## THE AMERICAN EDITOR, To the PUBLIC.

A GEN TLE MAN of the Faculty in the City of PHILADELPHIA, who was one of the Surgeons, in the Militaary Service laft War; and who is defirous of affording every help in his power, towards a fuccefsful termination of the prefent AMERICAN Meafures, for the · Defence of LIBERTY. Being of opinion, that the Publication of the following excellent Tracks will be attended with the most falutary influences, in the prefervation of the lives of many of those valuable Citizens of AMERICA, who, as Soldiers and Sailors, are now contending for the mighty Prize of FREEDOM : And would at the fame Time, communicate worth and dignity to the Military and Naval Practitioners in the Art of Healing, was generoully pleafed to, beftow, and recommend it to the notice of the Editor, who humbly apprehendeth, that the intereft of the Public, will be truly ferved in their purchafing, as well as his private intereft in felling, and by fuch favors which reciprocally gratify, the obligations are, at the fame time, fettled and continued.

# THE PREFACE

TO THE

DISEASES INCIDENT TO À R M I E S.

HE great and frequent inconveniences attending a military life, are of fuch a nature, as to make the greateft havock even among the most robust constitutions. It is not, therefore furprising, that an Army is feldom or ever without a great number of fick.

NEVERTHELESS, it has been observed, that the distempers mostly prevalent among the Troops are not in number very confiderable.

WE have, for this reafon, thought it fufficient to fpeak of thofe, whofe attacks the foldier is most fubject to, to defcribe them in fuch a manner, as they may be diftinguished from one another by certain figns; and at the fame time to give an account of fuch fymptoms as characterife the decrease or increase of each diforder; and lastly, to specify the medicines proper for the cure of the fick, and the diet they are to observe.

B

IT

G

It will be perceived, that, in our little Effay on this fubject, it will be equally neceffary to be fhort, and to endeavour to avoid being obfeure.

THIS Work, however no ways regards the Phyficians, who, mafter of their art, and in daily practice, fland in no need of the affiftance of thefe first elements.

But it often happens, in an army, that the number of fick is fo great, and they are difperfed in fo many different places, that it is impossible the phyficians should go every where, and give their attendance to each individual. In fuch cafes, necessity obliges the fick to be entrusted to perfons who cannot be expected to have the fame knowledge with those of the profession.

For the use of such practitioners, not fufficiently instructed, this small Tract is designed, that, by the signs exactly defcribed, they may understand the nature of the distemper, the conduct they are to observe, and the remedies proper to be administered.

AT the end are inferted the RECIPES or preferiptions referred to in the course of the Work. They are rendered as fimple as possible, and preference given

to

to those medicines that are easiest to be procured, and easiest to be prepared.

Ir may not be amifs to premife fome obfervations, by means of which, ficknefs may in fome degree be prevented, and the health of the foldier preferved. We are fenfible, that, in time of war, it is not always poffible to obferve exactly all what we are going to fay; but it cannot but be of ufe to know what is most advantageous, that it may be put in practice, at least when circumfrances permit.

First. THE foldier fresh listed, and tore at once from his family, no fooner loses fight of his village, but he becomes melancholy; and tho' a robust husbandman, finds himself fearce able to bear the fatigues and inconveniences of a military life. It were to be wished, that he could be used, little by little, to this new kind of life; but in the mean time nothing is better, than to procure him all kinds of amusement and diversion.

Second. GARDEN fluff and frefh greens are a wholefome nourifhment for the foldier; ripe fruits are equally good, and never hurt but by their abufe; but unripe and acrid fruits are very hurtful. The use of garden fluff and fruit prevents the foury fcurvy, and even cures those already attacked with it.

Third. THE choice of water is effential. If there is none to be found abfolutely pure, the preference is to be given to that leaft loaded with heterogeneous parts. There is an eafy way to diftinguith water that is pure, from that which is lefs fo, by means of *oleum tartari per deliquium*. If you let fall a few drops of this in a glafs of water, if not pure, it becomes inftantly thick, and milky, while the fame operation produces only a fmall cloud in that which is more pure.

RIVER water thould not be drawn nearthe banks; that which is in the middle of the fiream is always beft.

SOMETIMES, indeed, Troops are reduced to the fad neceffity of drinking bad water; in which cafe it may be much corrected, by mixing a certain quantity of vinegar. Six ounces, mixed with three quarts of water, will render the drink even more agreeable.

THE water may also be rendered lefs hurtful by steeping in it fome pieces of the root of the calamus aromaticus. This root is found every where, especially in marshy places, where commonly the water is worfe. Fourth.

## PREFACE.

Fourth. THE foldier ought to be well clothed and covered; his floes of a thick and flrong leather, and the thread they are fewed with well covered with wax: If all the feams could be well waxed the water would be prevented from penetrating.

Fifth. CAMPS ought to be pitched on a dry fpot, as much as possible. That which appears fuch is fometimes quite the reverfe, because the waters are but at a little distance below the furface. It is, however, very cafy to know that, by digging the ground, or even merely by examining the wells of the neighbouring villages.

IF the water is high in the wells, the foil is damp; if the water is low, the foil is dry.

IT would likewife be proper to avoid the neighbourhood of thick forefts; they prevent the wind from penetrating, and render the air of the circumjacent parts damp and clofc.

But if there is a neceffity of encamping in a damp ground, the foldiers must have their straw changed oftner than usual. The officers will be much benefited by spreading a waxed cloth under their bed.

In times of rain, the tighter the tents are extended, the lefs it penetrates : finall trenches trenches dug round the tents contribute to the drynels of the fpot where the foldies lies, because they receive the water that falls from above.

50

Sixth. WHEN an army remains long in the fame camp, the unwholefome effluviz. from fo many bodies always occafion ficknels, unlefs there happen to be violent and frequent winds. Thefe exhalations are mostly to be feared in a hot and moss are mostly to be feared in a hot and moss air. The changes of camps on this account, contribute much to the health of the foldier, more effectially when the bloody flux prevails. Hence arms one reafon the more for avoiding the neighbourhood of thick forefts, which prevent the free passage of the winds.

Seventh. NOTHING is more prejudicial, to the foldier, when heated with work, than to Arlp, expose himfelf to the cool air, and greedily drink cold water, and efpecially well-water, which commonly is very much fo. River water is less hurtful, as the rays of the Sun, to which it is conflantly expected, prevent its being fo cold.

*Lightb.* CARE muft be taken, during the great heats, that the foldier on duty frould remain exposed to the heat of the San as little as possible, and that he avoid

fleeping

# PREFACE.

fleeping there. The cuiraffiers, especially, when once their cuirafs is thoroughly heated, are those who fuffer most by the fun.

Ninth. NEATNESS cannot be too much infifted on. Let foldiers frequently wafh their hands, their face, and their feet; and, if the feafon permits, let them bathe as much as poffible in running water.

Teuth. GREAT care ought to be taken not to lodge many men together in a finall fpace; and if it cannot be avoided let the air be at leaft renewed as often as it can, whether those who lodge together are in health or fickness; for from hence arise the most dangerous, and even the contagious distempers.

*Eleventh.* THE bread ought to be well baked, and made of good and pure flour; for it is certain, that very dangerous diftempers are occasioned by musty or spoiled bread.

DISEASES OFTHE ARMY.

F the troops encamp in the fpring, efpecially early in the feafon, there will infallibly be many fick. The Difeafes, that principally prevail at that time, are, very troublefome Coughs, fore Throats, Pleurifies, Peripneumonies, and Rheumatifms.

THESE Diftempers, tho' not contagious, do not admit of much, motion in the Patients, wherefore it fhould be endeavoured to have the Hofpitals nigh hand, and, if the ftate of the Diftemper requires it, to bleed the Patient, before he be moved, the delay of which may produce very troublefome confequences.

SOMETIMES alfointermitting Fevers prevail during this feafon, but they generally are lefs obflinate than those that happen in Autumn. In Spring they are commonly Tertians, or Quotidians, but feldom Quartans, unlefs in those fubjects, who have been before attacked during the Winter, and in whom, properly speaking, they are only Relapses.

COUCHS

С

# DISEASES

# COUGHS.

OUGHS are more troublefome than dangerous : but if they continue any time, and are neglected, they fometimes degenerate into a *Phthifis Pulmonalis*.

LET the Patient make use of the receipt No, 1. for his common drink, and drink it luke-warm; it will be of service to add a fourth part of new milk.

THE Patient must abstain from wine, from falt and acid food. Rice, and barley broth, and new milk, with the yolk of an egg, will be fufficient nourifhment.

IF the Cough becomes too violent and troublefome, fo as to prevent the Patient from fleeping, he may take the prefeription No. 2.

IF the Çough is attended with a Fever, bleeding will be neceffary to prevent an Inflammation, which is then to be apprehended.

WHEN the Cough diminishes, and the exerctions, which before were without confistence, become thick, and are easily expectorated, the distemper is at an end.

14

SORE

## OF THE ARMY.

#### SORE THROAT.

IF the action either of fwallowing or refpiration fuffer an impediment, attend, ed with fenfible pain, and the caufe is in the neck, or throat, the diforder is called a fore throat, (Angina.)

It is a very dangerous diffemper, and fometimes even mortal; it is known to be fo, when refpiration is greatly impeded, the voice extremely fharpened, and the anxiety very confiderable. A large bleeding is immediately requifite, and cupping glaffes are to be applied, around, and on the nape of the neck, which often give inftant relief : the drink No. 1. muft be kept conftantly in the mouth warm ; and the poultice No. 3. applied, and continued hot on the neck, night and day.

IF the Patient can fwallow, let him take every hour a cupfull of the drink No. 1. made hot, with the addition twenty grains of purified nitre to each pint. If the reduefs appears on the neck or breaft, the Patient often recovers. Otherways this Difeafe is frequently mortal; but it is not common. The following fpecies is much more frequent.

ONE of the tonfils, grows red, sweiled, and

and painful, and the pain commonly extends itfelf to the internal part of the ear of the difeafed fide. In a day or two, the Difeafe attacks the gland of the other fide, while the fwelling difappears from that which was first affected. Sometimes the pulse is hard and quickened, and sometimes not at all.

In the first cafe, the urine appears of a deeper colour than it is in health; bleeding is then neceffary; and if the redness, fwelling of the throat, and difficulty of breathing do not give way, it will be proper to repeat it.

In the fecond cafe, viz. if the pulfe is natural, there is no neceffity for bleeding, unlefs the Patient be of a replete habit.

THE nourifhment must be restrained to light broth, to which may be added rice or barley cream.

LET the Patient take a tea-cup of the drink No.4. every hour, warm, unlefs he fleeps: and let him often keep in his mouth fome of the medicated tea, No. 5. warm, with which he is alfo to gargle his throat.

NEXT day let him be purged with the draught No. 6. which, if the diforder does not abate, he may take it again after two days, continuing, in the mean time the ufe

of

\* ---

of No. 4. and No. 5. till he can fwallow ' freely, and the redness hath disappeared from the infide of the throat.

IF the diforder has continued too long, before relief was applied, or the inflammation is too confiderable, (to give way,) suppuration will enfue.

THAT there will be a fuppuration is known, by the fwelling and rednefs in the throat continuing above three days, without any abatement. In this cafe, the Patient is to keep continually in his mouth fome of the decostion No. 7. warm, which likewise may be lightly injected into his throat.

THE cataplain No. 8. is to be applied, and kept night and day round about his throat.

IF the fwelling of the throat then begins to grow foft, the abfeefs will foon burft: if there appear a little fpotelevated and white, the concealed lancet (pharyngotomus) may with all fafety be ufed, to give, by this means, a freer iffue to the pus.

THE abfeefs being either broke of itself or opened by the lancet, the gargarifm No. 9. must be frequently used, and the cure will soon be compleated.

WHEN it happens that the fwelling prevents deglutition entirely, a glifler of twelve twelve ounces of new milk, and fix ounces of barley water is to be administred every four hours, which the Patient must retain as long as he possibly can. By this means he may be fushained till the abscess breaks.

THERE is fill another fpecies of fore throat, which, in the beginning, is eafily eured, but by neglect degenerates into a fort of mortification, and corrodes all the parts attacked, caufing at the fame time a most horrible flench.

THERE appears on the tonfils, on the palate, on both fides of the interior part of the mouth, or within the lips, one or feveral white fpots, fometimes yellowifh, and even brown, according as the diforder is more or lefs violent. The places round thefe fpots are much inflamed and painful. It fometimes happens that the patient has no fever; and the fwelling is never fo confiderable in this cafe, as in the before deferibed fore throat.

THE last fpecies generally goes off pretty foon, by rubbing every two hours lightly the parts affected with a pencil dipped in the mixture No. 10. and using for a gargarism a simple infusion of elder flowers. It is proper the Patient should drink fome cups of the same infusion about four times a day.

# OF THE ARMY.

It is to be observed, that the faid fpots increase very fuddenly, when the ftench of the mouth is great ; in that case, the quantity of fp. fal. mar. must be augmented to ftop the progress of this evil.

#### The PLEURISY.

THE Pleurify is known by a fharp pain, and flitches, felt in the breaft and attended with a fever.

THIS pain is increafed by infpiration, and leffened by expiration, and by holding the breath; the pulfe is generally hard, as in all acute and inflammatory difeafes: in violent Pleurifies the pain is fometimes fo fharp, that the Patient fearce dares to draw his breath, the face grows livid, and he feels himfelf juft fuffocating; in this flate the pulfe is finall and low.

THE Cough is almost continual, but interrupted by the violent pain: in some cases, this Cough is dry. without any excretion; in others it is, from the beginning, attended with excretions; less danger is to be apprehended in the last case than in the first.

THO' the fides of the breaft are most commouly attacked in this distemper, yet the anterior and posterior parts may be equally affected

IF

Ir the pain is most fensibly felt externally, and chiesty upon touching the part, the diforder is commonly named a false Pleurify, and is to be treated as follows:

BLEEDING is the first and chief remedy: let twelve ounces of blood, or even more, if the fubject is replete and robust, be taken from the arm, on the fide where the pain is. While the vein is open, let the patient refpirestrongly, and cough. Bleeding commonly lessens the pain, and sometimes carries it off altogether.

SOME hours after the bleeding, the glyfter No. 11. ought to be given.

FLANNELS dipt in the fomentation No. 12. are to be conflantly applied to the place where the pain is felt; and as it would be troublefome to apply this topic during the night, a plaifter of Labdanum, fpread on leather or linen, may be applied in its room.

In the morning this plaifter must be taken off, the part rubbed with the *ung. althea* and the medicine No. 12. Let the patient take every half hour, if he be awake, a spoonful of the mixture No. 13. and drink after it a warm cupfull of the decoction No. 1. to each pint of which one ounce of honey should be added.

IT

IT often happens, that the pain, which after bleeding was much leffened, or quite ceased, returns with as much violence as at first: in this cafe a fecond bleeding is neceffary, but commonly not fo large as the first, which always ought to be very copie ous : if after this the pain still returns very fenfibly, you must bleed a third time. and fometimes even a fourth, according to the violence of the diftemper.

IT must, however, be observed that flight remains of pain, and fuch as but little impede respiration, do not require fresh bleedings : the patient might by them be too much weakened, and rendered languid a long time after,

BLEEDING, therefore, must only be repeated in those cases where the pain is violent enough to obstruct the breath confiderably; the velocity of the pulle, increased commonly at the same time flows, the necessity for this evacuation.

IT is a good fign, when the pain changes its place, and affects the clavicles, the fhoulder-blades, the fhoulders and back ; and that this new pain requires no bleeding. Thefe changes generally haps pen about the fixth day : it is then fufficient to chafe the parts in pain lightly, and then D

then anoint them with the ung. dlth.

LET the nourifhment be light, and confift of thin broth, roafted apples, and well fermented bread : the decoction No. 1. or plain barley water with one fourth of new milk, may ferve for common drink. If the belly be conflipated, the glyfter No. 11. may be repeated.

s foon as refpiration grows eafier, and the pain is confiderably diminifhed, it will be fufficient to give every two hours a fooenful of No. 13. with a cupful of the decoction No. 1. warm after it.

BUT if, notwithfianding feveral bleedings, the pain continues, without any fenfible diminution; and above all, if the rattling of the breaft, and want of expectoration fluew the lungs to be filling, a blifter is to be applied to each calf of the leg.

A SHARP blifter applied on the painful part has often been attended with very good effects, even when repeated bleedings had procured no ceffation of the pain of the fide.

CARE must be taken in this, as well as in all inflammatory distempers, that the Patient be not kept too hot, and that the air be often renewed.

WHEN the illness begins to grow milder, by the use of the above medicines, fresh symptoms

fymptoms will appear, which flow the morbific matter is concocted, and ready to be expelled.

GREAT care must then be taken, not to prevent its course, but on the contrary, to facilitate it by all the means that art can fuggest.

BLEEDING piles are of fervice; a white, reddi.h, or iometimes a brownifh ieldment in the urine is a facourable fymptom; to encourage its continuance, the fick muft drink plentifully.

IF in the progress of the diffemper, after the symptoms grow milder, the excrements are yellow, and bilious, it is a good figa ; but at the beginning it affords but a bad prognostic.

In general this difeafe is carried off by expectoration, efpecially if the excretions are plentiful and diminifh the pleuritic pain, a. 1 above all, if they are ripe and refemble pusses Sometimes they are glewy, tenacious, and fanguineous; but there is nothing to fear from them, if the pain abates, the fever dominifhes, and refpiration becomes more free. Be cautious, however, not to repeat the bleeding, which under thefe circum tances, muft be prejudicial. Sometimes the excretions are yellowith, and mixed

# DISEASES

mixed with streaks of blood, and this alfo is a favourable fign.

LASTLY, it may be laid down as a geheral rule, that expectoration is to be efteemed a happy fymptom; whenever the excretions are thrown off with eafe, they diminish the pain and fever, and render the refpiration eafier.

IN fuch a flate of the expectoration, the mixture No. 13. must be laid aside, and the linguis No. 14. substituted in its place; two spoonfuls of which are to be given once in an hour; and leisfurely swallowed, with a cup of the decodion No.1. warm after it.

If the expectoration does not continue, but fuildenly flops, and there comes on a fattling in the breaft, attended with anxiety, the danger is very great ; blifters on the legs must be applied immediately, the powder No: 15. be given every four hours, and the warm decoction No. 1. fweetened with a little honey, be drank plentifully, till the fpitting comes on again, and the breaft is relieved.

THERE comes on fometimes, but not often, a painful fwelling behind the ears, or on the thighs, which pain is followed by a diminution of that of the breafl : in this cafe, the immediate use of the cataplasm No.

## OF THE ARMY.

No. 8. or fuch like, is neceffary, to ripen the fwelling which is to be opened with a lancet, as foon as it comes to a head, and be dreffed afterwards as an ulcer.

THE violence of the diftemper may be fo great, that the most efficacious remedies are infufficient to overcome it, and to expel the morbific matter. In this cafe, fuppuration, which is always dangerous, comes on, and most commonly theillness degenerates into a confumption, unless means be found to evacuate the already formed pus.

THAT this is the ftate of the cafe, may be known by the following fymptoms.

THE pain is flubborn, and yet lefs violent than at the beginning; it is attended with a dry cough, or with unripe excretions ; there is a continual quickness of the pulle, which increases towards night, or whenever the patient takes any nourifhment; the cheeks and lips become red; he has frequent shiverings and night-fweats; theurine is frothy and pale, and he foon becomes extreamly weak and lean. The abfccfs, formed in the lungs, is fometimes evacuated by excretions : when they begin to appear and are purulent, the infusion No. 16. fweetened with a little honey, is to be given every hour : broths, in which fresh chervil, lettuce

lettuce, and parfly roots, are boiled, may ferve for nourifhment; and for drink, barley water, with a fourth part of new milk, both to be continued till the purulent matter is quite evacuated.

BUT this does not always happen; the pus is often formed in a bag; and in that cafe it must be attempted to draw out this collection of matter.

A SMALL plaiffer applied, and made to flick clofely to the most painful place, will be very proper in the beginning of theillness; because if the Pleurisy should degenerate into an abscess, the collection of matter will point towards that place.

WHEN an Abfeefs is known to be formed, by the figns that have been deferibed, the marked place is to be corroded by a light cauffic ; and when open, care muft be taken to keep up the fuppuration. In fuch a care, there is reafon to hope, as the refi tance is the least at this place, that the macter collected will take it's courfe, and be difeharged by it ; for thefe collections are often lodged between the Fleura and the a j cent parts.

FOR the fame reafon, a feton on the fpot is fuccefsfully ufed; and the pus has often been feen to difcharge through fuch a paffage procured by art, IF

# OF THE ARMY.

IF the matter contained in the abfects cannot be drawn to the external parts, it will occafion a fwelling of the Pleura towards the cavity of the breaft; whereby the lungs will be oppreffed, the anxiety daily increase, the Pleura burft, all the fymptoms fuddenly difappear, but come on again foon, and the pus fall into the cavity of the breaft.

UNDER these circumstances, no other method can be used but the Paracenthesis, to discharge the breast from the pus there lodged, and prevent a mortal confumption.

DURING this laft trial, the use of the medicine No. 16. is to be continued. If, during the course of the distemper, the patient can get no fleep, a pint of the emulfion No.17. is to be administered, to which may occasionally be added an ounce of the syrup of white poppies, or more if necessary.

### PERIPNEUMONY.

THIS Diftemper is, properly speaking, an inflammation of the lungs : it is dangerous, and even more so than the Pleurify itself, which sometimes degenerates into a Perspucumony, when the patient is forced, by excess of pain, to keep in his breath. A DIFFICULTY of breathing, the load and opprefion of the breaft, and an acute and continual Fever, indicate a Peripneumony. In this differmer the patient feels no pain; or if he does complain of any, it is of fuch a dull one as diffinguifhes the Peripneumony from the Pleurify; which laft, in infpiration, gives the patient a very acute pain.

THE pulfe is not fo hard in the difease we are now defcribing, as in the Pleurify and other inflammatory diffempers; but, on the contrary, is generally found much fofter.

IF the Peripneumony is violent, there immediately comes on a great weaknefs, the pulle becomes finall, foft, unequal; the refpiration is fhort, frequent, difficult, and accompanied with a continual cough; the patient cannot lie down for fear of fuffocation, but is obliged to fit upright in his bed; his face, eyes, tongue and lips, become red and inflamed : thefe fymptoms are followed by an infupportable anxiety, and foon after by a delirium, and death.

ALL the figns, therefore, that we have recited, give us a very bad pronogftic.

A GREATER hardnefs in the pulfe, a lefs difficulty in breathing, more eafe in lying down, lefs rednefs and fwelling in the the face, the eyes, and the lips, are on the contrary, favourable fymptoms.

THIS diffemper requires immediate help, for very foon it brings the patient into evident danger.

You must begin by a large bleeding in the arm, and repeat it in the fame manner as in a Pleurify, if the anxiety and difficulty of breathing do not diminifh. If the blood, when drawn, remains fluid and thin, and fcarce coagulates at all, and if after the bleeding the refpiration is not freer, it is a bad fign, which indicates, that the thicker parts are retained in the lungs, 'and the thinner only difcharged. In this cafe, a fresh bleeding would produce no effect, and only evacuate that part of the blood which is least thick, and could still have made its way thro' the lungs.

SOME hours after the bleeding, it will be proper to give the glyflerNo.11. Fomentations, ointments, and plaiflers, may be applied to the breaft, but it must not be expected that the fe fort of things will be attended with as good fucces as in the Pleurify.

It will be better to apply frequently to the patient's mouth and noftrils, a linen or fponge foaked in warm water, the vapors of which may, together with the air, enter by infpiration into the lungs.

THE

E

THE diet ought, as in the Pleurify, to be extremely light, and the broths still thinner.

LET the common drink be the decoction No. 1. or barley-water ; but inflead of mixing milk with it, add to each pint half an ounce of pure honey.

WHILE the patient is awake, let him take every half hour a fpoonful of No.13. and drink after it a warm cup of the decoction No. 1.

IF, on the ufe of thefe medicines; the anxiety diminifhes, the refpiration becomes freer, the fever lefs violent; the pulfe more vigorous and equal, the tongue moift, and every part of the body, even to the extremities of an equal heat; if, above all, the fkin is moift and foft, we may hope for the beft, and nothing more is required than a continuance of the fame means, as the inflammation of the lungs is beginning to be refolved, and gradually to decline.

But things feldom take this turn, unlefs the diffemper is not violent, the folid parts are fupple, and relief has been applied from the beginning. It oftener happens, that the matter of this difeafe is evacuated by expectoration.

Tне fpitting muft, therefore, be carefully attended to; and it is a very bad fign, when

when at the fame time the patient does not expectorate at all, and has a difficulty to breathe, with a rattling in his throat. The fpittings are good, if difcharged fpeedily, copioufly, and eafily. They fhould be of a proper confiftence; fometimes they appear yellow, and ftreaked with a little blood; which ought to give no uneafinefs, for excretions of this fort are always good, and grow white in time.

THE effect they produce is remarkable, by the diminution of anxiety, the freedom of refpiration, and the alteration in the pulfe, which grows ftronger and fuller.

LET the patient, at that time, take two tea-fpoonfuls of the linctus No. 14. and after fwallowing them foftly, drink a cup of the warm decoction No. 1.

NOTHING more is to be done under these circumstances; and bleeding, purging, or exciting sweats, would be detrimental.

We ought chiefly to guard against the cold air, and cold drinks, for either the one or the other will flop the expectoration, and thereby throw the patient into imminent danger.

Ir a fuppression of the spitting should happen, and the anxiety be followed by the rattling of the throat, blisters are to,

be

.31

be applied to the legs, the powder No. 15. is to be given every four hours, and the fame decoction No. 1. be used as was ordered for the Pleurify. The patient is also to inspire by the mouth and nostrils the vapour of warm water.

IT fometimes happens, that, during the courfe of the diftemper, the patient voids by ftool a yellow and bilious matter, and is relieved by it. This is alfo a fovorable fign, as has been obferved, in fpeaking of the Pleurify.

A LARGE and thick fediment in the urine, at first red, afterwards turning white, is likewife a good fymptom. When this happens, the patient must drink plentifully as in the Pleurify. Nevertheles, it rarely happens that the cause of the evil is difcharged merely by urine; the spitting, which generally comes on about the same time, contributes greatly to the entire cure.

WHEN the patient, by the means of thefe evacuations, begins to find his breaft difengaged, he may have his broth fomewhat ftronger; but he flould conftantly take but little at a time and often, that the lungs may not afrefh be overcharged by a chyle, both too crude and too copious. Sometimes a plentiful bleeding of the nofe gives relief

to

32

to the patient; but this feldom happens.

33

IF none of the evacuations here defcribed are obferved within the fpace of a fortnight, if the fever continues pretty flrong, and the cough dry; if the heat extends to the extremities of the body; if the pulfe is quick, foft, and wavering; if a difficulty of breathing and fhiverings accompany these fymptoms; if the cheeks and lips are red, the thirft great, and laftly, the fever flronger towards night, it is certain that the inflammation is turning to an abfeefs.

THE indications of an abfects already formed in the lungs, befides the fymptoms already deferibed, are as follow : A dry continual obstinate cough, which increases when the fick moves, or takes any nourifhment ; he can only lie on the affected fide, without its being poffible for him to lie on the other ; he has periodically a little continued fever, which augments whenever he cats, drinks, or flirs, and is attended with a rednefs of the lips and cheeks; he has no appetite, but a violent thirst, and complains of night-fweats, efpecially of the head, and the upper part of the break; the urine is spumous, he is greatly emaciated, and extremely weak. WHILE the abscess remains whole, the

purvlent

34

purulent tumor increases more and more ; it presses upon those parts of the lungs which as yet are found ; it obstructs the respiration, and, after the most terrible anxieties, fussionates the patient.

IT is therefore effential, that the abfcefs fhould break, and be maturated, in order that the pus be evacuated. But it may happen to break in fuch a manner, as to difperse the matter into the breast, and occafion an empyema, which almost always proves mortal. This is known to be the cafe, by the fudden diminution of all the fymptoms, fometimes attended with flight faintings, and the total suppression of purulent spittings. It is because the abscess is in effect burft, that the fymptoms proceeding from the diffention of the purulent bag immediately ceafe : but the matter fpread in the cavity of the breaft, growing every day more copious, and more acrid, foon occasions new symptoms, worse than the preceding ones.

THE paracenthefis is the only means of help left; but as the ulcer has already corroded the fubftance of the lungs, the fuccefs will be very doubtful: and even tho' the pus is evacuated, the fick perfon, generally dies after the operation.

MUCH

MUCH more it is to be wifhed, that the abfcels may break in fuch a manner, as to let the puls fall into the bronchi or air veffels of the lungs, that fo it may be evacuated by fpitting.

35

WHEN this happens, it is to be feared, left the bronchi be totally filled and ftopped by the quantity of pus fpreading itfelf inftantly, and all at once, and occasioning thereby a fuffocation : but if the pus that falls in these vessels can still be discharged, the patient often recovers the 'the purulent confumption is always to be apprehended.

THE following are the principal fuccours which art has found out to forward the opening of the abfcefs into the bronchi, and the evacuation of the pus by expectoration.

As foon as the fymptoms of an abfeefs, as deferibed above, are perceived, let the fick infpire continually by the mouth and noftrils, the vapour of warm water, to foften and relax the parts.

LET him take fatter broth, and in larger quantity than before, that the ftomachbeing filled, the defcent of the diaphragm may be more difficult, and the abfects more compressed. The patient must be excited to cough, by applying warm vinegar to his nostrils, or to cry with a loud voice. This may may procure a chance of breaking the abfects, which, if the ftrength of the fick perfon can bear it, may be still forwarded by giving him an airing in a carriage, on a rough road, where he may be well shook.

As it is impossible to know exactly the moment when the abscess will break, you must repeat, from time to time, the attempts here described.

IF, when the abfcefs is broke, the excretions are purulent, white, and fmooth; if the fever difappears, or diminifhes confiderably; if the appetite returns, the thirft ceafes, and laftly, the excrements are folid and natural, there is reafon to hope that the fick will recover.

IF, on the contrary, the excretions are ftained of different colours, with a bad fmell; if the fever doth not ceafe, or, having ceafed, returns again; if the thirft remains, and the appetite doth not increafe, it is to be feared the patient will fink under it.

WHEN the abscels of the lungs discharges itself by means of purulent excretions, a little rice, or oats boiled in milk, affords an excellent nourishment; but care must be taken, that the fick take not too much at once, but little and often.

THE infusion No. 15. with a third part milk

36

milk and a little honey, will be a proper drink. He is to take thrice a day the powder No. 18. and as the lungs have been fatigued by a continual cough during the day, fome relaxation ought to be procured in the night; wherefore let the patient take two pills No. 19.

IF he is fomewhat coftive, it is not amifs, but if he remains fo feveral days, the glyfter No. 11. is to be given. If the excretions diminifh little by little, appetite comes on, ftrength increases, and the patient gets rid of his fever, a quick cure may be expected.

WHEN the excretions are confiderably leffened, the powder No.18. and infusion No.16. are no more to be used; instead of which, three small spoonfuls of the line tus No.20. and after it three cups of the intufion No. 21. may be taken thrice a-day.

IF, notwithstanding this, the cough returns stronger towards night, the patient may continue to take the pills No. 19. which otherwise are also to be left off.

IF, after the abfeefs in the lungs hath begun to be evacuated by excretion, this evacuation fhould fuddenly ftop, an extreme anxiety fucceeds, together with a rattling in the breaft, and the fick is in very imminent danger. This accident is com-F monly monly caufed by the imprudent admiffion of cold air, or by fome violent emotion of the mind, as anger, fear, or fuch like.

A SPEEDY relief must be given, by causing the patient to infpire the vapour of warm water, both by the mouth and nostrils, making him drink freely of the warm infusion No. 16. and give him every four hours the powder No. 13. until the breast be difengaged, and expectoration comes on again ; after which the use of the powder is to be difficunt.

IT will be of fervice to apply blifters to the calves of the legs, as has been recommended in the pleurify.

WHEN the purulent matter is reforbed by the veins, it fometimes occasions a fudden deposit of matter in other parts of the body, and there causes an abscess, viz. about the ears, the arms, or thighs. The load of the breast ceases at the fame time; and the fame remedies are to be used, and the fame rules observed, as in the case of an Abscess after a Pleurify.

As the inflammations of the external parts may degenerate into fchirrous hardneffes, the fame accident is to be feared in inflammations of the internal parts: for after a Peripneumony, there fometimes remains

38

mains in the lungs a fchirrous and callous hardnefs, in which cafe there is almost always an adhesion to the Pleura. Respiration continues in that case difficult for the rest of life, attended with a little cough, chiefly after meals, and after exercife; and there is no appearance of any of the indications of an Abscess we have been describing. This accident can rarely be got the better of ; and the little relief that may be afforded is fearce to be expected in a military life, unless it be for the cavalry, by riding on horseback.

LASTLY, if the Peripneumony be fo violent, that the remedies have no effect, gangrene and death are the confequence. This is forefeen, when the patient labours with intolerable anxiety, falling into extreme and fudden faintnefles, with an unequal, feeble, and very quick pulfe, and the excretions without confiftence, flinking and black. All thefe figns indicate a fpeedy and inevitable death.

RHEUMATISM, and RHEUMATIC PAINS.

THE general caufe of the Rheumatifin is the 1.1dden exposition of the body to the cold after being confiderably heated, either by work or the weather; efpecially pecially if a perfon, being overcome by the heat, throws off his cloaths, and refis himfelf in a damp and cold place.

4.0

THE foldier is most frequently liable to this diforder, when heated by fatigue, and exposed to rain, he is obliged to wear his wet cloaths, without changing them.

THE cold nights, which in Spring and Autumn fucceed very warm days, are alfo a caufe of the Rheumatifm. This diffemper begins with an univerfalfhivering, followed by heat, thirft, uncafined's and fever. After a day or two, and even fometimes fooner, the patient feels a fharp pain, not confined to one place, but moving from one limb to another, viz. At the wrifts, the fhoulders, the knees ; and fo different parts of the body are in this manner fucceffively affected ; and the articulations, that are attacked, become red and fivelled.

SOMETIMES, in this diforder, the tendinous expansions covering the mufcles are attacked, and occasion an excessive pain on the least motion of the part affected. Sometimes the fever ceases in a few days, tho' the pain continues. In general, it is a very troubletome diforder, effectially when it butacks the loins, as the fick is then coufined to a supine posture, without motion, and, and, as it were, like a log. It often paffes from the loins to the hips, or upper joints of the thighs; where, if it remains long fixed, the cure becomes very difficult.

WEEN the pain fuddenly and often changes from place to place, it is to be feared that the caufe of the illnefs will be drove inwardly, and attack the lungs or brain, which would be attended with the greateft danger. This accident is difeovered by a delirium, or a violent oppression of the breast, fucceeding a ceffation of pain in the extremities.

THIS difease is feldom mortal; but the violence of the pains, and their continuation upon an improper treatment, induce us to employ quick and efficacious remedies. When the diforder is neglected, it often happens, that the articulations are deprived of motion, and there remains for life, an incurable fliffness of the joint. (Anchylosis.)

THE method of treatment is as follows.

TAKE ten ounces of blood from the arm of the affected fide.

LET flannels, imbibed in the warm fomentation No.12. be confantly applied to the part in pain.

THE diet ought to be light, confifting of finall broth, with decoctions of barley,

outs,

oats, or rice, and with roafted apples. For common drink, use the decoction No.

1. or barley-water with a fourth part milk.

I wo fpoonfuls of the mixture No. 22. with a cupful of the infufion No. 23. warm, may be given every hour, unlefs the patient be afleep.

THE following day let him have the glyfter No. 11. and conftantly continue the medicines No. 22. and 23.

IF the pain does not give way, and the fever continues, the bleeding is to be repeated the next day, the fomentation No. 12. and the medicines No. 22. and 23. are to be continued ; after which the tollowing morning, let the patient take the purge No. 6. omitting during this day the ufe of No. 22. and 23. and taking at night the anodyne draught No. 24. Let him afterwards continue two days longer the ufe of No. 22. and 23. and on the third day repeat the purge No. 6. and at night the draught No. 24.

By this method, we commonly get the better of this diforder. If a good deal of a brick coloured fediment appears in the urine, attended with a general breathing fweat, it is a good fign.

IT will then be fufficient to compleat the

the cure, to keep the patient warm in bed, and make him take the decoction No. 23.

But if, after the use of these remedies, the pain still continues, and the part affected grows red, leeches are to be applied upon it.

SOMETIMES the fever ceafes, the patient appears recovered, but the pain flill roves from one joint to another : in this cafe, let the patient take half a drachm of Venice foap made into pills, morning, noon and night, drinking after it fix ounces of the infufion No.23. made warm. He must be kept from the cold, and the articulations lightly rubbed with a piece of dry flannel.

IT happens likewife fometimes, that the patient, tho' otherwife recovered, has a fixed pain left about the articulation of the hip. Apply in that cafe a blifter, about the fize of a crown piece, upon the part for twelve hours, then take it off, and pierce the bladder it has raifed, that the lymph amaffed may flow out, and cure the wound by means of the plaifter, called *empl. allum coclum.* 

EIGHT days after the place where the blifter was applied is healed, apply another, and proceed as before, and if the pain is then not entirely vanished, this operation operation may be repeated four times. Obferve, when you take off the blifter, only to pierce the veficle, and not take the epidermis, for the place thus made bare, would be extremely painful, and without any advance towards the cure.

THOSE who have fuffered of this diforder in Autumn, must take care, during the following winter, not to expose themselves to the cold, and the injuries of the feason, for they would certainly have a relapse.

WHEN by the pain continuing long fixed in the fame place, the affected articulation begins to fliffen, let the part be twice a day held over the fleam of hot water, then well wiped with hot linen, lightly rubbed, and anointed with *ung. clibca*.

#### INTERMITTING FEVERS.

A FEVER is known by a quickness of the pulse, usually attended with laflitude, languor, weakness, thirst, and feveral other symptoms.

WHEN after a fit of feveral hours, it fenfibly diminifhes, with all its fymptoms, and at laft abfolutely ceafes, but in fuch a manner as to return again, it is called an intermitting fever.

THIS fever has different appellations, according

according to the length of the interval between the fits.

IF it returns every day, it is called a Quotidian ; if there is a day between each fit, it is called a Tertian ; if the return is after two days free, it is named a Quartan.

THE intermitting Fever comes on with gaping, lassitude, debility, colds, shiverings, tremblings, paleness of the extremities, anxieties, ficknefs, and fometimes vomiting. The pulfe is feeble and finall, and the thirst pretty great. Heat succeeds after fome time ; infenfibly augments till iv become extreme. The body then grows red, the anxiety diminishes, the pulse is fuller and stronger, the thirst excessive, and the patient complains of a violent headach. and pain in all his limbs ; lastly, a general fweat fucceeds ; all the defcribed fyinptoms diminish, and the patient often falls into a fleep, after which he wakes without Fever, his pulfe is natural, and there remains nothing but lassitude, and weak-Sometimes during the hot fit of nefs. the Fever, bilious matters are thrown up with a perception of relief,

THE urine after the Fever, or during the fweat, is reddiff and frothy; and as foon as it is cold, there appears on the top

### DISEASES

a pelicle, adhering to the fides of the veffel, at the bottom of which is deposed a fediment, in colour refembling pounded brick or bole armoniac.

THIS appearance is, however, feldom obferved in any other but autumnal intermittent fevers, and it is more fo after feveral paroxyfins. In the fpring intermittents, the urine is commonly lefs red, and rather yellowifh, a cloud forms in the middle, and it depofes a white fediment, which is a good fymptom.

OF the two species of Intermitting Fevers we have just mentioned, the vernal ones are easier cured than the autumnal ones, which are attended with more troublefome symptoms.

THE Intermittents which prevail from February to July, are called Vernal; and those that begin in the latter end of July, or beginning of August, and cease at the end of January, or sometimes sooner, are called Autumnal Intermittents.

AFTER the long and violent heats of the fummer, if the troops have been much fatigued, there will be many Autumnal Fevers, and of the most dangerous kind, especially if the military operations require camping in marshy places.

IN

46

In September and October the number of these Fevers is commonly very confiderable, but there is great hope to see that number diminiss at the fall of the leaf, especially if the winds blow any thing hard.

As there is a great difference between the Spring and Autumn Fevers, and as the method of treating them often differ much, we fhall treat feparately of each.

SPRING INTERMITTENTS. SPRING Intermittents are generally Tertians, very often of a kindly fort; fometimes double Fertians, but feldomer than in Autumn.

WE call that Fever a double Tertian, where a fresh paroxysin comes on every day, but the fit is generally slighter on the alternate days.

DURING the paroxyfin, it will be fufficient to take a large quantity of any diluting liquor, made agreeable to the palate, butalways warm, fince cold draughts would be hurtful.

THE patient may therefore drink of the ptifan No. 25. keeping himfelf quiet and in a moderate degree of heat.

THF fit most commonly goes off by an iniversal sweat, which must be kept up by

waind

warm drink, but ought not to be rendered exceflive by too much covering, or other means that provoke heat.

JUET at this time, viz. on the going off of the fit, or as foon as it is over, the patient must have a mess of broth with fome lemon juice, or cream of tartar in it, to make it acid.

. THE intermediate days that are free from Fever, he may take food fomewhat more folid, viz. a little meat, provided the fielh be of young animals : beef will not hurt, fo it be but tender, but all forts of fat are to be avoided.

NOTHING is to be eat near the time that the return of the paroxyfin is expected; the nourifhment then taken would load the flomach during the fit, and caufe a bad digeftion.

FOUR hours, however, before the fit. the patient may take fome light broth. As in fpring Agues, the paroxyfms commonly anticipate the time they fhould return at, regard must be had thereto in the taking of nourifhment.

IF the day the patient is without Fever be ferene, it will be proper for him to use a little exercise; but not to lassifie to he ought likewise to endeavor to fleep rather more than usual.

49

It is to be remarked, that those spring Agues often turn to inflammatory diforders, especially in young and fanguine subjects: bleeding is therefore proper, especially if the sick have a redness in the face, a violent head-ach, or feel some pain on the fide of the breast.

Ir attended with frequent flatulent eruptions, if the tongue is charged, a bitter tafte in the mouth, or a light vertigo, it will be proper to give him an emetic.

LET him take four hours before the return of the fit the powder No. 26. or No. 27. if of a weaker conflitution, as foon as he fhallhave vomited, let him drink warm water plentifully; he will foon throw it up, and vomit afreth; he then must repeat his drinking, and go on in this manner till what is to be thrown off his stomach, be diluted, and his vomiting made eafy.

AFTER vomiting feveral times, the water drank commonly flays one hour; after the vomiting hath ceafed, let the patient have the potion No. 24. and fo wait for the paroxyfm, during which let him take the ptifan No. 25. obferving the rules before laid down.

Ir he complains of pains crofs his back, of grumbling or wind in his bowels, if his

AVI

his belly is fwelled or hard, he must be purged in the following manner.

50

EIGHT hours before the return of the fit, let him take the purge No. 28. and fix hours after he hath taken it, that is, two hours before the fit, give him the draught No. 24.

IF the fymptoms, that gave occasion to the purge, or the vomit, continue, these remedies may be repeated, which however is but feldom the case in spring Fevers.

OBSERVE, that fometimes emetics do not evacuate only by vomit, but by flool alfo, and that purges act likewife fometimes by vomit. There is nothing to be feared when this happens, fince the only object of thefe remedies is to evacuate the flomach and inteflines. After the bowels are thus cleanfed, let the patient take every two hours a fpoonful of the mixture No. 29. drinking after it a cup of camomile flower tea. This remedy muft not be used in the paroxyfm, but only whilft the patient is without Fever, nor fhould he be waked to take it.

THIS is the method of treating Spring Fevers: and there is feldom a necessity for using the bark.

Is after the third or fourth paroxyfm, ulcerated

ulcerated pultules break out about the nofe or lips, it is a good fign, and the fever quickly ceafes : but this is not fo fure in Autumnal Fevers.

It fometimes happens, the' rarely, that after feven or eight fits, the Spring Fever does not ceafe, nor even confiderably diminifh, and that, on the contrary, the fit becomes longer and ftronger. This is particularly the cafe, where the patients are fubject to fweat copioufly, as foon as they are in bed. Here the bark becomes neceffary.

LET him take every three hours while the Fever is off, one of the powders No: 30. in fome wine.

THIS method will foon complete the cure ; and as in the fpring the weather grows better every day, there is but little fear of a relapfe.

#### AUTUMNAL INTERMITTENTS:

THESE Fevers are more obflinate than those in the fpring; and of these the worst fost happen commonly after a very hot fummer.

THEY are alfo harder to be known; for when they first begin, the fits are fo long, and the returns fo frequent, that

they .

they feem continued Fevers, with little or no intermission.

52

SOMETIMES the Fever abates a little, and then returns in a few hours, after a light fhivering. It is only when it begins to give way its character is first known; it then appears that the diforder is a true intermittent. These Fevers, which at first appear to be continued, often degenerate into Quartans.

SOMETIMES these Fevers, which in the beginning did intermit, after long and redoubled paroxyfins, are changed into dangerous continued Fevers.

THESE Fevers are always bilious; the ftomach and inteflines are filled with putrid matter, which must be discharged without delay; to postpone it would be detrimental.

LET the patient take the emetic No. 26. or 27. having, regard, on this occasion, to what has been faid on the subject of intermitting Spring Fevers.

IF the fkin of the face is tight and red, the eyes inflamed, and the heat great and general throughout the body, a bleeding must precede the vomit.

ON the contrary, if the face is fhrunk and pale, and the pulfe not full, bleeding would hurt, and must be refrained from.

THE

THE vomit must be given in the intermission of the fever; or if it does not cease entirely, that instant is to be chosen when it is left violent.

SOMETIMES alfo, in an autumnal fever, it is neceffary to repeat the vomit, that is, when the naufeous fickness, the bitter taste of the mouth, and the foulness of the tongue, continue.

THE day the patient takes no vomit, let him drink the decoction No. 25. ad ding an ounce of the oxymel No. 31. to every pint of the decoction.

AFTER the first or second vomit, the powder No. 32. is to be taken every four hours.

THIS method will commonly fucceed in thefe Fevers ; and if before, they were continued, they will become intermittent, fo that there will be a confiderable interval from one paroxyfm to another, let the patient then take the mixture No. 29. following the directions given under the head of Spring Intermittents.

THE food should likewise be the same as in these Fevers; broths made pleasant with juice of lemon, or cream of tartar; roasted apples or pears, and well fermented bread, ought to be the principal nourissistic recover a H

# DISEASES

little more ftrength, you may add fome flefh meat, either veal or lamb : a little wine taken moderately to recruit his ftrength will do no harm.

54

But as in Autumn the days are continually growing colder, the recovering patient muft guard with care against the inclemency of the weather, otherwise a relapse is much to be feared.

LET him allo for a fortnight, on his recovery, take the quantity of a nutmeg of the electuary No. 33. in the morning falting, an hour before dinner, and an hour after fupper.

WHEN he has been a month without fever, give him the pills No. 34. in the morning fafting; repeat them a fecond time in eight days, and a third time in eight days more.

Ir, after the ule of the emetic, and other remedies here deferibed, the fever fhould fill continue, without any diminution of the paroxyfins, and if the patient grows weaker, the ufe of the bark becomes neceffary; this happens more frequently in Autumnal, than in Spring fevers.

THE powders No. 30. must then be made use of, as in Spring fevers, and in a sortnight be again repeated. IF the eyes grow yellow, the fick feel great anxiety at the orifice of the flomach, and the urine is icterical, you muft then (unlefs the extreme weaknefs of the patient forbid) leave off the ufe of the bark during the fpace of a fortnight ; inflead of which for fome days give him two fpoonfuls of the mixture No. 35. every three hours, ill thefe fymptoms are abated: the fever will return ; but during this interval, the fick having recovered ftrength, will better fupport it, and it foon will abfolutely leave him.

IF the use of the bark in this case was obstinately pursued, it would bring on fome chronical and obstinate diforder. It must be observed, that when the fever has been driven away by the bark, the pills No. 34. are not to be made use of, for commonly they bring it on again.

It fometimes happens, that there fevers are from the beginning attended with the worft of fymptoms. an unequal pulle, a cadaverous countenance, frequent faintnefs, and cold fweats. In fome fubjects, there fymptoms are attended with a cardialgia, or violent pain of the ftomach, and in others with a fleepy heaviners, fo netimes fo profound that the patieng gan fcarcely be waked. IN In this cafe the bark must be immediately given ; for it is to be feared another fit could not be bore. The prefeription No. 30. may be used.

IF by this means the fever being fuppreffed, the face b comes of the colour of wax, and anxieties about the orifice of the flormach are complained of, let the remedy No. 35. be used in the manner before explained,

### QUARTAN FEVERS.

THE first thing to be observed is, that bleeding is scarcely ever proper in these severs.

LET the patient take the emetic No. 26. or 27. before the fit comes on, following the method preferibed in the Spring Intermittents.

BEFORE the next paroxyfm, give him the purge No. 28. and then the quantity of a nutmeg of the electuary No. 36. which he must leave off while the fever fit is on him.

Ir, after eight fits, the fever does not diminifh, and the patient grows weak, he mult take the powders of bark No. 30. obferving what has been before faid on that fubject.

EIGHT days after the fever has left. him, the fame powders No. 30. are to be repeated

repeated, and a third and last time at the end of a fortnight, by which means there will be no fear of a relapse.

In the intermediate days of the parox fins, the fick may be indulged with more wine and a freer nourifhment, in this fort of fever, than in any other.

#### THE JAUNDICE.

A FTER a Fever, that hath continued for a length of time, and above all, after an Autumnal Fever, fometimes the hypocondria remain hard and tenfe, either with or without a dull pain; the patient feels after his meals an anxiety, which fometimes is followed by vomitings; the white of the eyes grows yellowifh; the urine is tinged of an obfeure yellow, and this colour quickly fpreads over the fuperficies of the body.

THIS illness is also a common confequence of bad nourithment; and the foldier is most fubject to its attacks, when a fearcity of provisions hath obliged him to live on meats of difficult digetion.

LET the patient take every three hours four spoonfuls of the mixture No. 35. drinking after it four ounces of the decoction No. 37 which may any where be cafily prepared. NIGHT NIGHT and morning let him have halk a drachm of Venice foap in pills, and his right hypocondrium be rubbed with flannel every morning, for a quarter of an hour, while fafting.

THIS method, followed fome days, ge<sub>3</sub> nerally renders the body open, and procures relief; but it mutt be continued till the urine recovers its natural colour, and the yellownefs difappears from the eyes and the fkin.

IF the body is still costive after having used these medicines fix days, you must give the pills No. 34. in the morning, and all that day abstain from the use of the other medicines, which must be resumed the following days.

I XFRCISE is excellent in this diffemper, above all in open air, if the weather permits.

FARINACIOUS and glairy food is to be avoided, and broth wherein are boiled chervil, forrel, lettice, endive, or fweet fuccory, is proper to be used.

#### THE DROPSY.

HEN the aqueous part of the blood is amafled together, and retained in any cavity of the body greater or lefs, this dileafe is called a Dropfy.

THE

THE denominations of it are different, according to the parts of the body affected.

IF the water is detained in the adipole membrane, and thereby caufes a general fwelling, it is called *Anafarca*. The fwelling generally begins in the interior parts, and gains infentibly the whole body; the eyes are languid, the face and body fallow, the urine in finall quantity, and the patient neverfweats. On preffing the fwelled part, it pits. The fwelled parts, and chiefly the thighs and feet, are always very cold.

It is common enough in the army for this difeafe to fucceed intermitting fevers of long duration, efpecially in autumn and winter. The foldier is also fubject to it, when after having fuddenly drank a quantity of cold water, he refts himfelf in a cold place: it is also frequently the confequence of a confiderable loss of blood, either from wounds, or bleedings too often repeated.

WHEN the Anafarca comes on after a long intermittent fever, evacuations are not extremely neceffary; but it is commonly cured by giving thrice a day, viz. in the morning fafting, one hour before dinner, and one hour before fupper, two ounces of the prepared wine No. 38.

To finish the cure, the patient must be

kept

kept warm, either by the natural heat of the air, or by an artificial one; he ought to be well covered in the night, keep to dry food, fach as meat or fifh roafted; his drink fhould be little and pure, and as much exercife be ufed as his ftrength will admit of.

IT will be found ufeful to rub the fwelled parts with warm flannels, as often as you can. If the patient voids urine in larger quantity, and begins to fweat in bed, and the fwelled parts come down, it is a very favorable fign.

AFTER the fwelling hath difappeared, there remains fuch a relaxation in the parts as threaten a relapfe; this may be prevented by caufing the patient to wear his cloathes ftraiter than ufual, and rolling his legs and thighs with bandages. Bodily exercife in the open air, and warm weather, does infinite good.

In this manner generally the Anafarca that fucceeds intermittent fevers is cured happily enough. But when this diftemper proceeds from other caufes, it often is more obfinate, and requires large evacuations of the ferous humour. Many ways are tried to procure the evacuations, but experience fhews the remedy No. 39. to be fure and efficacious. The patient is to take a fpeonful

60

ful of this in the morning; or if, as it fometimes does, it brings on a vomiting, only half a fpoonful. The most common effect is, however, only a fimple fickness.

THE urine after the use of this remedy comes away in large quantity, and affords a confiderable relief. It feldom purges; but if it should, does no harm.

THIS medicine is to be taken every day, till all the ferofities are evacuated, and the fwelling of the body entirely come down. If the dofe is not efficacious enough in robuft conflictutions, it fhould be infenfibly augmented till it procures a large difcharge by urine. When the patient is on the recovery, the fame regimen must be obferved as has been just defcribed.

SOMETIMES the extravalated lymph is accumulated in the lower belly, and the quantity increases fo much as to caufe it to fwell excessively. When fo, by preffing with one hand on one fide of the belly, and striking on the other with the other hand, the fluctuation is felt, and water is found to abound.

WHEN the diffemper is recent, it is cured often enough only by the use of the remedy No. 39. but if the flux of urine does not come on in some days, nor the

Ī

fweiling

fwelling of the belly diminish, haste must be made to draw off the water by the puncture. The operation is safe, and sure enough; but if attempted when the difcase is more inveterate, it is less efficacious.

It will be proper, as much as poffible, to draw off all the water all together at once; which may be done fafely, by firaitening the patients belly with a bandage, by little and little, and more and more, as the water runs off: the faintings and other accidents will by this means, be avoided.

AFTER the evacuation procured by the puncture, the belly must be bound tight with rollers, and the patient observe the diet we have described above.

THE use of the remedy No. 38. will be very proper here. Sometimes the belly fwells again, and the puncture is then to be repeated.

As it fometimes, though but rarely, happens, that the fwelling of the belly is caufed only by wind, and not at all by a collection of lymph, the most forupulous attention must be used in observing what the cafe is, because in this last the puncture is fearce ever of use, and, on the contrary, generally accelerates death.

THIS

62

THIS laft difease is called Tympanites, or Dropfy of the Belly.

ift. GENERALLY the belly is not fo exceffively fwelled as in the Dropfy.

2d. THE belly appears elevated before, and depressed on the lateral parts.

3d. WHEN the belly is firuck, the motion of water is not felt, but it gives a found fomewhat refembling that of a drum.

4th, THO' the fick lie on either of his fides, the form of the belly remains the fame, the fkin of which is white, extended, and elastic.

5th. COSTIVENESS, and gripings about the navel, often precede this ditemper.

6th. THE body of the patient is lighter than in a Dropfy of the Belly, where the collection of water confiderably augments the weight.

UPON the whole, this diftemper is more dangerous than the other, and is often, mortal.

THF cure may be attempted in the following manner. Let the patient's belly be rubbed with flannel, for a quarter of an hour at a time, twice a day; and after each friction, let it be anointed with the liniment No. 40. and for feveral days let him at night take the powder No. 41. Ir the wind begin to pass by the anus, and the belly grows less, there is room to hope a cure.

IT happens fometimes, that the lymph collects in the cavity of the breaft; and it has been often obferved, that foldiers are fubject to this kind of Dropfy, when, after having been heated by work, and all in a fweat, they fuddenly expose themfelves to the cold, and greedily drink cold water.

THIS difeafe is known by the preceding caufes, by the difficulty of breathing, effecially when the patient begins to fleep, and by a dry cougn; he cannot lie down, but is obliged to fit up in his bed, his body bent forwards, and has commonly his feet fwelled at the beginning of this diftemper.

It is obferved, that the breaft is fometimes difengaged when the fwellings of the legs and thighs become very confiderable; and that, on the contrary, the breaft becomes more opprefied, when this fwelling fuddenly difappears.

THIS fort of Dropfy, efpecially if not inveterate, is often fuccefsfully cured by the use of the remedy No. 39.

IF this does not an fiver, nothing remains but the puncture; but we find by experience, that this is but a doubtful means, and not always attended with fuccess.

VOMITING.

#### VOMITING.

65

OUR prefent inquiry does not regard those Vomitings that attend other diffempers, as Fevers, nephritic Cholics, &c. but only those occasioned by bad food, and a loaded fromach.

THE furest remedy, in this case, is to cause a large quantity of warm water to be drank, to render the vomiting and evacuation of foul matter easier.

IF after this there remains any naufea, or that the tonguebe loaded by a pituitous glairy matter, a light emetic, fuch as No. 27. fhould be given, and the fame regimen obferved as preferibed in Intermittent Fevers.

WHEN the patient has done vomiting, let him take two fpoonfuls every three hours of the mixture No. 12. and on the evening of the day he takes his vomit, let him have the draught No. 24.

COLERA MORBUS. IT is a fudden and immoderate evacuation of the humours, both upwards and downwards.

THO' this may happen, at all times of the year, in confequence of overcharging the ftomaca, and a crapula; yet it is most frequent frequent towards the end of the fummer, and beginning of the autumn. It is often occafioned in fummer by eating too much fruit, drinking putrid water, or a great quantity of new and fweet wine, called *Mu*/t.

THE violence of this diforder is fuch as to reduce the flrongeftman in a few hours, and fometimes to carry him quite off in the space of twenty-four hours.

INE thirft is commonly violent, the anxiety great, the pulfe quick, finall, and often unequ'al. The patient has cold fweats; his face is wan and cadaverous, and his extremities cold.

THE thighs or hands are attacked with fpains, and fometimes both together; all thefe fymptoms are foon followed by convultions, and by death, unlefs prevented by the most speedy and efficacious remedies.

EVERY emetic and purge is to be avoided, for the most gentle are hurtful in this cafe. The patient must be continually taking chicken or veal broth, made fo light as fearcely to have the taste of meat; or, instead of these, panada. A glyster of either of these drinks is likewise to be given, in order to discharge all acrid and irritating matter from the intestines.

AFTER

AFTER this method has been continued for three or four hours, a fpoonful of the mixture No. 43. is to be given every half quarter of an hour, till the vomiting and loofenel's are either ftopped, or confiderably diminisched.

WHEN the patient begins to be fomewhat better, it will be fufficient for him to take only every three hours a fpoonful of the fame medicine, till he has taken it all.

THOUGH the vomiting and loofenefs fhould by this means be entirely stopped, let the patient still continue, for four days, to take three spoonfuls of the same remedy No. 43. every night and morning.

THE best food, on these occasions, is veal broth with rice in it, taken little at a time, and often.

WHEN it happens that the fick lies long without help, and has had thele evacuations for feveral hours, and confequently is grown very weak, and efpecially if he feels fpafms in his thighs or hands, you must immediately recur to the mixture No. 43. in the manner above defcribed.

A DIARRHOEA.

W HEN the stools are liquid, and more frequent than utual, the diforder is called 2 Diarrhea.

THE

# DISEASES

16 A

THE pains and gripings of the belly are not violent in this diftemper; which by this principally is diftinguished from the Dysentery, which we shall treat of afterwards.

As the Diarrhtea fometimes ferves for the evacuation of bad humours, it follows, that it is not always hurtful, and that it may even be advantageous.

It is of fervice when it does not affect the ftrength, but, on the contrary, renders the body more light and alert. On the other hand, it is hurtful, when it brings on langour and weaknefs.

THE Diarrhœa, that at first appeared ferviceable, may become detrimental, by its too long duration, viz. if it last four or five days; for then the body is worn out by too long a flux, the intestines excoriate, a lively pain of the lower belly, with gripings, succeeds, and the Diarrhœa degenerates into a Dysentery.

WHEN the Diarrhœa requires any remedy, you may give the powder No. 44. and at night the potion No. 24. Veal broth with rice, and millet boiled in milk to a thickness, are proper food for the fick.

IF the Diarrhœa does not ftop in two day, the powder, No. 44. and potion No.

## OF THE ARMY.

No. 24. must be repeated, and again in two days, if it should fo long continue.

To avoid a relapse, let the patient on his recovery, for four nights fucceffively, take the bolus No. 45.

CARE must be taken that he be well covered and cloathed, and guarded against the injuries of cold air.

### THE DYSENTERY.

A DIARRHOEA too long neglected often degenerates into a Dyfentery.

BUT it most commonly happens, that it is not preceded by that diforder; and in the army it reigns during the heat of fummer, and the beginning of autumn.

A FLUX of the belly, attended with violent gripings, and very painful strainings for stool, is called a Dysentery.

THE ftools are not always accompanied with blood, as feveral phyficians have pretended, who therefore have called this diforder the bloody flux.

NEVERTHELESS, the fœcal matters are often reddifh and bloody, especially if the diforder has lasted any time.

THIS diftemper chiefly prevails among the troops. The caufes that produce it are as follow:

K

.

THE

THE bile grown acrid by the great heats and the fatigues of war; effectially if the foldier, when heated, fuddenly expoles himfelf to cold air, or fleeps in his cleaths foaked with rain : for which reafon it is often brief in places where cold nights fucceed to hot days.

STAGNATING, or marsh water for common drink

MEAT, or fifh, beginning to be tainted, musty bread, or bread made of musty corn for food.

SURE and reiterated observations convince us, that summer fruits scarce ever cause the Dysentery; but the excess of them may do hurt.

THIS diffemper proceeding from the caufes just deferibed, foon infects a whole army: the healthy foldiers are more effecially infected by the putridexhaltations of the fæcal matters, if they use the fame bog-houses as the fick.

THIS point must therefore be carefully attended to, when the Dyfentery prevails among the troops : it would be proper to dig deep trenches to ferve for necefiarics for the fick foldiers, to cover feveral times in a 'day the fœcal matters with carth, and to have other trenches referved altogether for those in health. To

OF THE ARMY.

To change the camp often would alfo be a proper means to ftop the progress of this diforder ; and by what has been faid relative to the caufes, it will appear neceffary to take all possible care to avoid them.

THE manner of treating the Dyfentery is as follows:

IF the fick is of a fanguine habit, and has great heat all over his body. or much Fever, he must lose eight or ten ounces of blood from the arm; but these fymptoms are rarely met with.

As the Dyfentery is feldom attended with a Fever, and then bleeding is of no ule, it will be fufficient to give the patient the powder No. 46. in wine.

AFTER the first vomiting occasioned by the powder, he must drink warm water with a little honey in it; this will excite fresh vomiting; after which he is still to be plied with warm water till he brings it up as clear as he drank it.

AFTER the patient shall have refied two hours from his last vomiting, you may give him fome small shoes of toasted bread, toaked in four ounces of cold wine; and to make it pleasant, a little cinnamon and sugar may be added. At night let him take the pill No. 47. THE

THE fame remedies are to be repeated next day; and if the diforder is not entirely, or much abated, the third day again.

72

But if the diffemper is confiderably diminished, it will be proper to leave a days interval between the use of these remedies, before they are given a third time.

EXPERIENCE has shown that inflead of the powder No. 46. that No. 48. with the pill No. 47. at night, has been given with good fucces. This must also be repeated three times, leaving the interval of one day, except the Dysentery should flop fooner. If the remedy No. 48. be too weak for robust constitutions, the dofe may be increased to ten or twelve grains. After these evacuations, the patient may; for feveral days, take at morning, noon, and night, one drachm of the electuary No. 49.

His drink mu't be two parts in three of barley or millet water, and one of new milk : and this is to be used in large quantities.

For food, milk thickened with barley, oats, millet or rice, may be given; and when the exceffive flench of the flools is fomewhat abated, meat broth thickened with the fame pulles.

Bat if the malignity or duration of the diffemper diffemper fhould have in a manner, annihilated the firength of the patient, evacuating medicines must be laid aside, as he is already but too weak.

THIS is known to be the cafe, by the violence of the gripings and frainings, by the vacillating finall pulfe, by the pale countenance, by the naufeating all food, and by an unextinguishable thirst.

LET the patient take every hour one ounce of the medicated wine No 50. and night and morning the pill No. 47.

As the bad fymptoms begin to difappear, and ftrength to come again, let the powder No. 44. be taken in the morning. and in the evening, the pill No. 47. to be repeated thrice, with one day's interval, if the diforder be not over fooner.

For fome days after, let the patient take one drachm of the electuary No. 49. thrice a day.

SOMETIMES the inteffines having been excoriated, by the frequent paffage of acrid matters, the patient is very much incommoded with a continual inclination to go to ftool, tho' he voids little or nothing ; in this fituation he is to have the glyfter No. 51. and to retain it as long as poffible. 74

IF, after the evacuations, there fhould remain fuch like pains in the lower belly, the patient would receive great relief, by fwallowing, every day, an egg bolled foft, with a little fresh butter.

INFLAMMATION of the INTESTINES,

A N INFLAMMATION of the INTES-TINES, a very dangerous diffemper, often arifes from the fame caufes as a Dyfentery.

It is differed by a violent pain of the lower belly, which often increafes upon the touch; by the fwelling of the belly, by vomitings, and by conflipation. Thefe fymptoms are attended, at the fame time, with an acute and continual Fever, and a violent heat : the pulfe is hard, the urine clear, and of a bright red, and there is a fudden profibration of firength.

IF the fymptoms are violent, most commonly death is foon the confequence. Before the patient expires, the pain ceases; but the extremetics become cold and livid, the face cadaverous, the pulse small, quick, and unequal. All these are signs of approaching death; altho' the sick, and those about him, are apt to draw an hap py omen from the ceffation of pain.

COPIOUS

### OF THE ARMY.

COPIOUS bleeding is immediately to be had recourfe to, and repeated boldly if the pains do not go off, or remit confiderably ; or if they return again.

LET the patient take the glyfler No. 52. three or four times in a day.

H15 belly must be constantly fomented with flaunels steeped in the fomentation No. 12.

THE caul of an animal fresh killed fometimes produces a good effect.

LET the patient take every half hour a warm cup of No. 53.

It is a good fign if the pulle becomes equal, and remains fo, if the pain diminimes, the fick break wind downward, and the glyfter bring away with it fœcal matter.

SOMETIMES, notwithftanding feveral glyfters, the belly remains obfinately conflipated : in this cafe the fumes of tobacco injected thro' the anus have produced very good effects.

THE drink is to be warm barley water, and light broths the whole nourifhment, until three days after the diforder fhall have entirely ceafed.

AND even then it will be necessary to observe an exact diet for some time, lest the

### DISEASES

the Intestines, irritated anew by acrid food, occasion a relapse.

THIS diffemper is indeed fo violent, that if it does not quickly give way to proper application, it degenerates immediately into a mortal gangrene. But, by the careful use of the above recited remedies, one may hope to refolve the Inflammation of the Inteffines.

If this method has begun to be used too late, if the distemper lasts, without growing worse, three or four days, and a dead pain succeeds to the acute pain of the lower belly; if at the same time the patient seels an unusual heavines, and has wandering subserings all over his body, it is certain there is an abscess forming.

I: which cale he mult have the fomentation No. 12. conftantly applied on his belly during the day, and at night a plaifter of labdanum.

If the abices's feems to be ready to pierce externally, which may be if the Inteftines adhere to the peritoneum, it must be opened to discharge the pus. But this cafe feldom happens.

IF the Absceis breaks in the cavity of the lower belly, the confequence is much to be feared, unless the matter can be drawn

# OF THE ARMY.

drawn off directly, which is very difficult to be done : nor is it eafy to judge of the existence of this case, because the quantity of matter from out of this Abscess is not confiderable enough to cause any remarkable swelling of the belly.

THE pus is more frequently evacuated by the anus: the glyiter No. 52. repeated feveral times, after fuppuration is perfected, facilitates its courfe. By the fmoothing of the internal coat of the inteffines the evacuation of the matter becomes eafier that way.

AFTFR the puß is evacuated, whether alone or with the excrements, the patient must drink plentifully of the decoction No. 16. fweetened with honey, and is to take the powder No. 18. three times a day.

LET endive, lettuce, chervil, or fuch like tender herbs, be boiled in broth for, his food; but it must be strained thro' a fieve, lest any thick substances should collest into a mass in the intestines.

LET him continue this method for three days after the pus shall have ceased paffing thro' the anus; and by degrees he may return to his former way of living.

PHRENZY.

L

# DISEASES

#### PHRENZY.

A PHRENZY is a continued delirium, attended with an acute Fever. It is thereby diffinguished from the Delirium, which is sometimes observed in the height of Intermitting Fevers, and which finishes with the fit.

An extreme heat, and a violent inflammatory head-ach, commonly precede the Phrenzy : the eyes and face are red; the patients, when asked questions, answer with ferocity; they pluck the knap of their cover-lids.

THE more frequent caufes of this diftemper are, the violent heat of the fun, to which the foldier is exposed, especially if bare headed, sleeping in that condition, long watches, extreme emotions of anger, excess of wine, brandy, or other spirituous liquors.

In this diffemper the pulle commonly is quick, and refpiration ftrong, and not frequent.

A Phrenzy is very dangerous, and often occasions fudden death, for it is a true inflammation of the meninges, and fometimes even of the brain itfelf.

GREENISH

GREENISH vomitings, frequent spitting, shiverings, crude aqueous and pale urine, convulsions, and no thirst, are bad signs: bleeding plies, a flux of the belly, a copious hæmorrhage of the nose, give relief to the patient.

PAIN of the breaft, or of the lower parts, is good in this illnefs : a ftrong cough coming on, fometimes alfo gives eafe.

BLEEDING here is effentially neceffary: it fhould be large, and chiefly in the foot : if the Fever and heat continue, it must be repeated ; and it will be right, after the first bleeding of the foot, to open one of the jugulars.

THE bleedings must be repeated, till the extreme heat and the violence of the Delirium are abated. While the patient does not fleep, he must take every hour a cup of the remedy No. 54. warm.

FOR his common drink, the decoction No. 25. may be used, and night and morning the glyster No. 11. must be given.

IF the hamorrhoids fwell, let leeches be applied.

IT will be proper to shave the patient's head, and to make him rinie his mouth often with warm water : let a compress sipped in oxycrate, or vinegar, and water in equal quantities, be applied on his forehead : fresh and temperate air is most proper for him, and he ought to be kept sitting upright in his bed, with his head railed as much as possible.

IT would be also proper to make him rile twice a day, to fet him in an arm chair, and bathe his feet in warm water. After the night bathing, the passe No. 55. should be applied to the foles of his feet, and lie on till morning

DURING the whole time of the illnefs, he must be confined to plain barley water, or water gruel.

IF, after the ufe of thefe remedies, the Fever begins fenfibly to grow lefs, and the Delirium to wear off, but the patient can get no fleep, let him have the emulfion No. 17. at night, with the addition of an ounce and a half of fyrup of white poppies.

But anodynesmuft be carefully avoided while the illness continues in its force.

At the beginning of this dangerous diftemper, all the remedies here recited muft be sigoroufly employed : but when the heat and Delirium are confiderably diminihed, bleeding and glyfters are no longer ucceffary, the drink No. 25. will be fufficient, cient, and the nourifhment may be a little flronger.

NOTWITHSTANDING the diminution of the fymptoms, it happens often enough, that the Delirium does not entirely give way; but commonly it decreafes infenfibly, efpecially if feveral times a day, and as much as his ftrength will permit, the patient is made to fit up in an arm chair with his body upright.

HEMORRHAGE of the NOSE.

A<sup>S</sup> Bleeding of the Nole is a prett<sup>y</sup> common fymptom in ardent Fevers, almost always giving relief, and fometimes even curing the distemper, it is casily apprehended, that it must not be too lightly stopped.

But fometimes the Bleeding of the Nofe is fo violent, both in fick perfons, and in those who are in health, that bod'ly ftrength is fo wafted, as to bring on total faintings, fo that even death may enfue.

In this cafe, the too violent H morrhage muft be flopped. To judge when this ought to be done, requires a fittle attention to the following confiderations.

WHILE the pulle keeps full, and the heat of the body is every where equal,

eyen

even to the extremities, and the lips and the face keep their red colour, there is no fear from the Hæmorrhage, was it even violent.

BUT when the pulfe begins to undulate, and the face and lips grow pale, it is time to ftop the bleeding.

THE means of ftopping it are, applying bandages to the arms and thighs of the patient, because the veins being thereby compressed, the reflux of the blood to the heart is in less quantity. The Hæmorrhage stopped, the bandages are not to be loofened all at once, but successively one after another, in such a manner as to leave the space of a quarter of an hour between the loofening of each bandage.

Ir, by the application of the bandages in the manner deferibed, the Hæmorrhage is not ftopped, or if it comes on again after taking them off, the following method is to be ufed ;

LET a tent of lint imbibed in the ftyptic No. 56. be put up that noftril from which the blood came. If fome lint dipped in the ftyptic be wrapped round a quill, it will be eafily introduced up the nofe : at first, for about half an inch, it must be put up horizontally, then raising the quill me

sensibly,

### OF THE ARMY.

fenfibly, it is to be pufhed gently, and by this means the lint introduced as far as poffible without hurting the adjacent parts. Afterwards, by gently compressing the nostrils, the quill may be withdrawn, and the lint left in the nose, where it is to remain for a day or two, till it falls out of itself.

THE agaric of the oak is also an efficacious remedy for stopping the bleeding. Some of the powder No. 57. may be blown through a quill into the patient's nostrils.

#### A CONTINUED FEVER.

A FEVER, that lasts from the moment of the first access, without interruption, to the end of the disease, is called a continued Fever.

THE principal caufes of Fevers of this fort in an Army, are, exceflive fatigue, and extreme lassified, which is its confequence, especially during the heat of summer, if the soldier is under the necessity of enduring thirst, or drink too much spiritous liquors.

For the most fluid and lightest parts of the blood being by these means lost; what remains, grown more thick and acrid, is in a state to occasion great diforders, and

above

84

above all inflammatory ones, becaufe the mais of humours fo thickened is now greatly difposed to inflammation.

WHEN a Fever of this fort produces a topical inflammation, the difeafe takes its name from the part affected : for the Pleurify, Perippeamony, Phrenzy, fore Throat (Quinzy,) inflammation of the inteffines, are often preceded by, and always accompanied with a Continued Fever.

Bur when it happens that fome of the above recited caufes occasion this Fever, and that it affects no part in particular, it is called fimply a Continued Fever.

THIS Fever is known by the caules that precede it, by the vigour of the time of life, and a hot and fanguine conflictution, by a hard and quick pulfe, and chiefly by its extreme heat, which burns, as it were, the fingers of him who touches it. The urine is red, thick, turbid, the tongue dry, the thieft great ; often an intolerable pain of the head, and an obfructed refpiration.

THIS difeafe, always dangerous, is more or lifs to according to the violence of the deferib d fymptoms.

LARGE blee lings are neceffary in the beginning, which are to be repeated till

the

the great heat and drynefs of the tongue begins to abate. Barley water is the com-, mon and proper drink ; but to every pint fhould be added an ounce of the remedy No. 31. of which let him take largely ; let there be given him every two hours a cup of the decoction No. 54. and twice a day the glyfter No. 11.

THIS method is to be continued till the decline of the diffemper, which is known by the diminution of heat, of the quickness of the pulse, and of thirst; by the humidity of the mouth and tongue, by the urine being not so high coloured, and by the sediment it then deposes. The fame regimen to be observed as in the Pleurify.

As the difeafe grows milder, the decoction No. 25. will be fufficient for common drink, and let the diet be gradually augmented till he is quite well.

It is highly neceffary to obferve, that there is alfo another fort of Continued Fever, without an inflammatory thicknefs of the blood, but rather occafioned by a putrid diffolution of the humours. This laft fort is much worfe, and more dangerous than the other, and very often, this Fever proves contagious.

M

Тния

DISEASES

86

THIS happens most frequently, when, . during the great heats, the Army is encamped in marfhy places ; for then they refpire an air corrupted with bad effluvia. This fost of Fever 1 revails alfo very much, where many men, even were they healthy, are lodged together in a narrow fpace, where the air cannot be renewed often shough. Ships of war and hoffitals, where the fick and wounded are much firaitened, are frequently vifited by theie Fevers, efpecially if the air cannot be refreshed often enough ; because the air then to be refpired is fo corrupted by the effiuvia from the bodies, the flink of the excrements, and the putridness of the gangrened parts, that it engenders a very bad, and maly putred Fever, which foon grows conlagious. It is therefore fometimes called the fail or Hofpital Fever. Its particular Amptoms should be exactly deferibed, dereby to know this diffemper.

Ir begins by a flavering, followed by a boat, but not violent; foon after, the flavering again, after which the heat, and to the flaverings and heat alternately.

TOTAL loss of appetite, fleep diffurbed, ord without refreilment, a heavy pain of the head, affecting especially the anterior

part ;

87

part : the pulle is almost as in a natural flate : the skin is not always very dry the fick languigh on in this manuer fome days, without being able to attend their butinefs, yet without being obliged to keep their bed. The tongue is feldom dry; it is more commonly left, moift, and covered with a fort of cruft of yellowifi green. The patient dozes much, fleeps little, and feems quite absorbed in profound reveries : in the progress of the illness, comes on a trembling of the hands, hardnefs of hearing, and dimnefs of fight ; the palle begins to grow feeble, and the patient is defirous of cordials and wine. Towards. night, all the fymptoms grow worfe : laftly, at different times during the course of this diffemper, there appear purple spots of an irregular fi ure.

The following fymptoms are confidered as mortal : A fulden profiration of firength, weaknels of the fight : the pofture of the fick, firetched on his back, and drawing up his knoes to him; reiterated efforts to get out of bed, black aphthæ, livid petechiæ, and firipes alfo livid, refembling the blow of a whip fipread over the body; the flux of the belly, with lead coloured or blackifu flools, weaken the patient more and more. DEAFNESS DEAFNESS is not a bad fymptom in this diffemper. Nay, it has been observed, that patients on their recovery are apt to grow deaf, and that fometimes they have an Abscess in the conduit of the ear.

BILIOUS flools, thick urine, a moift tongue, are good omens, efpecially if the patient keep up his firength.

A NUMBER of little red puffules, or white and elevated miliary ones, are good, if at the fame time expectoration is eafy, and the urine depofes a thick fediment. Laftly, it is counted a good fign, when an eafy fweat comes on, and relieves the patient, or the paretids fivell, or there appear white apthw.

As the caufes here recited indicate that all things tend to putrefaction, and that the firength is extremely exhausted, bleeding can feldom be of use, unless in replete habits, and that but once: for large bleedings abate the strength immediately, and occasion a Delirium. It is very necessary that the air be often renewed.

In cafe of a naufea, or weight felt about the region of the flomach, or that the tongue be covered with a yellowifh green cruft, the patient must take the emetio No. 27. and after the first effect of this powder, OF THE ARMY.

powder, let him drink plentifully of warm water, that he may vomit eafy, which is to be repeated, as has been faid in the article of Intermittents.

THE evening after the emetic, let the patient take the bolus No. 38. and drink after it fix ounces of the whey No. 59. If milk cannot be procured, the decoction No. 25. may be fubfituted in its room, obferving to add two ounces of wine, and half an ounce of oxymel, to every pint. This whey, or decoction, may ferve for common drink, efpecially as the fick are fond of vinous and comforting drinks, and that thefe drinks are fuitable to this diftemper.

LET him take every fix hours the powder No. 60. with fix ounces of the above whey, or decoction.

DEATH, preceded by great anxiety and convultions, is often the confequence of extreme languors, when the purples difappear, or the miliary fpots flrike in : in which cafe a fpoonful of the mixture No. 61. is to be immediately given, with three ounces of the whey or decoftion No. 25. to be repeated every three hours till he finds eafe, and the purples appear again, or the miliary fpots rife; after which the fame fame remedies are to be continued every four hours only. If, in confequence of this method, an equal breathing fiveat comes on through the whole body, the patient finds great eafe thereby. If the belly is conflipated, let the glyfter No. 52. be given.

It is proper to difcharge the patients from out of the hospital, as soon as they begin to recover, that they may breath a purer air; otherwife a relapse is much to be feared, which is feldom or never got over.

#### THE SCURVY.

HIS is a common diftemper, and of difficult cure, more effectially in fieges and unhealthy places, where fometimes the troops are obliged to take up their winter-quarters.

It begins by numbrefs of the limbs, with an unufual laffitude of the whole body : after walking, the limbs and mufcles feelquite fatigued, and, as it were, broken. In the increase of the diffemper, refpiration becomes thert and difficult ; fometimes the thighs fwell ; at first the face is pale, then grows brown, and the skin is stained with spots of different colours, the mouth begins to finell, the teeth loofen

.90

loolen in the fockets, the gums fwell, itch, grow painful, and bleed on the leaft touch; laftly, wandering pains affect different parts of the body.

In the progress of the diftemper, the gums putrify and exhale an horrid ftench; the seeth grow yellow, then black and carlous. Sometimes happen violent hæmorrhages; very bad conditioned ulcers break out, especially on the thighs ; the patient feels violent and painful thootings in all his limbs, which increase in the night, and the body is covered with black fpors. At this period the diftemper fuddenly grows worfe, fevers come on of different kinds, every thing grows quickly putrid, and mortal hæmorrhages break out of the mouth, the nole, or about the anus; the vifcera putrify; and faintings fucceed, which are foon followed by death.

THIS diffemper is frequent in winter quarters, from the following causes.

NOISOME vapours, arifing from marfhy grounds and flaguating waters, inaction, fcarcity of greens and vegetables, drinking of corrupted and flagnating waters, the use of falted and finoaked fieth and fith, and of cheese too old and acrid; damp and low lodgings, and not being open to the course of the winds. FEAR FEAR and forrow alfo occafion this diforder, and increase it in those already attacked with it. By that, and by bad food, it often makes fuch ravages in besieged places.

EXPERIENCE fhows, that the humours in this difeafe are not only putrid and acrimonius, but alfo condenfed.

THEREFORE, in the cure, care must be taken to attenuate the viscosity of the humours, and to prevent or correct putrefaction.

WE are to lend all the affiftance of art to prevent, or avoid the caufes of this evil, and thereby preferve the foldier from the ravages of this diffemper.

FIRST, by correcting the impure waters. This is done by mixing two ounces of vinegar, and two ounces of brandy, to every pot of water. For the want of these, fome flices of calamus aromaticus may be steeped in the water. This is a fort of reed, very common, growing almost every where, in such low, marshy, and damp gounds, as are most subject to the foury.

STRONG purges, vomits, and bleeding, do no fervice in this diftemper.

Bur as bad nourifhment is one caufe that produces the fcurvy, the ftomach and inteffines

# OF THE ARMY:

inteffines must be cleared, and evacuated which is easily done, by gentle and reiterated purges, such as No. 34. to be taken . three times, with the interval of a day between each.

THE food fhould be broth; with chervil, forrel, fpinage, lettuce, endive, fuccory; cabbage, effectially red cabbage; young nettle buds and tops, or any other fort of tender herbage, boiled in it; the preference to be given to those easiest to come at.

FRUIT quite ripe, uted moderately, always produces a good effect: but if neither fruit nor greens can be procured, the patient must have his broth with barley, oats, or rice; he may cat likewife a little yeal, or fowl, but it must be moderately.

AFTFR the ufe of light purgatives, antifcorbutics will be proper, but which are to be varied according to the different conflictution of the patient.

IF he feels himfelf cold, his face pale, his legs fwell, and his thirft is not great, let him take two ounces, that is, about a tea-cup of the decoction No. 62. thrice a day.

IF he is hot, his pulse feverish, his thirst great, his breath bad, his gums bleeding and half putrid, the decoction No. 62 is

not

not fo proper as No. 63. to the quantity of three ounces thrice a day.

RIPE fruits, and roafled apples and pears, eafy to be procured, are also very proper.

THE remedies are to be continued a great, while. When the limbs move eafier, and the pain diminishes, the distemper grows better, and then exercise and good food will be sufficient to compleat the cure. To carry of all relicks, it will be proper, on recovery, to take fifty drops of the elixir No. 64. in wine and water, equal quantities, thrice a-day.

ALTHO' it be certain, that when the diftemper is at an end, the fymptoms ought likewise to cease ; yet it is no lefs true, that after the fcurvy, we often fee those who have been attacked by it fub- , ject to ulcers of the gums, lips, infide of the cheeks, and of the palate, which foon fpread, and corrode thefe parts, and in a little time turn to a gangrene. Thefe ulcers often deceive those who do not rightly underfland them : they appear in form of white or yellowish spots, red, and inflamed round the border, and often very painful. A great flench accompanies them, and the spittle, which comes

comes in plenty, is alfo of a bad finell. This evil requires an immediate remedy, otherwife all would foon be infected with a gangrenous putridhumour, the teethwould fall out of the fockets, the jaws would be affected, and entirely corrupted.

BUT this diforder is cafily got the better of, by touching the parts lightly and often in the day with a little lint dipped in the preparation No. 65. Little compreffes, imbued with the fame, may alfo be applied between the gums and lip, and renewed from time to time.

CARE must be taken not to rub the parts affected too much, as is the bad custom of fome, for the evil and pain is thereby augmented.

IF the flench is great, and the ulcers extend themfelves rapidly, the quantity of fpirit of fea falt is to be augmented, till you get the better of the gangrenous corruption.

## THE GANGRENE.

A<sup>S</sup> mention has been made of the gangrane, it may be here proper to take notice, that the bark taken internally is a most efficacious remedy for this distemper, whatfoever part is attacked.

THE

96

THE patient is to take every four hours one of the powders No. 30. till the gangrene begins to feperate from the found parts, and a good fuppuration comes on : at which time it will be fufficient for him to take them twice a-day till the ulcer is mundified

THE bark is equally proper, when the fcorbutic ulcers of the infide of the mouth threaten to gangrene.

#### LUES VENEREA.

by contact, communicated by the infected to, even, the foundeft bodies.

THIS contagion produces many different diforders, which according to the different parts of the body where it fixes, go under different denominations.

SMALL ulcers appearing at the extremity of the penis, or on the prepuce, are called venereal fhancres : if the nervous papillæ of the genital parts form little elevations like warts, they are called venereal verrucæ : if the internal fuperficies of the urethra is affected, there arifes a difficulty and pain in making water, named a tranguary, and a running of a yellowifh, greenifh, or fometimes brownifh matter

97

it is then called a gonorrhœa; if swellings in the groins, buboes.

WHEN the virus having gained the blood circulates with humours, whereever it ftops, it produces evils of different kinds, for inftance, puffules, and fpots upon the fkin, that fometimes degenerate into filthy crufts: ulcers in the adipofe membrane, not giving way in the leaft to fuch medicines as are proper in other ulcers; which corroding the adjacent parts, leave profound and frightful cleatrices: thefe ulcers no fooner difappear from one place, but they quickly fhow themfelves again in fome neighbouring part.

THE throat most frequently, and the roof of the mouth, are corroded little by little by this distemper : there appears in these parts a fpot, refembling bacon ; the voice becomes hoarfe, the action of fwallowing is attended with pain, and the fpot we spoke of gaining ground by little and little, destroys all the fost parts, and at length attacks the bones of the palate and mouth ; which grow rotten and fall in, and leave for the rest of life a deformity, for which there can be no remedy. THIS diffemper, especially if it is inveterate, terate, attacks alfo the bones, and caufes fwellings on them, which if foft, are called tophi or gummi ; if hard, nodes or venereal exoftofes; whence enfue very bad caries, with intolerable pain, worfe in the hight, the warmth of the bed increasing it ; but rather easier in the day.

WHEN the bones are corroded even to the marrow, the cure is extremely difficult, and though cured in appearance, it often returns.

THIS diffemper may be eafily known by the deferibed fymptoms.

THE following is a fafe method of treating it.

LET the patient take, night and morning, one fpoonful of the medicine No. 66. drinking after it a pint of barley water with a third of milk in it, ufing the fame for his common drink : if milk is difficult to get, the decocition No. 67. may be fubflituted in its room.

THIS medicine gives no manner of trouble to the patients; to fome it procures fome light flools, but this feldom; in others it works by urine and fweat. Its use may be continued with the greatest fafety till all the fymptoms of the discase have absolutely disappeared.

98

IF

OF THE ARMY.

IF the weather is mild and temperate, the patient may go out; but in cold and damp weather, it is better he fhould keep his room.

Is the medicine feems to act too flow in robuft habits, or when the diffemper is inveterate, the dofe may be augmented to a fpoonful and a half: and if in fome days the fymptoms do not diminifh, two fpoonfuls may be given every night and morning, in all four fpoonfuls a-day.

THE time the patient is to continue the use of this medicine, cannot be exactly limited : often, if the distemper is not very bad, the cure is performed in three weeks ; if inveterate,' it takes up more time. But it may certainly be used a long while without the least inconvenience.

WHEN the ulcers cleanse, and cicatrize, when the rotten parts of the bone separate and fall off, and when the tumours and nocturnal pains diminish, the distemper gives way to the remedy.

As to the regimen of the diet, let the patient have broths with barley, rice, or oats, or tender greens, his flefn meat lean, milk diet, and ripe fruit.

FAT and fmoaked or falted meat, efpecially bacon, are bad.

THE

THE following remark is neceffary to be attended to. Sometimes a falivation comes on from the use of this medicine; but this is but feldom, and almost only to those who have before made use of mercury, either internally or externally : nevertheles, falivation not being necessary to the cure, the use of the medicine No. 66. is to be left off immediately on the first figns of a spitting coming on.

But the decoction No. 67. may be still continued.

THE fights of an approaching falivation are as follow.

THE gums begin to fwell, to grow red, to itch, and become painful, and the breath to finell ill. As foon as thefe fymptoms are remarked, the ufe of the remedy No. 66. must, as has been before faid, be fuspended : but if in eight or ten days thefe symptoms difappear, and the patient is not cured, it may again be ufed.

IF he has a gonorrhœa, he must drink plentifully of the decoction No. 67. totake off the acrimony of the urine; he may bathe the penis thrice a-day, for a quarter of an hour at a time, in equal quantities of water and milk warm.

IF, by fupprellion of the gounorrhœa, or

br from any other caufe, a tefficle becomes fwelled and painful, and the forotum red; let him be bled immediately, the fomentation No. 12. applied to the tefficle, and let him drink plentifully of the decoction No. 1. adding twenty grains of nitre to each pint. After the rednefs, fwelling, and Fever, which often attend fwelled tefficles, are appeafed, it will be proper to make use of the remedy No. 66.

IF venereal buboes grow hard, a plaister, of galbanum is to be applied.

### THE ITCH Savery troublefome diffemper to armies, and immediately fpreads by contact, unlefs the affected foldiers are feparated from those who are well.

THOUGH all the external parts of the body may be affected, vet the itch moft commonly flows itfeld first on the hands, principally between the fingers : full appears a puffule, or two, full of a fort of clear water, which itch extremely : when these puffules are broke by foratehing, the water that iffues out communicates the diforder to the neighbouring parts. It is not eafy in the beginning to diffinguish the Itch, unless one is well acquainted with this diforder : but in its progress the

pustules

pustules augment both in number and fize; and when opened by foratching, a difgustful cruss formed, and the evil gains the superficies of the whole body.

HITHERTO the Itch hath its feat between the epidermis and the fkin ; but if it continues long, it makes way through the fkin into the membrana adipofa, where it forms fmall ulcers, commonly in great number. This fort of Itch is the naffieft and worft, and at the fame time extremely contagious.

It isto betreated in the following manner. THE body is to be kept clean, and linen often changed : if the feafon of the year permit, they muft bathe, and in waters impregnated with fulphur, if they can : if they cannot, experience fhews, that to bathe in running water will be of fervice. The fhirt, breeches and ftockings, are to be fcented with brimftone before they are put on : but this fumigation muft be made in the open air, left the fulphurons vapours fhould do hurt, if taken in by refpiration.

LET the patient take the purging powder No. 68. in the morning failing, and repeat it every eight days.

On the intermediate days, let him take, morning, noon, and night, one of the powders No. 69. LET

## OF THE ARMY.

LET the parts affected be anointed every night with the ointment No. 70.

IF the ltch covers both the whole body and all the limbs, they muft not all be anointed together at once; but you may begin by the hands, and the arms; continue the next day by the feet, legs, and thighs, and the third day the body; the fourth day to begin again by the hands and arms, the fifth the feet, &c. and fo on to the entire cure.

WHEN the puscules are dry, the crufts fall, and the ulcers difappear and return no more, the patient is well.

Some fpots will, indeed, remain on the ikin, but thefe marks wear off infenfibly; and in time quite difappear.

THE patient must abstain from all manner of falt food during the cure.

### WORMS.

SOLDIERS are frequently troubled with worms. Bad food, unwholefome water, and other caufes engender them. Vertigoes, naufea, fudden fwellings of the lower belly, efpecially after meals, the heart-burn, grumbling in the bowels, and troublefome itching of the nofe, are indications of Worms. Some have a voracious cious appetite, others lose it entirely : the face is pale, and funk.

But all the figns here deferibed are not all found at the fame time in each patient; but the more of them are diffeovered, the more certainty we have of the diffemper.

BUT, after all, the most contincing fign is, when the fick void Worms, by vomit or flool.

ALL the cure confifts in expelling them out of the body, but this is not eafy; for Worms are found to flick as it were, to the Inteflines, fince otherwife they would come away with the excrements.

It will, therefore, be proper in order to get the better of them, for a couple of days to give the patient formewhat, that by its fmelt may, in fome manner, infect the inteftines; after which to give a roughpurge.

LET the parient take five grains of afa fætida in pills every three hours, for two days.

THE third day let him have the purging powder No. 71. in the morning failing, taking after it a light broth, to be continued from time to time, till the medicine has done working.

• JF. after this process, the symptoms da no douppear at eight days time the whole must be repeated. A ECIPES

103

RECIPES REFERRED TO,

IN THE FOREGOING TREATISE ON THE

DISEASES OF ARMIES.

1. AKE of the species for the pectoral decoction three ounces. Boil in a sufficient quantity of water for half an hour, to strain three pounds.

2. Take of the mass for pil. cynogloff. cight grains. Make two pills for a dofe,

3. Take of the fpecies for the emollient decoction fix ounces. Boil in fufficient water to the thicknefs of a cataptalm, adding towards the end, muftard feed bruifed one ounce, for a poultice.

4. Take'flower of elder one ounce. Let it just boil up in a fufficient quantity of water in a close vessel: then digest warm for half anhour; strain two pounds. To which add rob of elder one ounce and a half, pure nitre forty grains. Mix.

5. Take flower of elder, and red rofes, of each half an ounce, pure nitre one drachm. Mix. Infuse a pugil of this in warm water for tea.

6. Take leaves of fenna fix drachms, water feurvy grafs two drachms, agarie one drachm, tamarinds half an ounce. Boil for a quarter of an hour, in water eqough; ftrain two ounces, add fyrup of rhubarb rhubarb half an ounce. Mix for a draught to be taken at once.

7. Take of the fpecies for emollient decoction four ounces. Boil forhalf an hour in water enough to ftrain three pounds.

8. Take of the relidue after the Itraining of the laft, at will, add meal of lintfend, oil of lintfeed, of each two ounces. Dix for a catapfalm.

9. Take flowers of red rofes two pugils, zgrimony oue handful. Mix. Infufe like a tea for a gargarifin. Add a little honey.

10. Take honey of rofes halfan ounce, spirit of sea falt, twenty drops, Mix.

11. Take species for the emollient decochon two ounces. Boil in water fufficient, for half an hour ; firain one pound. Add fimple oxymel two ounces, pure nitre one drachm. Mix for a glyfler.

12 Take species for emollient decoction three ounces. Boil an hour in water fufficient ; strain four pounds. Diffolve Venice foap two ounces. Mix for a fomentation.

13. Take pure nitre one drachm and a half, crabs claws two drachms, fyrup of wild poppiestwo ounces, barley water ten ounces. Mix.

14. Take oil of fweet almonds, or, inflead

Read thereof, best olive oil, two ounces, one yolk of an egg; to them well beat up, add pure honey one ounce. Mix for a linctus.

1 j. Take kermes mineral three grains, crabs claws twenty grains. Mix.

16. Take Paul's betony, agrimony, ground ivy, golden rod, of each equal parts. Infuse in warm water for tea.

17. Take cucumber feed half an ounce, fweet almonds blanched No. 8. bitter ditto No. 2. Mix with barley water one pound : ftrain for use, for an emultion.

18. Take myrrh fifteen grains, crabs claws half a drachm. Mix for a powder.

19. Take of the mass for pills of horehound fix grains. Make two pills.

20. Take balfam capivi halfadrachm, a yolk of an egg. To them, well rubbed in a glafs mortar, add pure honey 1 ounce. Mix.

21. Take coltsfoot, scabious, tops of St. John's wort, of each one handful; powdered liquorish two ounces. Mix. Infuse for tea.

22. Take pure nitre one drachm, crabs claws two drachms, fyrup of marshmallows one ounce, barley water ten ounces. Mix.

23. Take raiping of fassafafras two ounces ounces, of the three faunders, of each two drachms, powder of liquorifh one ounce. Mix. Infufe for tea.

24. Take liquid laudanum of Sydenham, fifteen drops, fyrup of diacodit m half an ounce, barley water one ounce. Mix for a draught.

25. Take of the fpecies for the antcfebrile decoction three ounces. Boil for half an hour, in a clofe veffel, in fufficient water ; ftrain four pounds for ufc.

26. Take tartar emetic fifteen grains, a powder for one dofe.

27. Take root of ipecacuanha half a drachm, a powder for one dofe.

23. Take powder of carnachini40 grains.

29. Take fal. polychreft two drachms, tartar of vitriol one drachm, fyrup of five opening roots two ounces, barley water half a pound, diffilled water of lemon peel two ounces. Mix.

30. Take finely powdered bark one ounce, to be equally divided into twelve papers.

31. Take purified honey three pound, belt wine vinegar, one pound. Mix.

 32. Take cream of tartar forty grains, fal. polychreft twenty grains. Mix. Several of these doles to be given as occasion may require.
 33. Take 33. Take theriaca diateffarion, conferve of wormwood, of each one ounce. Mix,

34 Take pill. ruffi thirty grains. Take feven pills.

35 Take oxymel of fquills two ounces, fal. polychreft two drachms, vitriolated tartar one drachm, common water eight ounces, fpirit of mint half an ounce. Mix.

36. Take fal. polychreft two drachms, tartar of vitriol one drachm, theriaca diateffar. three ounces, fyrup of five opening roots, enough to make an electuary.

37. Take dog grafs half a pound, dandelion, with leaves and all, four ounces. Cut and bruife them, and boil in a fufficient quantity of common water, or whey if conveniently to be had, for half an hour; ftrain by ftrongly prefling two pounds. Add pure honey three ounces. Mix.

38. Take tops of common wormwood two ounces, roots of calamus aromaticus, gentian, imperatory, of each one ounce, bay berries one ounce and a half, juniper berries three ounces, wild carrot feed one ounce. Cut, bruife, mix. Infufe warmin a clofe vafe, in, either good wine or mead, cight pounds, for twenty four hours.

39. Take fquills fresh half an ounce. Infuse in good wine two pounds.

P

40. Take

40. Take camphor one drachm. Diffolve, by rubbing it with oil of fweet almonds one ounce, in a mortar.

41. Take diftilled oil of annifeed gutt. 4. white fugar forty grains, powdered rhubarb fifteen grains. Mix for a powder.

42. Take diffilled water of mint eight ounces, spirits of mint half an ounce. Mix.

43. Take diffilled cinnamon water one ounce, barley water half a pound, pure opium three grains, crabs claws one drachm and a half, fyrup of white poppies half an ounce. Mix.

44. Take best rhubarb one drachm, citrine myrabalans half a drachm. Mix for a powder.

45. Take Venice treacle one drachm, for a bolus.

46. Take ipecacuanha forty grains in a powder.

47. Take crude opium one grain in a pill.

48. Take waxed glafs of antimony eight grains in a powder.

49. Take bole armoniac fix drachms, gumm. arabic, one drachm, Venice treacle one ounce and a half, fyrup of wild poppies, enough to make an electuary.

50. Take good wine half a pound, barley water one pound and a half, cinna-

mon

RECEIPS.

mon water one ounce, white fugar fix drachms. Mix.

51. Take pure turpentine two drachms, one yolk of an egg. To them, well mixed, add Venice treacle half an ounce, pure milk five ounces. Mix for a glyfter.

52. Take fpecies for emollient decoction two ounces. Boil in water enough for haif an hour; ftrain ten ounces, add lintfeed oil two ounces. Mix for a glyfter.

53. Take leaves of marshmallows two handfuls, roots of ditto one ounce, bruifed lintfeed two drachms Boil half an hour in water enough to strain three pounds. Add, pure nitre one drachm, pure honey three ounces. Mix.

54. Take tamarinds three ounces. Boil a quarter of an hour in water enough to firain three pounds. Add, pure nitre one drachm, honey two ounces. Mix.

55. Take meal of multard feed one ounce, lintfeed one ounce and a half, beans one ounce, common falt two drachms. vinegar enough to make a pafte, to be apa plied to the foles of the feet.

56. Take white vitriolone drachm, coma mon water one ounce. Mix.

57 Take agaric of the oak, powder it.
58. Take Venice treacle one drachm<sub>g</sub> falt

falt of hartshorn ten grains. Mix for abolus,

59. Take new milk two pounds, generous white wine four ounces. Boil for an inftant; ftrain the whey from the curd for ufe.

60. Take Virginia ferpentine root, contrayerva root, of each ten grains, bark half a drachm, comphor four grains. Mix for a powder.

61. Fake camphorone drachm. Diffolve, by rubbing in a mortar, and dropping on . fpirits of wine rectified, twenty drops. Add, white dry fugar two ounces, rub them well together, pour on white wine vinegar ten ounces. Nix. Keep in a well flopt glafs vafe for ufe,

62. Take horfe-radifh root, frefh gathered and fliced thin, four ounces, leaves of feuryy-grafs frefh gathered, marfh treafoil, of each two handfuls; fage, one handful. Cut, mix; infufe in generous wine fix pounds, in a clofe veffel, with a gentle heat, for twenty-four hours; ftrain for ufe.

63. Take 100t of tharp pointed dock, polypody of the oak, of each half anounce, chrystals of tartar three drachms. Boil for halt an hour in milk three pounds; ftrain. Add, honey, one ounce and a half. Mix,

64. l'ake spirit of scurvy-grass two ou ces, clixir proprietatis Paracelsi, one ounce. Mix. 65. Take

\$13

65. Take fpirit of fea falt one drachm, honey of rofes one ounce and a half, common water five ounces. Mix.

66. Take corrofive fublimate twelve graias, rectified malt fpirit two pounds. Keep in a clean glass vial till the mercury hath voluntarily diffolved.

67. Take root of marshmallows two ounces. Boil in a sufficient quantity of waterfor an hour, adding near the end powderedliquorishone ounce. Strain four pounds.

68. Take feammony fifteen grains, fine fugar ten grains, Ethiops mineral twenty grains, diaphoretic antimony twenty grains. Mix for a powder.

69. Take flower of fulphur thirty grains, Ethiops mineral ten grains. Mix for twenty-one dofes.

70. Take Ethiops meneral one ounce, hogs lard three ounces. Mix for an ointment.

71. Take Turbith mineral five grains, rootof jalap forty grains, finest white sugar twenty grains. Mix ; rub to a very fine powder in a glass mortar.

The NATURE and TREATMENT,

of

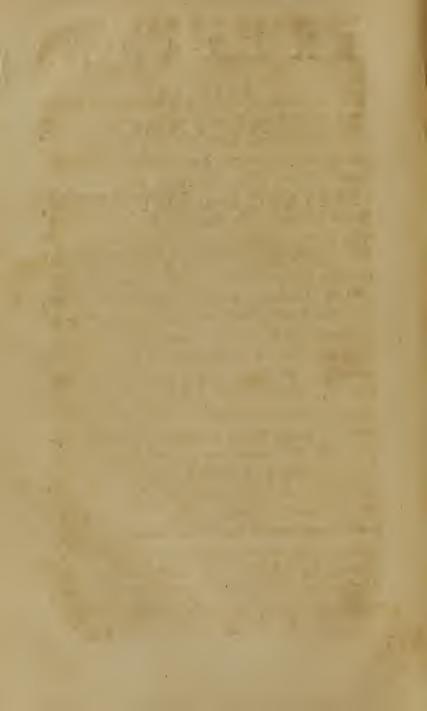

GUN-SHOT WOUNDS.

By JOHN RANBY, Efq; surgeon general to the BRITISH ARMY.

PHILADELPHIA, Printed:

BOSTON: Reprinted by E. DRAPER, for J.DOUGLASS M. DOUGALL, Opposite the Old-South Meeting-Houle.

M, DCC, LXXVII.

OF WOUNDS OF THE VEINS, ARTERIES, NERVES, AND TENDONS; WITH OBSERVATIONS.

IN Wounds of the Veins, the blood flows with a finooth even stream, of a gross confiftence and dark colour ; and is ordinarily reftrained by the common methods, fuch as dry lint, ftyptics, &cc.

IF an Artery is wounded, the blood flows impetuoufly and per faltum, and is of a florid colour ; to suppress which, if the orifice be accessible, make a ligature on the Artery with a crooked needle and waxed thread, which is the fureft and beft method : but the hæmorrhage may be suppressed by the torniquet, till the ligature can be made. If it be not acceffible, and the Artery runs along the fide of a bone, apply a fuitable bandage, compresses, or bolsters. It is not necesfary to compress it fo much as totally to preclude the acceffion of any blood, but only to impede its efflux, and retain the thrombus, fo as to grow to the fides of the divided arterial coats. It requires great judgment, however, not to let the compression be too finall, to prevent an Ancurilim. But if the wounded artery lics within a bone which prevents its late. ral compretiion, the only means remains Q

ing

## TI9 WOUNDS OF THE VEINS, &c.

i g is to apply dry lint, and retain it forcibly against the divided orifice. Neither flyptics nor cauteries flould ever be used to suppress an homorrhage when ligature or compression can take place.

If a large Nerve be totally divided, at first it causes excruciating pain and inflammation ty contracting and firetching the other branches communicating with it; afterwards the part becomes paralytic, and either fades by an atrophy, or is confumed by a mortification. For the arteries being no longer able to propel their contained fluids, for want of the Nerves which fupply their coats, the humours are accumulated, ftagnate, corrupt, and mortify the part. But if the Nerve (or even a Tendon) be only half divided, there follows a continual and flow laceration, a toreading. inflammation, excruciating pain, fever, delirium, convultions, &c. with a gleet, or thick ferous difcharge ; which fymptoms are in proportion more violent as the Nerve is more diffended or fire.ched.

In order to the cure, if the Nerve lie covered, under the fkin and membrana adipofa, dilate the Wound, that the medicaments may penetrate to the part. Drefs

## WOUNDS OF THE VEINS, &c. 120

Drefs with balf. peruy. warm (dropped in) a ple lget or foft digeflive, and an emotion poultice with a proper bandage to take off the differition. Wounds of the lendons and Ligaments are to be dread after the fame manner, only the applications should be more drying.

In the use of these, if the patient feel the heat of the topics moderate, then they are rightly fitted: if the part itch and f. rt, and the aperture become wider, the topics are fironger than they ought to be.

OF GUN-SMOT WOUNDS, THEIR N TURE AND TREATMENT WITH OBSERVATIONS.

"GUN-SHOT Wounds. of all others, are more complicate, and much more difficult of cure, than an incued Wound, even with Lifs of fubflance : bécaute here the fibres and veffels being lacerated, their juices extra afated, and their texture deftroyed, a large digerbon or fuppuration is neceffary to remove the injured parts, before the Wound can be incarn d and healed : and hence alfo the fymptoms of inflammation, pain, &c. are commonlymore violent in Contufed Wounds."

" They are more or lefs dangerous, according to their extent, and the part in which

BI ANIMINA IT

0,2

## C21 GUN-SHOT WOUND S.

which they are feated. Thofe which extend into the bones, vifcera, or joints, are of the worfe kind; and efpecially when any of the wadding, clothes, or fplinters are carried into the part together with the ball; for the confequences, in thefe cafes, mult be inflammations, gangrenes, caries, &c. which make an amputation neceffary. But Gun-fhot Wounds in the cranium are above all the moft malignant and fatal; though even here we have often furprifing inflances of cures made by art and the efforts of nature, when the cafe has appeared to be defperate,"

" The following method is extracted from Mr. Ranby's excellent Treatife on Gun-fhotWounds, whole penetrating judgment, and great experience in fuch cafes, muft be univerfally acknowledged."

"The first intention, in regard of accidents caufed by a mufket or piftol ball, is, if possible, to extract the ball, or any other extraneous body that may be lodged in the wounded part. And whenever these cafualties are attended with a great effusion of blood, from the rupture of some confiderable arterial vessel, it will be absolutely necessary, with all imaginable dispatch, to restrain the bleeding by taking up the artery with the needle ; and, at at the fame time, to be particularly careful that your hold proves no way elufive. There is no depending on any applications, however ftyptic, on these occasions "

" In order to get at the ball, or any other foreign matter that infelts the wound, I would advife probing or poking to be ufed as fparingly as possible ; having conftantly experienced, through the whole course of my attendance in these cales, that fuch a method is highly detrimental to the patient : and, indeed, where probing is neceffary, I would always prefer the finger as the best and truest probe."

" If a ball, or any other body happens to be lodged near the orifice, or is found by the touch to lie under the fkin, though at some diffance from the mouth of the Wound ; in the first cafe it is requisite immediately to remove fuch extraneous matter : and, on the other occasion, to cut upon it, and take it out. But when it is funk deep, and lies abiolutely beyond the reach of the finger, I could never bring myfelf to thrust those long forceps the Lord knows where, with fcarce any prebability of fuccels."

" A great number of inflances have occured to me, where balls have been quietly lodged in the body ; till, after many vears,

## 123, GUN-SHOT WOUNDS,

years, they have worked them felves a paffage tow rds the furface, and were confequently ery eafily extracted. In cale the wound be occafioned by a mulket or pillol fhot, and confequently but finell, it will be neceffary to dilate it immediately: yet I think, in Wounds near a joint, or in very membranous or tendinous parts, the knife, as well as forceps, fhould be put under fome reftraint; nor any more opening made, than what is abiola ely requifite for the free difcharge of the matter lodged within."

" Wounds in the joints are always dangerous, let them proceed from whatever caufe, whether a bullet, or any cutting instrument ; and membranous or tendinous parts must undoubtedly suffer from their being thus exposed to the very fenfible impreflions of the air. I could produce many inflances of balls going through muscular parts, and the Wounds being healed with very little trouble. And I have known Wounds of the fkull from a broad-fword (both tables having been cut through, and a considerable piece loofened) which were fullered to bleed for feveral hours, and did well; nor were attended, at least very feldom, with any feverifh complaint ; which was pro-

bably

bably owing to the great quantity of blood loft immediately af er the parts had been injured. If the ball has gone quite through, both orifices are to be widened (it in a part where it can be done with fafety) and particular care is to be taken to preferve both openings, that effectially which is the most depending. Notems are to be made ule of, where there is any poffibility of avoiding them; and I would, in general, recommend light, early dreffings, with a flight, moderate bandage, just fufficient to keyp them on the part. I hin flannel is what I would preter, in cafeit can be got."

" Where the wounded perfon has not fur r a my great lofs of blood, it will be al il to open a vein immediately, 2013 tak : irorn the arm a very large quantity, and to repeat bleeding, as circumftances to ty require, the fccond, and even the hill i day. This timely precaution will prevent a good deal of pain and inff. maaion, forward the digeflion, and contribute towards obviating a long train of complicated lymptoms, that are went ot' or vife to int rrupt the cure, mifern 'y harraf, the p patient : and too of m endanger his 'c."

" For he will twelve days it will be proper to ... sve a cooling regimen, both in

in refpect of medicines and diet : and as, in circum'lances of this kind, it is neceffary that the body fhould by all means be open, a ftool fhould be every day procured, either by emollient glyflers, or fome gentle laxative. Whatever application is of a hot, fpiritous nature, I find remarkably injurious on these occasions, and what nowounded part can in any degree bear."

" Let the first drefling be with lint, dry, or moiftened with a little oil, and a very light bandage ; the next with a digeflive warmed, and over it the bread and milk poultice, mixed with a fufficient quantity of oil to keep it moift : and, where there is a great tenfion, and the Wound large, a fomentation. This courfe is to be continued till the fore is clean ; and then it is to be healed according to art."

" I his method will commonly promote a conftant, eafy perfpiration, abate, the pain, very much facilitate the digefilion, and remove all danger of any approaching inflammation. What induces me to moifien the lint with the oil, is the eafe that is procured to a Contufed Wound from fuch an application, in comparison with one of an abforbent, drying difposition ; which, inflead of giving free liberty to the fanious blood to difcharge itfelr, and confequent-

ly preventing an inflammation by unloading the part, would poffibly obstruct the mouths of the capillary veffels, and hinder nature from getting rid of that incumbrance, which the endeavors to throw off."

"Should an inflamma ion feize any part, through the lodgment of a bullet, or any other foreign body, that could with fafety have been more immediately extracted; all attempts for diflodging fuch extraneous matter fhould be poftponed, till the fwelling has in fome measure fubfided, and the inflammatory difposition of the fibres is nearly vanished : unlefs the ball, or other extraneous body, lies at no great diftance from the orifice ; and there is, on that account, a certainty of removing this incumbrance, without any material trouble to the patient."

" If a Wound be of fuch a defperate nature, as to require amputation (which is often the cafe, when it happens in any particular joint) it would certainly be of confequence to perform the operation immediately as foon as the patient is brought down; left by delaying it an inflammation, which one may very reafonably expect, fhould obftruct a work that ought rarely to be entered upon during the continuance of fo calamitous a circumflance as

that

that of a finart engagement. The neglecting this critical juncture of taking off a limb frequently reduces the patient to fo low a flate, and fubjects the blood and juices to fuch an alteration, as muft unavoidably render the fubfequent operation, if not entirely unfuccefsful, at leaft exceedingly dubious. And in Wounds even where no amputation is required, it is equally advifeable not to defer the care neceffary to be taken of them; left, by the parts being exposed to the air, there might arife aferies of very dangerously mptoms."

" Wounds that border on any confiderable artery are very apt to bleed afresh upon motion, or a return of a free circulation of the blood into the part which was interrupted at first by the violence of the injury offered it; and this is almost always the cafe, when the flough begins to feparate : for which reafon one should never attempt to remove it by force ; but wait, with patience, till there be a perfect feparation of this flough ; nor be in the leaftwife shocked at the accident of arteries thus opening themfelves, which a very moderate experience will convince one to bealmostinevitable. I hepatient frequently gives warning of what is coming upon him, by complaining of a great weight and fulneis

fulnels in the limbs, which are ever accompanied with more or lefs pulfation in them : an infallible prognostic of the confequences. Let the Wound afflict what foever part, if these complaints attend it, I instantly enjoin bleeding and the bark."

" I have known feveral instances of perfons losing their lives from the starting of an artery before the furgeon could reach them ; particularly where there has preceeded an amputation. And I dare affirm, the quantity of blood loft in fome cafes, which I have observed to kill, has not amounted to twelve ounces ; which I do not know how to account for otherwife, than by the drain which had been made from the mass of blood both before and during the operation ; whence a fudden gush, though of so moderate a portion of blood, after the great quantity already loft, gives a check to the circulation, and causes immediate death."

"This reflection, I think, ought to be a leffon to every practitioner, to be particularly intent on the faithful difcharge of his duty in regard of tying the veffels. Repeated bleedings in the beginning draw after them many advantages : they generally prevent, and always leffen, any feverify

verifh attacks, and feldom fail to obviate impollhumations."

"The body must ever be kept in a laxative state; and, when pain puts it on the rack, immediate recourse must be had to the fovereign and almost divine powers of opium; next to this I likewise add the bark, a medicine which no human eloquence can extol with panegyric proportioned to its inestimable virtues. Of fuch incomparable benefit is it to mankind ! I have known it procure rest, if given in large doles, when even opium had been taken without any manner of effect "

"In all large Wounds, effecially those made by a cannon-ball, there is constantly a great laceration of the membranes, and parts endowed with an exquisite fensation. These are ever attended with an excruciating pain. and a discharge of a gleety matter; which, it not restrained, proves often of the last consequence."

" in this unhappy flate, the bark given in dofes of a drachm each, and repeated every three hours (or oftener, if the flomach will bear it) furprifingly repair the breach made in the conflitution by thefe tercible accidents. Flixir of vitriol taken three times a-day, in a glass of water I find

to

to be of fingular benefit, and to prove a very good affiftant to the virtues of the bark. And if the body be coffive, to each dofe of the bark, I add four or five grains of rhubarb, till that inconvenience is remedied. Should the bark run off by more than four or five fucceflive flools, I takecare to check this effect of it by ordering two or three drops of laudanum, or two fpoonfuls of the diafcordium mixture along with it, every time it is given.

"Where the fore difcharges a confiderable quantity of gleety matter, is flabby, looks pale and gloffy (which appearances are ever confequent to a lofs of fubftance) the bark continually relieves the pain that is predominant in this cafe, thickens the matter, leffens its quantity, and quite changes the complexion of the Wound."

" It is very common in cacheftic and fcorbutic conflictutions (which latter too much abounds in fea-faring people, efpecially in long voyages) for a fore, thefirft eight or ten days after taking off the limb, to promife all imaginable fuccefs : from which time it frequently begins to gleet prodigioufly, looks pale, gloffy, and flabby; and this gleeting, if not checked, foon proves mortal. In exigences of this kind, the bark

bark hardly ever fails to procure relief, and works an apparent change in a very fhort fpace of time; fometimes in twelve hours."

From what has been here faid by Mr. Ranby, it is evident that the bark is one of the best remedies in contracting the veffels, and reftoring their due action upon the blood, when too great a quantity of that neceffary fluid has been lost by a profuse hæmorshage, provided the wounded veffels are previously closed up, or well fecured from a return of the hæmorshage.

it also not only secures the most tender folids and finall veffels from being diffolved by the acrimony of any matter abforbed, and returned into the whole mais of blood from large Wounds or latent abfceffes; but it likewife preferves the texture of the blood itfelf from being too much broken, or rendered too watery from the fame caufe, which would otherwife inevitably produce a fatal and colliquative hectic. But where there is too great a fulnefs, or too great a ftrength and contractile force of the folids, and an inflammatory tenacity or fizinefs in the blood, it may occafion obstructions, pains, inflammations, and their consequences, unless it be timely laid afide upon the appearance of fuch effects. SOME

## SOME BRIEF DIRECTIONS PREVIOUS TO, AND IN ENGAGEMENTS, 325.

THE value of an able furgeon, and the neceffity of his affiftance, never more plainly appears than in dangerous wounds received in an engagementor battle; where many brave men must unavoidably perifh from lofs of blood and other caufes, unless restored and fnatched, as it were, from the jaws of death by the skill of their furgeon. And no doubt, the better opinion the officers and men conceive of their furgeon, the more spirits they have for the action ; being confident, the wounds, &c. they may chance to receive will be properly treated, and their lives (if poffible) preserved. Therefore a surgeon of a man of war should have every thing needful, in a fufficient quantity, always by him in readinels (but more particularly in time of war) placed in fome kind of box or drawer by themselves. His capital infruments should be constantly kept clean, bright, and in good order. His apparatus should confist of several tourniquets (of which Petit's fcrew tourniquet is the most convenient, as the patient can eafily manage it himfelf, after it is fixed) crooked needles of all fizes, threaded with proper flat ligatures, in proportion to the needle; a large quantity of scraped (short) lint, fame

fome mixed with flour in a bowl; double and fingle headed rollers (or bandages) of all breadths and lengths, in good flore; for flight wounds and contusions, those made of bunting (the fly-part of an old enfign) will be fufficient ; but for cafes of more consequence, such as amputations, fractures, diflocations, &c. the linen rollers must be used. He ought to be furnished with common needles and thread, with pins in plenty; pledgets of tow, of what fizes he pleafes; after they are made, they may be wet with water, or oxycrate, on the fame board, and dried either by the gally-fire or in the fun. By this means - he may the better lay them together (in a drawer or box) without intangling, and they are both much better and readier to forcad, when wanted, with any cerate, ointment, or liniment.

Splints of all fizes muft alfo be at hand, and when ufed armed with tow, or old linen cloth; likewife bolfters, or compreffes of clotb, or coarfe tow; but thefe may be readily made as occafion requires. To the above add yards of incle, or firong tape, to fecure your fplints in fractures, and for other ufes. By this method a furgeon will always be provided againft every accident which may befall his Crew.

When

#### SEA SURGEONS. 134

When the enemy is in fight, and you are like to come to an action, as foon as ai hat is are called to quarters (if your c what is not fufficiently large) you muft d are the first lleutenant, with the captun's permillion, to order the carpenters to lay 1 platform for your wounded men, if the caples will not be wanted, in one of the cable tues, or otherwife in the after-hold, by clearing off all manner of lumber out of the way. On the top of a finooth and even tire cafk, let there be deals or planks laid clofe together, over them an old idil. and upon that fome feamen's bedding from the purfer's hores room (for which you are to have the cape . tain's order, if he will not otherwife den liver them) ready made up, and laid one by another to place your wounded men on after they are dreft, that they may lie quiet without being disturbed.

If the ship be small, and there is no cock-pit, or fuch as you have not room to perform your operations in, you mull. as near the after hatchway as is convenient, have fome cafk removed out (if there be not height enough for you to fland upright on the platform) that you may have a place of eight, ten, or twel 'e feet square, to receive and drefs your wounded men, S

and

and from thence to hand them to their beds : on one fide of this place let there be fixed a cheft of a proper height (if you have no other convenient feat) to perform your operations upon ; and on another just by (or table) lay all your apparatus, fuch as your capital inftruments, needles, ligatures, lint, flour in a bowl, ftyptic, bandages, splints, compresses, pledges fpread with yellow basilicon, or some other proper digeftive ; thread, tape, tow, pins, new and old linen cloth, a bucket of water to put your spunges in, another empty to receive the blood in your operations; a dry fwab or too to dry the platform when neceffary ; a water-cafk full of water near at hand, with one head knocked in, in readinefs for dipping out occafionally as it may be wanted. You must also have near you your ung. basil, ---e gum. elem. -- fambucin ; ol. lin. --, olivar. c .--- terebinth ; ball. terebinth ; tinct. ftyp .--- thebaic ; fp. c. c. per fe .--- vol. aromat .--- lavend. c. Wine, punch, or grog, and vinegar in plenty.

A number of large candles fhould be immediately lighted, as foon as the engagement begins, not forgetting to have your mates and affiliants properly infiructed in what part they are to act, that every one

may

may know his station, and what he has to do to prevent confusion in time of action. Here it is necessary to observe, that the surgeon should always take peculiar care to defire the first officer to quarter a sufficient number of hands with him in the cock-pit, that he may want no affitance in the day of battle, however bloody the engagement may be.

All things being ordered, and placed as above in readincis, and the furgeon's and purfer's cabbin beds made up, to receive the captain, or any of his commission officers, who may chance to be wounded ; if you have any fick on board, that cannot stand to their quarters, let them be put down with their hammock and bedding into the hold, fore cock pit, or fheet cable tier, out of the way before the action begins ; but be fure to keep your platform entirely for the wounded men. Let one of your matesor affiftants go to them now and then to fee how they are; or elfe order one of the floutest of the convalescents to come to you at times, if he is able, and acquaint you if any of them are worle, and in cale of faintnefs, to give them a little cordial which, he fhould have by him for that purpose.

When the action is begun, it more than one wounded is brought down at a time, always

136

#### DIRECTIONS FOR ¥27

always first take care of him who is in the most immediate danger; but other wile drefs them as they come, without diffinction : if any is brought down with a limb c..., or a violent hæmorrhage, and you h pe pen to be in the midd of an amputation, or other capital operation, and cannot that instant attend, order your mate or affil ant (for the prefent) immediately to fix a tour; niquer on the part, to reffrain the flux of blood from being fatal to the patient, and do what elie you may think necessary, till you have finished the operation you were about, and laid the patient in bed.

Never encourage those to flay below. (after their wounds, &c. are dreft) who have been but little hurt, but infift on their going up again to their quarters, otherwsie threaten to report them when the engagement is over. I have many times known cowardly lubbers come tumbling down the ladder with molt violent groans and comp aints, though at the fame time they have received little or no huit; and all I could do or fay would not prevail on them to n ake a fecond trial of their courage, nor go up again till the action was all over. Nay, I have been told (by those quartered at the same gun) that some dastardly-fellows have actually put their feet, or flood in

## SEA SURGEONS.

in the way of the carriage, on purpofe to be hurt, that they might have a plaufible pretence for going down to the doctor : which I muil own I have great reafon to believe, having fometimes met with fuch contufions in the legs and feet, occafioned (according to their own confession) by the carriage, but at the fame time fo flight as was fearce worth mentioning ; though fometimes very violent, at other times there was fearce any injury or contustion to be perceived notwithstanding the most grievous complaints of pain and uncafinels.

When you are entering on any capital operation, you fhould ufe your utmost endeavors to encourage the patient (if he is fenfible) by promifing him, in the fofteft terms, to treat him tenderly, and to finish with the utmost expedition ; and indeed you fhould use expedition, but not hurry : you fhould not make more hafte than the cafe requires, nor cut less than is necessary, or leave any mischief unremedied ; for the neglecting this critical juncture of taking off a limb, frequently reduces the patient to fo low a ftate, and fubjects the blood and juices to fuch an alteration, as must unavoidably render the fubfequent operation, ir not entirely unfuccefsful, at least exceedingly dubious. Therefore, if a wound be - 5-2

139 DIRECTIONS FOR

be of fuch a defparate nature as to require amputation (which is often the cale in fea engagements) it is certainly of confequence to perform the operation immediately as foon as the man is brought down : and in wounds, even where no amputation is required, it is equally advifeable not to defer the care neceffary to be taken of them.

In regard to the wounded, you fhould act in all refpects as if you were entirely unaffected by their groans and complaints; but at the fame time I would have you behave with fuch caution, as not to proceed rafhly or cruelly, and be particularly careful to avoid unneceffary pain.

When the action is all over, you are then to go round your patients, and examine if the wounds have bled any thing confiderably fince they were dreft; and if the hamorrhage ftill continues, remove the dreffings very gently and carefully, and apply frefh ones.

It is not improper here to remark that the toucniquets fhould flill remain on those patients, who have had their limbs amputated or thot off; that they may be always in readiness, in case of a field hamorrhage; a d in case there be no affistant present when it happens, the patient

### SEA SURGEONS.

tient should be instructed himsfelf how to tighten it, if he feels the wound bleeding, before help can be procured. You are likes wife to fee that their wounded limbs, &c.lie easy, and as they ought; and that the pastients are supported with proper diet and medicines suitable to the symptomatic feever, &c. as mentioned under the various heads in Northcote's Marine Surgeon.

Asfoon as pollible after the engagement is ended, and your wounded are all taken proper care of, acquaint the captain how many there are wounded, and the nature of their wounds, if they are like to prove mortal, &c. And defire he will pleafe to order cradles forthwith to be made, as many as you think neceffary; wherein your wounded men muft be placed, with their bedding, in a proper birth by themfelves. The cradles are first to be well cleated, and fecured to the deck and fides of the ship, placed fo, as that you may eafily go between to drefs the people.

As foon as the flup arrives in a harbour, the fick and wounded must be immediately fent on fluore, where their cures will be perfected in a much shorter time than it is possible on board in an infalubrious air, and on fuch diet only as the ship affords.

It is neceffary the furgeon of the ship should

149

# 141 DIRECTIONS FOR

fhould give a more particular account of patients fent to an hofpital; than is the common practice in the navy, of merely filling up a fick ticket with the general name of a difeafe, &c. He ought to acquaint the furgeon, or his affiftant at the hofpital, of the peculiar conflictution of the patients, the manner they have been treated from first to last, the fymptoms; &c. that have occured ; and what ever other circumstances he should be informed of, in order to enable him to perform a more speedy cure.

PREVENTATIVES OF THE SCURVY AT SEA.

THE best method of preventing the Scurvy at Sea is a liberal use of acids (particularly those of vegetables) and to avoid eating the ships falt provisions as much as possible, to use friction daily, either with a stell-bruth or coarse cloth; Proper exercise, dry linen; and cleanliness, not a little contribute to health.

It appears from many repeated experiments of Dr. Lind, and a number of Surgeons in the royal navy, that of all acids, oranges and lemons have the bett effect in preventing and curing the Scurvy (the latter Ishallhere omit mentioning, it being already laid down in the Marine Surgeon,

Vol. A: You Book Some Say

#### SEA SURGEONS. 142

Vol. II. Chap. VIII. Sect. VI. Art. Scurvy, to which the reader is referred). Oranges, in my opinion, are better than lemons, for by thefe Lord Anfon's people were fo fpeedily and furprizingly recovered at the island of Tinian. It is certain, when they are properly and fufficiently used, they are an infallible cure in every ftage and species of the Scurvy, if there is any degree of natural firength left ; and where a diarrhœa, lientery, or dyfentery are not joined to the other fymptoms. Some are apt to think tamarinds, vinegar, spirit of falt, elixir of vitriol, and other acids of the fame kind, will do as well; but experience (that beft of mafters) plainly shews the contrary ; and though acids agree in certain properties, they differ widely in others. Whenever these fruits are given without fuccess, you may be fully affured the difease is not the Scurvy; for in the real genuine Scurvy they were never yet known to fail. However it is neceffary also to observe that freshvegetables of all kinds prove a great relief to fcorbutic patients when fet on fhore.

But as oranges and lemons are apt to fpoil in keeping, there is now to be had an excellent quinteffence of these fruits, which may be very advantageously used

25

# 143 DIRECTIONS FOR

as a fuccedaneum, being but little inferior to the recent juice.

When you are in countries where oranges and lemons grow fpontaneoufly, and can be procured in great plenty at a finall exbeace, I fhall here flew how to bring their juices, by a very eafy method, into a finall quantity without prejudice to their virtues.

Let the juice of these fruits be well cleared from the pulp, and depurated by ftandingfometime; after which it may be poured off from the groß fediment : let it then be poured into any clean open veffel of china or ftone ware, which should be wider at the top than at the bottom, that it may evaporate more readily. A china bafon or punch bowl is most proper on account of the form. Put this into a pan of water over a clear fire; let the water come almost to boil, and continue nearly in that flate; with the bowl full of juice in the middle of it, till the juice is found of the confiftence of a thick lyrup when cold. The flower the evaporation of the juice is the better ; that is, it ought to continue twelve or fourteen hours over the fire : when it is cold it is to be corked up in a bottle for use.

Two dozen of good oranges, weighing five pounds four ounces, will yield one pound nine ounces and a half depurated

juice ;

juice ; and when evaporated there will remain five ounces of extract, which in bulk will be equal to lefs than three ounces of water ; fo that twelve dozen of oranges or lemons may be put into a quart bottle, and preferved good feveral years. When this is mixed with water, and made into punch, few are able to diffinguish it from the from juice mixed up in the fame manner. However, when the fresh fruit can be , ad the fragrancy of the peel may contribute fomewhat to the cure of the fcurvy; and when these are wanting, the fame thing may be obtained from a few drops of their chymical effence, or the aromatic oil contained in their rinds ; and if a finall quantity of this be added to the extract, it will give it the fmell and fragrancy of the fresh fruit in great perfection : or rather add a little of the outer peel to the extract, a little before it is taken off the fire, and then the niceft tafte will not be able to diffinguish the difference between the fresh fruit and this. The virtues of this extract. thus made, lie in fo fmall a compafs, that a quart bottle full will ferve one man at iea feveral years. In making of it there is little or nothing flies off but the water.

It will likewife be of great ufe to all feafaring people to have always with them, bullace bullace, floes, wild-plums, 'hips, elderberries, goofe-berries, and the like, preferved in bottles, in the fame manner as the paftry-cookskeep the latter. Cabbage, French beans, &c. may be preferved by putting them in clean dry ftone pots or jars, with a layer of falt at the bottom, then a thin layer of the vegetable covered with falt, and to alternately till the pot is full ; then the whole muft be preffed down with a weight, and its mouth quite ftopped with a cork or timber plug, well pitched over, that no air or moifture may enter : thus the vegetable may be kept frefh and green for a whole year.

At the time of using, the fait is to be washed off with warm water. This is the manner by which they preferve that neverfailing remedy Greenland feurvy-grass. Every common failor should also lay in a stock of onions and mustard, for they are a great prefervative at fea. The Dutch failors are preferved from the feurvy by pickled cabbage. It must be observed, likewife, that a foup of beiled cabbage and onions will cure an adventitious feurvy in its first stage, either at land or stag, in any part of the world; and what will cure will prevent.

Salt

### SEASURGEONS. 146

Salt provisions should always be eaten with plenty of vinegar, mustard, and onions but as little of the meat as possible, especially when the Scurvy begins to make its appearance in the ship. Those who have been weakened by long illness should be more particularly guarded against the Scurvy, by living on boiled bifcuit, with a few drops of the quinteffence or extract of lemons or oranges, and a spoonful of wine; as also oatmeal and rice gruels, flummery, ftewed barley, with raitins or currants, fago, and wine, &c. But more particularly picked green cabbage or beans, as before mentioned, and fmall onions boiled with the portable foup made weak. Most of their food ought to be acidulated with orange and lemon juice, their quintessence or extract.

The infpiffated juice of turnips (a thing very eafily and cheaply procured) is an excellent kind of ingredient in foup for fea ufe. The water-dock (hydrolapathum) the berries mentioned above, and crab apples; alfo apples, pears, or any other fruit, either preferved with coarfe fugar (by being boiled in it) or elfe brought to a rob or extract, by boiling their expressed juices, &cc. as already laid down for that of of lemons and oranges, by which means it may be kept good through the longeft voyages. Apples, pears,&c. when well chofen, and well packed in dry tight cafks, will keep very good for two or three months ; or they may otherwife be cut in flices, and put upon ftrings in dry weather, by which they will be dried without lofing their flavour or tafte ; they are then to be carefully flowed in very dry boxes, and aired fometimes to prevent their mouldering or being damaged.

Good wine may be made by fermenting the before-mentioned extracts with water and fugar; bullace and floes are preferable to any other (oranges and lemons excepted) being a noble antifeptic aftringent.

Poor people that winter in Greenland, under vaft difadvantages in point of air and diet, preferve themfelves from the Scurvy by fpruce beer.

• The common beer brewed for the ufe of fhips fhould be imbittered with wormwood chamomile flowers, or even gentian, rather than by means of hops; and by the former it will keep longer than with the latter without acquiring any bad property, and have full as agreeable a taite; but it fhould be plentifully impregnated with those ingredients.

The

## SEA SURGEONS. 148

The fhrub black fpruce of America makes a moft wholefome drink, and affords a balfam fuperior to most turpentines; it is of the fir kind. A fimple decoction of the tops, cones, leaves, or even of the green bark, or wood of these, is an excellent antifeorbutie; but perhaps it is much more fo when fermented, as in making fpruce beer, which may be brewed fresh every two or three days. It is to be made by pouring boiling water on the tops, cones, leaves, bark, or wood of the fpruce, or any other fir, dried or green ; the latter may be eafily carried in bags at fea : but when these cannot be had, a little turpentine or wormwood may be fubflituted ; which ever be used, it is then to be fermented by the addition of a proper quantity of molaffes, which, by its diaphoretic quality, makes it a more fuitable medicine.

Again, when fpruce cannot be had, the common fir-tops ufed for fuel in the fhip fhould be first boiled in water, and then the decostion be fermented with molass; to which may be added a finall quantity of wormwood and root of horfe-radish (when it can be got); the fresher it is drank the better. When other things are wanting, tar-water may be fermented in the fame manner.

# \$49 DIRECTIONS FOR

A drink may alfo be brewed the fame way from the faffafras chips, or from the branches or berries of the juniper plant : for if the benefit is fuppoled to depend (as it certainly does) upon the fermentative quality, or to be derived from an acefcent, antifeptic, corroborative, and balfamic virtue in the remiedy, what is more liberally endowed with these qualities than these fubftances I have mentioned ?

Befides fresh and preferved fruits, vegetables, and the drinks above mentioned, fermented liquors of all forts are good, but more particularly cyder; among these are included many wines of every kind; or the juices of fruits (already taken notice of) may be fermented with ale, &c.

The late very learned and juffly celebrated Dr. Huxham fays, "Let all fhips, that are to proceed on a long cruife or voyage, be fupplied with a fufficient quantity of found generous cyder; the rougher, provided it is perfectly found, the better."

If apples are found of fuch vaft lervice in the fourvy, furely the juice of them, when become a vinous liquor, cannot but be very falutary, and feems exceedingly well adapted, as a common drink, to correct by its acidity the alcalefcent, putrefying quality of bad, corrupted provisions. This This cyder fhould be at leaft three months old before it is ferved in, and quite fine ; if it be too new, and foul, it is apt to give fevere colies : it fhould be racked off (once at leaft) from its groß ley into good and fweet veffels, which will contribute to its becoming fine, and prevent it from growing ropy, in which ftate it is good for nothing ; but if fome of it fhould turn to vinegar, which may frequently happen, it will ftill be very ferviceable ; but it is found, when well managed, to keep good and found even to the Indies. Every failor fhould have at leaft a pint of cyder a day befides beer and water.

The prize wines, which are commonly low and thin, and very frequently fpoil by keeping, might be diffributed among the fhip's company (effective in want of cyder) to very good purpose.

The ventilators fhould be conflantly worked, once a day at leaft; and the decks frequently washed or sprinkled with vinegar. In case of flinking water, lemon juice, clixir of vitriol, or vinegar should always be mixed with it, which will render it much less unwholesome. A small drachm of garlic brandy, or the tincture of bark, taken in the morning fasting, and when going on the night watch, is a

great

U

# 151 DIRECTIONS FOR

great prefervation. See the next Chapter on the Prefervation of Health, &c.

Cream of tartar, being the effential vegetable falt of wine, is a very proper fuccedaneum when fruit is wanting ; and orange or lemon peel (or its effence) will greatly improve the flavour : befides, cream of tartar is the most grateful of all acids, fubstituted in the room of the juice of lemons and oranges, and beft adapted to the constitution of mariners: it is also the cheapeft ; for an allowance of the eighth part of an ounce a day will not coft the government much more than one thilling yearly for each man, or eighteen pence at most. Two pounds and a half of cream of tartar will be fufficient to acidulate an hogfhead of water; this, with rum and fugar, will become a falutary composition of a cooling, Arengthening, antifeptic, and diuretic nature ; for there is nothing more reprefies the inflammatory and intoxicating power of fpirits than acids. Such a liquor would prove infinitely more wholefome than the grog, wherewith the navy is commonly ferved when spirits are used, both in the East and West-Indies, and ellewhere.

The officers and men (that can afford it) fhould always carry to fea a very confiderable quantity of pickles of different kinds, particularly particularly onions; and preferves and extracts of all acid fruits, fuch as floes, bullace, damfons, &c. They must all be properly preferved in glats bottles or stone jars well tied over; glazed earthen vessels are very dangerous either for preferves or pickles.

Allowing cyder, &c. to the fleet, indeed, may be deemed a very expensive project ; but where the lives of fo many brave and useful people are in the cafe, I think (as Dr. Huxham very humanely obferved) the coft fhould by no means come into competition with the advantage that may be received from it. The Romans constantly carried with them vinegar and wine in their fleets and armies, and the common foldier and failor daily partook of both; nay, they were at many other confiderable expences to preferve the health of their armies, &c. Now, if that glorious prudent people thought the life of a boman foldier to valuable, and were at fuch expence to preferve it, why flould not we have as much regard to that of a British failor, who is altogether as brave, and as useful to the Common wealth?

It is neceffary here alfo to remark, that the ufual method of impreffing feamen on their return from long and tedious voyages

## 153 DIRECTIONS, &c.

voyages, void of necessaries, chagrined at not feeing their friends and families, and most commonly in a bad state of health, and not allowed time and opportunity to recover it, hath been the bane of thoufands : and I most heartily with, for the honor of the nation and the good of the public, that a method of manning our deet could be found out more confistent with common humanity and British liberty; and likewife to have it ferved with more wholefome provisions, better beer, and a fufficient quantity of found generous cyder on board every fhip, to be used at diferction, and as necessity required ; from the foregoing remarks it is evident what advantages would accrue from it.

#### RULES

RULES FOR PRESERVING HEALT A: IN WARMAND COLD CLIMATES, BY DOCFOR LIND, and SURGEON NORTHCOTE.

**H**EAT itself is not fo prejudicial to Health as is generally imagined; but when joined to moisture it is remarked, that it occasions the most fatal distempers in all warm climates.

When a fhip rides at anchor near marfhy ground or fwamps, and the wind blows directly from thence in hot weather, the gun ports ought to be kept shut; and if fhe rides with her head to the wind, a thick finoke fail fhould be confantly kept up to the foremast, to carry up the sinoke of the galley, and prevent its coming aft over the ship : at such times the men should be injoined to finoke tobacco, and the fhip should often be fumigated with it, as well as with pitch and tar ; the method of procuring tobacco to be fo used, without any additional expence to the government, is, inftead of burning the great quantities every year feized by the cuftom-house and excile-officers, to order it to be preferved, and fent to the dock yards to fupply the fhips deftined for foreign voyages ; it may be either added to the boatiwain's or carpenter's stores, in fuch large quantities as may be thought convenient for the above use of fumigating : to prevent abuse, it should never be used without the Captain's

Captain's order, and always iffued out by weight; it would likewife be proper that centinels fhould attend the burning it to prevent embezzlement, which precaution in my opinion would be of infinite advantage on many occafions, and a much more prudent way than the prefent method of confuming it, without the leaft benefit accruing to any individual.

Boats crews and men employed on fhore, being most exposed to the open air, should be often relieved, and never fuffered to fleep on fhore, not even in tents or otherwife, if to be avoided ; but fhould always be obliged to return and lie aboard at night: but when this cannot be complied with, and men are obliged to remain on fhore, their tents should be very close, and erected on the drieft fpot they can find, that is, upon dry fand, gravel, or chalk, near the fea fliore. The negroes, and fome of the Indisns on the coast of Guinea, both of whom fleep on the ground, have conflantly a fire producing a little fmoke burning in the huts where they fleep, which corrects the moisture of the night, and renders the damp of the earth lefs noxious; therefore if your tent is made on the grafs, and at a diftance from the fea-fhore, it will be neccffary to observe the fame rule : the door of the .

155

## WARM AND COLD CLIMATES. 158

the tent fhould be towards the fea, and the back part fecured by double canvas. All old fortaken houfes, caves, and fuch like places, fhould be well purified with large fires; the men fhould never fleep on the ground, but in their hammocks, and be very well covered; every morning and evening they fhould take a dram of the fpiritous tincture of the bark: likewife the officers and men, when on fhore, fhould be allowed a more plentiful, but not immoderate ufe of vinous liquors.

Dr. LIND fays, that people coming first from a cold into a hot climate, are apt to have plethoric fymptoms (which in general I have found to be the cafe in many fouthern voyages, with fome few exceptions) a pain of the head, giddinefs, a fenfe of the weight, and fulnefs of the breast, and fome are apt to be feized with ardent fevers and diarrhœas.

All practitioners have obferved, that new comers into warm climates are at first liable to fevers tending to the ardent kind, and are very subject to fevers of the remitting and intermitting kind, which are the endemics of all warm countries at certain feasons of the year ; and after fome time they are apt to fall into fluxes, the yellow-fever, and other difeases depending pending on a putrescent flate of the juices?

Nothing has been found to be more productive of difeafes in those warm climates, than indulging freely in the use of spirits and other strong fermented liquors, lying on the ground, being exposed to damps and dews, and working hard, or using violent exercise in the heat of the day.

The most dangerous diseases in intemperate climates, and voyages to the fouthward, proceed from a continuance of hot; moift, clofe weather, or from heavy rains, common at fome feafons of the year between the Tropics; at first a few of the men are feized with the bloody-flux, which is fucceeded by a malignant fever of the zemitting or intermitting kind, but moft commonly it is like a double tertian : this is epidemic between the Tropics, and is the autumnal fever of all hot countries ; the fafety of the patient entirely depends on the fevers intermitting, or at least on its remitting fo much as to allow an opportunity of throwing in the bark, which is the only fovereign remedy in thefe fort of malignant fevers, though they put on different appearances.

The bark might be made extremely palatable by infufing it in fpirits with orange peel, and the billious fever, and the

157

the bloody-flux might be prevented by it: four ounces of bark, and two ounces of dried orange peel will be fufficient for a gallon of fpirits; and two ounces may be allowed each man a day when there is an apprehenfion of thefe malignant difeafes: it will be beft to take half in the morning on an empty ftomach, and the other half when they are called out to their night watch.

The bark is an excellent medicine for failors on many accounts, it being the greatest antifceptic taken inwardly of any vet discovered ; but as it is a very expenfive drug in England, it is not to be fupposed that ships will carry such a quantity of it as to be of common benefit to the whole crew : though this may unhappily be the cafe for the poor feamen, yet they may be fupplied at the cheapest rate with a medicine of nearly equal goodness and efficacy from our own foil, and if prudently employed, the feurvy, that maritime pestilence, will feldom or never make its alarming appearance among a thip's crew on long and dangerous voyages, proper care with regard to cleanliness and provisions being observed ; the medicine here recommended to their use is the fine bark of the English oak, which

X

is

is eafily preferved, and may be conveniently taken in the quantity of a drachm at a time, occafionally in powder, extract, decoction, or tincture. In intermittents (for poor people) it has been frequently ufed with fuccefs.

It is neceffary to obferve, that in fultry climates, or during hot weather in all places fubject to great rains, where the country is over-run by thickets, fhrubs, or woods, effectially if there are marfhes or ftagnating waters in the neighbourhood (which are exceedingly pernicious to the health of all Europeans) the malignant difeafes above-mentioned may juffly be dreaded : the fens and marfhes even in England are bad for ftrangers.

The fhip fhould never lie fo near the fhore, as that the mountains (if there be any) may intercept the fea breezes (or in the fea term, fhe fhould never be land lock'd); the fome precautions are necefiary in places, either during or foon after the rainy feafon : in hot climates windfails in the day-time fhould conftantly be kept up, and at fea in the night likewife; the ventilators fhould be continually worked, and the lower deck ports kept open, when the weather will permit, from fun rifing to fun-fet; the decks muft be kept

clean

759

#### WARM AND COLD CLIMATES. 163

elean foraped and washed, but the latter never after fun-fet. When fickness begins on board a ship, the fick should immediately be removed as much as conveniently may be from the found; the fickbirth should be as airy as possible, without exposing the fick to catch cold, and always kept as clean as may be; the centinels over the fick should constantly empty and wash the buckets which the fick make use of every watch.

The fhip (particularly a new one)fhould be every day fumigated with the fleams of tar or pitch, and in wet, damp weather, fires often lighted between decks, with proper centinels over them to prevent any danger.

To boil vinegar between decks or in the hold fills the whole cavity of the hull with a vapour that is falutary and antifceptic to a very great degree; and this may perhaps be the beft way of using vinegar to prevent a corruption of the air, or the fpreading of difeases; fumes of tobacco (as already mentioned) may be employed to the fame purpose with good fucces.

The cloaths of the fick and the fick birth ought particularly to be fumigated; their foul cloaths fhould always be inflant.

Ly.

ly fprinkled with vinegar, or tied to a rope and plunged into the fea, to wath them from all feeds of contagion ; vinegar fhould alfo be difperfed plentifully every where through the fhip, cloths dipt in it hung up in all parts, and frefh vinegar frequently fprinkled upon them, to keep the vapour of it continually afloat, but efpecially the fick birth ought to be daily well wathed with vinegar.

The ufe of cold bathing-tubs under the fore-caffle, and bathing in the fea early in the morning, have been found extremely beneficial in hot countries, for this practice not only braces up the fibres, and contributes to health but, cleanline's likewife, and promotes perfpiration ; but then the people fhould not ftay too long in the water, nor go in when overheated with work or liquor, nor when the ftomach is full, or there is an eruption with a prickly heat on the fkin. Diarrhœas and other complaints, the effects of great heat, have been cured by bathing, and their returns prevented.

Wine is the beft of all cordials in the decline of fevers, (provided it is found and good) and is a much better reflorative than rum or any other fpirits however mixed or prepared; it is likewife an excellent

et ste

#### WARM AND COLD CLIMATES. 162

cellent means to prevent infection; fome cafks of Madeira Wine (which keeps good in all climates) fhould be preferved for the ufe of the fick in thefe voyages.

The fwallowing large draughts of undiluted spirits has always the most fatal confequences in every climate; but when they are converted into punch, they become very falutary, preventing diseases which arife from hot and moift weather, and the tendency to corruption in the animal fluids, which is conftantly induced thereby ; as cleanlinefs alone greatly contributes to health, it may not be amifs to propole, that when at fea, the feamen and marines should be mustered when the feparate watches are called every Sunday, and pass in review by the officer of the watch, and those that are then dirty, having a foul fhirt, troufers, &c. fhall have their allowance of liquor, whether beer, wine, or grog, ftopt for that day (by the captains order); for the fecond offence to ftand in the pillory on the quarter-deck, and for the third, to receive a dozen lashes at the gangway : the fame notice might be taken of their hammocks, when the captain thinks proper to have them examined ; by this method the people would always be wholefome and clean, and confequently much healthier, for in every

every fhip, there are a number of dirty lubbers, particularly among the wafte guard and marines; and the cooks mates and his attendants are generally as bad as any.

I thall here only mention that when men are feized with inflammatory fymptoms on entering into warm climates, they may be blooded licely; afterwards they do not eafily bear fuch copious evacuations, but rather require to have them made in fimaller quantities, and very early and frequent, as inflammations make a rapid progrefs in warm countries,

Doctor Lind fays, many practitioners difapprove of bleeding in those countries which lie under the torrid zone, on a supposition that the blood is too much diffolved, but he thinks (very justify) that this rule will admit of many exceptions, and that failors being strong and exposed to greater vicifitudes of heat and cold, and more excesses and other accidents, bear freer bleeding in general than any other fet of people. After some time the difeases in these warm climates tend to the putrid kind, and then must be treated as such.

In warm climates the fhips are generally most healthy at fea, where the air is dry and ferene, and the heat moderated by refreshing breezes.

RULES

#### RULES FOR PRESERVING HEALTH. IN COLD CLIMATES.

N northern climates and channel cruizing, though the cold is intenfe, yet if the air is pure and dry, and the men are well cloathed, there are few difeafes; but when the weather is unfettled, cloudy, wet and rainy, the ufual confequences are colds, attended with feverifh' and inflammatory fymptoms, and effectially rheumatic, plearitic, and peripneumonic complaints; thefe laft require plentiful evacuations, but chiefly bleeding, which, when timely and freely ufed, will prevent confumptions and chronic rheumatifms.

When the men are almost constantly wet and chill from bad weather, and undergo an uncommon degree of fatigue, it will be proper to let them have the following mixture, viz. a pint of finall beer, and a quartern of brandy fweetened with molasses, to which may be added as much vinegar as will render the mixture palatable; or, instead of the last, cream of tartar; this the Kussians call as fibetten. Dry beds and cloathing are most necessary articles; for it is observable that the most naked ragged fellows are principally attacked with winter difeases.

The fourvy is a difeate common in the winter and fpring; the method to prevent vent which is already laid down in the preceeding fection, and to which the reader is referred.

... Dr. Lind fays, the most proper cordial dram a failor can use in the winter is garlic brandy, for a small quantity of it, not only warms the flomach, but keeps the breaft, kidneys, and skin free from obftructions; but neither this nor any other dram should be given to a man almost chilled to death with cold, having his limbs quite benumbed, and their extremities frost bit (as it is called) ; for, in this case, it has often proved fatal; but he fhould be immediately put into a warm bed,' and have fome warm gruel, fage tea, or fome fuch diluting liquor, given him ; after which a dram may be allowed, when it will prove less dangerous, and more beneficial.

A very renarkable cafe to this purpofe is related by Hildanus, viz. A man was found quite fliff and frozen all over; he was put into cold water, and immediately the icy fpicula were difcharged from all parts of his body, fo that he feemed covered with an icy cruft; he was then put into a warm bed, took a cordial draught, and a plentiful fweat followed; after which he recovered with the lofs of the laft joints of his fingers and toes. De Gang zna, chap. XIII. People

#### WARM AND COLD CLIMATES. 166

People who are benumbed with cold in frofly weather, ought never to be brought immediately near a fire; for that has been found either, to caule immediate death, or gaugrenes of the extremeties. Any kind of fruit frozen, when put immediately to the fire, will turn toft and rot; but if put into cold water, it throws out the icy ipicula, and recovers fo as to be almost as good as before, which, proves the above method uled with the man to be right.

In cold rainy weather, tea made with fage, faffafras, or a few roafied juniper berries, with the addition of a little garlic brandy, will be very beneficial; likewile a man will never be foliable to catch cold when he is wet upon the deck, and ales exercife, as when he is below in his wet clotths, or fleeps in them, or in a damp bed; when he goes upon deck he fhould eat a bit of bifcuit, and drink a little afhbetten, and then the weather will probably have but little power to alter his health for the worfe.

When a failer happens to be dead drunk, his head flould be raifed, and a fpunge dipped in vinegar flould be held to his nofe; and if he can drink, he flould have warm water mixed with vinegar; bleeding will likewife be proper, and a gentle emetic which operates fpeedily, fuch as the the oxymcl. scillitic. fal vitriol. &c.

Likewife dipping the feet in cold water will take off the preffure from the brain; and folutive glyfters will abate the diftenfion; it is but too well known how many people lofe their lives by exceffive drinking, and fpirituous liquors; the fame treatment will be ufeful after a large dofe of opium.

These methods here laid down (chiefly taken from Doctor Lind) but partly from others, I have practifed for many years in the royal navy ; and with the bleffing of God it has in general been attended with great fuccefs ; for which reafon I can the more frongly recommend it ; if it be true. as was published in December 1760, taken as is fuppoled from returns made to the House of Commons, that of 185,0:0 men, raifed for the fea-fervice during the late war, above 130,000 perilhed by difeafes ; and that two thirds of this number may be fafely charged to the account of discases that take their rile from putrefaction; furely every motive of policy and humanity flould excite men to endeavour at finding out fomewhat to check that fatal and deflructive diathefis; for if seamen could be preferved free from it, other kinds of difeafes would feldom endanger them.
