading. At Ewerby also we have a very fine and lofty broach spire of the same style, which our author describes as "perhaps the best example of its kind in England." Among the crowd of spires, chiefly of Decorated date, which raise their heads around Sleaford, not one of which is overlooked, the "imposing" steeple at Helpringham, with its bold pinnacles and flying buttresses, that of Billingborough, "remarkably slender for its height and singularly plain," Heckington, "unusually severe for the date, and aiming at massive dignity, but somewhat injured by the great size of the pinnacles," and Silk Willoughby (deemed by Mr. Sharpe "an admirable model for a small parish church"), with a tower, "one of the best proportioned in the district," and a later spire, "good in outline though poor in detail," receive discriminating notice. We have not space simply to catalogue the spires belonging to the Decorated and Perpendicular styles noticed in the Handbook. Where so many are of beautiful proportions, it is perhaps unkind to refer to the failures, but the spires of Caythorpe, hadly rebuilt after being struck by lightning, and of excessive height and leanness, and its neighbour, Welbourne, may be mentioned as examples of an exaggerated "entasis." The last-named resembles an ill-grown cucumber.

Passing from the towers and spires to the character of the churches generally, we meet everywhere with the same evidence of careful examination and discrimination.

The fine character of the parish churches of Lincolnshire is proverbial; but, as the author of the Handbook reminds us, the same kind of blunder is made about them as about the supposed fenny character of Lincolnshire, by taking one portion—and that not the largest—for the whole. Lincolnshire, in fact, like Yorkshire, is three counties within one shire boundary, the architecture of which varies as much as does their soil and physical condition. These divisions, which go to make up the large county of Lincoln, are called "parts," though once, as in the still larger county of York, they were known as "thirdings" or "ridings." These "parts" are:— Lindsey, the northern division, which claims for its share more than half the county; Kesteven, in the south-west; and Holland, on the south-east, the smallest in area. The architectural richness of these parts is in inverse ratio to their size, Holland being far the richest, and Lindsey the poorest in the size and character of its churches. As our author says:—

"If Lindsey were a county by itself, it would rank below Norfolk, Suffolk, Yorkshire, and Devonshire, and perhaps some other counties, though it has one of the most beautiful spires in the world at Louth, and churches of great beauty or interest at Barton-on-Humber, Bottesford, Grimsby, Kirtlington-Lindsey, Stow, Tattershall, Theddinsthorpe, and many other places. Some of the earliest churches in the kingdom are found round Grimsby and Caistor. But in the whole central Wold district the churches are either very small and mean, or else have been recently rebuilt, so that the average of this great division is not very high."

In the division of Kesteven the churches are very numerous, and are remarkable for the excellence of their masonry, being built chiefly of the fine Ancaster stone, which lends itself to finely-wrought detail, and for the abundance and general beauty of outline of their spires, in which this district can only be rivalled by Northamptonshire and parts of Leicestershire. To quote the "Handbook"—

"The glorious churches of Grantham, Hecking-

ton, and Sleaford would alone be sufficient to raise any county into the first rank, but several others, such as Billingborough, Caythorpe, Claypole, Deeping St. James, Ewerby, Helpringham, Loddington, Navenby, and the principal churches of Stamford, are only a few from a list of public buildings. The finest churches of this division are mostly grouped around Sleaford, or near the line of the cliff from Grantham to Lincoln."

But the district on which Lincolnshire founds its reputation for magnificence of church architecture is the small south-eastern corner, the marsh and fen district, known as the parts of Holland, of which Boston and Spalding are the capitals, which, "curiously enough, has been taken as typical of the whole county for its churches, just as it has for its fens." These churches may be divided into three groups: 1. Those between Spalding and Long Sutton, including Weston St. Mary, Moulton, Whaplode, Holbeach, Fleet, Gedney, and Tydd St. Mary. 2. Those in the triangle formed by Spalding, Donington, and Boston, in which we may reckon Pinchbeck, Gosberton, Swineshead, Bicker, Algarthorpe, and others of almost equal beauty. And (3) the "fine outlying group" on the pebbles of Holland which jut into Lindsey,—a dried-up channel of the Witham, running northwards, having been the original boundary—which embraces Skirbeck, Fishtoft, Freiston, Lecke, Wrangle, &c. Our attention is here justly called to the fact that these magnificent and spacious edifices occur in a district which is completely destitute of building stone of any description whatsoever. And, strange as it may appear, it is to this absence of native building material that their splendid character is due. The most accessible stone quarries were those of the Barnack oolite, a building stone almost unsurpassed in England for fineness of grain and durability, with which the "gotes" and "drains" which intersect the fens afforded easy and inexpensive water-communication. But, as the author says, it is not easy to assign an altogether satisfactory cause for the marvellous size and beauty of these fen churches, most of which must have always been far in excess of the needs of the population of the parishes. The most probable cause is conventual and parochial emulation. "In the line of churches between Spalding and Sutton Bridge there seems to have been a decided rivalry between the monastic houses of Crowland, Spalding, and Castle Acre, and the example once set was contagious to local patriotism." The noble church of Holbeach—which the author of the Handbook, although he allows it a place "in the front rank" as "an admirably complete specimen of the very latest period of flamboyant Decorated, gradually merging into Perpendicular," unduly depreciates as "a failure in the bold attempt to rival Boston"—probably owes its erection to the Bishops of Lincoln, towards the sustentation of whose table its revenues had been granted by the Pope, with the proviso, in December, 1340, that the Bishop was to completely rebuild the chancel *de novo*. The nave, with its wondrously tall and graceful arcade, is of the same date and design as the chancel. We can hardly be wrong in assigning the completion of the church to the same munificent benefactor. Fleet and Long Sutton may be ascribed to the Cistercians of Castle Acre, to whom they belonged (this connexion is overlooked in the Handbook in the case of Fleet), while Whaplode and Gedney were connected with the great Benedictine Abbey of Crowland, and Moulton, Weston and Pinchbeck with the neighbouring Benedictine house of Spalding. The rivalry of the great Monastic houses in church building is thus described by Mr. W. E. Foster, in his excellent little history of Whaplode Church, recently published (p. 8), "No sooner had Crowland erected a stone church at Whaplode than Spalding, probably aware of the beauty of the new fabric compared with their then small Saxon church at Moulton, took in hand the present church. Next Gedney was rebuilt by Crowland, then Weston and Pinchbeck and the parish church at Spalding by Spalding." The same writer continues (p. 28):

"Thus began a church building rivalry that

gave to the fen country its beautiful churches, built by funds raised by the various abbeys from their own estates and the gifts of various laymen."

No county probably contains so many examples as Lincolnshire of what the Handbook terms "primitive Romanesque or so-called Saxon." Of these, which are scattered widely over the county from Barton-on-Humber—the best known and most characteristic example—on the north to Little Bytham in the extreme south, and from Wath and Stow on the east to Hough-on-the-Hill on its western boundary, the Handbook provides accurate and intelligent descriptions. Long-and-short work is found in a considerable number of churches, usually at the eastern and western angles of the nave, testifying to the early date of the original fabric; but in Lincolnshire as elsewhere the towers constitute the principal structural remains of this early period. These are by no means infrequent, especially in the parts of Lindsey which, as the Handbook says, "is remarkable for the great number of towers which retain the primitive unbuttressed style, with mid-wall shafts." These chiefly occur in groups: one near Grimsby, a second near Caistor, and a third near Gainsborough; besides which, isolated examples are found in almost every part of the county. Barton-on-Humber is the only tower which exhibits the "stone carpentry," as it has been called, dividing the rubble faces of the tower into rude panels by strips of masonry, which we see in still more remarkable distinctness in its Northamptonshire namesake, Earls Barton, and at Barnack in the same county. The Lincolnshire towers are usually distinguished from later work merely by their tall, unbuttressed outline, the rudeness of the masonry of the walls, and the stonework of the doors and windows, and, when their top-most story has been preserved, by the coupled windows, with mid-wall shafts, of the belfreys. Two of these towers, Hough-on-the-Hill and Broughton, are remarkable for a semicircular or segmental turret projecting from the west face, similar to that at Brixworth. These turrets now contain spiral stairs, and this was probably their ancient purpose, the steps being then of wood, not of stone. In the Handbook, however, it is suggested that they were originally western apses, the stair being a later intrusion, and that the basement of the tower, with a supposed eastern apse (not an ordinary form in these early churches, which were usually square-ended) "formed the whole of the original church." The same interpretation is suggested, even more confidently, for the rectangular narthex projecting from the west face of the tower at Barton, as at Barnack, and "there can be little doubt that the base of the tower, with its projections east and north, formed the original church." The immense disproportion between the tower and the rest of the church such an idea involves would seem an almost sufficient answer to this suggestion. The church would have been nearly all tower. But a still more complete refutation is afforded by the many instances in which the long-and-short work existing at the angles of the nave, as at the south-west angle at Branston, and which is still more conclusive, at the north-east and south-east angle, as at Cranwell, Little Bytham, St. Benedict's at Cambridge, and many other places, indicates the dimensions of the original fabric, and proves that they were, in the main, the same with those of the later church. The rectangular annexes at Barton and Barnack were more probably of the nature of a porch, and were employed, as we know porches were in early ages, for many purposes: partly ritual, *e.g.*, the early part of the marriage service; partly judicial, as the south porch of the original cathedral at Canterbury was; and partly educational. The two Lincoln towers which Mr. E. A. Freeman has made so famous, and from which he has drawn such brilliant historical conclusions in connexion with the Conqueror's grant to Colswegen, find their due place in the Handbook, but with a

cautionary proviso. Nothing can rob these towers of their architectural interest, but their historical importance has been lately somewhat lessened by the documentary evidence which points to the churches mentioned in Domesday having been in another locality. "It is extremely doubtful, however," says the Handbook, "whether these two are really the Churches of Colswegen, and not rather two destroyed churches, St. Peter ad Fontem and St. Austin in Baggholm, on the east side of the city and on the northern bank of the river."

The course of our remarks having brought us to Lincoln, we may mention with high praise the account given of that most interesting historic city, and its almost unrivalled Cathedral. The whole occupies more than thirty double-columned pages, of which the survey of the Minster (illustrated by an excellent plan) occupies one and twenty. This latter the author states to be "based upon" that in Murray's Cathedrals, "somewhat shortened and simplified, and carefully revised to the present date." In its clearness and accuracy it leaves nothing to be desired. The author is deservedly severe on the "scraping and clumsy recutting" which eight and twenty years ago destroyed the authenticity of the west front, especially of the great doorways, which are now, to a great extent, substantially modern works. We observe also that he repudiates Mr. E. Sharpe's extraordinary notion that Remigius originally planned his Cathedral for a single western tower as at Ely. The "general and most probable opinion" that he planned two is, without doubt, correct, and it may be regarded as certain that "the foundations of the existing towers are of original work." When describing the Bishop's Palace, the author deservedly censures the "blank and featureless" character of the high wall with which Messrs. Bodley & Garner have deformed the otherwise beautiful chapel they have formed out of the remains of the domestic offices and the solar of St. Hugh's Hall. It is strange, indeed, both that such a blot should have been admitted by the designer, and stranger still that its execution should have been allowed by his employers. But architects are sometimes willful folk, and expect their "clients" to bow to their decisions, however contrary to their own wishes. The "possible restoration of the Great Hall" which is suggested as a justification of this blank wall, is, we imagine, a far-distant event, if it ever comes to pass. The present generation, and probably some successive generations, will continue to have their eyes offended by a piece of obtrusive ugliness.

Every part of this excellent and well-arranged Handbook furnishes material for observation, but our limits forbid our extending our notice any further. We must conclude by once more commending the volume to our readers, as one of the very best architectural handbooks to any part of England we have ever come across. Not that its merits are exclusively confined to that particular province; history, archaeology, geology, and the other necessary departments of a handbook, all receive their proper notice. But it is this division which chiefly concerns the *Builder*, and to this, therefore, we have confined our remarks.

We should add that the Handbook is furnished with a very complete index, and is illustrated with a good map and some plans. The latter might, with advantage, have been more numerous. Small plans of Grantham, Boston, and other large towns, and of some of the larger churches—Spalding is the only parish church thus honoured—would have been a welcome assistance to visitors.

#### ARCHAEOLOGICAL SOCIETIES.

We are obliged to defer till next week, for want of space, some account of the meeting of the Kent Archaeological Society, which took place at Canterbury on Monday and Tuesday last, and of the Bristol and Gloucestershire Archaeological Society, which was held at Bristol during this week.

#### NOTES.

NO one would expect that Lord Bramwell's opposition to the second reading of the "London Streets (Removal of Gates) Bill" should be successful in leading to the throwing out of the Bill, but it appears to have had at least this just measure of success, that it has led to some kind of admission from Lord Salisbury that compensation ought to be made to those whose interests were injuriously affected by the removal of the gates referred to. While admitting that whenever he drove to the Great Northern Station he found himself uttering imprecations against "those sacred gates," Lord Salisbury admitted that their lordships would have no right to authorise changes being made in the management of the traffic of the metropolis, which would bring traffic past houses that had hitherto been free from it, without directing compensation to be made. That is all that any reasonable person can want. It is for the interests of the greatest number that the barriers in the Bloomsbury district, at any rate (being on the main route to three large railway stations), should be removed, but it is unquestionable that the few to whom the change would bring a nuisance from which they had been hitherto free, have a moral if not a legal claim to compensation. There is no doubt that the residential character of some streets, and their desirability as places of abode, would be entirely altered by the change.

IT is well that the question of London water supply is being again stirred up. It is true that at the best a considerable time must elapse before any comprehensive scheme for supplying London from a new source and under a central controlling body can be elaborated and brought into action, but the sooner discontent with the present system is brought to a climax the sooner shall we arrive at the ultimate remedy. Not that it would be fair or just to complain of the quality of the present water supply of London in a general way; it is really a wonderfully good one considering how it is obtained and under what interests it is administered; but these questions of source and administration are just the essence of the subject. The drain from the Thames is already injurious to the river, and it must increase if the water companies are to meet increasing demands from this source; apart from the question whether an open watercourse is the best place to look for uncontaminated water. As to the despotic powers of the water companies over the consumers, and the injustice to the latter from this cause, there are no two opinions outside the water companies and their shareholders. As to the unsatisfactory nature of the present sources of supply there is less general conviction, because it is a subject less generally understood than the levying of rates, and does not "come home to men's business and bosoms" in the same manner; but a very few years more of draining the Thames for water supply will probably bring it home to every one in an unmistakable manner.

WE are entirely in sympathy with much that has been recently said, in more than one quarter, as to the desirability of having a gallery of national art, and also as to the undesirability of making such a collection a mere appanage of the South Kensington Museum, which was instituted for other purposes than that, though a considerable portion of its upstairs galleries is, as a matter of fact, at present filled with a rather heterogeneous collection of English paintings. Mr. Agnew's suggestion of the Kew Palace site is rather doubtful; it is not central enough; but wherever the site may be, why is it to be taken as agreed in advance that we are to have "well-built but simple galleries"? That is to say, an economical building, as cheap as can be had consistently with solid construction. That is too typical an example of the way in which such things are always regarded in England. If people are generous

enough to give pictures to the nation in large numbers, we must probably build a gallery for them; but no extravagance if you please, do not let us attempt an architectural gallery; something "simple"; plain brick walls and a skylight. That is not our idea. A collection of national art should be housed in a manner worthy of the nation, should itself add something to the national architecture. We do not want a building "suitable but plain"; we want a building suitable and noble, without which latter characteristic, indeed, it could not be said to be in the highest sense "suitable" for such an object.

THE Report of the Health of Liverpool in 1889, by Dr. Stopford Taylor, the Medical Officer of Health for the City and Port, draws attention to two important points in regard to sanitary conditions as considered from our point of view. One of these is the injurious effect on the city generally of the great growth and increase of population in what were a few years ago the rural suburbs of the city, but which are now converted into urban districts on the north and south. "This pushing back of the country," says the Report, "from its proximity to the city boundaries, deprives the inhabitants of the inestimable advantages of the healthful breezes so requisite for life, for the pure air cannot gain access to the city without being more or less polluted and devitalised by passing through large masses of population." It is impossible to see how this can be prevented; all that can be suggested is that it renders it still more necessary to continue every effort for the removal of nuisances and the extension of sanitary measures. In regard to the scavenging question, we find on another page a note as to the difficulty of securing frequent removal of domestic refuse, and the difficulty also of knowing where to put it when removed. Have the Corporation authorities given any consideration to the "destructor" system? The other important danger is one with which it ought to be possible to cope, viz. deficiency of hospital accommodation. This was severely felt, it appears, during "the usual increase of scarlatina and typhoid" in the autumnal months. "If," it is added, "we should be visited by an outbreak of epidemic disease, it would be, so far as hospital accommodation is concerned, quite impossible to control it, and the outlook is a most serious one for the health of the community." This is a grave warning, and it is to be hoped the Liverpool City Authorities will not neglect it. We find another significant item in the Report, page 47, as to the neighbourhoods where there was a series of courts from 7 to 11 ft. wide, with back-to-back houses, each house being a *cul-de-sac* within a *cul-de-sac*, "and a common offensive atmosphere pervaded the three rooms into which each house was divided." The average death-rate for three years in this neighbourhood is 46.5 per 1,000, the average of Liverpool being 23.7. The houses have been reported as unfit for human habitation, but we do not read that they have been demolished. A map of Liverpool is appended to the Report, showing by red and blue dots the number of deaths in the year from typhoid and typhus respectively. The position and grouping of these fatal dots ought to be matter of interest to those who are concerned in maintaining the health standard of Liverpool, not too high as it is.

WE observe that on the select committee to consider the Richmond Foot-bridge and Lock Bill, Mr. Moor, the Engineer to the Conservators of the Thames, gave evidence to the effect that any improvement in the river at Richmond by this means would be at the expense of the river below Richmond, which would be silted up by impeding the flow of the tide. Mr. Mansergh followed with the statement that it would undo the work done by dredging for the last eighteen years. We fear this is the truth, and that the prospects for Richmond are poor. Its inhabitants must look forward to improvement when a

contains additional book-store, bookbinding-room, and heating chamber, and has an approach from the yard on the west side.

The first-floor shows reference library at back, with a staircase for attendants in the west angle, communicating with the lending library. A book-store is placed over news- and magazine-rooms, adjoining the latter, whilst the ladies' reading-room is placed over entrance vestibule, with balcony over the porch, and a separate lavatory adjacent.

A spacious drawing-room for librarian occupies the south-west corner, and is lighted from the front.

The front block is carried up to a second floor, to provide dining-room, kitchen, and three bedrooms, to complete the librarian's residence.

The description of the building submitted by the author not being available for perusal, we assume that the elevations are intended to be executed in red brick and stone dressings. The elevations are pleasing on the whole, though the attenuated columns of Ionic character on each side of the entrance are somewhat open to criticism.

The first-premiated design, prepared by Mr. W. L. Bernard, of Bristol, certainly deserves the position it occupies. It has the peculiarity of having been designed with a view to the economical employment of female attendants.

A central entrance from Spa-road leads direct to the lending library, occupying a position at the back. The lighting of this room is by windows on the north and west walls, which do not abut on the boundary. The east wall adjoins on the boundary, but has no windows.

On the left of the entrance the news-room is placed with access from the lending library, and similar access is provided to the magazine-room, placed on the right side of the entrance.

A private entrance to the librarian's apartments in the centre of east boundary is reached from Spa-road by a colonnade adjoining the magazine-room. The librarian's room adjoins the entrance and occupies the corner space on this side of the site.

The reference-library, book-store, and ladies' reading-room occupy the first-floor, whilst the second-floor is devoted to librarian's quarters, which somewhat lack convenience of arrangement.

Mr. Henry T. Hare is the author of the design which receives the second premium.

This design differs from others in several respects. The ladies' reading-room has been placed on the right of entrance, facing Spa-road, with news-room behind, magazine on left of entrance, and librarian's room adjacent. The lighting of the lending library has been effected by windows placed in the side walls, which are set back from the boundary.

The first floor accommodates book-store, reference library, and librarian's principal rooms; but the two unlighted store-rooms in the centre of the building are hardly required, and the kitchen quarters might have been extended with advantage.

The front elevation of this design is pleasing, but the side elevation does not maintain its promise.

The third premium has been allotted to Mr. James Broadbent, of Manchester. This plan shows windows overlooking the Town-hall premises, the librarian's entrance also opening directly on to these premises.

It is difficult to understand how the Commissioners reconcile these points in the design with their printed conditions, or with their award of the third premium.

There are several designs unnoticed which show evidence of very careful consideration of the peculiarities of the site, and of much merit; and we consider that one, at least, of the premiums might have been otherwise awarded with a greater show of fairness.

**PARK AREA OF THE CITY OF NEW YORK.**—The Park Board furnished the Census Bureau on June 20 with the following statistics regarding the City parks:—The total number of parks is placed at fifty. Forty-eight of this number, with an area of 3,306 acres, are within the City limits. The area of water in the Central Park is 43 acres, and in the new parks 1,148 acres. The land for the Central Park cost 5,028,854 dols. 10 cents.; for Riverside Park, 6,173,621 dols. 80 cents.; for Morrisburg Park, 1,674,385 dols. 40 cents. The length of park roads is 33 miles. The average maintenance for the past ten years was 609,603 dols. per year.

**ELECTRO-DEPOSITED COPPER.**—Owing to pressure on our space we are compelled to defer to next week the promised article on this process.

## THE ARCHEOLOGICAL CONGRESS AT OXFORD.

[CONCLUDED.]

ON Friday morning, soon after breakfast, the archeologists were off by train to Witney, and on arriving they made their way on foot to the parish church, dedicated to the Holy Trinity, which they inspected, and the lending features of which were explained by the Vicar, the Rev. W. F. Norris. Its beautiful central tower and lofty spire were much admired, as was the size of the transepts, which offers a striking contrast to the small dimensions of the Early English chancel. The tower also is of the same period, the north transept is mainly decorated, while the clearstory and western door are both of Perpendicular date. The party also took a hasty glance at the Market Cross, which was erected towards the end of the reign of Charles II., and at the old "College," which is said to have been built during a visitation of the Plague for the benefit of the Scholars of Corpus Christi College, Oxford, to whom it still belongs.

The name of the town of Witney (Witan-eye) is of historic interest, as marking one of the places where in the Saxon days the Witan or wise men were called by the King to sit in council, foreshadowing our more modern Parliaments. A century or more ago Witney was one of the chief seats of the blanket manufacture, the water of the river Windrush, on the banks of which it stands, being celebrated for some sulphurous properties which give the blankets a peculiar whiteness. But of late years this manufacture has decreased, owing to the rise of our northern centres of industry, as is shown by the deserted Hall of the Old Blanket-makers' Company, which was built as recently as the year 1721.

After leaving Witney, the party drove on through a dreary open country to Minister Lovel, with its picturesque church, and the ruins of its venerable Priory close by. Here was the seat of the ancient family of Lord Lovel, built about A.D. 1400. The estate was formerly called simply Minister; and the chief buildings, which still remain, are the ruins of the old hall, with a deeply moulded and groined Gothic porch, and some other interesting details, mostly of the Perpendicular style. But both these ruins and the picturesque church the party were forced to inspect hurriedly, having to make their way on to Burford.

The parish church of Burford, dedicated to St. John the Baptist, stands on the banks of the Windrush, close to the ancient stone bridge by which that river is crossed. It has a central tower of Norman date; but throughout the building Perpendicular work is curiously intermingled. The fan tracery of the south porch is much admired, and so are the "parvise" over the porch, and the monuments in the north and south aisles and other parts, including one to Sir Lawrence de Tanfield, whose daughter was the wife of the gallant Lord Falkland, who fell on the battle-field of Newbury.

The party also inspected the picturesque Priory, once belonging to the Hospitaller Order of St. John, and afterwards the property and residence of the celebrated Speaker Lenthall, to whom it was granted by the Long Parliament, and who made it his residence for many years.

A carriage drive to Shipton, or, as it is here styled, Shipton-under-Wychwood (where are a fine Early English parish church and the remains of a small religious house), brought the archeologists back to the railway, where they were fortunately timed to catch the afternoon train back to Oxford, which they reached about five p.m.

At the evening meeting, which was held, as usual, in the New Examination Schools, Mr. A. J. Butler, M.A., of Brasenose College, in the chair, two papers were read; the former, by Mr. J. Park Harrison, M.A., on "The Saxon Church of St. Leonard's, at Wallingford," and the other by Mr. W. De Gray Birch, F.S.A., on "The Isis as it appears in the Saxon Charters."

The last-named paper, raising as it did some curious etymological questions, was followed by an animated discussion, in which the Chairman, Mr. Bruton, Mr. Laxton, Mr. Walford, Mr. Wright, and Mr. De Gray Birch took part. Just before the close of the proceedings Mr. Butler exhibited the original emblem of the nose of brass, or bronze, which gave its name to Brasenose College, and which had been lost sight of for the last 400 years or more, having been affixed to the wall of a house at Stamford, which was used by the members of the College

for some two or three years, when they made a "secession" thither from Oxford, either on account of a visitation of the Plague or "Black Death," or, as others are more inclined to believe, on account of a prolonged quarrel between the Oxford scholars who lived to the north of the Trent and the "Southerners."

Be this as it may, however, one thing is certain, namely, that only the week before last the very treasure was recovered by the College and brought back to Oxford. It was considered by Mr. Cope, and by other gentlemen who had special knowledge of antiquities, to be of ancient Italian, and probably Venetian, workmanship; and very possibly before the end of the long vacation it will once more adorn the gateway of the venerable College to which it gave its name. Doubtless, when the College was only an "inn" or "hostelry" the brass-nose (*Aeneas Nasus*) served as a sign; assuming this supposition to be true in fact, in all probability the object exhibited by Mr. Butler is the very best inn sign now existing in England; and if so, then probably there is no foundation for the common idea that the College was so called because it covers the site of the Brasinium, or royal "brusing" or "brewing" house, once attached to the hall. In the course of the discussion which followed, Mr. Walford raised this very question, and elicited from the Chairman the reply that, so far as the records of the College showed, there was no ground for supposing that any portion of its site was ever used as a brew-house, either royal or collegiate.

Saturday was devoted to a long drive to Dorchester and Ewelme, returning by way of Wallingford and Nuneaton. It is needless to say that the party were very grateful to the Vicar of Dorchester Abbey Church, the Rev. Mr. Poyntz, for an admirable paper on its fabric, its history, and its modern restoration, which he read to them when they were assembled in the church; nor is it needful to say how much the Early English windows, especially those of the north aisle, were admired. The celebrated "Jesse" window in the chancel was pointed out, and the Norman font of lead, and the monuments of knights, judges, and churchmen, mostly of the Decorated or Edwardian era. The original church of St. Peter and St. Paul at Dorchester was founded in the seventh century by St. Birinus, who made it an Episcopal See; but after the Norman conquest, St. Remigius, its then occupant, removed it to Lincoln. It was a thousand years ago the largest See in all England, including as it did many if not most of the counties now included in the dioceses of Winchester, Salisbury, Oxford, Lichfield, and Worcester. The Manor House to the north of the Abbey Church, and a fine range of ancient monastic barns, were pointed out and described.

From Dorchester a drive of three miles took the party on to Ewelme, where they were shown the fine Perpendicular parish church, with its almshouse or hospital, and grammar school attached. It is a sister church to that of Wingfield" in Suffolk, and was built by members of the same family. Here Sir Henry W. Acland explained the history and leading features of the fabric, and pointed out the very fine tombs of the De la Poles, Dukes of Suffolk, which divide the chancel from the southern aisle. One of the altar tombs (which, by the way, are all kept in the most perfect condition) commemorates Thomas Chaucer, a son of the poet; it is dated 1435, and from its numerous quarterings is well known to every student of heraldry. The tomb of the Duchess of Suffolk represents that lady with the insignia of the Order of the Garter. Many of the archeologists saw, or thought that they saw, in the Hospital of God's House, adjoining the western tower of the church, a very strong likeness to Lord Leicester's hospital at Warwick. Of the once royal palace of Ewelme very few traces remain, and these there was not time to inspect.

From Ewelme the party drove past Crowmarsh, with its fine Norman doorway, to Wallingford, where they made a hasty inspection of St. Leonard's Church and the grass-grown remains of the once extensive town walls; and were received at the Castle by Mr. J. K. Hedges, who read to them, when assembled on the mound, or mount, in his garden, a short paper on the antiquities of the Place.

They afterwards drove along the Berkshire side of the river through Brightwell, past the Romano-British encampment of Shinodun, and

\* Visited during the Yarmouth Congress of the Association about eight years ago.

so, by way of Little Wittenham, to Clifton Hampden, where they crossed by the new bridge, and then drove through Nuneham Park back to Oxford, which they reached an hour or so after their proper time.

In the evening the usual "official" meeting was held at the Town-hall, when the Mayor and Corporation exhibited their charters, which are very ancient and very fine, though not in the best of preservation, and also the city mace and a collection of gold and silver plate. The charters were explained at considerable length by the Rev. Mr. Ogle and by Mr. De Gray Birch, who drew attention to the sad condition of the seals attached to them; and the mace and plate were made the subject of some remarks by Mr. George Lambart, F.S.A., who stated that they are probably the finest belonging to any city in England, except London and Southampton.

Sunday (the 13th) was a *dies non*; but Monday and Tuesday were utilised as two "extra days," which were devoted to an inspection of some of the colleges and public buildings of Oxford and its neighbourhood, which had been omitted in their peregrinations in the previous week. Early on Monday they assembled in the Hall of Queen's College, when Mr. Madan, one of the resident Fellows, showed them over the chapel, library, and common room, and explained the fine collection of portraits for which the place is so famous. The college plate, including its fine trumpet and historic drinking-horn and goblets, was placed on the table for inspection, and it was made the subject of a few remarks by Mr. G. Lambart. At Corpus Christi College, which was visited next in order, the party was received by the President, Dr. Fowler, who exhibited a variety of treasures belonging to, or connected with, the founder, Bishop Fox, who established the College in the reign of Henry VIII. as a home of the "new learning" which came in along with the dawn of the Reformation and, under the auspices of Erasmus and Dean Colet, gradually superseded the old Latin curriculum. In this hall some of the earliest of the lectures of Ludovicus Vives and of other University professors were delivered in the presence of Royalty, the founder being not only a Bishop, but a favourite at Court, and an able diplomatist. Among the other articles exhibited were the golden crozier of Bishop Fox, and the ancient pisen and chalice, both of gold, which he used in saying mass, and some very beautiful gold tablespoons of early date. From Corpus Christi College the party went, past Oriel College, to the University Church of St. Mary's, where the vicar, the Rev. E. S. Foulkes, explained to them its history, pointing out its south porch, on which the statue of the Virgin with the child Jesus in her arms, was erected under the auspices of Archbishop Laud, and in the inside of which porch was the old parvium or parvise, where the first University Library was housed, and where the first University examinations were held. He also showed the spots where Cranmer, Latimer, and Ridley were tried for heresy, and where the former stood on a platform, to be abused publicly by the preacher, Dr. Cox, from the University pulpit. He also pointed out in detail the exquisite sculpture at the juncture of the tower with the spire externally, illustrative of the history of St. Hugh of Lincoln.

After luncheon the party visited Wadham College, a post-Reformation foundation, with a handsome hall, chapel, and garden; these were explained briefly by Mr. E. Walford. Lastly they visited St. John's College, where they were shown over the library, hall, chapel, and gardens, by one of the Fellows, Mr. Bidder, who exhibited to them the MS. diary of Archbishop Laud, formerly president of the college, the skull-cap which he wore when he was beheaded, and the walking-staff with which he supported himself on approaching the scaffold. Mr. Bidder afterwards gave a brief history of the College buildings.

On Tuesday, the weather being fine, the Archaeologists drove out to Stanton Harcourt, where they were shown over the mansion once inhabited by Pope, and in the tower of which he translated, at all events, one of the books of Homer's "Iliad." They also inspected the great kitchen, almost as fine as the well-known specimen of a kitchen at Glastonbury Abbey. On their way they stopped for a short time at Cumnor, where they saw the "Bear and Ragged Staff" inn, and the site of the old hall in which Amy Robsart met her death. In the parish church also they inspected the tomb of her supposed murderer, Anthony Foster, who is

immortalised by Sir Walter Scott in "Kenilworth." They drove, by way of Eynham, across to Abingdon, where they made a hasty inspection of its two churches and of the scanty remains of its once great Abbey, now embodied in Messrs. Morrell's brewery, whence they returned, by way of Badley and Kennington, to Oxford. In the evening, Mr. E. Walford read before the party a paper on "Oxford in the Olden Days," and with that the work of the Congress was at an end. On Wednesday they went by steamer down the Thames to Reading, where the party broke up after a fairly successful Congress, but one which would have been still more successful had its programme been issued at an earlier date.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of this Council was held on Tuesday last, Mr. Haggis, the Deputy-Chairman, presiding.

The first business dealt with was the election of a new Chairman in the place of Lord Rosebery, resigned. Mr. Martineau moved, seconded by Mr. Fardell, that Sir John Lubbock, the Vice-Chairman, be elected Chairman of the Council. A division being taken, the motion was agreed to by 61 votes to 28.

**Superannuation.**—The adjourned report of the Standing Committee with reference to a scheme of superannuation, sick pay, and compassionate allowances for the employés of the Council was discussed, and it was resolved "That the Council do apply in its next General Powers Bill for power to establish a superannuation and provident fund for its employés, and that it be referred to the Parliamentary Committee to take the necessary measures for this purpose." The details of the scheme and consideration of the rest of the report were postponed.

**Public Improvements.**—The adjourned report of the Improvements Committee was then taken, embodying proposals for nine important improvements, as follows:—Isle of Dogs bridges and approaches; for a new street from West India Dock to Bridge-road; Fortress-road, Kentish-town; Evelyn-street to Creek-road, Kewford; Chelsea Embankment extension; Dalham-palace-road and Queen-street, Hammersmith; High-street, Kensington; St. George's-place, Knightsbridge; and the Albert-embankment, Vauxhall. Only the first three of these suggested improvements were dealt with, owing to a lengthy debate consequent upon the important nature of the proposals. With regard to the suggested improvement of the Isle of Dogs bridges and approaches, the report stated that the bridges form the only means of access to the West India and Millwall Docks, and the river frontage of the Isle of Dogs. The traffic, which is for the most part metropolitan, consisting chiefly of heavily-laden wagons and trolleys going to and from the docks, is considerable, while the bridges provide for only one line of vehicles at a time, and consequently the blocks are frequent and the detentions very serious. The four bridges referred to are the following:—(A) The Preston's-road bridge, which crosses the entrance to the West India Dock basin, and forms a means of communication between Preston's-road and New-road. The bridge has a clear width of road of 8 ft. 5 in. only, the width of the footway on the river side being 2 ft. 2 in., and on the dock side 1 ft. 1 in. The approach to the bridge on the north of Preston's-road side is nearly at right angles to the bridge, and has a gradient of 1 in 36. The approach on the south side has a similar gradient. It is proposed to reconstruct the bridge so as to provide a carriageway 18 ft. wide, and two footways, each 5 ft. wide, and to improve the gradients of the approaches, at a total estimated cost of 9,550*l.* (B) Limehouse-bridge, which crosses the Limehouse entrance to the West India Docks at Bridge-road. It has a clear width of road of 9 ft. 9 in., the width of the footway on the river side being 5 ft. 7 in., and on the dock side 21 in. The approach to the bridge on the Limehouse side has a gradient of 1 in 21 for a length of 85 yards. The approach on the West Ferry-road side has a gradient of 1 in 40. It is proposed to reconstruct the bridge so as to provide a carriageway 18 ft. wide, and two footways, each 5 ft. wide, and to improve the gradients of the approaches, at a total estimated cost of 7,550*l.* (C) City Arms-bridge, which crosses the western entrance to the South Dock, and connects Bridge-road with Ord-

street. It has a clear width of road of 7 ft. 9 in., the width of the footway on the river side being 2 ft. 8 in., and on the dock side 5 ft. 9 in. The approach to the bridge on the north or Limehouse side has a gradient of 1 in 25 for a length of 36 yards, the approach on the south side having a gradient of 1 in 19 for a length of 36 yards. It is proposed to reconstruct the bridge so as to provide a carriageway 18 ft. wide, and two footways, each 5 ft. wide, and to improve the gradients of the approaches, at a total estimated cost of 7,750*l.* (D) West India Dock-road entrance (north end of East Ferry-road) bridge, which crosses the Blackwall entrance to the South Export Dock, and unites New-road with Manchester-road. It has a clear width of road of 8 ft. 3 in., the width of the footway on either side being 2 ft. 10 in. The gradient of the approaches is, on the south side, 1 in 40, and on the north side 1 in 39. It is proposed to reconstruct the bridge so as to provide a carriageway 18 ft. wide and two footways each 5 ft. wide, and to improve the gradients of the approaches, at a total estimated cost of 8,050*l.* The Engineer of the Council recommends that all the bridges shall be swing bridges. The Poplar District Board has expressed its willingness to contribute 10,000*l.* towards the cost of improving the bridges and approaches, such cost being estimated at 33,500*l.*, and the London and India Docks Joint Committee have agreed, but on nine conditions, mostly to the effect that the County Council should bear all the expenses of the improvement.

The Committee recommended that subject to the Dock Committee signing an agreement embodying those conditions, and subject to a contribution of 10,000*l.* by the Poplar District Board, powers be sought in the next session of Parliament to enable the Council to reconstruct the foregoing bridges and to improve the approaches thereto.

Mr. Clarke, the Chairman of the Improvements Committee, in moving that the report be received, said that the money which the Committee suggested spending was only 280,117*l.*, which represented a charge on the rates of one-tenth of a penny for the first year, diminishing annually. He urged the Council to consider each improvement on its merits.

Mr. Carr-Gomm moved that the Council should not receive the report, as it would be a waste of time to discuss the proposals of the Committee. If the Council agreed to the proposals, and the matter were given into the hands of a Parliamentary Committee, they, in embodying the proposals in a Bill, would add schemes of betterment and areas of influence, with the result that the Bill would be thrown out after a good deal of expense had been incurred.

Mr. Hubbard seconded, and said that he would oppose all improvements until they could get the money from others than the occupiers. Mr. Lidgett protested against the endeavour which was being made to waste the time of the Improvements Committee which had spent over twelve months in considering the question of the improvement of the neighbourhoods mentioned. It was a matter in which a large number of the people of London were interested.

A division was then taken when the numbers were:—For receiving the report, 69; against, 30.

The Council then proceeded to consider the first scheme, for the construction of the Isle of Dogs bridges and approaches.

Mr. Clarke said the Committee were of opinion that the present condition of affairs was a disgrace to them as a community.

Mr. Charles Harrison, in a long speech, said he would oppose the report unless it was agreed that the settlement of all plans, in case of dispute between the respective engineers, should be settled by a Board of Trade engineer.

Mr. Clarke accepted the suggestion.

The Rev. F. Williams said that the improvement should be delayed until the enormous ground value of London could be compelled to contribute to the cost, as well as the Dock Companies.

Mr. Bullivant said the public were perfectly justified in complaining of the state of things at the Isle of Dogs. After one hundred years nothing had been done to improve the locality. In answer to Mr. Williams, it was unreasonable to think that the Dock Companies could be made to pay, for they had no money to spend.

After some further remarks, the recommendation of the Committee to construct the bridges was agreed to.

The second recommendation of the Committee was as follows:—

"That power be sought in the next session of Parli-

ment to enable the Council to form a new street from West India Dock-road to Bridge-road."

In reference to this, the Committee in their report stated that at the present time the provision for the traffic going to and from the eastern side of the Isle of Dogs is very inadequate, there being no direct communication between Bridge-road and West India Dock-road. In connexion with this, the Limehouse District Board applied to the Council in January last for the widening of Three Colt-street, and they are now willing to contribute one-half of the cost, which it estimates at 30,000*l.* Three Colt-street carries traffic from Commercial-road East to Limehouse-bridge. The Committee had inspected the street, which is exceedingly narrow and tortuous, and in the opinion of the Engineer (in which they entirely concurred) would not, even if widened in the parts suggested by the District Board, make a good thoroughfare. They had considered an alternative scheme for the construction of a road of a uniform width of 40 ft., from the West India Dock-road, at the junction of Gun-lane to Limehouse-bridge, and, having regard to the amount of traffic to be provided for, they were of opinion that that would be the preferable plan to adopt. The estimated net cost for property and works is 59,800*l.* The Limehouse District Board had declined to contribute to the improvement. The Committee would be prepared to deal with the suggestion of widening Three Colt-street apart from the consideration of the improvement now reported on.

Mr. Clarke said, in reference to this proposal, that when they gave facilities to approach the bridges they must also provide facilities between the docks and the main roads. The present approaches were quite inadequate.

Mr. Harrison moved that the local authorities should contribute to the cost of the improvement.

The recommendation of the Committee was finally agreed to with the addition of words making it a condition that the Limehouse District Board contributed to the cost.

In reference to the improvement of Fortress-road, Kentish-town, the Committee stated that the Vestry of St. Pancras had applied to the Council to carry out the widening of Fortress-road, Kentish-town, at the point where this road and Highgate-road enter Kentish-town-road. The scheme submitted by the Vestry comprised a somewhat wide area, the idea being to take premises in the rear with the view of reconsecrating. The scheme also provided for the widening of the road from Leverton-street, Kentish-town-road, up to and inclusive of a large portion of Fortress-terrace. After viewing the locality, hearing a deputation from the Vestry, and carefully considering the proposal, the Committee were of opinion that some improvement is urgently required, and cannot be postponed without grave inconvenience. What was necessary to be done was the widening of the thoroughfare from the entrance of Fortress-road to Fortress-grove, from about 33 ft., the present width, to 60 ft. The estimated net cost is 28,200*l.*, of which sum the Vestry has agreed to contribute one-fourth. The traffic passing along this thoroughfare, between London and Upper Holloway, Highgate, Hornsey, Barnet, Finchley, and Wood-green is considerable, and often leads to blocks.

They recommended—

"That, subject to a contribution of one-fourth of the net cost by the Vestry of St. Pancras, powers be sought in the next session of Parliament to enable the Council to carry out the widening of Fortress-road, St. Pancras."

An amendment to refer the matter back having been lost, the recommendation was approved.

The other improvements suggested in the report were postponed.

**Recent Floodings of Sewage.**—Sir Walter de Souza asked Mr. Howell Williams (chairman of the Main Drainage Committee) what steps would be taken in reference to the recent flooding of sewage in Westminster, where the Army and Navy Stores and the Drill-hall of the London Scottish Rifles had suffered, and where disease might occur in consequence.

Mr. Howell Williams having stated that the matter would be reported upon at an early date, said that floodings had taken place elsewhere. On the occasion of the recent downpour of rain, about as much water was carried down the drainage system in two hours as was usually carried down in twenty-four.

The Council adjourned soon after seven o'clock until next Tuesday.

## ARCHITECTURAL ASSOCIATION

### VACATION VISIT:

#### EXCURSION TO OXFORD.

On Saturday last a party consisting of thirty-five members of the Association and thirteen members of the Birmingham Architectural Association spent an enjoyable day at Oxford in visiting, though somewhat hurriedly, the principal Colleges of the University, under the direction of Mr. Edmund Woodthorpe, M.A. Oxon. Reaching Oxford at half-past eleven, the first visit was made to Worcester College, where the gardens, the fifteenth-century old buildings, and the chapel, decorated under the direction of the late William Bungus, were the especial points of attraction; then, proceeding past the Taylor Buildings and Martyrs' Memorial, the visitors came to St. John's College, where the gardens and the work of Inigo Jones were both equally admired, and, even thus early in the day, desires expressed by some of the members to sit down and sketch, instead of running about seeing the old buildings. As, however, the programme was to see Oxford in a day, and not to study, it was necessary to hurry on. The next College visited was the modern one of Keble, which, with its gorgeous chapel, is a good example of the work of Mr. Butterfield, and, naturally therefore, came in for a certain amount of criticism; then, the representatives of the younger generation, who know not the merits of what they call the "streaky bacon" style.

The route taken then led past the Museum, the once highly esteemed work of Messrs. Deane & Woodward, to the interesting College of Wadham, with its manifestation of late Gothic work of the seventeenth century, and its gardens with the famous copper beech and cedar. Passing then from Wadham by way of "The Broad," leaving on the left the new Indian Institute, by Mr. Basil Champneys, to Trinity College, where the work of Mr. T. G. Jackson received far more admiration than that of Wren, or even the carving of Grinling Gibbons. For want of time the Lime Walk was omitted, although now that the lines are flowering this noteworthy feature may be found at its best. The exterior of the new buildings of Balliol, by Mr. Waterhouse, and the colleges of Exeter and Jesus were then rapidly glanced at. Next came the new building of Brasenose, by Mr. Jackson, and passing by the Church of St. Mary, with its famous Virgin Porch of the seventeenth century and its beautiful spire, the party reached the old Examination Schools with the noted "Five Orders" gateway, and then proceeded to the interior of the Divinity School and the Convocation House, both of which attracted considerable interest, architectural and sentimental. Noting the exterior of the Sheldonian Theatre and Hertford College, the visitors next proceeded to view the interior of All Souls' Chapel with its famous reredos, and then to Pembroke College, where the important function of lunch was observed, photographs of the party being afterwards taken. Then came a visit to Christ Church College, with the well-known "Tom" tower, Wolsey's quadrangle, the Hall with its fine collection of portrait-pictures, the kitchen, and then the Cathedral, the small size of which in no way diminished the very great enjoyment that every one seemed to feel in the charming interior with its Norman and Transitional work, and the modern stained-glass windows by Mr. Burne Jones; then, passing through Oriel College, along "The High," glancing at University and Queen's Colleges, the party came to Magdalen, where considerable time was spent in admiration of the old work as well as of the new buildings by Messrs. Bodley & Garner, the Cloisters, Deer Park, and, afterwards, a view of the famous tower from the bridge over the Cherwell. Then came a visit to New College, in the ante-chapel of which a considerable stay was made, listening to the choir practice and looking at the old stained glass as well as the celebrated window by Sir Joshua Reynolds, which can hardly fail to evoke admiration in spite of the unsuitable mode of treatment adopted. After this, Merton College, with its fine thirteenth-century chapel, was visited, and the artistic appetite of the visitors being by this time completely satiated, an adjournment was made by way of Broad Walk and Christ Church Meadows to the river and the College barges, where the party broke up into a number of small groups to pass

the remaining time of their stay in various ways according to their several fancies, one and all agreeing that they had spent a most enjoyable day.

### COMPETITION.

**HALIFAX.**—The limited competition for the new Infirmary for Halifax has just been decided. The architects who were invited to send in plans were Messrs. Young & Hall (London); Messrs. Mills & Murgatroyd (Manchester); Messrs. Worthington & Ellglood (Manchester); Messrs. Horsfall & Williams (Halifax); and Messrs. Otley & Gray (Halifax). Mr. Waterhouse was appointed as assessor, and, after a careful examination of the plans, reported in favour of those numbered 4, which proved to be by Messrs. Worthington & Ellglood. A resolution to accept and act on the advice of Mr. Waterhouse had been previously proposed and carried. The plans will be open to public inspection for a fortnight, at the Assembly Rooms, Harrison-road, Halifax.

### ENGINEERING SOCIETIES.

**THE SOCIETY OF ENGINEERS.**—An interesting visit was made by the Society of Engineers to the Royal Arsenal, Woolwich, on Friday, the 18th inst. The steamboat *Kaiser* was specially engaged to convey the party, who landed at the T. pier. The most noticeable operations carried on at the Arsenal are the squinting of rod-lead, manufacture of small-arm bullets and cartridge-cases, moulding and casting of projectiles in the Laboratory Department; dove-tailing and tenoning, wheel-making, stamp-forging by hammer and hydraulic press, and general engineering work in turning, planing, and slotting in the Carriage Department. In the Gun Factory the casting of steel ingots, forging parts of heavy guns by the 40-ton steam-hammer, turning, boring, and rifling guns of various sizes, trussing ingots and forgings, tempering steel tubes, and shrinking hoops on guns. Thanks to the courtesy of the officials, the visit was most instructive, and the members spent the whole day in examining the machinery and operations of the various departments. Among those present were:—Mr. Henry Adams (President), Mr. W. Newby Colam and Mr. Wm. A. Valon (Vice-Presidents), Mr. Jabez Church, Professor Henry Robinson, and Mr. A. T. Walmisley (Past Presidents), Mr. J. H. Cunningham and Mr. William Schönbeinder (Members of Council), Mr. G. A. Pryce Caxson (Secretary), and Messrs. H. W. Andrews, R. L. Andrews, W. Benbow, F. Brickwell, W. F. Broadberry, W. T. W. Castell, E. H. Cheeswright, J. Christie, W. D. Curzon, G. H. Dymoke, J. Elford, B. P. Ellis, W. R. Green, T. Guyatt, F. Hovenden, P. M. Justice, J. Manwaring, M. Mildred, Henry O'Connor, F. W. Quick, B. Rhodes, jun., W. T. Sugg, J. S. Tamburini, E. H. Toumlin, J. Waddington, and Henry Young.

**GIFTS TO MANCHESTER.**—Some splendid gifts, the money value of which represents over 200,000*l.*, were made in various forms to the city of Manchester on the 17th inst., when the new Whitworth Park and Institute were formally opened. Whitworth Park consists of a large plot of land formerly known as Potters Park, and with Grove House, which stands in the ground, was purchased by the residuary legatees of the late Sir Joseph Whitworth. The park, to be opened to the public and placed under the control of a trust, and the adjoining land, cost 52,000*l.*, and in it are to be built, also at the expense of the Whitworth legatees, some art galleries and a technical museum, Grove House being at present used as a temporary museum. A plot of land is given by the legatees in the city of Manchester, valued at 35,000*l.*, on which a technical school is to be erected. The legatees also give 50,000*l.* to be used in the equipment of the institution. Mr. Oliver Heywood, on behalf of the authorities of the Manchester Jubilee Exhibition of 1857, will present to the Institute the surplus from the Exhibition, amounting to over 40,000*l.*, 10,000*l.* of which is to be appropriated to the School of Art, 20,000*l.* to the purchase of works of art, and the remainder to the purposes of a technical school. Mr. William Agnew will present, on behalf of Mr. C. F. Watts, R.A., that artist's celebrated picture, "Love and Death," as the first donation towards the furnishing of the Institute. The Duke of Westminster has given, for a nominal consideration, a series of large casts of great value, taken directly from the original sculptures in the Galleries at Florence.—*Standard.*

**GOTENBURG.**—An Industrial Exhibition is to be held next year in Gothenburg. The President is M. Arthur Leffler.

Illustrations.

NEW BATTERSEA BRIDGE.

WE give reproductions of a portion of the working drawings of the new Battersea Bridge, which was opened by Lord Rosebery on Monday last. The bridge, as will be seen, is, with the exception of the piers and buttments, an iron construction; it has been designed by Sir Joseph Bazalgette, C.B., the engineer to the late Board of Works, in conjunction with Mr. E. Bazalgette, who has, we believe, been mainly concerned in the superintendence of its erection. The main facts of the construction are shown and described on the drawings; the piers, it will be seen, have a concrete foundation within sheet piling, above which is brick with granite facing. The iron skewbacks are built into the brickwork and granite of the piers, the arched ribs bolted to them through tapered steel packings interposed above and below the centre line of the arch, which has play to turn on a concave bearing. The skewbacks themselves are bolted by long 2 in. vertical holding-down bolts to a course of granite slabs extending right through the piers. The granite was supplied by the Kit Hill Granite Co.

The roadway is carried on a system of iron standards with cross bracing, forming with the arch rib a cantilever, and carrying a structure of concrete on which the pitching of the roadway is laid. The footways have an asphalt surface on a layer of concrete. A continuous iron pipe box of square section is laid down under the kerb of the footway.

The bridge, the cost of which has been £43,000, is an excellent piece of work constructionally, though it is much to be regretted that we have not had a monumental granite structure such as Putney Bridge, one of the best bridges on the river. This of course was a question of economy. If the economy had been carried a little further by the omission of the coarse and badly-designed cast-iron ornament (?) in the spandrels, it would have been better; but engineers apparently cannot be got to say that badly-designed ornament is a great deal worse than no ornament at all.

SCULPTURE: ROYAL ACADEMY EXHIBITION.

WE give this week illustrations of two from among the (as usual) numerous busts exhibited at the Royal Academy. That by Mr. G. A. Lawson, entitled "Old Marjorie," is a study of an aged woman's head. "While modelling it," says the sculptor, "it suggested to my mind the portrait of faithful old retainers one sometimes hears of, at once the pet and the autocrat in the same family for fifty years." The countenance well expresses this idea.

The bust by Mr. Woolner, R.A., is that of a distinguished South Australian, Sir Thomas Elder, who has taken a very important part in developing the riches of his country. He has owned vast herds of cattle and horses for agricultural purposes, and been a supporter of everything that tended to advance the civilisation of the colony, having amongst other acts of munificence contributed a fortune, it may almost be said, towards the establishment of the Adelaide University. Mr. Woolner has created the bust with characteristic and suitable simplicity of style.

WROUGHT-IRON PARK-GATES.

THESE gates are designed for an existing ornamental brick archway from the fore-court into a garden; the archway is also designed by the same architect. The gates are about 10 ft. 6 in. wide and 12 ft. 6 in. high; the main frame is 2 in. square, and the foliage in the gates is of thin plate hammered up. The arch is fitted with a fixed head.

They are being executed by Mr. Maddes, of Haslemere, one of those country blacksmiths who possesses the traditional skill of their craft. It was thought that, from his being of the county in which the gates are to be fixed, the workmanship might have a smack of the soil, and that the gates would be looked on with pride by the workmen and act as an incentive to the continuance of artistic skill in the blacksmiths of the locality.

The architect is Professor Aitchison, A.R.A., and the drawing from which the illustration is taken is exhibited at this year's Royal Academy Exhibition.

SHEFFIELD MUNICIPAL BUILDINGS COMPETITION.

WE publish this week the perspective view and plans of principal floors of the design submitted, in the final competition for the Sheffield Municipal Buildings, by Mr. F. H. Tulloch.

The plan, as will be seen, occupies the whole site, with a continuous corridor all round, and the Council-chamber at right angles with the main centre line of the plan, and the Accountant's General Office below it, reached from the two side corridors. The general arrangement of the plan considered *en bloc*, is very good; in detail, the offices seem rather too much mixed up; the committee rooms on opposite sides &c.; and the Town Clerk, though central in one sense, is at a centre rather too distant from the central field of operation.

The arrangement and use of the Mayor's parlour has evidently been very differently regarded by different competitors, and the instructions do not indicate with sufficient precision whether it was to be regarded as a private sitting-room or a state room. It should in our opinion, combine a certain degree of state with retirement and comfort, and hence we hardly think the central position between the reception-room and the dining-room is the ideal one for it. It then becomes a room with three large doors, one in each side of it; not the most comfortable kind of room to sit in; and the architect provides the Mayor with a small sitting-room with lavatory accommodation (which the Mayor's parlour has not), close to one of the Council-room entrances. But in that case it is not easy to see what is the function of the mayor's parlour; it is too large for a sitting-room and too small for a state reception-room, which is already provided for; and when guests are received for a large dinner, which would necessarily be in the reception room, they would have to cross the Mayor's parlour to arrive in the dining-room. Various competitors adopted this arrangement, the right or wrong of which of course depends to some extent on each designer's view of the way in which these state apartments were to be used. The general arrangement of the lavatories in this plan appears very good.

We append as a further explanation of the scheme, the greater portion of the report which accompanied the plans, omitting (for the sake of space) some minor details.

"The principal entrance is placed in the centre of the block facing Pinstone-street, and leads to a spacious entrance hall from which is approached the main corridors and the grand staircase.

"The Council-chamber is placed on the principal floor in the centre of the site, and is quite isolated from all noise arising in a large chamber. It is approached by the grand staircase and also by the north corridor; it has a commodious ante-room, and the cloak-rooms are conveniently adjacent thereto. A gallery for the use of the public is provided at the north end of the chamber, and is approached by a staircase leading from Surrey-street; screen doors are placed across the corridor to prevent the public having access to the main building. The reporters have space allotted them on the floor of the Council-chamber. A small retiring room for the use of the Mayor is provided, having an entrance from the south side of the Council-chamber.

"The reception-rooms are placed facing Pinstone-street, and being of large dimensions, entailing a corresponding magnitude in height, give an opportunity of dealing in a broad manner with the architecture of the main facade.

"These rooms are approached by the grand staircase, and have, for the purpose of exit, a smaller staircase on the south side leading direct to the street. The cloak-rooms are placed in a mezzanine floor, and are conveniently arranged for the accommodation of guests before entering the reception-rooms; they are also conveniently placed near the Council-chamber. . . .

"A serving-room is provided at the north end of dining-hall, which is in direct communication with the kitchen, &c., on the second floor.

"A platform is provided at the south end of the reception-hall, having an exit into a retiring room facing Cheney-row, which room is provided with a separate staircase leading to the half-way landing in the secondary staircase at the south end of the corridor.

"One large committee-room and two sub-committee-rooms are placed facing Surrey-street, and the remaining two large committee-rooms and sub-committee-rooms are placed facing Cheney-row, all on the first floor.

"There is provided a Mayor's small parlour for his private use, with lavatory and w.c. accommodation, in close proximity to the Council-chamber, reception halls, and Town Clerk's offices.

"The whole of the reception-rooms, the Mayor's parlour, Council-chamber, grand staircase, and

committee-rooms, with the exception of those facing Cheney-row, can be cut off from the departmental offices as shown by screen doors across the corridors on the ground and first-floor plans.

"The Town Clerk's offices are planned to occupy the end block facing Norfolk-street and a small portion of Cheney-row on the first floor, having easy access to the common staircase on the Surrey-street side. A staircase is provided in the octagonal turret in the general office for access to the store above.

"The Borough Surveyor's offices are placed to the left of the principal entrance facing Pinstone-street and part of Surrey-street, on the ground-floor, having north light, with the exception of the Building Inspector's office which is placed in the basement; this office has communication, by a circular staircase, with the drawing office above.

"The Borough Accountant's offices are planned to occupy the building in the centre of the site on the ground-floor and basement, the rooms in basement having direct communication with the general office above.

"The offices of the Health Department occupy the rooms on the right of the principal entrance facing Pinstone-street, and a small portion of the Cheney-row front on the ground-floor, also on the first floor over those rooms, on the ground-floor facing Cheney-row, and in the basement, occupying nearly the whole of the Cheney-row front, each floor having direct communication one with the other.

"The Sewerage and Rivers offices are placed to occupy the Norfolk-street front on the second floor, with the exception of the drawing-office, which has its whole length facing Surrey-street, thus obtaining north light, and having access to a common staircase, and being in direct communication with the offices of the Borough Surveyor.

"The Weights and Measures offices are placed in the basement. . . .

"The offices of the Waterworks Department occupy the whole of the block facing Norfolk-street, a portion of the Surrey-street and Cheney-row fronts on the ground-floor, the remainder being placed in the basement facing Norfolk-street, and Surrey-street, with the exception of the Engineer's offices, which occupy a portion of the Surrey-street front on the first floor, as specified in the competitors' instructions.

"Lavatories and W.C.'s.—There is provided an isolated block of buildings with sufficient lavatory and w.c. accommodation for the use of the several departments on each floor, being in a central position, and having thorough cross ventilation; there is also further provision of lavatory and w.c. accommodation in the centre block of buildings under the grand staircase on the ground-floor for the use of the different departments. . . .

"For warming, there is provision made in the boiler-room in basement for No. 2, 24 ft. 0 in. by 6 ft. 0 in. Lancashire steam boilers, and laid on from the same a steam main traversing the course of the general corridor. From this main carry branch pipes to the positions occupied by coils on the various floors overhead, with vertical services having connections on each floor.

"In the window backs of the various rooms or other suitable position, also in the entrance lobbies and the corridors, provide steam-heating "Radiators," and connect to the services before named, and carry from each a condense pipe back to the boiler-room, taking the same course as the steam pipes.

"In the Council-chamber, reception-rooms, and the grand staircase, it is proposed to have steam-heating battery chambers under the floor, and bring the heat from these chambers through gratings in the floor in suitable positions, or through panels in the dado at the sides of rooms.

"For ventilation it is proposed to provide the necessary fresh air in ample quantities by means of a fresh-air inlet-grating through the outer wall at the back of each of the coils, when it would become warmed on entering the room; these inlets to be made to open or shut at pleasure. Similar fresh-air inlets to be provided to the batteries warming the Council-chamber, reception-rooms, and staircase.

"The removal of the vitiated air from the various rooms would be effected by means of extraction ducts carried up in the walls, and provided in each room with a self-acting valve to prevent back draught.

"It is proposed to construct the whole of the building in the most approved fire-proof manner, the floors of the various offices being finished with wood block paving on asphalt bed.

"The whole of the front elevation and the return elevations of the main building would be faced with stone from the Warwick quarries, Huddersfield, or from the Bolton Wood quarries near Bradford. One of these stones would also be used for the architectural dressings, such as quoins, strings, cornices, window jambs, &c., to the remaining part of the building facing Surrey and Norfolk-streets and Cheney-row, the walls between being faced with hammer-dressed wall stones from the district.

"The large courtyard would be faced with pressed facing bricks, the smaller courtyards or areas would be faced with white glazed bricks.

"The roofs would be constructed of wood and iron and covered with Westmorland green slates. The floors of the reception-rooms, committee-

THE LONDON WATER QUESTION.

ON the 11th inst., at the Local Government Board, Mr. Ritchie received a deputation from thirty-two out of the thirty-nine Vestries and District Boards in the metropolis in favour of legislating this Session upon the water-supply of London.

Mr. Ritchie, in reply, said that the question divided itself into two parts—first, whether some legislation should take place immediately with regard to the charges of the companies; secondly, whether there should be some immediate legislation with regard to the transfer of the water supply undertakings to some public body. The first proposal again divided itself into two heads—first, whether it was practicable, and, secondly, whether it would be just. With regard to its practicability, the Government had undertaken, with certain exceptions of a minor character, not to propose any fresh legislation of a contentious character this Session, and it would come upon the House with something like dismay if the leader of the House were to announce that before rising they were to dispose of the water question. It would be quite impossible now for the Government to give any facilities to Mr. Canon's Bill, unless it were taken up as a Government question. It had been said that the legislation proposed would not be contentious; but he could hardly conceive anything much more contentious or much more likely to create opposition than to attempt to take away, at the fall end of a Session by an Act of Parliament, rights and privileges which, whether good or bad, had been conferred by statute. In 1885 Parliament passed a Bill which took away from the water companies the right which they then possessed of increasing their assessment, from time to time, within the periods of quinquennial revision. They were now approaching the first revaluation after the passing of that Act, and he would therefore suggest this consideration as being an added element of difficulty to the suggestion, that they were, on the first opportunity for the exercise of the rights which were practically agreed to by Parliament in 1885, to pass a Bill saying that the Companies should not exercise those rights. It had been said with great force that without any increased supply the right should not be given to make an increased charge. But he imagined that the effect upon the individual would be the same if the water-supply were transferred to a public authority, because the charge would be levied by means of a rate, and if a man's assessment rose, he would have to pay an additional sum, although he might not get a larger supply of water. What were the circumstances of the present day so far as the public were concerned, and with regard to the possibility, the probability, he hoped,—of the matter being at some time doubted to a public body? He very greatly doubted whether the approaching revaluation of the metropolis would greatly benefit the water companies. There was a very much larger question involved in the proposal that the water should cease to be supplied by companies whose interests were mainly divided interests, and given to a public body whose interests would be the interests of the general community. The only satisfactory solution of this question was to transfer the water undertakings to a public authority. He thought that, having created in the metropolis a large and important body fully representing the whole of the ratepayers of the metropolis, the transfer of those powers to any other body would be attended with great difficulty. His own view lay distinctly in the direction of casting the responsibility upon the London County Council when the occasion arose. As they knew, an enormous sum of money was involved, but he hoped that would not stand in the way of a complete solution of the question. He was sure there was a strong feeling in the metropolis that the water-supply of London should, upon fair and equitable terms, be transferred to a body which was representative

of the ratepayers, and which should administer the undertakings transferred to them solely in the interests of the public. In expressing that feeling for himself he felt sure that he was also expressing it for his colleagues. The London County Council had this year received the sanction of the House of Commons to the devotion of a sum of money to an investigation into the question of the water-supply. The Corporation of the City was also, he believed, at its own expense, making investigation into the question. He assured the deputation that the Government would be prepared to give a full, careful, and he hoped a satisfactory, consideration to any suggestions, recommendations, and reports which might be made to them by those authorities.

At the sitting on the 18th inst. of the inquiry which is being made into the question by the Corporation of London,

The Chairman (Sir Guyer Hunter, M.P.) said it had been brought to his notice that there was a rumour that the Committee was impeded to set in conjunction with the London County Council. He thought that the observations he made in opening the inquiry would have shown that they were disposed to act with the County Council in this important matter. He regretted to hear that this rumour existed, and he took the earliest opportunity afforded him of assuring the County Council that it was their wish and desire to co-operate with them in every matter connected with this inquiry, and he would be only too glad if the County Council would co-operate with them, in order to make the inquiry as brief as possible, and to bring it to a satisfactory conclusion. As to funds, enough money had been placed at the disposal of the Committee, and there was no necessity for any separate inquiry being conducted by any local body.

Mr. Archibald E. Dobbs was the first witness. In answer to the Chairman, he gave a summary of the various Acts under which the water companies supply their respective districts, and the arrangements under which they levy rates. The collection of the rates half-yearly in place of quarterly was a convenience to the consumer, but it placed an enormous additional power in the hands of the companies, for the ratepayer would have no redress if he had not tendered quarterly the amount actually legally due. If a ratepayer objected to a single item for some extra charge his supply would be cut off. The law on many points was not at all clear, and the capitalised value of charges made annually, of which the legality was questionable, would amount to a very large sum. The law placed the companies in such a position that if the consumer made the slightest slip he was "done for." The companies had not strained their Acts, considering the enormous powers which had been placed in their hands by loose and haphazard legislation. The companies had done everything, by compromise and otherwise, to prevent questions being looked into. In the various Acts there was a great want of uniformity, and nobody could tell the true position of matters. If a consumer objected to an extra charge he was helpless, and would have to pay. The only prudent and wise course in case of a dispute was for the consumer to go on paying all his life rather than personally to dispute the charge, even although he knew that the charge was illegal. If the charge was for 10s. it would cost him that amount for legal expenses in the initial stage, and he might have, if he lost, to pay his own and the company's whole expenses. If a water company made a charge which was disputed, the onus lay on the consumer of proving that they were wrong, there being no onus on the company to prove that they were right. Mr. Dobbs handed in the draft of a Bill, the details of which he did not desire to be made public, for the consideration of the committee. He thought that it would provide a fair settlement of the question, and would receive large support in Parliament. Being asked his views as to whom, in the event of the purchase of the water companies' undertakings, the control should be transferred, Mr. Dobbs said the actual administration and management of details would be better in the hands of a small body, who would use discretion in the carrying out of the Act of Parliament which would constitute the new arrangement, but that small body should be under a representative body, most probably the County Council and the Corporation. If the construction which the water companies placed upon their Acts was carried out to the hard and rigid

letter of the law, the consequences which would ensue were such as could never have been contemplated by any legislature of sane men. Mr. Dobbs further stated that the ratepayers seemed apathetic. In acknowledging the public contributions to the costs of his action against the Grand Junction Waterworks Company, he made an appeal for funds to have disputed questions legally tested, but a very poor response had been made.

Mr. John James Durrant, 40, Cheapside, stated that he paid for water-rates double what he paid fifteen years ago, although the supply had not increased.

Colonel Gouraud, the representative of Mr. Edison in this country, gave evidence as to the extraordinary variation between the amount of water-rates paid respectively for his offices in Northumberland-avenue and his house at Stratfordham.

Mr. Samuel Cook, from the firm of Messrs. Lass & Co., chartered accountants, gave details of the capital and profits of the water companies and of the present value of the shares so far as known. He stated that the nominal amount of the capital of the London water companies was, in 1871, 10,016,164s., and the market value 14,475,096s.; while in 1890 the nominal capital was 14,432,733s., and the market value 33,444,506s.

The committee then adjourned.

Correspondence.

To the Editor of THE BUILDER.

OLD CHURCH FRESCOES.

SIR,—As many of your readers have been interested in the restoration of old churches, I, and doubtless many of your readers, would be glad if they would give us the benefit of their experiences of the best mode of procedure to remove the superincumbent coats of plaster and whitewash without injuring any frescoes underneath, and also state if there is any preparation to preserve them from fading away afterwards through exposure to sun and light.

My experience in Church restoration confirms my belief that most of our old churches should have their walls aglow with colour, instead of the "restored" here aspect they now wear, and that through want of knowledge and proper care many links of the past are lost for ever.

The fine church of Ewelme, near Wallingford, for instance, its walls bearing indications of many frescoes under the coats of whitewash, and the finest resting frescoes around the chancel of Chalgrave Church close by are fast fading away on the north side, where the Life of Our Lord is depicted, from exposure to sun, while those on the south side illustrative of the Life of the Virgin, are almost as clear as when uncovered in 1853.

A. MARSDEN MOWBRAY,  
48, Ilfley-road, Oxford, July 19, 1890.

FIRE-RESISTING WOOD.

SIR,—With respect to the letter of your correspondent in your last issue respecting the fire-resisting quality of jarrah, it would probably be interesting to those of your readers who require non-combustible timber to know that the newly-imported Madagascar Laloua wood is also exceedingly difficult to burn.

G. W. BUCHANAN.

SIR,—I am interested in the letter of your correspondent, Mr. Francis Bird, which appears in your number for the 19th inst. I quite agree with your recommendation of oak as a fire-resisting material. Some other kinds of woods also do very well. I have in my possession a piece of timber used in the roof of Canterbury Cathedral, and which was in its place several centuries previously to the fire which occurred about twenty years ago; this timber had been subjected for a considerable time to a great heat, but is only charred on the surface; when seen through it is still so hard that a knife will not cut it. It is a piece of chestnut.

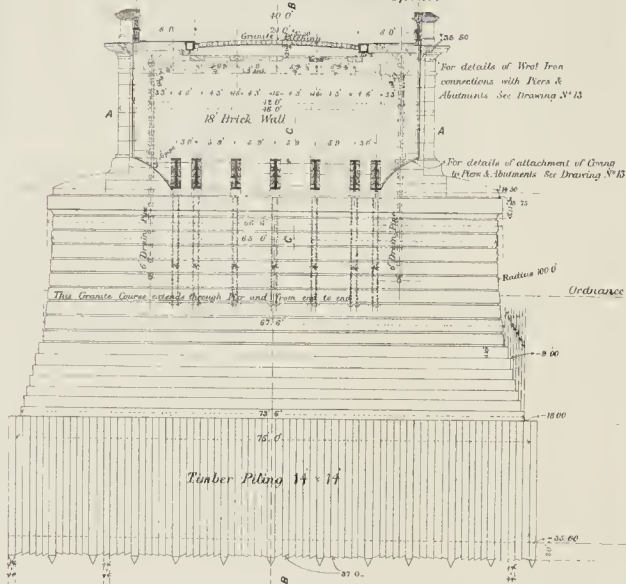

J. C. MERRYWEATHER.

PLAYING FIELDS FOR LONDON.—A meeting was held at the Mansion House on the 16th inst. in support of the movement for the further provision of playing-fields for London, and the improvement of existing ones. The movement originated at a meeting held in November last, presided over by Lord Aberdeen, an alderman of the Middlesex County Council, to make provision for the general cry among artisans for somewhere where they could go and play at cricket and football, and which they desired besides the free libraries and mechanics' institutes already provided for them. Mr. V. E. Walker has already given 500l. and fifteen acres of land at New Southgate, which munificent donation has provided for their wants in that district.

HOT-WATER SUPPLY—IV.

BOILERS: continued.

THE most efficacious way to add to the power of the saddle boiler, spoken of in the last paper, by increasing its heating surface, is to extend it up the back of the range, making it what is known as a "boot" boiler, fig. 6; nearly every make of range will

FIG. 6.

permit of this, and the boiler then becomes one of the most powerful that can be used, and such a boiler fitted into a six-foot range having a 1 1/2 in. fire will provide an abundant supply of hot water in a large residence with as many as twelve draw-off taps in regular use.

Another form of boiler to be occasionally met with similar to fig. 7, having a tube flue through

FIG. 7.

it, and when made "boot" shaped, the tube flue is sometimes continued up the port portion. This shape has two obvious advantages over the so-called saddle boiler, the first being that the lower part of the flue is heating surface, which is not the case with a saddle, and the flue being raised up from the bottom of the fire prevents its being so quickly choked with ashes; but it is commonly considered that these advantages are outweighed by the disadvantage it has in being so difficult to clean out.

Of course, it is not an impossible task to clean out a boiler of this description, but it must be borne in mind that this work has to be entrusted to workmen who are no more perfect than those in other trades; and, although one man may give additional care to an awkward boiler in cleaning out the angles—the parts of the boiler needing most attention—another man may be equally careless, with the most unfortunate results.

There is an idea very prevalent that this cleaning process is a simple task that may be relegated to a labourer (fitter's assistant), but no greater mistake could be made; it is work on which an experienced man should always be sent, as particular care must be exercised in the greatest heat, especially the angles where the welds or joints in the plate exist; and again, although a boiler is practically a box with an opening in the top, it is worth any one's while to insert their hand in a boiler when an opportunity occurs, to experience what a really awkward and difficult task it is to clean it out, remembering that the "fur" is usually hard like stone, and adhering to the boiler-plate. The trouble is greatly increased by many boilers being turned out with the inner edge of the manhole all rough and jagged with the filaments of iron that always appear on one edge of a hole that has been drilled, and there could scarcely be found a single hot-water fitter who has not scars upon his arms from this cause.

There are numbers of people (not range-makers) who signify a preference for square boilers,—that is, boilers having a flat bottom

without any arched or tubular flue, but which have a flue put to them by being placed on fire-bricks, as fig. 8; the argument in favour of these being, firstly, that

FIG. 8.

with an arched-flue boiler a weld or joint has necessarily to be made around the front edge of the arch, whereas in a square boiler a joint need not be there, as the bottom front angle can be formed by simply bending the plate; secondly, they contend that the narrow spaces on each side of the arched flue at the bottom of the boiler might quickly get solid with "fur"; these arguments are considered strong ones by those who use them, but it can be as strongly maintained, firstly, that although a weld does exist in an arched boiler where mentioned, it is not proper for the weld to be weaker than the solid plate; certainly boilers when "furred" occasionally open at the weld in question, but this is to an extent evidence of poor welding, as more than two-thirds of the fractures occur as at fig. 4 (page 33 ante), in which the crack is shown at right-angles to the weld, although close to it. Secondly, the narrow spaces referred to do not get furred so quickly as is commonly argued, and even if they did, a boiler has rarely, if ever, been known to crack there, and an argument in favour of these side water-spaces is that they add at least one-fourth to the available heating surface.

All boiler-makers recommend that boilers to be of good quality should be made of plate not less than 3/8 in. in thickness, and this is certainly a strength that can be used with confidence with the largest boilers for this purpose, including the Independent kind; but there is not the least doubt that boilers of 1/2 in., or even 5/8 in. plate, would do a deal of service, if not as much as the 3/8 in., for, as already explained, these boilers rarely fail from actual wear, and a 3/8 in. plate will fall almost as quickly as the thinner ones, if the failure is brought about by the fur. It is, however, not a desirable practice to use boilers of thin plate; the 3/8 in. is a serviceable and safe substance, and is (or should be) always used in the best quality of ranges.

The quality of the plate is of the greatest importance, but this unfortunately cannot be judged from inspection, not even by the experienced; good boilers are of the same appearance, and as rough as those of poor quality, and what might be ascertained from the colour or look of the metal is obviated by the makers coating the boilers with a preservative material, a kind of tar. A remedy for this can be suggested by recommending that such goods be only purchased from good and responsible firms.

No reliable rule can be made as to what sized or shaped boiler must be used to meet certain requirements, for in no two residences will the demand for hot water be found to be alike, and supposing the demand did not vary, the manner in which the fire is attended to in the kitchen varies greatly.—In fact, the quantity of hot water depends to a very considerable extent upon the amount of cooking done, as it is only when cooking operations are in full swing that the fire is assiduously attended to. It is, however, with every confidence that the "boot" shaped boilers can be recommended; they are decidedly powerful, and although costing more than the saddle shape, they undoubtedly save their extra cost in the end, as they work so economically, and a given quantity of fuel will heat double the quantity of water with the former than the latter; or, in other words, a certain quantity of water will be heated with half the fuel in half the time. Of course, this more expensive shape and size of boiler cannot well be specified for small—i.e., 40l. and 50l.—property, but where circumstances permit, the boot boiler will well repay the outlay.

Copper boilers, as already explained, are used in a very limited way in the south of England; not but what they are far superior to iron in many respects; but for the reason that there is no particular necessity for them, as the chalk in southern waters prevents the rust nuisance so keenly felt in the soft-water districts.

One superiority possessed by copper boilers is that this metal being a much better conductor of heat than iron, quicker results are obtained; a second is that the material is of a much more lasting nature, either from the effects of heat or of moisture; but the most peculiar and beneficial result obtained is that the "fur" trouble is, to a great extent, overcome.

It is noticed that copper boilers rarely have the deposit incrustated to any extent upon their inner surfaces, it being found lying loose in the bottom of the boiler in flakes or scales; many causes have been assigned for this, but there is no doubt that the comparatively great expansibility of copper when subjected to heat, and the corresponding great contraction upon cooling, has brought about this effect, as the incrustated fur has these properties to but a very trifling extent, and the result is the same as would be obtained by covering an elastic substance with a coating of a brittle compound. Of course, copper does not in the least prevent the lime precipitation taking place with hard water, and consequently the precipitated matter, whether fast or loose, has to be periodically removed. The nature of copper is also such that supposing the fur adhered to it as it does in iron boilers, the plates would not become fractured nearly so quickly; in fact, it would be difficult to do copper any great injury by the heat generated in a kitchen-range fire.

Copper boilers are much more costly than iron; the price is constantly fluctuating, but they commonly cost from four to five times as much as iron of good quality, but it should be borne in mind that a copper boiler, when its longest life of service has expired, is still valuable, whereas an iron boiler when unfit for use is quite valueless.

Those boilers are usually made of 1/4 inch or 5/8 inch plate, excepting the front which should be thickened to 3/8 inch or 1/2 inch, not so much to withstand the action of the fire as to bear misdirected blows of the poker, as copper is soft and rather easily penetrated; often a slab of cast iron is made to place in front of the boiler, this slab being of exactly the same shape as the boiler front, with the arched flue way at the bottom.

OBITUARY.

MR. JOHN WRAY, C.E., Borough Surveyor of Enniskillen, died at his residence, Darling-street, Enniskillen, on the 19th inst. The deceased gentleman has held the position of Borough Surveyor and Engineer to the Commissioners of Enniskillen for over eighteen years, and has also been for nearly forty years Assistant County Surveyor of Fermanagh. He carried out the works for bringing the Ballydoonagh water to Enniskillen, and during the drainage and navigation of the River Erin Mr. Wray rendered valuable assistance to the Drainage Board.

MR. DAVID DAVIES.—On Sunday afternoon, Mr. David Davies, well known throughout Wales, and at Llandinam, Montgomeryshire, after a long illness, in his seventy-second year. Deceased, who started life as a sawyer, represented Cardiganshire in the Liberal interest from 1880 to 1885. He was a well-known railway contractor, having constructed several Welsh railways, and was a founder and the largest shareholder in the Ocean Steam Collieries, Rhondda Valley, and Barry Dock, near Cardiff.

GENERAL BUILDING NEWS.

NEW BANK AT THAME.—The new premises in Thame for the Bucks and Oxon Union Bank have now been completed. Mr. C. P. Ayres, of Watford, is the architect, and the contractor was Mr. Kingerlee, of Oxford, Mr. Rogers being clerk of the works, and Mr. Maycock foreman of works.

PROPOSED TOWN-HALL IN NEWCASTLE-ON-TYNE.—Mr. J. J. Fenwick writes to the *Newcastle Chronicle* calling attention to a suggested site and plan for the New Town Hall, including new street, running from Grainger-street to Barras-bridge, according to plans by Mr. Knowles, architect, Grainger-street. Mr. Fenwick characterises this as "the most feasible, bold, and comprehensive scheme put before the public."

NEW THEATRE FOR IPSWICH.—The foundation-stone of the new theatre was laid by Mr. Edward Terry on the 24th inst. The whole of the constructive work of the theatre is being executed in steel, Mr. Emden (the architect) hoping by the lightness to be obtained by a steel construction to improve the sight and sound in the building.

COUNTY BUILDINGS FOR SURREY.—The Surrey County Council, sitting at Newington last week, approved plans for the new County Buildings to be erected at Kingston for the transaction of County Council and Quarter Sessions business, the Surveyor's estimate of the cost being approximately 35,400l.

**THE BUILDERS' ACCIDENT INSURANCE, LIMITED.**  
—The 19th ordinary general meeting of the above-named Company was held at the offices, 31 and 32, Bedford-street, Strand, on the 22nd inst. Mr. Stanley G. Bird presided. The minutes of July 9, 1889, were read and confirmed. The Secretary (Mr. E. S. Henshaw) read the report and accounts for the year ending May 31, 1890. The report was as follows:

"1. In presenting their ninth annual report the Directors are pleased to be able to state that in consequence of an additional 11 number of insurers, coupled with the improvement in the building trade the premium income of the Company amounts to 5,904, being an increase of 496 over last year, the largest sum yet received in any one year.

"2. Notwithstanding this increase in the premiums the Directors regret that they have had to pay in claims a considerably larger sum than in any previous year.

"3. The Directors are of opinion that this result is mainly due to the serious nature of some of the accidents with which they have had to deal, especially in class 3, which is not provided for under the Act, and is generally known to the members as the 'public' risk.

"4. The Directors after careful consideration of the result of the year's working have come to the conclusion that it is not profitable, or just to the insurers under the Employers' Liability Act, that the premium on the public risk should remain at the present rate of 1s. per 100, at which it was fixed experimentally in 1885, but which experience has proved to be inadequate.

"5. The Directors have therefore with reluctance, but with a full sense of the responsibility which rests upon them, decided to increase the 'public' risk premium from 1s. to 2s. per 100.

"6. It will be for members in general meeting to vote such sum to the Directors for their services during the past year as they may think fit.

"7. In accordance with the Articles of Association of the following Directors retire, viz.:—Messrs. S. G. Bird, H. H. Bartlett, J. Bradney, W. H. Cowin, J. M. Burt, and T. F. Rider, all of whom are eligible and offer themselves for re-election.

**STANLEY G. BIRD, Chairman.**  
The report and accounts, as presented to the meeting, were adopted unanimously, and the following Directors, Messrs. Stanley G. Bird, H. H. Bartlett, J. Bradney, W. H. Cowin, J. M. Burt, and T. F. Rider, who were re-elected, were re-elected in accordance with the articles of association. The usual formal resolutions having been passed the meeting terminated with a vote of thanks to Mr. Stanley G. Bird for his services as Chairman during the past year, and for presiding at the meeting.

**DERBYSHIRE INFIRMARY.**—A special report has been made on the condition of this building, which it is proposed to enlarge, by Mr. Rogers Field and Sir Douglas Galton (acting separately), in addition to the report of the architects called in, Messrs. Young & Hall. All the reports concur in recommending that the hospital except the "Nightingale Wing," is not in a condition to be worth adding to, and that it should be rebuilt on new lines. The following extract from Mr. Field's report gives sufficient indication of the necessity for the course recommended:—"The drains at present in use pass, to a large extent, underneath the buildings, and where they are outside they run about in a most complicated way, and are constructed in a very improper manner. In addition to this there are a large number of old drains underneath the buildings, remnants of a former system of drainage which has never been removed. Fever Ward numerous channels by which the foul air from the bad drainage can permeate over the whole of the building. In the first place there is a complicated system of ventilating flues, between which and the drains there is some connexion, as shown by the experiments carried out by Dr. Seaton. In the next place there are numerous holes through the walls where pipes pass; then there are rats running all over the building; and, lastly, I am informed that the walls themselves of the old building have been found to be hollow inside where they have been cut into. The water supply is also very unsatisfactory. According to the information which was given me, the whole of the drinking water for all the buildings comes from a large cistern in the tower at the south end of the fever ward. Through this tower, close to the cistern, pass the extract ventilating flues which take the foul air from the fever ward, and these flues, which are only constructed of lath and plaster, are defective in many cases, so that the foul air can escape from them and contaminate the water in the cistern. The above is the briefest possible outline of the results of my inspection, but, although this inspection was necessarily a very rapid one, I saw enough to convince me that the defects are so serious that nothing short of entire reconstruction of the drainage will suffice to put the building into a safe sanitary condition, so far as the drainage is concerned."

**NEW BATHS FOR BROUGHTON.**—The foundations of the new baths for Broughton, which are to be erected in Great Clowes-street, were laid on Tuesday by Alderman W. H. Bailey. The baths are to be built from the design of Messrs. Mangnall & Littlewoods, of Manchester. The principal contractors are Messrs. R. Nail & Sons, of Strange-rade, and the total cost will be 7,600*l.* The baths provide for a first-class swimming-bath, 69 ft. by 43 ft., with a water area of 60 ft. by 25 ft.; and a second-class swimming bath 97 ft. 6 in. by 46 ft., with a water area of 75 ft. by 25 ft.

**NEWTON FLOTMAN CHURCH, NORFOLK.**—This church, dedicated to St. Mary the Virgin, which, as stated in the Diocesan records, was entirely rebuilt in the year 1385, and which consists of nave, chancel, south porch, and square tower with one bell, was re-opened, in perfect weather, on the 16th inst., after restoration under the direction of Mr. J. T. Lee, architect, London; the work having been carried out by Mr. C. W. Bullen, builder, Weybread, Harleston. The work of restoration comprised, practically, a new roof, on the old lines; of oak, the old lead having been recast in the church; new stonework, &c., both to windows, walls, and chancel arch, were necessary; several windows replaced; the floor laid throughout with tiles and wood blocks; and the nave re-seated, the beautiful old poppyheads and other carving being adapted. The estimated cost, not including private gifts, amounted to about 670*l.*

**HOTEL METROPOLITAN, BRIGHTON.**—This sumptuous hotel, the design for which, by Mr. Waterhouse, is one of the exhibits in the Architectural Room at the Royal Academy, was thrown open to a private view for a number of invited visitors on Saturday last. It has been built by Mr. Thos. Holloway, and furnished throughout by Messrs. Maple & Co. The materials used are red brick and terra-cotta. The Rowlands Castle red facings were selected by Mr. Waterhouse, and the bricks were manufactured by Mr. Bastin at the Rowlands Castle Brick Works, near Havant. No colouring matter was used either in their manufacture or when in the building. The hotel is entered from the main road, through a port-cochère leading to the outer hall, which has panelled marble walls, with an enbossed material in dull Asiatic red above, and an ornate panelled ceiling. The inner hall is fitted as a lounge, and on the left are the passenger-lifts, fitted in Moorish style, and provided with the electric light. On the right of the hall are the three public dining-rooms, forming a series of rooms extending from the sea to the south side to the Italian garden and tennis lawn on the north, and capable of accommodating 500 guests at one time. The decorations of these rooms graduate from a warm rich golden brown to ivory white, while the curtains are of a silken material in similar tones. The walls are decorated with a golden brown material modelled in high relief. On the left or west side of the hall is the drawing-room, richly decorated, and further adorned with pictures by Mr. Albert Kingsley, representing Sussex Ancestral Homes. The marble chimney-piece is from the chisel of Prince Victor of Hohenzollern. The building includes also a library, a very richly-decorated smoking-room with a sumptuous ingle-nook fireplace in oak, Turkish and other baths, and a special suite of rooms known as the "Clarence Suite," intended for banquets, wedding breakfasts, &c. The grand staircase is of polished marble.

The whole of the floors are of freestone construction, a state white of rooms is provided in the centre of the building, including a reception-vestibule, dining-room and bedrooms. The heating and ventilation have been carried out by Messrs. Rosser & Russell, on their system of ventilating radiators heated by steam power at 20 lbs. pressure, fresh air being brought in and warmed before admission to the rooms. The two grand staircases are warmed by powerful batteries of steam-heated radiators. The structural ironwork is by Messrs. Handyside; the plumbing and sanitary work by Mr. George Jennings; the zinc work to dormers, roofs, copper to turrets, &c., ventilation and exhaust tubes and cowls, &c., by Messrs. F. Braly & Co.; the mosaic floors, &c., by Messrs. B. & C.; the marble work to hall and stairs by Messrs. Farmer & Brindley; the terra-cotta to south front by the Burmantofts Co.; that to annex and north front by Messrs. Cliff & Son; that to light courts and Clarence-rooms by Messrs. Gibbs & Canning; the whole of the cement floors throughout building, also paving to garden, &c., by the Granolithic Co.; the ironwork to balconies, porte-cochère, wrought-iron grilles, handrails and balusters to principal staircases, &c., by Messrs. Hart, Son, Peard, & Co.; the ornamental and stained glass by Messrs. Campbell & Smith and Clayton & Bell; the wall fittings to sanitary blocks, &c., by Messrs. Simpson & Son; the marble treads to principal and annex staircases, &c., by Messrs. W. & D. Bennett; the wrought-iron casements by Messrs. Richardson, Ellison, & Co.; and the passenger luggage and service lifts by Messrs. Waygood & Co.

**THE AUCTIONEERS' INSTITUTE.**—A special Council meeting was held at the offices of this Institute in London on Friday last, when Mr. George Brinsley, of 30 and 31, New Bridge-street, E.C., who has been a member of the Council for several years, was unanimously elected President; the Vice-Presidents, Messrs. E. M. Bradbeer, J. Catling, F. Everill, and W. Weatherhead were re-elected, and twelve new applicants were admitted to membership.

**NATIONAL ART COMPETITION.**—The exhibition of the works submitted for the National Art Competition, 1890, by the Schools of Art throughout the kingdom will be opened to the public on Monday next, the 28th inst., and will remain open until the end of August. The works will be on view in the Enamels Gallery of the South Kensington Museum.

## SANITARY AND ENGINEERING NEWS.

**ROAD MAKING.**—The Executive Council of the Inventors' Institute recently invited engineers and road surveyors in Great Britain to hear a paper read on this subject by Mr. D. Nicoll, Assoc. Inst., C.E. The lecturer referred to the recommendations of Sir Robert Rawlinson in respect to the construction of roadways, which he had largely followed, and the method pursued by the late Mr. Gordon at Leicester; it had answered admirably, and was the best roadway at present to be found. This system had to a great extent been his (the lecturer's) model; what disadvantages it presented he has entirely overcome, the following being an epitome of the perfected method:—Blocks of granite (5 in. by 3 in.) are wrapped, except on the upper surface, with waste fibre and an elastic bituminous compound, and the whole brought together in a homogeneous condition while resting on a continuous pad formed of the same substance. This continuous pad or slab is taken to the ground, and unrolled over the usual surface of concrete, the blocks are then placed diagonally, and by a powerful lever made to join together as above mentioned, the meeting faces of a horsehoe finish immediate resistance for stopping or starting a vehicle. There is comparatively neither noise, mud, nor dust, and last, but not least, great economy. The surface being non-absorbent, it is easily cleaned by an ordinary water-cart. After some discussion, the meeting passed a resolution to the effect that Mr. Nicoll's system of paving was worthy of serious trial on an extended scale.

**ACTION OF MOORLAND WATER ON LEAD PIPES.**—In a paper recently read by Dr. John Brown, of Bacup, before the Society of Medical Officers of Health, on "The Flumbeo-Solvent Action of Moorland Water," the author gave it as his opinion that the solution of lead was due to the presence of an acid, not sulphuric as he originally believed, but an organic acid. Dr. Brown suggested, as the result of his experiments, that lead-poisoning might be prevented by the addition of one of the three following methods:—(i.) Filtration through properly constructed beds of carbon or rough sand rock. (ii.) Stocking the reservoirs with fish, as the latter use up oxygen and give off carbonic acid. (iii.) By treating the water with chemicals, especially carbonate of lime or bicarbonate of soda.

**IMPROVEMENTS AT LEICESTER.**—A Local Government Board inquiry was held on Friday, the 11th inst., at North Evington, Leicester, before Colonel J. O. Hasted, R.E., in reference to an application made by the Billesdon Union Rural Sanitary Authority for sanction to borrow the sum of 2,500*l.* for works of private street improvement. Mr. William F. Ault, Surveyor to the Board, produced plans and gave evidence in support of the application. There was no opposition. The same Authority have recently received sanction to borrow 4,937*l.* for private street improvement in the new Hurststone district, from plans prepared by the Surveyor.

**MOLD SEWERAGE.**—Mr. W. H. Radford, C.E., of Nottingham, has been requested by the Mold Local Board to prepare a scheme for the sewage disposal of the whole town of Mold, and for the sewerage of a portion of it.

**DRAINAGE DISPUTE AT MORECAMBE.**—Following an inquiry at Great Crosby, R.E., the Local Government Board report:—"The Board observe from the report that West Morecambe is being rapidly developed for building purposes, and that the present sewerage outfalls, which it appears, have been constructed by private individuals and companies, are inadequate for the proper conveyance of the sewage of the district, and the encroachments on the foreshore not recognised by the Duchy of Lancaster. The Board, therefore, draw the attention of the Morecambe Local Board to Section 15 of the Public Health Act, 1870, which provides that 'Every Local Authority shall cause to be made such sewers as may be necessary for effectually draining their district for the purposes of this Act.' The Board are satisfied, from the evidence before them, that it is the duty of the Local Board to construct a main outfall sewer for the district of West Morecambe without further delay, and independently of any direct contributions from the owners of the properties which will be benefited by the construction of the sewer.' The Board also request that they may be informed at an early date of the course which the Local Board propose to adopt in the matter.—*Leeds Mercury.*

## STAINED GLASS AND DECORATION.

**CHURCH OF S. PETER-LE-POOR, OLD BROAD-STREET.**—The decorative works now in progress at the Church of S. Peter-le-Poor, Old Broad-street, are being executed by Messrs. Pitman & Son, of Newgate-street. The works are under the direction of Messrs. Arthur & Ernest Billing, of Bank Chambers, Tooley-street, S.W.

**THE GERMAN CHURCH, BRADFORD.**—The three-light window at the east end of the German Church in Bradford has been filled with stained glass. The work, which represents the Ascension of Our Lord, is from the studio of Messrs. Powell Bros., of Park-square, Leeds.

FOREIGN AND COLONIAL.

FRANCE.—A fine art exhibition is announced to be held at Dinan from August 15 to September 15, and an exhibition of painting at Bourgneuf from August 10 to September 15. Last week the inhabitants of Plombières, in the Vosges, gave a fête to their townsman François, the landscape-painter, in honour of his having obtained the Medal of Honour at this year's Salon.—The monumental fountain designed by M. Bartholdi, and which was a conspicuous object in what was called the "Galerie" of the Paris Exhibition of 1889, has been purchased for 100,000 francs for the town of Lyons. At Lyons also a new bridge has been opened, the Pont Morand, to replace the old wooden bridge built in 1774. The new bridge is a stone one.—On the 7th, at Orleans, the new galleries of the History Museum, founded in 1855 by the Abbé Desnoyers were opened. The founder, now aged 84, received on the occasion the Cross of the Legion of Honour.—At Rennes a competition has been opened for the erection of a bronze statue to Lepetit, a former mayor and benefactor of the town.—At Fougères a competition has been set on foot for a memorial statue in bronze to the General Lariboisnière.—On the 10th, at Bourgneuf (July 13) the statue of the saint of Paul Bert was unveiled at Hanou.—At Aix-le-Bains the competition opened for the Church of the Assumption has been decided. The first premium was awarded to M. Arthur Bertin, of Chambéry, the second to M. Joseph Aïx, of Lyon.—The Tour de la Grosse Horloge at Rouen is to be shortly restored. This is one of the oldest monuments of Rouen, dating from 1389.—M. Georges Rolland has officially demanded from the French Government the concession of the projected Sahara railway.—At Pantin the decorative paintings executed by M. Schommer for the Salle des Fêtes of the new hotel have just been completed.

BERLIN.—In connection with the great "Bundesversammlung" and partly international shooting competition and popular patriotic fête held at Berlin last week, we again found a group of interesting temporary buildings erected. The main feature of the group is the large banquet-hall on the "fête ground," measuring some 500 ft. in length and over 100 ft. in width, in which 5,000 persons were able to dine together at one and the same time. In this erection, which has been built entirely of wood, the open timber roof is specially worthy of notice; in fact, the whole construction has been very cleverly worked out. The grand historical procession which passed through the town on the opening day of the meeting was a great success, the artistic part being extremely well executed.

THE OTIS ELECTRIC ELEVATOR.—An electric elevator has just been placed on the market by Otis Bros. & Co., of New York City, which is said to be well suited to many places where it has heretofore been impracticable to use such an apparatus. The winding machinery and safety appliances are such as they have been using for many years, but which Rudolph Eickmeyer, of Yonkers, N.Y., is the inventor, possesses many novel features and was specially designed for elevator service. Among the advantages claimed for electric power generally, and for this motor in particular, are its safety, simplicity, efficiency, the absence of noise, and the fact that it is not freed from the liability to damage by frost or by careless manipulation. The elevator is described and illustrated in the New York *Engineering and Building Record* for July 5.

PROPOSED RAILWAY TUNNEL BETWEEN BROOKLYN AND NEW YORK.—Mr. Austin Corbin, President of the Philadelphia and Reading Railroad, has resigned that position with the intention, according to the *New York Times*, of promoting a scheme for connecting the Long Island Railroad system with New York by a tunnel under the East River from Atlantic-avenue, in Brooklyn, to the foot of Whitehall-street, New York. This tunnel, together with the proposed railroad tunnel from Hunter's Point, would, if constructed, permit of close connections between the Long Island Railroad and the great trunk lines, and such connections would be very advantageous in the event of the establishment of an American steamship line from the end of Long Island to Milford Haven, in Wales.

CABLE TRACTION FOR NEW YORK TRAMWAYS.—The *New York Times* of June 24 reports that the Third Avenue Railroad Company is determined to substitute a cable for horses on its road as soon as possible. It has been decided to use the duplex cable system, such as is now in use on the Harlem cable road. The directors are stated to have decided on a plan of varying rates of speed on the different parts of their cable road, for which they expect great things. Owing to the constant interruptions to traffic on the lower end of the road—through the Bowery and old Chatham-street—the cable in that section will be run at a comparatively slow rate of speed. In the next section above the cable will be run somewhat faster, and in the upper section, where the road is generally clear, the excessive rate of speed will be reached. The central power station will be at Third Avenue and Sixty-fifth-street, where the present stables are, and there will be two other power stations.

STEAM-HEATING IN NEW YORK.—No doubt it is very convenient to have steam for warming or power purposes laid on to one's house or place of business from street mains, just as water, gas, and electricity are laid on; but judging from one or two paragraphs in the *New York Herald* of June 27 there are certain inconveniences to be reckoned with. Referring to the recent Broadway explosion, the *Herald* says: "The Commissioner (Girty) we have been Grand Jury yesterday, and it is said he was called as a witness to give testimony as to whether the New York Steam-Heating Company was maintaining a nuisance in conducting a business that causes volcanic eruptions on the city's busiest thoroughfare." On the other hand, the Company announces (and the announcement is ironically described by the *Herald* as "pleasant news for the owners of property in the lower section of Broadway and adjacent streets, surely") that the supply of steam "will be continued without interruption, night and day, as regularly in the future as in the past history of the company." In this connection some statistics are given by the company, showing that various numbers of persons have been killed by horse-cars, waggons, gas and electric currents, but none by the steam-heating company, "and absolutely no one injured in the eight years that the company has been in operation in the streets of the city." The *Herald* some days previously published a graphic description of an explosion, and the announcement is ironically followed by an explanation of the "eruptions":—"The pipes of both of the gas companies are made of cast iron, and the joints are made fast with lead. When the heat of the steam pipes reached the joints the lead promptly melted away and allowed the gas to escape. If the pipes were made of wrought iron and screwed into each other such an explosion as is described above could never have happened." Since this was written, it is stated that Mr. Wilson, President of the New York Board of Health, has sent to Mayor Grant an exhaustive report drawn up by experts on the temperatures generated in the street sewers by the New York Steam Heating Company's mains. Five feet under Broadway, it appears, in an excavation 14 ft. from the steam main, the heat was 200 deg. Fahr. The heat in another instance, in a subterranean vault, was found to be 150 deg., and in another 137 deg. Fahr. The Board of Health has ordered the Steam-Heating Company to shut off steam at four different points.

ENGINEERING WORKS IN TURKEY.—According to the *Daily News*, a convention has been recently concluded between the Turkish and Montenegrin Governments for the regulation of the Drin and Boyana Rivers. This convention necessitates certain engineering operations by a company to which the Ministry of Public Works at Constantinople invites the assistance of capitalists. The people in possession of her Majesty's Government on the subject can be seen on personal application at the Commercial Department of the Foreign Office.

NEW MUSEUM AT CHRISTIANIA.—The programme has been issued for the building of a new historical museum at Christiania.

NORWEGIAN BUILDING LAWS.—Some years ago the official residence of the Bishop of Christiania was rebuilt, and it has now been discovered that the timber in the building is seriously attacked by fungus. In consequence, and according to law, an action has been brought against the architect and builder by the owner—the Norwegian Ecclesiastical Office.

MISCELLANEOUS.

A SUPPOSED RELIC OF SERPENT WORSHIP.—According to the *New York Herald*, a mammoth mound in the form of a snake has been found between Carthage and Quincy, Illinois, by the Rev. S. D. Post. According to the description, "a clearly-defined rattlesnake lies coiled along the ground following the line of the bluff. Its entire length is 1,450 ft. The ridge has been ploughed down until it is now only 2 or 3 ft. above the surface, but the outline is still plainly discernible. The mounds at the coils of the serpent are 10 or 12 ft. high. The specific dimensions are 600 ft. from the head to the coils, the coils occupy a space 300 ft. in length and are made up of four distinct mounds 100 ft. apart. From the coils to the rattle of the snake is 450 ft., and there are three rattles occupying a space of 150 ft." The serpent lies north and south, a straight line drawn through it showing a deflection to the east of 50 ft. near the head and 75 ft. near the tail."

ART IN SARDINIA AND JUDEA.—In the review of this work in our last issue, we inadvertently attributed to the authors an expression indicating that the temple of Ezekiel, which they endeavour to restore, had been "found," which of course they did not imply; it was only described or imagined.

ARCHAEOLOGICAL SOCIETIES.—We are compelled to defer any report of the meetings of the Kent Archeological Society and the Bristol and Gloucestershire Archeological Society; both of which were held this week, the former at Canterbury, the latter at Bristol.

THE WARRINGTON IMPROVEMENT BILL.—The House of Commons Select Committee on this Bill on the 16th inst. decided that the preamble of the Bill was proved, though the provisions would have to be amended with regard to the limits of the borough, and the boundary would be limited to the existing southern boundary of the borough. This gives the extension asked for, excepting the part of the township of Warrington outside the borough, the Arpley Meadows, and the Cheshire portions proposed to be included.

OPEN SPACES, &c., FOR OPENSHAW, NEAR MANCHESTER.—The Local Board of Open Spaces have applied to the Local Government Board for sanction to borrow 12,850*l.* for purposes of public walks and pleasure grounds, and 7,150*l.* for works of private improvement, an inquiry was held on the 10th inst. by Colonel Ducat, R.E., an inspector of the Local Government Board. The Board have provisionally obtained from Colonel Cornwall Legg a site having an area of 40,643 square yards. It is situated to the left of Ashton Old-road, immediately behind the office of the Local Board. The streets which it is proposed to pave and sewer are twenty-two in number.

THE CENSUS BILL.—It has long been felt by those taking the deepest interest in health progress that it is urgently necessary to get power in the forthcoming Census Act to take an intermediate and comparatively simple enumeration of the people between the decennial censuses of 1891 and 1901. It is not necessary to multiply examples of the difficulty in which sanitary authorities at the present time are placed by the impossibility of arriving at a trustworthy estimate of the population of their districts, inasmuch as the Registrar-General has long since ceased to make any estimates of the present population, or to publish death-rates of any but the largest towns and areas. It may be noted, however, as a solitary example of this difficulty, that the population of the district of Whitechapel, which was 76,573 in 1871, had declined in 1881 to 71,368. We see no good ground for believing that the Whitechapel population has continued to decline since 1881 at the same rate that prevailed between 1871 and 1881; but at the same time there is little evidence of the assumed increase of population. When, however, it appears impossible satisfactorily to estimate the population of a district like Whitechapel within 5,000 or 10,000 of its true number, it must be obvious that any calculated rate of mortality for the district must be divested of most of its value as an indication of sanitary condition. It is earnestly to be hoped that the Government will not in their Census Act lose sight of the two facts—(1) that no trust-worthy death-rates can be continuously calculated for sanitary districts without more frequent counting of the population; and (2) that without trust-worthy death-rates it is impossible to stimulate, or even to maintain, the rate of sanitary progress which has effected so much real improvement in public health in recent years.

THE ASPHALTE WORK AT THE FORTH BRIDGE.—A little late in the day, we are asked to state that the asphaltic work in connexion with this bridge has been done by the Seyssel and Metaïeu Lava Asphalte Co. (Mr. H. Glenn), 42, Poultry, London; and consisted of six miles run of Seyssel asphaltic wheel track troughs, half an inch thick; three miles run of dish surface of convex buckle-plates in ash blocks ft. 8 in. wide; 1 1/2 miles run of dish surface on similar plates in "six-foot way"; 3 miles run of asphaltic concrete (60 parts Seyssel asphaltic and 40 parts whinstone) in concave buckle-plates to form footpaths 4 ft. to 6 ft. wide; 3 1/2 miles run of asphaltic concrete (60 parts Seyssel asphaltic and 40 parts whinstone) in concave buckle plates of 3 in. thick, from 5 ft. to 6 ft. wide; 80,000 square feet of 3 in. Seyssel asphaltic on concave buckle plates; 8 acres of coating on steel plates with best refined bitumen, to receive asphaltic. The whole of this work was completed in nine months and five days, and was continued day and night.

WAGES OF DONCASTER JOINERS AND CARPENTERS.—A meeting was held on the 17th inst. of the operative joiners and carpenters of Doncaster. It was said that the masters had agreed that the rate of pay in future should be 7*d.* per hour, 8*d.* for the first two hours overtime, and 11*d.* per hour after this. The men, however, had drawn up certain rules, but the masters had proposed certain amendments. Those the men at their meeting accepted by seventy votes to six.

SOCIETY DINNERS.—The General Purposes Committee (past and present) of the combined London Lodges of the United Operative Plumbers' Association of Great Britain and Ireland met for their annual dinner at the "Queen's Arms," Queen-street, Cannon-street, on Monday, the 23rd inst. GODFREY.—We are informed that Mr. Edmund Boleyn, of Nafferton, Yorkshire, has been appointed Surveyor and Inspector to the Godstone Rural Sanitary Authority. There were 110 applications.

THE FORSE ESTATE, CAITHNESS-SHIRE.—This extensive property will be offered for sale in Edinburgh on the 29th instant. It covers more than 11,000 acres, whereof 2,195 are under cultivation, and 8,885 are pasture land, yielding a rental of 2,661*l.* per annum. The mansion house, overlooking the harbour and the sea, stands by the ruins of Forse Castle. Five years ago this estate was "exposed" at 80,000*l.* it is now to be put up at an upset price of 62,000*l.*

"THIS YEAR'S ART CONGRESS IN BIRMINGHAM.—A meeting of the Reception and Entertainments Committee was held on the 16th inst. at the Council House. Mr. C. E. Mathews presided, and those present included the Mayor (Alderman Clayton) and Sir Thomas Martineau. The Hon. Sec. (Mr. Whitworth Wallis) reported that the Presidential address would be delivered on the evening of Tuesday, November 4, and that the actual work of the sections would commence at 11 a.m. the same day. He also reported that arrangements had been made for the use of the large lecture theatre of the Midland Institute, and of rooms in the Mason College, the Council House, and the Town Hall, for the purposes of the meetings. It was decided to fix Wednesday, November 5, as the date for the reception by the Mayor, and Friday, the 7th, for the one to be given by the Local Committee, which would take place in the Edgbaston Assembly Rooms. The Chairman and Honorary Secretary were requested to prepare for circulation a preliminary programme of the arrangements for the Congress.

OPENING OF A NEW STREET.—On Monday last Lord Rosebery opened the new street running from the Holborn Town-hall to Farringdon-road, which will be known as Rosebery-avenue.

SALE OF ARCHITECTURAL AND TOPOGRAPHICAL BOOKS.—On Saturday last and the following four days, the stock-in-trade of the late Mr. James Sage, of Newman-row, Lincoln's Inn-fields, was sold by Messrs. Sotheby, Wilkinson, & Hodge. This consisted of a valuable collection of books relating to architecture, topography, county and family histories, heraldry, biography, and so on. The architectural trade was unusually rich in well-bound copies of standard works by such writers as Dart, J. Britton, E. King, E. W. Brayley, W. Woolnoth, Pugin, J. Skelton, E. Blore, H. Wilkins, with many others. On Monday some quarto volumes were sold as follows:—F. Nash's "Views of Paris and Environs," a large paper copy, two vols. (1829), 18s.; J. T. Smith's "Cries of London" (1839), 11s.; J. Britton's "Views in Western England," plates by T. H. Shepherd (1829), and Shepherd's "Modern Athens" (1829), 15s.; J. T. Smith's "Antiquities of Westminster," 245 etchings and the 62 additional plates, two vols. (1807-1809), 37. 18s.; J. Britton's "Picturesque Antiquities of English Cities," on large paper, with India proof plates (1830), 37s.; and his "Architectural Antiquities," four vols., on large paper (1807-1814), 2. 14s.; R. W. Billings' "Durham Cathedral," on large paper, Le Kux's plates, all with the engraver's duplicates (1843), 36s.; D. Lysons's "Engravers' complete," six vols. (1798-1811), 37. 3s.; W. S. Gibson's "Tynemouth Monastery," two vols., partly illuminated (1846-1847), 2. 7s.; and Grose's "Antiquarian Repertory," four vols. (1807-1809), 29s.

FROM the *Courrier de l'Art* we learn that the Museum of Arms and Armour at Brussels has been separated from the Museum of Antiquities and installed in the keep of the ancient *Palais de Hal*. The Museum of Antiquities will now occupy a portion of the galleries on the site of the ancient *Champ des Manœuvres*, at the end of the *Rue de la Loi*. In the same paper it is stated that the collections of the Antwerp Museum are placed in the new building which has been erected on a site where the collection will be more isolated and less exposed to risk from fire. It was announced that the museum would be opened on July 26 by King Leopold II.

CHAMP DE MARS FÊTES.—The *Semaine des Constructeurs* of July 19 publishes an interesting article on the fêtes which have taken place on the Champ de Mars under the Revolution and under Napoleon I. The first of these was that in which figured the *Autel de la Patrie*. The last of the series was that in which Napoleon, after his return from Elba, administered to his troops the new oath to the Imperial constitution. As the author, M. Henri de Clouzot, dryly remarks, "Waterloo followed in a few days after." Since then the Champ de Mars was left alone (having too many unimportant memories connected with it) until the recent exhibition gave back to it something of its old importance.

EDINBURGH.—Mr. Rhind's statue of the late Sir William Chambers, to be placed in Chambers-street, Edinburgh, opposite the Museum of Science and Art, has been sent to be cast in bronze. The sculptor has since modelled three panels for the pedestal, being symbolical of the virtues of Literature, Liberty, and Perseverance. These Mr. Rhind considers as requisite to the complete artistic realisation of the work, but it appears that no provision was made for them in the sum originally voted for the statue. Mr. Rhind asks 150*l.* for the purpose, certainly a very small demand for such work. An endeavour will be made to raise the amount either by a grant from the Town Council, or, failing that, by public subscription.

NEW ASYLUM, EDINBURGH.—The commemorative-stone of the new asylum for the insane at Craighouse, near Edinburgh, was laid on the 17th inst., by the Earl of Stair. The cost of the building will amount to nearly 60,000*l.*, and the plans have been prepared by Mr. Sydney Mitchell from rough designs by Dr. Clouston, the physician-superintendent of the Institution.

"SHALL GAS UNDERTAKINGS SUPPLY ELECTRICITY?" was the title of a paper read by Mr. Arthur E. Guy at the recent annual general meeting of the members of the Gas Institute, held at Ryde, I.W. Mr. Guy answered the question in the affirmative.

NEW MISSION CHURCH AND HALL, LONDON.—The foundation-stone has lately been laid by Lady Wimborne, of a New Mission Church and Hall in Canterbury-road, Old Kent-rd., S.E., for Corpus Christi College (Cambridge) Mission. The building has two floors, the lower one being devoted to a hall capable of seating 500 people. The church is on the first floor and has a chancel, sanctuary, &c., and seats about 500. The architect is Mr. Richard J. Lovell, of London, and the builder, Mr. B. E. Nightingale.

THE ENGLISH IRON TRADE.—There is a little more animation in the English iron market, and although prices do not show any appreciable advance, they are rather stiffer. More business is reported in pig-iron, sellers having mostly the advantage. The Glasgow warrant market has been steady, and the same may be said of Scotch makers' iron. Cleveland pig shows an improvement of 6*d.* per ton on the week. Lancashire iron is fairly firm, and the advance in Staffordshire is maintained. Bessemer pig is likewise selling at an improved price. Manufactured iron is slightly better as regards inquiry, but not with respect to price, although the latter is fairly steady. A fairly active demand is maintained for steel, at tolerably steady prices. The outlook in the shipbuilding trade is, to say the least, not worse, the few orders that have lately been placed giving rise to fresh business. Engineers do not secure much fresh work.—*Iron*.

THE MULGRAVE CASTLE COLLECTION.—A sale of the art collection of the Reverend the Marquis of Normandy was conducted at Christie's in the course of last week. The effects embraced numerous objects of racing and other plate, porcelain, metal, ivory, and the like. The paintings included portraits of the Duchesse de Portsmouth, and William Phipps, by Lely and Kneller respectively; Gainsborough's *Constantine*, second Lord Mulgrave, and his nephew Colonel Charles Phipps, of the new Scots Guards, sold for 957*l.* 10*s.*, and 110*l.* 5*s.*; and Reynolds's *Lady Lepel*, daughter of John Lord Mulgrave, who married the first Baron Mulgrave, and their two sons, the above-named *Constantine*, and his successor, Henry, first Earl of Mulgrave. The last three paintings were sold for 273*l.*, 283*l.* 10*s.*, and 372*l.* 15*s.* Also the original sketches for Wilkie's "Blind Fiddler" (30*l.* 15*s.*), and "Rent Day" (84*l.*).

## LEGAL.

## DISTRICT SURVEYORS' FEES.

A DIVISIONAL COURT OF QUEEN'S BENCH on the 17th inst. granted a rule calling upon Mr. Bennett, Sidingway Magistrate of the West London Police Court, and Mr. Williams, District Surveyor of South Kensington, to show cause why a mandamus should not issue commanding the Magistrate to state a case.

The motion was made on behalf of Mr. Frederick Moly, builder, and proprietor of a block of residential flats known as *Kensington Court*, containing fourteen separate residences under one roof, and the question at issue is whether the District Surveyor is entitled to charge fees for fourteen separate residences or for one.

The question is of some importance, as, if the Surveyor's contention is maintained, large fees would have to be paid.

## REMUNERATION OF ASSISTANT COUNTY SURVEYORS IN IRELAND.

At the Assizes for the County of Down, Ireland, on the 17th inst., before Mr. Justice Andrews, Mr. Harrison, barrister-at-law (instructed by Mr. F. W. Crawley, Downpatrick), on behalf of the Assistant County Surveyors, applied regarding a question of expenses which they had incurred in connexion with their duties, and which the Grand Jury considered they were not entitled legally to pass. Counsel said that several of the roads throughout the county had continued uncontracted for, and on this account the Assistant Surveyors had contracted considerable expense in the way of superintending the works that had to be done by the County Surveyor. The matter had come before the Grand Jury on a pretty large scale, and he understood that the County Surveyors Committee had decided that there was no power given to them in any Act of Parliament by which they could grant this or any similar remuneration.

His Lordship—As I understand you, it is not so much a question of remuneration as of recoupment of expenses.

Mr. Harrison said that in the barony of Castle-rough there had been an enormous amount of roads for which contractors would not come forward, and the County Surveyor had to take over works that would cost 22,000*l.* The Assistant County Surveyor told him that he would have to pay something like

250 in respect of expense to which he had been put in superintending the making of these roads. His whole salary was now 280*l.* a year, so that the decision of the Grand Jury practically fixed him 250 for the default of the road contractors, thus leaving him only 30 for his year's salary. After citing sections of the Act of Parliament bearing on the question, counsel pointed out that the same matter had come up several years ago before Lord O'Hagan, who decided that the Grand Jury had power to make this recoupment.

After further discussion, His Lordship said (as reported in the *Belfast Newsletter*) that while *prima facie* there was a case in favour of the Assistant Surveyors, his opinion was as much against them on the point of law, and the most he could do was to state a case for the superior court, in case Mr. Harrison had himself a strong opinion on the subject as to the justness of the application. Of course, the Grand Jury were the best judges of what would be just in a case of that kind, and they seemed to feel that if they had the power they would grant what appeared to them a reasonable allowance for the extraneous expenses which had arisen to the Assistant Surveyors through no fault of their own. If Mr. Harrison thought he had a strong case he (His Lordship) would take the presentation for what the Grand Jury thought fit, and state a case if it were agreeable to those making the application. Of course it would involve some substantial expense, but his present opinion was that unquestionably he would have no power to grant the application at present.

On the application of Mr. Orr, Q.C. (instructed by Mr. B. N. Johnson, Solicitor to the Grand Jury), and after a prolonged discussion,

His Lordship granted a presentation granting the County Surveyor, Mr. P. C. Cowan, a sum of 100*l.* in addition to his ordinary salary of 600*l.* for acting as architect for the present year in connexion with certain necessary repairs to the court-houses throughout the county.

## THE ERECTION OF A STUDIO.—ALLEGED BREACH OF CONTRACT.

At the Manchester Assizes on the 19th inst., Mr. Wm. Mahon, builder and contractor, of Hulme, brought an action against Mr. L. M'Laughlin to recover a balance of 496*l.* 16*s.* alleged to be due, and for damages arising from a breach of contract in the erection of a studio for the defendant at Chorlton-on-Medley, the total of which the plaintiff said amounted in round figures to 1,180*l.*—The defendant denied his liability, and repudiated having entered into any contract of the character alleged by the plaintiff.—After the case had been partly heard, the services of the plaintiff were dispensed with, each side being satisfied to leave the issue to the Judge.—After a long inquiry, his Lordship said he had come to the conclusion that no contract had been proved to exist upon which the plaintiff could prove. There had been work done, and there had been payments made. The matter must be submitted to a referee, and upon that report, which was to be sent to him in writing, he would give judgment, and adjudicate upon the costs.—*Manchester Courier*.

## RECENT PATENTS.

## ABSTRACTS OF SPECIFICATIONS.

11,445.—DOOR KNOBS: A. & T. Leadbeater.—By this invention the sides of the square spindle are grooved across, those on one side being half the pitch of the other. A washer in segments is provided with a square recess, so that when the two pieces are placed together a square hole is left in the centre of the washer, through which the spindle passes. The two segments of the washer are hinged together at one side, and held together at the opposite side by a screw, arranged preferably so as to pass radially through a lip or tongue on the one segment into the body of the other segment, or by means of a spring latch or catch. The smaller of the two segments is provided on the straight face, over the spindle is a series of projecting V teeth of such a size as to fit the recesses in the spindle. The knob can then be actuated by screwing or unscrewing.

12,180.—SASH FASTENERS: J. W. Hootch and another.—This invention relates to an automatic sash-lock, an arm of which is pivoted on an horizontal axis to one of the sashes, and engages with a horn or horns on the other part of the sash. At the end of the pivoted arm is connected a catch, the free end of which is adapted to engage with the horn so that, when the arm has been moved into engagement, it cannot be disengaged until the catch is moved out of engagement with the horn. In order to open the sashes, the arm is thrown back, and a lug thereon is adapted to project into the spring on an adjacent latch, arranged in conjunction with the horn. When the sashes are nearly closed the tappet engages with the lug to throw the arm down into its locking position.

9,175.—DOOR-CLOSER: E. Pöppel.—This invention relates to an appliance for effecting the closing of a door, by double or single action, with gentle motion; working by the compressed action of a vertical spiral spring on an angular sleeve can and double-action of a vertical spiral spring on an angular cam, the position of the spring relieving part of the friction of shaft from footstep.

3,722.—FLUSHING APPARATUS: W. Wittorf.—This relates to an improved apparatus by which the quantity of water used in flushing the basin can be determined and regulated. The descent of the valve to be accelerated or retarded to vary the quantity of water deemed necessary. It also acts automatically. Mechanism

### Legislation as affecting the Administration of Waterways.

THE Fourth International Congress on Inland Navigation has been held this week at Manchester, at present certainly a sufficiently appropriate centre for such a meeting. We observe, however, that the programme of the meeting, while dealing largely with Engineering and Trades questions, did not include any reference to the subject of legislation as affecting inland waterways and navigation. This being so, a short review of the history and the present state of canal legislation will not be out of place on this occasion, and may serve to fill up a gap in the list of subjects that have been discussed at the Manchester meeting.

Since the inception of the English railway system by the opening of the Stockton and Darlington Railway in 1825, which was materially accentuated by the completion of the first Liverpool and Manchester Railway in 1830, the commencement of one of the most marvellous of the developments to be found in the history of mankind, our artificial waterways have until quite recently been allowed to go by default. We have in effect neglected our canals for over half a century. It is only during the last few years that any evidence has been afforded of serious efforts to realise the great advantages which inland navigation under appropriate conditions can render to our enormous commerce. With all its imperfections our canal system, when considered in relation to the inferior resources existing at the period of its greatest expansion—the second half of the eighteenth century—has, nevertheless, been a truly great development, reflecting high credit upon the foresight and enterprise of the men of that day. The construction of the canals, which we are accustomed to look upon nowadays as slow and antiquated, had unquestionably infused new life into productive industry, developed our home and foreign trade, and the advantages conferred upon our most important industry, agriculture, were pre-eminently great. The provision of our inland waterways by our forefathers, placing the four great Ports of London, Liverpool, Hull, and Bristol in intercommunication with hundreds of miles of lateral canals, was a magnificent conception, and

we may justly credit much of our present prosperity to the foundations laid by the canal-makers of the eighteenth century. A striking illustration of the apathy and indifference manifested by the Legislature with regard to our canals,—which were before the railways,—is afforded by the fact that while in 1840 the railways by statute were placed under the jurisdiction of the Board of Trade, it was not until about half a century later that canals were also included among the functions of that Board by the provisions of the Railway and Canal Traffic Act, 1888, which came into operation from January 1, 1889.

Previously to 1845 our inland waterways were only regulated in their administration by the provisions of such statutes as were confined to the individual inland navigations which had been up to that time the subject of legislation. In that year the attention of the Legislature was drawn to certain influences at work which rendered competition between railways and canals extremely ineffective. Such a condition of things being highly prejudicial to the public interest, it was felt essential to give some encouragement to the weaker of the competitors,—the canals,—in order to ensure more effective competition. Accordingly the session of 1845 was characterised by the sanction of the Legislature being given to three well-known public statutes. There were respectively:—The Railway Clauses Consolidation Act, 1845 (8 and 9 Vict., cap. 20); the Canal Tolls Act, 1845 (8 and 9 Vict., cap. 28); and the Canal Companies Carriers Act, 1845 (8 and 9 Vict., cap. 42).

The preamble of the Canal Tolls Act, 1845, after noticing the provisions contained in the Railway Clauses Consolidation Act of the same session, conferring powers on railway companies to vary their rates according to the circumstances of traffic, recites that, "greater competition for the public advantage would be obtained if canal companies were to have the like powers granted to them in respect of their canals." Consequently, the Act grants to the canal companies powers identical with those given to the railway companies, to accommodate their rates to the varying conditions of traffic.

Simultaneously, and with a similar object, the Canal Companies Carriers Act, 1845, was passed in order to enable canal companies to become carriers of goods upon their canals, and to make working arrangements and to lease their canals to other canal companies.

The preamble of this Act also states that these powers being identical with those given to railway companies will give scope for greater public competition.

In 1845 the rage for railway speculation was of a most extraordinary character. The prices of railway stock, both of railways in actual operation and of projected lines merely existing on paper, rose immensely. As an illustration, in January of that year, Bolton, Wigan, and Liverpool 40l. shares with 4l. paid, were worth 44l. 10s., and in September were selling at 42l. 15s. In the same period, Midland 100l. stock rose from 114l. to 188l., and Great Western 100l. stock from 156l. to 228l. This railway mania of 1845-6 was a historical duplication of a canal mania in 1791-4,—no less than eighty-one statutes being passed relating to inland navigations during those four years. It had come to be said in 1846 that all that was required to obtain Parliamentary sanction for a Railway Bill was the specification of two points on the map of England which presented an opportunity for their connexion by a railway, whether there was any chance for traffic being secured or not. The result of this delirious excitement with regard to railway projects was that canal companies were very greatly alarmed at the prospects of competition. The outcome of the situation was that over 200 Bills were deposited for the consideration of Parliament during the session of 1846 containing provisions for railway and canal amalgamations. In some of these cases the railway companies had designedly acquired canals in order to extinguish competition. In other cases the purchasers of canals had been forced on the railway companies, in order to huy off opposition from the canal companies. The canal companies, apprehensive of diminished dividends, recognised their opportunity in the applications of the railway companies to Parliament to dispose of their undertakings on this ground. On the other hand, the railway companies, by making arrangements with the canal companies, succeeded in getting rid of serious opposition to their application to Parliament, and obtained the control of an amount of traffic which otherwise might be an awkward competitor; and a further advantage attended these arrangements, the railway companies thus acquiring feeders of traffic to their lines.

With over two hundred Bills relating to railway and canal amalgamations requiring the attention of Parliament during the ses-

sion of 1846, a Committee of the House of Commons was appointed for the consideration of the subject. The substance of their opinion was that while amalgamations between railways and canals should not be altogether refused, each case should be scrutinised on its individual merits. The imposition of a low scale of tolls and charges was essential in the case of canals, as the public are to a great extent their own carriers. In such cases as the conversion of a canal into a railway, care should be taken that no district is deprived of efficient means of communication, and the company concerned to afford due facilities of access to all parties affected by the change. A very important recommendation, which the Committee made "after mature consideration," is that—

"It is absolutely necessary that some department of the Executive Government should be so constituted as to command general respect and confidence, and charged with the supervision of railways and canals, with full power to enforce such regulations as may from time to time appear indispensable for the accommodation and general interest of the public."

On the recommendation of the Committee, a Railway Commission was appointed, but was abolished in 1851, its duties being handed over to the Board of Trade. During 1846 and 1847 the Legislature sanctioned the control or actual purchase by railway companies of 1,350 miles of navigable canals out of 3,000 miles in England and Wales.

The next important development in legislation regarding inland transport was Mr. Cardwell's well-known Act of 1854 (17th and 18th Vict., cap. 31), "An Act for the better regulation of railways and canals." This statute requires all companies to afford reasonable facilities for the conveyance of traffic without inordinate delay, and the strictest impartiality, and enables parties concerned to apply by motion or summons to a Superior Court; this being the first statute in which a special tribunal was fixed for the determination of issues relating to railway and canal traffic.

In 1858, a statute (21 and 22 Vict., cap. 7) was passed stipulating that canal companies which were also railway companies should not be permitted to lease any canal or the tolls, without the express sanction of Parliament. The object of this statute is to prevent the virtual amalgamations of canals with railways which had been effected under the pretence of leasing independent canals, by railway companies who were also canal companies, by reason of precedent purchase of navigable canals. In 1860, a further statute (23 and 24 Vict., cap. 42) made the Act of 1858 perpetual in its operation.

Nothing further was done by the Legislature of a practical character affecting the administration of canals until 1872, when a Joint Committee of the Lords and Commons was appointed to enter into an investigation of the whole hearings of the amalgamation question. The Committee made an exhaustive inquiry, and issued an able and comprehensive report. The following suggestions for the improvement and superior administration of canals were made by the Joint Select Committee:—

1. "That no inland navigation, now in the hands of a public trust, should be transferred to or placed under the control of a railway company; and that if the trustees of an inland navigation or a canal company apply to Parliament for power to purchase compulsorily a canal from a railway company, such purchase should be favourably regarded by Parliament.
2. That the utmost facilities should be given for the amalgamation of adjoining canals with one another, or with adjoining inland navigations.
3. That no canal should be transferred to or placed directly or indirectly under the control of any railway company, nor should any temporary lease of any canal to a railway company be renewed until it has been conclusively ascertained that the canals cannot be amalgamated with or worked by adjacent canals, or by a trust owning adjacent inland navigation.
4. That whenever a railway company, applying to Parliament for amalgamation, has under its ownership or control any canal communication in the district, the propriety of continuing or modifying such ownership or control should be a subject of

investigation by the Committee dealing with the Bill.

5. That the principles of the Railway and Canal Traffic Act should be strictly carried into effect by requiring every company owning or controlling a canal to maintain it in a state of thorough efficiency; to give every facility for through traffic; and to remove every obstacle, whether in the shape of bar tolls or otherwise, which are imposed for the purpose of impeding through traffic; and that those obligations should be enforced by proceedings before the Railway Commissioners.

6. That the owners of any canal or inland navigation should have power to make a through toll or rate from or to any place on its own canal, or to or from any place on any other canal, or on railway forming a through route; the toll or rate to be divided between the owners of the different parts of the route, as a general rule according to mileage, but with a provision that if any objection be made to the proposed rate, toll, or division as unfair, and no agreement can be come to, the Commissioners shall upon the application of any of the parties interested decide the matters in dispute."

From the Report of the Joint Select Committee of 1872, it was made apparent to Parliament that the time had arrived for the constitution of a lay tribunal for the redress of grievances arising out of railway and canal matters. The following is the recommendation of the Committee in this connexion:—  
"To perform the various duties referred to in this Report a special body should be constituted, entitled the Railway and Canal Commission, which should not consist of less than three members. They should be persons of high standing, of whom one should be an eminent lawyer, and one should be thoroughly acquainted with the details and practice of railway management."

It devolved upon Lord Carlingford,—then Mr. Chichester Fortescue,—as President of the Board of Trade, to bring before Parliament a Bill based upon the Report of the Joint Select Committee. In passing through the Committees of both Houses, the powers which the Bill contemplated granting to the Commission were, as the consequence of formidable railway opposition, materially curtailed. After passing through these ordeals, at length the Bill emerged, and was placed on the statute book as, "An Act to make better provision for carrying into effect the Railway and Canal Traffic Act, 1854, and for other purposes connected therewith." This statute, 36th and 37th Victoria, cap. 48, received the Royal assent on July 21, 1873, and came into operation on September 1 of that year. The Commission was appointed for an experimental period of five years. Its powers were, however, prolonged in 1878, and since from time to time, until the supersession of previous legislation as affecting the administration of railways and canals by the Railway and Canal Traffic Act, on January 1, 1889.

Although the Act of 1873 rendered most excellent service, it was soon discovered that finally had not yet been attained to by the Legislature as regards railway and canal administration. As, however, the Railway and Canal Traffic Act, 1888, virtually consolidates precedent legislation, it is unnecessary to mention in detail the provisions of the enactment of 1873. Those interested in the limited number of cases which have arisen under the Act of 1873 will do well to consult the valuable work on "The Practice before the Railway Commissioners," by J. H. Balfour Browne, Registrar to the Railway Commission.

During 1881, a Select Committee of the House of Commons was appointed "to inquire into the charges of railway companies and canal companies for the conveyance of merchandise, minerals, agricultural produce, and parcels on railways and canals, into the law and other conditions affecting such charges, and into the working of the Railway Commission of 1873." This Select Committee, finding the inquiry could not be concluded during that session, only reported the evidence to Parliament, with a request to be reappointed during the next session. In 1882, another Committee, with the same functions, was nominated, the evidence given before the Select Committee of 1881 being referred to the Committee of 1882. No less

than 44,974 questions were asked, and, in addition to the voluminous minutes of proceedings, the appendices formed a volume exceeding 600 pages of matter. The recommendations made by the Committee with regard to canals in their Report dated July 27, 1882, are as follows:—

"That Parliament do not sanction any further control direct or indirect of canal navigation by a railway company.

"That the powers and jurisdiction of the Railway Commission may be made to cover—  
(a) All questions arising under the special Acts or the public statutes for regulating railway or canal traffic affecting passengers or goods.

(b) The making of orders which may necessitate the co-operation of two or more railway or canal companies within the statutory obligations of the companies.

(c) Power to order through rates on the application of traders, but no such order to impose on a railway company a rate lower than the lower rate of such railway company for similar articles under similar circumstances.

(d) The revision of traffic agreements both of railways and canals, in as large a measure as the powers formerly exercised by the Board of Trade.

(e) The Commissioners to have power, on the joint application of parties, to act as referees in rating appeals.

(f) The High Court of Justice to have power to refer to Railway Commission cases which involve questions under the Railway and Canal Traffic Act.

The subject of canals in Ireland being under different conditions to that of canals in England, and large districts in Ireland having no other means of communication, that powers be given to Local Authorities or Public Trusts to acquire, extend, and maintain such canals in that country as may be deemed for the public benefit of the districts affected."

As might be naturally expected from the anomalous constitution of the Committee and the nature of the proceedings before it, the Report upon review is found to be inconclusive upon many important points. Of the twenty-seven members of the Committee, excluding the chairman, the Honourable Evelyn Ashley (at that time acting as Parliamentary Secretary to the Board of Trade), who may be assumed to be neutral from his function, of the remaining twenty-six no less than seven were railway magnates. The remaining nineteen members, although among the most capable men who could be selected from the House of Commons, were at a considerable disadvantage, owing to two important considerations, namely, that they could not possibly have the same measure of acquaintance with the questions involved as the seven railway members, nor had they the assistance at command which the railway members undoubtedly had, having at their back officials representing the law and traffic departments, who note every atom of evidence and prompt the railway magnates as occasion requires. The witnesses representing trades are for the most part unused to giving evidence, and are easily misled by the adroitness of questions suggested by practical railway officials. When it comes to the turn of these officials, they answer as veteran experts accustomed to be on the alert, and wide-awake in their replies to the insinuating inquiries made of them.

On February 22, 1883, on the motion of Mr. Thomas Salt, the Member for Stafford, a Select Committee of the House of Commons was appointed "to inquire into the condition and position of the canals and inland navigation of the country, to report thereupon, and to make such recommendations as may appear necessary." The Committee consisted of eighteen members of Parliament, held eleven sittings between April 19 and July 12, 1883, examined twenty-three witnesses, and asked 3,692 questions. The Minutes of Evidence and Appendix occupied 331 printed folios of matter. On July 12, 1883, the Committee reported to Parliament the evidence taken, but as it was not in their power to conclude the investigation during the session, recommended the reappointment of the Committee in the next session of Parliament. The Committee was not, however, reappointed, and legislation regulating the administration of canals rested in abeyance for several years. The Railway and Canal Traffic Act, 1888, which received the Royal Assent on August

10 of that year (51 and 52 Vict., cap. 25) and came into operation on Jan. 1, 1889, may be said to have embodied all the essential features of precedent legislation relating to navigable canals, and supercedes all previous statutes regulating the administration of waterways. Its provisions have been largely governed by the recommendations of the Joint Select Committee of 1872, and those of the Select Committee of the House of Commons, 1881-82, on Railway and Canal Charges and the working of the Railway Commission appointed under the Act of 1873. The Act constitutes a new Commission, entitled "The Railway and Canal Commission," which has the status of a Court of Record to be judicially noticed. The Commission consists of two appointed and three *ex-officio* Commissioners. The Commission may act notwithstanding any vacancy that may occur. The two appointed Commissioners are to be chosen by Her Majesty on the recommendation of the Board of Trade, and one of them must be of experience in railway business. It is lawful for the Lord Chancellor of England, if he think fit, to remove for inability or misbehaviour any appointed Commissioners. Of the three *ex-officio* Commissioners, one must be nominated for each of the three Kingdoms, and not be required to attend out of that part of the United Kingdom for which he is nominated. The *ex-officio* Commissioner in each case must be a Judge of a Superior Court; such as in England the Lord Chancellor, in Scotland the Lord President of the Court of Session, and in Ireland the Lord Chancellor of Ireland. If any Judge who is assigned as an *ex-officio* Commissioner is temporarily unable to attend, he may nominate a Judge of a Superior Court, who will be for any case he may hear an *ex-officio* Commissioner.

Any Local Authority,—say a Harbour Board or Conservancy Authority,—and any Council of a city or borough, any representative county body, any Justices assembled in Quarter Sessions, the Commissioners of Supply in any county in Scotland, or any Urban or Rural Sanitary Authority not being a Council, and any Association of Freighters or Chamber of Commerce or Agriculture, which may obtain a Certificate from the Board of Trade that, in the opinion of that Board, they are a proper body to make a complaint, may make such complaint to the Commission of any grievance which they have jurisdiction to determine, without proof that such Authority is aggrieved in the matter of complaint, and may also appear in opposition to any complaint made to the Commission in such cases as the Authorities appear to be likely to be affected by any determination of the Commission.

All powers granted by any precedent statutes relating to the Commission are by the Act of 1888 transferred to the Commission as newly constituted. No appeal shall be made from the Commission upon a question of fact or upon a question regarding the *locus standi* of a complainant except that, as otherwise provided by the Act, an appeal shall lie from the Commission to a superior Court of Appeal. The decision of a superior Court of Appeal shall be final, provided that when there has been any difference between any two superior Courts of Appeal, any superior Court of Appeal in which a matter of difference is pending may give leave to appeal to the House of Lords on such terms as to costs as the Courts shall determine, save as provided by the Act, an order or proceeding of the Commission shall not be questioned, and shall not be restrained by prohibition, injunction, certiorari, or otherwise, either at the instance of the Crown or otherwise. The Commissioners can determine all matters of law or fact, and as regards attendance and examination of witnesses, the inspection of property, and have all the other powers, rights, and principles vested in a superior Court.

All the clauses of Part II. of the Act of 1888 apply equally to both railway and canal companies, and both are bound to submit to the Board of Trade a revised classification of merchandise traffic, and also a revised

schedule of maximum rates proposed to be charged by the companies, and to fully state the nature and amount of all terminal charges proposed to be made. The Commission have powers to enforce legislative provisions with reference to through rates, undue preference, and the provision of reasonable facilities for traffic.

Annual returns made to the Board of Trade must contain such statistics as the Board require. Classification-tables must be open for inspection, and copies must be provided for sale.

The Act stipulates that section 15 of the Railways Regulation Act of 1873 (36 and 37 Vict., cap. 48) shall apply to the terminal charges of a canal company. The terms of the section are as follows:—"The Commission shall have power to hear and determine any question or dispute which may arise with respect to the terminal charges of any railway company when such charges have not been fixed by an Act of Parliament, and to decide what is a reasonable sum to be paid to any company for loading, unloading, covering collection, delivering, and other services of a like nature. Any decision of the Commissioners under this section shall be binding on all Courts and in all legal proceedings whatever."

The power of the Commission extends over canal rates, tolls, and charges where a railway company or its officers own or control the traffic of a canal.

Returns have to be made on or before January 1 of each year, a description of the qualification of the company and a description of the undertaking, and (at a certain period of the year to be fixed by the Board of Trade) giving particulars of traffic, capital, revenue, expenditure, and profits. When a canal is intended to be stopped for more than two days, the company have to report to the Board of Trade defining the period the stoppage may last, and on re-opening to inform that Board. Every canal company, by a date to be fixed by the Board of Trade, are required to send true copies of their by-laws, and any new by-laws will not have any force or effect until two months after sending the copy, unless the Board of Trade report earlier. Should the Board of Trade have any reason to suppose that a canal is in a condition dangerous to the public, or causing serious inconvenience or hindrance of traffic, the Board may on their own account appoint an officer to inspect and report.

Section 42 of the Railway and Canal Traffic Act of 1888 is very stringent with regard to the acquisition of any unauthorised interest in a canal by any railway company or its officers. The terms of the section are as follow:—

"No railway company or director or officer of a railway company shall without express statutory authority apply or use or authorise or permit the application or use of any part of the company's funds for the purpose of acquiring in the name of the railway company, or of any director, or officer of the railway company, or other person to purchase or acquire any canal interest, or of guaranteeing or repaying to any director or officer of the railway company, or other person who has purchased or acquired any canal interest, the sums of money expended or liability incurred by such director, officer, or person, in the purchase or acquisition of such canal interest, or any part of such money or liability. In the event of any contravention of the provisions of this section, the canal interest purchased in such contravention shall be forfeited to the Crown, and the directors or officers of the company, who so applied or used or authorised or permitted such application or use of the company's funds, shall be liable to repay to the company the sums so applied and the value of the canal interest so forfeited, and proceedings to compel such repayment may be taken by any shareholder in the company."

Canal companies may enter into agreement for through tolls, and may establish a clearing-house system. A novel feature introduced into the Act of 1888 is that the Board of Trade may be called in to arbitrate in any differences arising between the public and the railway and canal companies. No distinction between home and foreign trade is to be allowed. Special emphasis is given in the Act of 1888 to the rights of harbour authorities to complain of undue preference in favour

of a rival port. The Act of 1888 also stipulates that in the event of any canal being held to be unnecessary or to have become derelict, the Board of Trade, under the hand of the Secretary, may issue a warrant for its abandonment, and when the conditions of the Act have been fulfilled, may grant a discharge releasing the proprietors from all obligations of maintenance and any further liability. The definition of "derelict," as applied by the Act, describes a canal which is either unfit for navigation or has not been used for navigation for three years. Before a canal can be held as unnecessary the proprietors must fully satisfy the Board of Trade that such is the case, also that the application has been approved by the votes of a majority of the shareholders at a meeting specially convened, and that public notices as required by the Board of Trade have been given to such persons as are entitled in consequence of abandonment, and also that compensation has been given to such persons. In case of dispute as to the amount of compensation, the Board of Trade may determine the amount.

While it must be admitted that the Railway and Canal Traffic Act, 1888, is a great advance in the right direction, it cannot be claimed that it affords a final solution of the complicated difficulties attending legislative efforts to arrive at a perfect system of Government control of the administration of our railways and canals. The situation has even greatly intensified in its complexity since Robert Stephenson, on the occasion of his taking the chair as President of the Institution of Civil Engineers in 1856, thus summed up the position:—"Little more than a quarter of a century has elapsed since Parliament first began to legislate for railways. In that period a multitude of laws has been placed on the statute book, which will certainly excite the wonder, even if they fail to be the admiration of future generations. But it is not so much the number of the statutes regarding railways that excites surprise. The extraordinary feature of the Parliamentary legislation and practice consists in the anomalies, incongruities, irreconcilabilities, and absurdities which pervade this mass of legislation. A Commission was appointed a few years since for the consolidation of the statute law. If ever that Commission should have to deal with railway law, it will find itself in a dilemma. It will find that legislation for railways, both in principle and detail, is utterly irreconcilable, and that the only way of escaping the difficulties of the position would be to sweep away the whole from the statute book and legislate afresh."

The remaining statutes relating to matters affecting inland waterways which require mention may be dealt with by a brief reference; one of these, the Explosives Act, 1875 (38 & 39 Vict., c. 17), enables the canal companies to frame by-laws for the conveyance, loading, and discharging of gunpowder and other explosives. The Canal Boats Act, 1877 (40 and 41 Vict., c. 60), provides for the registration and regulation of canal boats used as dwellings; and the Canal Boats Act, 1884 (47 & 48 Vict., cap. 75), makes further provision for the registration of such boats. These statutes only apply to such of the canal companies, and such of the general public, as are carriers on the canal.

THE ENGLISH IRON TRADE.—The English iron market is quieter than last week, but perfectly steady at the higher prices. In pig-iron the business doing has been moderate, a firm tone prevailing. Middlesbrough pig No. 3 is 3d. a ton higher, and Bessemer iron has gone up 1s. 6d. a ton; but Scotch makers' iron is rather irregular in price, although there has only been a small traffic in warrants at firm rates. In Lancashire and Staffordshire makers hold firmly to the advanced prices. Manufactured iron is in rather better demand, but values show no real improvement with the exception of plates in the North, prices of which are stiffer. There are also some inquiries for steel-plates, due, probably, to the better prospects for shipbuilders, caused by fresh inquiries for new ships. Engineers continue tolerably well employed.—Iron.

## NOTES.

**T**HE Board of Trade have now submitted to the railway companies draft classifications and schedules of rates as revised by the Board. These documents are of the greatest importance, embodying as they do the decisions come to by the Department after considering the arguments of all parties interested. That they have recognised the justice of many of the objections made by the traders to the proposals of the railway companies is very evident, although they have not always adopted the counter-proposals of the former. With regard to the companies' claim to charge fractions of a quarter of a ton as a quarter of a ton,—to which the traders strongly objected,—the *Times* remarks that they have got their way upon the point, although a good deal of unnecessary fuss was made over it. As a matter of fact, however, the proposals of the Board are for this to be done only when a consign-ment exceeds five tons, while below that weight the companies may charge fractions of a quarter of a hundredweight as a quarter of a hundredweight,—which is only reasonable, and to which no trader will object. The "small" question is of far greater importance, and the Board recommend a limit of 3cwt., instead of 500 lbs., as at present. It will be remembered that the railway companies sought to raise this limit to 500 lbs., while the traders agitated for a reduction to 2cwt. The decision will, doubtless, meet with some opposition on the part of the railway companies, particularly those whose trade is largely what may be described as a retail one. The adoption of this recommendation would make a considerable difference to many small traders, and would be viewed with a corresponding amount of disfavour by the railway companies concerned. After all, the latter have no great cause for complaint, as they were content with a 1cwt. minimum a few years back, although possessing power to raise it to 500 lb. Moreover, the additional charge proposed to be authorised is rather higher than that at present levied by the companies. Both station and service terminals are recognised, but the sums claimed by the railway companies for the respective services are considerably reduced,—the extra amounts proposed to be imposed in the case of certain large towns being disallowed altogether. We apprehend that the companies will not submit to these reductions without protest, and there may be a further struggle upon this point,—and so, too, with regard to the mileage rates, which are also reduced. It may probably be taken for granted that, as a whole, the proposals of the Board commend themselves to the Railway and Canal Traders' Association, for at their annual general meeting on the 25th ult. they contented themselves with passing a resolution urging the desirability of the report of the Board being presented to Parliament without delay. It must be admitted that the officials of the Board have so far proved themselves quite competent to deal with this complicated and difficult business, although, of course, it does not follow that their decisions and recommendations will be accepted as final. The protracted nature of the inquiry has been no fault of theirs, and the present stage has really been reached more expeditiously than at one time seemed at all probable.

**T**HE Secretaries of the Institute of Architects have addressed a letter to the Secretary of H.M. Office of Works calling attention to the custom of that Office, in advertising for tenders, of not only stating that "The Commissioners do not hold themselves responsible for the accuracy of the quantities" but adding, "which must be verified by the persons desirous of tendering." The Institute letter points out all the reasons, well known to most of our readers, why such a stipulation is unfair and unreasonable, and that to be of any value such verification would in fact amount to taking out the quantities over again. The Secretary of the Office of

Works, in a brief reply states that he is instructed by the First Commissioner of Works to acquaint his correspondents, "for the information of the Council of the Institute of British Architects," that the words "which must be verified by the persons desirous of tendering" will in future be omitted from the Board's advertisements for tenders for building works. Nothing is said as to the clause to the effect that "the Commissioners do not hold themselves responsible for the accuracy of the quantities." Yet as the Office of Works issues the quantities, they certainly ought to make themselves responsible for their accuracy.

**W**E regret to see that the London County Council have disagreed with one recommendation of the Improvements Committee, and have refused to widen High-street, Kensington. This improvement is most urgently needed, and the fact that the Council will not undertake it shows how inadequate are their views of their duties. The cost of the improvement was estimated at 47,000*l.*, and every year that it is delayed will add to its cost. The work might have been done several years ago at less than it will cost now, and the refusal of the Council to proceed with it is not to the credit of the members, who, on questions of this nature, exhibit the narrow spirit of the average Vestryman. Members who have their own purely local interests to serve strenuously support schemes affecting their own localities, which in their view are, of course, always "metropolitan" in character, and therefore deserving of a contribution towards their cost from the central authority. When, however, a projected improvement is remote from their own district they pool-pool it, and the project is defeated unless an exchange of votes has been agreed to. It was alleged in the course of the debate on the Improvement Committee's Report on Tuesday that members representing districts remote from each other agreed to support each other's local schemes, on the principle of *quid pro quo*. Tactics of this kind are not likely to result in the soundest decisions on such questions, which ought to be dealt with on their individual merits, having due regard to the improvement of the arterial communications of the metropolis as a whole.

**S**OME hundreds of drawings are being exhibited at the South Kensington Museum, the work of the students in competition for the National Medals and Prizes. The architectural and decorative work, with which we have particularly to deal, is far from strong as a whole, although there is some praiseworthy work. Architectural design is decidedly poor, the only two specimens which seem worthy of notice being a Town-house by Frank B. Cooper, and a design for a church by C. Townson. The measured drawings of old work are better—those of the river front of the Naval College at Greenwich by G. Harvey, and the set of drawings of the Lady Chapel, Llandaff Cathedral, by John H. James, being apparently very carefully done. The latter set is, however, much spoiled by the introduction into the lettering and some of the architectural features of coloured ink. Some pencil sketches by Mr. A. H. Hind and a measured drawing of some panelling at St. Vincent, Rouen, are also worthy of note. The drawings of decorative work are numerous. A design by Miss Foster, for a mosaic floor, is excellent, particularly the full-size drawing; and good work dealing with the same subject and tiles, bears the names of Miss Wickham, Miss Mohun, Miss Roots, and Mr. Rathbone. The latter shows some very effective tiles of a reddish hue, with fish cleverly worked into the pattern and the border. Miss Brothers exhibits a textile design with dodos introduced, simple in design and good in colour. Among the wall-paper designs, that by L. P. Butterfield should be mentioned,—a bold flowing design in green and pink, and tapestry and silk hangings by James Atherton. An elegant design for a cup, with figure subjects

introduced, incidents from Tennyson's "Lady of Shalott," calls for mention, and an effective water-colour sketch of the mosaic fountain, which is still one of the sights at Pompeii, by Herbert Cole. The space allotted to these drawings is small, and it is a pity the authorities cannot place them where they can be better seen. Most of the works referred to have been awarded a medal, but the scattering of medals—gold, silver, and bronze—assumes large proportions at South Kensington. It seems probable that the standard of work would be raised if the number of prizes was smaller, to say nothing of the increased value of the prizes themselves to those who received them.

**A**CCORDING to Sir Edward Watkin's speech to the Metropolitan Railway shareholders last week, it seems that the imitation of the Eiffel Tower, to which the Chairman of the Metropolitan Railway is going to treat Londoners, is to be placed at Wembley Park, where the Company have purchased 480 acres of land. Whether an enterprise of this kind can be successful if Londoners have to reach it by rail may be doubted, for the tendency of the times is a disinclination in dwellers in the metropolis to patronise suburban amusements, however good. One thing, however, is clear, that if the tower is constructed at Wembley, the Board of Trade should insist on Baker-street station being enlarged, and means taken not only there but on the main line of the Metropolitan Railway to meet the increased traffic in an adequate manner. Baker-street station is now at times most dangerous for passenger traffic, and the Board of Trade, whose duty it is to see to the safety of the public on railways, ought not longer to overlook this matter.

**T**HE new portions of Chester Railway Station, which have been in progress for the last thirteen months, have now been opened for traffic. They add greatly to the accommodation of this important railway centre, which now takes its place as one of the largest junctions in England. It is another instance that the more flourishing a railway company is, the more it is willing, as is natural, to do for the convenience of the public, and it keeps up the reputation of the London and North-Western Railway Company for efficient service to the public. It is much to be desired that the Great Western Railway would set about building a new station at Reading, and the North-Western have also much work on hand to make Willesden Junction more convenient to the public.

**T**HE programme of the course of instruction in architecture at the Cornell University, U.S.A., shows that the Americans are in earnest in endeavouring to provide a systematic training in architecture as part of a university education. The course of study leading to the degree of a Bachelor of Science in Architecture is a very wide one, and seems calculated to turn out the student of architecture with some progress towards the attainment of that ideal of all-round knowledge indulged in by Vitruvius. It includes natural sciences, mathematics, geology, drawing, building materials and construction, stereotomy, &c. The following extract from the circular of information gives the outline of the subject of Building Construction as treated at Ithaca:—

"*Building Materials and Construction.*—This subject is taken up as early as practicable, in the second term of the sophomore year. The nature, properties, and uses of stone, wood, iron, brick, &c., are explained by lectures. The methods of preparing materials for use are fully discussed. Instruction is given also in measuring, and making out bills of quantities. The various processes of building are then explained, and the ordinary forms of architectural structures fully illustrated. The determination of the bearing power of the soil, or bottom, the means of strengthening it when necessary, and the adjustment of the footings, receive special attention. The lectures are accompanied by nine hours a week of drawing, and followed in the succeeding term by twelve hours a

week of lectures and work in the draughting-room relating to the preparation of scale-working drawings, with full-sized details, and complete specifications and contracts. The subjects usually selected are (1) a frame dwelling; (2) slow burning construction on the system approved by the Boston Manufacturers' Mutual Fire Insurance Company; (3) advanced problems in wood, masonry, and iron construction. The last subject is treated through the Junior year by exercises in sketching, to scale, solutions of some of the more difficult problems incident to the detail of houses; by study of the mechanical principles involved in the construction of roofs, iron trusses, &c.; and finally by the complete working out of all the constructive requirements of a large commercial building, involving the calculation of loads, the determination of proper thicknesses of walls, the designing of box girders, the selection of I beams and wrought-iron columns, and the designing of cast-iron pillars. The department has the beginning of a collection of working drawings of buildings actually completed, contributed by prominent architects, including examples of public, domestic, educational, and mercantile work, to which the student has access for study. The methods of work in the drawing rooms are approximated to those of an architect's office, and by the end of the second year the student should acquire sufficient knowledge and experience of scale and detail drawing to secure him employment, if he wish it, during the summer vacation.

**A** MADAGASCAR forests company has been established to deal with and bring into use the native timber of Madagascar, and held its first meeting in the course of last month. The enterprise seems at present to be in rather an early and tentative stage, being engaged rather in recommending the timber than in doing any material business in it; but the evidence of some practical correspondents whose letters were read seemed to indicate that Madagascar teak was a timber that deserves more attention than it has hitherto received, in this country at least.

**W**E fear that the Select Committee of the House of Lords, who have passed the preamble of the Richmond Lock Bill, will find when it is too late that they have made a mistake. They are evidently much impressed by the advantage to so beautiful a locality as Richmond of being gifted with a perennially full river; and no doubt Richmond under these circumstances would be one of the most beautiful and attractive portions of the Thames; but we doubt whether the Committee have realised either the extent to which the present condition of the river at Richmond is due to the absorption of water by the Water Companies (a system which is doomed to no very distant date), or the extent to which the tidal river will be likely to be injured by this cutting short of the entry of tidal water. Eminent engineers have given evidence on both sides, it may be said; but it is overlooked that the strongest evidence against the scheme comes from those who are most especially experts as to the treatment of tidal rivers and estuaries. It would be far wiser to take steps to expedite a new scheme for London water-supply, and leave the question of another weir on the Thames till it be seen how far the stoppage of the water companies' drain out of the river will affect its condition for the better, by affording a larger supply of land water.

**W**E are glad to find that the Corporation of Leeds fully recognises the responsibility attaching to its recent acquirement of Kirkstall Abbey. A number of men are hard at work clearing away the rubbish which has for so many years covered a considerable portion of the buildings. The ground to the north and east of the church has been excavated to the depth of 3 or 4 ft., and the base courses along these sides have been laid bare. One wall of a porch, which sheltered the enriched doorway in the westernmost bay of the north wall, has been uncovered, and several small tiles have been unearthed. Part of the east wall of the chapter-house is now visible; it stands a little higher than the base-course, and is a few feet outside the modern wall which forms the present end of

the building. The chapter-house formed part of the original structure erected in the latter half of the twelfth-century, but was extended at the beginning of the fourteenth-century, and the wall now exposed is of the latter date. Excavations have also been made in the refectory, disclosing certain walls not marked on current plans of the abbey; and in the hospitium and other portions of the building a considerable clearance has been effected. Little or nothing has been done in the church, and the stones, which formed a great heap in the nave and north transept when the north-west pier of the central tower gave way in 1779, still remain there. The greater part of the ivy which covered the walls has already been stripped off, and the fine elms which flourished amid the ruins and added so much to their picturesqueness, have been cut down. By the picture-maker, perhaps, the destruction of all this greenery will be contemplated with sorrow, but by architects and archaeologists all steps which are taken to show the ancient buildings more clearly and to preserve them for a longer period will be gladly welcomed. We do not know whether it be contemplated to pull down the modern walling, which has been inserted in the doorways leading from the cloister garth to the refectory, in the east end of the chapter house, between two arches in the abbot's hall, and in other places, but we certainly hope that this will be done, so that at any rate access may be obtained to the various rooms in the way provided by the original builders.

**I**T is proposed to construct a new street in continuation, eastwards, of Tavistock-street, Bedford-square. This thoroughfare will run from Caroline-street to Charlotte-street, passing between Great Russell-street and the southern side of Bedford-square. The slip of ground to be thus let, upon building leases, covers about 59,000 ft. superficial. The improvement will involve, we understand, the destruction of a house on the eastern side of Caroline-street, formerly inhabited by John P. Kemble,--it was No. 13 in his time, and has since been renumbered 12,--and whence he removed to a house, since destroyed, on the northern side of Great Russell-street.

**N**EARLY half of the last number of the "Journal of Hellenic Studies" (vol. xi, No. 1) is devoted to the report by Mr. H. A. Tabbs of the past six years' excavations in Cyprus. No discovery of any great general interest has been made, but the report abounds with details that are important to the specialist. The paper that will probably attract most general attention in the number is that by Mr. Cecil Smith on the Macmillan lekythos. This vase was presented to the British Museum by Mr. Malcolm Macmillan shortly before he started on the expedition to Greece, from which he never returned. Apart from the melancholy interest that attaches to it on this account, the lekythos claims attention as the finest specimen extant of the class known as "Protokorinthian." The beautiful plates that accompany the text are the memorial gift to the Journal of the Macmillan family. In his able paper, Mr. Cecil Smith arrives at two main conclusions, very valuable for the history of early Greek ceramicography,--i.e., 1. That the Protokorinthian ware, following shortly after Mykene, is closely connected with the old Greek Korinthian metal industry, and hence was influenced by the Cypriot-Phoenician metal bowls. 2. The fabrics of Naukratis, Kyrene, and Daphne were subject to this Cypriot-Phoenician influence at a later date, and probably in two ways:--Directly, through communication with Cyprus; indirectly, through Korinthian importation. Mr. E. J. Gardner, besides his annual report of the work of the British School at Athens, contributes an interesting paper on the processes of Greek sculpture, as shown by some unfinished statues in Athens, a paper in which he acknowledges the help received

from a practical sculptor, Mr. W. Goscombe John, Gold Medallist (Sculpture) of the Royal Academy. Dr. Chas. Waldstein publishes a small terra-cotta, of interest in relation to the central slab of the east frieze of the Parthenon. It represents a woman carrying a cushioned seat. Dr. Waldstein inclines to agree with a recent conjecture in the *Classical Review*, iii, p. 378, that the two attendants in the slab may be the priestesses called by Istros Trapezo and Kosmo; the terra-cotta may have been buried in the grave of a woman who held the function of Trapezo (table-priestess).

**W**E have received a printed circular in regard to the Penryn (Moelfre) Limestone and Marble Quarry, situated in Traeth Bychan Bay, Anglesey, from which it appears that the stone is about to be more extensively raised, both for building and ornamental purposes, than formerly. The material is, geologically, a Carboniferous limestone on the same horizon as the encrinurid or crinoidal marbles of Derbyshire, and of similar character to that quarried and polished near Penmon, about four miles north of Beaumaris. The Carboniferous limestones of Anglesey is exceedingly crystalline, and takes a clean and beautiful polish, and in a small way it has been favourably known for a long time. The prevailing tint is brownish-grey of a fine mottled appearance, with dark spots and veins, but dark brown and black marbles can also be found. The Penryn quarry is practically on the sea-shore, some distance from rail, and the cost of carriage has hitherto handicapped the stone. This is intended to be remedied by forming a dock by cutting a channel about 100 ft. in length out of the solid rock, so as to make it available for coasting vessels and steamers. The building stone has been employed in many important engineering works--notably the Meaul Tuhular Bridge, where the compact and heavy nature of the material, and large size of the blocks available, proves its utility on this head. Moreover, the stone is very durable,--all such highly crystalline limestones are; but the sombre aspect of the whole when built up, together with the refractory nature of the material, hardly renders it suitable for the better class of buildings, especially, where fine mouldings are required. It makes a good serviceable marble, however, and herein consists its chief value.

**T**HE recommendation of the Committee of the House of Lords on the "Removal of Gates" Bill, to the effect that no compensation is necessary, but that portions of streets which would now experience a new traffic nuisance should be laid with wood pavement, is a very lame and impotent conclusion to what had been previously urged in the House of Lords on the subject, and to the admissions made by Lord Salisbury. It was shown in evidence that some of these gates had been in existence in the same positions as private gates on the Duke of Bedford's estate for centuries; it was stated plainly in evidence by the Duke of Bedford's solicitor, who had the letting of all the property in question, that its letting value would be seriously depreciated by their removal; there is no pretence that the maintenance of these gates up to the present time has been illegal; but now an Act is to be passed to compulsorily remove them without any compensation to those whose interests are undoubtedly affected by their removal. This is sheer confiscation. We have long been of opinion that the gates, in the interests of the general public, ought to be removed; but to remove them without any compensation to the minority who are thereby injured is such a manifest piece of injustice that we can hardly yet believe that this course can finally be allowed to be taken.

**RIVERSIDE INNS.**--The *Art Journal* for August has an article on "Riverside Inns," the illustrations to which show some most interesting bits of picturesque old buildings.

## LETTER FROM PARIS.

A GREAT impression was produced in Paris by the recent death of Sir Richard Wallace, who had gained a reputation here not only as an amateur of art and a collector, but as a public benefactor and a faithful friend to Paris in her worst troubles, for he elected to remain here all through the siege, and organised an ambulance corps which was very well worked, and was very useful. Since that sad epoch, he further showed his generosity in the gift to the City of the fifty bronze drinking-fountains which bear his name, and which have been such a boon to the artisan class of Paris. These fountains, cast in bronze, have a small octagonal base above which is a square pedestal decorated with reversed consoles, and above this four caryatid figures supporting a small dome, from the centre of which pours continually a small thread of water, to be collected in a cup when required by a passer-by. The design for these fountains was by M. le Bourg, a sculptor of considerable talent.

It was in the "Château de Bagatelle," in the Bois de Boulogne, that Sir Richard Wallace died. This is a charming house, formerly called the "Folie d'Artois," and built by the brother of Louis XVI., who became afterwards Charles X. The property was sold during the Revolution and transformed into a concert-garden. The events of 1815 caused its restoration to the Comte d'Artois, who gave it to his son, the Duc de Berry. The park is one of the pleasantest promenades in the environs of Paris, facing Suresnes and Mont Valérien. The Château de Bagatelle lastly fell in right of succession to the heir of the Marquis of Hertford, whose monument is to be seen in Père la Chaise, close to those of General Foy and Béranger. It is a heavy and massive construction in ashlar, terminating in five steps, making a kind of pyramidal finish. In the interior, in a sort of chapel, is seen a bronze bust of the Marquis of Hertford.

At the cemetery of Mont Parnasse, as it is mentioned, there is talk of restoring the memorial to Admiral Dumont d'Orville. The tomb of this celebrated navigator, which was designed by Constant Dufeux, was in a state which threatened ruin, and a committee of architects, presided over by M. Chas. Garnier, has been appointed to carry out the necessary work for putting the monument in a state of repair.

All who know the École des Beaux-Arts have admired, in the Cour du Mirier, the fine figure of "La Jeunesse" by Chappu, which stretches out the palm-branch towards the bust of Henri Regnault. In addition to this monument, erected in a general sense to the memory of the pupils of the École des Beaux-Arts who fell in the war, a very simple monument has just been placed in the École, specially dedicated to Regnault, who fell fighting bravely at Buzenval on the 22nd of January, 1871. It is a plaque in black marble on which is fixed a mask in bronze of the painter, accompanied by branches of palm and of oak, also in bronze. A reproduction of this monument has been placed at the Villa Medicis. Another new monument, to be inaugurated in September, is that of Eugène Delacroix, the figures for which are just being cast in bronze by the *cire perdue* process.

The models and cartoons for a portion of the proposed further decoration of the Pantheon have been put up in their places in the building to enable the Committee the better to judge of the effect. The statue of Mirabeau by M. Injalbert has been approved without discussion, but that of Victor Hugo, by M. Rodin, is pronounced deficient in height and amplitude of style, and he has been requested to submit another model more in harmony with the general scheme of decoration. The Committee has been equally unfavourable to the "Triumph of the Republic," which was to decorate the choir, the central figure of which rises above the cornice, and even hides a portion of the mosaic recently executed after the cartoons of M. Hébert. The new models will soon be put in their places in order to judge of the effect of the modifications, and also the models of the sculptural designs intended to mask the bases of the four main piers of the cathedral.

The "Service des Bâtimens Civils et des

\* One of these fountains was a conspicuous object in the Ville de Paris pavilion in the 1889 Exhibition. The continuous pour of even so small a stream of water means, of course, an appreciable amount of waste, but this method of supply has the advantage of aerating the water and keeping it exceedingly cool.—Ed.

Palais Nationaux," which has passed through many vicissitudes, has just undergone a new transformation. Created by the National Convention and incorporated with the Ministry of Public Works, it was transferred, under the Empire, to the "Ministère d'Etat." It passed thence to the control of the "Ministère de la Maison de l'Empereur," then to that of the Beaux-Arts, and finally, it has been reorganised under the control of the "Ministère des Travaux Publics." As the faults of the department arise from its own defective organisation, it is hardly supposed that this new transformation will effect any change for the better. It recalls the remark of a lord of Naples who was always altering the uniform of his soldiers,—"Dress them in green, red, yellow, or blue, they run away all the same!"

The receipts of the two Salons of this year prove that this double event stimulated public curiosity, since the joint receipts of the two exhibitions were 410,000 francs (240,000 for the old Salon and 170,000 for the new), while in 1888 the takings of the Palais d'Industrie Salon only amounted to 320,000 francs. The effect, however, has been to reduce the amount of funds available for the charitable foundations of the Société des Artistes Française (the old Salon). This is only one of the regrettable results of the schism; and in the discourses delivered on the occasion of the distribution of the "récompenses" in connexion with the Palais d'Industrie Exhibition, the various official orators vainly implored the adoption of a peace policy; and vainly also did the Ministère des Beaux-Arts preach conciliation and offer its services as arbitrator. These attempts were made, it is feared, with no success. The venerable M. Bailly has used all his efforts in this direction; but M. Bouguereau still sulks, and M. Meissonier, like Achilles, withdraws himself to his tent. It is even said that he has made a formal demand for a perpetual use of the Palais des Beaux-Arts for the exhibition of his Society, a request which, if made, seems to indicate a determination to a complete and permanent rupture.

The Palais des Arts Libéraux, opposite, is to form the home of a permanent exhibition for the inhabitants of Grenelle, and will also include a salle de conference and a salle des fêtes. The exhibitions of ethnography and social economy will also be installed there. The central dome and the 30-metre gallery will form a public promenade. The Galerie des Machines will be levelled and covered with sand, in readiness to serve for exhibitions of horticulture, agriculture, horse-shows, &c. The cafés and brasseries of the Exhibition will nearly all be re-installed in their former positions. Such are the present arrangements of M. Alphand, which will probably have at all events the effect of giving life and animation to a quarter of Paris which before the Exhibition was comparatively deserted.

The fête of July 14 offered nothing of special interest. As usual, it was made the occasion for an abundant distribution of decorations; but this year the Arts have not obtained a great proportion of these red ribbons. We can only mention, among the new chevaliers, the painters Chartran and Schommer, and the sculptors Roulleau and Zacharie Astruc. The latter, it should be mentioned, is also a very talented water-colour artist. The same ceremony has also been made the occasion of distributing to the engineers, foremen, and workmen who were engaged on the Eiffel Tower a very badly-designed medal voted by the Municipal Council, which passed over all the renowned and first-class medalists of Paris, and gave the work to an artist of little repute, who has turned out a failure.

After having presented France with an ungainly and pretty-nearly useless edifice, M. Eiffel has recently been occupying himself about the important subject of the proposed Metropolitan railway. The Conseil Général des Ponts et Chaussées has voted for the project, the concession for which has been demanded by M. Eiffel, and if the results of the negotiations on this point are satisfactory, M. Yves Guyot will shortly present to the Chambers a "projet de loi" to authorise the construction of the line. M. Eiffel will certainly in this case have earned the gratitude of the Parisian public, who are exceedingly anxious for the construction of the railway.

Among works in progress, there is again repair to be done to the Pont Neuf. This time it is to strengthen the four arches of the right bank, the piling of which is decayed. There is

also the demolition of the Lycée Louis le Grand, which has been taken in hand during the vacation period. New buildings of a solid and monumental character have been raised to take the place of the old buildings founded in 1550 by Guillaume Duprat, under the name of the Collège de Clermont. Lastly, in Rue des Recollets, the municipal administration have inaugurated a disinfecting establishment for all objects which have been connected with or in use by persons suffering from contagious diseases. This building has been constructed from the designs and under the superintendence of M. Bouvard. The destruction of disease-germs is carried on in a hermetically-sealed cylinder, by means of steam under high pressure.

We may mention also the construction at the Gare du Nord of a large buffet with an important staircase, intended for the use of travellers arriving from England, Belgium, Holland, Germany, and Russia, who can under the new railway arrangements proceed to Spain, Switzerland, or Italy, without having to traverse Paris between one terminus and another.

The works of re-arrangement recently carried on at the Louvre have led to the discovery of the fragments of a splendid mosaic brought from Asia in 1860 by M. Renan, and which up to the present moment had been entirely forgotten. M. Guillaume, as architect in charge of the Louvre, is going to arrange for the exhibition of this curious specimen of Assyrian art in one of the galleries of the museum.

The Direction des Beaux-Arts has put up for competition, for the year 1890, the Prix de Sèvres, which is awarded every two years. The subject this year is a table-service and a dessert-service. The models are to be deposited at the École des Beaux-Arts on the first of October.

The Académie des Beaux-Arts has announced the results of the competition in painting for the Prix de Rome. The first grand prix has been awarded to M. Devambaz, pupil of MM. Quay, Jules Lefebvre, Boulanger, and Benjamin Constant; second prizes have been awarded to M. C. A. Lenoir (pupil of MM. Bouguereau and Tony-Robert Fleury) and to M. G. A. Lavergne (pupil of M. Lévy); but it must be confessed that the works exhibited in the competition are by no means of a high order of merit; the best appears to us to be that of M. Lavalley, which, however, obtained no mention at all; he received the second grand prix last year.

The results in the sculpture competition have been much more satisfactory. The grand prix has been awarded to M. Gasq, pupil of MM. Joffroy, Falguère, and Mercier; the second to M. Belloc, pupil of MM. Dumont, Bonissieu, Thomas, and Mercier, and an additional second prize to M. Sicard, pupil of M. Cavalier. The subject given was "The Death of the Spartan Othryades, the conqueror of the Argives." The work of M. Gasq is a very remarkable one in conception, and very ably modelled; the latter praise may equally be given to the work of M. Belloc, which, however, is rather deficient in expression. On the other hand, that of M. Sicard exhibits a remarkable degree of life and vivacity.

The decoration of the Hôtel de Ville certainly seems to bring misfortune to the painters selected to take part in it. After losing Cabanel, Lavreille, Rapin, and Hanoteau, we have now to register the death of Charles Lapostolle, who had been commissioned to paint a landscape panel in the Salon des Arts. He was a much esteemed marine painter; one of his pictures figures in the Luxembourg. He received medals in the Salons of 1870 and 1883, and a silver medal in the 1889 universal exhibition. He died in his sixtieth year. We also regret to have to announce the sudden death last week, at the age of forty-nine, of the sculptor Jean Gauthier. He was born in Le Morvan, and commenced life as a shepherd; but showed at an early age such decided artistic talent that he was sent to Paris, where he worked in the atelier of Dumont and at the École des Beaux Arts. In 1867 he obtained a first medal with a splendid figure of Narcissus. He had a very uphill fight in the early part of his career, and it was not before 1876 that he was able to create such works as his "St. Sebastian," "Clotilde de Surville," and "Le Paradis Perdu," the latter exhibited in 1878 and purchased by the city authorities of Paris, who have placed it in the Parc Monceau.

Among Gauthier's works may be mentioned also "La Ville de Paris," which forms the decoration of the clock tower of the Hôtel de Ville;

"Diderot," which is to be found on the "Place St. Germain des Prés," the bust of "La République" which has become the official effigy decorating most of the public edifices of France, and the statue exhibited at the Salon this year, entitled "Avant l'ORAGE," which was noticed in our review of "Some Sculpture of the Year" (see *Builder* for May 31 last, p. 389). The untimely death of this able artist in the full tide of life and work, and before he had fully attained the measure of his own capabilities, is an irreparable loss to French art.

COMPETITION FOR THE NEW INFIRMARY, HALIFAX.

THE necessity for more extended infirmary accommodation for Halifax and the surrounding district having increased steadily for some time past, the Committee decided upon the erection of new buildings, and limited the competition which has recently been decided to five firms of architects, each of which received an honorarium of 100*l.*, with the exception of the firm selected to erect the building.

The designs submitted by Messrs. Worthington & Elgood, and Messrs. Mills & Murgatroyd, of Manchester; Messrs. Horsfall & Williams, and Messrs. Utley & Gray, of Halifax; and Messrs. Young & Hall, of London, all carry out the conditions in a careful manner, and are now on exhibition in the Assembly-rooms, in the Harrison-road, and form an interesting collection.

The conditions and instructions issued to architects by the Committee were explicit and carefully prepared, and called for the provision in the designs of sixteen pavilions of one storey in height, which should contain a ward of twenty beds and a separate ward of two beds, with nurses' duty-room and the necessary ward offices and accommodation. In addition, two pavilions for isolating patients in small wards were required, as well as a separate pavilion for the treatment of infectious cases. A nurses' house was also asked for.

The site for the new buildings is on the outskirts of the town, and of irregular quadrangular shape, bounded on the south and one long side by Free School-lane, and with the two short sides abutting on Clover Hill-road and New South-road respectively.

The difference of level in the length of the site, amounting to upwards of 60 feet, added somewhat to the difficulties of conveniently planning the building.

The Committee, who were well advised in calling upon Mr. Waterhouse to help them in assessing the merits of the designs, have selected the designs of Messrs. Worthington & Elgood, and will be supported in their decision by all who carefully compare the drawings. Messrs. Worthington & Elgood place their administrative block in the centre of the Free School-lane frontage, and form a terrace to give a level approach to the front entrance.

From the centre of the administrative block, the main corridor, which is straight, runs east and west from end to end of the site, so to speak; and the ward pavilions branch from the corridor north and south. At the lower end of the corridor is placed the nurses' houses, facing New South-road, whilst the infectious ward, which cannot be removed too far from the latter, occupies a position at the opposite end facing Clover Hill-road, but is nevertheless set well back from this thoroughfare. The isolation wards occupy a convenient position adjacent to the administrative block, and east and west of it, but on the north side of the corridor.

A separate carriage entrance with a lodge is placed in the north-east corner of the site in the New South-road, and gives access to the back of the administrative block where the casualty wards and waiting-rooms for patients are placed. It also leads to the laundry, the boiler-house, engineer's cottage, mortuary, and post-mortem rooms, which are behind the administrative block and against the back boundary of the site.

In contrast to the overcrowded aspect of the plans of some of the other designs, the buildings are well placed on the site, and leave a fair proportion of open space, which has been partly utilised for the provision of tennis lawns at the west for the officials, and at the east end for the nurses.

Special points in this set of designs are the system of ventilating cross passages between wards and offices, the provision of a sun-room and balcony at the end of each large ward, and

the distance between the nurses' house and the infectious-ward.

Turning to one of the ward pavilions for more careful examination, we find a short corridor for cross-ventilation leading at right angles from the main corridor, on the right of which is placed the coal places, with the nurses' water-closet, &c., on the opposite side. These are then cut off by another cross-ventilating passage with windows at each end. The corridor then runs direct to the two-bed ward, but on the right are placed splint and linen rooms and pantry, whilst the nurses' duty-room adjoins and overlooks the large ward. On the other side of the corridor is a two-bed ward with a room for patients' clothes adjoining; a passage from the ward also leads to the ventilating-passage already mentioned. Owing to the existence of this passage, we think the position of the nurses' water-closet would be improved if it were placed on the side of the corridor opposite to and away from the two-bed ward.

The large ward accommodates twenty beds, ten on each side. Windows are placed on both sides of every bed; the end bed is kept away from the walls, and a small window inserted in accordance with the accepted theory of ventilation for this position. Swing-doors shut off the ward at either end, with steam radiators on each side, in addition to the one in the centre of the ward. Two double fireplaces, with ventilating grates, are provided for each ward. The ceilings of the wards have a semi-elliptical form.

The opposite end of this ward opens into a cross-ventilating passage, with a sun-room and balcony beyond for the use of patients. One side is occupied by the bath-room and lavatory, and the other by the sink, two water-closets, urinal, &c.

The isolation pavilions, with their small one- or two-bed wards, are necessarily treated in a different way; they are entered by a small cross-ventilated passage from the main corridor, a cross-ventilated space divides the coats and water-closets from the nurses' duty-room, and the pantry on the left side of the corridor with the brushes, linen, splints, and patients' clothes rooms opposite. Another ventilating cross-passage then divides the nurses' portion from the wards. The wards are placed on one side only of a well-lighted corridor, and are ranged thus: a two-bed ward, then two one-bed wards, then a cross-ventilating passage; the wards then repeat with the cross-ventilating passage dividing the wards from the bath-room placed at the end of the pavilion, with men and women's water-closets, sink, and lavatory, arranged on either side.

The infectious pavilion differs again from the isolation pavilion. The wards are ranged on one side only of the corridor, over which they are lighted and ventilated. The pavilion is divided by a central cross ventilating passage into two blocks, each block containing two two-bed wards, with a nurses' duty-room placed between and overlooking both wards. Two bedrooms for nurses, each with two beds, are placed near the entrance. The other offices correspond with the bath-rooms, &c., placed at the end of the isolation wards.

The nurses' house is entered at the first-floor level from the main corridor. It comprises a series of rooms grouped round a central space with glazed roof, which will provide the nurses with an excellent recreation-hall, into which the corridors on each floor will open. Convenient suggestions for future extensions have also been made.

The designs submitted by Messrs. Horsfall & Williams differ materially from all the others. The administration block plan in the middle of the Free School-lane frontage occupies the centre of a corridor forming an arc of a circle extending from the south-west to the south east corners. The wards open out of this corridor in radiating lines.

The nurses' house at the south-west corner occupies a position at the elevated end of the site. The infectious pavilion is in the north-west corner, and connected with the main corridor by a separate corridor running between two wards.

The wards on the left hand are intended for female, and those on the other side for male patients.

The openings to the large wards in this design are not placed opposite one another in the main corridor, as they are in all the other designs. The corridors for cross-ventilation between the wards and offices are not so conveniently arranged as could be wished, and the

nurses' rooms are shown in most cases without windows overlooking the ward. It is difficult to believe that the circular arrangement of this plan would be an artistic success.

The hasement of the building has been enclosed to a great extent by unnecessary walling, and the small openings shown have not been left entirely open.

The isolation wards differ from the large wards entirely in arrangement. The position of the water-closet is inconveniently distant from the wards, and little is gained by the circular treatment of the offices and nurses' bedroom.

Messrs. Young & Hall's designs show the administration block in the centre, with laundry and offices at the back connected by a covered way. The straight corridor runs east and west, and the isolation blocks adjoin the administration block.

The position of the infectious ward at the lower end of the site cannot, however, be considered good, as the distance between nurses' house and the infectious ward cannot be too great; but of the two we think there is no doubt that the higher position of the site should be occupied by the ward.

The isolation wards are arranged on one side of a corridor, with the duty room and offices on the other; the water-closets are projected at right-angles to the corridor on each side,—an arrangement which detracts considerably from the compactness of the plan.

The duty room adjoining the large wards has no window overlooking the ward shown, and the lavatories at the end are placed in separate blocks, and connected by short diagonal lobbies at the corners of the ward. A large balcony occupies the space between.

The pavilions facing the north have balconies on the west side. The bath and other rooms have been placed in one block, and join the ward by a short corridor for cross ventilation. In the infectious block the two bed wards are placed on each side of a duty room, without overlooking windows and with the nurses' bedrooms on the other side of a corridor. The bath room appears to be too far away.

Messrs. Utley & Gray in their design show entrances in Free School-lane and New South-road, and a carriage-drive around the site. The administrative block occupies the centre of the site, and a straight corridor leads away in each direction. In this design, the nurses' house and the infectious pavilion have been placed at the west end of the site. Both in the isolation and large wards, some additional cross-ventilating passages would have been a great advantage.

Messrs. Mills & Murgatroyd have confined themselves to one entrance only in the New South-road, and have carried carriage-drives round to the back and front of the administrative block. We should prefer to have seen the water-closets more completely cut off by passages ventilated at each end, both in the large wards and the isolation wards, and the windows in the former appear to be much too small. In this design the nurses' house and the infectious ward are both placed at the upper end, and though there is considerable space between the two buildings, it has only been accomplished by placing this ward almost against the boundary of Clover-hill-road.

A somewhat novel arrangement has been suggested for dealing with the considerable slope of the corridors, by dividing the width into two, one portion being a continuous slope, the other having steps at intervals for foot-passengers. Such an arrangement would have many inconveniences, and inevitably necessitate the doubling of the width of the corridor. The hasement openings are too small to permit efficient ventilation.

The styles of architecture chosen by the competitors were either Elizabethan or later Renaissance, and the architectural treatment being confined mostly to the administration block and the nurses' house. Messrs. Worthington & Elgood's treatment of their elevations is of a quiet and dignified character, suited to its purpose.

The expressed intention of the Committee is to build only a portion of the wards at present. They will doubtless be well advised in the matter, but we hope that funds will allow them to build at once the administration block, the nurses' house, and the whole of the wards facing the Free School-lane. This will render the front of the buildings architecturally complete, and the wards for future requirement can be added at the back.

The south aspect should certainly be given to the wards to be erected immediately.

## THE KENT ARCHEOLOGICAL SOCIETY.

THE annual meeting of the Kent Archeological Society was held on Monday and Tuesday, July 21 and 22, the headquarters being at Canterbury. From an early hour members and their friends began to assemble, and the fineness of the weather and an attractive programme caused the attendance to be the largest that has yet been recorded.

The proceedings opened by a preliminary meeting for the transaction of business, under the presidency of Earl Stanhope, who occupied the chair. By permission of the Rev. T. G. Crosse, the meeting was held in Eastbridge House. The ancient building was a congenial place for the assembly of an antiquarian society, and an admirable opportunity was thus afforded for the inspection of its curious admixture of very Early work with Later Gothic. After the election of new members, &c., the party, by this time greatly increased, proceeded to the Cathedral, where several hours were spent in the examination of the fabric, and also of the many interesting buildings adjoining to it not ordinarily seen.

The numbers being so considerable, it was found necessary to divide them into three or four parties, and under the escort of the Dean, the Rev. Canon Scott-Robertson, and Dr. Sheppard, &c., the inspection was made in great comfort.

In the crypt the western wall had been further excavated to allow of its inspection. It proves to be of solid masonry put together with hard mortar, and certainly forming no portion either of the work of the oldest Norman builder, Lanfranc, or of his building successor, Ernulf.

The opinion most generally expressed was that the work is of Roman date. In the Chapter Library, the whole of the objects, the crozier, the chalice, &c., recently found in opening an uninscribed monument in the south aisle of the Presbytery, were laid out for the inspection of the parties. The discovery of this interment, as our readers know, has caused a considerable amount of interest and discussion, and it is now pretty conclusively determined that the interment is that of Archbishop Hubert Walter, 1205. The chalice, a cup circular in plan, has elaborate and beautiful workmanship of a design which looks earlier than this date, accounted for probably by the supposition that an old chalice was buried with the Archbishop. The privilege of close inspection of the remains was greatly appreciated. Much of the textile work bears Eastern patterns, and was most probably imported from abroad. The articles have been removed with great care from the human remains which still repose within the curious shrine-like monument well known to visitors, and which had never previously been supposed to contain an interment. In the Chapter-House one bay of the dilapidated ceiling has been restored to its pristine beauty, and the spectators could form, in consequence, some idea of the original aspect of this stately room.

The party then proceeded to the ruins of the little church of St. Pancras, which stand partly in the grounds of the Kent and Canterbury Hospital. Here the Rev. Canon Routledge acted as guide, and pointed out that the walls, which in some places rise only to the level of the turf, are of Roman workmanship and material. The highest portion, which rises to a height of 8 or 9 ft., was visible before the excavations made a few years ago, and has always been recognised as of Roman date, constructed wholly of flat tile-like bricks, but its connexion with the church, of nearly similar work, has only been revealed by the explorations. The east gable of the chancel is of 14th century date, and has superseded the original apse. The Church of St. Martin is close to St. Pancras, and it was next inspected. Canon Routledge pointed out here also that the walls of the nave and chancel were of Roman workmanship, and referred to his recent discovery of a return eastern wall to the chancel about midway in the present length, showing that the Roman chancel had been only about half the length of the present extended fabric. Mr. Loftus Brock, F.S.A., pointed out that the south wall of the nave still retain a coating of plaster formed of pounded Roman brick which extends almost up to the eaves. These evidences of the existence of Roman churches were scanned with no small interest, and they were referred to at length at the evening meeting held in the crypt beneath the library of St. Augustine's College, where a

paper was read by Canon Routledge on "Roman Churches in Canterbury."

This paper contained the notices given by the Venerable Bede of the existence of a ruined Roman church on the site of the cathedral, of the existence of St. Martin's in Roman times, and of a pagan temple where St. Pancras now stands. Mr. Loftus Brock followed in the same direction, pointing out that it was but reasonable to suppose that Christianity was prevalent in Britain in late Roman times, since it was the State religion here for about one hundred years before the Romans left our shores; and since it was so in Gaul.

A second paper was read by the Rev. Canon Scott-Robertson on the burial-places of all the archbishops, a paper of considerable research. This was followed by a communication with respect to the walls of Canterbury, from Mr. C. Roach Smith, F.S.A., read by the hon. secretary, Mr. Geo. Payne, F.S.A., and by a report from Mr. Geo. Dowker, of the discovery of a portion of what is probably a Roman villa in the grounds of a school at Canterbury.

In the interval before the evening meeting, a public dinner had been partaken of in the Music Hall, under the presidency of Earl Stanhope, after which, in proposing the health of the Mayor, thanks were rendered to him for having, at his own expense, repaired the tower of the ruined church in Burgate, to prevent its removal, after it had been damaged by a recent storm. The very agreeable office was rendered by the President presenting to Canon Scott-Robertson a massive silver bowl which had been voted to him by the Council, on his resignation of the office of honorary secretary, an office which he has held for a great many years. He will still continue to edit the journal of the Society.

Tuesday, the 22nd, was another day of brilliant sunshine, and the party filled a large number of carriages and breaks, which formed a long procession through the quiet roads along which the journey lay. The first stopping-place was at Charlham Church, where, after the party had been welcomed by the rector, the Rev. Cyril Hanolph, Mr. Loftus Brock rendered a description of the fabric. It is a large church, consisting of a Late western tower, nave, transepts, and chancel, the ridges of the roofs being of equal height, and the roofs being of ancient oak. The principal interest centres in the elaborate windows of the chancel, fitted with the peculiar tracery known as "Kentish," and which Mr. Brock traced to the same architect as had erected the large window of St. Anselm's Chapel in the Cathedral, which dates from 1336. The windows are filled with stained glass, restored to its original design a few years ago, under the direction of the late Sir E. Street, under whose care the church was brought to its present appearance.

The celebrated brass, Sir R. de Septans, 1306, and the other brasses were seen as well as could be under the circumstances, there being hardly standing room in the church for the party. Proceeding along the valley of the Stour, the carriages stopped at Chilham Church, where Canon Scott-Robertson acted as *cicerone*. The church is of large size, with small transepts, a porch with a parvise over, and a characteristic western tower, the whole, except the rebuilt chancel and aisles, being of fifteenth century work of plain character. The church contains many curious monuments, the epitaphs of many being of great length and written in flowery style. Sir Dudley Digges, Knight, "was among the wisest men do reckon amongst ye publick calamities of these times," &c., 1638, is an elaborate composition of four sitting female virtues, with a marble column in the centre. A fine group by Chantry, 1822, to the memory of J. B. Wildman, deserved all the admiration it received. But the principal interest in the monuments is probably deserved by the style of two of them. These are formed of polished Bethersden marble, upon which elaborate designs were traced, the ground being then chiselled to a rough surface. The effect of the polished portions in contrast to the unpolished parts is very good. Both of these monuments date from the earlier part of the seventeenth century, and are worthy of careful study as examples of decorative effect.

Across the green of the beautiful village of Chilham is the entrance to the castle, to which the party proceeded, on the invitation of C. Stewart Hardy, Esq., J.P., the present owner. The mansion has had new stonework windows inserted in recent years, but the entrance is original, and it still bears the pious motto,

"The Lord is my horse of defence and my castle. 1616." The keep of the old Norman castle is very carefully preserved, and from its position on a high mound it is a conspicuous object in the landscape. A large flag waved above its roof, and another on the church tower to welcome the party. Some excavations which have recently been made were pointed out by Mr. Geo. Payne. They reveal the existence of very ancient foundations.

Godmersham Church was next visited, and described by Canon Scott-Robertson. It is a Norman building with a tower on the north side at the commencement of the chancel, and from its eastern wall opens a semi-circular apse, vaulted in stone. The old court house adjoining contains an elaborate thirteenth-century window of great height, under a trefoiled head, originally of two lights.

Traversing beautiful country, apparently but little known to most of the party, a brief visit was made to the church at Waltham, leaving the church of Petham on the left, and, finally, Canterbury was reached soon after six o'clock.

## THE ARCHITECTURAL ASSOCIATION EXCURSION.

We have received the programme of the twenty-first annual excursion of this Association, which will be made to Oxford and neighbourhood, under the general guidance of Mr. Leonard Stokes, F.R.I.B.A., the President, in the week commencing Monday, August 11, and terminating on Saturday, August 16. The headquarters of the excursion will be at the "Mitre Hotel." On Tuesday, August 12, visits will be made to fifty, Dorchester, and Ewelme. On Wednesday, the 13th, the excursionists will visit Stanton Harcourt, Witney, and Cogges. On Thursday, the 14th, Witney, Minster Lovell, and Burford will be visited. On Friday, the 15th, the party will proceed to Woodstock and Blenheim, Kidlington and Water Eaton. The hon. secretary is Mr. H. D. Seales-Wood, 157, Wool-exchange, E.C.

## BRISTOL AND GLOUCESTERSHIRE ARCHEOLOGICAL SOCIETY.

THE annual meeting of this Society was held last week, commencing on the 22nd and terminating on the 25th, thus occupying four days. The opening meeting was held in Bristol, where the members were received at the Guildhall by the Mayor (in the "Criminal Court," as the *Bristol Times and Mirror* is careful to inform us; that, however, was a circumstance devoid of any more sinister significance than that the Bristol municipal buildings are not quite so commodious as the Mayor could wish).

The Rev. W. Bazeley, the general secretary, presented the report, which showed that there were 467 members in the society; that the income for the year ended April 21, 1890, was 276*l.*, of which 256*l.* had been expended, and there remained an accumulated balance of 278*l.*—against 264*l.* in April, 1889. Besides this, there was an invested capital of 432*l.*, representing the contributions of life members.

Sir Brook Kay moved, and Mr. A. E. Hudd seconded, that the report be received and adopted.

Retiring members of the committee were re-elected.

Sir Brook Kay, who occupied the chair, announced that Mr. J. T. Agg-Gardner, M.P., was unable to be present owing to Parliamentary duties and other engagements.

Dr. Beddoe, the President for the ensuing year, was then introduced, and after a few prefatory remarks, he proceeded to read a paper entitled "An Apology for Archaeology." He said that their science had been the butt of many a satire, and of much obloquy generally, at the hands of Philistines incapable of appreciating its scope and tendencies; but sometimes at those of superior men, themselves pastmasters therein, but who had seen it from the humorous side. Who had ever better depicted the antiquarian than Sir Walter Scott himself, who, with kindly humour, dissected the antiquarian for them, as Isaac Walton impaled the worm, as if he loved him; or Robert Burns, who told them of his friend Captain Gross's collection? He had spoken of their serious and deadly foes the sordid Philistines, who called themselves practical men, who recognised no benefit that was not immediate, visible, and material. Of such a temper generally

were the men who, for some small or fancied advantage, or it might be in mere ignorance or want of thought, destroyed the vestiges of ancient society—camps and barrows and standing stones, and the sepulchral monuments of past generations. He hesitated to include the too hastily zealous restorers of churches; yet in that department mischief was not seldom done with good intent, and the perpetrators thereof allied themselves to their Philistine foes through their narrowness of view. Next came the despisers of small things—men willing to accept and capable of understanding and utilising the great facts and broad generalisations of social and political history, but who did not understand the necessity of careful and minute labour in collecting the material and laying the foundations of the edifices which they did not disdain to inhabit or build. But there was work for all. Let the architect not despise, but rather encourage, the brickmaker; and let the philosopher—as did, for example, Herbert Spencer—respect the industry and acknowledge the usefulness of the obscure collector of facts—facts, by the way, which, in their own region of archaeology, would in many cases perish utterly and remain fruitless if not speedily gathered and recorded. Archaeology furnished one of the foundations of patriotism by interesting them in the progress of their own country. Surely they had one of the strongest possible motives for its cultivation. Was it not partly from a recognition, more or less conscious, of this fact that their cousins the Americans, and their nephews the Australians, sighed for antiquities? The latter, indeed, possessed none; but the former were beginning to cherish the comparatively few they possessed with an extraordinary affection. The French endeavoured to stimulate this feeling, among other methods, by keeping in the view of their people all that might remind them of their country's history and illustrious men. Thus, at the corner of every other street one saw the name of some former benefactor or champion of France, or of some memorable event in her national life; but for any indication of this kind our country, mother of heroes as she had been, might never have had any admiral except Nelson, or any general except Wellington. They might have a few smoky statues, indeed, and there was a Rodney-place in Clifton; but where was there a Clive-street or a Havelock-square?—or where were Milton, Locke, Newton, Lyell, Faraday, or Darwin similarly commemorated? One of the finest and most pathetically eloquent of their British military monuments, erected by Draper and sung by Chatterton, adorned the eastern end of Clifton Down, but a few years ago it came within an ace of destruction. Let them rejoice, then, in the recent action of the Clifton Antiquarian Club, who were beginning to indicate by tablets the houses connected with their Bristol worthies; one already pointed out Southey's birthplace.

The Rev. A. E. Fuller followed with a paper on "Cirencester Castle."

The members then proceeded to the Mayor's Chapel, where Mr. W. R. Barker read a paper on the interesting monuments therein contained.

The Cathedral was next visited, and here the Ven. Archdeacon Norris gave a brief history of the building of the Abbey church. He said that in the early accounts of that building numerous references were made to Abbot Newland's Chronicle, which existed up to the year 1820, when it was mislaid, and it was thought to be lost. He (the Archdeacon), however, believed otherwise, and for eight years tried to induce Sir John Maclean to search for it among the muniments at Berkeley Castle. About two months since Mr. I. H. Jayes, assistant in the department of MSS. in the British Museum, went to Berkeley, and, acting on the suggestion of Sir John Maclean and himself, Mr. Jayes searched for and re-discovered Abbot Newland's Chronicle, a transcript of which had since been published. This chronicle explained many difficulties which formerly existed respecting the building of the Abbey church.

In the evening the members attended a *conferencione* at the Fine Arts Academy, where, during the evening, Mr. James Baker, F.R.G.S., read a paper on "A Medieval Pompeii of Bohemia," which he illustrated with landscape sketches in water-colour, and two figure studies, with tracings, by Mr. Walter Crane. The paper dealt in a chatty way with a visit on the part of the author to the old town of Tabor, where Mr. Baker and his friends heard of Pribenic, and which they afterwards explored. The

country was delightful and full of interest to the student of antiquity, as well as to those desirous of visiting an almost entirely unknown portion of Bohemia. Pribenic is a ruined town with wall. It was built in the thirteenth century, and was destroyed by the Taborites in 1420. A very interesting old town known as Prachatic was in the locality. This place had a wall and a quaint gateway, over which are some curious specimens of coloured figure work.

On the second day, the members met again at the Fine Arts Academy, Bristol, where Mr. Latimer read a paper on "Civil Bristol," and Mr. John Taylor one on "Ecclesiastical Bristol." Both papers were exceedingly interesting. Later on, the members, divided for convenience into two parties, made a tour of the city, noting the chief points of interest. In the afternoon, the members met together in the Council House, where they were hospitably entertained by the Mayor (Sir Charles Wathen). They subsequently inspected the municipal insignia and plate, which were described by Mr. W. H. St. John Hope.

On the third day Wells and Glastonbury were visited. At Wells, Canon Church met the visitors, on their arrival, at the Church of St. Cuthbert, and gave a concise account of the edifice, setting forth the chief points of interest. He said it was difficult to understand or to know why a church so far south-west should have been dedicated to a northern saint. It was reasonable to suppose that there was formerly a Saxon church on that spot, and that the saint chosen was a favourite one of King Alfred. There was a record that the church was consecrated by Bishop Godfrey in 1124. Evidence existed of the church having been originally cruciform, with a tower in the centre. At the south entrance there was some Early English moulding and other signs of thirteenth-century style; but undoubtedly the present building was mainly fifteenth-century work. The visitors afterwards walked to the Cathedral, where Canon Church gave a description of the building. The outside of the north transept, the crypt under the Chapter-house (a storehouse of interesting relics), the Chapter-house itself, the choir, the Lady Chapel, the cloisters, the Vicar's-close, and the College-library, were also visited, Canon Church and Mr. Hope acting as guides. The party entered the grounds of the Bishop's Palace, and saw the ruins of the great hall, and also visited the Bishop's chapel of the Holy Trinity and other parts. In the afternoon the members drove to Glastonbury, where they visited the famous abbey. Professor Freeman met them at the ruins, and gave a historical sketch of the abbey. The professor mentioned, among other interesting places to see, the tower on the top of Tor, the old barn, the hospital, the Abbot's kitchen, and the "Triumph of Inquisition." Professor Freeman and Mr. Hope conducted the party round the abbey, and pointed out some of the chief architectural features of the ruins. Several of the other objects named were also visited by members of the party. They returned subsequently to Wells, and thence to Bristol.

On the fourth and last day (Friday, the 25th ult.), the final meetings and visits took place. The members first of all assembled in the Grand Jury Room of the Bristol Guildhall, when certain formal business was transacted and votes of thanks were accorded to all and sundry who had contributed to the success of the meeting. It was decided to hold the next annual meeting at Moreton-in-the-Marsh. The members of the Society subsequently visited the fine Church of St. Mary Redcliffe, of which a description was given by the Rev. C. E. Cornish, the vicar. They also went to the Hermitage near, and to Canynge's house, Mr. John Taylor acting as guide. Finally, they proceeded to Temple Church, where the Rev. W. Hazeldine gave a description of the archaeological associations of the building.

NATIONAL ASSOCIATION OF MASTER BUILDERS OF GREAT BRITAIN.

THE half-yearly meeting of the National Association of Master Builders of Great Britain was held on Wednesday, the 23rd ult., at the Hartley Institution, Southampton, under the Presidency of Mr. J. H. Colls, of London, when representatives were present from London, Liverpool, Manchester, Birmingham, Leeds, Nottingham, Bristol, Hull, The Potteries, and Newcastle, Cambridge, Southampton, Winchester, and Gosport.

The report and accounts for the past half-

year were passed and adopted, and several matters in the interest of the building trades were discussed, and also what measures should be taken to strengthen the Association.

A vote of thanks was passed to the chairman for his services to the Association during the past half-year; and also to the committee of the Hartley Institution, for their allowing the use of the room for the meeting.

THE CARPENTERS' COMPANY AND TECHNICAL EDUCATION.

The third examination inaugurated by the Worshipful Company of Carpenters has just been held. This examination is of a very stringent character, the candidates having to present themselves on two evenings at Carpenters' Hall for the written work, and on the following day they are examined in practical work at the Company's workshops at their institute at Stratford, and on the fourth day they are orally examined by the committee consisting of the Presidents of the Institute of British Architects, the Institution of Civil Engineers, the Architectural Association, the Institute of Builders, the Clerks of Works' Association, Sir P. Magnus, Sir J. C. Lawrence, Bart., Professor T. Roger Smith, and Professor Banister Fletcher. The examiners did not award a gold medal, but gave one silver and two bronze medals. The following are the successful candidates:—

*First-class Certificates*:—T. Vest (Silver Medal); T. J. Evans (Bronze Medal); J. Davison (Bronze Medal); J. Goddard, W. M. Dixon, and D. Bryant.

*Second-class Certificates*:—J. Inkpen, G. A. Mitchell, J. Davies, W. H. Masters, W. E. Cutter, and H. J. Prosser.

Illustrations.

THE NEW MONTPELLIER MEDICAL BATHS AND WINTER GARDEN, HARROGATE.

THIS building, when finished, will be the most complete of its kind in this country, and, except in size, not inferior to any on the Continent. Provision will be made for the use of the natural mineral waters in all the ways familiar to modern medical science.

The building, as designed, has primarily two divisions, the one for water-drinkers and the other for bathers. The first consists of a Pump-room, with a counter for the distribution of the water in the ordinary way, and a Winter Garden having an area of over 8,000 ft. super., in which the water-drinkers can take the necessary exercise in all weathers and in which entertainments can be given. The Winter Garden faces south, and in fine weather can be thrown completely open.

The bath buildings proper contain a large central hall, with cooling, reading, and refreshment rooms, as well as a general ticket office and manager's room, and four complete suites of baths, each entered directly from the central hall. The four suites are, respectively, the gentlemen's baths, the ladies' baths, the Turkish bath, and the inhalation, pulverisation, and dry massage rooms. The whole of the accommodation for bathers and water drinkers is upon one level. An approach without any steps gives access at the west end of the building for Bath-chairs and for the most helpless invalids. The basement affords accommodation for the laundry, the engineer's department, and the mess-rooms, &c., for the attendants.

Messrs. Baggallay & Bristowe are the architects of the buildings, their design having obtained the first premium in the recent competition, and the work will be carried out under their supervision.

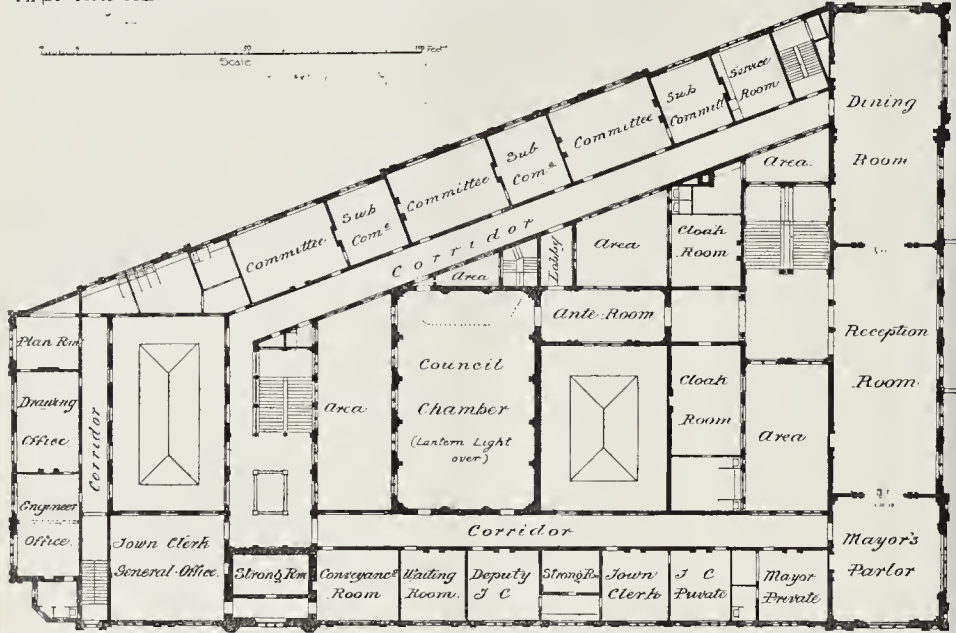

COMPETITION DESIGN FOR SHEFFIELD MUNICIPAL BUILDINGS.

WE publish this week the elevations and principal plans of the design submitted by Mr. W. Harvey and Mr. Bernard Smith, forming the last of the set of six designs of the final competition.

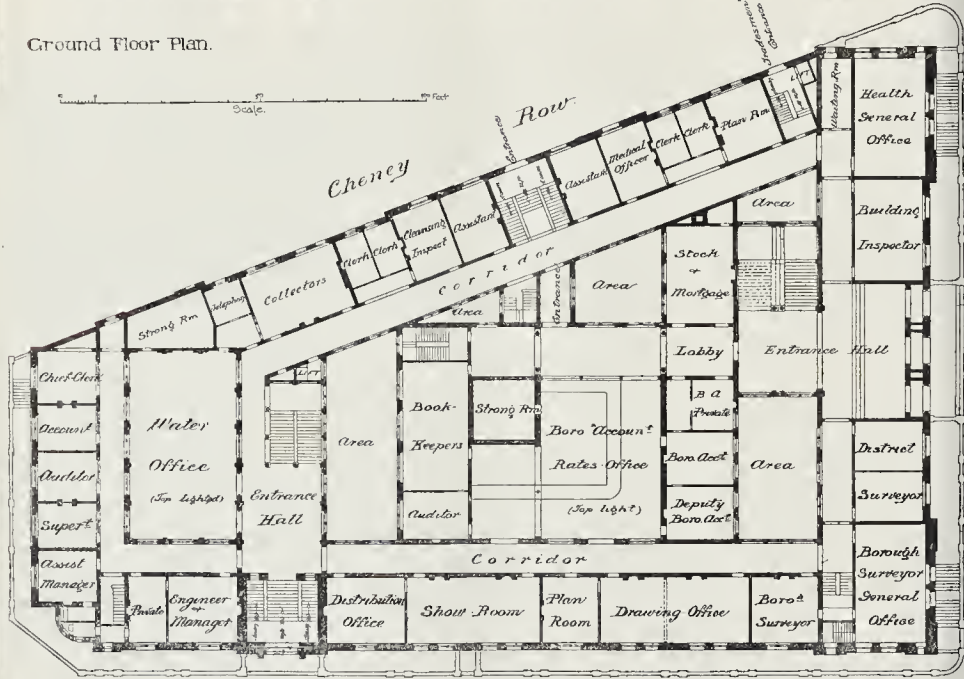

The following notes are extracted from the reports sent with the first and second set of competition drawings:—

"In the set of drawings sent herewith several

First Floor Plan

Ground Floor Plan.

Sheffield Municipal Buildings, Final Competition: Plans of Design submitted by Messrs. W. Harvey and Bernard Smith.

important modifications of the original plan have been made.

The large principal offices are arranged on the ground-floor level as before, but the entrance from Norfolk-street has been abandoned and a large entrance and staircase hall placed at the corner of Surrey and Norfolk streets.

The Borough Accountant's office has been so arranged that all the rooms of the staff now open direct into the general office. The Rates Office is

approached from Pinstone-street, Surrey-street, and Cheney-row, and as now planned the Pinstone-street entrance can be closed if required on special occasions without in any way interfering with the general work of the office.

The arrangement of the Water Department has been considerably varied; by the accompanying plan the offices of the staff are all grouped around the general office, a private corridor communicates and avoids the necessity of the staff entering the

general office in order to reach each other's offices; staircase at the end of the corridor next Surrey-street leads direct to the Engineer's office and drawing office on the floor above.

An alteration has been made in the Borough Surveyor's department, by which the District Surveyor's office is brought close to the Surveyor's office.

In the Health Department the general office has been placed at the corner of Pinstone-street and

NORFOLK STREET ELEVATION.

SCALE OF FEET

SURREY STREET ELEVATION.

CHENEY ROW ELEVATION.

Cheney-row, the medical offices and Cleansing Inspectors' offices being placed on each side of the Cheney-row entrance.

On the first floor the principal alterations consist of the arrangement for a second Mayor's parlour for business use, the provision of a lobby leading directly from the Council Chamber into the room to the committee-rooms, and a re-arrangement of the Town Clerk's department, which it is considered would prove more convenient.

The principal staircase adjoins the large entrance-hall, and forms the communication to the reception-rooms and Council Chamber only.

The reception-rooms and Mayor's parlour occupy the whole of the Hinstone-street front, the dining-room having a serving-room adjoining.

The Council Chamber is placed in the centre of the block over the subordinate offices of the Rates Office. The committee-rooms being grouped on the Cheney-row front, these have a separate staircase and access to the Council Chamber. A smaller staircase enclosed from the ground-floor level provides access for the general public to the gallery in Council Chamber.

The style of architecture adopted for the elevation is Early French Renaissance, the fronts proposed to be faced with stone from the Huddersfield quarries.

The net cubical contents of the building, inclusive of the tower, are 2,220,300 ft., and the cost, calculated at the rate of 10d. per foot cube, would be 92,510l. If the tower were omitted the cost could be reduced to 89,500l."

THE SURREY ARCHÆOLOGICAL SOCIETY.

ABOUT one hundred members and friends, including ladies, attended the annual excursion of this Society on Wednesday, the 23rd ult.

The *rendezvous* was at Leatherhead, whence vehicles drove the party to Little Bookham, where the church was visited. Mr. A. J. Style, A.R.I.B.A., here said that when or by whom the church was built was not known, but it was thought probable that it was designed by the architect who planned the neighbouring church of Fetcham. In Domesday Book the manor was described as being held by William de Broose; Halsart was the name of the tenant. In 1275 it was held by Sir John Haunsart. In 1281 William de Broose (the fifth in descent from the William mentioned in Domesday) obtained a grant of free warren, and his widow Mary, who died in 1326, held the manor and church of the honour of Gloucester and of Bramber. It was, therefore, probable that the church was built by one of the De Broose family, or the Haunsarts, who were tenants under them in the twelfth century, and it either had, or was intended to have, a south aisle. The sexton, when digging a grave about 7 ft. from the south wall, came upon flints and rubble which might have been the foundation of the south aisle wall. Further southward other foundations, probably of the south porch, were discovered. The small windows at the west end, and in the north wall, to the west of the doorway, as well as the north doorway, are of the original Norman work. The arches and capitals of the columns on the south side were extremely interesting, and excellent specimens of Norman architecture. Some of the windows were probably of the fourteenth or fifteenth century, and others much later. There is one bell in the wooden bellcot, and the date on the weather-vane is 1744, with the initials "J. S." There were some fragments of the original stained glass, particularly the head of Our Saviour in the small west window. A piece of metal, which was dug up, and appeared to be the lid of a censer, was produced by the vicar. The font was a plain bowl, and there was a local tradition that Cromwell's soldiers were responsible for the cracks in it; but Mr. Style said he did not know what authority there was for supposing that Cromwell or his soldiers ever visited Little Bookham. The manor passed through various generations to the Howard family, then to the Eflingham branch of that family, to Lord Monson, and it was afterwards held by Sir John Garrett, Sir Benjamin Madox, and the Pollen family. There were no brasses in the church, said Mr. Style, and he concluded by pointing out the chief monuments and tablets.

The party was next driven to Great Bookham. Major Alfred Heales, F.S.A., here described the church, and said he read a paper here in 1867, and which would be found illustrated and printed in Volume V. of the Society's "Transactions," and he had little to add to what he then said. The church consisted of a western tower, nave, and aisles (the southern of which is enlarged as a chapel), and chancel. The earliest record of the church occurred in Domesday

Book. The tower and south side of the nave are the earliest parts, and were probably erected about the middle of the twelfth century, or rather sooner. In the fourteenth century the Slyfield family built the large aisle. The church belonged to Chertsey Abbey prior to the Conquest. It always was, and still is, the duty of a rector to repair or, if necessary, even to rebuild the chancel, a duty which Chertsey Abbey honourably performed by building the present spacious chancel in 1341, and the fact was commemorated by an inscription on a small slab let into the chancel wall, south of the east window, inside, which, to the good fortune of archaeologists, still remains there, though only cut in clunch. The slab also records that the church was dedicated to Saint Nicolas by the Abbot John de Rutherford. Various alterations had taken place in the building, but the ancient portions of the structure had been well preserved. Major Heales also drew attention to an elm-tree in the churchyard, which was planted in 1627. Mr. Ralph Nevill pointed out two admirable pieces of sculpture, one being a monument to the memory of Robert Shiers, of Slyfield, his wife, Elizabeth, and his son, George, erected in 1608; the other was to Thomas Moore, erected in 1735.

"Fairfield," formerly the residence of Madame D'Arblay (Fanny Burney), was the next place visited, and here Mr. Bousfield, the owner of the house, read a paper, in which he showed that the life of Fanny Burney, the authoress of "Evelina," who, in 1793, became the wife of General D'Arblay, was much connected with the county of Surrey. She was married to the General in Mickleham Church, and immediately afterwards took lodgings at Great Bookham, and in less than five months they removed to "Fairfield." Her residence here comprised the four happiest years of her married life—from 1793 to 1797. She and her husband then removed to a house at Westhumble, in Mickleham, on land adjoining Norbury-park, where they remained till 1802, when General D'Arblay went to France. Mr. Bousfield concluded by reading several extracts from Madame D'Arblay's diary. Another drive brought the party to

Slyfields Manor, which was described by Mr. Ralph Nevill, F.S.A. He said it was traditionally believed that Queen Elizabeth had slept there. It appeared from the Cobham register that Queen Elizabeth did visit the place when it belonged to a former family, but she could not have slept in that house, for it was of a later period. The estate belonged to the family of Slyfields down to 1610, when it was sold to the Shiers family, whose monument he had pointed out in Great Bookham Church. He then described the highly ornamental plaster ceilings. These ceilings he thought were probably mostly the work of foreigners, but one of the best was undoubtedly done by an Englishman. The remarkable brickwork, and the very peculiar and interesting fixtures, were also pointed out by Mr. Nevill, who also said that the late Mr. Charles Baily, architect, who was a great authority on these subjects, had written an interesting paper on Slyfields Manor, which was published in Vol. VII. of the Society's "Transactions." After inspecting the rooms of the house, the company was again driven off, and proceeded to

Stoke d'Abernon, where, in the church, Mr. Mill Stephenson, F.S.A. (hon. secretary), read a paper. He said the earliest record of a church at Stoke d'Abernon was to be found in Domesday Book, which stated that Richard de Tonbridge held both the manor and advowson. Some parts of that church still remained in the south wall of the nave, and previous to the restoration of the church, in 1866, some of the "long and short" work so characteristic of Saxon architecture could be seen. In the first half of the thirteenth century one of the D'Abernon family, whose fine brass was in the chancel, enlarged and practically rebuilt the church in the then prevailing style,—the Early English. The chancel was entirely rebuilt. In the reign of Henry VII., Sir John Norbury added the chantry on the north side, and by his will it was found that the church was dedicated to St. John the Baptist and St. James. In the early part of the seventeenth century Sir Thomas Vincent carried out extensive repairs, and probably refitted the church. The pulpit was also presented by one of the same family, and was a fine specimen of Jacobean work. This church underwent complete restoration in 1866. The font was probably of the Early English period, and in the small window

behind were collected all the fragments of the old stained-glass. There were three bells in the tower, one of which was inscribed 1687.

Mr. J. G. Waller, F.S.A., next described the brasses in the church. The two in the chancel to the D'Abernon family were, he said, the most interesting brasses in existence. One, to the first Sir John D'Abernon, was the oldest in England, and the oldest but two to be found anywhere, the two exceptions being in Germany. The date of this brass was 1277. Having described the costumes, Mr. Waller expressed his regret that the brasses had not been better taken care of since he first saw them fifty-three years ago, when they were in a better state of preservation than at present. There were three brasses of the D'Abernon family, and others of the Pray, Norbury, and other families.

The Manor House, adjoining, was next inspected by permission of the Rev. F. P. Phillips, M.A., where there was a fine collection of Morland's and other paintings. The carriages now took the party back to Leatherhead, where at the "Swan" hotel, Major Heales presided at a collation, and the several readers of the papers were thanked.

BUILDERS' BENEVOLENT INSTITUTION.  
ANNUAL MEETING.

THE forty-third annual meeting of this Institution took place on Thursday, July 24, at 4, Vernon-place, Bloomsbury-square, W.C. Mr. George Plucknett, J.P. (hon. treasurer), occupied the chair in the unavoidable absence of Mr. J. W. Hobbs, J.P. (president), and amongst those present were Messrs. Thomas Stirling, Charles Bussell, Robert Perkins, G. Evans, A. Ritchie, and other friends of the charity.

Major Bruton (secretary) read the report, in which the Committee congratulated the subscribers on the circumstance that the income from all sources had been sufficient to meet the necessary expenditure of the year. This gave great satisfaction to the Committee, and they desired to express their hearty thanks to Mr. J. W. Hobbs, J.P., for his able advocacy of the claims of the Institution, whereby the charity was substantially benefited. Whilst acknowledging with gratitude the success which had thus been achieved, the Committee hopefully trusted that the subscribers would not relax in their annual support of the Institution, as only by the persevering and united help of its well-wishers could it be made to prosper and to be continuous in effecting the good it is doing. In the past year there had been four deaths of pensioners, one man and one woman had been elected, and one man had been elected by the Institute of Builders, in accordance with the terms agreed upon by the Institute and the Committee. The Committee with much regret had to report the death of Sir Samuel Morton Peto, bart., who was a trustee and a munificent contributor to the Institution. He was President so far back as the year 1852. Mr. Frederick John Dove had been appointed a trustee in the place of the deceased baronet. The annual ball realised a profit of 554. 5s. The annual dinner will take place, with the consent of the Worshipful Company of Carpenters, at their Hall, on Thursday, November 6, when Mr. William Shepherd, who has consented to accept the position of President of the Institution for the ensuing year, will preside.

The Chairman moved the adoption of the report.

Mr. Thomas Stirling seconded the motion, which was unanimously agreed to.

Cordial votes of thanks were passed to the President, the Vice-Presidents, Trustees, Treasurer, Committee, and Auditors.

The Chairman next proposed that Mr. William Shepherd be the President for the ensuing year. Mr. Charles Bussell seconded the motion, which was cordially adopted.

A hearty vote of thanks was then accorded to Mr. Plucknett for presiding, and the proceedings terminated.

SUB-CONTRACTING IN THE BUILDING TRADE.—

This is the subject of the leading article in the new number of the *R.I.B.A. Journal*. The writer is Mr. Edwin T. Hall, who deals with the subject in some detail, and makes reference to the full report which appeared in the *Builder* for June 23 of the interviews which took place on the subject between the workmen's representatives and the Council of the Institute.

## ELECTRO-DEPOSITED COPPER.

The Elmore Patent Copper Depositing Company have been holding a special exhibition of their seamless copper tubes, wires, and other copper productions.

The electro-depositing process by which these goods are made is exceedingly interesting and useful, and the results are absolute purity, and uniformity of density of metal and of thickness and tensile strength, with a certainty of true circular section of cylinders of any required diameter and length. The copper is deposited on a slowly revolving iron mandrel dipping into the electro-bath. The films of copper as they thus consecutively deposit their crystals are pressed down by burnishers, which are kept in contact with the upper portion of the copper-coated mandrel. When the deposit of copper has attained the required thickness, the mandrel, with its coating, is subjected to a heat of 400 degrees, when the expansion and cooling of the two metals being unequal, the separation of the two surfaces of iron and copper takes place, and the copper outer cylinder is slid away from the inner iron mandrel. These operations can be repeated on the same mandrel, or on others of varying sizes, cylinders of 12 ft. in length and 20 in. in diameter being amongst the specimens on view, and there is no reason why cylinders of larger, indeed, any size, should not be made if required.

For wire the copper cylinder, formed as described, is cut into square-sectioned strips of any dimensions according to the thickness of the copper deposited. These strips are passed through two or three dies which are ample for obtaining a round section for the wire, and which thus results without the hardening which occurs through the repeated drawings which ordinary wire undergoes and which renders it brittle and necessitates the after process of annealing.

In the market, the Elmore process has chiefly to contend with brazed tubes made from rolled copper. There is no question as to the superiority of seamless tubes, if the price of the latter be not in excess of the commercial price of the brazed tubes; and on this point the makers undertake to sell their goods at the same price as buyers are accustomed to buy the brazed goods for. For copper steam-pipes for modern high-pressure engines, the value of seamless tubes is very great, as with the steam strain upon them the brazed goods are always liable to explosion, and in such cases it is nearly always that the burst takes place in the vicinity of the weld. The strength of a brazed cylinder or pipe is only on a par with its weakest part, and any over-heating in its brazing operation may increase its brittleness locally to a very dangerous degree. In the electro-deposited process there is a complete elimination of the detriment to be effected by heat, as no heat at all is employed except that harmless heating necessary for separating the copper cylinder from its mandrel, and which is far below an injurious temperature. In some tests conducted by Mr. W. Parker for the committee of Lloyd's Register, the electro-deposited Elmore metal stood a pressure of 3,450 lb. per square inch before it burst. A solid drawn copper tube by a leading firm stood a pressure of 2,200 lb. A third tube of brazed sheet-copper burst at 2,200 lb. near the line of brazing—always a weak place. The Elmore tube stretched and expanded uniformly until the copper was reduced from  $\frac{3}{8}$  to  $\frac{1}{8}$  of an inch.

The solid drawn tube also extended, but not in the same uniform way. The tenacity of these three descriptions of copper are given as 23 $\frac{1}{2}$ , 20 $\frac{1}{2}$ , and 14 tons per square inch. The superior ductility is also shown in the manner of breaking the contraction of area in the vicinity of the fracture,—being 12.8 per cent. in the sheet copper, 45 per cent. in the drawn copper, whilst in the deposited copper it averages 73 per cent. The reports on the breaking stress show, in many cases, 60,000 lb. per square inch of section. For electrical purposes the Elmore copper is very efficient, affording a conductivity as measured by the standard in use as high as 101 per cent. Professor Kennedy, of University College, also gives his testimony as to several tests of sections of copper of about 0.165 of a square inch, of which the breaking load amounted to 26.83 tons. The tensile strength can, it is said, be raised for special purposes to 40 tons per inch.

Finally, we may remark that the natural process by which the copper is deposited frees

the metal from all contaminations, and there is a certainty therefore of the absolute uniformity of the metal itself throughout the whole mass of copper deposited.

## SQUARE DRILLING.

It is obvious that square holes are a need in mechanical engineering. Such holes cannot be made by punching, on account of the stress put upon the metal being injurious in its effect upon it, and no other simple means has hitherto existed. The new machines, the Ainley-Oakes, and the Tyler & Ellis improvement thereof, which have been shown in London recently, effect square, triangular, polygonal, and other linear forms of drilling by actual mechanical cutting. The first-named machine, by an ingenious arrangement of sleeves, cams, and an inner spindle carrying the cutting tool, combined with a mode of working against hard steel-plates of the nature of a template, perfectly fulfils its purpose, and produces square holes of fine fixed dimensions, from  $\frac{1}{2}$  in. to 1 in. in size, a fresh tool being required for each change. In the Tyler & Ellis improvement the spindle

The Tyler and Ellis Drilling Machine.

moves about a ball-joint at top, and is provided with a roller which travels round the inner edge of a template, being pressed outwards by springs. By lowering the inner spindle which carries the cutting-tool, the hole drilled can be varied with great accuracy, whilst to drill a parallel hole the whole head of the machine is lowered in guides in the main framing. The tool is so made that its cutting-edge terminates on the centre line of the spindle, and is suitable for any size or shape of hole. The template in each case requires to be changed, but this is easily done. This improved machine is also provided with a slotting motion, so that shapes of complex form can be turned out without difficulty. All the work is quickly and accurately performed, and the action of the machine can be applied not only to drilling, but to shaping the external forms of objects intended to fit the particular shape and size of hole drilled.

Of the utility of such a mechanical tool in engineering workshops it is unnecessary to speak; and if it only works well in practice without undue wear or liability to injury, there is a very wide field before it.

## THE LONDON COUNTY COUNCIL.

A SPECIAL meeting of the London County Council was held on Monday afternoon last at the County Hall, Spring-gardens, Sir John Lubbock, the Chairman, presiding.

**Superannuation Allowances to Officers and Employés.**—The consideration of the details of the superannuation scheme propounded by the Standing Committee was resumed. It will be remembered that the Council last week agreed to the general principle of the scheme, and resolved to apply to Parliament for powers to carry it out. The main outlines of the scheme which is to be framed are as follow:—

1. A deduction of 2 $\frac{1}{2}$  per cent., or 6d. in the pound shall be made from the salaries of all employés not weekly, and not at present entitled to pension.

2. The Council shall add 2 $\frac{1}{2}$  per cent., or 6d. in the pound, making the total equal to 5 per cent.

3. All the members of the permanent staff in receipt of weekly wages shall be entitled voluntarily to contribute a proportion of their pay, at the rate of 6d. every £ and 3d. for every 10s., or portion thereof, the Council shall add thereto an equal amount.

4. There shall be no power to withdraw from obligation when an employé has joined the fund.

5. According to the recommendation of the Civil Service Commission and the Manchester Ship Canal Committee, an account shall be kept in favour of an employé, and in the event either of his death, or of retirement under the Standing Order passed by the Council on March 31, last, or through incapacity, unless he or his legal personal representatives shall receive the whole amount then standing to his credit including compound interest at the rate of 3 per cent. or an equivalent in the shape of an annuity as he or they may elect.

6. If there be no legal personal representative of an employé, the amount he has himself contributed, including compound interest at 3 per cent., may, at the discretion of the Council, be paid to the persons who appear to them entitled to receive the same.

7. In case of voluntary resignation or discharge for any other reason than fraud the employé shall receive the whole of his own contributions with compound interest thereon at 3 per cent.

8. In case an employé is discharged for fraud, or amount standing to his credit shall, to the extent of his own contributions, without interest, be applicable far as it will go, to replace the amount of his defalcations; and the balance (if any) of his own contributions shall be forfeited, or otherwise dealt with as the Council may see fit.

9. The expense of administering the fund shall be borne by the Council, and be under the control of the Finance Committee.

Councillor Lawson, in a long speech, explained the reasons which had induced the Standing Committee to frame the foregoing scheme, which, he said, was based on schemes which existed in connexion with the London and North-Western, the Great Western, the Midland, and other railway companies, and the Railway Clearing-House. A long discussion ensued, in the course of which it was alleged that the scheme would operate unfairly towards the higher officers of the Council, who, as a rule, entered the service at a much later period in life than the rank and file of the staff. To this objection it was replied that there was no compulsion for such officers to join the fund, and that if they did their salaries would enable them to supplement a comparatively small benefit they would derive by joining the scheme. Ultimately the foregoing scheme was adopted, with some verbal amendments.

**Sick Pay and Compassionate Allowances.**—The Council also agreed to certain recommendations of the Standing Committee as to sick-pay, and resolved to apply to Parliament for general powers to make special grants of compassionate nature to other of its employés than the members of the Metropolitan Fire Brigade, the Council already having power to make compassionate allowances to the members of the Fire Brigade incapacitated in the discharge of their duty.

**Projected Improvement Schemes.**—The Council then proceeded with the consideration of the improvement schemes recommended by the Improvement Committee, adjourned from 1 week. The first scheme to be considered at the meeting was No. 4, in accordance with which the Committee proposed the formation of a new street from Evelyn-street to Creek-road, Deptford, one of the improvements included in a Bill deposited by the Metropolitan Board of Works in 1888. The Committee said that the original plan had been revived, with the view of effecting an economy. They considered that the original plan accomplished all which the old one did, at a reduction in the cost, the estimated net cost being 62,000l. They accordingly recommended—

“That, subject to a contribution by the Greenwich District Board of one-fourth of the net cost, powers be sought in the next session of Parliament for the formation of a new street from Evelyn-street to Creek-road, Deptford, as shown upon the plan submitted herewith.”

This recommendation was agreed to, after a long discussion, by 52 votes for to 19 against.

On the recommendation of the Committee that the Chelsea Embankment wall and Embankment be extended, the Vestry filling up the embankment, constructing two tidal basins, and two filtering beds, laying out certain small portions of the adjoining land as gardens, contributing one-half of the net cost estimated at 62,000*l.*, and retaining and keeping in repair the whole of the road, baths, gardens, &c., and that the Council maintain and light the Embankment wall and parapet as it did now in the case of other embankments.

Councillor Charles Harrison moved that the recommendations of the Committee be disagreed with. He said that the proposal involved almost all the elements of betterment, and it ought not to be undertaken until Parliament had had an opportunity of reconsidering their decision with regard to betterment.

Councillor Anstin seconded the amendment, and after discussion, the Council divided, with the following result:—For the amendment, 36; against, 36.

The Chairman said that as he had to give a casting vote he thought he should be doing what the Council wished if he voted in favour of the report of the Committee.

The recommendations were subsequently agreed to.

The Council divided on the proposal to widen Fulham Palace-road and Queen-street, the Council contributing half the net cost, not to exceed 4,250*l.*, and the numbers were—For, 43; against, 27; majority in favour, 16.

On the proposal to widen High-street, Kensington, at an estimated net cost of 47,000*l.*,

Councillor Lemon moved, and Alderman the Rev. Fleming Williams seconded, that the recommendation be disagreed with.

Councillor Lawson said he was not prepared to postpone every improvement in London, however necessary it might be, until what was called the principle of betterment was conceded.

After discussion, the amendment was adopted, and the recommendations of the Committee disagreed with, without a division being demanded.

On the proposal to widen St. George's-place, Knightsbridge, at an estimated total cost of 32,067*l.*,

Councillor Lawson moved that the recommendation be disagreed with on the ground that there was no contribution towards the improvement on the part of the local authority.

The subject of this improvement was still under discussion when the Council adjourned.

The last ordinary weekly meeting of the Council prior to the holiday recess was held on Tuesday last, Sir John Lubbock presiding.

**Election of a Vice-Chairman.**—On the motion of Councillor James Beal, seconded by Councillor Benn, Alderman Sir Thomas H. Farrer was unanimously elected Vice-Chairman, in the room of Sir John Lubbock, who has succeeded Lord Rosebery in the Chairmanship.

**Further Consideration of Improvement Schemes.**—The Council then proceeded with the further consideration of the Improvements Committee's report. The Committee's recommendation to widen the Knightsbridge-road at St. George's-place, Knightsbridge, at an estimated cost of 32,067*l.*, was defeated by 53 to 18. Subsequently, an amendment moved by Councillor Howell Williams, pledging the Council to carry out the improvement on condition that the parish of St. George's, Hanover-square, contributed one-fourth of the estimated cost of the improvement, was agreed to.

The Council then proceeded with the ninth and last recommendation of the Improvements Committee, viz., that for the widening of a part of the Albert Embankment to improve the line of thoroughfare from Westminster Bridge to Battersea, at an estimated cost of 26,600*l.*

Councillor Westcott, as an amendment to the recommendation, proposed that it be approved, subject to the parish of Lambeth contributing one-fourth of the cost. The amendment was carried, and the recommendation approved as amended.

**Election of two District Surveyors.**—The Building Act Committee recommended:—“That Mr. Edward John Tarver be appointed District Surveyor for the District of South St. Marylebone, and Mr. Josiah Goodchild be appointed District Surveyor for the District of East Islington.”

After transacting other business, the Council adjourned for the holidays until September 30.

Books.

*A Popular Manual of the Law of Railway Rates.* By B. S. FOSTER MACGEAGH and H. C. RICHARDS. London: Simpkin, Marshall, & Co.

THIS is a subject upon which, until recently, very little had been written. The attention which it has of late years attracted, however, has had the effect of bringing out a number of more or less useful works,—some elaborate and exhaustive, and others more brief and concise. This little volume is of the latter description, and contains a synopsis of the law as it stands at present, together with extracts from the existing classification, and a list of rates (presumably from London) to all the principal stations in the United Kingdom.

Both the authors are barristers-at-law, and the legal information selected is calculated to be very useful to the trading community,—particularly the portion dealing with procedure before the Railway Commissioners. The schedules of rates, however, are incomplete, and will, we imagine, prove disappointing. The classification and tabulated list of rates only comprise the third, fourth, and fifth classes, the authors remarking in the preface that these are the classes which chiefly affect the retail trade of the country. Seeing, however, that a large number of those for whom the work is intended are interested also in classes one and two, it is difficult to see why they should have been ignored,—especially as the additional information would have occupied so little extra space. For example, the grocer may find the rates for lump sugar and tea (third class), but not those for moist sugar, which is in Class 1, nor for coffee (Class 2). We also fail to find any mention of several articles which should be included in the three classes dealt with. Boots and shoes, for instance, are certainly provided for, but only when packed in parcels, hampers, or casks. We believe that hoots are more frequently packed in cases than in any other way, and although the railway clearing-house classification places them in Class 3 when so packed, this is omitted. We should certainly recommend the authors, if they should find that there is a demand for another edition of this work, to extend the classification and add the two additional columns to the list of rates. Everything would then be embraced, except raw material and other heavy traffic conveyed at exceptional rates, and the book would be of much more service.

*The Electrical Engineer's Pocket-book of Modern Rules, Formulae, Tables, and Data.* By H. R. KEMPE. London: Crosby Lockwood & Son, 1890.

ANY work by the author of “A Handbook of Electrical Testing” must be of interest to electrical engineers. From this pocket-book all historical matter, or explanations which should be found in a text-book on the subject, have been carefully excluded, and the pages are almost entirely filled with numerical tables, definitions, and short notes. Indeed, the author is perhaps too brief at times; for, instance, under units we read 981 dynes=1 gramme, though doubtless he considers those who will refer to his pocket-book can insert the missing phrase if they wish.

In many cases quantities are given in both French and English units. This is necessary where power is concerned, since mechanical engineers always use English measure, but the less English units are introduced into electrical work the better for all except lovers of long sums in arithmetic. A curious custom persists among writers of giving the formulae for the tangent galvanometer in absolute measure, and the reader is left to find out for himself whether “current strength,” given by the formula, is in C. G. S. units or amperes. Surely the ampere should be uniformly employed throughout a book of this kind.

As might be expected, the pages devoted to telegraph work are far more complete than those given up to the electrical light, and it is to be hoped that in future editions the portions dealing with the latter branch will be considerably enlarged. The important work done in recent years in connexion with magnetism, and the consequent simplicity of the new as compared with the old methods, is entirely omitted. This certainly ought not to

be, and is a serious fault in this otherwise valuable little book.

The concluding pages consist of a dictionary of technical terms. Many of the definitions are open to criticism,—e.g., self-induction: Currents produced by the electric induction of a current on itself. At the same time it will prove of great use to those who have forgotten for the moment what any particular expression means.

We have received the first number of the *Art-Workman*, a new monthly publication, consisting entirely of plates of decorative work and furniture. The subjects published in the first number consist chiefly of modern work, reproduced from line drawings; the subjects selected are not in the purest taste in point of design, if they are intended as models, though they are rich in effect. The only old work illustrated consists of two capitals from Freiburg.—*The Gentlewoman*, a new magazine for ladies, contains a considerable variety of matter and illustration, including a suggestion in artistic design for the ceiling of a music-room, which is certainly original but not very decorative in effect. As on one page we find very sensible remarks against the absurdity and bad effects of tight-lacing &c., why on another page do we find those hideous “fashion” plates with figures drawn more like wasps than women? *The Gentlewoman* might make a very desirable new departure by giving fashion designs drawn to the figure as it is or should be, and not to impossible lay figures unlike anything in human nature.—*The Gas and Water Companies' Directory* (Hazell, Watson, & Viney) gives in a tabular form the leading particulars as to all the gas and water companies of the Kingdom.—*Specification of Plasterer's Work* issued by Messrs. Joseph Robinson & Co. gives particulars of specification for the use of “Robinson's Cement” with tables of the sections of iron joists required to carry cement concrete floors of this cement. It is a very useful memorandum for architects and builders.—*Die Architektur der Hannoverischen Schule* (Carl Manz, Hanover) is a publication appearing in parts, illustrating modern North German Gothic work, and is a painful illustration of the wretched debased cast-iron style of Gothic prevailing among modern German architects.—*The Classical Picture Gallery*, a monthly collection originated in Germany but published in London by H. Grevel & Co., gives in each number about a dozen very good photographic reproductions of celebrated pictures by old masters. It is worth the attention of those who wish to make a collection of illustrations of the works of great painters at a small cost.

Correspondence.

To the Editor of THE BUILDER.

THE COLOMBIER OF BOOS, NORMANDY.

SIR,—While staying at Rouen, I went to see this small, homely, but most interesting and little known pigeon-house, some seven miles distant on the road to Fleury-sur-Audelle. Photographs of it are not to be had, and, having no time to measure it, I had to content myself with a rough sketch and some notes of it. It is smaller than that at the Maison d'Ange, near Dieppe, and entirely different in its treatment; but, in its way, is quite as interesting, and it well deserves to be carefully measured and illustrated. It shows, primarily, how much may be done with local materials. It is circular on plan within, and octagonal without, but again becoming circular to receive its roof by means of a hold cornice, most delicately moulded, and covered with reddish-brown tiles, and the whole capped with a pommel of lead, surmounted by a weather pigeon (much the worse for wear). It appears to be a work of the reign of Louis XII. or François I. Its doorway, much mutilated, is even now very beautiful, both in proportion and in detail; but the great charm of the work lies in the exquisite arcing and tracery of red brick of the upper story, which is quatre-foiled and trefoiled in alternate heads, the quoins at the angles being of limestone and the panels of red, grey, black, yellow, and green bricks, glazed and unglazed, of most beautiful and varied patterns. The plinth and wall below it to the ground level are, as all other stone is, of a beautiful limestone, made softer in colour by the growths upon it. Above the plinth,

up to the stringcourse under the aforementioned arading, the walling is of brick, glazed and unglazed, in square, lozenge, and random patterns, most wonderfully worked out, so as to give great wealth and change of design in every face, and still relieved by similar stone quoins. The circular roof is sufficiently broken up by a simple but most effective little dormer for access to the interior, the birds only at present occupying the upper story. A bold stringcourse of limestone separates the flat brick treatment over the plinth from the elaborate tracered and panelled work above it. It is quite impossible to describe the harmony of greys and the mellow tones of the brickwork and the work generally, and what may possibly have been at first a trifle "loud," is now made, by the kindly hands of time and decay, wonderfully soft, delicate, and refined.

One can but hope that the times may again come round when pigeons may be similarly housed, and the humblest buildings delighted in for their own sakes. The designer and builder of this little building must indeed have revelled in their work, and those who have eyes to see and hearts to feel cannot possibly visit this place without feelings of gratitude towards the unknown producers of it, rendered the more agreeable by the courtesy of its present owners. Hard by are the remains of religious buildings of much interest, but the "Colombier" is really quite enough to make the drive from Rouen (pleasant in itself) a thing to be looked forward to by the architect and the lover of the beautiful.

E. SWINFEN HARRIS, F.R.I.B.A.

#### THE BERNONDESEY PUBLIC LIBRARY COMPETITION.

SIR,—Your review of last week [p. 63, ante] was the first intimation I had that the designs in this competition were on view, and that the awards had been made. I was one of the competitors, and had been daily expecting to receive an official notice of the selected designs, and an invitation to come and see those that had been submitted. No notice has been sent, and the exhibition ended, I understand, last Saturday. A case of such discourtesy, to say nothing of the omission of thanks which might be extended to competitors who spend their time and money in complying with the invitation of the promoters, I have seldom come across.

After reading your review, I addressed a letter to the Hon. Sec. to the Commissioners, reminding him that I had, before preparing a design, asked him whether condition 4 of the Instructions, which runs thus: "There is no right to open windows overlooking any of the adjoining properties," referred to the property of the Vestry on the east side, and that his reply was that it did so refer. I obtained also a similar verbal answer from the Surveyor to the Vestry, Mr. Elkington, who, I understand, acted as the assessor. I further stated that I had had no official notice of the award, and that I should like to see the designs submitted, and to know how, in the face of condition 4, the first and fourth prizes had been awarded, as the authors of these designs have, as stated in the *Builder*, violated condition No. 4, and should have been by the Instructions "excluded from the competition."

Mr. Harrison replies, "The designs have been on view here all the last week, but are now being returned, yours amongst the number; by reason of the large number of competitors, notices could only be sent to those to whom premiums were awarded. As to the reasons why condition 4 was not adhered to I must refer you to Mr. Elkington."

The titles in the foregoing are mine, for I wish to direct special attention to them, as it hardly seems credible in this age of cheap printing and halfpenny postage that such a paltry excuse should be made. Mr. Harrison refers me to Mr. Elkington to explain the awards that have been made, and through you, Mr. Editor, I appeal to Caesar in the person of Mr. Elkington.

I have always looked upon competitions as a lottery, but I see no reason why lotteries, if they are to exist, should not be fairly conducted. All cannot win, but all have a right to insist on adherence to the instructions issued; a gross violation of an agreement entered into with competitors, and more thoughtless and discourteous treatment than that meted out by the Commissioners of the Bernondesey Free Library to competitors, I have not come across, and I wish there were some means of bringing their sins home to them. I shall await with some curiosity Mr. Elkington's explanation, which I hope will be forthcoming.

GEO. A. ADAMS.  
66, Victoria-street, S. W., July 30, 1890.

#### OLD CHURCH FRESCOES.

SIR,—In reply to your correspondent [p. 70, ante], permit me to give some information on the point. Two years ago it was wished by the Dean of Winchester to have restored and preserved the

old paintings, or, as some call them, frescoes, in the Chapel of the Holy Sepulchre in the Cathedral, and as Mr. John Green Waller, F.S.A., of Belvoir-street, W., had written an illustrated article on these paintings, which was published in the "Transactions" of the British Archaeological Association at the meeting held at Winchester, 1845, he was communicated with, and the result was that he came down to the Cathedral prepared to carry out the wishes of the Dean.

Having the pleasure of personally knowing Mr. Waller, I much enjoyed rendering him my assistance, and can therefore now impart some of the *modus operandi*. The paintings were covered with a sort of smearing of linewash, which we had to get off most carefully, so as not to take off the colours beneath; for this purpose we began with soft brushes and rags, but did not make much progress until the Dean and Bishop Sumner came and looked on. They saw the difficulty we had, when Bishop Sumner said: "Why don't you try flannel?" "Capital," said the Dean, who at once grasped the idea; "how nice it is to have a practical head." So he at once procured some soft, thick flannel, which we folded, and set to work, and off came the linewash beautifully, without disturbing the painting in the least. When all was got off that could be done in safety, Mr. Waller sprayed the paintings all over with vinegar, which brought out the colours wonderfully, and destroyed the linewash remaining. When quite dry, he sprayed the paintings over with a mixture which he brought with him. This he did twice, and by so doing he brought out and fixed the colours, and up to this time it has apparently proved for years to come a good preservative. I will add that the process can only be carried out when the atmosphere is warm, or rather over 60 deg.

H. D. C.  
Winchester, July 28.

#### THE VENTILATION OF CHURCHES.

SIR,—I think a discussion in your columns on the ventilation of churches could not be without some good effect in evolving a remedy.

I am writing this just after having left an evening service in a church that seats over a thousand persons, and is always well filled, and the thoughts that occurred to me impel the penning of this. When the service is half through and the people sitting in their seats to hear the sermon, the church, no matter how lofty its roof may be, becomes very oppressive, consequently, after quiet sitting, the people become restless, languid, fidgetty, giddy, and then start coughing. There are many causes producing this uneasiness of body: one, the inherent impossibility of anyone to sit half an hour, the usual time of delivery of a sermon. Physically, unless the body is well trained, it is impossible to sit so silent and quiet as is required to listen attentively; one reason for such being that many persons have not long eaten their evening meal or taken their tea, consequently, after the walking to the church, their food is only just beginning to digest; but at the time this digestive process is taking place their brain is mentally on the stretch listening attentively to the sermon, or may be wishing the pulpitist to hasten so that they may get their mental strain digestion is disturbed, and the stomach becomes irritated, whence the short, dry cough so prevalent in all parts of the church. The chief cause, however, of the restlessness of the people assembled is the presence of a large amount of carbonic acid gas exhaled from the body of each person present. This gas is not only poisonous, but also has an irritating effect on the throat and stomach. As the gas is a very heavy one, it sinks down to the ground; consequently, when the people are seated they are in a dense, poisonous atmosphere which is becoming more and more charged with this carbonic acid gas every minute, until at last they feel faint and giddy. What I would like to draw attention of your architectural readers to is this.—Can they not attempt a system of ventilation which would lift off from the ground this heavy poisonous gas and clear it away? Of course the comfort of those assembled must be considered; no sudden draughts of air round their feet could be tolerated, neither should a descent from the ceiling of fresh air be made on to their heads; but could not the air of the building be exhausted by draught producers,—i.e., such as the Blackman air-propeller,—which, working in the upper parts of the building for a few minutes, would exhaust the vitiated air from all parts, and so purify the air of its most poisonous impurity?

H. C. SPADAGE.

#### SMALL PROPERTY ARCHITECTURE.

SIR,—I cannot help thinking that it would be very good experience for some architects if they had to reside for a time in the small houses and the dwellings for which they were preparing the plans. It is possible then, that a little deviation from the ordinary line of procedure might suggest itself to

\* Without controverting the general truth of our correspondent's letter, we may point out that as a general rule architects are not concerned in preparing the plans of the class of houses he refers to. They are mostly the work of speculating builders.—Ed.

their mind. I refer to the fact that the very room in such dwellings that is required to be the largest and most commodious in the house, is usually made the smallest and most uncomfortable. It is all very well for clerks and mechanics to have a little parlour to ask any one to occasionally, and also that it should be in the front rather than at the back of the building; but why not let it be a little one, and not suffer that particular room, for which there is least use of any, to occupy a larger area, and to be more pleasant than any other in the place? Whereas the one in which the family live, and where most of the work has to be done, is usually a small, dark, uncomfortable place at the back, oftentimes only a sort of passage rather than a room. Really, the wonder is that there is not a much greater influx of our lunatic asylums of poor wives and mothers, who have to spend the greater portion of their lives in such little cells; pent up, too, as they are, with the children, who have scarcely space to move about in, and whose noise—through being so confined—is most distracting to the mother's ear. It seems to me that with a very little contrivance, the evil might be remedied; and if the people who inhabit such dwellings and small houses could only have for their "living-room" (as it is called) a fair-sized, commodious room, with cooking convenience in the same, I believe it would be much appreciated, especially by those who have families,—and it is not many, comparatively, who have not.

A COMMERCIAL CLERK.

#### The Student's Column.

HOT-WATER SUPPLY FOR BATHS, LAVATORIES, ETC.—V.

BOILERS: continued.

WHEN ordering copper boilers it is most necessary to have brass strengthening bosses or rings brazed in where the pipes are connected, unless the plate is of good thickness, otherwise difficulty may be experienced in making a thoroughly rigid joint when inserting the unions, and the rim of the manhole should be similarly strengthened or still greater trouble will be occasioned in securing the manlid; and be sure the manhole is of good size, as makers are so apt to send out these boilers with not larger than a 3-in. manhole, tapped and screwed to take a 3-in. brass screw plug which does duty for a lid. It is needless to say such an arrangement is absurd, as but few workmen would be able to get more than their fingers through the hole, and a manhole might as well be omitted if the band and arm cannot be got well through it.

A fairly important feature in a boiler is the manlid itself, which is provided to securely close the manhole. These lids have considerable variety, both in shape and size, but in general character or construction the majority of them are similar to fig. 9 (shown in section). This

FIG. 9.

consists of a circular or oval lid seen at the top of the illustration and a "bridge" which is shown below it; the pin through the centre with nut at the top securing the two; this is the usual style, but occasionally an inside lid is met with which merely consists of a nearly plain casting secured by two set screws passed through the boiler-plate; this is a very simple lid, and, if anything, preferable to the outside lid which occupies space unnecessarily; and it will be readily seen that the pressure of water within the boiler tends to make the lid more secure rather than to cause it to leak.

A form of manlid to be objected to, unless a very large hole has to be covered, is that which consists of a plain wrought plate secured by a number of "set" screws. In the first place, the wrought plate is easily made uneven by the least improper or careless usage; and, secondly, great care is needed in making the packing material equal in substance all round the hole, and the set screws have to be most carefully screwed up to effect a sound joint; and a still further objection of some importance, is the strain exerted in tightening up these screws causes the threads to strip after two or three times.

Whatever form of manlid is used, its object is, of course, to stop up the manhole of the boiler in a thoroughly sound manner, as these boilers are often required to bear very high pressures (the inner surface of a manlid often has a pressure of 500 lbs. upon it, i.e., 25 lbs. to the square inch); and as boilers and manlids are not made with such perfectly true surfaces that they will fit together in a water-tight manner, a jointing material has to be used between the surfaces. This jointing usually consists of hemp, with a mixture of red and white lead of the consistence of putty; this material has been used almost from the time boilers were first thought of, yet for general purposes nothing has superseded it to any noteworthy extent. The hemp is sometimes used in strands and sometimes chopped up and incorporated with the red and white lead mixture, but better than the hemp in hanks is a material called "gaskin," which is a soft, thick, cord-like substance. The particular advantage gained by using a cord is that dependence can be placed in making an ever joint; with loose hemp a perfectly even joint is almost impossible.

A material now largely used by the majority of workmen and which answers very well, for the joints rarely fail, is ordinary cardboard of a moderate thickness. This the workmen obtain by breaking up a cardboard box or any other cardboard article, and the only preparation needed is to first cut a collar of it to fit the manlid, then soak it well in plain water; if only thin cardboard is obtainable two thicknesses is used; a mixture of red and white lead has to be applied with this. There is now a species of sheet asbestos made expressly for this purpose and it answers exceedingly well, but a little objection is that as it has to be used in the form of collars. These must either be made to order or cut with considerable waste, but the material itself answers admirably.

There is one other material deserving of mention, which is india-rubber, as it has several advantages peculiar to itself. This material is used in the form of collars or washers, several sizes of which can be found in stock at india-rubber warehouses and frequently at ironmongers; there is not such a difficulty in getting a size to fit with these as with asbestos, for the reason that any size can be stretched a little, if it is small or irregular, to the shape required, and, if necessity demands it, a circular collar can be made to fit around an oval lid; these collars should not fit loosely if it can be avoided. This material makes manlid packing a simple task. They do not need any preparation, no packing material, and they do not taint or render the water impure as the red and white lead joint often does, especially when a little too much of this material is used and squeezed into the boiler when the lid is tightened up; and if care is used a rubber collar can frequently be used a second time, and to effect this the surface of the collar that comes in contact with the boiler-plate should be black-leaded to prevent its adhering (there is no great objection to its adhering to the lid). This material also has its disadvantage, arising however mainly from careless or ignorant work on the part of the hot-water fitter. If the fitter screws his flow-pipe through the top of the boiler so that it projects to the least extent inside the boiler (as will be more fully explained later), or if he takes this pipe into the side of the boiler, it will to some extent cause a steam chamber to be formed close to the top surface of the boiler; and as steam will not protect the rubber from the action of the fire heat, it will fuse or melt, and in perhaps not more than two or three hours after lighting the fire; and rubber collars are also very troublesome where there is a liability of water running short, as immediately they are subjected to a little higher temperature than boiling water they fuse. Notwithstanding this they are to be highly recommended, as their disadvantages are only apparent when bad work or dangerous circumstances exist. An inside manlid with a rubber collar is as near being perfect as we have arrived at yet.

**INDEPENDENT BOILERS.**—It is only quite recently that the importance of using independent boilers for hot-water supply has come to the front, the chief reason being that residences even of large size were considered complete in their hot-water arrangements if a supply was provided to a bath, lavatory, pantry, scullery, and housemaid's closet, and a good-sized kitchen range will furnish these with an abundant supply (or should do); but the desirability of having hot-water services conveniently situated for every practicable purpose is now

having a deal of attention by both professional men, tradesmen, and clients, and unfortunately a good many failures are being experienced, as it naturally does not readily occur to one's mind that the kitchen-range boiler is going to fail in the useful work it has done for so many years.

An instance occurred quite recently in which a six-foot range with a hot boiler of the largest possible size that could be fitted to such a range, failed most signally, for investigation showed that the cylinder (hot-water reservoir) was a very full size—viz., 100 gallons, the pipes were a very full size, being 1½ in. throughout; there were thirteen draw-off services, including three baths, and two taps in the stables, which have a great demand for hot water; also a butler's sink, which when three-fourths full held about sixteen gallons; and in addition the hall was heated by two radiators, and a linen-closet heated by a coil—all from the kitchen-range boiler. The result made one believe that the boiler would not try to do the work, as the constant demand gave the boiler no opportunity to heat up a store of water. The introduction of an independent boiler of medium size entirely remedied this, as these heaters are so very powerful and so very rapid in results.

It is intended to treat the question of radiators and coils somewhat fully when the time arrives, but it may be mentioned here that these articles greatly oppose the efficient working of a hot-water supply apparatus, as of course they are made expressly to rob the hot water of its heat by dissipating or diffusing it, whereas with a supply apparatus it is most desirable to conserve every particle of heat within the pipes.

Independent boilers have very many advantages, and wherever an opportunity to use them occurs they can be most strongly recommended. In the first place they have the important advantage of requiring very little attention in use, the fire can be kept in for several hours with once feeling, so that water of a high temperature can be had at any hour in the night or early morning; this advantage alone is of the utmost value, preventing, for instance, the annoyance arising from the bath water not being hot in the morning owing to the servants rising at irregular hours, and should there be any heating coils in connection with the boiler these continue to give off heat when most needed, during the cold hours of early morning—a special advantage if it is a small conservatory in which the coil is fixed.

Small conservatories are often heated from the kitchen-range boiler, but cannot be at all successful owing to the kitchen fire being out when the heat is most needed, viz., in the night and early morning.

Another advantage, often overlooked, gained by the use of an independent boiler, is the fact that a kitchen range working without a boiler and one working with a boiler give very different results indeed; a range without a boiler at the back of the fire works with nearly double the efficiency, rapidly, and general good results of one with a boiler, and the difference in consumption of fuel is most obvious; a 5 ft. range with a high-pressure boiler costs as much in fuel as a 5 ft. range without a boiler, but with a moderate-sized independent boiler; further than this, the boiler fire can be urged independently of the range, and the cooking operations need not be regulated with any consideration for the water supply.

**SURVEYORSHIPS.**

**BURNHAM (SOMERSET).**—The Local Board of Burnham, Somerset, have appointed Mr. Robert A. Wilson as their Surveyor, Waterworks Manager, and Inspector of Nuisances, in succession to Mr. John H. Palmer, resigned. Mr. Wilson has been assistant to Mr. Palmer for some years, practically carrying out all the duties of above appointment. There were twenty-five applicants for the appointment, and the person appointed is allowed to practise as an architect and civil engineer within a radius of ten miles from Burnham.

**TORQUAY.**—Among the applicants for the Surveyorship at Torquay are Mr. Heath, the present Assistant-Surveyor, and Mr. C. Maemalon, the Inspector of Nuisances; Mr. Wyatt, Surveyor to the Paignton Local Board; Mr. Garrett, Assistant-Surveyor at Bournemouth; Mr. E. Webb, of Barnstaple; Mr. R. S. Scott, Ventnor; and Mr. H. J. Marten, C.E., Deputy Borough Surveyor at Bradford.

**DEATH OF PROF. HENRICH HANSEN.**—The death is announced of Prof. Heinrich Hansen, Director of the Copenhagen Academy of Arts.

**GENERAL BUILDING NEWS.**

**ST. SAVIOUR'S CHURCH, SOUTHWARK.**—On the 24th ult. the memorial-stone of the new nave of the collegiate church of St. Saviour, Southwark, was laid by the Prince of Wales. The new nave, of which Sir Arthur Blomfield, R.A., is the architect, was illustrated in this journal for May 10 last.

**HIGH SCHOOL FOR GIRLS, HIGHER TRANNEMERE, BIRKENHEAD.**—A large hall has been added to the High School for Girls, Higher Trannemere, which will accommodate 200 persons, also a large room below of same size for cloak and play-room, with extended lavatories, the whole costing about 800l. Mr. James N. Crofts, of Liverpool, was the architect, and Mr. John Shaw, of Birkenhead, the builder. The lead lights were executed by Messrs. Rowlands & Co., of Liverpool, the concrete and wood-block flooring by Mr. Lowe, of Farnworth, and the heating on the small-bore system by Mr. R. Renton Gibbs, of Liverpool. The building was re-opened on Tuesday, the 22nd ult.

**PRIMITIVE METHODIST CHAPEL, CONGLETON.**—A new Primitive Methodist Church, with school underneath, is in course of erection at Congleton, from the designs of Mr. A. Tomkinson, architect. The building, with fittings, will cost about 2,000l. Mr. John Worrall, of Congleton, is the contractor.

**SCHOOLS, WHALLEY RANGE, MANCHESTER.**—The alterations and enlargement of St. Margaret's National Schools have been commenced (in accordance with plans, &c., approved by the Education Department) by Messrs. R. Neil & Sons, builders, of Manchester, cost about 1,100l., under the superintendence of the architect, Mr. John Lowe, of Manchester.

**CONGREGATIONAL CHURCH, WITHINGTON, MANCHESTER.**—The contract for the erection of the lecture-hall and schools connected with this church has been accepted, and the work begun by Messrs. Southern & Sons, contractors, of Salford. The work, which involves an outlay of about 2,000l., will be carried out under the superintendence of Mr. John Lowe, architect, of Manchester.

**KINGTON MISSION CHURCH, HEREFORDSHIRE.**—The foundation stone of this mission church, which is to be erected as a memorial of the Rev. Matthew Wood and the Rev. Edward H. Harris, was laid by Lady Ormthwaite on August 1. The architects employed are Messrs. Kempson & Fowler.

**ST. PETER'S CHURCH, CENTRE, GLAMORGANSHIRE.** was consecrated by the Lord Bishop of Llandaff on Monday last. Between three and four years ago the late Mr. Griffith Llewellyn, of Bughan Hall, commissioned Mr. F. R. Kempson, of Birsbyfield, Herefordshire, to design a large church for the accommodation of the large population which had sprung up on his estates in the parish of Ystradofydwg. The original undertaking was for the bare church, but by the munificence of Mrs. Llewellyn all the important fittings and decorations to complete the church have been added. The design consists of a lofty nave, having an arcade of five bays surmounted by a clearstory. There are side aisles to the nave, a western tower, a large south porch, a chancel somewhat higher than the nave, chancel aisles, roofed terrace-wise, and having upper floors in each for organ and auxiliary choir. There is a morning chapel on the south side of the chancel, choir vestry and choir vestries, and a connecting passage behind the east wall of the chancel gives direct communication between the clergy vestry and morning chapel. The architecture is of thirteenth-century character throughout. Free use has been made of instructive colour in a variety of different kinds of stone, brickwork, alabaster, marbles, mosaic, tiles, and painted glass. The contract works, which have taken about two and a half years to complete, have been carried out by Mr. Thomas Collins, of Tewkesbury.

**BOARD SCHOOLS, WATFORD.**—The plans submitted by Messrs. Ayres & Ardron, architects, of London and Watford, in a recent competition for new Board Schools at Watford, Herts., have been accepted, with instructions to procure tenders for the work after the consent of the Education Department has been obtained.

**THE NEW ST. PANCRAS WORKHOUSE.**—On the 25th ult. the foundation stone of the new St. Pancras Workhouse was laid, on the site of a part of the old building which has been demolished. Mr. Churchwarden A. Boden, chairman of the workhouse building committee, stated that the question of rebuilding had been before the Board of Guardians many years, and many schemes had been considered. It had been decided to build a plain substantial building, so that there could be better arranged classification. Special attention would be given to the sanitary arrangements. There would be more accommodation for married couples, and also for another class, viz., the chronic loafing pauper, who would, although well housed, have to undergo the labour test. The Chairman of the Board of Guardians (Major-General Warren), having declared the stone to be well and truly laid, stated that the old building was erected in 1807, when the population was only 45,000; and during the eighty years five additions had been made to the building. Messrs. Kirk & Randall are the builders, the first contract amounting to 74,877l. The architects are Messrs. A. & C. Harston.

**ROYAL SOUTH LONDON OPHTHALMIC HOSPITAL.**—On the 24th ult. the foundation-stone of this new building, situate at St. George's Circus, by the obelisk at the bottom of Blackfriars-road, was laid by the Prince of Wales. Mr. Keith D. Young is the architect of the building, which will cost 20,000*l.* Mr. William Downes, of Walworth, is the contractor.

**MISSION CHURCH, MOSS SIDE, MANCHESTER.**—A contract for a mission church, in connexion with St. James's Church, has been accepted by the committee, and the work commenced. The outlay will be about 500*l.* Mr. Geo. Macfarlane is the contractor for the works, and the drawings have been prepared by Mr. John Lowe, architect, of Manchester, under whose superintendence the parish church was recently erected.

**PRIMITIVE METHODIST CHAPEL, COCKSHOTT, SALOP.**—Memorial stones were laid on the 21st ult. at Cockshott, Salop, of a Primitive Methodist Church and School, to cost about 700*l.* The plans have been prepared by Mr. A. Tomkinson, architect, Tunstall, and the contractors are Messrs. J. Wood & Son, of Willastow.

#### SANITARY AND ENGINEERING NEWS.

**EARLS BARTON WATER SUPPLY.**—A scheme has been designed by Mr. W. H. Radford, C.E., of Nottingham, for the supply of water to the village of Earls Barton. As the population is only 2,500, the inhabitants do not wish to carry out works involving a large capital outlay or annual maintenance. Four wells have been sunk through porous strata situate on rising ground above the village; and good water was found on the surface of a thick clay stratum at a depth of 20 ft. Neither of these wells would yield sufficient in itself to supply the village; but an ample supply can be obtained by connecting the four wells together with a collecting pipe laid just below the surface of the clay. The length of the 9-in. earthenware socketed collecting-pipe will be 300 yards; and it will have open joints at the top of the pipe to admit water. A 4-in. iron service-main will be connected to the end of the collecting pipe, and will convey the water to the distributing pipes in the village. The collecting pipe is sufficiently high in level to enable the greater part of the village which is too high to be supplied by gravitation, has already a good supply from surface wells; but the scheme is arranged so that a small pump can be put down at any time to raise the water into a tank, which would increase the pressure sufficiently to supply this part also. The cost of the gravitation scheme to supply those parts of the village now in need of water would only be 1,100*l.*, and the annual expense would be practically nothing. If a pump and water-tank is added to supply the high part of the village the extra cost would be 400*l.* The scheme is now being considered by the local authorities.

**MERSEY DOCK EXTENSION.**—At a recent meeting, the Mersey Dock Board passed a scheme for the expenditure of over half a million sterling in the improvement and deepening of the docks. It was explained that vessels drawing 26 ft. of water could only go into dock on 118 days in the year. By the proposed alterations vessels of this draught could dock in Liverpool at any time.

#### STAINED GLASS AND DECORATION.

**SANFORD CHURCH, DEVON.**—A stained-glass window has just been placed in this church as a memorial to the late Lady Ferguson Dairs. The window is a three-light one, and contains subjects of Mary sitting at the feet of our Lord, St. Anne teaching the Virgin, and Dorcas clothing the naked. The portions of the lights above and below the subjects, as well as the tracery, being filled with rich grisaille ornament of an Early English character. The window was designed and executed by Messrs. Warrington & Co., of Fitzroy-square.

**REBREDOS, CHOUZEN CHURCH, UXTOPETER.**—A reredos panel in Hutton's cloistered mosaic has been erected in this church. It is designed on the lines of a Medieval enamel. Three panels containing the sacred emblems are surrounded by a rich border in a blue harmony of colour, and the whole panel is covered with the rich and varying lines of the metal cloisons.

#### FOREIGN AND COLONIAL.

**THE CONSTANTINOPLE MUSEUM.**—The Constantinople Museum, in which are stored all the rich archaeological treasures found in the Turkish Empire, is having a new wing added to it. Here is to be mounted the splendid sarcophagus found at Sidon, together with other interesting finds. The former is said to have contained the remains of Alexander the Great. Hamdi Bey, the well-known director of the museum, will publish an illustrated pamphlet upon it. By the by, in the same locality in which the sarcophagus was found, it is said that a cavern has recently been discovered containing five beautiful sarcophagi, which will also be removed to the Turkish capital.

**INDUSTRY AND ART EXHIBITION IN NAPLES.**—An industrial art exhibition is to be held in Naples in the new arcade called the Galleria Umberto I., and which will be opened about the middle of August.

**FRANCE.**—In concert with the Post-office authorities, the French Administration is considering the laying of a new telegraph cable between France and England. At one of its recent sittings the Municipal Council of Lyons has taken in hand the organization of that town of a Universal National and Colonial Exhibition to be opened in May 1892.

A few days since there was inaugurated at Perpignan a memorial statue to Rigaud, the celebrated portrait painter of the seventeenth century, who was born in that town in 1659. The statue, of which a plaster model was exhibited in the Salon of 1889, is the work of M. Gabriel Farin. A "casino municipal" is to be erected at Royat. M. Camille Saint-Saëns has just presented to the town of Dieppe his collection of furniture, &c., which will be placed in a museum bearing his name.

The Emperor of Russia has contributed 1,000 francs towards the statue of the sculptor Houdon, to be erected at Versailles. Many of Houdon's most remarkable works have found a home in Russia. The statue, which is the work of M. Tony Noël, will be inaugurated next spring. A bust of Théophile Gautier is shortly to be put up in the town of Tarterre. The Faculté des sciences at Lyons is about to build an important institution of maritime biology at Tamaris (near Toulon) on a site which has been presented for this object. There has been a competition at Lausanne for the erection of a building to contain the artistic and scientific collections of the town. The first premium was not awarded; the second and third prizes were awarded to French architects, M. Gaspard André and M. Denierre respectively.

**THE NEW TOWN HALL IN COPENHAGEN.**—The public competition for designs for a new town-hall in Copenhagen has failed in producing one that the jury could accept, and consequently the highest prize has not been awarded. However, the second prize of 5,000 kr. has been awarded to architect M. Nyrop, and two more of 3,000 kr. each to other architects, with an extra prize of 2,000 kr. to a fourth. It has, therefore, been decided to invite the first-named architect to prepare, in conjunction with the jury, the design for the hall, with extra remuneration.

**THE THRONDRJEM CATHEDRAL.**—Visitors to Norway this summer should not fail to inspect the old Cathedral of Throndrjem. The work of restoration has now proceeded so far that the scaffolding in the eastern tower has been taken down, so that the interior may be seen.

#### MISCELLANEOUS.

**MESSRS. MATHESON & GRANT'S ENGINEERING TRADERS' REPORT.** for the first half of the current year, says that the demand for all kinds of engineering products, which grow so rapidly during the whole of 1889, appears to have culminated early this year, and now, though most branches of manufacture are well employed at high prices, this activity is mainly due to contracts taken some months ago. The revival of trade was long in coming; it was caused by a simultaneous demand from all parts of the world not yet satisfied; and although some of the staple industries may already feel a reaction, engineers generally are assured of a steady trade for the remainder of the season. The manufacturers of bridges and roofs have been, and still are, busier than at any time during the last ten years, but though there has been advantage and profit from an increased output, the rise in price has been little more than that due to dearer labour, material, and fuel. The Colonies (India, South America, and Japan) have all taken largely from this country, and a simultaneous increase in the miscellaneous demands at home will keep the principal factories busy for the rest of the year. Steel equal to from 27 to 30 tons strain is more and more replacing iron in the case of bridges, but not yet so much as was expected for roof structures. Various important works are in view which will afford employment in the early future. Public works at home have been more active than of late years, for although there are no longer great railways to be constructed, the aggregate work in railway extensions, docks, canals, and water-works has been considerable. A new trunk line from Yorkshire to London is in view, and is likely to be made. Portland cement is higher in price than in January, but though still in good demand prices do not continue to increase. Large shipments have been made to America lately, and the demand for export is still good. At home, trade has improved, and there seems every probability of its continuing to do so for the remainder of the year. At the present time there is much uncertainty as to the price that may have to be paid for fuel (almost entirely coke from the London gas-works), which will materially affect the cost of making cement.

**NEW CLOCK FOR DOUGHTON CHURCH.**—A new clock has just been fixed in the tower of this church. It is the gift of Mr. Sargeant Spinks, of Bretnley, near Faversham. The order was entrusted to J. W. Benson, of Ludgate-hill. The clock shows time upon three copper dials, each 5 ft. in diameter, and strikes the hours upon the tower bell (weighing 12 cwt.) and the Cambridge quarters upon four others. It is made with all the latest improvements, and fitted with Graham's dead-beat and compensated pendulum.

**NORWEGIAN GRANITE.**—In a recent article in the *Christiania Morgenblad*, Dr. Hans Rausch, the well-known geologist, draws attention to the development of the Norwegian granite industry during the last few years, and the discovery of new varieties, all of which are most suitable for architectural purposes. The varieties now quarried in Norway include the common red granite, or more correctly speaking, syenite, found near Christiania; the very cheap grey granite, from the great quarry in the Idefjord, on the eastern shore of the Christiania fjord; a violet, almost purple, stone, found near Trondheim, on the other side of the latter fjord; and finally, a rare, almost unknown stone, found near Laurvik and Frideriksværn, some distance from the latter place. This is the so-called "Labrador" granite, which is nearly black in colour, whilst in some varieties the felspar in the stone has the appearance of mother-of-pearl, which becomes especially prominent when the stone is polished. Dr. Rausch predicts for this granite a great sale abroad as soon as it becomes known, on account of its great beauty. A building is now being built in Christiania, in which some of the Norwegian granites are used with great effect.

**THE RAILWAY AND CANAL TRADERS' ASSOCIATION.**—The seventh annual general meeting of this Association was held at the Cannon-street Hotel, on Friday, the 25th ult. Mr. Alfred Lafone, M.P., presided. The annual report and a revised prospectus were approved and adopted, and the Council was re-elected and enlarged. The course of action to be adopted by the Association with respect to the revised classification of rates proposed by the Board of the Canal Companies was considered, and the meeting came to the decision that it was undesirable for the new schedules to be dealt with until the revision of railway rates was completed. The attention of the meeting was drawn to the importance of the Fourth International Congress on the subject of classification, which commenced at Manchester on Monday last. It was reported that the Association would be represented at the Congress by the Chairman of the Council and the secretary, and that the latter had contributed a paper respecting the present condition of the inland navigations of the United Kingdom, and the best means of improving them. It was resolved:

"That, in the opinion of this Association, it is very desirable that a special Commission, or other body, should be appointed by Parliament for the purpose of making full inquiry into the present condition of the inland navigations of the United Kingdom, and the best means for their improvement, connection, and extension."

The revised classifications and schedules of maximum rates and charges prepared by the Board of Trade, and proposed to be applicable to the London and North-Western and Great Western Railway Companies, were considered. The Chairman related the procedure to be adopted in accordance with the Railway and Canal Traffic Act, 1888, and explained the desirability of the revised maximum rates being settled with the least possible delay. Mr. Tomlinson endorsed the Chairman's remarks, and, after a discussion, it was unanimously resolved:

"That, in view of the time which has already been expended in the first stages of the revision of railway maximum rates, in accordance with the Railway and Canal Traffic Act, 1888, and the procedure provided by section 24 of that Act, this Association urges the desirability of the report of the Board of Trade being in any event presented to Parliament during the present Session, and hopes that the revised classification and schedules will be submitted to Parliament during the ensuing Autumn Session."

It was stated that the Association would continue to act with respect to the revision of railway rates wholly through the Mansion House Association (Sir James Whitehead, President), with which body and Lord Honniker's Railway Rates Committee it would co-operate throughout the proceedings in Parliament.

**THE IRON AND HARDWARE TRADERS' PENSION SOCIETY.**—The half-yearly meeting of this excellent charity was held at the Board-room, 195, Upper Thames-street, E.C., on Wednesday, and as Colonel Steadall, the veteran President, has been compelled by ill-health to resign, the meeting elected Mr. Howard Kennard, J.P., to the post. More than once before a year has been asked to accept this post, but business precluded his doing so. With the acceptance of office Mr. Kennard has thrown himself into his work with characteristic vigour, and he was prepared to announce that his self-imposed goal is to collect a lump sum of 20,000*l.*, and to raise the normal income of the charity to 30,000*l.* a year. He had the good fortune to meet, from the magnate to the humble clerk with a modest salary, was exempt from the obligation of contribution, and while he should expect to receive many substantial donations of 500*l.* or 250*l.*, he intended to angle very closely for the thousands of smaller donors of a guinea or ten shillings. To this end he was executing a vast variety of plans, and among others a mass meeting of the trade. The usefulness of the Society only needed to be known to be amply supported. In the subsequent scrutiny of voting-papers, seven pensioners (four men and three women) were elected.

PRICES CURRENT OF MATERIALS.

Table listing prices for various materials including timber (Greenheart, Oak, etc.), iron (Bar, Cast, etc.), and other goods. Columns include material name, unit, and price.

TENDERS.

[Communications for insertion under this heading must reach us not later than 12 noon on Thursdays.]

ABERDARE.—For constructing Marly New-road, Aberlath, for the Aberlath Local Board. Mr. Owen Williams, Engineer, Local Board Offices, Town Hall, Aberlath.—
E. Lewis, New Tredegar ..... £5,382 14 10
Thomas Rees, Ely, Cardiff\* ..... 3,145 0 0
[Engineer's estimate, £3,154 7 0.]
\* Accepted.
+ In addition to the above amount, a sum of £301 15 to be added for drains, gates, &c.

BELFAST.—For constructing sewers at Chichester Park, Belfast, for the Belfast Guardians. Messrs. Young & Mackenzie, engineers.—
Wm. Minnick, High-street, Holywood £218 10 0
F. & J. Quinn, Bloomfield, Belfast ..... 213 15 0
Robert Gabriel, Oakpark-road, Belfast (accepted)..... 167 0 0
BRACKNELL (Berks).—For the erection of additional buildings at the National School, Bracknell, near Wokingham, Berks, for the Managers of the School. Mr. Isaac Burgess, architect, Bracknell, Berks.—
Maybrick, engineers ..... 490 0 0
Charman, Ascot ..... 597 0 0
Owen, Bracknell ..... 508 0 0
Woodbridge, Maidenhead ..... 459 0 0
Seaward, Wokingham ..... 487 0 0
Hutt, Bracknell ..... 481 0 0
Wm. Watson, Ascot (accepted)..... 427 0 0
BRIGHTON.—For repairs, &c., at No. 19, The Drive, West Brighton, for Mr. Budd Scott and Mr. H. Bentinck Budd, Mr. Paul E. Chambers, architect, Ship-street, Brighton.—
H. H. York, East Grinstead\* ..... £18 0 0
\* Accepted.
BRISTOL.—For the erection of new Wesleyan Chapel, Westbury-park, Ordham Down, Bristol. Mr. Hy. Dare Bryan, architect, Bristol. Quantities by Mr. Bernard.—
Eastbrook ..... £3,384 0 0
£23,666 0 0
Batherley ..... 3,200 0 0
Forze ..... 3,127 0 0
Charnock ..... 2,984 0 0
Humphreys ..... 2,972 0 0
Perkins ..... 2,885 0 0
Love ..... 2,579 0 0
Hayes ..... 2,385 14 0
Perrott ..... 2,335 0 0
Lewis ..... 2,148 0 0
\* Accepted.
BRISTOL.—For alterations to printing and publishing offices, Stonebridge, Bristol, for Messrs. John Wright & Co., Mr. Herbert J. Jones, architect.—
J. Perrott ..... £1,044 0 0
G. Humphreys ..... 1,633 0 0
T. R. Lewis ..... 1,623 0 0
W. Church ..... 883 0 0
Cowlin & Son ..... 816 0 0
Eastbrook & Sons (accepted) ..... 780 0 0
[All of Bristol.]
CAMBORNE (Cornwall).—For the erection of new Public Rooms, for the Camborne Public Rooms Company, Limited. Mr. Sidvanus Trevali, architect, Truro.—
James Julian, Truro (accepted)..... £3,600 0 0
CARDIFF.—For erecting new Roller Flour Mills, Sidos, &c., at the East Bute Docks, Cardiff, for Messrs. James Tucker, Limited, Cardiff. Mr. S. Rooney, architect, Caladonian Chambers, Cardiff.—
C. Shepherd & Son, Cardiff ..... £35,870 0 0
Jones Bros., Cardiff ..... 35,800 0 0
J. E. Hillips, Cardiff ..... 34,570 0 0
J. Linton, Newport ..... 33,950 0 0
Shepton & Son, Cardiff ..... 30,900 0 0
E. K. Lock, Cardiff ..... 30,500 0 0
W. Symonds, Cardiff ..... 29,200 0 0
A. Krauss, Bristol ..... 29,069 0 0
Jas. Allan, Cardiff ..... 29,003 0 0
W. Thomas & Co., Cardiff ..... 29,200 0 0
\* Accepted.
CATFORD.—For building new Police-station at Catford, for the Receiver for the Metropolitan Police District. Mr. John Butler, Surveyor.—
Patman & Fotheringham ..... £4,950 0 0
E. Nightingale ..... 4,700 0 0
H. Smith & Son ..... 4,808 0 0
Avis & Co. .... 4,370 0 0
J. T. Chappell ..... 4,843 0 0
Hart Bros. .... 4,392 0 0
Scrivener & Co. .... 4,800 0 0
Higgs & Hill ..... 4,774 0 0
Smith & Sons ..... 4,700 0 0
Lathley Bros. .... 4,700 0 0
C. Ansell ..... 4,688 0 0
S. T. Scott ..... 4,593 0 0
Grabham & Co. .... 4,495 0 0
CATFORD.—For building two houses, for Dr. C. A. Adams.—
Francis & Flowerday, Lacon-road, S.E. (accepted) ..... 2,950 0 0
[No competition.]
COVENTRY.—For constructing a new street at Coventry, for Mr. W. R. Goate, Mr. E. J. Purnell, jun., engineer, 18, Hertford-road, Coventry.—
Curral, Lewis, & Martin, Birmingham ..... £892 10 0
R. Woodton, Coventry ..... 828 0 0
Barnham & Phillips, Birmingham ..... 799 0 0
W. B. Hall, Rugby ..... 719 0 0
C. Haywood, jun., Coventry ..... 683 0 0
W. Boun, Coventry (accepted) ..... 600 0 0
G. Storor, Coventry ..... 644 8 0
COVENTRY.—For additions to the Bulze Cycle Co.'s premises (Limited). Mr. E. J. Purnell, architect, Coventry.—
C. G. Hill (accepted) ..... 2,379 0 0
COVENTRY.—For additions to Messrs. Hillman, Herbert, & Cooper's (Limited) Premier Cycle Works. Mr. E. J. Purnell, architect, Coventry.—
Smith & Sons ..... £4,416 0 0
Garlick ..... 3,300 0 0
C. G. Hill ..... 2,985 0 0
C. Haywood, jun. (accepted)..... 2,863 0 0
CROMER.—For the construction of 200 yards of 12-inch stone-ware pipe-sewers, with manholes, ventilators, &c., at Ranton-road, Cromer, for the Cromer Local Board. Mr. A. F. Scott, surveyor to the Board, 24, Castle-meadow, Norwich.—
J. R. W. Bray, Great Yarmouth ..... £298 0 0
R. W. Bennett, Norwich ..... 194 0 0
J. Young, Norwich ..... 185 0 0
J. Newman, Cromer (accepted) ..... 160 0 0

DEVONPORT.—For rebuilding the "Ordnance" Inn, Queen-street, Devonport, for the Plymouth Breweries (Limited). Mr. W. N. Richards, architect, 29, St. Aubyn-street, Devonport.—
Reed, Bight, & Co., Plymouth ..... £387 0 0
W. Trevena, Plymouth ..... 383 0 0
G. Sullabell, Plymouth ..... 380 0 0
T. Jenkin & Son, Devonport\* ..... 374 0 0
\* Accepted.
DORKING.—For making new roads, Dorking, for the Dorking District Local Board. Mr. G. Somers Mathews, Surveyor, 35, High-street, Dorking.—
Orchard-road.
C. Dndley, Dorking ..... £611 18 2
£542 14 3
W. Edser, Dorking ..... 602 18 0
G. A. Franks, Guildford ..... 597 0 0
W. Rayley, Dorking ..... 584 3 3
Surveyor's estimates ..... 550 0 0
\* Accepted.
ELMSWELL (Suffolk).—For building proposed schools, for the Elmswell School Board. Mr. John Shewell Corder, architect, Wimbourne House, Ipswich.—
Plummer, Rattlesden ..... £310 0 0
Orford, Colchester ..... 79 0 0
Mullely, Elmswell ..... 741 0 0
O. Andrews, Stowmarket ..... 734 0 0
Bird & Gosling, Stowmarket ..... 652 0 0
J. Robinson, Bury ..... 607 0 0
Hinds, Beccles ..... 583 0 0
A. Andrews, Bury\* ..... 583 0 0
\* Accepted, subject to approval of Education Department.
EPPING.—For decorative repairs and the erection of handry, &c., for Mr. C. J. Hainworth, Mr. Richard Peters, architect, 72, Wool Exchange, Coleman-street, E.C.—
Palmer Bros. (accepted) ..... £180 0 0
EXETER.—For latrines, &c., at Board school, Paradise-place, Exeter. Messrs. Hayward, Son, & Tait, architects, Exeter.—
Scudling, Exeter ..... £270 0 0
Diggin, Exeter ..... 237 0 0
Stephens, Exeter (accepted) ..... 196 0 0
GUILDFORD.—For the erection of a residence for Mr. T. Lucas. Mr. Richard Peters, architect, 72, Wool Exchange, Coleman-street, E.C.—
Newland ..... £965 0 0
Harris & Son, architects ..... 877 0 0
Gale ..... 810 0 0
Whitburn ..... 780 0 0
Pullen ..... 640 0 0
Wheeler ..... 640 0 0
HANWELL.—For additions to Medical Officer's houses, Central London District Schools, Hanwell. Messrs. Jarvis & Son, architects.—
G. Gibson ..... £456 0 0
W. Ruckerlidge ..... 404 0 0
F. Wallis ..... 397 0 0
Flew & Co. .... 328 0 0
Gadsdon & Sons (accepted) ..... 325 0 0
HASTINGS.—For additions, &c., to Board School, Waterloo-place, Hastings, for the Hastings School Board. Messrs. Elworthy & Son, architects, London-road, St. Leonard's-on-Sea.—
Taylor Bros., Hastings ..... £256 0 0
F. W. Anderson, Hastings ..... 355 11 0
C. & E. Harman, Hastings ..... 350 0 0
A. D. Womersley, Hastings ..... 340 0 0
D. H. Snow, Hastings ..... 313 0 0
T. Whittier, St. Leonard's ..... 286 0 0
E. Boniface, St. Leonard's (accepted) ..... 285 0 0
HASTINGS.—For building Board School for boys and girls, for the Hastings School Board. Mr. H. Humphreys, architect, 6, Trinity-street, Hastings. Quantities by the architect.—
J. Longley & Co., Crawley ..... £3,367 0 0
F. W. R. Kite, Salisbury ..... 3,342 10 0
A. D. Womersley, Hastings ..... 3,290 0 0
J. F. Anderson, Hastings ..... 3,272 0 0
J. Lester, Hastings ..... 3,145 0 0
D. H. Snow, Hastings ..... 3,132 0 0
Taylor Bros., Hastings ..... 3,102 0 0
T. Taylor, Hastings ..... 3,043 0 0
W. Small, Hastings (accepted) ..... 2,944 2 0
HEREFORD.—For alterations to villa residence, St. Ebbeher-street, Hereford. Mr. W. W. Robinson, architect, 19, King-street, Hereford.—
T. Lewis ..... £269 0 0
W. P. Lewis & Co. .... 956 0 0
W. Bowers & Co. .... 956 0 0
Benyan & Hodges (accepted) ..... 795 0 0
[All of Hereford.]
HEREFORD.—For erecting villa residence, Ayleston-hill, Hereford. Mr. W. W. Robinson, architect, 19, King-street, Hereford.—
W. Gills ..... £3,600 0 0
Benyan & Hodges ..... 3,741 0 0
J. Davies ..... 2,680 0 0
W. P. Lewis & Co. .... 2,575 0 0
W. Bowers & Co. .... 2,550 0 0
T. Lewis (accepted) ..... 2,553 0 0
[All of Hereford.]
HEREFORD.—For shop-fronts and alterations, King-street, Hereford. Mr. W. W. Robinson, architect, Hereford.—
W. Bowers & Co. .... £490 0 0

J ST. MARY CRAY (Kent).—For four cottages and stabling at Hoekenden, St. Mary Cray. Messrs. Haslam & Son, architects:—

Table with 2 columns: Name and Amount. Includes Taylor & Son (2938 0 0), Butler (784 0 0), Knight (747 0 0), Lewis (609 0 0).

SANDIACRE (Derbyshire).—For erecting pumping-station at Sandiacre. Mr. W. H. Radford, engineer:—

Table with 2 columns: Name and Amount. Includes W. Dalley (2378 0 0), Wheatley & Mansel (376 0 0), E. Keeling (368 0 0), G. Bell & Son (363 0 0), R. Hind (349 0 0), A. Fankh (327 0 0), J. Hodgson & Sons (323 0 0), F. Wainaby (315 0 0), J. W. Priestley (302 5 0), J. J. Adams (300 0 0), J. Hutchinson (300 0 0), T. Cuthbert (269 10 0), A. Fillett (209 0 0), W. E. Shaw (209 0 0), J. Cooper (206 18 0), Gilbert & Gabbittas (205 5 0), J. Osroft (accepted) (282 0 0).

SHARLSTON (Yorkshire).—For the construction of sewerage and sewage works, for the Wakefield Union Rural Sanitary Authority. Mr. Arthur Fawcett, Engineer and Surveyor, Old Town Hall, Wakefield:—

Table with 2 columns: Name and Amount. Includes J. Bairdrow, Rutley (21,717 4 10), G. Sumner, Wakefield (1,690 1 0), E. Eyre, Sheffield (1,023 8 3), T. & G. Wilson, Wakefield (1,464 7 9), Wm. Doleman, Dewsbury (1,420 14 0), F. Ringler, (Sheffield) (accepted) (1,318 15 0), M. Arundel, East Ardsley (1,226 16 2). [Engineer's estimate, 21,474.]

SOUTHAMPTON.—For new road, sewers, surface-drains, &c., on an estate at Northam, Southampton, for the National Land Corporation, 18, Adam-street, Adelphi, W.C. Messrs. Lomon & Howard, engineers:—

Table with 2 columns: Name and Amount. Includes J. W. Roe & Co., Southampton (4,790 0 0), A. Chasen, Southampton (769 0 0), J. Butt, Southampton (736 0 0), John Crook, Swadlow, Southampton (383 0 0). \* Accepted.

STAFFORD.—For laying down a water-main and connecting same with the works at Stafford, for the Guardians of the Stafford Union:—

Table with 2 columns: Name and Amount. Includes Thos. Goodwin, Stafford (2,255 0 0), Thos. Tilt, Stafford (215 0 0), E. Eopley, Stafford (194 2 0), Rudger & Griffith, Stafford (accepted) (187 7 0).

TONBRIDGE (Kent).—For the erection of new works, &c., at Tonbridge Union Workhouse. Mr. W. Oakley, architect, 35, Mount Pleasant, Tunbridge Wells:—

Table with 2 columns: Name and Amount. Includes Geo. Mansfield & Son, Tunbridge Wells (25,349 0 0), J. Longley & Co., Crawley, Sussex (5,195 0 0), G. & F. Penn, Pembury (5,095 0 0), G. H. Deane & Son, Deal (4,892 0 0), H. Adams, Tunbridge Wells (4,663 0 0), G. E. Wallis & Son, Maidstone (4,677 0 0), G. J. Jones, Tonbridge (accepted) (4,569 7 4).

TRURO (Cornwall).—For the erection of new parochial schools in Fydar-street, to accommodate 300 children, for the Building Committee of St. Mary's Schools, Truro. Messrs. Henderson & Sons, architects, 31, Lemon-street, Truro:—

Table with 2 columns: Name and Amount. Includes James Julian, Truro (accepted) (22,600 0 0).

WATCHET (Somerset).—For erecting a detached residence for Mr. Wm. Spate, jun. Mr. Herbert J. Jones, architect, Bristol:—

Table with 2 columns: Name and Amount. Includes Wm. Church, Bristol (22,637 0 0), Cowlin & Son, Bristol (2,593 0 0), G. Humphreys, Bristol (2,469 0 0), Thos. R. Lewis, Bristol (2,480 0 0), H. W. Pollard, Bridgewater (2,330 0 0), Chubbott & Sons, Williton (2,225 0 0), G. H. Pollard, Taunton (2,230 0 0), A. Poole, Hminster (accepted) (2,100 0 0).

WINSFORD.—For supplying 640 tons Penmaenmawr road-metal, for the Winsford Local Board. Mr. Joseph Waring, Surveyor:—

Table with 2 columns: Name and Amount. Includes Brunridt & Co., Kancorn (s. d. 9 0), Darbishires & Co., Penmaenmawr (s. d. 8 9). \* Accepted.

TO CORRESPONDENTS.

E. T. A.—'Denizen' (you are too old for apprenticeship in the ordinary way, but perhaps by the payment of a premium in the year of age, by entering into an agreement with a small master tradesman to give a few years of service, you might get a fair knowledge of one of the trades named. ## Oxford.

AMONG architects and archaeologists there seems to be quite a run this year on Oxford. The British Archaeological Association, as recently reported in our columns,\* have made it the centre of their annual meeting; the Architectural Association took a hurried and scrambling day there as one of their vacation visits; and the same society has fixed upon Oxford and the surrounding neighbourhood as the scene of that more important function, the Annual Excursion, which occupies a week, and which is usually the occasion of much sketching and of a critical examination of the architectural characteristics of the buildings visited, ancient and modern, quite distinct from that mere hunting after antiquarian lore which characterises the archaeologist *pur sang*; and which, to say truth, is often joyfully pursued on a very meagre basis of architectural knowledge. The Architectural Association Excursion, which takes place during next week, is therefore the most interesting to us of this series of Oxford visitations, and the one to which we are devoting, this week and next, such special illustration of architectural Oxford as we are able to give.

It was suggested not long since by an enthusiastic member of a certain society of enthusiasts, that the value of the old buildings in Oxford was greater to the world than

that of any of the studies which had been carried on in them; an opinion to which, though it be our business and pleasure to exalt architecture, we hardly feel able to subscribe *sans phrase*. Is the Bodleian building, truly, of more value than the Bodleian books? Put in the more moderate and general way in which it is put by Mr. Lang in his charming book on Oxford, it is nevertheless true that the surroundings of Oxford life are among its strongest and best influences for happiness, and those which are most certainly to be felt. Lander, one of the brilliant but rebellious sons of Oxford, thought that the pleasantest and most profitable hours he could remember at the University were passed with a chosen friend "in the Magdalen-walk by the half-hidden Cherwell." "Hours like these," adds Mr. Lang, "are indeed the pleasantest and most profitable that any of us pass at Oxford. The one duty which that University, by virtue of its very nature, has never neglected, is the assembling of young men together from all over England and giving them three years of liberty of life, of leisure, and of discussion, in scenes which are classical and peaceful." And certainly the buildings play a not unimportant part in this "classical and peaceful" scenery.

To the habitual dweller in Babylon, paying but an occasional passing visit to Oxford, there is a curious dual feeling of contrast between the capital and the fair University city. One is struck equally by the small extent of Oxford, and by its character of distinction within that extent. Coming straight from London, Oxford seems, in comparison with its fame, a mere pocket city, where

\* Oxford: Brief Historical and Descriptive Notes. By Andrew Lang, M.A. With Illustrations. London: Seeley & Co.: 1890.

everything is close to everything else, and it is but a few minutes' stroll from Christ Church on the south confines to Balliol and St. John's on the north; Keble forming a kind of *ultima Thule* a quarter of a mile further out, "at the hack of the north wind." But it is in part owing to this small scale of Oxford that the city has that air of distinction which is so remarkable. In a larger town the University buildings would in all probability have been more scattered, and would at all events have been less dominant. As it is, the secular town of Oxford, apart from the University, is of such small account that we seem to be in a town composed entirely of dignified or picturesque buildings with lawns and gardens interposed. Cambridge, which comes of course the nearest to it, does not present anything quite like this, from the more scattered manner in which the colleges are placed; and Cambridge, again, has no High-street in the sense that Oxford has. It is true that people coming to Oxford for the first time, and entering "The High," as nearly every one does in these railway days, from the western end nearest the railway station, will probably experience a little shock of disappointment at the first sight of the street which enjoys such a world-wide fame. It looks narrow, the Mitre Hotel is not as picturesque as we expected, and All Saints, from this point of view at least, is not a very noteworthy specimen of architecture. But by the time the visitor has got down past the bend of the street, and looks back up it, with St. Mary's and All Saints' towers standing out separately in the view, the quiet and reposeful street fronts of University and All Souls forming contrasting horizontal lines, and Hawksmoor's heavy but wical grandiose

\* See *Builder* for July, 12, 19, and 26.

Chapel of St. Ranseph Christ Church Cath.

Fig. 1.

Fig. 2.

Queen's gateway as a foreground object on his right, he will probably admit that Oxford High-street deserves all that has been said about it. But to realise a striking first impression of Oxford every one visiting it for the first time ought to go by a round-about route and drive in over Magdalen-bridge at the east end of the town, with Magdalen College and Tower on the right, and the High-street and St. Mary's and All Saints' towers opening out as he advances. Mr. Fullerlove's sketch of Magdalen Tower from the other side of the bridge, a reproduction of which is published in this number, shows the first view of Oxford entering from this side, the sketch being taken from the western or further side of the bridge from the town, instead of from the point on the bank exactly opposite the tower east of the bridge, which is the more usual point of view. This view as taken here makes the heter composition, though we could have wished to have had the tower in its normal state, without the realistic detail of the apparatus of repairment which appears to have been going on at the time the drawing was made. The view is nevertheless of special interest as the work of an artist who has gained a somewhat exceptional position as a painter of the picturesque of old buildings. Another of the main features of High-street, the tower and spire of St. Mary's, is also given among our illustrations of this week. The most noticeable points architecturally about St. Mary's tower are the rich effect produced by the double pinnacles at the base of the spire, and the generally pyramidal composition of the whole; the large buttresses with their numerous set-offs, spreading outwards towards the base, giving a remarkable solidity and monumental character to the whole.

Next to the view down (or up) the High-street, perhaps nothing in Oxford is so characteristically Oxford as the small square in which stands the Radcliffe Library flanked by All Souls' screen on the one hand and Brasenose on the other, and

\* A drawing of the upper portion of Magdalen tower without the scaffolding, &c., will be given in our next.

backed by the square mass of the Bodleian. The mere view of this group of buildings caught, in passing down the High-street, through the narrow lanes west and east of St. Mary's Church, is sufficient to awaken curiosity and interest, so unique is it, so unlike anything to be seen in any other town in England. The comparatively small scale of Oxford is noticeable here too; for probably there has been no visitor who, knowing Gibbs's famous domed library by engravings only, has not been surprised at finding the actual building smaller than he had expected. In every other respect it is a building that bears out its reputation; somewhat cold and formal perhaps, but essentially dignified. Perhaps it suffers nothing in this respect from its contiguity with the rather nondescript and corrupt architecture of the large quadrangle of All Souls, an inspiration of Hawksmoor's in which he was by no means so bappy as in his entrance and screen to Queen's College. In the latter he kept within the lines of a style which he understood and in which he could show his best qualities; in All Souls he made an unhappy attempt at a kind of Gothic outline built up with Classic details; a thing which can be done, no doubt, but Hawksmoor was not the man to do it; his hand was not light enough nor his taste in detail sufficiently refined, and he has succeeded only in producing a kind of nondescript architecture which is striking in a general way and as part of the *coup d'œil* at this point, but which looks less desirable the more it is examined in detail.

If Radcliffe-square furnishes the most characteristic and unusual architectural effect in Oxford, the visitor has only to recross the High-street and penetrate a little distance to the south of it to come upon the most sumptuous and palatial of the University buildings, the great quadrangle of Christ Church, which architecturally is to Oxford what Fountain Court, Trinity, is to Cambridge; architecturally only, for no one college at Oxford holds intellectually the "pride of place" which Trinity holds at Cambridge; if there be any Oxford College which can pretend to intellectual precedence it would probably be

Balliol, which architecturally is not of special account except in regard to the space it covers. A quadrangle on such a scale as that

Christ Church Cathedral Oxford.

Carving on Caps.

The Tomb of Prior Sulton 1294-1316.

Fig. 3.

of Christ Church must produce a fine effect whatever the surrounding architecture, which in this case is not of the highest interest as regards the quadrangle façades, with

Fig. 4.

Magdalen College, Oxford.

Fig. 5.

the exception of Wren's picturesque though corrupt-looking tower over the main entrance. Like the great court at Trinity, Christ Church has no cloisters, though the bases of the buttresses for the cloister are all *in situ* and show what a sumptuous piece of work was intended. This, however, would hardly have been an entire architectural success in one sense, in that it would have been a projecting cloister, an addition to the main line of building, which has not so fine an effect as a

cloister forming the ground story of a building which is continued over it, at all events not in a residential building; in a cathedral the conditions are somewhat different.\* But one of the treasures of the ancient architecture of Oxford is found in the Cathedral, now the College Chapel, as adapted and altered for

\* It may be of interest to note here that we gave a view of Christ Church College, from St. Aldates, (from a drawing by Mr. John Fulleylove), in the *Builder* for February 9, 1880.

that purpose by Wolsey, the founder of the college, who lived before the days of an S.P.A.B. Society, and, like the gentleman mentioned in that Society's last Report, "altered things as he and his architect thought fit." We give a sketch of a portion of the Cathedral (see lithograph) showing the remarkable contrast between the late Norman work of the sub-structure and the rich effect of Wolsey's (?) fan-traceried and pendants roof; also the interesting character of the transitional foliage of the capitals, showing the germ of the forms of Early English foliage while still in their state of stiff young sprouts, retaining (see the lower leaves of the foreground capital) some reminiscence of the classical leaf from which they originated, and before they took to the free curling crisp forms of their mature growth.

In the subjoined cuts, fig. 1 shows the window of the chapel in the south transept, which is similar to the work in the chancel at Dorchester Abbey (a building also included in the week's proceedings of the Architectural Association); and fig. 2 is a sketch of the tomb of Prior Sutton in the Cathedral, a good example of a tomb of that date, with Parbeck shafts and very delicately carved caps, sketches of some of which are given in fig. 3. The tomb stands in one of the bays of the arcade between the north choir aisle and the "Latin Chapel" (so-called because the College prayers in Latin were formerly read there at the commencement of each Term). In the Latin Chapel itself are some good poppy-heads, one of them with the head of Cardinal Wolsey. Two of

Fig. 6.

these are shown in the right-hand corner of the photo-lithograph of various sketches which forms one of the separate plates in this week's issue (see plate).

The quadrangle of Peckwater, a portion of Christ's College, though having no relation architecturally to the large quadrangle, may be called in its present state a fine gloomy example of Classic architecture applied to a building of this class. The library is a really powerful work of its class, simply on account of the holdness of its parts and projections; there is nothing little or trivial about it, and perhaps the blackened and decayed state of the stone does not diminish its dignity of effect; but the extent to which this and other Classic work of earlier date in Oxford (notably Inigo Jones's work at St. John's) has decayed is rather serious, and looks as if repair or partial refacing would become a necessity before long, however much one may regret to touch the old work. Certainly Peckwater quadrangle at present is a somewhat gloomy spectacle, stately but rather grim in its decay.

Though Magdalen is inferior to Christ Church in extent, it surpasses the latter in the possession of so fine a tower, and in general picturesqueness, and many critics are disposed to place it first among the architectural attractions of Oxford. We give some further sketches of parts of the Magdalen buildings. Fig. 4 shows a portion of the large quadrangle with the bell-tower in the rear, and the stone pulpit is seen just inside the gate, from which formerly a sermon was preached on St. John Baptist's

Day, the open-air delivery of the sermon having, we are told, a reference (somewhat distant, it must be confessed) to the circumstance of St. John the Baptist preaching "in the wilderness." Fig. 5 is a sketch of the "Founder's Tower" with the sumptuous oriel window of the Founder's Chamber, a room which has witnessed the entertainment of not a few guests of note in history, royal personages and others. The doorway below, leading to the cloisters, has some beautiful carved work in the spandrels. Fig. 6 is a sketch of the old Singing School, a most characteristic bit of domestic Gothic architecture, remarkable, however, for its repose and simplicity rather than for more ostentatious qualities. It is seen again in the corner of the ink-photo illustration showing the new buildings of Magdalen. It is this character of repose and absence of ostentation which is for the most part so remarkably exemplified in the old University buildings both of Oxford and Cambridge, and which it seems so difficult for those who are called on to add new buildings to retain. In this particular case it may be said that Messrs. Bodley and Garner have been successful; their new buildings are not out of keeping with its surroundings further than every new building among old ones must unavoidably appear to be; and other similar examples are to be found; but of the modern buildings of Oxford collectively we have a word to say further on.

A near neighbour of Magdalen, Merton College, has also some affinity with it architecturally. The tower, shown in the sketch of the chapel in the lithographed plate, is not dissimilar to that of Magdalen in the treatment of the upper stages, though much shorter in proportion. The College was founded by Walter de Merton in the time of Henry III., and the chapel, of which the fine east window is shown in the sketch, was, like Christ Church Cathedral, an older church metamorphosed for the College Chapel by the founder. The east window and the rest of the choir are, however, Walter de Merton's work; the remainder having been formerly the Parish Church of St. John the Baptist. In the chapel is the brass lectern presented to the college by "Master John Martock," of which a drawing is also given; and we have added on the plate, what will be of interest in this connexion, a drawing of the memorial brass to the same John Martock, which still exists at Banwell in Somersetshire. A window of the library at Merton, given on the same plate, is a noteworthy specimen of that mingling of Classic detail with Gothic feeling which is so frequently met with in the old work at Oxford; the cornice round the window is Classic, but the arrangement of the mullions and the slightly-pointed arches to each compartment, with the hatted ornament on the upper side of the transom, are distinctly Gothic, though of a very late type.

Among the colleges north of High-street, New College has a special architectural interest in the mere fact that it was founded by William of Wykeham, who doubtless influenced its architectural design more or less. Its Bell-tower, a view of which will appear in our next week's illustrations, is notable for its remarkably massive and plain character, rendering it more like an adjunct to a fortress than to a University building; but this special character, if somewhat out of keeping with its purpose and surroundings, at all events serves to give it a special interest. In connexion with New College we add also (see lithograph plate) a sketch of one of the most curious and interesting of the miserere carvings in the chapel.\*

North of that remarkable architectural group, referred to before, of which the Radcliffe is the centre, the east end of Broad-street, with the Sheldonian Theatre and the old Clarendon, is another most characteristic Oxford hit. In the *Builder* for Jan. 5, 1889, was published a view looking westward along Broad-street, with the columns of the Claren-

don Portico in the foreground: an admirable view in a picturesque sense; but the most specially characteristic feature, the apse of the Sheldonian Theatre, with its concentric range of quasi-Classic colossal heads on "terms" forming part of the balustrade of the theatre, is lost from this point of view. The heads, to say truth, are rather a piece of "hunkum," but they form an unusual incident in street architecture which one would be sorry to lose. The portico of the Clarendon, like other Classic work of its date in Oxford, such as Peckwater Library, impresses one at once with its holdness of scale (in its parts, for it is not actually large) and its weather-worn condition.

But to find the gem of Renaissance architecture in Oxford we must follow Broad-street westward, and turn up past the angle of Balliol to St. John's College, enter the second quadrangle, and turn round to view the sadly faded though once sumptuous work by Inigo Jones. His work is seen along the east and west sides, the more emphasised by contrast with the plain Elizabethan building on the north and south sides. There is nothing in Oxford to equal these two façades by Inigo Jones in grace and richness of detail, nothing that so clearly bears the stamp of artistic genius. It is a kind of work that one would far more expect to find in Italy than in England; there is a richness and profusion in the decorative detail which seems redolent of the full bloom of the Florentine Renaissance. The decayed state of much of the work, unhappily, is melancholy to look upon, and one is inclined to suggest that at all events the decayed parts of the fluted columns might as well be carefully cut out and refaced, this being more or less mechanical work in which the intrusion of the modern hand would not be so much felt. The decorative work it would be wrong to touch; it must retain its own faded and weather-stained beauty; but the columns seem to have suffered most, and will best bear repairs. If anything were done of this kind, however, it should be under the most stern conservative direction, such as would hardly allow a workman to touch a single bit of stone without a written order!

The tendency to restore, we should say, has not touched Oxford severely, so far; yet Mr. Lang complains that there is always some repair of a dangerous kind going on; remarking at the same time that there is nothing about which the members of other colleges than the restoring one are so sensitive. This dual feeling is traced back as existing two centuries ago, according to the testimony of one Prideaux, of that date, who records that St. Mary's was undergoing restoration, and the old men exceedingly exclaim against it. "That is the way of Oxford," adds her modern biographer, "a college is constantly rebuilding amid the protests of the rest of the University. There is no question more common, or less agreeable, than this: 'What are you doing to your tower?' or 'What are you doing to your hall, library, or chapel?' No one ever knows; but we are always doing something, and working men for ever sit, and drink beer, on the venerable roofs." Now really, if it is so, we must say that all the recent restoration must have been done in a very conservative spirit, for on the old buildings the marks of the cloven-hoof of the restorer are by no means much apparent to the casual visitor. A large part of the street façade of All Saints has, it is true, been lately refaced, but that is not a University building, and, after all, the architectural value of All Saints is not of the highest class, except as regards its part in the *comp d'œil* of High-street, and so far as that goes it is not injured. Mr. Fulleylove's drawing testifies that on the date of September 29, 1887, workmen "sat on the venerable roof" of Magdalen tower,—at all events their apparatus is in evidence; we presume some repairs were done to the pinnacles and battlements; but the consequences are certainly not at the present moment offensively conspicuous to the naked eye, from below at all events. There has been talk recently of

irreverent hands being laid on the Mitre Hotel, which, though not a part of the University, is no doubt a very time-honoured feature of Oxford, one of the remnants of the old High-street architecture; and objectors have been as solemn on the subject as if it were the very ecclesiastical institution symbolised by the Mitre that was threatened. We should be loth indeed to see so characteristic an old front demolished, but we must humbly confess our own conviction that the Mitre,—the existing building that is to say,—cannot much longer be retained: it is venerable, doubtless, but also knock-kneed and out of the perpendicular, and the rooms are very low. The rumour is that it was proposed to be purchased for the erection on its site of some new University erection. In that case the essential portion, the spirit, of the Mitre Hotel establishment would probably put on a new body elsewhere. One would be sorry to lose the old house, but there is no necessity that the new one, if built, should be such a piece of architectural vulgarity as the Randolph Hotel, for example.

And this leads us to our promised word about the new buildings of Oxford. Mr. Lang is lugubrious over this matter also, and thinks the next generation will regard the multitudinous new buildings as "imitative experiments, without style or fancy in structure or decoration, and often more than mediocrally uncomfortable." Elsewhere he observes that "the Fellows of a College at any given moment are not necessarily endowed with architectural knowledge and taste. They should think twice, or even thrice, before leaving on Oxford for many centuries the unconcomely mark of an unfortunate judgment." And seeing what Oxford is, and what is her charm, it is not to be wondered at that her sons should desire to keep her unchanged. There is unfortunately evidence, too, of the extent to which people may deceive themselves as to the ultimate value of buildings which they erect with much mutual congratulation. Think of the praises that were lavished on the New Museum; how it was hailed as the evidence of a revival of the true Medieval spirit, how its carven stones were pointed to as showing the true Gothic treatment of ornament based on natural forms, &c. But a quarter of a century since, was it not? And who has a good word for it now? And Kehle College, and its Chapel, within a stone's throw, are not a much happier example. The College buildings have the advantage of being less pretentious than the Chapel, less fireworky; but they are far inferior in their parti-coloured brick-work to the repose of the old (or some of the new) stone buildings. The new buildings at Balliol (about which, however, no such fuss was made) are not exactly pretentious, but they leave the impression that they would be very well as business chambers in London or Manchester; they are not of the spirit of Oxford. On the other hand, Mr. Lang's vaticinations savour a little too much of that tendency, peculiar to the literary mind, to dislike all new buildings, and to appreciate architecture by its date. We do not know that there are any among the modern Oxford buildings that are in worse taste or more pretentious than Hawksmoor's work at All Souls; it is certain there are some that are much better; but then All Souls is sanctified by the hand of Time. The examples of the New Museum and Kehle seem to indicate that the best future chance lies with those buildings which are restrained and sober in their character, and which do not attempt to strike out a marked new departure at variance with the prevalent type of Oxford work. In this respect an impartial criticism must, we think, admit that some of the new buildings of which we give illustrations in this number have fairly met the rather difficult problem. Mr. Jackson's Examination Schools, of which we give a view of a portion of the east side towards the quadrangle, has the merit of combining dignity

\* We may note here that sketches of other miserere carvings in New College Chapel were given by us in our number for August 3, 1889.

\* A view of part of High-street, showing this hostelry and All Saints tower, from a drawing by Mr. Fulleylove, will appear in our next issue.

with refinement and repose of style: it is of course made up mainly of old architectural materials, so to speak, though there is a certain individuality in the detail. Of course the centre *fronton*, rising above the roof, is an illogical and contrived effect; but if we were to begin to apply that principle of criticism rigidly in Oxford, how many charming bits of old work should we have to pull down? The High-street front of the new schools is more distinctly original; we have not been able on this occasion to give an illustration of it; but we consider that on the whole the best piece of new architecture in Oxford; and that is not mere imitation. The most original portion of the building, the interior arcade of the hall, with its heavy bracketing, is to our thinking the least successful bit; there is too manifest an attempt to do something new and striking; the upper hall and arcade, of which we give a view, is far more to our mind. The same architect's new building at Corpus Christi is so curiously like old Oxford in its architectural inconsistencies that, passing it the other day and forgetting for the moment what it was, we looked up curiously to see if it were an old building that had suffered the process of scraping. This is the effect it was probably intended to produce, and it is not every architect who can do that even when he means it; the experiment is interesting, and has been carried out with great delicacy; still one is tempted to say "something too much of this." The same criticism applies to the nevertheless beautiful range of modern buildings which Mr. Jackson has added to Trinity College, an addition of which, for refinement of design and detail, the College may well be proud; but it is rather too imitative. Mr. Champneys's angle feature to his new Indian Institute, of which we give a view, is a really happy bit of architectural invention; this turret stands at the end of Broad-street, near the north-east angle of the old Clarendon, and from its position is seen from the further end of the street. The architect may be congratulated on having added to so characteristic a portion of Oxford a new architectural feature which, though small, is both picturesque in itself and in harmony with its surroundings.

While, however we consider that the outcry in some quarters against the new buildings in Oxford, or against any new building at all there, has been pushed to an illogical and uncritical extreme, and that some of the recent additions to Oxford architecture merit a great deal of praise, we are quite in sympathy with those who deprecate all changes in Oxford that can be reasonably avoided. Like Venice to Europe, so Oxford to England is a completely unique possession left to us from the past. Let us at least preserve it as long as we can.

DR. PUCHSTEIN ON THE PARTHENON MARBLES.

HOWEVER uncertain much of the history of Greek art might be, one truth we had all thought stood safe and sure, that the Parthenon Marbles, though not indeed all actually sculptured by the hand of Pheidias, were designed by him and executed under his immediate supervision, and hence that for a knowledge of the style of Pheidias these Marbles were our principal and, indeed, only original source. This conviction is as old as the days of Visconti, and dates from the day he visited the Marbles in Burlington House before they were bought by the nation. He writes to Hamilton (November 25, 1814) "En visitant les marbres sculptés que my lord Comte d'Elgin a fait transporter d'Athènes à Londres, le connoisseur est certain d'avoir sous les yeux plusieurs de ces ouvrages précieux qui conçus et dirigés par Pheidias et exécutés en partie par son ciseau, ont fait pendant plus de sept cents ans l'admiration du monde ancien." Visconti seems to agree with Cicero: *Pheidia signum simul adscriptum et probatum est*. The grounds of his con-

viction are in the main subjective, and such arguments are hard to disprove. Sanctioned moreover by the tradition of more than half a century, they are peculiarly difficult to combat,—a doubt as to the connexion of Pheidias with the Parthenon Marbles will with many only raise a contemptuous smile.

None the less, Dr. Puchstein comes boldly forward to state, not merely a doubt, but his own conviction of the contrary,—*i.e.*, that the Parthenon Marbles are not merely executed but designed by a sculptor substantially later than Pheidias, and of a style markedly different. He does not state what raised the question in his mind, but it is easy to see, in reading his paper just published in the *Jahrbuch* of the Prussian Archaeological Institute (V. 1890, 2), that the doubt first occurred to him owing to his study of the copy of the Parthenon which was discovered during the Pergamene excavations. Setting aside Visconti's purely subjective argument, it has been usual to base the Pheidian connexion on two passages, in Pausanias and Plutarch respectively. In describing the Parthenon, Pausanias (1, 24, 5) mentions the pediment sculptures and an undoubted work by Pheidias immediately together, without naming the sculptor. This, it is presumed, is because the authorship of both was too well known to need statement. Such an argument, of course, considering the accidental way in which Pausanias names or leaves nameless the artists of the work he describes, is practically *nil*. Plutarch's statement is at first sight more serious. In his life of Perikles (C. 12 and 13), in describing the extraordinary artistic activity of the rule of Pheidias, he says, "that although each work had its own architect and artist, and those of the first rank like Kallikrates and Iktinos, Mnesikles, &c., yet Pheidias had the supervision of them all (*πάρα διήμιε*) and everything was well nigh dependent upon him (*πάρα ην οξύδου ην αβρύ*). As the friend of Perikles he kept an eye over all the works and the artists (*πάρων ιεραρχος ην, πάντων έπιερατής τοις οργάνοις*). But he himself erected the gold and ivory statue of the goddess." Now here, if anything is insisted on, it is this, that Plutarch distinguishes between the work Pheidias did himself (*i.e.*, the gold and ivory statue) and the work done by other artists, on which he kept a friendly, supervising eye; hence it may fairly be concluded that so far as literary evidence goes we have no hint whatever as to who *did* design and execute the marbles of the Parthenon, but a pretty clear inference that Pheidias did *not*. Our only source of knowledge, then, is a comparison of the style of work of art known to be by Pheidias with that of the Parthenon marbles. As all the actual works of Pheidias have perished, we are further reduced to an examination of well authenticated copies and of literary statements describing statues and compositions. Further, as the copies of the Olympian Zeus (on coins) are too small to exhibit details of technique, practically we are limited to the copies of the chryselephantine Parthenos and the design on its basis.

Here Dr. Puchstein's argument bifurcates;—he takes first the question, is the treatment of the drapery of the Parthenos,—as seen in copies,—such that it could possibly have been executed by the same hand that did the drapery of the Parthenon marbles; secondly, is the style of composition, which we know from accounts of the relief at Olympia representing the Birth of Aphrodite and of the Birth of Pandora, on the basis of the Parthenos, such that it can possibly have been conceived by the same artist who composed,—say the east pediment or the frieze of seated gods? To both these questions Dr. Puchstein returns an unhesitating No.

Respecting the first question,—the drapery of the Parthenos,—Dr. Puchstein's argument can only be fully appreciated in relation to the sections he gives of the drapery of the Varvakeion statuette, of the Akropolis torso, and of the Dresden and Pergamon Athenes. A most careful and detailed

analysis of the scheme of folds in these statues shows that all statues which are copies of the Parthenos show analogous schemes, and these schemes are marked by a close and severe naturalism. It is a commonplace of criticism to note the *idealism* of the drapery of the Parthenos marbles,—it is "wie im vision gefunden," "supersensuous," and the like: in fact, it leaves on the mind of every spectator the effect of a thing non-natural, supernatural, if we like,—a thing imagined, not actually seen. We cannot predicate of one and the same sculpture a close naturalism and an extreme idealism. It is, Dr. Puchstein maintains, unthinkable that, making all allowance for difference of technique in the round and in relief, the artist who made the simple, severe, almost archaic Parthenos, could have broken loose into the imaginative idealism of the "Gaia and Thalassa": the two are not only not the same, they are not even developed one from the other, they presuppose a complete break,—a contrary impulse.

Much the same is maintained of the compositions known to be designed by Pheidias. In his Birth of Aphrodite we have a central group of three, with pairs of the gods symmetrically balancing each other side against side, and bounded at either end by Helios and Selene. How simply and symmetrically such a composition was conceived in the days of Pheidias, and by him, may be seen in the remains of the Pergamene basis, which is unquestionably a copy of the Birth of Pandora, and on which five gods still remain standing in simple order, side by side. Contrast this with the east pediment composition, where we have an analogous subject—a birth, and the birth scene bounded by Helios and Selene. Instead of a simple scheme of spectator gods side by side we have a composition of infinite complexity. Every conceivable diversity of pose, a balance of elaborate diversity, a design, in fact, wholly, fundamentally different from the old archaic scheme which we know Pheidias preserved, even while he ennobled it.

We have given only a brief *résumé* of the lines of Dr. Puchstein's argument—his present paper is but a first instalment—in the next issue of the *Jahrbuch* he promises a further dissertation, dealing with the more positive evidence as regards date, of the use of certain tools in the Parthenon marbles. Enough has at least been said to show that a problem of the highest importance has been laid before the archaeological world.

NOTES.

MR. E. T. HALL'S paper in the last number of the *R. I. B. A. Journal* on the subject of "Sub-contracting in the Building Trade" (apropos of some recent deputations to the Institute), is a very painstaking and clear review of the subject, though not one that is likely to give satisfaction to the members of the deputations referred to. Mr. Hall pretty conclusively shows that all sub-letting is not necessarily attended by the evils which were so eloquently lamented on that occasion. In regard to masons' work, for instance, Mr. Hall says,—

"In this trade I know of two systems of sub-letting; there may be more. (a) One is for a contractor to sub-let the stonework—labour and material—to a sub-contractor in London who makes a speciality of stonework, and has space and plant for moving and working stone; (b) the other is for the contractor to sub-let to the quarry-owner, who works the stone in the country.

Now, as to the first system, I believe that the men employed by the sub-contractor are identically of the same class as those employed by the chief contractor. Indeed one firm—whose name as large chief contractors has been well known all over the country, I mean Messrs. George Smith & Co.—take a lot of stonework by sub-contract. The fact is, their facilities for moving and working stone are so much greater than all but the largest contractors, that they can do stonework cheaper than the chief contractors under whom they work without attempting to cut down wages."

That is to say, that this is simply a question of employing contractors who, because they

do only one kind of work, have all the plant and labour for it ready to hand, and can save time and money in carrying it out. The matter, he admits, is rather different when the sub-contractor is merely the working mason; a skilled workman, but not possessing the facilities of the great firms referred to. As to the second system, that of quarry-working, Mr. Hall's reply is that "quarry-worked" stone is *not* worked at the quarry, but in masons' yards in its neighbourhood, and also as near to a railway station as possible. He adds,—

"Mr. Weighill says 'quarry-worked' means sub-contracting by 'cheap labour.' I have made inquiries of one of the largest firms of quarry-owners in England, who employ from 1,200 to 1,500 men, and am assured by them that all the stone prepared in their eight depôts is worked by hand by masons paid the highest regular rate of wages in the district. Most of their men belong to the trade union.

Mr. Weighill's observations as to 'cheap labour' and the owners' statement to me,—although at first sight they appear contradictory,—are, it will be seen, quite consistent one with the other, as, of course, the rate of wages in the country is less than in London; its relation to rent and cost of living, however, being probably identical. We cannot, of course, nor would Mr. Weighill, condemn as an inferior craftsman a mason who happens to live in the country; and we cannot accept as reasonable the alternative logical inferences from the argument, either that the country-qualified mason should be paid the same as the London mason,—which would be very unjust to the London mason, who has to pay so much more for everything,—or that all stone to be used in London should be worked in London, in order to give more work to the London mason at the expense of his country fellow-workman.

As architects, we can condemn only the inferior craftsman and his workmanship. I believe all the stone for the Spanish-place Church was worked in the country by the quarry-owners. Is it inferior to work done in London by our masons?"

These and other points in Mr. Hall's paper are well worth the consideration of those who see such a bugbear in the mere fact of subletting. Whether Mr. Hall is equally successful in his reply to Mr. Robins's denunciation of competition is another question. He says that if a theatre is destroyed, hundreds of poor people are thrown out of employ; it is legitimate to try and get that place of employment rebuilt as soon as possible, and so with every other place of employment. Yes; if we are to regard architecture as a purely business matter of furnishing a building up to time. We presume Mr. Hall does regard it in that light; so do a good many other people. As we have before said, there is nothing immoral in the theory; only, high-class architecture cannot be had on that system; and some of us still think that high-class architecture is something worth having.

IT appears that our prediction that the "Removal of Gates" Bill would not be allowed to go without something in the shape of a compensation clause has been justified to a certain extent. After two somewhat lengthened discussions, the Earl of Wemyss's proviso was carried on Tuesday by a majority of 56 to 18; it runs thus:—

"Provided that if any lands shall be taken or injuriously affected by anything to be done under or by virtue of this Act without the consent of the owner thereof, compensation shall be made for the same by the Council in the manner provided by the Lands Clauses Consolidation Act, 1845, and the Acts amending the same, the provisions of which Acts, so far as relates to lands taken otherwise than by agreement and to compensation for lands injuriously affected, shall be deemed for that purpose to be incorporated with this Act."

The Earl of Wemyss expressed himself very plainly in regard to the Bill as it originally stood, pointing out that by the American constitution contracts were absolutely protected from interference by the Legislature, whereas "we had no written constitution or supreme Court in this country to protect the rights of property. Their Lordships' House was the only check on wild legislation which did away with rights of property." No doubt a certain colour was given to the line taken by the objectors to the clause, from the

fact that the Duke of Bedford, the freeholder of the property, did not take any action against the Bill; but even having regard to that fact, the tone adopted by Lord Herschell in opposing the introduction of any compensation clause appears to us perfectly inexplicable, unless there is something more behind it than appears on the surface. It is evident that the Lord Chancellor had a strong feeling on this point, from the decisive rebuke he gave to "the indirect menace" of Lord Herschell's speech, and his remark that "if the thing was right he trusted their Lordships would have the courage to do it." It is impossible to avoid the conviction that this confiscatory proposal was counted on, if carried, as a precedent in future cases of a similar nature.

ONE of the most unsatisfactory of the many strikes which are now agitating the labour world is that of the Tyne shipyard joiners. It affects only a comparatively small body of men, but the circumstances are peculiar and unusual. The dispute is an old-standing one, turning on the apportionment of work between ship carpenters (or shipwrights) and ship joiners. A similar dispute was settled at Hull, after a strike of some weeks, by representatives of the parties to the dispute drawing up a list of each other's work; but the Tynesiders, failing to come to an agreement as to the division of their respective classes of work, submitted their differences to arbitration. An award was made as long ago as the beginning of last April, by Mr. Burt, M.P., which, like most decisions of this nature, failed to commend itself to all concerned. The shipwrights, however, have repeatedly expressed their willingness to accept the award, but the joiners have persistently declined to work up to it, the climax being reached by the latter coming out on strike last week. They ask for a joint Conciliatory Committee to go into the whole question again, but the shipwrights naturally fall to see the utility of this, and it is difficult to see how the strikers can expect any faith to be placed in them after their repudiation of Mr. Burt's award. When questions are referred to arbitration in this way it is almost impossible for both sides to obtain all they want, but it is fortunately very seldom that the losing party doggedly refuse to make the best of it. This is what the Tyneside joiners appear to be doing, and as Mr. Burt has been a leading referee in disputes of this nature in the North, a severe blow would be dealt at the principle of arbitration should the example of the strikers be followed by others. It should be added that their contention is that the award was against the weight of evidence, and that the strike is the unavoidable consequence of their being unable to appeal against it in any other way.

WE recently published some correspondence on the exorbitant charges made by landlords for dilapidations. Last week a case was tried at the Sheriff's Court, London, again illustrating the unreasonable way in which dilapidations are estimated. The Dowager Marchioness of Downshire let Benfield Park, Berks, at a rental of 5,900 a year; at the end of four years the tenancy was concluded. The first estimate for dilapidations was 2,000, but this was reduced, and the amount claimed was 1,000. The jury, according to the report before us, awarded only 290. And this, though the tenant did not defend the case. Such figures as these speak for themselves. In such a case as this it is obviously those who are engaged professionally, and not the landlord, or rather landlady, who are to be blamed, since, of course, the Marchioness of Downshire could know nothing of the cost of putting the premises into tenable repair. We cannot too often state that professional men injure their profession by estimates of damages in cases of dilapidations, obstruction of lights, and compulsory taking of land or buildings

which are proved to be unreasonably high in the result.

SINCE the opening of the Forth Bridge there has been a congestion of traffic at the Waverley-station, and during the present month the utmost endeavours of the railway officials have failed in starting the through trains in proper time. It is evident that something must be done to obviate this state of matters, and it has been suggested that a loop-line should be formed by utilising the valley of the Water of Leith, which might be covered over from where it is crossed by the railway, about two miles to the west of the city, onwards to Leith Docks and from thence to the Portobello branch. The covering over of the stream would doubtless be an expensive process, but not more so than what the Caledonian Railway proposed to do in driving a tunnel along the whole length of Princes-street, Waterloo-place, and the Calton Hill. The covering over of the stream would effect a sanitary improvement, and the railway would afford facilities to the north side of the city which have long been wanted.

THE Committee of the City Corporation, under the Presidency of Sir Guyer Hunter, for inquiring into the charges for and the supply of the metropolitan water companies, has elicited some characteristic replies from the water companies, who have been invited to send official representatives to the Committee. The Southwark and Vauxhall Company said that as the Committee was wholly irresponsible "and apparently formed for supporting the erroneous views held against the Water Companies," they did not deem it expedient to take any part in the proceedings. Most of the other replies, though not all so candid as this, were practically to the same effect. The New River Company gave no reply. Sir Robert Rawlinson, in giving evidence, said he thought it was possible to vastly improve the water supply taken from the Thames, and that it might be taken from the area of the Thames basin without drawing out of the open river at all. That would be better for the water, very likely, but not perhaps any better for the Thames. In the meantime we are glad to see Sir R. Rawlinson express himself so decisively on the impropriety of allowing house-boats on the Thames while it is a source of water supply. No such thing, he pointed out, would be tolerated on the great artificial reservoirs in connexion with Liverpool and other large towns. Of course not; yet as long as the Thames is the main source of our drinking-water, the objection is just the same. Our wish and hope, however, is to see some totally different source of supply established, which will not drain away our river either directly or indirectly. We observe also that Sir Robert recommended the adoption of the meter system. This is the real remedy, both for water waste and for inequitable imposition of rates.

THE "Architectural Association Sketch-Book" fully keeps up its high character as a collection of architectural measured drawings and sketches. Among the drawings which illustrate rather curious and out-of-the-way subjects is the first one, of the elegant stone chimney-piece from "The Astrologer's Room," Chautmont, by Mr. H. D. Walton, a curious mingling of Late Gothic feeling with a good deal of Renaissance character of detail. Mr. Needham Wilson's pencil drawings of the chapel of the Castle Beaucaire show a remarkably good bit of drawing of vaulting in the interior view; the ribs abut on to a central cylindrical pier without impost, the section lines of the mouldings being defined against the surface of the pier. The title-page, by Mr. W. R. Lethaby, is a rather curious affair, inspired by the style and feeling of the engraved book illustrations of the Renaissance, and shows a courtyard with a well in the middle

in the water of which the semicircular round-arched arcade which forms the background is partially reflected; a vista is seen through the arches, and a higher circular columned building rises behind, drawn elaborately out of perspective, according to the style of the period. The drawing does not incorporate the title, which is merely printed above; and though it is cleverly done, we should more admire a true decorative design than this bit of archaeological drawing. The prize of 5*l.* 5*s.* for the best design for a title-page to vol. viii. has been awarded to Mr. W. G. B. Lewis; the prize of 3*l.* 3*s.* for the best set of two transfers from any one member is gained by Mr. Arnold Mitchell, and the prize of 2*l.* 2*s.* for the best set of three plates to Mr. T. Maclaren. Oakwell Hall is well illustrated in a set of measured drawings by Mr. F. Mitchell. Mr. Maclaren delineates admirably the fine and curious Renaissance carved detail of a pilaster in San Pietro in Casinensis, Perugia. Sutton Place, Guildford, is another old house illustrated by measured drawings by Mr. A. Gladding; and a chromo-lithograph is given of the head of a pastoral staff in the Library of Wells Cathedral, full-size, from a coloured study by Mr. R. W. Paul. Among other drawings may be mentioned Mr. Leslie C. Cornford's careful and delicate measured drawing of the screen in the Presbytery at Winchester; Mr. Horsley's rood screen at Bergamo (reproduced from the drawing now in the Royal Academy); Mr. Hardy's comparative sketches of towers at Bologna, Cremona, and Genoa; Mr. Victor T. Jones's delicate drawings of the South Porch, St. Helens, Bishopsgate; Mr. Maclaren's pencil sketches of Pompeian bronzes; Mr. Lorimer's details of the Board Room at Heriot's Hospital; Mr. Gimson's interior of St. John's, Chester; Mr. Barnsley's mosaic in the Palace Gardens, Athens; Mr. Gimson's Firedog from Haddon Hall; Mr. Edmund Sedding's measured drawings of St. Magnus, London Bridge, with a number of sections of mouldings appended; Mr. Horsley's very fine coloured drawing (chromo-lithograph) of a portion of St. Mark's Baptistery, Venice; Mr. Barnsley's measured drawings of Wells Chapter House; Mr. Begg's South Transept, Melrose Abbey (from the drawing in the Royal Academy); Mr. Lorimer's decorative details from Kellie Castle, curious and unusual examples of rather realistic Renaissance floral ornament; Mr. Gimson's interior of dining-room, South Waxall Manor House, with its elaborate and fine plaster ceiling; and Mr. Percy K. Allen's measured drawings of the porch of Southwold Church.

WE recently adverted [p. 63, ante] to the opening of St. Giles-in-the-Fields Churchyard as an open space, under the Metropolitan Open Spaces Act, 1881. It was stated in the Consistory Court that no human remains will be interfered with, and no tombstones or vaults removed. The site dates from a period remote. According to a plan of circa 1500, the precincts of Queen Mathilda's lazaret hospital occupied a triangular space, enclosed by a high wall, and bounded westwards by Eldstrate (since Hog-lane, or Crown-street), southwards by Le-lane (since Monmouth-street), and northwards by a wide thoroughfare,—the present High-street, separating it from the Pitance Croft, or Sixteen Acre-close of Blemundesburye Manor.\* The plan delineates the public gallows at what is now the end of Tottenham Court-road; the detached parish and hospital churches, with St. Michael's chapel within the latter—each having its own altar, but all being under one roof, and with a round two-storied bell-tower surmounted by a cupola at the south-western angle; the hospital proper, since Dudley

House, next west of the church (end of Denmark-street); the hospital gate north of the church; the two cottages drawn in the later view by Aggas, east of the church; the way to the Elms (Endell-street); and the Merestade or Marshland, since known as Cook-and-Eye-fields—the modern Seven Dials. The nave, of two aisles with five side-windows and an east window apiece, was, together with the tower, pulled down in 1623, and replaced with one, built of brick, whereof Hatton gives a description. That church again, which Laud had consecrated, was supplanted by Fliccroft's edifice, opened on April 14, 1731. Hatton mentions the monument of one William Styddulfe, who demised a plot of land for enlarging the churchyard southwards. The whole burial-ground was surrounded by a wall, whereof a portion is replaced with a massive iron railing. The so-called "Judgment" or "Resurrection" gate, removed about 1865 to opposite Denmark-street, was originally of yellow and red brick, and stood at the end of the former avenue. Hatton says it was built in 1687 (from W. Leverton's design), at a cost of 186*l.* 14*s.* 6*d.* Various accounts are given of its curious carving, hut in the rector's annual parochial report for 1865, quoted in "Old and New London," the work is stated to be "carved in oak, of the date of 1658." In this churchyard were buried "trusty" Richard Penderel, of Hobball Grange, Tong, who with his brothers aided Charles II. in his escape from Worcester fight; Chapman, the poet, and friend of Ben Jonson—his tombstone, against the church's south wall, was set up, as its inscription records, by Inigo Jones; and the headless body of the Jacobite Earl of Derwentwater, since exhumed and reinterred at Thorndon, Lord Petre's seat, near Brentwood, in Essex.

MR. SPEAR'S Report to the Local Government Board upon the recent prevalence of diphtheria and "croup" in the Stalybridge Urban Sanitary District, and upon the general sanitary circumstances of the district, gives the following notes on the sanitary state of the district in regard to drainage:—

"The district is sewered chiefly by pipe-sewers, but partly by brick and stone channels all emptying by many different outlets into the river as it passes through the town. Some years ago,—owing, it is said, to the entire absence of ventilation of the sewers,—two men working in one of them lost their lives; and since then they have been ventilated at various points by open man-holes, while the Authority have likewise favoured the plan,—one that is open to grave objection,—of connecting with the sewers rain-water spouts from the roofs of houses. There are evidently many branch sewers that are still without ventilation, or that are ventilated only by the ineffective and objectionable method last referred to. Water-closets are uncommon (there are only some sixty in the town), but a large proportion of the middens are drained into the public sewers; this mistaken and mischievous plan of dealing with slop-middens having been adopted by the Authority some ten years ago, and for a while actively enforced.

During the last five years direct connexions between the interior of houses and the sewers have been severed in more than one thousand cases, and it was believed that the greater part of this work had been accomplished. Nevertheless, direct connexion by kitchen slopstone or by cellar gully, sometimes even without the intervention of a trap, was found in thirteen of the houses invaded by diphtheria or "croup" during the recent prevalence, or in nearly 50 per cent. of their number; while in five others untrapped or defective drains existed in such close proximity to the doors and windows as to produce practically the same result as if the drain had been within the house. In most of the above cases, in fact, it was obvious that the houses were habitually invaded by sewer air, and in three cases in which the experiment was tried the draught coming from the drain was sufficiently strong to extinguish a lighted candle applied to the opening."

DR. AIRY'S Report to the Local Government Board on diphtheria and fever in the Grays Sub-district of the Orsett Registration District in 1889, gives an account of the disgraceful manner in which rustics who "made up a party to go hopping" at Coghham

were provided for, though this was probably only a normal case:—

"They crossed the Thames to Gravesend, and walked thence to Coghham on September 1. There they were housed, with other parties, fourteen families in all, in a large barn in a farmyard. They say that they had to lie on old dirty straw on which a company of harvesters had lain, some of whom stayed to the hopping, that there was no separation between families or sexes, except what they contrived for themselves by heaping up the straw between them, and that all their meals had to be taken on the straw. There was no privy accommodation; water was obtained from a well in the farmyard."

A second portion of the report deals with the state of the drainage in the Grays Thurrock Urban Sanitary District. The report says:—

"The Board were made acquainted in 1884, by the report of Mr. John Spear, with the want of sewerage in the town of Grays, then under rural administration. This want still remains unsupplied. The two old drains on the east and west sides of High-street (already mentioned) which discharge behind the sluice at the head of the dock, and a newer private drain which serves a number of houses belonging to one owner in the eastern part of the town, and which discharges into a ditch communicating by a sluice with the Thames, are the only provision for the conveyance of sewage out of the town. The general plan is to lead the house drainage to cesspools which are sunk through 10 ft. or 12 ft. of gravel down to the chalk, as described by Mr. Spear on page 3 of his report. Some of the surface drainage is disposed of in a similar way. In a new cesspool the chalk at first allows percolation of the fluid, but after two or three years the solid matter seals the pores of the chalk with an almost impervious coating. The newer cesspools are provided with inlet ventilators, but these are almost invariably plugged by the tenants.

In the northern part of the town there is great want of proper surface drainage. A large piece of waste ground is converted into a swamp by the accumulation of rain, for which no available escape is provided. A tramway embankment appears to be the main obstacle to the escape of this surface water. It is proposed to fill up the hollows in which the water lies. Care should be taken that the material employed for this purpose is not putrescible.

The want of sewerage is especially apparent in the southern part of the town, where the dwellings have been pushed forward on to the alluvial marsh land which lies below the level of high water in the river."

ALTHOUGH the system of cremation has certainly made progress during the last few years, burial is still likely to hold its own; and even if burial in churchyards, i.e., sepulture in the neighbourhood of large towns, may at a date not so very far hence be done away with, these churchyards will only be replaced by a catacomb, or rather mausoleum system of high standard. That this latter system is already coming to the foreground will be seen by referring to the "Kjivlevanin" of Russia, or to the "Journal of the Franklin Institute" of the United States, both of which happen (on very nearly the same date) to bring forward reports on such systems as have just been proposed in the respective countries.

Whilst, at Kiev, the city architect has laid before the municipal authorities a design for an extensive burial place in the shape of a pyramid, divided up into galleries and cells, showing such dimensions as would give accommodation to the dead of the city for at least a century to come, but not having any special features from the hygienic point of view; Mr. John Meyers, of Washington, has laid before the Committee on Science and Arts of the Franklin Institute of Pennsylvania a design for a system of sanitary entombment for the dead of New York, in the form of a mausoleum system on a large scale, so equipped as to make the contamination of the air surrounding all but impossible. According to the report of the sub-committee, this system depends for its operation upon the enclosing of bodies in receptacles (or sarcophagi) made of concrete, and the circulating of pure dry air through such receptacles; this dry air being discharged into a closed conduit leading to a furnace, where after passing through burning fuel, it is divested of all noxious or offensive properties, and is discharged through a chimney. The design

\* Hence Bloomsbury: from the dyke which one William Bloomund, temp. John, made here through the Ruggenera. Monmouth, latterly Dudley, street, and Crown-street, have been absorbed in Shattisbury-avenue and Charing Cross-road.

embraces the construction of a group of large buildings, having several floors and ample corridors with tiers of "receptacles" of concrete, each provided with a proper air-inlet and outlet separate from the ventilation of the buildings themselves.

A PROPERTY, known as Markyate Cell Priory, by Market-street, Bedfordshire, is offered for sale, consisting of an estate of about 410 acres, situated near to Luton and Dunstable, and a manor house, which was mainly rebuilt some sixty years ago, but retains portions of the ancient priory. This we take to be the religious house whereof Leland writes:—

"Margate was a nunnery of late tyme. It standeth on a hill in a faire woods hard by Washing-street, on the east side of it. Humphrey Boncher, base sone to the late Lord Berners, did much cost in translating of the priore into a maner place: but he left it nothing ended."

The priory was valued in 26th Henry VIII. at 114*l.* 16*s.* 1*d.*, according to Dugdale. Speed's valuation is 143*l.* 18*s.* 3*d.* In 1145 Dean Ralph and the chapter of St. Paul's, as lords of the soil, gave a site with lands to Christina, first prioress, when Alexander, Bishop of Lincoln, consecrated the church at Markyate nunnery to the Holy Trinity. Matthew Paris says that Geoffrey, Abbot of St. Alban's, rebuilt the nunnery, and endowed it with the tithes of Cashio. Dugdale gives a list of the eleven prioresses, Joane Zouche being the last. In 38th Henry VIII. it was granted to George Ferrers, from whose descendant it passed, 1640, to the Coppin family, and thence to the Howells.

NORBURY PARK, near Dorking, a fine property covering about 860 acres in a favourite part of the county, was put up for sale at the Mart on Tuesday last, by order of trustees under the will of the late Mr. Thomas Grissell. It is bounded upon three sides by the Mole; Mickleham Church, and what are locally known as the river "Swallows," lying to the south. The park is well timbered. In a wood upon the estate stands the Druids' Grove, composed of yew trees, many of which have attained to a great age. Norbury Park was held, 8 Edward II., by William Husee of Gilbert Earl of Clare at service of half a knight's fee; his daughter and heir, Isabel, brought it in marriage to William Wymeldon. From the Wymeldons it passed, 14 Henry VII., to Thomas Stodewolfe. Having devolved, in 1691, upon the Tryons, it was sold for 35,000*l.* to one Anthony Chapman, in 1766, who cut down many of the famous walnut trees. Eight years later it was bought by William Lock, who pulled down the old house in the meadows by the river, and built for himself the new house on the higher ground, whence the prospect extends to distances remote both north and south. Some of the sitting-room walls were painted by Cipriani and George Barret, the ceiling and the sky effects being by Pastorini. The property includes two farms and three separate residences, known as Foxbury, the Priory, and Cowslip Castle.

WE are glad to see that the question has at all events been asked, whether the Constitution-hill arch is ever to be surmounted by a *quadriga* group, or something of the same nature, in accordance with the intention of its ill-used architect, Decimus Burton. The reply of the First Commissioner of Works was that it would cost a great deal, and that he was not prepared to make that demand upon the Treasury. This, however, is the stereotyped reply in the House of Commons to all appeals in favour of a work of art, in the first instance at all events. A little persistence in asking the question will perhaps elicit something more, by degrees.

\* We are informed that, having been withdrawn at the sale, it was afterwards purchased by private contract.

TRULY we live in an age of competition. Even "professional services" are put up to tender. A reliable correspondent sends us the following list of tenders:—

"WEST HAM.—For designing, planning, and superintending the erection of Poor-law schools, for the West Ham Union, Essex, including all attendances, travelling expenses, and all charges:—

A. & C. Harston .....	5 per cent.
J. T. Newman .....	5 " "
J. M. Knight (accepted) .....	23 " "

This, as our correspondent says, is "cutting it fine." The successful competitor, we understand, is Surveyor to the Mile End Vestry.

ROYAL ASSOCIATION FOR THE PROMOTION OF THE FINE ARTS IN SCOTLAND.—On the 30th ult. the annual meeting of this Association was held in the Society of Arts' Hall, 17, George-street, Edinburgh. Sir Thomas Clark, Bart., presided. In the unavoidable absence through illness of Mr. H. W. Corillon, the Secretary of the Association, Mr. Ramsay, the clerk, read the fifty-sixth yearly report by the committee of management. The subscriptions for the present year amounted to 2,529*l.* Out of the sum placed at the disposal of the Committee during the year they had purchased from the recent Exhibition of the Royal Scottish Academy, and from the Exhibition in Glasgow of the Royal Scottish Society of Painters in Water-Colours, at a cost of 466*l.* 12*s.*, works of art consisting of twenty paintings and nine water-colour drawings. The presentation work for this year consist of a volume of reproductions of several of the best works of Sir Henry Raeburn, containing also a biographical sketch of the artist, and descriptive notices of the persons represented. The report was adopted.

OLD COTTAGES, GLOUCESTERSHIRE.—V.

THIS farmhouse at Humphries End lies close to More Hall, illustrated on July 19. It is an instance of the late survival of mullion windows, since it is dated on the north side 1696. The style has become more formal, however, than the earlier work, and the usual return gables are not present. The dormers lit small spaces in the roof that, as I mentioned in writing of Surrey, were doubtless thought sufficiently good sleeping-berths at the time they were built, but are now closed up. It is probable, however, that the shutters that fill many of the windows are original, and that the windows were never glazed. The ground floor is kept well up and good cellar windows provided. The chimney "sets off" are of a usual form. The old houses in Church-street, Stroud, were built in 1642, as is narrated in the delightful "Notes and Recollections of Stroud," written by Mr. P. H. Fisher. They were very infirm, and I was told last November were shortly to be taken down to allow of the street being widened, so probably they do not now exist. The house shown in the distance, I learn from the same authority, was built in 1633 by Thomas Webb, a member of one of the principal weaving families. Other houses of this family are Egypt Millhouse that I have already illustrated, Gydlyknup, and the Hillhouse, Wickridge, close to Stroud, built by this same Thomas Webb in 1634.

The sketch at Stonehouse is at the back of a house that, as shown by a mutilated projecting window, once possessed importance. The arrangement of chimney and gable is picturesque and instructive.

At Stonehouse is a fine Elizabethan house, of too important a character for my work. It has

At Stonehouse.

Oulpen Manor-house, Gloucestershire.

the question of registered against unregistered work, but the general feeling appeared to be that the power of the registered plumbers would certainly increase as their number increased.

The next question considered was the desirability of obtaining Parliamentary powers. It was very strongly urged that plumbers of all grades should be made to recognise the vital influence of their work upon the health of the community. It was necessary that there should be an Act of Parliament to ensure that none but thoroughly skilled and competent men should undertake plumbers' work. "Can certificates be cancelled or suspended under the present voluntary system?" was the next question dealt with, and, after full discussion, it was answered in the affirmative. A resolution was passed to the effect that the best way to get plumbers to take practical interest in the movement was to promote technical education among members of the trade by the maintenance and extension of the plumbers' classes, and by affording inducements to plumbers to attend—at the same time impressing upon public authorities, architects, master plumbers, and the public generally the advantages of employing none but registered plumbers.

The Clerk of the Plumbers' Company described a graded syllabus of instruction in the principles and practice of plumbing which the Company were preparing, together with model indentures, with the object of identifying the systematic training of apprentices with the conditions of their apprenticeship. A resolution was passed expressive of the opinion of the Congress that a graded scheme of education for plumbers, including workshop practice, was feasible and desirable; that the scheme of the Worshipful Company of Plumbers should be considered by the District Councils; that all apprentices should be indentured, and that master plumbers should interest themselves in the education of their apprentices.

It was further resolved that it would be desirable that a general as well as a district list of all registered plumbers should be issued, that the laws of all district councils should be framed after one model, and that pocket certificates should be issued to registered men.

A long discussion took place as to whether it was desirable to have a Central Board in Scotland for the management of the business of the Scottish Councils, but the general feeling was against the suggestion, and it was decided instead to have a similar Congress annually, Glasgow being fixed upon as the next meeting-place.

The Chairman, in closing the proceedings, said the Congress had more than answered his expectations, and that was saying a good deal. It was a great pleasure to him to listen to the frank and full discussions which had taken place, and he was especially pleased to note the remarkable unanimity in the opinions elicited from the representatives of the several Scottish Councils.

ARCHAEOLOGICAL SOCIETIES.

CAMBRIAN ARCHAEOLOGICAL ASSOCIATION.—The forty-fifth annual meeting of this Association will commence at Holywell, Flintshire, on Monday, August 18, and will be continued on the four following days.

DERBYSHIRE ARCHAEOLOGICAL SOCIETY.—On the 26th ult. the members of the Derbyshire Archaeological and Natural History Society made an expedition into East Derbyshire. They arrived at Dronfield about noon, and inspected the church under the guidance of Mr. J. B. Mitchell-Withers, F.R.I.B.A., who had prepared a paper upon it, and which he read to the visitors assembled in the chancel. First dealing with some of the changes which had been impressed upon the fabric, he observed that it was not certainly known by whom it was erected, but in all probability it was by one of the family of Brailsford soon after the Norman conquest.

Early in the reign of Elizabeth, commissioners were appointed to survey the chancel and the parsonage-house, and to certify to the decays thereof; how long they had been in decay; by what occasion, and who had made any waste, and by whose default the same remained un-repaired. They were also to estimate the cost of the repairs, and what the parishioners would contribute towards it. The commissioners reported that the east window of the chancel had fallen down, and was in great ruin and decay; that other windows were in decay for

SCOTTISH OPINION ON THE TRAINING AND REGISTRATION OF PLUMBERS.

A CONGRESS of the Scottish District Councils, acting in conjunction with the Worshipful Company of Plumbers, was held on the 31st ult. and 1st inst. at Edinburgh, under the presidency of Dr. Alexander Crum-Brown, Professor of Chemistry, Edinburgh. There was a good attendance of representatives from the several District Councils in Scotland, and the Clerk of the Plumbers' Company was also present.

The subjects discussed included the question whether any steps should be taken to enlarge or enforce the by-laws of municipal authorities with reference to plumbers' work in new dwellings and other buildings, and it was mentioned that in Aberdeen, where a set of by-laws had been framed by the co-operation of plumbers, architects, and other members of council, the result had been most beneficial to the community. Some reference was made to

the central porch and other features of the period, and inside a mantelpiece carved with the royal arms. This has been illustrated by the Gloucestershire Archaeological Society, and it is thought to commemorate Queen Elizabeth's visit here.

In the churchyard at Stonehouse are a number of "coffer" tombstones, most elaborately carved, and well worthy notice. One, at least, has very beautiful carving of a florid character, and must have been done by a first-class artist.

R. N.

THE ROYAL ITALIAN OPERA HOUSE, COVENT GARDEN.—In the course of this autumn will be offered for sale, at the Auction Mart (unless previously purchased) the ground-lease, for fifty-seven years unexpired, of the Royal Italian Opera House. The sale will extend to the library of music, the wardrobes, costumes, and furniture, together with a varied collection of theatrical "properties."

want of glass and iron, and that the roof and other parts of the fabric were out of repair; but no lead or timber or other matters had been taken away. The parishioners undertook to provide all stone, lead, and other things for the repair of the church. In 1818 the church was struck by lightning, and the spire and other parts of the building were much damaged, and it had to undergo extensive repairs. Coming to the architecture of the church, as it exists at the present time, Mr. Mitchell-Withers said the remains of the Norman period were small, and consisted of the piers of the tower arch, the base of a buttress at the west end of the north aisle, and the bases and capital of the nave piers. The latter had been recut and altered at different times, but still retained some of the elements of their original sections. The south aisle is of the Early Decorated period simply treated, its windows being of the class called intersecting tracery. The north aisle had been of a similar class of work, but evidently rebuilt, probably after the damage by lightning in 1818. The result was unsatisfactory and weak. The chancel is of a later period, probably about 1300, and is a fine example of Geometric work, with touches of transition to the next or Curvilinear style, seen in the ogee form of the canopies of the sedilia. The east window is denuded of its tracery, but retains its original jambs and arch. The tracery of the other windows is of excellent design. The ancient stained-glass in the windows is of a fragmentary character; but the whole is beautiful in colour, and contains exquisite bits of design, and he trusted it would never be replaced by modern work. The remains of the stalls are simple and massive, and are ornamented with a four-leaved flower and poppy heads, and they were not much later, he believed, than the chancel itself. The vestry and room over are of the same date. The square-headed window in the south aisle is of the Curvilinear or Late Decorated period, and must, he thought, have been inserted to give more light to the altar of the Blessed Virgin, which was situated below it. The remains of the piscina still exist behind the boarding, and Perpendicular work occurs in the tower and spire. In the chancel are two interesting brasses, one to the memory of the Fanshawe family, dating from 1573; the other representing two ecclesiastics, former rectors of the church, one Thomas Gouffrey, who died 1399, and the other Roger Brailsford, who died 1396. A bugle horn is suspended between the two, having reference to the Foresters of Wormhill, to which family Gouffrey belonged. The upper portion of the pulpit is English Renaissance, and is a very fine specimen. It is similar to those in Chesterfield, Rotherham, and other neighbouring churches. After luncheon, the visitors proceeded to Beauchief, in order to inspect the Abbey. The party having taken seats within the Abbey Church, Mr. J. D. Leader, F.S.A., read a short paper on the history of the Abbey, and explained the position of the monastic buildings. The Abbey was founded by Robert Fitz Ranulph, between 1172 and 1176, and dedicated to St. Thomas the Martyr. It was given to the white canons of the Order of Premonstré, and was made a daughter of Welbeck. The only remains now standing are the west tower and a portion of the nave of the church; but on the south side of the church it is easy to recognise the site of the monastic buildings. Mr. Leader pointed out the position of the chapter house, the refectory, the guest chamber, and the abbots' lodgings, all standing around the cloister garth. Beyond these, round an outer court, were the domestic offices, brewery, bakehouse, barns, stables, &c., occupying the site of the present farm buildings. The church has been long without aisles, but with north and south transepts, and an aisleless choir and presbytery. At the intersection of the nave and transepts stood a tower, the ruins of which now form a grass-covered mound. Large portions of the ruins have been taken away for the erection of modern buildings; but in a meadow lying south-east from the church there are indications of buried foundations, which Mr. Leader suggested might be the site of the infirmary. Subsequently the visitors proceeded to Norton, and at Norton Church Mr. Francis Westby Bagshawe, J.P., described the principal features. He said that the church probably was built by the founder of Beauchief Abbey, on which it was dependent, as were also Dronfield Church

and churches at Edwalton, in Nottinghamshire, and Wymeswold, in Leicestershire. The chancel was, he thought, erected about the year 1490, and the Blythe Chapel was also of the same period. This latter was built by one Blythe, who was Bishop of Lichfield and Coventry, and the chapel was put up by him in memory of his father and mother, as also was the monument of his parents, in full effigy, still in the church. This monument is in alabaster, and is exquisitely carved, and at one time had been beautifully painted. On the roof of the bosses, on which were carved roses, the monogram, D. and I.H.S., were in a good state of preservation. A door, just below the chapel step, was closed up during the late restoration. After leaving the church Mr. Bagshawe entertained the party at tea at The Oaks, where he had placed for inspection in one of the ante-rooms an interesting series of early charters and deeds. The excursionists, after leaving The Oaks, drove to Sheffield station, whence they returned to Derby after a pleasant expedition.

NEWCASTLE SOCIETY OF ANTIQUARIES.—At the monthly meeting of this Society, held on the 30th ult., Dr. J. Collingwood Bruce, F.S.A., read a long and interesting paper on the life and antiquarian labours of Mr. John Clayton, whose death was recently recorded in our columns. Subsequently, Dr. Hodgkin read some "Notes on the discovery of twelve bronze vessels on the site of Prestwick Carr," and Mr. Boyle read a paper "On the materials, printed and unprinted, for the history of Northumberland."

WILTSHIRE ARCHEOLOGICAL SOCIETY.—The annual meeting and excursions in connexion with this Society were held at Devizes on Wednesday, Thursday, and Friday last week. The business meeting was held on the first day at the Town-hall. On the motion of Mr. Story-Maskelyne, M.P., General Pitt-Rivers was elected President of the Society for the ensuing year. The Rev. F. H. Goddard, one of the general hon. secretaries, read the report of the Committee. This showed that the total number of members on the books was 373, or a decrease of four. Reference was made to the loss by death of the Right Hon. E. P. Bouvier, the Rev. Prebendary Scarth, Sir Daniel Gooch, and the Rev. H. Brown-Cave. Profound regret was expressed at the resignation of the Rev. A. C. Smith as hon. secretary and editor of the magazine, and a warm tribute was paid to his valuable services. The report also referred to the work done by General Pitt-Rivers in excavating Wans Dyke and Dokerley Dyke. The report was adopted and ordered to be printed. The President, General Pitt-Rivers, then delivered his inaugural address, which was descriptive of the excavations that he had made during the past ten years in the two Romano-British villages of Woodarts and Rotherley. The address was illustrated by diagrams and models. At the close of the paper the Rev. C. U. Plenderleath took the opportunity of referring to a curious mistake which had been made during the meeting of the British Archaeological Association at Devizes ten years ago, and which had been allowed to pass uncorrected ever since. It was stated that at that meeting that Devizes Castle was built by "Roger Poore, Bishop of Salisbury." Now it was a fact that no such person as Roger Poore was ever Bishop of Salisbury, but it was evidently a mistake for Roger the Norman. He thought it was advisable, in the interests of correct history, that the mistake should be mentioned and put right. The members then adjourned to the churches, which were explained by the Rev. Dr. Burges, and by the kindness of Sir Charles Rich the grounds of Devizes Castle were visited, and the principal points of interest were shown and explained. On the following days there were excursions to various places of interest in the locality, including Fotherne, where the Ven. Archdeacon Buchanan described the old church, pointing out that it was built in the early part of the thirteenth century. The party then proceeded to the Old Porch House, the property of Mr. W. B. Richmond, R.A., of which Mr. Walter Buchanan gave an interesting account. Various ideas were hazarded as to the date of the building, but it was generally agreed that it was Elizabethan. The floors were originally of mud and rushes, but now Mr. Richmond has had them laid with tessellated pavements. After inspecting the museum of curiosities, the party proceeded to Market Lavington, where Mr. C. E. Ponting, Diocesan Surveyor, read an interesting and comprehensive paper, saying that formerly a

Norman church stood there, and was rebuilt in the fourteenth century. A very interesting feature of the church was that the floor originally sloped with the natural level of the earth. This was levelled in the fifteenth century. The staircase to the tower is only 16 in. wide, and is in perfect preservation. The tower is fifteenth century. The roof of the chancel is the original fourteenth-century roof.

## Illustrations.

### ILLUSTRATIONS OF OXFORD.

THE illustrations in this and the next number have all been selected in reference to the annual excursion of the Architectural Association, which takes place this year to Oxford and its neighbourhood. The illustrations in the present number are all taken from Oxford itself.

Mr. Fulleylove's sketch gives the first near view of Oxford as seen on entering it by Magdalen Bridge, with Magdalen tower and buildings on the right. Views of two of the most remarkable ecclesiastical structures in the city follow: St. Mary's spire and the interior of Christ Church Cathedral. Three views of Mr. T. G. Jackson's buildings are illustrated: part of the interior of the Examination Schools, the exterior of the same building towards the quadrangle, and the new buildings of Corpus Christi. Mr. Champneys's Indian Institute, and Messrs. Bodley & Garner's new buildings at Magdalen, form the subjects of two other plates, and another one gives various sketches made for this occasion from Merton College and Christ Church Cathedral.

All the illustrations are further commented on in an article on another page; but in regard to one or two of the new buildings we have received some special information from their architects.

Begun in 1876, the main building of the Examination Schools was finished in October, 1882, and inaugurated by a concert, at which H.R.H. the Prince of Wales was present. The building was completed in 1888 by the addition of the building at the corner of Merton and of High-street, containing a library for the unattached students, and various delegates' offices. The materials used are Clifton stone for exterior dressings, Caen stone within. The body of the walls is of stone from Headington, and were not faced with ashlar, facings of Giltshire stone, hammer-dressed, are used. The marble work in staircase and angle halls is chiefly Italian, and in some cases consists of antique fragments from the ruins of the baths of Caracalla at Rome. The cost of the whole block, including the schools proper, and the non-collegiate building, including lighting, heating, and ventilating, and all structural decoration, such as the moulded plaster ceilings, marble work, chimney-pieces, chandeliers, &c., door-cases, and carving, of which every detail was studied and designed by the architect, was about 106,000*l.*, which is rather less than 1*s.* 2*d.* per cubic foot on the entire work.

The Indian Institute is built in Tynnton stone. Messrs. Symm, of Oxford, were the contractors. The present building includes rather more than half of the entire scheme, the museum and library being at present little more than one-third of the length of those designed. It is intended ultimately to extend it some 40 ft. along the "Broad," and the additional site has been secured. The present portion was erected in 1883-4.

THE ANCIENT ARCHBISHOP'S THRONE, CANTERBURY.—As reported in the *Times*, Mr. Cavendish-Bentinck last week asked the Vice-President of the Committee of Council on Education whether he was aware that the Archbishop's throne which was presented to Canterbury Cathedral by Archbishop Tenison, and which was designed and executed by Grinling Gibbons, had for many years past been stowed away as lumber in a damp cellar adjacent to the Cathedral cloisters; and whether he would, on behalf of the Department of Science and Art, apply to the Dean and Chapter for the loan of this beautiful and interesting work in order that it might be rescued from its present unsatisfactory position, and preserved in the Kensington Museum. Sir W. Hart-Dyke said that he was much obliged to Mr. Cavendish-Bentinck for calling attention to the matter, and would be glad to act upon his suggestion as soon as possible. How does it come about that such an artistic relic has been for so many years treated as lumber? Some one of those concerned ought surely to have known better.

**BOYLE'S PATENT VENTILATORS.**

Mr. ROBERT BOYLE, of the firm of Robert Boyle & Son (Limited), has, with characteristic enterprise, just made his third circuit of the globe, with a view, we are informed, of "awakening an increased interest in sanitary science and securing the adoption of improved sanitary measures and appliances,"—especially, we make no doubt, Boyle's ventilators. "The first country visited" (we quote from an account which has been sent to us) "was Egypt, where Mr. Boyle surveyed the Palace of the Khedive at Cairo, furnishing plans and estimates for the ventilation of it. At Bombay, in India, he made an examination of the drainage of that city, and submitted plans for its ventilation. The Boyle system has also been adopted at the military barracks and officers' quarters, Bombay. In China, he surveyed the French Cathedral at Canton, supplying plans for the ventilation, also the Summer Palace of the Emperor at Peking. A scheme for the improvement of the sanitary condition of the capital has likewise been submitted to the Chinese Government through Li Hung Chang, the famous Viceroy and virtual ruler of China, whom Mr. Boyle had the honour of meeting at Tientsin. When in Shanghai Mr. Boyle tested his system of ventilation as applied to the Shanghai Club, said to be the finest club in the East, and the following report from the architect, Mr. J. Cory, F.R.I.B.A., testifies to its success:—"The application of your system of ventilation to the Shanghai Club has proved so successful and given such satisfaction that I purpose using it exclusively in my practice here. Your latest improved air-pump ventilator has successfully withstood the trying conditions of this climate, where open pipes and other such arrangements have proved useless." The Chinese Merchant Steamship Company, Shanghai, have adopted the Boyle system of ventilation for their vessels, several of them being already fitted with air-pump ventilators. In Japan Mr. Boyle surveyed the new Imperial Houses of Parliament, also the Imperial University of Japan, for the ventilation of which buildings plans have been sent in. Mr. Boyle returned to England *via* the United States and Canada, important contracts being pending in San Francisco, and a scheme of ventilation having been sent in for the Canadian Houses of Parliament, Ottawa." We are informed that it is Mr. Boyle's intention to publish shortly in book form his experiences in the East.

Last year we mentioned Mr. Boyle's visit to Salt Lake City, Utah. In the course of his three journeys round the world he seems to have surveyed mankind "from China to Peru," and if he continues at this rate he will soon be signing, like Alexander, for other worlds to conquer.

THE ENGLISH IRON TRADE.—The English iron market is firm, and the trade doing, though moderate on the whole, shows more life. Pig-iron is in a rising tendency, although so far the advance has not been much, showing itself chiefly in the greater stiffness of makers. Middleborough No. 3 is from 8d. to 6d. per ton dearer. The Glasgow warrant market has also been stronger, and there is more inclination to buy. Scotch makers' iron is likewise in more request, at firm prices. Although business is rather slow in Lancashire, a steady tone is maintained. In the Midlands there is a fair current of activity. A slight rise has taken place in the North-west for hematite pig, makers now selling at 58s. 9d., the figure quoted for warrants. The demand for manufactured iron is somewhat brisker, at unchanged rates. Steel continues rather quiet, but steady, and even stiffer. Ship-builders continue to receive fresh orders, and engineers remain active.—*Iron.*

PROPERTIES FOR SALE.—(1) Dutchish, comprising the lands of Slen, Collieston, and Glendale, at the head of Loch Follart, in the west of the Isle of Skye, a sporting estate of 25,000 acres, and divided into several holdings, all yielding a net rental of about 1,000l. a year. (2) By auction, at York, on September 13, Bossall Hall, in the North Riding, lying on the western side of Derwent-valle. This estate, being nearly 500 acres, possesses many historical associations, and has been held during five centuries past by the ancestors of its present owner.

SCOTCH ESTATE FOR SALE.—The Invermay Estate, situated in the valley of the Earn, on the south-eastern confines of Perthshire, will be exposed for sale at Edinburgh on September 10 next, at an upset price of 95,000l. It extends over nearly 3,900 acres, whereof 2,620 are under cultivation, with 690 acres of woodland. The house stands on the western slope of the Ochil Hills, overlooking the vale, and in the policies are the Invermay Bikes, watered by the river May, a tributary of the Earn. The free rental, exclusive of the mansion and shootings, is stated to be 2,642l. a year.

**Books.**

*Kelly's Directory of the Building Trades.* London: Kelly & Co., 51, Great Queen-street.

THE sixth edition of this excellent Directory has just appeared. It purports to comprise "every trade and profession in any way connected with architecture and building throughout England, Scotland, and Wales, and the principal towns in Ireland." The volume extends to nearly 2,000 pages, and is well printed and arranged. So far as we have tested it we have found it to be reliable and up to date in most respects. We may point to one omission in the list of Metropolitan Vestries and their officials. The office of Surveyor to the Vestry of St. Martin-in-the-Fields is indicated in the Directory as vacant; but the appointment of Mr. Charles Mason to that office was mentioned in the *Builder* of March 1st as having taken place in the previous week. The preface contains some interesting statistics as to the number of persons to whom the building trades give employment. The number for London alone is stated at 125,618, a total which is thus made up:—Architects, 2,007; surveyors, 1,173; builders, 7,333; carpenters and joiners, 38,143; bricklayers, 23,231; mason paviours, 7,514; plumbers, 7,503; painters and glaziers, 28,181; plasterers, white-washers, &c., 6,706; paperhangers, 1,808; sculptors, 328; and wood-carvers, 1,632. These figures are stated to be taken from the last published "Occupations of the People." If the description "mason paviours" means masons and paviours, the figures given, 7,514, seem to us to be of doubtful accuracy, for the use of stone in London buildings has largely increased of late years, and we should have thought, would give employment to more than 7,514 people. It is true, on the other hand, that stone paving is not so much used in London as it used to be. The Directory includes lists of County and Borough Surveyors, and other official information; but, as we pointed out in our review of the fifth edition in 1886, the Directory would be improved in usefulness by the addition of a few pages devoted to lists of the Architectural Societies, the Master Builders' Associations, and the principal trade unions connected with the building trades, with names of the principal officers and statistics of membership. Some of this information is given in scattered fragments under different towns; but these fragments form a very incomplete whole, if we may be allowed the expression. We trust that in the next edition of the Directory our suggestions under this head may be adopted.

*Electric Light Fitting: A Handbook for Working Electrical Engineers, embodying Practical Notes on Installation Management.* By JOHN W. URQUHART. London: Crosby Lockwood & Son, 1890.

THIS book "is addressed to intelligent men already engaged in the work of electric lighting or training for it, and it more especially refers to the branches known as 'fitting' or 'wiring.'" The opening chapter deals with central-station work, and it is when considering the means which have to be adopted to overcome the sparking at the commutator of a dynamo machine, that Mr. Urquhart first regards his subject in the light of science. In a paragraph headed "Lead in the Adjustment of the Brushes," the author says: "It will be found, notwithstanding the calculations of several eminent electricians to the contrary, that even in dynamos with no iron in the armature, as in Siemens' alternator or the Ferranti dynamo, 'lead' must be given to the brushes." Mr. Urquhart ought to be truly grateful to all eminent scientific men for giving him, as they almost invariably do, opportunities of showing the superiority of his own methods. When one of the author's "eminent" men makes a calculation the result is hopelessly wide of the truth; if a consequence of theory is given it agrees in no way with fact. These little peculiarities, however, do not in any way detract from the value of the work, for we need hardly say that in every case Mr. Urquhart is able to give the true solution or explanation by virtue of his own experiences. The rough-and-ready tests suggested in the next chapter, for the discovery of faults which are likely to occur, may prove useful to those who are unable to use the more accurate methods generally employed by electrical engineers. But the author seems astonished to find that

instruments designed to measure quantities of a certain magnitude will not do equally well to measure others one hundred or a thousand times as great, for he remarks—"It is curious that scarcely any of the instruments that have been hitherto employed for measuring purposes in the laboratory or class-room have been found useful for the practical work of the dynamo-room."

The descriptions of various pieces of electric-lighting plant and apparatus are good, though telling nothing that is new and cannot be found in the illustrated catalogues of manufacturing firms. An important exception, however, must be noted in connexion with accumulators where 0.5 volt is given as the limit to which the electromotive force may be allowed to fall during discharge; unless this figure is to be taken in a "scientific" sense, it is obviously a misprint.

On the subject of "The 'Dangers' of Electricity," we find ourselves able to agree entirely with the author. His views may be summed up in his own words as follows:—"... a good deal of discreditable work in the form of wiring has been done by unscrupulous contractors. ... There is one leading maxim for a contractor putting in electric light, and it is to avoid contracts that do not allow of the best class of material and labour being used throughout."

As the men for whose special use the present volume is intended will be engaged for many years to come in laying underground mains, it might reasonably be expected that a chapter or two should be given up to this most important branch of "fitting," more especially as very little indeed has been published about it and become public property. It has possibly something to do with this fact, that the reader may look in vain for the sadly needed information throughout Mr. Urquhart's pages.

*L'Exposition Universelle.* Par HENRI DE PARVILLE. Paris: J. Rothschild, 13, Rue des Saints-Pères. (1890.)

THIS book, which forms the twenty-ninth annual volume of the series known as "*Croniques Scientifiques*," is a compendious record of the Exhibition of 1889. It is pre-faced by a letter to the publisher from M. Alphand, who, having perused the proof-sheets of the work, says it gives "une idée exacte de la grande manifestation nationale qui vient de se terminer, en jetant sur notre pays un si glorieux éclat." He adds that he deems his own participation in the Exhibition to be the greatest honour of his long career, and goes on to say that "Le talent de M. de Parville s'affirme une fois de plus dans cette œuvre, à laquelle il a su donner une forme attrayante, et je pense que son livre fournira des informations utiles à tous ceux qui se sont intéressés à notre grande Exposition du Centenaire, véritable revanche expiatoire des malheurs immérités de la France." M. Alphand's encomiums appear to be fully deserved. The book is pleasantly and clearly written, and the author seems to have availed himself of the best sources of information, for he expresses his thanks to the leading architects and engineers associated with the Exhibition for having placed at his disposal documents, drawings, sketches, photographs, &c. The book is well printed, and copiously illustrated by 700 engravings. Many of these are devoted to the constructional details of the Exhibition buildings, including, of course, the large Palais des Machines and the Eiffel Tower; others consist of general views of the Exhibition buildings and their contents. Some of these engravings, it is true, —notably those showing the construction of the vast roof of the Palais des Machines,—are too small to give more than a reminiscence of the construction, which is perhaps sufficient in a popular book of this kind; those who want more than this can revert to the French and English engineering journals. The book is divided into seventeen chapters, the first of which not only details the preliminaries of the Exhibition, but describes and illustrates previous great international exhibitions, including those held in London in 1851 and 1862. The second chapter is devoted to a description of the site, or rather sites, of last year's Exhibition, and the disposition of the various buildings on the Champ de Mars, the Quai d'Orsay, the Esplanade des Invalides, and in the grounds of the Trocadéro. Succeeding chapters are devoted to the means of locomotion to and from and within the Exhibition; to the

gardens and terraces; to the Palais des Machines, the Palais des Industries Diverses, the Palais des Beaux-Arts, and the Palais des Arts Libéraux; to the mechanical, electrical, and hydraulic services, including the luminous fountains; to the Eiffel Tower; to the Pavillon des Travaux Publics; to the Pavillon des Forêts; and to the Pavillons de la Ville de Paris. Many of the most representative of the contents of these pavilions, illustrating public and municipal works of great importance, are figured and described. The sanitary administration of the City of Paris is treated of at some length, and is not the least interesting topic of this very interesting book.

*The Works Manager's Handbook of Modern Rules, Tables, and Data for Civil and Mechanical Engineers, &c.* By WALTER S. HUTTON. Fourth Edition. London: Crosby Lockwood & Son, Stationers' Hall Court. (1890.)

This excellent handbook has been noticed by us at some length on the occasion of the appearance of earlier editions, particularly the second (see the *Builder* for September 5, 1885). The book is well printed, and contains upwards of 150 illustrations. This edition, we are assured on the title-page, has been carefully revised and partly re-written, and we are glad to see that the author has acted upon some of the suggestions made by us, and has inserted a variety of new matter relating to steam-engines and gas-engines, further information as to pumps, and useful practical data for water-supply. The work will be found exceedingly useful for reference.

"Waterworks Statistics," 1890, edited by Charles W. Hastings (London: Hazell, Watson, & Viney, Creed-lane, E.C.), is a very useful compilation. This, the tenth edition of the book, contains more information than any previous edition, columns having been added for "storage capacity" and "daily consumption per head of population." But it must be added that the figures recorded in these two columns are few and far between. This is evidently not the fault of the editor. The figures regarding the London water companies are of special interest just now, and they will be found in this book.

"Gasworks Statistics," 1890 (same editor and publishers as the foregoing work), has now attained to its twelfth edition. It is very carefully compiled, and gives not only the quantity of gas made and the dividends paid, but the number of consumers, the quantity of coal carbonised, the price charged to private consumers and for public lamps, the number of street lamps, the illuminating power of the gas, and other information relating to the gasworks of Great Britain, Ireland, and the Continent.—*The Antiquary* for August (London: Elliot Stock) is a good number. Its contents include an article on "A Recent Visit to Pompeii," by Prof. Frederick Halbherr; some interesting accounts (from MSS. by Sir Edward Lytton, Bart., 1588-1618) of the cost of labour and materials in building the Manor House of Kyre Park, Worcestershire (edited by Mrs. Baldwin-Childe); a paper on Monumental Brasses in Yorkshire, by R. H. Edleston; and several other articles of interest.—*Cassell's Magazine* for August (London: Cassell & Co., Limited) has a short article calling attention to "Two Little-known London Libraries," viz., the Patent Office Library and the Ronalds Library of the Institution of Electrical Engineers. "Few persons" (remarks the writer) "outside the circle of inventors and patent-agents are aware of the existence of an excellent scientific library in the very heart of London,—namely, the free library of the Patent Office, in Southampton-buildings, Chancery-lane. Still fewer know of another which is also open to the public at certain times, and contains the best collection of electrical books in the kingdom. This is the Ronalds Library of the Institution of Electrical Engineers, at 4, Broad Sanctuary, Westminster Abbey. The former is open every week-day from 10 a.m. to 10 p.m.; and the latter is free to visitors unconnected with the Institution from 10 a.m. till 8 p.m. on Mondays, Tuesdays, Wednesdays, and Fridays, and on Thursdays and Saturdays from 10 a.m. till 2 p.m. This collection was a gift of the late Sir Francis Ronalds, the well-known telegraph inventor, to the Society of Telegraph Engineers, now the Institution above named, and it has been further enriched by a large donation of rare and valuable works belonging

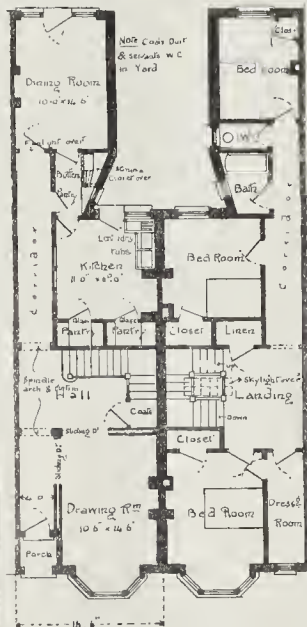

to Mr. Latimer Clark, F.R.S."—*The Sunday at Home* for August (London: 56, Paternoster-row) contains an engraving and description of Archbishop Whitgift's monument, in Croydon Parish Church.—*The Boy's Own Paper* (published at the same address) contains two illustrated articles on "Figure-heads of Famous War-ships." One of the illustrations to these articles is an engraving of the picture by Mr. H. S. Marks, R.A., entitled "Old Friends."

## Correspondence.

To the Editor of THE BUILDER.

### AN AMERICAN SUGGESTION FOR THE IMPROVEMENT OF EIGHT-ROOMED HOUSES.

SIR,—I have seen with much interest the letters on, and improved plans for, an eight-roomed house. While in England I lived in a suburb not far from London, on the London and North-Western Railway, where miles of the "everlasting" type of house were constantly going up. I can therefore fully realise the necessity for improvement. I send you the

enclosed plans of a house, showing what an American would do under the same conditions. The house contains the usual feature of the drawing-room, entering from the hall with sliding-doors, and as the dining-room would be only used for meals, I have placed it at the back and connected it by a butler's pantry (containing sink and china-cupboard over) to the kitchen, which contains two glazed earthenware laundry-tubs in lieu of the usual copper. The bedrooms have a closet to each in the usual way.

ARTHUR CLAYTON.  
46, Eagle-street, Albany, N.Y.  
July 8, 1890.

### "THE BERMONDSEY PUBLIC LIBRARY COMPETITION."

SIR,—On February 3 last the Vestry of Bermondsey approved the plan submitted by myself showing the land proposed to be appropriated for the Public Library. I did not at that time contemplate the opening of any windows on the north and east boundaries. The fourth condition of the Instructions, which were approved by the Commissioners prior to being issued, is equally explicit to the same effect, nor up to the present moment has any sanction been given by the Vestry conferring a right to open such windows.

With reference to the awards, I can only

state that they were not made in accordance with my recommendations.

GEO. ELKINGTON.  
95, Cannon-street, E.C., Aug. 6.

SIR,—It may interest some of your readers who sent in designs for the above to know that we wrote to Mr. Harrison, Clerk to the Commissioners, asking whether windows might be opened on the boundaries adjoining the Town-hall, and were informed that they could not. Also that on the morning the designs were to be delivered the Commissioners held a meeting, and proceeded to examine the designs which had already arrived.

Do not the conditions of competition constitute an agreement between the Commissioners and the competing architects? If so, would not some combined action on the part of the latter be advisable?

The conditions state that the Commissioners reserve to themselves the right of selecting the design to be adopted, but do not confer on them the right of selecting a certain number, and awarding the premiums, without first submitting the whole of them to their assessors.

Firstly, the competition has been conducted in a most irregular and unfair manner, the Commissioners having repudiated the most important conditions, and arrogated to themselves powers they were not at liberty to assume.

This is not a question of person but of principle, and it is quite time the members of the profession took measures to secure fair play.

GIBSON & RUSSELL.  
34, Craven-road, W., August 6.

SIR,—I was a competitor in this, and received my drawings back (minus the specification and report) just prior to receiving the *Builder* of last week.

I have read with interest Mr. Cole A. Adams's letter on the subject in your issue of the 2nd inst. (p. 92), and I have again looked over the "Instructions to Architects" issued by the Commissioners. No. 3 was a subject to which I paid great attention, as the property belonging to the Commissioners and that of the Town Hall are as separate and distinct as any other adjoining owners, and as such I treated.

Note the last paragraph but one of the Instructions: "Any design," &c., &c., "or which does not comply with the other conditions and instructions, shall be excluded from the competition!" Plain, certainly. Again, in the last paragraph but four of "Instructions," it is stated that if tenders do not come within 10 per cent. of architect's estimate, then another design may be selected, and so forth. To be brief, fifty-four architects have lost time and money. What other profession or business throws away so much time and money on such work? And many can ill afford it! Can this sort of thing last?

HARRY T. PERCIVAL.  
97, Mill Hill-road, W., Aug. 4.

### SUB-CONTRACTING IN THE BUILDING TRADE.

SIR,—With reference to the report published in your issue of June 28 (pp. 463 and 469), also Mr. Robbins's letter in your issue of 7th ult. (p. 29), and Mr. Graham's letter in your issue of 14th ult. (p. 29), we would be glad if you would permit us to add a few remarks to same.

We cannot agree with the general tone of the arguments of the deputation of the building operatives, because architects' specifications are generally very rigidly drawn; the best materials and finish are invariably specified. A clerk of works is generally appointed to see that the specification is faithfully carried out. When this is done, and the contract finished to the satisfaction of the architect or engineer, a certificate to this effect is given and payment made to the contractor on production of same. Now it follows that if the clerk of works and architects (or engineers) pass and give certificates for "scamped" work or improper materials, they are as much to blame as those who put in these things. Evidently, then, if the arguments be true, it is necessary for the profession first of all to "set their houses in order," and then to do business under the same will perforce do likewise.

The old question of wages is a very trying one. We cannot agree that any employers of labour should be compelled to pay the "union" rate of wages. Our experience of "union" men is, that they consist (like all other men) of good, bad, and very indifferent hands; hence if they are to be indiscriminately paid alike, either the better men will be paid too low, or the worst men too high. Hence the good man, finding he receives no better wage than the inferior one, at once takes things easy, reducing his day's work down to about the level of the slow, or careless, or indifferent (possibly drunken and dissolute) hand, instead of the latter striving to attain the abilities of the former, which, in the millennium of the union, would mean harder work for such, and no extra pay. Or, looking at it in the abstract, it seems no matter what are the man's capabilities, he has to join a "union" and his wages are assured at the highest rate, and one dare not pay him less! Such an idea must present itself

as both impracticable and impossible to all right-thinking men.

Now as to "sub-letting." It is possible this may be carried to an undue extent, and that "scamped work" or inferior (and sometimes totally different) material may be used to what is specified, but it would seem the profession and their clerks of work should have such practical knowledge as to prevent all this. But assuming not, then surely there cannot be any objection to respectable, proved, established firms, of good repute (possibly "specialists," as it were, in their particular line), still doing their work as sub-contractors, as hitherto. If this system is carried to an undue extent, the remedy appears to lie not in architects and others prohibiting "sub-letting" *in toto*, but in approving of the firm to whom the contractor proposes to sub-let the work. Being large employers of quarry labour, we may be forgiven if we add that, in our opinion, no better sub-contractors can be than quarry-owners, because they not only have a reputation for good work to maintain, but are very jealous to see that only the most suitable stone is used, as specified, having the further interest in maintaining the good reputation of their stone, as well as labour, and it will be at once seen that by so doing the circumstances are not what Weighill alludes to, viz., "so that when people thought of a Portland stone, the front it often happened that other stone was mixed with the Portland," are obviated, and the proper material is assured, as no Bath stone quarry-owner could attempt to palm off say Wealdon stone, or a Portland quarry owner endeavour to pass the inferior to Bear Stone. Mr. Weighill's experience of machine-worked stuff is very original, but putting aside the fact that machine-worked stones as such a necessity nowadays as machine-worked wood, particularly to compete against terra-cotta, which, we believe, cuts against masons more than anything else alluded to by the various speakers, we believe there are not a few turned balusters in London of machine-worked durability of machine-worked stone equally well with perhaps the machine-worked plinth, dies, and capping to same. We allude to these, not as in any sense the only examples of machine-worked stone,—because there is that which comes from the ordinary planing and moulding machine,—but because every inch of face of anything under the machine-tool and is exposed, whereas in a cornice or string-course, one of the faces only is seen that has passed through the machine. We may add, however, that, assuming Mr. Weighill's statement to be correct, viz., "when such machine-worked stuff was new and wet, it was often possible with one's thumb-nail to scrape off the surface to the extent of an eighth of an inch, owing to the unevenness of the surface by the machinery"; it is also equally possible to do so from under the "stems" of a mason's chisel; but where the precaution is taken to rub the surface of all stone, whether machine or hand worked, the matter of which Mr. Weighill speaks is removed, and we may add, further, that, if properly managed, the pulverisation whatever occurs, or can be detected, either with one's thumb-nail or any other medium, as can be daily proved in our yard.

Mr. Weighill's experience as to quarry-worked stone also appears to be very unique. Indeed, so unique, that some time seems to have elapsed before he comes to the mind of the remarks, which appear so entirely contrary to facts, that we cannot permit to endeavour to rectify his apparent incorrect statements. Having stone worked at the quarries does not mean employing "cheap labour." At least, in our district we pay as high a rate as we believe is paid anywhere in the provinces, and higher than obtains in many parts of the country where there are no quarries. The secret of the cheapness of quarry-worked stone lies in the fact that the quarry people, having (1) a large stock to select from, are able to select blocks to cut with a minimum of waste; (2) they have to pay carriage upon the net weight of the stone only, when worked, instead of in its finished state direct from the quarries to site, instead of as is the case with block stone, delivering it first to the builder's yard to be cut and worked, and thence to the site,—double cartage; and (3) the quarry people lay themselves out for the best and quickest manipulation of their own tools, using the latest and most effective machines, or sawing, rubbing, turning, planing, moulding, &c.; and their masons, who are constantly working upon their particular stone, are able (as can be readily understood) to do more work upon that stone than a mason could in a builder's yard, who has, perhaps, to work Portland, Bath, and Cornish, of their several sorts, perhaps a little (part of all sorts), then some Caen, Ancaster, &c.; or to turn to a job to chip down some badly-made or badly-fitting terra-cotta. A builder's yard, to let it be ever so good and extensive, is not to be used upon, perhaps, any of these stones, cannot be made so effective upon any particular material as a quarry-owner, whose machines are, from year's end to year's end, constantly engaged upon the same stone, are specially made and adapted for the same, the result is the most suitable, and even the speed regu-

lated to be the most effective upon their particular stone.

As we have said, quarry-owners having also a reputation for the durability of their stone to maintain, would, and do, see the quality they work up and send out is not only well finished (not scamped), but that the stone is of the most durable quality, of the sort specified, possibly, and most certainly, not substituting for, or mixing with, an entirely different stone, as Mr. Weighill says other (not quarry) sub-contractors do.

Mr. Gregory's lamentations, we think, can easily be explained, not by the stone being worked out of London so much, as the large quantity of brick and terra-cotta now used, which has been brought about to a considerable extent by masons (or the lenders of masons) themselves, owing to their unreasonableness and the great strike in which they were engaged some time since, when the new Law Courts were building. We observe, however, that he attributes the prevalence to "slavery" over the stone to the London sub-contractor, whereas Mr. Weighill (in his after-thrust) says this is a quarry sub-contractor's trick! Either Mr. G. or Mr. W. is incorrect, or both are right, perhaps; then, if so, why need Mr. Weighill complain of what his London friends are as guilty of, apparently? Mr. Gregory's remarks are evidently directed to soft stones, in which it is perhaps possible to resort to the following he mentions with advantage, but not so in the harder stones, and if his statements be true, the quarry-worked stone becomes the more necessary, because, as stated earlier, presuming the workmanship to be as bad as the London work is stated to be, the architect is at least sure of getting the quality of stone he wishes, whereas he is not sure of even that much from the merciless London sub-contractor, according to Mr. G., who says, "Needless to say that one kind of stone was often substituted for another with impunity, the substitution never being discovered by the clerk of works or the architect."

Mr. Macvicar Anderson's reply seems to us very much to the point. And we believe that if the North of England method were more generally adopted, a much better result would obtain. Professor Aitchison seems afraid this may entail more work on the architect; but if so the result were better; architects would not object to the extra work we feel sure.

Following the line of argument used by the members of the deputation quoted, we countryfolk might as strongly protest against the using in the country of stuff manufactured in London, and if the objection were practised on both sides, commerce would receive a severe check. And again, a line and cry have long been made against country people flocking to London; but if their means of living is to be still further taken from them here, then London will have a still larger crowd of these people to contend with.

Mr. Robin's letter in your issue of the 5th ult. (p. 3) hardly calls for comment from us, except that we observe our recent remarks sound his replies to Mr. Anderson's and Professor Aitchison's remarks.

Mr. Graham's letter in your issue of the 12th ult. quite agrees with our view, and we may add that, although our operations do not go further into the building trade than the quarrying, sawing, working, and, where required, fixing of stone, we have been long trying to devise a means of co-operation with our workmen, and although we have not yet been able to do so, we trust we shall soon be in a position to admit them on similar lines to the Co-operative firm at Brixton to which he draws attention.

July 30, 1890.

\* \* \* Although "Quarry-Owners" have been somewhat tardy in their rejoinder to some of the allegations made by the deputations to the Institute of Architects, we print their letter, on the principle of "*Andi alteram partem*." The matter is also commented upon in our first "Note" this week.

THE VENTILATION OF CHURCHES.

SIR,—The statement in Mr. Standage's opening remark on page 92 that a discussion upon this subject in your columns would do good, is quite right, but his own remarks show that if a proper practical remedy for the bad air in churches is to be got, we must have some real knowledge of the cause of this bad air.

Mr. Standage blames the carbonic-acid gas exhaled from the lungs, which, he says, is very heavy, and so "it sinks down to the ground;" and, therefore, he wishes some process that "would lift off from the ground this heavy poisonous gas and clear it away." Now if it were really true that the carbonic-acid gas was so "very heavy," and that it "really fell down to the ground," the best way to get rid of it would simply be by boring, making, or leaving holes in or near the floor to let it run away like water. When we do try this, however, we find that instead of this "very heavy" CO<sub>2</sub> running out down these holes in the floor, it is the ordinary air, fresh or otherwise, that blows up! The law of gravitation would, therefore, appear to be set at naught here. Carbonic acid gas is half as heavy as ordinary air, but the energy involved in the law of the diffusion

of gases prevents the carbonic acid gas sinking to the ground, as Mr. Standage says, and causes it to be equally distributed. It is owing to this that the proportion of CO<sub>2</sub> at the top of a mountain is the same as at its base. When the CO<sub>2</sub> is exhaled with the expired air from the lungs to the extent of 100 times more than is inhaled, it is warm, being heated to 97 deg., and so it rises with the other air towards the ceiling, and seeks to get out there; but, on account of either no provision, or inefficient provision, being made to let it out, it gets cooled, and then falls, and all the more so as it is displaced by the warmer air continually rising. We want, therefore, simply in the ceiling of a church one or more sufficiently large openings properly fitted to let this warm, vitiated air out, and to carry it off as it rises upwards. This can, generally speaking, quite easily be done by automatic means, and without the continuous expense of a fan, if a good wind-acting exhaust ventilator is set up above the ridge, and with a large enough pipe. Further, as the down-draught at times through a large pipe would be a nuisance, a proper self-acting anti-down-draught appliance should be used; and when this is done, with proper fresh-air inlets, complaints of bad air in churches from the persons assembled would cease. When architects and others put up only 10 or 15 in. pipes in place of 24 in. or 30 in. diameter (or their equivalent), it is no wonder that bad and short-allowance systems of ventilation in churches give disagreeable results.

W. P. BURCHAN.  
Glasgow, August 2, 1890.

The Student's Column.

HOT-WATER SUPPLY FOR BATHS, LAVATORIES, ETC.—VI.

INDEPENDENT BOILERS: continued.

INDEPENDENT boilers can be fixed in any position where convenient for stoking, in a basement or cellar, or at the side of the kitchen range, and the smoke-pipe can be connected into the kitchen range-flue. If a vertical shape is selected, it will occupy but little room.

Independent boilers can be had in every conceivable design and size, but there is not one yet made that is worthy of any particular recommendation for this work. There are great numbers of excellent boilers so far as their ability to heat water is concerned, but as hitherto they have hardly ever been used for other than heating purposes only, manufacturers have not been called upon to consider the "fur" question; this is the drawback to all the existing patterns, as there is hardly one which will admit of easy cleaning.

FIG. 10

Fig. 10 represents in section a vertical doped top cylindrical boiler, one occupying little space and having every convenience for stoking, &c., but a circular boiler of this sort is most difficult to clean out, and it should have at least two manholes and three or even four mucholes (holes, about 1 1/2 in., at the lowest point for scraping out the loose "fur," as the hand cannot be inserted); this illustration shows a boiler having the waterway terminating at a level with the fire-bars, and an improvement is effected (but at a little more expense) by having the waterway continued to the bottom

as fig. 11, the greater portion of the fur is then found below the fire-level, where no harm can

FIG. 11.

be done, and what adheres to the flat boiler-plate surface around the fire is more easily removed than from the angle as in fig. 10.

The fuel used with these boilers is usually coke, an economical and clean fuel, and if the boiler is filled up to the top the charge is sufficient to last a number of hours, varying with the size of the boiler and the way the dampers are set or regulated. The speed of combustion is regulated by a valve at the furnace front, and it can be further regulated by having a valve damper fitted in the smoke nozzle or pipe. The coke fuel must be broken small, about walnut size, otherwise it will wedge or "bridge," and the fire burn hollow by reason of the fresh fuel not falling as the lower portion of the charge is burnt away.

A better shape for cleaning purposes is as

FIG. 12.

fig. 12, as it can have one large or two ordinary lids fitted at the top with mudholes below, but unless fitted with a "hopper" top to take a charge of fuel, it cannot be kept burning for long without attention, and another slight objection is that this shape occupies more room than the cylindrical pattern.

It remains for some one to introduce an independent boiler for hot-water supply of a character nearer perfection than we have at present, as, for instance, all small or medium-sized vertical boilers, when fitted with man-holes, have the objectionable wrought-iron plates secured by a number of set screws, and several other little difficulties present themselves owing to the necessity of removing the fur, an operation that was not anticipated when they were designed.

In ordering an independent boiler the following information is required before the maker can proceed:—State the position that the smoke-nozzle is required in, whether on top or whether projecting from the back or either side (the furnace and stoking-doors are always situated in front); state what size pipe is being used, and indicate where the return-pipe is to be connected (the flow-pipe should always start from the top); indicate where the man-holes should be put, so as to be easily accessible for removal; state whether  $\frac{1}{2}$  in. or  $\frac{3}{4}$  in plate is required (the latter is about one-fifth more expensive than the former), and it is much the better to mention that a valve-damper is required in the smoke-nozzle, as few makers provide this unless specially ordered.

Before proceeding to treat the various fittings, tanks, pipes, &c., used in this work, it will perhaps be best to describe the two most common forms of apparatus in general use, as by this means the explanation devoted to appliances will be rendered more clear.

THE TANK SYSTEM.

This is the style of apparatus that succeeded the simple arrangement described in the first paper. Strange to say, it has never had any distinguishing name given it, and the term, "tank system," is only now applied to distinguish it from the cylinder system.

FIG. 13.

Fig. 13 is the general arrangement of this system, and one of the chief features about it, as the name implies, is the tank, which is always fixed somewhere above the highest draw-off service, commonly in the bath-room, or an upstairs linen closet, or in the roof. If the tank is fixed anywhere below the draw-off services, it practically converts the apparatus into the cylinder system, as will be understood from the next paper.

As to the position of the tank, this needs some consideration; in the first place it must be below the cold water cistern; occasionally it is fixed on a level with this cistern, but in principle this is bad and should be avoided, as the least shortness in the cold water supply interferes with the hot water, and, what is worse, fixing the tank on a level with the cold water cistern means necessarily that it is to be fixed in a cold position, in the roof or in a cistern-room. This is one of the strong objections to this system, viz., that the tank being at the top of the building must be in a cold situation, and the efficiency of a hot water supply apparatus is in ratio to the amount of heat it can keep within the water, not the amount of heat it can dissipate, or be robbed of by cold surroundings, which is the aim and object of a heating apparatus.

To make this system at all economical as well as successful, the tank must be kept warm, or in a warm position. This can be done either by having the tank within a closet or in a warm room, or much better by casing and packing it with some poor conductor of heat, —sawdust, hair, &c.; the insulation of tanks, pipes, &c., will be more fully treated in a later paper.

When the position of the tank is located, a service-pipe, known as a "flow"-pipe, is carried from the highest point in the boiler to the tank, where it is connected near to the top, either through the side, or through the bottom and projecting up inside, as shown in the illustration. This is the pipe up which the water finds its way from the boiler immediately heat is applied to it. To allow of the corresponding volume of cold water coming down to replace the hot, a second pipe, called the "return"-pipe, is provided, starting from a low position in the tank, either from the bottom, as illustrated, or from a low point in the side, and from there it is carried down to near the bottom of the boiler, usually through the top, projecting down inside as shown. It should be noted that it is customary to speak of the "flow"-pipe as proceeding from the boiler to the tank, and the "return"-pipe as from tank to boiler.

The flow-pipe should always be connected

from the very highest point in the boiler, and on no account must it be screwed through the boiler-plate, so that it projects down inside in the least degree, otherwise an air-chamber will be formed. It will be readily understood that if this pipe project through the top plate, as in

FIG. 14.

fig. 14, the boiler cannot be filled beyond the end of this pipe as shown, as the air cannot be expelled. As an example, supposing an ordinary glass tumbler had a hole drilled in its side, and the tumbler was then inverted and lowered into a vessel of water. The result would be that the tumbler would have the water rise up within it as far as the top edge of the hole, but little further (only so far as a certain compression of the air will allow), and the air in the upper portion of the glass cannot be expelled except by having another hole made at the top (or by shaking the glass violently). This formation of an air chamber in the boiler is a very prolific source of trouble, and it occurs with the greatest frequency either through carelessness or ignorance on the fitter's part. It frequently happens that the fitter connects the flow-pipe into the side of the boiler, one of the worst practices, and only to be tolerated under some very special circumstance: when this is done the air is got out of the top of the boiler by packing the manlid, but only partially securing it; so that when water is allowed to run into the boiler, the air is driven out and the lid then finally tightened up.

The particularly ill results experienced from the cause under discussion are that it is accountable for the violent noises and shaking that is sometimes experienced with new work (noises in old work are generally accounted for by furred pipes) as when the boiler is heated and steam generated the latter expels the air, and afterwards the steam itself has to escape, and as both the steam and the air have to be forced down through water to escape up the flow-pipe, the violence exhibited cannot be wondered at. A further annoyance and source of trouble arising from this cause, and which is quite as objectionable as the noises, is the fact that as the water is not always in contact with the upper boiler plate, the manlid packing quickly gets destroyed and wants renewing, and this particularly with india-rubber manlid collars.

OBITUARY.

MR. CHARLES ROACH SMITH, F.S.A.—We hear with great regret of the death of this veteran antiquary and author, which took place at his residence, Temple-place, Stood, on Saturday last, at noon. Only a week or so before, he was presented with the medal struck by the Society of Antiquaries of London in recognition of his life-long services to archaeology. The presentation was made privately, consequent upon the critical state of the recipient's health. Moreover, a surplus of over 100 guineas accompanied the medal, the presenting of which was entrusted to his intimate friend, Mr. G. Payne, F.S.A., on behalf of the subscribers. His decease is a national loss; but in Stood, where, according to the *Maidstone and Kentish Journal*, he has been the means of aiding many young men to rise in life, he will be mourned by all classes of the people. He was a prolific writer, the chief of his works being published by subscription. At the time of his death he was engaged on the closing volume of his "Retrospections—Social and Archaeological." He was justly regarded as the greatest modern authority on Roman antiquities in Britain. Only two or three years ago he took charge of a controversy as to the walls of Chester, and in former years he was a valued contributor to the columns of the *Builder*. According to "Men of the Time," he was born at Landguard Manor, in the Isle of Wight, early in the century, had written "Collectanea Antiquaria," seven vols., 1845-56; "The Antiquities of Richborough, Dover, and Lyme," 1850, with supplements on Lyme and Perenssey, 1852-3; "Illustrations of Roman London," a work based on the author's personal researches made during his residence in the City of London, when he formed the collection of local antiquities described in his

"Illustrated Catalogue of the Museum of London Antiquities," 1874. This collection was transferred to the British Museum in 1876. Mr. Roach Smith's earliest antiquarian papers were printed in the "Archæologia;" and he contributed to the earlier volumes of the British Archaeological Association, and to the *Gentleman's Magazine*, in which he wrote the monthly article called "Antiquarian Notes." With Mr. T. Wright he founded the British Archaeological Association, the forerunner of the modern archaeological societies, and many of his contributions are in its "Journal." In 1856 he edited the "Inventorium Sepulchrale" of Bryan Faussett. Mr. Roach Smith had devoted much attention to pomology, and especially to the culture of the vine in the open ground; and in 1853 he published a pamphlet, which had a large circulation, "On the Secrecity of Home-grown Fruits in Great Britain, with remedial suggestions" (second edition 1868). In 1868 was printed privately "Remarks on Spoken-peare, bis Birthplace," &c.; and in 1870 was published "The Rural Life of Shakespeare, as illustrated by his Works." Mr. Roach Smith also wrote the Catalogue of the Anglo-Saxon antiquities discovered at Faversham, Kent, and bequeathed to the South Kensington Museum by Mr. Gibbs. Since his retirement from London to Strood, Mr. Roach Smith has actively assisted the Kent Archaeological Society, and he has contributed many papers to its *Archæologia*. He has also been a member of the Philological Society. He has received the first Medal of the London Numismatic Society, of which, for some years, he was secretary. He assisted in editing the "Dictionary of Roman Coins," by the late Seth W. Stevenson.

GENERAL BUILDING NEWS.

PROPOSED MUNICIPAL BUILDINGS FOR COVENTRY.—The Coventry City Council were on the 29th ult. occupied for some time in discussing the scheme for new municipal buildings. The Estates Committee brought up a report recommending St. Mary's street and an area adjoining the best site, and a provisional order was applied for to carry out the work. The adoption of the report was proposed by the Mayor and seconded by Alderman Marriott, the latter being the author of the scheme. On being put to the vote, the scheme, no hint of the cost of which was given by its advocate, was approved by a large majority.

CHURCH RESTORATIONS, HANTS.—Repairs and to some extent alterations are being carried out at Christchurch, under the supervision of Mr. E. Burton, architect, of Bournemouth. The roof over the Lady Chapel, which has been for some years in a very decayed, and in consequence dangerous, condition, has just been restored. In the adjacent stonework and the porch wall over there is a large room over the Lady Chapel which was formerly used as a schoolroom, and the above-mentioned roof is therein exposed to view. The roof is of very massive wrought oak, and is slightly moulded, and as nearly as possible an exact reproduction of the old roof taken down. The tie-beams are also of oak, and all the other timbers are correspondingly large. Great difficulty was experienced in obtaining these tie-beams without defects. The roof over the south nave aisle has also just been restored with oak, and corresponds with the old roof taken down and the new one on the north side of the church restored some years since, and the restoration of the south nave aisle roof, the lath and plaster screens, put up as a protection against the cold occasioned by the bad state of the old roof, have now been removed, and the triforium is once more open. It is proposed to open the arches on the north side when funds are forthcoming.

NEW CORRIDOR AT THE BIRMINGHAM COUNCIL HOUSE.—The Birmingham Council says that the grand corridor at the Council House has now been connected with the Art Gallery by an ornamental iron corridor, which was found extremely useful at the Mayoral reception on Wednesday evening in last week. This corridor is 99 ft. long by 10 ft. 9 in. wide, and 17 ft. high from floor to highest point of roof. It is constructed of iron and glass, with lean-to roof, and is carried on two columns 34 ft. high from courtyard below, with a lattice girder, 2 ft. 10 in. deep, spanning the whole length of 99 ft. The side is formed of cast-iron stanchions and panels, with ornamental eashes glazed with double tinted glass. The roof is formed of wrought-iron rafters glazed on Hollowell's patent system. The rafters are supported by semicircular arches, filled with foliated ornament—similar to that in the industrial hall of the Art Gallery. The whole of the work has been designed and carried out by Messrs. Hart, Son, Peard, & Co., under the direction of Mr. Wheeldon, of the City Surveyor's office.

GAS OFFICES, WESTMINSTER.—The Gaslight and Coke Company are making extensive additions to their offices in Horseferry-road. The roof of the strong room is on Fawcett's fireproofing system.

MEMORIAL CHAPEL, TOTNES CEMETERY.—A memorial chapel is about to be erected in Totnes Cemetery. Mr. F. J. Reeves, of Totnes, is the architect, and Mr. J. H. Foden, of Ashburton, is the builder.

BOARD SCHOOLS, POULTON-CUM-SEACOMBE.—The School Board of this place has decided to erect a school for 1,200 scholars. A large site has been selected after an examination of six hundred schools by various architects the Board has selected Mr. T. Mollard Reade, of Liverpool, as the architect for the school.

DEVELOPMENT OF BARRY, SOUTH WALES.—On the occasion of the recent visit of the members of the Merchants Chamber of Trade to Barry Dock, Mr. Lewis Lewis, estate agent, made a statement to the effect that about a quarter of a million of money was about being spent upon house property, public works, &c., in the Cadocton and Barry district. The announcement was received with a certain amount of surprise, not to say incredulity; but after entering minutely into the details of the calculation, the *Western Mail* says that the estimate is highly gratifying to find that the estimate is greatly under-estimated. The Local Board have already passed plans for the erection of buildings on the Brooks Estate representing 100,000*l.* in value. On Messrs. John James & Soule's estate plots have been arranged for 500 houses to cost 3,000*l.* each, representing another 1,500,000*l.* In Dockview-road and Thompson-street (Barry Dock) buildings of the value of 80,000*l.* are in course of erection or about being commenced. The Kingland Building Company have decided to expend 27,000*l.* upon houses on their estate, and the Weston Syndicate are actually building houses to cost upwards of 20,000*l.* Mr. John James, contractor, has commenced an hotel in Weston-street which will cost fifty 10,000*l.*, while plans have been passed for house property to the value of 10,000*l.* on the Mal Estate. The Holton Land and Building Company, too, are laying out the sum of 6,000*l.* upon houses on their property, while at the last meeting of the Local Board plans were submitted for the erection of 160 houses on a portion of the Wenwoe Castle Estate, representing an outlay of over 30,000*l.* Mr. Alderman John Cory, J.P., Chairman of the Local Board, has also just arranged to pay 7,500*l.* for thirty acres of land in the parish of Calxotton for building purposes. After mentioning the main sewerage scheme, which the Local Board are carrying out, and the proposed construction of the new graving dock at an outlay of at least 50,000*l.*, and other items, the *Barry Dock News*, summarising the various items, says:—"We have thus a clear total of half a million of money, the whole of the work in connexion with which will be in hand within the next three months."

PROPOSED NEW POST-OFFICE, BRENTWOOD.—The *Essex Chronicle* says that the plans of Mr. A. T. G. Woods have been accepted for a new post-office to be built in the High-street, at the corner of St. Thomas's-road, and Mr. Woods has been appointed architect. The building will comprise the postmaster's house, an office 21 ft. by 19 ft., a sorting room 35 ft. by 20 ft., instrument, and other rooms.

PROPOSED NEW RAILWAY-STATION AT ABERDEEN.—On the 4th inst. the Aberdeen Town Council, on the recommendation of the Improvements Committee, agreed to entertain the revival of the question of a passenger station at Schohill in connexion with a proposal submitted by the Great North of Scotland Railway Company for placing a turn-table near Union Bridge.

THE PROPOSED ST. MICHAEL'S BELL TOWER, COVENTRY.—On the 1st inst., the working men's committee, which has canvassed Coventry for signatures in favour of a bell tower for St. Michael's Church, waited on Mr. George Woodcock, at the King's Head, to present the memorial to him. Mr. Woodcock has promised 5,000*l.* towards the proposed work, and the memorial of 8,500 house-holders was intended to give support to his advocacy of a new tower for the bells. Mr. Woodcock said Coventry would have the bell tower and as handsome a campanile as could be found either in England or on the Continent.

PROPOSED HANDEL COSSHAM MEMORIAL INSTITUTE, BRISTOL.—It has been resolved at a meeting held at Bristol to raise funds for the erection of a mechanics' institute in East Bristol, as a memorial of the late Mr. Handel Cosham, M.P.

A NEW LECTURE-HALL AT COGGESHALL, ESSEX, was opened on the 29th ult. The buildings externally are faced with yellow stock bricks, with white brick arches and bands. The work has been carried out by Messrs. Gardner & Son, builders, of Coggeshall, at a cost of about 700*l.* Mr. Charles Pertwee, of Chelmsford, was the architect.

ST. PETER'S CHURCH, BOWDON, CHESHIRE.—The Building Committee have accepted the tender of Mr. James Hamilton, contractor, Altrincham, for the erection of St. Peter's Church, Bowdon. The architects are Messrs. Tate & Poppelwell, of Moseley-street, Manchester. The work is to be commenced at once and pushed on at all speed.

BOTHWELL PARISH CHURCH, N.B.—On the 3rd inst. Bothwell Parish Church was re-opened, after being closed for four months for alterations, consequent on the erection of an organ. The instrument, enclosed in an oak case, has been built by Foster & Andrews, Hull. Various structural improvements in the building have been carried out by Messrs. Bruce & Hay, architects, Glasgow. The cost of the organ and alterations, excluding personal gifts, is 1,200*l.*

SCHOOLS, BABBACOMBE, DEVON.—The cornerstone of a new day-school for infants was laid at Babbacombe, South Devon, on the 2nd inst. The cost of the schools, which are being erected by Mr. Sampson Hanbury, J.P., as a memorial of his daughter, Helen Marguerite, will be 700*l.* Mr. P. Mathews, of Babbacombe, is the contractor.

PROPOSED COTTAGE HOMES AT LIANTWIT VARDRE, SOUTH WALES.—The *Western Mail* says that the Pontypridd Board of Guardians have decided to erect cottage homes for pauper children, and that with that end in view they have purchased a very eligible piece of ground in Liantwit Vardre, facing the main road from Llantrisant to Pontypridd, about ten acres in extent. After several consultations with the Local Government Board, and studying the arrangements of somewhat similar establishments elsewhere, plans have been prepared by Messrs. Seward & Thomas, to Cardiff. The contract has been let to Messrs. Turner & Sons, of Cardiff, for 7,450*l.*

NEW BUILDINGS, CHELMSFORD GRAMMAR SCHOOL.—A meeting of the Governors of the Chelmsford Grammar School was held on the 31st ult. The scheme for building on the Broomfield-road site is now well in hand, and the *Essex Chronicle* understands that the architect will be communicated with at once.

NEW COUNTY BUILDINGS FOR SURREY AT KINGSTON.—The *Surrey Comet* gives a description of the new County Buildings to be erected in St. James's-road, Kingston. The elevation will face St. James's-road. The length of the building will be about 160 ft., its depth about 130 ft. The cost of erecting the buildings is estimated at about 35,000*l.* The architect is Mr. C. H. Howell, the County Surveyor.

SHED ACCOMMODATION, &c., DUNDEE HARBOUR.—On the 31st ult., at a meeting of the Works Committee of the Dundee Harbour Board, the Engineer reported the completion of the shed erected on the north-west quay at Camperdown Dock, and recommended various improvements to facilitate the working of the traffic, including the removal of the causeway setts with which the area of the new shed is laid, and the substitution of granolithic pavement. The estimated cost of the work is 400*l.*, but the stone setts taken up will be sufficient to pave all the adjoining parts of the quay. The matter was remitted to a sub-committee, with powers.

PROPOSED NEW BOARD SCHOOL AT LARGS, N.B.—The School Board of Largs are now taking steps to procure plans of the new school, for which a site was acquired the other day in the Shotts Field, Largs. Accommodation for 700 children is to be provided, and the building will be in two stories. The total cost of erection, including boundary and division walls of play-ground, is not to exceed 5,000*l.*

THE THEATRE ROYAL, GLASGOW.—The Theatre Royal, Glasgow, was re-opened on Monday evening last, after having been internally reconstructed under the supervision of Mr. C. J. Phipps, architect, London. The gallery and the upper circle have been lowered 7 ft., and the roof brought down to a corresponding extent by the removal of the old topmost gallery, which was closed three years ago by the desire of the authorities. The private boxes at the stage ends of the upper circle have been taken away, and this portion of the house has now been brought more into a horseshoe shape than formerly. Perhaps the most important improvement has been effected in the dress-circle tier, the boxes at the rear of which have been removed, and a new part formerly called the family circle. It comprises 183 half-crown seats, which can be booked beforehand. The theatre will now accommodate an audience of about 2,600 persons, 1,100 of whom can be seated in the gallery, 800 in the pit, 200 in the upper circle, 170 in the dress circle, 160 in the orchestra stalls, 133 in the family circle, and the remainder in the twelve private boxes, six of which are on each side of the stage.

SANITARY AND ENGINEERING NEWS.

HAYES DRAINAGE.—The Rural Sanitary Authority of Uxbridge Union have selected the plan submitted by Mr. F. Beesley, C.E., of Westminster, for the drainage of Hayes. The "international" process for dealing with the sewage is to be adopted, and the sludge to be dried by means of presses. According to the engineer's report, the cost of the work is estimated at 8,500*l.*, or with the outlying extensions, 10,500*l.*

A NEW DRAIN-CLEANSER.—Messrs. Merryweather & Sons, of Long-acre, have just brought out a patented drain-cleaning apparatus which they call their "Microholizer," or "destroyer of drain poisons." We have had an opportunity of seeing the apparatus in action, and it seems calculated to be very effective in cleansing the interior surface of house drains which can readily be brought under its action. There is a great deal of force in Messrs. Merryweather's remark that "disinfectants as at present applied to drains by simply pouring them down are delusions, as the liquid simply runs down the drain, touching in its course the bottom part only." It is claimed that the "Microholizer" is capable of pumping ten or twelve gallons per minute

of disinfecting fluid with great force over the interior surface of the pipes, removing the impure matter, and washing it away into the main sewer or cesspool. It is made entirely of copper and galvanized metal, so as to be free from rust and chemical action, and is fitted with a novel form of jet distributor, with spigots which, being flexible, can be passed through any drain pipe or winding drain. Shortly described, it consists of a length of tubing having at its far end the jet distributor mentioned. The jet distributor is circular on plan, with the jet holes pierced all round it. By means of a small pump, water mixed with disinfectants is forced through this tube and through the holes in the jet distributor, the liquid being thus caused to impinge on the whole surface of the interior of the drain. Messrs. Merryweather & Sons have also, we understand, patented and are constructing a steam-worked "Microbolizer." This machine, although developing 6 indicated horse-power, is on wheels, and easily removable by one man. It is intended for operating on large sewers of any size. The hose pipes or spigots are on movable carriages inside the sewers, and the jets rotate work in and back and forward motion, thus securing the thorough cleansing and deodorising of the whole surface of the sewer. If, however, a high pressure water service is available from a hydrant, the steam-worked "Microbolizer" may be dispensed with, and a patent and specially-constructed hydrant standpipe with a "sucker" disinfectant ejector may be used. The pressure of the water causes the jet infusing fluid to mix in the proper proportions with the water when the operation in the sewer is the same as with the steam "Microbolizer."

#### STAINED GLASS AND DECORATION.

**THE CANTERBURY MUSIC-HALL, WESTMINSTER BRIDGE-ROAD.**—The interior of this music-hall, otherwise known as the "Canterbury Theatre of Varieties," has been entirely re-arranged and re-decorated, at a cost of 5,000*l.*, under the superintendence of Mr. F. Matcham, architect. The alterations comprise a new promenade along each side of the stalls, with fresh tiers of boxes next to the proscenium, in lieu of some private boxes removed from the sides of the balcony; the sliding roofs retained. The decorative work has been done by Messrs. Campbell Smith & Co.

**THE BROOKE MEMORIAL WINDOW, ROTHERHAM PARISH CHURCH.**—On Saturday last the memorial window erected by Mr. James Brooke, of Scarborough, in memory of his wife, was unveiled. The window, which is 18 ft. 6 in. wide and 31 ft. high, is of the Perpendicular period. The central subject is illustrative of Our Lord's majesty, the lights on the right and left being representations of apostles, prophets, Virgin, holy church, and St. John the Baptist. The idea has been obtained from the "De Deum Laudamus." The three middle lower lights are occupied by the Adoration of the Infant Christ, Virgin and Child being in the centre, and the adoring Magi and shepherds on the right and left respectively. The first (counting from the left), second, sixth, and seventh lower lights in the same division illustrate the Annunciation, the Nativity, the Baptism, and the Transfiguration of Christ, each subject having its Old Testament type below, namely, angels appearing to Abraham, the birth of Isaac, the passage of the Red Sea, and Moses descending the mountain. The upper tracery is filled with cherubims and angels, bearing scrolls, musical instruments, and emblems of the Passion. The work, which has cost over 1,000*l.*, has been executed by Messrs. Clayton & Bell, of Regent-street, London. The stonework has been placed in thorough repair under the direction of Mr. E. I. Huhland, architect.

**THE EFFINGHAM MEMORIAL WINDOW, WHISTON CHURCH.**—On the 27th ult., a new stained-glass window, being the east window of the south aisle, was unveiled in Whiston Parish Church, in memory of the second Earl of Effingham and Lady Charlotte Howard. The window has been placed there by Mrs. Wm. Howard, widow of the Hon. and Rev. Canon Howard, late rector of Whiston. It is the third largest window in the church, and contains three lights. Christ enthroned in glory is the subject illustrated in the top of the central light, angels with emblems of the Passion are represented in the upper side-lights; below, in the centre light, are male saints, St. Jerome being conspicuous. Virgin saints are represented on the right, and widow saints on the left side. The work has been carried out by Messrs. Burlison & Grylls.

#### FOREIGN AND COLONIAL.

**FRANCE.**—The Société des Amis des Arts of Versailles has just opened its annual exhibition. This society, founded forty years ago, is one of the most important in the provinces, and the present exhibition (the thirty-seventh) includes about 800 pictures.—The curator of the museum at Cherbourg gave notice some time ago of the unaccountable disappearance of a small picture by Clouet, a portrait of a lady. This work, valued at 25,000 francs, has been found at Paris, by a painter, M. Frérot, at a carver and gilder, in rue Tailbout,

who had bought it for 40 francs from a stranger. The picture has for the present been deposited at the Direction des Beaux-Arts. It is announced that the municipal museum at Roubaix has been transformed into a national museum, and will become an annexe to an "Ecole Nationale des Arts Industriels" which the State has founded in that town. The new museum will be inaugurated in October. The jury commissioned to examine the competition designs for a Savings Bank to be built at Troyes have unanimously awarded the first premium to M. Henry Schmitt, architect, of Paris. They have not awarded the second premium, but third premiums have been given to MM. Collier (Paris), Mony & Vernot (Troyes), and Gueyon (St. Maurice), MM. Mignan, Forest, Bungo, Fauconier, Mathieu, and Pergot have obtained honourable mentions. Some days ago, at a meeting held at the Mairie of Alger, it was unanimously resolved to hold a universal exhibition there. Some curious mural paintings of the seventeenth century have been recently discovered in the church of Fonzy, near La Motte, and according to the *Semaine des Constructeurs*, the Municipal Council of Paris has passed votes for the requisite sums for four new "Casernes des sapeurs-pompiers." The Council has also adopted the conclusion of the report of M. Charles Lament, in favour of mortuary deposits near the principal cemeteries, to reside the head of poor families living in small houses, until interment. A small morgue is to be built near the Canal St. Martin, at a cost of not above 3,800 francs. The Council has adopted the "projet de délibération," presented by M. Santon, which invites the administration to examine the utility and the consequences to Paris generally of the projected railways, and the modifications which their construction would necessitate in water and gas service, drainage, &c.

**DURBAN WATERWORKS EXTENSION.**—The Corporation of Durban, Natal, are taking steps to push forward with their new waterworks extension as rapidly as possible. Mr. J. Fletcher, C.E., the local Borough Surveyor of Durban, has drawn out a preliminary scheme for taking a large supply of water from the Umhlanga River, in the neighbourhood of Durban. Mr. W. H. Radford, C.E., Nottingham, is the consulting engineer for the scheme, and the scheme was arranged for execution in two sections. The estimated cost of the first section was 65,767*l.*, and of the second section, 54,025*l.*, making a total of 120,392*l.* The intake for the first section will be situated on the Umhlanga River, ten miles from Durban. The water will be conveyed several miles down the river in 18-in. iron pipes to the pumping-station, where a portion of the water will be utilised to work turbines, which will pump the remainder of the water to a high summit reservoir and filter-beds. From the summit reservoir and filter-beds the water will flow by gravitation through four miles of 15-in. iron pipes, delivering into three local town distributing reservoirs. When the second section is carried out, the 18-in. iron pipes will be carried eight miles farther up the river to a water intake, at a sufficiently high level to supply the town by gravitation. When the scheme is finally completed, the works will deliver 2,000,000 gallons per day. As consulting engineer, Mr. Radford designed all the details of the special castings required, and calculated all the strains and thickness to perform the work intended. The greater number of the pipes will be turned and bored, with a keyed space outside for lead or cement. Each casting will be tested at the iron works by hydraulic pressure to 500 and 700 ft. head respectively, for working pressures of 250 to 350 ft. All castings will be heated in stoves and dipped in Dr. Angus Smith's composition at a temperature of 300 deg. Fabr. Tenders were invited by advertisement, and there was a good competition. The Durban Corporation have let the contract to the Staveley Iron Works Co., Erwash Valley, England. The contract amount for the pipes delivered on board at an English port is 16,684*l.* The special castings are to be paid for by schedule of prices. There will be about 8,000 iron pipes in 9 by 12 ft. lengths, and weighing about 3,500 tons. The sizes of the pipes are 18 in., 15 in., 12 in., 8 in., 5 in., 4 in., and 3 in. The pipes are now being made.

**THE STOCKHOLM INDUSTRIAL EXHIBITION.**—Active preparations are in progress for the industrial exhibition to be held in Stockholm in a year or two.

**STATUE OF THE LATE MR. FORSTER.**—On the 1st inst., Viscount Cranbrook, Lord President of the Council, unveiled a statue of the late Right Hon. W. E. Forster, which has been appropriately placed in the Embankment Gardens, immediately opposite the offices of the London School Board. The statue, which is the work of Mr. H. Richard Finkler, is of bronze, and represents Mr. Forster standing in an attitude of rest in the interval of a speech. The right arm is bent behind and rests on the top of the hip towards the back; in the left hand is held a book, and the head is erect. The statue is on the scale of most of the other statues on the Thames Embankment, being about 9 ft. high, and the height of the pedestal on which it stands is about a foot less.

#### MISCELLANEOUS.

**THE ADDITIONS TO WESTMINSTER HALL.**—It appears that this in every sense satisfactory structure is already showing signs of decay. In reply to a question asked in the House of Commons on Tuesday night, the information was elicited from the First Commissioner of Works that,—"Some interesting stones which were taken from the old buttresses have been re-used in corresponding positions in the new buttresses, and these, having been covered up in the old buildings for many years, are, now that they are again exposed to the atmosphere, showing signs of decay on the surface, but this, after a time, will probably cease to a great extent. With respect, however, to the new stonework which has been used as a facing to the main wall in the interior of the hall, I regret to say that from some reason which cannot at present be explained certain patches of the work are undoubtedly decaying on the surface, and, strange to say, in the same places as the decay had principally occurred in the old stonework before the repairs were effected. As an architect, Mr. Pearson, is quite unable to account for this mysterious decay, and assures me that the stone selected for the work (Ketton) is the best for the London atmosphere, and this opinion would appear to be borne out by its standing well on the outside of the building. I am, Sir, of course in the latter, a case of peculiarity in the mortar of those parts of the wall where the decay is taking place." The building seems disposed in various ways to revenge itself on its originators.

**KIRKSTALL ABBEY.**—The *Leeds Mercury* reports that at a meeting of the Sub-Corporate Property Committee, Sir E. Caine in the latter part of a report by Mr. J. T. Micklethwaite, of London, was of the result of his examination of the ruin of the Abbey, according to the instructions of the committee, and it was decided that with a view to the carrying out of the necessary works of preservation the services of an experienced clerk of works should be obtained, as recommended in the report. A letter was read from Mr. W. H. St. John Hope, M.A., Assistant Secretary of the Society of Antiquaries, London, in which he stated, "Your excavations at Kirkstall have opened up things of the greatest interest, and by the time you have done Kirkstall will certainly equal Fontaine in archaeological interest. When all is done I shall be glad to undertake for the Corporation a proper descriptive history of the abbey."

**FEDERATION OF CARPENTERS AND JOINERS.**—A conference of carpenters and joiners was held on Monday last at the "Hen and Chickens Hotel," Sheffield, for the purpose of forming a federation as recommended in this branch of the industry. Representatives attended from Birmingham, Liverpool, Sheffield, Leeds, Hull, Burnley, Bury, and Newport. A scheme was drawn up and agreed upon, whereby in case of disputes any of the federated towns will immediately receive the moral and pecuniary support of the whole federation. In addition to the towns before mentioned, a number of other large towns have already signified their approval of the scheme. Birmingham was fixed as the headquarters of the federation for the coming year.

**CONSTABLE'S SKETCHES.**—The *Portfolio* for August contains an interesting article by the Editor on Constable's sketches, with some facsimile reproductions giving examples of the great landscape painter's manner of rapid sketching in chalk and in brush monochrome. The value of these is as examples of methods of rapidly seizing an effect on the spot.

**NEW METHOD FOR VENTILATING RAILWAY-CARRIAGES,** and preventing dust from entering with the air, is said to have appeared in France. The more quickly the train moves, the more rapidly the apparatus works. The air is made to traverse a receptacle containing water, which cools it and relieves it of dust, after which it goes through another filtering before entering the carriage.

**MEETING OF ROAD SURVEYORS IN DUNDEE.**—The sixth annual general meeting of the Road Surveyors' Association was held in the Royal Hotel, Dundee, on the 31st ult. There was a good attendance, and Mr. W. Rankin, Thornhill, presided. It was arranged that the next meeting should be held at Glasgow. Mr. Alexander Hogg, Alford, was elected President, and Mr. Thomas Johnston, Hurlst, and Mr. A. B. Smith, Annan, Vice-presidents. Mr. Stevenson, Ayr, was reappointed Secretary. Mr. Hogg, Alford, read a paper on "Roads and Traffic," in which he said the road required for the traffic of our time must be stronger and more consolidated than the road of our coaching days. It must also be smooth and clean, and to secure this the material must be from the best stone, and consolidated with heavier appliances. A road to stand locomotive or heavy traffic of any sort must be consolidated with a uniform pressure as great or greater than the traffic it has to sustain, and finished with a smooth surface which will not rattle, so as to accommodate the passage of the tenderer class of vehicles. Ten years ago there were only one or two steam rollers in Scotland; now there are about thirty, and the number is still increasing. In many districts there would not be sufficient work in rolling alone to warrant the outlay, and the way to meet this difficulty was to combine either steam breaking or haulage, or both.

### Around Oxford.

N a neighbourhood such as that surrounding Oxford, an excursion, limited in time as that of the Architectural Association is, has necessarily to be planned to give those taking part in it as good an idea of and insight into the architecture of the district as possible. In former years the mistake of including too many places in the programme has been somewhat apparent, and this year it is satisfactory to find that the list is shorter, and care seems to have been taken to choose places typical of the district, rather than to include everything that is worth seeing. Even as it is, there is a goodly list—upwards of ten churches, exclusive of the manor-houses and the two days devoted to the University itself. The only point, however, which we should like to criticise, was the inclusion of Burford and Minster Lovell in one day. Burford is essentially a place where a day should be spent,—and a long one,—and undoubtedly it would have been much better to have included Minster Lovell in the same day as Cogges.

Burford is not only interesting in itself, but also architecturally it forms a kind of connecting link between Oxfordshire and Gloucestershire. The Archeological Institute is visiting just now some of the notable Gloucestershire centres, and amongst them Cirencester and Northleach, both having many points in common with their Oxfordshire neighbours. As in the West (by which

we more particularly mean Somersetshire and Devonshire), the fifteenth century was a great era for the enlargement of the parish church, and in those buildings which the Association and Institute have been visiting, the century has stamped itself very clearly on the ecclesiastical work. To it we owe the extensive work in the western portion of Burford, and the grand churches of Northleach, Cirencester, and Fairford. The smaller churches, such as Kiddington, Stanton Harcourt, and Cogges have retained more of their earlier work. In their case probably the absence of a rich donor is the cause of their remaining much as they were in the thirteenth and fourteenth centuries, and highly interesting they are to compare with the larger buildings that have undergone the change. Even at Witney, which, compared with some of the other churches of its size, has been altered in a less degree, we find that clearstories have been added to transepts and nave, and the inevitable side chapel, which seems, in this part of the world, to have been expressly designed to swamp the porch, which, again, in one or two cases, has, in its turn, retaliated by growing up into a miniature tower, and not only looking down on the chapel, but contemplating a rivalry with the central tower itself. Among our illustrations of the Banbury Excursion, we gave an instance of this at Bloxham,\* but this is far inferior in size and elaboration to the fine porch at Burford (see lithographic plate), and the equally large examples at Cirencester and Northleach, over the border.

Before returning to the churches in detail a word should be said concerning the Domestic work. Its strength on the present excursion

\*See *Builder*, September 12, 1885.

is apparent rather in the University city than in the neighbourhood. Although few of the villages have not a manor-house of some interest, the work is not on that scale which the Association saw on its last Oxfordshire visit. But if there is no building of the importance of Compton Winayates and Broughton, there are two or three manor-houses of some interest, besides some smaller examples in the villages and towns. Taking them in order of date, the two oldest, the manor-houses of Minster Lovell and Stanton Harcourt, have suffered considerably. Both are in ruins, the former more than the latter, and both likewise date from the fifteenth century.

Minster Lovell is but a shell. Situated picturesquely by the side of the Windrush, in close proximity to the church, and well protected by a grove of trees, it appeals more to the eye of the artist, perhaps, than to that of the architect who wishes for an abundance of detail. The principal part now remaining is the Great Hall, raised above a low ground story, and with windows high up in the walls. A good vaulted passage is at the north-west angle, which might have been the chief entrance; and close by, against the hall, is a cloister with good windows, having four-centred rear-arches with pierced spandrels. A detached building with a good octagonal staircase stands nearer the river, but all between has been ruthlessly destroyed in making a road, the object of which is not quite apparent. No doubt much of the building pulled down has been re-used for the road, and there does not seem much likelihood that even excavation would reveal much more of the plan.

At Stanton Harcourt we have a better guide, as an old ground-plan is still in

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

existence, — rough, but probably reliable. As in most of the houses of that date, the buildings were arranged round a quadrangle. In this case the north side was occupied by the great hall, with the "screens" and butteries on its west side, and the chapel and retiring-rooms on the east. The west side seems to have been taken up entirely with the great kitchen (fig. 1) and offices. How

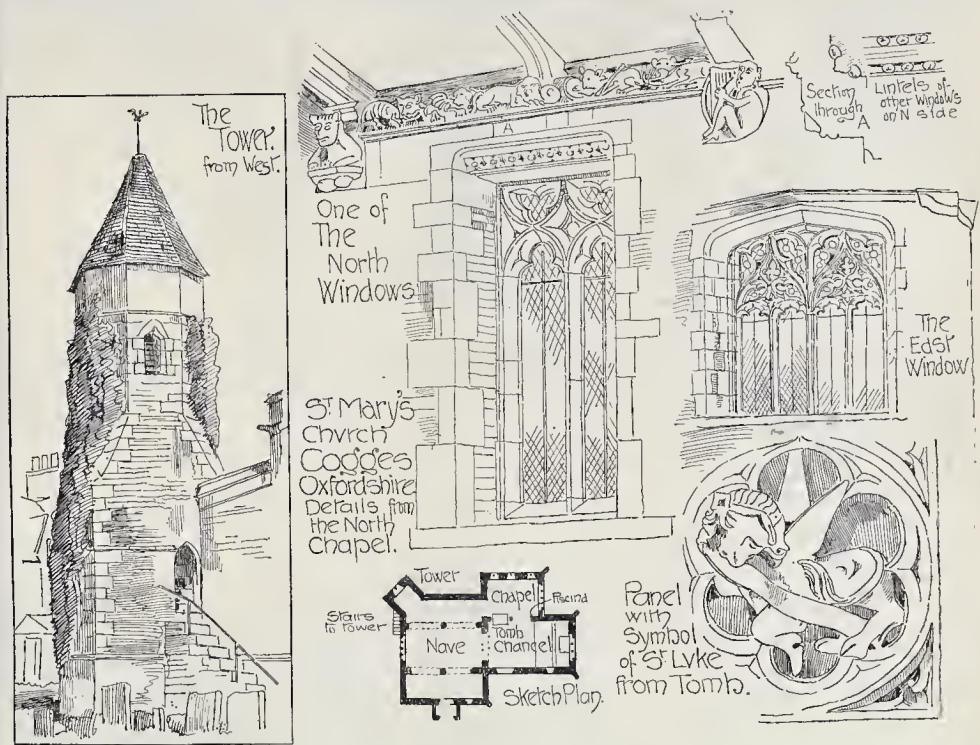

Fig. 5.

Fig. 6.

the east and south sides were filled up does not seem clear. It is probable that only a curtain wall existed on the south, with perhaps a moat. Further eastward, near the church, were the fish-ponds, which still exist.

A detached gatehouse stood north of the main block, its entrance being nearly opposite the entrance to the "screens." It has been incorporated into the later residence, which is still in use, and on its north side is the old four-centred arch, with a little oriel above, and the dripstone terminations with the arms of Harcourt impaling the crowned lion rampant of the Darrells (fig. 1). The kitchen before mentioned is a large square pile, with a low octagonal lantern, over which rises a pointed roof, and a good vane as a finish. Four sides of the lantern were glazed and four left open,

the draught being regulated by shutters or luffer-boards worked from below. Inside, the great fireplaces remain, and an old pair of fire-dogs and some kitchen utensils, which, if not coeval with the building, certainly testify to having done their parts for a century or two in ministering to the wants of mankind.

Hall and screen, parlour and bedroom, have all disappeared, and the only portion of the north side left is the chapel, with two stories over, one of which has been immortalised by Pope: he translated some of Homer here, and emphasised the fact by scratching it on the window. The pane is at Nuneham. The chapel itself is in a direct line with the church, its east window facing the west window of the latter. It has been decorated in recent times, and the sanctuary portion is

vaulted in stone with some good bosses. A general view of this and the church is given in fig. 2.

The next manor house is that of Water Eaton (see lithographic plate), a fine Elizabethan house situated on the banks of the Cherwell. The arrangement was very symmetrical. A quadrangle, with the house on one side and the entrance gate on the other, and outbuildings on either side at the extreme outer corners, made a picturesque group, and if we except the loss of the old garden, which existed south of the house, it may be taken as much the same in appearance as in 1585,—the date which is recorded on a doorway inside. The great gates have gone, it is true; and the broad drive, which either went direct to the house or curved round the quadrangle,

has disappeared. Its general design is extremely simple, as will be seen from the view, the arrangement of the two-storied bay on the left-hand of the porch reminding one somewhat of Woollas Hall, in Worcestershire. No carving appears on the front,—not even the usual panel with the arms and mantling, and general proportion and delicacy of moulding are left to play their part instead,—and excellently they do it. The interior is not remarkable for much except the quantity of oak panelling, and the odd “up and down” arrangement of the rooms. The chapel lies north of the house, and is interesting as being coeval in date with it.\*

A still later example is Burford Priory, built in the time of James I., and once the residence of Speaker Lenthall, who died here in 1662. It is now in ruins, like Kirby, which it somewhat resembles, although much smaller in scale. The front originally was twice the present length, for in 1808 the old front was partly demolished, the features left (the central porch and the extreme gables of the side wings) being brought close together and rebuilt. This to some extent accounts for the serious settlement to the right of the porch. The chapel is a curious little building at the end of a passage, which projects from the south end of the building. There is much delicate work, especially in the gallery, and the window tracery is extremely effective. In the house itself the drawing-room, with its plaster ceiling, and the principal staircase, with twisted balustrade and considerable traces of inlay on the treads and landings, are the chief points. Burford town is full of old houses. A large building (now the Salvation Army Barracks, fig. 3) is in the main street, and was formerly the “Bear Inn.” There is a pretty little oriel window in the middle of the front, but the house has been a good deal pulled about and later windows inserted. The house which is now occupied as the Vicarage is dated 1672, with a good front towards the street. Higher up the town is the Old Tolsey, and several fragments, of which one is given (see left-hand side of fig. 3).

Of the two places south of Oxford,—Dorchester and Ewelme,—little remains of

Font, Burford church

Fig. 8.

the abbey buildings at the former; but at Ewelme, adjoining the church, is a picturesque hospital or almshouse with some good brick-work, and wooden bargeboards in the court. We give a view of the entrance (fig. 6), and also a sketch of the Old Grammar School, a good brick building with mullioned windows, standing below the hospital on the main road.

To return to the churches. Most of those on the list retain traces of Norman work. Itley remains in its primitive form,—a well-known and interesting specimen. In the others little beyond a wall or a door remains, Burford being an exception, the central tower

\* We noticed a similar, but more elaborate example from Somerset, at Low Ham, in *Builder* for October 20, 1888.

Fig. 7.

being practically Norman work to the belfry stage. Norman windows still exist at Stanton Harcourt; and for some unaccountable reason the outer door of that date, on the north side of Witney, has survived many alterations and additions. Transitional work occurs at Cogges in the nave arcade, and Early English fully developed in the chancel of Stanton Harcourt and Witney. But the chief glory of thirteenth-century work in this district is Witney spire, of which we give an illustration amongst the plates.\* The Lady Chapel at Burford was of this date, but very little now remains,—that little being incorporated with the Sylvester aisle, and consisting principally of windows and a door. There are also traces of the chancel having been of the same style. Decorated work is very abundant. To this belongs the fine work at Dorchester Abbey, with its beautiful Jesse window and sedilia (see plates), the Shrine at Stanton Harcourt (see plate), and most of the church at Kidlington, except the tower, spire, and nave clearstory. Cogges is nearly all of this date, including the curious little tower set diagonally at the north-west corner (see plate and figs. 4 and 5). Our view of Kidlington (fig. 7) shows the two chief Decorated windows at the east ends of the aisles or chancel chapels. The one on the south is exceptionally beautiful. Perpen-

\* A measured drawing of this tower and spire was given in the “Proceedings” of the Institute of Architects, 1881, by Mr. W. A. Pitt, whom we have to thank for the plans of this church and Burford.

Fig. 9.

Fig. 10.

Fig. 12.

dicular work occurs in most of the churches. Ewelme and Minster Lovell are the only ones entirely in that style, the period being chiefly marked by alterations or additions to existing structures. The nave of Burford is the most extensive piece of work of this date, and there are also additions to Stanton Harcourt (the tower and chapel), Witney (the clearstories in nave and transepts), and Kidlington (nave clearstory). A word as to ground-plans. The simple Norman church is well represented by Ifley. Stanton Harcourt is perhaps the best of the Early English examples—a plain cross church without aisles, and a late chapel south of the chancel (fig. 13). Kidlington is also a cruciform church, with south aisle to the nave and chapels flanking the chancel. At Witney and Burford the original plan can still be made out, although both these churches have increased considerably. Witney has extensive transepts, and chapels attached to the north aisle. Burford, not content with chapels attached to the chancel, has one squeezed between the south transept and porch, and a still larger "aisle," which stands partly on the site of the old Early English detached chapel, and projects some feet further west than the nave. At Minster Lovell, an effective way of getting over the difference in width between nave and tower is shown in our interior view (see plate). Cogges has nothing unusual beyond its curious tower. Dorchester is a long Decorated church, with a south aisle to the nave, and two long aisles to the chancel; and Ewelme is an ordinary plan, with aisles running the whole length, as so often occurs in Devonshire.

The interiors of these churches are remarkable in many cases for the number of chapels and altars which either remain or of which considerable traces have been left.

Pre-eminent stands Burford, which had probably upwards of a dozen altars. One, St. Peter's Chapel, stands against the east respond of the north arcade, and occupies the entire bay. It is partly of stone and partly of wood, and is still in use as a side altar at the present time. In every possible position in this church we find the piscina, or the niche, retaining its colouring, besides a very large number of other points of interest,—a wooden pulpit, the font (fig. 8),\* with a series of niches in which are represented the Crucifixion, SS. Catherine, John the Baptist, Lawrence, Hugh of Lincoln. There are traces of frescoes in various parts of the building, and a series of tombs, some of those in the Sylvester and Tanfield aisles being of interest, although late in date. The addition of the spire on the Norman substructure was a work attended with some risk. Owing to

Fig. 11.

the low-lying ground near the river where the church stands, a serious settlement appeared on the north side, and in addition to inserting deep four-centred arches under the north and south sides, a flying buttress was built in the wall dividing the transept from

\* On the lead at the top are several names, amongst them "Anthony Sedley, 1649, Prisoner."

the Tanfield Chapel to resist the thrust. All this and the marks of the various roofs against the tower showing the gradual development of the nave, makes Burford a most interesting study,—it probably stands unique even in Oxfordshire. At Witney much of the dignity of the nave is marred by the lowness of the arcade, and the consequent large extent of wall between it and the clearstory. In the transepts will be found the chief points of interest. At the north end are two Decorated canopied tombs high up in the wall. Their somewhat unusual elevation is accounted for by the former existence of a crypt, of which considerable traces remain. This raised chapel has a counterpart at Burford in the "Burgess" aisle, which also has a crypt below. There are several traces of altars on the east wall, and at its southern end is an arch of wide span, now blocked, but formerly leading into another chapel. The tomb on the west side of this transept should be noticed. On the brass is an excellent representation of the Trinity. A curious little chapel has been placed between the porch and the north transept, and on the north-west side of the church is a larger one with a good doorway (fig. 9).

At Minster Lovell is a very fine alabaster

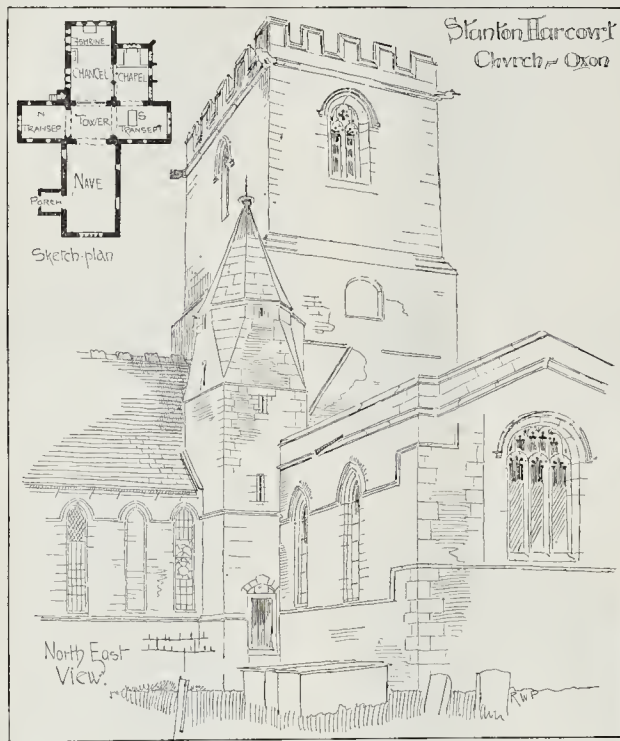

Fig. 13.

tomb, supposed to be that of Lord Lovel, who built the Manor House. The sides are panelled with shields and standing figures at intervals. Those of St. Christopher and the Virgin and Child (both shown in our lithographic plate) are especially beautiful, and noteworthy from the amount of effect which has been got out of them without undue projection from the sides. Altogether the figures project little more than 2½ in.\* The lion's head, too, on the tilting helmet, is a very delicate piece of work, and altogether this monument is worth some study. In Ewelme Church is another monument in the same material, but later in date, and decidedly inferior in execution. At Cogges is an interesting monument (see plate), in this case of stone, with some wonderfully bold representations of the Evangelistic symbols. We give one (fig. 5), and two others are shown in the view of the interior. The church at Cogges is an interesting Decorated building, and the north chapel has several bits worthy of notice. The windows are interesting, the east one retaining its old glazing in the tracery, and the carved cornice, with animals playing musical instruments, is very grotesque and effective. Continuous impost in the arcading occurs in more than one place. The arches dividing the chapel under notice from the church at Cogges are good examples of Decorated work. Another type is exemplified in the nave arcade at Kidlington (fig. 10), which is, however, the more common one of the two orders of the arch dying into one in the shaft. In the nave arcade at Witney we have the same idea, but in this case the moulding,—two chamfered orders,—is simply carried round shaft and arch.

We have left Dorchester Abbey for the last notice, as it altogether differs from the others. Being partly monastic and partly parochial, it was saved and used for parochial purposes at the Dissolution. It was

\* Some similar work, perhaps by the same hand, occurs on the tomb in the chapel of Berkeley Church.

once cruciform, but the transepts have gone, and likewise the central tower. To Richard Bewforrest we owe the preservation of the building, it having been bought by him and presented to the parish in 1554. In its present form it is a long building, with nave and chancel of equal height. A side aisle to the nave had evidently an important altar, and some idea of the elaboration may be gathered from a bracket projecting from one of the columns of the arcade about 5 ft. from the ground (fig. 11). This might either have been a support for figures, or a portion of the rood screen which formerly must have existed in the parochial church. The east end was, however, that portion on which the fourteenth-century designer lavished his ideas and labour. Three fine windows light the sanctuary, a Jesse on the north, with figures both in stone and glass. On the south is a series of sedilia with the backs pierced and glazed near the top. In the south aisle is a remarkable door in the south-east angle and a double piscina adjoining (see lithograph), and some good monuments, that supposed (from the arms) to be to one of the Segraves being the finest (see plate). The stalls in the choir are of Bewforrest's time; one of the ends bears his name on a scroll accompanied by a pastoral staff (fig. 12), and another has the cross-keys of S. Peter, alluding to the dedication—SS. Peter and Paul.

Not much woodwork remains in the churches under notice compared with the richness of the rood-screens of such places as Charlton-on-Otmoor and others, but Stanton Harcourt retains an Early English chancel-screen of great interest, and there are screens of late date at Ewelme. To some of the fonts we have already referred. Dorchester has a valuable example of a leaden one, and Stanton Harcourt (fig. 14) and Minister Lovell Perpendicular specimens, the former now denuded of its heraldic shields, which have been barbarously cut off and placed in a frame on the adjacent wall. It is pleasing

Fig. 14.

to note, however, that vandalism has not been at work in the district to the same extent as in other places. Churches have been in most cases carefully restored, and are in good hands. We would draw attention, however, to the arrangement at the east end of Dorchester, which can scarcely be considered satisfactory. There is a tawdriness about the general appearance which is not in keeping with the thorough and good work surrounding it, and, apart from its colour, it does not look as if made for its position. It may be open to doubt what the arrangement here was. The treatment of the great east window, with its somewhat cumbersome central buttress, demanded a special form of retables.

In conclusion, we may say that few districts will repay the student and the sketcher for the time spent on them better than that which the Architectural Association is visiting this week, and any of the places, even taken singly, will be a profitable field; and perhaps the chief feeling amongst those at the present excursion will be that there was so little time in which to see so much.

#### MYTHOLOGY AND MONUMENTS OF ANCIENT ATHENS.

NO branch of archaeological literature is more fascinating to the student than that relating to mythology. It matters little what were the sources of the marvellous fables that so frequently bear an impress of truth enveloped in an impenetrable veil of allegory, or whether such fables were nothing more than the mental reflections of men influenced by external appearances, physical effects being mistaken for independent invisible powers. It is enough for us to know that myths of all ages and in all countries have been a source of inspiration to the poet, enabling him to clothe with imagery the hard dogmas of religion, and they have given the painter and the sculptor a field for the exercise of the imagination more fertile than any field in the pages of Bible narrative. The prevalent idea among earlier nations that all things inanimate were endowed with the same spontaneity of action as man supplies the foundation of many of the fictions of mythology, and consequently a close investigation of natural phenomena, and of the characteristics of animal and vegetable life, helps to a solution of many an old-world fable. Again, the history of a people is so

imately interwoven with early traditions, and the boundary-line between fable and fact is often so difficult to determine, that history, based on these traditions, is robbed of half its interest if we exclude the fable and record only the fact. Where record fails we have to fall back upon the remains of monumental art, either in the form of sculptured allegory or those mythical representations of gods and men that are familiar to us on the painted vases and cylixes by Greek artists. "When literature and monument go hand in hand," is a modern critic has observed, "when the passage in classical authors concerning works of art and the existing remains confirm each other, the passage giving us definite information concerning the monument and the monument showing us that the ancient author is to be trusted, then we have a state of things that is most satisfactory."

It was a happy thought, therefore, on the part of Miss Harrison, in studying the monuments and mythology of ancient Athens\*, to take Pausanias as a guide for the purpose of elucidating the mythology with reference to the existing monuments. The question arises whether the selection of this old-world writer was a judicious one, in the presence of more trustworthy authors and more brilliant narratives. Of Pausanias we know but little beyond his travelling notes, which stamp him as a keen observer, a ready listener, and a patient student of everything relating to archaeology. Living in an age which was essentially an age of peace, when the Romanised Greek was kept in restraint under the pliable rule of Hadrian and the still gentler sway of the Antonines, travellers like Pausanias had better opportunities for quiet observation than in the more stirring time of the Cæsars, or in the period approaching the dismemberment of the Roman Empire. But the divided opinion on the merits of Pausanias, as the author of the best guide-book of his time, need not much concern us. In the eyes of critics like Scaliger he might have been *omnium Græcutorum mendacissimus*, but the unprejudiced reader of his narrative will be inclined to agree with Miss Harrison that it is the careful, conscientious, and in some parts amusing and quite original narrative of a *bona-fide* traveller. A perusal of his studied phraseology, which has now received so able and scholarly an interpretation at the hands of Mrs. Verrall, gives indication of a certain bias in the mind of the traveller, which mars the value of many of his statements. As a stern believer in the gods of his country, and a loyal upholder of every myth and tradition that touched the borderland of his creed, he was too apt to regard every monument he saw as an exponent of a myth or endowed with a mythical personality. Faithful to his religion, and watching with a awakened interest the struggle then beginning between the decaying Paganism of the old world and the rising Christianity of the new, what wonder that Pausanias, in arranging his notes at a later period of his life in the quietude of his Asiatic home, should have given a religious, or, rather, mythographical, character to his narrative? It is this aspect of his writings, and not the descriptive qualities of his narrative, that has had special attraction for the author of this volume. "I shall pass with scant notice," says Miss Harrison in the preface, "all temples, buildings, statues of the decadence, they ever so showy and spacious; I shall be sparing in details of Roman architecture and topography,—let those discuss them to whom they are dear,—but wherever Pausanias stops to tell some early legend, or to describe the rude image of some primitive faith, we will stop with him." We are unable to follow the author through the maze of allegory that necessarily pervades this work, but if we cannot stop by the way to analyse every local or foreign cult that Athens welcomed within her hospitable walls, we may at least offer

Miss Harrison a word of praise for the skill and clearness with which a difficult subject has been handled.

If we are to accept the testimony of Hesiod that there were in the Greek mythology 30,000 gods on earth, guardians of men, we may well pause before we enter the portals of Olympus to investigate the powers and duties of these celestial governors of the human family. For us there is no need to go further back in the history of Athens than the advent of the first civilised man that the Attic tribes recognised as a ruler. With Cecrops "the real live mythology of Athens begins," and, if we are to accept tradition, the two great events in Attic history,—the strife of Athens and Poseidon, and the birth of Erichthonios,—are intimately associated with his reign:—

"The legend of a strife between two gods for a favoured city was not confined to Athens. Hera and Poseidon, Pausanias tells, contended for Argos. The ancient dwellers in Argos, Phoroneus, Cephissus, and Asterion were, like old King Cecrops, arbitrators in the strife; they, like Cecrops, adjudged the prize to the goddess, and Poseidon in his vengeance took away their water from the city. The manner of the strife at Athens is always the same; the rival gods show their tokens; it is only the manner of arbitration that differs. Sometimes it is Cecrops, sometimes the Athenians, who decide by vote; later probably, when the Olympian system got the upper hand, it is the twelve orthodox Olympian gods. The rise of such a story seems easy enough; a queer crooked olive-tree, too strangely shaped to be quite of natural growth, and near to it a brackish spring and an old mark on a rock that might be a trident; these, with the rival worship of Athens and Poseidon, were enough material in a myth-making age. One point, however, deserves notice; there is, so far as I know, no trace of the myth earlier than Herodotus."

With such a foundation for Attic genealogy in a myth-loving age, we need not here pause to consider the legendary history of the immediate successors of Cecrops, of Erichthonios and Erechtheus, and the fabulous career of the daughters of Cecrops, who are traditionally associated with the three daughters of Erechtheus. Rather let us enter the gates with old Pausanias, and see whether, with the aid of Miss Harrison's lucid commentary, we can arrive at a solution of some of the doubtful problems connected with the chief monumental remains of ancient Athens.

A glance at the plans in the present volume shows how largely our knowledge of the topography of Athens has increased since the first issue of Stuart and Revett's great work in 1762. This result is due to the labours and emulation of various representative archaeological bodies, but mainly to the patient investigation and enthusiasm of so able a scholar as Dr. Dörpfeld. Entering the city by the Sacred Gate, better known as the Dipylon, we are confronted by the precinct of Dionysos, the stoa of Attalos and the Giants, and of other stoa, the sites of which, in the light of present investigations, must still be regarded as conjectural. Of Dionysos we know that he came into Attica as a wanderer, and that after a long sojourn in the country his deification was ultimately marked by appropriating to his worship a whole precinct within the city walls. The affection in which this youthful and effeminate god of wine was held by the ancient Greek is evidenced by the great and lesser festivals in his honour. As it was with the old Greek, so it is apparently with the new; for Mr. Theodore Bent notes in his book on the "Cyclades" that in Paros "there is a church dedicated to the Drunken St. George. On November 3, the anniversary of St. George's death, the Paroites usually tap their wine and get drunk; they have a dance and a scene of revelry in front of this church, which is hallowed by the presence of the priests." Pausanias next takes us past the site of the Matrion or sanctuary of the mother of the gods; the Bouleuterion or council chamber of the Five Hundred; and the Tholos, a circular building of doubtful purposes; then, skirting the foot of the Areopagus, brings us to the hill of the Pnyx, the site of which and the controversy as to its identification are matters of great interest:—

"The word 'Pnyx' is used in two senses,—a wider sense, in which it means an extensive hill

district; a narrower, in which it means the place of assembly for the Athenian people. In the time of Plato it clearly included in its wider sense the whole hill district to the south-west of the Acropolis and Areopagus, possibly the Areopagus itself."

The Pnyx, then, in its narrower sense, was in the form of a theatre, but arranged, as Pollux informs us, "according to usual simplicity, not with the complexity of a theatre," by which it is inferred that it had an altar and a space for spectators, but was not provided with a stage, or with stone seats and porticoes. "Beyond the Kerameikos and the stoa called Basileios," says Pausanias, "is a temple of Hephaistos." Recent investigations have clearly proved that this temple, the best preserved example of the Doric order in the world, is the one hitherto known as the Theseion, or Temple of Theseus:—

"Up to the year 1838 it went usually among travellers by the name of the Theseion, a title so time honoured that it will be necessary to set forth in some detail the reasons for its rejection. One traveller only up to that date,—Cyrilic, of Ancona,—called it the temple of Ares. This name was revived in 1838 by Ross. Curtius inclined to the view that it was the temple of Herakles in Melite. Dyer calls it the Amazonium; Lange, the Temple of Aphrodite. To Pervanoglu is due the credit of first giving the temple its right name, the Temple of Hephaistos; and Dr. Dörpfeld supports this view by arguments which can scarcely be contravened."

Next to the Acropolis, no quarter of Athens has a greater interest to architects than that known as the city of Hadrian. This building-loving Emperor, who left memorials of his presence in every corner of the Roman Empire, showed his affection for the Athens of old days by a munificence that has no parallel in the history of nations. To associate his name with the completion of the Olympieion was a worthy ambition; and though it was never finished, we have the testimony of Pausanias that "the Temple of Zeus Olympios was dedicated by Hadrian, the Roman Emperor, who also set up the image of the god, which is worth seeing." He further informs us that "leaving out of account the colossal figures at Rhodes and Rome, it exceeds in size all other images. The material is gold and ivory, and the workmanship is good, considering the size. Outside this sanctuary are two statues of Hadrian in Thasian marble, and two in Egyptian marble; in front of the pillars bronze statues are set up, called by the Athenians, 'the Colonies.' The whole enclosed space round the temple is about four stades in circuit, and is completely filled with statues. For every city has presented a portrait statue of the Emperor Hadrian, and the Athenians have overtopped all the rest by setting up the remarkable Colossus behind the temple." The whole subject has given rise to much interesting discussion during recent years, and, thanks to Mr. Penrose in conjunction with Dr. Dörpfeld, we now know all that we are likely to know concerning this gigantic unfinished temple and the peribolos, of which a large portion is still visible. Respecting the so-called stoa of Hadrian, the seven remaining columns of which are familiar to every traveller, recent excavations confirm the description given by Pausanias of a building he saw in this part of the city, which he describes as having a "hundred pillars; these are of Phrygian marble, and the walls are arranged like those of colonnades. There is a building there, with a gilded roof and alabaster stone, also decorated with images and paintings; this building contains books. There is, moreover, a gymnasium, called after Hadrian; this also has a hundred pillars of marble from the Libyan quarries." The most remarkable coincidence with the words of Pausanias is, as Miss Harrison informs us, that the outer colonnade, laid down by the Archaeological Society of Athens, and of which a plan is given in this volume, is furnished with columns exactly 100 in number. Of the Tower of the Winds and the Monument of Lysikrates nothing new has been discovered, but it is satisfactory to learn that a portion of the street of the Tripods, which was graced by these monuments, and was evidently a fashionable promenade in old

\* "Mythology and Monuments of Ancient Athens," being a translation of a portion of the "Attica" of Pausanias, by Margaret de G. Verrall, with introductory essay and archaeological commentary by Jane E. Harrison, illustrated. (London: Macmillan & Co. 1890.)

days, has now been clearly defined. No mention is made by Pausanias of the Dionysiac Theatre which, at the present day, is one of the most conspicuous objects at the foot of the Acropolis. The study of this structure, under the direction of Dr. Dörpfeld, has revealed the remains of four distinct stages,—the stage of Lycurgus, a second late Greek or Early Roman modification of it, a stage built in the reign of Nero, and the Logeion of Phædrus. If we desire to know what the earlier Greek theatre was like, and to recall the stage of Æschylus or Sophocles, we must give up our cherished conceptions founded on descriptions by Latin authors:—

"To get at the fifth-century theatre we have to study small and obscure remains, observable only to the trained eye. What one actually sees is a place shaped like an *ape* and suggesting nothing further; it is shut in by a balustrade of marble steps—a protection necessary, indeed, when the Greek dancing-place became the amphitheatre for Roman wild-beast shows; but unmeaning for early days. All this must go; the splendid array of seats, which are to the modern mind the theatre, must go; not only the steps of Phædrus, but every scrap of stone stage building must also go. The theatre of the Greeks was originally an orchestra, or dancing-place, *that and nothing more*, yet enough for Dionysos, the Dance-lover—an altar and a level place about it, circular because the worshippers danced round in a ring. Such a place for worship may well have preceded even the temple itself."

We must pass by the chapter on the Asklepieion, the site of which has now been laid bare, with its great altar, the sacred well, the portico and the precinct wall. Miss Harrison's elaborate commentary on the attributes of the presiding deity and of the existing remains forms a valuable contribution to mythological literature.

And now we can approach the Acropolis, to which, says Pausanias, "there is only one access; no other is practicable, as the hill rises abruptly on all sides, and is fortified with a strong wall." The old traveller's brief notice of the Propylæa, "with its roof of white marble," and its picture-gallery on the left of the gateway, indicates very clearly that the building, as he saw it, was then in a very incomplete state. Indeed, what he saw was very much what it is now. Had there been other galleries he would have mentioned them, for the purpose of describing, as was his custom, the statuary and images relating to the legendary history of the Athenians. It has been reserved to the School of Archaeology to solve the vexed problems affecting the extent of the structure, and to realise the character of the original plans as designed by Mnésikles. Of course, there is much in this suggested restoration that is conjectural, but the arguments adduced by Dr. Dörpfeld are so plausible that his views are likely to meet with general acceptance. We refer the reader to the train of reasoning that has resulted in the plan of the completed building given in this volume. Pausanias could have had but slight acquaintance with architecture, his notes on the Parthenon being confined to a description of the images he saw in the temple, and the legends associated with them:—

"We are accustomed to call this temple 'The Parthenon'; but such was not, could not ever be, its official name. Its full title was 'The Temple of Athene Polias.' For short it was known as *the temple*. That it bore the title of 'Temple of Polias' down to quite late days is, perhaps, more vividly shown by a certain passage in Lucian than anywhere else. The name Parthenon was then a sub-name given to the great new temple of Athene Polias comparatively late, and derived, like the title Hekatompedos, not from the whole, but from a portion of the structure. The temple, in fact, consisted, as the plan clearly shows, of two main parts, distinct, and without internal communication. The larger and eastern half was called Hekatompedos, and was fronted by a pronaos; the smaller western half was called the Parthenon, and was itself fronted by a pronaos. The back or western chamber of a temple was usually called the Opisthodomos. It is natural to ask why an exception was made in the case of this particular temple. The answer is simple. After the new temple was built, there still existed, and was in use, another Opisthodomos, —i.e., of the old temple. To avoid confusion with this, the Opisthodomos of the new temple was not called Opisthodomos, but for distinction Parthenon (Chamber of the Virgin)."

The summary manner with which Pausanias treats that portion of the Acropolis on which the Erechtheion stands is unfortunate, as it leaves a settlement of the extent and internal plan of this and other edifices still undecided. "There is also a building called the Erechtheion," and further on he speaks of the images "in the temple of Athene Polias," adding that "the temple of Pandrosos adjoins the temple of Athene." With regard to the Erechtheion, attention should be called to two points of great importance:—

1. Pausanias regarded it rather as a dwelling-place than as strictly a temple. 2. Clearly it was regarded as belonging to Erechtheus, not to Athene. The "good house of Erechtheus" had long since perished, but its memory, no doubt, remained, and when the new Erechtheion was built to incorporate and commemorate old cults, it was natural that a building should be upreared, which was not so much strictly a temple as a sacred dwelling-place. The Erechtheion, I am fully convinced, will be better apprehended if it be considered as "a house" as well as, if not instead of, a temple.

It is quite possible that the building, as we now see it, was raised on the foundations of a portion of the palace-fortress of King Erechtheus. Respecting the site of the temple of Pandrosos we know next to nothing, as no traces of the walls have been discovered, but as two inscriptions recently unearthed refer to "two pediments, one towards the east and the other towards the Pandroseum," it is reasonable to infer that the Pandroseum was necessarily west.

Want of space precludes a reference to the interesting chapters relating to recent discoveries on the Areopagus and in the unearthed Street of Tombs. Enough has been said, however, to show the great value of this work, which "is addressed, not to the professional archaeologist, but to the student." Further discoveries will, no doubt, enlighten us on many points connected with life in Ancient Athens, and those mysterious cults that were so intimately interwoven with it. For the present, we are quite content with Miss Harrison's lucid commentary, which merits a high place in archaeological literature.

## NOTES.

 It is a noteworthy sign of the times that at a meeting of the International Tailors' Union in East London two or three days ago, to consider the report of the Committee on the sweating system, the principal resolution moved included a demand "that all work-places provided be clean and healthy, free from any objectionable or offensive matter, and that modern ventilating shafts be used, so that each worker shall be supplied with a sufficient amount of fresh air during work hours." The phrase "modern ventilating shafts" seems to indicate, it is true, some kind of belief in an infallible system of supplying enough fresh air to each individual, which is less often met with than the framers of the resolution probably suppose; but they are quite right to want that, and if they stick to their demand they will get it, sooner or later. The Tailors' Union should, however, understand, that in asking for a sufficient supply of air for each person, they are asking for what is still an unattainable luxury in places frequented by persons much better off and more exacting than journeyman tailors have hitherto been. We could tell them of one of the most aristocratic places of entertainment in London, where a few weeks ago one of the audience had to go out in the middle of a concert and hully the managers of the building into adopting the rude expedient of opening some windows, without which some persons would probably have fainted for want of oxygen before the evening was over, "modern ventilating shafts" having no existence in the building. It may surprise them to hear that in the London season people are daily nearly choked in the dining-rooms of millionaires, with every luxury about them, and their appetites destroyed and headaches brought on, by simple want of necessary air to breathe.

They will find plenty of fashionable churches with no method of changing the vitiated air, and where people go to sleep, or even faint occasionally, from want of fresh air and of "modern ventilating shafts." The Tailors' Union, in asking for an adequate supply of fresh air, are asking for a luxury which is at present only to be counted on in two classes of buildings in this country, prisons and hospitals. But let them persevere in their demand. If they can succeed in getting an adequate supply of fresh air, introduced in a scientific manner, into tailors' workshops, they will have set an admirable example, which perhaps will be eventually followed in theatres, concert-rooms, churches, and West-end dwelling-houses.

**T**HE draft classification and schedule of maximum rates submitted to the Railway Companies by the Board of Trade, does not, as we anticipated, meet with the approval of the former. Lord Colville of Culross stated at the half-yearly meeting of the Great Northern last week, that the schedule did not sufficiently recognise the rights of the Railway Companies, and that it would be the duty of the Directors to make further representations to the Board of Trade. The Chairman of the Midland (Sir M. W. Thompson), says that the Board have gone far beyond what the traders had asked them to do, and have cut down rates to an extent which leaves no margin whatever for contingencies. The London and North-Western meeting was being held as we went to press, and as the correspondence with the Board has been conducted by this Company on behalf of the others, Sir Richard Moon, no doubt, alluded to it at length. The position taken up by the London and North-Western, however, he gathered from copies of the correspondence referred to, which accompany this half-yearly report. They declare that the adoption of figures such as those proposed "would diminish the present annual income of the company by so large a sum as to render it quite impossible for the directors to submit to the proposal except under the compulsion of Parliament." They respectfully ask whether the Board adhere to the assurance of the Prime Minister, that their revenue should not be "confiscated" (a word which occurs more than once in the course of the correspondence), and if not, upon what principle the rates have been fixed. The Board reply that they have simply proposed what they considered "just and reasonable,"—having had no other direction from Parliament,—and failing to come to an agreement with the companies, they will present their report without delay. It is further stated that this action will not preclude the consideration of any facts and figures which the companies may lay before them after the report has been submitted to Parliament. Consequently, a number of fresh returns and comparisons are to be prepared; and as the clerks and officials have had more than enough of such work in connexion with this business already, they will be quite ready to join in the general regret that the company and the Board of Trade have failed to come to an agreement upon it.

**T**HE rambling discussion in the House of Commons on Monday evening, in regard to the Lords' amendments on the Removal of Gates Bill, which was in the end adjourned, formed a curious example of the illogical and unreasonable arguments which people will put forth in support of a course for which there are diplomatic reasons which cannot be openly brought forward. Mr. Lawson, indeed, let the cat out of the bag (and we doubt if the County Council will thank him) in his unguarded remark that "there were 200 gates and bars in London, and if the Bill were passed in its present shape those obstructions would never be removed." In other words, the County Council want to be free to remove them without incurring the responsibility of compensation for which the Bill as amended would form a precedent. The Solicitor-

General, we are glad to observe, upheld the principle that where private interests were injured by work carried out for the public benefit, "the persons deprived of their property should receive compensation." The "200 gates and bars," to the residents living near them, are a most important element in the comfort of London life, consequently in the value of the house property affected. It is ridiculous to say otherwise: indeed, it is questionable whether it is altogether for the public benefit that all of these gates should be removed, and that the special character of seclusion, belonging to some portions of London, should be thus entirely destroyed. The gates in the Bloomsbury district are more open to attack than most others, being in the way of the access to three great railway stations. But even in this case those who are injured have a right to be considered.

ON Monday night, Mr. Cavendish-Bentinck, acting as the mouthpiece of Sir William Harcourt, again questioned the Home Secretary as to the Police Buildings on the Embankment, and as to whether, in getting them carried out, he "had consulted any authority on architecture." Sir William Harcourt must have known perfectly well that Mr. Norman Shaw was the architect of the building, but we presume he is one of those people who imagine that an architect is not any authority on such a subject. Mr. Cavendish-Bentinck proceeded to state that "the buildings had been viewed with great disfavour by some authorities in the country." By whom? We know of no one who is a recognised authority on architecture who has expressed disapprobation of them. The whole thing is a foolish pretence, to lay a trap for a political opponent. Mr. Matthews's reply, as reported in the *Times*, was short and much to the point. He said "that he found the site partially unoccupied, and he had to cover it as best he could. He took the advice of high artistic authorities in London, persons who were at the head of art in this country. He asked them the name of the best architect to employ, and he commissioned that gentleman to put up the best building he could for the money." Could he have done more?

IT is to be regretted that the Government have been compelled to drop their Savings Bank Bill, through the persistent opposition of Mr. Storey, the Member for Sunderland. It was supported by all persons interested in the subject. Its loss shows what can be achieved by vanity and ignorance in the House of Commons. For when there is a consensus of opinion in favour of a measure such as this, which had also been carefully examined by a Committee of the House, it is only a vain belief in a man's assumed superior intelligence which can enable a member to prevent the passing of a useful piece of legislation. If the House of Commons did not daily exhibit illustrations of the manner in which middle-headed men believe themselves to be paragons of wisdom, and also show how utterly vain are many of our heaven-horn legislators, it would be impossible to believe that anyone could have so little regard to the opinions of other men as alone to oppose the passing into law of so useful and a practical measure as the Savings Bank Bill. At the same time, while Mr. Storey's conduct appears wrong, it is obvious that there is a tendency at the present time for the Government in power to treat discussion of non-party measures as undesirable, whereas every measure, political or social, requires a discussion of its principles and details within reasonable bounds.

ON Monday last the clause in the London County Council Bill as to the height of buildings came under discussion in the House of Lords on the third reading of that measure. The Select Committee by whom the Bill was examined allowed as the maximum height 30 ft. and two stories. Lord Stanley, of Alderley, moved as an amendment that the

height should be 70 ft. and one story. This amendment was, however, negatived. Lord Wemyss appears to have hit the right nail on the head when he inquired why there was no clause making the height of buildings bear some proportion to the width of the street. There can be no question that such a clause should have been in the Bill. Seventy feet in some streets may be much too high. No one, we suppose, can doubt that Northumberland-avenue has been spoilt by the height of the buildings—had it been double the width this would not have been the case. It is clearly too late in the day to object to high buildings in London; the value of land makes them a necessity, and mechanical contrivances make them habitable, and that the top story of a high building is a healthy place can scarcely be doubted. But what is required is their regulation, and for this purpose the width of the street must be considered.

AS we have now entered upon the legal Long Vacation, it is opportune to point out that a great deal of good work has been done during the past legal year by the Official Referees. This tribunal is now more and more resorted to in cases of action for dilapidations, and in claims for various forms of work done, such as building and decoration. It is less expensive than private arbitration, and the Referees are becoming thoroughly at home in the examination of builders' accounts. The main thing is that the Referees should be kept up to a high standard of efficiency, and that they should not be old men. At the present time Mr. Hemming, Q.C., and Mr. Ridley thoroughly answer these conditions,—both being not only first-rate lawyers, but men considerably above the average in mental capacity. Mr. Verey is a painstaking official, but of inferior calibre to the two first-named referees. When the system of Official Referees was first inaugurated it was very nearly a failure from the new referees being men too old for the work, but at the present time it is one of the few satisfactory parts of our judicial procedure.

THE Directors of the North British Railway have, it seems, resolved to take immediate action with a view to obviate the congestion of traffic at the Waverley Station, Edinburgh, to which we referred last week. It is a state of matters which could not possibly be allowed to continue, and for which a remedy must be found, at whatever cost. The position of the station is such as to render it very difficult to increase the accommodation, but the Directors are to direct their efforts to its extension and the improvement of the approaches. They have, it appears, three propositions to make, the acceptance of any one of which would effect the purpose in hand. The first of these is to drive a tunnel through Charlotte-square, George-street, and St. David-street to the Waverley Market, which would be added to the station. The second proposal is similar to that submitted by the Caledonian Railway in the Bill which was rejected this session. The third is to run a line alongside the embankment in the Princes-street Gardens, which would be covered in and added to the breadth of the embankment. For the accommodation and further extension of the goods traffic, it is proposed to acquire part of Macdowall-street and the gasworks, to the eastward of the present station. The removal of the gasworks from their present position would effect a desirable improvement in the amenity of the district, and is likely to meet with general approval; but much difference of opinion is likely to arise as to the other proposals. Whatever scheme is carried out, it is to be hoped that the aesthetic aspect of the matter will not be overlooked; and if the railway Directors are wise, they will make the scheme as comprehensive as possible.

THE official list of awards in the architectural division of this year's Munich Art Exhibition has been rather a surprise to the German architects, and although we

have reason to believe that they in general quite concur with the decision of the jury, we hear that there is a certain feeling that will probably lead to our seeing the works sent in for the next exhibition being greater in number and, at the same time, perhaps superior in quality. As already stated by us in our issue of the 2nd inst. [p. 95], the first medal fell to Mr. Waterhouse, the work sent in being the "Natural History Museum, South Kensington"; three second medales were given away, and these fell to Mr. Anderson, of Edinburgh (Scottish National Portrait Gallery); Bandirector Hugo Licht (Restoration and Extension of the Leipzig "Rathhaus"); and Messrs. Rettig and Pfau, of Berlin (primated design for a national monument to Emperor William I). Although only twenty-five designs were to be found in the architectural room, some good names could be seen attached to the numbers, and we are hence all the more pleased that the first prizes fell to Great Britain.

THE controversy about the so-called "Euhouleus" head seems likely to go on for some time. Mr. Ernest Gardner, reporting on the present state of the National Museum at Athens, writes:—"A word of protest may be raised against making the undoubtedly authentic Scopas heads from Tegea yield the place of honour in the fourth-century room to the very doubtful 'Euhouleus' head from Eleusis. Surely few who have seen the Hermes of Praxiteles at Olympia can accept the theory that attributes this to the same hand. Yet, apart from such a theory, the head has no right to its place." The question is, of course, a double one. Is the head by Praxiteles? Is it rightly called "Euhouleus"? We are with Mr. Gardner in his doubt about Praxiteles. There is to our minds little of the masterpiece about the Eleusis head, but then unhappily very good sculptors have been known to do very bad work. That the head must, anyhow, represent a youthful under-world god is again maintained by Dr. Winter in his paper on *Iachos* in the *Bonner Studien* mentioned below.

UNDER the title "Bonner-Studien," the pupils of Reinhard Kekulé have just dedicated to their justly-popular professor a collection of monographs in memory of his work at the Bonn University. The list includes the names of some of the most distinguished among rising archaeologists. Dr. Paul Wolters contributes an article on the date of the building of the Nike temple at Athens, illustrated by a series of sections showing the relation between the foundation of the Nike temple and those of the adjacent wing of the Propylæa, and also the position of the newly-discovered inscribed blocks belonging to the statues of horsemen seen by Pausanias. His elaborate examination of the site leads him to the following conclusions:—1. Cimon was the builder of the Nike pyrgos, but not, as Bendorff has recently maintained, of the Nike temple. 2. The original plan of Mnesicles for the south wing of the Propylæa presupposes the existence of the pyrgos and of the Nike altar. 3. The plan and position of the temple was the result of the modified scheme adopted by Mnesicles, and in thus as it were a monumental protest against the encroachments meditated by Mnesicles in the precinct of Artemis Brauronia. Another paper of general interest is by F. Dümmler, whose name ranks very high, if not the highest, as an authority on the chronology of Greek vases. His monograph is practically a criticism of Dr. Klein's position in his "Euphronios" as seen in the light of the recent finds in the Acropolis. Dr. Klein, writing before these discoveries, examined the relation between vase painters of the date of Euphronios and the great monumental painters—supposed then to be contemporaneous. He came to the conclusion that the influence of wall-painting on vase-painting was

—barring the choice of subject—*nil*. We know now that the cycle of Epiktetos (including Euphronios) preceded Polygnotos, instead of being contemporary with him, so that with this premise the whole of Dr. Klein's deductions fall to the ground. Space forbids our even resuming Dr. Dummler's monograph; but it is of the first importance to all students of Greek Ceramography. It seems a pity that a paper so valuable should be hidden away in the "Bonner Studien," and if it must be so hidden, why cannot foreign publishers give us a list of the contents of such collections of monographs?

**T**WO daily newspapers exited last week over the recent demolition of Nos. 1 and 2, Rolls-yard, Chancery-lane, with the attendant discovery of the supposed "fourteenth-century" window in the chapel's southern wall\*, and the increased facilities thus gained for the working of the Record Office. In his report of this year, the Deputy-Keeper, referring to the blocked-up windows now uncovered, writes: "One of which certainly dates from the fourteenth century." It appears that several of the ill-conditioned houses along the western side of Rolls-yard, and fronting Chancery-lane, are still used for the storing of departmental papers, despite the dangers from fire to which their contents are exposed. In Rolls-yard were formerly the Curator's, Subpœna, Petty Bag, and other minor offices. The house next north of the gateway served, fifty years since, as the Marshalsea and Palace Courts office, its records being kept in Clifford's Inn and White Bear-yard, Eyre-street, Hatton-garden. The house recently demolished was built circa 1785 for the Clerk of the Records and the Master's secretaries; it had latterly served for purposes of the Record Office. Perhaps the Rolls Chapel was used for the deposit of records upon the annexation of Henry III.'s *Domus Conservatorum* in 1377. Hatton (1708) mentions daily attendance in the chapel "for taking in and paying out money (pursuant to order of Court), and for making Searches of Rolls, &c." A report upon the state of the documents kept therein was made to Parliament in 1732 by a committee appointed to examine all such repositories, after the partial destruction by fire of the Cottonian Library at Ashburnham House, Little Dean's-yard, Westminster, on October 23, 1731. Forty years later the House ordered that the Rolls Chapel should be fitted up with presses (the seats even being utilised), and a Rolls Chapel office be built next thereto.

**T**HE places viewed by the committee above-mentioned were about twenty-five in number: the principal being at Whitehall; the Chapter House and the Hall, Westminster; the Houses of Parliament; the Rolls Chapel; and the Tower. In the Tower had been appropriated the Wakefield Tower, "Cæsar's" Chapel in the Keep, with a gunpowder magazine immediately beneath, and, for Chancery Records, the King's Treasury House, of which building we printed an illustration on August 7, 1886. Cromwell had brought all the Scottish public registers, rolls, and records to the Tower, where they remained until the Restoration; the vessel in which they were returned was lost, with its precious cargo, at sea. An Act, 1 and 2 Vict. c. 94, vested in the Master of the Rolls all public records at that time deposited wheresoever, to be brought under controul of a general Record Office; and the Treasury were directed to provide a suitable building for their safe custody. During the interval, 1850-70, votes in excess of 250,000, were taken *ad hoc*. On July 19, 1890, a Commission for Great Britain was set up, the "more effectually to provide for the better arrangement, preservation, and more convenient use" of our public records. The Commission, renewed from time to time,

\* Rebuilt, says Pennant, by Inigo Jones, in 1617, at a cost of 2,000.  
† Thomas Allen's "History of London" says that all the houses here were rebuilt, after Colin Campbell's design, in 1719, by Sir Joseph Jekyll, Master of the Rolls, at a cost of from 25,000 to 26,000, and that Jekyll built thirty more.

expired at the end of the year 1837, having exceeded their "votes" by a sum of 24,000. Their report upon the condition of the papers themselves is but an echo of the grossness account of the Tower Records given by W. Pryne in his dedication, *temp.* Charles II., to vol. iv. of the Parliamentary Writs. In 1832 the Commissioners advocated the erection of a new central office on the Rolls Estate, the cost to be met out of the "Suitors' Fund"; a few years later the Treasury propounded a scheme for utilising the Victoria Tower and the roofs of the new Houses of Parliament, where Sir Charles Barry fitted up a small portion of the roof by way of experiment. In the end, a site was cleared for the present Record Office by Fetter-lane. The still incomplete designs of Sir James Pennethorne, architect to the Office of Works, were approved, and Lord Romilly laid the first stone on May 24, 1851.

**A** CORRESPONDENT writes: "I was at St. Albans this week, and was much struck with the difficulty that there must have been in setting-out the elaborate circular window of the north transept of the Abbey; but after much cogitation I found that the setting-out could be done to  $\frac{1}{2}$  in. scale for 1*l.* 1*s.* 4*d.* (which well represents the value of the design). Thus:—Take a penny piece, place around it nine threepenny pieces and around them again nine two-shilling pieces, and around them again eighteen shillings, and the job is done. This would give a good idea, too, for the stained glass design, and then the glass and tracery would suit very well."

**I**N describing the new Town-hall at Portsmouth, opened on Saturday last, the *Daily Chronicle* gives an interesting example of the architectural discrimination of the daily paper reporter. We read that "this beautiful work" is "what is vaguely called classic,—that is to say, it is Corinthian in the delicate details of its columns; it is Italian in general feeling, and it is Renaissance in some parts of its ornament." It would be interesting to know what ideas the writer of that sentence attaches to each of the three epithets he uses, and what he thinks is the relation of "Italian" to "Renaissance." In thus describing, in rapturous though somewhat blundering phraseology, "this beautiful building," the *Daily Chronicle* does not trouble itself to give the name of the architect who designed it; such matters of detail being, we presume, "of no public interest."

### Illustrations.

#### BUILDINGS IN AND AROUND OXFORD.

**O**UR illustrations this week are in connexion with the Oxford excursion of the Architectural Association, which is taking place this week.

The view of the High-street by Mr. Falleylove we referred to in our article on Oxford last week. Sketches by Mr. T. MacLaren of the Bell Tower at New College and of the upper part of Magdalen Tower are now given.

The other plates illustrate the principal objects of interest in the vicinity, and should be taken in connexion with the leading article in the present number, in which also will be found some further views of places visited. A report of the progress of the excursion will be found on another page.

It ought to have been stated by us last week that the illustrations of new buildings at Oxford then published by us were taken from photographs by Messrs. Gillman & Co., St. Aldate's, Oxford.

**THE NEW CLOCK AT PORTSMOUTH TOWN HALL.**—The clock at the new Portsmouth Town Hall was made and fixed by Mr. J. W. Benson. It is a very powerful clock; in fact, it is stated to be only second to the great clock at Westminster. All the wheels are made of the finest gun-metal, the main wheels being 2*ft.* in diameter and 1*¼* in. thick. The escapement is the "gravity," invented by Lord Grimthorpe, and similar to that in the great clock in the Houses of Parliament.

#### THE GLOUCESTER CONGRESS OF THE ROYAL ARCHÆOLOGICAL INSTITUTE.

The Royal Archaeological Institute of Great Britain and Ireland is holding its Congress this year at Gloucester, a city which it visited in its young days, namely in 1860. Its President for this year is Sir John Dorington, Bart., one of the members for a division of the county, and among its chief supporters are the Bishop and the Dean of Gloucester, the Lord-Lieutenant of the county, Lord Ducie, Lord Moreton, Lord Eldon, and the usual number of local celebrities.

The Congress was opened on Tuesday at noon in the Corn Exchange of the city, in the presence of most of the persons above-mentioned, and of Mr. T. Robinson, M.P., Sir John Maclean, Sir Brook Kay, and Earl Percy, the permanent President of the Institute. The proceedings were commenced by a very brief speech by the Mayor of Gloucester, who was in the chair, and an address of welcome, duly signed and sealed with the seal of the Corporation, was read aloud by the Town-Clerk; this was followed by another address of welcome from the Bristol and Gloucestershire Archaeological Society, which has now reached, as we gathered, its fourteenth year of existence, and very many of whose members were present.

Earl Percy then took the chair, and thanked the Mayor and Corporation for the very kind reception which they had accorded the Institute on that occasion. He proceeded to touch upon the objects of archaeology, remarking that their investigations served to present difficult questions in new lights. The county generally appeared to be full of interesting antiquities, and, if he might judge from the programme before them for the present meeting, these were more numerous in the neighbourhood of Gloucester than most parts of the county. There were so many objects of interest in the immediate neighbourhood of Gloucester that they would hardly be able to visit them all, and it was well not to attempt to crowd too much work into a short time, and thus interfere with the enjoyment and instruction to be gained from those objects visited. He expressed, in conclusion, the thanks of the Institute towards the Gloucestershire and Bristol Society for the assistance they had afforded in promoting their convenience.

Sir John Dorington, as President of the Congress, next read his "inaugural address," which was a very able and exhaustive essay on archaeology in general, and that of Gloucestershire in particular. He treated this, as was to be expected, chiefly with regard to its Roman remains. In these, he said, not only the city, but the country all around, is very rich, more rich in all probability than any portion of Great Britain of similar size; for it was the residence, even in the middle of the first century, of Anlus Plautius, the Emperor's great lieutenant, who was stationed here in command of several legions in order to hold this spot, the key of South Wales, against the Silures. There were known to be, he added, as many as twenty-four Roman villas in the county, and 112 Roman camps, all made by these conquerors from the far south. He then dwelt in considerable detail, and at much length, on the conditions of life as it must have presented itself in Gloucestershire during the three or four centuries of Roman occupation, declaring his conviction, based on a careful study of what he had read and seen, but mainly on the latter, that society and civilisation were then in as forward a state as that in which we find them nowadays, with the exception, of course, of steam and other modern science; from that condition they fell, as he believed, mainly through the invasion of the Saxons; and the deterioration lasted down to the age of the Tudors, if not to that of the first of our Stuart kings. The archaeologists would be shown, during the coming weeks, much that would astonish them in the way of Roman discoveries; for much had been brought to light in the last few years; and the collection of such relics to be seen in the local Museum would be a study for the most learned member of the Institute. He concluded by expressing a hope that the weather and the arrangements made by the local secretaries would conduce to the comfort of the party, and give general satisfaction in their results.

Lord Percy briefly proposed a vote of thanks to Sir John Dorington (whose address will appear in due course in the Journal of the

Institute), adding that he had given the party plenty of subjects for discussion and argument during the whole of their visit to Gloucester.

An adjournment of an hour having been made for luncheon, the party met again at 2 p.m. at the local Museum, adjoining the School of Art, where Mr. John Bellows, who has made the remains of Roman work, especially in Gloucester, his special study, took one-half of them in hand, and conducted them to four or five different parts of the city where the ancient walls are to be seen or can be traced, explaining them in detail by the aid of a small diagram map of Roman Gloucester which he had made for the occasion. The chief places where he gave his explanations were on the site of the old South Gate, at the Castle ditch and the adjoining "Bare" land, in the Cathedral-close, at the North Gate close to St. Aldate's-street, and at his own house in Eastgate-street. Here, under his dwelling-house and the adjoining printing works, Mr. Bellows has carried his researches into the ground under his cellars, and has within the last few months laid bare in two places the foundations and exterior facings of the old Roman wall built in the days of Plautius, on one of which are to be seen marks of tools similar to those seen in Jerusalem and at Cologne. He added that, in his opinion, Gloucester was originally fortified with a special view to check the incursions of the Silures; but that when the Romans pressed forward their conquering arms to Isca Silurum, Caerleon-on-Usk, the city gradually diminished in importance, and became in course of time a mere "Colonia" instead of the chief military post in the West of England. On this subject Mr. Bellows was able to give, before starting, a short lecture in the Art School Lecture-room, where he exhibited a series of most interesting maps and plans, drawn strictly to measure.

Meantime, the rest of the party, who had elected to inspect the ecclesiastical and mediæval buildings of the city, were led by Mr. F. W. Waller, Mr. H. Medland, and the Rev. W. Bazeley, to the chief of the old houses and inns and parish churches in various parts of the city, including the "New" Inn,—which, curiously enough, is the oldest in Gloucester, in spite of its name, and one of the oldest in the Kingdom. It is built almost wholly of wood, and has open galleries running around a central court, like the London inns of Shakespeare's day. It was built by a priest in the first half of the fifteenth century. They were also shown the Booth Hall, and the scanty remains of the once splendid fabrics of the White Friars and the Black Friars, the one to the east and the other to the west of Southgate-street. Both of these churches are now dwelling-rooms, and the old dormitory of one of the two religious houses is now a warehouse. The party also inspected the Church of St. Mary le Crypt, with its fine frescoes, font, and monuments, and went down into the undercroft from which the church derives its name, and which was kindly lit up for their inspection by the rector.

In the course of the afternoon, the entire party, to the number of 150, were entertained at the Palace by the Bishop and Mrs. Elliott, the Bishop and Mr. Bazeley giving a brief *visû* *in* account of the building, including the great dining-hall, in which most probably William the Conqueror was feasted, and certainly many of his Norman successors were entertained.

In the evening the "Antiquarian Section" was opened in the lecture-room of the School of Art, by Dr. E. Freshfield, F.S.A., with a chatty and discursive paper on the present state of archeological and antiquarian studies in Great Britain and in foreign lands, including Greece and Turkey. In concluding his paper he showed how easily subjects of study arise in any and every profession, and in any and every town and village; and he counselled those who wished to become antiquaries to lose no opportunity of following up such subjects.

The reading of this paper was followed by a discussion, in which Mr. Micklethwaite, Canon Venables, and other gentlemen took part, the Canon taking that opportunity of drawing attention to the fact that at Lincoln many important records relating to the city had been carelessly lost during the last thirty years.

Professor Burrows then read a paper on the Progress of Archaeology at Oxford in late years, in which he reviewed *seriatim* (1) the old Oxford Architectural Society, which was founded over half a century ago by the late Mr. J. H. Parker, and of which Professor Freeman was a leading member even whilst an undergraduate; (2) the

New Historical Society of Oxford; and (3) the recent appointment of a "Reader" in Archeological Studies, which he hoped and believed at no distant day would bear good fruit. This paper also was followed by a brief discussion, in the course of which Mr. E. Walford stated that in his own day at Oxford (1841-1845) only one head of a college, and scarcely any fellow or tutor, took part in the meetings of the Architectural Society, but that the undergraduates not only believed in but supported it, showing their faith by their works, by subscribing the first hundred pounds raised towards the repairing of Dorchester Abbey Church, and the first hundred pounds also, as he believed, towards the repair of St. David's Cathedral.

On Wednesday the party started, soon after breakfast, by steamer for Deerhurst, where they had been promised a rich treat, and for Tewkesbury, where they had arranged to visit the battle-field and the celebrated Abbey, in which so many of the noble knights who fell there lie buried. The morning was fine, but at noon heavy showers came on, and the pleasure of the excursion was sadly marred. At Deerhurst the party—about 130 strong—was met by the Vicar—the Rev. George Butterworth—who led them to his church, which is one of the most curious in the whole kingdom, for it now stands but little altered—in its interior, at least—from what it was a thousand years ago, since it is clearly established that it was a flourishing abbey in the eighth century, and the walls of its nave and chancel are much older than the Norman Conquest. At a far more recent date—namely, in the first and second Pointed periods—aisles were annexed to it, but without altering its interior structure. One of the most curious features of the church is its singular double tower, and another is a double window, of a very Early Romanesque type, which looks down into the nave and commands a view of the high altar. Mr. Butterworth here read to the party a short paper on this church and on the adjoining monastic buildings, some of which remain but little altered, and on the small Saxon chapel hard by, which, as our readers are aware, has lately been brought to light after having been for centuries embodied,—and, indeed, embedded,—in a modern dwelling-house, but which now has been carefully restored,—or rather repaired. Here Professor Middleton took up his parable where Mr. Butterworth had left off, and gave the party an interesting account of the structure and of its recent discovery. From Deerhurst they went on by steamer to Tewkesbury, in a most drenching shower of rain.

We will continue our notes of the Congress in our next.

THE ARCHITECTURAL ASSOCIATION EXCURSION.

As our readers know, Oxford has this year been chosen as the locality for the annual excursion of the Architectural Association. As we have dealt pretty fully with the buildings visited in our leading articles of last week and this week, it is only necessary here to give a few notes as to the progress of the excursion.

It was determined that the morning of Monday last should be spent in visiting some of the more important buildings of Oxford, and accordingly a start was first made for Christ Church, where the Hall of the College, with its pictures and the interesting late example of fan vaulting to the staircase (date 1640) were inspected; then, after a glance at the kitchen, the Cathedral was visited, where the party remained till the time of service. After seeing the Chapter-house, the members proceeded to the Library, and thence to Merton College, where the Chapel, Library, and Hall were the points of attraction. Proceeding to the New Examination Schools it was found that these were in possession of the University Extension students, and the party therefore went on to Magdalen College, where the quad, Hall, Chapel, and the new buildings by Messrs. Bodley & Garner (illustrated by us last week) were examined. After this New College, with its Chapel and Hall, were visited, and then the well-known buildings and gardens of Wadham College. A return was then made to the Examination Schools (also illustrated by us last week), which were then thoroughly seen by as many of the members as were not tired of the personally-conducted system. After luncheon the members went, as fancy dictated, to the several parts which most attracted them

as sketching grounds, or, in some few instances, to the less serious pursuit of river scenery.

On the second day (Tuesday) the programme was rigidly adhered to, Ilfley with its Norman church, Dorchester, and the charming village of Ewelme (see illustration this week) being visited, and a fine day, and well-appointed four-horse coaches over good roads and through pretty scenery, raised the spirits of the members and conducted to a general feeling of satisfaction.

The third day of the excursion opened with beautiful weather and warm sunshine, which rendered the hour's drive to Stanton Harcourt (illustrated this week) a pleasure to all—less so, perhaps, to the bicyclist member, who found the roads not all that could be desired. At Stanton Harcourt, following the principle adopted generally in the programme of this excursion, a long stay was made, to the satisfaction of the water-colour artists in the party, who found the *locale* well adapted for their particular hobby. After luncheon the members proceeded to Witney, which was safely reached, although the near wheeler of one of the coaches showed signs of impending collapse about a mile from the town. The rest at Witney, however, hrought about his recovery, and no further signs of mishap occurred. At Witney the honorary amateur photographer seized the opportunity for a group of the party in front of the west door, after which, the church having been explained, and attention having been especially called to its salient points by a letter from the rector, the members dispersed to view in small parties the Grammar School Market Hall, the Hermitage, an interesting house of 1564, and the neighbouring village of Cogges, where the church and the thirteenth-century Domestic windows, figured in Parker's "Domestic Architecture," attracted attention. A heavy shower here seemed to damp the enthusiasm of the sketchers, as very little work was done, in spite of the length of time allowed, the attractions of tea at the Golden Fleece appearing to have stronger power. On the return to Oxford a short halt was made at Eynsham, although it was not in the programme, for the sake of the horses, and the sketchers then set to work with vigour to make the most of the five minutes' halt. The return to Oxford was accomplished in good time, and the third day's work satisfactorily completed.

We will conclude our notes of the excursion next week.

GARGOYLES.

HORACE WALPOLE, in his chapter entitled "State of Architecture to the end of the reign of Henry VIII.," refers to the researches of the French writer, Felibien, author of "Lives and Works of Celebrated Architects," who died in 1733, and of his father, André Felibien, author of "Les Principes de l'Architecture," who died in 1695. He says their researches had very small results. To them only two ancient architects revealed themselves. One was Sexulphus, abbot and afterwards bishop, who built a considerable monastery, called Medes Hampstede (Peterborough); and the other was Marston of Arezzo, architect to Pope Innocent III., "who first invented those grotesque monsters and hurlerque faces with which the spouts and gutters of ancient buildings are adorned."

The Papacy of Innocent III. extended from 1198 to 1216. That gargoyles are not found on Mediæval buildings of earlier date, however, is a statement that can hardly be accepted without demur; nor is it likely that any individual inventor can now be hit upon for such a class of detail.

When the choir of the Cathedral of Notre Dame was built neither spouts nor gargoyles were provided; but for other parts of the same edifice erected a little later, about A.D. 1210, arrangements were made to carry off rain waters by means of gutters placed at intervals. About 1220, a few gargoyles were placed upon the Cathedral of Laon. They were composed of two lengths of stone, one for the gutter and the other for the cover. Even at this early date they were fashioned into the form of fantastic animals. They were large in size and few in number. Subsequently architects preferred to divide the distribution of rain waters into smaller jets, and the number of gargoyles employed was lavishly increased. Eventually they became the objects of much sculpturesque decoration.

The term gargoyle, or gargouille, as it is written by our French neighbours, is said to be derived

from gargoyle. Gargoyles are made to represent griffins and other beasts, birds, human figures holding ewers out of which the waters are directed to pour; grotesque and toad-like creatures, demons, fanciful birds with the heads of beasts, and, in late examples, the mouths of cannon. They are of much more frequent occurrence in some places than in others, and much more so, generally, in France than in our own country. Writing of French examples, M. Viollet-le-Duc says,—after mention of the prodigious variety in their forms and the fact that no two have been found to resemble each other in France—that many of them are fine works of sculpture, and are attached so adroitly to buildings as to bring out their salient points and conduce very much to their general effect. In modern efforts they are often badly placed, and of heavy or poor form, poor invention, and no character; but the old architects and sculptors combined to make them real and pleasing. At first short and robust, they were subsequently elongated, and their heads so outstretched that the waters should be thrown as far as necessary from the foundations. They became veritable pieces of sculpture in the delicacy of their design and execution. The church of St. Urban de Troyes has very fine examples, one of which is a human figure, elegantly draped, holding a vessel from which the waters issue. During the fourteenth century they were generally long, and often charged with details; and in the fifteenth took a strangely ferocious character; and it was not till the second half of the sixteenth century that these old forms were abandoned.

Our own examples occur most frequently on church towers, where they are placed below the parapets at intervals. They are for the most part small and simple. There are some grotesque specimens on the old tower of Stewkley Church, which are bold and striking. Others may be noticed, too, below the parapets of Badworth Church, Gloucestershire, and on Fleet Church, Lincolnshire, and on Adlesthorpe Church tower and porch in the same county. They are to be seen on the topmost angles of the tower of St. Michael's Church, Aylsham, Norfolk. On the Church of St. Mary, Bishop's Lydeard, Somerset, they occur on the tower, on the porch, and below the parapet of the nave. Helpston Church, Northamptonshire, and All Saints' Church, Hawton, Notts, to give a few more instances, have examples, and the Church of St. Gregory, Bedale, Yorkshire, has some very bold specimens. On the nave of Morpeth Church, Northumberland, is a pleasing female figure holding a ewer from which the waters issue.

Some of our castellated buildings were also furnished with gargoyles. On the very interesting tower, known as Pope's Tower, at Stanton Harcourt, Oxfordshire, they occur, as well as on the church tower close by. On the fine entrance gateway of St. Cross, Winchester, they are placed at intervals. On a length of curtain-wall at Alnwick Castle they occur in the likeness of the mouths of cannon, and direct the rainfall on to the site of the old moat.

Kilpeck Church, down among the green pastures and gay orchards of Herefordshire, was one of the early works of the Norman masons. There are traces of Saxon handling in it likewise—in its tower especially. And among the sturdy lowly curves and the zigzag work, that are characteristic of its early period, may be seen some of these grotesque creations, very quaint and noteworthy. As in other instances, scant notice has been taken of them hitherto, except, perhaps, by the few interested in the subject.

There are some gargoyles on the octagon of the fine tower of St. Bartholomew's Church, Lostwithiel, in Cornwall. They are but small, and are placed between the gables at the base of the spire. There are two examples along the parapet of the south of the nave of the fine old church at Minehead. But perhaps our most important specimens may be sought in work of the Perpendicular period, and especially in the Perpendicular towers of Somersetshire churches. They are not to be found in every instance in towers of this period and county, as witness Evercreech Church and St. James's Church, Taunton, but very frequently. They are specially to be noted on the grand tower of St. Mary Magdalene's, Taunton; on that of St. Mary, Bishop's Lydeard; St. Mary, Kington; St. Peter, Staple Fitzpaine; Banwell, and Huish Episcopi.

Among others mention may be made, too, of those on St. Michael's Tower, Coventry, which overlook the bulging, subsiding, overhanging almshouses, the old and new shops, the venerable buildings of the ancient Corporation, with their crypt, halls, galleries, and courts, the narrow and wide streets, and look on other large churches, with interiors as lofty and light, and spires as proud, and all the other precious details of one of the most famous of our Medieval towers.

#### A SANITARY NOTE FROM GREENOCK. FROM A CORRESPONDENT.

NOTWITHSTANDING much that is being written and done by those who take an active part in questions relating to sanitary matters and structural improvements, it is evident that the great mass of the people are still but feebly alive to the obligations they owe to one another regarding the laws of sanitation and health. It will be readily admitted that the health of the working-classes is their capital, and ought to be as carefully guarded as the property of the wealthy. Nevertheless, there are plenty of work-people who seemingly prefer to rear their families in unsanitary, dilapidated dwellings, rather than pay a slight increase of rent for a clean, healthy, modern habitation. This is more the result of their ignorance of the danger they run, than of any desire on their part to frustrate the good intentions of the sanitary engineer.

Still, with many of the poorer class, a low rent suitable to their indigent circumstances is the principal factor in determining their choice of a habitation. Some of the wealthier classes who are alive to the danger of occupying insanitary houses, might, with propriety, warn their poorer neighbours (with whom they occasionally come in contact) of the risk they run in not guarding against sanitary defects, and adopting preventive measures to ward off infectious disease. Some who give little consideration to the question, console themselves in the belief that their own dwellings are beyond the reach of the contaminating influence of the poorer districts. Let all who hold this opinion bear in mind that if, by failing to caution their less-informed and unsuspecting neighbours of the duty they owe to themselves and the public, an infectious disease is allowed to take hold and settle down in a poor locality, that disease will find its way into the districts of the wealthy, who will assuredly reap the reward of their reticence, in the sickness and probable bereavement of their own household. A very forcible instance of this is to be had from the town of Greenock, which twenty-five years ago was famed as being the most unhealthy town in Scotland. At that time its annual death-rate ranged from 34 to 36 per 1,000 of its inhabitants. The late Mr. James Drummond (when Burgh Assessor) turned his attention to this unsatisfactory state of matters, took it in hand as a labour of love, devoting his spare time to trying to discover the cause, with the view of removing, if possible, such a stigma from the town. He proceeded to divide the town into divisions, and each division into six districts, then tabulated the death-rate in each district, when, to his great surprise, the districts he expected to be the most healthy he found to be the most unhealthy. In 1871, Mr. Drummond issued a report of his past labours. His own words in reference to one of the districts will best explain how matters then stood. He says, "The death-rate of No. 6 district, however, seems to me to be higher than the general character of the locality would appear to warrant. Not only is the population in that district low, but the dwellings are, generally speaking, of an average class, many being of a superior kind. The district, too, lies considerably higher than the others of this division and is much more open, yet with all these advantages the average death-rate is one of the highest in town." Mr. Drummond intended to give an annual report, but unhappily he died before the date when his next report should have appeared. This investigation being no part of his official duties, and the mind of his successor not lying in that direction, this valuable inquiry has not been followed up. But any one who knows the locality and studies the report along with its accompanying map (which is divided into the districts referred to) can have no difficulty in tracing the close connexion that existed between the excessive death-rate and defective drainage,

trapping, ventilation, and the stinted supply of water given at the time for flushing purposes. District No. 6 referred to is the highest part of the town, with much open space and modern tenements, constructed professedly on sanitary principles. From the low-lying districts on which stood many insanitary dilapidated tenements, densely populated by the poorer classes, there is a thoroughfare leading to No. 6 district; in it there is a main sewer that receives the drainage of the upper district. Many of the drains, and even the main sewer in the lower district, were no better than elongated cess-pools, the gases generated from their decomposing contents being conveyed from the lower to the No. 6 district along this main sewer, which had no provision for ventilation at its upper extremity, so that these gases found their way into the streets and houses through defective traps and bad connexions, resulting in the excessive death-rate of that district. Mr. Drummond's report had the effect of bringing about a better state of things. Shortly after it appeared the Local Authority adopted the Artisans' Dwellings Act, purchased and demolished many of the old dilapidated dwellings inhabited by the poorer classes, paid greater attention to drainage, and allowed a more plentiful supply of water than formerly, with the result that Greenock now ranks as the most healthy town in Scotland. Its annual death-rate for several years past has not exceeded from 16 to 17 per 1,000 of its population, instead of from 34 to 36 twenty-five years ago.

Much yet remains to be done to reduce the death-rate, particularly amongst children. A recent number of the *Sanitary Journal* reports that of the eight principal towns of Scotland the death-rate in Glasgow was the highest, being 24 per 1,000 of its inhabitants, while in Greenock it was lowest, being 17 per 1,000; and of the total deaths in Glasgow 45 per cent. occurred among children under five years of age, while in Greenock the deaths under five years were 41 per cent. It is most alarming to find the death-rate amongst children highest in the city of Glasgow and in Greenock, where in both places more is being done in the way of sanitary reform and structural improvements than in any other town in Scotland. There is certainly some preventable cause at work that requires special attention, and until that cause is discovered and mastered the fact that nearly half of the human beings born in these cities sicken and die before reaching the fifth year of their age will stand as a reproach on the reputation of our good-intentioned sanitary reformers.

There are without doubt various causes for this great infantile mortality, but I fear that the draining and trapping of our dwellings as practised in Glasgow, and now being demanded by the Sanitary Department in Greenock, has more to do with it than is generally supposed.

Some time ago an attempt was made through the local press to point out this danger and to draw attention to the desirability of making it compulsory to have all new drains constructed by certificated or skilled workmen, so as to make sure of having sound connexions, good joints, and a proper declivity towards the main sewer; also to have all air openings to or from traps and drains, carried up to the main roof instead of discharging on to the footpaths or back courts as done at present in Glasgow and Greenock. This idea was most vigorously opposed by local builders and others interested in trap patents. Some of the former honestly confessed to the writer that if drains were constructed as proposed, no repair would be required, and their trade would suffer. Owing to the depressed state of the building trade for two years past, the requirements of the sanitary inspectors to have defective drains rectified formed their chief source of employment.

In the *Builder* of May 17 last there is a short report of an excellent paper read to the Association of Public Sanitary Inspectors at Carpenters' Hall, by Mr. Thomas Lowther, of Bristol. On the question of drainage and trapping of modern houses, he is most decided, and points as clearly to some of the defects here referred to, as though his attention had been specially directed to them. Referring to the construction of drains, he says:—"Even where such work was entrusted to professed sanitary engineers, satisfactory results were not always obtained; for generally some local builder, possessing perhaps but little knowledge of this particular branch of sanitary work, was called upon to do it." Referring to the ventilation of traps and soil-pipes, he states that "fresh air inlets should be carried above

the main roof, and to assist ventilation power fan exhaust-pipes should always be fixed on outlet vent-pipes." With regard to intercepting traps, he says, "where placed at the foot of each soil-pipe, the air inlets are generally fixed right over them. Such a system was subject to serious defects, and in his opinion should not be applied to private dwellings."

In Hellyer's work on "Plumbing and Sanitary Houses," page 169, referring to the ventilation of traps, he says, "If there is much traffic near the induct pipe, it should be taken 15 ft. or more above the ground level, so as to prevent any one inhaling the air that would be sent through the pipe when any of the water-closets were in action." At page 276 he again states distinctly that induct pipes for the admission of fresh air into drains or traps should be at a point well removed from the house, so as to be at a distance from windows, doors, or passenger traffic, so as to lessen the risk of catching contagious diseases,—applied to what not,—from disease germs coming from the stools of an infected patient. The very reverse of what is here recommended to be avoided as dangerous to health is practised in Glasgow and now being enforced in Greenock. The branch drain to every new property has a disconnecting ventilating trap, generally placed in the foot-path, and directly over it is an iron plate, in which are from fifty to one hundred half-inch holes. The avowed intention of this perforated plate is to admit a down current of fresh air to ventilate the house-drain and soil-pipe. This it will probably do, as long as the closets on the soil-pipe are not in use; but whenever a closet or bath is put in action, the discharge from it descending the soil-pipe acts like a plug or piston and ejects through the perforated plate on to the footpath a volume of foul air and gas, and, it may be, disease-germs, to the great danger of passers, and particularly of children, who, in fine weather gather round these plates and use them for playing at their little games.

There are some very suspicious intercepting traps that are being strongly recommended by our good-intentioned sanitary officials. These gentlemen are no doubt doing good work, and have strong claims on our sympathy and support in the many difficult and thankless duties they are called on to perform. Still, much of the good they are doing is being neutralised by their present system of ventilating and trapping of drains and soil-pipes.

I can assure your readers that this is no mere fancy. The writer has tested several properties, two of them very recently, within two days after the drains and traps had been executed to the satisfaction of the Sanitary Inspector, and the result was as here stated.

Enough has been said to draw the attention of parents to the great danger to which their children are exposed by this erroneous system.

Were those who are interested in this matter to lay aside all prejudices and to take an intelligent and practical view of the question, they could scarcely fail to see it to be their duty to insist on such a change as would tend to preserve the health and save the lives of many children. X. Y.

Books.

*Excursions Archéologiques en Grèce. Mycènes, Délos, Athènes, Olympie, Eleusis, Epidaure, Dodone, Trogathe, Tanagra.* Par CH. DIEHL. Avec huit plans. (Armand Colin & Cie, Paris.)

WE have often heard the wish expressed that some one would write a book which should give briefly, and, above all, readably, the main results of recent excavations. Here is the book, in French, and written with that easy lucidity seldom attained by any but a Frenchman. M. Diehl says in his bright preface that he lays no claim to profound erudition or to originality of view in his book; the reader is to look for,—and will certainly find,—the simple statement, made as fully and as clearly as possible, of the great discoveries that classical archeology has made in Greece during recent years. The results of these discoveries have hitherto for the most part remained the exclusive property of the learned specialist and specialist, specially as archeology loves to look up its treasures in splendid but bulky folios or to scatter them to the four winds in the pages of a dozen or more learned periodicals; hide them as best she may—they will not

escape she knows the searching gaze of the initiated. As to the profanum vulgus, she either despises or at best, ignores their curiosity, and, as a matter of fact, falls to awaken it; and yet the material she has at hand is such that, fitly treated, it would arouse their interest." The book is light and interesting reading at home, it will probably be widely used by travellers abroad. It just gives the background—the historical background that cannot fairly be expected from Murray and Baedeker. It puts in the simplest possible form, with an ingenious elimination of vexatious detail just what a fairly intelligent traveller would like to have in his mind when he visits Olympia, Mycena, &c., and what he might hope actually to remember when he got home. Moreover, each chapter is headed by a really admirable bibliography, so that the reader may know the sources of the vast mass of information that has been boiled down for his benefit, and may also have at hand material if he cares to study the subject seriously.

*The Gentleman's Magazine Library.* Being a classified collection of the chief contents of the *Gentleman's Magazine* from 1731 to 1808. Edited by LAURENCE GOMME, F.S.A. Architectural Antiquities: Part I. London: Elliot Stock, 1890.

THIS portion of the reprints from the *Gentleman's Magazine* forms a curious and interesting volume, the chief practical value of which at the present moment is in the record it gives of the state and condition of a number of our architectural monuments at the close of the last and the early part of the present century. In this sense it forms a historical record from which to measure the extent of work done in restoration since the time it was written. As the editor says, "The details are extremely important, because they consist of descriptions written from actual surveys of the various buildings." The papers forming this series were published in the *Gentleman's Magazine* under the signature "An Architect," but were pretty well known and subsequently acknowledged to be the work of John Carter.

The higher interest of this volume consists in the evidence it affords of history repeating itself; of the existence of the self-compunct restorer and the conscientious objector side by side a hundred years back, just as they are now. From a literary point of view Carter's writing is certainly not a model; his English style is slipshod and even ungrammatical to a degree; but "his meaning is good," and his perception that there was more in Gothic architecture than his contemporaries were aware of is shown in a manner highly creditable to his architectural insight and enthusiasm. In this respect, indeed, he was in his generation as the voice of one crying in the wilderness.

Carter's classification of Medieval remains, though not without method, was on a system very different from that now accepted. He went not by dates, even when known or reputed, but by style and character. Thus, what we now call Norman he calls Saxon, applying that phrase to all the Medieval architecture of this country previous to the introduction of the pointed arch. He was evidently aware that many of the buildings so classified were not really built by the Saxons, but he claims that they belong to that style, and that in his system of nomenclature he is only following out the same principle as in the nomenclature of classical buildings. "Is it not a general observation when a building is raised in our own time to say it is either Grecian (example, east front of Covent-garden Theatre) or Roman (example, east front Covent Church), &c.?" As for classification of later periods of Gothic, those were refinements that waited for the hand of Hickman.

In his enthusiasm for Medieval architecture, the contributor to the *Gentleman's Magazine* was quite in advance of his age; but his notions of the manner of displaying that enthusiasm are, if put into plain English, such as would be violently scouted in the present day by the very people who are so earnest to bring his views before the notice of modern readers. For the book is brought out and edited in an "S. P. A. B." spirit throughout. It is intended to show that here, nearly a century ago, was a pure-minded "Anti-scrape" protesting against restoration and the alteration of ancient buildings. And so Carter, according to his lights, was actually doing so; but alas! how partial were those lights. For, from a passage on page 114,

it is evident that Carter was by no means indignant at the imitation of ancient Gothic *per se*, but only at the bad and imperfect imitation practised in his day.—

"I define imitation to be the copying of any of these objects, so as to be enabled to realise their forms in some projected pile about to be erected, and we follow the arrangement, imitate the doorways, windows, buttresses, and every other peculiarity, that distinguishes the original under our survey; then will our rising walls meet the comparative eye, the work will become of consequence from its historic reference, and continue an example of genuine taste and true imitation. Thus alone can the word "imitation" be properly understood by the real admirors of our ancient architecture. . . . Yet of those patrons who deceive themselves and the world by their false imitations, they are most abundant. Their ideas of imitation are to substitute fancy designs for true copies; their restorations of decaying or mutilated structures is (sic) destroying them in part, and disguising their remaining lines with strange decorations that can in no wise suit but with theatrical boards or convivial domes."

Evidently Carter thought that the true virtue of imitation of Medieval architecture consisted in exact and truthful reproduction; he was a predecessor, in fact, of Scott, in theory though not in practice. But it is certainly amusing to read the sentence we have italicised above, and to reflect that this reprint is brought out (obviously, from remarks in the preface) as an example of the development of the "S. P. A. B." spirit in a previous generation!

The editorial intellect must have been nodding, surely to have passed that passage without a comment. Carter's criticisms on Wren's criticisms on old St. Paul's are delightful, and perhaps it is difficult to say whether he or Wren showed the most bigotry or want of power of looking at two sides of an architectural question, though perhaps it may be admitted that Wren does best, with his summing-up of the Gothic cathedrals as "mountains of stone; vast and gigantic buildings indeed, but not worthy the name of architecture." Carter is reasonably indignant at this; but then he is just as indignant at Wren for saying that the dangerous state of Salisbury Cathedral arose "from want of true judgment in the first architect"; which is no more than the plain and obvious truth.

In his remarks on proposed alterations to Magdalen College, Carter anticipates Mr. Lang, the modern historian of Oxford, in his objection to schemes for new buildings:—

"Magdalen College! to thy guardians I now call with another warning voice. Do ye wish to build, lack ye more habitations, sigh ye for modern habitations, drawing-rooms? . . . Ye assure us that your intended pile is to be entirely unconnected with, and in no way trenching on any one stone of, your present buildings; yet forbear to begin the same without well considering the propriety of the plans and elevations, in their pretences to be correct 'imitations' of those architectural remains which you may now call your own. Trust not professional men in this respect—nursed in the prejudices of the 'theatrical school' of constructing edifices; their bigotry for foreign modes will not let them, of their own wills, be true to the ancient architecture of their native land."

In another reference to Oxford, Carter, in relation to St. Mary's Church, says "The most remarkable innovation is the grotesque porch"—that porch which architects vie with each other in praising and in sketching now. Had Carter had his own way, we can have no doubt he would have removed it and set up a correct "imitation" of the original porch; the very thing which the editor and the annotator of the book would have been ready to laugh to scorn if proposed at the present moment: such is the consistency of antiquarian critics.

One of the best bits in the book is the description of the alterations that were being made in a window in Windsor Castle chapel, where the tracery had been removed and a new nondescript design, with much wider lights, "and a number of turns after a new way," had been introduced, which he was told was to be a substitute for the multifarious lines of the old windows. "I answered, 'but do not these said multifarious lines correspond with the general design of the whole chapel? I was thus replied to: 'That is nothing; the celebrated painter who has been given his sketch must have a large field whereon to display his abilities.'" On farther remonstrating, he was told there was no manner of doubt that what was now being done would be recognised as an improvement of the highest importance so,

adds Carter, "I consoled myself with sketching the east window."

The book is a most curious repository of notes of the former state of many famous buildings, as well as an interesting record of the feeling and opinions of a past generation. It was quite worth reprinting, and we have quoted enough to show that, in addition to its historical interest, when rightly read, as Lamb stammeringly observed of Coleridge's preachments, it is "f-f-full of f-f-fun," though in a sense perhaps not quite contemplated by the ingenious editor.

### Correspondence.

To the Editor of THE BUILDER.

#### "TENDERS FOR PROFESSIONAL SERVICES."

SIR,—Your "reliable" correspondent on the subject of "Tenders for Professional Services" (see p. 106, ante) can scarcely be said to have accurately stated the case so far as I am concerned. I enclose copy of the letter sent me by the Clerk to the Guardians, and as I am well known professionally in West Ham, where I am largely employed in Board School work, there was nothing to suggest to me competition in regard to fees. Had there been any such intimation, I should have declined to have had anything to do with it.

J. T. NEWMAN, F.R.I.B.A.  
2, Fen-court, Fenchurch-street, Aug. 12.

[COPY]

"Union Workhouse, Leytonstone, E.,  
July 21, 1890.

DEAR SIR,—The Guardians propose erecting new school buildings at Forest House, Leytonstone, to accommodate 300 children, together with the necessary administrative buildings, and I am to ask you kindly to favour them with your inclusive terms for preparing plans and acting as architect in the matter.

I shall be glad to receive this information by Wednesday next.

(Signed) FRED. E. HILLEARY,  
Clerk to the Board."

#### "THE BERMONDSEY PUBLIC LIBRARY COMPETITION."

SIR,—In common, I think, with all the other competitors in this competition, I am glad to find from Mr. Elkington's letter, in your last issue (p. 110), that he is not responsible for the awards that have been made, in direct violation of the contract entered into with all the competitors, and to learn that the Vestry have not yet given consent for windows to be opened overlooking their property; and we may still further gather that the Commissioners were fully aware of this restriction as to rights of lighting and of the conditions of the competition. We are now able to fix, without any doubt whatever, the whole responsibility for this miscarriage of justice upon the Commissioners themselves, who have awarded the first and fourth premiums to designs which directly violate the conditions approved by them and issued under their sanction. I cannot conceive a clearer case of injustice. All who entered into the competition did so, I suppose, on the understanding that the contract between themselves and the Commissioners would be honourably kept to, and those who ventured to solve the problem of lighting by the simple expedient of putting windows where they were told no windows must be put, did so at the risk of wasting their time, and must have been as much surprised as any one to find that the Commissioners gave their approval to a direct violation of their own conditions.

In this flagrant case the conditions, on the face of them fair and equitable, are not acted upon; the advice of their own skilled assessor is ignored by the Commissioners; and the awards are made without knowing apparently whether the Vestry will grant a right of lighting. I hope they will show their sense of the conduct of the Commissioners by refusing the permission.

An explanation of the awards must now come from the Commissioners. I challenge them to give it.

COLE A. ADAMS.

ARTESIAN BORED TUBE WELLS.—We learn that Messrs. C. Isler & Co., of London, have completed artesian bored tube wells on their improved principle at the Kingston Brewery Company, Limited, Leeds, where, for some time past, the supply has all but failed from the existing dug well. After reaching the depth of 160 ft. from the surface, springs were struck yielding 6,000 gallons water per hour without reducing the head of water. Similar results are obtained at Mr. J. W. Wright's brewery, Armley, Leeds. At Messrs. J. C. & J. Field's, London, a continuous supply of over 7,000 gallons per hour is obtained from an artesian bored tube well 404 ft. deep.

### The Student's Column.

#### HOT-WATER SUPPLY.—VII.

THE TANK SYSTEM: continued.

THE flow-pipe, as already said, is taken from the highest point in the boiler, and it is continued from there to the tank and connected about half or three-fourths the way up it. This pipe should nowhere be permitted to travel in a downward direction; if possible it should be kept gently rising all the way, but more often than not this is impossible, and the pipes that are not fixed vertically have to be carried horizontally, as along passages, beneath floors, &c. There is no positive objection to the pipes being carried horizontally, though it sometimes occasions a check in the circulation, and it is always best if possible to have the pipe more or less on a rising gradient in every part of its length.

There are many conflicting notions as to whereabouts in the tank the flow-pipe should enter. All are of opinion, of course, that it should be somewhere above the return-pipe; but beyond this there is no universally-agreed position. Some contend that the flow should be immediately above the return, with not more than 3 in. space between the two; others consider it should enter at least three-fourths the way up the tank; and there are various other opinions on the subject. There is not the least doubt that the flow-pipe should terminate about 6 or 8 in. from the top of the tank, for, in the first place, we have to remember that if the quantity of hot water be ever so small it will be found at the top of the tank (when once it has had time to reach the top of the house); and secondly, and more important, all the draw-off services are taken from this pipe, and as water proceeds both up and down the flow-pipe when a tap is opened (as will be shown more fully presently), it would be bad policy to have the upper extremity of the flow-pipe anywhere near the bottom where the cold water enters. It is sometimes thought that having the flow-pipe entering near the top of the tank (as just recommended) lessens the quantity of hot water at demand, but this idea is erroneous, as it will be seen that, supposing the tank to be three parts full of hot water (the upper three parts as a matter of course) when a tap is opened, this hot water commences to flow down the flow-pipe, and as fast as it does an equal quantity of cold water enters the bottom of the tank from the cold-water cistern, and pushes, so to speak, the hot water up above it (as the cold and hot do not mix readily) and no cold water will issue from the tap until all the hot has passed out; if the contents of the tank could be watched at this time, it would be found that no noticeable mixing of the hot and cold waters took place, but the quantity of the hot water would be seen gradually growing less at the top of the tank, and the bulk of cold water growing greater and greater, but creeping up from the bottom.

All draw-off services are taken from this flow-pipe, and it is usual to arrange the apparatus in the best way to avoid long draw-off services, as a long draw-off service means annoyance by having to draw a quantity of cold water (from the hot-water tap) before any hot is obtained; and this is particularly noticeable at lavatory basins, which usually have small, slow-running taps, and it is not at all uncommon to meet with instances where a lavatory tap will have cold water issue from it for half a minute after being opened before any hot is obtained. This is a serious objection in another way, as every drop of cold water that flows from a hot-water tap has been heated once, but allowed to get cold for no useful purpose, and no apparatus of this sort ought to admit of a portion of its heat being wasted in this way.

It can easily be understood that the water in a long draw-off service remains stationary when the tap is closed, and hot water that is allowed to remain so quickly loses its heat and grows cool, so that when the tap is applied to for hot water this which is cool has to be run off before the hot water issues. Then when the tap is closed the pipe is again left full of hot water only to grow cool before the tap is opened again, and it is by no means uncommon for a single draw-off service on an ill-devised apparatus to waste as much as twenty gallons of hot water per day by this means, and it is by no means rare for it to be largely accountable for the failure of an

apparatus, as the waste may exceed the quantity of water actually used.

A simple remedy, when a long draw-off service must necessarily exist, is to "return" it. This is effected by continuing the service-pipe back to where it started from, but connecting it to the return-pipe, as Fig. 15. This

FIG. 15.

will permit the water to keep circulating in the draw-off service, and the annoyance is at an end. There is no need for the returned portion of this service to be as large as the draw-off service itself, as it is only required to just keep the water moving, and a drawback to having the returned portion of a large-sized pipe is that when the tap is opened water will instantly flow towards it along both pipes, and so some of the water will be proceeding from the main return-pipe, which is a very objectionable feature; 3 in. may be considered amply large enough for the return to any draw-off service, or even smaller in some instances, as there is no fear of this pipe getting furred up quickly. A bath-service rarely requires this attention, as some cold water is nearly always needed here, and it is immaterial which tap it proceeds from.

The return pipe is carried from the lowest point in the tank either from the bottom, or from the side near the bottom, and from thence to about three-fourths the way down the boiler, either through the top or side; but it may be mentioned here that it is best to carry these pipes from the top surface of the boiler, as bends and elbows, objectionable at any time, are particularly objectionable close to the boiler if hard water is used, as far always seems to collect within them so much more readily than in straight pipes. It is usual for the return pipe to follow the flow down, and an endeavour is generally made to prevent this pipe rising or ascending anywhere on its way down from tank to boiler, and no pipes are connected to this except the "returns" of draw-off services.

In the illustration, fig. 13 (p. 112 ante), it will be noticed that there is a pipe proceeding from the top of the tank, and carried from there to above the level of the cold-water cistern; this is the expansion or steam-pipe, and its use is to permit the free escape of any steam that may be formed, and also, as its name implies, to permit of the expansion of the water when heated. The difference in bulk between water at 32 deg. (freezing) and water at 212 deg. (boiling) is one in twenty, that is twenty gallons of water at the former temperature would fill a twenty-one-gallon vessel when raised to boiling temperature.

This expansion-pipe is usually of 1-in. tube, sometimes 3/4-in. when the apparatus is small, and its top extremity should be at least 3 or 4 ft. above the cold-water level. It is necessary to terminate this pipe either over the cold-water cistern or through a roof or outer wall, as a good deal of water drips from it, and if the boiler overheats a little hot water may be ejected by the steam as it escapes. It is most usual to carry this pipe over the cold cistern, as carrying a pipe through the roof necessitates a little greater trouble and expense, but at the same time water falls into and tends to warm the cold water, which is exceedingly objectionable in the hot summer months, and it is at this time that it happens most frequently, as the demand for hot water is then small, and the boiler has every opportunity to overdo its work. When possible it is best to carry the pipe through a wall, but see that it is not over any part of the premises where people may pass or stand under.

The lower extremity of this expansion pipe should not project through inside the tank, for the reasons explained in regard to the flow-pipe

in the boiler; this is very commonly overlooked, as, unless a flange is ordered to put on the tank, it is difficult to avoid it. The trouble that may arise, however, is not nearly so great as in the other case, as in a general way very little steam finds its way to the top of the house, it being condensed as it passes up the flow-pipe; but if the boiler beats well, or is a little too powerful for the apparatus, some annoyance must be experienced, and care should be taken to avoid dipping this pipe inside the tank whenever it can be avoided.

GENERAL BUILDING NEWS.

UNITED METHODIST FREE CHURCH, BURNLEY.—In a limited competition, in which five sets of drawings were received, the plans by Mr. V. Dunkerley, architect, Burnley, have been accepted for the above church. The chapel provides accommodation for about 800 people, and in the rear are minister's and trustee vestries. The building is designed in uniformly with the schools adjoining. The cost is estimated at £2,100.

BURLINGTON HALL, ASTON, WARWICKSHIRE.—On Saturday last Mr. George Dixon, M.P., laid the memorial stone of the New Burlington Hall, Aston, which is to be occupied by the Burlington-street Adult and Evening School. It is intended at some future time to erect upon the site a hall, from designs selected in a competition held some time ago. The cost will be about 5,000*l.* Mr. Thomas Guest, of Birmingham, is the architect.

WESLEYAN CHURCH, LICHFIELD.—We are informed that Mr. Thomas Guest, of Birmingham, has been selected, from amongst several competitors, as the architect of the proposed Wesleyan Church, Lichfield.

ELECTRICAL WORKS, BUSBURY.—The new electrical works at Busbury, near Wolverhampton, of the Electric Construction Corporation, of London and Wolverhampton (late Messrs. Ellwell & Baker, limited), are now almost completed, and the machinery and plant will shortly be put in. A site of 24 acres, with a siding on to the London and North-Western line, has been acquired, and the buildings already erected cover an area of about 42 acres. The construction has been carried out by Mr. Henry Lovatt, contractor, of Wolverhampton, from the plans of Mr. G. H. Stanger, architect and engineer. The shops cover an area of 76,350 square ft., exclusive of a warehouse containing 8,905 square ft. They are divided into five bays of 30 ft. span, two of 25 ft., and one of 45 ft. This last is for the accommodation of heavy machinery, and is provided with galleries on either side, carried on columns and cross girders, 10 ft. apart, covered with a 3 in. plank floor. The roofs over the shops are carried on cast-iron columns, 6 in. in diameter, in groups of four for the large bay, and two for the remaining shops, with base plates bolted down into the concrete foundation and upper columns for carrying the roof trusses. The offices and administration block comprise a very extensive range of buildings. The pattern-shop and store-room are each 100 ft. by 33 ft. 6 in. The iron-foundry is 160 ft. by 82 ft. 2 in., and the brass-foundry is 62 ft. 2 in. by 40 ft. They are constructed in the same manner as the large shops, with columns, girders, and travelling cranes. Three large drying-stoves are provided, with specially-designed ranges for heating. Two of Thwaites's patent rapid cupolas are now being erected there. There are also a blacksmith's shop, dining-rooms, and kitchens. The works are built entirely of brick. The ordinary bricks were supplied by the Thibington Brickworks, and the blue bricks by the Hockley Hall Company. The facing-bricks for the offices and mess-rooms were obtained from Messrs. Partridge & Co., Kingswinford. A large part of the roof area over the shopping is glazed on the "Simplex" system. The office corridors are laid with Eber's Terrazzo mosaic. The works form a prominent block as seen from the London and North-Western main line, and they are the subject of one of the most important building contracts that has been undertaken in Wolverhampton or the neighbourhood for some years past.

REBODS, ST. JOHN'S CHURCH, CANTON, CARDIFF.—On Sunday last special services were held at St. John's Church, Canton, Cardiff, in connexion with the dedication of the recently erected vestry in the church. The rebods is of Cast stone, with red and green Irish columns supporting the cusping and canopies. The three niches are to be filled with paintings in oil on canvas, the central one portraying the Good Shepherd, with St. Peter and St. Paul on either side. New altar steps, of red Dunfrieth stone, have also been fixed. The work on the altar about 2 ft. above the old level. The work has been carried out by Mr. William Clarke, of Landaff, from the design and under the superintendence of Messrs. Kempton & Fowler, architects, Landaff.

SWALEND'S HOUSE, PENSHURST.—Large additions are being made at Swaland's House, Peshurst, the residence of Mr. George Drummond, by Mr. M. E. Macartney, the architect. The whole of the fireproof floors are being put in on Fawcett's system.

DEVELOPMENT OF BARRY, SOUTH WALES.—In reference to the paragraph under this heading in our last week's issue, we are asked by Stuart's Gravelthick Paving Company to say that their paving has been very largely used in the footpaths there, viz., about 90,000 ft.

SANITARY AND ENGINEERING NEWS.

THE ASSOCIATION OF PUBLIC SANITARY INSPECTORS OF GREAT BRITAIN.—A special general meeting of the members of this Association was held on Wednesday evening last at Carpenters' Hall, London-wall, E.C., in accordance with Rule VIII, to receive a report from the Council nominating Mr. B. W. Richardson, F.R.S., to the position of President, in succession to the late Sir Edwin Chadwick. The report was adopted, and Mr. Richardson was unanimously elected, Mr. Aubrey Richardson being at the same time appointed honorary solicitor to the Association. The annual summer meeting of the Association will be held on Saturday, the 23rd inst., at Great Yarmouth, by the invitation of the Mayor and Corporation.

CRYSTAL PALACE SCHOOL OF PRACTICAL ENGINEERING.—On Saturday afternoon last Sir James N. Douglass, F.R.S., Engineer-in-Chief to the Corporation of the Trinity House, and Member of the Council of the Institution of Civil Engineers, distributed the certificates and diplomas of the Crystal Palace School of Practical Engineering, awarded for the summer term, 1890. The examiners for the term were Mr. A. R. Sennett and Mr. S. H. Cox, who reported that the Electrical section was a valuable addition to the work, in view of the great advances recently made in the practical applications of electrical science. The mechanical section appeared to be filling a want which was more than ever felt, the means of obtaining a practical knowledge of subjects and processes only to be met with in colonial occupations. The Class work throughout the term had been very satisfactory, and the drawing specimens exhibited the result of careful training and a thorough appreciation of what was taught on the part of the students. Sir J. N. Douglass, in presenting the certificates, expressed himself highly pleased with the technical and theoretical work of the school, which he had that morning inspected in the several departments. He believed that institution to be a most valuable gateway to the profession, and it had given him real pleasure to be present. He congratulated the students upon the excellent character of their work, and said he envied the young men of the present generation of engineers for the great privileges they enjoyed with regard to the education they received to fit them for their profession. An Englishman ought never to be afraid of competition, and he believed it was one of the best things that could happen to him to be placed in a position where he would have to compete with others. If an Englishman did his work honourably and faithfully he was sure of success in any part of the world. The Chairman, in the course of further remarks, spoke in high terms of the practical nature of the teaching given by the Principals, Mr. W. Wilson, M.Inst. C.E., M.Inst. M.E. The report of the Examiners stated that Mr. F. D. Maw was highest in the first year's course for Mechanical Engineering. In the Drawing Office, first year's course, Mr. W. Beer was first. In the Pattern Shop, first year, Mr. H. Key was first. In the Fitting Shop, first year's course, Mr. F. D. Maw was first. In the Civil Engineering Section, second year's course, Mr. H. E. Field and Mr. J. W. Revy were bracketed first in the first term, Mr. W. E. Brewerton was first in the second term; and Mr. E. M. Proes and Mr. W. G. Wales were bracketed first in the third term. In the Electrical Section Mr. F. T. W. Fletcher was first. In the Marine Engineering Section Mr. G. L. Wingate was first. In the Colonial Section Mr. S. W. Ormsby was first in the first grade and Mr. C. M. F. Williams was first in the second grade, Mr. W. G. Curtis being first in the third grade.

DUFFIELD WATERWORKS.—The Belper Rural Sanitary Authority have instructed Mr. W. H. Radford, C.E., Nottingham, to report on the best mode of obtaining a water supply for the villages of Duffield and Duffield Bank, in Derbyshire.

PENDBLEBURY SEWAGE WORKS.—These works, having been completed, were opened on the 28th ult. They are stated to have resulted in the purification of what has hitherto been a very foul stream, and to have thus removed one of the many sources of pollution to the River Irwell. The outflow is situated about four miles from Manchester, and is within the district of the Swinton and Pendlebury Local Board. It comprises a population of between 6,000 and 7,000; and being in a watercourse separate from the main portion of the Swinton and Pendlebury Local Board's district, its purification had to be dealt with independently. Until recently the various sewers discharged direct into the Slack Brook, but in the year 1883 the Board took steps to abate the nuisance caused thereby, and last year the intercepting sewer was completed along the Slack Brook Valley. This sewer conveys the whole of the sewage to a point between the Clifton Hall Colliery and the Lancashire and Yorkshire Railway (Atherton line), where a plot of land was

available admirably suited for the construction of sewage purification works. It is about two acres in extent. The sewage to be purified is mostly domestic, but it reaches the works in a highly concentrated condition. Recently, however, a quantity of manufacturing sewage has been taken into the sewers, so that the dry weather flow will probably average about 160,000 gallons per twenty-four hours (25 gallons per head). The outfall sewer discharges into a small chamber in which is placed a strainer having cleaning rakes attached. The sewage then passes over a sill, and at this point the precipitating material is added, the flow of sewage driving a 4 ft. breast water-wheel, which is geared to the spindle of a distributing hopper (Baldoe's patent). The precipitant used is called "ferrozo," and is supplied by the International Sewage Purification Company, whose system of purification is adopted in its entirety at these works. The quantity of ferrozo added (which will probably average about seven grains per gallon) is automatically regulated by the flow of the sewage. The mixer is situated upon a hill-side about 20 ft. above the level of the settling tanks; and the sewage, in its passage to the tanks, has to traverse a distance of about 120 ft., at one point of which is a series of baling-plates to thoroughly incorporate the ferrozo with the sewage. The settling-tanks are four in number, with a total capacity of about 500,000 gallons. They are large enough to serve for a greatly increased population. The tanks are of brickwork, with hoop-iron bond, and faced with blue Staffordshire bricks. Cast-iron coupling conveys the sewage along the length of the tanks; and from the troughs the sewage enters one or other of the tanks by means of a float-valve inlet board, which allows it to flow in quietly, and the board is also arranged so as to some extent to oxygenize the sewage by breaking it up into small particles. A tank having been filled, it is allowed to stand for not less than one hour to allow precipitation to be completed. The tank effluent is conveyed by a pipe to the filter-beds. These consist of a total area of about 150 square yards, and are divided into four plots. Shallow troughs are fixed on brackets around three sides of each bed, and the water overflows the sides. The filtering media consists of a total thickness of 3 ft., made up in layers as follows, viz., 4-in. pipes embedded in 5 in. of broken stones, 5 in. of gravel, 4 in. of sand, 12 in. of sand and "polarite" mixed together in equal proportions, and 9 in. of sand. The top layer forms the top one. The beds are arranged in pairs, and by means of valves the top layer of sand in one bed may be freed from the slight accumulation of dirt upon its surface by upward washing from the water in the adjoining bed. It is stated that the effluent emerges from the polarite filters perfectly bright, colourless, and odourless. It is then conveyed through the adjoining pool (the Carrs) by means of an effluent sewer of cast-iron pipes, and finally discharges into the Irwell near its junction with the river. The sludge is removed from the tanks through valves, and the land on one side being much lower than the tank floors, offers a ready means of getting at the sludge. A large part of the water in the sludge is removed by confinement in narrow chambers. The supernatant water is pumped back to the tanks to be re-treated, and the sludge will be conveyed in troughs direct from the sludge-shed and dig into the adjoining land, which is rented for the purpose, and will be cultivated. The sludge-pit is rooled over. The purification works have cost about 5,250*l.*, including land, but excluding land and engineering expenses. The effluent sewers cost about 1,600*l.*, including easements; and the intercepting sewers about 2,300*l.* The works were originally designed by Mr. A. H. Mountain, late Surveyor to the Board, and now Surveyor to the Withington Local Board. Under the direction of the Board, their execution was commenced under the late Mr. R. Vawser, of Manchester, who also approved the design; but upon that gentleman's death, Mr. Theo. S. McCullum, A.M.Inst. C.E., was appointed Engineer, and the works, with several modifications and additions, have been completed under his supervision. The contractors for the works are:—For the intercepting sewer, Mr. J. Unsworth, Barliston; for the settling tanks, &c., Mr. M. W. Walsley, Manchester; and for the filter-beds, Mr. S. Johnson, Pendleton.

FOREIGN AND COLONIAL.

THE SWEDISH BUILDING LAW.—On the representation of the Insurance of Workmen Committee of the Swedish Parliament, the Government has added the following clause to the Swedish building law:—"The building boards of the towns shall issue regulations as to the erection of scaffolding in order that they be not dangerous to workmen or others, it being also their duty to see that they are carried out."

BUCHAREST.—A competition, open to architects of all nations, is announced for the best designs for a Chamber of Deputies and a Senate House for the Roumanian Government, at Bucharest. These are to be treated as two separate competitions, and for each of them three premiums will be given, of 15,000, 7,000, and 3,000 francs. Particulars can be obtained from the Secretary of the Council of Ministers, at Bucharest.

FRANCE.—A statue of Gay-Lussac has been inaugurated at Limoges. There is also announced at Poitiers the inauguration of a statue of M. Casimir Périer, a former deputy, and one at Evreux of David, surgeon to Louis XV., and who was the first to practise (at Paris) the operation for the removal of strabismus. The monument to Admiral Courbet will be inaugurated at Abbeville on the 17th.—A railway from Hyères to St. Raphael has just been opened, which will eventually be connected with the Paris, Lyons, and Mediterranean system.—At Rochelle, in the same district, the President is to have been constructed at an expenditure of nearly 15 million francs, and will have at the lowest tides a depth of 9 metres of water.—The Comtesse de Chateau-Narischkine has presented to the Department of Finances the fine estate of Keryolet, near Concarneau, as a people's park, and including also the chateau, of the Renaissance period, which contains a valuable collection of objects of art.—A number of leading industrial firms of Paris who received medals at the Exhibition of 1889, have decided, at a meeting held at the Hotel Continental, to set on foot a French exhibition at Moscow next year. The French exhibition at Moscow publishes a decree for a "credit" of 400,000 francs towards the laying of an electric cable between Folkestone and Calais, the expense to be shared between England and France, and an overhead wire to be carried from the Calais shore end of the cable to Paris.—It is announced that the Ecole des Beaux-Arts at Toulouse is to be rebuilt, at a cost of five millions of francs.—Parliament has voted 350,000 francs for the enlargement of "the bassin de l'Eure" in the port of Havre.

HARDENGER.—A chateau of somewhat palatial form is being built a short distance from here, on one of the finest sites Norway has. It is generally believed that the place is being put up for the ruler of Germany, who is said to have been rather enthusiastic about the scenery in these parts, and to have expressed the wish to be able to stay here on *terra-firma* with his family for a week or two every summer.

COPENHAGEN.—The inactivity in the building trade of the town will be at once remarked by the visitor, who, we believe, would have some difficulty in finding a dozen buildings in course of erection. Quite in contrast may be termed the great activity of the paviors, several of the main thoroughfares being "up," and a large number of men being employed in regulating the curbstones, laying a very neat slab pavement, and preparing the roadways for asphalt, a pavement, so far, not to be seen in the city.

BERLIN.—The special exhibition which has been opened in connexion with the much-spoken-of Medical Congress, and the exhibits of which have found room on the grounds of the "Landes-Anstalten Park," was well organised and arranged. The number of architectural designs hung is an exceedingly large one, so that specialists who are interested in the planning of hospitals, lunatic asylums, &c., will find a large field for study. Besides the plans, elevations, and details of interior arrangements (often supplemented by models of wings, rooms, &c., as the case may be) of the most important hospitals of the empire, a number of designs for town improvement, drainage, and sewers, public baths (especially such as have been erected lately in the bathing places of the central and southern provinces), hydropathic establishments, &c., were to be seen. The City of Berlin showed the largest contingent of modern hospitals, those of Friederichshelm (784), am Urban (592), and Moabit (812), together 2,188 beds, attracting most notice. During the Congress week most of the municipal institutions, including workrooms and sewerage stations, were visited by the members, and we hear that their impression was a very satisfactory one on the whole. It may be well to state that several models of portable hospitals as used in or proposed for use in the army were on view in the exhibition grounds, and that the portable kitchen, operation room, &c., were represented both in tent and hut form. The regulation portable hut, with felt wall-sheeting on wooden frame, the wooden floor being used as sides of the packing-cases for the paraphernalia, excited special interest.

RESTORATION OF AN OLD NORSE BUILDING.—The Norwegian Government have decided upon restoring the ancient Hæo Hall in Bergen, which was the residence of the Norse kings some 900 years ago. The style is Early Gothic. For many years it has served as a grain storehouse.

ARCHITECTURAL EXHIBITION IN TURIN.—The Italian Government announces that an architectural exhibition will be held in Turin between September 23 and October 23 next. A portion of the exhibition will be of an international character, and embrace plans for the enlargement of cities, the improvement of their sanitary conditions, with plans of works of this kind that have recently been carried out, or are to be carried out.

THE SWEDISH GRANITE INDUSTRY.—A new company has been formed in Sweden for the working of certain granite quarries in the province of Calmar, with a capital of 40,000.

## MISCELLANEOUS.

## THE COVENANTERS' MONUMENT, KIRKWALL.

MR. James Hutcheon, Aberdeen, has just finished a memorial of the 200 Covenanters who perished at Doerness, near Kirkwall, in 1679. It is to be erected at Kirkwall, in close proximity to the Town-hall. Composed of Rubislaw grey and Hill of Fare red granite alternately, it stands 16 ft. high, and has a 4 ft. square under-base, finely dressed, with a bold splay on three sides. At the front side of the base there is a drinking-trough for dogs. The second base is 3 ft. 1 in. square, and is of polished Rubislaw granite. It has a moulding round the upper edge, and in one side has a cavity for the supply of water to the trough. The die, or principal part, of the monument, composed of Hill of Fare granite, measures 2 ft. 6 in. high by 2 ft. 6 in. in diameter. It is polished on each side, and has a representation of a rope carved on each corner. Polished Rubislaw granite basins are fitted in on three sides, and the water flows into these from representations of lions' heads in bronze. A cap of Rubislaw granite, also polished on the sides, has on the corners four vessels of Hill of Fare granite. These vessels are about 1 ft. 4 in. high by 8 in. in diameter. In front of the cup there is the following inscription:—"Erected by voluntary subscription to the memory of 200 Covenanters who perished at Doerness in 1679." The cap is surmounted by a polished Hill of Fare granite column, 8 ft. high, with a bold moulding. The column has a cap of polished Rubislaw granite.

MONUMENT TO THE LATE MR. JOHN RYLANDS, MANCHESTER.—The monument which has been for some time in course of erection in the Southern Cemetery, in memory of the late Mr. John Rylands, is now completed. It is hexagonal in plan, is raised upon two granite steps from the level of the pavement, and is 28 ft. in height, of which the solid base measures 3 ft. This lower portion has panelled faces inscribed with a series of scripture texts. From the six upper angles of the panelled base rise six square pillars, fluted in front; terminating with caps and richly-carved corbelling on each side, supporting a moulded cornice, the several divisions of which bear ornate scrolls respectively inscribed with the words "Faith," "Joy," "Peace," "Mercy," "Love," "Hope." Above the cornice, and directly over the pillars, are six angelic figures, kneeling or half-seated, four of which bear the symbols of the Christian warfare, as described by St. Paul in the sixth chapter of the Epistle to the Ephesians. In the space between the figures are carved shields, alternately bearing wreaths of laurel, oak, and palm, as emblems of Honour, Might, and Victory. At a higher level, and recessed from the line of these emblematic figures, are smaller figures of two angels standing; four of which are the forms of heralds of salvation to the four quarters of the world. Of the other two one represents Faith, triumphantly holding to the Cross; the other Hope, leaning upon an anchor and directing a rapt upward gaze to Heaven. The space between and above the pillars forms a vaulted dome, on the interior arch of which are stars and other emblems. In the open space beneath the dome, and resting on the centre of the base, is a large block of granite containing the inscription:—"John Rylands, of Manchester. Born February 7, 1801. Died December 11, 1888. In loving memory." With the exception of the granite block, the memorial is executed in white Sicilian marble, the hardest procurable. The whole monument has been designed, and its erection superintended, by Messrs. Heathcote & Rawie, architects, of Manchester. The sculpture is from the studio of Mr. Boulton, Cheltenham; and the bronze railings were made by Messrs. Hoole & Co., Sheffield; and the rest of the work has been executed by Messrs. Patteson, of Manchester.

THE ENGLISH IRON TRADE.—The improvement in the English iron market, of which the first signs showed themselves last week, has extended. The better tone is due to three principal causes—the favourable nature of the Board of Trade returns for July, the prevailing labour difficulty and impending further troubles, and the revived demand for finished iron and steel. As far as pig-iron is concerned, the higher prices quoted are to be attributed rather to speculative influences than to a better inquiry; trade in crude iron being still comparatively small. Scotch warrants are about 1s. also are dearer. Middlesbrough pig has been advanced 1s. a ton, and Bessemer pig in the north-west 2s. 9d. a ton. Lancashire makers of pig-iron quote from 1s. 6d. to 2s. per ton more than a few weeks ago. A surplus of manufactured iron has been felt, and the threatening aspect of the labour question may interfere with supplies, both consumers and merchants have been anxious to buy more largely of finished iron and steel, which, in many cases, has led to slight advances being made. Ship plates are from 2s. 6d. to 2s. higher in the north. Generally the tendency of prices is upwards, both manufactured iron and steel being stiff. The condition of the shipbuilding and engineering trades is about the same as last week.—Iron.

HOUSING OF THE WORKING CLASSES.—The Housing of the Working Classes Bill was on the 5th inst. considered by the House of Lords' Grand Committee on Law, Lord Herschell presiding. In reply to Lord Norton, Viscount Cross said that the measure made no alteration in his Act on the same subject. He then moved as a new sub-section that the County Councils or any of their officers should, for the purposes of closing and demolishing unhealthy or obstructive buildings, have the same right of admission to any premises as any Vestry, District Board, local authority, or their officers in carrying out the Public Health Acts. The amendment was agreed to. It was also resolved, at the instance of Viscount Cross, that local authorities in London when of opinion that an improvement scheme under the Bill was of general importance to the whole county of London, should only act when the unhealthy buildings proposed to be demolished were dwelling-houses, the latter word being substituted for "premises." Some minor amendments having been made in the Bill, it was ordered to be reported to the House.—Daily News.

NEW MEDAL ROOM, BRITISH MUSEUM.—As will have been seen from an advertisement in our columns of the 2nd inst., the authorities are about to provide a new Medal Room at the British Museum. It will be a fine corner of subsidiary attention in that department. The national collection of coins and medals is not ordinarily open to members of the public. The original collection made by Sir Hans Sloane, worth some thousands of pounds as specie alone, has since been enriched by numerous others (including finds or the hoards of the late King George's medals, Sir Robert Cotton's, the Cracherode medals and coins; Robert's English coins, bought for 4,000 guineas; the Townley and Payne Knight ancient coins, Miss Banks's bequest, the Rich collection (Asiatic), and so on. Amongst the additions during last year was the Pandit Bhagwanlal Indraji's bequest of four thousand and more coins, chiefly Indian. Here have been deposited Queen Anne's farthings sufficient in number to belie the popular tradition, and indeed, it is stated that a large number were circulated. Of personal mementoes we may cite the following: The oval-shaped gold token, "touch-piece," which was customary, that sovereign bestowed when she touched the infant Samuel Johnson for "the evil"; before the Restoration an angel coin was given to the child; the "Putney" guinea, an heir-love, presented in 1828 by Sir John Murray, which Robert Walpole had lost to the Earl of Bath; the matter of his misquotation in the House from Horace, rec'd of past days when our senators adorned their speeches in a fashion that is now rare; together with two gold snuff-boxes, formerly the property of Napoleon, one given to the Honourable Mrs. Damer, and bequeathed the other, a gift to him from Pope, Pius VI., to Lady Holland.

THE LONDON AND COUNTY BANKING COMPANY.—The report of this company, adopted at the half-yearly general meeting held on the 7th inst., shows that, after paying interest to customers and all charges, making provision for bad and doubtful debts, &c., &c., the net profits for the half year amount to 237,204 2s. 11d. The Directors have declared a dividend of 10s. for the half-year of 11 per cent. The balance-sheet is printed in our advertisement column.

MR. HENRY LOVEGROVE, of Budge-row, asks us to state that he is, happily, in perfect health. The statement circulated in some quarters that he was seriously ill has arisen through a serious accident to his son Gilbert Henry, from which the boy has quite recovered.

SOMERSETSHIRE ARCHÆOLOGICAL SOCIETY.—The annual meeting of this society is fixed for August 27, 28, and 29, at Castle Cary. The President of the meeting is Mr. Henry Hobhouse, M.P. Excursions will be made to Ditchet, Hornblotton, Alford, Bolter's Bridge, Lyve's Cary, West Camel, Queen Camel, Sparkford Hill Quarry, Hazelgrove, South Cadbury, North Cadbury, and Hadsden. Evening meetings will be held for the reading and discussion of papers.

ELECTRIC LIGHTING IN ST. PANCRAS.—A special meeting of the St. Pancras Vestry, held on the 6th inst., decided, by 47 votes to 7, to accept tenders amounting to upwards of 50,000*l.*, to carry out the electric lighting scheme of their Engineer, Professor Henry Robinson.

## LEGAL.

WHAT IS "GOOD TENANTABLE REPAIR"?

FROUDD *v.* HART.

Following up former references to this important case,\* we are now able to give the text of the judgment of the Master of the Rolls in the Court of Appeal:—  
Lord Esher, M.R.: The question in this case arises between landlord and tenant as to whether the tenant did, or did not, break his agreement,

\* See *Builder*, May 10 last, p. 334, and May 17, p. 357. † As printed in the "Law Reports," 25 Q. B. D., p. 42.

made with respect to a tenancy for three years, to keep premises in good tenable repair," and leave them in good tenable repair at the expiration of the tenancy.

The case was tried before one of the Official Referees, Mr. Ridley, and he gave a judgment laying down the principles upon which he meant to act, and did act, in making his award. The case was then taken to a Divisional Court, who thought that some, -not all,- of those principles were not correct, and that if he did act upon them it might be that he had arrived at a wrong result in his decision as to figures and facts. The Divisional Court, therefore, did not attempt absolutely to decide the case, but they sent it back to the Official Referee in order that he might again take it into consideration, and work out his figures upon the principles enunciated by them. The plaintiff has appealed to this Court, and his appeal must be based upon the ground that the principles stated by Mr. Ridley are right, and those stated by the Divisional Court are wrong. The question, therefore, or with those of the Divisional Court, but we have open to us the alternative course of saying that we do not agree with either, and of ourselves laying down the principles upon which we think that the Official Referee ought to deal with the facts and work out the figures.

The true construction of a tenant's contract to keep premises in good tenable repair? Now, it is not an express term of that contract that the premises should be put into tenable repair, and it may therefore be argued that, where it is conceded, as it is in this case, that the premises were out of tenable repair when the tenancy began, the tenant is not bound to put them into tenable repair, but is only bound to keep them in the same repair as they were in when he became the tenant of them. But it has been decided -and, I think rightly decided- that, where the premises are not in repair when the tenant takes them, he must put them into repair in order to discharge his obligation under a contract to keep and deliver them in repair. If the premises are out of repair at any time during the tenancy, the landlord is entitled to say to the tenant, "You have now broken your contract to keep them in repair," and if they were out of repair at the end of the tenancy he is entitled to say, "You have broken your contract to deliver them up in repair." I am of opinion that under a contract to keep the premises in tenable repair and to deliver them in tenable repair, the obligation of the tenant, if the premises are not in tenable repair when the tenancy begins, is to put them into, keep them in, and deliver them up in tenable repair.

Now, what is "tenable repair"? Definitions of it have been given at different times by the Courts. In *Becher v. Mackintosh* Alderson, B., directed the jury as to the law with respect to a covenant as a lessee to put premises into "habitable repair," and so to deliver up the same. He says (I am reading from Moody and Robinson's Report): "It is difficult to suggest any material difference between the words 'habitable repair,' used in this agreement, and the more common expression, 'tenable repair;' they must both imply such a state as to repair that the premises might be used and dwelt in not only with safety, but with reasonable comfort, by the class of persons by whom, and for the sort of purposes for which, they were to be let." That is the whole definition, and, so far as it goes, it is correct. Then he used the words apply it: "They were old premises and dilapidated; the agreement was not that the tenant should give the landlord new buildings at the end of his tenancy, but that he should take the premises at their former dilapidated condition, and deliver them up fit to be occupied for the purposes they were used for." In *Payne v. Haines* the contract was to keep the premises, and at the expiration of the tenancy deliver up the same, in "good repair," which is much the same thing as "tenable repair." This was the case which decided that in order to satisfy the tenant's obligation under his contract it was not sufficient for him to deliver the premises in the same condition of repair when he took them; he must deliver them in good repair, even if they were not in good repair when the tenancy began. Parke, in the course of his judgment, said: "This contract to keep the premises in good repair is a contract to keep them in good repair because they happened to be in that state when the defendant took them. The facts all show that the age and class of the premises with their general condition as to repair, may be estimated in order to measure the extent of the repairs to be done. Thus a house in Spitalfields would be repaired with materials inferior to those used in repairing a mansion in Grosvenor-square; but this lesser estimate says he will do no repairs; or leave the premises in bad repair, because they were old and out of repair when he took them. It was to keep them in good repair, and in that view, with reference to their age and class, he was to deliver them up at the end of the term."

Alderson, B., said: "A contract to put premises in good repair cannot mean to furnish new ones where those demised were old, but to put and keep them in good tenable repair with reference to the purpose for which they are to be used." Rolfe, B., said: "The term 'good repair' is to be construed with reference to the subject-matter, and must differ, as that may be a palace or a cottage; but to 'keep in good repair' presupposes the putting it into, and means that during the whole term the premises shall be in good repair." In *Muntz v. Goring*, Tindal, C.J., said: "Every one knows what such a tenant means, and the tenant must fulfil it according to the nature of the premises; for it is established by *Stanley v. Towgood* and other cases that the same nicety of repair is not exacted for an old building as for a new one." It seems to me that in none of these cases can there be found quite as full a definition of the meaning of the term "tenable repair" as those words require and import. The result of the cases seems to be this: the question whether the house was, or was not, in tenable repair when the tenancy began is immaterial; but the age of the house is very material with respect to the obligation both to keep and to leave it in tenable repair. It is obvious that the obligation is very different when the house is fifty years older than it was when the tenancy began. Lopes, L.J., has drawn up a definition of the term "tenable repair" with which I entirely agree. It is this: "Good tenable repair is such repair as, having regard to the age, character, and locality of the house, would make it reasonably fit for the occupation of a reasonably-minded tenant of the class who would be likely to take it. The age of the house must be taken into account, because nobody could reasonably expect that a house 200 years old should be in the same condition of repair as a house lately built; the character of the house must be taken into account, because the same class of repairs as would be necessary to a palace would be wholly unnecessary to a cottage; and the locality of the house must be taken into account, because the state of repair necessary for a house in Grosvenor-square would be wholly different from the state of repair necessary for a house in Spitalfields. The house need not be put into the same condition as when the tenant took it; it need not be put into perfect repair; it need only be put into such a state of repair as renders it reasonably fit for the occupation of a reasonably-minded tenant of the class who would be likely to take it. I think our definition is an expansion of the definitions given in the earlier cases, or rather it is a collocation of all the different parts of the definition to be collected from those cases. I can see nothing in the case of *Crawford v. Newton*; contrary to our definition. I think that case goes far to support it.

I will add a few words as to the way in which the definition should be worked out in the present case. The Official Referee appears to have said that in his view "tenable repair" included painting, papering, and decorating. If he meant, as I think he must have meant, that it included all papering, painting, and decorating, I have no hesitation in saying that his construction of the term "tenable repair" was wrong. Again, he has said that the tenant's obligation is to "re-paper with similar paper to that which was on the walls before, and re-point with similar point to that which was on the pointed portion of the premises before." I think that view was wrong also. With regard to the papering, *Cave, J.*, in the Court below, said: "I cannot see how in any case a man can be bound to put new paper on the walls simply because the old paper which was on at the time when he took the house, or which he has subsequently put on the walls, has become worn out." I agree that he is not bound to re-paper simply because the old paper has become worn out, but I do not agree with the view that under a covenant to keep a house in tenable repair the tenant can never be required to put up new paper. Take a house in Grosvenor-square. If when the tenancy ends, the paper on the walls is merely in a worse condition than when the tenant went in, I think the mere fact of its being in a worse condition does not impose upon the tenant any obligation to re-paper under the covenant, if it is in such a condition that a reasonably-minded tenant of the class who take houses in Grosvenor-square would not think the house unfit for his occupation. But suppose that the damp has caused the paper to peel off the walls, and it is lying upon the floor, so that such a tenant would think it a disgrace, I should say then that the tenant was bound, under his covenant to leave the premises in tenable repair, to put up a new paper. He need not put up paper of a similar kind - which is of no matter of equal value - to the paper which was on the walls before the tenancy began. He need not put up a paper of a richer character than would satisfy a reasonable man within the definition. The same view applies as to painting. If the paint is in such a state that the woodwork will decay unless it is painted, it is obvious that the tenant must repair. But I think that his obligation goes further than that. A house in Spitalfields is never painted in the same way as one in Grosvenor-square. If the tenant leaves a house in

Grosvenor-square with painting only good enough for a house in Spitalfields, he has not discharged his obligation. He must paint it in such a way as would satisfy a reasonable tenant taking a house in Grosvenor-square. As to whitewashing, one knows it is impossible to keep ceilings in the same condition as when they have just been whitewashed. But if, though the ceilings become blacker, they are still in such a condition that a reasonable man would not say, "I will not take this house because of the state of the ceilings," then I think that the tenant is not bound, under his covenant to leave the house in tenable repair, to whitewash them. Take, again, the case of a house in Grosvenor-square having an ornamental ceiling, which is a beautiful work of art. A tenant goes in and finds such a ceiling in the house, and in course of time the gilding becomes in such a bad condition, or so much worn off, that the ceiling is no longer ornamental. I should think that a reasonable tenant taking a house in Grosvenor-square would not require a gilded ceiling at all - if that be so, on the mere covenant to leave the premises in tenable repair, I should think that the tenant who has entered into that covenant was not bound to regild the ceiling at all. As to the floor, it may have been rotten when the tenancy began. If it was in such a state when the tenancy began that no reasonable man would take the house with a floor in that state, then the tenant's obligation is to put the floor into tenable repair. The question is, what is the state of the floor when the tenant is called upon to fulfil his covenant? If it has become perfectly rotten, he must put down a new floor; but if he can make good in the sense in which I have spoken of, all the other things - the paper, the paint, the whitewashing - he is not bound to put down a new floor. He may satisfy his obligation under the covenant by repairing it. If he leaves the floor out of repair when the tenancy ends, and the landlord comes in, the landlord may do the repairs himself, and charge the costs as damages against the tenant; but he is only entitled to charge him with the necessary cost of a floor which would satisfy a reasonable man taking the premises. If the landlord puts down a new floor of a different kind, he cannot charge the tenant with the cost of it. He is entitled to charge the cost of doing what the tenant had to do under his covenant; but he is not entitled to charge according to what he has himself in fact done.

I think we have explained more fully than it was explained in the Court below, what is the true construction of the contract to keep premises in tenable repair. If our judgment is inconsistent with any part of the judgment of *Cave, J.*, we must, of course, be taken to disagree with it, but we certainly agree that this case must go back to the Official Referee.

Lord Justice Lopes concurred.

- MEETINGS.
- SATURDAY, AUGUST 16.  
*Architectural Association*. - Concluding day of the Annual Excursion.  
*Royal Archaeological Institute*. - Annual Meeting, Gloucester (continued).

- RECENT PATENTS.
- ABSTRACTS OF SPECIFICATIONS.
- 12,136.-IMPROVEMENTS IN WATER-CLOSETS: *J. and A. Jackson*. - According to this invention, a circular weir is substituted for the ordinary water-closet basin. The outlet is through its centre to a trap below, when, entering the inlet to the weir or basin, the water is deflected by a suitable slide and causes it to traverse the circular track of the weir in two currents, which meet together at the back of the track opposite the inlet with great force, carrying all before it into the central outlet to the trap below.
- 13,008.-FIRE-RESISTING FLOORING: *J. Wilson*. - In order to provide a simple and economical method of forming combined metal and concrete flooring, decking, &c., and of fixing it; rolled steel or iron beams of peculiar section are by this patent placed upon the usual supports, and the beams or girders are filled in or embedded with concrete or composition. The beams are preferably of a semi-elliptical section, with flanges

which in fixing about one to the other. This forms a better hold for the concrete.

13,740.—PRESERVING MIXING TIMBER: H. Atken.—In order to make timber absorb moisture from the atmosphere, and to render it incombustible, or nearly so, it is treated with chemicals, or acids, or a vapour of gas is made from the combination of chemicals, and the timber impregnated with it in a vacuum in suitable chambers or vessels.

14,777.—CASEMENT WINDOWS: J. B. Pring.—The object of this invention is so to construct casement windows that the outside can be readily turned inward for cleaning. The top and bottom of the window sashes are provided at the ends of the stiles with studs adapted to slide in grooves made in the top and bottom of the window-frame, and small rollers are applied to each sash. By this means the sashes may be slid along, and then, by swinging them upon their studs, easily turned then round with their outer sides inward. With this side at the hinge ends of casements for preventing draughts. This was not practicable with casement windows as ordinarily made.

NEW APPLICATIONS FOR PATENTS. 5,715.—STOCKS AND FITTINGS FOR BRICK-MOULDING: G. H. Stocks and Others.—It has been found that bricks made by means of stocks constructed of wood as generally used are of irregular shape and size. By means of this invention, which is a combination of iron or similar material and wood, the uniform size of all bricks made by it is assured, as the brick-mould, when placed on the stock, always remains at one gauge. 5,823.—MIRRORS AND SASH-LIFTERS: C. Shoel.—This invention relates to sash-lifters, which consist of a fixing-plate having at its middle and at a suitable angle thereto an eye or finger-loop, by which the sash is lifted, and provides for the manufacture of the lifters by piercing or stamping them out of one piece or two pieces of sheet metal.

NEW APPLICATIONS FOR PATENTS. July 28.—11,752, W. Welch, Ventilators for Sewers, Public Buildings, &c.—11,753, M. Valentine, Fasteners for Window Sashes, Doors, &c.—11,771, W. Morrison, Check or Door Spring.—11,782, T. and J. Mann, Kitchen Ranges.—11,796, E. Dupont, Compound Plates or Slabs of Cement, Plaster, &c. July 29.—11,836, R. McNally, Combination Nail and Screw.—11,851, W. Lester, Glazing Bars or Astragals, for Roof Lights and Windows.—11,832, J. Bolding, Engaging Valve Water-Closets, &c.—11,843, C. Walton, Bricks.—11,852, F. Weldon, Scaffolding Attachment or Device.

July 30.—11,893, A. and J. Filton, Sash Movements without Corbels or Weights.—11,927, W. Morton, Door Knob Attachments. July 31.—11,964, G. Stokes & Co., Laths for Venetian Blinds.—11,972, T. Charley, Chimney Tops.—11,978, H. Hillon, Water-proof Dust-proof Glazing without Putty.—12,011, G. Rohrbach, Gate Hinges.—12,012, G. Dohrlach, Gate Latches.—12,020, J. Bayly, Water-closet Valve.

Aug. 1.—12,051, W. Wilson, Bakers' Ovens. Aug. 2.—12,107, W. Worsam, Screw-driver.—12,125, R. Swales, Water Tanks for Water-Closets, Urinals, &c.—12,136, T. Harries, Grate.

PROVISIONAL SPECIFICATIONS ACCEPTED. 5,403, J. Smeaton, Flushing and Waste-preventing Apparatus for Water-closets, &c.—5,586, W. Pavey, Preventing Waste of Water in Cisterns used for Flushing Water-closets, &c.—7,423, R. Harris, Combination and Set Square and Scale Rule.—8,743, W. Currie, Locks, Latches, and other Fastenings.—9,376, J. Bayly, Trap for Sewers, &c.—9,378, J. Scammell, Level and Plumb Rule.—7,930, H. Evans, Fixing Sash Cords of Wire to Sliding Window Sashes, without removing Sashes.—10,245, C. Samuels, Window Fasteners.—10,255, J. Carroll, Latches for Doors, Gates, &c.—10,294, E. Turner & J. Crocker, Gunny Traps for Horse Sinks and other Drains.—11,243, F. Proctor, Nails.

COMPLETE SPECIFICATIONS ACCEPTED. 13,135, F. Barnett, Ventilating Sewers, &c.—13,483, R. Bell, Top Bars for Blinds.—13,492, E. Bishop, Burning Line and Kins for sashes.—15,250, J. Bowes, Door Latches.—5,905, H. Marples, Joiners' Squares, &c.—6,784, A. Smith, Bolts for Doors, &c.—8,425, H. Goodson, Water Waste-preventing Valve.—10,129, G. Miller and others, Closet Cisterns.—10,242, T. Bergmann, Fastening Decorative Metal-plates for Walls.

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

AUGUST 1.—By Driner & Co. (at Wakefield): "Kettlethorpe Hall," near Wakefield, and 100a. 3r. 21p., f. 8,700f.; two l. enclosures of 1. land, 15a. 3r. 15p., 22. 10a. p.a.; 1,575f.; f. building land, 2a. 1r. 32p., 3l. p.a.; 400f.; f. arable land, 2a. 1r. 30p., 4l. p.a.; 190f.; a fee farm rent of 2r. 12a. p.a. 60f.

AUGUST 2.—By Driner & Co. (at Cambridge): "Borough Farm," Great Chesterford, 131a. 1r. 9p., f. and c. 4,000f.; two cottages and 3r. 26p., r. 59f. p.a.; 983f.; "Field Farm," 230a. 0r. 12p., f. 4,000f.

AUGUST 5.—By J. Matthews: No. 85, Hagston-road, n.t. 49 yrs., gr. 82. ss., r. 36l., 250f.; 5. **Re Board Schools, Markhouse-road, Walthamstow.**—Mr. Walter Wallis, of Balham, writes to say that his tender for this work was £10,934, and not £13,934, as stated in the list published in the *Builder* last week. The mistake was not ours. We printed the list as we received it from an authoritative source.

**SUBSCRIBERS IN LONDON AND THE SUBURBS** by prepaying at the Publishing Office, 198, per annum (or 3s. 6d. per quarter), can ensure receiving "The Builder" by *Friday Morning's post*.

**TO CORRESPONDENTS.**

W. H. B. (we cannot insert lists of tenders where the amount of the highest tender does not reach £100).—C. F. M.—G. C. G. (we cannot insert lists of Builders without the amount).—C. H. T. (ditto).—E. C. H. (ditto).—S. & H. (ditto).—J. B. (ditto).—H. F. (thanks, but it arrived too late).—S. W. (for obvious reason we cannot insert letters which contain any remark on any other way).—C. F. W. (thanks).

All statements of facts, lists of tenders, &c. must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and printing addresses. We cannot undertake to return rejected communications. Letters or communications (beyond news, news-items) which have been duplicated for other journals, are NOT DESIRED. All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

**TERMS OF SUBSCRIPTION.**

"THE BUILDER" is supplied by post from the Office to residents in any part of the United Kingdom at the rate of 19s. per annum in advance. For all parts of Europe, America, Australia, and New Zealand, 25s. per annum. To India, China, Ceylon, &c. 30s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publishers, No. 49, Colchester-street, W.C.

**W. H. Lascelles & Co.**  
121, BUNHILL ROW, LONDON, E.C.  
Telephone No. 270.

**HIGH-CLASS JOINERY.**  
**LASCELLES' CONCRETE**  
Architects' Designs are carried out with the greatest care.

**CONSERVATORIES GREENHOUSES, WOODEN BUILDINGS, Bank, Office, & Shop Fittings CHURCH BENCHES & PULPITS**

ESTIMATES GIVEN ON APPLICATION.

**BEST BATH STONE.**  
**CORSHAM DOWN. | FARLEIGH DOWN.**  
**BOX GROUND. | COMBE DOWN.**  
**WESTWOOD GROUND. | STOEK GROUND.**  
**THE BATH STONE FIRMS, Limited.**  
HEAD OFFICES: BATH.

**DOULTING FREESTONE.**  
The stone from these quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England.

**THE OHELYNOH STONE.**  
Is of the same crystalline nature as the Oheylnoh Stone, but finer in texture, and more suitable for firebricked work.

**THE BRAMBLEDITCH STONE.**  
Prices, and every information given, on application to **CHARLES TRASK & SONS, Doulting, Shepton Mallet.**  
London Agent—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.O. [ADV.]

**HAM HILL STONE.**  
The attention of Architects is specially invited to the durability and beautiful colour of this material. Quarries well opened. Quick despatch guaranteed. Stonework delivered and fixed complete. Samples and estimates free. Address, The Ham Hill Stone Co., Norton, Stoke-under-Ham, Somerset. London Agent: Mr. E. A. Williams, 16, Craven-street, Strand, W.O. [ADV.]

**Asphalte.**—The Sessell and Metallo Lava Asphaltic Company (Mr. H. Glenn), Office, 42, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk rooms, granaries, tun-rooms, and terraces. Asphalt Contractors to the Forth Bridge Co. [ADV.]

### Landscape Gardening and Park Architecture.

WHAT is the true object of landscape gardening? For very different theories on the subject are possible and have been put into practice, with more or less success after their respective manners. There is the theory of which Le Nôtre was the most eminent practitioner on record, which regarded nature as merely a bare space on which to lay out an ornamental design of the most symmetrical and artificial character; and trees, shrubs, and flowers as merely so much raw material provided by Nature out of which to work the designs of art. On the Le Nôtre system, the natural contour of the landscape was not of much account; or rather, it was thought all the better if it had no natural contour at all, but presented a flat plain or plateau with no excrescences to interfere with the symmetry and completeness of the design. There was the simple English faith of the last century, which regarded the planting of an avenue as the great desideratum, the central expedient for effect compared with which other things were of merely secondary importance. There is that happily exploded idea which aims at the manufacture of the artificial picturesque of a sentimental type; which once prompted misguided persons to build up artificial ruins (which they would gladly have lighted by artificial moonlight if they could have got it), to have a shepherd and sheep in stone on a lawn, and which beguiled Pope into the lowest deep of having rakes and hayforks painted as leaning against the walls of his paddock. There is a more reasonable and practical view which regards landscape-gardening mainly as the means of enhancing the importance of a country house and its approaches, of placing the lodge entrance and laying out the drives in the most effective manner, always taking care that the first view of the house caught from the approach drive is such as to produce a favourable impression on the visitor, as to the scale and architectural

importance of the habitation; that the carriage sweep to the front door is laid out in convenient as well as ornamental lines; that the parterre is arranged according to approved patterns; that the lodge gates are so adroitly placed in reference to a turn of the road that the public road seems at a little distance to be laid out for the purpose of leading up to them,—a harmless piece of mock importance which those who look out for it will find is practised much oftener than is generally supposed, though it is to be feared it hardly produces the effect on the visitor that is intended. This latter may be called, perhaps, the tradesman's view of landscape gardening; the art by which an estate for purchase is set off to the best advantage, and which meets the views of the newly-established country gentleman whose house "pricks a cockney ear" in the distance over its "perky larches and pine," as the Poet Laureate expresses it.

The artificial system on a great scale, of which Versailles was the climax, has been in this country by common consent abandoned, and is even spoken of with some contempt as a system contrary to nature, and therefore to be condemned. Even in its own day Milton had a fling at it in his description of Eden—

"Which not nice art,  
In beds and curious knops, but Nature boon  
Poured forth profuse on hill and dale and plain;"

a passage the full point of which is lost unless we hear in mind the system against which it was aimed. The objection that this system is artificial, however, might just as well be brought against architecture, which also is a purely artificial art. The creation of a highly ornamental artificial garden on a great scale is really the production of a beautiful and unique form of art and of artistic enjoyment, and the objections to it as a general form of landscape gardening are rather practical than æsthetic. In the first place, when carried out in a sumptuous manner and on a large scale (and it is of little value except on these conditions), it is enormously expensive; and secondly, it is a kind of garden which can only produce its effect and be enjoyed in bright sun-lit summer weather. Nothing looks more blank, more

ineffectual, more at variance with place and season, than a sumptuous ornamental garden in bleak or rainy weather; and considering how the English summer, always short enough, seems yearly to get shorter and shorter, it is not worth the while of any but the few who can afford to keep up a summer and a winter palace on separate estates, to go to the cost of making a grand garden on the artificial system.

Leaving this, then, out of the question, we are left to what has been called the "natural system" of landscape gardening, which consists in the treatment of a site so as to get the best effect out of the natural features of the ground, aided by a system of planting which is really artificial, but which is to be arranged so as to appear more or less natural. It is an exceedingly difficult and delicate point to decide how far this imitative treatment may be carried without degenerating into mere trick and scenic arrangement. There is one principle, however, which may be positively affirmed at the outset, viz.: that all mere attempts at illusion are detestable, and carry their own condemnation with them. The arrangement, for instance, of a piece of standing water so as to imitate the curves of a winding river which has no existence, the introduction of a sham bridge to close the vista and suggest the idea of the continuation of the water beyond it (as at the east end of the Serpentine); all such things are pieces of sheer vulgarity of taste, even in other senses than the artistic one. A lake is a beautiful addition to an estate; but let it appear as a lake, and not endeavour to mimic a river.

The arrangement of plantations and drives is another matter; there is no pretence at deception here, or need not be, for the growth of trees and shrubs has been in the course of ages continually changed by the hand of man over the whole face of a cultivated country, and the very hedges which have been removed to clear the ground for a park were themselves a form of artificial plantation. But in the "natural style" of landscape gardening it must be borne in mind that the habitation is the *raison d'être* of the whole scheme, to an extent which is not the case with the artificial garden on the ancient system. The

symmetrical design of the latter is an object in itself, even if there were no mansion connected with it (though it would no doubt lose its backbone in that case); but the only sense and meaning of the natural system of laying out grounds consists in the relation of the grounds to the habitation which forms their centre. The habitation is itself a production of art—of the most artificial, in fact, of all the arts; placed right in the middle of unsophisticated natural scenery, it will appear in itself unguarded, uncomfortable, devoid of the effect of retirement and repose, while it will also appear an intruder on and out of harmony with the landscape. The business of landscape gardening is to gradually connect the building with the landscape, giving it a *temenos* of its own and arranged so as to promote its comfort and its effect. To this end, even when the natural system is adhered to for the most part, the artificial system may be and in most cases ought to be adopted in immediate contiguity to the house, in order to give a kind of architectural semblance and feeling to those parts of the ground which are immediately contiguous to the architectural centre of the whole. This idea may be carried further, and each portion of the surrounding ground treated in its own appropriate manner, in accordance with the nature of the site and the distance from the habitation, but always so as to unite the whole into one conception.

To do this well requires an eye and an imagination capable of taking a comprehensive grasp of the whole of an extended site, picturing it in the mind's eye as it should be when complete, and treating each portion with reference to the intended ultimate effect of the whole. Something more than taste and experience, something like the intuition of genius, is necessary to accomplish such a task. In this connexion it is worth while to call attention to the spirit in which such work was undertaken by our great English master of the art, Repton, whose remarkable work on the subject, forgotten at present by most of his countrymen, would be well worth re-editing and republishing in a modernised form. Repton was a man of genius in his way; with some ideas which would now be thought a little pedantic and old-fashioned, he had the faculty, so to speak, of generalising a site and forming a broad conception of what could and should be done with it in relation both to the natural characteristics of the ground and the nature of the house, and we should be disposed to say that he was the most capable and brilliant man in his profession since Le Nôtre; a true landscape gardener, and not, like too many of the craft, a mere estate agent.

The great merit of Repton consists in his broad and comprehensive grasp of the whole character and possibilities of a site, in reference to the general section of the land, the existing or proposed style of the house, and the objects for which it was to be used. His work is illustrated in a very ingenious manner by a number of coloured prints with movable slips pasted to or fitted by slots into the plates, so as to show the view with and without certain characteristics, and enable the reader to compare the two effects. The plates are not first-rate specimens of chromolithography, according to the lights of the present day, but they are exceedingly well contrived for their object, and were so popular an element in the book at the time of its publication as to extract, in a later edition, a remonstrance from the author, to the effect that he had aimed at producing something more than a book of pictures, and had desired to show that true taste in the art "is not a matter of accident but of understanding." In expounding his general view of the objects of landscape-gardening, he continues:—

"In deciding on the character of any place, some attention must be given to its situation with respect to other places; to the natural shape of the ground on which the house is or may be built; to the size and style of the house, and even to the rank of its possessor, together with the use which he intends to make of it, whether as a mansion or constant residence, a sporting seat, or a villa; which particular objects require distinct and opposite

treatment. To give some idea of the variety that abounds in the characters and situations of different places, it will be proper to insert a few specimens from different subjects. I shall begin this work, therefore, by a remarkable instance of situation, only two miles distant from the capital."

In reference to the words "character" and "situation," italicised by the author in the above quotation, it should be observed that he had before said that "the character of a place teaches us what is advisable, the situation, what is possible." The example "not two miles from the capital" is Bransbury House (Bromesbury?) which, "standing on a swelling hill," and with no trees near it, therefore must have home shrubberies, to give retirement and privacy. He proceeds to show, by a very amusing illustration, how this problem would have been met by "Capability Brown," whose idea was in such case to enclose a "home park" round the house by a high paling, shutting out the landscape altogether; and Repton gives a plate showing the inhabitants or visitors at the house endeavouring to get a glimpse of the landscape through the chinks of the paling. Repton's idea is to plant up a much smaller portion of the estate near the house with shrubberies interspersed with walks giving views of the landscape at occasional points, the paling being sunk at these points, and hidden elsewhere by the planting, which can be so arranged "that the twelve acres thus enclosed will appear considerably larger than the sixty acres originally intended to be surrounded by a park pale." This touches upon a most important element in what may be called the poetry of landscape-gardening, the art of so dividing and diversifying a given superficial area by plantations and banks, breaking it up into retired glades, open lawns, and shaded alleys, that the really small extent of the area is entirely masked, and an impression of extent and variety is conveyed which would seem hardly possible to a spectator who saw the bare site in its untreated state. To effect this in so truly artistic a manner as to take away from it all appearance of art or contrivance, is one of the triumphs of landscape-gardening; a triumph, it must be confessed, not very often realised.

The particular reason for planting up close to the house, leaving openings for the distant prospect, in the case just described, was, as Repton observes, that the house stood on an eminence overlooking a wide extent of country. For the reverse case, that of a house in a vale with rising ground all round, Repton's advice is, plant up the heights so as to increase the effect of shelter and seclusion, and introduce water at the low level of the site. This is in keeping with true artistic principle, which should always aim at intensifying those characteristics of a composition which are necessarily the predominant ones. An elevated situation gives the advantage of prospect; make that an element in the laying out of the ground. A low-lying situation suggests seclusion and calm; intensify these characteristics by crowning the heights with wood, and introducing the element of water, with its level surface and calm reflections, as the base of the scene. In connexion with this we may call attention to Repton's acute remark as to the value of water in giving the eye a measuring-point or base-line for the estimate of heights, whether of buildings or of eminences of ground.

Like all writers on the subject, Repton insists on the absolute necessity of the landscape gardener having "a complete knowledge of architecture," and, equally like all others, proceeds to show by his illustrations that he has no such knowledge. There seems to have been no progress made in this direction since Repton, for in Mr. H. E. Milner's work on the subject, just published, the architectural sketches for lodges, boat-houses, balustrades, bridges, &c., are of the poorest and weakest description, whether regarded as drawings or as designs, and form a serious blemish on an otherwise useful book. The author should have taken a competent architect and

\* The Art and Practice of Landscape Gardening. By Henry Ernest Milner, F.L.S., M. Inst. C.E. With plans and illustrations. London: Simpkin Marshall & Co.; 1890.

draughtsman [into co-partnership in regard to this portion of the work, and he would then have been saved from discrediting his book by drawings which any pupil brought up in a good architectural office or atelier would be ashamed of. Repton, it must be observed, saves himself from some of these difficulties by avoiding for the most part any architectural detail at all; he merely shows houses *en bloc* with an indication of a cornice and a pediment; but on the other hand he shows himself to have had a very good eye and judgment for architectural effect in a broad sense, in connexion with landscape, in his remark that "there are only two characters of architecture, in a broad sense, one perpendicular and the other horizontal"; "call them, if you like," he says, "Gothic and Grecian"; and he adds that "their characters are better distinguished by their general effects than by minute details"; which, from a landscape point of view, is quite true; and he is also quite correct in his remark that "trees of a conic shape" go badly with Gothic, owing to the repetition of line. In this and other respects Repton's remarks on the combination of architecture and landscape are worth study, though his knowledge of architecture in detail seems to have been no better than that of his profession generally.

The question of the avenue is the subject of some passing sarcasm by Jane Austen, who represents Percival as a tasteless innovator bent on removing the noble old avenue of Sotherton. But if Jane Austen had, like Repton, been called on to visit numbers of country estates in succession, and found everywhere the eternal avenue, she would probably have recognised that there was more reason in Repton's war against the avenues than she had imagined. He denies, indeed, having any natural antipathy to an avenue, but he says truly that when universally used it reduces all houses to the same landscape, "if looking up a straight line between two green walls deserves the name of a landscape." His objection that an avenue often acts as a "wind-spout" to direct cold blasts on to the house appears more fanciful than real; such an effect may have been noticed under special conditions, but it must at all events be very exceptional; but his aesthetic reasons against it are worth quotation:—

"If at the end of a long avenue be placed an obelisk, or temple, or any other eye-trap, ignorance or childhood alone will be caught and pleased by it; the eye of taste or experience hates compulsion, and turns away with disgust from every artificial means of attracting its notice; for this reason an avenue is most pleasing which, like that at Langley Park, climbs up a hill, and passing over the summit, leaves the fancy to conceive its termination."

This is ingenious; but how when the visitor (as curious persons will have walked over the hill? Mr. Milner regards the avenue, rightly, as "the expression of grandeur", and it should not, we may add, be made use of except in connexion with an estate and a dwelling of such scale as may rightly pretend to grandeur. To quote Mr. Milner in continuation—

"It should be planted only when importance is to be given to its line, and when an imposing ending can be bestowed upon it. Its line should be, if possible, straight" [surely an avenue that is not straight is not an "avenue" at all] "and free from extraneous planting, unless indeed it pass through a wood and form part of it. Its trees should be considered as belonging to, and forming part of, the road. It is essentially a stately feature in its appearance; and its purpose should be harmonious with its expression. The mind is apt to resent a patry result to such promise as it impressively gives, if the ending be unworthy of the beginning. When age and luxuriant growth come on it, there is a veneration in its beauty that is not obtainable by any like means. . . . But when ill-planned—to conduct the vision or the footsteps from some point of little importance to a position of less interest—it bears all the penalty of a wasted resource. . . . It must be remembered that an avenue across a park divides it in two parts at that point. It is not fitting except it proceed from some important entrance on a side entrance, no distant views can be spoiled by its introduction."

This latter caution, as to the effect of an

\* "Mansfield Park."

avenue in cutting the park in two, is also strongly insisted on by Repton.

Mr. Milner's book, by no means exhaustive (for the subject is really an immense one), is to be recommended as a guide to the laying out of estates, except in regard to the examples of architectural adjuncts already referred to. The general suggestions of the introductory chapter are mostly exceedingly good. The author draws attention to the value of intermediate objects in giving scale and assisting the estimate of space and distance (a quality admirably illustrated in the landscapes of Clauds, who intentionally places his middle distance trees and buildings so as to give a scale for the distance); he suggests how the idea of spaciousness may be artificially promoted in various ways; he points out how the ground immediately around a dwelling, forming the artificial base on which it rests, should be treated formally and in direct relation to the house. In the chapter on "The Approach" are many excellent hints as to the laying out of the approach drive, in most of which we entirely concur; the direction that "the gradient of a good drive should not be steeper than 1 in 14, though 1 in 9 is a road over which a carriage may be driven with safety," seems to err on the side of steepness; and we may point out (what is sometimes overlooked) that a gradient which is very well to drive down with a four-wheeled vehicle may be felt, both by horse and driver, to be too steep for a gig or dog-cart. "The drive should not skirt the garden or overlook it": an important point for the comfort both of residents and visitors, sometimes forgotten. Any curves in the drive should appear to be rendered necessary by some obstacle: there must be a good deal of *ars celare artem* here, though, if the eye of the observant visitor is to be cheated; and any popularity which such a treatise as this may attain will be likely to have the effect of putting the observant visitor on the *qui vive* for these little artifices: but the author is completely right in his remark that "a straight drive should be used only when an imposing or somewhat pretentious building is at the end of it;" in this respect it is somewhat in the same category as the avenue. We may add a very good caution from Repton, viz.: that except when the house is a mansion of the largest class, the first view of it should not be at too great a distance, otherwise the first impression will be that it is small and insignificant. With a mansion of the largest class, a distant view, subsequently intercepted in the progress of the drive, may have a very charming effect.

The designs and directions for terraced gardens, terraces, and the termination of the drive on reaching the house, savour, we fear, more of the proclivities of the estate-agent than of the artist or architect; but on this head it may be said that Mr. Milner is only in the same boat with all the rest of his profession. It is difficult to define exactly the particular details which mark the hand of the estate-agent, but a mere glance at a plan or a sketch in these cases is sufficient to reveal it. Where an architect who is worth anything is employed on the house, he should be entrusted with all the immediate surroundings also, unless they are to be reduced to mere commonplace in conception and detail.

Where Mr. Milner quits what is (or should be) properly the domain of the architect, and enters on that which is peculiar to the landscape-gardener, we are disposed to regard his *dicta* with general respect. He takes a large view of his subject, as the art of producing natural beauties where they did not previously exist, but in accordance with the opportunities naturally presented by the site. His distinction between the foliage treatment proper to this garden adjoining the house, and that proper to the park, is very well drawn. "Near the house the planting should be finer, and of trees and shrubs that are not indigenous; or rather, such trees or shrubs may be abundantly used there, to produce their effect; for the introduction into a district of plants not indigenous to it marks

an innovation, as it were, and shows the hand of man. Such plants or trees must be sparingly used, or not at all, in the park, where an object is to conceal the fact that all is not due to nature in its local development." The author rightly dwells on the importance of the landscape-gardener endeavouring to realise and forecast, while making young plantations, the effect which these will have when mature. With regard to the various suggestions for arranging the planting in a park, we have no doubt that many of them will aid in producing a good effect; one can quite see, for instance, the force of the recommendation that the outlines of tree-groups should have strong prominences and present deep recesses, and that these recesses will be intensified in effect by being planted with dark-foliaged trees\*; but when it comes to making apparent undulations in the line of a really straight belt of trees by introducing fainter-tinted foliages at intervals, and at the same points *lowering the skyline* to give an effect of perspective, one feels that this employment of optical illusion has only to be detected to be condemned by most spectators. It is well to know how to produce a desired effect of nearness or distance; to remember, for example, that "white foliage, or blossoms, seem nearer to the spectator than they really are"; but after all one feels that one could hardly escape a sense of unreality and *made* picturesque as the effect of a good deal of the system recommended by the landscape-gardener; and when the reader is told that trees should be placed in this and that manner, he is often tempted to go down to the roots of things with the impertinent question, "Why should they?"

The practical sides of Mr. Milner's book, in regard to the formation of the ground for a new park, the placing of the house, &c., is very good as far as it goes; the scale of the book does not allow of going much into detail. In the chapter "On Planting," the list of trees and shrubs for various situations is very useful; and the two plans and descriptions of executed work (Keszthely in Hungary and Peverly in Shropshire), are much to the point as examples of this manner of setting to work to form a park and gardens on a new site. In the case of Peverly the park was formed on a site consisting previously of purely agricultural land. One difficulty in this case usually is to get rid of the evidences of the old divisions and landmarks; hedges can be easily removed, but it is another matter to root up and remove fine trees which have from time immemorial grown on the lines of such hedgerows. There is always a reluctance to remove such trees, and then there is perhaps the attempt made to plant about them and disguise their formality of position, a process which leads to breaking up the ground into small parts and divisions and thereby losing breadth and unity. At Peverly, the author tells us, "the walks have been undulated in plan as well as in level, and the different parts of the garden are hidden and separated to such an extent that the whole cannot be seen at once, and the former plain field-look has been entirely removed."

Park architecture is in itself a very interesting and fascinating subject, to which little justice has been done either in books or in actual building. In the shape of lodges, terraces, bridges, and shelters or summer-houses, it affords the opportunity of considering the ornamental or decorative aspect of architecture only, almost unfettered by practical considerations, and in connexion with beautiful natural (or, if the reader please, artificial) surroundings. Unfortunately, it is not often that the most is made of these opportunities. The great curse of park architecture is the effort to be picturesque, or (still worse) to be "rustic." Mr. Milner tells his

\* The effective treatment of plantation on a large scale is well illustrated in Gilpin's fine old book on "Forest Scenery," a work deservedly of note in its day, of which a cheap reprint was issued some years ago; but we regretted to observe, without the powerful and characteristic monochrome illustrations of the original book.

readers that all summer-houses or resting-places in a park should be "rustic"; that bridges should be massive in construction when they carry a main drive, and "rustic" when they carry a garden walk; and he gives a plate of examples of both descriptions. It would be cruel to criticise his "massive" bridge (in Buxton public gardens); the rustic bridges are all right—for that kind of thing. But "rustic" bridges and other erections are in fact the very reverse of good taste; they are pieces of vulgar and foolish affectation. A bridge is an artificial thing; make it as graceful as you can, as an artificial design, but do not try to make it look natural. We will not go so far as to say that we would rather see an iron lattice-girder bridge in a park; but we should at all events feel that it was not a sentimental affectation, as the "rustic" one is. The sooner landscape-gardeners give up this kind of nonsense the better. It is an equal mistake to be constantly struggling after what is called "the picturesque" in lodges and gate-houses; that is to say, designing them with all kinds of angles and elbows and spikes and perforated barge-boards, as if the object were to make them as bristling and angular as possible. The very reverse should be the aim. Architecture is a completely artificial thing, and amid natural foliage its aim should be contrast, not imitation. Where the house and estate are of moderate pretensions only, simplicity is the proper characteristic of the lodge; architectural, not "rustic," simplicity. And when the mansion and property are of a more stately class, so that dignity rather than simplicity becomes suitable in its Park architecture, nothing really allies itself so well with a park landscape as Classic architecture, or a form of a design founded on the lines and feeling of Classic architecture. The great landscape-painters have known this, and grouped Classic architecture with their wooded scenes; but there is no need for this purpose to practise imitation Classic detail. Architecture which combines the qualities of grace, refinement, and repose, is what is needed; Classic elements, but not necessarily Classic detail. Of course, where the mansion itself has a very marked character—a Scotch castle, for instance, with modern additions, the entrance architecture must have some reference to the style of the house; but the elements of repose and simplicity of line may nevertheless be attained, and attempts at a false picturesqueness avoided. It is the object of architectural design in combination with landscape to present a contrast to nature, not to strive after an assimilation with natural forms; and that is just what modern landscape-gardeners habitually forget or ignore.

#### NOTES.

 ENSINGTON GARDENS are the chief playing-grounds of the West-London children; but there is no water fit for them to drink. At the south-east corner there is a small open well, called St. Gover's Well, which a few years ago was reputed to possess medicinal virtues, and was presided over by an old woman. When the Round Pond, situated about 100 yards away, was cleaned out three or four years ago, the well ran dry, and some wooden pipes were found in the mud at the bottom of the pond which were suspected to communicate with this well. Since the re-filling of the pond the water supply has been very much reduced, and in summer it is generally dry, and it can at best be only the drainage of the small plateau of gravel in the centre of which the pond is situated. It is obvious, therefore, that St. Gover's Well no longer supplies the wants of the thirsty children, and it is more than probable that such water as finds its way to it is impure and unfit for drinking purposes. At the south-east corner, near the Italian tea-house, there is a pump which is largely used by children. Quite recently it was found that the cess-pool belonging to the tea-house and a public urinal behind it

was situated close to the pump, and as the soil is gravel, and the well a shallow one, the water is most probably contaminated with sewage. This is really a very discreditably state of things for a Royal park. The parks under the management of Metropolitan authorities are well provided with drinking-fountains, which are supplied with water from a known source, and it should only be necessary to call attention to the deficiency in Kensington Gardens (and, indeed, Hyde Park, the Green Park, and St. James's Park are equally badly off for drinking fountains) to secure a proper supply. The waterworks on Campden Hill are sufficiently near and sufficiently elevated to enable an enterprising and artistic Commissioner to erect some fountains which might be ornaments to the parks as well as useful to their visitors. Even the drinking-fountains in the walls of the pumping-house at the top of the Long Water are not supplied with water, and the cups have disappeared.

**T**HE Select Committee of the House of Commons on the Woods and Forests and Land Revenues of the Crown made their report in the last days of the recent session. We give that portion of the report which refers to the London property of the Crown *verbatim*, as it is very brief. It is somewhat difficult to discover from it whether the Committee do or do not approve of the way in which the Crown property in London has been managed. On the whole, we gather that they do, though they are of opinion that the Commissioners have rather shifted their responsibility on to Mr. Cates's shoulders. It is probable that the public exchequer has benefited by this; but then, what is the good of Commissioners at all? We may perhaps return to this important subject at greater length. Meanwhile the following is the portion of the report referred to:—

"The London property consists in the main of ground-rents, consisting of 237,008l. per annum issuing out of about 4,252 houses, the rateable value of which is at present about 300,000l. a year. The leases of 2,938 of these houses expire for the most part within the course of the next twenty-five or thirty years. At that date the rack-rental of these properties will fall into the possession of the Crown, producing a very large increase of income.

The question has been raised whether it would not be desirable, by periodical renewal of those leases, to anticipate and equalise the growth of the income. Your Committee think that this policy should be very carefully considered by the Commissioners, with a view to promote a gradual increase of income, and to avoid as far as possible a sudden increase at a specific date. The management of the London property appears to be mainly in the hands of Mr. Arthur Cates, and he has practically managed the purchase of ground-rents. Mr. Cates is paid by a percentage and fees; varying in various years from 5,800l. to 2,165l.; out of which he has to provide his office and staff. Mr. Cates does not devote the whole of his time to the service of the Commissioners. The Committee are of opinion that one of the Commissioners should take a more active part in the management of the London property, and that, although he would necessarily be advised by professional authority, larger responsibility should be assumed by him."

**T**HE discussion on the vote for the National Gallery in the House of Commons last week was not interesting. Mr. Cavendish Bentinck attacked Sir F. Burton for giving higher prices in Italy for inferior pictures than would be done by private individuals, and for altering the names of the painters when the new pictures were placed in the National Gallery. Even at the risk of paying a somewhat higher price, we think it is better for the Director to conduct negotiations himself. At the same time, he ought not to be too "squeezeable." There is grave doubt, however, whether the present Director is wise in purchasing inferior pictures in Italy, and whether the best policy is not to wait for the sale of great examples of the old masters which are sold from time to time in this country or abroad. Mr. Cavendish Bentinck would prefer that the money voted from year to year should be kept in hand ready for use when pictures of really great value are in the

market, and we cannot but think there is much to be said for the idea. Nearly all the Continental galleries are depreciated by the number of inferior pictures which are mixed with great masterpieces. Our own National Gallery has hitherto been free from this reproach, and it would be sound policy to add to it only pictures which by a general consensus of skilled opinion are of the highest class. To purchase a picture, as was done this year, as being by Carlo Dolce, and to attribute it in the Gallery to Giovanni Bellini (though many are the critics who do not think it is by this master) is, it must be said, not altogether commendable management. We can do without "doubtful" pictures.

**A**T the present time of year, it may be well to call attention to a case decided during the recent sitting of the High Court of Justice, that of *St. Martin's Vestry v. Gordon*. It was decided in this case that, under sections 125 to 129 of the Metropolitan Management Act, 1853, the ashes and clinkers produced in the furnaces of boilers to supply steam for the general purposes of an hotel must be removed by the Vestry scavengers, as being in the nature of domestic refuse. There is a strong tendency on the part of the scavengers of the metropolis to shirk their business, and this case shows that this disinclination is rather encouraged than checked by their superiors. The fact is, nothing would be more desirable than a society which would look after the proper cleaning away of the refuse of the metropolis, and assist private individuals to keep the *genus* dustman in order. But we fear that numerous and eccentric as are the societies which exist at the present day, it will be some time before this one is established. At any rate, the above decision gives a very wide meaning to the term "domestic refuse," and householders should be encouraged by it to do battle boldly against the dustman.

**I**N Sweden there is at present a certain amount of activity in church building, and more specially so in the restoration of such of its old monuments as are of architectural value; this architectural value, however, being of a very low standard, and the "activity" is perhaps rather shown in the projection of work and the collection of funds than in the actual work itself, which is for the most part carried on so slowly that there is a doubt whether this generation will ever see service resumed in Upsala Cathedral. In the restorations it is to be noticed that details, originally imported and badly carried out by unskilled workmen, are being replaced without improvement; whilst the new works in progress, distinctly leaning towards the German school, are again (excepting in one or two cases) showing this fault of earlier days, —*i.e.*, the imported forms are designed without proper knowledge of the original. This new work, which is generally in brick, and bears a striking resemblance to Professor Otzen's designs which we had an opportunity of seeing this Spring, shows a more liberal use of stone facings than in the models from which it is derived, though in many cases the stone is an artificial one, toned in colour to suit the brick on the exterior or the polychromatic treatment of the interior; and a dull black brick is used instead of the glazed one, which is the favourite material in Otzen's work. At Stockholm the finishing touches are being put to C. Möller's new church, certainly one of the most agreeable modern erections Scandinavia is likely to see for some time to come. At Upsala, the Cathedral restoration already referred to includes the erection of two new spires of considerable height, the entire reconstruction of the roof, and a thorough overhauling of all the brick, stone and stucco surfaces, with all the disadvantages pertaining thereto, these disadvantages being rather too marked in one or two places, especially when one finds iron girders replacing vaults, or a composite stone with its dull blue-grey surface replacing the natural free stone.

**W**E have received from Mr. F. S. Waller, architect of Gloucester, a copy of a quarto pamphlet on Gloucester Cathedral,\* prepared by him with the view of affording some assistance to the Archaeological Institute on the occasion of their visit to Gloucester, but which ought to have a permanent value beyond the occasion. The work is rather architectural than archaeological, and contains notes on the various portions of the cathedral, accompanied by a plan and a number of interesting and well-executed sketches of various portions of the building. Among these the author has hit on the rather novel idea of showing a bird's-eye perspective of the cathedral as it would appear if all work later than Norman were removed, showing at a *coup d'œil* the whole Norman work as now existing. Another interesting sketch is a comparative one of a portion of the choir as left by the Normans, and as cased in the fourteenth century by Abbot Staunton. The thing is exceedingly well done, and all who are interested in Gloucester Cathedral ought to be grateful to Mr. Waller for such an interesting and compact set of notes and illustrations of it.

**M**ESSRS. DOULTON & CO. have now on view at the Lambeth Potteries, Albert Embankment, a terra-cotta reredos for St. John's Church, Notting Hill. It has been designed by Mr. Aston Webb, the figures in the panels having been modelled by Miss Emmeline Halse. The reredos consists of three panels, divided by open piers or pilasters each containing a niche in which is an angel with outstretched wings. The two figures of angels are to a much smaller scale than the other figures in the composition, and their wings project (behind the angle mullions or tracery bars supporting the traceried canopy work above) some slight distance over the background of the centre and side panels. The centre panel, which is higher and wider than the side panels, contains a group of the Crucifixion, with St. John at the foot of the cross. The panel on the left hand side contains a figure of St. John as a young fisherman mending his nets, while in the panel on the right hand side he is represented as an old man writing his Revelations in the Island of Patmos. The panels are surmounted by traceried canopy work of Perpendicular character, and the whole composition is very effective. The architectural portion is additionally noteworthy from the fact that it is executed in Messrs. Doulton's new "cellular" terra-cotta, which requires no filling-in with concrete, and permits of all the ornamental detail being produced, as in the present instance, without moulds, so that every piece of ornament is separately modelled, and no piece is an exact replica of another piece. In addition to this advantage, the mouldings of the main architectural lines of the composition are produced, by means of improved dies, with great exactitude, and owing to the cellular formation of the blocks they are not distorted and twisted in firing, and thus trueness of line to an extent not hitherto attainable is observable in the structure as a whole when it is built up. Messrs. Doulton also brought to our notice a new kind of glazed terra-cotta for architectural work. The glaze is of a dull or matt character, and the surface is slightly granulated in texture. It is quite devoid of the glassy shininess so disagreeable to look at when exposed to the glare of the sun; and as it can be made in a variety of good tints it is likely to be useful in brightening our street *façades*, especially if (as we were informed in the case) it can be produced at a moderate cost.

**T**HE International Exhibition of Mining and Metallurgy at the Crystal Palace, even in its unfinished state, includes several exhibits of interest to our readers. As might be expected, the majority of the stalls are devoted to metal and coal mining and appliances, metallurgical specimens, maps, &c.; but we find several accessories, such as ornamental cement work, bricks and tiles

\* J. Bellows; Gloucester.

joinery, wall-papers, &c. Seeing that mining and quarrying are so closely related to each other that in many cases it is difficult to decide on general (though not technical) grounds what constitutes a mine and what a quarry, it is rather remarkable that so few building stones, granites, slates, &c., have found their way into the exhibition. The New South Wales section includes some building stones, marbles, and serpentine. A table inlaid with different varieties of marble from Marulan, Cow Flat, Moonbi Ranges, Kempsey, and other localities, and serpentine from Bingera, are especially worthy of note. There are also several cubes of light-grey and brown Hawkesbury sandstone, which is a good representative building stone of the colony, it having been extensively used in the erection of the principal buildings in Sydney, and is exported to the adjacent colonies. Several Norwegian granites and gneisses, rough and polished, worked up into curbs, pitching, and tombstones, are also exhibited; whilst Portugal sends large slate slabs, some of which are worked into tables, from the quarries near Vallongo, in the district of Oporto. In the British section there is a fine show of Donegal granites, from quarries near Dungloe; these granites are becoming conspicuous features in the market. The exhibit comprises polished pedestals and specimens in red, pink, rose, salmon, and various grey tints of medium and coarse grain. The stones have a splendid polish, and the slightly porphyritic character presented by the some of the coarser varieties justly entitles the material to rank amongst the best of our ornamental granites, rendering it a formidable competitor to those of similar nature from Scotland and Cornwall. The Glyn Stone Company show samples of the material from their quarries near Glynceiriog, North Wales. The stone, which is a hard trachyte, has for many years been worked by the Llangollen Highway Board, but has recently been acquired by the Company referred to, which is opening it up extensively. From a knowledge of the behaviour of the material, we are able to say that it makes excellent road-metal and paving; but perhaps the most remarkable thing in connexion with it is that for years it has been used instead of brasses for bearings of machinery in the mills and factories of the district. Its utility in this respect is exemplified by a specimen exhibited which has been in use for years at a neighbouring mill; in some instances the Glyn stone bearings are still in use, after thirty and thirty-five years' constant wear. This is no doubt due to the fact that the material is tougher and harder than the majority of the other igneous rocks in the market. The Pant Glas Slate Company has erected in the exhibition a small shed roofed with the slate from the quarries near Chirk, and also have several loose examples. The slabs, of dark blue colour, are thin, clear, and free from extraneous spots, having a sound metallic ring. The Ormonde Slate Quarries send some rather thick and substantial-looking slabs; whilst blocks of bluish grey, hard "Tam-o-Shanter" stone come from Dalmore, Ayrshire. The Victoria stone is present in the shape of steps forming a doorway, vases, urns, slabs, pillars, railway-platform coping, &c. The Aqueous Works and Diamond Rock-boring Company exhibits specimens of cores passed through in boring wells and shafts. One specimen was obtained at a depth of 1,100 ft. from the surface in boring for the New River Company at Ware. Speaking generally, there does not seem to have been much attempt at classifying the different exhibits, especially in regard to the British section, a circumstance which, for obvious reasons, is much to be regretted.

FROM a letter in the *Times* of the 16th, dated from the Temple, and presumably by a lawyer, it appears that there is a clear precedent for the demand for compensation for the removal of gates in London streets, which has been declared to be an entirely new kind of claim. Mr. Horne-Payne, the writer of the letter referred to, states that in 1869 the London and North-Western Railway

Company applied for powers to remove the gates then standing across the north end of Euston-grove, in order to make a better access to their station, and that they were granted the requisite powers subject to a special provision that the company should compensate all owners or occupiers whose interests were injuriously affected by the removal of the said gates. It was further provided "that the amount of compensation should be settled by arbitration under the Lands Clauses Act, and that the arbitrator might deal as he thought fit with the costs of any claim which, in his opinion, should be frivolous or vexatious. In pursuance of this Act a number of claims were settled by arbitration for amounts varying from 50*l.* to 150*l.* or 200*l.*, and the remainder by agreement. When the Bill was before a committee of the House of Commons, a precedent for the special compensation clause was found in a Bill passed in a previous Session authorising a Liverpool improvement." This is an amusing commentary on the indignant speeches of Lord Rosbery and Lord Herschell on the claim for compensation for the removal of the still existing Bedford estate gates, as if it were the arbitrary invention of a new and unheard-of species of claim.

THE *Antiquary* for this month describes a method which has been used for fixing the monishk paintings, done under Prior Gondouin in 1484, upon the backs of the stalls (*temp.* Bishop Strickland) in Carlisle Cathedral.\* Subsequent coatings of white-wash were removed in the course of last century; of late years the painting has "scaled" from off the woodwork. By the advice, we read, of Mr. Richmond, R.A., these paintings have been syringed with fine parchment-size, which, by soaking in under the flakes, has secured them to the wood. Our contemporary animadverts upon Sir Arthur Blomfield's design for a lofty new font-cover, to be made, apparently, of wrought-iron, inasmuch as the "traditions [of the Cathedral] are, so to say, of wood-work. The late Mr. Street made a huge mistake in intruding a stone pulpit (the Paley Memorial pulpit) into Carlisle Cathedral." What this really means is, that because there was once a wooden font-cover and a wooden pulpit, which have both disappeared, therefore it is wrong now to make a font-cover or a pulpit of more durable materials. Common-sense will probably side with the architects. In a general sense, however, we may commend the concluding remarks, to the effect that "some opportunity should be given to the inhabitants of a diocese of expressing an opinion on anything that may be proposed to be done in their Cathedral."

IN *L'Architecture* for August 16 is an amusing article by M. Bourdais on what he calls "L'Ingénieurophobie," a malady which he says has been on the increase for a long time, and to which architects are especially subject. It is contagious, and has made immense progress during the year of the Paris Exhibition. Some of the best and most amiable people in the world will become suddenly "méchants et dangereux" on merely hearing the word "engineer." It will not be difficult to recognise in this description the characteristics of a malady which is not unknown on this side of the Channel. M. Bourdais has been occupying himself much with considerations as to the best kind of remedy to apply to check the spread of this disease. He concludes that the method of Pasteur in dealing with canine rabies affords the best example, and that when an architect or a member of a society for protecting ancient buildings exhibits signs of having fallen a victim to this malady, he should, on M. Pasteur's principle, be himself inoculated with a little of the virus of engineering, and

\* Strickland, sixteenth bishop, built the tower and belfry, circa 1405. The paintings—of episodes in the lives of St. Augustine, Anthony, and Cuthbert—are illustrated, with their legends or labels, in Hutchison's "History of Cumberland," vol. ii. (1794).

after a due lapse of time he will be found to have recovered his reason, and will regard an engineer with equanimity, and even welcome him as a brother. M. Bourdais signs himself "Architecte, peintre, et musicien, quoique ingénieur"; but if he can justify that signature he must be rather too exceptional a man to be able to enter fully into the failings and temptations of weaker brethren.

THE GLOUCESTER CONGRESS OF THE ROYAL ARCHEOLOGICAL INSTITUTE.\*

FROM Deerhurst it is by river only about three miles to Tewkesbury, and the members of the Congress reached the end of their voyage, just below the ferry under Tewkesbury Park, at the time arranged, but they had before them a walk of nearly a mile to the Abbey, through heavy rain. As soon as the party were assembled, Mr. Hartshorne read a short summary of the history of the Abbey and an account of its leading features. The following is an abridgement of his paper, taken from the *Birmingham Daily Gazette*. The Abbey is said to have been founded about 115 by Oddo and Dodo, Dukes of Mercia, who endowed it with certain possessions, and established within it five monks and a prior. In the latter part of the tenth century Tewkesbury had become a cell to the monastery of Cranbourn, in Dorsetshire; and in 1083, when Cranbourn passed into the King's hands, the abbot at once set about a reconstruction of the Tewkesbury establishment. In 1087, the honour of Gloucester, which included the lordship of Tewkesbury and the patronage of the monastery, was given by Rufus to Fitz Hamon, who was slain at Falaise, in Normandy. In this nobleman the abbot found a noble patron, and the foundations of a great church were soon laid. On the death of Fitz Hamon, the work was carried on by Robert, Earl of Gloucester, a great man and a great builder, who married Mæcol, eldest daughter of Fitz Hamon; and in 1123 the abbey church was dedicated. But it is improbable that the whole church, from the east end to the west front, was finished at this early date. There are indications of certain changes of plan which tend to show that not more than the choir, the *ecclesia* proper, was finished and dedicated in 1123. No doubt the foundations were laid and the work of the nave was advancing to the west in 1123; but much more than this cannot be said, for, in consequence of the extreme plainness of the Norman work, it is not easy to put even approximate dates. The famous west front of the abbey is believed to be of the time of William, son of Robert, Earl of Gloucester, the latter of whom died in 1147. The Decorated work in the choir and the vaulting throughout the church were much and deservedly admired. Directing attention to the tombs contained in the Abbey, which Mr. Hartshorne regards as among the finest in Europe, he said they were divisible into two classes,—those with effigies and those without. In the north side of the nave is the effigy of a man of the middle of the fourteenth century. This has been commonly but wrongly attributed to Lord Wenlock, who was killed at the battle of Tewkesbury in 1471. The figure exhibits some curious points of costume. It wears a pointed bascinet with a camail of banded mail, fastened with a lace in the usual way. Only five examples of banded mail are known in England, this being one of them. The effigies of Hugh Despenser, who died in 1349, and his wife Elizabeth, lie under a magnificent canopy on the left side of the altar. The effigy of the man is tenderly sculptured in white alabaster, and shows him in a round bascinet, which is not characteristic of this period. The fan vaulting of the canopy is very early—perhaps the earliest known. The effigy of Guy de Bryan, who died in 1390, has some features which are rarely, if ever, seen in armour. The mail boss covering the legs is strengthened and protected by splints of steel embedded in it after the Oriental fashion, and there are at regular intervals upon the figure small wooden pegs that have held decorative studs. The whole of the mail has been worked in *gesso*, and the field of the arms diapered in the same way. It is recorded that the whole of this effigy has been covered with leaf silver, and painted and gilt in parts. The effigy of Edward Despenser, who died in 1375, represents him kneeling upon a cushion, under a curious canopy on the top of the Trinity Chapel. This figure, Mr. Hartshorne

\* Concluded from page 139, ante.

stated, is quite unique, and is extremely valuable, because it is pointed all over to the life, and gives the back as carefully finished as the front. The monument attributed to Abbot Wakeman, the last abbot of Tewkesbury (1531-1539) was described by Mr. Hartsborne as quite a century earlier. "The lively picture of death" has reptiles crawling over it; which is a very unusual if not a unique feature. There are several plain tombs of abbots and three canopied ones in the south aisle showing admirably the gradual growth of such memorials during about a hundred years. Mr. Hartsborne has also devoted some attention to the painted glass in the choir, and, in the course of an interesting description, said it was unsurpassed in its brilliancy. It was rendered still more interesting by eight military figures in it. They all carry lances, and wear ailettes, and the mixture of mail and plates in their harness fixes the date of the figures to the early part of the second quarter of the fourteenth century, the most important feature of military costume. By closely studying the heraldry on these figures Mr. Hartsborne identified Robert, Earl of Gloucester, Fitz Hamon, four de Clares, a Zouche, and a Despencer, and he is of opinion that they were placed in the Abbey by Eleanor, wife of Hugh Despencer the younger.

Owing to the absence of a guiding spirit and the consequent straggling of the party, very few of the members heard what was said by Mr. Hartsborne and others as they made their perambulation of the nave and choir and the chapels which the latter contains; and the continued downpour of rain prevented all, except a few of the more venturesome, from inspecting the Abbey gateway and the other monastic structures which adjoin the central fabric; but a few were able to take hasty glances at the quaint old bowling-green behind the old "Bell" inn, the scanty fragments of the Abbey cloisters, and other buildings now used for schools. In their way back to the station, in the midst of heavy rain, the party had pointed out to them the two sites of the battle of Tewkesbury,—the one in a field lying a few hundred yards to the south-west of the Abbey, the spot where the luckless Queen Margaret was encamped, and the other in Tewkesbury Park, which lay on their left hand as the party made their way back to the steamer. Here, in what was once a vineyard, and is now known as the "bloody field," the slaughter was heaviest; and here the King fell, while most of his adherents were overpowered and forced down into an arm of the Severn, where they were drowned.

On the return voyage, the weather brightened up, and the party had pointed out to them as they re-passed Deerhurst, the Island of Olney, where in 1016 Canute and Edward Ironside met and agreed to divide England between them. On reaching Gloucester, and having duly dined, they repaired to the Tolsey, where Professor Middleton opened the Architectural Section by a lecture, in which he reviewed somewhat cursorily the progress made in archaeological antiquarian science since the previous meeting of the Institute at Gloucester in 1860, in which the late Mr. Gambier Parry, Professor Willis, and the Rev. C. Hartsborne had taken part. He also drew attention to the great similarity of architectural style which is discernible in all the great churches of Gloucestershire and Worcestershire. Professor Middleton's lecture was followed by another from Mr. John Bellows on "Roman Gloucester." Mr. Bellows is a thorough master of his subject, to which he has devoted years of patient study; and as he has the happy art of expressing himself clearly and popularly, even on a technical subject, his lecture was received with marked attention and by a hearty vote of thanks.

The morning of Thursday, the 14th inst., was devoted to the holding of the annual meeting of the Institute. The secretary (Mr. Heller Gosselin) read the report, and this, along with the accounts, was adopted, on the motion of Lord Percy, seconded by the Rev. Sir Talbot Baker. The report expressed much regret at the loss by death of Prebendary Scarth, Mr. R. Soden Smith, Mr. Charles Roach Smith, and Mr. John Clayton, of Chesters, near Hexham. It showed that, though the number of members has been stationary, yet the financial position of the society is better than it was a year ago. Some of the members suggested that a portion of the life-subscriptions should be funded, instead of being used for the expenses of the current year; and others urged the necessity of carrying on the

index to the Journal of the Society's transactions down to a more recent date. Edinburgh was unanimously chosen as the place of meeting for the Congress of 1890, an invitation having been received from the Society of Antiquaries of that city.

On the conclusion of the meeting, which was held in the Tolsey, the members repaired to the Chapter Room of the Cathedral, where they were received by the Dean, who opened the Historical Section of the Congress with a long and most interesting account of Gloucester, and especially of its ecclesiastical buildings (for of the Castle and its mural fortifications he left others to speak) taking up their history from the point at which Mr. Bellows had left it on the previous evening. He showed that for two or three centuries after the departure of the Romans an historic mist hung over "Gleawestrest," under the Saxon domination, when the neighbouring county was ruled over by the petty Kings or Princes of Cirencester, Bath, and Gleva itself. Still even before the Norman Conquest, Gloucester had its palace, and by the middle of the eighth century it had come to be reckoned one of the three noblest cities in our island, second indeed only to Westminster and Winchester. Its importance was increased by the foundation of a religious house here under the dedication of St. Peter, in the century named above, which house was given to the great Benedictine Order in 1022, during the reign of Canute. It is probable that some of the foundations of the Cathedral date from this era; but soon after the Norman Conquest the existing fabric was substantially built, and it is on record that it was solemnly consecrated in 1100 by the Bishop of Worcester, assisted by two other English prelates. The Monastery was largely favoured by Archbishop Anselm, and it continued to grow in wealth and importance until the middle of the sixteenth century, when the heavy hands of Henry VIII. were laid upon it for its suppression. Happily, however, the grand old Abbey Church was preserved, being wanted for a Cathedral; and the result is that we have still at Gloucester an all but perfect example of a Benedictine Monastery, but little changed. The story of the Abbey during our Norman and Plantagenet kings is not very eventful,—at least, not rich in incident; though William the Conqueror held at least one of his *Witanagenots* or Parliaments here, and feasted in the Abbot's Palace, and William Rufus and his brother Robert, and Edward II., and probably several other English sovereigns, enjoyed in turn its hospitality. When Berkeley Castle, the then Abbot, showed his hospitality by giving his body that burial which had been refused to it by two at least of his brethren in Gloucestershire and Somersetshire; and this hospitality met with its reward, for in the course of the first century after that King's death, his tomb, which is still to be seen to the north of the altar in the choir, came to be an object of pilgrimage; and it was chiefly out of the oblations which were offered at his tomb, that the grand but heavy Norman pile came to have added to it that wealth of very early Perpendicular architecture which probably was nowhere else to be seen so happily blended with the earlier style.

The Dean finished his paper by inviting the antiquarians and architects present to take special note of the details of the crypt under the choir, which they would see in the course of the day; and then a paper was read by the Rev. Mr. Porter on the encaustic tiles of the cathedral and their heraldic devices. This was followed by a discussion on various points of detail in the Dean's lecture, in which Canon Venables, Professor Montagu Burrows, Mr. St. John Hope, and other members of the Congress took part; the Professor, we may add, ascribing the popularity of the tomb of King Edward II. (to whom, he said, history had been most unjust), as an object of pilgrimage, partly to the great fame of that great sovereign, Edward I. his father. After luncheon, the party re-assembled at the Cathedral at 2 p.m., when

Professor Middleton, standing at the lectern in the choir, read a long and elaborate paper on the fabric of the cathedral, taking *seriatim* its Norman nave, its choir and sanctuary, and its windows. He showed how admirably the Perpendicular work had been "dovetailed," so to speak, into the original Norman structure, and with what skill the additional weight of the massive central tower had been met by afterthoughts of construction; and he drew

attention to the great east window, explaining its design and the curious and exceptional way in which it had been coloured. He also mentioned a fact which can scarcely be credited, that only thirty years ago, at the date of the last Gloucester Congress, it was seriously discussed whether this noble window, one of the very finest in England, should not be taken out and superseded by glass of a modern design! He afterwards led the party into the south and north transepts, and through the ambulatory into "Lady Chapel," where he showed the remains of several stone altars still *in situ*, and the defaced and mutilated retables which in other days must have been almost unrivalled. He afterwards took the party down into the crypt, where opinions were as much divided as ever with regard to its post-Norman or pre-Norman character. The interesting cloisters on the north side of the nave, with their lavatory and carrels of stone, were then perambulated, while some of the more adventurous spirits accompanied the Dean in a walk through the triforium.

As soon as the perambulation of the Cathedral and the monastic buildings was over, the entire party were welcomed to take afternoon tea at the Deanery, where they had the privilege of inspecting the beautiful Norman room now used as the Library, and which formerly was either the Chapel or the Banqueting Hall: at present it is uncertain to which of the two uses it was devoted; for it lies east and west, and as yet no search has been made in its eastern or southern wall for the side of an altar or a piscina. Another room, the panelling of which is Jacobean and is traditionally said to have been put up by Laud, was much admired; and so was a curious bracket on the staircase wall,—a lamp,—and also a fine piece of tapestry in the Library representing Jephthah's daughter.

In the evening the Mayor and Corporation gave, in honour of the Congress, a public conversation and reception in the Shire Hall, in Westgate-street. Here they exhibited the maces and other regalia of the City and of some of the neighbouring towns. These were made the subject of a brief lecture by Mr. St. John Hope, who said that they were of great interest, although not equal to those of London, Norwich, or Southampton, and added that at the time of the Commonwealth all the provincial maces were ordered by the Parliament to follow the type of Oliver Cromwell's "hamble," but that on the Restoration the Royal arms were again replaced. Among the other articles exhibited was a collection of the charters and seals of the city, and some of the city minute books, in one of which is an entry to the effect that the citizens of Gloucester bind themselves to do their best to promote the great General, Oliver Cromwell, to the dignity of Lord Protector, and also to settle on him an income of £5 yearly out of the funds of the city!

At the Friday evening meeting in the great room at the Tolsey, two papers of a general, rather than local, interest were read. The first by Mr. A. Hartsborne, F.S.A., dealing with the rather ghastly subject of the old custom of "Hanging malefactors in chains," a practice which he traced from early times down to its formal abolition just before the accession of her Majesty to the Throne, the last instances of that punishment being inflicted, as we understood him to say took place, in or about 1834. His paper was illustrated by diagrams of various "chains" and "irons," including the noted example in the possession of the Mayor and Corporation of Rye, in Sussex, which was exhibited, a few years ago, at the Lewes Congress of the Association. The other paper, by Mr. A. Watkins, treated of ancient pigeon and dove-cots, mostly from South Wales and the Western counties. This, too, was illustrated by photographs after the manner of a magic-lantern, but unfortunately the speaker was not very audible.

Saturday morning was devoted to the reading of two papers of local interest in the great room at the Tolsey, the former being by Mr. Cecil T. Davis, on "The Monumental Brasces of Gloucestershire," and the other by Mr. F. A. Hyett, on "A very rare and curious Civil-War Tract relating to the Siege of Gloucester." Mr. Davis said that he had gone over the Gloucestershire parishes *seriatim*, and that the largest number of such brasces that he could find was eighty-three, dispersed through forty-three churches and one grammar school. In date they ranged mostly from the fourteenth to the sixteenth century, and they might be roughly

divided into ecclesiastical, military, judicial, and civil; and in each of these divisions they bore testimony to progressive change of costume from simplicity to costliness; and this remark, he added, applied to the figures of the ladies as well as to those of their husbands, wherever they appeared on the brass by their sides. Mr. Hyett's paper was one which showed how easy it is even for careful historians to be taken in, and was, indeed, an example of the truth of Sir Robert Walpole's adage, to the effect that history is too often made up of lies. The tract, purporting to give an account, from an eye-witness, of a severe and bloody battle, fought near Gloucester by a Lord Grandison on October 11, 1642, professed also to be printed in London on the 16th of the same month; and it mentioned, among other persons, some whose names were and are unknown in connexion with Gloucester. There can be little doubt that the tract itself is not a forgery, but a fraud, and that it was issued in the hope of keeping up the spirits of the party on whom it conferred a fictitious victory; and Mr. Wallford is another member of the Cooness remarked, the date of its publication in London within five days of the event which it professed to record, in an age when there were no telegraphs or even coaches, and when stage-waggoners took some days to reach London from Gloucester, is enough to stamp it as a fabrication. Sir Talbot Baker compared it to the fictitious news of a "great victory" or a "great defeat" which were so often published in the London streets during the Russian War. After a few remarks from the Chairman of the meeting, votes of thanks were passed to the readers of the papers.

After luncheon, the party, over a hundred strong, went off by the Midland Railway for Woodchester, near Stroud, where the remains of the Roman villa within the area of the parish churchyard brought to light towards the close of the last century (though known to exist at an earlier date) are another member of the Cooness after its full discovery in 1797. Dr. Lysons published an elaborate monograph upon this villa, for which he rightly claimed the credit of being the finest known to exist in Great Britain; and, though several other examples have since been brought to light in various parts of the kingdom, as at Leicester, in the Isle of Wight, at Limsfield, and at Chesters, near Hexham, in Northumberland, the remark still holds true. The mosaic pavement of its great hall or atrium, for such it must have been, still shows its ornamental borders, and squares and circles, worked in bright red and blue; and the forms of recumbent Bacchanalian figures, coupled with those of tigers and pards above, can leave little doubt on the classical scholar's mind that the hall was intended for festive uses, for among the inscriptions which it bears is one which runs, "Panem eventum colite," and it will not be forgotten that Horace ascribes to the god "Bacchus" or "Liber" a particular efficacy in this direction, as he writes:—

Liber vota bonos dicit extans.

The building in its complete state must have consisted of more than sixty rooms; and in one corner are to be seen, though in an imperfect condition, the means of warming them by flues. The central atrium, which in a warmer climate would have been "hypocaustal," was probably here covered in, and the feasters were disposed around its four sides. The house is conjectured to have been a country residence of the Roman praetor or general, and experts consider, from the character of the ornamentation, that it dates from about the reign of Hadrian (A.D. 117), for whose use it may perhaps have been erected during his visit to Britain. The materials of which the pavement is composed are, or seem to be, small pieces of very hard brick, slightly glazed; but Murray, in his "Handbook for Gloucestershire," says that "the tesserae, except the white, are the produce of a hard calcareous stone, bearing a good polish, and resembling the Palombino marble of Italy, found in the vale of Gloucester." It is only at distant intervals that this "Roman Villa" is laid open for inspection, so that the members of the Institute were fortunate in the choice of the date of their Congress, and also that the Rector of Woodchester and his accomplished daughters have done all in their power to illustrate, by drawings and by the publication of a small volume,\* the treasures which they hold in their hands.

\* "The Mosaic Pavement and Roman Villa at Woodchester," by A. G. S. Published by White, printer, Stroud, 1890.

By the time that these lines reach the eyes of our readers the entire villa will have been covered up again for a certain interval of time; ten years have elapsed since it was opened previously, and large bodies of pilgrims from Gloucester, Cheltenham, Bristol, Bath, Tewkesbury, Worcester, and other large towns have seen it during the month that it has been open and "on view." It should be added that on Saturday's visit Professor Middleton gave a brief account of the building as soon as the party had assembled within the enclosure, and that a very general opinion was expressed by the Archaeologists that it would be most desirable, in the interests of architectural enquiry, to lay open further portions of the area once covered by this noble edifice.

Between three and four o'clock the party proceeded from Woodchester in carriages and brakes, through Stroud to Painswick and Prinknash. At the former village the party saw its fine church of the Debased style, but now under the process of "restoration." It consists of two chancels, a nave, a north aisle, quaintly ornamented with gargoyles, chantry chapel, south aisle, and tower, the latter surmounted by a slender spire, which was struck by lightning about seven years since, and had to be rebuilt in consequence. Not far off is the "Lodge," formerly the residence of the lords of the manor; the altar-stone of its old chapel has been formed into the lintel of a pigery; it bears a Latin inscription as follows: "HOC ALTARE DEDICATUM EST IN HONOREM SANCTI TRINITATIS ET OMNIUM SANCTORUM A NICOLAIO EPISCOPO SUPPREGANEO." Another relic of the old chapel, a window, gives light to the dairy. In the neighbourhood are some picturesque old cottages and farmhouses, some of the sixteenth century, or even older; and a mile off is a hamlet called "Paradise," with a quaint old inn, the "Adam and Eve." On the brow of Painswick Hill is an encampment dating in all probability from pre-Roman times; the mounds here, however, are much marred by the formation of large quarries cut in the hill-side in order to obtain the oolitic freestone so well known in this neighbourhood, and of which a large portion of Gloucester Cathedral is built. Tradition reports that Earl Godwin encamped on this hill; and certainly in later times the Royalist army was here, for a longer or shorter time, on its way to besiege Gloucester, and again in the course of its retreat. The Court-House at Painswick, built in 1604 (see sketch in this week's *Builder*, p. 150), is a good sample of Elizabethan architecture, just verging into Jacobean. Charles I. held a court here, as is proved by documentary evidence still in existence. The little town of Painswick was formerly of some importance from its woollen manufactures, and near it is another mansion, Painswick House, with a fine mantel-piece in its library, and here is preserved the bed on which Charles I. slept while he was staying at Matson House, near Gloucester. Prinknash Park, the seat of Mr. T. Dyer Edwardes (late the seat of the Ackers family), which the party visited along with Painswick, is one of the ancient, and perhaps the finest, residences of the former Abbots of Gloucester, and stands, according to Murray, "on a glorious but impracticable hill in the midst of a little forest, and commanding Elysium." Though much altered, it retains some of the exterior, and very much of the interior, arrangements of the fifteenth century. It is in excellent preservation, and indeed has never been allowed to fall into disrepair. The chapel was restored partly by the late Duke of Devonshire, and partly by the present owners, and is said in the local topographical books that Abbot Malvern made extensive repairs in the fabric about 1520, less than twenty years before the surrender of the Abbey into the hands of the King, and the great dining-hall was built as far back as the reign of Edward IV.; this is confirmed by the fact that its beams bear in their centre the "falcon and fetter-lock open," the favourite cognizance and device of that monarch. After seeing the house at their leisure the party returned to Gloucester in time for dinner.

No meeting was held, and so no paper was read, on Saturday evening; and Sunday also was a  *dies non*, so far as the Congress was concerned, except that in honour of their visitors the Mayor and Corporation went in state to the Cathedral, where the Dean preached an appropriate sermon. In the afternoon several members of the party made excursions on their own account, some to the ancient encampment at

Uley, near Dursley, while others explored the ruins of Llanthony Priory, or drove out to Matson, Brockworth, and Upton, where they were shown a lock of the hair of Edward IV., which is kept in an ancient lock of gold.

On Monday, as soon as breakfast was over, the party, to the number of about eighty, went by Great Western Railway to Andoversford, to inspect Withington Church, the Roman villa at Chedworth (which was discovered in 1861 or 1865), and Northleach Church. Withington Church is said to stand upon the site of a former and much earlier structure, the foundations of which, at least, must have been Saxon, for it formed the chapel of a convent of nuns established here by Wilfrid or Wilfrith, Bishop of Worcester, in the eighth century, and ultimately annexed by papal sanction to that see. The church is remarkable for its fine tower, adorned with curious gargoyles. It was formerly the burial-place of the Lords Chedworth, a title which became extinct about the end of the last century. From Withington the party drove on to Chedworth, to inspect, under the guidance of Mr. George E. Fox, a Roman villa, which was found here as far back as 1760, but was not really excavated till 1864, when that work was done at the cost of a member of the Farrer family. It is not to be compared, at all events, in beauty, with that at Woodchester, which was visited by the Institute on Saturday, but it consists of two courts, an inner and an outer one, and it contains its triclinium and corridors leading to the living and banqueting rooms, while there is a strong probability that the outer courtyard was intended for the stabling and barns. The special interest in Chedworth lies in the fact that it shows marked alterations in its original plan, and (to use Mr. Fox's own words) "Curious changes made at a late period of its existence, in order to adopt a portion of the building to other than strictly domestic uses." For instance, he remarks, "a series of chambers was inserted in the northern side, apparently appropriated to the object of carrying on the trade of dyeing and fulling." Of the outer courtyard only the northern wing remains, and it consists of a range of chambers, with a corridor running along the front of them; but these contain little or nothing of interest, except the fragment of a composite hypocaust. The whole of the western range of buildings, including the triclinium and the *therme* or baths adjoining it, can be made out by an observant eye. The triclinium has still the imperfect remains of a mosaic floor, decorated, as usual, with squares and braided borders, and with Fauni and Bacchantes in the intermediate panels; and in the corners are the presiding genii of the Four Seasons. Unfortunately, this pavement has been much damaged by the roots of trees, which have been allowed to grow between its once elaborate tesserae, and probably also by fire, as traces of ignition are apparent upon its surface. The rooms in this villa were about thirty-eight or thirty-nine. The following paragraph is in the words of Mr. Fox:—

"Not forming part of the villa itself, but attached to its wall of *encinte*, at the extreme north-western corner of the site is a semicircular recess, formed in the steep ground of the hill-side, with dwarf walls prolonging the apse on either hand. The enclosed space contains a little reservoir of water, still full, and still flowing as in the old Roman times; and amongst the mass of stones and earth which concealed the spot up to the time of its discovery, lay a little altar. . . . Above this site, in the woods, was yet another building, of which but little more than the foundation remains. This was without doubt, the place of sepulture of the inhabitants of the villa. An unusually large number of fragments of architectural details is to be found on this site, either placed on the ruined walls or half buried in the turf. . . . Amongst the most interesting of the contents of the museum which has been collected and arranged just outside the villa, may be mentioned three examples of the sacred monogram, XP, rudely scratched upon stones which appear to have served as steps to the fullers' court in the western angle of the villa."

We may be allowed to add here our own appreciation of the Museum, and assure our readers that the numerous objects of Roman art which fill its cases are well worth study, as they will assist the visitor in forming correct ideas about a time and a civilisation removed from us by many centuries, and so like in many ways, and in other ways so unlike, our own.

It was with regret that the party quitted Chedworth, but the inexorable hugh gave notice that it was time for them to press on to Northleach, where a handsome parish church (see our illustrations this week) awaited their visit. Here they found an interpreter in the Rev. J. W. Sharpe, a short notice from whose

pen was placed in their hands. The church, as it now stands, is of the latter half of the fifteenth century; but it stands on the site of one of far earlier date; for Sampson, Bishop of Worcester, granted it, with its tithes, to St. Peter's Abbey, at Gloucester, and Pope Innocent III. confirmed the grant. It now consists (see plan on p. 148 of this week's *Builder*) of a large nave with north and south aisles, a chancel with side chapels, a western tower, and one of the very finest and most richly ornamented south porches in the kingdom. The porch bears in niches figures of the Trinity, the Virgin Mary with the infant Christ on her knee, and other saints; and on the hutchesses are niches for others. The symbols of the four Evangelists, though much defaced by time, are still to be discerned on the weatherings of the hutchesses. The roof of the porch is richly groined, adorned with bosses, and studded with heads of angels and saints. The windows, especially those in the south aisle, have still some rich painted glass, and amongst the saints figured on it is St. Lawrence. At the east end of this aisle is an elaborate reredos, which has been much hattered; but the scullia in the chancel are in a better condition. The old altar steps remain in the north aisle; and among the devices here are to be seen the arms of Beauchamp, and the badge of the hear and ragged staff of the house of Leicester. The nave is fine and spacious; it was heightened, if not rebuilt, by John Fortey, a rich woolstapler of the town. It is of five bays; the pillars are lofty, with depressed arches. A small ogee bracket balances the caps under the soffits of the arches. In the second bay on the north, as at Camden, are semi-caps, to carry, perhaps, a canopy, as at Barford, in Oxfordshire. The pulpit is of stone. The clearstory is a transparency of large pointed windows; in the east end is a broad elliptical window of nine lights. The parapets outside are embattled with diagonal pinnacles, which rise from square crocketed hutchesses, one to each embattlement. A figure of John the Baptist, the patron saint of John Fortey, occupies an elegant canopy in the eastern apex. The angle buttresses of the chancel have fine niches, and the remains of rich sculpture on the weatherings. The tower is a grand and massive pile, in four stages. The heltry windows are flanked by sculptured compartments, pedimented, pinnacled, and crocketed. Lofty as is the tower, yet there are to be seen inside preparations for a contemplated spire. The lower portion of the tower is, in fact, a lantern, lighted by a large double-arched window. In the groined stone roof are carved the heads of a king, a queen, an abbot, and a civilian. The altar-cloth is made up of several magnificent copes, which were preserved entire until within the last few years. It is interesting to learn that the old stone slab of the high altar has lately been discovered, marked with the five crosses which denote its original consecration; it measures 10 ft. by 3 ft., and is over 8 in. thick. The church contains no fewer than eight old brasses—one to a priest, and the others to the Forteyes and other woolstaplers, who built the fabric out of, let us hope, their honest gains.

The above remarks are extensively abridged from Mr. Sharpe's notes, and it is to be hoped that the efforts of the late and present vicars for the repair and conservative restoration of this church may be successful.

At the concluding meeting, held in the great room of the Tolsey on Monday evening, the Rev. Sir Talbot Baker was in the chair, and he said that in consequence of the death of one of the members of the Congress (Mr. H. Ross) the Council would not, as a Council, take part in the proceedings of the last day of the meeting, but would leave it to individual members to go to Berkeley Castle or not, as they pleased. The usual votes of thanks were proposed—to the Mayor and Corporation, to the Bishop and the Dean of Gloucester, to the officers and members of the local Archaeological Society, to those gentlemen who had kindly read papers or delivered lectures, and finally to the President of the year, Sir John Dorington, for the able and excellent address with which he had inaugurated the proceedings of the Congress.

On Tuesday, soon after breakfast, with slightly diminished numbers, but still nearly eighty strong, the party went over by train to Berkeley, where the Rev. Mr. Bazeley had promised to act as their guide and interpreter by reading a paper on the history, antiquities, and architecture of that noble building; but as Berkeley Castle is so very generally known to

all travelled Englishmen, it will not be necessary to give more than the briefest outline of what he said. He ascribed the foundation of the castle, situated on a strong plateau, which is nearly surrounded by meadows and lowlands, to Fitzhardinge, said (but by a doubtful tradition) to have been a scion of the Royal house of Denmark, but certainly a companion-in-arms of William the Conqueror. The Fitzhardinges intermarried with the Berkeleys, and on settling down at this castle, took the local name, and the manor, estate, and castle have since then passed down through twenty-six generations of Berkeleys to the present owner, Lord Fitzhardinge. Mr. Bazeley then described minutely the outer walls, with the moat, now dry, giving the measurements of the area contained in them, and also of the quadrangle,—if the inner court, so irregular in its ground-plan, can be so designated. He gave also the measurements of the great hall, of the kitchen, of the keep, and of the semi-circular towers by which it is flanked, and of the tower in the rear, the armament-room, the chapel, &c. He also gave a list of the nineteen principal portraits with which the hall is adorned. He failed, however, to draw attention to the fact that the great fireplace stands in the very unusual place of the top, instead of at one side, of the hall,—an arrangement which can only be accounted for by the narrowness of the spaces between the windows on either side. The chapel, which is very small in proportion to the hall, was much admired on account of the quaint oak pew at the western end, with its carved oak work, and the confessional,—for such it undoubtedly is, or, rather, was,—hollowed out in the southern wall. The party then inspected the buttery and kitchen; and were shown a deep dungeon, now a dry well in one of the towers; and also the chamber in which, if tradition speaks truly, the unfortunate Edward II. was so cruelly and barbarously murdered by the hands of the two knights, his custodians, Maltravers and Gurney, at the instigation of the Queen-Mother, Isabella, "the she-wolf of France," and her paramour, Lord Mortimer. Some of the party also ascended the keep, and enjoyed a walk upon the leads, following the track of the Warder's walk, from which they obtained a good view of the general plan of the castle, and also of the surrounding country, with the Severn, and the Monmouthshire hills beyond it. A vote of thanks to Mr. Bazeley was passed by the party whilst assembled within the walls of the keep. In the great hall there was put out in cases for their inspection a very good collection of ancient charters relating to Berkeley, mostly along with their seals, in good condition; beside them were the maces of the towns of Berkeley and Wotton-under-Edge, which were pronounced to be of more than average excellence for places so small in point of population. A gentleman from the British Museum offered the party a few remarks on the charters; but, like too many lecturers on such occasions, he was almost inaudible, and his hearers accordingly straggled off in different directions.

After luncheon, an hour was devoted to an inspection of the handsome Early English parish church which adjoins the castle, and which has, in the opinion of some who were present, been rather "over-restored" by Sir Gilbert Scott. It consists of a fine and spacious nave, chancel, and side aisles; and the choir is separated from the nave by a noble stone screen, richly carved. At the end of the nave, in front of the pulpit, the party had shown to them the fine monument of Thomas, second Lord Berkeley, and of Margaret, his wife. The figures are carved in alabaster, and lie recumbent on a large and handsome altar-tomb. The rest of the church does not call for much remark, except for the curious position of its tower, which is situated in the churchyard at a distance of some 70 ft., or 80 ft., to the north of the north porch. It was rebuilt in 1760 on the old lines, but not very successfully, as the details of Gothic architecture were not well known at that time. Its appearance, therefore, is scarcely satisfactory to the eye of an ecclesiastical architect, though it is good for the age in which it was rebuilt. The previous tower stood in the same spot, but it had become impaired, and the present replica is the result. It was mentioned by one or two of the party that the church tower occupies a similar isolated position at Beccles, in Suffolk; at Elstow, in Bedfordshire; and at Magdalen College, Oxford.

The return journey to Gloucester, early in the

afternoon, brought to an end a Congress which, in spite of one sad incident, has been a most pleasant and successful one.

#### HALL FOR THE CHORAL SOCIETIES' FESTIVAL IN VIENNA.

THE accompanying plan and two sections represent the temporary building which has been erected at Vienna for the fourth Festival of the Deutsche Sängerbund (German Choral Societies' Union), which was held, with every evidence of Teutonic enthusiasm, on Saturday and Sunday last. They have been forwarded to us by the architect, Herr Herrmann Otte, and, though unfortunately on too small a scale to show the details of construction and design, they indicate the principle on which the hall has been planned and constructed, and may be of some interest as an example of a class of structure in which the German architects excel us,—partly, perhaps, because they are more often called upon to exercise their talents in this way. We are not aware at what intervals of time the German Choral Societies' Union hold their great Festivals,—we observe that this is the fourth of a series; but such meetings of combined choirs, for part-singing on a great scale, have been for many years a favourite form of musical function in Germany. In the present case provision was to be made for a chorus of no fewer than 8,000 persons, a kind of thing of which we have no experience in England on the same scale,—our Handel Festival chorus, which is a quite exceptional gathering, amounting to only 4,000 singers.

The architect, it will be seen, has adopted the form of a long room rounded at both ends. The rounding of the seats for the singers is to a certain extent a necessity, in order that they may hear each other and may be all equally within sight of and under the control of the conductor; but we doubt whether it would not have been better to have had a segment of a circle only instead of making a complete semicircle and continuing the seats to some extent in a straight line facing each other. The singers occupying this portion of the seats would really be singing at each other and not at the audience. Nor do we recognise any practical advantage in making the opposite end of the auditorium of similar curve; in the case of a solid-walled building there would be a distinct disadvantage in this, inasmuch as it would focus an echo on the portion of the audience around the centre of the circle; in a timber building like this, with so many projections in the way of roof-timbers and story-posts to break up the sound, this echo would probably not be very perceptible, whatever were the form of the end plan of the room; and no doubt the circular end has a finer appearance and leads to a more symmetrical architectural treatment both internally and externally; but that is its only advantage.

The following descriptive particulars were forwarded to us along with the engravings:—

"The Committee decided on erecting a hall capable of containing 20,000 persons for the Choral Festival to be held in Vienna this summer, and tenders were solicited for the design and construction of the building. Among the six offers received, the selection fell on the design submitted by Herr Herrmann Otte, architect, of Vienna, to whom the construction was entrusted on an estimate of 65,662 florins. The building material will remain the property of the contractor.

The hall, with its semicircular ends, is 116 metres long, 56 metres wide, and 23 metres high in the centre. The hall will be formed of combined semicircular plank rihing secured into the ground.

The manner in which the plank rihing is put together and the construction of the profiles, are quite new. The plank ribs (or arches) are thrown over the entire span, and only receive some additional support from the side columns which carry the gallery.

In consideration of the great capacity of the building, forty-five passages, each 1.60 m. wide, are provided on both sides, and radiating towards the narrow sides, so that the public, when leaving the hall, can reach the outlet by the shortest way. In the same manner one can pass from the gallery to an open balcony, 4 metres in width, which surrounds the whole

\* We received also a pictorial view of the exterior of the building, but the engraving was too coarse in execution to be suitable for publication here.

hall, and whence wooden steps, 3 metres wide, lead to the ground.

The orchestra, for 8,000 singers, rises on three sides from the conductor's desk, and is formed in somewhat the section of a basin. Under this is placed the section of a basin for the singers. The dressing-rooms are in the three portals, and the lavatories in outhouses, which are connected by a passage with the hall.

Small beer buffets are situated under the landings, while the large refreshment room is placed at the back on the long side of the hall, and is 50 metres in length. Behind this are the offices.

The tuning-rooms are on the first floor of the portal adjoining the trihune. The band which plays during the intervals between the songs is

placed in the gallery opposite to the main entrance of the long side. The gallery for the flags runs all round the hall above the spectator's gallery.

The building is lighted by large lateral openings, which are covered with white painted material, in order to subdue the light. The ventilators are at the highest point of the roof.

The inspection rooms for doctors, the police, fire, and safety brigades, also offices for the committee, post, and telegraph, are arranged in two small buildings outside the hall.

The grounds are surrounded on three sides by a hoarding, and on the fourth, towards the "Prater-Allee," by a railing, in the middle of which is the entrance, with twelve ticket-takers' boxes and turnstiles. The hall and grounds are lighted by electricity."

LONGITUDINAL SECTION.

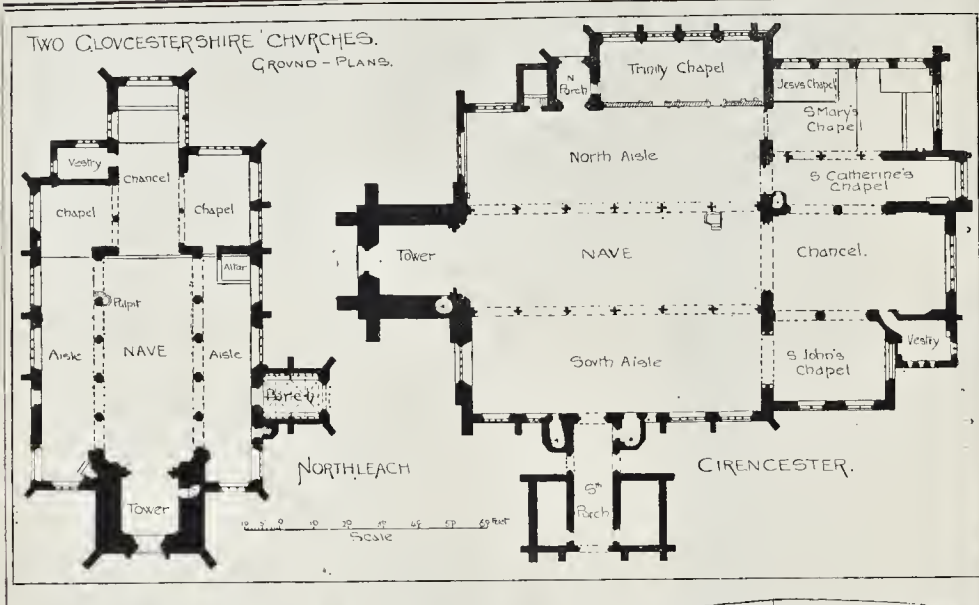

PLAN.

CROSS SECTION.

Temporary Concert Hall for the Festival of the German Choral Societies' Union at Vienna.—Herr Herrmann Otte, Architect.

**Illustrations.**

**SCULPTURE FROM THE SALON OF 1890.**

THE two works in sculpture illustrated this week were both among the fine collection in the Paris Salon of this year, and were mentioned in our article on "Some Sculpture of the Year" in the *Builder* for May 31 last.

M. Marqueste's group, "Perseus Slaying the Gorgon," is a highly-finished work in marble which occupied a central position in the exhibition, and was purchased by the State. Perseus is represented as grasping Medusa by the snaky hair, in order to keep her deadly countenance away from him while he prepares to decapitate her. Both figures are finely modelled, that of Perseus being full of calm and conscious power. The helmet on his head is a beautiful bit of decorative design.

M. Levasseur's work, "The First-horn," was a plaster model which occupied a position among a row of remarkable works at one side of the sculpture court, under the gallery. The motif of the work is a very old one, which has often afforded a subject to sculptors; it is remarkable for the fine and harmonious composition of the three figures, which is still better seen from a point of view rather more to the right of the photograph from which our illustration is produced has been taken rather too much in front, and foreshortens the figures of the mother and child more than is desirable; but from the peculiar composition of the work it is rather difficult to find any one point of view which is altogether satisfactory for photography.

Patera from Sedilia, Northleach.

Font Northleach.

**TWO GLOUCESTERSHIRE CHURCHES: CIRENCESTER AND NORTHLEACH.**

NORTHLEACH CHURCH has been visited by the Royal Archaeological Institute during the Gloucester Congress which concluded on Tuesday last, and we give in the present number the ground-plans of it and of Cirencester Church, and some views illustrative of the principal points of interest in each. Both churches were referred to by us in our leading article on the neighbourhood of Oxford last week, and we then drew attention to them as in some ways possessing points of resemblance to the large churches of Burford and others in the west of Oxfordshire.

The church at Northleach is almost entirely Perpendicular in style, and is chiefly remarkable for its lofty western tower and magnificent south porch. Both these are shown in our plates. There is also a good font, and an ex-

cellent pulpit, and the delicate patera on the sedilia should not be overlooked (see sketches).

At Cirencester is another large porch,—so large, in fact, that one of its upper rooms was used as a town-hall. The church itself is very spacious, and has a particularly noble nave. Here, too, is another pulpit, of somewhat curious design. In the eastern part of the church we find traces of an earlier building, and we give a drawing of a fine Early English cap, which forms the central feature in the arcade dividing the Chapel of St. John from the chancel.

There are some interesting caps at Deerhurst church, showing the development of the Early English foliated cap from the Norman cushion form, and two examples are here given. An account of some of the places in the county will be found in the *Builder* of January 29, 1887, in which also occur an illustration of the Saxon chapel and picturesque house adjoining, which formed one of the points of interest during the Institute Congress. A view of the exterior of

Tewkesbury Abbey was given by us January 29, 1887, and two tombs from the interior on December 18, 1886.

**DECORATION AND GLASS, FOLKESTONE PARISH CHURCH.**

We illustrate the north wall of the aisle of Folkestone parish church, which has been recently extensively decorated with a series of pictures and other mural ornamentation. The pictures shown are the first three of the "Stations of the Cross." In size they vary from 5 ft. to 12 ft. in length, the height of each being 8 ft. They are executed on mahogany panels, and let into the wall, the chief object of this being that the work should be executed in the studio of the artist. The colouring of these pictures is exceedingly subdued in tone, giving more the effect of tapestry on the wall. The stained glass is also particularly quiet in colour, with almost a total absence of ruby and blue;

rooms, on either story, direct to the Turkish baths. The corridors are level throughout on each floor; they are wide and well lighted, and will form pleasant promenades. A number of the front bedrooms on the principal floors will be specially arranged as sitting and bedroom combined, on the Continental system. The lighting throughout will be by electricity.

Suitable gate lodges and stables will be provided.

The cost of the building is approximately estimated at between 40,000*l.* and 50,000*l.*

The architects are Mr. R. Knill Freeman, F.R.I.B.A., of Manchester, and Mr. S. Denison Robins, of Newcastle.

THE ARCHITECTURAL ASSOCIATION EXCURSION.\*

ON the fourth day of the excursion (Thursday, August 14), the train was first taken to Witney, the concluding point of the previous day's work, and from there the party proceeded by the "Burford" bus—a change by no means for the better after the well-appointed four-horse coaches on which previous rides from Oxford had been made. Architecturally, this was decidedly the best day of the week, the head-quarters, of course, being *hors concours*. The weather, too, was fine, though dull and cold, a fortunate circumstance considering the state of the roads, the hilly route, and the limited capabilities of the Burford horses, which managed, with considerable effort, to take the party over five miles in fifty-five minutes. The first halt was made at Minster Lovell, where the hour and a quarter allowed were found all too short for the adequate study of the church (see illustrations in last week's *Builder*) and manor-house. The next stoppage was at Asthall, or, possibly a corruption of Asthall-leigh, the village being situated in a valley, which would justify the suffix. Thence progress was made to Burford, where the church (see illustrations in last week's *Builder*) and priory, to say nothing of the old houses in the town (some of which were illustrated by us last week), justified the allotment of the five hours and a quarter set down in the programme for the stay here, and disconcerted the intentions of some of the members to return to Oxford at an earlier hour in order to see the "Town" regatta and fireworks. The return was made by the "Burford bus" to Witney, whence train was again taken to Oxford.

The fifth day's outing (Friday, the 15th instant) commenced with a drive to Woodstock, in the teeth of the strong wind which has been so severely felt on the coast, and which the bicycling members found especially trying for the first part of the day. After waiting at Woodstock for the hour of eleven, at which his Grace of Marlborough opens his gates to the public, the party proceeded to view the famous palace of Blenheim, —or at least so much of it as is shown to the ordinary everyday sightseer, a favour which hardly satisfied the dignity of members of the Architectural Association, especially as they, like other sightseers, were charged the sum of one shilling each by his Grace for the favour. These circumstances, perhaps, contributed in some degree to the openly-expressed disapproval of the work of Vanbrugh, who, in the opinion of the members, seemed to deserve all that has been said of him in the well-known epitaph, and more. The fine church of Kidlington (illustrated in last week's *Builder*) was next visited, together with the almshouses; and after luncheon the party proceeded to Water Eaton, which, by the strategy of the drivers, was reached after a mile's walk across the fields. The interesting manor-house (see illustration in last week's *Builder*) and church of Water Eaton quite restored the equanimity of the visitors, and obliterated the effects of the disappointment at Blenheim, so that all reached Oxford thoroughly prepared to enjoy the final dinner and the usual convivial evening afterwards, during which the scene of next year's excursion was discussed and the committee of management elected.

The last day (Saturday, the 16th), was, as is customary, somewhat broken, several members departing early. A small party, however, visited some of the more important colleges omitted on Monday, including Worcester, St. John's, Trinity, the Radcliffe Library, and the Sheldonian Theatre, and thus brought to a close the twenty-first excursion of the Architectural Association.

\* Concluded from p. 129, ante.

the subjects represent five of the Archbishops of Canterbury, with scenes from their lives. The design for this work was exhibited in the late exhibition of the Royal Academy, and we noticed it in our issue of June 28 last. It is the work of Mr. Alfred O. Hemming, of Margaret-street, Cavendish-square, who is now, we understand, carrying out the remainder of his scheme on the south wall, and hopes to have all completed by the end of this year.

REEREDOS, ST. MARY'S CHURCH, ABERAVON.

THE new reeredos in St. Mary's Church, Aberavon, is the gift of Mrs. Llewellyn, of Baglan Hall, and has just been formally dedicated. It is constructed of alabaster, with richly-coloured Irish green marble columns. It consists of an arcade of five arches, containing figures in white marble, of which the central one represents the Good Shepherd, while the other four are figures of the four Evangelists. All the arches or niches have mosaic backgrounds, and the whole is finished with a richly-moulded and carved cornice. The side arches are finely-moulded, and the panels are carved throughout. The marble and alabaster work was executed by Mr. Clarke, of Llandaf. The figures, by Mr. H. H. Armstead, R.A., were exhibited at the Royal Academy this year, and of one of them, that of St. John, we gave an illustration to a larger scale in our article on "Some Sculpture of the Year" in the *Builder* for May 31 last. Messrs. Kempson & Fowler, of Llandaf, designed the work. Our illustration is from a drawing exhibited at this year's exhibition of the Royal

Academy. The total cost of the work has been about 1,200*l.*

SPRINGBANK HYDROPATHIC ESTABLISHMENT, HARROGATE.

THIS new building will stand in the centre of a site of nine acres which has been acquired in the best position in Harrogate, adjoining the Spa grounds, with a frontage to the Ripon-road. It is close to the Montpellier Baths and Winter Gardens about to be erected by the Corporation at a cost of some 47,000*l.*,\* and also near to the Sulphur Wells. The position and contour of the land render it peculiarly adapted to the purpose, and when laid out, the grounds, which are well wooded, will be very picturesque. The part near the building will be arranged as terraces falling towards the Spa grounds, the remainder being treated naturally, with a small lake in one part. Numerous tennis-courts are provided. This work has been entrusted to Mr. T. H. Mawson, Landscape Gardener, of Windermere. The building will be of stone, in the Renaissance style. It will contain about 200 bedrooms, a large Dining Saloon to seat about 350, large and small Drawing-rooms, Library, Reading, Smoking, and Billiard-rooms, &c. It will also have a large Winter Garden and Entertainment Hall, with retiring rooms, &c. The Turkish and other baths will be in the centre of the building at the back, and will be fitted up with the newest and most approved appliances. Lifts are so arranged that patients can be taken in wheeled chairs from their

\* We published elevations, plan, and sections of this building (Messrs. Baggallay & Bristowe, architects) in the *Builder* for August 2.

OLD COTTAGES, GLOUCESTERSHIRE.—VI.

OWLPEN MANOR-HOUSE, illustrated on August 9 [p. 107, ante], is a most interesting old place, as the greater part of it remains, save for decay, in its original state. On a panel in front is a coat of arms, and elsewhere the date 1616 and the initials T.D., for Thomas Daunt, who was no doubt the builder of the house. Some of the windows retain the old fancy glazing, and as nothing seems to have been done to the house for about one hundred and fifty years, this is some proof of the comparatively modern nature of much of the square and diamond quarries after it had been in existence about one hundred years. There is much nice ironwork of a simple character remaining to the doors, and one room is panelled with oak, which has been distempered brown, and a rude sort of tree pattern painted on it in a darker shade. This is a probably original instance of what I mentioned in speaking of Surrey, that our ancestors, even before the introduction of the Dutch taste for paint, set little store by the beauty of the natural grain of wood. Another bedroom is hung with original "German waterwork" tapestry. In the offices is a sort of "hot-plate" of stone, containing round places which were filled with lighted charcoal, and fitted with vessels on the top. One wing was modernised about Queen Anne's time, and is all that is now inhabited. It is much to be hoped that while the house is preserved in its present condition as a most interesting genuine specimen, care will be taken that it does not fall into decay. There is an old-fashioned garden in front, with very large clipped yews which I have taken the liberty of showing more on one side than they exist. There is also a good flight of steps and gateway.

Painswick is a very clean and picturesque town, almost entirely built of the famous stone, which appears to be very weatherproof. The Court-house (Fig. 1) is a large house adjoining the churchyard, and is so named from the fact that in 1643 King Charles I. held his court here at the time of the siege of Gloucester. He is supposed to have used the room with the bow-window, which was built on to the original house in 1640. The other side of the house is a very good specimen; but the ivy has been allowed to grow too thickly, and destroys its picturesqueness, and renders it "unsketchable." The hall was in the centre, with the entrance, and small gable over it, on one side. This part is dated 1604. The house is excellently cared for by its present owner, Mr. U. J. Davis.

Two other sketches at Painswick are of two separate pin mills, the first erected in this country. One (Fig. 2) has a picturesque conjunction of large and small gables; the other (Fig. 3) with the porch has the date 1678 on a shield (Fig. 4) over the porch. The gables contain the chimneys, and the small windows on each side light the chimney-corners and cupboards.

Fig. 4.

In the porch is one of the oval windows generally found in the gables of the houses, and, therefore, generally inaccessible. I am able to give measurements of this and sketches (Fig. 5) of several other varieties; other forms will be found in the views. The reversal of these internally seems generally to be square, and the openings had often only a shutter, but I have found in a house at Stroud, illustrated some time ago, one instance of original lead glazing.

The house at Steanbridge (Fig. 6) I regard as a useful example of how absolutely little, beyond a happy proportion, is required for successful effect. There is nothing here but a perfectly plain wall and roof, with grouped windows, and yet the result is more pleasing than many a more elaborate building. This also is probably quite accidental, as the parapet is certainly of later date than the windows, and I have no doubt there were originally a series of gables, as on other buildings of the period. There is another lesson here that has struck me forcibly in studying the buildings of this neighbourhood, and that is that, given certain formal shapes and details, it is important that they should not be displayed symmetrically. Thus, the mullioned windows are almost monotonous in form, and so are the gables. In the few instances in which these are all symmetrically arranged, there is a certain monotony of effect.

Fig. 5.

Fig. 6.

spacious and populous town in Flintshire. He hoped that at no distant time its prosperity might be again renewed. The President, lastly, told his audience of the antiquities on his own property, amongst the most important of which were the great pre-Norman cross known as the Maen Achwynfan (or Stone of Lamentation) and the Roman Pharos, by which the ships were enabled to steer their course up the River Dee. Lord Mostyn concluded his admirable address by cordially inviting the Association to visit his house on Friday.

Archdeacon Thomas, in returning thanks to the President for his address, remarked that he thought a great opportunity had been missed when the last edition of Pennant's "Tours in Wales" was published. It had not been brought down to the present date in the same spirit that it had been begun. To execute this work in a more becoming manner, he thought, was a task that Lord Mostyn was eminently fitted to perform. He hoped they might live to see him undertake the editing of Pennant's "Tours." He also commented on the value of the "Chronicle of St. Werburg," as throwing light on the early history of Flintshire.

After the annual report of the Association had been read,

Mr. Henry Taylor, F.S.A., of Chester, was called upon to read his paper on "The First Charters Granted to the Four Senior Boroughs of Wales." The learned author traced the development of municipal institutions from the time of Edward I., showing the diplomatic policy adopted by this monarch in establishing merchants' guilds in the towns, which should act as a check upon the power of the feudal lords in the country. He said he believed Flint to be the birthplace of municipal institutions in Wales, and it was at this place that the first four Royal Welsh Charters were signed.

The paper was followed by a discussion, in which Messrs. Banks, Owen, and others took part, one question in dispute being whether the merchants' guilds were composed of Welshmen or Englishmen.

On Tuesday last the carriages started from the "King's Head" Hotel, at Holywell, at 9.30 a.m., taking the road towards Mold in a southerly direction along a hill-side. Had the day been finer, a good view would have been obtained across the estuary of the River Dee. As it was, only the nearer objects could be distinguished. The leading industry of the district appeared to be lead-mining, and vast heaps of limestone debris were to be seen in all directions.

The first stop was at Halkin, nearly four miles from Holywell. Here the Rector, the Rev. Walter Evans, acting in his capacity of Local Secretary for the meeting, pointed out the peculiarities of the church. The present structure was erected at the expense of the Duke of Westminster by Messrs. Douglas & Fordham, of Chester. It is built of yellow sandstone, with a good deal of polished marble within. The churchyard is entered under a well-designed timber lych-gate, and the modern carved woodwork inside the church deserves careful study. The whole of the present church is new, with the exception of a piece of sculpture, perhaps of the fourteenth-century, built into a buttress on the south side of the nave outside, at the east end. It was found by the Rev. Walter Evans in the belfry of the old church (built in 1763), used as a stone for the ringers to put their feet on. The sculpture possibly formed part of the churchyard cross. The subject represented is the Crucifixion, with

in spite of the first sight being somewhat imposing. In a number, however, there is a great variety and want of symmetry in the way the windows and other features are put together, and it is this happy combination to which they owe their picturesque appearance. A certain "stiffness" seems still to have been felt in many of them, and this was remedied at what seems to have been a later date by coatings of ornamental plaster over the main walling. Very few examples remain of this, but I shall speak of it later on.

Near Painswick is what is called "The Lodge," the remains of an important manor-house, containing some interesting Mediaeval fragments, and an inscription, but nothing for sketch,

RALPH NEVILL, F.S.A.

THE CAMBRIAN ARCHAEOLOGICAL ASSOCIATION AT HOLYWELL.

The forty-fifth annual meeting of this Association was commenced at Holywell, in Flintshire, on Monday last, under the presidency of Lord Mostyn.

The first impression made by Holywell on the mind of the stranger is that the days of its greatest prosperity are gone by. The town is situated a mile and a half from the station, being reached by a road up the valley formed by the stream flowing from the far-famed well of St. Winefred, which gives the place its name and chief celebrity. One is rather startled to see a notice over an inn near the railway station to the effect that "St. Winefred's Fine Old Welsh Ales" may be drunk on the premises, in memory of the saint is generally suggestive of water, rather than ale, but the meaning of the notice is explained by the fact of there being a St. Winefred's brewery not far from the well. Just before entering the town a great mass of foliage is seen high above the road, and the left is St. Winefred's well, with the

picturesque old buildings which enshrine it. For the present we must be content with a passing glance, and hurry on to the "King's Head," a pleasant, old-fashioned hostelry, where the Association made their head-quarters.

The proceedings of the meeting were opened by the President's inaugural address, which was delivered in the Town Hall. It was a model of what such an address should be—not too long and not too dry. Lord Mostyn avoided the error, made by so many persons who have occupied a similar position, of treating his audience to a learned disquisition on archaeology from the pre-historic period down to the present time. All his remarks were to the point. He touched lightly only on such subjects as were likely to interest those present, and treated everything with a characteristic lightness of touch. He commenced by pointing out that the portion of Flintshire to be explored during the week's excursions was the sacred ground of Welsh archaeology, as being the birthplace of Thomas Pennant, the great topographical writer of the last century, and author of the "History of the parishes of Whitford and Holywell." Downing, the house where he lived, would be visited on the following Friday. He next referred to the date of the foundation of Basingwerk Abbey, and gave many curious particulars with regard to St. Winefred's Well, mentioning that within recent times quarter-sessions and assizes were held in the chapel above it. He said that Pennant gave the name of a fool-hardy individual who used to risk breaking his neck by jumping off the wall of the church-yard into the well. The President spoke of James II's visit to Holywell, when he cured diseased persons by the laying-on of hands. He wondered also whether any of the gold rings, set with his hair, which the King had given away during his visit, were still in existence. Coming down to a later period, he observed that when George II. was proclaimed King in 1727, Holywell was described as the most pro-

figures of St. Mary and St. John, each having the head inclined on one side, so as to look up at the Saviour. The folds of the drapery are as sharp as when first carved, assuming that the sculpture has not been tampered with by attempted restoration. Beneath is an angel, with a cross on the forehead, supporting the crucifix, which is placed under a small cusped canopy.

A mile and a quarter beyond Halkin the members left the carriages to walk up to the top of a hill, 993 ft. above the sea-level, called Moel-y-Gaer. The whole of the summit is enclosed within a single rampart of stones and earth, with a ditch on the outside. This hill fort is probably ancient British. It commands a fine view of the Moel Famau range of mountains, which were, however, on the present occasion unfortunately concealed from view by a dense black mist hanging over the whole valley.

Rejoining the carriages at the foot of the hill, a drive of two miles in an easterly direction brought the party to Northop Church. The most remarkable feature about the exterior is a massive Perpendicular tower, 98 ft. high, built in five stages, at the west end of the nave. The church has been recently restored and furnished with carved oak seating. The plan consists of a nave and chancel of the same width, with a north aisle continued along the whole length of both, and separated by an arcade of six pointed arches, springing from octagonal pillars. The old Perpendicular roof of low pitch still remains. The portion over the chancel has been decorated with painting. At equal distances along the north wall of the north aisle are four effigies placed in arched recesses in the wall, three being those of knights in plate armour, and one that of a lady under a canopy. The inscription on the effigies of one of the knights is in late Lombardic capitals, as follows:—

BIC : IACCC : IC6 : VAC6 : AP :  
BLEED : VAC6.

[Here lies Ithel Vychan ap Blodd-Vach].

The effigy of the lady is inscribed in almost identical characters:—

DIE : MAI : ANNO : DNI :  
M : CCCCLXXII.

I. . . day of May in the year of our Lord 1472.]

On the edge of this effigy was another inscription, but it has all been chipped away except the letters V C V. Pennant conjectured from this that it might have been the tomb of Leuel Llwyd, who died in 1482.

From Northop the party proceeded to Mold, two miles to the south, where after luncheon and a short rest the parish church was inspected. The plan consists of a nave with north and south aisles, separated from it by an arcade of seven Tudor arches, having a western tower built in 1770, and an apsidal chancel of octagonal shape, not more than fifty years old. The effect of seeing the three windows of the apse through the wide chancel arch from the west end of the nave is not by any means unpleasing. The nave and aisles are Late Perpendicular in style. The arcades are very richly decorated with sculpture. Above each pier is an angel holding a shield bearing a coat of arms; in the spandrels are other similar shields, but smaller, and a frieze of heasts runs the whole length of the church above the points of the arches. The devices on the shields are partly religious, consisting of the emblems of the Passion, and partly heraldic. Amongst the latter were to be seen the curious representation of the eagle carrying the swathed body of an infant in its claws, which was adopted as a coat-of-arms by the Stanley family. The clear-story windows are square, and very small. There are several fragments of old stained glass in the windows of the north aisle. One small piece bears the date 1500. Over the north door of the north aisle was remarked a beautiful painted glass window, with two coats-of-arms and inscriptions beneath; the one on the left being the royal arms of Henry VII., with a request to pray for the soul of David ap Res, a previous vicar of Mold; and the other, on the right, the Derby arms, with a request to pray for the soul of Edward, Earl of Derby, who died in 1572. A frieze of heasts runs round the whole of the church outside, as well as inside. The porch has a stone roof.

Leaving Mold the members drove on to Pentre Hobin, a mile and a half to the south-east, the residence of Mr. Pennant A. Lloyd. The house is built of yellow sandstone, and is an interesting example of old Welsh domestic

architecture, with mullioned windows and oak-panelled rooms. The date on the doorway is 1540, and that over the curious carved oak chimney-piece in the dining-room, 1546. Adjoining the house is a series of eight vaulted cells, erected by an ancestor of the present owner in order to afford accommodation to the travellers, after the dissolution of the monasteries, when the monks could no longer entertain strangers. The cells average 5 ft. by 7 ft. by 6 ft. high, and each has a small entrance doorway, and an aperture for ventilation at the side of it. The cells are all covered by one roof. At one end is a building containing a room for the superintendent, which is reached by a short flight of steps.

After Pentre Hobin the next place visited was the Tower, half a mile to the south-west, a Medieval fortified house where in 1465 Beinnalt ap Gryffydd ap Bleddyn killed Robert Byrne, the Mayor of Chester, after a faction fight at Mold fair. The stanchion in the tower, now used as a dining-room, is traditionally believed to have been made use of to hang the Mayor, but it was more probably intended for the suspension of a chandelier. The present owner, Mr. Howard, has modernised the building, but without destroying any of the ancient features.

On the return journey to Holywell the party again passed through Mold, getting just a glimpse of the once strongly-fortified mound called the Bailey Hill. The last stop was at Gwasaney, two miles north-west of Mold, the residence of Mr. Philip B. Davies Cooke, who entertained the members to tea, and also read a paper on Bulo Castle. Mr. Davies Cooke exhibited some of his Welsh MSS. He is the fortunate possessor of the original MS. of the "Liber Landavensis," but it could not be seen on this occasion, as it is being copied at Oxford.

A drive of over seven miles brought the party back to Holywell.

We will next week continue our account of the proceedings.

## Books.

*Public Libraries: a History of the Movement and a Manual for the Organisation and Management of Rate-Supported Libraries.* By THOMAS GREENWOOD, F.R.G.S. Third Edition. London: Simpkin, Marshall, & Co. 1890.

THIS admirable and comprehensive manual, now in its third edition, has been entirely rewritten. It extends to nearly 600 pages, and its carefulness and completeness are such as to render it a reliable source of information to all who are interested in the provision of public libraries. As the author points out, the feeling in favour of the adoption of the Public Libraries Acts has been rapidly growing during the last few years. Four years ago, when the first edition of this work was published, only 133 places had adopted the Acts. But up to June 25 last, while the third edition of the book was in the press, 209 places had adopted the Acts, 21 of this number being metropolitan parishes. Seventy-six adoptions of the Acts in four years, against 133 for the previous thirty-six years, may certainly be considered a very satisfactory record, and it is one which has afforded great delight to Mr. Greenwood, who is an enthusiastic upholder of the Free Libraries movement, about which he is thoroughly well informed, and writes *con amore*. He advocates the discontinuance of the word "Free" as applied to rate-supported Public Libraries. He says: "The use of the word 'free' attached to these libraries rather stamps them as being of the nature of charitable institutions. In no sense are they so. The more accurate as well as the more dignified designation is that of Public Libraries." In his introductory chapter the author gives a history of the Public Library movement since the first Public Libraries Act was carried by the late Mr. William Ewart, M.P., in 1850. The text of this and of the amending Acts are given in the book, which contains no fewer than thirty-four chapters and four appendices. Every conceivable question arising in connexion with the adoption of the Public Libraries Acts is treated of in some detail. For example, there is a chapter showing "how to bring about the adoption of the Acts," and there are several chapters as to the special objects to be aimed at in the administration of libraries in London, in provincial cities and towns, and in villages. The ways in which public libraries can be made to facilitate technical education, and to supplement lectures and work in science and art classes, &c., are enlarged upon in two chapters, while several other chapters are devoted to the description (illustrated with small views and plans) of public libraries at home and abroad. The names of the architects of these buildings, we regret to notice, are not always given, and there are one or two slips in the architectural descriptions: for instance, the block on p. 236 is a cross section, not an "elevation," of the new Edinburgh Public Library. Nevertheless, the book is well worthy of the attention of architects. There is likely to be an increased demand for Public Library buildings within the next few years, and, as Mr. E. W. Mountford pointed out in his paper read before the Architectural Association in February last (see *Builder* for February 15, 1890, p. 116) a well-arranged Public Library plan can only result from a clear comprehension of the essential points to be attained, viz., plenty of storage room for books; sufficient light, room, and comfort for readers; and facility of superintendence and management. Mr. Greenwood's book, especially when read in conjunction with Mr. Mountford's paper, makes these points clear, but we are in some doubt as to endorsing the views put forward by both gentlemen to the effect that lavatory accommodation and sanitary conveniences for readers within the buildings should be of "a very limited character if provided at all." There are special difficulties attending this question, mainly arising out of the necessity which exists for economy of administration; but each case ought to be carefully considered with a view to combine efficiency with economy.

*Heating by Hot Water.* A Reprint of Papers from the *Ironmonger*. By WALTER JONES. (London: Crosby Lockwood & Son. 1890.)

THIS small book, although having but little more than a hundred pages, can be read with considerable profit by all seeking information in this direction, as it is the work of a practical engineer, and it deals with the subject very soundly and as comprehensively as the limited space permits.

It must, however, be pointed out that of the eighteen chapters that the book contains, all but three are devoted to the low-pressure system. It must be admitted that this system is of far wider application, and in more general favour for almost every purpose, than either the high or medium pressure system; and as the author is the manufacturer of appliances for low-pressure work, we may infer that a preference for this branch of the subject is naturally arrived at.

Briefly, the book consists of a chapter upon the high-pressure method, and some information upon heating water for bath supply; the remaining pages dealing with the low-pressure system, advantages, cause of circulation, various methods of application, laws governing water and heat, causes of failure, boilers and boiler setting, chimneys, fuel and stoking, pipes and joints, water-supply, radiating media and appliances; and interspersed are a variety of useful tables and calculations, which, however, are chiefly taken from existing standard works. The book should be of use as an elementary treatise.

THE TECHNICAL INSTRUCTION ACT, 1889.—We are officially informed that the Lords of the Committee of Council on Education have received a letter from Mr. J. J. Bickerton, Town Clerk of Oxford, dated August 6, 1890, stating that the Town Council of that city propose to make grants under the powers conferred upon them by the Technical Instruction Act, 1889, to the School of Science and Art in Oxford for the promotion of technical instruction; that at that institution instruction is given in the following subjects which are not included in the branches of science and art with respect to which grants are at present made by the Department of Science and Art, viz.: (1) Wood-carving, with lessons in design; (2) Drawing to scale as applied to practical work; (3) Manual training in the use of tools for working wood and iron; and that the circumstances of the district require facilities for instruction in the above subjects. In accordance with the request of the Town Council, their lordships have sanctioned the proposed instruction in Oxford, under clause 8 of the Technical Instruction Act, 1889. Under like circumstances, their lordships have sanctioned instruction in plumbers' work for the borough of Rochdale.

The Student's Column.

HOT-WATER SUPPLY.—VIII.

THE TANK SYSTEM; continued.

THE last paper completed the description of this apparatus so far as the hot-water pipes are concerned, and it only remains to speak of the pipe or service which brings the cold water to the tank as fast as any of the hot is withdrawn.

The "cold supply," as this pipe is called, is brought from any low point in the cold-water system, and from there it is carried to and into the apparatus. There are many different opinions as to where this service should be connected, some recommending that it be taken into the return pipe near the tank, others that it be taken into various places in the tank, and advocates can be met with for taking this pipe down to the hoiler. What has to be considered wholly and solely is that the inflowing cold water must not materially affect the temperature of the hot water, neither must it be possible to have cold water issuing from the hot taps before all the hot water is withdrawn. It is not necessary to go into particulars just now, but it may be taken for granted that the best place to bring in the cold supply is at the bottom of the tank, as far removed from the return and flow-pipes as possible. The reason of this will be clearly understood presently.

It will have been noticed in fig. 13 (page 112, *note*) that the "cold supply" service-pipe is carried down with a dip before entering the tank. This dip in the pipe is called the "syphon" not by any means a correct term, as it is not called upon to answer the purpose of a true syphon, nor could it do so in this inverted form, and it answers the purpose of preventing hot water finding its way up the cold supply into the cold-water cistern, which it would quickly do if this pipe were carried straight from cistern to tank. This dip or "syphon" is usually about 10 to 12 in. deep, and its purpose is fulfilled by the fact that hot water, being of less specific gravity than cold, cannot descend and overcome the superior weight of the latter, and it will be understood, by referring to an earlier paper, that when hot and cold water are set in motion by their different degrees of gravity, the hot water has no power to descend until it has lost its heat.

This pipe is usually  $\frac{3}{4}$  in. or 1 in. diameter all water-pipes are measured internally), depending upon whether the apparatus is a small or a large one, and it should always be provided with a stop-cock, so that when needed the apparatus may be emptied without drawing off all the cold water in the house, or without stopping the cold-water cistern. This stop-cock should have two special features, the first being that it should have a loose key, as it

FIG. 16.

THE CYLINDER SYSTEM.

could never be interfered with except by those who understand its use (this tap should also have a distinctive label, as there are often several stop-cocks in a house), and the cock should particularly have a "full way,"—i.e., a cock should have a 1-in. clear way through as an impediment of any description in the

cold supply will materially interfere with the full flow of water from any and every part of the apparatus, and it will be seen clearly that it is useless having a 1-in. service-pipe if the stop-tap has only a  $\frac{3}{4}$ -in. way through it.

It used to be the regular thing to fit up a small supply cistern with a ball valve at the side of the tank; but few could ever explain why it was used, and as in the majority of instances it was not only useless but an actual drawback in impeding the free inflow of cold water, it soon fell into disuse, and cannot often be met with now. An instance where this arrangement is a desirable one is when the cold cistern is situated at the top of the house (as usual) and hot water is only required on the ground-floor, in which case, to save carrying the expansion pipe to the top of the building a supply cistern may be fitted as fig. 16.

This more modern and much improved apparatus is supposed to be of American origin, and the chief feature in it, as can be judged by its name, is the cylinder which acts as the hot water reservoir, and it is necessary to explain first why a cylindrical reservoir is used with this system, instead of the more familiar rectangular tank.

This apparatus, which is illustrated at fig. 17,

FIG. 17.

has the reservoir in quite a different position to that in the tank system, and the prevailing idea to be followed, and which is one of the chief advantages gained in erecting this apparatus, is to have the reservoir as little above the level of the hoiler as possible, so that all the *draw-off services* can be taken from above it, which is exactly contrary to the plan adopted in the last system explained.

The reason that a cylinder is used in place of a tank is simply that the former is capable of bearing a much higher pressure of water than the latter; and as a cylinder has quite commonly to withstand an internal strain of 25 lbs. to the square inch, a tank would be totally unsuited, as the strongest of these latter, made of, say,  $\frac{3}{8}$  in. plate, are not guaranteed by the makers to withstand such a pressure as this; but a cylinder of  $\frac{3}{4}$  in. plate is always supposed to be tested to 25 lbs. before it leaves the manufacturer's works; and a tank or cylinder can always be worked up to the maker's tested pressures.

Tanks are and can be used in place of cylinders sometimes when the pressure is light, but unless it is very light indeed some trouble is nearly sure to ensue, especially if the tank does not come from a good maker, as in making tanks it is supposed and intended that they shall not be fixed more than a very few feet below the cold water level under any circumstances. Of course, what leads people to use tanks if they have a reasonable excuse for so doing is the desire to economise, as they cost so much less than cylinders; for instance, one of our

best maker's lists prices a 40-gallon tank,  $\frac{3}{4}$ -in. plate quality, at 2l. 11s., whereas a 40-gallon cylinder,  $\frac{3}{4}$ -in. plate quality, is priced at 3l. 6s. The practical difference, however, is not so very great, as it must be borne in mind that there is a very considerable variation in the pressures they will bear, and it is fairer to compare them in this respect when the difference assumes quite another aspect; for instance, a 40-gallon tank tested to 10 lbs. per square in. ( $\frac{3}{8}$ -in. plate) is priced 4l. 1s., and a 40-gallon cylinder, tested to 15 lbs. (14 gauge), is 2l. 1s. only.

To locate the position of the cylinder first, it is most usual to put this in one of the recesses that are nearly always to be found on either side of the kitchen chimney-breast, or, if it is impossible to place it here, it can be fixed up in another room, but it must be noted that the proper place for it is as close to the boiler as it can be got, in as warm a position as possible, and the bottom of the cylinder to be between, say, 12 in. and 30 in. above the top of the hoiler.

Between the hoiler and the cylinder is carried a flow and return service, as illustrated, and on precisely the same principle explained in the tank system, although much shorter; but it should be explained here that cylinders are never sent out with manlids at the side unless expressly ordered, as they have removable tops,

FIG. 18

as shown in fig. 18; but without a side manlid it is very awkward to reach the pipe connexions inside at the bottom, if it is desired to do so. Some makers will put a side manlid to the medium and better quality cylinders, free of charge (in which case the top is a fixture), and this is much the most convenient arrangement, but it is necessary to specify this when ordering. It is also most necessary to have flanges put on in the required positions, as illustrated, as it is a poor job to connect the pipes without them. There is no extra charge for these, and there should be one for each flow and return pipe, one centrally on top, for the expansion (or rising main, as it is more often called in this system), and one centrally in the bottom for cold supply.

GENERAL BUILDING NEWS.

NATIONAL MUSEUM AND LIBRARY, DUBLIN.—The new Museum of Science and Art and the National Library of Ireland, forming the new block of buildings in Kildare-street, will be formally opened to the public by the Lord Lieutenant on Friday next, the 29th inst. The architects are Messrs. T. N. and T. M. Deane.

A NEW CHURCH FOR FLEUR-DE-LIS, MONMOUTHSHIRE.—The *Western Mail* says that to meet the growing requirements of this district, the trustees of the Gelligaer Lectureship Charity have decided to erect a church, for which they have selected the designs submitted in competition by Mr. E. A. Johnson, of Abergavenny and Newport.

A NEW PUBLIC HALL FOR SOUTH SHIELDS.—The *Newcastle Chronicle* says that a large assembly hall, with suitable apartments connected with it, which, it is stated, will be one of the largest halls in the North of England, is about to be built by Mr. F. M. Laing, of South Shields. Messrs. Middlemiss Bros., Corbridge and Newcastle, are stated to be the contractors.

CHAPEL AT ST. JOSEPH'S HOME, HARTLEY, NEAR PLYMOUTH.—The Right Rev. Dr. Vaughan, Roman Catholic Bishop of Plymouth, recently laid the foundation-stone of a private chapel at St. Joseph's Home, Hartley, near Plymouth, in connexion with the Little Sisters of the Poor. The cost will be about 2,000l. Mr. F. Tasker is the architect, the contractor being Mr. P. Blowey.

**NEW CHURCH AT CRAWSHAWBOOTH.**—The erection of a new church at Crawshawbooth, near Rawtenstall, has been commenced, from the designs of Messrs. Paley & Austin, architects, Lancaster. Mr. Thomas Brooks, J.P., generously has given the site for the church, besides subscribing 3,000*l.* towards the cost of erection. Tenders amounting to 6,836*l.* 1*8s.* have been let.

**NEW WESLEYAN CHAPEL AT LITTLEBECK, NEAR WHITEY.**—The memorial-stones of a new Wesleyan chapel have been laid here. The building will be built of stone by Mr. J. Hutchinson, of Slough, from designs by Mr. Wm. Watson, of Lybhe.

**NEW SYNAGOGUE AT NOTTINGHAM.**—A new Jewish synagogue and schoolhouse in Chancery-street, Nottingham, have lately been opened. The architect was Mr. W. H. Radford, of Nottingham, and the builder Mr. J. Oscefort, the contractors for the marble-work being Messrs. Lewis & Grundy. Including the cost of the site, the expenditure has been about 3,000*l.*

**RAILWAY EXTENSIONS AT SOUTHPORT.**—In consequence of a rapidly-increasing traffic, the Lancashire and Yorkshire Railway Company are making extensive additions to and alterations at the Chapel-street station, Southport, and have other improvements in contemplation. The chief addition at present is the erection of a new engine-shed. Other works in connexion, at a cost of some 14,000*l.* The plans have been prepared by Mr. Hunt, the Company's engineer, and will be carried out, under the supervision of Mr. Bowen, by Messrs. Robert Neill & Sons, contractors, Manchester.

**NEW BRASS FOUNDRY AT WALKER, NORTHUMBERLAND.**—A large building for Messrs. John Mills & Sons, brass-founders, of Newcastle, has been erected close to Walker Gate Station. The removal of Messrs. Mills & Sons' foundry from Forth-street has been rendered necessary by the comprehensive scheme of railway improvements now being carried on by the North-Eastern Company, which has entailed the demolition of a vast amount of old property, and has brought about the migration of more than one old and well-known business concern. According to the *Newcastle Chronicle*, the proprietors instructed the architect to provide them with a building of some architectural character, and they are stated to have been successful in getting it. The whole of the works have been designed and carried out by Mr. W. H. Knowles, architect, Newcastle, Mr. Walter Scott being the contractor.

**THE PARISH CHURCH OF MOUNTNESSING, ESSEX,** has been re-opened, after partial re-building under the direction of Messrs. Bodley & Garner, architects. According to the *Essex Chronicle*, the walls and arcades have been rebuilt, and a new oak roof, hoarded and plain-tiled, provided. The tower, which was in a dilapidated condition, has been fully restored, English oak being used, as in all other work executed. The chancel has likewise been repaired, and the whole of the church re-seated. The material of the old building has been utilised as far as possible, so that the columns appear in their old form. The font was once in Euton Church, and the pedestal is made of stone from the old font of Mountnessing. The cost of the restoration amounts to 2,000*l.* The builder was Mr. J. Cross. The church is stated to be two miles from the village.

**SHELTER, BRASSEY RECREATION GROUNDS, MIDDLETON (LANCS).**—On Saturday last a new shelter was opened in the Brassey Recreation Grounds at Middleton. It contains compartments for boys and girls and is well fitted with seats. It is built in the Old English style with local bricks and Raabon stock-dressings, the roof being covered with red tiles. The design was selected in an open competition, the author being Mr. T. A. Piton, architect, of Middleton, who has superintended its erection. Messrs. Parlington, of Middleton, were the builders.

**PRIMITIVE METHODIST CHURCH, EXMOUTH.**—Extensive alterations and additions have been made to the Primitive Methodist Church, Exmouth, Devon. The chapel and school-room have been lengthened by about 30 ft., a new gallery erected with front of horse-shoe shape (designed by Messrs. & Co., of Glasgow), an open colonnade built in front of the church, and five new class-rooms, and ministers' vestries, &c., added in the rear. The church has been re-seated throughout and a new rostrum provided, this and the seats being in pitch pine. Messrs. Korley & Ellis, of Exmouth, were the architects, and Messrs. Cooper & Son the builders.

**SCHOOLS AT BABBY, NEAR THIRSK.**—The schools here, which are at present small and dilapidated, are to be pulled down, and new ones, with master's house, &c., to be erected. Messrs. W. Lewis & Son, architects, York, have been instructed to prepare plans.

**GREENWICH UNION INFIRMARY.**—We understand that Messrs. T. Potter & Sons, Limited, of Oxford-street, have just supplied and fixed at the Greenwich Union Infirmary, two of their large hydraulic lifts; also sixes of their central double "thermo-hydric" system, hot and cold water supply for baths and lavatories, and drying closets in laundry. The two sets of iron fire-escape staircases and balconies have also been carried out by them.

## SANITARY AND ENGINEERING NEWS.

**SANITARY CONGRESS AND EXHIBITION AT BRIGHTON.**—On Monday next, the twelfth Autumn Congress and Exhibition, under the auspices of the Sanitary Institute, will be opened at Brighton. We have received a copy of the preliminary programme. Sir Thomas Crawford, K.C.B., M.D., will be the President of the Congress, which will, as usual, be divided into three main sections, viz., Section I., Sanitary Science and Preventive Medicine, presided over by Dr. G. V. Poore; Section II., Engineering and Architecture, presided over by Professor L. Roger Smith, F.R.I.B.A.; and Section III., Chemistry, Meteorology, and Geology, presided over by Mr. William Topley, F.R.S., F.G.S. In connexion with the Congress there will be conferred honours of Medical Officers of the Congress and Inspectors of Nuisances. There will also be a Health Exhibition, which will be held in the Corn Exchange, the Pavilion-buildings, and Museum. On Monday, at 1 p.m., the Mayor will receive the members of the Congress in the Pavilion-buildings. Lunch will be served at 3 p.m., the Mayor will open the Exhibition, and at 5 p.m. the Mayor will open the Congress. The first general meeting of the Congress will be held at 8 p.m., when the President of the Congress, Sir Thomas Crawford, will deliver the opening address. On Tuesday, Section I., Sanitary Science and Preventive Medicine, will meet. At 10 a.m. there will be a "Lecture to the Congress," by Dr. W. H. Poore, F.R.S., on Friday, Section III., Chemistry, Meteorology, and Geology, will meet at 10.30 a.m., when the President of the Section, Mr. W. Topley, F.R.S., will deliver his address. The Section will devote the remainder of the morning and afternoon until 4 p.m. to the reading and discussion of papers. At 11 a.m. on the same day there will be a Conference of Medical Officers of Health, and at 5 p.m. there will be a "Lecture to the Congress," by Dr. W. H. Poore, F.R.S. On Friday, Section III., Chemistry, Meteorology, and Geology, will meet at 10.30 a.m., when the President of the Section, Mr. W. Topley, F.R.S., will deliver his address. The Section will devote the remainder of the morning and afternoon until 4 p.m. to the reading and discussion of papers. At 11 a.m. on the same day there will be a Conference of Inspectors of Nuisances. At 5 p.m. the closing general meeting of the Congress will be held. Saturday will be mainly given up to excursions, but in the evening, at 8 o'clock, Dr. Richardson, F.R.S., will deliver an "Address to the Working Classes."

**THE ASSOCIATION OF PUBLIC SANITARY INSPECTORS OF GREAT BRITAIN** will hold their annual Summer Meeting at Yarmouth this Saturday, the 22nd inst., Dr. Richardson, the new President, presiding, supported by Sir Robert Rawlinson, Dr. Alfred Carpenter, and other gentlemen. Dr. John Bately, Medical Officer of Health, will deliver an address entitled "Historical Notes on Sanitation in Great Yarmouth." Afterwards, the President will inspect the waterworks and drainage system.

**BISHOPSTORTON WATER-SUPPLY.**—A Local Government Board inquiry has been held by Mr. R. J. Smith at Luton School, Bishopstorton, respecting an application from the Rural Sanitary Authority to borrow 350*l.* for works of water-supply. The hamlet of Luton, which comprises about 100 inhabitants, is at present supplied by four wells, which are occasionally dry during the summer months. The proposed works will give an ample supply to all the cottages. It is proposed to utilise a spring in a field at Hicher Brake, situated on land belonging to Lord Cliffield. His lordship has granted the use of the water free and given the site for the reservoir, which will contain 8,000 gallons, on condition that the farm on which the land is situated is supplied gratuitously. The spring yields a supply of 3,000 gallons per day, as tested last summer.

**CROMER WATER SUPPLY.**—An unforeseen accident to the machinery at the Cromer Water-works a few days ago rendered it necessary to obtain a temporary supply. This was accomplished by laying a nearly half a mile of iron pipes. The iron pipes were procured from a distance, laid with caulked and leaded joints, all connexions made, the water turned on, and a full supply to the town (which is crowded with visitors) again established in the short space of forty-eight hours. This is expeditious work.

**FALKIRK AND LABBERT WATER-SUPPLY.**—The new works for providing a much-needed additional water-supply for Falkirk, Labbert, and district have lately been completed. The population to be supplied, allowing for a probable increase during the next ten years, numbers 30,000, while allowances have also been made for a probable demand for water for manufacturing purposes. By the present scheme the district is supplied from the Fauchlin Burn, a tributary of the Carron, situated about eleven miles from Falkirk. Mr. W. R. Copland was the engineer, and Messrs. D. Y. Stewart & Co., of Glasgow, were the sole contractors. The total cost of the scheme has been about 70,000*l.*

**THE EDUCATION AND REGISTRATION OF PLUMBERS.**—The following resolution was passed by the Public Health Section of the British Medical Association at Birmingham a few days since:—"That this Public Medicine Section at the Meeting of the British Medical Association in Birmingham approves of the system of education, examination, and registration of Plumbers, and of the formation of a Committee and local centre for the purpose, and expresses its hope that the memorial addressed to the Plumbers' Company will be approved and acted on in the interests of public health." The resolution was moved by Dr. Alfred Hill, Medical Officer of Health, Birmingham, seconded by Dr. J. B. Welch, Huddersfield, and supported by Dr. Ernest Hart, London.

## STAINED GLASS AND DECORATION.

**NEW WINDOWS IN WICKERSLEY CHURCH.**—During last month the side windows in the chancel of Wickersley Church, near Rotherham, have been filled with stained glass. The one opposite the altar represents St. Cecilia, and the two within the arcarium depict angels in the act of praise and adoration, below being the words "We Praise Thee, O Lord," and "We acknowledge Thee to be the Lord." The inscription below the window on the north side is as follows:—"In the vault beneath this window were interred on Easter Eve, 1839, the remains of Amelia Yates, of Wickersley Hall." The inscription of the opposite window is—"In loving memory of Thomas Cavill, dedicated by his widow, Sarah Cavill, and his daughter, Fanny Woodhouse, 1850." The windows are the work of Mr. Barnett, of Leith, and have been fixed by Mr. W. B. Watson, of Rotherham.

**WINDOWS, STRATFORD-ON-AVON PARISH CHURCH.**—The chancel of this church, writes the Vicar, the Rev. Geo. Arthnot, has just been enriched by the gift of two windows from the studio of Messrs. J. Lavers & Westlake. They have been erected at a cost of 600*l.*, in accordance with the will of the late Miss Bromley, and represent the Seven Acts of Mercy, illustrated from female lives in the Old Testament, and the eight Beatitudes, from the same in the New Testament.

**WINDOW, WOLVERCROFT CHURCH, NEWTON ABBOT, DEVON.**—This old South Devon church has just received the addition of another stained-glass window. It occupies a place in the south aisle, near the porch, and is erected by Lady Rao, in memory of Sir William Rao, K.C.B., who died in April, 1875, at the age of eighty-six years. The subject treated is the parable of the Good Samaritan. Not the least interesting feature in this work (according to the *Western Morning News*) is the preservation of the fragments of ancient stained glass scattered throughout the old glazing. These have now been placed by Mr. Fred. Drake, of Exeter, the artist, chosen to design and execute the window, in the tracery of the window. These fragments consist of the heads of a hishop, an abbot, a priest, and a layman, but the greatest interest centres in the two panes of ancient glass placed in the two middle tracery openings. They are small, but beautifully painted, and represent a female saint behind prison bars. The hand passing through the bars is the position of Beatrix, the heroine in the story, as shown in a male head. The second piece of glass is painted to represent the hand and arm of a woman pulling down an idol of most hideous appearance, which stands upon an altar, holding a kind of billhook in its claws, and is broken off short in the middle of the back. The saint represented behind prison bars breaking idols is said to be St. Christina.

## FOREIGN AND COLONIAL.

**FRANCE.**—There is to be a competition opened for designs for sale halls at Dix; the building is to cost 300,000 francs. The authors of the three best designs will receive premiums of 4,000, 1,500, and 500 francs. The railway station at Santes (Lower Charente) having proved inadequate for the traffic, is to be rebuilt, at a cost of 260,000 francs.

—The town of Meaux (Seine-et-Marne) has a memorial statue to General Bugeot, killed during the Franco-German war. M. Aubé, the author of the Gamhotta monument, is to be the sculptor.

—At Conflans-St. Honorine, in the department Seine-et-Oise, a Merovingian burial-ground has been discovered, containing 285 sepulchres.

—Alphonse de Rothschild has presented to the Museum of Geneva a fine altar-piece by the recently completed painter, Lapostolle, representing a view of Rouen, which figured in the Salon of this year.

—All French architects and engineers are invited to take part in the competition for designs for the building for the National and Colonial Exhibition to be opened at Lyons in 1892. The competition will be closed September 30. —M. Albert Lefevre has just completed the model for the statue to be erected at Livry to Vice-Admiral Jacob, who defended Rochefort against the Allies, and died in 1854. The pedestal will be designed by M. Reboul. —The jury for the competition for a set of school buildings at St. Denis have awarded the first prize to

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITIONS.

Table with 4 columns: Nature of Work, By whom Advertised, Premium, Designs to be delivered.

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, Tenders to be delivered.

CONTRACTS.—Continued.

Table with 4 columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, Tenders to be delivered.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in.

Those marked with an Asterisk (\*) are advertised in this Number. Competitions, p. iv. Contracts, pp. iv. and vi. Public Appointments, xviii.

UCKFIELD (Sussex).—For building infirmary and out-patient wards at the Workhouse, Uckfield, Sussex, for Mr. Wm. Beach, Surveyor, Pymouth-road, Haywards Heath:—

HOVE (Sussex).—For paving and other works at Byron-street, Hove, for the Hove Commissioners. Mr. H. H. Scott, Town Surveyor, Hove:—

BUCKINGHAM (Hants).—For the erection of a wrought-iron girder bridge, at Curbridge near Botley, for Southampton County Council. Mr. Jas. Robinson, City Surveyor, 13, Southgate-street, Winchester:—

FIELD.—For the construction of a covered reservoir at Lavender Field, for the Enfield Local Board. Mr. W. Kitteringham, Engineer, Court House, Enfield:—

FIELD.—For making up the "Fourth Avenue," Hill Park, Enfield, in accordance with sec. 150 of the Public Health Act, 1875. Plans and specification read by Mr. W. Kitteringham, Engineer & Surveyor to the Enfield Local Board:—

LONGGATE (Hants).—For the reconstruction in iron steel of the superstructures of four bridges at Longparish, Hants, for the Southampton City Council. Mr. James Robinson, County Surveyor, Winchester:—

STINGS.—For erecting Olive Vale Board School, for the Hastings School Board. Quantities architects, Messrs. Elworthy & Son, St. Leonards:—

LONDON.—For proposed alteration to No. 7, Great St. Thomas Apostle, E.C. Mr. Edward Gabriel, architect, 42, Old Broad-street, E.C.:—

LONDON.—For alterations, &c., to the "Compasses," High-street, Fulham, for Mr. Thomas Steed. Mr. H. I. Newton, architect, 49, Victoria-street, Westminster, S.W.:—

LONDON.—For the erection of proposed cottages, Buxton and Hunt-streets, Spitalfields, E., for Mrs. Hayward. Mr. John A. J. Woodward, architect:—

LONDON.—For new road forming Northern Approach to the Alexander Palace and St. Wood Green. Mr. E. Eton Hawkins, surveyor, 19, York-buildings, Adelphi, W.C. Quantities by Mr. C. G. Saunders, 6, Agar-street, Strand, W.C.:—

LONDON.—For alterations at "The Bell," Thames-street, for Mr. F. Garner. Mr. Edw. Brown, architect, 21, Liverpool-street, E.C.:—

LONDON.—For building a warehouse at Wood-street, Spitalfields, for Messrs. Pezaro & Son. Mr. Edw. Brown, architect, 21, Liverpool-street, E.C.:—

LONDON.—For alterations and repairs to Nos. 52 and 54, Lambeth-walk, S.E. Mr. J. A. J. Woodward, architect:—

MILBORNE WICK (Dorset).—For the erection of a mission church at Milborne Wick. Mr. Henry Hall, architect, 19, Doughty-street, London:—

MOUNTAIN ASH (Glamorgan).—For the construction of 2,000 yards of cutfall sewers, setting tanks, &c., for the Mountain Ash Local Board. Mr. John Williams, Surveyor, Town-hall, Mountain Ash:—

**NEWENT.**—For alterations and enlargements of Pickleash School, Newent, for the Newent School Board. Mr. William Sheppard, architect, Gloucester.—  
 J. Coleman ..... £285 0 0  
 J. Bidmead ..... 242 11 10  
 A. H. Wood, Newent (accepted) ..... 235 12 6

**NEWSOME (Worshire).**—Accepted for building dwelling-house, at Newsome. Mr. J. Berry, architect, Huddersfield:—  
 David Heston, Newsome, Mason.  
 Alm. Mellor, Armitage Bridge, Joiner.  
 J. Holdsworth, Berry Brow, Plumber.  
 D. Tunnicliffe & Sons, Huddersfield, Plasterer.  
 W. & P. Holroyd, Huddersfield, Painter.  
 Total cost..... £350 0 0

**NOTTINGHAM.**—For additions to Board School, Bath-street, Nottingham, for the Nottingham School Board. Messrs. Evans & Jolly, architects, Eldon Chambers, Wheelersgate, Nottingham:—  
 Mr. B. Keeling, Nottingham..... £320 0 0

**PORTSMOUTH.**—For the completion of the east end of the R. C. Cathedral, including the sanctuary, two side chapels, two transepts, and the crossing of nave, porch, sacristies, &c., for the Right Rev. Dr. Virtue, Bishop of Portsmouth. Quantities by Mr. Henry Smith, of S. John-street, Adelphi. Mr. Joseph Schanklaus Hanson, architect, 27, Alfred-place West, South Kensington:—  
 W. R. & C. Light, Portsmouth\*..... £9,685 0 0  
 \* Accepted.

**RAINHILL (Lancs).**—For the extension of Recreation Hall at Rainhill Asylum, for the County Council of Lancashire. Messrs. Grayson & Ould, architects, 31, James-street, Liverpool:—  
 Thornton & Sons ..... £861 0 0  
 Hughes & Sterling ..... 550 0 0  
 E. Nell & Sons ..... 783 0 0  
 Nicholson & Clarke ..... 784 0 0  
 Jones & Sons ..... 777 0 0  
 Roberts & Robinson ..... 720 0 0  
 Thos. Urmsion ..... 716 0 0  
 R. H. Davies, St. Helena (accepted)..... 630 0 0

**RICHMOND.**—For works at the "Rose & Crown," Richmond, for Mr. Hopkins. Mr. Geo. Whitaker, architect, 32, Craven-street, Strand:—  
 Fiew & Co., West Kensington\* ..... £2927 0 0  
 \* Accepted.

**RHYL.**—For making Beachwood-road, Plasfinch Estate, Rhyll. Mr. R. E. Hughes, architect and surveyor, Wood-road, Rhyll:—  
 Ed. Jones ..... £713 17 0  
 Thos. Whitley ..... 550 0 0  
 Thos. Griffiths, Rhyll (accepted) ..... 519 0 0  
 David Griffiths ..... 498 0 0  
 Isaac Hughes ..... 465 0 0

**RHYL.**—For the erection of three ornamental shelters on the Promenade, Rhyll, for the Rhyll Improvement Commissioners. Mr. T. J. Scoones, Engineer, 15, Great George-street, Westminster, and Bristol:—  
 J. T. Clark ..... £833 0 0  
 Jones & Roberts ..... 817 0 0  
 August Kraus, Bristol (accepted)..... 789 0 0

### The Public Fountains of Paris.

OR some time past the water supply from the Dhuiss and the Vanne has been insufficient for the daily needs of the inhabitants of Paris, and in summer the administration has

been compelled to supplement it with water from the Seine, though the danger to public health from this source of supply is not unrecognised. This poverty in the matter of drinking-water has been one of the great anxieties of the Municipal Council of Paris, who have at length obtained a sufficient increase to the supply from various sources in the Department of the Euro. This series of operations, which has been attended by vigorous but really quite unjustifiable opposition on the part of those living near the sources of supply, has formed the necessary complement to the work undertaken thirty-five years ago by the eminent engineer Belgrand, to whom the sanitary improvement of the French capital is mainly due, though most of the honours of it (including that of monumental commemoration) have been passed on to his pupil, Durand-Claye.

Belgrand accomplished a great work, however, and entirely changed the state of things in Paris in regard to water supply. Not very long since it was extremely rare to find a house in Paris with a water service in every suite of apartments; it was rarely even that a whole house in a populous quarter possessed one sole tap to itself for the supply of several families. In those days water-carriers (now a nearly extinct institution) circulated in the streets, with their tubs bearing the stamp of the police authorities, and filled at the public fountains or at the reservoirs called "fontaines marchandes."

All this is ancient history; and in a little while, when every inhabitant of Paris will be assured of an ample water supply in summer and winter alike, the fountains formerly erected in the public streets will serve no purpose except for street watering and as street ornaments, or will be retained only as monuments of the past and artistic documents dear to archaeologists. In anticipation of this transformation, it may be of interest to give some account of this class of public works in Paris, many of which are well worth attention.

Though the numerous street improvements since 1855 have considerably modified the aspect of Paris, a good many of the old fountains still remain. Many, however, have disappeared, such as that fine fountain of the Cour Batave, designed by Sobre in 1791, and also the fountains of Ponceau, St. Victor (the work of Bernini), the Fontaine de Vaugirard formerly decorated by the statue of Leda which now adorns the Fontaine Medicis, that of the Palais Royal decorated with the sculptures of Guillaume Coustou, and many others, now forgotten, which found no grace in the eyes of M. Haussmann.

Confining ourselves to those which still exist, we will mention the principal erections of this kind in the different districts. In the First Arrondissement we come at once on the celebrated Fontaine des Innocents [see lithograph], which, in spite of many transformations, is still one of the most graceful creations of French art of the sixteenth century. As is well known, the general design is that of Pierre Lescot, and the nymphs are from the chisel of Jean Goujon. This fountain, now standing isolated in the centre of a square, was formerly placed against the wall at the angle of two streets. When it was removed, in 1786, into the Marché des Innocents, the sculptor Pajou, commissioned to produce a fourth façade, assimilated in a clever manner the style of the existing work. The monument consists of a square pavilion with four open arches, rising from a base consisting of six hasins arranged one above the other in a pyramidal form, down which the water flows in cascades into a large circular hasin.

We may just notice, in passing, the ancient fountain of the Halle au Blé, the last vestige of the Hôtel de Soissons, which the architect of the Bourse de Commerce has contrived to incorporate, in a kind of way, into his new work.

The Fontaine du Châtelet, like that of the Innocents, has been shifted from its old position. It is the design of Bralle, the figures and ornaments being by Boizot. It stands in the centre of a triple series of superposed hasins, and has a palm-wreathed column surmounted by a statue of Victory. At the base, four sphinxes discharge the water into the lower reservoir. It was Boizot also who sculptured the nymph which decorates the Fontaine de l'Arbre Sec, the stalactites and vermiculated rustications of which adorn the angles of Rue St. Honoré and Rue de l'Arbre Sec. This fountain, rebuilt in 1776 by

Soufflot, dates in fact back to the time of Francis I., when it was called the "Fontaine du Trahoir."

The Fontaine de Molière, Rue Richelieu, is the work of Visconti. The marble statue of the poet is seated in a circular niche, between Corinthian columns carrying an entablature adorned with a circular *fronion*. It was executed by Seurre, and the two allegorical figures which symbolise serious comedy and light comedy were executed by James Pradier.

The Fontaine Desaix, though destroyed a few years ago, merits a word of commemoration. It stood in the middle of the Place Dauphine, and was erected in 1802, after a competition in which Percier carried off the prize. The principal *motif*, which is preserved in the municipal museum, represents a young antique warrior crowning the bust of the Republican general.

Among the sculptural decorations of fountains we must not forget the graceful nymphs by Mathurin-Moreau and Carrier-Belleuse, which decorate the fountains of the Théâtre Française, erected in 1874.

In the Second Arrondissement two fountains only merit attention, both the work of Visconti. That of the Place Louvois recalls the site of the old Opera-house, where the Duc de Berry was assassinated in 1820. It has a circular basin of which the centre is occupied by a group of allegorical figures (by Klagmann) which support a vase. The second example, situated in the Place Gaillon, is decorated with a little Triton mounted on a dolphin. It is placed in a niche flanked by columns carrying an entablature.

The central quarters of Paris, being the most ancient, are naturally the richest in old monuments; and we find accordingly in the Third Arrondissement a number of fountains of considerable interest. The Fontaine St. Avoys, Rue du Temple, offers a pretty decorative design showing the arms of the city flanked by two dolphins. The mask carved on the Fontaine Boucherat, Rue Turenne, is of fine character of work. This fountain is dated 1697. The Fontaine St. Louis, also in Rue Turenne, was erected in the seventeenth century originally; it was rebuilt in 1846 in a very poor style, and is entirely devoid of character.

Not far from here, in the Rue Vieille du Temple, is a fountain of some originality of form; a hexagonal erection terminated by a coved cornice, with a canopy-shaped termination over it. This fountain, erected in 1671,

is the oldest one in the Quartier du Marais, and is known under the name of the "Fontaine de l'Echaudé" [see lithograph]. That called "des Haudriettes," which is in a more severe style, dates from 1760. It is the work of Moreau Desproux, who was beheaded in 1793, and who, from 1763 to 1789, was "maître-general des bâtiments" to the city of Paris. In this fountain the water spouts from a lion's head in a surbase which carries a sculptured Naiad in bas-relief, the work of Mignot, in 1765. Above, there is a moulded architrave surmounted by a triangular pediment supported by two consoles.

The Fontaine du Vert-bois, situated in the Rue St. Martin, has been recently restored. It is built up against an ancient boundary wall of the priory of St. Martin des Champs, the site of which is now occupied by the Conservatoire des Arts et Métiers; on a pedestal adorned with a lion's head in bronze, from which the water issues, there rise two rusticated pilasters supporting a cornice terminated by a cartouche crowned with a shell. Between these pilasters is a tablet on which is sculptured in delicate bas-relief an antique galley which symbolises the city of Paris.

This triform, with its elegant lines and projecting prow, is a far more decorative form of the Paris symbol than is the heavy galley which adorns the upper part of the fountain situated at the angle of the Rue St. Martin and the Rue Maubourg, which gives the name to it. The Fontaine Maubourg—one of the oldest in Paris—is mentioned in some documents dated as early as 1392. It is decorated with a bas-relief much impaired by time, and on which are traces of a vase surrounded by marine plants. It was reconstructed in 1733.

We are now in the city, that is to say in the heart of the ancient Lutetia (now the fourth arrondissement). Behind Notre Dame, in the middle of a shady square rendered still more sombre by the mass of the Cathedral overshadowing it, rises a fountain in the Gothic style, adorned with pinnacles and terminating in a crocketed spirelet. There is an open canopy which shelters a statue of the Virgin and Child: the Twelve Apostles are sculptured on the pedestal, and at the angles are angels trampling on dragons, through the mouths of which the water is poured into two hexagonal basins. This is the Fontaine de l'Archevêché, built from the designs of Vigoureux, in 1843, and decorated by Parfait Meurieux.

If we now penetrate into a narrow blind alley near the Rue St. Antoine, we find an elegant construction known under the name of the Fontaine "de Jarente" or "de Poissonnerie," built in 1783 from the design of the architect Caron. Two Doric pilasters support an entablature with a pediment, enclosing in its tympanum a vase surrounded with garlands. The whole is surmounted by a pyramidal cupola. Dolphins interlaced with cornucopie decorate a shallow niche between the pilasters, and on each side are the carvings of shells and aquatic plants which form the special characteristic of the style of that period.

The Fontaine Charlemagne, erected in 1840, offers no detail of interest, but we may notice in passing, behind the "marché des blancs manteaux," two steels adorned with bulls' heads which discharge water into small basins; these are the "têtes-des-bœufs" fountains. The fountains of the Place des Vosges, erected under the Restoration, present nothing for remark.

The Fifth Arrondissement is also rather rich in relics of this kind. The best known is probably the Fontaine Cuvier, situated near the Jardin des Plantes. Heavy in design, and in a commonplace style, it makes a bad substitute for the one formerly erected on the same site by Bernini. It is the work of Vigoureux. The surbase, from which the water escapes through dolphins' heads, supports a group representing Natural History, surrounded by symbolic animals. The group is the work of Feuchères. On the acroterion is to be read the name of Cuvier.

Fragonard, the painter, made the design for

the fountain placed in the "Marché des Carmes," which, however, does little credit to his inventive genius. In the middle of a circular basin is a kind of pillar in the form of a double "term," representing Commerce on the one side and Abundance on the other, in the guise of young girls crowned with fruit and supporting a sculptured vase. Various "attributes" scattered about,—cornucopie, caducei, olive-branches, the arms of the city, &c.,—complete the rather heterogeneous decoration of the whole.

The opening of the Boulevard St. Germain necessitated the removal of the Fontaine Childebert, which now adorns the Square Monge. This fountain, which dates from the end of the seventeenth century, has a niche decorated with shells, between the pilasters, with an arch over, carried by two consoles, and decorated with dolphins on the extrados, with a vase in the centre from which depend aquatic plants. In the niche a human head in bronze forms the spout for the water.

There are to be noticed also the fountains named Valhubert, Pot-de-fer St. Marcel, and Poliveau; the latter, in the worst taste of the First Empire, consists of a monumental stele adorned with an eagle crowned with laurels.

In the Sixth Arrondissement is found the Classic fountain of St. Sulpice, bearing the impress of the cold and pompous art of Visconti. It is too well known to need a detailed description; it is sufficient to note that above the tier of basins for the cascade rises a monument adorned with Corinthian pilasters, and with circular niches occupied by statues of the great orators of the French ecclesiastical school—Fenelon, Bossuet, Flechier, and Massillon; the statues are the work respectively of Lanno, Feuchères, Desprez, and Faugnot. Oddly enough, this latter artist, whose name is not otherwise much known, is not indicated in any account of the monument, which dates only from 1847, and it is only chance that has given us the information which we have vainly looked for in official records. Close to this fountain, in the Rue Garancière, one may remark a fine mask in bronze of a human head, which delivers water into a basin on the ground-level. This is the Fontaine Garancière, constructed in 1715 at the cost of Anne of Bavaria, widow of the Prince de Condé.

The fountain of the Marché St. Germain is not without a certain character. It was the architect Voinier who, in 1802, modified and put in execution the design first composed by Détournelle in 1724. The bas-reliefs in white marble which decorate the four faces of the monument are the work of Espercieux. They symbolise Peace, the Arts, Commerce, and Agriculture.

The fountain which forms such an imposing mass at the end of the Avenue de l'Observatoire is the most recent in Paris. It dates from 1875, and is a powerful and energetic design by Carpeaux, who has modelled with his usual vigour the figures representing the four quarters of the world supporting the terrestrial globe. The rearing sea-horses at the base of the group, and the water-spouting turtles, are all the work of M. Frémiet; the decorative garlands were modelled by M. Villemainot. The Fontaine de l'Observatoire cost no less than 330,000 francs.

M. Davioud, who designed the plan of the last-mentioned fountain, was less fortunate with the Fontaine St. Michel, though it has a certain character of grandeur. It is unquestionably very well placed, and its façade, 26 mètres high and 15 wide, adorned with columns of red marble, looks striking enough in its situation at the angle of the Boulevard and the Place St. Michel: but the principal group, representing the archangel trampling down the demon, is terribly heavy. This group is one of the least fortunate works of Duret. Above the attic are six allegorical figures: Prudence, by Barre; Strength, by Guillaume; Justice, by Elise Robert; Temperance, by Gurnery; Dominion and Moderation, by Debay. M. Jacquemart executed the two-winged dragons which pour the water into the basin, and the children sculptured in

the middle of the water and on the attic were the work of Mme. Claude Vignon, the recently-deceased wife of the present Minister of Finance, M. Rouvier.

One of the finest fountains of Paris, and that of which the architectural design is certainly the most noble and grandiose, is the Fontaine de Grenelle, in the Seventh Arrondissement, constructed 1739—1745, from the designs of the illustrious artist Bouchardon. This remarkable monument presents an *avant-corps* backed by a wall-screen 29 mètres wide and 12 mètres high. It is adorned with a fine Ionic order of coupled columns which support a triangular pediment. A figure in white marble symbolising Paris is seated on the surbase of the central portion; at each side are two statues reclining on urns, and representing the Seine and the Marne [see lithograph]. In the side wings the pilasters form three bays on each side, of which the centre one is adorned with the ship of Paris and the two others have niches with statues representing the Seasons. The same subjects are treated below in the charming bas-reliefs of the lower panels. Between the columns a Latin inscription records the origin of the fountain, the water from which is poured out from two dolphins' heads at the base of the central block or *avant-corps*.

The "stalactite" decoration of the podium of this fountain, a rather too favourite form of fountain ornament in French work of the period, is no doubt in bad taste and rather annoying to the eye; but in the main this is a work remarkable for its noble decorative character as a whole, and for grace of design in detail, and in these respects forms a striking contrast with some of the heavy and mannered works of the same class left by the artists of the First Empire. As an example of one of these we give an illustration of the Fontaine de Mars [see lithograph], in the Rue St. Dominique, opposite the Hôpital Militaire. It dates from 1806, and the author of the general design is unknown, but we know that it was a pupil of Pajou, Beauvalet, who executed the bas-relief on the principal face, showing the figure of Mars, and of Hygeia the Goddess of Health offering him a cup of water (presumably) which he seems exceedingly unwilling to taste. Probably there was some idea in it of a moral addressed to the army as to the advantage to their health of drinking nothing stronger than water; and as it was said at the time of the Franco-German war that the army was to a great extent demoralised by habitual indulgence in absinthe, there may be a point to the moral, though its artistic expression is absurd enough. Marine animals of a grotesque order complete this piece of stock mythology.

Although dating from the same year, the Fontaine de l'Égyptienne, Rue de Sèvres, is very superior to the last named. The design was by Bralle, or at all events it was erected under his superintendence, and represents with sufficient correctness the portal of an Egyptian Temple, of which the open bay forms a niche for a statue of a young slave whose head is ornamented with bands, and who holds in each hand a vase from which water runs into basins at the base of the pedestal. This figure, the work of Ghechter, replaced, in 1844, the original statue made by Beauvalet after a marble statue discovered, in 1738, at Hadrian's Villa at Tivoli.

In the Eighth Arrondissement we find at once, in the middle of the lawns of the Champs Élysées, four fountains almost identical in design, all by Hittorf; the Fontaine des Ambassadeurs, the Fontaine du Cirque, and those of Marigny and l'Élysée. They each have a circular basin surmounted by a vase whence the water falls in a cascade. Two of them are adorned with statues representing Diana and Venus in the midst of garlands; these are very mediocre works by Desprez and Duret. Nearly the same description applies to the fountain of the Square Laborde, erected in 1852, except as regards the sculptural part.

We pass over without mention many mere basins with simple jets of water which are found in the promenades of the same

Arrondissement, but which have no architectural character. Nor is there much to be said for the two little fountains erected by Davidou, in 1865, on the Place de la Madeleine; they are poor affairs, and their decoration at once pretentious and commonplace.

It is not the same with the fountains of the Place de la Concorde, which, with the Luxor obelisk, may be said to be the best-known features of Paris. They are identical in general design, and only differ in the statues which symbolise the sea and river divinities. In the middle of a circular basin divided by pedestals surmounted by pine-cone ornaments, six figures, separated by dolphins spouting water, are seated with their backs to the pedestal of a vase ornamented with various devices. Tritons and Nereids emerge from the basin surrounding the centrepiece, each one holding a fish which spouts up a jet of water. Above the vase is a group of symbolic geni and swans, and a central fountain-jet from the top. These fountains were erected during the period 1836-16, under the direction of Hittorff. Eleven artists contributed to their decoration; we may mention, among the best known of these, Feuchères, Debay, Lanno, and Desbœufs. One fact of interest may be noted; the fountain nearest to the Pont de la Concorde marks exactly the place where Louis XVI. perished on the scaffold on January 1, 1793.

The Pigalle and St. Georges' fountains, in the Ninth Arrondissement, have no architectural or historical interest; their only merit is to freshen the air on a site which in summer is exposed to the full heat of the sun. The Fontaine de la Trinité, which contributes to the decoration of Ballu's church on the axis of the Chaussée d'Antin, is a work of more importance. The porch of the church has three large bays, before which are three pedestals ornamented with bronze masks whence the water falls successively into basins disposed in tiers. The central pedestal is surmounted by a group in marble symbolising Charity. The two other pedestals support figures of Faith and Hope. The total effect is very good. The figures were modelled by Duret, whose work was interrupted by his death, and was completed by his pupil Lequesne.

The fountain of the Château d'Eau having given place to the monument of the Republic, the Tenth Arrondissement now possesses no fountains except the twenty-eight little fountains, all of the same design, put up in 1848, by public subscription, along the two foot-pavements of the Faubourg St. Martin. These small fountains, all in the same style, are decorated alternately with groups of Tritons and Nereids supporting a vase, surmounted by a child and swan.

We find in the Eleventh Arrondissement, at the angle of the Faubourg St. Antoine and the Rue de Charonne, a fountain in very dilapidated condition, but of which the decoration, dating from 1671, is still of interest. This fountain was constructed by order of Louis XIV. The principal portion is adorned with Doric pilasters supporting an entablature with pediment. Between the pilasters are panels with mouldings and filled in with aquatic symbols, &c.

The Fontaine de Montreuil, in the same street, dates from 1724; it is, however, of no interest otherwise, any more than the Fontaines Popincourt and la Roquette. The two latter have nearly the same decoration as that of the Fontaine de Charenton (in the Twelfth Arrondissement) and of the Fontaine de Charlemagne already mentioned. They each comprise a closed arch flanked by pilasters and surmounted by a small attic. Shells, aquatic plants, and lions' heads from which the water pours, form the almost universal ornamentation of the various fountains erected about the date of 1846.

The monument to the Republic, by Delou, has been illustrated in our pages, and need not therefore be dwelt upon here; and the fountain of the Place de la Nation being still in course of construction, may be passed over for the present. We may mention, however, in this Arrondissement, the Fontaine Daumesnil,

which is no other than the old fountain of the Place du Château d'Eau. This monument, the design of Davidou, comprises a series of basins superposed, interrupted by flower-baskets and surmounted by two large vases, also superposed, whence the water falls in a cascade. Eight bronze lions, modelled by M. Jacquemart, spout jets of water into the lower basin. The general effect of this fountain is not bad in a decorative sense, though it has been the object of much adverse criticism of late.

The Thirteenth and Fourteenth Arrondissements possess no monumental fountains, and in the Fifteenth there is not much worth mention except the artesian well of Grenelle. This monument, 42 metres in height, comprises a large circular basement giving access to a staircase in open ironwork which rises spirally round a column crowned by a lantern; the staircase gives access successively to four hexagonal balconies at various levels. The object of this construction was to carry up and aerate the water, but unfortunately its ascensional force has never been sufficient to enable this idea to be carried out. The well was pierced and the whole construction made in 1833-41.

There is in the Sixteenth Arrondissement another artesian well hidden in the middle of a plantation of trees and shrubs, in the Square Lamartine, whence the water pours over some artificial rocks. The well was made in 1855-62. The artesian well of the Place Hébert (Eighteenth Arrondissement) is not yet, we believe, quite completed.

The two remaining Arrondissements of Paris contain some fountains, which need not, however, claim our attention; we may mention only that of the Marché aux Bestiaux (Nineteenth Arrondissement), which also for a long time decorated the Place du Château d'Eau, and made way, in 1869, for that by M. Davidou, which disappeared in its turn in 1882. This work has three concentric basins disposed in steps, the two upper ones cut at equal intervals by pedestals each supporting two bronze lions projecting jets of water into an intermediated reservoir; the whole surmounted by a vase and cascade.

We have rapidly enumerated those of the Paris fountains which, either from their design or their antiquity, are most worthy of notice. With the new water supply, fed from the large reservoirs of Montrouge, Meuilmontant, and Montmartre, as well as the supply from more recent sources, many of these old fountains will no longer serve any public need. It is to be hoped that they may nevertheless be allowed to remain. Dispersed throughout the different districts, these fountains, once so precious and now left to go to decay, add to the picturesque aspect of Paris, recall her ancient physiognomy, and contribute, with other old edifices, to break that monotony so common to modern cities, and that long perspective of straight streets which is the peculiar invention of "Haussmanisation." As Belgrand finely said, in his treatise on the ancient water supply—"For every stone ornamented with carving, every fragment of whatever kind, which falls under the hammer of the *démolisseur*, it seems as if the City of Paris tore away with her own hands her own titles of nobility!"

PRESENTATION OF A FOUNTAIN TO GLASGOW.—On Wednesday Sir Henry Doulton, of Lambeth, presented to the City of Glasgow the large fountain which was exhibited at the Glasgow Exhibition by his firm two years ago. It has now been re-erected near Nelson's Monument on Glasgow-green. Sir Henry complimented the Corporation upon having brought water from Loch Katrine. It was to him, he said, a great honour to present a fountain from which would ever flow Loch Katrine water.

ELECTRIC RAILWAYS IN THE UNITED STATES.—It is stated, says the *Newcastle Chronicle*, that by the close of the present year the electric railway mileage in the United States will be double what it was at the close of last year. By this showing there will be no insignificant measurement, seeing that there were completed in 1889 very nearly 1,900 miles of electric railway. In the course of three years 150 towns have adopted this system of locomotion, and the total number of passengers carried in this way last year amounted to 200 millions.

THE PRINCIPLES OF PROPORTION AS PRACTICALLY EMPLOYED IN THE PARTHENON.

BY W. WATKISS LLOYD, F.S.A.

(With Illustrations.)

THE question is certainly open to discussion whether any especial value can attach to the execution of architectural works with scrupulous attention to exact numerical proportions when it is considered how relative dimensions, as presented to the eye of the spectator from different points of view, are apparently modified and, from the most favourably selected point of view, defy precise appreciation. The consonance of musical notes is dependent on the precise mathematical relations of the vibrations of the instruments which produce them, but they are exempt from any interference analogous to the perspective modifications of visual objects. Notes produced concurrently reach the ear together if they reach it at all, and there reproduce the original consonant vibrations. Dimensions, on the other hand, have diverse visual representations accordingly as they are seen under diverse angles at varying distances. A square opening,—as a window,—seen obliquely, will not be presented as a square, and even when seen directly from the front, the image produced will be inexact, and whether the square itself is made minutely exact, might seem not to matter very much. The upper diameter of an Ionic column, 20 ft. high, is found to be exactly one-sixth less than its lower diameter. The pleasingness of the effect no more depends on our knowledge of this fact than the satisfactoriness of a musical chord on knowledge of the exact mathematical relations of the notes; but what reason is there to think that the exactness in the architectural instance is as essential to the pleasurable result as it is in the musical?

All that can be said,—at least, what is to be said that is sufficient for our present purpose,—is this: that, at any rate, the greatest Greek architects worked under the impression that it was not enough to make the proportions of their buildings satisfactory in a general way; that they bestowed great pains in bringing the proportions which they found satisfactory within the compass of systematic schemes, and then in putting the dimensions so determined into execution with a degree of accuracy which is surprising even when regarded as a mere technical feat.

Furthermore, there is this to be said in justification of the study and the pains so unsparingly bestowed, that the result of these pains is found to have been triumphantly successful,—a realisation of marvellous majesty and beauty, and that the admiration which the works have evoked has always found expression in praise of the charm of their proportions.

That proportion, that just relation of parts, must be an essential characteristic of every fine work of art which is only a fine work in virtue of being a coherent whole, will be admitted by moderns as readily as it was assumed by the Greeks,—that the Greek architects also laid stress upon such minute accuracy in execution has at least this advantage to students, that it enables us to recover the principles of their system from their monuments with a degree of confidence which laxer practice might have failed to confirm.

It is due to the supreme interest of the genius of the Greeks that the elucidation of their views on proportion would deserve attention, though their application of it had been less successful than we find it; but having regard to what they achieved we may enter upon the inquiry with the fair anticipation that the principles which they teach will be introductory to a theory of architectural proportion which shall not be restricted in its application to Greek architecture, but susceptible of application to other even most contrasted styles. There must be, in fact, a general theory of architectural proportion, from which the schemes and systems appro-

prate to particular styles are developments; the advantages of commencing with the study of the Greek development are due to the possession of well-measured and delineated examples of very exactly executed works of admitted excellence and beauty. While, therefore, study approaches the subject on the one hand by considering independently what from the nature of the case are the principles to be assumed, on the other the exemplar works sometimes give hints as to the direction in which these principles are to be looked for, and then enable us to test our theory by actual practice.

Architecture has been called petrified music, and the analogy between the two arts has doubtless been recognised in the intimate dependence of both upon proportion. Many theorists, however, have been misled by it into a short cut by "the high priori road," and have attempted to solve all the problems of architectural proportion by the ratios of the notes of the musical—the diatonic scale. Certain coincidences have flattered them with a notion of success—coincidences which are inevitable, inasmuch as the simpler ratios are certain to recur in all the arts. But architecture is not to be tied down to the laws of another art. The musical ratios are controlled by one special physical fact which does not apply to architecture: it is, that the duplicate multiples and submultiples of the vibrations which produce a given note only reproduce the same note at differences of pitch, higher or lower. This law at once sets a limit to the number of ratios that can be included within the scale upon a particular key-note, but architectural visual proportions are exempt from any such limitation.

The true analogy holds good only when broadly interpreted with regard to art in general. Then we may say that in architecture, as in music, a harmonious composition will be governed by a scale of proportions limited in number and decided by the characteristics of the artist's conception of the design; proportions selected, but still comprising a series sufficiently numerous and forming a sequence with intervals of considerable uniformity, though not without variations in the interest of the resources of contrast.

The expression of definite character is obtained in both arts by appropriate selection of a scale of proportions,—the equivalent of a key, and the employment of the most important of these in varied combinations. The primary elements which architecture presents for regulation by proportion are the three dimensions of length, breadth, and thickness. A straight line, whether upright, horizontal, or oblique, may be divided into parts having definite proportions to each other; so the height of a column may be compared with the height of the entablature above it; or the breadth of a metope with the breadth of an adjacent triglyph. These may be conveniently called cases of rectilinear proportion,—proportion between parts of the same straight line, or between lines that are not at an angle with each other, as between the heights of two columns.

Comparisons between dimensions taken on lines at right angles to each other may be called rectangular proportions; such as those which may be established between the breadth and length of an apartment or a platform, or between the height or breadth of a colonnade or a façade. Areas of circles are to each other as the squares of their diameters. This is a case which will be found of importance in the comparison of columns of different dimensions associated in the same composition; they are often found to be proportioned by sectional area.

Quantities of any kind, and among them dimensions and areas, as compared together, may differ in any degree between the smallest possible degree beyond 1:0, and absolute equality, 1:1.

Degrees of difference between quantities within these limits are infinite, and a first distinction to be remarked is this, that certain quantities may differ from each other but stand in no proportion that can be pre-

cisely expressed in numbers; there are quantities which are incommensurable. This is the case, for example, between the sides of a square and its diagonal; and between the diameter and circumference of a circle. When we exclude these and the like cases from consideration, the proportions of commensurables are still infinite in number, and from these we may again, for our particular purpose, exclude those which involve very high numbers, which express either very great differences or very small, as 1:100 or 99:100 to take extreme cases.

In architecture, as in music, peculiar value is found to attach to simple proportions,—that is, to proportions which can be expressed in low numbers, with no further exception than proves to be recommended by the requirements of an exceptional design.

The general conception of a design in plan, as in elevation, will be independent, in most cases, of any definite reference to numerical proportions. The architect, no doubt, may try experiments; may say to himself, I will put to the test whether such-and-such proportions have or have not any special recommendations in effect, as a painter may set himself to try the capabilities of a new colour; but the more usual and desirable process of invention is for the imagination to originate a conception of considerable liveliness in the first instance. If this has a true artistic value, it will assuredly be found upon examination to involve a certain proportional fitness as its basis, and it is for the architect to elicit this and the requirements and consequences of it, even as a musician only when he takes pen in hand considers in what key the air is to be written down which has haunted him by fits and at last is attaining perfect development.

The foregone conditions of the conceived design will, therefore, necessitate the adoption of certain proportions taken out of the general scale, and these will in turn demand that others, which are adopted for subordinate members or details, shall not be so near to them as to encroach on their effect and confuse it, and while sufficiently varied to suit the various exigencies of the design, shall still be not so numerous as to interfere with each other, and so frustrate an effect of concentration and unity.

The leading and imposed proportions will, in fact, decide in a general way the selection of a scale of proportions.

In the well-ascertained scale of proportions employed in the Parthenon, the advance of the terms towards equality—the proportion of a square—commences from 1:6 and proceeds by the successive ratios 2:7; 3:8; 4:9; to 5:10 = 1:2 or the double square; thence again by ratios having the common difference between their terms of 5: 6:11; 7:12; 8:13; 9:14; to 10:15 = 2:3. From this point the series is continued by ratios having the common difference between their terms of 1, the so-called super-particular ratios, 3:4; 4:5; 5:6; 6:7; 7:8; 8:9, &c. This change is required from the closeness of the intervals, the trifling differences, of the higher ratios of the former series.

The gradations of the scale of which the employment is traceable in the Parthenon, are therefore reducible to a very simple system of the series of super-particular ratios, supplemented by certain of those which have the difference between their terms of 5.

We must not, however, suppose that this scale has such an exclusive authoritative value as attaches to the ratios of the notes of the diatonic scale. The temple at Bassæ is executed with remarkable attention to systematic proportion, but the primary dimensions of the platform exhibit the ratio 2:5, which does not appear in the Parthenon scale at all. Considering that we are in possession of no inconsiderable number of notices and even treatises of the ancients on the subject of Greek music, it might seem that our knowledge of the theory of Greek music should be more satisfactory than of Greek architecture. It is not found so. The treatises are curiously unsatisfactory as to the musical theory; we search them in vain for any definition of a

chord, and of other principles also, but for the possession of which no satisfactory or useful theory could have existed at all. The music itself, which is written in terms at once so appropriate and so enthusiastic that it must have had high merits, has perished, and the musical literature that survives only perplexes us. In the case of architecture it is the reverse; the architectural treatises of the chief ancient writers on the subject have perished; we have but faint and confused echoes in Vitruvius, but then their executed works—the very finest of all, especially—remain to us, miserably ruined, no doubt, but still remain in sufficient preservation for us to recover invaluable information as to their original state. These remains, therefore, enable us to recover the equivalents of the architect's working drawings. We may be said to have succeeded—so well has the work been done—in recovering the illustrations of the text of the ancient treatises, and there is as good hope to recover the drift of the original text from the illustrations as it might have been to reduce the illustrations from the text.

The general form and distribution of the Parthenon, both in architectural style and in plan, were in accordance with precedents, which were themselves the traditional outcome of developments from remote and unrecorded antiquity. We can perceive, however, with certainty that the primary element of the composition was the sacred naos,—the apartment or residence of the tutelary divinity as presented to us in subordinate examples. A portico free or *in antis* was added to this as an enhancement of dignity; and then, from the same motive in more important temples, the entire structure was surrounded by a general colonnade. A more spacious naos made necessary the support of the roof by columns in the interior, which indeed were introduced even in such a small temple as that at Ægina, without the same structural necessity. In the Parthenon, a second smaller chamber was added at the rear of the naos,—the treasury of both of the goddess and of the State under her protection.

The cella, including both naos and treasury or *opisthodomus*, is raised by two steps upon the platform of the ambulatory, and that again by a basement of three degrees so steep as to require intermediate steps to facilitate ascent at certain points upon the fronts and flanks.

The colossal statue of the goddess Athene, in ivory and gold, was erect upon a sculptured pedestal at the further end of the naos, fronting the doorway. The frieze of the cella and its porticos was enriched by the sculpture of the Panathenæic procession; the metopes of the exterior colonnade all round were filled with groups in high relief, and the triangular pediments of either front were occupied by statues in the round,—the most important compositions of which we have either remains or record, of the finest period of Greek art. Divinities occupied the pediments, the metopes were devoted to heroic subjects,—the frieze exhibited an idealised representation of a contemporary human celebration. So much may be said of the unsparing cost which was lavished on this monument in completion of the proper dignity and charm of its architecture,—the subject with which we are here more immediately concerned.

The Parthenon was commenced and completed under the administration of Pericles; Ictinus is named as the architect, assuredly as supreme in his own art as Phidias, with whom he worked, in sculpture. It occupies the very site of an earlier Parthenon, with which, as appears by traces of foundation, and various architectural fragments, it had very close agreement in positive dimensions. All the characteristic members of the Doric style were already and had long been decided; but it remained for the new Parthenon to supersede the very faintest suggestion of coarseness and clumsiness, and to display, and chiefly in virtue of the charm of unerring proportion, the compatibility of the loftiest and most impressive dignity with scrupulous refinement in finish and gracefulness supreme.

OUTLINE OF THE NAOS OF THE PARTHENON. IN ISOMETRICAL PERSPECTIVE.

The temple then, as technically described, is Doric Octostyle, Amphiprostyle, peripteral. By the name, the Parthenon, it is indicated as the Chamber of the Virgin Goddess,—that is, of Athene. It is sometimes referred to as the Hecatompedon,—the Hundred foot temple,—a title which is justified by the breadth of its platform on the upper step, exactly 100 Attic feet. The same title is appropriated in the inscriptions to the naos specially, and here we find the 100 ft. accommodated in its full length from partition wall to entrance.

The presumptions are very strong in favour of the original model of the Doric column having been derived from Egyptian examples; but, however this may be, the developed and completed Doric style betrays most positive imitation in stone of the details of wood construction. The triglyphs represent the exposed ends of beams resting on the architrave and grooved vertically to promote the descent of moisture across the circular ridges of the grain. The mutules and guttae below the cornice represent tenons and trenails transformed into ornaments by regularity and repetition.

The most important modification, which was induced of necessity by the substitution of marble for wood, is the reduction of the extent that could be spanned by a single beam. But for the respect commanded by the precedents of sacred structures built solely of wood, it is conceivable that the Greeks might have developed the construction of arches, and even of vaults,—an arcuated architecture; but apparently the model was too strongly established to be varied from; the vast stone temples of Egypt were not unknown; and the mountains and quarries of Hellas furnished the beautiful material marble in abundance; and the reduction of span, the closer spacing of supports which the employment of it involved, had the great recommendation of enhancing the expression of solidity and dignity.

Man, according to the dictum of one of the ancient Greek philosophers, is the measure of everything, certainly of everything which presents itself in relation to man, to his haunt,

his appreciation, or employment. It is among the perfections of the Parthenon that the magnitude of its parts are proportioned to its constructors with such happy effect. Humanity forfeits its dignity and sinks into insignificance when confronted with its own works in the pyramids. Men might crowd in any multitudes about the colossal columns of the hypostyle hall of Karnac, but to one who took in the entire scene they would appear little better than a swarm of ants.

The columns of the Parthenon have a bulk which is effective to awe, but not to oppress or to degrade the spectator who approaches and passes between them. Their diameter, 6.25 ft., exceeds the height of men in general very decisively, yet that is all, and the visible or semi-girth is beyond a man's power to encompass in an embrace. Dignity again is asserted by the degrees of the hasement being too steep for easy ascent, yet not so proportioned between tread and riser as to preclude the insertion of one intermediate accommodating step.

One of the most constant applications of definite proportion in Greek columnar architecture is between the length and breadth of the basement, taken either upon the proper stylobate or a lower step.

The following are the proportions of the basements of a number of Greek temples in the order of approach to equality of sides:—

	Basos:	2 : 5 (=4 : 10) :: 51-892 : 129-732* (52-340 measured?—steps uncertain.)
Doric	Parthenon and Thesoum:	4 : 9 (=4 : 9)
	Ægina:	1 : 2 (=4 : 8)
	Priene:	6 : 11 (=4 : 7.33) :: 69-600 : 127-270
Ionic	Suintheum:	5 : 9 (=4 : 7.2) :: 73-705 : 132-67
	Teos:	4 : 7 (=4 : 7) :: 72-332 : 125-978

The stylobate of the Parthenon is very

\* This proportion comes out exact on the line of the lowest step by measurement of the engraved plan, PL. VI., Cockerell.

accurately set out with all its angles right-angles; the measured dimensions are:—

100 Attic feet=101.341 : 228.141 on flank.

The length of the flank, if deduced from the front by the proportion 4 : 9, would come out 0.124 less, an inaccuracy of 1 1/2 in. which may seem of little consequence in such an extent, but is much in excess of the differences which will require to be allowed for where smaller dimensions are in question.

Two other comparisons of over-all dimensions may be made, namely, of the full height with the breadth of the front and with the length on flank.

	Breadth.	Height.
14 : 9 ::	101.341	65.148 (measured 65-185)
	Height.	Length.
2 : 7 ::	65.185	228.147 (measured 228-141)

If we assume the measured length of the flank as the basis of our calculations we have these results:—

	Measured,
9 : 4 ::	228.141 : 101.396; cf. 101.341 (err. + 0.055)
14 : 9 ::	101.396 : 65.1825; cf. 65.185 (measured)
2 : 7 ::	228.141 : 65.183; " "

By this process the calculated height comes out in agreement with the measured, but the breadth of front is shown as 0.055, or nearly 1/2 in. in excess of measured. It will be observed that these three important dimensions are regulated by proportions which fall into series as having a common difference between their terms of 5; 2 : 7; 4 : 9; 9 : 14.

It must, at the same time, be observed that if the proportion of the breadth to height of front and length of flank respectively are fixed at 4 : 9 and 14 : 9, the proportion of height to length comes out of necessity as 2 : 7.

The ratios may be thus represented:—

	18 : 28 : 63
	9 : 14 : 4 : 9
	2 : 7

Any difference in the height of the front would have disturbed this harmony; but we are not to suppose that it was obtained by

violently forcing the architectural members into it as into a predetermined frame. We must conceive the concern of the designer to be to conciliate appropriate and expressive proportions of the members of the façade with some simple circumscribing proportion; the proportions which we have detected were the solution of his problem, obtained after we cannot tell how many trials and comparisons.

The temple at Bassæ is said by Pausanias to have been built by the same architect as the Parthenon; the height of the front is here proportioned to the breadth of the top step by the same ratio, 3:4, which is employed in the other hexastyle Doric temples of Sanium, Rhamnus, and the Theseum.

$$4:3::48.221 \text{ measured} : 36.165 \text{ (cf. 36.014 measured.)}$$

For this temple we have not the same secure basis of full and fully-verified measurements as Mr. Penrose has provided us with in the case of the Parthenon. There is no doubt, however, that the main horizontal rectangle had the proportion of 2:5. According to the engraving this comes out most exactly in the length and breadth of the cornice which plumbs about the middle of the second step.

The full height compares with the length of the top step in the ratio 2:7, the same as in the Parthenon,

$$7:2::125.014 : 35.885 \text{ (cf. 36.014 measured.)}$$

The general proportions of the temple, however, are very contrasted, from the greater narrowness of plan on the one hand and on the other the squarer proportion of the front.

In this Phigaleian example the architect secures his three cases of leading circumscribing proportions, though to accommodate other other harmonies he does not confine himself to three terms.

The 101,341 ft. of the breadth of the stylobate of the Parthenon was formed of seven segments, six joints of which were accurately covered by the lower drums of the six interior columns of the octastyle portico; the determination of the places of these joints will therefore give the dimensions of the columniations—that is, the distance on plan of these columns from centre to centre.

The problem, however, is affected by the circumstance that, by the traditions of the Doric style, the columniations at the angles are somewhat reduced, and to a greater extent than is made up for by the equally traditional requirement of somewhat extra stoutness of the angle columns, and then by the fact that the end segments of the step have to accommodate the entire diameters of the angle columns.

In the first instance, therefore, the architect had to decide the degree of excess required for the two angle segments; the remainder of the front after deduction of this joint excess, divided by seven, will give the lengths of the six intermediate stones from joint to joint, and thus the columniation required.

The seven segments of the step correspond in a general way to the seven segments of the architrave which span the columns above; and these, in turn, correspond severally to the joint breadths of two metopes and two triglyphs,—that is one whole and two half triglyphs,—except that each of the extreme segments is required to provide space for an additional half triglyph.

If, now, we deduct the breadth of a semi-triglyph from each end of the step,—or the same thing, a complete triglyph from the entire step and divide the remainder by seven, we shall find that we obtain the normal columniation with the greatest accuracy.

This process, of course, assumes that the architect had already determined on the breadth of the triglyph 2.786,—an assumption in which no more is involved than that all the members of the architecture were under consideration together, and every one subject to reconsideration and adjustment until its relation to the whole was determined as this whole advanced to consistency and completion.

$$101.341 - 2.786 = 98.555 \div 7 = 14.079 + 1.233 = 15.312$$

$$228.341 - \quad \quad = 225.355 \div 10 = 22.535 + \quad \quad = 25.468$$

The angle segments of the steps on the

east front are as, measured, 15.478, and 15.367, to compare with 15.472 as thus deduced; and the calculated 15.468 on flanks compares with measurements 15.468, 15.449, 15.531, 15.443,—comparisons which are to be accepted as coincident.

The columniations of the interior columns on the east front are 14.078, 14.106, 14.113, 14.084, 14.115, giving an average  $(70.496 \div 5) = 14.099$  to compare with the calculated 14.079.

The flank columniations, which by calculation as given come out 14.084, have variations among themselves which may be regarded as considerable, ranging, in fact, between the limits of 14.141 and 14.052; but the average of these extremes is 14.096, and when we take the average of consecutive triplets or quartets of columniations, we find that the result gives wonderfully close coincidences. The inference is that exact care was taken in deciding the place of every third or fourth column, but that either for the sake of avoiding over-anxious uniformity or from disregard of slight variations, so long as they were debarred from becoming cumulative, the joints of the stylobate which placed the intermediate columns were settled with less scrupulous care.

The north-east angle columniation on flank for some reason is abnormally open at the expense of its neighbour, which is reduced to 13.983, excluding this one, the rest follow on, and average as shown below.

The angle columniations, indeed, are remarkably irregular:—

$$6.085 : 6.181 \text{ East. } 6.228 \text{ N.E. } : 6.169 \text{ S.E.}$$

$$6.099 : 6.176 \text{ W. } 6.130 \text{ N.W. } : 6.123 \text{ S.W.}$$

But if we take the measurements from the angle of the steps to the axis of the fourth columns, we find them identical, a proof that these irregularities were deliberately admitted while controlled within strict limits.

From north-east angle of flank to south-east.

14.052	
14.124	} 56.365 ÷ 4 = 14.091
14.110	
14.079	
14.093	
14.088	} 42.275 ÷ 3 = 14.091
14.094	
14.066	
14.113	} 42.268 ÷ 3 = 14.089
14.089	
14.068	
14.124	} 42.276 ÷ 3 = 14.092
14.084	

On the south side by like process we obtain the consecutive averages 14.090, 14.090, 14.087, 14.086.

The extents from north-east angle of step to axis of fourth column front and flank are identically

$$43.566 \left\{ \begin{array}{l} 15.367 \\ 14.115 \\ 14.084 \end{array} \right. \left\{ \begin{array}{l} 15.591 \\ 13.983 \\ 14.052 \end{array} \right. 43.566$$

The like at south-east angle, front, 15.478 } 15.468 } 43.637  
14.078 } 14.060 }  
14.106 } 14.009 }

The like at south-west angle, front, 43.626; flank, 43.652.

The like at north-west angle, front, 43.784; flank, 43.647.

As the centre flutes of the columns are adjusted very accurately midway upon the joints of the top step, it must have been in laying the stones of this that the precautions were taken which set very positive limits to the variations, trifling as they may seem, between the columniations. In result, the precise axial line of the plan divides the central columniations of the front with an excess in each case to the right of the spectator,—about 1 in. on the east and 1½ in. on the west.

The free space between the cella-wall and the columns of the peristyle exceeds the inter-column of the peristyle.

Deduct diameter of column and margin of step	6.410

8.920

This dimension is to the average inter-column as 8 to 7; that is, exceeds it by one-seventh.

$$8.920 \div 8 = 1.115 \times 7 = 7.805 \text{ to compare with } 7.827 \text{ for ordinary inter-column as deduced.}$$

The same proportion rules approximately the excess of the interval from step of Pronaos to edge of top step on the front, above corresponding interval on flank.

$$7:8::15.00:17.143 \text{ (cf. 17.270 measured.)}$$

The columniation thus obtained and verified, is divisible between two semi-diameters of a column equivalent to one complete diameter, and the intermediate inter-column. We find that this was done by dividing it into nine parts and assigning five to the inter-column and four to the column.

$$14.09 \div 9 = 1.565 \times 5 = 7.827 \text{ Intercol.}$$

$$\quad \quad \times 4 = 6.266 \text{ Lower diam. of col.}$$

The measured diameters of the ordinary columns have the slight variations from this and amongst themselves, of 6.245 on east front and 6.251 on west and north, by average of all the columns that Mr. Penrose found could be measured.

(The 3/4 of an inch is only 0.104.) The diameter of the column, therefore, compares with the columniation in the ratio 4:9 which is the proportion also of the general plans of the stylobate.

The full average diameter of the angle columns from fillet to fillet, is 6.388, showing an increment of 0.138, or somewhat less than 1 1/2 in.

The question as to the determination of the precise increment is one of those which are mixed up with the problem of the general proportions of the column.

W. W. L.

NOTES.

**T**HE way in which, in a sense, the metropolis has taken possession of a great part of the Upper Thames during the last few years is very noticeable, and in some respects regrettable. Thus the Quarry Woods, below Great Marlow, have now quite lost their quiet sylvan character. There is nothing to be said against the small houses in the chalet style which have been erected at various distances in these woods along the river bank. The scene is bright and gay, but it is essentially artificial. The natural character of the scenery has been lost, and Quarry Woods and the neighbouring parts are rapidly becoming to the London of to-day what Twickenham and Richmond were to the London of fifty years ago. The lover of peaceful river scenery must go above Henley; in any reach below that he is sure to come across fanciful house-boats and villas, but he will not find the natural scenery of the Thames. But there is another aspect of this increase of river-side villas and moored house-boats. That is the sanitary aspect. It is obvious that the great increase of buildings, not only villas, but larger houses and hotels, will sooner or later utterly pollute the water of the Thames, which is not only for the present the main supply for London, but for numerous towns and villages along the banks of this river. In these same Quarry Woods to which we have alluded,—not on account of anything very special about them, but as typical of the modern Thames,—may be seen boards advertising further sites for buildings. Thus it is evident that every year buildings on the banks of the Thames will become more numerous, and railway facilities will increase. This being so, it is high time that before another summer comes round the Local Government Board should seriously consider what is in future to be done with the sewage of the houses rapidly rising from Henley to Kingston.

**T**HE present is the time when more persons are in rural districts than at any other season of the year. Landed proprietors are now at home. We cannot, therefore, too

\* To be concluded in our next.

strongly impress on all owners of cottages the desirability of inspecting them carefully, and at any rate spending a small sum on whitewashing and cleaning interiors. There is nothing more conducive to health than washing or repapering walls; there is nothing which is more neglected, even by comparatively careful landlords. There is nothing which is a more constant source of village epidemics than absence of wall-cleaning, and there is no work which is less costly. In fact, a great many landlords habitually have the walls of piggeries and cattle-houses washed who scarcely ever use the same precaution in the cottages of their labourers. Again, also, it would be very desirable if coloured walls were more in vogue in cottage bedrooms than they are; when walls are papered they soon, in many cases, become untidy, and in many cases the paper is left on for years, becoming a fertile source of infection. In most cases, also, when a cottage bedroom is repapered, the country workman puts the new paper on the top of the old, instead of first stripping the walls. But the truth is, that the more the subject of cottage repairs is considered, the more evident it is that the only way in which these buildings can be kept in a proper state is by systematic inspection by competent sanitary authorities. Unfortunately, however, the rural sanitary authorities are often very lax in the performance of their duties. "Quis custodiet ipsos custodes?"

THE coach accident in the Lake District has directed public attention to the state of the roads in that part of England. There is no doubt that when much coach traffic exists the roads should be surveyed by thoroughly competent engineers from time to time. We can see no reason why an inspection of a coach road should not be undertaken by the Board of Trade at the beginning of each year. In other parts of the country residents must look after their own interest. But it is much to be hoped that the County Councils will introduce a higher class of road surveyors than those usually appointed by Vestries and Highway Boards. The ordinary road surveyor has absolutely no engineering knowledge, and his only object is to spend as small a sum on the roads as possible.

ON the rear portion of the site of the proposed City Bank in Ludgate-hill, opposite the Old Bailey, a considerable piece of mediæval walling, composed of Kentish ragstone cemented together by a very fine quality of mortar, has been revealed in clearing the site and digging for the foundations of the new buildings. By the courtesy of Mr. T. E. Colcutt, the architect of the building, and his clerk of the works on the spot, we have had an opportunity of seeing this piece of wall, which extends along the whole of the south side of the site, under the pavement in Pilgrim-street, and runs from east to west. It undoubtedly forms a continuation of the wall which was met with some few years ago a little to the westward, when Little Bridge-street was being widened, and which was described by us at the time, and was again referred to by us last year (see *Builder* for June 15, 1889), when we gave a sketch of an old tower brought to light by the widening of Ludgate-hill. The wall is about 9 ft. in thickness, and contains here and there what are apparently Roman tiles, indicating (as was the fact) that the wall was partially built of the debris of an older structure. In order to construct the vaults on the south side of the new building it is necessary, unfortunately, to break-up and remove this piece of walling, and the work of its removal (a very difficult task, owing to the strength of the wall) is now in progress. The wall is mentioned in Lambert's "History of London" as having been ordered to be built in 1274 (see *Builder* for the date previously mentioned, p. 449). It formed no part of the London wall proper. It was described in the King's order to the citizens as running from Ludgate westward behind the houses to Fleet Ditch, and thence

southward to the Thames. This wall practically added to the City an area about the size of an average West-end square, including Playhouse-yard, where the *Times* office now stands. But the precinct thus enclosed was not then subject to the jurisdiction of the Lord Mayor.

IT is stated in the *Times* that the Earl of Aberdeen has sold to Mr. James Mason, of Eynsham Hall, Oxfordshire, the lease of his town residence, No. 27, Grosvenor-square. This house,—until lately No. 24,—stands on the square's western side; it is conspicuous for its new stone and red brick elevation, its narrow and lofty portico having a large scallop shell carved beneath the pediment, and its high central *fronton*. Here, as likewise in St. James's-square, students of London topography will be at fault if they have not kept record of the changes made in the postal addresses and in the houses themselves. Eight years ago No. 37,—now 42,—on the southern side was Lord Aberdeen's; two doors away stands the historical "No. 39," re-numbered 44,—where, as Lord Harrowby's guests, on the evening of February 23, 1830, the Cabinet Ministers narrowly escaped from the plot which Thistlewood and his "Cato-street" conspirators had laid for their assassination. The present Lord Harrowby's house is marked by its wide bay front, and together with two or three of its neighbours on that same side, by the fine old railings and wrought-iron work carrying lamp-holders and link extinguishers. Many of the houses, however, have been rebuilt within recent years, and in varied styles very different from those of their predecessors. The earlier No. 23,—site of the present No. 26,—was built, we have read, by Robert Adam in 1773 for Edward, twelfth Lord Derby, who, in 1797, married Miss Farren. Lord Shaftesbury, the philanthropist, lived at the old No. 24. The square was originally laid out in or before 1716 by Sir Richard Grosvenor, who had inherited the Audley property which Mary Davies had brought in marriage to his father; the central garden was planned by Kent.

THE Vestry of St. Martin-in-the-Fields have lately informally thrown open to the public an out-door gymnasium in Drury Lane, which occupies part of the site of a disused burial ground lately utilised as a recreation-ground, with shrubberies, &c., more especially adapted for aged people. The Vestry, thinking that more provision should be made for the poorer children in this crowded locality, decided to convert the ground into a playground. Consequently, upon the recommendation of their Surveyor, the centre groups of shrubs have been taken away, the surface covered with tar-paving, and swings, horizontal ladders, parallel bars, see-saws, &c., erected. A small portion of the foreground has been retained (and seats placed therein) specially for the accommodation of the aged people. The place is highly appreciated by the children, and one has only to visit it to see that the Vestry have done well in providing such an excellent playground in this locality. The paving works were executed by Messrs. Bradshaw & Co., of London and Manchester, and the gymnasium apparatus supplied by Messrs. Piggott Bros., of London, the whole being planned by and carried out under the immediate supervision of Mr. Chas. Mason, Assoc. M.Inst.C.E., Surveyor to the Vestry. Other parishes will do well to copy the example thus set them by the "royal parish" of St. Martin-in-the-Fields.

DR. BARRY'S Report to the Local Government Board upon the General Sanitary Condition of the Sculcoates Rural Sanitary District, not apparently made in consequence of any special outbreak of disease, shows nevertheless circumstances in the district very unfavourable to the maintenance of health. According to the Report, the cottages throughout the district are as a rule well built, and almost all have doors and

windows at the back as well as at the front; but in general "there is inefficiency of surface drainage about dwellings, the ground surface at the back in a large proportion of cases being neither properly guttered nor paved, and in some instances the slope was found to be actually towards dwellings, thus causing dampness of foundations. In addition, a considerable number of houses are unprovided with eave spouts, and as a result dampness of walls and basements is very general in the district." The water supply is mostly from wells, and even where the mains of the Hull Corporation have been laid, the inhabitants generally still draw from their old wells. What these are likely to contain is shown in the following extracts from the Report:—

"The house drains throughout the district are very defective, being constructed frequently of rubble or of agricultural pipes, and often containing in their course numerous unnecessary catchpits. The ground along the course of such drains is necessarily permeated by filth. Hitherto apparently no supervision of any kind has been exercised over the connexion of the house-drains with the sewers, and as a consequence these communications have been irregularly made. The drainage from mansions is, as a rule, discharged into cesspits, excavated to a depth of some 20 to 60 ft. Generally speaking, no attempt has, I understand, been made to render them watertight, and as a result the sewage soaks into the surrounding soil, or, where the cesspool is sunk to the chalk, finds its way into the water-bearing stratum, to become perhaps a grave source of danger. The danger is intensified in those cases,—of which I understand there are several,—where a boring has been made into the chalk for the express purpose of getting rid of the sewage amongst its fissures. I was furnished with a list of some twenty of these cesspools which were stated to be in existence in the district. Cesspools of this sort are not only a danger to particular local water supplies, but some of them appeared to me to be so situated as perhaps to compromise certain of the sources of the Hull water supply.

The privies are almost all constructed on the Hull system, having each a small fixed receptacle under the seat. These receptacles are not, as a rule, cemented or otherwise rendered watertight, and consequently allow of the percolation of liquid on to, and into, the soil. In a few instances pails have been provided. The larger houses are furnished with indoor waterclosets, which are mostly in direct communication with unventilated cesspits or sewers. The soil-pipes are frequently unventilated, or are furnished with a pipe one or two inches in diameter, which is carried to the roof. In only one instance did I see a soil-pipe properly ventilated by means of two openings on the house drainage."

ANOTHER inquiry, also conducted by Dr. Barry, has been made to ascertain the general sanitary circumstances and administration of the Urban Sanitary District of Rawdon, with respect to which complaints had from time to time been made to the Board of default by the Sanitary Authority; and of which it is significantly remarked, "The Board could learn nothing from the reports of the Medical Officer of Health." In regard to general conditions we read of "sewerage of a piecemeal and makeshift character," drains composed in many cases of loose rubble, houses back to back; and that, "with the exception of a single pipe-drain to silence a particular complaint," no attempt has been made by the sanitary authority to provide for the needs of the district. A double-column schedule is given showing the nominal provisions of the by-laws, and the evidence as to how far they are carried out; of which the following is a portion:—

By-laws.

"16. Every person who shall erect a new building shall cause every wall of such building to have a proper damp-course of sheet lead, asphalt, or slates laid in cement, or of other durable material impervious to moisture, beneath the level of the lowest timbers, and at a height of not less than 6 in. above the surface of the ground adjoining such wall.

Actual state of things.

Damp-proof course absent. It is stated that the provision of damp-proof course in the case of small houses has never been enforced in the district. In certain houses in course of erection the cellars were observed to contain a quantity of water, and the walls to be damp considerably above the ground level.

*By-laws.*

25. Every person who shall erect a new building shall cause every party-wall of such building to be carried up 9 in., at the least, in thickness:—  
 (1) Above the roof, flat, or gutter of the highest building adjoining thereto to such height as will give, in the case of a building of the warehouse class or of a public building, a distance of at least 3 ft., and in the case of any other building a distance of at least 15 in., measured at right angles to the slope of the roof, or above the highest part of any flat or gutter, as the case may be.

31. A person who shall erect a new building shall not place the end of any bressummer, beam, or joist in any party-wall of such building, unless the end of such bressummer, beam, or joist be at least 43 in. distant from the centre line of such party-wall.

*Actual state of things.*

Instead of the party-walls being carried through the roof, they are frequently only carried to the level of the ceiling of the topmost story. In no case have the particular provisions of this bye-law been carried out.

In practice the Sanitary Authority, far from requiring a 9 in. interval within the party-wall between the joists of contiguous houses, has permitted such joists not only to meet but even to pass through party-walls and to overlap one another. Moreover, the roof timbers of adjoining houses are in all cases continuous.

*By-laws.*

53. Every person who shall erect a new domestic building shall provide in the rear of such building an open space exclusively belonging to such building, and of an aggregate extent of not less than 150 sq. ft., and free from any erection thereon above the level of the ground, except a water-closet, earth-closet or privy, and an ash-pit.

He shall cause such open space to extend, laterally, throughout the entire width of such building, and he shall cause the distance across such open space from every part of such building to the boundary of any lands or premises immediately opposite or adjoining the site of such building, to be not less in any case than 10 ft.

*Actual state of things.*

Despite the elaborate provisions contained in By-law 53 for securing through ventilation to houses, houses are at the present time being erected at Little London, with the approval of the Local Board, on the back-to-back plan.

*By-laws.*

61. Every person who shall erect a new building shall, in the construction of every drain of such building, other than a drain constructed in pursuance of the by-law in that behalf for the drainage of the subsoil of the site of such building, use good sound pipes formed of glazed stoneware, or of other equally suitable material.

He shall cause every such drain to be of adequate size, and, if constructed or adapted to be used for conveying sewage, to have an internal diameter not less than four inches, and to be laid in a bed of good concrete, with a proper fall, and with watertight, socketed, or other suitable joints.

*Actual state of things.*

By-law 61, Clause 11. The requirements with respect to the concrete bed for pipes has never been enforced. The Sanitary Authority seemingly consider disturbance of drains through subsidence of the soil about them as inevitable, and accordingly prefer the joints to be made of clay puddle.

There is plenty more of the same kind; but this is sufficient to show with what kind of conscience the Sanitary Authorities of the district referred to look upon the grave responsibilities of their position.

**T**HE opening meeting of the biennial gathering of the members of the amalgamated societies of German architects and civil engineers was held in Hamburg on Monday last, several preliminary committee meetings of the official deputies of the various societies having taken place during the preceding week. Some 1,200 members were present to hear the opening address of the President, Herr Wiebe, of Berlin. After transacting certain routine business, the President of the Hamburg Arch. and Ing. Verein delivered the opening address, the title of which was "Hamburg and its Buildings." Herr Hohrecht, Berlin, then read a highly-interesting paper on "Street Building in Cities, with special regard to the future requirements of underground connexion." Both papers were well received. After the lectures, the new harbour works were visited and inspected. We hear that the next biennial meeting (1892) will be held at Leipzig.

**W**E hear that the new Mont Blanc shelter hut, which will at the same time serve as an observatory, is now complete. The site chosen is the highest that has been ever used for a similar purpose. The parts of this timber hut (which has been designed by an engineer, M. Vallot), making some 112 loads, together with ninety loads of furniture, scientific instruments, tools, victuals, &c., were carried up to the ground by Chamounix guides and bearers, between June 15 and July 31. The erection proper took M. Vallot, together with seven helpers, four days, during which time the party was housed in a provisional tent, and went about their work in costumes similar to those worn by the Esquimaux. Bad weather and continual mountain sickness of two of the party then compelled them to descend before completing the interior arrangements and supplementary constructive parts. Some days later the same party (this time accompanied by a lady who wished to see to the comfort of the interior of the new erection, and by an American astronomer, who had undertaken to superintend the placing of the instruments) again made the ascent, and three days were still necessary to complete the work. The hut, which has been lined with several layers of tarred felt to keep out the damp, is divided into two rooms, one of which, containing nine beds, will always be open to tourists; whilst the other, in which four visitors would find fairly comfortable accommodation, will serve for observatory purposes, and can only be visited with a special permit.

**A** CIRCULAR signed by Mr. John Leighton, P.S.A., draws attention very opportunely to a scheme which has been before mooted, and the idea of which we have before reported, of forming a main central avenue and drive from Park-square through Regent's Park, and over the centre of Primrose-hill. Mr. Leighton reminds us that the open space on Primrose-hill was originally acquired at the instigation "of that arch economist Joseph Hume, M.P." when the whole locality was threatened with building speculation, and when it was part of the open country round London. It is a valuable open space with which, however, nothing much has hitherto been done beyond preserving it as an open space. The idea of forming a drive and avenue connecting this and Regent's Park is a fine one, and would, as Mr. Leighton observes, give an uninterrupted line of four miles from Whitehall to Hampstead; but to make it altogether a veritable "Champs Elysees" worthy of London, the scheme ought, to our thinking, to be combined with a complete laying-out of Primrose-hill as an ornamental park; an object for which the nature of the site affords great advantages.

**W**ITH the commencement of what is called the "silly season" the *Times* starts at once with one of its architectural crazes, a long large-type article retreating to what may be called the "Westminster Hall folly," and endeavouring again to justify it and represent it as an admirable piece of work. The *Times* never gives this kind of prominent position to architects writing on architectural subjects; and taking this into account, along with the obvious bias of the article, we shall probably not be wrong in concluding that Mr. Shaw-Lefevre has again been promoted to the position of anonymous critic on his own schemes. The whole article, at all events, is simply another endeavour to throw dust in the eyes of the public as to the real nature of this ill-judged piece of work, and to make out that the added rooms (added without practical reason, purpose, or forethought, as the architect's evidence plainly showed) are by no means so useless for any practical purpose as people have said. A column and a-half of the *Times* is devoted to this attempt to bolster up a foolish proceeding which has been condemned since its completion even by those who could not see its absurdity in advance. Lord Grimthorpe, another almost invariable accompaniment of the silly season, will probably appear in due course.

## THE CAMBRIAN ARCHÆOLOGICAL ASSOCIATION AT HOLYWELL.\*

The carriage excursion on the third day, Wednesday, the 20th inst., was in a westerly direction, starting as before at 9.30 a.m. from King's Head Hotel, at Holywell. The first point made for was Caerwrys, fourth mile south-west of Holywell as the crow flies, but which has to be approached by a circuitous route, owing to intervening hills. Caerwrys is believed to occupy the site of a Roman station, and the rectangular arrangement of the streets seems to favour this view. Nothing beyond the plan of the town was seen that would confirm the theory of its Roman origin. The church was the only object of interest which claimed attention. The ecclesiastical buildings seen on the previous day near Mold were of an English type; the one at Caerwrys is distinctly Welsh. The plan consists of a nave and chancel of nearly the same width, with a tower and aisle on the north side, together extending the whole length of the church. The tower, which is at the north-west corner, is of a plain massive military pattern. The oldest portions, the pointed chancel arch, and a double-light cusped lancet window, are of the Early English period, but most of the west is of later date. There is a window with Decorated tracery in the south wall of the chancel at the east end, and two with Perpendicular tracery at the east ends of the chancel and north aisle. There are some nice fragments of old stained glass in these three windows, a small figure of an angel censuring, coloured blue, yellow, and white, being particularly good. Between the nave and the north aisle, there is a single pointed arch, quite devoid of mouldings, like the chancel arch. The arcade, if it can be dignified by such a term, between the chancel and the north aisle is formed by two chamfered oak posts or pillars, with curved struts branching from the top to support a horizontal beam going across. The font is octagonal, poor in design, and dated 1661. In an arch recess with Decorated cusping, beneath a window on the south side of the chancel, is an effigy of a lady with the hands folded in prayer over the breast, carved in low relief and much mutilated. On the exterior of the chancel, on the south side, is a remarkably well-cut inscription in Roman capitals to Robert Evans, of Cairwys (*i.e.*, Caerwrys), who died in 1582. The oak communion table has well-turned legs, and is dated 1620. Two curious old relics were exhibited in the church—(1) a small hand-bell used at funerals, and (2) a pewter flagon also used for drinking out of on similar occasions. Both relics are dated 1703. The communion plate has the date 1685.

From Caerwrys the party proceeded to Newmarket, six miles to the north-west. Here the members left the carriages to climb on foot to the summit of Gop Hill, which is 820 ft. above sea level. A great archaeological treat was in store for every one, in the shape of an address by Prof. Boyd Dawkins upon the tumulus and bone cave on Gop Hill. On reaching the top a magnificent view of the surrounding country was to be seen, and of the sea coast to the Great Orme's Head on the west to Hlbre Island at the mouth of the Dee on the east, and even further to Liverpool in the extreme distance. The district immediately surrounding Gop Hill is an undulating plain of limestone formation, bounding the Vale of Clwyd on the east side, and overlying the Coal Measures, which run along the coast at a lower level. Gop Hill is not more than six or seven miles from Rhyl, and any one who may be staying at this fashionable seaside resort may be strongly recommended to make an expedition to this interesting spot. The tumulus is a huge mound of limestone rubble, and is a very prominent feature in the view for miles round. It reminded many of the members of the cairns they had seen in Brittany the previous year.

Professor Boyd Dawkins having collected the party round him on the top of the mound, proceeded to deliver the following address, as well as the rather high wind in the exposed position would allow him:—"Mr. President, Ladies, and Gentlemen,—The cairn on which we are now standing is one of the largest, if not the largest, pile of stones in the whole of Wales. I commenced its exploration in the year 1886, the owner, Mr. Pochin, having very generously defrayed all expense. We first sunk a vertical shaft from the top, as near the middle as we could guess, and then drove a horizontal drift

\* Concluded from p. 162, ante.

30 ft. long from the bottom of the pit. Every portion of the work had to be heavily timbered to prevent the sides falling in, which rendered the work both costly and tedious. The results obtained were few, as might have been expected from the small area we were able to explore by the method described. We were unlikely to have struck the true centre of the mound, but it was extremely easy to miss it. At any rate we found nothing to reward our efforts beyond a few bones of the horse and other animals. With this meagre list of objects we were obliged to be content, and our work then came to an end, but I look forward to completing the thorough exploration of this most interesting tumulus in the near future. Perhaps some of you will ask why I have called it a cairn, that is to say an artificial heap of stones in contradistinction to a natural one. Well, I have referred to it as a cairn because any competent judge would at once see that it belongs to a type of ancient remains known to be sepulchral. I may mention a very similar tumulus, perhaps not of such large dimensions as the one now beneath our feet, which, on being opened, was found to contain a burial accompanied with a necklace of amber beads and the wonderfully beautiful golden caskets now amongst the most highly-prized treasures of the British Museum. The tumulus on Gop Hill is sometimes called 'Queen Boadicea's tomb,' but there is no evidence, with which I am acquainted, that this celebrated ruler of the ancient Britons was ever in Wales. Nevertheless I believe that the tradition is true to the extent of indicating that the tumulus is the burial-place of some famous chieftain, but whether of the Age of Stone, or of Bronze, or of Iron, I am not now prepared to say. I hope, however, before many sessions of the Cambrian Archaeological Association are over that the question may be finally settled. The diameter of the mound is 350 ft. and the height 46 ft. Although its exploration has furnished so insignificant results up to the present, I must remind you of the sporting phrase that 'very often in aiming at a crow you may shoot a pigeon.' It was so in this instance as we shall shortly see." Prof. Boyd Dawkins at this point in his address requested his audience to accompany him a short way down the hill-side below the cairn, to a spot in front of the entrance to a cave in the limestone rock. A ledge of limestone projects over, forming a rock shelter on the left side of the cave. The learned Professor having pinned up a plan and section of the cave against a vertical rock continued his discourse. He said: "At the time that we were opening the tumulus, Mr. Pochin dug out a fox-run on the hill-side, and in doing so unearthed the entrance to the cave you now see in front of you. This we determined to examine. You will notice a large heap of *shells* in front of the cave. Through this we drove two horizontal passages or adits. We discovered large quantities of charcoal, bones and teeth of domestic animals, and pieces of rude pottery adorned with chevrons. Close against the rock, below the overhanging ledge of limestone, we found a large slab of limestone covering the bones of several human beings, and to the right of it a rectangular sepulchral chamber, about 4 ft. 6 in. square by 3 ft. 10 in. high, having its sides formed of dry rubble walling and containing an enormous quantity of human remains. It had evidently been a burial place used by a large number of individuals over a long period. We found no bronze implements of any kind, but the pottery taken out of the chamber is obviously of the kind manufactured during the Bronze Age. Three curious objects were associated with the burials, namely, two perforated pieces of jet and a polished flint flake. The skulls were chiefly long or dolichocephalic, such as we know to have belonged to the dark-haired aborigines of the Iberic stock that once were spread all over Europe, but some were of the round, or brachycephalic type which has been identified with the Celtic population. Thus we have here represented the two leading elements of the ethnology of Wales. Let us glance at the question of the coming of the Celtic people into Europe and into this country. The Aryans invaded Europe at a very early period, but we have no evidence of the appearance of the Celts in Britain before the commencement of the Bronze Age. The Continental Celt did not dare to attack the Aryan inhabitants of this country until he could do so with some prospect of success, such as the possession of a superior weapon

would be likely to ensure him. It was with a Bronze spear in his hand that the Continental Celt marched to overcome his neolithic neighbour across the silver streak which has afforded us so good a defence through countless ages. There is important archaeological evidence derived from the formation of the bones found in this sepulchral chamber, that the individuals buried there did not wear hoots with hard soles, but used their feet for grasping objects. I do not know whether there is any connexion between the cave and the tumulus. In the earth of the cave were discovered the bones of reindeer, rhinoceros, and other animals bearing the marks of having been gnawed by the hyenas, whose den it once was. At the bottom of all was a layer of clay without bones. There is evidence that the cave is of the post-glacial period."

Before leaving the neighbourhood of Gop Hill an inspection was made of Newmarket Church, which lies at its foot, an uninteresting building with a churchyard cross of the fourteenth or fifteenth century, having the crucifixion sculptured on both sides of the head. This cross, as well as others seen during the meeting, is described by the Rev. Elias Owen in his "Stone Crosses of the Vale of Clwyd." Mr. Owen formed one of the party on the occasion. The remaining places visited during the day on the return journey back towards Holywell, were Gwaenygor Church (one mile north-west of Gop Hill), celebrated for its early registers, dating from 1538, where a fine Norman font, the best in this part of the country, was seen; Llanasa Church, well restored by the late Mr. G. E. Street, and having a quaint hell-gable, and some good old stained glass; and last, but not least, the splendid pre-Norman cross, called the Maen Achwynfan, which stands in a field one mile west of Whitford, quite apart from any church, and surrounded by a wooden railing. The Maen Achwynfan has often been illustrated from the time of Camden down to the present day. The best are those in Prof. J. O. Westwood's "Lapidarium Wallias" and in Lloyd Williams & Underwood's "Village Churches of Denbighshire."

At the evening meeting, papers were read by Mr. G. W. Shrubsole, Curator of the Chester Museum, on the "Course of the Roman Road from Deva to Varis," and by the Rev. Elias Owen on "Holy Wells." The latter contained many curious particulars as to the superstitious uses to which the Ffynon Eilian was put as a cursing well. The method of cursing was to write the person's name on a pebble and drop it into the well. Ill-luck attended anyone after being "put into the well," and continued until after the pebble which represented him was removed.

The third day (Thursday, the 21st inst.) was devoted to Flint and Chester. Leaving Holywell railway station at 9.8 a.m., the members arrived at Flint at 9.19, where they were met by Mr. Henry Taylor, F.S.A., the Deputy Constable, and conducted over the Castle and Town Hall. Flint does not give the idea of being an attractive place, as seen from the railway, owing to the proximity of chemical works, but it improves on further acquaintance. Mr. Taylor has published an excellent little guide-book to the Castle, containing an illustration by the late Randolph Caldecott of the memorable scene, described by Froissart, in which the unfortunate King Richard II. is deserted by his greyhound Mathe the day before he was conveyed with the Earl of Salisbury to Chester, by order of Bolingbroke, on "two little nagges, not worth 40 frankes." Flint Castle is situated on the sea-shore, and is well worth a visit, notwithstanding the forbidding aspect of the red-brick building between it and the town, formerly used as the county prison. The plan consists of a square area with a round tower at each corner and a curtain wall between. The tower at the south angle, which formed the keep, is detached, and of much greater size than the other three. It has vaulted galleries in the thickness of the wall running right round. The whole building is remarkably well constructed of yellow sandstone.

After the Castle had been thoroughly examined a move was made for the Town Hall. Mr. Henry Taylor here pointed out the various improvements he had effected in the decorations of the Council Chamber, in order to make it worthy of the ancient borough of Flint. The painted ceiling is divided into fifteen panels, containing the armorial bearings of the royal tribes of North Wales. Arranged round the walls are various pictures and other objects

connected with the history of Flint. Amongst these are copies by the talented young Flintshire artist, Mr. Leonard Hughes, of the portrait of Richard II. in Westminster Abbey, and of Colonel Roger Mostyn, the gallant defender of the Castle in 1643; a rubbing of the brass in Colham Church, Kent, of Sir Nicholas Hauherk, Constable of the Castle 1396-1399; a water-colour painting of Edward the Black Prince; a case of seals relating to Flint; and Speede's map of the county of Flint. On the table in the Council Chamber were displayed the Corporation and Church plate.

The members having seen Flint, left for Chester by the 10.30 train. On arrival at the station they were joined by a party of the Chester Archaeological Society, and at once proceeded to St. John's Church, where, in the absence of the Rev. S. Cooper Scott, they were received by the Rev. G. Child. This church is so well known that it will be unnecessary to describe it at length, but it may be mentioned that considerable interest was excited by the pre-Norman headstones preserved in the crypt, together with many other well-executed pieces of later sculpture. The crypt was very dark, so that the stones were not seen to advantage. It would be well to remove the Saxon stones to the Grosvenor Museum.

From St. John's Church the members went on to the Cathedral, where the Rev. Canon Blencowe undertook the office of guide. After luncheon, hospitably provided by the Mayor, at the Town Hall, the charters and regalia were exhibited, preparatory to making a perambulation of the town walls, under the able guidance of Alderman Charles Brown. The day's proceedings terminated with a visit to the Grosvenor Museum, where the Curator, Mr. G. W. Shrubsole, explained the various antiquities preserved there. On the side of a Roman pig of lead of the date A.D. 74, found near the Roodeye, is the word DEGRANGL, which some of the authorities present believed to be identical with the more modern name of the district of Tegengel. The inscription has been previously read in two words as DE GRANGL. It will be unnecessary to describe the wonderful series of inscribed stones recently found built into the town walls. As Welsh archaeologists the members were particularly interested in the fine sepulchral urns of the Bronze Age obtained from Mr. Darbshire's quarry at Penmaenmawr. Inside one of the urns was found a hoat-shaped stone cup, which has been pronounced by the best authorities to be unique. The Grosvenor Museum is far too small for its purpose, and the cases containing art objects, lent by the South Kensington Museum, are quite out of place in such a collection.

The last day of the meeting (Friday, the 22nd inst.), was also the finest, so that there was no necessity for the use of a cloak like the one described in the life of St. Winefrid. Every year on the vigil of St. John the Baptist, St. Winefrid sent a cloak to St. Beuno by placing it on a stone in the fountain, when it was immediately conveyed to him floating down the stream on the stone. "The virtue of this cloak, on account of the merit of the virgin, was such, that whosoever Beuno might be clothed therewith, it neither got wet with rain, nor was its nap turned by the wind. From the event of such thing Beuno called the coat "Siccus." There is a stone still to be seen beneath the water of St. Winefrid's Well, which is called "St. Beuno's Stone." This is no doubt the one that formerly was credited with such miraculous properties.

Starting at 9.30 a.m., some of the party went to see a portion of Wati's Dyke, situated just outside the town of Holywell, on the north-east side, but the majority made straight for the church and St. Winefrid's Well, which lies close to it. Wati's Dyke is an earthwork of the same description as Offa's Dyke. Nothing is known of its history. Its course is marked on the Ordnance map, running in a south-easterly direction between Northop and Mold, nearly parallel with the shore of the estuary of the Dee, at a distance of from three to six miles from it, and then turning south at Hope towards Wrexham and Oswestry. Offa's Dyke runs parallel with Wati's Dyke, the latter being to the east of the former, and consequently further away from the foot of the Welsh mountains and nearer England.

Holywell Church possesses hardly any interest for the antiquary. There are some tablets with inscriptions to the memory of members of the Mostyn and Pennant families in the interior, and a mutilated effigy of a priest with a

maniple, holding a chalice against his breast. Adjoining the churchyard, and upon the same level with it, is the chapel above St. Winefrid's well, a building in the Perpendicular style, having a frieze of sculptured beasts forming a moulding running round the whole, similar to that already noticed at Mold Church. The well lies immediately beneath the chapel, the floor of the latter being supported by the vaulted ceiling of the former. The well is approached by a flight of steps from the road. Camden says of it:—"Under this place I viewed Holywell, a small town where there is a well much celebrated for the memory of Winefrid, a Christian virgin, ravished here and beheaded by a tyrant; also for the moss it yields very sweet odour. Out of this well a small brook flows (or rather breaks through the stones, on which are seen I know not what kind of red spots), and runs with such violent course that immediately it is able to turn a mill." Nothing is more astonishing than to see the enormous volume of water which rushes out from the stream, and the clacking of the wheel of the mill which Camden speaks of is still to be heard. It is not more than twenty yards from the spring. It is hardly necessary here to repeat all the legends connected with St. Winefrid. Those who are interested in the subject may consult Rees's "Cambro British Saints," or Bishop Fleetwood's "Life and Miracles of St. Winefrede." The life of the saint is said to have been written by the contemporary monk Elerius, but the earliest authentic account is that given in the twelfth century by Robert, Prior of Shrewsbury. Ralph Higden, in his "Polychronicon," has a curious Latin poem about St. Winefrid, in which he tells us that the descendants of Caradoc, who beheaded St. Winefrid, were condemned to bark like dogs, until they came to bathe in the well:—

"Qui scelus hoc putaverat  
Ac nati et nepotuli  
Litrant ut canum cattuli  
Duce Sanctæ antigram  
Pescant ad hoc fonticulum  
Vel ad urbem Salopia  
Ubi quiescit hodie."

The well is rented by the Roman Catholics, and large numbers of pilgrims annually visit the place that they may take advantage of the reputed miraculous properties of the waters in order to be cured of various diseases. Suspended from different parts of the roof and walls of the well are to be seen many *ex voto* offerings of crutches, &c., left by grateful persons who have been healed at the well. The feast of St. Winefrid is on November 3. The structure over the well is a very beautiful specimen of Perpendicular architecture, erected by Margaret, Countess of Richmond, the mother of Henry VII., to whose generosity we also owe the churches of Mold and of Northop. A plan of the well is given in the *Archæological Journal* (vol. iii, p. 148), and general views will be found in Pennant's "Tours in Wales." The shape of the basin of the well is an eight-pointed star, having angles of 90 and 135 degrees. Vertical mullions or pillars rise from each corner of the star to support the vaulted roof, and the spaces between were originally filled in with tracery (now gone), which screened the well off from the passage running round it. The chamber in which the well is enclosed is square, having no openings in the walls except in the front, which is pierced by three low-pointed arches, and a door in one of the side walls. There are flights of steps within the chamber on each side of the basin of the well in front leading down to the bottom. The bosses of the vaulting are ornamented with the arms of the Stanley family, Catherine of Arragon, and others. There is a very large cylindrical pendant boss over the centre of the well, covered with elaborate sculpture. Outside the well is a large bath open to the air. Under the water, at one corner, is St. Beuno's stone, already mentioned.

Leaving St. Winefrid's Well and its Medieval associations with much regret, a drive of a mile down the road along the west side of the gorge formed by the stream which issues from the well, brought the party to Basingwerk Abbey. The ruins are situated on rising ground on the east side of the entrance to the valley, about a quarter of a mile south of the Holywell railway station. Papers on Basingwerk have been published in the *Archæologia Cambrensis* (vol. i, p. 37) and in the *Journal of the British Archæological Association* (vol. 34, p. 468) by Mr. E. P. Loftus Brock. Buck's "Views" (vol. 2, pl. 380) may be referred to as showing how much of the ruin has been

destroyed during the present century. Giraldus Cambrensis lodged a night at Basingwerk (A.D. 1188) when in the train of Archbishop Baldwin on his progress through Wales to preach the Crusade. He calls it "Cellula de Basingwerk," which does not seem to favour the idea that there was a large monastery there at that time. Ranulph, second Earl of Chester (A.D. 1131), was one of the greatest benefactors to the abbey, and possibly its founder. The style of the architecture of what now remains of the abbey is very late Transitional Norman or Early English. The north side of the nave, the north transept, and the choir are completely gone, although their position might be ascertained, no doubt, by excavation. The west wall of the nave is standing to a height of 8 ft., and the south wall to a height of 2 ft. 6 in. The west and south walls of the south transept are complete, and the triple lancet window in the south gable is the most prominent feature in all the views of the abbey. The pointed arch leading from the south aisle of the nave into the south transept is still perfect. The width of the aisle may be fixed by the respond of the nave arcade. The springing of the arches of the central tower can be seen at the top of the south-west pier, the only one now standing. To the south of the south transept are the ruins of a long range of buildings on the east side of the site of the cloisters. The east walls are the most perfect. When Buck's view was taken the west walls also were in existence. The lower story was occupied by the sacristy, chapter-house, frater, &c., and the upper story (the holes for the floor beams and rows of lancet windows of which are not yet destroyed) was used as the monks' dormitory. Part of the chapter-house forms a chamber lighted by lancet windows adjoining the east side of the range of buildings and entered from it through two round arches springing from a pillar in the centre of the opening. On the south side of the site of the cloisters is the refectory, which is perfect, with the exception of the roof, and contains some good Early English architectural details. One good result of the visit of the Cambrian Archæological Association to Holywell will be that there is a chance of the ruins of Basingwerk Abbey being systematically excavated. Mr. T. Vaughan Hughes has commenced to dig some trenches on the site of the north transept, and has discovered several encaustic tiles. Mr. Hughes has, unfortunately, no special knowledge as to how such a work should be undertaken, but he has promised that he will do nothing further without advice from some competent authority. It would be better to leave the thing altogether untouched than to do it badly.

The next place visited was Downing, formerly the residence of Thomas Pennant, the great Welsh antiquary, which is situated about three miles west of Holywell railway-station. The house was built in 1627, and afterwards altered by Thomas Pennant, who was born in the yellow room on June 14, 1726. He was enabled to spend money on improvements owing to the fortunate discovery of a valuable lead mine on his estates. Thomas Pennant's branch of the family came from Bychton, which lies midway between Downing and Mostyn Hall. A full description of Downing and its contents will be found in Pennant's "History of the Parishes of Whiteford and Holywell." The members were allowed to see the interior of Downing House, through the courtesy of the Earl of Denbigh. Afterwards an inscription was made of an inscribed stone which was brought from Caerwys, and is now erected in the garden close to a small artificial lake below the house. It is a rude whinstone boulder, 3 ft. 9 in. high by 3 ft. wide by 1 ft. 6 in. thick, inscribed in debased Latin capitals of the sixth or seventh century.

HIC LACIT MYLI  
ER BONA NOBILI

["Here lies a good and noble wife"; or, according to Professor Rhys, "Here lies the good wife of Nobilis."]

THE M of MYLIER is the only letter of the minuscule form, indicating a transition from the Roman capitals to the Hiberno-Saxon minuscule.

From Downing the members went on to Mostyn Hall, where they were received by Lord Mostyn, the President of the Meeting, and conducted over the house and grounds in batches of twenty under his lordship's able guidance. Afterwards they were most hospitably entertained to luncheon. We must here record the fact that by some mismanagement a large

number of non-members were allowed to join this day's excursion with the sole object of getting a free lunch. It is unfair to overtax the hospitality of persons who are kind enough to throw open their houses to archæologists by bringing double the number of guests that is expected; and on this particular occasion the working members of the Association were prevented from seeing the house, whilst complete outsiders were busy eating and drinking. It is high time that the plan adopted by the Royal Archæological Institute of declining all offers of hospitality should be followed by other societies.

The most interesting objects at Mostyn Hall are a splendid gold torque found at Harlech Castle in 1692; a Roman cake of copper weighing 42 lb., inscribed—

SOCTO ROMAE

and

NATSOL

The silver harp used at the Caerwys Eisteddfod in 1868 was shown; and Lord Mostyn also exhibited (under a glass case) a selection of his valuable collection of Welsh MSS. for the inspection of members. His lordship will not, however, allow anyone to examine his MSS. for purposes of research, and has repeatedly put difficulties in the way of experts who were anxious to do so.

On the return journey to Holywell visits were paid to the so-called Roman "pharos," illustrated by Pennant, which turned out to be the ruins of a comparatively modern windmill; and Whitford Church, where there are a few fragments of early sepulchral slabs and a sundial with a Welsh inscription.

The papers read at the evening meetings, with the exception of one or two, were not such as would be likely to attract a general audience, however suitable they may be for publication in an archæological journal. A complaint of the dullness of the papers was formally made by a member at the meeting on Friday evening. He said he was glad to notice the author of paper No. 1 was yawning and showing visible signs of being bored whilst the author of paper No. 2 was trying the patience of his audience.

## Illustrations.

### THE PUBLIC FOUNTAINS OF PARIS.

THE illustrations of these fountains, reproduced from photographs, are published to accompany and illustrate a full article on this curious and interesting subject, which will be found on another page, and in which the few fountains here illustrated are further described and the names of their designers given, so far as they are known. As is pointed out in our article, the numerous works of this type in Paris form an important series of links with the architectural history of old Paris: and among them the talent of some of the first architects and sculptors of their day was employed.

### LITHOGRAPHIC PROPORTIONS OF THE PARTHENON.

THE diagrams which occupy four of our lithographic plates are published to accompany an important essay by Mr. Watkins Lloyd on the subject of the proportions of the Parthenon, and inferentially of Greek temples generally, the first half of which is published in the present number of the *Builder*. The objects of the diagrams, and the assumed system of proportion which they illustrate, are fully explained in Mr. Lloyd's paper, which must be taken in connexion with the plates.

The second portion of the paper, for the elucidation of which these diagrams are also requisite, will be given in our next issue,—the whole being too long for publication in one number.

NEW FREE CHURCH, MOFFAT, N.B.—The foundation-stone of this building was laid on the 19th inst. Competitive plans were submitted in March last, and those of Mr. D. B. Burnie, architect, Edinburgh, were approved of. The style of architecture is Early English Gothic. The church is to be built of whinstone from Moffat Well Quarry, with dressed red freestone facings from Corneockle Quarry. It will contain 700 sittings, with ample hall accommodation and vestry, and the height of the spire will be 123 ft. The total estimated cost is £4,200.

**SANITARY CONGRESS AND EXHIBITION AT BRIGHTON.**

The Sanitary Institute is holding its twelfth Autumn Congress at Brighton this week. The proceedings were formally commenced by the reception of the members by the Mayor (Mr. Alderman G. Manwaring, J.P.) at the Pavilion. Shortly afterwards, the Mayor presided at a public luncheon, and in proposing the toast of "The Institute," he very aptly said that sanitation meant something more than perfect drains: it included proper food, clothing, dwellings, and rational recreation. Sir Douglas Galton briefly replied on behalf of the Institute, and two or three other toasts followed. In the afternoon the Mayor formally opened the Health Exhibition, of which we give some account in succeeding columns.

The first general meeting of the Congress was held in the Music Room of the Pavilion, on Monday evening. Sir Douglas Galton, as Chairman of the Council, took the chair, in the unavoidable absence of Mr. G. W. Hastings, M.P., the President of last year's Congress, held at Worcester. In introducing the President of the Congress to the meeting, he said that Sir Thomas Crawford, after devoting between forty and fifty years to the service of the Queen in all parts of the world, had, since his return to this country, held the appointment of Director-General of the Army Medical Department, in which capacity he had done much good service.

*The President's Address.*

Sir Thomas Crawford, K.C.B., M.D., then took the chair, and proceeded to deliver his Presidential address. He commenced by saying that the formation of a national Society having for its main object the advancement of all subjects bearing upon the public health was a philanthropic conception which found expression in the inauguration of the Sanitary Institute of Great Britain in 1876. That Society had now been amalgamated with a kindred association [the Parkes Museum], founded in honour of that great apostle of practical hygiene, the late Professor Parkes. The Sanitary Institute, thus constituted, had extended its sphere of usefulness, without curtailing in any way the objects for which these allied institutions were originally founded. One of the chief objects was, and still is, the holding of meetings and exhibitions like the present, in such populous and influential centres as might be moved, in the interests of the public, to offer the Institute facilities for the purpose. Having thanked the Mayor and Corporation of Brighton for their hospitable invitation, and for the very liberal provision which had been made for the accommodation of every branch of the Congress, including the Health Exhibition, the President said:—"My next words must be couched in terms of regret for the loss of one who has long held a prominent position among the officers of the Institute, of which he was an esteemed Vice-President. I need hardly say I allude to Sir Edwin Chadwick, whose recent death leaves a blank in the roll of worthies whom philanthropists in general, and sanitarians in particular, delighted to honour. Robust of frame, resolute of purpose, quick to perceive the irresistible logic of facts, and indefatigable in collecting such as throw light on the health condition of the wage-earning classes in particular, he exercised a powerful influence for good over the social and sanitary legislation of the past half-century. It was mainly through his action that Lord Blythburgh was induced to support and carry through Parliament an Act authorising the establishment of the Registrar-General's office, from which has since issued a mass of carefully-prepared vital statistics which are invaluable. We are also largely indebted to him for those earlier Royal Commissions, which have contributed so materially to improve the sanitary condition of our public services. Sir Edwin Chadwick was spared to exceed by many years the proverbial three score years and ten, and to the last he retained a freshness and vigour of intellect as much above the average as was his length of days." In the course of the next portion of his address the President alluded to the possible great power for good which could be exerted by the clergy in the cause of sanitation. The clergy of all denominations, he said, were indefatigable in their endeavours to save men's souls, and with that object in view, they were zealous at all times in enforcing the due observance of the moral law; but it had often occurred to him that all that important work would be materially advanced if coupled in a larger

measure with equally zealous efforts for the enforcement of those physical laws the violations of which were, in many instances, the direct cause of the needless and wasteful suffering and misery, premature decay, and early death entailed by preventable disease. The clergy as a body did undoubtedly take an active interest in the physical as well as the spiritual condition of the people, but if one might judge from the polluted atmosphere which too often pervaded the places set apart for religious assemblies, they were not sufficiently equipped with that sanitary knowledge which was so essential for those who undertook to guide the people in such matters. It was for that reason they bailed with special satisfaction such sermons as that delivered by the Dean of York, on the occasion of their visit to that city in 1886; and still later by Canon Creighton, before the Congress at Worcester, in 1889. He could not pass on without quoting two sentences from the admirable address of the latter: "It is bard," says the Canon, "for those who live with enfeebled frames, amid neglected and filthy surroundings, to feel strong aspirations after the beauty, the purity, and the truth of a spiritual life." The conditions under which life is lived—the unwholesome air of the factory, the crowded room, the ill-ventilated chamber, all these rob the body of its vigour; how must they react on the soul? You heard in the epistle this morning of the works of the flesh—uncleanness, hatred, variance, drunkenness, revellings; do not these things, think you, come very largely from, and are they not very largely affected by, the physical conditions with which life is lived?" These sermons and the kindred address recently delivered by the Archbishop of Canterbury before the British Medical Association at Birmingham, made them hope that in the near future the clergy would rival the medical profession in their pursuit of that knowledge, by means of which the suffering and misery entailed upon the people by preventable disease could alone be effectually met; and that, with that end in view, they would enroll themselves in large numbers as members of the Sanitary Institute. The laws which governed the origin and spread of preventable disease were not merely physical, as some scientists were apt to assume, nor were they merely moral laws, the violation of which entailed those terrible consequences to which Canon Creighton alluded. They were both. There was a moral as well as a physical code which must be observed if men were to realise all that might reasonably be hoped for in Preventive Medicine. The chief point to which he wished to call attention was the wastefulness of ignorance in regard to sanitation in general, and domestic hygiene in particular; and the ample financial returns which all might realise by grappling vigorously with the whole question of disease prevention, the practicability of which the Sanitary Institute was yearly endeavouring to bring home more clearly to the masses of the people. Of the excellent work done in that direction, the development of these annual congresses was perhaps the most practical. They demonstrated the importance of sound sanitary principles in every detail of domestic life. The papers read at these meetings, and published in the "Transactions," and the valuable body of vital statistics and health reports compiled from the writings of Dr. Farr and Sir John Simon, and now made easily accessible to the public by the Sanitary Institute, were efforts in this direction of which any society might be proud. And yet they were still at a loss for reliable data on which to base accurate calculations of the suffering and loss entailed upon the people by preventable disease. The facts as to mortality had been carefully noted, and tabulated with great advantage to the public, but the facts regarding sickness, apart from mortality, were only approximately known. It was in that direction that the labours of the Medical Officers of the Army had proved of value to sanitary science, and it was to the results of these labours, as set forth in the reports of the Medical Department, that he wished to direct attention. The President then went at some length into this question, and quoted statistics the upshot of which was that in the Army the loss to the nation from sickness represented a money value alone of more than half a million of money. Applying the same principle of classification which prevailed in the Army to men of similar ages, and subject to similar influences and disease factors in civil life, it was possible to make a tolerably accu-

rate estimate of the actual loss of money entailed upon the wage-earning classes by preventable disease. True, we had no trustworthy record of sickness among civilians, nor was it likely that we would ever be able to apply the numerical methods, so valuable in the study of vital statistics, to such attacks terminating in recovery. Something was done in that direction by benefit societies, sick clubs, and other labour organisations; and much more might be done with advantage by the great companies and large employers of labour. The coming International Congress of Hygiene and Demography, which included the study of the life conditions of communities from a statistical point of view, would, it was hoped, throw much light on this important point. Meantime, and till some such record was available, we must be satisfied with such approximation to truth as we might be able to obtain. Sir James Paget delivered an address at the Health Exhibition in 1884, in which he established, on reasonably conclusive evidence, that the loss from sickness, between the ages of fifteen and sixty-five, in England and Wales, amounted to about 20,000,000 weeks' work in the year, or about one-fortieth part of the work done in the year by the whole population between these ages. Rather more than half that loss fell upon those whom the Registrar-General described as the domestic, agricultural, and industrial classes. Valuing these lost services as equal, on an average, to 1*l.* per individual per week, the amount at which the soldier's services had been valued, the loss to the annual wealth of the country from sickness among these classes alone amounts to 11,000,000*l.* sterling. Of the other classes, who lost the remaining 9,000,000 weeks' work, it would be bard, Sir James added, to make a guess in any known coin; for these included our great merchants, judges, lawyers, clergy, medical men, statesmen, legislators, poets, writers, musicians, painters, philosophers, and princes, who certainly did more for the wealth and welfare of the country than could be told in money. These estimates did not include the still greater loss inflicted upon the people by the premature death of our most industrious bread-winners, at an age, too, when they were most productive; nor did they touch the cost of subsistence and nursing, and other sources of expenditure which sprang out of sickness; or the sorrow and suffering of the widow and orphan left desolate by such bereavements. Sir Edwin Chadwick considered Sir James Paget's estimate of loss too low by many millions, and that the burden of taxation arising from that cause was three times greater than the poor rate. "In London this burden, from preventable disease, was £700,000 a year at a very moderate estimate."

The President then proceeded to discuss the various theories of disease-producing organisms, and said that bearing in mind the saprophagous character of some at least of these organisms, there was presumptive evidence in favour of the views held by some that, after all, these microbes were in the main scavengers, and that it was only when the healthy human frame had been in some way weakened that they were able to find a lodgment in it. But however that may be, it was obvious that the removal and destruction of all decaying organic matter was clearly indicated. Starve the microbe and save the man. In one particular that important principle was too often neglected: he alluded to the present system of dealing with house refuse, which was in many instances a convenient and attractive nidus for such organisms, and an effective vehicle for their spread. Dr. Louis Parkes had dealt so admirably with that subject in his excellent manual—"Hygiene and Public Health," the second edition of which had just been issued, that he could not do better than refer his hearers to it for further particulars. Dr. Parkes truly said, "The best method of getting rid of dustbin refuse is to burn it," and he gave a description of a destructor furnace which seemed to be well suited for the purpose. The Jews, more advanced in sanitary precautions than most nations, were well aware of the purifying power of fire. Would that we, too, had a *gehenna* in every locality in which people were permitted to shoot rubbish! There would be fewer complaints regarding the foulness of the subsoil or the "made" ground on which the modern "jerry builder" was permitted to erect his speculative blocks of artisans' dwellings. Having referred to the necessity of good laundry accommodation, the President said that of all

the causes which contributed to the origin and spread of preventable disease, overcrowding was, perhaps, the most important. That evil was met with in its most mischievous forms in large centres of human industry, where, for want of space, buildings were crowded together, and carried up to undue elevations; and where the prospects of employment at high wages attracted numbers of the working classes greatly in excess of the available accommodation. Nothing short of prohibitive legislation would check this. Every human habitation, whatever its height, should have open spaces in front and rear, commensurate with such elevation, so as to secure a free and adequate supply of both air and light to every part of the building; and the number of persons inhabiting such dwellings, or congregating in places of public assembly, should also be limited to that for which its aerial capacity is pronounced by competent authority to be adequate. Another indispensable requisite was a full and continuous supply of fresh potable water of good quality. Unfortunately the rapid and progressive increase of population in our large towns, and the wasteful prodigality of past generations in the matter of water conservancy, had surrounded this question of a full, free, and wholesome water supply with many difficulties. Still these were not insuperable; and till they were overcome we must not rest, nor admit that we were satisfied. Our sanitary engineers and Medical Officers of Health were thoroughly alive to the urgency of our needs in that direction, and we had confidence in their ability and readiness to do all that was necessary as soon as they were clothed with the requisite powers, and provided with the means. For the first we must look to the Legislature; for the second to the liberality of the nation. In conclusion, turning again to the reports on the health of the Army, we found that the rate of mortality among the European troops stationed in India during the half century prior to the date of the Report of the Royal Commission, was, in round numbers, 60 per 1,000; and in the Army at home, about 17 per 1,000. Since then, thanks to the wise policy pursued both in India and at home, the death-rate in the Army had been a steadily decreasing quantity. According to the report for 1888, the death-rate in all India was 15.20 per 1,000, and at home 5.52 per 1,000. He was not able to refer to the statistics of sickness among the troops serving in India prior to 1859; but were these accessible, he had no doubt they would show a corresponding diminution of the non-effective rate from sickness. In that instance there could be no question as to the great advantage, even from a pecuniary point of view, of the decreasing sick and death-rates, because the individuals concerned were all of the most productive ages; and also, because the expense entailed on the State in replacing them, more particularly in India, was very large. And yet the health of the Army was not as satisfactory as it should be, nor were the barracks in anything like a reasonably satisfactory sanitary condition. Thanks to the liberality of the House of Commons, and to the determination of the Secretary of State for War (and to the Sanitary Committee, of which Sir Douglas Galton was a distinguished member) to do all that was possible to remedy known defects, we might hope that the 4,000,000, just voted for barrack construction and improvement would remove all cause of complaint on that score. In civil life, too, we saw satisfactory results following sanitary improvements. Taking an illustration from London in which such works were progressive, although still far from complete, in the quarter ending June last, the death-rate was 17.3 per 1,000, of which 2.5 only was from zymotic disease. Ten years ago the death-rate was 19.0, and twenty years ago it was 22.0 per 1,000. This showed steady progress, and was in happy contrast to similar conditions prior to the completion of the main-drainage scheme. In Brighton the death-rate was still lower, being only 15.5 per 1,000. That was, with two exceptions, the lowest death-rate of any large town in England. Still there was room for improvement, even in Brighton; and with the improved laws now on the eve of passing the Legislature, there was a fair prospect of seeing the mortality reduced to 10.0 per 1,000 before the lapse of another decade.

On the motion of the Mayor of Brighton, seconded by Mr. Baldwin Latham, a vote of thanks was accorded to the President for his address.

We will report further proceedings of the Congress in our next.

#### The Health Exhibition.

The usual Health Exhibition in connexion with the Congress is being held in the Corn Exchange, in the Dome of the Pavilion buildings, and in one of the rooms of the Museum and Art Gallery. The space afforded by these contiguous premises, which are thrown into direct communication with each other, is ample, and we had expected to find an exceptionally good Exhibition in so large and important a town as Brighton. As a matter of fact, it is not so good an Exhibition as some others which have been held under the auspices of the Institute in other parts of the country. This Exhibition, too, differs from its predecessors in not being ready by the opening day. It has hitherto always been the commendable practice of the Institute to compel exhibitors to have their stalls in readiness by the opening day, on pain of being ineligible for examination by the judges. At the opening ceremony Mr. Rogers Field, the Chairman of the Judges of the Exhibition, said it had been their usual practice to make the awards before the Exhibition opened; but in the present instance, although the authorities of the town had done their best, it had been found impossible to get the Exhibition completed. In a few days the awards would be made. We may here mention that the other Judges of the Exhibition are Dr. A. Wreter Blyth; Prof. W. H. Corfield; Mr. T. W. Cutler, F.R.I.B.A.; Mr. Baldwin Latham, M.Inst. C.E.; Mr. H. Law, M.Inst. C.E.; Dr. Louis Parkes, D.P.H.; Mr. J. Wallace Peggs, Assoc.-Mem. Inst. C.E.; Dr. J. C. Steele; and Mr. Ernest Turner, F.R.I.B.A. Although the Exhibition contains a great many excellent sanitary appliances (as will be seen by our enumeration of some of them), there are comparatively few novelties that are likely to be of much practical utility. Nevertheless architects, builders, and house-owners and occupiers in the South of England, as well as visitors to our southern watering-places, will find much to interest them in the Exhibition, which will remain open until Saturday, September 13.

Most of the exhibits which are of special interest to our readers will be found in the Corn Exchange portion of the Exhibition. Here are arranged the great bulk of the exhibits in "Class I., Building Materials, Construction and Machinery;" "Class II., Water Supply and Sewerage;" and "Class III., Heating, Lighting, and Ventilation." Each of these "Classes" is in the catalogue divided into numerous "sections," but as many of the exhibitors are represented in two or three of the "Classes" and in several of the "sections," we will avoid the needless repetition of names by noticing some of the principal exhibits stall by stall in numerical order, ignoring the classification of the catalogue, which is perhaps somewhat overdue, having regard to the scantiness of material in some of the sections.

At Stall 3, the Burnmantofts Company, Leeds, are staked in the catalogue as exhibiting, besides decorative pottery, the "Burnmantofts Firesides," with grates, fire-backs, hearths, and brick fenders complete; but up to Tuesday morning their exhibit was not *en evidence*.

Messrs. J. Tylor & Sons, London, have, at Stall 6, a very good show of baths, lavatories, urinals, water-closets, water-waste-preventing flushing cisterns, brasswork, disconnecting traps, and gullies. One of their specialties well worth attention is the patent "Column" pedestal closet, which is made in one piece of earthenware, with lead trap to shoot either out or down. The use of a lead trap, it is urged, ensures the joint between the closet and soil-pipe being well made. The lead trap is joined to the earthenware basin by a simple brass collar, as in the ordinary valve-closet. This joint between earthenware and metal,—always a difficult joint to make,—is above the trap, and hence there is no danger of sewer-gas entering the house through careless fixing. Several other good closets are shown at this stand, including the "Compound" pedestal closet, in which the force of the flush is exerted directly on the water in the trap. The same exhibitors' patent "Universal" disconnecter traps and patent connectors are very good and convenient, and capable of application under a great variety of circumstances.

The London Water Meter Company (Ltd.) exhibit (Stall 7) their patent service-meters, which are shown in action. They are very simple in construction, have few working parts (which are all made interchangeable), and seem to be calculated to ensure unvarying accuracy

of registration, whatever the pressure or rate of the flow. They should certainly be seen by all who are interested in preventing waste of water or who wish to pay only for what they use.

At Stall 8, Messrs. Bostel Brothers, of Brighton, have a varied collection of sanitary appliances and fittings, including a bath, lavatories, urinals, water-closets, sinks, air-light manhole-covers, traps, and Maignen's "Fille Raspide." Their patent "Brighton" drain-trap, with diminishing channel, is a very good one. They exhibit a "silent-action" syphon-flushing cistern, and some very good forms of water-closets, including the improved "Brighton Excelsior." Their "Artizan" closet may be specially mentioned as worthy of commendation for simplicity and efficiency. It is a pedestal closet, made in one piece of earthenware with the trap, and with a vertical back allowing of a direct drop into the water of the trap. It is efficiently flushed by Holmes's patent cylinder syphon waste-preventing cistern. It is worth noting that these exhibitors recommend the provision of brackets to keep the weight of the seat and of the sifter off the earthenware, their reason being that in most closets of this type the trap is in one piece with the basin and the connection with the soil-pipe has necessarily to be made below the trap. It is obvious that the vibration caused by a constantly falling lid, or by the movement of a person whose whole weight rests upon the earthenware, must in time tend to loosen the joint, and to make it the channel for the admission of the air of the soil-pipe into the building. Visitors to the Exhibition should not leave this stand without inspecting the very ingenious screw-down tap, for hot or cold water, invented by Sir William Thomson; there are no leather or rubber washers in it, and no packing round the spindle. It is entirely of metal, and cannot be injured by over-turning.

Mr. D. T. Bostel, of Ebury-street, London (Stall 9), exhibits a varied assortment of plumbers' brass-work of good quality, some effective but silent flushing cisterns, and the "Brighton Excelsior" closet in various forms, including that with the "Tarver pattern" pedestal, which is an agreeable improvement on the too often unsightly appearance of these pedestal closets; being unsightly, they are sometimes boxed-in or masked in some way,—an expedient to be strongly deprecated on sanitary grounds; the "Tarver pattern" pedestal affords no justifiable pretext for concealment.

Stall No. 10 is occupied by Mr. John Jones, of Sydney-street, Chelsea, who exhibits some novelties worth notice. Firstly, we may mention a simple but ingenious pipe- or drain-stopper, for temporarily stopping drains or pipes when under repair, or when being tested. It consists, briefly described, of an expandible ball or cylinder of india-rubber or other material, connected with a length of flexible tubing to a small air-pump or bellows. The expandible balls are made of various sizes, to suit large or small pipes. Inserted while in a condition of collapse into the drain or pipe to be stopped, they are readily inflated or distended under sufficient pressure to effectually dam up the liquid or to prevent the passage of gas. The turning of a cock on the flexible tubing at once releases the air which inflates the stopper, which is then readily removed. Mr. Jones also exhibits a new manhole-cover, the principle of which is to utilise the liquid formed by condensation on the under surface of the manhole-cover for automatically making a gas-tight seal round the edges of the cover. The water of condensation trickles down the under surface of the cover, and runs into a continuous groove or channel, into which the edges of the cover dip. This exhibitor also shows a chimney-cowl which appears likely to prove very effective in preventing down-draught and smoky chimneys.

At Stall 11, the Corporation of Brighton through the Borough Surveyor, Mr. F. J. C. May, are described in the catalogue, and in the Brighton papers of Tuesday, as exhibiting a model section of house, showing the system of drainage and ventilation adopted in Brighton, and the method of testing new drains; together with models of flushing shafts for cleansing house drains and sewers. But these exhibits were not on view up to Tuesday mid-day, so we can say nothing about them now.

Messrs. John Smeaton, Son, & Co., of Great Queen-street, London, exhibit, at Stall 13,

very good selection of baths, lavatories, water-closets, and other sanitary fittings. Their patent "Amplex" closet is well worth notice. It has a rapid and effective flush, and has a good appearance. These exhibitors also provide brackets for taking the weight of the seat and sitter off the basin, and the brackets are hinged so as to fold back to allow of more readily cleaning behind and around the basin. This firm also exhibit some very good automatic siphon-action flushing cisterns for urinals, &c. They also show an admirable slop-and-draw-off sink, with copper tube for flushing and a hinged gun-metal fork or tripod upon which to stand a pail. Among their other exhibits is a very complete spray, douche, and plunge bath, with shampooing apparatus; a new regulating safety-valve for kitchen cylinders and boilers; and a dust-shoot lid or hopper for artisans' dwellings; this hopper is so contrived that when pulled open the air in front of the lid is shut off from the dwelling.

At Stall 15 Messrs. Burr & Bailie, of Edinburgh, exhibit the patent "Eclipse" draining apparatus, which may be described as hydro-pneumatic in principle. If it detects a leakage, it is provided with means for applying the smoke test to discover the exact point of leakage. The same firm exhibit some lavatory-basins, embodying an important improvement in regard to the accessibility of the overflow for cleansing, and a good quick-filling and quick-discharging bath.

Mr. H. Heim, of London (Stall 18), shows his "Helios" chimney-piece stove, for which it is claimed that it will burn a whole day without attention, at a cost of threepence. At the next Stalls (19 and 20), the Eagle Range and Foundry Company show some of their ranges and stoves in action. At Stall 22 Messrs. Geo. M. Hammer & Co., of London, have a very good show of church and school fittings. Stall 27 is occupied by Messrs. Crossley Bros., of Manchester, with one of their "F.B." horizontal gas-engines. Messrs. William Sugg & Co., of London (Stall 28), exhibit gas-cooking ranges, &c. At Stall 31 Messrs. Merryweather & Co., of London, exhibit in action their patent "Microboliser" or drain cleanser, recently described by us (see *Builder*, p. 113, ante). At Stall 33 the Sanitary and Domestic Engineering Company exhibit the "Wallas" patent indicating gradient block, for ensuring accuracy in fall when laying drain-pipes and sewers. This was described and illustrated in the *Builder* for Jan. 18 last (p. 41).

Messrs. Douilton & Co., of Lambeth (Stall 32), have, as usual, a very good collection of exhibits, including a variety of water-closets of various types. The "Simplicitas" wash-down closet and trap in one piece is specially worthy of notice on account of its efficiency and cheapness. It is largely used, we believe, in Post Office buildings. Other closets too numerous to mention are shown, as well as an improved stoneware urinal, without basins or angles, and which, regularly flushed by automatic cisterns, seems likely to remain always sweet and clean. This firm also exhibit a variety of excellent flushing cisterns, including the "Paisley" (with a very rapid and effective flush) and the "Thirmer" (adopted by the Manchester Corporation). They also show their patent self-adjusting joint for drain-pipes under test as to its water-tightness.

Messrs. Peters, Bartsch, & Co., of Derby (Stall 36), exhibit their "Carbolinum Avenarius," and proofs of its efficiency as shown by specimens of woodwork treated by it contrasted with specimens not so treated.

Messrs. T. H. Durans & Sons, of London (Stall 38), exhibit their patent metallic-jointed air-tight cover, which has truly turned and ground bevelled faces, which are brought together by a bayonet-joint fastening in a very ingenious manner. It has previously been noticed by us. Their "Dukbak" accessible gully, and their patent grease-trap, are two appliances worth inspection; and their "Dukbak" stable-floor, for stalls and loose boxes, is likely to do much for the healthiness of stables and the comfort of horses.

Messrs. Joseph Cliff & Sons, of New Wortley, Leeds (Stall 41), have in view a good selection of their well-known specialties, amongst which we may mention an inspection-chamber with Winsor's channel-bends; Light's patent inter-venting-trap, which has an air-tight flap as well as a water-trap and ventilating pipe, as an additional precaution against the admission of sewer-gas into the house-drain; and a new louble joint for drain-pipes: the pipes are

made with elongated sockets, and that portion of the socket remotest from the lip is provided (as well as the spigot end of the pipe) with Stanford's joint. The portion of the socket nearest to the lip is made with an annular groove to receive liquid cement, which is poured into the luted joint after the pipes have been fitted together, so that here we have the Stanford joint backed up by a cement joint. Enamelled fireclay baths, the "Cecl" slop sink with flushing-rim, Winsor's grease gully, and some good enamelled bricks are a few other items out of many worth attention at this stand.

At Stall 45 Mr. A. T. Angell, of Fulham-road, exhibits his manhole-cover. At Stall 47 Messrs. Smith, Collier, & Co., of London, exhibit their very simple and convenient Venetian blind fittings, of the merits of which we spoke in our issue of July 19 last, p. 54. At Stall 48 the Archer Pipe Company, London, exhibit the Archer drain-pipe joint under tests as to strength and water-tightness. This excellent joint has already been described and illustrated in our columns. At Stall 49, the Walker Sewer Valve Company, London, exhibit their patent sewer valve, which has some very good points to recommend it. Stall 50 is occupied by Mr. F. Augustus Moore, of London, who shows his ventilating appliances, including the "M.P." globe chimney-cowl and ventilator. Messrs. Illingworth, Ingham, & Co., Leeds, exhibit parquet flooring, &c., at Stall 51.

Messrs. C. Kite & Co., of London, Stall 52, have, as usual, a very good display of their well-known and effective ventilating appliances, of which we have often spoken in terms of commendation. Stall 53, described in the catalogue as displaying Mr. John Hewes's "patent plans or drawings of sewage-sludge cremator, with samples of by-products therefrom," was invisible at the time of our visit.

At Stall 54, the Rainbow Engineering Company, London, exhibit drawings of the "Robber" system of filtering, heating, and circulating the water of swimming-baths. Stall 55 is occupied by Moul's Patent Earth Closet Company with samples of their appliances.

At Stall 56 Messrs. Hayward Bros. & Eckstein, of London, exhibit their well-known specialties in the shape of pavement and stall-board lights, as well as Hayward's Sheringham inlet ventilators and Hayward's improved mica-flap outlet ventilators. They also exhibit the "Southwark Universal Venetian Ventilator," which consists of a perforated plate masking a series of louvres. It is available either for the ingress of fresh air or for the egress of foul air simply by reversal in fixing.

At Stall 82, in the Dome, the Morris Tube Ammunition Company, London, exhibit a selection of the Morris patent circulating water-filter. At Stall 104, in the Art Gallery, Messrs. W. Woollams & Co., London, exhibit specimens of their artistic and non-poisonous wall-papers. Stall 105 in the same gallery consists of an erection showing the decorative capabilities and varied applications of Aspinall's Enamel.

The Exhibition, as already mentioned, will remain open until the evening of Saturday, September 13.

SANITATION AT GREAT YARMOUTH.

THE Annual Summer Meeting of the Association of Public Sanitary Inspectors of Great Britain was held at Yarmouth on Saturday last, on the invitation of the Mayor (J. W. B. Johnson, Esq., J.P.), who at 10.30 a.m., accompanied by the Medical Officer of Health (Dr. John Bately) and the Borough Surveyor (Mr. J. W. Cockhill, A.R.I.B.A., Assoc.-M.Inst.C.E.), received the members at the Town-hall, and a quarter of an hour later took the chair and formally opened the proceedings by cordially welcoming the Association to Yarmouth. They in Yarmouth had for some years past been doing a great deal for the sanitary welfare of their ancient borough, but he did not suppose they were quite perfect; and if the members of the Association, from their fund of practical experience, could teach them anything, they would be only too glad to learn. Sanitary inspectors were not only inspectors of nuisances, but were by many people regarded as nuisances themselves. That opinion of them, he was quite sure, was a most erroneous view to take of an exceedingly important and very necessary body of men. With these words of welcome the

Mayor vacated the chair, which was then taken by Mr. Hugh Alexander, the Chairman of the Council of the Association, in the absence of Dr. B. W. Richardson, F.R.S., the newly-elected President.

Mr. Alexander said they were all very much obliged to the Mayor for his hearty welcome. He (the Chairman) very much regretted that Dr. Richardson, their new President, had not arrived; he had been staying at Swanage for the benefit of his health, and was to have sailed round to Yarmouth. Dr. Richardson, he might say, was unanimously nominated by the Council as the successor of their late venerable and distinguished President, Sir Edwin Chadwick. Dr. Richardson's long and intimate acquaintance with Sir Edwin, coupled with his own great services to sanitary science, fully justified his nomination, which was unanimously adopted by the members of the Association in general meeting assembled. He was pleased to be able to say that Dr. Richardson had accepted the position, and had promised to open the next session of the Association, in November, with an address upon the life and labors of Sir Edwin Chadwick. He also regretted the absence of Sir Robert Rawlinson, who had written stating his intention to be present, but probably at the last moment he was advised not to take so long a journey. The Mayors of Norwich and Lowestoft were also unable to be present, the first owing to ill-health, and the second owing to a business engagement. Letters expressing the regret of the writers for their inability to accept invitations to the meeting had been received from Sir Henry Tyler, Professor Roscoe, M.P., and many other gentlemen. With regard to the objects of the Association, he need not say much. For a long time past every thoughtful and intelligent sanitary inspector had been fully alive to many anomalies connected with their duties and their tenure of office. A statement of those anomalies had been made by him (the speaker) in a paper read by him in December last, and a resolution embodying the points of that report, and expressing agreement with them, was submitted to the meeting after Dr. Bately's paper had been read.

Dr. Bately, Medical Officer of Health for Yarmouth, then read an exceedingly interesting paper entitled "Historical Notes on Sanitation in Great Yarmouth." We regret that we have not space for it *in extenso*, but we give a summary of its most salient points. He said that where Yarmouth now stands, the waves of the ocean rolled for ages; but in consequence of the action of the tides, soon after the Roman occupation land arose as a sandbank at the mouth of the estuary. Aided by wind and tide, the sand increased, and established itself above high water-mark. Then, assisted by saline vegetation, especially the marram grass, dried sand found an entanglement, and most materially contributed to the building up of firm and dry land. The hindrance this sand island offered to the eflux of the tide led to the silting up of the shallow waters of the estuary and made the reclamation of large tracts of swampy land an easy matter. That process, first commenced on the south side, had in course of time been extended from every parish bordering on the waters, so that the tidal mere of Breydon at the back of the town is all that remains of the ancient arm of the sea. An attempt made some fifty years ago to bore an artesian well near the oldest and highest part of the town revealed the fact that at a depth of 515 ft. occurs the primeval chalk. Upon the chalk is 350 ft. of dark coloured clay, 49 ft. of dark sand, and 111 ft. of clean sand and shingle, the latter being the subsoil of Yarmouth. Through this subsoil the tide still has an action, and the water in the wells rises and falls with the tides. This is a fairly rapid underground current, and it is a happy thing for the town it is thus practically floated. Much liquid impurity gets quickly washed down through the porous sand to the subsoil water, and if this were stagnant, or, in other words, if it were water-logged, what a glorious cesspool Yarmouth people would be living over! But this underground tidal movement not only cleanses the subsoil but washes away all that is objectionable, and, being sand, the soil soon dries, and therefore contributes very little by way of exhalation to the humidity of the atmosphere. In Saxons

\* See *Builder* for Dec. 14, 1889, p. 492.  
+ A happier thing for the town than for the new Town-hall, apparently, which has suffered much from settlement of the foundations.

times and long previous the inland coast line of the estuary mentioned, as well as the seaboard of Norfolk and Suffolk, was populous with fishermen, and Norwich and Beccles were the markets at which they delivered their catches. When Domesday Book was compiled the waters of the estuary had considerably subsided, but there were then numerous saline or salt-pans in operation at many villages now remote from the sea. As soon as the Yarmouth sandbank had become permanently established above water, fishermen flocked hither, and during the herring season especially considerably crowded the Yarmouth island. As fishermen came faster than the land grew to accommodate them, their houses, or rather huts, were planted so close together that there was barely room to pass between them. A somewhat more orderly arrangement soon became a necessity, so that their fronts and backs at least might afford free passage and have some amount of light and air. Being as it was a very small island and area exceedingly precious, the early inhabitants could not afford to waste it in making the streets any wider than was necessary for pedestrian traffic. Hence the peculiar character of the old and ancient portion of the town, where these narrow streets are called "rows," a Saxon name evidently referring to the houses on each side rather than to the streets themselves. The herring has ever been king at Yarmouth, and during its early days, and indeed until the Black Death of the fourteenth century, the fishing and the commerce it gave rise to had the first and chief attention of the authorities. Prior to that fearful visitation the sanitary condition of Yarmouth resulting from the habits of the people and the dirty processes of their trade, must have been dreadful indeed. The earth, air, and water were much polluted by the filth resulting from so many people being huddled together and carrying on their fish-curing almost in their own houses. Their streets and "rows" were not paved, the only drain being an unbricked gutter down the middle, until the absorbent sand received its sluggish liquid sewage. With such a state of things more or less disease must necessarily have resulted. Nevertheless, pestilence was accepted as a Divine infliction, and regarded as inevitable. The connexion between dirt and disease was hardly dreamt of. Dr. Bately next graphically described the visitation of the Black Death in 1349, and called attention to a silent witness of the severity of the plague, the ancient foundations at the west end of St. Nicholas' Church. In 1330, when the town was at its zenith of early prosperity, it was proposed to erect a magnificent western front to the church, which would have formed a vestibule 107 ft. long, corresponding with the width of the church, by 47 ft. in breadth. The western door would have been set in a deeply-splayed entrance 40 ft. wide, flanked on either side by a fine octagonal turret, with others at the north-east and south-west corners, and the whole work would have been richly decorated. This grand piece of church work, which would certainly have given the structure a cathedral-like appearance, was to be known as the Bachelors' Aisle, as it was commenced and carried on for eighteen years by the young men of the town. This noble pile, although prepared 60 ft. from the ground, was, after the plague, left to decay during 300 years, when a portion of it was removed to fill in the piers at the Haven's mouth. A few years later more of it was demolished to strengthen the fortifications, and in 1714 all that then remained above ground was removed to form the foundations of St. George's Chapel. Succeding visitations of pestilence did not do much to stimulate remedial measures until 1584, when a dread of the return of the plague moved the Assembly (as the then governing body was called) to appoint scavengers to cleanse the streets. Again in 1590, when a similar alarm was felt, women were appointed to visit the houses where any sickness or death should happen and report whether it was the plague, and if so, such houses were to be watched, and no one allowed in or out unless every person entering remained there a month. Such houses were to be supplied with all necessary things by a general collection, where the parties could not obtain them at their own charge, and every Saturday night lists were to be made of all who had died in the previous week and of all infected houses. And "for avoiding God's judgement upon drunkenness, then common in the town," and all meetings which might spread the in-

fection, it was ordered that no person should resort to an ale-house, except with a stranger and for especial business, and also that all bedding, clothes, &c., that should come out of infected houses, should be carried near the North Mill, or the old Haven to the south, to be aired on stakes set up for that purpose, on pain of having the bedding, &c., burnt. The plague was still prevalent in 1597, for on May 9 of that year the aldermen, constables, and vintners were ordered to visit "all houses and people as have the plague," and to direct that "the doors be spered in, and the people also." Fires were ordered to be made throughout the town every Tuesday and Saturday night. "Spering the people in," whatever proceeding that may have been, seems to have had little effect upon the pestilence, and we find a far more sensible order on October 6, 1598, "That the alderman of every ward should appoint a scavenger in his ward for weekly cleansing the gutters, drains, &c., and each alderman with three or four chief of the housekeepers to assess the ward with a weekly rate to defray the expense, and if any refuse payment, the constable to seize their goods and sell them. The alderman to appoint carters for carrying away the muck, and any refusing to cart it to be imprisoned." Here we have a whole Sanitary Act in a nutshell, and this order seems to indicate a more intelligent conception of the relationship of dirt to disease than we have hitherto met with. Anyhow, with the advent of the seventeenth century a considerable improvement in sanitary effort is very evident, for we read of penalties attaching to those depositing refuse on the quays, streets, or public places of the town, and to carters not properly disposing of "that they carry forth from the town." Nuisances were prohibited in the town, all filth had to be placed by the sea shore, to be washed away by the tide, and again and again did the Assembly order "that this be done." In 1601 the streets were thoroughly cleansed and paved, and Henry Hill was appointed overseer to see the streets and gutters cleansed, "and to receive the fines levied on those who neglect to clean their gutters, &c., for his trouble." This gentlemen seems to have been the first inspector of nuisances, and as his salary depended upon his energetic action, no doubt he carried out his office as thoroughly as he could. Notwithstanding his exertions, the plague reappeared here in 1602 and 1603, and it was deemed advisable to revive the orders of 1597 respecting the aldermanic visitation of infected houses; to prohibit wools and woollen cloths being brought from London, where the infection was very rife, under a penalty of 40l.; to make collections for the infected poor shut up in their houses; and to do many other things. Our early sanitarians certainly did not err on the side of lenity. In 1610, the channels and gutters crossing the Quay—and they were the principal drains in the town at that time—were covered in "very neatly," so that "men may pass along the Quay without annoyance, and the poor beasts draw their burdens far more easily than in former times they could do." Recently, in renovating the Quay sewers, many of these early ones were taken up, and they were found to be merely bricks placed on each side of the original trench or channel, with others on end meeting above, and without any flooring. In not a few instances oaken planks from defunct ships were in the place of bricks. In conclusion, Dr. Bately referred briefly to present-day sanitation, and to the claims of Yarmouth as a health-resort.

On the motion of Mr. E. R. Boulter (Bexley), seconded by Dr. Wynne (Medical Officer of Health, Lowestoft), a hearty vote of thanks was accorded to Dr. Bately for his paper.

Mr. Wilkinson, Chief Sanitary Inspector for the Borough of Derby, then moved the following resolution:—

"That in the opinion of this meeting, the administration of sanitary law would be greatly improved by the following amendments thereof, prescribing:—1. That every candidate for the position of sanitary inspector shall have a general knowledge of the building trades, and in addition shall possess a certificate in sanitary science. 2. That sanitary inspectors shall be elected to a permanent tenure of office, and shall only be dismissible for misconduct or proved incompetence, with right of appeal to the Local Government Board. 3. That it shall be the duty of sanitary inspectors to periodically inspect the dwellings of the district to which they are appointed for the detection of nuisances, and to receive complaints of nuisances and serve notices forthwith requiring all necessary work to be done for the abatement of the nuisances; such notices to be as valid, if confirmed by the local authority, as if served

by the authority's order. 4. That in all appointments requiring the officer's whole time to be given to the duties of his office, an adequate minimum salary shall be prescribed. 5. That the officers, now variously named 'sanitary inspectors' and 'inspectors of nuisances,' be designated 'sanitary inspectors.'"

In an able speech he enlarged upon each of these heads.

Mr. Jennings (Rotherham), a rural inspector supported the motion by a speech which lost nothing in effectiveness from its under-current of dry humour. He narrated the very hard case of a rural inspector well-known to him who was appointed for five years at the "enormous" salary of 225*l.* a year, out of which he had to find his own horse and "trap." When the term of his appointment had nearly expired, there was a movement on the part of some members of the Board under whom he had served not to reappoint him except at a salary reduced by 40*l.* per annum—not that a salary dissatisfied with him, but because they thought the salary was too high! Ultimately, the officer was reappointed at a reduction of 15*l.* per annum, on condition that he would take care that his employers (the Board) should spend as little money as possible! The poor man, who had no chance of other employment, was obliged to accept these terms. Such a case was an injustice not only to the officer, but to the public. Why should officials the proper performance of whose duties was of so much importance to the public be dependent on the caprice of their employers as to the tenure of their offices, when a Board of Guardians could not dismiss even the gatekeeper of their workhouse without the permission of the Local Government Board?

Mr. Nicholson, Town Clerk of Lowestoft, having suggested a verbal amendment in one of the sections of the resolution, which was agreed to.

Professor Stuart, M.P., addressed the meeting. From what had been said by the previous speakers, and from what he had read (by the kindness of Mr. Alexander) as to the anomalies which existed both with regard to their powers and responsibilities as public officials, and as to their salaries and tenure of office, he thought they had a very good case indeed, and he should do all that he could as one member of the Legislature to remedy the defects and grievances from which they suffered. There could be no doubt that the effectiveness of the sanitary administration of the country was largely dependent upon the sanitary inspectors, and therefore any representations which they had to make with the view of rendering their services of greater value to the community were worth very careful consideration. Sanitary inspectors were, indeed, the pivots upon which the sanitary administration of the country turned, and they should not be deficient either in responsibilities or powers. He was very pleased to find, from one of the sections of the resolution, that there was a movement on their part not only for examination, but for something like a curriculum of study. As had been very well said by the mover of the resolution, an examination alone would not and could not afford an adequate test of a man's competency to act as a sanitary inspector, who, to judge of what was required of him, ought to be acquainted with building construction, and to be something of an architect and engineer, as well as a bit of a lawyer. But while it was, no doubt, very desirable that sanitary inspectors should have a knowledge of building construction, it was still more to be desired that building workers themselves should have a knowledge of building construction and sanitary principles, especially the plumbers, upon the excellence or otherwise of whose workmanship the health of the public was so largely dependent. But in justice to the English plumber he was bound to admit that English plumbers was much superior to that of other countries, so far as his own personal observation went.

On the motion of Mr. E. Tidman, C.F. seconded by Mr. Watson (St. James's, Westminster), a vote of thanks was given to the Mayor for his kindness; and on the motion of Mr. J. J. Colman a vote of thanks was given to the Mayor, who briefly replied and invited the members to luncheon.

After luncheon, the members started in carriages to inspect the arrangements for flushing the sewers and watering the roads.

\* Mr. Stuart has perhaps not heard of the excellent work which the Flinners Company has been doing in the past in promoting the technical education and registration of plumbers.

be town by sea water, arrangements which have been carried out by the Borough Surveyor (Mr. Cockrill) with very satisfactory results. Mr. Cockrill accompanied the party, and gave some interesting particulars. The works were commenced in 1886, and cost £5,000. The pumps are 12 in. in diameter with 15 in. stroke, and are driven by an 8 horse-power Crossley gas engine. The distributing tank is 45 ft. above low-water level, and has a capacity of 2,300 gallons. The rising and distributing mains are over nearly eight miles in length. There are forty-three valves for flushing the sewers direct from the water-mains, varying in size from 6 in. to 3 in. in diameter, in addition to which there are fourteen self-acting siphon flushing tanks of a capacity of 3,000 to 2,000 gallons each. The cost of water for street watering and sewer flushing in the town district previous to putting in this installation of sea-water service was 550*l.*, for which rather more than ten million gallons were obtained. Of this about seven million gallons were used for street watering, and only about three million gallons or sewer flushing. The result of last year's working of the sea-water works was that about forty million gallons were raised, at a cost of about 400*l.*, or less than 3*d.* per 1,000 gallons. This sum includes all charges for interest, repayment of capital, and working expenses. Of the forty million gallons raised, about five million gallons were used for street-watering, and the remainder, or about thirty-five million gallons, for sewer-flushing. The effect of this had been to thoroughly cleanse the sewers, and combined with improved and increased ventilation had been to place the great proportion of the sewers in a condition which Mr. Cockrill thought could not be much improved upon.\*

After concluding their inspection of the sewer flushing arrangements, the members had a pleasant drive to Ormesby Broad, whence Yarmouth derives its water-supply. At the waterworks, they were received by Mr. E. P. Conell, the Chairman of the Water Company, and by Mr. Ayris, the Engineer and Manager, who explained the arrangement of the works, which are a model of cleanliness and order. The water is twice filtered through filter-beds made from the sand and pebbles brought from Yarmouth beach. A very ingenious machine for washing the sand was shown at the works. Mr. Ayris stated that about 800,000 gallons of water per day are drawn from Ormesby Broad, and there is a constant service system throughout Yarmouth. The only precaution taken against waste is to insist on fittings of the very best quality.

Having thanked Messrs. Youell and Ayris for their kind reception, the visitors drove back to Yarmouth, and so concluded a very pleasant and instructive outing.

Correspondence.

To the Editor of THE BUILDER.

VITAL STATISTICS OF SCHOOL CHILDREN.

SIR,—Amongst the various important papers read at this year's meeting of the Sanitary Association of Scotland at Perth, under the presidency of Dr. Cameron, M. P., the one read by Professor Matthew Tay, of Aberdeen, calls for special consideration. That "the death-rate among children between ten and fifteen had actually increased" is a rather remarkable statement, while the assertion that "the health of children of the school age did not appear to have improved," raises the question, "Why not?" An outsider would have thought that with the erection of so many palatial-looking schools the health of the children must have improved; but when we enter the schools the solution of the problem is not far to seek, for the foul-smelling atmosphere that saturates the nasal organ quickly kills where the sweet and pure atmosphere hath his home. We kill our children by id air just as surely as by liquid poison.

Professor Hay asserts the same in other words when he says:—"The first and great essential to the improvement of the hygiene of schools is a scientifically pure atmosphere within the school-room. It is here that a number of schools in Glasgow and elsewhere lately, and the atmosphere of some of the school-rooms just before closing was so disgusting to a person entering from the fresh air outside. In most of the cases the teachers complained strongly of the bad provision existing

\* A fuller description of these works will be found in paper by Mr. Cockrill in the *Builder* for June 12, 1886, 566. The same method of utilising sea-water has been adopted at Bournemouth, with, we hear, fully satisfactory results.

for ventilation, and my knowledge of the subject enables me to say they had good cause. In some large schools, even in Glasgow, the provision for ventilation was by opening the windows, which has been so justly condemned by Professor Duncan and Mr. Honeyman. A gentleman accidentally came out with an interesting remark lately when I was going home in the train one evening. I happened to be speaking to a gentleman sitting beside me about the bad ventilation in our schools, when another gentleman opposite suddenly remarked:—"My children are at the X schools, where they seem to be between the devil and the deep sea as regards ventilation. When the windows are open, they catch the cold; and when they are shut, they are poisoned by bad air." Might it not be better in this case to give fewer bursaries and prizes, and instead to improve the ventilation? At one Board School, where the ventilation was microscopic and the merest sham, the head teacher stated that the air was sometimes so bad and close that the children turned sick and had to be sent home! This was a country school. In a Glasgow Board School, however, where the atmosphere smelt very bad, when I visited it the means of ventilation were holes in the ceiling. In one room facing the east, the teacher said, "When the wind is from the east, we have to stop the ost. as the cold air blows down so badly on the children." As to another room, the remark was made, "The pupil-teachers complain very much of the bad ventilation here when they come up for examination, and especially of the way in which the cold air blows down upon them when engaged at their tasks." At another large new school the fresh provision for the outlet ventilation only amounts to a pipe in one of the end walls, only a small 9-in. pipe for a roomful of about seventy scholars, and this, too, in a city school! It ought to be five times as much, especially when the ventilation is automatic. Mechanical ventilation has been mentioned as the cure for all this, but, unless it is properly carried out, it will not improve matters either, for one of the worst smelling rooms I felt was one large room ventilated mechanically, but with only two 9-in. outlets, and these a long distance from the fan, for 130 pupils. I visited one well-ventilated school at Glasgow, in Cecil-street, Hillhead. It is ventilated mechanically, with an Otto gas-engine and an induction fan inside the roof, and the result was well situated, and if only one story, mechanical ventilation is quite unnecessary. Satisfactory automatic ventilation can be got quite easily if the pipes are put in of a proper size, and provision adopted against down-draught. It is perfectly shameful, in a Christian country like ours, to find how harshly the children are treated in this respect. Were Dickens living, he would supplement "Dotheboys' Hall" with stirring account of Kill-the-Children's School. Sanitation has advanced so far in the interests of the public that new houses are not allowed to be occupied until they are in a proper sanitary condition. This should be extended to schools and any school that has not proper ventilation should not get any Government grant. I understand the Education Department has, in some cases, taken action in this direction. In cities especially, a written complaint from a parent to the Medical Officer of Health ought to give him ground for examination of the school, and if he should find it faulty, he ought to be able to force its improvement; while the new sanitary officials under the new County Councils—like new brooms—ought to make a grand sweep of the causes in this relation of the ill-health and high death-rate among the children. W. P. BUCHAN.

SALARIES OF CLERKS OF WORKS.

SIR,—Will you kindly allow me to call the attention of your readers to an advertisement in this week's issue of the *Builder* of a clerk of works at the remunerative salary of 2*l.* 2*s.* per week.

It is only because of the repeated attacks which are made on the character and ability of clerks of works as a whole that the thing is worth notice at all; I will, therefore, put what I have to say as shortly as possible, in order to claim your attention. The usual "competence" is asked for, with a thorough experience in all branches of building, "especially brickwork." Now, in London and in many of the large towns, there is at present a fair demand for bricklayers, whose wages would equal, and in some instances, exceed, 2*l.* 2*s.* a week. On my own job the bricklayer's money has amounted to 2*l.* 1*s.* 6*d.* for some time past. The bricklayer's general standard of living is of necessity much lower than would be accepted by the advertisers in the person appointed to the post. Looked at from this low standard the persons offering such a salary can surely not understand who or what they want.

Their advertisement asks for a man of experience in all branches of building, with special reference to brickwork; and I unhesitatingly say that they will not get an honest man with the required abilities, nor have they a right to expect it. As long as public bodies and others about to build continue to offer, and men are found, from various circumstances, to accept such wages, dirty exposures must be continually expected, bringing disaster and discredit to both architect and client, and covering

with shame an honourable and useful body of professional men. Considerably higher ground might be taken in urging the fallacy of offering such wages. A clerk of works, as a rule, is an expert workman in one or other of the building trades, and by patient study and perseverance has raised himself to an honourable position, as he thinks, above his fellows. He is a good general draughtsman, and is expected, in a position of peculiar temptation, to be strictly honest. Yet there are people ready to offer him not more, if as much, as the workman under his supervision, without one thought beyond their labour. A client entrusts a clerk of works with the superintendence of a building costing him many thousands of pounds, and if his servant be not true to him he may be robbed with impunity, yet he haggles like a huckster over the wages he must pay him. The wily builder knows methods of reaching the low-waged clerk of works.

The Amersham job may be much, or it may be nothing at all, but its advertisement is sufficient, I feel sure, to call forth the condemnation of a journal in which is interested in keeping abreast of all the professions connected with architecture and building as pure as it may be possible. GEO. DALTON, 2, New-street, Erdington, Birmingham, Aug. 23.

LINCOLN'S-INN GATEHOUSE.

SIR,—It was with much surprise I noticed in your columns recently some allusion to the proposed removal of the Gate-house of Lincoln's Inn in Chancery-lane.

For some years past I have regretted that no effort was made to at least clean and repair this one of the few surviving gateways of London; and now, it would seem, we are to be robbed of a more one of our ancient and only too few authentic examples of the later Medieval building.

What useful purpose can be served by this spoliation I have not chance to hear, but call the attention of your readers to the similarity of the general outline and mass of this structure to those of other gate-houses of Henry VII and the VIII. periods, when the leading features continued the same as in former times, but with the refinements of the later Gothic nearly lost.

Whether this gateway ever had a groined stone or brick ceiling is doubtful, but there can be no doubt that the turrets were finished with battlements in cut brickwork, like the *Wye-House Gate House*, and probably had leaden-covered cupolas and vanes, which could be now added, for which probably some old engraving could be found to authenticate the design, and this would give much effect to the elevation.

The front would also gain in picturesque appearance by the correct glazing of all windows with lattices and diamond panes instead of the extremely ill designed sash-windows of Georgian era.

Again, the removal of perhaps thirty or forty coats of paint from the oak gates, which are sound, and of fairly good design, would give these a fair chance of showing their original surface; and although I do not advocate painting, and thereby scraping the whole of the brick front, yet a good washing and careful replacing of all damaged bricks would do much good. As the Bencher of this Inn have in past times been foremost in building on a noble scale, it probably would not be with them a matter of great moment to restore this the most ancient entrance, and the first a visitor to their Inn meets on his approach from the city. L. C.

OLD COTTAGES IN GLOUCESTERSHIRE.

SIR,—In the *Builder* of the 9th inst. and 23rd inst., reference is made to "Old Cottages, Gloucestershire," and there is also the notice of *Owpen Manor-house*; but upon the bills of Gloucestershire there are cottages and farmhouses, which were formerly occupied by the gentry, well worth notice. At *Dowdeswell*, four miles from Cheltenham, on the Oxford side, there is a farmhouse close to the church which would not escape the observation of any one interested in old houses, and about half a mile higher up the hill, and in the same parish, there is another of this description.

In the next village, *Whittington*, there is the "Court," with the moat, and which was occupied a few years ago by the eminent architect of Gloucester, Mr. F. Waller, and which his experienced hand much repaired.

At *Blypton* there are old cottages and a very interesting church, which retains the mark of a Norman doorway on the north side, and where there is an excellent specimen in the chancel of Early English windows, with detached shafts, forming a good type of the earlier date of this style, which is also found at *Swenhampton* and *Charlton Abbots*. *Whittington*, a few miles further on, has a very fine church, with much Norman work to be traced in it, and some houses of antiquity worth seeing, amongst which I must mention *Cassey Compton*.

It would make my letter too long to proceed further, although the account might be much enlarged, especially when I mention that at *Notgrove*, on the outside of the church, at the south side of the east end, is our Saviour on the cross carved in stone, of course of much antiquity. E. W. GARROW, *Bilsthorpe Rectory, Southwell*.

## The Student's Column.

## HOT-WATER SUPPLY FOR BATHS, LAVATORIES, &amp;c.—IX.

THE CYLINDER SYSTEM: *continued.*

FROM the extreme top of the cylinder is carried a service-pipe known either as the expansion pipe or "rising main." This is taken by the most convenient way to about 3 or 4 ft. above the level of the cold-water cistern at the top of the house, and its upper extremity is terminated in any of the ways explained with the expansion-pipe of the tank system. This pipe should be fitted and run in the same manner as a flow-pipe,—that is, it should only be carried in horizontal or ascending directions (the former to be avoided if possible), and it is from this pipe that all draw-off services are taken, as illustrated in fig. 17, p. 153 *ante*. When this pipe is of considerable length, or carried in a horizontal direction to any great extent, it is found desirable, and oftentimes absolutely necessary, to return it so that the water it contains may circulate and not become cold. This is a very simple matter indeed, as it is merely to connect a service-pipe at any convenient point, usually close to the highest draw-off service, and carry it down and connect it into the cylinder,—in fact, make a secondary flow and return from the cylinder, fitted in general respects like the primary flow, and return from a boiler. One particular advantage of this secondary return is that it need not come back alongside the rising main; it may be brought back by any other desirable route, which is a great convenience when the hot-water taps are wanted scattered about in different parts of the house, as there is no objection whatever to connecting draw-off services from this return pipe, as in fig. 19.

FIG. 19.

There is much difference of opinion as to where the lower end of this return-pipe should terminate; every imaginable place is suggested, and it would be almost difficult to find two average fitters agreeing exactly on this point. In the last illustration it will be noticed that the termination is made about a third of the way down the cylinder, and although this is a position that only a minority of fitters adopt, yet a very short explanation will show that it is the correct one to obtain the best results.

In the first place, we have to aim at being able to withdraw every drop of hot water from the apparatus before having any cold water come from the taps, and in seeking to attain this we have always to bear in mind that when a tap is opened the water instantly rushes from all directions towards the tap in question (the arrows on the last illustration indicate the direction the water takes when a tap is opened, not the direction in which the water circulates when the taps are closed), therefore it will be plainly seen that as the hottest water may be

reliably looked for at the top of the cylinder, it would be bad policy to connect this secondary return any lower down than shown, and especially had to connect it into the bottom of the cylinder where the cold water enters, as is most usually done. There would be no objection to connecting it even higher than illustrated, as every particle of hot water rises to the top of the cylinder before it leaves the apparatus; it will also be seen that to connect this pipe into the primary return is equally bad.

If it is not required to connect any draw-off services from the secondary return, this pipe may be reduced in size.

The cold supply service is brought down from the cold-water cistern to the cylinder, where it is usually connected in at the bottom, as illustrated; some people, however, connect it into the primary return, and some consider that the boiler itself is the best place to bring the cold supply into; in general good results the bottom of the cylinder is the most satisfactory; but in another chapter will be shown a method of reducing the length of this cold-water pipe in many instances.

The necessary syphon and stop-cock has to be put in this cold service the same as explained with the tank system.

There is a rather important feature that should always appear in this system, but which somehow is very commonly overlooked, even by those who profess this work; it is a means of emptying the cylinder when the boiler has to be opened for cleaning or any other purpose. It is not by any means an uncommon thing for a workman to find when he attends to open and clean out a boiler, that there is no provision for emptying the apparatus, except by the draw-off services, which are all taken from the rising main above the cylinder, and he therefore has but two resources,—one to leave the boiler unopened and uncleaned, the other to take the man-lid off the boiler and let the contents of the cylinder flow into the kitchen, unless the contents of the cylinder are syphoned out through the top with a piece of tube into receptacles placed for them, which sometimes has to be done.

The proper thing is to have a short draw-off service fitted below the cylinder, either from this article itself or from the primary return, or from the lowest point in the cold supply service; but the tap of this emptying service must have a loose key, which should be kept with the key of the cold supply stop-cock, so that neither of these taps may be used except by a competent person, as already explained.

The cylinder system has several advantages that the tank system does not possess, but the chief of these is the immunity that it ensures from any danger arising from shortness of water. It will be gathered from the description given that it is most necessary that all ordinary draw-off services be connected to the rising main (above the cylinder), making it impossible for the contents of the cylinder to be drawn off except by the special emptying service; so that should the general supply of water run short, the fire can still be used in the ordinary way, even for a day or two,—that is, until the whole of the water in the cylinder is disposed of by evaporation.

This advantage alone is sufficient to recommend the system, especially in country residences, where the supply of water is wholly dependent upon an odd man's attention to a pump, and it is almost wonderful that accidents are so rare under these circumstances.

One point requiring every consideration in hot-water supply is the pressure exerted by water, either in pipes or vessels which are used as reservoirs. The pressure of water in pipes is generally calculated by the power it exerts in a pipe having an internal area of 1 square inch (this would be about a 1½ in. round pipe); a pipe of this size, 20 ft. 4 in. long, placed vertically and filled with water, would be found to weigh 1 lb. more than when empty,—that is, it contains 1 lb. of water; or, in other words, a column of water, 2 ft. 4 in. high and 1 in. square, weighs 16 oz. It is usual to define the pressure of water as so many pounds to the square inch. The word "pressure" might very well be replaced by the word "weight" in some instances, as it is necessary to understand that the strain exerted only varies as the quantity of water varies, and you cannot get variable pressures from a given quantity of water, as you can with steam or gas, as water is practically incompressible.

Water in horizontal pipes exerts no appreciable strain, so that in calculating what pressure has

to be withstood, it is only necessary to measure the distance the pipe extends vertically, and if the cold-water cistern is situated 35 ft. above the cylinder, then this latter should be of sufficient strength to withstand a pressure of 15 lbs. on every square inch of its internal surface.

When a pressure of water is exerted from a pipe into a close vessel, that pressure is transmitted to and felt equally in all parts of the vessel in question,—top, bottom, and sides, without diminution; or, in other words, if the supply-pipe descends vertically 35 ft., the water within it will exert a pressure of 15 lbs. to one square inch, and this pressure will be felt on every part of the cylinder internally, and this makes it easily understood why these reservoirs need be so well and strongly made, the strain some of them having to bear being very great.

The following, taken from the list of a London maker, will show the great difference that exists between tanks and cylinders in resisting pressure, and it will be readily seen why a tank is not suited for the cylinder system of apparatus:—

*Directed and galvanised iron rectangular close tanks, for hot water:—*

Thickness of plate ..... ¾ in. ½ in. 14 g. 16 g.  
Tested to, per square in. 10 lb. 5 lb. 3 lb. 1 lb.

*Directed and galvanised iron cylindrical tanks, for hot water:—*

Thickness of plate ..... ¾ in. ½ in. 14 g.  
Tested to, per square inch. 40 lb. 25 lb. 15 lb.

## OBITUARY.

MR. C. W. COPE.—The death is announced, at Bournemouth, of Mr. Charles West Cope, retired A., in his eightieth year. According to the *Times*, he was the son of a painter of no mean reputation, and was born in Leeds in 1811. He came to London and first learnt of Mr. Sass, after which he worked at the Royal Academy. After a residence of two years in Italy, on his return to these shores his picture of the "Holy Family" attracted considerable attention. He began to exhibit at the Royal Academy in 1833. In 1838 he entered in the Westminster Hall competition, and for his cartoon of "First Trial by Jury" gained a 300l. prize. The following year found him in another competition for fresco designs, and his success with the "Meeting of Jacob and Rachel" procured for him the acquisition of one of six frescoes for the adornment of the new House of Lords. Having been elected an Associate of the Royal Academy in 1844, he was in 1848 elected an Academician. Mr. Cope was professor of painting at the Royal Academy from 1867 to 1874, and was a trustee of that body.

ALDERMAN J. G. NAYLAR, OF ROCHESTER.—We regret to hear of the death of Alderman James George Naylar, the head of the well-known firm of J. G. Naylar & Son, builders, Rochester. He was seventy-three years of age. He had served the office of Mayor, and devoted much time to public work. Born of poor parents, he was apprenticed (says the *Standard and Rochester Observer*) to the late Mr. Bartholomew, who had a small building shop and works in Deale, and here it was that he acquired the rudiments of the trade in which he afterwards became a leader. As an apprentice he was noted for his steadiness and the attention which he gave to his work, and at the conclusion of his apprenticeship he at once commenced business for himself.

MR. JULIUS SAX.—We regret to announce the death of Mr. Julius Sax, M.I.E.E., on the 21st inst., at his residence, 100, Great Russell-street, Bloomsbury. Born in 1824, in Sagare, Russia, he was educated at Königsburg, and went to Hamburg in the year 1845, where he was apprenticed to the late Mr. Filby, optical instrument maker, of that town. Having served his apprenticeship, he went to Berlin, where he entered the telegraph establishment of Messrs. Siemens & Halske. He came to London in 1851, and worked with Mr. L. Gerdting for four years, after which he started in business on his own account for the manufacture of instruments. Mr. Sax was employed by the late Professor Graham, at that time Master of the Royal Mint, to construct automaton and other balances for use in the Mint. At the International Exhibition of 1862 he exhibited bullion and chemical balances, and obtained a prize-medal for excellence of workmanship and accuracy. These balances were, by arrangement, Mr. Sax was employed by the late Professor Graham by the Government for the Mint of Hong Kong in 1863. Mr. Sax turned his attention to domestic telegraphy, &c., and in 1864 took out patents for a metallic fire-alarm button, which would act as an ordinary call as well as a fire-alarm indicator, also indicators to be used with same and for other purposes. In 1869 Mr. Sax invented a form of magneto A B C telegraph; in 1870 an improved mechanical recorder; in 1872 an electric billiard marker; in 1881 an electro-magnetic telephone, an electric water-gauge, an electric toll-tale clock for watchmen, with a fire-indicator combined; and

electric vane; automatic system of electrical call-bells for fire-stations, &c. (adopted by the Metropolitan Board of Works for all the stations of the Metropolitan Fire Brigade in London); a system of call bells for police-stations, prisons, &c., as prepared for and adopted by the Commissioners of the Metropolitan Police for use at all stations under their control; an improved apparatus especially adapted for communicating between drivers and passengers in vehicles; an electric apparatus for locking cash-takings, and a perfected form of automatic fire-alarm. Mr. Sax has also made several improvements from time to time in electric bells and appliances for various purposes. His business will be continued by his sons.

GENERAL BUILDING NEWS.

WIDENING OF THE GREAT WESTERN RAILWAY BETWEEN MAIDENHEAD AND TWYFORD.—It is announced that Messrs. John Mackay & Son, of Twyford, have obtained the contract to widen the Great Western Railway between Maidenhead and Twyford, at a cost of over 100,000L.

LIBERAL CLUB-HOUSE FOR SWANSEA.—The foundation-stone of a new Liberal Club-house for Swansea was laid on the 11th inst. The building will cost 4,000L, and the contract has been given to Messrs. Thomas, Watkins, & Jenkins, Swansea, who will erect the buildings from the designs of Messrs. Bucknall & Jennings, architects.

FISH MARKET, DUNDEE.—The new Fish Market erected by the Police Commissioners on the site at King Pier, formerly occupied by Newcome's Circus, was formally opened by Lord Provost Hunter, on the 26th inst. Improvement Committee, said the operations of that Committee in Whitehall-street and Greenmarket necessitated the resolution of the Police Commissioners thirteen months ago to sweep away the Fish Market—a circumstance which, he ventured to think, was not deplored by any citizen of Dundee, and which, he believed, had not inconvenienced the business transacted in it, nor was it creditable to the city. The new building was described by the speaker as doing credit alike to the architect, the contractor, and the city of Dundee, but a architect's name is not mentioned in the Dundee *Advertiser's* report. The cost of the building has been about 2,500L.

ARRY DOCK.—According to the *Western Mail*, Messrs. J. Strachan & Co., builders, Cardiff, have secured the contract for the erection of a large dock over the Barry Company's railway to Barry and on. The bridge will have a wrought-iron superstructure, with cast-iron columns. There will be nine spans, with 24 ft. centres. Provision has also been made on the island for a number of new railway sidings for the transit of building materials, &c. Messrs. Strachan & Co. have also secured the contract from the Barry Company for the widening of railway bridge at East Barry, operations in connection with which have been commenced this week. The estimated cost of the works, which will cost several thousand pounds, is under the supervision of Mr. John Robinson, C.E., the resident engineer of the Barry Company.

ST. MARY'S ROMAN CATHOLIC CHURCH, SALTCOATS, has been re-opened, after having undergone extensive improvements. A new altar of marble and Caen stone, designed by Messrs. Pugin & Pugin, Westchester, has been erected. The design is Gothic, and from the base of the floor to the uppermost angle the height will be about 30 ft. The work executed by Mr. R. J. Boulton, of Cheltenham. Formerly, the church has been re-decorated by Messrs. Hardman & Co., Birmingham.

KIRK HAMMERTON CHURCH.—The foundation-stone of a new chapel in connexion with the Church of St. John the Baptist, Kirk Hammerton, a village which lies midway between Knaresborough and York, has been laid. This church is considered to be the second oldest in Yorkshire. As it is a simple structure, it consists of an old square tower, a nave, chancel, north aisle, and a transept, the two eastern bays evidently of more modern origin than other portions of the building. It has never needed accommodation for more than about 100 persons. Some time ago Mr. Stanforth had intended to give 1,000L towards a restoration of the church. The architect entrusted with the work is Mr. H. G. Pugh, of Durham; and the estimated cost of it is a little over 2,000L. The work in progress consists of (besides the restoration of the old fabric) the erection of an entirely new east and chancel, with aisle, vestry, and organ chamber, on the north side of the old church—the portion of which will thus be preserved intact in its original position. The new building is designed in the style of the latter part of the fourteenth century, and large tracery windows at the east and west ends. Accommodation will be provided for 217 persons. Mr. John Keswick, of Micklegate, York, is the contractor for the whole of the work.

NEW RAILWAY STATION AT MILLFIELD.—After a long period of agitation, the North-Eastern Railway Company have at last given orders for a new railway station to be built at Millfield, where it was originally wanted. The contract has been let to Mr. J. Shatto, of Sunderland, and the work will be commenced at once. The improvements include the widening of the road over the bridge to be 47 ft. in width, instead of 25 ft., as at present.

SANITARY AND ENGINEERING NEWS.

THE LIVERPOOL WATER SUPPLY: THE AQUEDUCT TUNNEL UNDER THE MERSEY.—At a meeting of the Water Committee (Vyrnwy Works), on Monday, the engineer (according to the *Liverpool Post*) reported that the insertion of the cast-iron segments had proceeded with gradually decreasing difficulty, and the rate of progress had, therefore, gradually increased. So far as could be estimated, the engineer is of opinion that the contractors would probably be ready to insert the shield for driving the permanent tunnel in about seven or eight weeks. The portion of the work in which the contractors were now engaged was by far the most difficult they were likely to encounter, owing to the fact that a shield such as would be used in the driving of the horizontal tunnel could not at present be employed. The engineer said that until the work done with the shield had been actually tried he was unable to estimate the rate of progress of the tunnel, but the experience gained in the work so far and its successful strengthening his view that it would be completed satisfactorily and without serious difficulty.

WATER SUPPLY OF GLASS HOUGHTON.—On the 22nd inst. Col. Charles Hy. Luard, R.E., opened an inquiry at the Old Schoolroom, Glass Houghton, to receive evidence respecting an application made to the Local Government Board to borrow 1,030L for works of water-supply for the township of Glass Houghton. Mr. Glover, Deputy Clerk to the Sanitary Authority, opened the enquiry. He said that as far back as 1879 an inquiry had been held as to the need of a water-supply, which was then reported by the inspector holding the inquiry to be urgent, and the Local Government Board confirmed that report. The matter, however, had been left in abeyance, when a further letter in 1884 from the Local Government Board urged the necessity of no further delay. In May, 1889, a Vestry meeting was held and passed a resolution to adopt a scheme for a supply, in consequence of which the sanitary authority instructed Mr. Patterson to prepare a preliminary scheme which was obtained. Wakefield water from the Whitwood Local Board at the rate of 10d. per 1,000 gallons, which price the Whitwood Board had agreed to, and the Wakefield Corporation sanctioned. To this scheme the Vestry meeting had agreed, and passed a resolution on January 18, 1890, asking that it be carried out as early as possible, hence the present application. Mr. Patterson, the engineer to the scheme, produced his report and levels of the scheme, and said that the parish contained 10,079 acres, and that the population (1,300) was rapidly increasing by being in close proximity to collieries in the district. The present water-supply was very defective and scanty, and was taken from shallow surface wells. One well was close to manure land and piggeries, and was thus greatly polluted therewith. In fact, all surface wells were impure. Another well was surrounded by porous rock and soil, and a wall surrounding exhibited at present over a dozen deposits of circumlocutions matter. Another witness called was Dr. Percival, who gave evidence showing the death-rate to be 33 per thousand. And no wonder, having regard to Mr. Patterson's evidence.

STRAYFIELD SEWERAGE SCHEME.—At the ordinary meeting of the Strayfield Local Board on the 22nd inst., Mr. W. Lark presiding, a letter from the Local Government Board was read sanctioning the proposal of the Local Board to borrow 35,000L for works of sewerage.

STAINED GLASS AND DECORATION.

THE MAYOR'S CHAPEL, BRISTOL.—The scheme for the restoration of the Mayor's Chapel has now been completed. The window of the newly-erected north transept and the re-opened nave window which adjoins it were last year filled with cathedral glass; but Sir Charles Watson having promised stained glass for the former, and Sir George W. Edwards for the latter, the designs for the two windows were soon after put in hand. The transept window, designed by Mr. J. L. Pearson, is of fine proportions, some 24 ft. in height and 14 ft. in breadth, and occupies the whole of the upper part of the north wall of the transept. It is constructed with four principal lights, the two pairs standing within sub-arches, and each pair being surmounted with a bold trifoliate opening. The upper part of the main arch encloses wheel tracery, with six foliated divisions and a circular centre. The window is Transitional in style, and of later character than the thirteenth century windows of the nave. Although plain and dignified in appearance, its composition is a study in itself, immense labour having been bestowed on its details. As the chapel of the Gannets, the building was originally dedicated to St. Mark, and that relationship is illustrated by the stained glass now introduced, as "a St. Mark window." In every part it has some bearing upon the life, work, and associations of this evangelist. The subject chosen by the donor of the re-opened nave window is that of the Ascension of our Lord.

WINDOWS, GIRVAN PARISH CHURCH.—Two memorial windows have been placed in the north transept of Girvan Parish Church to commemorate the ministry of the late Rev. William Corson, in

the latter years of whose incumbency the present church was erected. The windows are by Messrs. Ballantyne & Son, Edinburgh.

WINDOW NEAR UPTON-ON-SEVERN.—A new east window has been placed in the chapel of the Good Shepherd, Hook Common, by Captain and Mrs. Grice-Hutchinson, to the memory of the late Mr. Atwood, of the Boynes, widow of Mr. Atwood, formerly M.P. for Birmingham. The memorial window is of three lights. The centre one represents the shadow of death, the Good Shepherd, and underneath is Psalm xxiii., v. 1. The light on the left shows a pilgrim guarded by an angel, and underneath are the words, "Beside the still waters," Psalm xxiii., v. 2; while the right light shows an allegorical representation of "Through the valley of the shadow of death," Psalm xxiii., v. 4. The design for the window was supplied by the Rev. Canon Lawson, the rector of the parish, and the window has been executed by Messrs. Hoaton, Butler, and Bayne.

FOREIGN AND COLONIAL.

FRANCE.—The Minister of Public Works is about to inaugurate at Verjux the fine new bridge built for that town at the expense of the late M<sup>me</sup>. Boucicaut, and which has cost 700,000 francs. In the same neighbourhood a monument to this lady is to be erected, the plans of which have been prepared by M. Boileau, author of the general design for the Gambetta monument.—The Soci<sup>te</sup> Decauville has obtained powers for four new lines of narrow-gauge railway. These lines are to be from Luc-sur-Mer to Dives; from Isigny to Grandcamp; from Croci to Rimogne station (on the Nord railway); and from P<sup>er</sup>ny to Pithiviers. A statue to the poet Xavier Navarre (called the "Yvesman Berger") has been erected at Oloron, Basses Pyr<sup>en</sup>ees.—There is a warm discussion as to the ultimate situation of Lemaire's estate of Du Guesclin which was in the last *Salon* (illustrated in the *Builder* for May 31 last). It was promised by the Government to the town of Habardville, where the illustrious soldier died, and by Chateau-neuf-de-Randon, which has a legend of his having been killed there.—The Soci<sup>te</sup> Artistique et Litt<sup>er</sup>aire, which has its headquarters at Paris, has organised an exhibition of painting and sculpture at Dinan, to open on September 21, and which will probably be of unusual interest. A monument to General Desaix has been inaugurated at the little village of Ayat (Puy de D<sup>o</sup>me). It is a pyramid of white granite bearing a medallion portrait, with a palm-wreathed sword.—At Milan a monument has been erected to the memory of a French electrician, Gaulard, the inventor of various electrical apparatus.—The Council General of the Lower Seine district has taken special measures for the protection from injury of the ancient marble table in the Salle des pas perdus at Rouen, which was connected with the "Juridiction des Eaux et For<sup>et</sup>s," one of the oldest institutions in France.—The small town of Roquecourbe (Department du Tarn) has shown its spirit of progress by establishing a system of complete lighting by electricity. This is not the first of the small country towns of France which are in advance of the capital in this respect.—The cyclone which has visited several points in France has caused great damage. In the town of Dreux the Palais de Justice has been nearly destroyed, as well as the College and the ancient Episcopal Palace; and in the district of Saint Claude (Jura) several churches have been ruined.—The jury of the competition opened for the re-building of the Casernes des C<sup>ele</sup>stins at Paris have selected for execution the design of M. Jacques Hermand, who received the first premium. The second premium was awarded to M. Antonin Durand, the third to M. M. Bernard and D<sup>e</sup>sermaux, the fourth to M. Boage, the fifth to M. Formig<sup>e</sup>, and the sixth to M. Girault.

DENMARK.—There are at present being erected in Copenhagen several important official buildings. They are a new Meteorological Museum, a Polytechnic Institute, and the great Museum of Arts, in which the valuable collections from the late Christiansborg Palace are to be stored, besides which arrangements are being made for the building of a new town hall, a central fire-station, a museum of arts and industries, a national library, &c. The strike of bricklayers in Copenhagen has now terminated.—A new harbour has been constructed at Frederikshavn in connexion with the new railway thither. There are three basins. The cost is 125,000L.

SWEDEN.—Herr Helgo Zettervall, chief of the Stockholm Building Board, has been commissioned to prepare designs for the new Houses of Parliament in Stockholm, the official competition failing to satisfy the jury. He has now finished his task, and published his plans, which appear to be chiefly based upon the prize drawings of last year. Herr Zettervall, however, points out that the designs may be amended in detail.

RUSSIA.—An interesting archaeological discovery has been made in Russia, the labourers in a quarry near Kertch having discovered a catacomb with a number of inscriptions, emblems, and frescoes. It is in the form of a great hall cut in the rock,

supported by thirteen pillars artistically ornamented. One of these pillars bears the following inscription:—"The Judge Sorak built this sanctum without removing the human bones found on the spot. May no one touch or desecrate my body, as he who does so shall not enter the realm of the spirits."

UPPERLINGS.—The restoration and completion (including the usual erection of spires) of the old "Münster" is to be taken in hand, and a committee has been formed to look after the different interests in the matter. The foundation-stone of the "Münster" is said to have been laid in 1353; the first service was held in the choir in 1408. At present the exterior is in a rather dilapidated condition.

MISCELLANEOUS.

THE BOARD OF AGRICULTURE AND OPEN SPACES.—The Board of Agriculture have drawn up a draft scheme, having received a memorial to that intent, under the provisions of the Metropolitan Commons Acts, 1866 and 1869, for the future management of Banstead Downs, together with the adjoining Banstead and Burch Heaths, and the Park Downs. The scheme sets up a body of six conservators, to be elected by the Banstead Vestry, who are to maintain the common lands free from encroachment; to preserve the turf, shrubs, and trees; to drain, plant, level, &c.; to set apart a space for games, and to make cricket-grounds. The conservators will also be empowered to make by-laws, with penalties as against offenders, for protecting the lands from wanton injury or disfigurement, excluding all idle and disorderly persons, regulating the sports and games, and ensuring generally the enjoyment and good behaviour of all concerned. Banstead Downs still retain, in some degree, their rural aspect. The days are now numbered of their renown as a choice pasturage, by reason of the abundance of thyme and other sweet herbs, for flocks of sheep, extolled in John Dryer's poem of "The Fleecce," whereof the present fame bears Akenside's panegyric. The Board of Agriculture have, moreover, framed similar schemes in respect to Mitcham Common, with Deddington Corner, and to Hackney Marsh, and an influential committee is formed to promote the latter undertaking. The committee includes the three Members for the Parliamentary divisions, the Bishop of Bedford, with several others who take a benevolent interest in the welfare of the district. In the case of Hackney, the London County Council are nominated to act as conservators by the Board.

SIR HENRY BESSEMER'S OBSERVATORY: A QUESTION OF RATING.—Amongst the appeals just decided by the Camberwell Assessment Committee is one of more than local interest, viz., whether an observatory, built in the grounds attached to a gentleman's residence for purposes of observation and scientific research, can be said to add to the annual value of the premises. Sir Henry Bessemer, at considerable cost, erected, not long since, an observatory in his grounds, and in due course the overseers assessed it at 100*l.* gross value. Mr. W. H. Blanch, assessment surveyor, who conducted the appeal on behalf of Sir Henry against the assessment of his property as a whole, objected particularly to the assessment placed upon the observatory, on the ground that, instead of adding to the annual value of the hereditament, the observatory had, in his opinion, reduced it. The Overseers, Mr. Blanch contended, were too prone to assume that an expenditure of money must necessarily increase the annual value; whereas it often, as in Sir Henry Bessemer's case, operated the other way. The observatory, fitted as it was with one of the most magnificent telescopes to be found in the country, was doubtless a source of amusement and instruction to Sir Henry; but if the house and grounds were in the market to-morrow, a great difficulty would be experienced in finding a tenant who would use the observatory as it was being used at the present time. The building, without the telescope, would probably be used as a summer-house or outdoor smoking-room, if, indeed, it was not regarded as an eyesore, to be got rid of at the earliest opportunity; for an observatory was not altogether a "thing of beauty" in a gentleman's grounds. In the end the Assessment Committee, whilst not conceding all that was asked on behalf of the applicant, made a substantial reduction on the assessment.

A NEW FIND OF LIMESTONE IN SCOTLAND.—The Glasgow Herald of the 23rd inst. gives an account of the inspection of the new railway now being constructed between Aviemore and Carr Bridge. At the inspection there were present Lord Thurlow, Sir George M'Pherson Grant, Mr. A. Dougall, general manager; Mr. Murdoch Peterson, engineer to the Highland Railway Company, and several other officials. The party commenced the inspection at Aviemore, and followed the line along its course to Carr Bridge. Great progress has been made by the contractors, and there is every probability that the line will be opened for traffic by May 1, 1891, as originally contracted for. It is understood that at the first meeting the directors will consider the advisability of inviting contracts for the second section, extending from Carr Bridge to the river Findhorn. In connexion with the first section, the great rock

in the Crannick Wood is now all but finished. Till this cutting was opened it was never suspected that limestone existed in any quantity in the district of Dalruid, but Mr. Ross, who, one of the contractors, by testing a Crannick rock by nitric acid and otherwise, proved that it is composed of splendid limestone. The rock extends to nearly a quarter of a mile in one direction; and although one of the greatest obstacles in the construction of the railway, it is likely to be of lasting service to the community by its affording the means of starting a new industry in the locality. The viaduct at the Findhorn will be over 300 ft. in length, and built at an altitude of about 190 ft.

MEETINGS.

SATURDAY, AUGUST 30.  
Liverpool Engineering Society.—Visit to the Overhead Railway works, Liverpool.

MONDAY, SEPTEMBER 1.  
Clerks of Works Association (Carpenters' Hall).—Paper by Mr. T. Edmonds, 8 p.m.

TUESDAY, SEPTEMBER 2.  
Glasgow Architectural Association.—Mr. J. Fairweather on "Greek Architecture." 8 p.m.  
Royal Society of Antiquaries, Ireland.—Ordinary general meeting at Strabane, 1 p.m.

RECENT PATENTS:

14,355.—FRAMES FOR DOORS AND WAINSCOTS: J. T. ...  
14,419.—SASHES, SHUTTERS, &c.: T. Widdowson.—Two long coiled springs of suitable length and strength are, according to this invention, fastened by one end of the spring to the top of the window-frame, the other end of the spring being brought down through a vertical groove in the edge of the sash and secured at the bottom of the sash, and when in this position, it will shut and keep closed the sash. If the sash is brought down by hand, it is raised again by the action of the two springs to the top of the window-frame, after which the surface of the unbraced bricks has a thin preliminary glazing coat applied to it, and, where necessary, a second coating. The bricks or tiles after these coatings are fired in the usual way of firing glazed bricks.

14,463.—GLAZED BRICKS AND TILES: A. J. Clay.—By this patent tiles from London clay are made by the pulverised mixture of clay and silica can be made into unbraced bricks or tiles of any desired form, after which the surface of the unbraced bricks has a thin preliminary glazing coat applied to it, and, where necessary, a second coating. The bricks or tiles after these coatings are fired in the usual way of firing glazed bricks.

14,754.—NURSERY WINDOW-GUARDS: F. Ripley.—According to this invention, on the top and bottom sides of a metal or wood frame are sockets or loops to carry rigid metal tubes, which are fixed in place by a keyhole and a square and screw which, by being turned by a screw, works through the sides of the rigid tube and acts on the adjustable ends. The arrangement is also useful for exhibiting goods in shop windows.

14,797.—PAINTS, &c.: A. Barton.—It is claimed that an improved non-inflammable paint is made by taking as a base kieselerit or distonaceous earth, and mixing it with oil or lead baryta, with coloring matter added. The materials are ground in a roller mill.

20,510.—DRIVING TIMBER: R. A. Shephard.—The timber according to this specification is treated in a chamber to which the air is admitted after having been drawn through a system of small pipes; and this warmed air, after traversing the timber, is withdrawn from the chamber by a powerful exhaust fan.

14,471.—DOOR KNOCKERS: G. E. Baldwin and F. H. Farley.—When the knocker, which is the subject of this patent, is actuated the blow is struck on the inside of the door, whereby the sound is more audible to the inmates of the house than if it was struck in the usual way on the outside. Mechanism for this purpose is described in the specification.

NEW APPLICATIONS FOR PATENTS.  
Aug. 11.—12,535, J. Philbey, jun., Window Fastener.  
—12,541, E. Truman, Sanitary Arrangements of Buildings.  
Aug. 12.—12,569, P. Ayton, Bolt Fastenings for Casements, Windows, Doors, &c.—12,573, C. Wright, Band Saw Guides.—12,591, J. Ricketts and F. Torrance, Couplings for Water-closets.—12,599, M. Atkinson and D. Stockstill, Brick-making Machinery.—12,607, C. George, Artificial Stone.—12,621, R. Crane, Process for Detecting Leaks in Soil Pipes, &c.  
Aug. 13.—12,635, E. Stevens, Flushing Tanks.—12,656, T. Normanton, Hanging and Counter-punching Sliding Sashes or Sliding Doors.—12,667, A. Lovekin, Casement Stays.—12,687, G. Chaillet, Portable Folding Step Ladder.  
Aug. 14.—12,721, J. Fryer, Brick.—12,735, J. Bowling, Manufacture of Portland and other Cements.—12,753, E. Fry and G. Farrel, Door-closing Mechanism.—12,765, E. Gregory, Overlapping Blocks for Flooring.—12,781, H. Werner, Concrete Pipes, &c.  
Aug. 15.—12,786, R. Roome, Screw Nail.—12,837, J. Costello, Sewer Trap.—12,844, S. Robinson, Protection against contagion in Water-closets.  
Aug. 16.—12,890, A. Toulreville and A. Hrien, Heating and Ventilating Rooms, &c.

PROVISIONAL SPECIFICATIONS ACCEPTED.  
9,829, E. Hallam, Ventilating.—10,826, A. Bretwell, Bolts for Doors or Gates.—10,819, W. Sanders, Flush Bolts.—10,969, J. Rogers, Fixing Knobs to Spindles.—11,237, E. Adonis, Ventilating.—11,428, See and W. M. Bowers, Pumps or Siphons applicable to Wash-basins.—12,020, J. Bayly, Water-closet Valve.—12,054, W. Wilson, Bakers' Ovens.—12,126, R. Swales, Water-tanks for Water-closets, &c.

COMPLETE SPECIFICATIONS ACCEPTED.  
Open to Opposition for Two Months.  
13,347, J. and H. Wilson, Ornamenting and Decorating the Ceilings and Walls of Buildings.—14,353, A. Danbar,

Machine for Splitting, Dressing, and Planing Wood.—16,178, H. Hardy, Water-closets.—16,398, F. Stewart, Mirr. Clamps.

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

AUGUST 12.—By Worsfold & Hayward (at Ashford) "The Old Vicarage House," and 4a. Or. 34p, Headcorn, Kent, 85*l.*; "Church Cottages," Shoreham, L. G. of 35 60*l.*—By G. Newman (at Havant) "The residence called "Southbrook," L. Langstone, Hants, 1,275*l.*  
AUGUST 19.—By Humbert, Son, & Flint (at Watford) "Burnt Farm," containing 75a. 1r. 30p. 1l., Bushey Heris, 8,260*l.*

AUGUST 20.—By R. J. Collier: The Cranford Estate, 10a. 3r. 13p. 1l., Broadstairs, Kent, 2,500*l.*; four l. cottages, 250*l.*—By Messrs. Woods: L. G. of 61 35 with reversion in 37 yrs., St. Leonard's-on-sea, 1,400*l.* By A. (Contractors use these lists.—F. G. for leasehold ground-rent; l. g. r. for leasehold ground-rent; g. r. for improved ground-rent; g. for ground-rent; c. for copyhold; l. for leasehold; r. for estimated rental; n. t. for unexpired term; p. a. per annum; yrs. for years; st. for street; r. for road; sq. for square; p. for plot; ter. for terrace; cre. c. for crest; y. for yard, &c.)

PRICES CURRENT OF MATERIALS.

Table with columns for material names (e.g., Greenheart, B.G., Teak, E. I., Sequoia, U.S., Ash, Canada, Birch, Elm, Fir, Danisic, &c., Oak, Canada, Pine, Canada, Lath, Danisic, Deals, Finland, 2nd and 1st. std., 100, Ripa, St. Petersburg, 1st yellow, Spruce, 1st, New Brunswick, &c., Battens, all kinds, Flooring Boards, 8q., 1 in., pine, Second, Other qualities, Cedar, Cuba, Honduras, Mahogany, Cuba, St. Domingo, cargo average, Mexican, Tolomeo, Honduras, Box, Turkey, Rose, 150, Bahia, Satin, St. Domingo, Puerto Rico, Walnut, Italian) and columns for prices in various units (e.g., ton, load, foot cube, 100, 1000, 10000, 100000, 1000000).

METALS.

Table with columns for metal types (e.g., Iron—Bar, Welsh, in London, at works in Wales, Standard, in London, Best selected, Sheets, strong, Q. B. I. bars, YIELD-POINT METAL, LEAD—Pig, Spanish, English, com. brands, Sheet, English, 3 lb. square foot and upwards, Pipe, Zinc—English sheet, Tin—Strait, Australian, English Ingots) and columns for prices in various units (e.g., ton, 100, 1000, 10000, 100000, 1000000).

OILS.

Table with columns for oil types (e.g., Lined, Coconut, Coconut, Ceylon, Palm, Lagos, Refined, English pale, Cottonseed, refined, Tallow and Oleine, Lubricating, U.S. refined, TAR—Stockholm, Archange) and columns for prices in various units (e.g., ton, 100, 1000, 10000, 100000, 1000000).

COMPETITIONS, AND CONTRACTS.

COMPETITIONS.

Table with 4 columns: Nature of Work, By whom Advertised, Premium, Date to be delivered. Includes entries for New Town Hall, New Municipal Buildings, and other works.

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, Tenders to be delivered. Includes entries for rebuilding churches, iron roofs, and various engineering works.

CONTRACTS.—Continued.

Table with 4 columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, Tenders to be delivered. Continues from the previous table with entries for alterations of premises, ironwork, and various construction projects.

\* Those marked with an Asterisk (\*) are advertised in this Number. Competitions, p. iv. Contracts, pp. iv. and vi.

TENDERS.

Communications for insertion under this heading must reach us not later than 12 noon on Thursdays.]

BANGOR.—For the erection of two houses in Bangor, Down, Ireland, for Mr. Alexander Robb Dundonald, & James Ewart, architect, 20, Rosemary-street, Belfast:—
William Magee £260 0 0
William Kerr 625 0 0
Niel & Finlay 550 0 0
James Fletcher, Bangor (accepted) 530 0 0

BOW.—For altering and adapting No. 199, Bow-road, for Mrs. Fanny Davies. Mr. J. Williams Dundford, architect, 100, Queen Victoria-street, E.C.:—
F. J. Coxhead, Leytonstone\* £280 0 0
\* Accepted.

BRACKLEY.—For works in connexion with a new system of drainage, with fittings, &c., at the Workhouse, Brackley, for the Guardians. Mr. Robert John Asch, architect and surveyor, Brackley:—
Claridge & Bloxham £498 0 0
Edwin Jarvis 475 0 0
W. J. Harding 445 0 0
A. Wootton 400 0 0
W. Jenkins & Son, Brackley (accepted) 320 0 0
\* Accepted.

BRIGHTON.—For the supply of glazed stoneware pipes, at Brighton, for the Brighton Town Council. R. J. C. May, Borough Surveyor, Town-hall, Brighton:—
Percent. below schedule prices.
4-in. 6-in. 9-in. 12-in. 15-in. 18-in.
Hiff & Sons 45 45 40 40 30 30
Goullon & Co. 45 45 40 40 30 30
Fennings Parkstone, Dorset (accepted) 45 45 40 40 30 30
Lylesford Pottery Co. 55 55 55 50 40 40
Doper Bros. 57 57 55 52 52 50

CANTERBURY.—For alterations to Simon Langton Schools, Canterbury, for the Governors. Mr. G. Smith, architect, 32, Dover-street, Canterbury:—
C. Mount £458 14 0
G. Whitbread 495 0 0
W. Gentry 385 10 0
J. C. Slade 380 15 0
W. Cozens, Canterbury (accepted) 359 0 0

CHESHUNT.—For the erection of engine-house and water-shaft for the Cheshunt Local Board of Health. T. Bennett, Engineer:—
Hunt £1,950 0 0
Kirk & Randall 1,951 0 0
Holliday & Greenwood 1,930 0 0
Jas. Dickson 1,920 0 0
Kilby & Gayford 1,630 0 0
W. Neil 1,600 0 0
J. Jackson, Enfield (accepted) 1,475 0 0
Hampton 1,433 0 0
Favey 1,427 0 0

CROYDON.—For the erection of stables, coach-house, living rooms in the Grant-road, Addiscombe, Croy. Mr. Henry Gough, architect, West Croydon:—
J. Doody £495 0 0
Dewdney 479 0 0
J. Saunders 450 0 0
L. Bennett 417 0 0
Smith & Bullard, Croydon (accepted) 400 0 0

FIELD HIGHWAY.—For construction of a new on the Outlands Estate, Enfield Highway. Messrs. Ben. Son, & Flint, surveyors, 11, Serle-street, Lincoln:—
Nicholls £2,066 0 0
Lizze 2,060 0 0
Jackson, Enfield (accepted) 2,035 0 0

LEICESTER.—For the construction of brick, iron, and stone-ware pipes, sewers, overflow weir, &c., at Borough Surveyor, Town Hall, Leicester:—
Monk & Newell £2,582 7 0
W. J. Botterhill & Co 5,288 0 0
Jos. Tomlinson 5,212 19 6
J. Dickson 5,048 1 6
Holme & King 4,380 10 0
S. & E. Bentley 4,660 11 3
E. Tempest 4,440 18 8
T. Philbrick 4,400 0 0
Jno. Bond, Wisbech (accepted) 3,990 0 0

LONDON.—For rebuilding and fitting-up the "George and Dragon" public-house, at adjoining site, at Blackheath Hill, S.E., for Mr. W. Prangnell. Mr. T. H. Smith, architect, 17 and 18, Basinghall-street, E.C. Quantities by Mr. F. Taperell:—
H. J. Williams £5,580 0 0
W. Smith 6,183 0 0
Holliday & Greenwood 6,079 0 0
Pitman & Fotheringham 6,064 0 0
S. J. Gerrard 6,034 0 0
C. F. Kearley 5,970 0 0
H. L. Holloway 5,569 0 0
Allen & Sons 5,560 0 0

LONDON.—For the construction of underground drain, Whitechapel-road, for the Whitechapel Board of Works. Mr. W. La Riviere, Surveyor:—
Howard £689 0 0
Little 679 0 0
Coulsh Bros. 668 0 0
Eaton & Co. 667 0 0
Caldmar 639 0 0
Finch & Co. 620 0 0
Hunt 600 0 0
Wood 583 0 0
Gladding (accepted) 516 0 0

LONDON.—For repairs to be done at the Licensed Victuallers' Asylum, Asylum-road, Old Kent-road, London, S.E. Mr. W. F. Potter, architect:—
Walker Bros. £317 0 0
S. Hayworth & Sons 228 10 0
Smith & Bell 221 12 6
J. White 208 0 0
J. Ames 181 2 6
B. Cook 171 0 0
W. Walls 165 0 0
W. Wythe, Dalston (accepted) 130 0 0

LONDON.—For improvements to laundry, stores, &c., at the Camberwell Infirmary. Mr. R. P. Whellock, architect:—
A. Garner £350 15 0
B. Evans 309 0 0
Young & Lonsdale 303 0 0
W. V. Goad 280 0 0
F. P. Treweeke (accepted) 288 0 0

LONDON.—For constructing Abbotsford road, West Green, with sewers and fencing, for Mr. J. Abbott. Mr. R. J. Collier, surveyor, Finsbury-payment:—
Thos. Adams, Kingsland (accepted) £1,620 0 0

LONDON.—For making-up, kerbing, channelling, &c., Bromley-road, Lee, for the Plumstead District Board of Works:—
Hudson £3,200 0 0
Newlen & Co. 3,182 0 0
Woodham & Fry (accepted) 2,976 0 0

LONDON.—For making-up a portion of Ivydale-road, Camberwell, for Mr. E. Yates:—
Woodham & Fry (accepted) £304 0 0

LOWER GORNAL (Sedgley).—For the erection of new schools and caretaker's house, Lower Gornal, Sedgley, for the Sedgley School Board. Mr. A. P. Brevitt, architect, Wolverhampton:—
H. Gough, Wolverhampton £2,740 0 0
\* Accepted.

MACCLESFIELD.—For the erection of new vagrant wards at the Union Workhouse, Macclesfield, for the Guardians. Mr. John Foster, architect, Norfolk-chambers, Norfolk-street, Sheffield. Quantities by the architect:—
I. Massey £1,850 0 0
Tom Hill 1,827 0 0
J. T. Mosley 1,820 0 0
Geo. Raylance, Water's-green\* 1,785 0 0
\* Accepted.

NEWCASTLE-ON-TYNE.—For alterations to wards at the Workhouse, Newcastle-on-Tyne, for the Union Guardians. Mr. W. H. Dunn, architect, St. Nicholas-buildings, Newcastle-on-Tyne:—
Joseph Elliott, North Shields (accepted) £216 0 0

NEW SWINDON.—For building dwelling-house, coach-house, &c., at New Swindon, for Mr. G. Raven. Mr. R. J. Bewick, architect, Fleet-street, New Swindon:—
G. R. Henly & Co. £272 10 0
Mrs. Chambers 269 8 0
J. Pouting, Stratton, near Swindon\* 555 10 6
\* Accepted.

NUNEATON.—For the erection of two cottages at Tuttle-hill, Nuneaton, for Mr. W. Boon. Mr. E. J. Purnell, jun., architect:—
Hallam & Co. £65 0 0
C. Haywood, jun. 584 0 0
Cave 576 0 0
R. Wootton (accepted) 519 0 0

OTLEY.—Accepted for the supply of materials and construction of main outfall sewers, tanks, buildings, precipitation works, &c., at Otley. Messrs. Brierley & Holt, engineers, Blackburn:—
T. & W. Maston, 35, Skipton-road, Otley £4,414 19 3
Julien, Coulson, Stokes, & Co., Sheffield 757 7 2
The Leeds Fireclay Co., Wortley, near Leeds 502 10 10

READING.—For the erection of a new hotel-house, near Caversham Lock, for Mr. Arthur H. East. Mr. J. Hugh Goodman, architect, Town Hall chambers, Reading:—
Winter & Pitt £1,185 0 0
Wernham, G. 1,060 0 0
Higgs & Sons 1,031 0 0
Hawkins, W. 975 0 0
Wheeler, W. 949 0 0
Taylor, D. 897 0 0
Hawley, F. (accepted) 630 10 0

RHONDDA.—For works in the general improvement of roads at Penygraig, Rhondda, for the Ystradgynodwg Local Board. Mr. J. W. Jones, Surveyor, Local Board Offices, Penre Rhondda:—
Daniel Phillips £1,019 0 1
W. Mathias 1,001 16 4
David Evans 992 13 8
Thomas Kue, Merthyr Vale\* 914 13 11
\* Accepted.

SEAFORD.—For the erection of nine terrace houses on the Seaford Bay Estate. Mr. Thos. Moody, architect, 35, Craven-street, Strand, W.C.:—
Kibbey, Berry, & Kirk, Seaford\* £8,510 0 0
\* Accepted.

RICHMOND (Surrey).—For the supply of road materials. Mr. Walter Brooke, Surveyor.

Table listing suppliers and prices for Broken Blue Guernsey Granite, Broken Penine Stone, and Broken Brown Pit Flints.

SEAFOORD.—For the erection of six terrace houses on the Seaford Bay Estate.

Table listing suppliers and prices for Broken Chalk Flints.

SOUTH MOOR (Co. Durham).—For sewerage and road formation works at South Moor.

Table listing suppliers and prices for Broken Chalk Flints.

STAFFORD.—For the erection of new business premises in Greengate-street, Stafford.

Table listing suppliers and prices for Broken Chalk Flints.

STAFFORD.—For alterations, &c., to the "Carriers Arms," Sash-street, Stafford.

Table listing suppliers and prices for Broken Chalk Flints.

STARTFORTH (near Barnard Castle).—For the erection of new police-station at Startforth.

Table listing suppliers and prices for Broken Chalk Flints.

STORNOWAY.—For the erection of a new quay in the inner harbour, Stornoway.

Table listing suppliers and prices for Broken Chalk Flints.

TUNBRIDGE WELLS.—For the erection of a new farm-house at Bidborough, Tunbridge Wells.

Table listing suppliers and prices for Broken Chalk Flints.

WOLVERHAMPTON.—For building the "Victoria" Hotel, Wolverhampton.

Table listing suppliers and prices for Broken Chalk Flints.

WOLVERHAMPTON.—For building the "Victoria" Hotel, Wolverhampton.

Table listing suppliers and prices for Broken Chalk Flints.

WOLVERHAMPTON.—For building the "Victoria" Hotel, Wolverhampton.

Table listing suppliers and prices for Broken Chalk Flints.

WOLVERHAMPTON.—For building the "Victoria" Hotel, Wolverhampton.

Table listing suppliers and prices for Broken Chalk Flints.

WOLVERHAMPTON.—For building the "Victoria" Hotel, Wolverhampton.

Table listing suppliers and prices for Broken Chalk Flints.

WOLVERHAMPTON.—For building the "Victoria" Hotel, Wolverhampton.

Table listing suppliers and prices for Broken Chalk Flints.

BEST BATH STONE. CORSHAM DOWN. FARLEIGH DOWN.

BOX GROUND. WESTWOOD GROUND. COMBE DOWN. STOKE GROUND.

THE BATH STONE FIRMS, Limited. HEAD OFFICES: BATH.

DOULTING FREESTONE. The stone from these quarries is known as the "Weald Beds," and is of a very crystalline nature.

THE OHELYNOH STONE. THE BRAMBLEDITCH STONE.

Prices, and every information given, application to CHARLES TRASK & SON, Doultling, Shepton Mallet.

London Agent—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

HAM HILL STONE. The attention of Architects is specially invited to the durability and beautiful color of this material.

Asphalte.—The Seyssel and Metallic Asphalt Company (Mr. H. Glenn), Office, 22, Martin's-lane, Cannon-street, E.C.

SPRAGUE & CO., STATIONERS, &c., Keep a Special Stock of Sundries for Professional Offices.

DRY MAHOGANY, WAINSCOT, WALNUT, TEAK, &c.

EXTENSIVE AND VARIED STOCK. WILLIAM BLOORE, 80 to 90, BOND STREET, VAUXHALL.

HERBERT HANKS, CONTRACTOR FOR DECORATIVE AND OTHER WORK.

Special attention to Interior Decorative Sanitary Work. 39, BERNERS ST., OXFORD ST.

SUBSCRIBERS IN LONDON AND THE SUBURBS, by prepaying at the Publishing Office, 2s. per annum.

TO CORRESPONDENTS. W. F. S.—"Pupil" (we cannot undertake to point out books; see standing notice to that effect).

TERMS OF SUBSCRIPTION. "THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum.

### From Australia.

**W**E purpose in the future to give our readers some periodical information in regard to architectural progress in the Australian Colonies, as well as to undertake some criticism as to the course of architecture in the cities of that fifth continent; still few, but increasing in size and importance, and which may have before them a great architectural future, especially when they can emerge, as the Americans are now beginning to emerge, from the mere reproducing of European types of architecture, and proceed to develop an architecture of their own; if not exactly a new style, at all events a new treatment arising out of the circumstances of climate, materials, and mode of life. We cannot say that we have seen any signs of this so far, but we have little doubt that the time will come for Australia to play her part also in contributing a fresh chapter to the history of the world's architecture. In the meantime, it will probably be of interest to our readers to have some regular information as to the present condition of architecture and of building work in the leading cities of Australia.

With this intention in view, it may not be out of place to give here a few general notes as to the country, and as to the physical and social conditions under which our Australian relatives live; otherwise English readers might fail to realise the why and the wherefore of much that we may have to record.

In the first place, this island continent is our-fifths the area of Europe, and extends from the 10°39' to the 39°11' parallels of latitude. The climate of the northern half is therefore tropical and sub-tropical, and the southern sub-tropical and temperate; but in no part, except on the highest of the southern mountains, does the average yearly temperature approach that of England in coldness. To illustrate this we give below the principal cities of Australia, and in a parallel column, well-known cities in the northern hemisphere, having about the same mean annual tempera-

ture, and also their respective latitudes north and south of the equator:—

Melbourne ...	37°52' S	Madrid .....	40°28' N
Sydney.....	34° 0' S	Naples.....	40°50' N
Adelaide.....	34°56' S	Cairo .....	30°04' N
Perth .....	31°50' S	Smyrna .....	38°25' N
Brisbane .....	27°10' S	New Orleans	30°07' N

The above are the capitals of their respective colonies, and they are all situated in the southern half of the continent.

Australia does not possess the great ranges of mountains that are so marked a feature of European scenery, but there is an elevated range of considerable width, commencing at the northern extremity of Cape York, and running parallel to the eastern and southern coast, and finally dying away near Adelaide. The highest point at Mount Kosciusko reaches 7,308 ft., but the average is only about 3,000 ft. There are other isolated ranges dotted over the vast expanse of the continent, but they are not of sufficient height or area to materially affect climatic conditions. The consequence of this is that the narrow slip of coast-land between the mountains and the sea is well supplied with rivers, and has a good rainfall, but in the interior there is only one great river system—viz., that of the Murray, and its still more important tributary, the Darling. The greater part of central and Western Australia is, therefore, characterised by a climate of Egyptian dryness, the rainfall varying from 2 to 4 in. per annum. The monsoon rains of the tropics, however, spread over a considerable portion of the northern section of the continent, and the rain-clouds of the great southern ocean perform a like duty at the other extremity. Between these belts is one of calm, and its natural condition is drought. Variations in the position of the rain-belts of a few hundred miles are, however, of frequent occurrence, hence the frequent disastrous floods in the interior of the usually dry portion of the country. In a great part of Australia it is alternately a year of flood and then two or three of drought: in colloquial speech, it is a "feast or a famine." The rains, when they do come, are often of tropical violence, and when driven up by a southerly storm, few walls will resist their penetrating power. How best to meet the effects of great heat and driving rain is therefore a problem which materially influences the architectural treatment of Australian buildings.

We have hitherto referred only to the

mainland, but the delightful little island of Tasmania, and that England of the south, New Zealand, must not be passed over without a word of notice. The former is distinctly temperate in climate, with a good rainfall, and the two islands of the latter stretch themselves over a length of 1,100 miles, from 34°30' to the 47°30' parallels of latitude. Auckland at the northern end possesses a climate much like that of Sydney, while Dunedin and Invercargill in the south are as cold as Scotland; and the province of Otago is, in fact, appropriately populated in great measure by the hardy sons of North Britain. New Zealand is distinctly mountainous, Mount Cook in the south island reaching a height of 12,349 ft., and in the north island volcanic phenomena are of frequent occurrence. The rainfall is abundant, and an Australian drought unknown; but tempests and occasional earthquakes detract from an otherwise beautiful climate. These earthquakes render brick or stone structures undesirable in the north island, and, as there is an abundance of good timber, the buildings are mainly of wood. In the south island the same limitations do not apply, but cheapness still causes wood to be largely employed, though of late years permanent structures of brick or stone are becoming much more frequent.

The population of Australasia is very largely composed of emigrants from the British Isles, the proportion of Germans and other European nationalities being so small, except in certain special localities, as to have no influence on the marked British characteristics of the people. Much political capital is made out of the presence of a few thousands of almond-eyed Chinese, but except in the northern territory and Northern Queensland they may be ignored in any discussion of new problems. The native "black-fellow" of Australia is fast becoming extinct, and is only to be found in any numbers in the uninhabited wilds of the north and west, while in New Zealand the Maori, though semi-civilised, is nevertheless doomed. The total population of Australia amounts to over three millions, and of these the great majority are located in the mountain and coast lands of the east and south. Out of the total, New South Wales and Victoria each claim over a million; South Australia and Queensland divide the remainder between them, except a meagre 40,000 located in the

west territory of Western Australia. One very noticeable feature of the distribution of the people is the remarkable position taken by the capitals of each of the three southern colonies. It is a case of Melbourne, Sydney, and Adelaide being first and the rest of the towns nowhere. Sydney has a population of just under and Melbourne a little over 400,000, a full third of the total population of each colony. This concentration in the chief cities is an evil that may have disastrous effects in the near future unless the tendency to congestion is modified. It is an unhealthy sign in a country of unlimited material resources crying out for development. The only exceptions are Ballarat and Sandhurst, in Victoria, which have been made by gold, and Broken Hill and Newcastle, in New South Wales, whose prosperity depends respectively on silver and coal. The cause is not far to seek. Railways have so quickly followed settlement that local centres have had no chance of growth. The consequence of this is that outside the capitals there is no scope for the architect, engineer, or builder, and all the best work in the country districts is carried out from the cities. In New Zealand the same difficulties do not exist, as Auckland and Wellington in the north island and Christchurch and Dunedin in the south divide the honours, and several other towns take a good second place. They are all on the coast, and intercommunication is mainly by sea; hence every district requires its own commercial centre.

The first impression an Australian city makes on the visitor from the old country is that of airiness and spaciousness, and the next a depressing feeling of stiffness and uniformity. The former is owing to the width of the streets and the frequent reserves, and the latter to the rectangular plan on which they are nearly all laid out. Adelaide is the most striking example, and in many respects is unique. The city proper is a rectangle of one mile by a mile and a quarter, divided into four equal sections by tree-lined streets 132 ft. in width. At the crossing in the centre a large square has been formed and planted with trees and shrubs, and round it most of the public buildings are located. In the centre of each of the four sections is another smaller square; and broad streets, none less than 66 ft. in width, sub-divide each quarter. Around the city stretches a belt of park lands, one-third of a mile broad, and beyond this again are the suburbs. The plan is an ideal one, and possesses many advantages, but among the practical defects are want of diagonal communication, and a too rigid uniformity of line.

In the planning of Melbourne there is no such leading idea. The city is mainly laid out in rectangular blocks, and but for the fact of the slightly undulating surface of the central portions, and the placing of the same at an acute angle with the surrounding suburbs, the result would be very monotonous. The two chief streets, Collins-street and Bourke-street, are wide, and gently dip towards the centre of their length, so that the view, especially from near the lower end, is fine. At the upper extremity of the former stands the Treasury Building, while the new Parliament House faces the latter. Local quidnuncs would prefer them away, but those who know the value of a fine termination to a vista fully appreciate the wisdom of the Government which placed them there. There are several fine boulevards or avenues leading out of the city, or rather they will be fine when the trees are fully-grown; and some are of great width, consisting of three roadways and two footpaths separated by rows of trees. Indeed, all through Victoria, tree-planting in the streets of the towns has been carried out with great vigour, and succeeding generations will reap abundant benefit, both in comfort and beauty, from the forethought of the men of our own time. It is an unfortunate thing that in New South Wales tree-planting has been neglected, probably owing to the example of the capital, the streets of which, in comparison with those of Melbourne and Adelaide, are decidedly narrow,

and so leave barely sufficient space for traffic in the busiest portions.

It is difficult to describe the plan of Sydney. It is a growth, and is therefore more like that of an English town than any other in Australia. In the first place the city is situated on the shores of one of the most beautiful harbours the world possesses, which is indented at all points by deep bays or coves. At the head of one of these and on the banks of a small stream of fresh water the first explorers founded a settlement, and as the surrounding country was occupied bullock tracks were formed thereto and thus laid down the lines of the principal streets. As may be expected, they are neither quite straight nor perfectly parallel, but to the eye-wearied traveller fresh from the prim regularity of Adelaide and Melbourne this is no defect. As the city grew, it occupied the various points jutting out into the harbour, and with the building of the railway to Parramatta, fifteen miles inland, suburbs began to spring up thereon. Then, owing to its proximity, people began to flock over to the opposite side of the Harbour, called the North Shore, a district which promises ere long to become another city. With the extension of steamer traffic on the harbour, small settlements have been made at almost every available point, and thus it is dotted on all sides with human habitations, and in the not distant future these now separated settlements will form part of one vast city. This outlook, though it may seem sanguine, is almost certain of realisation, in consequence of the natural advantages of Sydney as a commercial port, and its position in the centre of the great coalfield of Australia, which must eventually make it the headquarters of Australian industry. In writing thus, we are fully aware of the great start Melbourne has attained in this direction by the aid of protective duties and the well-known energy of the Victorians, but in the end the great natural advantages of Sydney must operate with telling effect.

Passing north to Queensland, its capital, Brisbane, lies on each side of a comparatively small river at a distance of about twenty-five miles (by water) from Moreton Bay; and though everything has been done to foster its trade it can never rival either of the southern capitals. Queensland has several other natural outlets which will develop *pari passu* with the capital, and so prevent the latter's abnormal growth. As a city it is not very interesting, the planning on the flats being of the familiar rectangular type; and the suburbs on the hills, though pretty, have not been made the most of, many of the roads being very steep, whereas by judicious planning easy grades might have been secured. Important as this is further south, it is doubly so in a sub-tropical climate like that of Brisbane, where the saving of unnecessary exertion is a most essential point. Of most other Australian towns it is only necessary to say that the rectangular system of planning is the prevailing one, and this after a time becomes so depressing to the eye at all trained to appreciate beauty of line that any variety, however slight or accidental, is hailed with delight.

#### THE WOODS AND FORESTS LONDON PROPERTY.

**I**N a note in our issue of August 23, we set out *verbatim* the part of the report of the Committee of the House of Commons which dealt with the London property of the Woods and Forests Department. This Committee was first appointed in the session of 1889, and was re-appointed in that which has lately come to an end. The subject of the inquiry was one of much importance, but we are now concerned only with so much of it as deals with the London property of this department. It is desirable, in the first place, to clear up a popular mistake, namely, that the Crown estates, or, in other words, the estates under

the administration of the now very absurdly named department the "Woods and Forests," belong to the Sovereign. On the contrary, they are administered for the benefit of the nation, and the revenue obtained from them is paid into the National Exchequer. For the year ending March 31, 1889, the net income was 430,000*l.* The estimated rateable value of the Crown property in London is 900,000*l.* Mr. Cates, who has the management of it, states that if all the property were in hand, the annual rental would be about 1,000,000*l.* a year, as compared with the present annual rental of 250,000*l.* Thus the Crown estates form a valuable national asset, and the "unearned increment," as the phrase is, goes not into the pockets of the landlords of the country, but into those of the tax-payer. The recent inquiry thus shows that the importance of the department, so far as the metropolis is concerned, is increasing, and we think that the Committee have rightly resolved that the Commissioners should take a more responsible part in its management. But we take it that the Committee in making the recommendation in no way consider that there is any hostile criticism to be made against the management of the London property by Mr. Cates. On the contrary, it is obvious that his management has been so capable that the Commissioners have not taken more than a nominal part in looking after the Crown property in London. This is not surprising, for Mr. Cates is a person, as his professional brethren know, of great capacity and experience; whilst neither of the two Commissioners, Mr. Culley and Sir Robert Kingscote, are men of sufficient calibre or experience to overrule his views. Of course, in justice to them, it is fair to point out that a competent Surveyor of long practice is necessarily a better judge of the routine business of the management of house-property than an ordinary official can be. Thus, when a lease is about to expire, the main question is, what shall be the future rent? It is obvious that Mr. Cates is a better judge of this than most Commissioners would be. On the other hand, a Commissioner who went into these details carefully would in a comparatively short time be able to form a competent judgment on such matters as these when assisted by a skilled opinion. It appears to us that as each lease approaches its end, the amount of the future rental, the person to whom the new lease shall be offered, whether it shall be offered to the occupier or put up to public competition, should be considered by the Commissioners. It is clear, for example, from the evidence given by Mr. Cates, that a new lease of Crown premises is always offered in the first place to the occupying tenant, though he may be only the sub-tenant of the actual lessee from the Crown. But though this seems to be *prima facie* a sound general principle, it ignores the actual lessee; and we can see no reason why the actual lessee from the Crown should not have as much right to the new lease as the occupying tenant. Mr. Cates has been desirous of getting rid of the middle-man, which, again, is a sound general principle to act upon. But it is also a sound principle that the person with whom the original contract has been made has a fair right to expect that on a renewal of the lease he or his representatives will have the preference in regard to a new lease.

Mr. Cates states that in the Crown leases there is no stipulation against sub-letting. It would, he thinks, be wiser if such a clause were inserted in all future leases. Then the actual possessor of the lease, either the original lessee or his representative or his assignee, would naturally and rightly have the preference in the granting of a new lease. Where sub-tenancies have been created, then we cannot but think that each case should be considered on its merits, and that the occupier or sub-lessee should not *prima facie* be considered as having a greater right than the lessee or his representatives. A very important question is also raised by the Committee—as to whether a scheme of periodical renewals to anticipate the closing of the lease

in its natural course and then gradually to raise the Crown income should not be established. They consider that this point should be carefully considered by the Commissioners." It is difficult to understand why the Committee do not themselves give a definite opinion upon it. It is a subject, indeed, rather for the Chancellor of the Exchequer than for the Commissioners, who are only managers of this property. It concerns the national finances, and it is a point which should be settled by the responsible Finance Minister of the country, the details being worked out by the Commissioners with professional advice. That a scheme of renewal on a proper basis would be desirable we cannot doubt. It would prevent any question as to the person to whom a new lease should be offered, since the privilege of renewal would necessarily belong to the lessee alone, and it would enable the value in the improvement of the Crown property to be more certainly estimated for revenue purposes, and to come earlier into the public exchequer. It would also give a greater security of tenure to leaseholders of the Crown. The latter would, in fact, have perpetual tenancies, subject to the performance of the conditions in their leases and to the payment of certain fines or increased rents, which would be known from the very moment that they became lessees of the Crown. We believe that such practice exists on Lord Derby's Liverpool estate, though it does not seem to be the same on the London estates of the great landlords. Mr. Cates's practice is to arrange the terms of a new lease with the occupying tenant "about a year before the expiring of the lease." This gives the lessee or the tenant too insecure a tenure. The latter, it is obvious, does not know, until a short time before he may be turned out, on what terms he may remain in; and the former, whether he likes it or not, has to give up his interest. Crown leaseholds should, as nearly as possible, have the attributes of freehold property, and to give it these a scheme of renewals must be in force. If a tenant, when such a scheme exists, does not care to make use of it, he has no one to thank but himself.

THE PRINCIPLES OF PROPORTION AS PRACTICALLY EMPLOYED IN THE PARTHENON.\*

BY W. WATKINS LLOYD, F.S.A.

It will be observed that the open space between the columns of nearly 8 ft. is so ample relatively to human dimensions as to give no suggestion of inconvenient narrowness for two persons entering together.

The columns of the pronaos are smaller than those of the peristyle, and their columniations are also somewhat closer (13.736:14.090). The consequence is that each ranges somewhat nearer to the axis of the plan than the peristyle column, which is partly in front of it. The difference is exaggerated at the angles from the close spacing of the columns of the peristyle by the angle both front and flank; this has the happy effect of giving greater openness to the ambulatory at the corners, and allowing an uninterrupted passage of light through the second columniations on front and on flank.

The columns of the pronaos compare with those of the peristyle very nearly in the proportion of 6:7 by diameters. 7:6:6.245:5.352—cf. 5.402 measured. This is a pair of numbers, of which the squares also approach a simple proportion, viz. (49:36) 4:3. If we square the diameter of the peristyle column we have 39.0, which by ratio 4:3 gives 29.25 for the square of the diameter of the pronaos column, and the root of this number 5.408 is still nearer to the measurement than the result obtained by direct comparison of diameters.

The like comparisons worked out between

the west peristyle and posticum columns give us:—

Diameters 10:9::6.251:5.626; cf. 5.632 measured.

Areas 5:4::(6.251<sup>2</sup>=) 39.07:31.256 (=5.590<sup>2</sup>).

In this case, therefore, the exacter result is given by ratio of diameters.

The platform of the cella with its two porticoes has the proportion of breadth to length of 7:19.

Of this oblong an exact square is assigned to the Posticum, Opisthodomus and partition wall.

71.330:71.334 by Penrose's independent measurements.

The remaining rectangle has consequently the proportion of 7:12 comprising the naos and pronaos; this is the proportion of the front of the temple from level of stylobate to apex of pediment.

The plan of the naos in the interior, the chief and most sacred apartment, has very exactly indeed the proportion 9:14, or the same which, as we shall see, obtains between the breadth and full height of the front.

9:14::63.010:98.015 (cf. 98.095 measured).

The hundred Attic feet which justified the title 'Hecatopædon' as applicable specially to the naos, extend to midway of the front wall,—the line, in fact, of the doors. In consequence, if the façade of the temple were drawn to scale and laid down on the plan of the naos, its bounding lines would be exactly contained within the flank and end walls of the naos.

The nearest, but by no means satisfactory approach of the interior of the opisthodomus to a simple proportion is, 11:16.

16:11::63.01:43.318 (cf. 43.767 measured).

The naos column is in proportion to that of peristyle as 7:12 by diameters, and to its inter-column as 3:4.

The aisles taken jointly and upon the centre line of the columns give a dimension comparing with breadth of naos as 3:4.

The coincidences of proportion were, of course, no matter of mechanical deduction, necessary consequences from foregone assumptions; they were, doubtless, conclusions obtained after a series of trials and adjustments conducted only under guidance of the principle to search for special proportions compatible with available and appropriate arrangements.

By the established Doric system a triglyph was to be placed exactly central over each joint of the architrave stones, and between each pair of these, another intermediately. But if equal spacing were observed rigidly, the architrave must finish at either end with a half triglyph, and the architrave stones would only extend as far as the centre of abacus of the columns at the angle. It was probably to escape this anomaly that the angle columniations were first contracted and the angle column brought entirely under the architrave stone, though some advantage in effect must have been recognized in this departure from uniformity, otherwise we cannot doubt that a different solution of the difficulty would have been found. The architects, however, elected to allow the anomaly of finishing the architrave with a complete triglyph, which did not in this case centre with the axis of the column beneath it. But the further consequence now ensued that the extra half triglyph admitted on the architrave would pinch the space for the adjacent metopes. This difficulty was got over or alleviated by the angle architrave stone encroaching on its neighbour and extending beyond the axis of the second column, and so the irregularity was distributed and dispersed.

On the east front of the Parthenon the lengths of the architrave stones are:—

15.227—13.966—13.889—14.210—14.126—13.617—15.260—

The metopes:—  
4.160—4.066—4.064—4.050—4.282—4.295—

4.320—4.375—4.169—4.186—4.195—4.192—4.120—4.121 S.E. (Penrose, p. 16).

As a triglyph is placed very accurately over

the centre line of each of the intermediate architrave stones, the metopes fall into pairs which are very accurately of the same breadth: 4.282, 4.295; 4.195, 4.192, &c.

The central east architrave stone gives the widest pair, 4.320, 4.375; the pairs of architrave stones on either side are somewhat shortened to accommodate the anomaly of the extra half triglyph on the terminal architrave stones, and the breadths of the several pairs of metopes are more or less reduced in consequence.

Apart from these subordinate variations, the average proportion of the breadth of the triglyph to that of metope is 2:3.

The full length of the frieze on east front allowing for slight setting back from the architrave (0.067 x 2 = 0.134) is 100.161 to accommodate 14 metopes and 15 triglyphs, and in view of the given proportion divisible into 72 aliquots—

14 x 3 = 42 } + 72 = 1.390  
15 x 2 = 30 }  
1.390 x 2 = 2.780 for triglyph comp. } N.E. 2.786  
pairs with } S.E. 4.765  
1.390 x 3 = 4.170 for metope, comp. } N.E. 4.192  
pairs with } S.E. 4.126

The metopes towards the centre measure 4.330, 4.282, &c., by excess over calculation, which is compensated for by reductions above the shorter architrave stones towards the sides, 4.064, 4.066, &c.

At the south angle of the east front, the space between the two super-columnar triglyphs is, as in most other cases, accurately divided by the inter-columnar triglyph, making the metopes on either side equal; but at the north angle there is a difference. This is due to the second architrave stone being shortened, to the advantage of the third. The contrasted dimensions are these:—

S.E. 15.227—13.966—13.889—14.210.  
N.E. 15.260—13.617—14.126.

The metopes are so reduced above the short architrave stone that the slant face of the southern half triglyph had to be cut away to make room for the sculpture.

Had the last inter-columnar triglyph been set quite symmetrically, it would have given metopes of uniform breadth, 4.129, to compare with the corresponding metopes at the other angle, 4.126 and 4.120. But the architect preferred an unequal division, which made the southern metope just equal to those above the short architrave, viz. 4.066. This leaves 4.192 for the last metope, which compares with the breadth of the corner metope very nearly as 3:2.

3:2::4.192:2.794 (cf. 2.786 measured).

It seems clear that the architect, having to deal with an inevitable irregularity in disposing of the terminal half-triglyph, contrived to distribute it, and in doing so deliberately avoided giving emphasis to rigid uniformity in parts adjacent. As we have seen, he did not deal with the difficulty exactly in the same way at both extremities of the frieze. It was probably due to like considerations that he allowed more irregularity in the columniations by the angles than to any others. Perfect uniformity throughout was excluded by the nature of the case, and the want of it was in some degree concealed by the departure from uniformity, though under strict limitations as we shall see, not being exactly repeated or so concentrated as to declare itself by direct contrast with the uniform.

It is worthy of remark that the breadth of the triglyph compares with the lower diameter of the peristyle column in the ratio, so frequently employed in the Parthenon of 4:9.

9:6.25::4:2.770 (cf. 2.770 measured).

This may possibly be a coincidence which was never weighed or recognised; but the two dimensions are very naturally compared, and the recognition of their proportion so favourably, may quite as probably have had its influence in deciding the precise proportion of triglyph to metope which conciliated it.

We have now gone through a consideration of the chief elements of the design and its distribution, which concern or are in direct dependence on the ichnography of the temple,

\* The first part of this paper, with a number of illustrations, appeared in last week's Builder.

rigid as to enforce absolute precision, and absolute height would also be liable to be affected by the degree of projection allowed to the cornice at the angles from which the slope line of the corona started, and then by the optional height which might be given to the corona; but these differences would be slight variations of a total height which could not be less than between 13 and 14 ft.

We are, therefore, bound to admit that while the architect sat down to design his front upon the absolute basis of a breadth of 101.341 ft., he had the second condition to bear in mind in adjusting his proportions that they must be such as to allow for a pediment only variable within narrow limits of height. What he worked for was to realise a temple having its specific character of dignity by well-selected proportions of parts in accordance with the general character prescribed by the norm of the Doric style. It is but a conjecture, but it is plausibly conceivable, that in the tentative processes of embodying his ideal, he followed out first the suggestions which were presented by regarding chiefly the condition of an assumed height of pediment, and then in turn by the independent ordination of columns of various proportions, until he was satisfied by hitting on those combinations which so happily conciliate both processes and form a plexus of harmonies of which the artifices defy attempts to unravel.

The dimension which is left over for us for the height of the pediment by the analysis adopted, is about 13.97, and the measured is 14.073. This dimension agrees with the second columniation of the front south-east 14.073, and with the third south-west 14.034. At the same time it completes a total height of front which gives the proportion to top step, as we have seen, of 9:14; and a height from the top step to the same of 7:12.

Cornice and tympanum have a relation of solid and void analogous to that between column and intercolumn, and a certain harmony of gradation results from the similar dimension being distributed in contrasted proportions.

The vertical height of the cornice of the pediment at the apex compares with the horizontal cornice in the ratio of 4:3.

4:3::2.601:1.950 (cf. 1.953 measured).

The breadth of the south-east angle ahaeus is 6.857, and height 1.150, this is more than one-sixth; and the shorter examples are many of them higher; at the same time the sixth of the angle abacus approaches the average height of the ahaeus generally—

6.857÷6=1.143 (cf. 1.149 "F. C. P.," p. 15).

The height of the capital varies little for angle and ordinary columns. It is given by the ratio of 4:9 to the diameter of the angle column.

9:6.878::4:2.834 (cf. 2.833 measured).

Penrose's plate 14 gives 2.810 as height of capital of the northern of two central columns, east front, of which abacus takes 1.145, echinus and necking 1.675.

The approach to the ratio 2:3 is not close enough to be relied on.

It is pointed out by Mr. Penrose (p. 15) that the upper diameter of the column is proportioned to breadth of the abacus in the ratio 13:18; these are high numbers, and the agreement may be a coincidence; but the proportion is in the normal series of ratios with difference of 5, and may have been welcome in addition to other determining considerations.

13:18::6.756:4.83 (cf. measured upper diam. 4.839).

Mr. Penrose also notes (*ibid.*) that the diminution of the column which gives the upper diameter, is at the east end .683 and at the west .685, which is exactly  $(31.253÷50)$  1.50th of the height of the column.

Of the south-east angle column the diameters are—

Lower diam. ....	6.373* = 40.68
Upper diam. ....	4.989* = 24.89
Diam. of echinus...	6.733* = 45.33

The upper and lower diameters compare directly as 11:14, but the corresponding sectional areas which are as the squares of these

diameters, give very exactly the normal ratio 8:13.

The sectional areas of upper diameter and echinus come out very exactly in the ratio 9:10.

The lower diameter of the column of the pronaos is derived from that of the ordinary column east front, either by ratio of diameter—

7:6 (6.245:5.352 cf. 5.402 measured).

Or more exactly by ratio 4:3 of sectional areas.

4:3::39 (=6.245<sup>2</sup>):29.25 (=5.402<sup>2</sup>).

The diameter which is given for the naos column compares with that of the pronaos, by diam. as 2:3, and therefore by sectional area as 4:9; but much more exactly with the peristyle column by diameter as 7:12, a normal of Parthenon.

12:7::6.245:3.643 (cf. 3.656 measured).

The naos column is proportioned to its inter-column as 3:4.

It may be noticed here that the due subordination of the Propylaea to the Parthenon columns, is effected by giving them a diameter in the ratio of 9:11, or sectional areas proportioned very nearly as 2:3.

3:9 (=6.245<sup>2</sup>):2:26 (=5.098<sup>2</sup>).

11:6.245::9:5.109 (cf. 5.110 measured).

The small Doric column of the Propylaea is proportioned to the larger by as 11:16 by diameters.

16:5.11::11:3.513 (cf. 3.516 measured).

We have now reviewed the chief proportions of this supreme achievement of Hellenic architectural genius, the Parthenon. In looking back through our comparisons it will be observed that the architect confined himself to a remarkably restricted scale of well-distinguished consecutive ratios; that he employed the same ratio over and over again, now upon one scale of dimension, now on another, rectangularly or rectilinearly, or by area; now in erect presentation and now horizontally.

By manipulation of these ratios he effected a gradation of masses sufficiently decisive but without suddenness, between the columns of the peristyle, those of the inner porticoes, and those of the naos, enhancing the dignity of the superior without degrading the subordinate. The gradation of intervals is ordered with equal art and effectiveness.

The projection of the two broad steps and the offset below them is to the diameter of the column as 4:5—that is, it has the same proportion to the diameter as the diameter has to the inter-column, and is subordinated to the interval of the columns accordingly.

5:4::6.245 (diam. of col.):4.990 (cf. 4.974 projection of steps).

The inter-column is then subordinated to the interval between peristyle column and cella wall by the ratio 7:8.

8:7::8.945:7.825 (cf. measured inter-col. 7.829, &c.).

The breadth of the ambulatory on flank from edge of step to cella wall is in turn subordinated to like breadth on eastern front taken to the edge of pronaos step, in proportion of 7:8; and this breadth on the east front, from edge of top step to the step of the pronaos is subordinated to the dimension thence to naos wall in the ratio 5:6.

6:5:19.04::15.867 (cf. measured 15.878.)

In this manner we are conducted with a sense of constantly expanding room to the spacious interior of the naos.

The posticum is in general plan identical with the pronaos; but the slightly larger columns bring their intervals more near to equality with those of the peristyle, and the space from the cross wall to the top step is here equally divided by the step of the posticum.

Here we have still one more, and a very decisive, example of how the architect made it a principle to introduce an element of diversity between similars, and yet always in subjection to a new scheme of definite proportion.

I may say, in conclusion, that the confident

assertion that we have here a true recovery of the principles, and it may be added the practice, of the Greek architecture, depends on the propriety of the selection of the members and dimensions which are brought into proportional relation, on the universality of the application of proportional regulation, on the simplicity of the select scale of proportions which is employed; and lastly, on the extraordinary accuracy with which the proportionate dimensions are put into execution.

Furthermore, it may be recommended to those who, after testing the calculations here provided, may be disposed to fancy that such appropriate and such precise proportions may be mere fortuitous coincidences, to examine for themselves the numerous Sicilian temples. Whatever may be the system on which the design of these was regulated, they exhibit but the very slightest and rarest approaches to such systematic proportions as we have traced in the Parthenon; yet these could not have been so abundant in the Athenian temples, and so all but entirely wanting in the Sicilian if it were in the nature of things for them to crop up, to develop themselves spontaneously.

W. WATKISS LLOYD.

NOTES.
