The new part of the ground floor consists of entrance-hall, drawing-room, dining-room, with oak panelling to the walls and ceiling; kitchen and offices. The older part of the ground floor is utilised for morning-room, school-room, pantry, &c. Cellarage is provided under part of the new rooms.

The first floor contains a library fitted with walnut panelling and book-cases. Upon the roof over, but communicating with the library by a separate staircase, is a book-room for pamphlets, also a smoking-room in the turret. Eleven bedrooms, besides dressing-room, bath room, &c., complete the remainder of the accommodation provided upon the first and second floors, a few of these rooms being in the older part of the building.

The halls, corridors, staircase, and some of the rooms, are warmed by hot-water radiators. Marlborough stoves have been adopted throughout. The house is fitted with electric bells, peaking tubes, and a service lift.

The grounds have been laid out by Mr. Paul, of Cheshunt.

The builder is Mr. John Greenwood, and the total cost has been about 6,000*l.* Mr. Alfred Fowler, F.R.I.B.A., is the architect.

#### THE VILLAGE HALL, ORPINGTON, KENT.

This building has been recently erected in a central position in the village of Orpington, at the sole cost, together with the furniture and fittings, of Mr. Alfred Brown, of Pine Ridge, Orpington, for the use of the parishioners, irrespective of creed or politics.

The plans, &c., were prepared by Mr. St. Pierre Harris, A.R.I.B.A., architect, and the works have been carried out under his supervision, by Messrs. W. Holt & Son, builders, of Troydon. The building was opened by Sir John Lubbock on October 22.

Externally, the walls are faced with red bricks from Woolpit, the window dressings, balustrade, porch, &c., being of buff terra-cotta, with a slight tinge of pink. The front gables are weather-tiled, relieved by a sparing use of self-timber work, the roof (which is surmounted by a flèche in English oak, and covered with copper) is of strawberly-coloured Broseley tiles. The architect's aim has been to provide a building suitable to modern requirements, of substantial character, and designed to harmonise as much as possible with its old-fashioned surroundings.

The plan in the corner of the plate shows the general arrangement. The hall is covered by a summer-beam roof, and that and the Club Rooms ceilings have ornamental friezes of fibrous plaster. At one end of the hall is a moveable platform with an arched recess at the back and a minstrel gallery over. The rooms are at present not permanently decorated, but an agreeable colour effect has been obtained by the use of plain tints, in which work the architect has been assisted by Mr. Lewis F. Day.

Messrs. Doulton & Co. supplied the terrazzo and the sanitary fittings; Messrs. Mainzer Kempthorne, the mosaic paving; Messrs. Brode & Co., the wrought-iron gas-fittings, leather-vane, &c.; Messrs. Worrall & Co., of Liverpool, the wrought-iron fences and balustrades; Messrs. Mortelmans & Co., of Camberwell, the fibrous plaster; Messrs. Weekes & Co., the heating apparatus; Messrs. Kelley & Co., the leaded cathedral glazing; Messrs. Parkes Bros., the stoves and mantels, which are supplied with fresh-air inlets into the rooms; Messrs. Boyle, Limited, the fresh-air jets; Messrs. Hart, Son, and Peard, the locks and fittings.

**THE ENGLISH IRON TRADE.**—There is an improvement in the English iron market, which shows itself a larger volume of business and firmer prices, as a matter of fact, the better tone is perceptibly in the northern markets, but it cannot fall far long to influence those of the south. In pig-iron the buying is still only for immediate requirements, but more money has to be paid. The Glasgow warrant market has again been in a rising tendency, and the business done has aggregated a large total. There is a fair demand for makers' iron, and some brands are being quoted again. Liddesburgh pig has advanced 6*d.* per ton, and the best Bessemer iron, 2*s.* There is a fair movement in the tin, and values are steady. Steel is as less stiff, because of a somewhat slacker demand, temporarily. The shipbuilding trade is in satisfactory condition. Engineers keep well employed.—*Iron.*

#### ANCIENT BUILDINGS AND MODERN ARCHITECTS.\*

BOTH in relation to the use to be made of the architectural art of the past, and the scope to be given to the architectural art of the present, it seems desirable that some attempt should be made at a dispassionate consideration of the relation of the modern architect and his work to the claims of ancient monuments, on occasions when the work of the ancient and of the modern architect comes unavoidably into juxtaposition or into absolute competition.

Every one is aware that, with the Gothic revival movement half a century ago, there arose not only a passion for making modern imitations of Medieval work, but for restoring, as it was called, such Medieval monuments as had suffered from time, or from wreckage, or wilful injury of one kind or another; though perhaps every one is not alive to the fact that, at that time and up to twenty years ago, the whole feeling of the best educated and most ardent section of the community was in sympathy with such restoration, and regarded it as the best practical appreciation of the value of the ancient architecture; and that to be careless about or opposed to restoration was to be a "Philistine." Now the pendulum has swung the other way; it is "Philistine" to be an advocate of restoration, and those who regard themselves as "superior persons" mostly affect a great contempt and disgust for restoration and restorers, though in many cases this opinion is only parroted as a fashion by people who hardly understand the real grounds either for or against it.

It may be observed also that it is the fashion at present to class under the general term "restoration," or at all events "under the same condemnation," every sort of meddling with an old building, either by altering old work or adding new work to it. This suits the plan of campaign of the "anti-restorers," as it gives them a handle for lashing every one with the same brush who lays any sort of hand on an ancient building; but it is in many cases a misuse of language which leads to confusion of ideas. The term "restoration" is only properly applicable to two processes: (1) building up something which is supposed to have been once there and which has been destroyed, or (2) cleaning and refurbishing up and piecing old work to make it "as good as new." Adding new portions to an ancient structure is not "restoration," though it is frequently included under that term and visited with the same censure.

Both the restorers of the last generation and the "anti-scrapsists" of the present day have made serious mistakes (though the mistakes of the former unhappily have had the more permanent consequences), owing to looking at only part of the truth about ancient buildings and shutting their eyes to the rest.

There are three kinds of value an ancient building may have for a modern generation: (1) its historic value as a record of the past; (2) its artistic value as a piece of architectural design (3) its practical value as a building still in use for practical purposes. It was the mistake of the generation of restoring architects to ignore the first factor entirely; it appears to be the mistake of the "anti-scrapsists" of the present generation to ignore the other two entirely. The real duty of the modern architect who is called upon either to alter, repair, or add to an old building, depends entirely upon the relative degree in which these several qualities of interest, the historic, the architectural, and the practical, are found in it; and his treatment of each ancient building must depend on the special circumstances of each case. No hard and fast rule can be laid down.

Before proceeding to illustrate this view more in detail, let me, however, say at once that I differ very little even from the extreme anti-restoration fanatics of the day in regard to what is, properly speaking, restoration in its purest form,—viz., the building up again of something which has disappeared, from indications found on the existing remains. Such indications never can give the real truth as to the disappeared portion; there may be the most probable, the most ingeniously logical restoration; but it is only probably after all. Therefore the restoration is absolutely valueless historically; it does not resemble the workmanship of the original builders, and we cannot say

By Mr. H. H. Statham. Read in the Section of Architecture at the Art Congress, Birmingham on Wednesday last.

positively that it resembles their design, and it would be far better to build up the destroyed portions our own way, as well as possible in an architectural and practical sense. But in the case of a complete design, of which a portion is gone, but of which the portion remaining gives the design entirely,—say in a continuous cloister, of which two bays have been ruined, and the rest are in good preservation, I consider it would be absurd to object to rebuilding the ruined bays in order to complete the design. For this, it must be observed, does not pretend to be history; this is a question of completeness of architectural effect, which is quite another matter. Architecture is design as well as history, and both elements claim consideration.

A line may be drawn, however, in regard to such work as carved detail, which cannot be precisely reproduced, like mouldings or tracery lines, and which usually differs in different portions of the same arcade, for instance. In such a case it is better for the new portions to show their novelty, and make no attempt to imitate ancient work, only to preserve such a general similarity in the balance of parts as may harmonise with the general design of the whole. Carving of figures or foliage stands on a very different footing from such purely architectural details as can be set out by measurement. The personal equation of the worker comes out much more strongly in such work, and it is impossible that any modern sculpture, for instance, can look like Medieval sculpture or harmonise with Medieval architecture. In the case of recent repairs to a Medieval gateway, repairs which were absolutely necessary for its safety, it was mentioned that a new figure was to be executed for the niche over the gateway, and the fragment of the old one still existing was to be put in a museum with other relics. I ventured to make the suggestion, in print, that the old fragment should be left where it was, and the new statue put in the museum. This was "wrote sarcastic," but the architect engaged took it seriously, and wrote to me that he had given the suggestion every consideration, but that the old remnant was too rotten to be left *in situ*, and that the authorities were very much pleased with the new statue. This is the way such things are generally settled. I see no objection in such a case to putting in a modern statue by the best modern sculptor you can get; but not a modern Medieval one, which is a mere pretence, neither one thing nor another.

That minor part of restoration which consists in cleaning, repairing, and refurbishing up what is old, is again a matter to be settled according to special circumstances. As a general rule, it is undesirable to interfere with exterior surfaces of buildings, not only because the effect of weather-stain and vegetation is far better, in a picturesque sense, than that of masonry scraped to the raw surface, but because such scraping is generally injurious to the wall, practically destroying the hardened skin which weathering has given it, and leaving it softer and more friable than before. There are few cases in which anything is gained by meddling thus with the exterior surface of an old wall. But in regard to interior cleaning and reparation the case is very different, when we are dealing with a building still in ordinary use. To say that the clergy and congregation of an ancient church which is in daily or weekly use for service, are not to clean off the whitewash with which it has been barbarously covered; not to have new seating if the old is worn, unsightly, or inconvenient; not to relay a battered and uneven floor with new tiles; all this is about as reasonable as to say that a man who happens to live in an old house is not to have new furniture, carpets, wall-papers, or decorations when he requires it. Cleanliness, order, decency, convenience, surely count for something in a place of worship in regular use. Yet people are gravely rebuked for the offence of making their churches clean and decent, and of removing clumsy and ugly fittings which have no affinity with the architecture of the church, because, forsooth, they are destroying the history of the various changes in the church. Rubbish! Such changes as covering mouldings and carving with whitewash, and putting up bad woodwork utterly out of keeping with the architectural character of the building, are pieces of "history" that are better forgotten. There are occasions, no doubt, when it is an æsthetic crime to remove the old fittings from a building. Such a case is that of Wren's famous church of St. Stephen's, Walbrook

where, within the last two or three years, the original seating has been removed (merely because it is out of the present ecclesiastical fashion), the floor-space cleared, and the pews replaced with open benches. In this case there is a real mischief done to the architectural design of the building, of which the original fittings formed an integral portion, the columns being designed with hases just above the level of the woodwork; they are now left standing on tall, bare pedestals, with no meaning at all, and entirely out of proportion to the columns; the columnar order having been specially designed to be seen only above the line of the woodwork. Thus the whole proportions and intended effect of Wren's original design are spoiled. Yet the very persons who would and did protest against this alteration, on the ground that it destroyed the architect's design, will equally protest against the removal of commonplace pews from a fine Mediaeval church, where they have nothing to do with the original architecture, and form an unsightly excrescence, entirely out of keeping with it. In the eyes of such critics, apparently, "whatever is, is right," whatever is there is to remain, had or good, architectural or not, simply because a previous generation put it there. This is nothing better than foolish bigotry, the only possible merit of which is that it saves people the trouble of thinking, or of forming an opinion on rational grounds, a kind of mental exertion which many people like to be saved.

But this new kind of bigotry is shown in even greater force when it is a question of making any addition to an old building. According to the views of those who pose as the special guardians of ancient buildings, it appears that a clergyman whose congregation has outgrown the size of an ancient church is not to make room for more worshippers by adding a new transept; another who wants a larger vestry is not to build it; a new organ-chamber for a larger organ is not to be added; or a clergyman is taken to task for sacrilegiously cutting a doorway through a Mediaeval wall to make a more convenient access from the vestry. All these cases refer to buildings in actual use for the purposes for which they were originally built; so that it comes to this, that the practical usefulness of a building is to be entirely set aside and regarded as of no consequence in comparison with its preservation in the form in which the present generation found it. That is a principle which has never been proposed or acted upon in the whole history of architecture until the present day, and it is a principle entirely opposed to common-sense and to the whole *raison d'être* of architecture. The basis of architecture is utility; and to put utility out of sight and act merely on sentiment—and sentiment of a very exaggerated and indiscriminating type—is simply a *reductio ad absurdum* for architecture.

A brief reference to some actual buildings and their treatment may be useful by way of further illustration of the fact that each case has its own special circumstances and requires to be considered in reference to them. Taking a building which has become an actual ruin, such as Kenilworth (to mention a notable example in this neighbourhood), there can be no doubt that in that case the sole thing to be done is to leave it alone, beyond doing what seems necessary to preserve it from further decay. A man who could propose to rebuild Kenilworth as a restoration of it as it existed say in Elizabeth's reign, would amply deserve any of the hard things which would certainly be said about him. It would destroy all the sentiment and all the historic interest of the ruins, and give us a mere sham in return. But the case is different with a building which is still architecturally complete, though in a neglected and dilapidated state. Dunblane Cathedral is such an instance; it is complete or nearly so as a shell, but was long in ruin internally, and partially roofless. The people of Dunblane recently conceived the idea of raising money, and asking for a Government grant in aid, for roofing and refitting this fine old church, and restoring it to the purposes of divine service for which it was originally built. Now, considering that the large majority of the more serious people of this country regard public worship as an important aid to religious life and faith (and, not being what is called an orthodox churchman myself, I am here speaking entirely without prejudice), it might surely have been thought that it was a most praiseworthy act to fit this building for its religious use, and to fill its long-silent spaces once more with the sound of

prayer and praise. But no; your anti-restoration fanatics will have none of this, and have actually done and said all they could to discredit the scheme and to excite the public mind against it, merely because the nave of the building has long stood empty and dilapidated, and they wish it to remain so still. People who act in such a spirit seem beyond the reach of argument or reason.

Another good illustrative case is that of Chester Cathedral, which I select partly because, living in the neighbourhood then, I saw a great deal of the work. The cathedral was almost refaced externally by Scott, and scraped, cleaned, and some ugly galleries removed internally, and a certain amount of decoration done. The worst thing done was the wooden vanit over the nave, a barbarism for which there is not a word of defence to be said. But no reasonable person who knew the interior in old days, and how dismal, dirty, and neglected it looked, would deny that its present state is far more suitable to a church in daily use for service. The exterior is another matter. In its old state it was a delight to painters, the soft red sandstone being rounded and worn to such a degree that the whole looked, as I heard it remarked, like "an old sea-beaten rock"; of architectural detail there were, for the most part, but a few uncertain traces remaining; and the building certainly looked as if it was going to ruin. This was the pretext in fact, for refacing it, but I think the real reason was to give it "architectural style" again. Scott's clerk of works one day imprudently observed to me "You have no idea how strongly these old walls are bonded; it is sometimes a whole morning's work for two men to get one stone out." I replied "I thought you were doing all this to make the building secure," and for once the clerk of works, generally most loyal to his architect, had nothing to say. The cathedral externally is now practically a church of Scott's, with some late emendations by Sir A. Blomfield. The alteration has almost altered one may say, the whole character of Chester, and if the cathedral was secure in its old state, I think it should have been left alone externally. It was at least picturesque and genuine. But I cannot help thinking that, in spite of the clerk of works' admission about the solidity of the walling, it may have been very questionable how long a building would have remained secure when the walls had once become furrowed and pitted in the way they were, and that all this must be considered before too hastily condemning the re-casing of the building. But there is one incident in Scott's restoration which is an example of the absurdity of conjectural restoration: I mean the stone pyramid to be seen over the east end of the south aisle. This is all the offspring of a bit of moulding and a sloping weather-mark found on the adjoining wall in the course of the restoration. Out of these elements, coupled with a record of a French abbot of Chester in the Transitional period, Scott ingeniously evolved this exceedingly French-looking termination to the aisle. The reasoning, based on such slender premises, was very clever; we were told in fact (according to the fashion of restoring architects in these cases) that "the evidence was quite complete." The evidence was complete that something of that kind was once there, but that is all; even if Scott knew exactly what it was it was no use doing it over again; but as the facts stand the erection is the very height of absurdity, a useless and ugly thing put up because there is some reason to suppose that somebody put up something like it seven or eight centuries ago.

St. Alhans is another building that has its lesson as to looking at things from all sides. The fight over it began about the proposal to raise the nave roof to the old high pitch, and the anti-restorationists forthwith raised the cry that the existing roof was only in need of a little judicious repair to last for ever. They did not take the trouble to look at the roof first. I did; I went into it with a lantern, and I never saw such a mass of rotteness and decay pretending to call itself a roof; one hardly liked to trust one's own weight on it. A hue and cry was then raised about the old painted ceiling; could it be possible, it was said, that there was any talk of removing that? And what was this precious relic? A commonplace pattern in circles, such as any school-boy could draw with a pair of compasses, painted on thin hand-box slips of wood  $\frac{1}{2}$  to  $\frac{3}{4}$  of an

inch thick, and so rotten that many of the pieces could be crumbled in the fingers. Yet it was over this sort of stuff that a lamentation was set up, as if people were going to pull down the building. All this plays into the hands of a man like Lord Grimthorpe, who knows well how to turn it to account. And about the west front? Well, considering what the dilapidated state of the old west front was, that the west window was a debased affair in design, and ready to fall to pieces, and that almost every vestige of architectural detail had been eliminated from the façade; considering also that the building was about to start on a new career as a centre of a diocese, I say that to build a new façade to it was in itself a perfectly right, and reasonable and truly architectural project. The mischief was that a Chancellor of the Diocese, who boasted of his ignorance of architecture and declared that he could not understand a drawing if it was shown to him, gave over the unhappy building to a man who had no claim to meddle with it but the possession of a money to indulge his whims, with the help of a half-educated clerk of works, who had picked up a smattering of Gothic, to do the designing for him. Such a proceeding, I believe, would be impossible in any other country but England. But the opponents of it took the wrong line. They insisted that no one ought to put a new façade to an old building, however dilapidated, and the common sense of the public was against them. They should have argued that such a task required the highest architectural power and culture to do it justice, and that it had been sold to a manifestly incompetent person. There might have been some chance of success on those lines.

The treatment of Westminster Hall is the last great *copy* in restoration, and not the least instructive. The origin of it all was that when the old Law Courts were removed from the west side of the building, a piece of Norman walling was uncovered; not Norman architecture, but simply Norman masonry, which was not in condition to bear exposure to the weather, and in order to cover it up and preserve it, slight and rather doubtful indications of a former double cloister were brought forward, and such an erection was made over again, and we were assured, as in the case of Scott's pyramidal erection at Chester, that not a link of evidence was wanting for the "restoration," as it is called. It is the same thing over again: there was evidence that something of the sort was probably once there, and something of the sort is built again; but it is all conjectural in detail. Its historic value is absolutely nil. But as it was feared that public opinion would not stand all this expenditure for building a pretended Mediaeval "restoration," it was contended that the long low narrow rooms thus formed would be very useful, though their use has not yet been discovered. That is inverting the natural and logical process of architecture, creating a structure first, and endeavouring to find a use for it afterwards. That is the whole history of the thing, and no one who reads the blue-books of the Westminster Hall Restoration Committee can honestly make anything else out of it. And all this to preserve a piece of Norman wall—why, it is sheer fetishism, this bowing down to every old stone wherever it is found. The Norman masons who built the wall would have laughed if they could have known of it.

Then what should have been done? I think I know what a Mediaeval architect would have done, and what in all probability Sir Charles Barry would have done; who, like every great architect, lived in the present and did not confine himself to worshipping the past. Either of them would, probably, have cut away the old patched, shabby, dilapidated buttresses like so many pieces of cheese, and cased the whole exterior of the hall with a new design connecting it with the architecture of the great modern palace which has sprung up around it. The architectural glory of Westminster Hall is in its interior; its exterior, if it were ever intended to be seen (which I leave open to question), had lost all architectural character at the time when it was laid bare in view on the removal of the old courts. What has now been built against it is an architectural sham, having no meaning or value, at introducing details entirely out of scale with their surroundings. What I have suggested as the probable action of a genuine architect, Mediaeval or modern, would have resulted in a

architectural reality. No doubt, the very idea will make some people's hair stand on end. Then what do they say to William of Wykeham's treatment of Winchester nave?

Oh, but, we are told, there was a national style of architecture then; there is none now. *That* what the opponents of all interference with ancient buildings are waiting for? They will have to wait till the Greek Kalends, then. All that is gone for ever. How can there be a national style of architecture carried on in the same inevitable kind of way, with the same naive simplicity as Medieval architecture, comprising only one way of doing a thing, when history and modern means of rapid travel are brought our minds into contact with every type of the world, and every monument of ancient and modern architecture? Architecture is no longer national, it is individual, and it cannot be otherwise under the conditions of modern life. It has become a form of artistic expression; and if, on the one hand, we should give all value and admiration to the good work of the past, we ought not to be afraid of doing good work in the present, even when the practical and structural circumstances which control architecture require that it should be done at the expense of the old. Time moves on, and old buildings cannot stand for ever. Let us respect them, but not make fetiches of them. That is not the spirit in which anything great in architecture has been produced. Nothing seems to me more desirable, or more opposed to all real advancement of the art of architecture, than this kind of grovelling before an old building, merely because it is old. "True, it is dark and dilapidated, and, perhaps, unhealthy, and unsuited to modern requirements, but still spare it, for, alas, can do nothing to equal it; we are poor wambling bodies, who can produce nothing worth calling architecture now," and so on *ad libitum*. If architecture is dead, we will all events shall not do much to bring it to life again by folding our hands in despair, and lamenting over our incapacities. Rather let the modern architect, if it becomes necessary to remove or improve an old building that has done its work, strive with all his heart, and mind, and soul, and strength, to do something better in its place. He may succeed: who knows?

#### THE ARCHITECTURAL ASSOCIATION.

THE second meeting of this Association for the present session was held on Friday, the 1st ult., in the meeting-room of the Royal Institute of British Architects, Conduit-street, St. Leonard Stokes, President, in the chair.

The minutes of the previous meeting having been read and confirmed, the following gentlemen were elected members of the Association, &c.:

Messrs. F. T. Malby, C. G. Mayhew, G. H. Goddill, T. A. Sladdin, P. F. Hookings, F. L. J. Farrow, F. E. Ward, W. J. A. Anderson, E. A. Richards, S. Leake, A. J. Dalton, E. P. Bannell, E. Kirk, E. P. Casson, H. Webber, A. C. Chen, C. B. Thomas, E. H. Gatchous, J. H. J. Anderson, H. E. Jones, W. A. Forsyth, T. J. W. Anderson, G. E. Boys, P. C. Fuller, J. H. Tyeas, F. W. Chancellor, R. T. Barker, A. H. L. Mackinon, I. S. East, O. C. Hill, E. A. Vigers, C. E. Backourn, J. J. Chalmers Francis, P. Soames, H. H. Johnson, Lester Binns, R. Jones, J. Haire, and A. Spiers.

Mr. F. T. Baggalay proposed the adoption of the report of the Committee for the past year.

Mr. Brodie seconded the motion, which was unanimously agreed to.

On the motion of the Chairman a vote of thanks was accorded to the auditors, Mr. Max Clarke and Mr. W. Campbell Jones.

Mr. F. R. Farrow (senior hon. sec.) announced that the special business meeting, advertised in the "Brown Book" for November 28, would be postponed to December 12, and that Mr. W. H. White (Secretary of the Royal Institute of British Architects) would read his paper on November 28.

#### The Past, Present, and Future of the Association.

Four papers were then read by Messrs. A. Beresford Pite, Walter Millard, Needham Wilson, and Owen Fleming on "The Past, Present, and Future of the Architectural Association."

#### Mr. Pite's Paper.

That the past has produced the present as we find it to-night is a sufficient statement of the oneness of the original constitution of the

Architectural Association, as well as of the wise elasticity which has permitted it to enjoy such a rapid and easy growth to success.

Within certain limits, and in attaining certain objects, the Architectural Association has undoubtedly been a success, and a great success. Its influence and constituency are practically as wide as its profession, for it gathers all students within its ranks upon the commencement of their career, edifies, amuses, and benefits them with companionships. It provides the best occupations for their spare hours, offers them small prizes for competition, and, as becomes a society existing in this age of eloquence, affords the various facilities for debating and discussing papers and lectures; and lastly, and this has a not unimportant influence upon the present crisis, develops the young man's powers of statesmanship by initiating him into committees and their peculiar ways, early adorns him with titles and Vice-Presidencies, and ere his wisdom-teeth are cut he dreams of a night that he is sitting in that elaborately-carved Romanesque throne which inspires its occupants with Presidential gravity and sapience.

By means of its ordinary meetings, essays and lectures upon every branch of architecture have been published, that in quantity and interest, if not in weight or polish, rival the papers produced for the Institute, and in these days quantity in production means energy, and interest in matter popularity. Our papers are produced in theory for fellow-students but are equally valuable to the whole body of architects, viz., papers on "Lunatic Asylums," "Hospitals," "Continental Tours," "Water-supply to County Houses," and many others whereon published authorities are either scarce, silent, or ignorant. And the discussions that have ensued have been provided with the most patient, attentive, and generous audience for the speakers to be found in the profession.

But below the surface the work has been quite as successful, the number of those who have needed the help of classes has been few in comparison to the whole body. But one year only, as a rule, is wanted for attendance at each class, but many, and many their number ever be lengthened, for membership of the Association.

Many classes in construction, surveying, drawing, and design have been formed among the members, really upon their own initiative, and wider experience has been gained by such contact with fellows in better or worse offices than oneself, and an ardour and emulation has existed among visitors and teachers to be armed against mistakes and pitfalls.

An important factor in this success has been that opportunities for architectural study have been given without interfering or competing with any of the surrounding and more regular methods of architectural education. The invaluable series of lectures at University and King's Colleges and the work of the Royal Academy Architectural Schools have not been interfered with, and we have always retained the invaluable help of the professors at the colleges and their recommendations to our classes. Their time-tables have fitted in with the Architectural Association calendar, and our harmony and elasticity of constitution have again ensured success, as the Architectural Association has never offered lectures to equal or rival the late Professors Cockerell, Donaldson, and Hosking. No attempt has been made to discredit the apprenticeship system, as nothing in the constitution of the Association clashes with the usual requirements of articles of pupillage, and the hands of the pupil have been strengthened in the classes of construction where he supplements and tests by question and answer, his daily learnings and observations; and by classes of design, where he learns to be impracticable, visionary, and poetic, and builds temples and abbeys that no sane master could afford time or patience to thoroughly criticise.

It should not be supposed that a practising architect's pupil could acquire knowledge of the archaeological and antiquarian branches of architecture without an added stimulus to enthusiasm, or that his defective early education in mathematics or free-hand drawing should be remedied by premiums to business men,—such enthusiasms must be cultivated, and such defects remedied by courses of Drs. "Birkbeck" and "A. A.," and our part has been most successfully done; the confidence of the pupil in himself has been increased, and the sympathy of the whole body of practising architects

enlisted on behalf of the Association. I have always believed it below the dignity of this Association to discuss the relations and mutual duties of architects to pupils; but as the question undoubtedly bears most largely upon architectural education, it cannot be overlooked in a review of the work of the Association. The architect in practice is presumably qualified to practice, and the pupil that he contracts to teach is to be provided with similar qualifications, so that in a given time he may similarly practise. Now, I do not suppose that it will be maintained here, for a moment, that the majority, or a large minority, or any considerable number whatever of the practising architects of London, are not fairly and properly qualified for ordinary business practice. Business experience goes for much, nowadays,—for a great deal too much in architecture,—but as long as injunctions are so perilously easy, builders so eccentric, workmen so stupid, surveyors so tortuous in their accounts, and district surveyors so nervous and legal, this experience must be bought, as it is indispensable, for without it you cannot be a "practising" architect. Now, all this has been recognised by the Association, and the lighter and pleasanter paths of design and colour, and the interesting discussion of constructive questions, have proved to be attractive to a large number of students, to whom our policy of co-operation has proved a very successful aid.

One other point, and I have done with the past. What has it done for the higher and ultimate objects of the Architectural Association? There is an object beyond the offering of facilities to architectural students, the improvement of the individual architect is not the only end in view or the final results of our operations. As the Association takes the young architect in hand at the period when his mind is most open to high ideals, we have here energies that only need right guidance and encouragement to react upon our national art. The work and influence of the Association need not, and must not, be devoted to the cultivation of professionalism, to the neglect of wider and greater influence upon the practice of the art of architecture. In the past this sphere has been only occupied spasmodically. The influence of artistic men has been felt in the classes of design and colour, in the discussion and criticism of current design at the ordinary meetings, and in the improvement and advancement of constructive ingenuity and simplicity at the construction classes. But this field has been scarcely cultivated. The fact does not seem to have been fully grasped that by influencing for art a large body of young enthusiastic architects the outward and visible architecture of our streets and country places might be vastly changed. For many years past it seems to have been taken for granted that unity of artistic feeling and aim was impossible; that we were hopelessly divided into two or three irreconcilable schools of design, and that though all owned the same constructive habits and practice, it was undesirable and impossible that unity of artistic aim and feeling could be secured. But this is rapidly becoming a dead tradition, and "design with beauty build in truth," because it dates from the past, almost sounds as if it had a covert intention of setting rival schools, which either preferred beauty in design to truth in construction, or naked truth in building to designed beauty, at war with each other. The doctrine of the unity of architectural art is the result of the throes and struggles of this singular century, issuing, we hope, in that more perfect brotherhood of all the arts which has distinguished the great art movements of the past.

But our present, our controversies, the subjects that most frequently appear in our discussions and programmes, the burning questions of the day and hour, what are they? What do they mean? What is their tendency? In what direction are the forces of this Association being bent? In the inverse order of our review of the past, are we intent first upon the advancement of art? upon the recognition of its essential unity and power upon national life? Are we bent upon manifesting in our student designs, in those small jobs upon which we cut our teeth, in those competitions which fill us so full of hope and dreams, that we intend to develop with sincere industry in detail, with the greatest patience and revision, all the powers of design for which our work gives us the opportunity? Are we determined to win for English architects the merit of loving

care and watchfulness over every delicacy or strength of effect that can be earned by the texture of our national materials, or by the cultivation of the very peculiar light and shade of our uncertain climate, or of reflecting in our business premises the uncompromising subjection of every feature to usefulness and suitability, and in our public edifices of the same qualities, with the added problems of monumental character and of centralised classification? Alas, no! the burning question, the will-o'-the-wisp of the hour, the present ideal of future attainment is professional qualification, tested by enigmatic examination, to be sealed by legislative enactment in registration, against all poaching by "auctioneers, land-agents, and surveyors" or other unauthorised and uncharted commission agents. The homom of this Association is now heaving with emotion and excitement, not to ascertain wherein lies the power of such great designers as Burgess, Street, Godwin, Thompson, or Cockerell, but as to how best to solve "apophyge," "hagioscope," "acroteria," or "amhon," and as to which is the safest method of guessing the number of columns in a temple, or either of spelling in writing or of pronouncing in *viva voce* the names of some "leading architects" of a selected period. Could pedantry be more aptly illustrated than by such questionings? or the docility of the youthful architectural mind by submission to them? And then the all-importance of constructive knowledge is to be demonstrated by playing a sort of "lucky bag" game with an architect's compendium of building materials, or by a specification, written without drawings, details, or locality, in an hour and a half. Here, therefore, is work enough for specially-trained teachers for new classes, for a whole race of newly-created pedants and pedagogues. Hence, our present excitement and labour over "curriculum," and our forgetfulness that "architects," to quote Mr. Sedding's admirable dictum,—not a new one, either,— "must be artists first." For we listen to, and take in, advice as to "education" and "qualification," as to "curriculum" and "diploma," from men who, whatever else their attainment, are not "artists first," and who could not, with any facility, produce good architecture.

At present we are off the track; in the absence of Scott, Street, Burgess, and Godwin we have gone astray. The great designers that remain who were their later contemporaries, and who share their powers and zeal, are unfortunately silent and prefer retirement. So that we are left to unartistic boards of examiners and the feebleness of their inexperience. Our eager young men take up the programme of the "examination in architecture" (sad misnomer), and in default of better leaders imagine that the position and dignity offered by the consolidated ranks of the examined is the best object of their early aim, and what classes are formed or fees propounded will be accepted with this end, and architecture will fade away from the brilliant position that the free efforts of the great artistic enthusiasts have obtained for her and become scrawp academic and intolerably dull. The profession may be advanced and the art will be forgotten.

But what for the future? What is the hope of the Architectural Association? Let it be a lofty one; let us not be afraid of having somewhat of a distinctive ambition and ideal of our own. We have inherited a good constitution that has proved itself to possess the elements requisite for enduring and for accommodating itself to the times. Our system of co-operative assistance in education can be maintained and enlarged in whatever direction or degree may be necessary for the real advancement of the architectural and artistic knowledge of our members. Classes for drawing from the antique, for architectural modelling in wax or plaster, for perspective drawing, for the systematic criticism of modern work, and the analysing of the design of ancient buildings, might perhaps be added to those already existing, and embrace a practical and artistic range of subjects quite outside the purview of examination boards. There will be no need for revolutionary measures, the ultimate object of which is to create a constituency for the Royal Institute of British Architects, and which must issue in the forsaking of the Association, so soon as the examination is passed and the Associateship of the Institute acquired.

The curriculum that has been propounded essentially reforms the whole work of the Association upon the basis of this examination programme of the Institute. It is proposed to

do this very thoroughly, at the expense of our old traditions, and, I fear, of our old success. I wish to ask, in conclusion, is the end to be attained worth the sacrifice? Will the recognition of the examination—as our goal and object advance the Association in numbers, friends, and usefulness? Will our old success remain to us as an independent body when we have sacrificed individuality to the generalisation of the academic programme? Does all this tend to the advancement of the art of architecture? Will the hitherto small share that the Association has had in stimulating the enthusiasm of students for the work of great architects, and the appreciative zeal and emulation of their pupils be increased by the reduction to a curriculum of artistic freedom and by the ignoring of all sources of architectural knowledge and skill that cannot be learnt from books, crammed for examination, or distilled into questions and conundrums?

This subject has naturally led one face to face with the Associateship examination of the Institute, and solely because it is proposed to impress and cast it upon the entire work of the Association in the future, have I been led to criticise it. I believe it to be in part a fair test of certain qualifications for the surveyor's part of the architect's many-sided character, but it is ill applied and ill suited to encourage appreciation of daily office work, or to improve the daily practice of a student. It removes him from the study of a great and noble art, from the contemplation of the vast and renowned beauties of the architecture of the world, to the consideration of papers of questions that reveal in every line the fact that the examiners have mistaken definition of terms, or extemporaneous delineation of features, for knowledge of principles and discernment of fitness and beauty. In conclusion, I would exhort students to seek instruction and emulation from the examples and work of the really great masters of the nineteenth century, from those who, by patient and long observation and study, have produced beautiful architecture, from those, in other words whose works entitle them to be the guides, teachers, and if need be, examiners of young architects, and not from men whose chief claim to our attention is their enthusiasm for mere professionalism and diplomatic examination; remembering what I think must be an incontrovertible fact, that if the great modern architects, whose premature departure has been so disastrous,—Street, Burgess, and Godwin,—were alive and with us, the R.I.B.A. compulsory examination would scarcely yet have come into existence.

#### Mr. Millard's Paper.

In reluctantly complying with the Committee's request that I would read a short paper on the subject of "The Present, the Past, and the Future of the Architectural Association," I must state that I am unable to offer you anything more than my own one-sided opinions on the question, just as I have held them for some time past,—only to get more and more confirmed in them, and without professing to have made a complete or exhaustive study of the whole subject. I regret this the more, seeing that, as it happens, it is nothing particularly pleasant,—or original either,—that I can find to say on this topic.

On the last occasion that I had the honour of reading a paper before the Association, some three years and a half ago, I concluded with this proposition, viz., that "Our whole profession, as a body, is responsible for the training of its pupils." To this, of course, you very possibly may decline altogether to assent, preferring to regard our profession as one holding a position before the public so different from those of law or medicine, for example, as to admit of no parallel being established between them and ourselves, regarding it, in short, as a profession that is *not* responsible, as a body, for the training of its pupils; but, if there be any here who do agree with me as to the substantial truth of my proposition, I may hope to have them, at any rate, with me in asking whether all, or nearly all, is done that might be done by the whole profession, as a body, towards fulfilling what we believe to be its responsibility for professional training in general.

An intelligent inquirer who desired to comprehend what manner of profession ours is, how recruited, and how practised, would, on extending his inquiries far enough, see scattered all through the Kingdom,—throughout the Empire, we may say,—a large and ever-increasing

number of men, more or less busily pursuing practice as architects, for the benefit of their employers, the general public partly, and to some extent, perhaps, also for their own pleasure,—and profit; and further, he would observe some of these gathering by degrees in several of the larger centres of population into knots and groups known as professional societies, various in size, and, though with certain common aims mainly independent of one another to begin with, as were their individual members.

Among these societies he would note more particularly two, in the metropolis, presenting, at first sight some semblance of joint action, both being housed under the same roof, and, by the courtesy of one of them, both holding meetings in the very same room. One, he would learn, had been founded as "an Institution for the general advancement of Civil Architecture and for promoting and facilitating the acquirement of the knowledge of the various arts and sciences connected therewith"; whilst the other had for its "objects": 1. "To afford facilities for the study of Civil Architecture"; 2. "To advance the profession"; 3. To serve as a medium of friendly communication between the members and others interested in the progress of the art." Whatever the difference between these two manifestoes may appear to amount to, our enquirer, in watching how they "come out in execution,"—to use a professional term,—would find one Society ardently professing to be a teaching body, the other, for its own part, proclaiming that *it* is not so.

Naturally, then, our inquiring friend, who would probably wish to begin his investigations into this interesting profession of ours some where towards the beginning, might be expected to first turn his attention to a society, where professional education is, by common repute, carried on; and a society, too, on whose model the majority of the professional societies,—aiming at being teaching bodies,—appear to be formed, to a great extent. From observing its present condition he might find himself gradually led into studying its past, and perhaps even speculating on its future. I could imagine that, whilst thus engaged, he might more than once stop and ask, "But in this society, then, commissioned in any special way by your profession at large to dispense architectural knowledge? and is this teaching which it is imparting by its various methods supposed to represent the most generally approved means of preparing students for practice? Is this the course of training that architects go through? and, if not, where of any such thing to be found?"

Then, to be sure, it would have to be gently broken to him that there are thought to be many ways than one of gaining instruction in our profession—several more—and that there is such thing as any sort of monopoly in the business of supplying it. "The other society of the premises," he would be told—"the Royal Institute of British Architects—has got itself clothed with authority to examine as to whether or not the knowledge has been acquired, but apparently without caring much to know how or whence it has been obtained." The illustration of the various ways by which one may gain instruction in our profession, numberless sources of special knowledge in the shape of lectures and schools, libraries as classes—besides office experience—would be indicated, nearly all of some use, at some particular point in a student's career, and invaluable to him, but all without organisational arrangement or connexion, each going independently in true British fashion. This perhaps at length would the actual state of the case dawn upon our intelligent friend, and he would find himself contemplating—yes, a marvellous—at a great profession, whose members, when interrogated, are unable to point to any systematic or definite course of special training generally recognised by the whole body as an established means where intending members can secure even so much as what may be termed the irreducible minimum of absolutely indispensable knowledge entering on practice.

One almost fanciful one can hear our friend concluding his inquiries about us with a remark to himself, quite low, "Verily they must be a profession of born artists!"

To return to our Association itself; will we have really to show to intelligent inquirers? Well, looking at our recently-issued Brochure, which has come out at last, and bigger than ever, bristling with particulars and replete

of something like a dozen different classes, about half as many courses of lectures, and of open prizes, and with a roll of over 1,100 members, we seem to make quite a brave show—on paper. But, let me ask, have not many of us, who are only too painfully aware of such things as shortcomings in our system, often enough limited sadly,—if not blushed,—at hearing the good-natured words of praise for past efforts and of encouragement for the future, every now and then pronounced like a benediction over us by generous but indiscriminating well-wishers, sometimes even by those who might have been supposed to be too familiar with the facts?

Besides those who from afar "beam" on us through rose-coloured glasses without having themselves had any actual experience in the inner working of the Association, there are others, not a few, who, having in the exuberance of their youth given their invaluable assistance in earlier days,—the "fathers" of the Association,—continue still to indulge in the amiable fondness so natural to parents and grandparents, and, as usual, are just a wee-bit prone to overlook the indisputable fact that "the child" has grown up.

Nevertheless, for such a task as fairly grappling with the problem of education for a great profession, the Architectural Association is now notoriously and ludicrously inadequate. And what wonder that it is so? From the beginning the thing has been on a false bottom, on which it has not even yet succeeded in floating entirely.

Undenied and not genuinely self-supporting it has for years and years depended for its main working power on voluntary labour, as a matter of fact, on the surplus energy of a comparatively small minority of its members given occasionally out of their spare overtime, whilst on the part of the recipients of the benefits derived, the—anything but lavish—expenditure is one hundred and twenty-six pence per annum, with an odd shilling or two extra for class fees, as long been supposed to count as a fair contribution to meet working expenses.

Did anyone ever hear of other professions—lawyers, for instance, or the doctors, or the artists, doing this sort of thing, and trusting to turn out qualified practitioners or even assistants, on such terms? It may appear, on the face of it, an economical way of going to work; but surely architects, of all people, have pretty good reason to know something of a certain un-common-sense complaint to the mere cheapness and superficial economy. Somehow, our luckless profession seems to be distinguished by a peculiar and hopeless propensity for performing services gratuitously,—or for next to nothing. See, just for the sake of argument, how we weekly suffer ourselves to be fleeced by the public in the matter of competitions alone! Charity may come either as a blessing or a blight, according to circumstances, and, for this broken reed—voluntary aid—I would prefer to say the Association has been chiefly done what it has accomplished for itself, in spite of, rather than by means of, such meant aid. Worse than being merely inefficient for existing needs, it has been misadvised, in so far as it has had the result of leading others to believe and say, and us to say ourselves—even if not fully to believe—that "all's well," or, at any rate, "pretty well." How the Architectural Association body came into existence, got on its legs, and has managed to stagger along so far, is a matter of history, periodically, for years past, as we know, and ably from the first, it has kept on showing symptoms of suffering from inherent chronic debility—as might be expected from a weak constitution. Witness, the extra-special committees of investigation into things in general, which seem to be appointed, on an average, every other year.

Not I am sorry to say, using another simile, I can make it out to be, at best, is a rickety concern on a rotten foundation, liable to continuation as "a dangerous structure." It is "shoring up and underpinning" at least; "rubbing down, stopping, and painting;" few coats won't meet the case. Still, just as, proverbially, a creaking door hinges long on its hinges, so it is perhaps conceivable that the old Architectural Association nature, which has creaked for so many years, might manage to creak on, as hitherto, for their decade or so; if no serious effort be made to save it from itself. To continue harping on that one string, the old-fashioned argument, that the Association was not intended or established to do any such things as some

of us think it might accomplish,—with advantage in every way to all,—is as much as to say that we, the successors to an inheritance, are less free to act in the management of it than they who created it were in their day. Besides, have we not already decided it is high time to take proper steps for superseding our desultory, amateurish methods of instruction by something more like real "business?" The day has gone by for half-trained architects, brought up, more or less, on a semi-gratuitous system, or otherwise.

In the past, then, as I read it, we have seen the Association spring up into its place, like a forlorn hope, owing to the sheer necessities of the situation—the parent profession having steadily neglected, through its responsible executive the Institute, its bounden duty of looking after and directing the training of its recruits, as though it expected to enlist them ready-drilled; we have watched these latter struggling bravely with their desperate task, so gallantly, and in some respects so successfully for the time being, as to deceive others and even themselves, year after year, into supposing they were really equal to it; thus enabling the great slothful parent to continue soothing its conscience in regard to its own responsibility. Still, thank goodness! it is not always utterly in vain that even a forlorn hope is led. The Association has stood in the breach and, in the true spirit of self-sacrifice, done deeds that will for ever count to its honour and glory, and to the shame of those through whose blundering neglect it was driven to do them.

And now we, in the present, seeing what has been accomplished, and what still remains to be done, can't help exclaiming, "*C'est magnifique, mais ce n'est pas l'éducation*;" it is not systematic training worthy of a great and learned profession at this time of day. It won't suffice, as it is, for the future.

The civil engineers and the surveyors seem to have been wiser in their generation than we architects, in not leaving their students to "set up" for themselves in the business of conducting education; for both the influential Institutions in Great George-street keep their students under their own eye. What deplorable, if not culpable, short-sightedness it must have been on the part of the seniors of our profession, when hysing themselves about the founding of their Institute, to go and practically shut out the juniors to such an extent as to apparently leave them no alternative but to start an Association for their own protection and benefit. What a huge initial blunder! looked at even as regards the true interests of the Institute alone. Think what a very much stronger position this would have been in for years past, if it had owned its students from the first!

And now, for any one to pronounce authoritatively,—with whatever approach to accuracy, in face of the Charter from which I have quoted,—that the Institute is not a teaching body, never has been and never was intended to be, may be to make a statement of fact, but, even in that case; not necessarily a fact to hold up one's head about, or to tamely rest content with,—hardly a thing, one would suppose, to sit twiddling your thumbs over. The statement itself, by the way, seems to be worth just about as much as it would have been worth saying, some years ago, that the Institute was not an examining body and was not intended to be so. Instead of education, the juniors were given examination alone,—a part, in place of the whole, and, moreover, not the most important part first!

Is the Institute, I wonder, ambitiously bent on following the example of the University of London in holding aloof as long as it dares from taking a part in conducting education, on the plea that it is quite sufficient to examine, and that nothing more was ever intended to be done? What do we see now in the case of this latter Institution? Why, the probable assumption by it in the immediate future, if I mistake not, of responsibility for teaching in addition to examining and degree-giving; thanks to the gentle aid of a Royal Commission and the threat of a rival teaching university arising to undertake the work of education, if it be shirked any longer by the existing authority.

The fact is, the Institute, as the chartered representative before the public of the profession, cannot,—at its peril,—and will not evade any clearly-defined duty to the profession now-adays, whatever it may have done in the past. Only let the profession make up its mind and speak out unmistakably.

At this moment, I submit, the Institute, by sheer good fortune, has an exceptional opportunity to not only make some atonement for past weakness, but to secure to itself a sure source of strength for the future, if only it will boldly seize it, and, even at this eleventh hour, offer honourable terms to the Association. A good working alliance between the Institute and the Association presents to my mind the only rational solution of the whole question of our professional education. Nor is there any insurmountable obstacle to such a thing; requiring removal first of all.

By-law XVI. of the Institute says:—"Branches of the Royal Institute may be established according to regulations to be made from time to time by the Council," and, according to clause 17 of the charter, "The Council may, subject to such limitations or restrictions as by-laws may from time to time prescribe, apply the funds of the Royal Institute in furthering professional education." The Association would be doing itself nothing but honour in becoming the educational branch of the Royal Institute of British Architects, enabling them to exercise their permissive powers, whilst retaining, by proper mutual arrangement, its own system and methods of self-government for its own particular affairs; and moreover, at the same time securing for its special work the material and moral support of the corporate body of architects, and through them of the whole profession they represent. The prestige and real strength thereby accruing to the Association would far more than outweigh any imaginable loss of influence or dignity based on feeble and empty independence.

To obtain the sanction of the Institute to the appointment of instructors and lecturers would be to invest these with an importance and to give them a position in the eyes of the world which can never be conferred by the Association of itself. Consequently, a far wider field would be opened from which to draw instructors. Then may we hope to see some approach to an ideal course of training for an architect,—commenced in schools and workshops,—as of old, and crowned by what I would call advanced pupillage in offices. And in connexion with this, I am not ashamed to again put forward a pet project of mine which I have already advanced. It is that of Pupil Scholarships, similar to what exist for the Bar, at the Inner and Middle Temple, whereby successful candidates are enabled to spend a definite period in the chambers of any leader they themselves may decide on reading with,—the necessary premium being paid out of the Scholarship fund.

Of course, some few prejudices would have to be sunk or swallowed on both sides, but that both sides should cheerfully give and take a little, is of the very essence of a good bargain. It would probably conduce not a little to such a result in this case, if only we each did our best to look at the matter as making for (1) the common good of our entire profession as a whole; (2) the general benefit of our own particular society; and (3) the personal advantage to each of us individually, instead of regarding it in the reverse order.

Not that I think anybody even in this case would have any real ground for objection.

But it is so natural and easy, for the best of us, to make a handle of some particular point, in a comprehensive scheme, that may seem to be the least bit unfavourable to us, and to make that a ground for opposing the whole measure. It is so easy to take it for granted that the interests of all must be identical with what one fancies, for the moment, to be one's own.

A fusion of the two bodies would mean power to them for real good, just as their disunion must imply comparative weakness and inefficiency, because involving needless waste of power, which might be economised and directed to more advantage, with more intelligent distribution and application. And not to our two societies alone would 'the beneficial effect of their joint action be advantageous, but, what is of vastly wider importance, it would be felt in the end as a re-vivifying influence throughout our whole profession. Surely, then, it is for the whole profession to see to it.

Being a member, as I am, of both societies, and not connected in any official capacity,—to speak of,—with either, I have felt no hesitation whatever in saying all I mean concerning both; and I now appeal to the members of both, as individuals, to both societies as organised bodies, and to our great profession at large,—

as a whole, to act up to and discharge the responsibility for the training of its pupils which, I maintain, rests on it as a profession.

This alliance would afford a means,—and, I believe, the best means,—for doing so. Many, perhaps, will be found at first to declare it is inadvisable,—some even that it is impossible. I have ventured to support and urge it in full confidence because I firmly believe it to be not only advisable and feasible, but, even more than that,—ultimately inevitable!\*

#### ARCHITECTURAL SOCIETIES.

**LIVERPOOL ARCHITECTURAL SOCIETY.**—The second ordinary meeting of the present session of this Society was held on Monday evening in the Royal Institution, Colquitt-street. Mr. T. Mellard Reade, President, occupied the chair. Mr. J. H. Woodhouse, of Manchester, read an exhaustive paper, the subject of which was, "A few Recent Notes in Holland and Belgium." Aided by a number of sketches, he described the architectural and other features of the principal towns in the countries named, and received at the close a cordial vote of thanks.

**MANCHESTER SOCIETY OF ARCHITECTS.**—At the annual meeting of the Manchester Society of Architects, held on the 30th ult., Mr. R. Knill Freeman, F.R.I.B.A., was re-elected President. In the students' competition, the first prize of seven guineas was awarded to Mr. Roger Oldham, and the second of five guineas to Mr. Harold Brakspeare.

#### THE LONDON COUNTY COUNCIL.

The ordinary weekly meeting of this Council was held on Tuesday last, Sir John Lubbock in the chair.

**The Bethnal-green Slum Scheme.**—Nearly the whole period of the sitting of the Council was occupied by the adjourned discussion of the report of the Housing of the Working Classes Committee recommending the removal of a large slum in Bethnal-green (see text of the report in our last issue (p. 347).

After nearly four hours' debate, Mr. Watney's amendment, the terms of which we gave last week (p. 348), was rejected by 41 votes,—72 votes against, to 31 votes for.

Mr. Beachcroft then moved as a further amendment:—

"(a) That the Council, whilst satisfied that the area comprised in the official representation from Bethnal-green is an unhealthy one, considers, having regard to the provisions of the Housing of the Working Classes Act, 1890, and to the requirements of other districts in London, that it should be dealt with partly by an improvement scheme under Part I. of the Act, partly by a scheme or schemes under Part II. of the Act, and, as to the remainder of the area, under the provisions of the Act relating to unhealthy dwelling-houses and obstructive buildings; that accordingly the portion of the area to be dealt with under Part I. be the part lying to the east of and including the area of the road marked on the plan before the Council as intended street running north and south from Virginia-road to Church-street, and including sufficient land to the west thereof for the purpose of building frontage, but excluding that part of the area which lies on the east side of Mount-street (the estimated net cost of such an improvement scheme, including roads and sewers, being 138,000*l.*) and that the requisite resolution under Section 4 of the Act be passed accordingly.

(b) That the draft scheme submitted by the Committee, modified in accordance with the foregoing resolution, be approved, and that it be referred to the Committee to take all necessary steps for depositing and obtaining confirmation thereof, and further, that it be an instruction to the Committee to represent to the local authority that the part of the area on the east side of Mount-street, and the part lying centrally between Fourmier-street and Half-Nicol-street, should be dealt with by that authority by an improvement scheme or schemes under part 2 of the Act, and the provisions of the Act in regard to unhealthy houses and obstructive buildings, and that failing prompt action by the local authority, the Committee be authorised to take such initial steps as they may see fit to give effect to this resolution, reporting thereon to the Council."

This amendment was seconded by Mr. Costelloe, and after a short discussion, it was

\* We are obliged to hold over the papers read by Mr. Needham Wilson and Mr. Owen Fleming, together with some notes of the discussion which followed, until next week.

rejected by a majority of 24 votes,—58 votes against to 34 votes for.

The recommendations contained in the Committee's report were then formally agreed to, with the following additions, moved by Mr. Marsland, and accepted by Lord Compton as Chairman of the Committee, viz.,

"And that it be an instruction to the Committee to report to the Council, before proceeding to carry out the scheme when it is confirmed, as to what steps will be taken to limit as far as possible the amount of compensation to owners of insanitary houses, and also as to their proposals for a gradual clearance of the area and for the rehousing of those displaced by the scheme."

The Council then adjourned.

#### Correspondence.

To the Editor of THE BUILDER.

#### BERMONDSEY FREE LIBRARY COMPETITION.

SIR,—It will be in the recollection of your readers who were interested in this competition how the Library Commissioners violated, without apology or explanation, their own specific conditions which they laid down for the conduct of this competition. Yet another instance has to be recorded. I have received a list of tenders sent in on the accepted design. The highest, 8,840*l.*, the lowest,—Messrs. H. & I. F. Higgs,—7,650*l.*, as amended and accepted, 6,170*l.* The conditions gave an outlay of "5,000*l.*, or thereabouts." COLE A. ADAMS.  
Westminster, Nov. 4.

#### TENDERS FOR WORKS AT THE WOOLWICH UNION.

SIR,—I beg to call your attention to the terms offered to builders wishing to complete for the proposed additions to the above Union House, as set forth in the advertisement in the *Builder* of Saturday last, viz., that every builder competing shall deposit with the architect of the board a 50*l.* bank-note until the completion of the contract. From an intimate acquaintance with building contracts of late years, I know that through keen competition and want of proper organisation, many builders now sign, perhaps, the most inequitable contracts offered in any trade, but I should hope they will not be tempted to deposit for several months a large sum of money without interest with a parochial board.

MATTHEW H. HADLAND.  
30, New Bridge-street, E.C., November 4.

#### DEATH IN THE VENTILATOR.

SIR,—Notwithstanding all that has been published in the professional and trades journals about the danger to the occupants of houses when no provision is made for the prevention of the siphonage of the water-traps of the closets, we find within the last few weeks a firm of gas engineers actually advertising and recommending the use of an appliance for soil-pipes, which if used would have the effect of causing siphonage of the water-traps of the closets, and so allowing the houses to get polluted with foul air from the soil-pipes!

I refer to a ventilator or cowl with a balanced valve upon the top of the pipe inside of the cowl, which valve shuts against any attempt at down-draught. Now as the ventilating pipe of a soil-pipe is put up for the purpose of letting air in (for the prevention of siphonage) as well as for letting it out, it follows that one of the principal uses of the soil-pipe ventilator is counteracted by the insertion of this anti-down-draught valve upon the top of the soil-pipe.

The use of this valve is being pushed up as a grand new A.D. 1890 idea, but it so happens that it was invented by me about twelve years ago, and it was referred to by the late Mr. Wm. Bassett, C.E., the well-known sanitary engineer, in his "Dictionary of Sanitary Appliances," as mine. It was not intended to be used for ventilating soil-pipes, however, so for the safety of the public and the credit of the plumbing trade I respectfully ask you to publish this caution, so that neither plumbers nor any other persons may put a ventilator with a self-closing anti-down-draught valve upon the top of any soil-pipe; and, further, if any person has already, owing to ignorance of its bad effect, or, unthinkingly, put up one, it should be immediately taken down and the valve removed.—I am, &c.,

W. P. BUCHAN.

Glasgow, November 3, 1890.

THE "STUDENT'S COLUMN."—In consequence of unusual pressure on our space, we are compelled to postpone this week's chapter of the Student's Column to our next issue.

#### GENERAL BUILDING NEWS.

**THE NEW SCOTLAND-YARD.**—The new headquarters for the Metropolitan Police are now practically completed, and have been opened this week. We are obliged to hold over our description of the building until next week.

**THORNE, NEAR DONCASTER.**—Messrs. William Lewis & Son, architects of York, have prepared plans for a new farm-house on the Levels estate. The work has been let to Messrs. Smith Bros., contractors, Thorne. For the Heslington estate, Yorkshire, the same architects have prepared plans for covered folds, with alterations and repairs, to about forty farmsteads on this estate. The contracts have been let to different contractors.

**CHURCH EXTENSION AT WESTON-SUPER-MARE.**—The new south aisle of the parish church of St. John, Weston-super-Mare, was opened by the Bishop of Bath and Wells on the 29th ult. The new aisle has three windows, with Perpendicular tracery and transoms. The buttresses have pinnacles enriched with crocket terminals and traceried panels, and the gallery ceiling is of panelled wood-work. The arading is executed in stone-work, with panels and angle columns. A new two-light window has been introduced in the south side of the church, and the two old windows from the south aisle have been utilised in the west and east ends of the galleries, with additional windows on each side of the tower. The whole of the new windows are filled with cathedral-tinted glass, enriched with holders of antique stained glass. This portion of the work was entrusted to Messrs. Bell & Sons, College-green, Bristol. The ventilation and heating of the edifice generally have been improved and extended. The total church accommodation is now 1,212 persons. The contractors for the general work were Messrs. Hawkins & Son, of Glastonbury, and the plans were prepared by Messrs. Price & Wooler, of Weston-super-Mare. The total cost of the enlargement is 1,600*l.*

**NEW SCHOOLS, SHEFFIELD.**—The foundation-stone of new schools and mission hall about to be erected in connection with the church of St. Bartholomew, Sheffield, was laid on the 25th ult. The building is to contain large kitchen, store-room, coal-pace and heating-vault. On the ground-floor there will be an entrance lobby, an inner cloak-room, &c., and the boys' school, 64 ft. 6 in. long by 22 ft. 6 in. wide. In this room iron roller shutters will be placed, so as to cut off, when required, a separate outer door, 64 in. long by 18 ft. wide, having a separate outer door. The upper floor will be a repetition of the room below. The total cost will be 1,500*l.* The architect is Mr. J. B. Mitchell-Withers, F.R.I.B.A., of Sheffield. The contractors are Mr. James White (mason), Mr. W. Gee (joiner) and Mr. Mills (plumber).

**NEW WESLEYAN CHAPEL FOR WALTON.**—On the 29th ult. a new Wesleyan Chapel, which has been erected in Brook-road, Walton, was formally opened by Mr. Isaac A. Mack. The new edifice is in the Liverpool (Boots) circuit. Its total cost is about 3,700*l.* Accommodation is provided for 60 worshippers. The plan of the chapel includes nave and transepts. The architects are Messrs. Briggs & Wolstenholme, Liverpool and Blackburn; and the builder Mr. M'Dermott, of Liverpool and Boots.

**NEW PUBLIC BUILDINGS FOR SOUTH STOCKTON.**—On Saturday afternoon, the 25th ult., Mr. Job Steel (chairman of the South Stockton Local Board) laid the foundation-stone of new public buildings for that town. The site is close to the railway station. Mr. J. M. Garry, of West Hartlepool, is the architect of the building, and Mr. W. C. Addison, of Stockton, the builder.

**RERIDOS, ST. GEORGE, EASTON-IN-GORDAN NEAR BRISTOL.**—The fine church of St. George, Easton-in-Gordano, has just received, at the hands of Mr. Henry Mirehouse, a recond, madoof polished-alabaster and English marble. The work rests upon a massive rotunda of Appleson (Devon) variegated marble, and consists of a triple arch recessed panels, with cusped and crocketed gable all in alabaster. The heads of the arches are supported by carved capitals, resting upon serpentine (Cornish) columns. The figures are carved in high relief, and are in outline the more vividly shown by backgrounds of gold tesserae. The central group represents the birth of our Lord; those on either side contain groups of Attic angels. The work has been executed by Mr. Hat Hems, of Exeter.

**A NEW CHURCH FOR LANGLEY.**—The new church of St. Michael and All Angels, at Langley, in Birmingham, was consecrated by the Bishop of Worcester on the 30th ult. The church is planned to accommodate 617 worshippers. The nave is 75 ft. long by 24 ft. wide. On the north side are the choir and clergy vestries, also organ chamber. In the designing of the church simple treatment in brick and stone of the decorated Gothic style of architecture has been adopted. The western gable has a four-light traceried window, with stone shafts and arches also a three-light piercing above. The east end has triple windows, with stone joints, shafts, and arches. The north and south elevations are pierced with three-light windows. Internally the piers are of

with moulded red brick arches and plastered walls. The channel has a barrelled wooden roof. The floors under the seats are laid with wooden blocks upon concrete, and the aisles with tiles. The chancel-window is composed of three lights, the work having been executed by Mr. Samuel Evans, of Westmethwick, and is the gift of Mr. A. M. Chance. The other figures in the group include Mary, the mother of Jesus, St. John, and Mary Magdalene. The whole is worked upon a background of grisaille ornament. The bricks for walling have mostly been supplied by the Cuckoo Brick Company. The ornamental facing and moulded bricks are from the works of Messrs. King & Co., at Stourbridge. The exterior tonework is best Hollington, and the interior dressings are in Bath stone. The heating-services by Mr. J. Grundy, of London. Mr. Cox has been clerk of the works, and the whole of the work has been carried out by Mr. T. Rowbottom, of Birmingham. The joint architects are Messrs. Osborne and Reading, of Birmingham, and Messrs. Wood and Kendrick, of West Bromwich. The contract or the erection of the church was for 4,700.

**NEW CHAPEL AT SMALL HEATH.**—The memorial tones of a Baptist chapel at Small Heath, near Birmingham, were recently laid. The site of the buildings is situated at the corner of Coventry-road and Jenkins-street, and will be occupied by an institute with committee-rooms and cloak-rooms for the ground floor; a chapel, 74 ft. long and 50 ft. wide, and capable of holding 700 people; lobbies, vestries, and organ chamber. The frontage to Jenkins-street is occupied by a lecture-room holding 400 persons; while a caretaker's house stands at the extreme end of the site. The chapel is planned in shape, with accommodation for the choir in an octagonal apse, and organ chamber and vestries at the rear. The building, which will cost 3,000*l.*, is in the Gothic style of architecture, with terra-cotta facings, and is being carried out by Mr. F. Johnson, contractor, of Neshells, to the designs and under the superintendence of Messrs. Ingall & Son, architects, Birmingham.

**SANITARY AND ENGINEERING NEWS.**

**THE WATER SUPPLY OF DENBY.**—Colonel C. H. Luard, R.E., an inspector of the Local Government Board, recently resumed his inquiry, begun on August 20, at Denby National School, into an application by the Denby Local Board for sanction to borrow 6,000*l.* for the purpose of constructing a reservoir of the capacity of 100,000 gallons, and other works, for the better supply of the district with water. Mr. G. H. Crowder, C.E., Huddersfield, gave evidence on behalf of the Board. Six bottles of water were produced as specimens of the water proposed to be taken, and by reason of its dirty colour caused a great deal of amusement. Against this, however, there were two analyses showing the water to be very good. Mr. Maudslayi, Clerk to the Dewsbury and Heckmondwike Water Board, said that that Board had power to supply the district if the Denby Board would take water from them. The inquiry was then closed.

**DUNDEE WATER SUPPLY.**—On the 30th ult. the Works Committee of the Water Commission of Dundee approved of the plans and sections submitted with reference to the proposed extension and improvement of the water supply of the city, and recommended the Board to promote a Bill in the ensuing session of Parliament for power to carry out the projected works. The Commissioners propose to relay the old main in the Valley of Strathmore with stronger pipes; to double the main between Pittaville and Dundee, giving a second pipe the whole way to Lintrathen; to increase the storage capacity at Lintrathen by raising the banks, &c.; to reduce the compensation supply; and to extend the compulsory supply area so as to include Tayport, Downfield, Monifeith, and other districts. The estimated cost of the work is about 70,000*l.*

**STAINED GLASS AND DECORATION.**

**MANCHESTER CATHEDRAL.**—At the Cathedral, Manchester, on the 27th ult., a new stained-glass window, at the west end of the north clerestory, was presented to the authorities by Mr. R. L. Monk. The window, which has been prepared by Messrs. Clayton & Bell, represents "Aaron offering the Sacrifice on the day of Atonement."  
**NEW WINDOW, ST. JOHN'S CHURCH, RAMMOOR.**—A new memorial window, presented by Sir Frederick T. Mappin, Bart., has just been placed in position at the head of the chancel of St. John's Church, Rammoor. The subject represents the Crucifixion. The window contains three openings. The central panel contains a figure of the Saviour on the Cross surrounded by kneeling angels, who bear emblems of the Passion. In the left-hand panel are the Holy Women and the Virgin. In the right panel is St. John the Evangelist, the patron saint of the church, while behind him stands the faithful centurion and soldier. Below the three principal lights the artist has dealt with a supplementary

subject, representing the recumbent figure of the dead Christ in the arms of the Virgin Mother. The work has been executed by Mr. W. F. Dixon, of London.

**FOREIGN AND COLONIAL.**

**DRESDEN.**—The travelling studentship of the Saxon Royal Academy (1891 for two years) which fell to the Architectural division this year has been gained by a pupil of Professor Lipsius, Herr Theobald Hoffmann. According to the *Deutsche Bauzeitung*, the prizeman is the same who won last year's Academy medal and this spring obtained the Semper studentship.—A new town hospital is to be built here; 708,000 marks, or nearly 35,400*l.*, have already been granted by the authorities for this purpose.

**SWITZERLAND.**—The Bundesrath has passed a decree ordering the formation of a National Museum, the collections of which are to be housed in a monumental building having not less than 3,000 square metres superficial area of exhibition rooms; the site and money for the erection of which will be found by the canton in which it is to be situated.—The Government has granted 910,000 francs and 300,000 francs respectively, for the erection of new general telegraph offices at Bern and Thun.—Zurich is to have electric lighting; the Municipal Authorities have granted a credit of 2,317,000 francs for this purpose.

**ROMANIA.**—The foundation-stone of the long-planned Danube bridge at Cernaovoda was laid last month, in presence of the King. This bridge, or, rather, long system of alternate bridges and viaducts (the designs for which were open to competition, 1882), will be carried out under the superintendence of the chief engineer of Roumanian railways, Mons. A. Salgny, at a cost very close on 1,000,000*l.*

**COLOGNE.**—At the great fire in the machinery hall of the Military Exhibition occurred an interesting example of the fire-resisting faculties of a plaster wall on wire grouting, constructed according to the "Rabitz" system (German patent, No. 4,590), the fire (of intense heat) being kept from spreading into the adjoining division by such a wall, of some 200 square metres surface and only 5 cm. thickness, so completely, that drapery hanging on the further side was not even singed (*Deutsche Bauzeitung*). The Rabitz work has of late been much used in Germany for buildings required to be heat and fire proof. In the new Halle Theatre, the minor partitions, the floors and ceilings of the tiers, &c., are of this composition.

**MISCELLANEOUS.**

**BIRMINGHAM LAW COURTS.**—In referring to this building last week, we wrote by a slip of the pen "Yorkshire stone" for "Portland stone" as the flooring of the great hall. It is Portland in 3 in. slabs.

**THE LONGFORD PICTURES.**—The *Portfolio* publishes a reproduction of the Holbein recently added to the National, the identity of the portraits in which has been so much discussed recently.

**WORKMEN'S DWELLINGS: THE GUINNESS TRUST.**—It is stated in the *Daily Chronicle* that the trustees of this fund have already begun operations upon three of the four sites which it is expected will be included within their scheme to provide for a total of 3,900 families, or, say, 5,000 persons. Lord Cadogan has conveyed, upon generous terms, a plot in the Marlborough-road, Chelsea, whereon eight separate blocks will be erected, after the designs of Mr. Macartney, architect. Mr. Pilkington is the architect for a group of dwellings in the Bethnal-green district, where has been acquired the site of some condemned and already vacated buildings at the junction of Hackney-road and Columbia-road, being a triangular-shaped piece of ground about 3,750 yards superficial, and capacious enough to admit of an inner courtyard, to be planted with trees and shrubs. Mr. N. S. Joseph, architect of the industrial dwellings in Brady-street, Whiteapel, has finished designs for the Artisans' Dwellings schemes under Cross's Acts have cost a total sum of 1,849,103*l.*, of which amount 1,517,856*l.* was paid "for compensation," 27,066 persons being re-housed for 25,217 displaced.

**THE CITY AND SOUTH LONDON ELECTRIC RAILWAY.** extending from King William-street to Stockwell, was opened on Tuesday by the Prince of Wales. We will say something about it next week.

**LIGHTNING-CONDUCTORS.**—For the convenience of London clients, Mr. Joseph Blackburn, of Notting-ham, has opened an office at 2, Norfolk street, Strand.

**WATER SUPPLY OF ST. PETERSBURG.**—According to a recent report by the British Consul at St. Petersburg, the Russian Waterworks Company long resisted all demands for filtering the water of the Nova before delivery for consumption, a necessary measure owing to the growing impurity of the water, through its pollution at and above the portion of the river from which it was supplied. After much delay the company was obliged to construct filters, through which the water passes before entering the system of pipes. The filtering-beds are on a very large scale, the main one covering 14,000 and the smaller one 6,500 square yards. Together they are capable of supplying 32,484,000 gallons a day. The filter-beds, three feet thick, consist of layers of fine sand, gravel, rubble, and cobble stones, the two latter materials being placed at the bottom. Three feet of earth, covering the top of the filtering wall, secures the water against frost in winter and heat in summer. The water first enters several 4-in. feed pipes extending into the river, thence it flows naturally into a reservoir, 46 ft. 3 in. long, 5 ft. wide, and 18 ft. deep, situate in the main pumping station close to the river bank. From this the water is pumped into an iron tank, 165 ft. long, 14 ft. wide, and 4 ft. deep, from which it runs out through 110 apertures protected with very fine brass sieves placed in an inclined position over the apertures. Passing through these sieves, the water, now considerably free from earthy and other extraneous matter, enters into a basin arranged on both sides of the large reservoir. From this the water is conducted into the above-named filters, situate underground and divided into several compartments, having the appearance of vaulted chambers. The cost of construction of the filtering tanks amounted to 191,379*l.*

**TREE-PLANTING.**—At a meeting of the Vestry of St. Marylebone on the 30th ult., a further communication was received from the Metropolitan Public Gardens Association as to their offer to contribute conditionally the sum of 100*l.* towards the expense of planting trees in the thoroughfares of the parish.—Mr. Harris, as Chairman of the Works Committee, recommended that the offer be again declined. The trees would cost between 4*l.* and 5*l.* each, and how many would they get for 100*l.*? He quite agreed that Portland-wood would make a splendid boardwalk if planted with trees, but thought they should do the work themselves. Mr. Lewis contended that the ratemakers should be consulted on the question, and Mr. Emery said that planting trees meant shutting out air, light, and sunshine. After some further discussion the debate was adjourned.

**UNDERGROUND PIPES AND WIRES.**—At a meeting of the Strand Board of Works on the 30th ult. Mr. Emlyn's proposal respecting the subway being made for the storing of the pipes and wires of the gas, water, and electric light companies was discussed, and the matter was referred to the Works and Parliamentary Committee with a view to united action being taken. A memorial will be promoted by all the districts in London to induce the County Council to bring a Bill into Parliament dealing with the subject.

**ARCHITECTURAL PARTNERSHIP.**—Mr. William Dawes, architect of London and Manchester, has taken Mr. Francis Frazer Hoyland into partnership, and the style of the firm will in future be "Dawes & Hoyland."

**LIVERPOOL ENGINEERING SOCIETY.**—The first ordinary meeting of the session of the Liverpool Engineering Society was held on the 29th ult. in the Royal Institution. Mr. Ferdinand Huddleston, the new President, delivered the inaugural address, and dealt with the growth of the Liverpool dock estate, viewed from an engineer's point of view, which, he said, was the most complete dock estate in the world. In his concluding remarks, the president said the two highwaters of the Mersey were the Pluckington Bank and the Bar. The Pluckington Bank would continue to be a nuisance until Traamere Ferry and Dingle Bank had walls built across them to strengthen the flow of the ebb tide. The size and shape of the bank, however, must always depend very much upon the condition of the low water channel in the upper estuary. He did not think that the Ship Canal works would affect the wanderings of the channel, and thought that the works which were being done in connexion with the bar were satisfactory. In his opinion, training walls might perhaps ruin Liverpool as a port, and kill the trade of Lancashire.

**GLAZING.**—We understand that Messrs. Shelley & Co., of 55, Lionel-street, Birmingham, have obtained a three years' contract from H.M. War Office for supplying and fixing their patent "Unique" glazing in the Royal Arsenal and Dockyard, Woolwich; Royal Gunpowder Factory and Buildings, Quinton-hill, Walkham Abbey; Royal Small Arms Factory, Enfield Lock; and other Government establishments in England.

**KING'S COLLEGE.**—The annual prize of 5*l.* given by the Clothworkers' Company for proficiency in mechanical engineering has been awarded this year to Loveridge Frank Potter, son of Mr. W. F. Potter, architect.

CONTRACTS AND PUBLIC APPOINTMENT.

CONTRACTS.

Table with columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, and Tenders to be delivered.

CONTRACTS.—Continued.

Table with columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, and Tenders to be delivered.

PUBLIC APPOINTMENT.

Table with columns: Nature of Appointment, By whom Advertised, Salary, and Application to be in.

Those marked with an Asterisk (\*) are advertised in this Number. Contracts, pp. iv, and vi. Public Appointments, p. xviii.

THE PLUMBERS' COMPANY.—A number of applicants for registration by the Worshipful Company of Plumbers, under the rules of the National Training and Registration of Plumbers, were examined at the Guild's Institute on Saturday.

PUBLIC IMPROVEMENTS AT DARLSTON.—On the 30th ult., Mr. J. Thornhill Harrison, an Inspector of the Local Government Board, attended at the Town Hall, Darlston, for the purpose of holding an inquiry into an application made by the Local Board to obtain a loan of 2,300l. to expend in improving the footpaths in the parish.

LEGAL.

THE SMOKE NUISANCE AT SALFORD.

At the Salford Police-court on the 31st ult., before the Stipendiary (Mr. J. Makinson), Messrs. Bailey & Craven, bleachers, dyers, and printers, Agcroft Works, Pendleton, were summoned under the Salford Improvement Act, 1862, for a smoke nuisance. Inspector Thompson stated that the works are within 500 yards of the borough boundary.

MEETINGS.

MONDAY, NOVEMBER 10.

Surrey's Institution.—Opening address by the President, Mr. R. C. Driver, 8 p.m. Royal Academy of Arts.—Prof. A. H. Church, M.A., F.R.S., on "Chemistry of Vehicles and Varieties," 4 p.m.

TUESDAY, NOVEMBER 11.

Sanitary Institute (Lectures for Sanitary Officers).—Mr. J. F. J. Sykes on "Nature of Nuisances, including Nuisances the abatement of which is difficult." 3 p.m. Royal Society of Antiquaries of Ireland.—Meeting at Dublin, 4 p.m. Institution of Civil Engineers.—Mr. John McLaren on "Steam on Common Boats." 2. Presentation of Medals, Premiums, and Prizes. 8 p.m.

WEDNESDAY, NOVEMBER 12.

London Society for the Extension of University Teaching (Chelsea Centre).—Mr. Walter Leaf on "Homeric Dress and Armour." 4.15 p.m.

THURSDAY, NOVEMBER 13.

Institution of Electrical Engineers.—Professor W. E. Ayrton, F.R.S., Mr. C. G. Lamb, E.Sc., and Mr. E. Smith on "The Chemistry of Secondary Cells." 8 p.m. Royal Academy of Arts.—Professor A. H. Church, M.A., F.R.S., on "Chemistry of Pigments." 4 p.m.

FRIDAY, NOVEMBER 14.

Architectural Association.—A paper to be read on "The Work of the Hum. Amateur Photographer," by Mr. J. L. Robinson, A.R.C.A., 7.30 p.m. Sanitary Institute (Lectures for Sanitary Officers).—Mr. A. Rostock Hill on "Trade Nuisances." 8 p.m.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

15,593.—VENEERS: A. G. Brooks.—According to this invention, the veneer is made of bamboo or lignous material, and in order to prepare it for use under surface of the bamboo is scored in cuts or grooves, so that a better hold may be obtained when the veneer is glued on. 15,737.—PORTLAND CEMENT: W. T. Tenevell.—In order to make cement from hard limestone or Portland stone, the limestone is, according to this specification, reduced to a fine powder, burned, and then ground and re-mixed. The proportions are guided by the quantity of carbonate of lime in the stone and of silica and alumina in the clay, and by an allowance for moisture in either of the materials. 15,874.—FLUSHING APPLIANCE: G. E. Arnold.—This apparatus for cisterns of wash-out closets is operated by means of a ball-tap and levers connected with the same. 15,893.—PRELATAL WATER-CLOSERS: R. G. L. Borna and another.—This invention relates to dual pedestal closets, having the trap of the closet arranged sufficiently high to keep a small quantity of water in the bottom of the pan, so that the lower part of the basin is always kept wet, preventing the soil from adhering to it. The basin is made as small as possible, and the flushing rim arranged so that the whole surface is well flushed and the contents discharged down the trapped outlet at the back. 15,971.—HINGES AND DOOR-CHECKS: E. J. B. Mills.—This invention relates to a device constituting a combined spring hinge and door check, which may be used as a simple hinge, or by a slight change as a door-check and hinge; a closing spring is provided apart from the hinge itself. The principle is that well known as in use with the American pattern of door closers. 15,974.—DECORATING WALLS: H. Pickford.—The decoration, which is the subject of this patent, is called "Crystalline" and is composed principally of broken pieces of natural spar crystals, granite, or stones

which sparkle. The pieces are affixed to the wall in patterns by cement, and the colours being harmonised or contrasted, decorative effect is obtained.

NEW APPLICATIONS FOR LETTERS PATENT.

October 29.—16,643, H. Allison, Paving Stones.—16,650, B. Nieklin, Draught and Ventilating Cowl.—16,656, T. Robertson and W. Wood, Joint for Pipes.—16,675, W. Mansbridge, Ventilation of Sewer Shafts and Buildings, &c.—16,695, W. Wilson, Converting Open Fire-grates into Close Grates. October 21.—16,703, G. Caswell and G. Clark, Flushing (Chicago).—16,730, J. Graman, Automobile Ventilation.—16,737, J. Archer, Material for Laying Roofs.—16,765, C. Rogers, Wood Screws.—16,783, R. Stone, Fireproof Plastic Material for Cement, &c.—16,801, P. Hollick, Cement Sack. October 22.—16,812, P. Ambley, Ventilator.—16,820, J. Croshaw, Rain-water Pipes, &c.—16,850, E. H. Hadjan, Stove.—16,852, J. Munson and others, Traps for Floors, Stairs, &c.—16,854, W. Williamson and R. Styles, Stacks, Drains, and other Pipes.—16,861, J. Mackay, Kitchen Ranges.—16,870, R. Grimald, Producing Inlaid Designs on Tiles.—16,883, R. Allen and J. Evans, Clamping and Lifting Apparatus applicable for Laying Pavement Slabs. October 23.—16,893, H. Lever, Automatic Sash-fastener.—16,907, W. Holbrook, Fastening and Window Stay for Casements, &c. October 24.—16,902, H. Shepherdson, Preventing Vibration in Windows and Doors.—16,966, D. Gardner, Joisting Pipes, &c.—16,969, P. Dawson, Draught and Draft Excluders.—17,008, L. Tirard, Automatically Opening and Closing Windows, &c., according to the temperature. October 25.—17,047, J. Barclay, Water-closet Basins.—17,053, J. Bayly, Floor Jack.—17,061, J. Bayly, Carpenters' Roll Gauge.—17,072, J. Smith and W. Foster, Cupboard Turns or Fasteners for Doors.—17,074, W. Clegg and G. J. Hardy, Wall-papers.—17,094, J. Walker and H. Carver, Sanitary Paper-hangings.—17,099, F. Dux, Window-fasteners.

PROVISIONAL SPECIFICATIONS ACCEPTED.

13,737, S. Washington, Connecting Lead-pipes, &c.—14,123, E. Wilford, Joints or Couplings for Pipes.—14,543, P. Colby and W. Elmore, White-lead.—14,730, S. Hill, Adjusting the position of Swing Mirrors, &c.—14,902, C. Heuser, Substitute for Decorative Tiles used for Furniture, &c.—14,939, H. Dickinson, Sky Signs.—14,973, A. Clark, Tool for Setting Saw-teeth.—15,337, J. Bonnardot, Electric Alarm-bells.—15,492, J. Gilmore and W. Clark, Mortising Machines.—15,523, F. Trewinard, Ventilating.—15,617, A. Rose, Window-fastener.—15,811, H. Hardy, Stays and Fasteners for Casements and Windows.—15,985, L. Kern, Support for Builders and Decorators Platform or Staging.—16,055, W. McClellan, Mould for the production of Inlaid Designs on Tiles.—16,132, C. Mitchell, Clamping for use as a Chimney-top or Ventilating-cowl, &c.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to Opposition for Two Months.

20,843, F. Parker, Hinges.—12,410, A. Rockwell, Door-locks.—12,410, A. Rockwell, M. Atkinson and D. Stock-steel, Brickmaking Machinery.

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

OCTOBER 27.—By C. ### A Review of the Birmingham Art Congress.

HE weakness of an Art Congress, as compared with a scientific one, of course lies in the fact that art is really concerned with producing original works and not with inquiring into facts about existing phenomena. Science is necessarily progressive, and has newly-discovered facts to impart at each periodical meeting; art is not necessarily progressive (though many critics in the present day seem to think it is), and papers on artistic subjects, unless when they are concerned with imparting either historical records as to past epochs of art, or technical information as to modes of working, are necessarily of a critical order, and deal in the discussion of opinions and principles. That art-criticism is not art so one knows better than some of the eminent artists who read papers at the Congress; and it is quite true, as has been more than once observed in connexion with the subject, that if art were in a healthy and flourishing state among us, art congresses would be quite uncalled for and probably would never be thought of. In this country, unfortunately, the public indifference to all art except mere picture painting, and the want even of any perception of what it means, is so deplorably evidenced both in private life and in the utterances of the newspapers which best represent average public opinion, that some special effort is certainly needed to open the eyes of the English public and to rouse them from their state of torpor and indifference in regard to the artistic side of life. The annual Art Congress may in time do something towards this end, may succeed in arousing public attention and public enthusiasm for art in this country, though it will take a good many years first, more especially as the daily press of the country does nothing to help the movement, but rather everything to prejudice it, by insufficient and incorrect reporting, and often by apparently utterly wanton misrepresentation.

If essays on art are not art, there are at all events good and bad essays, and the Bir-

mingham Congress has shown a remarkable predominance of the good. We do not know that much will be done for art by such papers as Mr. Brett's attacks upon all other painters, ancient and modern; and though there is no doubt a considerable amount of amusement to be got out of such a performance at the time, it will be better for the dignity of the Art Association if that kind of paper were suppressed for the future. But taken as a whole, the collection of papers read at the Birmingham Congress is really a very remarkable one; remarkable not only for the eloquence and the critical insight of many of them, but for the tone of moderation and practical common sense which pervaded nearly all of them. At the first Congress at Liverpool there was a certain proportion of papers in which "sentiment" of a very florid description was predominant. This element seems to have fortunately disappeared, and the proceedings of the Birmingham Congress, when fully published, will show that it is possible for artists who are enthusiastic in their calling to discuss it with judgment and logical reasoning.

This practical and commonsense element is nowhere better exhibited than in the address delivered by Mr. J. E. Hodgson as President of the Congress; and in this connexion we may heartily congratulate the Association on the fact that they have discarded the idea of having ornamental presidents, selected for the possession of a title or of social position or influence, and have selected an artist as the proper person to preside over an art congress: a principle which we are glad to hear is to be acted on for the future. No one could have filled the post more ably than Mr. Hodgson, whose address was a model of good sense expressed in a pointed and original manner. He deprecated any idea that the Art Association expected to alter men's ways of thinking, to change the face of society, or to bring about an art era equal to that of Pericles or Leo X. The object was to elicit public opinion, and to consider how to clear away obstacles from the path of the artist, and provide him with occupation worthy of his powers. "There is," he said "artistic talent enough in this country, and it is surely a useful thing for the community at large to meet together as we have done, and to consult together how that talent can be most

profitably employed." Nor is Mr. Hodgson among those artists who regard the great practical works of the day with indifference or dislike. His remarks on this point are worth quotation, as coming from a painter:—

"It is quite natural and excusable if we have failed in this matter [viz.: the reulering of work beautiful] when called upon to make things unknown in the world before, such as a locomotive engine and a Forth Bridge; and indeed it seems questionable to my mind how far such things can be made beautiful. There is an inexorable law in their constitution which compels them to go one way and no other. It was a tremendous problem in science to span the river Forth, and to suspend a roadway over it; and the form the bridge took was probably as necessary for the solution of that problem as the form of the Pons Asinorum of Euclid. I cannot, therefore, at all sympathise with those who anatomise that wonderful structure for its ugliness. The effect it produces on my mind is a sensation of immense power, of a splendid human triumph over materials, which gives me as much pleasure as does a sensation of beauty. It is narrow-minded and unworthy of our vaunted progress to ask for the same thing everywhere and in every place. A factory, with its straight brick walls, its hundred windows all alike, and its tall chimneys belching forth volumes of black smoke, is an unsightly thing, no doubt; but the idea of which it is the visible embodiment is a great one, and thrills the imagination. It is ugly in itself, but it is a cause of beauty; it is helping to spread civilisation and comfort in far-away countries; its ugliness is a necessary evil that much good may come to humanity at large."

How far more wise and reasonable is this attitude of mind as compared with the prolonged shriek of indignation which Ruskin has uttered, in one form or another, against every production of the manufacturing and engineering work of the day. The object which we should keep before us now, in Mr. Hodgson's view, is the cultivation of the power of design. "A pennyworth of beauty often turns the scale;" but we cannot get the artists who will provide this beauty by any such system as the immense machinery of the Department of Science and Art. If five or six youths with a genius for design were to appear in the Art Schools of Birmingham, he considers they would be no better as far as Government encouragement was concerned. "Local masters are able to discern talent in their pupils, and though they may discern talent of a high order, and especially suited to the locality in which they are placed, under the present

administration they have no means of encouraging it; that must be done by others than the heads of the department. This is no fault of any one's; it must be so as things are now administered. There is no other way, the scheme is too complex to admit of special deviations, no hitch must occur anywhere, lest the whole machinery be thrown out of gear. The only way we can bring our art schools in touch with our manufacturing industry is by decentralising. In all provincial schools should be taught the elements and principles of design, with special reference to local needs."

To understand the special bearing of this remark it should be observed that it had been arranged that this year the subject of Art Education, both for artists and the public, should be as far as possible the central idea of the Congress. This is the keynote of the admirable address by Mr. T. G. Jackson, as President of the Architecture Section, which we have printed in full in this week's and last week's issue, and of other papers in connexion with architectural training read by Mr. Astor Webb, Mr. Ralph Nevill, and Mr. R. T. Blomfield. The most important points in Mr. Jackson's address, as in opposition to the commonly received notions in regard to the architect's profession, are his caution against the use of drawing as an end in itself rather than a means, and the objection raised to the combination of the profession of architect and surveyor. In regard to drawing, it will be seen that Mr. Jackson does not deny the artistic interest of drawings of architecture made for the purpose of artistic effect, but he objects, and with reason, against the waste of time in elaborating elevations the real object of which should be to represent the facts of the buildings so as to facilitate their correct execution. As far as this is concerned with what are called working drawings we are quite of the same mind. To proceed further in elaboration than is necessary for the execution of the building—to draw out in detail a number of windows, for instance, which are exactly similar, is abstracting valuable time which might be far better employed in some other manner; in giving more careful consideration, for instance, to the study of detail. We do not agree, however, in finding no artistic interest in a beautifully-drawn elevation. It does not show, certainly, what the building can ever look like in execution, but it shows what the building actually is, when compared with sufficient profile delineations in plan and section; and we confess to finding a great pleasure in the contemplation of the beautiful coloured elevations which the French architects, for instance, produce for the Commission des Monuments Historiques. A perspective view executed with the same accuracy and finish would not have the same value as a record of the building; it not only is capable of being copied in various ways, but with the best intentions of accuracy it is likely to convey a more or less inaccurate impression. The coloured elevation conveys the colour and (when properly treated) the texture of the building, and places the facts as to size and proportion of parts with trustworthy correctness, because it can be checked by measurement, which cannot be done with a perspective view, except in a very general and comparative manner. This of course is a question of the illustration of architecture, not of drawings made for working purposes.

Again, in the illustration of modern works of architecture, we cannot but think that there is much to be said for the French system of exhibiting large geometrical elevations, with plans and sections, in exhibitions which include architecture, rather than the charming perspective pictures which many of our architects make for the Architectural Room at the Royal Academy. It is quite true that these elevations do not show the effect of the building, and that the pictures are much more interesting to the general public. But in a general exhibition architectural drawings such as these are quite on a different footing from the pictures properly so called; the architect in an exhibition does not, like the painter,

show his work, but a representation of his work; and the geometrical drawings of the French are in reality a much more faithful representation of this work than the perspective drawing. The latter shows the work not so much as it is, but as the architect wishes the spectator to think it is; and it is a fact that many drawings in the Academy are so got up as to give to the building represented a picturesqueness and vivacity of effect of which the real building, if seen afterwards, will be found sometimes to be remarkably destitute. Imaginary effects of light and shadow, texture and colour, are got up to give apparent poetry and picturesqueness to a building which has little of these qualities in reality; in fact we have long been of opinion that a really artistic perspective draughtsman can make a pleasing picture out of almost any building. The French system of geometrical drawing for exhibitions, on the other hand, makes no pretence of bringing the architectural drawings into the same category as the pictorial portions of the exhibition; it is tacitly recognised that the exhibition of architectural drawings stands on a different footing from the other pictures. An architect has produced a building which has architectural merit; he cannot bring the building itself for exhibition, but he brings a set of drawings which, discreetly examined and studied, show exactly what it is that he has done, and enable the competent spectator to picture it in his mind's eye on the basis of a really accurate analysis in drawing, not on that of a possibly deceptive perspective sketch in water-colour. In France it would seem, from the large space given to such analytical drawings in the annual Salons, that the artists who are not architects, who are concerned in the selection of works, recognise this fact; in England it seems they do not. A suggestion in favour of more geometrical drawings in the Royal Academy Architectural Room was made by an architect in the discussion on Mr. Bidlake's paper on Architectural Drawing at the Art Congress, but a R.A. painter who was present repudiated the idea, and especially said that he would like to keep out all drawings which showed the mark of the ruler. This merely shows a misconception of the object of such architectural drawing, which is not to show a view of the building, but to show what the building is in the way in which analytical drawing can show it, and we are still of the same mind, that there is too little of such drawing in the Royal Academy Architectural Room, and that the French collections of geometrical drawings are of more interest and of much more value to the student of architecture than mere pictures of the buildings.

Mr. Jackson's plain question "What can he more foreign to architecture than the valuation of building land, the letting of ground on building leases, the decision of questions of light and air," &c., will no doubt arouse wrath and contempt in the minds of many a respectable and successful "architect and surveyor" who is making a comfortable living out of the combined professions. But is it not the truth? Is there really any connexion between designing a fine building and estimating the market value of the land it stands upon? The fact is that "solicitor and surveyor," would seem a far more rational compound than "architect and surveyor," if we are to regard architecture as an art, and if we use the term "surveyor" in the wide sense in which it is now generally used, as indicating a man who is skilled in questions of the value of landed and house property, and of rights of light and "dilapidations." The art of surveying in the technical and strict sense, the art of geodesy, we do not hold to be in any way in opposition to the work of architecture proper; it is a very fascinating pursuit, in fact, and every architect, let him be as artistic as he pleases, should be able to use the theodolite and level: an art easily acquired with no great expendi-

\* Such drawings cannot be accurately made without a ruler, any more than a wall can be accurately built without a plumb-line.

ture of time. But questions of the valuation of property, and of rights of light, really can only be adequately dealt with by those who have made a special study of them, and have long experience to add to that; they often concern the settlement of very large claims, and no wise man would entrust his interests in such matters except to a person specially skilled in them. Now, life being short, it must inevitably be the case that any "architect and surveyor" who possesses this special knowledge in such subjects cannot have given much of his time and intellect to the study of design; he has had no time for it, and the two kinds of study are in themselves almost incompatible. Hence, when this man of the dual profession is entrusted with a building to design, he simply falls back upon stock-in-trade commonplaces, and can produce no architecture worth the name. So emphatically is this the case that it would not be difficult to discriminate by mere style, in any given collection or street of buildings, those which had been designed by an architect and those which had been designed by an "architect and surveyor."

It may be a question, however, whether the ground taken in Mr. Blomfield's bright and enthusiastic paper, before referred to, that an architect should be above all a modeller, a sculptor, and that we can never have any fine architecture until that is the case, is not going too far in the other direction, and forgetting the basis of architectural art. This view received a probably unexpected caution and criticism in Mr. W. B. Richmond's address as President of the Painting Section, and which, coming at the close of the Congress, was made to a certain extent a summary of its whole tendencies. As coming from a painter this address was a surprise, an agreeable surprise, in several of its points, as indicating a breadth of view in regard to art generally which certainly does not always characterise the lucubrations of painters, who are somewhat apt to regard other branches of art as of little interest in comparison with their own. Mr. Richmond is not a painter of this type, and his remarks on architecture are admirably put, and are worth the serious consideration of architects. Taking the three necessities of architecture as put by Vitruvius,—"*Stabilitas, Utilitas, Firmitas*,"—he draws attention to the significant order in which these three qualities are placed by Vitruvius, which he is disposed to accept as the right one. The following passage from the address is certainly very well put:—

"In the whole range of the vast field of architecture there is, I think, nothing more striking than the unadorned simplicity of a Doric temple, even as we see them now, the temples in Greece, in Sicily, and elsewhere, without their sculpture, without their colour, how impressive are their proportions, and how purely are they examples of the master builder's art.

It has been my good fortune to visit nearly all the Doric temples in Europe, and I confess to the growing belief that for pure architecture,—and by that I mean the art of *building* without adornment, delightfully and nobly,—those ancient temples must still be our guides. What other buildings would remain such complete works of art as these do, if robbed of all the sculptors, the painters, the carvers, the copper and silver smiths, the blacksmiths, and the carpenters' arts have enriched them with? Surely, then, the foundation of all architectural teaching should be of *structure and proportions*, ornament should be a very after consideration. Like music, architecture is a perfectly pure art,—purely abstract, purely creative. It is not till the sculptor wakens her with the sound of his chisel and mallet, and the painter touches her with colour, reminding us, by their playful and fanciful rendering, of the adornment of nature's hands upon her stones, that architecture begins her close relationship to her sister arts. Till then she stands by herself, like the bare mountains, unadorned by man.

Yet this, her special gift, her unadorned simplicity, and complete individual majesty, is too often forgotten. Too often do we mar her beauty by the vestments with which we clothe her natural simplicity. Division of their labours is therefore necessary to the architects; they should leave to the sculptors and to the painters those adornments which they know more about than do the architects."

This is a good counterblast (though not so intended) to the view of architecture often

taken by sculptors, who will cite these very buildings and say "What is a Greek temple with the sculpture removed?" A foolish kind of criticism which Ruskin started. But it is perhaps as well for the too enthusiastic architect to be reminded that to excel in three arts is not given to every one, and that after all it is possible to "build nobly" (the real end of architecture) without being a painter and sculptor at the same time; though we quite agree that if an architect has had the time and the talent to acquire the power of modelling his own carved ornament, he will be able to give far more artistic unity and life to his building. But to say that there can be no refined and interesting architecture without this is going a little further than the truth will bear.

Mr. Ralph Nevill's paper on the "importance of the Field Study of Architecture," the title of which did not exactly convey its meaning, was a very well-urged plea for the advantage of getting students of local art schools to study and sketch local architecture as represented in picturesque old buildings, not necessarily large or important, in the locality; old farm-houses and other buildings which have quietly picturesque beauty and something of a vernacular style, a style of the district. Mr. Nevill's main object in suggesting this was to infuse some feeling for architectural detail, of a simple and unobtrusive kind, into the mind and taste of the kind of men who might become builders, builders' foremen, or clerks of works; to foster in them such a refinement of taste and such a perception of local style that they could be trusted to assist in working it out for themselves in taking their own part in the erection of a building. To get at established builders, Mr. Nevill admits, is probably hopeless, but it may be possible to get at the builders' sons or destined successors. This is an excellent idea, to provide a class of men engaged in working on buildings, who should be not merely blindly doing what was put before them in detail drawings, but sympathising with the spirit in which the work was to be carried out, and bringing their own taste to bear on the execution of the work. It would make a difference often in the final effect of a building if there were this sympathy and understanding on the part of the workmen engaged on it; but what is perhaps of even more importance, it would raise their work from a dry and dull task to an occupation of interest. It is to be hoped this suggestion will not be lost sight of by the masters of local art schools.

The subject of architectural education was touched on from another side in the paper by Mr. Aston Webb, on the Education of Architects, which the author was unfortunately prevented by illness from reading himself, but which was read for him. This was a paper in favour of the examination scheme of the Institute of Architects, but which Mr. Webb desired to see united with the teaching of the Royal Academy Schools. Mr. Jackson has taken to task the Institute for not being an educating body, and says very truly that examination is not education, and we quite concur with him in desiring that young architects should not be led into thinking that the great object of their study was to pass a brilliant examination. At the same time, as we have said before, we do not see how the Institute can become a teaching body without its entire reconstitution; it was not created with that object, and has no means or machinery for it. As to its examination, we consider that an excellent institution, as a preventive measure, but not further than that. It provides an assurance that everyone who has passed it has a certain definite amount of practical and scientific knowledge, that amount without which he ought not on practical grounds to be entrusted with buildings; but it should be recognised that this is not to be understood as "hall-marking" him as a superior architect, only as a man who has given proof of possessing adequate practical knowledge. The examination is distinctly likely to raise the status of those who enter the Institute ranks, and to keep

unfit men out; but it can only have a negative object; the qualities which render a man really a great architect can never be tested by examination. The public must find them out as it finds out eminent sculptors or painters.

Mr. Mackmurdo's address as President of the Applied Art section was supplemented, in a most piquant and practical manner, by the production of some examples of Birmingham wares made for exportation to various parts of the world where there was a half-civilised coloured population, in contrast with the more costly and gewgaw articles made for home consumption. Mr. Mackmurdo produced two copper jugs of simple design and in perfectly good taste, which he found getting made in the back rooms of an establishment the show-room of which was filled with things that no artist would endure. He was told he could not buy these except wholesale, they were for exportation for negroes and were not for sale in Birmingham, as not being good enough for the reputation of the firm! There could hardly be a better lesson on the point that ornament is not necessarily art. Here was a firm making really artistic objects in its back work-rooms which the owners were ashamed of showing, and which they sent abroad as just good enough for negroes, while they offered bad ornament to their local customers.

In connexion with this section of the Congress a visit to some of the Birmingham manufacturers engaged more especially in works of art was organised on the part of some of the members specially interested in applied art; but time only allowed of two or three large firms being visited, where the members were very cordially received. One of these was a large goldsmith and jewellery establishment where there was an evident desire to have any hints that the visitors could offer, and where some designs made in the house were shown (on paper) which were above the average of such design as turned out from commercial establishments. There was more of hand work and less of machine work than was expected, but the party were told that the firm in question was exceptional in this respect. It was a somewhat sad sight, however, to observe the wholesale manufacture going on of a couple of designs for brooches, the shape of which exactly suggested a finger-plate for a door on a small scale, and suggested nothing else. The work was being carefully and conscientiously done, but what a pity that the workers had not something more beautiful to exercise their craft on. The mere issue of things by the gross on the same pattern takes away all sense of Art, more especially when one goes behind the scenes and sees the process going on; still, as Mr. Richmond had the courage to say in his address, we perhaps cannot do altogether without machine-produced ornament for some purposes; the point is to endeavour to get something good to produce. It is impossible to suppose that anyone could have had any interest or enjoyment in producing these "finger-plate" brooches.

A few other papers we can only mention incidentally. Mr. Simonds's address as President of the Sculpture section was a very well-written one and very well delivered, but adopted again the exaggerated view of the necessary relation between sculpture and architecture. It is quite a mistake to urge that sculpture necessarily loses half its effect apart from architecture; the highest works of sculpture not only can afford to stand alone, but would even lose some of their complete and all-round character if compelled to form part of a building. It is the architecture which inevitably gains by the alliance; the sculpture must almost of necessity lose something by being conventionalised into harmony with the architecture, though it gains in another sense no doubt. In short, there is no absolute principle in the matter: bas-relief, of course, is necessarily in connexion with architecture; but group sculpture in the round is not, and the sculptor would often be hampered in his conception and design by being compelled to adapt his group to a special position on a

building. It is surprising that sculptors themselves (or some of them) cannot see this.

Mr. Mullins's paper on "Sculpture as applied to Internal Decoration" dealt of course entirely with sculpture in the bas-relief form, or as applied to objects of furniture &c., and was a very good plea for decorative use of the figure in this manner. Mr. Selwyn Image, in speaking of "Colour in relation to internal decoration," was strictly practical in tone, and gave some very valuable hints as to the means of procuring good colour effect in interiors without extravagant expenditure. An exceedingly sensible and practical paper that was read by Mr. F. G. Jackson on "Art Education in Relation to the Industries," the main point of which was that considering the short time many of our art students remain in the schools, it was important that a system of drawing should be adopted which would give the eye and hand as much training as possible in the allotted time; and to this end he recommended greater attention to drawing with the brush. The following passage from his paper is worth quoting:—

"Having had a lengthened experience of the (South Kensington) system, both as a student and teacher, and an intimate acquaintance with some of the important manufacturers of the district, I may be allowed to speak as to its working and its direct bearing upon the industries, and point out what appear to be practical defects. First, then, one conclusion has been forced upon me, that there is throughout a too great insistence upon rigid outline drawing. Outline drawing, or, as it is technically called, freehand drawing, was no doubt instituted as a protest against the slipshod drawing prevailing before the system was promulgated, and to encourage accuracy and care; so far, it served its purpose. The practice of outline is an essential part of a pupil's training, but the manner in which it is taught, and the extent to which it is carried on, may hinder his progress. The so-called freehand drawing, as pursued in schools generally, might be more appropriately called stiffhand drawing, as the method of teaching engenders anything but the free use of the pencil, leading rather to timid, laboured, and inexpressive outlines. The attention is directed towards the production of mechanically finished outlines to the neglect of the realisation of the form the outline is intended to define. This undue attention to line, resulting in the neglect of form in the preliminary stages, is more painfully noticeable in subsequent ones, such as outline from the cast and from plants. The timid, halting, and laboured attempts one sees from time to time in these exercises cause one to think that there is something wrong in our methods, and this I believe to be the case. Drawing is not generally taught in a sufficiently direct way, and the practice is limited to the use of a hard point alone. As regards the first, I think if drawing was taught more after the manner that writing is, distinct advantages would result; probably the early exercises would be as bad as those of first copy-books, and would not be so presentable as the first laboured drawings under the existing method; but that would be of no consequence so long as we bare in view, as we ought to have, the development of executive power as a means of expressing form, rather than the making of drawings. Power is to be obtained by repeated well-directed efforts rather than by laboured attempts to get perfection in a few."

This is just the same complaint, essentially, that we and others have before made against the system of learning to draw the figure by stippling shadows on one drawing for weeks, instead of making a number of less highly finished studies from different positions.

Mr. Heywood Sumner's paper on "Advertisement as a field for design" was an admirable one, but the artistic element in advertisements can only be introduced by the cultivation of public opinion, which probably will slowly work a change in this respect. If an advertisement is offensive to public morals it can be dealt with by the law, as we have recently had occasion to know; but it is impossible to apply any law against ugly advertisements, because it is impossible to draw any defined line between the ugly and the not-ugly. Public opinion must do it, and every one interested in the subject should take every reasonable means to awaken and stimulate public opinion to put down this mass of staring vulgarities which overruns our streets on all sides, and perpetually accustoms the eyes of the multitude to the contemplation of ugliness and vulgarity. Taxing advertisements according to area,

which was suggested, might have some influence in at all events reducing the nuisance within narrower limits.

Among papers of a more philosophic and general turn may be named Mr. Hodgson's charming lecture to working men on "Open Sesame; or, how to unlock the Treasure House;" a lecture of advice as to the best way of cultivating the mind by such reading as the daily labour leaves time for, and which is remarkable not only for its sound sense but for the kindness and sympathy which runs through it. And last we must mention the remarkable paper by Mr. Holiday on "The Figure in Design," which turned out to be not, as was expected, a lecture on designing the figure, but on the mental reasons why the figure is the highest and most expressive thing in art. The aim was to give a reason, on the basis of Evolution, for the mysterious effect of beauty produced on us by nature, as the environment with which we had been harmonised, and by the figure as nature's climax. "The delight which every true artist and every lover of art must feel in the beauty of the human form, is precisely similar in its origin to that aroused by the sky and the water, the mountains and trees, both being derived from the harmonies exhibited in the things contemplated, and the harmony between them and our own nature; but though similar in origin, it is far more intense in degree, objectively because of the greater perfection and subtlety of its harmonies, subjectively because of its more intimate relation with our spiritual faculties." This gives the outline of the main idea of the paper, which was very fully and eloquently worked out. We do not remember before to have met with any such distinct attempt to give a reason, founded on the nature of things, for the supremacy of the figure as a mode of artistic expression, though of course it has been tacitly accepted as such for generations. It may be said that such a paper has no practical influence on art, but it may have, if read and understood, a very practical influence on public comprehension of art; at all events it was a most eloquent and thoughtful paper, and was listened to with almost breathless attention by a delighted audience.

#### NOTES.

 I entirely concur in the opinion already expressed in the *Times*, that the dreadful railway accident (?) at Norton Fitzwarren is morally chargeable upon the railway company who apparently sanction the arrangement of shunting goods trains at a place where there are no sidings, and leaving a heavy goods train waiting on the main line. As far as can be at present understood, the signalman in charge was an exceptionally good and steady man who had been on the line over thirty years. He appears to have forgotten the waiting goods train at the moment, and though it seems an extraordinary piece of forgetfulness, it has to be remembered that the human brain is not an automatic machine, and it is impossible that it can always be counted upon to act as one. The essential fault is that any train intended for the down road should have been shunted on to the up road and left to stand there at a time when a fast train was nearly due. Such a proceeding is, in view of the fearful risk that is run, little short of criminal; but unfortunately criminality cannot be brought home to companies in any adequate or practical manner.

WE observe that Dr. Orme Dudfield's last monthly report on the sanitary condition of Kensington entirely confirms the opinion we had already expressed in regard to the recent sensational correspondence about smells in London, that these smells were the result of brick-making works at Hammersmith, and not of defects in drainage and sewer ventilation. All the reasonable evidence pointed in that direction, and it is satisfactory to find it confirmed on such

reliable authority. Dr. Dudfield had long recommended that brick-burning nuisance should be the subject of legislation, either special or under existing Acts dealing with noxious trades, and he draws attention to and quotes the by-laws which have recently been recommended by the County Council, and now wait the sanction of the Local Government Board, for controlling this nuisance. Dr. Dudfield adds the following practical comment on the situation:—

"Should the by-laws be confirmed by the Local Government Board, it will be interesting to note the result. Of course, nothing can come of them, should the Sanitary Authorities of the districts where brickmaking is carried on neglect to put them into force; unless, indeed, the Council, or private individuals subjected to annoyance, should take the matter into their own hands. To us, locally, the by-laws will not, probably, give entire relief, as there can be no doubt that the stinks arise, in part, in the western district outside the Metropolitan area, e.g., at Acton, to which the by-laws would be inapplicable. But as regards brick-burning in Hammersmith, I should not be surprised if it were brought to an end, at any rate, so far as the "clamp" system is concerned; for it would appear impossible that brick-burning can be carried on under that system, without generating 'noxious effluvia,' that must, except the by-laws would be inapplicable, it being impossible, moreover, to prevent the production of such effluvia when dust-hill refuse is used in the making or in the burning of bricks, and alike impossible that such effluvia should be 'effectually arrested or destroyed,' as required by the by-laws."

THE great scheme of "General" Booth, which has aroused so much enthusiasm, is no new idea, and like many other schemes for benefiting the homes and condition of the poorer classes, will be found to have been suggested years before in our columns. In 1871, the then Editor of this journal was commissioned by a wealthy man, whose name was not divulged, to invite suggestions for the best manner of expending half a million of money for the public good, while avoiding pauperisation. The announcement brought a number of suggestions, the best and most reasonable of which were published in the *Builder* for April 15, April 22, and May 6, 1871. Among these is a short statement of a scheme, (May 6, p. 341) under the signature "R. P." which is substantially the same as that now being offered for public consideration. It runs as follows:

#### "Home Colonisation."

This can be done by purchasing a portion of the common lands of England, and forming a colony, where men who have been reduced through want of employment could be sent to reclaim the land and renew their strength. On each ten or twenty acres of land could be built a small homestead. In the erection of these the skilled labour could be employed; and when the whole was reclaimed and made productive it should be let or sold, and more land purchased with the proceeds.

In connexion with this colony should be a city colony, for the reception of all men willing to work, but so reduced in circumstances that their appearance and strength prevent their obtaining work. These should be drafted to the country colony as required, and when their health was recruited sent back. Donations might be invited from the general public, for loans to the wives and children, if any, to support them during the absence of the husbands; but in all cases the husband should be sent away to recruit his strength.

This is the outline of the scheme for improving the country and the people, and it could be extended so as to embrace the rebuilding of the worst parts of large cities by judicious purchases and by working parties or pioneers from the country colony."

THE attention of all tradesmen who are in the habit of using dangerously inflammable substances in their daily occupation ought to be called to the coroner's jury verdict on the recent fire at Messrs. Rowley & Brock's establishment in the City. The jury found that the fire was caused by accident, but that "the employers were deserving of severe censure for the dangerous manner in which their business was conducted." This verdict has been clenched, so to speak, by a summons against the employers, under the authority of the London County Council, for keeping petroleum on the premises without a licence, and Messrs. Rowley & Brock have

been fined 20*l.*; which it is hoped will be a caution to others not to evade the law in regard to dangerous substances of this class.

WE hear that the German Government intends bringing before the public a valuable publication under the title "Olympia: Results of the Excavations made under superintendence, &c., of the German Empire," and that the task of compiling this work has been given to Professors Ernst Curtius and F. Adler. The first two parts, "History of the Excavations," and "History of Olympia," will be from the pen of Herr Curtius; Herr Adler will work out the part describing the destruction and loss of the remains found; and will at the same time, together with his son-in-law Dr. Dörpfeld, and others, compile the descriptions of the architectural parts discovered; whilst the description of the sculpture will be taken in hand by Herr Georg Treu, and the bronzes will be described by Herr Furtwängler. The publishers of these official volumes, which are to be well illustrated, and will have a good supply of maps attached, will be Asher & Co., Berlin. The price is stated at 1,200 marks (or nearly 60*l.*). The part treating of the bronzes will be the first put into print.

A CORRESPONDENT in Birmingham draws our attention to what we had already noticed, that we were in error in ascribing to the Birmingham Town Hall the true architectural treatment which its exterior suggests viz.: a basement story of offices with a *piano nobile* above. It is many years since we were inside the Hall, and we could hardly have credited that such an architectural solecism had really been committed there as to design a Classic temple with an immense projecting rusticated podium, and then scoop out nearly the whole interior as a great hall, entirely irrespective of the strongly-marked division of the exterior design. The correction is a melancholy one to make, for it robs the Birmingham Town Hall of most of its architectural value. As a public hall decorated with an exterior order, and placed on a podium containing inferior rooms, it would have been a rather grand architectural conception; as it is, the exterior is nothing but a piece of deceptive scenery. St. George's Hall at Liverpool gives the true treatment for a Classic building of this type. That has also a lofty podium, with a grand flight of steps on two sides, and the upper step, on which the colonnade rests, represents the level of the floor of the great hall (all except the necessary entrance-step at the doorways) as it should do, while the Birmingham building is merely a stately-looking sham.

IN connexion with the publication a fortnight ago (p. 348, *ante*) in our correspondence column of a translation of the "Prussian Standard Rules for the Uniform Delivery and Testing of Portland Cements," it may be well to mention that a gathering of gentlemen interested specially in the uniform testing of building materials took place at Berlin last September, by request of Professor de Bauehinger, and that among the sixty persons present at this gathering, Austria and Switzerland were well represented, also Russia and France, with a delegate each in form of a Government official sent over for the occasion. The purpose of the gathering was to further the idea of uniform testing on the Continent, and the publication of the results of scientific and practical research referring to this subject. A unanimous decision was passed advising the formation of a proper society, with regular meetings and a fixed programme of work, as a mode of giving the movement a firmer basis, and after due consideration of the time required to make some decisive progress in the solution of the different problems now on hand, 1892 was chosen as the year for the holding of the next, or, rather, first official meeting of the newly-formed society, Vienna being selected as the

locality for this gathering, in lieu of Zurich, first proposed. The results obtained at the discussions of this year's meeting are to be published as soon as possible, time, however, having to be allowed for the careful wording of the decisions come to. It may be of interest to mention that the "testing of Portland cements" subject took up a greater part of the time devoted to the discussions, and that the subjects especially treated here were in regard to (1) quicker modes of testing, (2) use of steel-plate sieves in comparison with ordinary fine wire-sieves for the sand, and (3) the proper quality of the sand to be used in connexion with the cement-testing, and last, not least (4), the times of setting of trial cakes as well as the most practical form of these cakes for the tensile and compressive, as well as for the cohesive trials.

THE current volume of the "Minutes of Proceedings of the Institution of Civil Engineers" contains an interesting communication by Mr. L. J. Le Conte, on the "Contamination of Waters in Storage-Reservoirs on the Pacific Coast." He particularly notices the water-supply of San Francisco and Oakland as cases in point. The supply of the former city is derived from three large artificial storage-reservoirs, located in the coast range of mountains, and having a united area of water-surface of 1,140 acres; whilst that supplied to Oakland is obtained from storage-reservoirs having a united area of upwards of 410 acres. The seasons are so dry along this coast that, ordinarily, nearly half the year, and sometimes the whole year, passes without producing any water for storage purposes; and it has happened that no surface-waters have entered the reservoirs during an interval of 600 days. These periods of drought, occurring usually in summer time, cause a certain amount of stagnation in the water; offensive vegetable matter puts in an appearance, carbonic acid and light carburetted hydrogen gases bubble up from the bottom, and the quality of the water in consequence becomes much deteriorated. This goes on from bad to worse, until the rainfall commences, and the reservoirs are replenished. Owing to the different modes of treatment (which are briefly described) after leaving the storage reservoirs, the water supplied to San Francisco is of better quality than that supplied to the other city, where decomposition largely takes place, even in the supply-pipes. The author concludes that the primary cause of the deterioration is the putrefaction of the mud (which averages 10 ft. in depth) deposited by subsidence on the floors of the storage-reservoir alluded to, and as a remedial measure he suggests that this mud be removed from time to time. Under the circumstances, however, we question whether such a common-sense recommendation will have much effect. Surely it must be useless to preach the doctrine of purification to those who are so far lost, or ignorant of the general principles of water-supply, as to permit the accumulation of such filth in the reservoirs for "many years," and who have for that period wittingly allowed the service-pipes to become receptacles of such an amount of putrefactive matter that when delivered to the consumer the water "is always very much worse than that of the surface-water in the reservoirs whence it comes." Not only should the filth be cleared out, but those also who are responsible for its accumulation.

WE have received from Mr. J. D. F. Andrews a copy of his "Rules for the Concentric Wiring of Buildings and Ships." An introductory leaflet asserts "that it has been found that [the electric light] has intense heat, and that it has generated many serious fires. . . . It does not effect disasters. . . . by spontaneous ignitions and explosions, for it requires no air; but it generates hidden fires where the wires are buried." This is rather startling, as it has been stated over and over again, by those who are supposed to be high and disinterested authorities, that no

electrical fires have ever occurred where the rules adopted by the leading insurance offices have been followed. It is, however, consoling to learn that "by the system of concentric wiring as devised and patented by Mr. J. D. F. Andrews, these dangerous properties have been entirely set aside by a mode of construction, and the simplicity and substantial and durable character of electric lighting greatly enhanced." Many of the rules laid down apply equally to all systems of wiring, and are, indeed, essentially those adopted by all competent contractors; but when the author suggests regulations that can only be fulfilled by concentric wires, he does not fail to point out that "a method . . . in concentric wiring in accordance with the above rules has been patented by J. D. F. Andrews." Concentric wires are not new, and for certain purposes they are unquestionably useful, but we wish Mr. Andrews had not felt it necessary, in pushing his wares, to call to his aid the now almost-forgotten terror, among the uninitiated, of the hidden dangers of electricity. Probably the science of no branch of engineering is so thoroughly understood as that of electricity. If an installation goes wrong, it does so on account of bad material and bad workmanship, or from such accidents as cause the explosion of gas or the bursting of a steam boiler,—not because of the absence of concentric wires.

IN the *Deutsche Bauzeitung* we find some interesting figures regarding the amount spent in Prussia during the last ten financial years for matters concerning directly or indirectly the improvement of natural intercourses and formation of new waterways. It appears that since 1880, 61,152,000 marks have been spent in improvement of the larger and smaller navigable rivers of the country; 74,812,000 for supervision and maintenance of works on these rivers; 47,142,000 for the improvement of the non-navigable parts; indirect expenses, including the erection of bridges. These various expenses make an aggregate of about nine millions. To this sum must be added another 9,000,000 for construction of new waterways and works pertaining thereto (the works on the Dortmund-Ems Canal and the North Sea-Baltic Canal having cost some 59,800,000 and 50,000,000 marks respectively during the above period). A total of 18,000,000 in a decade certainly shows to what an extent the waterway question interests the authorities abroad, and that a good inland connexion by water is considered to be of importance.

THE *Athenæum* states that a committee, with Lord Melville and Professor David Masson (the poet's biographer) as chairman and vice-chairman, has been formed for erecting a suitable memorial over the grave of William Drummond of Hawthornden, in Lasswade churchyard. The church stands on an eminence about 2½ miles distant from Hawthornden. The existing church was built circa 1775; the site of the former is marked by an enclosure in the graveyard. What is known as "Drummond's aisle" is still preserved; and is thus described by the Professor in his *Life of Drummond* (1873):—

"A small arched space of stonework, with a roofing of strong stone slabs, and a grating of iron for doorway. Within that small arched space Drummond's ashes certainly lie, though there is no inscription to mark the precise spot as distinguished from the graves of some of his latest descendants who are also buried there. . . . The small arched aisle itself is his monument, and it is a sufficient one."

In this same enclosure is the tomb of Henry Dundas, created Viscount Melville December 24, 1802, Lord-Advocate of Scotland, and subsequently Treasurer of the Navy. His first wife was daughter to David Rennie, of Melville Castle, hard by. Hawthornden, where are the celebrated caves, reputedly of Pictish origin, in the rock above the North Esk, belonged in 1838 to the Abernethys, who sold the property to the house of Douglas, of

whom it was bought by Sir John Drummond, of Carnock, descendant of William, brother to Annabella Drummond, Queen of Robert III. It subsequently passed by marriage to Sir John Forbes, Bart. (died 1829), and went to his son-in-law, Mr. Francis Walker, who assumed the name and coat-arms of Drummond, and became second baronet. At the Stuart Exhibition was shown the table, from Hawthornden, carved with the Scots lion, and the initials R. S. and A. D., which belonged to Queen Annabella, and which Ben Jonson probably saw on his memorable visit to the poet. At Lasswade, Sir Walter Scott passed, 1798-1804, what—had he but known it—were the happiest years of his life, and in the cottage garden there he cultivated a taste for planning and planting which afterwards contributed to disaster. The phæton he used at Lasswade was the first to be driven in Liddesdale.

WE lately adverted\* to the fall of John Lomb's silk-mill on the Derwent at Derby. We read in the *Standard* that the equally famous mills at Cromford, near Matlock, by the same river, were destroyed by fire on the evening of Friday, 6th inst. These mills were founded by Sir Richard Arkwright in 1771, and are the first of their kind that were worked by water-power. They were built of gritstone quarried in the township. In 1769 Arkwright took out a patent "for spinning by rollers," and set up a small mill at Nottingham, horses being used for supplying the motive power. But finding the employment of horses too costly, Arkwright,—with the help of Messrs. Strutt, of Derby, and Need, of Nottingham,—removed to Cromford, or Crumbeferde, being attracted thither on finding he could use a stream which, flowing from the mines on the moor, was not liable to be frozen in winter time. This is the mill which is described by Darwin, with some ingenuity in view of so prosaic a theme, in his "Botanic Garden." Arkwright bought Cromford manor in 1789, and, having done much to promote the prosperity of the locality, died at Rock House in 1792. His son completed and endowed the St. Mary's Chapel which he had founded there. It was restored by the late Mr. Peter Arkwright thirty years ago. It is stated that the damage is estimated at 35,000Z, and that the mills, owned by Mr. F. C. Arkwright, of Welleley Castle, were tenanted by Messrs. Holline & Co., of Nottingham, merino spinners. Richard Arkwright was knighted, not for his inventive genius, or for his benefits to the world, but for having presented a local address to the King on his escaping Margaret Nicholson's attack.

THE parsimony of Government Departments frequently mars both the beauty and the utility of our public buildings. Hers is an instance in which, for the sake of saving a comparatively small sum, the utility of the Law Courts has been diminished. The west and east wings are occupied by various legal departments, which have to be visited daily by large numbers of solicitors and clerks, to whom the saving of time is important. But the several stages of these lofty wings have to be reached by climbing up long flights of stairs. In any building in London owned by a company or by private persons, of such a size as the wings of the Law Courts, there would long ago have been lifts. As it is, not only are business men delayed and inconvenienced, but in some instances there is injury to health through the constant ascent of the stairs in question. Moreover, various attendants are in waiting about the staircases, so that the cost of working the lifts would not be additional. It is high time, indeed, that some pressure were put upon the Board of Works to motion the Treasury to sanction the placing of lifts in the Law Courts.

THE Arts and Crafts Association invited the Institute of Architects to visit the Exhibition at the New Gallery on Tuesday

\* Vol. cii. (1889), p. 370.

\* See "Note" in the *Builder*, September 9, 1890.

evening. The east gallery was partly cleared as a reception-room and seats and a small platform placed in it, and Mr. Walter Crane presided while some speeches were made by Mr. Waterhouse and Mr. W. Morris, and a paper on the Arts and Crafts Exhibition, dealing with the relation of the crafts to architecture and pointing out the merits of some of the best exhibits, was read by Mr. Sedding. The speechmaking and reading was rather longer than necessary, especially considering that the noise made by the movement and conversation of visitors passing to and fro in the hall rendered it difficult to hear; and though Mr. Sedding no doubt felt, as he said in his paper, that the architects were "very much at home" in the Arts and Crafts Exhibition (as they certainly ought to have been), as a matter of fact the invitation appeared to have received very scant response, nor did we notice more than about half-a-dozen well-known members of the Institute among those present. This is a pity, and it is not creditable to the architects that they should be so indifferent to an invitation of this kind; it looks as if their interest in the artistic craftsmanship was rather lukewarm; which is not at all as it should be.

**T**HE exhibition of the works of David Cox at Birmingham, before referred to, formed the principal attraction at the Mayor's reception in connexion with the Art Congress, given at the Council House on the 5th, the Art Gallery Rooms being placed *en suite* with the Council House reception-rooms. A detailed examination of the collection in its completed form was calculated to further raise one's estimation both of the full and representative character of the collection, and of the genius of David Cox. The collection brought out in a remarkable manner the variety of his work, which is such in fact that it would not have been difficult to believe the pictures to have been the work of several different artists. Some there were, no doubt, which were rather like large blotted-in sketches or studies than pictures, and probably this was the light in which the author regarded them. A remarkable feature in the collection was formed by the oil-paintings, which, though a small portion of the whole collection, was much more numerous than might have been expected, and probably included nearly all the oil-paintings which Cox executed. They are not equal to his water-colours, but include some very fine works, well worth seeing. The exhibition at the galleries of the Royal Society of Artists in New-street, was another artistic attraction of the week, and contained some very good pictures, more or less known already, among which it was interesting to meet again one of the most beautifully-finished paintings which Sir F. Leighton ever produced, exhibited a good many years ago at the Royal Academy under the title of "The Juggler,"—a girl standing in front of a light-coloured curtain and throwing balls in the air, the face turned up and seen foreshortened, a remarkable piece of drawing. But the best of all the entertainments connected with the Congress was unquestionably the Reception given by the Local Committee on the 7th at the Edgbaston rooms. The entertainment included a well-known comedietta, acted by two amateurs, and an admirable performance of classical music by a small but efficient band, including the whole of Beethoven's First Symphony (the only one which lends itself to performance by a small band), which was much appreciated. The Local Committee deserve every credit for giving a really artistic turn to an entertainment on such an occasion, instead of leaving it a mere promenade.

**STREET IMPROVEMENTS AT BELFAST.**—At a special meeting of the Belfast Corporation on the 11th inst., it was agreed to petition the Local Government Board for a provisional order for street improvements at a cost of over 100,000.

## A NOTE FROM ITALY.

A CORRESPONDENT sends us the following notes in regard to the ancient Christian house recently discovered in Rome:—

"In 1887 and 1888 excavations were carried on at Rome, on the Coelian Hill, under the basilica of St. Giovanni e Paolo, resulting in some of the most notable discoveries ever made in the field of Christian archaeology. The present discovery is that of a house which must have been one of the most magnificent of ancient Rome. Instead of the usual decorative frescoes, well known from the examples in Pompeii and Herculaneum, the walls are covered with cycles of symbolic Christian paintings, used for the decoration of the walls and ceilings of the rooms in which lived SS. John and Paul, martyrs, under Julian the Apostate. In fact, this is the first known example of a Christian palace in Classic Rome. The entire ground-floor, containing more than fifteen rooms, is still in a good state of preservation.

The works began under the High Altar of the modern church, and two rooms were found, with the walls and the ceiling decorated with frescoes in a style of art of the decadence of the second half of the fourth century A.D. The decoration is composed of simple squares, with architectural ornaments and leaves, with fish and birds.

Continuing the excavations under the principal aisle of the church, the *tablinum* has been discovered, which measures nearly 7·00 x 4·50. Near the *tablinum* is found another room of lesser proportions, with frescoes.

Here, however, is to be seen, in an angle, the figure of a woman *praying*, of the same type as those found in the Christian cemetery catacombs. On another wall is painted the scene of Moses taking off his shoes before he ascended the Mount, as is seen in the frescoes of the Roman catacombs. The same Moses, probably in the act of striking the rock, is represented in another part of the wall, but this subject is indistinct, the painting being much damaged. On a wall constructed in a period subsequent to the *tablinum*, and near this, are found some frescoes representing historical scenes, which, according to the judgment of the well-known archaeologist, Com. G. B. De Rossi, refer to the Acts and Passion of the Christian Martyrs, and certainly allude to the martyrdom of Saints John and Paul, of whom it is narrated in ancient documents and ecclesiastical records, that they were killed, and secretly buried, by the order of Julian the Apostate, in their own dwelling, over which was subsequently erected the church. In fact, in the wall before mentioned opens a little window (*fenestella confessionis*) through which pilgrims looked down on the tomb of the martyrs. At the sides of the window are painted the images of the Apostles Peter and Paul, and beneath them a figure praying, at the feet of whom are prostrated, in supplicating attitude, a man and a woman.

The Commendatore De Rossi thinks that this scene represents one of the two martyrs before-mentioned, venerated by Pammachius and his wife, Faustina, who effected the transformation of the house into a Christian Basilica. On both sides of the wall are painted groups of figures which seem real and historical, among which is to be noticed a scene of martyrdom; two men and a woman kneeling, with their hands tied behind their backs, and who are about to receive a mortal blow from the Lictors. The style of the paintings is of the end of the fourth century. The researches of 1887 were continued by Padre Germano, and several other rooms were found destined for different domestic uses. The edifice communicated with the public way by means of a vestibule which about the XI. A.D. century was made into an oratory and decorated with various paintings. The most important is a group in which is represented the Saviour, with a richly-gemmed vestment, holding in his left hand a volume on which is written: "Lux ego sum mundi; nati qui cuncta creavi." On each side of the Saviour are the archangels, Michael and Gabriel. Near is the figure of St. Paul, dressed in the costume of the Byzantine court. Under the apse of the Church have been discovered two rooms, one of which is adorned with good paintings on the ceiling, representing scenes of vintage and various birds. On the walls are painted twelve winged genii, with simple mantle thrown over the shoulders, and sustained by the arms. A series of large festoons and flying birds decorate the intermediate spaces. These paintings reveal a still

flourishing state of art, and may be attributed to the epoch of the last Antonines.

In that part of the house destined to the use of baths have been discovered pipes for water and for hot air. The central hall of the baths is square, covered with an arched ceiling, and well cemented; on the wall facing the entrance there is the apse of the laconicum, as wide as the basin for the bath, formed of bricks, and covered with strong cement. Traces of fire are to be seen under the pavement of the central hall (*calidarium*); a chimney opening blackened by smoke, and tubes of terracotta for the transmission of the heat indicate that the pavement was that of the hypocaust.

In the excavations were found many amphoræ, and little lamps of terra-cotta, and fragments of decoration in marble. One amphora, for wine, had painted on the surface in red colour, some letters and numbers, with the XP monogram between A and Ω. L. B.

## ST. MARY'S (ISLINGTON) PUBLIC BATHS COMPETITION.

THE three premiated designs in this competition have been on view for the last few days at the Vestry-hall, and we have been invited to see them, and by implication we may presume to express an opinion on them. But before availing ourselves of this opportunity we must express our disapprobation of the system which has been followed occasionally in other Vestry competitions, of allowing only the premiated designs to be open to public criticism, and returning the others to their authors without any opportunity of public exhibition. The result of this is, in the first place, that the advantage to the architects and the ratepayers of a public criticism of the whole of the designs submitted, and the guarantee which such publicity affords of fair dealing on all sides, is practically nullified. The public and the architects want to know not only what are the merits of the premiated designs, but what are the merits of the whole number from which they are selected. In the second place, an architect who has produced a design of merit, but which has, from whatever reason, been unsuccessful, loses also the small advantage which he might otherwise have in a public recognition of the merits of his design. This is a minor matter, however; the important point is that if there is any value in public criticism of competition designs, it should be exercised on the whole of the designs from which the choice has been made, and not on the selected ones only.

Furthermore, the difficulties of criticising even the three premiated designs have been increased by allowing the selected design to be amended and altered to suit the wishes of the Commissioners; this is quite right, as far as it goes, but it would have been better to have exhibited the drawings immediately after the publication of the report of Professor Rogers Smith (the assessor) and previous to the alterations. With the terms of the award we are prepared to agree, so far as an examination and comparison of the three designs is concerned. The successful designs of Mr. Hessel Tiltman sent in under the motto of "Comme il faut," certainly surpass those of other competitors in method and convenience of plan. With regard to the elevations we can only say that the amended and coloured elevations are pleasing, and are far in advance of the sepia-tinted elevations which were submitted in competition. We may here mention that though evidently not intended for our inspection, an opportunity of inspecting two of Mr. Hessel Tiltman's superseded plans was afforded us, and the comparison between this plan and that which has been amended and exhibited, is an instructive one. One point especially, we are unable to understand. Two swimming-baths, 90 ft. by 40 ft., are asked for in the instructions, but Mr. Hessel Tiltman has shown a second-class bath with a figured water-space of 72 ft. by 37 ft., but the bath in question only scales 27 ft. This is misleading, and it is to be regretted that the credit of the additional 10 ft. has been given to Mr. Hessel Tiltman in the report of the assessor, though the error has been rectified in the amended plan. We may mention that rigid economy was absolutely necessary in designing this building, and that economy also was considered of the first importance in making the award, for the Commission did not feel justified in making a lavish expenditure of the money of the ratepayers.

ayers, who decided by a bare majority upon the adoption of the Act in this locality.

The successful design shows the first-class swimming-bath adjoining Twyford-street, and this has the required size of 90 ft. by 40 ft. The second-class swimming-bath adjoins the latter, but has been kept much smaller both in length and breadth, which allows a small ante-room and lavatory accommodation to be placed at the west end for use in the event of public meetings being held in the winter; for exit in his case an additional door has been provided at the end of the Twyford-street frontage. At the other end of the small swimming-bath space is obtained for a convenient sized hall, from which access is obtained to both the swimming-baths and to the eleven men's first-class baths, occupying a one-storied building at the corner of Twyford-street and the Caledonian-road. The pay office in one corner of this hall is flanked on each side by an entrance-passage. The north passage leads to the men's second-class baths, which are placed at the side of the small bath, and with a Board-room on the north side. Another entrance on the other side of the Board-room leads to the staircase to the women's baths on the first floor, and also to the establishment laundry, boiler-houses, and store spaces in the basement.

The arrangement of the wash-house and ironing-rooms has been considerably altered in the revised plans. The waiting-rooms and pay offices, originally placed in Stanmore-street, have been transferred to the Caledonian-road frontage, thus saving the expense of an attendant by utilising the pay box already mentioned. A feature has been made of a disinfecting-room and small yard at the corner of the Stanmore-street frontage.

A carefully-arranged suite of apartments for the Superintendent on the first floor is reached by a staircase from the hall already referred to. Mr. Hessel Tiltman's elevations have been considerably improved in the amended plans, and with the addition of colour have a pleasing effect.

The designs of Mr. J. Douglass Mathews, submitted under the motto "Cleanliness," have received the second premium; they differ in every way from those already mentioned. The baths are placed at the corners of the site, with their axis parallel to Twyford-street and Caledonian-road respectively. The intervening space is occupied by two entrances with pay-box between, and these also lead to men's first and second-class warm baths placed behind. This arrangement makes a convenient plan, and is economical as regards administration. The establishment-laundry is placed at the extreme end of the Twyford-street frontage, and an adjacent staircase leads to the wash-house and laundry on the first floor. We cannot comment on the position nor the projection of this compartment over a portion of the bath below, an arrangement which would be costly in construction and unsightly in execution.

Mr. R. J. Lovell's designs, submitted under the motto "Soap and water," have been awarded the third premium. The baths have been placed side by side; but, with a view to economise space and increase the water area, gangways have been omitted on one side, and a portion of the dressing-boxes of each bath taken a gallery floor. We consider that the elevations of the second and third designs might have been much improved without adding to the cost of the building in any way.

#### THE "NEW SCOTLAND-YARD."

THE new and striking building which has been erected at the Westminster end of the Victoria Embankment for the headquarters of the Metropolitan Police is now practically completed, and the Police authorities have, in fact, taken partial possession of it.

The architect of the building, as our readers know, is Mr. F. Norman Shaw, R.A., and notwithstanding the criticisms of Sir William Harcourt and other would-be authorities on architecture,—criticisms with which we dealt at the time,—the building is one which is admirably adapted to the purposes for which it is intended. It will be devoted entirely to offices and stores for the several departments of police administration. There are no cells, as it is not intended to keep prisoners in the building.

The building forms a large quadrangular block, completely isolated and well lighted on all four sides, with a large courtyard in the

centre, and a large open space or yard on the west side, between the building and the backs of the houses in Parliament-street. The granite for the massive plinth which forms so striking a feature of the external *façades*, and which is continued round the interior of the quadrangle, is from Dartmoor, and has been worked by the convicts there. A noteworthy point is that where the windows are partly below the line of this plinth, and partly above it, the mullions of the windows are in the same granite up to the level of the top of the plinth, above which level they are continued in Portland stone. There is, moreover, no moulding, string-course, or other feature in relief to mark the junction between the granite plinth and the superposed brickwork. The principal doorway leading to the offices is a very effectively-designed composition in Cornish granite, from the De Lank quarries. This doorway opens on to the new private roadway which will bound the building on the side nearest to the Houses of Parliament, and which, leading from the Embankment to Cannon-row, at the back of Parliament-street, will give access to the large yard or open space in the rear of the building, where cabs and other licensed vehicles can await the inspection which must precede the granting or renewal of a licence.

Internally, the building is very simple in plan, consisting of, in the sub-basement, a large brick-vaulted crypt extending under the whole area of the building (courtyard included). Above that portion of the crypt which is covered by the buildings is the sub-ground floor, which, together with the crypt, will be used for storage and other purposes. The ground-floor is a few steps above the level of the external roadway, and will be entirely occupied as offices. A broad, end-lighted, vaulted corridor runs along the centre of each of the four sides of the quadrangular block on this and the floors above, and opening into this corridor are doors giving access to the various departmental offices. Each departmental group of offices is so arranged as to be self-contained. The construction of the corridors and floors throughout is fire-proof. The greater part of the constructional ironwork was supplied by Messrs. Measures Bros., and the remainder by Messrs. Homan & Rodgers. The floors of the principal corridors are of marble-mosaic, executed by Messrs. Wilkinson, who also supplied and laid the concrete paving generally, including the granolithic with which the floor of the crypt and the courtyard are paved. The floors of all the rooms are laid with Mr. Rogge & L. Lowe's wood-block flooring. The stoves and cement-openers are by Messrs. Elsiey & Co. The whole of the internal plumbing has been done by Messrs. Wenham & Waters, of Croydon, who have also executed the heating arrangements. The treads of all the stairs are of Craigleith stone. The electric lighting installation is by Messrs. Drake & Gorham. The lifts (for passengers and stores) are by the American Elevator Company. The dado mouldings and architraves in all the rooms are executed in Keene's cement. The doors are all framed in oak, but have pine mouldings and *papier-mâché* panels,—the latter concealing the diagonal members of the frame, and forming light but sound-proof doors, the whole being painted. Above the ground floor is a *mezzanine* floor devoted to offices of minor importance, and above that again is the first floor, in which, at the corner nearest Westminster Bridge, is the room for the First Commissioner. This room has pleasant outlooks from the windows of the angle-turret, and is lined for the greater part of its height with panelling in American walnut. This is the only room to which any richness of effect has been given. The tile-borders have been supplied by Mr. J. C. Edwards, of Ruabon. The second and third floors are entirely appropriated as offices, and the floors above partly as offices and partly as stores for clothing, boots, and everything else connected with police equipment. The upper parts of the external and quadrangular *façades* of the building are of red brick, with Portland stone dressings and strings. The whole of the work is built in cement, and the foundations are carried down to depths of from 30 ft. to 40 ft. into what was at one time part of the bed of the Thames, several old piles having been found. As far as possible the massive foundations of the ill-fated Opera-House, which was commenced and half-built on the site some years ago, have been utilised to carry the new building. All the external gables are of stone, lined with Claridge's asphalt.

The building has been erected by Messrs. John Grover & Son, Builders, of Wilton Works, New North-road, whose foreman has been Mr. William Brown.

The clerk of the works is Mr. Erant. The total cost of the building will be about 120,000.

#### THE ART CONGRESS AT BIRMINGHAM: PRESIDENTIAL ADDRESS IN THE SECTION OF ARCHITECTURE.

THE following is the second half\* of the address delivered by Mr. T. G. Jackson, M.A., F.S.A., as President of the Section of Architecture:—

To some it may seem that I have put too much into my curriculum; "Who, then," they will say, "can become an architect?" No doubt, all this is not to be done in the three or even five years of pupillage, and if an architect's education is, as many suppose, to be compressed into that term, there would be an end of the matter. But these three or five years, rightly regarded, are but the opening of a course of study which is to end only with the student's professional life. An architect is not like a tailor or a baker, who, having once learned to make a coat or a hat, has nothing to do but to go on making similar coats or hats all his life. He has a duty to himself and to his art; he must be constantly trying to make his own work better, and himself a better artist; and, in so far as he succeeds in doing this, he will be doing something towards the general progress of art itself. I have given him enough to do; plenty to occupy all his working hours till his powers of work fail him; but not more than is well within the bounds of possibility; not more than is done by dozens of architects at the present day, I am happy to say; men whose work you would all rank deservedly as the best outcome of modern architecture, and not more than is accepted as their proper line of study by many, if not most, of those younger men in the promise of whose work lies the justification of our hope for the future.

It is needless, however, to say that this is not the education nor the practice of the majority of professing architects, but since they, most of them, undertake a vast amount of work in addition to architecture, with which it has as little to do as it has with medicine or divinity, they should be the last to charge my programme with being too full and comprehensive. If they would throw aside a great part of my scheme as superfluous and *mal à propos*, they more than fill up the gap by fresh subjects of their own, and those, too, subjects which are quite of a different nature. What can be more foreign to architecture than the valuation of building land, the letting of ground on building leases, the decision of questions of light and air, and the awarding of compensation for infringement of ancient easements? and yet these are all matters, strange as it may seem, that most professing architects consider within the scope of their business, and in very many cases they make up the greater part of it. Why skill in designing and building a house should be supposed to help a man to an estimate of the value of the land it stands on, is a curious question; it seems at first sight equally reasonable to take the opinion of a painter upon the market price of the cattle he puts in his picture. But whether absurd or not, so it is, that all this work which properly belongs to the surveyor, or the lawyer, is habitually undertaken by the architect. It is impossible that both kinds of work so undertaken can be well done: two callings so distinct as surveying and architecture can never be successfully practised by the same man, he cannot serve two masters, and either he will hate surveying and love architecture or he will despise architecture and hold to surveying. And when it comes to the question, which of the two must go to the wall, the issue is not doubtful. The surveying work touches upon property and income, and cannot be put on one side; it must be attended to at any cost first, and consequently architecture comes off second best, and is only attended to in spare hours. Very often, indeed, it is not done at all by the ostensible architect. Too busy to attend to it himself, he gets it done for him by some humble "ghost," to whom is due whatever merit the design possesses. At the Liverpool Congress, in 1888, I gave several instances that had come to my knowledge of large and important

\* We printed the first half last week.

buildings—works offering splendid architectural opportunities—of which the nominal architect had not done a single drawing, in some cases the whole being the work of a "ghost," in others the details being filled in by the builder from sketches of the vaguest and roughest kind. I need not now do more than refer to what I then said. The buildings in question were, for the most part, erected by great corporations or city companies, and the nominal architect was their surveyor. The real architect in such cases is the poor "ghost," who surely deserves, in common honesty, whatever credit is to be got out of the building, but of whose existence neither employer nor public ever hear a whisper. As for the ostensible architect, he is nothing but a middleman, who contributes nothing to the work, and whose useless intervention might much better be dispensed with, leaving the employer face to face with the real designer, who would, in all likelihood, turn out much better work if he acted as the principal and not as his shadow.

Now, if this is the right way to practise architecture, it is clear that all I have been saying on the matter of education is beside the mark. If architecture is so easy a matter that it can be attended to in a man's off-time, it is idle to talk of devoting a life-time to it and finding that all too short. From this point of view, architecture is not an art at all; it is only an employment which may be usefully combined with the more commercially important profession of surveying, and this is no doubt the view of it which many people hold. At an Art Congress, such as this, it is surely unnecessary seriously to combat this opinion. To us, at all events, architecture is an art or it is nothing, and as such it demands the whole of a man's time and attention. It is impossible for men whose best hours are occupied in matters so foreign to architecture as those I have named to turn out anything better in the way of design than the mediocre stuff, even if it be no worse, with which our streets are lined. I do not blame these gentlemen for this,—far from it,—they are but human, and the fault is not theirs if they fail to achieve impossibilities. The blame lies with the public, who force an impossible task upon them, and rest so well satisfied with the melancholy result. By the separation of surveyor's work from that of the architect, both would be better done. Let the surveyor be satisfied with the important and honourable work which belongs to his profession,—work involving as much delicate and skilful conduct as that of the lawyer, to which it is in many points so closely allied, work which, if it will please him, I am quite prepared to admit is even more necessary and useful to society than ours. There is quite enough there to occupy him, and all we ask in return is that he should attend to himself, but to which we are ready and anxious to devote the service of a life-time. There can be no hardship in this to any one. There would be the same amount of work to do, and the same number of men to do it, but it would be differently distributed, each man taking up that calling for which he was best fitted by his natural endowments, and following it with all his powers, free from the distraction and interruption of other work of an utterly different nature.

Returning to the education of the architectural pupil, the question arises, How is he to get that part of it which lies outside the doors of his master's office? Is he to pick it up for himself as well as he can, or, if not, what is there to help him to it? Now, indubitably, in many ways, a man is his own best master; and the greater his turn for art, the more important it is that he should not be fettered by system, but encouraged to follow that line of study which most attracts him, and to develop his knowledge in his own way. But at the same time, I am far from undervaluing the help a beginner may receive from organised methods of teaching by classes and lectures and in the studio. For many years the Architectural Association, a body recruited from the younger members of the craft, has carried on the work of mutual improvement in a manner which it is difficult to praise too highly. If has its regular classes for instruction by volunteer teachers; its meetings for reading of papers and discussion, its designing club, its travelling studentships, and, in summer time, its excursions to visit new buildings or buildings in progress, and to sketch and measure old buildings, not only in England but on the

Continent. Hitherto the system of instruction has been voluntary and mutual, but it is now proposed to organise it more efficiently with paid teachers and an architectural studio. In order to carry out this programme, which naturally involves new and heavy expenses, the Association applied to the Institute of Architects, the older and wealthier society, in hope that that body would put itself at the head of the new educational scheme and aid it with its resources. The Institute, on its side, has also been agitated by the question of education, but has come to a very different conclusion to that of the Association; its solution of the problem being to establish a system of examination, and to close its doors to all who fail or decline to pass it. The reply that was received by the Association, therefore, was to the effect that the Institute was not a teaching but an examining body. The Association, having thus asked for bread and received a stone, is now thrown back on its own resources, and is courageously trying to carry out its educational scheme unaided from without, a task in which we may heartily wish it success.

With regard to the examination question, while fully recognising the good intentions of the members of the Institute, and the pains they have taken with their scheme of examinations, I cannot but feel that, like many other people, they have confused examination with education as if they were the same thing, instead of being, as they are, perfectly distinct, and sometimes even opposed to one another. In other branches of study the balance of opinion seems inclining against examination; it has been protested against by many headmasters and professors, and is only accepted by others as a necessary evil and because no substitute for it can be found. It is altogether idle to attempt to justify the examination of architects, and the diploma which is the next step we are threatened with, the effect of which would be to make architecture a close profession, on the ground that law and medicine are already close professions, and that admission to their ranks can only be had by examination. Society imposes these tests on lawyers and doctors for her own sake, not for theirs. Her object is not to educate them, but to protect herself from doctors who do not know the effect of their own drugs, and lawyers who cannot draw a conveyance or a will through which you could not drive a coach and horses. If, in the same way, society thought fit to guard herself against unwholesome and insecure buildings, by requiring that everyone who built a house should pass an examination in building construction, it might be a very good thing, provided, of course, builders, surveyors, and engineers had to pass it as well as architects; and this would be the true parallel case to that of the lawyers and doctors. But to think that any test can be devised to protect society against bad architects, and secure to her the blessing of good art, is as ridiculous in the case of architecture as in that of painting or sculpture. You may examine the student in construction, and enable him to show himself a competent builder; you may examine him in the history of architecture and the character of its various styles, and enable him to show himself a fair antiquarian and historian; but no examination you can devise will measure his artistic capacity. He may be commonplace in intellect, unsusceptible of impressions of beauty, vulgar in taste, and hopelessly barren of invention, and yet what examiner would dare to reject him on those grounds, even if he were able to discover them? Provided he can pass muster in those subjects which can be learned from books and lectures, you will be bound to pass him, to set your seal upon him, to hall-mark him as sterling metal, and to produce him to society as your idea of an architect.

If I may offer a suggestion to the Architectural Association with reference to their scheme of education, it would be this,—that success in examination should not be the goal towards which the aim of the student should be directed. That can never form a worthy motive for study. Let the young architect pursue that which interests him, and that which he feels he wants and ought to know as an artist, and not that which he thinks will pay best with the examiners. In the printed report of the Association, are these words:—"We are of opinion that the subjects included in the intermediate and final examinations of the Royal Institute do not comprehend the whole of the knowledge necessary to an architect, and that provision should, there-

fore, be made for the study of certain additional subjects." What these are may be gathered from a paper read to the Association by Mr. Reginald Blomfield, from whom, I am happy to say, we are to hear more on the same subject this morning. He says:—"An exhaustive syllabus has been provided for the study of the history of architecture and of the science of construction and drain-pipes, &c. I still think that one particular corner remaining untouched, and it is the education of architect as artists." Such matters as modelling, study of colour, figure-drawing, and general design of other things besides pure architecture, are subjects which will not pay with the examiners, and cannot be brought to the test of examination; but nevertheless they do, I rejoice to see, form part of the course of study which the more active members of the Association propose to themselves.

But there is another side to the question of education in art. It is of no use training artists unless the public on their part learn to recognise and appreciate good art when it is offered to them; and as to the general incapacity of the British public for anything of the kind artists seem to be unanimous. From all sides at the two preceding Congresses at Liverpool and Edinburgh arose a chorus of lamentation over the dulness and indifference of society. And if this is true of architecture, it is so in a still greater degree of architecture. Every man likes to be thought to have an opinion about pictures; but how few are ashamed to confess that they understand nothing about architecture, and do not care to learn? Even among professional artists who are not architects, how few have given any attention to it; how seldom does a painter even learn to draw it correctly, and how often is an architect's eye offended by crippled arches, mis-proportioned columns, false perspective, and ill-drawn details of buildings in pictures otherwise meritorious? How often, too, will you see accomplished painters dwelling contentedly in homes of the most appalling architecture? And if such as they are ignorant or careless of the difference between good and bad architecture, what hope can there be of finding the general public more discriminating?

But if the public neither know good architecture when they see it, nor take any pains to get it, depend upon it no improvement in the present state of things can be hoped for. Art follows the general laws of economic science; there will be no supply unless there is a demand. So long as you are content with the average architecture of the present day, so long will you go on getting that and nothing better. As Sir Frederic Leighton said, in his inaugural address at the first of these Congresses, "What you demand that you will get, and according to what you accept will be that which is provided for you." Individual architects may do their best and get well ahead of the current taste of the day, but the number of those who employ and value them is so limited that the few really good buildings produced under such conditions stand out as exceptions, and have no power to lift architecture, as a whole, out of the bathos into which it has sunk. They show the way, but it rests with you to follow. "That architecture is not dead," said Professor Aitchison, at the Liverpool Congress, "is because architects present it gratuitously to their employers." There is no general demand for it; the wretched architectural failures that spring up on all sides are what the public really like, or they would never be built, and the men who build them would have nothing to do, and so long as this is the case we shall have nothing better, except in the isolated cases to which I have alluded.

And yet surely of all the arts there is none that concerns us so closely as architecture. Life is possible without the others, but not without this. There is no escaping from it. Painting and sculpture have to be sought out, and, when bad or uninteresting, may be avoided; but architecture is ever with us; you have it in your home, and it meets your eye at every step as you walk down the street. Surely if any form of bad art is insufferable, bad architecture,—which you cannot run away from or move out of the way,—is, or should be, the most intolerable of all; and if any form of good art is pleasurable, none is so capable of giving constant enjoyment as architecture when it is good. Surely it is worth the while of every educated man and woman to acquire such a measure of architectural knowledge as will enable them to recognise and enjoy good work

when they see it, and, as a natural consequence, to eschew the bad.

The architectural education of the public formed the subject of two papers read at the Congress last year. Both authors argued that one instruction in the history and characteristics of the various styles should be taught as part of an ordinary school education. This, it is no doubt, very desirable so far as it goes, but it is not enough without some instruction in the general principles which underlie all styles, and to which they owe their being. It is very easy to study art too much and too exclusively on the historical side, and to forget that we, too, have it in us, if we please, to contribute a chapter of our own to the history of art, and that our studies of the past ought to be only instrumental to our better use of the present. If our work is to have any real life now, and any aim to the respect of those who follow us, it must be no mere reproduction of hygone styles; it must be intensely modern, instinct with the spirit of the age in which we live, — surely the most wonderful and original the world has ever witnessed. I have heard a modern building condemned by a popular critic because it was like nothing he had ever seen. This reminded me of the Latin prose and Greek speeches of our school and college days, when, if ever we ventured on some humble flight of our own, we were pulled up with the question, "Where do you find that? What is your authority?" Even then we used to feel that, for as our invention may have been, it was not condemned on the proper ground. And so when you see something in modern architecture that strikes you as novel and unexpected, do not ask whether there is authority for it in the past, but ask yourself whether it is reasonably unobtrusively suggested by some necessity of plan or material, or resulting from some artistic idea of proportion or composition; in short, whether there is a precedent for it, but whether it is sensible and beautiful, and if you find it to be so, for heaven's sake welcome it, and rejoice over it as a sign of life and progress. Is a last word I would say, think for yourself, and defy the critics. "You English," said an avoia, "see with your ears." At a Congress like this, when we are met for the purpose of talking about art, it may seem ungracious to be so condemned on the proper ground. And so when you see something in modern architecture that strikes you as novel and unexpected, do not ask whether there is authority for it in the past, but ask yourself whether it is reasonably unobtrusively suggested by some necessity of plan or material, or resulting from some artistic idea of proportion or composition; in short, whether there is a precedent for it, but whether it is sensible and beautiful, and if you find it to be so, for heaven's sake welcome it, and rejoice over it as a sign of life and progress. Is a last word I would say, think for yourself, and defy the critics. "You English," said an avoia, "see with your ears." At a Congress like this, when we are met for the purpose of talking about art, it may seem ungracious to be so condemned on the proper ground.

#### ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION AND THE RAILWAY SCHEMES. — A special meeting of the Edinburgh Architectural Association was held on the 7th inst., to consider the schemes of the Caledonian and North British Railway Companies, when resolutions were adopted thanking the Lord Provost for the judicious attitude he has assumed on the question, urging the Town Council to oppose any proposal to encroach on Princes-street-gardens unless it is proved to be absolutely essential for the public convenience, and protesting against any abandonment of the tunnel along Princes-street. It was also agreed to call not only for plans, but sections and elevations of the proposed alterations of the Waverley station, and the plans which will be effected on the architecture of the city by the Caledonian project. These resolutions were ordered to be sent to the Lord Provost.

DUNDEE INSTITUTE OF ARCHITECTURE, SCIENCE, AND ART. — The Dundee Institute of Architecture, Science, and Art opened its winter season by a *conversazione* in the Victoria Art Gallery on the 5th inst., when the President, Mr. Ower, delivered an address.

THE ITALIAN RENAISSANCE. — Under the title, *Arte Italiana, Decorativa e Industriale*, an important monthly publication, illustrative of Italian Renaissance work, is to be issued shortly by Omnia, of Venice.

#### THE LONDON COUNTY COUNCIL.

The usual weekly meeting of this Council was held on Tuesday afternoon last, Sir John Lubbock in the chair.

*Free Library for Bermondsey.* — On the recommendation of the Finance Committee, it was agreed, subject to the usual conditions, to lend the Vestry of Bermondsey the sum of 7,000*l.*, to defray the cost of erecting buildings for a new Free Library for that parish.

*The Bethnal Green Slum Scheme.* — With regard to this scheme, the Finance Committee reported, for the information of the Council, that the Committee had passed the following resolution: — "That this Committee recommends the Council to sanction the incurring a liability for the Bethnal Green Improvement Scheme not exceeding 300,000*l.*, and that such amount be included in the estimate to be now submitted to the Council; and that the amount had been included accordingly.

*Report of the Special Committee on Contracts.* — This report, the discussion of which was adjourned until next week, owing to the late hour at which it was reached, was in the following terms: —

"Your Committee have proceeded upon the reference made to them on June 4, 1889 (No. 5), to receive a deputation from the London Building Trades Committee, and to inquire into the subject of fair contracts which that body wished to bring before the Council. Your Committee have had an interview with the London Building Trades Committee, and have also received deputations from the Amalgamated Union of Street-masons, Paviors, and Stone-dressers, and the London Amalgamated Trade Society of Upholsters. The representations made by each of these deputations were in the main of similar character, and may be briefly summarised as follows: — That contractors were in the habit of driving their workmen to scamp their work, and also of employing inferior workmen at low wages; that sub-contracting was a common practice; that sub-contractors were unscrupulous in the means they adopted to insure a profit; and that the workmen and the quality of the work alike suffered in consequence. The deputations urged that with a view to remedy to some extent this state of affairs, the Council should exercise a rigorous supervision over all work done for it under contract; that sub-contracting should be absolutely prohibited; that a scale of the wages to be paid to the workmen should be attached to every contract; that all contractors should be compelled to observe the trade union rules in relation to hours of labour and rates of wages; that the Council should impose heavy penalties upon contractors offending in these respects, even to the extent of refusing, after offence had been proved, to allow them to sign tenders under the Council; and, further, that all the Council's contracts should only be let to London firms, and the work under them be executed by London workmen. The deputations were, however, unanimous in the desire that the Council should employ its own workmen, and should carry out its own works, without the intervention of contractors.

Your Committee have carefully weighed the statements with reference to inferior workmanship, but can find no positive evidence that inferior work has been done for the Council or for its predecessor, the Metropolitan Board of Works. They are, however, fully alive to the importance of keen supervision being exercised over works of construction, and are of opinion that the Clerks of Works employed by the Council should be highly trained specialists who should be capable of promptly detecting inferior materials or bad workmanship.

With the allegations of sub-contracting, your Committee have found it very difficult to deal, having regard to the impossibility of defining what is the real meaning of the term in the sense in which it is used by the deputations and understood and applied by the contractors. Workmen apply the term sub-contracting to any other form of labour than day-work. Piece-work, task-work, contracts to workmen, or any arrangement made of a special kind, is, in their opinion, sweating or sub-contracting. Some contractors do not consider piece-work and task-work to be sub-contracting, and regard sub-contracting as effected only when they enter into a contract with a second person who finds both labour and materials. The clause usually inserted in the Council's contracts with reference to this subject is as follows: —

"The contractor is not to assign or make over this contract to any other person, nor to underlet it, nor to make a sub-contract with any workman or workmen for the execution of any part of the brickwork, groundwork, masonry, or any other work appertaining to this contract, but he is to employ his own workmen for the labour thereof, who are to be paid by him in wages by the day. And in case the contractor assigns or makes over this contract or makes a sub-contract contrary to this agreement he shall for each offence forfeit to the Council the sum of 250*l.* which shall be deemed liquidated and ascertained damages, and may be recovered by action or deducted by the Council from any sum or sums due or to become due to the contractor under this contract or otherwise howsoever; and should

the contractor or his agent give any gratuity to any officer of the Council, the Council shall be at liberty to determine this contract."

This appears to your Committee to be sufficiently stringent for the protection of the workmen employed, more especially as the Council now requires every person tendering to make a declaration that he pays such rates of wages and observes such hours of labour as are generally accepted as fair in his trade; and the London Building Trades Committee concurred with this view. Your Committee would, however, point out that if taken in its literal meaning and applied to the whole of the works under some contracts, this clause would become unworkable, inasmuch as in many cases it is absolutely necessary for the contractor to enter into sub-contracts for the supply of certain portions of the materials to be used, as, for instance, iron girders, and also for the execution of some of the work which he would himself be unable to produce or carry out. Your Committee are of opinion that such cases should be provided for by an addition being made to the clause; and they recommend —

"(a) That the following words be added to the clause, now inserted in the Council's contracts, with reference to sub-letting or sub-contracting: — "But the Council retains power to allow the contractor to sub-let such special portions of the work as would not be produced or carried out by him in the ordinary course of his business."

With regard to the suggestion that a schedule of the wages to be paid to the workpeople should be attached to each contract, your Committee are of opinion that, previously to any action being taken on the question, the various trade societies should submit the schedules of hours, wages, and conditions of work which they desire should be adopted.

With reference to the suggestion that the letting of the Council's contracts should be limited to London firms only, and that the work should be carried out by London workmen exclusively; your Committee are of opinion that if this course could be taken, which they have reason to doubt, its adoption would inevitably add materially to the cost of the works carried out by the Council. Stone and iron, for example, can only be obtained from places at a distance from London, and the advantage derived from their being fashioned at or near their sources is twofold: — the work of preparing them is more efficiently and economically done, and the cost of carriage is less, inasmuch as the weight is reduced by the waste portions being left behind, and only the completed parts carried to the buildings or other works for which they are required. Inspection to ensure good work can be insisted upon even during production.

With regard to the suggestion of the deputations that the Council should employ its own workmen and carry out its own works without the intervention of a contractor, your Committee are of opinion that this could not be done without involving a very large outlay for plant, which the Council would not be justified in incurring. Indeed, the special plant required for some works would probably cost as much as the works themselves. Moreover, the Council could not keep in permanent employment a sufficient staff of workmen to cope with a sudden emergency, such as the bursting of a sewer for instance. Your Committee would point out that the Council has in many cases where men have been employed through a contractor on work of a continuing character, taken these men into its direct employment and dispensed with the contractor's intervention; and your Committee think that this course should be followed wherever practicable. There can be no doubt that it is better for the men to be employed directly by the Council, and the contractor's profit on their labour is to a large extent saved. Your Committee therefore recommend —

"(b) That all work of a continuous nature, which does not involve a large outlay for plant, &c., such as the cleansing and watching of the bridges and embankments, &c., under the control of the Council, be executed as far as possible by men directly employed by the Council, without the intervention of a contractor."

Your Committee further recommend —

"(c) That a copy of this report be sent to the London Building Trades Committee, the Amalgamated Union of Street-masons, Paviors, and Stone-dressers, and the London Amalgamated Trade Society of Upholsters."

*Proposal to take Pupils in the Offices of the Council.* — Mr. Breton moved, —

"That it be referred to the Standing Committee to consider and report whether it is desirable, in the interest of the public, to utilise the educational advantages to be obtained in the professional department of the Council by allowing the heads of those departments to receive a limited number of pupils."

In support of his proposal the mover urged that it was very difficult to get competent, "all-round" men to fill important appointments on their staff, particularly in the Engineer's department. This he attributed partly to the fact that as a rule municipal engineers holding public appointments were debarred from taking pupils, and partly to the fact that in all such offices the assistants were kept too much to one branch of work.

Dr. Longstaffe seconded the motion, which was opposed by Mr. Burns, Mr. Howell Williams, and Mr. Beachcroft, who all contended that the proposal was an impracticable one.

The subject was still under discussion when the Council adjourned.

### Illustrations.

#### DECORATIONS: ST. GEORGE'S CHURCH, NEWCASTLE-ON-TYNE.

**W**E give this week reproductions from photographs showing the chancel decoration of this church, the general scheme being designed by Mr. T. R. Spence, the architect of the church; the figures of the Apostles were drawn by Mr. C. W. Mitchell. Mr. Spence writes:—

"The entire available wall-space is covered with mosaic, somewhat after the manner of the famous fifth and sixth century mosaics in the churches of Ravenna. On the north and south walls are ranged the Twelve Apostles, at the same height as the three figures on the east wall, of our Lord, the archangels Michael and Gabriel. The background to these figures and to all forms of ornament embraced in the scheme is of deep blue, slightly varied in tone over the surface. Above the figures runs a deep band of enriched strongly-coloured conventional foliage. The spandrels of the arches between the roosting chapel and the organ-chamber are filled with figures of angels representing acts of praise."

The mosaics were executed by Messrs. Rust & Co. Several coloured drawings of the work are at present hung in the first-floor balcony or corridor at the Arts and Crafts Exhibition.

#### STUDENTS' CLUB, ERLANGEN.

This is a students' club for a small University town. The facade is of sandstone, with coloured majolica work inlaid in the walls. The basement contains kitchen, larders and storerooms. On the ground-floor is a large saloon, a beer-room with a verandah, and a billiard-room. The first floor contains the drawing-room, reading library, &c.

The architect is Herr Theodor Eyrich.

#### SCHWARZENBERG CASTLE, FRANCONIA.

This is a restored elevation of a castle belonging to the Princes of Schwarzenberg, who now however live chiefly in Bohemia, and the German castle has been turned over for offices and habitations for officials connected with the estate. The restoration of the facade has been carried out under the direction of Herr Theodor Eyrich, of Nuremberg.

#### LODGES, PARK HATCH, GODALMING.

These lodges will flank the principal entrance to the park. The walls are built of Bargate stone, and the roofs are covered with Horsham stone slates. The timber work in the gables is oak. The carriage-way is stone pitched. The covered ways are paved with red brick. The lodges are placed between old yew hedges.

Messrs. Mitchell Bros., of Shalford, are the contractors, and the architect is Mr. Edwin L. Lutyens.

#### HAILSDEN SCHOOLS.

The design for these schools was selected in a limited competition. They are about to be built in Acton-lane, and afford accommodation for 300 children. There is a great fall in the ground from the front to the back; this necessitated a covered playground under part of the girls' school. They are to be built of red brick, with stone dressings to the windows; the roofs to be covered with slates. The builder is Mr. Martin Brooks.

THE VILLAGE HALL, ORPINGTON.—Messrs. Thomas Gregory & Co., of Clapham Junction, write to say that their system of wood block flooring was used in this building, illustrated and described in our last. The omission was not ours.

MILBANK PRISON.—The Penitentiary at Milbank, which until four years ago served as one of our largest convict prisons, was finally closed on the 1st inst. The premises will be vacated on or before the 16th inst., and then, we understand, the site will be cleared.

### COMPETITIONS.

**BOARD SCHOOLS, OLDHAM.**—A special meeting of the Oldham School Board was held on Saturday last to decide upon the plans for Coppice School, when the assessor (Mr. W. Landless, Architect to the Leeds School Board), who was appointed to adjudicate upon the plans, was present. It was stated that thirty-eight designs had been sent in, four of them being from local architects. The whole of the designs had been carefully examined by the assessor, who had selected seven for the special consideration of the Board. These were gone through, one by one, after which it was decided to award the premiums as follows:—First premium of 50l. to the author of the design numbered 1, Mr. G. E. P. Lawrence, Albert Buildings, Queen Victoria-street, London. Second premium of 15l. to the author of the design numbered 33, Messrs. Phillips and Hodge, Newport and Cardiff. Third premium of 10l. to the author of the design numbered 15, Messrs. Winder and Taylor, Priory Chambers, Oldham. The designs are on view in Messrs. Scott Bros.' rooms, Ascott-street, and will be open to the inspection of the public for a few days.

**AYR FREE LIBRARY.**—The Committee met on Monday night, and decided that in the new building there be a lending and reference department, with shelving for 30,000 volumes. The general reading-room is to have accommodation for 100 readers; a small room is also to be provided for ladies. The cost of the site is under 2,000l., leaving about 8,000l. for the building itself. The following architects were asked to send in competitive plans:—Mr. Washington-Browne, Edinburgh; Messrs. McArthur & Watson, Edinburgh; Campbell, Douglas, & Morrison, Glasgow; T. L. Watson, Glasgow; John Honeyman & Keppie, Glasgow; John Burnett & Carophell, Glasgow; D. Sturrock, Glasgow; J. M. H. Young, Stirling; Morris & Hunter, Ayr; Wm. Kerr, Ayr; and H. Englisham, Ayr.

**THE ASHTON, STALYBRIDGE, HYDE, AND DISTRICT CARRIAGE CO.'S PREMISES.**—In an open competition for new premises for these buildings the first premium has been awarded to Mr. Joseph Lindley, of Hyde, the second to Messrs. J. George & Son, Ashton, and the third to Messrs. Benwell & Taylor, of York.

#### THE PAST, PRESENT, AND FUTURE OF THE ARCHITECTURAL ASSOCIATION.\*

We last week printed *in extenso* the two papers on this subject read at the last meeting of the Association by Mr. A. Beresford Pite and Mr. Walter Millard. We now give the remaining two papers, by Mr. Needham Wilson and Mr. Owen Fleming.

##### Mr. Needham Wilson's Paper.

I must confess to a feeling of hesitancy in addressing the Association on this subject, for, receiving my student education in the provinces, I had passed the time, on arriving in London, when the Association's Classes could have been of the most benefit to me. But though I am debarred by this and my recent membership from speaking of the past with the intimate knowledge of many here, I trust I can be acquitted of lukewarmness since I have been called upon to interest myself actively in the objects of this Association. Indeed, I fear I may be rightly taxed with presumption in giving my views on its work and prospects after so short a service in its ranks. But though I cannot speak authoritatively of the past, the present affects me, and the future excites my warmest interests.

The past of this Association requires neither eulogy nor defence from me. Results speak for themselves, and I need mention no names to remind you of the work this body has done, and the manner in which it has set its seal on the architecture of to-day. I therefore confidently leave the past to take care of itself, and pass on to the present, which seems to me to be indissolubly linked with the future, and about which I can speak with more confidence.

Now, it is claimed by some that the Architectural Association is not to-day justifying its past high character and traditions. We are hidden to believe that it has not moved with the times, and that, if it is to maintain its high character and traditions, alterations must be made in its methods of teaching. Thus we are led to believe that the Architectural Association is in a transitory state, and its

\* See p. 369, ante.

affairs in a state of chaos. But if the educational methods that have obtained hitherto have been so successful, why are they so no longer? What has occurred to disturb the equilibrium of the Architectural Association, and what has led many of its members to believe that we are lagging behind the age? If we are losing ground, how is it that we now number 1,123 members, against 1,052 two years ago? Or does this indicate a paper strength represented by the 100l. arrears of subscriptions? I take this augmentation of numbers to imply approval of the educational methods, and not as an argument in favour of change. Indeed, I find that the increase of members is less at the commencement of this session than it was at the beginning of last session. Is this the result of the proposed changes? Why are they necessary? We are told that we are not meeting the educational demands of our students. Let us examine this statement, which seems to be based on the assumption that the Architectural Association is above everything a teaching body. This assumption appears to be of recent birth, for the first clause of Rule 2 surely cannot be construed into such a meaning. Then why should the suggestion now be made? Is it because of that bogey which is always being dangled before our eyes, the Institute Examination? Is this the cause of the solemn opening declaration of the committee appointed to inquire into our educational methods? "Gentlemen," they begin, "it has for some time been evident to those members most intimately acquainted with the working of the Architectural Association, that a desire existed amongst the active members (who are the active members) for some change in the teaching methods hitherto followed." What has occasioned this desire, unless it is the Institute Examination? If so, it follows that the aim and end of this Association, as far as its educational adjuncts are concerned (and these are to be paramount), is to prepare students for that Examination. I say nothing against the Examination, as far as it goes, but I do object to its being made the basis of our educational methods. The very wording of the committee's report is contradictory on this point, for though somewhat ostentatiously announcing it as the basis of their proposals, they seem to have had a lingering presentiment that it was not all it should be, and so they interspersed in parenthesis, and as a sort of afterthought, the enunciation that it would not form the limit of any systematic scheme of instruction established by the Architectural Association. I am led to ask—if not the limit—why the basis? And why should this Association resolve itself into an academy for preparing students for the Institute Examination? I venture to think that the chief function of this Association is neither to compete with other organisations as to which shall have the honour and glory of turning out academic architects, nor to become a mere cramming machine, nor to usurp the system of pupillage. I venture to think that the educational functions of the Association are distinctly supplementary, and were designed to furnish the student with facilities for studying those subjects which he could do in office hours. I am not giving an essay on the pupillage system,—the spirit and vigour of our architecture as compared to the academic style on the Continent is its best defence,—but I do take this opportunity of emphatically protesting against any educational scheme that will have the effect of doing away with that system. The jeers that meet some remarks of mine on this subject not long ago considerably opened my eyes, and certainly did not tend to dispose me favourably to such an educational scheme as that before the Association. Up to that point of the controversy I certainly never contemplated such a result of the proposals; but the way in which my remarks were received left no doubt that the majority of those present so considered it, to say nothing of subsequent speeches. I have nothing to say against any scheme to prepare students before entering an office. By all means let us have one. But I judged that many would far rather receive their training in the Architectural Association or other Classes than in an architect's office. Where, then, would they receive that early practical acquaintance with office routine that is so essential? I venture to think that a man must be born an architect, and no amount of office or academic training will make him one if it is not in him. He may make a tricky draughtsman, he may know to a decimal fraction the

proportions of Diogenes' tub, he may be ground through a curriculum (I like that word—it is so suggestive of scari-fying), he may even pass institute examinations and develop into a diligent A.R.I.B.A., sinking into oblivion as a full-fledged Fellow; but unless he is born to it he will never make an architect.

Is it because this scheme, with its studio, day-classes, &c., would need far less hard work, that those members approved it? We are always being told of those who learn nothing in an architect's office, whose premiums and years of pupillage are wasted. Then I venture confidently to assert that, in nine cases out of ten, it is entirely their own fault. At the risk of being considered egotistic, I must say that I was educated in an office where my thirst for information was answered by "Find out." And I had to, and precious little help did I get; but the experience I gained,—by hard work, mind you, and keeping my eyes open,—laid a solid foundation for any superstructure to be raised on it. No, sir; no curriculum will make an architect.

I will not stay now to dwell on the dangers inherent in the professorial system, though I venture to express the opinion that the proposed one would provide but mediocre talent. If this teaching is to do more than merely instruct in theories, and pad students with a lot of knowledge only to fit them for clerks of works, it requires men in the very front rank of the profession, men whom I take it are better employed in practice for themselves. Those are the men wanted; can they be secured?

To what are our educational methods tending nowadays? Flashy and tricky draughtsmanship, which seems to be superseding the good, steady, old style. Is this a case to make the Architectural Association believe it is not advancing with the age? Then I am thankful if it is not.

No, Sir: I am still open to conviction that academic training will make architects. Such as have had that training are not particularly distinguished for brilliancy compared to others one can name, who have gained their knowledge by the process known as picking-up and hard work, witness the testimony of two gentlemen who addressed you a fortnight ago.

We are told, as an argument in favour of change, that there is a diminution in the number of members attending Classes, and that members of these Classes are not reaping the advantages they should,—that the work is perfunctory, &c. (Now I take it that mere numerical strength is no criterion to judge the Class-work by, but the proportion of work done to members present and the nature of such work as being true indications. Comparing the sessions 1887-8 and 1888-9, for which I have the full figures, I find that in the former year the attendances in seven Classes numbered 1,200, and the drawings and papers submitted, 991,—i.e., an average of 23 and 19 respectively for each meeting. In the following year the attendances fell to 983, and the papers and drawings to 927, or an average per meeting of nearly 19 and 18 respectively; so that though there were on an average four members less attending, the work is represented by an average of only one less per meeting. And if I include the session 1886-7, omitting the Elementary Class of Design, for which I have not the figures, I obtain the same satisfactory result. It is difficult to compare the figures of last session; but I think they sufficiently bear out my contention. It is stated that the rules enforcing work if attending have been more strictly applied, and this has had the effect of ridding the Classes of some dead weight, and representing them at their true instead of a paper strength. If members are not deriving the benefit they should, why do the reports of the Class secretaries testify to the increasing value of the work, or are we to believe that they present bogus reports and exaggerate the value? If the administration of the Classes has become slack, let us improve it. Perhaps the Classes do now partake of the nature of erratic satellites revolving round the central body. If so, then it is high time that the central body should control them more firmly. At the same time, I suggest that all the Classes should be entirely self-supporting, provide their prizes, and even contribute to the general working expenses of the Architectural Association. That the Classes are too cheap I freely admit, and the subscriptions to most, if not all of them, might well be raised. That this can be successfully done we have recently had an example of, though the increased fee was subsequently reduced on the "split-the-difference" principle.

Now I come to a subject most intimately connected with the past, present, and future of the Architectural Association: I mean its finances. I have made it no secret that much of my antipathy to the educational scheme lay in the fact of its embodying a proposal to raise the subscription,—a proposal based on three main statements, viz., that it would be necessitated by the increased cost of the curriculum; that the Association's income is now insufficient for its requirements, and that additional clerical assistance is urgently needed for the secretary, or that a paid secretary must be appointed. I have dealt with the first, inasmuch as I condemn the scheme supposed to necessitate it; and, with regard to the second, I must beg leave to traverse it somewhat fully.

How the Committee had the courage to make it, after 140l. had been spent in 1888-9, and 115l. in 1887-8, on the *conversazione* and *soirée*, I leave them to say. If this is a specimen of the way the Architectural Association's funds are dispensed, I do not doubt that the present subscription is inadequate. And apparently the cost of the *conversazione* is increasing, for I find that 94l. were absorbed by it last session, and I hear over 100l. this session. I do not advocate its discontinuance, but surely it need not be so heavy a burden on our funds. To spend about an eighth part of our income in these frivolities, and then set it up as a plea for raising the subscription, is surely a thankless task. Cannot the cost of the *conversazione* be much less, and the *soirée* either abandoned or made self-supporting? If we have so many who are wedded to this latter meeting, surely they would not object to pay the small charge that would render it independent of the general funds, as the annual dinner very nearly is.

There is, too, an ugly item in the balance-sheet that I have already referred to. I mean the large amount of subscriptions in arrear.

If it is now difficult to collect the subscription, what would it be with a doubled one?

Does this mean that the strength of the Architectural Association is a paper strength? For this amount is not diminishing. Surely some very drastic action is necessary to remove this shackle, instead of condoning these arrears by raising the annual subscription. The income of the Association is insufficient! I should think so, with over 200l. a year wasted or lost.

But, these drawbacks notwithstanding, we seem to be in a healthy financial condition, with assets amounting to 931l.

Now, taking the third statement, I find that 65l. is annually devoted to clerical assistance, though what proportion goes to the secretary I cannot say; though, we are informed that he is annually 25l. out of pocket—a fact that no one regrets more than I do. My contention, therefore, is that the saving effected in the manner I have indicated should be partly devoted to additional clerical assistance to the secretary rather than the insufficiency of the present sum allotted be used as a lever to raise the subscription.

Further, if we consider the proposal as inseparable from the educational scheme, there is much to be said against it. For students a guinea entrance fee and a guinea annual subscription, in addition to fees for the curriculum, would in many cases be a heavy tax—and for those who have passed the student stage, many of whom are members of the Institute, and who derive no great benefit from the Architectural Association, though giving it the benefit of their moral support and experience, it is too much to expect them to put their hands in their pockets to pay for others' education. And, again, if we consider the proposal as incidental to a continuance of the present method, it is too much to pay a guinea for the privilege of imparting instruction to others. I am told I am unparliamentary for this, sooths. Surely this Association was not intended for those blessed with long purses.

I always thought it such an admirable institution because it brought its advantages within the reach of all. Why should these advantages be denied to those who may be equally deserving, but who have the misfortune to possess short purses? I must protest against any attempt to make this Association exclusive as a grave error, to be attended with the most disastrous results.

It surely does not follow that because a man happens to have scanty means he ought not to try and become an architect. But there are those who argue thus, deeming it a good thing to get rid of those who either cannot or do not care to pay an extra 10s. 6d. It is idle to say

that such a one has no business to enter the profession. These remarks I intend to apply as much to the present as the future, and I do hope this ill-advised proposal will die a natural death.

I have no time to deal with alterations to the Rules, except with the one relating to voting.

Certainly cannot be right to deprive a man of a say in important matters concerning the conducting of the Association simply because he cannot get to the meetings.

The principle of voting for all members by means of ballot papers is admitted in respect to one important matter, viz., the annual election of officers. Then why not in other cases? It ought to be out of the power of a coterie—a mere handful, may-be—to dominate the affairs of the Association. This was exemplified last session when half a hundred members out of over 1,100 passed resolutions involving the most radical changes in the working of the Association. I take it that the alteration of this rule as to voting is a very urgent reform, which I hope to see adopted.

Before closing, may I reiterate the able plea put forth a fortnight ago for "craft" education? It requires no words from me to convince you of its importance, and, curriculum or no curriculum, I trust facilities will be speedily afforded.

And now, sir, I have finished my ungrateful task. Ungrateful, because I have to oppose and criticise the views of those whose efforts are tending in the same direction as my own,—the lasting good of the Association and the maintenance of its high reputation.

We have an excellent, if somewhat pedantic, motto. May I add to it "Let well alone"?

Mr. Owen Fleming's Paper.

We shall shortly be called upon to give the final vote upon a question of greater importance than any that has yet been considered by the Architectural Association, a question upon which our future depends; and yet I am afraid there are many among the 1,129 members of the Association who, from various causes, have even yet an imperfect appreciation of the nature of the question they are called upon to decide. It has, therefore, seemed to me that I may do some humble service if I try to help those to whom I have referred in their desire to arrive at a sound and accurate judgment by placing before them, as clearly and as logically as I can, the influences which have caused this great movement, proceeding then to consider the adequacy of the scheme proposed by the Committee to meet the alleged needs, and after examining into its financial prospects, endeavour to estimate its ultimate effect upon English architecture.

(a) *The Causes of the Educational Movement.*—The influences which have led to the inception of the scheme suggested by the Committee seem to be of two principal kinds, those internal and those external to the Association, although it is not always easy to determine under which of these heads a certain specified influence should be classed.

Perhaps the most important of the internal influences is the great and growing dissatisfaction of the students working in the Classes at the disconnected character and superficiality of the instruction imparted. Although our Visitors deserve our very warmest thanks in coming here, often at great personal inconvenience, to teach their fellow-members what they have learned by hard experience, yet the system under which they labour minimises to a great extent the value of their information. A Visitor is usually totally ignorant of the nature and extent of the teaching previous Visitors have given, and, in consequence, not only is the train of thought in the Class continually being diverted, but frequently most important matters are entirely unconsidered by the class,—an omission which is scarcely compensated for by the fact that frequently the same question is treated by two Visitors. Another feature of the visitatorial system which has given rise to the dissatisfaction in the Classes is, that personal interest between the teacher and the taught is almost impossible. A Visitor on taking a Class before him can hardly be expected to discern the characteristics of the individual student in a single evening, and beyond, perhaps, the lectures, there is little that enables him to feel for and with his students; yet without this feeling of personal sympathy, Classes and lectures are, at the best, but cold and dreary functions. To this want of fellow-feeling may, I venture to think, be

scribed the inevitable and rapid dwindling of nearly every Class as the session progresses, and the total lack of that enthusiasm which we rightly look for in classes of young students, and without which good earnest education is impossible. Unfortunately the individual student can do but little to alter what he knows to be wrong. He can grumble to his fellows, and those who mix unreservedly with the younger students will bear me out when I say that he *does* grumble, and then he can do one of two things—continue as best he can in the Classes, or leave them altogether; and I fear there are not a few who choose the latter course. It was only when the students of the two junior construction classes met together one vacation evening, some time ago, and expressed the views of their kind in a petition to the Committee, that the inquiry was ordered which gauged the depth of the feeling, and which ultimately led to the preparation of the education scheme we are now considering.

Another influence which has exercised for some time the minds of the elder workers in the Association is the knowledge that there is no connected train of thought permeating the education system of the Association. If I may venture on a simile, I would liken our course of instruction to an Act of Parliament conceived originally for the needs of another generation, but which has received continued additions and amendments to fit it for new necessities. So it is with our educational system. It is an unconnected concourse of atoms rather than one whole, and, following our simile, as it becomes necessary at certain intervals to thoroughly revise and consolidate an Act of Parliament and its amending Acts, so it has become essential to revise and consolidate our educational scheme, making it thoroughly definite, sequential, and intimately connected together.

Passing now to the chief external influences which render a change necessary, by far the most important is the recent development of the Institute scheme of Examination. Examination is good or bad in direct ratio to the quality of the education that has preceded it. If the education is thorough and complete, the examination takes its proper subsidiary place as a means to an end; but permit the education to flag, or to be hastily or imperfectly imparted, and the examination immediately becomes the end in itself, and wields its usurped power with such intense severity that education soon becomes altogether demoralised, and assumes the form known as "cramming." And, therefore, gentlemen, we must take the greatest care that our education is not hastily or imperfectly imparted.

Another influence may, I think, be found in the tendency in certain quarters to regard the Association and its teaching as a temporary expedient pending the establishment of some new collegiate body. Our ex-President, Mr. Gotch, has stated that he for one should not be satisfied till the functions now fulfilled in a voluntary way by the Association should have devolved upon a body representing the whole profession. More than that, some of the speakers at the Conference of Architects our President referred to went so far as to outline a programme for this new Institution that seemed needed. Is not this some reason for commencing with ourselves?

There is yet another influence which it will not be wise to neglect or under-estimate in considering the future of the Architectural Association. The educational institutions known as Polytechnics mostly have a class or classes for the study of Building Construction, at extremely low fees. These classes are generally founded upon the South Kensington lines, and therefore treat of building construction as a complete science in itself, and not as it really is, an integral and inseparable part of the great art of architecture. This training naturally engenders a habit of inartistic thought in the minds of those under its influence, and it is desirable, therefore, to discourage architectural students attending these classes by making our own equally thorough, business-like, and practical, but, in addition, preserving the necessary interdependence between them and their correlative classes or lectures.

Did time permit, it would be an interesting and profitable task to continue our analysis further, but we have, I think, examined the question sufficiently to see that there is an extraordinary combination of influences at work upon the Association at the present time, and that these influences, one and all, are tending

to impel us to modify our existing policy; and further, we see that those who hold that the present movement is of an artificial character, or that it is not of sufficient importance to demand our serious attention, are occupying a position which, if persisted in, may result in serious harm to the Association.

(b) *The Adequacy of the Committee's Scheme.*—Those who have given a careful and earnest consideration to the education question are probably by this time of the opinion that the one essential feature in any successful amendment scheme must be a thorough revision and expansion of the curriculum. Unless this difficulty is attacked, it will be futile to attempt reform, but a programme which comprises a liberal curriculum, originally well considered, and afterwards well administered, contains in itself the elements of success; and one of the reasons why I am sanguine of the success of our new schemes is that it is firmly based upon a well-thought-out curriculum. It is singular that amongst the storm of criticism aroused by the education proposals, hardly a word has been said against the curriculum. It has been urged, and justly urged, that its scope might be extended so as to include some manual instruction in the various handicrafts, but it is impossible to do everything at once; and the Committee, although alive to the great and growing importance of this subject, hardly felt justified in over-burdening their scheme at first by including such matters as these, entailing as they would a considerable financial outlay.

The Committee, however, apart from this workshop practice, felt it desirable that the curriculum should be complete in itself, with the various individual Classes very intimately connected, working harmoniously together, and forming one whole under one direction and management; and it will be at once seen that, holding these views, they were unable to recommend what is called the "taking advantage of existing institutions." It would be impossible to utilise advantages presented by external institutions without yielding up, to a great extent, the control over the particular class and classes taught elsewhere; and I need hardly say that a system of dual control would be fatal to any ideas of unity and solidarity. Of course we ought to use to our utmost the priceless treasures at South Kensington, Tufton-street, and the British Museum,—far more than we do at present; and if any arrangement could be made whereby we could obtain the occasional use of one of our excellent metropolitan engineering laboratories, it would be altogether good. But to go further than this would, I am convinced, be a fatal mistake.

Having fixed the curriculum and made up our minds that it shall be thoroughly taught, it will be found that the remainder of the scheme follows as a natural sequence. Some criticism has been caused by the number of attendances and amount of work imposed on the students, but it must be remembered that ours is an arduous profession, and entails hard work. Besides, if a student is so fortunately situated as to be able to spare his afternoons for Class-work, he will have no occasion to grumble. It is the hope of many besides myself that day classes may gradually supplant evening classes altogether, as it is not right to make students work from nine in the morning to nine at night. Under existing circumstances, however, the Committee thought it desirable to make the whole curriculum available to evening students. Some exception has also been taken to the payment of teachers, but the objectors could hardly have understood the extent of the proposed curriculum, which it is quite impossible to successfully carry out with voluntary effort. The amount of fees to be paid by the students has also been objected to, but this will be better considered in our third division.

(c) *The Financial Prospects of the Scheme.*—The financial questions involved in the proposed scheme are necessarily of some magnitude, but as the figures were only arrived at after careful investigation, and were based upon a sound economic principle, I do not think they can fairly be termed illusory or optimistic.

The leading principle to which I have referred is that the whole of the current expenses of education, such as lecturer's fees and materials consumed by the students, should be borne by those for whose benefit they were incurred. It is not fair that those who have passed their student days, with their accompanying expenses, should be taxed for the

benefit of the education of their fellows; and it will be found upon consideration that in the Committee's estimate no charge is imposed upon the Association in its corporate capacity for the direct education of its students, each of whom is charged a sufficient fee to cover the expenses of his education. It has been held that this fee of 10l. 10s. per annum is excessive, but I do not think this view can be maintained when it is understood that for this sum the student receives no less than eighty lectures and sixty-four evenings of studio instruction from men whose capabilities prove that they deserve to hold the positions of responsibility which they occupy. Nor can it be said that the Committee have been other than extremely cautious in their estimate of numbers. At the present time about one hundred students annually enrol their names as members of the Association, and yet, under the changed conditions, the Committee estimate that the educational system will progress smoothly and harmoniously if only twenty-five students annually take up the whole course. There is little doubt that this is a low estimate, and that the attractions of the new scheme will draw a much larger number; but even if it be not so, it is surely sounder policy to educate thoroughly twenty-five students than to cover with a superficial gloss of knowledge four times that number.

While I have been saying this, however, a question has been probably forming itself in your minds, and it is this: Why, if the Committee declare that no extra funds are wanted for the education of the students, are we asked to double our contributions to the funds of the Association? This is a very pertinent question, but the answer is simple. In most, if not all, other educational institutions no expenses are incurred on account of the buildings. Either heavy endowments or a generous donor have rendered any annual payments upon this score unnecessary; but it must be understood, and the sooner the fact is grappled with the better, that we have neither heavy endowments nor a Samson Fox, and how are we ever to hope to provide the necessary accommodation for our proposed development if we do not supply funds for the purpose? The Committee have placed apart the sum of 250l. per annum for extra accommodation, but I fear they have been over sanguine as to the cost of the instruction,—more particularly in the studio,—and that a considerable portion, if not the whole, of this 250l. will be absorbed for this purpose. In any case, the cost of the building accommodation is certainly a matter for the Association in its corporate capacity. This accommodation will at first have to be temporary, but ultimately we must be housed in a suitable permanent building, fitted with the necessary studios, lecture-theatres, class-rooms, &c., and, I hope, workshops for the handicrafts,—a building, in fact, worthy of the central educational institution of the profession of architecture in the richest country in the world. To attempt to carry out the proposed scheme of education in our two or three little rooms upstairs would be simply to court ridicule; to throw the burden on the shoulders of the young student passing through would be unmanly and unworthy of the Association; to wait till the Institute, or a conference of architects, or the general public, agree to advance the money, would be to convert our scheme into a mirage. So what is to be done? The answer comes straight and direct,—hear the burden ourselves, and let the world see we mean business. Gentlemen, I ask you to give this question your most earnest consideration. You have an opportunity before you of placing once and for all the education of English architects on a firm and sound basis. You have practically in your hands the character of our national architecture of the future, and I do earnestly plead with you not to be influenced by feelings of personal selfishness, but rally to the occasion, as the Association always has rallied to the occasion, and agree, not grudgingly, but gladly and unanimously, to supply the small amount of extra funds you are asked for to enable this great reform to be successfully carried out.

(d) *The Ultimate Effect of the Scheme on English Architecture.*—I cannot pretend at this late hour to do much more than briefly indicate the manner in which the proposed scheme will affect the architecture of the future. The architecture of the present we know too well. We have only to stroll down our latest metropolitan improvements,—Shaftesbury-Avenue and Charing Cross-road, or to go

for a walk through the outskirts of London, or any country town, to find building after building totally devoid of any architectural interest whatsoever, had in massing, had in proportion, had in construction, had in sanitation, and an ever-present monument to nineteenth-century ignorance, otherwise called bad taste. Let us not fall into the mistake of supposing that architectural design is a gift, and not obtainable by those who do not possess it. We should consider it an intolerable presumption if a man, ignorant of the elementary laws of harmony, attempted to compose a Cantata, or if a butcher sought to perform a delicate surgical operation; but their jumbles would not be a wit worse than the atrocious compositions that we are daily compelled to witness.

And yet it is hardly fair to blame the architects who continually perpetrate these false quantities. We must rather blame the system which deludes the innocent student into a belief that he can learn, perhaps, the most intricate and far-reaching profession of modern days in a three years' pupillage by having the run of a small practitioner's office. We limit our chance of progress in every possible way, and adopt the very best method that ingenuity can devise for stunting and retarding the growth of the artistic faculties, and yet we are foolish enough to expect our nineteenth-century architecture to improve.

No: if we are really in earnest in our desire to raise up a national school of highly-trained scientific architects, we must see that they are properly educated; that their environment is one which will stimulate into healthy growth, instead of stifling the young artistic perception. And if our endeavours to deal in a masterly manner with the great problem of education prove successful, as there is every reason to hope they will, we may then be able to seek some other, not for mere registration or examination, but for a compulsory education which is more serviceable than a mere statutory book-marking; and then, and not till then, may we look forward to a national school of architecture as highly skilled and as efficient as is our national school of medicine at the present day. The briefest recapitulation and I have done, commenced this address by showing to you how many influences there have been at work making it essential, if the Association is still to go forward, for it to modify its present scheme of teaching. We examined one by one the important influences, and incidentally referred to others, and, I think, felt that it would be safe to further postpone the consideration of this vital question. We then considered the nature of the reforms proposed by the committee, and, after finding that the key to the situation was an amended and expanded scheme, saw the importance that had been given to this in the Committee's report. Aligning them with other minor matters, we used to finance, found that the leading financial principle was a thoroughly sound one, and felt that the Committee had been temperate and judicious in their estimates, and that there was every probability of the estimate being reliable. We saw the extreme necessity of raising our own contributions to ensure a satisfactory execution of the scheme of education, and concluded by endeavouring to estimate the nature of the influence which the new scheme would have upon the future of English architecture.

Mr. H. O. Cresswell proposed a vote of thanks to the authors of the four papers,—gentlemen so far from their knowledge of the Association as to be qualified to express their views on this subject; but he thought that if each member, after hearing the opinions of others, would carefully consider the question for himself and in his own conclusions, it would be to the advantage of them all when they came to vote on the new rules, as they would shortly be asked to do. It seemed to him the papers might be divided into two groups,—those which were satisfied with the present state of affairs, and those which were not. Mr. Needham Wilson and Mr. Pite saw a great deal to admire in the present system, and wished to continue it, if not exactly on the present lines, at all events very much on the present lines. Mr. Millard and Mr. Owen Fleming, on the other hand, did not seem to approve of the present system at all, and thought that they ought to have suggestions of the most radical description. Mr. Wilson had referred to the very large expense which was incurred every year for the *concessione* and the *soirée*. The Committee were

entirely in accord with Mr. Wilson in thinking that the expense was more than they could afford, and the matter had engaged their serious attention for two sessions, as being a constant item in every balance-sheet. He (the speaker) was in favour of the proposition that the expense of at least one of those entertainments should be borne by the members attending it. Mr. Wilson had also referred to the arrears of subscriptions, but he must not imagine that the same arrears were being carried forward for several years,—though the amount was generally about the same,—the truth being that the amount which appeared in each year's balance-sheet under the head of "arrears of subscriptions" merely represented the amount which happened to be due at that time, and probably the majority of those then due were paid off in the next few months.

Mr. E. Doran Webb (Salisbury) seconded the vote of thanks.

Mr. F. R. Farrow said he would like to ask Mr. Needham Wilson whether certain men whom they knew in their profession were architects; because he had said that academic training did not and could not produce architects. Did he consider that M. Charles Garnier, the designer of the Paris Opera House, was an architect? Did he consider that the late Alexander Thomson, of Glasgow, who did so much to show what could be done with Greek architecture in modern work, was an architect? Did he consider that the late H. H. Richardson, of America, who invented an entirely new treatment of Romanesque, was an architect? And did he consider that Mr. Norman Shaw was an architect? All those men had received an academic training.

Mr. Pite suggested that Mr. Farrow's questions were questions for the Institute Examination.

Mr. Farrow thought they were questions which might be put to the Institute very well.

Mr. Wilson said that the four architects whom Mr. Farrow had mentioned were architects despite their academic training.

The Chairman (Mr. Leonard Stokes, President), in putting the vote of thanks to the meeting, said that Mr. Pite had said very rightly that an architect should be an artist first. So he should; but then he did not prove that he should necessarily be an ignorant artist.

The vote of thanks having been put and carried unanimously,

Mr. Pite, on behalf of the four readers of papers, briefly replied, and the meeting terminated.

#### Advanced Class of Construction and Practice.

At the meeting on Wednesday evening Mr. Francis Hooper read a paper on "Artisans' Dwellings," dealing chiefly with the principles governing their arrangement. The discussion was opened at some length by Mr. Owen Fleming, and the points raised by him and Mr. Hooper were deemed to be of such importance that the further discussion was adjourned until November 26, when it is hoped that several representative officials conversant with the question will be present.

#### BUILDERS' BENEVOLENT INSTITUTION: ANNUAL DINNER.

The forty-third anniversary dinner in aid of the funds of this Institution was held on Thursday evening, the 6th inst., at Carpenters' Hall, London Wall. Mr. Wm. Shepherd, the President of the Institution, occupied the chair, and was supported by Mr. George Plucknett, J.P., (Treasurer of the Institution), Mr. Rowland Plumbe, F.R.I.B.A., Mr. T. F. Rider, Mr. B. J. Jacob (Warden of the Carpenters' Company), Mr. Molnes, Mr. Peters, Mr. W. Brass, Mr. Stoner, Mr. A. Ritchie, Mr. C. Bussell, and the friends of the Institution, the company numbering about 150.

The Chairman gave the toast of "Her Majesty the Queen, the Prince of Wales, and the rest of the Royal Family." The Chairman also gave "The Army, Navy, and Reserve Forces," Major Brutton responding for the Army and Navy, and Sergeant Thomas Siting for the "Reserve Forces."

The Chairman, in proposing the toast of the evening, "Success to the Builders' Benevolent Institution," said it was forty-three years ago since several gentlemen interested in the matter met and laid the foundations of this deserving charity. It was the bounden duty of the successors of those founders to hand it on unimpaired, and to maintain its efficiency. The tree had borne considerable fruit already, for no fewer than 120 male and 68 female pensioners had enjoyed the benefits of the Institution. At the time of the issue of the last report, there were 25 men and 39 women on the roll of the charity. Those who had conducted

the Institution had from time to time entertained more ambitious views than they had been able to give effect to, such as the establishment of almshouses; but such schemes had been put aside for want of the necessary funds. To pay the present pensioners about 2,000, was needed yearly, besides the necessary expenses for conducting the charity. The object of the Institution was to help those who had been unsuccessful in business, and it was an astonishing thing that so many connected with the building trade took so little interest in this Institution. The building trade was one which was surrounded with great vicissitudes; in fact, there was hardly another business attended with so many conflicting elements. It was therefore of the utmost importance that the members of the industry in the Metropolis, who had been compelled to give up the struggle, through no fault of their own, should have some other resource than being declared paupers, and being associated for the remainder of their lives with persons who had never tried to make headway. It was strange that those who had always been farthest removed from such a contingency had been the greatest supporters of the Institution. At the same time, he was sorry to say that a large number of firms and individuals connected with the trade, and who were doing a lucrative business in the Metropolis, had never contributed a shilling to the funds of the charity. In this Institution the danger of indiscriminate charity were reduced to a minimum, as every case was personally investigated by the Committee. After some further remarks, the Chairman coupled the toast with the name of Mr. George Plucknett, J.P., the Treasurer.

The toast having been duly honoured, Mr. Plucknett replied on behalf of the Institution, which he believed was doing its duty according to the intentions and objects of the founders and subscribers. The great drawback was the want of sufficient money to provide for all those who sought its benefits. It was a remarkable fact that in the area which the charity covered there were something like 5,000 builders, besides thousands of others engaged in trades connected with building; yet out of all that number, only 500 subscribed to the Institution. At the same time, the Committee were grateful to the consistent subscribers, and to the present President for his anxiety to help the charity.

Mr. J. W. Duffield gave "The Worshipful Company of Carpenters." The Institution, he said, was very much indebted to the Carpenters' Company for the use of their noble hall, and for the substantial donation they gave to the funds.

Mr. B. J. Jacob (Warden of the Company) replied. The carpenters and builders, he considered, were so closely allied that if one trade suffered the other suffered also. As long as he had a voice in the direction of the Company he would do all he could to aid the Institution.

Mr. T. F. Rider, in a humorous speech, proposed "The Chairman and President." Mr. Shepherd, he added, was a man who was respected by the trade, and who carried out a large amount of work, doing it, at the same time, honestly and well.

The toast was most cordially received, and the Chairman made a suitable reply.

Mr. H. Ashby proposed "The Architects and Surveyors."

Mr. Rowland Plumbe responded, and said that an architect who was properly trained, and knew his business, must look upon his position as being that of one who held the scales between the client and the contractor. He believed that if the relations between architects and builders were carefully considered, there should be no necessity for any disputes.

Mr. Arding also replied on behalf of the Surveyors.

The remaining toast, viz., "The Vice-Presidents, Committee, and Stewards," was proposed by Mr. A. Richards.

In the course of the evening subscriptions and donations to the amount of £277 were announced, of which sum 615s. appeared in the President's list.

#### A SCARIFIER FOR MACADAMISED ROADS.

MANY of our readers will no doubt have lately seen the macadam scarifier, which has recently been working on the Victoria Embankment, and in Hyde Park and various other places in the Metropolis. This appliance undoubtedly possesses several advantages over the old system of breaking up our roads by hand-labour. The inventor of the scarifier (which when in use is drawn by an ordinary 6-horse power traction engine) claims for it that the work can be done at less than half the cost of the old method by pick-axe, even when done in the most economical manner. But this work, as must often have been observed, is generally done by old and infirm men far too weak for work so laborious, and who are not able to pick up the road to a uniform depth. By the use of this machine the depth can be made from 1½ in. to 3 in., as required, by working a single and simple part of the apparatus, which raises or lowers the steel times which plough up the road. By its use, too, every stone is completely shifted, although there is no danger of the stones flying

about, as so commonly happens in the old method of hand "picking," with the result of leading to accidents and expense.

The scarifier is complete in itself, and does the work in far less time than is possible by manual labour. We understand that it will do from 2,000 to 2,500 superficial yards in an ordinary day of ten hours. It can also be used by night equally as well as in the daytime, a great advantage in our busy streets, which, when this work is carried out, are too oftentimes closed to the traffic longer than necessary. The inventor and patentee is Mr. G. G. Ratty, of Bromley-by-Bow, London, a well-known contractor for paviors' and masons' work. We witnessed the machine at work in High-street, Poplar, on Monday last, and the ease and celerity with which it accomplished its work appears to fully justify all that is claimed for it.

## Correspondence.

To the Editor of THE BUILDER.

### CEMENT TESTS.

SIR,—Mr. Roechling's letter in your issue of the 1st inst. [p. 348], giving a translation of the German standard rules for the delivery and testing of cement, calls for some notice, for although these regulations are, no doubt, suitable for the country in which they were framed, they are certainly not applicable to our practice here, and if generally adopted would undoubtedly lead to many difficulties and misunderstandings.

With respect to the part relating to the packing and delivery—it is purely a commercial matter, and I have nothing to say either for or against it. Here, a sack of cement is supposed to weigh 200 lbs., and we have, as a rule, two sized barrels, one weighing 400 lbs. gross, and the other 400 lbs. net, *i.e.*, about 427 lbs. gross. The barrel trade is entirely a shipping trade, and the size of the barrel depends on the market to which the cement is consigned.

I would, however, more particularly draw attention to the test for tensile strength, and the test for "blowing"—*i.e.*, the determination of the soundness of the cement.

If only for three reasons, the sand test is an impracticable test—1. A standard sand has to be procured; the late Mr. Grant, who was a great believer in this test, found a sand at Leighton Buzzard which answers the purpose very well, and on the rare occasions when I have to make a sand test, I use it, but it is not always uniform in size and form of grain, and has to be very carefully washed and sifted in my testing-room before being used; and, furthermore, it does not bear the official stamp, as does the standard sand, or grit, which is supplied by the Government laboratory at Berlin. Another and greater difficulty is that not one man in ten, who is otherwise a good cement-ganger, can satisfactorily gauge a sand briquette; there is a knack in manipulation which is difficult, and to some impossible, to acquire, and hence results by different operators with the same cement do not agree, and but little reliance can be placed on them. But the third and most serious objection is, that we cannot wait four weeks to know the constructive value of a cement. Whether it be for shipment or for use in a contract here, it is only on rare occasions that the cement can be allowed to remain in bulk for the four weeks during which the test is being carried out, and which means actually five or six weeks, before it is either accepted or rejected.

The German test for "blowing," *i.e.*, soundness or freedom from expansion or contraction, I am obliged to say, is an absolutely delusive one. I tried it for quite a year in my testing-room with several hundred samples of different cements, and obtained no satisfactory and decided results from it. My reason for giving this test such a severe trial was that some years previously I devised a test for the same purpose, but, as the German one seemed simpler, I was prepared to abandon mine if the German test gave satisfactory results. It is some ten years since I first devised this test, and some six years since I began to make it public, and all I can say about it is that during the whole of that time it has never once deceived me. I enclose a few notes on cement testing and sampling which gives a description of it, and for further particulars I may refer to the new edition of "Portland Cement for Users," published by Messrs. Crosby Lockwood & Co. I may add that there is no patent in it, and anybody and everybody is free to use it.

I have always maintained that if a cement proved to be sound, and satisfied the general conditions of a cement when gauged with water, it was in ninety-nine cases out of a hundred strong enough for the work for which it was intended to be used, and my practice is to test every sample of cement immediately it comes into my testing-room for soundness. I can then, if necessary, in the short space of twenty-four hours, advise definitely whether or no the cement may be safely used; and everybody,—engineer, contractor, and cement-maker,—will admit that this is an advantage which cannot be over-estimated.

I may add that I received a copy of the German regulations some three years ago—*i.e.*, on their publication, and had I found any part of them worthy of imitation I should have felt it my duty to have made that part public; but, as I have before stated, I am not of opinion that these regulations and tests are best suited to our practice here. We have no governing body to regulate the quality and properties of the material we buy and sell as cement. Years ago I tried to induce the cement-makers to agree to a standard test, but I failed lamentably, and perhaps it is as well that I did. But, though not supporting these German regulations and tests, I am quite prepared to admit that the Germans have done a great deal for the cement industry, and by individually carrying out a vast number of experiments have induced and fostered an improved manufacture, but they have to a very great extent stultified the value of their experiments and tests by a too strict and almost bigoted adherence to the purely scientific and theoretical side of the subject. HENRY FAJJA, M.Inst.C.E.

November 3, 1890.

SIR,—With regard to Mr. Roechling's letter in the *Builder* for November 1 [p. 348], giving the Prussian standard rules for cement testing, the latter would appear to be almost identical with those laid down by the Metropolitan Board of Works in 1886, and, I believe, continued by the London County Council. The fineness and residue are exactly the same, but the Prussian test is 227 lbs. tensile strain, as against the Board of Works' 250 lbs., the relative proportions of sand, and cement, and age being alike. The rules of the Prussian authorities as to "blowing" are those recommended by Mr. Grant, Mr. Fajja, and others, years since, so that possibly the Prussian standard tests of 1887 were adapted from the Metropolitan Board of Works' tests of 1886. At any rate, the latter were the outcome of many years' experience and many thousands of experiments, and might well be recognised as a uniform standard for high-class cement. It is worth noting that Mr. Grant, as engineer for the Board of Works, made a large number of experiments, in the years 1861 and 1862, with cement mixed in various proportions with sand, and the average of many tests subject to similar conditions to those stipulated by the Prussian authorities, *viz.*, 1 of cement to 3 of sand, only gave, in 27 or 28 days, a tensile strain of 108 lbs. on a specimen of area of 2½ in., the requirements now are 227 to 250 lbs. per superficial inch.

The Forth Bridge contract stipulated that 1 part of cement and 3 parts of sand should withstand a tensile strain of 170 lbs. per in. in 24 hours; the Metropolitan Board of Works' test in 1859 only required a tensile strain of 178 lbs. on neat cement of the same age. This remarkable increase of the capacity of cement to amalgamate with sand to form mortar, suggests whether the time has not arrived when for ordinary building purposes it may not take the place of lime. As a matter of fact, measured by strength, Portland cement is now cheaper than lime, and although specifications for building contracts, as a rule, I believe, require the same amount of sand to cement as formerly, a very much larger proportion of sand could be used, and yet make a first-class mortar. THOMAS POTTER.

Abresford.

### BETHNAL GREEN SLUMS.

SIR,—Apropos of the necessary remodelling of the neighbourhood of Columbia- and Virginia-roads by the clearing out of so much that the continuation of these roads into the High-street of Sporeditch could be effected at a very small cost, and as no more favourable opportunity than the present can occur for about another century, I would like to put the question publicly, through your valuable medium, What are the local authorities about to allow the new\* dwellings (now about to be erected) to have such a large frontage on this route, and not to set back, at least, 20 ft. from centre of the road? In our suburbs,—often laughed at on account of their insignificance,—such would not be tolerated

\* Guinness's dwellings.

(not even for a local somebody), as they would pay compensation if it could not be done without it. Surely there is something wrong, as everyone knows by this time. Given good wide thoroughfares, and much of the objectionable character these neighbourhoods sink into will be changed. Here is an opportunity: about three-quarters of a mile, mostly of good width, but cramped at each end, and now no time to be lost. Whoever heard of such a thing? A big block, perhaps five or six floors high, and yet the roadway at one end speaking without measuring, I have no hesitation in saying, including footpaths, under 20 ft. wide, the other end perhaps 5 ft. wider, though I doubt if 25 ft. True, there is a thoroughfare of 30 ft. or 35 ft. running into this at the wider end, but what is that in, perhaps, 400 ft. of frontage?

I trust the publicity of this will find out the way to not only initiate, but to complete, the whole of this much-needed improvement.

A CONSTANT READER.

### "DEATH IN THE VENTILATOR."

SIR,—I have pleasure in endorsing the remarks of Mr. Buchan in your paper of last week [p. 372] with respect to the fixing of a mechanical ventilator provided with a balanced valve so constructed as to be closed by a moderate blast of wind at top of soil-pipe. I, too, must denounce this as being quite against all that has been done to prevent syphonage of the w.c. traps. In the first place, it would soon get out of order, and, provided it got fixed open to its full extent, so much the better. A moderate blast of wind would partially close the valve, and the sucking-action of the discharge of a w.c. at the time would finish it, resulting, most probably, in the syphonage of the w.c. trap, even were the latter ventilated. Those who fix these will have the pleasure of removing them at no very distant date—at least, I hope so.

Bristol.

## The Student's Column.

HOT-WATER SUPPLY FOR BATHS, LAVATORIES, &c.—XIX.

IMPROVED SYSTEMS (continued)—COILS AND COIL SERVICES.

AN instance of a descent in circulating pipes to which no objection can be raised is when it becomes desirable to carry a returned draw-off service close to the tap. It has been the general practice when returning draw-off services to connect the returned portion at the point where the pipe turns down to the tap, as fig. 47, leaving some

6 or 8 ft. of single pipe in which the water lies stagnant; this in many instances is not very objectionable, but, should it be desired, the pipe may be returned from a point close to the tap, as fig. 48, and the circulation under this arrange-

ment will be very good; or where the pipes rise to the tap, as fig. 49, the circulation will be found quite perfect. In the case of a lavatory basin, it is always a satisfaction to find hot water issuing immediately a tap is opened; the majority of these have but small taps, and annoyance is always experienced here if any cold water has to be drawn off before the hot arrives.

As a general rule, there is only one objection to dipping the circulating pipes (provided the

lip is not a very deep one), which is, that it probably leaves some portion of the pipes as at fig. 46 (see p. 349, ante), and the disengagement of the confined air will give in-

FIG. 49.

finite trouble, and, on this account, any plan of carrying the pipes in irregular directions requires considerable thought before being put in practice, for it must be borne in mind that a collection of air in pipes will quite impair the efficiency of the apparatus and bring about noises and erratic results. In a heating apparatus, air-cocks for releasing confined or collected air figure very prominently, as they require fairly regular use; but a heating system is commonly under the care of some one who has a knowledge of the air-cocks and their use, which cannot be looked for from the maidservants in an ordinary residence.

In completing this paper, there is a feature in the cylinder system which has not been mentioned before, but which is of considerable importance in rendering general good results, and this is the insertion of a stop-cock in the secondary return, which should be closed at night to stop the circulation and so retain the store of warm water in the cylinder (which is usually in a warm position), and which can then be relied upon to provide a tepid bath before the fire is lighted in the morning. If the upper circulation is not stopped, we have the water travelling around the house dissipating its heat in all directions, to no purpose, as the circulation will not cease of its own accord until the water is cold.

The best position for this tap is in the kitchen or somewhere where it can be easily used, as fig. 50; no harm can ensue, as, should it

FIG. 50

be left closed, it only converts the secondary flow into an ordinary single-rising main, and the effect is that a quantity of cold water would have to be drawn before hot was obtained in the morning. If the cock has to be put near a ceiling it can have a cross-key with cords or chains, as fig. 51.

FIG. 51.

COILS AND COIL SERVICES.

The attachment of a small quantity of hot-water pipes or a coil or radiator to a supply apparatus is much in vogue, but it is really not a practice that can be recommended very strongly unless special circumstances render it necessary. In the first place, a coil service and a supply service for draw-off purposes are directly at variance with each other in the objects that they are intended to attain, as with the former the sole aim and purpose is to radiate, dissipate, and transfer the heat from the water to the air; whereas with the latter every effort is usually made to conserve the

heat within the pipes, so that it may all be had with the water from the taps, and not to diffuse it with a proportionate reduction in the temperature of the water; consequently, if a heating appliance of any description is connected on to an existing apparatus, a reduction in the quantity or the temperature of the hot water must be anticipated; or, if we include such an appliance in a new apparatus, we must, of course, put a boiler of a power more than sufficient for the taps only.

It is very commonly desired to heat a small greenhouse or conservatory by one or two pipes heated from the kitchen boiler, and this arrangement is just as commonly carried into effect; but it has a most fatal objection, which is that when the heat is most needed, in the early morning hours, the fire is out and the water cool. This objection is not so noticeable with a coil in the house, as the loss of heat brings about no serious harm and no particular inconvenience at night, when the occupants are at rest; but, at the same time, if the coil was in connexion with a stove that kept the fire going all night, a good deal of comfort would be felt from the warm temperature in the early morning, when the cold is greatest and felt the most.

If the kitchen range has a convertible open and close fire, this goes far towards overcoming the difficulty just referred to, as an open fire, if fed the last thing at night, will frequently remain burning until morning, and, although the combustion is slow, it keeps up the temperature very well, as but a small fire will do this when no water is being drawn off.

In concluding the objections to the arrangement now under discussion, it should be mentioned that a boiler which is sufficiently powerful to give a good supply of hot water and satisfactorily work the heating appliance in winter will probably prove a source of worry in the summer by furiously overdoing its work, as the water would be then shut off and the demand for hot water considerably diminished.

The oldest form of coil is that having box ends, as, in fact, many are made now, but the joints between the pipes and the box ends were made and secured by a rust, or a composition joint, which was a great source of trouble to make up, and these rigid joints did not do very well, as the expansion and contraction brought about occasional leakages, and, under the best of circumstances, the erection was abnormally ugly, requiring an expensive casing solely to hide it. This casing itself introduced two obstacles to the success of the coil, the first being that it obstructed and absorbed a deal of heat; and, secondly, and worse, it made it difficult to keep the coil clean, and it is surprising what a preventative of heat-radiation a coating of dust is, it being composed chiefly of poor conductors of heat (minute particles of wool, fibre, straw-like materials, and stone grit).

More recently two or three forms of expansive joints (the packing medium being a rubber ring or collar) have come into use, and are a decided improvement, as, although costing a little more, the joint does not give way, and the labour of erection is reduced to a minimum. Fig. 52 in

FIG. 52

section is one of the best-known of the joints as applied to two lengths of pipe. It will be noticed that the pipes may have perfectly plain

FIG. 53.

ends; no sockets being needed, and if the pipe-ends are a little rough or irregular a good joint can still be made. Fig. 53 shows a coil made up

with this joint, connecting the pipes to the box ends.

XX.

COILS AND COIL SERVICES (continued).

A MORE recent introduction, which is very suitable for houses, as no casing or other device for hiding it is necessary, is termed a "radiator" (fig. 54). These are now being made in various designs and forms by different manufacturers, and as they can be treated to match the surrounding decorations their appearance need not be objectionable.

FIG. 54.

The majority of these radiators have the pipes in a vertical position, and an object retained in view by the manufacturers is to give as large a heating surface as possible with the smallest quantity of water, so that they can be heated up quickly, although, of course, they as quickly grow cold when the fire is out; but this is not a serious matter in a residence where the kitchen fire is always alight from 7 a.m. to 10.30 p.m. The small quantity of water is an advantage, as a coil of ordinary pipes which holds so much water is like attaching a second reservoir to an apparatus, and it greatly imperils the efficiency of the boiler, and takes a great deal of time to heat.

As a general rule, it may be considered that two medium-sized radiators is as much as ever should be attached to a domestic supply apparatus; to attach more than this will only be at the risk of rendering the supply of hot water at the taps inadequate in temperature, and it is only when a boiler is more powerful than is necessary for the supply of water drawn off that this can be done.

There has been some controversy as to which gives the best results—a coil or radiator of vertical pipes, or of horizontal pipes. From experiments made it is found that the water will circulate through each at about the same speed, but with horizontal pipes there will be found a difference in temperature between the top and bottom pipes, whereas with the vertical pipes the circulation is regular through all pipes, and it is quite the exception for one pipe to heat differently to the others, supposing no obstruction exists; but it has to be pointed out that with vertical pipes, if air accumulates, preventing the pipes filling right up, the circulation will be checked, but at the same time this only indicates that the air-cock wants opening, which instantly remedies the trouble. A strong point in favour of vertical pipe-coils is that they do not get coated with dust so quickly.

There are various ways of connecting these appliances to the circulating pipes; some on to the flow-pipe only, some on to the return (the secondary return to a cylinder, not the return of a tank system), and some on to both flow and return.

To commence with the first arrangement, fig. 55 illustrates a radiator connected to a

FIG. 55

flow-pipe with a stop-cock beneath to divert the whole or part of the water through the coil as required; if there were no stop-cock at this point the apparatus would still heat, but not so rapidly; and it is usually found desirable to have the cock so that it can be "set" to permit of the coil having a fair share of the circulation without interfering seriously with the house

supply. The setting of the cock is necessary, as requirements differ so greatly, some people needing hot water at a later hour or in less quantity than others, or considering the coil of the most importance; and in some instances the coil is closed off while the cylinder or tank is being heated up, and so on. If desired, the cock beneath can be quite closed, so that all the water has to pass through the coil, which will heat it up quickly, but it must not be expected to have hot water at the taps past the coil so quickly in the morning as when this tap is partially opened; in many cases, however, it can be done, and although the flow of water has to first rise up to the coil and then descend, the circulation will not be impaired. The stop-cocks at the sides of the coil are for wholly stopping off the circulation when not required; two stop-cocks are necessary if the coil is required to be quite cold, or if the coil is provided with a tap to empty it and prevent its rusting when not in use. It will be noticed that the arrangement just explained introduces an objectionable feature, viz., stop-cocks in the flow-pipe.

FIG. 56

Sometimes it can be arranged as at fig. 56, by which a little better results are obtained, as the flow-pipe has not to descend; but the gain is so slight that it is not worth going to a great trouble to effect it.

FIG. 57

When it is desired to connect the coil with both flow and return, it is done in a similar way to a returned draw-off service, as at fig. 57 or fig. 58, with stop-cocks, as shown, and this arrangement has the advantage of having no cocks in the primary flow or return services.

FIG. 58

If a coil is attached to the secondary return of a cylinder apparatus, it can be arranged as at fig. 59, but in this case the cocks can be adjusted to allow the whole of the current through the coil, supposing there are no draw-off taps past it,—i.e., between the coil and the cylinder,—at E, for instance.

It is usually found that if two stop-cocks are not provided for shutting off the coil (one in the pipe to it, and one in the pipe from it) the coil will not remain quite cold, and, although its temperature will not be high, the warmth is usually objected to in the hot summer months, when the least artificial heat is considered intolerable. It is found in the majority of cases that one stop-cock, although closed, does not wholly prevent a feeble circulation setting in up the open pipe, although this is generally aggravated by the stop-cock being placed in the wrong position. If the cock is placed in the pipe that leaves the coil, as shown at fig. 57, the coil will not heat, except to a trifling extent, as we have to remember that, although a slow cir-

ulation will set in up a single pipe, it is next to impossible for it to take place in a directly descending one.

FIG. 59

The radiators referred to are generally supplied by the makers completely fitted, so that the connexion of flow and return pipes is all that is needed. This makes an agreeable improvement over the old pattern coils, which had to have all the pipes fitted and jointed on the premises. Of course, this convenience is paid for in the increased cost of radiators over plain coils.

#### SURVEYORSHIPS.

**SOUTHAMPTON.**—Mr. A. D. Creatorox, of the City Surveyor's office, Manchester, has been appointed Assistant Borough Surveyor of Southampton. Mr. Creatorox served his articles under Mr. J. Price, Assoc. M. Inst. C.E., Engineer and Surveyor to the Tentheth Park Local Board, near Liverpool, and for the past four years has been hon. sec. of the Association of the Manchester Students of the Institution of Civil Engineers.

#### OBITUARY.

**MR. J. P. HOLDEN.**—The death of Mr. James Platt Holden is announced. One of the oldest architects and surveyors in Manchester, he commenced practice in 1838, with his brother, Mr. Isaac Holden (who died in 1894). Born in Liverpool in August, 1806, he served his time and worked as a Journeyman bricksetter; then emigrated to America, where he first worked as journeyman; then as builder; and, ultimately, as architect and surveyor. Returning to England in 1838, Messrs. Isaac & J. P. Holden continued practice in Manchester until 1852, when they separated by mutual consent, each continuing on his own account. Mr. James P. Holden held the office of Surveyor to the Dean and Chapter for something like thirty-five years, and of architect to the Cathedral for about twenty-eight years, during which time a considerable portion of the fabric was restored, and the new tower rebuilt. Retiring in 1879, he still retained his connexion with the profession through the Manchester Society of Architects, of which he was one of the original members. He was also one of the oldest members of the Literary and Philosophical Society of Manchester. He has passed away at the ripe age of eighty-five years, and will be remembered by many friends for his kindly disposition and his readiness to assist others in all matters within his power. His nephew, Mr. John Holden, is a member of Council of the Institute.—*R.I.B.A. Journal.*

**MR. WILLIAM STEWART.**—The death is announced of Mr. William Stewart, the Town Surveyor of Rugby. Mr. Stewart, who was articled to a Rugby architect, succeeded Mr. J. Palmer, the present Surveyor of Malvern, in the office about sixteen years ago. According to the *Birmingham Gazette*, he was thoroughly in the confidence of the Board, and during his surveyorship had designed and carried out several important works—notably, the surface-drainage scheme, the laying-out of the recreation-ground and the cattle-market.

#### GENERAL BUILDING NEWS.

**NEW CONVENT OF THE SACRED HEART, COOKSTOWN.**—The new convent of the Sacred Heart, Cookstown, which has just been completed, was formally opened on the 6th inst. This building has been erected from design by Mr. William Hague, Dawson-street, Dublin. It consists of three stories. On the second floor are the cells or sleeping apartments of the community. The lavatory, bath-rooms, and hot-water arrangements, together with the electric bells, have been put up by Mr. W. J. Scott. The contract for the convent has been completed by Messrs. McNally & McKee, Cookstown.

**CHURCH OF ST. MARY MAGDALENE, SANDRINGHAM.**—The reopening on the 9th inst., after enlargement, of the Church of St. Mary Magdalene, Sandringham, was attended by the Prince and Princess of Wales. The earliest portions of Sandringham Church belong to the end of the twelfth or the beginning of the thirteenth century. The chancel was rebuilt with a vestry on the north side in 1857. The works just completed consist of improvements in the chancel by strengthening and raising the walls, altering the windows, replacing the deal roof with an oak one, and the erection of a porch over the south chancel door. A specially-designed floor, executed in rustic mosaic, has also replaced the former tiles in the spaces now occupied by seats. A necessary enlargement of the church has been made by the addition of two small transepts, and a new pulpit of carved oak on a stone base takes the place of a stone one put up when the chancel was rebuilt. A rearrangement of the choir seats and the font, a new warming apparatus, and several necessary general repairs complete the work, which has been carried out from the designs and under the direction of Sir Arthur Blomfield.

**ST. JAMES'S CHURCH, TREDGAR.**—The Bishop of Llandaff on the 6th inst. consecrated a new church at Georgetown, Tredgar. The church, which will accommodate 500 persons, is in the Early English style of architecture. The plans were prepared and won in competition by Messrs. James & Morgan, of Cardiff, and the work has been carried out by Mr. Edward Morgan, of Tredgar, whose contract price was 2,200*l.* The building is divided into nave and aisles by an arcade of arches, supported on Corsham Bath stone columns, with moulded caps and bases, and clerestory windows being inserted over the arches. The choir vestry is situated on the north side, and the organ-chamber on the south side, of the chancel. The elevations are faced externally with blue Bedwelly stone, with grey Forest of Dean stone dressings to the doorways, windows, copings, &c. The west end of the chancel is surmounted by a bell-cot, worked out of Forest of Dean stone, and covered with blue and purple slates in alternate courses. Internally the roofs are open to the ridge, and are constructed of pitch-pine. The seating is also of pitch-pine. The pulpit is of Corsham stone and pitch-pine, moulded and carved. The font is of Caen stone, moulded and carved. Both were executed by Mr. Wortleington, sculptor, of Cardiff.

**MAIDSTONE CHURCH INSTITUTE.**—The formal opening of a new hall, in connexion with the Maidstone Church Institute, to be called the Hollingworth Hall, took place on the 6th inst. The new portion of the Institute is situated at the rear of the building in Union-street. The whole of the basement is occupied by the gymnasium, which measures 51 ft. long by 23 ft. wide, and is paved with wood block paving. A small dressing-room with lavatory, &c., adjoins it. The ground floor contains three well-lighted rooms, approached by a corridor leading from the present entrance hall. These rooms are allotted for library, senior's room, and recreation-room. The recreation-room measures 30 ft. by 20 ft. The upper floor is occupied by the new Hollingworth Hall, which measures 51 ft. by 23 ft., and will seat 300 people. A permanent platform occupies the further end of the hall, and a small retiring-room is provided. An iron external staircase is also provided. The building is warmed throughout by hot water. The building generally is in accordance with the plans of the late Mr. E. W. Stephens, F.R.I.B.A., who was the architect for the first portion. The contractors were Messrs. G. E. Wallis & Sons.

**MEMORIAL CHURCH AT ABERDULAIS.**—On the 6th inst., the foundation-stone was laid of the St. Anne's Memorial Church at Aberdulais (Neath), by Miss Mary Griffiths, of Resolven. The designs have been prepared by Mr. E. H. Lingen-Barker, of Hereford, and the contract has been entrusted to Mr. Walter Dowland, of Abercaverry. The Gothic style of architecture has been chosen. Sitting accommodation will be afforded for 300 persons.

**METROPOLITAN POLICE STATIONS.**—For the improvement and enlargement of some of the principal stations within the metropolitan district, certain land and hereditaments, as follows, are about to be acquired—St. James's, Westminster; 11,350 ft. superficial, with the police-station and Court in Great Marlborough-street, and No. 20 in that thoroughfare. Hackney: 5,772 ft. superficial, with No. 422, Mare-street, and the police-station next west of St. John's churchyard. St. Pancras: 3,355 ft. superficial, with Nos. 53, 55, and 57, Judd-street, and the contract has been entrusted to an area of 11,010 ft. superficial, which is taken for purposes of a new police-station on the western side of Kentish-town-road, between the Midland Railway line and Holme's-road (formerly Mansfield place).

**THE HORNE CROSS ESTATE, GREENHITHE.**—We understand that the whole of the property, consisting of about fifty acres, and known as the Horne Cross Estate, Greenhithe, has been disposed of by Mr. Frederic W. Fryer, of Walbrook, for the sum of 20,000*l.*, and that Mr. Fryer has been retained by the purchasers to lay out the same and to act as architect and surveyor for the extensive building operations which are to be immediately commenced.

**THE NEW TOWN HALL AT SUNDERLAND.**—The Mayor of Sunderland (Mr. Robert Bradford, J.P.), formally opened the New Town Hall on the 7th inst. the buildings have been erected in Fawcett-street, at a cost of about 50,000l. The architect was Mr. Wrightman Binyon, F.S.A., of Sunderland. We have a view of the buildings in the *Builder* for May 21, 1887.

**NEW R.C. CHURCH FOR STRABANE, IRELAND.**—The ceremony of laying the foundation-stone of the new Catholic church of Mary Immaculate, by the Bishop of the diocese, took place on the 9th inst. at Strabane. The church is to be cruciform in shape, and of dimensions capable of accommodating a large congregation. The architect of the work is Mr. Hague, of Dawson-street, Dublin, and the contractor Mr. R. Cullen, of Portadown.

**NEW CHURCH FOR ASTON.**—The foundation stone of the new church of St. James's, Aston, which is to be erected at the junction of Whitehead and Redrick-roads, was laid on the 8th inst. by Mr. S. Lloyd. The contract for erecting the chancel, vestry, and chancel aisle—the portion of the work he carried out first—has been accepted by Mr. T. Collins, of Tewkesbury, from plans of Mr. A. Chawlin.

**ANTY AND ENGINEERING NEWS.**

**WATER FILTRATION AT NANTES.**—The British Consul at Nantes, in a recent report on the commerce and trade of that district, gives an account of some experiments as to whether it was practicable to use natural filtration through sand to obtain from the Loire a sufficient quantity of good water to meet the requirements of the city, whose inhabitants numbered, in 1888, over 127,000. At a certain distance up the river, above the city, an artificial islet of sand was constructed on a bed of marl material in the middle of the river and provided with a dam across the river from the west and a revetment of loose stones. Through this mass of sand a well was sunk into the bed of the river. The well was constructed of stonework, water-tight, with ranges of "harbooms" or apertures filled with hal stones to stop the ingress of filth, which could be closed to any degree, so as to prevent the water from overflowing the river from forcing its way through the well too rapidly. The water filtered through the sand into the well was pumped out by steam-power. The experiments were most satisfactory, and as regards the quality and quantity of the water, the former being pronounced to be as clear and limpid as any passed through "Pastor's" filter, with the advantage of being better aerated. It is estimated that the water wells sunk in the vicinity would supply all the requirements of Nantes.

**THE NORTH CHANNEL TUNNEL.**—The scheme proposed by Mr. Barton, to connect Islandmagee, County Antrim, and Wigtownshire, by a tunnel through the North Channel, is an undertaking which, although more stupendous than any other in a Channel tunnel, is far more likely to be carried out than the plan of Sir Edward Watkin. Mr. Barton's tunnel is to be thirty-three miles in length; its greatest depth below the bottom of the channel 500 ft., and the steepest gradient 1 in 75. It is estimated that the undertaking has the support of Sir John Hawkshaw, Sir Benjamin Baker, and Sir Douglas Fox. The estimated total cost of the tunnel is 8,000,000l., which seems rather high, and it would take from ten to twelve years to complete it. Of the great importance of the work we can be in no doubt; nor would there be any misgivings as to its practicability. The only difficulty which faces the problem of ventilating such a stretch of tunnel, for air-shafts would be out of the question.—*Iron.*

**PROPOSED PLUMBERS' REGISTRATION CENTRE IN BIRMINGHAM.**—The Mayor (Alderman Clayton) has issued a notice on Wednesday, the 19th inst., for a public meeting at the Central Hall, Corporation-street, in support of the memorial recently forwarded to the Municipal Company of Plumbers in favour of abolishing a registration centre in that city.

**FOREIGN AND COLONIAL.**

**FRANCE.**—M. Yves Guyot, Minister of Public Works, is to proceed shortly to Yssengouin (Haute-Loire) to examine the line of railway from that place to Puy.—The Minister of Public Instruction has presented to the Museum of Dioppe a statue by Aizelin, "Vestale," and a picture by Paul Colin, "La Ferme de Laysal," both from former Salon exhibitions. Baron Alphonse de Rothschild has sent to the same exhibition M. Hector Leroy's sculpture of "Jeanne d'Arc." Last Monday the monument to the "Moules" of Doune killed in the war, of which we have already written, was formally inaugurated. The monument by the sculptor Roubaud.—At Bethune (Pas-de-Calais) a competition has been opened for a new Salle d'Armes, to cost 100,000 fr.—Prize of 2,500 fr., 100 fr., and 1,000 fr. will be awarded for the best designs.—M. Larroumet, the Director of the Arts, has caused the replacement of the shells, formerly surrounding the lead coffins of Princes of Condé, which are in the crypt of the Abbey of St. Denis. This has been done at the request and at the expense of the

Duc d'Annam.—The Government has just commissioned from M. Tarcan Croisy and M. Horace Dailion three stone statues intended to adorn the court of the Louvre, and to represent "Painting," "Sculpture," and "Science." Millet's celebrated "Angelus" has been bought back again by M. Chaudard at a price of 750,000 fr., from the American Art Association, which has however retained the right to exhibit it in America till January next. M. Chaudard, who was one of the founders of the Magasin du Louvre, has already a remarkable collection of pictures.—Next Sunday, at the Mont Parnasse cemetery, the monument erected to the memory of Langon, the etcher, is to be inaugurated. The monument is the work of M. Chas. Gauthier.—The death is announced of M. Eudoxe Mareille, the learned director of the Museum of Orleans.

**BERLIN.**—The Verein Berliner Kuenstler proposes the arrangement of an international Art Exhibition for next year. Although the Government has expressed its approval of such a scheme, and has even promised 2,500,000 towards the decoration of one of the halls, an ultimate decision has not yet been published by the above society.—Professor Raschdorff (honorary corresponding member of the Royal Institute of British Architects) has received the commission from the Potsdam mausoleum of Emperor Frederick III. in connexion with the latest design for the proposed Berlin Cathedral is being worked out to a scale of 1:100, and a model of the design is being made; definite proposals, with specifications, &c., will be laid before the Imperial Reichstag next Spring.—Although the Potsdam mausoleum, with together over 1,100 beds, have been completed in rapid succession, we already hear of proposals for a new one—an accident hospital, the wards of which are to be kept by the different trade societies, who have up till now paid for their sick members lying at the common hospitals.—At a meeting held in connection with the restoration of the old Prussian Castle Marienburg, near Danzig, it was stated that some 4,700,000 marks would be required to do the work thoroughly; about 900,000 marks are so far available; the sum still required is to be raised by means of a set of five lotteries opened by permission of the Emperor.

**THE WATER SUPPLY OF VIENNA.**—According to the official report on the water supply of Vienna for 1889, the length of water pipes at the close of the year was 297,378 metres (185 miles), of which 33,464 metres were outside the city boundary. Of the 13,531 houses of the ten districts of Vienna, 12,104 had been connected with the mains. For watering the streets and public gardens, 993 underground hydrants are provided, while for fire-extinguishing purposes there are 828 hydrants. For controlling the supply to houses, 11,931 watermeters of various construction have been fitted. The average daily water supply amounted to 53,680 cubic metres (43,702 in winter and 63,637 in summer), or 11,809,600 gallons.—The water rates yielded 1,763,743 florins (about 175,000l.).

**INTERNATIONAL EXHIBITION IN ROME.**—Negotiations are in progress for the holding of an international exhibition on the same scale as the last one in Paris, in Rome, a few years hence. The president of the committee having the arrangements in hand is Signor Baccelli, ex-Minister of State.

**CONSTANTINOPLE.**—The new railway station of the Oriental Lines has been opened, in presence of the Sultan.

**NATAL.**—Mr. W. H. Radford, C.E., of Nottingham, has just been appointed consulting engineer for the new waterworks at Newcastle, Natal.

**MISCELLANEOUS.**

**THE SURVEYORS' INSTITUTION.**—The opening meeting of this Institution for the present session was held on Monday evening last, when the President, Mr. K. C. Driver, delivered an address, part of which was in type; but we are obliged to hold it over until next week for want of space.

**THE PROPOSED NEW RAILWAY STATION SCHEMES IN EDINBURGH.**—On the 31st ult. an adjourned meeting of the local committee of the National Art Association was held to consider further the schemes for improvement in connexion with railway-station matters in Edinburgh.—Mr. G. S. Aitken, architect, submitted a plan for dealing with the area of the North British railway east and west of the North Bridge. He considered that as the present station roofs to the west cut so much into the North Bridge arches, it was undesirable to entertain the idea of a span-bridge of the usual form, but to treat the terraces or embankment, extending it eastward and westward, and lighting the space below by arcades at the sides. The east line of the terrace would be in continuation of the back of the existing buildings at the south end of the North Bridge. The western side of it was represented as about 100 ft. westward of the present west parapet, with a recess in the centre in the form of an octagonal bay. The "Place" so formed would be over 200 ft. wide at the broadest part, exclusive of the bay referred to. The station below was assumed to be entirely

roofed in on the west as far as the Waverley Bridge, and on the east as far as the Regent Arch; the roof of the Eastern section was arranged in two levels, and treated as terraces with flights of steps from the altered North Bridge; that on the west was arranged in one terrace with stairs also from the North Bridge. On the west, a circular two-storied building of moderate height is placed, which would form a point of view from which on two levels the fine prospect westward could be enjoyed; on the east the terraces would serve the same purpose as regards the eastern view; and to conceal the unsightly railway lines which would appear in the hollow between these terraces and the Calton Hill, a domed building with wings was shown which could be used as a winter garden, or for some similar purpose. It was objected that Mr. Aitken's plan filled up too much of the valley, but a vote of thanks to him was passed for it, on the proposal of Professor Baldwin Brown, who said that it might be kept in mind when the North British Company brought forward their plan. Another plan, by Messrs. H. F. Kerr and F. W. Simon was then discussed. This plan was described in the *Scotsman* of October 21. It is based on the assumption that the Caledonian Company should be allowed access to the east end of the city, provided it can be done without injury to the amenity of the city. The route proposed by the directors wd Princes-street, and with a station in the Waverley Market, and under the roadway at the Register House, was taken to objection, and has met with great opposition on account of the tunnelling of Princes-street, the unsatisfactory nature of the station accommodation, and for other reasons. The route suggested by Messrs. Kerr & Simon is by tunnel through George-street to a daylight station in St. James's-square, and thence by viaduct over Greenside, and a tunnel through Calton-hill to the lines of the Company already authorised at Easter-road. It was resolved that a deputation should wait on the Town Council representing Messrs. Kerr & Simon's plans as preferable to any of the Caledonian Company's schemes, but without hindering the Association to it. Since this was in type we have received a newspaper containing Mr. W. Shelford's report to the Town Council on the subject.

**THE ENGLISH IRON TRADE.**—Notwithstanding adverse influences—a high bank-rate and Stock Exchange panic—it cannot be said that the English iron market has changed sensibly. There is still a steady, if moderate, trade, prices being fairly well maintained, the reductions which have been made being chiefly attributable to the causes mentioned. The effect of an excited money market would naturally be reflected, in the first place, in that other centre of speculation, the Glasgow warrant market, and this has been the case, constant fluctuations having characterized its course during the past week. Bessemer iron in the North-West has lost 1s. per ton. The finished iron market preserves its steady tone almost generally, only manufacturers requiring work consenting to slight reductions. The demand for steel shows no abatement, and ruling prices are in consequence well adhered to. Shipbuilders continue active, although the placing of fresh orders is not general, in one or two instances good bookings have been made. Engineers have a respectable amount of work in hand.—*Iron.*

**ROBERT BOYLE & SON, LIMITED.**—The directors of Robert Boyle & Son, Limited, ventilating engineers, London and Glasgow, have resolved to recommend a dividend of 12½ per cent, free of income-tax, on the ordinary and deferred shares of the company for the year ending September last, placing to reserve-fund one-sixth of the profits earned, and carrying forward to next year a balance of 1,269l. We are informed that the year ended has been the most prosperous since the formation of the company. Mr. Robert Boyle recently visited Egypt, India, China, and Japan, and has surveyed and furnished plans and estimates for the ventilation of the Khedive's palace, Cairo; drainage of Bombay; French Cathedral, Canton; Summer Palace of the Emperor of China, Peking; New Houses of Parliament, Japan; Imperial University, Japan; also a scheme for the improved sanitation of Peking.

**GLAZING.**—Messrs. Mellows & Co., of Sheffield, ask us to state that the extensive range of buildings, consisting of large winter garden, conservatories, and ferneries, erected at Avery Hill, the residence of Colonel North, have been glazed by them with their patent "Eclipse" glazing. The structure are entirely of iron, and the superficial measurement of the roofs is about 45,000 sq. ft. The same firm also inform us that they have obtained a three years' contract from H.M. War Office, for supplying and fixing their "Eclipse" imperishable glazing (tin-lead and steel bars) at the Royal Arsenal, Woolwich, and at the dockyards and other Government establishments.

**LIBRARY OF THE LATE J. G. CRACE.**—The catalogue of the library of the late Mr. J. G. Crace, which is to be sold early next month by Messrs. Sotheby, includes a considerable number of rare and curious books on subjects connected with architecture, decoration, and building.

PUBLIC APPOINTMENT.

Table with columns: Nature of Appointment, By whom Advertised, Salary, Appointments to be delivered.

Those marked with an Asterisk (\*) are advertised in this Number. Competition, p. iv. Contracts, pp. iv., vi., and vij. Public Appointments, p. xvii.

REMOVAL.—Messrs. Davey, Paxman, & Co., of Colchester, have removed their London offices from 183, Queen Victoria street, to larger and more convenient premises, situate 75, Queen Victoria-street.

TILES.—We have received from Messrs. Malkin & Edge, of Burslem, a well-printed sheet in chromolithograph showing a number of their recent tile patterns to a scale of 2 in. to a foot for hearth and wall tiles, and 3 in. for floor tiles.

ELECTRIC LIGHT IN SURREY.—The installation of the electric light has been completed at Woking, Surrey, and on the 10th inst. the light was supplied for the first time to private consumers. The price charged is 8d. per unit, which is equivalent to 4s. 2d. per 1,000 ft. of gas. Hitherto Woking has had no illuminant other than oil and candles, and there is no system of public lighting whatever.

ST. MARY MAGDALEN, OLD FISH-STREET.—Having been left desolate since the fire of December 2, 1886, which destroyed most of its interior, the Church of St. Mary Magdalen (Old Fish-street) in Kightrider-street, is about to be demolished. Notice has just been given that the tablets and monuments, together with the remains of those persons buried there, will shortly be removed.

ST. GABRIEL FEUCHURCH AND ANCIENT LIGHTS.—At a sitting of the Consistory Court, in St. Paul's, on the 5th instant, Dr. Tristram, Q.C., Chancellor of the Diocese of London, granted a faculty in respect of St. Gabriel Feuchurb churchyard. The rector and churchwardens asked for authority to license the City of London Real Property Company, occupants of Nos. 35 and 36, Lime-street, to open seven ancient and certain other new lights in their wall, which forms the western wall of the now disused burial ground.

\* For an account of the church (with view) and of the site see the Builder of December 11, 1886.

LEGAL. BUILDING BEYOND THE LINE OF FRONTAGE.

THE adjourned hearing of the summonses against the City and South London Railway Company for building stations at the corner of New street, Kennington-park-road, and Harleyford-road, Kennington-oval, beyond the line of frontage, and without the consent in writing of the London County Council, were heard at Lambeth Police-court, on Monday.—Mr. J. C. Glen supported the summonses on behalf of the London County Council, and Mr. William Graham represented the company.

INFRINGEMENT OF BUILDING BY-LAWS.

At Barnsey on the 5th inst., Mr. William Ritchie, surgeon, of Hoyalnd, was summoned for two breaches of the building regulations of the Wexley Union Sanitary Authority, by allowing several houses which he had erected at Tankersley, to be inhabited before receiving a certificate of their fitness for habitation from the inspector to the authority.

MEETINGS.

MONDAY, NOVEMBER 17. Royal Institute of British Architects.—Business meeting for Members only. 8 p.m. Royal Academy of Arts.—Professor A. H. Church, M.A., F.R.S., on "Selected and Restricted Palettes." 4 p.m.

TUESDAY, NOVEMBER 18. Institution of Civil Engineers.—(1.) Further discussion on Mr. John McLaren's paper on Common Roads. (2.) Time permitting Professor John Milne,

F.R.S., and Mr. John McDonald on "The Vibrations of Locomotives." 8 p.m. Sanitary Institute (Lectures for Sanitary Officers).—Mr. A. Wynter Hyatt, on "Diagnosis of Animals in relation to Meat Hygiene." Characteristics of Vegetable Fish, &c., unit for Food. 8 p.m. Leeds and Yorkshire Architectural Society.—Address by the President, Mr. W. H. Thorp, F.R.I.B.A., 7.30 p.m. Manchester Architectural Society.—Mr. F. Barker, on "A Three Months' Tour in Belgium and Northern France." 7.30 p.m. Glasgow Architectural Association.—Mr. T. Robertson on "Art in our Homes." 8 p.m.

WEDNESDAY, NOVEMBER 19. Society of Arts.—Opening address of the Session by the Attorney-General, Sir Richard Webster, M.P. 8 p.m. Institution of Electrical Engineers.—President's Conversation. From 9 to 12 p.m. London Society for the Extension of University Teaching (Chelsea Centre).—Mr. Walter Leaf on "Homes for the Sick and Aged." 8.15 p.m. British Archaeological Association.—Mr. A. Langdon on "Ancient Coped Stones in Cornwall." 8 p.m. Royal Meteorological Society.—Address by the President, Mr. Baldwin Latham, on "The Relation of Ground Water to Disease." 7 p.m.

THURSDAY, NOVEMBER 20. Royal Academy of Arts.—Professor A. H. Church, M.A., F.R.S., on "Chemistry of Painting: Methods." 4 p.m.

FRIDAY, NOVEMBER 21. Sanitary Institute (Lectures for Sanitary Officers).—Mr. A. Wynter Hyatt on "Sanitary Law, English, Scotch, and Irish; General Enactments, Public Health Act, 1875; and By-laws," &c. 8 p.m. Institution of Engineers.—Professor Silvanus Thompson, B.A., on "Electro-Magnetic Mechanism." 8 p.m.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS. 19,951.—KILNS: W. J. Hagen.—In order to obtain the greatest efficiency in heating kilns by common gas, the base of the gas producer, with an inlet for air provided. This communicates with other passages formed in making or depositing the goods in the kiln and allows the heat to be regulated and preserved. 19,952.—IMPROVED MORTISING CHISEL: R. W. Little.—The extremities of all three walls of the chisel extend so as to lie in the same horizontal plane, assuming the chisel to be vertically placed, but only one of the side or blade is brought to a cutting edge, the other, though very thin, being ground off flat. This construction has an advantage in use, the wood being cut at the same time taken out of the mortice. 5,974.—IMPROVEMENTS IN GRATES: F. M. Goodall.—This invention consists of a removable support with legs forming part of the grate bars, and a frame with a screw for attachment to a stove. The grate itself is two semi-circular sections with hinges, allowing them to be raised and lowered, and the grate shaken. The grate bars may easily be removed altogether to clean or to away ashes. 9,883.—RATTLING WINDOWS: G. Kendall.—To prevent rattling from rattling a turn button of a special shape attached to a vertical strip, and pressing against the same. 11,443.—GYPSUM BRICKS: A. Buecher.—In order to overcome the difficulties of making light bricks, gypsum the calcium gypsum is stirred with water, mixed with specified ingredients and then dried. Advantages claimed for these gypsum bricks are lightness and the direct use of the bricks without mortar plaster, thus including vermiculite. 12,466.—SASH BALANCERS: G. C. Gardner.—Instead of using sashcord, a wire of thin metallic band, is employed by this inventor for the purpose indicated. 8,462.—BRICKS, AND BRICKS OR TILES: A. von Arnim.—Enamel bricks, plates or tiles, suitable

struction of friezes, floors, &c., according to this...
vention made by combining and melting ingredients...

### Further Notes on the Turin Exhibition.

WE have more than once referred to the future promise of Italian architecture as indicated in the work of those who are the students of to-day, the architects of tomorrow. To anyone who would understand the position of a people in regard to any branch of art, the work of its students, containing as it must do the best evidence of what may lie beyond the present, cannot but prove of the highest interest. There is sufficient in the Turin Exhibition to justify hopes that in the next decade, granted suitable opportunity for expression, modern Italian architecture may produce good and earnest work that will mark the end of the nineteenth century as a time of high achievement in the history of the art.

The fair promise for the future is, however, we can but regret, not universally indicated by all of the architectural schools represented in the exhibition. In the *Scuola di Architettura* that forms one faculty of the *Regia Scuola di Applicazione per gli Ingegneri in Torino* there is, unfortunately, too much evidence of an academic following of precedent, too little originality of conception, and too frequent exhibition of that lack of a fine sense of proportion in design which, as we have already remarked, is so frequently found in modern Italian architecture. From this school are exhibited designs for colleges, theatres, markets, libraries, and museums, illustrated by plans, elevations, sections, and details fully worked out, coloured and shaded, which show but too clearly a constrained and stunted art development, that exhibits the faults we have indicated.

When, however, we come to examine the work submitted from the *Scuola Speciale di Architettura* of the *Regia Accademia di Belle Arti di Milano*, we recognise that in Professor Boito has been found one of those born teachers who are able to draw out the best powers of the students who are so fortunate as to profit by the educational ability of their masters. One cannot doubt that the impres-

sion of the pupils of this school will leave on the sands of time will be one to be regarded with admiration and satisfaction in the chronicles of the future of Italian architecture. The school that has produced such men as Moretti, Sommaruga, and, in ecclesiastical art, Brentano, whose loss is one ever to be regretted, will bear like good fruit in the future.

Fortunately, too, we gather from the drawings exhibited in the Exhibition that, in modern Italy, a young man of ability and talent stands an excellent chance of being fairly recognised by the almost universal selection, in the great competitions here illustrated, of designs that can most readily be accepted as the best of those submitted. Possibly the method of deciding on the merits of designs sent in competition, which appears to obtain in Italy as elsewhere on the Continent, by a qualified jury rather than by a single assessor, has much to do with the satisfactory nature of the conclusions to which competitions are usually brought. The decision of a single assessor has not in our own country, as we need hardly remind our readers, been universally that which meets with the general approval either of the profession or of the press. With the most sincere intention and the most careful consideration, a single assessor, however unwittingly, may be, and we fear often is, unduly biassed, either by a predilection, possibly for some particular style, possibly for some particular principle of planning; or by what is equally fatal to a right judgment, by the desire to avoid undue prejudice, leading to an unsound conclusion, which might probably be avoided by the combination of varied views, such as is the necessary concomitant of the differing shades of opinion to be found in the minds of a properly-qualified jury. "In the multitude of counsellors there is wisdom" is as true at the close of the nineteenth century as when the statement was first formulated, and hence we cannot but feel that in the continental jury system, rather than in our insular method of a single assessor, is to be found the panacea for some, at least, of the soreness too often engendered by our architectural competitions.

To return, however, to the Milan School of Architecture; we find exhibited designs for the various ideal buildings that universally figure in students' work, designs in varied

styles—Pompeian, Renaissance, Romanesque—but one and all showing power of design, originality of conception combined with knowledge of the past, a right sense of proportion, and excellence of draughtsmanship, especially in the use of the brush, that is exceedingly refreshing. There is exemplified also a feeling for colour and a facility in its employment that is of very happy augury. If there is a possible fault in the work of the Milanese students, it is a slight tendency to a *bravura* method of expression that needs careful watching and repression, but this even is a pleasant antithesis to dull and deadly coldness and formality,—qualities that, in the Milan school, are conspicuously absent.

Highly interesting is a group of extemporaneous sketch designs in pencil for set subjects,—a method of architectural education too much neglected in the training of English students. The ability to immediately grapple with an architectural problem, and quickly to grasp its solution, is indeed the power that is most tested in the examination in design held by the Royal Institute of British Architects as an integral portion of the qualifying examination for the Associateship; but as a means of education the method herein indicated is absent from the work of the Architectural Association, as from that of other schools. The value of such a method in the artistic training of an architect is sufficiently obvious, and possibly some of the pre-eminence of the Milan school is due to the adoption of this method.

The students of the *Regia Istituto di Belle Arti di Venezia* exhibit drawings showing an ability in design and expression scarcely inferior to that of the Milan students, and the qualities we have mentioned as characterising the work of the latter may be found in the Venetian work also.

As studies of old work there are shown, in drawings by students of the *Istituto di Belle Arti di Firenze*, a large-scale detail of the cornice of the Strozzi, in section and isometrical perspective, a full-size drawing of one of the Erechtheion capitals, and a conjectural restoration of the Temple of Venus and Rome.

The work of the other architectural school exhibited, that of the *Regia Accademia Albertina di Torino*, consists too largely of drawings of existing buildings, apparently

copied from books. Such a means of instruction may teach drawing, but not design; hence the designs submitted show too much of mere copying, and are, in the worst sense of the word, academic.

From the work of students in the schools we may pass on to that which consists of study in the open, sketches and measured drawings from existing buildings. As we have remarked in a former article, these consist mainly of studies by church designers and of official records of historical monuments. Foremost among the ecclesiastical studies are the sketches by Brentano, who, we need hardly mention, was the successful competitor for the new façade to the Cathedral of Milan. The interest attaching to these studies is still further heightened by the melancholy fact of his decease ere the realisation of his conceptions had been begun. The examples of Brentano's work exhibited consist of photographs and lithographs of his various designs for the Milan façade, and a collection of sketches chiefly from Regensburg, Nürnberg, Venice, and Siena. These are, for the most part, perspective sketches in pencil, some shaded, some in outline, together with studies of detail.

An interesting collection of sketches is that by Odo Cavagnari, made during a tour in Genoa and the Riviera in September, 1889, and therefore probably a fair specimen of the Italian student's sketch-book at the present time. The sketches are mainly of ecclesiastical work, fairly catholic in style, but wholly drawn in ruled-up elevations, usually to small scale. No dimensions are figured, and no scale is indicated, while sections and details of mouldings, &c., are few. Thus, compared with that of our present-day English students, the Italian method would seem to lack thoroughness and careful analysis.

By far the greater part of the illustrations of old work in the Exhibition is that gathered by the Department of Antiquities and Fine Arts of the Ministry of Public Instruction. This is divided into the representative work of the various provinces of Italy. Thus from Emilia we have measured drawings and designs for the restoration of the Mercanzia and the Palazzo delle Meade, in Bologna, also photographs and designs for the restoration of the Antico Palazzo Accursio, Bologna. From Tuscany there are shown measured drawings in ink-line of the singing galleries of Donatello and Luca della Robbia in the cathedral church of S. Maria del Fiore, Florence, also some good photographs both of general views and of details together with tracings of plans of the ducal palace at Urbino. "Marche ed Umbria" are represented by Professor Calderini's designs for the restoration of the cathedral at Perugia; Rome by a plan showing the antique monumental remains to be preserved as ancient monuments; tracings showing the restoration of the atrium to the Church of St. Paul; and measured drawings of the Croce di Lucca and Sapienza to the large scale of  $\frac{1}{16}$ , with details half full-size.

The district of Naples is particularly well represented by a large and fine collection of drawings to various scales, several full size, of the coloured decoration found in Pompeii, together with carefully-drawn plans of the town as ascertained by exploration. The effect of the coloured decoration of Pompeii is still further illustrated by a full-size model of the Frigidario del Sarno prepared under the superintendence of Professor E. Taverna.

From Sicily are sent photographs of the Church of S. Francesco, Palermo, which, with its pointed arches ornamented with Norman zigzag and billet, cannot fail to prove interesting to an Englishman.

In connexion with the restoration of the Cathedral of Orvieto, there are exhibited two sumptuously-bound albums, one containing a large number of photographs, including some of the unexecuted designs of Ippolito Scalza (1532-1617 A.D.), of Michelangelo, and of other authors whose names are not recorded; the second containing detail drawings of the existing coloured decoration, chiefly to the ribs of ceilings.

An exceedingly nice collection of tenderly-executed pencil-sketches illustrates the highly-interesting work of South-Eastern France, Aigues-Mortes, Carcassonne, and other old-world towns.

Although exhibited probably as an advertisement of skilful handicraft, the full-sized model, or rather reproduction, of part of the façade of the so-called Casa del Conte Verde, at Rivoli, fitly has a place among the records of the past of Italian architecture. The reproduction is executed in red brick and red terra-cotta, and comprises two of the four arches of the ground story, with two windows over, and gives an excellent idea of the treatment of these materials in North Italy during the sixteenth century. Under the windows is an elaborate frieze, representing the Count and Countess (possibly) looking out of flamboyant windows. The work is exhibited by Villanova, of Turin, and the original casts are also shown.

The work of Piedmont and Liguria is extensively represented by photographs and casts of the Roman arch of Augustus at Susa; measured drawings and sketches of Medieval work, especially of coloured decoration; details of mosaic work, shown by coloured "squeezes,"—a method that is worth remembering as a facile expedient for obtaining an absolutely reliable record of the exact treatment; and some highly interesting specimens of wood-panelling, chiefly of the fifteenth century, and showing various applications of linen panel work.

From Lombardy there come lithographs of careful measured drawings of the Ducal Palace at Venice, and photographs of St. Mark.

In addition to the drawings hung on the walls, there are in this department of historical monuments floor cases containing some good photographs, chiefly from Bologna, Venice, and Aosta, and various models, including one of considerable interest showing the shoring and scaffolding to the Ducal Palace at Venice, a model of part of the city of Pompeii in its actual state, and a restoration of a Pompeian house, also models in cork of the three Doric temples of Paestum, and the amphitheatre of Pompeii.

Models as a means of architectural delineation are fairly well represented in the Exhibition, though it must be admitted that but few are of quite modern work. Models are costly, it is true, still their value is evidently appreciated, especially for the better comprehension which they afford to the non-professional observer. To the student also casts of old work such as are here exhibited are of high value; thus we have a fine example of the work of Pellegrini in the choir-stalls of the church of S. Celso, Milan, details of Bramante's work in an internal frieze from the Ospedale Maggiore, a reproduction of the marble altar in the cathedral at Como by Tommaso Rodari di Maroggia of the date 1492, and close by a cast of a doorway from St. Lorenzo, Lugano, also the work of Rodari di Maroggia, but dated 1517, and showing the advance made in the detail of the Italian Renaissance during that quarter of a century. Further on we find a cast of Madonna and angels from Ascona, on the Lago Maggiore, the work of Fra Sordino, date 1620; and a large replica of the window dressings, in Barocco style, date 1650, the work of Antonio Camussi da Montagnola, from the church of St. Rocco, Lugano. Thus, in a collection of some half-dozen well-chosen examples, we have an epitome of the course of Italian Renaissance detail, highly instructive both to the student and to the laic.

These casts are but one branch of the work of the *stuccatore*, a handicraft which, as we have before remarked, is carried to a high state of excellence in Italy. Other examples of this craft are not wanting, executed either in stucco, plaster of Paris, or Parian cement, or in various imitations of natural stone, some resembling granite or marbles of various tints, some different kinds of freestone.

Skil in imitation is also found in the reproduction of old tiles by Cantagalli, of Florence, who has laid under contribution the

work in the Alhambra, the church of S. Maria Novella, Florence, the majolica ware of Luca della Robbia, the Sala Borgia in the Vatican.

There are also excellent examples of imitation mosaic by the Società Anonima Facsimili di Mosaico di Venezia, consisting of reproductions of the mosaic work of St. Mark's, Venice. This Company also exhibit a reproduction of a Madonna by Luca della Robbia.

Akin to these productions of fictile art are the works in terra-cotta, numerous specimens of which are shown. The terra-cotta is for the most part in mildly-burnt clay, and usually red in colour, though there are also pieces of glazed work, coloured usually green, blue, or white. Amongst the terra-cotta we come across examples, chiefly in model, of fireproof floor construction, similar to the Doulton-Peto method of our own experience.

There are several collections of samples of building stone, marbles, and granites, in which latter Italy is rich. An excellent description of light grey granite, for example, is the *granito bianco d'Alzo*, from the Lago d'Orte, which, indeed, has been somewhat largely used in Turin itself.

Metal-work is sufficiently represented in the Exhibition to give a good idea of the ability of the modern Italian craftsman in this direction. Wrought-iron work is exemplified by candelabra of various forms and designs, balconies, door-handles, and so forth. There appears evidence of too great a desire to economise labour and so promote cheapness, rivets taking the place of welded joints, and a suspicion of stamping that of genuine hammering up. In general effect the Italian works look somewhat coarser than our best English work, and there is generally a pleasing absence of file work and smoothness of finish. In design, though some examples are a trifle bizarre, there is ample evidence of versatility and originality, especially in those examples which are based on motifs of Late Renaissance character; the spirit of Barocco and Rococo design being one which clearly suits the modern Italian in this as in other classes of decorative accessories.

Some of the best examples of metal-work in the Exhibition are seen among the bronzes, in designs for lamps, knockers, and other bijouterie. Both in conception and in execution the bronze-work leaves little to be desired, granting that exception be not taken to the somewhat fantastic character of Late Renaissance feeling.

In zinc and lead there are shown specimens of moulded, hammered, and cast work for eaves, gutters, and other external parts of roofs. Some few examples of sanitary works, baths, and other plumbing details, tin-lined pipes, and an application of the water-spray method for ventilation may be seen. In this department, however, it is scarcely necessary to say that Englishmen have little to learn from their Italian confrères.

Woodwork is represented by some skilfully-wrought parquetry and by a few examples of carved wood furniture, which show pre-eminently skilful in handicraft as well as fair design.

There appear to be in Italy some architects who make a speciality of internal design,—a principle which obtains elsewhere on the Continent. Of these, for example, Signor Giovanni Riggi, of Rome, sends photographs of executed works which remind us of the work of the late Talbot Bury, chiefly designs for staircases and balls, such as those in the Villa Malta for Conte Leone Bohinsky, the Villa Massimo for Prince Colonna di Sonnino, and the palace of the Duke Grazioli Lante della Rovere. The same artist also sends photographs of the ball-room and staircase of the English Embassy at Rome. In the same category are the photographs of the library of Baron Leopold Rothschild in his London residence, the design of Professor Rinaldo Barbetti, of Florence.

Elaborate designs for internal coloured decoration appear in the drawings of many architects, showing that this is a branch of artistic work that receives considerable attention in modern Italy, while specimens of the

work of the actual executants of painted and their decoration, modelling, and embroidery re exhibited. The painting, both of ornament and of pictorial decoration, shows considerable variety of treatment, with, perhaps, tendency to exaggeration in the composition of colour as well as in the drawing of lines. Thus in decorative work, as in so many other forms of art expression, there is found a striving, among, apparently, the younger generation of Italian artists, for strong and powerful effects, for dash and fire rather than refinement and delicacy, for thunder and lightning rather than calm and unruffled serenity. In architectural design, in draughtsmanship, in colour, and in form there is clearly evident a seething restlessness, an eager impetuosity to escape from anything like academical restraint, to burst the bonds of classical regularity, and to give free play to fancy without limitation, save that force and vigour must at any cost be paramount in every form of art expression. That cost is the exchange of refinement for vulgarity, of restraint for licence, of breadth and repose for splutter and splash. Not that vulgarity and licence are as yet characteristic of the work of young artistic Italy, but there is danger ahead to the architectural Pegasus if he fiery steeds he has yoked to his chariot are not held with a firm hand on the reins.

Modern Italian architecture, together with its allied arts and crafts, thus clearly divides to two schools: on the one hand, the cold, formal, lifeless work of the older régime, academical in its insipidity, but not academical in correctness of taste or of proportion; on the other hand, the exuberant, boisterous, tensely living work of the younger men, full of fire and vigour, and without doubt due to a natural revulsion of feeling against the tame and tasteless work of the immediate past. This state of things we cannot but regard as one of happy augury for the future of Italian architecture. The life and vigour will survive, the exuberance will be toned down. It is so already in the work of the best men, the most thorough artists; but just the style of Michelangelo produced that of the Caracci, so we may expect that the work of Moretti and of Sommaruga, of Brentano and of Muggia, will produce imitators who will mistake vulgarity for vigour and licence for liberty.

Literary material for architectural education is a product with which Italy, in common with other continental nations, is well supplied, and there are exhibited some excellent collections of photographs by Manno, of Turin; Popp, of Bologna, and others, especially illustrating, for the most part, the work of North Italy, both Medieval and Renaissance; while such well-known architectural publishers as Ungania, of Venice; Ceppi, of Milan; Clausen, of Berlin; Ernst and Korn, of Berlin; Lehmann and Wenzel, of Vienna, and others, are represented by photographs and other special technical works. There are also some interesting specimens of architectural books, a rare copy of Vitruvius, date 1500; a volume of illustrations of buildings in Rome newly-erected during the Pontificate of Alexander VII.; the palaces of Genoa, illustrated by Ruhens, published at Antwerp, 1622; a Dutch account of the architecture of Piedmont and Savoy, published at Graevenhage, 1725, and many others.

With a praiseworthy intention of making an Exhibition instructive, an opportunity of comparing the work of their own country with that of foreigners has been afforded to the Italian architects, as well as their employers, by the admirable collection of the work of many parts of Europe, lent by various municipal authorities. For the purpose of complete comparison of European architecture as a whole, the value of the collection is, however, diminished by the absence of French work. Possibly political considerations have militated against the catholicity of art.

London is represented by drawings and models from the City Architect's office, showing the designs for the Tower Bridge, the

Guildhall Library, Council Chamber, and Courts; Leadenhall Market, the Foreign Cattle Market, Deptford; Billingsgate Market, the Central Markets at Smithfield and Farringdon, the Caledonian-road Cattle Market, the Artisans' and Labourers' Dwellings, Petticoat-square; the Cemetery at Ilford, Holborn Viaduct, Underground Urinals, the Destructor at Lettis' Wharf, and plans and details of the City sewerage.

Our own share in the Exhibition is, however, eclipsed by the extensive contribution of Berlin and Vienna. From Berlin have been sent full illustrations, plans, and details of the sewerage system of the city, and of its water-supply; historical data of the growth and development of the city, together with particulars of municipal improvements; illustrations of scholastic buildings, hospitals, markets, bridges, municipal and other public offices.

Vienna is represented by plans and bird's-eye views, showing the growth of the city, and especially the formation of the Ring, and the regulation of the Danube river; also by drawings of the Rath-haus and other public buildings and municipal works. There are also graphic delineations of the amount of building carried on in various years from 1818 to 1889, of the tables of mortality, and of the movement of subsoil water.

From Warsaw and Cracow come extensive collections of photographs, which will probably be a revelation to many Italian architects, as they certainly would to the majority of their English colleagues. Prague, which also is represented here, has recently received some attention at the hands of English travelling students—and justly so—for the picturesqueness of its Medieval architecture. Cracow, from the exhibition to be seen at Turin, would prove of equal interest to those at least for whom Prague has charms.

Other cities and towns of Europe are represented by photographs, drawings, and pamphlets illustrating usually both the old and modern work of the locality, and plans of the city. These are Worms, Eger, Rostock, Passau, Stuttgart, Nuremberg, Eisenach, Erlangen, Augsburg, Meiningen, Furth, Mayence, Lubeck, Altenburg, Hamburg, Leipzig, Weissenfels, Wesel, Wiesbaden, Stralsund, Magdeburg, Stettin, Iglau, Kaiserslautern, Strasburg, Halle, Erfurt, Constantinople, and Barcelona.

Even such far-off spots as Boma on the Congo, Colombo, and Hayti are represented by photographs of their local buildings.

Besides these foreign contributions, the various municipalities of Italy send highly-interesting and important evidence of their corporate works and civic development.

Thus, the Corporation of Turin exhibits large plans of the town at various dates, showing its gradual growth from the Colonia Julia Augusta Taurinorum to the Torino of 1890, illustrations of the public cemeteries and school-buildings, besides models and designs for bridges over the Po. In designs for bridges we find generally in Italian work some compensation for the unhappy supremacy of the engineer over the architect, on which we have commented in a former article. The design of the bridges certainly benefits by the architectural training of the engineer, and this whether the material be stone or iron. The bridges are, in fact, designed, as they should be, by architects who are scientifically trained, not by skilful handlers of formulae, whose work is afterwards dressed up by an unsympathetic draughtsman, too often imperfectly endued with the power of artistic design, and lacking in fertility of conception. Comparison of the design of our Tower Bridge, for example, with that of some of the new bridges over the Po or the Tiber does not tend to an overwhelming concert as to our national ability in the paths of artistic engineering.

From Milan has been sent a most carefully-prepared and elaborate series of studies in water-supply, comprising data of every kind, graphically expressed, so as to convey to the mind the various complicated questions which have to be considered in arranging for such

an important undertaking, particulars of density of population, of manufactures and their requirements, of the sources of supply, with their constantly-varying capabilities, and other important points.

Other municipalities of Italy have sent plans and illustrations of various matters connected with civic administration, the formation of new streets, as at Spezia, Novara, Bologna, Naples, and elsewhere, plans of public school-buildings, drainage, and water-supply, markets and other institutions.

From Rome the only illustration is that of the proposal to make the city a seaport, by the construction of a ship canal from Ostia, a plan of which is exhibited.

Thus the exhibition of the representative works of both foreign and Italian municipalities, although somewhat irregularly arranged, gives a valuable opportunity to the specialist for comparison of various methods of dealing with the great problems of modern civic life, water-supply, drainage, and means of communication.

Before closing our notes on the first exhibition of Italian architecture we should call attention to the very admirable reproduction of a Medieval Piedmontese town and castle which has been erected, after the fashion of Old London, in the public gardens on the banks of the Po, in close proximity to the building in which the architectural exhibition is housed. This, however, is superior to our own example, as, instead of being mere scene-painting of quartering and canvas, lath and plaster, it is a permanent collection of substantially-built erections in brick, stone, and half-timbering, carefully reproduced from good authority, so that the student is able to grasp not only the salient points, but also the treatment of detail, of North Italian Medieval work, with perhaps almost too much ease and too little wandering and exploration. Turin has hitherto been one of the towns of Italy to be missed by English students, but with the opportunity now afforded, all who wish to gain an idea of the Medieval domestic work of North Italy should make a stay at Turin, and seek out the ancient burg, even when they can no longer visit the Exhibition of Architecture.

THE RIGHT OF ACCESS OF AIR TO BUILDINGS.

RECENT decision by Baron Pollock in the case of Bass v. Gregory raises an interesting and important question as regards the right of access of air to a building. Popularly, the right to light has been often called the right of light and air. But this connexion is very misleading, since the right to light is quite distinct from the right to air, and the coupling of the two would lead a layman to suppose that the two rights are on the same footing. What, then, is the general right to air? That is to say, is there a prescriptive right to a full amount of air as there is of light? If, for example, the light of a window has been enjoyed for the legal term of years, no one can legally lessen that amount. But the same rule does not apply to air. "A right by way of easement to the access of air over the general unlimited surface of a neighbour's land cannot be acquired by mere enjoyment." These are the words of Lord Justice Cotton, and they state clearly and briefly what may be called the general law as to the right to air. But in the same case, that of Bryant v. Lefevre, the same judge remarks, "whether, if the uninterrupted flow of air through a definite aperture or channel over a neighbour's property has been enjoyed as of right for a sufficient period, a right by way of easement could be acquired, it is unnecessary now to say." In the case decided by Baron Pollock, the plaintiff's cellar in a rock was ventilated by a shaft cut through the rock into a well belonging to the defendant. This means of ventilation was stopped by the defendant closing the mouth of the well: hence arose the action. Care must

be taken not to confuse a claim to access of air through a definite channel with one to air in order to keep a place in a wholesome condition. In the well-known case of Dent v. The Auction Mart Co., decided in 1866, this passage occurs in the judgment:—"The Court has interfered to prevent the total obstruction of all circulation of air; and the introduction of three water-closets into a confined space of this description is, I think, an interference which the Court will recognise on the ground of nuisance. This, perhaps, the proper ground on which to place the interference of the Court; although in decess the words 'light and air' are often inserted together, as if the two things went *pari passu*." Here is a simple ground upon which a right to air is based,—a right necessary for the wholesome enjoyment of property. But this is a case on which Baron Pollock relied when he decided,—as he did,—that there was a right in the plaintiff to have the channel of air to their cellar kept uninterrupted. If the cellar could have been ventilated by other means, we have doubts whether the decision was a right one, because then the stoppage of the channel did not necessarily make the cellar unwholesome, as it could be ventilated by other means. If, however, there was no other possible means of ventilation, then the blocking-up of the channel would not only make the cellar unwholesome, but unuseable. But the ground of the judgment was that there had been established a right to a flow of air through a definite passage, a ground quite distinct from that of a right to air in order to keep a room wholesome. Whether a right to air through a defined channel exists in English law is certainly not quite clear. In actual practice it is obvious that the most usual way for air to get into an apartment is through a window, hence we see how the elements light and air have become coupled in legal phraseology. If the air of a window is blocked up, a portion of the light is kept away. Thus the vindication of the right to light would also give again the access of the air. For this reason it is obvious that it is difficult to say whether a right to air without a right to light through a definite passage can exist, and we do not think that the recent decision of Baron Pollock helps to elucidate the matter, since, as we have pointed out, the cellar in question might have become useless without the air through the passage. It is possible to think of passages for ventilating purposes which have nothing to do with light, but it is not very easy to think of the stoppage of these without injury to the wholesome character of a building. One of the reasons which have been practically stated to exist against a general right to air over a wide space, is the impossibility of the owner of the servient tenement preventing such right from accruing. The same reason does not exist in regard to air flowing along a defined channel. But we are thus confronted with the question of size. It is clear, therefore, that there is a debatable point of law in regard to ventilation which may some day be settled. But seeing that it does not arise if light or health comes in question, it may be a long time before it arises in a bare, or, as the lawyers say, in a "clean" form.

#### COMPETITIONS.

**BOARD SCHOOLS, PRITTELEWELL.**—A special meeting of the Prittlewell School Board was held, on the 3rd instant, to decide upon the plans received in a limited competition for new schools in the Brewery-road, designs having been submitted by Messrs. Charles Bell, London, E. Wright, Walter J. Wood, and J. Taylor, of Southend-on-Sea. The Board unanimously selected the plans of Mr. Walter J. Wood, and instructions were directed to be given to the architect to proceed with the work.

**ASSISTANT SURVEYORSHIP, ISLINGTON.**—Mr. T. Ridyard Roscoe, of Hammersmith, and late of Ramsgate, has been appointed by the Islington Vestry Assistant Surveyor for the northern portion of their district.

#### NOTES.

**T**HE scaffolding is now almost entirely removed from the restored face of the north transept of Westminster Abbey, and considering that the refacing was a thing which had to be done for practical reasons, and that it cannot be classed as mere sentimental restoration, we think the general result externally is very satisfactory. Mr. Pearson's filling of wall arcading and tracery in the gable differs somewhat from that shown on the frontispiece to Brayley's book; whether that was a correct representation of the design as it existed in Brayley's time is not much to the point; if it is, Mr. Pearson's tracery is an improvement on it in general richness of effect, but the new work at this point would have been all the better for a rather lighter section of tracery bars; it looks somewhat heavy and tends to lessen the scale of the facade. The curious-looking balustrade indicated by Brayley has been removed, and no reasonable person will regret that. The design of the wheel window has been altered, by the shortening of the radiating tracery which formerly extended to the jamb of the window, and the interposition of a circle of quatrefoil lights round the outer margin of the design; and the quatrefoil lights in the lower spandril adjoining the wheel are filled up solid, being represented only by exterior wall tracery. In regard to exterior effect we do not know that the change is for the worse; but internally it is certainly a loss not to have the two small lights in the spandrils below the window, which still form a pleasing and characteristic incident in the south transept window, and the loss of them in the north transept is to be regretted, nor can we see any compensating advantage in it. In regard to the general design of the circular window there is no doubt that it is richer and finer in effect than the form shown in Brayley, and which is seen also in the south window, but the mischief is that it does not suit the old glass, and the figures of the Apostles and Evangelists (we believe they are) which figured so well in the old lights, have actually been put in again shortened by the feet to make them go into the shorter lights. Such a sheer piece of bungling as this seems almost incredible. We can only conclude that Mr. Pearson intended to do away with the old glass and have new designed for the new window; and that after the tracery was executed he was compelled to reinstate the old glass. That some such explanation as this is at the bottom of the matter we must charitably hope; but it is an absurd business at the best.

**T**HE intended memorial to Lord Salisbury, set on foot by the "Society for the Preservation of the Monuments of Ancient Egypt," came before the meeting of the Institute on Monday, and lay for signature in the entrance lobby after the meeting, though the small number of signatures did not say very much for the interest felt in the matter by those present. The memorial, after recounting some of the points of interest and historic value in Egyptian art, continues:—

"Unhappily, the destruction which has been in progress during centuries has of late years been carried on with increased intensity. The growing prosperity of the country has naturally created a demand for building materials, and the ancient monuments are now, as formerly, resorted to as convenient quarries. Miracles of the sculptor's art and vast wall spaces, on which are inscribed the documents relating to the earliest civilisation, are broken up for rubble or cast into the lime-kiln. But the worst cases of destruction have arisen from other causes, as in the recent most notorious mutilations at Den-Hassan. Here, and at other places, portions of the most interesting paintings and sculptures in Egypt were ruthlessly cut away, evidently for sale; and this source of destruction can only be met by constant vigilance, and by a system of inspection more thorough than can be exercised by the director of a large and important museum."

We believe that it is owing to the suggestion of members of the Institute of Architects who are interested in the subject that one slight

but important alteration has been made in the wording of the final petition of the memorial. This ran originally:—

"We are strongly of opinion that the devastation can only be prevented by placing the monuments under proper inspection. We, therefore, most earnestly plead that your lordship will direct your Agent at Cairo to move the Egyptian Government to appoint an English Official Inspector fully qualified for the performance of the duties proposed, who should be instructed to submit, with view to their publication, yearly reports of his proceedings."

To have specially stipulated that the Official Inspector should be an Englishman would be casting a slur on the French, who took an enlightened interest in Egyptian monuments long before we did. It was accordingly suggested by the Art Committee of the Institute that the words "a competent official" should be substituted for "an English official," which has been agreed to, and the memorial now stands in that form.

**T**HE Scientific Committee formed to promote the search for coal in the south-east of England appears to be exceedingly earnest in its endeavours. Two meetings have recently been held with the object of placing the scientific aspect of the matter before the public—one at Ashford, on the 13th inst., under the presidency of the Earl of Winchelsea and Nottingham, when Professor McKenny Hughes, of Cambridge, was the lecturer; and the other at Brighton, on the 15th inst., on which occasion Mr. Wm. Whitaker, of the Geological Survey, was the exponent. An outline of the geological argument affecting the occurrence of coal-measures in our south-eastern counties, with special reference to their probable mode of distribution in Kent, has already appeared in our columns, and we have nothing to add to our previous remarks from that point of view. It was evident from the enthusiasm of the Ashford meeting, however, that the question is not altogether a scientific one. As Lord Winchelsea said, whilst agreeing with the object of the committee, Kent is justly proud of her beautiful scenery, and her people would regard with jealous eyes any attempt at spoliation,—all of which we most cordially endorse. Still, it must be remembered as a melancholy fact that the greatness of the nation has not been produced and cannot be maintained by the contemplation of the beautiful. Our position as manufacturers, as everybody must know, is largely dependent on our supplies of coal and iron, and without the former the exploitation of the latter is practically impossible. No one can have regarded the evidence of the duration of our coal supplies (as detailed by the Royal Commission appointed to inquire into that and cognate subjects), and borne in mind the increasing demand for that useful substance, without being struck by the fact that at no very distant date its price must be considerably augmented, and the time must arrive when the supply will fall short altogether.

**T**HE Railway Commissioners have this week been called upon to give effect to the Act of 1888 with respect to "undue preference." It will be remembered that, after much "amending," the section dealing with this subject ultimately gave the Court considerably enlarged powers in this matter. In a condensed form the clause runs as follows:—"Wherever it is shown that a railway company charges the traders in any district lower rates for the same or similar services than the charge to the traders of another district, the burden of proving that such difference in treatment does not amount to an undue preference shall lie on the railway company." The case under notice was brought by the Liverpool Corn Trade Association, but the principle underlying it renders it of equal interest to all classes of traders. The complaint was that the traders of Cardiff were given an undue preference as compared with those of Liverpool, by the granting by the railway company of low rates to Bir-

tingham,—the rate from the former place to Birmingham being less than that from Liverpool, although the distance is nearly twice as great. The intervention of the Board of Trade in their mediatorial capacity having been invoked without success, the case was brought before the Commissioners for decision. The railway company relied for their defence upon the sub-section authorizing the Commissioners to take into consideration "whether such lower charge is necessary for the purpose of securing in the interests of the public the traffic in respect of which it is made." In this case they held that they were consulting the public interest by granting the low rate complained of, and we believe this is the first time this plea has been put forward. Mr. Justice Wills showed, however, that the public interest would not suffer by the withdrawal of these rates. He considered that Liverpool was entitled to be freed from competition that was unfair, and that this was a case in which the Court had power to restrain it. Consequently, the railway company will have to remove the inequality, and this will doubtless be effected by the withdrawal of the Cardiff rates, the traffic from that town being of far less importance to them than that from Liverpool. This judgment (in which each Commissioner concurred) establishes a precedent which the railway companies will probably regard with a considerable amount of apprehension.

IN the last issue of *L'Architecture* M. Deslignières discusses at some length the various schemes for a metropolitan railway for Paris, without finding any of them satisfactory. He is of opinion that the making of an extensive underground railway would cause (as our Paris correspondent has already suggested) an infinity of inconvenience in the making, besides encountering great difficulties from the nature of subterranean Paris, and that the difficulty also of adequate ventilation would be very great in a railway which, according to the schemes set forth, would contain lengths destitute of external communication twice as great as the longest of such lengths in the London Metropolitan Railway, which is, as he truly observes, very inadequately ventilated and oppressive to travel on. M. Deslignières urges the abandonment of all idea of steam locomotives and heavy carriages, the adoption of small and light carriages and electric motors, and the restriction of the proposed railway to a line forming a connexion between the various main terminal stations of Paris, and not attempting to communicate with all the suburbs. Such a railway, he urges, could be laid in many parts of its route above ground, and only be subterranean where absolutely necessary. We presume the writer contemplates some such railway as that which connected the Pont de la Concorde with the centre of the Paris Exhibition last year. That was a very convenient and handy little railway, and took its gradients in so light-hearted a manner as to have no difficulty in burrowing rapidly underground at certain points to get under a main street, and coming up to the surface again. It is possible that a railway of this type may be the best means, after all, of meeting all the conditions of the case in Paris.

IN reference to the second (this time "limited") National Monument Competition for Germany, for which invitations were issued under direct supervision of the Emperor last September, we have already mentioned that the majority of the artists invited to compete had the intention of sending in a protest as to the non-mention of the assessing body. A formal protest has accordingly been sent in to the Chancellor, desiring (1) the mention of the names of the jury or assessors; (2) the assurance that the competition designs shall be publicly exhibited; (3) the assurance that the first prizeman shall have the erection of the monument. An official reply has been given by the Emperor's command, the purport of which is that but one de-

mand, "the public exhibition of designs sent in," will be granted. This reply, and the manner of it, has caused much displeasure in artistic circles in Berlin, where the decision as to the course about to be taken by the artists concerned is eagerly expected. It may be of interest to know that of the eleven invited to compete, five—Messrs. Illgers, Pfann, Rettig, Schaper, and Bruno Schmitz—signed the protest, in concurrence with the ideas of Messrs. Donndorf and Siemerling. Messrs. Hildebrandt and Schilling refused to sign, and the Emperor's favourite, Reinhold Begas, had, of course, to keep aloof from his fellow-competitors in this matter.

WE hear from Berlin that the very stringent and harassing "Building Regulations of Berlin, 1887," are likely to be altered a couple of years hence, if the complaints be regularly and systematically continued. The fire-brigade authorities, who under their former chief caused some of the most extravagant rules to be made, are likely under the more commonsense management (under which the Theatre Building Regulations were revised last year) to have to drop a number of their more exacting requirements in favour of some few others which promise to be more in harmony with general public interests.

WE hear from Paris that there is talk of extending the lines of study open to students of the French Academy at the Villa Medicis, and that whereas hitherto the travelling students have been restricted to Greece, Italy, and Sicily, it is proposed that they should in future have authority to include Spain and Holland in their travelling study-ground. We presume therefore that the official authorities presiding over art-education in France are beginning to awake to the fact that something more than the study of the remains of Classic architecture is desirable as a part of the education of a modern architect, and that the "envois de Rome" are not forever to be restricted to drawings and restorations of Classic temples, however ably carried out. They have been a good while in coming to this conclusion, but better late than never. Perhaps in time we may even hope to find that French architectural students are encouraged to study the monuments of architecture in England, of which French architects (as M. Planat's "Encyclopédie d'Architecture" amply testifies) are for the most part deplorably ignorant.

IN connexion with the scheme for bringing Vienna proper and its suburbs under one municipal body,—i.e., the formation of a so-called "Gross Wien," which is soon to take place, the local authorities, and also the architectural and engineering societies, are busy with plans for alterations and extensions of the present building laws. Among the alterations proposed are some important ones, which, if adopted, will invest the municipality with powers to prescribe not only the form of buildings to be erected (whether street frontages or detached residences, &c.) in different streets and parts of the city, but also the relegation of certain kinds of buildings (factories, offices, shops, &c.) into certain districts to be strictly defined. A set of regulations in respect to the modification of the heights of buildings is to be formed. For this purpose a new system, according to which the city will be divided into several zones, for each of which different rules for the same street-widths will be in force, is likely to find favour.

AT the professional meeting at the Institute on Monday it was satisfactory to find that the attempt of a very irrepressible associate member to make capital out of the discussion about the Whitfield Chapel competition, by bringing forward a motion to discuss the conduct of the assessor, was put a stop to, a majority voting that it was *ultra vires*. It was more than that, it was a piece

of exceedingly bad taste, which the Council ought never to have allowed to pass at all; as indeed, judging from the remarks of the President, they seem to have been rather inclined to think themselves. An incident in the meeting was the presentation of a copy of a publication de luxe on the architecture of Jeypore, presented by the Rajah of Jeypore; the first occasion, probably, that a native Indian potentate has presented the Institute with a work illustrative of Indian architecture. Of this work, Colonel Jacob, and in which the drawings are all made by native draughtsmen, we shall have more to say. The Secretary also announced that the Institute had at last succeeded in securing for the Library a copy of the very rare "Editio Princeps" of Vitruvius, which the Institute has long wished to possess, and for which their Library is certainly one of the fittest resting-places, as it will thus be easily accessible to all architectural students who wish to refer to it.

THE Chancellor of the Diocese of Rochester has reserved his judgment in a case of some general interest. The vicar of St. Peter's, Brockley, applied for a faculty to put bells in the church at that place; the application was opposed by some of the parishioners, on the ground that the noise was objectionable and injurious to health. With due respect to the Chancellor, the objection appears untenable as regards the grant of a faculty. It is not an ecclesiastical objection, it is not one against the lawfulness of bells in a church. Neither, we may observe, can bells be pronounced a legal nuisance till they are heard. But the opposition shows the growing dislike of church bells in populous places. Such dislike, if the bells are in fact a legal nuisance, can take a practical form: because, if church bells are a legal nuisance, they can be stopped by an injunction from the Court. This is clear law. But we do not think the fact that they may be a nuisance is a valid objection to the grant of a faculty. But vicars and churchwardens ought to hesitate long before they allow peals of bells to be placed in churches in towns. In such a place as Kensington, to take one instance only, they are a nuisance, injurious to health, and an anachronism into the bargain. They are a survival of a pre-watch-and-clock age, and it is high time that the practice was discontinued, except in rural districts, where it is yet of some use.

THE case of "Noble v. Yates," tried by Mr. Justice Charles and a jury last week, should be noticed by house-owners and intending tenants. It was an action against a house-owner by a would-be tenant for damages sustained through being injured when looking over a house which it was proposed to take. The jury found a verdict for the defendant. There seems, however, to be no doubt that if a person goes into a house which is to be let, and falls, as the phrase is, into "a trap," that the owner of the house would be liable for damages, as, for instance, if a piece of an apparently sound flooring were to give way. On the other hand, people who go over houses must be careful. If they have been guilty of contributory negligence, they cannot, of course, recover damages. The moral seems to be that each party must be careful, but in some respects the chief care should be that of the landlord, who must have no missing steps and similar "traps," which are so conducive to accidents.

THE verdicts of juries on railway accident cases are often bewildering (or rather bewildered), but that of the coroner's jury on the Norton disaster is one of the most extraordinary we have ever come across. As the coroner said, it was no verdict at all, or amounted to "accidental death." Not even a word of blame was directed against the signalman, who absolutely confessed that he forgot his duty (though, as we observed, a man's

brain will trip sometimes without implying moral negligence); not a word (still more extraordinary) is said about the danger of permitting shunting on to a main line in the middle of fast traffic, for which the company and their regulations are morally responsible; and the only person blamed is the unfortunate driver of the goods train, who was a passive agent in the matter, who was told nothing and simply followed orders in being where he was! It is difficult to look with any patience on the "palladium of English liberty" when it becomes the field for the display of such stupidity as this, and in a matter of life and death too. The coroner persuaded the jury to accept the word "negligently" in regard to the action of the signalman, which gave a legal ground for committing him for trial, and when that second trial comes off it is to be hoped we shall hear a different kind of verdict from that of the coroner's jury, in regard to the responsibility of the railway company at all events.

IN spite of the figures put forward by the railway companies to demonstrate that the adoption of the Board of Trade rate proposals will involve loss of revenue, it appears that these same proposals are still, in some quarters, considered inimical to the interests of the traders. The South Wales colliery proprietors, for example, regard the Board of Trade schedules as calculated to aggravate existing evils, and do irreparable damage to the South Wales coal trade. The Department is blamed for not adopting the present rates as maximum charges, though this it would be clearly unjust to do. It appears from the report of the Collieries Association that coal is carried to Cardiff and other ports at an average rate of a 3d. per ton per mile, and it is obviously useless to expect such low rates to govern the charging power of large railway systems. Different sections of a line will, as before, be favoured or not according to circumstances, but the purpose of the new schedules is simply to fix limits beyond which no rates may rise. Sir Michael Hicks-Beach stated on the 14th inst., at Clifton, that he believed the result of the Board of Trade revision of the schedules to be a considerable reduction of charges as compared with those now authorised by law; and this, together with the strenuous opposition of the railway companies to the schedules, should reassure objectors generally; though, of course, the proposals of the Board may be open to criticism upon certain specific points. The report alluded to, for instance, quotes a case in which a railway company is granted higher powers than it sought for, and the Board should certainly not hesitate to accept an amendment to their scheme upon this being established.

FROM the sixty-third annual report of the Council of the Royal Scottish Academy, which was submitted to the Academicians last week, we gather that several bequests and grants have fallen to the Academy during the course of the year. Amongst these is one for the behoof of decayed Scottish artists, by the late James Nasmyth, of Hammerfield, Penshurst, Kent, in memory of his father, Alexander Nasmyth, "the father of Scottish landscape painting;" and a grant of 5,000l. by Mr. William McEwan, M.P., for the purchase of works of art for the National Gallery of Scotland. The Council emphasise the protest of the Academy against any interference by the rival railway companies with the Prince's-street-gardens or destruction of the amenity of Prince's-street for railway and other purposes, "which would take from the attractiveness of the city upon which so much of its prosperity depends—a result which would ever be deplored by lovers of the beautiful, and, indeed, by all who will give the matter careful consideration." It is stated that no further information has been received from the Privy Council by the Academy regarding the proposed Supplementary Charter.

IT is announced in the *Academy* that the committee which was formed in May last to buy Dove Cottage, Grasmere, as a national memorial of Wordsworth, have obtained a conveyance of the premises, and have entered into possession. Wordsworth lived here from December, 1799, to the spring of 1808; during that interval he married, worked at his "Prelude," "Excursion," and "White Doe of Rylstone," made acquaintance with Southey, Scott, and Sir George Beaumont, and was visited by Coleridge and De Quincey. It is related of De Quincey that he turned back when he had reached the threshold, just as Rogers did from Dr. Johnson's doorstep in Bolt-court. We are informed that the high-level garden, the well, the sitting-room, the poet's bookshelf, and the like, remain as of old, though some intervening houses now obstruct the view from the cottage towards the lake. Other houses in this neighbourhood that are associated with Wordsworth are Allan Bank, the Parsonage, and Rydal Mount. The committee ask for contributions towards putting the cottage into good repair, replanting the garden, and so forth. They also invite the loan or gift of such articles as shall form a museum to illustrate the poet's life and work.

NEARLY three years ago\* we adverted to two projects for re-opening the Alexandra Palace and its grounds, which then belonged to the London Financial Company, as a place of recreation for the public. On May 12 of that year the Palace was re-opened by a company who had obtained a seven years' lease of the property. We now read, in the *Daily Chronicle*, that final steps are about to be taken to demolish the Palace, and that Parliamentary powers will be sought for to convert the ground into building sites. So the counter scheme of 1887, to buy the land as a Jubilee Memorial, for the public benefit, seems to have come to naught. But it will be a great pity if the whole of these beautiful grounds should be thus lost to the vast population of North London. The palace itself (unfortunately a very ugly building, both in its first and later edition) was originally constructed, for the most part, with materials from the Great Exhibition of 1862 (Captain Fowke, R.E., architect), including one of the two great domes, dodecagonal at base, and 160 ft. in diameter. That building was opened on May 24, 1873, but a fortnight later was entirely destroyed by fire. Having been rebuilt, it was again opened to the public on May 1, 1875, and for a while formed a highly popular resort. Portions of the grounds are finely timbered, and command extensive views over the northern limits of the county.

WE have received from Mr. Brawn, of Chelsea, a description and illustration of a fire-escape for dwelling-houses, which appears to deserve attention. It consists of a metal bracket fixed to the woodwork of the window frame, and carrying a double pulley through which an endless rope is rove, of such a length that the lower bight will just reach the ground. A leather sling is fixed on the upper end of the rope so as to hang opposite the window, and a similar sling on the lower end, so that when one occupant gets into the upper sling and has lowered himself to the ground the other sling has mounted to the window on the opposite length of rope, ready for the next person, so that there is no waste of time in sending the sling up again. The speed of descent is regulated by a brake action on the pulley, which operates automatically in proportion to the weight of the person descending. The attachment of the escape is fixed inside the room, and we presume it is intended that the rope should be coiled inside the room and the bracket swung outward for use. The patentee quotes Captain Shaw to the effect that "it is both safe and simple, requiring no skill to manipulate, and I would not hesitate a moment to descend

by it." Women however, and elderly men of nervous temperament or who are clumsy with their hands, may have another opinion. They will however find it better than being burned, and the contrivance seems to answer the main desideratum of being always ready for use, without occupying much space or forming a special feature on the exterior of a building.

THE remarks of the jury and some of the newspapers in regard to the case of the School Board for London v. Wall Bros. indicate an entire misconception as to what an architect occupying the position of the School Board Architect could accomplish. The fault is really with the Board themselves, who did not provide for sufficient supervision of their schools. The action was brought to recover damages from the defendants for the expense incurred by making good their bad work. In the course of the case it appeared that one clerk of works had several schools under him at the same time, which of course meant that any real and effective supervision was impossible, and Mr. Robson stated that he only visited the schools when completed, in order to study the result with a view to further school designs. The judge, in his summing up, while commenting strongly on this state of things, does appear to put the blame on the right persons, the School Board and their system; but we have no doubt the comment of the jury in regard to "the state of things in the Architect's department" was meant as a condemnation of that department itself. But it must be obvious that Mr. Robson, though a man of great power of getting through work, could by no possibility have undertaken personal supervision of all the schools going on. He was more than fully occupied in merely planning and devising all the schools that were going on one after another as fast as they could be done, and was at one time quite over-worked at that. The real fault was with the Board, who were pursuing a system of false economy in making one clerk of works do the work of three or four, and expecting one architect to look after and design all their schools. They should have retained Mr. Robson's services as consulting and directing architect, and employed outside architects for the actual designing and carrying out of the various schools, in subordination to the consulting architect's main idea. Then they could have ensured the work being properly carried out. Their system was a system of impossibilities, carried on under a false notion of economy, and from such a system unsatisfactory results might be expected.

THE opening address of the President of the Leeds and York-shire Architectural Society, delivered on Tuesday last, dealt largely with the subject of education, and supported the idea of the Institute examination as likely to afford in the end the best practical form of diploma for those who favoured the idea of some recognised guarantee of the architect's professional competency. In commenting on some local topics, Mr. Thorp referred to the new Post-office at Leeds as a building which did not at all rise, architecturally, to the importance of its position and scale in the town architecture. This is another of these buildings turned out from the architectural room of the Office of Works, and if it is like what we have recently seen in other cities, we do not wonder that it became the subject of some criticism. In our opinion some such body as the Royal Academy or the National Art Association ought to memorialise the Government or the First Commissioner of Works in regard to the injury done to architecture in this country by entrusting the designing of these large buildings to officials with probably very adequate practical knowledge, but totally destitute of architectural genius. The move could not be made, of course, by any such body as the Institute of Architects, as they would subject themselves, however undeservedly, to the

\* See the *Builder*, February 11, 1888.

charge of being influenced by selfish motives but we certainly think the matter ought to be taken up by some constituted body which is interested in art. As it is, one town after another is having large buildings of coarse and vulgar architectural design inflicted on it, because the Office of Works prefers the economy of supplying architectural designs from the hands of its own staff. In France every such building would probably be the subject of an open competition with the object of getting the best architectural design possible; and it ought to be so in England.

**T**HE special feature at the French Gallery in Pall Mall, which opened its winter exhibition this week, is a collection of a certain number of Mr. Leader's landscapes, including several of the large and well-known ones in which the composition and motive are very similar, such as "At Evening Time it shall be light," "February fill Dyke," &c. In these and others the artist has worked out with great care and finish a kind of receipt for a poetic landscape which has become exceedingly popular, because it appeals to the ordinary perceptions of ordinary persons, and is finished with that kind of neatness and smoothness which the ordinary person (in a picture gallery) especially loves. Pictures of this kind, with evening skies reflected in rain pools in the meadows, give innocent pleasure to so many people that one cannot grudge them, even if unable to join in the chorus of applause over this superficial art. Occasionally Mr. Leader shows that he could do better things than paint for popular applause, as in the bright little work "Spring Time" (62) and in "Sunshine after Rain North Wales" (79), a small picture with much more of natural and open-air truth and freshness than his larger and more popular works. Among the other paintings in this year's exhibition may be noticed "The End of the Day" (1) by Sadée, an idea which both this painter and Israels have treated before; "Musical Critics" (4) by Jimenez; "A September Morning" (16) an admirable cattle and landscape picture by Emile Claus; "Dutch Pastures" (68) by W. Roelosa; "After the Charge" (71) by Koekkoek, a pathetic picture with a great deal of expression in some of the figures, but rather crude and harsh in colour; and "A Village Smithy" (90), by E. A. Schmidt, a little interior which is a marvel of realistic truthfulness in detail.

**W**E hear with some dismay that the commission of architects dispatched by the Spanish Government to the Alhambra, in order to ascertain the damage caused by the recent fire, has finished its task, and reported that "the building can be restored at comparatively little cost." Can it? That may prove worse than the fire.

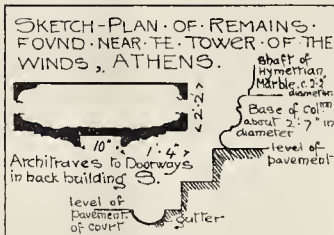

**A LETTER FROM ATHENS.**

The following communication from Professor Aitchison, who is at present travelling, — partly, we believe, in order to collect materials for his next course of Royal Academy Lectures on Architecture, — will be of interest to our readers:—

"Athens, November 8, 1890.

SIR,—I thought it might interest some of your readers to know that excavations are now being made close to the Tower of the Winds, on the west side of the sloping road, and to the north of the tower.

A portion of an agora or open peristyle has been discovered, possibly a part of the Stoa of Hadrian. There are eight columns on the south side and twelve on the west side; all these columns have Attic bases, the lower torus resting on the pavement without a plinth, and with shafts of Hymettian marble from 14 ft. to 16 ft. high from the pavement—i.e., including the bases. Beyond this peristyle is a space of about 19 ft. 6 in. Southward of the south portico is a chamber with three doorways, in front of which is a pronaos with two columns. To the west of the west portico are nine shafts without

bases. Amongst the numerous fragments found are many Ionic caps, as well as some Doric ones, with fluted shafts. One of these fluted shafts is standing in the area with an unfluted Hymettian shaft on it. Parts of the excavations are bounded by banks of earth and part by a Byzantine construction of stone with bricks in the joints.\*

As regards the Acropolis, it is greatly to be regretted that sculptural fragments are left exposed to the air. Some pieces that have been from their position protected from the weather have the carving almost perfect, and some of the coffers have the most distinct traces on them of the patterns that were painted or gilt. The Parthenon frieze that still exists on the wall of the Opisthodomos of the Parthenon is exposed to the weather, the coffering having fallen. A temporary roof would not only protect the sculpture, but also restore the original effect, as it was lit from reflected light from below. The same remarks apply to the portico of the temple of Minerva Polias, the doorway of which is exposed. It also is to be regretted that a copy of the sculpture on the temple of Nike Apteros is not substituted for the real sculpture and the actual

\* The accompanying plans are drawn out as nearly as possible to scale from the measurements given on Professor Aitchison's sketcher.

pieces placed in the museum. As we owe the re-erection of this temple to the munificence of Dr. Schliemann, he would hardly object to the preservation of the actual sculpture.

The remarks about a temporary roof between the columns and the walls of the naos equally apply to the Temple of Theseus.

No care is bestowed on the remains of Jupiter Olympius. The boys who play about these ruins amuse themselves with breaking off pieces of the fillets of the fluting, as many of the fractures are quite new. The volutes from the fallen columns have disappeared, and the sculpture of the capitals will soon be destroyed.

G. AITCHISON.

**THE SURVEYORS' INSTITUTION: THE PRESIDENT'S ADDRESS.\***

THE first ordinary general meeting of the present session of the Surveyors' Institution was held on Monday evening, the 10th inst., when the opening address was delivered by Mr. Robert Collier Driver, President.

Having thanked the members for his election to the position of President of the Institution, he proceeded to review some of the Bills introduced into Parliament during the past ses-

\* Unavoidably postponed from our last issue

sion. In the course of this part of his address, he said:—

The Public Health Acts Amendment Act contains some important conditions relating to drain-connections and made-up sites, to which members of the Institution, practising outside the administrative county of London, will do well to give attention.

One of the most important measures, from a surveyor's point of view, and one of special interest to our Institution, is what is known as the General Powers Act of the London County Council, which received the Royal Assent on August 18. The sections of this Act which specially concern us as surveyors are the 27th, 30th, 32nd, 33rd, 34th, and 36th. The Council of the Institution were of opinion, and urged in the proper quarter, that as regards Section 27, the sittings of the tribunal for the approval of plans should be continuous throughout the year, and that the points objected to and the reasons of adverse decisions should be stated; but their representations as regards this point did not apparently commend themselves. As regards Section 28, which concerns the fixing of the general line of buildings by the Superintending Architect of the Council, it had long been felt to be a grievance that no right of appeal existed against a decision which might prejudicially affect valuable building sites, therefore it speaks well for the London County Council that a tribunal of appeal has been voluntarily conceded, and no better court for the purpose could well be desired than one constituted of a nominee of the Surveyors' Institution as representing property, a nominee of the Royal Institute of British Architects as representing public taste, and a nominee of the London County Council as representing municipal control.

The Council of the Institution were not of opinion that it was desirable to fix a new limit for the cubical contents of buildings in place of the 216,000 ft. prescribed by the Building Act of 1855. Although the limit has now been extended to 450,000 cubic feet, the concession is guarded in the Act by conditions which remove some of the objections which the Council entertained to the proposal. It was felt very strongly that the original proposals of what is now Section 33 of the Act might result in serious injury and loss to the owners of corner plots. There was no objection to the proposal that in the laying out of new streets the line of frontage should be continued through until it met the lines of frontage of adjoining streets; but the Council felt and stated that, where buildings already exist at the corners of streets, the application of such a rule, however desirable, would cause such injury to the owners that it should only be carried out on giving compensation. It is satisfactory to observe that words have been introduced specially exempting existing rights from the operation of the clause.

The proposal to limit the height of new buildings to 70 ft. was modified in Committee to 90 ft. from the level of the ground to the level of the parapet. This is probably a reasonable compromise, and will save London from a multiplication of the monstrosities which threatened to invade the skies, without putting too much restriction on building-owners.

The London Streets (Removal of Gates) Act was a measure which can hardly fail to considerably affect large masses of property in the central districts of London. The Act makes provision for compensation to the freeholder for "injuriously affecting." It is, however, matter of common knowledge that a large number of the houses in these secluded streets have been taken by persons to whom quiet is a special object, on the strength of the exclusion of general and particularly night traffic. These are the persons whose bargains are disturbed by the Act without provision for compensation of any kind whatever, and who, unlike yearly tenants, will be denied even the consolation of a lowered rent for many years to come.

The Housing of the Working Classes Act is one of the most important measures of the session. Speaking generally, it is a consolidating Act, and proposes to deal in a very comprehensive manner with so-called insanitary areas and unhealthy dwellings, both in towns and in the districts of Rural Sanitary Authorities. The re-housing provisions, which formed the principal obstacle to the carrying out of what are known as Cross's Acts, are re-enacted; but, on the other hand, the law relating to the assessment of compensation is modified by making evidence receivable that the rental of the property was

enhanced by its illegal use, that it is a nuisance within the meaning of the Acts relating to nuisances, or that it is not capable of being made fit for human habitation. The arbitrator is authorised to award compensation under either of the first two categories, on the basis of the lower rental obtainable if the premises were legally and properly used, and, in the case of the third category, on the value of the land and the mere materials of the buildings.

No surveyor, worthy of the name, however jealous of any infringement of the legitimate rights of property, will find fault with provisions which prevent unscrupulous persons from obtaining compensation on rentals swollen by a disregard of the principles of humanity and common decency.

As local authorities are not empowered by the Act to re-cover the cleared sites without the special approval of the confirming body, it is to be hoped that the effect of the diminished compensation paid will be to enable them to offer the sites on such terms as will induce Improvement Societies and other responsible bodies to engage in the work of reconstruction.

The London County Council have already taken the initiative with a scheme for the improvement of about fifteen acres in one of the worst districts of the Metropolis, and the result will be awaited with sympathy and interest. But with every desire to see many of the acknowledged evils of overcrowding promptly remedied, I have great doubts whether much will be achieved under this ambitious measure.

The fatal weakness which underlies all this class of legislation is the assumption that the rates are an inexhaustible fund on which to draw for every purpose that may be in the abstract desirable; whereas, as a matter of fact, the ratepayer is already saddled with an almost intolerable burden.

I would, however, guard myself from being taken to imply that there has been any sensible addition to the burden of local taxation in country districts during recent years, and in this opinion I am fortified by the views of one of our most esteemed and experienced members, who has carefully investigated the question in almost every county in England.

However this may be, the latest available returns of local taxation show that there has been a steady increase in the total amount of rates levied in England and Wales during eight years of this decade.—the rise being from 22,160,999l. in 1879-80 to 27,194,836l. in the year 1887-88.

This enormous increase, amounting to 5,034,737l., representing 22½ per cent. in eight years, is accounted for by an extra 1½ millions swallowed up by the Metropolitan authorities, 2½ millions by municipal corporations and Urban Sanitary Authorities, 123,000l. by Rural Sanitary Authorities, and more than half a million by extra-Metropolitan school boards.

Add to this the startling fact that the outstanding loans (some of course productive) of local authorities increased from close on 137 millions in 1879-80 to over 192 millions in 1887-88, or about 29 per cent., and we have some measure of the enormous burden which the ratepayers now have to carry, and which Parliament is continually adding to by new legislation for objects most beneficent in intention but very costly in execution. It is to be hoped we are not drifting into a disguised system of State Socialism.

Within the last few weeks we have witnessed a revival of the project of the purchase of the London water companies. As the President's address is happily free from liability to criticism in this room, I may, without fear, venture the opinion that London will never again get so good a bargain as was placed within its reach by the ability of our late distinguished colleague, Mr. Edmund James Smith, whose proposals fell a prey to political exigencies, and who may be said to have died a martyr to the cause. . . .

While upon the subject of house property, I may note the remarkable change of habit which in London is coming over a large section of the population possessed of moderate means. I refer to the great development of the system of collective occupation of dwellings in what are known as flats. The system is, of course, no novelty in Continental towns, and in Scotland (possibly from its close connexion with France during the times of the Stuarts) flatted houses have existed in large numbers for some hundreds of years. Whatever be the cause of the change in London, whether it be the domestic service diffi-

culty, the loss of time involved by the daily journey from the constantly-receding suburbs, or a symptom of the co-operative tendency which appears to be entering into every consideration of life, the fact remains that the system has greatly extended within recent years, with the result of a return wave of prosperous people to districts of London from which a few years ago they appeared to have permanently departed.

The effect upon London trade and upon the value of land in localities suitable for the erection of buildings of the kind is becoming noticeable, and a person of a fanciful turn of thought might in his mind's eye picture the city merchant living once more hard by the scene of his daily labour. Oddly enough, the system which has been so long in vogue in Scotland is there now falling into disfavour, the tendency being to self-contained dwellings. I propose, during the session, to read a paper on this subject.

A subject on which I can speak with some knowledge is British forestry,—at least in one of its aspects,—the realisation of its products, in which my experience has been neither short nor slight. I believe that, in selected situations, larch, oak, and beech can all be grown at a profit, especially if the crop be credited in its early years with a share of the profit derived from the shelter it affords to the surrounding land.

There is no doubt that home-grown timber reached its lowest level, within living memory, ten or fifteen years ago. The last two or three years have seen a gradual improvement; oak has improved from 1d. to 8d. per foot, ash has kept the lead as the most saleable timber for some years, and now realises as much as, and in some places more than, oak. The devastating storm of October, 1881, so flooded the market with elm that the price fell 50 per cent., and it is only within the last two years that any decided recovery has become apparent. Beech has nearly recovered the position it held eight or ten years ago.

The Institution has shown its sense of the importance of the Forestry question in England by establishing a special examination, and granting a diploma of efficiency in the subject. It may be claimed that this is the first examination in home forestry ever held in England. The existing conditions in this country are not, in my opinion, favourable to the establishment of a National School of Forestry. The most that can be done for the present is to stimulate, by means of a special diploma of the kind, the ambition of young land-agents to a more careful study of the science with such facilities as already exist.

A few more words and I have done. The Session upon which we enter to-night will introduce an epoch most interesting as regards the future of the Institution. We stand committed to what is virtually a revolution in our constitution. It was assumed that ten years was sufficient notice to the profession of the impending compulsory examinations, and, speaking generally, we have secured the complete adhesion of the rising generation of surveyors, who have, in large numbers, been making their way into the Institution through the examination system applicable to the younger men. During the last seven years we have also been so happy as to draw into our ranks most of the leading surveyors of all classes in England and Wales. Any of our professional brethren, possessing the requisite qualification of five years' practice, not yet on our roll, have still for a few months the option of applying for admission without the ordeal of examination, and I can promise that their applications will receive all due consideration at our hands. It is to be earnestly hoped that the Institution will find itself completely representative of the whole profession before the advent of the important change to which I have alluded.

On the motion of Mr. E. P. Squarey, Past-President, seconded by Mr. Wheeler, Q.C., Associate, the thanks of the meeting were unanimously accorded to Mr. Driver for his address.

REGENT'S PARK BARRACKS. — The Household Cavalry barracks in Albany street, Regent's Park, are about to be pulled down. The rebuilding, on an enlarged scale, including the hospital, and for which some adjacent property has been acquired, will be begun next April. It is stated that the existing quarters were condemned some ten years since, the drainage being found to be defective, particularly beneath the stables and the officers' mess-house.

## THE ARCHITECTURAL ASSOCIATION.

The third meeting of this Association for the present session was held on Friday, the 14th inst., in the meeting-room of the Royal Institute of British Architects, Conduit-street, Mr. Leonard Stokes, President, in the chair.

The minutes of the previous meeting having been read and confirmed, the following gentlemen were elected members, viz., Messrs. S. D. Adhead, R. G. Rendle, E. White, C. C. Brewer, P. P. Cotton, E. E. Sadler, R. M. Vining, F. Thompson, W. McClelland, F. H. Willis, F. Taylor, G. Lucas, G. E. Martin, and H. Legg.

The Chairman announced that the Committee of the Association proposed to nominate Mr. P. J. Marvin to fill the vacancy on the Committee caused by the resignation of Mr. Francis G. Hooper. The election would take place that day fortnight.

The Chairman also announced that the "Common Room" had been re-opened under entirely new management, and expressed the hope that it would be more freely used than in the past.

Mr. F. R. Farrow (senior hon. sec.) announced a donation by the author to the library, entitled "The Parish of Hamsbury: being the first part of the Hundred of Hamsbury," by Mr. E. Doran Webb. A vote of thanks was accorded to the donor.

Mr. C. H. Brodie said he wished to refer to some remarks made by the President of the Royal Institute of British Architects in his opening address to the Institute. Those remarks, as far as they concerned the Architectural Association, were not very flattering, and were not altogether fair. In the first place a very common error had crept into Mr. Waterhouse's address, in which the President said that he had heard that the more complete system of instruction of the Committee had not been adopted by the general body of the Association. That was not so. It was adopted, but was not carried into effect owing to the difference as to the alterations of the rules which would be necessary to carry its adoption into effect.

In the second place a comparison was drawn between the total number of members of that Association and the number of its members who also belonged to the Institute. To be just, he thought that comparison should concern only the members of that Association who were resident in London and its neighbourhood, because it was clear, and it had been spoken of and regretted on many occasions, that that Association could not help, to the extent it would like, students in the country. A little further on some remarks were made as to the number of men admitted to the Preliminary Examination; and it was stated that for the examinations held in Bristol, Glasgow, London, and Manchester, the total number of candidates was seventy-three, of whom only 22 were members of that Association. He must say again that that Association did not pretend to educate the young architects of Bristol, Glasgow, and Manchester, and the comparison should be with regard to the number of men resident in London and the neighbourhood who went up for that particular examination. He thought that if figures were given of the men who, since the institution of the obligatory examination, had passed that examination, a very large proportion of those men would be found to be members of the Association. A paragraph in Mr. Waterhouse's address referred to the register of architects' assistants. He (the speaker) did not know much about the register of the Institute, but he knew a great deal about that kept by the Association, and that register was a great success, and he did not think that any fault could be found with it. A little further on in his address, he noticed that it was stated that people calling at the Institute office on the subject of the Association made requests which were often unheeded. All he could say was that if the clerks at the Institute office would just refer applicants to Mr. Collins, to whom the Association owed a great debt of gratitude, their wishes would not be overlooked, and if Mr. Collins could not assist these applicants, he would put them in communication with those who could. He would like to ask whether any steps were being taken by the Committee for the appointment of a joint committee to confer with the Royal Institute of British Architects as to the means to be taken for bringing about a closer union of the two bodies? Mr. Waterhouse spoke of such a union,

and it seemed to him (Mr. Brodie) to be a very desirable thing.

The Chairman replied that the matter had not been before the Committee so far.

Mr. John L. Robinson, R.H.A., of Dublin, then delivered an interesting and amusing lecture, illustrated by a large number of excellent photographic slides, from photographs taken by himself, and shown by the oxy-hydrogen lantern, of buildings visited by the Association on its annual excursions during the last four years, viz., 1887, to Bath and neighbourhood; 1888, to Derby and neighbourhood; 1889, to King's Lynn and neighbourhood; and 1890, to Oxford and neighbourhood. As we have in each year fully reported these excursions, and illustrated to a considerable extent the buildings visited, it is not necessary here to go over the ground again. It will suffice to say that all the principal buildings visited were shown by means of Mr. Robinson's admirable photographic slides, his comments on each being characteristically pertinent and witty.

Mr. H. O. Cresswell, in proposing a vote of thanks to Mr. Robinson, said they all owed a deep debt of gratitude to their *confirre*, not only for the wonderful series of photographs he had shown them, but for the exceedingly pleasant way in which he had taken them for a personally-conducted tour through four different districts of England by the aid of dissolving views, and not less for the running commentary which he had made on the various buildings illustrated. Mr. Robinson had concluded his remarks with a few practical and pointed observations as to the advantages to be derived from attending the Association excursions, and he (Mr. Cresswell) thought it would be an advantage if a larger number of members attended. He himself attended this year for the first time, and he sincerely trusted that it would not be the last. They had a very enjoyable trip, with a great deal of interesting work to see; a great deal of sketching was done, and he thought a good deal of social enjoyment was extracted out of the excursion.

Mr. H. L. Florence seconded the vote of thanks. The younger members who had not yet been to one of the Association excursions would learn from Mr. Cresswell's experience and advice that there was much to be learned and much benefit to be derived from joining these excursions. It had been his good fortune to be present at a great many of the excursions, and he had attended all the four which had been brought before them that evening. He thought, however, that any attempt to increase very greatly the number of those joining the excursion was likely to result in some dissatisfaction. From the experience that he had had he thought that thirty was the largest number that could be conveniently arranged for. Seeing that they had had already some twenty excursions, the time was coming when they would not be able to find new and interesting localities to visit; he therefore thought that it was for the benefit of those who had not been to those excursions, and some old places were visited again; and instead of trying to make a very large party, which was very difficult to manage on account of the hotels and conveyances, smaller parties might be conducted by one or two of the older members who had previously visited the places.

A junior member, whose name was not announced, said he took part in the last excursion, and had tried to make a few sketches; but with the older men round him he had felt a bit nervous. The Excursion seemed to him to be a perfect scramble; in fact, he had heard the annual excursion called the "Annual Scramble." Would it not be a good idea if they had an excursion for junior members only, giving them a chance where they would have a little more time?

The Chairman, in putting the vote of thanks to the meeting, said he could not advise beginners to go on the excursions. They must first gain a certain facility with their pencils, as unless they could sketch tolerably freely, it would be much better for them to go by themselves, or with one or two others, and not with the Excursion. He heartily believed in the Excursion, although at one time he was prejudiced against it. He could not help thinking that Mr. Robinson was a public benefactor to the Association, and particularly to members of the Excursion, because the collections of photographs that he did for them yearly were particularly valuable, as they could not get them anywhere else. The views that they could buy were not generally architecturally interesting, but simply pretty views. Architectural detail

they could not get, as a rule, without Mr. Robinson's help.

The vote of thanks was then put and carried unanimously.

Mr. Robinson briefly replied, and the meeting terminated.

## DR. LEAF ON HOMERIC GREECE.

## IV.—DRESS AND ARMOUR.\*

THE question of Homeric dress, the lecturer began by observing, is not so slight as it might seem. It is intimately bound up with the wider question of Homeric culture generally. Dr. Helbig, when he brought out the first edition of his book, had come to the conclusion that the dress described by Homer was in the main Oriental, thus according with what he supposed to be the general state of civilisation of Homeric times, *i.e.*, a condition scarcely to be regarded as Greek at all. The young Viennese archaeologist, Dr. Studniczka, on the other hand, has (in a book we reviewed some time back on Greek dress, "Die Altgriechische Tracht") clearly shown that the principal garment known by Homer was the peplos, a purely Greek piece of drapery. Dr. Leaf then proceeded, by means of illustrations, to draw a clear distinction,—often disregarded by even eminent archaeologists,—between the two main Greek garments: 1. The Ionic type, a *henn chiton*, fitting close, and having sleeves. 2. The Doric chiton, or, as Homer calls it, the peplos, woolen, loose, and sleeveless. The word chiton is Semitic, and the origin of the garment Asiatic; the Doric peplos is primitive Greek.

That the dress of the women in Homer was mainly the Doric peplos is shown by the fact that it is often spoken of as variegated, and wool, not linen, is the proper material for dyeing. Linen takes colour,—excepting certain shades of purple,—badly. Further, frequent mention is made of the girding of women's raiment, and girding implies the loose peplos, not the tight-fitting chiton. Lastly, we often read of brooches or pins, and these are in use for the loose peplos,—not needed for the tight-sewn chiton.

Dr. Leaf referred to the story told by Herodotus of how the Athenian women slew the one surviving man who returned from Ægina with their brooch-pins, and how for punishment they were obliged to wear the broochless Ionic chiton. In addition to the peplos, the women wore often a *kredemnon*, or large cloak-like veil, which fell at the back of the head, and partly shadowed the face. Innovations are, of course, eschewed at all times in the dress of men than of women. Accordingly, we find that, in Homeric times, the Ionic linen chiton, both in its short and long form, was already universally adopted by men. Later, the Ionic chiton, as has been seen, was introduced at Athens, and in other parts, for women also, but was again, in part, suppressed, possibly by the national reaction after the Persian War. Previous to Homeric times,—if the Mycenaean sword-blades are to be taken as evidence,—men wore a sort of close-fitting short drawers, and a woolen cloak over them; but the evidence of prehistoric monuments, the lecturer observed, is, in the matter of both men and women's dress, very unsatisfactory. In addition to the outer cloak or chaina, we hear of the pharos, which seems to have been usually white, sometimes purple, made of linen, and very probably, like the name, of Egyptian origin.

Turning to hair-dressing, artificial modes, like shaving, can be traced to pre-Homeric times, and it is noticeable that Paris is twitted with wearing his hair like a "horn," a method that can be illustrated from extant monuments. As regards armour, there is no break in monumental evidence, and it accords closely with Homeric tradition. The Homeric panoply of greaves, breastplate, helmet, spear, shield, was, with some very slight modifications, substantially the same as that seen on archaic statues of the late sixth and early fifth centuries B.C., and on the beautiful vase by Duris, who flourished early in the fifth century B.C.

THE COURT OF THE BLACKSMITHS' COMPANY have just conferred their honorary freedom and livery upon Sir John Fowler, Bart. A similar honour was bestowed some months since upon the two engineers associated with Sir John,—namely, Sir Benjamin Baker and Sir William Ayrton.—*City Press.*

\* For reports of the previous lectures of this course, see *Builder*, pp. 303, 345, *ante*.

### APPARATUS FOR TESTING THE SOUNDNESS OF CEMENT.

THIS annexed cut gives an illustration of the apparatus used by Mr. Fajja, and referred to in his letter in our columns last week (p. 390 *ante*) on "Cement Tests," for determining the soundness of cement in a few hours.

The space between the two vessels is to be filled with water, the inner vessel being filled with water only to the height shown.

Mr. Fajja says "the apparatus is based on the principle, which has been proved by practice, that moist heat accelerates the setting of cement, and that if judiciously applied the age of several days may be artificially given to a cement in a few hours. A sound cement acquires great hardness in a short time when treated in this apparatus, but an unsound one, or one that would under ordinary conditions "blow" when used in work, is caused to develop this characteristic in a few hours; and hence by the use of this apparatus, a definite opinion may be formed as to whether or no a cement is a safe one to use; independently, of course, of its tensile strength, which may or may not be equal to that required."

### METROPOLITAN GOVERNMENT.

By the new Bill which they will introduce into Parliament, the London County Council intend to ask for powers in regard to compulsory purchase of lands, the establishment of markets, and the superannuation of their officers; the removal of wires, with "other appliances" overhead, and, generally, the regulation or prohibition of the erection of any structures for advertisement or other purpose which, in their opinion, "may cause danger to the public or tend to the disfigurement of London." Powers will also be sought for the following specific objects:—Acquisition of some land and buildings for approaches to the Millbank Prison site; the conversion of Bishop's Meadow, Fulham, into a public park, with the construction of a riverside embankment there; exchange of land at Plumstead-common, with Queen's College, Oxford; maintenance of Maryon-park, Charlton, the gift of Sir Spenser Maryon-Wilson; purchase of 74 acres of Bostall Woods, Plumstead; extension of Peckham-rye; formation of public recreation-grounds at Beresford-street, Limehouse, Trafalgar-road, East Greenwich, and by the new Hammersmith Bridge; new Fire Brigade Stations at Renfrew-road, Lambeth, and at the northern end of Clapham Common; widening of Fortess-road, Kentish-town, Fulham Palace-road and Queen-street, Hammersmith, and St. George's-place, Knightsbridge; new streets from Evelyn-street to Creek-road, Deptford, and Falkland-road to Fortess-road, Kentish-town; to substitute permanent bridges for the swing bridges at Preston-road, South Dock, City Arms, and Limehouse entrance,—being four in number,—Isle of Dogs; and for rebuilding, partly at the expense of West Ham District, the present iron bridge across Bow-creek in Barking-road.

In our leading article of July 20 last we com-

mented upon the Fortess-road, the Evelyn-street to Creek-road, and the Isle of Dogs bridges and approaches schemes. With respect to some of the others the following particulars may be of interest:—Peckham Rye: The proposed addition consists of the Homestead Farm Estate, about 49 acres, towards the purchase whereof the Charity Commissioners promised 12,000*l.*, under the City of London Parochial Charities Act of 1883, and the Camberwell Vestry 20,000*l.*, the freeholders having agreed to sell at 1,000*l.* per acre. The farm, a pottery, and two messuages, if not removed, would yield about 525*l.* yearly. At their meeting on July 29 last the Council approved a contribution not exceeding 18,000*l.* towards this purchase. Hammersmith: The Vestry applied to the Council to enable them to widen to 45 ft. the junction of Queen-street and Fulham Palace-road at what is known as "Robin Hood-corner," and to contribute one half of the cost, estimated at 8,500*l.* Knightsbridge: The widening of the road (now from 46 ft. to 53 ft. wide) was ultimately agreed to by the Council at their meeting on July 29 last, upon Councillor Howell Williams's amendment, provided that the parish of St. George, Hanover-square, contribute one-fourth of the estimated cost of 32,067*l.* The leases of part of the scheduled property on the southern side, between Wilton-place and William-street, owned by the Ecclesiastical Commissioners, are about to fall in; for this land the Commissioners asked 21,892*l.* We may add that the Poplar District Board has expressed its willingness to contribute 10,000*l.* towards the estimated cost (33,500*l.*) of the Isle of Dogs scheme. The St. Pancras Vestry agreed to contribute one-fourth,—say 7,000*l.*—towards the widening from 33 ft. to 60 ft. of Fortess-road, with subsidiary improvements; and the Deptford improvement, previously scheduled by the late Metropolitan Board of Works in 1888, has been estimated to cost 62,000*l.*, towards which we understand, the Southwark and Deptford Tramways Company and the Greenwich District Board will contribute. The new thoroughfare would accommodate much of the traffic from Plumstead to London Bridge, and *pro tanto* relieve London-street, as also New Cross-road and Greenwich-road.

### Illustrations.

#### BRIDGE CHAPELS.

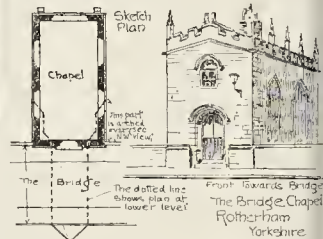

ATTENTION was recently drawn to the old Bridge Chapel at Wakefield, Yorkshire, undergoing for the second time a thorough restoration. This and the one on the bridge over the Don, at Rotherham, not far distant, are the two most perfect examples we have remaining. In Medieval times a large number of these bridge and wayside chapels existed in various parts of the country, but those now remaining, either as a whole or in part, would probably hardly reach a dozen in number. One of the most celebrated of them, now gone, was the chapel of St. Thomas à Beckett on Old London Bridge (shown in the views of London published in the *Builder*, May 10th, 1884, and January 7, 1888). Others existed at Rochester, Derby, York, Durham, Wallingford, Bridgnorth, and Exeter. There is a small building on the bridge at Bradford-on-Avon, Wilts (see *Builder*, August 20, 1887), but it seems doubtful whether it was ever used as a chapel; it probably occupies the site of a former structure of that kind. In 1882 an interesting paper on the subject of Bridge Chapels was read by Mr. S. W. Kershaw, F.S.A., before the St. Paul's Ecclesiastical Society, which we printed in our issue of April 29th of that year.

Of the two examples which we illustrate today (see plate), that of St. Mary's, Wakefield, is by far the most elaborate in design. Not quite in the centre, "below bridge," is an island on which the chapel is built, the plan being so arranged below as to offer the least resistance to the stream (see dotted lines on plan). The extra width required for the chapel above is obtained by corbelling out on either side, which gives a total external width of about 20 ft. The total length is about 45 ft. The front towards the bridge is very elaborate, and is divided into five ogee-headed compartments, with buttresses between. Three of these, the centre and two ends, are doorways, the other two being panelled. Over this is a series of five panels

filled with sculpture representing the Annunciation, the Birth of Jesus, the Resurrection, the Ascension, and the Descent of the Holy Ghost on the Disciples. Surmounting the whole are battlements; and a bold group of pinnacles at each end of the front over the buttresses. Each side is lighted by three three-light windows, and the east end has a large one of five lights; all have rich Decorated tracery. A well-designed turret stands at the north-east angle, and contains the staircase which communicates with the roof and crypt. On the north, south, and east fronts is a panelled parapet, and there is a canopied niche over the east window. There was formerly a priest's house adjoining, but the last vestiges of it were removed in 1866.

In 1847 the chapel was restored—practically rebuilt—by the late Sir G. G. Scott. The original front was removed to the grounds of Kettlethorpe Park, a short distance south, where it is still to be seen. Unfortunately, Bath and Caen stone were used externally in the restoration, and the atmosphere of Wakefield has played havoc with the new work. Indeed, some of the detail is sharper in the original at Kettlethorpe than in the restored chapel, and its deplorable condition has rendered a second restoration necessary. The interior is in good repair, and is fitted up for service, being the only example that exists at the present time. The windows on the south and east are filled with stained glass.

Not far distant is the bridge chapel at Rotherham, also illustrated in the present number. Here, again, we find a small island, which has been utilised to some extent to form a foundation for the chapel. As at Wakefield, the upper portion is corbelled out on either side, the end against the bridge being carried by a half arch. The Rotherham example is much simpler in

design and is smaller in size, being a rectangle about 30 ft. by 14 ft. It is lighted by two windows on either side, a large one over the altar, and a smaller one over a door facing the bridge. An embattled parapet with pinnacles ran round the whole. The building is now used as a tobacconist's shop, and has been divided into two floors. All the tracery has disappeared from the windows, and the space walled up and pierced with small modern sash windows. In Mr. Guest's book on Rotherham an engraving is given of the chapel and bridge, with the tracery restored. Each of the side windows is shown there as of three lights, and the small one over the door of two lights. It seems a pity that this chapel cannot be restored and the window tracery replaced.

Next week we propose to give some sketches of the bridge chapel at St. Ives.

#### EXAMPLES OF BRASSES.

THE brass of Sir Nicholas Dagworth, Blickling, Norfolk, belongs to what is known as the camail period of armour. The knight's head is placed on the tilting helm, which is surmounted by the crest. The jupon, cut into a curious leaf pattern, is confined by the baldric, to which is attached the sword and dagger. The sword-hilt is of a curved pattern, and the upper portion of the scabbard is ornamented with a canopied detail, which is also to be seen at the extremity of it. The armour, which is ornamented, is very simple. Mail is seen above and below the knees, at the armpits, and over the instep. The mode of attaching the camail to the bascinet is not shown in this instance. The inscription, of which very little is now left, is in black letter with sprays of leaves placed between each word. On either side of the figure are placed shields of arms.

by Nayland, Suffolk, presents some features not usually to be seen in the brasses of this type. The head, which is here, is placed on the tilting helm, and a long beard falls over a kind of mail gorget. In the detail it is somewhat similar to that of Sir N. Dagworth, in the ornament on the gauntlets, the baldric, and in the sword-hilt and scabbard. Mail may be seen at the armpits and instep. The figure of the lion under the feet is different to that usually seen. The brass of Simon de Wenslaygh Wensley, Yorkshire, is of the kind known as Flemish. It bears a very strong resemblance in the detail to that of Abbot Delamere, St. Albans (see *Builder*, September 13). The head of the figure rests on a cushion supported by angels. The hands, contrary to the usual practice, are turned downwards, and above them is placed a chalice and paten. Below the feet are two dogs. The matrix of a marginal inscription is round the figure. An inscription, dated 1607, is placed over the head of the effigy.

A. O.

PREMIATED DESIGN FOR BOARD SCHOOL, HARRINGAY.

This design was awarded second place in the recent competition by Mr. E. R. Rohson, the professional referee. The school was planned to accommodate 1,200 children, with a cookery class for girls, caretaker's house, and hall to seat 600 in addition. The materials proposed were red brick, with moulded brick strings, rough-cast in the gables, with plain tiled roofs. The whole scheme was to cost about 11,000. The design is by Messrs. Mitchell & Butler, architects.

MEMORIAL CHAPEL, TRAFALGAR-ROAD, GREENWICH.

This chapel, which is nearly completed, is built of brick, with a wooden barrel-vault roof. It is lighted by a three-light window at the west end, and by a dormer in the chancel roof. The pavement is of black and white marble, with wood block flooring under chairs. The whole of the interior will be decorated. The work is being carried out by Messrs. Wheeler Bros., of Reading. The decoration is by Mr. H. A. Bernard Smith, of Lewisham-hill. Mr. A. H. Shipworth, of London, is the architect. The original drawing is exhibited in the Arts and Crafts Exhibition.

BARNWELL CASTLE.

The present dwelling-house, which is now being enlarged, belongs to the Duke of Buccleuch and Queensberry. It was built early in the seventeenth century out of the stones of

a thirteenth-century castle, and some fifty yards away from that dismantled structure. Some time during last century the house was considerably enlarged by the addition of a drawing and dining-room, with bedrooms over, but the accommodation for servants was left quite inadequate. The object of the present enlargement is to provide such accommodation, and the new wing contains the kitchen and kitchen offices, servants' hall, and butler's pantry, with bedrooms over. The style of the new work is in conformity with the seventeenth-century portions, although the view we publish shows the plain eighteenth-century part of the old work. The walling is carried out in local stone, chiefly obtained from old buildings that have been pulled down, and the dressed stone is from the Weldon quarries. Since the accompanying drawing was made, it has been decided to add a story for the nurseries over the end of the new wing, while at the other end of the building a new boadiv with bedrooms over it has also been added.

The contractor is Mr. George Henson, of Wellingborough, who is carrying out the works from the designs of Mr. J. A. Gotch, F.R.I.B.A., and Mr. Chas. Saunders, of Kettering. The remains of the ancient castle are visible in the illustration, as also are the seventeenth-century stable-buildings to the right. There is very little known of the history of the castle, except that it was built by one answering to the romantic name of Berenger le Moine. It was not a large place, but the remains are very considerable, and the ground-plan, which is given in the annexed cut, is tolerably complete. Fireplaces and windows of upper floors can also be seen from below, but they are inaccessible.

BRIGSTOCK MANOR HOUSE, NORTHAMPTONSHIRE.

This house has recently been enlarged by the addition of a servants' wing. It was formerly used as a farm house, in which capacity full advantage could not be taken either of its large rooms or of its dignified character. It was at one time the residence of the Montagues, and within its walls was born the founder of the dual house of Montagu of Boughton.\* Parts of it date from the fifteenth century, and other parts from early in the seventeenth. But although it was a house not unworthy of being a manor-house, it was badly supplied with servants' accommodation,—hence the decision to add a new wing. This includes servants' hall, butler's pantry, brushing-rooms and lamp-room, with bedrooms over them. To gain access from the old part to the new, a one-story

\* From them it has descended, along with their other Northamptonshire estates, to the Duke of Buccleuch and Queensberry.

corridor was thrown out in the angle where the new and old joined.

The walls are built of local stone, with Weldon stone dressings, and the roofs are covered with Broseley tiles.

The contractor was Mr. George Henson, of Wellingborough, who carried out the work from the designs and under the superintendence of Messrs. J. A. Gotch, F.R.I.B.A., and Charles Saunders, of Kettering.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday afternoon, Sir John Lubbock in the chair.

Waterloo Park.—The Parks and Open Spaces Committee presented the following report as to Waterloo Park, Highgate:—

"We have had before us the question of Waterloo Park, which, as the Council is aware, was presented to the public by Sir Sydney Waterlow. It is a property estimated to be worth about 50,000*l.*, and we consider that, both in deference to the wishes of Sir Sydney, who so generously made the gift, and to the public to whom it was given, the Council should place the park in such a condition as to render it suitable for the public use. At present it is enclosed by a high wall, which excludes the public from any view of it, and we may, perhaps, add that a great many people who have no time to visit parks obtain pleasure by being able to see them in passing if the parks are enclosed with an open fence. There are other necessary works, such as the provision of a water supply, the cleaning out and rendering safe of the lake and a pond, the fencing in of shrubberies, the raising of the portion of the boundary-wall which adjoins certain houses, the repair of certain houses, the provision of public conveniences, seats, and the renovation of the Superintendent's lodge, which is in a somewhat dilapidated condition, although otherwise a slightly building. We are endeavouring to make arrangements with the owner of Fairseat House and grounds, which are held on lease, so that the Council may be enabled to remove it altogether or to let it for other purposes than that of a private dwelling, for which it does not appear to be in demand. There are, however, two other houses on the freehold portion of the park, one, Hertford House, which is neither useful nor ornamental, nor possessed of any historical interest; and the other, Lauderdale House, which is possessed of a certain historical interest. We propose that Hertford House shall be at once pulled down, and as regards Lauderdale House, that it should be retained, if it be possible to repair it at a moderate cost. In any case, as regards the old garden adjoining it, which is laid out in the style of the seventeenth century, we propose to restore it with its terraces at a cost of 320*l.* The expenditure which we have to ask the Council to incur is necessarily a large one, but we are of opinion that the Council, having accepted the park, is morally bound to put it into such a condition as to be a credit alike to the Council and the donor.

We may add that there is a proposal from the Vestries of St. Pancras and Islington that, in erecting the open fence next Dartmouth Park-hill, a portion of the park should be given up for the widening of the road, which is at present very narrow. We propose to report upon this at a future date. In the meantime, the recommendation which we have to submit is as follows—

"That, subject to an estimate being submitted to it by the Finance Committee as required by the statute, the Council do authorise an expenditure on capital account of 9,485*l.* for alterations at Waterloo Park; the works comprising—

Construction of paths .....	23,550 "
Laying water supply .....	350 "
Cleaning out lake and pond and making them safe .....	525 "
Fencing shrubberies .....	440 "
Restoring Lauderdale-house terrace .....	320 "
Erecting boundary fencing in place of close brick wall .....	2,000 "
Raising north-west boundary wall next backs of houses .....	225 "
Renovating greenhouses .....	575 "
Erecting public conveniences for both sexes .....	650 "
Improving shrubberies .....	300 "
Pulling down Hertford house .....	175 "
Renovating Cemetery Lodge .....	150 "
Purchasing 100 seats .....	225 "
	29,485 "

This report led to a long discussion, which was raised on an amendment, moved by Mr. Beachcroft, to reduce the amount of the proposed expenditure by 4,015*l.*, by omitting the sums of 3,550*l.* for making paths, 320*l.* for restoring Lauderdale House-terrace, and 175*l.* for pulling down Hertford House. The opinion was expressed that the amount proposed to be expended on paths and roads was excessive, and Colonel Edis and other members of the Council protested against the conversion of Waterloo-park into any such Cockneyified specimen of

"landscape gardening" as were to be witnessed, they said, in Dulwich-park and Vauxhall-park. On a show of hands, the amendment was carried by 36 votes to 30, and on a division by a larger majority, —17 to 38. On the amendment being put as a substantive motion, the members of the Committee asked that the whole question might be referred back to them for consideration, and this course was agreed to.

*The Report of the Special Committee on Contracts.*—On this report\* being called,

Mr. Arthur Arnold moved that recommendation of it be referred to the General Purposes Committee for examination and report. He contended that such clauses and restrictions as the Council had inserted in its conditions of contract had deterred respectable and responsible contractors from tendering.

Mr. Howell Williams seconded the amendment, but the recommendations of the Committee were supported by Mr. Stevens, Mr. Roberts (both builders), Mr. Burns, and Col. Edis, who, as an architect, said it was not only desirable, but absolutely necessary, in the case of special work, to allow subletting. Mr. W. Eneas Smith, the Chairman of the Special Committee, said that the adoption of recommendation a would only be a reversion to the old practice of the late Metropolitan Board of Works, who inserted such a condition into their contracts for years.

On being put to the vote by show of hands, the amendment was lost by a large majority. A division not being demanded, recommendation a, and the other recommendations of the Committee, were agreed to.

*Tenders for Works at Abbey Mills Pumping Station.*—The report of the Main Drainage Committee contained the following paragraph:—

"The Council on the 11th instant referred to your Committee the tenders which had been received for the execution of certain alterations and additions to the boiler-house, &c., at the Abbey Mills Pumping-station. Only two tenders had been sent in, namely, from Mr. William Noll, £3,898, 19s. 2d., and from Messrs. J. Mowien & Co., £10,934. Under these circumstances, and looking to the great disparity in the two amounts, your Committee have come to the conclusion that the best course will be to re-advertise the work. They are also of opinion that in doing this bills of quantities should be supplied by the Council. They recommend—

"That an advertisement be again issued, inviting tenders upon proper bills of quantities."

This was agreed to.

*The Water Supply Question.*—The Special Committee on Water Supply and Markets brought up the following report:—

"We have had before us a copy of the Parliamentary notice issued on behalf of delegates of the Vestries and District Boards as to a Bill relative to the London Water Supply. The main objects of this Bill are to empower either the Council or a specially-constituted Water Trust to acquire the undertakings of the eight water companies, on terms to be settled by agreement or by compulsion; and also to provide supplemental or alternative sources of supply. In view of the introduction of this Bill and of the possibility that it may be dealt with by a Parliamentary Committee in the course of next session, it is desirable that the Council should determine the course to be taken with regard to it. By the 38th section of its General Powers Act of last session the Council was authorised to prosecute and conduct inquiries and negotiations relating to the supply of water, or companies supplying water, in or near London; and the Council empowered us to enter upon such inquiries and negotiations. We at first considered that the best course would be to hold an inquiry, at which evidence could be taken, and with this view we put ourselves into communication with the eight water companies. The companies, however, were unanimous in declining to submit evidence at such inquiry, and, as it appears to us to be essential in an inquiry of this nature that all sides should be heard, and that the investigation should be of an exhaustive nature, we have come to the conclusion that, in the absence of the co-operation of the water companies, it is not desirable to enter upon an inquiry in this form.

The Council cannot promote any Parliamentary Bills relating to the water supply, but can oppose Bills in Parliament affecting the County of London, and we have come to the conclusion that the most desirable course for the Council to take in connexion with the authorised inquiries is to obtain—

\* Printed *in extenso* in last week's *Builder*, p. 385.

† Recommendation a was as follows:—"That the following words be added to the clause now inserted in the Council's contracts, with reference to subletting or sub-contracting:—'But the Council retains power to allow the contractor to sublet such special portions of the work as would not be processed or carried out by him in the ordinary course of his business.'"

information and prepare evidence, with a view to its being submitted to any Parliamentary Committee dealing with the subject.

In connexion with this subject we may refer to the report recently issued by the County Purposes Committee of the Corporation of London relative to the inquiry on the subject of water supply which has been held by that Committee on behalf of the Corporation. It appears to us that although much valuable information was submitted to the Committee, the inquiry was open to the objection that it was an *ex parte* inquiry, and that the water companies submitted no evidence. The conclusion came to by the Corporation Committee was that, as the eight water companies who supply London also supply large areas outside London, Parliament should create a water authority consisting of representatives of the governing bodies over the entire areas of the watersheds of the Thames and Lea, and that such authority should govern the watershed and manage the supply. The Committee also pointed out that the presentation of a Bill relating to the London water supply must fall upon the Corporation, as at the present time no other public body has power to incur the necessary expenditure. Should the Corporation introduce any such Bill it will be necessary that the Council should be prepared to submit evidence upon it.

We do not propose at the present time to enter upon the merits of the proposals made either by the delegates of the Vestries and District Boards or by the Corporation, as the Bills embodying these proposals are not yet before us, but it is obvious that the creation of a water authority over such an extensive area as that indicated must raise very serious questions. In recent legislation relating to the water supplies of provincial cities, Parliament has invariably given the Corporation of the city to be supplied the sole control of the water undertaking, providing, however, for the supply by the Corporation of a sufficient water-supply to the surrounding districts.

Whilst holding these views we feel that the Council and the Corporation are at one in desiring to place the supply of water to London in public hands, and we are now in communication with the Corporation on the subject. We recommend:—

"That it be referred to the Parliamentary Committee to take, in conjunction with this Committee, subject to any necessary resolutions under the Act relating thereto, the necessary steps to enable the Council to submit to Parliament its views on any Bills dealing with the water-supply of London which may be introduced during the ensuing session.

We also report that we have addressed a letter to the eight water companies supplying London with water, asking each of them to be good enough to permit Mr. Binnie, the Engineer of the Council, to examine the works of the company. To this letter seven out of the eight companies have replied, and the Chelsea, Grand Junction, and West Middlesex Water Companies have given the necessary permission to inspect their works."

The recommendation was agreed to.

*The Proposal to take Pupils in the Offices of the Council.*—The debate on Mr. Breton's motion (see last week's *Builder*, p. 385 *ante*) was resumed and concluded, and, after speeches in opposition by Mr. Haggis (the Deputy Chairman) and Mr. Fardell, the motion was negatived by a large majority.

After transacting some other business the Council adjourned.

#### ARCHITECTURAL SOCIETIES.

**BIRMINGHAM ARCHITECTURAL ASSOCIATION.**—The annual *convocation* of this Association was held at the Edghaston Assembly Rooms, on the evening of the 12th inst.; a very enjoyable evening was spent. There were about 300 members and guests present, and the proceedings opened with a reception by the President, followed by a concert and dancing, which was continued to a late hour. A fine collection of drawings was exhibited, those chiefly attracting attention among them being the pen-and-ink drawings of Mr. Herbert Raiton (kindly lent by Messrs. Virtue of London) and Mr. Rafles Davison, and the drawings and sketches lent by Messrs. Millard, Horsley, Aston Webb, Davies, May, Sedding, Edis, Bidlake, Bewlay, and Mitchell; the cartoons for stained-glass work, lent by Messrs. Holiday, Ward & Hughes, and Hardman & Co., and the pictures lent by Mr. E. R. Taylor and Mr. J. Pratt, also exhibited considerable interest. There was also interesting collection of English and foreign marbles lent by Mr. J. Ward, and the drawing-rooms were, by the kindness of Messrs. Norton & Co. of Birmingham, tastefully furnished and decorated under the direct superintendence of Mr. Bardell.

**LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.**—The first meeting of the fifteenth

session of this society was held on Monday evening last, in the society's rooms, Infirmary-street, Leeds, when the opening address was delivered by Mr. W. H. Thorp, F.R.I.B.A. At the outset he gave a brief history of the institution. He said that, in common with other organisations of a similar character, it had had varying seasons of light and shade, had been largely dependent for its existence and success on the continued efforts of a limited few, but had always shown signs of vitality, even at times when there had been cause for some little discouragement. One important event which must materially affect the welfare of the society had transpired since the concluding meeting of their last session. After somewhat prolonged negotiations and interchange of correspondence, the alliance of the Yorkshire Society with the Royal Institute of British Architects was now an accomplished fact. That the alliance would prove of benefit both to the parent institution and its branches in the provinces he thought there could be but little doubt. After referring to the advantages they would derive from the amalgamation, Mr. Thorp, speaking of examinations and diplomas, said he looked forward to a time, and that not very far distant, when the architect whose reputation had not been made prior to these more enlightened days, and who failed to possess himself of the necessary guarantees of ability, would find himself at no little disadvantage as compared with his fellows. Valuable appointments of a public nature were usually only obtained by those possessing the highest qualifications, whether they were representatives of the scholastic, medical, or legal professions; and, in like manner, the architect of the future who, in addition to his known capacity for work, was the owner of the Institute diploma, was more likely to be preferred than his less fortunate fellow-practitioner who was without.

**SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.**—The monthly meeting of this Society was held at the School of Art, on Tuesday evening last. Mr. F. Fowler presided, and there was a good attendance of members, including Messrs. C. J. Innocent, J. B. Mitchell Withers, E. M. Gibbs, W. F. Hemslow, W. C. Fenton, E. Macdougall, J. E. Benton, J. Smith, Thos. Winder, C. F. Wike (Dorough Surveyor), H. W. Lockwood, and others. Mr. J. R. Wigfall read a paper of a technical character, illustrated by well-executed diagrams, on domestic sanitary fittings. The subject was, he observed, one of special importance to Sheffield architects now that the Town Council were contemplating the system of sewage disposal by water-carriage. The new by-laws would, moreover, to improve sanitary work in the homes of all classes of the community. The various kinds of water-closet apparatus were noticed, and the different ways of constructing and jointing soil-pipes described, with the systems of ventilation, sewer disconnection, &c. The lecturer also noticed, as a probably useful means towards this end, the glass-lined pipes of Messrs. Dan Rylands & Co., specimens of which, lent by the agent, Mr. Donovan, lay on the table. A lengthy discussion of a practical character took place, in which Messrs. J. Smith, H. W. Lockwood, W. C. Fenton, E. Macdougall, and the Borough Surveyor, with others, took part; and, on the motion of Mr. J. B. Mitchell Withers, seconded by Mr. C. Hatfield, a hearty vote of thanks was awarded to Mr. Wigfall for his paper.

**GLASGOW ARCHITECTURAL ASSOCIATION.**—The usual monthly meeting of this Association was held on the 4th inst., when a paper on "Greek Architecture—Late Period" was read by Mr. R. J. Gildard. The President, Mr. William J. Anderson, occupied the chair. Mention was made of the reproduction of various types of Athenian architecture to be seen in Glasgow, such as the Gaol, Royal Bank, Waterloo Rooms, &c. Mr. David Andrew opened a discussion which followed, at the close of which the usual vote of thanks was passed to the essayist.

**ARCHITECTURAL SECTION OF THE PHILOSOPHICAL SOCIETY OF GLASGOW.**—The architectural branch of the Glasgow Philosophical Society commenced the winter session on the 17th, in the rooms, Bath-street, when the President, Mr. James Thomson, F.R.I.B.A., delivered the inaugural address, in the course of which he alluded to the erection of picture-galleries and museums in large cities, and while advocating the maintenance of these institutions, he thought that more might be done in the

ction of providing "People's Palaces" and recreation halls. As to the housing of the riding classes, he considered that a great deal had been done in that direction, but what was wanted seemed to be better accommodation for the lower orders, at a rental which would not be prohibitory. He concluded with reference to the late Mr. John Carrick, City architect of Glasgow. On the motion of Mr. Campbell Douglas, seconded by Mr. Gildard, vote of thanks was accorded to the President of his address.

Correspondence.

To the Editor of THE BUILDER.

ISLINGTON BATHS COMPETITION.

SIR,—In your article upon the premiated designs above, in your issue of to-day's date, you are commenting favourably upon my plans, drawing attention to a discrepancy that has been discovered several of the competitors between the figured plan and the drawing of my second-class bath. It is error admits of a simple, and, I think, acceptable explanation. In the preparation of my plans, I myself pencilled—in all notes and drawings dimensions upon the drawings, but by some means or other the assistant who generally does the printing to my plans mistook the 2 of the ft. for a 3, making the figured width 37, instead of what it should have been, 27 ft. In the report, however, accompanying my design the dimensions are correctly given, viz., 27 ft. by 27 ft. This fact, then in conjunction with the extent of the error, viz., added to a width of 27 ft., precludes the possibility, I think, of any imputation of unfairness on my part in the matter.

Your criticism of my scheme generally I consider to be just, and even complimentary. I would, however, like to correct you upon one portion of it. In the arrangement of the washhouse and ironing-room has been considerably altered in my revised plans. I think, on looking over the original ground-plan and the revised edition of the same (which I now send for your inspection), you will admit that this is not quite correct. In the revised plan, it is true that, at the desire of my Commissioners, I have incorporated a suggestion of the Messrs.—viz., to dispense with one of the paces. To do this I had but to transfer the entrance to the public laundry in the Stanmore-street to the other side of the women's pay-box in the Caledonian-road, displacing the ironing-room, longitudinally, to the extent of the space vacated by the transfer to the Caledonian-road front. I think, therefore, I may justly maintain that my plans have been altered to no considerable extent. It should, I think, be borne in mind, in criticising as to the buildings in question, that the site was designated for the proper accommodation required by the Commissioners; and that therefore some compromise had to be made by the several competitors in attempting to solve this problem. I myself did this at the expense of reducing the size of my second-class bath, and I was enabled thereby properly to provide on the ground-floor every part of the establishment that should be so accommodated. The provision of slipper-baths and the public laundry was so moderate in its requirement to admit of no reduction in this part of the establishment, and I was of opinion that one of the bathing-baths might better bear being reduced in size. A clause of the "conditions" issued to the competitors clearly gave them the right of effecting such compromise of the conditions that might best itself to them. This clause was as follows: "It is suggested that the following accommodation should be provided, but the architect is at liberty to vary and adapt his plan and design to it, so far as may be necessary to secure a more suitable accommodation."

This explanation is, I think, due to myself, and I believe you will kindly insert it in your next issue.

A. HESSELL TILTMAN.

November 15, 1890.

\* We should say that the portion of the plan referred to above had been "considerably altered," and we did not attach any blame to the designer for so doing.

THE PAINTING OF ASPHALTE.

SIR,—Will you allow me by means of this letter to obtain the assistance of those of your readers who are competent to give it under the following circumstances?—I am the possessor of an asphalt tennis-court in an open. When first laid, seven or eight years ago, it was of the usual dark slate-colour, very pleasant play upon, but got rapidly very much lighter by the bleaching action of the elements. I have interfered so much with the sight of this, which soon became soiled and grey in London, that I cast about for some means of restoring the original colour, but without success.

None of the Asphalte Companies could help me at all, but at last a chemical friend suggested a solution of pitch in naphtha.

I have tried this, but it will not do. It is very difficult to put on evenly because the naphtha evaporates so rapidly, and it thus makes a streaky job, and soon wears off.

I dare say others have the same trouble, and if anyone can tell me of a suitable painting material, I shall gladly make it public.

The asphalters people say that it must not contain either oil or turpentine, as these would injure the asphalt. (My court is laid with "Val de Travers" mastic.)

The paint must not be "shiny," but "flat"; it must not make the surface slippery, and it ought to last in good condition for several years.

I think the best colour would be a darkish neutral tint, or the colour of asphalt when just wet all over.

I am having a number of 4 in. squares of asphalt made on which I can try the material in case any persons send me samples of what they recommend.

I shall be much obliged for information. J. M.

CEMENT TESTS.

SIR,—In reference to the letters of Mr. Faija and Mr. Roehching, there is no reason why we should simply adopt bodily the German standard tests, but I think that a standard set should be drawn up for this country. There is not the slightest necessity to invoke Government interference. We have two powerful societies, the Institution of Civil Engineers and the Institute of British Architects, perfectly capable and fitted to deal with the whole question.

Let these two societies appoint a joint committee to draw up such a set of tests,—of course, after due consultation with the great firms of makers of cement; there is, I feel sure, no doubt but that such a committee could draw up most satisfactory regulations; and there is equally little doubt that if such a set of regulations were drawn up, very few engineers or architects would fail to adopt them; we should thus put an end to the often meaningless and contradictory tests now too frequently inserted in specifications.

I have no desire to make them compulsory, because I feel sure that common sense would be quite sufficient inducement for their general adoption.

I. HURSON BEARE, Engineering Laboratory, University College, London, W.C.

DEATH TO (NOT IN) THE VENTILATOR.

SIR,—The letters of Mr. Buchan and others in your last issue raise a curious point with regard to soil-pipe ventilation. Many eminent sanitarians, including Mr. Buchan, recommend the use of cowls on soil-pipes. I am now puzzled to know why, as Mr. Buchan informs us that such cowls are intended not only to extract foul air, but to "let air down," why, then, not leave the soil-pipe open? We all know an open pipe is the most powerful extractor by the wind's action, and it is obvious it can "let plenty of air down." Why, then, use a cowl? Surely not simply to keep dead leaves out? It is rather too bad of Mr. Buchan, after being paid for many soil-pipe ventilators, to now show his customers that they could have done so well with no cowls at all. If we still care to follow Mr. Buchan's precepts, let us evict "Death from the ventilator" by removing the roof from over his head; and henceforward when we buy cowls get a proper warranty with each, so that we can take our choice out of up-draught, down-draught, or "patent combination up-and-down-draught cowls."

J. F. SIMMONS, Liverpool, November 17, 1890.

BRICK-BURNING NUISANCE.

SIR,—I note in your current issue that you draw attention to the fact that Dr. Dudfield confirms your opinion as to the cause of smells complained of.

It has always puzzled me why there should be so much doubt and delay about the matter. It is perfectly obvious to anyone who understands the system pursued in and around London that a very serious nuisance exists.

How is it possible that animal and vegetable refuse, in all stages of putridity, together with all kinds of indescribable filth, can be burned slowly, at a low heat, and the fumes slowly diffused into the atmosphere without creating a great and dangerous nuisance? It is not a question of distance, for according to the state of the atmosphere and wind, the fumes will travel yards or miles accordingly.

I have detected the fumes of a brick clamp when at least three miles away. The clamp brick, or London stock, has been commonly for some time because of the tendency to use a better brick, and if the by-law referred to is rightly enforced (as it should be), there is an absolute end to the clamp system in all places where such a regulation exists. This fact seems serious at first sight, and will

doubtless put the brickmakers to the expense of erecting kilns, and burning the bricks with coal.

The bricks can be made either by hand or machine, and, if properly arranged, a good hard, kiln-burnt brick can be produced (obviating all the nuisance complained of) at a price as low, or lower, than those now produced by the clamp system.

JOS. JORLING.

The Student's Column.

HOT-WATER SUPPLY FOR BATHS, LAVATORIES, &c.—XXI.

COILS AND COIL SERVICES (continued).

AN example of a case in which coils were attached to a supply apparatus, and to which no objection could be raised, was in a residence only occupied during the summer months; in this case the coils did not come into use during the occupation, so that the supply of water for domestic purposes was not interfered with, but when the house was left in charge of two servants all the winter very little hot water was required to be drawn off, and the coils had practically the full benefit of the fire. There was one coil placed in each of five bedrooms for the purpose of keeping them aired, which they very effectually did. In an instance such as this, and whenever it is at all possible, it is best to take a distinct service to the coils, not in any way connected with the flow and return of the supply apparatus, as this in the majority of cases will save putting stop-cocks in the flow-pipe to divert the current; whereas if two distinct services are taken from the boiler they both start about equally, and should the coil service rob the supply then there is no objection to putting a stop-cock in this (coil) service, to check, adjust, or stop the circulation in this direction. If a distinct flow and return is not practicable, perhaps the flow-pipe can be so run, and the return branched into the other return, but in either case it is desirable to have stop-cocks in both pipes to totally prevent circulation, and by this means the coils and coil services can be emptied (by a cock provided for the purpose) in the summer months, to save the extensive rusting that would go on. There remains to be mentioned two small heating appliances that can, without any objection, be attached to a supply apparatus, as they need but very little boiler power to operate them, and they are articles of great utility in many instances. The first is a coil for heating a linen-closet (or, in other words, usually lined in a cupboard or closet), which is arising made up of 3-in. or 1-in. ordinary wrought-pipe, as fig. 59a, and six or eight pipes, 3 ft. long, is

FIG. 59a.

sufficient for a large-sized cupboard, say 9 ft high, 6 ft. broad, and 4 ft. deep, and this coil does not particularly need any stop-cocks, as it is generally used all the year round.

The other appliance to be mentioned is a towel-rail made of tube (decorated in colours or nickel-plated), as fig. 59b. This serves the purpose of drying and airing towels, and if it is severe weather the warmth both to the towels and in the dressing or bath room is agreeable. This does not need stop-cocks, unless desired.

One very essential feature in any description of coil or radiator is an air-cock or tube for giving free escape to the air with which the apparatus is charged before it is filled with water, and also to discharge the air that is perpetually accumulating in every description of hot-water apparatus. These air-vents require to be fixed at the highest point on every coil, as air being so much lighter than water is

always to be found in the extreme highest positions.

The objection urged against an air cock is, that it wants regular attention (every few

FIG 59b.

days at the least) which makes it unsuited for domestic purposes, and the remedy for this is to have an air-pipe, which, being open at the end, gives free discharge to the air as fast as it accumulates, and requires no attention; but an air-pipe is not always convenient, as, if there is a coil situated on the ground-floor, and the general apparatus terminates at the top of the house, then the air-pipe must be carried up to the top also, or it will overflow; it is, in fact, a secondary expansion-pipe. If air-pipes are used, these require to be just as many as air-cocks, but one air-pipe may be branched into another, but on no account must an air-pipe descend anywhere; in fact, they should not be carried horizontally, but ascending in a greater or less degree everywhere from beginning to end.

If a single coil is attached to a supply apparatus upon the tank principle it can either be connected to the flow pipe wholly or to the flow and return, as already explained; but with an apparatus upon the cylinder system we are better situated as regards this as we can connect it to the flow (secondary), or flow and return (secondary), or to the return only (secondary); this latter arrangement being the best by far, and which is not applicable with the tank system, as in this latter case the return takes a great time in getting hot, and when it is so it is continually being cooled down whenever a tap is opened and cold water enters the tank.

In connecting a coil to the secondary return of a cylinder apparatus we gain an advantage in only using water that has practically done its work, it having passed all the draw-off services and only having to pass through the coil on its way back into the cylinder; this is worth every consideration, as if a hot-water apparatus is designed to supply hot water there should be no obstacles or impediments placed in the way of its doing the work thoroughly, and to place a coil between two draw-off services means, as a matter of course, that the service nearest the boiler will have hot water some time before the one the further side, and if this one on the further side is of the least importance the coil will prove a source of annoyance to this extent. If the coil is placed (which in a cylinder apparatus is very hot) can be made to pass through it, but a means of cutting it out must be provided for the hot weather.

In many of our suburban residences, it occurs that the kitchen is on the same floor as the entrance hall, and it is desired to place a radiator in this hall (one of the most efficient places for such a thing) with a view to warm some of the cold air that is perpetually pouring in here. A difficulty arises in the fact that if we place the radiator on the floor it will be below the boiler, a difficulty commonly supposed to be insurmountable, but such is not exactly the case, for we have already shown that in the usual way a pipe may descend and ascend (dip) to a certain extent, and it is so in this case.

It is not within the province of these papers to deal with the theory that supports this suggestion, especially as the subject of heating by here, but in practice it will be found that this arrangement is permissible, and will give fairly good results, sufficient to prevent its being deemed a non-success.

It is necessary to effect this that the general

apparatus extend up two or three floors, as usual, in which case it may be connected up as

FIG 59c.

FIG 59d.

at fig. 59c or fig. 59d, illustrating the cylinder and tank systems respectively.

GENERAL BUILDING NEWS.

EDINBURGH.—Dr. Rowand Anderson has prepared plans for a new Free Church to be erected at Braid-road, South Morningside, a newly-formed suburb to the south-west of Edinburgh. The congregation have for some time met in a small hall, which was designed by Dr. Anderson, and which will form an adjunct to the new church, the estimated cost of which is about 8,000l. The church is to consist of a nave 98 ft. long by 33 ft. broad, with narrow aisles and transepts. At the north-west angle there is a tower 30 ft. square and 83 ft. high, surmounted by a lead-covered spire, 65 ft. high. The aisles have no windows, the interior being lighted from the clearstory and east and west gables. There are two windows in each compartment of the clearstory, which are square-headed, and of three lights, filled with tracery in the upper part. The window in the east gable is pointed, of seven lights, and in the west gable are two pointed windows of three lights each. The style adopted is that of the Third Pointed, and the accommodation provided is for a congregation of 800. This church will occupy a site in the immediate proximity of the recently-erected and very effective parish church, designed by Mr. H. J. Blanc, and the two buildings will naturally challenge a comparison between their respective merits.

THE DEVELOPMENT OF ADRINGTON, NEAR BRIGHTON.—The *Brighton Herald* says that since the sales by auction, in May and September last, by Messrs. J. W. Stride & Sons, the auctioneers have negotiated sales in land and houses on the estate amounting to upwards of 20,000l. The purchasers, it is believed, contemplate developing large portions of the estate: new roads will be formed, attractive villas built, belts of trees planted (a wise project), and other improvements will be carried out. The ADRINGTON estate embraces an area of over 300 acres. To show the comparative values of some portions of the estate, negotiations are stated to be pending for the transfer of land en bloc at the rate of 2,000l. per acre, whilst other parts fetch the very low sum of 200l. per acre,—these extremes affording plenty of scope for speculation.

COLDRED CHURCH, KENT.—The new Bishop of Dover performed his first official duty on Wednesday, the 29th ult., by reopening the ancient Church of St. Pancras, at Coldred, which has recently been restored. The funds have been collected mainly by the exertions of the Rev. C. B. Shirres, vicar of Sibberton, with which parish Coldred is united, Lady Gifford, of Walden, and Park, being the principal contributor. The church is a small building, consisting only of a nave and chancel, with a south porch. Until recently the fabric was

in very poor condition, the accumulated earth having for centuries risen above the original level and thus making the walls damp and the interior cold and comfortless, added to which the wind found free access through the old tiles of the roof and the decaying plaster of the ceiling. The porch was in a dangerous condition, although its age was very great. The bell-turret, at the west end (there is no tower), had lost its original gables, and the plastering of the interior was greatly decayed. All this has now been changed. The roofs have been lined with felt to exclude the cold, the earth has been dug away from the bases of the walls, and proper channels formed to prevent rain-water from damaging the foundations; the falling porch has been rebuilt of open timber-work, of larger dimensions, to allow of easy ingress and egress. The ceiling has been boarded, and the dreary-looking aspect of the interior removed by the colouring the walls in warm but subdued tints, relieved by some effective patterns and bands. The lost upper part of the old bell-turret has been added, and the interior has been laid with brick and black and red tiles, and the exhalation from the ground has been prevented by a layer of concrete. The works have been carried out from the plans arranged under the direction of Mr. E. P. Loftus Brock, F.S.A., architect, of London, by Mr. W. A. Cock, builder, of Maison Dieu yard, Dover. The church is remarkable for its extreme antiquity. When it was visited by the British Archaeological Association during the Congress held at Dover in 1883, Mr. Loftus Brock pointed out that there was good reason for the belief that the church had been erected in Saxo times, since the angle-quoins had been formed originally of rough flint in very primitive fashion. The interior had been repaired at a later period, and by different hands, with Caen stone, evidently the work of early Norman builders. The church was again repaired in the middle of the fourteenth century, of which date is the nave and the bell-turret, and a window on the south side. The fifteenth century witnessed the remodelling of the chancel. The church is one of the few buildings dedicated to St. Pancras, an early saint having been martyred at Rome in the fourth century.

A NEW CHURCH FOR NEATH, SOUTH WALES.—The foundation-stone of a new church for the outlying district of Tonua was laid on the 6th inst. The building will be cruciform on plan, with semi-circular apse and a lofty tower and spire on the western side of the north transept. The stone for the walls will be raised on the estate of the donor and the total cost will be about 3,000l. Mr. E. I. Lingon Barker, of Hereford, is the architect.

A NEW EAST-END "DOSS HOUSE."—There has recently been erected at the East-end, from the plans of Mr. R. J. Lovell, A.R.I.B.A., a new model "Doss-house." This contains accommodation for forty-five lodgers. The top floor is devoted to beds with screens between; and the two lower floors have "cubicles," which really form a distinct room for each lodger. Each cubicle is fitted with shelf, seat, and looking-glass. On the ground floor is a large entrance-hall and stone staircase to each floor with water-closets on each landing; a common kitchen, fitted with lockers, one for each lodger; a "deputy's" room, bar, and pantry and store; (the basement are the lavatories, with hot and cold supply to each basin; bath-rooms, lined with glazed bricks, with hot and cold supply. Deputy's room, and washing-room, with appliances for the lodgers to wash and dry their clothes. There is a yard, with urinals, and the roof of the houses flat, serving as a recreation-ground, and for smoking-place in summer for the men.

SANITARY AND ENGINEERING NEWS.

TEDDINGTON SEWERAGE WORKS.—The Teddington Local Board have, we understand, upon the advice of their Surveyor, Mr. Henry York, placed an order for sewage pumps with Messrs. S. Ouellet & Co. They are to be on Mr. J. C. R. Ouellet's patent. The quantity to be raised is 54,000 gallons per hour. Mr. J. C. Melliss, of Gresham House, the consulting engineer.

SEWERAGE OF HESWALL.—At the meeting of the Wirral Sanitary Authority, on the 12th inst., the Engineer, Mr. Charles H. Felow, M. Inst. C.E., reported that the system of sewerage at Heswall was practically completed, and the houses might be connected with the sewers at once. This work has been in progress since March last, and has been attended with considerable difficulty, nearly a whole of the excavation being in hard rock. The total length of the sewers is about 4 miles, and they are composed of stoneware pipes supplied by Messrs. Doulton & Co., of St. Helens, and laid with Stamford's joints. The sewer discharges by a large brick tank sewer, 260 ft. long by 7 ft. dia. and 4 ft. 8 in. wide, which will serve as a reservoir to hold the sewage while the tide is up. On the ebb tide the sewage will be discharged into the Mersey through a line of cast-iron pipes, 9 in. diameter, which are carried to low-water mark, and are supported on strong timber piles firmly driven into the shore. Special provision has been made for flushing these sewers by large flushing tanks be-

structed at the end of every branch sewer, which will be supplied with water from the main of the West Cheshire Water Company. Owing to the precipitous nature of the land at Howell, it has been deemed advisable to break the flow of sewage into sections means of specially-designed trapped manholes, which will also prevent the sewer gas from unloading; at any one spot and compel it to escape at numerous points in the system. In order to prevent any objectionable smell arising in the sewers, all the manholes are furnished with a special desodorising baskets, designed by the engineer, and filled with "polstrite," through which the sewer gas must pass. The amount mentioned by the Local Government Board to be expended on these works is £4,700, and it is not expected that this sum will be exceeded. The details of the works have been designed and carried out under the personal supervision of the Engineer in Charge, Mr. Charles H. Beloe, C.E., of Liverpool, and the contractors for these works were Messrs. Thomas & Co., of Danby, and Liverpool.

**WELL-SINKING AT HOMERTON.**—The Hackney Board of Guardians, finding that they were paying a very great deal of money for the sinking of a well at Homerton, consulted Messrs. W. Wain & Son, Artesian Well Engineers, Tottenham, and recommended them to carry out the following plan: They have sunk a shaft 80 ft. deep, with iron cylinders 6 ft. in diameter, and from this shaft continued down with a 14-in. boring carried on by a steam engine, until it reached the water level. They also designed a 25-horse power engine, a 12-in. long barrel pump, with a 3 ft. stroke, which is fixed in the 14-in. bore-hole at the depth of 260 ft. from the surface, with a total lift of 12 ft., and giving a yield of 150,000 gallons per day. The season, during several months, supplying buildings throughout the district of the water company, giving every satisfaction. The total cost of sinking out this work was 2,800l., and the contractors agreed to forfeit half the cost of the outlay, 1,400 gallons per day was not raised. The contractors have also carried out similar work at the City of London Board of Guardians at their refinery.

FOREIGN AND COLONIAL.

**FRANCE.**—The monument to Flaubert, by Chapu, which we drew attention when speaking of the sculpture of this year, is to be inaugurated at the end of next year. The works are to be commenced for the monument at Reims in the year of Joan of Arc, the cost of which is to be paid by a public subscription which has now amounted to 110,000 francs.—The Government occupied with a scheme for the establishment of a geological museum in Algeria. A committee has been formed in the department of Aisne for the erection of a monument, a statue to be erected at Reims, in the château of which the heroine was raised.—The competition opened for a new arch at Aix-les-Bains has resulted in the first and the commission for execution being given to M. Arthur Berthé, of Chambéry; the second prize going to M. Joseph Aix, of Lyons. The thing is to cost 500,000 francs.—Some remains of a new theatre have been discovered at Lyons, in the neighbourhood of the approaches for a bridge which is the site of the district of Fourvière with that of Croix-Rouge. The steps of the theatre appear to have been used up, in course of ages, as a quarry, the sub-structures remain.—In spite of the closing of the Seine, the work for the new bridge Pontons is being carried on, the piling having commenced from the Irvy side.—M. Henri Buschi has presented to the Ecole des Beaux-Arts a curious collection of six hundred specimens of coloured marbles such as may be employed in architecture. The series, which is believed to be unique of its kind, has been placed in Salle de la Construction, where architects and decorators can study or refer to it.

Municipal Council of Dijon have decided to give the plaster statue of Duguesclin, in the shape of a lion, by a bronze one to be executed by M. Caravanzi, a young sculptor who has already produced a statue of the celebrated stable for the monument of the Comte de Chamillat at Ste. Anne d'Auxy. The state will be supplied by the bronze; the cost of modelling the statue will be borne by public subscription.—The ancient collegiate church of Louvain (Vienna), which dates from the fourteenth century, is in the process of being transformed into a covered walk. (What does the "Société des Amis des monuments" say to this?)—The "Société Générale des Chemins de Fer Économiques" has been authorised to commence this month new lines from Lyons to Lapeyrouse, and from Châteauneuf to La Courbe.—The Municipal Council of Lyons has expressed officially the opinion that the professional school of Céramique ought to be placed in that town, in order to train up artists and masters in the highest class of work.

A communication on this effect has been submitted to the Chamber of Deputies. A new way has just been opened in Corsica, from sea to Calvi.

**THE TWENTY-FOURTH ANNUAL CONVENTION OF THE AMERICAN INSTITUTE OF ARCHITECTS** was held at Washington on the 22nd of October, and was attended by nearly ninety members. Mr. R. M. Hunt, the President, was kept away from the meeting by illness, and the chair was taken by Mr. W. W. Carlin, the first vice-president. Mr. Douglass, on behalf of the City and District of Washington, read an address of welcome, in which he said that during the past ten years permits for 17,733 new buildings in the city had been issued, representing a valuation of 43,133,843 dollars. The average cost of buildings erected in 1880 was more than 40 per cent. greater than the cost of buildings erected in 1851, a fact which he regarded as conclusive evidence of improvement in the character of the houses erected. The annual address of the President (Mr. Hunt) was then read by Mr. Kendall, who condemned the practice of leaving all architectural work for the Government in the hands of a bureau of the Treasury Department at Washington. He argued that were the national buildings put in charge of well-selected men, and the duties of the Supervising Architect restricted to a general supervision of them, the Government would be better and more economically served, as then the architect could be more closely to his design and more efficient superintendence to its execution. The Treasurer's report showed that the Institute is in a satisfactory condition financially. The reports of the several Chapters were referred to a committee for consideration and report. The secretary then read reports from several committees,—upon "The Code of Ethics," upon "The Employment of a Clerk of the Works," upon "Railroad Transportation," and upon a "Uniform Contract." These reports were all laid upon the table, without acceptance, for future action. The text of these reports will be found in the *American Architect* for November 1. The committee on "Ethics" declines to submit definite code of ethics, but recommends "that the topic be kept well and constantly in mind." The report on the clerk of works question sums up distinctly in favour of the employment of clerks of works in America. The proceedings of the Convention were continued on the 23rd and 24th ult.

**BERLIN.**—1,008 matriculated and 355 non-matriculated students have last summer attended the lectures, classes and practical courses of the Royal Technical College. Of the 1,008 matriculated students, 138, or over 10 per cent., were resident foreigners, 60 Russians, 23 Norwegians, 11 Austrians, 8 Japanese, and 5 English (two architects, three engineers). A great increase in numbers is expected this winter. The annual calculations of the cost of the city railroad viaduct (which consists of different main lines and serves for local traffic) show that 27,109,000 marks were spent on acquisition of the necessary ground, and that the construction cost 33,339,000 marks; together 60,538,000, or over 3,000,000l. (about 250,000 t. per kilomètre).—The underground telephonic connection is now nearly complete. The post-office, to which the line is being brought, intend opening a night service, hoping thereby to assist the Fire Brigade service, which will then have more chance of getting their "alarms" as quickly as possible.

**SWEDEN.**—The amended design for the new opera-house to be built in Stockholm by the architect, Herr Anderberg, has now been completed. In front of the building a terrace will be laid out in a similar manner to the Biltische Terrasse in Dresden, with a fine view of the most picturesque parts of the city, whilst the ground-floor of the building will be occupied by a first-class café, &c. Two broad marble stairs will lead up to the terrace. The principal entrance to the opera-house will face the Square of Gustavus Adolphus, opposite the Royal Palace, and consists of a vestibule with a fountain in the centre. There will be a separate entrance to the Royal box. Through the new design a saving of about 28,000l. on the structure has been effected.—The great new Serafhus Hospital, now in course of construction in Stockholm, is approaching completion. The architect is Herr A. Kumin.—In order to effect certain important street improvements in Stockholm the corporation has purchased half a million square feet of ground, at a cost of 36,000l.—A new municipal church is to be built in Sundsvall (a town totally burned down last year), at a cost of 20,000l., in addition to a school-house to cost 15,000l.—The restoration of the ancient Cathedral of Skara is progressing. Up to the present time 15,000l. has been expended in the work, and there still remains in hand 6,000l.—The architect (Herr Adrian Pettersson) commissioned to erect buildings for the industrial exhibition to be held in Gothenburg next year has completed his designs. The principal building contains a large central and five smaller galleries. All the buildings are of wood, and in Norse style.—In consequence of the depressed state of the wood-pulp industry, leading Swedish and Norwegian manufacturers have agreed to a reduction of output for this and next year of 25 per cent.

**RUSSIA.**—A hygienic and sanitary exhibition is to be held next year in St. Petersburg.—The *Peterburgskaja Wjedomosti* states that the Russian Ministry of Finance has appointed a commission

to report upon the question of a normal day of labour for workmen in Russia.—The Russian Government has decided upon thoroughly repairing and restoring the house in Zaandam, inhabited by Peter the Great in 1697, whilst working as a ship's carpenter in Holland. It is to be made as much as possible similar to its appearance at that date. The work will be carried out by a Russian architect.

MISCELLANEOUS.

**DISCOVERY OF PETROLEUM IN FRANCE.**—According to the Paris correspondent of the *Daily News*, a discovery of petroleum is reported to have been made at the foot of a hill named the Puy de la Poix, four miles from Clermont, in Auvergne. The naphtha which exudes from the rock in different parts is equal to Baku or Pennsylvania oil, and geologists are of opinion that it extends in a subterranean sheet over the whole extent of the vast Plain of Limagne, and is probably to be found at a depth of 1,600 ft. Borings have commenced near the village of Lussac. One of them attained a depth of 450 ft., when a rush of natural gas took place, which caught fire and stopped any further progress.

**MR. JOHN THOMAS HURST, C.E.**, so well-known in a civil engineering and architectural circles, as author of the "Pocket Book for Surveyors"; revised edition of Tredgold's *Carpentry*, &c., has, we are informed, just retired from the public service, having held the appointment of senior first-class surveyor in the Royal Engineer Civil Branch of the War Office. On the occasion of his retirement, Mr. Hurst was presented with an address by the professional members of the Royal Engineer Civil Branch as a token of esteem and respect. Mr. Hurst is, we believe, an Irishman by birth, but has for many years resided in London. He is a member of the Society of Engineers.

**CANAL BETWEEN THE AZOFF AND BLACK SEAS.**—A company, with the Duke of Leuchtenberg, cousin of the Czar, as patron, has been formed for the construction of a canal between the Azoff and Black Seas. The capital is 100 million francs. The canal will be 100 versts in length, and is to be completed in six years. The company will have a proprietorship of ninety-one years.

**THE ENGLISH IRON TRADE.**—The recent troubles in the money market have not been without effect upon the iron trade. To some degree the present quietness in the English iron market is due to that cause, and the resulting stagnation in business might have been worse were it not the case that the trade, taken by itself and as a whole, is in a healthy condition, awaiting only a slight revival in the demand to fully recover its former steadiness. Pig-iron has been depressed in price. The Glasgow warrant market has been flat, with a downward tendency. Middlesex pig has dropped quite 1s. a ton. In other districts pig-iron is tolerably steady, and the same may be affirmed of Bessemer pig. Finished iron is weaker in price, and steel is likewise easier, with no appreciable change in the demand, however. Shipbuilders have again been booking fresh work, and there is no sensible slackening of activity amongst engineers.—*Ira.*

**LIVERPOOL ENGINEERING SOCIETY.**—The second ordinary meeting of the session was held at the Royal Institution, Colquhoun-street, on the 12th inst. Mr. Ferdinand Huddleston, Assoc. M. Inst. C.E., was President in the chair. A paper, entitled "Water-pressure Engines," by Mr. M. E. S. Brodie, Assoc. M. Inst. C.E., Mr. M. J. S. Whitehead, was read to a large gathering of members. The author, after a general introduction on the subject, dealt with some water-pressure engines which had recently been erected at the Whitehaven Water-works for the purpose of pumping water to a portion of the town which is situated at a high level. In doing so he stated the conditions under which they had to be erected and the work they had to perform, and then proceeded to describe the engines and pumps in detail, giving statistics of their performance, together with the first cost and the actual cost of working. A discussion upon various details of the pumps followed the reading of the paper, and a vote of thanks to Mr. Brodie terminated the proceedings.

**WINDOW AT ST. MICHAEL'S CHURCH, HELSTON.**—A stained-glass window has been placed in St. Michael's Church, Helston, by Mr. T. Davey in memory of his son, Mr. G. T. Davey. The subject of the window is the raising of the widow's son at Nain. It has been designed and executed by Messrs. Clayton & Bell, of London.

**TRAMWAY AT BERN.**—A new tramway on which compressed air (Mikarski system) is used as motive-power has been opened. The new line, of 3 km. length, constructed at a cost of 410,000 francs, has an average gradient of 11.4 per cent., the curves having radii varying between 30 and 50 metres. When the Mikarski system was tried in London a few years ago it failed.

**CREMATORIUM AT HEDDERSBACH.**—A crematorium specially for the Duchy of Baden is to be constructed here on a site given by the municipality. The work will be commenced next spring.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENT.

COMPETITIONS.

Table with columns: Nature of Work, By whom Advertised, Premium, Date to be delivered.

CONTRACTS.—Continued.

Table with columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, Tenders to be delivered.

PUBLIC APPOINTMENT.

Table with columns: Nature of Appointment, By whom Advertised, Salary, Application to be in.

Those marked with an Asterisk (\*) are advertised in this Number. Competitions, p. iv. Contracts, pp. iv. and vi. Public Appointment, p. xvi.

THE PROPOSED NEW RAILWAY ACROSS ENGLAND.—The recent report that a new railway was to be cut from King's Lynn, on the east coast, to Liverpool, on the west, passing through Cheshire, is quite correct, although it was incorrect to ascribe the enterprise to the Great Northern and the Great Eastern Railway Companies.

ROYAL METEOROLOGICAL SOCIETY.—The opening meeting of the session of the Royal Meteorological Society was held, on Wednesday evening, the 19th instant, at the Institution of Civil Engineers, when the President, Mr. Baldwin Latham, M. Inst. C.E., delivered an address on "The Relation of Ground Water to Disease."

EAST COAST RAILWAY, INDIA.—Nothing has yet been settled about the provision of the link between the East Coast Railway at Cuttack and the system of railways in Bengal. But there is every reason to believe that it will be made, and that the East Coast line will proceed in a north-easterly direction from Cuttack to Balasore, Midnapore, and Budge Budge to Calcutta.

NEW MUSEUM AT ANTWERP.—A new Museum building, which has been especially erected for the valuable picture collections of the city, which have up till now been dangerously housed, has lately been handed over to the public. In 1877 it was the object of an open competition, with unsatisfactory results, followed by an equally unsatisfactory limited one in 1879.

LEGAL. THE BUILDING ACT AND RAILWAY COMPANIES.

The District Surveyor of Bromley Saint Leonard, E., on the 4th inst. summoned Charles Clayton, a builder, of Queen-street, E.C., before the magistrate at the Thames Police-court for refusing to give "notice" of certain works executed by him to a warehouse in the occupation of the "Far-Famed Cake Company," in Cording-street, Bromley.

From the statement of the District Surveyor it appeared that the works consisted of an "alteration" to the building in question, which was a large one, being some 160 ft. long, 40 ft. wide, and 15 ft. high to eaves. A length of about 22 ft. of the end external wall of this building was entirely taken down, and the building was re-inclosed by a new wall which was not built on the same line as the old—an obtuse angle of the building being cut off, thus rendering necessary a corresponding reduction of the roof.

The defendant was represented by the solicitor of the North London Railway Company, who said that the work described by the District Surveyor was done for the purpose of providing an additional approach to the South Bromley Railway Station, and that the new wall which had been built formed one side of the covered way, or gallery, or "bridge" over the railway metals, and he contended that inasmuch as "bridges" were specifically exempted from the restrictions of the Building Act, this work which had been done, forming as it did a part of a "bridge," must also, as a matter of course, be likewise exempt. He also claimed that the new wall was their property, or that it was built on land belonging to them, and he submitted that the wall was a "party" wall separating the Far-Famed Cake Company's factory from the enclosed covered way, or gallery, belonging to the railway company. He also further submitted that a railway company had no statutory power to build such a wall without giving proper "notice" to the District Surveyor.

In giving judgment, the magistrate (Mr. Mead) said he considered the District Surveyor had satisfactorily established his claim for a notice in respect of the works that had been executed, and he should order the defendant to pay a fine of 10s. and the costs of the summons. As, however, the matter was one of importance to District Surveyors and railway companies, he was willing to state a "case" for the opinion of a superior Court if the railway company desired him to do so.

REGISTRATION OF PLUMBERS AT CARDIFF.—On Saturday last Lord Aberdare distributed the certificates granted by the District Council for Cardiff, South Wales, and Monmouthshire to the candidates who had been successful in the examinations instituted under the auspices of the Plumbers' Company of London.

MEETINGS.

MONDAY, NOVEMBER 21. Royal Academy of Arts.—Professor A. H. Church, M.A., F.R.S., on "The Conservation of Paintings and Drawings," 4 p.m. The Chemistry of Secondary Cells, by Professor W. E. Aytton, F.R.S., Mr. C. G. Lamb, B.Sc., and Mr. E. W. Smith, 8 p.m. Edinburgh Architectural Association.—Opening Address by the President, 8 p.m. Society of Antiquaries.—8.30 p.m.

TUESDAY, NOVEMBER 25. Institution of Civil Engineers.—Professor John Milne, F.R.S., and Mr. McDonald on "The Vibratory Movements of Locomotives," 8 p.m. Sanitary Institute (Lectures for Sanitary Officers).—Mr. A. Wynter Blyth, on "Sanitary Laws and Regulations Governing the Metropolis," 8 p.m.

WEDNESDAY, NOVEMBER 26. St. Paul's Ecclesiastical Society.—Mr. J. Grimsham on "The Abbey Churches of England, both Perfect and Ruinous, with Special Reference to, and Suggestions as to the Treatment of, the latter," 7.30 p.m. Society of Antiquaries.—Mr. Francis Galton, F.R.S., on "Physical Tests in Competitive Examinations," 8 p.m.

THURSDAY, NOVEMBER 27. Institution of Electrical Engineers.—Adjourned discussion on the following papers:—"The Efficiency of Secondary Cells," and "The Chemistry of Secondary Cells," by Professor W. E. Aytton, F.R.S., Mr. C. G. Lamb, B.Sc., and Mr. E. W. Smith, 8 p.m. Edinburgh Architectural Association.—Opening Address by the President, 8 p.m. Society of Antiquaries.—8.30 p.m.

FRIDAY, NOVEMBER 28. Architectural Association.—Mr. W. H. White on "The Arts in Former Times and to-day," 7.30 p.m.

RECENT PATENTS: ABSTRACTS OF SPECIFICATIONS.

15,922.—COUPLING DRAIN-PIPES: J. W. Jones.—According to this invention, the outer or flange pipe is secured to the inner or spigot pipe by means of cotters, keys, pins, or studs, inserted so as to cause a pressure between the inner surface of the outer pipe and the outer surface of the inner pipe.

16,906.—LEAD GLAZING: H. S. Tanner and A. P. Godart.—The first lead used in glazing, according to this patent, is stiffened and strengthened by the introduction of a strip of hard metal within or against the heart of the lead. This stiffer metal is rolled at the same time that the lead is rolled.

19,024.—PLANS FOR PUBLIC BUILDINGS: T. J. Plocton and E. M. Gibbs.—The plan for which protection is claimed, consists in the placing of each apartment in a separate wing or compartment of the building, arranging the rooms within it very much as if each wing or compartment were a separate building, with windows upon the outside of the chimney pots, and with the arrangements round a central hall or passage.

19,628.—CHIMNEY-POTS: T. S. Mann.—The upper portion of the chimney-pots are provided with openings at the sides, fitted with hinged covers, all connected with each other by metal rods, in such a way that when at rest each opening or outlet is partly open. In case of a strong wind blowing, the hinged covers on the windward side of the chimney-pot are closed by the pressure, while those on the opposite side are open to allow for the exit of the smoke.

**LONDON.**—For salvation Army citadel and new house and laundry premises adjoining at Nunhead, for the Salvation Army Mr. W. Gilbey South, architect, 25, Bedford-park, London, W.C. £2,157 0 0. Accepted.

**LONDON.**—For the erection of a laundry, Peckham Park-road, for Mrs. Fanny Davies. Mr. J. Williams Dunford, architect, 169a, Queen Victoria-street, E.C. £900 0 0.

**LONDON.**—For the erection of lavatory and bathroom at the Mile End Old Town Union, for the Guardians of the Poor. Mr. Bunton, surveyor.

### Japanese Pottery and Japanese Drawing.\*

THE large and finely-illustrated volume recently brought out by Mr. James L. Bowes on Japanese pottery is not only one of the most beautiful but one of the most useful and rational books upon Japanese work which has been published in England: useful, because it gives a very complete and intelligible analysis of the various styles of Japanese pottery, and rational because the author, although probably the most accomplished connoisseur in Japanese art in this country, is not so indiscriminating in his admiration as to accept as beautiful everything that is Japanese, or even everything that the Japanese themselves consider to be beautiful. Critics who thus combine knowledge with judgment on Japanese art are too rare in this country.

Mr. Bowes is logical and systematic in his division of the subject. He commences with a mythological tradition, which is curious if not very instructive. All Japanese reports, he tells us at the commencement, agree in stating that the art of pottery was invented long before the historical period of Japan, which commences 660 B.C. This tradition is based on the fact, as vouched for by the late Mr. Ninagawa, archaeologist in the Imperial Museum of Tokio, that in the earliest Japanese history it is stated that "Sosanowano-o-mi-Kami advised Tenatsuchi to prepare from different fruits a drink in eight vases," but, adds the learned archaeologist, "we are unacquainted with any specimens of these ancient productions"; in which case his theories need not detain us.

Coming to the next chapter, "Traditional," we are on firmer ground, for here we are given figured specimens of very old and undated hits of Japanese pottery which have been dug up from various ancient mounds in Japan. These examples serve once more to point the lesson which every find of very

ancient pottery seems to teach, viz.: that in the earliest periods of which we find any remains of pottery the art was much the same all the world over. There is nothing specially Japanese, as we regard Japanese work in the present day, either in the outlines or the decoration of these ancient vases and fragments of vases found in Japan. They belong to the same general type as the pottery found by Dr. Schliemann and General Cesnola in their various explorations. The outlines are simple but shapely, and the ornamentation consists mainly of striations, oblique, horizontal, crossed, or chevroned, and much like what may be seen in the archaic Greek vase room at the British Museum. They have no affinity with the types which we are accustomed in these days to regard as peculiarly Japanese.

The "Historical" phase treated of in the next chapter commences not, as the Japanese would have it, at 660 B.C., but, according to Mr. Bowes, at about the eighth century of the Christian era. But at this period there is no evidence of the production of anything more elaborate than unglazed stoneware and earthenware made by hand; nor does there seem to have been any marked advance in this respect for the next four centuries, when we come on the first historical artist, whose original name is too long to write, but who became known as "Toshiro," and is recorded to have visited China in 1222, and there learned the art of glazing. "On his return to Japan his knowledge enabled him to select clays of a suitable character for the improved wares which he wished to produce, and he commenced to make small objects, having a slight approach to elegance in form, to which he imparted some degree of beauty by the skilful application of glazes but his skill carried him no further in this direction than simple brown glazes of various shades speckled with black."

The productions which are thus rather unsympathetically described were in fact the small jars of brown stoneware, made for holding powdered tea, and of which there were a number of specimens in the fine exhibition of Japanese work held some time since at the gallery of the Fine Art Society. There is a simplicity of design about these, and purpose-like and practical character, which is in itself admirable as far as it goes; but we

agree with the author in thinking that it is impossible to echo the extravagant admiration which it appears the Japanese connoisseurs have for these objects, and which is probably, as he suggests, a kind of affectation of conservatism which leads them to profess a preference for these plain little brown jars before all the elaborated and often beautifully decorated ware of more modern times. Partly perhaps there is a kind of social sanctity connected with this form of tea-mug, for the taking of tea seems to have been a very serious social function for centuries past, and the author gives, on one plate, sketches of no less than thirty-one different small implements which were necessary to the complete fitting out of a tea-function. But from some further remarks on the same subject on another page, it would seem either that the Japanese are more foolish than they are usually supposed to be in these matters, or else they find a certain serious and *spiritual* enjoyment in mystifying the stranger. In the frontispiece the author gives a coloured facsimile of such an ancient jar, which was sent to him as a specimen of Toshiro's work. It is simply a small brown stoneware jar of a shape rather like a barrel, narrower at each end than in the middle, and as the author observes, presents no feature which an intelligent English potter of to-day would find any difficulty in imitating.

"This object came to England most carefully protected in a double case, the jar being first enveloped in a white-wadded silken bag and then enclosed in a box of *kiri* wood decorated with gold lacquer; this was placed in a second case made of *saburo* wood, and protected by pads of white satin; the outer case bears the late owner's name written in gold, and the character *on-claire*, the prefix signifying that the *chaire* is entitled to honourable consideration."

This elaborate wrapping up of so simple an article seems something like the kind of childishness which was attributed to Bret Harte's "Heathen Chinese," and which half suggests an idea whether the author of it is not indulging in an elaborate jest at the expense of the credulity of the European.

The frontispiece, just alluded to, is one of the most useful points in the book. It is an admirably-executed chromolithograph, printed by Didot & Cie, Paris, giving facsimile representations of nine different characteristic classes of ware, with their approximate dates

\* Japanese Pottery, with Notes describing the Thoughts and Subjects employed in its Decoration, and Illustrations from Examples in the Bowes Collection. By James L. Bowes. Honorary Consul for Japan at Liverpool. Liverpool: E. Howell; 1890.

and so delicately executed that for purposes of comparison they are almost as good as the actual objects. We can here contrast the plain brown jar of seventeenth-century Satsuma work with the delicate work of the early nineteenth century, with its creamy tint, piquant shape, and sprinkling of daintily-wrought and gilded flowers. The Kaga ware of the same date, somewhat similar in general tone but a great deal more formal and conventional in style of ornamentation, is contrasted with the Satsuma; and other well-marked varieties are shown with equal brilliancy and delicacy, and serve to illustrate the information given in the text in regard to their date, place, and method of manufacture.

The dawn of the modern European taste for Japanese ware the author traces to the Paris Exhibition of 1867, before which time there was little real Japanese work known in Europe, the exception consisting mainly of the collection of lacquered work made by Marie Antoinette and now in the Louvre. "The mind," says Mr. Bowes, will "naturally turn in view of this statement to the porcelain known as Old Japan, of which examples may be found in almost every great house in Europe. But this ware does not in any sense represent Japanese art, as it was made to the order of Dutch traders, chiefly during the second half of the seventeenth century, and decorated with designs furnished by European artists." The modern admiration of and demand for Japanese pottery and other work seems to be leading us into somewhat similar complications, for we suspect that not a little that is sold and accepted as Japanese work is now made in this country. The "Old Japan" referred to was made entirely for export, like some classes of goods of Manchester and Birmingham manufacture, and the European style and appearance of it are at once recognisable in comparing the example given in the frontispiece with those by which it is accompanied. This is a white plate painted over with flowers and birds in rather strong colours and picked out or lined with gilding, and has a rich effect of its kind, but is as different as possible in feeling from pure Japanese work. As to the difference between old and recent Satsuma wares, and the curious manner in which the latter were imposed on purchasers (we believe not wilfully) as of the most rare and ancient work, we must refer the reader to the chapter on Satsuma, which will be of use in guarding those who have not mastered the subject from being deceived in like manner.

We cannot pretend here to follow the author through all the mazes of the various styles and dates, which he confesses have taken him many years to unravel, and he probably knows more of the subject than any other person in England. It is more to our purpose to look at the artistic results as exhibited in some of the objects illustrated. Pottery is one of the arts in which Japanese taste is set off to the best advantage, although, as we have seen, the Japanese themselves set a curiously exaggerated value upon some of what are by no means their best classes of work. Japanese and Greek pottery may be said to exhibit, taken broadly, two perfectly different principles of decorating pottery. The ornament in a Greek vase is applied distinctly with reference to the form and design of the vase itself, which is always paramount and controls the applied decoration. The vase thus decorated is intended as an object of art to be studied for its own sake, and to be complete in itself. The Japanese system seems rather intended to render the vase or plate, or whatever it is, an object which will supply decorative effect when regarded in connexion with other things; it is not so much to be studied apart for itself, as an object to contribute to a general scheme of decorative effect of an interior. And the style of decoration which suits the one purpose does not suit the other. The Kioto and Hiizen wares figured in Mr. Bowes's frontispiece, and perhaps intentionally contrasted, form a good illustration of this, though not so marked as would be

furnished by a Greek vase and the Kioto cup. The Hiizen plate (one of the "old Japan" articles) contains detail which is exceedingly pretty in itself, but the total effect of which is weak; in the Kioto cup the design, regarded in detail, is spotty and even clumsy, and destitute of distinct form; it cannot be said to be beautiful in detail, but the whole vase has a most powerful decorative effect, and would make itself felt among whatever collection of objects it was placed, in a way that a Greek vase would certainly not do. The Kaga ware is more symmetrically designed in detail, and in this respect varies from a good deal of other Japanese pottery, and rather falls between two stools; it is hardly sufficiently interesting merely as detail, and it is not sufficiently effective when viewed from without. The lesson that the Japanese pottery in a general way teaches is, that if we wish pottery to have a powerful general effect on the decoration of our rooms, we should select that in which colour is laid on in masses in a broad and fearless way, without too close attention to detail, rather than that in which detail is very refined and symmetrical and general effect is overlooked. There is no doubt that the former is the general characteristic of Japanese pottery, and on the whole perhaps it is the best way to use pottery in a decorative sense. At all events the demand in the present day for colour effect naturally gives the Japanese pottery a high place. A collection of Greek pottery of the best period would show a far higher and more refined art, as far as design is concerned; but as far as decorative effect is concerned, it would be nowhere besides Japanese. And this appears to be the real defence of the curiously haphazard and cross-corner manner in which decoration is applied to Japanese pottery. It is the work of a people who attached great importance to the general decorative effect of an apartment, and who designed everything to assist that effect. And as far as pottery is concerned they were on the whole right. Occasionally they are too *bizarre* and angular even in their pottery; but as a general rule it may be said that if you wish for a rich and decorative effect in your breakfast or dinner china, you will be more likely to get it by selecting a design on Japanese than one on Greek lines.

Before taking leave for the present of Mr. Bowes's book, which we strongly recommend to the attention of all who are interested in Japanese art, we should like to call special attention to one remark in it, which indicates a very interesting phase of Japanese character, and which perhaps throws some light on the feeling for bluish of workmanship which is so characteristic of the nation. In Japan, we are told in the "Historical" chapter, there have been no museums, and those who possessed objects of art that were worth seeing would exhibit them a few only at a time; a simple vase, or a pair, or a *hakemono* (hanging picture) would be placed in a recess in the room formed for the display of such objects; when another season came round other works would be exhibited in the same way. "It would be considered the height of vulgarity in my country," said a Japanese visitor to the writer, "to display all these works at once, as you do in your museum." It is not surprising that people who think thus should take care that each work they produce is worth seeing and will bear examination in detail; a lesson not without value to a country like this, where *objets d'art* are produced wholesale, and even by machinery.

It is in this appreciation of the highest and most delicate finish in decorative work, for the pure love of it, that the Japanese show themselves so eminently a nation of artists. But there is a curious anomaly in their coarse and childish drawing of the figures of men and animals, which shows that their powers have a very narrow range. This is illustrated especially just now in London by the exhibition of the drawings of Hokusai at the Fine Art Society's Gallery. Hokusai belonged to the latter part of the last and

early part of the present century, and is reputed one of the most able and distinguished of Japanese draughtsmen. We quite concur in the opinion expressed in the preface to the catalogue, that he was one of the most honest workers that ever toiled in the field of art. There is a passage translated from his preface to one of his own books, which is very interesting, recording how at the age of six he had a mania for drawing the forms of objects, and calculating how much more he will improve as time goes on, so that he thinks if he lives to a hundred and ten "every dot and every line from my brush will be alive. Written at the age of seventy-five by me, formerly Hokusai, now Gwa-kiō Rojin—the old man mad about drawing." This is charming; but the drawings executed by this naturally-gifted enthusiast only form a fresh example of the limitations of Japanese perception. There are admirable drawings of birds, as usual; a splendid study of a red lobster, and so on; but the figure-drawings are little better than absurdities. Like other Japanese, he has a faculty of seizing the grotesque or ludicrous in a momentary action of a figure or a group of figures, as in the little sketch of a group of people under umbrellas, printed in the margin of the catalogue preface, where nothing is seen but the umbrellas and the legs of two or three figures, yet there is a general impression of a group of people and of a certain movement in the group. But this kind of indication, when the knack of it is once obtained, is not very difficult to repeat *ad libitum*, and the Japanese do so repeat it, till one gets tired of these little jokes, the humour of which was amusing at first. Hokusai had also, like other Japanese artists, a faculty of giving a great deal of character to a woman's costume, and as the Japanese woman is all costume this does not make any demand upon figure drawing. There is an idea of motion well conveyed, too, in one or two of Hokusai's figures of women walking in their voluminous garments, the whole mass of which seems to move along together like a ship in full sail, as in No. 17, "Young Lady and Child Walking." But the face seems to be the last thing to which any care is devoted. The woman's costume is elaborately and apparently truthfully indicated; the face is an expanse with a dot for a mouth and two streaks for eyes; the expressions of all are the same, if they can be said to have any expression. But look at some of the figures of men, and their extraordinary attitudes, and the still more extraordinary drawing of hands and feet (the latter especially). How is it that people who can make a beautiful drawing of a bird's claw cannot draw or even indicate correctly a human foot? Look at the foot in the sketch of the "Sculptor of Masks" (45). Look again at the "Study of a Tiger" (19). It is not like a tiger, it is not like any animal in creation. Then for the interpretation of nature, look at the "Study of a Wave" (12), which we can only understand on the supposition that it is the original wave which gave rise to the sailor's title of "cat's-paw." Look at "Sagami Bay and the Island of Yénoshima" (80), with a few decorative waves put in, in parallel lines, in the front of the bay. Did Hokusai see waves like that? There is a large panel, "Corner of a Forest with high fir trees" (186), which is nothing more than a big smudge with some trunks of trees at the bottom of it. Any one could do that: why is it exhibited? It was creditable to Hokusai that he tried to draw trees, but it is quite evident he failed with them, as he did with women's faces and men's feet, and tigers, and waves. It is very strange that people who can draw a certain class of objects so well should draw others so badly; but it is still stranger that these grotesque attempts should be hung up in an Art Gallery for us to admire, and that a crowd of people should be simple enough to go and admire them merely because they are Japanese.

THE ANNUAL DINNER OF THE SOCIETY OF ENGINEERS is fixed for Wednesday, December 10, at the Holborn Restaurant.

A PROBLEM IN VENTILATION BY HEAT.

BY MR. W. P. BUCHAN, SANITARY ENGINEER.\*

SOME time ago I was testing the speed of the air up the ventilating-pipe from off the ceiling of a church. The vertical part of this pipe was about 40 ft. high, while the diameter of the pipe was 18 in.† Near to the bottom of the vertical pipe there was a small regular gas-tube, with provision for lighting a dozen of gas-jets when wished. I first tested the ventilating-pipe without the gas being lighted, when the speed indicated was 30 linear feet per minute. With the gas lighted, the speed rose to 300 linear feet per minute. This was no great speed, but it showed that the heat of the gas gave considerable increase of up-current. Then the question occurred, Would the speed be still further increased by suspending a piece of 2-in. diameter pipe, and, say, 3 ft. long, of thin sheet-iron a little above the gas-jets, so that when these jets were lighted they would heat the 12-in. tube, and so increase the up-current? As it was going to be rather troublesome to make the experiment with the 2-in. pipe, I constructed a 6-in. diameter pipe, 3 ft. long, with a 3-in. diameter inlet at its foot, but, to one side, the bottom being closed with a lid. The 3-in. diameter inlet was to suit the anemometer.

Upon suspending a piece of 3-in. diameter thin sheet-iron tubing, 1 ft. long, above a No. 4 Bray's gas-burner, placed inside of the 6-in. pipe, the speed indicated, with the gas lighted, was 590 linear feet in two minutes. With the 3-in. tube removed, the speed rose to 585 ft. in the two minutes, showing a difference of 65 ft. The inner tube in this case, therefore, did more harm than good. Another experiment was thereafter made with a piece of plain sheet-iron about 1 ft. long and 3½ in. wide, suspended a little above the gas, with the result that with this sheet-iron plate on the speed indicated was 55 ft. in two minutes. Upon removing the plate the speed rose to 580 ft. in two minutes. The use of the plates would, therefore, appear to be a mistake, and a pure waste of money. Also,—the up-current being fully 5 per cent. less with it than without it.

This loss of speed with the inner tube or plate suspended above the gas I attribute to the extra friction.

As Mr. Aitken, of Darroch, has stated that there are about 400,000,000 particles of matter in a cubic inch of air above a Bunsen gas-burner, we have still an ample quantity to heat the air in a ventilating tube, without the addition of either the inner tube or suspended plate above referred to, supposing the number of particles of matter above an ordinary gas-jet were less than a quarter of the number mentioned by Mr. Aitken.

In order to get the full value of the heat and conserve it for the up-current, it would be all right to wrap asbestos or felt round the outside of the pipe, but suspending large concentric pipes or plates inside the outlet ventilating pipe in the manner described, appears to me to be a pure waste of money. They retard the up-current, and so harm the ventilation, whether the gas is lighted below them or not; and in many cases, in practice, the gas would not require to be lighted, as when there was wind or other natural cause to produce a good up-current. In this latter case suspension of a pipe or plate inside of the outlet pipe would simply be a *continuous* leak. In fact, in thousands of cases, where the outlet ventilating pipes put in large rough, and fitted up properly, no gas would be needed,—as, e.g., for one-storied schools and for churches and many halls, &c.

SOUTH WALES ART SOCIETY AND SKETCHING CLUB.—The third annual exhibition held under the auspices of this Society was opened on the 19th inst. in Cardiff.

\* Read before the Philosophical Society of Glasgow on November 19.  
† The pipe would have answered its purpose better if it been 36 in. diameter.

NOTES.

IT has been said that among the matters which will have to be taken into account by the historian who deals with the present age, co-operation and strikes will occupy a prominent position. The latter have, perhaps, attained their prominence mainly in consequence of the principle of co-operation underlying trades unionism, and a connexion may thus be said to subsist between the two. But what is understood as the co-operative movement has, of course, aims entirely distinct from those of the unions. This distinction was clearly brought out by Judge Hughes, in an encouraging address to the co-operators at the Crystal Palace last Saturday, when he implored his hearers to pay no heed to "the syren songs of brand-new or old-revived nostrums for setting the world right,—the songs of State Socialists or new trade unionists." The report of the Labour Correspondent of the Board of Trade, which has just been published, states that there were strikes at no fewer than 3,164 establishments during 1889, 67 per cent. being for advanced wages. Now, although a large proportion of these latter were successful,—48.3 fully, and 31.5 partially,—it is shown that the average loss to each individual in wages while the strike lasted amounted to about 3l. 5s. This is equivalent to 1s. 3d. per week for a twelvemonth, and, as the strikes committees and trades unions expended a further sum of 63,636l. in support of the men, it certainly discounts the "success" considerably. Nevertheless, the fame of this same success seems to be inducing destitute workers from various quarters to flock to our shores. Only this week a batch of 300 Polish Jews arrived to swell the already crowded ranks, allured by the assurance that work is plentiful and well paid for in this country. Some twenty of the strikes of 1889 were what have been termed "sympathetic" strikes,—and this year they have, unfortunately, been still more numerous. The spectacle of trade after trade being called out to show their "sympathy" with entirely different industries by thus bringing additional pressure to bear upon employers is becoming very common, and proving very irritating and vexatious. It cannot but be regarded as fortunate that the great Australian strike, which proceeded on this method, ended in disastrous failure; for the principle is mischievous, and causes universal uncertainty, mistrust, and uneasiness, thus putting a restraint upon commercial enterprise. It is to be hoped that similar attempts at "coercion" in this country will meet with a similar fate, and that strikes of this nature may not figure so largely in the returns next year as they will in this.

AMONG the Bills announced at the opening of Parliament on Tuesday is one by Mr. Causton, "to regulate and limit the powers of the Metropolitan Water Companies in respect of their charges for the supply of water," and one brought forward by Mr. G. Bruce, "to provide for the supply of water by meter for domestic purposes within the limits of supply of the London Water Companies." We have long considered that the meter system of supply is the real remedy for most of the disputes between the water companies and their customers, and we hope this idea will be advanced a stage, though we do not expect the Bill to be passed this Session. We hope success will attend Mr. Jacoby's Bill "to limit the hours for the playing of street organs and other musical instruments in the metropolis." We can only regard this as a half measure, and we hope to see the day when the organ-grinder will be turned off the London streets altogether; but even to limit his hours would be something. The announcement of the Bill, we observe, was received with "laughter." It is no laughing matter to many people. Mr. Morton proposes a Bill to provide that "railway return tickets may be used at any time," from which we gather that Mr. Morton does not know much about

railway matters. If he limited the conditions to "any time within the year or half-year of issue," the Bill would have a chance of being passed, and would be a convenience to the public; but inasmuch as railway tickets are practically receipts for money, it is absurd to suppose that their use can be made entirely independent of the annual accounts. Sir W. Lawson's proposal for an address to her Majesty "praying that when she confers any honour or title on any of her subjects she will be pleased to state the services for which such honour or title is granted," would, if it were passed (of which we do not suppose there is the least chance), perhaps exercise a salutary effect in rendering the granting of titles a distinct acknowledgment of worthy service in all cases, instead of being, as it too often is, an empty honour bestowed according to routine, fashion, or Court interest. If the proposal actually comes up for discussion, we shall at all events be sure of an amusing speech from the mover of it. Mr. Lawson is to move "that it is expedient to open National Museums and Galleries on Sundays at certain hours and with special regulations," a moderate and guarded way of putting the matter which it is to be hoped will conciliate some of those irreconcilables who have hitherto turned their backs on every suggestion of the kind. Sir H. Roscoe promises a Bill in regard to technical education, and the Government, in an indefinite kind of way, promise us more legislation on the perennial subject of the public health. With these and other measures we shall deal when the texts of the Bills are printed.

THE accident at Jersey City, where the wall of an immense four-story building fell under the pressure of a high wind, seems to have been another Templeton mill case: an unroofed building with a great expanse of thin wall (1 ft. thick, is the statement), which might have been safe when built, but was evidently not safe while building. One man was killed, and about a dozen injured. Supposing that the report is correct as to the circumstances, this is another warning against the practice of designing buildings so as to be risky and insecure during erection. If those who design and erect buildings so as to be in danger of falling while in progress were brought in guilty of manslaughter in case of a fatal accident, it would perhaps have a wholesome effect.

IN reference to the case of Noble v. Yates, commented on in a "Note" in last week's *Builder* (page 401), we have received the following letter from a member of the jury (who gives us his name and address), which throws some new and useful light on the case, and confirms our view that, although in this case, owing to the circumstances mentioned by our correspondent, the plaintiff failed to obtain a verdict, in a general sense it must certainly be the duty of landlords having houses on view for the purpose of letting to see that they are in such condition at the time as not to cause accidents to persons going over them. The letter is as follows:—

"SIR.—In the paragraph under 'Notes' in this week's *Builder* the verdict in the case of Noble v. Yates is somewhat misleading, owing, no doubt, to the fact that the report of the trial presented to you was very briefly summarised. It is a fact that the verdict was legally given in favour of the defendant (Yates), but it was only under the following very special circumstances of the case, viz.:—The plaintiff could not positively satisfy the jury that she was the would-be tenant, being then accompanied by her previous landlord (who was also looking for a house), and the fact was, that being told this house was not to let,—having no notice up to that effect,—they went into it in preference to the other two which had notices up. Taking these and other circumstances into consideration, the jury, after three hours' deliberation, brought in a verdict for the defendant, but with a strongly-worded rider that there was some moral blame attached to the defendant by the keys of this house being on the same bunch as the two which were admittedly to let, and, as a consequence to this rider (which the Judge agreed with) the defendant consented to make the plaintiff some reasonable compensation.

I should be much obliged if you would mention

these facts in your next week's 'Notes,' as had the circumstances been *only* as reported by you the plaintiff would, I have little doubt, obtained the verdict with substantial damages.

ONE OF THE JURY."

THE proposed Berlin International Art Exhibition for 1891, alluded to on page 393 *ante*, has now been definitely decided on. The "programme" drawn up by the "Verein Berliner Künstler," under the presidency of Professor Anton v. Werner, has been approved of by the Government, the latter having promised to aid the scheme in every way. The Empress Frederick has accepted the "patronage," and wishes to use her influence to the benefit of the exhibition. The Emperor intends granting special awards in the form of gold medals, similar to those given away in 1886 at the so-called Jubilee Exhibition.

AMONG forthcoming new illustrative works on London, we hear of Mr. Loftie's "London City," which will contain more than three hundred illustrations, engraved in Paris, from original drawings by Mr. William Luker, jun. According to the list and prospectus issued from the Leadenhall Press, we gather that all the views will be of existing buildings, scenes, and episodes of London life. Some, indeed, are of rather a commonplace character—such as "Juvenile Ball at the Mansion House," "Bennett's Clock in Cheapside," "A Mid-day Snack," "Struggle for the 'Bus' (sic), New Bridge-street," "Sportsman Office, Fleet-street," "Early Morning, Winter" (carting the snow), and so on; whilst by "Middle Temple Bar" and "Old Gateway in Cbancery-lane," we hope drawings of Middle Temple Hall and of Lincoln's Inn-gatehouse (rather than of the entrance to Rolls-yard) are intended. The list needs revision in other respects; and "Petticoat-lane" and "Little Bridge-street" are names of the past. On the other hand, many of the subjects are aptly chosen, and should form a useful record of what are now familiar incidents of daily life in the City. A stranger's interest might be aroused by the mass of over-head wires, the crowd looking at the pages of *Punch*, and the street-orderly boy,—busy at his calling he plies his shovel,—delineated in the view of St. Bride's steeple, as seen from Fleet-street. The "old garden at No. 4, Crosby-square" is, we believe, the private garden which Mr. W. Besant claims to have discovered, and of which he hesitated to specify the situation lest it should be forthwith built over. There it is, however, and not quite hidden from sight. Mr. Alfred Beaver's work upon "Old Chelsea," with his own illustrations, is to consist of eighteen monthly parts. We are glad to notice that he has announced his intention of taking nothing upon trust, and of verifying everything point by point. The illustrations to Mr. George Church's "Marylebone and St. Pancras" have been taken, mainly, from the Craze Collection and other sources in the British Museum, and will, so far, be tolerably well known to students of London topography. This later volume should form an appropriate companion to the author's recently published "Bloomsbury and St. Giles's." Mr. Justin McCarthy's "From Charing Cross to St. Paul's" with twelve plates and many other engravings of street scenes from Mr. Joseph Pennell's drawings, was announced for publication this week.

MR. G. C. DOWNIE, Rose-street-lane, Edinburgh, has published eight cleverly-executed drawings representing views of that city as it might have been, and as it may be, should the railway companies have their way. One of the most striking of these drawings exhibits the Princes-street Gardens with the Nor Loch occupying the whole breadth of valley. In place of the earthen mound which cuts the valley in two, there is a suspension-bridge, so that, as viewed from a point above St. Cuthbert's Church, an expanse of water is seen extending eastward to the base of the Calton Hill, reflecting on the right hand the

Castle rock, and on the left the wooded terrace in front of Princes-street. The same scene is exhibited as in the possession of the railway companies; the whole breadth of the gardens is covered with rails, and the Scott Monument utilised for railway signals. The market-gardeners, fruit merchants, and green-grocers have drawn up memorials to the Town Council urging the preservation of the Waverley Market, which meets their requirements in a way that a similar building on another site could not do. A memorial to a like effect is being circulated amongst the citizens in general, and is receiving the signatures of a very large number of influential citizens.

THE Duke of Cambridge will preside at an entertainment to be given on the afternoon of Saturday, December 13 next, in Prince's Hall, Piccadilly, in aid of a fund for purchasing an organ for, and restoring the chapel at the Royal Military Asylum, Chelsea. This was founded by the Duke of York for children of soldiers of our regular army, and built in 1801-2, after the designs of John Sanders, architect. It is built for the most part of brick, with stone dressings; the principal and south-west front, towards Burton's-court, has a Classical portico with an order of four columns and pediment.

THE Capital and Counties Banking Company having purchased St. Andrew's House, Pershore, and the adjoining houses, have built a new wing, made other alterations and additions, and opened them as their business premises. The old disused chapel in the basement, with walls 6 ft. thick, and heavy vaulted ceiling, now forms in part the bank strong-room. This curious old structure was for years a matter of speculation as to its date and the purpose for which it was built. It was generally supposed to date from the fifteenth century, but upon opening out the back of the vault for the insertion of one of Milner's fireproof doors, it was found to be built with blocks of Perpendicular tracery and Early English moulded arch voussours taken from the Benedictine Abbey at the destruction of the nave by Henry VIII. The chapel must, therefore, have been built for the use of the Catholics after the Reformation. It was found that cart-loads of finely-moulded Early English and later work were buried in the foundations, together with bold window tracery of large size. Portions of the western turrets of the nave, of Early character, were brought to light from which the architect, Mr. Lunn, after carefully patching them together, took measured drawings. We add some details copied from the sketches which

he has kindly forwarded to us. The whole of the front ground-floor appears to have been

a large hall, about 40 ft. long, with fine ashlar walls of Painswick stone and huge oak beams. A circular turret staircase, partly destroyed, formed the communication with the chapel. The Banking Company's local managers, Mr. Slater and Mr. Pittway, have had all these interesting relics preserved with the greatest care.

IN the early part of last week there was an unusually dense fog in Dundee and its neighbourhood, on which occasion it appears that a gentleman belonging to the Chemical department of University College, Dundee, took the opportunity of investigating the amount of carbonic acid in the atmosphere within the College grounds at eight in the morning when (as we gather) the fog was at its thickest. He found this amounted to over eight volumes per 10,000, or more than double the normal quantity; so it was stated in the *Dundee Evening Telegraph*. It is not the first time that fog has been analysed, but we do not know whether attention has been drawn to a superfluity of carbonic acid in previous cases. The point is of some interest in regard to the origin of fogs and their possible influence on health.

THE fire at Wellington Barracks the other day was much less fatal than it might have been, owing to the circumstance that it occurred by day and not by night. As it was two children lost their lives. The "Rookery" (such is the suggestive name by which the quarters of the married non-commissioned officers has long been known) was condemned as unsafe and insanitary twenty-five or thirty years ago, and the censure passed by the coroner's jury upon the War Office authorities was therefore well-deserved and not one whit too strong, as all who knew the "Rookery" can testify.

A CORRESPONDENT informs us that on Friday last week a bazaar was held in the Grange Free Church, Edinburgh, the proceeds of which are to be applied in providing accommodation for ladies who may faint during the time of service. It is to be inferred, therefore, that fainting is a common occurrence amongst the ladies of this congregation when in church. This is not to be attributed to anything sensational in the service, but to the bad ventilation of the building. The interior is fitted up with cumbersome galleries, the object having been to provide sittings for the utmost possible number of persons within a given space, the consequence being that the air becomes speedily vitiated, and fresh air cannot be admitted in sufficient quantity without producing draughts. This is only one of many instances of the absurd fatuity with which churches, concert-halls, and other public buildings are crammed fuller and fuller without it even occurring to anyone, apparently, to reflect that each fresh person introduced means so much greater consumption of oxygen. This they are left to find how they can, and then women faint (and sometimes men also) from sheer want of air to breathe.

THE present is the right time for cutting down trees. Householders should bear this in mind, since many buildings are spoilt by the too close proximity of trees. It is not only houses, but public buildings, such as village schools, which are often injured by trees. The picturesque group of elms, shady in summer, casts in autumn thousands of leaves into gutters and pipes. Hence damp and injury to walls during the winter. Another point to be borne in mind at this season of the year is that trees are often planted too close to houses. It is forgotten that the young, bushy coniferous tree, now 6 ft. high, will in a few years become a forest tree. It will be spoilt by proximity to a building, and it will also spoil the house. But all over England examples may at this time of the year be seen of trees just planted in the ground by walks and walls, which in no long time they touch.

Messrs. Flockton & Gibbs's Patented Plan for Public Buildings.

|---------------------------------------|---------------------------|--------------------|
| P. E. Public entrance.                | O. Private offices.       | L. Lavatory.       |
| P. H. Public central hall or passage. | O. E. Official entrance.  | S. Strong room.    |
| P. S. Public staircase.               | O. S. Official staircase. | H. P. Hall porter. |
| G. O. Inquiry or general office.      | O. P. Official passage.   | T. Telephone room. |
|                                       | W. C. Water-closet.       | W. Waiting place.  |

MESSRS. FLOCKTON & GIBBS have written to ask us if we would publish the plans appended to their specification of the patent in architectural planning which they claim, in order that architects may understand what it is which they are endeavouring to establish as a right of planning of their own. We have not space for the four, but we give one, the most typical one, in response to their request. We quoted on page 357 *ante* ("Notes") the precise statement of claim as set forth in the specification.

WITH reference to the recent judgment in the Bishop of Lincoln's case, it may be apposite to mention that Messrs. Dawson, of Chiswick, have reproduced a picture by Mr. D. L. Floris of this historical trial. The work contains a large number of portraits, but what perhaps some of our readers may consider more important, it represents portions of the library at Lambeth Palace, in which the trial took place. It has, therefore, in one sense, an architectural value, though no doubt it will be prized more by persons interested in Church affairs as a collection of ecclesiastico-legal portraits.

SOME weeks ago the "East Grinstead Constitutional Club Company" advertised in our columns for designs for rebuilding some premises at East Grinstead for the purposes of the club. They offered the magnificent premium of *five guineas* for the set of drawings which "in their estimation" best commended themselves, and stated that this fortunate design would become "their property absolutely." They did not bind themselves to award the premium, or to employ the successful architect to carry out the work. These conditions, as stated in the original advertisement, would seem in themselves sufficient to render this invitation an exceptional instance of belief in the desire of architects to do work for nothing. But the further conditions of the programme, which has been forwarded to us by an architect who applied for it, are even more remarkable than the advertisement seemed to promise. It is intended that the lower story should be used as shops, the upper one for the usual purposes of a social and political club, with reading, smoking, billiard, and committee-

rooms, &c. The general design of the buildings is to be in harmony with the surroundings, and "it is to be borne in mind that every part of the structure will be open to public view" (which means four elevations, of course). The position of the site and nature of its surroundings are such, it appears, that "it is very desirable that competitors should see and judge for themselves" how it can best be utilised (the expenses of the visit come out of the five guineas, of course). Finally, as if to put the last touch of delicate irony to the composition, it is stated that any competitor canvassing among the directors will be disqualified! The spectacle conjured up of ambitious or determined candidates canvassing the directors for the chance of a success in such a prize as this is truly pathetic. The "directors" must certainly imagine that the architectural profession is in the last stage of pauperism.

A DAY'S WALK IN EAST KENT.

VERY nearly thirteen hundred years ago, a notable episode in our country's domestic history was enacted at a now obscure spot in the southern corner of Thanet. For there, in what Pope Gregory the Great called the "*finis, angulus mundi*," St. Augustine landed with a train of forty monks. Gregory had despatched Augustine, prior of his own convent of St. Andrew amongst the pines on the Caelian Mount at Rome, to carry out a mission he had himself long and earnestly purposed to perform—the conversion to Christianity of Æthelherht and his Kentish subjects. The missionary hand disembarked at what was then the most frequented landing-place in Britain by traders and marauders from Europe, already signalled by the descent there of the Jewish Hengest and Horsa upon our shores. The place was variously known as Ypwine, Hepe, Hiped, and Wipped, Fleet, in the island of Ruine (whence Ramsgate), and is now identified with Ebbe's Fleet in Thanet. At that epoch the Stoure, the British Doure, consisted of a broad estuary which opened from Sandwich Haven, forming the port of Rhutupiae or Richborough. That river, indeed,—in this part more correctly the Wantsum,—served as highway for maritime traffic from the Channel to the Thames mouth, entering the Nore by the Nethergang at Reculver or Regulium. At Ebbe's Fleet, Augustine had first audience of the heathen king. Æthelht predisposed, through

the influence of his wife, Bertha, to yield a willing ear, Æthelherht stipulates that running water shall flow between him and the preacher, lest some enchantment or magic should befall him and his people. So he takes his station upon the river's right bank, there to listen to what the monks, aided by interpreters, have to unfold. "Your words," he makes generous yet prudent answer, "are fair, and so are your promises. Yet, inasmuch as they are new and dubious, I cannot give my assent to them, and so leave the customs I have long observed, together with all the Anglo-Saxon race. But, because you have come hither, being strangers from afar, and as I seem to myself to see clearly that what you yourselves believe to be true and good you wish to impart to us, we do not desire to molest you. Nay, we are anxious to receive you hospitably, and to give to you all you need for support, nor do we hinder you from joining all whom you can to the faith of your religion." Thus encouraged, the monks are allowed to cross over the stream, and to hold another colloquy with the king hard by the ancient Roman citadel or stronghold of Rhutupiae, whose site is yet marked by the extensive ruins of Richborough Castle, in the parish of Ash, on the Wantsum's right bank. Thence he invites the monks to his capital at Canterbury, and gives them a settlement there by the Stapel-gate, near his own heathen temple. On Whit-Sunday, June 2, of that same year (597), Æthelherht is baptised, and Augustine re-dedicates the Pagan temple to St. Pancras, predecessor of St. Augustine's Abbey.

A walk of about six miles from Deal, through Upper Deal, once within half a mile of the sea, and Shouldham, along a well-metalled high road, brings one, after turning aside to see the church at Worth, into Sandwich, which is entered by the site of the New gate in the southern wall which has been partly rased and converted into a public promenade. In the northern wall, near the site of Stonhose, or Stonar, are preserved two other of the town gates. These are the Fisher's-gate, at end of Fisher's-street, and about 80 yds. to the west, the Davis, or David's-gate, distinguished by its Barlican and Custom-house. Fisher's-street led through its gate to the old ferry over the Wantsum. The quay separates the barlican from the stone bridge, for the building whereof, in lieu of a draw-bridge, an Act was obtained in 1755. These features of the town are highly-favourite "hits" for painters; and on a fair summer's evening this side of Sandwich presents a most attractive aspect, when the old red-bricked and tiled houses are tinged rosed by the setting sun, having for background the fine Norman tower of St. Clement's Church. Crossing the bridge the wayfarer is in Thanet. For a short distance an avenue borders the road which leads straight to Ebbe's Fleet, almost due north, and thence by Pegwell Bay to Ramsgate. For three miles this road, passing through the marshes, lies evenly within a large head of the Wantsum, which with devout course finds its way into the bay. Almost half-way to Ebbe's Fleet are Shellness and the "Red Lion" Inn, at which latter is a ferry. The coast-guard station at Ebbe's Fleet is close to the Stone Lees marshes, by a spot three miles from Sandwich and four from Ramsgate. A field here is the reputed scene of the landing, lately commemorated by the erection of an obelisk, but now lies some distance from the sea. Retracing our steps to the turnpike gate-house we find a road that turns off to Minster. A by-path from this road makes a very pretty and varied walk to the village, which is entered at Minster Court. The Court comprises the old manor house, formerly occupied by monks or stewards of the abbey estates, and dating from the end of the twelfth century. William de Thorne, a monk of St. Augustine's, Canterbury, and native of Minster (1380), gives an account of the endowment of the abbey with some 10,000 acres of land, as delimited by the track of a deer from West-gate, in Birchington, to Sheriff's Slope, near to Monkton. The abbey, since known as St. Mildred's, had for first prioress Domneva, granddaughter of Eadwald, King of Kent, and wife to Merwald, a son of Penda of Mercia. Domneva desired to found a religious house in memory of her brothers, Æthelred and Æthelbright, murdered by Egberht's consent. Egberht, remorseful, aided her project, and the new church was consecrated by Cuthberht, Archbishop of Canterbury, to SS. Peter and Paul (as had been his own cathedral), where, it is said, stands the present parish church of St. Mary. The convent was pillaged and destroyed

by Danes. St. Mary's cruciform church has a fine nave of Norman arches in five bays; the two transepts and chancel are Early English, vaulted in stone, and the latter has a deviation towards the south. The western tower is in four stages, and has a large turret rising from the ground. The spire is covered with lead, and in the bases of some of its buttresses are Roman tile-bricks. The chancel has two flying buttresses on its northern, and one on its southern, side. A grand view of the country around may be gained from the top of the embattled tower.

A way can be made to Richborough across the Minster marshes, but the route—as the writer learned to his cost—is not easily to be found. The ruins, however, are clearly in sight, and the pedestrian should keep alongside of the railway to Sandwich as far as the bridge across the river, and then follow the river until he reaches the ferry by the "Red Lion." Across the ferry a raised bank leads to the cliff that stands over the river. On this cliff is a rectangular area of nearly six acres under cultivation, enclosed on three sides other than the east by the ruined walls. In the mid-point of the north wall is the obliquely set *porta decumana*. The walls, ranging from 20 ft. to 30 ft. in height, have suffered from an enemy besides their age, for much of their facing stone has been quarried away for road-making material. The amphitheatre is distant about a quarter of a mile southwest. The Castle of Ruppescoster, which has no existing ditch or outworks, is said to have been built by Vespasian, on the then seashore, and to have been perfected by Severus, who, *teste* Matthew of Westminster, built a fastness at Reoliver. Here have been dug up a very large number of ancient coins, including some of Severus's time. Having formed a palace of Ethelberht it was sacked by the Danes under Sweyn, and rehabilitated by his son Knut. A pathway along the river leads to the road from Canterbury into Sandwich. Traversing Sandwich to the site of the Sandown Gate, one finds a trackway across the sandhills to the now dismantled castle of Sandown on the northern confines of Deal, which, together with Deal and Walmer Castles, was built by Henry VIII., *circa* 1533, and upon the same plan as theirs. The walls have destroyed the sea-battery, but the interior arrangement of the central tower, its other bastions, with their galleries, inclined entrances, &c., can be readily followed. Sandown Castle formed the prison lodging of Colonel Hutchinson.

#### FROM ITALY.

##### EXCAVATIONS IN THE FORUM OF AUGUSTUS.

I HAVE already described the excavations made by the Municipality of Rome in the southern semi-circle of the Forum of Augustus, last year (see the *Builder*, March 30, 1889, p. 235).

Recently, in making the foundations for a wall with the intention of supporting the earth upon which crosses, at present, the Via Bonella, there have been found some fragments of marble statues, among which is a very interesting bust of Greek marble, 1.22 metres high, belonging to the statue of an emperor, or victorious general. This sculpture recalls the well known statue of Trajan in the Museum of the Villa Albani.

To the decoration of the temple of Mars Ultor, which stood in the middle of the Forum, belong two large Corinthian capitals, a good deal damaged, 0.98 metres high and 0.80 metres in diameter; these formed part of the outer row of columns of the temple.

A great fragment of the marble cornice was also found, belonging to the roof of the vestibule, with richly-moulded sunk coffers, and a central rosette in each, and a second fragment of a smaller cornice, finely sculptured.

The ancient pavement of the Forum has been discovered, composed (like the portion found in 1889) of various qualities of marble, such as *giallo antico*, red and grey granite, *verde antico*, porphyry and serpentine marbles—forming, in the whole, a geometrical figure.

##### MOSAIC DISCOVERED IN THE PRÆTORIAN CAMP.

While some works were being carried out in the pavement of a modern soldiers' building at the Maccæo, there has been discovered a portion of an ancient mosaic, belonging to the ancient pavement of the Prætorian Camp which stood in the same spot. The mosaic represents a panther, with a small bell at the neck, between two tamers (*laniste*). To the right is an in-

scription, as yet inexplicable. The mosaic is 3.60 metres in length and 2 metres in width, and may be compared with the similar celebrated mosaic of the museum in the Villa Borghese, discovered in 1834 amongst the ruins of a Roman villa, near Torrenova, and interesting for the costumes represented and the animals which the gladiators are combating. Many of the figures of the gladiators have names annexed, as in the mosaic of the Prætorian Camp.

It may be well to mention that the Prætorian Camp, built by Sejanus, the Minister of Tiberius, outside the walls of Servius Tullius, was dismantled by Constantine, and three sides of the enclosure were included by Aurelian in his new wall. To this circumstance we are indebted for the preservation of the exact form of this celebrated camp, memorable as the scene of the principal revolutions during the first three centuries of the Christian era.

#### WELLS AND WINDMILLS.

BOTH wells and windmills date from remote antiquity. The origin of wells is simple enough to the mind; but of the origin of windmills there is no clue, and no record of the originator in the imperfect chronicle of inventors.

Those who have passed over fifty years of existence can look back to the days when all ordinary wells were dug, and stoned with bricks, and can remember the wonderful impressions made upon their childish minds by the huge timber sweeps and canvas sails of the ponderous windmills which then capped nearly every hill. The relics of those mills and wells still are numerous, and afford comparison with the modern appliances which science is substituting for them.

Borings were then practised, and artesian wells were not unknown. Linings of iron, too, within them were taking their place. But the driven tube-well, afterwards introduced, was a novelty quickly accepted for both civil and military purposes. To drive by the force of a falling weight a tube into the ground, and in this way tap the water beneath the soil, was a simple and expeditious means to be used by itself or added in supplement to dug wells of larger capacity. Intermediate between the well and the windmill is the pump. The first transporter of water was doubtless the bucket. After hand came the balanced rod, still used in Eastern lands.

But the pump retains the bucket, and in the force-pump the bucket is supplanted by the plunger. The modern advance in wells, pumps, and windmills was well displayed in the excellent contribution to the recent Breweries Exhibition, at the Agricultural Hall, by Messrs. Alfred Williams & Co., of Great Eastern-street—a firm which devotes special attention to these matters. The woodcut (Fig. 1) shows the compactness and simplicity of the arrangements of their tube well. The driving-tube (*a*) has a flat-sided steel point (*b*) for penetrating the ground, and a steel plug (*c*) is screwed into its top end. Connected to this plug is an iron guide-rod (*d*), over which freely slides a heavy cylinder or weight (*e*). Attached to this weight are two

cords or ropes (*f<sup>1</sup>*, *f<sup>2</sup>*), passing over two pulleys (*g g*), fitting on to the top of the guide-bar. By raising and dropping this weight the steel-pointed tube is driven hlow by blow until the steel plug is nearly level with the ground. A fresh length of pipe is then screwed on, and the whole driven forward again.

Fig. 1.—Tube Well.

into the ground by the falls of the heavy weight. In this way length after length is added until the depth of the water-bearing stratum is attained. The plug, guide-rod, and driving-tube are then removed, and a hand or force-pump screwed into the well-tube in its place. Fig. 2. In first using the tube well, the water is lifted by the pump, and then allowed to fall back, thus causing a disturbance of the ground outside the point, and washing out a surrounding cavity free from dirt and small particles of mud or sand likely to choke the access of the water through the perforations into the tube. After this operation the water is drawn off by the pump perfectly free from grit, and clear. Experience has shown also the advisability of other provisions which will, under certain circumstances, be

ful; and it is to meet and counteract such inferior matters that the ingenuity of inventors and makers is required.

The corrosion of the driving-tube perforations of ferruginous water is provided for in such cases by a special metal. For sandy water-bearing beds strainers are provided, and in this way all the requirements of successful and lasting results are perfected. The two chief advantages of the tube wells are that they are easily and cheaply executed, and that by their use tubes all contaminations from surface

of opening or closing either did or did not concur with the force of the breeze,—generally the latter, for seldom if ever are high winds without gusts. In the new windmill there is a remarkable scientific advance. There are no ponderous sweeps to this mill, no sails, no louver-boards. The rays or "slats" which drive the mill are all radial, and are arranged between an outer and inner circle, the inner space of the face of the mill being open and unobstructed, except by the iron radial bars which extend from the centre to the iron ring of the outer circle, and which with it constitute the frame work of the mill. The standards which carry this mill are pivoted and run on a turn-table, so that the large vane, which is attached at right angles to the mill, always keeps the face of the mill in front of the air currents—no matter how they may vary in direction. The weather rays or slats also act automatically, and are so set or hinged as to slope away at greater and greater inclinations in accordance with the strength of the blast. In this way the greater force of the wind does not act destructively, but the mill maintains a nearly uniform power by its traverse of the varying inclinations of the slats. The opening action of these boards is directly actuated by the wind. The closing action is effected by counterweights, which bring the boards together whenever the wind slackens. Such mills are very much lighter and more effective than the old common sorts of windmills, which artists most adore in their broken-down and ruinous conditions. The new mills are not designed for pictorial delineations but for useful purposes, and range from 13 ft. diameter of fan,—giving, with wind at eighteen miles an hour, 2-horse-power,—up to 60 ft. diameter,—giving off in a like wind 40-horse-power. Such mills are applicable for water-works, corn-grinding, or machine-driving in shops and factories, or crane-hauling. They can also be used on the farm for chaff-cutting and other purposes. One of these Halladay mills is in use at the Lockfield Waterworks, in Sussex. It is erected on a timber skeleton tower 70 ft. high, and it forces water from an artesian-bored tube well for a height of 150 ft. to the reservoirs. Such pumping mills are also at work at Lechlade, in Gloucestershire, at the seat of Mr. H. Tollenache, M.P., at Nantwich; at Kirk Hammerton Hall; at Cloghan, in Ireland; at the hospital at King's Norton; and numbers of other places. Mills of this description are being erected in London for advertisements and sign purposes.

There is one over Messrs. Williams' own works which pumps water to a height of 70 ft. and drives a lathe and drilling-machine in the upper shop. Messrs. Carwardine, of the City-road, have also just had erected a larger one, with a vane 20 ft. long by 7 ft. broad, embellished with letters 2 ft. 6 in. high—a veritable rival to the soaring "sky signs" as an advertising medium.

The pumps are the intermediate link in the service to which wells and windmills can be most frequently and to best advantage employed. Those supplied by Messrs. Williams are of good quality and high efficiency. The prominent feature in their "Curtis" double-action pump is that it consists of two barrels and only one plunger. On the up stroke the water when lifted to the top passes through a double set of valves before reaching the delivery. On the down stroke the plunger forces the water to the bottom of the first barrel, and through an aperture into the second barrel. On rising to the top of it, it passes through a second set of valves to the delivery, by these means ensuring a continuous flow of water with hardly any friction.

THE RELATION OF GROUND-WATER TO DISEASE.

AT the opening meeting of the Royal Meteorological Society for the present session, Mr. Baldwin Latham, C.E., the President, delivered an address on this subject, as we briefly mentioned last week. The following is a summary of the paper:—

The pages of history show that when the ground waters of our own or other countries have arrived at a considerable degree of lowness, as evidenced by the failure of springs and the drying up of rivers, such periods have always been accompanied or followed by epidemic disease. In all probability ground-water in itself, except under conditions where it is liable to pollution, has no material effect

in producing or spreading disease. As a rule, it is only in those places in which there has been a considerable amount of impurity stored in the soil that diseases become manifest, and the most common modes by which diseases are, in all probability, disseminated, are by means of the water supplies drawn from the ground, or by the admission of ground-air into the habitations of the people. It is found that the periods of low and high water mark those epochs when certain organic changes are taking place in the impurities stored in the ground, which ultimately become the cause and lead to the spread of disease. Mr. Latham defines "ground-water" as all water found in the surface soil of the earth's crust, except such as may be in combination with the materials forming the crust of the earth. It is usually derived from rainfall, by percolation; and it is also produced by condensation. In dry countries, ground-water is principally supplied by the infiltration from rivers, as, for example, in the Delta of the Nile.

The absence of water passing into the ground for a long period naturally leads to the lowering of the free ground-water-line, and may lead to the drying of the ground above the water-line; and it is curious to note, with reference to smallpox, that the periods marking the epochs of this disease are those in which there has been a long absence of percolation, and a consequent drying of the ground preceding such epidemics. On the other hand, smallpox is unknown at such periods as when the ground has never been allowed to dry, or is receiving moisture by condensation or capillarity.

The study of underground water shows that certain diseases are more rife when waters are high in the ground, and others when the water is low. The conditions that bring about and accompany low water, however, have by far the most potential influence on health, as all low-water years are, without exception, unhealthy. As a rule, the years of high water are usually healthy, except, as often happens, when high water follows immediately upon marked low water, when on the rise of the water an unhealthy period invariably follows.

Mr. Latham has found that those districts which draw their water supplies direct from the ground are usually more subject to epidemics and disease than those districts in which the water-supply is drawn from rivers supplied from more extended areas, or from sources not liable to underground pollution. In the case of Croydon, one portion of the district (under three-fourths) is supplied with water taken direct from the ground, whilst the remaining portion is supplied with water from the river Thames. It is curious to note that even so recently as 1885 the zymotic death-rate in the districts supplied with underground water was twice as great as in that part of the district supplied from the Thames; and in this particular year 41 deaths from smallpox occurred in the district, not one of which was recorded outside the district supplied by the underground water.

Mr. Latham, in his address, dealt largely with zymotic diseases as affected by ground water, and showed that cholera ordinarily breaks out when there is the least ground water; a high air and ground temperature is also necessary for its development, and as a rule the low-lying districts are favourable to the production of these high temperatures. Smallpox is almost always preceded by a long period of dryness of the ground, as measured by the absence of percolation. Typhoid fever is most prevalent after a dry period, and when the first wetting of the ground or percolation from any cause takes place. The condition essential to the development of diphtheria is a damp state of the ground marked by extreme sensitiveness to percolation of rain. Scarlet fever follows the state of the dryness of the ground which is essential for its development, and it occurs in the percolation period. The conditions that precede smallpox are those favourable for the development of scarlet fever, and, like smallpox, the dampness of the ground for any considerable period in any particular locality, may check its development or render it less virulent, and it is most rife in low-water years. Measles are least prevalent at the low-water periods, and mostly rife at and near high-water periods. Whooping-cough follows the percolation period in its incidence, increasing with percolation, and diminishing as the waters in the ground subside. Diarrhoea is generally more prevalent in a low-water year than in other years; that is, with a very much colder temperature in a

Fig. 2.—Tube Well and Pump.

water and deleterious soils are prevented. Tube wells are easily made up to 30 or 40 ft., and deliver from 1 1/2 in. tubes 150 to 3,000 gallons, and from 3 in. tubes from 450 to 3,000 gallons per hour. By connecting a number of tube wells, supplies from 10,000 to 50,000 gallons per hour can be obtained, the quantity, of course, being in degree influenced by the nature of the water-bearing strata. Tube wells can also be driven from the bottom of dug wells to increase the supply. Where the depth to the water-bearing strata is great, borings must be made. There are two modes available for this purpose. One is by the ordinary jumping tools, and the driving down of an iron tube by heavy falling weights; the other by the diamond circular drill. In the former the strength of the driven tube is of the utmost consequence, as, if the lining tube be broken, the only remedy is to drive a smaller tube inside it, which, of course, diminishes the water supply. Messrs. Williams have adopted a peculiarly advantageous form for their lap-welded wrought-iron tubes. They are shrunk in at the ends, and screwed on the outside. The tubes are then connected by steel sockets, which, owing to the shrinkage at the joint, come almost flush with the rest of the tube. The ends are butted against each other, thus giving great strength to the whole length of the lining. Consequently there is hardly any obstruction on the outside, and the driving is not only made more easy, but the danger of splitting under the blows of "monkey" or ram is greatly diminished.

In order of novelty, the Halladay windmill comes in front of the pumps. The first important improvement over the old sails was made in the last century, when the sweeps were fitted with series of movable boards instead of sails. These series were opened or closed by an iron rod to suit the strength of the wind. This had to be done by hand; and the extent

low-water year there is a very much higher death-rate from this disease.

Mr. Latham finds that the general death-rate of a district is amenable to the state of the ground-water, years of drought and low water being always the most unhealthy.

#### THE SESSION 1891.

AMONGST the miscellaneous bills for which application is to be made are the following:—

The Corporation of London: for the appointment of a public authority, by name of "The London Water Commission," to improve and regulate the supply, and diminish the cost, of water in London and adjoining places—with, if thought fit, a free supply to public baths, wash-houses, and hospitals—and for acquiring existing or future waterworks, and the right of taking water within the water-sheds of the Thames and Lee. The commission to consist of representatives of the Corporation, the London County Council, the Conservancy boards, and of other county, municipal, and local authorities.

By the Channel Bridge and Railway Company (Harbour Works): for the construction of two piers or breakwaters, 500 and 580 yards long and 440 yards apart, with subsidiary works, at St. Margaret's Bay, a pleasant retreat at foot of an opening in the cliff near to the South Foreland.

By the Gas Light and Coke Company: for further powers to more readily recover for consumption of gas, and for authority to enter premises in order to cut off the supply, and thus avoid, as far as possible, the breaking up of streets and roads for that purpose, together with enforcement of penalties for resistance against such lawful entry.

The "Trustees and Guardians of Shakespeare's Birthplace" will ask for enlarged powers to deal more satisfactorily with their accumulated capital than, as they are advised, the terms of their existing trust deed now permit. They seek for a conveyance to them of the property in Henley-street and elsewhere, at present vested in the Stratford-on-Avon Corporation, together with the Library and Museum. The site has been preserved of Sir Hugh Clopton's "Great House," more commonly known as "New Place," which, having been rebuilt, was, together with the mulberry tree, ruthlessly pulled down in 1759 by Francis Gastrell, vicar of Frodsham, to escape annoyance by visitors: some remains of the cellars and foundations are shown there.

The house in Henley-street was restored by Mr. Edward Barry, architect, and the earliest extant drawings of the building were followed. The trustees further seek to purchase, as opportunity may offer, Mary Arden's house at Wilcote, and Ann Hathaway's cottage at Shottery. Shakespeare demised a life interest in the house of his birth to his second sister Joan. Its subsequent history is traced in the late Mr. Halliwell-Phillips' "Outlines," appendix to vol. i. It was bought, in 1817, for 3,000*l*.

Notice has been given for a Bill to change the constitution of the master, wardens, and commonalty of the watermen and lightermen of the Thames, known as the Watermen's Company, and, if necessary, to dissolve the Corporation and distribute its property. The Bill proposes to make radical changes as touching the examination and licensing of lightermen and watermen employed on the river between Lower Hope Point, near to Gravesend, and Teddington Lock, and to repeal or modify certain existing tolls, rates, exemptions, and rights of ferry.

#### LECTURES ON HOMERIC GREECE.

V. AND VI.

IN his fifth lecture,\* Dr. Leaf dealt with the question of Homeric art. The Homeric poems yield us evidence respecting the sources of art, its subject, and the processes of technique, but no description can enable us adequately to judge of style, by which alone the development of art can be traced. Moreover, the Homeric record is deficient as regards many branches of art respecting which we should have been glad of material for comparison with the monuments,—notably pottery, engraved gems, terra-cottas, and wall-painting. The importance of Phœnician influence had, Dr. Leaf thought, been overrated. He showed, however, though with only partial acceptance, Mr. Murray's re-

storation of the Shield of Achilles, and noted especially the courses of cyanos. Lapis lazuli was rare then as now, and this cyanos was no doubt used as a substitute; it still remained a puzzle as to how exactly the courses were inlaid. A subject of more immediate interest is the evidence as to the existence previous to and contemporary with the conventionalised Oriental style of a more naturalistic type of art, as shown in the wall-painting of Tiryns, and still more noticeable in the Vaphio cups. As to the famous man and bull of Tiryns, Dr. Leaf rejected any attempt at mythological interpretation, and held, as we believe most archaeologists now do hold, that the scene was, like those in the Vaphio cups, one from daily life,—a bull capture. Very fine reproductions of the Vaphio cups were shown on the screen, and fully discussed.

The last (sixth) lecture dealt with the question of the steps by which Homeric developed into Classical Greece. Homeric Greece was later, according to Dr. Leaf, than the civilisation of Mycene. Iron, for example, in Homer is freely used, not, indeed, for weapons, but for tools. None is found at Mycene, though, as the lecturer warned his audience, it might have been present, and have disappeared through rust. Again, the remains of Hissarlik and Mycene are of wholly different epochs, whereas Homer represents Greek and Trojan as in the like stage of civilisation; but it must be remembered he is avowedly narrating events of an elder world. On the whole, recent excavations went to show that however poetical and imaginary the story of it might be the war was a real one. Dr. Leaf alluded to the theory,—now, let us hope, finally exploded, but once widely popular,—that the Trojan heroes were (solar) mythological persons. He noted, in opposition to this, the interesting fact that in the early kernel of the poem, the "Wrath," the gods play but a small and episodic part, in the later portions they are essential actors; this does not look like mythological origin. Setting aside the question of the relative ages of the Mycene remains, and the poems they have thus in common, that both evidently stand at the end of a long civilisation abruptly brought to a close. In the poems the tribal names are those of the Achæans, Argives, Danaans, when history dawns these have disappeared, we find instead Eolians, Ionians, Dorians,—the great question is, how came all this about. Of the Dorians we know that they were a mountain race pushed south and westward, and, entering the Peloponnesus from the west, where they crowded out the Achæans. The Achæans crossed to Attica and over the Ægean Sea; there in the north they became Æolians. The south, as had been seen in the first lecture, was mainly Dorian. Midway came the Ionians,—the most puzzling of all the races, and yet the most important, because, when history dawned, we find them in possession of the Homeric poems, written in their dialect. Briefly, Dr. Leaf concluded, and the conclusion is of vital interest both for history and mythology, that the Ionians are the *Pelagians* *Hellenised by the Achæans*. The ancient, effete, aristocratic civilisation of the Achæans fell before the incoming Dorians, the hardy mountaineers, but the old, autochthonous Pelagians, with their primitive habits and their chthonic cults, were strong to maintain themselves anew when the war had broken and past. The far-reaching consequences, if interesting now,—especially for mythology,—cannot be discussed here. A hearty vote of thanks to Dr. Leaf for his interesting lecture was accorded at the close. The subject of Homeric mythology was taken up by Miss Harrison on Wednesday. We shall give a short *résumé* of Miss Harrison's four lectures at the close of the course.

#### ARCHITECTURAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—A meeting of this Association was held at the Midland Institute on Tuesday evening last, and was attended by a good number of members, the President, Mr. T. Naden, being in the chair. As it was the opening meeting of the session, some formal business was transacted at the commencement, during which Mr. Herbert R. Lloyd, hon. sec., stated that the classwork of the session had made a better start than had been the case for some years, and that there was every prospect of the session being in every way a success. The business was followed by a paper on "Architectural

Drawing," read by the Vice-President, Mr. W. Hawley Lloyd, in which he laid emphasis on the fact that architectural drawings should not be regarded as pictures, whether they were drawings of new or studies of old buildings, and that in either case their use should be borne in mind, and they should be made to accurately and truthfully show the building as it existed. The author deprecated the making of pretty sketches in place of definite studies of old work, and quoted the drawings of Sir Christopher Wren, instancing his studies of the domes of Florence and St. Peter's at Rome, as splendid examples of what such drawings should be. With regard to working drawings, Mr. Lloyd said that it should be borne in mind that it was a more difficult thing for a workman to interpret a drawing than for the man who had made it to do so, and that it was undesirable to do anything likely to lead to the mystification of the workmen, such as the drawing of details across one another. Mr. Lloyd further said that he considered all architects should, in making perspective drawings of their buildings, avoid the introduction of effects, such as the weather-stains, lichens, and mosses of centuries, as being untruthful; and he protested against the perspectives often seen, which, whilst clever in themselves and as drawings, represented as old and weather-worn a building which for years would keep the spick-and-span appearance in which it left the builder's hands. The paper was illustrated by many fine drawings by Messrs. J. F. and A. E. Barnsley, W. H. Bidlake, Herbert Raiton, A. B. Mitchell, C. E. Mallows, and others, many of them kindly lent for the occasion. A discussion followed in which Messrs. J. Cotton, W. H. Bidlake, W. Henman, C. E. Bateman, and others took part, and in the course of which the President and others of the speakers congratulated the Association on the change by which the use of the Institute room had been secured for the meetings.

MANCHESTER ARCHITECTURAL ASSOCIATION.—The last ordinary meeting was held at the Athenæum on the 19th inst. (Mr. A. H. Davies Colley in the chair), when the members of the "Association of the Manchester Students of the Institute of Civil Engineers" were present. Mr. S. S. Platt, A.M. Inst. C.E., read a paper entitled "Notes on Paving Stones used at Rochdale," illustrated by special arrangement of lantern, showing microscopic sections of the several stones under polarised light. A vote of thanks, proposed by Mr. J. S. Hodgson, seconded by Mr. Greatorex, and supported by the chairman, terminated the meeting.

MANCHESTER SOCIETY OF ARCHITECTS.—The annual dinner of this Society took place on the 19th inst., at the "Queen's Hotel." Mr. A. Waterhouse, R.A., President of the Royal Institute of British Architects, the Dean of Manchester, Mr. Woolner, R.A., Mr. Chadwick, President of the Manchester Architectural Association, and Mr. J. H. P. Leresche were present as guests.

ARCHITECTURAL ASSOCIATION (LONDON).—At the meeting of the Advanced Class of Construction and Practice on Wednesday evening last, the discussion on Mr. Francis Hooper's paper, read at the last meeting, on Artisans' Dwellings, was resumed. Dr. Shirley F. Murray (Medical Officer to the London County Council), Mr. P. Gordon Smith (Architect to the Local Government Board), and Messrs. Keith D. Young, Henry W. Dobb, J. Barry O'Callaghan, and G. N. Hooper took part, in addition to members of the class. The remarks elicited were of the most practical character, and cordial votes of thanks were passed to the reader of the paper and the special visitors.

#### COMPETITIONS.

THE LONDON COUNTY COUNCIL'S PROPOSED MUNICIPAL LODGING-HOUSE FOR 320 MEN.—In this competition, we are informed that seventy-five designs have been received; and the drawings are now being arranged for the inspection of the Assessors, Mr. Ewan Christian, and the Architect to the Council.

THE COUNTRY HOUSE (WHAT OUR ARCHITECT HAS TO PUT UP WITH).—Fair albeit: "I want it to be nice and homelike, Queen Anne and Elizabethan, and all that; kind of quaint and Nuremberg, you know—regular Old English, with French windows opening to the lawn, and Venetian blinds, and sort of Swiss balconies, and a loggia. But I'm sure you know what I mean!"—*Punch*.

\* For brief reports of the previous lectures see pp. 303, 345, 405, ante.

**ARCHAEOLOGICAL SOCIETIES.**

**BRITISH ARCHAEOLOGICAL ASSOCIATION.**—At the meeting of this Association on the 19th inst., Mr. G. W. Grover, F.S.A., in the chair, the Rev. Carus V. Collier announced the discovery of a vase of glazed ware, filled with Roman coins, at Shipley, during the construction of the railway there, and he exhibited some of the best-preserved examples. These are of the 3rd, 4th, 5th, 6th, 7th, and 8th centuries, and are of various types, such as the "Penny," "Halfpenny," etc. The vase was taken in possession of by the workmen, and had five of the coins been recovered. Mr. C. Brown, Mayor of Chester, sent for exhibition some photographs of the remarkable Roman column which was found *in situ*, during some recent building works on his property in Westgate-street. The column has now been preserved on the spot where found, by the construction of an arch over it to carry the new building. The Rev. C. G. R. Birch reported the discovery of a beautiful brass, during the restoration of Hedney Church, Lincolnshire, where it was found beneath the floor. It represents a female figure, in the costume of the fourteenth century. A reproduction of a rubbing, made by Mr. Birch, was exhibited. The first paper was "On the Coped Stones of Cornwall," by Mr. A. G. Langdon. After remarking that ancient sepulchral monuments of the form of an inverted boat had not previously been observed in Cornwall, although other examples were known in the North of England, and one or two in Wales, the lecturer proceeded to point out, by the aid of some beautiful drawings, and full-sized rubbings, the peculiarities of the examples cited, which are three in number, respectively at St. Tudy, Lanivit, and St. Suryan, the latter being a fragment only. They are worked in granite, and are covered with interlaced and key patterns of pre-Norman date, agreeing in style with other examples of interlaced work on the Cornish crosses. The second paper was by Dr. Russell Forbes, of Rome, read, "A author's abaco, by Mr. de Gray Birch, F.S.A. It was on a charm against 'The Evil Eye,' which is depicted on a tessellated pavement of great beauty recently found at Rome, in an owl, representing 'The Evil Eye,' is surrounded by other animals representative of protecting deities.

**GLASGOW ARCHAEOLOGICAL SOCIETY.**—The annual meeting of the Glasgow Archaeological Society was held in the Society's Rooms, Bath-street, on the 21st inst. Mr. J. Honeyman, President, occupied the chair. The report by the Council showed that the number of members admitted in 1889-90 was thirty-four, as against thirty-three last year. The Society had sustained the loss during the past year of two distinguished honorary members, viz., Mr. John Layton, F.S.A., and Mr. C. Rosch Smith, F.S.A., and of several ordinary members, including the Earl of Glasgow and Mr. John Larrick, City Architect. The present membership, after deducting deaths and resignations, was nine honorary and 310 ordinary members. Messrs. William Wilson, A. M. Scott, A. B. Grigor, and J. O. Mitchell retired at this time from the Council. It was recommended that Messrs. Scott and Mitchell be re-elected, and that Professor Storey, D.D., and Robert Guy should be elected as new members of Council. The Council further recommended the re-election of Professor Ferguson, LL.D.; Mr. C. D. Donald, F.S.A. 1886; and Dr. Murray, as Vice-Presidents; of Mr. Dalrymple Duncan and Mr. Black, as hon. secretaries; and of Mr. Marwick as hon. treasurer; and the re-appointment (pending re-organisation) of the Society's committees. The financial statement showed that there was a balance in hand at present of 222l. 9s. 6d. The Chairman, in moving the adoption of the report, said that there was still room for the Society to grow in Glasgow. He was glad to see that the funds were larger this year, and that would enable them to use more money in the way of publication than formerly. The Society of Antiquaries in Glasgow were engaged in a work which would be facilitated by the co-operation of other societies, and by individual members, namely, a complete illustration of all the sculptured stones in Scotland. The report was adopted. The Most Rev. Archbishop Lyre, D.D., afterwards addressed the Society on "The Episcopal Seals of Glasgow."

**ELECTRIC LIGHTING AT CARDIFF.**—The Cardiff Corporation have given notice of their intention to apply to the Board of Trade before December 21 next for a Provisional Order under the Electric Lighting Acts, 1882 and 1888, to enable them to light the principal streets of the town with electricity.

**THE SURVEYORS' INSTITUTION.**

The following gentlemen have been reported by the scrutineers as elected to various classes of membership, at the ballot of Saturday, November 22, 1890:—

As *Fellows*—Stephen Bailey, Nynhead, Wellington, Somerset; Robert Buck Broster, Keighley; George Buckley, Halifax; Henry Philip Chalk, Linton, Cambs.; William Clarkson, Poplar, E.; George Radcliffe Cobham, Gravesend; Samuel Hood Cowper Coles, Crickhowell; Brian Ballans Lird Cowgill, Bradford; Henry Brook Dransfield, Huddersfield; Edward Fillingham, Hull; George William Finn, Faversham; Thomas Hills Forsyth, Newcastle-upon-Tyne; Edwin Fox, jun., Gresham-street; Arthur Richard Gradwell, Blackburn; Thomas Thornton Green, Poultry; William Benjamin Hobditch, South Petherton, Somerset; Isaac Matthews Jones, Chester; John Kidwell, Rochester, Kent; Edward Osmond, Upton Pynne, Devon; William Henry Parker, Worcester; William Parkin, Batworth, Bedford; Notis; Albert Woodward Parry, Reading; Frederick Cecil Parsons, Brighton; Frederick Atkinson Powell, Kennington-road; Arthur Stirling Primrose, Junction-road; Peter Purves, Huntingdon; Henry Adair Rawlins, Queen Victoria-street; Ethel Trehanne Rees, Cardiff; Richard George Scriven, Castle Ashby, Leics.; William Willard Scroggs, Kidlington, Oxford; Harry Samuel Senior, Sturminster Newton, Dorset; Henry Russell Smith, Bradford; Edward Tidman, Victoria-street, S.W.; Joseph Harington Turner, Kilmarnock; Edward James Turco, Horkestow, Barton-on-Humber; John Allen Wadlington, Bayfordbury, Hertford; Francis Walker, William Richard Mellor Walsh, Maclesfield; Herbert Fuller Waring, Maidstone; Herbert Walter Williams, Norwich; Stephen Woodbridge, jun., Brentford; Lionel Burnet Woodforde, Theford, Norfolk; William Booth Woodhead, Bradford; and Robert Walter Wordsworth, Whitley, Oxford, Nottinghamshire.

As *Professional Associates*.—Francis Reginald Arnytage, Pump-court, Temple; Cecil High Aylen, New Broad-street; Frederick Herbert Bancroft, Manchester; Thomas Barclay, Birmingham; Maurice Frederick Beadell, Gresham-street; Arthur Body, Clippenham; Frederick Edward Boulton, Birmingham; N.W.; Frederick Henry Brackett, Chesapeake; George William Cobham, Gravesend; Frank Minshall Elgood, Wimpole-street; Francis Ellis, jun., Trafford-park, Patricroft, near Manchester; William Forrest, Penarth; Arthur Norman Garrard, Cannon-street; Alexander Goddard, Leicester; Alexander Green, Exning; James Henry Hodgkinson, Stalybridge; Gilbert Plantagenet Mitchell Innes, Chester; Walter Robert Kay, Bury, Lancs.; Graham Harold Mould, Thornton Heath, Surrey; George Osenton, jun., Mount-street; Edward John Partridge, Fleet-street, E.C.; Joseph Perkins, Edgbaston, Birmingham; Richmond Pinder, Upper Baker-street; Herbert Edward Prall, Dartford, Kent; Frank J. Ruddle, Spring-gardens, S.W.; Edwin Savill, New Broad-street, E.C.; Charles Frederick Slater, Richmond, Surrey; James Frederick Kemp Smith, Market Harborough; Walter Wadman Southam, Newbridge, Wilts.; William Wilton Ris Spalding, Norwich; Ernest George Verity, Gray's-in-square; Hugh Calthrop Webster, Gresham-street; and Charles Bruce Wood, Irene-road, Parson's Green.

As *Associates*.—Mr. Reginald Ward, Solicitor to the London County Council; Spring-gardens, S.W.; and Mr. John Wrightson, College of Agriculture, Downton, Wilts.

At the ordinary general meeting of the Institution held on Monday evening last, Mr. T. A. Dickson (Fellow) read a paper on "The Labour Question as Regards Agriculture."

**THE LONDON COUNTY COUNCIL.**

The usual weekly meeting of this Council was held on Tuesday last, Sir John Lubbock in the chair. After the confirmation of the minutes, a vote of condolence with the late Chairman, Lord Rosebery, in his sad bereavement, was unanimously assented to by all the members rising in their places.

**Resignation of the Solicitor.**—The Standing Committee reported that the Chairman of the Council had received a letter from Mr. Reginald Ward, the Solicitor, resigning his office, on the ground of failing health, and asking to be allowed to do so under the provisions of the Superannuation Act. Mr. Clarke (Chairman of the Improvements Committee), Mr. Hutton (Chairman of the Building Act Committee), and Mr. Charles Harrison (Chairman of the Parliamentary Committee), having spoken of Mr. Ward's long services, and of his ability and

courtesy, it was resolved to "accept the resignation with regret," and it was referred to the new General Purposes Committee to consider the question of pension.

**Tenders and Conditions of Contract.**—The first paragraph of the Report of the Main Drainage Committee was as follows:—

"The Council, in September last, issued an advertisement inviting tenders for engines, boilers and machinery, to be erected at the Crossness Outfall Works. The tenders were to be received by the Council on October 21, and would in the ordinary course have been referred to us. No tender, however, was sent in, although four firms had applied for copies of the plans and specification. We had a letter from Messrs. James Watt & Co., stating that they were unable to send in a tender for the work, as, having regard to their engagements, the time named for the completion, six months, precluded them from undertaking such a contract. After conferring with the Engineer, we determined to re-advertise the work, and in doing so, to extend the time allowed for the completion of the contract from six months to nine months. We also decided to modify the clause in the specification providing that the contract should not be assigned or underlet, by inserting the words 'or make a sub-contract,' and the words 'without the previous consent of the Council,' and omitting the following words:—'Nor shall the contractor make a sub-contract with any workman or workmen for the execution of any part of the cast-iron, wrought-iron, or other metal-work, timber, brick-work, concrete, ground-work, masonry, or any other work appertaining to this contract, but . . . to employ . . . own workmen for the labour thereof, who are to be paid directly by the contractor.' We have thus, in the adoption of that clause, acted within the powers conferred upon us by the Council; but having regard to the decision of the Council on Tuesday last, upon the report of the Special Committee on Contracts, we think it desirable to report the above circumstances for the information of the Council, and we accordingly do so."

The report was received.

**Bishop's-meadow, Fulham.**—The Parks Committee and the Improvements Committee each presented reports on this subject. The Report of the Parks Committee was as follows:—

"On October 28 last, we reported to the following effect, viz.:—

"On May 25, 1889, the Vestry of Fulham informed the Council that the Ecclesiastical Commissioners were willing to give this twelve acres of land, which adjoins the Bishop of London's Palace at Fulham, as a recreation-ground, and the Vestry asked the Council to lay out the land and build a wall along the portion of it known as the Bishop's-meadow, which lies between the palace grounds and the Thames. The question of the five-acre wall we deemed to be one for the consideration of the Improvements Committee, who might at some future date have to deal with the embankment of the Thames generally at this point, and we accordingly referred the matter to them, and they are reporting on it to the Council. Meanwhile, we have gone into the question of laying out the grounds, and have applied to the Vestry in order to ascertain whether they would contribute to the cost. This they have agreed to do to the extent of 1,500l., the total outlay being estimated at 2,500l. We also prepared with the concurrence of the Ecclesiastical Commissioners, to convey the lease of Bishop's-meadow (5 acres) to the Council, and the Commissioners will transfer to the Council direct the lease of the West-meadow (7 acres). The leases are both for 999 years, and the two meadows form the recreation-ground of 12 acres. We have visited the locality on more than one occasion, and are fully impressed with the public advantage which will accrue by securing the property. We may add that the conditions attached to the gift are that a river wall shall be built, and that the ground shall be laid out and maintained by the Council as a public recreation-ground,

and we recommended that, subject to an estimate being submitted to it by the Finance Committee as required by the Statute, the Council should authorise an expenditure of 1,500l. for the laying-out of Bishop's-meadow and the West-meadow, to be maintained by the Council in perpetuity. The Council referred this recommendation back to us for the Valuer to report as to the value of the land offered as an open space conditionally. The Valuer's report is to the effect that, subject to the above-named conditions, he does not see that any value whatever attaches to the land. If sold free from restriction, he states that it would be worth 750l. per acre, or 9,000l. for the whole. Taking into consideration the facts that sooner or later an embankment will have to be constructed, and that owing to the rapid increase in building, the necessity for open spaces in Fulham is becoming greater every year, we are of opinion that the Council should accept the gift, and we repeat our recommendation, viz.—

"That, subject to an estimate being submitted to it by the Finance Committee, as required by the Statute, the Council do authorise an expenditure of 1,500l. for the laying-out of Bishop's-meadow and the West-meadow, Fulham, as a public recreation-ground, to be maintained by the Council in perpetuity."

\* See *Builder* for November 15, p. 385, and No. vember 22 p. 408.

\* All having passed the qualifying examination.

The Improvements Committee's Report on the same subject was as follows:—

"On July 26, 1889, the Parks Committee referred to us the question of the construction of a river wall on the southern side of Bishop's meadow, Fulham, which was proposed to be laid out as a public recreation-ground. On January 29 last we advised the Parks Committee as to the description of wall which we would recommend. On February 21 last, however, the Parks Committee informed us that in its opinion the formation of the wall should be carried out as a Metropolitan improvement, and should therefore be dealt with by us, upon which we suggested that the Parks Committee should take up a report to the Council dealing with the laying out of the land, so that instructions might be given by the Council, if it were considered desirable, for us to proceed further in the matter. But the Parks Committee now asks us to submit a report dealing with the river wall, and states that it will at the same time report upon the question of laying out the land. Having carefully considered the subject and viewed the locality, we are of opinion that, if the Council resolves to acquire and lay out the land at Bishop's meadow as an open space, the erection of the river wall will be indispensable. We consider that the wall should be constructed of concrete blocks, so that in the event of the Council at some distant date deciding to embank the river with a similar wall up to this point, there may be some uniformity of appearance. The estimate for building the wall with concrete blocks is 8,800*l.* We recommend—

"That, subject to an estimate being submitted by the Finance Committee and approved by the Council as required by the Statute, and subject to the Council agreeing to acquire and lay out the land as an open space, the Council do seek powers in the next session of Parliament to construct an embankment wall at Bishop's meadow, Fulham, such wall to be formed with concrete blocks and with a curved batter to the face."

After a long discussion, in the course of which Col. Edis, Mr. Roberts, and Mr. Barns strongly condemned the proposed use of concrete blocks for facing the proposed embankment wall, the Parks Committee's report was adopted, but the Improvements Committee's report was referred back for further consideration.

After transacting other business, the Council adjourned.

### Illustrations.

#### THE CHATEAU DE MAINTENON.

**I**N his work entitled "Days near Paris," which was reviewed in the *Builder* some time since, Mr. Augustus Hare completely forgot the existence of the Château de Maintenon, which is one of the most beautiful works of French architecture of the sixteenth century. We supplied the deficiency briefly in the article in question, but our readers may be glad to have a further account and illustration of this picturesque building.

Maintenon is a small town on the Eure, about 69 kilometres from Paris by the Bretagne railway. The château, which is still the property of the Noailles family, has held many illustrious guests. The "Grand Monarque" himself was there several times; Racine stayed there for some time, and composed there, for the ladies of St. Cyr, his two tragedies of "Esther" and "Athalie."

The château, "restored" some years ago, was built by Jean Cottereau, treasurer of finance to Louis XI., Charles VIII., Louis XII., and Francis I., and whose daughter married in 1526, Jean d'Angennes, lord of Rambouillet. From the d'Angennes family the property passed into the hands of the Marquis de Villeray, who sold it to Louis XIV. in 1674, who made a present of it to Françoise d'Aubigny, Marquise de Maintenon, his wife by a morganatic marriage. She gave it as a wedding gift to her niece on the marriage of the latter with the Duc d'Ayen, son of the Marquis de Noailles, ancestor of its present possessor.

The situation of the château is beautiful. There is a fine park round it, of which the gardens were laid out by Le Nôtre. Two rivers, the Voise and the Eure, as well as numerous canals, divide the meadows, which are connected by about thirty bridges at different points.

The château itself forms a picturesque irregular mass of buildings, the effect of which is heightened by the fine warm colouring of the brickwork. The arms of the founder, Jean Cottereau, are still to be seen on the turrets flanking the entrance-gate. Internally there is to be noted a pretty chapel with some fine sixteenth-century windows representing the scenes of the Passion. One façade, with a *cour d'honneur* before it, looks towards the principal square of the town; the other, which has been shown, is the principal façade towards

the park side, which in the general view from gardens, also given, is nearly lost behind the projecting wing. The park façade is by far the most interesting in its details, although perhaps in another sense the one towards the town would be more correctly called the principal façade. The wing which extends between the large square tower on the left, and the entrance gateway, was built by Madame de Maintenon, who built also the right wing, containing a fine gallery which the present Duc de Noailles has had splendidly decorated. This gallery contains the portraits of all the known members of that family since the crusades. The apartments commonly occupied by Madame de Maintenon herself are among the sights of the building, and still contain much of their ancient furniture and hangings, as also her portrait by Mignard.

#### UNITED METHODIST FREE CHURCH, MANOR PARK, ESSEX.

This church, now being erected, consists of a nave and aisles, 40 ft. across, intersected by aisled transepts of equal height and width. Seating is provided upon the ground-floor for 175 people, the seats themselves radiating in the large square formed by the junction of nave and transepts, so that all the congregation look directly to the pulpit, placed in the centre of the building.

The communion platform will have choir seats on either side, and behind the pulpit is the organ chamber, carried up to the full height of the church. There are two large vestries, under one of which is the heating chamber.

The turret and porch on the opposite side lead into a lobby extending the whole width of the building. Materials,—red bricks, Bath stone, green slates, and lead for flats and spirelet. The contractor is Mr. H. J. Carter, of Grays, Essex; and the building is being carried out from the designs and under the superintendence of Messrs. Potts, Sulman, & Hennings, of London, their designs having been chosen in a limited competition.

#### INTERIOR ST. BARTHOLOMEW THE GREAT, SMITHFIELD.

This interior view, from a small oil-painting executed by Mr. W. D. West, shows one bay of the Norman arcade on the south side of the church. It may be of interest to some of our readers to have an illustration of one of the few pieces of Norman architecture remaining in London.

#### ST. IVES BRIDGE CHAPEL.

IN continuation of the illustrations of bridge-chapels (Wakefield and Rotherham) which we published last week, we now illustrate the one at St. Ives, Huntingdonshire. The bridge is about 14 ft. wide, with triangular recesses at intervals over the piers. The chapel was about the same size as that at Rotherham—the front measures 15 ft. in width. It differs in plan from the other two, having an apsidal termination eastward. The original parapet has been removed, and a modern brick house of two stories has been built over it, following the outline of the chapel. The height to the string-course which formed the lower member of the parapet is 5 ft. above the parapet of the bridge. The house is now used as offices, and modern windows are inserted. There are traces of a gable against the east wall, but whether original or a mark of a later building it is difficult to say. The bridge itself is an interesting example, and near it are some good houses of later date.

Both the chapels at Rotherham and St. Ives are of the fifteenth century.

#### OAK CHEST, BRANCEPETH CHURCH.

This finely-carved chest is of fourteenth-century work, probably Flemish. The carving is clean and sharp, cut to about the same depth as the tracery, about a half-inch sinking. The panels at the ends are plain, but those of the lid are stop-chamfered. The lock-plate is modern. Brancepeth Church, in which the chest is kept, is about five miles from Durham.

The illustration is from a drawing by Mr. W. G. Fostitt.

#### "THE HUT," HATCH END, PINNER.

"The Hut" is from the designs of Mr. James Ransome, and has been built for Lady Watkin Williams on a picturesque site about two miles from the village of Pinner. The

lower part of the building is in red brick, the millions and transoms of the windows being of wood painted white. Above the first-floor level the walls are of timber construction, with black-traced posts and light yellow distempered rough-cast. The roof is hung with red tiles. The house consists of three reception-rooms on the ground-floor, all approached from the hall, and opening on to the loggia, which faces south; seven bedrooms, a small boudoir, and the usual offices, bath-room, &c. The panelled dado in the drawing-room is of wood painted white, and is 3 ft. 6 in. high. Above this level the walls are hung with a dark "tapestry paper." At one end of the room a large arched recess has been formed for the accommodation of a grand piano. The building of "The Hut" was completed some eighteen months since, Mr. Batchelor, of High-street, Harrow, being the contractor.

### Books.

*Murray's Handbook for Durham and Northumberland.* London: John Murray, Abbe-marie-street, 1890.

At the risk of appearing ungracious, we may point out the omission of a few facts in the revised edition of Murray's really good handbook relating to Durham and Northumberland, which should be rectified in the next issue, and likewise call attention to a few incorrect statements that it will be well to put right when the same occasion arrives. It is, in the main, an excellent handbook, all the same, full of matter, light to hold, and easy to read; and as it is furnished with two good maps, deposited in two pockets in the cover, it is a very desirable item in the equipment of a traveller in the part of the kingdom to which it refers.

It must be premised that the plan of the work is a series of excursions, and that it is only the places within easy distance of these routes that are mentioned. By this arrangement several very interesting buildings are omitted altogether. Woodhorn Church is one of these. This is an ancient church of Saxon foundation, with Saxon fragments in it, and additions of nearly every subsequent century, and it is within a very short walk of Newbiggen Church, of which a brief description is given. Duddo Church is another omission, though the village is mentioned. Byrness Church, the smallest in the archdeaconry of Lindisfarne, has no word, though Byrness has four lines of notice of Door Tam in a chasm in a cliff two miles away. Iderton Church is not mentioned, though a mausoleum in the churchyard has a line. Ancofot Church, which has the singular feature of a fortified Plantagenet tower built on the walls of a Norman nave (shown in a view in the *Builder* some time ago), is accredited only with a tower attached to the church for the residence of the curate and the protection of the villagers from the inroads of the Scots. The rare heaon-turret at the south-east angle of Alnwick Church is slightly alluded to as an Italian turret (whatever that may mean); and the other numerous instances of fortified church towers are not specially pointed out. They are, however, the special features of border architecture. They stand like sentinels guarding the borderland, and form, with the flat towers and mighty castles, a defence of the first importance. One example, at Edlingham, has its fastenings on the side approached from the nave of the church, which proves it was, at some time, used as a place of detention as well. The mention of Edlingham is an opportunity to correct the statement that there are "some interesting chimney-pieces, doorways, &c.," in Edlingham Castle. The edifice has been in reality a fine pele tower, with a winding stone stair. The principal chamber was grained with arches springing from corbels in the angles which intersected each other. It is now in ruins, open to the sky. There is but one fireplace, which is now falling to pieces, with a lintel formed of ten stones joggled together with alternate straight and semi-circular joggles, which has been delineated in Parker's Glossary. To pass to another Castle, it may be remarked there is an interesting fact about Bamborough Castle that has not been touched upon. Malory, in the *Morte d'Arthur*, says Sir Lancelot desired the Bishop of Canterbury to see that he was buried in Joyous Gard, according to a vow he had made, and states, parenthetically, "Some men say Alnwick, some men say Bam-

THE CHÂTEAU DE MAINTENON : PRINCIPAL FAÇADE.

row." Some colouring is given to this identification of Bamborough Castle with the Gardie yeuse in the popular name given to the figure of a cross-legged knight now lying in the church, which is known as Sir Lancelot du lake. In the reference to the monument to a memory of Grace Darling in Bamborough orchard, perhaps it is too much to expect that mention should be made of the singular fact that the original figure of the heroine was so worn away by the action of the elements that it has already been replaced by a second one, from the chisel of the same artist who sculptured the first. In the brief account of the church, the crypt is spoken of as "probably the place where the dead of the joining monastery were laid before interment," which would lead anyone to suppose the latter is under the impression that the magnificent crypts in larger edifices were also intended for mortuaries. In another place the hand-books state that Embleton vicarage is one of the original fortified vicarage-houses in Northumberland, the two others being at hitton and Elsdon, whereas there are others at Shilhotell, Ponteland, and Alnham; and in other place Whalton is mentioned as having been. Reference to the index shows that Shilhotell and Alnham have not been included in the survey. The vicarage-house at Alnham is next to Elsdon, the best specimen of these curiosities of horder architecture; and the amples at Shilhotell and Ponteland are both extremely interesting, the first being incorporated with modern additions, as in that in Embleton vicarage, and the other standing, isolated, in the vicarage-grounds, having been carefully preserved when more modern work was attached to it was taken down a few years ago.

There is a paragraph relating to the names of places in Northumberland that would be still more interesting if the significant fact was added to it that many of the hills bear names that testify to the frequency of beacons upon them. These names are Wisp Law, Flare Cairn, pye Law, Lampet Law, Watch Law, Leam cacon, Beacon Plantation, Lantern, Jenny antern, Look Out, Hook-up, Light Berks, lamboro', Lemedec, and Upper Leme. And here is another string of names of equal significance:—Gallow Moor, Hanging Law, fanging Shaw, Gallowes Hill. In one instance, gallowes that had fallen into ruin has been recently restored, and now maintains the old traditional character of the locality in which it situated.

The editor has had the advantage of the assistance of several able hands, including Canon Greenwell, Bishop Lightfoot, Sir William Crossman, and many of the local clergy. These are given special value to various parts of the work, as in the account of Durham Cathedral, Bishop Auckland, and Holy Island, and various particular parishes. The fact remains, however, that there are districts in both counties not included in the scheme. The extent of the surface passed over has precluded search for minute archaeological details. However, in a road way, the two counties are faithfully represented, and their leading features described. In Durham the early railways, the collieries, timen and keelmen, the lead mines, and glass and iron and steel works are touched upon; the popular customs described; eminent men enumerated; the castles and country-seats briefly described; the standard histories and guide-books catalogued; the inns mentioned; and a skeleton tour "comprising all the chief objects of interest in the county" laid out. In Northumberland, horder history, horder tenures, allads, mines, agriculture, sheep and sheep-dogs, language, customs, superstitions, smuggling, otany, and natural history are all gone into, as well as the structural works. The editor recognizes the architecture of the last century as "gingerbread." He says the Northumberland churches "are not generally remarkable; most of the ancient buildings are mutilated or modernized; other churches are gingerbread rections of the last century." The renovations at Alnwick Castle, in the last century, he describes as "gingerbread," and those made at the same period in Ford Castle are also styled "gingerbread Gothic;" and the chancel of Alnwick Church is also "gingerbread Gothic." Nevertheless, the accounts of the leading lions of the North are fairly correct. Alnwick Castle, or instance, is faithfully described. In the church, however, ancient features recently restored, such as a row of clearstory windows on plastered up out of sight, have been

missed. Tapestry is mentioned and described as being at Hulne Abbey, which has, in fact, been removed to Warkworth Castle, these twenty years or more. In the account of Warkworth Castle, the editor falls into the mistake of confusing the decisions and work of the fourth Duke of Northumberland with those of the first Duke, which rather mixes things up. He says, in connexion with this subject, it was a question with the first Duke whether Alnwick or Warkworth were most fitted for the ducal residence, Alnwick being then almost as untenable as Warkworth, which is quite correct; but he adds: "When he decided in favour of Alnwick, he still caused the partial restoration of this keep, and several rooms have been fitted up with oak carvings and tapestry." This is incorrect, for it was Algernon, the fourth Duke, the grandson of the first Duke, who, a century after the decision arrived at, arrested the decay going on at Warkworth, and fitted up the rooms in question in which the tapestry mentioned is now hung. In another place, this same Duke, Algernon, is spoken of as the fifth Duke. The great gateway, known as Bonigate tower, in Alnwick, is erroneously ascribed to the father of Hotspur. Hotspur was slain in 1403, and his father in 1409, and no parts of the walls or towers of the town were erected before 1433. The best authorities assign the erection to the son of Hotspur, to whom Henry VI. granted a licence to "wall around the whole of the aforesaid town, and embattle and machicolate the walls of the said town, and also make and order any other defences whatsoever around or upon these walls free from any hindrance whatsoever;" though a document still preserved by the Corporation shows that fifteen years after this date the work was not finished, and that a petition for help towards its accomplishment was issued by the King's "trew liegemen." In the mention of Alnmouth "Dixon's History" should be Dickson's. And one more line might have been given to the neighbouring Lesbury Vicarage, to tell that Miss Jane Porter used to visit there. Lesbury Church, too, is another of the edifices that might have had mention. In the matter of ownership, it is of course difficult to keep a work of the kind up to date. The Chesters, for instance, needs attention in this respect.

As before indicated, these trivial shortcomings are but small specks upon a work that is generally executed in a masterly manner. The wild nature of some parts of the country is skilfully outlined; the free lives of the Northumbrian clans; the civil wars in the moss-trooping times; the cattle-stealing, raids, and general hard conditions of old border life are brought out; and the general toning down noted from the days when the farmers gambled away their farm-stock to the present time when the handbook allows that "among all English counties the palm of courtesy and hospitality is carried off by Northumberland." In some parts, in Elizabethan times, the cattle were driven into the villages, and there watched all night; in others, wolves and robbers were equally to be guarded against. Hodgson tells us a watch used to be set at all passages and fords along the middle marches towards North Tyndale and Rededale, that hue and cry might be raised directly thieves approached. The dalsmen were divided into clans, and the head of each resided in his own pele-tower, and exercised a right of pasturage over the vast moors around them. The editor adds:—"A few of these families still exist as lairds on their ancient estates; more still as tenant-farmers on their former properties. They lost their estates through getting into debt by gambling, drinking, and betting on horses and cocks; but the old names, and much of the old pride, haughtiness, and exclusiveness remain." And, indeed, it is not at all uncommon to find farms in various other parts of the country in the occupation of families who have held them for nearly three centuries. The merchants of Newcastle, in Elizabeth's time, made a law that they would admit no apprentices from the districts inhabited by these clans, which was not repealed until 1771. The editor has picked up many of the old sayings and the old ghost stories, and some of the peculiar idioms of the country. He has not noticed, however, the frequent use of the word "shall" instead of "will" in common speech. Fragments of the old hallads, too, lie like flowers on the pages. Condensation has been the aim, yet old authors are quoted and old histories given at sufficient length. Defoe, for instance, wrote of Darlington that it "had

nothing remarkable in it but dirt and a bridge over little or no water," which serves as introduction to the improvements that have been effected since his day, and leads up to a good account of St. Cuthbert's Church, where visitors are hid to notice the "squince" in the south side, which is evidently a "squint," and the Easter Sepulchre on the north side of the chancel. "The spire," says the editor, "is called Darlington Broach, from the fact of its being simply placed upon the tower without a guard." King James's remark that the town should be called "Darnton in the dirt" is also given, as also a slight outline of the romance of the place, by which a daughter of the post-master became the ancestress of some of the great people of the land. There is mention, also, that the inn is described in "Rob Roy." Open the bright red volume where we may, in truth, there is pleasant information in its narrow columns, compactly compressed.

*London of the Past: a Picture of the Olden City.*  
By J. ASHTON AINSCOUGH. London: Elliot Stock.

It has been said that there is much need of little books upon great subjects. We think this small volume will be found to answer the first condition, as it undoubtedly satisfies the second. Within the compass of sixty-three pages Mr. Ainscough presents us, not with a text-book, but with a collection of noteworthy facts, intended, as he says, "to draw the outlines of a suggestive picture, by grouping together piquant details of the Great City's past, and by calling attention to the striking changes it has undergone." He takes an extensive variety of topics, more than fifty in number, but dismisses each of them in a few well-considered paragraphs that serve as *indicia* to any one who would pursue its subject further. He makes many quotations from Stow's survey, and from Fitzstephen's much earlier record, but does not give references to several other citations which we should like to have seen supplied.

Turning to matters in which we are more particularly concerned, we notice that he directs attention, under the somewhat large heading of "Architecture of Old London," to Crosby Hall, the hair-dresser's shop in Fleet-street, opposite to Chancery-lane, and Staple-inn. The last-named, he might have added, has been lately rehabilitated for the Prudential Assurance Company by Mr. Alfred Waterhouse. Of the older houses, he says: "The material of which the houses were constructed was chiefly wood, chestnut being the variety most in use." Yet we think that chestnut, albeit sometimes employed for screens, open roofs, and similar ornamental work, where money was to hand, was not used for ordinary purposes to the extent that the writer seems to indicate.

In these more enlightened days, we cannot easily figure to ourselves the depreciatory manner in which strangers and foreigners were regarded by our fellow-citizens. In the two pages in which he speaks upon their disabilities in London, Mr. Ainscough touches upon a topic which has not been commonly explored, and should form an important chapter in the domestic history of the town. "Strangers and other mean people" are held up to obloquy: by "strangers" we should understand intruders from without the City limits; and there are many contemporary evidences of the restrictions that were placed upon their traffic with the citizens, especially in the case of immigrants from beyond sea and dealers in foreign wares. The persecution of the Jews was greatly due to causes other than their alien origin. The author devotes a few words to the City walls, of an important piece of which, in Ludgate Hill, we gave an account three months ago.\* The concluding eighteen pages are devoted to the rural surroundings of London, its gardens and orchards, the environs, and Vauxhall and Ranelagh. In noticing Marylebone, whilst giving its correct derivation to the name of the parish, Mr. Ainscough does not quite correctly say that the Tyburn rose near Primrose Hill and flowed through what is now called Tyburnia. It did flow through the parish, but towards the gallowes at what is now the southern end of Marylebone-lane; the gallowes, on removal further westwards, appear to have taken the name of Tyburn along with them. Though we cannot say that this book casts much new light upon an old, yet inexhaustible, subject, it is refreshing to meet with a writer

\* See "Note" in the *Builder*, August 3

who, whilst cognisant of their multitude, sparingly uses the vast materials at his command, and so using them does not weary us or lead us astray.

*Holy Trinity Church, Hull: a guide and description.* By J. R. BOTLE, F.S.A. London: Simpkin, Marshall, & Co. Hull: A. Brown & Sons. 1890.

THIS is a good attempt to put together all the historical facts of interest as to a church which is not in itself very interesting, but is the chief ancient architectural monument which Hull possesses. The illustrations of the interior would have been better omitted: they are rather too much of the "guide-book" type.

*Two Beverley Churches: The Minster.* By W. STEPHENSON, M.R.C.S., and *St. Mary's Church,* by JOHN BILSON, A.R.I.B.A. Hull: A. Brown & Sons. 1890.

THIS is a pamphlet containing papers read by the respective authors on the occasion of the visit of the British Association to Beverley on September 11 of this year. The first is mainly archaeological and historical, the latter, as might be expected, more architectural in character. There are no illustrations, but the writers understand their subject, and the pamphlet will be a useful companion for any one about to visit Beverley.

### Correspondence.

To the Editor of THE BUILDER.

#### TEMPLE OF NIKE APTEROS.

SIR,—In "A Letter from Athens," Professor Aitchison, referring to this Temple of Nike Apteros, writes:—"As we owe the re-erection of this temple to the munificence of Dr. Schliemann—"

There must be some misapprehension here. It is generally understood that this little temple was demolished by the Turks, in order to establish a battery, during the siege of 1657, the fragments forming part of the foundation of such battery.

When the remains of this work were cleared away in 1835, the architects,—Schauert and Hansen, who, with Professor Ross, had charge of the excavations,—found the fragments of the temple comparatively uninjured, and, with great patience and skill, they reinstated the whole as it now stands, almost perfect, on its original terrace.

Great as is the honour due to Dr. Schliemann for his munificence in other matters, he would certainly not desire to appropriate the credit for the work done, and so well done, by Messrs. Schauert and Hansen, some fifty-five years ago.

When recently in Athens, I noticed with regret how much the fallen column (not columns) of the Temple of Jupiter Olympius had continued to suffer by the injuries inflicted by thoughtless persons since its fall in 1852.

ARTHUR CATES.

#### BRIDGE CHAPELS.

SIR,—I venture to supplement the list of these given in your illustrated article of last week with the names of Doncaster, Ludlow, across the Teme (St. Katharine's), Bideford, Richmond (York), Leeds, Bristol, Bedford (St. Thomas's Chapel, Bunyan's gaol), Caterick (St. Ann's), and Droitwich (road through chapel). Leland, who returned from his tour in 1542, cites a bridge across the Thames at Cauxham, perhaps Caversham, and that of Archbishop St. William across the Ouse at York. He also says:—"I entered Rotherham by a fair stone Bridge of four arches, and on hit is a Chapel of stone, well wrought." The Wakefield bridge across the Calder is, *tert. Hall*, the one of the young Earl of Rutland's murder by Lord Clifford, in December, 1460. Norrison Scatterd wrote two treatises—1828 and 1843, London, 8vo—upon this and similar wayside chapels. He ascribes its date to before 1357, rather than 1460-1. He uses the somewhat polemical style not infrequently with essay writers of an old school, yet what he says is worthy of attention. He compares St. Mary's Chapel with Prior Crawden's chapel at Ely, 1321-40, and is "almost persuaded they were built by the same architect, Alan de Walsingham. It has been illustrated by Toms after George Fleming, 1743; Lodge, in Thoresby's Ducatus; and Cawthorne, circa 1800. Together with the "Little Lady Chapel" over the Don,

at Rotherham, and of which mention is made in 1483, it forms the subject of the architects, Messrs. J. C. & C. Buckler's, book in 8vo, printed at Oxford, 1843. Those authors are of opinion that the St. Mary's Chapel, Wakefield, was early fourteenth century work. In Hone's "Table Book," 1734, is an account, with woodcut, of the Elvet bridge, Durham, originally built by Bishop Pudsey, about 1170, where formerly stood the chapels of St. Andrew and St. James, and, according to some, another which gave name to the Magdalen steps there.

W. E. D. M.

#### PRESERVATION OF THE MONUMENTS OF ANCIENT EGYPT.

SIR,—In one of your "Notes" in this week's issue, you lament the small number of signatures to the memorial to Lord Salisbury, as evidencing the lack of interest in the subject on the part of those present at the last meeting of the Institute. Permit me, as one of the implicated individuals, to explain that I had not the remotest idea that there was any petition to sign. The invitation to do so may have been on the printed "agenda," but I cannot now say, as mine is destroyed. The President referred to the matter at the commencement of the meeting, but I failed to catch his concluding remarks. I scarcely think the matter was sufficiently notified to the meeting, else I feel sure the members would have very cordially supported the Council in their laudable efforts, especially if the signing is in the jeopardy alluded to in the letter in the *Times* of this date.

November 25, 1890.

#### "CEMENT TESTS."

SIR,—I have read with much interest the letters in your paper, re Cement Tests, in reply to my communication in your paper of October 25 last. The view I had in mind when writing the same was not so much to start a discussion upon sundry characteristics of a good Portland cement, or the relative value of some tests, but rather to show what had been done in Prussia in the matter of bringing into uniform shape various opinions and specifications. The rules I have quoted were given by the Prussian Minister of Public Works for his department only, which is a very large one, but the convenience of having short, precise, and uniform rules has proved so great that they are now largely used beyond their originally intended sphere of application, and I am informed that they are enforced in many private works, in works undertaken by Municipal Corporations, &c.

In order to show that there is really no much difference between these rules and those adopted by the first Municipal Authority in this kingdom, I quote the following from a specification of the late Metropolitan Board of Works, issued shortly before its dissolution:—

"The whole of the cement for these works, and herein referred to, is to be Portland cement of the best quality, ground so fine that the residue in a sieve of 5,800 meshes to the square inch (equal to about 76 per lineal inch) shall not exceed 15 per cent. by weight. When tested, should the proportion which will not pass through the sieve be greater, a quantity of neat cement equal to such excess shall be added (at the contractor's expense) to the specified proportion of all cement, mortar, or concrete, used upon the works. When brought upon the works, it is immediately to be put into a dry shed or store which the contractor shall provide for the purpose, having a wooden floor and all approved necessary sub-divisions. The cement is to be emptied out upon the floor, every ten tons being kept separate, and is not to be used until it has been tested by samples taken from different sacks. The cement is to be gauged with three times its weight of dry sand, which has been passed through a sieve of 400, and been retained upon one of 900 meshes to the square inch. The cement and sand having been well mixed (dry, about 10 per cent. of their weight of water to be added, and briquettes formed in moulds of 1 in. sectional area at the weakest point. The briquettes, having in the meantime been kept in a damp atmosphere, are to be put into water twenty-four hours after they have been made, and remain in water until their tensile strength is tested by means of apparatus belonging to the Board, and by their officers. These briquettes must bear, without breaking, a weight of 230 lbs. per square inch, twenty-eight days after the date the briquettes have been made; and the cement, neat, must not at any season of the year set in less than one hour. Any cement which does not answer the requirements will be rejected, and must be forthwith removed from the works. Briquettes of neat cement shall also be made and broken after seven days, as may be directed by the Engineer. Their degree of resistance and the weight of the cement shall also give results to his approval. The cement store to be provided with a Clubb's patent lock and key, to be obtained and fixed by the Board."

I have no doubt that this specification is based on the excellent experiments made by the late Mr. Grant, one of the Assistant Engineers of the Metropolitan Board of Works, who was a pioneer in this question, and to whom we owe very much in all matters relating to cement. It is difficult to say

with certainty to whom belongs the credit of having first laid down these rules; but this I know, that much in relation to Portland cement has come, with the name, from this country to Germany.

The value of uniform standard rules is recognised on the Continent beyond the limits of the Prussian Kingdom, and a permanent Commission is at work to establish further rules for universal acceptance, based on the latest and most extended experiments. This Commission meets periodically, and, at its last meeting, in Berlin, on September 19 and 20 last, there were present or represented, besides the heads of all the larger German engineering laboratories, the heads of public and private engineering laboratories in Austria, Switzerland, Russia, Sweden, France, and Holland, and also representatives of the cement industry, notably Dr. Delbrick, of Stettin, president of the Association of German Portland Cement Manufacturers.

I fully agree with what Professor Beare has said in his letter in reference to the desirability of some standard rules for this country. There is certainly no need for Government interference in this matter. In these days, when "time is money," surely it must be a great advantage to all concerned to be able to work to standard rules that have been adopted in this country by representatives of the profession and cement industry alike. Engineers are now put to so finding out for themselves, out of a mass of confusing information, what appears to them a good specification, and manufacturers will not be subjected then to one sort of test here and another one there.

I conclude with quoting an instance that has recently come to my knowledge which I think will demonstrate the want of standard rules.

An engineer in charge of works decided to test cement supplied to him by a manufacturer. To do so he used wooden moulds, in which he made his briquettes. When examined before testing, the briquettes presented a very rough appearance on the sides, as the cement had crumbled away, the wooden moulds having sucked up the moisture. The result was the cement was found to be, of course, was a hardship to the manufacturer, the moulds being at fault, not the cement.

H. ALFRED ROEHLING, Assoc. M. Inst. C. E.

#### DEATH IN THE VENTILATOR.

SIR,—It would have been more creditable to Mr. Simmanna for him to have cordially admitted his mistake, than to lay the blame upon the unconscious ventilator, as he does on p. 409. He advocated the use of a particular style of ventilator, which was unsuitable and dangerous for that particular purpose, and, when corrected, he is now puzzled to know why a cowl in the form of a soil-pipe requires to let air in as well as to let it out. I gave the reason on page 372.

He further tries to cover up his mistake by the red-herring process in asking, "Why use an extraction-cowl at all, if it is to let air in as well as to let it out?"

Now, the letting-in part of the work is only momentary,—when closed, &c., is being discharged,—and a proper cowl is useful in many cases for preventing continuous blow-down, which, without it, would often happen with the plain, open pipe in many situations. Further, in cases where there is a self-acting fresh-air inlet-valve at foot of soil-pipe, &c., it often happens that, although the plain pipe is closed, the inlet valve, the letting in of a good exhaust ventilator open it, and thus the end desired by the architect or plumber is attained.

The letter from Mr. Simmanna on page 409 is clever enough, but at the same time it is only quibbling.

W. P. BUCHAN.

P.S.—As this matter of selling valve ventilators to plumbers or other people for use upon soil-pipes seriously affects the health of the community, Mr. Simmanna should get his firm to recall the circulars sent out recommending such, and issue new circulars cautioning against the use of these upon soil-pipes, or they may find themselves sued for heavy damages should evil come from their issue.

W. P. BUCHAN.

Glasgow, November 22, 1890.

#### HARRINGAY SCHOOLS.

SIR,—With reference to the design you published last week for the Harringay schools, and which is described as "Second Preferred Design," I think it right to let you know that my design for the said schools was adjudged of equal merit with that of Messrs. Mitchell & Butler, and we divided the second prize of £52. 10s. equally between us.

HOWARD CHATFIELD CLARKE.

#### OBITUARY.

MR. LAWRENCE MARR.—The death is announced of Mr. Lawrence Marr, contractor and team-owner of Lodge-lane, Liverpool. According to the *Liverpool Daily Post*, among the many contracts which the deceased carried out were the excavation works in connexion with Lime-street Tunnel and Exchange Station, not to mention road-making on a large scale under the Corporation and various suburban boards.

The Student's Column.

HOT-WATER SUPPLY FOR BATHS, LAVATORIES, &c.—XXII.

FAULTS AND SOURCES OF DANGER.

Enumerate all the faults that may meet even a single individual's experience would occupy a great deal of space, but there are some of a very common character that it may be profitable to enumerate and describe. One is the connexion of a draw-off service (or services) to the return-pipe instead of the flow. This, although of frequent occurrence, can only be the work of an utterly ignorant or careless man, or one who has been accustomed to heating work in which the return-pipe has all, or nearly all, the services connected to it. This fault is usually recognised by one tap yielding water of a very different temperature to the others, but if all taps should be from the return-pipe a difficulty may be experienced in judging whether the boiler or other part of the apparatus is at fault, unless the pipes are all exposed so that the error in connexion is obvious.

Another, and only too frequent, cause of failure is a boiler of insufficient power. This is usually detected in a measure by the fact that hot water is only obtained some hours after the fire is lighted, or only some time after the early demand has temporarily ceased—say, between breakfast and luncheon hour. There are great numbers of ranges condemned on this account, as but few range-makers even now seem to comprehend that an efficient supply of hot water is as essential as efficient cooking facilities, and the most miserable boilers are often provided with what otherwise may be first-class ranges. The only remedy is to introduce a good hot boiler, or an independent boiler if needed.

Sometimes the work of a boiler is rendered next to futile by reason of the pipes being exposed to such an extent as to cause a serious loss of heat by radiation. This happens when the pipes are carried along cold galleries or passages, which are not packed or filled with some poor conductor of heat (as has been already explained), or what, perhaps, is the most frequent cause of this trouble, the tank being situated and exposed in a roof where it is robbed of its heat as fast as it is possible to do so.

Another frequent cause of trouble is omitting to terminate the return-pipe in the boiler at a lower point than the flow, although every care is exercised to terminate the flow at a higher point than the return in the tank. This arrangement is adopted by many, who profess that it gives equally good results as making the return lower than the flow in the boiler; and, certainly, if the apparatus is once started and kept going without cessation, no trouble would afterwards arise, but when starting with cold water in every part of the apparatus there is no knowing which pipe will act as the flow and which as the return, for as both openings are at a level, and as there is no influence brought into action to cause the first particles of heated water to travel up one pipe in preference to the other, there will be no knowing which pipe will act as the flow or which as the return; and, further than this, the pipe that acts the part of a flow one day will, possibly, be the return on the next, and would give rise to a complaint that although hot water could be had one day, the supply was bad another day; and there is every likelihood of the servants being blamed for this, as it would be attributed to non-attention to the fire or non-cleaning of the flues.

The mere fact of one pipe standing higher than the other in the tank makes no difference whatever when starting an apparatus charged with cold water. The chief use and object of the flow-pipe reaching a high position in the tank is to enable us to draw off the hot water without having the inflowing cold water mixed with it.

Sometimes a fitter is unfortunate enough to see his bearings, so to speak, and ends up his work by crossing his pipes,—that is, connecting the flow-pipe from the boiler into the tank as a return, and the return-pipe from the boiler into the tank as a flow; this can only happen in a large and complicated apparatus; and although the water will circulate very well here is the disadvantage of having the flow-

pipe proceeding from the bottom of the tank, where the cold supply enters; and when a tap is opened we do not get the hottest water by many degrees, for the water will flow, as indicated by the arrows at Fig. 60. This is usually easy of remedy by transferring the stand-pipe in the tank from one pipe to another. This could only happen with the tank system, and it will be noticed that some of the faults under discussion are distinctly peculiar to this system, while others apply to the cylinder principle.

FIG. 60.

It frequently happens that, for the sake of economy, the cold supply to a cylinder is branched from an existing house service, instead of bringing down a distinct cold supply service for the purpose. This is frequently a saving of expense, but it has two drawbacks, one of them of a rather objectionable nature. The first is that, supposing we open a cold tap and a hot tap at one and the same time, as we often do at a bath or lavatory, both taps will run at an annoyingly low speed (unless a high pressure exists) as both services are fed by one supply-pipe from the cistern; whereas with an apparatus that has a distinct cold supply, as it should have, the water will issue from both taps at an equal force, as in this case each outlet has its own distinct supply from the house cistern. This objection would not be felt, of course, if the cold and hot taps were never opened together, or if the one cold house service was of unusually large size.

The other and more objectionable feature with the one service pipe supplying the cylinder as well as the cold taps is, that if any of these latter are near the cylinder, warm water will be drawn (unless a stop-back valve is provided).

We have already explained that a very long draw-off service may be looked upon as a fault by reason of the waste of water it entails, but an instance once came to notice in which this practice caused sufficient trouble to amount to a complete failure. In this case an apparatus existed upon the tank system, with the reservoir at the top of the building as usual, and an attempt to gain the safety of the cylinder system was made by taking away all the draw-off services from the flow-pipe and substituting a single draw-off service taken from the top of the tank and carried down the

FIG. 61.

house to the different places where hot water was required, as fig. 61, so that this single

service was about 120 ft. long in all, the house being a high one, and the waste it occasioned neutralised the efforts of the boiler.

On new buildings a method is largely practised of running pipes on the walls before they are plastered, the plaster afterwards being laid over them. This has certainly two good features, one being that the pipes present no unsightly appearance, and the plaster and brickwork prevent to a great extent loss of heat by radiation; but immediately the pipes require exposing for any purpose whatever a great expense becomes necessary, as it must impair the decorations, which may be costly. While the apparatus is working satisfactorily, it matters not whether the pipes are in view or hidden, but there are so many purposes for which the pipes require inspecting that trouble of a more or less serious character must arise at some time with pipes that lie beneath or in the plaster.

Closely allied to this is the trouble occasioned by omitting to put "connectors" (union pieces) into the service-pipes at convenient points, so that when a pipe requires disconnecting at any particular place it may be necessary to take the pipes down for some distance, or else cut the pipe. This is a frequent source of trouble, and it often retaliates on the workman himself, as should he leave a leak to pick up (i.e., rust up), and the leakage refuses to remedy itself in this manner, then the workman has to return to disconnect and reconnect his pipes. This unworkmanlike practice of leaving leaks to remedy themselves is only too prevalent, for workmen are apt to leave leaks to too serious a nature with the hopes of their stopping of their own accord, and this induces a client to think that bad workmanship may have been introduced into the whole undertaking. A leak that only permits of one drop of water falling, say every ten minutes, will remedy itself (in plain iron pipe) very soon by the mere oxidation of the metal, and the joint will be as good after this has taken place as any perfectly-made one; but it is much better to remedy all leaks in a workmanlike way, as otherwise it is apt to lead to carelessness in this particular direction.

GENERAL BUILDING NEWS.

NEW WESLEYAN CHAPEL, LEEDS.—On the 11th inst. the opening ceremony of "Eldon" Wesleyan Chapel, which has been erected in Woodhouse-lane, Leeds, was performed by Mrs. W. T. Myers. The chapel is 70 ft. long, and 51 ft. wide. It is in the Decorated Gothic style of architecture, and has been carried out from the designs and under the superintendence of Mr. George F. Darby, architect, of Leeds. It is built of stone, lined with brickwork, and the internal woodwork is of pitch pine. In the centre of the front elevation the main entrance consists of a double doorway, with granite columns, carved capitals, and moulded arches, terminating in a gable. Over this doorway a four-light tracieried window is placed, with two-light windows on either side to correspond. A staircase is arranged at the south-east corner for access to an end gallery. A second staircase to the gallery is also provided at the opposite corner, both being of stone. The ground-floor is entered from the centred doorway, passing through lobbies into a large inner vestibule, 30 ft. by 8 ft. The seats will provide sitting accommodation for 520 on the ground-floor, and 230 in the gallery. The chancel is separated from the chapel by a moulded arch supported on granite columns and carved stone bases and caps, with a tracieried circular window filled in with stained glass beyond. The pulpit is of polished pitch pine. Two and three-light tracieried windows, terminating in gables, are arranged on both sides of the chapel, filled in with leaded lights. The roof is open-timbered, and is covered with green Westmoreland slates. The heating is by the low pressure hot-water system. The contractors for the stone and brickwork are Mr. Chas. Myers; carpenter and joiner's work, Messrs. Craven & Umpleby; slating, Messrs. John Atkinson & Son; ironfounder's work, Messrs. J. & H. Smith; and warming apparatus, Messrs. Holmes & Co.

NEW CHURCH at HALIFAX.—On the 13th inst. a new church, dedicated in the name of St. Jude, was consecrated at Halifax by the Bishop of Wakefield. The church stands at the north-east corner of Savile Park. The plan comprises a nave with aisles and tower at the south-east corner, chancel with clergy and choir vestries on the north side, and organ transept on the south. The tower is 95 ft. high. The style is that of the fifteenth century. The font is of Caen stone and the pulpit of oak. There is accommodation for about 500 worshippers. The total cost is about 8,400. Mr. W. Swindon Barber, of Halifax, is the architect, and the contractors are Messrs. J. Cluett & Sons, Messrs. T. Bancroft & Son, Mr. John Naylor, and Messrs. Jonas Birles & Sons.

**A NEW PUBLIC SCHOOL AT LEITH.**—On Saturday, the 22nd inst., a new school, to be called Corporation Public School, was formally opened at Leith by Lord Young. The school, which is built of red and white sandstone, will accommodate about 1,880 pupils, and the cost will be about 14,000*l.*, exclusive of the price of the site. The main building measures about 127 ft. by 75½ ft. deep, and consists of three floors. On the ground-floor is a large central hall, 82 ft. long by 29 ft. wide, and on the second floor are nine class-rooms. On the first and second floors are similar central halls, each having ten class-rooms branching off. A stair, made of iron and steel, leads up from the ground-floor; and the floors of the halls are all freestone. On the second-floor are situated the cookery, sewing, drawing, and music rooms, and these are all lighted from the roof, which, being flat, is fitted entirely with glass. The architect was Mr. George Craig, and the builder was Mr. William Baxter, Leith.

**MANCHESTER GIRLS' INSTITUTE.**—The foundation-stones of a new institution, to be known as the Manchester Girls' Institute, were laid on the 15th inst. The site of the new building adjoins the hospital in Mill-street, Ancoats, in the centre of a thickly-populated district. The basement of the building will consist of a gymnasium (with a dressing-room), nine separate baths, and several class-rooms. On the first-floor there will be a restaurant, a library, a room for a clothing-club, a kitchen, and a room in which lessons are to be given. The next floor consists of an assembly-room and several class-rooms, while above that are the caretaker's apartments. There is to be a laundry behind the building. The cost of the building, which is in red brick and terra cotta, together with the furnishing and the heating and ventilating appliances, is estimated at 7,500*l.* The architects are Messrs. Daryshire & Smith, of Manchester.

**NEW PUBLIC SCHOOL, GLASGOW.**—The new Public School in West-street, Calton, Glasgow, was formally opened on the 15th inst. by the Lord Advocate. The school is situated at the junction of West-street and M'Kechnie-street. The main building, which is three storeys in height, is 99 ft. long by 83 ft. 6 in. wide. The walls of the principal fronts are built of rock-face ashlar, and terminated at the top partly by a parapet and partly by a boldly-moulded cornice. The roofs are pavilion, and covered with Elterwater slate. The buildings are of red freestone from Gatelaw Bridge quarries, Dumfriesshire; the boundary walls are faced with vitrified bricks, and the interior walls with white enamelled bricks. The playyards are roofed with concrete, and the playgrounds throughout are paved with granolithic. The style of architecture is Romanesque. Internally the centre of the building is occupied by a rectangular hall, which is enclosed on its two sides by class-rooms, and on the ends by entrance porches and teachers' rooms. The stairs are wide and of easy gradient, the stringers and breasts of steps are of rolled iron, the treads of Aberroath stone, and the plats of granolithic. Hall and staircases are roofed with glass. The accommodation for scholars comprises an infants' school, sixteen class-rooms, a drawing-room, and a kitchen for cookery lessons. The school accommodates in the aggregate 1,612 scholars. The teachers' accommodation comprises six rooms, two on each floor. The whole building is heated on a mild hot-water system, the hall and staircases are warmed by six radiators. The work has been executed under the superintendence and from plans prepared by Mr. John Gordon, architect, Glasgow.

**BUSINESS PREMISES, BLAYDON-ON-TYNE.**—The Blaydon District Industrial and Provident Society, Limited, has opened part of a new building which, when completed, will be 120 ft. in length. The building already erected forms the grocery and provision department, and has been fitted up with the most modern means for easy working and quick despatch. The architects were Messrs. Thompson & Dunn, Newcastle-on-Tyne. The building is three stories in height, and the design is described as a free and bold treatment of French Renaissance, executed in Gimmerton stone.

**NEW BATHS, SALFORD AND BRIGHTON.**—The Salford Borough Council at their last meeting accepted the tenders of Messrs. R. Neill & Sons for Messrs. Bradford's for the engineering and boiler, amounting to 1,060*l.* The designs are by Messrs. Mangall & Littlewoods, architects, Manchester, and were selected in a competition. The land is a road and Dorset street, and is well adapted for its purpose, being in a populous neighbourhood. The same architects. They are situated in Great Clove-street, and are advancing rapidly towards completion, the Baths Committee being sanguine of having them ready for use next summer.

**NEW MALTHOUSE, LISWICH.**—Besides the extensive range of buildings, comprising a six-story 200 quarters) recently completed and extending from Albion Wharf to Key-street, Messrs. R. & W. Paul have just erected another new malt-house at Eagle Wharf, adjoining the dock, also a large factory for cleaning and sorting foreign barley portion of the site of the buildings formerly known as the Eagle Foundry, and extends 190 ft. back

from the public quay. It consists of a five-storied building, for 150 quarters steep, with two kilns at its eastward end fitted with some of the most modern appliances. The drying-floors are laid with Herrmann's patent wire work, supplied and fixed by Messrs. Lewis Olrik & Co., and the heating apparatus is Tomkins, Courage, & Cracknell's patent, fitted up by Messrs. G. J. Worsam & Co. The first floor of the warehouse is entirely occupied by a malt-store, and has capacity for 5,000 quarters. An elevator is provided for the barley stores on the west or dock front, also skip lifts from the cistern, and for loading the kilns, all of which, with Boby screens, &c., are driven by a 10-h.p. gas-engine. On each story of the malt-house there are several lines of hanging skip tramways for distributing the wet grain upon the floors, and these are also worked in connexion with the lifts for loading the kilns. The grain-cleaning factory is a four-storied building, about one-third of which is occupied by special and costly machinery, effecting no less than thirteen separations of the grain and removing dust, offal, and all foreign matters. This machinery is driven by steam-power. The whole of the buildings were designed by Mr. Thomas Miller, M.Inst. C.E., and Engineer to the Ipswich Dock Commission, and they have been carried out by the contractors, Mr. Fred. Bennett for the malt-house; Messrs. Cockesidge & Co. for the machinery; and Mr. R. Girling for the grain-cleaning factory.

**CHURCH RESTORATION IN RADNORSHIRE.**—The restoration of the dilapidated old Church of St. Mary, Danfared, Radnorshire, has been commenced, from plans prepared by Mr. Ernest Collier, of Carmarthen. The work includes new stone windows in place of the nineteenth-century square wooden ones, new buttresses, and crosses, an oak bell-turret at the west end, wood-block floor in the nave, and marble mosaic pavement in the chancel, oak choir stalls and reading-desk, oak pulpit, and an oak vestry screen. The contractor is Mr. J. D. Williams, of Knighton. The marble mosaic paving is supplied by Messrs. Maizer & Kempthorpe, of London.

**RE-OPENING OF ST. BOTOLPH'S CHURCH, BISHOPS-CAYE.**—On the 23rd inst. the parish church of St. Botolph, Bishops-cay, was re-opened, after external restoration. The restoration, which has necessitated the building being closed for about five months, has been confined almost exclusively to the stone-work, which was found to be greatly decayed, and the cost has been about 2,000*l.* Mr. Bentley was the architect, and Messrs. Higgs & Hill the builders.

#### SANITARY AND ENGINEERING NEWS.

**UTOXETER WATERWORKS.**—Mr. W. H. Radford, C.E., of Nottingham, has been instructed by the Utoxeter Rural Sanitary Authority to inspect and report on the water supply of the town, and if the present supply is found inadequate, to prepare a scheme with plans, sections, report, and estimate for obtaining a further supply from the best available sources.

**THE WATER SUPPLY OF DARWEN.**—At a special meeting of the Darwen Town Council on the 13th inst., it was by a large majority decided to purchase the Pickup Bank and Daisy Gorton reservoirs from the Blackburn Corporation for 60,000*l.* The acquisition for an increased water supply has now extended over two years, the alternative schemes being either Thirlmere reservoir of the Manchester Corporation or the Raddlesworth reservoir of the Liverpool Corporation.

**SEWAGE DISPOSAL AT WORCESTER.**—A three days' inquiry was commenced, on the 4th inst., at the Shire Hall, Worcester, by Colonel Ducat, Inspector of the Local Government Board, into the scheme of the Corporation for disposing of the sewage of the city. Mr. Lumley Smith, Q.C., opened the case for the Corporation, and stated that the Local Government Board at first suggested irrigation, and the Corporation arranged to purchase twenty-eight acres of land at Diglis, where they would have had space for irrigation. The purchase of that land was opposed by a number of persons who were under the impression that there was going to be a sewage-farm established at Diglis. That was an erroneous impression. It appeared, however, that the Severn Commissioners wanted a portion of the twenty-eight acres of land at Diglis, in connexion with the Severn Navigation Scheme. The Corporation, therefore, desiring to promote the navigation scheme, agreed to retain only six and a-half acres, at the north end of the site, the Commissioners taking the rest for their docks. The Corporation proposed to erect on that six and a-half acres certain buildings in which the sewage would be received and dealt with. It was estimated that the scheme would cost 50,000*l.* All the tanks would be covered in, and there would be no possible means of anybody being offended by the works or seeing the sewage. He asked the inspector to consider whether, in his opinion, it would be essential that there should be any irrigation in addition to the precipitation which they proposed to carry on upon the process of dealing with the sewage. That piece of ground by chemicals would render the effluent perfectly clear and fit to go into the river.

But if the Local Government Board would not sanction a scheme unless there was some irrigation, the Corporation could obtain land on the other side of the river, and the effluent could be passed over.—Mr. Stephens, Q.C., for the opponents of the scheme, objected that Mr. Smith had presented two schemes of sewage disposal, and not one. He asked him to declare whether the Corporation intended to stand by precipitation or irrigation.—Mr. Smith replied that he would call evidence on all parts of the case as he had opened it.—The Inspector then proceeded to view the site at Diglis.—At a subsequent sitting Dr. Dodsworth, Medical Officer of Health for Chiswick, described the precipitation works which have existed there for eleven years. During that time there had been no nuisance, and in witness's opinion the proposed works at Diglis could not be carried out without causing a nuisance.—Mr. Henry Macaulay, engineer and Borough Surveyor of Kingston, said he designed the sewage works there, which were completed in 1888. They had been at work ever since, and no complaint of any kind had reached the Corporation. The effluent went into the river just below the works. It was not treated by filtration in any way whatever. Witness had examined the site at Diglis, and had seen Hawksley's plan of the proposed works. He thought it a most suitable position.—The first witness called for the opposition was Mr. R. W. Binns, chairman of a committee of citizens formed for the purpose of opposing the present scheme. Mr. T. W. Smith, a member of the Town Council, and Mr. A. H. Parry, architect, gave evidence as owners and occupiers of property near the proposed works. They had reason to believe that the carrying out of the proposed scheme would depreciate the value of property in the district. Mr. E. Ryde, surveyor, London, said he had visited the site at Diglis, and did not consider it suitable for sewage works. If the city went on increasing it would have larger sewage works. The Dean of Worcester gave evidence against the scheme. Dr. Swete, county analyst, gave his opinion strongly against the scheme. The works should certainly be taken further from the city. Mr. Marten, Engineer to the Severn Navigation Commissioners, stated that the site was too low down and too near the town, which was growing, and would grow in that direction when the new docks were established if these works were not carried out. The site suggested was too small to admit of sewage works being constructed for a town which might be expected to grow very much. Mr. Stephens, Q.C., having spoken, and Mr. Smith, Q.C., having replied for the Corporation, the inquiry concluded.

**ELECTRIC LIGHTING, CHRIST CHURCH, VICTORIA-STREET.** This installation has proved, so far, a success, not only as regards the increased amount of light, but also in that the first cost was much less than gas; as the estimate for installing electricity was about 75 per cent. lower than that for putting in gas-pipes and fittings. This saving is mainly brought about by using incandescent lamps of 100 candle-power; eight of these, in cut-glass lanterns, are suspended by flexible copper leads, strengthened with steel wire; on each of the side aisles two similar lamps, placed out of sight, illuminate the chancel. All the lamps can be lighted or turned out independently, and a few of 100 candle-power are also fixed about the building to be used for partial illumination. The cost of running is not expected to exceed the sum previously paid for gas, as half the lamps can be extinguished during the sermon, also with the high candle-power lamps there is a great saving in renewals compared with the ordinary 16-candle lamp, the cost of the former being only twice the latter and giving over six times the light. The electricity is obtained from the Westminster Company's mains, which are run to a meter; the current can be shut off by a double-pole switch, and fusible mica-foils prevent any danger from fire due to excess current or a short circuit in the building. The arrangements have been carried out under the superintendence of Mr. Killingworth Hedges, M.Inst. C.E.

**MALDON SEWERAGE.**—The works of sewerage and of sewage disposal for the town of Maldon, Essex, were opened by the Mayor and Corporation on the 4th inst. The works have been carried out from the designs and under the superintendence of Messrs. R. E. Grantham & Son, of London, by Mr. Osenton, the contractor; Mr. John Wood acting as clerk of works. The Town Council has determined to form a promenade along the frontage of the River Blackwater, and to lay out a recreation-ground in connection therewith.

**POLLUTION OF THE RIVER CALDER.**—On the 4th inst., Mr. J. T. Harri-on, M.Inst. C.E., held a Local Government inquiry at the Board Room, Earlsheston, near Dewsbury, relative to an application by the Souththorpe Local Board, for sanction to have a promenade along the frontage of the River Blackwater, and to lay out a recreation-ground in connection therewith. Mr. W. C. Handley, Clerk to the Board, stated that the population of the district was about 5,750, the effective rateable value 13,113*l.*, and the amount of the present debt 1,530*l.* Mr. Malcolm Paterson, M.Inst. C.E., Bradford, Engineer, produced the plans and sections of the scheme, and explained the details. The scheme is entirely by gravitation,

there being two main outfall sewers meeting at one point, and the method of treatment proposed is chemical precipitation in three tanks working separately, combined with filtration on land specially prepared to a depth of 5 ft. or 6 ft., the total area being four acres. The principal features of the scheme are: (1) separation of storm-water from the sewage; (2) utilisation of the fall of sewage for mixing chemicals; and (3) the taking of the manufacturing refuse into the sewers, thus striking at the root of river pollution, a step which, in view of the terrible state of the River Calder, will doubtless be watched with interest by the West Riding County Council. The Inspector advised that on acquisition of the land at once by conditional agreement, and stated that in no case would the Local Government Board sanction the discharge of sewage clarified by precipitation, without its passing over land, not even the supernatant water periodically discharged before cleansing the tanks; and further stated that with this proviso he would recommend the granting of the application.

**DRAINAGE, WEST ARDLEY.**—At the meeting of the Rural Sanitary Authority of the Wakefield Union, held on the 12th inst., it was resolved to adopt the plans and estimates prepared by their engineer, Mr. Frank Massie, Assoc. Mem. Inst. C.E., and further to employ Messrs. G. and W. Mason, of the works at Hay Beck, for the drainage of the Westerton District in the township of West Ardsley, and for the purchase and laying out of two acres of land for the treatment of the sewage from the Lower-street drainage area in the same township. It is proposed to apply to the Local Government Board for a grant towards the sum of £2,800 for the completion of first section of this scheme.

FOREIGN AND COLONIAL.

**FRANCE.**—The Académie des Beaux-Arts has named the preliminary Commission Consulting Member in place of the late Sir Richard Wallace. The death is announced, at Mas-Thibert, of the painter Inard, a former pupil of M. Gérôme. He was known as a painter of landscapes in the Arles district, as well as of figure pictures of local character. The Subscription Committee which is formed at the General Assembly of the Académie has decided that instead of a simple statue, there should be a monument on a large scale, which should be consecrated to all the officers and soldiers who fell on the 30th and 31st of August and the 1st of September, 1870. The Committee propose to open a competition for this, and to award a gold medal to the best among the highest rank of French sculptors. The General Exhibition at Ajaccio (Corsica), to be opened in January, is in active preparation. A competition has just been opened by the Municipality of Compiegne for the enlargement of the hospital for aged men in that town. It is intended to add 45,000 francs to the new work. The excavations have been commenced for the construction at Paris of a Hôtel to form a centre for the principal telephone services. The building will stand on ground bounded by the Rue du Louvre, Rue Jean Jacques Rousseau, and the Guttenberg, where the principal facade will be. The arrangements at the Hotel des Postes correspond with that of the new Hotel des Postes. The direction of the National Gardie Menlie has sent an important collection of artistic objects to St. Petersburg to decorate the new hotel of the French Ambassador. Among these are twelve fine Gobelin tapestries, an immense carpet, and a very fine piece of Louis XVI. furniture from the old palace of St. Cloud. The Government has commissioned M. Guilbert Martin, the well-known Mosaic artist, to restore a Mosaic pavement discovered by M. Renan near the ancient site of Tyre. These Mosaics, which belonged to a Byzantine church, are to be placed in the Louvre. The room preceding the staircase of the Pavillon, Mollin.—M. de Baudot has opened at the Trocadéro an annual course of instruction in architecture. He has commenced with lectures on the methods of composition of French Medieval and Renaissance architecture, and their application to modern architectural design. The new gallery of casts at the Trocadéro has just been opened to the public. The Louvre has just received two works by Delacroix, left to the Museum by the late Philippe Burty, the Inspecteur des Beaux Arts, who died in June last; these are a pen drawing called "La Monte au Calvaire," and an album of maps, drawings, and water-colour sketches.

**BERLIN.**—The designs for the proposed memorial church to the deceased Emperor William I. have been placed before the Emperor for approval. He has chosen a design in Romanesque style, planned to hold 1,600 seats, bearing the name of "Banrath" Schweschen, for erection. The Norwegian architect Munthe, who has built Holmenkollen, so much admired by the Emperor on his last northern trip, has received a commission to build a hotel-house (in Norwegian style) in the Castle grounds in Potsdam. A hunting-box is to be built for the Emperor in East Prussia by the same architect.

**SWEDEN.**—Herr J. G. Clason, a prominent architect, in the employ of the Stockholm Building

Board, has been appointed Professor of Architecture at the Technical High College in the Swedish capital. At the last meeting of the Architectural Section of the Swedish Technological Association the question of a defined classification of tiles and bricks, according to strength, colour, and finish, was discussed, in order to obviate the frequently occurring disputes on delivery. It was decided to appoint a committee of architects and engineers to frame a set of technical regulations respecting the qualities that should be shown in tiles and bricks. The second part of an interesting work has just been issued in Stockholm, viz., Drawings of Objects in the Northern Museum, by Artur Haehusli. This part embraces Iceland, and is accompanied by 108 drawings of Norse antiquities of all kinds, as well as designs of ancient buildings, &c.

**NORWAY.**—The town of Hammerfest, situated close to the North Cape, and which was recently totally destroyed by fire, is rapidly being rebuilt. The new Imperial railway pavilion to be built at Magdeburg is to be in the Norse style, at the request of the Emperor, who took a great fancy for this style of architecture during his sojourn in Norway.

**DENMARK.**—The Danish Government has presented a Bill to the Parliament demanding a first instalment of the sum to be expended in building a Museum of Industries and Arts in Copenhagen—viz., 20,000*l.*, and an additional 550*l.* a year for ten years towards its maintenance; and also a Bill for a new Museum of Art, to cost 21,000*l.* In connection with the first-named institution, drawing and artisans' classes are eventually to be established. Various great works are to be carried out in Copenhagen, among which are the erection of a Municipal Central Electrical Station, at a cost of 110,000*l.*; the making of four new great thoroughfares in the northern part of the city; the erection of two large public schools; the building of a picture and sculpture gallery; and the construction of a new spring-water aqueduct, at a cost of 12,500*l.*, the length being 5,000 ft. The Government has also adopted a scheme for rebuilding the Royal Frederic's Hospital and the Royal Children's Institute, besides the building of a new surgical college, at a total cost of 235,000*l.*; but this work will take several years to carry out. Finally, new barracks are to be built in Copenhagen at a cost of 112,000*l.* For some years past the Danish Ministry of the Interior has attempted to introduce a suitable system of heating churches in the country without disfiguring them, but none has proved satisfactory. The Ministry has in consequence commissioned an engineer and an architect jointly to elaborate a plan to attain the object in view.

MISCELLANEOUS.

**GLASGOW PHILOSOPHICAL SOCIETY.**—Mr. W. P. Buchan, sanitary and ventilating engineer, has been elected President of the Sanitary and Social Economy Section of the Philosophical Society of Glasgow in succession to Mr. John Humevan, F.R.I.B.A. At the meeting of the Society on the 19th inst. Mr. Buchan read a paper on "A Problem in Ventilation by Heat," illustrated with experiments. We print this paper on another page, and the discussion which followed, Professors Bottomley and Blyth and other members took part. On the motion of the chairman, Professor McKendrick, F.R.S., a vote of thanks was awarded to Mr. Buchan for his paper.

**SANITARY STATE OF CADIZ.**—The British Consul at Cadiz, in a report on the trade of that district for 1888, observes:—Taking the statistics for the last eleven years, the death-rate of Cadiz shows the high proportion of 44.6 per 1,000. Out of 2,829 deaths in 1888, 913, or 32.2 per cent., were from diphtheria, typhus fever, and diseases of this class. In ten of the most healthy streets the average death-rate during the last ten years was 19 per 1,000; in ten other streets, 41 per 1,000; in Calle Venzorles, 100 per 1,000; in Campo de Santa Elena, 102 per 1,000; in Calle Campillo de los Cloches and Calle Correo, 111 per 1,000, reaching the maximum of 115 per 1,000 in Calle San Fernando. It is scarcely credible that Cadiz, enclosed by the sea, being an island connected with the mainland by a series of causeways seven miles long, should be so unhealthy, and its hygienic condition so unfavourable. The causes of this excessive mortality are the want of an adequate supply of water and the absence of a proper system of drainage. The supply of drinking water is limited, and costs 3*s.* 10*d.* per 1,000 gallons. There is no water to flush the sewers, and in summer the effluvia in the streets is often so offensive that people are forced to seek relief in the purer air of the neighbouring villages. A project is on the tapis for the construction of a proper system of sewerage on the most approved modes or plans, with a sufficient supply of salt water to regularly flush the sewers.

**IMPROVEMENTS AT BURNLEY.**—A Local Government Board inquiry at Burnley has just been held by Mr. S. J. Smith, C.E., Inspector of the Local

Government Board, into the application of the Corporation to borrow 27,000*l.* for sewage purposes, 12,000*l.* for laying out the public park, 2,100*l.* for street improvements, and 1,060*l.* for markets. The Town Clerk stated that, at the suggestion of the Inspector, in viewing the sewage works, they had asked to amend the application to 30,000*l.* for sewage purposes, in order to add other four to the present eight tanks. With respect to the second application for 12,000*l.*, the Town Clerk explained that the land (twenty-eight acres) had been presented to the town by Sir John Harby Thurstly. There was no opposition to any of the applications.

**THE CHANNEL BRIDGE.**—According to the daily papers, M. Renault, engineer and marine hydrographer, has presented to the Minister of Public Works and the Minister of Marine his report upon the soundings taken in the Straits of Dover. His report is favourable to the construction of a bridge over the Channel.

**PROPOSED NEW SHIP CANAL IN THE MIDLANDS.**—The North Staffordshire Railway Company, which has its Cheshire terminus at Crewe, has given notice of its intention to apply for an Act of Parliament allowing them to widen and deepen their Trent and Mersey navigation and other canals, so as to render them navigable for vessels of much larger burden. The widening and deepening of the canal will transform it into a great ship canal, and will necessitate the construction of eleven new locks. The new ship canal will provide direct communication for vessels of heavy tonnage for the whole of the populous area between the Cheshire shore of the Mersey and the Potteries of Staffordshire.

**ELECTRIC LIGHTING IN SPAIN.**—It is stated that a large central electric-lighting station has recently been completed in Madrid, at a cost of 80,000*l.*, and electricity is already being distributed by underground mains to houses at a distance of two miles. The undertaking is in the hands of an English company holding a concession from the Madrid authorities.

**ROYAL VICTORIA HALL, WATERLOO BRIDGE ROAD, S.E.**—The "Penny Science Lectures" to be delivered in this hall during December include the following:—On December 2, Mr. E. Wothered will lecture on "Rocks seen through a Microscope." On December 9, Dr. Foster Morley will lecture on "What we get from Coal Tar," with experiments. The oxyhydrogen lantern will be used with these lectures.

**JUNIOR ENGINEERING SOCIETY.**—The presidential address was delivered to the members of this Society on the 21st inst., at the Westminster Palace Hotel, by Professor Silvanus P. Thompson, D.Sc., on "Electro-Magnetic Mechanisms." The Society's prize was presented to Mr. A. H. Tyler for the best paper of the past session, and a vote of thanks was passed to Professor Perry, D.Sc., F.R.S., the retiring president.

**ARTIFICIAL ASPHALTE.**—A Danish engineer, Herr J. Erslev, has obtained a patent for a process of making artificial asphalt. He mixed 80 to 90 parts of carbonate of ammonia with 10 to 12 parts of coal tar, and when these have been well mixed adds 100 parts of fine sand or dry clay. The whole having been thoroughly kneaded the substance is cast in blocks, and used like ordinary asphalt. The artificial substance resists changes of temperature and hot water, whilst showing a hardness equal to the natural. It also adheres well to any material upon which it is laid.

**THE BALTIC-WHITE SEA CANAL.**—It is reported from Archangel that the preliminary surveys for the canal that is to connect the Baltic with the White Sea have been completed. The new canal will commence from the Lake Omega, as there is already a canal between the latter and the Finnish Gulf. The length of the new canal is estimated at 135 miles, of which eighty-two miles are natural waterways. It will be 634 ft. wide and 10 ft. deep, but at the locks, where ships have to pass each other, the width will be 112 ft. The cost of the canal is estimated at 7,500,000 roubles, or 750,000*l.* The fall of the canal between the White Sea and Lake Omega will be about 15 ft. Naturally, great importance is attached to the construction of this line of communication, as, apart from its strategical value, it will open up the great metal deposits and rich forests in Northern Russia to commerce.

**A LONG ELECTRICAL RAILWAY.**—A project has been mooted for the construction of an electrical railway between St. Petersburg and Aichang, on the White Sea. The length is estimated at about 800 kilometres, and the cost at 2,000*l.* per kilometre. It is proposed to work the railway from generating stations along the line. It is suggested that an electrical railway would work better than an ordinary one.

**MEMORIAL WINDOW, ALL SAINTS' CHURCH, BARBACOMBE.**—At All Saints' Church, Barbacombe, on the 22nd inst., was dedicated a stained-glass window placed in the south aisle to the memory of the late Duchess of Sutherland. The window, which consists of three lights, is the work of Messrs. Mayer & Co. The subject of it is, "The Holy Women at the Tomb."

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

COMPETITIONS.

Table with columns: Nature of Work, By whom Advertised, Premium, Designs to be delivered. Includes entries for New Court House, Public Baths, etc.

CONTRACTS.

Table with columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, Tenders to be delivered. Includes entries for Limestone Gravel, Steel Work for Bridge, etc.

Those marked with an Asterisk (\*) are advertised in this Number. Competitions, p. iv. Contracts, pp. iv, vi, and vii. Public Appointments, p. xvi.

CONTRACTS.—Continued.

Table with columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, Tenders to be delivered. Includes entries for Iron, Steel, Castings, Timber, etc.

PUBLIC APPOINTMENTS.

Table with columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in. Includes entries for Superintendent Harbour Improvements, etc.

THE ENGLISH IRON TRADE.—Notwithstanding the almost complete restoration of the equilibrium in the Money Market, the effects of the recent troubles in the financial world are still being felt in the English iron market.

PRINTING A NEWSPAPER WITH A 15-TON STEAM ROAD-ROLLER.—Owing to an accident at the gas-works, the town of Middlesbrough was last Saturday wholly deprived of gas for all purposes.

COLLAPSE OF A BUILDING AT NEWPORT.—According to the South Wales Daily News, a serious disaster occurred at Newport on the 21st inst., resulting in the death of one man and serious injury to another.

MUSIC, DANCING, AND THEATRE LICENCES.—The London County Council have just notified that in future they will not entertain any application for a new licence for music, dancing, or stage plays, unless the owner or lessee of the building in question possesses a Council's certificate under the Act of 1878, or in the case of a building in course of construction, a provisional approval by the Council.

LEGAL. IS A "SKY-SIGN" A TEMPORARY STRUCTURE?

At the Marylebone Police-court on the 21st inst., Mr. George Lolls, the proprietor of the Lord Elgin Hotel, Maiden Lane, was summoned by the London County Council for setting up an erection of a movable or temporary character, the same not being exempted by the first part of the Building Act of 1855, and without having first obtained a licence.

WIDTH OF ROADWAY: WHAT IS A NEW STREET?

At the Woolwich Police-court last week, before Mr. Kennedy, the magistrate, Mr. James Mackintosh, the lessee of some building property fronting Albert-road, North Woolwich, was summoned by the London County Council to compel him to put back the dwarf wall of the forecourts to some distance recently erected, alongside the said road, as not being 20 ft. from the centre thereof. The road was made up and taken over by the Local

Board two years ago. It has a footpath on the side adjoining the buildings, but none on the other, which is merely the fence of the North Woolwich Railway, its total width being 31 ft.

Mr. Mackintosh is the building lessee of the lands, which belong to Messrs. Komard, and has built three terraces of artisans' dwellings to front the same about 8 ft. inside the fence dividing the road from the property, and had put up a dwarf wall (which he intended to continue the whole length) in front of the houses 2 ft. inside the road footpath, and parallel with the old fence; thus voluntarily giving up a strip of land to the road, which it was claimed was not a new street or road within the meaning of the Metropolitan Building Acts.

The case on behalf of the lessee was argued by Mr. Scrutton, barrister, and in the result, the magistrate dismissed the summons, with damages against the London County Council, and refused to grant the latter a case for appeal.—Continued.

MEETINGS.

- MONDAY, DECEMBER 1. Royal Institute of British Architects.—Ordinary General Meeting, 8 p.m. Society of Engineers.—Mr. J. F. Andrews on "Ship Classification for Dock Basins and Dry Docks," 7.30 p.m. Society of Arts (Concor Lectures).—Professor Vivian Bell on "Gaseous Humiliants," 8 p.m. Victoria Institute.—Professor Hall, F.R.S., on "The Geology of Egypt," 8 p.m. Clerks of Works' Association (Carpenters' Hall).—Monthly meeting, 8 p.m. Royal Institution.—General monthly meeting, 5 p.m. Liverpool Architectural Society.—Mr. T. Harnett Harrison, F.R.I.B.A., on "House Drainage," 7 p.m. TUESDAY, DECEMBER 2. Institution of Civil Engineers.—(1) Further discussion on the paper by Professor John Milne, F.R.S., and Mr. John McDonald on "The Vibratory Movements of Locomotives," (2) time permitting Mr. F. E. Robertson on "The Sukkur Bridge at Benares," (3) Mr. E. W. Stoney on "The new Chattravati Bridge, Madras Railway," 8 p.m. Society of Biblical Archaeology.—8 p.m. Manchester Architectural Association.—Mr. G. H. Willoughby on "Terra-Cotta: its Advantages Relative to Town and City Buildings," 7.30 p.m. Glasgow Architectural Association.—Mr. W. J. Milligan on "Ornament," 8 p.m. WEDNESDAY, DECEMBER 3. Society of Arts.—Mr. James Drege on "The Chicago Exhibition, 1893," 8 p.m. British Archaeological Association.—(1) "The Epinal Glossary," by Mr. W. de Gray Birch, F.S.A.; (2) "Notices of a Brass recently discovered at Gloucester," by Mr. Cecil Davis, 8 p.m. THURSDAY, DECEMBER 4. Society of Antiquaries.—8.30 p.m. Royal Archaeological Institute.—Three papers, including two by the Rev. Precator Venables.

LONDON.—For the erection of a new police-station, Marylebone, for the Receiver for the Metropolitan Police District. Mr. John Butler, F.R.I.B.A., architect. Quantities by Mr. W. H. Thorp.—

Table with columns for contractor names and amounts. Includes Palsan & Potheringham, Grover & Son, J. & J. Greenwood, etc.

LONDON.—For completing for occupation eighteen dwelling-houses in Glensay road and Chertsey-road, Kilburn, for the Mutual Land and Investment Association, Limited. Mr. Thomas Spink, architect, 25, Charing-cross, S.W.—

Table with columns for contractor names and amounts. Includes W. W. Robinson, B. Weeks, Ludlow.

MILTON.—For alterations and alterations of Union house, for the Guardians. Mr. C. W. Bevan, architect, King's road, Bathurst—

Table with columns for contractor names and amounts. Includes W. Ward, H. W. Lewis, H. F. Boulton, T. W. Quick.

PANTILLAS (Herdorshire).—For new hall at Pantillas, Herdorshire, for Mr. E. Sandeman Lucas. Mr. C. H. Gosnell, architect, Palace-chambers, King street, Herford—

Table with columns for contractor names and amounts. Includes B. Andrews & Son.

RYECROFT (near Newcastle-under-Lyme).—For the extension of schools at Ryecroft, near Newcastle-under-Lyme, for the School Board. Messrs. Chapman & Stamp, architects, Newcastle-under-Lyme—

Table with columns for contractor names and amounts. Includes G. Bloom, S. Wilson, Bradbury Bros.

ST. LEONARD'S-ON-SEA.—For shop front and other buildings at Nos. 20, 26, and 32, Western-road, St. Leonard's, for Mrs. G. J. Mills. Mr. Arthur Wells, architect, Hastings—

Table with columns for contractor names and amounts. Includes H. E. Crutenden, C. E. & E. Harman, T. S. Siler, G. Vigar.

SLEAFORD.—For the erection of engine-sheds and quays at Sleaford, for Messrs. F. & W. Ward & Co. Mr. J. B. Beistead, architect, Sleaford—

Table with columns for contractor names and amounts. Includes Hockley & Son, W. Seddon, Wadley & Son, Buiks & Peck.

SWANSEA.—For laying out from socket-pipes (2,171 yards), together with connection of sluice-valves, hydrants, &c., for the Swansea Rural Sanitary Authority. Mr. J. Thomas, Surveyor, 22, Fisher-street, Swansea. Quantities by Mr. J. Thomas—

Table with columns for contractor names and amounts. Includes Charles Hanney, Frank Thomas.

SWINDON.—For the erection and completion of Westcott School, Swindon. Mr. B. Binyon, architect, Prince's-street, Chelsea, Ipswich—

Table with columns for contractor names and amounts. Includes Clridge & Birkham, G. Jones, W. Samuel, J. H. Collinson, H. J. Kite, Reed, Right, & Co., W. H. Hulse, W. Gibson, G. W. Bisher.

WESTON-SUPER-MARE.—For additions to "Priory Restaurant," Weston-super-Mare. Messrs. Price & Wouler, architects, Waterloo-street, Weston-super-Mare—

Table with columns for contractor names and amounts. Includes Geo. Steere, C. Admitt, The Painter, T. Allen.

SUBSCRIBERS IN LONDON AND THE SUBURBS, by prepaying at the Publishing Office, 19s per annum (or 4s. 6d. per quarter), can ensure receiving "The Builder" by Friday Morning's post.

TERMS OF SUBSCRIPTION. "THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 19s per annum.

### From Athens.

HE work of preserving the Byzantine mosaics in the church at Daphne, near Athens, is now well in hand. Towards the middle of summer Messrs. Salvati & Co., of

Venice, at the request of the Greek Government, sent a competent craftsman to undertake the task of removing the damaged mosaics in the dome, with a view to refixing them in their places when the structure had been made thoroughly secure. A grant of ten thousand drachmas was voted by the Chamber towards the cost of this work. The idea of taking these mosaics to Athens and permanently exhibiting them in the museum there has, we are glad to say, been abandoned, and, acting under the advice of Dr. Dörpfeld, the Director of the German Institute, himself a practical architect, and of a committee of competent persons appointed to confer on the subject, the dome, which is cracked in many places, and quite unsafe, will be taken down and rebuilt on the same lines, and the mosaics refixed exactly in their old places, without being restored in any way. A light iron gallery will be constructed round the dome at the level of the string-course, in order to enable students to get close enough to study their technique. Access to this gallery will be obtained from the later bell-tower on the north side.

The mosaics in question consist of figures, a little over life-size, of sixteen prophets, which have been placed between the windows, and of the large bust of Christ, which here, as in all Byzantine churches of this period, occupies the centre of the dome. This bust of Christ is enclosed in a circle, the outer diameter of which is 15 ft., and the length of the head alone, measured to the point of the beard, is 6 ft. 6 in. The prophets have been very much damaged, and the greater part of some of them is completely gone, whereas the central Christ is almost entire, one corner only having disappeared, but the eyes have been obliterated by the bullets of the Turkish soldiery who, during their occupation of the

monastery at the time of the Greek Revolution, amused themselves by using this head as a target for rifle shots. These soldiers also contributed to spoiling many of the other mosaics by lighting fires in the church, under a mistaken impression as to the nature of the gold cubes, and with the idea that the heat would melt the gold, and make it drop down.

Between the Christ in the centre and the prophets at the sides extends a large field of plain gold cubes which is now being removed in large squares. The Christ will be taken down in one piece and each prophet removed separately. The method employed is to cover the face of the mosaic with a thin coat of plaster of Paris, and on this is glued a stout sheet of canvas. The piece is then gradually detached from the wall by cutting it away from its bedding, and resting it on a wooden frame or stretcher, which is made exactly to fit, and on which it remains, after the whole of the plaster has been cleared away from the back of the cubes, till the wall is ready to receive it again. A new fresh wet cement ground work will then be prepared on the wall, the frame to which the mosaic is fixed will be pressed firmly on to it, so as to let the cement get well into the joints between each cube; it will be left to set hard, and, the frame and coating having been removed, the mosaic picture will be once more exposed, firmly fixed on to the new wall.

No attempt will be made to restore the mosaic, even parts which have gone where the accurate completion of the subject is quite obvious; but it will be possible, provided a good man is employed, to complete in fresco what is wanting in mosaic, and so obtain a better idea of the original *tout ensemble* of the scheme, but this will have to be done very carefully, otherwise it is sure to detract from, rather than add to, the general effect of the whole.

The other mosaics in the church, which are in a more or less insecure state, will also be attended to, and so we may hope to have preserved, for some considerable time, this valuable series of Byzantine mosaics, of probably twelfth-century date, which otherwise would have disappeared in a few years through inattention and neglect.

We may add that the British School at Athens have been fortunate in securing a number of coloured drawings of the most

interesting of these mosaics, made before they were disturbed, and these will form an important item in their series of drawings of the Byzantine architecture of Greece.

The British School is again at work at Megalopolis on the site of the ancient city. These excavations, which were started last spring, were discontinued during the hot months of summer. Operations have, in the meantime, been suspended at the theatre, and attention is at present being directed to the stretch of level ground on the north side of the river Helisson, where the first digging took place in the spring, and which then had to be postponed owing to the disturbance of the standing crops. On account of the continuous and heavy rains very little has yet been done, but the long stoa lying some distance in from the banks of the river, and running east and west, parallel with it, has been uncovered over its whole length, a distance of 500 ft. It has had two rows of columns, the inner ones Ionic and the outer Doric; but only the foundation-stones of the columns are *in situ*, and one or two of the Ionic bases, and two or three courses of the back enclosing wall. Portions of the columns are, however, lying scattered about, but no capitals have yet been unearthed. In the length of the back wall there are two flat recesses, or exedrae, separated from the stoa by triple openings, which in one case has double columns between each bay. This stoa is in all probability the one alluded to by Pausanias as the stoa of Philippos, and which he describes as running along the north side of the Agora.

With regard to the theatre, the General Ephor of Antiquities has stipulated that the entire area of the orchestra and the seats, where in position, shall be completely excavated. Probably few additional facts will be gained from this work, which, on account of the depth of soil to be removed and the distance to which it will have to be taken, will entail a considerable amount of labour and consequent outlay, but it will ensure permanency to what has already been done, and make the general scheme of the theatre apparent to all. Satisfactory arrangements have now been concluded between the School and the Government, which will enable this work to be undertaken in the spring, and it will, when finished, permanently identify the

British School at Athens with the complete excavation of the site of the largest theatre in Greece.

There are prospects that the excavation of Delphi will, after all, be undertaken by the French School. We believe that it has already got a concession from the Greek Government, but the vote of the necessary grant of money to buy up the present village of Castri, which covers the site, has still to pass through the French Chamber. Meanwhile, the recent heavy rains have washed away several of the houses in the village, but doubtless the inhabitants will rebuild them at once in order to secure their rights to compensation when the work goes on.

The German Institute is going to undertake excavations at Magnesia, in Asia Minor. They will be under the immediate charge of Dr. Humann, and Dr. Dörpfeld will visit them at intervals.

Drs. Schliemann and Dörpfeld were at Hisarlik most of the summer. The results of their work have not been published yet, but we understand the topographical researches have been satisfactory, although no important objects have been found.

The Greek Archeological Society are excavating on a site to the west of the Tower of the Winds, and between it and the Roman Agora Gate. They have unearthed a large stoa of Roman times, with plain pillars of the Ionic order, raised two steps above a paved court, which has an open water-channel running round it.\* On the south side the stoa is double, and eleven bays are already visible towards the central court. Next the Tower of the Winds the stoa is single, and only about half of it is yet excavated. In the centre of this side is the Propylæa, with three doors, the cills of which are raised three steps above the level of the stoa. These steps are very much worn, and have been roughly repaired at a later period. On the excavated side of the Propylæa are four small chambers opening on to the stoa, and somewhat similar to those in the Stoa of Hadrian close by. If the Propylæa is situated in the centre of the east side, as one would naturally suppose, there will be eleven bays towards the court on this side also. On the stylobate, between two columns on the south side, are four hemispherical sinkings in the stone. Three of these are of progressive sizes, and the fourth is similar to the largest of the three. They were probably measures of some description. The work of excavation is still being proceeded with.

In the Ceramicus, outside the Dipylon Gate, where the Archeological Society are also digging, some new funeral reliefs have been discovered. Negotiations are still in progress between the Ecclesiastical Synod and the Society regarding the removal of the small church of the Holy Trinity, the existence of which has interrupted the excavations on a portion of the site. This church is not old, and it contains nothing of sufficient interest to warrant its preservation.

The two statues found during the recent excavations by the Government authorities at Rhamnus, in Attica, have been set up in the vestibule of the National Museum at Athens. The one is a female figure of over life-size, and of fourth-century (n.c.) workmanship. It may be a statue of Nemesis, and is by a hitherto-unknown artist, possibly a local man. The other, also a female figure, and probably a portrait, is smaller, and of the Hellenistic period. Neither of them are of great artistic merit or importance, but are interesting because they have been found with their original bases, on which are inscribed the dedicatory inscriptions. The base of the larger one is a shallow square block, with the usual small single moulding of the time resting on a lower plain block of somewhat larger dimensions. The base of the smaller statue is a simple square stone, without mouldings of any kind. In both cases the statues have a solid piece of marble under the

\* These were referred to and partially illustrated in a letter from Professor Aitchison published in this journal a fortnight since.

feet, which is let in to a sinking in the base stone.

Excavations have meanwhile been discontinued at Rhamnus, but they will be resumed in the spring, when the sacred way leading to the sea will be examined.

Steady progress has been made during the summer with the arrangement of the National Museum. Two of the large heads and a portion of the sculptured drapery of one of the figures belonging to the lately found temple statues have been brought from Lykosoura in Arcadia, and are now on view in one of the galleries. One of the magnificent Corinthian capitals of the fourth century (n.c.) from the interior of the Tholos of Polykleitos at Epidauros, and perhaps the finest of all the types of this order, has been brought from the local museum at the site, and set up beside the other sculptures from that place.

The numerous marbles of various kinds which were stored in the vaults at the Varvakeion, where was formerly the museum of the Archeological Society, have now been removed to the National Museum and are being incorporated with the collections there.

The sculpture galleries are being rearranged and many additional objects exposed to view. There is, however, a danger of overcrowding the walls, especially in the hall of later sculpture, which contains many interesting examples of the later Greek and Roman times. Here indifferent Roman busts are being posted about on brackets all over the walls. They had far better be consigned to an obscure position in some subsidiary gallery or corridor, where they would not interfere with other and more important things, and where they could be consulted by those who have need to do so.

The great hall of the funeral stèle is now in complete and permanent order, and three more rooms devoted to additional examples of these will shortly be opened, thus making this collection the finest and most extensive of its kind in existence.

A large number of bronzes and terra cottas have been arranged in two rooms in the right wing of the Museum, and they will before long be also open to public inspection.

Great credit is due to M. Kavvadias, the General Director of Antiquities, and to his assistants, for the untiring energy with which they are devoting themselves to the arduous task of arranging such a vast collection, which is increasing day by day by the addition of new finds from all parts of Greece.

#### NOTES.

N the current number of the *Nineteenth Century* Mr. Frederic Harrison makes what may be called an impassioned appeal for the restoration of the Elgin Marbles to Greece. He does not propose that they should be placed *in situ* on the Parthenon again, which would be in fact impossible, but that they should be placed in a museum at Athens so as to be seen in close contiguity, at all events, with the building to which they belonged. This idea, we know, has been mooted frequently of late years in this country, though not publicly; and under present circumstances there is no doubt a good deal to be said for it. Athens, as Mr. Harrison says, is now a more central archeological school than London; the Athenian atmosphere is no doubt more favourable to their preservation than that of London (if London can be said to have an atmosphere), and no doubt also the Greeks of the present day do value these great records of their past. But there are considerations on the other side which Mr. Harrison entirely ignores. No doubt, if any one at the present day were to pull down and carry off the sculptural work of any ancient architectural monument, there would be a hue and cry raised against him. But what were the circumstances at the time? No authority on the spot cared a rush for the marbles then. Isolated individuals may have done so (according to an instance quoted by

Byron in the notes to "Childe Harold"), though from merely sentimental and patriotic reasons, and without any real knowledge of their artistic value. But at that time the sculptures of the Parthenon were in constant danger from wanton mischief. The Turkish soldiers, it was known, used the figures as marks for shooting at. Mr. Harrison asserts that Byron "did not say a word too much" in his poetic denunciations of Lord Elgin's proceedings. Byron said a great deal too much; he also was entirely ignorant of the artistic value of the sculptures, and careless of it; all he wanted was that, as a matter of sentiment, Athena's shrine should not be despoiled. No one knew their value till they were brought to London, when Fuseli and Haydon were chiefly instrumental in making it known. It is not too much to say that had the sculptures not been then brought to London, the enormous influence which a knowledge of them has exercised on modern sculpture and on our estimate of Greek art would never have come into existence at all. Before the time had arrived when all the educated world learned to take such deep interest in Greek art as it now takes, the sculptures would have suffered far more severely than they have already suffered. Whatever may be said as to the motives of Lord Elgin and the manner in which the "loot" was effected, the fact remains that he practically saved them, and that the English taught the world their value, which their then native possessors knew nothing of. All these considerations ought to be borne in mind in reference to any question of restoring them to Greece; and Mr. Harrison's appeal ignores them all.

**T**HE Mansion House United Association on Railway Rates seems to have an insatiable appetite for "returns." At their meeting last Friday a resolution was passed urging Parliament to require returns from the railway companies showing the rates charged for the conveyance of staple articles of merchandise, and the tonnage of the articles carried at these rates during 1889 between the most important trade centres in the United Kingdom. Seeing that a large proportion of these particular rates would be special ones, we really cannot see that any good purpose would be served were the returns obtained, as they could hardly be of any greater value in the determination of maximum charges than many of the tables of figures already submitted. The Board of Trade have a right to assume that in the course of the long inquiry that they held, the full state of the case was laid before them, and it is extremely doubtful whether they will advise Parliament to demand still further returns. Their own proposals, in spite of the opposition of the railway companies, do not appear to be acceptable to the Mansion House Association. At the meeting referred to it was resolved that in the opinion of that body the proposed classifications and schedules, if authorised, would enable railway companies to increase their charges upon merchandise. This resolution concludes by stating that the increase would be due to a large extent to the charges from station terminals, which the Association does not admit to be legal. Now, although we ourselves have never believed in the legality of these charges under the old law, it seems increasingly evident that Parliament has yielded the point, and that their legislation is now inevitable under the new system. Future effort, therefore, should be in the direction of securing the best possible terms; and, seeing that the Board of Trade have so curtailed the powers sought for by the railway companies as to cause the latter very grave apprehensions, the Board will probably be rather surprised at the attitude of the Association; for they conclude by stating that they are unable to accept the proposals of the Board as being just and reasonable, and will use every means in their power to prevent their authorisation in their present form by Parliament.

AT the meeting of the School Board for London last week the question of employing outside architects in the designing of schools was canvassed at great length. In reference to the difficulty of keeping pace with the demands, an important communication from the Board's Architect, Mr. Bailey, was read, which seems to show conclusively that in some cases at all events delay has arisen from causes outside of the architect's office. "I apprehend," wrote Mr. Bailey, "that my duty, as the Board's Architect, is to build the schools upon the sites acquired and definitely settled on; but until I receive from your land-surveyor a proper site plan, with levels, I am, as a matter of fact, unable to complete my plans." Mr. Bailey then went on to point out that in one case the question of building a school for 800, since increased to 1,000 (thus involving a new type of plan) had been in abeyance from January 1887 to October 1889, though the site had been in possession for years. In the case of four out of fifteen sites in possession, no numbers had yet been settled on, so that he was without instructions. One site is in abeyance, and for another he had no site plan. Mr. Sharp, in the course of discussion, moved that the Works Committee be instructed to have six new schools planned and built under the superintendence of three outside architects. An amendment by the Rev. Copeland Bowie, "that the Board adheres to its present practice of having schools planned by their own office staff," was ultimately carried by twenty-four to thirteen. In the course of the discussion it appeared that some members were of opinion that it was impossible and absurd to maintain their own Architect's department and employ outside architects as well. We do not see that it need be so. The Board's Architect would be in the position of a consulting architect and an authoritative referee as to whether the "outside" plans were satisfactory. There is no doubt a natural feeling that it would be a kind of confession of weakness to give up this system after having carried it out for so long; but the fact remains evident that the Board are putting upon their present Architect, as they did on his predecessor, more work than any one man can properly look after. There appears to have been an idea that school plans should have been duplicated in order to save labour, but Mr. Bailey remarks that the best type of school for duplicating has only recently been erected. We may observe on this head, what Mr. Bailey no doubt knows as well as we do, that duplicating a building for another site than that for which it was designed can never be really satisfactory, as every site has its own special conditions. The proposition is in itself a confession of the unsatisfactory character of the present system.

THE judgment of the Chancellor of Rochester in regard to the question of the peal of bells for St. Peter's, Deptford, is of some importance to those who are concerned in church building. It was claimed on behalf of the bells that the hanging of a peal was intended before the church was consecrated, and was only omitted because the funds for the purpose were not at the time forthcoming. The Chancellor set this aside on the ground that the then parishioners might, if they pleased, have approved the bells, or they might have petitioned the Bishop not to consecrate the church with the bells. He could not legislate in regard to what might have been done under circumstances which had not occurred. Going into the memorials which had been presented on both sides, he found that there were 821 houses in the parish, of which 41 appeared to be empty, and of the remaining 780 it appeared that 212 occupiers were in favour of the bells and 241 against them; the remainder either were neutral or it had not been possible to obtain their views. Taking the area within a furlong of the church, which would naturally be most directly affected by the bells, there appeared to be, out of 248 tenanted houses, 131 occupiers who were against the bells and

only 55 in favour of them; while in the same area 44 persons, owners of long leases of 93 houses, objected to the bells as "calculated materially to lessen the value" of their property. Taking all these considerations into account, the Chancellor refused the faculty. The petitioners, he thought, were seeking what might be called a luxury, the opponents apprehended a nuisance. "If the faculty is refused no parishioner will be the worse; but if the faculty is granted, a great many will be exposed to more or less annoyance." Considering that some people have a passionate love of bells and bell-ringing, it is perhaps hardly fair to say, except in a technical sense, that they would be none the worse for being deprived of them. But the judgment, broadly speaking, seems to have been for the greatest happiness of the greatest number; and the result seems to give prominence to two facts: (1) that a peal of bells is a less popular form of entertainment than it used to be, and (2) that a majority in a neighbourhood who object to the importation of a peal into their midst are very likely to get their own way if they set about it systematically.

AT Berlin, Professor Koch is to have his own "Institute for Purposes of Research," and the sites for this Institute will be given him, not, as first proposed, by the municipal authorities of the capital, but by the Prussian Government. This new Institute will have two distinct divisions, (1) the "bacteriological" and (2) the "clinical" one. For the present, provisional localities will be used, and the plans for such (made with a certain amount of celerity) have already been approved of by the learned Professor. For the purposes of Division I. an old building will be adapted, in which laboratories for analytical, chemical, and microscopic research will be fitted up, a first-class photographic atelier attached, and a number of studies (for both German and non-German medical men visiting the Institute) arranged for. For Division II., a small hospital, with some 130 beds (but with extensive accommodation for doctors and nurses) is to be erected with all modern hygienic conveniences, on the isolated harrack system. Both provisional localities will be situated in close connection with the old State hospital, the "Charité." The total cost is estimated at about 370,000 marks.

DR. BALLARD'S Report to the Local Government Board\* on a special prevalence of enteric fever during recent years in Chester contains some important and interesting information as to the possible part played by the river Dee in relation to the sewerage of the city. From the Report, which is a long one, we extract the following passage:—

"Between the ancient city and Handbridge there is a bridge over the Dee, and at about this spot there is a 'causeway or weir' constructed to dam back the waters of the river for the use of some mills in this situation. At ordinary times the tide only rises as far as this weir, but at spring tides the tidal flow surmounts the causeway, and then the river is tidal for at least fourteen miles above it. About these tides and the condition of the river below the causeway something more requires to be said. The Dee is one of the few English tidal rivers in which the spring tides rise rapidly with a 'bore' or wave. In the Dee this is about 3 ft. 6 in. high, and it sweeps up and only about an hour and twenty minutes before high water. This, then, is the time which elapses between low and high water in the Dee at Chester. The wave sweeps before it, in its first rush, all movable deposits in the bed and on the banks of the stream. The first rush does not overtop the causeway, but in a short time the rising tide does so, and the tidal water carries with it much of the fouling material which the 'bore' wave had swept before it up to the weir. I am informed by Mr. Enfield Taylor, C.E., who for the last twenty years has been observing the condition of the Dee, that at high spring tides the water below the weir runs up at the rate of from 5 to 7 miles an hour; above the weir, however, it is somewhat slower in its rise. The rate of fall of the

tide above the weir is only about one mile in three hours. Another matter that must be mentioned is that the river below Chester has, from very many years of neglect, become to a great extent silted up by deposit of sand in banks. Passing down the river from Chester the first considerable sand-bank, which renders the river shallow, is met with a short distance on the Chester side of a bend of the river at Saltney. At this spot, on June 15, I measured the depth of water over the bank, and found it only 4 ft. I was informed by fishermen that it was sometimes even less, and that at times they had seen the sand bank exposed. Above this bank, or between this spot and the weir, the water is fairly deep, even at low water. Between the time of low water and the time when the tide begins to rise the water between these places is nearly stagnant. It is into this section of the river that the sewage flows continually from all the southern part of the borough except Saltney (the sewage of which village is discharged a little lower down, but is necessarily washed up by the 'bore'), and into this section also is discharged, at certain intervals, the effluent of the sewage works on the northern side."

In a subsequent portion of the report we again come on the difficulty of midden-privies, and the unwillingness of the owners to incur any expense in having them emptied—

"The Sanitary authority undertake the removal of the contents of both privies and ash-pits on request, but they charge the householders with the cost of the work. The cost varies with the quantity of material to be removed, from 1s. 6d. to 3s. or 4s., and in some instances to a very much larger sum. The result is that the poorer inhabitants of houses, who can ill afford these charges, delay the cleaning of both privies and ash-pits as long as they possibly can, especially where the filth has to be carried through the house; and it is in the case of these poor people, whose privies and ash-pits are the nearest to their houses, that the retention of this filth is most dangerous. Removal, in some instances, I found neglected for six or seven months."

How can it be expected to be otherwise, when uneducated and poor persons are allowed the option of deferring an operation for which they have to pay money? Of course they do it as seldom as possible, to the detriment of the community as well as themselves. The removal, whether charged to them or not, should in their own interests and in those of public health be compulsory.

A REPORT by Dr. Parsons, to the Local Government Board on an epidemic of pneumonia at Scotter, Lincolnshire, and in the neighbouring places, seems to refer the disease to what may be called biological rather than insidious influences. The report includes, however, a statement from the local surgeon, Mr. Frankland Eminson, in which insidious conditions are regarded as the cause of the commencement and spread of the disease: and we observe that Dr. Parsons himself, though differing from Mr. Eminson's view generally, admits some statements which seem to support it: e.g.:

"The western end of the village street is drained by two sewers, which discharge into the 'parish ditch,' a water-course which finds its way into the river Eau. Comparatively few of the houses at this end of the village are connected with the public sewers, those on the north side of the road draining separately, or two or three by a joint outlet, direct into the 'parish ditch.' The house drains in this part of the village are of very rough construction, being made of field tiles, or of brick, with rough untrapped inlets. Some of the inlets are large, square, brick catchpits, locally called 'cesspools'; others are furnished with cast-iron 'D traps,' generally loose and non-efficient. The house-drains in the south end of the village are described as having been formerly of similar character (some seem were so still), but considerable improvements have been effected by the Sanitary Authority in the drainage of this portion of the village since the occurrence of the epidemic, and many of the old inlets have been replaced by earthenware trapped gullies. The inlets are usually at some little distance from the houses; in one instance in Scotter was one found indoors; this was in the workshop occupied by a man who had died of pneumonia. . . . The water supply is obtained from shallow wells; in the lower part of the village the water level is not more than 2 ft. or 3 ft. below the surface. The wells are stoned only with loose masonry, and many of them are near to privies, farmyards, leaky drains, and such like sources of contamination."

IN the last number of *The Lancet*, Mr. A. L. Griffith, in a letter headed "Diphtheria in Kensal Town," makes some

\* Eyre & Spottiswoode; Adam and Charles Black, Edinburgh; Hodges, Figgis, & Co., Dublin.

very strong remarks as to the close, he even seems to imply, the necessary connexion of diphtheria with bad drainage. "Until diphtheria makes its appearance," he says, "there is no suspicion of imperfect drainage; but once established drains may be found faulty" ("will he" is perhaps rather what is meant). He then gives the following case from his own practice:—

"About five years ago I was called in to attend a family of six children and two adults. They lived in two upper rooms of a house, using the back one principally for the children. They had always noticed a very unpleasant smell in this room. The first child attacked was the worst case of diphtheria I ever saw. . . . Half of the children had this disease, the other half had scarlatina; the mother also had a bad throat, and aborted; she was kept in the front room. The whole family recovered. I suspected the drains, my theory being that the warm air of the back room drew the foul air from the drain up the stack-pipe of the wash house along the gutter into the window. The drains were examined, and found to be improperly trapped, and the connexion with the sewer imperfect; this was at once made good, and all smells were removed."

In regard to a theory set forth by another correspondent in *The Lancet*, that the disease is due to damp, Mr. Griffith thinks that there may be a great deal of truth in this. Of course, it may be added, defective drainage often causes damp in the foundation of a house as a concomitant evil.

THE recent "cold snap," to use an American expression, has drawn the attention of many persons to weak places in their houses. For, unfortunately, the ordinary builder's ordinary house is suited only for temperate weather. As soon as a hot midsummer day comes it is impossible to be cool in it. When a sharp frost arrives everyone is shivering. There are, indeed, some points in which householders are themselves to blame. Shutters, in many persons' opinion are not needed, whereas they will keep out too glaring a sun in summer and too keen a frost in winter. Again, too, when persons have a fairly well-built house erected for them, they too often oblige the architect to put in such things as windows opening to the ground, with which no room can be warm in winter. Again, how seldom also do we see double windows or an extra window put up in winter as in Germany and France? The fact is, the so-called practical Briton is the most careless of men in regard to his house, and puts up with all sorts of inconveniences as if it was impossible to prevent them.

THE project to make a line through St. John's Wood appears likely to meet with opposition. The Manchester and Sheffield Railway Company desire, it seems, to make an open cutting through Lord's Cricket Ground. Probably they have no real desire to do this, but by asking for much they may obtain less, since Parliamentary applications are conducted somewhat on a bargaining principle. If the terminus were placed near the Marylebone-road, and the line taken under St. John's Wood through a tunnel, the inconvenience to the district would be reduced to a minimum.

ONE of the central points in the winter exhibition of sketches and studies at the Society of Water-colours Gallery (opened this week) is a study by Mr. Holman Hunt for a rather mystical subject from an "Early English Poem" (303), a study made out in white lines and touches on a grey paper. It is very conventional and medieval in character, looking like a cartoon for stained glass, but is a remarkable work of its kind. Many of the exhibits are, as usual, finished drawings and not sketches or studies, including Mr. Tom Lloyd's "First Breath of Autumn" (13), a Thames-side scene with a very big dog and a very tall young lady looking out of a gate; Mr. C. Robertson's "Loot" (46), a large Arab interior with a number of figures; and Mrs. Allingham's

various beautiful little works, which are not finished as usual, the most beautiful perhaps being "Farringford Dairy, Freshwater" (168). If it be said that such exquisitely refined rustic figures are not often met with in real life, the more thanks to Mrs. Allingham for inventing them. Among fine works which belong more to the "sketch and study" order may be mentioned Mr. Hunt's "Warkworth—Sunlit Shower" (161), perhaps a little too vague in the attempt to give the blotted effect of landscape seen through a shower; Mr. Colin B. Phillip's "Great Landslip, Loch Ridden" (91); Mr. R. W. Allan's "Kirchweih" (19) and "A Scotch Washing" (33); Mr. J. Parker's "Poppies" (98), a lovely study of a girl; Mr. Eyre Walker's "Old Farmstead" (109); Mr. David Murray's "Mid-day" (193); Mr. Albert Goodwin's "Ponte Vecchio, Florence" (243), a study of night effect; and Mr. Charles Robertson's "The House-tops, Damascus" (337), a study of an Oriental city from a new point of view. "Mr. Goodwin's "Afterglow in the Mediterranean" (185), a very large work, is powerful enough in the effect of sky and sunset light, but the sea is hardly a success. The same artist sends a beautiful little study of "Maidstone" (20). One corner of the room is occupied by a selection of the works of the late Mr. Arthur Glennie, who has long contributed studies of ancient Rome and its neighbourhood to the Society's exhibitions. Mr. Glennie drew ancient architecture admirably, and the collection of drawings shown here, though a little hard and antiquated in style, are of great interest as refined and faithful representations of the localities and monuments illustrated.

A GOOD deal has been said lately as to the desirability of architects becoming practised in modelling, and it will be of interest to those who sympathise with this view to hear that Mr. Conrad Dressler, the well-known sculptor, has opened evening modelling classes at his studio for the especial use of architects and painters. No one could be more capable of giving instruction in this class of work than Mr. Dressler, who, as some of our readers are aware, has devoted a good deal of attention to the modelling of decorative work.\*

#### LETTER FROM PARIS.

A GREAT deal of feeling has been aroused in the artistic world by the sudden dismissal from his position of M. Coquart, for many years architect to the Ecole des Beaux-Arts and the Cour de Cassation. This step has been taken suddenly and without notice by M. Yves Guyot, Ministre des Travaux Publics, who holds also in his hands the direction des Bâtimens civils. The excuse for this high-handed measure is apparently that M. Coquart has exceeded the expenditure intended on the Cour de Cassation, and has been too dilatory in the forwarding of the work for the enlargement of the Ecole des Beaux-Arts. The decision is regarded here as a most unjust one, and the manner in which it has been carried out, without warning or without any opportunity for the architect to justify his procedure, causes a general anxiety as to the whole position of architects under the present Government. In regard to the Cour de Cassation, the Grande Salle d'Audience, the decoration of which is carried out in a most elaborate manner and with a great amount of gilding, has after all only cost 25,000 francs, or 45 francs per square metre, which can hardly be considered an extravagant sum for work of that importance. In regard to the Ecole des Beaux-Arts, M. Coquart had transformed the Hôtel de Chimay, bought for the purpose of enlarging the Ecole, and utilised the existing materials in such a manner as to realise a very considerable economy in the work in comparison with what had been expected. M. Coquart has lived the life of an artist devoted to his art, and has amassed no fortune out of his professional labours, a circumstance which renders the blow

\* Particulars can be obtained from Mr. Dressler at his studio, 36c, Giebe-place, Chelsea.

all the heavier to him. The Parisian press in general has sided strongly with him, and the pupils of the Ecole des Beaux-Arts, in conjunction with the members of the Institut (of which M. Coquart is also a member), have addressed a strong remonstrance to the Government against this procedure. The Association of "Architectes Diplômés du Gouvernement" have addressed to M. Coquart the following letter:—

"Chor et éminent confrère  
La mesure qui vient d'être prise à votre égard nous a doublement émus, car elle frappe à la fois l'artiste et le membre de notre Association.  
Sans perdre absolument l'espoir de vous voir terminer votre œuvre, permettez nous, cher maître, de vous adresser nos sincères et profonds regrets, ainsi que l'expression de notre respectueuse sympathie."

Here follow the signatures. The letter expresses the general feeling in the artistic world in regard to this step. As matters now stand, however, M. Louis Bernier, architect (a former holder of the Prix de Rome) has been named to replace M. Coquart at the Ecole des Beaux-Arts, and the continuation of the work at the Cour de Cassation is notified as entrusted to M. Paul Blondel.

While M. Yves Guyot has been, so to speak, sentencing M. Coquart to execution, his colleague of the Ministère de l'Instruction Publique, M. Bourgeois, has been occupied in dealing somewhat severely with the "joyusetés" of the pupils of the Atelier Bonnat at the Ecole des Beaux-Arts. We have before suggested (in referring to the question of the admission of female students to the Ecole), that the manners of the ateliers were not quite perfect. The youthful mob of students gathered together here affect a licence of behaviour which, to say the least, is hardly in accordance with the standard of manners of the present day. In particular they have adopted in full force the system of "Brimades," so much practised in the French regiments, and against which a special interdiction has been made at the military school of St. Cyr. The word "Brimade," which has probably no equivalent in English,\* signifies a systematic series of vexations to which new comers are subjected, and which too often pass quite beyond the reasonable limits of joking. On this occasion the "Brimade" degenerated into a furious fight in downright earnest, leading to serious injuries. Several pupils have been sent away from the schools as a disciplinary measure; the Atelier Bonnat has been closed, and the seventy-three pupils who were members of it have been deprived of the benefit of State instruction for three months. It is generally considered that the Government have been right in interfering, and that the thing had gone too far to be any longer overlooked.

The affair has been made an occasion, on the part of the Conseil Supérieur de l'Ecole, for examining into the conditions on which students are admitted into the different ateliers. As a matter of fact, every head of an atelier admits whom he will and how he will, without any pre-arranged conditions. The so-called State ateliers are therefore, in actual fact, only private ateliers established in a State building, except that the instructions are gratuitous. This is considered an anomaly, which the Conseil Supérieur intends to put an end to in future by requiring that every pupil should be admitted by the central authority of the Ecole. The ways and means for operating this alteration will be considered shortly.

Other reforms are in the air. The recent discussion of the Beaux-Arts budget has attracted special attention to the present tendencies of the Ecole, and it is probable that there will soon be important modifications in the manner of Government intervention in the artistic education of the French nation. That is at least the conclusion to be derived from certain speeches in the Chamber of Deputies, in the course of which the Ministre de l'Instruction Publique observed that "there ought not either to be a State art or a State taste," and that the business of the State was to go wherever there was real talent, without any question of schools of teaching; a principle the general truth of which will hardly be contested.

\* We believe the word has no equivalent in English; but if our Paris correspondent got hold of some of the private annals, say of an English cavalry regiment, or of some of the reminiscences of Woolwich students, he would probably find that the thing is. It is very well understood in England. Among our young men, however, it is considered a point of honour never to lose temper over these little amusements.—Ed.

In the last competitions in the *École des Beaux-Arts* the subject given in historical architecture was the reconstruction of an ancient Persian palace; the jury awarded a second medal only, to M. Mars, pupil of M. Lalou.

Since our last letter the competition for the decoration of the *Galerie Lobau* at the *Hôtel de Ville* has been decided. Out of seventy-five competitors the jury selected five who are to submit, in a few months, a portion of their respective designs of the size intended for execution. The five chosen are M. Bourreau (painter), M. Espony (architect), M. Guillaume (painter), M. Moreau Neret (painter) in collaboration with M. Noël Bontou (architect), and M. Picard (painter) in collaboration with M. Risler (architect). In order to facilitate this second competition, the *Service des Beaux-Arts* has had constructed large models of one cupola, one of which will be put at the disposal of each of the competitors, who will thus find their work much simplified.

To the *Galerie Lobau* competition has just succeeded, at the *Hôtel de Ville*, that which the "Société Française des Habitations à Bon Marché" has opened for studies of lodgings-houses and workmen's cottages of various types to be erected at St. Denis, on an irregular piece of ground near the "Nord" railway line. Among the forty-eight schemes submitted, very few show any remarkable novelty. Most of them are only repetitions of commonplace forms of structure resembling barracks, and where many families are crowded into one block in a manner by no means favourable to healthy conditions. One project only, No. 35, seems to realise any improvements worth speaking of. It includes various types of habitation, with one fairly picturesque style of architecture pervading them; it is well laid out and with an abundant distribution of water. The total effect of this design contrasts agreeably with the monotony of the work of the others. The decision on the competition will be made some time during the present month.

Public works have been nearly stopped the last few days by the exceptionally cold weather. This has also necessitated some delay in the work of exhuming the ancient arena in the *Rue Monge*, which M. Juste Lisch had been carrying out actively. All the side of the arena facing *Rue de Navarre* has now been uncovered and restored, and at the first fine weather M. Alphonse's gardeners will appear on the scene and transform this curious vestige of ancient *Lutetia* into an ornamental square. The municipal administration proposes to provide a small museum on the site, in which will be placed various antiquities discovered in or near the site, including fragments of sculpture, coins, jewels, pottery, and even some skeletons discovered in *Gallerie-Roman* sepulchres.

While preserving the remains of ancient sculpture, the authorities have also been turning their attention to the preservation of some modern sepulchral monuments. The cemeteries of Paris are full of monuments to illustrious personages, many of which are works of art of great interest, which have suffered greatly from time and from want of proper care. M. Havard, *Inspecteur des Beaux-Arts*, has been struck with the melancholy condition of many of these monuments, and has expressed the opinion that it is the duty of the State to take under its charge the repair and conservation of these monuments. He suggests that the *Commission des Monuments Historiques* should classify them, and that an annual sum of 10,000 francs should be placed to the credit of the *Ministère de l'Instruction Publique* to be employed in their preservation and repair. The idea has received much support in artistic circles, and it seems not improbable that it may be seriously taken up.

There is much talk about again enlarging the *Luxembourg Museum*, which is still too small for its purpose. This enlargement would necessitate the construction of a new gallery which would be projected from the central block of the building and abut on the grille of the *Rue Vaugirard*. In this way the *Museum* would form three blocks surrounding an interior court which would permit of the exhibition of a certain number of works of sculpture. There is also talk (for the twentieth time at least) of the completion of the *Boulevard Hansmann*, and the *Municipal Council* will probably be presented presently with financial proposals in regard to this often-discussed and long-deferred project.

We have to record the death, a few days

since, of M. John Lewis Brown, a painter whose talents were well-known in London as well as in Paris. He was born at Bordeaux in 1829. He first became known for his studies of horses and dogs, for military subjects and sporting scenes, and latterly had given himself more to the latter class of subjects than to any other. He went through a steady course of study of the horse at the "École des Haras" at Pin (Calvados), and subsequently established himself at Bordeaux in 1859, but his success in various exhibitions led him to come to Paris. His works are very numerous, and distinguished by a fine sense of colour and great power of drawing. Scarcely any exhibition in Paris of late years was without examples of his work, whether in water-colours, pastels, or etchings, besides his numerous oil paintings. He obtained medals in 1865, 1866, and 1867; and the *Cross of the Legion of Honour* in 1870. He exhibited four works at the *Great Exhibition of 1889*, and a small collection of his pictures formed a striking group in the "Salon Meissonier" of this year. He died after a long and painful illness, much regretted by all who knew him.

We have also to record the death of M. Léon Rivière, expert of the *Tribunal de la Seine*, and architect of the *Crédit Foncier de France*. He died at Paris at the age of seventy-six.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE third ordinary general meeting of this Institute for the present session was held on Monday evening at No. 9, Conduit-street, Regent-street, Mr. Alfred Waterhouse, R.A., the President, in the chair.

The Recent Examinations.

The Secretary announced that the following gentlemen had passed the Preliminary Examination, and had thereby become Probationers of the Institute:—

Messrs.: Frederick John Almond, Manchester; Henry Victor Ashley, Woodside Park, N.; Raymond Turner Barker, Southgate; Ralph Waldo Beddingfield, Leicester; Thomas Percy Bennett, Manchester; Percival Chery Blow, St. Albans; Cecil Claude Brewer, Watford; Albert Thomas Butler, Dudley; George Edward Gay, Warrington; Frederic Wykeham Chancellor, Finsbury-circus; Henry James Cooper, Leicester; John Marie Craun, Dublin; Harry Bulkeley Creswell, Denbigh-place, W.C.; Edward Cruikshank, Bloomsbury-square; Ernest Rouben Orton Davis, Leicester; Thomas Denton-Brooks, South Elmstall, near Doncaster; Charles Frank Dewitt, Finsbury-circus; Claude Henry Dorman, Northampton; John William Fair, Manchester; Thomas Speirs Fraser, Glasgow; Richard Frank Freeman, Bolton-le-Moors; Thomas Wallis Gordon, Nottingham; George Gregory, jun., Stonehaven, N.B.; Herbert Wilcox Hare, Manchester; William Arthur Lionel Hill, Derby; David Horn, Hampstead; Franklin Kaye Kendall, Blackheath; Harold Clapham Lander, Tunbridge Wells; William Langley, Leicester; Herbert Henry Law, Northampton; John Bowmer Mason, Derby; Percy Matthews, Crouch-hill; William Allen Maylett, Worcester; Thomas Clewshaw Mayor, Manchester; Arthur Ernest McLewin, Handsword; William David McLennan, Paisley; Percy William Meredith, Bideford; Thomas Anderson Moodie, Glasgow; Lionel Forster Morris, Kentish Town; Wilfrid Rowland Mosley, Derby; Charles Frederick Newcombe, Newcastle-on-Tyne; Robert Orr, Scarborough; George William Phillips, Peterborough; Francis John Potter, Hampstead; Andrew Macdonald Poynter, Albert Gate; Orlando Edmund Thomas Prescott, Southport; Roland Rich, Newcastle-on-Tyne; Herbert Cyril Simott, Westbury-on-Trym; Thomas Arthur Sladdin, Haverstock-hill; John Elliott Smales, King's Langley; Osgeod Smith, Crouch-hill; John Charles Southcombe, Arlington, near Barnstable; Arthur John Steadman, Farnham, Surrey; Isaac Taylor, Manchester; Abol Sabban Toke, Cluswick; Bernard Hugh Webb, Hampstead; and Emil Fitzwalter Wren, Powis-square, W.

The following gentlemen were reported as having passed the Examination for the Association held last week, viz.:—

Bartlett, Arthur Edward, Blyth-road, W.  
Conner, William Tai, Glasgow.  
Flower, Arthur Symth, Staubone-gardens.  
Gambie, Henry Gilbert, Highgate.  
Glazier, Richard, Manchester.  
Greenaway, Francis Hugh, Elgin-crescent.  
Howell, William Roland, Reading.  
Hutchinson, Christopher Bernard, Kensington.  
Jackson, Arthur Bloomfield, Mecklenburgh-square.  
Jefferson, John England, Stroud Green.  
Jones, George Sydney, Sydney.  
Mitchell-Withers, John

Brightmore, jun., Sheffield.  
Musto, Frederick, Leeds.  
Pegz, Hallam Carter, Nottingham.  
Pite, William Alfred, Bloomsbury-square.  
Porter, Horatio, M.A., Russell-square.  
Pratt, Robert Bailie, Brecknock-road.  
Rogers, Henry Cornwallis, Gerald-road, S.W.  
Smith, Walter Henry, Maidstone.  
Strange, Charles Hilbert, Stoke-Newington.  
Sutcliffe, George Estar, Heptonstall, *via* Manchester.  
Wigglesworth, Herbert Harley, Aberdeen.  
Williams, Frederick Ernest, Osalow-gardens.  
Womacott, Ernest Wm., Malpas, Bishop's-road, W.  
Young, Vivian Edward, 53, Ennismore-gardens, S.W.

The Asphitel Prize (it was announced) has been awarded to Mr. F. William Bedford, formerly of Leeds, aged twenty-two years.

The Royal Gold Medal, 1891.

The Chairman announced that, on February 2, the name of the person who is considered by the Council the fitting recipient of the Royal Gold Medal for 1891 will be announced. Any member of the Institute desirous of sending in any name is requested to do so before January 1.

The Architectural Association.

The President then said he had learned from sources which he need not particularise that the references he made to the work of the Architectural Association in his presidential address at the opening meeting of the session had left an unfavourable impression on the minds of some who were deeply interested in the welfare of both the senior and the junior bodies of their profession. His words, of which the chief complaint was made, were:—

"The educational work done by the Association does not appear from the statistics with which I am furnished to afford any great material assistance to the Institute."

and he had been asked to show from the returns of one whole year what was the proportion of members of the Association who passed the examinations in architecture, which he had great pleasure in doing. During the current year, 1890, two examinations to qualify for candidature as Associates had been held in London, at which 51 candidates had passed. They had come up obviously under the old arrangement, none of them having passed either a preliminary or an intermediate examination, and there had been no candidates for this qualifying examination at any non-metropolitan centre. Of the 51 who passed in London 32, he understood, and it gave him great pleasure to have to say so,—were members of the Association, and most of the 32 were London men, but he thought they were justified in asking whether they owed their successes to attendance in the classes of the Association, for the President of the Association, in his address of 1889, asked "How it is that when a member wishes to go up for the Institute examinations we find that, instead of availing himself of the opportunities afforded him in the Association, he goes to a private institution to obtain the instruction he requires?" And again, in his address of this year, he said he did not think "a student who confined himself to attending classes at the Association would stand much chance of passing the Institute examinations." Such an opinion expressed by a gentleman who must be thoroughly conversant with the facts of this important subject, and the statistics with which he (the President) was furnished by the Secretary of the Institute, seemed to him to justify the doubts expressed in his address. Undoubtedly, while there was only one examination the Institute obtained a large proportion of its recruits from among the members of the Association, but the establishment of the progressive examinations already appeared to him to have effected a change in this respect, as he then stated, and as he would now show from details prepared for him of the three preliminary examinations already held in London and other parts of the United Kingdom. Up to the present 196 probationers had been registered, of whom 44 or 46 were now members of the Association, but at the time of their application, as was natural, only about 26 out of the 196 were members of the Association, although 75 out of the 196 came from London and its neighbourhood. Of the 32 gentlemen from London and neighbourhood who passed in November, 1889, only 10 were members of the Association; of the 23 who passed in March last, only 10 were members; and of the 20 who passed this November,

only 6 were members. Further, not one of the 10 probationers registered in 1889, who were also members of the Association, helped to compose the 8 who were admitted to the first intermediate examination held in November, 1890. On the other hand, in the space of twelve months, some 20 gentlemen, after admission to the Probationers' examination, had joined the ranks of the Association; and he sincerely trusted that the majority of their 46 Probationers who belonged to the Association would make a good show at the intermediate examinations to be held in November of next year and in March, 1892. It might be interesting to add that, of the 196 probationers, 89 were declared exempt from examination, 63 were examined in London, 3 in Dublin, 3 in Glasgow, 12 in Bristol, and 26 in Manchester, and he thought it was impossible to estimate too highly the debt of gratitude owing to most of their allied societies for their disinterested labours on this and previous occasions. But, to return to the Association, though he felt bound to give these statistics in answer to certain criticisms on his address, he wished it to be distinctly understood that he did not in his remarks wish to imply anything prejudicial to the Association. Though he never had the advantage of being a student within its ranks, he had been a member for many years. He had always upheld its advantages, and if he spoke plainly the other night it was out of real interest in its welfare, and not out of any antagonistic feeling whatever. He wished the Association to seriously consider its position with regard to the Institute, and thought he could best express his wish by calling attention to what he believed to be the facts of the case.

Mr. H. C. Brodie suggested that a letter by Mr. Owen Fleming, containing statistics regarding examinations published that day in *A. A. Notes* should be republished in the *Journal* of the Institute.

The President replied that if possible the editors of the *Journal* would reprint the letter.

#### Sassanian Architecture.

Mr. R. Phené Spiers then read a paper on "Sassanian Architecture," of which the following is an abstract:—

Mr. Spiers commenced by stating that the recent edition of two works,—"L'Art Antique de la Perse," by M. Dieulafoy, and the "Histoire de l'Art dans l'Antiquité," vol. v., by MM. Perrot and Chipiez,—both of which added to the scanty knowledge we possessed of the architecture of the Sassanian Dynasty (A.D. 226-636), had suggested this subject as one likely to interest the Institute; for though that dynasty had endured but little more than 400 years, the architects and artists of the period had developed a characteristically marked style from a constructional point of view. But the style had, in Mr. Spiers's opinion, other claims to consideration, as it seemed to form a connecting link between Assyrian and Babylonian architecture on the one hand, and Byzantine work on the other,—of retrospective value, if the vaults of Al Hadhr, Serhistan, and Firouzabad represented the traditional method of such coverings handed down from Assyrian times, and of prospective value in regard to Byzantine work, provided that the dates given to Serhistan (about A.D. 350), and Firouzabad (about A.D. 450), were correct. The earliest building classed as Sassanian by Fergusson was the Palace of Hatra, now called Al Hadhr, respecting which little was known beyond the information communicated to the Institute in 1846 by Mr. (now Sir) A. H. Layard. There were further accounts of the ruins given by the late Dr. Ross, the surgeon of the British Residency at Baghdad, in the 9th volume of the *Journal of the Royal Geographical Society*, and by Mr. Ainsworth, in the 11th volume of the same *Journal*, though for a general description of the city, members were referred to the MS. Essay by Sir H. Layard in the Institute Library. Two of the great halls of Al Hadhr measured about 95 ft. by 42 ft., or 46 ft., and the third 60 ft. by 65 ft., and their vaults which had fallen in were said to be semicircular, though the Sassanian vaults were usually elliptical. Their doorways were, however, invariably circular-headed. Certain of the vousoirs of the arches were enriched with sculptured heads, and the entrance doorways to the smaller halls had heads with curly bagwigs, such as were found on Parthian coins, on every vousoir. As regarded the form of the vaults, the elliptical, or three-centred curve, was that used at Serhistan and Firouzabad, and as

a matter of fact that form of arch in brick construction was one of the earliest known, for the vaulted granaries behind the Hamession of Thebes in Egypt were of the same elliptical form as those found in Persia.

The possibility that the palace owed its erection to Parthian rather than Sassanian architects, had been suggested in Professor Rawlinson's "Sixth Great Oriental Monarchy," for when the city was besieged by Trajan in A.D. 116, it contained a Temple of the Sun, which was probably the square building at the back of the palace, containing a frieze above the doorway, ornamented with the head of the Sun-God, with crescents to represent the moon on either side, and, among other emblems, winged griffins. These last were precisely similar to a griffin found at Warka (the ancient Erech), in the south of Mesopotamia, 250 miles south of Al Hadhr, and described in the work on Chaldaea by Loftus, who therein gave drawings of various objects discovered at Warka, of the same type as that shown in Sir H. Layard's sketches, viz., Syro-Greek, a style which distinguished all Eastern work of that period. The second building mentioned by Fergusson was the so-called Palace of Tigranes, now the Great Mosque at Diabekr, which seemed to have been built up of materials taken from some earlier building, while the ornament, which resembled that found by Loftus at Warka, seemed to be Parthian in style. The next example quoted by Fergusson, the Palace of Serhistan, seemed to Mr. Spiers to be the first genuine Sassanian building, and in design and construction it appeared to be the outcome of many experiments made in earlier buildings no longer existing, or not yet discovered. The halls, which were about 26 ft. wide, were covered with elliptical barrel vaults, traces of which were to be seen on an end wall.

Next, there was the Palace of Firouzabad (A.D. 450), which had a frontage of about 170 ft., and a depth of about 320 ft. The entrance consisted of a hall 90 ft. in depth, nearly 40 ft. wide, covered with an elliptical barrel vault. Other halls were on either side, and beyond were three halls were on either side, vaulted with a dome on each side by side, each consisted of a series of concentric arches advancing one over the other and displaying increased scientific knowledge, whereby the Sassanian architect did away with centring altogether, each superimposed ring being carried back on the top of such ring beneath, and resting on it. Another palace, distant about thirty miles from Baghdad, that of Ctesiphon, on the Tigris (about A.D. 500), which was known to have been built by Chosroes I., formed a rectangular block 312 ft. by 170 ft., and about 110 ft. high. In the centre of the front a magnificent portal,\* which rose to the full height of the building, gave access to a hall, 163 ft. deep by 83 ft. wide, covered with an elliptical barrel-vault, 95 ft. from the ground to the crown of the vault, and 67 ft. from the ground to the springing of the vault. The bricks or tiles with which it was built were laid fatwise, as in the granaries at Thebes. The remains of two other palaces had been found in Persia, one at Immuzak which consisted of a dome on arches, and a second, called the Tag-Eiran, recently discovered by M. Dieulafoy, the hall of which showed a considerable advance in construction, as it was lighted by clearstory windows between the barrel-vaults. These vaults were composed virtually of a series of transverse arches, the interspaces being vaulted across in a most scientific manner. Two other Sassanian buildings remained to be mentioned, which were remarkable for their decoration rather than their construction, namely, the Palace at Mashita, and the Hall at Rabbath-Ammon, both in Moab. They were supposed to have been erected under Chosroes II. by Syro-Greek artists, and they were enriched with ornament derived from Hebrew monuments, interspersed with Persian figures and Sassanian decorative details.

Mr. W. Simpson, R.L., Hon. Associate, expressed great satisfaction at Mr. Spiers's paper, which brought together the main points of the Old Sassanian Architecture, and had exhausted almost all that was known of the subject. Architectural students were tending more east-

ward in their researches, so that men, who had the time and means, were wanted to explore for architectural remains, and he felt sure, if the teachers at the Universities could be influenced to so direct the thoughts of young men, that valuable results would follow. Major the Hon. M. G. Talbot, R.E., of the Survey Dept., attached to the Afghan Boundary Commission, had made plans and sections of some rock-cut caves found by him at a place called Haibak, not far from the ancient Balkh. Among them were a number of domes, which, although excavated, were copies of structural domes, and similar in shape to the Sassanian ones. The sectional outline of one tall oval dome was almost the same as that of the great arch at Ctesiphon. These caves showed that the Sassanian style existed over a much wider area than the Mesopotamian Valley. Poetry, architecture, art, and science generally had once been in the most flourishing condition in Khorassan and the countries round it, and it was quite possible that the art of the Sassanians came from that region. In Persia, where wood was scarce, vaulted roofs and domes were the rule. Central Asia must have been, he considered, in a similar condition, and, having seen how easily simple villagers constructed vaults and domes without centres, it appeared to him that in all probability such roofs had been used in those regions from very early times. The Euphrates valley had also been rather destitute of wood, which he thought accounted for the vaulted roof being used in that region; and it might be assumed that from Mesopotamia to the ancient Balkh and Samarkand the vault and dome existed from the earliest period of civilisation. Professor Baldwin Brown, in Vol. V. of the "Transactions," gave a reference, showing that ancient Alexandria had been built on vaults. The vault seemed to have existed far more widely than had been previously realised; it had been a sub-structure only wanting the necessity, or occasion, to bring it above ground as a superstructure. In the domes and vaults now built in Persia, the bricks were placed in a sloping position, as described by Mr. Spiers, so as to rest partly on one another, which no doubt largely helped to do without centres. He supposed lightness was the object of the use of pots in domes; the Persians in building a mud wall made square hollow bricks, to which they gave the term "Sanduk," which meant a box, and these they placed on the top courses for lightness. Mr. Simpson concluded by proposing a vote of thanks to Mr. Spiers for his paper.

Mr. Alma Tadema, R.A., in seconding the motion, said he was sorry he attended the meetings of the Institute so seldom, because when he did so he always learnt a great deal. As far as the paper was concerned, he could only repeat what Mr. Simpson had said, that it was learnedly wrought out. It had caused him to think particularly of the old question of the arch and the dome with reference to which he was rapped over the knuckles many years ago, because he contradicted the statement that Arabic architecture had its dome from the Byzantine, which he did not believe. With reference to the Palace of Tigranes, he rather believed it to be Armenian.

The President said the members were very much indebted to Mr. Spiers, who had taken so much pains to illustrate his subject and to bring it before them in the way he had done. There seemed to be very little left for them to exercise their ingenuity upon, but to him the illustrations contained a most striking feature in the arch of Ctesiphon, which he thought was nearly 100 ft. high, and the curious wall ornamentation on either side of it. They would all remember the bit of ornamentation from Mashita which was so lovely and so exquisitely rich.

The resolution was cordially adopted, and the proceedings then terminated.

ABERDEEN STREET IMPROVEMENTS. — The Improvements Committee of Aberdeen Town Council agreed on the 27th ult. to the extension of Huntly-street to Chapel-street, the cost of the scheme being 3,000.

PUBLIC IMPROVEMENTS AT HANLEY. — On the 12th ult., Colonel John Ord Hasted, R.E., Inspector of the Local Government Board, held an inquiry at the Hanley Town-hall into an application by the Town Council for power to borrow 8,650*l.* for market alterations and street improvements, 3,750*l.* for the completion of the Town-hall, and 1,500*l.* for the adaptation of the Potteries Mechanics' Institution to the purposes of a museum and science school. There was no opposition offered to either of the applications.

\* See sketch and description of this great arch, in a letter by Mr. Phené Spiers printed in the *Builder* for March 24, 1888, p. 211.

Silver-Gilt and Mother-of-Pearl Spoon, with Crystal Handle.

Pyx belonging to Stonyhurst College.

Snuffers (Renaissance).

Silver Table presented by the City of London to Charles II. (from Windsor Castle).

SPECIMENS OF ORNAMENTAL WORK.

SOME SPECIMENS OF ORNAMENTAL WORK.

THESE illustrations are from a collection made by the late Sir Digby Wyatt, to which we have before referred, for an intended publication. The Pyx from Stonyhurst is the most characteristic piece of design; the treatment of the supports round the glass receptacle is curious and not inelegant. The Renaissance table from Windsor Castle is a rich specimen of the work of its epoch, very satisfactory on general lines, but showing that constant defect in Renaissance furniture, the want of proper joining of the constructive parts of the design; the scroll legs are merely (to all appearance) hinged against the lower part of the central stalk, instead of appearing to be constructively connected with it.

We do not know the "provenance" of the other two objects. The snuffers suggests in the handles the kind of treatment which is dear to the makers of ceremonial keys for the opening of buildings in the present day, viz., the use of a miniature Classic capital from which a stem seems to spring. The design of this portion is however more workmanlike than we generally find in the ceremonial key, as the parts where strength is required really appear strong. The fault of the design is in the second heads or masques introduced on the handles below the torsos. They have no decorative business there, and just spoil what would otherwise be a good design of its kind.

The spoon is so curious as to be worth illustration, but certainly not imitation. There is something clever certainly in the way in which the dragon's tail is carved on in a spiral twist round the handle; but the three component parts have no relation to each other in idea, and the connexion of the handle with the bowl, as if held in the dragon's mouth, introduces an appearance of weakness just where that of strength ought to be most emphasised.

ARTS AND ARTISTS IN FORMER TIMES AND TO-DAY.\*

UNTIL a comparatively recent period a monument of architecture,—or, in more prosaic words, a national or public building,—contained within itself, as parts of itself, all the great arts, technic, æsthetic, and phonetic; and these are three words which, in spite of Examination Boards, the majority of us have often difficulty in clearly and tersely defining. Let me therefore adopt the definitions of them given by the late James Fergusson. He tells us that the *technic arts* are those resulting from one's muscular action or power, whereby the materials composing a great building are wrought into constructive forms; that the *æsthetic arts* are due to those developments of sense by which one is enabled to arrange and distribute the parts of a great building for given purposes, culminating in what is called "design"; that the *phonetic arts* emanate from one's power of representation, their many developments culminating in "sculpture" and "painting." The two first suffice to make a building useful and beautiful; the phonetic arts endow it with expression, whereby it becomes a record of the life and manners, the thoughts and aspirations, of the people who erected it,—in short, an historical monument. To put the matter in another way: a great building may be described as perfect,—first, on *technic* principles, because of the proper use, application, and distribution of materials in its construction; secondly, on *æsthetic* principles of design, because of its convenient and harmonious arrangement, combined with its ornamental construction; thirdly, for its *phonetic* adjuncts, like sculpture and paint-

\* A paper read before the Architectural Association on Friday, the 28th ult., by Mr. William H. White, Secretary of the Royal Institute of British Architects, as elsewhere mentioned.

ing, employed as voices to tell its story,—to explain the purposes for which it is erected.

These arts were common to the artists of every nation which achieved excellence prior to the invention of Printing, and the consequent diffusion of general knowledge, between the years 1450 and 1550, wherein the boundary line between the old and the new methods of artistic practice, according to Fergusson, must be sought.

The Ancient Migrations.

The fame of Alexander of Macedonia, the master of Greece some 2,200 years ago, still lives in the names of cities in eastern Europe, in Egypt, all over Asia Minor, and in north-western India. His armies are said to have started from Macedonia, over the Balkans to the Danube, and then to have returned southwards to the Hellespont which they crossed in order to make the conquest of Asia. That the armies of Alexander the Great contained a vast number of Greeks may be assumed to be correct. The Greeks for 200 years before his time, and for at least 800 years afterwards, were the artists of the world, or rather that part of it known as the Roman Empire; and their migratory character is proved in a host of instances. That they reached as far East as the Punjab is attested by the discovery in recent years of Greek sculptures in that part of India; and that Indian tradition preserved the habit of systematically moving large bodies of men is an historical fact. There is an authentic account, left by an English ambassador sent by James I. to negotiate a commercial treaty with the Emperor of Hindustan, of what was then called "a movable court," which moved rapidly from place to place. Sir Thomas Roe, the ambassador referred to, saw one "set up and finished in four hours, though it was done with great order and exactness." The Emperor was said to "go a prograss," which resembled the removal of a nation. At the several halting places, his pavilion was placed in the centre

of the encampment, and isolated from all around. Every one knew what ground to take, and how far from the Emperor he must pitch his tent, or raise some kind of shelter; every one knew where to go for the supply of his wants—for special streets, so to speak, were devoted to different tradesmen, artificers, and others. Elephants, horses, oxen, were arranged in specified places; they were always ready to start for some other camping place. Some such systematic method of travelling as this must have prevailed before the time of the Romans; and it is believed that 400 or 500 years before Christ great cities flourished in Asia Minor and northern Africa in which extraordinary excellence was attained in the construction of buildings with light and perishable materials, under the guidance of Greek artists. The dome and even the arch were then used. The Roman, when, so to speak, he came upon the scene, found the arts of which he afterwards made so extensive a use in working order.

Another hero, of whom more information is extant than has been found of Alexander the Great, was Julius Caesar. His camp was a square, entrenched on its four sides, laid out in streets within, and having quarters specifically arranged for the several divisions of the army. In the camp was a market-place, and there were special quarters for the artificers. Caesar had to build bridges over the Rhine and other rivers, and before he crossed to this country he had to build a fleet. His armies were something more than mere aggregations of fighting-men. They were communities of soldiers and craftsmen who at times were compelled to settle down in one place, to remain there for months, ten years; and the arts of peace were probably pursued by them with as much earnestness as those of war.

The masters and chief artists employed by the Romans in the design and superintendence of their buildings were Greeks. Their various corporations of workmen were highly trained; and, as may be seen at the present day in the quarries once worked by Roman enterprise, the organisation for the supply of materials was of a character beyond the conception of modern practice. Even when the so-called Barbarians were masters of Rome, the Emperor Theodoric instructed his architects in a proclamation—quoted, a short time ago, by one of the Presidents of the Architectural Association—which serves to show in what esteem the design and erection of monumental edifices was then held. From Theodoric's time until the eleventh century the thick veil drawn over history has never been lifted. The annals of the arts during the first half of that period are absolutely void, and during the remaining half extremely meagre. One thing, however, is certain. The great cities founded by the Romans in all parts of their Empire remained, to afford a shelter or a quarry to generation after generation of inhabitants.

#### The Monastic System.

That the influence of Rome over the world was ever entirely lost is more than doubtful; its moral influence exists at the present day over an enormous portion of the globe. The monastic system, practised more than 1,800 years ago, flourishes, it may be said, to-day. Gibbon, in perhaps the most fascinating chapter of his "Decline and Fall of the Roman Empire," describes the early communities of monks. He says:—

"The philosophic eye of Pliny had surveyed with astonishment a solitary people who dwelt among the palm trees near the Dead Sea; who subsisted without money, who were propagated without women; and who derived from the disgust and repentance of mankind a perpetual supply of voluntary associates."

Colonies of monks flourished at Thebes in Egypt, and in the cities of the Nile, during the third and fourth centuries; and about A.D. 340, the practice of the monastic life was introduced and taught in Rome. A little later, monasteries were established in Gaul; and at last every city of the Empire was inhabited by increasing multitudes of monks. Gibbon shows how the monastic life, by the aid of which the arts came down from Roman times to our own, was propagated over the world. He says that "the life of Hilarius," who was born at the close of the third century,

"Displays the facility with which an indigent hermit of Palestine might traverse Egypt, embark for Sicily, escape to Epirus, and finally settle in the island of Cyprus. . . . The pilgrims who visited Jerusalem eagerly copied, in the most distant climates of the earth, the faithful model of the monastic life. . . . The monastery

of Banchor, in Flintshire, dispersed a numerous colony among the barbarians of Ireland; and Iona, one of the Hebrides, which was planted by the Irish monks, diffused over the northern regions a doubtful ray of science and superstition."

So says Gibbon; and there can be no doubt that when the Roman power came to an end, and even during its decline, these aggregations of monks exercised, in their respective localities, both physical and moral sway over the country around.

What a camp was to an ancient Roman army, with its market-place, its streets of artificers' workshops, its functionaries of every description, the original monastery was to the army of the ancient Church. Like the movable "court" or camp which Sir Thomas Roe saw in India, three centuries ago, the Emperor's pavilion, that is to say, the church, was placed in the centre, and the several dependencies had their respective positions around. The villa or town which the Romans had built often became a home for the monks; and there is abundant evidence of their having converted the ancient temples and other buildings into churches and monastic dwellings. The Roman villa was in fact the model of the monastery or abbey of the ninth century. One of these great abbeys, founded some two centuries before the time of William the Conqueror, was situated near Micon. Its name and fame will long endure, for in the Middle Ages the Abbey of Cluny was the common school or university of arts, whence issued the men who directed the construction of the great abbeys, cathedrals, and churches of France and England, of a large part of Germany and Spain, and of northern Italy. If this fact be once grasped—that in the Middle Ages there flourished a central institution in which a common language, the low Latin, was spoken and taught—the Medieval sequence of events wherein, under the tutelage of religion, the great arts played a principal part, becomes perfectly clear and comprehensible. From the Abbey of Cluny went forth the masters and chief artists of the eleventh, twelfth, and thirteenth centuries; and throughout western Europe similar branch establishments, founded on the model of Cluny, existed. Not only all the learning, but all that contributed to education, was confined within the religious houses, and could be learnt only from the monks. How was it that they worked? How came it that the face of western Europe, in the course of five centuries, was covered with buildings which have been the puzzle and admiration of Englishmen during the last hundred years?

#### Western Europe in the Middle Ages.

Architects who have seen a village or a small town situated on the site of an ancient building or within its ruins; those who have seen the walls of peasants' cottages composed of moulded stone or squared blocks of granite, can realise the appearance of a city in Italy or southern France about the ninth and tenth centuries. It was constructed very largely of old materials placed one over the other, not without some thought of external effect. From Rome downwards all the cities of the Empire went through this experience. Given the plan of a church, with instructions to put into the building so many windows, doors, and arches, so many columns, and having raised the walls to a certain height to cover it with a vault, local artists obtained for the various purposes indicated ready-made materials from neighbouring old and disused buildings. The theatres, triumphal arches, baths, the tombs and other monuments of Roman magnificence, were dismantled, and the materials of which they were composed needed for the earlier churches. In the older cities of Provence and other parts of southern France, huge blocks of stone, perfectly worked, lofty columns of vast dimensions, elegant mouldings, and capitals of refined execution, are to be seen in the more primitive churches; and they astonish the beholder by the grandeur of their appearance in the midst of a semi-barbarous medley of construction. Indeed the vastness which distinguishes the French cathedrals, as compared with the English cathedrals, is mainly due to the fact that the legacy left to France by the Romans was far larger than that which they left to us. When, in the middle of the thirteenth century, the style evolved out of the constructive methods employed by or forced upon the earlier Medieval builders attained perfection, an expert, with the training which a modern archaeologist undergoes, might have easily traced the origin of every portion of a cathedral from

some ancient building in the neighbourhood, or within a certain area of territory.

The principles of construction adopted in the ecclesiastical edifices of the Middle Ages are similar in France and England, and identical from period to period in buildings which are a thousand miles distant from each other, and which were erected almost at the same time. If one takes the early cathedrals, it will be found that, whether in France or England, or in other parts of western Europe, they are all of the same general model, and must consequently have been erected from a common plan. This plan was one accepted by the Church, and it was worked out at a common centre, probably at Cluny. Moreover, when at subsequent periods, prior to the fourteenth century,\* most, if not all, the cathedrals of western Europe were enlarged and beautified, the form of arrangement, the principal constructive features, even the ornaments, were similar, as many buildings, situated at a great distance from each other, suffice to testify. In the Middle Ages a central institution, through its innumerable branches, guided the masters and artists, just as, at the present time, a Government department in India issues the plan and elevation of Barracks to be erected in different parts of the Indian Empire, with instructions to different local superintendents to use the materials at their immediate disposal, and to employ the workmen of their respective localities in the execution of the work.

One who would realise what the face of western Europe must have been like in the Middle Ages should travel in those parts of India but slightly inhabited by Europeans, where there are still many walled cities and fortified hamlets; or in China, which still abounds in Buddhist monasteries. Let us imagine a vast plain, with here and there a jungle or forest marsh or morass, and as far as the eye can reach no trace of a substantial dwelling. The road is a jagged series of tracks, over which at distant intervals a horseman may trot or gallop, a palanquin or a litter with a lady and her child may be borne by runners and accompanied by horsemen, friars may be walking, merchants, pedlars with goods for sale, may be seen, each with an escort proportionate to his rank. Travellers in such localities accept the risks of robbery and murder; and on the great highways of Europe in Medieval days men had to protect themselves and each other as best they could. Imagine, therefore, the delight with which, then, a traveller saw in the distance a tower or a spire—the encouragement it afforded to him—the influence upon his senses caused by the distant sound of a peal of bells! Within that inclosure, the existence of which afar off was thus proclaimed, he sought and found a lodging for the night, meat and drink after the labours of the day; and, if he were poor, along with which to continue his journey. The stranger within the gates of such a building, or group of buildings, enjoyed not only hospitality and rest for his body, but also intellectual recreation. The sculptures, both on the outside and inside of the various edifices composing an abbey or a monastery, formed an exhibition which he could perfectly understand. Paintings on the walls and windows, on the roofs and floors, were all illustrations of the sole and universal story of Christendom, told in a diversity of ways—illustrations that, in times when the great mass of both gentiles and simple could neither read nor write, were graphic renderings of a common living language, with which the teaching and preaching of the period made even the humblest familiar.

Whatever opinions may be now entertained respecting the aims or character of the Roman Church, it is certain that without its fostering care during the Middle Ages the moderns would have known very little of the ancient civilisation. The pagan authors were diligently studied within the cloister, and copied and recopied by monastic scribes, who thus filled the libraries pertaining to the several abbeys with MSS., the publication of which, by the aid of rude printing-presses, assisted the great intellectual movement of the fifteenth century in Italy, and of the sixteenth in France and England.

\* Macaulay shows that early in the thirteenth century "commences the history of the English nation," and that one hundred years later "the amalgamation of the races was all but complete." ("Hist. of England," l. ch. 1.) It was not until the fourteenth century that architecture in England became definitely Anglicised.—W. H. W.

*The Fifteenth and Sixteenth Centuries.*

The stir amongst the artists of Italy in the fifteenth century, which has furnished the text of numerous books on the Renaissance, much more resembled, I humbly think, development or renovation than revival. The Italians never entirely lost the practice of the arts between the time of Diocletian, and his palace at Spalato, and the time of Bramante, who flourished nearly 400 years ago. Serlio, who inherited the designs and other papers of one of Bramante's pupils, published, in the middle of the sixteenth century, a work which has served as the model for many similar works in all the western countries of Europe. Palladio about the same period was studying Vitruvius and Alberti, and he made plans of all the great public baths of the ancients which he could find, and which were in fair preservation in his day. All the great works of architecture executed during the fifteenth century in Italy were adorned with paintings and sculptures by the hands of the best painters and sculptors of the period; and the numerous pupils of these masters formed schools whose works have been ever since the admiration of the world.

The eminence of the Italian masters, and the fame of the great buildings which abounded in Italy, caused many Frenchmen and Englishmen of distinction, and many travellers of all countries, to visit the Italian cities, whence they sent home tales of the wealth and beauty of the materials which composed the principal palaces and churches. Italian architects and sculptors returned the visit, and some were induced to stay in France. Vignola practised and died there, and his work on architecture has always been to the French what Palladio's work was to the English. The literature studied in Europe during the fifteenth and sixteenth centuries was classical, and the language in which scholars conveyed their thoughts to the world, was Latin. During the reigns of Mary and Elizabeth young ladies of distinction read and wrote Latin, for it was not until many years afterwards that the classical works which the monks had preserved were "Englished out of Latin." The architecture of the time was illustrated—that is to say, the phonetic arts which help to compose a great work of architecture were made to tell the classical story of gods and goddesses, satyrs and nymphs, fates and graces, of pagan creation; and this story was consonant with the general current of conversation and the feeling or affection of the age. Vast numbers of Italians and Spaniards flocked to England in Queen Mary's time, and the chief poems and romances were translations from the Italian. Inigo Jones, whose Christian name possesses an Italian flavor, made several visits to Italy. Many of the tombs with which the churches and cathedrals, especially in this country, were then filled were executed by Italian workmen. The deep interest taken in the arts during the sixteenth and seventeenth centuries by the ruling class of France—partly, no doubt, from motives of ostentation,—is shown in the books of the time, and the dedications they contain to great personages. The country palaces and châteaux of the nobility then designed and erected were adorned with sculptures and paintings, and surrounded with gardens, fountains, and waterfalls. The vast town-houses which they possessed were equally spacious, with courtyards in front and gardens behind. Absolute harmony of design was maintained both in the exteriors and the interiors of these buildings; and for more than a hundred years the developments of the style which mark the epoch of Louis XIV. and his two successors were pre-eminent throughout Europe.

*Three Epochs.*

Three distinct epochs of intellectual activity in the great arts can be defined, especially in England. Roundly stated, they occurred in the years 1250, 1550, and 1850, thus leaving a lapse of three hundred years between each. During the first epoch the artists drew their inspirations from solid remains of great edifices which had survived the fall of Roman power and the subsequent struggles of the various peoples that composed the Roman Empire. A child's game of house-building with small cubes of wood, played by real workmen with blocks of stone torn from existing buildings, affords an insight into the process by which the forms and details of the earliest abbeys and cathedrals were evolved. This process, or these processes, were afterwards regulated or systematised, and then directed within certain grooves by a great

central institution, which in its turn acknowledged the supremacy of a universal power stationed in the ancient capital of Rome. During the second epoch artistic inspiration was aroused partly by the study of ancient and Medieval MSS., which had been previously restricted to the use of the monks, but which were at length open to all who could read. The MSS. were copies principally of the works of Roman writers, some of them transcribed in low Latin, no doubt, but perfectly intelligible to the upper classes of French and English. A translation of Vitruvius published in Paris in 1547, in the French vernacular, contains a kind of apology that it is intended for workmen and others who do not understand Latin. The movement of the sixteenth century was largely influenced by the voyages to foreign lands, the influx of foreigners in the various European capitals, and the conviction, which had suddenly seized upon ambitious imaginations, that the world was bigger, and contained more in it, than the decaying Church had been willing to admit. During the third epoch—that of the present century—artistic inspiration has been sought and derived mainly from printed books and illustrations, the art of photography having largely contributed to increase the general confusion of published precedents—and this in spite of extraordinary facilities of travel and almost equally extraordinary efforts of draughtsmanship.

The first of these movements, that of the thirteenth century, was a practical, general manifestation of artistic vigour. The second, in the sixteenth century, was a studious relaxation of religious discipline, a mental demonstration which affected everything that contributed to the enjoyment of life, from a Royal decree to a piece of buffoonery. The third, in our own time, has been mainly pictorial and scenic—an affair of sentiment, fashion, and party-spirit, confined to only a portion of the community at large.

*The term "Artist."*

The very word "artist," in the course of the last hundred and twenty years, has obtained a meaning different from that it possessed during the preceding seventeen or more centuries. In low Latin, in Italian, in Spanish, the word *artista* meant one who exercised a mechanical art. Dr. Johnson, the first edition of whose Dictionary was published about the year 1754, defined an artist as the professor of an art, generally of an art manual; he also defined "artificer" and "artisan" as artists. In other English Dictionaries of early date "artist" is defined as one skilled in an art or a trade; and "artificer" or "artisan" as an artist or a mechanic, one who is skilled in any art, mystery, or trade, a handicraftsman. But in the year 1762 the literary autocrats of the Académie Française, in their great dictionary, so altered the old meaning of the word "artist" that it has come to be applied, both in France and England, solely to a person of aesthetic training and acquirements—one who draws, or paints, or models, or who makes designs on paper for buildings, furniture, jewelry, &c. One hears now such compounds as "artist-architect," or "art-workman," used by gentlemen and ladies who are immensely amused when a hairdresser calls himself an "artist in hair," a vain denomination to which he is traditionally entitled; and the "art tailors" of Bond-street have as much justification for their compound title as the self-styled "art-architects." Indeed, I have often wondered that practitioners of the lower arts should be allowed to monopolise the title of "workman," seeing that every Englishman who is worth anything at all, is or has been a working man. But a musician appears to be excluded from the fraternity of British artists; he or she, as the case may be, is called *artiste*, with an "e," and the word is printed in the italic character to show that it has been appropriated from a source other than the pure well of English undefiled.

*Foreign Artists in England.*

The periodical immigration of foreigners into this country, due to various causes, religious and political rather than commercial, has contributed in no small degree to enlarge its artistic capacities and develop its artistic sense. After the fall of the Roman Church in England, the condition of the arts was worse here than in any other part of western Europe. We had routed them from their original homes, and compelled them to seek miserable lodgings anywhere and anyhow.

We set up no new institutions in the place of those we had destroyed, and after the excitement of the sixteenth century had subsided in England, a century of native inaction, as far as the arts were concerned, followed. The nobility, who had the means of knowing what the artists of Italy, France, and Flanders were doing, sent to obtain their advice and assistance. In the days of the Stuarts, when a further influx of foreigners took place, the chief artists employed in England were not English, though some of them bore English titles and became anglicised in name and language. Sir Anthony Vandyc, Sir Peter Lely, Sir Godfrey Kneller, were foreigners who worked in England. The design of the numerous churches, the erection of which was superintended by Sir Christopher Wren, was, I feel sure, largely due to foreign assistance—for after carefully looking at some of Wren's works, and after comparing them with particular buildings erected a short time previously in Venice,—which Wren had never visited,—one is struck with marked resemblances in type and detail. Sir John Vanbrugh was of foreign lineage; the magnificence of his architectonic conceptions, the character of the works executed under his direction, betray their French origin, and the details prove it. Then there were the two brothers Adam, the "adelphi" who gave names to a series of London streets lying between the Thames and the Strand, and whose delicate designs for plaster ornamentation burst suddenly upon the town. The art which made them is known to have been the work of Italians whom the brothers employed, and it expired with the few pupils they left behind. Sir William Chambers was not horn an Englishman, and many of his draughtsmen,—some of whom worked on the drawings of Somerset House,—were foreigners. If one carefully examine the English illustrated books on the arts, especially architecture, published during the last century, one finds that the names of the draughtsmen and of the engravers are almost invariably foreign, while the character of the work is entirely French. At the commencement of the Queen's reign Italians employed at the Mint executed the beautiful coins which bear her Majesty's image and superscription; and I think it may be fairly admitted that until the year of Jubilee, 1857, no Englishman had reason to be ashamed of the artistic character of his country's coinage. Even at the present day some of the Royal Academicians are foreigners, or of foreign lineage.

*The Great Arts To-day.*

I have attempted to realise, by an imperfect description, the feelings of the Mediæval traveller on first catching sight of a tower or a spire; and even now when, halfway on the road—an ancient Roman one—between Dover and Canterbury, one gets a first glimpse of the cathedral towers, the effect—especially in the sunlight on a summer's day—is very charming and inspiring. But what must it have been to the worn and footsore, in all weathers, five hundred years ago? They knew that those towers marked the existence of a glorious and beautiful home of refuge and delight, where bed and board, and alms with which to continue the journey to Rochester and London, would be obtained. It is impossible to doubt the sincerity with which a man, under such circumstances, cried out, "The Lord is my refuge," "In His courts is peace," or "I was glad when they said unto me, Let us go unto the house of the Lord." When there now, once a week, one repeats those phrases as a sentimental exercise for spiritual comfort; but in the Middle Ages they possessed a definite meaning, conveying a recognition of substantial benefits received.

Again, the towers of a Mediæval fortress were absolutely essential to its defence. A tower in those days was also often necessary to hold aloft a sun-dial, which was not only convenient but absolutely essential to every inhabitant of the town or village in which it was placed. But, at the present time, men consult their watches in preference to the town clock, or even that hell which every quarter of an hour during the session irritates the House of Commons; and modern fortresses are built to show little masonry or brickwork for big guns to attack—a tall tower being the very first thing in a siege to carry destruction into the ranks of its defenders. Nevertheless, few public, few large private buildings, are now considered complete without towers, some of which are erected for absolutely no purpose whatsoever;

and all are intended, in a technic as well as an æsthetic sense, to "break the sky-line" of the building. But I am bold enough to believe that no Græco-Roman artist, no Mediæval artist, ever of malice aforethought broke the sky-line of his buildings; or intentionally so grouped them as to secure what, in this pictorial and scenic epoch, is called a picturesque outline. If one study minutely the history of an old cathedral, both from written documents and from the evidence to be obtained of the building itself, it will be found that its course of life has been something like this. Early in the twelfth century (and sometimes earlier) it was erected and finished according to a general uniform plan, and in consonance with instructions received from headquarters. The masters who had the general direction of the artists engaged upon it were mainly ecclesiastics, and the master mason was the chief artist who worked on the building. Years afterwards, as population increased and civilisation advanced, a larger cathedral was required. Another plan was obtained from headquarters; and, without destroying the whole of the original building, additions were made to fit it to the new and enlarged plan, for I have no doubt in my own mind that the church services, which were then a principal part of the ordinary business of life, were carried on during the repairs. Ultimately, after the fourteenth century, for well known reasons, no more general uniform plans could be obtained, or they were not wanted. Additions or alterations were made by local artists as they were required. If a window did not give light enough, another and larger one was substituted, without any heed to what is now called "style." No attempt at what is now called "restoration" was made; and alterations were effected without regard to appearances, though the artists engaged expended their best talents upon the work. If a new chapel or chapter house, or any other adjunct was wanted, it was fitted on to the building in the place most convenient for its purpose; and, as a rule, the same happened to the municipal and the private edifices. The result was that, after three or more centuries of such alterations and additions, the cathedrals, the castles, the country-houses, which had survived successive periodical destruction—outlines rendered, in later centuries, still more picturesque from decay and wanton destruction.

The too enthusiastic study of Mediæval buildings in their ruined condition has partly led to the present methods of design. We have taken the plan and view of our cathedrals and churches as they came down to our forefathers of the sixteenth century, after three or more centuries of modification, and founded upon that plan and view the church and the cathedral of the present day. We have been utterly and wilfully oblivious of the regular and symmetrical form they both had in the plans of the thirteenth-century architect. We treat the modern country-house in the same fashion, and arrange a new building of our own time with every possible irregularity of outline, both vertical and horizontal, for the purpose of imitating effects which during the Middle Ages, and even later, grew naturally, or as circumstances demanded. Yet we are astonished that the shrewd British public fail to appreciate the true uses of architecture, that the run of a revived style barely lasts ten years, and that Governments desirous of erecting national monuments are as cautious in their dealings with artists as they are perplexed with the rapid changes of the artistic kaleidoscope. It was well said, three hundred years ago, "Nothing is lasting that is feigned; it will have another face than it had, ere long."

Then, as regards the employment of painting and sculpture in new churches, we give the enlightened world the same old versions, told in the same old way, of the once sole and universal story of Christendom. Does any one attempt to decipher them? Does any one ever try to read the sculptures upon the national and municipal buildings of the country? Does one ever ask oneself what the subject of most of them has to do with men and women of to-day,—with the life of the present time? It may be possibly due to some such feeling that the public buildings of our time are very little indebted to sculptors for their adornment; and, as to the art of painting, the question with the government or a municipality, even in these days when the nation consents to spend 75,000*l.* upon a framed picture, concerns rather

the number of coats of good oil paint to be used, than any subject to be portrayed, upon the walls.

Again, how do the once subsidiary arts of painting and sculpture use the liberty they have enjoyed in England since the sixteenth century? To study the progress they have made, one must go to an exhibition in London or Manchester, or some other big centre. There, after half a day spent in an agony of examination, equally divided between a catalogue of pictures and the pictures themselves, one retires with a sense of relief that such exhibitions are held only once a year; and if by accident a year be skipped, or even two years, the complaint is just loud enough to prove that, as a person of fashion, one wished to see the things that others say should be seen by the fashionable world. But take up a copy of the *Illustrated London News* or the *Graphic*. One is interested at once. It portrays current events, which make the history of the present time—the views of life as it passes before living eyes. Even in the late Madame Tussaud's Waxworks Exhibition the groups of men and women in whose fate and career one is and has been interested attract the artist and delight the crowd. But does an exhibition of modern sculpture cause delight? I cannot believe that a marble or bronze figure of a man, deprived of any architectural surroundings, and perpetually fixed on a pedestal in the middle of a road or on the pavement, in fair weather and foul as we get it in this country, can ever delight or even interest the passers-by. Yet that represents the principle on which sculpture, freed from the tutelage of the master-art, is now invariably treated. If one could adopt only the spirit instead of the letter of the arts of former times, the ornamental parts of a new building, whether executed with a chisel or a brush, would be made perfectly intelligible to the mental capacities of ordinary people, and would relate to current events, to the habits and occupations, the sentiments and aspirations, of the living world. I feel convinced that this will again come to pass. I believe even that architecture, if professional education continue to be directed in its proper course, will re-assume its ancient pre-eminence as the master-art, and partly for reasons which are more political and social than artistic. Perhaps the youthful pluck of America, with its utter want of respect for the ties of tradition, may help the old country out of its present grooves. Bret Harte sounded the true note of emulation in the first verse of what "Miss Blanche Says," written and recited in Rochester, U.S.A., nearly twenty years ago:—

"And you are the poet, and so you want  
Something,—what is it?—a theme, a fancy?  
Something or other the muse won't grant  
In your old poetical necromancy.  
Why one hail you poets—you can't deny—  
Don't know the muse who you chance to meet her,  
But sit in your attics and mope and sigh,  
For a faintest goddess to drop from the sky,  
When flesh and blood may be standing by  
Quite at your service, should you but greet her."

Instead of "poet" I pray you read "artist," or the title of any other genius, and for "flesh and blood" substitute the life of the present day and the current events of human existence.

#### Present Worship of the Past.

It is, nevertheless, impossible to treat lightly the actual triumph of archæology, due principally to the researches of the present century. There is no building of any importance mentioned in Holy Writ or any historical MSS.,—though, perhaps, not a vestige of it remains,—that the archæologist is not prepared to entirely rebuild upon paper; and further, he will support every item of his restoration with accumulated references and analogies. Museums are full all over the world, of archæological curiosities, some of which are valuable objects of workmanship, dug from the surface of the earth, and emanating from pre-historic as well as historic times. It is also equally impossible not to admire the archæological knowledge, the æsthetic and phonetic skill, with which a new building can be at once invested with the character and appearance of an old one. This ostentatious love of the old is a fashion that must run its course, and the loud objections now raised to rendering a dilapidated edifice fit for actual use will doubtless outlast the century,—the sentiment, of which both are born, having served a good purpose in the present epoch of artistic unreality. It is, however, obviously ephemeral, for it is opposed to the known traditions of every country and every age in which the great arts have flourished and progressed.

To this worship of the Past,—to the belief half expressed even by intellectual critics that there were once men, not absolutely giants, who did things that cannot be done now,—may be attributed some of the diffidence with which the authorities in this country regard an architect, however talented or experienced he may be. This architect, perhaps, erects tenfold dwelling-houses which come to pieces after the wear of sixty or eighty or 100 years, and his critics seriously remind him that the Pantheon at Rome has endured for at least fourteen centuries. They conclude that the domestic architecture which adorned the Imperial City was executed with strength and beauty equal to the strength and beauty still visible in the few great monuments that have survived the attacks of Time and men. But architects know that if certain temples and amphitheatres are still standing, it is because they were built with extraordinary skill and strength. If buildings which once surrounded them have disappeared, it is often because they were not better built than those of the present day. The vast majority of the dwellings in ancient cities were not as well built as are those of our own time, and hardly a vestige of them has come down to us. Indeed, with the fear of an old anecdote before me, I do not hesitate to believe that the Romans made a vast amount of worthless mortar, which, like all the other rubbish of Mediæval builders, has disappeared. Lord Byron put the matter very neatly when he wrote—

Out upon Time, that never canst leave  
But enough of the past for to grieve!

#### Female Competition.

A noble feature is said by competent persons to await the arts of this country, and although no man ought to prophesy unless he knows, let me add, in concluding this Paper, a surmise as to the future. Since 1851 the State has expended money for the purpose of assisting the technic artist; the City and Guilds of London have also come to his assistance. Moreover, the architects, unaided by the State, have by their own energy, and with their own money, progressed according to their lights quite as fast as those who practise the lower arts. Much more is known at the present day of architectural history, and of the monuments of the world, than at any previous period of the national existence, and the power of artistic delineation recently acquired is amazing. What must come to pass before any real benefit can accrue from all this knowledge and skill is a closer relation between the technic, æsthetic, and phonetic artists, and between them and the architect. To secure this, the technic artists must rise in the social scale; indeed, measures are ripening which must take effect slowly, and be but slightly perceived at the time, to advance the skilled craftsman. Somewhere in the next century—and the present one has only nine more years to run—the male monopolist will have to contend with female competition, at least in all those callings or occupations that are considered "genteel"; or, in better language, in all the gentle arts. In Europe, less than a thousand years ago, men practised those arts which for the last three hundred years have been almost exclusively practised by women; and, at the present time, among the Eastern nations, all such arts are still the exclusive patrimony of men. But about a year ago I read in the *Times* a telegram from Calcutta, stating that "at the last primary scholarship examinations in Bengal eight out of twenty scholarships were awarded to girls." What a revolution of thought is conduced in those words! This was not in Bombay, among the commercial Parsees, nor in Madras, where the progress of native education is favoured by absence of caste prejudices, but in Bengal, among the Hindus, whose women are kept under lock and key with even greater strictness than was used by the ancient Greeks! As for England, the schools of art and the art academies show almost as many female students as male students; and in all the annual distributions of prizes at the Royal Academy and other similar institutions, and even at the technical schools, the young women came up to receive their prizes with the young men quite as a matter of course, or without attracting undue observation. In point of fact, out of a total of 2,119 exhibits in the Royal Academy Exhibition of last May, some 400 were by women; and one-fourth of the exhibits contributed by outsiders were by women. It may be confidently pre-

Faint, illegible text, possibly bleed-through from the reverse side of the page.

dicted that such gentle arts as painting and what is still called sculpture—but which is really only modelling—and design of every kind will eventually be practised by women, to the ultimate exclusion of men; that, in fact, the designer, pure and simple,—who now often fancies himself an architect,—will be sorely pressed by the “softer man” in their mutual struggle for existence; and that, consequently, the masculine arts of construction will regain the consideration attached to their practice in Roman and mediæval times. Masonry, carpentry, plumbing, wrought-iron work, and other such handicrafts, or arts as they used to be called, will be practised by educated men; and men of imperfect education, who are not skilled in such arts—who have no better knowledge of them than the ordinary unionist of to-day—will be relegated to their proper position of labourers. The sciences will not be much affected by female competition, and if what was once the master-art can maintain its original place among the sciences—if the fatal notion that draughtsmanship signifies to make an architect can be entirely dispelled—architecture may yet successfully resist the handshishments of the better half of human kind.

*Fergusson's Three Points.*

More than a generation ago, the late James Fergusson,—whose line of argument will probably be better appreciated in the next century than it was understood in his lifetime,—began the hook which he called the best he had ever written, by an allusion to the held paradox of Rousseau,—

“That the sciences and the arts had served only to debauch and corrupt mankind, and that almost all the vices incidental to a state of civilisation could be traced to their pernicious influence.”

But Fergusson replied,—

“Cultivate the sciences and the arts. No . . . real and permanent good can be effected except from an improvement of knowledge; no higher or more elevated tone can be given on the all-important subjects of morals or religion, except by imparting a higher degree of refinement, and a better appreciation of the purely beautiful, to the public mind.”

In the same book, in a chapter on the Prospects of Art, he showed briefly the principal points to which he believed attention should be directed. “The first,” he wrote,

“Is to restore to art its progressive vitality, or, in other words, to give up all imitation of past styles, and to start at once with the determination to surpass all that has hitherto been done—to progress towards a degree of perfection that has not hitherto been reached. The second is to enlist a higher order of minds in the practice of the arts, or at least a higher class in society than has hitherto condescended to interfere with them. The third is to fit them with some higher aim than merely to please the dilettante or the connoisseur; for they must teach and elevate, or themselves suffer degradation.”

[Some notes of the discussion which followed will be found on another page.]

**Illustrations.**

**DECORATIVE PAINTING, RED CROSS HALL, SOUTHWARK.**

**A** SERIES of panels, about 6 ft. by 11 ft. high, has been designed by Mr. Walter Crane to decorate the above hall, which has already been illustrated in this journal (interior view, Nov. 9, 1889). The first panel, illustrated in this number, has been painted from Mr. Crane's design and under his superintendence by Mrs. Russell Barrington, for the recess on the left-hand, near the entrance to the Hall. It is intended to commemorate an action well worth commemorating in painting, viz.: the courage and self-devotion of the servant-maid Alice Ayres, who in 1855 sacrificed her own life in saving those of her master's children at a fire in Gravel-lane, when she refused the means of escape herself till she had three times deliberately gone back into the burning house to bring the children out one after another, and was too exhausted to save herself, and fell on the pavement and died shortly after she was taken to the hospital.

Some of our readers will remember the incident, which made a great impression at the time; and we are glad to hear that such a noble subject from real life has been selected as a wall decoration; a subject which is peculiarly suitable in a hall intended for use by the poorer classes, as showing how heroic deeds may be done, even by those in a humble position, who are faithful to the idea of duty. The subject was suggested, we are informed, by Mr.

Plan of Barfreestone Church, Kent.

G. F. Watts, but we may feel sure it is one which Mr. Walter Crane would work at *con amore*.

Similar deeds of heroism in humble life are to form the other subjects, nine in all, with which the Red Cross Hall will ultimately, it is hoped, be decorated.

**BARFREESTONE CHURCH, KENT.**

THE measured drawings of this curious little Norman churoh, published in this number, were made by Mr. Alan C. Walker, a young Australian architect, during a visit to England to study English architecture *in situ*. It would be very desirable if more of the profession in Australia would spare time to come over and study the ancient architecture of the mother country, not by any means because we wish them to copy it, but because of the educating effect of the study of ancient architecture, of which the inhabitants of a country where there is no ancient architecture are deprived. The Americans are now producing very picturesque modern buildings, but they never did so until it became the habit of their architects to study and draw ancient European monuments. The Australians, as far as we may judge from illustrations of their architecture which reach us from time to time, are now in the same position in which the Americans were a quarter of a century ago; they have no architecture except bald repetitions of modern Renaissance work.

Mr. A. C. Walker has therefore set a good example to his contemporaries at home, and at the same time has produced a set of measured drawings which are of interest to English architects as a record of the peculiarities of a rather exceptional old monument.

There is a curious semi-Celtic appearance about some of the ornament which seems to indicate some special influence at work in the erection of the church, which has two other notable peculiarities, the curious irregularity in the setting out of the walls (as shown in the subjoined plan), and the fact that the wall arcing on the south side of the nave shows slightly pointed arches, a very peculiar incident, as it is generally found that merely ornamental arches in Transitional buildings remained round-headed for some time after the larger constructive arches had assumed the pointed form for constructional reasons. The curious skew in the plan has been accounted for by a suggestion that the church was built with stones brought from other places and which had been used in some previous building; this may be the case in regard to the decorative heading of the south door of the nave, which has very much the appearance of a later insertion; but the crookedness of the plan may be sufficiently accounted for as clumsy and careless setting-out on the part of some rude local masons, in all probability.

Partly owing to this crooked character there is an impression of early simplicity about the building which inclines one at first sight to regard it as earlier than it really is; an examination of the details, especially the moulding and carving of the capitals of the chancel arch, show that one can hardly give it an earlier date than 1100.

**STAKE FARM, NEAR SEVENOAKS.**

THE alterations, &c., to this cottage consisted in removing the front door from the centre and throwing the entrance-passage into the dining-room, turning the drawing-room into the hall,

and converting the existing cowshed adjoining into the drawing-room, with new bedroom and dressing-room over, fitting up stables and new drainage, plumbing, heating, painting, &c., throughout. The architect was Mr. Fred M. Simpson, of Westminster, and Mr. Edward Punnett, of Tonbridge, was the builder.

**GAMEKEEPER'S COTTAGE, SIDBURY.**

THIS lodge is built in red brick and Ham Hillstone, with dog-kennels and pheasant sitting-house attached. It is roofed in red tiles, and the work was carried out by the workmen of the estate. The architect is Mr. Walter F. Cave, and the drawing from which the illustration is taken was exhibited in this year's Royal Academy Exhibition.

**THE ARCHITECTURAL ASSOCIATION.**

THE fourth meeting of this Association for the present session was held on Friday, the 28th ult., at 9, Conduit-street; Mr. Leonard Stokes, President, in the chair.

The minutes of the previous meeting having been read and confirmed, the following gentlemen were elected members of the Association:—Messrs. E. S. Collins, E. L. Harrison, E. Jessop, G. B. Macdonald, G. A. Kerr, and A. H. Carter.

The Chairman stated that there had been no other nomination than the nomination by the Committee of Mr. P. J. Marvin to fill the vacancy on the Committee caused by the resignation of Mr. F. Hooper.

Mr. Marvin was then duly elected. Mr. William H. White then read a paper on “Arts and Artists in Former Times and Today,” which we print on another page.

Mr. John Slater, in proposing a vote of thanks to Mr. White, said he was sure they had listened with the greatest interest to the very instructive and amusing paper which Mr. White had read. They had had most interesting excursion into the past. Mr. White had touched upon a great many topics that many of them, at one time or another, had thought about; but he had brought them together, and put them in such an interesting way, that he (the speaker) was sure they could not be other than extremely obliged to him. He had often been struck in thinking over Mediæval times, with the wonderful facility which undoubtedly did exist in those times for people to get about all over Europe. It was very surprising indeed at first sight; but he supposed the people who travelled then did not carry very much of their wealth with them. Most of those who travelled were not rich men, and consequently they were not so afraid of being robbed of their property as of being detained themselves, and made to work at their special craft for the benefit of those who detained them. There was no doubt that many of the little Italian towns known in the history of art, detained a painter or sculptor in that way, and kept him and made good use of him. Mr. White had very accurately described the influence of the Roman Catholic Church in the promotion of the arts. The monasteries were really missionary bodies in the true sense of the word; they were continually sending out people to teach not only the little learning that was then taught, but all the technic arts. And there was no doubt that there was much intercourse between the various countries and monasteries; and if any one monastery had an exceedingly good master mason, when a cathedral was to be built some

distance away, it was extremely probable that the monastery would be asked to send that man and some labourers to assist in building that cathedral; that would, probably, account for some of the similarities which were often to be found in buildings far apart; although with all the similarities found in buildings in different parts of Europe, they generally got a good deal of local colour, because necessarily a great deal of the work was done by local workmen, whose work naturally showed local peculiarities. Mr. White has alluded to foreign artists in England. Of course, it was well known that in many big houses that were erected the foreign artist and foreign workmen were employed. Mr. White had touched very properly upon the absurdity of putting towers into buildings where there was no necessity for towers or anything of the kind. He could not help thinking that in Medieval times no such instance would have occurred, as he was credibly informed occurred in this great city, of a very elaborate *flèche* being erected by mistake on the wrong roof of a semi-public building, which had three roofs, before the mistake was discovered and the *flèche* transplanted to the roof for which it was intended. The constructional value of that *flèche* could not have been much. They should all endeavour to learn and practise the maxim that they should not use ornament for the sake of ornament,—that they should not build their ornament, but ornament their building. That was a lesson which all, whether old or young, ought to take to heart.

Mr. F. T. Baggally seconded the vote of thanks, and said that Mr. White had been rather better than his word; for, although he had only promised to give them an account of the past and present aspects of his subject, he had taken a small excursion into the future. Mr. White's little epitome of the career of art in the past was as clear and striking, or, rather, clearer and more striking, than any such epitome that he (Mr. Baggally) had come across, and his account of art in the present day was exceedingly amusing, to say nothing of its accuracy.

Mr. W. J. H. Leverton said it had been suggested that the Freemasons had a good deal to do with the spread of architectural skill in the old times.

The Chairman said that Mr. White had told them how in the Middle Ages a hand, or a school practically, of architects existed; and had mentioned Cluny. It would be interesting to have his ideas as to how the school of architects at Cluny was kept going. He (the speaker) supposed there was somebody at Cluny who taught those architects how to work—or did they merely examine? It was very true, as Mr. White had said, that in old buildings they found that the best painters and the best sculptors had been at work, and it was a great pity that this was not more often the case in modern times. But he thought things were improving, and there were some architects who now tried to get a good sculptor to do their sculpture and a good painter to do their decorative painting. He thought Mr. White had been a little severe on the modern sculptor, or “modeller,” as he called him. He (the speaker) agreed that a great deal of modern sculpture was atrociously bad, but he thought that that very often arose from the fact that it was paid for so badly. If a man was paid only 10s. for carving a bust they could only get poor work. It was part of a system which certainly wanted mending. If they could get the public, and perhaps even themselves, to insist upon having nothing but good work in their buildings, they would get on rather better. Mr. White had spoken a little sarcastically about “art-architects.” He (the speaker) did not know where Mr. White had got the term from. He knew that there was an idea abroad that some architects looked down upon all constructional matters, but he did not think that there was very much foundation for the idea. He had heard of an amusing combination by a gentleman who was a member of that Association, who called himself “architect and artist,”—words which were generally held to be synonymous, although evidently the gentleman in question did not seem to think so. He was sorry that Mr. White had tried to rob Wren of a good deal of the merit which was attributed to him. He had said that very probably Wren copied a good deal of his work from Venice. He (the speaker) hoped that was not so; at least, he would not say that, because he

admired the work, whether it was copied or not; but he would like to think that it was not copied. He thoroughly agreed with Mr. White in what he had said about towers. It was most absurd that every building larger than a semi-detached villa must have a tower. Every town-hall must have its huge tower. He did not agree with that notion himself, and he was glad that Mr. White expressed himself so strongly on the subject. Mr. White had also talked about picturesque skylines! When he (the Chairman) heard a man talking about a “picturesque skyline,” he generally put him down as an engineer, a “duffer,” or an outsider. Mr. White had said he hoped that architectural education would continue to be directed in its proper course. On that point he (the Chairman) said he thought the members of the special committee on education deserved some little credit for having embodied in the curriculum which they had submitted to the Association, a course of lectures on painting and sculpture. That was a step in the right direction, he thought. At present architects were too prone to think that painting and sculpture were quite distinct professions from their own. He thought that if architectural education continued to be directed in its proper course, that they would see better results in the future. He also agreed very cordially with what Mr. White had said about the worship of the past. He (the Chairman) did not wish for one moment to run down the past or what the men of the past did, but he thought one copied too much what they had done. If we studied what they did and tried to get imbued with their ideas, and if we tried to execute our work in the spirit of the old men, without using the identical mouldings or details, he thought that we should obtain better results. He did not think young architects should confine themselves to the study of the work of the past; but that they should also study the best work of the present day. If we were to watch the progress we were making, and try to surpass it and improve upon it, he thought we might progress still more rapidly.

The vote of thanks was then put and carried unanimously.

Mr. W. H. White, in reply, said that Mr. Leverton had remarked that he (Mr. White) had made no allusion to the Freemasons with regard to the work of the Middle Ages. He would ask that gentleman to read Mr. Wyatt Papworth's paper on the Superintendence of Medieval Buildings, which was in the “Transactions” of the Institute, and in which the writer referred to the Freemasons. If he might put it rather roughly he might say that the whole story of the Freemasons was exploded. As to the bands of travelling Freemasons, he did not think that anybody in our days had the slightest belief in that tradition. There was also another old idea about the existence of fraternities of bridge-builders. He believed that that idea was almost equally doubtful; but Mr. Papworth's paper was well worth the attention of every young man who cared to study it. Then with regard to Cluny. It was a story which had been told a great many times, and it had been best told by M. Viollet-le-Duc in his “Dictionnaire;” in fact most of those who had talked about the subject had got their ideas of it from Viollet-le-Duc. Cluny was destroyed at the great Revolution, and only a few remnants remain. Its great library was also destroyed at the end of the last century, but as far as education at Cluny was concerned, he believed that in all ranks of life men from all parts of Western Europe used to be sent there, very much as a Londoner was now sent to Oxford or Cambridge. As at Cluny, there was undoubtedly a great system of training for young men in the arts. There was no doubt also a body of seniors who looked very carefully into the doings of the juniors, and if they did not understand present methods of examination, they doubtless had something corresponding to it. With regard to what had been said about persons who called themselves “architects and artists,” he could not help thinking of the immortal Pecksniff, who was described as “architect, artist, and man,” and whenever he (the speaker) read about “art workmen” and “art architects” he always remembered that Pecksniff was “architect, artist, and man.” The chairman had expressed regret that he (Mr. White) had hardly written of Wren with sufficient respect in stating that his draughtsmen had evidently been foreigners. The fact was well known, he believed, and it must be remembered that Wren had an enormous

quantity of work all over the kingdom and all over London. Wren was also Surveyor to the Office of Works and Public Buildings. Wren was undoubtedly a man of great taste and scientific knowledge, but it was not to be supposed that he sat down with drawing-board and T-square to make drawings of the buildings the execution of which he superintended. The Chairman had also alluded to the subject of education, which was the leading topic of the day. He (the speaker) thought that the Chairman had almost hinted that painting and sculpture were hardly sufficiently appreciated; at least, that the teaching of painting and sculpture was hardly sufficiently cared for by the Architectural Association. All he could say was that architecture was such an enormous subject that, if the Association would teach architecture, everyone would be satisfied. The Association had enormous powers; but not sufficient to enable them to do all that they tried to do, and all that they wished to do. Too much was attempted, if he might be permitted to say so. As a very old member of the Association, —for he remembered the Association when its quarters were at Lyon's Inn Hall,—he remembered Professor Donaldson offering, in the name of the Institute, to take the whole of the Association in as students, to which he (Mr. White) and others objected. He also remembered Mr. Norman Shaw as the head of one of the A.A. classes. There was no person more desirous of seeing the Association prosper and become self-dependent than himself.

#### WORKMEN'S ACCIDENT INSURANCE IN SWEDEN.

THE new law of State insurance for Swedish workmen against accidents and sickness covers all workmen engaged in the building and kindred trades, saw-mills, deal-yards, quarries, all industrial concerns, &c. A State insurance institute is to be established, the employers paying the premiums. Insurance with the State institute is not, however, compulsory, provided the employer has his hands similarly insured elsewhere; but, nevertheless, the State guarantees the compensation in all such cases. The amount of compensation is the same in all cases, viz., for total disablement for life, an annuity of 20*l.*; for disablement reducing working capacity for life an annuity of 17*l.*; for temporary disablement or sickness, 1*l.* 4*s.* a day. Hands under eighteen years of age receive only three-fourths of the above sums. In addition to the two former cases, where the assured has children he receives 2*s.* a year for each one under fifteen years of age, the total compensation, however, not to exceed 24*l.* 10*s.* In case of death through accident the payments are:—For funeral expenses, 1*l.* 13*s.*; annuity to widow, 6*l.* 13*s.* 6*d.*; annuity to every child under the age of fifteen, 3*l.* 7*s.*, total, however, not to exceed 17*l.* a year. The employer has to report the accidents to the nearest police authorities, who, after investigating the case, report it to the institute. Anyone dissatisfied with the decisions of the latter may appeal before the Stockholm municipal court within one year. The payments for sickness are made weekly and others quarterly, the premiums of the employers being payable half-yearly, and in case of non-payment they may be enforced as Crown debts. When insured with the State the workman enjoys the great advantage of being insured from the moment he enters upon his work, whether notice thereof be given or not by the employer or himself. As to the rates of premium, the Minister of Public Works will divide them into classes, according to the risk of occupation, at first for three years, and afterwards every fifth year. Should experience prove any trade less risky it may be reduced in class. The State insurance also covers foremen and overseers of work. Should any person injured receive compensation from other persons according to general law the institute has the right of indemnification for any compensation. Moreover, employers as well as men may effect voluntary insurance with the State, but in no case must the sums assured be more than double those stated above. The State will establish and maintain the institute, the officials being one chief administrator, three directors, a secretary, a registrar, and a treasurer, and neither of the first four named must hold any other public office or position.

COMPETITIONS.

**LICHFIELD UNION.**—The Guardians of the Lichfield Union having decided to erect a new infirmary, it was resolved to invite several architects to meet a committee of the Guardians, who were to select one gentleman to be recommended to the meeting of the Board for the appointment. This was done, and Mr. W. H. Woodroffe, London, was unanimously appointed.

**OSWESTRY NEW MUNICIPAL BUILDINGS.**—At the monthly meeting of the Oswestry Town Council, held on the 1st inst., the Mayor (Mr. A. Wynne Corrie) presiding, it was agreed to submit the accepted plans of the new municipal buildings, designed by Mr. Cheers, of Twickenham, to the Library Committee, the Works Committee, the Standing County Joint Committee, and the county and borough magistrates, for suggestion. The estimated cost of the new buildings is £2,200.

ARCHITECTURAL SOCIETIES.

**LIVERPOOL ARCHITECTURAL SOCIETY.**—On Monday, under the auspices of this society, at a numerously-attended meeting in the Royal Institution, Colonnade-street, Mr. T. H. Harrison, F.R.I.B.A., read an interesting paper on the subject of "House Drainage." One of the principal purposes of the paper was to instruct younger members of the society, who propose to enter the profession through the ordinary ordeal of the examination, as to the best means of carrying out house drainage efficiently and under the best known sanitary conditions. By means of a flask and syphon tubes Mr. Harrison demonstrated the unreliability of some traps used as a protection against sewer-gas. He produced specimens of tree roots which had grown into and filled up drains, thereby showing the necessity for cement joints as against clay joints. He also described the best known system of providing efficient drainage for country houses where no sewers exist, as well as for others.

**MANCHESTER ARCHITECTURAL ASSOCIATION.**—The third ordinary meeting of this Association for the present session was held on Tuesday, at the Diocesan Buildings, Mr. T. Chadwick, A.R.I.B.A., President, in the chair. Mr. G. H. Willoughby read a paper on "The Advantages of Terra-Cotta relative to our Town and City Buildings," which he classified under five heads:—its durability as compared with stone; its comparative cost; its variety and permanency of colour; its advantages for internal decoration in the form of "faience"; and, lastly, a few general remarks. Each heading was exhaustively dealt with, and many buildings mentioned as illustrating its use. Much injury has been done to the progress and adoption of terra-cotta by the use of inferior material on account of cheapness. Manchester is far behind London in its adoption of terra-cotta, and to Mr. Waterhouse, who may be regarded as its most enthusiastic advocate, are the London people greatly indebted for the increased cheerfulness and lightness his buildings have given to their streets and suburbs. The application of "faience," or glazed terra-cotta, for internal decoration in some of our Manchester buildings recently erected was a recognition of its value as a permanent decorative material.\* Before concluding, Mr. Willoughby suggested several remedies to the objection of the use of this material. A vote of thanks, proposed by Mr. Davis Colley, seconded by Mr. Mee, and supported by the chairman and Messrs. J. S. Hodgson and Selfox, concluded the meeting.

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—The opening meeting of the thirty-third session of the Edinburgh Architectural Association took place on the 27th ult., in the Architectural Hall, George-street, Edinburgh. Mr. John Kinross, President of the Association, occupied the chair, and delivered an opening address. He touched briefly on the need of University teaching of architecture, and for that purpose the need of endowed chairs. He advocated the establishment of a Scottish institute of architects, and discussed the question of open or limited competitions. He thought, in regard to the latter point, that the remedy was in the hands of architects them-

selves, who ought to discourage competitions for buildings of little importance or moderate cost by refusing to enter them. Turning to subjects of more general interest, Mr. Kinross had some remarks to offer regarding the character of our buildings, particularly in the suburbs. He thought the overcrowding and high buildings in some parts of the suburbs ought to receive attention. No building seemed high enough. Another subject to which he drew attention was the antiquated methods of our buildings. We were still deplorably behind the age in some respects. The floors were a harbour of vermin. The roofs were far from being as advanced as they should be. It was high time a move was made towards improvements in those directions. Mr. Kinross went on to speak of matters which concerned the younger members of the profession. He passed some criticism upon the excessive refinement of some of the draughtsmanship of the present day, he emphasised the value of the systematic study of old buildings, and closed with some practical advice as to methods in designing. At the close there was some discussion on the points raised in the address, in which general concurrence was expressed with Mr. Kinross's views. Mr. Kinross was cordially thanked for his address.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday afternoon, Sir John Lubbock in the chair.

**Appointment of Measuring Surveyors and Measuring Clerk.**—The General Purposes Committee's report contained the following paragraph and recommendations:—

"The Council on October 14 authorised the following appointments, viz. (1), a Measuring Surveyor in the Chief Engineer's Department; (2) a Measuring Surveyor in the Architect's Department; and (3) a Measuring Clerk in the Architect's Department. We have now to report that, having advertised for candidates, we received 19 applications for the appointment of Engineer's Measuring Surveyor, 36 for that of the Architect's Measuring Surveyor, and 37 for the Measuring Clerkship. The qualifications of the applicants having been carefully examined, we recommend:—

(a) That Mr. J. Gray be appointed Measuring Surveyor to the Engineer's department, in the first class, at the commencing salary of £206 a year; that his appointment be held during the pleasure of the Council, and be subject to the conditions that he be required to give his whole time to the duties of his office, and be not allowed to take any private business; that he shall not on retirement claim or be entitled to any superannuation or pension, and that he shall submit to any general scheme which the Council may adopt with respect to insurance for pensions or superannuation."

(b) That Mr. E. Brown be appointed Measuring Surveyor in the Architect's department, in the first class, at the commencing salary of £206 a year; that his appointment be held during the pleasure of the Council, and be subject to the conditions that he be required to give his whole time to the duties of his office, and be not allowed to take any private business; that he shall not on retirement claim or be entitled to any superannuation or pension, and that he shall submit to any general scheme which the Council may adopt with respect to insurance for pensions or superannuation."

(c) That Mr. G. J. Ashton be appointed Measuring Clerk in the Architect's department, in the third class, at the commencing salary of £106 a year; that his appointment be held during the pleasure of the Council, and be subject to the conditions that he be required to give his whole time to the duties of his office, and be not allowed to take any private business; that he shall not on retirement claim or be entitled to any superannuation or pension, and that he shall submit to any general scheme which the Council may adopt with respect to insurance for pensions or superannuation."

These recommendations were all agreed to.

**The Bethnal Green Slum-clearance Scheme.**—The Report of the Housing of the Working Classes Committee contained the following paragraphs and recommendation as to the Bethnal Green Slum-clearance Scheme, of which we have already published the details at some length (see *Builder* for Nov. 1, p. 347):—

"Your Committee are carefully considering the question of substituting the present area which will ultimately be displaced by the proposed clearance in Bethnal-green, and their wish is to effect the clearance with as little inconvenience as possible to those who will have to be removed. Directly the area is acquired by the Council, the first step will be to close the most insanitary dwellings, and therefore it is necessary to make provision beforehand in the vicinity of the area for the accommodation of those who are first displaced. Your Committee were unable to take any actual step in the direction of recommending to the Council the hiring or buying of any vacant land for the above purpose until the Council had passed a resolution in favour of the scheme. The Committee, however, were aware that there are two vacant sites which are convenient

for the purpose, and after the adoption of the scheme by the Council they at once entered into preliminary negotiations with the owners of those sites. They have now ascertained that with regard to one of these the matter is extremely urgent, as the owners have received an offer to acquire the site for commercial purposes, and intend to accept this unless they receive an offer from the Council without delay. As a matter of urgency, therefore, your Committee bring this question before the Council.

The site is situate between Gossett-street and Duke-street, and is only about 150 yards from the sanitary area. The ground is vacant, and building might commence immediately. The accommodation would be for about 250 persons in buildings of four floors. Your Committee are of opinion that a fair price for this site, if acquired by purchase, would be £4,500, or, if by way of lease, a rent not exceeding 240*l.* per annum. Buildings erected on this site would be ready for occupation within twelve months from the date of acquisition. Your Committee are aware that there is difficulty in great clearance schemes to find accommodation for those who are first displaced, and they feel bound to lose no opportunity of making some provision, so as to have suitable accommodation ready in hand. Your Committee therefore recommend the Council to pass the following resolution:—

"That, in order to provide part of the accommodation which will be required in connexion with the Boundary-street scheme, it is desirable that the piece of land in Gossett-street, now vacant and comprising about half-an-acre, should be acquired under Part 3 of the Housing Act, 1890, and that the Housing of the Working Classes Committee be authorised, subject to the necessary estimate being submitted to the Council by the Finance Committee, as required by the statute, to make arrangements for acquiring the same with the consent of the Local Government Board, by purchase or lease; by purchase, at a price not exceeding £4,500, or if by way of lease, at a rent not exceeding 240*l.* per annum."

Mr. Rhodes moved, and Mr. Hutton seconded, an amendment referring the report back to the Committee, with instructions to state what measures were to be taken for utilising the land proposed to be acquired.

After considerable discussion the debate was adjourned till next week.

**Rosebery-avenue.**—The Improvements Committee, in their report, said:—

"We have had under consideration the plan for the northern portion of this improvement (lying between Farrington-road and St. John-street-road), and we find that it is necessary to obtain the formal sanction of the Council to the construction of the subway, the same not having been specifically mentioned in the Act authorising the improvement. The Council is aware that a subway has already been provided in the completed portion, and it is intended to extend it the whole length of Rosebery-avenue. The section now reported on would be about 2,000 ft. in length, 12 ft. in width, and 7 ft. 6 in. in height, and is estimated to cost about 12,000*l.* We recommend:—

(a) That, subject to an estimate being submitted to the Council by the Finance Committee, as required by the statute, a subway be constructed along Rosebery-avenue, between Farrington-road and St. John-street-road."

We are also of opinion that persons who use the subway for laying their pipes and wires should pay for the privilege, and therefore we recommend:—

(b) That it be referred to the Parliamentary Committee to consider and report on the advisability of applying to Parliament for powers to compel gas, water, and other companies to place their pipes, wires, &c., in the subway, and to enable the Council to charge a rent for such user."

In connexion with this subject, we have had under consideration the question of altering the position of a 45-in. water main belonging to the New River Company. This main runs from the New River Head to St. John-street-road, and for a distance of about 400 ft. will be disturbed by the formation of Rosebery-avenue. By the terms of the Act the main must be laid between the months of November and April, and we are anxious to arrange for the work to be commenced immediately, for it is obvious that unless it be completed by April there will be a delay of nearly a year. The question now arises whether this main, for the short length which it will traverse Rosebery-avenue, shall be inside or outside the subway. If it be placed inside, a considerable difficulty presents itself, because the sewer will be laid under the subway, and we are advised that it would be utterly impossible to clear the ground and construct the sewer with the subway above it, in sufficient time to enable this large main to be laid down within the time specified. We are informed by the Engineer that if this main were to be laid outside the subway the very serious delay indicated would be avoided, and that, as it serves as a conduit for feeding the supply pipes it is not subject to a high pressure, and consequently not liable to be disturbed like an ordinary service main. The service main for the supply of the locality would be laid inside the subway. The matter being one of some importance, we have felt it our duty to report to and seek the

\* No doubt, but care should be taken to give to the tiles and pipes described in the paper, with the plaster. For want of this precaution much inconvenience, and even danger, has been experienced, we hear, with regard to the internal decorations of the National Liberal Club.

instructions of the Council thereon. The completion of this important improvement is so urgently desired by the Council and the public, that we believe that any avoidable delay would not be sanctioned by the Council. We therefore recommend,—

“(c) That the 48-inch water-main belonging to the New River Company be laid outside, and the service main inside the subway of Rostery-avenue.”

These recommendations were agreed to, and after the transaction of other business the Council adjourned.

#### BUILDERS' BENEVOLENT INSTITUTION.

##### ELECTION OF A PENSIONER.

An election of one pensioner on the funds of this Institution was held at the Offices, 4, Vernon-place, Bloomsbury-square, on Thursday, the 27th ult., Mr. W. Shepherd (President) in the chair. There were five candidates for the one vacancy, viz., one man and four women.

Shortly after the close of the poll, the scrutineers (Messrs. T. Stirling and T. F. Rider) announced the result of the poll to be as follows, viz.—Charles Sabey, 97, St. Peter's-street, Islington, aged 71, builder (third application), 1,636 votes; Margaret Alice Richardson, 5, Preston, North Shields, aged 66, widow of B. Richardson, builder (fourth application), 1,297 votes; Mary Ann Shapland, 132, Stamford-street, Lambeth, aged 71, widow of William Shapland, builder (third application), 1,241 votes; Elizabeth Darby, 2, Sangora-road, Clapham Junction, aged 81, widow of Edward Darby, builder (first application), 3,227 votes; Bessy Webb, 314, Old-street, E.C., aged 60, widow of Robert Webb, builder (second application), 1,555 votes. The successful candidate was therefore declared to be Elizabeth Darby, whose late husband subscribed to the Institution from the time of its foundation.

The Chairman regretted that the Committee had the painful duty of sending away four deserving candidates through want of funds. The building and allied trades numbered 5,000 firms within the Metropolitan area, yet only one-tenth of that number supported the Institution. He therefore appealed to non-subscribers for assistance.

Among the friends of the Institution (other than those already named) who took part in the proceedings were Messrs. C. Bussell, J. T. Bolding, W. Scribner, R. Perkins, and G. M. Watts.

Votes of thanks to the chairman and scrutineers closed the proceedings.

#### ROBERT BOYLE & SON, LIMITED.

The fifth annual meeting of this Company was held at the City Terminus Hotel on the 26th ult., when a dividend of 12½ per cent. was declared on the ordinary and deferred shares, one-sixth of the profits earned being placed to the reserve fund, and a balance of 1,299½ carried forward to next year.

The Chairman (Mr. Gilbert Wood) in moving the adoption of the report and accounts, which were unanimously carried, called attention to the continued satisfactory position of the Company, which still maintained the high position that had been won for it under the experienced management of Mr. Boyle. The business of the Company showed a steady increase from year to year, and he thought the shareholders were to be congratulated on the results achieved.

In moving the re-election of Mr. Robert Boyle as a Director, the Chairman said that the shareholders present would feel, with himself, that this was a more or less formal resolution, Mr. Boyle being practically the Company itself.

Mr. Robert Hobart (a Director), in seconding the resolution, which was carried unanimously, said he thought the shareholders owed a deep debt of gratitude to Mr. Boyle for his energy and self-sacrifice in the interests of the Company. He devoted his whole time to its affairs. He devoted his labours on behalf of the Company was the fact that, in the face of the keenest opposition, and the numerous attempts that were being made on all sides to successfully compete with the Company, the dividends had been maintained at so satisfactory a figure.

The other Directors for the year and the Auditors having been unanimously elected.

Mr. Robert Boyle, in acknowledging the unanimous vote of thanks accorded to the Board and to himself as Managing Director, said: I beg to thank you on behalf of my co-Directors and myself for the very cordial manner in which you have recorded your approval of the report which has been submitted to you.

When the prospectus of this Company was issued five years ago, I showed the confidence I had in the business by taking practically the whole of the purchase-money in shares in the shares issued, to which I have added as opportunity offered. I also personally guaranteed a minimum dividend of 10 per cent. each year for the first five years, which period having now elapsed, you are in a position to judge as to how I have fulfilled my undertaking. I trust, as I also believe, that the next five years will be equally as successful, the

demand for the ventilating and sanitary appliances of the Company increasing every year, both at home and abroad. The latest improved form of the self-acting air-pump ventilator giving great satisfaction wherever used, and though of superior power and make, being constructed of the best rolled steel plates, galvanised, and the workmanship of the highest class, is sold at about 50 per cent. less in price than the inferior forms previously manufactured. The foreign agencies are progressing satisfactorily, the air-pump ventilator and other appliances being applied with continued success to an ever-increasing number of important public buildings in Germany, France, Russia, Belgium, Italy, Spain, Holland, Denmark, and Norway and Sweden, also America and Australia. You will doubtless have seen from the published accounts that I have during the past year visited Egypt, India, China, and Japan, and I believe a good foundation has been laid for an important extension of the Company's business in those countries, where we have already ventilated a large number of Government and other public buildings. It is my intention to proceed early next year to South Africa, where we have always done a large business, but which I believe to be one of the most desirable development if systematically worked up, and I trust at our next annual meeting to be able to submit to you, as the outcome of my endeavours, results which may be considered satisfactory. The proceedings then terminated.

#### Books.

*Estimating: A Method of Pricing Builders' Quantities for Competitive Work.* By GEORGE STEPHENSON. Second Edition, carefully revised. London: B. T. Batsford, 1890.

*Repairs: How to Measure and Value them. A Handbook for the Use of Builders, Decorators, &c.* By GEORGE STEPHENSON. London: B. T. Batsford, 1890.

IT is strange that amongst the immense number of books which have been produced on various matters connected with building so few have dealt in a thorough manner with the subject of estimating. Yet its importance can hardly be overrated. A builder builds in order that he may gain a livelihood and, therefore, a profit, and—unlike almost every other tradesman,—he undertakes in advance to produce for a certain price something differing in many respects from anything that has ever been produced before.

One would expect, therefore, that estimating would be universally based on scientific principles. This, however, is far from being the case. Indeed, we fear that more than half the estimates made are based on prices partly traditional and partly got by rule of thumb. It has been our lot on several occasions to examine the same hills of quantities as priced by two or three competing firms, and we have always been struck by the marvellous diversity in the prices set down for the same thing,—a diversity to all appearance wholly unwarranted. And to make the matter worse, these diversities are most marked in the items of labour only, where surely we might almost expect identity.

A London builder, carrying on a large business, upon whom these considerations were once pressed, replied that if some of his prices were too low, others were too high, so that the result was the same! This happy-go-lucky fashion of pricing a bill of quantities, at all times dangerous, is rendered still more so by the condition now usual in building contracts, under which the priced hills of quantities become a schedule for the valuation of extra works. Thus a builder often finds himself called upon to do a considerable amount of work of a kind he has under-priced, and a contract that would have shown a profit leaves him with an absolute loss; a result due to want of reasonable care in preparing his original estimate and to nothing else. As all builders know, price-books are of little or no use in pricing a competitive estimate, and each competitor must construct his prices for himself. By few is the importance realised of doing this in a scientific manner. Of what elements does a price consist? Clearly of the following:—1. Material; 2. Waste; 3. Labour; 4. Carriage; 5. Profit, including risk.

1. The price of materials constantly varies with the market, and must be calculated and re-calculated as occasion may require.

2. Waste can be ascertained by observation, classification, and analysis, and may be expressed by a percentage.

3. The quantity of labour can be similarly arrived at, and can be expressed by a constant, which, being applied to the current rate of

wages, will give this element of the price. For example, assuming that the constant for a 2-in. four-panel square-framed deal door is .68 per foot per hour, and the rate of wages 9d., the labour would be 6.12d. (or about 6½d.) per foot superficial.

4. The cost of carriage may vary with every contract, but can usually be ascertained by inquiry, and expressed by a percentage on all items, excepting labour at the workshops.

5. Profit and risk.—In our opinion the proper mode of dealing with these elements is to price every item in the first instance at prime cost, and at the end of each bill to add for carriage, next a percentage for risk, and lastly a percentage for profit. The percentage for risk will obviously vary with the different trades, and in a less degree that for profit also, being in the latter case greatest when the proportion of labour to material is highest.

We can see no reason why, in every builder's office, there should not be compiled from foremen's reports a series of tables showing the constants of labour and waste, which would render the calculation of prices an easy task.

The two books before us on "Estimating" and on "Repairs" deserve commendation, inasmuch as they are based on a theory of the calculation of prices which is in the main correct. They also contain many valuable hints and maxims of a general character, but their chief merit lies in the fact that they attack the "jumping" method of estimating with its results at once ridiculous and disastrous, and that they do this in the most effective manner, viz., by showing a better way. False ideas may be confuted by argument, but only by true ideas can they be expelled.

At the same time we must point out that the books contain many faults. The first and chief of these is that the prices are too low. Good work cannot be done at these rates. The author seems to assume that every workman will always be working at his maximum of efficiency. There is also too little allowance for risk. 1s. 2d. is hardly enough for labour of mixing, throwing in, and levelling a cubic yard of concrete; nor 1s. 11d. for a superficial yard of Portland cement paving, ¾ in. thick, laid in the best manner.

A further illustration of the same error is to be found in the price of 4d. each for fair ends to a 11 in. x 3 in. York throated window sill, which is based on the sanguine assumption that a mason would do four of them in an hour! (p. 53). On the item, "extra only on common brickwork, for rubbed and gauged arches in best red bricks and pointing," the author remarks, "I should say these were not deducted from the red facings." This is to misunderstand the plain meaning of the item. Erroneous also are the statements that in pricing "overall one course of facing, there is the material in the projection to provide for" (p. 26), and that it is not usual to price rough relieving and segmental arches.

In conclusion, we must add a word of criticism on the following passage on money provisions (p. 6):—"It is a custom with many architects to say of provisions: 'These prices are P.C., and the contractor must add his profit, &c.' If the work is wanted by the contractor, he seldom adds anything to the so-called P.C. prices, but relies on the trade discount for profit. Where the discount is allowed, this often leads to a dispute between architect and builder as to whether P.C. means list prices or net after deducting the trade discount."

In the interests of honesty of estimating, we must protest against the practice of pretending to misunderstand the meaning of the term P.C. As every one knows, it means the price after deducting the trade discount, which varies from 5 to 40 per cent. There is no surer way of breeding disputes and irritation than for the builder in these cases to "rely on the trade discount for a profit." He can only succeed by outwitting the architect in collusion with the special tradesmen. He is almost certain to be found out, and all confidence in him is henceforth at an end.

*Asbestos: Its Properties, Occurrence, and Uses.* By ROBERT H. JONES. Crosby Lockwood & Son.

The author of this admirable treatise on a subject of rapidly growing importance may be congratulated on having written a book that was really needed. Asbestos has hitherto, so far as we know, only been dealt with sectionally and in scattered communications buried

in encyclopedias, scientific journals, and blue books.

The work is, of course, largely and necessarily a compilation, but the compilation is very well done, and is interspersed with much useful original matter. The value of the book is greatly increased by the numerous and excellent illustrations with which it is embellished. The beautiful colotype plates merit special recognition, reproducing, as they do, with photographic fidelity, the curious fibrous structure of various specimens of the mineral.

Although asbestos is a widely-used word, and the general physical characters of the mineral pretty well known, it does not seem to be so well understood that the term is not a specific one, but is applied to a number of minerals differing considerably in chemical and other characters, but resembling each other in having some degree of fibrous structure. Asbestos is usually regarded as a variety of hornblende, which, by Dana, is classed as a sub-division of *Amphibole* and includes the following varieties:—

*Amianthus* which is characterised by the length of its flexible and elastic fibres. Common asbestos which is unctuous to the touch, often of a pearly lustre, and is heavier and less flexible than amianthus.

*Mountain Cork*, so called from its general appearance and power of floating on water, due to the multitude of air spaces it encloses. *Mountain leather*, *Mountain paper*, and *Mountain wood* are, as their names indicate, fibrous minerals of peculiar appearance. In addition there are included under the term asbestos fibrous varieties of *Pyroxene* and *Crocidolite*.

As regards chemical composition, the different forms of asbestos may be regarded as silicates of lime and magnesia, or alumina with varying amounts of water.

At the present time Canadian and Italian asbestos hold the market, and although other deposits has been met with that promise well, no serious competitor to the products of these two countries has yet come to the front. The principal mines are nearly all in the hands of a few large manufacturers, who require all they can get for their own purposes; hence the market price of the mineral tends to rise to a point that greatly restricts its general availability, especially as new applications for it are being constantly discovered. It is to be hoped that large and easily-worked deposits of suitable mineral will before long be discovered and worked, otherwise it may rise in value, as platinum has, to an almost prohibitive figure. Platinum, it may be remembered, was a few years ago purchasable at about 40s. per oz.; recently through the numerous fresh and extended applications of the metal, which have created a demand for it greatly exceeding the limited supply, the price has risen to 84s. per oz., a price that simply prevents its profitable utilisation in certain directions; and so it seems likely, in less degree, to be the case with asbestos, of which, however, there is plenty of a certain kind, but only a limited amount of the most useful quality.

To our readers the chapters dealing with the technical applications of asbestos will have special interest.

The employments of the woven and felted mineral in boiler-coverings, packings, and fire-felts, the millboard used for steam-joints, lining walls and safes, and even in the construction of library shelves, are all well known.

The value of asbestos curtains in theatres and similar places of amusement, for the purpose of confining the flames and smoke in the event of an outbreak of fire to the stage, is pretty fully recognised. Such curtains have obvious advantages as regards lightness, noiselessness, and infusibility, over those of iron or steel, which are apt to be cumbersome, clumsy, and noisy, in addition to their liability to rust when not in use, and to bulge and fuse when their services are most required.

Asbestos paint has proved itself an efficacious localiser of fire, when applied to woodwork and other inflammable materials. For packing and lining the walls of cold storage buildings and refrigerating chambers, its low conductivity for heat makes it very serviceable. As a roofing material it is also efficient in certain situations, and can be utilised in one or other of its manufactured forms.

We counsel our readers to get this exceedingly interesting little work for themselves; they will find in it much that is suggestive, and a great deal that is of immediate and practical usefulness.

*The Architects' Valuator and Directory of Architects belonging to Institutes and Associations in the United Kingdom.* Manchester: William Osborn. 1890.

WE are at a loss to conceive whence the "Architects' Valuator" gets its name. It is simply a collection of trade prospectuses, and its value consists of being a convenient compendium of what a large number of manufacturers have to say in recommendation of their own goods. The appendix, giving a list of architects belonging to the recognised Institutes and Associations of the United Kingdom, is useful.

## Correspondence.

To the Editor of THE BUILDER.

### BRICK-BURNING.

SIR.—Mr. Jopling's letter in your issue of Nov. 23 calls, I think, for a reply from some one acquainted with the brickmaking process, and with your permission I will briefly give expression to my opinions from a brickmaker's point of view, as I am quite sure you will readily admit there are two sides even to this question.

From Mr. Jopling's letter it would appear that clamp bricks are burned with "animal and vegetable refuse, in all stages of putridity, and all kinds of indescribable filth," permit me to say that clamp bricks are burned with breeze and ashes, these being the technical names applied to the coarser and finer residue of clivders extracted from rough dust, after the animal, vegetable, mineral, and other refuse has been most carefully sorted out.

In regard to the opinion expressed that the clamp brick is doomed, and that kiln bricks of a better quality can be produced at as low or lower cost, I would say that in the opinion of men well qualified to judge there is no brick which will stand the atmospheric influences of London so well as the clamp-burnt stock, which resists fire, frost, and the effect of smoke, &c. Many buildings have been erected in London within the last few years, and faced with these cheap kiln bricks, and I have watched with interest in several cases the disfigurement of many of these buildings through the decay of these same bricks, which may be seen in a state of disintegration. I think, however, I may safely say that no one can refer to a properly burnt London stock brick deteriorating under similar conditions.

The great point of difference between a clamp-burnt and a kiln brick is that the former is actually burnt, the clay and admixture of ashes forming a fuel, whilst the latter is only baked, although, possibly, at a great heat. Nature, ever beneficent, appears to have provided a clay in the proximity of London exactly suited to the requirements of the neighbourhood, and, although, I readily admit some kiln-burnt bricks of an expensive character may stand the influences of weather fairly well, I feel quite sure that the common class of wire-cut brick, which has recently been brought into the London market, will not stand like a clamp-burnt stock, which does not fly under the influence of fire, is unaffected by frost, and resists the insidious attacks of acids in sewage and smoke. The clamp brick is light in weight, though sound, and the granular skin gives the best possible surface for the adhesion of mortar or cement.

The proposed by-law of the London County Council is undoubtedly of the gravest importance to brickmakers in the London district, as I fail to see how it is possible to burn either clamp or kiln bricks without emitting smoke. The kiln really emits a denser volume of smoke than the clamp, as it is fired entirely with coal, whereas the clamp burns wholly every brick-forming fuel, layers of breeze, which is practically smokeless, being used to "fire" the clamp. The clamp brickmaking interest supplying the London market would represent an output of some six or seven hundred millions of bricks per annum, the capital invested is very large, and the men employed many thousands. Some districts are almost entirely populated with families interested in this class of brickmaking, and the announcement of your correspondent that the trade is doomed is a big order. All brickmakers (with very few exceptions who are freeholders) hold their leases under a covenant to make a minimum number of some millions of bricks per annum upon which a royalty has to be paid, and if there is a possibility of closing brickworks, many of which have been in operation for very many years, and have been the means of employment to families for generations, I think the question of compensation may very properly be raised.

There is no doubt that the present agitation is caused through some West end Vestries depositing the refuse of the parishes in two or three brickfields near populous neighbourhoods, and in which no facilities were provided for the destruction of the animal and vegetable matter, which was therefore openly burnt, and the smell arising from this has perhaps somewhat naturally, although erroneously,

been attributed to the burning of bricks, and has unquestionably been a cause of offence. I take it, however, that a large industry such as this should not be condemned through the indiscretion of two or three individuals. A BRICKMAKER.

### MESSRS. FLOCKTON & GIBBS'S PATENT.

SIR.—In our letter to you of October 31 we stated "The date of advertisement of this patent is, we believe, October 29, 1890."

Our attention has recently been drawn to an advertisement in the *Patent Journal* of October 8 of "Patent No. 10,624, Flockton & Gibbs." This printer's error led to our patent agent not noticing the advertisement.

He has applied to the Patent Office for a correction, and, at our request, for an extension of the time within which notice of opposition must be given. The Patent Office will correct the printer's error, but refuse to extend the time for notice of opposition beyond the 8th inst. We hasten to inform you of this. FLOCKTON & GIBBS, Sheffield, December 3.

### BRIDGE CHAPELS.

SIR.—Your correspondent, "W. E. D. M.," might have added to his list the Chapel of St. Edmund and St. Edward the Confessor, formerly on the bridge over the Dart, at Totnes, Devon.

C. R. E. K.

## The Student's Column.

### HOT-WATER SUPPLY FOR BATHS, LAVATORIES, &c.—XXIII.

FAULTS AND SOURCES OF DANGER (continued).

It is possible for great trouble and annoyance to arise from a very trifling cause. As an instance, we may mention a piece of loose material in the pipes. This may arise from the workman omitting to look through his pipes the last thing before using them, or it is usual for workmen, when leaving an unfinished job at night, to stop up the open ends of their pipes with a plug of hemp or other such material, which, if not carefully removed, may leave sufficient in the pipe to give the greatest trouble imaginable.

There is no fault so difficult to locate and remedy as that of what we may call a "floating obstacle," and it is a fault that may not show itself except at irregular intervals.

Sometimes a stoppage will occur by a fall of "fur," which will collect at one of the angles; this rarely occurs if the pipes are not interfered with, but if old pipes are being altered or worked upon in any way, it is one of the most common results to expect, as the jar of the tools and the hammering so often necessary in loosening old sockets, also loosens the incrustated deposit as a matter of course. The most common place for the loosened matter to collect is just by the taps, as the rapid passage of the water carries it to this point, and after working on old pipes in a hard-water district one or more of the old taps have to be removed to clear the pipe nearly always.

When noises are heard in the pipes of a hot-water supply apparatus they may arise from various causes, many of which are peculiar to new work and of which we have already spoken. In old work they are nearly always attributable to furred pipes, which, when sufficiently obstructed, prevent a free escape of steam, which, consequently, has to attain sufficient strength to force its way out with more or less violence according to the resistance it experiences.

When the pipes are clear the rapid circulation of the water carries the steam with it to the point where it can escape easily, i.e., to the expansion-pipe, but when the pipes are closed the circulation is retarded, and the steam requires to make its exit faster than the water can convey it.

This trouble is always conspicuous by its gradual growth, but when professional assistance is called in, it is, of course, usually, at its height, as the occupiers of the building nearly always allow it to go on until the noises are positively alarming, when it is necessary to take down the furred portion of the pipes and replace them with new. In almost every instance the pipes nearest the boiler will be found in the worst condition.

### ACCIDENTS AND SOURCES OF DANGER.

An apparatus of the kind under discussion may be said to be perfectly safe in a general way, but, like everything else, it is subject to accidental circumstances, which in this instance are often sources of real danger. The element

of danger is steam, but this is quite harmless if it is not confined, and has free exit and escape.

The expansion-pipe is provided expressly to ensure safety, but if it becomes stopped by any means its safety is instantly disposed of; but the stoppage of the expansion-pipe only will not usually bring about an explosion, as before this can occur the pressure exerted will relieve itself by way of the cold supply service, supposing this pipe to be clear, and, in fact, if there is any possible way for the steam to escape by the exertion of pressure, it will go this way before there is any likelihood of the boiler bursting, as we must remember that the boiler and pipes, &c., are of a strength that requires a very great power to bring about their rupture, and it is on this account that such accidents are so usually fatal to life, as when an explosion does occur the force, which is of a rending nature, is most destructive.

We may sum up the causes of accidents, by explosion at the boiler, as follows:—

1. Frost.—This is the general cause of such accidents, and it is really wonderful that the number is so very small from this cause. In the first place, some portion of the cold supply service to the cylinder is generally in the coldest place imaginable, such as the roof or a room just under the roof, and it follows, as a matter of course, that the expansion pipe is terminated in a similar position. Now, here we have the two open pipes of the apparatus, with their extremities in a position most favourable for their being stopped by frost; we may take it for granted that in a simple form of apparatus, the contents of the reservoir will be brought down to a low temperature in four or five hours after the fire is extinguished at night, particularly in severe weather, and this leaves two or three hours (the coldest of the twenty-four) for the pipes to become frozen if it is possible for them to become so, and it must be remarked again that accidents of greater frequency from this cause ought almost to be expected.

There is not the least doubt that many and many a kitchen fire has been lighted in happy ignorance when it has been almost suicidal to do so; but there are, fortunately, many small things unknowingly done by servants and others that tend to obviate danger. For instance, there is no danger until steam is formed, and under a very high pressure; this can only happen if the boiler is a rapid heating one, and *no water is drawn off*. If we draw water we relieve the pressure, and, what is more, reduce the temperature probably, and the opening of the tap will most likely give indication that something is wrong. Then another source of safety is present in the fact that there is every possibility of the ice in the expansion-pipe melting (by the warmed water in the apparatus) before any steam is generated.

The conclusion we must arrive at in this matter is that all pipes in connexion with a hot-water supply apparatus that are situated in cold positions, particularly in roofs, should be well covered with some poor conductor of heat, such as hair felt or any woolen material or other substance that will prevent loss of heat by radiation.

Next in priority to frost as a source of danger is the practice of putting stop-cocks in the main (primary) flow and return pipes; this practice has already been referred to fully, and needs no further notice here, except to say that it should be condemned to the utmost of everyone's power.

Another possible cause of explosion is a shortness of, or exhausting, the water supply unknowingly; we say unknowingly, as should the failure in supply be noticed every one has sufficient sense to take some steps to avoid possible accidents. This cannot very well happen with the cylinder system of apparatus, and it cannot very well occur anyhow without the shortness of water becoming quickly apparent at the taps, but it was only quite recently that a serious accident from this cause was only escaped by the fortunate existence of a safety valve, as it appears the water had been drawn nearly all away overnight, and the fire had been lighted for some hours in the morning without anyone noticing the want of water, so that what little remained had been evaporated, and when the daily supply of water came in, some portion of it did its best to flow into the red-hot boiler, with results that need no describing. The force exerted in this instance was so great that the safety valve did not merely open but had the upper portion twisted up like a piece of crumpled paper.

The last source of danger there is to explain is "furred" pipes. This question has been practically exhausted in the previous papers, but it might be repeated that an accident from this cause, though possible, is highly improbable, as before any real danger need be feared the noises and violent shakings and vibrations must warn everyone to give the matter attention promptly.

#### OBITUARY.

MR. JOSEPH, F.S.A.—The death has just occurred of Mr. Joseph, of Brecon, in his sixty-fifth year. The deceased gentleman, who was formerly a banker in Brecon, was a Fellow of the Society of Antiquaries, and an old member of the Cambrian Archaeological Society.

MR. ROBERT SLATER.—The death is announced, at the age of 49, of Mr. Robert Slater, which took place on Monday night, at his residence, Holly Bush, Broomfield Crescent, Headingley, Leeds. According to the *Leeds Mercury*, Mr. Slater had achieved an enviable reputation as a sanitary engineer. He was called in to overhaul the drainage of Hawarden Castle, Clifton Castle, the Reform Club, Cookridge Hospital, and many other mansions and institutions in various parts of the country. Mr. Slater was a guardian of the poor, and also a member of the Corporation. He entered the Leeds County Council in January, 1886.

#### GENERAL BUILDING NEWS.

NEW POLICE BUILDINGS AT BROMSGROVE.—On the 25th ult. Mr. G. W. Hastings, M.P., Chairman of the Worcester County Council, opened the new police buildings, which have been erected by the County Council in the Crescent New-road, Bromsgrove. The total cost has been between 4,500l. and 5,000l. The new police-station comprises residences for the superintendent, sergeant, and a married constable, with a mess-room and dormitory accommodation for six single constables. A charge-room, six cells (with a corridor approaching), and a drying chamber are also provided and heated with hot-water apparatus. The Magistrates' Court is 50 ft. by 30 ft., by 22 ft. in height. The buildings were designed by Mr. Henry Rowe, County Surveyor, Mr. Turberville being clerk of the works, Messrs. Tilt & Weaver, of Bromsgrove, the contractors, and Messrs. Ward & Son, of Worcester, the hot-water engineers.

NEW HALL, KIDDERMINSTER.—A new building has just been erected in Lorno-street, Kidderminster which has been presented to the Baptists of the town. The building, which has been named Milton Hall, was built by Messrs. Bannan, of Kidderminster, from the plans of Messrs. Ingall and Sons, of Birmingham, and will seat 350 people. Its erection and furnishing cost about 2,000l.

NEW Y.M.C.A. INSTITUTE, BIRKENHEAD.—On the 20th ult. a new Institute for the Young Men's Christian Association was opened at Birkenhead. The new building is constructed of red bricks and terra cotta. It is situated in Grange-road, and has a frontage of 60 ft. The entrance in Grange-road gives access to the entrance-hall, and from this hall staircases lead down to the gymnasium, and up to the public hall, and to the reading-rooms, library, &c. On the ground floor, on either side of the entrance-hall is a shop, and cellar below, in the rear of the shops are the secretary's office and a small class or waiting room. On the first floor are the lecture-room or library, 28 ft. by 19 ft., and two reading-rooms. On the second floor are provided residential apartments for the secretary, committee-rooms, &c. The gymnasium has a floor-space of 70 ft. by 40 ft. At the Grange-road end is a visitor's gallery, and along the west side there are dressing and bath-rooms. The public hall, 86 ft. by 40 ft., and accommodating over 900 persons, is placed over the gymnasium, and has a gallery at the Grange-road end, while there are four class-rooms and retiring-rooms from the public hall. Caretaker's rooms and ample cellars and store-rooms are provided in the basement, and lavatories and conveniences in various parts of the building. The public hall, gymnasium, and dressing-rooms are heated by hot-water, and the reading-rooms, library, and class-rooms with open fireplaces. The rooms are ventilated by fresh-air inlets and foul-air extracting flues. The architect is Mr. William Wallis Baldwin, of London, under whose supervision and that of Mr. J. C. Old, jun., the work has been carried out by Mr. Alexander Bleanley, of Birkenhead.

CHURCH RESTORATION AT CASTLE BROMWICH.—On the 30th ult. the Church of SS. Mary and Margaret, Castle Bromwich, was reopened, after being closed for two months, during which time various works have been carried out. These comprise some structural repairs, a scheme of decoration by Mr. John Taylor, of Edgbaston; the placing of a marble pavement and steps in the sanctuary by Messrs. Bennett; and the insertion of four stained-glass windows. The windows have been executed by Messrs. Ward & Hughes, of

London, the canopy work being designed by Mr. Bateman, of Birmingham, the architect under whose superintendence the work has been carried out.

MEMORIAL SCREEN, PEBBLES.—There has just been completed in Pebles Church, Peebles, a chancel memorial screen, the gift of Mr. R. T. Hamilton Bruce, of Edinburgh. The screen consists of three bays, each being divided into two portions by a representation of a tree stem, spreading out into branches, leaves, and fruit in the cusped head of the bay respectively, the vine in the centre, with apples and pomegranates on the sides. In the bays at left and right are painted the Ten Commandments. Above the bays are nine spaces or niches, each being filled with a kneeling figure representing Truth, Charity, Hope, &c. The work has been executed by Messrs. Cottier & Co., of London.

ST. PAUL'S CHURCH, GREENOCK.—It has been decided by the congregation of the free church in Newark-street, Greenock, to erect a permanent church on the site at the corner of Bentinck and Newark-streets. Dr. Rowand Anderson, of Edinburgh, was entrusted with the preparation of the designs. The church consists of a nave 90 ft. long, 31 ft. broad, a choir of 30 ft. long and 21 ft. broad. At the west end is a vestibule, and on the north and south sides of the porch are stairs for access to a gallery over the vestibule. The nave is divided into six bays, five of which open into a narrow aisle on each side, serving only as a passage. On the north side, and occupying the space of two bays, is a transept. The choir has a north and south aisle. The one on the north side will be set apart for the organ. As the ground falls from east to west, the east end of this is to provide a hall under the choir and aisles, and vestry, session-room, lavatories, &c., under the north transept. Provision is made for the erection of a tower to the north of the choir aisle. The church will be lighted by the clearstory and large windows in the gables. The principal entrance is by a pointed archway doorway, flanked by windows which light the vestibule. The window above consists of eight lights. The window in the east gable is composed of six lights, with tracery. The gable is flanked with buttressed pinnacles terminating with crocketed spires. The aisles of nave have no windows, but each bay of the nave has a large three-light pointed window, with buttresses between. The tower is to be 40 ft. square at the base, 115 ft. to the top of the tower, and 180 to the top of the vane of the spire. The roofs, which will be covered with green slates, have their principal constructive parts made of steel. Pointed wood ceilings are framed on the under side, and divided into panels by mouldings, the main ones rising from stone shafts which rise from the floor.

NEW THEATRE, NEWCASTLE.—The new Empire Theatre of Varieties in Newgate-street, Newcastle, was opened on Monday. The new theatre consists of pit, with stalls separated from it by folding chairs. Above this is the first circle. On the second-floor are the private boxes. The upper balcony is on this level, and is provided with sitting and standing accommodation. The procedure is nearly 30 ft. wide. The entire building is lighted by electricity. Ample exits are provided from every part of the house, all doors either sliding or opening outwards. Refreshment-rooms and cloak-rooms are provided on each floor. The general contractor is Mr. Alexander Pringle, of Gateshead. Messrs. Charlton & Co. are the electrical engineers. The whole of the works have been designed by Messrs. Oliver & Loosan, architects, of Newcastle.

A NEW CHURCH FOR TYNEWYDD.—On the 27th ult. the ceremony of laying the foundation-stone of a church at Tynewydd was performed by the Countess of Dunraven. The church is designed to accommodate about 400 worshippers. It consists of a nave, 63 ft. 6 in. long by 26 ft. wide, chancel, and organ chamber and vestry. The nave is lighted from the west by a five-light window, with foliated heads, and the north and south walls are pierced with two-light Early English windows, set alternately in the bays between the buttresses. The chancel has a three-light window with foliated heads, and two small traceried lights in the north wall. A sedilia and credence are shown on the south side of the chancel. The roof internally will be open to the apex, and constructed of unvarnished pitch-pine. The chancel roof is similar. The seating and furniture are to be of pitch-pine, and varnished. Externally the walls will be faced with grey stone, and the jambs and arches of the doors and windows are to be worked out of Bath stone. The roof, which is to be covered with green slates and a red tile ridge cresting, will be broken over the apical with a bell-shaped. The church, including the whole of the seating and furniture, heating apparatus, and boundary-walls, will cost 1,500l. The architect is Mr. E. M. Bruce-Vaughan, and the contract is let to Mr. John Haines, of Cardiff.

PONTYFRIDG FREE LIBRARY.—On the 27th ult. the new Pontyfridg Free Library was opened by Mrs. D. W. Williams, Fairfield. The building, which was erected at a cost of 2,000l., from designs by Messrs. Potts, Sulman, & Hennings, of London, is situated in Gallowastad grove. Mr. Julian, of Pontyfridg, carried out the contract.

**NEW WESLEYAN CHAPEL, DOWNDERRY.**—A new Wesleyan chapel has just been opened at Downerry, Cornwall. The new chapel is built of local stone, much of which was raised from the site itself. The exterior is covered with Portland cement, washed by the sea, and the arches of the windows. It measures 58 ft. by 34 ft., and the height is 20 ft. It will seat about 200 persons, and is lighted with thirteen windows of Gothic design, glazed with straw-coloured cathedral glass. The building is roofed with Dalabole slate and is furnished with a rostrum and seats of pitch pine, mixed with American red pine, varnished. Mr. J. E. Small, of Plymouth, is the architect, and Mr. T. E. Madams, of Liskeard, the contractor.

**WESLEYAN SCHOOLS, WILLENHALL.**—The new Wesleyan schools, Willenhall, have just been rebuilt on an enlarged scale, at a total cost, including fittings and furniture, of 2,000. Mr. Benjamin Baker, of Bilston, is the architect.

**CHURCH RESTORATION AT WELSH ST. DONATS.**—The Church of Welsh St. Donats, near Cowbridge, Glamorganshire, is now to undergo substantial restoration. It is reported to be quite unfit for use at present. The tower and bell-framing is to be made good, and the works will comprise new floors, new roof, new organ, and new chancel, and heating apparatus, new pulpit, lectern, altar, and seats, complete restoration of the old oak roofs, a new roof on porch, new chancel seats, and new oak doors, &c. A faculty has been applied for, and the architects who have been entrusted with the work are Messrs. Kempson & Fowler, of Llandaf.

sewers. The sewers are flushed with brook water. The Commissioners have expressed themselves well satisfied with the efficient working of the scheme, and with the fact that the actual cost has proved less than the estimate. The engineer to the works is Mr. W. H. Radford, C.E., of Nottingham, and the design was chosen in open competition. The contractors were Messrs. McKay & Son, of Broughty Ferry, near Dundee.

**STAINED GLASS AND DECORATION.**

**ST. PAUL'S CHURCH, WESTLEIGH.**—On the 29th ult. three stained glass windows were unveiled at St. Paul's Church, Westleigh. The windows, which are placed in the south-west wall of the church, have been executed by Messrs. Heaton, Butler, & Bayne, of London.

**NEW WINDOWS, ST. JAMES'S CHURCH, GLOSSOP.**—Two windows, in memory of the three brothers Wood, and Mr. John Wood, have just been placed in St. James's Church, Glossop. They have been executed by Mr. A. O. Hamming, of London, and represent the two apostles, St. James, the patron saint of the church, and St. John, and the two prophets, Solomon and Daniel. In the upper part of the windows are angels hearing scrolls.

**FOREIGN AND COLONIAL.**

**FRANCE.**—The Commune of Thiais has opened a subscription for a monument to soldiers who died in the Franco-German War and are buried in the cemetery of that town.—The Museum of Montpellier is to have a marble statue of Cabanel, to be executed by M. Antonin Mercié.—The Town Council of Lyons has decided to offer to Besancon a plaster model of the figure of the Republic which surmounts the monument in the Place Carnot.—The Conseil Général du Rhône has adopted a project for a railway line from Grax Rousse to St. Etienne.—The Ministère des Travaux Publics intends to ask the Government for a vote for the formation of a new railway line between Dieppe and Havre. There is also talk of a new line between Beaune-la-Rolande and Etampes. This line, of a length of 400 kilometres, would pass by Pithiviers.—The Ministère de l'Instruction Publique has promised a subvention of 15,000 francs towards the Jeanne d'Arc Monument at Reims.—M. Louis Cazal has arranged at Toulouse a competition in sculpture and painting to coincide with the opening of the Exhibition there on March 15, 1891. The competition is intended especially for artists belonging to the south of France who have received medals at the Salon.—At the request of Municipality of Pau, M. Alphonse has promised his assistance in the works that are to be undertaken for the embellishment of that town. He will go to Pau next month, accompanied by M. Lafourcade, gardien-en-chef of the City of Paris, who last of all the Champ de Mars for the great exhibition.—At the commencement of next month the Colonial Museum at the Palais d'Industrie will be reopened.—A certain number of former pupils of the Ecole des Beaux-Arts and of the Ecole Centrale des Arts et Manufactures, in concert with the architects of Limousin, have founded a local or regional society of Architects of Limousin, which will include the districts of Haute Vienne, La Creuse, and La Charante. The President will be M. Geay, Inspecteur des Edifices of the diocese of Limoges, supported by M.M. Texier and Mallet, architects, at Limoges, who will act respectively as Secretary and Treasurer.

**BERLIN.**—The municipality have voted 1,300,000 marks for the construction of unloading quays on the Landwehr Canal, which passes through the city and over which most of the water traffic to the capital passes.—Among the many hospital schemes now on hand, another for a so-called "Domestic Servants' Hospital" has to be carried to the foreground, the municipality having voted the cheap sale of a site of 7,000 square metres superficial area for the proposed building.—A workingmen's covered swimming-bath is to be erected here at a cost of 368,000 marks.—From a corrected statement, just published, it appears that the total cost of the Berlin Metropolitan Railway, after allowing for land held and for disposal amounts to 60,533,000 marks, of which 27,199,000 marks is for property acquired and 33,339,000 marks for cost of construction. The total length of the railway, with its east and west junctions, being 127½ kilometres (79 miles), the expenditure has been at the rate of about 5,000,000 marks per kilometre, or nearly 400,000 per mile.

**VENEZUELA.**—Some new railroad lines, having together a total length of 500 kilometres, the construction of which embraces some difficult pieces of civil engineering, are being carried out according to the designs, and under the supervision, of the German engineer, Carl Ploek. Most of the materials required are being ordered in Germany,—the rails from Krupp, the ribs of the metal viaducts from the "Friederick-Wilhelm Kueste," the rolling-stock from a firm in Deutz, &c.

**WARSAW.**—An international competition, apparently, as the advertisement of competition is in

German, Austrian, Swiss, and Russian papers, has been opened for the purpose of obtaining suitable designs for a large terminus building to the Vienna-Warsaw Railroad Line. A jury of nine members has been appointed; the first three prizes are 3,000, 2,000, and 1,000 rubles; three extra prizes 500 rubles each. The latest date for sending in designs is May 8 to 29, 1891. Particulars can be obtained at the "Direction der Warschau-Wiener Bahn," Warsaw.

**BREMEN.**—The Municipality intends having a system of electric lighting laid, and after due consideration of several competition schemes, has decided to have the work done by Messrs. Siemens & Halske, of Berlin, whose tender amounted to 1,500,000 marks, or nearly 75,000. The firm arranges its apparatus and lines for 25,000 incandescent lamps, besides the arc lights for street illumination.

**SPANDAU.**—The military authorities have decided on erecting 1,350 dwellings for the families of workmen employed at the Royal Small Arms Factories.

**SIAM.**—The proposed first Siamese railroad (Bangkok—Bang-Pa-In—Ajuthia—Saraburi—Korat; total length, 268 kilometres), which is to be carried out by a German Government engineer (on furlough), Herr "Baurath" Bethke, is now going to be taken into hand. The Bangkok-Ajuthia contemporary, the *Centralbahn der Siam*, the Siamese Government informs German contractors of its intention of asking for tenders for construction of this railroad a few months hence, and states that it might be advisable for would-be competitors to now inform themselves on the spot as to the nature of the work, the month of December to February being suitable for such a trip of investigation. The notice mentions that, according to the present state of "the preliminary works," some 4,000,000 cubic metres of soil and 200,000 cubic metres of rock will have to be moved, and that some 55,000 cubic metres of brick and stone work, 3,000 cubic metres of wood will be required. The Bangkok-Ajuthia line will have to be in working order two years hence; the whole line within five years. We hear that the Siamese Government is trying to obtain the services of several young German engineers, and is offering salaries of from 6000. to 7500. per annum.

**MISCELLANEOUS.**

**NEW HARBOUR SCHEME, DOVER.**—In a Parliamentary notice which has been published, details are given of the scheme for the enlargement of Dover Harbour, which the Dover Harbour Board propose to carry out with the sanction of Parliament. Powers are to be applied for to enable the promoters to erect a new pier in continuation of the Admiralty Pier, extending eastwards for about 530 ft., and terminating in the sea. Also to construct another pier, to be called the East Pier, which will terminate in the sea about 640 ft. from the existing head of the Admiralty Pier. Provision is to be made in the Bill for the erection of sea-walls for the purpose of reclaiming a part of the foreshore and a portion of the bed of the sea lying between the Admiralty Pier and the existing South Pier. It is intended also to construct two short piers or jetties at this part, which will extend 425 ft., or thereabouts, in the sea. The cost is proposed to be covered by means of a poll-tax of 1s. a head on Continental traffic, realising the sum of 300,000. when capitalised as a contract amount for the work to be executed.

**LONDON PROPERTIES FOR SALE.**—Two well-situated freehold properties are about to be put up for sale by auction at the Mart. On the 11th inst., by order of the Commissioners of Her Majesty's Works and Public Buildings, the premises lately occupied by the Inland Revenue Department, on Tower-hill, and extending through to Great Tower-street, to which the frontages are about 77 ft. and 37 ft. 6 in. respectively. The premises have cartway entrances in both thoroughfares, extensive basement and cellarage, and a large inner courtyard. They cover an area of nearly 10,000 ft. superficial, and rise in part to four floors in height. In course of February next, the premises being Nos. 423 and 424, Strand, with a frontage of 20 ft. there, now leased at 3000. a year, together with the return in Bedford-street, being Nos. 2 and 3, the Bedford Hotel, having a frontage of 122 ft., are leased at 1700. per annum. The present leases will expire at Midsummer next. The total area amounts to 2,650 ft. superficial.

**ROYAL INSTITUTION.**—The following are included in the lecture arrangements before Easter.—Professor Dewar, Christmas Lectures to Juveniles, on " Frost and Fire." Professor C. Meyrowitz, 15, three lectures on "Modern Chemistry in relation to Sanitation;" Mr. W. Martin Conway, three lectures on "Pre-Greek Schools of Art;" the Right Hon. Lord Rayleigh, six lectures on "The Forces of Cohesion." The Friday evening meetings will begin on January 23, when a discourse will be given by the Right Hon. Lord Rayleigh on "Some Applications of Photography;" succeeding discourses will probably be given by the Right Hon. Lord Justice Sir Edward Fry, Professor J. W. Judd, Professor A. Schuster, Dr. E. E. Klein, Mr. Percy Fitzgerald, Dr. J. A. Fleming, Dr. Felix Semon, Professor W. E. Ayrton, and other gentlemen.

**SANITARY AND ENGINEERING NEWS.**

**MATLOCK BRIDGE WATERWORKS.**—A report has been received from Mr. W. H. Radford, C.E., of Nottingham, in which he advises the company to take an additional spring from the Yorodale Grit. The spring yields 68,580 gallons a day, in dry weather. The water has been analysed by Dr. Frankland, and found to be of extraordinary purity and softness. The company have applied to the Board of Trade for a Provisional Order to increase their capital from 7,5000. to 20,000.

**ELECTRIC LIGHTING AT WOKING.**—The growing town of Woking, which has hitherto been without any form of public lighting for streets or houses, has now adopted the electric light under the auspices of the Woking Electric Supply Company, Limited, of Palace-chambers, Westminster. A suitable site for the works has been secured on the north side of the London and South-Western Railway, in the vicinity of the London and Basingstoke Canal. Here substantial brick buildings have been erected, comprising boiler-house, engine and dynamo-house, offices, and stores, containing at present a plant capable of dealing with 4,000 lights, consisting of two multitubular externally-fixed boilers, fitted with donkey-pumps, circulating and feed-tanks on columns, &c. The engine and dynamo-house is a large and lofty building, containing two high-speed triple-expansion vertical condensing-engines, capable of indicating about 100-horse-power each (with a boiler-pressure of 150 lbs. per inch), at a speed of 340 revolutions per minute. The engines are coupled direct to two Kingston alternators, wound for high tension of 2,000 volts; the shafts of these are excited by a continuous-current dynamo, driven by a belt. Each dynamo has a capacity of 30 amperes at a tension of 2,000 volts, or 60 kilowatts or Board of Trade units. The transformer system is in use in the district. The mains are insulated cable laid at the road sides in stoneware pipes. The dynamo house contains all necessary distributing and regulating apparatus, together with electrical instruments and gauges. A 6-ton travelling crane spans the entire engine and dynamo house and is available for lifting the machinery. The plant as at present fixed is intended to supply 2,000 lamps in duplicate, but arrangements have been made with the view of extension, in which occasion may require. Water for feed and condensing purposes is obtained from and returned to the Canal by means of underground pipes, delivering into a sump below the cistern, to which it is raised by a special auxiliary pumping engine, which also works the air pump of the condenser. From the tank the water flows to the surface hot condenser, and thus returns to the canal uninjured. The boilers, engines, dynamo, tank, water-heater, and crane were made by Messrs. King, Masterman, & Terry, of Kiddercore, Staffordshire, under the management of Mr. S. H. Torry. Mr. G. Mann, the Secretary of the Woking Electric Supply Company, Limited, has the supervision, and the erection of the plant, and has contended successfully with the many local difficulties incidental to the starting of an electric installation. Light has been given regularly since November 1.

**TAYPORT SEWERAGE, SCOTLAND.**—The sea outfall works here have just been completed at a cost of 3,4800. The population of Tayport is about 2,000, and the contract has included new pipe sewers in every street. There are two sea outfalls into the tidal estuary of the Tay. All gases generated in the sea outfalls have been disconnected from the town sewers. The sewage discharges by gravitation at all states of the tide, and, therefore, no storage is required. Street surface-water is admitted to the

A TALL TOWER FOR BLACKPOOL.—It is stated that arrangements have just been completed at Blackpool for the erection of a tall tower.

SANITARY INSPECTOR FOR PERTSHIRE.—At a meeting of the Finance Committee of the Perthshire County Council on the 28th ult., Mr. George McKay, Sanitary Inspector, Girvan, was appointed by a large majority Sanitary Inspector for the county of Perth, at a salary of 300l. per annum, with expenses.

SANITARY APPOINTMENT AT BIRMINGHAM.—On the 28th ult. the Health Committee appointed Mr. William Holt, of Rochdale, Superintendent of the Interception Department. Mr. Holt was manager to the Rochdale Sanitary Works, and was previously manager of a large engineering works at Rochdale, and constructed for that Corporation the machinery for dealing with the night soil of the borough. There were 196 candidates for the position. The amount voted to the post by the Council is 350l. per annum. Mr. Wilkinson, who held the office of superintendent, was receiving 400l.

LIVERPOOL ENGINEERING SOCIETY.—The third ordinary meeting of this Society for the present Session was held at the Royal Institution, Colquhoun, on the 26th ult., Mr. Ferdinand Hudleston, Assoc. M.Inst. C.E., President, in the chair. After the election of several new members, a paper was read by Mr. G. L. Addenbrooke, M.Inst. C.E., of London, entitled "The Distribution of Electricity from Central Stations." Mr. Addenbrooke first dealt with the conditions required for the proper working of incandescent lamps and the laws which regulate the flow of the current in the mains, and then passed on to a consideration of the difficulties which arise, first, from loss of energy in the conductors, and secondly, from difference in pressure in conductors, and of the manner in which these difficulties are surmounted. He then described in turn the use and arrangement of feeders, the three-wire system, the use of accumulators in central stations, the alternating system, and the construction and use of converters. He also gave a description of the mains on the low and high pressure systems, of arc lamps, and of meters, and concluded his paper, which was illustrated by experiments and diagrams, with some general remarks upon the whole subject. The paper was listened to with great interest by a large number of members, and upon its conclusion an animated discussion took place upon various points, principally upon the merits of the two systems, high tension and low tension. A vote of thanks to Mr. Addenbrooke terminated the proceedings.

BUSINESS CHANGES.—We have received a notification that the partnership heretofore subsisting between Mr. William Hayward and Mr. William Eckstein, carrying on business at Nos. 187, 189, 191, and 193, Union-street, in the borough of

Southwark, under the style or firm of Hayward Brothers & Eckstein, has been dissolved by mutual consent, as and from June 30, 1889. All debts due to and owing by the late firm will be received and paid by Mr. Eckstein. Messrs. Lawford & Sons, of College and Devonshire Wharves, Great College-street, Camden Town, inform us that they have taken over, as from the 1st inst., as a branch concern, the old-established business carried on at Cowley Wharf, Hoxton, by the late Mr. Thomas Capon.

SOCIETY OF BIBLICAL ARCHEOLOGY.—The anniversary meeting of this Society will be held at 9, Conduit-street, Hanover-square, W., on Tuesday, January 13, 1891, at 8 p.m., when the Council and officers of the Society will be elected, and the usual business of the anniversary meeting transacted.

THE INSTITUTION OF ELECTRICAL ENGINEERS.—The annual general meeting of this Institution will be held at the Institution of Civil Engineers, 25, Great George-street, Westminster, on Thursday next, December 11, at 8 o'clock in the evening, for the reception of the annual report of the Council, and for the election of Council and officers for the year 1891.

TURIN EXHIBITION.—The international jury assessing the exhibits of Division IV. of the Turin Exhibition have awarded sixteen diplomas, three gold, and six silver medals, and have also given fourteen honourable mentions, and twenty-three ordinary commendations. Of the sixteen diplomas seven have fallen to municipalities in Germany (Berlin, Halle a. S., Hamburg, Leipzig, Magdeburg, Munich, and Worms); three to municipalities in Austria (Krakan, Trieste, Vienna); two to government departments, and two to municipalities in Italy (board of health, prison authorities,—Milan, Turin); one to Russia (Warsaw), and one to England (London). The three gold medals fell to municipalities in Italy (Bologna, Ferrara, Spezia).

SOCIETY OF ENGINEERS.—At a meeting of the Society of Engineers, held at the Town Hall, Westminster, on Monday evening last, Mr. Henry Adams, President, in the chair, a paper was read by Mr. J. J. F. Andrews, M.A., "On Ship Caissons for Dock Basins and Dry Docks." The author pre- faced his paper by a general review of ship caissons generally in use for dock basins and dry docks, and pointed out the progress of caisson construction from the early caissons closing entrances of from 40 to 50 ft. openings, and 20 ft. of water over sill, to those now in use in some of Her Majesty's and other dockyards, closing entrances of from 90 to 95 ft., and having water over the sill of some 36 to 38 ft., and a depth from sill to coping of 40 to 45 ft. He then reviewed the improvements and alterations in design as to construction, methods of working, from the caisson floating with the bottom buoyancy, and sinking by water admitted to the bottom or interior of the caisson (the water so admitted being pumped out or run into the dock when raising), to the caissons with watertight decks, forming an air-chamber, and having a top tank to contain water for sinking. He then reviewed the question of stability under different conditions of working, as to quantity of ballast required for safe working, and the conditions of flotation, as regards position of metacentre centre of gravity, and centre of buoy-

ancy of flotation, and stated generally that for a caisson floating with bottom buoyancy the common centre of gravity of caisson, ballast, and all the weights should be at same determinate distance below the metacentre, and, with the caisson floating with air-chamber, the common centre of gravity of caisson, ballast, and all the weights should be from between 1 ft. to 2 ft. below the centre of flotation of air-chamber, and all the parts immersed; and he then gave as a general approximate rule for the height or position of the metacentre, above the centre of buoyancy at which the caisson is floating, as B x .08, where B = breadth of caisson at which it floats, d = draft of water; this formula being for the ship shape only. The author explained the relative values of six different types of caissons, as to design, construction, method of working, stability of flotation, use, &c.

THE ENGLISH IRON TRADE.—The English iron market continues very quiet, with no prospect of an improvement this side of the New Year. Pig-iron has been dull during the past week. The Glasgow and other warrant markets have been flat, and prices of pig-iron generally have shown a downward tendency. Middle-sized pig has been quoted from 1s. to 2s. a ton lower, with little business doing, however, even at the lower figure (43s. 6d.). Manufactured iron is equally depressed, and concessions can be obtained for good orders. Welsh bars have been reduced 5s. a ton. The demand for steel is better, comparatively, than for finished iron, but weakness characterises the market. Ship-builders and engineers keep well employed.—Iron.

ELECTRIC LIGHTING.—We understand that Messrs. Dickenson & Co., of Hanway-street, have secured from Mr. Norman Forbes a contract to install the electric light throughout the Globe Theatre.

MEETINGS.

- SATURDAY, DECEMBER 6. The Association of Public Sanitary Inspectors of Great Britain.—Mr. J. C. Swinburn Hamlyn on "Cremation as a Mode of Disposing of our Dead." 6 p.m. MONDAY, DECEMBER 8. Surveyors' Institution.—Adjourned Discussion on Mr. T. A. Dickson's paper on "The Labour Question as regards Agricultural." 8 p.m. Society of Arts (Condon Lectures).—Professor Vivian B. Lewes on "Gaseous Illuminants." III. 8 p.m. Leeds and Yorkshire Architectural Society.—Mr. E. Clibborn on "Normandy." 7.30 p.m. TUESDAY, DECEMBER 9. Institution of Civil Engineers.—Mr. E. W. Stoney, M.E., on "The new Chittravati Bridge, Madras Railway." 8 p.m. WEDNESDAY, DECEMBER 10. Society of Arts.—Mr. F. Bailey on "Electric Lighting Progress." 8 p.m. Society of Engineers.—Annual Dinner, Holborn Restaurant. 6 p.m. St. Paul's Ecological Society.—Objects of Ecological interest to be exhibited and described. 7.30 p.m.

## Fortification.

**A**MONGST the able men who at the present time aid with their experience, their counsel, and their advice our Inspector-General of Fortifications, and through him our Secretary of State

for War, and through the Secretary of State for War the Ministry of the day, is to be found the author of the work on "Fortification" from which the foregoing extract has been made, and it reflects in a measure not inconsiderable the tone which pervades the whole work, which is a work of great power, of great research, of careful balance between advantages and disadvantages, and is wholly distinct in style to any other work on this subject with which we are acquainted. But more than this, it has been presented to the public at a most appropriate period—a period of profound peace, when matters of this kind can be calmly weighed and criticised, and the difference between right and wrong is more likely to be correctly determined than can ever be the case in the time of feverish excitement and semi-panic to which civilised nations are generally prone when war seems imminent.

It may perhaps be thought that such a subject is hardly within the proper scope of an architectural journal; but at all events the author of the work thinks otherwise, since he has laid his book before us for review; and as a matter of fact, the fortification of our empire must always be a matter of the deepest concern to every one of the four classes of the readers for whom our journal is especially published, and must be intimately connected with their prosperity. We have to fortify both the land and the sea; we have to build forts as well as ships; we have to consider, not merely as a matter of what is best for success, but also what is best for our national purse, the materials of which those fortifications shall be made. We

have not merely to guard our island home for the above-mentioned and other classes of the community, but to do our duty also to the children who have left the nest but prefer to cling to empire, and to strengthen instead of snap the cords which connect them still with the old country.

It is the due selection of the materials of which these fortifications should be made which influences the expense which has to be incurred, and the first item of national fortification is men. We will, however, assume, and not enter into any argument on such a point, that our nation has a sufficiently numerous population, and we hope (not perhaps with absolute confidence) that the organisation of that population for war justifies the idea that a sufficient proportion of men, *i.e.*, trained men, would be able to turn out and take their share in the fortification of the country whenever its integrity is menaced and its existence threatened.

It is from a point of view almost as broad as that above indicated that Major G. S. Clarke, of the Royal Engineers, treats the subject of fortification. He commences his work by giving a *résumé* of such comparatively recent sieges and other operations of modern war as bear on the question of what is best to be done at the present time. He then measures the respective influences on design which ought to be the natural consequence of improvements in modern weapons of offence. The general requirements of modern fortification naturally follow on the consideration of modern weapons. He next shows how futile it is to presume that any conclusions of the slightest value about coast defence can be arrived at without a thorough study of the naval architecture and general arrangements of the war-ships of possible enemies; and, acting on that view, his work contains, in a form of condensation which is remarkably effective, and in a style which is simplicity itself and suited to the most un-professional comprehension, a complete account of the powers for offence and defence possessed by the war-ships of France, Russia, and Italy, as well as those of our own country, when engaged with coast defences.

It may seem at first sight that such apparently naval and military questions do not concern our readers, that the consideration of the almost infinite amount of detail connected

with them is beyond the ordinary scope of people engaged in peaceful pursuits, but if we bear also in our minds the very large national expenditure which is annually incurred on works of construction and of maintenance for what are ordinarily termed fortifications, and the large amount of work which has been, is, and will have to be done by the engineers and the builders of this country in connexion with these fortifications, it seems probable that a few hours expended on the perusal of Major Clarke's work will be hours well spent, and that the perusal may improve the understanding and expand the mind.

The object of fortification is the economy of life; it should assist a small body of men to defeat a more numerous body, and, consequently, in the days of hand-to-hand combat, the men of war who could afford it covered their own bodies with metal, and the success of a battle depended much on the number of mail-clad warriors that could be brought into the field. So do we fortify our wood with paint, and sometimes our walls with tiles, &c., to defeat the elements of destruction.

The materials of which fortifications are composed may be briefly divided into earth, stone, and iron, the progression of cost being very much in the order named, and, consequently, the object of the engineers of the State, who want to produce the greatest benefit at the smallest cost, must be to utilise the first-named as much as is justified by the end to be obtained. They have to consider the relative power of materials to resist the projectiles which are hurled at them, and exercise their judgment accordingly, so that they afford due protection to the men they are intended to shelter, and (in some cases) to the weapons those men are to use. Major Clarke has laid very great stress in his work on this very point of the *exercise of judgment*, and has produced data to show into what extravagance people may be led by a false estimate of the probabilities of destruction by the projectiles from weapons of offence. It is well to be thoroughly *au fait* as to the practices and theories of our neighbours in these matters of fortification; but we must be careful not to assent too readily to the soundness of Continental decisions, whether they be German, Belgian, French, Italian, or American. For instance, in the course of

\* "Fortification, its past achievements, recent development, and future progress." By Major G. Sydenham Clarke, C.M.G., Royal Engineers. London: John Murray, Albemarle-street.

this work, the author has taken the opportunity of exposing the fallacies of some of the conclusions at which a Belgian engineer of renown, General Brialmont, has arrived in the matter of what are called cupolas, or land turrets. Some of these are made to disappear after the gun or guns which they enclose have been fired, and some are not; whilst others there are, designed by a M. Mongin, which oscillate into and out of the firing position. The author weighs with perfect fairness the merits and demerits of this form of fortification, and, referring to a turret which has been provided for Bucharest on the recommendation of General Brialmont, of a similar description to those which had at one time been contemplated to be used for the defences of certain parts of this empire, he says:—

"The cost of the turret at Bucharest was about 10,000*l.*, and for the same about six movable over-hank guns of greater power could be provided. Unless siege warfare is to be regarded in the light of a mere duel on the backwoods principle between guns in fixed positions, all tactical handling of the defence being put out of sight, it may well be doubted whether a movable armament of equivalent cost would not be infinitely more effective from the defenders' point of view. The great advantage possessed by the attack in all ages has been the employment of a mobile artillery against armaments cribbed, cabined, and confined by fortifications. Is it necessary to perpetuate this advantage? . . . The disappearing cupola is a creditable manufacturer's production. Two or three men buried in a subterranean chamber lit up by a lantern are at the right moment to raise their cupola and deliver an overwhelming fire in the right direction. The mechanical principles are apparently sound: the arrangement will probably work so long as it is not hit by anything heavier than a rifle bullet. The price is satisfactory—to the makers—and purely military considerations are of small account. . . . General Brialmont practically contents himself with sprinkling cupolas over his plans, and retains all the objectionable features of the stereotyped fort. In his view the advance in the power of weapons merely calls for increased protection. He accepts with effusion the designs of the ironmasters, and superimposes them upon all the tricks of drawing office fortification in its most aggravated form. The new ironmongery is, in fact, to be an addition to old methods, and cannot be trusted sufficiently to form the basis of a new system."

Before quitting the subject of these cupolas, we are constrained to depart here from our intention of excluding from the review of this work any special reference to purely military details, but the somewhat pungent and very scornful manner in which the author finally disposes of these cupolas is too good to be omitted:—

"Given a dead, level, featureless plain, and an enemy who will attack in broad daylight on a given line of a given breadth, a plan of action may be conceived. The ground over which the attack is to take place might be divided up among the different cupolas. . . . At the sound of the bugle the disappearing cupolas rear their heads, and the whole collection of paper-pot lids twist themselves into position, and come into blind action till the 'cease fire' is sounded. With a well-exercised garrison, this would perhaps be practicable, although, in the excitement of the action, many of the combatants would lose their nerve, forge their chalk-marks, and fire far over their enemy's heads. Men who would distinguish themselves for bravery if their comrades were within sight, would unquestionably disappoint expectation if thus buried alive in dispersed iron boxes completely hidden from their officer's eye. The assumptions above made are, however, precisely those which could not occur, and it requires very little imagination to picture the wild confusion which an attack in the grey dawn would create in defences of this nature applied to ordinary topographical conditions. No one would know what was happening, or from what side the danger was coming. There would be no command, no unity of purpose. The cupolas would raise themselves prematurely and disappear when their fire was most needed. The combat would be more unequal than that between good modern cavalry and the ironclad knights of the Middle Ages, who would be ridden through and through and rolled over like so many helpless ninipins. M. Mongin's typical fort is practically a mastless turret ship buried up to the deck-level in the ground, and manned by mechanics. Difficulties and inconveniences of all kinds have to be accepted when a fort is made to steam across the seas, but to gratuitously adopt them in an extremely aggravated form on land appears to be madness. Machinery can aid fortification, but only within limits. Tactical principles and human nature are practically the same

in all ages, and in them alone can a solid basis be found for systems of fortification."

The only example which we have in this country of a work corresponding in any way to those of the above-named nature, is the turret at the end of Dover Pier, in which a pair of eighty-ton guns are mounted. It cost an immense sum of money, and the author considers that the possibility of its jamming when struck has, perhaps, not yet been fully realised. The advantages which he admits that it possesses are (1) complete protection, limited only by thickness of armour and size of port; (2) a relatively small target; (3) all-round fire; (4) two guns combined in one protection; (5) overhead protection given against splinters and shrapnel; (6) the curvature is unfavourable to penetration; (7) the conning tower affords a wide field of view for aiming purposes; and (8) the system has been proved to work satisfactorily on board ship. But he does not approve of the position in which it is placed,—no need to have gone out to sea,—and evidently seems to think that the object to be attained there might have been equally well or better effected at a smaller cost. It is easy to write in this light and airy way, but we fail to see how any blame or charge of error of judgment can be attached to those who decided to place this turret at the end of Dover Pier, whether the object could or could not be more cheaply effected now. The decision must have been arrived at most unquestionably after the fullest consideration by every one concerned, both statesmen and soldiers, though probably the experts amongst the artillerymen and engineers had most to say in the matter. But the decision must have been made by the light of the knowledge which they actually possessed, and it is evident that it is as impracticable to foresee all the changes which scientific inventions may make in the details of our fortifications, as it is in the details of weapons of offence, or of the ships which carry them. The position is very parallel to that of the manufacturer who sets up a plant of machinery at great cost, but finds that after a time it repays him to substitute for it a new plant, constructed on still more scientific principles. The shipowners and many other people are in the same situation, and the struggle for the survival of the fittest becomes more and more accentuated as the scientific knowledge of man increases.

The Dover turret belongs, however, to the class of works known as coast defences, and is for a totally different purpose to the cupolas above-mentioned, which are proposed to occupy certain parts of "permanent" land fortifications not exposed to fire from heavy guns in ships. Our Parliament rarely declines to grant the funds which are represented as necessary for the defence of the country, as soon as it is satisfied that those funds are needed; but the cost of iron and steel fortifications, as distinguished from those made of other materials, is so very great that it must be a source of the most sincere satisfaction to every patriotic person if our military engineers can convince us that they may be to a great extent, and perhaps entirely, dispensed with. That is apparently the view with which they now regard such materials, for not only the author of the work now under review, but another military engineer engaged in our War Office, who has produced, at the same time as Major Clarke, a work on fortifications,\* says, speaking of cupolas and turrets, that—

"There is no likelihood of their being introduced into the English service. I believe it to be a mistake to put so much money as this system requires into passive protection, which is always liable to be overpowered by a new weapon. It would be better to expend the sum in developing the offensive strength of the place by increasing the number, power and mobility of the armament."

There is another kind of cupola of a much lighter nature, which is assuming a certain amount of prominence, as it was tried at the

\* "Permanent Fortifications for English Engineers." By Major J. F. Lewis, R.E.

German Military Manœuvres last year. The author not only alludes to this and gives an illustration of it, but seems to consider that with certain modifications it might find useful employment in advanced defences of "field" type. These "field" cupolas, the invention of Colonel Schumann, who died last year, are intended each to hold one quick firing gun of 1½ in. bore, protected by a cylindrical case of 1 in. steel with a domed top, the platform and cover being pivoted, so that the gunner who garrisons it can revolve himself, gun, and cover, and, seated on a saddle, can fire ad libitum at the rate of forty rounds per minute if necessary. There is room inside for another man to hand up the ammunition. They are proof against bullets and splinters, and as their weight is only 28 cwt. they can be transported without difficulty on a truck drawn by two horses. They have been used experimentally as stated, but it is very problematical whether they will ever take a permanent place in the material of campaign, as this use of portable iron fortifications seems to bear too close a resemblance to the plate-armour, iron helmets, visors, and similar antique contrivances of the Middle Ages. They could be planted in prepared positions, but could not follow in advance or be withdrawn in retreat. At General Brialmont's recommendation, the Roumanians have been supplied with a good many of these as well as of the larger kind, but our experts do not seem to consider it wise to follow such a lead, and there seem to be good reasons for concluding that guns of the same calibre as those which are held by these cupolas would, if mounted on "disappearing" carriages, be more effective, more portable, and less costly. Consequently, they ought to stand condemned, without hope of mercy; and we have advisedly devoted some space to this branch of the subject, in order to demonstrate that the operations of war cannot be controlled by mechanical genius to the extent that mechanics would like us to believe.

The historical portion of this work is full of interest, devoted as it is to the examination of the influence which fortification has had on war generally, and on the prolongation by its means of the existence of armies and the retention of important places. They are usually subdivided, at all events by the schoolmen (as the author terms them), into what are called "field," *i.e.*, improvised, and "permanent fortification." Of the former we have laid before us with admirable clearness the cases of Silistria, Kars, and Sebastopol in 1854-5, Petersburg in 1864, and Plevna in 1877. It will be remembered that on the arrival of the English and French allied armies on the south side of Sebastopol after the battle of the Alma, it was a fact that the works of defence of the town on that side were next to nothing; but that as time went on they grew, until at the time of its fall, after holding out for 349 days, the Russians had actually nearly a thousand guns in first line, opposed to about 800 guns of the Allies. The Malakoff Tower, a two-storied casemated building, with five guns only on each tier, was the only completed permanent work of fortification: all the rest were earthworks thrown up by the Russians during the siege, and the argument held and the conclusions deduced from this lesson by the author and those who agree with him, is that these improvised and comparatively slight works (so far as regards their sections) held the Allies at bay, and kept them from destroying the great dockyard quite as long as would have been the case with more permanent and originally expensive works, with "vast ditches, monumental retreats, clever drawbridges, fantastic traces, exaggerated flank defences, and all the luxuries of engineering fancy."

He at the same time admits that national arsenals should not be left without defences of some sort; and, admitting that, he lays at our feet, fully exposed to view, the crux of the whole matter; for Todleben, the great Russian engineer, distinctly states that, in consequence of having to throw up these

works during the period of the siege the loss of life in constructing them was enormous.

At Petersburg, at Plevna, and elsewhere the author shows that fortifications composed almost entirely of earth have achieved marked successes, and must always command deep respect, if the men behind them know their work; but he very pithily adds that, "You cannot make an indifferent and badly-handled force safe with all your money and art." Armaments are, in fact, useless without men, and men of little use without training.

The author demonstrates that the adoption of the magazine rifle has indisputably caused quite a revolution in many of the details of land fortifications, in their plans, their sections, and the specifications of their materials; that it has also tended to bring into greater prominence the increased value of the least expensive material of which such works can be made, *i.e.*, earth. He pleads, therefore, for a revolution in the teaching of the science of fortification, that students shall be clearly, — more clearly than is the case now, — have impressed upon them that the old systems such as those of Vauban, &c., were systems suited, and probably well suited to the military tactics of their particular period, but that they are not in any way suited to the tactics of the present day, and that until this is done there can be no hope of sound progress, or "of reaching a fair general consensus of matured opinion." "Fort building," he very justly remarks, "is not fortification, and lavish expenditure upon non-essentials can never atone for the absence of real preparation for war. The very elaboration and cost of the conventional defences have tended to induce neglect of real requirements, and to foster the dangerous belief that any troops, commanded in any fashion, will suffice as garrisons."

In the spring of last year a very valuable debate was raised at the United Service Institution in Whitehall by Admiral Colomb, who tried, with some eloquence, to induce the Government of the day to allocate for naval purposes all the funds they could spare from those voted for national defence, and grant little or nothing for that branch known as fortifications. The debate, carried on by statesmen and several of the most clear-headed men in the army and navy, was, as we have said, valuable, in fact, invaluable, for it had an effect which, perhaps, the originator had not contemplated, that of proving most conclusively the criminal folly of neglecting the latter for the sake of the former. Whether Major Clarke's work is intended for the further instruction of this misguided but somewhat influential Admiral we know not, but the evidence he produces in his book of the utility of modern ships of war to make even a decent fight with fairly well-made and properly-armed coast fortifications is absolutely crushing. We must refer the reader to the work now under review, which is pleasant, light reading, and not burdened with technicalities or elaborate details, for the analysis of the case, for the exposition of the weak points of the war vessels (which are admirably illustrated), and for the description of the class of works now approved for coast defences.

We are not concerned, from our point of immediate interest, to know how long it would take these ships to sink or capture each other, but, judging from the arguments which have been adduced by Major Clarke and others, there seems little reason to doubt that they are capable of performing those operations with considerable celerity. As, however, the question whether an enemy's ships of war would, or would not, be able to ensure some measure of success in fighting coast fortifications is a matter of enormous importance from our point of view, *i.e.*, the nature of the works which should be made to resist them, we cannot do better than give the author's own words to support the definition which we have given of fortifications, *viz.*, that its object is the economy of life. With this object the war-ships are made, so that by smashing their opponents they may save themselves, and the lives and property of their

countrymen, and in confining their work to the high seas, the combat may be assumed to be on fair and equal terms. But, in engaging coast batteries this fairness of combat disappears, and whilst many of the so-called armour-clad ships are so designed that what are called their "vitals," *i.e.*, their guns and engines, are fairly protected, their crews are so exposed in the other very vulnerable parts of the ships, which almost always bear a large proportion to the protected parts, that "the coast battery will not concern itself with their armour, and will employ common shell, which would quickly convert them into slaughter-houses; except for a great and definite purpose, it would be criminal to pit such vessels against moderately-armed coast defences. It is not essential to sink a vessel or disable her engines. To cause a heavy loss in personnel would amply suffice for the purposes of coast defences, and the position of a modern ship at a long distance from her base, with her unarmoured portions riddled and half her crew *hors de combat* would be eminently precarious. From this point of view, the armoured belt will be of little service to the ship in action with coast defences, but, by keeping her afloat, may lead to her capture by an inferior vessel." Which is cold comfort for the men of the sea, but reassuring for the defenders of our shores.

The author's observations about the Zalsky gun, a pneumatic tube which will in future be employed in warfare, will give them colder comfort still, if they expose themselves to this new implement of destruction, which costs very little to mount in suitable positions, and will add very potently to the means for protecting coasts, harbours, &c.: a weapon which has been described by Lord Wolsley as "most probably destined to influence, if not revolutionise, warfare in future, both on land and sea."

The author considers that one 6 in. breech-loading rifled gun, well mounted and handled, should be capable of disposing of any ordinary war cruiser by destroying her crew, and the mode of mounting he seems to prefer is that on a disappearing hydro-pneumatic carriage, firing over a wall of concrete, acting as a revetment to earth, the whole gun emplacement being rendered as invisible as possible by avoiding contrasts with the neighbouring ground. One gun of this kind, with its mountings, costs about 2,700*l.*, and it is worthy of note that 200 rounds of ammunition costs about the same as the gun; whilst the emplacement to put it in and the foundation on which it stands, would not cost more than from 200*l.* to 300*l.* We, consequently, recognise two things at the same time, *viz.*, that land and coast fortifications cost at the present day an insignificant sum compared to the cost of the armament, whether of guns or of men, which they help to protect, and that the work of the navy progresses in importance for such work in contradistinction to the work of the builder, whether in stone or iron. For the national pocket this is highly satisfactory, though by the individual builder it might, perhaps, be viewed in a different light.

The aspirations of the Fortification Department of our War Office evidently point to the probability of their being able, with good organisation and previously-prepared details of all kinds, to throw up, if necessary, in the course of a few days, for the defence of the Metropolis and other strategic points in the United Kingdom such works of fortification as will enable our people, if properly armed and trained, to successfully resist a foreign army, if by any fatality it set foot on the wrong side of the "silver streak," and that the ignominious surrender of everything that makes life precious to our people, shall not, as has been predicted by some weak-kneed people, be the inevitable result of invasion.

"There is an old French saying that 'Nothing is sacred to the sapper,' and the author of this work is evidently prepared to justify this to the fullest extent, for he spares no one whose views differ from his own. If he is wrong in those views he will soon be shown the error of his ways by those he takes

to task, but as we feel well satisfied that the joints in his harness are few and far between, and that, in the publication of this work, he has performed an act of very considerable public importance, one which will help to prevent the waste of money, and ensure even better fortifications in the future than we have had in the past, he will probably be able to sustain without distress the charge of want of sacredness.

But in the work which we have had the pleasure of perusing, there flows a current of statesmanship underlying the stream of engineering, which attracts to an extent which fascinates the mind and brings conviction to the reader that the words he reads are those of truth and great soundness of judgment. We can do no more than to recommend every one who desires to understand the conditions under which his labour is protected to read and mark the contents of this valuable work.

#### THE CINCINNATI BRIDGE.

IN Volume XXIII of the American Society of Civil Engineers' Transactions will be found a valuable and interesting paper by Mr. William H. Burr, M. Am. Soc. C. E., on the bridge recently constructed over the Ohio river at Cincinnati.

The structure, with its approaches, forms a part of the Chesapeake and Ohio Railway system, and is a good example of modern American practice in bridge-building.

The bridge consists of three large spans, the central one being 550 ft. long, between the centre of the piers, and the side spans each 490 ft. between centre of piers. At either end of these large spans is a viaduct approach, which extends for 1,533 ft. on one side and 2,300 ft. on the other, but does not call for any special notice. The whole structure is designed not only for a double line of railway, but also for two roadways and two side walks, for the ordinary vehicular and pedestrian traffic.

The simple non-continuous truss over the middle opening is the largest one yet constructed. All the main parts of the trusses are of steel, but no specific process of manufacture was insisted upon, provided the material stood the tests specified; consequently we find both Bessemer and open-hearth steel largely used in the work. The lateral and transverse systems of bracing and the floor beams and stringers are of wrought-iron.

The weight of iron and steel in the two 490-ft. and one 550-ft. span is 5,000 tons, and an additional 5,180 tons was required for the construction of the viaduct approaches.

The specifications under which this work was executed were drawn up by the Phoenix Bridge Company, by whom the entire work of these spans was designed, constructed, and erected. The type of truss adopted is that generally proposed by the Phoenix Bridge Company for large spans. It will be noticed that the single system of web members is used, and consequently the stresses are well defined.

The work of the construction of these spans was commenced in the shops in March, 1888, and in June, as soon as the state of the river would permit, staging was begun for one of the 490-ft. spans, and the whole span was erected by August, although it had a very narrow escape at one time of being carried down the river by a flood during the early part of July. This flood caused a rise in the river of about 25 ft., and great quantities of drift were brought down by the current and lodged against the stage, which was then carrying a large traveller, and about two-thirds of the trusses and railway floor. The pressure was so great that it pushed the stage about 1 ft. down stream, but did no other damage.

The erection of the 550-ft. span was commenced in August, and towards the end of the month another flood, which rose some 27 ft., brought down the river such quantities of drift that it swept the stage for this span,

as well as some 350 tons of the truss which was then upon it, down the river, notwithstanding extensive temporary protection which had been provided to shield the stage as much as possible, and in spite of the whole staff who were occupied in attempts to protect the work that had already been done. Masses of the wreckage were carried down the river fully fifty miles from the works, and two steel eye bars were recovered at a distance of forty-five miles from the bridge.

The Phoenix Bridge Company commenced the reconstruction of this stage at once, and, by working night and day, within five weeks a new stage was built, and the iron and steel floor, which had been reconstructed also in the interval, was placed upon it. The erection of the 550-ft. span was then proceeded with, night and day, and was completed at the end of October.

The state of the river would not permit any stage being constructed for the third span until the end of November, and it was not until December 9 that the first ironwork for the railway floor was placed upon it. The whole of this span, however, was erected and finished in sixteen days.

On December 25, 1888, only ten months after the Phoenix Bridge Company had commenced the work in their shops, the first regular railway traffic passed over this bridge.

The foundations for the shore piers of the two 490-ft. spans were formed by driving piles 4 ft. apart in both directions, to carry solid 12 in. white oak platforms, about 72 ft. by 36 ft. in area, upon which the masonry of the piers was built. These masonry piers are about 82 ft. high, from the timber platform to the underside of the trusses, and their weight, together with the steelwork and live load, causes a load of 40 tons per pile.

The two river piers, one at each end of the 550-ft. span, rest on pneumatic caissons 81 ft. by 35 ft. in plan at the cutting edge, and 51 ft. high. The sides of these caissons batter 1 in 15 to facilitate sinking. These caissons are constructed wholly of timber. The working chamber is 8 ft. 9 in. in height, and the walls are 4 ft. thick. The roof of the caisson is formed by seven solid transverse and longitudinal layers of 12 in. by 12 in. timbers.

The first caisson was launched on June 2, 1887, and at that time only one course of the roof of the working chamber was built, but the remaining six courses were then added, after which it was floated into position behind a row of protection piles, and gradually sunk, the sides being built up and concrete filled in over the roof of the working chamber. The pneumatic machinery and electric light plant was located on two barges alongside the caisson.

The work of actually sinking the caisson was begun on July 1, and continued without serious interruption until the middle of October, when the depth of the cutting edge below low water was some 53 ft., with an air pressure of 23 lbs. per square inch. At this depth the sinking was stopped, and the working chamber completely filled with concrete.

Both the caissons, before sinking commenced, were placed 12 in. up stream, it being expected that they would drift that amount down the river before the work of sinking was completed. This expectation was realised in one case, but the other remained in its first position, and is consequently 12 in. out of its correct place.

The heat in both working chambers was at

times very great, and a few men were disabled by the so-called "bends," but no lives were lost, nor were the men apparently injured from working eight hours each shift continuously.

When the caisson was entirely filled up with concrete, the masonry of the pier was commenced, and built up to the bearings of the trusses, at the rate of about 8 in. per day, in height. The weight of the whole pier, steel-work, and live load causes a load of about 61 tons per square foot, after deducting the buoyant effect of the displacement.

It has already been stated that no specific process of manufacture was demanded for the steel forming the trusses, provided the same stood the tests specified. These tests were as follows:—The ultimate tensile resistance of the steel to be used in tension must not be less than 29 tons or more than 33 tons per square inch, and the ultimate tensile resistance of the steel to be used in compression must not be less than 32 tons or more than 36 tons per square inch. These tests are specified to be made in the following manner:—From one ingot of each cast, a round sample bar not less than 3 in. in diameter, and having a length not less than 12 diameters between the jaws of the testing machine, shall be furnished by the manufacturer, and from these test-pieces alone the quality of the material shall be determined.

Such test-pieces must have an elastic limit not less than one-half the tensile strength of the test-bar, and a percentage of elongation not less than 20 per cent., and a percentage of reduction of area not less than 40 per cent. In determining the ductility, the elongation shall be measured after breaking on an original length of ten times the shortest dimension of the test-piece.

There appears to have been considerable difficulty in obtaining the steel for the heavy plate links which were required, owing to the small amount of work which was put upon the metal between the ingot and the finished plate.

Several tests were made upon the full-sized steel eye bars, and these are of special interest. The general result is as follows:—For open hearth steel eye bars, 7 by 2 in. in section, and 26 ft. 8 in. long, the steel stood 31 tons per square inch and stretched 13.3 per cent. in a length of 24 ft., and 41 per cent. in a length of 12 in. For an eye bar of Bessemer steel 8 by 1½ in. in section and 34 ft. 6½ in. long, the steel stood 32 tons per square inch in tension, and stretched 14.3 per cent. in a length of 31 ft., and 35.8 per cent. in 12 in.

In designing the main trusses the following loading was provided for:—First, for each line of railway, two engines followed by a train of 2,500 lbs. per lineal foot, and for each roadway and side-walk 60 lbs. per square foot. The wind-pressure was calculated for 30 lbs. per square foot on the exposed surfaces of both trusses, and on the vertical projection of the floor system, and also on a moving train surface, averaging 10 square feet per foot-run of bridge. All the parts of the structure are so proportioned that the combined effects of temperature and all specified loads, except wind-pressure, shall not cause the stress per square inch to exceed the following limits:—

#### For Iron.

In tension, 5 tons.  
In compression, for lengths less than fifty times the least radius of gyration, 4 tons.

In shearing across fibres, 3½ tons.

In bending, on extreme fibres of pins, 7½ tons.

On bearing surfaces, 6 tons.

The stresses per square inch in compression, for members whose length exceeds fifty times their least radii of gyration, were to be reduced according to certain formulae given.

#### For Steel.

In tension, on chord bars and end main diagonals, 8 tons.

In shearing on rivets and pins, 5 tons.

In bending on the extreme fibres of pins, 10 tons.

On bearing surfaces, 7½ tons for rivets and 9 tons for pins.

In compression, on top chords and inclined end-posts, provided that the ratio of length to least radius of gyration does not exceed fifty, 7 tons per square inch; but for other struts the stress was reduced according to certain formulae given.

An addition of fifty per cent. to all specified intensities of working stresses was allowed for all wind stresses, and for all combinations of wind stresses and other stresses.

Bed plates and bearing plates are so proportioned that the maximum pressure per square foot on the masonry does not exceed eighteen tons, and the diameters of rollers which are of steel are calculated so that the pressure on them per lineal inch does not exceed  $\sqrt{540,000/d}$ , where  $d$  is the diameter of the roller in inches. The variation of temperature allowed for is 150 deg. Fahr. Great care was taken in making the links, as it was specified that in no case must the distance between the centre of the pin-holes be more than ½ in. of an inch from the true dimension, and the diameter of the pin-holes was not allowed to exceed that of the pin by more than ¼ th of an inch for pins under 3½ inches diameter.

In a few instances where the plates were thin the steelwork was allowed to be punched, but, as a general rule, in all important parts of the main trusses it was drilled. Annealing was also insisted upon when any part of the steelwork had been partially heated.

Before the work left the shops it was thoroughly coated with boiled linseed oil, and all painted and turned surfaces were protected by being coated with white lead mixed with tallow. After the erection of the structure it received two coats of red lead.

The above description from Mr. Burr's paper may be taken as representing the best American practice in bridge building, and English engineers will notice that it differs in many particulars from the system adopted in this country.

It appears to us that until the manufacturers of bridges are asked to submit their own designs, made in conformity with a specification of an engineer advising the intended purchaser, true economy will not be obtained.

The system at present generally adopted here not only causes the cost of a structure to be considerably increased, but it is also the cause of much delay in the progress of the work, occasioned by the manufacturers being often compelled to ask for many alterations in the details of the designs. No one is so well able to judge, as the manufacturer himself, where he can save expense in construction; and therefore his tender, based on his own design, would be necessarily less than on designs made by others, who are probably unaware of the appliances he has in

his shops, and who generally do not attend very much to details that are most important from an economical point of view.

In England at the present time a pin-jointed truss is not considered to be so satisfactory as a girder with riveted joints, and it is most exceptional for them to be used. Such trusses, however, are easily erected, and the rapidity with which the Cincinnati Bridge was built is a good deal owing to the design of the truss being such that most of the work could be completed in the Phoenix Bridge Company's shops, where every facility is obtained, leaving but little to be done at the site, where the work is always more difficult and takes much longer.

Bessemer steel for important structures has not at present been adopted in this country; all specifications for steelwork stating that the material is to be that known as "open hearth." The tests for the steel are almost identical with those specified for the Forth Bridge, although the stresses allowed in that case are somewhat exceeded, notwithstanding that in this country a wind pressure of 50 lb. per square foot is provided for.

In conclusion, we think that the whole work reflects the greatest credit on all who were engaged in bringing to so successful a completion a structure of such importance as the Cincinnati Bridge.

#### NOTES.

**T**HERE is a grave note of warning in Lord Norton's letter in Thursday's *Times* in regard to the principle involved in the London County Council's Bethnal-green scheme, that it is their duty to take in hand and rebuild large tracts of insanitary dwellings in London; a principle which the majority of the Council seem disposed to affirm as the right one for future adoption. Lord Norton upholds the principle that landlords of insanitary property should be compelled to realise their responsibilities and to do their own duty to their tenants and the public, instead of leaving the County Council to step in and do it for them. As an unintentional rider to this comes the report, in another column of the same day's paper, of the judgment given against the landlords of forty-one tenements by Mr. Montagu Williams, on the action of the Sanitary Authority of the Parish of St. Matthew Bethnal-green, compelling them to close their houses until such improvements had been carried out as would satisfy the Sanitary Authority. Mr. Montagu Williams had the good sense to visit the property himself and form his own independent opinion before giving judgment, a degree of conscientious trouble which not every Magistrate will go to. There is no doubt that if the London County Council are going to make it an essential part of their function to purchase and rebuild large areas of bad property, unless they sternly refuse compensation to the landlords of houses that are "unfit for human habitation" for anything but the mere value of land and materials, they would actually be giving an encouragement to unconscientious landlords to leave their property in an insanitary condition. Then it appears there is a great feeling on the part of inhabitants of the Bethnal-green district to be delivered from the huge blocks of "model dwellings," and to have houses rebuilt on a smaller and more home-like scale. Such a course would be impossible in carrying a large scheme under the "Housing of the Working Classes Act," but it would be not only possible but the natural outcome of the matter, if individual landlords were come down upon and compelled each to rebuild or render habitable his own house property. Of course this is a much slower process, and the glamour about the County Council scheme is that it promises a great work of improvement to be carried out comparatively promptly; and no wonder this attracts people who are wearied with the slow progress of sanitary reform in London. Perhaps it may be as well that this large experiment

should be tried, but the drawbacks to it already suggested must not be forgotten, besides another which very few people are alive to, viz.: that not only has the building of lofty blocks of harrack-like dwellings a very depressing effect on the appearance of a neighbourhood, but that the crowding of the same number of people in tall blocks of buildings with a certain minimum space between them may be nearly as unhealthy as crowding them in lower houses more closely set. Overcrowding vertically is very little better than overcrowding laterally; it is only another way of arranging the same number of people on an area too small for them.

**T**HE action of the Mansion House Committee on Railway Rates, in condemning the Board of Trade proposals, is endorsed by the Railway and Canal Traders' Association, a resolution to that effect having been passed at a Council meeting of the latter body on the 5th inst. These proposals cannot, in their opinion, be accepted as just and reasonable,—although Lord Cobham, a Great Western Director, alluding to this subject on the very same day, declared that Parliament was "proposing to whittle down their profits to the vanishing point." Curiously enough, a deputation of South Wales freighters had, a week previously, protested specifically against the Great Western schedules; complaining that (particularly with regard to coal, iron, steel, &c.) the Company were given excessive charging powers as compared with other companies. Turning to the statistics supplied by one of the other companies thus alluded to,—the Midland,—it appears that out of the annual loss of revenue which, it is asserted, they would have to bear if the Board of Trade's proposals became law, £48,216 is placed under the head of coal and coke, and £28,176 for iron and steel (undamageable). This is rather more than half of the total. To add to the conflicting testimony on these points, the Birmingham and District Railway and Canal Traders' Association, led by Mr. Chamberlain, M.P., asserted before the President of the Board of Trade last week that the proposed hardware rates would be from 50 to 150 per cent. higher than those at present in force. The Birmingham district is served almost exclusively by the Midland, Great Western, and London and North-Western, and Sir Michael Hicks-Beach is going to try and get to the bottom of the matter by having a certain number of test cases thoroughly gone into, with a view to ascertaining if the alleged differences really exist. He will probably find that the parties to the dispute are going upon different data,—particularly with regard to the existing powers of the companies in the matter of terminals. In order to demonstrate further the remarkable difference of opinion existing upon this subject, we extract the following from a letter published in a contemporary last Saturday:—

"It is not to be denied that the Board of Trade proposals will be of sufficient advantage to the iron trade, and especially to the finished iron and steel industries. The classification has been lowered for a great many articles of the first importance, thereby allowing of their being carried at much lower rates than those to which they would have been subjected under the companies' proposals, and lower also than those to which they have, in the past, been liable."

Now, this would be written about the time that Mr. Chamberlain was making his energetic appeal on behalf of the iron and steel industries; and yet it appears,—not, as might be imagined, in a railway organ,—but in the columns of the *Ironmonger*.

**T**HE Government have again introduced a Bill for the purpose of establishing a Commission, before whom Private Bills relating to Scotland shall be heard. The proposed change is a very desirable one. Great expense is incurred by bringing up witnesses, say from Aberdeen, in respect, perhaps, of a Water Bill, or some essentially local matter,

to London. Parliamentary Committees are by no means first-rate tribunals. It says a good deal for the practical common sense of the average Englishman that these curiously-composed bodies have got through their business as well as they have done; but a strong Commission would not only do their work more quietly but better. It is obvious, however, that if Scotch Private Bill business is to be transacted in Scotland, the same system must be adopted in relation to Ireland, and probably in some modified way in relation to England and Wales also. It seems also likely when this change of system occurs, as occur it certainly will, the system of Grand Committees of the House of Commons will be enlarged, since more members will be available to serve on them, and this again will help to accelerate the general business of the House.

**I**N reference to the new Institute at Berlin for Professor Koch, already referred to, we hear that the Government has taken the matter up in a very energetic manner, the tenders for the proposed provisional works having been accepted on most liberal terms, cheapness and Prussian economy being for once left out of the question, the best materials put together on the most improved system in the shortest possible time being all that is required. The hospital for Division II. of the Institute is planned for 128 patients, and will include, besides the four smaller and four larger wards erected on the isolated harrack system, extensive accommodation for doctors, nurses, and a large number of servants, the usual receiving-rooms, studies, &c., localities for the administrative and kitchen departments, and a small lecture amphitheatre (with fifty seats) for Professor Koch's special use. The "barracks" will be constructed of timber-framing with an outside covering of gypsum slabs, and a double line of planking on the inside, the whole standing on a foundation of "héton." The Government "Bauinspector" Böttcher and an assistant have been to Paris to visit Pasteur's Institute, for the purpose of studying the fittings of this establishment, which are to be adopted, as far as possible, in Berlin. Instead of the estimated 370,000 marks, 500,000 are to be spent, directly and indirectly, for the provisional work. One hundred and fifty beds (with all expenses pertaining to the keeping of them) of the new city hospitals at Moabit and Urbau have been put at the disposal of Professor Koch by the municipality of the capital. Among the instances of general interest and munificence, we may mention the gift of Herr Bleichröder, Consul-General for Great Britain. This donor has put 1,000,000 marks (or nearly 50,000*l.*), together with a very suitable site, at the disposal of Professor Koch, for the erection of a small hospital of sixty beds for the treatment of infectious diseases, and intends finding thirty beds in hired premises until the completion of this hospital.

**A** QUESTION was put to the Postmaster-General on Monday evening in regard to the Liverpool General Post-office, which has for many years been located in a part of the grim and gloomy building known as the Custom-House, against which complaints of unhealthiness and inconvenience have been made for many years, probably with ample cause, and it was urged by Sir G. Baden-Powell that Liverpool ought to have a new Post-office building on the same footing as Manchester and Birmingham. Mr. Raikes, while declining to admit all that was urged against the present quarters of the Liverpool head office, promised to direct special inquiry to the subject. If a new office is to be built for Liverpool, we beg to repeat strongly the recommendation that it should either be entrusted to an eminent architect or be the subject of an architectural competition. The buildings which are turned out from the Office of Works

for this purpose are utterly without architectural refinement or interest. In France every such building would be the subject of a public competition in order to obtain the best planning and the best architecture which the architectural ability of the day could afford, and to erect a building which would be an architectural ornament to the town on which it was conferred. In England each new Post-office is only a new architectural eyesore.

THE Society of Antiquaries of Scotland have now taken possession of the east wing allotted to them in the Scottish National Portrait Gallery. The scheme of arrangement, under the superintendence of the Curator, Dr. Joseph Anderson, locates, in a general way, the historical articles on the ground floor, the pre-historic on the first floor, and the comparative collection on the upper floor. The two former collections are confined to Scottish articles, but the comparative section embraces articles from all parts. In the Council-room, at the extreme east end, will be hung the collection of portraits, which will be seen in a manner which they could not possibly be in the vacated premises. The library, which is located on one of the upper floors, is lighted from above, and half-way up the walls is fitted with a gallery having a light iron balustrade, by means of which access is obtained to the upper tiers of books. Although the room is much larger than the former library, the greater part of the available space is required for the accommodation of the books. The society will find itself very comfortable in the new premises provided for them by private munificence.

WE regret to observe, from an answer given to a question put by Sir G. Campbell in the House of Commons on Tuesday night, that there is no intention at present of taking any further steps towards the permanent lighting of the British Museum by electric light for evening opening. The excuse is that the evening attendance had not been kept up, the average, which in February was 635 per evening, having fallen March to 367, and in November to 145. No doubt at first curiosity drew a good many persons there who had no serious interest to serve, but we are convinced that if the Museum were known to be permanently open in the evenings it would be a boon to numbers of students, which would be fully appreciated and made use of in the long run. It is not a question merely of the working classes (commonly so-called); there are numbers of professional men who are mostly detained at other work during the day, who would be thankful for the opportunity of study at the Museum without the inconvenience of breaking away from their regular hours of employment.

ANOTHER important addition to what may be termed the domestic electric lighting of London will now shortly be made. At a general meeting of the Reform Club held last week it was decided, by a very large majority, that the club premises should be lighted by electric light. Two years ago the same proposition was mooted, but the matter did not proceed further. In the interval of time which has elapsed, electric lighting has become cheaper, and there is no doubt that the delay has saved the members of the club a considerable sum of money. This decision is noteworthy because the Reform Club, in spite of its name, is a somewhat conservative body, largely composed of practical men. It may, therefore, be pretty well assumed that if this system of lighting is adopted by this club, no building, domestic or otherwise, of any size in London will long be without it. While touching on this subject of electric lighting it may be well to call attention to the fact that although the Central Hall of the Law Courts, as well as the courts and court corridors, are lighted by electricity, yet

the corridors and wings of the staircases, as well as all the rooms in the east and west wings, where a great amount of important business is transacted,—as, for example, in the chambers of the chief clerks in the Chancery Division,—are still lighted by gas, and that somewhat dimly. Considering that the Law Courts have engines and cellars for the purpose of electric lighting, the entire building should be lighted by this method.

IN days when a number of the working classes seem only desirous of getting as high wages as possible for as little work as possible, it is refreshing to read such a letter as that of a working miner, Benjamin Morris, which was published in the *Times* of Tuesday in regard to the "Miners' Eight Hours Bill." The writer does not scruple to say that the passing of such a Bill would result in a monstrous injustice to the workmen, and that it would be impossible in practice to carry it out; that is for men who, like Benjamin Morris, wish to do their work well and honestly. The writer's position will be best appreciated by the quotation of one or two sentences from his letter:—

"The Mines Regulation Act prohibits any workman from leaving his stall or working place before making it safe; and, in order to comply with the said Act, it is often necessary to stay half an hour and more after the pit has ceased turning coal for the day, and, owing to the nature of the work a miner has to do, this cannot be avoided. You will at once see that if a restriction is put upon the hours a miner is to work he will be compelled to violate one rule in order to comply with another, and the result will be useless litigation. The present rule says that no workman shall place or leave any coal or other material in such a way as to impede the air course. It often happens that just before the time for leaving work a fall of coal will take place, sometimes falling against a pack which has been put up to support the roof, and if left in this position it would greatly impede the air current, and for so leaving it the miner would be liable to prosecution or heavily fined. I have often been compelled to stay three-quarters of an hour in order to comply with the rule. But if the proposed Bill should become law you will at once see that I shall be placed in a great difficulty. . . . The injustice of the proposed Bill is apparent from the fact that it often occurs that an half-hour's extra work would save the miner a great deal of labour the following day, and also loss. I ask, therefore, what moral right has the law to interfere with me in working at my trade to my own benefit so long as I injure no one by so doing? . . . In Dorsetshire the eight hours system is already recognized, and none was more surprised than the miners themselves when the question was forced upon them. I am in constant conversation with my fellow-workmen upon this subject, and they all consider it would be unfair to expect to be paid for walking to their work, for this is what the eight hours from bank to bank means, and the objections to this are too numerous to particularise in a letter. Moreover, it would be absolutely unfair to the general public, who have always been ready to put their hand in their pocket when any catastrophe has taken place and funds have been needed. Coal is already dear enough, and to force another advance upon the same would be base ingratitude for past kindness. I observe that some platform orators declare that it will make no difference either in wages or the price of coal, because they say the miners will be able to work with increased activity, a statement which is ridiculously absurd, forgetting that even if this were true it would mean increased danger and loss of life."

It would be a good thing for England if there were a larger proportion of working men (a large proportion we trust there is) animated by the same spirit of honourable pride in doing their duty thoroughly.

HAVING long outlived their younger and more lordly neighbour, Craven House, the two old gabled houses in Drury-lane, near Wych-street, have at last been pulled down. That to the south was conspicuous for its pannelled front; the other was formerly known as a tavern by sign of "The Cock and Magpie"—a corruption, perhaps, of "Cock and Pie." When Justice Shallow vows that Falstaff shall remain to enjoy his hospitality, he swears "by cock and pie, sir, you shall not away to night." Here, in all likelihood, we have the origin of the sign. In his "Illustrations to Shakspeare,"

Douce traces it to a burlesque remembrance of the once solemn oath of fealty or for a deed of chivalry that was taken upon a dish of roasted pheasant or peacock. It has been said that this tavern gave a name to, or took its name from, the Cock and Pie Fields over which Seven Dials was built, by Neale, a speculator, in 1691-5, but there was another tavern of that name, to the north-west, wherein, we believe, this particular connexion should be sought. A copy of S. Rawles' print (1807) of the houses we refer to, together with J. Findlay's water-colour (1850), will be found in the Crace Collection, British Museum. They are included in the views taken by the Society for Photographing Relics of Old London, and in the accompanying description we read:—"A writer in the *European Magazine* for 1807, vol. 52, p. 33,

where also an illustration is given, says that tradition, derived from very old persons, who had long been dead, asserts that this was known as a place of entertainment in the reign of Henry VII. It then looked over the fields. Towards the close of the reign of James I. the houses at the upper end of Wych-street began to be built. Probably no part of the existing houses is of earlier date than the first half of the seventeenth century." Close by lived Nell Gwynne, whom Pepys, on his way to Westminster, saw standing at her lodging's-door in Drury-lane on May 1, 1667, watching some milkmaids with garlands upon their heads, as they danced with a fiddler going before them. The memory, at any rate, of Charles's Strand maypole is preserved by Maypole-alley, by the side of the Olympic Theatre (just rebuilt) which, together with Craven-buildings, stands on the site of Craven—originally Drury—House.

IN answer to a question in the House on Thursday week last, Mr. Plunket is reported to have said that the old table now placed in the tea-room served for the table of the House from 1706,—when Sir Christopher Wren was employed to reconstruct the fittings and furniture of St. Stephen's Chapel, after the increase of members consequent upon the Union,—to 1834, when it was saved from the fire. This is the table which is depicted in the painting of the House of Commons which the Emperor of Austria presented, in June, 1855, to Her Excellency Lady Paget, wife of our Ambassador at Vienna, for the National Portrait Gallery. In that same year the trustees deposited the picture in the National Gallery, where it has been hung in a basement room of the eastern wing. This picture, painted in London, is the work of Karl Anton Hicel, portrait painter to Louis XVI. and Queen Marie Antoinette. Hicel retained it in his possession on leaving this country for Germany. His representatives sold it, in 1816, to the Emperor Francis I. of Austria. It shows the interior of the house in 1793; and, as some say, in January

or February, a few days after the French had executed their King and declared war against England and Holland. We may suppose, then, that Pitt, who is at the table, is speaking in advocacy of taking up the challenge by sending the Duke of York's expedition to Ostend. The Speaker we take to be Addison. On his right may be recognised Canning; R. Pepper Arden, Master of the Rolls, in his robes, elevated Lord Alvanley in 1801; Dudley Ryder, who succeeded as second Lord Harrowby, and was at that date, we believe, Paymaster-General; Richard, second Earl of Mornington in the peerage of Ireland, created Marquis of Wellesley six years later; and Henry Dundas, afterwards Viscount Melville. Erskine, Sheridan, and Fox are identified amongst the figures on the left side of the chair.

ON the opposite wall hangs the picture,—bought for 2,520*l.* at the Hamilton Palace sale (July, 1882), by the National Portrait Gallery Trustees,—showing an interior in old Somerset House. At a covered table are seated figures of the eleven Commissioners, who on August 18, 1604, ratified a treaty of peace and commerce between England, Spain, and the Archduchy of Austria. There we see named portraits of Charles, first Earl of Nottingham, K.G., Lord Elphinstone of our fleet that opposed the Spanish Armada; with the Earl of Dorset, and his successor in the High Treasurership, Lord Cecil of Essendon, who on August 20 of that same year, was created Viscount Cranbourne; William, first Earl of Northampton, Lord President of the Welsh Marches and Lord Warden of the Cinque Ports, who eloped from Canonbury with Sir John Spencer's daughter; and Sir William Cavendish, son to the celebrated "Bess of Hardwicke," from whom he inherited her three noble properties,—Chatsworth, Oldcotes, and Hardwicke, and afterwards first Earl of Devonshire. Amongst the other delegates are John de Velasco, Constable of Leon and Castile, and the Prince of Aremburg, of the Order of the Golden Fleece. According to its inscription and date, the painting should be by Santaona de la Cruz, 1594, but is considered by Mr. Scharf, upon internal evidence, to be the handiwork of Marcus Gheeraerts, to whom it is officially assigned.

THE exhibition of "water-colour drawings of many-sided nature" (as it is pleasantly entitled) by Mr. Albert Goodwin, at the Society of Fine Arts' Gallery, is a far more powerful collection than that which he exhibited there two or three years ago, and is many-sided in style and variety of power as well as in its subjects. In his preface the artist, referring to the possibility that he had lost something by rushing from one subject to another too erratically, adds that "if there are disadvantages, the pleasure of enjoying the manifold wonder of the beauty of the world has been one that I have had in full." The collection quite answers to the feeling of these words. It is the work of an artist of wide sympathies,—one who is not content with repeating one or two effects that have been thoroughly studied and mastered till the repetition of them becomes a mere business. There are a certain number of those studies of localities expressed in a very delicate scale of colour, of which the artist has produced a good many of late; among them may be mentioned the two views at Buck's Mills, North Devon (1 and 69), "Abingdon" (41), "Bury St. Edmunds" (21), "Ifley Mill" (29), and "Dordrecht" (35), with the brass milk-cans in the foreground. But there are other works of a very different stamp from these; special effects of nature portrayed with great power. Among them may be specially mentioned the night effect over the sea in a "Hartland and Lundy Island Lights" (7), a most remarkable success in what might be thought an almost impossible subject; "Canterbury" (10), the canal and

the old brick walls and timber houses, with the cathedral towers rising above; "Abbeville" (15), a pile of buildings seen in evening light, with a remarkably fine and wild effect of sky; "The Maclestrom" (47) in illustration of Edgar Poe's tale; "Salisbury Close, Twilight" (51), to which the artist appends the note, "I do not mean to say that all twilights are as blue as this, but this one was;" "The End" (54), a sad-looking evening scene with the timbers of a wrecked ship in the foreground; "Woolacombe Sands" (67), another scene of coast desolation which seems like the end of a romance. Independently of the mere ability in the management of materials which these sketches exhibit, it is not often that one finds so much real poetry in a collection of water-colour sketches.

AN interesting collection of water-colours is now on view at the Dudley Gallery. Mr. James, whose work fills the room (divided for the time into two, the "Gold" and the "White"), has gone both far and near for his subjects. Besides a large number of exquisite flower subjects, there are landscapes from Scotland, the Riviera, and nearer home in Sussex and Rutland. Many are "impressions"—very charming bits of colour, with the freshness of work done at once and on the spot; but there is in most, and more particularly in the subjects in which architecture is prominent, a considerable grasp of effect and detail without unnecessary labour. Perhaps the best are those from "Fort Augustus" (65); a peep into the door and up the stairs at the "Old King's Inn" (60); "Maria's Emporium" and Nos. 15, 22, and 42. These are in the "White room." In the Gold room we noticed "New Romney" (104) and "Sandwich" (113), the latter the better of the two, and a very fresh bit of landscape at Uddimere, Sussex (108). Many more are purely sketches of effect and "values," but the few we have mentioned show what can be done with simple architectural subjects by a competent hand.

MOST readers who visited the Royal Academy this year will remember the picture of "Tulip-culture," representing beds of these flowers of different colours. Mr. Hitchcock, the painter of this work, is one of the Americans who have become artistically French, and a small collection of his paintings, one of which, "Maternité," gained him a gold medal at the Paris Exhibition, is on view at the Goupil Gallery, and is worth a visit, though there are no other paintings equal to the two we have named. In another room at the same house is the set of drawings made by M. Boutet de Monvel in illustration of the novel "Xaviere." These were made for reproduction in chromo-lithography, which we presume accounts for their rather hard and precise style, but in point of character and drawing they are admirable, and almost tell the story without the aid of the book.

PROPOSED HERALDIC EXHIBITION IN EDINBURGH.—According to the *Scotman*, it is proposed, in connexion with the visit to Edinburgh in the summer of 1891 of the Royal Archaeological Institute of Great Britain and Ireland, to hold an exhibition illustrative of Heraldry in its various aspects. The exhibition will be divided into two sections—a historical section, dealing generally with objects of heraldic interest; and a decorative section, illustrative of heraldic painting and decoration as a branch of the Fine Arts. Mr. A. Ross, F.S.A., Scot., Marchmont Herald, has undertaken the secretarialship of the former section, which will appeal mainly to the historical and genealogical student; and the latter section, which it is hoped will be of interest to decorative and other artists, will be under the more immediate direction of Dr. R. Howard Anderson, architect, and Mr. J. M. Gray, curator of the Scottish National Portrait Gallery. Mr. Thomas Ross, architect, joint author of "The Castellated and Domestic Architecture of Scotland," has undertaken to superintend the production of a series of drawings and reproductions of painted and other heraldic decorations of old Scottish castles and mansions.

#### THE MODEL FOR THE NEW FAÇADE OF MILAN CATHEDRAL.

OUR readers may remember that one of the conditions attached to the first competition for the new façade for Milan Cathedral was that the finally successful competitor should have a wooden model of his proposed façade made, to a scale of one-twentieth the size of execution; and that until this was done he was not entitled to the second half of the amount of the premium, the first half of which was payable on the announcement of the choice of the jury. The model of the late Signor Brentano's design, which has been made in accordance with these conditions, is now on view at Milan. The model, we should add, according to the terms of the competition, was made at the cost of the Cathedral administration; the architect, or his representative, giving only his skill and supervision to the work. Moreover, the model of the new façade was to be made in relation with the old model of the cathedral now existing in the offices of the administration.

This same ancient model is a very singular affair. It is of course of the scale of one-twentieth already notified as the scale for the new model, and is executed in wood in a rough-and-ready manner which sufficiently betrays the epoch of its execution; an epoch in which Gothic had begun to be interpreted in a somewhat arbitrary manner. Nevertheless the old model is worth a visit. It is to be found in the cathedral offices, at No. 1, via Archvescovado.

According to the conditions, Brentano received the 20,000 lire, the half of the premium, when he was announced as the successful competitor, and had then to proceed to direct the construction of the model. It should be borne in mind, however, that his design was not accepted by the jury without some reservations. They commenced by expressing great admiration for the portals in his façade, to which perhaps they were specially led by the fact that there does not exist at present anything like a decent entrance portal to the cathedral. The transepts have a kind of lean-to of comparatively modern date, and at the side of the cathedral is a small modern entrance of anything but monumental character. It is no wonder therefore that the jury were struck with this point in the design, and said that "to create a central entrance and another at each side, all of dignified character, was a problem which Signor Brentano had perfectly solved;" but they went on to express the opinion that in order that the rest of the design should harmonise with the entrances, it was desirable that the central portion of the design should be somewhat raised.

The desire thus expressed was naturally equivalent to a direct instruction; but unfortunately, from whatever reason, it has not been attended to. The architect had not had time to study this proposed alteration seriously, or to leave any adequate drawings for it. He did however make some attempt at meeting the criticism of the jury. He made three sketches of the façade with the centre portion raised, but these were not, as he himself said before his death, to be regarded as definitive studies for the modification of the original design, about which in fact, he had not been fully persuaded himself. He did not himself believe the alteration to be necessary and was disposed to wait till he saw better reasons, as he thought, given for it, and especially till he saw the effect of the model. Possibly he would have made two models, one representing the original design, the other the modification.

Brentano sent his drawings to Siena as an *envoi* in connexion with the travelling studentship which he had gained in the Gou-Feront competition some years before. Only the photographs of these drawings, which had been taken by the order of the cathedral administration, remained at Milan.

Of the modified drawings previously referred to, no notice has been taken in making the model, which is simply a reproduction of the first design. It is the nature of models in relief to bring out defects in a design unsuspected when it was only shown in drawings, and it has been so in this case; the model in relief producing an effect very different from that conveyed in the picturesque and cleverly-executed drawings.

The model shows even more plainly than the drawings, in the first place, the necessity for the raising of the centre, not only for æsthetic but for what may be called organic structural

reasons. In the central portion there is a grand window, suggested by those in other parts of the building; but no other window in the cathedral is so far below the vault as this one would be, and therefore it is out of harmony with the whole architectural ordinance of the building.

The great portals, which were so much admired in the drawings, as shown in the model are the objects of a great deal of criticism. The portals, as portions of a façade, have two faults; the first in regard to their connexion with the surbase (which only applies however to the central one); the second in regard to their gables, which are out of character with the style of Italian Gothic which belongs to Milan. M. de Geynüller, who has written an admirable critique on the design, goes so far as to say that these gables would hardly be more out of place in front of the Pantheon than in front of Milan Cathedral. Another mistake which appears to me to be revealed in the model is that the portals are too much crowded and broken up with a multitude of little columns and other small details, in keeping with Gothic of another school no doubt, but out of keeping with Milan, which has a character of its own, a kind of compromise between northern and Italian Gothic, and which is precisely what gives the cathedral a good deal of its special interest, as also, it must be admitted, some of its greatest faults. And one of the characteristics of the building is that there is plenty of wall surface around and in connexion with the windows and doors generally, giving them so far a monumental effect; and there is in fact, hardly a regular shaft or colonnette in the whole building. And the model of the design shows clearly that in comparison with the detail of the existing building, the central portal is in too high relief and the details too pronounced.

The foregoing may be taken as a fair expression of the general opinion among competent critics in regard to the effect of the design as seen in the form of a model; and while it was formerly said that any new façade to Milan must be logically composed in relation to the interior, the effect of the model, in which this principle has been adhered to, is rather to support the judgment of those who said from the first that the new façade ought not to be restricted by the lines of the existing building.

The case no doubt would be very different but for the lamented death of the young architect. I remarked in a former communication that if the model did not give satisfaction, the question of the façade would remain in the region of projects, and the design of Brentano would merely go to swell the number of unexecuted designs for a façade for the cathedral. I do not believe, and the majority of Milanese who take interest in the matter do not believe, that the proposed façade will be executed, at all events within any short time. As before observed, it might have been different if Brentano had lived; but now there are so many difficulties, artistic, personal, and financial, that it seems unlikely they can all be surmounted.

It may be added, before quitting the subject, that the model referred to has been admirably executed by the Milanese carver, Signor Brambilla, at a cost of 15,000 francs. The work has occupied just a year in execution.

A. MELANI.

**THE ENGLISH IRON TRADE.**—There is no improvement in the English iron market, and, if anything, its tone is even quieter than it has been during the past few weeks, the approach of the holidays having also, no doubt, a share in the quietness ruling. The downward course of pig-iron has not been arrested, warrants practically ruling the market. The Glasgow market has again been flat, and Scotch warrants are about 2s. a ton lower. In Middlesbrough pig-iron, the drop has been 1s., and west coast beam-iron has lost in value to a similar extent. In Lancashire almost any prices are taken to effect sales, especially of forge pig. Manufactured iron and steel are in no better demand, and easy in tone, concessions being frequently made to accelerate business. Shipbuilders keep steady at work, and are still receiving fresh orders, although the bulk of the tonnage ordered is gradually decreasing. Engineers continue well employed.—Iron.

**THE BRUSSELS SEAPORT SCHEME.**—The municipality of Brussels has decided that, in order to carry out the scheme of making Brussels a seaport through a canal, a limited company, supported by the city, is to be formed with a capital of twenty-two million francs.

A Pair of Wrought-Iron Gates.

#### WROUGHT-IRON GATES.

THESE gates have been recently made on commission by Messrs. Hill & Smith, the design having been made in their house, by Mr. H. P. Hodgkinson. They are entirely hammered work.

#### SYRIAN ARCHITECTURE—THE JEWISH TEMPLE.\*

PROBABLY the best use we can make of the Vision in Ezekiel is to unite it with the statements in Kings and Chronicles, and with those in Josephus and the Talmud: we shall in this way arrive at a very fair idea of the appearance and plan of the latest temple of all, that of Herod. For there can be no doubt that the first temple followed the lines of the two earlier temples, only that it was much more ornate than they, and had a larger extent of outer court.

The two subjects on which Ezekiel enters with some detail are the gateways to the two courts and the plan of the temple and its adjuncts. To take his description of the temple first, we learn that there was an open porch 30 ft. wide (taking the cubit at 18 in.). No height is there given, but, if we refer to the Talmud, we find that it states the height as 60 ft. We have thus an opening 60-0 by 30-0, which we may turn into a "portico in autis" by introducing the two columns, Jachin and Boaz, which we are told in I. Kings were set in the porch. They thus had some constructional purpose to serve in supporting the porch lintel. What confirms this theory is the height assigned to the columns in Chronicles—viz., 60 ft., with shaft and capital,—which is just the height of the porch given in the Talmud.

What did these columns support? The Talmud tells us that the porch had five carved oak beams as lintels, with stones in between, and that these beams increased in length by one cubit from the lowest to the highest, the highest being 30 cubits long. This would make the lowest beam 22 cubits, so giving it one

cubit wall hold. There is, moreover, a statement that the front of the temple shone from afar with the reflection of the gold which covered it, which seems to suggest that the five carved oak beams were covered with gold hammering to the form of the carving, and thus casting them in from the action of the weather. That wood, and not stone, should be used for the lintels, seems reasonable when we consider the enormous size of stone which would have been required to cover a 30-ft.—or with the columns—an 18-ft. span.

The repetition of the beams is also rational, inasmuch as it relieves the lower beam of much of the superincumbent pressure, in the same manner as the four lintels of the great pyramid mutually aid in relieving the true lintel over the chamber there. The gradually-increasing lengths of the lintels is a master stroke of æsthetic effect, as the result would be a form of lintel resembling a crown, somewhat like a stone which surmounts a lintel of a temple at Baal-Zimmon.

Mr. Fergusson's theory was that the columns and lintel assumed the form of something like the Sanchi Torii, or one of the Japanese Torii, so common in front of their temples, and so in his restoration of the temple he devised a screen of the Toran form, detached from the porch. He finds confirmation of this in the Talmudic statement that transverse beams were placed to tie the framework and prevent it from falling; but the fact is, the ties would be required in the other case also; and he overlooks the statement of the Talmud concerning the layers of stones between the beams, which would not, of course, be required in a detached piece of framework, but would be needed if it was incorporated with the wall.

Another oversight Mr. Fergusson makes is in taking the diameter of the columns as 18 in., because this, he thinks, would accord with classic proportions; he does not seem to have observed the passage in I. Kings and in Jeremiah—"A line of twelve cubits did compass them about,"—that is to say, the columns were 18 ft. in circumference, and therefore 6 ft. in diameter.

The next statement of moment in Ezekiel is, that there were three stories of chambers entered by a passage that ran round the

\* Portion of Ninth Lecture of course on History of Architecture, delivered by Mr. Atken, at Heriot-Watt College, Edinburgh, Monday, December 8, 1890.

temple, and which had side doors to the north and south at the east ends of the passage; these passages were repeated in the floors above, and they were approached, it would appear from Ezekiel xli., 7, by stairs, probably in the thickness of the temple walls. Mr. Fergusson reverses these passages, and places them outside the chambers, converting them into a series of open galleries; a very unsuitable form of construction for winter in so exposed a situation, and one that, moreover, shuts out the light from the windows of the chambers.

As regards plan dimensions, Ezekiel gives the temple walls as 6 cubits thick, the passage on lower floor, 5 cubits; the chamber wall, 5 cubits; the chambers themselves, 4 cubits; and the outer wall, 5 cubits; doubling this for the two sides, and adding the 20 cubits for the width of the holy place, makes up the 70 cubits mentioned by the prophet. Longitudinally, the dimensions taken from Ezekiel are: Porch, 11 cubits; wall to holy place, 6 cubits; holy place, 40 cubits; val, 2 cubits; Holy of Holies, 20 cubits; adding to all these the dimensions of walls, passage, and chambers at the end, results in a total length of 104 cubits. Ezekiel gives 100 cubits. He also mentions a figure of 90 cubits, which evidently refers to the length of the side chambers, which were shorter by the depth of the porch than the total length; if we therefore deduct 11 cubits, being the depth of the porch, from 104 cubits, there remain 93 cubits, a dimension sufficiently near to Ezekiel's 90 cubits, as the 104 cubits is to his 100 cubits, in order to warrant the accuracy of our plan, because it is evident that Ezekiel did not attempt to record fractions of figures where general dimensions were concerned.

Another point of confirmation is Ezekiel's statement of the number of side chambers as thirty; he mentions the length of the chambers as 20 cubits; this gives four chambers at the sides and two at the ends, which, multiplied by the three stories, makes up the thirty.

Another matter in which both Mr. Fergusson and M. Chipiez have taken alarming liberties with all the authorities, sacred and profane, is in the introduction of *twain* towers at the east or entrance end of the temple; for this there is not the slightest authority. On the contrary, we are expressly informed in the Chronicles account that there was a *single* tower 120 cubits high. The authority which these gentlemen trusted to, is the Talmudic statement that the porch had chambers projecting 15 cubits from it to the north and south, called the house of the instruments of slaughter; but it did not necessarily follow, as they assume, that these chambers reached to the height of 120 cubits, more probably they did not exceed the height of the first tier of side chambers, and would thus play a more efficient part in the general grouping than the ungainly arrangement which the assumed double tower plan would lend itself to.

#### ARCHITECTURAL SOCIETIES.

**THE ARCHITECTURAL ASSOCIATION (LONDON).**—At the meeting of the Advanced Class of Construction and Practice on Wednesday evening last, Mr. Maximilian Clarke read a paper with "Quantities" as the theme, taking the following heads for his remarks:—"Should quantity-taking be taught at the Architectural Association? To what extent should the subject be studied by architects? Remarks upon quantities as at present prepared by quantity surveyors. Remarks upon the difference between the London and country methods of preparing quantities." Mr. J. E. Drower was the Special Visitor, and added much to the information contained in the paper.

**LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.**—A *soirée* in connection with this society took place on the 8th inst., about fifty members being present. Mr. Clibborn, of Birkenhead, gave a description of scenes in Normandy, illustrated by some lantern slides, contributed by Mr. Thompson, of Liverpool. Later, the evening was passed with music. Mr. W. H. Thorp (president) occupied the chair.

**YORK ARCHITECTURAL ASSOCIATION.**—The eighth session of the York Architectural Association will be opened on Thursday evening next, the 18th inst., when an address by Mr. B. Priestly Shires, on "Domestic Life of the Middle Ages, as shown by its Architecture," &c., will be given.

**GLASGOW INSTITUTE OF ARCHITECTS.**—At a general meeting of the Glasgow Institute of

Architects, held on the 2nd inst., the terms and conditions of competition for designs for workmen's dwellings in High-street recently issued by the Improvement Trustees were under consideration. The matter being one of importance in view of its bearing on future competitions, the Institute appointed a committee to draw a letter to the Town Clerk on the subject, and, if necessary, to wait upon the municipal authorities as a deputation from the Institute.

**GLASGOW ARCHITECTURAL ASSOCIATION.**—The usual monthly meeting of this Association was held on the 3rd inst., Mr. W. J. Anderson in the chair. A paper was read by Mr. William J. Millwain on "Ornament." The right qualities in coloured, carved, and moulded ornament, and the province of each and all, were defined, the writings of Ruskin, Professor Dresser, and others being laid under contribution in the discussion of these questions. With regard to the exact prototype of forms met with in the art of all nations, a *résumé* of the opinions held was given. The essayist gave a review, with analysis, of the great historic styles of ornament, showing that in some, symbolism was a potent influence, in others the æsthetic taste alone was appealed to—e.g., Egyptian and Renaissance. In some, nature was copied with but little intervention of conventionality, in others the abstract laws of form and colour in heat and flower alone imitated; Gothic and Saracenic being examples of these opposites. A short discussion, opened by Mr. A. Muirhead, followed, at close of which the customary vote of thanks was passed.

**THE ARCHITECTURAL SECTION OF THE PHILOSOPHICAL SOCIETY OF GLASGOW** met on the 8th inst., when Mr. Campbell Douglas, F.R.I.B.A., gave some notes on "The Architecture of the Iberian Peninsula." Among other things, Mr. Douglas called attention to the fact that it is in the east end of the city, where the Moorish citadel and the Christian cathedral are close to each other, that almost the only architectural interest of old Lisbon can be found, for apparently something in the geologic strata of this part has offered more resistance to the severity of the shocks of the great earthquake than in the western parts. It is also noticeable that the Gothic towards the east end of the cathedral, as well as of the ruined Carmo Church further west, is of a fine, severe type of Early Pointed work. Mr. Douglas referred to the manner in which a large proportion of the houses are faced or veneered with glazed tiles, generally of a bluish colour, and known as "azulejos," on account of their being originally of an azul or blue colour, although that is not now universally adhered to. As houses veneered with tiles in this way have only to be well rained on to appear clean and fresh, their introduction would do much to break the dismal monotony of dirty grey in our streets. Mr. Douglas advocated that something might be done to make our footways more interesting. He was much struck in Lisbon with the many beautiful footpaths made in the various mosaic patterns of a brownish black and creamy white. The black is a whinstone, and the light-coloured a carbonate of lime, resembling in character the stone used by Hibernian engravers. Elegant and simple yet effective patterns are everywhere to be seen, and in one of the principal thoroughfares for shops—the Chiado—the number of the house is frequently worked into the design. One of the largest squares in Lisbon and some of the smaller ones are admirably decorated in this way. After showing that the building laws which were enacted by the Marquis de Pombal after the great earthquake of 1755, in order that the construction of houses might better enable them to resist the shocks of earthquakes, have been so far altered and modified that they no longer answer their original purpose, but rather make matters worse, Mr. Douglas proceeded to give an account of excursions to the great Church and Monastery of Alcobaca, as well as to those of Batalha. The second half of his paper was occupied with an account of a short visit to Spain, in which he rapidly sketched its history in Moorish and Christian occupation, in so far as each lent its own complexion to the development of its architecture. In Madrid there is little architecture worthy of attention. During the course of the lecture between thirty and forty limelight illustrations were shown, which had been specially prepared. Votes of thanks were accorded to the lecturer, and to the chairman, Mr. James Thomson, F.R.I.B.A.

#### ARCHÆOLOGICAL SOCIETIES.

**BRITISH ARCHÆOLOGICAL ASSOCIATION.**—At the meeting of this Association on the 3rd inst., Mr. J. W. Grover, F.S.A., in the chair, Mr. Sheraton exhibited a mass of lead which had been found in the thickness of part of the walling of the Roman camp at Carnarvon, where it had apparently been deposited in molten state from some conflagration. Mr. Bodger described some Roman coins which have been found at Woodstone Hill, near Peterborough. Mr. Loftus Brock, F.S.A., announced the discovery of a huge "Sarsen" stone, which has been found beneath No. 71, Moscow-road, Bayswater, to all appearance appearing to a fairly smooth surface. It is supposed to weigh nearly twenty tons, and when erect it would have been a conspicuous object from the Roman road from London to Silchester, the site of which is the present Bayswater-road. Miss Stoddart having recently presented a fine collection of rubbings of brasses, about 100 in number, a few of them were exhibited to the meeting. They are of additional interest from the fact that they were taken about fifty years ago, and several changes and losses are recorded. Mr. Oliver described a curious inscribed sial in Ashridge Chapel, representing a priest, John Stone, ob. 1395, which appears to have had prior use for some other person. A paper was then read by Mr. Davis on a brass to the memory of John Semis, Mayor of Gloucester, temp. Henry VIII., and Agnes, his wife, which had previously existed in the Church of St. John, Gloucester. It is described in Rudder's history, but had long since disappeared. During some recent restorations portions of a brass were discovered among some rubbish in a vault, and these have now been identified as having belonged to the lost brass in question. The second paper was descriptive of the celebrated Epinal Glossary, and was by Mr. W. de Gray Birch, F.S.A. It was compared with the Corpus Christi and Erfurth Glossaries, and specimens of the Early Saxon words were laid before the meeting.

**SOCIETY OF ANTIQUARIES OF SCOTLAND.**—The first ordinary meeting of this Society for the present session was held in the Library of the New Museum, Queen-street, Edinburgh, on the 8th inst. The Marquis of Bute, Vice-president, presided. The first paper, which, in the absence of the author, was read by Sir Arthur Mitchell, was entitled, "Fac-similes of the Scottish Coats of Arms emblazoned in the Armorial de Gêche, with notes" and was by Mr. Archibald Hamilton Druhar, F.S.A., Scot. In the second paper, Dr. D. Christison, Secretary, gave an account of the excavation of a curious fort, locally known by the name of Suidhe Chennaidh, situated on the side of Loch Ane, near Killochrean. With reference to the stone forts which were so numerous both in the Highland and Lowland districts, whose typical structure was yet comparatively unknown, much remained to be done. He described in detail the results of the excavation, which showed the fort to be of circular form, with a solid wall, containing neither chambers nor gallery, but having on the inside a series of step-like platforms. The next paper was an account of the excavation of two cairns on the estate of Aberlour, Banffshire, the property of Mr. J. R. Findlay, of Aberlour, by Dr. Joseph Anderson, Assistant Secretary and Keeper of the Museum. The first cairn was about 40 ft. in diameter, having its outline marked by a circle of stones of larger size than those composing the body of the cairn. The chamber in the centre of the cairn had been approximately circular, and formed of long slabs, set on end edge to edge, enclosing a space of about 5 ft. in diameter. The floor of the chamber had been much disturbed, but in its upper layer there were found fragments of urns of the usual character of the sepulchral pottery of the Stone Age, and an undisturbed deposit of ashes and charcoal containing the burnt bones of a cremated infant. The cairn had been chambered, it is to be referred to the Stone Age, but to the latter part of that period, when cremation was in use. The second cairn was about 45 ft. in diameter. No chamber or cist was found in it, but the surface of the ground underneath was covered with patches of charcoal and ashes, and at a depth of 3½ ft. under the base of the cairn there was a large deposit of ashes and charcoal, with traces of burnt bones. The fourth paper was a notice of the discovery of a cist and the opening of two cairns at High Banks, Kirkcubrightshire, by George Hamilton, Ardencle, F.S.A., Scot. The last paper was a notice

by Mr. John G. Winning of a cist discovered at Eskford, in Roxburghshire, in February last, being the third that has been discovered in the locality since 1885.

### Illustrations.

#### CAMBERWELL GREEN BATHS AND WASH-HOUSES.

**HIS** design, of which we publish two views, interior and exterior, was the one selected by the Camberwell Baths and Wash-house Commissioners (acting under the advice of Mr. Charles Barry, F.S.A., their professional assessor) in the recent limited competition.

As in the case of the baths to be erected on the East Dulwich-road site, by the same architects, the whole of the requisite accommodation for bathers has been provided on the ground floor, and the simplicity of plan thus ensured, in addition to securing the utmost possible convenience to the public making use of the establishment, facilitates an economical system of administration with efficiency of working, easy and effective supervision, and minimum cost of construction.

The men's and women's baths have separate entrances, between these is placed the check-taker's office, so that one person can take the money from both sexes and classes.

The following slipper bath accommodation has been provided:—

24	men's first-class slipper baths.
40	„ second-class „
12	women's first-class „
24	„ second-class „

Each of these sets or groups (all amply lighted and ventilated) is complete in itself, with waiting-room, w.c., &c., and each attendant in charge of a department can easily supervise the adjoining one by means of the direct through communication that has been provided.

The first-class swimming bath for men is near the men's entrance, with direct access from it as well as from their private baths. Its size is 120 ft. by 35 ft.

As this bath is on certain days to be set apart for women, a separate access thereto has been provided from the first-class women's waiting-room, which room, like the men's first-class waiting-room, would be shut off from the swimming bath whenever necessary, in order to insure absolute privacy to the swimming bath.

The men's second-class baths are also conveniently planned, and are directly approached by a wide corridor from the men's separate entrance.

Eighty-one dressing boxes are provided for the men's first-class swimming-bath, whilst for use in connexion with the second-class swimming-bath (which is of similar size to the first-class bath—viz., 120 ft. by 35 ft.), there are 103 dressing-boxes.

The whole of the accommodation required has been provided, including a superintendent's corridor for the easy supervision of the whole of the departments, and a gallery to the first-class bath, in connexion with which there are unusually spacious staircases, both for convenient access thereto, and in order to meet the stringent regulations now in force for facilitating free and rapid egress in case of panic.

In view of the utilisation of the first-class swimming-bath as a public hall, it has been thought desirable to connect it by means of swing folding-doors with the corridor leading direct to Harvey-road, and in accordance with the instructions, two artists' retiring-rooms, fitted with lavatories, have been provided. These rooms are in communication with the north end of the first-class swimming-bath, where it is proposed to place the platform for the performers, who would probably enter the building from the Harvey-road. All or any of the waiting-rooms adjoining the entrances from Artichoke-row would be available for cloak-rooms; the refreshment-room being placed, for convenience of service, on the first floor, immediately adjoining the kitchen.

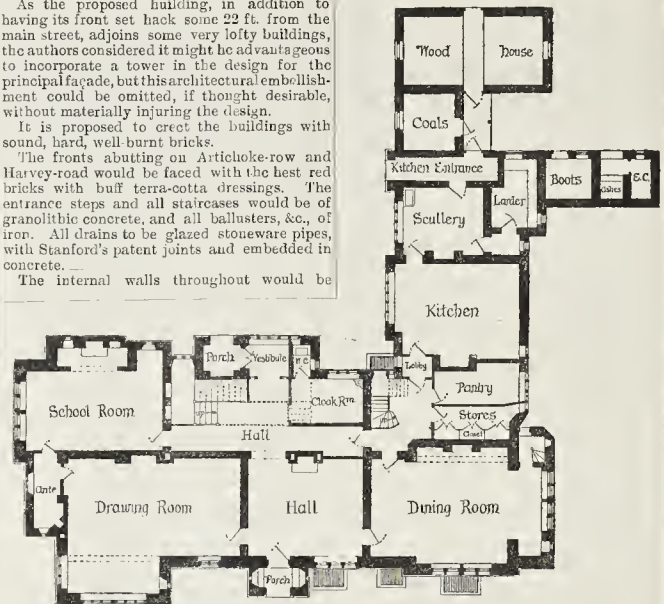

The wash-house department has been placed at the end of the site next Harvey-road, from which it is directly accessible, and has seventy-eight washing compartments.

The boiler-house, coal store, &c., with good external access from Harvey-road, are placed in the basement of this department, and would be separated from the upper part by fireproof floors.

As the proposed building, in addition to having its front set back some 22 ft. from the main street, adjoins some very lofty buildings, the authors considered it might be advantageous to incorporate a tower in the design for the principal facade, but this architectural embellishment could be omitted, if thought desirable, without materially injuring the design.

It is proposed to erect the buildings with sound, hard, well-burnt bricks. The fronts abutting on Artichoke-row and Harvey-road would be faced with the best red bricks with buff terra-cotta dressings. The entrance steps and all staircases would be of granolithic concrete, and all ballusters, &c., of iron. All drains to be glazed stoneware pipes, with Stanford's patent joints and embedded in concrete.

The internal walls throughout would be

Ground Plan

Plan of Residence at Street.

plastered or faced with white Suffolk bricks, and the insides of the swimming-baths lined with white, glazed bricks.

All floors and passages would be of fireproof construction, and the flooring round the swimming baths would be finished with ornamental tiling, and a curbed and sunk channel would be formed in order to prevent the surface water from passing into the baths.

The 1st class private baths would be of porcelain, and the 2nd class of enamelled iron.

The front roofs would be tiled with Broseley tiles, and the roofs of the swimming baths covered with the best Bangor duchess slates.

The heating apparatus would be placed in the basement of the wash-house block, and the tanks for the storage of water would be placed in the tower of the front block.

A service laundry is provided, which would be thoroughly fitted up with every requisite appliance, and spacious drying closets are provided.

The estimated cost of the proposed buildings is about 24,000l. Messrs. Spalding & Cress are the architects.

#### RESIDENCE AT STREET, SOMERSET.

THIS house, of which two views (the entrance front and garden front) are given, is situated on the brow of a gentle hill, and commands extensive and varied views of the surrounding country, including the celebrated Glastonbury High Tor and "Weary-all" Hill.

The garden front is occupied by the drawing-room (on the left of porch in garden-front view), the inner hall, and the dining-room. The pantries, kitchen, and offices extend behind the dining-room; the kitchen entrance is by the porch on the left-hand side in entrance-front view. The principal entrance is under the oriel window here. On the right, the gable, with chimney rising from the ground, is the school-room or library, and a chimney-corner is arranged inside. The bed-rooms are on the first-floor, with spacious attics over these.

Convenience of planning and general comfort in the apartments have been very carefully studied, and the elevations designed simply expressing the purposes of the interior, and as far as possible in conformity with the characteristic domestic architecture of the county.

A conservatory, vinery, laundry, stables, and a lodge have also been built. The materials for walling are local blue lias stone with Ham

Hill stone dressings. Bridgewater tiles for the roofs. The dining-room is oak panelled throughout, and the hall, staircase, &c., are also of oak. Special heating apparatus to supply warm and hot air has been arranged.

Mr. H. Hawkins, of Glastonbury, is the builder, and has nearly completed his contract. Mr. George J. Skipper, of Norwich, is the architect.

#### SALCOMBE CHURCH, DEVON.

THE illustration shows the east end of this small but solid-looking church, which has recently been erected at Salcombe from the designs of Mr. J. D. Sedding.

#### TWO BRASSES OF KNIGHTS.

THE brass of Lord William de Bryene, Seal, Kent, 1395, belongs to the camail period.

The head of the figure in the basinet rests on the helm with the crest and mantling. The sword hangs from the baldric, which is decorated with square roses. Over the head are two shields of arms, and a marginal inscription is round the slab. The evangelistic symbols are placed at the corners.

The brass of Sir Reginald Cohham, Lingfield, Surrey, 1403, belongs to the Transition period between the camail period and the Plate and Taces period. The former period is seen in acutely-pointed basinet, and the camail, and the later in the cuirass and taces.

Beneath the basinet is the helm, with the crest orb and mantling. A fillet of roses is placed round the head-piece. The armour on the arm is ornamented, and also the cuffs of the gauntlets. At the armpits there are fringed armholes, beneath which mail is worn, which may also be seen at the knees and insteps. The sword hangs in a socket which is attached to the baldric which passes across the waist. The scabbard is ornamented with a pattern similar to that on the scabbard of Sir W. de Tending (see *Builder*, November 22). Shields of arms are placed on either side of the figure, and a marginal inscription completes the composition.

In "Burtell's Brasses" p. 61, there is an illustration of this, showing that the crest, orb, shields, and the hilt of the sword and dagger were then lost. They have since been restored. A. O.

ENTRANCE LODGE AT OTFORD.—MESSRS. ROGER SMITH & GALE, ARCHITECTS.

NEW READING-ROOM, WANDSWORTH  
FREE LIBRARY.

The Wandsworth Free Library was the first established in the Metropolitan district under the Free Libraries Act. The Commissioners acquired an old house, of which the grounds had been detached, for building purposes, and adapted it to receive the library. Though void of the conveniences of a new building, the success which attended it in the adapted premises was increased by the gift from Dr. G. D. Longstaff of the reading-room, which overcame the chief difficulty in the original building, —namely, the want of space for a large number of readers.

The plan shows the walls of the original building scored, and the new uses of the rooms and the plans of the new reading-room are indicated. The walls externally were faced with white Suffolk bricks, and internally with Keen's cement, with decorative features in fibrous plaster by Messrs. Jackson & Sons. The building was carried out by the late Mr. Parsons, of Wandsworth. The architects are Messrs. Roger Smith & Gale.

## LODGE AT OTFORD, KENT.

This is one of a series of buildings carried out by Messrs. Roger Smith & Gale for Mr. Barclay Field. The house and stables have been previously illustrated. The materials were red local bricks, Broseley tiles, and yellow deal framing, finished with pure Stockholm tar. The cost was between 800l. and 900l. The work was in this, as in the case of the rest of the work, carried out by Messrs. A. Bush & Son, of Goswell-street, London, the clerk of works being Mr. James Hedden.

## THE LONDON COUNTY COUNCIL.

The ordinary weekly meeting of this Council was held on Tuesday afternoon, Sir John Lubbock in the chair.

*The Bethnal Green Steam-Clearance Scheme.*—With reference to the report of the Housing of the Working Classes Committee, presented at the last meeting, and printed by us on p. 445, ante, Lord Compton, the Chairman of the Committee, now asked leave to withdraw the report. He said that at a special meeting of the Committee on Saturday last, it was decided at the commencement of their proceedings to proceed with their recommendation, as they felt that they could easily answer most of the arguments that were adduced against it at last week's meeting of the Council. Particularly as to the statement that the price of the land in question was equivalent to something like 5d. per room, he had to say that it only worked out something like 2½d. At the end of the sitting they were informed that the other offer for this site would result in an acceptance, and in the area being partly covered by artisans' dwellings. When he brought forward the Boundary-street scheme he stated that the Committee were in hopes that they would be able without expense to re-house some of those who would be displaced. They expected at that time that one of the Gossett-street sites would be covered with artisans' dwellings; but subsequently they were told that it was to be sold for commercial purposes, and it was on that account, in fact that was the principal reason, why they brought forward their recommendation last week. As soon as they were informed that it was the intention of the gentleman who offered the site to erect cottage dwellings for the working classes to re-house about 200, they felt that the chief argument in support of their proposals had been removed, and, therefore, he asked leave to withdraw it. It was the intention of the Committee, after the recess, to bring forward a full report as to re-housing in connexion with this scheme.

The recommendation was then by leave withdrawn.

*Sky-Signs.*—The Parliamentary Committee reported that they had decided to introduce a separate Bill to prohibit or regulate sky-signs, and not to attempt to deal with the subject as part of the General Powers Bill, and recommended the Council to affix the seal of the Council to the petition for leave to bring in the Bill.

Mr. F. Harrison, Chairman of the Parliamentary Committee, said they thought it undesirable that they should promote a Bill in

which they claimed more than the public would give them. There were two points in which their definition might be more carefully guarded. One was that they ought to set forth a *minimum* of dimensions within which nothing should be considered a sky-sign, and the second was that nothing should be considered as a sky-sign unless some part of it stood higher than any actual building over which it was built. He begged leave to move:—

"That the Bill be referred to the Committee, with an instruction that the definition should be amended by adding the following provisions:—(1) To define a *minimum* measurement under which nothing shall be regarded as a sky-sign; (2) That nothing shall be considered a sky-sign of which no part stands above any part of the building on which it is placed."

Mr. Beachcroft, in seconding the amendment, said he regarded the measure as an attempt at grandmotherly legislation, only calculated to put feet into the pockets of District Surveyors.

Mr. Beck said that sky-signs were preferable to the horrible chimney-pots, and that he had seen some sky-signs which really improved the appearance of London rather than detracted from it.

Mr. Hollington said the desire of the Council was to avoid paying compensation for the removal of sky-signs. Surely the Council would not be so unfair as to say a man should pull down his sky-sign previous to its having had a reasonable life, and he did not think that six years would be a reasonable life.

Dr. Longstaffe remarked that people had been allowed to disfigure London by all sorts of abominations, and he hoped that the Council would decide, although it might seem a bit grandmotherly, that people should not only not be allowed to do that which was a nuisance and injurious to health, but should not be permitted to do that which was a nuisance to the senses of their neighbours. But for the lack of some controlling power in these matters in the past, London might have been preserved from many disfigurements.

Earl Compton said that whatever might be said against ugly and in all probability dangerous sky signs, he hoped that flags as a means of advertisement would not be interdicted.

Mr. C. Harrison, in reply, stated that there was not the slightest objection to the Council amending the Bill. It was very easy to refer back a clause to the Parliamentary Committee to define a sky-sign, but they had had eight or ten meetings, and with the advice of the Parliamentary agent and the Solicitor and all the members of the Committee, before they came to their decision, and if the Council could define sky-signs better he was sure the Parliamentary Committee would be very glad to accept any suggestion. There were special stipulations which prevented the Bill from affecting auctioneers' advertisements of houses to let, and brewers' signs. Under the Bill provision was made for an inspection or survey of sky-signs, and the District Surveyor should grant or refuse a certificate as to the stability of the sign, and its stays and construction generally. The Council would grant a licence for a continuance of the sign on the certificate being sent to them, and the licence would remain in force two years. It might be renewed for two periods of two years each, making six years in all. The sky sign should at the end of six years be in every case removed regardless of its structural condition, and, failing its removal, summary proceedings against the owner should be taken by the Council. If the sign were wanting in stability, and were not repaired or strengthened, proceedings should be taken by the Council to demolish it. By section 4, after the passing of the Act, it would be unlawful to erect or place any sky-sign wholly, or in part, above, or over any house, building, structure, street, or way.

After some further discussion, the amendment was negatived, and the recommendation of the Committee agreed to.

*The Proposed New Sludge Ship.*—The Main Drainage Committee reported recommending that the proposal to obtain an additional sludge ship, as agreed to at their meeting on October 7 last be abandoned for the present. This was agreed to.

*London Water Supply.*—The Special Committee on Water Supply and Markets reported that they had passed the following resolution, which they submitted and recommended the Council to adopt:—

"That in the opinion of the Council it is necessary to inquire whether the present sources of supply of water

are adequate to the growing demands of the population in quantity and quality, and that her Majesty's Government be requested to institute an immediate inquiry whether any and what steps should be taken to provide a new and better supply, so that a report may be made thereon in the course of the ensuing session."

The Chairman said that as he had proposed the resolution which was now recommended to the Council by the Committee, he was anxious to say a few words in its support. He had paid much attention to the subject of water supply, having served both on the Manchester and on the Liverpool Water Bills Committees of the House of Commons. He need not, however, enlarge on the reasons for doubting whether the supply of water in the Thames basin would be sufficient in quantity and satisfactory in quality for the supply of the rapidly-growing population in the metropolitan area. The memorandum of the vice-chairman, which they had all received, and the report of Mr. Binnie clearly set out the facts, as to which the Water Committee were indeed almost unanimous. The question was as to the policy. The Council, no doubt, had power under the Bill of last year to make inquiries, and indeed were doing so, but the sum to which they were restricted was not sufficient for more than a preliminary inquiry. Moreover, in this matter it was necessary not merely to convince the Council, but also the Government, and the Government would naturally attach more weight to an inquiry which they had themselves set on foot. The last words in the resolution were not in his proposal. They sounded rather preterpitory, but were not meant to be so. It was certainly, however, exceedingly desirable that the inquiry should be completed as soon as possible. This recommendation had no reference to the purchase of the water companies. It would be equally desirable whether the supply of water was in the hands of the companies or of the Council. Far from conflicting with the policy adopted by the Council, it would be quite in harmony with it, because the adoption of the resolution would certainly render the companies more disposed to treat, nor would it conflict with the Bills proposed by the Vestries and the Corporation, because if the Government approved they might carry out the inquiry recommended in the resolution by means of the committee on one or other of those Bills. The resolution did not commit the Council absolutely to the statement that an additional supply would soon be necessary. It did, however, record the opinion that the subject demanded the earnest attention of Government. If the Council rejected the resolution, and if the supply in a few years proved insufficient, he feared that they would be censured for having in this respect neglected the interests of London. If, however, they passed the resolution, they should have done all that for the present they were empowered to do. They would have recorded their opinion, and the responsibility would rest with Government. It was from this point of view that he had proposed the resolution; it gave them the opportunity of expressing their opinion, which had not yet been done, and under these circumstances he hoped the Council would support the recommendations of the Committee, and call the attention of Government to the importance of the inquiry whether in a few years the water supply within the Thames area would not be insufficient for the growing population of the Metropolis.

Mr. C. Harrison, Chairman of the Parliamentary Committee, was sorry he could not agree with the recommendation of the Water Committee. He thought the proper way of dealing with this matter was that the Home Office should be asked in Parliament to undertake to ascertain the opinions of experts as to whether the present supply was adequate, and, if not, where a new supply was to come from. If a Government Department undertook that, they would instruct experts to do it properly and would pay the expenses, and they would have a proper report. He did not think the question would be at all carried further by a Royal Commission or a reference to a Parliamentary Committee and a number of engineers saying they thought this might be done, and that such a supply might come from the Chiltern Hills or some other place, without the actual physical investigation.

The Vice-chairman (Sir Thomas Farrer) stated that the Committee did not think it right in framing this resolution to dictate to the Government the actual form the inquiry should take. There were not only engineering questions, but semi-political questions,—questions

of the rights of other bodies, and questions of other consumers of water. No doubt the engineering question was a primary and difficult one, and it would be open to the Government, if they were pleased to accede to their views on the subject, to appoint a special commission of experts. They thought it far the wisest thing in this large concern, in which he might say they felt the Government must be interested and must take part, most respectfully, of course, to ask the Government to make an inquiry, leaving them to judge of the best way in which the inquiry should be conducted.

The recommendation of the committee was ultimately agreed to, and after transacting further business, the Council was counted out at five minutes before seven o'clock.

#### THE ASSOCIATION OF PUBLIC SANITARY INSPECTORS.

At the opening meeting of the new session of this Association, held at Carpenters' Hall, the new president of the Association, Dr. B. W. Richardson, delivered his inaugural address. There was a large attendance of members and visitors, among them being—Dr. Danford Thomas, and a number of ladies. Mr. H. Alexander (Shoreditch), Chairman of the Council, opened the proceedings, and subsequently ceded the chair to Dr. Richardson. The address, which was extemporised throughout, commenced with an interesting historical contrast, in which the conditions of life in the eighteenth century were compared with the enormously improved conditions of the present period of the nineteenth, and concluded with the enumeration of the leading sanitary reformers of former times, and a sketch of the career of the last and greatest of them, the first President of the Association, the late Sir Edwin Chadwick. Medical opinion in the earlier of the two centuries was so little enlightened that even the profession often regarded the entrance of that dreadful malady—small-pox—into a family as a good thing because it was an inoculation, and therefore a safeguard against future attacks. The treatment of the insane, even in the case of persons wealthy enough to pay for proper treatment, was systematically cruel. Now the poorest inmates of asylums received better treatment than even kings or princes could then command, and the insane were frequently chained up in outhouses or cellars, like wild or savage animals. The death-rate, or rather the life-rate, the expression that he now preferred, might properly be called the pulse of the people. In a review he had set down the normal death-rate for England at 12.5 per 1,000 and the maximum at 15 per 1,000, but that very morning, as if providentially, he had received information from Hove (Brighton) of a rate reduced to 10.4. Even in the army, including that of India and other distant possessions, the rate, which last century was as high as 58 per 1,000, had now been reduced to 16 per 1,000. Such a death-rate as prevailed at the beginning of this century, even in towns considered fairly healthy, would create a panic if prevalent in any town now, and any such town would now be stunned as a plague spot. His picture of Hygieopolis had been considered so overdrawn and impossible that it had been called a mere poem, but sanitary improvements were progressing at a rate which promised to make his elevated gardens of London realities before the end of the present century. Before treating of the "Sanitary Reformer" who was the principal subject of his address, Dr. Richardson enumerated the leading sanitarians of previous periods, commencing with that encyclopedic philosopher, Sir Francis Bacon, the great Lord Verulam. In Italy Dr. Ramazzini, and in England Dr. Arbuthnot were the greatest reformers, followed in Scotland by a remarkable man, Dr. Benjamin Bell, who, with other merits, must be credited with being the first to propound the principle of Free Trade. Dr. Priestley, by his demonstrations of the properties of fixed air, and Dr. Pringle by his great army reforms, had subsequently carried on the knowledge of sanitary science in the last century, but it was to the new century that the greatest perhaps of all the sanitary reformers belonged, Sir Edwin Chadwick, their late venerated President. Dr. Richardson narrated the circumstances under which he had in 1852 first met Mr. Chadwick, then a barrister,

whose interference in questions of health earned for him a certain amount of dislike in the medical profession. He declared that, although so unlike in many respects, their late President and himself had always been in agreement on leading principles, and that throughout a long and close intimacy they had never had a personal disagreement. Among the long list of reforms on which the influence of Mr. Chadwick had been the most powerfully felt, were those of workhouses, registration, graveyards, and the dwellings of the working classes,—but he had been the first to suggest a great number of the most beneficent movements of the present and the immediate future, including coffee palaces, public promenades, baths and wash-houses, model lodging-houses, and cremation, and, although he was not a teetotaler, he had conceived a broad-minded scheme for a Permissive Bill. Sir E. Chadwick's proposals for "workhouse reform" had been greatly misunderstood, and the misrepresentations made had brought him into undeserved obloquy. The term "Union" was invented by him for a purpose totally different from that to which it had been since applied. His scheme of "Union Workhouses" was a splendid conception, and had it been realised in its entirety it would have given us fifty years ago, under one and the same state organisation, not only the "workhouse," but the "almshouse and the industrial school," and a group of such institutions as have since been created by voluntary effort. Mr. Chadwick had originated the regular registration of births, deaths, and marriages, and had discovered that greatest of Registrars-General, William Farr. His "Report on the Condition of the Working Classes" was a monumental work, which he brought out at his own risk. The revolution in the rites of burial which had taken place in the latter half of this century was initiated by his work on graveyards and cemeteries. He was an earnest advocate of the doctrine contained in Ward's formula, "the sewage to the soil, land to land, and water to water." Even his last notion, that pure air should be brought through the clouds by long tubes, was worthy of the most vigorous of youthful minds; instead of being, as it actually was, the conception of a man of eighty-seven. To sum up, Mr. Chadwick held that the one word "cleanliness" if properly understood, included all that was meant by such scientific terms as "antiseptics" and others of recent invention.

The address was frequently interrupted by applause, and at its conclusion a vote of thanks was accorded to the new president on the motion of Mr. Richards (Battersea), seconded by Mr. Fairchild (Clapham).

At the second meeting of the Association, held on Saturday last, an address on "Cremation as a mode of disposing of our dead" was delivered before the members of this Association, with Mr. H. Alexander in the chair, at Carpenters' Hall, London Wall, by Mr. J. C. S. Hanham, the Hon. Sec. of the Cremation Society of England. The usual arguments against the customary modes of burial were cogently presented by the lecturer, an interesting experiment made by M. Pasteur being cited, among other proofs offered, in support of the declarations of Dr. Parkes and other sanitarians of the highest authority, that the vicinity of a grave-yard was always an unhealthy district to live in. The great French scientist proved the existence of morbid germs in earth, beneath which a cow had been buried, by an inoculation experiment, every one of a number of guinea-pigs inoculated with earth taken from above the buried cow dying after inoculation, while of an equal number similarly inoculated with ordinary earth not one failed to recover. The best and most economical way of destroying such germs was by fire,—a test which they were unable to survive.

A discussion followed, in which Mr. Alexander, Mr. Wootton, Mr. Richards, Mr. Middleweek, Mr. Tidman, and other members took part, in the course of which objections on the score of cost in time and money were urged against cremation. A vote of thanks was accorded, in replying to which the lecturer answered the principal objections offered. The cost of cremating a body was at present as much as 6*l.*, but that was because the cost incurred was almost as much upon the fifty bodies per annum now disposed of in that way as it would be on three thousand. On the latter number the cost would not exceed half a guinea per body. There would also be a great public saving in the cost of sites for cemeteries if cremation became customary.

#### THE PLUMBERS' COMPANY.

On Monday evening last the Master, Wardens, and Court of the Worshipful Company of Plumbers, entertained a large company at dinner, the guests including a large number of gentlemen who have interested themselves in the promotion of the movement initiated by the Company some years ago for the education and registration of plumbers.

The Master (Mr. W. H. Bishop) submitted the toast of "Modern Sanitary Science and Technical Education," and in speaking of the efforts set forth by the Plumbers' Company, said the scheme involved a training for apprentices in the technical schools and colleges, some of the Principals of which he was very pleased to see present that night. A scheme had been prepared, and a syllabus of instruction issued to men who had passed through apprenticeship in order that the principles of science and the practice of plumbing might be improved. He coupled with the toast the names of Sir Bernhard Samuelson, M.P., Dr. Robert Farquharson, M.P., and Professor Garnett.

In replying, Sir Bernhard Samuelson congratulated the Plumbers' Company upon the great advance they had made with regard to the question of technical education.

Dr. Farquharson expressed a hope that in the future sanitation would permit of a man living 100 years to enjoy the good health which modern sanitation offered to every man.

Professor Garnett, responding, said the nation was indebted to the ancient Greeks of London for that which had been so successfully effected in any other large trade. This was a volunteer system of registration, based upon the best of qualifications, which, he thought, was the only one in which the co-operation of all authorities could be secured throughout the country. The movement had been generally responded to, because the health of the community depended upon the result. The President of the Local Government Board was one of the first to recognise the importance of the movement, and a circular was issued by the Plumbers' Company at his express suggestion, and this circular met with the ready support of all the County Councils. During the year they had held 123 meetings, and he believed that he might say that 200,000*l.* would be spent in economic and sanitary science, subject to the approval of the Attorney-General, and they had some hope that this would be supplemented by other contributions, and that it would be ultimately available for the promotion of an educational scheme which would be given to the whole of Great Britain and Ireland. He associated with the toast the names of the Mayor of Manchester and Mr. Ex-Bailie Crawford.

The Mayor of Manchester and Mr. Ex-Bailie Crawford having acknowledged the compliment, the Lord Mayor proposed "The Health of the Master of the Plumbers' Company." He said it would be impossible for a livery company to take up such a great work without its possessing a good Master, and he wished the Plumbers' Company did possess a very excellent Master. He hoped there might be held in the City of London a congress on hygiene, and he could assure them, if it was held, it would have his heartiest support, and he was certain he would receive the greatest assistance from the livery companies of the City.

The Master briefly thanked the company, and gave the toast of "The Guests," to which Sir E. Staveking and Mr. G. Galloway responded.

#### PROPOSED IMPROVEMENTS IN THE ISLE OF MAN.

—At a sitting of the Tynwald Court in Douglas, on the 25th ult., the petition of the Douglas Town Commissioners for leave to borrow 4,000*l.* for the erection of a public abattoir was presented and referred to a committee to report on the question of a site. The report of the committee of the court respecting the swing-bridge over Ramsay Harbour and further improvements on the Mooragh estate was presented. The Town Commissioners of Ramsey ask for a further loan of 12,000*l.* The committee reported generally that it appeared essential that the works should be carried out, and that the borrowing powers to the extent of 14,000*l.*, instead of 12,000*l.*, be granted, making the total indebtedness nearly 56,000*l.*

BYGONE NOTTINGHAM.—Mr. T. C. Hino, the well-known Nottingham architect, sends us a copy of a lithograph sheet from his drawing (made we presume for private circulation), in which he has brought in a kind of general view a number of bits of old Nottingham which have now disappeared: the old guild hall, the market cross, the old bridge over the Trent, &c.; the whole including twenty-eight relics, mostly architectural. They are compiled from former sketches by the author, and from illustrations by Speed, Deering, Sandly, and others. The names of Nottingham worthies are worked into scrolls on the ornamental border.

Correspondence.

To the Editor of THE BUILDER.

MR. WATERHOUSE AND THE ARCHITECTURAL ASSOCIATION.

SIR,—I have seen, with some surprise, that Mr. Waterhouse's statement that the new education scheme in its entirety was not adopted by the general body of members, has met with some challenge.

The proposals were put before a meeting not by any means full, and were not all adopted unanimously, while subsequent meetings proved that there was a growth of feeling on the subject, which rendered it impossible to carry out the scheme without modification.

The Committee that has just been sitting was not appointed for the purpose of giving effect to the scheme, but to act more as a conciliatory body to further consider the proposals, especially as there had been such a strong expression of opinion on the advisability of affording means to consult the general body of members in any changes of a drastic nature.

I take it that Mr. Waterhouse's view will be accepted as more correct than those of the partisans of the "curriculum." A. NEEDHAM WILSON.

BARFRESTON CHURCH, KENT.

SIR,—In the *Builder* of the 5th, you state "There is a curious semi-Celtic appearance about some of the ornaments which seem to indicate some special influence at work in the erection of this church, which has this other notable feature, the curious irregularity in the setting out," &c., &c.

This latter peculiarity is very characteristic of Roman work.

Was the original production Romano-British? With regard to the string moldings, the fret, and the patera ornamentation, they, too, are of that school.

Of the latter ornament, I remember seeing something very similar at the Roman villa at Fordington, Gloucestershire; and I enclose a tracing of a rubbing from a small piece of string-moulding in Parbeck marble, found in the excavation of the Basilica at Silchester some years ago.

Bath, December 8, 1890. RICHARD MANN.

BRIDGE CHAPELS.

SIR,—With reference to this interesting subject, lately discussed in your columns with illustrations from these mediæval structures, I would wish to refer those students in this branch of archæology to the "Calendar of Wills," proved in the Court of Hustings, London, recently edited by Dr. Sharpe, of the Town Clerk's office, and published by the corporation of the city.

In Part II. of this volume are numerous particulars of the wills of London citizens, and many items of the benefactions given for the maintenance of St. Thomas's Chapel on London Bridge, especially as to the keeping up the chantry in the same building.

These entries range in date from 1358-1638, and that a wide area is introduced, and the variety of bequests made with frequent mention of old (and now destroyed) churches, affords many a clue to the searcher for the past architectural wealth of old London.

Though naturally the documents are drawn from civic sources, still frequent mention is made of repairs and preservation of ancient bridges elsewhere, and where existing, of the chantry chapels founded on or near them. Surely the annalistic side of architecture is much enriched by such publications as the above. S. W. KERSHAW, F.S.A.

BRICK-BURNING.

SIR,—I assumed that my letter on this subject would only be of interest to brickmakers, and did not go into details, and, with your permission, I would like to reply as briefly as possible to the very fair and moderate letter signed "A Brick-maker."

Clamp bricks are burned with breeze and ashes; the first is used in layers in the clamp, the latter being introduced into the body of the brick itself, by being spread over the brick earth that has been dug and curfed up, or washed into a back, as the case may be; when used the temperer cuts down the face, and it is mixed in the pug-mill.

The breeze and ashes are procured as follows:—Dust-bin refuse is collected, bulky items are picked out, and it is then screened,—the coarse is the breeze, the fine is ashes,—it goes through no other process, and it is perfectly obvious that the fifth it will go through the screen as easily as the ashes. It is this fifth that, when burnt, causes the stench.

I say that the clamp brick is doomed if the now by-law is enforced, because the present system of burning cannot be continued without causing a nuisance; if the by-law is not to be enforced, why unduly harass a trade; competition is severe,—I

notice bricks made in Belgium being used in London, for both house building and street works. A properly-burnt brick, whether clamp or kiln, is imperishable; underburnt bricks, on either system, will not stand, and should only be used for interior work (if at all).

The bad kiln bricks referred to are probably such, or may be semi-kiln bricks,—these, unless made from suitable clay, will not stand at all.

I consider that both clamp and kiln bricks are burnt, the former partly by heat from the layers of breeze, but principally by the fuel in the brick; and the latter by the application of heat from coal fires applied to the outer sides only. Kilns when burning give off the gases and products of combustion from the coals, and very little of that if in competent hands. There is nothing injurious in this, or in the bricks themselves. It is the fifth, that cannot be separated from the breeze and ashes, that causes the trouble.

I know full well what is embarked in, and dependent upon, the trade. Many of my friends say that they have not heard of the proposed by-law, and it seems to me altogether wrong that a law having such serious and far-reaching effects, should be passed (as far as I can learn) without any proper inquiry into the rights and wrongs of the matter.

However, one thing is certain, you may doom a system, you cannot stop the trade. London has been, is, and will be a city of brick; and bricks and brickmakers will be wanted in ever-increasing numbers. It is simply a question of burning on a different system, for the sake of the public health. With the remarks as to compensation, and the last paragraph of your correspondent's letter, I heartily agree. JOS. JORDAN.

"DEATH TO IMPERFECT VENTILATORS."

SIR,—Mr. Buchan's letter in your last doubtless refers to me, although my name is misspelt,—probably through indistinct handwriting,—which thus exhibits a parallel with Mr. Buchan's arguments.

I have no time for long letters, not yet having arrived at the stage of "cultured leisure." So I must simply say:—

1. I have never, under any circumstances or at any time, advocated the use of valves in such a manner as to produce syphonage. In fact, I have never once mentioned soil-pipe ventilation in connexion with any valve. I do so now.

2. Exit valves may be used to distinct advantage on soil-pipes, and without causing syphonage.

3. This distinct advantage necessitates a radical deviation from the lines laid down by Mr. Buchan.

The above are direct contradictions of Mr. Buchan's statements. I may go further, and say he never invented a closely-fitting exit-valve such as mine, and I call upon him to indicate where one such is patented, or where one such of his manufacture is in use.

The kind wish expressed by him that my ventilator should be withdrawn from the market is so disinterested and unusual, as coming from a rival ventilator maker, that I hasten to thank him, and "refer his kind recommendation to the proper quarter." J. F. SIMMONCE.

Liverpool, December 4, 1890.

THE COMMUNION TABLE.

SIR,—The recent judgment of the Archbishop of Canterbury will have drawn the attention of those who have read it to the fact that there was a period when the altar was replaced by a table standing east and west within the chancel, and sometimes within the nave, of our parish churches. Some years ago an oak table in a very decayed condition came into my possession, and I was informed that at one period it had stood in a church in Westmoreland. It is of good design, and may be seventeenth century, or even sixteenth century work, but had the peculiarity that its legs are of two different patterns, and that they were placed in pairs at the two ends. That is to say, the legs at one end were handsomer than those at the other end. This unusual peculiarity can be understood if the table was to stand so that the congregation would habitually see its end, not its side, and is, I think, sufficiently curious to justify me in asking you to find room for this brief notice of it. Was it customary?—T. R. S.

FUNGUS.

SIR,—Can any of your numerous readers inform me how to destroy "fungus" (in an old brick wall), the growth of which has completely rotted a set of door-jamb which have only been fixed a little over a twelvemonth? I had the jamb well painted before they were fixed, and the brickwork well "dressed" with hot lime.

AN OLD SUBSCRIBER.

GRADIENT INDICATOR.—We have received an illustration and description of "Brown's Automatic Self-adjusting Gradient Indicator," the principle of which consists in a curved spirit tube in which the bubble remains stationary at a point in the index marking the angle of the surface on which it is resting. We have not, however, had any opportunity of testing the instrument.

The Student's Column.

HOT-WATER SUPPLY FOR BATHS, LAVATORIES, &c.—XXIV.

SAFETY VALVES, &c.

HERE are at present but four kinds of safety valves made for range boilers, viz., spring, dead-weight, lever, and diaphragm.

The spring valve, shown in section at fig. 62, is, perhaps, the one most used owing chiefly to its occupying but little room; it consists of an outer case A, a screw cap B, pin C, seating D, and a spiral spring.

The seating is held in place by the spiral spring which presses upon it at one end and at the other end against the screw cap; this where the utility of the screw portion of the cap manifests itself, as by unscrewing the cap we slacken the pressure exerted by the spring, and by screwing the cap down the spring exerts a greater force. The seating has the under side of it covered with a special compound of a rubber character so as to easily effect a water-tight joint, and the outer casing is perforated to allow of the ultimate escape of the steam when the seating is lifted.

When fixing these valves, and the apparatus is charged, it is usual to unscrew the screw cap until the valve leaks, then screw it up again until the leakage ceases, and afterwards give it one extra turn to keep it quite sound under ordinary conditions.

Undoubtedly, the proper place for a safety-valve is in the boiler, but it is very desirable to have the valve in sight, and this precludes the idea of having it fixed directly into the boiler itself; therefore, the next best arrangement is to have it fixed somewhere in sight, and connected directly with the boiler by a fair-sized pipe; there is no great risk of this pipe becoming stopped, not even by fur, as the water does not circulate within it, and if it is taken from the top surface of the boiler, there is not a great likelihood of the opening to the pipe being "furred" up, unless the boiler is allowed to get into a very bad state indeed.

FIG. 62. FIG. 64.

FIG. 63. FIG. 65.

There is an idea rather prevalent that as good a place as any for the safety-valve is on the cylinder (of the cylinder system). No doubt the advocates of this method have strong arguments in favour of it; but it must be borne in mind that cylinders never burst. It is the boiler that is the seat of danger, and where the pressure is exerted to the greatest extent; and, what is more, some of the accidents are due solely to something that occurs between the boiler and the cylinder—stop-cocks, for instance.

It was said just now that cylinders never burst—neither do they; they collapse, which is a very different thing, and which a safety-valve would in no way obviate, as the valves in question are provided expressly to relieve a pressure

that is exerted from the inside, whereas a cylinder collapses from an external cause—viz., atmospheric pressure, and an inlet-valve would be the proper thing to obviate this.

The collapse of cylinders is of as great a rarity as the bursting of boilers, and it is brought about usually in this way:—Supposing a cylinder for some reason is allowed to get empty, and a fire is still kept in the range (a most unlikely thing), if there is any water in the boiler this will boil, and the steam will, of course, enter the cylinder; now it is well-known that there is no better means of driving air out of any confined space than by injecting steam into it, and consequently while the steam is entering the cylinder in fair volume, very little air will remain there. While things are in this condition, if cold water is introduced the steam is condensed, and a vacuum is formed, when the pressure of the atmosphere crushes in the cylinder like cardboard. It takes but little calculation to arrive at the force exerted by the atmosphere, as we only have to find the number of square inches on the external surface of the container and multiply by 15 to have the total pressure in lbs. With a medium-sized cylinder this pressure would be about 15 tons.

The next form of safety-valve in general favour is the "dead-weight," as fig. 63. The body of the valve is similar in form to the one last described, but the seating is held down by weights placed and bearing upon the central pin. This is a good valve, but unfortunately takes up a good deal of room, and is not of slightly appearance, otherwise it is to be recommended on the score of reliability. This valve is still more unsuited to place directly into a range boiler, but it can be connected by means of a pipe, as described by the last. After it is fixed sufficient weights are placed on to just prevent leakage, then an extra weight is added to keep it quite sound under ordinary conditions.

Next in rotation comes the lever valve, as fig. 64, this is similar in internal construction to the two preceding, but the pin which bears upon the seating is held down by a weighted lever above, as shown; this is another reliable valve, but is even more cumbersome and unsightly than the dead-weight, consequently it is rarely seen affixed to range boilers, but it is a valve that must be familiar to every one, as it is much used on all sorts of steam boilers. It is a very safe valve.

The last to be described is an arrangement by which an excessive pressure bursts a thin sheet of copper, thus releasing the undue strain. Fig. 65 illustrates this valve. As the thickness of the copper must be proportional to the pressure on the boiler, it is necessary when ordering these to state what pressure of water exists, or, in other words, how far the cold-water cistern is above the boiler, and the maker inserts a diaphragm of suitable strength or lightness. Should the valve come into operation, it can easily be put in order again by the mere insertion of another diaphragm.

Fusible plugs are, perhaps, the most ingenious form of safety-valve ever introduced, but, owing to certain drawbacks, exceedingly difficult to overcome, they are not used as freely as they would otherwise deserve to be. A fusible plug, as its name implies, is a plug or piece of material arranged to be fitted in the boiler in such a manner that, although infusible at the temperature of boiling water (212 deg. or thereabouts), it would immediately melt if the boiler was without water, and by its melting leave an aperture for the free escape of steam, should water afterwards flow in, and so prevent an explosion and disaster.

These plugs are pieces of soft metal, usually a disc, enclosed in a brass or gun-metal socket, this socket being screwed inside the boiler (to prevent injury by the poker or stoking tools), and it is further made so that part of it is easily removable to replace the plug, when it may require renewing.

These plugs, however, can not only be used as an element of safety when danger from shortness of water arises, but, if properly made, will answer the purposes of a safety-valve when any dangerous symptoms arise with a full boiler, in the following way:—When a hot-water apparatus is working under normal conditions, with the expansion and cold supply pipes open, it may be assumed that the water does not ever reach a higher temperature than 212 deg., this being the boiling point at sea-level, where the pressure of the atmosphere is 15 lbs. to the square inch. If by any means the two pipes just mentioned become tightly closed, the atmospheric pressure will not regu-

late the boiling and consequent temperature, and before we have an explosion it is probable the pressure exerted in the apparatus will be 100 lbs. to the square inch, this pressure permitting the water to have a temperature of 330 deg. (approximate). This fact is utilised by making the fusible plug of an alloy (bismuth, &c.) that will melt at, say, 280 deg.—the superheated water will then effect its fusion and the approaching danger be obviated. This, however, as will be clearly understood, needs the plug to be most carefully made if it is to be relied upon.

The great objection to the fusible plug, in the South of England, is the "fur" deposit from hard waters. If the plug gets even a thin coating of this material it must suffer, as the deposit being a low conductor of heat, the water is prevented from absorbing the heat from the plug as fast as it receives it from the fire, and under these circumstances it will be found that the plug will more frequently fail when no danger is to be feared, than the reverse. With soft water there is no objection to be raised, but notwithstanding this, fusible plugs have never gained favour, and are most commonly used as auxiliaries to ordinary valves, or to meet some special condition that may exist.

#### SURVEYORSHIPS.

PERTH.—At a meeting of the Perth Police Commission, held on the 8th inst., Mr. Robert McKillop, of Messrs. Cunningham, Blyth, & Westland's, civil engineers, Edinburgh, was appointed Burgh Surveyor and Superintendent of Works and Drainage for the city, at a salary of 171.

ST. HELENS.—At the last meeting of the St. Helens Town Council, it was decided to grant the Borough Engineer, Mr. Geo. J. C. Broom, Assoc. M.I.C.E., the sum of 100l. for extra works carried out by him during the past year, principally the erection of the new public baths, just completed, at a cost of 10,080l.

#### GENERAL BUILDING NEWS.

THE PERSE SCHOOL FOR BOYS, CAMBRIDGE.—The new buildings for the Perse School for boys in Cambridge were opened on the 4th inst. by the Mayor, and a banquet was given in the great hall by the Chairman of the Governors, the Master of St. John's College. The school is a first-grade school, and at present has about 200 boys. The new buildings are calculated to accommodate between 300 and 400 with ease. The general plan of the school-buildings is that of a large hall with twelve classrooms grouped on the north side of it. The hall is 77 ft. by 37 ft. 6 in., and 25 ft. to the wall-plate, and it has an open timber roof. The classrooms are each 24 ft. by 20 ft.; those on the ground floor are 13 ft. high, and those on the first floor are 15 ft. high to the collar. Beside the above classrooms there are head-master's and assistant-master's rooms, a large entrance-hall and board-room, and all the necessary lavatories and out-buildings. The lodge is a small building at the gateway, calculated to accommodate a porter without family. The general style of the building is that of the end of the seventeenth century. It is built with red bricks, and the roof covered with red tiles. A lofty bell-cot rises from the centre of the hall roof. The entrance doorways and the gables are finished with red terra-cotta, and the windows have timber frame work, painted white. The architect is Mr. W. M. Fawcett, of Cambridge, and the builders were Messrs. Kerridge & Shaw, of the same town. The total cost has been about 7,200l.

THE NEW OLYMPIC THEATRE was opened last week. Last year, Mr. Charles Wilmot bought the old building, demolished it, and has since erected the new theatre for Mr. Wilson Barrett, now lessee, on the designs of Messrs. Crewe & Sprague, of Fitzalan House, Arundel-street, Strand. The style of the decoration is Louis Seize, and it has been carried out by a Parisian firm. The tableau-curtain and the stalls, both in rich silk plush, the velvet seats in the dress-circle and upper boxes, and the upholstery generally, have all been done by Messrs. Oetzmann & Co., of Hampstead-road, and are of the tint known as "Rose du Barry." The house is lighted by both electricity and gas, the former installed by Mr. H. South.

NEW PREMISES, WALSALL.—Some new buildings have just been completed at the junction of Liebig-street and Bridge-street, Walsall. The buildings comprise five shops, and also rooms used by the Literary Institute. The chief shop is occupied by Mr. Draycott, in the basement of whose premises there is a packing-room, framing and gliding shops, store for residuals, heating apparatus, and fuel-store. On the ground-floor is a retail shop and frame-making shop. The first-floor comprises a reception-room, having a panelled ceiling picked out in colours, panelled dado, and moulded base, walnut chimneypiece, &c. On this floor there is also a private office. The second-floor is lighted by means

of a stained-glass ceiling-light. On the left are dressing-rooms, and on the right a studio, at the back of which are enlarging, dark, re-touching, spotting, negative, and stock rooms, also lavatory, &c. On the third-floor are situated the printing, drying, assisting, proof, stock, and artists' rooms. The building, which is in the Queen Anne style of architecture, is treated in red terra-cotta with a sea-green slated roof, surmounted with ornamental iron cresting. A separate staircase, for the use of the employes, has been provided. The contract has been carried out by Messrs. Bradney & Co., of Wolverhampton, from the designs and under the superintendence of Mr. F. E. Bailey, A.R.I.B.A., Walsall.

NEW POST-OFFICE, DUNFERMLINE.—A new post-office, erected by the Government in Queen Anne-street, Dunfermline, was formally opened on Monday. It has been built from plans by Mr. W. Wybrow Robertson, of H.M. Office of Works, Edinburgh. An improved system of ventilation has been introduced by Messrs. Baird, Thompson & Co., ventilating engineers, Glasgow, their "Grabtrix" exhaust ventilator being used for the extraction of the vitiated air.

NEW SCHOOL FOR HULL.—The ceremony of laying the foundation-stones of a new Grammar School for Hull was performed on the 4th inst. The site is in Leicester-street, and the design for the new school has been prepared by Messrs. Smith & Brodrick, architects, of Hull. The building will have an elevation of red brick and stone dressings.

BLACKPOOL SOUTH SHORE PIER AND PAVILION.—The proposed new pier and pavilion for Blackpool South Shore will, it is anticipated, fulfil a long-felt want of the residents in and visitors to South Shore. The total length of the pier is about 340 yards, the pier promenade having a width of 45 ft. The pavilion structure, which will be capable of seating 1,850 persons, will be situated about 200 yards from the shore end of the pier, and is designed in the Byzantine style of architecture. The building will be rectangular in plan, and the roof will have a curved outline. Small ornamental cupolas emphasise the angles of the main building, large cupolas surmounting the whole structure. Encircling the main building will be a low colonnade or verandah, and the band kiosk will be situated behind the pavilion at the end of the pier structure. The architect for the entire superstructure is Mr. J. D. Harker, A.R.I.B.A., of Manchester; Mr. T. P. Worthington, engineer, of Blackpool, being responsible for the substructure.

NEW MARKET AT HALIFAX.—The Markets Committee of the Halifax Corporation are preparing a scheme for a new market on the present site, between Southgate and Market-street. Much property in that neighbourhood and Corn Market has been bought by the Corporation. The streets are being widened, and a new one—or rather an arcade—will be formed from Old Market to the Market. There are to be about 100 stalls in the covered area, 100 stalls and some fifty butchers' shops, and 40,000, or 50,000, is the estimated cost of the scheme.—*Leeds Mercury.*

TETBURY CHURCH RESTORATION.—The restoration of the tower and spire of Tetbury Parish Church, Gloucestershire, is about to be undertaken by Mr. W. H. Yatman, of Highgrove. Messrs. Waller & Son, of Gloucester, are the architects.

LUDLOW PARISH CHURCH.—The Lady Chapel of this church is now being restored under a scheme prepared by the Charity Commissioners for the management of a legacy of 2,000l. by Maria A. J. Nightingale. The stained-glass window is being renewed by Messrs. Hardman, of Birmingham, at an estimated cost of 630l. The stone tracery of the whole of the windows, together with the ashlar work of the exterior, is also being restored by Mr. Thompson, of Peterborough, at an estimated expense of 280l. During the work, an old priest's door has been discovered, and some carved Early English churchwork and the old tile pavement of the fourteenth century have been exposed.

RUDBAXTON CHURCH, PEMBROKESHIRE.—The Church of St. Michael, Rudbaxton, is to be restored by Mr. Reginald C. Pinder, F.R.I.B.A., of Bournemouth, the architect appointed by the restoration committee. It is one of the oldest churches in the county, and possesses many interesting features. It is stated to be at present in a very bad state of repair.

OPENING OF A NEW CHURCH IN THE GARW VALLEY.—A mile to the north of Pontycymer Station lies the little town of Blaengarw, and at this place a new church was consecrated on the 8th inst. by the Lord Bishop of Llandaff. The church is a stone building of cruciform plan, and in plain Early English style. The nave is 61 ft. by 28 ft., and the chancel 22 ft. by 19 ft. 6 in. There is also a vestry and an organ-chamber, spaces being left on the north side for extra accommodation,—the present being for 300. The ground woodwork is all of pitch-pine, and the roofing of stained red deal. The building is heated by hot air on Perrett's system. The contract price was 1,055l. The architects were Messrs. Bruton, Williams, Cardiff and Barry, Dock, and the builder Mr. John Rees, Ynysybwl. The site was given by the Earl of Dunraven.

**RE-OPENING OF TICEHAM CHANCEL.**—The chancel of the parish church of Ticeham, Somerset, has just been re-opened after complete internal renovation and restoration, under the supervision of Mr. Ewan Christian, the work being carried out by Mr. W. A. Green, contractor, of Clevedon. The plaster, which has been coloured with a blue wash, has been removed, and the plain stone laid bare. The floor has been raised to its former level, and paved with Godwin's encaustic tiles. New oak seats have been supplied, and the levels of the pinnacles lowered inside and over the side windows being filled with tinted glass. In the course of restoration, interesting discoveries were made of a very large hogscosse, opening out into the north aisle and giving a full view of the altar, and a slab under the former wood pavement of the sanctuary, bearing an inscription. The approach to the roof-loft was opened out, disclosing six steps in good preservation but closed with grain, as it was feared the stability of the chancel arch—the only remaining portion of the original Norman church—would be interfered with.

**NEW CLUB BUILDING, NEWBURGH.**—The Marquis of Salisbury opened, on the 3rd inst., a new building for the Club-house at Newburgh, Scotland. The building designed in a Late Gothic style of architecture. It has been simply treated, the walls being faced with parapets and having ashlar dressings. The assembly-room provides accommodation for over 400 people, and has a separate entrance for the public from the side street. Refecting rooms, ladies' waiting, six steps in good preservation but closed with grain, as it was feared the stability of the chancel arch—the only remaining portion of the original Norman church—would be interfered with.

**NEW WESLEYAN CHAPEL AT GOOLE.**—On the 4th inst. a new school-chapel, erected for the Wesleyan Methodist body off Booth Ferry-road, Goole, was opened for public worship. The cost of the building is 500*l.* Mr. H. B. Thorp, Goole, was the architect.

**A NEW CONVENT AT BAYSWATER.**—A new convent is in course of construction at Bayswater for the order of Notre Dame de Zion; Mr. Arthur Young is the architect. The floors are to be of fireproof construction, and are to be put in by Messrs. Mark Pawcett & Co.

**SANITARY AND ENGINEERING NEWS.**

**THE SANITARY ASSURANCE ASSOCIATION.**—At the meeting of the Council of the Sanitary Assurance Association, held at the offices, 5, Argyll-place, W., on the 8th inst., Sir Joseph Fayer, K.C.S.I., F.R.S., in the chair, the question of consolidating and amending the Public Health Acts was under consideration, and on the motion of Mr. Mark H. Judge, A.R.I.B.A., seconded by Surgeon-General Cornish, C.I.E., the following resolution was unanimously agreed to:—

"That the Council of the Sanitary Assurance Association learns with satisfaction from the Queen's Speech, that the Government intend to consider the expediency of consolidating and amending the laws relating to public health, and, therefore, it is hereby resolved to appoint a sub-committee to draw up a memorial to the Government, urging them to amend their Bill the essential features of the Sanitary Registration of Buildings Bill."

On the motion of Mr. H. Rutherford, Barrister-at-Law, seconded by Mr. Andrew Stirling, it was also resolved to send copies of the resolution to the Institutions which took part in the Sanitary Registration Conference of 1887 and 1888; also to Dr. R. Farquharson and the other Members of Parliament who had charge of the Sanitary Registration of Buildings Bill in Parliament.

**NEW ROADWAY BRIDGE OVER THE RIVER CAM AT CAMBRIDGE.**—Owing to the township of Chesterton, which lies immediately opposite to the town of Cambridge on the north side of the river Cam, having considerably increased as a residential place, and to the fact of all the college boat-houses being on that side of the river, the boat ferries have proved wholly insufficient for the traffic, besides being very inconvenient and unsafe for children. The town of Cambridge, therefore, joined with the Local Board of Chesterton and obtained Parliamentary powers for constructing a new road across Midsomer Common, just behind Jesus College, and a new bridge across the river. These works are now completed, and were formally opened on Thursday last by the Mayor of Cambridge, jointly with the chairman of the Chesterton Local Board. The new roadway is about half a mile long, and is 40 ft. wide; the bridge is 100 ft. clear span, 40 ft. wide between parapets, and has a clear height at the centre of 14 ft. 6 in. above the normal water level, a towing-path 12 ft. wide, being formed on the south side. The superstructure consists of six elliptic wrought-iron arches, with braced spandrels, spaced 7 ft. 6 in. centre to centre under the roadway, and 6 ft. 11 in. to the parapet-girders. The outer spandrels are covered with cast-iron ornamental spandrels,

surmounted with cornice, plinth, and parapet, the coats of arms of the Borough, University, County Council, and Local Board being on their respective panels in the centre of the spandrel. The roadway over the bridge is of granite macadam, and the footpaths of gravel with concrete. The abutments are of Portland cement concrete, resting on piled foundations, and faced with Darley Dale stone. The total cost of the work is about 14,000*l.* The engineers for the scheme are Mr. John J. Webster, M. Inst. C.E., of Liverpool and Westminster, and Mr. Frank Waters, of Cambridge; the whole of the work being designed by Mr. Webster, Mr. Waters acting as resident engineer. The sole contractor for the work was Mr. John Mackay, J.P., of Hereford, and he sublet the superstructure to the Butterley Company (Limited).

**FOREIGN AND COLONIAL.**

**NORWAY.**—The committee of architects appointed to consider the designs for a new Historical Museum at Christiania, has received seventeen designs. The first prize of 1,200 kr. has been awarded to Herr Karl August Henriksen, a comparatively unknown architect, whose design has been accepted in its main features. Third prize of 500 kr. has been awarded to Herr S. Lenschow, a leading Norwegian architect. Two new churches of considerable dimensions are being built by the State in Christiania.

**RUSSIA.**—According to news from St. Petersburg the Stadt Theatre at Irkutsk, in Siberia, and the Summer Theatre in Lublin, in Poland, have been burned to the ground, but no lives were lost. The authorities have decided to build inmediately new theatres on the sites. In regard to the proposed French Art and Industrial Exhibition in Moscow next year, the German railway authorities have refused to carry the exhibits at reduced rates, so that the promoters will dispatch them by sea via Hull and Liverpool instead. The famous "Czar's Bell" in Moscow, one of the chief objects of interest in the old Palace of the Kremlin, is to be removed to a chapel built in memory of the saving of the Imperial family in the Borki railway accident. In the chapel tower, which is to be 270 ft. in height, and bell-shaped, the "Czar's bell" will be hung.

**DENMARK.**—The work on the so-called marble cathedral in Copenhagen is progressing. Of late the figures of the Apostles, 14 ft. in height and weighing 1,600 lb. each, and which are to adorn the main entrance, have been placed in position. They are of zinc, and executed by Danish artists. Two new public schools are to be erected in Copenhagen, at a cost of about 20,000*l.* Of late years several interesting frescoes have been discovered in old Danish churches, dating from the thirteenth century, and much has been done for their preservation. They all appear to have been executed by foreign artists, probably monks. The subjects are biblical.

**CZECHIA.**—The equestrian statue to Charles II. of Brunswick, which has been a doubtful ornament to the town for some twenty years, is at last going to disappear from view, the pediment alone remaining as a relic. This pediment is, however, to receive some crowning ornament, the design for which is to be obtained by "international" competition, the author being gone so far as to give some very small prizes, at the same time giving would-be competitors about a month's time for sending in their work.—*Schweizer Bauzeitung.*

**KARLSRUHE.**—A monument to the deceased Emperor William I. is to be erected, and 120,000 marks have, so far, been voted for this purpose. The question as to the form of the proposed monument has been treated in a way not dissimilar to the "National Monument Question" at Berlin. Whilst public opinion and municipality were in favour of an architectural monument, the Grand Duke of the Duchy of Baden made known in a letter that he wished to see an equestrian statue erected in his capital. The municipality responded to the Grand Duke's wish by opening a competition for designs for a monument in this form, and the assessing jury unanimously recommended a design of Professor Volz's for erection, at the same time giving a second prize to Professor Huer. Professor Volz's design will, however, be carried out, the Grand Duke having thought fit to recommend the design of the second prizeman to the municipality, who have again taken the wish for law.

**FRANCE.**—The Museum of Rouen has received a gift of a clock in Viedervilles faience which is a very fine specimen of ancient Ceramic work.—M. Paul Maugé has left to the Museum of Douai an important collection of engravings and works of art.—A permanent picture exhibition has been opened in the Galerie Bertrand at Nice.—M. Rouvier, Minister of Finance, has presented to the small town of St. Jean de Villefranche sur Mer a statue "Le Pecheur" by the late Madame Rouvier, well known as a sculptor under the assumed name of Claude Vigon. She was one of the best pupils of Pradier.—The Academie des Beaux Arts has given "A Museum of Sculpture" as the subject of the competition for the Annie Leclere prize in architecture.—The competition opened for the construction of isolated pavilions for the lunatic asylum at Vancluse has just been decided. M. H. Poussin has received the first premium, M. E.

Georges the second.—The jury in the competition for a Lyceé for the town of Epinal has given its award. The first prize of 5,000 fr. has been awarded to MM. Clésquin and Monconot; the second, 3,000 fr., to MM. Cognat and Delaire; the third, 2,000 fr., to M. Jasson; the first honourable mention to MM. Schuler and Berger, the second to M. Jacob. The jury, which has pronounced this to be a remarkably good competition, has decided that the execution should be entrusted to MM. Cognat and Delaire, as the authors of the most practical plan.—The Minister of Public Instruction has reappointed M. Foucart as the new director of the French school at Athens, a position which he has already held, the present appointment expiring with the close of the year. M. Foucart is also charged with an archaeological mission to Egypt.—In getting out the foundations for the Collège St. Etienne at Châlons-sur-Marne, there have been found in an old well two sepulchral monuments adorned with sculpture and inscriptions, which appear to be as early as the fourth century. The monuments are rectangular and surmounted by pediments. Above each inscription is carved a figure of a horse and rider.—The Curé of the parish of St. Jacques de Guéret, near Guéret, has discovered in his church two frescos of the twelfth century, interesting both in an artistic and archeological sense.—The new lunatic asylum for female patients at Bordeaux has just been opened. The architect is M. Valletton, of the Department of the Ministère de l'Intérieur.—A missionary at Chiloé, Peru Garcia, has been occupied in constructing there an iron church, of which all the parts have been made in France and transported to the site. It is in the Gothic style, and 55 metres long by 29 wide.—The Société Régionale des Architectes du Nord has addressed to the President of the Republic a petition against the dismissal of M. Coquery and a request that compensation should be made to him.—The death is announced, at Nouillomont, of M. Achille Flocon, member of the Société Centrale des Architectes, and director of architectural work for the Company of the Chemin-de-fer d'Est.—We learn also of the death of M. Joseph Burn-Smeaton, wood engraver, born in London, but for a long time past resident in Paris. M. Burn-Smeaton was known by his annual exhibits at the Salon.—The French Fine Art Section of the Moscow Exhibition will include three galleries, of which two will be reserved for works of the highest class. There is also to be a retrospective exhibition of the works of masters of the French School.

**MISCELLANEOUS.**

**PRIZES TO THE ROYAL ACADEMY STUDENTS.**—Sir Frederic Leighton, P.R.A., on Wednesday presented the prizes gained by the students of the Royal Academy. Amongst the prize-winners were the following: Design for the decoration of a portion of a public building (the "Adoration of the Magi")—Prize (40*l.*), Alfred Charles Wadsworth; Design in architecture (a country gentleman's house)—Travelling Studentship (60*l.*), Charles Sidney Spooner. Set of architectural drawings (a portion extending over one bay of the choir, and the screen at their back, in St. Paul's Cathedral)—Silver medal, five shillings, James Baker; second not awarded. Set of architectural designs (Upper School)—Prize (25*l.*), Alexander Mackintosh. Set of drawings of an architectural design (Lower School)—Prize (10*l.*), James Cromar Watt. Plan of a building (a provincial picture and sculpture gallery). Prize (10*l.*), Herbert Tooley. Original composition in ornament.—Silver medal, not awarded. Perspective drawing in outline (open to architects only) (the end and three bays of the Hall in Hampton Court Palace).—Silver medal, no competition.

**NORTH SEA-BALTIC CANAL.**—The construction of the large twin-locks on the Baltic end of the canal is now to be taken in hand. These locks, which lie parallel to one another, have a total structural length of 216 meters. The accepted tender is for 3,860,000 marks, or nearly 193,000*l.* These locks, which will have sets of double gates at either end, can either be worked separately or together, according to the requirements. The measurements will permit two German ironclads of the largest type (say *König Wilhelm*, 108 meters stem to stern) to pass through with ease at the same time.

**BERLIN.**—The census held on the 1st inst. shows that Berlin proper has a population of 1,574,455. In the same date in 1885 the inhabitants of the capital numbered 1,315,287. This shows an increase of 259,168 in five years, or an average of about 52,000 per annum. The above numbers refer to Berlin proper. If the outer suburbs, such as Rixdorf, Schöneberg, &c., be included, the total would be about 1,900,000.

**THE CHIEF INSPECTORSHIP OF CROWN MINES.**—The Western Mail announces that the important offices of Chief Inspector of Crown Mines in Great Britain and Mineral Inspector for his Royal Highness the Prince of Wales for the Duchy of Cornwall, vacant by the decease of Sir Warrington W. Smythe, have been conferred upon Mr. Thomas Forster Brown, C.E., Deputy Gavelor and Crown Receiver for the Forest of Dean.

OLROYD'S PATENT SASH-OPENER.—The accompanying cut illustrates the method of bolting or unbolting a window by means of this fastener, which consists of a barrel-bolt in a brass carriage on the lower sash, working into holes in the upper sash, so

Olroyd's Patent Sash Opener and Closer.

as either to keep the window closed or to keep it fixed open at any desired point. The bolts are kept fastened by springs, and pulled out by the cords as indicated. The bolt appears to be a very good, solid, and reliable one which it seems absolutely impossible to reach or meddle with from the outside.

SOCIETY OF ENGINEERS.—The annual dinner of this society was held on Wednesday evening at the Holborn Restaurant, the President, Mr. Henry Adams, occupying the chair. The company, which was numerous, included Sir Benjamin Baker and Sir J. N. Douglass (hon. members); Professor Unwin, Colonel Banister Fletcher, Mr. A. R. Binnie (Engineer to the London County Council); Mr. J. W. Wilson, jun. (vice-president); Mr. J. R. Ballie, Mr. Jabez Church, Mr. Chas. Gandon, Mr. Perry F. Nursey, Mr. Arthur Bigg, Professor Henry Robinson, and Mr. A. T. Walmisley (past presidents); and Mr. Alfred Williams (hon. sec. and treasurer), and Mr. G. A. Pryce-Cuxson (secretary). After the usual loyal and patriotic toasts, the President proposed the toast of the evening, "The Society of Engineers." He said during the past year the number of members had increased by 8 per cent., exclusive of honorary members, and the attendance at the meetings had increased by 10 per cent. The

honorary members who had recently been elected were Lord Armstrong, Dr. Anderson (of Woolwich), Sir B. Baker, Lord Brassey, Sir James Douglass, Sir John Fowler, Earl Granville, and Sir William Thomson. The papers which have been read and discussed included various branches of civil and mechanical engineering, and were fully up to the mark of previous sessions. The visits to works in progress and centres of manufacture, one of the privileges of members of the society which was very popular, had this year included the Thames Ironworks, the Royal Arsenal at Woolwich, and the London and North-Western Railway Works at Crewe. In concluding, the chairman said that the progress of the society was largely due to the energy of their founder and treasurer, Mr. Alfred Williams, and their secretary, Mr. Pryce-Cuxson.—The toast was acknowledged by Mr. Williams.—The "Health of the President" was proposed by Mr. Walmisley, and Mr. A. J. Clark responded, and gave the health of the president-elect, Mr. W. N. Coker, who was unable to be present. Other toasts followed.

STRIKE AT MESSRS. DOULTON'S LAMBETH POTTERIES.—A strike occurred last week at Messrs. Doulton's Lambeth potteries, the men complaining that the proportion of lads (apprentices) to journeymen is excessive, to the detriment of the journeymen. Sir Henry Doulton, in a letter to the Times, denies that there is any reasonable ground for these assertions. He further says:—

"As to the employment of apprentices generally, I have always strenuously upheld the advantage of apprenticeship, especially in such a handicraft as pottery, which requires considerable manual skill, only to be acquired by long training at an early age.

For many years I endeavoured to maintain that system, but, owing to the operation of the Masters and Servants Act and the altered conditions of work, it was a troublesome and unsatisfactory arrangement.

An alternative plan was adopted in all respects equivalent to legal apprenticeship, but substituting a mutual agreement of honourable understanding between the lad and his parents and the firm. By this plan the lad agrees, without any legal compulsion on either side, to work for the firm until he is twenty-one (usually beginning about the age of fifteen), and the firm agrees to employ him regularly as long as he conducts himself with propriety. In consideration of this the firm undertakes to teach the lad his trade without premium, paying him the accepted trade rate hitherto given to apprentices, and adding a yearly good-conduct bonus amounting to £1. in all up to twenty years of age, and an additional bonus of 5s. at the close of the last year. They also agree to furnish the lad with a certificate of proficiency at the close of the term in the event of his leaving their employment.

The skilled artisans state that their own employment and machinery by such well-known firms as Messrs. Barrows & Co., Hill & Smith, F. Morton & Co., the St. Pancras Ironwork Co., Clayton & Shuttleworth, Aveling & Porter, Ransomes, Sims & Jefferies, E. S. Hindley, Aveling & Porter, E. R.

and F. Turner, Waller & Stevens, R. Hornsby & Sons, Robey & Co., John Fowler & Co., and Marshall Sons & Co. Among the exhibits of the last-named firm must be mentioned an independent vertical engine cylinder, 63 in. by 10 in., fitted with Moore patent crank-shaft governor and automatic cut-off balanced slide-valve, and a patent automatic sight-feed lubricator, &c. The engine is specially designed for use with electric-lighting plant. There is good provision for lubrication, and the governor, it is claimed, controls the engine to such a nicety that there is practically no variation in the speed, however much the load may change. Another exhibit worth special note is Priestman's oil-engine, which is shown in two sizes by Messrs. Priestman Bros., Limited, of Hull and London. An 11-h.p. Priestman's patent portable oil-engine is mounted on wheels with shafts, &c., complete. The special feature of this exhibit is the application of this motive power in a portable form. The makers claim it to be the first introduction as such. In this form it is useful for many purposes, especially for country districts where there is no gas, or where gas is dear and it is not convenient to use steam. The cost of the oil-fuel, we are told, is about equal to the cost of working a gas-engine with gas at 3s. per thousand.

LEGAL.

INSANITARY HOUSES IN BETHNAL-GREEN.

At the Worship-street Police Court, on Wednesday, the magistrate, Mr. Montagu Williams, gave judgment in the matter of the 42 houses, the owners of which were proceeded against by the sanitary authority of the parish of St. Matthew, Bethnal-green, under the Housing of the Working Classes Act, to show cause why the said houses should not be closed. From the sanitary condition of the houses was given last week by the officers—Messrs. Lapworth, Foot, and Weston—Mr. G. P. Bates, Medical Officer of the parish, certifying that they were unfit for human habitation. The magistrate had adjourned the matter in order that he might inspect the premises complained of and so form an opinion as to what length of time should be allowed the tenants for removing. According to the Times report, he now said that, having spent several hours in going in and about the houses complained of, he was convinced that, with regard to all but one, he ought to make the orders asked for. A house belonging to a Mr. Scott was so far advanced in satisfactory repair that there was no reason for making an order. With regard to the others, he could not see how they could be put into habitable state by any amount of repair. That, however, was a matter for the owners. How the people had lived in them he could not say. With respect to some houses in Cheshire-street, the people kept small shops, and he suggested that, as the business would be destroyed if the people were turned out at once, they should be allowed as long as possible,—two months,—to find other places, and, failing that, that they should be moved from house to

house,—that was to say, when one house was ready the occupants of the next to be repaired should be able to occupy it.

Dr. Date said every attention should be given to that point. Mr. Montagu Williams asked what had become of the County Council scheme with respect to clearing other sites in Bethnal-green, and providing houses for the people displaced?

Dr. Date said that it was in abeyance. Mr. Muskett Vetta, solicitor, on behalf of an owner named Dixon, raised objections to an order to close.

The magistrate said the houses could be reopened as soon as the Medical Officer was satisfied with their condition. The Act gave magistrates power to order the landlord to pay compensation for the displacement to the tenants as a penalty for letting the houses get into such a condition. He had not put that power in force, and he thought the owners in these matters had been leniently dealt with. Having seen the houses, he was satisfied of their condition, and though he had been astonished as to why he decided to do so, he could not see how one could know the condition of the places and the needs of the tenants unless personal inspection was made.

MEETINGS.

- MONDAY, DECEMBER 15. Royal Institute of British Architects.—8 p.m. Society of Arts (Center Lectures).—Professor Vivian B. Lewes on "Gaseous Illuminants." IV. 8 p.m. TUESDAY, DECEMBER 16. Institution of Civil Engineers.—Further discussion on (1) Mr. F. E. Robertson's paper on "The Lansdowne Bridge over the Indus at Sukkur"; (2) Mr. E. W. Stead's paper on "The New Chattrick Road, Madras Railway." 8 p.m. Statistical Society.—7.45 p.m. Manchester Architectural Association.—7.30 p.m. Leeds and Yorkshire Architectural Society.—"The Cathedral Door," by Mr. Wyke Baylis. 7.30 p.m. Wednesday, December 17. Royal Meteorological Society.—Five papers to be read 7 p.m. Society of Arts.—8 p.m. THURSDAY, DECEMBER 18. Society of Antiquaries.—8.30 p.m. Leeds and Yorkshire Architectural Society.—"The Cathedral Door," by Mr. Wyke Baylis. 7.30 p.m. York Architectural Association.—Mr. B. Priestley Shires on "The Domestic Life of the Middle Ages, as shown by its Architecture."

RECENT PATENTS:

- ABSTRACTS OF SPECIFICATIONS. 19,834.—SLOW-COMBUSTION GRATE: G. T. Phunkett.—The grate, which is made of cast-iron, has a specially-formed coving or hood, in order to arrest the draught. A chamber is made at the back of the fire-place, and this and the coving is made in one piece to prevent current of water air being generated and circulated in the apartment. 20,541.—FIREPLACES: W. Russel and others.—The improvement, which is the subject of this patent, is in the smoke exit and draught regulator in "Widginton" and such like grates, and consists in a sliding-box over the roof of the fire through which the products of combustion escape into the chimney, and from thence they may be readily removed. The front or canopy is hinged and in the interior of the box a sliding-flap is fitted in such a position that when it is thrown back the passage to the chimney is open, and when it is closed it is blown down or back draught of smoke, &c., into the room. When the flap is drawn forward it falls against the front plate or canopy and closes the passage to the chimney when the grate is out of use. 11,978.—GLAZING: H. Hilton.—The glass rests on a cushion of lead or metal, and has a dust and water protector, and a covering cap fitted. The glazing-bar is of peculiar section, and is channelled to carry away condensation. 12,107.—ORNAMENTAL MOULDINGS: O. Graetzer.—Blocks or plates of end wood are made in a peculiar manner, and are strengthened so that they cannot spread under pressure. Trunks of trees are cut longitudinally, and planed at the sides with a serrated plane, which forms grooves. The sides are then painted with a thin layer of glue, put together, and exposed to hydraulic pressure, so that the beams adhere firmly together at every point. They are then cut across their longitudinal axis into end wood, then moulded by rollers under great pressure. 12,215.—PRESERVING PAINT BRUSHES: H. Davis.—This invention refers to a receptacle made of non-corrosive metal, with a contrivance for suspending the brushes clear from the bottom. A metal tube is inserted through the handles of the brushes, which are suspended by pins passing through the tubes. 15,533.—PORTABLE HOUSES: F. Waelder.—The pieces composing the house, shed, kennel, or similar structure are shaped and knurled, and are automatically closed by the action of the lift, or worked by hand-power. Suitable mechanism for this purpose is described. NEW APPLICATIONS FOR LETTERS PATENT. November 24.—19,014, D. Gill, Water-closet Apparatus.—19,056, H. Kinross, and H. Graydon, Lining Brush Attachment.—19,063, T. Recknell, Ceilings. November 25.—19,075, W. Day, Chimney-cowl.—19,139, J. W. Thompson, Cover for Chimneys, &c.—19,151, W. A. Cutpin, Door-hinges.—19,154, G. Williamson and A. Cutpin, Metal-hinges for Doors, &c.—19,154, J. Bard-

sley, Door-spring and Check.—19,159, C. Keith, Grates.—19,192, G. Spring, Saab-holders. November 25.—19,215, J. Spear, Ornamentation of Wood. November 29.—19,446, H. Dwight and others, Hanging of Doors.—19,464, H. Chaplin, Draught, Dust, or Water Exchanger for Doors, Windows, &c.—19,476, J. Bayly, Rock Drill.

PROVISIONAL SPECIFICATIONS ACCEPTED.

15,320, J. Smeaton, Ventilation and Flushing of Drains, Sewers, Soil-pipes, &c.—16,739, R. Stone, Fire-proof Plastic Material for Cement, &c.—17,205, T. Fleming, Flushing Apparatus.—17,238, H. Peake, Weather Strips for Doors and Casement Windows.—17,417, G. Lewin, Door Handles, &c.—17,581, T. Twyford, Sinks.—17,595, J. Dixon, Securing Windows, &c.—17,684, W. Bell and others, Self-locking Casement Stay.—17,698, E. Cusack, Automatic Sash Bolt.—17,743, G. & A. Duckett and L. Stanworth, Flushing Tanks and Water-closets.—17,806, J. Bell, Door Latches.—17,810, C. Edwards, Flushing Apparatus.—17,897, E. Edwards, Sawing Machinery.—17,971, E. George, Combination Wood-working Machines for Planing, Moulding, Tenoning, &c.—17,985, A. Whitwell & E. Chadwick, Water-closets.—18,008, A. Bayly, Bench Planes.—18,095, J. Le Messiray, Window Fastenings, &c.—18,131, E. Hatton, Ventilating Valves and Wall Ventilators.—18,353, J. Woodward, Wearing Surfaces of Sash-treads, &c.—18,337, G. Howland, Fasteners for Doors and Windows.—18,468, G. Juruschina and R. Von Gnesch, Artificial Stone, or Composition and Building Blocks, &c.—18,474, W. Chapman, Window Fastening.—18,520, A. Cressler, Doors and Windows.—18,938, T. Arnold, Manufacture of Cement.

COMPLETE SPECIFICATIONS ACCEPTED.

Open to Application for Two Months. 1,130, G. Hurdle, Self-imbolting Pinleys for Window Sashes, &c.—1,348, W. Sugg, Ventilating Apparatus.—1,527, T. F. B. Adams, Blow-pipe.—12,591, J. Ricketts and T. Lorraine, Complies for Water-closets. 18,315, G. Redfern, Roofing Tiles.—16,067, F. Synde, Gully Water-closet and other Traps.—16,906, D. Gardner, Flushing Pipes or Traps.—17,047, J. Barchy, Water-closet Basins.—17,155, J. Flouich, Screw Nails, &c.

### The Profession and the Building Trades in Australia.

HERE are about 120 architects enumerated in Sand's Sydney Directory for 1890, and the population of the city is about 400,000, so that it will at once be seen the proportion of men in practice is unusually high. Amongst the number may be found many who have been properly trained to their work, either there or here, and whose artistic efforts would be appreciated in any city of the civilised world. Of course there is no one whose work is equal to that of the leaders of the profession in England; and in such a comparatively small community, this result could not be expected. On the other hand, there are a very large number of so-called architects, who have had no professional training whatever, except such as may be obtained from performing the duties of clerk of works, builder, foreman, or superior workman. The younger men who are coming on are, however, obtaining a much better training, and the class above referred to will gradually die out. The same general description will also apply to Melbourne and the other capital cities, except that on the whole there appears to be generally more building work in progress in Melbourne than in Sydney. With regard to the results in quality, both of design and execution, there is a considerable amount of emulation between the two chief cities, but it would be hard to say which can claim the first place. In Melbourne many of the leading architects are associated together as members of the Royal Victorian Institute of Architects, which at the present time has a muster-roll of 150. The present president is Mr. G. C. Inskip, F.R.I.B.A., and the retiring president, Mr. Eloy Taylor, F.R.I.B.A., who also represents the R.I.B.A. as hon. sec. for the colony. In New South Wales a local Institute was formed about eighteen years ago, and has had a chequered existence, and owing to dissensions many of the best men in Sydney feel unable to join it. There are, however, no less than

sixteen Fellows and Associates of the Royal Institute of British Architects resident in the city, and these have just determined to meet monthly for the purpose of friendly intercourse and conference on architectural subjects. The professional education of the younger members is much in the same state as it was in England thirty or forty years ago, before the Architectural Association became a power,—that is to say, a youngster is turned loose into an office, and has to pick up his training in the best way he can. The only aids at present available are a course of lectures at the University of Sydney on the History of Architecture and Building Construction, and the Association of Architects' and Engineers' Assistants at Melbourne, which is following on the lines of the Association at home.

In Brisbane and in Adelaide Institutes were formed about a year or so since, and one or two papers have been read. The question of registration of architects was also first mooted in the latter city by a Bill being introduced in the South Australian Parliament, but nothing, so far, has come of it. In Brisbane the Institute took up the question between builders and architects with reference to a Lien Bill, and also as to conditions of contract.

In all the Colonies it is as yet a day of small things in the matter of professional societies, conflicting personal interests being, unfortunately, too strong, and the community too small to render any united action possible. This will, however, be remedied as population increases, and the level of professional education is raised.

Among the factors that seriously affect architectural expression materials hold a very important place. For instance, in Sydney and the district around, sandstone is found cropping out almost everywhere at the edges of creeks and rivers; and in one particular spot—viz., at Pyrmont, close to the heart of the city, is a quarry of fine-grained sandstone of a beautiful golden-brown colour. This has been used in many of the public buildings, and its effect is superb; but its durability, alas, is by no means assured. In Melbourne, on the other hand, a very dark, bluish-grey stone is the local material, and its effect in mass is just as depressing as that of the Sydney stone is cheerful. Its durability is,

however, unquestioned. The defect in colour has led to the use of a soft imported white stone from New Zealand, and more recently to the introduction of a white, hard, and apparently durable stone from Stawell, in Victoria. But the prevalent building material in either city is not stone, but brick—in Sydney usually coated with cement, but in Melbourne not infrequently pointed and exposed. Variation in quality and climate is the reason. Bricks coated with cement may, however, be considered the normal type of building throughout Australia, as it is the cheapest and simplest mode of forming a weather-proof dwelling. Hollow walls are now being introduced, and, with improved qualities of facing-bricks, will in time effect a wholesome change. For roofing, imported Welsh or American slates are largely used in the towns, but for cheap buildings, and almost universally in the country districts, to which carriage is expensive, galvanised corrugated iron is the only covering. To English eyes this at first has a very temporary look, but in the dry climate of Australia its life under favourable conditions may be put at forty or fifty years; and as a water-collecting surface,—a most important qualification where rain is the only supply,—it is unsurpassed. Moreover, elates do not stand sudden variations of temperature, and in Queensland especially their use is very limited. Tiles were until lately unknown, but importations are now being made from the South of France, of an interlocking variety, which is meeting with some favour, and in a few cases plain tiles, imported or of local manufacture, have been adopted. They have many practical defects, but the question of roofing is too important to be entered on at this stage. For casing timber the native hardwoods are largely used, but, owing to the reckless mode of felling at all seasons of the year, the impossibility of obtaining seasoned stuff, and the consequent shrinkage and twisting, it is falling into disuse, and imported American pine, known as Oregon, is taking its place. The cost of handling and working Oregon is also less than that of the heavy native timbers. For finishings, native cedar, a wood something like Honduras mahogany, but lighter in weight and coarser in grain, used to be the universal material in New South Wales, but both there

and in Victoria imported American pine and Baltic deal are now very largely used. In New Zealand Kawri pine is the staple, and large quantities of flooring and linings are shipped to the other colonies. It makes a floor which is hard to beat. As regards such items as mantelpieces and grates, gasfittings and ironmongery, tiles, and other manufactured articles, the bulk are imported, and will be so, notwithstanding protective duties, until the population has largely increased. There are many firms doing good work in a comparatively small way, but they cannot as yet compete in quality or price with the great establishments of England and the Continent. The reason is not far to seek. Labour is approximately 30 to 50 per cent. dearer than at home, and the working day is eight hours.

This brings us to a very important subject. The complete organisation of labour in Australia is an accomplished fact,—at any rate, in the trades connected with building. Every trade has its union, and these unions are federated and combined, the representatives forming what is known as the Trades Hall Council. For some time past, owing to the slackness of trade, there have been but few labour disputes; but when business revives the power of the workman is at once felt. The general prosperity is, however, so great that all travellers are agreed in describing Australia as "the Paradise of the working man," and it is undoubtedly true that hand-workers receive better pay and possess more advantages in Australia than in any other portion of the globe. The old cry of "eight hours' work, eight hours' play, eight hours' sleep, and eight shillings a day," is realised in that happy land, even by unskilled workmen; while skilled tradesmen, such as masons, bricklayers, and lead-workers receive 1s. per day, and plasterers, gasfitters, carpenters, and joiners receive 10s. per day. Of course, the advance on English wages is not absolute, as the purchasing power of money is rather less than in England. This is especially the case with house-rent, and to a less extent in clothing; but food is, on the whole, quite as cheap; while education is in some colonies free, and in others the fees are very low, but in all cases the training is excellent. A prudent workman can, however, now provide himself with a house of his own on easy terms, and thus his chief outlay is minimised. There is, however, a shady side to the picture in the somewhat severe fluctuations of trade, causing occasional want of employment even for good workmen, but these times of depression only tend to throw the general state of prosperity into higher relief. As before stated, the working day is one of eight hours, and this limitation of the hours of labour has been in force for many years. It has become such an institution that the great festival of the workmen is the anniversary of the establishment of the eight hours system, on which day all labour is suspended, and the various trades indulge in a monster procession through the streets, with cars and groups, emblematical of the different trades, and banners and scarves *ad libitum*. It is a veritable festival of labour, such as cannot be witnessed in any other country in the world.

Just at the present time a determined attempt is being made to compel all employers to adopt only Union labour, and the great strike the Colonies are now suffering from will determine whether freedom of contract is or is not to be a thing of the past. To the general public this appears to be an abuse of the Trades Union system, and the present indications are that the men will not succeed. Politically, the workmen have great power, and know how to use it. Hitherto it has been judiciously employed, but there is an indication that labour may become a veritable power as great in its way as that of capital. These indications are becoming so patent that the employers are taking a leaf out of the workmen's book and forming themselves into a federated Employers' Union. This means that the next fight, whenever it comes, will be still more severe, for when handed labour has to meet banded capital, then will come

the tug of war, the issue of which no man can foretell.

The quality of work turned out appears to be equal to the average of that produced in England. This is especially the case in masonry. In brickwork the men have as yet had little opportunity for showing what they can do in "face-work," owing to the almost universal use of cement as a coating. Plasterers turn out very creditable plain and moulded work, but modelled decorations leave something to be desired. Some of the carpentry and joinery is not to be excelled in any part of the world, but, on the other hand, there is a good deal of very low-grade work produced. This is owing to the demand for rough carpentry up country producing a race of "bush" carpenters, who gradually work their way into the trade, and so lower its standard. Founders and smiths are perhaps the least satisfactory of any, and a firm doing first-rate work in these branches of the building trades at fair prices would meet with plenty of encouragement,—at any rate in Sydney, and we believe also in Melbourne. The best castings, a little time since, were made in Adelaide, and very creditable work has been turned out in Brisbane. Those special or accessory branches of the building trades in which artistic knowledge is essential, are, as may be anticipated, the least developed; but public taste is rapidly improving, and the demand for this class of work will quickly increase. Any one starting now would, therefore, have a good prospect of success. But let us give a word of warning in case these lines should be read by any who are thinking of transferring themselves and their belongings to the southern hemisphere. Second-rate men are not wanted,—they are there already. First-rate men of any standing are, of course, fully employed in England, hence it is the first-rate man who has his way yet to make, who would find the change profitable. In this connexion we would add that in Melbourne as in good stained glass is being produced as in the best ateliers of London, and in Sydney, as good bronze and brass work as can be desired.

The practical management of building operations is largely in the hands of builders and contractors, who take lump contracts for the whole of the operations; but the practice of sub-letting is almost universal, very few firms carrying the work through with their own men. Often two firms will combine to tender for an important work, dividing the trades between them. One may carry out the carpentry and joinery and the other the masonry or brickwork, by day labour, sub-letting the rest. This mode has its advantages and disadvantages. The chief trades in such a case are well carried out, but considerable care has to be exercised in the approval of sub-contractors. Of course, all conditions of contract contain the usual clause that no sub-letting will be allowed without the written consent of the architect or engineer as the case may be; but this limitation is rarely enforced. On the whole the result is fairly satisfactory, and in some cases where the principal contractor is a man of high standing, and selects sub-contractors of equal repute, better work is produced than by day work under foremen in each trade. This is due to the greater skill and higher standing of the sub-contractors. Of course, in the small communities of Australia there is not the same scope for large firms like those of London, but the best men would by no means take a back seat amongst their English confrères. Owing to the less extensive character of their business they have not yet lost a practical knowledge of the trades and become simply acute financiers and capable administrators, and this is by no means a small advantage. In order to protect their interests the builders of Sydney have formed a Builders' and Contractors' Association, which numbers 350 members. About 200 of these are chief contractors, the remainder being made up of sub-contractors and representatives of firms dealing in building materials. They also possess an Exchange, where a large amount of busi-

ness is transacted, effecting a great saving of time and expense, especially in the arrangement of contracts for materials, and the supply of goods. The Association also holds regular meetings at which matters affecting the interests of the trade are discussed, one important item at the present time being the conditions of contract which they wish to see adopted in all building works. In labour disputes the Association is also to the front, and by meeting the members of the Trades Hall Council, representing the men, difficulties, which otherwise would lead to friction, are frequently amicably settled. In legislation the Association is also able to make its voice heard and influence felt. One special Bill in which they are much interested at the present time, is a "lien" law, giving contractors and workmen a first claim on all work which the employer is unable to continue. In Melbourne, until quite recently, there were two Builders' Associations, but these have happily become amalgamated, and now form one powerful Society. It is run on the same lines as that at Sydney, but the members do not yet possess an Exchange, although negotiations are in progress for its institution.

### THE TOMBS OF NUMIDIAN KINGS.

BY ALEXANDER GRAHAM, F.S.A.

THE historic importance of sepulchral monuments has not always been fully recognised. Indeed, it was not till the close of the last century, when a taste for antiquarian pursuits was encouraged, that any attempt was made to illustrate this branch of archaeology, or to classify different structures as appertaining to different periods or different races. The enthusiasm aroused in these islands by the discovery of a simple tumulus, with its buried relics of flint or stone, bronze or vitrified earth, testifies to the value we now attach to any form of sepulchral monument. And if this be the case in a country comparatively modern in the world's history, how much more should our interest be awakened in those monuments that are frequently the sole visible remains of a people long passed away, and whose nationality is now almost forgotten. The progress of tomb-construction must have been the same in all countries. The upturned earth, the heap of stones, the rude masonry, were the earliest stages of a class of structures that developed at last into the gigantic Pyramids of the Pharaohs, the gorgeous domes of the Mogul Empire, the sepulchre of Mausolus, and such remarkable edifices as those which form the subject of this paper, and which may, not inaptly, be termed, "The Tombs of Numidian Kings."

The records of that part of North Africa called Numidia by the Romans, but known as Lihya by the Egyptians, are necessarily very scanty. It is not to be expected that a nation composed of a number of tribes, for the most part living in tents and having no fixed habitation, should have had any literature of its own. Contemporary history touches lightly on the subject, and consequently we know but little of a people who were regarded by Egyptian, and Greek, and Roman as a mere horde of barbarians, and whose alliance was only to be courted in time of war. The earlier of the two monuments under consideration dates from the close of the second Punic War, B.C. 201. At that period the intellect of Alexandria, the greatest of Greek colonies, was in its infancy, and the learning of the Egyptians, that had influenced other countries far more remote, had not spread westward of Carthage. It should also be borne in mind that the entire dependence of the tribes of North Africa upon Carthage, still the mistress of the Mediterranean, and the constant predatory warfare between the two divisions of the country, called by the Romans Eastern and Western Numidia, checked any great advance in the arts of civilisation. It was this division of the kingdom that proved so disastrous in its consequences, contributing

so largely to the rout of Hannibal's army on the fatal plain of Zama, and paving the way for the gradual extinction of a once-powerful race. The throne of Eastern Numidia was then occupied by Massinissa, while Syphax ruled over the Western division. In Massinissa were combined the fearlessness of his race and the foresight of a statesman. Intimate acquaintance with the more skilled warfare of the Romans prompted him, at the earliest opportunity, to throw off the yoke of his Carthaginian masters and to cast in his lot with the invading army. Syphax, on the contrary, more through hatred of his rival than from any affection for his country, held with the ill-fated Carthaginians, and paid the penalty of his faithfulness by the loss of his kingdom, which was afterwards transferred to Massinissa as the reward of his services. The story of these two kings, their restless struggle for supremacy, their rivalry in love as well as in war, and their shifting alliance with the Roman invader, is full of dramatic interest, and has a more important bearing on this eventful period than many historians are willing to recognise. The remarkable career of Massinissa, the inglorious fate of Syphax, and the tragic end of the woman whose charms exercised so fatal an influence over both, are matters appertaining to history rather than to archeology. It is not too much to assert that, had these warriors preserved their allegiance to their natural allies, the Carthaginians, the Roman occupation of North Africa might have been stayed for many a long year, and the sad tale of the third Punic War have never been written.

The earlier of the two monuments, of which illustrations are here given (see lithograph), is situated about fifty-two miles south of Constantine, and is known by the Arabs as the Medrassen, probably after a tribe called the Madres, who occupied a neighbouring territory on the northern slopes of the Aures mountains. By some it has been thought to be the sepulchre of Syphax, and there is a tradition that it was erected by the Emperor Probus in honour of the African chief Aradion, who fell bravely in battle with the soldiers of the Empire. We may pass by these conjectures, for it is tolerably certain this edifice was either erected by Massinissa towards the close of a remarkable life of ninety-seven years, as a sepulchre for himself and his descendants; or by his son and successor, Micipsa. Its situation in the centre of his kingdom, and at a convenient distance from his new capital Cirta, the modern Constantine, favours this opinion. There is no sufficient ground for supposing it to have been built by Syphax, for it must be remembered that Western Numidia, over which he ruled, corresponded nearly with the modern provinces of Algiers and Oran, and that his capital, till the last years of his reign, was at Siga, on the western frontier of his dominions. Moreover, Syphax was led captive to Rome and died in prison.

The form of the tomb is a cylinder, surmounted by a truncated cone formed of a series of stone steps, each step being 21 in. high. The cylinder, having a diameter of about 190 ft., is ornamented by sixty engaged columns, with a frieze and cornice, and stands on three steps which form a base to the entire monument. The material of the framework is a fine sandstone, but the mass of the structure is formed of thin slabs of inferior stone in regular courses, having at a distance the appearance of bricks. The interest of the structure lies in the peculiarity of the architecture. The columns and cornices are Egyptian in character. The capitals are Greek. The general form is that of ancient monuments of other countries, of Hindoostan and even of America. It is, in fact, one of the few existing buildings that marks the transition in Africa between Egyptian and Greek art, and was, probably, the work of an architect from the neighbouring colony of Alexandria. The entrance to the sepulchral chamber, which is nearly in the centre of the monument, is above the cornice on the west side, and is approached by a series of steps and a narrow,

straight gallery. The tomb has been ransacked from time to time in search of treasure, and, from the charred appearance of some of the stonework, attempts must have been made to set it on fire. It was not till 1873 that the French engineers succeeded in finding and effecting an entry, and, after much patient labour, discovered the sepulchral chamber, measuring 10 ft. 3 in. in length by 4 ft. 7 in. in breadth. Nothing of value is stated to have been found during the exploration.

To quicken our interest in the other monument we may pass on to the last chapters of Numidian history. Carthage had been crushed, but was destined to rise again as a Roman city. The great kingdom of Massinissa, over which he had ruled for sixty years and had left in a condition of the greatest prosperity, had passed into feebler hands. Jugurtha had opposed the Roman arms and had perished ignominiously. Juba I., his successor, in the bitterness of his heart, and worn out by constant adversity, had perished by his own hands; and now his infant son, a captive in the streets of Rome, was following the chariot-wheels of the ever-victorious Cæsar. The incidents in the career of this little lad are very touching. They shed unusual lustre on the closing pages of Numidian history. His marked intelligence and comely looks won the heart of the great Augustus, who committed him to the care of his sister Octavia, the discarded wife of the ill-fated Antony. Devoting himself to literature and the arts of peace, the young Juba became one of the most learned scholars of his time. On arriving at man's estate, Augustus seated him on the throne of his ancestors, and bestowed on him the hand of Cleopatra Selene, the beautiful daughter of Antony and his Egyptian queen. Wishing, however, to extend the Roman dominion in Africa, Augustus soon afterwards made Numidia a Roman province, and transferred Juba's capital from Cirta, the modern Constantine, to Jol, the modern Cherchel, known in Roman history as Julia Cæsarea. Here, on this beautiful spot, washed by the waters of the Mediterranean, Juba II. built himself a city, and embellished it with magnificent works from Greece and Rome. Here, during a prosperous rule of nearly fifty years, he gathered around him all the celebrities of his time in art and literature, introducing into his kingdom elements of civilization unknown to the unruly tribes of North Africa. And here, some ten miles east of his capital, on the summit of a lonely mountain, he built a tomb of gigantic dimensions that was to contain the ashes of himself and his Egyptian queen. The points of resemblance between this monument (see lithographs) and the earlier one already described are very striking, leaving no room for doubt that the one furnished the idea of the other. They have the same graduated and truncated cone, and the same number of engaged columns in the ornamental podium. The proportions, however, are totally different, and the architectural details bear no resemblance. The diameter of the podium or cylinder, which is polygonal, is 198 ft., standing on a square stone platform, 210 ft. each way. The engaged columns are of the Ionic order, with Attic bases and capitals of a Greek type, and surmounted by a frieze and cornice which, as far as one can gather from the scattered fragments, had only a slight projection. One of the capitals, partly taken from a sketch by Bruce, reproduced in Sir Lambert Playfair's work, "Travels in the Footsteps of Bruce," is here given. The cone is composed of a series of steps, each 22 in. high, terminating in a platform similar to the Medrassen. The total height was originally about 130 ft., but, the top courses of masonry having been thrown down, the monument at the present time does not exceed 110 ft. At four places in the colonnade, corresponding with the cardinal points, are false stone doors, 14 in. thick, and about 20 ft. high. The entrance to the tomb, which is under the eastern false door, was discovered by MM. Berbrugger and MacCarthy in 1866. The plan of the monument, with its spiral gallery and sepul-

chral chambers, is taken from the elaborate notices and measurements by those eminent Algerian scholars. After a descent of seven steps is the commencement of the gallery, averaging 6 ft. 6 in. in width and 7 ft. 10 in. in height, and having a total length of nearly 500 feet. The gallery terminates in two vaulted chambers, 15 ft. high. The first, measuring 13 ft. by 4 ft. 9 in., is commonly known as "The Chamber of Lions," on account of a rudely-sculptured lion and lioness on the doorhead. The second, or central one, measures 13 ft. by 9 ft. 6 in. Stone doors, formed of single stone slabs, fitting loosely and moving in grooves in the jambs, shut off the two chambers as well as the gallery. There are niches at intervals in the walls of the gallery to receive lamps, and in the central chamber are two niches for similar purposes or for cinerary vases. Outside and about 10 ft. in front of the entrance are indications of a raised stone platform, where, according to M. Berbrugger, the ceremony of cremation was probably performed, and where the funeral urn or ossuary was deposited. The external masonry of the monument is of hard coarse limestone, but the interior filling is of tufa, solidly constructed. The courses of stone are laid with great regularity, breaking bond from top to bottom. They were put together with metal cramps, which, of course, have entirely disappeared, though the mortices in the blocks to receive them are very conspicuous. The masonry of the gallery and the chambers is still in good preservation, having been constructed with large blocks of squared and dressed limestone, and finely jointed. Mortar, if used at all, must have been very thin, and the gallery was apparently faced with a coating of plaster. The dilapidated condition of the monument externally is attributable to numerous unsuccessful attempts to penetrate the interior in search of treasure, more than once with the aid of artillery. So solid is the construction that, even in its exposed situation, it might have resisted the wear of nearly nineteen centuries and remained fairly perfect to the present day.

During a very long period succeeding the Roman occupation of North Africa, when the country was overrun successively by Vandals, Byzantines, and Arabs, the traditions associated with this monument, and the purposes of its erection, seem to have been lost sight of. So recently as the time of Shaw, the traveller, it was known by the name of Malta-pasi, or Treasure of the Sugar Loaf. How it came to receive the absurd appellation by which it is now universally known, "Le Tombeau de la Chrétienne," is not difficult to explain. Hear what M. Judas, a learned Orientalist, says on this subject. The term *Kub-er-Roumiyah* of the Arabs is the ancient Phœnician designation which, taken in its original sense, means "Tombeau Royal." The natives, instead of translating this foreign word *Roumiyah* as they ought to have done, have given it the same meaning as a similarly-sounding word in their own language, *Roumi*, viz., "Strangers of Christian origin," the feminine being *Roumiyah*. And the French mistranslation originated in a misinterpretation of a detail in the architecture, the styles of the panelled stone doors being mistaken for crosses. Hence it was inferred that such a tomb must have been that of a Christian! "The name is preserved," says M. Judas, "but nevertheless we must protest against its absurdity." Leaving this tangle of French and Arabic, we turn with satisfaction to the pages of Pomponius Mela, a geographer of the first century, who had seen this monument, probably in the lifetime of Juba II., and we find it designated in simple language as "Monumentum commune regis gentis." That it was intended as the common sepulchre of Juba and his descendants is clear enough; but his dynasty was short-lived. His only son, Pompey, who succeeded him, took up arms against Cæsar, and paid the penalty of his rashness by the sacrifice of his kingdom. His daughter, Drusilla, who died in a foreign land, had

married Felix, the Governor of Judea,—a name so familiar to us in the life of St. Paul. So remarkable a structure has given rise to numerous legends, which may be found in most works on Algeria, in the elaborate treatises by MM. Berbrugger and MacCarthy, and in the pages of that excellent book, already referred to, by our learned countryman, Sir Lambert Playfair. It is worthy of mention, before concluding the notice of this monument, that vegetation is so luxuriant on its conical top that M. Jourdain, the naturalist, found ample matter for a pamphlet published a few years ago, entitled "Flora murale du Tombeau de la Chrétienne."

The value of both these edifices must be estimated, not on the ground of any special artistic merit, but simply as links in a long chain of architectural history. The earlier one helps to bridge over the gap that severs eclectic Egyptian from Greek art. The latter, erected some two centuries later, though based on the same lines, shows considerable advance in architectural treatment. Its excellent proportions, and the extreme ingenuity of the plan, entitle it to a place among the great monuments of its kind. It possesses two essentials of noble architecture, simplicity and dignity,—elements that are worthy of notice in these days, when their absence in architectural design is too frequently conspicuous. This is not the place to write a biography, however short, of the monarch whose remains were deposited in this remarkable edifice, but a passing record of the labours of this great African may quicken our interest in his monument, and help to throw light upon a somewhat obscure page of ancient history. Had Juba II. lived in other times, his career would have entitled him to a far more conspicuous position, but the dazzling rule of the Cæsars and the stirring events in other parts of the world at the commencement of the Christian era, cast into the shade the unobtrusive labours of so peaceful a monarch, affording but few materials for the historian. Such was his popularity, during a long reign of nearly half a century, that the Athenians raised a statue in his honour, and the tribes of the desert worshipped him as a deity, "Et Juba, Mauris volentibus, deus est." Of all his numerous literary works fragments only remain. It is enough that Pliny, Strabo, and other less prolific writers bear ample testimony to the value of his researches, and quote freely from his histories of Rome and of Arabia, and his numerous treatises on various subjects. It is enough for us that, after the lapse of nearly nineteen centuries, we have before us the remains of this remarkable edifice, an enduring monument of the most learned, if not the greatest, among Numidians. A. G.

#### NOTES.

**T**HE "first report" of the Westminster Abbey Commission, which is just issued, is, in fact, no report at all in the proper sense, but merely the evidence of witnesses so far as it has been taken, accompanied by explanatory plans and one or two sketches exhibiting different ideas of Mr. Pearson's. The evidence contains a great deal of interesting matter, especially as to the history of the interments in the Abbey; but the main interest of course lies in the architectural propositions which have been made for the proposed erection of a monumental chapel. The general tendency of the evidence leads to the conclusion that Mr. Shaw Lefevre's preposterous scheme of an enormous hall at right angles to the Abbey, and almost dwarfing it, may now be considered practically dead. Of what may be called outsiders' plans (not by the architect to the Abbey) there are three appended to the report. The first is by Mr. Somers Clarke, and shows a very large five-aisled building tacked on eastward of the chapter-house, and with a grand entry from Old Palace-yard—the connexion with the ancient part of the Abbey being made by the Poet's-corner door, which is included within

the new building. The plan does not indicate how the great Chapter-house buttresses are to be disposed of in the new building. Mr. Tarrer has a plan showing a corona of small chapels between the buttresses of the Chapter-house and entered from it, and Mr. Seddon one containing this feature along with a chapel reaching eastward to the corner of Abingdon-street, and connected with the Chapter-house by a corridor. These are ingenious, but as to the first it may be said that it is too small and scattered a way of doing it, and that the Chapter-house is not the proper place for a monumental chapel; and as to the second the same objection applies, with the addition that the larger chapel is too unconnected with the Abbey. The latter objection applies to Mr. Pearson's plans for a chapel to the east of the Chapter-house; they can never appear as part of the Abbey. But he suggests a scheme for a new north aisle to the nave, which really seems to meet the required end, namely to have a space for monuments which will really seem part of the Abbey-church and be in close connexion with it. We are of opinion that the connexion might be architecturally even closer than has been indicated in Mr. Pearson's plans and evidence; but this is a point we prefer to consider more at leisure. But if the custom of honorary funerals to eminent men in the Abbey is to be continued, it is indispensable to the idea of the thing that the addition should seem a part of the church and not a separate building, and Mr. Pearson's north aisle is the only suggestion yet made which in any degree promises to meet this condition.

**O**N July 12 we drew attention to the fact that the County Councils of Lancashire and Cheshire and several Corporations of Lancashire had applied to the Local Government Board for a provisional order to form a "Watershed Board," which should have power to prevent the pollution of the Irwell and Mersey and their tributaries. On the 12th inst.—five months after the application was made—an inquiry into the subject was held in Manchester by Colonel W. M. Ducat, R.E., and Mr. T. W. Thompson, Inspectors sent by the Local Government Board. Representatives attended not only of the County Councils of Lancashire, Cheshire, and Derbyshire, and the Corporations of Manchester and thirteen towns, but also of about forty-five Local Boards and several Unions and Sanitary Authorities. The district now proposed to be placed under the administration of the Board contains 568,703 acres, and has a population of 2,163,942. It is patent to every one who glances at the Irwell, in Manchester, that it is grossly polluted with both sewage and manufacturing refuse, and the state of the Ship Canal, which is to be supplied with water from the Irwell and Mersey, will probably, in a few years, be truly sickening, unless the desired powers are granted. Salford, too, with its seventy-two acres of docks filled with foul, stagnant water, cannot but have an increased death-rate. Objection was taken by a few representatives to certain details of the scheme; but about the necessity of doing something to purify the rivers from source to sea, there were not two opinions. It is to be hoped that the Local Government Board will not longer delay so needful a work.

**S**IR JOHN LUBBOCK had a congenial task on the 12th inst. in presiding over the first regular meeting of the newly-constituted London Conciliation Board. This is the outcome of a proposal made at the annual general meeting of the London Chamber of Commerce in March last, and the rooms of the Chamber are placed at the disposal of the new Board for the first twelve months. The Board consists of nearly equal numbers of representatives of capital and labour, the chairman being selected from the employers on the Board, and the vice-chairman from the employed. Among the former appear many pro-

minent names, while the latter, elected by various groups of trades unions, includes representatives of a great variety of employments; and though it cannot be said that all classes of employers or employed are represented, yet the Board, as constituted, is competent to deal with questions affecting a large proportion of the numberless industries of the metropolis. Sir John Lubbock himself is the nominee of the London County Council, and Mr. Fenwick, the labour M.P., will probably join the Board to "preserve the balance of power." In addition to conciliation committees for particular trades, a standing committee for emergencies and general purposes has been appointed, and the course of procedure arranged for dealing with disputes that may arise. This is a step in the right direction, and, should the movement prove as successful as its promoters hope, the proceedings of the meeting may be looked upon (as the chairman remarked) as possessing almost a historical character.

**T**HE opinion we recently expressed as to the probability of the Board of Trade objecting to be overwhelmed with returns relating to railway rates was justified by the reply given by the President of the Board to the Lancashire and Cheshire Traders' Conference last week. Alluding to a certain return which a deputation from this body urged him to require from the Railway Companies, Sir Michael Hicks-Beach stated that he did not believe it to be necessary from any point of view. He doubted both whether it should be done, and whether, supposing it should be prepared, it would be of any service. At the same time, the Railway Companies will have to give some further information, as the Board are far from satisfied with the statement of prospective losses which they have rendered. The officials of the Department were very busy over this matter last week, conferring nearly every day with one or more deputations—chiefly from the Railway Companies. All the principal Companies have now laid their views before the Board, and endeavoured to explain and substantiate the statements of estimated losses already referred to. It appears to us that the net result of all this will simply be to satisfy the Board that, in steering a middle course with regard to most of the points in dispute, they did the best thing possible under the circumstances;—and, perhaps, to give them the impression that some of the objectors "do protest too much."

**T**HE new Cathedral for Berlin, which is now the subject of much talk, and for which the designs are being prepared by Professor Raschdorff, would probably cost, if carried out, somewhere about half-a-million sterling. The idea of a great Cathedral for Berlin, it may be observed, is no recent one, Frederick I. of Prussia having already, in 1703, ordered his Court architect, Schlueter, to work out the designs for a Cathedral. This King's very far-reaching ideas not being feasible at the time, Berlin's present small "Dom" was erected, 1747-1750, according to designs by Boumann, and by special command of Frederick the Great, whose descendant, Frederick III., had a restoration and extension made (1816-1817) by Schinkel, who, however, at the same time, had orders to prepare designs for a grand Cathedral to be placed on a more suitable site. Frederick William IV. then took the Cathedral idea energetically in hand (1840), going so far as to have the foundation-work commenced. The work, which had to be stopped for pecuniary reasons, was not forgotten by the late German Emperor, William I., at the time King of Prussia, who, in 1867, took the matter in hand by opening a competition for new designs, which competition, although without direct result, turned out to be a highly interesting one. The fifty-three designs sent in at the time (the estimates for which reached sums between 9,000,000 and 12,000,000 marks)

nearly all showed a central disposition, with a cupola at the crossing. After the awarding of the ten prizes no steps were taken in the Cathedral question for some time, until the late Emperor Frederick III., then Crown Prince, had designs worked out according to his own ideas by the now well-known architect, Raschdorff, whose efforts have found approval under the new régime, and who will, probably, sooner or later, receive the commission for the erection of the building, the present Emperor having apparently made up his mind to act according to the wishes of his deceased father in this matter.

IN the German Budget for 1891-92, which has now been put before the Imperial Reichstag for approval, it appears that no less than about 8,500,000 marks are required for building purposes, and that of this sum the military administration will require some 32,000,000, the naval authorities some 3½ millions, the administrations of the Imperial Post Office and Imperial Railroads 4½ and 7 respectively, whilst this year's vote towards the cost of the North Sea-Baltic Canal will be for 29,000,000 marks, and the one towards the harbour works at Hamburg 4,000,000. According to the official contemporary "Centralblatt," the Prussian Government has during the year 1889 had the superintendence of the erection or alteration of 525 buildings. Among these there are 43 churches, 90 elementary and 9 ordinary high-class schools, 37 buildings belonging to the university system, 7 for scientific collections, and 3 to be used as hospitals. The Government administration required 14 new homes, the town and provincial law courts numbered 23, and 23 prison buildings were in hand.

THE case of "in re Griffin," which recently came before the Court of Appeal, illustrated rather vividly the speculative builder's "road to ruin." It is unnecessary to go into all the details of this case, but it may be mentioned that in the autumn of 1888, Griffin, the bankrupt, purchased half-an-acre of land at Northwood, Middlesex, for which he gave 135*l.*, and began to build seven cottages upon it, upon which there was a loss of 573*l.* But the noticeable point about this affair is "that," as the Master of the Rolls stated, "at the time the bankrupt entered on this building business he had no money." It is hardly surprising, then, that the Court concluded that the bankrupt had engaged in rash speculation which contributed to bring about his bankruptcy, and by way of punishment suspended his discharge for twelve months. This, indeed, is no very severe punishment, for, after all, the time is soon gone, and then fresh speculations can be begun. The unfortunate part of such business as this affair discloses, is, that obviously no good building can be done under such conditions. The sole object of such a speculator is to get the building completed as cheaply and quickly as possible, to sell it as soon as possible, and before its defects can be discovered, and then, without thought either for the purchaser or his own credit, to seek elsewhere fresh fields for his nefarious enterprise.

THE judgment of Mr. Justice Romer in the case of the Attorney-General v. Edwards, touches on a point of some interest in regard to the interpretation of the Public Health Act in regard to lines of frontage. The action was in the form of an information at the instance of the Corporation of Bristol, as the Urban Sanitary Authority, against Sir George W. Edwards, to restrain him from continuing to erect two new shops on his land abutting on Park-row Bristol, so as to project beyond the front main wall of the Bristol Asylum for the Blind, which was the adjoining building. The contention was that this was in contravention of section 3 of the Public Health Act, 1888, which provides

"That it shall not be lawful in any urban district, without the written consent of the urban

authority, to erect or bring forward any house or building in any street, or any part of such house or building, beyond the front main wall of the house or building on either side thereof in the same street, nor to build any addition to any house or building beyond the front main wall of the house or building on either side of the same."

The defence was that the wall of a building standing back from the main road and in a garden of its own could not be regarded as intended to mark a line of frontage beyond which an adjoining building was not to project. Where the building is some distance back, this seems the interpretation consonant with common sense at all events, and Mr. Justice Romer, though acknowledging a difficulty in the case, has ruled that it is correct in law, in the present case, at all events. As reported in the *Times* he said:—

"Was the asylum a building in the same street? In one sense it was. It might be said to be in the same street just as Holland House might be described as being in the Kensington High-road. But was it in the same street for the purposes of section 3? His Lordship thought not. There clearly must be some limits—that was admitted—to the expression 'in the same street.' For instance, where a house, though numbered in a street, was built 100 ft. back in a garden, it could not fairly be said to be in the street. Taking what was, perhaps, an extreme case, his Lordship did not think that Holland House was, for the purposes of the Act, in Kensington High-road. If a house was only separated from a street by a small strip, 1 ft. or 2 ft. wide, it could not be said that the house was not in the street within the meaning of the section. The difficulty here was that the asylum was not at a long distance from the street, and it was difficult to say whether it was so far off as not to be in the street. Now, in considering whether it was in the same street, the asylum must be looked at as a whole. One could not rely on the solitary fact that the south wall of the east wing was only a short distance from the street. Was the building as a whole in the same street? His Lordship looked at the position of the centre or main part of the building and both the wings. He noticed that the building was in private grounds, and surrounded by trees. The grounds might at any time be swept away from the public and used as a purely private garden. Looking at the building as a whole, his Lordship had not been satisfied by the relators that it was in the same street within section 3. Lastly, he had not been shown to his satisfaction that the south wall of the east wing was the front main wall of the building. Looking at the asylum again as a whole, was it right to pick out the end of a wing and say that was the front main wall? Why should not the end of the west wing or the south wall of the main central portion be considered? Having regard to all these things, his Lordship thought the relators had not shown that the south portion of the east wing was the front main wall. Therefore, the information failed, and must be dismissed."

This seems to leave the matter, however, open to reconsideration in each future case that may arise, according to the distance of the building from the street. This is not a very satisfactory position for building owners, and seems to point to the necessity for a further legal definition of the expression "in the same street."

WE hear that Mr. T. Fairman Ordish, F.S.A., formerly editor of the *Antiquary*, has undertaken to prepare an edition of Stow's Survey, upon a more extended scale than that of Mr. Morley's volume recently issued as one of the Caribbees Library series. We gather that, whilst Mr. Ordish does not purpose to supplement the survey with the events of the past 300 years, he will annotate the text so as to indicate what features of the town which Stow knew have remained to this present day, and how much has disappeared. The text and notes, on these lines, are to be accompanied with appropriate illustrations.

THE Edinburgh Sick Children's Hospital has been abandoned, owing to an outbreak of typhoid fever amongst the nurses and patients, and the establishment has been removed to the Morningside College, at Plewlands, to the south-west of the city. The building which has been abandoned is situated immediately to the west of the Royal Infirmary, and consisted of what was originally a suburban villa, to which was added an additional story and wing. The

Morningside College was erected for a hydropathic establishment, but stood unoccupied for some time, when it was utilised as an educational establishment. This, too, having proved a failure, the building has been applied to the purposes of a hospital, for which it is better adapted than the premises that have been abandoned. The situation is elevated and open on all sides, surrounded by several acres of pleasure grounds. The accommodation is ample, the rooms airy and comfortably heated. The little sufferers will benefit by the removal. The number of patients in the Hospital at present is about sixty, and the staff consists of sixteen nurses and two resident doctors. The College has been merely taken on lease, and the Directors leave for further consideration whether a new hospital shall be erected and the site which may be chosen. We are informed that there are not sufficient funds at command for the erection of an entirely new hospital, which would be undoubtedly the proper course to follow. But the Directors, we learn, intend to appeal for funds to enable them to erect a new hospital on a new site.

SO much is being said and written at the present time on the subject of that scourge of our race, pulmonary consumption, and Dr. Koch's alleged specific for it, that we should not venture to allude to it now but for the fact that that aspect of the question which is concerned with what may be called preventive sanitation has been generally overlooked. In the new number of the *Asclepiad*\* Dr. B. W. Richardson briefly discusses the subject. It is not within our province to discuss the medical aspect of the question, but we may perhaps be allowed to quote the following passages from Dr. Richardson's article, which appear to us to contain a very timely warning against premature conclusions on the subject:—

"Of late the idea that pulmonary consumption is a parasitic disease is revived. The lung infested with hosts of a specific bacillus is supposed to be destroyed by them or by the secretion which they eliminate; and the mode of cure is expected to be found in a lymph or poison which shall kill the bacillus without injury to the patient.

At the present moment the general press is filled with reports and anticipations of such a kind that the uninitiated in the mystery of disease are beginning to see an immediate future when phthisis, pulmonary, which next to alcoholic disease stands highest as a cause of mortality, will practically be wiped off the blackboard of death, and one of the most fatal maladies of past ages be known no more. This were indeed a consummation devoutly to be wished. But scientific medicine is conservative and careful before she speaks a word; and the more so because in her too ready acceptance of speculative practices in former days, she has seen reason to become wary and chary of belief. Some of her children run after new remedies and false gods fast enough; and many, no doubt, will run after this new promise long before there is sufficient evidence either for its establishment or its delegation to the shades of departed fallacies. Letting these pursue their own course for success or discomfiture, the prudent will wait not weeks nor months only, but years, before they come to a conclusion that shall mean an affirmative and historical success or failure. For the success of the mode of treatment attributed to Dr. Koch, but claimed already by some rivals of his school, can be proved by one proof alone, namely, the effect of the practice on the death-rate."

Then, coming to the question of the effect of preventive sanitary measures on this disease, Dr. Richardson writes:—

"Up to this time pulmonary consumption has had a high, though declining, death-rate, on which no defined line of curative treatment has had any obvious effect. The figures which indicate the death-rate will show, therefore, from date, the effect of the new mode of treatment.

In order to arrive at perfectly correct returns, many details will, however, have to be taken into account. First and foremost, it must be remembered that consumption is now on the decline from sanitary improvements alone. In 1881 the late Sir Edwin Chadwick joined me in making a calculation, by which we estimated the mortality from consumption in England in the year 1880, in order to compare it with the mortality of the disease in England during the year 1847, the space of thirty-

\* No. 23, VOL. VII. London: Longmans, Green & Co.

three years being marked by moderately advancing sanitation. From that comparison we learned that pulmonary consumption had decreased in the proportion of 34 per cent. of the deaths from all causes; that is to say, 12-57 persons died from it in 1847 to 9-12 in 1880. During the past ten years the decrease has been going on at a more rapid rate, though the figures are not yet at command. This must all be taken into account here, in estimating the assumed evidence of benefit from new treatment of a specific order."

**A** PAPER by Mr. L. d'Auria on the force of impact of waves and the stability of the superstructure of breakwaters is to be found in the November part of the *Journal of the Franklin Institute*. Great difficulty is experienced in determining the safe limits of construction of marine works, subjected to the action of breaking waves, on account of the ignorance prevailing in regard to the magnitude of the force of impact of such waves. Mr. L. d'Auria bases his method on a well-grounded scientific principle, namely, that the amount of energy which is necessary to cause the propagation of a wave is equal to the energy which such a wave would require if it had to be moved *en masse* with its velocity of propagation upon a frictionless level surface, and he deduces from this a formula for the maximum force of impact of the wave per lineal foot of superstructure to be,—

$$F = \frac{\gamma k v^2}{2g}$$

where *k* is the height of the wave measured from crest to trough,  $\gamma$  the weight of one cubic foot of sea-water, *v* the velocity of propagation, and *g* the acceleration of gravity. As an example, assume the height of the waves *k* to be 12 ft., the velocity of propagation to be 40 miles per hour, or 59 ft. per second, then *F* = 40,500 pounds.

**R**EPLYING to a question put by Mr. Cavendish-Bentinck in the House on the 5th inst., Mr. J. W. Lowther stated that by a scheme framed by the Charity Commissioners, under the City of London Parochial Charities Act (46 & 47 Vict., chap. 36), a sum of 41l. per annum has been set apart for the maintenance and repairs of St. George's, Botolph-lane, Church, together with another annual sum of 117l. for cleaning and public worship. Mr. Lowther is reported to have added that "in view of the fact that the church is not of primary architectural interest, and of the general condition of the parish, and that the Commissioners are advised that 2,700l. would be required for the church's restoration," the authorities did not feel themselves to be justified in dealing otherwise therewith, as a special case under clause 14 of the statute. Mr. Ewan Christian acted as adviser to the Commissioners *in re* St. George's Church, at the corner of Botolph and George lanes, which was built in 1673-4, at a cost of 1,509l. 4s. 10d., after the designs of Sir Christopher Wren, and has since served for the united parishes of St. Botolph Billingsgate, and St. George, which are named in the second schedule of the Act of 1833. In his "Churches of London" (1839), the late Mr. George Godwin directs attention to what is its chief beauty, "the tower"—"It possesses," he says, "two characteristics of Wren's churches,—a tower rising at once from the ground, and a solid unbroken basement story conferring stability in appearance on the whole edifice." The tower, having a simple, albeit, very pleasing, outline, is 16 ft. square at base, has three stages, of which the second and heltry stages are not marked externally save by the windows, and is finished with a plain cornice and a panelled parapet having angle-piers capped with urn-shaped pinnacles. The body of the church is 54 ft. by 36 ft., and is 36 ft. high. Two Corinthian columns, on either side, set widely apart, divide the nave and aisles. The fabric was repaired and beautified in 1836. On the sword-iron, southern side, was set up a plate inscribed to the memory of William Beckford, twice Lord Mayor of London, who died June 21, 1770.

**T**HE Dr. Williams Library has just been opened again for the use of readers after removal of the books from their former quarters in Grafton-street, by University College, into University Hall, Gordon-square. In June, 1889, the trustees of Manchester New College decided to quit University Hall,—where Dr. Martineau was principal,—and go to Oxford. There they recommenced work in October following, having found a temporary settlement at No. 90, High-street, as vacated by Mansfield College. This latter was founded for Nonconformists at Oxford, by the trustees of the Spring Hill College, Birmingham; about five years ago.\* The University Hall in Gordon-square—a memorial, we believe, of the passing of the Dissenters' Chapels Act—was erected after the designs of the late Professor Donaldson, in 1849. It has now been altered and adapted for the purposes of the library, and the librarian's private rooms, under the superintendence of Mr. T. Chatefield (Clarke), architect; the trustees accepted Mr. Nightingale's tender of 2,365l. for the work. We gave a brief account of Dr. Williams's trust and library, in a "Note," on September 21, 1889.

**T**HE annual exhibition of drawings sent in in competition for the various prizes at the Royal Academy was held on Thursday, the 11th inst. The architectural portion was not remarkable either for quantity or any originality in design. Such a subject, we should have thought, as a "Country House" would have attracted more competitors for the travelling studentship. Only three sent in designs, Mr. Spooner's, the successful one, being by far the most appropriate in character. The design was for a house constructed chiefly of stone with a bold tower over the entrance, half timber work in the gables of the garden front, and tile-hanging introduced in the offices and a portion of the entrance front. The plan generally seemed a good one, with a picturesque working of hall and staircase. The dining-room appeared small, however, for a house of this size, and the serving-room was rather awkwardly placed with regard to it. The drawings generally were excellent, with a fine line and good freehand work where it occurred. For the silver medal two sets were sent in, showing one bay of the choir-stalls St. Paul's. Mr. Baker, who was placed first, had rather overloaded his small scale drawing with dimensions, especially as a large sheet of details was given as well. A prize of £10 was awarded for planning a "Provincial Picture and Sculpture Gallery." In the design placed first, the space devoted to the hall and vestibules seemed too great and too much cut up. The 25l. prize was awarded to Mr. Alexander Macintosh, and the 10l. prize to Mr. James Cromar Watt, for a design of a "Loggia for Statuary," in which was some excellent freehand work. The Creswick prize for a painting this year was a very popular one, to judge by the number competing. The subject, a passage from Gray's "Elegy," gave a good opportunity for architecture to be introduced, and this was done in a very excellent way by Mr. Ralph Peacock, who obtained the prize.

COMPETITIONS.

**BOARD SCHOOLS, MIDDLESBROUGH.**—At the last meeting of the Middlesbrough School Board a communication was received from the Education Department formally approving of the plans of a block of schools to be erected in Victoria-road. The plan and design of these was accorded a first place in a limited competition, Mr. E. B. Robson, the Architect to the Education Department, acting as assessor. Nine architects in practice in Middlesbrough, Darlington, Hull, Leeds, York, Bradford, and Newcastle were invited to compete, and eight sets of plans were received by the Board. The design placed first by Mr. Robson bore the motto "Vi et Armis," and was found to be the work of Mr. J. Mitchell Bottomley, of Middlesbrough.

\* See the *Builder* of November 3, 1833, for an account of the new buildings, near to Wadham and Keble Colleges, designed by Mr. Basil Champneys.

PAST DAYS IN SOME COUNTRY PARISHES.

WHEN churchwardens' registers are well kept they form some of the most interesting records of life in our own country parishes that we can desire, and curious side-lights are sometimes thrown by them, not on church life only, but on the manners and customs generally of past days. Registers, of course, are not always carefully kept, either in the accounts, the statements, the writing, or in the actual care of the books; even in these days, the old parchment-covered volumes are sometimes to be seen lying about, in the vestry or the parsonage, or, as we once saw them, in the tower, thrown aside amidst old bell-ropes and brmses. From too many churches have the old chests disappeared, made in former days for the safe keeping of all the registering books, baptisms, marriages, funerals, and accounts, belonging to the parish; some have decayed from age, others have been sold or taken for other purposes; the early ones were often made with three locks, one key for the parson and each churchwarden, so that unlocking was impossible without the knowledge of the whole trio.

Some time since we looked through some old registers in Norfolk belonging to Sparham parish. The various collections noted, some for fires in quite distant places, e.g., Quade, Northamptonshire, and Teignmouth, South Devon, are interesting. Another was made on January 12, 1680, "toward the redemption of ye captives for Turkey." Thos. Brome, rector, gave 3s., and the amount altogether came to 8s. 2d., the sums vary from 1d. to 1s.; the note is signed Thos. Brome, and the churchwardens mark crosses. These collections were generally made in obedience to a King's (or Queen's) letter or brief, which authorised such in every village in England, to rebuild churches, restore loss by fire, &c. By stat. 4 Ann. c. 14, churchwardens are to collect money upon these briefs, which are to be read in churches, &c., and the sums collected to be indorsed on the brief in words at length, and signed by the minister and churchwardens, after which they shall be delivered, with the money collected, to the persons undertaking them, in a certain time, under the penalty of 20l. A register is to be kept of all money collected, and the undertakers, in two months after the receipt of the money and notice to sufferers, are to account before a Master in Chancery appointed by the Lord Chancellor. Such briefs have now fallen into disuse, the last dating more than forty years ago.

In 1538 the Guildhall M.S. Journal states that the Corporation of London, for certain reasonable and necessary considerations, assessed the wages of agricultural and other labourers at 7d. and 8d. the day, classing them with carpenters and masons.\* Labourers employed on Government works in the reign of Henry VIII. never received less than 6d. a day, and frequently more. Sixpence was also the lowest daily pay of the soldier. In Elizabeth's time, wages were increased by about one-half as much again.

The following accounts from the Sparham register show something of the rate of wages in 1690:—

	£	s.	d.
"Pd. to Augustine Cooke for work done about y <sup>e</sup> bells and Church	...	11	2 6

p.d. for timber for y <sup>e</sup> Church	3 19 4

Some people are apt to think that taking care of a church is a virtue especially belonging to the present time, but entries such as the above show that at least in some places the parishioners minded their ecclesia. In some years instead of "bread and wine for Easter" being noted, it is "bread and wine for Palm Sunday," as Sparham was held with Roxley, and the celebration at Easter occurred in each parish alternate years.

The following items show that parishioners were well looked after:—

October 15, 1655.	£ s. d.
Laid out for Widow Eglington	0 1 9

for Spelman's child's board	1 12 6
To Goody Rainer for looking to G. ody Anson	0 2 0

In the King's Lynn register for 1645 is inserted: "Paid to William King, for defacing superstitious epitaphs, 5s." As Blomefield remarks, in his "History of Norfolk," it was too great a reward for so bad a service! It is sad to see in Norfolk the terrible "defacements" that have been made,—brasses removed, stately broken, screens whitewashed, &c.,—most of such work dating from the Commonwealth, but some later, from so-called church restoration of last century. There is an amusing bit in Christabel Coleridge's pretty historical novel of "Lady Betty" where the young Devonshire lady, in 1730, beautifies (j) the church by whitewashing it, putting new square pews, and plasters up the pointed arches. To have had conscientious views in the way of church restoring in an unartistic age seems to us now rather love's labour lost,—i.e., in an artistic way, not, of course, really and truly, as far as the workers themselves were concerned. And, after all, had it not been for the constant repairing and partial restorations of old buildings, we of the nineteenth century might find the very fabric of many churches too tottering and insecure to restore at all. We have seen one church in Norfolk where paint-pots seem to have run riot, as the old road-sides, originally painted with figures of saints, is white-washed, the carved oak pulpit is stained and grained "mahogany," like cheap furniture, and the square pews, ornamented with oak carving taken from other parts of the church, are daubed over with yellow. Fortunately, the beautiful oak stalls in the chancel, and the octagon font, with elaborate carvings of the Crucifixion and the Seven Sacraments, remain untouched. Also the roof still shows treasures of painting and carving, but unless the work of restoration is soon commenced, that seems likely to come down with a run. Sale is one of the most splendid parish churches in England in size, proportions, and architecture. Every one who sees it must wish it could be (like the sister church of Cawston, 1½ miles away) cleansed from this spoliation, and its old beauties saved and revived.

A list of the families in each parish was sup-

posed to be kept, as is shown by this certificate for "y<sup>e</sup> poor to go out of one parish to live in another." "We, whose hands and seals are hereunto sett, and churchwardens and overseers of the poor of the Towne of —, do hereby certify that — is legally settled as an inhabitant of the said Towne, and that we do hereby promise that whenever and that as soon as y<sup>e</sup> said — shall fall into poverty, or become chargeable to y<sup>e</sup> Towne — where she now dwelleth, we will receive her and provide for her according to the y<sup>e</sup> statute in that case made and provided; to which we have sett our hands and seals this day of —, in the year of his Majesties reign, Anno Domini 1700. Signed and sealed in the presence of —"

In Blomefield's "History of Norfolk" are given lists of the clergy in charge of each parish, from the earliest ascertainable date up to the present time. The first person at Sparham was in 1303. A few are mentioned by some personality, as at Geyton, "John cum Barba" (with the beard), 1318. In the reign of Henry V. the "wages" of a parish priest were limited to 5l. 6s. 8d., except in cases where there was special licence from the bishop, when they might be raised as high as 6l. Till the Reformation, presentments to livings were entirely in the hands of the Pope; private patrons might give away a living, but in the case of each institution a reference was admitted, or was supposed to be admitted, to the Court of Rome. In 1529, it was enacted that pluralities should no longer be permitted with benefices above the yearly value of 8l., and residence was made obligatory under penalty, unless in cases with special reason, of 10l. for each month of absence. Last century pluralities crept in again, owing to the scarcity of men taking orders, which happened from various reasons, unpopularity of the clerical profession, war time, &c., &c.

Before the Restoration, and for some time after, the time and space in preaching the sermon, was generally conformable to and directed by the hour-glass, set up in most churches in England, in an iron frame. At Lynn the churchwardens' account notes that a very fine one was procured from Holland, costing 18s. George Herbert's injunction to be patient must certainly have been needed by those unlucky mortals who had to listen for sixty minutes to the firstly, lastly, to continue, in conclusion, and finally; nor, it is believed, were they always let off with "one glass." Church repairs come largely into the following:—"The account of Robt. Taylor and John Graves, churchwardens, for the year ending Easter Tuesday, April 23, 1701:—

OUR RECEIPTS [sic].

Received by a Levy made April 17, 1701.	£ s. d.
Due to y <sup>e</sup> parish upon y <sup>e</sup> last year's acct.	0 1 8½
in all	£ 4 7 6½

OUR DISBURSEMENTS.

July 2, paid at the parochial visitation	£ s. d.
Court fees at Cawston	0 2 0
For Churchwarden's dinner	0 1 0
For bread and wine on Trinity Sunday	0 2 7
For surplis, table cloth, and napkin washing	0 1 6
John Graves' diner at Cawston Court	0 1 0
Spent by John Graves at the perambulation	0 2 0
For two Mats for y <sup>e</sup> steps to y <sup>e</sup> Altar	0 3 6
For Bread and Wine at Christmas	0 3 10
Surplis washing at Christmas	0 1 0
For Quarteridges to Mr. Eglington	1 1 8
For presentments	0 1 6
For Churchwarden's dinner	0 1 0
Will Blakely and boy one day for mending fonts &c.	0 2 6
For 15 foot of boards and nails	0 2 6
For iron work of Tom Buxley	0 2 0

For 4 foot repaired	0 0 6
For mortering y <sup>e</sup> glass	0 1 0
For two iron bars, and one mending	0 0 6
For fire-line and harte	0 1 6
For bread and wine at Easter communion	0 3 10
In all	£ 4 1 9

The following entries for the slaughter of birds are curious:—  
Dec. 11th, 1824. Pd. Cocks for 4 jackdaws s. d.  
and 18 starlings .. .. . 2 6  
March 7th, 1825. Pd. Cocks for 6 jackdaws at 3d. each .. .. . 1 6

\* Froode.

May 27th, 1825. Pd. Wm. Burton 2½ dozen sparrows	s. d.
June 11th, 1825. Pd. John Cocks 5½ dozen sparrows	0 10
July 15th, 1825. Pd. Wm. Burton for 6 dozen sparrows	2 2½
July 22nd, 1825. Pd. Wm. Burton for 2 dozen sparrows	4 0
Jan. 27th, 1826. Pd. Wm. Burton for 1½ dozen sparrows and 20 dozen other birds	9 0

Then from Michaelmas, 1826, to Easter, 1827, 17. 19s. 6d. was paid for killing seventy-nine dozen sparrows, and from Easter, 1827, to the following Michaelmas, 12. 4s. 6d. for jackdaws, starlings, and sparrows. The last entries in the Sparham registers of the bird destruction is in 1835. The accounts of Easter, 1770, to Michaelmas, 1771, mention that Benjamin Capps, the clerk, was paid 3s. 2d. for thirty-eight jackdaws, and 6d. for caddows, the old name for sparrows; it is sometimes spent cadder. They are not so mentioned after 1786. Among curiosities of past times, old epitaphs seem to stand out prominently. These in Norfolk are very quaint. At Felbrigg:—

"Here lyeth the body of Thomas Windham, Esq., 3rd son of Sir Edmund, who lived a single life, and died December 20, 1599, to whose memory Sir John Windham, of Orchard, in Somersetshire, his cosen and heir, hath set this marble.  
Lift'st thou, Thomas? Yes—where with God on high.  
Art thou not dead? Yes, and here I lie.  
I, that with men on earth did live to die,  
Dy'd't for to live with Christ eternally."

The next is at Guestwick:—

"Here lyeth entombed the breathless remains of Mrs. Sarah Mills, and Mrs. Rebecca Ward, two sisters-in-law, the only daughters of Mr. George and Mary Mills, of Gaystwick, the former of which died June 10, 1696, aged 13; and the latter, May 20, 1702, aged 26.

Under this stone, in case slumber lies  
Two dusty bodies that at last shall rise,  
Their parted atoms shall again rejoin,  
Be cast into new moulds by hands Divine."

The statement that they were sisters-in-law seems peculiar.

We now conclude this short paper; it is rather disconnected, and the records given are scanty, but it may serve to remind some in charge of old parish lore that such things are interesting and well worth looking through, and, in some cases, may possess a good deal of historical value.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The fourth ordinary meeting of this Institute for the present session was held on Monday evening last at 9, Conduit-street, Mr. Alfred Waterhouse, R.A. (President), in the chair.

Mr. William H. White (Secretary) announced the decease of the Very Reverend the Dean of St. Paul's, *Honorary Associate*, and of Mr. George Robson, *Associate*.

St. Saviour's, Southwark.

Mr. Aston Webb read the following communication:—

"6, Montagu-place, Montagu-square, London, W., December 11, 1890.  
MY DEAR ASTON WEBB.—The modern nave of St. Saviour's, Southwark, has now been completely demolished, leaving only such remains of the ancient work as were left undisturbed when the old nave and aisles were pulled down. There, I need scarcely say, are of great interest, and present some puzzling features, which, perhaps, some members of the Institute may like to examine. It is not intended to begin any new work until those who are interested in such matters have had an opportunity of seeing things as they were found. Perhaps you would kindly let it be known that Mr. Simpson, the Clerk of Works, will be happy to show the place to any architect who wishes to inspect it, and that any party from the Council, or from the members generally, would like to pay a visit to the building. I shall be glad to meet them; and I am sure that Mr. Robson, whose labours in connection with it are so well known, and so valuable, would be very pleased to accompany me.—I am very sincerely yours,  
ARTHUR W. BLOMFIELD.

Aston Webb, Esq., Hon. Sec., R.I.B.A.

Decorative Plaster Work.

The President said that the members would be favoured with four papers that evening, whilst in the corner of the room they would notice that Messrs. Whitcombe and Priestley had already begun to give a practical demonstration of their method of modelling in plaster.

Mr. Edward S. Prior, M.A., read a paper entitled "Design in Plaster." He began by

asking what design in plaster should be, and how architects should design for it, the material having its own province, its legitimate indulgence, and its limitations. If the designers took no account of these they would transgress the limits. They were driven to study first principles, which was the sort of intellectual research which professed designers had to initiate in every department of craftsmanship. That should be left to the professors, and the determination of the capabilities and limitations of building materials should be their work as architects. Though it might seem too ambitious, they should have in their pupilage a constant intercourse with real artists, so that they might become familiar with the work. In developing an actual personal acquaintance with the matter they were apt to hold on to some system of rules, and to throw the responsibility of precedent on the examples and masterpieces of established reputation. This system was called the principles of design, a striving after what could be got without thought, and under such conditions they might be excused for having some misgivings whether architects, as at present situated, should attempt the designing of decoration at all. It was found so much more convenient to fall back upon the commercial executant. Perhaps their conscience revolted, and they struggled out with a miserable compromise, the result being seen in the plaster ornamentation which failed to ornament some of our fashionable buildings. He would ask them not to design under those conditions. Plaster was the most impressionable of all materials which gave an architectural surface. It was responsive to the hand of the craftsman, it had a power of expression and vigour in itself, as was especially seen in the case of the famous house-front at Ipswich, called the Four Seasons. What refinement was to be seen in the Adam ceilings, and what delicate ornament was to be found in the tombs of the Aprian Way! What a satisfying texture the plaster-work of one hundred years ago afforded when compared with the smooth and insipid work which was now substituted for it. Plaster failed to give the final delicacy of surface by which the finest style of aesthetic form was reached; that being reserved for marble and bronze. In design it was essential to have something to express, and if this was not the case the plaster would show up the insincerity of the designer's aspirations. The great deficiency was the passion for the make-believe, and it was much better to go, like Mr. Heywood Sumner, to Nature herself. The face of plaster had no crossing or jointing, no piecing or talling; so here was a material suited for broad architectural effect. His paper might seem to be a plea for undecorated rather than for decorated plaster work, for plaster undecorated was really adorned the most, as far as architects could adorn it. They should endeavour to escape from the insincerity of their profession, and that night, at any rate, they would associate with workers in plaster, and with artists whose hands were in their crafts. And if architects wished to get hold of their art, they must take their place beside the craftsmen as fellow-workers in the crafts connected with building.

Mr. G. T. Robinson next read a paper on "Stucco Duro, or modelling in Plaster." Plaster-work, he remarked, divided itself into two main divisions, the one in which carbonate of lime formed its basis, and the other where sulphate of lime was concerned. He would confine his remarks to the former of these. This stucco work was much practised by the ancients, and Vitruvius gave the best receipt for its composition. Some of the ancient work rivalled the fineness of metal or gem engraving. He did not intend, however, to dwell upon that, but would hurry on to the revival of the art in the fifteenth century, to show how it had influenced the art of this country. A long lapse in artistic progress occurred in Europe after the fall of the Roman Empire, and working in plaster almost became a lost art. No doubt many of those present would recollect the Winter Exhibition of 1888 at the Royal Academy, where were shown some very fine reliefs in stucco, and there were also some excellent specimens to be seen in the South Kensington Museum. Mr. Robinson then spoke of the revival of the art of plaster-work as an architectural adjunct. This was due to the partial discovery of the Baths of Titus, the artists of the day reproducing some of the ancient ornament. The old grey ground arose from the fact of using *travertino*, putting on a

coat of white, laid with water. The speaker traced the revival of the art at the Vatican, until, he said, stucco duro became completely lannched as an architectural accessory. In Venice it made itself at home, that city being now, perhaps, the only place in Europe where stucco duro was carried out by professors of the art. At Mantua an important school of the art was established, and it afterwards made its way into France, being eventually introduced into England in the time of Henry VIII. The art was made use of in the case of the palace called Nonsuch, which the speaker described, quoting from the diaries of Pepps and Evelyn to show what the buildings looked like in their time. The fashion prevailed long in England, and at the end of the sixteenth century, there was hardly a mansion which did not set forth the art of the stucco-worker, both inside and out. During the reign of Charles I. the fashion of reticulation fell into desuetude, but the covers were full of decorative work, Sparrows House, at Ipswich, being a typical example. After the Restoration, design improved, and the French taste largely prevailed. From the end of the seventeenth to the end of the eighteenth century, a steady influx of foreign workers came to this country, and about the middle of last century a more classical style was shown in ceilings. The reign of Adam then came in, and in Adam free modelling in plaster died. Mr. Robinson pleaded for its restoration, stating that the substance was easy to manipulate and very lasting. The Departmental Schools were turning out a host of modellers, with enough technical facility to do what was needed, and who only lacked direction and guidance, with sufficient humility to do the bludge and mount the scaffold. If a knowledge of what great artists had done would reach them, the study of what the old Romans had done should fire their imaginations to attain excellence in so useful and pleasing an art.

Mr. Heywood Sumner then gave a description of "The Methods of Sgraffito as applied to Plaster-decoration." He said that the branch of plaster work of which he was speaking was called *sgraffito*, which simply meant scratching, and which was quite the simplest form of all plaster work. It was simply scratching a plastic surface before it had set, and, at present, the method in England,—for he did not think he would call it an art,—was principally seen in the sham stone-joints of stucco fronts. He would first begin by showing a panel where they would see various colours, and he desired to demonstrate the manner in which those colours were placed. The groundwork of the panel represented the face of a wall which had been coated with Portland sand. The first necessity was that there should be plenty of key in it, and that it should be tolerably gritty. When it had set on the wall for three days or so, the cartoon was pinned upon the surface which it was desired to cover with sgraffito. After being fixed in its place, the design on the cartoon was first of all defined with lines of small prick holes, and then dusted through with a pounce-bag. The cartoon was next removed, when they found that the prick-marks showed the lines of the design on the panel. If the panel was being worked in two or three colours, it was necessary then to chalk in the different spaces with colour, placing in the middle of each space whatever colour was desired, the plaster then following on with the coloured cements, filling up what had been marked in, until the result was like a great puzzle or irregular patchwork of colour. In the filling up, it was necessary to be careful about the register-holes of the cartoon and the panel, because these were the key of the colour; if these were missed in any way, it spoilt the register of the colour, owing to the cartoon not being fixed precisely in the same place as before. When the colour was all in its place, it was covered over with a final coat. The whole of the surface of the panel was again covered with the final coat, whatever it might be, the craftsman being exceedingly careful of the register. In the case of the panel exhibited, it was Parian, and he had put a little ochre with the water with which it was mixed, thus getting a somewhat creamy appearance, and taking away the cold appearance of the Parian. The cartoon was again fixed in the same place as before, and pounced through. The design was then cleared, and all that was necessary was to make the edges sharp. Mr. Sumner next

showed how the outlines should be made, being followed up by his assistant, who cleaned up after him. The work was very quick, he said, because the final coating was setting all the time, and in about two hours it would be so hard that it would be inconvenient to clean off a large surface. There were all sorts of small questions which were important, and which only experience could solve, such as when it was necessary to follow on. They could either follow on with the colour two hours after it had been put on, or they could follow on when it had thoroughly set, treating it as if it were a fresh wall. If they followed on when the colour was pretty fresh and had not set, they would get the full strength of colour; and there were endless questions about the final coat. In conclusion, he called attention to a diagram on the wall containing the following recipes for material for *sgraffito* work:—

*Course Coat*: 1 of Portland Cement, 3 of Sand.

*Colour Coat*: 1 of Portland, 1 of Sharp Sand, 1 of Colour.

*Final Coat*: Parian, or 1 of Selenetic and 1 of Athertham lime; or 1 Selenetic and  $\frac{1}{2}$  of Silver Sand.

Mr. Stephen Wehhread a fourth paper, entitled "The Proper Treatment of Modelled Work for Plaster as applied to Ceilings or other Large Surfaces and to Friezes." Mr. Wehhread said that he had endeavoured to confine himself to matters peculiarly applicable to modelling for ceilings and friezes. One important matter for the architectural modeller was that of scale. He must acquire the ability to see his work, not as it appeared on the easel, but when it was fixed in relation to its structural and architectural surroundings. This matter of proportion or scale was of the essence of the craft, and nothing would condone the least fault in the matter of scale. There might be people so enthusiastic for their own hands that they might become oblivious to the outer surroundings, but very often if a man were properly trained, and had the necessary previous knowledge, he might do his work well, even when it was not *in situ*. A clever man would benefit by other people's mistakes. The treatment of the modelled work of friezes, as compared with that of ceilings, was a fairly simple matter, and might be quickly disposed of. If an architect had sufficient confidence in his modeller to leave to him the disposition of the purely decorative forms, this might be frequently done without disadvantage. If this happened the modeller would set to work to divide his frieze into the most convenient lengths for repetition, unless he was guided by the architectural lines; or, should there be no pilasters, he would so arrange the divisions that each form which marked the divisions of the frieze should occur at the principal places in the ceiling-mouldings and with the corners. Great care was needed to avoid crossings by the modification of the outlines, and much variety could be had by a studious management of the surface lines. Where the human figure was introduced it should be done with the utmost care, since while a lack of scale in the arrangement might be sometimes overlooked by anybody but an expert, the incorrect modelling of the figure was always disastrous. Assuming the necessary knowledge of drawing the figure on the part of the artist, what was wanted was that he should show how it might be used in some fresh and artistic combinations with other forms, so that a man of cultivated taste might receive pleasure in looking at the composition, and that those of the craft might receive some guidance in the same direction. Coming to the ceilings, they were met at once with greater difficulties and by greater opportunities for the expression of anything they might have to show by means of their art. A remark, which had exerted some influence on his own work, was made to him a good while ago. He had been asked to say something on the same subject at a similar gathering. In the discussion which followed, one gentleman, for whose opinion on most matters connected with art he had great respect, had taken no part, and after the discussion he was anxious to know what that gentleman's opinion was. When pressed, he said roundly that he had never been able to see why people should put any decorations at all on ceilings. From his point of view the gentleman referred to was able to deduce what did appear to be one or two essentially good reasons for the faith that was in him. One was, as he said, that nobody ever looked at the decoration of ceilings as applied to

living-rooms. Another objection was that one of the most important functions of the ceiling was to reflect light downwards, and that this was frustrated more or less by the use of decoration. That did not, however, apply in the same degree to modelled work as to that in which colour was used. The decoration of the ceilings of living rooms was, in a greater or less degree, open to these objections. But, in the case of the first, if one could not see the whole of the ceiling they could see sufficiently large sections to apprehend the motives of the design. It was well to keep this objection in mind, and lay out the forms in such a manner as to avoid all intricate combinations. The modelling should be in character and keeping with all the other decorations of the room, but the treatment in the case of ceilings must be entirely different from that adopted for work in another situation. He felt that modelling in ceilings should not be in the smallest degree assertive, but should be done in such a way that it might serve as an apology for being there at all,—requiring, no doubt, great self-repression on the part of the artist. About the best position from which to look up at a ceiling was from an ordinary easy chair, which allowed one to lean pretty well back. Very few men had leisure to contemplate their ceilings until the business of the day was over, and therefore the man who had to live in the house should be somewhat considered. This would naturally suggest that the treatment of the decorative forms should be quiet and reposeful. He considered that the most graceful and manageable forms should be adopted, and that abrupt shadows should be no more used than was absolutely necessary to give expression to the idea. It was well to vary the centre, and the leading object, as far as practicable, as soon as two or three repetitions had taken place. Referring to surface treatment and texture, his opinion was that a great deal of the time spent in the discussion of these smaller matters, and especially in the case of students, would be much better employed in endeavouring to get a right knowledge of form and a proper acquaintance with the distribution of ornament which should be applied to surfaces. The surface texture might then be left to take care of itself. It was very grievous when, in deference to the prejudices of some one, a real artistic piece of work had to be handed over to the clay-smoother or plaster-carver. Another fruitless waste of labour was the time the modeller gave to acquiring the mannerism of some artist whose artistic peculiarities might have no value whatever. He would have liked to say a few words about the curious tendency shown in modern modelled ceilings to imitate carvings, but he had now reached the end of his space, and he would therefore conclude.

Mr. J. D. Sedding, in opening the discussion, said that as representing the Art Committee he would like to say how extremely gratified the Committee were with the excellent attendance that evening, as showing the strong interest taken in everything that had been said and demonstrated. One could not help feeling that architects were getting a little nearer to the crafts. A great many hard things had been said about architects by Mr. Prior, who, being an architect himself, could afford to say them, but what had been brought home to them very much was the advantage of the art of modelling, which they ought all to possess more or less. He was glad to see so many of their younger brethren present that evening, and he hoped they would spend more of their evenings in learning to model. It would be a great gain for art when they realised the power of designing the largest buildings in the Renaissance style as well as in the Gothic. They had had most beautiful illustrations that evening of stucco ornaments,—such things as they were accustomed to in Wren's buildings, but which people would be horrified to see in a Gothic church. He hoped, therefore, that they would open their minds, and be able to go for the Renaissance as well as the Gothic churches.

Mr. Basil Champneys said he was exceedingly glad that the subject had evoked so much interest as the crowded room appeared to suggest. Plaster work was one of those branches of art which had lately been utterly neglected, and which would be exceedingly valuable in the design of the future. He had been very interested in seeing one branch, with which he had been acquainted in theory, being worked out before his eyes, and he considered that a

balance of that kind, in which one had an opportunity of seeing the actual thing done, was better than all the theory in the world.

Mr. George Simonds remarked that the method of executing *graffito* work was exceedingly interesting. The only question which occurred to his mind was whether, in going in for such polychrome work, one was not rather running beyond the proper limits of plaster? It seemed to him that in the case of one of the *graffito* panels exhibited, the fine lines must be extremely liable to injury, as the material was very fragile, and likely to break away. The oldest *graffito* work seen in Italy was very much simpler, being only of two colours, and yet it had suffered when placed out of doors. Something had been said about modelled plaster work for architectural decorations, and about "repeats." The word "repeat" was a word which he very much detested; indeed, it seemed to him the curse of decorative plaster work, especially on ceilings. He recently inspected some ceilings in Harrington-gardens. In one case there was a long, low room with several architectural members, the whole of the ceiling being decorated in a tremendously elaborate way. The result was that the proprietor could not help seeing the ceiling continually, and he would find that the same little hoy was running about the ceiling in different parts, but always the same hoy. This was extremely unpleasant, and he was afraid there was a great tendency among architects to do that sort of thing. Of course the public demanded a great deal of decoration, but they did not care to pay for it. He very much sympathised with what had been said about the modelling of the figure, for one did see the figure modelled in friezes and ceilings in a very objectionable way; in fact, the rules of relief, even in the rooms where they were assembled, had been utterly set at defiance. The thing was all very nice on paper as a drawing, but as a piece of modelling it was simply ridiculous.

Professor Atchison said that he fancied, from the peculiar pungency of the words which had been quoted by one of the readers of the paper, that they must have been the words of Mr. Brett, who had very peculiar ideas on many subjects. The idea that ceilings should be left untouched was an utterly erroneous view, for nothing gave so great a finish to a room as having the ceiling beautifully modelled. A room admirably decorated in every respect, but with a vast space of white ceiling, gave the idea that people had expended all their money on the walls, and were obliged to put in the ceiling flat. The great charm of the work was not only that it should be artistically done, but that it should be entirely new, though the difficulty lay in the expense being so great. At the same time schools of art were now so common that art work should be comparatively cheap. Mr. Brett was very severe on the modern method of decorative paper hanging. Now, nothing was more beautiful than good ornament, but when it was used with too much repetition it was the most degrading thing possible to put up. The only thing that then redeemed it was the breaks made by pictures and furniture. He objected to the supposition that it was an easy thing to apply ornament, taken directly from nature, to anything, and it was too much used in the present day. The traditional ornament, which had come down from pre-historic times, had gradually received the modifications which a great series of highly skilful and endowed men had been able to give it. A great tendency of modern art was to copy things from nature direct, the only effect of which was to make the thing all over look flabby or wire-drawn. Every great artist who had used plaster had gone to nature, but he had at the same time adapted it for the purpose for which it was intended. The greatest fault generally to be found with modelling in plaster work was that a small piece was done, cast, and put up regardless of the different lights it was likely to be subjected to.

Mr. Ralph Nevill remarked that there still remained a vestige of Nonsuch at Reigate priory, in the shape of a mantelpiece. He had always understood that Italian workmen had been brought over by Henry VIII.; but he did not know there was so much evidence as Mr. Robinson had given them of the fact. An antiquarian friend of his in Somerset had informed him of a great number of fine ceilings in the manor-houses of that county. He understood there was an extract of a will extant, executed by the manager of the Italian travel-

ling craftsmen who did the work, in which he bequeathed all his tools and instruments. He had lately come across an interesting class of plaster-work which he did not think had been much noticed. That was to be found in the stone districts, especially of Gloucestershire, where the houses were of stone with millioned windows, the spaces between the stone-work being apparently ornamented with cast ornaments of plaster, and some modelled by hand for the surface of the walls. Little of this was now left, because it had been destroyed in the course of constant whitewashings. As to repetition, if they could always have ceilings and other things designed out of the artist's head, and varying in shape up to a certain point, it might be nice. But there was a certain point at which it was necessary to have repetition, and where, without it, the design would become wearisome, as in many ceilings of the Jacobean period. He thought it was a horrible idea to put forward that a man must be always staring at everything that was put up in his house, instead of supposing that it should all merge into one harmonious whole. It was also a pernicious theory to advance that the object of the ceiling was to reflect light. With respect to the question of modelling by architects, they must not hurry things too fast, as there was plenty of work for the profession without their taking up modelling. An architect in good practice would do the work in an inferior manner, and it was, therefore, better to employ those who had devoted their whole lives to the craft.

Mr. Arthur Cates said that the attention given to the papers, and the interest with which the subject had been received, had demonstrated the wisdom of the step taken by the Art Committee in this new departure. He believed this would be only the first of a series of similar demonstrations and papers, which would be of an instructive nature, and originate equally useful discussions. The credit of the new departure was due to the Art Committee of the Institute, to its Chairman, and its energetic Secretary, Mr. A. B. Pite. He had, therefore, much pleasure in proposing a vote of thanks to the Art Committee, to the readers of the four papers, and also to the two silent speakers, Messrs. Whitcombe and Priestley, who for something like two hours had been so busy demonstrating their method of modelling in plaster. This he hoped would lead to the restoration of the art in this country, and that by Englishmen.

The motion was then put and carried by acclamation.

Mr. Sumner said, in reply to a criticism, that he had given several colours in the *graffito*, merely to show how many could be used.

Mr. Priestley added a few words in explanation of his method of modelling in plaster.

The President announced that the next meeting, to be held on January 12, 1891, would be a business one, when a ballot would take place, and the awards for studentships, medals, and prizes would be announced.

**SURVEYORSHIP, DROITWICH.**—At a meeting of the Droitwich Town Council, held on Wednesday last, Mr. Bernard Godfrey was unanimously appointed Borough Surveyor. Mr. Godfrey for some time past has been assistant to Mr. Robert Godfrey, A.M.I.C.E., Engineer and Surveyor to the King's Norton Rural Sanitary Authority, and also Assistant Surveyor to the Northfield Highway Board, and Hon. Sec. of the Association of Birmingham Students of the Institution of Civil Engineers.

**DISCOVERY AT BEVERLEY MINSTER.**—A few weeks since, when workmen were excavating for a new rain-water drain from the corner of the north-west transept of Beverley Minster, they came upon the plinth of one of the walls of the octagonal Early English Chapter-house. Further investigations have revealed the foundations and part of the walling of the other sides, as well as the circular base of the central column of the structure. It is evident that the building was of two stories, having been erected like those of Wells, Westminster Abbey, Old St. Paul's, and others, on a vaulted crypt or under-croft. This discovery is of great interest, as explaining the object of the well-known beautiful double-arcaded staircase in the wall of the north aisle of the choir. The twin doors of the top of this staircase must have been by a short passage into the Chapter-house itself, the low round-headed doorway in the wall below the stairs giving access to the under-croft. When and why this beautiful building was destroyed is the unrecorded. It is to be hoped that means will be devised, as at St. Paul's, for keeping these remains of the Chapter-house open and visible.—*Manchester Courier*.

"Castle Garth," Newcastle-on-Tyne.

#### CASTLE GARTH, NEWCASTLE-ON-TYNE.

The accompanying sketch is one of the old "bits" of Newcastle-on-Tyne, called "Castle Garth." The high-peaked tiled roof that is seen on the sketch is part of the "Castle," which is at the end of the street, while the lantern of St. Nicholas' Church fills up the centre of the vista. The sketch is by Mr. J. R. Hutchinson.

**SOCIETY OF ENGINEERS.**—The thirty-sixth annual general meeting of the Society of Engineers was held on December 8, at the Rooms of the Society, 17, Victoria-street, Westminster, S.W. The chair was occupied by Mr. Henry Adams, M.Inst.C.E., President. The following gentlemen were duly elected by ballot, as the Councilors and officers for 1891, viz. —As President, Mr. William Naveby Colam; as Vice-Presidents, Messrs. Joseph William Wilson, jun., William Andr-w Valon, and George A. Goodwin; as other Members of Council, Messrs. Chris. Anderson, R. W. Peregrine Birch, Chas. C. Carpenter, Henry Fajin, C. Nicholson Ladley, T. Bell Lightfoot, William G. Peirce, and Arthur Rigg; as Hon. Secretary and Treasurer, Mr. Alfred Williams; as Hon. Auditor, Mr. Alfred Lass (Messrs. A. Lass & Co.). The proceedings were terminated by a vote of thanks to the President, Council, and Officers for 1890, which was duly acknowledged by the President. The annual dinner was held on the 10th inst., as mentioned by us last week.

#### Illustrations.

##### SCULPTURE PANELS IN REREDOS, ST. JOHN'S, NOTTING-HILL.

THE sculpture here illustrated was modelled in terra-cotta by Miss Emmeline Halse, for the reredos of St. John's Church, Notting-hill, the architectural portion of which was designed by Mr. Aston Webb. The whole was, we believe, carried out in terra-cotta by Messrs. Doulton.

The church being dedicated to St. John, the artist has selected for illustration the three most prominent points of the life of St. John as recorded in the New Testament—"The Call" when James and John, mending their nets, were addressed by Christ with the words "Follow Me;" "The Commission," when Christ commended Mary to his care with the words "Behold thy mother!"; and the Revelation. The principal panel is not only a good sculptural composition, but the subject is treated with great feeling and expression.

##### TOMBS OF NUMIDIAN KINGS.

The illustrations of some of these tombs which we publish in the present number, are from drawings by Mr. Alexander Graham, and are fully explained in the article from his pen which will be found on another page.

As will be seen, Mr. Graham gives, on the larger sheet of illustrations, restorations of two of the tombs, with some details and a plan of the tomb of Juba II., and a sketch of the entrance and the adjoining masonry. The "four-panelled door" is an ancient sham door in stone. On the smaller sheet is a general view of the remains of the same tomb as at present existing.

##### ENTRANCE TO THE CHAPEL, BARGELLO, FLORENCE.

OUR illustration shows the doorway to what is now the fourth room of the National Museum, and which was formerly the Chapel of the Bargello. The walls of the chapel were decorated with frescoes by Giotto representing scenes from the life of S. Mary and the Magdalen, and there were also a series of portraits, amongst them being one of Dante. This and the frescoes generally suffered considerably during the period when the building was used as a prison, and the portrait of Dante has lost much of its interest by restoration. The building is of the fourteenth century, the earlier building having been burnt at the beginning of the century. The doorway here given has some good heraldic work.

The illustration is reproduced from a coloured drawing by Mr. H. W. Lonsdale.

##### PANELLING, CHURCH OF ST. VINCENT, ROUEN.

THIS is a portion of a large drawing which gained its author, Mr. Arthur A. Hind, a South Kensington medal for this class of drawing. The carving is a characteristic bit of Renaissance work, not of the highest order, but the frieze shows a free and graceful treatment, and the perpetual variety in the treatment of the panel decoration below is noticeable.

##### ANCIENT WELL-HEADS FROM VENICE AND PADUA.

THESE are illustrations of some of the ancient decorative stone heads or fences to well openings, so many of which were produced in the Renaissance period in Italy, and which are now common objects in museums. The two upper ones in the plate, however, are of a different date and of a more uncommon type, and whether or not originally fixed in or near Venice, like the architecture of Torcello their parentage is Byzantine. The other two, the left-hand one especially, are very elegant examples of the better-known type of the Renaissance period. The illustrations are reproduced from drawings by Mr. R. Glazier.

##### THE ARCHITECTURAL ASSOCIATION.

THE fifth meeting of this Association for the present session was held on Friday, the 12th inst., in the meeting-room of the Royal Institute of British Architects, Conduit-street, Mr. Leonard Stokes, President, in the chair.

The minutes of the previous meeting having been read and confirmed, the following gentlemen were elected members of the Association, viz., Messrs. P. Banhof, T. J. Morgan, and A. H. Bamher.

Mr. Cole A. Adams said he rose for the purpose of asking two questions, not for the purpose of raising a discussion, but so as to obtain an answer from the chair. His first question was whether or not *A.A. Notes* was the official organ of the Architectural Association? Secondly, did the leading article in the December issue of that publication express the authorised views of the Committee of the Association?

The Chairman stated that the answer he was instructed to give to those two questions was, that *A.A. Notes* is the official organ of the Association, but that the article in question does not give expression to the authorised views of the Committee.

The Chairman then declared the ordinary meeting terminated; and the meeting then became special, to consider the revision of the rules.

The minutes of two previous special business meetings were read, and after some discussion confirmed.

The Chairman said he wished to remind the meeting of a fact which they must keep clearly before them. They had heard from the minutes that a special committee was appointed

to revise the rules of the Association, and the rules which they had before them were the work of that special committee. The report, which had been drawn up, was to the President, Committee, and Members of the Architectural Association; therefore, they (the meeting) would be considering the report of a committee which they themselves had appointed.

Mr. Hugh Stannus said he had been asked by the President to begin the business that evening. He had been asked, and he did it with a very great deal of pleasure, to take the initial step in asking the Association to agree to the revised rules. The report commenced by saying that it was the report of the Special Committee for the revision of the rules, and was to the President, Members, and Committee of the Architectural Association. He had taken exception to that, because the Special Committee was appointed by the Association and not by the President and Committee, and the report should have been to the Association only. The rules had been divided into two classes, for it had been thought better that one portion should relate to the Constitution of the Association, and the other portion should be the By-laws. It was easy to divide the former rules into those two classes, and it was very generally felt that it ought to be more difficult to alter the Constitution than the By-laws. A constitution was something which had reference to the existence of a body, whereas By-laws referred to its continuance within itself. The very existence of a body should not be imperilled lightly by the voting obtained in a snatch manner at any meeting; whereas with By-laws it ought to be possible to alter them from time to time. Therefore, the object of dividing the rules into Constitution and By-laws would be understood. The Constitution had been placed first, and the first rule, the adoption of which he moved, was as follows:—

"1. The Society shall be called 'The Architectural Association'; and shall be carried on under the authority and provisions (so far as applicable) of the Literary and Scientific Institution Act, 1854."

Mr. H. W. Pratt seconded the motion, and the rule was adopted.

Mr. Stannus then moved the adoption of the second rule:—

"2. The objects of the Association shall be—to afford facilities for the study of Architecture, and to serve as a medium of friendly communication between the members and others interested in the progress of the Art."

Mr. F. T. Baggallay seconded the motion. Mr. C. H. Brodie said that in the old rules one of the objects of the Association was stated to be "to advance the profession," and he would like to know why that had been omitted in the new rule.

The Chairman said it was obvious that their efforts were "to advance the profession," but their first object was to advance the younger members of the profession.

The Chairman then put the motion, which was carried.

Mr. Stannus then moved the adoption of the third rule, as follows:—

"3. The Association shall consist of Ordinary Members and Allied Societies."

Mr. Owen Fleming said that in the resolutions which had been referred to the Special Committee, ordinary members were divided into two classes: Town Members and Country Members. He should like to know the reason of the omission of that distinction in the rule as now submitted.

Mr. Cole A. Adams stated that the proposal under the new rules was to make the subscription the same to Town as to Country Members; therefore there would be no need to define any difference between Town and Country Members.

Mr. Fleming said he quite saw the reason, but he would like to defer the consideration of that part of the constitution until they came to the question of the subscription. He therefore moved as an amendment that Rule III. be deferred until the consideration of By-Law IX. The amendment was seconded and carried.

Mr. Stannus next moved the following Rule:—

"4. Members shall be engaged professionally in the study or practice of architecture; but, with the sanction of the Committee, gentlemen interested in the arts or sciences associated therewith may also become Members."

This having been seconded,

Mr. Cresswell moved, as an amendment, that the word "ordinary" be inserted before the word "members" in the first line of the rule.

Ordinary members had been referred to in the previous rule, and the same should be done in Rule IV. or the adjective omitted in both cases.

Mr. W. Burrell seconded the amendment, which, on being put, was lost.

Mr. Burrell then moved that, after the word "be" in the first line, the words "generally those" be inserted.

This amendment not finding a seconder fell to the ground, and the original motion was then put and carried.

In regard to Rule V., Mr. Stannus said that as it stood it read thus:—

"5. Each ordinary member shall have the right to participate in all the privileges of the Association, and to vote as prescribed by By-laws."

He wished to add after the words, "prescribed by the By-laws," the sentence: "and the annual subscription from each present member shall be half-a-guinea."

Mr. Cole A. Adams said he heard the suggestion with the utmost amazement. Mr. Stannus, who sat on the Committee and had helped to thrash out the rules, had come and suggested an important alteration. He (Mr. Adams) hoped they would unanimously vote against it.

Mr. Stannus, in formally moving his amendment, said that in one of the By-laws it was stated that members elected prior to January 1, 1891, should pay an annual subscription of half-a-guinea. All he proposed to do was to transfer those words. Instead of appearing in a By-law, they should appear in the Constitution. The thing was perfectly clear, and he hoped his amendment would be carried unanimously, for it was only in that manner that the Association could vindicate its title to something like Consistency.

Mr. W. H. A. Berry said he fully shared Mr. Stannus's views on the point raised, but he thought the matter might be dealt with in another clause of the Constitution.

Mr. Stannus said he was willing to accept Mr. Berry's suggestion and move his amendment later on.

Rule V., as previously set out, was then, on the motion of Mr. Cole A. Adams, seconded by Mr. Goldsmith, carried unanimously.

Mr. Stannus then moved the adoption of Rule VI.:

"6. Allied Societies shall be societies whose meetings are held not less than thirty miles from Charing Cross, and whose rules have been approved by the Committee of the Association."

Mr. E. W. Mountford seconded the motion.

Mr. H. O. Cresswell urged that allied societies should have a more definite distinction; such as that they should be engaged in the study of architecture. He suggested the insertion of the words "architectural or kindred" after the words "shall be."

Mr. Cole A. Adams said he thought the rule gave the Society every protection that was possible.

The amendment was carried, and Rule VI., as altered, was then put as a substantive motion and carried.

Mr. Stannus next moved the adoption of Rule VII.,

"7. Allied Societies and their members shall have such privileges as prescribed by By-laws."

Mr. Needham Wilson seconded the motion, which was agreed to.

The adoption of Rule VIII. was next moved by Mr. Stannus:—

"8. The affairs of the Association shall be managed by a Committee, subject to the approval of the general body of Members."

Mr. E. W. Mountford seconded the motion, which was also agreed to.

Mr. Stannus then moved the adoption of Rule IX.:

"9. The Committee shall consist of a President, two Vice-Presidents, two Secretaries, a Treasurer, a Librarian, and such number of ordinary members, and such representatives of allied societies as shall be prescribed by By-laws."

Mr. Slater seconded.

Mr. E. W. Wimperis moved, as an amendment, that after the words "shall consist of" in the rule, the words "the following honorary officers" should be inserted. This was carried, as was another amendment to omit the word "and" after the word "librarian." Rule IX., as amended, was then put as a substantive motion, and carried.

Mr. Stannus then moved the adoption of Rule X.,

"10. All Members of the Committee shall be Members of the Association, and shall be elected annually as prescribed by By-laws."

Mr. Max Clarke moved as an addition to Rule X. the words, "And shall not be entitled to receive any monetary consideration or honorarium from the Association during their term of office or the session following."

Mr. Stannus said he hoped Mr. Clarke would not press his amendment, as it opened up a very delicate question. They did, he believed, ask their honorary secretaries to accept some small honorarium towards their expenses in connexion with the Association, but it was for money out of pocket. If they passed an amendment of that kind it might appear that it was aimed at the secretaries.

Mr. Goldsmith seconded the amendment, which, on being put, was lost.

After some further discussion Rule X. as set out was agreed to.

Mr. Stannus then moved the adoption of Rule XI.:

"11. General meetings of the Association, including such as may be summoned by the Committee on the requisition of Members or otherwise, shall be held, as By-laws may from time to time prescribe, and at least one general meeting shall be held in every year."

This was carried.

Mr. Stannus then moved as an addition to the Constitution, the following rule:—

"That the constitution of the Association shall be only altered or amended by a vote taken by means of voting papers sent to all Members as prescribed by By-laws."

Mr. Dicksee seconded the motion.

Mr. R. Phené Spiers said that he would like Mr. Stannus to amend his motion, so that in any alteration which might be made in the Constitution, it would be necessary to have two-thirds of the members present to make the alteration.

Mr. Cole A. Adams said he had no personal objection to voting by voting-papers, but it was a good old English way to vote by acclamation and with the hands.

Mr. Needham Wilson said that unless some such rule as Mr. Stannus had suggested were added to the Constitution, it would be perfectly competent for a small faction to dominate the whole of the Association by getting up a packed meeting. He did not think that country members should be debarred from having a voice in the affairs of the Association.

Mr. A. B. Pite supported Mr. Spiers's suggestion.

Mr. Spiers moved the following as an amendment:—

"That the Constitution shall be only altered by a vote of two-thirds of those present at a special general meeting called for that purpose."

Mr. T. E. Pryce seconded.

The amendment having been lost, Mr. Stannus's motion was put and carried.

On the motion of Mr. Owen Fleming, and seconded by Mr. Dicksee, the meeting was adjourned until Friday, the 19th inst., at 7 p.m.

ARCHITECTURAL SOCIETIES.

MANCHESTER ARCHITECTURAL ASSOCIATION.

—On Tuesday evening last at the ordinary meeting of the Association, Mr. T. Chadwick, A.R.I.B.A., President, in the chair, a lecture was given by Mr. Edward Hewitt, A.R.I.B.A., Vice-president, and member of the firm of Messrs. E. & F. Howitt, architects, Manchester, in the Lecture-hall, Athenæum, the subject being "A Tour in Normandy and Brittany from an Architectural Point of View," illustrated by oxy-hydrogen lantern, with sixty original views from drawings and photographs. A long report of the lecture came to hand too late for insertion this week.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

—Mr. J. B. Mitchell-Withers, F.R.I.B.A., read a paper before the last meeting of this society on "The Development of Ornament in English Medieval Architecture." There was a good attendance of members and others, including Mr. F. Fowler, President; Mr. C. J. Innocent, Vice-President; Messrs. W. M. Gibbs, Potts, Winder, jun., Smith, Homell, H. Webster, Benton, McDougall, Wigfull, H. Tootley, A.R.I.B.A., J. T. Cook, and others. Mr. Mitchell-Withers introduced the subject by stating that a knowledge of the historical development of the various styles was absolutely necessary to the artist, and he proceeded to carry out that view by tracing the history of ornamental English architecture. He cited the principal characteristics of the English styles, adopting the simple nomenclature of Rickman, and divided the periods into Norman, Early English, Decorated, and Perpendicular. He instanced the principal English buildings in which these types are exemplified, and there

were lantern-slide illustrations (prepared principally by Mr. Mitchell-Withers, jun.) showing specimens of ornament in detail, and groups of each period found in various notable buildings. An interesting discussion took place, in the course of which Mr. Tooley, remarking on the lecturer's criticisms of the flint panelling work seen in Norfolk and Suffolk, thought the lecturer judged it too harshly. He admitted that its appearance was much improved by the hand of time. On the proposition of Mr. F. Fowler, seconded by Mr. McDougall, and supported by Mr. Gibbs, a hearty vote of thanks was awarded to the lecturer for his paper. Mr. Gibbs, in supporting the resolution, said he could not allow the opportunity to pass without asking the society to join him in congratulating Mr. J. B. Mitchell-Withers, jun., on having passed the recent examination to qualify for the Associateship of the Royal Institute of British Architects. He trusted that his example, as the first of the rising generation of Sheffield architects, would be largely followed by other of their junior members.

**BIRMINGHAM ARCHITECTURAL ASSOCIATION.**—At a meeting of this society held on the 9th inst., the president, Mr. T. Naden, gave an address to the members, in which he referred at considerable length to the growth and development of the city up to the earlier part of the nineteenth century, showing that its progress was the outcome of the wonderful power, energy, labour, and genius of the men who have created it. Beginning with the mention of Birmingham in "Domesday Book" and of the weekly market held in the twelfth century, Mr. Naden passed rapidly over the earlier periods of the growth of Birmingham till the stirring times of the seventeenth century, in which the old "Ship Inn," and Stratford House at Camp Hill were well-known houses on the outskirts of the town. Aston Hall was built by Sir Thomas Holt, and St. Martin's Church was raised in brick for its preservation. At the close of the seventeenth century, in 1689, the first dissenting chapel was built in Old Meeting-street, followed by a second in three years' time in Digbeth, and about the same time the Roman Catholics built a chapel and convent near the present St. Bartholomew's Church, both these were almost immediately destroyed, and in their place a chapel was built at Edgbaston. From this time onwards the growth of Birmingham was rapid and steady. Before the close of the seventeenth century there were six churches or chapels in the town, and, according to Hutton, "the greater prosperity of the people was reflected in the improved appearance of the town." St. Philip's Church was finished 1719, and in 1731 was, with St. Martin's and the newly-built Grammar School, the most prominent building in the town. North of which there lay the grounds of New Hall, and beyond those open country, while the centre of the town, from Digbeth to the Bull Ring, was occupied by picturesque gabled half-timber buildings overhanging the winding thoroughfare. Mr. Naden was able to show, by means of the surveys of Wesley and Bradford, and those of the present time, the growth in the next hundred years, and concluded his address by a tribute to the genius and labour of the manufacturers and inventors to whom Birmingham owes her prosperity. The hearty thanks of the meeting were, on the motion of Mr. H. R. Lloyd, supported by Messrs. Hale, W. Doubleday, V. H. Bidlake, and others, accorded to Mr. Naden, and with the vote was coupled a wish that the paper might be printed, in order that it could be permanently retained by the members of the Association.

**EDINBURGH ARCHITECTURAL ASSOCIATION.**—The second meeting of this Association for the present session was held on the 11th inst., Mr. John Kinross presiding. Councillor Mackenzie read a paper on "Heating of Buildings by Hot Water and Steam," his opinion being that there was no advantage in using steam for ordinary buildings, while there were many disadvantages, and always considerable risk. The merits of various shapes of boilers were discussed, and the subject of mechanical ventilation, combined with heating, was touched upon. The paper was illustrated by diagrams. A discussion followed. The prizes gained by the successful students for the last year were afterwards distributed.

**BRONZE STATUETTES.**—Mr. A. L. Collie, of Old Bond-street, has reproduced in bronze, small size, Sir F. Leighton's "Sluggard" and Mr. Onslow Ford's "Peace."

#### THE LONDON COUNTY COUNCIL.

THE last ordinary weekly meeting of the London County Council prior to the Christmas recess was held on Tuesday afternoon last, Sir John Lubbock, Chairman, presiding.

*The Employment of Quantity Surveyors.*—The General Purposes Committee's report contained the following paragraph and recommendations:—

"On October 14 the Council resolved that a quantity surveyor should be employed by the Council (whenever required) to prepare bills of quantities for all large works, the Council accepting the responsibility for such bills of quantities; and on October 21 we reported that we proposed to make inquiries among persons in the profession, and to make a selection from a certain number of experienced surveyors. Having taken the course proposed, we have received a number of offers from persons carrying on the business of quantity surveyors in London, stating the terms upon which they would undertake the Council's work. All these offers have been carefully considered, with the aid of a sub-committee appointed for the purpose. We do not think it desirable that the Council should bind itself to only one quantity surveyor, or one firm of surveyors. It seems to us better to make arrangements with several firms, and in the case of each work to select the one which may appear best suited for the purpose. We recommend—

(a) That the following surveyors be retained as quantity surveyors, to prepare bills of quantities in connexion with works to be carried out under the direction of the Chief Engineer of the Council:—Messrs. Fowler and Huggan, 8, Craig's-court, S.W.; Mr. J. Nichols, 8, Craig's-court, S.W.; Messrs. J. H. Strudwick & Son, 10 and 11, Bedford-street, W.C.; Messrs. S. J. Thacker & Son, 22, Montague-street, Russell-square, W.C.

(b) That the following surveyors be retained as quantity surveyors, to prepare bills of quantities in connexion with works to be carried out under the direction of the Architect of the Council:—Messrs. Franklin & Andrews, 25, Ludgate-hill, E.C.; Mr. C. W. Brooks, 43, Inbury-pavement, E.C.; Mr. F. H. A. Hardcastle, 34, Southampton-street, W.C.; Messrs. Young & Brown, 5, Henrietta-street, W.C.

(c) That the conditions of the arrangement with the persons or firms above mentioned be embodied in formal agreements to be prepared by the Solicitor, and that for that purpose the Chief Engineer and the Architect be instructed to furnish the Solicitor with such information as he may require."

These recommendations were agreed to without discussion.

*Rosebery Avenue.*—The Improvements Committee presented the following report as to this new thoroughfare:—

"The Council on July 15 last approved a contract for the supply of plane-trees for Rosebery-avenue, and, in conformity therewith, those needed for the completed section will be planted forthwith. It is necessary that they should be protected by guards, and we have therefore obtained designs and tenders for the same. We have selected a strong but neat pattern (for the whole thoroughfare we shall need 81), and we recommend—

That the design of Messrs. Bayliss, Jones, & Bayliss be approved, and that, subject to an estimate being submitted to the Council by the Finance Committee, the work required by the statute, the requisite number of tree-guards be obtained from that firm at £1. 3s. 9d. each."

By the terms of the contract for the construction of the viaduct at Rosebery-avenue (the Metropolitan Board of Works form having been used), it is stipulated that the contractor shall maintain the viaduct for twelve months after completion. For this purpose it has been usual to provide the contractor with some accommodation for tools and materials needed from time to time for such work of maintenance. The contractor for the viaduct claims under this form of contract to retain possession of some land between Warner-street and Cold-bath-square for the purpose indicated above. The Corporate Property Committee has arranged to sell the surplus land in this locality, and it is most desirable that the sites retained by the contractor should be given up. We have therefore called upon the contractor to do so, but he refuses unless he is relieved from any further maintenance of the viaduct. The Engineer has, after a thorough examination, reported that the viaduct and paving works are in a satisfactory condition, and that the contractor may be released from further responsibility, without any risk to the Council. We therefore recommend—

That the contractor (Mr. Dickson) be called upon to remove all his plant from, and to give up possession of the vacant land adjoining Rosebery-avenue, at present occupied by him, and that thereupon he be paid the balance of his account and be relieved of all responsibility in respect of maintenance of the works."

These recommendations were agreed to.

After transacting other business the Council adjourned until Tuesday, January 13.

#### Books.

*Blackie's Modern Cyclopaedia of Universal Information.* Edited by CHARLES ANNANDALE, LL.D. Vol. VII. Blackie & Son; London, Glasgow, Edinburgh, and Dublin, 1890.

THIS forms the concluding volume of this excellent little Cyclopaedia, and we must congratulate the publishers and the editor on the punctual manner in which the successive volumes have been issued, a merit which is unfortunately very rare in the case of works of this kind brought out in a series of succeeding parts. Among the subjects in the eighth volume there are not many that come within our scope, but "Theodolite" and "Theatre" are both fairly treated according to the limits imposed by the scale of the dictionary, the latter article including some general information on the Greek theatre, with a small engraving of the theatre of Segesta restored.

Speaking generally, Dr. Annandale has done his work admirably, and the Cyclopaedia is a very useful one in a small compass. The maps are a most useful addition, and the indications of pronunciation of words are given on a clear and intelligible system. We have never opened the book for information on any subject on which a work on that scale should give information, without finding it; and we have found information sometimes which is wanting in larger and more ambitious works.

*Surveying and Levelling Instruments.* By W.F. STANLEY. London: E. & F. N. Spon. 1890.

FEW can write with such experience on the construction of surveying and levelling instruments as Mr. Stanley. The book now published by him, which is intended to be the complement to a former work, by the same author, on drawing-instruments, six editions of which have been called for, describes both theoretically and practically all the instruments that are generally used by civil engineers and surveyors, from a 2-ft. rule to a 36-in. theodolite; and a typical example of each class is examined in detail, frequent reference being made to the many excellent illustrations, in order to make the subject as clear as possible.

To render the work quite complete it was thought necessary to give briefly the manner of using many instruments in practical surveying, as well as explaining those optical principles upon which many of the instruments depend; consequently, the book will be found of value in this respect to those who are in the habit of using the instruments described by the author.

*Quantity Surveyors' Tables and Diary.* Revised and re-written by a Fellow of the Surveyors' Institution. London: Metchim & Son. 1891.

THIS is a small diary of a convenient size and shape, containing a number of pages of facts for reference; extracts from the Metropolitan Building Act, data as to materials and measurements &c. It seems to be well done as far as the contents go; the copy sent to us has only a paper cover, which would soon be worn out in the pocket; possibly it is also published in a more durable cover.

#### German Architectural Publications.

AMONG the long list of German architectural publications which have been brought out in the course of the year we find several interesting ones in the form of sets of photo-lithographs, partly of subjects already well known through measured drawings.

Among the former sets we must count two publications by Professor H. Strack, of Berlin, whose carefully-compiled volume of December, 1889, on "Italian Brick Buildings" (Gothic and Renaissance periods), comprising fifty excellently reproduced plates, together with a number of illustrations in the text, has been much commended by archaeologists, architects, and art-critics abroad. These two publications are:—(1) "Baudenkmaeler Roms des XV.-XIX. Jahrhundert," as an extension to Letarouilly's "Édifices de Rome Moderne," and (2) "Baudenkmaeler des alten Rom," both consisting of a series of very fine views reproduced from photographs, and showing both detail and general effect very clearly.

Among illustrative works on subjects not so well known as the former is the set compiled by

M. Junghindl, "Die Baukunst Spaniens," embracing the more important Spanish monuments of the Moorish, Romanesque, Gothic, and Renaissance periods, and forming a six-volume publication, with 150 folio illustrations. Another such publication on the monuments of Portugal is also in course of preparation, and promises to be quite up to the average standard.

Of the photo-lithographic sets, treating of quite modern work, H. Kneckwardt's "Berliner Neubauten" (vol. 1, 20 sheets folio) ought to be mentioned, the choice of subjects having been carefully made, whilst the reproduction has been done in a first-class style; and another set, published in Vienna under the title, "Moderne Wiener Barockfacaden" (30 sheets folio), might as well be referred to as a very similar work.

The Post Office London Directory, 1891, London: Kelly & Co., Great Queen-street, W.C.

THIS is, it appears from the title-page, the ninety-second annual issue of a truly indispensable publication. The present edition testifies more than ever (if further testimony were needed) to the unflagging enterprise and unceasing energy of the publishers. The book has again slightly increased in size, this year's issue consisting of 2,849 pages as against 2,706 pages in the issue for 1890. But the principal event connected with the present edition is the reduction in the price from 32s. 6d. to 25s. to subscribers, and from 40s. to 32s. to non-subscribers. This material reduction in price should, and no doubt will, lead to an increased demand for the Directory, the usefulness of which is commensurate with its bulkiness. Another proof of the enterprise of the publishers is given by the issue with the Directory of an entirely new map of London on a somewhat larger scale than that used in recent years, —viz., 4 in. to the mile instead of about 3 in. to the mile. The result of this is that the new map is very much clearer to read than the old ones; but *per contra*, it must be pointed out that inasmuch as the size of the map as a whole is very little larger than that of last year's issue, it does not take in so much of the suburban districts as the old map did. To have made the new map on the enlarged scale cover as much ground as the old map would, however, have been attended with the disadvantage of making it somewhat unwieldy in size; while the disadvantage (if such it be) of excluding some portions of the suburbs is more than compensated for, in our opinion, by the enlargement of the scale of the map, which, as it is, extends from Shepherd's Bush and Hammer-smith in the west, to Stratford and Blackwall in the east, and from Highgate and Holloway in the north, to Brixton and Camberwell in the south,—that is to say, the map covers an area of about ten miles long by nearly seven miles broad. This will be found sufficient for all practical purposes of business, especially when it is remembered that for the suburban districts Messrs. Kelly & Co. publish a separate directory. On the whole, the change in the map is very decidedly for the better. There are one or two errors in it, however. For instance, the piece of ground officially known as Myatt's Fields, Camberwell, presented two years ago to London by Mr. Minett, a builder, is figured on the map as "Camberwell Park." But "Camberwell Park" is the name which was given many years ago to, and which is still retained (*malgré* the new map) by the much smaller piece of ground formerly known as Camberwell Green, at the foot of Denmark-hill. Again, the way in which "Marshalsea-road" (the new street from Southwark Bridge-road to the Borough, opposite Great Dover-street) is shown is not quite accurate. As to the Directory itself, every effort appears to have been made to post it close up to date. For example, the name of Mr. Wm. Beckett, late M.P. for the Bassett-lay Division of Nottinghamshire, whose lamentable death on the South-Western Railway was mentioned in the papers for November 25, has been struck out of "Parliamentary" pp. 2,515 and 2,528, "Court," p. 2,289, and "Banking," p. 2,753. Again, the name of Sir Edward E. Kay, Lord Justice of Appeal, sworn of the Privy Council, gazetted November 25, appears in the list of Privy Councillors, p. 73.

CHRISTMAS WEEK.—The Builder for next week will be published on Wednesday morning. All communications for the Editor must reach the office by Tuesday morning.

Correspondence.

To the Editor of THE BUILDER.

"DEATH TO IMPERFECT VENTILATORS."

SIR,—On page 465, Mr. J. Simmance asserts that he has never mentioned the use of his ventilator with valve in it for soil-pipe ventilation. Now, I beg to ask, then, who it is that is responsible for the issuing of the illustrated circular showing two valve ventilators, with the words above them:—"Sugg's New Patent Continuous Up-draught Ventilators, Sugg's & Simmance's Patents," and underneath the diagrams, "For ventilating Soil-pipes?"

This circular purports to be issued by "William Sugg & Co.," with which firm Mr. Simmance is connected, and I have every reason to believe that he is the "Simmance" mentioned in the circular.

Further, in the columns of various contemporary journals this valve ventilator has been illustrated, and at the same time it is stated that it may be applied "also for ventilating soil-pipes, one being put upon the soil-pipe at Messrs. Sugg's works in Regency-street, Westminster."

As to the assertion that exit valves may be used to advantage upon soil-pipes, that may be possible under certain circumstances, but in ordinary plumbing the use of either my balanced hinged-valve ventilator, or Mr. Simmance's form of such, or his disc-valve one either, upon the top of the ventilating pipes of soil-pipes, is a mistake.

For Mr. Simmance to state that, with a "radical deviation" from ordinary plumbing practice, valve ventilators may be used, goes for nothing when no advantage from the change is pointed out.

Mr. Simmance asserts I never invented a closely-fitting valve like his. Now, his (?) balanced hinged-valve is similar to one of those illustrated in my patents of A.D. 1878 and 1883. The latter shows a small pipe for carrying off water, as Mr. Simmance also has. Having given the dates of my patents, I now again ask Mr. Simmance to tell us the No. and date of his two patents. I have repeatedly asked this information both publicly and privately from both Mr. Simmance and Messrs. Sugg & Co., but have never got it. Neither can my patent agents discover evidence of the existence of such. Why is this, if proper patents really exist? The use of a hinged balanced valve inside an outlet ventilator is now public property, but in calm weather it is a great hindrance to the ventilation.

W. P. BUCHAN.

SIR,—I notice in your issue of to-day that Mr. J. F. Simmance denies that he ever advocated the use of valves in such a manner as to produce siphonage, or that he ever mentioned soil-pipe ventilation in connexion with any valve.

Might I draw Mr. Simmance's attention to the circular issued by Messrs. Wm. Sugg & Co., Limited, illustrating the particular ventilator, with valve arrangement referred to.

The latter, as you say, is for ventilating soil-pipes, drains, &c., and among the advantages claimed for it, is that "it is fitted with a new patent automatic float-valve."

I presume that as joint patentee with Mr. Sugg, Mr. Simmance must be held responsible for this circular, and his name is duly printed thereon.

I express no opinion on the correspondence, but where a simple matter of fact is concerned, I think this should not be allowed to pass unchallenged.

JAMES CHALMERS, I.A., Architect.

Glasgow, December 13.

REMAINS OF ST. MARY'S ABBEY, ISLE OF WIGHT.

SIR,—With the owner's permission I have started excavating the site of the Cistercian Abbey of St. Mary, at Quarr, in the Isle of Wight, on the lines laid down after a careful consideration of the "lay of the ground," and have, so far as I have gone, met with complete success. The ground has not, I believe, been broken since the reign of James I., when Sir John Oglander assayed a haphazard excavation with complete failure of result. The abbey was bought soon after the "Dissolution" by a Southampton merchant named Mills, who, in the most vandalic manner, pulled down this monument of religious piety, and sold the fragments for building material. Although the stones have, in many cases, been entirely removed, we have come upon, at an average depth of 4 ft., the concrete had on which they lay. The foundations at present discovered appear to be those of the great church, the chapter-house, the cellarium, the frater, the docto, the kitchen, the calcatorium, and the infirmary. The cloister apparently was of considerable size, 130 ft. by 120 ft.; and a lady chapel will, I expect, be found to the east of the great church. The enclosing walls of the monastery comprised an area of nearly forty acres, and are, more or less, still *in situ*. The ground, unfortunately, has for many years been used for farm purposes, which makes exploration a somewhat difficult matter.

So far the cost of excavating has been defrayed out of my own pocket, but, finding so much as we have done, it becomes an imperative necessity to

progress further, which intention I shall be compelled to abandon unless I can succeed in securing outside help, as the cost will be too great, I fear, for a "private purse." I sincerely trust that those interested in the history of the past will not allow a work of so important an archaeological nature to fall to the ground for want of funds.

PERCY G. STONE,  
To whom all communications can be addressed,  
16, Great Marlborough-street, W.

ALTAR-TABLES.

SIR,—In Nequis church, Flintshire, is an altar-table of the character mentioned by your correspondent, "T. R. S.," [p. 465, ante]. The two legs at one end, intended to be placed towards the congregation, are square in section, with richly-carved patterns on the flat surfaces, the ground of the panels being sunk. The top and bottom rails are carved in the same manner. Below the top rail, at this, the "show" end, is a second, thinner, deep rail, cut to a semi-circular, arched form, with surface-carving following the arch, with further carving in the spandrels between this and the top rail. The opposite end of the table has legs square and plain at the top and bottom, the middle part being turned and fluted. The top rails at this end and at the sides are carved, with small, plain brackets beneath, next the legs.

As the table now stands, altar-wise, the front shows legs of different pattern at the opposite ends. The work dates from the early part of the seventeenth century.

The Student's Column.

HOT-WATER SUPPLY FOR BATHS, LAVATORIES, &c.—XXV.

LOW-PRESSURE BOILERS, ALSO FITTING HIGH-PRESSURE BOILERS FOR TEMPORARY LOW-PRESSURE WORK.

BOILERS that have to supply water upon or below their own level only are commonly designated "low-pressure" boilers in contradistinction to those that are called high-pressure and have to supply water to the floors above. These boilers partake of infinite variety in shape, and they are constructed of a great variety of materials, as not only can we have them of welded wrought-iron and copper, but also in cast-iron, and galvanised wrought-sheet.

Cooking-ranges that have but one oven are usually fitted with a boiler at the opposite side of the fire, this boiler being generally of cast-iron, having an open top with a loose cover, and being of the shape and size that the manufacturer considers most suitable for the purpose to which it is adapted. Of all materials common cast-iron is the most unreliable, as nearly everyone knows, owing to its liability to crack if suddenly or unequally cooled at any time; the next best material is galvanised sheet-iron, but this has a disadvantage in its being apt to laminate, that is, peel or flake, from which it soon perishes, and, although it is not likely to crack, its failure will occur almost as soon as the former material, although it will not be so sudden. A more reliable material is a good quality of soft cast-iron, this material making excellent boilers; and range-makers who use this metal have but a small demand for new boilers, as only the greatest neglect will bring about a fracture. Next in lasting properties is welded wrought-iron; this is given to lamination, although not to the extent of sheet iron, and, even if it were, its life would still be a long one, as they cannot very well be made of a less thickness of plate than ½ in. Last and highest in the scale of excellence is copper; this is necessarily costly, but gives the best results, although if made of very thin sheet it will not do much better than some of the others. The materials that permit of general use, and which are generally satisfactory, may be said to be the good quality cast and the welded wrought irons.

When any of these boilers require renewing, a most difficult task commonly presents itself, as no means are provided for removal and replacement without dismantling the range, occasioning sometimes eight to twelve hours' work more than there need be, and the cost is, of course, proportionately increased, both in labour and material, whereas the work charge should never exceed a matter of shillings, if suitable provision is made. Every range-maker knows that new boilers are needed sometimes, and it is the most simple thing imaginable to make the provision, as, instead of having the

boiler screwed on to the hot-plate itself, there should be a loose panel to which the boiler can be attached, so that by removing the tap (and the union, if it is connected to a self-filling apparatus) the boiler can be lifted right out, as fig. 66.

FIG. 66.

The best method of preserving the life of these boilers is to have a self-filling apparatus fitted up and attached to them, so that their being supplied with water is not dependent upon the attention of servants, for, even with the most careful, forgetfulness must sometimes occur; and, if not forgotten, the boiler is not always kept *quite* full, which leaves the part which experiences the greatest heat, viz., one side at the top, without any water behind to protect it.

In fitting up a self-filling apparatus, or when connecting an existing apparatus to a new range, there is a most serious error commonly perpetrated in not allowing the boiler to fill sufficiently; it is quite the usual practice for workmen to regulate the ball-valve so that the boiler fills up within about 3 to 4 in. of the top, and this leaves totally unprotected the upper portion of the boiler where the flame and heat impinges with the greatest intensity, and the result is that a new boiler is needed much too soon. The average workman's argument in favour of this is that "room must be left for boiling," and further that the steam which rises from the water when it boils will serve to protect the metal the same as water. Both these arguments are quite wrong, as in the first place the difference in bulk between cold and very hot water is only about one in sixteen, so that  $\frac{3}{4}$  in. is sufficient room for expansion, but to allow for ebullition as well it is best to regulate the ball-valve so that the water fills up to from 1 in. to 1 1/2 in. of the top (when cold), this will be ample, as the water in these boilers never boils very furiously. Steam will not protect the iron, as, while it is at a high temperature, it is a gas without appreciable moisture.

FIG. 67.

Fig. 67 shows (in sectional elevation) a boiler fitted with a self-filling apparatus in an ordinary approved manner, and the flame passing from the fire is also shown impinging directly upon the upper part of the boiler side, as just explained, and where it is so necessary that there should be water.

One of the most common complaints a range-maker has is of peculiar character; although an explanation will make it quite clear to any one, yet strange to say, only a small minority of our range-fitters know the simple means of remedying the trouble. The complaint in question is that the "boiler won't heat," meaning, of course, that the water in the boiler does not get hot as it should do; now, this complaint may be correctly stated in some instances, but as it occurs

with the greatest frequency with quite new ranges, it is obvious that there is some special cause for it.

A more accurate description of the fault will be found in the majority of cases to be "that there is hot water in the boiler, but it will not flow out at the tap," and it is sometimes described in this way by the person who complains.

It will be noticed in the preceding illustration that the cold-supply service is connected into the side of the boiler near the bottom, and this is strictly correct, but it will be noticed that the tap is also at the bottom of the boiler, generally within a very short distance of where the cold water enters. The action that takes place when a tap is opened is that the contents of the boiler nearest the bottom commence to flow out, and at the same instant cold water commences to flow in; now, as the cold water is heavier than the hot that may be in the boiler, it will be found that a steady flow will set in from the cold-supply pipe to the tap across the bottom, hardly disturbing the heated water above, and unless remedied in the way about to be described there will be no means of getting the hot water out unless we stop the inflow of cold each time the tap is opened, or else ladle the water out at the top of the boiler.

There is, fortunately, a very simple means of remedying this, as all we have to bear in mind is (as already explained on two or three occasions) that the hot water, whether there be much or little, will be found at the top of the container. Therefore with all boilers that are self-filling, the tap should be inserted within three or four inches of the top, when the range is first made; or, with ranges already made, the difficulty can be overcome by attaching an elbow and short piece of pipe to the end of the tap, standing up *inside* the boiler, as shown at fig. 68. The elbow and pipe simply require to be screwed on tightly; these joints need not be perfectly water-tight, and it is the easiest remedy imaginable, except with  $\frac{3}{4}$  in. cocks, as

FIG. 68. FIG. 69.

we cannot get iron elbows and pipe of this size. This tap needs an elbow specially made for the purpose, or a  $\frac{3}{4}$  in. one can be used by soldering it on to the back-nut of the cock, as fig. 69, or a piece of lead pipe, if properly secured, will answer.

The stand-pipe should terminate at top, about four inches below the water level, as we must allow for the water issuing from the tap in greater quantity than it comes from the ball-valve.

#### OBITUARY.

SIR EDGAR BOEHM, R.A.—We regret to announce that Sir Edgar Boehm died suddenly on the evening of the 12th inst., while working in his studio in the Fulham road. Shortly before six o'clock he was found in a dying condition, and when medical assistance was obtained he was discovered to be dead. It is stated that Sir Edgar was seen about an hour earlier by one of the attendants at the studio, and he then appeared to be in his usual health. He was born in Vienna on July 6, 1834, of Hungarian parents, his father being Director of the Mint in the Austrian Empire. He was educated in Vienna, and from 1848 to 1851 in England. He also studied in Italy, and for three years in Paris, and in 1852 settled permanently in England. Here he speedily obtained work, and, having been fortunate enough to obtain the patronage of the Queen, soon had as many commissions as it was possible for him to execute. A complete list of his works would be a long one, but among them we may mention his statues of Thomas Carlyle and of William Tyndale (the first translator of the Bible into English), which are placed on the Thames Embankment. Sir Edgar also executed the equestrian figure of the Duke of Wellington, which has replaced at Hyde-park-corner the one by Wyatt, which was transferred to Aldershot. He became an Associate of the Royal Academy in 1878, and an Academician in 1882, and a baronetcy was conferred upon him in 1889. Sir Edgar married, in

1861, Louisa, only daughter of Mr. F. L. Boteler, who died a few months ago. His remains are to be interred in the crypt of St. Paul's Cathedral this Saturday, the 20th inst.

MR. P. HORSMAN.—The death is announced of Mr. Philip Horsman, which took place on the 14th inst., at Wolverhampton. According to the *Wolverhampton Chronicle*, Mr. Horsman went to Wolverhampton about the year 1854, and carried on business as a stone-mason. He secured a number of large contracts for buildings in and about Wolverhampton, and in time established a thriving business as a builder. He erected, at his own cost, and gave gratis to the town of Wolverhampton, the Art Gallery in Lichfield-street.

#### GENERAL BUILDING NEWS.

WHALTON PARISH CHURCH.—The chancel of this ancient and interesting parish church has been restored. The works include the provision of marble pavement and steps, carved oak screens, choir-seats, and altar-rails. The east window has been raised 2 ft. higher in the wall, thus giving space for a dossal with side hangings. A part of the old plaster has been removed from the south wall, laying bare the traces of an ancient low-side window, close to the east wall, and ancient sedilia which had been destroyed and walled up apparently in the fifteenth century, a piscina and a font, and a table combined taking the place of the sedilia, with an alms-house. In raising the modern east window, it was found that the inside arch was made of a large grave slab, with a floriated cross and sword incised upon it. This had been cut away to give it an arched form, and the incised cross covered with plaster. The marble pavement, of Crostley, Sicilian, and Siena marbles, was supplied and laid by Messrs. Entley & Sons, Newcastle. The oak work was made by Mr. Ralph Hedley, of Newcastle; the contractors for the alterations of floors and east window were Messrs. Carse & Sons, of Amble; and the whole of the work was carried out from the designs of Messrs. Hicks & Charlewood, architects, of Newcastle.

MOVING A NEW MARKET AT BARRY.—On the 11th inst. new market buildings at Barry were formally opened by Mr. D. T. Alexander. The buildings have frontages to Barry Dock-road, West-street, and High-street. The premises just completed form part of a larger scheme which has for its object the erection of market buildings, 166 ft. in length by 74 ft. in width. The portion of the scheme now completed comprises a market-hall, 74 ft. in length by 40 ft. in width. Shops are arranged on both sides and at the front of the hall. The internal portions of the walling to the hall are faced with red brick, and are divided into bays on one side, with pilasters and arches over, with windows in the centre of each bay lighting the rooms over the shops. The light to the market is principally obtained from glass in the apex of the roof and clerestory windows. The ceiling has been boarded with match-boarding. The height is 33 ft. to the springing of the roof, and 48 ft. to the apex. The central hall has been arranged so as to be available for concerts, &c. The interior will be warmed with hot-water pipes by Mr. E. Hampton, of Abercromby. The style of architecture adopted has been "Queen Anne," freely treated with moulded cornices, string-courses, &c., the walling being faced with red brick relieved with Bath stone. The work has been carried out by Messrs. C. Shepherd & Son, of Cardiff, at a cost of £,972*l.*, under designs by and under the superintendence of Messrs. W. G. Habershon & Fawcett, of London.

NEW SCHOOLS, HEATON MOOR.—On the 13th inst., the new church schools of St. Paul's, Heaton Moor, were formally opened by Lady Egerton. The total estimated cost of the building is 2,000*l.* The schools, which have been erected by Messrs. Neill & Sons, according to the design of Messrs. Darbyshire & Smith, of Manchester, have a frontage to St. Paul's-road. The plan consists on the ground floor of two rooms 60 ft. by 22 ft. and 30 ft. by 24 ft., and having a class-room on either side 18 ft. by 16 ft. In the basement is provided a kitchen, and also heating apparatus chamber and coal cellar. The schoolrooms are heated by a series of hot-water piping, with valves to shut off various portions of the building as required. The walls are lined with enamelled bricks to a height of 4 ft. The roof timbers where seen, and inside doors and finishings are of pitch pine, and the entrance floors are tiled. Buff terra-cotta, manufactured by Mr. J. C. Edwards, of Runcorn, has been used for the window jambs, leads, sills, and other dressings in lieu of stone. Buff bricks have been used for all external faces of the buildings. The roofs are covered with Westmorland green slates from the Massingford quarries. An open turret is fixed on the front roof to be used as a ventilating shaft and heltry.

PROPOSED NEW HOSPITAL FOR WALSLEND.—The erection of an infectious diseases hospital in the neighbourhood of Walslend has for some time engaged the attention of the local authorities in that district. The *locality* of the proposed hospital is about half a mile from Walslend, and distant some 300 yards from any habitation. The new building will be flanked on the west and south by a deep ravine, known on Tyne-side as the Burn Closes.

**NEW INDUSTRIAL SCHOOLS AT SHUSTOKE.**—The new industrial schools of the Birmingham Corporation at Shustoke have been inspected by the Industrial Schools Committee. The new buildings have been approved by the Home Office, and erected from the plans of Mr. Daniel Arkell, architect, Birmingham, by Mr. W. Hopkins, builder, Birmingham. The new schools consist of an assembly hall, 35 ft. by 70 ft., with a recessed platform at one end. At each side of the platform are provided a table, and a room above to be used as a library. The upper portion of the walls of the hall is faced with red pressed bricks, and a glazed brick dado in different colours. The floor is paved with wood blocks. The whole of the rooms are heated by means of hot-water pipes carried from the heating apparatus in the basement. The exterior of the building is treated in the Renaissance style of architecture. The roof is surmounted by a clock tower. The other extensions comprise a new swimming bath, lined with white glazed bricks, with the dressing-rooms adjoining. There are also a new dormitory for the officers, and a general room. The lavatory contains fifty basins on slate tops, supplied with hot and cold water. The walls of the interior are lined with white glazed bricks, and the floor is of Victoria concrete. The whole is lighted by a lantern roof, with provision for ventilation. A new playground is provided for the boys adjoining the schools. The new washhouse is arranged so as to be in close proximity to the stores and garages, with the coal stores adjoining. The washhouse has been extended, and a new fire-proof staircase provided. A new glass-covered way is provided at the one side of the quadrangle so as to connect the laundry, washhouse, bakehouse, kitchen, &c., with the administrative department.

**CEMETERY CHAPEL, SCOTFORTH.**—Part of a new cemetery for Scotforth, Lancashire, was on the 12th inst. consecrated by the Bishop of Manchester. A small mortuary chapel has been erected near the entrance at a cost of about 500l., the works being carried out from designs by and under the supervision of Mr. E. Howard Dawson, A.R.I.B.A., of Lancaster.

**ST. MARY'S PARISH, CRUMPSALL, MANCHESTER.** is being provided with a commodious building, to be known as St. Mary's Hall, which is to be used as a Sunday School and for other parochial purposes. The cost of erection will be about 2,000l. The architect is Mr. Thomas Muirhead, of Manchester.

**PROPOSED WORKMEN'S DWELLINGS ON THE BIRMINGHAM SEWAGE-FARM.**—Major-General C. Phips Carey, R.E., one of the Inspectors of the Local Government Board, recently held an inquiry at the Council House, Birmingham, into an application by the Birmingham Tame and Lea Drainage Board for permission to borrow a sum of 3,250l. for the purpose of erecting twenty workmen's cottages on the Sewage-farm, and providing the same with an efficient water supply. The Town Clerk explained that a large number of workmen were employed on the sewage-farm, and as there were few dwelling houses in the immediate neighbourhood, some of the workmen had to walk as much as two miles to and from their work. To remedy this inconvenience the Board proposed to erect twenty cottages, in two blocks, at an average cost of 150l. per house, each to consist of three downstairs and three upstairs rooms, with ample modern sanitary arrangements. The well-water on the farm was bad, and it was proposed to connect the cottages with the water mains of the Birmingham Corporation, which passed near, at an estimated cost of 250l.—The City Surveyor produced plans of the proposed cottages, and gave particulars of the area, means of ventilation, &c.—The Inspector promised to use his influence in the direction requested.

**PROPOSED NEW BATHS AT STOCKTON.**—On the 10th inst. Colonel Charles Henry Luard, R.E., one of the Inspectors of the Local Government Board, held an inquiry at the Town-hall, Stockton, with reference to the application of the Corporation to borrow 6,500l. for the purpose of reconstructing the baths and washhouses, and 1,000l. for the purchase of property for improving the means of ingress and egress from the Borough Hall. The Borough Engineer submitted plans showing the alterations, and explained the same to the Inspector. No one appeared to oppose the application.

**SANITARY AND ENGINEERING NEWS.**

**THE WATER SUPPLY OF LANELLY.**—A public meeting was held at the Athenaeum-hall, Lanely, on the 8th inst., for the purpose of supporting the Local Board in applying in the ensuing session of Parliament for powers to construct a storage and service reservoir (to cost about 60,000l.) in the Cromwell Valley. Mr. Joseph Maybery presided. A Resolution was passed, the Chairman moved, "That this meeting approve of the Local Board proposing a Bill in the ensuing session for the construction of a storage and service reservoir at Cromwell." A vote was taken, and the motion was unanimously carried.

**SEWERAGE AND SEWAGE DISPOSAL: KNAREBOROUGH (YORKSHIRE).**—At a special meeting of the Knareborough and Tentergate Improvement

Commissioners and Local Board of Health, held a few days since in the Town-hall, Knareborough, Mr. B. T. Woodd, J.P. (chairman), presiding, Mr. D. Balfour, M.L.S.C.E., F.G.S., civil engineer, Newcastle-on-Tyne, presented plans and estimates for a scheme of main sewerage and sewage disposal for the town of Knareborough, which the Board agreed unanimously to adopt. The scheme shows two main outfall sewers, one for the east part of the town, by Chain-lane; and the other for the west part, along the side of the River Nidd, joining together at Grinbald Bridge, thence to the land for sewage disposal at the Haugh's farm, lower down the river, where the sewage will be purified by the process of intermittent land filtration, without the use of any chemicals whatever, sufficient and suitable land being there available. The scheme is being carried out to avoid the impending injunction by Lady Hewley's trustees for polluting the Frognare Dike, which passes through the Haya Park estate before reaching the River Nidd.

**KNAREBOROUGH SEWERAGE AND SEWAGE DISPOSAL.**—The drainage of the district is just now engaging the attention of the Local Board, who have under consideration a scheme of sewerage and sewage disposal, prepared by their Surveyor, Mr. Heward. It has been referred to Mr. G. E. Bruges, A.M.I.C.E., of Westminster, who, we understand, has reported favourably to its adoption, subject to certain modifications recommended.

**STREETS DISTRICTION.**—The Banbury Town Council are about to erect a steam distillery at their Infectious Hospital, and have authorised the Borough Surveyor to visit Manchester and report upon one offered by Messrs. Bradford & Co., of Salford Iron Works.

**STAINED GLASS AND DECORATION.**

**MEMORIAL WINDOW, EXETER CATHEDRAL.**—A memorial window to the late Earl of Devon has just been unveiled in Exeter Cathedral. The window, which has been placed in the north aisle, represents the vision of Jacob and other incidents in his life, and has been executed by Messrs. Clayton & Bell.

**MURAL TABLET, TIVERTON.**—A mural tablet of alabaster in memory of the late Mr. D. Powell has been placed behind the choir stalls at Tiverton Baptist Chapel. The tablet was executed by Mr. H. Hems, of Exeter.

**FOREIGN AND COLONIAL.**

**FRANCE.**—The Ledru-Rollin Convalescent Asylum for Women is to be built shortly at Fontenay-aux-Loises (Seine).—Doctor Didot, an old army surgeon, has erected at Livry-sur-Marne a large building for the reception of aged and infirm persons.—The Municipality of Chartres has acquired an electric clock which has replaced the old thirteenth century clock at the cathedral. The new cathedral clock is electrically connected with the Mairie, and in case of fire or any other cause an alarm can be sounded on the bell by an official at the Mairie.

**THE NATIONAL SOCIETY OF ANTIQUARIES OF FRANCE** has elected the following as officers and council for the ensuing year: President, M. Corroyer, the Inspecteur-Général des Edifices Diocésains; Vice-Presidents, the Comte de Lasteyrie and the Abbé Duchesne; Secretaries, the Comte de Rougé, and M. Fleuret.—It appears that it was incorrect or at all events premature to report that M. Foucart was re-appointed to the French School at Athens. He has, as was stated, an archaeological mission to Egypt, and to leave him free for this, M. Homolle has been appointed to the School.—The Egyptian Government has conferred the position of "Secrétaire-Général des Musées et Fouilles" on M. Hervé Basile, a connexion of M. Maspero.—A committee has been formed to raise, by public subscription, a monument to the poet Emile Deschamps, at Bourges, on the occasion of his centenary next year.—The following is a brief description of the monument erected from the designs of Barthelemy at Ville d'Avray, by the house in which Gambetta died: on an immense plinth of the red Alsace sand-stone is placed a pedestal of simple design carrying a statue of Gambetta, more than life size, standing and grasping the French standard. On the front of the pedestal is a bas-relief with two female figures representing Alsace and Lorraine, seated back to back with an "Autel de la Patrie" between them. The monument is framed within a kind of portico, a half-ellipse on plan, bearing as decorations the arms and the names of the principal towns of Alsace and Lorraine. At each extremity is a kind of pylon bearing the arms and devices of Strasbourg and Metz. The monument is placed on a terrace to which access is gained by a portico with a pediment adorned with emblems of the Republic. The monument has been erected by

public subscription in Alsace-Lorraine. There is some talk of bringing the remains of Gambetta from Nice to re-inter them by or beneath this monument.—It is stated that the Société des Architectes de la Seine Inférieure protest strongly against the project for connecting Paris with the sea, as they say the execution of it will interrupt the road communications of Rouen and will alter the whole valley of the Seine and destroy its picturesque effect.—The bringing to Paris of water from the Vigne and Vernueil necessitates the construction, in the park of Versailles, of a vast subterranean reservoir, access and aeration to which will be obtained by fourteen shafts, now being sunk. The Municipal Council of Paris has voted 300,000 francs for this operation.—The death is announced of M. Jean Edme Portuistot, architect, at the age of 55.

**BERLIN.**—The exhibition of designs for a memorial church to the deceased Emperor William I. has now been opened, and the Emperor's taste in awarding the first prize to "Baurath" Schwachten is being much criticised. The nine designs on exhibition give little cause for remark, excepting for the different ideas as to the essential requirements of a modern Lutheran place of worship. As to style, Romanesque in place of work-taste. According to the Budget, 1890-91, now before the Imperial "Reichstag," Berlin is to have two new military barracks, at a total cost of some 5,300,000 marks. A garrison steam-laundry is to be erected at a cost of some 350,000 marks.—In order to assist Berlin workmen wishing to live in the outer suburbs of the capital, the fares for artisans and labourers on the local trains are to be reduced to a minimum.—The theme for the annual Schinkel competition for 1892 has been decided on. The programme (made under the auspices of the Berlin "Architekten-Verein," and with the approval of the Government) requires candidates to send in designs for a "people's theatre" with some 3,000 seats placed amphitheatrically. The designs for the Schinkel competition, 1891, are now being handed in, and will be decided on in February next. The subject is a Royal Palace in the old Bellevue Park outside Berlin.—The work of completing and restoring the spire of St. Mary's Church, before alluded to, is to be placed in the hands of the City Architect, "Stadtbaurath" Hankenstein.—In reference to the International Art Exhibition, which will be held here next summer, we hear that the managing committee will lay special stress on having Spain well represented in their halls. A well-known German painter, F. Possart, has been sent to Madrid, on behalf of the committee, to see to their interests, and to make arrangements as to the easy transport of exhibits. We hear that the committee hopes to obtain the loan of several "old masters" from the Prado collection, which would have a special room given them in the Exhibition buildings.

**MISCELLANEOUS.**

**THE SANITARY INSTITUTE'S EXAMINATION FOR INSPECTORS OF NUISANCES.**—At an examination for Inspectors of Nuisances, held in London on December 4 and 5, by the Sanitary Institute, ninety-five candidates presented themselves. Questions were set to be answered in writing on the 4th, and the candidates were examined viva voce on the 5th. The following fifty-one candidates were certified to be competent, as regards their sanitary knowledge, to discharge the duties of Inspectors of Nuisances, viz., Messrs. T. O. Allen, T. W. Bailey, J. G. Banks, E. L. Bell, W. Johnson, St. A. R. Blackburn, H. Blackman, H. K. Blake, J. R. Blockley, F. J. Bostel, J. Budd, W. H. Burton, W. Butler, A. G. Cole, G. E. Coxill, W. R. Cronk, S. Cullum, T. H. Culver, A. I. Fairry, H. R. Folkin, R. Fisher, J. Goddard, J. Gough, M. Grice, W. H. Grigg, F. Hartool, A. Hennen, H. J. Jackson, R. Jewsbury, H. W. Johnson, St. Johnson, J. W. Kirk, G. Lewis, G. F. Liscombe, F. W. Mason, G. E. Merredow, R. E. Miners, G. T. Misselbrook, A. G. Moore, D. Nicholas, F. Nott, E. Osborn, J. Robinson, C. B. Rowney, M. E. Scott, W. H. Small, W. Stollery, T. F. Thomas, J. H. Till, J. Twiss, H. F. Webb, and T. V. Warrup.

**HARBOURS OF REFUGE.**—The German Government, which has of late years taken great interest in the safety and welfare of the fishing fleets on the North Sea, intends constructing a row of small harbours of refuge along the coast. Such harbour works have already been commenced at Norderey and Sassenitz (both popular German summer resorts), and designs for similar works at Hele and Berkum are on paper.

**PROPOSED TECHNICAL SCHOOL FOR WARRINGTON.**—A scheme has been drawn up for the establishment of a technical school at Warrington. It is proposed that the Museum and Library Committee of the Corporation shall take over the School of Art, and become responsible for science and art teaching in the borough in connexion with the free public library and museum, to establish a complete technical school for day and evening students, to be open to all classes of both sexes, and to establish scholarships of 10l. a year, with a free education for two years at least, open to both sexes.

Table with 5 columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, Tenders to be delivered, Date.

Those marked with an Asterisk (\*) are advertised in this Number. Competitions, p. iv. Contracts, pp. iv, and vi.

THE RAPID DESTRUCTION OF AMERICAN FORESTS.

We learn from a Government report on the forests of the United States that deforestation is going on rapidly. The chief drain upon the timber supply of the country is by the railways, about 73,000,000 cross-ties or sleepers being annually needed for the construction of new roads, or the repair of existing lines.

NORTH SEA AND BALTIC CANAL.—Of late the workmen employed in moving the upper layers of soil on the canal line have come upon a number of valuable relics of olden times, among which are some excellent examples of tools of the "Stone Period."

IMPROVEMENTS AT THE BRISTOL DOCKS.—The Bristol Docks Committee met on the 8th inst. at Avonmouth Dock, and on the spot considered some important proposals for the development of that dock.

THE ENGLISH IRON TRADE.—The English iron market continues depressed, and is likely to remain in that condition until the New Year has been well entered. There is very little demand for pig-iron, and when sales are made, they are of iron held in second hands, as makers, being still fairly well booked, keep up on the market.

LABOURERS' DWELLINGS, LIVERPOOL.

At the weekly meeting of the Insanitary Property Committee, held on the 12th inst., in the Municipal Offices, Liverpool, the question of providing cheap dwellings for the labourers who become dispossessed of their homes through the demolition of insanitary property was discussed at some length.

ROYAL METEOROLOGICAL SOCIETY.—The usual monthly meeting of this Society was held on Wednesday evening, the 17th inst., at the Institution of Civil Engineers 25, Great George-street, Westminster, Mr. H. F. Blanford, F.R.S., Vice-President, in the chair. The following papers were read:—1. "Note on a Lightning Stroke, presenting some features of interest," by Mr. R. H. Scott, F.R.S.

LIVERPOOL ENGINEERING SOCIETY.—The fourth meeting of this society for the present session was held at the Royal Institution, Colquhoun street, on Wednesday evening, the 10th inst., when the President, Mr. Ferdinand Hudleston, Assoc. M.Inst. C.E., being in the chair, after the usual routine business, Mr. Thomas L. Miller, Assoc. M.Inst. C.E., introduced a description of some refrigerating apparatus, which had been adopted under peculiar circumstances for the preservation of provisions at the mine gold mines in Peru.

RECENT PATENTS:

ABSTRACTS OF SPECIFICATIONS.

17,381.—SLIDING-SASHES: P. Beveridge.—The window, which is the subject of this patent, is made to open upwards to facilitate repairing and cleaning. In the left-hand pulley-stile are two dove-tailed grooves, one for each sash. On the back of each hinge is a dovetail block to slide in these grooves to keep the sashes in position when opened out for cleaning.

17,382.—IMPROVED NAIL: R. Brown.—According to this invention, a nail to be used chiefly for fixing battens is made with a shank of the same dimensions throughout instead of being tapered. The shank is of T, H, or V section, and when it is driven into an even wall will hold very firm and tight.

17,383.—THEATRE DOORS: H. Held.—Counter-balanced by weights connected by strings who ropes, all the doors are made up at once when desired, to prevent panic or danger.

6,800.—WINDOW-SASH FASTENER: J. Lacey.—This invention comprises a lever, and extension formed with a curved edge eccentric to the axis, about which the lever can turn. A hook projection is applied to the other window-sash or part to be secured. The extension engages with the lever in turn.

15,678.—PLASTERING COMPOSITIONS: W. A. Robinson and J. Y. Terry (U. S. A.).—These compositions are stated to consist of several novel ingredients, and this comprising therewith of sawdust saturated with a solution of lime, alum, white lead and water, hair, sand, and plaster of Paris and glue, with water in sufficient quantities to make it pliable.

NEW APPLICATIONS FOR LETTERS PATENT.

December 1.—19,514, W. Tinsdale, Fastener for Cupboards and other Doors.—19,534, J. Lupton, Firegrates.—19,537, J. Thompson, Ventilators.—19,539, W. Thompson, Building Structures.—19,594, G. Boisselier, Mosaic Tiles, &c.

December 2.—19,699.—T. Beech and H. Dixon.—Automatically supply fuel to kins, brick ovens, &c.—19,695, G. Abernethy, Draught Excluders for Windows, Doors, &c.—19,618, M. Wadsworth, Boring, Bushing, Reaming, and Slotting Wood.—19,646, R. Gardner, Sash Balances.—19,646, Smith and J. Hunt, Metallic Cement.—19,654, A. Booth, Sewing Machines.

December 3.—19,687, C. Morrill, Saw Sets.—19,712, J. Baily, Locks.—19,741, W. Press, Cowl, &c.—December 4.—19,763, D. Baker, Closets and Fixings.

December 6.—19,836, J. Beddow, Reversible Locks and Latches for Doors and Gates.—19,841, G. Harrison, Branch Traps.—19,842, W. Savage and J. Grubb, Ropes for Ceilings and Wall Conduits for Electrical Conductors.—19,871, W. Bryan, Water Waste Preventer.

December 6.—19,892, J. Burdon, Ventilating Gratings.—19,897, J. Smith, J. Wilson, Plaster.—18,974, A. Bohme, Serrated Stones or Bricks for Floors, Sills, Ceilings, &c.

PROVISIONAL SPECIFICATIONS ACCEPTED.

17,294, W. Press, Window Sash-fastener.—17,652, J. Parker, Windows.—17,668, J. Clarkson, Sash-pullies for Windows.—18,486, A. Louis, Air-heating Stoves and Fireplaces.—18,519, J. Wilson, Plaster.—18,574, A. Drummond, Glazing Structures.—18,672, E. Ward, Joining the ends of Pipes.—18,768, A. Smith, Exhaust Ventilator and Chimney-pot.—18,805, W. Forster, Door-fastener.

LONDON.—For road-making and paving works, in Lettice-street, Crossham-road, for the Fisham Vestry, Mr. W. Sykes, New Street Surveyor, Town-hall, Walham-green.—

Table with columns for contractor names and amounts. Includes entries for Barton-street, Greenham, Crossham-road, Lettice-street, and Wilson-street.

LONDON.—For kerbing, paving, and road-making, Putnam Park, Southam, for the Lewisham Board of Works, Mr. John Irvine, Surveyor, Board of Works Office, Catford, S.E.—

LONDON.—For erecting three shops in Holborn-place, St. Pancras, for the Metropolitan District Railway, Mr. G. Ashby Lewis, architect, Edling.—

LONDON.—For the erection of towers and galleries, and the construction and fixing of seating to the Pasham-rye Tavern, for the Committee, Mr. W. H. Woodroffe, architect, 214, Great Dover-street, S.E.—

LONDON.—For retaining the church premises, Philpot-street, E., for the Military Mission to the Jews, Messrs. Alfred R. Pitt & Son, architects, 44, Brompton-square, W.C.—

LONDON.—For the erection of four shops in Walworth-road, S.E. Mr. Albert L. Guy, architect, Lewisham, S.E.—

LOXWOOD (Hants).—For alterations and repairs to the 'Air Roper' 'Thebarn' Inn, Loxwood, Sussex, Mr. William Buck, architect, Hornham.—

Table with columns for contractor names and amounts. Includes entries for Wadley & Son, Titterton, and King Bros.

MORDEN (Surrey).—For road-making and surface drains for new cemetery at Heald's Barn, for the Board for the Parish of St. Mary, Battersea, Mr. William C. Pook, surveyor, 62, Bellevue-road, Wandsworth Common, S.W.—

NORTHWICH.—For the erection of a new post-office and post-master's house.—

POTTERNEWTON (Hants, Leeds).—Accepted on schedule of prices for building two terraced houses, at Potternewton, for Mrs. Chas. D. Swale, Messrs. Swale & Mitchell, architects, 38, Albion-street, Leeds.—

RASTRICK.—Accepted for the erection of a new Board School, out-offices, &c., at Rastrick, Brighstone, Mr. B. Stocks, architect, 7, Union Bank-street, New-street, Huddersfield.—

SYDENHAM.—For the erection of three villa residences, Newland's-park, Sydenham, for Mr. H. Gaukroger, Mr. W. H. Woodroffe, architect, 214, Great Dover-street, S.E.—

THAMES DITTON.—For completing the building of a shop and two houses in Summer-road, Mr. A. G. Collins, architect, 22, Flushing-pavement, E.C.—

TORQUAY.—For supplying and fixing new steam and hot water pipes, fittings, &c., also the fitting of pipes, &c., of the bath, tubs, and skating rink, for the Local Board, Mr. Henry A. Garrett, Assoc. Inst. C.E., Surveyor to the Board, Town-hall, Torquay.—

WITTINGTON, Manchester.—For sewerage and training Didsbury Park, and road-making, Chorlton-cum-Harby, for the Wittington Local Board, Mr. A. H. Mountain, Surveyor, Local Board Office, Wittington, Manchester. Quantities by Mr. Mountain.—

SUBSCRIBERS IN LONDON AND THE SUBURBS, by prepaying at the Publishing Office, 10s. per annum (or 4s. 9d. per quarter), can ensure receiving 'The Builder' by Friday Morning's post.

TO CORRESPONDENTS. R. C. (we cannot publish your letter)—T. A. (shall be glad to hear from you at another time as you suggest)—G. H. H. and W. R. B. (amounts should be sent)—G. S. S. (letter)—J. & H. T. (too late)—W. B. C. (your communication is unsuitable).

TERMS OF SUBSCRIPTION. 'THE BUILDER' is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 10s. per annum in advance, for all parts of Europe, America, Australia, and New Zealand, 20s. per annum. To India, China, Ceylon, &c. 30s. per annum. Remittances payable to DOUGLAS FOULDRINE, Publisher, No. 46, Catherine-street, W.C.

THE BUILDER.—For sewerage and training Didsbury Park, and road-making, Chorlton-cum-Harby, for the Wittington Local Board, Mr. A. H. Mountain, Surveyor, Local Board Office, Wittington, Manchester. Quantities by Mr. Mountain.—

### The Evidence before the Westminster Abbey Commission.

**A**S we have already observed, a good deal of the evidence laid before the "Commission appointed to enquire into the present want of space for monuments in Westminster Abbey" is of considerable interest, though we have yet to learn the conclusion which the members of the Commission have deduced from it. That this conclusion, whenever it comes to be formulated and published, will be a rational and well-considered one is almost guaranteed by the composition of the Commission, which is a striking contrast in this respect to the Commission on Westminster Hall. We commented strongly, in speaking of that Commission, on the absurdity of appointing, to consider a difficult architectural question, a Committee of persons, the majority of whom were totally unacquainted with the subject, and were apparently appointed merely because they were respectable members of the House of Commons. Our comments aroused the wrath of the Chairman of that Commission, but they appear to have been not altogether without result, since we find that the next Commission appointed to consider a similar question, viz: that now sitting on the question of Westminster Abbey extension, though much smaller in numbers than the Westminster Hall one, consisting in fact of only six members besides the Secretary, includes among those six a very eminent archeologist (Sir Henry Layard), the President of the Royal Academy, and the President of the Institute of British Architects, besides the First Commissioner of Works and the Dean of Westminster, who have a kind of *ex officio* claim to sit on such a Committee. That is the kind of way in which a Commission on such a subject would ordinarily be constituted in Paris, but it is a new thing in London to find a Royal Commission on a matter concerning art constituted in so rational and suitable a manner. It is to be hoped that this will be established

as a precedent for future Commissions dealing with the same class of questions, and that the wording of the formal preamble, "reposing great trust and confidence in your knowledge and ability," will not again be such a farce as it may be said to have been in the case of the Westminster Hall Commission.

The subject as considered by the Commission so far, as indicated by the course of the evidence, resolves itself into several distinct questions: whether it is desired that Westminster Abbey should still be a place of burial for distinguished Englishmen; whether there is room for more interments and monuments in it; if not, how additional room should be provided; and whether any disturbance or removal of existing monuments is to be countenanced. This last consideration has an important practical bearing on the whole question. If it were to be ruled that some of the largest and what are now considered the most aesthetically obnoxious monuments were to be removed from the cathedral—those especially which were erected to persons whose fame was in reality by no means commensurate with the size of their sepulchres—of course the question of space would for a considerable time in advance be answered, the rather as we have now arrived at the point of perceiving that it is the beauty of artistic design rather than the size and mass of a monument that go to render it worthy of a great name. Upon this question, however, we have only one answer to give, and that most emphatically: no tampering with or removing of the existing monuments in the Abbey ought to be sanctioned or thought of for a moment, unless as a matter of absolute necessity—for getting an approach, for instance, to a proposed new chapel. It need hardly be said that we are as fully alive as any one can be to the esthetic defects of many of these monuments, and their architectural incongruity with the building in which they stand. But there are points of more importance in such a case than architectural fitness. Those monuments were admitted by former custodians of the Abbey as memorials to persons who hoped thereby to be remembered to posterity, and who, if not all gifted or famous, were probably in nearly all cases worthy of honourable memory. To remove them now would be

not only to impair the historical interest of the Abbey, but it would be to break faith with the past, and to set a precedent for the future that a monument in a sacred building has not the hallowed rights formerly supposed to be attached to it. The architect to the Abbey, we regret to say, appears not to be sufficiently impressed with this reverence due to the memorials of the dead of other ages, and wishes to remove some of the monuments for purely architectural reasons, and in order to make his restoration of the portions of the Gothic edifice which have been injured in the erection of the later monuments. If he could in removing the latter also replace the original Medieval work intact, there would be something more, perhaps, to be said for it; but he cannot do that, and his restoration will be of no value. That Mr. Pearson should be ready to do this will surprise no one after his treatment of the Apostles in the north transept window; but we are glad to see that other witnesses of weight pronounce most emphatically against any kind of meddling with the existing monuments. Mr. John Evans, in answer to the question whether he would object to such removal "even in the case of monuments to persons who are unknown and forgotten," answers "they are buried there, and if their memorials are there, I do not think we have any right to destroy them." Mr. F. H. Jeans, on the legal question, says that in his opinion the Dean and Chapter have no power to move any monument in the cathedral in opposition to those who are interested, *i.e.*, representatives of the family of the person to whom the monument was erected. The Archbishop of Canterbury goes into the subject largely in his evidence. He remarked that there was a loss of substantial sentiment if you once led people to think that the monuments were disturtable. Further on, speaking of the incongruity of styles among the monuments, he says:—

"I have not the slightest objection to the great variety. Well, one hideous monument has gone away from the Abbey, a monument which we all regarded as hideous, but the persons who put the monument there, the best critics and architects of their time, they did not think it hideous in their time, and a time may come when their view will come back. I do not think the historical sentiment should be interfered with, because there is in a

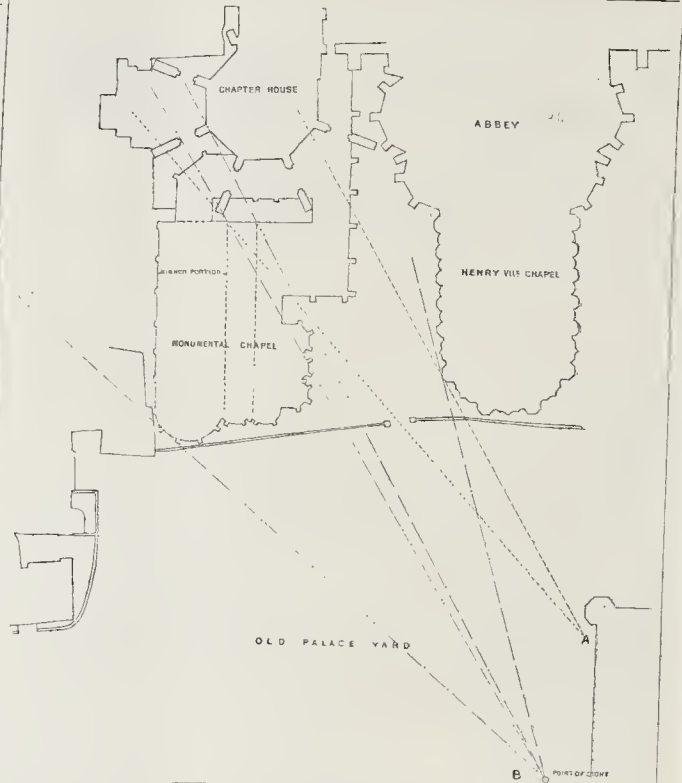

small part of such a vast building a hideous monument.

Mr. Somers Clarke expresses the same opinion, that people who were buried there have a right to remain there, and their descendants have a right to require that they should be undisturbed; and there is a significant little remark from the Dean, when the Chairman observed that the whole corner where the beautiful Fawcett memorial stands was overshadowed by the enormous monument to Captain Cornwall,—"That is the earliest monument erected at the national expense to a naval officer." Considering what the naval history of England has been, could any charge of ugliness or abnormal size in such a monument justify its removal?

One idea which crops up, we observe, is that if a new monumental chapel is built, some of the largest monuments might be moved into it partly to relieve the crowding in the existing building, partly,—as appears to be oddly suggested on one page of the report,—that they would give a kind of sanctity to the new chapel, start it as it were, or, as is still more irreverently said by another speaker, "act as decoy ducks." The very reverse would be the case. The mere commencement of such a proceeding would take away the whole feeling of historical continuity in regard to the Abbey monuments, and convert them into furniture to be shifted here and there as might be convenient.

The question whether it is really and generally desired in the future that men who have deserved well of their country should be given sepulture in the Abbey as a mark of honour comes almost outside the scope of the powers of a Royal Commission, and can only be decided by popular opinion at large. Recent events seem to show that the feeling is still as strong as ever; but on the other hand, it must be remembered that the right to Abbey sepulture is far more sparingly bestowed in the present day than in earlier times. The evidence of the Dean of Westminster on this subject is a most interesting piece of history, tracing back to the time when mere parochial juxtaposition gave a title to burial in the Abbey precincts, as in an ordinary parish church. The idea of the Abbey as a place of distinguished sepulture dates, however, a long way back. The fame of Poet's Corner, the Dean thinks, commenced from the probably accidental burial of Chaucer at that spot. Spenser was the first person buried in the Abbey as a distinguished poet, and on account of such distinction, and naturally he was laid near Chaucer, and so the poetical character of this part of the Abbey became established. Among other statements of interest in the Dean's evidence was that about the claim possessed by the family of the Percies, the Duke of Northumberland's family, to be buried in the Abbey, independently of the permission of the Dean. But the whole of this evidence forms a chapter of the greatest interest in regard to the past history of the Abbey, and renders the Blue-book containing it worth having on that account alone.

The evidence of Mr. Wright, the Clerk of Works to the Abbey, is in its way also a very curious document, in regard to the information it gives about former interments and the present subterranean state of the Abbey. Mr. Wright knows where all the dead lie for several generations back, apparently: all the known or renowned dead, at all events, and some of the unrenowned. His estimate is that there is now, with care, and if excavations may be made in the concrete of the north transept (on which he refers to Mr. Pearson's judgment), room for about seventy more burials within the Abbey itself. Mr. Pearson considers this estimate too large, because it includes burial in portions which are known to have been used for former interments, or two successive burials in the same superficies of ground. This is a merely sentimental objection of course, as in fact it matters nothing whether two coffins be divided laterally or vertically by intercepting earth; but it is a sentiment which many no

Sketch Plan of New Chapel adjoining Chapter House, as proposed by Mr. Pearson.

Sketch showing space occupied by New Chapel adjoining Chapter House, as proposed by Mr. Pearson.

doubt would feel, and we cannot call it an unreasonable one. The cloister garth was mentioned by Mr. Knowles, in his article in the *Nineteenth Century*, as a place where future interments could be made; but the evidence of Mr. Wright is to the effect that this has been nearly occupied by former interments already, though no precise details, as far as we have observed, are given as to this. We may conclude, however, from the evidence, that in the matter of interments alone the available space is now very limited. If we were to contemplate the adoption of monuments merely, the actual interment being elsewhere, we consider (in spite of Mr. Wright's opinion to the contrary) that Mr. Knowles' diagrams of the four cloister walls and their existing monuments show conclusively that there is space for a long time to come for monuments of this class on the cloister-walls; monuments which could be rendered important rather by artistic perfection than by size. One objection to this is that the cloister is

not the church; it is, however, very closely connected with it, and has at all events far more of the *genius loci* about it than any new monumental chapel could have for many generations to come. But monuments apart from interment will not, we believe, satisfy the acquired sentiment in regard to the Abbey. It is the exceptional honour of the remains being received into that time-hallowed temple which forms the essential element to be considered. The general adoption of the system of cremation would no doubt alter the conditions materially, and would make the cloister at all events a satisfactory expedient for many generations to come; but we are hardly as yet in a position to count on the general adoption of cremation within a short period.

The general conclusion therefore is that as neither interment without a monument, nor a monument without interment, would satisfy the present sentiment as to the Abbey as a mausoleum, if such a use of the Abbey is to be continued, the time must very shortly

Perspective View of Monumental Chapel proposed by Mr. Pearson on the Site of the Ancient Refectory.

come when an addition to the Abbey would be a condition of carrying on the practice. Now, if the question be merely the architectural one of adding to the Abbey without deforming it, the solution would not be a very difficult one. But that is not all. It is essential that any new portion added for this purpose should be as much as possible a part of the Abbey church. It is in the Abbey that people desire to see a great man receive the honour of sepulture, not in a new building only remotely connected with the great church. And this consideration seems at once to dispose of the plans which suggest a separate building at the eastern or south-eastern part of the church, approached by a passage round the chapter-house. Mr. Pearson has three different suggestions to make. The first is a chapel to the eastward of the chapter-house, for which two plans are suggested, one placing the chapel rather further south than the other. We give a reduced copy of the plan for the more northern one, and of the sketch showing the extent to which it would shut out the view of the Chapter-house from Old Palace-yard. The other plan shows the same chapel moved 25 ft. further south, the only advantage in this being that of leaving open a clearer view of the Chapter-house from the same point. It will be seen that Mr. Pearson gets rid of the intrusion of the Chapter-house buttresses into his chapel, making a passage under them. Architecturally we see no reason against this at all; the only objection to it is that it does not fulfil what we regard as the desideratum, that of intimate union with the Abbey church. It is out of the church, and places the monuments out of connexion with the

series within, and it would not be regarded as burial in the Abbey. The second scheme is to acquire and restore the remains of the Refectory, or rather to make a modern Gothic interior on the site of the Refectory, working in such of the old work as is left. The view of the proposed interior, of which a reduced reproduction is appended, shows in itself a very pleasing and suitable interior, and as a matter of sentiment it has the recommendation of being within the remains of a portion of the ancient buildings, and being approached from the church not by a new but by the old cloister. So far it is, as a matter of sentiment if not of fact, in closer connection with the Abbey than the proposed new chapel at the eastern end of the Abbey. There would be some practical difficulties as to the claims of Asburnham House in regard to light, &c.; but we do not attach very much importance to these matters, which could probably be arranged without much difficulty. There is still the objection, however, that the new place of tombs is out of the church, though as a building abutting on the ancient cloister, it may be considered as having a tolerably close connexion with the church.

The third scheme proposed by Mr. Pearson is that of a north aisle to the nave, abutting on the west side of the north transept, but stopping rather short of the west end of the nave, and with a projection northward on the block plan which looks like a large porch. No sketch is given of the proposed architectural treatment. There is also a modification of the addition on the north side, of which no plan is given. The two are described as follows in Mr. Pearson's evidence:—

"Referring, firstly, to the scheme on the north side, which seems to me to have the distinct ad-

vantage of affording a building which would be an integral portion of the structure, and to which the sentiment so strongly attaching to the Abbey would thus extend, I have made two alternative plans. One of these takes the form of an additional aisle to the nave, with chapels attached for the display of monuments and with communications leading to it from the west end of the nave and from the north transept. I have not the least doubt that such an aisle, well designed, in a style which would be distinct from the adjoining part of the Abbey without being out of harmony with it, would form a great addition to the general effect of the structure, both externally and internally.

It will be readily understood how well the recesses between the great buttresses and other recesses provided in the plan would lend themselves to the arrangement and display of monuments. It should be borne in mind, in considering an addition of this character, that nearly the whole of the stone work of the existing structure which would be enclosed by this aisle is a modern restoration, and not in the best character.

My second plan takes the form of a double cloister glazed on both sides, enclosing a garth with approaches from the Abbey similar to the previous scheme. The four sides towards the garth I propose to divide into chapels, by transverse walls, and the recesses formed by the great buttresses of the nave would also be available as before. I consider that the first of these two schemes would form a greater improvement to the Abbey than the second."

The second of these two schemes would probably be the one which would meet with the least opposition, and it would be architecturally the easiest to deal with. But it is a far less dignified scheme than the additional aisle, and moreover is, again, not so much an integral part of the church. The evidence indicates, however, that the opposition to a north aisle scheme is likely to be strong. The Archbishop of Canterbury, after expressing the opinion that the addition, however made, should be in the closest possible connexion with the existing church, went on to say that while the north aisle would give the closest connexion, he thought there were so many objections to it that "the next closest ought to be taken," and in answer to a question from the Chairman (Mr. Plunket) he further stated his objections as follows:—

"It is the only part of the Abbey in which you see the whole design of the church by itself; the south side is so entirely blocked up by other buildings and the east end is so altered by Henry VII.'s Chapel, and blocked by St. Margaret's, the projection of the chapter-house is so great, and the alteration of the west end is so great, that there is no other part of the Abbey which gives you an idea of what was the original design of it as a great church. Therefore, the erection of any building against it, even if it were a low building, would completely block out the original conception of the Abbey, and would prevent a view of the elevation, and then, amongst all the cathedrals of England, it would be the one which could not be seen. The interior alteration would be also great."

There is a great deal of reason in this, and we give full weight to it. There is no doubt that architecturally the scheme of a chapel in the south-eastern portion of the church is a very much easier problem, in regard to architectural grouping and connexion with the present church. But the question, as already observed, is not purely an architectural one, and it is a mistake to regard it in that light. The question is to get the closest approach to being a part of the Abbey Church in such a way as not to be architecturally an anomaly. It can hardly be said that the addition of another aisle is an architectural anomaly, considering how many are the four-aisled and five-aisled Medieval churches in existence; and in regard to the Archbishop's objection that it shuts out or interferes with the only general view of the present church, it must not be forgotten that (as Mr. Pearson took care to point out) the north exterior of the nave as at present existing is not the genuine original architecture, and is not, as an exterior, of much value historically, or even architecturally; nor do we see that the treatment of the problem in that way may not be an architectural addition to the *coup d'œil* of the building as seen from the north-west. Mr. Pearson's ideas as to the treatment are to be gathered from the following passage in the evidence:—

"My idea is that the chapel should be as much a part of the Abbey as possible, and that the

feeling that people have as to being buried in the Abbey and of having monuments erected in it should not be weakened in any way, and that by adding to the nave you would make the addition part of the Abbey,—absolutely part of the Abbey.

538. Would that chapel rise to a height equal to the height of the Abbey?—No, sir. I have two schemes, one to make it as high as the side aisle of the nave, and another to keep it down some 15 ft., and, in that case, making in the spaces between the buttresses and low buildings underneath the eills of the windows, the highest part in that case would be 35 ft. inside.

539. (Sir F. Leighton.) Would that obstruct the light?—It would, to some extent.

540. (Mr. Waterhouse.) Then there would be no light to this chapel, except on the north?—Yes, there would also be a clearstory. There would be an entrance from the transept here underneath the window, and here also in the nave aisle underneath the window, besides the external entrance to the west.

541. (Sir F. Leighton.) It would be a small church rather than an aisle?—It would be so in point of size.

542. (Chairman.) I suppose the architecture would be as identical as possible with the old Abbey?—No, sir, I would make it of a late style, to show that the building was an addition.

543. (Sir F. Leighton.) It would be a twin building; by the side of the Abbey?—Yes; you frequently see in old churches large aisles added.

544. (Chairman.) Would the roof be resting against the old Abbey, or an independent one?—It would rest or abut upon the Abbey at this end.

545. Would it be an independent building at this end?—It would be.

546. What would you remove?—Nothing.

547. (Sir H. Layard.) No tombs would be removed?—No tombs, only some tablets on the walls where openings in the new aisles would come, and these could be replaced by the side of these entrances."

This gives a pretty fair idea of what the addition would be as contemplated by Mr. Pearson. Externally we do not see that it need be any disfigurement of the architectural ensemble of the Abbey; but rather the reverse. As to the idea of building it in a later style of Gothic, so as to show that it was an addition, that may be open to question. If there was a nineteenth-century Gothic, the use of that would of course tell the tale plainly. But merely to adopt, say a late fourteenth-century style to show that it was not part of the original thirteenth-century building, would only be to adopt a slightly different form of architectural illusion. The more logical course would seem to be to treat the addition, in its general lines, in a manner to harmonise with the nave architecture, while

"Perhaps some modern touches here and there" would tell the tale of the actual date of its erection: harmony of general style, without copyism of detail in every respect.

There is one objection to be raised, however, when we come to consider the north aisle as regarded from the interior of the Abbey. Mr. Pearson proposes merely two doors of access to it, one from the nave and the other from the north transept. The mere practical objection to this constructional interference, suggested by Mr. Somers Clarke, who said it "would knock the building about," is not of any importance. With a strong timber bracing between the buttresses, any alteration to the intermediate walls could be carried on without danger to the structure. But the more important objection is that in that case, after all, the new aisle would no longer be an aisle, but as Sir F. Leighton observed, "it would be the next room," and would form no part of the vista. To say as Mr. Clarke does, that "it would be more out of the church than going through Poet's Corner" (and afterwards through a new corridor to a chapel entirely removed from the main building) is merely a natural exaggeration on the part of a hostile witness. But the general objection is a valid one. We will suggest a way out of this. In architecture [the boldest thing is often the best. Build the new north aisle, then, not with a lean-to roof but with a gable roof, with its internal gutter sufficiently above the head of the present north aisle windows. Make the new aisle of the same architectural ordinance as the existing one, with the same windows: take out the glass from the existing windows and replace it in similar windows on the north side of the

new aisle. Four of these windows are memorial windows in stained glass, but they would merely be removed to a similar window opening opposite to their present situation. Remove the few monuments on the north side of the present aisle which stand up above the window sills, and replace them in the new aisle: they are only a few, and here again it is only moving them perhaps a few feet from their present position. Leave the present window openings and mullions as they are, with the spaces open between them. Supposing the new aisle to have been built, we should then see from the nave a series of open mullioned arches with a screen wall at the base, and through these we should see the vault and part of the interior architecture of the new aisle, which would then appear, in Sir F. Leighton's words, "as part of the vista," part of the Cathedral itself, only shut off by a screen in the lower portion with two doors in it. If an extensive addition to the Abbey for monumental purposes is actually called for, that is the way we should propose to carry it out: a method which would render the new aisle architecturally a portion of the general interior of the church, seen by the eye from the nave and entered by a door from the nave and from the exterior: an addition which would not only satisfy the demands of sentiment, but might be capable of adding to the Abbey a new and very fine interior effect.

#### METAL-WORK.\*

BY J. STARKIE GARDNER.

MY business in life is to work with, and not to talk about, metal-work. This is, however, the occasion of an Art Congress, and I can only imagine that the invitation to lecture here was addressed to me because I am a stranger to you. As a Londoner I am deprived of that profound knowledge of the craft that exists in Birmingham, the result of the accumulated experience of centuries; but, on the other hand, I come more in direct contact with the most educated section of the public, and am in a better position to discuss the directions in which the taste of the public is moving. And I see with profound regret that it is travelling in an opposite direction to that which, speaking broadly, and not of the exceptions, Birmingham manufacturers are taking. It would be mere affectation to ignore that Birmingham work is conspicuous by its rarity or absence in our London Arts and Crafts Exhibition, that it is not holding its own in the estimation of London architects, and that it is out of harmony with the styles of decoration in vogue with our best decorators. If the patterns Birmingham puts on the market are used, it is under a sort of protest, and the laments are continual that, taking bedsteads for an example, brass bedsteads have to be used which destroy the whole harmony of a room. Now you know as well as I do that if a real demand exists which you cannot or will not supply, the demand will very soon find its supplies elsewhere. Taste and fashion permeate downwards. There are still large classes who buy Birmingham patterns, but the tide is irresistibly against them, and the art metal trade of Birmingham must collapse before the assaults of its better-equipped enemies, unless it sets about meeting them on equal terms. Mr. Whitworth Wallis wished me to devote the evening to the analysis of pieces of metal, to explaining why some are good and others bad; but I take a grave view of the condition of Birmingham art metal-work, and to talk of such details appears to me like discussing questions of diet when the patient is *in extremis*. Before proceeding further, I should like to explain what decorative art is, for our conceptions about it and what course it is likely to take are extremely hazy, even if we have formed any conceptions at all. If we talk over the possible developments of elec-

tricity or engineering, we base our ideas on what has been before. But whoever heard about any one arguing rationally about the development of art? In persistently treating art as a matter of caprice and fashion, like the whims of a lady, we willfully shut our eyes; for, actually, art is only a highly-cultivated but still wholly ordinary instinct of nature, and, as such, just as subject to definite laws as any other force in nature. As humanity has developed, so art has developed, the course of both being one chequered course of progress from the most primitive stages to the highest developments. The ceaseless changes of style are simply manifestations of ceaseless progress. Usually they have been accomplished by the slow modification or addition to that which pre-existed, consequent on the instincts implanted in us, which makes progress a necessity, and mere copying and reproduction hateful. Exceptionally they have been brought about by the meeting of two previously isolated styles, as when the Egyptian and Assyrian arts met on Greek soil, to be fused by the genius of a new race into the Classic; or when the flower of Western Europe, suddenly dazzled by contact with Oriental splendour, laid the foundations of Gothic architecture. But it required even in the case of Classic art five hundred years, from the days of Homer to the building of the Parthenon, to bring it to perfection, and scarcely less to mature Gothic art into the culminating richness of Henry VII.'s and St. George's Chapels.

Gentlemen, I claim that if we reflect upon the whole history of art we see that it teaches us that we cannot create, we can only develop; and designers, when they have accepted this truth, have learnt the secret of the art they are called to practise. Man can no more create a new style than Nature can create a new animal. A gifted individual may hasten its progress; but extravagance, the result of haste in art, is like the monstrosity in Nature,—it bears no offspring. Again, art, to be lasting, must be in unison with the genius of the people. You can no more acclimatise an exotic art, if it runs counter to our habits, our comforts, and our climate, than you could bid crops of rice and sugar-cane to replace our wheat and turnips.

Till recently the course of art has been easy to follow; but those who deal with art in this nineteenth century have to deal with a very exceptional state of things, the like of which has not been seen since art began. Down to the early years of this century, art, in some form or other, had been the one outlet for the energies of the peaceable and cultivated section of humanity. Art had been all in all, when, suddenly, Art's younger sister, Science, came out, and by the splendid beauty of her achievements, turned the heads of all beholders. What wonder if, with the marvels of steam, electricity, and gas, and the profound changes made by them in our habits, all crowded into a few years, Art should have been cast aside and forgotten? Not only these applied sciences, but the abstract sciences,—chemistry, physics, physiology, geology,—have filled men's minds, and made the nineteenth century a century of science such as the world had not beheld. Art had been flowing serenely, like a broad river, when this young leviathan ploughed so rudely across, that its troubled surface is only now, at the close of the century, beginning to yield some broken reflections of its ancient self.

During the eclipse of art, manufacturers had little need to trouble about it, and, as long as new season's patterns were produced, shopkeepers bought, and the public bought, so that we have had for many years a long succession of mere commercial patterns.

But now the sun of art is re-emerging. For thirty years schools of art, numerous exhibitions and loan collections, facilities for travel, and our museums, have been incessantly and profoundly turning the public taste, and we see not only an appreciation of pictures and sculpture, but of bric-à-brac, which comprises everything we use,

\* A Lecture to Working Men. Delivered at the Birmingham Art Congress.

even down to the humblest household utensils. We are all groping about to pick up the broken thread. It is no wonder if the public take their ideas of what is good from what is set before them in museums rather than in shops; and it is coming to this—that the classes for whom we have to cater will not trust themselves to buy anything unless it recall some museum object. It is utterly vain and futile to imagine that taste will even go back into its former vitiated grooves, and all the Queen Anne and Neo-Grec trivesties of styles that have been produced will shortly be as extinct as the Dodo.

The question is, Will Birmingham continue to stand aloof while the trade passes from it to other towns and other countries; or will it make an effort to take once more the place its vast resources entitle it to take? You may depend upon it that unless you can meet the demands of people of good taste you will not be long permitted to meet the demands of others. Why should not Birmingham be again what it was thirty years ago in the Gothic revival,—that first symptom of reviving art, when it led the van and was uncontestedly the metropolis of good metal-work?

Now, unfortunately for Birmingham, the fact that it profited in an exceptional degree by the activity of science has seemed to sever it more completely from the traditions of art. All peoples, all cities even, have their epochs of prosperity and progress, and periods of repose and decadence. Is Birmingham resigning itself to one of the latter? Will it continue to sleep while the trade passes from it to other towns, and, worse, to other countries? Is it to the credit of Birmingham that Chiswick should lead the way in designing copper and brass; that Frome should revive the "Cire Perdue" process; that we should have to send to Naples to get good castings, to Paris for good chasing; that in our great revival of wrought iron work Birmingham should have lagged, not led, so that ten times more is done out of Birmingham than in it; that enamelling, an art that has always had a home in this country, should be almost dead; and that in exhibitions the exhibits of Tiffany, Christophle, and a host of others are incomparably finer than ours?

The dearth of rivalry,—that wholesome stimulant,—has been injurious to Birmingham, but, to judge by the signs of the times, Birmingham will not be cursed with any lack of it in the future.

To resume its place, those great employers who have the plant and capital should attach and associate themselves with those who have proved their talent, instead of leaving them to exhaust the best years of their lives in founding businesses which either wither up or develop into dangerous rivalry. Every metal business pretending to supply goods into which art enters, should have one artistic partner, not an aesthete, but with practical knowledge of the requirements of the trade; and it should have a sufficiency of designers, and these should be Englishmen.

This brings us to the question of design. It is the fashion to talk a good deal of "high falutin'" about going to the fields and gardens and taking your designs straight from nature, or being manly and independent and evolving them out of your own conscience. But I don't see that these professors practice what they preach. Art lives in cities among communities of workers, working in friendly rivalry, and not in the fields. More has been done for art in the flat plains of the Netherlands, or swampy lagoons of Italy, than in all the places where nature is fairest to nature. Does architecture borrow from nature? Did our grandest craftsman, Alfred Stevens, or do Alfred Gilbert and Walter Crane, though adepts in the secrets of nature, draw their inspirations from it, or from reminiscences of the heaped-up stores of artistic experiences of the past? Nature is a good corrective, but not a good diet, and the designer should take it in homeopathic doses. No grand decorative artist ever was inspired by nature direct, and you can but rarely use the crude forms it sup-

plies just as they are. To test this, try to use a shell—beautiful objects to use in any design—and you will find yourself compelled to abandon any close adherence to its lines. Or make up sprays of flowers or leaves, and see how difficult it is to use them in any design. When we require organic forms in decoration, we do not take horses and cats and dogs and men as we see them, we resort to griffins, harpies, cherubs, mermaids, sphinxes, satyrs, and everything as far removed from nature as possible. If we want a fish, it is the conventional dolphin, because it is quite unlike anything real. While as to foliage, we escape recourse to nature by using the conventional forms of acanthus, vine, arum, and pomegranate, forms brought under control by generations of modifiers, to fit them to the purposes of art. I must leave this theme, however, though reluctantly. A recently-issued catalogue of art metal-work, entirely taken from Nature, not Birmingham, I am glad to say, is the most egregious thing ever seen. Such catalogues are a slur on the country. You will not be surprised if I say, go to the museums and copy those things which you can make use of. Don't turn a grand Renaissance helmet upside down and make a coal-box of it, nor a shield by Cellini into a wall-plate for a common paraffine lamp, especially if the lamp must be supported by the haft of a common nineteenth-century sword-bayonet. These, like the designs from Nature I have just referred to, are I am sure, employers' or managers' inspirations, and when anything is right down bad and vulgar, it is always some pet fad of some conceited body who is destitute of the remotest pretence to art-training, but with the unhappy power of forcing them on public notice. Use common sense at the museum, and when you have exhausted all the useful objects, you will find inexhaustible stores of hints and suggestions in the next. Don't become aesthetic, or join the camp of the aesthetes, for taste in art is not concentrated in the productions of any modern clique whatever, but beware of conceit, and get as good a mastery of styles as you can, and then take your own course.

I have only one more point, and that is as to the styles you should endeavour to take up with. We should most undoubtedly begin by reviving all that was good in English art, for that sits best in English houses. Unfortunately, the art of our own country is exactly what you do not get in English museums, and Birmingham is no exception. Museums abroad are mainly devoted to the work of their own country; but here, what little we have is flooded and lost in the sea of Italian and German objects with which they are crowded. This places us at a great disadvantage, for Germans, Italians, and French have enormous material to copy from, and do use it well; and inundate our market with reproductions and adaptations which pass current with the public for museum objects. The present generation of the general public, to whom decorative art is as new as the tall hat and frock coat to the Sandwich Islander, do not perceive that these when brought are, as a rule, wholly out of place with their surroundings and not in the least adapted to their requirements. A copy of a sanctuary lamp will not light a room unless you spoil it, and modern candles are not meant to be stuck on spikes. To go back to obsolete inconveniences is like spinning our wool by hand again; and, fortunately for us, Germans and Italians are both bad designers, and are only dangerous as long as they stick absolutely to copying. France is formidable, for its art has always been so interwoven with ours that it is almost at home in English surroundings. The French, moreover, can design in their own styles with perfect taste and accuracy. The French will probably run us hard, but we must hope our superior adaptability will stand us in good stead, and that we may at least win on our own ground. Let us begin, however, I say, by being English, and mastering our own styles thoroughly. We must know their origin, growth, development, and technique

as the doctor knows diseases. We must know, as the French do, almost instinctively what the workers in these styles would have done.

I have now no more to say than to thank you for your patience with me, and to assure you that, though a rival in a small way, for my works are quite insignificant, I have a profound respect for your great city, and consider the maintenance of its prosperity a question of national honour. J. S. G.

## NOTES.

THE memorial of the "Society for the Preservation of the Monuments of Ancient Egypt," to which we referred recently (page 400, ante) was sent in to Lord Salisbury a few days ago. But while we were assured that Lord Wharnclyffe, the President of the Society, had concurred with the suggestion of the Institute of Architects to petition for the appointment of "an Official Inspector fully qualified" to take charge of the monuments, leaving the question of nationality open, we now find that in the letter from Lord Wharnclyffe accompanying the memorial it is stated that the memorial is presented in two forms,—first, as praying for the appointment of "an English official," the other, in the words first quoted, for that of "a competent official." The letter continues:—

"The change thus effected in the scope of the Memorial was not made until the first form in which it was circulated had been numerously signed, and I would call your Lordship's attention to the point that those whose signatures are attached to the first memorial are not necessarily in opposition to this change, which some of the signatories thought it advisable to have made before attaching their names or proceeding further in the matter."

The letter concludes:—

"I beg, therefore, your Lordship's favourable consideration of the memorial, which I forward herewith, and further that your Lordship will cause it to be communicated to H.M. Agent and Consul-General in Egypt, for the information of the Egyptian Government, as expressing the opinion of many eminent Englishmen on the question of the Preservation of the Monuments."

Among the long list of signatures appended to the memorial in its first form appear those of Mr. Armstead, Lord Armstrong, Professor Blackie, Lord Bramwell, Mr. Ford Madox Brown, Mr. John Evans (President of the Society of Antiquaries), Professor Flower, Mr. Ernest George, Mr. H. C. Jebb, Sir James Linton, Mr. Mahaffy, Mr. Du Maurier, Professor Middleton, Mr. F. C. Penrose, Mr. Norman Shaw, Mr. A. C. Swinburne, Mr. Alma Tadema, Mr. Chas. Waldstein. Among the names appended to the "competent official" memorial are those of Sir A. Blomfield, Mr. T. Blashill, Mr. Ewan Christian, Professor Hayter Lewis, Mr. Waterhouse, and a good many other architects, this form of the petition having been brought more under the notice of the architectural profession; we also find in the list the names of Mr. Percy Gardner, Sir F. Leighton, Mr. Mundella, and Sir Richard Temple. These names are sufficient to show how widespread is the interest felt in this subject among able Englishmen of various professions and classes.

THE correspondence between the Council of the Institute and Messrs. Flockton & Gibbs, which appears in the last number of the *Journal of Proceedings* of the Institute, in regard to the Sheffield architects' ill-advised scheme of patenting their plan for the arrangement of municipal buildings, includes a concluding expression of opinion by the Council which we imagine will be accepted by most of our readers as embodying the common sense of the matter. The following is the portion we refer to:—

"The Council have learnt that, under the terms of Section II of the Patents Act, 1883, they have no power to oppose the grant of such patent to you; but, had the power existed, they would have opposed it in the interests alike of the profession and the public, and because the course proposed to be taken by you is inimical to the interests of

the profession, and one likely to bring you into serious conflict with other architects.

The Council trust that this expression of their opinion may induce you to withdraw your application for the patent; and they beg you to remember the honourable tradition of the English medical profession, not to take out a patent on subjects relating to that profession.

The Council are further of opinion that, even if the plan be patented by you, the patent cannot be sustained."

In regard to the last sentence, we are also of opinion that the arrangement of the plan of a building cannot be the subject of a patent. It is not a new mechanical or scientific invention, but merely a question of arrangement; and in any case it would be hardly possible to make out absolute priority in such an arrangement. We published one of the plans and Messrs. Flockton & Gibbs's letter a few weeks ago, in order to show what they proposed to claim, but we believe it is a mistaken attempt, in every sense. From the final reply of Messrs. Flockton & Gibbs to the letter above quoted, we gather that they are disposed to follow the advice of the Council; in doing which they will not only act gracefully, but probably spare themselves and others a good deal of unprofitable worry and contention.

WE learn from the last number of the *R.I.B.A. Journal* that Mr. Andrew T. Taylor, Hon. Secretary of the Institute for Canada, has forwarded to the Secretary of the Institute a copy of the Constitution and By-laws of the Province of Quebec Association of Architects. Special difficulties there existed, owing to the fact of two nationalities,—English and French,—being prominent; but they have been overcome, and nearly all architects in the province, having joined to form this Association, are now seeking an Act of incorporation. The general body of members is to be divided into three classes,—namely, Members, Student-Associates, and Honorary Members. Article IV. defines the status of an architect as follows:—

"An architect is a professional person, whose occupation consists in the artistic and constructive designing of buildings, and in supplying the drawings, specifications, and other data required for carrying such design into execution; also in exercising administrative control over the operations of contractors employed in the construction of said buildings; in officiating as arbitrator of contracts, and stipulating terms of obligations between proprietor and contractor."

Article V. of the "Constitution" is framed upon the lines of the declaration required by the Institute from its professional members, while Section VIII. of the "By-laws" of the Quebec Association provides for Examinations.

FOR several years the idea of having a good harbour at the mouth of the Elbe has been talked about in Germany, and the Berlin *Deutsche Bauzeitung* now publishes an illustrated description of the harbour-works proposed, and from this description we see that the Senate of the Hanse Town, Hamburg, intends having constructed on and near ground owned by them at the mouth of their river, near Cuxhaven, a first-class harbour for the purposes of (1) affording convenient arrangements for the quick landing and taking-off of passengers and mails to Atlantic liners, as well as for purposes (2) of refuge in winter time, when the Elbe is ice-bound, to vessels unable to reach Hamburg on that account, or to vessels unable at all times of the year to reach the port 100 km. up the river on account of being disabled. The plans as they now stand show an ordinary enclosed sea-water harbour subject to tides, of the size of 300 by 250 metres, with an additional extension running an extra 300 metres inland, and eighty metres wide, the whole basin with a low-water depth of eight metres throughout being entered by an opening of 100 metres, enclosed on either side by solid harbour-heads with frontages 120 metres long, running parallel to the current of the tide. Three years would be required to construct this

harbour, at a cost of about 7,000,000 marks, or nearly 350,000*l.*; and 80,000 marks would be the annual expense for keeping the harbour in condition, which latter expense would, however, be easily covered by the 90,500 marks offered by the Hamburg "Packetfahrt" Line, as fixed annual sum to include all landing dues of their boats and rent for 200-metre frontage of quay (30 metres deep) for erection of sheds, passengers' offices, &c. It being taken into consideration that the proposed harbour is chiefly or rather entirely to serve for passenger purposes, no cranes, warehouses, &c., are to be erected, the special comfort of passengers being provided for by having the Hamburg-Cuxhaven Railway line continued to harbour head. For the purposes of the North-Sea Fishing Fleets the old Cuxhaven harbour is to be enlarged and deepened at a cost of some 600,000 marks, this piece of work, when complete, giving the fishermen a well-protected sheet of water, 137 by 218 metres, with a depth at low water of 24 metres, the entrance having 50 metres width.

WE have before us an account of some fresh-water algae which are known to infest reservoirs on the Atlantic sea-board of the United States and elsewhere. The author, Mr. Geo. W. Rafter, explains that these minute plants are very hardy, having been found in active growth in water covered over by a sheet of ice more than 1 ft. in thickness, and whilst some only live in water containing sulphur, iron, salt, or other particular mineral matter, &c., in solution, others prefer the purest water. The bad tastes and odours imparted to drinking-water by these algae arise, he believes, from their jelly, starch, oil, or sulphur-producing properties, and good reasons are advanced in support of this hypothesis. He found especially that a particular species, containing much starch with chlorophyll granules, gave out a very offensive odour when in an advanced stage of decomposition, and on experimenting with starch and water he artificially produced a similar result. Other varieties detected impart a cucumber taste; and he has successfully demonstrated that the pollution of the water-supply of Rochester (N.Y.), in 1888, was largely due to a certain alga which caused a fishy taste and smell. In discussing preventive measures he advocates the covering-in of reservoirs, aeration, rapid circulation of the water, and in some cases efficient sand-filtration. In congratulating the author on the production of this important contribution to knowledge, we may point out that the methods of counteracting the evils alluded to, although clearly induced by purely philosophic reasoning, have long been known to engineers from their practical value, and within certain limits those methods have undoubtedly proved efficacious. The late Mr. J. F. Bateman, C.E., speaking of the contamination of a reservoir at Warrington some years since, for example, gave a striking illustration of the fact. Although the water was filtered as well as it could be, it very soon became filled with various kinds of growth, and after much consideration it was decided to cover over the reservoir. This was effected, without emptying it, by erecting vertical pillars supporting cross beams, on which large flags were placed. As the work progressed the confervæ beneath the covered parts gradually fell to the bottom, and by the time it was finished they had entirely disappeared, and the water was delivered in a much purer condition. Precisely similar results have been experienced at the Berlin waterworks and elsewhere. There can be no question, also, that the growth of vegetation on the surface of open reservoirs is greatly retarded, and in many instances altogether arrested, when the water is more than 15 or 20 ft. in depth.

OUR Australian correspondent writes:—"The most exciting architectural topic at the present time in Sydney is the great fire in the heart of the city, which has consumed nearly a million's worth of building and stock. The writer of this note was a witness

of the conflagration, and the rapidity with which one building after another went down under the flames was a sight never to be forgotten. It commenced in a solidly-built printing establishment, which was gutted, and the walls beginning to fall down, in a little more than half an hour. The fire extended from roof to roof and window to window across narrow lanes, notwithstanding the utmost efforts of the fire brigades. Not less than six separate properties have been totally destroyed, and thirteen others have been severely damaged. Most of them were four and five story buildings, and occupied as soft goods warehouses, offices, and clubs. All the buildings were of ordinary construction, with timber joists and thin floor boards, and in several cases cut through by lift shafts, which formed furnace flues to each building. It is to be hoped that this severe lesson will teach property owners the necessity of introducing a somewhat better system of construction to resist the spread of fire. Although the loss is immense, yet, if the opportunity is grasped by the Government, a great public improvement may be made by the construction of a new street, between Pitt-street and Castlereagh-street, on the site of some of the buildings thus destroyed. The matter has been mentioned in Parliament and referred to in the press, and it is to be sincerely hoped that the idea may be carried out. This street would be a continuation of the new street just being formed in front of the Post Office, and would be the first step towards securing a wide thoroughfare right up to the site of the new Houses of Parliament in Macquarie-street."

WE have, in a prior number, referred to Germany not having its recognised "Salon," like other countries, owing to the collision of the various larger Art Exhibitions held annually at several art centres, such as Berlin, Munich, Düsseldorf, Dresden, &c., each of which try to out-do each other by offering special attractions, lenient hanging juries, and the like, to artists wishing to exhibit. Up till a few years ago, the Berlin annual "Academy" Exhibition took the lead, but in 1889 and this year, owing to nearly all the South German artists having their work hung at the newly-formed Munich "Annual" Exhibition, the low standard of the Berlin show was so marked that it was thought advisable to discontinue it in favour of that of the Bavarian capital,—the Prussian Royal Academy even going so far as to definitely decide not to hold their "Academy" next year, a decision which was, of course, hailed with great triumph in South Germany. By way of drawing the North and South together, the Berlin Art Society proposed that the southern artists should be invited to send a representative collection of works to the Berlin International Exhibition in 1891, coupling this with an undertaking that, if the Munich exhibition of 1891 were dropped, there should also be no Academy exhibition in Berlin in 1892, the Berlin artists exhibiting in a body at Munich in that year. It is perhaps not surprising that the Munich artists have rejected this offer, having even come to a determination to make their 1891 exhibition an unusually good one; but the result would have been better for the progress of modern German art if they had decided to join hands with Berlin.

MR. ARTHUR PEW, M. Am. Soc. C.E., describes in the *Transactions of the American Society of Civil Engineers* for September, a railroad constructed between Wrightsville and Dublin, two Georgia villages about nineteen miles apart, which is supposed to be the cheapest line ever constructed for a regular freight and passenger business. In the Southern and Western States it is often very difficult to procure enough money to build any kind of railroad whatever, and the engineer is often called upon to make surveys and estimates for the very cheapest and poorest railroad his conscience will allow him to build. The line, which is through moderately-rough country,

passes for the greater part through pine forests, which furnish suitable timber for bridges and other purposes. The track is of standard gauge, and was laid with a good second-hand 45 lbs. iron rail obtained from, and laid by, a neighbouring railway company, who were substituting steel for these iron rails, for 370l. per mile. The actual total cost of the line, when completed ready for the chartered rolling stock, which was used, was about 700l. per mile. The company, however, do not pride themselves so much on building a cheap road as on doing so much good work at such a small expense, and it is satisfactory to hear that the earnings of the line up to this time have been so good that in addition to paying an annual dividend of nearly 7 per cent. to the stockholders, considerable improvements have been made to the line itself.

AT a Vestry meeting, St. Sepulchre's, Holborn Viaduct, last week, it was resolved that the churchwardens be empowered to contribute 25l. to a fund for restoring the tombstone of Captain John Smith, founder of the "London Company" which colonised South Virginia. Smith, a parishioner, died on June 21, 1631; but within the next eighty years, as we read in Hatton's "New View," all traces of the tombstone had disappeared. His epitaph, however, has been preserved; it began—

"Here lies one conquered, that hath conquered Kings."

He explored the river Chickahominy, and for a while was made captive by Powhatan's tribe of Indians. We are informed that Pocahontas, to whom, when a girl, Smith is said to have owed his life, came to this country as the wife of one John Rolfe, and that having died, aged 22 years, on board the *George*, a trader bound for Virginia, off Gravesend, she was buried March 31, 1616-7, in the chancel of the old church there, which, having been burnt in 1727, was rebuilt and dedicated to St. George. Pocahontas stayed seven months in England, and was received by the Queen, to whom Smith had made a petition (June, 1616), wherein appeared the first account of the way in which she saved him from her father's "braves."

A LARGE number of Americans visit St. Sepulchre's Church every year. They, in common with ourselves, must have been struck, latterly, with the pains that are taken to make a pretty garden of the southern graveyard. There is a burial-ground along the northern side, and another was made by Greenhill's-rents, St. John-street, Clerkenwell. The church itself, one of the largest in the older part of London, has undergone many structural changes since its almost entire rebuilding by Wren. Extensive repairs were carried out in 1738; and again, by Clark, in 1790; in 1873-5 the late W. Pettit Griffith restored the tower and south porch; and two or three years later Mr. A. Billing renovated the interior, when, we believe, Wren's side-galleries were taken down. The fine organ, originally by Renatus Harris (1677), was rebuilt by Messrs. Gray & Davison. It was subsequently removed from over the ambulatory, at the western end, to within the St. Stephen's Chapel, north side. That may, perhaps, be the chapel which Sir John Popham, Chancellor of Normandy and the King's Treasurer, built in 1440, together with the porch.\* Popham died at Reading in 1463; a tablet to his memory was set up in the cloister at Charterhouse. In our review, No. viii., "Architecture at the Royal Academy," on June 28 last, we noticed Mr. W. D. Carie's design for a reconstruction of the organ in two cases, to stand at either end of a screen across the church. We may add that this church is of ancient foundation. Maitland tells us that Roger of Sarum gave it, in 1178, to the prior and canons of St. Bartholomew, West Smithfield. That gift

\* Stow says Popham's chapel stood on the south side of the choir.

was subsequently confirmed by a charter of Henry III., dated June 15, 1253. Here were buried Roger Ascham, author of "The Schoolmaster," and Sir Robert Peake, who held Basing House for the King, and was Faithorne's master in engraving. John Rogers, burnt at Smithfield, temp. Mary, had been vicar.

THE Midlothian County Council have appointed a committee, with powers to deal with the Society of Writers to the Signet in regard to acquiring a piece of ground belonging to the Society, which is situated immediately to the south of the County Buildings in Edinburgh, and which it is desirable should be acquired by the Council as a site for additional buildings for the accommodation of that body. The County Buildings were erected in 1814, from the designs of Mr. Ellis, shortly before the first City Improvement was carried out. That improvement scheme involved the formation of a thoroughfare running immediately to the back of the new building, which faced a narrow close, and had no architectural features whatever. The late Mr. David Bryce, at the request of the county authorities, prepared a new architectural elevation to supersede the present unsightly one, but no active steps were taken in order to carry it out. If the County Council should carry out the erection of a new façade towards Melbourn-place, there would still remain a vacant site between the County-buildings and the Sheriff Courts. This site belongs to the Faculty of Advocates, and that body is desirous to utilise it for the extension of their library. This library is possessed of similar privileges to those enjoyed by the British Museum library, but has not similar support from Government, which is desired, in order to make the valuable library fully available to students. Were the library extended to George IV. Bridge, with a suitable façade, and the County-buildings completed in like manner, this thoroughfare would be one of the most attractive in the northern metropolis.

THE Indian correspondent of the *Times* drew attention, on the 19th, to the sudden fall of a house in Bombay, causing the death of about thirty people, and in the letter of the next day he adds that the event "has again called public attention to the necessity for municipalities adopting improved building regulations and more closely supervising the construction of new and the inspection of old buildings. The existing practice is very lax, and this is the second accident of the kind which has happened in Bombay within the last few months." We know little of the nature and extent of the official building regulations of Bombay and Calcutta, but it certainly appears from this that there must be urgent need of some more efficient system of supervision of buildings than at present exists in the great Anglo-Indian cities.

#### MYTH OF THE HOMERIC CYCLE.\*

It was with a graceful tribute to Mr. Leaf's lectures on "Homeric Greece" that Miss Harrison began on November 26 the first of the four lectures which were to continue and complete his course. That break in the traditions that appear before and after Homeric mythology, that flaw in the stratification of myths, only became completely clear to her, the lecturer said, when Mr. Leaf had explained how the Achaean civilisation represented in Homer had been preceded by a primitive people—the Pelasgians. These primitive people, after the the Achaean power had been broken and laid waste by the Dorian invasion, had emerged again, and with them emerged many of their cults, which asserted themselves even in presence of that new Olympian theology which the poems of Homer had the power to impose on the Greek world. With this knowledge it became possible to understand the later complex Greek mythology, where side by side with the orderly twelve Olympians, each with well-defined characteristics and attributes, there is a

\* Four Lectures by Miss Jane E. Harrison.

medley of small tribal gods with fluctuating duties and powers, relics of old local cults when tribes had to economise their deities. The two systems became in time more or less fused, the Olympian gods absorbing many of the local deities who were the most nearly related to them.

This may be well illustrated by the myth of the old Thessalian goddess Kyrene, who was absorbed, by steps which we can trace, into the Olympian Artemis. Starting with the version of the myth of Kyrene as told by Pindar in the ninth Pythian, Miss Harrison showed how the development of the story could be traced on three monuments. The connexion of a particular class of ancient vases with the colony of Cyrene was proved by the well-known clyx (Paris: Bibliothèque Nationale), representing Arkesias the Second presiding at the weighing of sacks, presumably of *silphion*; next, by another clyx with the curious figure of a god seated on his own altar. Coins of Arcadia now enable us to recognise in this god Zeus Lykaios, who was worshipped at Cyrene. These two vases lead up to the most important example of this class, a clyx in the British Museum, where a female figure, surrounded by little winged men and women, is to be identified as the nymph Kyrene herself, tended by the fostering winds. She holds in one hand a twig of the silphion plant, the main source of the wealth of the African colony; in the other, a branch with apples, in reference to the favourite identification of the fertile Cyrenian plain with the Garden of the Hesperides. Other vases were adduced to prove this personification of the winds as winged figures; the harpies of early Greek art are nothing but the winds, not necessarily in their hostile aspect.

The myth of Kyrene is found in a relief in the British Museum, where a nymph is seen wrestling with a lion, while another nymph, Libya, crowns her victory with a wreath. This relief is late, and is no doubt a conscious illustration of Pindar; but the same scheme of the nymph wrestling with the lion is found in earlier works; for instance, in a well-known archaic bronze found at Olympia, and, which is more important, in a relief found at the same place from the pediment of the Treasury of the Cyrenians. The same type of a winged figure holding a lion by the ear and tail is to be seen also in vases from Thera or Metes. It was, in fact, the general type of the "Mistress of Wild Beasts," under which so many of the primitive local goddesses are to be brought. Other instances besides Kyrene, are Atalanta, Britomartis, Iphigenia, &c., all of whom were ultimately identified with Artemis in official theology, though locally they generally enjoyed a special, but poorer, worship by the side of the Olympian. This was the fate of Kyrene herself. Originally a local "Mistress of Wild Animals," and a goddess mother worshipped by the old Thessalian population, she was taken with them first to Thera, and then to Africa, where, as Aristotle tells us, many separate sacred rites were, as a measure of democracy, fused together. Thus, instead of being the bride of Apollo and a mother, she was converted into the virgin Artemis, sister of Apollo.

Passing, in her second lecture, to Homer's beliefs about the under-world, Miss Harrison showed that the conception of the Homeric Hades was never so victorious as that of the Homeric Olympos. The probable reason of its failure to attain supremacy over other beliefs was, that with regard to the under-world, primitive faith reasserted itself most powerfully. "Homer believes that something persists after death: that something is no more life, though it is called *Psyche*; rather, it is the very opposite of life, it is the shadowy double of a man deprived of all the characteristics of life. This something, *as soon as the body is burnt*, goes away to a place apart, remote from which there is no possibility of return. The Homeric world is haunted by no ghosts—Patrios himself, once his body burnt, can reappear no more; hence after the funeral there is no cultus of the dead; no offerings at the tomb, no oracular utterance: all is done." Now if we pass from Homer to examine the beliefs of later Greece, especially the popular beliefs, as they are echoed for us in the large class of grave-reliefs and on the white Attic *kylixes*, which were made purposely for the service of the tomb, we find that stronger than any Homeric notion of annihilation and final departure is the other belief that the dead man can haunt his tomb, can receive the homage of his survivors, enjoy the things he has cared for in

life, and even partake of food. For this conception we must look back, not to Homer, but to the races that preceded him. In the "shaft graves" and the "bee-hive tombs" of Mycenæ we had seen how the dead were buried intact and surrounded by the utensils of daily life, which the survivors believed the dead man could use in his tomb. The Homeric "break" between the earlier and the later beliefs—the fact that Homer had ceased to believe in full life after death, is to be explained partly by the poet's individual belief, partly also, by the great tribal upheavals represented by the Dorian and Achaean migrations. "When you are moving about from place to place, when conditions almost nomadic compel you to burn your dead, you tend to drop a cultus that is local and ancestral; your dead, instead of hovering about their graves, go to a common Hades and revisit you no more, uncertain where you are. But when you settle again, rebuilding home and hearth, the old local ancestral faith and ritual revive."

One of the most charming instances adjoined of the fusion of the Homeric and the *loca* beliefs was a *tekythos* with Charon preparing to ferry the dead man to Hades, while about the tomb itself are hovering little winged figures, which would be more suitable in Hades as representations of the Homeric Eridolon or phantom. In another *tekythos* Charon is curiously identified with the dead man, and prepares to snatch the offerings brought to the tomb.

The third lecture dealt mainly with the parentage of Achilles. There are two distinct versions of the marriage of Peleus and Thetis—the older story of the wrestling, which is merely one form of the world-wide *würchen* of the sea-maiden who can change her form at will (cf. Proteus); and, secondly, the *epic* version of the twelve wedding-feast presided over by the stately orthodox Olympian gods. Pindar, who knows both stories, yet never confuses them. The *epic* by Peithinos is one of the finest instances of the art-type of the wrestling, while the splendid frieze on the François vase shows us the marriage procession. The prophecy that Thetis should bear a child "mightier than his sire" was probably invented to account for the eclipse which an old Thessalian poem, with Peleus for its hero, a "Peleid," suffered from the rise of the legend of Achilles. Later, when it became necessary to link the story to the Olympians, the prophecy was made to be uttered as a warning to Zeus and Poseidon (Pindar: Isthmian vii.).

In the fourth lecture, the art-form of the "Judgment of Paris" was shown to be borrowed from that of the *Charities* led by Hermes to the cave of Pan. Hence the processional form which persists in vases both of the archaic and of the fine period; the actual Judgment only appearing late on. The story of the Golden Apple which, it should be carefully noted, never appears on vase paintings, possibly originated in a misunderstanding of the flowers or fruit often carried by the goddesses, as by their prototypes the *Charities*. The connection of the Judgment with the Trojan War is late, and the whole story may be due to some imaginative poet who wished to account for the partisanship of the goddesses in the war, though, originally, it was natural that the Argive Hera, and with her Athena, the special protectress of Achilles, should side with the Greeks, while the semi-Phrygian Aphrodite protected the Trojans.

With regard to Helen, the story of the rape is simple enough; but the legend told of her at the fall of Troy points to the real solution of her myth. Stesichoros and Lesches both told of the fury of Menelaos against his faithless wife, and of his relenting as he beheld her beauty. Numberless vases—where Menelaos lets fall his sword, either at the sight of Helen, or by the intervention of Aphrodite—confirm this version. Mythology, however, seeks a further explanation for the act of Menelaos. The story of the birth of Helen gives us the clue. Helen springs from the egg of the divine Zeus-swan; by birth divine, she is herself a goddess. Leda is to her a sort of foster-mother, and later legends variously give Tyndareus or Zeus as her father. But Tyndareus and Zeus are one—Tyndareus is but a name of the Zeus of Taygetus. We have here again a case of double fatherhood (other instances are Theseus and Heracles), meaning that an earlier local cult has had to give place to an Olympian cult, and Tyndareus, or Aigeus, or Amphitryon have to become the mortal father, really nothing more, but the foster-father of the child of an Olympian. The exact original nature of the

Goddess Helen may be gathered from a passage in Pausanias, who says that the Rhodians worshipped her in the character of a tree goddess (*δένδρον*). The connexion with tree worship is further confirmed by Theokritos (Idyll xviii.), when the maidens who chaunt the bridal song promise to perform certain rites connected with the sacred "Tree of Helen" in honour of the bride. Helen was worshipped at Therapnai, and possibly also at Amyklai. Homer might transform this old local goddess as he would into mortal woman and sinner, yet her immortality would assert itself, and it is because she was a goddess and "the Daughter of Zeus" that the sword of Menelaos must fall powerless before her.

The Chelsea centre for the extension of University Teaching must be congratulated on having offered its students so brilliant a course as this by Mr. Leaf and Miss Harrison. Professor Warr, of King's College, in moving a vote of thanks to Miss Harrison at the close of the last lecture, suggested that it was time for students to think of repaying their lecturer by starting original work on the lines and principles which Miss Harrison has twice in this year laid before a Chelsea audience. Such work seems to have already begun in good earnest, and that this is the case is due not only to the energy and enthusiasm of the lecturers, but to the numerous facilities for work which the admirable organisation of the Hon. Secretary, Mr. R. G. Tatton, places within reach of the students.

#### THE ARCHITECTURAL ASSOCIATION.

THE adjourned special business meeting\* of this Association, to consider the revision of the rules, was held on Friday the 19th inst., in the meeting-room of the Royal Institute of British Architects, Conduit-street, Mr. Leonard Stokes, President, in the chair.

Mr. Owen Fleming, in resuming the discussion, said they were considering, when they adjourned the previous week, a motion by Mr. Stannus, to incorporate the amount of subscription in the Constitution. He (Mr. Fleming) thought very strongly that the whole question of the subscription ought to be deferred until the By-law dealing with the subscriptions should be considered. He therefore moved as an amendment, "That Mr. Stannus's motion be deferred till the question of subscription comes up."

Mr. Leverton seconded the amendment, which, on being put, was carried.

Mr. Stannus then moved the adoption of the first By-law as follows:—

"3. The objects of the Association shall, so far as practicable, be carried out by means of Papers and Discussions; a Library; Lectures and Classes; a Studio; Prizes and Scholarships; Visits to works and buildings; Periodical Publications; and by such other methods as the Committee may determine from time to time."

Mr. Pratt seconded the motion.

Mr. W. H. A. Berry moved as an amendment that the words "a studio" be omitted from the By-law. However desirable and important it might be to have a studio in connection with the Association, he did not think it necessary to make it binding upon them; at any rate, until they knew something more about it, and how it was going to be carried out. It was always open to them, if they wished to have a studio, to institute one at any time.

The Chairman remarked that the Association had already declared that it was very desirable to have a studio added to the curriculum.

Mr. Berry said he knew that, but he did not think they were irrevocably committed to it.

Mr. F. R. Farrow said that during the past year the British Institution had offered to students of sculpture, painting, and architecture some valuable scholarships. For the architectural competitions some members of the Association wanted to enter; but it was a condition of the competition that the drawings made for the studentship should be prepared within the walls of the society to which competitors belonged. They had no accommodation for that, and, therefore, their men were not eligible to enter.

Mr. Berry's amendment not finding a seconder, fell to the ground, and after some further conversation the original motion was put and carried.

Mr. Stannus then moved the adoption of By-law II.:

"4. The arrangements for all the above methods, including the appointment of lecturers, instructors, and visitors, and the fees, &c., shall be determined by the

Committee; but members desirous of associating for the study of any specific subjects shall, with the approval of the Committee, be allowed to form classes, frame their own rules, and appoint their own officers."

Mr. E. R. Barrow seconded the motion.

Mr. W. J. H. Leverton moved, as a rider to the By-law, the following words:—

"The Committee shall have power to appoint such Sub-Committees, whether members of their own body or not, for specific subjects, as they shall think desirable."

Mr. Leverton added that the committee had already a great deal too much work to do, but under the new system the amount of work would be enormously increased.

The Chairman said he thought there was a good deal in Mr. Leverton's suggestion; but at the same time he thought that the terms of the By-law covered the object aimed at by the rider.

Mr. Hudson seconded the amendment.

Mr. Brodie said he thought the matter might very well be left to the Committee.

Mr. Cole A. Adams said he thought the interpolation of two words in the By-law would meet the case. He would suggest the insertion of the words "sub-committees," after the words "appointment of."

Mr. Hudson seconded.

After some further discussion, Mr. Leverton's rider was agreed to, and By-law II., as amended, was then put and carried.

Mr. Stannus then moved the adoption of By-law III. as follows:—

"3. Each Class shall submit a Monthly Report to the Committee."

Mr. H. O. Cresswell seconded.

Mr. C. H. Brodie asked why the annual report of the classes was not mentioned in the By-law? He moved as an amendment that the words, "annually and," be inserted before the word "monthly."

Mr. F. T. W. Goldsmith seconded the amendment.

Mr. T. E. Pryce, in supporting the amendment, asked Mr. Brodie to add as a rider the words, "That the Class Secretaries' annual reports be sent in before the end of June."

Mr. Brodie said that as they were making the session to commence in June instead of October, there was clearly no necessity to state in the By-law the date that the reports should be sent in.

Mr. Pryce then moved as a separate amendment that "The Class Secretaries' annual reports be sent in before the end of June."

Mr. F. R. Farrow, in seconding Mr. Pryce's amendment, said, in addition to the monthly and annual reports, he would like to see added to Mr. Brodie's amendment the words "and balance-sheets." It was very desirable that the committee should have the balance-sheets of the classes at the time they had the annual report.

Mr. Stannus said he would suggest the following consolidation of the various amendments:—

"Each class shall present a monthly report and an annual report and balance-sheet at the end of June in each year to the committee."

The suggestion was eventually adopted, and before the chairman then put By-law III., as amended, which was carried.

Mr. Stannus then moved the adoption of By-law IV.:

"4. Any gentleman desirous of becoming a member shall be proposed by two members, according to the form appended hereto, but the Committee shall have the power of nominating any candidate without the proposal of two members, and also of rejecting any proposal should they consider it desirable. Nominations shall be made at a General Meeting, and voted upon by show of hands at the next succeeding meeting. Voting to be by ballot if demanded, in which case the election shall be postponed for at least a fortnight, and notice given of such postponement at the meeting, and also sent to the proposers by the Honorary Secretaries at least a week before the election. In either case one adverse vote to five shall exclude from election. The Secretaries shall by letter inform each gentleman of his election."

Mr. E. S. Gale seconded.

Mr. F. T. Baggallay moved as an amendment to substitute the words "the result" for the words "his election," in the last sentence.

Mr. Sire seconded the amendment, which was carried.

Mr. Dicksee said, at the end of the first sentence of the by-law, the word "desirable" was used; what was evidently intended was that any undesirable proposal should be rejected, and not that the desirable proposal was to be rejected.

Mr. Cole A. Adams said the difficulty might be met by omitting the line "should they consider it desirable."

This alteration having been agreed to, the

DESIGN FOR DINING ROOM.

PHOTO: SIRIAGUE & CO. LONDON. PHOTOGRAPHED BY G. H. P. HARRISON. ENGLAND.

MR. J. ARMSTRONG STENHOUSE

original motion, as amended, was put and carried.

Mr. Stannus then moved the adoption of By-law V. :—

"5. A list of candidates, with their proposers, shall be exhibited in the premises of the Association during the meeting, and the nominations are made, and until the election takes place. No one whose nomination has been voted upon and negatived shall be again nominated during the same Session without the special sanction of the Committee."

Mr. Cole A. Adams seconded the motion, which was agreed to.

Mr. Stannus next moved the adoption of the following By-law :—

"6. Allied Societies may be admitted by resolution of the Committee, confirmed by a vote of the Association at a General Meeting. No alteration or modification shall subsequently be made in the Rules of any Allied Society without having been approved by the Committee of the Association."

Mr. E. S. Gale seconded the motion, which was agreed to.

Mr. Stannus then moved the adoption of By-law VII. :—

"7. Allied Societies shall have such rights and privileges, and shall contribute such sums to the funds of the Association, as shall be arranged between the Committees of the two Societies."

Mr. A. W. Earle seconded the motion.

Mr. Leverton proposed as an amendment the addition of the words, "But the details of the arrangement must be approved at the general meeting at which the admission is confirmed."

Mr. Cole A. Adams said that Mr. Leverton's amendment was met by By-law VI., which had just been passed. It was quite competent for a member to ask, when a proposal came up before a general meeting, upon what conditions society was admitted, and the Committee could be bound to give an answer.

Mr. Leverton then withdrew his amendment, and the motion was adopted.

The adoption of By-law VIII. was then moved by Mr. Stannus :—

"8. The arrangement with any allied Society shall be printable on the order of any session, by written notice on either Society delivered not later than the last day of April."

Mr. F. R. Farrow seconded the motion, which was agreed to.

Mr. Stannus then moved the adoption of By-law IX. :—

"9. The entrance-fee of each member shall be two guineas, and his annual subscription one guinea; but members residing prior to the first day of January, 1891, shall pay an annual subscription of half a guinea."

Mr. Owen Fleming moved as an amendment :—

"The entrance-fee of each member shall be one guinea, and the annual subscription one guinea; but members residing or having their place of business outside a radius of twenty-five miles of Charing-cross, shall pay an annual subscription of half-a-guinea."

He said they were all anxious to see the new scheme carried through, but by By-law IX. it is proposed that the whole burden of the additional expense which would result from the adoption of the new scheme should be thrown upon the young students who would come into the Association. He considered that a most important proposition. If the resolution was carried they would have no *locus standi* whatever to approach the Institute, or any other body, and ask them for help. It had been said that some members did not get anything for their subscriptions, but the question was not whether they received, but whether they were helping to forward the welfare of the profession and the Association. He thought it was very necessary for the Association to subscribe to educational schemes in its corporate capacity, was utterly ridiculous to think that the additional expenditure in connexion with the scheme could be raised out of the students' pockets.

Mr. Millard seconded the amendment. He declined to be a party to such a mean-spirited shuffle as that proposed by the Committee.

Mr. Cole A. Adams said he had always felt that if the subscription was doubled there could be many men who would leave the Association. It was not for them to analyse too closely the motives which might determine a man to refuse to pay to an Association a subscription which was double what he paid before. He was quite certain from what he had gathered from the young and old members of the Association whom he had spoken to on the subject, that if they agreed to Mr. Fleming's amendment there would be a large secession from the ranks of the Association. Mr.

Millard had characterised the proposal of the Committee as a shabby proceeding. He (Mr. Adams) did not see that at all. It was a perfectly fair and open proceeding. To those men who entered the Association in the future there would be advantages which they who entered it some years ago did not have. He did not think it would be harsh to those members who would join the Association under the new rule to raise their subscriptions, for there would be increased privileges. Then it was difficult to define the difference between a town and a country member. A country member might enter the Association under the half-guinea subscription, and yet he might come to town and join the studio (which he, Mr. Adams, hoped very much to see established) and classes very much in the same way that a young man who is articled to a solicitor comes and spends a year or two in town. He believed that as education advanced,—and it would advance, they could not stop it,—they would have students coming up and residing in London; and if the amendment was carried that would give rise to a good many complications. Even looking at the matter from the point of view of the poor student, the difference between half a guinea and a guinea was not so great. Did they want to hold out that it was such a cheap thing to come into the profession? He thought they would find that in the future only those gentlemen who had had a really good education would be received as architects' assistants. Then as regarded the guinea and two guineas, was it not a fact that the parents and guardians of the young men who entered the Association, or their masters, in the case of articled pupils, usually paid the money? The question had been carefully considered, and he thought they would show great wisdom and discretion in supporting the Committee in the line they had taken.

Mr. W. H. A. Berry said he agreed with Mr. Adams that it was not expedient to raise the subscription of the present members, but he most distinctly differed from him when he argued that the subscriptions of future members should be raised. That would be a very unfair and selfish thing to do. They themselves had enjoyed certain advantages in the Association at a given subscription, and he contended that the subscriptions of all members should remain as at present. They should go on holding out the same advantage to the present members and those who come after.

Mr. Hudson said he thought that those who paid half-a-guinea should not only be those living outside a radius of twenty-five miles of Charing-cross, but also those elected prior to January, 1891.

The Chairman then put Mr. Fleming's amendment, which was lost by a considerable majority.

Mr. A. W. Earle then moved as an amendment that :—

"The entrance-fee of town members shall be two guineas, and their annual subscription one guinea. The entrance-fee of members residing outside a radius of thirty miles of Charing-cross shall be one guinea, and the annual subscription half-a-guinea; but members elected prior to January 1, 1891, shall pay an annual subscription of half-a-guinea."

He contended that country members should have some difference made in their subscriptions, as they received such slight advantages from becoming members.

Mr. A. H. Clark seconded the amendment.

Mr. H. W. Pratt said he did not agree with the amendment, for it would be extremely difficult to define a country member. A man might enter the Association as a country member, and very shortly afterwards he might remove to town. As it was, many men gave their country addresses, and yet they were town members.

Mr. H. O. Cresswell said he thought Mr. Pratt's difficulties might be overcome. Town members might be those residing or having an office within thirty miles of Charing Cross.

Mr. E. W. Mountford said a member might be a country member for the first six months, a town member for the next three, and then a country member again for the remaining three months. What subscription was such a member to pay? It had been said that country members did not obtain many advantages from the Association. He would ask whether country members were of much use to them? A town member who attended the Association, and spoke at the meetings, was worth half-a-dozen country members. He thought it would be a great mistake to make a difference in the subscriptions.

Mr. F. T. W. Goldsmith said he could not

help thinking it would be a mistake to make any difference between the subscriptions or entrance fees of town and country members.

Mr. Cole A. Adams said he should certainly oppose the amendment, for the reason that had been stated by Mr. Pratt and Mr. Mountford. A little practical experience in such matters was worth an immense amount of theory.

The Chairman then put the amendment, which was lost by a considerable majority.

A Member, whose name was not announced, then moved as an amendment—"The entrance-fee of each member be one guinea."

Mr. Bonrell seconded.

The amendment was opposed by Mr. Pratt and Mr. Sirr, and on being put by the Chairman was lost.

Mr. B. Dicksee then moved as an amendment the following :—

"The entrance-fee of each member shall be two guineas, and his annual subscription 25s., which will entitle him to a copy of the Architectural Association 'Sketch-book' without extra subscription."

He said the object of his amendment was to raise extra money, and he estimated that if the subscription to each member, including the "Sketch book," be put at 25s., there would be an excess over the money received under the present system.

Mr. Earle seconded.

Mr. Cole A. Adams said he hoped the amendment would be defeated. The amendment, if carried, would tend to cheapen the "Sketch book" which was a very valuable publication.

The amendment was then put from the chair, and lost by a large majority.

By-law IX., without alteration, was then put and carried.

Mr. Stannus then proposed the adoption of By-law X. :—

"10. A member shall pay his entrance-fee and first annual subscription within two months of the day of his election, otherwise his election shall be void; and he shall be ineligible for re-election during the remainder of the Session."

Mr. H. W. Pratt seconded the motion, which was agreed to.

Mr. Stannus next proposed the adoption of By-law XI. :—

"11. Annual subscriptions shall be paid in advance at the commencement of each Session; but the subscription of any member elected after the last day of April in any year shall cover the ensuing Session."

Mr. F. R. Farrow seconded the motion.

The Chairman stated that the Committee had resolved, in the event of By-law X. being passed, that all the gentlemen nominated on December 12 for election on January 9, should be placed on the same footing as those elected prior to January 1, 1891.

The motion for the adoption of By-law XI. was then put and carried.

The adoption of By-law XII. was then proposed by Mr. Stannus :—

"12. A member shall be liable for the payment of his annual subscription until he has either ceased to be a Member under By-laws Nos. 13 and 14 or has signified in writing to the Secretaries (by whom it shall be acknowledged) his intention to resign; and has paid all arrears; but the Committee shall have power to reinstate any former Member who has paid all subscriptions due at the time of his resignation, and he shall not be required to pay another entrance-fee."

Mr. Farrow seconded the motion, which, after a verbal alteration, suggested by Mr. H. O. Cresswell, had been agreed to, was carried.

Mr. Stannus then moved the adoption of By-law XIII. :—

"13. A list of Members whose subscriptions are in arrear shall be posted in the premises of the Association. If any Member shall permit his annual subscription to remain in arrear for a period exceeding one Session, his name may be removed from the roll of Members by resolution of the Committee; but the Committee shall have power to reinstate him upon satisfactory explanation and payment of arrears."

Mr. Cole A. Adams seconded the motion.

Mr. F. T. Baggallay said he thought it ought to be stated for how long a period the list should be posted. He moved, as an amendment, the insertion of the words "one session" before the words "in arrears" in the first sentence.

Mr. Goldsmith suggested that the word "and" be inserted after the word "Association" and between the word "if."

The amendments having been seconded and carried, By-law XIII. was carried as amended.

Mr. Stannus then moved the adoption of By-law XIV. :—

"14. If the Committee shall consider that the conduct of any member has been derogatory to the Association

or his professional character, then they shall have power, after due inquiry, to expel him, provided they shall so decide by a majority of at least two-thirds of those present, and in any case by the vote of not less than eight of those present. If the Committee so decide, then the Chairman at the next General Meeting shall announce such decision, and the Secretaries shall thereupon communicate the fact by registered letter to such Member, and any subscription he may have paid for the current session shall be returned."

This having been seconded, was put to the meeting, and carried.

Mr. Goldsmith suggested that before the next By-law was considered, Rule III. of the Constitution, which had been deferred at the last meeting until the question of the subscription had been dealt with, should be considered.

Mr. Stannus then moved the adoption of Rule III. of the Constitution:—

"The Association shall consist of ordinary members and allied societies."

Mr. Pratt seconded the motion, which was agreed to unanimously.

The adoption of By-law XV. was then proposed by Mr. Stannus:—

15. "The Committee shall consist of the President, two Vice-Presidents, two Secretaries, and the Treasurer, the Librarian, ten Ordinary Members, and a representative of each Allied Society who shall be a Member of the Association. Six Members shall form a quorum."

Mr. F. R. Farrow seconded the motion.

Mr. W. J. H. Leverton, moved as an amendment the addition of the words, "No member of the Committee may hold any paid office."

Mr. Cole A. Adams said that the Constitution stated that they should be honorary.

Mr. Leverton said that that did not meet his case. It was proposed to engage somewhat extensively in paid teaching, and it would be part of the duties of the Committee to nominate the teachers and fix their fees.

Mr. Hudson seconded the amendment.

Mr. Stannus opposed the amendment on the ground that the Committee at times found it very difficult to get lecturers or teachers for the classes, and often had to undertake the duties themselves. The proposed amendment would debar them from doing that unless they were to forego an honorarium of a few guineas in aid of the expense of preparing their diagrams,—an honorarium which, as far as his experience went, did not do more than cover one-fourth of the actual outlay to which lecturers were put. Mr. Leverton was mistaken in supposing that these lectureships or teacherships were valuable pieces of patronage.

Mr. Cole A. Adams said he should oppose the amendment, because frequently men who were doing the best and most energetic work of the Association would be on the Committee, and not only that, but they would be teachers, and, to a very limited extent, paid teachers in the future.

The amendment was then put and lost.

Mr. Owen Fleming moved as a further amendment the insertion of the word "ordinary" before the words "member of the Association."

This amendment was agreed to, and By-law XV. thus amended, was adopted.

Mr. Stannus then moved the adoption of By-law XVI.:—

"16. The duty of the President shall be to preside at all meetings; and to deliver an address at the annual general meeting."

Mr. Farrow seconded the motion, which was agreed to.

Mr. Stannus next moved the adoption of By-law XVII.:—

"17. A Vice-President shall undertake the duties of the President in his absence."

Mr. Pratt seconded the motion, which was carried.

The adoption of By-law XVIII. was then moved by Mr. Stannus:—

"18. In the absence of the President and Vice-Presidents at the time for the commencement of any meeting, the Members present may elect a chairman for that meeting."

Mr. Cresswell seconded the motion, which was agreed to.

Mr. Stannus then moved the adoption of By-law XIX.:—

"19. The Secretaries shall have charge of all the Property of the Association, except the Funds, and the Committee Meetings; and shall, subject to the direction of the Committee, manage the general business of the Association."

Mr. Cresswell seconded the motion, which was carried.

Mr. Stannus moved the adoption of the next By-law as follows:—

"20. The Treasurer shall, subject to the control of the Committee, have the receipt and disbursement of the Funds of the Association; and shall present an audited account at the Annual General Meeting."

Mr. Cole A. Adams seconded, and By-law XX was agreed to.

On the motion of Mr. F. T. Baggalay the meeting was at this point adjourned. There are nineteen other By-laws to consider.

## Illustrations.

### DESIGN FOR A DINING-ROOM.

THIS interior is reproduced from a coloured drawing exhibited by the artist, Mr. J. Armstrong Stenhouse, in the Architectural Room of the Royal Academy Exhibition of this year, along with another drawing of a boudoir interior. We drew attention to them at the time as good examples of design of this class. The "strapwork" Elizabethan detail which is introduced is not a form of decoration we have much sympathy with, neither the weak-looking scroll supports to the chair-arms; but the general effect of the apartment is rich and harmonious, and preserves the general character suitable to a dining-room.

### HOUSE, WOLVERHAMPTON.

THIS design was submitted by Messrs. Bell & Roper in a limited competition which was decided in favour of Messrs. Grayson & Ould.

It was proposed to use red brick for the ground-floor walling, with stone dressings; and oak framing with a little hanging tile work above, and tiles for the roof.

The sketch plan sufficiently indicates the general arrangement of the interior, the fittings of which were to be in keeping with the building.

### ELGIN CATHEDRAL.

LIKE St. Andrews, the Cathedral of Elgin has suffered considerably both from fire and the mob. It is still, however, one of the finest ruins in Scotland, and is especially noteworthy for some very delicate details on the west doorway, which retains some of its figure sculpture. We give an elevation and section, with plans of the eastern end of the choir, with its flanking turrets, from drawings by Mr. R. B. Pratt. From what remains, it seems probable that the tracery in the head of the west window was of the same design as the circular one shown in the drawing. The two western towers are fairly perfect, and have some very beautiful detail, although the general effect is severe. In the south aisle are two windows still standing, one of which retains its tracery in almost a perfect condition. Most of the work in the building is of the thirteenth and fourteenth centuries, but there is some earlier work in the south transept. There are remains of a fine octagonal chapter-house on the north side of the choir, connected with the north aisle by a short passage.

### WESLEYAN CHAPEL AND SCHOOLS, WEST KIRBY.

THE Chapel, which is designed to seat 650 adults, is not yet erected.

Its plan is cruciform, with nave and transepts. It has a gallery on three sides, and organ-chamber behind the rostrum, over the vestry. The spire will be 90 ft. high. The estimated cost of this part of the scheme is 3,000*l.*, and the cost of the school portion of the scheme, as now completed, is about 1,050*l.* (exclusive of land).

The buildings consist of an assembly-room, one vestry, and three class-rooms. One of the latter is to be used as an infant-room, and the others are so arranged as to serve as transepts, opening into the assembly-room by means of rolling partitions.

The building material is local sandstone, rock-faced, with dressed stone for the front windows, coping, &c.

There is accommodation provided for 400 scholars.

The whole is designed with a view to its adaptability for purposes of worship until the main building (the chapel) is erected, and on this account the architectural features of the assembly-room have been specially studied. All the windows are glazed with cathedral glass in

quarries and margins, and behind the rostrum there is a traceried circular window filled in with a design.

The architect is Mr. John Wills, of Derby; and the builder is Mr. Wm. Christian, of West Kirby.

### NEW RAILWAY BRIDGES IN INDIA.

AT a recent meeting of the Institution of Civil Engineers, the President, Sir John Cooke, K.C.M.G., being in the chair, a paper was read on "The Lansdowne Bridge over the Indus at Sukkur," by Mr. F. E. Robertson, M.Inst. C.E.

At Sukkur, where the North-Western State Railway had been carried across the Indus, the river passed through an isolated ridge of nummulitic limestone, and was divided into two channels. The Sukkur Pass was bridged by three spans of 278 ft., 235 ft., and 94½ ft., respectively, while the Bori Channel was crossed in a single span of 820 ft. The steel superstructure of the last-named span was designed by Sir A. M. Rendel, K.C.I.E., and consisted of a pair of cantilevers each having a projection of 510 ft., carrying between them a central girder 200 ft. in length. The paper was principally a description of the methods employed in the erection of this span. Each cantilever had a vertical height of 170 ft. above the abutment, and at this point the principal members consisted of a vertical pillar and an inclined strut or jib, united at the top by a horizontal tie, and tied back by an inclined land-tie or backstay anchored into the rock. When the anchorage had been bedded, the inclined guy and the vertical pillar were erected by means of temporary staging, and were permanently connected at the top. The inclined strut, which was 230 ft. in length, was then built up from the abutment, being laid in its inclined position on staging at the lower end, and further supported, as it progressed, by temporary wire-ropes from the vertical pillar. For the erection of the permanent horizontal tie between the tops of the pillar and the strut, a temporary wire-rope suspension-bridge was thrown across the space of 123 ft. between their summits. This bridge carried a gantry, on which ran the travellers employed in erecting the steelwork of the horizontal tie. The cantilevers on each side of the river having thus been pushed forward with an over-reach of 123 ft., a system of running overhead rope-gear was fitted up, spanning the intervening gap and serving for the erection of the remaining members of each cantilever piece by piece. The ropes were worked from the summit of each cantilever by winches which were driven by a steam-engine on land by means of a running rope. When the cantilevers had thus been carried out to their full length, the central girder was erected upon a temporary inverted bowstring, which was slung across the opening with the aid of the overhead gear.

At a subsequent meeting of the Institution, the account of "The New Chittiravati Bridge, Madras Railway," by Mr. Ed. W. Stoney, M.Inst. C.E., was read.

The main line of the Madras Railway was originally carried across the Chittiravati River upon a plate-girder bridge, consisting of forty spans of 70 ft. each. This bridge was opened for traffic in 1868, and was partially destroyed by a great flood in October, 1874, when nine of the piers were undermined and overthrown. It was afterwards repaired, and the damaged piers having been replaced by screw-piles, the structure had served for some years to carry the traffic, but was now replaced by the bridge which formed the subject of this paper. The new bridge had a total length of 2,680 ft., consisting of nineteen spans of 140 ft. from centre to centre of the piers. It crossed the river alongside the old bridge, but more nearly at right angles to the stream, the approaches being formed by a railway diversion 1½ mile in length. The source of the river was 80 miles above the bridge, and in that distance it drained an area of 2,400 square miles. In the flood of 1874 its velocity was calculated to have been 8½ ft. per second, and the discharge 114,625 cubic ft. per second. As a rule the bed of the river was practically dry for nine months in the year, and taking advantage of this fact, the dry bed of the stream was made use of for the transport of materials, for the erection of the ironwork, and for the operations connected with the sinking of the pier cylinders and the well-foundations of the abutments. The foundations were carried down to the solid rock at a depth varying from

18 ft. to 80 ft. below the present bed, the overlying strata consisting of sand, gravel, and clay, and in some places of a deep bed of large trap holders. The cylinders were sunk by various processes, according to the nature of the ground, the greater part of the work being done by dredging, while some cylinders were partly excavated in the dry with the aid of pulso-meter pumps, and in others the work was carried on by divers or by pneumatic apparatus. The superstructure was designed for a single line, the girders being of the Murphy-Whipple type. The ironwork of each span was erected, during the dry season, upon carner-blocks laid upon the dry bed of the river, and was lifted into place by 60-ton hydraulic jacks applied under the end pillars of each girder. The weight of each span was 146 tons 12 cwt.

#### VIBRATION OF RAILWAY TRAINS:

AT THE INSTITUTION OF CIVIL ENGINEERS.

At a recent ordinary meeting of this Institution, Sir John Cooke, K.C.M.G., President, in the chair, a paper was read on the "Vibratory Movements of Locomotives, and on Timing Trains and Testing Railway Tracks," by John Milne, F.R.S., and John McDonald. This was an account of certain instruments which had been designed to register the oscillations and vibrations of trains, so as to give an automatic record of the run, and information as to the condition of the track. These instruments were modified forms of seismographs, the ordinary earthquake instruments being affected so much by the suddenness of the jolts, and by changes in inclination, as to be unsuitable for this purpose.

The apparatus for recording vertical movements consisted of a clock spring coiled upon an axle, and connected with a lever carrying a weight in such a way that when the spring was wound the weight was supported by it. The result of this combination was, that for up and down movements of the apparatus some point in the weight remained at rest, and the relative motion of the apparatus and the weight was recorded by means of a pointer attached to the lever.

Horizontal vibrations were registered by the movement of pointers attached to two pendulums, the planes of motion of which were at right-angles to each other. The simplest form of pendulum was a metallic cylinder, free to swing on pivots placed on its upper edge. The oscillations of the pendulum might be controlled by giving a certain frictional resistance to the movements of the pointers, as, for instance, by increasing the pressure upon the writing point. Another method of making the vibrations of the pendulum dead-heat, by coupling together two pendulums with a sliding joint, was also shown.

The recording-surface might be a drum, covered with metallic or ordinary paper and driven by clockwork, the pointers being strips of metal, pencils, or pens; and to obtain a record extending over a considerable period a long hand of paper rolled on a drum, as in the Gray-Milne seismograph, was pulled over another drum and wound up on a third, driven by its own system of clockwork.

Reference was made to fifty-eight locomotives now in Japan, on which experiments were carried out. In England, diagrams had been taken in carriages running on the London and North-Western, the Caledonian, the Great Northern, the South Eastern, and the Metropolitan Railways; and in America a diagram, the original of which was exhibited, was taken, showing the motion of a carriage between New York and San Francisco, a distance of about 3,300 miles.

As the diagrams produced by the vibration-recorder were evidently connected with the balancing of the engines, details of the weights of reciprocating parts and the balance-weights were given, together with the equivalent balance-weight, which was determined experimentally in the following manner:—A pair of wheels, with their balance-weights and crank-pins, were placed on the rails; a large round steel ring was then hung from the crank-pin, and from this weights were suspended until a balance was obtained. This weight hung upon the crank-pin was called the equivalent balance-weight, and it was found that when this weight was nearly equal to that of the reciprocating parts—that was to say, when the horizontal

component of the energy due to the reciprocating parts was balanced—the diagrams for longitudinal motion were small.

Most of the diagrams were taken on locomotives running on the line between Tokyo and Yokohama, a distance of 17½ miles, and they showed that there was a relationship between the character of the line and the recorded movements. Soft ground could be distinguished from hard ground, and the effects of bridges and culverts were recorded, all diagrams on the same line showing the same characteristics.

As an illustration of the use of the instrument, two diagrams were shown, taken on different engines running over the line from Shinhashi to Yokohama, the paper moving at the rate of 1 in. to the minute. It was pointed out that as Shinagawa was approached the diagram became larger. This was explained by the fact that this portion of the track rested on the mud of Tokyo Bay, and was, therefore, soft and yielding. At the third minute after starting a sudden movement of the pointer occurred as the engine passed one of the culverts, but the cause of this jerk had not been determined. The train was seen to have left Shinagawa two minutes late, and to have stopped at Omori a minute and a half, instead of one minute, the schedule time. Between Omori and Kawasaki there were irregularities indicating soft places, but the most important mark occurred in the second span of the 40 ft. girders forming the water-way leading up to the large bridge at Kawasaki. This mark was found regularly in all the diagrams, and a staff of workmen who knew nothing of the experiments having been sent to examine the place, reported that a sleeper on the second span of the down track yielded, when a train passed, twice as much as any of the other sleepers. Between Tsurumi and Kanagawa the diagram was rather larger, indicating a soft place that required attention. Yokohama was reached four minutes late, the places where time was lost being easily determined upon a close examination of the diagram.

The record of longitudinal motion was found to show most clearly differences in balancing, the size of the diagrams upon engines which differed only in the balancing having been as 6 to 27. A striking feature in the diagram of longitudinal motion was that it indicated ascents and descents by deviating to the right and left of a median line. Curves were marked in a similar manner by the portion of the instrument recording transverse motion.

The observation that certain locomotives gave a larger longitudinal diagram than others suggested that such engines were not exerting their power in an economical manner. It was found that the engines which had used the least coal per mile were those in which the difference between the weight of the reciprocating parts and the equivalent-balance was small; and, on the contrary, in those engines where the difference was large the consumption of coal and oil was considerably greater. It occurred to the authors that engines yielding different diagrams might show a difference in the wear of their tires. The data obtainable were meagre, but they appeared to indicate that those engines which gave a small diagram for longitudinal motion did not wear out their tires so quickly as others.

The conclusions arrived at by the authors were:—1. The vibration-recorder might be of value to those who had to deal with the management of the traffic, inasmuch as it furnished details of the times of stoppage and the speed at any part of the run. 2. The instrument might be used by those who had to inspect lines. Variations due to carelessness on the part of the platelayers were recorded. Curves, ascents, and descents, and even slight variations in grading, were indicated; faults in sleepers, irregular yieldings on bridges, soft portions of the track, and other imperfections were definitely marked; and changes in the permanent way could be at once detected if such diagrams were taken at intervals. 3. The vibration-recorder might furnish information of value with regard to the manner in which a locomotive should be balanced, the vibrations due to this cause being measured by the diagrams for longitudinal and vertical motion. For this purpose, diagrams might be taken on a surface running at the rate of 1 in. per second. In this case each vibration of the locomotive was recorded separately, and from these diagrams the maximum acceleration of each backward and forward motion had been calculated.

#### CRYSTAL PALACE SCHOOL OF ENGINEERING.

THE certificates gained by the students of the Crystal Palace School of Practical Engineering during the past term were presented on Saturday afternoon, in the lecture-room of the school, South Tower, by Major F. A. Marindin, R.E. (Government Inspector of Railways). The report of the Examiners was read by Mr. F. K. J. Shenton.

Mr. C. R. Hanson, who examined the students in the Mechanical Engineering Department, reported that of the fifty students who attended the lectures, thirty-eight were eligible for examination, and of these twenty-two satisfactorily passed. The practical training which the students received in the School could not fail to be of use to them in after life, whether or not they continued to practise the profession they were now training for. He was much struck by the excellent work that had been done during the term by many of the students in the workshops.

Mr. W. T. Douglass, who conducted the examination in the Civil Engineering Department, in his report said the regularity and efficiency of the teaching and the distinction gained by the students were entirely satisfactory. Good work continued to be done, and a high reputation was gained by the students in the various branches of the profession for which they were prepared in the school. It appeared that the School was advancing in numbers, and, as in past terms, had been distinguished not more by the ability and energy of the teachers than by the great earnestness of the students.

Major Marindin, in addressing the students, asked those who had won awards to remember that all the prizes and all the certificates in the world would not ensure success in their profession unless they worked hard at their studies for years to come. Those who had not gained certificates he hoped would not be discouraged, but would go on trying, always remembering that many men who had failed in their examinations in their youth had shown by subsequent achievements that examinations were not the only test of a man's ability. He had had an opportunity of inspecting the School, and had been struck not only with the excellent models and other practical work, but with the drawings in the civil engineering section, which were quite up to anything he had ever seen in an engineering school. Another thing that struck him while making his inspection was the great advantages the present generation enjoyed in schools of this kind compared to those possessed by men like Stephenson. All the more credit was, of course, due to men who had come to the front entirely by their own exertions, but it was satisfactory to think that the advance that had taken place in the means of obtaining scientific education had borne good fruit. Looking at the great engineering works of late years, such as the St. Gothard Tunnel, the Forth Bridge, the Eiffel Tower, and the Severn Tunnel, which was, in itself, a monument of difficulties overcome, he had good reason to be satisfied with the results. No doubt in other scientific professions there had been great progress, but it was satisfactory to know that their own profession had advanced so much. With regard to railway engineering, with which he was more intimately acquainted, he wished to say that a railway engineer, in the first place, must be a good surveyor. He should also have an intimate scientific knowledge of all classes of building materials, especially iron and steel, and a knowledge of mechanics was essential. There was yet another quality they should possess, and that was that they ought to be leaders of men. This was important, because, however skillful they might be, and although having every scientific appliance at their command, there would always remain that one weak link in the chain, viz., human fallibility. Those who controlled the railways now pretty generally recognised this, and the result was that there did not, he believed, exist in the kingdom a body of men more intelligent, more able, more steady and respectable, taking them all round, than the servants of the railway companies of Great Britain. Probably some of them believed that railway engineering must soon come to an end in this country, and that the profession was getting overcrowded. Those who did entertain that idea had plenty of other fields open to them. Electricity, for instance, —that infant science the future of which no one could foretell, and the importance of which it

was almost impossible to exaggerate,—opened a wide field for the engineer. Another matter to which they could turn their attention was that of how to deal with the smoke of our large towns, and anyone who was so fortunate as to solve that problem would earn the gratitude of everyone, and deserve a monument. All things considered, he did not think that the profession, even in this country, would love to pine for fresh worlds to conquer.

The certificates were then distributed in the following order:—

**Mechanical Engineering Lecture Examination.**—R. F. Hull, W. Beer, A. H. Daniel, A. S. Harbord, J. F. J. Reynolds, H. C. Rose, H. F. Key, W. L. Wilson, A. J. Hobman, G. A. G. Jensen, F. W. Luxton, G. N. Spencer, A. F. Baynham, T. F. Firr, W. L. Wynn, G. H. Powell, P. D. Michol, G. H. Laidman, L. C. H. Savory, S. T. Edge, H. T. Jackman, F. H. M. Maynard.

**Drawing Office.**—C. N. Spencer, R. Beeching, A. J. Hobman, W. Margetts, A. W. Pevitte, T. F. Firr, P. H. Nichol, H. E. Bromsge, and H. C. Adams.

**Patent Shop.**—A. S. Harbord, W. L. Wynn, A. F. Baynham, L. C. H. Savory, J. E. Campbell, A. D. Allport, R. Roberts, H. T. Jackman, G. H. E. Cooke, R. T. Goodman, T. J. Freme, and J. R. E. F. Davy.

**Fitting Shop.**—H. C. Rose, W. L. Wilson, W. Beer, S. T. Edge, A. E. Franks, H. F. Key, J. F. J. Reynolds, A. H. Daniel, F. R. Hull, A. Patch, F. W. Luxton, C. L. Curtis, F. H. M. Maynard, G. H. Powell, F. H. Kraus, F. W. Delman, and L. N. C. Knapp.

**Civil Engineering Section.**—First term: F. D. Maw, W. H. Sadler, G. H. Laidman, T. Nitta, A. J. Kenward, C. J. Walker, E. M. L. Nicholls, and S. R. E. Cooke. Second term: W. B. Fletcher, F. W. Mandlow, and H. K. Forbes. Third term: H. E. Heald, J. W. Key, C. W. Spencer, W. J. Watson, A. Woodbill, J. E. Macdonald, G. F. Moorehead, P. M. L. Nicholls, and S. R. E. Cooke. Fourth term: W. B. Brewerton, A. B. Matthews, P. W. Wheldon, F. D. Workman, A. H. Roberts, G. R. S. Kirkpatrick, E. W. J. Acton, S. C. Harrold, D. A. Aerial, W. B. Sate, H. Remell, and F. L. Mirus. Fifth term: W. G. Wates, H. W. Blather, and A. H. Alton. Electrical Section: C. B. Clay and E. S. Eccles.

The chief honour was awarded to Mr. W. G. Wales, who received a bronze medal for having, during his course through the school, obtained the necessary nine certificates, none of which were below third in order of merit. It should be mentioned that only eight of these honours have been awarded in the eighteen years of the School's existence.

Mr. J. W. Wilson, Principal of the School, and other gentlemen, addressed the students in the course of the proceedings, and votes of thanks were accorded to the Examiners and to the Chairman.

#### ARCHITECTURAL SOCIETIES.

**THE ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.**—The annual general meeting of this Institute was held on the 13th inst., at 37, Dawson-street, Dublin, Mr. Thomas Drew, R.H.A., President, in the chair. Amongst those present were—*Ex-officio*—Sir Thomas Deane, G. C. Ashlin, W. H. Byrne, J. B. Carroll, C. Geoghegan, R. C. Millar, W. M. Mitchell, A. E. Murray, J. J. O'Callaghan, W. Stirling. *Members*—T. M. Deane, J. Freeman, J. Holloway, W. Kaye Parry, J. H. Pentland, W. J. Symes.—The hon. secretary read telegrams and letters of apology for non-attendance from Messrs. S. Symes, W. H. Beardwood, W. Gillespie, and J. L. Robinson, Dublin; also from W. C. Cox, Limerick; J. H. Fullerton, Armagh; H. Watt, Belfast, and P. J. Lynch, Carlow.—The first business brought before the meeting was the election of Council and officers for the ensuing session. The result of the ballot for these was subsequently announced by the scrutineers, Messrs. W. J. Symes and W. M. Mitchell, as follows:—President, Mr. Thomas Drew; Hon. Sec. and Treasurer, Albert E. Murray; Members of Council, Messrs. J. J. O'Callaghan, S. Symes, J. B. Carroll, Sir T. N. Deane, G. C. Ashlin, J. H. Pentland, C. Geoghegan, R. C. Millar, W. M. Mitchell, J. L. Robinson; Auditors, T. M. Deane, W. H. Byrne.—Mr. John Charles Wilmot, Dublin, was proposed by the President as member, seconded by Mr. A. E. Murray, and admitted.—The Hon. Secretary and Treasurer, Mr. Albert E. Murray, then read the report of the Council and the Treasurer's report for the past year.—The adoption of the report was proposed by Mr. J. Rawson Carroll, seconded by Sir Thomas Deane, and agreed to.—The President asked if there were any observations to be made regarding the Dublin Corporation Bill, and also the Architects' and Engineers' Bill, alluded to in the report just read.—Sir Thomas Deane gave his views regarding the advantages of a University degree. The subject had been warmly taken up some time since, in bringing it before Trinity College; but, so far as the matter went at the time, fell through for want of support.—After some discussion, it

was proposed by Mr. J. H. Pentland, seconded by Mr. W. K. Parry, and carried:—"A sub-committee, consisting of the President, Secretary, Sir Thomas Deane, G. C. Ashlin, J. H. Pentland, and W. Kaye Parry, be appointed to report to the Council on the question of the establishment of a University of Architecture, as proposed in Mr. Arthur Hill's letter of the 5th of September to the Hon. Secretary."—Considerable discussion took place on the subject of the proposed new form of building contract, when it was ultimately agreed that, as a committee of the Royal Institute of British Architects was at present sitting on the question, no further steps should be taken until the views of that body had been ascertained, it being desirable that all contracts should be as uniform as possible.—The proceedings then terminated.—The annual dinner of the Royal Institute was afterwards held at the Grosvenor Hotel, Westland-row.

**LREBS AND YORKSHIRE ARCHITECTURAL SOCIETY.**—On the 18th inst., in the Corporation Art Gallery, Leeds, Mr. Wyke Bayliss, F.S.A., gave a lecture, entitled "At the Cathedral Door." Mr. Bayliss said that he who would fully see the splendour of a cathedral church must first learn to use his eyes; and he who visited a cathedral church without some knowledge of art saw indeed, but knew not what he saw. A cathedral was an art-education in itself. Westminster, Canterbury, York, Durham, and Winchester were not only churches for theologians,—they were, in their subtle forms and finely-balanced proportions, schools of art which none of them could afford to disregard. In the course of his remarks, Mr. Bayliss gave a description of the different effects produced upon the visitor of the Cathedral of St. Peter's at Rome and the Cathedral at Milan. The construction of St. Peter's, he said, consisted of four great single arches, formed by the intersection of the transept. Upon them rested a circle binding them together, and in its turn upholding the vaulted dome. Nothing was hidden; everything could be understood; it was in art what a perfectly lucid sentence was in rhetoric,—it carried the mind by storm. But Milan,—how different was the spell with which it affected the visitor. There they saw line upon line, arch over arch, vault over vault, in infinite complexity of form. How it came about one did not ask, its effect was like that of the hidden music which would steal through its dark aisles, its source unseen. St. Peter's held one by the power of the intellect,—its spell was on the brain; Milan held by the power of the imagination,—its spell was upon the heart. In the course of his lecture, Mr. Bayliss sketched in chalk a number of illustrations of the different styles of ornamentation of columns and arches, and explained how the growth of beauty had gradually taken place. A hearty vote of thanks to the lecturer was accorded at the close.

**GLASGOW INSTITUTE OF ARCHITECTS.**—At a general meeting of this Institute recently, the conditions of competition for designs for workmen's dwellings in High-street were again considered, when it was unanimously agreed to record regret that, after having been waited on by a deputation from the Institute, the Improvement Trustees had not seen their way to amend the conditions of competition to meet the views of the Institute as expressed by the deputation.

**GLASGOW ARCHITECTURAL ASSOCIATION.**—Mr. Francis H. Newbery, head-master of the Glasgow School of Art, gave a lecture before this Association on the 16th inst., on "Impressionism in Architecture." The President (Mr. William F. Anderson) occupied the chair. Impressionism in architecture, the lecturer defined to be the imitation of a suggestion from nature, and his object was to prove the need of cultivating this spirit if architecture is to regain her first vitality. As accepted by painting and sculpture, the result is seen in their having attained positions not originally theirs. This theory he illustrated by an allegory, in which a queen and her attendants, twin sisters, have perpetual youth ensured by tallsmans given by the good fairy. The queen loses hers, and so wanes in beauty, and in process of time the image of the court is transferred to her erstwhile attendant. This tallisman of Dame Nature Architecture has well-nigh lost, and appears to rest content with self-admiration of her long past golden age. Sculpture and painting, on the other hand, overstepping precedent when it became irksome, have again and again had recourse to nature,

and so preserved vitality. This contention the lecturer illustrated by instancing the several historical schools. He was not to be supposed as indifferent to the glories of classic art while decrying classic tradition. Of modern instances of a right impressionism, veritable revivals of first principles, Waterhouse's Natural History Museum in London and "Greek" Thomson in Glasgow were cited.

#### ARCHAEOLOGICAL SOCIETIES.

**NEWCASTLE ANTIQUARIES' SOCIETY.**—On the 17th inst. a meeting of this society was held in the Castle, Newcastle. Dr. Bruce presided. The secretary (Mr. Robt. Blair) read correspondence on the subject of the proposed removal of the Glasgow Records of Durham from London to Durham. After a short discussion it was agreed to allow the matter to drop. Mr. Boyle read "Notes on Dr. Hunter's copy of Bourne's 'History of Newcastle,' with a catalogue of its manuscript contents." Mr. Bates (the High Sheriff of Northumberland) read a paper on "Additional evidence of church dedications in Northumberland." The business then concluded.

**GLASGOW ARCHAEOLOGICAL SOCIETY.**—The monthly meeting of the Glasgow Archaeological Society was held on the 18th inst. Mr. Honeyman, the President, read a paper on "Recent Alterations in the Choir of Glasgow Cathedral, and Notes on the Post-Reformation Chancel Arrangements." About seven months ago, he said, operations were commenced in the Cathedral with the view of improving the arrangements for the congregation, and it was thought desirable to have a record of what was found in the course of the operations and what was done. When alterations were made forty years ago no record was kept. On the present occasion the old pulpit was removed, and the enclosure round about it was cleared away. The floor was opened up to the extent of about 600 superficial feet. The lecturer also mentioned that at the west end of the choir there was a brick sarcophagus, which had evidently been put there during former alterations. It was evident, he said, that the builders of this nineteenth century kist had made a mistake in the measurement, as the lid was a foot longer than the kist. He pointed out that these facts indicated that there had been great carelessness in looking after the work, and that the workmen had evidently been left to do what they liked. In regard to the alterations recently made, the lecturer dealt with them at length. They had covered the whole of the area with a marble floor, which, in order not to overload the arches below, was carried on dwarf walls. He also mentioned the marbles which were used as coming from Ireland, Italy, Portugal, and Africa. These had been placed there by Messrs. Galbraith & Winton, a member of which firm, Mr. Gilliland, had given the whole in memory of his father and grandfather, who were buried in the adjoining ground. Mr. Wm. Jolly afterwards read a paper on "Some Notes on the Antonine Wall."

**THE AMERICAN FORESTS.**—According to an official report on the consumption of forest supplies by American railways, about 73,000,000 cross-ties are annually needed for new construction and renewals by the roads of the United States, which is equivalent to about 365,500,000 cubic feet of raw material. The various woods are estimated to be used in about the following proportions:—Oak, 45,000,000; pine, 12,500,000; red, white, and California cedar, 5,000,000; chestnut, 3,500,000; redwood, 2,500,000; hemlock and lambrak, 2,500,000; cypress, 1,500,000; other kinds, 500,000 cubic feet. Thus oak furnishes about 60 per cent. of the supply, and not only from choice trees mainly, but from the young growth, which may make one tie to the tree or one to the tree. For bridge and trestle work, 40,000,000 cubic ft. of sawn material may be added to the requirement, so that a total of 500,000,000 cubic feet of wood in the shape of round timber for railway purposes seems to be a reasonable estimate of the annual consumption. This involves the selection of the best timber from probably more than 1,000,000 acres of natural forest lands, and it is calculated that not less than from 10,000,000 to 15,000,000 acres of well-managed forest would be required to furnish this quantity continually, or, with the present absence of management, the area to be reserved for the purpose would have to exceed 50,000,000 acres, or more than 10 per cent. of the present forest area of the country. The report furnishes a powerful argument in favour of the advocates of the universal adoption of metal sleepers for the railways of the United States.—*Iron.*

THE GATES ORE BREAKER.

The principle of this machine may be described as that of a vertical, tapered, and fluted head gyrating in a cylindrical hopper. The top of the spindle forming part of the head is central. The lower end is eccentric, producing when in operation an agitating motion. The continuous gyration of the solid convex head against the quartz, between it and the concave lining, insures the breakage of the material into uniform cubes.

Whatever the obstinacy of the material may be, the head adjusts itself to the required speed.

The machine is claimed to be a great improvement on the flat jaw breaker, where an immense strain is thrown upon the bearings. The machine can be driven either by steam or hand-power. We saw the machine tested with a sample of obstinate gold quartz. Irregular shaped blocks, about 3 in. cube, weighing 2 lb. were put through and crushed to the size of one-eighth to three-eighths of an inch in the space of seven seconds. Two other different samples were crushed in proportionate time.

The larger sized machines, of which there are eight varieties, are used for preparing macadam, concrete, granite work, &c. One crusher is said to have a capacity equaling 150 tons per hour; the cost being computed at less than 3d. per ton. These produce a uniform size of about 1 1/2 in. cube. By returning the material from a large machine to a small one, it is brought almost to the fineness of Thames sand.

The machines can be fed from the tip-cart right into a hopper-head on a level with the top, regulated by one man. The driving-wheel is removable while in motion for safety in the event of chocking.

Correspondence.

To the Editor of THE BUILDER.

DISCOVERY AT BEVERLEY MINSTER.

SIR,—In the account of the discovery of the foundations of the Chapter-house, reported in your last issue (p. 479) from the *Manchester Courier*, there is a slight inaccuracy which it may be well to correct, as it is, unfortunately, possible that the remains may soon be covered up again.

The base of the central column of the crypt of the Chapter-house is not circular; it consists of a chamfered plinth octagonal in plan, with the angles of the octagon placed on the centre lines of the sides of the octagonal Chapter-house, and upon this plinth is a moulded base of plain character, of sixteen sides on plan, the projecting angles below the moulding being simply bevelled downwards. The central column was, therefore, a sixteen-sided figure on plan, about 2 ft. 8 1/2 in. in diameter. Part of the stone floor of the crypt still remains around this base.

The other fragments discovered are a part of the south-west wall of the octagon (including the internal angle of a buttress), one side of the buttress between the eastern and south-eastern faces (the base-course of which is retained upwards as if to meet the base-course of the north-east transept), and part of the inside face of the south-east side of the octagon. From these fragments it appears that the crypt under the Chapter-house has an octagon of 28 ft. 7 in. internal diameter, and 38 ft. 5 in. external diameter above the base-course. The low level of the base-course, compared with that of the main building, is remarkable, the difference being some 4 ft. 6 in. All the masonry uncovered is set with sand or fine gravel joints, apparently quite without lime. The remains must be contemporary with the lancet choir and transepts, one of the mouldings of the base-course being of exactly the same section as one in the base-course of the main building.

It is to be hoped that the Minster authorities may be induced to continue the excavations, and to keep open the very interesting fragments which have already been uncovered.

JOHN BILSON.

Hull, December 20, 1890.

The Student's Column.

HOT-WATER SUPPLY FOR BATHS, LAVATORIES, &c.—XXVI.

LOW-PRESSURE BOILERS, ALSO FITTING HIGH-PRESSURE BOILERS FOR TEMPORARY LOW-PRESSURE WORK.

(Continued).

WHEN a range has two ovens and has a low-pressure boiler, this requires most usually to be fixed at the back of the fire, occupying the same position as a high-pressure boiler would; this boiler must of necessity be boot-shaped, as a tolerably large space must be allowed for ebullition, as the water in these boils so violently; if a good space is not left, then the annoyance of boiling-water being ejected from the steam-pipe is experienced.

Fig. 70 shows the usual method of connecting

FIG. 70.

up a low-pressure boot-boiler. The cold supply is carried in near the bottom as usual, and the draw-off service is taken from about 4 to 5 in. below the water-line, so as to avoid drawing cold water until the hot is exhausted, as just explained.

The ball-valve should be regulated so that the boiler fills within about 4 in. of the top, so as to leave ample room for any violent motion of the water, and there is no objection to this large space in this instance, as only the lower part of the boiler comes in contact with the fire. The real object of the large space is to permit a free escape of the steam above the water, as should any particles of water be thrown by their motion into the mouth of the escape-pipe, the steam will instantly eject them into the chimney, sometimes a pint of water at once. All pipes that are run behind ranges should be iron,—never lead, as there are numerous enemies to this latter pipe, and should a leakage show itself the range has to be removed before a repair can be effected; this also applies to ranges with side boilers, when it becomes necessary to carry a pipe round the back or beneath the range.

It will be noticed in the drawing that there is a "set" or crank in the steam-escape or expansion-pipe. This answers a very useful purpose in preventing any small quantity of water from being ejected, as when the water (unless in quantity) is propelled up the steam-pipe, this obstruction will prevent its free passage and escape into the chimney under ordinary circumstances. These boilers should be of welded wrought-iron.

Sometimes a low-pressure boiler is used for supplying hot water above its own level by regulating the ball-valve to a height that will allow of the water rising up within the expansion-pipe, as fig. 71. This will answer, certainly, but if the boiler is a rapid heating one, a good deal of annoyance will be experienced by the steam forcing water out of the pipe, even if this pipe is carried to an unusual height; or should the steam experience any difficulty in escaping, it will probably make its way through the cold supply cistern, causing this to overflow. This arrangement cannot be recommended. It is better to have the water drawn from the level of the boiler, or else have a small tank and circulating pipes fitted up.

The ball-valve, which is an essential feature in the self-filling apparatus of a low-pressure boiler, is frequently a source of complaint; for, as every practical man knows, a ball-valve anything near perfection has not yet been made; but perhaps of the different varieties those that

are constructed upon an equilibrium principle give the best results. Ball-cocks are now losing favour, as they act so slowly in filling a boiler. While the level of the water is low the cock admits an abundant supply, but as the

FIG. 71.

level rises the supply decreases gradually, so that when the water is within 1 in. of its accustomed level the water is only dribbling in, and this slowness in filling gives every opportunity for the fire to injure the boiler-plate, besides being objectionable in other ways.

The fitting-up of a high-pressure boiler before the circulating apparatus is erected, so that the boiler has to be used for low-pressure purposes temporarily, sometimes for a few months, is of common occurrence, and can usually be arranged without difficulty or great expense. This can be done in two or three ways, but the least expensive method costs the most to re-convert when the hot-water circulation is ready, and vice versa.

The least expensive method is to fit in the high-pressure boiler and construct the flue to it at the back of the range, and then to carry a flow and return service from the boiler just through the chimney jamb (as fig. 72); these two services

FIG. 72.

being capped off until required for circulation. From the flow-pipe is carried a steam escape pipe as shown, but the boiler is fed and drawn from in the same manner as a low-pressure boiler. The flue under the boiler requires to be stopped while it is used for low-pressure purposes; this is best done by a piece of fire-brick cut to shape, as it is easily removable, leaving the flue clear when needed.

When the conversion is made, the flue is cleared as just explained, the flow and return services are uncapped and connected, the steam escape and the cold supply pipes are both stopped off, and the draw-off tap can be left as an emptying service if the tap has a loose key; it is then ready for use, provided the circulating apparatus is complete.

Another method is to complete the apparatus from boiler to cylinder, but supplying the cylinder temporarily with a supply cistern, as fig. 73. This is without doubt the best arrangement, if the conversion is to be made afterwards, as when it is done the work is reduced to a minimum—in fact, it is only

just necessary to put the fire out, as all that is needed is to complete the apparatus above the cylinder, the draw-off tap below answering for

FIG. 73.

the emptying service. By this arrangement very little expense is incurred but what is necessary to the complete apparatus.

In conclusion, let it be the ambition of everyone to do this work really well. There is no branch of mechanics which will permit of careless labour so little as this, and workmen have an opportunity of displaying ability and discernment to a far greater extent than in many other trades.\*

#### GENERAL BUILDING NEWS.

**NEW MUNICIPAL BUILDINGS FOR BLACKPOOL.**—At the meeting of the Blackpool Town Council on the 17th inst. the General Purposes Committee's recommendations with respect to new municipal buildings were confirmed. The proposal is to purchase the plot of land in Victoria-street, adjoining the town's yard, extending to Bank Hey-street. About a dozen large houses and several shops and two licensed houses will have to be pulled down, and it is intended to make a large square, in which will be included a town-hall, with all the Corporation offices together—police offices, free library, market, art gallery, &c. The intended size of the town-hall is 72 ft. on the front, and extending 70 ft. backwards, altogether covering an area of 5,040 ft.

**LISWORTHY CHURCH, NEAR COWBRIDGE.**—The report of Messrs. Bruton & Williams, architects, of Cardiff, has been adopted for the restoration of Lisworthy Church, near Cowbridge, Glamorgan-shire.

**RESTORATION OF BRADFORD ABBAS CHURCH.**—The old parish church of Bradford Abbas, Dorset, which dates from the fifteenth century, has just undergone restoration, at a cost of 1,400l. Mr. C. B. Bunson, architect, of Yeovil, furnished the plans; and the restoration has been carried out by Mr. R. Andrews, of Thornford.

**NEW CHURCH, BIRKDALE, SOUTHPORT.**—The new Church of St. John, Clifford-road West, Birkdale, Southport, has just been completed. The structure has been erected from the designs of Messrs. Palsey & Austin, of Lancaster, to supply the requirements of a portion of St. James's Parish, Birkdale. The architects' plans are not at present being carried out in their entirety, the sitting accommodation being for 366 persons, against a total of 510 sittings provided for in the complete structure. The cost of the work is 2,620l.

**RE-OPENING OF CHALFORD CHURCH.**—Chalford church, near Stroud, was re-opened on the 9th inst., after having been closed for repairs and improvements. The builders were Messrs. Drew, of Chalford, and the architect was Mr. B. Edmund Ferrary, F.S.A., London. The galleries have been removed, the church has been re-roofed, re-seated, and re-floored, and a new heating apparatus has been inserted. The whole of the work will cost about 1,200l.

**NEW SCHOOLS, HORWICH.**—New Wesleyan Sunday-schools, situated at the rear of the existing chapel at Horwich, Lancashire, have just been completed, at a cost of 3,034l. The new schools are estimated to afford accommodation for 600 scholars. The style is simple Gothic, and the building was erected from designs by Messrs. Woodhouse & Morley, architects, Bolton. The contractors were Dougill, Horwich; carpenters and joiners, Messrs. Moore Brothers, Rawtenstall; slating, Messrs. Warr & Co., Bolton; plumbing, Mr. R. Cherdlen, Bolton; and plastering and painting, Mr. A. E. Warburton, also of Bolton.

**A NEW VETERINARY ESTABLISHMENT AT THE WEST END.**—Messrs. T. A. Doller & Sons' new premises at 56, New Bond-street, which have just been completed, occupy a site on the east side of the street, between Brook-street and Maddox-street. Passing through an archway supported by granite pillars and fitted with ornamental iron gates, the visitor reaches a paved yard, half of which is covered

\* These papers will be published in book form by Messrs. E. & F. N. Spon, Strand, London.

in with a glass and iron roof. Beginning at the right or south side of the premises there is the clerks' office—cozy, well-lighted apartment, supplied with all the modern implements of communication, bells, speaking-tubes and telephone. Next on the ground-floor is the consulting-room, from the window of which a view of the whole place is commanded. This is the heart of the establishment; everything centres round and is subservient to it. Book-cases and shelves round the room offer resting places for a complete reference library, not only of purely professional works, but of the literature of collateral arts and sciences relating to live stock. The various said-books and calendars of pedigree stock, from the thoroughbred to the Shetland pony, and from the shorthorn to the pig and sheep, will all be here when the wants of clients render necessary a reference to them. Beyond the *sanctorum sanctorum* are large coach-houses and store-rooms, and at the end of this range a row of boxes and stalls, fitted with hot and cold water, and books and rings for slinging or otherwise controlling sick and injured horses. On this level there is also a covered ride, in which horses may be galloped to test their soundness. The ends are circular, and are provided with inspecting rooms, from which the surgeon may safely view the horse without approaching, turning, or reeading. On the north side, commencing at the entrance, is first the inclined way leading to the stabling on the first floor. About this nothing need be said except that its gradient is much easier than is usually possessed by that way, and that by a novel arrangement of paving material a secure footing is always assured. Beyond it is a ten-stall stable admirably fitted, lighted, and ventilated. Further on is the shoeing-Forge—almost unique in its arrangement and fittings; the two fires are back to back, and the bellows, usually so unsightly and cumbersome, by cranks and levers. Each horse has a water tap, which serves the double purpose of saving the nozzle from injury by heat, and providing a constant supply of hot water for the stables. Coming back to the inclined-way, we find behind it a Turkish bath for horses, fitted with air-shaft, and all the necessary hygienic appliances for this form of therapeutic or hygienic agent. A "Constantine" Turkish bath-stove will provide the means of heating; hot and cold water are laid on for shampooing, and the walls are of smooth hard cement to allow of frequent washings down. Here also are the harness-room, the pharmacy, the surgery, and fitted for a working institution. At the top of the incline is another harness-room, and a mess-room for the men. Then, on the left, a large isolation-hox, and on the right two loose-boxes for ordinary patients. Beyond these we enter the ten-stall stable—the finest stable in the establishment. The floor is of Wilkinson's patent metallic paving, a very durable, hard and clean substance, giving good, firm footing to the horses. The walls are of enamelled bricks, with tiles of a cool green tint in front of the stalls. There is a timber roof, stained and varnished, and lighted by a 20-ft. lantern, all the windows of which are opened simultaneously by turning a crank handle (Adam's patent). The same arrangement is used throughout the stables and offices. Beyond, and communicating with this stable, is the operating theatre, a spacious room, lighted by a lantern and two windows, and floored with wood blocks. Ample space is provided for hay and corn, and at the extreme east end of the building stands the gas-engine room, where all chaff used is cut by power. A commodious dwelling-house for the resident members of the firm occupies most of the first and all the second floors of the stock block, but at the east end of the former are three most important rooms, viz., the library, physiological and chemical laboratories. The keynote in construction appears to have been good sanitation. For this reason, the light is everywhere excellent, for good lighting means cleanliness—the walls and even the roofs are entirely of waterproof materials, and can be washed down. Surface drainage is universal within doors, and outside there are numerous manholes in case of a block, while the drainage system is ventilated by pipes running to the loftiest points on the buildings. Lastly, there are five cisterns (each of 400 gallons capacity) to supply water for drinking, washing, and flushing drains; and hot and cold water are everywhere laid on. The stable construction is fireproof throughout, all corners are rounded to avoid injury to horses, and the stable fittings (supplied by Messrs. Mosgrave & Co.) are of the best. The entire work has been carried out by Messrs. Jao. Mowlem & Co., and the architect is Mr. Robt. Walker, E.R.I.B.A.

#### SANITARY AND ENGINEERING NEWS.

**BIRMINGHAM SEWERAGE.**—These works have just been completed, at a total cost of 4,032l. 11s. 7d. The sewage is conveyed by pipe sewers into the Birmingham system, and purified on the Birmingham Sewage Farm. This arrangement necessitated some sewers from 30 ft. to 40 ft. deep, and special precautions had to be taken. The engineer to the works was Mr. W. H. Radford, C.E., of Nottingham, and the contractor was Mr. G. Law, of Kidderminster.

**CHESTER-LE-STREET SEWERAGE.**—The Chester-le-Street Union Rural Sanitary Authority have approved of four schemes of main sewerage and sewage disposal for (1) Birtley, (2) Witton Gilbert, (3) Sacriston and Daisy Hill, and (4) Elmsdonsley, in the County of Durham, with a total estimated population of 10,000, as per plans, prepared by Mr. D. Balfour, M.Inst.C.E., Newcastle-on-Tyne. The main sewerage scheme embraces about twelve miles of pipe sewers, and the sewage will be purified by the process of intermittent laud filtration, the total cost being estimated at 14,000l. The necessary steps for the compulsory purchase of the land are now being taken.

**PENSHAW BRIDGE, SUNDERLAND.**—This bridge over the river Wear, at Panshaw Staiths, near Sunderland, consisting of iron-bow girders 155 ft. in length, supported by Marsden limestone ashlar abutments, resting on concrete and pitch-pine piled foundations to a depth of 20 ft. under the bed of the river, is now rapidly approaching completion, and is expected to be opened for traffic about the end of the year. The whole of the works have been designed by, and carried out under the superintendence of, Mr. D. Balfour, M.Inst.C.E., F.G.S., St. Nicholas-buildings, Newcastle-on-Tyne. The contractors for the masonry, piling, and ironwork are Messrs. Head, Wrightson, & Co., Stockton-on-Tees, and for the approach roads Mr. J. Carrick, Durham.

#### STAINED GLASS AND DECORATION.

**NEW WINDOW, ST. SWITHIN, SPROATLEY-IN-HOLDerness.**—The newly-restored Church of St. Swithin, Sproatley-in-Holderness, has very recently been fitted with a new light east window by Clayton & Bell. The subject is "The Agony." The other subjects are "The Crucifixion," "The Taking Down the Body from the Cross," and "The Ascension."

**NEW WINDOWS, ST. SAUVIUR, WOOLCOTT PARK, BRISTOL.**—Two stained-glass windows have recently been erected in the Church of St. Saviour, Woolcote Park. One, in the south side, is from the design of Mr. A. D. Henning, of London, and the subject is "The Flight into Egypt." The other window is in the south transept, and is from the studio of Messrs. Joseph Bell & Sons, of Bristol, and the subject consists of three figures—Faith, Hope, and Charity, which are treated symbolically.

**NEW MEMORIAL WINDOWS AT THE MANCHESTER CATHEDRAL.**—A memorial window has been presented to the Manchester Cathedral by Lord Egerton of Tatton. It is affectionately remembered of William Tatton, first baron. The window, which represents "Joseph among his Brethren," has been designed by Messrs. Heaton, Butler, & Bayne, of London, who are also executing the work. A stained-glass window is also being erected near the south part of the Cathedral, the gift of Dr. Stevenson, of Stratford. The principal subject of illustration is "Christ Healing the Sick," extending over the four principal lights. The tracery panels are occupied by figures of the four Evangelists. Messrs. Wailes & Strang, Newcastle-on-Tyne, have designed the window, and the work is being executed by that firm under the direction of Mr. M. Donald.

#### FOREIGN AND COLONIAL.

**FRANCE.**—The museum at Dijon has acquired a statue representing François Rude, the sculptor, in atelier costume and working at the bas-relief of the Arc de l'Étoile. The work is by M. Ernest Christophe. An antique female head in polished stone, a remarkable work of antiquity, has been stolen from the Vienna Museum, as well as a number of Roman coins. The thirty-ninth exhibition of the Société des Amis des Arts is to be opened at Bordeaux on the first Monday in March.—The Association Artistique et Littéraire de Brittany has organised an exhibition to be opened at Rennes on February 2, and to close in March: the artistic society of "Enfants du Nord" has undertaken a special exhibition of artists of the north of France, to be organised by M. Dutert (architect), M. Commerre and Meetz (painters) and M. Hector Lemaire (sculptor): an "International" exhibition of paintings was opened in the Galerie Georges Petit on December 20, and in the same gallery, in March, there is to be an exhibition and sale of the works of John Lewis Brown. On the eighteenth of this month an exhibition of pastels, pictures and sculpture was opened in the Galerie Durand Ruel.—A club of artists and literary men has been founded at Paris, under the title "Cercle des Châtelains," the object of which is to organise private exhibitions, and also to bring about a fusion between the two opposing Salons.—The Society of French Pastellists has elected M. Le Tendre, Rosset-Granger, and Hillette to replace MM. John Lewis Brown, Emile Lévy, and Olivier Merson.—The military engineers are again busy about the fortification question. According to the present proposals, the existing fortifications are to be demolished, and a fortified *accroche* to be reconstructed on the line of the ancient ramparts, that is to say, at the extreme limit of the suburban communes which surround Paris. The town of Puy is about to arrange in various arrangements of its Museum, a series of small lodgings to be placed gratuitously at the use of painters coming

to study landscape in the neighbourhood.—The Société des Beaux-Arts de Paris at Monaco has commissioned M. Touzin, architect, to carry out some important work in decoration of the Casino.—Artists will hear with considerable regret that the Government propose to substitute a full-blown "departmental" road for the charming path now leading to the "Mantua" of Vincennes and the chateau of Petrarch.—The Government has given over to the Museum of Decorative Art a number of very curious objects once the property of Napoleon.—A competition is now open for the building of a new theatre at St. Nazaire, the designs to be sent in on the 15th.—M. Schuller, architect, of Nancy, has been commissioned to build the new theatre for the Municipality of Toul.—The Société Centrale des Architectes has elected its Council for the ensuing year as follows: President, M. Charles Garnier; vice-presidents, MM. Joly and A. Hermand; principal secretary, M. Loviot; assistant secretary, M. Roux; editing secretary, M. Bellenau; architect, M. Harzé; treasurer, M. Barthelemy; censors, MM. Bailly, Daupne and A. Normand.—M. Croizet, a former pupil of the Ecole des Beaux-Arts, has been appointed by the Académie des Beaux-Arts to occupy the post of professor at the Free School of Art at St. Quentin.—The death of the eminent painter Eugene Lamé is announced, at the age of ninety-two.

BERLIN.—The seventieth birthday of Professor C. Becker, president of the Prussian Royal Academy, was officially celebrated last week.—In reference to the erection of a monument to the deceased Emperor William by the Rhine Province, the design for which was won in competition by Messrs. Jacobs & Wehling, of Dittelsdorf, we now hear that, owing to difference of opinion in the building committee as to the design to be carried out, the prearranged design, several fresh proposals among which one by Herr Bruno Schmitz is to be found) are to be laid before the Emperor for criticism, the committee's letter begging him to act as final assessor having been accepted.—According to Herr Bruno Schmitz, the designs for memorials to William I., already erected in the Westphalia and in the Kyffhäuser, have been estimated for, with the result that the expenditure first granted will not be exceeded. In the Kyffhäuser monument case the estimate is nearly 30,000.—The general census held throughout Germany, on December 1, shows that the empire has seven cities with populations numbering over 250,000. These seven cities are:—Berlin, with 1,674,485; Hamburg, 570,430; Leipzig, 353,272; Munich, 334,710; Breslau, 334,710; Cologne, 282,537; and Dresden, 276,985.

NEW CHURCH AT RAMLEH, EGYPT.—On Saturday, November 1, the new church of All Saints, Ramleh, was opened with a special service conducted by the Rev. E. J. Davis, M.A., Chaplain of St. Mark's, Alexandria. The building has progressed very rapidly, for the foundation stone was only laid on September 27 last. It is a substantial structure of four bays, with organ chamber, vestry, and apsidal chancel, the whole being covered with open-belted roofs. The walls are of solid masonry. The *Egyptian Gazette* says that too much praise cannot be given to Messrs. Falanga and Diamanti for the execution of the work entrusted to them, and to their praiseworthy liberality in giving the valuable time of themselves and their staff free, their only charge being the cost price of the materials employed. Mr. Diamanti has himself personally superintended the building, and his efforts have been much appreciated. The original designs were the work of Mr. Pricoe, of Cairo, but valuable suggestions by Mr. James H. Money, of Newbury, Berkshire, were also availed of.

RUSSIA AND FINLAND.—A permanent exhibition of manufactures is to be established in Moscow, the promoters also undertaking the sale of their goods. An exhibition building is to be erected in the Sadovaya-street.—Although the port of Batoum was considerably enlarged and improved in 1885, further works of a similar character have become necessary through the annual increase of the petroleum exports. Many articles of merchandise also are conveyed from Central Asia to Europe across the Transcaucasian Railway.—The Russian Government has, for financial reasons, relinquished the original plan for the Siberian railway; but, by combined railway lines and canals, communication will nevertheless be established with the Pacific Ocean. The route decided upon will cover the Siberian Railway from Tomsk to Irkutsk, 1,654 kilometres; the Transbaikalian Railway from Lake Baikal to Stritensk, 1,656 kilometres; and the Ussuri Railway, from the latter place to Vladivostok, 405 kilometres.—The new premises of the Finnish Society of Literature have now been completed at Helsingfors, the cost being 8,000.—The leading Russian timber merchants have, like their *Swedish confrères*, decided upon decreasing their manufactures in 1891.

SWEDEN.—The cost of the great Exhibition of Industry and Arts proposed to be held in Stockholm is estimated at 110,000. It is expected that the State, as well as the city, will contribute thereto. The time of its taking place has not yet

been fixed.—Simultaneously with the Industrial Exhibition to be held in Gothenburg next year meetings of manufacturers, engineers, &c., are to take place.—A company with a capital of 10,000 k. has been formed for the working of a valuable cement deposits recently discovered in Sweden.—The Vadstena Church, one of the most historical and ancient in Sweden, is at length to be restored to its original grandeur.—A project presented by a Swedish gentleman towards new school-houses in that city.—The well-known Norwegian architect, Herr Nissen, has paid a visit to Sweden in order to study the arrangements of Swedish Masonic buildings with a view to the erection of a great new central lodge in Christiania. The new Masonic palace at Helsingborg, to which we recently referred, is to have special attention, this being said to be the finest of its kind in Scandinavia.—The Swedish Government proposes to put a tax upon the felling of trees in forests. We have referred to the association formed among Scandinavian woodpulp makers for the restriction of the output next year, and it seems that this step is already being felt, foreign consumers being eager to conclude contracts before prices rise. The production is to be reduced by thirty-six hours a week.—Negotiations are now also going on among the sawmill owners for reducing the output of woodwork next year from 25 to 30 per cent. All the leading firms have already given their adhesion to the step.

MISCELLANEOUS.

THE NORTHERMOST TELEPHONES IN THE WORLD.—A telephone has just been completed between Reykjavik and Havesford, in Iceland, being the first telephone in that island, and the second telephone within the Polar Circle. The first laid within the Circle, and the northernmost in the world, was that of Hammerfest, in Norway, lat. 70 deg. 40 min. N., close to the North Cape, completed some months ago. Arrangements are now being made for extending next summer the telephones to the North Cape, where a small office is to be established in summer, for the benefit of tourists.

SIBERIAN RAILWAYS.—On account of the difficulties and great expense of continuing the Siberian line, so as to be able to have through trains between Moscow and Vladivostok on the East Asiatic coast, an extension which would require some 8,500 km. of rails, a new scheme of connecting the above two points is now under consideration. This new scheme combines a railway and waterway route; Tomsk to Lake Baikal (1,570 km.), Lake Baikal to Ussuri River (1,070 km.), and Ussuri River to Vladivostok, altogether some 3,100 km. of rail, estimated to cost about 6,300,000.—*Deutsche Bauzeitung.*

REGISTRATION OF PLUMBERS.—At the Plymouth Municipal Buildings, on the 13th inst., the Mayor of Plymouth (Mr. J. P. Bond) distributed a number of certificates granted by the Worshipful Company of Plumbers to master and operative plumbers in the district. The Mayor said it afforded him much pleasure to preside at that meeting of the Plymouth Centre of the National Registration of Plumbers, the object being to instil into the minds of men engaged in the plumbing trade a desire to become real masters of their craft, and in proportion as they became qualified they would afford satisfaction to householders who employed them. Mr. W. N. Elliott moved.—That it is essential to the health and well-being of all classes of the community that efficient measures should forthwith be taken for securing the systematic training and instruction of plumbers' apprentices, and education in the branches of science and technology required by persons engaged in works affecting the sanitary condition of dwelling-houses and other buildings in respect of their water supply and drainage, and that the object can only be satisfactorily attained by the combined action of plumbers and educational authorities throughout the United Kingdom in accordance with the proposal of the Worshipful Company of Plumbers, which is worthy of general approval and support. He had always considered that there should be a condition attached to the apprenticeship of every lad that he should attend technical instruction so many hours a day. If boys were instructed regularly in the scientific portion of their business it would give them more serious thought as to what was expected of them. The Worshipful Company of Plumbers was doing a very excellent work, and he looked for the time when it would be no longer possible for the "handy man" to take upon himself responsibilities which ought to belong to men who had a thorough practical and theoretical knowledge of the trade they professed. He was pleased to hear Mr. Cole's assurance that the Company would endeavour to keep control over those certificated, as a man ought to be compelled to do his work as well as know how to do it. The motion was agreed to.

THE PROPERTIES AND EFFECTS OF FOG.—The fog, it is said, is about to undergo at the hands of certain scientific observers the ordeal of scientific investigation. The inquiry will not be the first of its

kind. Though, perhaps, never before the subject of a collective examination, the characters of this fog are far pall which from time to time wraps our streets in dangerous uncertainty, have already given rise to much original thought, observation, and suggestion. To assign to it any constant composition is indeed impossible, since, besides its fundamental basis of water vapour, it must carry in a condensed form the mixed impurities of city air. In considering these gloomy winter clouds one primary idea which commonly presents itself is that of smoke. Our tingling eyes and our offended sense of smell alike protest against this contact of carbonaceous matter out of place. Analysis confirms the sensible fact. Other matters, however, claim their place as components. The various refuse gases of manufactures, the miasmata of a river overwrought by commerce, the emanations from innumerable human homes, and the additions furnished by sewage add each its contribution to the dense and semi-liquid atmosphere. Happily no process of accumulation can, under ordinary circumstances, abolish the inherent vitalising purity of the now overladen air. There is, too, the saving influence of the suspended carbon. With all such qualifying conditions, however, the fog atmosphere continues a direct cause of much discomfort and ill-health. Acting, though it must largely by its irritant properties, it hears about also at all times more distinctly morbid ingredients. Whatever its precise nature, however, there is no question as to the injury to health, fatal too often, which the fog assuredly brings.—*Lancet.*

THE EDINBURGH RAILWAY SCHEMES.—At a meeting of the East of Scotland Engineering Association, at 5, St. Andrew-square, Edinburgh, on the 16th inst., a discussion took place with reference to the railway schemes. Mr. James Thomson, sanitary engineer, occupied the chair. The principal speaker was Mr. Kerr, of Messrs. Kerr & Symon, the originators of the George-street scheme. Dealing first with the North British proposals, he said he believed there was no way of getting over the difficulty at the Waverley Station, without either granting a double line westward to Corstorphine, or doubling the station at Haymarket and increasing the accommodation at the Waverley Station. As to Princes'-street-gardens, he thought the Mound should be pierced on the south side instead of the north, in order to preserve the northern side of the Gardens and to overcome public opposition. Dealing somewhat over the Caledonian proposals, he called attention to the risk of danger which a tunnel would cause to the Royal Institution and the Scott Monument. The Royal Institution was founded entirely upon piles, and there was no doubt that a tunnel above the base of the piles would tend to act as a drain for water, and so, by altering the substratum, create insecurity. The Scott Monument was founded partially upon piles, and, owing to the construction of the Monument, the damage which might result from displacement would be difficult to repair. The greater part of the Monument above Sir Walter's head was founded upon the vault, and there was great risk, if that vault was disturbed in its foundations, of incalculable damage being done. Apart from the depressing effect of the low girders of the station, the station itself would practically be a station in a tunnel, and be nothing less than a blow-hole for a long tunnel from the west and to the Waverley, and from the Waverley to the Caledon Hill. Speaking lastly of the George-street scheme, he explained that this scheme had been prompted, not from opposition to the Caledonian Company, but from a desire to meet the wishes of the community.—Amongst other speakers, Mr. R. C. Brehner said he had no hesitation in stating they would find contractors quite prepared to construct a tunnel below Princes'-street, and to undertake all risks. It was also stated that, as far as was known, the Caledonian Company intended to propose to ventilate their tunnel by fans; and, further, that in the meantime only one building had been acquired for the purposes of constructing ventilating apparatus. In reply to the Chairman, Mr. Kerr said he did not know what the Edinburgh and Leith Junction Railway engineers proposed to do to secure the ventilation of the George-street tunnel, but he thought they might adopt something like fans. He pointed out that at the same time the greater air space offered by the St. James-square station of the George-street scheme and its surroundings as compared with the air space of the Waverley Market and its surroundings. As had been previously arranged, the meeting came to no resolution on the schemes.

PUBLIC IMPROVEMENTS AT HORBURY.—An inquiry was held at Horbury on the 17th inst. by Colonel J. Orie Haskett, R.E., an Inspector from the Local Government Board, touching the application of the Horbury Local Board for sanction to borrow the sum of £2,000 for street improvements in the township. Mr. T. Barker, Clerk and Solicitor to the Local Board, stated that the principal improvement sought to be carried out was the widening of Westfield-road, between Horbury and the borough of Ossett. There was no opposition. The Inspector viewed the sites of the intended improvements.

CONTRACTS AND PUBLIC APPOINTMENTS.

CONTRACTS.

Table with 5 columns: Nature of Work or Materials, By whom Required, Architect, Surveyor, or Engineer, and Tenders to be delivered. Lists various construction contracts such as bridge repairs, water pipes, and school buildings.

CONTRACTS.—Continued.

Continuation of the Contracts table, listing items like Hotel Sewer System, Ventilators, and various engineering services.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Applications to be in. Lists sanitary inspector, district surveyor, and borough engineer positions.

Those marked with an Asterisk (\*) are advertised in this Number. Contracts, pp. 4v, and vi. Public Appointments, p. xvi.

ROYAL VICTORIA HALL, WATERLOO BRIDGE-ROAD, S.E. The following scientific lectures will be given at this Hall during January: January 6, "The Moon," by Dr. Fleming; January 13, "Glaciers," by Prof. A. H. Green; January 20, "Our Bodies," by Dr. P. H. Carpenter; January 27, "All about Spectacles," by Dr. Collins. A special variety entertainment will be held at the Hall during the Christmas holidays and for the following week. The first performance will be at two o'clock on Boxing Day.

BOOK SALE.—Two good collections of books relating to the fine arts, and including some standard works upon architecture, engraving, sculpture, and ornamental design, were sold at Messrs. Puttick & Simpson's auction-rooms, on Tuesday, 18th inst. Amongst the volumes sold were the following:—Octavo: W. G. Rawlinson's "Description and Catalogue of Turner's 'Liber Studiorum'" (1878), Chaffers's "Hall Marks" (1872), and E. Hamilton's "Catalogue Raisonné of Reynolds's Engraved Works," 11. 4s. (Parsons); Robert Dumont's "Sculpture-Graiver Français," with G. Duplessis's "Supplément," the eleven volumes in seven (Paris, 1835-71), 5l. 10s. (Quaritch); Gustav Parthey's "Hollar" (Berlin, 1855), 1l. (Galway); Quarto: Mahler's "Print Collector," 1844, 14s. (Galway); Henry Shaw's "Specimens of Ancient Furniture," text by Myrick (W. Pickers, 1869), 16s. (Quaritch); J. D. Passavant's "Peinture-Graver," six volumes in three (Leipzig, Weigel, 1860-4), 2l. 2s. (Galway); Vertue's "Works of Hollar," 1759, and others, 12s. (Fawcett); Folio: N. X. Willemin's "Monumens Français," A. Pottier's text, with 300 plates, 2 vols. (Paris, 1839), 3l. 16s. (Bayers); John Ruskin's "Modern Painters," 5 vols. original edition (except as to vols. 1 and 2), imp. 8vo., 1851-60, 22s. (Sotheran); 3 copies of "La Décoration Arabes," containing each 100 chromos from Prisse d'Avennes's work, 4to (Paris, 1855), 6l. 10s. (Batsford); Owen Jones's "Grammar of Ornament," imp. fol. (Day & Son, 1856), 7l. (Money); Douglas Morrison's "Haddon Hall," imp. fol., 1842, 7l. (Parsons); Dugdale's "Monasticon Anglicanum," abridged, with the two additional volumes by Captain John Stevens, several plates after Hollar, &c., fol., 1718-22, 3l. 5s. (Emanl); J. S. Proust's "Castles and Abbeys of Monmouthshire," imp. fol., 1835, 1l. 5s. (Defries); Boadillon's "Musée des Antiques," 275 plates of ancient sculpture, no text, 3 vols., imp. fol., 2l. 14s. (Lery); John Nichols's Hogarth's original subscriber's copy (Balwin & Co., 1820-2), atlas fol., 6l. 10s. (Jones); Sir R. C. Hoare's "Ancient History of South Wilts," atlas fol., 1812, 2l. 10s. (Brough); Jules Labarte's "Histoire des Arts Industriels au Moyen Age et à l'époque de la Renaissance," second edition, 3 vols., 4to. (Paris, Morel, 1872-5), 5l. 5s. (Galway); Paul Lacroix's works, 10 vols., sup. imp. 8vo. (Paris, Firmin-Didot, 1847-84), 8l. (Parsons); D. Roberts's "Holy Land, &c.," Croly's text, lithographs by L. Harbe, 6 vols., atlas fol., 6l. 17s. 6d. (Bill); Alphons Legros's "Les Eaux Fortes," twelve fine etches, unbound—of this work only twenty complete sets were issued, at 59 guineas the set—(London: R. Guernert, 1878), 5l. 10s. (Deprez); R. F. A. Gould's "History of Freemasonry," 6 vols., 4to., 1883-7, 1l. 9s. (Jones); Vol. I. of Goldsmith's "Vicar of Wakefield," first edition, cf. 12mo. (Salisbury, B. Collins, 1769), together with a printed reprint of the first edition, being the two volumes in one, very scarce (London, 1766, no printer's name), 11l. 5s. (Harvey); E. Joynt's account of G. E. Street's restoration of Christ Church Cathedral, Dublin, with numerous portraits, views, &c., fol. 82, 10s. (Parsons); a

copy, original edition, of R. B. Brough's "Life of Sir John Falstaff, illustrated by Craikshank, imp. 8vo., with faults," 1l. 2s. 6d. (George); twenty-six volumes of Ackermann's "Repository," 8vo., 7l. 17s. 6d. (Robson); Le Pantré's "Éuvres d'Architecture," sixty fine plates (Paris), 1l. 1s. (Curradozzi); and Hall's "Baronial Halls and Picturesque Estates of England," with coloured views after Harding, Prout, Cattermole, &c., 2 vols., 1858, 1l. 5s. (Parsons).

THE CITY AND NORTH LONDON RAILWAY.—The new line of communication between the City and the southern suburbs of London, which was formally inaugurated a short time ago by the Prince of Wales, was opened for traffic last week. The line is somewhat of a novelty in railway enterprise. When Parliamentary sanction for the project was first obtained in 1881 the scheme was comparatively a modest one. It was not even dignified by the title of "railway," but was merely to be a subway—a kind of underground tram line, with cars worked upon the cable principle. The journey was to be a short one, the whole distance contemplated being from King William street to the Elephant and Castle, probably less than a mile and a-half. In 1887 further powers were obtained from the Legislature for an extension to Stockwell, and last year permission was obtained to make a still further extension to Clapham-common. When the extension to Stockwell was sanctioned the company determined to complete the line to that point before the line, however, had been finished. After much anxious deliberation it was decided to adopt the electric current as a means of propulsion, and special locomotives have been constructed to drive the trains by that means. Electricity will also be employed to light the carriages and stations, but for the latter gas will also be available. The City and North London Railway, as it is in future to be called, is a double line three miles and a-half in length, running in two distinct tunnels, from King William-street to Stockwell. At the City end the tunnels pass underneath the narrow thoroughfare known as Swan-lane, and in order to avoid interfering with the foundations of the houses, it was found necessary to carry one of the tunnels for a short distance over the other. Along the remainder of the course the tunnels run side by side, being connected at intervals between the stations,—of which there are six,—by short passages. The work of driving the tunnels was commenced by sinking a shaft 15 ft. in diameter near the Old Swan Pier, and was carried on from that point north and south, the soil being brought up and shot into barges on the river. A special shield, devised by the engineer, Mr. Hutton Greathhead, was used, and as the soil was cut through and cleared away the space was lined with segments of cast-iron firmly bolted together, thus forming a circular ring 10 ft. in diameter. As the shield was pushed forward the small space between the iron casing and the soil was filled with grouting. The levels, and, of course, the distance from the street to the station platforms varies accordingly. For the most part, the boring was through London clay, which presented little or no difficulty, but between Kennington and Stockwell, a dip or basin of loose rough gravel, heavily saturated with water, was encountered, which had to be cut through under atmospheric pressure, and at a slow rate of progress. Altogether, the tunnelling has occupied about four years, at a cost of nearly 200,000, per mile. The six stations are situated at King William-street, Borough (opposite St. George's Church), Elephant and Castle, New-street, Kennington; Kennington Oval, and Clapham-road.

Stockwell. With the exception of the City Terminus, they have all been specially designed, the principal external feature of each being a dome surmounting the lifts, which are constructed to carry 50 persons each, and are worked by hydraulic means situated near the Stockwell terminus. There are also wide staircases for those who prefer that means of ascent or descent, and commodious waiting-rooms above and below. Turnstiles at the entrance take the place of the ordinary ticket offices, where each passenger is to pay the uniform rate of two pence for any distance, and an office will be provided where change may be obtained. In the Clapham-road, not far from the Stockwell Station, the company have established a large depot, where the rolling-stock is housed, and here, too, are located the engines for generating electricity and for working the lifts. The carriages (a slight improvement on the simple character, somewhat resembling a light tramcar, only that windows are absent, the upholstery is carried high up on the back of the seats nearly to the roof. About 100 persons can be carried by three carriages, and the connecting platforms, enclosed by iron lattice-work on either side, give travellers the opportunity of passing along the entire length of the train. The whole journey from the City to Stockwell occupies about twenty minutes. Mr. F. Schutz was the assistant engineer, Mr. Basil Mott the resident engineer, and the general contractors were Messrs. W. Scott & Co., of Newcastle-on-Tyne. The Brunswick Rock Asphaltic Pavement Company were the contractors for the asphaltic work required in covering the shafts at the whole of the stations on the line.

LEGAL.

VENTILATION OF SEWERS IN KENSINGTON.

KENSINGTON VESTRY v. SIMPSON & SON. A TEST case of some interest to property-owners and their professional advisers was reported in the *West London Reporter* of the 13th inst. At a recent sitting of the Kensington Justices of the Peace, in *Party Sessions*, the Kensington Vestry summoned Messrs. Robert Simpson & Son, of Hollywood-road, for penalties, it being alleged that in erecting a building they had not complied with the regulations of the Vestry in providing a ventilating pipe up the front of the wall of the building to connect with the main between an intercepting trap and the sewer. Mr. Austin appeared for the Vestry, and Mr. Bodkin for the defendants. Mr. Austin stated that in June, 1890, the defendants sent in a plan subject to the usual order, and that the drain and soil-pipes should be fitted to the satisfaction of the Vestry. On June 26, Mr. Weaver, Surveyor of the Vestry, wrote a letter, in which the clause occurred—"It is also requested that a ventilation-pipe, not less than 20 in. in sectional area, be carried up the front of the building and between the intercepting trap and the sewer." The matter had been before the Bench as far back as October 23, and the questions to be decided were, to his mind, two in number, whether or not the breach under Section 73, was a nuisance, and whether the Vestry had any power to order this work, and assuming it had the power, whether it was a reasonable request to make. The first was a question of law, and the second a question for the Bench. The summons for penalties was taken under Section 83 of the Metropolitan Local Management Act, 1855, and for the breach under Section 73. The difficulty that had arisen with regard to modern sanitary arrangements was this, that the escape of sewer gas from the street gullies was increasing. As Mr. Weaver would explain, an evil had arisen from the perfect sanitary arrangements in
