Linnaeus enumerates 47 species of spiders, viz. 1. The diadema, has a globular reddish belly, with a white cross. It inhabits the birch-tree. 2. The reticulata, has a reticulated round belly, and is dusky or purple on the back. It frequents gardens. 3. The cucurbitina, has a globular yellow belly, with a few black spots. It lives in the leaves of trees, and incloses its eggs in a soft net. 4. The calycina, with a round pale yellow belly, and two hollow points. It lives in the cups of flowers, after the flower-leaves have fallen off, and catches bees, and other flies, when they are in search of honey. 5. The octopunctata, with a roundish yellow belly, four black marks on each side, and a red anus. It is a native of Sweden. 6. The bipunctata, with a round red belly, and two hollow points. It frequents windows. 7. The arundinacia, with a white roundish belly, and dusky-coloured spots. It frequents reeds. 8. The angulata, with an oval belly; the fore-part of the sides form an acute angle. It frequents trees. 9. The domestica, or common house-spider, has a dusky oval belly, with five contiguous black spots. 10. The trilineata, with a white belly, and three longitudinal lines of blackish spots. It lives in woods. 11. The riparia, has an oval glazed black belly, and a yellowish forked hairy anus. It lives in the sandy banks of rivers. 12. The labyrinthica, with a dusky oval belly, a whitish indented line, and a forked anus. The web of this species is horizontal, with a cylindrical well or tube in the middle. 13. The quadrilineata, has a roundish yellow belly, and four spots and four purple lines on each side. It is a native of Sweden. 14. The redimita, has an oblong yellow belly, and a red oval ring on the back. It frequents gardens. 15. The corollata, has a black oval belly, and an oval white ring on the back. It dwells upon plants. 16. The fumigata, has a dusky oval belly, and two white points at the base. It lives in the fields. 17. The montana, has a white oval belly, with ash-coloured spots. It lives in trees. 18. The fanguinolenta, has a blood-coloured belly, with a black longitudinal line. It is a native of Spain. 19. The notata, has an oval dusky-coloured belly, with white transverse lines. 20. The rufipes, has a dusky belly, and reddish legs. It most frequently lives among nettles. 21. The nocturna, has a black belly, with two white points, and a little white half-moon at the base of the anus. 22. The extensa, has a long greenish shining belly, and its legs are extended longitudinally. It frequents marshy grounds. 23. The fimbriata, has a black oblong belly, with a white line on each side, and dusky-coloured legs. It lives in water, upon the surface of which it runs with great swiftness. 24. The sexpunctata, has an oblong belly, and three pair of hollow points. It lives in woods. 25. The flavissima, has a smooth oblong belly of a very yellow colour. It is a native of Egypt. 26. The bimaculata, has a chestnut-coloured roundish belly, with two white points. 27. The clavipes, has an oblong belly, and the last joints of the legs, excepting the third pair, are hairy and clavated. It is a native of America. 28. The quadripunctata, has a black oblong belly, and four hol-

low points. It is to be met with in windows, &c. 29. The holosericea, has an ovalish belly covered with a down like velvet; at the back, or under part, it has two yellow spots. It is found in the folded leaves of plants. 30. The fenoculata, is distinguished from the rest by having only six eyes. 31. The avicularia, has a convex round breast, hollowed transversely in the middle. It is a native of America, and feeds upon small birds, insects, &c. The bite of this spider is as venomous as that of the serpent. 32. The spinimobilis, has moveable black spines on its legs. It is a native of Surinam. 33. The venatoria, is a hairy spider, with a round convex breast, about the same size with the belly, which is oval. It is a native of America. 34. The ocellata, has three pair of eyes on its thighs. It is about the same size with the tarantula, of a pale colour, with a black ring round the belly, and two large black spots on the sides of the breast. It is a native of China. 35. The tarantula, Plate XXIII. fig. 10. The breast (1), and belly (2), are of an ash-colour; the legs (3) are likewise ash-coloured, with blackish rings on the under part; the fangs, or nippers (4), are red on the inner side, the rest being blackish; (5) is the antennæ or feelers: Two of its eyes are larger than the other, red, and placed in the front; four other eyes are placed in a transverse direction towards the mouth; the other two are nearer the back. It is a native of Italy, Cyprus, Barbary, and the E. Indies. The breast and belly are about two inches long, terminated by two short tails. This figure was taken from the life, in the island of Cyprus, by Alex<sup>r</sup> Drummond, Esq; late consul at Aleppo. The bite of the tarantula is said to occasion an inflammation in the part, which in a few hours brings on sickness, fainting, and difficulty of breathing: The person afterwards is affected with a delirium, putting himself into the most extravagant postures. However, this is not always the case; for they are sometimes seized with a deep melancholy. The same symptoms return annually, in some cases, for several years, and at last terminate in death. Music is said to be the only cure. It induces the patient to dance, and sweat out the poison. 36. The fecnica, is a black jumping spider, with three white semi-circular lines across its body. It frequents old walls. 37. The truncorum, is a black jumping spider, with white spots on the back. It frequents walls, and old wood. 38. The rupestris, is a jumping spider, with black spots on its belly, which is edged with red and white in the middle. It frequents walls and trees. 39. The aquatica, is of a livid colour, with an oval belly, and a transverse line, and two hollowed points. It frequents the fresh waters of Europe; and lodges, during the winter, in empty shells, which it dextrously shuts up with a web. 40. The faccata, has an oval belly of a dusky iron colour. It lives in the ground, and carries a sack with its eggs, where-ever it goes. This sack it glues to its belly, and will rather die than leave it behind. 41. The palustris, has an oblong cloudy belly, with two white lines on each side. It frequents marshy grounds. 42. The virescens has an oblong greenish yellow belly, with white lines on the sides. It frequents gardens. 43. The viatica, has a roundish plain belly,

with the four last legs shorter than the others. It frequents gardens, and sits upon its eggs. 44. The levi-pep, has a depressed rhomboidal belly, with its legs extended in a transverse direction. It is found on trees and walls. 45. The tetracantha, has a lunated belly, and is found in St Thomas's isle. 46. The cancriformis, has a globular belly, and is a native of America. 47. The spinosa, has eight spines on its back, and a conical belly. It is a native of America. ARANEA *conchea*, the spider-shell, a name given to several species of murex. See MUREX. ARANEUS, in zoology, the trivial name of a species of cancer. See CANCER. ARANJUEZ, a palace belonging to the king of Spain, beautifully situated on the banks of the Tagus, about fifteen or sixteen miles eastward of Madrid. ARAPABACA, in botany, a synonyme of the spigelia. See SPIGELIA. ARARAT, the name anciently given to part of mount Caucasus, lying between the Euxine and Caspian seas, and where Noah's ark rested. ARARAUNA, in ornithology, the trivial name of a species of psittacus. See PSITTACUS. ARASH, a city of the province of Afgar, in the kingdom of Fez, where the river Luca falls into the Western Ocean. ARAUCO, a city of Chili, in S. America, situated on a river of the same name, in 78° W. long. and 37° S. lat. ARAXES, or ARRAS, a river of Persia. See ARRAS. ARAYA, one of the most celebrated capes in S. America, forming the north point of the river Oronoque. See ORONOQUE. ARBALET, the same with cross-bow. See CROSS-BOW. ARBELA, or IRBIL, in geography. See IRBIL. ARBITER, in law, a person to whose decision any dispute or difference is voluntarily referred by the parties. ARBITRARY, that which is left to the choice or arbitration of men, or not fixed by any positive law or injunction. ARBITRARY punishment, in Scots law, denotes such punishments as are by statute left to the discretion of the judge. It is a general rule in arbitrary punishments, that the judge cannot inflict death. Hence all punishments that are not capital have acquired the name of arbitrary punishments, even although they be expressly pointed out by statute. ARBITRATION, ARBITRAGE, or ARBITREMENT, the power given by contending parties to an arbiter. See ARBITER. ARBITRATOR, a private extraordinary judge, chosen by the mutual consent of parties, to determine controversies between them. ARBOIS, a town of Franch Comte in France, situated in 5° 40' E. long. and 46° 50' N. lat. ARBON, a town of Swabia in Germany, situated in 9° 30' E. long. and 47° 40' N. lat. ARBOR, in mechanics, the principal part of a machine which serves to sustain the rest: also the axis or spindle on which a machine turns, as the arbor of a crane, windmill, &c.

**ARBORIST**, a person skilled in that part of botany which treats of trees.

**ARBOUR**, in gardening, a kind of shady bower, formerly in great esteem, but of late rejected, on account of its being damp and unwholesome.

Arbours are generally made of lattice-work, either of wood or iron, and covered with elms, limes, horn-beams; or with creepers, as honey-suckles, jasmynes, or passion-flowers; either of which will answer the purpose very well, if rightly managed.

**ARBUTUS**, in botany, a genus of the decandria monogynia class. The calix of the arbutus is divided into five parts; the corolla is ovated; the fruit is a berry with five partitions or cells. There are five species of arbutus, *viz.* the unedo, or common strawberry-tree, a native of Britain; the andrachne, a native of the East Indies; the acadensis, a native of Acadia; the alpina, or mountain strawberry-tree, a native of Britain; and the uva ursi, a plant lately discovered in the Highlands of Scotland, and which formerly was thought not to be a native of Britain.

**ARC, ARK, or ARCH.** See **ARCH.**

**ARCA cordis**, the same with pericardium. See **PERICARDIUM.**

**ARCADIA**, a sea-port town of European Turkey, situated on the western coast of the Morca, in 22° E. long. and 37° 20' N. lat.

**ARCANGIS**, in the Turkish armies, a kind of irregular light-armed horse which subsist by plunder.

**ARCANUM**, among physicians, any remedy, the preparation of which is industriously concealed, in order to enhance its value.

**ARCHBOUTANT**, in building, an arched buttress. See **BUTTRESS.**

**ARCH**, in geometry, any part of the circumference of a circle or curved line, lying from one point to another, by which the quantity of the whole circle or line, or some other thing sought after, may be gathered. See **GEOMETRY.**

**ARCH**, in architecture, a concave building erected for the purposes of supporting some structure, or for making an easy passage over rivers. See **ARCHITECTURE.**

**Triumphal ARCH**, a stately gate of a semicircular form, adorned with sculpture, inscriptions, &c. erected in honour of those who had deserved a triumph.

**ARCH**, in composition, signifies chief, or of the first class, as archangel, archbishop, &c.

**ARCHÆUS, or ARCHEUS.** See **ARCHEUS.**

**ARCHANGEL**, an angel occupying the eighth rank in the celestial hierarchy.

**ARCHANGEL**, in botany. See **LAMIUM.**

**ARCHANGEL**, in geography, a city of the province of Dwina in Russia, situated four miles from the White Sea, in 40° 12' E. long. and 64° 30' N. lat.

**ARCHBISHOP**, a prelate who has several suffragan bishops under him. There are only two archbishops in England; the archbishop of Canterbury, who is primate of all England; and the archbishop of York, who is only styled primate of England.

**ARCHBISHOPRIC**, in ecclesiastical geography, a province subject to the jurisdiction of an archbishop.

**ARCHBUTLER**, one of the great officers of the German empire, who presents the cup to the emperor on solemn occasions. This office belongs to the king of Bohemia.

**ARCHCHAMBERLAIN**, an officer of the empire, much the same with the great chamberlain in England. The elector of Brandenburg was appointed, by the golden bull, archchamberlain of the empire.

**ARCHCHANCELLOR**, an high officer who, in ancient times, presided over the secretaries of the court. Under the two first races of the kings of France, when their territories were divided into Germany, Italy, and Arles, there were three archchancellors: and hence the three archchancellors still subsisting in Germany; the archbishop of Mentz being archchancellor of Germany, the archbishop of Cologn of Italy, and the archbishop of Treves of Arles.

**ARCHCHANTOR**, the president of the chantors of a church.

**ARCHCOUNT**, a title formerly given to the earl of Flanders.

**ARCHDEACON**, an ecclesiastical dignitary or officer next to a bishop, whose jurisdiction extends either over the whole diocese, or only a part of it. There are 60 archdeacons in England, who visit the parishes subject to their jurisdiction, inquire into abuses, suspend, excommunicate, &c. They likewise induct all clerks into their benefices.

**ARCHDUKE**, a title given to dukes of greater authority and power than other dukes. The archduke of Austria is among the most ancient: His principal privileges are, that he shall distribute justice in his own country, without appeal; that he cannot be deprived of his countries, even by the emperor and the states of the empire; and that he have a power of creating counts, barons, &c. throughout the whole empire.

**ARCHED**, in a general sense, denotes something bulk or constructed in the fashion or after the manner of an arch.

**Arched legs**, a fault in a horse when his legs are bended archwise.

**ARCHER**, in the ancient military art, one who fought with bow and arrows. The English archers were esteemed the best in Europe, to whose prowess and dexterity the many victories over the French were in a great measure owing.

**ARCHES-court**, the chief and most ancient consistory that belongs to the archbishop of Canterbury, for the debating of spiritual causes, so called from Bow-Church in London, where it is kept, whose top is raised of stone-pillars, built archwise. The judge of this court is termed the dean of the arches, or official of the arches-court: Dean of the arches, because with this office is commonly joined a peculiar jurisdiction of thirteen parishes in London, termed a deanry, being exempted from the authority of the bishop of London, and belonging to the archbishop of Canterbury; of which the parish of Bow is one. Some of

thers say, that he was first called dean of the arches, because the official to the archbishop, the dean of the arches, was his substitute in his court; and by that means the names became confounded. The jurisdiction of this judge is ordinary, and extends through the whole province of Canterbury; so that, upon any appeal, he forthwith, and without any further examination of the cause, sends out his citation to the party appealed, and his inhibition to the judge from whom the appeal is made.

**ARCHES**, in geography, a name used among navigators for the Archipelago.

**ARCHETYPE**, the first model of a work, which is copied after to make another like it. Among minters, it is used for the standard weight by which the others are adjusted. The archetypal world, among Plato-

nists, means the world as it existed in the idea of God, before the visible creation.

**ARCHEUS**, among chemists, a term used to denote the predominating principle of things, whereby their peculiar qualities are fixed and determined.

**ARCHILOCHIAN**, a term in poetry, applied to a sort of verses, of which Archilochus was the inventor, consisting of seven feet, the four first whereof are ordinarily dactyls, though sometimes spondees, the three last trochees; as in Horace,

*Solvitur acris hyems, gratâ vice veris & Favoni.*

**ARCHIPELAGO**, in geography, a general term for a sea interrupted with islands; but more especially denoting that between Greece and Asia.

**ARCHITECT**, a person skilled in architecture.

## ARCHITECTURE.

**ARCHITECTURE**, or the art of building, ought to be considered in a twofold light, as an object of taste, and as a mechanical art. An examination of its principles improves our taste; the practical part contains

such instructions as are necessary for the mechanic. Many books have been composed upon the mechanical part, but few authors have attempted to unfold the philosophical principles of the art.

### S E C T. I.

#### OF ARCHITECTURE AS AN OBJECT OF TASTE.

**M**ANY ages must have elapsed before architecture came to be considered as a fine art. Utility was its original destination, and still continues to be its principal end. Experience, however, has taught us, that architecture is capable of exciting a variety of agreeable feelings. Of these, utility, grandeur, regularity, order, and proportion, are the chief.

Architecture being an useful as well as a fine art, leads us to distinguish buildings, and parts of buildings, into three kinds, viz. what are intended for use solely, what for ornament solely, and what for both. Buildings intended for utility solely, ought in every part to correspond precisely to that intention: The least deviation from use, though contributing to ornament, will be disagreeable; for every work of use being considered as a mean to an end, its perfection as a mean is the capital circumstance, and every other beauty in opposition is neglected as improper. On the other hand, in such things as are intended solely for ornament, as columns, obelisks, triumphal arches, &c. beauty alone ought to be regarded. The principal difficulty in architecture lies in combining use and ornament. In order to accomplish these ends, different and even opposite means must be employed; which is the reason why they are so seldom united

in perfection; and hence, in buildings of this kind, the only practicable method is, to prefer utility to ornament according to the character of the building: In palaces, and such buildings as admit of a variety of useful contrivance, regularity ought to be preferred; but in dwelling-houses that are too small for variety of contrivance, utility ought to prevail, neglecting regularity as far as it stands in opposition to convenience.

In considering attentively the beauty of visible objects, we discover two kinds. The first may be termed *intrinsic* beauty, because it is discovered in a single object, without relation to any other. The second may be termed *relative* beauty, being founded on a combination of relative objects. Architecture admits of both kinds. We shall first give a few examples of *relative* beauty.

The proportions of a door are determined by the use to which it is destined. The door of a dwelling-house, which ought to correspond to the human size, is confined to seven or eight feet in height, and three or four in breadth. The proportions proper for a stable or coach-house are different. The door of a church ought to be wide, in order to afford an easy passage for a multitude; and its height must be regulated by its wideness, that the proportion may please the eye. The size of the windows

dows ought always to be proportioned to that of the room they are destined to illuminate; for if the apertures be not large enough to convey light to every corner, the room must be unequally lighted, which is a great deformity. Steps of stairs should likewise be accommodated to the human figure, without regarding any other proportion; they are accordingly the same in large and in small buildings, because both are inhabited by men of the same size.

We shall next consider *intrinsic* beauty, blended with that which is *relative*. A cube in itself is more agreeable than a parallelepipedon; this constantly holds in small figures: But a large building in the form of a cube is lumpish and heavy; while a parallelepipedon, set on its smaller base, is more agreeable on account of its elevation: Hence the beauty of Gothic towers. But if this figure were to be used in a dwelling-house, to make way for relative beauty, we would immediately perceive that utility ought chiefly to be regarded; and this figure, inconvenient by its height, ought to be set on its larger base: The loftiness in this case would be lost; but that loss will be more than sufficiently compensated by the additional convenience. Hence the form of buildings spread more upon the ground than raised in height, is always preferred for a dwelling-house.

With regard to the internal divisions, utility requires that the rooms be rectangular, to avoid useless spaces. An hexagonal figure leaves no void spaces; but it determines the rooms to be all of one size, which is both inconvenient and disagreeable for want of variety. The cube be the most agreeable figure, and may answer for a room of a moderate size; yet, in a very large room, utility requires a different figure. Unconfined motion is the chief convenience of a great room; to obtain this, the greatest length that can be had is necessary. But a square room of a large size is inconvenient. It removes chairs, tables, &c. at too great a distance from the hand, which, when unemployed, must be ranged along the sides of the room. Utility therefore requires a large room to be a parallelogram. This figure is likewise best calculated for the admission of light; because, to avoid cross-lights, all the windows ought to be in one wall; and if the opposite wall be at such a distance as not to be fully lighted, the room must be obscure. The height of a room exceeding nine or ten feet, has little relation to utility; therefore proportion is the only rule for determining the height, when above that number of feet.

Artists who deal in the beautiful, love to entertain the eye; palaces and sumptuous buildings, in which intrinsic beauty may be fully displayed, give them an opportunity of exerting their taste. But such a propensity is peculiarly unhappy with regard to private dwelling-houses; because in these, relative beauty cannot be displayed to perfection, without hurting intrinsic beauty. There is no opportunity for great variety of form in a small house; and in edifices of this kind, internal convenience has not hitherto been happily adjusted to external regularity. Perhaps an accurate coincidence in this respect is beyond the reach of art. Architects, however, constantly split upon this rock; for they never can be persuaded to give over attempting to reconcile these two incompatibles:

How otherwise should it happen, that of the endless variety of private dwelling-houses, there should not be one found that is generally agreed upon as a good pattern? The unwearied propensity to make a house regular as well as convenient, obliges the architect, in some articles, to sacrifice convenience to regularity, and, in others, regularity to convenience; and accordingly the house, which turns out neither regular nor convenient, never fails to displease.

Nothing can be more evident, than that the form of a dwelling-house ought to be suited to the climate; yet no error is more common than to copy in Britain the form of Italian houses, not forgetting even those parts that are purposely contrived for collecting air, and for excluding the sun: Witness our colonnades and loggias, designed by the Italians to gather cool air, and exclude the beams of the sun, conveniences which the climate of this country does not require.

We shall next view architecture as one of the fine arts; which will lead us to the examination of such buildings, and parts of buildings, as are calculated solely to please the eye. Variety prevails in the works of nature; but art requires to be guided by rule and compass. Hence it is, that in such works of art as imitate nature, the great art is, to hide every appearance of art; which is done by avoiding regularity, and indulging variety. But in works of art that are original and not imitative, such as architecture, strict regularity and uniformity ought to be studied, so far as consistent with utility.

Proportion is not less agreeable than regularity and uniformity; and therefore, in buildings intended to please the eye, they are all equally essential. It is taken for granted by many writers, that in all the parts of a building there are certain strict proportions which please the eye, in the same manner as in found there are certain strict proportions which please the ear; and that, in both, the slightest deviation is equally disagreeable. Others seem to relish more a comparison between proportion in numbers, and proportion in quantity; and maintain, that the same proportions are agreeable in both. The proportions, for example, of the numbers 16, 24, and 36, are agreeable; and so, say they, are the proportions of a room, whose height is 16 feet, the breadth 24, and the length 36. But it ought to be considered, that there is no resemblance or relation between the objects of different senses. What pleases the ear in harmony, is not the proportion of the strings of the instrument, but of the sound which these strings produce. In architecture, on the contrary, it is the proportion of different quantities, that pleases the eye, without the least relation to sound. The same thing may be said of numbers. Quantity is a real quality of every body; number is not a real quality, but merely an idea that arises upon viewing a plurality of things in succession. An arithmetical proportion is agreeable in numbers; but have we from this any reason to conclude, that it must also be agreeable in quantity? At this rate, a geometrical proportion, and many others, ought also to be agreeable in both. A certain proportion may coincide in quantity and number; and amongst an endless variety of proportions, it would be wonderful if there never should be a coincidence.

coincidence. One example is given of this coincidence, in the numbers 16, 24, and 36; but to be convinced that it is merely accidental, we need but reflect, that the same proportions are not applicable to the external figure of a house, and far less to a column.

It is ludicrous to observe writers acknowledging the necessity of accurate proportions, and yet differing widely about them. Laying aside reasoning and philology, one fact universally agreed on ought to have undeceived them, that the same proportions which please in a model are not agreeable in a large building: A room 48 feet in length, and 24 in breadth and height, is well proportioned; but a room 12 feet wide and high, and 24 long, approaches to a gallery.

Perrault, in his comparison of the ancients and moderns, goes to the opposite extreme, maintaining, that the different proportions assigned to each order of columns are arbitrary, and that the beauty of these proportions is entirely the effect of custom. But he should have considered, that if these proportions had not originally been agreeable, they could never have been established by custom.

For illustrating this point, we shall add a few examples of the agreeableness of different proportions. In a sumptuous edifice, the capital rooms ought to be large, otherwise they will not be proportioned to the size of the building; for the same reason, a very large room is improper in a small house. But in things thus related, the mind requires not a precise or single proportion, rejecting all others; on the contrary, many different proportions are equally agreeable. It is only when a proportion becomes loose and distant, that the agreeableness abates, and at last vanishes. Accordingly, in buildings, rooms of different proportions are found to be equally agreeable, even where the proportion is not influenced by utility. With regard to the proportion the height of a room should bear to the length and breadth, it must be extremely arbitrary, considering the uncertainty of the eye as to the height of a room when it exceeds 16 or 17 feet. In columns, again, every architect must confess, that the proportion of height and thickness varies betwixt 8 diameters and 10, and that every proportion between these two extremes is agreeable. Besides, there must certainly be a further variation of proportion, depending on the size of the column: A row of columns 10 feet high, and a row twice that height, requires different proportions: The intercolumniations must also differ in proportion according to the height of the row.

Proportion of parts is not only itself a beauty, but is inseparably connected with a beauty of the highest relish, that of concord and harmony; which will be plain from what follows: A room, the parts of which are all finely adjusted to each other, strikes us not only with the beauty of proportion, but with a pleasure far superior. The length, the breadth, the height, the windows, raise each of them a separate emotion: These emotions are similar; and, though faint when separately felt, they produce, in conjunction, the emotion of concord or harmony, which is very pleasant. On the other hand, where the length of a room far exceeds the breadth, the mind, comparing together parts so intimately connected, immediately per-

ceives a disagreement or disproportion which disgusts. Hence a long gallery, however convenient for exercise, is not an agreeable figure of a room.

In buildings destined chiefly or solely to please the eye, regularity and proportion are essentially necessary, because they are the means of producing intrinsic beauty. But a skilful artist will not confine his view to regularity and proportion; he will also study congruity, which is perceived when the form and ornaments of a structure are suited to the purpose for which it is appointed. Hence every building ought to have an expression suited to its destination. A palace ought to be sumptuous and grand; a private dwelling, neat and modest; a play-house, gay and splendid; and a monument, gloomy and melancholy. A heathen temple has a double destination: It is considered as a house dedicated to some divinity; therefore it ought to be grand, elevated, and magnificent: It is also considered as a place of worship; and therefore ought to be somewhat dark and gloomy, because dimness or obscurity produces that tone of mind which is favourable to humility and devotion. Columns, besides their chief destination of being supports, contribute to that peculiar expression which the destination of a building requires: Columns of different proportions serve to express loftiness, lightness, &c. as well as strength. Situation may also contribute to expression: Convenience regulates the situation of a private dwelling-house; and the situation of a palace ought to be lofty. This leads to a question, Whether the situation, where there happens to be no choice, ought, in any measure, to regulate the form of the edifice? The connection between a great house and a neighbouring field, though not extremely intimate, demands however some congruity. It would, for example, displease us to find an elegant building thrown away upon a wild uncultivated country: Congruity requires a polished field for such a building. The old Gothic form of building was well suited to the rough uncultivated regions where it was invented; but was very ill adapted to the fine plains of France and Italy.

The external structure of a house leads naturally to its internal structure. A large and spacious room, which is the first that commonly receives us, is a bad contrivance in several respects. In the first place, when immediately from the open air we step into such a room, its size in appearance is diminished by contrast; it looks little, compared with the great canopy of the sky. In the next place, when it recovers its grandeur, as it soon doth, it gives a diminutive appearance to the rest of the house; passing from it, every apartment looks little. In the third place, by its situation it serves only for a waiting-room, and a passage to the principal apartments. Rejecting therefore this form, a hint may be taken from the climax in writing for another that appears more suitable: A handsome portico, proportioned to the size and fashion of the front, leads into a waiting-room of a larger size, and this to the great room, all by a progression from small to great.

Grandeur is the principal emotion that architecture is capable of raising in the mind: it might therefore be the chief study of the artist, in great buildings destined

to please the eye. But as grandeur depends partly on size, it is unlucky for architecture that it is governed by regularity and proportion, which never deceive the eye by making objects appear larger than they are in reality. But though regularity and proportion contribute nothing to grandeur, so far as that emotion depends on size; yet they contribute greatly to it by confining the size within such bounds that it can be taken in and examined at one view; for, when objects are so large as not to be comprehended but in parts, they tend rather to distract than satisfy the mind.

We shall next pass to such ornaments as contribute to give buildings a peculiar expression. It has been doubted, whether a building can regularly admit any ornament but what is useful, or at least has that appearance. But, considering the double aim of architecture as a fine, as well as an useful art, there is no reason why ornaments may not be added to please the eye, without any relation to utility. A private dwelling-house, it is true, and other edifices, where use is the chief aim, admit not regularly any ornament but what has at least the appearance of use: But temples, triumphal arches, and other buildings intended chiefly or solely for show, may be highly ornamented.

This suggests a division of ornaments into three kinds, *viz.* 1. Ornaments that are beautiful without relation to use; such as statues, vases, basso or alto rilievo: 2. Things in themselves not beautiful, but possessing the beauty of utility, by imposing on the spectator, and appearing to be useful; such as blind windows: 3. Where things are beautiful in themselves, and at the same time take on the appearance of use; such as pilasters.

With regard to the *first*, we naturally require that a statue be so placed, as to be seen in every direction, and examined at different distances. Statues, therefore, are properly introduced to adorn the great stair that leads to the principal door of a palace, or to lessen the void between pillars. But a niche in the external front is an improper place for a statue. There is an additional reason against placing them upon the roof or top of the walls; their reckless situation gives pain, as they have the appearance of being in danger of tumbling down; besides, we are inclined to feel from their being too much exposed to the inclemencies of the weather. To adorn the top of the wall with a row of vases, is an unhappy conceit, by placing a thing, whose natural destination is utility, where it cannot have even the appearance of use. As to carvings upon the external surface of a building, termed *basso rilievo* when flat, and *alto rilievo* when prominent, all contradictory expressions ought to be avoided. Now, firmness and solidity being the proper expressions of a pedestal, and, on the contrary, lightness and delicacy of carved work, the pedestal, whether of a column or of a statue, ought to be sparingly ornamented. The ancients never ventured any bolder ornament than the basso relieve.

With respect to ornaments of the *second* kind, it is a great blunder to contrive them so as to make them appear useless. A blind window, therefore, when necessary for regularity, ought to be so disguised as to appear a real window: When it appears without disguise, it is disgust-

ful, as a vain attempt to supply the want of invention; it shows the irregularity in a stronger light, by signifying that a window ought to be there in point of regularity, but that the architect had not skill sufficient to connect external regularity with internal-convenience.

As to the *third*, it is an error to sink pilasters so far into the wall, as to remove totally, or mostly, the appearance of use. They should always project so much from the wall, as to have the appearance of supporting the entablature over them.

From ornaments in general, we descend to a pillar, the chief ornament in great buildings. The destination of a pillar is to support, really or in appearance, another part termed the *entablature*. With regard to the form of a pillar, it must be observed, that a circle is a more agreeable figure than a square, a globe than a cube, and a cylinder than a parallelepipedon. This last, in the language of architecture, is saying, that a column is a more agreeable figure than a pilaster; and for that reason it ought to be preferred, when all other circumstances are equal. Another reason concurs, that a column annexed to a wall, which is a plain surface, makes a greater variety than a pilaster. Besides, pilasters at a distance are apt to be mistaken for pillars; and the spectator is disappointed when, on a nearer approach, he discovers them to be only pilasters.

As to the parts of a column, a bare uniform cylinder, without a capital, appears naked; and without a base, appears too ticklishly placed to stand firm: It ought therefore to have some finishing at the top and bottom: Hence the three chief parts of a column, the shaft, the base, and the capital. Nature undoubtedly requires proportion among these parts, but it admits of variety of proportion. Vitruvius and some of the elder writers seem to think, that the proportions of columns were derived from the human figure, the capital representing the head, the base the feet, and the shaft the body. The Tuscan has been accordingly denominated the *Cyclopæic*; the Doric, the *Herculean*; the Ionic, the *Matronal*; and the Corinthian, the *Virginal*:—the Composite is a mixture of the Corinthian and Ionic. As to the base, the principle of utility interposes to vary it from the human figure, and to proportion it so to the whole, as to give the column the appearance of stability.

Among the Greeks, we find only three orders of columns, the Doric, the Ionic, and the Corinthian, distinguished from each other by their destination as well as by their ornaments. It has been disputed, whether any new order can be added to these: Some hold the affirmative, and give for instances the Tuscan and Composite; others maintain, that these properly are not distinct orders, but only the original orders with some slight variation. The only circumstances that can serve to distinguish one order from another, are the form of the column, and its destination. To make the first a distinguishing mark without regard to the other, would multiply orders without end. Destination is more limited, and it leads us to distinguish three kinds of orders; one plain and strong, for the purpose of supporting plain and massy buildings; one delicate and graceful, for supporting buildings of that character; and between these, a

third, supporting buildings of a mixed nature. So that, if destination alone is to be regarded, the Tuscan is of the same order with the Doric, and the Composite with the Corinthian.

The ornaments of these three orders ought to be suited to the purposes for which they are intended. Plain and rustic ornaments would be not a little discordant with the elegance of the Corinthian order, and sweet and delicate ornaments not less with the strength of the Doric.

With respect to buildings of every kind, one rule, dictated by utility, is, that they be firm and stable. An-

other, dictated by beauty, is, that they also appear so to the eye; for every thing that appears tottering, and in hazard of tumbling down, produceth in the spectator the painful emotion of fear, instead of the pleasing emotion of beauty; and accordingly it should be the great care of the artist, that every part of his edifice appear to be well supported. Some have introduced a kind of conceit in architecture, by giving parts of buildings the appearance of falling; of this kind is the church of St Sophia in Constantinople; the round towers in the uppermost stories of Gothic buildings is in the same false taste.

## S E C T. II.

### OF ARCHITECTURE AS A MECHANICAL ART.

#### *Of the ORIGIN of BUILDINGS.*

**B**UILDINGS, in the first ages of society, behoved to be extremely rude. The first huts were probably of a conic figure, being the most simple, and best adapted to the materials that could be obtained in such an uncultivated state of society. These huts were formed of branches of trees, covered with reeds, leaves, and clay.

But, finding the conic figure inconvenient, on account of its inclined sides, they changed it into a cubical one, in the following manner: They fixed in the ground several upright trees to form the sides, filling the intervals between them with branches closely interwoven, and covered with clay. The sides being thus completed, four large beams were placed on the upright trunks, which, being well joined at the angles, kept the sides firm; and likewise served to support the roof, which was composed of many joists, covered with reeds, leaves, and clay.

As men improved in the art of building, new methods of rendering their huts lasting and handsome were gradually invented. They took off the bark and other unevennesses from the trunks of the trees that formed the sides, and raised them above the dirt on stones. The spaces between the ends of the joists were closed with clay, and the ends of them were covered with thin boards, cut in the form of triglyphs, &c.

From this simple construction the different orders of architecture took their rise. When buildings of wood were laid aside, they imitated, in their edifices of stone, the form which necessity had introduced into the primitive huts: Hence the upright trees gave rise to the columns; and the beams, joists, rafters, and strata of materials that formed the covering, suggested architraves, frizes, triglyphs, and cornices.

At what time, or by whom, the Grecian orders were invented, is not certainly known. But the following is the account which Vitruvius gives of them.

Dorus, king of Achaia, and son of Helenes and Optica, built a temple to Juno in the ancient city of Argos, which happened to be in the manner now called *Doric*, from the name of the inventor. This manner was afterwards imitated in many other temples in the several cities of Achaia.

The Athenians, about the same time, sent thirteen colonies into Asia, under the command of Ion, son of Xuthus and Creusa. This Ion conquered all Caria, founded many cities, and called the country *Ionia*. The first temple he built was after the Doric manner. But afterwards he built a temple to Diana of a more delicate structure, and formed upon the proportions of a female body, as the Doric had been on those of a robust man. The capital was adorned with volutes, to represent the curls of a woman's hair; and flutings were cut on the shaft of the column, in imitation of the folds of her garment. This order got the name of *Ionian*, in honour of the Ionians who invented it.

The third sort of columns, called *Corinthian*, are said to owe their origin to the following accident:—A young girl of Corinth having died, her nurse placed on her tomb a basket, containing certain trinkets, in which she delighted when alive, and covered it with a tyle to prevent the rain from spoiling them. The basket happened to be plac'd on a root of acanthus, which pushing out its leaves in the spring, covered the sides of the basket; some of the longest of which, being obstructed by the corners of the tyle, were forced downwards, and curled in the manner of volutes. Calimachus the sculptor, passing near the tomb, was so pleas'd with the beautiful appearance of the acanthus growing in this manner, that he imitated it in the columns which he afterwards made at Corinth.

Villalpandus treats this story of Calimachus as a fable, and maintains that the Corinthian capital took its origin from an order in Solomon's temple; and it must be acknowledged, that some descriptions in the Bible favour this opinion.

Besides these three orders, said to be invented by the Greeks, two other, *viz.* the Tuscan and Composite, are thought to have been invented by the Romans. The Tuscan first appeared in Tuscany, before the Romans had any intercourse with the Greeks. The Composite is a mixture of the Ionic and Corinthian. These five manners of building, invented by the ancients, are called **ORDERS**, on account of the regularity and beauty of their forms.

*Of the PARTS that compose an ORDER, and their ORNAMENTS.*

1. OF THE TUSCAN.

THE parts that compose an order may be distributed into two different classes. In the *first* may be ranged all that have any analogy to the primitive huts, and represent some part that was necessary in their construction. Such are the shaft of the column, with the plinth of its base, and the abacus of its capital, representing the upright trees, with the stones on which they were placed, and those that covered them; likewise the architrave and triglyphs, representing the beams and joists; the mutules, modillions, or dentils, which all of them represent the rafters, or some other pieces of timber used to support the covering; and the corona, representing the beds of materials that composed the covering. All these may properly be distinguished by the name of essential members. The subservient parts, contrived for the use or ornament of the former, and commonly called mouldings, may constitute the *second class*.

THERE are eight regular mouldings in ornamenting columns; the fillet, litlel, or square; the astragal, or bead; the torus, or tore; the scotia, mouth, or casement; the echinus, ovolo, or quarter-round; the inverted cyma, talon, or ogee; the cyma, cyma recta, or cymatium; the cavetto, or hollow. The names of these allude to their forms, and their forms are adapted to the purposes for which they are intended. See Plate XXVII.

The ovolo and talon, as they are strong at the extremities, are fit for supports; the cyma and cavetto, tho' improper for supports, serve for coverings to shelter other members; the torus and astragal, being shaped like ropes, are intended to bind and fortify the parts with which they are connected: But the use of the scotia and fillet, is only to separate and distinguish the other mouldings, to give a graceful turn to the profile, and to prevent the confusion which would arise from joining several curved members together.

There are various methods of describing the contours of mouldings; but the simplest and best is to form them of quadrants of circles, as in Plate XXVII.

An assemblage of what are called essential parts and mouldings, is termed a *profile*. The most perfect profiles are such as are composed of few mouldings, varied in form and size; and so disposed, that the straight and curved ones succeed each other alternately. When ornaments are employed in mouldings, some of them should be left plain, in order to give a proper repose: For, when all are ornamented, the figure of the profile is lost.

*Of the ORDERS of ARCHITECTURE.*

AN ORDER consists of two principal members, the COLUMN and the ENTABLATURE; each of which is composed of three principal parts. Those of the Column are, the *Base*, the *Shaft*, and the *Capital*; and those of the Entablature are, the *Architrave*, the *Frize*, and the *Cornice*. All these are subdivided into many lesser parts, whose number, form, and dimensions characterise each order, and express the degree of strength, delicacy, richness, or simplicity peculiar to it.

THE TUSCAN (Plate XXIV.) is the most solid and simple of all the orders. It is composed of few parts, devoid of ornaments, and so massy, that its genius capable of supporting the heaviest burden. There are no remains of a regular Tuscan order among the antiques; the doctrine of Vitruvius concerning it is obscure; and the profiles of Palladio, Scamozzi, Serlio, de l'Orme, and Vignola, are all imperfect.

The height of the Tuscan column is 14 modules, or femidiameters, each consisting of 30 minutes; and that of the whole entablature  $3\frac{1}{2}$  modules; which being divided into 10 equal parts, three of them are for the height of the architrave, three for the freeze, and the remaining four for the cornice: The capital is one module; the base, including the lower cincture of the shaft, is likewise one module; and the shaft, with its upper cincture and astragal, 12 modules.

These are the general dimensions of the order; the particular dimensions may be learned by inspection of the Plates.

In the remains of antiquity, the quantity of diminution at the top of the Tuscan column is various; but seldom less than one eighth, nor more than one sixth of the inferior diameter of the column. The last of these is generally preferred; and Chalmers and others make the same diminution in all columns, without regard to their order.

2. OF THE DORIC ORDER.

THE DORIC ORDER, (Plate XXV.) is next in strength to the Tuscan; and being of a grave, robust, and masculine aspect, is by Scamozzi called the Herculean. As it is the most ancient of all the orders, it retains more of the structure of the primitive huts than any of the rest; the triglyphs in its freeze representing the ends of the joists; and the mutules in its cornice, representing the rafters.

The height of the Doric column, including its capital and base, is 16 modules, and the height of the entablature four; the latter of which being divided into eight parts, two of them are for the architrave, three for the frieze, and three for the cornice.

In most of the antiques, the Doric column is executed without a base. Vitruvius likewise makes it without one; the base, according to him, having been first employed in the Ionic order, in imitation of the sandal of a woman's foot. Scamozzi blames this practice, and most of the modern architects are of his opinion.

In the profile of the theatre of Marcellus, the frieze is enriched with hulks and roses; the architrave consists only of one fascia and a fillet; the drops are conical; the metope is enriched with a bull's skull, adorned with a garland of beads, in imitation of those on the temple of Jupiter Tonans at the foot of the Capitol. In some antique fragments, and in a great many modern buildings, the metopes are alternately adorned with ox-skulls and pateras. But they may be filled with any other ornaments, according to the destination of the building.

## 3. OF THE IONIC ORDER.

THE IONIC ORDER (Plate XXVI.) is of a more slender make than the Doric or Tuscan; its appearance is simple, yet graceful and majestic; its ornaments are few; so that it has been compared to a sedate matron, in decent, rather than magnificent attire.

Among the ancients, the form of the Ionic profile appears to have been more positively determined than that of any other order; for, in all the antiques at Rome, (the temple of Concord excepted) it is exactly the same.

The modern artists have likewise been unanimous in their opinions; all of them, excepting Palladio and his imitators, having employed the dentil, cornice, and the other parts of the profile, nearly as they are found in the Coliseum, the temple of Fortune, and the theatre of Marcellus.

The height of the Ionic column is 18 modules, and that of the entablature  $4\frac{1}{2}$ , or one quarter of the height of the column, as in the other orders, which is a trifle less than in any of the antique Ionics. In all the antiques, the base is Attic; and the shaft of the column may either be plain, or fluted with 24 flutings, or 20 only, as in the temple of Fortune. The plan of the flutings may be a trifle more than a semicircle, as in the forum of Nerva, because they then appear more distinct. The fillets, or intervals between them, must not be broader than one third of the breadth of a fluting, nor narrower than one fourth. The ornaments of the capital must correspond with the flutings of the shaft; and there must be an ove above the middle of each fluting. The volutes ought to be traced according to Mr Goldsmid's method, which is as follows:

Plate XXVII. fig. 9. Draw the cathetus F C, whose length must be 15 minutes, or one fourth of a module; and, from the point C, describe the eye of the volute A E B D, of which the diameter is to be  $6\frac{1}{2}$  minutes; divide it into four equal sectors by the diameters A B, D E. Bisect the radii C A, C B, in 1 and 4; and on the line 1, 4, construct a square 1, 2, 3, 4. From the centre C, to the angles 2, 3, draw the diagonals C 2, C 3, and divide the side of the square 1, 4, into 6 equal parts, at 5, 9, C, 12, 8. Then through the points 5, 9, 12, 8, draw the lines 5, 6, 9, 10, 12, 11, 8, 7, parallel to the diameter E D, which will cut the diagonals in 6, 7, 10, 11; and the points 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, will be the centres of the volute. From the first centre 1, with the distance 1 F, describe the quadrant F G; from the second centre 2, with the distance 2 G, describe the quadrant G H; and, continuing the same operation from all the 12 centres, the contour of the volute will be completed.

Fig. 10. The centres for describing the fillet are found in this manner. Construct a triangle, of which the side A F is equal to the part of the cathetus contained between A F and the side F V, equal to C 1; place the distance F S from F towards A, equal to F S the breadth of the fillet, and through the point S draw the line S T, which will be to C 1 in the same proportion as A S is to A F; place this line on the diameter of the eye A B;

divide it into three equal parts; and, through the points of division, draw lines parallel to the diameter E D, which will cut the diagonals C 2, C 3, and you will have twelve new centres, from whence the interior contour of the fillet may be described, in the same manner as the exterior one was from the first centres.

## 4. OF THE CORINTHIAN ORDER.

THE proportions of this order are extremely delicate. It is divided into a great variety of members, and enriched with a profusion of ornaments. Scamozzi calls it the *virginal order*; and indeed it has all the delicacy in its make, and all the gaiety in its dress, peculiar to young girls. See Plate XXVIII.

The most perfect model of the Corinthian order is generally allowed to be in the three columns in the Campo Vaccino at Rome, the remains, as it is thought, of the temple of Jupiter Stator.

The Corinthian column should be 20 modules high, and the entablature 5; which proportions are a medium between those of the Pantheon and the three columns. The base of the column may either be Attic or Corinthian: They are both beautiful. If the entablature be enriched, the shaft may be fluted. The flutings may be filled, to one third of their height, with cablings, as in the inside of the Pantheon; which will strengthen the lower part of the column, and make it less liable to injury.

In most of the antiques at Rome, the capital of this order is enriched with olive-leaves; the acanthus being seldom employed but in the Composite. De Cordemoy, however, prefers the acanthus.

The divisions of the entablature bear the same proportions to each other, as in the Tuscan, Ionic, and Composite orders.

## 5. OF THE COMPOSITE.

THE COMPOSITE is, strictly speaking, only a species of the Corinthian; and therefore retains, in a great measure, the same character. See Plate XXIX.

It does not appear that the ancients affected any particular form of entablature to this order. Sometimes the cornice is entirely plain, as in the temple of Bacchus; at others, as in the arch of Septimius Severus, it is enriched with dentils differing very little from the Ionic; and in the arch of Titus, there are both dentils and modillions; the whole form of the profile being the same with the Corinthian, as executed in the antiques at Rome.

The modern architects have varied more in this than in any other order, each following the bent of his own fancy.

The height of the Composite column, and parts of the entablature, is the same with that of the Corinthian. The foot of the leaves of the capital ought not to project beyond the upper part of the shaft. The different bunches of leaves should be strongly marked; the sprigs which arise between the upper ones should be kept flat upon the vase; and the ornaments of the volutes must not project beyond the fillets that inclose them.

PLATE XXIX  
COMPOSITE  
ORDER

## OF PILASTERS.

PILASTERS differ from columns only in their plan; which is square, as that of columns is round. Their bases, capitals, and entablatures, have the same parts, with the same heights and projections, as those of columns: They are also distinguished in the same manner, by the names of Tuscan, Doric, Ionic, Corinthian, and Composite.

The column is undoubtedly more perfect than the pilaster. However, they may be employed with great propriety on many occasions. Some authors declaim against pilasters, because, according to them, they do not admit of diminution. But this is a mistake; there are many instances, in the remains of antiquity, of their being diminished. Scamozzi always gave his pilasters the same diminution as his columns: Palladio and Inigo Jones have likewise diminished them in many of their buildings.

Pilasters are employed in churches, galleries, halls, and other interior decorations, to save room; for, as they seldom project beyond the solid wall above one quarter of their diameter, they do not occupy near so much space as columns. They are likewise used in exterior decorations; sometimes alone, instead of columns, on account of their being less expensive; and sometimes they accompany columns, being placed behind them to support the architraves, where they enter the building, as in the Pantheon at Rome; or, in the same line with them, to fortify the angles, as in the portico of Septimius.

When pilasters are used alone, they should project one quarter of their diameter beyond the walls. When placed behind columns, especially if they be very near them, they need not project above one eighth of their diameter. But, when placed on a line with columns, their projection must be regulated by that of the columns; and consequently, it can never be less than a semidiameter, even when the columns are engaged as much as possible.

The shafts of pilasters are frequently adorned with flutings, in the same manner as those of columns; the plan of which may be a trifle more than a semicircle: Their number must be seven on each face, which makes them nearly of the same size with those of columns. The intervals, or fillets, must either be one third or one fourth of the fluting in breadth.

The capitals of pilasters are profiled nearly in the same manner as those of columns.

## OF PERSIANS AND CARYATIDES.

BESIDES columns and pilasters, it is sometimes customary to employ representations of the human figure, to support entablatures in buildings. The male figures are called *Persians*; and the female, *Caryons*, or *Caryatides*. The ancients made frequent use of Persians and Caryatides, and delighted in diversifying them a thousand ways. The modern artists have followed their example; and there is a great variety of compositions of this kind to be met with in different parts of Europe.

VOL. I. No. 15.

3

Indecent attitudes, distorted features, and all monstrous productions, ought to be avoided, of which there are many examples in Gothic buildings. On the contrary, the attitudes should be simple and graceful, the countenance always pleasing, though varied and strongly marked agreeable to the nature of the object represented.

The Caryatides, or female figures, should never much exceed the human size. But the Persians, or male figures, may be of any size; and the larger the better, as they will strike the beholder with the greater awe and astonishment. Persians may be used with propriety in arsenals, galleries of armour, &c. under the figures of captives, heroic virtues, &c. Their entablature ought to be Doric, and bear the same proportion to them as to columns of the same height. The entablature for Caryatides ought to be either Ionic or Corinthian, according as the character of the figures is more or less delicate.

Termini are sometimes employed, instead of Persians or Caryatides, to support the entablatures of monuments, chimney-pieces, and such like compositions. These figures owe their origin to the stones used by the ancients to mark the limits of particular possessions. Numa Pompilius, to render these inviolable, consecrated the terminus into a deity, and instituted festivals and sacrifices to his honour. In a short time, what was formerly only large upright stones, were represented in human shape; and afterwards introduced as ornaments to temples and other buildings. The termini are now principally used as ornaments for gardens and fields.

## OF PEDESTALS.

MOST writers consider the PEDESTAL as a necessary part of the order, without which it is not complete. It is indeed a matter of little importance whether it be considered in that light, or as a distinct composition: We shall therefore treat of a pedestal as a distinct body, having no more connection with the order than an Attic, a base, or any other part with which it may on some occasions be associated.

A pedestal consists of three principal parts; the base, the dye, and the cornice. The dye is always nearly of the same figure; being constantly either a cube or a parallelepipedon: But the base and cornice are varied and adorned with more or fewer mouldings, according to the simplicity or richness of the composition in which the pedestal is employed. Hence pedestals are, like columns, distinguished by the names of Tuscan, Doric, Ionic, Corinthian, and Composite.

Some authors are averse to pedestals, and compare a column raised on a pedestal to a man mounted on stilts; imagining that they were introduced merely from necessity, and for want of columns of a sufficient length. It is indeed true, that the ancients often made use of artifices to lengthen their columns; as appears by some that are in the Baptistery of Constatine at Rome; the shafts of which being too short for the building, were lengthened and joined to their bases by an undulated sweep, adorned with acanthus leaves. Nevertheless there are many occasions where pedestals are evidently necessary; and some in which the order, were it not so raised, would

4 U

lole

lose much of its beautiful appearance. Thus, in the insides of churches, if the columns that support the vault were placed immediately on the ground, the seats would hide their bases, and a good part of their shafts; and, in the theatres of the ancients, if the columns of the scene had been placed immediately on the stage, the actors would have hid a part of them from the audience. In interior decorations, a pedestal diminishes the parts of the order, which otherwise might perhaps appear too clumsy, and hath the advantage of placing the column in a more favourable view, by raising its base nearer the level of the spectator's eye. In a second order of arcades, there is no avoiding pedestals; as without them it is impossible to give the arches any tolerable proportion.

With regard to the proportion that pedestals ought to bear to that of the columns they support, it is by no means fixed. Both the ancients and moderns vary greatly on this head. Vignola's proportions are generally reckoned the best. He makes his pedestals, in all the orders, of the same height, viz. one third of the column; and as their breadth of course increases or diminishes in the same degree as the diameters of their respective columns do, the character of the order is always preserved, which, according to any other method, is impossible.

As to the divisions of the pedestal; if the whole height be divided into nine parts, one of them may be given to the height of the cornice, two to the base, and the six remaining to the shaft. The breadth of the shaft is always made equal to that of the plinth of the column. The projection of the cornice may be made equal to its height; and the base being divided into three parts, two of them will be for the height of the plinth, and one for the mouldings, whose projection must be less than that of the cornice. These measures are common to all pedestals. See Plate XXX.

## OF INTERCOLUMNIATIONS.

COLUMNS are either engaged, or insulated; and, when insulated, are either very near the wall, or at a considerable distance from it. Engaged columns, or such as are near the walls of a building, are not limited in their intercolumniations, as these depend on the breadths of the arches, windows, niches, or other decorations placed between the columns. But columns that are entirely detached, and perform alone the office of supporting the entablature, as in peristyles, porches, and galleries, must be near each other, for the sake both of real and apparent solidity.

The intercolumniations among the ancients were various. Those used in the Ionic and Corinthian orders were the pycnostyle, of which the interval was equal to one diameter and a half of the column; the systyle, whose interval was equal to two diameters; the eustyle, to two and a quarter; the diastyle to three, and the aræostyle to four. In the Doric order, they used other intercolumniations, regulating them by the triglyphs, one of which was always placed directly over the middle of each column; so that they were either systyle, monotriglyph, of one diameter and a half; diastyle, of two

diameters and three quarters; or aræostyle, of four diameters; and the Tuscan intervals were very wide, some of them being above seven diameters, which was very practicable, as the architraves were of wood.

Among these different intercolumniations, the pycnostyle and systyle are too narrow; for although the ancients made frequent use of them, that ought rather to be ascribed to necessity than choice. For, as the architraves were composed of single stones, extending from the middle of one column to the middle of another, it would have been difficult, especially in large buildings, to find blocks of a sufficient length for diastyle intervals.

With regard to the aræostyle and Tuscan intercolumniations, they are by much too wide, and can only be used in rustic buildings, where the architraves are of wood; neither is the diastyle sufficiently solid in large compositions. The eustyle is a medium between the narrow and broad intervals; and, being at the same time both spacious and solid, hath been preferred to any of the rest by the ancients as well as the moderns.

Vignola observed nearly the same proportion in all his intercolumniations; which practice, though condemned by several writers, is certainly preferable to any other; as it preserves the character of each order, and maintains in all of them an equal degree of real solidity. Setting aside therefore the pycnostyle and systyle dispositions on account of their want of space, and the aræostyle for its deficiency in point of strength, it may be established, that the diastyle and eustyle intercolumniations, (the latter of which, on most occasions, ought to have the preference), may be employed in all the orders without distinction, excepting the Doric; in which the most perfect interval is ditriglyph; neither the monotriglyph, nor the aræostyle, being to be suffered but in cases of necessity.

Sometimes, on account of the windows, doors, niches, and other decorations, which correspond with the intercolumniations of the peristyle, or gallery, it is not possible to make the intervals so narrow as eustyle, or even as diastyle: Wherefore the moderns, authorised by some few examples of the ancients, where grouped columns are employed, have invented a manner of disposing them, called by Perrault *aræostyle*, which admits of a larger interval, without any detriment to the apparent solidity of the building. This kind of disposition is composed of two systyle intercolumniations; the column that separates them being approached towards one of those at the extremities, sufficient room only being left between them for the projection of the capitals; so that the great space is three diameters and a half wide, and the little one half a diameter.

In peristyles, galleries, or porticos, all the intercolumniations must be equal: But in a logio, or porch, the middle interval may be broader than the others, by a triglyph or modillion, or three or four dentils; unless the columns at the angles be coupled, or grouped with pilasters; in which case, all the intervals should be of the same dimensions.

When buildings are very small, as is frequently the case in temples and other inventions used for ornamenting gardens, the intercolumniations may be broader, in proportion to the diameter of the columns, than usual; because,

caufe, when they are nearer each other than three feet, there is hardly room for a bulky perfon to pafs between them.

### OF ARCHES.

ARCHES are not fo magnificent as colonnades; but they are more folid, and lefs expensive. They are proper for triumphal entrances, gates of cities, of palaces, of gardens, and of parks; and, in general, for all openings that require an extraordinary breadth.

There are various manners of adorning arches. Sometimes their piers are ruficated; fometimes they are adorned with pilafters, termini, or caryatides; and fometimes they are made fufficiently broad to admit niches, or windows. The circular part of the arch is either furrounded with ruffic key-ftones, or with an archivolt enriched with mouldings; which, in the middle, is fometimes interrupted by a confole, a mafk, ferving at the fame time as a key to the arch, and as a fupport to the architrave of the order. The archivolt is fometimes fupported by an impoft, at the head of the pier; and, at others, by columns placed on each fide of it, with a regular entablature, or architrave cornice. There are likewife inftances of arcades without piers, the arches being turned on fingle columns, as in the temple of Faunus at Rome, &c. This practice, however, ought to be feldom imitated, as it is neither folid nor handfome.

When arches are large, the key-ftone fhould never be omitted, but cut in the form of a confole, and carried clofe under the foffit of the architrave, which, on account of its extraordinary length, requires a fupport in the middle. The impofts of arches fhould never be omitted; at leaft, if they be, a platform ought to fupply their place. If columns are employed without pediftals in arcades, they fhould always be raifed on a plinth. In all arches, the circular part ought not to fpring immediately from the impoft, but take its rife at fuch a diftance above it, as is neceffary in order to have the whole curve feen at the proper point of view.

The void or aperture of arches fhould never be higher, nor much lower, than double their breadth; the breadth of the pier fhould feldom exceed two thirds, nor be lefs than one third, of the breadth of the arch; and the angular pier ought to be broader than the others, by one half, one third, or one fourth; the impoft fhould not be more than one feventh, nor lefs than one ninth of the aperture; and the archivolt muft not be more than one eighth, nor lefs than one tenth of it. The breadth of the confole muft, at the bottom, be equal to that of the archivolt; and its fides muft be drawn from the centre of the arch: The length of it muft not be lefs than one and a half of its fmalleft breadth, nor more than double. The thicknefs of the pier depends on the breadth of the portico; for it muft be ftrong enough to refift the preffure of its vault. But, with regard to the beauty of the building, it fhould not be lefs than one quarter of the breadth of the arch, nor more than one third. Thefe are the general dimenfions of arches.

### OF ORDERS ABOVE ORDERS.

WHEN, in a building, two or more orders are employ-

ed, one above another, the laws of folidity require, the ftrongeft fhould be placed lowmoft. Hence the Tufcan muft fupport the Doric, the Doric the Ionic, the Ionic the Compofite or Corinthian, and the Compofite the Corinthian.

This rule, however, is not always ftrictly adhered to. Moft-authors place the Compofite above the Corinthian. There are likewife examples where the fame order is repeated, as in the theatre of Statilius Taurus, and the Colifeum; and others, where an intermediate order is omitted, and the Ionic placed on the Tufcan, or the Corinthian on the Doric. But none of thefe practices ought to be imitated.

In placing columns above one another, the axis of all the columns ought to correpond, or be in the fame perpendicular line, at leaft in front.

With regard to the proportions of columns placed above each other, Scamozzi's rule, That the lower diameter of the fuperior column fhould constantly be equal to the upper diameter of the inferior one, is univerfally efteemed the beft, and gives all the columns the appearance of one long tapering tree, cut into feveral pieces. According to this rule, the Doric column will be to the Tufcan, as  $13\frac{1}{7}$  to 14; the Ionic to the Doric, as 15 to 16; the Compofite or Corinthian to the Ionic, as  $16\frac{1}{2}$  to 18; and the Corinthian to the Compofite, as  $16\frac{1}{2}$  to 20.

In Britain there are few examples of more than two ftories of columns in the fame afpect: And, though in Italy, and other parts of Europe, we frequently meet with three, and fometimes more; yet it is a practice by no means to be imitated; for there is no poffibility of avoiding many ftriking inconfiftencies, or of preferving the character of each order in its intercolumnial decorations.

### OF BASEMENTS AND ATTICS.

INSTEAD of employing feveral orders one above the other in a compofition, the ground-floor is fometimes made in the form of a *basement*, on which the order that decorates the principal ftory is placed. The proportion of thefe basements is not fixed, but depends on the nature of the rooms on the ground-floor. In the palace of the Porti in Vicenza, the height of the basement is equal to that of the order. In fome buildings, its height exceeds two thirds of that of the order; and in others only half the height of the order. It is not, however, advifable to make the basement higher than the order it fupports; neither fhould it be lower than one half of the order.

The ufual method of decorating basements is with ruffics of different kinds. The beft, where neatnefs and finifhing is aimed at, are fuch as have a fmooth furface. Their height, including the joint, fhould never be lefs, nor much more, than half a module of the order placed on the basement. Their figure may be from a fquare to a fefquialtera; and their joints may be either fquare or chamfered. The fquare ones fhould not be broader than one eighth of the height of the ruffic, nor narrower than one tenth; and their depth muft be equal to their breadth; thofe that are chamfered, muft form a rectangle; and the breadth

breadth of the whole joint may be from one fourth to one third of the height of the flat surface of the rustick.

Instead of a second order, it is sometimes usual to crown the first with an **ATTIC STORY**: These Attics should never exceed in height one third of the height of the order on which they are placed, nor be less than one quarter of it. Their figure is that of a pedestal: The base, dye, and cornice, of which they are composed, may bear the same proportions to each other as those of pedestals do; and the base and cornice may be composed of the same mouldings as those of pedestals. Sometimes the Attic is continued throughout; at others, it projects, and forms a pilaster over each column of the order. The breadth of this pilaster is seldom made narrower than the upper diameter of the column below it, and never broader. Its projection may be equal to one quarter of its breadth.

### OF PEDIMENTS.

**PEDIMENTS** most probably owe their origin to the inclined roofs of the primitive huts. Among the Romans, they were used only as coverings to their sacred buildings, till Cæsar obtained leave to cover his house with a pointed roof, after the manner of temples. In the remains of antiquity we meet with two kinds of pediments, the triangular and circular. The former of these are promiscuously applied to cover small or large bodies: But the latter being of a heavier figure, are never used but as coverings to doors, niches, windows, or gates.

As a pediment represents the roof, it should never be employed but as a finishing to the whole composition.

The ancients introduced but few pediments into their buildings, usually contenting themselves with a single one to adorn the middle or principal part. But some of the moderns, and particularly the Italians, have been so immoderately fond of them, that their buildings frequently consist of almost nothing else.

The girder being a necessary part in the construction of a roof, it is an impropriety to intermit the horizontal entablature of a pediment, by which it is represented, to make room for a niche, an arch, or a window.

In regular architecture, no other form of pediments can be admitted, besides the triangular and circular. Both of them are beautiful: and when a considerable number of pediments are introduced, as when a range of windows are adorned with them, these two figures may be used alternately, as in the niches of the Pantheon, and in those of the temple of Diana at Nismes.

The proportion of pediments depends upon their size; for the same proportions will not do in all cases. When the base of the pediment is short, its height must be increased; and when the pediment is long, the height must be diminished. The best proportion for the height is from one fifth to one fourth of the base, according to the extent of the pediment, and the character of the body it covers. The materials of the roof must also be attended to; for if it be covered with tiles, it will be necessary to raise it more than one quarter of the base, as was the custom of the ancients in their Tuscan temples.

The tympan is always on a line with the front of the frieze; and, when large, admits of various ornaments.

### OF BALLUSTRADES.

**BALLUSTRADES** are sometimes of real use in buildings; and at other times they are only ornamental. Such as are intended for use, as when they are employed in stair-cases, before windows, or to inclose terraces, &c. must always be nearly of the same height; never exceeding three feet and a half, nor ever less than three. But those that are principally designed for ornament, as when they finish a building, should be proportioned to the architecture they accompany; and their height ought never to exceed four fifths of the height of the entablature on which they are placed; nor should it ever be less than two thirds thereof, without counting the zocholo, or plinth, the height of which must be sufficient to leave the whole ballustrade exposed to view.

The best proportion for ballustrades is to divide the whole given height into thirteen equal parts; eight of these for the height of the balluster, three for the base, and two for the cornice or rail; or into fourteen, (if it be required to make the balluster less), giving eight parts to the balluster, four to the base, and two to the rail. One of these parts may be called a module; and, being divided into nine minutes, may serve to determine the dimensions of the particular members.

In ballustrades, the distance between two ballusters should not exceed half the diameter of the balluster measured in its thickest part, nor be less than one third of it.

The breadth of the pedestals, when they are placed on columns or pilasters, is regulated by them; the dye never being made broader than the top of the shaft, nor much narrower: and when there are neither columns nor pilasters in the front, the dye should not be much lower than a square, and seldom higher. On stairs, or any other inclined planes, the same proportions are to be observed as on horizontal ones.

### OF GATES, DOORS, AND PIERS.

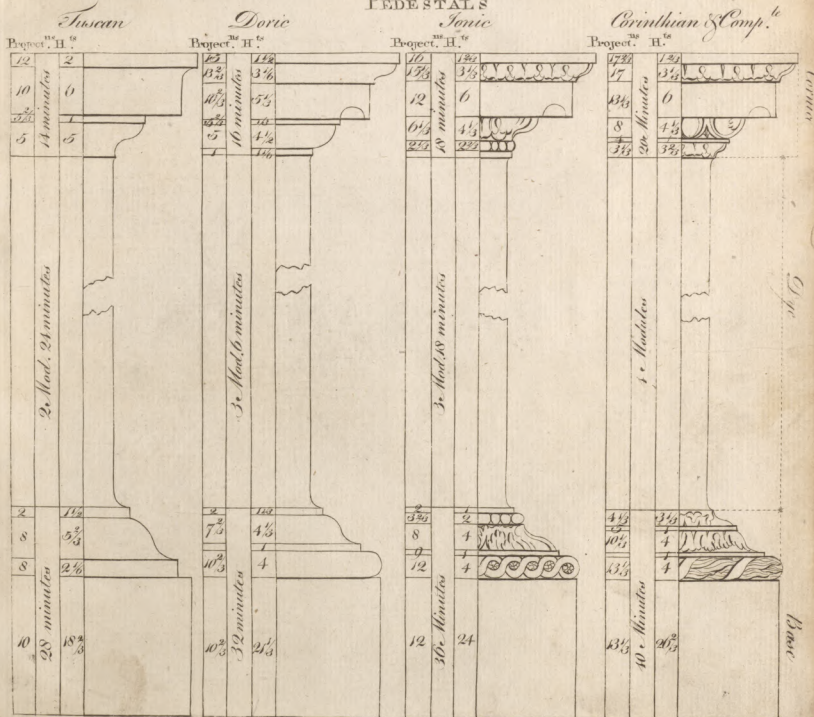

THERE are two kinds of entrances, *viz.* doors and gates. The former serve only for the passage of persons on foot; but the latter likewise admit horsemen and carriages. Doors are used as entrances to churches, and other public buildings, to common dwelling-houses, and apartments: And gates serve for inlets to cities, fortresses, parks, gardens, palaces, &c. The apertures of gates being always wide, they are generally made in the form of an arch, that figure being the strongest. But doors, which are generally of small dimensions, are commonly parallelograms, and closed horizontally.

The general proportion for the apertures, both of gates and doors, whether arched or square, is, that the height be about double the breadth.

The usual ornaments of gates consist of columns, pilasters, entablatures, pediments, rusticks of different kinds, impost, archivolts, &c.; and the most common method of adorning doors is with an architrave, for rounding the

the sides and top of the aperture, on which are placed a regular frieze and cornice. Sometimes the cornice is supported by a couple of consoles placed on each side of the door; and sometimes, besides an architrave, the aperture is adorned with columns, pilasters, caryatides, or termini; and a regular entablature with a pediment.

Inside-doors, however small the building may be, should never be narrower than two feet nine inches; nor should they ever, in private houses, exceed three feet six inches in breadth, which is more than sufficient to admit the bulkiest person. Their height should at least be six feet three or four inches; otherwise a tall person cannot pass without stooping. In churches, palaces, &c. where there is a constant ingress and egress of people, the apertures must be larger. The smallest breadth that can be given to a gate is  $8\frac{1}{2}$  or 9 feet, which is but just sufficient for the passage of a coach.

Plate XXXI. Fig. 1. Is a rustic door, composed by the celebrated Vignola, in which the aperture occupies two thirds of the whole height, and one half of the whole breadth; the figure of it being a double square. The rustics may be either smooth or hatched; their joints must form a rectangle, and the breadth of each joint may be one third, or two sevenths, of the vertical surface of a rustic. The joints of the claveaux, or key-stones, must be drawn to the summit of an equilateral triangle, whose base is the top of the aperture. The architrave surrounding the aperture may be composed either of a large ogee and fillet, or of a plat-band and fillet. Its whole breadth must be one tenth of the breadth of the aperture; the remaining part of each pier being for the rustics. The entablature is Tuscan: The cornice is to be one fifteenth of the whole height of the door; and what remains below it being divided into twenty-one equal parts, the two uppermost of them will be for the frieze and architrave, and the remaining nineteen for the rustics and plinth at the foot of the door.

Fig. 2. Is a disposition of Michael Angelo's. The windows of the Capitol at Rome are of this kind; and Sir Christopher Wren hath executed doors of the same kind under the semicircular porches in the flanks of St Paul's. The figure of the aperture may be a double square; the architrave one sixth of the breadth of the aperture; and the whole entablature one quarter of its height. The front of the pilasters or columns, on each side, must be on a line with the fascia of the architrave; and their breadth must be a semidiameter.

Fig. 3. Is likewise a design of Vignola's. It is of the Corinthian order, and executed in the Cancellaria at Rome. The height is equal to double its breadth; and the whole ornament at the top is equal to one third of the height of the aperture. The architrave is in breadth one fifth of the breadth of the aperture; and the pilasters that support the consoles, are half as broad as the architrave. The whole is well imagined, but rather heavy; and it will be best to reduce the architrave to one sixth of the aperture, diminishing the entablature proportionally.

Fig. 4. Is a design of Serlio's. The aperture may be either twice as high as broad, or a trifle less. The diameter of the columns may be equal to one quarter of

the breadth of the aperture; and their height may be from eight diameters to eight and a half. The entablature must be somewhat less than one quarter of the height of the columns; and the height of the pediment may be one quarter of its base.

Fig. 5. Is a door in the salon of the Farnese at Rome, designed by Vignola. The aperture forms a double square. The entablature is equal to three elevenths of its height, the architrave being one of these elevenths; and the whole ornament on the sides, consisting of the architrave and pilasters, is equal to two sevenths of the breadth of the aperture: The cornice is Composite, enriched with mutules and dentils; and the frieze is adorned with a festoon of laurel.

Fig. 6. Is copied from a door at Florence, said to be a design of Cigoli's. The height of the aperture is a trifle more than twice its breadth. It is arched; and the impost is equal to half a diameter. The columns are Ionic, somewhat above nine diameters high; and their shafts are garnished each with five rustic cinctures. The entablature is less than one quarter of the column; and the breadth of the tablet, in which there is an inscription, is equal to the breadth of the aperture.

## O F W I N D O W S .

THE first consideration with regard to windows, is their size, which varies according to the climate, the destination of the building, &c. In Britain, the windows of the smallest private houses are commonly from 3 to  $3\frac{1}{2}$  feet broad; and being generally twice their breadth in height, or somewhat more, in the principal apartments, they generally rise to within a foot or two of the ceilings of the rooms, which are frequently no higher than 10 feet, and at most 12 or 13. But, in more considerable houses, the apartments are from 15 to 20 feet high, and sometimes more; and in these the windows are from 4 to 5 and  $5\frac{1}{2}$  feet broad, and high in proportion. These dimensions are sufficient for dwelling-houses of any size in this country; when they are larger, they admit too much of the cold air in winter. But churches, and other buildings of that kind, may have larger windows, proportioned to the size of the structures.

The proportions of the apertures of windows depend upon their situation. Their breadth in all the stories must be the same; but the different heights of the apartments make it necessary to vary the height of the windows likewise. In the principal floor, it may be from  $2\frac{1}{2}$  of the breadth to  $2\frac{3}{4}$ , according as the rooms have more or less elevation. In the ground-story, where the apartments are lower, the apertures of the windows seldom exceed a double square; and, when they are in a rustic basement, they are frequently made much lower. The height of the windows of the second floor may be from  $1\frac{1}{2}$  of their breadth to  $1\frac{3}{4}$ ; and Attics and Mezzanines may be either a perfect square, or somewhat lower.

The windows of the principal floor are generally most enriched. The simplest method of adorning them is, with an architrave surrounding the aperture, and crowned with a frieze and cornice. The windows of the ground-floor are sometimes left entirely plain, without

any ornament; and at others they are furrounded with rustics, or a regular architrave with a frieze and cornice. Those of the second floor have generally an architrave carried entirely round the aperture; and the same is the method of adorning Attic and Mezzanine windows. But the two last have seldom either frieze or cornice; whereas the second-floor windows are often crowned with both.

The breasts of all the windows on the same floor should be on the same level, and raised above the floor from two feet nine inches to three feet six inches at the very most. When the walls are thick, the breasts should be reduced under the apertures, for the conveniency of looking out. In France, the windows are frequently carried quite down to the floor. When the building is furrounded with gardens, or other beautiful objects, this method renders the rooms exceeding pleasant.

The interval between the apertures of windows depends in a great measure on their enrichments. The breadth of the aperture is the least distance that can be between them; and twice that breadth should be the largest in dwelling-houses; otherwise the rooms will not be sufficiently lighted. The windows in all the stories of the same aspect must be placed exactly above one another.

Plate XXXII. Fig. 1. Is a design of P. Lescot, abbot of Clagny, executed in the old Louvre at Paris. The apertures may be a double square, or a trifle more; the architrave from one sixth to one seventh of the breadth of the aperture: The pilaster is equal to that breadth, when the architrave is narrow; or less, by one quarter, or one fifth, when it is broad. The whole entablature should not exceed one quarter of the height of the aperture, nor be much lower. The consoles may be equal in length to half the breadth of the aperture at most, and to one third of it at least.

Fig. 2. Is a design of Palladio's, executed at the Chiericato in Vincenza: Its proportions are not much different from the following. The plat-band that supports the window is equal to the breadth of the architrave.

Fig. 3. Is likewise a design of Palladio's, executed by him in many of his buildings. The aperture is a double square. The breadth of the architrave is one sixth of the breadth of the aperture; and the frieze and cornice together are double the height of the architrave. The breadth of the consoles is two thirds of the breadth of the architrave.

Fig. 4. Is a design of Ludovico Da Cigoli; and executed in the ground-floor of the Ramachini palace at Florence.

Fig. 5. Is a design of Inigo Jones, executed at the Banqueting-house. The aperture may be a double square; the architrave may be one sixth of its breadth; the whole entablature one quarter of its height; and the breadth of the consoles two thirds of the breadth of the architrave.

Fig. 6. Is a design of M. Angelo Buonaroti, executed at the Farnese.

## OF NICHES AND STATUES.

It hath been customary, in all ages, to enrich differ-

ent parts of buildings with representations of the human body. Thus the ancients adorned their temples, baths, theatres, &c. with statues of their deities, heroes, and legislators. The moderns still preserve the same custom, placing in their churches, palaces, &c. statues of illustrious persons, and even groups composed of various figures, representing occurrences collected from history, fables, &c. Sometimes these statues or groups are detached, raised on pedestals, and placed contiguous to the walls of a building, or in the middle of a room, court, or public square. But they are most frequently placed in cavities made in the walls, called *niches*. Of these there are two sorts; the one formed like an arch in its elevation, and semicircular or semielliptical in its plan; the other is a parallelogram both in its plan and elevation.

The proportion of both these niches depends on the character of the statues, or the general form of the groups placed in them. The lowest are at least a double square in height; and the highest never exceed  $2\frac{1}{2}$  of their breadth.

With regard to the manner of decorating them, when they are alone in a composition, they are generally inclosed in a pannel, formed and proportioned like the aperture of a window, and adorned in the same manner. In this case, the niche is carried quite down to the bottom; but on the sides and at the top, a small space is left between the niche and the architrave of the pannel. And when niches are intermixed with windows, they may be adorned in the same manner with the windows, provided the ornaments be of the same figure and dimensions with those of the windows.

The size of the statues depends on the dimensions of the niches. They should neither be so large as to have the appearance of being rammed into the niches, as in Santa Maria Maggiore at Rome; nor so narrow as to seem lost in them, as in the Pantheon. The distance between the outline of the statue and side of the niche should never be less than one third of a head, nor more than one half, whether the niche be square or arched; and when it is square, the distance from the top of the head to the ceiling of the niche should not be greater than the distance on the sides. Statues are generally raised on a plinth, the height of which may be from one third to one half of a head; and sometimes, where the niches are large, the statues may be raised on small pedestals.

The character of the statue should always correspond with the character of the architecture with which it is furrounded. Thus, if the order be Doric, Hercules, Jupiter, Mars, Æsculapius, and all male statues representing beings of a robust and grave nature, may be introduced; if Ionic, then Apollo, Bacchus, &c.; and if Corinthian, Venus, Flora, and others of a delicate nature, should be employed.

## OF CHIMNEY-PIECES.

Among the ancients, there are very few examples of chimney-pieces to be met with. Neither the Italians nor French have excelled in compositions of this kind. Britain, by being possessed of many able sculptors at different

different times, has surpassed all other nations, both in taste of design, and workmanship.

The size of the chimney must be regulated by the dimensions of the room where it is placed. In the smallest apartments, the breadth of the aperture should never be less than three feet, to three feet six inches. In rooms from 20 to 24 feet square, or of equal superficial dimensions, it may be from 4 to 4½ feet broad; in those of 24 to 27, from 4½ to 5; and, in such as exceed these dimensions, the aperture may even be extended to 5½ or 6 feet.

The chimney should always be situate so as to be immediately seen by those who enter the room. The middle of the partition wall is the most proper place in halls, salons, and other rooms of passage; but in drawing-rooms, dressing-rooms, and the like, the middle of the back wall is the best situation. In bed-rooms, the chimney is always in the middle of one of the partition-walls; and in closets, and other very small places, to save room, it is put in a corner. Where-ever two chimneys are used in the same room, they should be placed either directly facing each other, if in different walls, or at equal distances from the centre of the wall in which they both are.

The proportion of the apertures of chimney-pieces of a moderate size is generally a perfect square; in small ones, it is a trifle higher; and in large ones, a trifle lower. Their ornaments consist in architraves, frizes, cornices, columns, pilasters, terminus caryatides, consoles, and all kinds of ornaments of sculpture, representing animals and vegetables, &c. likewise vases, chalices, trophies of arms, &c. In designing them, regard must be had to the nature of the place where they are to be employed. Such as are intended for halls, salons, guard-rooms, galleries, and other large places, must be composed of large parts, few in number, of distinct and simple forms, and having a bold relief; but chimney-pieces for drawing-rooms, dressing-rooms, &c. may be of a more delicate and complicated nature.

Chimney-pieces are composed of wood, stone, or marble; the last of which ought to be preferred, as figures or profiles are best represented in a pure white.

Plate XXXIII. Fig. 1, 2, 3, and 4. are different designs for chimney-pieces by Palladio and Inigo Jones. Their proportion may be gathered from the designs, which are accurately executed.

## OF THE PROPORTIONS OF ROOMS.

The proportions of rooms depend in a great measure on their use, and actual dimensions: But, with regard to beauty, all figures, from a square to a sesquialteral, may be employed for the plan.

The height of rooms depends on their figure. Flat ceiled ones may be lower than those that are coved. If their plan be a square, their height should not exceed five sixths of the side, nor be less than four fifths; and when it is oblong, their height may be equal to their breadth. But coved rooms, if square, must be as high as broad; and when oblong, they may have their height equal to their breadth, more one fifth, one quarter, or

even one third of the difference between the length and breadth: And galleries should at least be in height one and one third of their breadth, and at most one and a half, or one and three fifths.

The coldness of the British climate is a strong objection to high rooms; so that it is not uncommon to see the most magnificent apartments not above 15, 16, or at most 18 feet high; though the extent of the rooms would require a much more considerable elevation. But, where beauty is aimed at, this practice ought not to be imitated.

When rooms are adorned with an intire order, the entablature should never exceed one sixth of the whole height in flat-ceiled rooms, and one sixth of the upright part in coved ones; and when there are neither columns nor pilasters, but only an entablature, its height should not be above one seventh of these heights. If the rooms be finished with a simple cornice, it should never exceed one fourteenth, nor ever less than one fifteenth part of the above-mentioned height.

## OF CEILINGS.

CEILINGS are either flat, or coved, in different manners. The simplest of the flat kind are those adorned with large compartments, surrounded with one or several mouldings, either let into the ceiling, or projecting beyond its surface: And when the mouldings that form the compartments are enriched, and some of the compartments adorned with well-executed ornaments, such ceilings have a good effect, and are very proper for common dwelling-houses, and all low apartments. Their ornaments and mouldings do not require a bold relief; but, being near the eye, they must be finished with taste and neatness. For higher rooms, a flat ceiling which has the appearance of being composed of various joists framed into each other, and forming compartments of various geometrical figures, should be employed. The sides of the joists forming the compartments are generally adorned with mouldings, and represent either a simple architrave, or an architrave-cornice, according to the size of the compartments and the height of the room.

Coved ceilings are more expensive; but they are likewise more beautiful. They are used promiscuously in large and small rooms, and occupy from one fifth to one third of the height of the room. If the room be low in proportion to its breadth, the cove must likewise be low; and when it is high, the cove must be so likewise: By which means the excess of the height will be rendered less perceptible. But, where the architect is at liberty to proportion the height of the room to its superficial dimensions, the most eligible proportion for the cove is one fourth of the whole height. In parallelogram-figured rooms, the middle of the ceiling is generally formed into a large flat panel. This panel, with the border that surrounds it, may occupy from one half to three fifths of the breadth of the room. The figure of the cove is commonly either a quadrant of a circle or of an ellipse, taking its rise a little above the cornice, and finishing at the border round the great panel in the centre. The border projects somewhat beyond the coves on the outside.

side; and, on the side towards the pannel, it is generally made of a sufficient depth to admit the ornaments of an architrave, or architrave and cornice.

In Britain, circular rooms are not much in use; but they are very beautiful. Their height must be the same with that of square rooms; their ceilings may be flat; but they are handsomer when coved, or of a concave form.

*Arcs doubleaux*, or soffits of arches, when narrow, are ornamented with *guillochis*, or frets; but, when broad, they may be adorned in a different manner.

When the profiles of the room are gilt, the ceilings ought likewise to be gilt. The usual method is to gild all the ornaments, and to leave the grounds white, pearl colour, light blue, or of any other tint proper to set off the gilding to advantage. Painted ceilings, so common in France and Italy, are but little used in Britain.

## OF STAIRS AND STAIR-CASES.

THERE are many kinds of stair-cases; for in some the steps are made straight; in others, winding; in others mixt of both. Of straight stairs, some fly directly forward; others are square; others triangular. Others are called French flights, or winding-stairs, (which in general are called spiral or cockle-stairs); of which some are square; some circular, or round; and some elliptical, or oval; and these again are various; for some wind about a solid, others about an open newel. Stairs mixt of straight and winding steps are also of various kinds; some are called dog-legged; some there are that wind about a solid newel; and others that fly about a square open newel.

Great care ought to be taken in placing of the stair-case in any building; and therefore stair-cases ought to be described, and accounted for justly, when the plan of a building is made. For want of this, sometimes unpardonable errors have been committed: Such as having a little blind stair-case to a large house; or, on the other hand, to have a large spacious stair-case to a little one.

Palladio says, in placing stair-cases, the utmost care ought to be taken, it being difficult to find a place convenient for them, that will not at the same time prejudice the rest of the building. But commonly the stairs are placed in the angle, wing, or middle of the front.

To every stair-case are required three openings.

First, the door leading thereto.

Secondly, the window, or windows, that give light to it;

And, thirdly, the landing.

First, the door leading to a stair-case should be so placed, that most of the building may be seen before you come at the stairs, and in such a manner that it may be easy for any person to find out.

Secondly, for the windows; if there be but one, it must be placed in the middle of the stair-case, that thereby the whole may be enlightened.

Thirdly, the landing of stairs should be large and spacious, for the convenient entering into rooms: In a word, stair-cases should be spacious, light, and easy in ascent.

The height of large steps must never be less than six inches, nor more than seven inches and a half.

The breadth of steps should never be less than 10 inches, nor more than 18 inches; and the length of them not less than three feet, nor more than 12.

Plate XXXIV. Fig. 1. A stair-case of two flights.—*A* shews the manner of drawing the *ramp*, which is to rise equal to the height of the first step of the next flight, and as much as its *knelling*; as is shewn by the *ramp* intersecting the rail of the second flight.

Fig. 2. Shews the straight rail intersecting a circular cap.

Fig. 3. Section of two different hand-rails.

Fig. 4. Shews the manner of dove-tailing the riser into the step.

Plate XXXV. Fig. 1. Represents a stair-case, with flights, and its landing rail.

Fig. 2. Shews the solid part of the step out of which the scroll is formed; where *a* represents the *oversail* of the step; *b*, The thickness of the bracket, with its *mitring to the riser*; and, *c*, The *spring-board*.

Fig. 4. Shews the scale for drawing the scroll of fig. 3.—To perform which, take the distance from 1 to the centre, in fig. 3. and set it from 1 to the centre in fig. 4.; divide that extent into three parts, then set four such parts on the upper side of the scale, and draw the line from 4 to 1; set one foot of your compasses at 4, and strike the circular line; let that be divided into 12 equal parts, and then draw lines from 4 through those divisions to the upright line.

The scale being thus made, draw the scroll of fig. 3. by it in the following manner.

Set one foot of your compasses in 1, and describe a stroke at *c*; take the same distance, and with one-foot in 2, cross the stroke at *c*; then from *c*, turn the part from 1 to 2, and proceed in the same manner; for if the distance were taken in the scale from 1 to the centre, it would strike the circle too flat; and if taken from 2, it would strike the circle too quick.

When this is well understood, there will be little difficulty in drawing the scroll below fig. 2.; which throws itself out farther in proportion than that in fig. 3.; for this will always be the case when the upper line of the scale, which consists of four divisions in fig. 4. is made but with three divisions or less; whence it appears, that the upper line of the scale may be drawn at what length you please, according as you would bring in or keep out the scroll.

Plate XXXVI. Shews the manner of squaring twist-rails.

Fig. 2. Exhibits the pitch-board, to shew what part of the step the twisted part of the rail contains; the three dotted lines drawn from the rail to the pitch-board represent the width of the rail, which is to be kept level. The dotted lines *a* and *b* shew how much half the width of the rail turns up from its first beginning to 3.

Fig. 3. Shews the same pitch-board, with the manner of the rail's turning up. If the sides of the twisted part of the rail be shaped by the rail-mould, so that they direct down to its ground-plan, that is, the upper side

of the rail being first struck by the mould, then apply the mould to the under side, as much back as the level of the pitch-board shews, by being struck on the side of the rail, and then fig. 3. being applied to the outside of the rail, from its first twisting part to 3, will show how much wood is to be taken off.

Fig. 5. Exhibits the square of the rail, with the raking-line of the pitch-board drawn through the middle on the upper side; then draw the depth of the side of the rail parallel to this, and the dotted lines from the diagonal of the rail; these lines shew what quantity of wood will be wanting on the upper and lower sides of the rail. Set your compasses at *c*, and draw the circular stroke from the raking part of the pitch-board to *b*; take the distance *a b*, and transfer it from *a* to *b*, in fig. 7. The several distances thus found may be set at any number of places, ranging with the straight part of the rail; and it then forms the width of the mould for the twisting part of the rail.

Fig. 7. Shews the sweep of the rail. The rail cannot be fixed less than one fourth part from the nosing or front of the step.

The remaining part of the pitch-board may be divided into any number of parts, as here into four; from these divisions draw lines across the pitch-board to the raking-line; then take the distances from the ground-line of the pitch-board to the plan of the rail, and set them perpendicular from the raking-line of the pitch-board; and these divisions, when the rail is in its proper position, lie directly over the divisions on the ground-plan.

In this figure *l*, *m*, and *n*, rise as much above *o* as the dotted line in fig. 5. does above the width of the rail; and they sink as much below *o* as the other dotted line in fig. 5. falls below the width of the rail; the same thicknesses must be glued upon *o*, though the greatest part will come off in squaring. The reason of placing the letters *l*, *m*, and *n*, where they are, is, that they might not obstruct the small divisions of the rail-mould.

Fig. 4. Shews how to find the rail when it takes more than one step. The remaining part of the pitch-board is divided into four parts, as before in fig. 7. and it takes in two such parts of the next step. Draw lines from these divisions to the diagonal of the pitch-board, as in fig. 7.; then take the distance *a b*, and set it from *c* to *d*, and so proceed with the other divisions.

Another way to find the outside of the rail-mould is, to draw all the divisions across the plan of the rail; then take the distance from the ground-line of the pitch-board to 4, transfer it from the diagonal of the pitch-board to 4

on the rail; and so proceed with the other distances. Now, when the rail is put in its proper situation, *c* will be perpendicular to *b*, and all the divisions, as 1, 2, 3, 4, &c. in the rail, will be perpendicular to 1, 2, 3, 4, &c. in the ground-plan.

Fig. 6. Shews the plan of a rail of five steps.

To find the rail.—Set five divisions, as from *e* to *b*, which is the height of the five steps; draw the diagonal *b* to the plan of the rail; then take the distance *e f*, and transfer it from *g* to *b*, and proceed in the same manner with the other seven distances.

To find the width of the rail-mould.—Draw the lines across the plan of the rail, as at *k*; set that distance from the diagonal to *i*; and so proceed with the rest, as was shewn in fig. 4.

Having formed the sides of the rail perpendicular to its ground-plan, and having squared the lower end of the rail, then take a thin lath, and bend it with the rail, as is represented by *m* fig. 1.

This is the readiest method of squaring a solid rail; but if the rail be bent in the thicknesses, the nosing of the steps must be drawn upon a cylinder, or some other solid body of a sufficient width to contain the width of the rail or string-board.

*r*, Represents the depth of the rail, touching the nose of each step. Take a sufficient number of thicknesses of this width, to make the thickness of your rail; glue them all together upon your cylinder or templet, confine them till they are dry, and the rail taken off is ready squared. Proceed in the same manner with the architrave, marked *a*.

## OF ROOFS.

PLATE XXXVII. Fig. 1. Shews the form of a trussed roof, with three ring-poles, that may carry seventy feet, or upwards.

Fig. 2. Exhibits an *M* roof, capable of carrying as great an extent as the former. Indeed both these designs are capable of carrying almost any extent.

Fig. 3. Represents two different sorts of trusses.

Fig. 4. Shews the manner of piecing timber. Sometimes the joint may be extended as far as *a*, with another bolt through it. To the right is shewn a different sort of joint.

Fig. 5. Shews the manner of trussing a girder. If the trusses are full long, with the pieces *b* and *c* you may make them as light as you please.

Fig. 6. Represents the manner of trussing partitions.

## A R C

**Military ARCHITECTURE**, the same with what is otherwise called fortification. See **FORTIFICATION**.

**Naval ARCHITECTURE**, the art of building ships. See **SHIP-BUILDING**.

**Counterfeit ARCHITECTURE**, that which consists of projectures, painted in black or white, or in colours after the manner of marble, which is also called

## A R C

scene-work, in the painting of columns, &c. for the decoration of theatres.

**ARCHITECTURE**, in perspective, a sort of building, the members of which are of different modules, and diminish proportionably to their distance, in order to make the work appear longer to the view than it really is. See **PERSPECTIVE**.

- ARCHITALASSUS**, or admiral-shell, a synonyme of a species of conus. See **CONUS**.
- ARCHITRAVE**, in architecture, that part of a column which lies immediately upon the capital, being the lowest member of the entablature, and so called from its representing the principal beam in timber-buildings. See **ARCHITECTURE**.
- Over a chimney, this member is called the *mantle-piece*; and over doors or windows, the *hyperthyron*.
- ARCHIVOLT**, in architecture, the inner centre of an arch, or a band adorned with mouldings running over the faces of the arch-stones, and bearing upon the impost.
- ARCHIVE**, or **ARCHIVES**, an apartment in which are deposited the records, charters, and other papers of a state or community.
- ARCHMARSHAL**, the grand marshal of the empire, a dignity belonging to the elector of Saxony.
- ARCHON**, in Grecian antiquity, the chief magistrate of Athens, after the abolishing of monarchy; and also, the appellation given to several officers, both civil and religious, under the Greek empire.
- ARCHONTICI**, in church-history, a branch of Valentinians, who maintained, that the world was not created by God, but by angels called *Archontes*.
- ARCHTREASURER**, the great treasurer of the German empire, a dignity belonging to the duke of Brunswick, king of Great Britain.
- ARCIGOVINO**, a province of Dalmatia, bounded by Bosnia, Mantenero, and the Adriatic sea, and called by the Italians *Santa Sabata*.
- ARCILEUTO**, a lute longer and larger than ordinary.
- ARCION**, in botany, an obsolete name of the tussilago.
- ARCO**, a town of the bishopric of Trent in Italy, situated about 16 miles S. W. of Trent, in 10° 46' E. long. and 46° N. lat.
- ARCTAPELIOTES**, a term used to denote a north-east wind.
- ARCTIC**, in astronomy, an epithet given to the north pole; and likewise to a circle of the sphere, parallel to the equator, and twenty-three degrees thirty minutes distant from the north pole. See **ASTRONOMY**, and **GEOGRAPHY**.
- ARCTICA**, in ornithology, a synonyme of a species of larus. See **LARUS**.
- ARCTIUM**, in botany, a genus of the syngenesia polygamia equalis class. The calix is globular, squamous, and hooked at the tops. There are only two species of arctium, viz. the lappa, or burdock, a native of Britain; and the perforata, a native of the Alps, &c. The roots and seeds of the lappa are esteemed to be diuretic and sudorific. Decoctions of the roots have of late been used in rheumatic and gouty disorders.
- ARCTOPHYLAX**, a constellation, otherwise called *Botes*. See **BOOTES**.
- ARCTOPUS**, in botany, a genus of the polygamia diccia class. The umbella of the male is compound; the involucre consists of five leaves; the corolla has five petals; the stamina are five; and two pistils: The umbella of the hermaphrodite is simple; the involucre is divided into four parts, is spinous, large, and contains many male flowers in the disk. There is but one species of arctopus, viz. the echinatus, a native of Ethiopia.
- ARCTOTIS**, in botany, a genus of the syngenesia polygamia necessaria class. The receptacle is bristly; the corona of the pappus is pentaphyllous; and the calix is imbricated, with the scales loose at the top. There are 11 species of arctotis, all of them natives of Ethiopia, or the Cape of Good Hope.
- ARCTURUS**, a fixed star of the first magnitude, in the skirt of *Botes*.
- ARCTUS**, in astronomy, the Greek name of the ursa major and minor. See **ASTRONOMY**, and **URSA**.
- ARCUATION**, in gardening, the raising of trees by layers. See **GARDENING**.
- ARCUATION**, in surgery, denotes a distortion or incurvation of the bones, as happens in the rickets, &c.
- ARCUTIO**, a machine consisting of hoops, used in Florence by nurses, in order to prevent the child from being overlaid. Every nurse is obliged to lay her child in an arcutio, under the pain of excommunication.
- ARCYRIA**, in botany. See **CLATHRUS**.
- ARDASSES**, the coarsest of all the silks in Persia.
- ARDEA**, in ornithology, a genus of the order of grale. The general characters of this order are these: The bill is straight, sharp, long, and somewhat compressed, with a furrow that runs from the nostrils towards the point; the nostrils are linear; and the feet have four toes. This genus consists of 26 species; and under it Linnæus comprehends the grus or crane, the ciconia or stork, and the ardea or heron, of other authors. The first species is the pavonina, or crowned crane, which has an erect bristly crest, with the temples and two wattles naked. The head is black; the crest is yellowish, and tipped with black at the top; the wings are white; and the feathers of the tail black, and of an equal length. It is a native of Africa.
2. The virgo has long white supercilia that hang down backwards. The body is of a bluish ash-colour, and about the size of a stork; the head and prime feathers of the wings towards the points are black and pendulous; the edges are red, and the pupils are ash-coloured; behind the eyes, on both sides, there is a feathery crest, which turns backwards a considerable way, and is of a white colour: The feet are black; the beak is green at the base, yellowish in the middle, and red at the point.
3. The canadensis, or brown and ash-coloured crane of Edwards, is naked and papillous on the forehead; the body is ash-coloured, and the wings are of a reddish or brick-colour.
4. The grus, or common crane of English authors, has a naked papillous crown; the prime feathers of the wings are black; the body is ash-coloured; the prime feathers of the tail are ragged. It is a native of Europe and Africa. It winters in Lithuania, Padolia: *Trans Pontum fugat et terris immittit apricis*. Virg. This bird commonly rests upon one foot.
5. The americana, or hooping crane of Edwards, is a native of America: The crown of the head and temples are naked and papillous; the forehead, nape of the neck, and prime wing-

wing-feathers are black; but the body is white: The under part of the head, as far as the lower chap, is red; the beak is yellowish, and jagged at the point; the feet are red, and the prime tail-feathers white. 6. The Antigone, or greatest Indian crane of Edwards, has a naked head, and papulous collar; the body is ash-coloured, and the prime wing-feathers black. Behind the eyes, there is a small white spot, and the crown of the head is also white. The breast is of a greenish yellow colour; the feet are red, and the prime tail-feathers ash-coloured. It is a native of Asia. 7. The ciconia, or white stork of Ray, has naked eye-balls, and black prime wing-feathers. The skin below the feathers, as also the beak, feet, and claws, are of a blood-colour. It is a native of Europe, Asia, and Africa; but is seldom or never to be met with in Italy. The ciconia feeds upon amphibious animals. It is such an enemy to serpents, that it is reckoned almost a crime to kill a stork. From this favourable treatment, they are seen in Holland and the Low Countries walking unconcerned in the middle of the streets. Storks are birds of passage; they spend the summer in Europe, and disappear all at once, and go off to Egypt, Ethiopia, &c. before winter, and do not return till about the middle of March. 8. The nigra, or black stork of Willoughby, has naked orbits, and the breast and belly are white; the body is black; the feet and orbits are blood-coloured. It inhabits the northern parts of Europe. 9. The nycticorax, or lesser ash-coloured heron of Ray, has a crest, consisting of three frail horizontal white feathers, on the back part of the head; the back is greenish, and the belly yellow. It inhabits the southern parts of Europe. 10. The purpurea, or common heron of English authors, has a crest, with two long green feathers hanging down from the back part of the head; the body is of an olive-colour, and purple below; the head is of a shining green colour. It is a native of the East. 11. The cinerea, or ash-coloured heron, has a smooth black head, a bluish back, white belly, and oblong black spots on the breast. It is a native of Europe. Great numbers of them together build their nests in trees. They are said to fly very high before storms. 12. The major has a black crest depending from the back part of the head, an ash-coloured body, and a black line and belt on the neck and breast. It is a native of Europe. 13. The garzetta is crested behind; the body is white, the beak black, and the feet greenish. It is a native of the East. 14. The cocoi has an ash-coloured crest hanging down from the back part of the head; the whole body is ash-coloured. It is a native of Cayenne. 15. The herodias is crested behind, has a dusky-coloured back, reddish thighs, and the breast speckled with oblong black spots. It is a native of America. 16. The violacea has a white crest; the body is variegated with black and white, and bluish below. It is a native of America. 17. The cœrulea has a crest behind, and a bluish body. It is a native of N. America. 18. The hudsonia has a black crest on the top of the head; the body is dusky-coloured, and white below. It frequents Hudson's Bay. 19. The striata has a small crest on the back-part of the head; the back is of a hoary grey colour, and ash-coloured be-

low; the long wing feathers are tipped with white. It is a native of Surinam. 20. The virefcens has a small crest on the back part of the head, a green shining back, and dusky-coloured breast. It is a native of America. 21. The itellaris, or bittern, has a smooth head; it is variegated through the whole body with dark-coloured spots of different figures and sizes. It is a native of Europe, and inhabits chiefly the fen-countries. It is met with skulking among the reeds and sedge, and its usual posture is with the head and neck erect, and the beak pointed directly upwards. It will suffer persons to come very near it without rising; and has been known to strike at boys and at sportsmen, when wounded and unable to make its escape. It flies principally about the dusk of the evening, and then rises in a very singular manner, by a spiral ascent, till it is quite out of sight. It makes a very strange noise when it is among the reeds, and a different and very singular one as it rises on the wing in the night. 22. The grisea has a smooth dusky head; the body is tawny above, and white below; and the prime wing-feathers have a black spot at the points. It is a native of the East. 23. The brasiliensis has a smooth head; the body is blackish, with yellow spots; and the prime feathers of the wings and tail are greenish. It is a native of America. 24. The alba has a smooth head, a white body, a yellow beak, and black feet. It is a native of Europe. 25. The equinoctialis has a smooth head, and a white body. It is a native of America. 26. The minuta has a smooth head, a dark-coloured body, and a yellowish belly. It is about the size of the turdus, and is a native of Switzerland and the East.

ARDENBURG, a fortified town of Dutch Flanders, situated about 12 miles N. E. of Bruges, in  $3^{\circ} 20'$  E. long. and  $51^{\circ} 15'$  N. lat.

ARDENNE, a forest in Germany, lying between Thionville and Liège.

ARDEVIL, or ARDEML, the burying-place of some of the ancient kings of Persia, situated in  $64^{\circ} 20'$  E. long. and  $36^{\circ}$  N. lat.

ARDMAGH, in geography. See ARMAGH.

ARDOR-VENTRICULI, the same with the heart-bum.

ARDRES, a town of the province of Picardy in France, situated about 10 miles south of Calais, in  $2^{\circ}$  E. long. and  $50^{\circ} 45'$  N. lat.

ARDRES, or ARDRA, is also the capital of a country on the slave-coast of Guinea in Africa, situated near the river Lagos, in  $4^{\circ}$  E. long. and  $5^{\circ}$  N. lat.

ARE, in music. See ALAMIRE.

AREA, in geometry, denotes the superficial content of any figure. See GEOMETRY.

AREA, among physicians, the same with alopecia. See ALOPECIA.

AREION, a town of Guinea in Africa, situated at the mouth of the river Formosa, in  $5^{\circ}$  E. long. and  $5^{\circ}$  N. lat.

ARECA, in botany, a genus of the order of palmæ pennatifolix. The male has no calix, but three petals, and nine stamens; the female has no calix; the corolla

corolla has three petals, and the calix is imbricated. There is only one species, *viz.* the cathecu, a native of India.

**AREMBERG**, a city of Germany, situated about 25 miles south of Cologne, in  $6^{\circ} 25'$  E. long. and  $50^{\circ} 30'$  N. lat.

**ARENA**, in natural history. See **SAND**.

**ARENA**, in Roman antiquity, a place where the gladiators fought; so called from its being always strewn with sand, to conceal from the view of the people the blood spilt in the combat.

**ARENARIA**, or chickweed, in botany, a genus of the decandria trigynia class. The calix has five open leaves; the petals are five, and entire; the capsule is unifoliar, and contains many seeds. There are 17 species of arenaria, only 7 of which are natives of Britain, *viz.* the peploides, or sea-chickweed; the trinervia, or plantain-leaved chickweed; the serpyllifolia, or least chickweed; the faxatilis, or mountain-chickweed; the laricifolia, or larch-leaved chickweed; the tenuifolia, or fine-leaved chickweed; and the rubra, or purple-flowered chickweed.

**ARENATION**, a kind of dry bath, wherein the patient sits with his bare feet on hot sand.

**AREOLA**, among anatomists, the coloured circle surrounding the nipple of the breast.

**AREOPAGUS**, a sovereign tribunal at Athens, famous for the justice and impartiality of its decrees, to which the gods themselves are said to have submitted their differences.

Authors are not agreed about the number of judges that composed this august court; some reckon thirty-one; others, fifty-one; and others, five hundred. In effect, their number seems not to have been fixed, but to have been more or less in different years. At first, this tribunal consisted only of nine persons, who had all discharged the office of Archons, had acquitted themselves with honour in that trust, and had likewise given an account of their administration before the Logistæ, and undergone a rigorous examination. Their salary was equal, and paid out of the treasury of the republic; they had three oboli for each cause. The Areopagites were judges for life; they never sat in judgment but in the open air, and that in the nighttime, to the intent that their minds might be the more present and attentive, and that no object of pity or aversion might make any impression on them; and all the pleadings before them were to be in the simplest and most naked terms. At first they took cognizance of criminal causes only, but in course of time their jurisdiction became of great extent.

Mr Spon, who examined the antiquities of that illustrious city, found some remains of the Areopagus still existing in the middle of the temple of Theseus, which was heretofore in the middle of the city, but is now without the walls. The foundation of the Areopagus is a semicircle, with an esplanade of 140 paces round it, which properly made the hall of the Areopagus. There is a tribunal cut in the middle of a rock, with seats on each side of it, where the Areopagites sat exposed to the open air. It is very uncertain

when this court was instituted, since Demosthenes himself is at a loss upon the point: Some think that it was instituted by Solon; but others carry it much higher, and assert it to have been established by Cecrops, about the time that Aaron died.

**AREQUIPPA**, a city of Peru, in S. America, situated in  $73^{\circ}$  W. lon. and  $17^{\circ}$  S. lat.

**AREHA**, in botany, a genus of the pentandria monogynia class. The corolla is divided into five parts; the tube of the corolla is ovated; and the capsule is globular, and consists of but one cell. There is only one species, *viz.* the alpina.

**ARETHUSA**, in botany, a genus of the gynandria diandria class. The generic character is taken from the nectarium, which is tubular, situated at the bottom of the corolla; and the inferior labium of it is fixed to the stylos. There are four species of the arethusa, all natives of America, except the capensis, which is only found at the Cape of Good Hope.

**ARGEMONE**, in botany, a genus of the polyandria monogynia class. The corolla consists of six petals; the calix of three leaves; and the capsule is semi-valved. There are three species of argemone, none of which are natives of Britain. They are all a kind of poppies.

**AREZZO**, a city of Tuscany in Italy, situated in  $13^{\circ} 15'$  E. long. and  $43^{\circ} 15'$  N. lat.

**ARGEA**, or **ARGEI**, in Roman antiquity, thirty human figures, made of rushes, thrown annually by the priests or vestals into the Tiber, on the day of the ides of May.

**ARGENT**, in heraldry, the white colour in the coats of gentlemen, knights, and barons. See **HERALDRY**.

**ARGENTAN**, a city of France, in the Lower Normandy, upon the Orne, in  $25^{\circ}$  E. long. and  $48^{\circ} 34'$  lat.

**ARGENTARIA creta**, pure white earth, found in Prussia, and much esteemed for cleaning plate.

**ARGENTIERE**, a small island in the Archipelago, situated about 60 miles east of Morea, in  $25^{\circ}$  E. long. and  $37^{\circ}$  N. lat.

**ARGENTIERE** is also the name of a small town of Languedoc in France, in  $4^{\circ}$  E. long. and  $44^{\circ} 30'$  N. lat.

**ARGENTINA**, in ichthyology, a genus of fishes belonging to the order of abdominales. The generic characters are these: The teeth are in the tongue as well as the jaws; the branchiostegæ membrane has eight radii or rays; the anus is near the tail; and the belly-fins consist of many rays. There are two species of argentina, *viz.* 1. The sphyryna has 15 rays in the fin at the anus; the air-bladder of this species is conical on both sides, and shines like silver: According to Mr Ray, false pearls are sometimes made of it. 2. The carolina has likewise 15 rays in the fin near the anus; the tail is forked, and the lateral lines are straight. It inhabits the fresh waters of Carolina.

**ARGENTON**, a town of France, situated about forty-five miles south-west of Bourges, in  $1^{\circ} 35'$  E. long.  $46^{\circ} 40'$  N. lat.

**ARGENTUM**. See **SILVER**.

**ARGILLA**,

- ARGILLA**, clay, in natural history. See **CLAY**.
- ARGO**, in astronomy, a constellation of fixed stars in the southern hemisphere; whose number of stars, in Ptolemy's catalogue, is eight; in Tycho's, eleven; and in Mr Flamsteed's, twenty-five. See **ASTRONOMY**.
- ARGONAUTA**, the name of a genus of shell-fish belonging to the order of vermes testacea. The shell consists of one spiral involuted valve. There are two species of argonauta, *viz.* The argo with a subdentate carina, which is found in the Mediterranean and Indian oceans. This is the famous nautilus of other authors. It lies on the surface of the water, and extends an exceeding thin membrane, which it uses in some measure both as sails and oars; and in this manner it swims from one place to another. 2. The cymbium with a blunt plaited carina. This species is very small, and is found in the Mediterranean.
- ARGONAUTS**, in Grecian antiquity, a company of illustrious Greeks, who embarked along with Jason, in the ship Argo, on an expedition to Colchis, with a design to obtain the golden fleece.
- ARGOS**, a sea-port town of European Turkey, in the Morea, situated on the bay of Napoli de Romania, in 23° E. long. and 37° 30' N. lat.
- ARGUIN**, an island on the coast of Negritia. It lies on the Atlantic Ocean, about 20' N. lat.
- ARGUMENT**, in rhetoric and logic, an inference drawn from premises, the truth of which is indisputable, or at least highly probable. See **LOGIC**.
- ARGUMENT**, in astronomy, denotes a known arch, by means of which we seek another one unknown.
- ARGUMENT**, in matters of literature, denotes also the abridgment or heads of a book, history, comedy, chapter, &c. See **SYLLABUS**.
- ARGUN**, a river of Tartary in Asia, serving as a boundary between the Chinese and Russian empires.
- ARGUN** is also a city of Asiatic Tartary, situated on the above river, in 104° E. long. and 51° 30' N. lat.
- ARGUS-SHELL**, a species of porcelain-shell, beautifully variegated with spots, resembling in some measure those in a peacock's tail.
- ARGYLESHIRE**, a county of Scotland, lying westward of Glasgow, and comprehending the countries of Lorn, Cowal, Knapdale, Kintyre, together with the islands Mull, Jura, Isha, &c. It gives the title of duke to the noble family of Campbell.
- ARGYROPOEIA**, among alchemists, a pretended art of transmuting or changing other metals into silver.
- ARHUSEN**, a city of Jutland in Denmark, situated at the entrance of the Baltic sea, in 10° 20' E. long. and 56° N. lat.
- ARIANO**, a town of the kingdom of Naples, and province of Principata, situated about 15 miles east of Benevento, in 15° 35' E. long. and 41° 16' N. lat.
- ARIANS**, in church-history, a sect of ancient heretics, who denied the three persons in the Holy Trinity to be of the same essence, and affirmed Christ to be a creature.
- ARICA**, a sea-port town of Peru in South America, situated on the Pacific Ocean, in 70° 20' W. long. and 18° 20' S. lat.
- ARIDAS**, a kind of taffety, manufactured in the E. Indies, from a shining thread which is got from certain herbs, whence they are styled *aridas of herbs*.
- ARIDULLAM**, in natural history, a kind of zarnich found in the E. Indies. See **ZARNICH**.
- ARIES**, in zoology. See **OVIS**.
- ARIES**, in astronomy, a constellation of fixed stars, drawn on the globe, in the figure of a ram. It is the first of the twelve signs of the zodiac, from which a twelfth part of the ecliptic takes its denomination. See **ASTRONOMY**, *Of the fixed stars*.
- ARISARUM**, in botany. See **ARUM**.
- ARISH**, a Persian long measure, containing about 38 English inches.
- ARISI**, the Indian name for the plant which produces the rice. See **ORYZA**.
- ARISTA**, or **AWN**, among botanists, a long needle-like beard, which stands out from the husk of a grain of corn, grass, &c.
- ARISTIDA**, in botany, a genus of the triandria digynia class. The calix has a double valve; the corolla has one valve, and three awns at the points. There are 3 species of aristida, *viz.* the adscensionis, a native of the island of Ascension; the Americana, a native of Jamaica; and the plumosa, a native of America.
- ARISTOCRACY**, a form of government where the supreme power is vested in the principal persons of the state. See **GOVERNMENT**.
- ARISTOLOCHIA**, in botany, a genus of the gynandria hexandria class. It has no calix; the corolla consists of one entire petal; and the capsule, which is below the flower, has 6 cells. There are 21 species of aristolochia, none of which are natives of Britain.
- ARISTOLUS**, an obsolete name of a species of clupea. See **CLUPEA**.

## A R I T H M E T I C K.

**ARITHMETICK** is a science which explains the properties of numbers, and shews the method or art of computing them.

Vol. I. No. 16.

We have very little intelligence about the origin and invention of arithmetick; but probably it must have taken its rise from the introduction of commerce, and consequently

quently be of Tyrian invention. From Asia it passed into Egypt, where it was greatly cultivated. From thence it was transmitted to the Greeks, who conveyed it to the Romans with additional improvements. But, from some treatises of the ancients remaining on this subject, it appears that their arithmetick was much inferior to that of the moderns.

NUMBER, which is the object of arithmetic, is that which answers directly to the question, How many? and is either an unit, or some part or parts of an unit, or a multitude of units.

To a person having the idea of number in his mind, the following questions naturally occur, *viz.* 1. How is such a number to be expressed or written? Hence we have Notation. 2. What is the sum of two or more numbers? Hence Addition. 3. What is the difference of two given numbers? Hence Subtraction. 4. What will be the result or product of a given number repeated or taken a certain number of times? Hence Multiplication. 5. How often is one given number contained in another? Hence Division.

These five, *viz.* Notation, Addition, Subtraction, Multiplication, and Division, are the chief parts, or rather the whole of arithmetic; as every arithmetical operation requires the use of some of them, and nothing but a proper mixture of them is necessary in any operation whatever; and, by an Arabic term, these are called the *algorithm*.

## CHAP. I. NOTATION.

NOTATION is that part of arithmetic which explains the method of writing down, by characters or symbols, any number expressed in words; as also the way of reading or expressing, in words, any number given in characters or symbols. But the first of these is properly notation, and the last is more usually called *numeration*.

The things then proper to be comprised in this chapter are, 1. The figural notation. 2. Numeration, or the way of reading numbers. 3. Descriptions of the kinds or species of numbers.

### I. Figural Notation.

AN unit, or unity, is that number by which any thing is called one of its kind. It is the first number; and if to it be added another unit, we shall have another number called *two*; and if to this last another unit be added, we shall have another number called *three*; and thus, by the continual addition of an unit, there will arise an infinite increase of numbers. On the other hand, if from any part be subtracted, and again from that part another part be taken away, and this be done continually, we shall have an infinite decrease of numbers. But though number, with respect to increase and decrease, be infinite, and knows no limits; yet ten figures, variously combined or repeated, are found sufficient to express any number whatsoever. These, with

the method of notation by them, were originally invented by some of the eastern nations, probably the Indians; afterwards improved by the Arabians; and at last brought over to Europe, particularly into Britain, betwixt the tenth and twelfth century. From the ten fingers of the hands, on which it hath been usual to compute numbers, figures were called *digits*. Their form, order, and value, are as follows:

1 One, an unit, or unity, 2 two, 3 three, 4 four, 5 five, 6 six, 7 seven, 8 eight, 9 nine, 0 cipher, nought, null, or nothing. Of these, the first nine, in contradiction to the cipher, are called *significant figures*.

The value of the figures now assigned is called their *simple value*, as being that which they have in themselves, or when they stand alone. But when two or more figures are joined as in a line, the figures then receive also a local value from the place in which they stand, reckoning the order of places from the right-hand towards the left, thus,

Twelfth place.	Eleventh place.	Tenth place.	Ninth place.	Eighth place.	Seventh place.	Sixth place.	Fifth place.	Fourth place.	Third place.	Second place.	First place.
7	7	7	7	7	7	7	7	7	7	7	7

A figure standing in the first place has only its simple value; but a figure in the second place has ten times the value it would have in the first place; and a figure in the third place has ten times the value it would have in the second place; and universally a figure in any superior place has ten times the value it would have in the next inferior place.

Hence it is plain, that a figure in the first place simply signifies so many units as the figure expresses; but the same figure advanced to the second place will signify so many tens; in the third place, it will signify so many hundreds; in the fourth place, so many thousands; in the fifth place, so many ten thousands; in the sixth place, so many hundred thousands; and in the seventh place, so many millions, &c. Thus, 7 in the first place, will denote seven units; in the second place, seven tens, or seventy; in the third place, seven hundred; in the fourth place, seven thousand, &c.

Every three places, reckoning from the right-hand, make a half period; and the right-hand figures of these half-periods are termed *units* and *thousands* by turns; the middle figure is always tens, and the left-hand figure always hundreds.

Two half-periods, or six places, make a full period; and the periods, reckoning from the right-hand towards the left, are titled as follows, *viz.* the first is the period of *units*; the second, that of *millions*; the third is titled *bimillions*, or *billions*; the fourth, *trimillions*, or *trillions*; the fifth, *quadrillions*; the sixth, *quintillions*; the seventh *sextillions*; the eighth, *septillions*; the ninth, *octillions*; the tenth, *nonillions*, &c.

Half-periods are usually distinguished from one another by a comma, and full periods by a point or colon; as in the following

TABLE.

T A B L E.

3d Period.				2d Period.				1st Period.									
Billions.				Millions.				Units.									
Hundred thousands.	Ten thousands.	Thousands.	Hundreds.	Ten thousands.	Thousands.	Hundreds.	Tens.	Units.	Hundred thousands.	Ten thousands.	Thousands.	Hundreds.	Tens.	Units.			
8	1	3	7	0	0	2	3	7	8	9	4	6	7	8	0	4	0

The table may be expressed in a more concise form thus,

3.				2.				1. Per.									
Billions.				Millions.				Units.									
8	1	3	7	0	0	2	3	7	8	9	4	6	7	8	0	4	0

From the table it is obvious, that though a cipher signify nothing of itself, yet it serves to supply vacant places, and raises the value of significant figures on its left hand, by throwing them into higher places. Thus, in the first period, by a cipher's filling the place of units, the figure 4 is thrown into the place of tens, and signifies forty. But a cipher does not change the value of a significant figure on its right-hand. Thus, 07, or 007, is the same as 7.

II. Numeration.

NOTATION and numeration are so nearly allied, that he who understands the one cannot fail soon to acquire the other. The method of reading numbers, expressed by figures, may be easily learned from the table of the figural notation; in which observe the following

**RULE.** Beginning at the left hand, and reading toward the right; to the simple value of every figure join the name of its place, and conclude each period by expressing its title, every where omitting the ciphers.

III. Descriptions of the kinds or species of numbers.

1. An *integer*, or *whole number*, is an unit; or any multitude of units; as 1, 7, 48, 100, 125.
2. A *fraction*, or *broken number*, is any part or parts of an unit; and is expressed by two numbers, which are separated from one another by a line drawn betwixt them; the under number being called the *denominator*, and the upper one the *numerator*, of the fraction; as  $\frac{1}{2}$ ,  $\frac{3}{4}$ ,  $\frac{7}{8}$ .
3. A *mixt number* is an integer with a fraction joined to it; as  $4\frac{1}{2}$ ,  $7\frac{3}{4}$ ,  $48\frac{1}{2}$ .
4. A number is said to *measure* another number, when it is contained in that other number a certain number of times, or when it divides that other number without any remainder. Thus, 3 measures 6, 9, or 12.
5. An *even number* is that which is measured by 2, or which 2 divides without any remainder; as 2, 4, 6, 8, 10, 12.

6. An *odd number* is that which 2 does not measure, or which cannot be divided by 2, without a remainder; as 1, 3, 5, 7, 9, 11, 13.

7. A *prime number* is that which unity, or itself, only measures; as 3, 5, 7, 11, 13, 17, 19.

8. A *composite number* is that which is measured by some other number than itself, or unity; as 12, which is measured by 2, 3, 4, or 6.

9. Numbers are called *prime* to one another, when unity only measures them. Thus 13 and 36 are prime to one another; for no number, except unity, measures both.

10. Numbers are called *composite* to one another, when some number, besides unity, measures them. Thus 12 and 18 are composite to one another; for 3 or 6 measures both of them.

11. A number which measures another is called an *aliquot part* of that other. Thus 6 is an aliquot part of 18, and 3 of 12, and 5 of 20.

12. The number measured, or which contains the aliquot part a certain number of times, is called a *multiple* of that *aliquot part*. Thus 18 is a multiple of 6, and 12 of 3.

13. A number is called an *aliquant part* of another, when it does not divide that other without a remainder. Thus 7 is an aliquant part of 24.

14. Two, three, or more numbers, which, multiplied together, produce another number, are called the *component parts* of the number produced. Thus 3 and 4, 2 and 6, are the component parts of 12; and 2, 3, and 4, are the component parts of 24.

15. The product of a number multiplied into itself is called the *square*, or *second power*, of that number; and the number itself is in this case called the *root*. And if the square be multiplied into the root, the product is called the *cube*, or *third power*, of that number. And if the cube be multiplied into the root, the product thence arising is called the *biquadrate*, or *fourth power*, &c.

CHAP. II. ADDITION.

ADDITION is the collecting of two or more numbers into one sum or total.

I. Addition of Integers.

**RULE I.** Set figures of like places under other, viz. units under units, tens under tens, &c.

II. Beginning at the lowest place, set down the right-hand figures of the sum of every column, and carry the rest as so many units to the next superior place.

**EXAMP. I.** Because similar or like things only can be added, place the numbers as directed in Rule I. viz. units under units, tens under tens, &c. as in the margin. Then beginning at the lowest place, viz. that of units; say, 4 units and 3 units make 7 units, which set below in the place of units; then 3 tens and 5 tens make 8 tens, which set below in the place of tens; then 2 hundreds and 4 hundreds make 6 hundreds, which set below in the place of

453  
234  
687

of hundreds, and you will find the sum or total to be 687.

EXAMP. II. Having placed the numbers, units under units, &c. as in the margin, say 2 and 1 make 3, and 3 make 6, and 4 make 10; which being just 1 ten, and nothing over, set the right-hand figure 0 in the place of units; and because ten in any lower place makes but one in the next superior place, carry 1 ten, as directed in Rule II. — saying, 1 ten, collected out of the units, and 6 tens, make 7 tens, and 4 make 11, and 0 makes but still 11, and 7 make 18; here again set down the right-hand figure 8, in the place of tens, and carry the remaining figure 1, being 1 hundred, to the next place, viz. that of hundreds; and having in like manner added up this column, the amount is 31; set down the right-hand figure 1 in the place of hundreds, and carry the remaining figure 3 to the next place or column; which being also added, amounts to 24; set the right-hand figure 4 below, in its proper place, and the remaining figure 2, which belongs to the next place, set on the left hand, there being no figure in the next place to which it can be carried. So the sum or total is 24180.

II. Addition of the parts of integers, such as shillings, pence, farthings, ounces, &c.

RULE I. Place like parts under other; viz. farthings under farthings, pence under pence, &c.

II. Begin at the lowest of the parts, and carry according to the value of an unit of the next superior denomination; viz. for every four in the sum of farthings carry 1 to the pence, and for every twelve in the pence carry 1 to the shillings, &c.

III. If you carry at 20, 30, 40, 60, or any just number of tens, as in adding shillings, degrees, poles, minutes, seconds, &c. proceed with the column of units as in addition of integers, and from the sum of the column of tens carry 1 for every two, or 1 for every three, &c. according as 20 or two tens, thirty or three tens, &c. make an unit of the next superior denomination. The reason appears plain in the following operations.

I. M O N E Y.

T A B L E.

4 farthings	} make	{	1 penny
12 pence			1 shilling
20 shillings			1 pound

Marked thus.

l.	s.	d.	f. or q.
1	= 20	= 240	= 960

Note, The above mark signifies equal to.

l. is put for *libra*, a pound; d. for *denarius*, a penny; and q. for *quadrans*, a fourth-part; but f is now the more usual mark for farthings.

That the learner may proceed in addition of money with the greater ease, it will be proper he get the following table by heart.

MONEY-TABLE.

f.	d.	s.	s.	l.
4 = 1	12 = 1	20 = 1	20 = 1	
8 = 2	24 = 2	40 = 2	40 = 2	
12 = 3	36 = 3	60 = 3	60 = 3	
16 = 4	48 = 4	80 = 4	80 = 4	
20 = 5	60 = 5	100 = 5	100 = 5	
24 = 6	72 = 6	120 = 6	120 = 6	
28 = 7	84 = 7	140 = 7	140 = 7	
32 = 8	96 = 8	160 = 8	160 = 8	
36 = 9	108 = 9	180 = 9	180 = 9	
40 = 10	120 = 10	200 = 10	200 = 10	

EXAMP. Having, according to Rule I. placed like parts under other, viz. farthings under farthings, pence under pence, &c. and in each of these denominations, units under units, tens under tens, as in the margin, begin with the lowest of the parts, viz. the farthings; and say, 2 farthings and 1 farthing make 3 farthings, and 2 make 5, and 3 make 8; which, by the money-table, is 2 fours, or 2 pence, and nothing over; wherefore place 0 below in the place of farthings, or rather leave that place blank, and carry 2 pence to the place of pence, as directed in Rule II, saying, 2 pence, collected out of the farthings, and 9 make 11, and 8 make 19, and 1 (passing the 0) make 20; to this sum of units add the tens. Thus, 20 and 1 ten make 30, and 1 ten more make 40 pence; which, by the money-table, is 3 twelves, or 3 shillings, and 4 pence over; these 4 pence set below in the place of pence, and carry 3 shillings to the place of shillings. Thus, 3 shillings, collected out of the pence, and 1 shilling make 4, and 7 make 11, and 9 make 20, and 8 make 28; and because in shillings we carry at a just number of tens, viz. at 20, set the right-hand figure 8 below in the place of units, as directed in Rule III. and carry the 2 tens to the place of tens. Thus 2 tens collected out of the units, and 1 ten make 3 tens, and 1 make 4, and 1 make 5 tens, or 2 twenties, and 1 ten over; and because 2 tens, or 1 twenty, make an unit in the next place, viz. that of pounds, set the 1 ten below in the place of tens, and carry the 2 twenty-shillings, or 2 pounds, to the place of pounds; which, being integers, are added as taught in addition of integers.

It is usual to subjoin the farthings to the pence by way of fraction, as in the margin, where the former example is transcribed in this form for the learner's instruction; in which  $\frac{1}{2}$  denotes one farthing,  $\frac{1}{4}$  two farthings, and  $\frac{3}{4}$  three farthings.

l.	s.	d.
74	18	11 $\frac{3}{4}$
96	9	19 $\frac{1}{2}$
58	17	8 $\frac{1}{2}$
63	11	9 $\frac{3}{4}$

In adding up large accounts, some dot at 60 in the pence, and for every dot carry 5 to the shillings; and in adding the shillings they dot likewise at 60, and for every dot carry 3 to the pounds. Others chuse to divide them

them into parcels, then cast up each parcel separately, and afterwards add the sums of the several parcels into one total.

2. AVOIRDUPOIS WEIGHT.

T A B L E.

16 drams	}	make	1 ounce.
16 ounces			1 pound.
28 pounds			1 quarter.
4 quarters			1 hundred.
20 hundreds			1 tun.

Marked thus.

T.	C.	Q.	lb.	oz.	dr.
1 = 20	80 = 2240	35840 = 573440			
1 = 4	112 = 1792	28672			

By Avoirdupois weight are weighed butter, cheese, rosin, wax, pitch, tar, tallow, soap, salt, hemp, flax, beef, brans, iron, steel, tin, copper, lead, allum, and all grocery wares.

Note, 19½ C. of lead make a fodder.

In adding the following example, begin with the ounces, and say, 15 and 10 make 25; which being above 16, dot, and carry away the excess 9, saying, 9 of excess and 6 make 15, and 8 make 23; where again dot, and carry away the excess 7, saying, 7 and 2 is 9, and 1 ten on the left is 19; where dot, and proceed with the excess 3, saying, 3 and 4 is 7, and 1 ten on the left is 17; where dot, and carry the excess 1, saying, 1 and 5 is 6, and 1 ten on the left is 16; where again dot, and there being no excess, you have nothing to set down.

(10)	(20)	(4)	(28)	(16)
T.	C.	Q.	lb.	oz.
74	19	3	27	15.
85	17	2	24.	14.
68	13	1	20	12.
52	18	3	19.	8.
50	10	2	18.	6
48	9	3	16	10.
97	5	1	3	15

478 15 3 20

Proceed now to add the pounds; saying 5 carried from the ounces, viz. one for every dot, and 3 make 8, and 6 make 14, and 1 ten on the left is 24, and 8 make 32; which being above 28, dot, and go on, saying, 4 of excess and 1 ten on the left is 14, and 9 is 23, and 1 ten on the left is 33; where again dot, and go on, saying, 5 of excess and 20 is 25, and 4 is 29; where dot, and proceed, saying, 1 of excess and 2 tens on the left make 21, and 7 make 28; where dot, and the 2 tens, or 20, on the left, set below.

We should now proceed to add the quarters; saying, 4 carried from the pounds and 1 make 5, &c.; but as you carry here 1 for every four, the quarters are added exactly as the farthings in addition of money. In the hundreds you carry at 20; which, therefore, are added as shillings. The tuns are integers; and added accordingly.

Vota. I. No. 16.

III. Proof of Addition.

ADDITION may be proved several ways.

1. Merchants and men of business usually add each column first upwards, and then downwards, and, upon finding the sum to be the same both ways, they conclude the work to be right; and this is all the proof that their time, or the hurry of business, will admit of.

2. It is a common practice in schools, to prove the work by a second summing without the top-line; and if thus sum added to the top-line makes the first total, the work is supposed to be right; as in the following example.

	L.	s.	d.
Top-line	748	15	10½
	674	13	11½
	835	17	9½
	90	18	8
Total	2350	6	3½
Total without the top-line	1601	10	4½
Proof	2350	6	3½

Note, This mark + signifies added to.

3. Addition is also proved by casting out the 9's; for if the excess above the 9's in the total be the same as the excess in the items, the work may be presumed right. Thus, to prove the example in the margin, begin with the items, and say, 3+4=7, and 7+7=14=1+4=5; with this 5 pass to the next item, and say, 5+6=11=1+1=2, and 2+8=10=1, and-1+4=5; which 5 being the excess of the items, place at the top of the crosses, and proceed to cast the 9's out of the total, saying, 1+3=4, and 4+1=5; which 5, being the excess of the total, place at the foot of the crosses; and because it is the same with the figure at the top, you conclude the work to be right.

If the items are of different denominations; as pounds, shillings, pence, &c.; you must begin with the highest denomination; and, after casting out the 9's, reduce the excess to the next inferior denomination; and then casting out the 9's, reduce the excess to the next inferior denomination; proceed in like manner with this, and all the other lower denominations, placing the last excess at the top of the crosses; then, in the same manner, cast the 9's out of the total, placing the excess at the foot of the crosses; and if the figure at the foot and top be the same, the work may be presumed right.

If any operation, whether in addition, subtraction, multiplication, or division, be right, this kind of proof will always show it to be so; but if an operation be wrong, by a figure or figures being misplaced, or by miscounting 9, or any just number of 9's, this kind of proof will not discover the mistake.

## CHAP. III. SUBTRACTION.

SUBTRACTION is the taking a lesser number from a greater, in order to discover their difference, or the remainder.

## I. Subtraction of Integers.

RULE I. Set figures of like place under other, viz. units under units, tens under tens, &c. and the greater of the given numbers uppermost.

II. Beginning at the place of units, take the lower figures from those above, borrowing and paying ten, as need requires, and write the remainders below.

EXAMP. I. Because similar or like things only can

867 major, or minuend.

562 minor, or subtrahend.

305 difference, or remainder.

Then, beginning at the place of units, say, 2 units from 7 units, and 5 units remain; which set below in the place of units; then 6 tens from 6 tens, and nothing remains; wherefore set 0 below, in the place of tens; then 5 hundred from 8 hundred, and 3 hundred remain; which set below, in the place of hundreds; and you will find the total difference or remainder to be 305.

II. Having placed the numbers, units under units, &c. as in the margin, say, 5 units from 2 units, you cannot, but, because an unit in the next superior place makes ten in this place, you must borrow 1, viz. 1 ten, from the said next place, as directed in Rule II.; which 1 ten being added to 2 makes 12; then say, 5 from 12, and 7 remains; which 7 set below in the place of units; then proceed, and pay the unit borrowed, either by effacing 3, the next figure in the major, to be only 2, or, which is more usual, and the same in effect, by adding 1 to the next figure in the minor, thus, 1 that you borrowed and 8 make 9, from 3 you cannot, but, borrowing as before, you say, 9 from 13 and 4 remains; which 4 set below: proceed, and say, 1 that you borrowed and 7 make 8, from 4 you cannot, but from 14, and 6 remains; which 6 set below: go on, and say, 1 borrowed and 2 make 3, from 7, and 4 remains; which 4 set below. So the difference or remainder is 4647.

## II. Subtraction of the parts of Integers; such as Shillings, Pence, Farthings, Ounces, &amp;c.

RULE I. Place like parts under other, viz. farthings under farthings, pence under pence, &c. and the greater of the given numbers uppermost.

II. Begin at the lowest of the parts, and borrow according to the value of an unit of the next superior denomination; viz. in farthings borrow 4, in pence borrow 12, &c. as the tables of money and weights direct.

III. If you borrow 20, 30, 40, 60, or any just number of tens, as in subtracting shillings, degrees, poles, minutes, seconds, &c. proceed with the right-hand column, as in subtraction of integers; and then subtract

your tens, borrowing, if need be, the number of tens contained in an unit of the next superior denomination. The reason appears plain in the following operations.

## 1. M O N E Y.

	(10)	(20)	(12)	(4)
Rule I. placed like parts	L.	s.	d.	f.
under other, viz. farthings under farthings,	73	15	10	2 major.
pence under pence, &c.	48	12	6	2 minor.
and in each of these denominations, units under	25	3	4	remainder.

units, tens under tens, and the greater of the given numbers uppermost, as in the margin, begin with the farthings, and say, 2 from 2, and 0 remains; and proceed to the pence, saying, 6 from 10 and 4 remains; which 4 set down, and go on to the shillings, saying 2 from 5 and 3 remains, and 1 from 1, and 0 remains; or you may say at once, 12 from 15, and 3 remains; which 3 being set down, proceed to the pounds, which are integers, and subtracted as such.

In this example say, 3 farthings from 1 farthing you cannot, but as directed in

Rule II. you say, 3 from	(10)	(20)	(12)
4, the number of farthings	L.	s.	d.
in 1 penny borrowed, and	708	14	6½ major.
1 remains; which 1 added	170	17	10½ minor.
to 1 in the major gives 2	429	16	7½ remainder.

farthings for a remainder; which set down, and proceed to the pence, saying, 1 penny borrowed and 10 make 11, which from 6 you cannot, but from 12, the number of pence in 1 shilling, and 1 remains; which 1 added to 6 in the major gives a remainder of 7; which set down, and go on to the shillings; and because in subtracting shillings we borrow a just number of tens, viz. 2 tens, or 20, work as directed in Rule III.; and in the right-hand column say, 1 borrowed and 7 make 8, which from 4 you cannot, but from 14, and 6 remains; which being set down, go on to the left-hand column, and say, 1 borrowed and 1 make 2, which from 1 you cannot, but from 2, the number of tens in 1 pound, and nothing remains, which 0 added to 1 in the major gives 1 for a remainder; which set down, and proceed to the pounds, saying, 1 borrowed and 8 make 9, which from 8 you cannot, but from 18, &c.

Note. Some add the number borrowed to the figure or number in the major, and then subtract from their sum. Thus, in the farthings they add the 4 borrowed to 1 in the major, and then from the sum 5 they subtract the 3 in the minor; and in the pence they add the 12 borrowed to 6 in the major, and subtract from the sum 18, &c.; but the method taught above is the easiest and most usual.

## 2. AVOIRDUPOIS WEIGHT.

BEGIN with the pounds, and	(10)	(4)	(28)
say, 24 from 22 you cannot, but	G.	℥.	lb.
from 28, the number of pounds in	84	1	22 major.
1 quarter, and 4 remains, which	49	3	24 minor.
added to 22 in the major, gives	34	1	26 rem.
			26 for

26 for a remainder; which set below, and proceed to the quarters, saying, 1 quarter borrowed and 3 make 4, which from 1 you cannot, but from 4, the number of quarters in 1 C. and 0 remains, which 0 added to 1 in the major gives 1 for a remainder; which set down, and go on to the C. which are integers, saying, 1 C. borrowed and 9 make 10, which from 4 you cannot, but from 14, &c.

III. The Proof of Subtraction.

MERCHANTS and men of business use no other proof besides a revival of the work, or running over it a second time; but it is usual in schools to put the learner upon proving the operation, by some of the three methods following, viz.

1. The work may be proved by addition; for if you add the remainder to the minor, the sum will be equal to the major, as in the following example.

<i>Examp.</i>	<i>L.</i>	<i>s.</i>	<i>d.</i>
major	73	15	10
minor	48	12	6
	<hr/>		
rem.	25	3	4
	<hr/>		
proof	73	15	10

2. By subtraction; for if you subtract the remainder from the major, the difference will be equal to the minor, as follows.

	<i>L.</i>	<i>s.</i>	<i>d.</i>
5847 major	73	15	10
2569 minor	48	12	6
	<hr/>		
3278 rem.	25	3	4
	<hr/>		
2569 proof	48	12	6

3. By casting out the 9's; for the major being equal to the sum of the minor and remainder, if you cast the 9's out of the major, and place the excess at the top of the cross, and then cast the 9's out of the minor and remainder, as if they were items in addition, and place the excess at the foot of the cross, it is plain the figure at the top and foot, if the work be right, will be the same. Only, in proving subtraction of money, Avoidupois weight, &c. care must be taken to begin with the highest denomination, reducing always the excess to the next inferior denomination, as taught in the proof of addition. See the following example.

	<i>L.</i>	<i>s.</i>	<i>d.</i>	
major	73	15	10	X
minor	48	12	6	
	<hr/>			
rem.	25	3	4	7

CHAP. IV. MULTIPLICATION.

IN multiplication there are two numbers given, viz. one to be multiplied, called the *multiplicand*; and another that multiplies it; called the *multiplier*; these two go

under the common name of *factors*; and the number arising from the multiplication of the one by the other is called the *product*, and sometimes the *fact*, or the *rectangle*. If a multiplier consists of two or more figures, the numbers arising from the multiplication of these several figures into the multiplicand, are called *particular*, or *partial products*; and their sum is called the *total product*.

Multiplication then is the taking or repeating of the multiplicand, as often as the multiplier contains unity. Or, Multiplication, from a multiplicand and a multiplier given, finds a third number, called the *product*, which contains the multiplicand as often as the multiplier contains unity.

Hence multiplication supplies the place of many additions; for if the multiplicand be repeated or set down as often as there are units in the multiplier, the sum of these, taken by addition, will be equal to the product by multiplication. Thus,  $5 \times 3 = 15 = 5 + 5 + 5$ .

The first and lowest step in multiplication is, to multiply one digit by another; and the fact or number thence arising is called a *single product*. This elementary step may be learned from the following table, commonly called *Pythagoras's table of multiplication*: which is consulted thus; seek one of the digits or numbers on the head, and the other on the left side, and in the angle of meeting you have their product. The learner, before he proceed further, ought to get the table by heart.

To Pythagoras's table are here added, on account of their usefulness, the products of the numbers 10, 11, 12.

T A B L E.

1	2	3	4	5	6	7	8	9	10	11	12
2	4	6	8	10	12	14	16	18	20	22	24
3	6	9	12	15	18	21	24	27	30	33	36
4	8	12	16	20	24	28	32	36	40	44	48
5	10	15	20	25	30	35	40	45	50	55	60
6	12	18	24	30	36	42	48	54	60	66	72
7	14	21	28	35	42	49	56	63	70	77	84
8	16	24	32	40	48	56	64	72	80	88	96
9	18	27	36	45	54	63	72	81	90	99	108
10	20	30	40	50	60	70	80	90	100	110	120
11	22	33	44	55	66	77	88	99	110	121	132
12	24	36	48	60	72	84	96	108	120	132	144

I. Multiplication of Integers.

RULE I. Set the multiplier below the multiplicand, so as like places may stand under other, viz. units under units,

units, tens under tens, &c. : but if either or both of the factors have ciphers on the right hand, set their first significant figures under other.

The order prescribed in this rule is not absolutely necessary, but very convenient as will appear in the examples.

II. Beginning at the right hand, multiply each figure of the multiplier into the whole multiplicand, carrying, as in addition, and placing the right-hand figure of each particular product directly under the multiplying figure.

III. Add the particular products, and their sum will be the total product.

EXAMP. I. Having placed the multiplier under the multiplicand, as directed in Rule I. proceed to the operation, and say, 7 times 4 make 28; set the 8 below in the place of units, and carry the 2 tens to the next place, as directed in Rule II. saying 7 times

9 make 63, and 2 that I carried make 65; set 5 below in the place of tens, and the 6, which belongs to the next place, set on its left hand, there being no further place to which it can be carried; so the product is 658.

II. Here first multiply the right-hand figure 8 into the whole multiplicand, as in the former example; then proceed, and multiply likewise the 6 tens into the whole multiplicand, saying 6 times 2 make 12; set the 2 below under the the multiplying figure, viz. in the place of tens, and carry the 1 to the next place, as directed in Rule II. The reason why the 2 is set under the multiplying figure, or in the place of tens, is, because the multiplying figure 6 is really 6 tens or 60, and 60 times 2 make 120; so that by carrying the 1 to the next place, and setting down 20, the 0 would fall into the place of units, and throw the 2 into the place of tens; but as 0 can make no alteration in the addition of the partial products, the setting of it down is safely and justly omitted.

III. When the multiplier has ciphers on the right hand, as it would be evidently lost labour to multiply by the ciphers, their only use being to throw figures on their left hand into higher places, set the first significant figures of the factors under other; and, after the operation is finished, annex the ciphers of the multiplier to the right hand of the product.

IV. When the multiplier has ciphers intermixed with significant figures, omit the ciphers, because the multiplying by them would only produce so many lines of ciphers and so be labour in vain; wherefore multiply by the significant figures only; but take care to place the right-hand figure of each particular product directly under the multiplying figure.

*Contractions, and simple ways of working multiplication of integers.*

1. To multiply any number by 10, by 100, by 1000, &c. to the given number annex one, two, three ciphers, &c. Thus,  $23 \times 10 = 230$ ; and  $384 \times 100 = 38400$ ; and  $745 \times 1000 = 745000$ .

2. To multiply any number by 9, by 99, by 999, &c. multiply the given number first by 10, by 100, by 1000, &c. that is, annex one, two, three, &c. ciphers to it; from this subtract the given number, and the remainder is the product; as in the following examples.

Ex. 1.	Ex. 2.	Ex. 3.
Mult. 47	Mult. 627	Mult. 999
by 9 470	by 99 62700	by 999 999000
Sub. 47	Sub. 627	Sub. 999
Prod. 423	Prod. 62073	Prod. 998001

From Ex. 3. we may learn, in general, that to multiply any number consisting entirely of 9's by itself, is to set 1 in the place of units, then as many ciphers, save one, as there are 9's in the given number; then 8, and on the left hand of 8 as many 9's as there are ciphers on its right.

3. To multiply any number by 5; first multiply it by 10, that is, annex a cipher to it, and then halve it: and to multiply any number by 15, use the same method; and add both numbers together, as in the following examples.

Multiply 7439	Multiply 9856
by 5 — 74390	by 15 — 98560
	49280 } add

4. To multiply any number by 11, 12, 13, 14, 15, 16, &c. multiply by the unit's figure, and add the back-figure of the multiplicand to the product; and to multiply by 21, 22, 23, 24, 25, 26, 27, &c. add the double of the back-figure; and to multiply by 31, 32, 33, 34, &c. add the triple of it; and to multiply by 112, 113, 114, &c. add the two back-figures; and to multiply by 101, 102, 103, 104, &c. add the next back-figure save one: as in the following examples.

Ex. 1.	Ex. 2.
876 or multiply by 11	876 or thus, 876
11 thus	876
9636	9716
Ex. 3.	Ex. 4.
435	241
27	34
11745	8194
Ex. 5.	Ex. 6.
7234 or thus, 7234	263
112	7234
810208	119
	7234
	7234
	810208
	31297
	76735

In multiplying by 12, as in Ex. 8. it is more usual, and equally easy, to proceed by saying, twelve times 8 make 96, and, setting down the 6, say, twelve times 4 is 48, and 9 carried is 57; which set down, and the product is 576.

5. If the multiplier consist of the same figure repeated, as 111, 222, 333, 777, &c. multiply by the unit's figure, and out of that product make up the total product, thus. Begin at the right hand, and first take one figure, then the sum of two, then the sum of three, &c. repeating the operation still from the right hand, as often as there are figures in the multiplier; then neglecting the right-hand figure, or figure in the first place, take the sum of as many figures toward the left hand as the multiplier has places; and if there be not so many, take the sum of all the figures there are; then, neglecting the figures in the first and second place, begin at the figure in the third place, proceed as before; and thus go on till the last or left-hand figure is taken in alone; as in the following examples.

Ex. 1.	Ex. 2.	Ex. 3.
7645	4983	38
33	666	444
22935 pr. by 3.	29898 pr. by 6.	152 pr. by 4.
252285 total.	3318678 total.	168872 total.

6. The operation may frequently be rendered shorter or easier, either by addition, subtraction, or a more simple multiplication; and the cases of this kind are so numerous and various, that they admit of no limitation. Consult the following examples and directions.

Ex. 1.	Ex. 2.	Ex. 3.
438	374	746
87	56	84
3066	2244	2984
3504	1870	5968
38106	20944	62664

Work the above examples as follows.

Ex. 1. Multiply by 7, and add that product to the multiplicand, instead of multiplying by 8.

Ex. 2. Multiply by 6, and out of that product subtract the multiplicand, instead of multiplying by 5.

Ex. 3. Multiply by 4, and double that product for 8.

II. Multiplication of the parts of Integers.

Here there are three cases.

1. If your multiplier is a single digit, set it under the units figure of the lowest denomination, multiply it into all the parts of the multiplicand, beginning at the lowest, and carrying always as in addition, or according to the value of the next superior place.

EXAMP. What is the price of 7 packs of cloth at L. 64, 8 s. 10½ d. per pack?

Here say, 7 times 2 is 14, which is 3 pence and 2 farthings over; set down the 2 farthings, and carry 3 to the place of pence, saying, 7 times 10 is 70, and 3 that I carried makes 73, which is 6 shillings and 1 penny; set down the

1 penny, and carry 6 to the place of shillings, saying, 7 times 8 is 56, and 6 that I carried is 62, which make 3 pence and 2 shillings; set down the 2 shillings, and carry 3 to the place of pounds which are integers.

2. If your multiplier consists of two or more figures, multiply continually by its component parts, or by the component parts of the composite number that comes nearest to it, and then multiply the given multiplicand by the difference of the multiplier, and the nearest composite number: the sum or difference of these two products is the answer.

EXAMP. I. What is the price of 56 C. tobacco, at L. 2 : 14 : 9¼ per C.

Here the component parts are 8 and 7; for 8 × 7 = 56: therefore,

Multiply first by 8, and that product by 7; or, which will give the same answer, multiply first by 7, and then that product by 8.

L. s. d.
2 14 9¼
8
21 18 6
7

153 9 6

EXAMP. II. What is the price of 126 yards of velvet, at L. 3 : 8 : 4 per yard?

Here multiply first by 6, that product by 7, and that product again by 3; but as the component parts are various, and may be chosen at pleasure, you would have had the same answer, had you multiplied by 9 × 7 × 2; or by 7 × 3 × 3 × 2.

L. s. d.
3 8 4
6
20 10
7

143 10
3
430 10

From the above example may be deduced a general and easy rule for working all questions of this kind; and is of excellent use when the multiplier happens to be a number; viz.

Multiply continually so many times by 10 as there are figures in the multiplier, save one; then multiply the given price by the right-hand figure of the multiplier; and again, the first product of 10 by the following figure of the multiplier; and so on, till you have multiplied by all the figures in the multiplier. The sum of these products is the answer.

EXAMP. III. What is the price of 8604 yards of cloth, at 19 s. 6½ d. per yard?

L. s. d.	Price of	L. s. d.	Price of
19 6½	1 yd, × 4 =	3 18 2	4 yds.
10			
9 15 5	10 yds, × 0 =		
10			

97 14 2 100 yds, × 6 = 586 5 600 yds.

977 1 8 1000 yds, × 8 = 7816 13 4 8000 yds.

Price of 8604 yards, 8406 16 6  
5 B

3. If

3. If your multiplier consists of integers and parts, the operation is performed by a cross multiplication of the several parts of the multiplier into all the parts of the multiplicand.

The contents of mason and joiners work are frequently cast up by this kind of multiplication; for understanding of which observe, that

The superficial content of any rectangle is found by multiplying the length into the breadth; and the content of a right-angled triangle is found by multiplying the base into half the perpendicular or height.

The dimensions are usually taken in lineal feet, inches, and lines; and the operation is performed by the following rules.

I. Any lineal measure multiplied into the same lineal measure produces squares of that name. Thus, lineal feet multiplied into lineal feet produce square feet; lineal inches into lineal inches produce square inches, &c.

II. Lineal feet into lineal inches produce rectangles 1 foot long and 1 inch broad, which divided by 12 quote square feet; and the remainder multiplied by 12, produces square inches.

III. Lineal feet into lineal lines produce rectangles 1 foot long and 1 line broad, which divided by 144 quote square feet; and the remainders are rectangles equal to square inches.

IV. Lineal inches into lineal lines produce small rectangles 1 inch long and 1 line broad, which divided by 12 quote square inches; and the remainder, multiplied by 12, produces square lines.

EXAMP. I. In an area, pavement, or piece of plaster-work, in length 24 feet 7 inches, and in breadth 18 feet 5 inches, how many square feet?

F.	in.	18×7=126	}	by Rule II.
24	7	24×5=120		
18	5	12)246(20		
432	35	24		
20	72	12×6=72		
452	107			

Here multiply 18 lineal feet into 24 lineal feet, and the product is 432 square feet; then multiply 5 lineal inches into 7 lineal inches, and the product is 35 square inches, by Rule I.; then multiply 18 lineal feet into 7 lineal inches, and the product is 126; and again multiply 24 lineal feet into 5 lineal inches, and the product is 120; which added to the former product, gives 246 rectangles, each being 1 foot in length and one inch in breadth; these divided by 12 quote 20 square feet; and the remainder 6 multiplied by 12, produces 72 square inches, according to Rule II.; these add to the former square feet and inches, and you'll find the answer or total product to be 452 square feet, and 107 square inches.

EXAMP. II. In an area or floor, in length 38 feet 9 inches 6 lines, and in breadth 23 feet 8 inches 6 lines, how many square feet?

F.	in.	23×9=207	}	By Rule II.
38	9	38×8=304		
23	8	12)511(42		
874	72	48		
42	84	31		
278	8	24		
919	98	12×7=84	}	By Rule III.
38	6=228	8×6=48		
23	6=138	9×6=54		
144	366(2	12)102(8		
288		96		
78		12×6=72		

Because the sum of the inches exceeds 144, carry 1 from them to the column of feet, and set down the overplus, viz. 98.

The operation may be rendered easier and shorter by previously reducing the factors to two denominations, viz. inches and lines. Thus the former example may be proposed and wrought as follows.

In an area or floor, in length 465 inches 6 lines, and in breadth 284 inches 6 lines, how many square inches and feet?

Inch.	lin.	465×6=2790	}	By Rule IV.
465	6	284×6=1704		
284	6	12)4494(374 in.		
1320	60	72 li.		
374	72			
132434	108			

The answer here is 132434 square inches, and 108 square lines; and if the inches be divided by 144, you will have 919 square feet and a remainder of 98 square inches, as before.

Or the factors may be reduced to the lowest denomination, viz. lines, and then the product will be square lines, which, divided by 144, will quote square inches, and the remainder will be square lines; and the square inches, divided by 144, will quote square feet, and the remainder will be square inches. Again, the square feet, divided by 9, will quote square yards, and the remainder will be square feet; and the square yards, divided by 36, will quote square roods, and the remainder will be square yards.

If this cross multiplication be extended to the mensuration of solids, the content of which is found by multiplying the superficial content of the base into the height, depth, length, or thickness, the operation must be conducted by the following rules.

V. Any superficial measure multiplied into the same lineal measure produces a solid of the same name. Thus superficial feet multiplied into lineal feet produce solid feet; superficial inches multiplied into lineal inches produce solid inches, &c.

VI. Superficial feet into lineal inches produce parallelepipeds, whose base is 1 square foot, and their height 1 inch; which divided by 12 quote solid feet; and the remainder, multiplied by 144, produces solid inches.

VII. Superficial feet into lineal lines produce parallelepipeds, whose base is 1 square foot, and their height 1 line; which divided by 144 quote solid feet; and the remainder multiplied by 12 produces solid inches.

VIII. Superficial inches into lineal lines produce parallelepipeds, whose base is 1 square inch, and their height 1 line; which divided by 12 quote solid inches; and the remainder multiplied by 12 produces solid inches.

IX. Lineal feet into superficial inches produce parallelepipeds, whose base is one square inch, and their height 1 foot; which divided by 144 quote solid feet; and the remainder multiplied by 12 produces solid lines.

X. Lineal feet into superficial lines produce parallelepipeds, whose base is 1 square line, and their height 1 foot; which divided by 12 quote solid inches; and the remainder multiplied by 144 produces solid lines.

XI. Lineal inches into superficial lines produce parallelepipeds, whose base is 1 square line, and their height 1 inch; which divided by 144 quote solid inches; and the remainder multiplied by 12 produces solid lines.

EXAMP. III. In a piece of timber, whose length is 18 feet 16 inches, breadth 2 feet 4 inches, and thickness 2 feet 3 inches, how many solid feet?

Ft.	in.		
18	6	$2 \times 6 = 12$	} by Rule II.
2	4	$18 \times 4 = 72$	
36	24	$12)84(7 F.$	} by Rule V.
7			
43	24	superficial	} by Rule VI.
2	3	lineal	
86	72	$2 \times 24 = 48$	} by Rule IX.
10	1256	$12 \times 48 = 576 in.$	
	576		
97	216	solid	

Here first multiply 18 feet 6 inches into 2 feet 4 inches, as formerly, and the product is 43 feet 24 inches superficial; which next multiply into 2 feet 3 inches lineal, thus, 43 superficial feet into 2 lineal feet produce 86 solid feet, and 24 superficial inches into 3 lineal inches produce 72 solid inches, by Rule V.; then 43 superficial feet into 3 lineal inches produce 129 parallelepipeds, whose base is 1 square foot, and their height 1 inch; which divided by 12 quotes 10 solid feet; and the remainder 9 multiplied into 144 produces 1296 solid inches, by Rule VI. Again, 2 lineal feet into 24 superficial inches produce 48; which, being less than 144, you esteem a remainder, and multiplying it into 12 you have a product of 576 solid inches, by Rule IX.

Because the sum of the inches exceeds 1728, carry 1 from thence to the feet, and the overplus 216 set down.

EXAMP. IV. How many solid feet in a polished stone, that is 8 feet 9 inches 5 lines long, 7 feet 3 inches broad, and 3 feet 5 lines thick?

Ft.	in.	l.		
8	9	5	$7 \times 9 = 63$	} by Rule II.
7	3		$8 \times 3 = 24$	
56	27		$12)87(7 F.$	} by Rule III.
7	36		$12 \times 3 = 36 in.$	
	35		$7 \times 5 = 35 in.$	} by Rule IV.
	1	36	$3 \times 5 = 15$	
63	95	36	$12)15(1 in.$	} by Rule VIII.
3		5	sup. $12 \times 3 = 36 li.$	
189		180	$63 \times 5 = 315$ , and $144)315(2 F.$	} by R. VII.
2	124		$12 \times 27 = 324 in.$	
2	108		$3 \times 99 = 297$ , and $144)297(2 F.$	} by R. IX.
	9		$12 \times 9 = 108 in.$	
	41	432	$3 \times 36 = 108$ , and $12)108(9 in.$	} by Rule X.
193	482	612	$5 \times 99 = 495$ , and $12)495(41 in.$	
			$144 \times 3 = 432 lines.$	} by R. VIII.

The operation may be facilitated by previously reducing the three factors to two denominations, viz. inches and lines, as was done in Example II. on superficial measure.

Or the three factors may be reduced to the lowest denomination, viz. lines, which being multiplied continually, will produce solid lines, which divided by 1728, will quote solid inches, the remainder being solid lines; and the solid inches divided by 1728 will quote solid feet, the remainder being solid inches; and the solid feet divided by 27 will quote solid yards, the remainder being solid feet; and the solid yards divided by 216 will quote solid rods, the remainder being solid yards.

We shall only further observe, that as the rules for working questions by cross multiplication are numerous, and the operation tedious, it is easier to convert the parts into a decimal fraction of their integer, and then work as taught in the multiplication of decimals.

### III. The Proof of Multiplication.

MULTIPLICATION may be proved several ways, viz. by multiplication, by division, and by casting out the 9's.

1. By multiplication: Change the places of the factors, and make that the multiplier which before was the multiplicand; and if the work be right, you will have the same product as before; but this method is tedious.

2. By division: When the work is right, the product divided by the multiplier quotes the multiplicand; or, divided by the multiplicand, quotes the multiplier. But this supposes the learner acquainted with division.

3. The most usual method therefore of proving multiplication is by casting out the 9's; which is done thus: Cast the 9's out of the multiplicand and multiplier, and place the excesses on the right and left sides of a cross; multiply these two figures into one another, casting the 9's out of their product, if need be, and place the excess at the top of the cross; then casting the 9's also out of the product of your multiplication, place its excess at the bottom;

bottom; and if the work be right, the figures at top and bottom will agree, or be the same.

EXAMP. I. Here cast the 9's out of the multiplicand, and place the excess 7 on the right side of the cross; then cast the 9's out of the multiplier, and place the excess 2 on the left side of the cross; next multiply these excesses 2 and 7 into one another, cast the 9's out of their product, and place the excess five at the top of the cross; lastly, cast the 9's out of the product, and place the excess 5 at the foot of the cross; which being the same with the figure at the top, you may conclude the work to be right.

$$\begin{array}{r} 154 \\ 38 \\ \hline 6032 \\ 2262 \\ \hline 28652 \end{array}$$

$$\begin{array}{c} 5 \\ \times \\ 7 \\ \hline 2 \\ 5 \end{array}$$

EXAMP. II. Here, in casting the 9's out of the multiplicand, and out of the product, begin with the pounds, and reduce the excess to shillings, and in like manner the excess of the shillings is reduced to pence, and that of the pence to farthings. The multiplier being an abstract number, needs no reduction; but if a multiplier be a mixt number, or consist of integers and parts, as feet and inches, &c. the excess of the higher denomination must always be reduced to the lower.

$$\begin{array}{r} L. s. d. \\ 43 \quad 8 \quad 4\frac{1}{4} \\ \hline 347 \quad 6 \quad 10 \end{array}$$

$$\begin{array}{c} 7 \\ \times \\ 2 \\ \hline 8 \\ 7 \end{array}$$

## CHAP. V. DIVISION.

DIVISION discovers how often one number is contained in another: or,

Division, from two numbers given, finds a third, which contains unity as often as the one given number contains the other.

The number to be divided, or which contains the other, is called the *dividend*; the number by which we divide, or which is contained in the dividend, is called the *divisor*; and the number found by division, or which expresses how often the dividend contains the divisor, is called the *quotient* or *quot.*

As multiplication supplies the place of many additions, so division, which is the reverse of multiplication, serves instead of many subtractions; as will thus appear: Suppose it were required to divide 18 by 6, that is, to find how often 6 is contained in 18, the work by subtraction will stand as in the margin: by which it appears, that 6 is contained 3 times in the number 18. But this, by division, may be found at one trial: thus,

Set the divisor on the left of the dividend, leaving room on the right hand for the quotient, as in the margin; and then say, How often 6 in 18? *Ans.* 3 times: this 3 set in the quotient; then multiply the quotient figure 3 into the divisor 6, saying, 3 times 6 make 18; which set down below the dividend, and subtract it from the dividend, and 0 remains.

$$\begin{array}{r} 18 \\ 6 \\ \hline 12 \\ 6 \\ \hline 6 \\ 6 \\ \hline 0 \end{array}$$

### I. Division of Integers.

RULE I. From the left-hand part of the dividend point off the first *dividual*, viz. so many figures as will contain the divisor.

II. Ask how often the divisor is contained in the *dividual*, and put the answer in the quotient.

III. Multiply the divisor by the figure set in the quotient, and subtract the product from the *dividual*.

IV. To the right of the remainder bring down the next figure of the dividend for a new *dividual*; and then proceed as before.

EXAMP. I. Here, because the divisor 7 is contained in 8, the left-hand figure of the dividend, point it off as the first *dividual*, according to Rule I; and then say, How often 7 in 8? *Ans.* 1 time; which 1 set in the quotient, as directed in Rule II.; then multiply the divisor 7 by this quotient figure 1, and subtract the product 7 from the *dividual* 8, as directed in Rule III.; to the remainder 1 bring down the following figure of the dividend, for the second *dividual*, as directed in Rule IV.; then proceed as before, and say, How often 7 in 17? *Ans.* 2 times; wherefore, setting two in the quotient, multiply and subtract and find the next remainder to be 3; to which bring down the following figure of the dividend, and you have 35 for the third *dividual*; then say, How often 7 in 35? *Ans.* 5 times; which 5 being placed in the quotient, multiply and subtract, and 0 remains; so the quotient is 125.

By reviewing the steps of the preceding operation, and reducing the *dividuals* and quotient-figures to their separate values, the reason of the rules will be obvious; for,

The separate value of the first *dividual* 8 is 800; and the separate value of 1, the first figure put in the quot. is 100; for as 8 contains 7 the divisor 1 time, so 800 contains it 100 times, and 100 remains; to which bring down the following figure of the dividend 7, whose separate value is 70; and the second *dividual* is 170; and as 7 is contained 2 times in 17, so it is contained 20 times in 170, and 30 remains; to which bring down the next or last figure of the dividend 5; and the third *dividual*

Divi-	Divi-	Quo-	
for.	dend.	tient.	
			7)875(125
			...
			7
			—
			17
			—
			14
			—
			35
			—
			35
			—
			(0)

$$\begin{array}{r} 2 \times 7 \\ 8 \times 3 \\ 2 \end{array}$$

is 35, in which the divisor 7 is contained 5 times. Now it is evident, that the sum of the partial quots, 125, is the total quot, or a number expressing how often the dividend 875 contains the divisor 7.

From the above example we may learn, that there are always just so many figures in the quotient as there are dividends; or the first dividend, with the number of subsequent figures in the dividend, is equal to the number of places or figures in the quotient.

Hence likewise may be inferred, that no divisor is contained in any dividend oftener than 9 times; for the dividend, excluding the right-hand figure, is always less than the divisor by 1 at least; and if both be multiplied by 10, or have a cipher annexed to each of them, the product of the dividend will be less than the product of the divisor by 10 at least; but no right-hand figure can supply this defect of 10; therefore the divisor is not contained 10 times in any dividend, and consequently not oftener than 9 times.

Here too observe, that the right-hand figure of the first dividend, and all the subsequent figures of the dividend, have a point or dot set below them, as they are brought down; which is done to prevent mistakes, by distinguishing them, in this manner, from the figures not yet brought down.

$$8)56032897(7004112 \frac{1}{8} \text{ numer.} \\ \text{.....} \quad \text{denom.}$$

$$\begin{array}{r} 56 \\ \hline .032 \\ 32 \\ \hline .8 \\ 8 \\ \hline .9 \\ 8 \\ \hline 17 \\ 16 \\ \hline (1) \end{array}$$

EXAMP. II. Here, because 8 is not contained in 5, point off 56 as the first dividend, and say, How often 8 in 56? *Ans.* 7; which put in the quotient; then multiply 7 into the divisor 8, and subtract the product 56 from the dividend; and as nothing remains, bring down the next figure of the dividend, which happens to be a cipher; and as you cannot have 8 in 0, put 0 in the quotient;

and, as multiplying and subtracting is in this case needless, you bring down the next figure of the dividend 3; and as you cannot have 8 in 3, put another 0 in the quotient, and bring down the next figure of the dividend '2': Then say, How often 8 in 32? *Ans.* 4; which put in the quotient: Then multiply and subtract; and as nothing remains, bring down the next figure of the dividend 8, and say, How often 8 in 8? *Ans.* 1; which put in the quotient: then multiply and subtract; and as nothing remains, bring down the next figure of the dividend 9, and say, How often 8 in 9? *Ans.* 1; which put in the quotient: then multiply and subtract; and to the remainder 1 bring down the next and last figure of the dividend 7, and say, How often 8 in 17? *Ans.* 2; which put in the quotient: then multiply and subtract, and 1 remains.

To complete the quotient, draw a line on the right hand, and set the remainder above the line, and the di-

visor 8 below it, signifying that 1 remains to be divided by 8; or that part of the quotient may be considered as a fraction, whose numerator is 1, and its denominator 8; and the quotient thus completed shews, that the dividend contains the divisor 7004112 times, and one eighth part of a time.

Here observe, that not only the last remainder, but every other remainder, must be less than the divisor; for if it be either greater or equal, the divisor might have been often got, and the quotient-figure is too little. And should any one in this case attempt to continue the operation, the quotient-figures would be all 9's, the dividends would prove inexhaustible, and the remainders would constantly increase.

Hence also learn, that if any dividend happen to be less than the divisor, you must put 0 in the quotient, and bring down the next figure of the dividend; and if it be still less than the divisor, you must put another 0 in the quotient, and bring down the following figure of the dividend, &c.

III. Here the divisor consists of two figures; and because it is contained in the two left-hand figures of the dividend 78, point them off as the first dividend; and say, How often 3 in 7? *Ans.* 2, and 1 remains; which 1 placed, or conceived as placed, on the left hand of the following figure 8, makes 18: then say, Can I have the following figure of the divisor 6 also 2 times in 18? *Ans.* Yes; consequently I get 36 the divisor 2 times in 78 the dividend; wherefore put 2 in the quotient, and multiply that 2 into the divisor 36, and subtract the product 72 from the dividend 78; and to the remainder 6 bring down the following figure of the dividend 9, for a new dividend: then say, How often 3 in 6? *Ans.* 2, and 0 remains; again you say, Can I have 6 also 2 times in 9? *Ans.* No; therefore you can have 36 in 69 only 1 time, which 1 you put in the quotient: then multiply and subtract as before; and to the remainder 33 bring down the next figure 4 for a new dividend: Then, because the dividend consists of a figure more than the divisor, say, How often the first figure of the divisor 3 in the first two figures of the dividend 33? *Ans.* 9, and 6 remains; which 6 placed on the left hand of the following figure 4 makes 64: Again, say, Can I have 6 also 9 times in 64? *Ans.* Yes; consequently 36 can be had 9 times in 334; wherefore you put 9 in the quotient: Then multiply and subtract; and to the remainder 10 bring down the next figure 2 for a new dividend: Here likewise, because the dividend has a figure more than the divisor, say, How often 3 in 10? *Ans.* 3, and 1 remains; which 1 placed on the left hand of the following figure 2 makes 12: Again say, Can I have 6 also 3 times in 12? *Ans.* No; consequently 36 cannot be had 3 times in 102; wherefore try if

$$\begin{array}{r} 36)789426(21928 \frac{1}{6} \\ \text{.....} \\ 72 \\ \hline 69 \\ 36 \\ \hline 334 \\ 324 \\ \hline 102 \\ 72 \\ \hline 306 \\ 288 \\ \hline (13) \end{array}$$

you can have it 2 times; saying, 2 times 3 is 6 from 10, and 4 remains; which 4 placed on the left hand of the next figure 2 makes 42: And again say, Can I have 6 also 2 times in 42? *Ans.* Yes; consequently 36 can be had 2 times in 102; accordingly put 2 in the quotient, multiply and subtract; and to the remainder 30 bring down the next and last figure of the dividend 6, for a new dividend: Then, because the dividend has a figure more than the divisor, say, How often 3 in 30? *Ans.* 9, and 3 remains; which 3 placed on the left hand of the following figure 6 make 36: And again say, Can I have 6 also 9 times in 36? *Ans.* No; consequently 36 cannot be had 9 times in 306; therefore try if it can be had 8 times, saying, 8 times 3 is 24 from 30, and 6 remains; which 6 placed on the left hand of the following figure 6 makes 66: Again say, Can I have 6 also 8 times in 66? *Ans.* Yes; consequently 36 can be had 8 times in 306; wherefore put 8 in the quotient, and multiply and subtract as before: The last remainder 18 is the numerator of a fraction, and the divisor its denominator, to be annexed to the integral part of the quotient; as was taught in the former example.

The preceding operation points out the manner of procedure when the divisor consists of more figures than one, *viz.* you must take the first figure of the divisor out of the first figure of the dividend, or out of the first two figures of the dividend in case the dividend have a figure more than the divisor: Then imagine the remainder to be prefixed to the next figure of the dividend, and try if you can have the second figure of the divisor as often out of this number; if you can, imagine again the remainder to be prefixed to the following figure of the dividend, and try if you can have the third figure of the divisor as often out of this number, &c.; but if you find you cannot have some subsequent figure of the divisor so often as you took the first, you must go back, and take the first figure of the divisor 1 time less, or some number of times less out of the first, or out of the first two figures of the dividend: Then proceed as before, repeating the trial till you find you have the second and all the subsequent figures of the divisor as often as you took the first.

But here observe, that if, in trying how often the divisor can be had in the dividend, either 9, or a number greater than 9, any where remain, you may conclude, without further trial, that all the subsequent figures of the divisor can be had as often as you took the first; as may be thus demonstrated.

Suppose the subsequent figures of the divisor to be the highest possible, that is, all 9's, and the following figures of the dividend the lowest possible, that is, all 0's; again, imagine the remainder 9 prefixed to the following figure of the dividend 0, that it will make 90; now it is plain, that the subsequent figure of the divisor 9 can be had in 90, the highest number of times possible, *viz.* 9 times, and 9 will remain; which prefixed to the next figure of the dividend 0, makes 90, in which the subsequent figure of the divisor 9 can again be had 9 times, and 9 will remain as before; therefore all the subsequent figures of the divisor can be had as often as you took the first; and if they can be had in this case, much more can they be had when a number greater than 9 remains.

IV If, as in the margin, a cipher or ciphers, possess the right hand of the divisor, cut them off, and cut off as many figures, *viz.* in this example, the figure 2 from the right hand of the dividend; then divide the remaining figures of the dividend, *viz.* 89678, by the remaining figures of the divisor, *viz.* 648, and you have the integral part of the

$$\begin{array}{r} 648 \overline{) 89678} \quad | \quad (138 \frac{144}{648}) \\ \underline{648} \phantom{00} \\ 2487 \phantom{0} \\ \underline{1944} \phantom{0} \\ 5438 \phantom{0} \\ \underline{5184} \phantom{0} \\ 2542 \phantom{0} \end{array}$$

quotient; but to the remainder 254 annex the figure cut off from the dividend, and you have 2542 for the numerator of your fraction, and the whole divisor 6480 is the denominator.

The reason will appear obvious by working a question in this manner, and also at full length, without cutting off the cipher or ciphers, and then comparing the two operations.

V. If, as in the margin, the figures cut off from the right hand of the dividend, happen to be all ciphers; in this case, the last remainder, without regarding the ciphers cut off, is the numerator of your fraction, and the significant figures of the divisor the denominator. The reason is assigned in the doctrine of fractions.

$$\begin{array}{r} 48 \overline{) 00978000} \quad | \quad (203 \frac{16}{48}) \\ \underline{000} \phantom{000} \\ 978 \phantom{000} \\ \underline{000} \phantom{000} \\ 978 \phantom{000} \\ \underline{000} \phantom{000} \\ 978 \phantom{000} \\ \underline{000} \phantom{000} \\ 16 \phantom{000} \end{array}$$

In like manner, if there be cut off from the dividend any number of significant figures, with a cipher or ciphers on their right hand; in this case the last remainder, with the significant figures cut off, make the numerator of your fraction; and the significant figures of the divisor, with as many ciphers as the number of significant figures cut off from the dividend, make the denominator. Thus, if, in the above example, the figures cut off from the dividend had been 50, the numerator of your fraction would have been 365, and the denominator 480.

#### Contractions in working Division of Integers.

1. To divide any number by 10, 100, 1000, &c. you have only to point off for a remainder as many figures on the right hand of the dividend as the divisor has ciphers, and the other figures on the left of the point or separatrix are the quotient. Thus, 7489634 divided by 10, 100, 1000, &c. stands as follows.

$$\begin{array}{r} \text{Quot rem.} \\ 10) 7489634 \\ 100) 74896.34 \\ 1000) 7489.634 \\ 10000) 748.9634 \end{array}$$

2. If the figures of the divisor are all 9's, or all except the units figure, as 9, 99, 999, 98, 997, 9996, &c. work as follows:

Find a new divisor, by annexing to unity as many ciphers as there are figures in the given divisor, subtract the given from the new divisor, and the remainder or difference is the complement. Divide the given dividend by the new divisor, *viz.* point off so many figures on the

visor and quotient, place the excesses on the right and left sides of a cross; then multiply these two figures into one another, and cast the 9's out of their product; add the excess to the remainder; and, casting out the 9's if need be, place the sum or excess at the top of the cross; then cast the 9's out of the dividend, and set the excess at the bottom. If the work be right, the figures at the top and bottom of the cross will agree, or be the same.

These methods of proof are a proper exercise to the learner in schools; but, in business, the only proof used is a careful revival of the operation.

## CHAP. VI. REDUCTION.

REDUCTION teacheth how to bring a number of one name or denomination to another of the same value; and is either descending, ascending, or mixt.

I. Reduction descending brings a number of a higher denomination to a lower, when the lower is some aliquot part of the higher; as pounds to shillings, pence, or farthings; and is performed by multiplication.

II. Reduction ascending brings a number of a lower denomination to a higher, when the lower is some aliquot part of the higher; as shillings, pence, or farthings, to pounds; and is performed by division.

III. Mixt reduction brings a number of one denomination to another, when the one is no aliquot part of the other; as pounds to guineas, and requires the use of both multiplication and division.

In treating of reduction we shall conjoin the descending and ascending, the one serving as a proof of the other; and shall afterwards treat of mixt reduction by itself.

In working reduction, of whatever kind, the following rule is to be observed, *viz.*

Multiply or divide as the tables of money and weights direct.

### Reduction descending and ascending.

#### 1. MONEY.

QUEST. 1. In L. 472 how many shillings, pence, and farthings?

This reduction is descending,	472 pounds.
therefore multiply the pounds by	20
20, because 20 shillings make 1	9440
pound, and the product is shillings:	shillings.
then multiply the shillings by 12,	12
because 12 pence make 1 shilling,	1888
and the product is pence: lastly,	944
multiply the pence by 4, because	113280
4 farthings make 1 penny, and the	pence.
product is farthings.	4
	453120
	farthings.

### Proof by Reduction ascending.

In 453120 farthings how many pence, shillings, and pounds?

Here divide the farthings by	4)453120	farthings.
4, because 4 farthings make 1	113280	pence.
penny, and the quotient is		
pence: then divide the pence	20)9440	shillings.
by 12, because 12 pence make	472	pounds.
1 shilling, and the quotient is		
shillings: lastly, divide the		
shillings by 20, because 20 shillings		
make 1 pound, and the quotient is		pounds.

Note 1. To reduce pounds to pence at one operation, multiply by 240, the number of pence in 1 pound.

Note 2. To reduce pounds to farthings at one operation, multiply by 960, the number of farthings in 1 pound.

Note 3. To reduce shillings to farthings at one operation, multiply by 48, the number of farthings in 1 shilling.

Note 4. To reduce pence to pounds at one operation, divide by 240, the pence in 1 pound.

Note 5. To reduce farthings to pounds at one operation, divide by 960, the farthings in 1 pound.

Note 6. To reduce farthings to shillings at one operation, divide by 48, the farthings in 1 shilling.

Here follows the farthings of Quest. 1. reduced back to pounds by these notes.

By note 4.	4)453120	farthings.	By note 5.	960)453120	(472 L.
	113280	d. (472 L.		384	
	96			691	
	172			672	
	168			192

CHAP. VII. THE RULE OF THREE.

The Rule of Three, called also, on account of its excellence, the *Golden Rule*, from certain numbers given finds another; and is divided into simple and compound, or into single and double.

SECT. I. *The Simple or Single Rule of Three.*

The simple rule of three, from three numbers given, finds a fourth, to which the third bears the same proportion as the first does to the second.

The nature and properties of proportional numbers may be understood sufficiently for our purpose from the following observations.

In comparing any two numbers, with respect to the proportion which the one bears to the other, the first number, or that which bears proportion, is called the *antecedent*; and the other, to which it bears proportion, is called the *consequent*; and the quantity of the proportion or ratio is estimated from the quot arising from dividing the antecedent by the consequent. Thus the ratio or proportion betwixt 6 and 3 is the quot arising from dividing the antecedent 6 by the consequent 3; namely, 2; and the ratio or proportion betwixt 1 and 2 is the quot arising from the division of the antecedent 1 by the consequent 2; namely  $\frac{1}{2}$ , or one half.

Four numbers are said to be proportional when the ratio of the first to the second is the same as that of the third to the fourth; and the proportional numbers are usually distinguished from one another as in the following examples.

$$4 : 2 :: 16 : 8 \qquad 6 : 9 :: 12 : 18.$$

Proportional numbers, or numbers in proportion, are usually denominated *terms*; of which the first and last are called *extremes*, and the intermediate ones get the name of *means*, or *middle terms*.

If four numbers are proportional, they will also be inversely proportional; that is, the first consequent will be to its own antecedent as the second consequent is to its antecedent; or the fourth term will be to the third as the second is to the first. Thus, if 6 : 3 :: 10 : 5, then by inversion, 3 : 6 :: 5 : 10, or 5 : 10 :: 3 : 6. *Euclid v. 4. cor.* By either of these kinds of inversion may any question in the rule of three be proved.

If four numbers are proportional, they will also be alternately proportional; that is, the first antecedent will

be to the second antecedent as the first consequent is to the second consequent; or the first term will be to the third term as the second term is to the fourth. Thus, if  $8 : 4 :: 24 : 12$ , then, by alternation,  $8 : 24 :: 4 : 12$ . *Euclid* v. 16.

But the celebrated property of four proportional numbers is, that the product of the extremes is equal to the product of the means. Thus, if  $2 : 3 :: 6 : 9$ , then  $2 \times 9 = 3 \times 6 = 18$ . *Euclid* vi. 16.

Hence we have an easy method of finding a fourth proportional to three numbers given, *viz.*

Multiply the middle number by the last, and divide the product by the first, the quot gives the fourth proportional.

**EXAMP.** Given 6, 5, and 36, to find a fourth proportional; put  $x$  equal to the fourth proportional, then  $6 : 5 :: 36 : x$ , and  $5 \times 36 = 180 = 6 \times x$ ; wherefore, dividing the product 180 by the factor 6, the quot gives the other factor  $x$ , namely 30, the fourth proportional sought.

Every question in the rule of three may be divided into two parts, *viz.* a supposition and a demand; and of the three given numbers, two are always found in the supposition, and only one in the demand.

**EXAMP.** If 4 yards cost 12 shillings, what will 6 yards cost at that rate?

In this question the supposition is, If 4 yards cost 12 shillings; and the two terms contained in it are 4 yards and 12 shillings: The demand lies in these words, What will 6 yards cost? and the only term found in it is 6 yards.

The supposition and demand being thus distinguished, proceed to state the question, or to put the terms in due order for operation, as the following rules direct.

**RULE I.** Place that term of the supposition, which is of the same kind with the number sought, in the middle. The two remaining terms are extremes, and always of the same kind.

II. Consider, from the nature of the question, whether the answer must be greater or less than the middle term; and if the answer must be greater, the least extreme is the divisor; but if the answer must be less than the middle term, the greatest extreme is the divisor.

III. Place the divisor on the left hand, and the other extreme on the right; then multiply the second and third terms, and divide their product by the first; and the quot gives the answer; which is always of the same name with the middle term.

When the divisor happens to be the extreme found in the supposition, the proportion is called *direct*; but when the divisor happens to be the extreme in the demand, the proportion is *inverse*.

The three rules delivered above are indeed so framed, as to preclude the distinction of direct and inverse, or render it needless, the left-hand term being always the divisor; but yet the direct questions being plainer in their own nature, and more easily comprehended by a learner, we shall, in the first place, exemplify the rules by a set of questions of the direct kind, and shall afterwards adduce an example or two of such as are inverse.

### I. The Simple Rule of Three Direct.

**QUEST. 1.** If 4 yards cost 12 shillings, what will 6 yards cost at that rate?

The supposition and demand of this question have already been distinguished, and the two terms in the former are 4 yards 12 shillings, and the only term in the latter is 6 yards.

The number sought is the price of six yards, and the term in the supposition of the same kind is the price of 4 yards, *viz.* 12 shillings, which place in the middle, as directed in Rule I. and the two remaining terms are extremes, and of the same kind, *viz.* both lengths.

It is easy to perceive that the answer must be greater than the middle term; for 6 yards will cost more than 4 yards; therefore the least extreme, *viz.* 4 yards, is the divisor, according to Rule II.

<i>Yds.</i>	<i>s.</i>	<i>yds.</i>
If 4 :	12 ::	6
—		
		4)72(18 shillings <i>Ans.</i>
—		
		4
—		
		32
—		
		32
—		
		(0)

Wherefore place the divisor 4 yards on the left hand, and the other extreme 6 yards on the right; and multiplying the second and third terms, divide their product by the first term, and the quot 18 is the answer, and of the same name with the middle term, *viz.* shillings, according to Rule III.

And because the divisor is the extreme found in the supposition, the proportion is direct.

**QUEST. 2.** If 7 C. of pepper cost 21 l. how much will 5 C. cost at that rate?

The supposition in this question is, that 7 C. of pepper costs 21 l. and the two terms in it are 7 C. and 21 l.; the demand is, How much will 5 C. cost? and the term in it is 5 C.

The number sought is the price of 5 C. and the term in the supposition of the same kind is the price of 7 C. *viz.* 21 l. which place in the middle. The two remaining terms are extremes, and of the same kind, *viz.* quantities of pepper.

It is obvious, that the answer must be less than the middle term; for 5 C. will cost less than 7 C.; and therefore the greatest extreme, *viz.* 7 C. is the divisor.

<i>C.</i>	<i>L.</i>	<i>C.</i>
If 7 :	21 ::	5
—		
		5
—		
		7)105(15 l. <i>Ans.</i>
—		
		7
—		
		35
—		
		35
—		
		(0)

Accordingly place the divisor 7 C. on the left hand, and the other extreme 5 C. on the right; and having multiplied the second and third terms, divide their product by

by the first term, and the quot 15 is the answer, of the same name with the middle term, viz. L. Sterling.

And because the divisor happens to be the extreme in the supposition, the proportion is direct.

QUEST. 3. If 13 yards of velvet cost L. 21, what will 27 yards cost at that rate?

$$\begin{array}{r} T. \quad L. \quad T. \\ \text{If } 13 : 21 :: 27 \quad * \text{ Rem. } 4 \text{ s.} \\ \hline 27 \qquad \qquad \qquad 12 \\ \hline \end{array}$$

$$\begin{array}{r} 147 \qquad \qquad \qquad 13)48(3 \text{ d.} \\ \hline 42 \qquad \qquad \qquad \qquad \qquad 39 \\ \hline \end{array}$$

$$\begin{array}{r} 13)567(43 \text{ L.} \quad \text{Rem. } 9 \text{ d.} \\ \hline 52 \qquad \qquad \qquad \qquad \qquad 4 \\ \hline \end{array}$$

$$\begin{array}{r} 47 \qquad \qquad \qquad 13)36(2 \text{ f.} \\ \hline 39 \qquad \qquad \qquad \qquad \qquad 26 \\ \hline \end{array}$$

$$\begin{array}{r} \text{Rem. } 8 \text{ L.} \quad \text{Rem. } 10 \text{ f.} \\ \hline 20 \\ \hline \end{array}$$

$$\begin{array}{r} 13)160(12 \text{ s.} \\ \hline 13 \\ \hline \end{array}$$

$$\begin{array}{r} 30 \quad \text{L. s. d. f.} \\ \hline 26 \quad \text{Ans. } 43 \quad 12 \quad 3 \quad 2\frac{2}{3} \\ \hline \end{array}$$

\* Rem. 4 s.

Such remainders are always of the same name with the preceding part of the quot. Thus, the first remainder 8, and the first part of the quot 43, are both pounds; and the second remainder 4, and the second part of the quot 12, are both shillings; and the third remainder 9, and the third part of the quot 3, are both pence; and the fourth remainder 10, and the fourth part of the quot 2, are both farthings.

As we have no money under farthings, the last remainder cannot be reduced any lower; so there remains 10 farthings to be divided by 13; that is, there is wanting to complete the quot, the thirteenth part of 10 farthings, or the thirteenth part of every remaining farthing; that is, ten thirteenth parts of one farthing; so you set the remainder 10 above, and the divisor 13 below a line drawn between them, in the form of a fraction, of which the remainder is the numerator, and the divisor the denominator.

II. The Simple Rule of Three Inverse.

QUEST. 1. If 8 men can do a piece of work in 12 days, in how many days will 16 men do the same?

In this question the supposition is, If 8 men do a piece of work in 12 days, and the two terms contained in it are 8 men and 12 days: The demand lies in these words, In how many days will 16 men do the same? and the only term contained in it is 16 men.

The number sought here is the days in which 16 men will do the work, and the term in the supposition of the same kind is 12 days; wherefore I place 12 days as the middle term, according to Rule I. the two remaining

terms are extremes, and of the same kind, viz. both of them men.

It is obvious that the answer must be less than the middle term; for 16 men will do the work in fewer days than 8 men; and therefore, by Rule II. the greatest extreme, viz. 16, is the divisor; which place on the left hand, and the other extreme on the right, as directed in Rule III. Then multiplying the second and third, and dividing their product by the first, the quot comes out in days; that is, of the same name with the middle term.

And because the extreme found in the demand happens to be the divisor, the proportion is inverse.

QUEST. 2. How much plush of 3 quarters wide will line a cloak that hath in it 4 yards of 7 quarters wide?

$$\begin{array}{r} \text{Here the answer must be} \\ \text{greater than the middle term;} \\ \text{for the plush being narrower} \\ \text{than the cloth of which the} \\ \text{cloak is made, will require} \\ \text{more length.} \\ \hline \text{Ans. } 28 \text{ (} 9\frac{1}{3} \text{ yards.} \\ \hline \end{array}$$

QUEST. 3. If 36 yards be a rood of mason-work, at 3 feet high, how many yards will make a rood at 9 feet high?

$$\begin{array}{r} \text{Feet. yds. feet.} \\ 9 : 36 :: 3 \\ \hline 9)108 \\ \hline \text{Ans. } 12 \text{ yards.} \\ \hline \end{array}$$

SECT. II. The Compound Rule of Three.

THE Compound Rule of Three, from five given numbers finds a sixth, or from seven given numbers finds an eighth, or from eleven finds a twelfth, &c.

This rule easily and naturally admits of subdivisions, which, from the number of the terms given, may be denominated the rule of Five, the rule of Seven, the rule of Nine, the rule of Eleven, &c.

Questions in the Compound rule of three are also resolved into two parts, viz. a supposition and a demand.

If five terms be given, three of these are always found in the supposition, and two in the demand; if seven terms be given, four of these are in the supposition, and three in the demand; if nine terms are given, five of these are in the supposition, and four in the demand; if eleven terms be given, six of these are in the supposition, and five in the demand, &c.

The supposition and demand being distinguished, proceed to state the question; that is, to put the terms in due order for operation, as the following rules direct.

RULE I. Place that term of the supposition which is of the same kind with the number sought, in the middle.

The

The remaining terms are extremes, which must be classed into similar pairs, by making each pair consist of one term taken from the supposition, and another of the same kind taken from the demand.

II. Out of each similar pair, joined with the middle term, form a simple question; and in each simple question, so formed, find the divisor; *viz.* consider from the nature of the question, whether the answer must be greater or less than the middle term; and if the answer must be greater, the least extreme is the divisor; but if the answer must be less than the middle term, the greatest extreme is the divisor.

III. Place all the divisors on the left hand, and the other extremes on the right; then multiply the divisors, or extremes on the left, continually, for a divisor, and multiply the extremes on the right hand and the middle term, continually, for a dividend; and, lastly, divide the dividend by the divisor; and the quot is the answer, of the same name with the middle term.

The answer to questions in the compound rule of three may also be had by working the simple questions separately, or by themselves, in the following manner, *viz.*

The middle term, with any one pair of similar extremes, make the first simple question, and the answer to this question must be made the middle term to the next similar pair of extremes; and the answer to this second question, must in like manner be made the middle term to the following similar pair of extremes, &c.; and the answer to the last simple question is the number sought.

But the joint operation prescribed in Rule III. is the shorter as well as the easier method; for in working some of the simple questions, there may happen to be a remainder, and consequently the middle term of the next simple question will have some fractional part; which inconvenience is avoided by working jointly.

In every simple question, when the divisor is an extreme found in the supposition, the proportion is direct; but when the divisor is an extreme found in the demand, the proportion is inverse.

The three rules delivered above are indeed so calculated, as to make no difference between direct and inverse, or so as to render that distinction needless, the left-hand extremes being all divisors; but yet, as questions consisting entirely of direct proportions are the plainest and easiest, it will be proper, in the first place, to exemplify the rules by questions of the direct kind, and afterwards introduce such as are inverse.

And as questions in the rule of five are by far more numerous, and occur much oftener, than questions in the rule of seven, nine, or eleven; we shall, first of all, give questions in the rule of five, wherein both proportions are direct; then those wherein one or both proportions are inverse; and, lastly, give a few examples of the rules of seven, nine, and eleven.

### I. The Rule of Five Direct.

QUEST. 1. If 14 horses eat 56 bushels of corn in

16 days, how many bushels will 20 horses eat in 24 days?

The supposition in this question is, If 14 horses eat 56 bushels in 16 days; and the three terms contained in it are, 14 horses, 56 bushels, and 16 days: The demand is, How many bushels will 20 horses eat in 24 days? and the two terms contained in it are 20 horses, and 24 days.

The number sought is bushels, and the term in the supposition of the same kind is 56 bushels; wherefore, according to Rule I. place 56 bushels in the middle. The remaining four terms are extremes, which you class into similar pairs, by making each pair consist of one term taken from the supposition, and another of the same kind taken from the demand. Thus, 14 horses, and 20 horses make one pair; again, 16 days, and 24 days make another pair.

Out of the several similar pairs, joined with the middle term, you form five simple questions, according to Rule II. *viz.* by saying,

1. If 14 horses eat 56 bushels in a certain number of days, how many bushels will 20 horses eat in the same time?

2. If 16 days eat up, or consume, 56, or any other number of bushels, how many bushels will 24 days consume?

In the first simple question it is obvious, that the answer will be greater than the middle term; for 20 horses will eat more bushels than 14 horses will do in the same time; and so the least extreme, *viz.* 14, is the divisor; and because 14 is an extreme found in the supposition, the proportion is direct.

In the second simple question it is also plain, that the answer will be greater than the middle term; for 24 days will consume more bushels than 16 days; and consequently the least extreme, *viz.* 16, is the divisor; and because 16 is an extreme found in the supposition, the proportion is direct.

According to Rule III. place the divisors on the left hand, and the other extremes on the right, and both of them under one another, so that the two upper ones make a pair, or be of one kind, and the two lower ones make another pair, or be of one kind; and no matter which of the pairs be uppermost: then multiply the divisors, or the extremes on the left hand, for a divisor; and again multiply the extremes on the right, and the middle term, continually, for a dividend; and dividing the dividend by the divisor, the quot or answer comes out of the same name with the middle term, *viz.* 120 bushels.

<i>Joint operation.</i>	
<i>Horses.</i>	<i>bushels.</i>
If 14 :	56 :: 20
da. 16	24 da.
84	480

	224
	448
	448
	(0)
	<i>Ans.</i> 120 bushels.

The

The two simple questions into which the compound question is resolved, are stated, and wrought separately, as follows.

$\begin{array}{r} H. B. \quad H. \quad Days. \quad B. \quad Days. \\ \text{If } 14 : 56 :: 20 \quad \text{If } 16 : 80 :: 24 \\ \hline 20 \\ \hline 14 \mid 1120 (80 B. \\ \hline 112 \\ \hline (0) \end{array}$	$\begin{array}{r} 16 \mid 1920 (120 B. \\ \hline 16 \\ \hline 32 \\ \hline 32 \\ \hline (0) \end{array}$
<i>Ans.</i> 120 bushels, as before.	(0)

II. *The Rule of Five Inverse.*

THE questions that fall under this rule have commonly one of the proportions inverse, and the other direct, and sometimes the upper, and sometimes the lower, is the inverse proportion; and in some few questions both proportions are inverse. Now, though the three rules delivered above make no difference betwixt direct and inverse; yet, to bring the learner to some measure of acquaintance with this useful distinction, we shall, in stating the following questions, expose the same to view, by affixing an asterisk to the extremes of every inverse proportion.

*Quest.* If 14 horses eat 56 bushels of corn in 16 days, in how many days will 20 horses eat 120 bushels at that rate?

In this question the supposition is, that 14 horses eat 56 bushels in 16 days; and the demand is, In how many days 20 horses will eat 120 bushels.

The number sought is days, and the term in the supposition of the same kind is 16 days; and accordingly place 16 days in the middle. The remaining four terms are extremes; which class into similar pairs, by making each pair consist of one term taken from the supposition, and another of the same kind taken from the demand. Thus, 14 horses and 20 horses make one pair; again, 56 bushels and 120 bushels make another pair.

Out of the similar pairs, joined with the middle term, form so many simple questions; namely,

1. If 14 horses eat a certain number of bushels in 16 days, in how many days will 20 horses eat the same quantity?

2. If 56 bushels are eat up in 16 days, in how many days will 120 bushels be eat up by the same eaters?

In the first simple question it is plain, that the answer must be less than the middle term; for 20 horses will eat the same number of bushels in fewer days than 14 horses; and so the greatest extreme, viz. 20, is the divisor; and because 20 is an extreme found in the demand, the proportion is inverse.

In the second simple question it is also obvious, that the answer must be greater than the middle term; for 120 bushels will require more days to be eat up in than 56 bushels; and therefore the least extreme, viz. 56, is the divisor; and because 56 is an extreme found in the supposition, the proportion is direct.

We now proceed to state the question, by placing the divisors on the left hand, and the other extremes on the right; then multiply and divide, as directed in Rule III. and the answer comes out of the same name with the middle term, viz. 24 days.

<i>Joint operation.</i>

III. *The Rule of Seven, Nine, &c.*

*QUEST.* If 15 men eat 156 d. worth of bread in 6 days, when wheat is sold at 12 s. per bushel, in how many days will 30 men eat 520 d. worth of bread when wheat is at 10 s. per bushel?

This question belongs to the rule of seven, the number sought is days, and the term of the same kind in the supposition is 6 days, which place in the middle. The remaining six terms are extremes, which class into similar pairs, by taking one term of each pair out of the supposition, and another of the same kind out of the demand.

Out of the similar pairs, joined with the middle term, form so many simple questions, in each of which you find the divisor by Rule II.; then place the divisors on the left hand, and the other extremes on the right, as directed in Rule III. and multiply and divide, as follows.

*Joint operation.*

*Men. days. men.*

$$* 10 : d. 156 \quad * 30 : 6 :: 15 * \quad s. \quad 520 d. : 12 *$$

4680	30
10	75

<hr/>	

$$46800 \div 561600 (12 \text{ days. } \textit{Ans.})$$

468

936

936

(0)

This compound question is resolved into three simple ones, as follows.

$$30 : 6 :: 15 : 3$$

$$156 : 3 :: 520 : 10$$

$$10 : 10 :: 12 : 12 \text{ days. } \textit{Ans.}$$

**EXAMP.** If 100 lb. of Venice weigh 70 lb. of Lyons, and 120 lb. of Lyons weigh 100 lb. of Roan, and 80 lb. of Roan weigh 100 lb. of Toulouse, and 100 lb. of Toulouse weigh 74 lb. of Geneva, how many pounds of Geneva will 100 lb. of Venice weigh?

This question belongs to the rule of nine; and because pounds of Geneva is the number sought, the given pounds of Geneva, *viz.* 74, must be the middle term: the remaining terms are extremes; which may be classed into similar pairs, and stated as follows.

Ven. Ly.	<i>Tol. Gen. Tol.</i>	Ly. Ven.
120 : 120 : Roan 80	100 : 74 : 100	100 Roan : 70 : 100

8000	10000
120	70
<hr/>	
960000	700000
100	100
<hr/>	
96000000	70000000

74

$$96000000 \div 518400000 (53 \frac{8}{9} \text{ lb of Geneva. } \textit{Ans.})$$

480

380

288

(92)

But the question becomes more simple, and is wrought with greater ease and advantage, by being stated in the fractional form, as follows.

$$\frac{100 \times 70 \times 100 \times 100 \times 74}{100 \times 120 \times 80 \times 100} = \frac{70 \times 100 \times 74}{120 \times 80}$$

$$\frac{7 \times 10 \times 74}{12 \times 8} = \frac{5180}{96} = 53 \frac{8}{9} \text{ lb. of Geneva. } \textit{Ans.}$$

We shall conclude by observing, that every compound question, whether in the rule of five, seven, nine, or eleven, &c. properly speaking, consists but of three given terms. For the first term, or divisor, is to be considered as one compound term made up, or produced, by the continual multiplication of the extremes on the left hand, as so many component parts. In like manner, the third term is to be considered as one compound term, made up by the continual multiplication of the extremes on the right, as component parts. Suppose the question to be,

If L. 100 in 12 months gain L. 5 interest, what will L. 75 gain in 19 months?

Here it is obvious, that it is neither the L. 100 principal, nor the 12 months of time, taken separately, that gains the L. 5 interest, but both contribute their share; that is, they conspire, as joint causes, to produce one effect; and therefore their product, *viz.* the first term, is to be considered as the cause producing the effect; that is, the first term, *viz.*  $100 \times 12$ , causeth, produceth, or gains L. 5 of interest. And in like manner, the product of the extremes on the right hand, or the third term, *viz.*  $75 \times 9$ , is to be esteemed the cause that produceth a similar effect; that is, gains a like sum of interest, namely, the fourth term, or answer. In reference to this way of considering the first and third terms, the question might be stated as under.

$$\text{If } 100 \times 12 : 5 :: 75 \times 9$$

## CHAP. VIII. FELLOWSHIP.

**FELLOWSHIP**, called also *Company*, or *Partnership*, is when two or more persons join their stocks, and trade together, dividing the gain or loss proportionally among the partners.

Fellowship is either without or with time, called also *Single* or *Double*.

### I. Fellowship without time.

Questions in fellowship without time are wrought by the following proportion.

As the total stock  
To the total gain or loss,  
So each man's particular stock  
To his share of the gain or loss.

*Ques.* A and B make a joint stock: A puts in 121. and B 81.; they gain 51.: What is each man's share?

L.

	<i>L.</i>	<i>Stock, gain. Stock.</i>	
A's stock	12	A. If 20 : 5 :: 12	12
B's stock	8		5
Total stock 20			20 6 0

	<i>Stock, gain. Stock.</i>	<i>A's gain</i>	
B. If 20 : 5 :: 8	8	3 .	<i>L.</i>
	—	A's gain	3
	20 4 0	B's gain	3
		—	
B's gain 2 .		Total gain	5 proof.

*Note 1.* When in any question there happen to be remainders, they must be reduced equally low, so as to be all of one name; and then their sum will be either equal to the divisor, or exactly double, triple, &c. of it: and accordingly 1, 2, 3, &c. carried from the sum of the remainders, and added to the particular gains, will make up the total gain; or the divisor will always divide the sum of the remainders exactly, and the quot added to the particular gains will give the total gain.

*Note 2.* When the partners have equal shares of stock or capital, their shares of gain, loss, or neat proceeds, is found readily by dividing the total gain, loss, &c. by the number of partners.

II. Fellowship with time.

In fellowship with time, the gain or loss is divided among the partners, both in proportion to the stocks themselves, and also in proportion to the times of their continuance in company: For the same stock continued a double time, procures a double share of gain; and continued a triple time, procures a triple share of gain; that is, the shares of gain or loss are as the products of the several stocks multiplied into their respective times: and accordingly questions belonging to this rule are wrought by the following proportion.

As the sum of the products of the several stocks into their respective times

To the total gain or loss,

So the product of each man's stock into his time

To his share of the gain or loss.

*Quest. 1.* A put into company 40*l.* for 3 months, B 75*l.* for 4 months; they gain 70*l.*: What share must each man have?

A  $40 \times 3 = 120$ , third term for A's share.

B  $75 \times 4 = 300$ , third term for B's share.

420, first term.

	<i>L.</i>		<i>L.</i>
A. If 420 : 70 :: 120	70	B. If 420 : 70 :: 300	70
	120		300
420 840 20 <i>l.</i>		420 2100 50 <i>l.</i>	
	84		210

	<i>L.</i>		<i>(o)</i>
A's gain	20	<i>(o)</i>	
B's gain	50		
Total gain		70	proof.

*Quest. 2.* A put into company 560*l.* for 8 months, B 279*l.* for 10 months, and C 735*l.* for 6 months; they gained 1000*l.*: What share of the gain must each have?

A  $560 \times 8 = 4480$ , third term for A's share.

B  $279 \times 10 = 2790$ , third term for B's share.

C  $735 \times 6 = 4410$ , third term for C's share.

11680, first term.

	<i>L.</i>		<i>L.</i>		<i>s. d. f. Rem.</i>
A If 11680 : 1000 :: 4480	1000	4480	383	11	2—3—208
B If 11680 : 1000 :: 2790	1000	2790	238	17	4—3—80
C If 11680 : 1000 :: 4410	1000	4410	377	11	4—1—880

Proof 1000—00—0—0—11680

CHAP. IX. VULGAR FRACTIONS.

A FRACTION is a part or parts of an unit, or of any integer or whole; and is expressed by two numbers, one above and the other below a line drawn between them; as,  $\frac{1}{2}$ .

The number under the line shews into how many parts the unit or integer is divided; and is called the *denominator*, because it gives name to the fraction: The number above the line shews or tells how many of these parts the fraction contains; and is therefore called the *numerator*.

In the fraction  $\frac{1}{4}$  *l.* a pound Sterling is the unit, integer, or whole; and the denominator 4 shews that the pound is broken or divided into four equal parts, *viz.* 4 crowns; and the numerator 1 shews that the fraction contains three of these parts, that is, three crowns; and so the value of this fraction is fifteen shillings.

*COR. 1.* Hence it follows, 1. When the numerator of a fraction is less than the denominator, the value of such a fraction is less than unity, or the integer. 2. When the numerator is equal to the denominator, the value of the fraction is exactly an unit or integer. 3. When the numerator is greater than the denominator, the value of the fraction is more than an unit; and so often as the denominator is contained in the numerator, so many units or wholes are contained in the fraction. If, therefore the numerator of a fraction be divided by the denominator, the quot will be a number of units or integers, and the remainder so many parts.

The numerator of a fraction is to be considered as a dividend, and the denominator as a divisor; and the fraction itself may be taken to denote the quotient.

*COR. 2.* From this view of a fraction, it is evident, that if the numerator and denominator of a fraction be either both multiplied or both divided by the same number, the products or quotients will retain the same proportion to one another; and consequently the new fraction thence arising will be of the same value with the given one. Thus the numerator and denominator of the fraction  $\frac{2}{3}$  multiplied by 2 produces  $\frac{4}{6}$ ; and divided by 2 quotes  $\frac{1}{3}$ , both which fractions are of the same value with  $\frac{2}{3}$ .

Fractions having 10, 100, 1000, or 1, with any number of ciphers annexed to it, for a denominator, are called

ed decimal fractions; and fractions having any other denominator are called vulgar fractions.

1. A proper fraction is that whose numerator is less than its denominator, and consequently is in value less than unity; as  $\frac{3}{7}$ .

2. An improper fraction is that whose numerator is equal to or greater than its denominator; and consequently is in value equal to or greater than an unit; as  $\frac{4}{7}$ ,  $\frac{7}{7}$ .

3. A simple fraction is that which has but one numerator, and one denominator; and may be either proper or improper; as  $\frac{4}{7}$  or  $\frac{7}{7}$ .

4. A compound fraction is made up of two or more simple fractions, coupled together with the particle *of*, and is a fraction of a fraction; as  $\frac{3}{7}$  of  $\frac{1}{2}$ , or  $\frac{1}{2}$  of  $\frac{3}{7}$ .

5. A mixt number consists of an integer, and a fraction joined with it; as  $7\frac{1}{2}$ .

Because in most cases fractions can neither be added nor subtracted, till they be reduced, we begin with reduction.

#### Reduction of Vulgar Fractions.

**PROBLEM I.** To reduce an improper fraction to an integer, or mixt number.

**RULE.** Divide the numerator by the denominator, the quot gives integers; and the remainder, if there be any, placed over the divisor or denominator, gives the fraction to be annexed.

#### EXAMPLES.

1.  $8\frac{3}{4} = 85$  integers, there being no remainder.

2.  $5\frac{4}{7} = 54\frac{4}{7}$ , the remainder being 5.

3.  $98\frac{3}{5} = 98\frac{3}{5}$ , the remainder being 10.

4.  $173\frac{4}{8} = 173\frac{4}{8}$ , the remainder being 48.

**PROB. II.** To reduce a mixt number to an improper fraction.

**RULE.** Multiply the integer by the denominator; to the product add the numerator: The sum is the numerator of the improper fraction; and the denominator is the same as before.

#### EXAMPLES.

1.  $54\frac{4}{7} = 4\frac{17}{7}$ ; for  $54 \times 7 = 432$   
 $\quad \quad \quad + 4$

    Numerator 437

2.  $98\frac{3}{5} = 1\frac{4}{5}$ ; for  $98 \times 5 = 1372$   
 $\quad \quad \quad + 10$

    Numerator 1382

**PROB. III.** To reduce a whole number to a fraction of a given denominator.

**RULE.** Multiply the whole number by the given denominator; and place the product by way of numerator over the given denominator.

#### EXAMPLES.

1. Reduce 9 to a fraction whose denominator is 5.  
 $9 \times 5 = 45$ ; so the fraction is  $\frac{45}{5}$ .

2. Reduce 36 to a fraction whose denominator is 4.  
 $36 \times 4 = 144$ ; so the fraction is  $\frac{144}{4}$ .

3. Reduce 8 to a fraction whose denominator is 1.  
 $8 \times 1 = 8$ ; so the fraction is  $\frac{8}{1}$ .

The reason of the rule appears by reverting the operation; for if the numerator be divided by the denominator, it will quot the integer, or whole number.

**PROB. IV.** To reduce a compound fraction to a simple one.

**RULE.** Multiply the numerators continually for the numerator of the simple fraction; and multiply the denominators continually for its denominator.

#### EXAMPLES.

Ex. 1.  $\frac{3}{7}$  of  $\frac{4}{7} = \frac{12}{49}$ .

Ex. 2.  $\frac{1}{2}$  of  $\frac{3}{7}$  of  $\frac{1}{3} = \frac{1}{14}$ .

**COR.** From this problem may be deduced a method of reducing a fraction of a lesser denomination to a fraction of a greater denomination; namely,

Form a compound fraction, by comparing the given fraction with the superior denominations; and then reduce the compound fraction to a simple one.

#### EXAMPLES.

1. What fraction of a pound Sterling is  $\frac{3}{4}$  of a penny?  
 $\frac{3}{4}$  d. is  $\frac{3}{4}$  of  $\frac{1}{12}$  of  $\frac{1}{20}$  L. =  $\frac{3}{1600}$  L.

2. What fraction of a C. is  $\frac{1}{8}$  of a pound?  
 $\frac{1}{8}$  lb. is  $\frac{1}{8}$  of  $\frac{1}{4}$  of  $\frac{1}{4}$  C. =  $\frac{1}{64}$  C.

**PROB. V.** To reduce a fraction of a greater denomination to a fraction of a lesser denomination.

**RULE.** Multiply the numerator of the given fraction, as in reduction of integers descending; and the product is the numerator, to be placed over the denominator of the given fraction.

#### EXAMPLES.

1. What fraction of a shilling is  $\frac{3}{4}$  of a pound?

Here, as in reduction descending, multiply the numerator 3 by 20, because 20 shillings make a pound; as under.

L.

$$\frac{3 \times 20}{4} = 15 \text{ shilling.}$$

4

2. What fraction of a penny is  $\frac{3}{4}$  L.?

L.

$$\frac{4 \times 20 \times 12}{5} = 96 \text{ d.}$$

5

The reason of this rule will appear by observing, that every fraction may be considered in two views. Thus,  $\frac{3}{4}$  may either be considered as expressing three fourths of one unit, or as denoting the fourth part of three units. Now, if the unit be a pound Sterling, the fraction, in the latter view, will denote the fourth part of three pounds; and by reducing the numerator L. 3 to shillings, we have  $\frac{60}{4}$  s.; and again reducing 60 shillings to pence, we have  $\frac{720}{4}$  d. equal to  $\frac{180}{1}$  s. or to  $\frac{18}{1}$  L.

**PROB. VI.** To find the value of a fraction.

**RULE.** Reduce the numerator to the next inferior denomination; divide by the denominator; and the quot, if nothing remain, is the value complete.

If there be any remainder, it is the numerator of a fraction whose denominator is the divisor. This fraction may either be annexed to the quotient, or reduced to value, if there be any lower denomination.

EXAMP.

EXAMP. What is the value of  $\frac{1}{2}$  L.?

$$\begin{array}{r} 3 \\ 20 \\ \hline \end{array}$$

4)60(15 s. Here consider  $\frac{1}{2}$  L. as expressing the fourth part of three pounds Sterling; so reduce L 3, the numerator, to shillings, and divide by the denominator 4; and as nothing remains, the quot, viz. 15 shillings, is the value complete.

(o)

$$\begin{array}{r} L. \quad s. \\ \frac{1}{2} = 15 \end{array}$$

The reason of this rule is the same with that in the preceding problem. It is by the practice of this problem that remainders in the rule of three are reduced to value.

PROB. VII. To reduce a fraction to its lowest terms.

RULE. Divide both numerator and denominator by their greatest common divisor; the two quots make the new fraction.

The greatest common divisor of the numerator and denominator of a fraction is found by the following

RULE. Divide the greater of these two numbers by the lesser; and again divide the divisor by the remainder; and so on, continually, till 0 remains. The last divisor is their greatest common divisor.

EXAMP. Reduce  $\frac{784}{952}$  to its lowest terms.

First find the greatest common divisor of the numerator and denominator, as follows

$$\begin{array}{r} 784)952(1 \\ \underline{784} \\ 168)784(4 \\ \underline{672} \\ 112)168(1 \\ \underline{112} \\ \hline \end{array}$$

(o)

Greatest common divisor 56)112(2  
 $\underline{112}$   
 (o)

Then proceed to reduce the given fraction to its lowest terms, by dividing both numerator and denominator by 56, the great common divisor.

$$\begin{array}{r} 56)784(14 \text{ new num.} \\ \underline{56} \\ 224 \\ \underline{224} \\ \hline \end{array} \quad \begin{array}{r} 56)952(17 \text{ new denom.} \\ \underline{56} \\ 392 \\ \underline{392} \\ \hline \end{array}$$

(o) (o)

So  $\frac{784}{952} = \frac{14}{17}$ .

PROB. VIII. To reduce fractions of different denominators to a common denominator.

RULE. Multiply the denominators continually for the common denominator; and multiply each numerator into all the denominators, except its own, for the several numerators.

EXAMPLES.

Reduce  $\frac{1}{2}$  and  $\frac{2}{3}$  to a common denominator.

$$4 \times 5 = 20, \text{ the common denominator.}$$

$$3 \times 5 = 15, \text{ the first numerator.}$$

$$4 \times 4 = 16, \text{ the second numerator.}$$

So the new fractions are  $\frac{15}{20}$  and  $\frac{16}{20}$ .

When the denominator of one fraction happens to be an aliquot part of the denominator of another fraction, the former may be reduced to the same denominator with the latter, by multiplying both its numerator and denominator by the number which denotes how often the lesser denominator is contained in the greater.

$$\text{Thus, } \frac{3}{4} + \frac{1}{2} = \frac{3}{4} + \frac{2}{4}$$

Here 3 is contained in 12 four times; so multiply both 2 and 3 by 4, and you have  $\frac{8}{12} = \frac{2}{3}$ .

$$\text{Again, } \frac{1}{2} + \frac{1}{3} + \frac{1}{4} = \frac{6}{12} + \frac{4}{12} + \frac{3}{12}$$

Sometimes too, the fraction that has the greater denominator may, in like manner, be reduced to the same denominator with that which has the lesser, by division.

$$\text{Thus, } \frac{1}{2} + \frac{1}{3} = \frac{1}{2} + \frac{1}{3}$$

$$\text{And } \frac{6}{12} + \frac{4}{12} + \frac{3}{12} = \frac{4}{12} + \frac{3}{12} + \frac{1}{12}$$

The reason of the above rule for reducing fractions to a common denominator is evident from Corollary II.; for both numerator and denominator of every fraction are multiplied by the same number, or by the same numbers.

After fractions are reduced to a common denominator, they may frequently be reduced to lower terms, by dividing all the numerators, and also the common denominator, by any divisor that leaves no remainder, or by cutting off an equal number of ciphers from both.

Addition of Vulgar Fractions.

RULE I. If the given fractions have all the same denominator, add the numerators, and place the sum over the denominator.

EX. 1. What is the sum of  $\frac{1}{2} + \frac{1}{2}$ ? *Ans.*  $\frac{2}{2}$ .

2. What is the sum of  $\frac{1}{3} + \frac{1}{3}$ ? *Ans.*  $\frac{2}{3}$ , by Prob. VII.

RULE II. If the given fractions have different denominators, reduce them to a common denominator, by Prob. VIII. then add the numerators, and place the sum over the common denominator.

EX. What is the sum of  $\frac{1}{2} + \frac{1}{3}$ ?

$$\frac{1}{2} + \frac{1}{3} = \frac{3}{6} + \frac{2}{6}, \text{ by Prob. VIII.}$$

$$\text{and } \frac{3}{6} + \frac{2}{6} = \frac{5}{6}$$

RULE III. If mixt numbers be given, or if mixt numbers and fractions be given, reduce the mixt numbers to improper fractions, by Prob. II; then reduce the fractions to a common denominator, by Prob. VIII. and add the numerators.

EX. What is the sum of  $7\frac{1}{2} + 5\frac{1}{3}$ ?

$$7\frac{1}{2} + 5\frac{1}{3} = 12\frac{1}{2} + 5\frac{1}{3}, \text{ by Prob. II.}$$

$$\text{and } 12\frac{1}{2} + 5\frac{1}{3} = 17\frac{2}{6} + 5\frac{2}{6}, \text{ by Prob. VIII.}$$

$$\text{and } 17\frac{2}{6} + 5\frac{2}{6} = 22\frac{4}{6} = 13\frac{2}{3}, \text{ by Prob. I.}$$

When mixt numbers, or mixt numbers and fractions, are given, you may, with greater expedition, work by the following rule, viz. reduce only the fractions to a common denominator, and add the sum of the fractions

to the integers. The above example wrought in this manner follows.

Ex. What is the sum of  $7\frac{1}{2} + 5\frac{7}{8}$ ?

$$\frac{1}{2} + \frac{7}{8} = \frac{4}{8} + \frac{7}{8} = \frac{11}{8} = 1\frac{3}{8}.$$

$$\text{and } 7 + 5 + 1\frac{3}{8} = 13\frac{3}{8}.$$

**RULE IV.** If any, or all of the given fractions, be compound, first reduce the compound fractions to simple ones, by Prob. IV.; then reduce the simple fractions to a common denominator, by Prob. VIII. and add the numerators.

Ex. What is the sum of  $\frac{2}{3}$  of  $\frac{4}{5} + \frac{1}{4}$ ?

$$\frac{2}{3} \text{ of } \frac{4}{5} = \frac{8}{15}, \text{ by Prob. IV.}$$

$$\text{and } \frac{8}{15} + \frac{1}{4} = \frac{32}{60} + \frac{15}{60}, \text{ by Prob. VIII.}$$

$$\text{and } \frac{32}{60} + \frac{15}{60} = \frac{47}{60} = 1\frac{17}{60}, \text{ by Prob. I.}$$

**RULE V.** If the given fractions be of different denominations, first reduce them to the same denomination, by Cor. of Prob. IV. or by Prob. V.; then reduce the fractions, now of one denomination, to a common denominator, by Prob. VIII. and add the numerators; or reduce each of the given fractions separately to value, by Prob. VI. and then add their values.

Ex. What is the sum of  $\frac{1}{2}$  s. and  $\frac{3}{4}$  l.?

METHOD I.

$$\frac{1}{2} \text{ s.} = \frac{1}{2} \text{ of } \frac{1}{20} \text{ l.} = \frac{1}{40} \text{ l. by Cor. Prob. IV.}$$

$$\text{and } \frac{3}{4} \text{ l.} + \frac{1}{40} \text{ l.} = \frac{15}{20} \text{ l.} + \frac{1}{40} \text{ l.} = \frac{15.5}{40} \text{ l. by Prob. VIII.}$$

$$\text{and } \frac{15.5}{40} \text{ l.} = \frac{155}{400} \text{ l.} = 18 \text{ s. } 3 \text{ d. by Prob. VI.}$$

METHOD II.

$$\frac{1}{2} \text{ l.} = \frac{7 \times 20}{8} \text{ s.} = 17.5 \text{ s. by Prob. V.}$$

$$\text{and } \frac{1}{2} \text{ l.} + 17.5 \text{ s.} = \frac{6}{8} \text{ l.} + 17.5 \text{ s. by Prob. VIII.}$$

$$\text{and } \frac{6}{8} \text{ l.} + 17.5 \text{ s.} = 18.5 \text{ s. by Prob. I. and VI.}$$

METHOD III.

$$\left. \begin{aligned} \frac{1}{2} \text{ s.} &= \frac{3 \times 12}{4} \text{ d.} = 9 \text{ d.} \\ \frac{3}{4} \text{ l.} &= \frac{7 \times 20}{8} \text{ s.} = 17.5 \text{ s.} = 17 - 6 \\ &\quad \underline{18 - 3} \end{aligned} \right\} \text{ by Prob. VI.}$$

### Subtraction of Vulgar Fractions.

**RULE I.** If the given fractions have the same denominator, subtract the lesser numerator from the greater, and place the remainder over the denominator.

Ex. From  $\frac{4}{5}$  subtract  $\frac{1}{5}$ .

$$\frac{4}{5} - \frac{1}{5} = \frac{3}{5}.$$

**RULE II.** If the given fractions have different denominators, reduce them to a common denominator, by Prob. VIII.; then subtract the lesser numerator from the greater, and place the remainder over the common denominator.

Ex. From  $\frac{1}{2}$  subtract  $\frac{1}{3}$ .

$$\frac{1}{2}, \frac{1}{3} = \frac{3}{6}, \frac{2}{6}, \text{ by Prob. VIII.}$$

$$\text{and } \frac{3}{6} - \frac{2}{6} = \frac{1}{6}.$$

**RULE III.** If it be required to subtract one mixt number from another, or to subtract a fraction from a mixt number, reduce the mixt numbers to improper

fractions, by Prob. II.; then reduce the fractions to a common denominator, by Prob. VIII. and subtract the one numerator from the other.

Ex. From  $7\frac{1}{2}$  subtract  $5\frac{7}{8}$ .

$$7\frac{1}{2}, 5\frac{7}{8} = \frac{14}{2}, \frac{45.5}{8}, \text{ by Prob. II.}$$

$$\text{and } \frac{14}{2}, \frac{45.5}{8} = \frac{56}{8}, \frac{45.5}{8}, \text{ by Prob. VIII.}$$

$$\text{and } \frac{56}{8} - \frac{45.5}{8} = \frac{10.5}{8} = 2\frac{1}{2} = 2\frac{4}{8}, \text{ by Prob. I. and VII.}$$

**RULE IV.** If it be required to subtract a mixt number, or a fraction, from an integer, first subtract the fraction from an unit borrowed; that is, subtract the numerator from the denominator, and place the remainder, as a numerator, over the denominator, for the fractional part of the answer: Then, for the unit borrowed, add 1 to the integral part of the mixt number; subtract the sum from the given integer; and prefix the remainder to the fractional part of the answer. But when a fraction is subtracted from an integer, for the unit borrowed, take 1 from the given integer, and prefix the remainder to the fractional part of the answer.

Ex. 1. From 14 subtract  $7\frac{7}{8}$ .

Here say,  $5 - 3 = 2$ ; so  $\frac{7}{8}$  is the fractional part of the answer: Then say, 1 borrowed and 7 make 8, and 8 subtracted from 14 leaves 6; which prefix to the fractional part: So the difference or answer is  $6\frac{7}{8}$ .

Ex. 2. From 12 subtract  $\frac{1}{2}$ .

Here say,  $7 - 3 = 4$ ; so  $\frac{1}{2}$  is the fractional part; then say, 1 borrowed from 12, and 11 remains: So  $11\frac{1}{2}$  is the difference, or answer.

*Note.* When an integer is given to be subtracted from a mixt number, you have only to subtract the given integer from the integral part of the mixt number; and to the remainder annex the fractional part. Thus,  $9\frac{3}{4} - 5 = 4\frac{3}{4}$ .

**RULE V.** If one or both of the given fractions be compound, first reduce the compound fractions to simple ones, by Prob. IV.; then reduce the simple fractions to a common denominator, by Prob. VIII.; and subtract the one numerator from the other.

Ex. From  $\frac{4}{5}$  subtract  $\frac{1}{3}$  of  $\frac{1}{2}$ .

$$\frac{1}{3} \text{ of } \frac{1}{2} = \frac{1}{6}, \text{ by Prob. IV.}$$

$$\text{and } \frac{4}{5}, \frac{1}{6} = \frac{24}{30}, \frac{5}{30}, \text{ by Prob. VIII.}$$

$$\text{and } \frac{24}{30} - \frac{5}{30} = \frac{19}{30} = \frac{19}{30}, \text{ by Prob. VII.}$$

**RULE VI.** When the given fractions are of different denominations, first reduce them to the same denomination, by Cor. of Prob. IV. or by Prob. V., then reduce the fractions, now of one denomination, to a common denominator, by Prob. VIII.; and subtract the one numerator from the other. Or, reduce each of the given fractions, separately, to value, by Prob. VI.; and subtract the one value from the other.

Ex. From  $\frac{1}{2}$  l. subtract  $\frac{1}{3}$  s.

METHOD I.

$$\frac{1}{2} \text{ s.} = \frac{1}{2} \text{ of } \frac{1}{20} \text{ l.} = \frac{1}{40} \text{ l. by Cor. Prob. IV.}$$

$$\text{and } \frac{1}{3}, \frac{1}{40} = \frac{13.3}{120}, \frac{3}{120}, \text{ by Prob. VIII.}$$

$$\text{and } \frac{13.3}{120} - \frac{3}{120} = \frac{10.3}{120} \text{ l.} = 14 \text{ s. } 4 \text{ d. by Prob. I. and VI.}$$

METHOD II.

$$\frac{1}{2} \text{ l.} = \frac{3 \times 20}{4} \text{ s.} = 15 \text{ s. by Prob. V.}$$

$$\text{and } \frac{6}{10}, \frac{3}{12} = \frac{18}{30}, \frac{7.5}{30}, \text{ by Prob. VIII.}$$

$$\text{and } \frac{18}{30} - \frac{7.5}{30} = \frac{10.5}{30} \text{ s.} = 14 \text{ s. } 4 \text{ d. by Prob. I. and VI.}$$

METHOD

METHOD III.

$$\left. \begin{aligned} \frac{1}{2} l. &= \frac{3 \times 20}{4} s. = 6^{\circ} s. = 15^{\circ} \frac{s.}{d.} \\ \frac{1}{3} s. &= \frac{2 \times 12}{3} d. = 8^{\circ} d. = \frac{8}{14-4} \end{aligned} \right\} \text{by Prob. VI.}$$

Multiplication of Vulgar Fractions.

In multiplication of fractions there is no occasion to reduce the given fractions to a common denominator, as in addition and subtraction: only if a mixt number be given, reduce it to an improper fraction; if an integer be given, reduce it to an improper fraction, by putting an unit for its denominator; if a compound fraction be given, you may either reduce it to a simple one, or, instead of the particle *of*, insert the sign of multiplication: then work by the following

**RULE.** Multiply the numerators for the numerator of the product, and multiply the denominators for its denominator.

EXAMP. 1.  $\frac{2}{3} \times \frac{4}{5} = \frac{8}{15}$

2.  $\frac{1}{2} \times 5 \frac{1}{3} = \frac{1}{2} \times \frac{17}{3} = \frac{17}{6} = 4 \frac{1}{6}$

**NOTE 1.** If any number be multiplied by a proper fraction, the product will be less than the multiplicand; for multiplication is the taking of the multiplicand as often as the multiplier contains unity; and consequently, if the multiplier be greater than unity, the product will be greater than the multiplicand; if the multiplier be unity, the product will be equal to the multiplicand; and if the multiplier be less than unity, the product will, in the same proportion, be less than the multiplicand. Thus, supposing the multiplier to be  $\frac{1}{2}$  or  $\frac{1}{3}$ , the product, in this case, will be equal to one half or to one third of the multiplicand.

2. Mixt numbers may be multiplied without reducing them to improper fractions, by working as in the margin; where first multiply the integral parts, viz. 54 by 24; then multiply the integral parts cross-ways into their altern fractions, viz. 54 by  $\frac{1}{2}$ , and the product 27 set down; in like manner multiply 24 by  $\frac{1}{3}$ , and the product 6 likewise set down; then add; and to the sum annex  $\frac{1}{6}$ , the product of the two fractions.

3. In multiplying a fraction by an integer, you have only to multiply the numerator by the integer, the putting one for the denominator being only matter of form. And to multiply a fraction by its denominator is to take away the denominator, the product being an integer, the same with, or equal to the numerator. Thus,  $\frac{7}{8} \times 8 = 7$ . For  $\frac{7}{8} \times \frac{8}{8} = 7$ .

4. If the numerators and denominators of two equal fractions be multiplied cross-ways, the products will be equal. Thus, if  $\frac{1}{3} = \frac{2}{6}$ , then will  $3 \times 12 = 9 \times 4$ ; for multiplying both by 9, we have  $3 = \frac{9 \times 4}{12}$ ; and multiplying these by 12, we have  $3 \times 12 = 9 \times 4$ . Hence, if four numbers be proportional, the product of the extremes will be equal to the product of the means: for if

$3 : 9 :: 4 : 12$ , then  $\frac{3}{9} = \frac{4}{12}$ ; and it has been proved, that  $3 \times 12 = 9 \times 4$ . Therefore if, of four proportional numbers, any three be given, the fourth may easily be found, viz. when one of the extremes is sought, divide the product of the means by the given extreme; and when one of the means is sought, divide the product of the extremes by the given mean.

5. In multiplying fractions, equal factors above and below may be dashed or dropt. Thus,  $\frac{1}{2}$  of  $\frac{1}{3}$  of  $\frac{1}{4}$  of  $\frac{1}{5} = \frac{1}{2} \times \frac{1}{3} \times \frac{1}{4} \times \frac{1}{5}$ ; and dropping the factors 2, 3, 4, both above and below, the product is  $\frac{1}{5}$ . In like manner, to facilitate an operation, a factor above and another below may be divided by the same number: Thus,

$$\frac{6}{7} \times \frac{5}{12} = \frac{5}{7} \times \frac{1}{2} = \frac{5}{14}$$

Or we may exchange one numerator for another: Thus,  $\frac{6}{7} \times \frac{5}{12} = \frac{5}{12} \times \frac{6}{7} = \frac{5}{7} \times \frac{1}{2} = \frac{5}{14}$ .

6. To take any part of a given number, is to multiply the said number by the fraction. Thus,  $\frac{1}{3}$  of 300 is found thus,  $\frac{1}{3} \times \frac{300}{1} = \frac{1}{3} \times \frac{300}{1} = \frac{300}{3} = 100$ . In like manner,  $\frac{1}{4}$  of 45, is  $\frac{1}{4} \times 45 = \frac{45}{4} = 11 \frac{1}{4}$ ;  $\frac{1}{5}$  of  $\frac{63}{4}$  is  $\frac{1}{5} \times \frac{63}{4} = \frac{63}{20} = 3 \frac{3}{20}$ . Hence, to reduce a compound fraction to a simple one, is to multiply the parts of it into one another.

7. If a multiplicand of two or more denominations be given to be multiplied by a fraction, reduce the higher part or parts of the multiplicand to the lowest species, and then multiply. Thus, to multiply 8 l. 10 $\frac{1}{2}$  s. by  $\frac{2}{3}$ , say, 8 l. = 8  $\times$  20 s. = 160 s. and 160 + 10 $\frac{1}{2}$  = 170 $\frac{1}{2}$  s. =  $\frac{341}{2}$  s.; and  $\frac{2}{3} \times \frac{341}{2} = \frac{341}{3} = 113 \frac{2}{3}$  s. = L. 5 : 13 : 10. Or, without reducing, you may multiply the given multiplicand by the numerator of the fraction, and divide the product by the denominator.

EXAMP. 1. Multiply  $\frac{1}{2}$  by  $\frac{2}{3}$ . Prod.  $\frac{1}{3}$ .  
 2. Multiply  $7 \frac{8}{9}$  by  $\frac{2}{3}$ . Prod.  $6 \frac{16}{9}$ .  
 3. Multiply  $8 \frac{1}{2}$  by  $9 \frac{1}{2}$ . Prod.  $84 \frac{1}{4}$ .

The reason of the rule may be shewn thus:  $\frac{2}{3} \times \frac{3}{2} = 1$ ; for  $\frac{2}{3} = \frac{2}{3}$ , and  $\frac{3}{2}$  of  $\frac{2}{3}$  is  $\frac{3}{3}$ ; and consequently  $\frac{2}{3}$  of  $\frac{3}{2}$  is  $\frac{3}{2}$ .

The truth of the rule may also be proved thus: Assume two fractions equal to two integers, such as  $\frac{2}{3}$ , and  $\frac{3}{2}$ , equal to 2 and 3, and the product of the fractions will be equal to the product of the integers; for  $\frac{2}{3} \times \frac{3}{2} = \frac{6}{6} = 6$ , and  $2 \times 3 = 6$ .

Division of Vulgar Fractions.

In division of fractions, if a mixt number be given, reduce it to an improper fraction; if an integer be given, put an unit for its denominator; if a compound fraction be given, reduce it to a simple one, and then work by the following

**RULE.** Multiply cross-ways, viz. the numerator of the divisor into the denominator of the dividend, for the denominator of the quot; and the denominator of the divisor into the numerator of the dividend, for the numerator of the quot.

EXAMP. 1.  $\frac{2}{3} \div \frac{1}{4} = \frac{2}{3} \times \frac{4}{1} = \frac{8}{3} = 2 \frac{2}{3}$ .  
 2.  $\frac{1}{2} \div 4 \frac{1}{2} = \frac{1}{2} \div \frac{9}{2} = \frac{1}{2} \times \frac{2}{9} = \frac{1}{9}$ .  
 3.  $4 \frac{1}{2} \div \frac{3}{8} = \frac{9}{2} \div \frac{3}{8} = \frac{9}{2} \times \frac{8}{3} = 12$ .

Note.

Note 1. Instead of working division of fractions as taught above, you may invert the divisor, and then multiply it into the dividend. Thus, in Example 1. instead of  $\frac{1}{2} \div \frac{1}{3}$ , you may say,  $\frac{1}{2} \times \frac{3}{1} = \frac{3}{2} = 1 \frac{1}{2}$ .

2. If any number be divided by a proper fraction, the quot will be greater than the dividend: for in division the quot shews how often the divisor is contained in the dividend; and consequently if the divisor be greater than unity, the quot will be less than the dividend; if the divisor be unity, the quot will be equal to the dividend; and if the divisor be less than unity, the quot will, in the same proportion, be greater than the dividend. Thus, supposing the divisor to be  $\frac{1}{2}$ , or  $\frac{1}{3}$ , the quot in this case will be double or triple of the dividend.

3. To divide a fraction by an integer, is only to multiply the integer into the denominator of the fraction, the numerator being continued. Thus,  $7 \frac{1}{2} \div 3 = 2 \frac{1}{6}$ .

4. A mixt number may sometimes be divided by an integer, with more ease, in the following manner. Divide the integral part of the mixt number by the given integer; and if there be no remainder, divide likewise the fraction of the mixt number by the given integer, and annex the quot to the integral quot formerly found. But if, in dividing the integral part, there happen to be a remainder, prefix this remainder to the fraction for a new mixt number; which reduce to an improper fraction: then divide the improper fraction by the given integer, and annex the quot to the integral quot formerly found. Thus, if it be required to divide  $15 \frac{1}{2}$  by 8, say, 8) 15(1, and 7 remains; which 7, prefixed to the fraction, gives  $7 \frac{1}{2}$  for a new mixt number; and this, reduced to an improper fraction, is  $\frac{15}{2}$ , and 8)  $\frac{15}{2}$  ( $3 \frac{1}{2}$ : so the complete quot is  $1 \frac{1}{2}$ .

5. If the factors of the numerator and denominator of the quots, instead of being actually multiplied, be only connected with the sign of multiplication, it will be easy to drop such factors, above and below, as happen to be the same, thus:  $\frac{1}{2} \div \frac{1}{3} = \frac{1 \times 4 \times 3}{3 \times 5 \times 8} = \frac{4 \times 3}{5 \times 8} = \frac{12}{40} = \frac{3}{10}$ . Or a factor above and below may be divided by the same number thus:  $\frac{6 \times 7}{5 \times 12} = \frac{7}{5 \times 2} = \frac{7}{10}$ . Or the factors of the numerator of the quot may be exchanged, thus:  $\frac{3}{2} \div \frac{5}{8} = \frac{3 \times 5}{2 \times 9} = \frac{5 \times 3}{2 \times 9} = \frac{15}{18} = \frac{5}{6}$ .

6. To divide an integer by a fraction, is to divide the product of the denominator and integer by the numerator, thus:  $\frac{5}{4} \div 8 = \frac{5 \times 8}{4} = 5 \times 2 = 10$ .

7. If the divisor and dividend have the same denominator, you have only to divide the numerator of the dividend by the numerator of the divisor, thus:  $\frac{8}{5} \div \frac{3}{5} = \frac{8}{3} = 2 \frac{2}{3}$ .

8. If a dividend of two or more denominations be given to be divided by a fraction, reduce the higher part or parts of the dividend to the lowest species, and then divide. Thus, to divide 61. 9  $\frac{1}{2}$  s. by  $\frac{1}{3}$ , say, 61 = 6  $\times$  20 s. = 120; and 120 + 9  $\frac{1}{2}$  = 129  $\frac{1}{2}$  s. =  $\frac{259}{2}$ ; and  $\frac{259}{2} \div \frac{1}{3} = \frac{259 \times 3}{2} = 194 \frac{1}{2}$  s. = 9 l. 14 s. 7  $\frac{1}{2}$  d.

Or, Divide the given multiplicand by the numerator of the fraction, and multiply the quot by the denominator.

EXAMPL. Divide L. 276 : 16 : 8 among four men, A, B, C, D, so that A, B, C, may have equal shares, and D only two thirds of one of their shares.

$$1 + 1 + 1 + \frac{2}{3} = \frac{1}{3} + \frac{1}{3} + \frac{1}{3} + \frac{1}{3} = \frac{4}{3}$$

L.	s.	d.	
11) 276	16	8	( 25 3 4 $\times$ 3 = 75 10 A.
			$\times$ 3 = 75 10 B.
			$\times$ 3 = 75 10 C.
			$\times$ 2 = 50 6 8 D.

Proof 276 16 8

The reason of the rule will appear by considering, that the method here used is nothing else but the reducing the divisor and dividend to a common denominator, and then dividing the one numerator by the other. Thus,  $\frac{1}{2} \div \frac{1}{3}$ , for reducing the divisor and dividend to a common denominator, we have  $\frac{3}{6} \div \frac{2}{6} = \frac{3}{2}$ .

The truth of the rule may also be proved by assuming two fractions equal to two integers, such as,  $\frac{6}{4}$  and  $\frac{6}{4}$  equal to 2 and 4, and the quot of the fractions will be equal to the quot of the integers. Thus,  $\frac{6}{4} \div \frac{6}{4} = \frac{2}{4} = 2$ , and  $2 \div 4 = \frac{1}{2}$ .

The Simple Rule of Three in Vulgar Fractions.

The question is stated as formerly taught in the rule of three. The extremes must be of one denomination. Reduce mixt numbers and integers to improper fractions, compound fractions to simple ones, and then work by the following rule, viz.

Multiply the second and third terms, and divide the product by the first term; that is, multiply the numerator of the first term into the denominators of the second and third, for the denominator of the answer; and multiply the denominator of the first term into the numerators of the second and third, for the numerator of the answer.

I. Direct.

QUEST. If  $\frac{1}{2}$  yard cost  $\frac{1}{3}$  l. what will  $\frac{2}{3}$  yard cost?

Ans. L.    Yd.  
If  $\frac{1}{2} : \frac{1}{3} :: \frac{2}{3} : ?$ .

$$\text{Ans. } \frac{4 \times 5 \times 9}{3 \times 8 \times 10} = \frac{5 \times 9}{3 \times 2 \times 10} = \frac{9}{3 \times 2 \times 2} = \frac{3}{4} = \frac{3}{4} \text{ l.} = \frac{3 \times 20}{4} \text{ s.} = 60 \text{ s.} = 60 \text{ s.} = 1 \text{ s.}$$

II. Inverse.

QUEST. If  $\frac{1}{2}$  yard of cloth that is 2 yards wide, will make a garment, how much of any other cloth that is  $\frac{1}{3}$  yard wide will make the same garment?

Bread. len.    Bread.  
 $\frac{1}{2} : \frac{1}{3} :: ?$ .

$$\text{Ans. } \frac{5 \times 3 \times 2}{3 \times 4 \times 1} = \frac{5 \times 2}{4} = \frac{10}{4} = 2 \frac{1}{2} \text{ yards.}$$

The Compound Rule of Three in Vulgar Fractions.

QUEST. If  $\frac{1}{2}$  acre of grafs be cut down by 2 men in  $\frac{1}{3}$  day, how many acres shall be cut down by 6 men in  $3\frac{1}{3}$  days?

Men. acr. men.

$$\frac{2}{3} : \frac{1}{2} :: \frac{6}{1} : \frac{6}{3} \text{ days.}$$

$$\text{Ans. } \frac{3 \times 3 \times 60}{4 \times 4 \times 3} = \frac{3 \times 60}{4 \times 4} = \frac{3 \times 15}{4} = 11\frac{1}{4} \text{ acr.}$$

Or thus:

$$\text{Ans. } \frac{3 \times 1 \times 3 \times 6 \times 10}{2 \times 2 \times 4 \times 1 \times 3} = \frac{3 \times 6 \times 10}{2 \times 2 \times 4} = \frac{3 \times 3 \times 5}{2 \times 2} = 11\frac{1}{4} \text{ acres.}$$

CHAP. X. RULES OF PRACTICE.

WHEN the first term of a question in the rule of three happens to be unity, the answer may frequently be found more speedily and easily than by a formal stating or working of the rule of three; and the directions to be observed in such operations are called *Rules of Practice*.

The rules of practice naturally follow the doctrine of vulgar fractions, the operation being nothing else but a multiplying the number whose price is required, by such a fraction of a pound, of a shilling, or of a penny, as denotes the rate or price of one.

Thus, if the price of 24 yards, at 6 s. 8 d. per yard, be demanded, the answer is found by multiplying 24 by  $\frac{1}{3}$ , the fraction of a pound equivalent to 6 s. 8 d. viz.  $\frac{2}{3} \times 24 = 16$  l.

Hence, it is obvious, that to multiply a number by a fraction whose numerator is unity, is to divide the said number by the denominator of the fraction. But if the numerator of the fraction be not unity, you must first multiply the given number by the numerator, and then divide the product by the denominator. Thus, if the rate be 13 s. 4 d. =  $\frac{1}{3}$  l. the price of 24 yards is found by saying,  $\frac{2}{3} \times 24 = 16$  l.; or take  $\frac{1}{3}$  of the given number twice.

When the fraction denoting the rate happens to be compound, the product or answer is found by dividing the given number by one of the denominators of the compound fraction, the quot by another, and the next quot by the third, &c. Thus, if the rate be 2 farthings =  $\frac{1}{12}$  of  $\frac{1}{12}$  of  $\frac{1}{12}$  l. the price of 1440 yards is found by saying,  $\frac{1440}{12} = 120$ , and  $\frac{120}{12} = 10$ , and  $\frac{10}{12} = 8\frac{1}{3}$  s.

When the rate is expressed by two or more simple fractions, connected with the sign +, the product or answer is found by dividing the given number successively by the several denominators, and then adding the quot. Thus, if the rate be 3 s. =  $\frac{1}{20} + \frac{1}{12}$  l. the price of 80 yards is found by saying,  $\frac{80}{20} = 4$ , and  $\frac{80}{12} = 6\frac{2}{3}$ , and  $4 + 6\frac{2}{3} = 10\frac{2}{3}$  s.

The fractions equivalent to any number of farthings under 4, to any number of pence under 12, and to any number of shillings under 20, are exhibited in the following tables.

T A B L E I.

Farthings.	of a penny.	of a shilling.	of a pound.
1	$\frac{1}{4}$	$\frac{1}{2}$ of $\frac{1}{12}$	$\frac{1}{2}$ of $\frac{1}{20}$ of $\frac{1}{20}$
2	$\frac{1}{2}$	$\frac{1}{6}$ of $\frac{1}{12}$	$\frac{1}{6}$ of $\frac{1}{20}$ of $\frac{1}{20}$
3	$\frac{3}{4}$	$\frac{1}{4}$ of $\frac{1}{12}$	$\frac{1}{4}$ of $\frac{1}{20}$ of $\frac{1}{20}$

T A B L E II.

Pen. of a shill.	s. d. of a pound.
1	$\frac{1}{20}$
1 <td><math>\frac{1}{10}</math></td>	$\frac{1}{10}$
2	$\frac{1}{5}$
3	$\frac{3}{10}$
4	$\frac{2}{5}$
5	$\frac{1}{2}$
6	$\frac{3}{10}$
7	$\frac{7}{10}$
8	$\frac{4}{5}$
9	$\frac{9}{10}$
10	1
11	$1\frac{1}{10}$

T A B L E III.

s. d.	of a pound.
1	$\frac{1}{20}$
2	$\frac{1}{10}$
3	$\frac{3}{20}$
4	$\frac{1}{5}$
5	$\frac{1}{4}$
6	$\frac{3}{10}$
7	$\frac{7}{20}$
8	$\frac{2}{5}$
9	$\frac{9}{20}$
10	$\frac{1}{2}$
11	$\frac{11}{20}$
12	$\frac{3}{5}$
13	$\frac{13}{20}$
14	$\frac{7}{10}$
15	$\frac{3}{4}$
16	$\frac{4}{5}$
17	$\frac{17}{20}$
18	$\frac{9}{10}$
19	$1\frac{1}{20}$

The fractions in Table II. become compound fractions of a pound, by annexing (of  $\frac{1}{20}$ ) to each of them. Thus, 1 d. is  $\frac{1}{20}$  of  $\frac{1}{20}$  l.; and 5 d. is  $\frac{1}{4}$  of  $\frac{1}{20}$  of  $\frac{1}{20}$  l. &c.

The variety that occurs in the rules of practice arises chiefly from the different rates, or prices, of one thing, as a yard, a pound, an ounce, &c. and may be reduced to the eight cases following, viz.

- The rate may be, 1. Farthings under four. 2. Pence under twelve. 3. Pence and farthings. 4. Shillings under twenty. 5. Shillings, pence, and farthings. 6. Pounds. 7. Pounds, shillings, pence, and farthings. 8. The given number may consist of integers and parts.

CASE I. When the rate is farthings, under four.

RULE. Divide the given number by the denominator of the fraction denoting the rate, as contained in Tab. II. viz. if the rate be 1 or 2 farthings, divide by 4 or 2, the quot will be pence; and the remainder, in dividing by 4, will be farthings, and in dividing by 2, it will be halfpenny: then divide the pence by 12, the quot will be shillings, and the remainder pence. lastly, divide the shillings by 20, the quot will be pounds, and the remainder shillings. But if the rate is 3 farthings, first multiply the given number by the numerator 3, and then divide as above directed.

Ex. 1.	Ex. 2.
$\frac{1}{4} 4859$ , at 1 f.	$\frac{1}{2} 8347$ , at 2 f.
$\frac{1}{12} 1214$ —3 f.	$\frac{1}{12} 4173$ — $\frac{1}{2}$ d.
$\frac{1}{20} 1011$ —2 d.	$\frac{1}{20} 317$ —9 d.
L. 5 1 2 $\frac{1}{2}$	L. 17 7 9 $\frac{1}{2}$

CASE II. When the rate is pence, under twelve.

RULE. Divide the given number by the denominator of the fraction denoting the rate, as contained in Table II. and you have the answer in shillings; which reduce into pounds, by dividing by 20.

$$\begin{array}{r} \text{Ex. 1.} \\ \frac{1}{12} \overline{) 818, \text{ at } 1 \text{ d.}} \\ \underline{636} \\ 182 \\ \frac{1}{20} \overline{) 182} \\ \underline{180} \\ 2 \\ \text{L. } 3 \text{ } 8 \text{ } 2 \end{array}$$

$$\begin{array}{r} \text{Ex. 2.} \\ \frac{1}{6} \overline{) 5316, \text{ at } 2 \text{ d.}} \\ \underline{886} \\ 443 \\ \frac{1}{10} \overline{) 443} \\ \underline{440} \\ 3 \\ \text{L. } 44 \text{ } 6 \end{array}$$

*Note.* The remainders at the first division in the above examples are the same with the rate. Thus, in Ex. 1. every remainder is 1 d.

**CASE III.** When the rate is pence and farthings.

**RULE.** The pence must be some aliquot part of a shilling; and, at the same time, the farthings some aliquot part of the pence; and if they be not so given, divide the pence into two or more such parts, so as the farthings may be some aliquot part of the lowest division of the pence. Then, beginning with the highest division of the pence, divide by the denominators of the fractions denoting the aliquot parts.

$$\begin{array}{r} \text{Ex. 1.} \\ 1 \text{ d. } \frac{1}{12} \overline{) 532, \text{ at } 1\frac{1}{4} \text{ d.}} \\ \underline{44} \\ 11 \\ \frac{1}{10} \overline{) 11} \\ \underline{10} \\ 1 \\ \text{L. } 2 \text{ } 15 \text{ } 5 \end{array}$$

$$\begin{array}{r} \text{Ex. 2.} \\ 1 \text{ d. } \frac{1}{12} \overline{) 1753, \text{ at } 1\frac{1}{4} \text{ d.}} \\ \underline{146} \\ 73 \\ \frac{1}{10} \overline{) 73} \\ \underline{72} \\ 1 \\ \text{L. } 10 \text{ } 19 \text{ } 1\frac{1}{4} \end{array}$$

## EXPLANATION.

In Ex. 1. work first for 1 d.; which being  $\frac{1}{12}$  s. divide the given number by the denominator 12, and the quot is shillings, and the remainder pence; then, because 1 farthing is  $\frac{1}{4}$  d. divide the former quot by 4, and the sum of the quots is the price in shillings; which divide by 20.

In Ex. 2. the rate  $1\frac{1}{4}$  d. being an aliquot part of a shilling, the second method is shorter and better than the first.

**CASE IV.** When the rate is shillings under twenty.

**RULE.** Multiply the given number by the numerator of the fractions contained in Tab. III. and divide the product by the denominators. Or, instead of this general rule, take the two particular ones following.

1. If the rate be an even number of shillings, multiply the given number by half the number of shillings in the rate, always doubling the right-hand figure of the product for shillings, and the rest are pounds.

2. If the rate be an odd number of shillings, work for the next lesser even number of shillings, as above; and for the odd shilling take  $\frac{1}{20}$  of the given number.

**EXAMP. 1.** When the rate is an even number of shillings.

$$\begin{array}{r} \text{Ex. 1.} \\ 436, \text{ at } 2 \text{ s.} \\ \underline{1} \\ \text{L. } 43 \text{ } 12 \text{ s.} \end{array}$$

$$\begin{array}{r} \text{Ex. 2.} \\ 127, \text{ at } 4 \text{ s.} \\ \underline{2} \\ \text{L. } 25 \text{ } 8 \text{ s.} \end{array}$$

2. When the rate is an odd number of shillings.

$$\begin{array}{r} \text{Ex. 1.} \\ 635, \text{ at } 1 \text{ s.} \\ \text{L. } 31 \text{ } 15 \text{ s.} \end{array} \quad \begin{array}{r} \text{Ex. 2.} \\ 422, \text{ at } 3 \text{ s.} \\ \underline{42} \\ 4 \\ \underline{21} \\ 2 \\ \text{L. } 63 \text{ } 6 \text{ s.} \end{array}$$

*Note 1.* The reason of multiplying by half the number of shillings in the rate will appear by considering, that these are the numerators of the fractions denoting the rate. Thus, 2 s. is  $\frac{1}{5}$  l. and 4 s. is  $\frac{1}{5}$  l. and 6 s. is  $\frac{1}{5}$  l. and each unit in the product is two shillings. The division by the denominator 10 is performed by cutting off the right-hand figure of the product, and the figure so cut off is the remainder; and as each unit in the remainder is two shillings, the double of them is the remainder in shillings.

*Note 2.* From Ex. 1. we may learn, that when the rate is 2 s. the price is found by doubling the right-hand figure of the given number for shillings, and the other figure or figures are pounds.

*Note 3.* In Ex. 2. the price may also be had by taking  $\frac{1}{3}$  of the given number; and in this way every remainder will be 4 s.

*Note 4.* By reversing the operation, from the price and any even rate given, we may readily find the quantity of goods, viz. Multiply the price by 10, that is, to the price annex a cipher, and divide the product by half the rate.

**Ex. 1.** How many yards, at 14 s. may be bought for 49 l. 7)490(70 yards. *Ans.*

**Ex. 2.** How many gallons, at 8 s. may be bought for 500 l. 4)5000(1250 gallons. *Ans.*

**CASE V.** When the rate is shillings and pence, or shillings, pence, and farthings.

**RULE I.** If the rate be shillings and pence which make an aliquot part of a pound, divide the given number by the denominator of the fraction denoting the rate; the quot is pounds, and each unit of the remainder is equal to the rate.

$$\begin{array}{r} \text{Ex. 1.} \\ \frac{1}{12} \overline{) 354, \text{ at } 1 \text{ s. } 8 \text{ d.}} \\ \underline{29} \\ 10 \\ \text{Ex. 2.} \\ \frac{1}{4} \overline{) 443, \text{ at } 2 \text{ s. } 6 \text{ d.}} \\ \underline{55} \\ 7 \text{ } 6 \end{array}$$

**RULE II.** If the rate be no aliquot part of a pound, but may be divided into such parts, divide it accordingly, work for the parts separately, and then add.

$$\begin{array}{r} \text{Ex. 1.} \\ 427, \text{ at } 8 \text{ s.} \\ \underline{6} \\ 6 \text{ s. } \frac{1}{10} \overline{) 128} \\ \underline{128} \\ 2 \\ 2 \text{ s. } 6 \text{ d. } \frac{1}{5} \overline{) 53} \\ \underline{53} \\ 7 \text{ } 6 \\ \text{L. } 181 \text{ } 9 \text{ } 6 \end{array} \quad \begin{array}{r} \text{Ex. 2.} \\ 540, \text{ at } 5 \text{ s.} \\ \underline{4} \\ 4 \text{ d.} \\ \underline{90} \\ 2 \text{ s. } \frac{1}{10} \overline{) 54} \\ \underline{54} \\ \text{L. } 144 \end{array}$$

**RULE III.**

**RULE III.** If the rate be no aliquot part of a pound, and cannot readily be divided into such parts, divide it into parts whereof one at least may be an aliquot part of a pound, and the subsequent part, or parts, each an aliquot part of some prior part.

<p style="text-align: center;"><i>Ex. 1.</i></p> $\begin{array}{r} 350 \overline{) 6, \text{ at } 1 \text{ s. } 3 \text{ d.}} \\ 1 \text{ s. } \frac{1}{20} \quad 175 \quad 6 \\ 3 \text{ d. } \frac{1}{4} \quad \underline{43 \quad 16 \quad 6} \\ \text{L. } 219 \quad 2 \quad 6 \end{array}$	<p style="text-align: center;"><i>Ex. 2.</i></p> $\begin{array}{r} 9 \overline{) 5, \text{ at } 1 \text{ s.}} \\ 10 \frac{1}{2} \text{ d.} \\ 1 \text{ s. } \frac{1}{20} \quad 4 \quad 15 \\ 6 \text{ d. } \frac{1}{4} \quad \underline{2 \quad 7 \quad 6} \\ 3 \text{ d. } \frac{1}{2} \quad \underline{1 \quad 3 \quad 9} \\ 1 \frac{1}{2} \text{ d. } \frac{1}{2} \quad \underline{11 \quad 10 \frac{1}{2}} \\ \text{L. } 8 \quad 18 \quad 1 \frac{1}{2} \end{array}$
---	--

**CASE VI.** When the rate is pounds.

**RULE.** Multiply the given number by the rate, and the product is the price in pounds.

<i>Ex. 1.</i>	<i>Ex. 2.</i>
42, at 2 l.	13, at 8 l.
<u>          </u>	<u>          </u>
L. 84	L. 104

**CASE VII.** When the rate is pounds and shillings, or pounds, shillings, pence, and farthings.

**RULE I.** If the rate be pounds and shillings, multiply the given number by the pounds, and work for the shillings as in Cafe IV.

<p style="text-align: center;"><i>Ex. 1.</i></p> $\begin{array}{r} 1 \text{ l. } \quad 46, \text{ at } 1 \text{ l. } 4 \text{ s.} \\ 4 \text{ s.} \quad \underline{9 \quad 4} \\ \text{L. } 55 \quad 4 \end{array}$	<p style="text-align: center;"><i>Ex. 2.</i></p> $\begin{array}{r} 82, \text{ at } 4 \text{ l. } 10 \text{ s.} \\ 4 \text{ l.} \quad \underline{328} \\ 10 \text{ s.} \quad \underline{41} \\ \text{L. } 369 \end{array}$
---	---

**Note.** When the rate is more than 1 l. and less than 2 l. as in Ex. 1. we have no occasion to draw a line under the given number, it being esteemed so many pounds, and the parts for the shillings or pence are added up with it.

**RULE II.** If the rate be pounds, with shillings and pence that make some aliquot part of a pound, or are divisible into aliquot parts, or into shillings and some aliquot part or parts; then multiply the given number by the pounds, and work for the shillings and pence as in Cafe V. Rule I. or II.

<p style="text-align: center;"><i>Ex. 1.</i></p> $\begin{array}{r} 54, \text{ at } \text{L. } 3 : 2 : 6. \\ 3 \text{ l.} \quad 162 \\ 2 \text{ s. } 6 \text{ d.} \quad \underline{6 \quad 15} \\ \text{L. } 168 \quad 15 \end{array}$	<p style="text-align: center;"><i>Ex. 2.</i></p> $\begin{array}{r} 43, \text{ at } \text{L. } 5 : 3 : 4. \\ 5 \text{ l.} \quad 215 \\ 3 \text{ s. } 4 \text{ d.} \quad \underline{7 \quad 3 \quad 4} \\ \text{L. } 222 \quad 3 \quad 4 \end{array}$
---	---

**RULE III.** If the rate be pounds, with shillings, pence, and farthings, that cannot readily be resolved into aliquot parts of a pound; multiply the given number by the pounds; and then work for the shillings, pence, and farthings, as in Cafe V. Rule III.

<p style="text-align: center;"><i>Ex. 1.</i></p> $\begin{array}{r} 1 \text{ l.} \quad 213, \text{ at } 1 \text{ l. } 13 \text{ s.} \\ 10 \text{ s.} \quad 106 \quad 10 \\ 2 \text{ s.} \quad \underline{21 \quad 6} \\ 1 \text{ s.} \quad \underline{10 \quad 13} \\ 3 \text{ d.} \quad \underline{2 \quad 13 \quad 3} \\ 1 \frac{1}{2} \text{ d.} \quad \underline{1 \quad 6 \quad 7 \frac{1}{2}} \\ \text{L. } 355 \quad 8 \quad 10 \frac{1}{2} \end{array}$	<p style="text-align: center;"><i>Ex. 2.</i></p> $\begin{array}{r} 37, \text{ at } 3 \text{ l. } 8 \text{ s.} \\ 10 \frac{1}{2} \text{ d.} \\ 3 \text{ l.} \quad 111 \\ 6 \text{ s.} \quad \underline{11 \quad 2} \\ 2 \text{ s. } 6 \text{ d.} \quad \underline{4 \quad 12 \quad 6} \\ 3 \text{ d.} \quad \underline{9 \quad 3} \\ 1 \text{ d.} \quad \underline{3 \quad 1} \\ \frac{1}{2} \text{ d.} \quad \underline{9 \frac{1}{2}} \\ \text{L. } 127 \quad 7 \quad 7 \frac{1}{2} \end{array}$
--	---

**CASE VIII.** When the given number consists of in tegers and parts.

**RULE.** Work for the price of the integers as already taught; and for the part or parts, take a proportional part or parts of the rate.

<p style="text-align: center;"><i>Ex. 1.</i></p> <p style="text-align: center;"><i>Yards.</i></p> $\begin{array}{r} 720 \frac{1}{2}, \text{ at } 6 \text{ s. } 8 \text{ d.} \\ \text{per yd.} \\ 6 \text{ s. } 8 \text{ d.} \quad 240 \\ \frac{1}{4} \text{ yd.} \quad \underline{0 \quad 1 \quad 8} \\ \text{L. } 240 \quad 1 \quad 8 \end{array}$	<p style="text-align: center;"><i>Ex. 2.</i></p> <p style="text-align: center;"><i>Yards.</i></p> $\begin{array}{r} 116 \frac{1}{2}, \text{ at } 4 \text{ s. } 6 \text{ d.} \\ \text{per yd.} \\ 2 \text{ s. } 6 \text{ d.} \quad 14 \quad 10 \\ 2 \text{ s.} \quad \underline{11 \quad 12} \\ \frac{1}{2} \text{ yd.} \quad \underline{2 \quad 3} \\ \text{L. } 26 \quad 4 \quad 3 \end{array}$
---	--

An operation in the rules of practice may be proved by running over the several steps a second time, by working the same question a different way, or by the rule of three.

## CHAP. XI. OF DECIMALS.

### I. Notation.

A FRACTION having 10, 100, 1000, or unity with any number of ciphers annexed to it, for a denominator, is called a *decimal fraction*; such as,  $\frac{14}{10}, \frac{1000}{10000}, \frac{14}{10000}$ .

In decimal fractions, as in vulgar, the denominator shews into how many parts the unit or integer is divided, and the numerator shews how many of these parts the fraction contains. Thus, if the fraction be  $\frac{9}{10}$ , the unit is divided into ten equal parts, and the fraction contains nine of these parts; and consequently, if the unit or integer be a pound Sterling, the value of such a fraction is eighteen shillings.

We may conceive the denominator of a decimal fraction to be formed by dividing the unit into 10 equal parts, and each of these parts into 10 other equal parts, each of these again into 10 other equal parts, and so on, as far as necessary; and hence a decimal fraction will always be so many tenths, or so many tenths of  $\frac{1}{100}$ , or so many tenths of  $\frac{1}{1000}$ , &c.; and by reducing the compound fraction to a simple one, we have the decimal. Thus,  $\frac{9}{10} \text{ of } \frac{1}{10} \text{ of } \frac{1}{10} = \frac{9}{1000}$ .

Or we may conceive the denominator of a decimal to be formed by the continual multiplication of unity into 10, as often as there are ciphers in it. Thus,  $1 \times 10 = 10$ , and  $1 \times 10 \times 10 = 100$ , and  $1 \times 10 \times 10 \times 10 = 1000$ , &c. And because the fractions  $\frac{1}{10}$ ,  $\frac{1}{100}$ ,  $\frac{1}{1000}$ , &c. have the highest numerators possible, it is plain, that the number of figures or places in the numerator of a decimal can never exceed the number of ciphers in the denominator.

It is usual to write down only the numerator of a decimal fraction, omitting the denominator; and when the numerator has the same number of figures or places as the denominator has ciphers, it is done by writing down the figures of the numerator, and prefixing a point, to distinguish them from a whole number. So  $\frac{7}{10}$  is written thus, .7; and  $\frac{25}{100}$  is written thus, .25. The point thus prefixed is called the *decimal point*.

But when the numerator has not so many figures or places as there are ciphers in the denominator, the defect is supplied by prefixing a cipher for every figure wanting, and then placing the decimal point on the left. So  $\frac{3}{100}$  is written thus, .03; and  $\frac{3}{10000}$  thus, .0003; and  $\frac{5}{100000}$  thus, .00005.

From this manner of notation, it is easy to read a decimal, or to know its denominator, viz. imagine 1 to stand under the decimal point, and a cipher under every decimal place. Thus, .9 is  $\frac{9}{10}$ , and .48 is  $\frac{48}{100}$ , and .05 is  $\frac{5}{100}$ , and .007 is  $\frac{7}{1000}$ , and .00036 is  $\frac{36}{10000}$ .

Hence it is plain, that decimals, like integers, decrease from the left to the right, and increase from the right to the left, in a decuple proportion. On the contrary, any decimal figure, by being removed one place toward the left, becomes ten times greater.

An integer, by annexing ciphers, is raised to higher places on the left, and may by this means have its value increased to infinity. On the other hand, a decimal, by prefixing ciphers, is depressed to lower places on the right, and may by this means have its value diminished to infinity.

Ciphers annexed to decimals do not change the value of the decimals. Thus, .50 = 5, and .500 = 5, for  $.50 = \frac{50}{100} = \frac{5}{10} = .5$ ; and  $\frac{500}{1000} = \frac{5}{10} = .5$ .

Decimals may be resolved into constituent parts, and the parts may be read, separately, thus,  $.847 = 8 + \frac{4}{10} + \frac{7}{100}$ .

In decimals the figure next the point, being the first decimal place, is sometimes called *primes*, and the second figure from the point is called *seconds*, the next *thirds*, &c. Thus, in .875 the figure 8 is primes, 7 is seconds, and 5 is thirds.

From this brief account of the nature of decimals, it follows, that the manner of operation in decimals will be the same as in whole numbers; and also, that the same number may be differently expressed, according as the integer is chosen. Thus, the time since our Saviour's birth may be written thus, 1769; or thus, 176.9; or thus, 17.69; or thus, 1.769; or thus, .1769, according as one year, a decad, a century, a chiliad, or myriad, is used as the integer. Hence arises the superior excellency of decimal arithmetic, above every

other sort of numerical computation; as will appear in the sequel.

## II. Reduction of Decimals.

PROB. I. To reduce a vulgar fraction to a decimal.

RULE. To the numerator of the vulgar fraction annex a point or comma, then annex a competent number of ciphers, and divide by the denominator; the quot is the numerator of the decimal, and the cyphers annexed show the number of decimal places.

EXAMP. I. Reduce  $\frac{1}{2}$  to a decimal?

Here to the numerator 1 annex one cipher, 2)1.0(.5  
and dividing by the denominator 2, the quot is 5, and 0 remains; and because a single cipher only was annexed to the numerator, the decimal numerator will consist but of one figure, namely 5; to which, therefore, prefix the decimal point. So  $\frac{1}{2} = .5$ .

Hence appears the reason of the rule; namely, 2 : 1 :: 10 : 5; that is, as the vulgar denominator to the vulgar numerator, so is the decimal denominator to the decimal numerator.

EXAMP. II. Reduce  $\frac{3}{4}$  to a decimal.

To the numerator 3, annex two ciphers; 4)3.00(.75  
and, dividing by the denominator, the quot gives 75 for the numerator of the decimal, two ciphers having been annexed. So  $\frac{3}{4} = .75$ .

Though ciphers may be annexed at pleasure, yet it is the ciphers used that determine the number of decimal places in the quot; and at first it is sufficient to annex so many as serve to complete the first dividial, leaving room to annex more as you proceed in the operation; or rather annex the other ciphers to the remainders, without giving them a place in the dividend.

The first dividial also shows whether ciphers ought to be prefixed to the quot, and how many. Thus, if the first dividial take in only one of the annexed ciphers, the figure put in the quot is primes, and no cipher to be prefixed. If the first dividial comprehend two of the annexed ciphers, the figure put in the quot is seconds, and one cipher must be prefixed. If the first dividial comprehend three of the annexed ciphers, the figure put in the quot is thirds, and two ciphers must be prefixed, &c. Hence, in reducing a vulgar fraction to a decimal, the natural and easy way is, to place first the decimal point in the quot, and after it a cipher or ciphers, or the quotient-figure, as the first dividial directs.

In reducing a vulgar fraction to a decimal, if 0 at last remains, as in all the above examples, the decimal is precisely equal to the vulgar fraction, and is called a *finite* or *terminats* decimal.

In finite decimals, the denominator is always some aliquot part of the numerator increased by annexing ciphers; and such decimals take their rise from vulgar fractions whose denominator is 2 or 5, or some power of

2 or 5, or the product of some of their powers. See Chap. XII. and ALGEBRA, Chap. III.

The powers of numbers are sometimes expressed by indices or exponents placed at the corners of the numbers. Thus,  $2^2$  signifies the second power of 2, and  $5^3$  signifies the third power of 5; and  $10^4$  signifies the fourth power of 10, &c. The index of the root or first power is seldom expressed.

Any power of 2 multiplied into the like power of 5 gives a product equal to the same power of 10; as appears from the following specimen of the powers of 2, 5, and 10.

$2^1 = 2$	$5^1 = 5$	$2 \times 5 = 10^1 = 10$
$2^2 = 4$	$5^2 = 25$	$4 \times 25 = 10^2 = 100$
$2^3 = 8$	$5^3 = 125$	$8 \times 125 = 10^3 = 1000$
$2^4 = 16$	$5^4 = 625$	$16 \times 625 = 10^4 = 10000$
$2^5 = 32$	$5^5 = 3125$	$32 \times 3125 = 10^5 = 100000$
$2^6 = 64$	$5^6 = 15625$	$64 \times 15625 = 10^6 = 1000000$
$2^7 = 128$	$5^7 = 78125$	$128 \times 78125 = 10^7 = 10000000$
<i>&amp;c.</i>	<i>&amp;c.</i>	<i>&amp;c.</i>

The product of two different powers of 2 and 5, is equal to the product that will arise by raising 10 to the power denoted by the lesser given index, and then multiplying this power of 10 into that power of the other number which is denoted by the difference of the two given exponents. Thus,

$$2^6 \times 5^3 = 64 \times 25 = 10^4 \times 2^1 = 100 \times 16 = 1600$$

$$2^3 \times 5^6 = 4 \times 15625 = 10^4 \times 5^2 = 100 \times 625 = 62500$$

From these remarks it is easy to perceive, that 2 or 5, or any of their powers, or product of their powers, will measure 10 or its powers, viz. 100, 1000, &c. or their multiples, such as, 20, 200, 2000, &c. 30, 300, 3000, &c.; and such every numerator becomes by having ciphers annexed; and therefore 2 or 5, or their powers, or product of their powers, used as a denominator, will divide any numerator with a competent number of ciphers annexed, and leave no remainder; and consequently the decimal thence resulting will be finite.

If the numerator of the vulgar fraction be unity, and the denominator any single power of 2 or 5, there will be as many decimal places in the quot as there are units in the index of the given power. Thus,  $16 = 2^4$  gives a decimal of four places, viz.  $\frac{1}{16} = .0625$ ; and,  $125 = 5^3$  gives a decimal of three places, viz.  $\frac{1}{125} = .008$ .

When the denominator is the product of like powers of 2 and 5; in this case, such a product being equal to the like power of 10, and any power of 10 being equal to 1, with as many ciphers annexed as there are units in the index, it follows, that there will still be as many decimal places in the quot as there are units in the index, either of 2, of 5, or 10. Thus,  $8 \times 125 = 2^3 \times 5^3 = 10^3 = 1000$ , gives a decimal of three places, viz.  $\frac{1}{1000} = .001$ .

When the denominator is the product of different powers of 2 or 5, find what power of 10, and what power of 2 or 5, upon being multiplied, will give the same product, as is taught above; and the sum of the indices shews the number of decimal places; thus,

$2^6 \times 5^2 = 10^4 \times 2^2$ ; and the sum of the indices,  $2 + 4 = 6$ , gives the number of decimal places, viz.  $\frac{1}{10000} = .0000625$ .

And, in general, to find what number of decimal places any such vulgar fraction will give, divide the denominator by 2, 5, or 10, till the last quotient be 1, and the remainder 0; and the number of divisors shews the number of decimal places. Thus,  $\frac{1}{18}$  gives a deci-

mal of four places; for  $2)18(4(2(1$ . And  $\frac{1}{11}$  gives

a decimal of three places; for  $5)125(25(5(1$ . And  $\frac{1}{1000}$  gives a decimal of three places; for  $10)1000$

$(100(10(1$ . And  $\frac{1}{10000}$  gives a decimal of six places; for  $10)1600(160(16(8(4(2(1$

If the denominator of a vulgar fraction be neither 2 nor 5, nor any of their powers, nor product of their powers, such a denominator will not divide the numerator with annexed ciphers without a remainder; and the decimal thence resulting is called *infinite*, or *interminate*.

Of infinite or interminate decimals, there are two sorts. For some constantly repeat the same figure; and are called *repeating decimals*, *repeaters*, or *single repetends*. Others repeat a circle of figures; and on that account are called *circulating decimals*, *circulates*, or *compound repetends*.

EXAMP. III. Reduce  $\frac{1}{3}$  to a decimal.

Here the remainder being still the same,  $3)1.0(.3$  viz. 1, the same figure will constantly be repeated in the quot.

$$\begin{array}{r} 9 \\ \hline (1) \end{array}$$

Repeating decimals are of two kinds: viz. some consist only of the repeating figures, such as the examples above; and these are called *pure repeaters*; others have one or more digits or ciphers betwixt the decimal point and the repeating figure; and these are called *mixt repeaters*; and the digits or ciphers on the left of the repeating figures are called the *finite part* of such decimals.

Pure repeaters take their rise from vulgar fractions whose denominator is 3, or its multiple 9; and are but few in number.

Mixt repeaters derive their origin from vulgar fractions whose denominator is the product of 3 into 2 or 5, or into some of their powers, or product of their powers; and such denominators may be considered as the product of two component parts, whereof one is 2 or 5, or some of their powers, or product of their powers; and hence the finite part. The other component part is 3; and hence the repeating figure.

EXAMP. IV. Reduce  $\frac{1}{6}$  to a decimal.

Here the repeater is mixt, the finite part being 2, and the repeating figure 6.

$$\begin{array}{r} 15)4.0(.2\bar{6} \\ \underline{30} \\ *100 \\ \underline{90} \\ (10) \end{array}$$

We now resolve such denominators into their component parts, and divide the numerator by one of these parts, and then divide the quot by the other. Thus,  $15 = 5 \times 3$ .

$$\begin{array}{r} 5)4.0(8 \\ \underline{20} \\ (0) \end{array} \quad \text{and } 3)8.(2\dot{6} \\ \underline{6} \\ *20 \\ \underline{18} \\ (2)$$

The number of places in the finite part of a mixt repeater may be ascertained from the number of units in the index of the powers of 2 or 5.

And, universally, to find the number of places in the finite part of such fractions, divide the denominator first by 3, and then divide the quot by 2, 5, or 10, till the last quot be 1, and 0 remain; and the number of divisors, excluding 3, shows the number of places in the finite part.

Repeating decimals are usually marked by a dash through the right-hand figure, as in the examples above: But some chuse to mark them by a point set over the repeating figure, thus,  $.3, .2\dot{6}$ . The remainder where the repetition begins is commonly marked with an asterisk.

Because any quotient multiplied by the divisor reproduces the dividend, it follows, that any decimal multiplied by the denominator of the vulgar fraction from which it resulted, will reproduce the numerator with the annexed ciphers. Thus, if  $.75$ , the decimal of  $\frac{3}{4}$ , be multiplied by 4, it will reproduce the numerator 3 and the two annexed ciphers.

Now, suppose the given decimal to be a repeater; such as  $.3$ , resulting from the vulgar fraction  $\frac{1}{3}$ , if the repeating decimal be multiplied by the denominator 3, it will, by carrying at 0 on the right hand, reproduce the numerator 1 with the annexed cipher. In like manner, if the repeater  $.6 = \frac{2}{3}$ , be multiplied by 3, it will, by carrying at 0 on the right hand, reproduce the numerator 2 with the annexed cipher. Again, if the repeater  $.2 = \frac{2}{9}$ , be multiplied by the denominator 9, it will, by carrying at 0 on the right hand, reproduce the numerator 1 with the annexed cipher. And, if the mixt repeater  $.2\dot{6} = \frac{2}{3}$ , be multiplied by the denominator 15, it will, by carrying at 0 on the right hand, reproduce the numerator 4 with the two annexed ciphers.

From these remarks we may conclude, that the right-hand figure of every repeating decimal is ninth-parts: and the same truth may be evinced by resolving the decimal into its constituent parts, in the following manner.

The vulgar fraction  $\frac{1}{3}$  reduced to a decimal gives  $.3$ , &c.; and this repeater resolved into decimal constituent parts, becomes  $\frac{1}{10} + \frac{1}{100} + \frac{1}{1000}$ , &c. to infinity. But if we esteem the right-hand figure to be ninth-parts, we have  $\frac{1}{9} + \frac{1}{90} + \frac{1}{900} = \frac{10}{90} + \frac{1}{90} + \frac{1}{900} = \frac{110}{900} = \frac{11}{90} = \frac{1}{8.1}$ , the given vulgar fraction. And as the vulgar fraction  $\frac{2}{3}$  gives  $.67$ , so  $\frac{2}{9}$  gives  $.22$ ; that is,  $.67 = \frac{2}{3} = 1$ . And, universally, a series of nines infinitely continued is equal to unity in the place on the left hand; thus,  $.999 =$

$1$ ; and  $.999 = 1$ ; and  $.0999 = .01$ , and  $.4999 = .5$ .

Hence may be ascertained the value of an infinite series decreasing in a decuple proportion. Thus,  $\frac{1}{10} + \frac{1}{100} + \frac{1}{1000}$ , &c.  $= \frac{1}{9}$ . And  $\frac{1}{10} + \frac{1}{100} + \frac{1}{1000}$ , &c.  $= \frac{1}{9}$ .

If the denominator of a vulgar fraction be neither 2 nor 5, nor any power of 2 or 5, nor any product of their powers; nor 3, nor 9, nor any product of 3 into 2 or 5, or into some of their powers, or product of their powers, the decimal resulting from such a vulgar fraction will circulate.

Circulates, like repeaters, are of two sorts, *viz.* pure and mixt. A pure circulate consists of the figures of the circle only; as  $.09, 09$ , &c. or  $18, 18$ , &c. A mixt circulate has a finite part betwixt the decimal point and the figure that begins the circle; as  $.0, 45, 45$ , &c.; or  $.32, 142857, 142857$ , &c. Some chuse to distinguish the finite part from the circle, and one circle from another, by a comma, as above. Others dash the first and last figure of the circle. It is likewise usual to mark the remainder where the new circle begins, by affixing an asterisk.

EXAMP. V. Reduce  $\frac{1}{11}$  to a decimal.

The denominator 11 gives a pure  $11)1.00(.09, 09$ , circle of two figures.

$$\begin{array}{r} 11 \overline{)1.00} \\ \underline{99} \\ *100 \\ \underline{99} \\ *1 \end{array}$$

$\frac{1}{11} = .18, 18,$	$\frac{1}{7} = .63, 63,$
$\frac{1}{4} = .27, 27,$	$\frac{1}{7} = .72, 72,$
$\frac{1}{3} = .36, 36,$	$\frac{1}{7} = .81, 81,$
$\frac{1}{2} = .45, 45,$	$\frac{1}{7} = .90, 90,$
$\frac{1}{5} = .54, 54,$	

It is easy to perceive, that if any of the vulgar fractions in the above specimen have both its numerator and denominator multiplied by 9, there will arise a new vulgar fraction of the same value, whose numerator will be the figures of the circle, and its denominator the like number of 9's. Thus,

$$\frac{3 \times 9}{11 \times 9} = \frac{27}{99}, \quad \text{and} \quad \frac{7 \times 9}{11 \times 9} = \frac{63}{99}.$$

As the denominator 11, whereof 99 is a multiple, gives a pure circulate of two places, so any denominator, whereof 999, or 9990, or 99999, &c. are multiples, will give a pure circulate of three, four, five, &c. places; that is, of as many places as there are 9's in the multiple. And such denominators are all the prime numbers, except 2, 3, and 5, *viz.* 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, &c.; also their products into 3, *viz.* 21, 33, 39, 51, 57, 63, &c. Such too are all the powers of 3, except 3 and 9, *viz.* 27, 81, 243, 729, 2187, &c.

The reason is plain: for if any divisor, as 37, divide 999, without a remainder, it will also divide 1000, and leave a remainder of 1, to begin a new circle.

To find how many places the circle will consist of, divide a competent number of 9's by any of the above denominators, continuing the operation till 0 remain; and the number of 9's used will show the number of places.

Thus,

Thus, 7)99999 six places. Thus, 27)952 three places.  
 142857 37

The number of figures in a circle, when some power of 3 is the denominator, may also be found thus: Divide the given denominator by 9, and the number of units in the quot will be equal to the number of figures in the circle. Thus, 9)27(3 places. Thus, 9)81(9 places, &c.

If 3 divide a repeater whose repeating figure is not a multiple of 3, the quot will be a pure circulate of three places. Thus, 3).11(.037, and 3).55(.185, and 3).77(.259.

If 3 divide a pure circulate, the circle not being a multiple of 3, the quot will be a pure circulate of thrice as many places as the circle of the dividend. Thus, 3).037,037,037(.012345679.

Mixt circulates take their rise from fractions whose denominators are the prime numbers 7, 11, 13, 17, 19, 23, 29, &c. multiplied into 2, 5, or 10, or into some of their powers, or product of their powers.

EXAMP. VI. Reduce  $\frac{28}{84}$  to a decimal.

28)9.0(.32, 142857, 14

40	*
28	
<hr/>	
120	
112	
<hr/>	
8	

The denominator 28 = 7 × 2 × 2, gives a mixt circulate, consisting of the finite part 32, and a circle of six figures or places, whose sum is equal to the product of 9 into half the number of figures; that is, 9 × 3 = 27.

10) 57

circle. Thus, 10).0500(2050(205(47; and 47)99999 (2439, and 6 remains. So you may conclude, that the finite part will consist of three places, and the circle of five.

Universally, any vulgar fraction being given, we may determine whether the decimal thence resulting will be finite or infinite; and if infinite, whether pure or mixt; with the number of places, &c. in the following manner.

Reduce the given vulgar fraction to its lowest terms, then divide the denominator by 10, 5, or 2, as often as possible; and if the last quot be unity, without any remainder, the decimal is finite, and the number of divisors shews the number of decimal places.

If the last quot be 3, or any power of 3, the resulting decimal will be a mixt repeater, the number of whose finite places will be equal to the number of divisors.

If the last quot cannot be divided by 2, 5, 10, or 3, the resulting decimal will be a mixt circulate; and the way of finding the number of places, both in the finite part and circle, is taught above.

If the denominator of the given vulgar fraction can be divided, neither by 2, 5, nor 10, the resulting decimal will be a pure repeater, or a pure circulate, according as the denominator is 3 or 9, or some of the prime numbers, 7, 11, 13, &c.; as has been already explained.

Every vulgar fraction may be reduced to a decimal, finite or infinite; that is, to a finite decimal, to a repeater, or a circulate. For if the denominator divide the numerator with ciphers annexed, fo as to leave no remainder, the resulting decimal is finite. If the remaining figure be always the same, the resulting decimal will be a repeater. If neither of these be the case, yet, because the divisor is a finite number, the remainder at last must either be the same with the numerator of the vulgar fraction, or the same with some preceding remainder, and then a new circle begins; and consequently the resulting decimal will be a circulate.

Because it circulates the circle runs on sometimes to 16, 18, 22, 28, 81, 243, &c. places, and because, in decimals of every sort, the finite part runs sometimes on to many places, such circulates, or finite parts, may, without any sensible error, be limited at five or six places, and used as finites: for five decimal places, divide the integer into 100,000 equal parts, and all the lots that can be occasioned by such limitation, is less than one hundred thousandth part of the integer. And in most cases, the decimal may be limited at three places, which divide the integer into 1000 equal parts.

Circulates, or finite parts, thus limited, are called *approximate decimals*; and are sometimes marked with + or - annexed, according as the right-hand figure is taken less or greater than just: for in limiting the decimal, if you foresee that the succeeding figure of the quot would be 6 or 7, or any figure above 5, you lessen the error by increasing the right-hand figure of the approximate by unity.

PROB. II. To reduce the parts of coin, &c. to decimals.

RULE. Convert the given part or parts to a vulgar fraction

The number of places, both in the finite part and in the circle, may be ascertained thus: Divide the denominator of the vulgar fraction by 10, 5, or 2, as often as possible, and the number of divisors will shew the number of places in the finite part; make the last quot a divisor, and the dividend any competent number of 9's; continue the operation till 0 remain, and the number of 9's used will be equal to the number of places in the

fraction of the integer, and then reduce the vulgar fraction to a decimal.

Ex. 1. Reduce 9 pence to the decimal of a shilling.

$$d. \quad s. \\ 9 = \frac{9}{12}$$

and 12)9.0(.75 of a shilling.

$$\begin{array}{r} 84 \\ \hline 60 \\ \hline 60 \\ \hline 0 \end{array}$$

Here the fraction  $\frac{9}{12} = \frac{3}{4}$ ; and the denominator  $4 = 2 \times 2$  gives a finite decimal of two places.

Ex. 2. Reduce 9 pence to the decimal of a pound.

$$d. \quad L. \\ 9 = \frac{9}{20}$$

240)9.00(.0375 of a pound.

$$\begin{array}{r} 720 \\ \hline 1800 \\ \hline 1680 \\ \hline 1200 \\ \hline 1200 \\ \hline 0 \end{array}$$

The fraction  $\frac{9}{20} = \frac{9}{2 \times 2 \times 5}$ ; and the denominator  $80 = 10 \times 2 \times 2 \times 2$  gives a finite decimal of four places.

Ex. 3. Reduce 16 s. 6 d. to the decimal of a pound.

$$s. \quad d. \quad L. \\ 16 \quad 6 = \frac{192}{20}$$

240)198.0(.825 L.

$$\begin{array}{r} 12 \\ \hline 198 \end{array}$$

$$\begin{array}{r} 1920 \\ \hline 600 \\ \hline 480 \\ \hline 1200 \\ \hline 1200 \\ \hline 0 \end{array}$$

The fraction  $\frac{192}{20} = \frac{66}{5} = \frac{132}{10}$ ; and the denominator  $40 = 10 \times 2 \times 2$  gives a finite decimal of three places.

PROB. III. To reduce the remainder of a division to a decimal.

RULE. The remainder being the numerator, and the divisor the denominator of a vulgar fraction, after placing the decimal point on the right of the integral part of the quot, annex ciphers to the remainder; then continue the division till 0 remain, or till the quot repeat or circulate, or till you think proper to limit the decimal; and the number on the right of the point is a decimal of the integer expressed in the quot.

Example 1.

Divide 513 l. among 36 men.

$$\begin{array}{r} 7 \overline{)513} 14.25 \\ \underline{36} \\ 153 \\ \underline{144} \\ \text{Rem. } 90 \\ \underline{72} \\ 180 \\ \underline{180} \\ 0 \end{array}$$

Rem. 90

72

180

180

(0)

Example 2.

Divide 176 s. among 24 boys.

$$\begin{array}{r} s. \\ 24 \overline{)176} 7.3 \\ \underline{168} \end{array}$$

Rem. 80

72

(8)

PROB. IV. To reduce a decimal to value.

RULE. Multiply the given decimal by the number of parts of the next inferior denomination contained in an unit of the integer; and from the product point off so many figures to the right hand as there are places in the given decimal. On the left hand of the point are parts, and on the right a decimal of one of these parts; which decimal must be reduced in the same manner to the next inferior denomination, and from that to the next, and so on to the lowest; the several figures on the left of the points are parts; and if there be still some figure or figures on the right, they are a decimal of the lowest of the parts.

Example 1.

Reduce .875 l. to value.

$$\begin{array}{r} L. \quad s. \quad d. \\ .875 = 17 \quad 6 \\ \hline 20 \end{array}$$

s. 17.500

12

d. 6.0

Example 2.

Reduce .7691 l. to value.

$$\begin{array}{r} L. \quad s. \quad d. \quad f. \\ .7691 = 15 \quad 4 \quad 2 \\ \hline 20 \end{array}$$

s. 15.3820

12

d. 4.584

4

f. 2.336

The reason of pointing the product, as the rule directs, is plain. For, in Ex. 1. as  $1000 : 875 :: 20 : 17$ ; that is, as the decimal denominator to the decimal numerator, so the vulgar denominator to the vulgar numerator.

In Ex. 1. the full value of the decimal comes out in parts, the decimal being quite exhausted; but in Ex. 2. besides the parts, there is a decimal of a farthing, viz. .336 f.

The decimal of a pound Sterling may be reduced to value by inspection, in the following manner.

Double the figure in the place of primes for shillings; and if the figure in the place of seconds be 5, or exceed 5, reckon 1 shilling more; and rejecting 5 in the second place, the figures in the second and third places are so many farthings, abating 1 for every 25.

L. s. d. f.

EXAMP. 1. .718 = 14 4 2

2. .759 = 15 2 1

3. .894 = 17 10 3

In Example 1. the figure 7 doubled gives 14 s.; the two following figures 18 are farthings, equal to 4 d. 2 f.

In Example 2. the figure 7 doubled gives 14 s. and 5 in the place of seconds gives 1 shilling more, in all 15 s.; and the other figure 9 is farthings, viz. 2 d 1 f.

In Example 3. the figure 8 in the place of primes, and 5 in the place of seconds, give 17 s.; the remaining figures 44, abating 1, are farthings, viz. 10 d. 3 f.

When the figures in the second and third place to be converted into farthings are 25, the answer, by inspection, comes out exact, viz. 24 f. or 6 d.; but in all other cases, the answer, by inspection, is too great, no allowance or correction being made till the convertible number

number amount to 25, and afford a deduction of 1 farthing complete. Hence, by inspection, we have frequently 1 farthing more than by the common method; but the two methods will agree, or give the same answer, if, from the figures to be turned into farthings, we subtract their 25th part, esteeming the remainder farthings and decimal parts of a farthing.

Thus,  $.718 \text{ l.} = 14 \text{ s. } 4 \text{ d. } 2 \text{ f.}$  by inspection; but by the common method, and by inspection corrected, the answer comes out 1 farthing less, as follows.

<i>Common method.</i>	<i>Inspection corrected.</i>
L.	If 25 : 1 :: 18 : .72.
.718	that is, 25)18.0(.72
<u>20</u>	<u>175</u>
s. 14.360	50 and 18
<u>12</u>	<u>50</u> .72
d. 4.32	(0) 17.28
<u>4</u>	
f. 1.28	<i>d. f.</i>
	And 17.28 = 4 1.28

To conclude, instead of dividing by 25, we may multiply by .04; and then the exact value of any decimal of a pound Sterling may be found as follows.

From the primes and seconds set off the shillings; multiply the remainder by 4, setting the product two places to the right; subtract the product from the first remainder; and from the second remainder point off so many places to the right as there are figures in the first remainder. The number on the left of the point is farthings, and the figures on the right are a decimal of a farthing.

<i>Example 1.</i>	<i>Example 2.</i>
<i>s. d. f.</i>	<i>s. d. f.</i>
.718 l. = 14 4 1.28	.7691 l. = 15 4 2.336
1 Rem. .18	1 Rem. 191
<u>72 = 18 × 4</u>	<u>764 = 191 × 4</u>
2 Rem. 17.28	2 Rem. 18.336

PROB. V. To reduce a decimal to its primitive vulgar fraction.

CASE I. When the given decimal is finite.

RULE. Divide both numerator and denominator of the given decimal by their greatest common measure; the quot is the vulgar fraction required.

Thus,  $.875 = \frac{875}{1000} = \frac{7}{8}$ . For 875)1000(1

875

Greatest common measure 125)875(7

875

(0)

And 125)1000(8

CASE II. When the given decimal is a pure repeater, or a pure circulate.

RULE. Make the repeating figure, or the figures of the circle, the numerator of the vulgar fraction; the de-

ominator is 9 for the repeating figure, or 99 for every figure of the circle; and then, if occasion require, reduce this fraction to its lowest terms.

Thus,  $.3 = \frac{3}{10} = \frac{3}{10}$ , and  $.6 = \frac{6}{10} = \frac{3}{5}$ , and  $.9 = \frac{9}{10}$ .

Again,  $.27 = \frac{27}{100} = \frac{27}{100}$ , and  $.714285 = \frac{714285}{999999} = \frac{7}{9}$ .

CASE III. When the given decimal is a mixt repeater, or a mixt circulate.

RULE. From the mixt repeater, or mixt circulate, subtract the finite part, and the remainder is the numerator of the vulgar fraction; the denominator is 9 for the repeating figure, or 99 for every figure of the circle, with as many ciphers annexed as there are figures in the finite part.

Thus,  $.03 = \frac{3}{100} = \frac{3}{100}$ , and  $.16 = \frac{16}{100} = \frac{4}{25}$ , and  $.083 = \frac{83}{999} = \frac{83}{999}$ .

The reason of the rule may be shewn thus: Esteem the finite part of the last example an integer, and then the mixt number  $3\frac{83}{999}$  will be equal to the given circulate. Again, reduce this mixt number to an improper fraction, viz. multiply the integer 3 by the denominator 999999, and to the product add the numerator, as directed in reduction of vulgar fractions.

Multiply the integer 3 into 999999 by the method of multiplying any number by 9, 99, 999, &c. taught in multiplication of integers, and to the product add the numerator, and the sum shall be the numerator of the improper fraction, as in the margin.

3000000

3

2999997

571428

3571425 num.

Now it is evident that the same numerator will be found, if, in the upper line, instead of the six ciphers, you place the figures of the circle, and from them subtract 3, the finite part.

3571428

3

3571425 num.

To the numerator thus found, the denominator is 999999; and so the vulgar fraction is  $\frac{3571428}{999999}$ . But we esteemed 3 an integer; whereas, in fact, it is  $\frac{3}{10}$ ; and so our vulgar fraction will be 100 times greater than it ought to be: to correct this error, we must multiply the denominator by 100, which is done by annexing two ciphers to it; and the true fraction comes out to be  $\frac{3571428}{99999900}$ , as by the rule.

Because this rule is of great importance, and will often occur in practice, we shall here subjoin another example.

Reduce .0416 to a vulgar fraction.

416

41

Num. 375

=  $\frac{1}{12}$

Den. 9000

In this manner too may any mixt number, consisting of an integer with a repeater or circulate, be reduced to an improper vulgar fraction; but no ciphers are to be annexed to the denominator for the figures of the integer.

Ex. Reduce  $8\frac{3}{8}$  to an improper vulgar fraction.

$$\begin{array}{r} 8\cancel{3} \\ \underline{\phantom{8}3} \\ \text{Num. } 75 \\ \text{Den. } 9 \end{array} = \frac{75}{9} = 8\frac{2}{3}$$

Approximate decimals being imperfect, cannot be exactly reduced back to the vulgar fractions from which they resulted. But if the approximate be completed by annexing to it a vulgar fraction, whereof the remainder of the division is the numerator, and the divisor the denominator, you shall have a mixt number, which you may reduce to an improper vulgar fraction; then to the denominator annex as many ciphers as there are figures in the approximate; and this fraction reduced to its lowest terms, will be the primitive vulgar fraction required.

PROB. VI. To reduce unlike circles to others that are similar and conterminous.

Similar or like circles are such as consist of an equal number of places.

Thus, .27, and .09, are similar circles, as consisting of two places each. But .63, and .148, are unlike; the former consisting of two, and the latter of three places.

Conterminous circles are such as begin and end at the same distance from the decimal point.

Thus, .153846, and .384615, are conterminous; because they both begin at the place of primes, and have an equal number of places. And .0714285, and .7857142, are conterminous, because they both begin at the place of seconds, and have the same number of places. But .81, and .136, are not conterminous, the former beginning at the place of primes, and the latter at the place of seconds. Again, .63, and .481, are not conterminous, because they have not the same number of places; for circles cannot be conterminous unless they be at the same time similar.

Unlike circles are reduced to similar ones by the following

RULE. Find the least multiple of the numbers denoting the number of places in the several given circles, and extend each of the given circles to as many places as there are units in the least multiple.

Thus, to reduce the unlike circles .63, = .636363, .63, and .148, to similar ones, extend .148, = .148148, tend both circles to six places, because 6 is the least multiple of 2 and 3, the number of places in the given circles.

In a circle any one of the circulating figures may be made the first of the circle. Thus, 7.592, may be expressed thus, 7.5925; or thus, 7.59259; and that without changing its value: consequently a pure circulate may put on the form of a mixt circulate, if one or more figures on the left be set aside for the finite part; thus, .72 = .727, where .7, is the finite part.

That the value is not changed may be thus demonstrated.

$$.727 = \frac{727}{1000} = \frac{72}{100} = .72$$

Hence two or more given circles may be made conterminous, by the following

RULE. Set aside by a comma on the left, as many figures as there are places in the longest finite part, and then prolong the several circles to as many places as will make them similar.

Ex. To make .54,63, and .54,63, = .54,636363, .9,148, conterminous. .9,148, = .91,481481,

Here, because .54, the longest finite part, consists of two places, set aside .91, in the other circulate, for a finite part, and then prolong both circles to six places, which renders them similar.

### III. Addition of Decimals.

RULE I. Place the given decimals so that the points may stand directly under each other, and consequently tenths under tenths, hundredths under hundredths &c.; then, if the given decimals be all finite or approximate, add them as integers, inserting the decimal point directly under the column of points. The figures on the left of the point are integers, and those on the right are a decimal of the integer, consisting of as many places as there are figures in the longest of the given decimals.

The operation is the same here as in addition of vulgar fractions; for a cipher on the right of a decimal does not change its value: If, therefore, ciphers be annexed, so as to give every decimal the same number of places, as is done in the margin, they will by this means be reduced to a common denominator, viz. 1000.

Note, If the decimals to be added are of different denominations, first reduce them to one denomination, and then add. The reason is, because like things only can be added or subtracted.

Ex. What is the sum of .725 l. and .625 s.?

Here you may either reduce the decimal of a shilling to that of a pound, or you may reduce the decimal of a pound to that of a shilling.

First reduce the decimal of a shilling to that of a pound, by reduction-ascending, viz. divide by 20, as follows.

$$\begin{array}{r} \text{L.} \\ 20 \cdot 62500 \cdot 03125 \\ \underline{\phantom{20}725} \quad \text{s.} \quad \text{d.} \\ \text{Sum } 75625 = 15 \quad 1\frac{1}{2} \end{array}$$

Secondly, reduce the decimal of a pound to that of a shilling, by reduction-descending; that is, multiply by 20, as follows.

$$\begin{array}{r} \text{The answer here} \\ \text{is the same as be-} \\ \text{fore.} \end{array} \begin{array}{r} .725 \text{ l.} \\ \underline{\phantom{.725}20} \\ \text{s. } 14 \cdot 500 \\ \underline{\phantom{.725}625} \\ \text{s. } 15 \cdot 125 \text{ sum.} \\ \underline{\phantom{.725}12} \\ \text{d. } 1 \cdot 500 \\ \underline{\phantom{.725}4} \\ \text{f. } 2 \cdot 0 \end{array}$$

APPROXIMATES.

If the decimals to be added run on to a great many places, it will be sufficient in most cases to use only four or five places, and observe to increase the figure at which you break off by an unit, if the rejected figure on the right exceed  $\frac{5}{10}$ . And in adding such approximates, omit the right-hand figure of the sum, as uncertain, but take in the carriage. Follows an example at large, and the same contracted.

<i>Ex. at large.</i>	<i>contracted.</i>
12.2352946	12.23529 +
8.15789325	8.15789 +
7.086968435	7.08696 —
6.32143482	6.32143 +
4.75	4.75
<hr/>	<hr/>
38.551591105	38.5515 certain.

**RULE II.** When all or any of the given decimals are repeaters, give every repeater the same number of places, and one place more than the longest finite; and for every nine in the right-hand column carry 1. or to its sum add 1 for every nine, and then carry at ten.

<i>Examp.</i>	$748\frac{1}{9} = 748.23$
	$653\frac{2}{7} = 653.86$
	$84\frac{3}{4} = 84.75$
	$25\frac{5}{6} = 25.83$
	$37\frac{2}{3} = 37.66$
	$8\frac{1}{2} = 8.50$
	<hr/>
	$1557\frac{2}{3} = 1557.66$

In this example the sum of the right-hand column is 24, which contains 9 twice, and 6 over; so set down 6 and carry 2: Or to the sum 24 add 2, for the two nines, which makes 26; so set down 6 and carry 2. Proceed with the rest as in integers.

The sums, differences, and products, of interminate decimals, are always interminate, unless they end in a cipher.

A repeating digit is the numerator of a vulgar fraction, whose denominator is 9; and hence, in adding a column of repeating digits, every 9 of the sum is  $\frac{9}{9}$ , or an unit, to be carried; and what is over a just number of nines is so many ninth-parts.

Or, if to the sum of a column of repeating digits, 1 for every 9 contained in it be added, we then carry 1 for every ten; but what is over a just number of tens will still continue to be ninth-parts.

If in any example the repeating figures happen all to be reiterated, the carriage from the right-hand column adjusts the column on the left, or makes every ten of them equal to an unit of the next superior column, &c. Thus, if we imagine a column of the repeating figures reiterated on the right of any example, the carriage from it would adjust the right-hand column of the example.

**RULE III.** When all or any of the given decimals are circulates, make all the circles conterminous, find the number of tens to be carried from the left-hand column

of the circles, add this carriage to the right hand column, and proceed as in addition of integers.

If repeaters be mixed with the circulates, give the repeaters the form of circulates, by extending the repeating figures till they become conterminous with the other circles.

If finite decimals are joined with the circulates, extend the finite parts of all the circulates to as many places as there are figures in the longest finite.

<i>EXAMP.</i>	$\frac{1}{3} = .428571, = .428571,$
	$\frac{2}{7} = .857142, = .857142,$
	$\frac{1}{4} = .45, = .454545,$
	$\frac{1}{37} = .370, = .370370,$
	<hr/>
	2.110630

In order to find the carriage from the left-hand column of the circles, add the column next to it on the right, saying,  $7 + 5 + 5 + 2 = 19$ ; from which carry 1, and say,  $1 + 3 + 4 + 8 + 4 = 20$ ; from which carry 2, and go on to add the right-hand column of the circle, saying, the carriage  $2 + 5 + 2 + 1 = 10$ ; so set down 0, and carry 1, and proceed with the rest as in integers.

The adding the carriage from the left-hand column of the circles to the column on the right hand, arises from the flux of numbers; for as the circles repeat infinitely, if we suppose a new set of the same circles to be repeated upon the right of our examples, it is plain, that in adding them the carriage from the left-hand column of the new set would naturally fall into the right-hand column of our example.

The operation here is the same as in addition of vulgar fractions; for every circle is the numerator of a vulgar fraction, whose common denominator is 999999; and if the circles or numerators be added, without minding any carriage from the left-hand column, the sum will be 2110628.

$$\begin{array}{r} \text{And } 999999 \times 2110628 \left( 2\frac{110630}{999999} \right) \\ \hline 1999998 \\ \hline 110630 \end{array}$$

But, by pointing off from the sum of the circles six figures towards the right, we divide by 1000000, instead of dividing by 999999; which gives indeed the same quot, but makes the remainder too small.

Now, that the carriage-figure from the left-hand column of the circles, is the integral part of the quot, and at the same time the difference between the true and false remainder, is evident; for the quotient-figure 2, multiplied into the two divisors 1000000 and 999999, gives two products, whose difference is 2; and consequently, if the greatest product, viz.  $2 \times 1000000 = 2000000$ , be subtracted from the dividend, the result will want 2 of the true remainder. To prevent such errors, and to put the work on a sure footing, find the carriage from the left-hand column of the circles, add this carriage to the right-hand column, divide the sum by 1000000, and you will have a true quot, and a true remainder. The learner may look back to division of integers.

integers, where the method of dividing by 9,99,999, &c. is explained.

Hence it follows, that if we add the circles as they stand, without minding any carriage from the left, and to the sum add the excrement figure on the left of the decimal point, we shall have the full sum of the circles, both as to the integral and fractional part, as in the margin.

Pure repeaters, being the numerators of vulgar fractions, whose denominator is 9 as often taken as the digit is repeated, may be added in the same manner as circles. But in examples clear of circulates, the method preferred in Case II. is preferable.

In adding circles and pure repeaters by the method now explained, it will sometimes happen that the fractional part of the sum will be a series of nines, as in the margin: And in this case, the numerator of the fraction being the same with the denominator, its value will be unity; and accordingly 1 must be added to the integral part. But in adding pure repeaters by the method in Case II. this cannot happen.

By way of proof, we shall here add all the vulgar fractions in Examp. I. and reduce their sum to a mixt number, continuing the division to a decimal.

$$\frac{1}{7} + \frac{6}{7} + \frac{1}{7} + \frac{1}{7} = \frac{6217}{24277} + \frac{12274}{24277} + \frac{6611}{24277} + \frac{6611}{24277}$$

$$14553 \text{ } 30716 (2.110630,$$

$$29106$$

$$* 16100$$

$$14553$$

$$15470$$

$$14553$$

$$91700$$

$$87318$$

Here the dividend being the same with the second, a new circle begins.

$$43820$$

$$43659$$

$$* 16100$$

#### IV. Subtraction of Decimals.

**RULE I.** Place the minor under the major, so that the points may be in one column; and then, if the given decimals be finite or approximate, work as in subtraction of integers.

If the major and minor have not the same number of places, imagine the void places to be filled up with ciphers.

#### EXAMPLE I.

$$\begin{array}{r} \text{From } 48 \text{ } 10 \text{ } 6 = 48.525 \\ \text{Sub. } 18 \text{ } 12 \text{ } 8\frac{1}{4} = 18.634375 \\ \hline \end{array}$$

$$\text{Rem. } 29 \text{ } 17 \text{ } 9\frac{1}{4} = 29.890625$$

#### EXAMPLE II.

$$\begin{array}{r} \text{From } 54 \text{ } 2 \text{ } 21 = 54.6875 \\ \text{Sub. } 36 \text{ } 3 \text{ } 14 = 36.875 \\ \hline \end{array}$$

$$\text{Rem. } 17 \text{ } 3 \text{ } 17 = 17.8125$$

#### APPROXIMATES.

In subtracting approximates, neglect the right-hand figure of the remainder, as uncertain; but an unit borrowed on the right must be repaid, as in the two examples following.

$$\begin{array}{r} \text{Ex. 1.} \\ \text{From } 783.0625 \\ \text{Sub. } 495.28571 + \\ \hline \end{array} \quad \begin{array}{r} \text{Ex. 2.} \\ \text{From } 549.4643 \\ \text{Sub. } 78.0875 \\ \hline \end{array}$$

$$\text{Rem. } 287.7767 \text{ certain. Rem. } 471.376 \text{ certain.}$$

**RULE II.** If one of the given decimals is a repeater, and the other a finite decimal, give the repeater one place more than the finite decimal, and in subtracting borrow 9 on the right hand.

But if both major and minor repeat, give them an equal number of places, and then subtract as above.

$$\begin{array}{r} \text{Ex. 1.} \\ \text{From } .714583\bar{3} \\ \text{Sub. } .634375 \\ \hline \end{array} \quad \begin{array}{r} \text{Ex. 2.} \\ .525 \\ \text{Sub. } .3333 \\ \hline \end{array} \quad \begin{array}{r} \text{Ex. 3.} \\ .998958\bar{3} \\ \text{Sub. } .0291666 \\ \hline \end{array}$$

$$\text{Rem. } .080208\bar{3} \quad .191\bar{6} \quad .969791\bar{6}$$

In Ex. 1. and 2. you give the repeater one place more than the finite decimal, and by this means you obtain the repeating figure of the remainder. But in Ex. 3. you give the two repeaters an equal number of places.

In Ex. 2. and 3. you borrow 9 on the right hand.

**RULE III.** If both the given decimals be circulates, make the circles contemporaneous, and work as in integers; only if, in the left-hand column of the circles, you foresee, that, in subtracting the figure of the minor from that of the major, one must be borrowed, in this case add 1 to the right-hand figure of the minor, and then subtract.

If one of the given decimals be a circulate, and the other a repeater, give the repeater the form of a contemporaneous circulate, and then subtract as above.

If one of the given decimals be a circulate, and the other a finite decimal, extend the finite part of the circulate to as many places as there are figures in the finite decimal, and then subtract.

$$\text{EXAMP. I. From } \frac{6}{7} = .6,428571, = .64,285714, \\ \text{Sub. } \frac{1}{4} = .17,857142, = .17,857142,$$

$$\text{Rem. } .46,428571,$$

In this example, because, in the left-hand column of the

the

the circles, 8 cannot be subtracted from 2 without borrowing; therefore add 1 to the right-hand figure of the minor, and say,  $1+2=3$ , and 3 from 4, and 1 remains. The reason is obvious: for, supposing the circles reiterated on the right of the example, it would be, 8 from 2 you cannot, but 8 from 12 and 4 remains; 1 borrowed, and 2, make 3, &c.

EXAMPLE II.

$$\begin{array}{r} \text{From } \frac{1}{3} = .9, 285714, \\ \text{Sub. } \frac{1}{3} = .\beta \\ \hline \end{array}$$

Rem. .2619047,

In the above example the repeaters are given in the form of conterminous circulates.

EXAMPLE III.

$$\begin{array}{r} \text{From } \frac{1}{3} = .384615, \\ \text{Sub. } \frac{1}{3} = .125 \\ \hline \end{array}$$

Rem. .259,615384,

In the last example the finite part of the circulate is extended to as many places as there are figures in the finite decimal, by which means like things come to be subtracted, and you obtain the exact circle of the remainder.

V. *Multiplication of Decimals.*

In multiplication and division there may happen nine varieties, arising from the different nature of the numbers that may occur in the operation; and these are of three sorts, *viz.* integers, mixt numbers, and pure decimals.

Now, since the multiplier or divisor may be of three kinds, and the multiplicand or dividend of as many, there must of consequence be nine varieties; which are these following.

An integer may multiply or divide	}	an integer, a mixt number, a pure decimal.
A mixt number may multiply or divide	}	an integer, a mixt number, a pure decimal.
A pure decimal may multiply or divide	}	an integer, a mixt number, a pure decimal.

Of these varieties, the first belongs properly to vulgar arithmetic, the other eight occur in decimal operations.

But in multiplication and division of decimals, there will occur other nine varieties, arising likewise from the nature of the numbers; which may either be finite, repeating, or circulating.

And since the multiplier or divisor may be of three sorts, and the multiplicand or dividend of as many, there must of course be nine varieties; and these are so obvious, that it would be losing time here to enumerate them.

Before entering on multiplication, we shall lay down a rule for pointing the product, which is of a general nature, and extends to decimals of every sort, whether finite, repeating, or circulating; and is as follows.

Vol. I. Numb. 17.

GENERAL RULE.

Give to many decimal places to the product, on the right, as are in both factors; and if the product has not so many figures, supply that defect by prefixing ciphers.

We now proceed to multiplication.

RULE 1. If both factors are finite or approximate, work exactly as in multiplication of integers.

Ex. 1.	Ex. 2.
.785	.125
.75	.25
3925	625
5495	250
58875	03125

In Ex. 2. the product not affording for many decimal places as are in the multiplicand and multiplier, the defect is supplied by prefixing ciphers.

The reason of giving as many decimal places to the product as are in both factors, appears by considering that the operation is the same here as in multiplication of vulgar fractions. Thus,  $.785 \times .75 = \frac{785}{1000} \times \frac{75}{100} = \frac{58875}{100000} = .58875$ .

To multiply by 10, 100, &c. move the decimal point to many places toward the right hand as there are ciphers in the multiplier.

Thus:	And thus:
$.4375 \times 10 = 4.375$	$6875 \times 10 = 68.75$
$.4375 \times 100 = 43.75$	$6875 \times 100 = 687.5$

APPROXIMATES.

In multiplying approximates, the certain places of the product may be determined by one or other of the two rules following, *viz.*

1. If both factors are approximates, the uncertain places of the product will be one more than the number of places in the longest factor.
2. If one of the factors be finite, and the other approximate, the uncertain places of the product will be one more than the number of places in the finite factor.

Ex. 1.	Ex. 2.
245.118—	.210526+
.3529+	2.875
2206062	1052630
490236	1473682
1225590	1684708
735354	421052
86.5021422	.605262250

In Ex. 1. the integral part of the product, *viz.* 86, is certain, and all the decimal places on the right are uncertain. In Ex. 2. only four places on the left, *viz.* .6052, are certain, and all the other places uncertain.

The reason of Rule 1. is plain. For if in Ex. 1. we make the longest factor the multiplier, and the total product will be the same either way, it is obvious, that in this case we shall have six particular products, in each of which the right-hand figure will be uncertain, and consequently

consequently we shall have six uncertain places in the total product toward the right, and also one uncertain place more on account of the uncertain carriage from the column in which the right-hand figure of the last particular product stands.

The reason of Rule 2. is also obvious. For in Ex. 2. by making the finite factor the multiplier, we have four particular products, in each of which the right-hand figure is uncertain; and so we have four uncertain places in the total product, and one uncertain place more arising from the uncertain carriage.

The carriage in some cases may affect several columns on the left, and thereby render so many more figures uncertain.

The surest way therefore to determine the certain places in the product of approximates, is by a second operation, giving the approximates contrary signs; for then, so far as the two products agree, the figures are certain. The second operations of the two former examples follow.

Ex. 1.	Ex. 2.
245.117+	.210527-
.553-	2.875
<hr/>	<hr/>
235351	1052635
1225585	1473689
735351	1684216
<hr/>	<hr/>
86.526301	421054
	<hr/>
	.605265125

In Ex. 1. 86 5 is certain, and all the other figures uncertain. In Ex. 2. .60526 are the only certain places.

Because the multiplication of decimals that consist of many places, proves, in the way hitherto practised, a tedious operation, we shall here explain a method whereby decimals of this sort, whether finite or approximate, may be multiplied expeditiously, and at the same time have the decimal places in the product limited to any number proposed. This may be effected by the following

**RULE.** Under the multiplicand place the multiplier inverted, so that its units place may stand under that place of the multiplicand to which you propose to limit the product; then multiply the right-hand figure of the multiplier into that figure of the multiplicand which stands directly over it, taking in the carriage from the right, and go on to multiply it into all the other figures on the left. Proceed in like manner with every other figure of the multiplier, placing the right-hand figures of all the particular products directly under other. The total product will be approximate, and the right-hand figure uncertain.

To make this rule more easily understood, the reader may look back to the multiplication of integers; where it was observed, that instead of beginning with the right-hand figure of the multiplier, we may begin with the left, and still have a just product, provided the right-hand figure of every particular product be placed directly under the multiplying figure. Now, the working an example, both in this manner, and also by the rule, and comparing the steps and results of the two opera-

tions, will throw a light upon the matter, and unfold the reason of the rule. Which take as follows.

Multiply 18.634375 into 9.875, and limit the product to four decimal places.

By the rule.	By the other method.
18.634375	18.634375
578-9	A 9.875
<hr/>	<hr/>
1677093	1677093 75
149075	149075 000
13044	13044 0625
931	931 71875
<hr/>	<hr/>
184.0143+	184.0144 53125
	B

In working by this rule, you invert the multiplier, and place 9, the units figure, under 3, the fourth place of decimals, because the product is limited to four decimal places; then multiply, saying,  $9 \times 3 = 27$ , and 6 carried from the right makes 33, &c. In multiplying by 8, say,  $8 \times 4 = 32$ , and 3 of carriage makes 35; so set 5 under 3; and proceed in like manner to multiply the figures on the left. The right-hand figure of the product is defective, as wanting the carriage from the columns cut off on the right by the line A B. The figures expressing the sum of the columns so cut off, are so many uncertain places of the product, when the factors are approximate, and on that account to be rejected as useless. The figures, moreover, on the right of the line A B, show how far the operation is contracted, or how much labour is saved in working by the rule.

If there be no units in the multiplier, in this case set the right-hand figure of the inverted multiplier under that figure of the multiplicand, below which it would have stood had there been units.

Ex. Multiply .825 by .825, limiting the product to three decimal places.

By the rule.	The common way at large.
.825	.825
528.	.825
<hr/>	<hr/>
640	4125
16	1650
4	6600
<hr/>	<hr/>
.680+	.680625

The decimal places of the factors may either be retained at full length, or turned into approximates before you begin to multiply.

Ex. Multiply 25.845013625 by 42.97235, limiting the product to two decimal places.

25.845013625
33279.24
<hr/>
103396
5169
2326
180
<hr/>
5
<hr/>
1110.76+

We shall next turn the decimals of the former example into approximates, and then the operation will be as follows.

By the rule.	Common way at large.
$\begin{array}{r} 25.85 \\ + 79.24 \\ \hline 103400 \\ 5170 \\ 2326 \\ 180 \\ \hline \end{array}$	$\begin{array}{r} 25.85 \\ 42.97 \\ \hline 18095 \\ 23265 \\ 5170 \\ 10340 \\ \hline \end{array}$
Prod. 1110.76+	1110.7745

It remains to be observed, that the want of carriage from the right hand may sometimes affect more columns on the left than one, and thereby occasion more uncertain figures in the product than that on the right hand. The best security on this head is, never to limit the product to fewer than four or five decimal places.

To conclude, when decimals to be multiplied are long, you may frequently perform the operation more easily in vulgar fractions, and then reduce the product to a decimal.

**RULE II.** If the multiplier be finite, and the multiplicand repeat, in multiplying carry at 9 on the right hand; and before you add, prolong the repetends of the particular products, till their right-hand figures stand directly under one another; and in adding, carry at 9 on the right hand.

The product repeats, as in Ex. 1. 2. &c.; or turns out finite, as in Ex. 6.

Ex. 1.	Ex. 2.	Ex. 3.	Ex. 4.
.3	.16	27.083	354.26
4	7	.5	.03
1.2	1.16	13.5416	28.3413
	Ex. 5.	Ex. 6.	
	4.06	6.43	
	5.2	123	
	813	1930	
	20333	12866	
	21.146	64333	
		791.30	

*Note.* If the multiplier has ciphers on the right, instead of annexing ciphers to the product, reiterate its right-hand figure so many times as there are ciphers.

Ex. 1.	Ex. 2.
79.6	874.3
50	900
3983.3	786900.0

**RULE III.** If the multiplier be finite, and the multi-

placand circulate, to the product of the right-hand figure of the circle add the carriage from the left, then proceed as in multiplication of integers; but before you add the particular products, make them conterminous, and then add as in addition of circulates.

The product commonly circulates; and then its circle is similar to the circle of the multiplicand, as in Ex. 1. and 2.; but the product sometimes repeats, as in Ex. 5.; or it may turn out finite, as in Ex. 6.

Here it is obvious, that in multiplying .481 Ex. 1. by 7, the carriage from the left would be 3; .481, so say,  $7 \times 1 = 7$ , and 3 of carriage, make 10, 7, &c. The product circulates, and its circle .370, is similar to .481, the circle of the multiplicand.

Ex. 2.	Ex. 3.	Ex. 4.
7.518,	7.518,	7.518,
.5	.05	.005
3.7592,	.37592,	.037592,

In the above three examples the products are mixt circulates, the three figures on the right being the circle, and the figures on the left the finite parts.

**RULE IV.** If the multiplier be interminate, reduce it to a vulgar fraction, as directed in reduction of decimals, Prob. V.; then multiply the given multiplicand by the numerator, (working as in integers, if the multiplicand be finite; or as directed in Rule 2. if it repeat; or as prescribed in Rule 3. if it circulate); and divide the product by the denominator.

Here there are six cases; for the multiplier may repeat or circulate, and may multiply a finite, a repeating, or circulating multiplicand.

**CASE I.** When a repeating multiplier multiplies a finite multiplicand.

**EXAMP.** Multiply 638.25 by  $.4 = \frac{2}{5}$

638.25.	
4	
9)2553.00	(283.6 product sought)
18	
75	
72	
33

 \hline
 2571,4 \\
 25,7
 \end{array}$$

Prod.  $.25,97402\bar{5} = .259740\bar{25}$

The circle of the first product is always similar to that of the multiplicand, and in the above example consists of six places; but to secure the carriage from right to left, and thereby complete the circle of the quot or total product, transfer 7, the left-hand figure of the circle of the first product, to the right, and fill up the places under it with the figures that come in course, and from the sum of these figures on the right carry 2, which completes the circle of the total product.

## VI. Division of Decimals.

BEFORE we enter on division, it will be proper to observe, that there are two rules for pointing the quot, both which are general in their nature, and extend to decimals of every sort, whether terminate or interminate; but unwilling to perplex the learner with too many things at once, we shall at present lay down only one of these rules; and afterwards, when the rule now to be assigned appears to be sufficiently exemplified, shall then bring the other rule upon the field.

### GENERAL RULE.

The decimal places in the divisor and quot together must always be equal in number to those of the dividend.

The

The five following practical directions will make the application of the general rule easy.

1. When the divisor and dividend have an equal number of decimal places, the quot comes out an integer; as in Ex. 2.

2. When the decimal places of the dividend are more than those of the divisor, the number of decimal places in the quot must be equal to the excess; as in Ex. 1, 4, and 8.

3. When the decimal places of the divisor are more than those of the dividend, annex ciphers to the dividend, so as to make them equal, and the quot, by direction 1. will be integers; as in Ex. 3, 5, and 7.

4. When, after division is finished, the quot has not so many figures, as, by the general rule, it ought to have decimal places, supply that defect by prefixing ciphers; as in Ex. 6.

5. If, after the dividend is exhausted, there be a remainder, annex a cipher, or ciphers, to the remainder, and continue the division till o remain, or till the quot repeat or circulate, or till you think proper to limit it; as in Ex. 9, 10, 11, and 12.

We now proceed to division.

**RULE I.** If the divisor and dividend are both finite or approximate, work exactly as in division of integers.

<p><i>Ex. 1.</i>  <math display="block">\begin{array}{r} .75)58875(.785 \\ \underline{525} \phantom{00} \\ 637 \phantom{00} \\ \underline{600} \phantom{00} \\ 375 \\ \underline{375} \\ 0 \end{array}</math></p>	<p><i>Ex. 2.</i>  <math display="block">\begin{array}{r} 2.5)182.5(73 \\ \underline{175} \phantom{00} \\ 75 \\ \underline{75} \\ 0 \end{array}</math></p>
---	---

In Ex. 1. A decimal divides a decimal; and because the dividend has five decimal places, and the divisor only two, give three decimal places to the quot, according to Direction 2.

In Ex. 2. A mixt number divides a mixt number, and the divisor and dividend having an equal number of decimal places, the quot comes out an integer, according to Direction 1.

The reason of the rule for pointing the quot is obvious; for multiplication gives as many decimal places to the product as are in both factors; but the dividend is the product of the divisor and quot, and so has as many decimal places as are in both; consequently the decimal places in the divisor and quot together must be equal in number to those of the dividend.

<p><i>Ex. 3.</i>  <math display="block">\begin{array}{r} .85)476( \\ \underline{85}476.00(560 \\ \underline{425} \phantom{00} \\ 510 \\ \underline{510} \\ 0 \end{array}</math></p>	<p><i>Ex. 4.</i>  <math display="block">\begin{array}{r} 7).875(.125 \\ \underline{7} \phantom{00} \\ 17 \\ \underline{14} \\ 35 \\ \underline{35} \\ 0 \end{array}</math></p>
---	--

In Ex. 3. A decimal divides an integer; and the dividend having no decimal place, annex two ciphers, be-

cause there are two decimal places in the divisor, and the quot comes out an integer, according to Direction 3.

In Ex. 4. An integer divides a decimal; and because the dividend has three decimal places, and the divisor none, give the quot three, by Direction 2.

<p><i>Ex. 5.</i>  <math display="block">\begin{array}{r} .375)12.75( \\ \underline{375}12.750(34 \\ 1125 \\ \underline{1500} \\ 1500 \\ \underline{1500} \\ 0 \end{array}</math></p>	<p><i>Ex. 6.</i>  <math display="block">\begin{array}{r} 2.5).22875(.0915 \\ \underline{225} \phantom{00} \\ 37 \\ \underline{25} \\ 125 \\ \underline{125} \\ 0 \end{array}</math></p>
--	---

In Ex. 5. A decimal divides a mixt number; and the divisor having three decimal places, and the dividend but two, supply that defect by annexing a cipher, and the quot comes out an integer, by Direction 3.

In Ex. 6. A mixt number divides a decimal; and because the dividend has four decimal places more than the divisor, and the quot, after the division is finished, has only three figures, supply this defect by prefixing a cipher to it, according to Direction 4.

<p><i>Ex. 7.</i>  <math display="block">\begin{array}{r} 3.75)180( \\ \underline{375}180.00(48 \\ 1500 \phantom{00} \\ \underline{3000} \\ 3000 \\ \underline{3000} \\ 0 \end{array}</math></p>	<p><i>Ex. 8.</i>  <math display="block">\begin{array}{r} 38)243.2(6.4 \\ \underline{228} \phantom{00} \\ 152 \\ \underline{152} \\ 0 \end{array}</math></p>
---	---

In Ex. 7. A mixt number divides an integer; and the dividend having no decimal places, supply that defect by annexing two ciphers, the number of decimal places in the divisor, and the quot is an integer, by Direction 3.

In Ex. 8. An integer divides a mixt number; and the divisor having no decimal place, and the dividend only one, give one to the quot, according to Direction 2.

<p><i>Ex. 9.</i>  <math display="block">\begin{array}{r} .8)2936.25 \\ \underline{24} \phantom{00} \\ 50 \\ \underline{48} \\ 20 \\ \underline{16} \\ 40 \\ \underline{40} \\ 0 \end{array}</math></p>	<p><i>Ex. 10.</i>  <math display="block">\begin{array}{r} .018).0024(.13 \\ \underline{18} \phantom{00} \\ 60 \\ \underline{54} \\ 6 \end{array}</math></p>
--	---

In Ex. 9. A decimal divides an integer; and after the dividend is exhausted, annex a cipher to the remainder, and continue the division till o remain, according to Direction 5.

In Ex. 10. A decimal divides a decimal; and after the dividend is exhausted, annex a cipher to the remainder, and continue the division till you find the quot repeats.

$$\begin{array}{r} \text{Ex. 11.} \\ 11)8( \\ 11)8.0(72 \\ \underline{77} \\ 30 \\ \underline{22} \\ 8 \end{array}$$

$$\begin{array}{r} \text{Ex. 12.} \\ 3.25)76.75(23.615+ \\ \underline{650} \\ 1175 \\ \underline{975} \\ 2000 \\ \underline{1950} \\ 500 \\ \underline{325} \\ 1750 \\ \underline{1625} \\ 125 \end{array}$$

$$\begin{array}{r} \text{Var. 3.} \\ 35)32.095(.917 \\ \underline{315} \\ 59 \\ \underline{35} \\ 245 \\ \underline{245} \end{array}$$

$$\begin{array}{r} \text{Var. 4.} \\ 35)3.2095(.0917 \\ \underline{315} \\ 59 \\ \underline{35} \\ 245 \\ \underline{245} \end{array}$$

$$\begin{array}{r} \text{Var. 5.} \\ 35)32095(.00917 \\ \underline{315} \\ 59 \\ \underline{35} \\ 245 \\ \underline{245} \end{array}$$

$$\begin{array}{r} \text{Var. 6.} \\ 35)032095(.000917 \\ \underline{315} \\ 59 \\ \underline{35} \\ 245 \\ \underline{245} \end{array}$$

In *Ex. 11.* An integer divides an integer; and the dividend being less than the divisor, annex a cipher to it; again, after the dividend is exhausted, annex a cipher to the remainder, and continue the division till you find the quot circulates.

In *Ex. 12.* A mixt number divides a mixt number: and after the dividend is exhausted, by annexing ciphers to the remainder, continue the division till the quot has three decimal places; and as there is still a remainder, it might be carried further; but three decimal places being in most cases sufficiently accurate, here you may limit it; so the quot is approximate.

In division of decimals, the place of the first figure of the quot may likewise be known from the first dividend, much after the same manner as in division of integers, by the following

## II. GENERAL RULE.

The place of the first figure of the quot is the same with the place of that figure in the dividend which stands over the units of the first product.

Thus, in the example of integers in  $35)32095(917$ , the margin, the figure 0, that stands over 5, the units of the product of  $9 \times 35$ , is in the place of hundreds; and therefore 9, the first figure of the quot, is likewise hundreds; and so the quot is 917 integers.

To illustrate the rule, we shall give decimal places to the dividend of the above example; and thereby exhibit the varieties that will occur in pointing the quot.

$$\begin{array}{r} \text{Variety 1.} \\ 35)3209.5(91.7 \\ \underline{315} \\ 59 \\ \underline{35} \\ 245 \\ \underline{245} \end{array}$$

$$\begin{array}{r} \text{Var. 2.} \\ 35)320.95(9.17 \\ \underline{315} \\ 59 \\ \underline{35} \\ 245 \\ \underline{245} \end{array}$$

$$\begin{array}{r} \text{Var. 1.} \\ 35)32095(9170 \\ \underline{315} \\ 59 \\ \underline{35} \\ 245 \\ \underline{245} \end{array}$$

$$\begin{array}{r} \text{Var. 2.} \\ 35)32095(91700 \\ \underline{315} \\ 59 \\ \underline{35} \\ 245 \\ \underline{245} \end{array}$$

$$\begin{array}{r} \text{Var. 3.} \\ 0.35)32095(917000 \\ \underline{0.315} \\ 59 \\ \underline{35} \\ 245 \\ \underline{245} \end{array}$$

$$\begin{array}{r} \text{Var. 4.} \\ 0.035)32095(9170000 \\ \underline{0.0315} \\ 59 \\ \underline{35} \\ 245 \\ \underline{245} \end{array}$$

In *Var. 1.* say,  $9 \times 35 = 315$ ; and the unit 1 standing under the place of thousands, the figure 9 is also thousands; and as 0 at last remains, annex a cipher for the decimal .5 in the divisor; then dividing, you get 0 to the quot; and because 9 stands in the place of thousands, the quot is wholly integers.

In Var. 2. the unit 3 stands under the place of ten-thousands, and so 9 is ten-thousands; and to the remainder 0 annex .00, for the two decimal places in the divisor; then dividing, you get 00 to the quot; and because 9 stands in the place of ten-thousands, the quot continues to be wholly integers. The process is the same in Var. 3. and 4.

Lastly, we shall allow decimal places to both dividend and divisor.

<p><i>Var. 1.</i>  <math display="block">\begin{array}{r} 3.5 \overline{) 320.95 (91.7} \\ \underline{31.5} \phantom{00} \\ 59 \phantom{00} \\ \underline{35} \phantom{00} \\ 245 \phantom{00} \\ \underline{245} \phantom{00} \\ 0 \phantom{00} \end{array}</math></p> <p><i>Var. 3.</i>  <math display="block">\begin{array}{r} .35 \overline{) .32005 (.917} \\ \underline{.315} \phantom{00} \\ 59 \phantom{00} \\ \underline{35} \phantom{00} \\ 245 \phantom{00} \\ \underline{245} \phantom{00} \\ 0 \phantom{00} \end{array}</math></p>	<p><i>Var. 2.</i>  <math display="block">\begin{array}{r} 3.5 \overline{) 32.095 (9.17} \\ \underline{31.5} \phantom{00} \\ 59 \phantom{00} \\ \underline{35} \phantom{00} \\ 245 \phantom{00} \\ \underline{245} \phantom{00} \\ 0 \phantom{00} \end{array}</math></p> <p><i>Var. 4.</i>  <math display="block">\begin{array}{r} 3.5 \overline{) 32095 (.0917} \\ \underline{31.5} \phantom{00} \\ 59 \phantom{00} \\ \underline{35} \phantom{00} \\ 245 \phantom{00} \\ \underline{245} \phantom{00} \\ 0 \phantom{00} \end{array}</math></p>
---	---

In Var. 1. the units of the first product stand under tens of the dividend; and so 9, the first figure of the quot, is tens. In Var. 2. the units of the first product stand under units of the dividend, and so 9 is units. In Var. 3. the units of the first product stand under primes, and so 9 is primes, &c.

To divide by 10, 100, 1000, &c. is to move the decimal point one place toward the left for every cipher in the divisor.

Thus,	And Thus,
10)768( 76.8	10)17.28( 1.728
100)768( 7.68	100)17.28( .1728
1000)768( 768	1000)17.28( .01728
10000)768(.0768	10000)17.28(.001728

APPROXIMATES.

In dividing approximates, the certain places of the quot, may be determined by the following

**RULE.** Place the divisor under the first dividend, and the number of certain figures in the quot shall be one less than the number of places from the left of the divisor to the first + or -, whether in the divisor or in the dividend.

<p><i>Ex. 1.</i>                  Dividend 1110.79286078—                  Divisor 42.9723+                  Certain places five, where-                  of three are decimals.</p>	<p><i>Ex. 2.</i>                  Dividend 1110.7929—                  Divisor 25.8490136+                  Certain places six, where-                  of four are decimals.</p>
--	---

But here it is to be observed, that the uncertain car-

riage may, in some cases, effect several columns on the left, and thereby render more figures of the quot uncertain than the rule prescribes. The surest way, therefore, is, to make two operations with contrary signs, and then the figures in which the two quots agree are certain.

In order to make the reason of the rule appear, it will be necessary to work an example.

*Example.*

42.9723+	1110.79286078—	(25.849.
	A	
	859446.....	
	-----	
	2513468	
	2148615	
	-----	
	3648536	
	3437784	
	-----	
	2107520	
	1718892	
	-----	
	3886287	
	3867507	
	-----	
	18780	
	B	

Here we stop, no more places being certain. The reason is obvious; for the right-hand figure of the first product, viz. 6, is uncertain; and consequently all the figures under it, on the right of the line A B, will be so too; that is, the last remainder and new dividend are uncertain, and of course the figure that would go next to the quot.

From this example it appears, that all the figures on the right of the line A B are uncertain and useless; if therefore a way of working, without writing down these useless figures, can be found, we shall then have a method of dividing long decimals, whether finite or approximate, so as to contract the operation, and limit the product to any number of decimal places proposed. And this may be effected by observing the following

**RULE.** Write the product of the first quotient-figure under the dividend; and from the situation of the units place, consider how many figures of the dividend must be retained to give the quot the number of decimal places intended; cut off the other figures on the right, and also the figures corresponding to them on the right of the divisor; then subtract; esteem this and every following remainder a new dividend; and for each new dividend drop a figure on the right of the divisor; but in multiplying the quotient-figures into the divisor, take in the carriage from the right hand; as in the following examples.

**Ex. I.** Divide 95.432756463275 by 3.4637528; and limit the quot to four decimal places.

Contracted.

Contracted by the rule.

$$3.4637528)95.432756463275(27.5518$$

$$\begin{array}{r} 261577 \\ 242462 \end{array}$$

$$\begin{array}{r} 19115 \\ 17318 \end{array}$$

$$\begin{array}{r} 1797 \\ 1731 \end{array}$$

$$\begin{array}{r} 66 \\ 34 \end{array}$$

$$\begin{array}{r} 32 \\ 27 \end{array}$$

(5)

In the above example the units of the first product standing under the place of tens, the first figure of the quot is tens; and hence it is easy to foresee, that six figures of the dividend retained will give four decimal places to the quot; and accordingly cut off all the other figures on the right of the dividend; cut off likewise from the divisor two figures that correspond to them.

At every new dividend, drop or omit a figure on the right of the divisor, and mark the figure so dropped by setting a point under it; and in multiplying the quotient-figure 7 into the divisor, say, 7 times 7 is 49, and 3 of carriage from the right, (arising from  $7 \times 5 = 35$ ), makes 52; so set down 2, and carry 5. The same method is observed in multiplying every other quotient-figure into the divisor.

The same Example at large.

$$3.4637528)95.432756463275(27.55183$$

$$\begin{array}{r} 261577004 \\ 242462696 \end{array}$$

$$\begin{array}{r} 191143086 \\ 173187640 \end{array}$$

$$\begin{array}{r} 179554463 \\ 173187640 \end{array}$$

$$\begin{array}{r} 63668232 \\ 34637528 \end{array}$$

$$\begin{array}{r} 290307047 \\ 277100224 \end{array}$$

$$\begin{array}{r} 132068235 \\ 103912588 \end{array}$$

$$\begin{array}{r} 129055647 \\ B \end{array}$$

In working the same example at large, the line A B shows how far the operation is contracted, and how much labour is saved.

But here observe, that by the rule for approximates the certain places of the quot are no more than five, viz. 27.551. And therefore, in all operations of this kind, care should be taken to limit the quot to so many places certain; as is done in the following example.

EXAMP. II. Divide  $87.0763264525$  by  $9.365407024$ ; limiting the quot to four decimal places certain.

$$9.365407024)87.0763264525(9.2976$$

$$\begin{array}{r} 278766 \\ 187308 \end{array}$$

$$\begin{array}{r} 91458 \\ 84288 \end{array}$$

$$\begin{array}{r} 7170 \\ 6555 \end{array}$$

$$\begin{array}{r} 615 \\ 561 \end{array}$$

54

Here we put a stop to the operation; because, by the rule for approximates, the next figure of the quot would be uncertain.

We shall conclude division of finite decimals with two very useful problems.

PROB. I. From a given multiplier to find a divisor that gives a quot equal to the product.

RULE. Divide an unit with ciphers annexed by the given multiplier, and the quot will be the divisor sought.

EXAMP. What divisor will give a quot equal to the product of 125 into the dividend?

Given multiplier 125)1.000(.008 divisor sought.

Now, if any number be divided by .008, and the same number be multiplied by 125, the quot and product will be equal.

$$.008)7315.000(914375 \text{ quot.}$$

$$\begin{array}{r} 72 \dots \dots \end{array}$$

$$\begin{array}{r} 11 \\ 8 \end{array}$$

$$\begin{array}{r} 35 \\ 32 \end{array}$$

$$\begin{array}{r} 30 \\ 24 \end{array}$$

$$\begin{array}{r} 60 \\ 56 \end{array}$$

$$\begin{array}{r} 40 \\ 40 \end{array}$$

$$\begin{array}{r} 7315 \\ 125 \end{array}$$

$$\begin{array}{r} 36575 \\ 14630 \\ 7315 \end{array}$$

914375 product.

The reason is plain: for an unit contains the quot .008 just 125 times; and consequently .008 dividing any number

ber will give a quot 125 times greater than the dividend ; that is, the quot will be equal to the product of the dividend multiplied by 125.

PROB. II. From a given divisor to find a multiplier that gives a product equal to the quot.

RULE. Divide an unit with ciphers annexed by the given divisor, and the quot will be the multiplier sought.

EXAMP. What multiplier will give a product equal to the quot arising from the same number divided by .008?

Given divisor .008)1.000(125 multiplier sought.

$$\begin{array}{r} 8^{\cdot\cdot} \\ \hline 20 \\ 16 \\ \hline 40 \\ 40 \\ \hline \end{array}$$

Now, if any number be multiplied by 125, and the same number be divided by .008, the product and quot will be equal ; as appears in the example following.

785	.008)785.000(98125 quot.
125	72
3925	65
1570	64
785	—
98125 product	10
	8
	—
	20
	16
	—
	40
	40

RULE II. If a finite divisor divide a repeating dividend, work as in integers ; but in continuing the division, instead of annexing ciphers to the remainder, annex the repeating figure of the dividend.

EX. 1.

$$\begin{array}{r} 5)33.0\dot{8} \\ 30 \\ \hline *3 \end{array}$$

EX. 2.

$$\begin{array}{r} 4)5.1\dot{8}(1.291\dot{8} \\ 4 \\ \hline 11 \\ 8 \\ \hline 36 \\ 36 \\ \hline 6 \\ 4 \\ \hline 26 \\ 24 \\ \hline *2 \end{array}$$

RULE III. If a finite divisor divide a circulating dividend, work as in integers ; but in continuing the division, instead of annexing ciphers to the remainder, annex the circulating figures of the dividend.

EX. 1.

$$\begin{array}{r} 7)3.370(.481,481, \\ 28^{\cdot\cdot} \\ \hline 57 \\ 56 \\ \hline 10 \\ 7 \\ \hline *33 \\ 28 \\ \hline 57 \\ 56 \\ \hline 10 \\ 7 \\ \hline *3 \end{array}$$

EX. 2.

$$\begin{array}{r} .5)3.7592,(7.518,5 \\ 3.5^{\cdot\cdot} \quad \quad \quad 5 \\ \hline *25 \quad 3,7,592, \text{ proof.} \\ 25 \\ \hline \end{array}$$

RULE IV. If the divisor be interminate, reduce it to a vulgar fraction, as taught in reduction of decimals, Prob. V. ; then multiply the given dividend by the denominator, and divide the product by the numerator.

Here there are six cases ; for the divisor may either repeat or circulate, and may divide a finite, a repeating, or circulating dividend.

CASE I. When a repeating divisor divides a finite dividend.

EXAMP. Divide 23.5 by .4 =  $\frac{5}{2}$

$$\begin{array}{r} 9 \\ \hline 4)211.5(52.875 \\ 20 \\ \hline 11 \\ 8 \\ \hline 35 \\ 32 \\ \hline \end{array}$$

CASE II. When a repeating divisor divides a repeating dividend.

EXAMP. Divide 43.28 by .3 =  $\frac{8}{3}$

43.28	Or rather thus :
9	
3)389.40(129.8	432.86
3^{\cdot\cdot} \quad \text{quot.}	43.28
8	3)389.40(129.8
6	
—	
29	
27	
—	
24	
24	

CASE III. When a repeating divisor divides a circulate.

EXAMP. Divide 92.518, by  $.4 = \frac{4}{10}$   
 Or rather thus:  $925.185,$   
 $9$   $92.518,$   

---

 $832.666$   $4)832.666(208.16$   
 $8$   $8$   

---

 $32$   
 $32$   

---

 $6$   
 $4$   

---

 $26$   
 $24$   

---

 $*2$

CASE IV. When a circulate divides a finite dividend.

EXAMP. Divide 9 by  $.45 = \frac{45}{100}$   
 $900$  In order to multiply the di-  
 $9$  vidend 9 by 99, first multiply it  
 $45)891(19.8$  by 100, which is done by an-  
 $45$  nexing two ciphers; and from  

---

 $441$  this product subtract the divi-  
 $405$  dend.  

---

 $360$   
 $360$

CASE V. When a circulate divides a repeating dividend.

EXAMP. Divide  $5.8\bar{3}$  by  $.72 = \frac{72}{100}$   
 $583.33$   
 $5.8\bar{3}$   

---

 $72)577.50(8.0208\bar{3}$   
 $576$   

---

 $150$   
 $144$   

---

 $600$   
 $576$   

---

 $240$   
 $216$   

---

 $*24$

CASE VI. When a circulate divides a circulate.

EXAMP. Divide  $.962$ , by  $.18 = \frac{18}{100}$

$$\begin{array}{r} .962, \\ \underline{.18} \\ 18)95.333(5.296, \\ 90 \dots \\ \hline *53 \\ 36 \\ \hline 173 \\ 162 \\ \hline 113 \\ 108 \\ \hline *5 \end{array}$$

When the circle of the quot is likely to run on to many places, you may stop the operation, and complete the quot by a vulgar fraction; as in the following example.

EXAMP. Divide  $34.56097$ , by  $3.592 = \frac{3592}{1000}$

$$\begin{array}{r} 34560.97560, \\ 3 \quad 34.56097, \\ \hline 3589)34526.41463,(9.6200653 \frac{272446144}{1589} \\ 32301 \dots \\ \hline 22254 \\ 21534 \\ \hline 7201 \quad \text{Or, } 9.6200653 \frac{272441617}{1589} \\ 7178 \end{array}$$

The quot would run on to 49 figures of a finite part, and then a circle of 65 places; but limit it at seven places of decimals, and then complete it by a vulgar fraction; as follows, viz.

Complete the partial remainder 2724 by annexing to it the circle of the dividend, and placing both, by way of numerator, over the divisor 3589.

The numerator of this complex fraction being a mixt number, reduce it to an improper fraction, by multiplying 2724 by the denominator 99999, and adding the numerator 46341 to the product; as in the margin: and then, instead of the mixt number, the numerator of the complex fraction will be  $\frac{272441617}{3589}$ . Or rather work thus: Esteem 2724.46341, a circulate; and then you find the numerator of the vulgar fraction by subtracting the finite part.

Next divide this fractional numerator by the denominator; which is done by multiplying 3589 by 99999, as in the margin; and now the simple vulgar fraction to be annexed to the partial quot is

If the quot thus completed be multiplied by the divisor, it will produce the dividend.

VII. *Decimal Practice.*

THE price of goods or merchandise may be cast up decimally by any of the methods following.

METHOD I. Find the decimal of the rate, viz. the value of one yard, one pound, one piece, &c.; and this decimal of the rate multiplied into the number or quantity of the goods gives the price.

Ex. 1. At 3 s. 4 d. what cost 346? The decimal of the rate is  $.1\bar{6} = \frac{1}{6\frac{1}{2}}$

346  
15  
-----  
1730  
346  
-----  
L. s. d.  
5|0519|0(578 = 57 13 4  
45'  
-----  
69  
63  
-----  
60  
54  
-----  
\*6

Ex. 2. At 6 s. 8 d. what cost 439?

The decimal of the rate is  $\frac{3}{4}$   $3)439(146.\bar{3} = 146 \frac{6}{8}$

METHOD II. When the rate consists of pence and farthings, find how often it is contained in one pound Sterling, divide the given number of goods by this number, or by its component parts, or work by aliquot parts, and the result will be the price sought.

We confine this method to such rates as consist of pence and farthings, because when the rate consists of shillings, pence, and farthings, or of pounds, shillings, pence, &c. it is shorter and easier to work by Method I.

To make the practice ready and easy, it will be proper to have at hand a table of rates and divisors, such as the following one.

TABLE of RATES and DIVISORS.

Rates.	0 Farth.	1 Farth.	2 Farth.	3 Farth.
d.	Divif.	Divif.	Divif.	Divif.
0		3,8,40.	8,60.	8,40.
1	6,40.	8,6,4.	4,40.	4,30,—8.
2	4,30.	4,30,+8.	4,30,+4.	80,—12.
3	80.	80,+12.	80,+6.	80,+4.
4	60.	60,+4 of 4.	60+8.	60+8+2 of 8.
5	6,8.	40,—8.	40—12.	40—4 of 6.
6	40.	40+4 of 6.	40+12.	40+8.
7	40+6.	40+6+4 of 6.	40+4.	40+4+6 of 4.
8	30.	30+4 of 8.	30+2 of 8.	80, X3,—12 of 80.
9	80, X3.	80, X3,+12 of 80.	80, X3,+6 of 80.	80, X3,+4 of 80.
10	8,3.	30,+4,+8 of 4.	20,—8.	40,+2,+2,+6.
11	20,—12.	40, X2,—8 of 40.	40, X2,—12 of 40.	8,3,+5,—8 of 5.

In the above table the pence stand in the left-hand column, and the farthings on the head, and the divisors in the angle of meeting; which are to be understood and read as follows.

3,8,40. Divide the given number of goods by 3, divide the quot by 8, and again divide this last quot by 40.

4,30,—8. Divide the number of goods by 4, divide the quot by 30, and from this last quot subtract one 8th of itself.

80,+12. To an 80th add a 12th of that 80th.

4,30,+4. To a 30th of a 4th add a 4th of that 30th.

60,  $\frac{1}{4}$  of 4, Divide by 60, divide again the quot by  $\frac{1}{4}$ , and to the first quot add a  $\frac{1}{4}$ th of the second quot.  
 $80 \times 3 = 12$  of 80. Divide by 80, multiply the quot by 3, and from the product subtract a  $\frac{1}{12}$ th of the first quot.

Ex. 1. At 1 f. per yard, what cost 432 yards?

$$\begin{aligned} \text{One 3d} &= 144 \\ \text{One 8th of that} &= 18 \\ \text{One 40th of that} &= .45 = 9\text{s.} \end{aligned}$$

Ex. 2. At 3 f. what cost 728.5?

$$\begin{aligned} \text{One 8th} &= 91.0625 \quad L. \quad s. \quad d. \\ \text{One 40th of that} &= 2.2765625 = 2 \quad 5 \quad 6\frac{1}{2} \end{aligned}$$

METH. III. The third method is by decimal tables of rates suited to the nine digits; such as those composed and published by the Rev. Mr George Brown in 1718, under the title of *Arithmetica Infinita*, and recommended by Dr John Keill professor of astronomy in the university of Oxford.

These tables are still extant, and extend from 1 farthing to 20s.; a short specimen of which, with their construction, and the manner of using them, we shall here subjoin.

Decimal Table of Rates, 1 l. the integer.

N.	Rate.		Rate.	
	s. d.	s. d.	s. d.	s. d.
	11 5	11 5 $\frac{1}{2}$	11 5 $\frac{1}{2}$	11 5 $\frac{1}{2}$
1	0.57083	0.571875	0.572916	0.5739583
2	1.1416	1.14375	1.14583	1.147916
3	1.7125	1.715625	1.71875	1.721875
4	2.283	2.2875	2.2916	2.29583
5	2.85416	2.859375	2.864583	2.8697916
6	3.425	3.43125	3.4375	3.44375
7	3.99583	4.003125	4.010416	4.0177083
8	4.56	4.575	4.583	4.5916
9	5.1275	5.146875	5.15625	5.165625

In the left-hand column stand the nine digits; and on the right of 1 are the decimals of the respective rates on the head. Thus, .57083 is the decimal of 11s. 5d. one pound being the integer; and .571875 is the decimal of 11s. 5 $\frac{1}{2}$ d. &c. Those decimals opposite to 1 being multiplied through the nine digits, make up or compose the rest of the table.

The superior excellency of tables thus constructed is, that we multiply or divide by 10, 100, 1000, &c. by moving the decimal point so many places to the right or left as there are cyphers in the multiplier or divisor.

Hence the price or value of any number of yards, or other things, denoted by a single digit, or by any of its decuples, may be readily found. Thus, the price of 7, 70, 700, 7000, 70000, 700000 yards, at 11s. 5d. per yard, is found as follows.

Yards.	L.	L. s. d.
7 =	3.99583 =	3 19 11
70 =	39.9583 =	39 19 2
700 =	399.583 =	399 11 8
7000 =	3995.83 =	3995 16 8
70000 =	39958.3 =	39958 6 8
700000 =	399583.3 =	399583 6 8

Now, every number may be resolved into decuples of the several digits of which it is composed; find therefore the price of each decuple by itself, as already taught, and their sum will be the price of the whole.

EXAMP. 1. Required the price of 7956 yards, at 11s. 5 $\frac{1}{2}$ d. per yard.

Yards.	L.	L. s. d.
7000 =	4017.70833	
900 =	516.5625	
50 =	28.697916	
6 =	3.44375	
	<hr/>	
	4566.412500 =	4566 8 3

EXAMP. 2. How much money will one spend in a year, or 365 days, at the rate of 11s. 5 $\frac{1}{2}$ d. per day?

Days.	L.	L. s. d.
300 =	171.875	
60 =	34.375	
5 =	2.864583	
	<hr/>	
	209.114583 =	209 2 3 $\frac{1}{2}$

Tables of this sort may be framed for a great variety of useful purposes, and are easily constructed.

Thus, suppose a table wanted for showing the daily income of any annuity, or yearly pension; in this case, divide 1 by 365, and the quot is the income of 1l. annuity for one day; and by multiplying this quot through the nine digits, and by this is constructed as follows.

TABLE.

1	0.02739726,
2	0.05479452,
3	0.08219178,

The use of the table will best appear by examples; which take as follows.

Example 1.

If one has a yearly pension of 375 l. what is his daily income?

L.		
300 =	.8219	
70 =	.1917	
5 =	.0136	
	<hr/>	
	1.0272 =	1 0 6 $\frac{1}{2}$

Example 2.

The yearly rent of a gentleman's estate is 968 l. 10s. what can he afford to spend per day?

L. .900 = 2.4657  
 60 = 1.1633  
 8 = .0219  
 0.5 = .0013

---

L. s. d.  
 2.6532 = 2 13 0½

If the income for any number of days be required, find the income for one day as above; and multiply the decimal answer by the given number of days. Or, multiply the yearly pension by the given number of days, and use the product as the yearly pension. Thus, in Ex. 2. if the gentleman's income for 64 days be demanded, you may either multiply 2.6532 by 64; or multiply 963.5 by 64; and then work for the product as follows.

968.5            60000 = 164.3835  
 64                10000 = 2.7397  
 -----  
 38740            900 = 2.4657  
 58110            80 = .2191  
 -----  
 61984.0            4 = .0109

---

L. s. d.  
 169.8189 = 169 16 4½

The decimals in the table being circles of eight figures, we have used them as approximates, by confining the operations to four decimal places; which, in affairs of this kind, is sufficiently accurate.

If the annual interest of any principal sum be considered as the yearly pension, the interest of the same principal for any number of days may be found by the table as taught above.

The interest of any principal sum for a year is easily found, as being always the hundredth part of the product of the principal multiplied by the rate per cent.

EXAMPLE. Required the interest for 26 days of 685 l. principal, at 5 per cent.

L.  
 685  
 5  
 -----  
 34.25 annual interest.  
 26  
 -----  
 800 = 2.19178  
 90 = 2.4657  
 0.5 = .00136

---

L. s. d.  
 890.50            2.43971 = 2 8 9½

DUODECIMALS.

Decimal practice may be used with great advantage in the multiplication and division of duodecimals, where the integer is divided into twelve equal parts, called *primes*, and each prime into twelve seconds, each second into twelve thirds, &c.

For the ready conversion of primes, seconds, thirds, &c. into decimals of the integer, the following table is constructed.

Decimal table of primes, seconds, &c.

N.	Primes.	Seconds.	Thirds.	Fourths.
1	.083	.00694	.000578,703	.00004823
2	.16	.0138	.001157,407	.00009645
3	.25	.02083	.001736,111	.00014467
4	.3	.027	.002314,814	.00019290
5	.416	.03472	.002893,518	.00024112
6	.5	.0416	.003472,222	.00028935
7	.583	.0486	.004050,925	.00033757
8	.6	.056	.004629,629	.00038580
9	.75	.0625	.005208,333	.00043402
10	.83	.0694	.005787,037	.00048215
11	.916	.07638	.006365,740	.00053047

In the column of fourths, the decimals run on to eight places of a finite part, and nine figures of a circle; but the finite part by itself, which alone is inserted in the table, will be found sufficient; and in the column of thirds too, the circle of three figures may in most cases be neglected.

I. Multiplication.

Example 1.

What is the product of 247 by 18 5.

24 7 = 24.583  
 18 5 = 18.416 = <sup>5117</sup>/<sub>9876</sub>

---

24.583  
 16575  
 -----  
 122916  
 1720833  
 12291666  
 147500000  
 245833333

---

24.58333  
 614.81  
 -----  
 2458333  
 1966666  
 98333  
 2458

---

452.5790  
 1/2 = 819  
 1/3 = 819

8.9136  
 12  
 -----  
 110.9632

9|00) 407468.750  
 -----  
 452.74308  
 12  
 -----  
 8.91666  
 12  
 -----  
 11.000  
 " " " " " " " "

Ans. 452 8 11

In working by the inverted method, for the repeating  $\phi$  in the multiplier, take  $\frac{1}{2}$  of the multiplicand. The result wants very little of the true answer.

## Examp. 2.

Multiply 18 6 by 2 4, and 2 3 continually.

$$\begin{array}{r}
 18\ 6 = 18.5 \quad 2.3 \\
 2\ 4 = 2.3 \quad 18.5 \\
 2\ 3 = 2.25 \\
 \hline
 \phantom{18\ 6} \phantom{=} 11\phi \\
 18\phi 6 \\
 \hline
 2333 \\
 \hline
 43.1\phi \\
 2.25 \\
 \hline
 2158\phi \\
 86333 \\
 86333 \\
 \hline
 97.1250 \quad \text{Ans. } 97\ 1\ 6 \\
 12 \\
 \hline
 1.500 \\
 12 \\
 \hline
 6.0
 \end{array}$$

## II. Division.

## Examp. 1.

Divide 452 8 11 = 452.74308  
 by 18 5 = 18.416 =  $\frac{92175}{5000}$

$$\begin{array}{r}
 18.41\phi 4527.43085 \\
 1841\ 452.74308 \\
 \hline
 16575)407468.750(24.583 \\
 33150 \dots \quad 12 \\

 *5525
 \end{array}$$

## Examp. 2.

$$\begin{array}{r}
 \text{Divide } 97\ 1\ 6 = 97.125 \\
 \text{by } 2\ 3 = 2.25 \quad \text{and the quot} \\
 \text{by } 18\ 6 = 18.5 \\
 \phantom{97\ 1\ 6} 18.5 \\
 2.25)97.125(43.1\phi(2.\phi \\
 900 \dots \quad 370 \quad 12 \\
 \hline
 712 \quad 616 \quad 4.0 \\
 675 \quad 555 \\
 \hline
 375 \quad *61 \\
 225 \\
 \hline
 1500 \\
 1350 \quad \text{Ans. } 2\ 4 \\
 \hline
 *150
 \end{array}$$

## SEXAGESIMALS.

Decimal practice might likewise be used to good purpose in the arithmetic of sexagesimals, as it would shorten and facilitate the operations.

Sexagesimals, strictly speaking, are degrees, minutes, seconds, thirds, &c. where each degree is divided into 60 minutes, and each minute into 60 seconds, &c.; but under this title is also usually comprehended the division of a sign into 30 degrees. They are commonly marked as under.

Signs. deg. min. sec. thirds.

7 24 36 54 48 &c.

Sexagesimals properly belong to astronomy, being used in computations of motion and time, where the degree of motion, and hour of time, are equally divided into 60 minutes. The preference of the decimal method to that of the sexagesimal will appear from the following example of addition done both ways.

Sexagesimally. Decimally.

Signs. S.  
 10 20 47 17 = 10.69293,518,  
 7 18 50 40 = 7.62814,814,  
 9 25 30 28 = 9.85018,519,  
 11 10 40 50 = 11.35601,851,

3 15 49 7 = 3.52728,703,

From the above example it is obvious, that even in addition the decimal operation is more simple and easy than the sexagesimal, especially if care be taken to use no more decimal places than what are absolutely necessary.

But in multiplication and division the advantage of the decimal method is still greater; for in the sexagesimal way the operation is extremely tedious; whereas, by working decimally, it is performed in the same manner, and with the same ease, as in duodecimals.

## VULGAR FRACTIONS.

Decimal practice may sometimes be profitably used in the

the arithmetic of vulgar fractions, the operation being shorter and easier in the decimal than in the vulgar way. This we shall illustrate by a few examples.

$$\begin{array}{r} \frac{4}{11} = .36, \text{ and } 6\frac{7}{8} = 6.3\bar{7} \\ .36 \overline{) 638.88} \\ \underline{00} \quad 6.3\bar{7} \\ 36 \overline{) 632.50} (17.5694 = 17 \text{ II } \frac{4}{7} \\ \underline{36} \quad \cdot \cdot \end{array}$$

I. *Addition.*

Ex. 1. What is the sum of  $\frac{1}{2} + \frac{1}{3}$ ?

$$\begin{array}{r} \frac{1}{2} = .25 \\ \frac{1}{3} = .\bar{3}33 \\ \hline .91\bar{6} = 18 \quad 4 \end{array}$$

$$\begin{array}{r} 272 \\ 252 \\ \hline 205 \\ 180 \\ \hline 250 \\ 216 \\ \hline 340 \\ 324 \\ \hline 160 \\ 144 \\ \hline *16 \end{array}$$

Ex. 2. What is the sum of  $14\frac{7}{8} + 18\frac{3}{4} + \frac{1}{2}$  of  $\frac{5}{8}$  C.?

$$\begin{array}{r} C. \\ 14\frac{7}{8} = 14.875 \\ 18\frac{3}{4} = 18.75 \\ \frac{1}{2} \text{ of } \frac{5}{8} = \frac{5}{16} = .3125 \\ \hline 34.1\bar{6}66 = 34 \quad 0 \quad 18\frac{3}{4} \end{array}$$

$$\begin{array}{r} 250 \\ 216 \\ \hline 340 \\ 324 \\ \hline 160 \\ 144 \\ \hline *16 \end{array}$$

II. *Subtraction.*

Ex. 1. From  $\frac{1}{2}$  subtract  $\frac{1}{3}$ .

$$\begin{array}{r} L. \\ \frac{1}{2} = .75 \\ \frac{1}{3} = .\bar{3}33 \\ \hline .41\bar{6} = 8 \quad 4 \end{array}$$

Ex. 2. From  $\frac{2}{3}$  of  $\frac{7}{8}$  subtract  $\frac{1}{2}$  of  $\frac{1}{4}$  lb. Troy.

$$\begin{array}{r} lb. \\ \frac{2}{3} \text{ of } \frac{7}{8} = \frac{7}{12} = .58\bar{3}3 \\ \frac{1}{2} \text{ of } \frac{1}{4} = \frac{1}{8} = .125 \\ \hline .458\bar{3} = 5 \quad 10 \end{array}$$

*Rule of Three Direct.*

DECIMAL practice is frequently the shortest and easiest method of operation in the rule of three.

EXAMP. I. If C. 3 : 1 : 14 of raisins cost L. 10 : 2 : 6, what will 6. C. 3 Q. cost at that rate?

$$\begin{array}{r} C. \quad Q. \quad lb. \quad L. \quad s. \quad d. \quad C. \quad Q. \\ \text{Vulgar state} \quad 3 \quad 1 \quad 14 : 10 \quad 2 \quad 6 :: 6 \quad 3 \\ \text{Decimal state} \quad 3.375 \quad : 10.125 \quad :: 6.75 \end{array}$$

$$\begin{array}{r} 6.75 \\ \hline 50625 \\ 70875 \\ 60750 \\ \hline 3:375 \overline{) 68.34375} (20.25 = 20 \quad 5 \\ \underline{6750} \quad \cdot \cdot \cdot \\ 8437 \\ 6750 \\ \hline 16875 \\ 16875 \end{array}$$

III. *Multiplication.*

Ex. Multiply  $19\frac{7}{8}$  by  $22\frac{1}{2}$  feet.

$$\begin{array}{r} F. \\ 19\frac{7}{8} \quad - \quad - \quad - = 19.875 \\ 22\frac{1}{2} = 22.5 = 22\frac{5}{10} \\ \hline 19587 \\ 391666 \\ \hline 9)3936.250 \\ \hline \text{Sq. f. sq. in.} \\ 437.367 = 437 \quad 52 \end{array}$$

II. *Division.*

Ex. Divide  $6\frac{7}{8}$  by  $\frac{4}{8}$ .

EXAMP. II. If a wedge of gold, weighing 14 lb. 3 oz. 8 dw. cost L. 514, 4s. what is that per ounce?

Vulgar:

*lb. oz. dw. L. s. oz.*  
 Vulgar state 14 3 8 : 514 4 :: 1  
 Decimal state 14.283 : 514.2 :: .083

514.2  
 156  
 1333  
 8333  
 418666  
 -----  
 14.283)42.8500(  
 1428 42.850  
 -----

### CHAP. XII. EXTRACTION OF ROOTS.

If unity be multiplied continually by any given number, the products thence arising are called *powers of that number*; and the given number is called *the root, or first power*.

Thus, if 2 be the given number, then  $1 \times 2 = 2$  is the root or first power; and  $2 \times 2 = 4$  is the square or second power; and  $4 \times 2 = 8$  is the cube or third power; and  $8 \times 2 = 16$  is the biquadrate or fourth power; and  $16 \times 2 = 32$  is the fursolid or fifth power; and  $32 \times 2 = 64$  is the sixth power, or cube squared, &c.

The natural numbers, 1, 2, 3, &c. are sometimes placed over these powers, denoting the number of multiplications used in producing them, or showing what powers they are; and are called *indices or exponents*, as in the following scheme.

Indices, 0, 1, 2, 3, 4, 5, 6, 7, &c.

Powers, 1, 2, 4, 8, 16, 32, 64, 128, &c.

The raising any root or number given to any power required, is called *involution*; and is performed by multiplying the given root into unity continually, as taught above. But the finding the root of a given power is called *evolution*, or *extraction of roots*.

If the root of any power not exceeding the seventh power, be a single digit, it may be obtained by inspection, from the following table of powers.

T A B L E.

1 <sup>st</sup> power or root.	2 <sup>d</sup> power or square.	3 <sup>d</sup> power or cube.	4 <sup>th</sup> power or biquadrate.	5 <sup>th</sup> power or fursolid.	6 <sup>th</sup> power or cube square.	7 <sup>th</sup> power.
1	1	1	1	1	1	1
2	4	8	16	32	64	128
3	9	27	81	243	729	2187
4	16	64	256	1024	4096	16384

8	64	512	4096	32768	262144	2097152
9	81	729	6561	59049	531441	4782969

#### I. Extraction of the Square Root.

RULE I. Divide the given number into periods of two figures, beginning at the right hand in integers, and pointing toward the left. But in decimals, begin at the place of hundreds, and point toward the right. Every period will give one figure in the root.

II. Find by the table of powers, or by trial, the nearest lesser root of the left-hand period, place the figure so found in the quot, subtract its square from the said period, and to the remainder bring down the next period for a dividend or resolvend.

III. Double the quot for the first part of the divisor; inquire how often this first part is contained in the whole resolvend, excluding the units place; and place the figure denoting the answer both in the quot and on the

the right of the first part; and you have the divisor complete.

IV. Multiply the divisor thus completed by the figure put in the quot, subtract the product from the resolvend, and to the remainder bring down the following period for a new resolvend, and then proceed as before.

Note 1. If the first part of the divisor, with unity supposed to be annexed to it, happen to be greater than the resolvend, in this case place 0 in the quot, and also on the right of the partial divisor; to the resolvend bring down another period; and proceed to divide as before.

Note 2. If the product of the quotient-figure into the divisor happen to be greater than the resolvend, you must go back, and give a lesser figure to the quot.

Note 3. If, after every period of the given number is brought down, there happen at last to be a remainder, you may continue the operation, by annexing periods or pairs of ciphers, till there be no remainder, or till the decimal part of the quot repeat or circulate, or till you think proper to limit it.

EXAMP. I. Required the square root of 133225.

Square number	133225(365 root	365	
	9	365	
1 div. 66)	432 resolvend.	1825	
	396 product.	2190	
		1095	
2 div. 725)	3625 resolvend.		
	3625 product.	133225 proof.	

EXAMP. II. Required the square root of 72, to eight decimal places.

72.00000000	(8.48528137 root.

After getting half of the decimal places, work by contracted division for the other half; and obtain them with the same accuracy as if the work had been at large.

EXAMP. III. Required the square root of .2916.

.2916(.54 root.	
25	
104) 416	
416	

If the square root of a vulgar fraction be required, find the root of the given numerator for a new numerator, and find the root of the given denominator for a new denominator. Thus, the square root of  $\frac{2}{3}$  is  $\frac{\sqrt{2}}{\sqrt{3}}$ , and the root of  $\frac{3}{4}$  is  $\frac{\sqrt{3}}{2}$ ; and thus the root of  $\frac{2}{3}$  ( $=6\frac{2}{3}$ ) is  $\frac{\sqrt{2}}{\sqrt{3}} = 2\frac{1}{2}$ .

But if the root of either the numerator or denominator cannot be extracted without a remainder, reduce the vulgar fraction to a decimal, and then extract the root, as in Example III. above.

II. *Extraction of the Cube Root.*

RULE I. Divide the given number into periods of three figures, beginning at the right hand in integers, and pointing toward the left. But in decimals, begin at the place of thousands, and point toward the right. The number of periods shews the number of figures in the root.

II. Find by the table of powers, or by trial, the nearest lesser root of the left-hand period; place the figure so found in the quot; subtract its cube from the said period; and to the remainder bring down the next period for a dividial or resolvend.

The divisor consists of three parts which may be found as follows.

III. The first part of the divisor is found thus: Multiply the square of the quot by 3, and to the product annex two ciphers; then inquire how often this first part of the divisor is contained in the resolvend, and place the figure denoting the answer in the quot.

IV. Multiply the former quot by 3, and the product by the figure now put in the quot; to this last product annex a cipher; and you have the second part of the divisor. Again, square the figure now put in the quot for the third part of the divisor; place these three parts under one another, as in addition; and their sum will be the divisor complete.

V. Multiply the divisor, thus completed, by the figure last put in the quot, subtract the product from the resolvend, and to the remainder bring down the following period for a new resolvend, and then proceed as before.

Note 1. If the first part of the divisor happen to be equal to or greater than the resolvend, in this case place 0 in the quot, annex two ciphers to the said first part of the divisor, to the resolvend bring down another period, and proceed to divide as before.

Note 2. If the product of the quotient-figure into the divisor happen to be greater than the resolvend, you must go back, and give a lesser figure to the quot.

Note 3. If, after every period of the given number is brought down, there happen at last to be a remainder, you may continue the operation by annexing periods of three ciphers till there be no remainder, or till you have

as many decimal places in the root as you judge necessary.

EXAMP. I. Required the cube root of 12812904.

$$\begin{array}{r} \text{Cube number } 12812904 \text{ (234 root)} \\ \underline{8} \\ \text{1st part } 1200 \left. \vphantom{\begin{array}{l} 1200 \\ 180 \\ 9 \end{array}} \right\} )4812 \text{ resolvend,} \\ \text{2d part } 180 \left. \vphantom{\begin{array}{l} 1200 \\ 180 \\ 9 \end{array}} \right\} \\ \text{3d part } 9 \left. \vphantom{\begin{array}{l} 1200 \\ 180 \\ 9 \end{array}} \right\} \\ \hline \text{1 divisor } 1389 \times 3 = 4167 \text{ product.} \\ \hline \text{1st part } 158700 \left. \vphantom{\begin{array}{l} 158700 \\ 2760 \\ 16 \end{array}} \right\} )645904 \text{ resolvend.} \\ \text{2d part } 2760 \left. \vphantom{\begin{array}{l} 158700 \\ 2760 \\ 16 \end{array}} \right\} \\ \text{3d part } 16 \left. \vphantom{\begin{array}{l} 158700 \\ 2760 \\ 16 \end{array}} \right\} \\ \hline \text{2 divisor } 161476 \times 4 = 645904 \text{ product.} \end{array}$$

P R O O F.

$$\begin{array}{r} 234 \quad \text{Square } 54756 \\ \underline{234} \quad \quad \quad 234 \\ \hline 936 \quad \quad \quad 219024 \\ 702 \quad \quad \quad 164268 \\ \underline{468} \quad \quad \quad 109512 \end{array}$$

Square 54756      Cube 12812904

EXAMP. II. Required the cube root of  $28\frac{1}{2}$ .

$$\begin{array}{r} 28.750000 \text{ (3.06 root.)} \\ \underline{27} \\ 270000 \left. \vphantom{\begin{array}{l} 270000 \\ 5400 \\ 36 \end{array}} \right\} )1750000 \text{ resolv.} \\ 5400 \left. \vphantom{\begin{array}{l} 270000 \\ 5400 \\ 36 \end{array}} \right\} \\ \underline{36} \end{array}$$

$$\text{Div. } 275436 \times 6 = 1652616 \text{ prod.} \\ \underline{97384 \text{ rem.}}$$

P R O O F.

$$\begin{array}{r} 3.06 \quad \text{Sq. } 9.3636 \\ \underline{3.06} \quad \quad \quad 3.06 \\ \hline 1836 \quad \quad \quad 561816 \\ 918 \quad \quad \quad 280908 \\ \hline \text{Sq. } 9.3636 \quad \quad 28.652616 \\ \underline{\quad \quad \quad 97384 \text{ rem.}} \\ 28.750000 \text{ cube.} \end{array}$$

If the cube root of a vulgar fraction be required, find the cube root of the given numerator for a new numerator, and the cube root of the given denominator for a new denominator. Thus, the cube root of  $\frac{8}{27}$  is  $\frac{2}{3}$ , and the cube root of  $\frac{27}{8}$  is  $\frac{3}{2}$ ; and thus the cube root of  $1\frac{3}{8}$  ( $=1\frac{3}{8}$ ) is  $1\frac{3}{2}$ .

But if the root of either the numerator or denomina-

tor cannot be extracted without a remainder, reduce the vulgar fraction to a decimal, and then extract the root.

### III. Extraction of the Biquadrate Root.

RULE. Extract the square root of the given number; and again extract the square root of the root so found, and the last of these roots is the root sought.

EXAMP. Required the biquadrate root of 5308416.

$$\begin{array}{r} 5308416 \text{ (2304 (48 root.)} \\ \underline{4} \quad \quad \quad 16 \\ \hline 43)130 \quad 88)704 \\ \underline{129} \quad \quad \quad 704 \end{array}$$

$$4604) 18416 \\ \underline{18416}$$

If, in the first extraction, there happen to be a remainder, continue the operation, by annexing pairs of ciphers, till you have twice as many decimal places in the square or first root, as you propose to have in the last root.

### IV. Extraction of the root of the fifth power, or sursolid.

RULE I. Divide the given number into periods of five figures, find the nearest lesser root of the left-hand period, put the figure so found in the quot, subtract its fifth power, and to the remainder bring down the next period for a resolvend.

II. Put  $a+y$  for the root, and then the sursolid or fifth power will be  $aaaaa + 5aaaay + 10aaaay + 10aaayy + 5ayyy + yyyyy$ . Now,  $aaaaa$  being already subtracted, there remains the other five parts; and to find  $y$ , divide by its coefficient, viz. by  $5aaaa+10aaa+10aay + 5ayy + yyy$ ; that is, try how often  $5aaaa$  is contained in the resolvend; and, by the help of the quotient-figure, you make up the other four parts of the divisor.

EXAMP. Required the sursolid root of 33554432

$$\begin{array}{r} 33554432 \text{ (32 root.)} \\ \underline{243} \\ \hline ) 9254432 \text{ resolv.} \\ 4050000 = 5aaaa \\ 540000 = 10aaay \\ 360000 = 10aayy \\ 12000 = 5ayyy \\ 16 = yyyy \end{array}$$

Divisor  $4627216 \times 2 = 9254432$  prod.

(o)

### V. Extraction of the root of the sixth power, or cube squared.

RULE. Extract the square root of the given number, and then extract the cube root of that root, the last is the

the root sought. Or, first extract the cube root, and then extract the square root of that root.

EXAMP. Required the root of 191102976, being the sixth power.

$$\begin{array}{r}
 191102976 \quad (13824 \text{ 2d root.}) \\
 \underline{\phantom{191102976}} \\
 23) \cdot 91 \quad 1200) 5824 \text{ resolv.} \\
 \underline{\phantom{23) \cdot 91}} \quad \underline{\phantom{1200) 5824}} \\
 69 \quad 240 \\
 \underline{\phantom{23) \cdot 91}} \quad \underline{\phantom{1200) 5824}} \\
 268) 2210 \quad 16 \\
 \underline{\phantom{268) 2210}} \\
 2144. \quad 1456 \times 4 = 5824 \text{ prod.} \\
 \underline{\phantom{268) 2210}} \\
 2762) 6629 \quad (0) \\
 \underline{\phantom{2762) 6629}} \\
 5524 \\
 \underline{\phantom{2762) 6629}} \\
 27644) 110576 \\
 \underline{\phantom{27644) 110576}} \\
 210576
 \end{array}$$

VI. *Extraction of the root of the seventh power.*

RULE. Put  $a^{\frac{1}{7}}$  for the root, and the seventh power will be  $aaaaaaa + 7aaaaaa + 21aaaaay + 35aaaaayy + 35aaaaayyy + 21aaaaayyy + 7aaaaayyy + yyyyyyy$ , by the aid of which proceed as in extracting the root of the fifth power.

EXAMP. Required the root of 3404825447, being the seventh power.

$$\begin{array}{r}
 3404825447 \text{ (23 root.)} \\
 \underline{\phantom{3404825447}} \\
 128 \\
 \underline{\phantom{3404825447}} \\
 ) 2124825447 \text{ resolv.} \\
 \underline{\phantom{) 2124825447}} \\
 448000000 = 7aaaaaa \\
 201600000 = 21aaaaay \\
 504000000 = 35aaaaayy \\
 756000000 = 35aaaaayyy \\
 680400000 = 21aaaaayyy \\
 340200000 = 7aaaaayyy \\
 729000000 = yyyyyyy
 \end{array}$$

Divif.  $708275449 \times 3 = 2124825447$  prod.

(0)

VII. *Extraction of the root of the eighth power.*

RULE. Extract the square root of the given number.

A R K

A R K

ARITHMOMANCY, a species of divination performed by means of numbers.

ARK, or *Noah's ARK*, a floating vessel built by Noah, for the preservation of his family, and the several species of animals, during the deluge. See Plate XXXVIII. fig. 1.

continually till you have three roots; the last of these is the root sought.

Thus, let 1785793904896 be the eighth power; by extracting the square root you get the biquadrate or fourth power, viz. 1336336; and by extracting the square root of the biquadrate, you get the square or second power, viz. 1156, whose square root is 34, the root sought.

VIII. *Extraction of the root of the ninth power.*

RULE. Extract the cube root of the given number, and you have the cube or third power, whose cube root is the root sought.

Thus, let 5159780352 be the ninth power; by extracting the cube root you get the cube or third power, viz. 1728, whose cube root 12 is the root sought.

Univerfally, whatever the given power be, put  $a + y$  for the root, and by involution raise  $a + y$  to the power of the given number; then, with this as your guide or canon, extract the root in the manner prefcribed and exemplified in the extraction of the root of the fifth and seventh powers.

But if the index of the given power be a multiple of 2, the work may be rendered easier: For, by extracting the square root of the given number, you obtain a power whose index is one half of the index of the given power. Thus, by extracting the square root of the tenth power, you have the fifth power; and the square root of the twelfth power is the sixth power, &c.

Again, if the index of the given power be a multiple of 3, by extracting the cube root you obtain a power whose index is one third of the index of the power given. Thus the cube root of the ninth power is the cube or third power; and the cube root of the twelfth power is the biquadrate or fourth power, &c.

Involution is directly contrary to extraction or evolution; and therefore, if a square number be squared, it will give the biquadrate or fourth power; and if a biquadrate be squared, it will give the eighth power. Again, if a cube number be cubed, it will give the ninth power; and if the biquadrate be cubed, it will give the twelfth power. See ALGEBRA, Chap. IX. and X.

For the application of Arithmetic to various branches of business, &c. see ALLIGATION, ANNUITIES; BARTER, BROKAGE, BANKRUPTCY, EXCHANGE, INSURANCE, INTEREST, MENSURATION, &c. &c.

The ark has afforded several points of curious inquiry among the critics and naturalists, relating to its form, capacity, materials, &c.

The wood whereof the ark was built, is called in the Hebrew *Gopher-wood*, and in the Septuagint *square timbers*. Some translate the original *cedar*, others *pine*, others

others box, &c. Pelletier prefers cedar, on account of its incorruptibility, and the great plenty of it in Asia; whence Herodotus and Theophrastus relate, that the kings of Egypt and Syria built whole fleets thereof, instead of deal.

The learned Mr Fuller in his Miscellanies, has observed, that the wood whereof the ark was built, was nothing else but that which the Greek call *κωνιακός*, or the *cypressi-tree*; for, taking away the termination, *kupar* and *gopher* differ very little in sound. This observation the great Bochart has confirmed, and shewn very plainly that no country abounds so much with this wood as that part of Assyria which lies about Babylon.

In what place Noah built and finished his ark is no less made a matter of disputation. But the most probable opinion is, that it was built in Chaldæa, in the territories of Babylon, where there was so great a quantity of cypress in the groves and gardens in Alexander's time, that that prince built a whole fleet out of it, for want of timber. And this conjecture is confirmed by the Chaldean tradition, which makes Xithurus (another name for Noah) set sail from that country.

The dimensions of the ark, as given by Moses, are 300 cubits in length, 50 in breadth, and 30 in height, which some have thought too scanty, considering the number of things it was to contain; and hence an argument has been drawn against the authority of the relation. To solve this difficulty many of the ancient fathers, and the modern critics, have been put to very miserable shifts: But Buteo and Kircher have proved geometrically, that, taking the common cubit of a foot and a half, the ark was abundantly sufficient for all the animals supposed to be lodged in it. Snellius computes the ark to have been above half an acre in area, and father Lamy shews, that it was 110 feet longer than the church of St Mary at Paris, and 64 feet narrower; and if so, it must have been longer than St Paul's church in London, from west to east; and broader than that church is high in the inside, and 54 feet of our measure in height; and Dr Arbuthnot computes it to have been 81062 tons.

The things contained in it were, besides eight persons of Noah's family, one pair of every species of unclean animals, and seven pair of every species of clean animals, with provisions for them all during the whole year. The former appears, at first view, almost infinite; but if we come to a calculation, the number of species of animals will be found much less than is generally imagined, not amounting to an hundred species of quadrupeds, nor to two hundred of birds; out of which, in this case, are excepted such animals as can live in the water. Zoologists usually reckon but an hundred and seventy species in all; and bishop Wilkins shews that only seventy-two of the quadruped kind needed a place in the ark.

By the description Moses gives of the ark, it appears to have been divided into three stories, each ten cubits, or fifteen feet high; and it is agreed on, as most probable, that the lowest story was for the beasts, the middle for the food, and the upper

for the birds, with Noah and his family; each story being subdivided into different apartments, stalls, &c. Though Josephus, Philo, and other commentators, add a kind of fourth story under all the rest; being, as it were, the hold of the vessel, to contain the ballast, and receive the filth and feces of so many animals: But F. Calmet thinks, that what is here reckoned a story, was no more than what is called the *keel* of ships, and served only for a conservatory of fresh water. Drexelius makes three hundred apartments. F. Fournier, three hundred and thirty-three; the anonymous author of the Questions on Genesis, four hundred; Buteo, Temporarius, Arias Montanus, Hofius, Wilkins, Lamy, and others, suppose as many partitions as there were different sorts of animals. Pelletier makes only seventy-two, viz. thirty-six for the birds, and as many for the beasts; his reason is, that if we suppose a greater number, as 333, or 400, each of the eight persons in the ark must have had thirty-seven, forty-one, or fifty stalls to attend and cleanse daily, which he thinks impossible to have been done. But it is observed, that there is not much in this; to diminish the number of stalls without a diminution of animals is vain; it being perhaps more difficult to take care of three hundred animals in seventy-two stalls, than in three hundred. As to the number of animals contained in the ark, Buteo computes that it could not be equal to five hundred horses; he even reduces the whole to the dimensions of fifty-six pair of oxen. F. Lamy enlarges it to sixty-four pair of oxen, or an hundred and twenty-eight oxen; so that supposing one ox equal to two horses, if the ark had room for two hundred and fifty-six horses, there must have been room for all the animals. But the same author demonstrates, that one floor of it would suffice for five hundred horses, allowing nine square feet to a horse.

As to the food in the second story, it is observed by Buteo from Columella, that thirty or forty pounds of hay ordinarily suffices for an ox a day, and that a solid cubit of hay, as usually pressed down in our hayricks, weighs about forty pounds; so that a square cubit of hay is more than enough for one ox in one day. Now it appears that the second story contained 150,000 solid cubits, which divided between two hundred and six oxen, will afford each more hay by two thirds, than he can eat in a year. Bishop Wilkins computes all the carnivorous animals, equivalent, as to the bulk of their bodies, and their food, to twenty-seven wolves; and all the rest to two hundred and eighty bees. For the former he allows 1825 sheep, and for the latter, 109,500 cubits of hay, all which will be easily contained in the two first stories, and a deal of room to spare. As to the third story, no body doubts of its being sufficient for the fowls; with Noah, his sons, and daughters. Upon the whole, the learned bishop remarks, that of the two, it appears much more difficult to assign a number and bulk of necessary things to answer the capacity of the ark, than to find sufficient room for the several species of animals already known to have been there. This he attributes to the imperfection of our list of animals, especially

*Fig. 1. NOAH'S ARK  
floating on the waters of the Deluge*

*Fig. 2. ARK of the COVENANT*

specially those of the unknown parts of the earth; adding, that the most expert mathematician at this day could not assign the proportion of a vessel better accommodated to the purpose than is here done; and hence finally concludes, that the capacity of the ark, which had been made an objection against scripture, ought to be esteemed a confirmation of its divine authority, since, in those ruder ages, men, being less versed in arts and philosophy, were more obnoxious to vulgar prejudices than now; so that had it been an human invention, it would have been contrived, according to those wild apprehensions which arise from a confused and general view of things, as much too big, as it had been represented too little.

But it must be observed, that besides the places requisite for the beasts and birds, and their provisions, there was room required for Noah to lock up household utensils, the instruments of husbandry, grains and seeds, to sow the earth with after the deluge; for which purpose it is thought that he might spare room in the third story for six and thirty cabins, besides a kitchen, a hall, four chambers, and a space about eight and forty cubits in length to walk in.

**ARK of the covenant**, a small chest or coffer, three feet nine inches in length, two feet three inches in breadth, and two feet three inches in height, in which were contained the golden pot that had manna, and Aaron's rod, and the tables of the covenant. This coffer was made of sycamore-wood, and was covered with the mercy-seat, which was of solid gold; at the two ends whereof were two cherubims, looking toward each other, with expanded wings, which, embracing the whole circumference of the mercy-seat, met on each side in the middle. The whole, according to the rabbins, was made out of the same mass, without joining any of the parts by solder. Here it was that the Shechinah or Divine Presence rested, both in the tabernacle and in the temple, and was visibly seen in the appearance of a cloud over it; and from hence the Divine oracles were given out by an audible voice, as often as God was consulted in the behalf of his people. Plate XXXVIII fig. 2.

**ARKLOW**, a sea-port town of Ireland, situated in the county of Wicklow, about thirteen miles south of the city of Wicklow, in  $6^{\circ} 20' W.$  long. and  $52^{\circ} 55' N.$  lat.

**ARLES**, a city of Provence in France, situated on the eastern shore of the river Rhone, in  $4^{\circ} 45' E.$  long. and  $43^{\circ} 32' N.$  lat.

**ARLEUX**, a town of Hainault, in the French Netherlands, situated about six miles south of Douay, in  $3^{\circ} E.$  long. and  $50^{\circ} 20' N.$  lat.

**ARLON**, a town of the duchy of Luxemburg, on the Austrian Netherlands, situated in  $5^{\circ} 30' E.$  long. and  $49^{\circ} 45' N.$  lat.

**ARM**, in riding, is applied to a horse, when, by pressing down his head, he endeavours to defend himself against the bit, to prevent obeying, or being checked thereby.

**ARMADA**, a Spanish term, signifying a fleet of men-of-war, as *armadilla* signifies a squadron.

**ARMADABAT**, a very large city of Asia, the metropolis of the kingdom of Guzarat.

**ARMADILLO**, in zoology, a synonyme of the dasypus. See **DASYPUS**.

**ARMAGH**, once a considerable city of Ireland, but now much reduced, situated about thirty miles south of Londonderry, in  $6^{\circ} 45' W.$  long. and  $54^{\circ} 30' N.$  lat. It is still the see of the primate of Ireland, and gives name to the county of Armagh.

**ARMAGNAC**, a district or territory in the north-east part of Gascony in France.

**ARMAN**, in fariery. See **DRENCH**.

**ARMED**, in the sea-language. A cross-bar shot, is said to be armed, when some rope-yarn or the like is rolled about the end of the iron bar, which runneth through the shot.

**ARMED**, in heraldry, is used when the horns, feet, beak, or talons of any beast or bird of prey, are of a different colour from the rest of their body.

**ARMENIA**, a large country of Asia, comprehending Turcomania and part of Persia.

**ARMENIACA**, in botany. See **PRUNUS**.

**ARMENIANS**, in church-history, a sect among the eastern Christians; thus called from Armenia, the country anciently inhabited by them. There are two kinds of Armenians, the one catholic and subject to the pope, having a patriarch in Persia, and another in Poland; the other makes a peculiar sect, having two patriarchs in Natolia. They are generally accused of being manophysites, only allowing of one nature in Jesus Christ. As to the eucharist, they for the most part agree with the Greeks; they abstain rigorously from eating of blood and meats strangled, and are much addicted to fasting.

**ARMENTIERS**, a fortified town in French Flanders, situated about seven miles west of Lille, in  $2^{\circ} 50' E.$  long. and  $50^{\circ} 42' N.$  lat.

**ARMIERS**, a town of Hainault, in the French Netherlands, situated on the river Sambre, about twenty miles south of Mons, in  $3^{\circ} 40' E.$  long. and  $50^{\circ} 15' N.$  lat.

**ARMIGER**, an esquire, or armour-bearer. See **ESQUIRE**.

**ARMILLARY**, in a general sense, something consisting of rings, or circles.

**ARMILLARY sphere**, an artificial sphere, composed of a number of circles, representing the several circles of the mundane sphere, put together in their natural order; to ease and assist the imagination, in conceiving the constitution of the heavens, and the motions of the celestial bodies. See **GEOGRAPHY**.

**ARMILUSTRIUM**, in Roman antiquity, a feast held among the Romans, in which they sacrificed armed, to the sound of trumpets.

**ARMINGS**, in the sea-language. See **ARMED**.

**ARMINIANS**, in church-history, a sect of Christians which arose in Holland, by a separation from the Calvinists. They are great assertors of free-will. They speak very ambiguously of the presence of God. They look upon the doctrine of the Trinity as a point not necessary to salvation; and many of them hold there is no precept in scripture by which we are enjoined

to adore the Holy Ghost;—and that Jesus is not equal to God the Father.

**ARMIRO**, a town of European Turkey, in the province of Theflaly, fituated in  $23^{\circ} 30'$  E. long.

**ARMOISIN**, a filk ftuff, or kind of taftefy, manufactured in the E. Indies, at Lyons in France, and Lucca in Italy. That of the Indies is flighter than thofe made in Euiopce.

**ARMONIAÇ**, or **AMMONIAC**, a volatile falt, of which there are two kinds, ancient and modern. The ancient fort, defcribed by Pliny and Diofcorides, was a native falt, generated in thofe large inns or caravanferas, where the croud of pilgrims, coming from the temple of Jupiter Ammon, ufed to lodge; who, in thofe parts, traveling upon camels, and thofe creatures when in Cyrene, a province of Egypt, where that celebrated temple flood, uring in the ftables, or, fay fome, in the parched fands, out of this urine, which is remarkably ftiong, arofe a kind of falt, denominated fometimes, from the temple, *Ammoniac*, and fometimes, from the country, *Cyreniac*. Since the ceffation of thefe pilgrimages, no more of this falt is produced there; and, from this deficiency, fome fufpect there was never any fuch thing: But this fufpicion is removed, by the large quantities of a falt, nearly of the fame nature, thrown out by mount *Ætna*. The characters of the ancient fal armoniac are, that it cools water, turns aqua fortis into aqua regia, and confequently diffolves gold.

The modern fal armoniac is entirely factitious, and made in Egypt; where feveral long-necked glafs bottles, being filled with foot, a little fea-falt, and the urine of cattle, and having their mouth luted with a piece of wet cotton, are placed over an oven or furnace, contrived for the purpofe, in a thick bed of afhes, nothing but the necks appearing, and kept there two days and a night, with a continual ftiong fire. The ftcam fwells up the cotton, and forms a pafte at the vent-hole, hindering the falts from evaporating; which, being confined, ftick to the top of the bottle, and are, upon breaking it, taken out in thofe large cakes, which they fend to England. Only foot exhalled from dung, is the proper ingredient in this preparation; and the dung of camels affords the ftrongeft and beft. See **CHEMISTRY**.

**ARMORIAL**, fomething relating to arms, or coats of arms. See **ARMS**.

**ARMORY**, a warehoufe of arms, or a place where the military habiliments are kept, to be ready for ufe.

**ARMORY** is alfo a branch of the fcience of heraldry, confifting in the knowledge of coats of arms, as to their blazons and various intendments. See **HERALDRY**.

**ARMOUR** denotes fuch habiliments, as ferve to defend the body from wounds, efcpecially of darts, a fword, a lance, &c. A complete fuit of armour formerly confifted of a helmet, a fhield, a cuiraffe, a coat of mail, a gantlet, &c. all now laid afide.

**ARMOUREUR**, a perfon who makes or deals in arms and armour.

**ARMS** of *courtefy*, or *parade*, were lances not fhod, fwords without edge or point, &c. ufed in the ancient tournaments. See **TOURNAMENT**.

**Pafs** of **ARMS**, a kind of combat, when anciently two or more cavaliers undertook to defend a pafs againft all attacks.

**ARMS** of *armorics*, in heraldry, marks of honour borne upon fhields, banners, and coats, in order to diftinguifh ftates, families, and perfons. See **HERALDRY**. **Charged ARMS**, are fuch as retain their ancient integrity, with the addition of fome new honourable bearing.

**Canting**, or *vocal ARMS*, thofe in which there are fome figures alluding to the name of the family.

**Full**, or *entire ARMS*, fuch as are not conformable to the rules of heraldry.

**ARMS**, in falconry, the legs of a hawk from the thigh to the foot.

**ARMUYDEN**, a fea-port town of the ifland of Zetland, fituated at the mouth of the canal of Middleburg, in  $2^{\circ} 35'$  E. long. and  $51^{\circ} 30'$  N. lat.

**ARMY**, a large number of foldiers, confifting of horfe and foot, completely armed, and provided with artillery, ammunition, provifions, &c. under the command of one general, having lieutenant-generals, major-generals, brigadiers, and other officers under him. An army is compofed of fquadrons and battalions, and is ufually divided into three corps, and formed into three lines; the firft line is called the van-guard, the fecond the main body, and the third the rear-guard, or body of referve. The middle of each line is poffeffed by the foot; the cavalry form the right and left wing of each line; and fometimes they place fquadrons of horfe in the intervals between the battalions. When the army is drawn up in order of battle, the horfe are placed at five feet diftance from each other, and the foot at three. In each line the battalions are diftant from each other one hundred and eighty feet, which is nearly equal to the extent of their front; and the fame holds of the fquadrons, which are about three hundred feet diftant, the extent of their own front. Thefe intervals are left for the fquadrons and battalions of the fecond line to range themfelves againft the intervals of the firft, that both may more readily march through thefe fpaces to the enemy: the firft line is ufually three hundred feet diftant from the fecond, and the fecond from the third, that there may be fufficient room to rally, when the fquadrons and battalions are broken.

This is to be underftood of a land army only. A naval, or fea army, is a number of fhips of war, equipped and manned with failors and mariners, under the command of an admiral, with other inferior officers under him. See **NAVY**.

**ARNAY-LE-DUC**, a town of Burgundy in France, fituated on the river Arroux, in  $4^{\circ}$  E. long. and  $47^{\circ}$  N. lat.

**ARNHEIM**, a large city of Guelderland, in the United Netherlands, fituated on the river Lech, about 10 miles north of Nimeguen, in  $5^{\circ} 50'$  E. long. and  $52^{\circ}$  N. lat.

**ARNICA**, in botany, a genus of the fyncenefia polygama fuperflua clafs. The receptacle of the arnica is naked; it has a fimple pappus; and the filaments are five.

- five, without antheræ. There are seven species of arnica, all natives of Ethiopia, except the montana and scorpioides, which are found in Germany. The leaves and root of the arnica have been esteemed a specific in resolving coagulated blood; but their operation is so violent, that they are but rarely used.
- ARNO**, a river of Italy, which, after watering Tuscany, falls into the Mediterranean, below Pisa.
- ARNOLDISTS**, in church-history, a sectary, so called from their leader Arnold of Bresse, who was a great declaimer against the wealth and vices of the clergy; and who is also charged with preaching against baptism and the eucharist.
- ARNOT**, in botany, the English name of the bunium. See **BUNIAM**.
- AROLEC**, an American weight, equal to 25 of our pounds.
- AROMA philosophorum**, denotes either saffron, or the arom of Paracelsus, as aroma germanicum denotes elecampane.
- AROMATIC**; an appellation given to such plants as yield a brisk fragrant smell, and a warm taste, as all kinds of spices, &c.
- ARONA**, a fortified town of the Milanese, situated on the fourth-west part of the lake Maggior, in 8° 50' E. long. and 45° 40' N. lat.
- ARONCHES**, a town of the province of Alentejo, in Portugal, situated in 7° 30' W. long. and 39° N. lat.
- ARO-ORCHIS**, in botany. See **KEMPFERIA**.
- ARORNOS**. See **JUN FERUS**.
- AROURA**, a Grecian measure of fifty feet. It was more frequently used for a square-measure of half the plethron. The Egyptian aroura was the square of one hundred cubits.
- ARQUATA**, in ornithology, the trivial name of a species of scolopax. See **SCOLOPAX**.
- ARRACHEE**, in heraldry, a term applied to the representations of plants torn up by the roots.
- ARRACK**. See **RACK**.
- ARRAIGNMENT**, in law, the arraignment or setting a thing in order, as a person is said to arraign a writ of novel disseisin, who prepares and fits it for trial. It is most properly used to call a person to answer in form of law upon an indictment, &c.
- ARRAN**, an island of Scotland, situated in the Frith of Clyde, between Kintyre and Cunningham.
- ARRAS**, a large fortified town of the French Netherlands, capital of the province of Artois, situated in 2° 50' E. long. and 50° 20' N. lat. It is from this city that the tapestry called *arras hangings* takes its denomination.
- ARRAS**, or *Araxes*, is also the name of a river of Georgia, which discharges itself into the Caspian sea.
- ARREST**, in English law, the apprehending and restraining a person, in order to oblige him to be obedient to the law.
- ARREST** of judgment, the assigning just reasons why judgment should not pass.
- ARRESTMENT**, in Scots law, signifies the securing of a criminal till trial, or till he find caution to stand trial, in what are called *ailable crimes*. In civil cases, it signifies either the detaining of strangers or natives *in meditatione fugæ*, till they find caution *judicio fisci*, or the attaching the effects of a stranger in order to find jurisdiction. See **SCOTS LAW**, tit. *Jurisdiction and Judges in general*. But, in the most general acceptation of the word, it denotes that diligence by which a creditor detains the goods or effects of his debtor in the hands of third parties till the debt due to him be either paid or secured. See **SCOTS LAW**, tit. *Arrestments and Poindings*.
- ARRESTO facto super bonis**, &c. a writ brought by a denizen against the goods of aliens found within this kingdom, as a recompence for goods taken from him in a foreign country.
- ARRESTIS**, in farriery, mangy tumours upon a horse's hinder legs, between the ham and the palern.
- ARRIERE**, the hinder or posterior part of any thing. See **REAR**.
- ARRIERE-ban**, in the French customs, is a general proclamation, whereby the king summons to the war all that hold of him, both his vassals, *i. e.* the noblesse, and the vassals of his vassals.
- ARRIERE fee**, or *fiel*, is a fee dependant on a superior one. These fees commenced, when the dukes and counts, rendering their governments hereditary in their families, distributed to their officers parts of the royal domains, which they found in their respective provinces; and even permitted those officers to gratify the soldiers under them in the same manner.
- ARROE**, an island of Denmark, situated in the Baltic sea, in 10° 15' E. long. and 55° 15' N. lat.
- ARRONDEE**, in heraldry, a cross, the arms of which are composed of sections of a circle, not opposite to each other, so as to make the arms bulge out thicker in one part than another; but the sections of each arm lying the same way, so that the arm is every where of an equal thickness, and all of them terminating at the edge of the escutcheon like the plain cross.
- ARSCHIN**, in commerce, a long measure used in China to measure stuffs. Four arschins make three yards of London.
- ARSCHOT**, a town of the Austrian Netherlands, situated about fourteen miles east of the city of Mechlin, in 4° 45' E. long. and 51° 5' N. lat.
- ARSENIC**, a poisonous mineral preparation, which is either white, red, or yellow, prepared from the flowers of cobalt. See **COBALT**, and **CHEMISTRY**.
- ARSENICAL Magnet**, a preparation of white arsenic with antimony and sulphur, said to be a gentle caustic.
- ARSENOTHELYS**, the same with hermaphrodite.
- ARSIS** and *Thefis*, in music. A point is said to move arsin and thesin, which rises in one part and falls in another, and *vice versa*.
- ARSMART**, in botany. See **PERSICARIA**.
- ART**, a system of rules serving to facilitate the performance of certain actions.
- ART** is also an appellation given to several superstitious practices, as, *St Anselm's art*, *St Paul's art*, &c.
- ART and part**, in Scots law. See **ACCESSARY**.

- ARTEZIA**, in botany, a genus of the pentandria digynia class. The involucre is pinnatifid; the floccules of the disk are masculin, and the fruit is rough. There is only one species, *viz.* the *squamata*, a native of Libanum.
- ARTEMISIA**, southernwood, in botany, a genus of the syngeneis polygamia superflua class. The receptacle is either naked or a little downy; it has no pappus; the calix is imbricated with roundish scales; and the corolla has no radii. There are 23 species of *artemisia*, only 4 of which are natives of Britain, *viz.* the *campestris*, or field-southernwood; the *maritima*, or sea-wormwood; the *absinthium*, or common wormwood; and the *vulgaris*, or mugwort. The *vulgaris*, or mugwort, is used both as a pot-herb and as a medicine; the leaves are principally celebrated as uterine and antihysterical. The leaves of the *absinthium* are chiefly used as a bitter or stomachic.
- ARTERIOTOMY**, the opening an artery, with design to procure an evacuation of blood.
- ARTERY**, in anatomy, a conical tube or canal which conveys the blood from the heart to all parts of the body. See **ANATOMY**, Part III.
- ARTHRITIS**, in medicine, the gout. See **GOUT**, and **MEDICINE**.
- ARTHRODIA**, in natural history, a genus of imperfect crystals, found always in complex masses, and forming long single pyramids, with very short and slender columns. See **CRYSTAL**.
- ARTHRODIA**, in anatomy, a species of articulation, wherein a flat head of one bone is received into a shallow socket of another.
- ARTICHOAK**, in botany. See **CINARA**.
- ARTICLE**, a clause or condition of a contract, treaty, &c. It is also a small part or division of a discourse, a book, or writing, &c.
- ARTICLE**, in grammar, a particle in most languages that serves to express the several cases and genders of nouns, when the language has not different terminations to denote the different states and circumstances of nouns. See **GRAMMAR**.
- ARTICULARIS *marbus***. See **GOUT**, and **MEDICINE**.
- ARTICULATE sounds** are such sounds as express the letters, syllables, or words of any alphabet or language: such are formed by the human voice, and by some few birds, as parrots, &c.
- ARTICULATION**, in anatomy, denotes the juncture of two bones intended for motion.
- ARTIFICER**, a person whose employment it is to manufacture any kind of commodity, as in iron, brass, wood, &c. such are smiths, weavers, carpenters, &c.
- ARTIFICIAL**, in a general sense, denotes something made, fashioned, or produced by art, in contradistinction from the productions of nature.
- ARTILLERY**, large fire-arms, with their appurtenances, as cannons, mortars, bombs, petards, musquets, carabines, &c. See **CANNON**, **MORTAR**, **GUNNERY**.
- ARTILLERY-park**, the place in the rear of both lines in the army, for encamping the artillery, which is drawn up in lines, of which one is formed by the guns; the ammunition-waggons make two or three lines, sixty paces behind the guns, and thirty distant from one another; the pontoons and tumbrils make the last line. The whole is surrounded with a rope which forms the park; the gunners and matrosses encamp on the flanks, and the bombardiers, pontoon-men, and artificers, in the rear.
- ARTILLERY-train**, a certain number of pieces of ordnance, mounted on carriages, with all their furniture fit for marching.
- ARTILLERY-company**, a band of infantry, consisting of six hundred men, making part of the militia or city-guard of London.
- ARTISCUS**, in medicine. See **TROCHE**.
- ARTOIS**, a province of the French Netherlands, situated between Flanders and Picardy.
- ARVALES *fratres***, in Roman antiquity, a college of twelve priests, instituted by Romulus, who himself made one of the body: they assisted in the sacrifices of the ambervalia, offered annually to Ceres and Bacchus, for the prosperity of the principal fruits of the earth, *viz.* those of corn and wine.
- ARUBA**, a small island on the coast of Terra Firma, subject to the Dutch, and situated in 69° 30' W. long. and 12° 30' N. lat.
- ARUM**, in botany, a genus of the gynandria polyandria class. There are 22 species of *arum*, only one of which, *viz.* the *maculatum*, or water-lobin, is a native of Britain. The root of the *maculatum* is a powerful stimulant and attenuant.
- ARUNCUS**, in botany, the trivial name of a species of *spirea*. See **SPIREA**.
- ARUNDEL**, a town of Suffex, situated on a river of the same name, in 30° W. long. and 50° 45' N. lat. It gives the title of earl to the noble family of the Howards, and sends two members to parliament.
- ARUNDO**, in botany, a genus of the triandria digynia class. The calix consists of two valves, and the floccules are thick and downy. There are six species of *arundo*, four of which are natives of Britain, *viz.* the *phragmitis*, or common red-grass; the *calamogreffis*, or branched red-grass; the *epigejos*, or small red-grass; and the *arenaria*, or sea red-grass.
- ARUSPICES**, or **HARUSPICES**, an order of priesthood among the Romans, that pretended to foretell future events by inspecting the entrails of victims killed in sacrifice; they were also consulted on occasion of portents and prodigies.
- ARYTÆNOIDES**, in anatomy, the name of two cartilages which, together with others, constitute the head of the larynx. It is also applied to some muscles of the larynx. See p. 200.
- ARYTÆNOIDEUS**, in anatomy, one of the muscles that close the larynx. See p. 301.
- ARYTHMUS**, in medicine, the want of a just modulation in the pulse. It is opposed to *eurythmus*, a pulse modulated agreeably to nature.
- ARZILLA**, a sea-port town of the empire of Morocco, situated about 15 miles south of Tangier, in 5° 40' W. long. and 35° 40' N. lat.

**AS**, in antiquity, a particular weight, consisting of twelve ounces, being the same with libra, or the Roman pound. It was also the name of a Roman coin, which was of different matter and weight, according to the different ages of the commonwealth. It is also used to signify an integer, divisible into twelve parts; from which last acceptance it signified a whole inheritance.

**ASAFOETIDA**, in the materia medica, the concrete juice of a large umbelliferous plant growing in Persia. This juice exudes from wounds made in the root of the plant, liquid and white like milk. When exposed to the air, it turns of a brownish colour, and gradually acquires different degrees of consistence. It is brought to us in large irregular masses, composed of various little shining grains, which are partly whitish, partly reddish, and partly of a violet colour. Those masses are accounted the best which are clear, of a pale reddish colour, and variegated with a great number of elegant white tears. This drug has a strong foetid smell like garlic, and a bitter, acrid, biting taste. It is frequently used in hysteric and nervous complaints, flatulent colics, and as a promoter of the menses. It is likewise an ingredient in the official gum-pills, and several other compositions.

**ASA dulcis**. See **BENZOIN**.

**ASAPH**, or *St ASAPH*, a city of Flintshire in North Wales, situated about 20 miles N. W. of Chester, in 30° 30' W. long. and 53° 18' N. lat.

**ASAPPES**, or **AZAPES**, in the Turkish armies, a name given to the auxiliary troops which they raise among the Christians under their dominion, and expose to the first shock of the enemy.

**ASARABACCA**, in botany. See **ASARUM**.

**ASARINA**, in botany, a synonyme of the chelone. See **CHELONE**.

**ASARUM**, in botany, a genus of the dodecandria monogynia class. The asarum is quinquefid, and rests on the germen; it has no corolla. The species are four, only one of which, *viz.* the europæum, is a native of Britain. It is a strong sternutatory, and occasions great evacuations, both upwards and downwards.

**ASBESTOS**, a sort of native fossil stone, which may be split into threads and filaments, from one inch to ten inches in length, very fine, brittle, yet somewhat tractable, silky, and of a greyish colour, not unlike talc of Venice. It is almost insipid to the taste, indissoluble in water, and endued with the wonderful property of remaining unconsumed in the fire, which only whitens it. But, notwithstanding the common opinion, in two trials before the Royal Society, a piece of cloth made of this stone was found to lose a dram of its weight each time. Paper as well as cloth has been made of it; and Pliny says he had seen napkins of it, which, being taken foul from the table, were thrown into the fire, and better scoured than if they had been washed in water. This stone is found in many places of Asia and Europe; particularly in the island of Anglesey in Wales, and in Aberdeenshire in Scotland.

**ASCARIS**, in zoology, a genus of insects belonging to Vol. I. No. 18.

the order of vermes intestina. The body of the ascaris is cylindrical, filiform, and tapers at both ends. The species are two, *viz.* 1. The vermicularis is about a quarter of an inch long, and is found in lakes, in the roots of putrid plants, and very frequently in the rectum of children and horses. 2. The lumbricoides is about the same length with the lumbricus terrestris, or common earth-worm, but it wants the protuberant ring towards the middle of the body, the only mark by which they can properly be distinguished. The body of the lumbricoides is cylindrical, and subulated at each extremity; but the tail is somewhat triangular. The lumbricoides is the worm which is most commonly found in the human intestines. For the method of expelling these two kinds of insects, see **MEDICINE**, *Of worms*.

**ASCENDANTS**, in law, are opposed to descendants in succession; *i. e.* when a father succeeds his son, or an uncle his nephew, &c. heritage is said to ascend, or go to ascendants.

**ASCENDENS obliquus**, the same with the obliquus internus abdominis. See **ANATOMY**, p. 102.

**ASCENDING**, in astronomy, is said of such stars as are rising above the horizon in any parallel of the equator.

**ASCENDING vessels**, in anatomy, those which carry the blood upwards, as the aorta ascendens.

**ASCENSION**, in astronomy, is either right or oblique. Right ascension of the sun, or a star, is that degree of the equinoctial, counted from the beginning of aries, which rises with the sun or star in a right sphere. Oblique ascension is an arch of the equator intercepted between the first point of aries, and that point of the equator which rises together with a star in an oblique sphere.

**ASCENSION-day**, a festival of the Christian church, held ten days before Whitsuntide, in memory of our Saviour's ascension into heaven after his resurrection.

**ASCENSION-island**, an uninhabited island, lying almost in the midway between Africa and Brazil, in 17° W. long. and 7° S. lat.

**ASCENSIONAL difference**, the difference between the right and oblique ascension of the same point to the surface of the sphere. See **ASTRONOMY**.

**ASCENT of bodies on inclined planes**. See **MECHANICS**.

**ASCENT of fluids**. See **HYDROSTATICS**.

**ASCETICS**, in church-history, such Christians in the primitive church as enured themselves to great degrees of abstinence and fasting, in order to subdue their passions.

**ASCHAFFENBURG**, a city of Germany, situated on the river Mayne, in the circle of the Lower Rhine, about 20 miles east of Frankfort, in 9° E. long. and 50° 15' N. lat.

**ASCIDIA**, a genus of insects belonging to the order of vermes mollusca. The body is cylindrical and fleshy; it has two apertures towards the top, the one a little lower than the other. There are six species of this insect, *viz.* the papillosum, gelatinosum, intestinale, 5 Q quadrinata,

- quadridentata, rustica, and echinata, all inhabitants of the ocean.
- ASCII, among geographers, an appellation given to those inhabitants of the earth who, at certain seasons of the year, have no shadow: such are all the inhabitants of the torrid zone, when the sun is vertical to them.
- ASCITES, in medicine, the dropsy. See DROPSY, and MEDICINE.
- ASCLEPIAD, in ancient poetry, a verse composed of four feet, the first of which is a spondee, the second a choriambus, and the two last dactyls; or of four feet and a cæsura, the first a spondee, the second a dactyl, after which comes the cæsura, then the two dactyls, as,  
*Mæcenæ atavis edite regibus.*
- ASCLEPIAS, in botany, a genus of the pentandria digynia class. The generic character is taken from five oval, concave, horn-like nectaria, which are found in the flower. There are 18 species of asclepias, none of which grow wild in Britain. The root is used by the French and German physicians as a sudorific, diuretic, and emmenagogue; but it is not in use with us.
- ASCODRUTÆ, in church-history, a sort of Gnostics, who placed all religion in knowledge; and, under pretence of spiritual worship, would admit of no external or corporeal symbols whatever.
- ASCOLI, a city in the marquisate of Ancona in Italy, situated on the river Tronto, in 15° E. long. and 42° 50' N. lat. It is also a city of the kingdom of Naples, situated in the province of Capitanata, in 16° 30' E. long. and 41° 15' N. lat.
- ASCOLIA, in Grecian antiquity, a festival celebrated by the Athenian husbandmen in honour of Bacchus, to whom they sacrificed a he-goat, because that animal destroys the vines.
- ASCUS, in natural history, the pouch or bag of the opossum. See OPOSSUM.
- ASCYRUM, in botany, a genus of the polyadelphia polyandria class. The calix consists of four leaves; the corolla has four petals; the filaments are numerous, and divided into four bundles. The species are three, viz. the crux andrææ, the hypericoides, and the villosum, all natives of the West-Indies or America.
- ASELLUS, in zoology, the trivial name of a species of oniscus. See ONISCUS.
- ASH, in botany. See FRAXINUS.
- ASHBURTON, a town of Devonshire, situated about twenty-two miles S. W. of Exeter, in 4° 15' W. long. and 50° 30' N. lat.
- ASHBY DE LA ZOUCH, a market-town of Leicestershire, in 1° 25' W. long. and 52° 40' N. lat.
- ASHES, the earthy part of wood and other combustibles, remaining after they are consumed by fire. These, if produced from a vegetable, are of a white colour and saltish taste, and, when boiled with fair water, yield a lixivium of an acrimonious, alkaline, fiery, urinous taste. The ashes of all vegetables are visible, and are found to contain iron. See AGRICULTURE, and CHEMISTRY.
- ASHFORD, a market-town of Kent, situated about 12 miles S. W. of Canterbury, in 45° E. long. and 51° 15' N. lat.
- ASIA, one of the four great parts of the world, and the second in order. It is bounded on the N. by the Frozen Sea, on the E. by the Eastern Ocean, which is part of the South Sea, on the S. by the Indian Sea, and on the W. by Europe and Africa. It is of larger extent than any of the three parts in our continent. Arts and sciences were early cultivated here; though they are thought to have come originally from Egypt: but all the considerable religions now known had their first beginning in Asia; and there are still a great number of people who maintain their ancient tenets, which, according to them, are a hundred thousand years old. They have one sort of religion in China, and another in India, whose priests are the Brachmins; not to mention the Jews, Christians, and Mahometans, whose beginnings are sufficiently known to all the world. This was the seat of several ancient empires or monarchies; such as that of the Assyrians, Medes, Persians, and Greeks. It is 4740 miles in length from the Dardanelles on the W. to the eastern shore of Tartary; and 4380 in breadth from the most southern part of Malacca, to the most northern cape of Nova Zembla. It may be divided into ten great parts, namely, Turkey in Asia, Arabia, Persia, the Mogul's empire, with the two peninsulas of India, Thibet, China, and Corea; Great and Little Bocharia, with Carazm, Little and Great Tartary, Siberia, and the Islands. The governments of Asia are generally monarchical; and Turkey, Persia, the Mogul's Empire, Thibet, and China, are subject to single monarchs; but the rest is divided among several sovereigns; inasmuch that there are reckoned seven emperors, and 30 kings, besides petty princes, and the rajahs of India, which are very numerous. With regard to the extent of their religions, the Christian is but small in respect of the Mahometan, which comprehends one third of Asia; and the Pagan is near twice as much extended as the Mahometan. Beside these, some pretend there is the natural religion, which has about as many followers as the Christian. The languages are so many and so various, that it is impossible to enumerate them; but the chief are the Turkish, the Grecian, the Arabic, the Chinese, the Persian, and the Old Indian. In short, every country and island has almost a distinct language. Besides the animals we have in Europe, there are lions, leopards, tigers, camels, elephants, rhinoceroses, and many others.
- Lesser ASIA*, the same with NATOLIA. See NATOLIA.
- ASILUS, or hornet-fly, a genus of insects belonging to the order of insecta diptera. It has two wings, a horny, straight, two-valved beak. There are 17 species of this insect.
- ASINUS, or ASS, in zoology, the name of a species of equus. See EQUUS.
- ASIO, in ornithology, a synonyme of a species of strix. See STRIX.
- ASISIO, or ASITIO, a city of the pope's territories in Italy, situated about 16 miles E. of Perugia, in 13° 35' E. long. and 43° N. lat.

**ASLANI**, in commerce, a silver coin, worth from 115 to 120 aspers. See **ASPER**.

**ASMER**, a province of India, on this side the Ganges.

**ASPIS**, in zoology, the trivial name of a species of coluber. See **COLUBER**.

**ASPALATHUS**, or **ROSE-WOOD**, in botany, a genus of the diadelphia decandria class. The calix consists of five divisions; the pod is oval, and contains two seeds. There are 19 species, none of them natives of Britain.

**ASPARAGUS**, in botany, a genus of the hexandria monogynia class. The corolla consists of six erect divisions; the three inferior petals are bent outwards; the berry has three cells, and contains two seeds. There are 14 species of asparagus, only one of which, *viz.* the officinalis, is a native of Britain. This species is commonly used as food; but it is also supposed to promote urine.

**ASPECT**, in astronomy, denotes the situation of the planets and stars with respect to each other. See **ASTRONOMY**.

**ASPEN-TREE**, in botany. See **POPULUS**.

**ASPER**, in grammar, an accent peculiar to the Greek language, marked thus (´), and importing, that the letters over which it is placed ought to be strongly aspirated, or pronounced as if an *h* were joined with them.

**ASPER**, in ichthyology, the trivial name of a species of perca. See **PERCA**.

**ASPER**, or **ASPRE**, in commerce, a Turkish coin, three of which make a medine, and worth something more than our halfpenny.

**ASPERA arteria**, in anatomy, the same with the wind-pipe or trachea. See **ANATOMY**, p. 281.

**ASPERIFOLIATE**, or **ASPERIFOLIOLUS**, among botanists, such plants as are rough-leaved, having their leaves placed alternately on their stalks, and a monopetalous flower divided into five parts.

**ASPERUGO**, in botany, a genus of the pentandria monogynia class. There are two species, *viz.* the procumbens, or wild buglos, a native of Britain; and the *egyptiaca*, a native of Egypt.

**ASPERULA**, in botany, a genus of the tetrandria monogynia class. The corolla is infundibuliform, and the capsule contains two globular seeds. There are six species, of which the odorata, or wood-roof, and the cynachica, or squinancy-wort, are natives of Britain.

**ASPHALTUM**, in natural history, a solid, dark, opaque, inflammable substance, found in Egypt about the Dead Sea, and in many places of Europe, in detached masses of no regular structure, breaking easily in any direction, very light, fusible, and, after burning some time with a greenish white flame, leaving a white residuum of ashes. Dr Hill enumerates three species of it, the first being the bitumen judaicum, which is of a discent quality, promotes the menstrual discharge, and enters as an ingredient into the Venice creacle. See **BITUMEN**.

**ASPHODELUS**, in botany, a genus of the hexandria

monogynia class. The calix is divided into six parts; and the nectarium consists of six valves covering the germen. There are three species, *viz.* the beatus, a native of Sicily; the fitululosus and ramosus, both natives of Spain, &c.

**ASPHERELATA**, in natural history, are semi-metallic fossils, fusible by fire, and not malleable in their purest state, being in their native state intimately mixed with sulphur and other adventitious matter, and reduced to what are called ores.

Of this series of fossils, there are only five bodies, each of which makes a distinct genus; and these bodies are antimony, bismuth, cobalt, zinc, or quicksilver. See **CHEMISTRY**.

**ASPIRATE**, in grammar, denotes words marked with the spiritus asper. See **ASPER**.

**ASPIRATION**, among grammarians, is used to denote the pronouncing a syllable with some vehemence.

**ASPLENIUM**, in botany, a genus of the cryptogamia filices class. The parts of fructification are situated in the small sparse line under the disk of the leaves. There are 24 species, five of which, *viz.* the scolopendrium or hart's tongue, the ceterach or spleenwort, the trichomanes or common maiden-hair, the viride or green maiden-hair, are natives of Britain. The ceterach is recommended for promoting urine, and as a pectoral.

**ASPREDO**, in ichthyology, the trivial name of a species of silurus. See **SILURUS**.

**ASS**, in zoology, is ranked as a species of equus, or horse. See **EQUUS**.

**ASSAI**, in music, signifies quick; and, according to others, that the motion of the piece be kept in a middle degree of quickness or slowness, *As, assai allegro, assai presto*. See **ALLEGRO**, and **PRESTO**.

**ASSARON**, or **OMER**, a measure of capacity, in use among the Hebrews, containing five pints. It was the measure of manna which God appointed for every Israelite.

**ASSASSIN**, a person who kills another by attacking him at some disadvantage. It is also meant of one who hires himself to murder a person, in order to revenge the quarrel of another.

**ASSAULT**, in law, a violent injury offered to a man's person, being of a higher nature than battery.

**ASSAULT**, in the military art, a furious effort made to carry a fortified post, camp, or fortress, wherein the assailants do not screen themselves by any works: while the assault continues, the batteries cease, for fear of killing their own men.

**ASSAY**, **ESSAY**, or **SAY**, in metallurgy, the trial of the goodness and purity of metals. Hence,

**ASSAYING** is the art of finding how much pure metal is contained in any ore, or the proportion of the several ingredients of any mixed metal. See **CHEMISTRY**.

**ASSAYING** of weights and measures, the examining the common weights and measures by the clerk of the market.

**ASSAYING**, in music, a flourishing before one begins to play.

- play; or the running divisions, to lead one into the piece before us.
- ASSAY-MASTER**, an officer appointed by certain corporations to make a just assay of all gold and silver brought to him, and to make a true report thereof.
- ASSEMBLAGE**, the uniting or joining of things together; or the things themselves so united or joined. It is also used, in a more general sense, for a collection of various things so disposed and diversified that the whole produces some agreeable effect.
- ASSESSOR**, an inferior officer of justice, appointed chiefly to assist the ordinary judge with his opinion and advice.
- ASSESSOR** is also one who assesses, or settles taxes and other public dues.
- ASSEVERATION**, a positive and vehement affirmation of something.
- ASSIDEANS**, in Jewish antiquity. See **HASSIDEANS**.
- ASSIENTO**, a Spanish word signifying a farm, in commerce, is used for a bargain between the king of Spain and other powers, for importing negroes into the Spanish dominions in America, and particularly to Buenos Ayres. The first asiento was made by the French Guinea company; and, by the treaty of Utrecht, transferred to the English, who were to furnish four thousand eight hundred negroes annually.
- ASSIGN**, in common law, a person to whom a thing is assigned or made over.
- ASSIGNEE**, in law, a person appointed by another to do an act, transact some business, or enjoy a particular commodity.
- ASSIGNING**, in a general sense, is the giving over a right to another; and in a special sense is used to set forth and point at, as to assign an error, to assign false judgment, to assign waste; in which cases it must be shewn wherein the error is committed, where and how the judgment is unjust, and where the waste is committed.
- ASSIGNMENT**, the transferring the interest one has in a lease, or other thing, to another person.
- ASSIMILATION**, in physics, is that motion by which bodies convert other bodies related to them, or at least such as are prepared to be converted, into their own substance and nature. Thus, flame multiplies itself upon oily bodies, and generates new flame; air upon water, and produces new air; and all the parts, as well similar as organical, in vegetables and animals, first attract with some election or choice, nearly the same common or not very different juices for aliment, and afterwards assimilate or convert them to their own nature.
- ASSIS**, in natural history, a term used to denote opium, or the powder of hempseed, which being formed into boluses is swallowed by the Egyptians, who are thereby intoxicated.
- ASSISER**, or **ASSIZER**, of weights and measures, an officer who has the oversight of those things. See *Clerk of the market*.
- ASSIZE**, in law. See **JURY**.
- ASSOCIATION** of ideas, is where two or more ideas constantly and immediately follow one another, so that the one shall almost infallibly produce the other. See **METAPHYSICS**.
- ASSOILZIE**, in law, to absolve, or free.
- ASSONANCE**, in rhetoric or poetry, is where the words of a phrase or verse have nearly the same sound or termination, but make no proper rhyme.
- ASSOS**, a sea-port town of Natolia, situated about twelve miles south-east of Troas, in 27° 30' E. long. and 38° 30' N. lat.
- ASSUMPSIT**, a voluntary or verbal promise, whereby a person assumes, or takes upon him to perform or pay any thing to another.
- ASSUMPTION**, a festival in the Romish church, in honour of the miraculous ascent of the Virgin Mary into heaven: the Greek church, who also observe this festival, celebrate it on the fifteenth of August with great ceremony.
- ASSUMPTION**, in logic, is the minor or second proposition in a categorical syllogism.
- ASSUMPTION** is also used for a consequence drawn from the propositions whereof an argument is composed.
- ASSUMPTION**, in geography, a city of S. America, situated near the mouth of the river Plata, and on the opposite shore to Buenos Ayres, in 60° W. long. and 34° S. lat.
- ASSUMPTIVE arms**, in heraldry, are such as a person has a right to assume, with the approbation of his sovereign, and of the heralds: Thus, if a person, who has no right by blood, and has no coat of arms, shall captivate, in any lawful war, any gentleman, nobleman, or prince, he is, in that case, intitled to bear the shield of that prisoner, and enjoy it to him and his heirs for ever.
- ASSURANCE**, or **INSURANCE**, in commerce. See **INSURANCE**.
- ASSUROR**, a merchant, or other person, who makes out a policy of assurance, and thereby insures a ship, house, or the like.
- ASSYRIA**, an ancient empire of Asia, comprehending the modern provinces of Curdistan, Diarbec, and Irac-arabic.
- ASSYTH**, or **ASSYTHMENT**, in Scots law, signifies an indemnification made to an injured party. See **SCOTS LAW**, tit. *Crimes*.
- ASTER**, in botany, a genus of the syngenesia polygamia superflua class. The receptacle is naked; the pappus is simple; the rays of the corolla are ten; and the calix is imbricated. The species are thirty-six, only one of which, viz. the tripolium, or sea-flarwort, is a native of Britain.
- ASTERABAT**, a city of Persia, capital of a province of the same name, situated on the southern shore of the Caspian sea, in 54° E. long. and 37° 30' N. lat.
- ASTERIA**, in natural history, a beautiful pellucid gem of variable colours, as viewed in different lights; called also *oculus cati*, or *cat's eye*. The variable colours, which are a pale brown and white, seem to be lodged deep in the stone, and shift about as it is moved. It is nearly allied to the opals; from which, however,

however, it is distinguished by its colour and superior hardness.

**ASTERIA** is also the name of an extraneous fossil, called in English the *star-stone*. See **STAR-STONE**.

**ASTERIAS**, or **STAR-FISH**, in zoology, a genus of insects of the order of vermes molusca. The body is depressed, with a hard crust, and prickly tentacula: The mouth is in the centre, and has five valves. There are sixteen species of asterias, all found in different seas.

**ASTERISCUS**, in botany, a synonyme of the anthemis. See **ANTHEMIS**.

**ASTERISK**, a mark in form of a star, \*, placed over a word or sentence, to refer the reader to the margin, or elsewhere, for a quotation, explanation, or the like.

**ASTEROCEPHALUS**, in botany. See **SCABIOSA**.

**ASTEROIDES**, in botany. See **BUPHTHALMUM**.

**ASTEROPODIUM**, a kind of extraneous fossil, of the same substance with the asteria; or star-stones, to which they serve as a base. See **STAR-STONE**.

**ASTROPTERUS**, in botany, a synonyme of the aster. See **ASTER**.

**ASTHMA**, in medicine, a painful, difficult, and laborious respiration. See **MEDICINE**.

**ASTI**, a city of Piedmont, in Italy, situated upon the river Panaro, about thirty miles east of Turin, in 8° 15' E. long. and 44° 40' N. lat.

**ASTORGA**, a city of the province of Leon, in Spain, situated upon the river Inerto, about thirty miles south-west of Leon, in 6° 20' W. long. and 42° 20' N. lat.

**ASTOUR**, in commerce, a term in the E. Indies, for what in England we call discount. See **DISCOUNT**.

**ASTRACAN**, a city of Asiatic Russia, and capital of a kingdom of the same name. It is situated on the eastern shore of the river Wolga, about eighty miles north of the Caspian sea, in 52° E. long. and 47° N. lat.

**ASTRAGAL**, in architecture, a little round moulding, in form of a ring, serving as an ornament at the tops and bottoms of columns. See **ARCHITECTURE**.

**ASTRAGAL**, in gunnery, a round moulding encompassing a cannon, about half a foot from its mouth.

**ASTRAGALOIDES**, in botany, a synonyme of the phaca. See **PHACA**.

**ASTRAGALUS**, in botany, a genus of the diadelphia decandria class. The pod is gibbous and bilocular. There are thirty-nine species of astragalus, of which two, *viz.* the glycyphyllus, or wild liquorice, and the arenarius, or purple mountain milk-work, are natives of Britain.

**ASTRAGALUS**, in anatomy. See p. 185.

**ASTRANTIA**, in botany, a genus of the pentandria

digynia class. The involucre is lanceolated, open, equal, and coloured. The species are two, *viz.* the major and minor, both natives of the Alps.

**ASTRARIUS hares**, in law, is where an ancestor by conveyance has settled his heir apparent and family in a house in his life-time.

**ASTREA**, in astronomy, the same with virgo. See **VIRGO**, and **ASTRONOMY**.

**ASTRENIUM**, in botany, a genus of the diœcia pentandria class. There is but one species, a native of America.

**ASTRICTION**, in law. See **THIRLAGE**.

**ASTRICTION**, among physicians, denotes the operation of astringent medicines. See the next article.

**ASTRINGENTS**, in materia medica, substances distinguished by a rough austere taste, and changing solutions of iron, especially those made in the vitriolic acid, into a dark purple or black colour; such are galls, tormentil root, bistort root, balauilines, terra japonica, acacia, &c. Astringents yield their virtues by infusion both to water and vinous spirits, but generally in greatest perfection to the former. The medical effects of astringents are, to constringe the fibres, and incrassate or lightly thicken the juices. Their more experienced use is in disorders proceeding from a debility or flaccid state of the solids; in hæmorrhages from a thinness of the blood, laxity, or rupture of the vessels; in preternatural discharges of other kinds, after the offending matter has been duly corrected or evacuated; and in external relaxations.

**ASTROGNOSIA**, the science of the fixed stars, or the knowledge of their names, constellations, magnitudes, &c.

**ASTROITES**, or **STAR STONE**, in natural-history, is so called on account of its resemblance to a star. See **STAR-STONE**.

**ASTROLABE**, the name for a stereographic projection of the sphere, either upon the plane of the equator, the eye being supposed to be in the pole of the world; or upon the plane of the meridian, when the eye is supposed in the point of the intersection of the equinoxial and horizon.

**ASTROLABE** is also an instrument for taking the altitude of the sun or stars at sea. See **ASTRONOMY**.

**ASTROLABE**, among the ancients, was the same as our armillary sphere.

**ASTROLOGY**, a conjectural science, which teaches to judge of the effects and influences of the stars, and to foretel future events by the situation and different aspects of the heavenly bodies. This science has long ago become a just subject of contempt and ridicule.

**ASTRONOMICALS**, a name sometimes given to sexagesimal fractions. See **ARITHMETIC**, *Of sexagesimal.*

# A S T R O N O M Y.

**A**STRONOMY is the science which treats of the nature and properties of the heavenly bodies.

## CHAP. I. *Of ASTRONOMY in general.*

By astronomy we discover that the earth is at so great a distance from the sun, that if seen from thence it would appear no bigger than a point, although its circumference is known to be 25,020 miles. Yet that distance is so small, compared with the earth's distance from the fixed stars, that if the orbit in which the earth moves round the sun were solid, and seen from the nearest star, it would likewise appear no bigger than a point, although it is at least 162 millions of miles in diameter. For the earth, in going round the sun, is 162 millions of miles nearer to some of the stars at one time of the year than at another; and yet their apparent magnitudes, situations, and distances from one another still remain the same; and a telescope which magnifies above 200 times does not sensibly magnify them; which proves them to be at least 400 thousands times farther from us than we are from the sun.

It is not to be imagined that all the stars are placed in one concave surface, so as to be equally distant from us; but that they are scattered at immense distances from one another through unlimited space. So that there may be as great a distance between any two neighbouring stars, as between our sun and those which are nearest to him. Therefore an observer, who is nearest any fixed star, will look upon it alone as a real sun; and consider the rest as so many shining points, placed at equal distances from him in the firmament.

By the help of telescopes we discover thousands of stars which are invisible to the naked eye; and the better our glasses are, still the more become visible; so that no limits can be set either to their number or their distances.

The sun appears very bright and large in comparison of the fixed stars, because we keep constantly near the sun, in comparison of our immense distance from the stars. For a spectator, placed as near to any star as we are to the sun, would see that star a body as large and bright as the sun appears to us: and a spectator, as far distant from the sun as we are from the stars, would see the sun as small as we see a star, divested of all its circumvolving planets; and would reckon it one of the stars in numbering them.

The stars, being at such immense distances from the sun, cannot possibly receive from him so strong a light as they seem to have; nor any brightness sufficient to make them visible to us. For the sun's rays must be so scattered and dissipated before they reach such remote objects, that

they can never be transmitted back to our eyes, so as to render these objects visible by reflexion. The stars therefore shine with their own native and unborrowed lustre, as the sun does; and since each particular star, as well as the sun, is confined to a particular portion of space, it is plain that the stars are of the same nature with the sun.

It is no ways probable that the Almighty, who always acts with infinite wisdom, and does nothing in vain, should create so many glorious suns, fit for so many important purposes, and place them at such distances from one another, without proper objects near enough to be benefited by their influences. Whoever imagines they were created only to give a faint glimmering light to the inhabitants of this globe, must have a very superficial knowledge of astronomy, and a mean opinion of the Divine Wisdom: since, by an infinitely less exertion of creating power, the Deity could have given our earth much more light by one single additional moon.

Instead then of one sun and one world only in the universe, astronomy discovers to us such an inconceivable number of suns, systems, and worlds, dispersed through boundless space, that if our sun, with all the planets, moons, and comets belonging to it, were annihilated, they would be no more missed, by an eye that could take in the whole creation, than a grain of sand from the sea-shore: The space they possess being comparatively so small, that it would scarce be a sensible blank in the universe, although Saturn, the outermost of our planets, revolves about the sun in an orbit of 4884 millions of miles in circumference, and some of our comets make excursions upwards of ten thousand millions of miles beyond Saturn's orbit; and yet, at that amazing distance, they are incomparably nearer to the sun than to any of the stars; as is evident from their keeping clear of the attractive power of all the stars, and returning periodically by virtue of the sun's attraction.

From what we know of our own system, it may be reasonably concluded, that all the rest are with equal wisdom contrived, situated, and provided with accommodations for rational inhabitants. Let us therefore take a survey of the system to which we belong; the only one accessible to us; and from thence we shall be the better enabled to judge of the nature and end of the other systems of the universe. For although there is almost an infinite variety in the parts of the creation which we have opportunities of examining, yet there is a general analogy running through, and connecting all the parts into one great and universal system.

To an attentive considerer, it will appear highly probable, that the planets of our system, together with their attendants called *satellites* or *moons*, are much of the

the same nature with our earth, and destined for the like purposes. For they are solid opaque globes, capable of supporting animals and vegetable. Some of them are larger, some less, and some much about the size of our earth. They all circulate round the sun, as the earth does, in a shorter or longer time, according to their respective distances from him; and have, where it would not be inconvenient, regular returns of summer and winter, spring and autumn. They have warmer and colder climates, as the various productions of our earth require: And, in such as afford a possibility of discovering it, we observe a regular motion round their axes like that of our earth, causing an alternate return of day and night; which is necessary for labour, rest, and vegetation, and that all parts of their surfaces may be exposed to the rays of the sun.

Such of the planets as are farthest from the sun, and therefore enjoy least of his light, have that deficiency made up by several moons, which constantly accompany and revolve about them, as our moon revolves about the earth. The remotest planet has, over and above, a broad ring encompassing it; which like a lucid zone in the heavens reflects the sun's light very copiously on that planet; so that if the remoter planets have the sun's light fainter by day than we, they have an addition made to it morning and evening by one or more of their moons, and a greater quantity of light in the night-time.

On the surface of the moon, because it is nearer us than any other of the celestial bodies are, we discover a nearer resemblance of our earth. For, by the assistance of telescopes, we observe the moon to be full of high mountains, large valleys, and deep cavities. These singularities leave us no room to doubt, but that all the planets and moons in the system are designed as commodious habitations for creatures endued with capacities of knowing and adoring their beneficent Creator.

Since the fixed stars are prodigious spheres of fire like our sun, and at inconceivable distances from one another as well as from us, it is reasonable to conclude they are made for the same purposes that the sun is; each to bestow light, heat, and vegetation, on a certain number of inhabited planets, kept by gravitation within the sphere of its activity.

## CHAP. II. Of the SOLAR SYSTEM.

THE planets and comets which move round the sun as their centre, constitute the Solar System. Those planets which are near the sun not only finish their circuits sooner, but likewise move faster in their respective orbits, than those which are more remote from him. Their motions are all performed from west to east, in orbits nearly circular. Their names, distances, bulks, and periodical revolutions, are as follow.

THE SUN ☉, an immense globe of fire, is placed near the common centre, or rather in the lower focus, of the orbits of all the planets and comets; and turns round his axis in 25 days 6 hours, as is evident by the motion of spots seen on his surface. His diameter is computed to be 763,000 miles; and, by the various attractions of the

circumvolving planets, he is agitated by a small motion round the centre of gravity of the system. All the planets, as seen from him, move the same way, and according to the order of signs in the graduated circle  $\Upsilon$   $\text{♋}$   $\text{♌}$   $\text{♍}$ , &c. Plate XL. fig. 2. which represents the great ecliptic in the heavens: But, as seen from any one planet, the rest appear sometimes to go backward, sometimes forward, and sometimes to stand still; not in circles nor ellipses, but in looped curves which never return into themselves. The comets come from all parts of the heavens, and move in all sorts of directions.

The axis of a planet is a line conceived to be drawn through its centre, about which it revolves as on a real axis. The extremities of this line, terminating in opposite points of the planet's surface, are called its *poles*. That which points towards the northern part of the heavens, is called the *north pole*; and the other, pointing towards the southern part, is called the *south pole*. A bowl whirled from one's hand into the open air turns round such a line within itself, whilst it moves forward; and such are the lines we mean, when we speak of the axes of the heavenly bodies.

Let us suppose the earth's orbit to be a thin, even, solid plane; cutting the sun through the centre, and extended out as far as the starry heavens, where it will mark the great circle called the *ecliptic*. This circle we suppose to be divided into 12 equal parts, called *signs*; each sign into 30 equal parts, called *degrees*; each degree into 60 equal parts, called *minutes*; and every minute into 60 equal parts, called *seconds*: So that a second is the 60th part of a minute; a minute the 60th part of a degree; and a degree the 360th part of a circle, or 30th part of a sign. The planes of the orbits of all the other planets likewise cut the sun in halves; but, extended to the heavens, form circles different from one another, and from the ecliptic; one half of each being on the north side, and the other on the south side of it. Consequently the orbit of each planet crosses the ecliptic in two opposite points, which are called the planet's *nodes*. These nodes are all in different parts of the ecliptic; and therefore, if the planetary tracks remained visible in the heavens, they would in some measure resemble the different ruts of waggon-wheels crossing one another in different parts, but never going far asunder. That node, or intersection of the orbit of any planet with the earth's orbit, from which the planet ascends northward above the ecliptic, is called the *ascending node* of the planet; and the other, which is directly opposite thereto, is called its *descending node*. Saturn's ascending node is in 21 deg. 13 min. of Cancer  $\text{♋}$ ; Jupiter's in 7 deg. 29 min. of the same sign; Mars's in 17 deg. 17 min. of Taurus  $\text{♉}$ ; Venus's in 13 deg. 59 min. of Gemini  $\text{♊}$ ; and Mercury's in 14 deg. 43 min. of Taurus. Here we consider the earth's orbit as the standard, and the orbits of all the other planets as oblique to it.

When we speak of the planets orbits. All that is meant is their paths through the open and unresisting space in which they move, and are kept in, by the attractive power of the sun, and the projectile force impressed up

on them at first; between which power and force there is so exact an adjustment, that they continue in the same tracks without any solid orbits to confine them.

MERCURY, the nearest planet to the sun, goes round him (as in a circle marked  $\zeta$ , Plate XXXIX. fig. 1.) in 87 days 23 hours of our time nearly; which is the length of his year. But, being feldom seen, and no spots appearing on his surface or disk, the time of his rotation on his axis, or the length of his days and nights, is as yet unknown. His distance from the sun is computed to be 32 millions of miles, and his diameter 2600. In his course round the sun, he moves at the rate of 95 thousand miles every hour. His light and heat from the sun are almost seven times as great as ours; and the sun appears to him almost seven times as large as to us. The great heat on this planet is no argument against its being inhabited; since the Almighty could as easily suit the bodies and constitutions of its inhabitants to the heat of their dwelling, as he has done ours to the temperature of our earth. And it is very probable that the people there have such an opinion of us, as we have of the inhabitants of Jupiter and Saturn; namely, that we must be intolerably cold, and have very little light at so great a distance from the sun.

This planet appears to us with all the various phases of the moon, when viewed at different times by a good telescope; excepting only that he never appears quite full, because his enlightened side is never turned directly towards us but when he is so near the sun as to be lost to our sight in its beams. And, as his enlightened side is always toward the sun, it is plain that he shines not by any light of his own; for if he did, he would constantly appear round. That he moves about the sun in an orbit within the earth's orbit is also plain, (as will be shewn afterwards), because he is never seen opposite to the sun, nor above 56 times the sun's breadth from his centre.

His orbit is inclined seven degrees to the ecliptic; and that node from which he ascends northward above the ecliptic is in the 14th degree of Taurus; the opposite, in the 14th degree of Scorpio. The earth is in these points on the 6th of November and 4th of May, new style; and when Mercury comes to either of his nodes at his inferior conjunction about these times, he will appear to pass over the disk or face of the sun, like a dark round spot; but in all other parts of his orbit his conjunctions are invisible, because he either goes above or below the sun.

Mr Whiston has given us an account of several periods at which Mercury may be seen on the sun's disk, viz. in the year 1782, Nov. 12th, at 3 h. 44 m. in the afternoon; 1786, May 4th, at 6 h. 57 m. in the forenoon; 1789, Dec. 6th, at 3 h. 55 min. in the afternoon; and 1799, May 7th, at 2 h. 34 m. in the forenoon. There will be several intermediate transits, but none of them visible to us.

VENUS, the next planet in order, is computed to be 59 millions of miles from the sun; and by moving at the rate of 60 thousand miles every hour in her orbit, (as in the circle marked  $\zeta$ ), she goes round the sun in 224

days 17 hours of our time nearly. But though this be the full length of her year, as she performs only  $9\frac{1}{2}$  revolutions on her own axis in that time, her year consists only of  $9\frac{1}{2}$  days; so that in her, every day and night together is as long as  $24\frac{1}{2}$  days and nights with us. This odd quarter of a day in every year makes every fourth year a leap-year to Venus; as the like does to our earth. Her diameter is 7906 miles; and by her diurnal motion the inhabitants about her equator are carried 43 miles every hour, besides the 69,000 above mentioned.

Her orbit includes that of Mercury within it; for at her greatest elongation, or apparent distance from the sun, she is 96 times his breadth from his centre; which is almost double of Mercury's. Her orbit is included by the earth's; for if it were not, she might be seen as often in opposition to the sun, as she is in conjunction with him; but she was never seen 90 degrees, or a fourth part of a circle, from the sun.

When Venus appears west of the sun, she rises before him in the morning, and is called the *morning-star*; when she appears east of the sun, she shines in the evening after he sets, and is then called the *evening-star*; being each in its turn for 290 days. It may perhaps be surprising at first, that Venus should keep longer on the east or west of the sun, than the whole time of her period round him. But the difficulty vanishes when we consider, that the earth is all the while going round the sun the same way, though not so quick as Venus; and therefore her relative motion to the earth must in every period be as much slower than her absolute motion in her orbit, as the earth during that time advances forward in the ecliptic, which is 220 degrees. To us she appears, through a telescope, in all the various phases of the moon.

The axis of Venus is inclined 75 degrees to the axis of her orbit; which is  $51\frac{1}{2}$  degrees more than our earth's axis is inclined to the axis of the ecliptic; and therefore her seasons vary much more than ours do. The north pole of her axis inclines toward the 20th degree of aquarius, our earth's to the beginning of Cancer; consequently the northern parts of Venus have summer in the signs where those of our earth have winter, and *vice versa*.

The artificial day at each pole of Venus is as long as  $112\frac{1}{2}$  natural days on our earth.

The sun's greatest declination on each side of her equator amounts to 75 degrees; therefore her tropics are only 15 degrees from her poles, and her polar circles as far from her equator. Consequently, the tropics of Venus are between her polar circles and her poles; contrary to what those of our earth are.

As her annual revolution contains only  $9\frac{1}{2}$  of her days, the sun will always appear to go through a whole sign, or twelfth part of her orbit, in little more than three quarters of her natural day, or nearly in  $18\frac{1}{2}$  of our days and nights.

Because her day is so great a part of her year, the sun changes his declination in one day so much, that if he passes vertically, or directly over head of any given place on the tropic, the next day he will be 26 degrees from

from it; and whatever place he passes vertically over when in the equator, one day's revolution will remove him  $36\frac{1}{2}$  degrees from it. So that the sun changes his declination every day in Venus about 14 degrees more at a mean rate, than he does in a quarter of a year on our earth. This appears to be providentially ordered, for preventing the too great effects of the sun's heat, (which is twice as great on Venus as on the earth), so that he cannot shine perpendicularly on the same places for two days together; and by that means the heated places have time to cool.

If the inhabitants about the north pole of Venus fix their fouth or meridian line through that part of the heavens where the sun comes to his greatest height, or north declination, and call those the east and west points of their horizon, which are 90 degrees on each side from that point where the horizon is cut by the meridian line, these inhabitants will have the following remarkable things.

The sun will rise  $22\frac{1}{2}$  degrees north of the east; and going on  $112\frac{1}{2}$  degrees, as measured on the plane of the horizon, he will cross the meridian at an altitude of  $12\frac{1}{2}$  degrees; then making an entire revolution without setting, he will cross it again at an altitude of  $48\frac{1}{2}$  degrees; at the next revolution he will cross the meridian as he comes to his greatest height and declination, at the altitude of 75 degrees; being then only 15 degrees from the zenith, or that point of the heavens which is directly over head; and thence he will descend in the like spiral manner, crossing the meridian first at the altitude of  $48\frac{1}{2}$  degrees; next at the altitude of  $12\frac{1}{2}$  degrees; and going on thence  $112\frac{1}{2}$  degrees, he will set  $22\frac{1}{2}$  degrees north of the west; so that, after having been  $4\frac{1}{8}$  revolutions above the horizon, he descends below it to exhibit the like appearances at the fouth pole.

At each pole, the sun continues half a year without setting in summer, and as long without rising in winter; consequently the polar inhabitants of Venus have only one day and one night in the year, as it is at the poles of our earth. But the difference between the heat of summer and cold of winter, or of mid-day and mid-night, on Venus, is much greater than on the earth; because in Venus, as the sun is for half a year together above the horizon of each pole in its turn, so he is for a considerable part of that time near the zenith; and during the other half of the year always below the horizon, and for a great part of that time at least 70 degrees from it. Whereas, at the poles of our earth, although the sun is for half a year together above the horizon, yet he never ascends above, nor descends below it, more than  $23\frac{1}{2}$  degrees. When the sun is in the equinoctial, or in that circle which divides the northern half of the heavens from the southern, he is seen with one half of his disk above the horizon of the north pole, and the other half above the horizon of the fouth pole; so that his centre is in the horizon of both poles: and then descending below the horizon of one, he ascends gradually above that of the other. Hence, in a year, each pole has one spring, one harvest, a summer as long as them both, and a winter equal in length to the other three seasons.

At the polar circles of Venus, the seasons are much the same as at the equator, because there are only 15 degrees betwixt them; only the winters are not quite so long, nor the summers so short; but the four seasons come twice round every year.

At Venus's tropics, the sun continues for about fifteen of our weeks together without setting in summer, and as long without rising in winter. Whilst he is more than 15 degrees from the equator, he neither rises to the inhabitants of the one tropic, nor sets to those of the other; whereas, at our terrestrial tropics, he rises and sets every day of the year.

At Venus's tropics, the seasons are much the same as at her poles; only the summers are a little longer, and the winters a little shorter.

At her equator, the days and nights are always of the same length, and yet the diurnal and nocturnal arches are very different, especially when the sun's declination is about the greatest; for then his meridian altitude may sometimes be twice as great as his midnight depression, and at other times the reverse. When the sun is at his greatest declination, either north or fouth, his rays are as oblique at Venus's equator, as they are at London on the shortest day of winter. Therefore, at her equator there are two winters, two summers, two springs, and two autumns every year. But because the sun stays for some time near the tropics, and passes so quickly over the equator, every winter there will be almost twice as long as summer; the four seasons returning twice in that time, which consists only of  $9\frac{1}{2}$  days.

Those parts of Venus which lie between the poles and tropics, and between the tropics and polar circles, and also between the polar circles and equator, partake more or less of the phenomena of these circles as they are more or less distant from them.

From the quick change of the sun's declination it happens, that if he rises due east on any day, he will not set due west on that day, as with us; for if the place where he rises due east be on the equator, he will set on that day almost west-north-west, or about  $18\frac{1}{2}$  degrees north of the west. But if the place be in 45 degrees north latitude, then on the day that the sun rises due east he will set north-west by west, or 33 degrees north of the west, and in 62 degrees north latitude. When he rises in the east, he sets not in that revolution, but just touches the horizon 10 degrees to the west of the north point, and ascends again, continuing for  $3\frac{1}{2}$  revolutions above the horizon without setting. Therefore, no place has the forenoon and afternoon of the same day equally long, unless it be in the equator, or at the poles.

The sun's altitude at noon, or at any other time of the day, and his amplitude at rising and setting, being very different at places on the same parallel of latitude, according to the different longitudes of those places, the longitude will be almost as easily found on Venus as the latitude is found on the earth; which is an advantage we can never enjoy, because the daily change of the sun's declination is by much too small for that important purpose.

On this planet, where the sun crosses the equator in any year, he will have 9 degrees of declination from that place

place on the same day and hour next year, and will cross the equator 90 degrees farther to the west; which makes the time of the equinox a quarter of a day (or about six of our days) later every year. Hence, although the spiral in which the sun's motion is performed, be of the same sort every year, yet it will not be the very same, because the sun will not pass vertically over the same places till four annual revolutions are finished.

Venus's orbit is inclined  $3\frac{1}{2}$  degrees to the earth's; and crosses it in the 14th degree of Gemini and of Sagittarius; and therefore, when the earth is about these points of the ecliptic at the time that Venus is in her inferior conjunction, she will appear like a spot on the sun, and afford a more certain method of finding the distances of all the planets from the sun, than any other yet known. But these appearances happen very seldom. The first was in the year 1639. The second in the year 1761, June 6. In the morning of that day, when the sun rose at London, Venus had passed both the external and internal contacts. At 38 minutes 21 seconds past 7 o'clock, (apparent time) at Greenwich, the Rev. Dr Bliss, astronomer royal, first saw Venus on the sun; at which instant, the centre of Venus preceded the sun's centre, by  $6' 18''.9$  of right ascension, and was south of the sun's centre by  $18' 42''.1$  of declination.—From that time to the beginning of egress, the Doctor made several observations, both of the difference of right ascension and declination of the centres of the sun and Venus; and at last found the beginning of egress, or instant of the internal contact of Venus with the sun's limb, to be at 8 hours 19 minutes 0 seconds apparent time.—From the Doctor's own observations, and those which were made at Shirburn by another gentleman, he has computed, that the mean time at Greenwich of the ecliptical conjunction of the sun and Venus was at 51 minutes 20 seconds after 5 o'clock in the morning; that the place of the sun and Venus was Gemini  $15^{\circ} 36' 33''$ ; that the geocentric latitude of Venus was  $9^{\circ} 44''.9$  south,—her horary motion from the sun  $3' 57''.13$  retrograde, and the angle then formed by the axis of the equator and the axis of the ecliptic was  $6^{\circ} 9' 34''$ , decreasing hourly 1 minute of a degree.—By the mean of three good observations, the diameter of Venus on the sun was  $58''$ .

Mr Short made his observations at Savile-house, in London, 30 seconds in time west from Greenwich, in presence of his royal highness the duke of York, accompanied by their royal highnesses prince William, prince Henry, and prince Frederick.—He first saw Venus on the sun, through flying clouds, at 46 minutes 37 seconds after 5 o'clock; and at 6 hours 15 minutes 12 seconds he measured the diameter of Venus  $59''.8$ .—He afterward found it to be  $58''.9$ , when the sky was more favourable.—And, through a reflecting telescope of two feet focus, magnifying 140 times, he found the internal contact of Venus with the sun's limb to be at 8 hours 18 minutes 21 seconds, apparent time; which being reduced to the apparent time at Greenwich, was 8 hours 18 minutes 51 seconds; so that his time of seeing the contact was  $8\frac{1}{2}$  seconds sooner (in absolute time) than the instant of its being seen at Greenwich.

Messrs Ellicott and Dollond observed the internal con-

tact at Hackney; and their time of seeing it, reduced to the time at Greenwich, was at 8 hours 18 minutes 56 seconds, which was 4 seconds sooner in absolute time than the contact was seen at Greenwich.

Mr Canton in Spittle-Square, London,  $4' 11''$  west of Greenwich, (equal to 16 seconds  $44$  thirds of time), measured the sun's diameter  $31' 33'' 24'''$ , and the diameter of Venus on the sun  $58''$ ; and, by observation, found the apparent time of the internal contact of Venus with the sun's limb to be at 8 hours 18 minutes 41 seconds; which, by reduction, was only  $2\frac{1}{2}$  seconds short of the time at the Royal Observatory at Greenwich.

The Reverend Mr Richard Haydon, at Lestkard in Cornwall, (16 minutes 10 seconds in time west from London, as stated by Dr Bevis), observed the internal contact to be at 8 hours 0 minutes 20 seconds, which, by reduction, was 8 hours 16 minutes 30 seconds at Greenwich; so that he must have seen it 2 minutes 30 seconds sooner in absolute time than it was seen at Greenwich;—a difference by much too great to be occasioned by the difference of parallaxes. But by a memorandum of Mr Hayden's some years before, it appears that he then supposed his west longitude to be near two minutes more; which brings his time to agree within half a minute of the time at Greenwich; to which the parallaxes will very nearly answer.

At Stockholm Observatory, latitude  $59^{\circ} 20'\frac{1}{2}$  north, and longitude 1 hour 12 minutes east from Greenwich, the whole of the transit was visible: the total ingress was observed by Mr Wargentin to be at 3 hours 39 minutes 23 seconds in the morning, and the beginning of egress at 9 hours 30 minutes 8 seconds; so that the whole duration between the two internal contacts, as seen at that place, was 5 hours 50 minutes 45 seconds.

At Torneo in Lapland, (1 hour 27 minutes 28 seconds east of Paris), Mr Hellant, who is esteemed a very good observer, found the total ingress to be at 4 hours 3 minutes 59 seconds, and the beginning of egress to be 9 hours 54 minutes 8 seconds.—So that the whole duration between the two internal contacts was 5 hours 50 minutes 9 seconds.

At Hernosand in Sweden, (latitude  $6^{\circ} 38'$  north, and longitude 1 hour 2 minutes 12 seconds east of Paris), Mr Gifter observed the total ingress to be at 3 hours 38 minutes 26 seconds; and the beginning of egress to be at 9 hours 29 minutes 21 seconds;—the duration between these two internal contacts 5 hours 50 minutes 56 seconds.

Mr De La Lande, at Paris, observed the beginning of egress to be at 8 hours 28 minutes 26 seconds apparent time.—But Mr Ferner (who was then at Conflans,  $14''$  west of the Royal Observatory at Paris) observed the beginning of egress to be at 8 hours 28 minutes 29 seconds true time. The equation, or difference between the true and apparent time, was 1 minute 54 seconds.—The total ingress, being before the sun rose, could not be seen.

At Tobolsk in Siberia, Mr Chappe observed the total ingress to be at 7 hours 0 minutes 28 seconds in the morning, and the beginning of egress to be at 49 minutes  $20\frac{1}{2}$  seconds after 12 at noon.—So that the whole duration of the transit between the internal contacts was 5 hours

hours 48 minutes 52 $\frac{1}{2}$  seconds, as seen at that place; which was 2 minutes 3 $\frac{1}{2}$  seconds less than as seen at Heronand in Sweden.

At Madras, the Reverend Mr Hirt observed the total ingrefs to be at 7 hours 47 minutes 55 seconds apparent time in the morning, and the beginning of egress at 1 hour 39 minutes 38 seconds past noon.—The duration between these two internal contacts was 5 hours 51 minutes 43 seconds.

Professor Mathenci at Bologna observed the beginning of egress to be at 9 hours 4 minutes 58 seconds.

At Calcutta, (latitude 22° 30' north, nearly 92° east longitude from London), Mr William Magee observed the total ingrefs to be at 8 hours 20 minutes 58 seconds in the morning, and the beginning of egress to be at 2 hours 11 minutes 34 seconds in the afternoon; the duration between the two internal contacts 5 hours 50 minutes 36 seconds.

At the Cape of Good Hope, (1 hour 13 minutes 35 seconds east from Greenwich), Mr Mason observed the beginning of egress to be at 9 hours 39 minutes 50 seconds in the morning.

All these times are collected from the observers accounts, printed in the Philosophical Transactions for the years 1762 and 1763, in which there are several other accounts that are not transcribed.—The instants of Venus's total exit from the sun are likewise mentioned, but they are here left out, as not of any use for finding the sun's parallax.

Whoever compares these times of the internal contacts, as given in by different observers, will find such differences among them, even those which were taken upon the same spot, as will shew, that the instant of either contact could not be so accurately perceived by the observers as Dr Halley thought it could; which probably arises from the difference of peoples eyes, and the different magnifying powers of those telescopes through which the contacts were seen.—If all the observers had made use of equal magnifying powers, there can be no doubt but that the times would have more nearly coincided; since it is plain, that supposing all their eyes to be equally quick and good, they whose telescopes magnified most would perceive the point of internal contact sooner, and of the total exit latest.

Mr Short, in a paper published in the Philosophical Transactions, Vol. LII. Part II. has taken an incredible deal of pains in deducing the quantity of the sun's parallax, from the best of those observations which were

made both in Britain and abroad; and finds it to have been 8".52 on the day of the transit when the sun was very nearly at his greatest distance from the earth; and consequently 8".65 when the sun is at his mean distance from the earth.

The log. sine (or tangent) of 8".65 is 5.6219140, which being subtracted from the radius 10.0000000, leaves remaining the logarithm 4.3780860, whose number is 23882.84; which is the number of semidiameters of the earth that the sun is distant from it.—And this last number, 23882.84, being multiplied by 3985, the number of English miles contained in the earth's semidiameter, gives 95,173,117 miles from the earth's mean distance from the sun.—But because it is impossible, from the nicest observations of the sun's parallax, to be sure of his true distance from the earth within 100 miles, we shall at present, for the sake of round numbers, state the earth's mean distance from the sun at 95,173,000 English miles.

And then, from the numbers and analogies in § 11. & 14. of Mr Short's dissertation, we find the mean distances of all the rest of the planets from the sun, in miles, to be as follows.—Mercury's distance, 36,841,468; Venus's distance, 68,891,486; Mars's distance, 145,014,148; Jupiter's distance, 494,990,976; and Saturn's distance, 907,956,130.

The semidiameter of the earth's annual orbit being equal to the earth's mean distance from the sun, viz. 95,173,000 miles; the whole diameter thereof is 190,346,000 miles. And since the circumference of a circle is to its diameter as 355 is to 113, the circumference of the earth's orbit is 597,989,646 miles.

And, as the earth describes this orbit in 365 days 6 hours (or in 8766 hours) it is plain that it travels at the rate of 68,216.9 miles every hour; and consequently 1136.9 miles every minute; so that its velocity in its orbit is at least 142 times as great as the velocity of a cannon-ball, supposing the ball to move through 8 miles in a minute, which it is found to do very nearly: And at this rate it would take 22 years 228 days for a cannon-ball to go from the earth to the sun.

On the 3d of June, in the year 1769, Venus again passed over the sun's disk, in such a manner, as to afford a much easier and better method of investigating the sun's parallax than her transit in the year 1761. But as few of the observations upon this transit have as yet been made public, we can only give the following, made by different observers at London.

	External contact.		Regular circumferences in contact.		Thread of light completed, or the internal contact.		Telescopes made use of.	Magnifying power.

When Venus was little more than half emerged into the sun's disk. Mr Malkdyne saw her whole circumference compleated, by means of a vivid, but narrow and ill defined border of light, which illuminated that part of her circumference which was off the sun, and otherwise not visible. They all observed the black protuberance in the internal contact. They likewise, after the internal contact, saw a luminous ring round the body of Venus, about the thickness of half her semi-diameter; it was brightest towards Venus's body, and gradually diminished in splendor at greater distance, but the whole was excessive white and faint.

Venus may have a satelite or moon, although it be undiscovered by us: which will not appear very surprising, if we consider how inconveniently we are placed from seeing it. For its enlightened side can never be fully turned towards us, but when Venus is beyond the sun; and then, as Venus appears little bigger than an ordinary star, her moon may be too small to be perceived at such a distance. When she is between us and the sun, her full moon has its dark side towards us; and then we cannot see it any more than we can our own moon at the time of change. When Venus is at her greatest elongation, we have but one half of the enlightened side of her full moon towards us; and even then it may be too far distant to be seen by us.

The EARTH is the next planet above Venus in the system. It is 82 millions of miles from the sun, and goes round him (as in the circle  $\odot$ ) in 365 days 5 hours 49 minutes, from any equinox or solstice to the same again; but from any fixed star to the same again, as seen from the sun, in 365 days 6 hours and 9 minutes; the former being the length of the tropical year, and the latter the length of the syderial. It travels the rate of 58 thousand miles every hour; which motion, though 120 times swifter than that of a cannon-ball, is little more than half as swift as Mercury's motion in his orbit. The earth's diameter is 7970 miles; and by turning round its axis every 24 hours from west to east, it causes an apparent diurnal motion of all the heavenly bodies from east to west. By this rapid motion of the earth on its axis, the inhabitants about the equator are carried 1042 miles every hour, whilst those on the parallel of London are carried only about 580, besides the 58 thousand miles by the annual motion above mentioned, which is common to all places whatever.

The earth's axis makes an angle of  $23\frac{1}{2}$  degrees with the axis of its orbit, and keeps always the same oblique direction, inclining towards the same fixed stars throughout its annual course, which causes the returns of spring, summer, autumn, and winter; as will be explained afterwards.

The earth is round like a globe; as appears, 1. By its shadow in eclipses of the moon, which shadow is always bounded by a circular ring. 2. By our seeing the masts of a ship whilst the hull is hid by the convexity of the water. 3. By its having been sailed round by many navigators. The hills take off no more from the roundness of the earth in comparison, than grains of dust do from the roundness of a common globe.

The seas and unknown parts of the earth (by a mea-

surement of the best maps) contain 160 million 522 thousand and 26 square miles; the inhabited parts 38 million 990 thousand 569; Europe 4 million 456 thousand and 65; Asia, 10 million 768 thousand 823; Africa, 9 million 654 thousand 807; America, 14 million 110 thousand 874. In all, 109 million 512 thousand 595; which is the number of square miles on the whole surface of our globe.

The Moon is not a planet, but only a satelite or attendant of the earth; going round the earth from change to change in 29 days 12 hours and 44 minutes; and round the sun with it every year. The moon's diameter is 2180 miles; and her distance from the earth's centre 240 thousand. She goes round her orbit in 27 days 7 hours 43 minutes, moving about 2290 miles every hour; and turns round her axis exactly in the same time that she goes round the earth, which is the reason of her keeping always the same side towards us, and that her day and night, taken together, is as long as our lunar month.

The moon is an opaque globe like the earth, and shines only by reflecting the light of the sun: Therefore whilst that half of her which is toward the sun is enlightened, the other half must be dark and invisible. Hence, she disappears when she comes between us and the sun; because her dark side is then towards us. When she is gone a little way forward, we see a little of her enlightened side; which still increases to our view, as she advances forward, until she comes to be opposite the sun; and then her whole enlightened side is towards the earth, and she appears with a round, illuminated orb, which we call the *full moon*; her dark side being then turned away from the earth. From the full she seems to decrease gradually as she goes through the other half of her course; shewing us less and less of her enlightened side every day, till her next change or conjunction with the sun, and then she disappears as before.

This continual change of the moon's phases demonstrates that she shines not by any light of her own; for if she did, being globular, we should always see her with a round full orb like the sun. Her orbit is represented in the scheme by the little circle *m*, upon the earth's orbit  $\odot$ , Plate XXXIX, fig. 1.; but it is drawn fifty times too large in proportion to the earth's; and yet is almost too small to be seen in the diagram.

The moon has scarce any difference of seasons; her axis being almost perpendicular to the ecliptic. What is very singular, one half of her has no darkness at all; the earth constantly affording it a strong light in the sun's absence; while the other half has a fortnight's darkness, and a fortnight's light by turns.

Our earth is a moon to the moon, waxing and waning regularly, but appearing thirteen times as big, and affording her thirteen times as much light as she does to us. When she changes to us, the earth appears full to her; and when she is in her first quarter to us, the earth is in its third quarter to her; and *vice versa*.

But from one half of the moon, the earth is never seen at all; from the middle of the other half, it is always seen over head; turning round almost thirty times as quick as the moon does. From the circle which limits our view of the moon, only one half of the earth's side

side next her is seen; the other half being hid below the horizon of all places on that circle. To her the earth seems to be the largest body in the universe, for it appears thirteen times as large as she does to us.

The moon has no atmosphere of any visible density surrounding her; for if she had, we could never see her edge so well defined as it appears; but there would be a fort of a mist or haziness around her, which would make the stars look fainter, when they are seen through it. But observation proves, that the stars which disappear behind the moon retain their full lustre until they seem to touch her very edge, and then they vanish in a moment. The faint light which has been seen all round the moon in total eclipses of the sun, has been observed, during the time of darkness, to have its centre coincident with the centre of the sun; and was therefore much more likely to arise from the atmosphere of the sun than from that of the moon; for if it had been owing to the latter, its centre would have gone along with the moon's.

If there were seas in the moon, she could have no clouds, rains, nor storms, as we have; because she has no such atmosphere to support the vapours which occasion them. And every one knows, that when the moon is above our horizon in the night-time, she is visible, unless the clouds of our atmosphere hide her from our view, and all parts of her appear constantly with the same clear, serene, and calm aspect. But those dark parts of the moon, which were formerly thought to be seas, are now found to be only vast deep cavities, and places which reflect not the sun's light so strongly as others, having many caverns and pits, whose shadows fall within them, and are always dark on the sides next the sun, which demonstrates their being hollow; and most of these pits have little knobs like hillocks standing within them, and casting shadows also; which cause these these places to appear darker than others which have fewer or less remarkable caverns. All these appearances shew, that there are no seas in the moon; for if there were any, their surfaces would appear smooth and even, like those on the earth.

There being no atmosphere about the moon, the heavens in the day-time have the appearance of night to a lunarian who turns his back toward the sun; and when he does, the stars appear as bright to him as they do in the night to us. For it is entirely owing to our atmosphere that the heavens are bright about us in the day.

As the earth turns round its axis, the several continents, seas, and islands appear to the moon's inhabitants like so many spots of different forms and brightness, moving over its surface, but much fainter at some times than others, as our clouds cover them or leave them. By these spots, the lunarians can determine the time of the earth's diurnal motion, just as we do the motion of the sun; and perhaps they measure their time by the motion of the earth's spots, for they cannot have a truer dial.

The moon's axis is so nearly perpendicular to the ecliptic, that the sun never removes sensibly from her equator; and the obliquity of her orbit, being only  $5\frac{1}{2}$  degrees, which is next to nothing as seen from the sun, cannot cause the sun to decline sensibly from her equator. Yet her inhabitants are not destitute of means for ascer-

taining the length of their year, though their method and ours must differ. For we can know the length of our year by the return of our equinoxes; but the lunarians, having always equal day and night, must have recourse to another method; and we may suppose, they measure their year by observing when either of the poles of our earth begins to be enlightened, and the other to disappear, which is always at our equinoxes, they being conveniently situated for observing great tracks of land about our earth's poles, which are entirely unknown to us. Hence we may conclude, that the year is of the same absolute length both to the earth and moon, though very different as to the number of days; we having 365 $\frac{1}{4}$  natural days, and the lunarians only 12 $\frac{1}{2}$ ; every day and night in the moon being as long as 29 $\frac{1}{2}$  on the earth.

The moon's inhabitants on the side next the earth may as easily find the longitude of their places as we can find the latitude of ours. For the earth keeping constantly, or very nearly so, over one meridian of the moon, the east or west distances of places from that meridian are as easily found as we can find our distance from the equator by the altitude of our celestial poles.

The planet MARS is next in order, being the first above the earth's orbit. His distance from the sun is computed to be 125 millions of miles; and by travelling at the rate of 47 thousand miles every hour, as in the circle  $\sigma$ , he goes round the sun in 686 of our days and 23 hours; which is the length of his year, and contains 667 $\frac{1}{2}$  of his days, every day and night together being 40 minutes longer than with us. His diameter is 4444 miles, and by his diurnal rotation the inhabitants about his equator are carried 556 miles every hour. His quantity of light and heat is equal but to one half of ours; and the sun appears but half as big to him as to us.

This planet being but a fifth part so big as the earth, if any moon attends him, she must be very small, and has not yet been discovered by our best telescopes. He is of a fiery red colour, and by his appulses to some of the fixed stars seems to be encompassed by a very gross atmosphere. He appears sometimes gibbous, but never horned; which both shews that his orbit includes the earth's within it, and that he shines not by his own light.

To Mars, our earth and moon appear like two moons, a bigger and a less, changing places with one another, and appearing sometimes horned, sometimes half or three quarters illuminated, but never full, nor at most above one quarter of a degree from each other, although they are 240 thousand miles asunder.

Our earth appears almost as big to Mars as Venus does to us, and at Mars it is never seen above 48 degrees from the sun; sometimes it appears to pass over the disk of the sun, and so do Mercury and Venus; but Mercury can never be seen from Mars by such eyes as ours, unfitted by proper instruments; and Venus will be as seldom seen as we see Mercury. Jupiter and Saturn are as visible to Mars as to us. His axis is perpendicular to the ecliptic, and his orbit is 2 degrees inclined to it.

JUPITER, the largest of all the planets, is still higher in the system, being about 426 millions of miles from the sun; and going at the rate of 25 thousand miles every hour in his orbit, as in the circle  $\mu$ , finishes his annual

Period in eleven of our years 314 days and 12 hours. He is about 1000 times as big as the earth, for his diameter is 81,000 miles; which is more than ten times the diameter of the earth.

Jupiter turns round his axis in 9 hours 56 minutes; so that his year contains 10 thousand 470 days; and the diurnal velocity of his equatorial parts is greater than the swiftness with which he moves in his annual orbit; a singular circumstance, as far as we know. By this prodigious quick rotation, his equatorial inhabitants are carried 25 thousand 920 miles every hour, (which is 920 miles an hour more than an inhabitant of our earth's equator moves in twenty-four hours), besides the 25 thousand above mentioned, which is common to all parts of his surface, by his annual motion.

Jupiter is surrounded by faint substances, called *belts*, in which so many changes appear, that they are generally thought to be clouds; for some of them have been first interrupted and broken, and then have vanished entirely. They have sometimes been observed of different breadths, and afterwards have all become nearly of the same breadth. Large spots have been seen in these belts; and when a belt vanishes, the contiguous spots disappear with it. The broken ends of some belts have been generally observed to revolve in the same time with the spots; only those nearer the equator in somewhat less time than those near the poles, perhaps on account of the sun's greater heat near the equator, which is parallel to the belts and course of the spots. Several large spots, which appear round at one time, grow oblong by degrees, and then divide into two or three round spots. The periodical time of the spots near the equator is 9 hours 50 minutes, but of those near the poles 9 hours 56 minutes.

The axis of Jupiter is so nearly perpendicular to his orbit, that he has no sensible change of seasons; which is a great advantage, and wisely ordered by the Author of nature. For if the axis of this planet were inclined any considerable number of degrees, just so many degrees round each pole would in their turn be almost fix of our years together in darkness. And as each degree of a great circle on Jupiter contains 706 of our miles at a mean rate, it is easy to judge what vast tracts of land would be rendered uninhabitable by any considerable inclination of his axis.

The sun appears but  $\frac{1}{11}$  part so big to Jupiter as to us; and his light and heat are in the same small proportion, but compensated by the quick returns thereof, and by four moons (some larger and some less than our earth) which revolve about him; so that there is scarce any part of this huge planet but what is, during the whole night, enlightened by one or more of these moons, except his poles, whence only the farthest moons can be seen, and where their light is not wanted, because the sun constantly circulates in or near the horizon, and is very probably kept in view of both poles by the refraction of Jupiter's atmosphere, which, if it be like ours, has certainly refractive power enough for that purpose.

The orbits of these moons are represented in the scheme of the solar system by four small circles marked 1, 2, 3, 4, on Jupiter's orbit 26; but they are drawn fifty

times too large in proportion to it. The first moon, or that nearest to Jupiter, goes round him in 1 day 18 hours and 36 minutes of our time; and is 229 thousand miles distant from his centre; the second performs its revolution in three days 13 hours and 15 minutes, at 364 thousand miles distance; the third in seven days three hours and 59 minutes, at the distance of 580 thousand miles; and the fourth, or outermost, in 16 days 18 hours and 30 minutes, at the distance of one million of miles from his centre. The periods of these moons are so incommensurate to one another, that if ever they were all in a right line between Jupiter and the sun, it will require more than 3,000,000,000 years from that time to bring them all into the same right line again, as any one will find who reduces all their periods into seconds, then multiplies them into one another, and divides the product by 432; which is the highest number that will divide the product of all their periodical times, namely, 42,085,303,376,931,994,955,904 seconds, without a remainder.

The angles under which the orbits of Jupiter's moons are seen from the earth, at its mean distance from Jupiter, are as follow: The first,  $3^{\circ} 55'$ ; the second,  $6^{\circ} 14'$ ; the third,  $9^{\circ} 58'$ ; and the fourth,  $17^{\circ} 30'$ . And their distances from Jupiter, measured by his semi-diameters, are thus: The first,  $5\frac{7}{8}$ ; the second, 9; the third,  $14\frac{1}{2}$ ; and the fourth,  $25\frac{8}{10}$ . This planet, seen from its nearest moon, appears 1000 times as large as our moon does to us; waxing and waning in all her monthly shapes every 42 $\frac{1}{2}$  hours.

Jupiter's three nearest moons fall into his shadow, and are eclipsed in every revolution; but the orbit of the fourth moon is so much inclined, that it passeth by its opposition to Jupiter, without falling into his shadow, two years in every fix. By these eclipses, astronomers have not only discovered that the sun's light takes up eight minutes of time in coming to us, but they have also determined the longitudes of places on this earth with greater certainty and facility than by any other method yet known.

The difference between the equatorial and polar diameters of Jupiter is 6230 miles; for his equatorial diameter is to his polar, as 13 to 12. So that his poles are 3115 miles nearer his centre than his equator is.

Jupiter's orbit is 1 degree 20 minutes inclined to the ecliptic. His north node is in the 7th degree of Cancer, and his south node in the 7th degree of Capricorn.

SATURN, the remotest of all the planets, is about 780 millions of miles from the sun; and, travelling at the rate of 18 thousand miles every hour, as in the circle marked 5, performs its annual circuit in 29 years 167 days and 5 hours of our time; which makes only one year to that planet. Its diameter is 67,000 miles; and therefore it is near 600 times as big as the earth.

This planet is surrounded by a thin broad ring, as an artificial globe is by a horizon, fig. 5. The ring appears double when seen through a good telescope, and is represented by the figure in such an oblique view as it is generally seen. It is inclined 30 degrees to the ecliptic, and is about 21 thousand miles in breadth; which is equal to its distance from Saturn on all sides. There is

reason

reason to believe that the ring turns round its axis, because, when it is almost edge-wise to us, it appears somewhat thicker on one side of the planet than on the other; and the thickest edge has been seen on different sides at different times. But Saturn having no visible spots on his body, whereby to determine the time of his turning round his axis, the length of his days and nights, and the position of his axis, are unknown to us.

To Saturn, the sun appears only  $\frac{1}{27}$ th part so big as to us; and the light and heat he receives from the sun are in the same proportion to ours. But to compensate for the small quantity of sun-light, he has five moons, all going round him on the outside of his ring, and nearly on the same plane with it. The first, or nearest moon to Saturn, goes round him in 1 day 21 hours 19 minutes; and is 140 thousand miles from his centre: The second, in 2 days 17 hours 40 minutes; at the distance of 187 thousand miles: The third, in 4 days 12 hours 25 minutes, at 263 thousand miles distance: The fourth, in 15 days 22 hours 41 minutes, at the distance of 600 thousand miles: And the fifth or outermost, at one million 800 thousand miles from Saturn's centre, goes round him in 79 days 7 hours 48 minutes. Their orbits, in the scheme of the solar system, are represented by the small five circles, marked 1, 2, 3, 4, 5, on Saturn's orbit; but these, like the orbits of the other satellites, are drawn fifty times too large in proportion to the orbits of their primary planets.

The sun shines almost fifteen of our years together on one side of Saturn's ring without setting, and as long on the other in its turn. So that the ring is visible to the inhabitants of that planet for almost fifteen of our years, and as long invisible by turns, if its axis has no inclination to its ring: But if the axis of the planet be inclined to the ring, suppose about 30 degrees, the ring will appear and disappear once every natural day to all the inhabitants within 30 degrees of the equator, on both sides, frequently eclipsing the sun in a Saturnian day. Moreover, if Saturn's axis be so inclined to his ring, it is perpendicular to his orbit; and thereby the inconvenience of different seasons to that planet is avoided. For considering the length of Saturn's year, which is almost equal to thirty of ours, what a dreadful condition must the inhabitants of his polar regions be in, if they be half that time deprived of the light and heat of the sun? which is not their case alone, if the axis of the planet be perpendicular to the ring, for then the ring must hide the sun from vast tracks of land on each side of the equator for 13 or 14 of our years together, on the south side and north side by turns, as the axis inclines to or from the sun: The reverse of which inconvenience is another good presumptive proof of the inclination of Saturn's axis to its ring, and also of his axis being perpendicular to his orbit.

This ring, seen from Saturn, appears like a vast luminous arch in the heavens, as if it did not belong to the planet. When we see the ring most open, its shadow upon the planet is broadest; and from that time the shadow grows narrower, as the ring appears to do to us; until, by Saturn's annual motion, the sun comes to the plane of the ring, or even with its edge; which being then direct-

ed towards us, becomes invisible on account of its thinness; as shall be explained afterwards. The ring disappears twice in every annual revolution of Saturn, namely, when he is in the 19th degree both of Pisces and of Virgo. And when Saturn is in the middle between these points, or in the 15th degree either of Gemini or of Sagittarius, his ring appears most open to us; and then its longest diameter is to its shortest, as 9 to 4.

To such eyes as ours, unassisted by instruments, Jupiter is the only planet that can be seen from Saturn, and Saturn the only planet that can be seen from Jupiter. So that the inhabitants of these two planets must either see much farther than we do, or have equally good instruments to carry their sight to remote objects, if they know that there is such a body as our earth in the universe: For the earth is no bigger, seen from Jupiter, than his moons are seen from the earth; and if his large body had not first attracted our sight, and prompted our curiosity to view him with the telescope, we should never have known any thing of his moons; unless by chance we had directed the telescope toward that small part of the heavens where they were at the time of observation. And the like is true of the moons of Saturn.

The orbit of Saturn is  $2\frac{1}{2}$  degrees inclined to the ecliptic, or orbit of our earth, and intersects it in the 21st degree of Cancer and of Capricorn; so that Saturn's nodes are only 14 degrees from Jupiter's.

The quantity of light, afforded by the sun to Jupiter, being but  $\frac{1}{13}$ th part, and to Saturn only  $\frac{1}{27}$ th part, of what we enjoy, may, at first thought, induce us to believe that these two planets are entirely unfit for rational beings to dwell upon. But, that their light is not so weak as we imagine, is evident from their brightness in the night-time; and also from this remarkable phenomenon, that when the sun is so much eclipsed to us, as to have only the 40th part of his disk left uncovered by the moon, the decrease of light is not very sensible; and just at the end of darknels in total eclipses, when his western limb begins to be visible, and seems no bigger than a bit of fine silver wire, every one is surpris'd at the brightness wherewith that small part of him shines. The moon, when full, affords travellers light enough to keep them from mistaking their way; and yet, according to Dr Smith, it is equal to no more than a 90 thousandth part of the light of the sun: That is, the sun's light is 90 thousand times as strong as the light of the moon when full. Consequently, the sun gives a thousand times as much light to Saturn as the full moon does to us; and above three thousand times as much to Jupiter. So that these two planets, even without any moons, would be much more enlightened than we at first imagine; and by having so many, they may be very comfortable places of residence. Their heat, so far as it depends on the force of the sun's rays, is certainly much less than ours; to which no doubt the bodies of their inhabitants are as well adapted as ours are to the seasons we enjoy. And if we consider, that Jupiter never has any winter, even at his poles, which probably is also the case with Saturn, the cold cannot be so intense on these two planets as is generally imagined. Besides, there may be something in their nature or soil much warmer than

than in that of our earth: And we find that all our heat depends not on the rays of the sun; for if it did, we should always have the same months equally hot or cold at their annual returns. But it is far otherwise, for February is sometimes warmer than May; which must be owing to vapours and exhalations from the earth.

Every person who looks upon, and compares the systems of moons together, which belong to Jupiter and Saturn, must be amazed at the vast magnitude of these two planets, and the noble attendance they have in respect of our little earth; and can never bring himself to think, that an infinitely wise Creator should dispose of all his animals and vegetables here, leaving the other planets bare and destitute of rational creatures. To suppose that he had any view to our benefit, in creating these moons, and giving them their motions round Jupiter and Saturn; to imagine that he intended these vast bodies for any advantage to us, when he well knew that they could never be seen but by a few astronomers peeping through telescopes; and that he gave to the planets regular returns of days and nights, and different seasons to all where they would be convenient; but of no manner of service to us, except only what immediately regards our own planet the earth; to imagine that he did all this on our account, would be charging him impiously with having done much in vain; and as absurd, as to imagine that he has created a little sun and a planetary system within the shell of our earth, and intended them for our use. These considerations amount to little less than a positive proof, that all the planets are inhabited: For if they are not, why all this care in furnishing them with so many moons, to supply those with light which are at the greater distances from the sun? Do we not see, that the farther a planet is from the sun, the greater apparatus it has for that purpose? save only Mars, which being but a small planet, may have moons too small to be seen by us. We know that the earth goes round the sun, and turns round its own axis, to produce the vicissitudes of summer and winter by the former, and of day and night by the latter motion, for the benefit of its inhabitants. May we not then fairly conclude, by parity of reason, that the end and design of all the other planets is the same? and is not this agreeable to the beautiful harmony which exists throughout the universe?

In fig. 2. we have a view of the proportional breadth of the sun's face or disk, as seen from the different planets. The sun is represented, N° 1, as seen from Mercury; N° 2, as seen from Venus; N° 3, as seen from the earth; N° 4, as seen from Mars; N° 5, as seen from Jupiter; and N° 6, as seen from Saturn.

Let the circle *B*, (fig. 3.) be the sun as seen from any planet, at a given distance; to another planet, at double that distance, the sun will appear just of half that breadth, as *A*, which contains only one fourth part of the area, or surface of *B*. For all circles, as well as square surfaces, are to one another as the squares of their diameters. Thus, (fig. 4.) the square *A* is just half as broad as the square *B*; and yet it is plain to sight, that *B* contains four times as much surface as *A*. Hence, by comparing the diameters of the above circles (fig. 2.) together, it will be found, that, in round numbers, the sun appears

7 times larger to Mercury than to us, 90 times larger to us than to Saturn, and 630 times as large to Mercury as to Saturn.

In fig. 5. we have a view of the bulks of the planets in proportion to each other, and to a supposed globe of two feet diameter for the sun. The earth is 27 times as big as Mercury, very little bigger than Venus, five times as big as Mars; but Jupiter is 1049 times as big as the earth; Saturn 586 times as big, exclusive of his ring; and the sun is 877 thousand 650 times as big as the earth. If the planets in this figure were set at their due distances from a sun of two feet diameter, according to their proportional bulks, as in our system, Mercury would be 28 yards from the sun's centre; Venus 51 yards 1 foot; the earth 70 yards 2 feet; Mars 107 yards 2 feet; Jupiter 370 yards 2 feet; and Saturn 760 yards two feet; the comet of the year 1680, at its greatest distance, 10 thousand 760 yards. In this proportion, the moon's distance from the centre of the earth would be only  $7\frac{1}{2}$  inches.

To assist the imagination in forming an idea of the vast distances of the sun, planets, and stars, let us suppose, that a body projected from the sun should continue to fly with the swiftness of a cannon-ball, *i. e.* 480 miles every hour; this body would reach the orbit of Mercury, in 7 years 221 days; of Venus, in 14 years 8 days; of the earth, in 19 years 91 days; of Mars, in 29 years 85 days; of Jupiter, in 100 years 280 days; of Saturn, in 184 years 240 days; to the comet of 1680, at its greatest distance from the sun, in 2660 years; and to the nearest fixed stars, in about 7 million 600 thousand years.

As the earth is not the centre of the orbits in which the planets move, they come nearer to it and go farther from it, and at different times; on which account they appear bigger and less by turns. Hence, the apparent magnitudes of the planets are not always a certain rule to know them by.

Under fig. 3. are the names and characters of the twelve signs of the zodiac, which the reader should be perfectly well acquainted with, so as to know the characters without seeing the names. Every sign contains 30 degrees, as in the circle bounding the solar system; to which the characters of the signs are set in their proper places.

The COMETS are solid opaque bodies, with long transparent trains or tails, issuing from that side which is turned away from the sun. They move about the sun in very excentric ellipses; and are of a much greater density than the earth; for some of them are heated in every period to such a degree, as would vitrify or dissipate any substance known to us. Sir Isaac Newton computed the heat of the comet which appeared in the year 1680, when nearest the sun, to be 2000 times hotter than red-hot iron; and that, being thus heated, it must retain its heat until it comes round again, although its period should be more than twenty thousand years; and it is computed to be only 575.

Part of the paths of three comets are delineated in the scheme of the solar system, and the years marked in which they made their appearance. It is believed that

*[Faint, illegible handwritten text]*

that there are at least 21 comets belonging to our system, moving in all sorts of directions; and all those which have been observed, have moved through the ethereal regions and the orbits of the planets without suffering the least sensible resistance in their motions; which plainly proves that the planets do not move in solid orbs. Of all the comets, the periods of the above mentioned three only are known with any degree of certainty. The first of these comets appeared in the years 1531, 1607, and 1682; was expected to appear again in the year 1758, and every 75th year afterwards. The second of them appeared in 1532 and 1661, and may be expected to return in 1789, and every 129th year afterwards. The third, having last appeared in 1680, and its period being no less than 575 years, cannot return until the year 2255. This comet, at its greatest distance, is about 11 thousand two hundred millions of miles from the sun; and at its least distance from the sun's centre, which is 450,000 miles, is within less than a third part of the sun's semidiameter from his surface. In that part of its orbit which is nearest the sun, it flies with the amazing swiftness of 880,000 miles in an hour; and the sun, as seen from it, appears an hundred degrees in breadth, consequently 40 thousand times as large as he appears to us. The astonishing length that this comet runs out into empty space, suggests to our minds an idea of the vast distance between the sun and the nearest fixed stars; of whose attractions all the comets must keep clear to return periodically, and go round the sun; and it shews us also, that the nearest stars, which are probably those that seem the largest, are as big as our sun, and of the same nature with him; or otherwise they could not appear so large and bright to us as they do at such an immense distance.

The extreme heat, the dense atmosphere, the gross vapours, the chaotic state of the comets, seem at first sight to indicate them altogether unfit for the purposes of animal life, and a most miserable habitation for rational beings; and therefore some are of opinion that they are so many hells for tormenting the damned with perpetual vicissitudes of heat and cold. But when we consider, on the other hand, the infinite power and goodness of the Deity, the latter inclining, and the former enabling him to make creatures suited to all states and circumstances; that matter exists only for the sake of intelligent beings; and that where-ever we find it, we always find it pregnant with life, or necessarily subservient thereto; the numberless species, the astonishing diversity of animals in air, earth, water, and even on other animals; every blade of grass, every leaf, every fluid swarming with life; and every one of these enjoying such gratifications as the nature and state of each requires: When we reflect moreover, that some centuries ago, till experience undeceived us, a great part of the earth was judged uninhabitable, the torrid zone by reason of excessive heat, and the frigid zones because of their intolerable cold; it seems highly probable, that such numerous and large masses of durable matter as the comets are, however unlike they be to our earth, are not destitute of beings capable of contemplating with wonder, and acknowledging with gratitude,

the wisdom, symmetry, and beauty of the creation; which is more plainly to be observed in their extensive tour through the heavens, than in our more confined circuit. If farther conjecture is permitted, may we not suppose them instrumental in recruiting the expanded fuel of the sun, and supplying the exhausted moisture of the planets? However difficult it may be, circumstanced as we are, to find out their particular destination, this is an undoubted truth, that where-ever the Deity exerts his power, there he also manifests his wisdom and goodness.

The solar system here described is not a late invention, for it was known and taught by the wife Samian philosopher Pythagoras, and others among the ancients; but in latter times was lost, till the 15th century, when it was again restored by the famous Polish philosopher, Nicholas Copernicus, who was born at Thorn in the year 1473. In this he was followed by the greatest mathematicians and philosophers that have since lived; as Kepler, Galileo, Descartes, Gassendus, and Sir Isaac Newton; the last of whom has established this system on such a foundation of mathematical and physical demonstration, as can never be shaken.

In the Ptolemaean system, the earth was supposed to be fixed in the centre of the universe; and that the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn, moved round the earth: Above the planets this hypothesis placed the firmament of stars, and then the two crystalline spheres; all which were included in and received motion from the *primum mobile*, which constantly revolved about the earth in 24 hours from east to west. But as this rude scheme was found incapable to stand the test of art and observation, it was soon rejected by all true philosophers.

The Tychonic system succeeded the Ptolemaean, but was never so generally received. In this the earth was supposed to stand still in the centre of the universe or firmament of stars, and the sun to revolve about it every 24 hours; the planets, Mercury, Venus, Mars, Jupiter, and Saturn, going round the sun in the times already mentioned. But some of Tycho's disciples supposed the earth to have a diurnal motion round its axis, and the sun, with all the above planets, to go round the earth in a year; the planets moving round the sun in the foresaid times. This hypothesis, being partly true, and partly false, was embraced by few; and soon gave way to the only true and rational scheme, restored by Copernicus, and demonstrated by Sir Isaac Newton.

### CHAP. III. *The Phenomena of the Heavens, as seen from different Parts of the Earth.*

WE are kept to the earth's surface on all sides by the power of its central attraction; which, laying hold of all bodies according to their densities or quantities of matter, without regard to their bulks, constitutes what we call their *weight*. And having the sky over our heads, go where we will, and our feet towards the centre of the earth, we call it *up* over our heads, and *down* under our feet: Although the same right line which is *down* to us, if continued through, and beyond the opposite side of the

earth, would be *up* to the inhabitants on the opposite side. For, the inhabitants *n, i, e, m, s, o, q, l*, (Plate XXXIX. fig. 6.) stand with their feet towards the earth's centre *C*; and have the same figure of sky, *N, I, E, M, S, O, Q, L* over their heads. Therefore the point *S* is as directly upward to the inhabitant (*s*) on the south pole, as *N* is to the inhabitant *n* on the north pole; so is *E* to the inhabitant *e*, supposed to be on the north end of Peru; and *Q* to the opposite inhabitant *q* on the middle of the island of Sumatra. Each of these observers is surpris'd that his opposite or antipode can stand with his head hanging downwards. But let either go to the other, and he will tell him that he stood as upright and firm upon the place where he was, as he now stands where he is. To all these observers, the sun, moon, and stars, seem to turn round the points *N* and *S*, as the poles of the fixed axis *NCS*; because the earth does really turn round the mathematical line *nC's* as round an axis, of which *n* is the north pole, and *Q* the south pole. The inhabitant *U* (Plate XL. fig. 1.) affirms that he is on the uppermost side of the earth, and wonders how another at *L* can stand on the undermost side with his head hanging downwards. But *U*, in the mean time, forgets that in twelve hours time he will be carried half round with the earth, and then be in the very situation that *L* now is, although as far from him as before. And yet, when *U* comes there, he will find no difference as to his manner of standing; only he will see the opposite half of the heavens, and imagine the heavens to have gone half round the earth.

When we see a globe hung up in a room, we cannot help imagining it to have an upper and an under side, and immediately form a like idea of the earth; from whence we conclude, that it is as impossible for people to stand on the under side of the earth, as for pebbles to lie on the under side of a common globe, which instantly fall down from it to the ground; and well they may, because the attraction of the earth, being greater than the attraction of the globe, pulls them away. Just so would be the case with our earth, if it were placed near a globe much bigger than itself, such as Jupiter; for then it would really have an upper and an under side, with respect to that large globe; which, by its attraction, would pull away every thing from the side of the earth next to it; and only those on the top of the opposite or upper side could remain upon it. But there is no larger globe near enough our earth to overcome its central attraction; and therefore it has no such thing as an upper and an under side; for all bodies, on or near its surface, even to the moon, gravitate towards its centre.

The earth's bulk is but a point, as that at *C*, compared to the heavens; and therefore every inhabitant upon it, let him be where he will, as at *n, e, m, s*, &c. sees half of the heavens. The inhabitant *n*, on the north pole of the earth, constantly sees the hemisphere *ENQ*; and having the north pole *N* of the heavens just over his head, his horizon coincides with the celestial equator *ECQ*. Therefore, all the stars in the northern hemisphere *ENQ*, between the equator and north pole, appear to turn round the line *NC*, moving parallel to the horizon. The equatorial stars keep in the horizon,

and all those in the southern hemisphere *ESQ* are invisible. The like phenomena are seen by the observer (*s*) on the south pole, with respect to the hemisphere *ESQ*; and to him the opposite hemisphere is always invisible. Hence, under either pole, only half of the heavens is seen; for those parts which are once visible never set, and those which are once invisible never rise. But the ecliptic *YCX*, or orbit which the sun appears to describe once a year by the earth's annual motion, has the half *YC* constantly above the horizon *ECQ* of the north pole *n*; and the other half *CX* always below it. Therefore, whilst the sun describes the northern half *YC* of the ecliptic, he neither sets to the north pole, nor rises to the south; and whilst he describes the southern half *CX*, he neither sets to the south pole nor rises to the north. The same things are true with respect to the moon; only with this difference, that as the sun describes the ecliptic but once a year, he is for half that time visible to each pole in its turn, and as long invisible; but as the moon goes round the ecliptic in 27 days 8 hours, she is only visible for 13 days 16 hours, and as long invisible to each pole by turns. All the planets likewise rise and set to the poles, because their orbits are cut obliquely in halves by the horizon of the poles. When the sun (in his apparent way from *X*) arrives at *C*, which is on the 20th of March, he is just rising to an observer *n* on the north pole, and setting to another at *s* on the south pole. From *C* he rises higher and higher in every apparent diurnal revolution, till he comes to the highest point of the ecliptic *y*, on the 21st of June, and then he is at his greatest altitude, which is  $23\frac{1}{2}$  degrees, or the arc *Ey*, equal to his greatest north declination; and from thence he seems to descend gradually in every apparent circumvolution, till he sets at *C* on the 23d of September; and then he goes to exhibit the like appearances at the south pole for the other half of the year. Hence, the sun's apparent motion round the earth is not in parallel circles, but in spirals; such as might be represented by a thread wound round a globe from tropic to tropic; the spirals being at some distance from one another about the equator, and gradually nearer to each other as they approach toward the tropics.

If the observer be any where on the terrestrial equator *eCq*, as suppose at *e*, he is in the plane of the celestial equator; or under the equinoctial *ECQ*; and the axis of the earth *nC's* is coincident with the plane of his horizon, extended out to *N* and *S*, the north and south poles of the heavens. As the earth turns round the line *NCS*, the whole heavens *MOLI* seem to turn round the same line, but the contrary way. It is plain that this observer has the celestial poles constantly in his horizon; and that his horizon cuts the diurnal paths of all the celestial bodies perpendicularly and in halves. Therefore the sun, planets and stars, rise every day, and ascend perpendicularly above the horizon for six hours; and, passing over the meridian, descend in the same manner for the six following hours; then set in the horizon, and continue twelve hours below it. Consequently at the equator the days and nights are equally long throughout the year. When the observer is in the situation *e*, he sees the hemisphere *SEN*; but in twelve hours after, he

he is carried half round the earth's axis to  $q$ , and then the hemisphere  $SQN$  becomes visible to him; and  $SEN$  disappears. Thus we find, that to an observer at either of the poles, one half of the sky is always visible, and the other half never seen; but to an observer on the equator, the whole sky is seen every 24 hours.

The figure here referred to, represents a celestial globe of glass, having a terrestrial globe within it; after the manner of the glass-sphere invented by Dr Long, Lowndes's professor of astronomy in Cambridge.

If a globe be held sidewise to the eye, at some distance, and so that neither of its poles can be seen, the equator  $ECQ$ , and all circles parallel to it, as  $DL$ ,  $yzx$ ,  $abX$ ,  $MO$ , &c. will appear to be straight lines, as projected in this figure; which is requisite to be mentioned here, because we shall have occasion to call them circles in the following articles of this chapter.

Let us now suppose that the observer has gone from the equator  $e$  towards the north pole  $n$ , and that he stops at  $i$ , from which place he then sees the hemisphere  $MEINL$ ; his horizon  $MCL$  having shifted as many degrees from the celestial poles  $N$  and  $S$ , as he has travelled from under the equinoctial  $E$ . And as the heavens seem constantly to turn round the line  $NCS$  as an axis, all those stars which are not so many degrees from the north pole  $N$  as the observer is from the equinoctial, namely, the stars north of the dotted parallel  $DL$ , never set below the horizon; and those which are south of the dotted parallel  $MO$  never rise above it. Hence the former of these two parallel circles is called the circle of perpetual apparition, and the latter the circle of perpetual occultation; but all the stars between these two circles rise and set every day. Let us imagine many circles to be drawn between these two, and parallel to them; those which are on the north side of the equinoctial will be unequally cut by the horizon  $MCL$ , having larger portions above the horizon than below it; and the more so, as they are nearer to the circle of perpetual apparition; but the reverse happens to those on the south side of the equinoctial, whilst the equinoctial is divided in two equal parts by the horizon. Hence, by the apparent turning of the heavens, the northern stars describe greater arcs or portions of circles above the horizon than below it; and the greater, as they are farther from the equinoctial towards the circle of perpetual apparition; whilst the contrary happens to all stars south of the equinoctial; but those upon it describe equal arcs both above and below the horizon, and therefore they are just as long above as below it.

An observer on the equator has no circle of perpetual apparition or occultation, because all the stars, together with the sun and moon, rise and set to him every day. But, as a bare view of the figure is sufficient to shew that these two circles  $DL$  and  $MO$  are just as far from the poles  $N$  and  $S$  as the observer at  $i$  (or one opposite to him at  $o$ ) is from the equator  $ECQ$ , it is plain, that if an observer begins to travel from the equator towards either pole, his circle of perpetual apparition rises from that pole as from a point, and his circle of perpetual occultation from the other. As the observer advances toward the nearer pole, these two circles enlarge their dia-

eters, and come nearer one another, until he comes to the pole; and then they meet and coincide in the equinoctial. On different sides of the equator, to observers at equal distances from it, the circle of perpetual apparition to one is the circle of perpetual occultation to the other.

Because the stars never vary their distances from the equinoctial, so as to be sensible in an age, the lengths of their diurnal and nocturnal arcs are always the same to the same places on the earth. But as the earth goes round the sun every year in the ecliptic, one half of which is on the north side of the equinoctial, and the other half on its south side, the sun appears to change his place every day, so as to go once round the circle  $YCX$  every year. Therefore whilst the sun appears to advance northward, from having described the parallel  $abX$  touching the ecliptic in  $X$ , the days continually lengthen and the nights shorten, until he comes to  $y$  and describes the parallel  $yzx$ , when the days are at the longest and the nights at the shortest; for then, as the sun goes no farther northward, the greatest portion that is possible of the diurnal arc  $yz$  is above the horizon of the inhabitant  $i$ , and the smallest portion  $zx$  below it. As the sun declines southward from  $y$ , he describes smaller diurnal and greater nocturnal arcs, or portions of circles every day; which causeth the days to shorten and nights to lengthen, until he arrives again at the parallel  $abX$ ; which having only the small part  $ab$  above the horizon  $MCL$ , and the great part  $bX$  below it, the days are at the shortest and the nights at the longest; because the sun recedes no farther south, but returns northward as before. It is easy to see that the sun must be in the equinoctial  $ECQ$  twice every year, and then the days and nights are equally long; that is, 12 hours each. These hints serve at present to give an idea of some of the appearances resulting from the motions of the earth; which will be more particularly described in the tenth chapter.

To an observer at either pole, the horizon and equinoctial are coincident; and the sun and stars seem to move parallel to the horizon; therefore, such an observer is said to have a parallel position of the sphere. To an observer any where between either pole and equator, the parallels described by the sun and stars are cut obliquely by the horizon, and therefore he is said to have an oblique position of the sphere. To an observer any where on the equator, the parallels of motion, described by the sun and stars, are cut perpendicularly, or at right angles, by the horizon; and therefore he is said to have a right position of the sphere. And these three are all the different ways that the sphere can be posited to all people on the earth.

#### CHAP. IV. *The Phenomena of the Heavens as seen from different parts of the Solar System.*

So vastly great is the distance of the starry heavens; that if viewed from any part of the solar system, or even  
many

many millions of miles beyond it, its appearance would be the very same to us. The sun and stars would all seem to be fixed on one concave surface, of which the spectator's eye would be the centre. But the planets being much nearer than the stars, their appearances will vary considerably with the place from which they are viewed.

If the spectator is at rest without their orbits, the planets will seem to be at the same distance as the stars, but continually changing their places with respect to the stars and to one another, assuming various phases of increase and decrease like the moon; and, notwithstanding their regular motions about the sun, will sometimes appear to move quicker, sometimes slower, be as often to the west as to the east of the sun, and at their greatest distances seem quite stationary. The duration, extent, and distance of those points in the heavens where these digressions begin and end, would be more or less, according to the respective distances of the several planets from the sun; but in the same planet they would continue invariably the same at all times; like pendulums of unequal lengths oscillating together, the shorter move quick and go over a small place, the longer move slow and go over a large space. If the observer is at rest within the orbits of the planets, but not near the common centre, their apparent motions will be irregular, but less so than in the former case. Each of the several planets will appear larger and less by turns, as they approach nearer or recede farther from the observer, the nearest varying most in their size. They will also move quicker or slower with regard to their fixed stars, but will never be retrograde or stationary.

If an observer in motion views the heavens, the same apparent irregularities will be observed, but with some variation resulting from its own motion. If he is on a planet which has a rotation on its axis, not being sensible of his own motion, he will imagine the whole heavens, sun, planets, and stars, to revolve about him in the same time that his planet turns round, but the contrary way, and will not be easily convinced of the deception. If his planet moves round the sun, the same irregularities and aspects as above mentioned will appear in the motions of the other planets; and the sun will seem to move among the fixed stars or signs, directly opposite to those in which his planet moves, changing its place every day as he does. In a word, whether our observer be in motion or at rest, whether within or without the orbits of the planets, their motions will seem irregular, intricate, and perplexed, unless he is in the centre of the system; and from thence the most beautiful order and harmony will be seen by him.

The sun being the centre of all the planets motions, the only place from which their motions could be truly seen is the sun's centre; where the observer, being supposed not to turn round with the sun, (which, in this case, we must imagine to be a transparent body), would see all the stars at rest, and seemingly equidistant from him. To such an observer, the planets would appear to move among the fixed stars, in a simple, regular, and uniform manner; only, that as in equal times they describe equal areas, they would describe spaces somewhat

unequal, because they move in elliptic orbits. Their motions would also appear to be what they are in fact, the same way round the heavens, in paths which cross at small angles in different parts of the heavens, and then separate a little from one another: so that if the solar astronomer should make the path or orbit of any one planet a standard, and consider it as having no obliquity, he would judge the paths of all the rest to be inclined to it, each planet having one half of its path on one side, and the other half on the opposite side of the standard path or orbit. And if he should ever see all the planets start from a conjunction with each other, Mercury would move so much faster than Venus, as to overtake her again (though not in the same point of the heavens) in a quantity of time almost equal to 145 of our days and nights, or, as we commonly call them, *natural days*, which include both the days and nights; Venus would move so much faster than the earth, as to overtake it again in 585 natural days; the earth so much faster than Mars, as to overtake him again in 778 such days; Mars so much faster than Jupiter, as to overtake him again in 817 such days; and Jupiter so much faster than Saturn, as to overtake him again in 7236 days, all of our time.

But as our solar astronomer could have no idea of measuring the courses of the planets by our days, he would probably take the period of Mercury, which is the quickest moving planet, for a measure to compare the periods of the others by. As all the stars would appear quiescent to him, he would never think that they had any dependence upon the sun; but would naturally imagine that the planets have, because they move round the sun. And it is by no means improbable, that he would conclude those planets whose periods are quickest, to move in orbits proportionably less than those do which make slower circuits. But being destitute of a method for finding their parallaxes, or, more properly speaking, as they could have no parallax to him, he could never know any thing of their real distances or magnitudes. Their relative distances he might perhaps guess at by their periods, and from thence infer something of truth concerning their relative bulks, by comparing their apparent bulks with one another. For example, Jupiter appearing bigger to him than Mars, he would conclude it to be much bigger in fact; because it appears so, and must be farther from him on account of its longer period. Mercury and the earth would seem much of the same bulk; but, by comparing its period with the earth's, he would conclude that the earth is much farther from him than Mercury, and consequently that it must be really larger, though apparently of the same bulk; and so of the rest. And as each planet would appear somewhat larger in one part of its orbit than in the opposite, and to move quickest when it seems biggest, the observer would be at no loss to determine that all the planets move in orbits, of which the sun is not precisely in the centre.

The apparent magnitudes of the planets continually change as seen from the earth; which demonstrates that they approach nearer to it, and recede farther from it by turns. From these phenomena, and their apparent motions among the stars, they seem to describe looped curves which never return into themselves, Venus's path excepted.

excepted. And if we were to trace out all their apparent paths, and put the figures of them together in one diagram, they would appear so anomalous and confused, that no man in his senses could believe them to be representations of their real paths; but would immediately conclude, that such apparent irregularities must be owing to some optic illusions: And after a good deal of inquiry, he might perhaps be at a loss to find out the true cause of these inequalities; especially if he were one of those who would rather, with the greatest justice, charge frail man with ignorance, than the Almighty with being the author of such confusion.

Dr Long, in his first volume of Astronomy, has given us figures of the apparent paths of all the planets separately from Cassini; from them Mr Ferguson first thought of attempting to trace some of them by an orrery, that shews the motions of the sun, Mercury, Venus, the earth, and moon, according to the Copernican system. Having taken off the sun, Mercury, and Venus, he put black lead pencils in their places, with the points turned upward, and fixed a circular sheet of pasteboard so that the earth kept constantly under its centre in going round the sun, and the pasteboard kept it parallelism. Then, pressing gently with one hand upon the pasteboard to make it touch the three pencils, with the other hand he turned the winch that moves the whole machinery: and as the earth together with the pencils in the places of Mercury and Venus had their proper motions round the sun's pencils, which kept at rest in the centre of the machine, all the three pencils described a diagram, from which fig. 2. of Plate XL. is truly copied in a smaller size. As the earth moved round the sun, the sun's pencil described the dotted circle of months, whilst Mercury's pencil drew the curve with the greatest number of loops, and Venus's that with the fewest. In their inferior conjunctions they come as much nearer the earth, or within the circle of the sun's apparent motion round the heavens, as they go beyond it in their superior conjunctions. On each side of the loops they appear stationary; in that part of each loop next the earth retrograde; and in all the rest of their paths direct.

If Cassini's figures of the paths of the sun, Mercury, and Venus, were put together, the figure as above traced out would be exactly like them. It represents the sun's apparent motion round the ecliptic, which is the same every year; Mercury's motion for seven years, and Venus's for eight; in which time Mercury's path makes 23 loops, crossing itself so many times, and Venus's only five. In eight years, Venus falls so nearly into the same apparent path again, as to deviate very little from it in some ages; but in what number of years Mercury and the rest of the planets would describe the same visible paths over again, it is hard to determine. Having finished the above figure of the paths of Mercury and Venus, he put the ecliptic round them as in the Doctor's book, and added the dotted lines from the earth to the ecliptic for shewing Mercury's apparent or geocentric motion therein for one year; in which time his path makes three loops, and goes on a little farther; which shews that he has three inferior, and as many superior conjunctions with the sun in that time; and also that he

is six times stationary, and thrice retrograde. Let us now trace his motion for one year in the figure.

In Plate XL. fig. 2. suppose Mercury to be setting out from *A* towards *B*, (between the earth and left hand corner of the Plate), and as seen from the earth, his motion will then be direct, or according to the order of the signs. But when he comes to *B*, he appears to stand still in the 23<sup>d</sup> degree of  $\Upsilon$  at *F*, as shewn by the line *BF*. Whilst he goes from *B* to *C*, the line *BF*, supposed to move with him, goes backward from *F* to *E*, or contrary to the order of signs; and when he is at *C*, he appears stationary at *E*, having gone back  $11\frac{1}{2}$  degrees. Now, suppose him stationary on the first of January at *C*, on the 10th thereof he will appear in the heavens as at 20, near *F*; on the 20th, he will be seen as at *G*; on the 31st, at *H*; on the 10th of February, at *I*; on the 20th, at *K*; and on the 28th, at *L*; as the dotted lines shew, which are drawn through every tenth day's motion in his looped path, and continued to the ecliptic. On the 10th of March, he appears at *M*; on the 20th, at *N*; and on the 31st, at *O*. On the 10th of April, he appears stationary at *P*; on the 20th, he seems to have gone back again to *O*; and on the 30th, he appears stationary at *Q*, having gone back  $11\frac{1}{2}$  degrees. Thus Mercury seems to go forward 4 signs 11 degrees, or 131 degrees, and to go back only 11 or 12 degrees, at a mean rate. From the 30th of April to the 10th of May, he seems to move from *Q* to *R*; and on the 20th, he is seen at *S*, going forward in the same manner again, according to the order of letters; and backward when they go back; which it is needless to explain any farther, as the reader can trace him out so easily through the rest of the year. The same appearances happen in Venus's motion; but as she moves slower than Mercury, there are longer intervals of time between them.

#### CHAP. V. *The physical Causes of the Motions of the Planets. The Excentricities of their Orbits. The Times in which the Action of Gravity alone would bring them to the Sun.*

FROM the uniform projectile motion of bodies in straight lines, and the universal power of attraction which draws them off from these lines, the curvilinear motions of all the planets arise. In Plate XL. fig. 3. if the body *A* be projected along the right line *ABX*, in open space, where it meets with no resistance, and is not drawn aside by any other power, it will for ever go on with the same velocity, and in the same direction. For the force which moves it from *A* to *B* in any given time, will carry it from *B* to *X* in as much more time, and so on, there being nothing to obstruct or alter its motion. But if when this projectile force has carried it, suppose to *B*, the body *S* begins to attract it, with a power duly adjusted, and perpendicular to its motion at *B*, it will then be drawn from the straight line *ABX*, and forced to revolve about *S* in the circle *BTU*. When the body *A* comes to *U*, or any other part of its orbit, if the small body *u*, within the sphere

of  $U$ 's attraction, be projected as in the right line  $Z$ , with a force perpendicular to the attraction of  $U$ , then  $u$  will go round  $U$  in the orbit  $W$ , and accompany it in its whole course round the body  $S$ . Here  $S$  may represent the sun,  $U$  the earth, and  $u$  the moon.

If a planet at  $B$  gravitates, or is attracted toward the sun so as to fall from  $B$  to  $y$  in the time that the projectile force would have carried it from  $B$  to  $X$ ; it will describe the curve  $BY$  by the combined action of these two forces, in the same time that the projectile force singly would have carried it from  $B$  to  $X$ , or the gravitating power singly have caused it to descend from  $B$  to  $y$ ; and these two forces being duly proportioned, and perpendicular to one another, the planet obeying them both, will move in the circle  $BYTU$ .

But if, whilst the projectile force carries the planet from  $B$  to  $b$ , the sun's attraction (which constitutes the planet's gravitation) should bring it down from  $B$  to  $1$ , the gravitating power would then be too strong for the projectile force, and would cause the planet to describe the curve  $BC$ . When the planet comes to  $C$ , the gravitating power (which always increases as the square of the distance from the sun  $S$  diminishes) will be yet stronger for the projectile force; and by conspiring in some degree therewith, will accelerate the planet's motion all the way from  $C$  to  $K$ , causing it to describe the arcs,  $BC$ ,  $CD$ ,  $DE$ ,  $EF$ , &c. all in equal times. Having its motion thus accelerated, it thereby gains so much centrifugal force, or tendency to fly off at  $K$  in the line  $Kk$ , as overcomes the sun's attraction; and the centrifugal force being too great to allow the planet to be brought nearer the sun, or even to move round him in the circle  $Klmn$ , &c. it goes off, and ascends in the curve  $KLMN$ , &c. its motion decreasing as gradually from  $K$  to  $B$ , as it increased from  $B$  to  $K$ , because the sun's attraction acts now against the planet's projectile motion just as much as it acted with it before. When the planet has got round to  $B$ , its projectile force is as much diminished from its mean state about  $G$  or  $N$ , as it was augmented at  $K$ ; and so, the sun's attraction being more than sufficient to keep the planet from going off at  $B$ , it describes the same orbit over again, by virtue of the same forces or powers.

A double projectile force will always balance a quadruple power of gravity. Let the planet at  $B$  have twice as great an impulse from thence towards  $X$ , as it had before; that is, in the same length of time that it was projected from  $B$  to  $b$ , as in the last example, let it now be projected from  $B$  to  $c$ , and it will require four times as much gravity to retain it in its orbit; that is, it must fall as far as from  $B$  to  $4$  in the time that the projectile force would carry it from  $B$  to  $c$ , otherwise it could not describe the curve  $BD$ , as is evident by the figure. But in as much time as the planet moves from  $B$  to  $C$  in the higher part of its orbit, it moves from  $I$  to  $K$ , or from  $K$  to  $L$ , in the lower part thereof; because, from the joint action of these two forces, it must always describe equal areas in equal times, throughout its annual course. These areas are represented by the triangles  $BSC$ ,  $CSD$ ,  $DSE$ ,  $ESF$ , &c. whose contents are equal to one another, quite round the figure.

As the planets approach nearer the sun, and recede farther from him in every revolution, there may be some difficulty in conceiving the reason why the power of gravity, when it once gets the better of the projectile force, does not bring the planets nearer and nearer the sun in every revolution, till they fall upon and unite with him; or why the projectile force, when it once gets the better of gravity, does not carry the planets farther and farther from the sun, till it removes them quite out of the sphere of his attraction, and causes them to go on in straight lines for ever afterward. But by considering the effects of these powers, this difficulty will be removed. Suppose a planet at  $B$  to be carried by the projectile force as far as from  $B$  to  $b$ , in the time that gravity would have brought it down from  $B$  to  $1$ ; by these two forces it will describe the curve  $BC$ . When the planet comes down to  $K$ , it will be but half as far from the sun  $S$  as it was at  $B$ ; and therefore, by gravitating four times as strongly towards him, it would fall from  $K$  to  $V$  in the same length of time that it would have fallen from  $B$  to  $1$  in the higher part of its orbit, that is, through four times as much space; but its projectile force is then so much increased at  $K$ , as would carry it from  $K$  to  $k$  in the same time; being double of what it was at  $B$ , and is therefore too strong for the gravitating power, either to draw the planet to the sun, or cause it to go round him in the circle  $Klmn$ , &c. which would require its falling from  $K$  to  $w$ , through a greater space than gravity can draw it, whilst the projectile force is such as would carry it from  $K$  to  $k$ ; and therefore the planet ascends in its orbit  $KLMN$ , decreasing in its velocity, for the cause already assigned.

The orbits of all the planets are ellipses, very little different from circles; but the orbits of the comets are very long ellipses, and the lower focus of them all is in the sun. If we suppose the mean distance (or middle between the greatest and least) of every planet and comet from the sun to be divided into 1000 equal parts, the eccentricities of their orbits, both in such parts and in English miles, will be as follow. Mercury's 210 parts, or 6,720,000 miles; Venus's, 7 parts, or 413,000 miles; the earth's, 17 parts, or 1,377,000 miles; Mars's, 93 parts, or 11,439,000 miles; Jupiter's, 48 parts, or 20,352,000 miles; Saturn's, 55 parts, or 42,735,000 miles. Of the nearest of the three fore-mentioned comets, 1,458,000 miles; of the middlemost, 2,025,000,000 miles; and of the outermost, 6,600,000,000.

By the laws of gravity and the projectile force, bodies will move in all kinds of ellipses, whether long or short, if the spaces they move in be void of resistance; only those which move in the longer ellipses, have so much the less projectile force impressed upon them in the higher parts of their orbits; and their velocities in coming down towards the sun are so prodigiously increased by his attraction, that their centrifugal forces in the lower parts of their orbits are so great, as to overcome the sun's attraction there, and cause them to ascend again towards the higher parts of their orbits; during which time, the sun's attraction acting so contrary to the motions of those bodies, causes them to move slower and slower, until their

their projectile forces are diminished almost to nothing; and then they are brought back again by the sun's attraction, as before.

If the projectile forces of all the planets and comets were destroyed at their mean distances from the sun, their gravities would bring them down so, as that Mercury would fall to the sun in 15 days 13 hours; Venus, in 39 days 17 hours; the earth or moon, in 64 days 10 hours; Mars, in 121 days; Jupiter, in 290; and Saturn, in 767. The nearest comet, in 13 thousand days; the middlemost, in 23 thousand days; and the outermost, in 66 thousand days. The moon would fall to the earth in 4 days 20 hours: Jupiter's first moon would fall to him in 7 hours; his second, in 15; his third, in 30; and his fourth, in 71 hours: Saturn's first moon would fall to him in 8 hours; his second, in 12; his third, in 19; his fourth, in 68; and the fifth, in 336. A stone would fall to the earth's centre, if there were an hollow passage, in 21 minutes or seconds. Mr Whiston gives the following rule for such computations. "It is demonstrable, that half the period of any planet, when it is diminished in the sesquialteral proportion of the number 1 to the number 2, or nearly in the proportion of 1000 to 2828, is the time that it would fall to the centre of its orbit." This proportion is, when a quantity or number contains another once and a half as much more.

The quick motions of the moons of Jupiter and Saturn round their primaries, demonstrate that these two planets have stronger attractive powers than the earth has: for the stronger that one body attracts another, the greater must be the projectile force, and consequently the quicker must be the motion of that other body to keep it from falling to its primary or central planet. Jupiter's second moon is 124 thousand miles farther from Jupiter than our moon is from us; and yet this second moon goes almost eight times round Jupiter whilst our moon goes only once round the earth. What a prodigious attractive power must the sun then have, to draw all the planets and satellites of the system towards him; and what an amazing power must it have required to put all these planets and moons into such rapid motions at first!

#### CHAP. VI. *Reasons why the Sun, Moon, and Stars, when rising or setting, appear larger than when they rise higher in the Heavens.*

THE sun and moon appear larger in the horizon than at any considerable height above it. These luminaries, although at great distances from the earth, appear floating, as it were, on the surface of our atmosphere, (Plate XLI. fig. 1.) *HGFfeG*, a little way beyond the clouds; of which, those about *F*, directly over our heads at *E*, are nearer us than those about *H* or *e* in the horizon *HEe*. Therefore, when the sun or moon appear in the horizon at *e*, they are not only seen in a part of the sky which is really farther from us than if they were at any considerable altitude, as about *f*; but they are also seen through a greater quantity of air and vapours at *e* than at *f*. Here

we have two concurring appearances which deceive our imagination, and cause us to refer the sun and moon to a greater distance at their rising or setting about *e*, than when they are considerably high, as at *f*: first, their seeming to be on a part of the atmosphere at *e*, which is really farther than *f* from a spectator at *E*; and, secondly, their being seen through a grosser medium when at *e* than when at *f*, which, by rendering them dimmer, causes us to imagine them to be at a yet greater distance. And as, in both cases, they are seen much under the same angle, we naturally judge them to be larger when they seem farthest from us.

Any one may satisfy himself that the moon appears under no greater angle in the horizon than on the meridian, by taking a large sheet of paper, and rolling it up in the form of a tube, of such a width, that observing the moon through it when she rises, she may, as it were, just fill the tube; then tie a thread round it to keep it of that size; and when the moon comes to the meridian, and appears much less to the eye, look at her again through the same tube, and she will fill it just as much, if not more, than she did at her rising.

When the full moon is in her *perigee*, or at her least distance from the earth, she is seen under a larger angle, and must therefore appear bigger than when she is full at other times: And if that part of the atmosphere where she rises be more replete with vapours than usual, she appears so much the dimmer; and therefore we fancy her to be still the bigger, by referring her to an unusually great distance, knowing that no objects which are very far distant can appear big unless they be really so.

#### CHAP. VII. *Use of the common Quadrant, and the Method of finding the Distances of the Sun, Moon, and Planets.*

To enable the young astronomer to understand the method of finding the distances of the heavenly bodies, we shall here give a short description of the quadrant. This instrument (Plate XLV. fig. 6.) is chiefly used in taking altitudes.

The altitude of any celestial phenomenon is an arc of the sky intercepted between the horizon and the phenomenon. In fig. 6. of Plate XLV. let *HOX* be a horizontal line, supposed to be extended from the eye at *A* to *X*, where the sky and earth seem to meet at the end of a long and level plain; and let *S* be the sun. The arc *XY* will be the sun's height above the horizon at *X*; and is found by the instrument *EDC*, which is a quadrantal board, or plate of metal, divided into 90 equal parts or degrees on its limb *DPG*; and has a couple of little brass plates, as *a* and *b*, with a small hole in each of them, called *sight-holes*, for looking through, parallel to the edge of the quadrant whereon they stand. To the centre *E* is fixed one end of a thread *F*, called the *plumb-line*, which has a small weight or plummet *P* fixed to its other end. Now, if an observer holds the quadrant upright, without inclining it to either side, and so that the horizon at *X* is seen through the sight-holes *a* and *b*, the plumb-line will cut or hang over the beginning of the

degrees at  $o$ , in the edge  $EC$ ; but if he elevates the quadrant so as to look through the sight-holes at any part of the heavens, suppose to the sun at  $S$ ; just so many degrees as he elevates the sight-hole  $b$  above the horizontal line  $HOX$ , so many degrees will the plumb-line cut in the limb  $CP$  of the quadrant. For, let the observer's eye at  $A$  be in the centre of the celestial arc  $XYV$  (and he may be said to be in the centre of the sun's apparent diurnal orbit, let him be on what part of the earth he will) in which arc the sun is at that time, suppose 25 degrees high, and let the observer hold the quadrant so that he may see the sun through the sight-holes; the plumb-line freely playing on the quadrant will cut the 25th degree in the limb  $CP$ , equal to the number of degrees of the sun's altitude at the time of observation.

—[N. B. Whoever looks at the sun, must have a smoked glass before his eyes to save them from hurt. The better way is not to look at the sun through the sight-holes, but to hold the quadrant facing the eye, at a little distance, and so that the sun shining through one hole, the ray may be seen to fall on the other.]

In fig. 2. Plate XLI. let  $BAG$  be one half of the earth,  $AC$  its semidiameter,  $S$  the sun,  $m$  the moon, and  $EKOL$  a quarter of the circle described by the moon in revolving from the meridian to the meridian again. Let  $GRS$  be the rational horizon of an observer at  $A$ , extended to the sun in the heavens; and  $HAO$  his sensible horizon, extended to the moon's orbit.  $ALC$  is the angle under which the earth's semidiameter  $AC$  is seen from the moon at  $L$ , which is equal to the angle  $OAL$ , because the right lines  $AO$  and  $OL$  which include both these angles are parallel.  $ASG$  is the angle under which the earth's semidiameter  $AC$  is seen from the sun at  $S$ , and is equal to the angle  $OAs$ , because the lines  $AO$  and  $GRS$  are parallel. Now, it is found by observation, that the angle  $OAL$  is much greater than the angle  $OAs$ ; but  $OAL$  is equal to  $ALC$ , and  $OAs$  is equal to  $ASG$ . Now, as  $ASG$  is much less than  $ALC$ , it proves that the earth's semidiameter  $AC$  appears much greater as seen from the moon at  $L$ , than from the sun at  $S$ ; and therefore the earth is much farther from the sun than from the moon. The quantities of these angles are determined by observation in the following manner.

Let a graduated instrument, as  $DAE$  (the larger the better) having a moveable index with sight-holes, be fixed in such a manner, that its plane surface may be parallel to the plane of the equator, and its edge  $AD$  in the meridian: so that when the moon is in the equinoctial, and on the meridian at  $E$ , she may be seen through the sight-holes when the edge of the moveable index cuts the beginning of the divisions at  $o$ , on the graduated limb  $DE$ ; and when she is so seen, let the precise time be noted. Now, as the moon revolves about the earth, from the meridian to the meridian again, in 24 hours 48 minutes, she will go a fourth part round it in a fourth part of that time, viz. in 6 hours 12 minutes, as seen from  $C$ , that is, from the earth's centre or pole. But as seen from  $A$ , the observer's place on the earth's surface, the moon will seem to have gone a quarter round the earth when she comes to the sensible horizon at  $O$ ; for the index, through the sights of

which she is then viewed, will be at  $d$ , 90 degrees from  $D$ , where it was when she was seen at  $E$ . Now, let the exact moment when the moon is seen at  $O$  (which will be when she is in or near the sensible horizon) be carefully noted, that it may be known in what time she has gone from  $E$  to  $O$ ; which time subtracted from 6 hours 12 minutes (the time of her going from  $E$  to  $L$ ) leaves the time of her going from  $O$  to  $L$ , and affords an easy method for finding the angle  $OAL$  (called the moon's horizontal parallax, which is equal to the angle  $ALG$ ) by the following analogy. As the time of the moon's describing the arc  $EO$  is to 90 degrees, so is 6 hours 12 minutes to the degrees of the arc  $DAE$ , which measures the angle  $EAL$ ; from which subtract 90 degrees, and there remains the angle  $OAL$ , equal to the angle  $ALG$ , under which the earth's semidiameter  $AC$  is seen from the moon. Now, since all the angles of a right-lined triangle are equal to 180 degrees, or to two right angles, and the sides of a triangle are always proportional to the sines of the opposite angles, say, by the Rule of Three, as the sine of the angle  $ALG$  at the moon  $L$  is to its opposite side  $AC$ , the earth's semidiameter, which is known to be 3985 miles, so is the radius, viz. the sine of 90 degrees, or of the right angle  $ACL$ , to its opposite side  $AL$ , which is the moon's distance at  $L$ , from the observer's place at  $A$ , on the earth's surface; or, so is the sine of the angle  $CAL$  to its opposite side  $CL$ , which is the moon's distance from the earth's centre, and comes out, at a mean rate, to be 240,000 miles. The angle  $CAL$  is equal to what  $OAL$  wants of 90 degrees.

The sun's distance from the earth is found the same way, but with much greater difficulty; because his horizontal parallax, or the angle  $OAS$  equal to the angle  $ASG$ , is so small as to be hardly perceptible, being only 10 seconds of a minute, or the 360th part of a degree. But the moon's horizontal parallax, or angle  $OAL$ , equal to the angle  $ALC$ , is very discernible, being  $57^{\circ} 49''$ , or  $2456''$  at its mean state; which is more than 340 times as great as the sun's: And therefore the distances of the heavenly bodies being inversely as the tangents of their horizontal parallaxes, the sun's distance from the earth is at least 340 times as great as the moon's; and is rather under-rated at 81 millions of miles, when the moon's distance is certainly known to be 240 thousand. But because, according to some astronomers, the sun's horizontal parallax is 11 seconds, and according to others only 10, the former parallax making the sun's distance to be about 75,000,000 of miles, and the latter 82,000,000; we may take it for granted, that the sun's distance is not less than as deduced from the former, nor more than as shewn by the latter: And every one who is accustomed to make such observations, knows how hard it is, if not impossible, to avoid an error of a second, especially on account of the inconstancy of horizontal refractions: And here, the error of one second, in so small an angle, will make an error of seven millions of miles in so great a distance as that of the sun's.

The sun and moon appear much about the same bulk; and every one who understands geometry, knows how their true bulks may be deduced from the apparent, when their real distances are known. Spheres are to one another

Fig. 1.

Fig. 3.

Fig. 2.

A. Bell. Sculp.

1700

1700

another as the cubes of their diameters; whence, if the sun be 81 millions of miles from the earth, to appear as big as the moon, whose distance does not exceed 240 thousand miles, he must, in solid bulk, be 42 millions 875 thousand times as big as the moon.

The horizontal parallaxes are best observed at the equator. 1. Because the heat is so nearly equal every day, that the refractions are almost constantly the same. 2. Because the parallactic angle is greater there, as at *A* (the distance from thence to the earth's axis being greater) than upon any parallel of latitude, as *a* or *b*.

The earth's distance from the sun being determined, the distances of all the other planets from him are easily

found by the following analogy, their periods round him being ascertained by observation. As the square of the earth's period round the sun is to the cube of its distance from him, so is the square of the period of any other planet to the cube of its distance, in such parts or measures as the earth's distance was taken. This proportion gives us the relative mean distances of the planets from the sun to the greatest degree of exactness; and they are as follow, having been deduced from their periodical times, according to the law just mentioned, which was discovered by Kepler, and demonstrated by Sir Isaac Newton.

*Periodical Revolution to the same fixed Star in Days, and decimal Parts of a Day.*

Of Mercury, 87.9692	Venus, 224.6176	The Earth, 365.2564	Mars, 686.9785	Jupiter, 4332.514	Saturn, 10759.275
<i>Relative mean distances from the sun.</i>					
38710	72333	100000	152369	520096	954006
<i>From these numbers we deduce, that if the sun's horizontal parallax be 10", the real mean distances of the planets from the sun in English miles are,</i>					
31,742,200	59,313,060	82,000,000	124,942,580	426,478,720	782,284,920
<i>But if the sun's parallax be 11", their distances are no more than</i>					
29,032,500	54,238,570	75,000,000	114,276,750	390,034,500	715,504,500
<i>Errors in distance, arising from the mistake of 1" in the sun's parallax.</i>					
2,709,700	5,074,490	7,000,000	10,665,830	36,444,220	66,780,420
<i>But, from the transit of Venus, A. D. 1761, the sun's parallax appears to be only 8" <math>\frac{8}{100}</math>; and according to that, their real distance in miles are</i>					
36,668,373	68,518,044	94,725,840	144,588,575	492,665,307	903,690,197

These numbers shew, that although we have the relative distances of the planets from the sun to the greatest nicety, yet the best observers could not ascertain their true distances. until the above transit appeared, which we must confess was embarrassed with several difficulties. But the late transit of Venus over the sun, on the third of June, was much better suited to this great problem.

The earth's axis produced to the stars, being carried parallel to itself during the earth's annual revolution, describes a circle in the sphere of the fixed stars equal to the orbit of the earth. But this orbit, though very large, would seem no bigger than a point if it were viewed from the stars; and consequently, the circle described in the sphere of the stars, by the axis of the earth produced, if viewed from the earth, must appear but as a point; that is. its diameter appears too little to be measured by observation: For Dr Bradley has assured us, that if it had amounted to a single second, or two at most, he should have perceived it in the great number of observations he has made, especially upon *γ dragonis*; and that it seemed to him very probable that the annual parallax of this star is not so great as a single second; and consequently, that it is above 400 thousand times farther from us than the sun. Hence, the celestial poles seem to continue in the same points of the heavens

throughout the year; which, by no means, disproves the earth's annual motion, but plainly proves the distance of the stars to be exceeding great.

The small apparent motion of the stars, discovered by that great astronomer, he found to be no ways owing to their annual parallax (for it came out contrary thereto) but to the aberration of their light, which can result from no known cause besides that of the earth's annual motion; and as it agrees so exactly therewith, it proves, beyond dispute, that the earth has such a motion: For this aberration completes all its various phenomena every year; and proves that the velocity of star-light is such as carries it through a space equal to the sun's distance from us in 8 minutes 13 seconds of time. Hence, the velocity of light is 10 thousand 210 times as great as the earth's velocity in its orbit; which velocity (from what we know already of the earth's distance from the sun) may be asserted to be at least between 57 and 58 thousand miles every hour: And supposing it to be 58000, this number, multiplied by the above 10210, gives 592 million 180 thousand miles for the hourly motion of light; which last number, divided by 3600, the number of seconds in an hour, shews that light flies at the rate of more than a hundred and sixty-four thousand miles every second of time, or swing of a common clock pendulum.

CHAP. VIII. *The different Lengths of Days and Nights, and the Vicissitudes of Seasons, explained. The Explanation of the Phenomena of Saturn's Ring concluded.*

THE following experiment will give a plain idea of the diurnal and annual motions of the earth, together with the different lengths of days and nights, and all the beautiful variety of seasons, depending on those motions.

Take about seven feet of strong wire, and bend it into a circular form, as *abcd*, which being viewed obliquely, appears elliptical, Plate XLI. fig. 3. Place a lighted candle on a table, and having fixed one end of a silk thread *K*, to the north pole of a small terrestrial globe *H*, about three inches diameter, cause another person to hold the wire circle, so that it may be parallel to the table, and as high as the flame of the candle *L*, which should be in or near the centre. Then, having twilted the thread as towards the left hand, that by untwisting it may turn the globe round eastward, or contrary to the way that the hands of a watch move; hang the globe by the thread within this circle, almost contiguous to it; and as the thread untwists, the globe (which is enlightened half round by the candle as the earth is by the sun) will turn round its axis, and the different places upon it will be carried through the light and dark hemispheres, and have the appearance of a regular succession of days and nights, as our earth has in reality by such a motion. As the globe turns, move your hand slowly, so as to carry the globe round the candle according to the order of the letters *abcd*, keeping its centre even with the wire circle; and you will perceive, that the candle being still perpendicular to the equator, will enlighten the globe from pole to pole in its whole motion round the circle; and that every place on the globe goes equally through the light and the dark, as it turns round by the untwisting of the thread, and therefore has a perpetual equinox. The globe, thus turning round, represents the earth turning round its axis; and the motion of the globe round the candle represents the earth's annual motion round the sun, and shews, that if the earth's orbit had no inclination to its axis, all the days and nights of the year would be equally long, and there would be no different seasons. But now, desire the person who holds the wire, to hold it obliquely in the position *ABCD*, raising the side  $\mathfrak{D}$  just as much as he depresses the side *rs*, that the flame may be still in the plane of the circle; and twisting the thread as before, that the globe may turn round its axis the same way as you carry it round the candle, that is, from west to east, let the globe down into the lowermost part of the wire circle at *rs*, and if the circle be properly inclined, the candle will shine perpendicularly on the tropic of Cancer, and the frigid zone, lying within the arctic or north polar circle, will be all in the light, as in the figure; and will keep in the light, let the globe turn round its axis ever so often. From the equator to the north polar circle all the places have longer days and shorter nights; but from the equator

to the south polar circle just the reverse. The sun does not set to any part of the north frigid zone, as shewn by the candle's shining on it, so that the motion of the globe can carry no place of that zone into the dark: And, at the same time, the south frigid zone is involved in darkness, and the turning of the globe brings none of its places into the light. If the earth were to continue in the like part of its orbit, the sun would never set to the inhabitants of the north frigid zone, nor rise to those of the south. At the equator it would be always equal day and night; and as places are gradually more and more distant from the equator, towards the arctic circle, they would have longer days and shorter nights; whilst those on the south side of the equator would have their nights longer than their days. In this case there would be continual summer on the north side of the equator, and continual winter on the south side of it.

But as the globe turns round its axis, move your hand slowly forward, so as to carry the globe from *H* towards *E*, and the boundary of light and darkness will approach towards the north pole, and recede towards the south pole; the northern places will go through less and less of the light, and the southern places through more and more of it; shewing how the northern days decrease in length, and the southern days increase, whilst the globe proceeds from *H* to *E*. When the globe is at *E*, it is at a mean state between the lowest and highest part of its orbit; the candle is directly over the equator, the boundary of light and darkness just reaches to both the poles, and all places on the globe go equally through the light and dark hemispheres, shewing that the days and nights are then equal at all places of the earth, the poles only excepted; for the sun is then setting to the north pole, and rising to the south pole.

Continue moving the globe forward, and as it goes thro' the quarter *A*, the north pole recedes still farther into the dark hemisphere, and the south pole advances more into the light, as the globe comes nearer to  $\mathfrak{D}$ : And when it comes there at *F*, the candle is directly over the tropic of Capricorn, the days are at the shortest, and nights at the longest, in the northern hemisphere, all the way from the equator to the arctic circle; and the reverse in the southern hemisphere from the equator to the antarctic circle; within which circles it is dark to the north frigid zone, and light to the south.

Continue both motions, and as the globe moves through the quarter *B*, the north pole advances towards the light, and the south pole recedes towards the dark; the days lengthen in the northern hemisphere, and shorten in the southern; and when the globe comes to *G*, the candle will be again over the equator (as when the globe was at *E*) and the days and nights will again be equal as formerly; and the north pole will be just coming into the light, the south pole going out of it.

Thus we see the reason why the days lengthen and shorten from the equator to the polar circles every year; why there is no day or night for several turnings of the earth, within the polar circles; why there is but one day and one night in the whole year at the poles; and why the days and nights are equally long all the

year round at the equator, which is always equally cut by the circle bounding light and darkness.

The inclination of an axis or orbit is merely relative, because we compare it with some other axis or orbit which we consider as not inclined at all. Thus, our horizon being level to us whatever place of the earth we are upon, we consider it as having no inclination; and yet, if we travel 90 degrees from that place, we shall then have an horizon perpendicular to the former, but it will still be level to us. And if this book be held so that the circle *ABCD* be parallel to the horizon, both the circle *abcd*, and the thread or axis *K*, will be inclined to it. But if the book or plate be held so that the thread be perpendicular to the horizon, then the orbit *ABCD* will be inclined to the thread, and the orbit *abcd* perpendicular to it, and parallel to the horizon. We generally consider the earth's annual orbit as having no inclination, and the orbits of all the other planets as inclined to it.

Let us now take a view of the earth in its annual course round the sun, considering its orbit as having no inclination, and its axis as inclining  $23\frac{1}{2}$  degrees from a line perpendicular to the plane of its orbit, and keeping the same oblique direction in all parts of its annual course; or, as commonly termed, keeping always parallel to itself.

In Plate XLI. fig. 4. let *abcdefgh* be the earth in eight different parts of its orbit, equidistant from one another, *N* its axis, *N* the north pole, *s* the south pole, and *S* the sun nearly in the centre of the earth's orbit. As the earth goes round the sun according to the order of the letters *abcd*, &c. its axis *Ns* keeps the same obliquity, and is still parallel to the line *WNs*. When the earth is at *a*, its north pole inclines toward the sun *S*, and brings all the northern places more into the light than at any other time of the year. But when the earth is at *e* in the opposite time of the year, the north pole declines from the sun, which occasions the northern places to be more in the dark than in the light; and the reverse at the southern places, as is evident by the figure. When the earth is either at *c* or *g*, its axis inclines not either to or from the sun, but lies sideway to him, and then the poles are in the boundary of light and darkness; and the sun, being directly over the equator, makes equal day and night at all places. When the earth is at *b*, it is half way between the summer solstice and harvest equinox; when it is at *d*, it is half way from the harvest equinox to the winter solstice; at *f*, half way from the winter solstice to the spring equinox; and at *h*, half way from the spring equinox to the summer solstice.

From this oblique view of the earth's orbit, let us suppose ourselves to be raised far above it, and placed just over its centre *S*, looking down upon it from its north pole; and as the earth's orbit differs but very little from a circle, we shall have its figure in such a view represented by the circle *ABCDEFGHIH* (Plate XLII. fig. 1.). Let us suppose this circle to be divided into 12 equal parts, called *signs*, having their names affixed to them; and each sign into 30 equal parts, called *degrees*, numbered 10, 20, 30, as in the outermost circle of the fi-

gure, which represents the great ecliptic in the heavens. The earth is shewn in eight different positions in this circle, and in each position *E* is the equator, *T* the tropic of Cancer, the dotted circle the parallel of London, *U* the arctic or north polar circle, and *P* the north pole, where all the meridians or hour-circles meet. As the earth goes round the sun, the north pole keeps constantly towards one part of the heavens, as it keeps in the figure towards the right-hand side of the plate.

When the earth is at the beginning of *Libra*, namely, on the 20th of March, in this figure (as at *g* in Plate XLI. fig. 4.) the sun *S* as seen from the earth appears at the beginning of *Aries* in the opposite part of the heavens, the north pole is just coming into the light, and the sun is vertical to the equator; which, together with the tropic of Cancer, parallel of London, and arctic circle, are all equally cut by the circle bounding light and darkness, coinciding with the six o'clock hour-circle, and therefore the days and nights are equally long at all places; for every part of the meridian *ETLa* comes into the light at six in the morning, and revolving with the earth according to the order of the hour-letters, goes into the dark at six in the evening. There are 24 meridians or hour-circles drawn on the earth in this figure, to shew the time of sun-rising and setting at different seasons of the year.

As the earth moves in the ecliptic according to the order of the letters *ABCD*, &c. through the signs *Libra*, *Scorpio*, and *Sagittarius*, the north pole comes more and more into the light; the days increase as the nights decrease in length, at all places north of the equator *E*; which is plain by viewing the earth at *b* on the 5th of May, when it is in the 15th degree of *Scorpio*, and the sun as seen from the earth appears in the 15th degree of *Taurus*; for then the tropic of Cancer *T* is in the light from a little after five in the morning till almost seven in the evening; the parallel of London from half an hour past four till half an hour past seven; the polar circle *U* from three till nine; and a large track round the north pole *P* has day all the 24 hours, for many rotations of the earth on its axis.

When the earth comes to *c* at the beginning of *Capricorn*; and the sun as seen from the earth appears at the beginning of *Cancer* on the 21st of June, as in this figure, it is in the position *a* in Plate XLI. fig. 4.; and its north pole inclines towards the sun, so as to bring all the north frigid zone into the light, and the northern parallels of latitude more into the light than the dark from the equator to the polar circle, and the more so as they are farther from the equator. The tropic of Cancer is in the light from five in the morning till seven at night; the parallel of London from a quarter before four till a quarter after eight; and the polar circle just touches the dark, so that the sun has only the lower half of his disk hid from the inhabitants on that circle for a few minutes about midnight, supposing no inequalities in the horizon, and no refractions.

A bare view of the figure is enough to shew, that as the earth advances from *Capricorn* towards *Aries*, and the sun appears to move from *Cancer* towards *Libra*, the north pole recedes towards the dark, which causes the days to decrease, and the nights to increase in length,

till

rill the earth comes to the beginning of Aries, and then they are equal as before; for the boundary of light and darkness cut the equator and all its parallels equally or in halves. The north pole then goes into the dark, and continues therein until the earth goes half way round its orbit, or from the 23d of September till the 20th of March. In the middle between these times, *viz.* on the 21st of December, the north pole is as far as it can be in the dark, which is 23 $\frac{1}{4}$  degrees, equal to the inclination of the earth's axis from a perpendicular to its orbit; and then the northern parallels are as much in the dark as they were in the light on the 21st of June; the winter nights being as long as the summer days, and the winter days as short as the summer nights. It is needless to enlarge farther on this subject, as we shall have occasion to mention the seasons again in describing the orrery. Only this must be noted, that all that has been said of the northern hemisphere, the contrary must be understood of the southern; for on different sides of the equator the seasons are contrary, because when the northern hemisphere inclines towards the sun, the southern declines from him.

As Saturn goes round the sun, his obliquely posited ring, like our earth's axis, keeps parallel to itself, and is therefore turned edgewise to the sun twice in a Saturnian year, which is almost as long as 30 of our years. But the ring, though considerably broad, is too thin to be seen by us when it is turned round edgewise to the sun, at which time it is also edgewise to the earth, and therefore it disappears once in every fifteen years to us. As the sun shines half a year together on the north pole of our earth, then disappears to it, and shines as long on the south pole; so, during one half of Saturn's year, the sun shines on the north side of his ring, then disappears to it, and shines as long on its south side. When the earth's axis inclines neither to nor from the sun, but sidewise to him, he instantly ceases to shine on one pole, and begins to enlighten the other; and when Saturn's ring inclines neither to nor from the sun, but sidewise to him, he ceases to shine on the one side of it, and begins to shine upon the other.

The earth's orbit being elliptical, and the sun constantly keeping in its lower focus, which is 1,377,000 miles from the middle point of the longer axis, the earth comes twice so much, or 2,754,000 miles nearer the sun at one time of the year than at another; for the sun appearing under a larger angle in our winter than summer, proves that the earth is nearer the sun in winter. But here this natural question will arise, Why have we not the hottest weather when the earth is nearest the sun? In answer, it must be observed, that the eccentricity of the earth's orbit, or 1 million 377 miles, bears no greater proportion to the earth's mean distance from the sun than 17 does to 1000; and therefore this small difference of distance cannot occasion any great difference of heat or cold. But the principal cause of this difference is, that in winter the sun's rays fall so obliquely upon us, that any given number of them is spread over a much greater portion of the earth's surface where we live, and therefore each point must then have fewer rays than in summer. Moreover, there comes a greater degree of cold

in the long winter nights than there can return of heat in so short days; and on both these accounts the cold must increase. But in summer, the rays fall more perpendicularly upon us, and therefore come with greater force, and in greater numbers on the same place; and by their long continuance, a much greater degree of heat is imparted by day than can fly off by night.

#### CHAP. IX. *The Method of finding the Longitude by the Eclipses of Jupiter's Satellites: The amazing Velocity of Light demonstrated by these Eclipses.*

GEOGRAPHERS arbitrarily chuse to call the meridian of some remarkable place the *first meridian*. There they begin their reckoning; and just so many degrees and minutes as any other place is to the eastward or westward of that meridian, so much east or west longitude they say it has. A degree is the 360th part of a circle, be it great or small; and a minute the 60th part of a degree. The English geographers reckon the longitude from the meridian of the Royal Observatory at Greenwich, and the French from the meridian of Paris.

If we imagine 12 great circles, (Plate XLII. fig. 1.) one of which is the meridian of any given place, to intersect each other in the two poles of the earth, and to cut the equator *E* at every 15th degree, they will be divided by the poles into 24 femicircles which divide the equator into 24 equal parts; and as the earth turns on its axis, the planes of these femicircles come successively after one another every hour to the sun. As in an hour of time there is a revolution of 15 degrees of the equator, in a minute of time there will be a revolution of 15 minutes of the equator, and in a second of time a revolution of 15 seconds.

Because the sun enlightens only one half of the earth at once, as it turns round its axis, he rises to some places at the same moments of absolute time that he sets to others; and when it is mid-day to some places, it is mid-night to others. The XII on the middle of the earth's enlightened side, next the sun, stands for mid-day; and the opposite XII on the middle of the dark side, for mid-night. If we suppose this circle of hours to be fixed in the plane of the equinoctial, and the earth to turn round within it, any particular meridian will come to the different hours so as to shew the true time of the day or night at all places on that meridian. Therefore,

To every place 15 degrees eastward from any given meridian, it is noon an hour sooner than on that meridian, because their meridian comes to the sun an hour sooner; and to all places 15 degrees westward, it is noon an hour later, because their meridian comes an hour later to the sun, and so on; every 15 degrees of motion causing an hour's difference in time. Therefore, they who have noon an hour later than we, have their meridian, that is, their longitude, 15 degrees westward from us; and they who have noon an hour sooner than we, have their meridian 15 degrees eastward from ours; and so for every hour's difference of time 15 degrees differ-

rence of longitude. Consequently, if the beginning or ending of a lunar eclipse be observed, suppose at London, to be exactly at midnight, and in some other place at 11 at night, that place is 15 degrees westward from the meridian of London; if the same eclipse be observed at 1 in the morning at another place, that place is 15 degrees eastward from the said meridian.

But as it is not easy to determine the exact moment either of the beginning or ending of a lunar eclipse, because the earth's shadow, through which the moon passes, is faint and ill defined about the edges, we have recourse to the eclipses of Jupiter's satellites, which disappear so instantaneously as they enter Jupiter's shadow, and emerge so suddenly out of it, that we may fix the phenomenon to half a second of time. The first or nearest satellite to Jupiter is the most advantageous for this purpose, because its motion is quicker than the motion of any of the rest, and therefore its immersions and emersions are more frequent.

The English astronomers have calculated tables for shewing the times of the eclipses of Jupiter's satellites to great precision, for the meridian of Greenwich. Now, let an observer, who has these tables, with a good telescope and a well-regulated clock at any other place of the earth, observe the beginning or ending of an eclipse of one of Jupiter's satellites, and note the precise moment of time that he saw the satellite either immerse into, or emerge out of the shadow, and compare that time with the time shewn by the tables for Greenwich; then, 15 degrees difference of longitude being allowed for every hour's difference of time, will give the longitude of that place from Greenwich, as above; and if there be any odd minutes of time, for every minute a quarter of a degree, east or west, must be allowed, as the time of observation is later or earlier than the time shewn by the tables. Such eclipses are very convenient for this purpose at land, because they happen almost every day; but are of no use at sea, because the rolling of the ship hinders all nice telescopic observations.

To explain this by a figure, in Plate XLII. fig. 1. let  $J$  be Jupiter,  $K, L, M, N$  his four satellites in their respective orbits, 1, 2, 3, 4; and let the earth be at  $f$ , (suppose in November, although that month is no otherwise material than to find the earth readily in this scheme, where it is shewn in eight different parts of its orbit). Let  $\mathcal{Q}$  be a place on the meridian of Greenwich, and  $\mathcal{R}$  a place on some other meridian eastward from Greenwich. Let a person at  $R$  observe the instantaneous vanishing of the first satellite  $K$  into Jupiter's shadow, suppose at three o'clock in the morning; but by the tables he finds the immersion of that satellite to be at midnight at Greenwich; he can then immediately determine, that as there are three hours difference of time between  $\mathcal{Q}$  and  $R$ ; and that  $R$  is three hours forward in reckoning than  $\mathcal{Q}$ , it must be 45 degrees of east longitude from the meridian of  $\mathcal{Q}$ . Were this method as practicable at sea as at land, any sailor might almost as easily, and with equal certainty, find the longitude as the latitude.

Whilst the earth is going from  $G$  to  $F$  in its orbit, only the immersions of Jupiter's satellites into his shadow are generally seen; and their emersions out of

it while the earth goes from  $G$  to  $B$ . Indeed, both these appearances may be seen of the second, third, and fourth satellite when eclipsed, whilst the earth is between  $D$  and  $E$ , or between  $G$  and  $A$ ; but never of the first satellite, on account of the smallness of its orbit and the bulk of Jupiter, except only when Jupiter is directly opposite to the sun, that is, when the earth is at  $g$ ; and even then, strictly speaking, we cannot see either the immersions or emersions of any of his satellites, because his body being directly between us and his conical shadow, his satellites are hid by his body a few moments before they touch his shadow; and are quite emerged from thence before we can see them, as it were, just dropping from him. And when the earth is at  $c$ , the sun, being between it and Jupiter, hides both him and his moons from us.

In this diagram, the orbits of Jupiter's moons are drawn in true proportion to his diameter; but, in proportion to the earth's orbit, they are drawn 81 times too large.

In whatever month of the year Jupiter is in conjunction with the sun, or in opposition to him, in the next year it will be a month later at least. For whilst the earth goes once round the sun, Jupiter describes a twelfth part of his orbit. And therefore, when the earth has finished its annual period, from being in a line with the sun and Jupiter, it must go as much forward as Jupiter has moved in that time, to overtake him again; just like the minute-hand of a watch, which must, from any conjunction with the hour-hand, go once round the dial-plate and somewhat above a twelfth part more, to overtake the hour hand again.

It is found by observation, that when the earth is between the sun and Jupiter, as at  $g$ , his satellites are eclipsed about 8 minutes sooner than they should be according to the tables; and when the earth is at  $B$  or  $C$ , these eclipses happen about 8 minutes later than the tables predict them. Hence it is undeniably certain, that the motion of light is not instantaneous, since it takes about  $16\frac{1}{2}$  minutes of time to go through a space equal to the diameter of the earth's orbit, which is 162 millions of miles in length; and consequently the particles of light fly about 164 thousand 494 miles every second of time, which is above a million of times swifter than the motion of a cannon-bullet. And as light is  $16\frac{1}{2}$  minutes in travelling across the earth's orbit, it must be  $8\frac{1}{2}$  minutes in coming from the sun to us; therefore if the sun were annihilated, we should see him for  $8\frac{1}{2}$  minutes after; and if he were again created, he would be  $8\frac{1}{2}$  minutes old before we could see him.

To illustrate this progressive motion of light, (Plate XLII. fig. 2.), let  $A$  and  $B$  be the earth in two different parts of its orbit, whose distance from each other is 81 millions of miles, equal to the earth's distance from the sun  $S$ . It is plain, that if the motion of light were instantaneous, the satellite 1 would appear to enter into Jupiter's shadow  $FF$  at the same moment of time to a spectator in  $A$ , as to another in  $B$ . But by many years observations it has been found, that the immersion of the satellite into the shadow is seen  $8\frac{1}{2}$  minutes sooner when the earth is at  $B$ , than when it is at  $A$ . And so, as

Mr Romeur first discovered, the motion of light is thereby proved to be progressive, and not instantaneous, as was formerly believed. It is easy to compute in what time the earth moves from  $A$  to  $B$ ; for the chord of 60 degrees of any circle is equal to the semidiameter of that circle; and as the earth goes through all the 360 degrees of its orbit in a year, it goes through 60 of those degrees in about 61 days. Therefore, if on any given day, suppose the first of June, the earth is at  $A$ , on the first of August it will be at  $B$ ; the chord, or straight line  $AB$ , being equal to  $DS$  the radius of the earth's orbit, the same with  $AS$  its distance from the sun.

As the earth moves from  $D$  to  $C$ , through the side  $AB$  of its orbit, it is constantly meeting the light of Jupiter's satellites sooner, which occasions an apparent acceleration of their eclipses; and as it moves through the other half  $H$  of its orbit, from  $C$  to  $D$ , it is receding from their light, which occasions an apparent retardation of their eclipses, because their light is then longer before it overtakes the earth.

That these accelerations of the immerfions of Jupiter's satellites into his shadow, as the earth approaches towards Jupiter, and the retardations of their emerfions out of his shadow, as the earth is going from him, are not occasioned by any inequality arising from the motions of the satellites in excentric orbits, is plain, because it affects them all alike, in whatever parts of their orbits they are eclipsed. Besides, they go often round their orbits every year, and their motions are no way commensurate to the earth's. Therefore, a phenomenon not to be accounted for from the real motions of the satellites, but so easily deducible from the earth's motion, and so answerable thereto, must be allowed to result from it. This affords one very good proof of the earth's annual motion.

## CHAP. X. Of Solar and Sydereal Time.

THE fixed stars appear to go round the earth in 23 hours 56 minutes 4 seconds, and the sun in 24 hours; so that the stars gain three minutes 56 seconds upon the sun every day, which amounts to one diurnal revolution in a year; and therefore, in 365 miles, as measured by the returns of the sun to the meridian, there are 366 days, as measured by the stars returning to it; the former are called *star days*, and the latter *sydereal*.

The diameter of the earth's orbit is but a physical point in proportion to the distance of the stars; for which reason, and the earth's uniform motion on its axis, any given meridian will revolve from any star to the same star again in every absolute turn of the earth on its axis, without the least perceptible difference of time shewn by a clock which goes exactly true.

If the earth had only a diurnal motion, without an annual, any given meridian would revolve from the sun to the sun again in the same quantity of time as from any star to the same star again, because the sun would never change his place with respect to the stars. But as the earth advances almost a degree eastward in its orbit in the time that it turns eastward round its axis, whatever

star passes over the meridian on any day with the sun, will pass over the same meridian on the next day when the sun is almost a degree short of it; that is, 3 minutes 56 seconds sooner. If the year contained only 360 days, as the elliptic does 360 degrees, the sun's apparent place, so far as his motion is equable, would change a degree every day; and then the syderal days would be just four minutes shorter than the solar.

In Plate XLII. fig. 3. let  $ABCDEFGHIKLM$  be the earth's orbit, in which it goes round the sun every year, according to the order of the letters, that is, from west to east; and turns round its axis the same way from the sun to the sun again every 24 hours. Let  $S$  be the sun, and  $R$  a fixed star, at such an immense distance, that the diameter of the earth's orbit bears no sensible proportion to that distance. Let  $Nmn$  be any particular meridian of the earth, and  $N$  a given point or place upon that meridian. When the earth is at  $A$ , the sun  $S$  hides the star  $R$ , which would always be hid if the earth never removed from  $A$ ; and consequently, as the earth turns round its axis, the point  $N$  would always come round to the sun and star at the same time. But when the earth has advanced, suppose a twelfth part of its orbit from  $A$  to  $B$ , its motion round its axis will bring the point  $N$  a twelfth part of a natural day, or two hours, sooner to the star than to the sun; for the angle  $NBN$  is equal to the angle  $ASB$ ; and therefore any star, which comes to the meridian at noon with the sun when the earth is at  $A$ , will come to the meridian at 10 in the forenoon when the earth is at  $B$ . When the earth comes to  $C$ , the point  $N$  will have the star on its meridian at 8 in the morning, or four hours sooner than it comes round to the sun; for it must revolve from  $N$  to  $n$ , before it has the sun in its meridian. When the earth comes to  $D$ , the point  $N$  will have the star on its meridian at 6 in the morning, but that point must revolve six hours more from  $N$  to  $n$ , before it has mid-day by the sun: For now the angle  $ASD$  is a right angle, and so is  $NDn$ ; that is, the earth has advanced 90 degrees in its orbit, and must turn 90 degree on its axis to carry the point  $N$  from the star to the sun: For the star always comes to the meridian when  $Nmn$  is parallel to  $RS$ ; because  $DS$  is but a point in respect of  $RS$ . When the earth is at  $E$ , the star comes to the meridian at 4 in the morning; at  $F$ , at 2 in the morning; and at  $G$ , the earth having gone half round its orbit,  $N$  points to the star  $R$  at midnight, it being then directly opposite to the sun; and therefore, by the earth's diurnal motion, the star comes to the meridian 12 hours before the sun. When the earth is at  $H$ , the star comes to the meridian at 10 in the evening; at  $I$ , it comes to the meridian 8, that is, 16 hours before the sun; at  $K$ , 18 hours before him; at  $L$ , 20 hours; at  $M$ , 22; and at  $A$ , equally with the sun again.

Thus it is plain, that an absolute turn of the earth on its axis (which is always completed when any particular meridian comes to be parallel to its situation at any time of the day before) never brings the same meridian round from the sun to the sun again; but that the earth requires as much more than one turn on its axis to finish a natural day, as it has gone forward in that time; which, at a

mean rate, is a 365th part of a circle. Hence, in 365 days the earth turns 366 times round its axis; and therefore, as a turn of the earth on its axis completes a syderal day, there must be one syderal day more in a year than the number of solar days, be the number what it will, on the earth, or any other planet. One turn being lost with respect to the number of solar days in a year, by the planets going round the sun; just as it would be lost to a traveller, who, in going round the earth, would lose one day by following the apparent diurnal motion of the sun; and consequently would reckon one day less at his return (let him take what time he would to go round the earth) than those who remained all the while at the place from which they set out. So, if there were two earths revolving equably on their axes, and if one remained at *A* until the other travelled round the sun from *A* to *A* again, that earth which kept its place at *A* would have its solar and syderal days always of the same length; and so would have one solar day more than the other at its return. Hence, if the earth turned but once round its axis in a year, and if that turn was made the same way as the earth goes round the sun, there would be continual day on one side of the earth, and continual night on the other.

## CHAP. XI. *Of the Equation of Time.*

THE earth's motion on its axis being perfectly uniform, and equal at all times of the year, the syderal days are always precisely of an equal length; and so would the solar or natural days be, if the earth's orbit were a perfect circle, and its axis perpendicular to its orbit. But the earth's diurnal motion on an inclined axis, and its annual motion in an elliptic orbit, cause the suns apparent motion in the heavens to be unequal: For sometimes he revolves from the meridian to the meridian again in somewhat less than 24 hours, shewn by a well-regulated clock; and at other times in somewhat more: So that the time shewn by an equal going clock and a true sun-dial is never the same but on the 15th of April, the 16th of June, the 31st of August, and the 24th of December. The clock, if it goes equally and true all the year round, will be before the sun from the 24th of December till the 15th of April; from that time till the 16th of June the sun will be before the clock; from the 16th of June till the 31st of August, the clock will be again before the sun; and from thence to the 24th of December the sun will be faster than the clock.

The easiest and most expeditious way of drawing a meridian line is this: Make four or five concentric circles, about a quarter of an inch from one another, on a flat board, about a foot in breadth; and let the outmost circle be but little less than the board will contain. Fix a pin perpendicularly in the centre, and of such a length that its whole shadow may fall within the innermost circle, for at least four hours in the middle of the day. The pin ought to be about an eighth part of an inch thick, and to have a round blunt point. The board being set exactly level in a place where the sun shines,

suppose from eight in the morning till four in the afternoon, about which hours the end of the shadow should fall without all the circles; watch the times in the forenoon, when the extremity of the shortening shadow just touches the several circles, and there make marks. Then, in the afternoon of the same day, watch the lengthening shadow, and where its end touches the several circles in going over them, make marks also. Lastly, with a pair of compasses, find exactly the middle point between the two marks on any circle, and draw a straight line from the centre to that point; which line will be covered at noon by the shadow of a small upright wire, which should be put in the place of the pin. The reason for drawing several circles is, that in case one part of the day should prove clear, and the other part somewhat cloudy, if you miss the time when the point of the shadow should touch one circle, you may perhaps catch it in touching another. The best time for drawing a meridian line, in this manner, is about the summer solstice; because the sun changes his declination slowest, and his altitude fastest in the longest days.

If the casement of a window, on which the sun shines at noon, be quite upright, you may draw a line along the edge of its shadow on the floor, when the shadow of the pin is exactly on the meridian line of the board; and as the motion of the shadow of the casement will be much more sensible on the floor, than that of the shadow of the pin on the board, you may know to a few seconds when it touches the meridian line on the floor; and so regulate your clock for the day of observation by that line and any good equation table.

As the equation of time, or difference between the time shewn by a well-regulated clock and a true sun-dial, depends upon two causes, namely, the obliquity of the ecliptic, and the unequal motion of the earth in it, we shall first explain the effects of these causes separately considered, and then the united effects resulting from their combination.

The earth's motion on its axis being perfectly equable, or always at the same rate, and the plane of the equator being perpendicular to its axis, it is evident, that in equal times equal portions of the equator pass over the meridian; and so would equal portions of the ecliptic, if it were parallel to or coincident with the equator. But, as the ecliptic is oblique to the equator, the equable motion of the earth carries unequal portions of the ecliptic over the meridian in equal times, the difference being proportionate to the obliquity; and, as some parts of the ecliptic are much more oblique than others, those differences are unequal among themselves. Therefore, if two suns should start either from the beginning of Aries or Libra, and continue to move through equal arcs in equal times, one in the equator, and the other in the ecliptic, the equatorial sun would always run to the meridian in 24 hours time, as measured by a well-regulated clock; but the sun in the ecliptic would return to the meridian sometimes sooner, and sometimes later than the equatorial sun; and only at the same moments with him on four days of the year; namely, the 20th of March, when the sun enters Aries; the 21st of June, when he enters Cancer; the 23d of September, when he

enters

enters Libra; and the 21st of December, when he enters Capricorn. But, as there is only one sun, and his apparent motion is always on the ecliptic, let us henceforth call him the *real sun*; and the other, which is supposed to move in the equator, the *fictitious*; to which last, the motion of a well-regulated clock always answers.

In Plate XLIII. fig. 4. let  $Z\varphi\Omega$  be the earth,  $ZFRz$  its axis,  $abcde$  &c. the equator,  $ABCDE$  &c. the northern half of the ecliptic from  $\varphi$  or  $\Omega$  on the side of the globe next the eye; and  $MNOP$  &c. the southern half on the opposite side from  $\Omega$  to  $\varphi$ . Let the points at  $ABCDEF$  &c. quite round from  $\varphi$  to  $\varphi$  again bound equal portions of the ecliptic, gone through in equal times by the real sun; and those at  $abcdef$  &c. equal portions of the equator, described in equal times by the fictitious sun; and let  $Z\varphi z$  be the meridian.

As the real sun moves obliquely in the ecliptic, and the fictitious sun directly in the equator, with respect to the meridian; a degree, or any number of degrees, between  $\varphi$  and  $F$  on the ecliptic, must be nearer the meridian  $Z\varphi z$ ; than a degree, or any corresponding number of degrees on the equator from  $\varphi$  to  $f$ ; and the more so, as they are the more oblique: And therefore the real sun comes sooner to the meridian every day whilst he is in the quadrant  $\varphi F$ , than the fictitious sun does in the quadrant  $\varphi f$ ; for which reason, the solar noon precedes noon by the clock, until the real sun comes to  $F$ , and the fictitious to  $f$ ; which two points, being equidistant from the meridian, both suns will come to it precisely at noon by the clock.

Whilst the real sun describes the second quadrant of the ecliptic  $FGHKL$  from  $F$  to  $\Omega$ , he comes later to the meridian every day, than the fictitious sun moving through the second quadrant of the equator from  $f$  to  $\Omega$ ; for the points at  $GHKL$  and  $L$ , being farther from the meridian than their corresponding points at  $ghik$  and  $l$ , they must be later of coming to it: And as both suns come at the same moment to the point  $\Omega$ , they come to the meridian at the moment of noon by the clock.

In departing from Libra, through the third quadrants, the real sun going through  $MNOPQ$  towards  $rs$  at  $R$ , and the fictitious sun through  $mno pq$  towards  $r$ , the former comes to the meridian every day sooner than the latter, until the real sun comes to  $rs$ , and the fictitious to  $r$ , and then they both come to the meridian at the same time.

Lastly, as the real sun moves equally through  $STUVW$ , from  $rs$  towards  $\varphi$ ; and the fictitious sun thro'  $stuvw$ , from  $r$  towards  $\varphi$ ; the former comes later every day to the meridian than the latter, until they both arrive at the point  $\varphi$ , and then they make noon at the same time with the clock.

This part of the equation of time may perhaps be somewhat difficult to understand by a figure, because both halves of the ecliptic seem to be on the same side of the globe; but it may be made very easy to any person who has a real globe before him, by putting small patches on every tenth or fifteenth degree, both of the equator and ecliptic, beginning at Aries  $\varphi$ ; and then, turning the ball slowly round westward, he will see all

the patches from Aries to Cancer come to the brazen meridian sooner than the corresponding patches on the equator; all those from Cancer to Libra will come later to the meridian than their corresponding patches on the equator; those from Libra to Capricorn sooner, and those from Capricorn to Aries later: And the patches at the beginnings of Aries, Cancer, Libra, and Capricorn, being either on, or even with those on the equator, shew that the two suns either meet there, or are even with one another, and so come to the meridian at the same moment.

Let us suppose that there are two little balls moving equally round a celestial globe by clock-work, one always keeping in the ecliptic, and gilt with gold, to represent the real sun; and the other keeping in the equator, and silvered, to represent the fictitious sun: And that whilst these balls move once round the globe, according to the order of signs, the clock turns the globe 366 times round its axis westward. The stars will make 366 diurnal revolutions from the brazen meridian to it again; and the two balls representing the real and fictitious sun always going farther eastward from any given star, will come later than it to the meridian every following day; and each ball will make 365 revolutions to the meridian; coming equally to it at the beginnings of Aries, Cancer, Libra, and Capricorn: But in every other point of the ecliptic, the gilt ball will come either sooner or later to the meridian than the silver ball, like the patches above mentioned.

This would be a pretty enough way of shewing the reason why any given day, which, on a certain day of the year, comes to the meridian with the sun, passes over it so much sooner every following day, as on that day twelvemonth to come to the meridian with the sun again; and also to shew the reason why the real sun comes to the meridian sometimes sooner, sometimes later, than it is noon by the clock; and, on four days of the year, at the same time; whilst the fictitious sun always comes to the meridian when it is twelve at noon by the clock. This would be no difficult task for an artist to perform; for the gold ball might be carried round the ecliptic by a wire from its north pole, and the silver ball round the equator by a wire from its south pole, by means of a few wheels to each.

It is plain, that if the ecliptic were more obliquely posited to the equator, as the dotted circle  $\varphi\chi\Omega$ , the equal divisions from  $\varphi$  to  $\chi$  would come still sooner to the meridian  $Z\varphi\varphi$  than those marked  $ABCD$  and  $E$  do; for two divisions containing 30 degrees, from  $\varphi$  to the second dot, a little short of the figure 1, come sooner to the meridian than one division containing only 15 degrees from  $\varphi$  to  $A$  does, as the ecliptic now stands: and those of the second quadrant from  $\chi$  to  $\Omega$  would be so much later. The third quadrant would be as the first, and the fourth as the second. And it is likewise plain, that where the ecliptic is most oblique, namely, about Aries and Libra, the difference would be greatest; and least about Cancer and Capricorn, where the obliquity is least.

Having explained one cause of the difference of time shewn by a well-regulated clock and a true sun-dial; and considered the sun, not the earth, as moving in the ecliptic

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

ecliptic: We now proceed to explain the other cause of this difference, namely, the inequality of the sun's apparent motion, which is slowest in the summer, when the sun is farthest from the earth, and swiftest in winter when he is nearest to it. But the earth's motion on its axis is equable all the year round, and is performed from west to east; which is the way that the sun appears to change his place in the ecliptic.

If the sun's motion were equable in the ecliptic, the whole difference, between the equal time as shewn by a clock, and the unequal time as shewn by the sun, would arise from the obliquity of the ecliptic. But the sun's motion sometimes exceeds a degree in 24 hours, though generally it is less: And when his motion is slowest, any particular meridian will revolve sooner to him than when his motion is quickest; for it will overtake him in less time when he advances a less space than when he moves through a larger.

Now, if there were two suns moving in the plane of the ecliptic, so as to go round it in a year; the one describing an equal arc every 24 hours, and the other describing sometimes a less arc 24 hours, and at other times a larger, gaining at one time of the year what it lost at the opposite; it is evident that either of these suns would come sooner or later to the meridian than the other, as it happened to be behind or before the other; and when they were both in conjunction, they would come to the meridian at the same moment.

As the real sun moves unequally in the ecliptic, let us suppose a fictitious sun to move equably in a circle coincident with the plane of the ecliptic. In Plate XLIII. fig. 1. let  $ABCD$  be the ecliptic or orbit in which the real sun moves, and the dotted circle  $abcd$  the imaginary orbit of the fictitious sun; each going round in a year according to the order of letters, or from west to east. Let  $HIKL$  be the earth turning round its axis the same way every 24 hours; and suppose both suns to start from  $A$  and  $a$ , in a right line with the plane of the meridian  $EH$ , at the same moment; the real sun at  $A$  being then at his greatest distance from the earth, at which time his motion is slowest; and the fictitious sun at  $a$ , whose motion is always equable, because his distance from the earth is supposed to be always the same. In the time that the meridian revolves from  $H$  to  $H$  again, according to the order of the letters  $HIKL$ , the real sun has moved from  $A$  to  $F$ ; and the fictitious sun with a quicker motion from  $a$  to  $f$ , through a larger arc. Therefore, the meridian  $EH$  will revolve sooner from  $H$  to  $h$  under the real sun at  $F$ , than from  $H$  to  $k$  under the fictitious sun at  $f$ ; and consequently it will then be noon, by the sun-dial sooner than by the clock.

As the real sun moves from  $A$  towards  $C$ , the swiftness of his motion increases all the way to  $C$ , where it is at the quickest. But notwithstanding this, the fictitious sun gains so much upon the real, soon after his departing from  $A$ , that the increasing velocity of the real sun does not bring him up with the equally moving fictitious sun till the former comes to  $C$ , and the latter to  $c$ , when each has gone half round its respective orbit; and then being in conjunction, the meridian  $EH$  revolving to  $EK$  comes

to both suns at the same time, and therefore it is noon by them both at the same moment.

But the increasing velocity of the real sun, now being at the quickest, carries him before the fictitious one; and therefore, the same meridian will come to the fictitious sun sooner than to the real: For, whilst the fictitious sun moves from  $c$  to  $g$ , the real sun moves through a greater arc from  $C$  to  $G$ ; consequently the point  $K$  has its noon by the clock when it comes to  $k$ , but not its noon by the sun till it come to  $l$ . And although the velocity of the real sun diminishes all the way from  $C$  to  $A$ , and the fictitious sun by an equable motion is still coming nearer to the real sun, yet they are not in conjunction till the one comes to  $A$  and the other to  $a$ ; and then it is noon by them both at the same moment.

Thus it appears, that the solar noon is always later than noon by the clock, whilst the sun goes from  $C$  to  $A$ ; sooner whilst he goes from  $A$  to  $C$ ; and at these points the sun and clock being equal, it is noon by them both at the same moment.

The point  $A$  is called the sun's *apogee*, because when he is there he is at his greatest distance from the earth; the point  $C$  his *perigee*, because when in it he is at his least distance from the earth; and a right line, as  $AEC$ , drawn through the earth's centre, from one of these points to the other, is called *the line of the apses*.

The distance that the sun has gone in any time from his apogee (not the distance he has to go to it, though ever so little) is called his *mean anomaly*, and is reckoned in signs and degrees, allowing 30 degrees to a sign. Thus, when the sun has gone, suppose 174 degrees from his apogee at  $A$ , he is said to be 5 signs 24 degrees from it, which is his mean anomaly: And when he is gone, suppose 355 degrees from his apogee, he is said to be 11 signs 25 degrees from it, although he be but 5 degrees short of  $A$  in coming round to it again.

From what was said above, it appears, that when the sun's anomaly is less than 6 signs, that is, when he is any where between  $A$  and  $C$ , in the half  $ABC$  of his orbit, the solar noon precedes the clock noon; but when his anomaly is more than 6 signs, that is, when he is any where between  $C$  and  $A$ , in the half  $CDA$  of his orbit, the clock noon precedes the solar. When his anomaly is 0 signs 0 degrees, that is, when he is in his apogee at  $A$ ; or 6 signs 0 degrees, which is when he is in his perigee at  $C$ ; he comes to the meridian at the moment that the fictitious sun does, and then it is noon by them both at the same instant.

The obliquity of the ecliptic to the equator, which is the first mentioned cause of the equation of time, would make the sun and clocks agree on four days of the year; which are, when the sun enters Aries, Cancer, Libra, and Capricorn: But the other cause, now explained, would make the sun and clocks equal only twice a year; that is, when the sun is in his apogee and perigee. Consequently, when these two points fall in the beginnings of Cancer and Capricorn, or of Aries and Libra, they concur in making the sun and clocks equal in these points. But the apogee at present is in the 9th degree of Cancer,

and the perigee in the 9th degree of Capricorn, and therefore the sun and clocks cannot be equal about the beginning of these signs, nor at any time of the year, except when the swiftness or slowness of equation resulting from one cause just balances the slowness or swiftness arising from the other.

## CHAP. XII. *Of the Precession of the Equinoxes.*

It is a known fact, that there is a greater quantity of matter accumulated all round the equatorial parts of the earth than any where else.

The sun and moon, by attracting this redundancy of matter, bring the equator sooner under them in every return towards it, than if there was no such accumulation. Therefore, if the sun sets out, as from any star, or other fixed point in the heavens, the moment when he is departing from the equinoctial or from either tropic, he will come to the same equinox or tropic again 20 min.  $17\frac{1}{2}$  sec. of time, or 50 seconds of a degree, before he completes his course, so as to arrive at the same fixed star or point from whence he set out. For, the equinoctial points recede 50 seconds of a degree westward every year, contrary to the sun's annual progressive motion.

When the sun arrives at the same equinoctial or solstitial point, he finishes what we call the *tropical year*; which, by observation, is found to contain 365 days 5 hours 48 minutes 57 seconds: And, when he arrives at the same fixed star again, as seen from the earth, he completes the *sydereal year*, which contains 365 days 6 hours 9 minutes  $14\frac{1}{2}$  seconds. The *sydereal year* is therefore 20 minutes  $17\frac{1}{2}$  seconds longer than the solar or tropical year; and 9 minutes  $14\frac{1}{2}$  seconds longer than the Julian or civil year, which we state at 365 days

6 hours: So that the civil year is almost a mean betwixt the *sydereal* and *tropical*.

As the sun describes the whole ecliptic, or 360 degrees, in a tropical year, he moves 59 minutes 8 seconds of a degree every day at a mean rate; and consequently 50 seconds of a degree in 20 minutes  $17\frac{1}{2}$  seconds of time: Therefore, he will arrive at the same equinox or solstice when he is 50 seconds of a degree short of the same star or fixed point in the heavens from which he set out in the year before. So that, with respect to the fixed stars, the sun and equinoctial points fall back (as it were) 30 degrees in 2160 years; which will make the stars appear to have gone 30 degrees forward, with respect to the signs of the ecliptic in that time: For the same signs always keep in the same points of the ecliptic, without regard to the constellations.

To explain this by a figure, (Plate XLIII. fig. 1.) let the sun be in conjunction with a fixed star at *S*, suppose in the 30th degree of  $\gamma$  on the 21st of May 1756. Then, making 2160 revolutions through the ecliptic *VWX*, at the end of so many *sydereal* years, he will be found again at *S*: But at the end of so many Julian years, he will be found at *M*, short of *S*; and at the end of so many tropical years, he will be found short of *M* in the 30th degree of Taurus at *T*, which has receded back from *S* to *T* in that time, by the precession of the equinoctial points  $\gamma$  Aries and  $\text{♎}$  Libra. The arc *ST* will be equal to the amount of the precession of the equinox in 2160 years, at the rate of 50 seconds of a degree, or 20 minutes  $17\frac{1}{2}$  seconds of time, annually: This, in so many years, makes 30 days  $10\frac{1}{2}$  hours; which is the difference between 2160 *sydereal* and *tropical* years: And the arc *MT* will be equal to the space moved through by the sun in 2160 times 11 minutes 3 seconds, or 16 days 13 hours 48 minutes, which is the difference between 2160 Julian and *tropical* years.

A TABLE shewing the Precession of the Equinoctial Points in the Heavens, both in Motion and Time; and the Anticipation of the Equinoxes on Earth.

From

From the shifting of the equinoctial points, and with them all the signs of the ecliptic, it follows, that those stars which, in the infancy of astronomy, were in Aries, are now got into Taurus; those of Taurus into Gemini, &c. Hence likewise it is, that the stars which rose or set at any particular season of the year, in the times of Hesiod, Eudoxius, Virgil, Pliny, &c. by no means answer at this time to their descriptions. The preceding table shews the quantity of this shifting both in the heavens and on the earth, for any number of years to 25,920, which compleats the grand celestial period; within which any number and its quantity is easily found,

as in the following example, for 5763 years; which, at the autumnal equinox, *A. D.* 1756, is thought to be the age of the world. So that with regard to the fixed stars, the equinoctial points in the heavens have receded  $2^{\circ} 20' 2' 30''$  since the creation; which is as much as the sun moves in  $81^d 5^h 0^m 52^s$ . And since that time, or in 5763 years, the equinoxes with us have fallen back  $44^d 5^h 21^m 9^s$ ; hence, reckoning from the time of the Julian equinox, *A. D.* 1756, viz. Sept. 11th, it appears, that the autumnal equinox at the creation was on the 25th of October.

The anticipation of the equinoxes, and consequently of the seasons, is by no means owing to the precession of the equinoctial and solstitial points in the heavens, (which can only affect the apparent motions, places, and declinations of the fixed stars), but to the difference between the civil and solar year, which is 11 minutes 3 seconds; the civil year containing 365 days 6 hours, and the solar year 365 days 5 hours 48 minutes 57 seconds.

The above 11 minutes 3 seconds, by which the civil or Julian year exceeds the solar, amounts to 11 days in 1433 years; and so much our seasons have fallen back with respect to the days of the months, since the time of the Nicene Council in *A. D.* 325, and therefore in order to bring back all the fasts and festivals to the days then settled, it was requisite to suppress 11 nominal days. And that the same seasons might be kept to the same times of the year for the future, to leave out the biffextile day in February at the end of every century of years not divisible by 4; reckoning then only common years, as the 17th, 18th, and 19th centuries, viz. the years 1700, 1800, 1900, &c. because a day intercalated every fourth year was too much, and retaining the biffextile-day at the end of those centuries of years which are divisible by 4, as the 16th, 20th, and 24th centuries, viz. the years 1600, 2000, 2400, &c. Otherwise, in length of time, the seasons would be quite reversed with regard to the months of the year; though it would have required near 23,783 years to have brought about such a total change. If the earth had made exactly  $365\frac{1}{4}$  diurnal rotations on its axis, whilst it revolved from any equinoctial or solstitial point to the same again, the civil and solar years would always have kept pace together, and the style would never have needed any alteration.

Having already mentioned the cause of the precession of the equinoctial points in the heavens, which occasions a slow deviation of the earth's axis from its parallelism, and thereby a change of the declination of the stars from the equator, together with a slow apparent motion of the stars forward with respect to the signs of the ecliptic; we shall now describe the phenomena by a diagram.

In Plate XLIII. fig. 2. let *NZSVL* be the earth, *SONA* its axis produced to the starry heavens, and terminating in *A*, the present north pole of the heavens, which is vertical to *N* the north pole of the earth. Let *EOQ* be the equator, *TQZ* the tropic of Cancer, and *VT<sub>r</sub>* the tropic of Capricorn; *VOZ* the ecliptic, and *BO* its axis, both which are immoveable among the stars. But as the equinoctial points recede in the ecliptic, the earth's axis *SON* is in motion upon the earth's centre *O*, in such a manner as to describe the double cone *NON* and *SO<sub>r</sub>*, round the axis of the ecliptic *BO*, in the time that the equinoctial points move quite round the ecliptic, which is 25,920 years; and in that length of time, the north pole of the earth's axis produced, describes the circle *ABCD<sub>r</sub>* in the starry heavens, round the pole of the ecliptic, which keeps immoveable in the centre of that circle. The earth's axis being  $23\frac{1}{2}$  degrees inclined to the axis of the ecliptic, the circle *ADCDA<sub>r</sub>*, described by the north pole of the earth's axis produced to *A*, is 47 degrees in diameter, or double the inclination of the earth's axis. In consequence of this, the point *A*, which at present is the north pole of the heavens, and near to a star of the second magnitude in the tail of the constellation called the *Little Bear*, must be deserted by the earth's axis, which moving backwards a degree every 72 years, will be directed towards the star or point *B* in

6480 years hence; and in double of that time, or 12,960 years, it will be directed towards the star or point *G*; which will then be the north pole of the heavens, although it is at present  $8\frac{1}{2}$  degrees south of the zenith of London *L*. The present position of the equator *EOQ*, will then be changed into *oQ*; the tropic of Cancer *TQZ*, into *VtQ*; and the tropic of Capricorn *VTrs*, into *trtZ*; as is evident by the figure. And the sun, in the same part of the heavens where he is now over the earthly tropic of Capricorn, and makes the shortest days and longest nights in the northern hemisphere, will then be over the earthly tropic of Cancer, and make the days longest and nights shortest. So that it will require 12,960 years yet more, or 25,920 from the present time, to bring the north pole *N* quite round, so as to be directed towards that point of the heavens which is vertical to it at present. And then, and not till then, the same stars which at present describe the equator, tropics, and polar circles, &c. by the earth's diurnal motion, will describe them over again.

CHAP. XIII. *The moon's surface mountainous: Her phases described: Her path and the paths of Jupiter's moons delineated: The proportions of the diameters of their orbits, and those of Saturn's moons, to each other, and to the diameter of the Sun.*

By looking at the moon with an ordinary telescope, we perceive that her surface is diversified with long tracts of prodigious high mountains and deep cavities. Some of her mountains, by comparing their height with her diameter (which is 2180 miles) are found to be three times higher than the highest hills on our earth. This ruggedness of the moon's surface is of great use to us, by reflecting the sun's light to all sides; for if the moon were smooth and polished like a looking-glass, or covered with water, she could never distribute the sun's light all round; only in some positions she would shew us his image no bigger than a point, but with such a lustre as would be hurtful to our eyes.

The moon's surface being so uneven, many have wondered why her edge appears not jagged, as well as the curve bounding the light and dark places. But if we consider, that what we call the edge of the moon's disk is not a single line set round with mountains, in which case it would appear irregularly indented, but a large zone having many mountains lying behind one another from the observer's eye, we shall find that the mountains in some rows will be opposite to the vales in others, and so fill up the inequalities as to make her appear quite round; just as when one looks at an orange, although its roughness be very discernible on the side next the eye, especially if the sun or a candle shines obliquely on that side, yet the line terminating the visible part still appears smooth and even.

As the sun can only enlighten that half of the earth which is at any moment turned towards him, and being withdrawn from the opposite half, leaves it in darkness;

so he likewise doth to the moon; only with this difference, that the earth being surrounded by an atmosphere, and the moon having none, we have twilight after the sun sets; but the lunar inhabitants have an immediate transition from the brightest sun-shine to the blackest darkness. For, (Plate XLIII. fig. 3.) let *tkrsu* be the earth, and *ABCDEFGH* the moon in eight different parts of her orbit. As the earth turns round its axis from west to east, when any place comes to *t* the twilight begins there, and when it revolves from thence to *r* the sun *S* rises; and when the place comes to *s* the sun sets, and when it comes to *w* the twilight ends. But as the moon turns round her axis, which is only once a-month, the moment that any point of her surface comes to *r* (see the moon at *G*) the sun rises there without any previous warning by twilight; and when the same point comes to *t* the sun sets, and that point goes into darkness as black as at midnight.

The moon being an opaque spherical body, (for her hills take off no more from her roundness than the inequalities on the surface of an orange takes off from its roundness), we can only see that part of the enlightened half of her which is towards the earth. And therefore, when the moon is at *A*, in conjunction with the sun *S*, her dark half is towards the earth, and she disappears, as at *a*, there being no light on that half to render it visible. When she comes to her first octant at *B*, or has gone an eighth part of her orbit from her conjunction, a quarter of her enlightened side is towards the earth, and she appears horned, as at *b*. When she has gone a quarter of her orbit from between the earth and sun to *C*, she shews us one half of her enlightened side, as at *c*, and we say, she is a quarter old. At *D* in her second octant, and by shewing us more of her enlightened side she appears gibbous, as at *d*. At *E* her whole enlightened side is towards the earth, and therefore she appears round, as at *e*, when we say, it is full moon. In her third octant at *F*, part of her dark side being towards the earth, she again appears gibbous, and is on the decrease, as at *f*. At *G* we see just one half of her enlightened side, and she appears half decreased, or in her third quarter, as at *g*. At *H* we only see a quarter of her enlightened side, being in her fourth octant, where she appears horned, as at *h*. And at *A*, having completed her course from the sun to the sun again, she disappears, and we say, it is new moon. Thus in going from *A* to *E*, the moon seems continually to increase; and in going from *E* to *A*, to decrease in the same proportion; having like phases at equal distances from *A* or *E*, but as seen from the sun *S*, she is always full.

The moon appears not perfectly round when she is full in the highest or lowest part of her orbit, because we have not a full view of her enlightened side at that time. When full in the highest part of her orbit, a small deficiency appears on her lower edge; and the contrary when full in the lowest part of her orbit.

It is plain by the figure, that when the moon changes to the earth, the earth appears full to the moon; and *vice versa*. For when the moon is at *A*, new to the earth, the whole enlightened side of the earth is towards the moon; and when the moon is at *E*, full to the earth,

its dark side is towards her. Hence a new moon answers to a full earth, and a full moon to a new earth. The quarters are also reversed to each other.

Between the third quarter and change, the moon is frequently visible in the forenoon, even when the sun shines; and then she affords us an opportunity of seeing a very agreeable appearance, where-ever we find a globular stone above the level of the eye, as suppose on the top of a gate. For, if the sun shines on the stone, and we place ourselves so as the upper part of the sun may just seem to touch the point of the moon's lowermost horn, we shall then see the enlightened part of the stone exactly of the same shape with the moon, horned as she is, and inclining the same way to the horizon. The reason is plain, for the sun enlightens the stone the same way as he does the moon; and both being globes, when we put ourselves into the above situation, the moon and stone have the same position to our eyes, and therefore we must see as much of the illuminated part of the one as of the other.

The position of the moon's cusps, or a right line touching the points of her horns, is very differently inclined to the horizon at different hours of the same days of her age. Sometimes she stands, as it were, upright on her lower horn, and then such a line is perpendicular to the horizon: when this happens, she is in what the astronomers call the *nonagesimal degree*, which is the highest point of the ecliptic above the horizon at that time, and is 90 degrees from both sides of the horizon, where it is then cut by the ecliptic. But this never happens when the moon is on the meridian, except when she is at the very beginning of Cancer or Capricorn.

The inclination of that part of the ecliptic to the horizon in which the moon is at any time when horned, may be known by the position of her horns; for a right line touching their points is perpendicular to the ecliptic. And as the angle that the moon's orbit makes with the ecliptic can never raise her above, nor depress her below the ecliptic, more than two minutes of a degree, as seen from the sun, it can have no sensible effect upon the position of her horns. Therefore, if a quadrant be held up, so as one of its edges may seem to touch the moon's horns, the graduated side being kept towards the eye, and as far from the eye as it can be conveniently held, the arc between the plumb-line and that edge of the quadrant which seems to touch the moon's horns, will shew the inclination of that part of the ecliptic to the horizon. And the arc between the other edge of the quadrant and plumb-line will shew the inclination of the moon's horns to the horizon.

The moon generally appears as large as the sun; for the angle  $\angle A$ , (Plate XLIII. fig. 3.) under which the moon is seen from the earth, is the same with the angle  $\angle kM$ , under which the sun is seen from it. And therefore the moon may hide the sun's whole disk from us, as she sometimes does in solar eclipses. The reason why she does not eclipse the sun at every change shall be explained afterwards. If the moon were farther from the earth, as at  $a$ , she could never hide the whole of the sun from us; for then she would appear under the angle  $\angle NkO$ , eclipsing only that part of the sun which lies between  $N$  and  $O$ : were she

still further from the earth, as at  $X$ , she would appear under the small angle  $\angle Tkh$ , like a spot on the sun, hiding only the part  $TW$  from our sight.

The moon turns round her axis in the time that she goes round her orbit; which is evident from hence, that a spectator at rest, without the periphery of the moon's orbit, would see all her sides turned regularly towards him in that time. She turns round her axis from any star to the same star again in 27 days 8 hours; from the sun to the sun again in 29 $\frac{1}{2}$  days: the former is the length of the syderal day, and the latter the length of her solar day. A body moving round the sun would have a solar day in every revolution, without turning on its axis, the same as if it had kept all the while at rest, and the sun moved round it; but without turning round its axis it could never have one syderal day, because it would always keep the same side towards any given star.

If the earth had no annual motion, the moon would go round it so as to complete a lunation, a syderal, and a solar day, all in the same time. But, because the earth goes forward in its orbit, while the moon goes round the earth in her orbit, the moon must go as much more than round her orbit from change to change in completing a solar day, as the earth has gone forward in its orbit during that time, *i. e.* almost a twelfth part of a circle.

The moon's periodical and synodical revolution may be familiarly represented by the motions of the hour and minute-hands of a watch round its dial-plate, which is divided into 12 equal parts or hours, as the ecliptic is divided into 12 signs, and the year into 12 months. Let us suppose these 12 hours to be 12 signs, the hour-hand the sun, and the minute-hand the moon; then will the former go round once in a year, and the latter once in a month; but the moon, or minute-hand, must go more than round from any point of the circle where it was last conjoined with the sun, or hour-hand, to overtake it again: For the hour-hand being in motion, can never be overtaken by the minute-hand at that point from which they started at their last conjunction.

If the earth had no annual motion, the moon's motion round the earth, and her track in absolute space, would be always the same. But as the earth and moon move round the sun, the moon's real path in the heavens is very different from her visible path round the earth; the latter being in a progressive circle, and the former in a curve of different degrees of concavity, which would always be the same in the same parts of the heavens, if the moon performed a complete number of lunations in a year without any thing over.

Let a nail in the end of the axle of a chariot-wheel represent the earth, and a pin in the nave the moon; if the body of the chariot be propped up so as to keep that wheel from touching the ground, and the wheel be then turned round by hand, the pin will describe a circle both round the nail, and in the space it moves through. But if the props be taken away, the horses put to, and the chariot driven over a piece of ground which is circularly convex, the nail in the axle will describe a circular curve, and the pin in the nave will still describe a circle round the progressive nail in the axle, but not in the space through which it moves. In this case, the curve

described

described by the nail will resemble in miniature as much of the earth's annual path round the sun, as it describes whilst the moon goes as often round the earth as the pin does round the nail; and the curve described by the nail will have some resemblance of the moon's path during so many lunations.

Let us now suppose that the radius of the circular curve described by the nail in the axle is to the radius of the circle which the pin in the nave describes round the axle, as  $337\frac{1}{2}$  to 1; which is the proportion of the radius or semidiameter of the earth's orbit to that of the moon's, or of the circular curve  $A 1 2 3 4 5 6 7 B$ , &c. to the little circle  $a$ ; and then, whilst the progressive nail describes the said curve from  $A$  to  $E$ , the pin will go once round the nail with regard to the centre of its path, and in so doing, will describe the curve  $abcde$ . The former will be a true representation of the earth's path for one lunation, and the latter of the moon's for that time. Here we may set aside the inequalities of the moon's motion, and also the earth's moving round its common centre of gravity and the moon's: All which, if they were truly copied in this experiment, would not sensibly alter the figure of the paths described by the nail and pin, even though they should rub against a plain upright surface all the way, and leave their tracks visible upon it. And if the chariot was driven forward on such a convex piece of ground, so as to turn the wheel several times round, the track of the pin in the nave would still be concave toward the centre of the circular curve described by the pin in the axle; as the moon's path is always concave to the sun in the centre of the earth's annual orbit.

In this diagram, the thickest curve line  $ABCD$ , with the numeral figures set to it, represents as much of the earth's annual orbit as it describes in 32 days from west to east; the little circles at  $abcde$  shew the moon's orbit in due proportion to the earth's; and the smallest curve  $abcdef$  represents the line of the moon's path in the heavens for 32 days, accounted from any particular new moon at  $a$ . The machine, Plate XLIX. fig. 2. is for delineating the moon's path, and will be described, with the rest of the astronomical machinery, in the last chapter. The sun is supposed to be in the centre of the curve  $A 1 2 3 4 5 6 7 B$ , &c. and the small dotted circles upon it represent the moon's orbit, of which the radius is in the same proportion to the earth's path in this scheme, that the radius of the moon's orbit in the heavens bears to the radius of the earth's annual path round the sun; that is, as 240,000 to 81,000,000, or as 1 to  $337\frac{1}{2}$ .

When the earth is at  $A$ , the new moon is at  $a$ ; and in the seven days that the earth describes the curve  $1 2 3 4 5 6 7$ , the moon, in accompanying the earth describes the curve  $ab$ ; and is in her first quarter at  $b$  when the earth is at  $B$ . As in the earth describes the curve  $B 8 9 10 11 12 13 14$ , the moon describes the curve  $bc$ ; and is at  $c$ , opposite to the sun, when the earth is at  $C$ . Whilst the earth describes the curve  $C 15 16 17 18 19 20 21 22$ , the moon describes the curve  $cd$ ; and is in her third quarter at  $d$  when the earth is at  $D$ . Once more, whilst the earth describes the curve  $D 23 24 25 26 27 28 29$ , the moon describes

the curve  $de$ , and is again in conjunction at  $e$  with the sun when the earth is at  $E$ , between the 29th and 30th day of the moon's age, accounted by the numeral figures from the new moon at  $A$ . In describing the curve  $abcde$ , the moon goes round the progressive earth as really as if she had kept in the dotted circle  $A$ , and the earth continued immovable in the centre of that circle.

And thus we see, that although the moon goes round the earth in a circle, with respect to the earth's centre, her real path in the heavens is not very different in appearance from the earth's path. To shew that the moon's path is concave to the sun, even at the time of change, it is carried on a little farther into a second lunation, as to  $f$ .

The moon's absolute motion from her change to her first quarter, or from  $a$  to  $b$ , is so much slower than the earth's, that she falls 240 thousand miles (equal to the semidiameter of her orbit) behind the earth at her first quarter in  $b$ , when the earth is in  $B$ ; that is, she falls back a space equal to her distance from the earth. From that time her motion is gradually accelerated to her opposition or full at  $e$ , and then she is come up as far as the earth, having regained what she lost in her first quarter from  $a$  to  $b$ . From the full to the last quarter at  $d$ , her motion continues accelerated, so as to be just as far before the earth at  $D$ , as she was behind it at her first quarter in  $b$ . But, from  $d$  to  $e$  her motion is retarded so, that she loses as much with respect to the earth as is equal to her distance from it, or to the semidiameter of her orbit; and by that means she comes to  $e$ , and is then in conjunction with the sun, as seen from the earth at  $E$ . Hence we find, that the moon's absolute motion is slower than the earth's from her third quarter to her first; and swifter than the earth's from her first quarter to her third: Her path being less curved than the earth's in the former case, and more in the latter. Yet it is still bent the same way towards the sun; for if we imagine the concavity of the earth's orbit to be measured by the length of a perpendicular line  $Cg$ , let down from the earth's place upon the straight line  $bgd$  at the full of the moon, and connecting the places of the earth at the end of the moon's first and third quarters, that length will be about 640 thousand miles; and the moon, when new, only approaching nearer to the sun by 240 thousand miles than the earth is, the length of the perpendicular let down from her place at that time upon the same straight line, and which shews the concavity of that part of her path, will be about 400 thousand miles.

The moon's path being concave to the sun throughout, demonstrates that her gravity towards the sun, at her conjunction, exceeds her gravity towards the earth. And if we consider that the quantity of matter in the sun is almost 230 thousand times as great as the quantity of matter in the earth, and that the attraction of each body diminishes as the square of the distance from it increases, we shall soon find, that the point of equal attraction between the earth and the sun is about 70 thousand miles nearer the earth than the moon is at her change. It may now appear surprising, that the moon does not abandon the earth when she is between it and the sun, because she is considerably more attracted by the sun than by the earth.

earth at that time. But this difficulty vanishes when we consider, that a common impulse on any system of bodies affects not their relative motions; but that they will continue to attract, impel, or circulate round one another, in the same manner as if there was no such impulse. The moon is so near the earth, and both of them so far from the sun, that the attractive power of the sun may be considered as equal on both; and therefore, the moon will continue to circulate round the earth in the same manner as if the sun did not attract them at all; like bodies in the cabin of a ship, which move round, or impel one another, in the same manner when the ship is under sail, as when it is at rest, because they are all equally affected by the common motion of the ship. If by any other cause, such as the near approach of a comet, the moon's distance from the earth should happen to be so much increased, that the difference of their gravitating forces towards the sun should exceed that of the moon towards the earth; in that case, the moon, when in conjunction, would abandon the earth, and be either drawn into the sun, or comet, or circulate round about it.

The curves which Jupiter's satellites describe, are all of different sorts from the path described by our moon, although these satellites go round Jupiter, as the moon goes round the earth. In Plate XLIII. fig. 3. let *ABCDE*, &c. be as much of Jupiter's orbit as he describes in 18 days from *A* to *T*; and the curves *abcd* will be the paths of his four moons going round him in his progressive motion.

Now let us suppose all these moons to set out from a conjunction with the sun, as seen from Jupiter at *A*; then his first or nearest moon will be at *a*, his second at *b*, his third at *c*, and his fourth at *d*. At the end of 24 terrestrial hours after this conjunction, Jupiter has moved to *B*, his first moon or satellite has described the curve *a1*, his second the curve *b1*, his third *c1*, and his fourth *d1*. The next day, when Jupiter is at *C*, his first satellite has described the curve *a2*, from its conjunction, his second the curve *b2*, his third the curve *c2*, and his fourth the curve *d2*, and so on. The numeral figures under the capital letters shew Jupiter's place in his path every day for 18 days, accounted from *A* to *T*; and the like figures set to the paths of his satellites, shew where they are at the like times. The first satellite, almost under *C*, is stationary at + as seen from the sun; and retrograde from + to 2: at 2 it appears stationary again, and thence it moves forward until it has past 3, and is twice stationary, and once retrograde, between 3 and 4. The path of this satellite intersects itself every 42½ hours, making such loops as in the diagram at 2 3 5 7 9 10 12 14 16 18, a little after every conjunction. The second satellite *b*, moving slower, barely crosses its path every 3 days 13 hours; as at 4 7 11 14 18, making only five loops and as many conjunctions in the time that the first makes ten. The third satellite *c* moving still slower, and having described the curve *c* 1 2 3 4 5 6 7, comes to an angle at 7 in conjunction with the sun at the end of 7 days 4 hours; and so goes on to describe such another curve 7 8 9 10 11 12 13 14, and is at 14 in its next conjunction. The

fourth satellite *d* is always progressive, making neither loops nor angles in the heavens; but comes to its next conjunction at *e* between the numeral figures 16 and 17, or in 16 days 18 hours. In order to have a tolerably good figure of the paths of these satellites, take the following method.

It appears by the scheme, that the three first satellites come almost into the same line or position every seventh day; the first being only a little behind with the second, a *d* the second behind with the third. But the period of the fourth satellite is so incommensurate to the periods of the other three, that it cannot be guessed at by the diagram when it would fall again into a line of conjunction with them, between Jupiter and the sun. And no wonder; for supposing them all to have been once in conjunction, it will require 3,087,043,493,260 years to bring them in conjunction again.

In Plate XLIV. fig. 1. we have the proportions of the orbits of Saturn's five satellites, and of Jupiter's four, to one another, to our moon's orbit, and to the disk of the sun. *S* is the sun; *M m* the moon's orbit, (the earth supposed to be at *E*); *J* Jupiter; 1 2 3 4 the orbits of his four moons or satellites; *Sat* Saturn; and 1 2 3 4 5 the orbits of his five moons. Hence it appears, that the sun would much more than fill the whole orbit of the moon; for the sun's diameter is 763,000 miles, and the diameter of the moon's orbit only 480,000. In proportion to all these orbits of the satellites, the radius of Saturn's annual orbit would be 21½ yards, of Jupiter's orbit 11½, and of the earth's 2½, taking them in round numbers.

#### CHAP. XIV. *The Phenomena of the Harvest-moon explained by a common Globe: The years in which the Harvest-moons are least and most beneficial from 1751, to 1861. The long Duration of Moon-light at the Poles in Winter.*

It is generally believed that the moon rises about 48 minutes later every day than on the preceding; but this is true only with regard to places on the equator. In places of considerable latitude there is a remarkable difference, especially in the harvest time; with which farmers were better acquainted than astronomers till of late; and gratefully ascribed the early rising of the full moon at that time of the year to the goodness of God, in ordering it so on purpose to give them an immediate supply of moon-light after sun-set for their greater convenience in reaping the fruits of the earth. And indeed,

In this instance of the harvest-moon, as in many others discoverable by astronomy, the wisdom and beneficence of the Deity is conspicuous, who really ordered the course of the moon so, as to bestow more or less light on all parts of the earth as their several circumstances and seasons render it more or less serviceable. About the equator, where there is no variety of seasons, and the weather changes seldom, and at stated times, moon-light is not necessary for gathering in the produce of the ground;

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

A. B. So.

ground; and there the moon rises about 48 minutes later every day or night than on the former. At considerable distances from the equator, where the weather and seasons are more uncertain, the autumnal full moons rise very soon after sun-set for several evenings together. At the polar circles, where the mild season is of very short duration, the autumnal full moon rises at sun-set from the first to the third quarter. And at the poles, where the sun is for half a year absent, the winter full moons shine constantly without setting from the first to the third quarter.

It is soon said that all these phenomena are owing to the different angles made by the horizon and different parts of the moon's orbit; and that the moon can be full but once or twice in a year in those parts of her orbit which rise with the least angles. But to explain this subject intelligibly, we must dwell much longer upon it.

The plane of the equinoctial is perpendicular to the earth's axis: and therefore, as the earth turns round its axis, all parts of the equinoctial make equal angles with the horizon both at rising and setting; so that equal portions of it always rise or set in equal times. Consequently, if the moon's motion were equable, and in the equinoctial, at the rate of 12 degrees from the sun every day, as it is in her orbit, she would rise and set 48 minutes later every day than on the preceding: for 12 degrees of the equinoctial rise or set in 48 minutes of time, in all latitudes.

But the moon's motion is so nearly in the ecliptic, that we may consider her as present as moving in it. Now the different parts of the ecliptic, on account of its obliquity to the earth's axis, make very different angles with the horizon as they rise or set. Those parts or signs which rise with the smallest angles set with the greatest, and *vice versa*. In equal times, whenever this angle is least, a greater portion of the ecliptic rises than when the angle is larger; as may be seen by elevating the pole of a globe to any considerable latitude, and then turning it round its axis in the horizon. Consequently, when the moon is in those signs which rise or set with the smallest angles, she rises or sets with the least difference of time; and with the greatest difference in those signs which rise or set with the greatest angles.

But, because all who read this treatise may not be provided with globes, though in this case it is requisite to know how to use them, we shall substitute the figure of a globe; (Plate XLIV. fig. 2.) in which *FUP* is the axis, *STR* the tropic of Cancer, *LTr* the tropic of Capricorn, *EUR* the ecliptic touching both the tropics, which are 47 degrees from each other, and *AB* the horizon. The equator, being in the middle between the tropics, is cut by the ecliptic in two opposite points, which are the beginnings of  $\Psi$  Aries and  $\Omega$  Libra. *K* is the hour-circle with its index, *F* the north pole of the globe elevated to a considerable latitude, suppose 40 degrees above the horizon, and *P* the south pole depressed as much below it. Because of the oblique position of the sphere in this latitude, the ecliptic has the high elevation *N* above the horizon, making the angle *NU* of  $73\frac{1}{2}$  degrees with it when  $\Omega$  Cancer is on the meridian, at which time  $\Omega$  Libra rises in the

east. But let the globe be turned half round its axis, till *rs* Capricorn comes to the meridian and  $\Psi$  Aries rises in the east, and then the ecliptic will have the low elevation *NL* above the horizon, making only an angle *NUL* of  $26\frac{1}{2}$  degrees with it; which is 47 degrees less than the former angle, equal to the distance between the tropics.

In northern latitudes, the smallest angle made by the ecliptic and horizon is when Aries rises, at which time Libra sets; the greatest when Libra rises, at which time Aries sets. From the rising of Aries to the rising of Libra, (which is twelve syderal hours), the angle increases; and from the rising of Libra to the rising of Aries, it decreases in the same proportion. By this article and the preceding, it appears that the ecliptic rises fastest about Aries, and slowest about Libra.

On the parallel of London, as much of the ecliptic rises about Pisces and Aries in two hours as the moon goes through in six days; and therefore whilst the moon is in these signs, she differs but two hours in rising for six days together; that is, about 20 minutes later every day or night than on the preceding, at a mean rate. But in 14 days afterwards, the moon comes to Virgo and Libra, which are the opposite signs to Pisces and Aries; and then she differs almost four times as much in rising; namely, one hour and about fifteen minutes later every day or night than the former, whilst she is in these signs.

All these things will be made plain by putting small patches on the ecliptic of a globe, as far from one another as the moon moves from any point of the celestial ecliptic in 24 hours, which at a mean rate is  $13\frac{1}{2}$  degrees; and then in turning the globe round, observe the rising and setting of the patches in the horizon, as the index points out the different times in the hour-circle. A few of these patches are represented by dots at *O* 1 2 3, &c. on the ecliptic, which has the position *LUI* when Aries rises in the east; and by the dots *o* 1 2 3, &c. when Libra rises in the east; at which time the ecliptic has the position *EUR*; making an angle of 62 degrees with the horizon in the latter case, and an angle of no more than 15 degrees with it in the former; supposing the globe rectified to the latitude of London.

Having rectified the globe, turn it until the patch at *o*, about the beginning of  $\Psi$  Pisces in the half *LUI* of the ecliptic, comes to the eastern side of the horizon; and then keeping the ball steady, set the hour-index to XII, because that hour may perhaps be more easily remembered than any other. Then turn the globe round westward, and in that time, suppose the patch *o* to have moved thence to 1,  $13\frac{1}{2}$  degrees, whilst the earth turns once round its axis, and you will see that 1 rises only about 20 minutes later than *o* did on the day before. Turn the globe round again, and in that time suppose the same patch to have moved from 1 to 2; and it will rise only 20 minutes later by the hour-index than it did at 1 on the day or turn before. At the end of the next turn, suppose the patch to have gone from 2 to 3 at *U*, and it will rise 20 minutes later than it did at 2. And so on for six turns, in which time there will scarce be two hours difference: nor would there have been so much if

the 6 degrees of the sun's motion in that time had been allowed for. At the first turn the patch rises south of the east, at the middle turn due east, and at the last turn north of the east. But these patches will be 9 hours of setting on the western side of the horizon, which shews that the moon will be so much later of setting in that week in which she moves through these two signs. The cause of this difference is evident; for Pisces and Aries make only an angle of 15 degrees with the horizon when they rise; but they make an angle of 62 degrees with it when they set. As the signs Taurus, Gemini, Cancer, Leo, Virgo, and Libra, rise successively, the angle increases gradually which they make with the horizon; and decreases in the same proportion as they set. And for that reason, the moon differs gradually more in the time of her rising every day whilst she is in these signs; and less in her setting: after which, through the other six signs, *viz.* Scorpio, Sagittary, Capricorn, Aquarius, Pisces, and Aries, the rising difference becomes less every day, until it be at the least of all, namely, in Pisces and Aries.

The moon goes round the ecliptic in 27 days 8 hours; but not from change to change in less than 29 days 12 hours: so that she is in Pisces and Aries at least once in every lunation, and in some lunations twice.

If the earth had no annual motion, the sun would never appear to shift his place in the ecliptic. And then every new moon would fall in the same sign and degree of the ecliptic, and every full moon in the opposite; for the moon would go precisely round the ecliptic from change to change. So that if the moon was once full in Pisces or Aries, she would always be full when she came round to the same sign and degree again. And as the full moon rises at sun-set (because when any point of the ecliptic sets, the opposite point rises) she would constantly rise within two hours of sun-set, on the parallel of London, during the week in which she were full. But in the time that the moon goes round the ecliptic from any conjunction or opposition, the earth goes almost a sign forward; and therefore the sun will seem to go as far forward in that time, namely,  $27\frac{1}{3}$  degrees; so that the moon must go  $27\frac{2}{3}$  degrees more than round, and as much farther as the sun advances in that interval, which is  $2\frac{1}{3}$  degrees, before she can be in conjunction with, or opposite to, the sun again. Hence it is evident, that there can be but one conjunction or opposition of the sun and moon in a year in any particular part of the ecliptic. This may be familiarly exemplified by the hour and minute-hands of a watch, which are never in conjunction or opposition in that part of the dial-plate where they were so last before. And indeed, if we compare the twelve hours on the dial-plate to the twelve signs of the ecliptic, the hour-hand to the sun, and the minute-hand to the moon, we shall have a tolerably near resemblance in miniature to the motions of our great celestial luminaries. The only difference is, that whilst the sun goes once round the ecliptic, the moon makes 12 $\frac{2}{3}$  conjunctions with him: but whilst the hour-hand goes round the dial-plate, the minute-hand makes only 11 conjunctions with it; because the minute-hand moves slower in respect of the hour-hand than the moon does with regard to the sun.

As the moon can never be full but when she is opposite to the sun, and the sun is never in Virgo and Libra but in our autumnal months, it is plain that the moon is never full in the opposite signs, Pisces and Aries, but in these two months. And therefore we can have only two full moons in the year, which rise so near the time of sun-set, for a week together, as above mentioned. The former of these is called the *harvest-moon*, and the latter the *hunter's moon*.

Here it will probably be asked, Why we never observe this remarkable rising of the moon but in harvest, since she is in Pisces and Aries twelve times in the year besides; and must then rise with as little difference of time as in harvest? The answer is plain: for in winter these signs rise at noon; and being then only a quarter of a circle distant from the sun, the moon in them is in her first quarter: But when the sun is above the horizon, the moon's rising is neither regarded nor perceived. In spring these signs rise with the sun, because he is then in them; and as the moon changeth in them at that time of the year, she is quite invisible. In summer they rise about midnight, and the sun being then three signs, or a quarter of a circle before them, the moon is in them about her third quarter; when rising so late, and giving but very little light, her rising passes unobserved. And in autumn, these signs, being opposite to the sun, rise when he sets, with the moon in opposition, or at the full, which makes her rising very conspicuous.

At the equator, the north and south poles lie in the horizon; and therefore the ecliptic makes the same angle southward with the horizon when Aries rises, as it does northward when Libra rises. Consequently, as the moon at all the fore-mentioned patches rises and sets nearly at equal angles with the horizon all the year round, and about 48 minutes later every day or night than on the preceding, there can be no particular harvest-moon at the equator.

The farther that any place is from the equator, if it be not beyond the polar circle, the angle gradually diminishes which the ecliptic and horizon make when Pisces and Aries rise: And therefore, when the moon is in these signs she rises with a nearly proportionable difference later every day than on the former; and is for that reason the more remarkable about the full, until we come to the polar circles, or 66 degrees from the equator; in which latitude the ecliptic and horizon become coincident every day for a moment, at the same syderal hour, (or 3 minutes 56 seconds sooner every day than the former), and the very next moment one half of the ecliptic, containing Capricorn, Aquarius, Pisces, Aries, Taurus, and Gemini rises, and the opposite half sets. Therefore, whilst the moon is going from the beginning of Capricorn to the beginning of Cancer, which is almost 14 days, she rises at the same syderal hour; and in autumn, just at sun-set, because all that half of the ecliptic, in which the sun is at that time, sets at the same syderal hour, and the opposite half rises; that is, 3 minutes 56 seconds, of mean solar time, sooner every day than on the day before. So, whilst the moon is going from Capricorn to Cancer, she rises earlier every day than on the preceding, contrary to what she does at all  
places

places between the polar circles. But, during the above fourteen days, the moon is 24 sidereal hours later in setting; for the six signs, which rise all at once on the eastern side of the horizon, are 24 hours in setting on the western side of it; as any one may see by making chalk-marks at the beginning of Capricorn and of Cancer, and then, having elevated the pole  $66\frac{1}{2}$  degrees, turn the globe slowly round its axis, and observe the rising and setting of the ecliptic. As the beginning of Aries is equally distant from the beginning of Cancer and of Capricorn, it is in the middle of that half of the ecliptic which rises all at once. And when the sun is at the beginning of Libra, he is in the middle of the other half. Therefore, when the sun is in Libra, and the moon in Capricorn, the moon is a quarter of a circle before the sun; opposite to him, and consequently full in Aries, and a quarter of a circle behind him, when in Cancer. But when Libra rises, Aries sets, and all that half of the ecliptic of which Aries is the middle; and therefore, at that time of the year, the moon rises at sun-set from her first to her third quarter.

In northern latitudes, the autumnal full moons are in Pifces and Aries, and the vernal full moons in Virgo and Libra: In southern latitudes just the reverse, because the seasons are contrary. But Virgo and Libra rise at as small angles with the horizon in southern latitudes, as Pifces and Aries do in the northern; and therefore the harvest-moons are just as regular on one side of the equator as on the other.

As these signs, which rise with the least angles, set with the greatest, the vernal full moons differ as much in their times of rising every night, as the autumnal full moons differ in their times of setting; and set with as little difference as the autumnal full moons rise; the one being in all cases the reverse of the other.

Hitherto, for the sake of plainness, we have supposed the moon to move in the ecliptic, from which the sun never deviates. But the orbit in which the moon really moves is different from the ecliptic; one half being elevated  $5\frac{1}{2}$  degrees above it, and the other half as much depressed below it. The moon's orbit therefore intersects the ecliptic in two points diametrically opposite to each other; and these intersections are called the *moon's nodes*. So the moon can never be in the ecliptic but when she is in either of her nodes, which is at least twice in every course from change to change, and sometimes thrice. For, as the moon goes almost a whole sign more than round her orbit from change to change, if she passes by either node about the time of change, she will pass by the other in about fourteen days after, and come round to the former node two days again before the next change. That node, from which the moon begins to ascend northward, or above the ecliptic, in northern latitudes, is called the *ascending node*; and the other, the *descending node*; because the moon, when she passes by it, descends below the ecliptic southward.

The moon's oblique motion, with regard to the eclip-

tic, causes some difference in the times of her rising and setting from what is already mentioned. For whilst she is northward of the ecliptic, she rises sooner and sets later than if she moved in the ecliptic; and when she is southward of the ecliptic, she rises later, and sets sooner. This difference is variable, even in the same signs, because the nodes shift backward about  $19\frac{1}{2}$  degrees in the ecliptic every year; and so go round it contrary to the order of signs in 18 years 225 days.

When the ascending node is in Aries, the southern half of the moon's orbit makes an angle of  $5\frac{1}{2}$  degrees less with the horizon than the ecliptic does, when Aries rises in northern latitudes: For which reason the moon rises with less difference of time whilst she is in Pifces and Aries, than there would be if she kept in the ecliptic. But in 9 years and 112 days afterward, the descending node comes to Aries; and then the moon's orbit makes an angle  $5\frac{1}{2}$  degrees greater with the horizon when Aries rises, that the ecliptic does at that time; which causes the moon to rise with greater difference of time in Pifces and Aries than if she moved in the ecliptic.

To be a little more particular; when the ascending node is in Aries, the angle is only  $9\frac{1}{2}$  degrees on the parallel of London when Aries rises. But when the descending node comes to Aries, the angle is  $20\frac{1}{2}$  degrees; this occasions as great a difference of the moon's rising in the same signs every 9 years, as there would be on two parallels to  $10\frac{1}{2}$  degrees from one another, if the moon's course were in the ecliptic.

As there is a complete revolution of the nodes in  $18\frac{1}{2}$  years, there must be a regular period of all the varieties which can happen in the rising and setting of the moon during that time. But this shifting of the nodes never affects the moon's rising so much, even in her quickest descending latitude, as not to allow us still the benefit of her rising nearer the time of sun-set for a few days together about the full in harvest, than when she is full at any other time of the year. The following table shews in what years the harvest-moons are least beneficial as to the times of their rising, and in what years most, from 1751 to 1861. The column of years under the letter L are those in which the harvest-moons are least of all beneficial, because they fall about the descending node; and those under M are the most of all beneficial, because they fall about the ascending node. In all the columns from N to S, the harvest-moons descend gradually in the lunar orbit, and rise to less heights above the horizon. From S to N they ascend in the same proportion, and rise to greater heights above the horizon. In both the columns under S, the harvest-moons are in the lowest part of the moon's orbit; that is, farthest south of the ecliptic; and therefore stay shortest of all above the horizon; in the columns under N, just the reverse. And, in both cases, their rising, though not at the same times, are nearly the same with regard to difference of time, as if the moon's orbit were coincident with the ecliptic.

At the polar circles, when the sun touches the summer tropic, he continues 24 hours above the horizon, and 24 hours below it when he touches the winter tropic. For the same reason, the full moon neither rises in summer, nor sets in winter, considering her as moving in the ecliptic. For the winter full moon being as high in the ecliptic as the summer fun, must therefore continue as long above the horizon; and the summer full moon being as low in the ecliptic as the winter fun, can no more rise than he does. But these are only the two full moons which happen about the tropics, for all the others rise and set. In summer, the full moons are low, and their stay is short above the horizon, when the nights are short, and we have least occasion for moon-light: In winter, they go high, and stay long above the horizon, when the nights are long, and we want the greatest quantity of moon-light.

At the poles, one half of the ecliptic never sets, and the other half never rises; and therefore, as the sun is always half a year in describing one half of the ecliptic, and as long in going through the other half, it is natural to imagine that the sun continues half a year together above the horizon of each pole in its turn, and as long below it, rising to one pole when he sets to the other. This would be exactly the case if there were no refraction; but by the atmosphere's refracting the sun's rays, he becomes visible some days sooner, and continues some days longer in sight than at he would otherwise do: so that he appears above the horizon of either pole before he has got below the horizon of the other. And as he never goes more than  $23\frac{1}{2}$  degrees below the horizon of the poles, they have very little dark night; it being twilight there as well as at all other places till the sun be 18 degrees below the horizon. The full moon being always opposite to the sun, can never be seen while the sun is above the horizon, except when the moon falls in the northern half of her orbit; for whenever any point of the ecliptic rises, the opposite point sets. Therefore, as the sun is above the horizon of the north pole from the 20th of March till the 23d of September, it is plain, that the moon, when full, being opposite to the sun, must

be below the horizon during that half of the year. But when the sun is in the southern half of the ecliptic, he never rises to the north pole, during which half of the year, every full moon happens in some part of the northern half of the ecliptic, which never sets. Consequently, as the polar inhabitants never see the full moon in summer, they have her always in the winter, before, at, and after the full, shining for 14 of our days and nights. And when the sun is at his greatest depression below the horizon, being then in Capricorn, the moon is at her first quarter in Aries; full in Cancer, and at her third quarter in Libra. And as the beginning of Aries is the rising point of the ecliptic, Cancer the highest, and Libra the setting point, the moon rises at her first quarter in Aries, is most elevated above the horizon, and full in Cancer, and sets at the beginning of Libra in her third quarter, having continued visible for 14 diurnal rotations of the earth. Thus the poles are supplied one half of the winter time with constant moon-light in the sun's absence; and only lose sight of the moon from her third to her first quarter, while she gives but very little light, and could be but of little, and sometimes of no service to them. A bare view of the figure (Plate XLIV. fig. 3.) will make this plain; in which let  $S$  be the sun,  $e$  the earth in summer when its north pole  $n$  inclines toward the sun, and  $E$  the earth in winter, when its north pole declines from him.  $SEN$  and  $NWS$  is the horizon of the north pole, which is coincident with the equator; and, in both these positions of the earth,  $\psi\sigma\omega$  is the moon's orbit, in which she goes round the earth according to the order of the letters  $abcd$ ,  $ABCD$ . When the moon is at  $a$ , she is in her third quarter to the earth at  $e$ , and just rising to the north pole  $n$ ; at  $b$  she changes, and is at the greatest height above the horizon, as the sun likewise is; at  $c$  she is in her first quarter, setting below the horizon; and is lowest of all under it at  $d$ , when opposite to the sun, and her enlightened side toward the earth. But then she is full in view to the south pole  $p$ , which is as much turned from the sun as the north pole inclines towards him. Thus, in our summer, the moon is above the horizon of the north pole

*Fig. 1.*

*Fig. 2.*

*Fig. 4.*

*Fig. 3.*

pole whilst she describes the northern half of the ecliptic  $\varphi \ominus \Delta$ , or from her third quarter to her first; and below the horizon during her progress through the southern half  $\Delta \ominus \varphi$ ; highest at the change, most depressed at the full. But in winter, when the earth is at  $E$ , and its north pole declines from the sun, the new moon at  $D$  is at her greatest depression below the horizon  $NWS$ , and the full moon at  $B$  at her greatest height above it, rising at her first quarter  $A$ , and keeping above the horizon till she comes to her third quarter  $C$ . At a mean state she is  $23\frac{1}{2}$  degrees above the horizon at  $B$  and  $b$ , and as much below it at  $D$  and  $d$ , equal to the inclination of the earth's axis  $F$ .  $S \ominus$  and  $S \ominus s$  are, as it were, a ray of light proceeding from the sun to the earth; and shews, that when the earth is at  $e$ , the sun is above the horizon, vertical to the tropic of Cancer; and when the earth is at  $E$ , he is below the horizon, vertical to the tropic of Capricorn.

CHAP. XV. *Of the Ebbing and Flowing of the Sea.*

THE cause of the tides was discovered by Kepler, who, in his *Introduction to the Physics of the Heavens*, thus explains it: "The orb of the attracting power, which is in the moon, is extended as far as the earth, and draws the waters under the torrid zone, acting upon places where it is vertical, insensibly on confined seas and bays, but sensibly on the ocean, whose beds are large, and the waters have the liberty of reciprocation; that is, of rising and falling." And in the 70th page of his *Lunar Astronomy*:—"But the cause of the tides of the sea appears to be the bodies of the sun and moon drawing the waters of the sea." This hint being given, Sir Isaac Newton improved it, and wrote so amply on the subject, as to make the theory of the tides in a manner quite his own; by discovering the cause of their rising on the side of the earth opposite to the moon. For Kepler believed, that the presence of the moon occasioned an impulse which caused another in her absence.

The power of gravity diminishes as the square of the distance increases; and therefore the waters (Plate XLIV. fig. 4.) at  $Z$  on the side of the earth  $ABCDEFGH$  next the moon  $M$  are more attracted than the central parts of the earth  $O$  by the moon, and the central parts are more attracted by her than the waters on the opposite side of the earth at  $n$ ; and therefore the distance between the earth's centre and the waters on its surface under and opposite to the moon will be increased. For, let there be three bodies at  $H$ ,  $O$ , and  $D$ , if they are all equally attracted by the body  $M$ , they will all move equally fast toward it, their mutual distances from each other continuing the same. If the attraction of  $M$  is unequal, then that body which is most strongly attracted will move fastest, and this will increase its distance from the other body. Therefore, by the law of gravitation,  $M$  will attract  $H$  more strongly than it does  $O$ , by which the distance between  $H$  and  $O$  will be increased, and a

spectator on  $O$  will perceive  $H$  rising higher toward  $Z$ . In like manner,  $O$  being more strongly attracted than  $D$ , it will move farther towards  $M$  than  $D$  does; consequently the distance between  $O$  and  $D$  will be increased, and a spectator on  $O$ , not perceiving his own motion, will see  $D$  receding farther from him towards  $n$ ; all effects and appearances being the same, whether  $D$  recedes from  $O$ , or  $O$  from  $D$ .

Suppose now there is a number of bodies, as  $ABCDEFGH$ , placed round  $O$ , so as to form a flexible or fluid ring; then, as the whole is attracted towards  $M$ , the parts at  $H$  and  $D$  will have their distance from  $O$  increased; whilst the parts at  $B$  and  $F$ , being nearly at the same distance from  $M$  as  $O$  is, these parts will not recede from one another, but rather, by the oblique attraction of  $M$ , they will approach nearer to  $O$ . Hence the fluid ring will form itself into an ellipse  $ZIBLnKFNZ$ , whose longer axis  $nOZ$  produced will pass through  $M$ , and its shorter axis  $BOF$  will terminate in  $B$  and  $F$ . Let the ring be filled with bodies, so as to form a fluid sphere round  $G$ ; then, as the whole moves toward  $M$ , the fluid sphere being lengthened at  $Z$  and  $n$ , will assume an oblong or oval form. If  $M$  is the moon,  $O$  the earth's centre,  $ABCDEFGH$  the sea covering the earth's surface, it is evident, by the above reasoning, that whilst the earth by its gravity falls toward the moon, the water directly below her at  $B$  will swell and rise gradually towards her; also the water at  $D$  will recede from the centre, (strictly speaking the centre recedes from  $D$ ), and rise on the opposite side of the earth, whilst the water at  $B$  and  $F$  is depressed, and falls below the former level. Hence, as the earth turns round its axis from the moon to the moon again in  $24\frac{1}{2}$  hours, there will be two tides of flood and two of ebb in that time, as we find by experience.

As this explanation of the ebbing and flowing of the sea is deduced from the earth's constantly falling toward the moon by the power of gravity, some may find a difficulty in conceiving how this is possible, when the moon is full, or in opposition to the sun, since the earth revolves about the sun, and must continually fall towards it, and therefore cannot fall contrary ways at the same time; or if the earth is constantly falling towards the moon, they must come together at last. To remove this difficulty, let it be considered, that it is not the centre of the earth that describes the annual orbit round the sun, but the common centre of gravity of the earth and moon together; and that whilst the earth is moving round the sun, it also describes a circle round that centre of gravity, going as many times round it in one revolution about the sun as there are lunations or courses of the moon round the earth in a year; and therefore the earth is constantly falling towards the moon from a tangent to the circle it describes round the said common centre of gravity. In Plate XLV, fig. 1. let  $M$  be the moon,  $TW$  part of the moon's orbit, and  $C$  the centre of gravity of the earth and moon; whilst the moon goes round her orbit, the centre of the earth describes the circle  $ged$  round  $C$ , to which circle  $gak$  is a tangent; and therefore when the moon has gone from  $M$  to a little past  $W$ , the earth has moved from  $g$  to  $e$ ; and in that

time has fallen towards the moon, from the tangent at  $a$  to  $c$ , and so round the whole circle.

The sun's influence in raising the tides is but small in comparison of the moon's: For though the earth's diameter bears a considerable proportion to its distance from the moon, it is next to nothing when compared with the distance of the sun. And therefore, the difference of the sun's attraction on the sides of the earth under and opposite to him, is much less than the difference of the moon's attraction on the sides of the earth under and opposite to her; and therefore the moon must raise the tides much higher than they can be raised by the sun.

On this theory, so far as we have explained it, the tides ought to be highest directly under and opposite to the moon; that is, when the moon is due north and south. But we find, that in open seas, where the water flows freely, the moon  $M$  (Plate XLIV. fig. 4.) is generally past the north and south meridians, as at  $\beta$ , when it is high water at  $Z$  and at  $n$ . The reason is obvious; for though the moon's attraction was to cease altogether when she was past the meridian, yet the motion of ascent communicated to the water before that time would make it continue to rise for some time after; much more must it do so when the attraction is only diminished: as a little impulse given to a moving ball will cause it still to move farther than otherwise it could have done. And as experience shews, that the day is hotter about three in the afternoon, than when the sun is on the meridian, because of the increment made to the heat already imparted.

The tides answer not always to the same distance of the moon from the meridian at the same places, but are variously affected by the action of the sun, which brings them on sooner when the moon is in her first and third quarters, and keeps them back later when she is in her second and fourth; because in the former case the tide raised by the sun alone would be earlier than the tide raised by the moon, and in the latter case later.

The moon goes round the earth in an elliptic orbit, and therefore the approaches nearer to the earth than her mean distance, and recedes farther from it, in every lunar month. When she is nearest, she attracts strongest, and so raises the tides most; the contrary happens when she is farthest, because of her weaker attraction. When both luminaries are in the equator, and the moon in *Persigeo*, or at her least distance from the earth, she raises the tides highest of all, especially at her conjunction and opposition; both because the equatorial parts have the greatest centrifugal force from their describing the largest circle, and from the concurring actions of the sun and moon. At the change, the attractive forces of the sun and moon being united, they diminish the gravity of the waters under the moon, and their gravity on the opposite side is diminished by means of a greater centrifugal force. At the full, whilst the moon raises the tide under and opposite to her, the sun acting in the same line, raises the tide under and opposite to him; whence their conjoint effect is the same as at the change; and in both cases, occasion what we call the *spring-tides*. But at the quarters, the sun's action on the waters at  $O$  and  $H$  (Plate XLV. fig. 2.) diminishes the effect of the moon's action on the waters at  $Z$  and  $N$ ; so that they rise a

little under and opposite to the sun at  $O$  and  $H$ , and fall as much under and opposite to the moon at  $Z$  and  $N$ , making what we call the *neap-tides*, because the sun and moon then act cross-wise to each other. But, strictly speaking, these tides happen not till some time after; because in this, as in other cases, the actions do not produce the greatest effect when they are at the strongest, but some time afterward.

The sun being nearer the earth in winter than in summer, is of course nearer to it in February and October than in March and September; and therefore the greatest tides happen not till some time after the autumnal equinox, and return a little before the vernal.

The sea being thus put in motion, would continue to ebb and flow for several times, even though the sun and moon were annihilated, or their influence should cease: as if a basin of water were agitated, the water would continue to move for some time after the basin was left to stand still. Or like a pendulum, which having been put in motion by the hand, continues to make several vibrations without any new impulse.

When the moon is in the equator, the tides are equally high in both parts of the lunar day, or time of the moon's revolving from the meridian to the meridian again, which is 24 hours 48 minutes. But as the moon declines from the equator towards either pole, the tides are alternately higher and lower at places having north or south latitude. For one of the highest elevations, which is that under the moon, follows her towards the pole to which she is nearest, and the other declines towards the opposite pole; each elevation describing parallels as far distant from the equator, on opposite sides, as the moon declines from it to either side; and consequently, the parallels described by these elevations of the water are twice as many degrees from one another, as the moon is from the equator; increasing their distance as the moon increases her declination, till it be at the greatest, when the said parallels are, at a mean state, 47 degrees from one another: and on that day, the tides are most unequal in their heights. As the moon returns toward the equator, the parallels described by the opposite elevations approach towards each other, until the moon comes to the equator, and then they coincide. As the moon declines toward the opposite pole, at equal distances, each elevation describes the same parallel in the other part of the lunar day, which its opposite elevation described before. Whilst the moon has north declination, the greatest tides in the northern hemisphere are when she is above the horizon; and the reverse whilst her declination is south. In Plate XLV. let  $NESQ$  be the earth,  $NGS$  its axis,  $EQ$  the equator,  $T\mathcal{S}$  the tropic of Cancer,  $trt$  the tropic of Capricorn,  $ab$  the arctic circle,  $cd$  the antarctic,  $N$  the north pole,  $S$  the south pole,  $M$  the moon,  $F$  and  $G$  the two eminences of water, whose lowest parts are at  $a$  and  $d$ , (fig. 3.), at  $N$  and  $S$ , (fig. 4.), and at  $b$  and  $c$ , (fig. 5.), always 90 degrees from the highest. Now when the moon is in her greatest north declination at  $M$ , the highest elevation  $G$  under her, is on the tropic of Cancer,  $T\mathcal{S}$ , and the opposite elevation  $F$  on the tropic of Capricorn  $trt$ ; and these two elevations describe the pic

pics by the earth's diurnal rotation. All places in the northern hemisphere  $ENQ$  have the highest tides when they come into the position  $bDQ$ , under the moon; and the lowest tides when the earth's diurnal rotation carries them into the position  $aTE$ , on the side opposite to the moon; the reverse happens at the same time in the southern hemisphere  $ESQ$ , as is evident to sight. The axis of the tides  $aCd$  has now its poles  $a$  and  $d$  (being always 90 degrees from the highest elevations) in the arctic and antarctic circles; and therefore it is plain, that at these circles there is but one tide of flood, and one of ebb, in the lunar day. For, when the point  $a$  revolves half round to  $b$ , in 12 lunar hours, it has a tide of flood; but when it comes to the same point  $a$  again in 12 hours more, it has the lowest ebb. In seven days afterward, the moon  $M$  comes to the equinoctial circle, and is over the equator  $EQ$ , when both elevations describe the equator; and in both hemispheres, at equal distances from the equator, the tides are equally high in both parts of the lunar day. The whole phenomena being reversed, when the moon has south declination, to what they were when her declination was north, require no farther description.

In Plate XLV. fig. 3, 4, 5. the earth is orthographically projected on the plane of the meridian; but in order to describe a particular phenomenon, we now project it on the plane of the ecliptic. In the same Plate fig. 2. let  $HZN$  be the earth and sea,  $FED$  the equator,  $T$  the tropic of Cancer,  $C$  the arctic circle,  $P$  the north pole, and the curves 1 2 3, &c. 24 meridians, or hour-circles, intersecting each other in the poles;  $AGM$  is the moon's orbit,  $S$  the Sun,  $M$  the moon,  $Z$  the water elevated under the moon, and  $N$  the opposite equal elevation. As the lowest parts of the water are always 90 degrees from the highest, when the moon is in either of the tropics, (as at  $M$ ), the elevation  $Z$  is on the tropic of Capricorn, and the opposite elevation  $N$  on the tropic of Cancer, the low-water circle  $HCO$  touches the polar circles at  $C$ ; and the high-water circle  $ETP6$  goes over the poles at  $P$ , and divides every parallel of latitude into two equal segments. In this case the tides upon every parallel are alternately higher and lower; but they return in equal times: The point  $T$ , for example, on the tropic of Cancer, (where the depth of the tide is represented by the breadth of the dark shade), has a shallower tide of flood at  $T$  than when it revolves half round from thence to  $6$ , according to the order of the numeral figures; but it revolves as soon from  $6$  to  $T$  as it did from  $T$  to  $6$ . When the moon is in the equinoctial, the elevations  $Z$  and  $N$  are transferred to the equator at  $O$  and  $H$ , and the high and low-water circles are got into each other's former places; in which case the tides return in unequal times, but are equally high in both parts of the lunar day: for a place at 1 (under  $D$ ) revolving as formerly, goes sooner from 1 to 11, (under  $F$ ), than from 11 to 1, because the parallel it describes is cut into unequal segments by the high-water circle  $HCO$ : but the points 1 and 11 being equidistant from the pole of the tides at  $C$ , which is directly under the pole of the moon's orbit  $MCd$ , the elevations are equally high in both parts of the day.

And thus it appears, that as the tides are governed by the moon, they must turn on the axis of the moon's orbit, which is inclined  $23\frac{1}{2}$  degrees to the earth's axis at a mean state: and therefore the poles of the tides must be so many degrees from the poles of the earth, or in opposite points of the polar circles, going round these circles in every lunar day. It is true, that, according to Plate XLV. fig. 4. when the moon is vertical to the equator  $EQ$ , the poles of the tides seem to fall in with the poles of the world  $N$  and  $S$ : but when we consider that  $FHG$  is under the moon's orbit, it will appear, that when the moon is over  $H$ , in the tropic of Capricorn, the north pole of the tides (which can be no more than 90 degrees from under the moon) must be at  $c$  in the arctic circle, not at  $N$ , the north pole of the earth; and as the moon ascends from  $H$  to  $G$  in her orbit, the north pole of the tides must shift from  $c$  to  $a$  in the arctic circle, and the south pole as much in the antarctic.

It is not to be doubted, but that the earth's quick rotation brings the poles of the tides nearer to the poles of the world, than they would be if the earth were at rest, and the moon revolved about it only once a month; for otherwise the tides would be more unequal in their heights, and times of their returns, than we find they are. But how near the earth's rotation may bring the poles of its axis and those of the tides together, or how far the preceding tides may affect those which follow, so as to make them keep up nearly to the same heights, and times of ebbing and flowing, is a problem more fit to be solved by observation than by theory.

Those who have opportunity to make observations, and chuse to satisfy themselves whether the tides are really affected in the above manner by the different positions of the moon, especially as to the unequal times of their returns, may take this general rule for knowing when they ought to be so affected. When the earth's axis inclines to the moon, the northern tides, if not retarded in their passage through shoals and channels, nor affected by the winds, ought to be greatest when the moon is above the horizon, least when she is below it, and quite the reverse when the earth's axis declines from her; but, in both cases, at equal intervals of time. When the earth's axis inclines sidewise to the moon, both tides are equally high, but they happen at unequal intervals of time. In every lunation the earth's axis inclines once to the moon, once from her, and twice sidewise to her, as it does to the sun every year; because the moon goes round the ecliptic every month, and the sun but once in a year. In summer, the earth's axis inclines towards the moon when new; and therefore the day-tides in the north ought to be highest, and night-tides lowest about the change; at the full the reverse. At the quarters they ought to be equally high, but unequal in their returns; because the earth's axis then inclines sidewise to the moon. In winter the phenomena are the same at full-moon as in summer at new. In autumn the earth's axis inclines sidewise to the moon when new and full; therefore the tides ought to be equally high, and unequal in their returns at these times. At the first quarter the tides of flood should be least when the moon is above the horizon, greatest when she is below it; and the reverse

at her third quarter. In spring, the phenomena of the first quarter answer to those of the third quarter in autumn; and *vice versa*. The nearer any time is to either of these seasons, the more the tides partake of the phenomena of these seasons; and in the middle between any two of them the tides are at a mean state between those of both.

In open seas, the tides rise but to very small heights in proportion to what they do in wide-mouthed rivers, opening in the direction of the stream of tide. For, in channels growing narrower gradually, the water is accumulated by the opposition of the contracting bank; like a gentle wind, little felt on an open plain, but strong and brisk in a street; especially if the wider end of the street be next the plain, and in the way of the wind.

The tides are so retarded in their passage through different shoals and channels, and otherwise so variously affected by striking against capes and headlands, that to different places they happen at all distances of the moon from the meridian; consequently at all hours of the lunar day. The tide propagated by the moon in the German ocean, when she is three hours past the meridian, takes 12 hours to come from thence to London-Bridge; where it arrives by the time that a new tide is raised in the ocean. And therefore when the moon has north declination, and we should expect the tide at London to be greatest when the moon is above the horizon, we find it is least; and the contrary when she has south declination. At several places it is high water three hours before the moon comes to the meridian; but that tide which the moon pushes as it were before her, is only the tide opposite to that which was raised by her when she was nine hours past the opposite meridian.

There are no tides in lakes, because they are generally so small, that when the moon is vertical she attracts every part of them alike, and therefore, by rendering all the water equally light, no part of it can be raised higher than another. The Mediterranean and Baltic seas suffer very small elevations, because the inlets by which they communicate with the ocean are so narrow, that they cannot, in so short a time, receive or discharge enough to raise or sink their surfaces sensibly.

Air being lighter than water, and the surface of the atmosphere being nearer to the moon than the surface of the sea, it cannot be doubted that the moon raises much higher tides in the air than in the sea. And therefore many have wondered why the mercury does not sink in the barometer when the moon's action on the particles of air makes them lighter as she passes over the meridian. But we must consider, that as these particles are rendered lighter, a greater number of them is accumulated, until the deficiency of gravity be made up by the height of the column; and then there is an *equilibrium*, and consequently an equal pressure upon the mercury as before; so that it cannot be affected by the aerial tides.

#### CHAP. XVI. *Of Eclipses: Their Number and Periods. A large Catalogue of ancient and modern Eclipses.*

EVERY planet and satellite is illuminated by the sun;

and casts a shadow towards that point of the heavens which is opposite to the sun. This shadow is nothing but a privation of light in the space hid from the sun by the opaque body that intercepts his rays.

When the sun's light is so intercepted by the moon, that to any place of the earth the sun appears partly or wholly covered, he is said to *undergo an eclipse*; though, properly speaking, it is only an eclipse of that part of the earth where the moon's shadow or penumbra falls. When the earth comes between the sun and moon, the moon falls into the earth's shadow; and, having no light of her own, she suffers a real eclipse from the interception of the sun's rays. When the sun is eclipsed to us, the moon's inhabitants, on the side next the earth, see her shadow like a dark spot travelling over the earth, about twice as fast as its equatorial parts move, and the same way as they move. When the moon is in an eclipse, the sun appears eclipsed to her, total to all those parts on which the earth's shadow falls, and of as long continuance as they are in the shadow.

That the earth is spherical (for the hills take off no more from the roundness of the earth, than grains of dust do from the roundness of a common globe) is evident from the figure of its shadow on the moon; which is always bounded by a circular line, although the earth is incessantly turning its different sides to the moon, and very seldom shows the same side to her in different eclipses, because they seldom happen at the same hours. Were the earth shaped like a round flat plate, its shadow would only be circular when either of its sides directly faced the moon; and more or less elliptical as the earth happened to be turned more or less obliquely towards the moon when she is eclipsed. The moon's different phases prove her to be round; for, as she keeps still the same side towards the earth, if that side were flat, as it appears to be, the would never be visible from the third quarter to the first; and from the first quarter to the third, she would appear as round as when we say *she is full*; because, at the end of her first quarter, the sun's light would come as suddenly on all her side next the earth, as it does on a flat wall, and go off as abruptly at the end of her third quarter.

If the earth and sun were equally large, the earth's shadow would be infinitely extended, and all of the same bulk; and the planet Mars, in either of its nodes and opposite to the sun, would be eclipsed in the earth's shadow. Were the earth larger than the sun, its shadow would increase in bulk the farther it extended, and would eclipse the great planets Jupiter and Saturn, with all their moons, when they were opposite to the sun. But as Mars, in opposition, never falls into the earth's shadow, although he is not then above 42 millions of miles from the earth, it is plain that the earth is much less than the sun; for otherwise its shadow could not end in a point at so small a distance. If the sun and moon were equally large, the moon's shadow would go on to the earth with an equal breadth, and cover a portion of the earth's surface more than 2000 miles broad, even if it fell directly against the earth's centre, as seen from the moon; and much more if it fell obliquely on the earth: But the moon's shadow is seldom 150 miles broad at the earth, unless when it falls

A. Bell, Sculp.

very obliquely on the earth, in total eclipses of the sun. In annular eclipses, the moon's real shadow ends in a point at some distance from the earth. The moon's small distance from the earth, and the shortness of her shadow, prove her to be less than the sun. And, as the earth's shadow is large enough to cover the moon, if her diameter were three times as large as it is (which is evident from her long continuance in the shadow when she goes through its centre) it is plain, that the earth is much bigger than the moon.

Though all opaque bodies, on which the sun shines, have their shadows, yet such is the bulk of the sun, and the distances of the planets, that the primary planets can never eclipse one another. A primary can eclipse only its secondary, or be eclipsed by it; and never but when in opposition or conjunction with the sun. The primary planets are very seldom in these positions, but the sun and moon are so every month: Whence one may imagine, that these two luminaries should be eclipsed every month. But there are few eclipses in respect of the number of new and full moons; the reason of which we shall now explain.

If the moon's orbit were coincident with the plane of the ecliptic, in which the earth always moves and the sun appears to move, the moon's shadow would fall upon the earth at every change, and eclipse the sun to some parts of the earth. In like manner, the moon would go through the middle of the earth's shadow, and be eclipsed at every full; but with this difference, that she would be totally darkened for above an hour and an half; whereas the sun never was above four minutes totally eclipsed by the interposition of the moon. But one half of the moon's orbit is elevated  $5\frac{1}{2}$  degrees above the ecliptic, and the other half as much depressed below it; consequently, the moon's orbit intersects the ecliptic in two opposite points called the *moon's nodes*, as has been already taken notice of. When these points are in a right line with the centre of the sun at new or full moon, the sun, moon, and earth, are all in a right line; and if the moon be then new, her shadow falls upon the earth; if full, the earth's shadow falls upon her. When the sun and moon are more than 17 degrees from either of the nodes at the time of conjunction, the moon is then generally too high or too low in her orbit to cast any part of her shadow upon the earth; when the sun is more than 12 deg. from either of the nodes at the time of full moon, the moon is generally too high or too low in her orbit to go thro' any part of the earth's shadow: And in both these cases there will be no eclipse. But when the moon is less than 17 degrees from either node at the time of conjunction, her shadow or penumbra falls more or less upon the earth, as she is more or less within this limit. And when she is less than 12 degrees from either node at the time of opposition, she goes through a greater or less portion of the earth's shadow, as she is more or less within this limit. Her orbit contains 360 degrees; of which 17, the limit of solar eclipses on either side of the nodes, and 12, the limit of lunar eclipses, are but small portions: And as the sun commonly passes by the nodes but twice in a year, it is no wonder that we have so many new and full moons without eclipses.

To illustrate this, (Plate XLVI. fig. 1.) let *ABCD*

be the ecliptic, *RSTU* a circle lying in the same plane with the ecliptic, and *VWXY* the moon's orbit, all thrown into an oblique view, which gives them an elliptical shape to the eye. One half of the moon's orbit, as *VWX*, is always below the ecliptic, and the other half *XYV* above it. The points *V* and *X*, where the moon's orbit intersects the circle *RSTU*, which lies even with the ecliptic, are the moon's nodes; and a right line, as *XEV*, drawn from one to the other, through the earth's centre, is the line of the nodes, which is carried almost parallel to itself round the sun in a year.

If the moon moved round the earth in the orbit *RSTU*, which is coincident with the plane of the ecliptic, her shadow would fall upon the earth every time she is in conjunction with the sun, and at every opposition she would go through the earth's shadow. Were this the case, the sun would be eclipsed at every change, and the moon at every full, as already mentioned.

But although the moon's shadow *N* must fall upon the earth at *a*, when the earth is at *E*, and the moon in conjunction with the sun at *i*, because she is then very near one of her nodes; and at her opposition *n* she must go through the earth's shadow *I*, because she is then near the other node; yet, in the time that she goes round the earth to her next change, according to the order of the letters *XYVW*, the earth advances from *E* to *e*, according to the order of the letters *EFHG*, and the line of the nodes *VEX* being carried nearly parallel to itself, brings the point *f* of the moon's orbit in conjunction with the sun at that next change; and then the moon being at *f*, is too high above the ecliptic to cast her shadow on the earth: And as the earth is still moving forward, the moon at her next opposition will be at *g*, too far below the ecliptic to go through any part of the earth's shadow; for by that time the point *g* will be at a considerable distance from the earth as seen from the sun.

When the earth comes to *F*, the moon in conjunction with the sun *Z* is not at *k* in a plane coincident with the ecliptic, but above it at *T* in the highest part of her orbit: and then the point *b* of her shadow *O* goes far above the earth (as in fig. 2. which is an edge view of fig. 1.) The moon, at her next opposition, is not at *o* (fig. 1.) but at *W*, where the earth's shadow goes far above her (as in fig. 2.) In both these cases the line of the nodes *VFX* (fig. 1.) is about 90 degrees from the sun, and both luminaries are as far as possible from the limits of the eclipses.

When the earth has gone half round the ecliptic from *E* to *G*, the line of the nodes *VGX* is nearly, if not exactly, directed towards the sun at *Z*; and then the new moon *l* casts her shadow *P* on the earth *G*; and the full moon *p* goes through the earth's shadow *L*; which brings on eclipses again, as when the earth was at *E*.

When the earth comes to *H*, the new moon falls not at *m* in a plane coincident with the ecliptic *GD*, but at *W* in her orbit below it; and then her shadow *o* (see fig. 2.) goes far below the earth. At the next full she is not at *q* (fig. 1.) but at *Y* in her orbit  $5\frac{1}{2}$  degrees above *q*, and at her greatest height above the ecliptic *CD*; being then as far as possible, at any opposition, from the earth's shadow *M*, as in fig. 2.

So, when the earth is at *E* and *G*, the moon is about

her nodes at new and full; and in her greatest *north* and *south declination* (or latitude, as it is generally called) from the ecliptic at her quarters: But when the earth is at *F* or *H*, the moon is in her greatest *north* and *south declination* from the ecliptic at new and full, and in the *nodes* about her quarters.

The point *X* where the moon's orbit crosses the ecliptic, is called *the ascending node*, because the moon ascends from it above the ecliptic: And the opposite point of intersection *V* is called *the descending node*, because the moon descends from it below the ecliptic. When the moon is at *X* in the highest point of her orbit, she is in her greatest *north latitude*; and when she is at *V* in the lowest point of her orbit, she is in her greatest *south latitude*.

If the line of the nodes, like the earth's axis, was carried parallel to itself round the sun, there would be just half a year between the conjunctions of the sun and nodes. But the nodes shift backward, or contrary to the earth's annual motion,  $19\frac{1}{2}$  deg. every year; and therefore the same node comes round to the sun 19 days sooner every year than on the year before. Consequently, from the time that the ascending node *X* (when the earth is at *E*) passes by the sun as seen from the earth, it is only 173 days (not half a year) till the descending node *V* passes by him. Therefore, in whatever time of the year we have eclipses of the luminaries about either node, we may be sure that in 173 days afterward we shall have eclipses about the other node. And when at any time of the year the line of the nodes is in the situation *VGX*, at the same time next year it will be in the situation *rGr*; the ascending node having gone backward, that is, contrary to the order of signs, from *X* to *s*, and the descending node from *V* to *r*; each  $19\frac{1}{2}$  deg. At this rate the nodes shift through all the signs and degrees of the ecliptic in 18 years and 225 days; in which time there would always be a regular period of eclipses, if any complete number of lunations were finished without a fraction. But this never happens; for if both the sun and moon should start from a line of conjunction with either of the nodes in any point of the ecliptic, the sun would perform 18 annual revolutions and 222 degrees over and above, and the moon 230 lunations and 85 degrees of the 231st, by the time the node came round to the same point of the ecliptic again: So that the sun would then be 138 degrees from the node, and the moon 85 degrees from the sun.

But, in 223 mean lunations, after the sun, moon, and nodes, have been once in a line of conjunction, they return so nearly to the same state again, as that the same node, which was in conjunction with the sun and moon at the beginning of the first of these lunations, will be within  $28' 12''$  of a degree of a line of conjunction with the sun and moon again, when the last of these lunations is completed. And therefore, in that time there will be a regular period of eclipses, or return of the same eclipse, for many ages.—In this period, (which was first discovered by the Chaldeans), there are 18 Julian years 11 days 7 hours 43 minutes 20 seconds, when the last day of February in leap-years is four times included:

But when it is five times included, the period consists of only 18 years 10 days 7 hours 43 minutes 20 seconds. Consequently, if to the mean time of any eclipse, either of the sun or moon, you add 18 Julian years 11 days 7 hours 43 minutes 20 seconds, when the last day of February in leap-years comes in four times, or a day less when it comes in five times, you will have the mean time of the return of the same eclipse.

But the falling back of the line, or conjunctions, or oppositions of the sun and moon  $28' 12''$  with respect to the line of the nodes in every period, will wear it out in process of time; and after that, it will not return again in less than 12492 years.—These eclipses of the sun, which happen about the ascending node, and begin to come in at the north pole of the earth, will go a little southerly at each return, till they go quite off the earth at the south pole; and those which happen about the descending node, and begin to come in at the south pole of the earth, will go a little northerly at each return, till at last they quite leave the earth at the north pole.

To exemplify this matter, we shall first consider the sun's eclipse, (March 21st old style, April 1st new style), A. D. 1764, according to its mean revolutions, without equating the times, or the sun's distance from the node; and then according to its true equated times.

This eclipse fell in open space at each return, quite clear of the earth, even since the creation, till A. D. 1295, June 13th old style, at 12 h. 52 m. 59 sec. *post meridiem*, when the moon's shadow first touched the earth at the north pole; the sun being then  $17^{\circ} 48' 27''$  from the ascending node.—In each period since that time, the sun has come  $28' 12''$  nearer and nearer the same node, and the moon's shadow has therefore gone more and more southerly.—In the year 1662, July 18th old style, at 10 h. 36 m. 21 sec. *p. m.* when the same eclipse will have returned 38 times, the sun will be only  $24' 45''$  from the ascending node, and the centre of the moon's shadow will fall a little northward of the earth's centre.—At the end of the next following period, A. D. 1980, July 28th old style, at 18 h. 10 m. 41 sec. *p. m.* the sun will have receded back  $3' 27''$  from the ascending node, and the moon will have a very small degree of southern latitude, which will cause the centre of her shadow to pass a very small matter south of the earth's centre.—After which, in every following period, the sun will be  $28' 12''$  farther back from the ascending node than in the period last before; and the moon's shadow will go still farther and farther southward, until September 12th old style, at 23 h. 46 m. 22 sec. *p. m.* A. D. 2665; when the eclipse will have completed its 77th periodical return, and will go quite off the earth at the south pole (the sun being then  $17^{\circ} 55' 22''$  back from the node), and cannot come in at the north pole, so as to begin the same course over again, in less than 12492 years afterward.—And such will be the case of every other eclipse of the sun: For, as there is about 18 degrees on each side of the node within which there is a possibility of eclipses, their whole revolution goes through 36 degrees about that node, which, taken from 360 degrees, leaves remaining 324 degrees for the eclipses to travel *in expursu*

*panfum*. And as this 36 degrees is not gone through in less than 77 periods, which takes up 1388 years, the remaining 324 degrees cannot be so gone through in less than 12492 years. For, as 36 is to 1388, so is 324 to 12492.

To illustrate this a little farther, we shall examine some of the most remarkable circumstances of the returns of the eclipse which happened July 14th 1748, about noon. This eclipse, after traversing the voids of space from the creation, at last began to enter the Terra Australis Incognita about 88 years after the conquest, which was the last of king Stephen's reign; every Chaldean period it has crept more northerly, but was still invisible in Britain before the year 1622; when, on the 20th of April, it began to touch the fourth parts of England about 2 in the afternoon; its central appearance rising in the American south seas, and traversing Peru and the Amazon's country, through the Atlantic ocean into Africa, and setting in the Ethiopian continent, not far from the beginning of the Red sea.

Its next visible period was after three Chaldean revolutions in 1676, on the first of June, rising central in the Atlantic ocean, passing us about 9 in the morning, with four digits eclipsed on the under limb, and setting in the gulf of Cochinchina in the East Indies.

It being now near the solstice, this eclipse was visible the very next return in 1694, in the evening; and in two periods more, which was in 1730, on the 4th of July, was seen about half eclipsed just after sun-rise, and observed both at Wirtemberg in Germany, and Pekin in China, soon after which it went off.

Eighteen years more afforded us the eclipse which fell on the 14th of July 1748.

The next visible return happened on July 25th 1766, in the evening, about four digits eclipsed; and after two periods more, will happen on August 16th 1802, early in the morning, about five digits, the centre coming from the north frozen continent, by the capes of Norway, through Tartary China and Japan, to the Ladrone islands, where it goes off.

Again, in 1820, August 26th, between one and two, there will be another great eclipse at London, about 10 digits; but, happening so near the equinox, the centre will leave every part of Britain to the west, and enter Germany at Emden, passing by Venice, Naples, Grand Cairo, and set in the gulf of Baffora near that city.

It will be no more visible till 1874, when five digits will be obscured (the centre being now about to leave the earth) on September 28th. In 1892, the sun will go down eclipsed in London; and again, in 1928, the passage of the centre will be in the *expansum*, though there will be two digits eclipsed at London, October the 31st of that year, and about the year 2090 the whole penumbra will be wore off; whence no more returns of this eclipse can happen till after a revolution of 10 thousand years.

From these remarks on the entire revolution of this eclipse, we may gather, that a thousand years, more or less, (for there are some irregularities that may protract or lengthen this period 100 years), comprise the whole terrestrial phenomena of any single eclipse: and since 20 periods of 54 years each, and about 33 days, comprehend the entire extent of their revolution, it is evident, that the times of the returns will pass through a circuit of one year and ten months, every Chaldean period being ten or eleven days later, and of the equable appearances, about 32 or 33 days. Thus, though this eclipse happens about the middle of July, no other subsequent eclipse of this period will return till the middle of the same month again; but wear constantly each period 10 or 11 days forward, and at last appear in winter, but then it begins to cease from affecting us.

Another conclusion from this revolution may be drawn, that there will seldom be any more than two great eclipses of the sun in the interval of this period, and these follow sometimes next return, and often at greater distances. That of 1715 returned again in 1733 very great; but this present eclipse will not be great till the arrival of 1820, which is a revolution of four Chaldean periods; so that the irregularities of their circuits must undergo new computations to assign them exactly.

Nor do all eclipses come in at the four pole: That depends altogether on the position of the lunar nodes, which will bring in as many from the *expansum* one way as the other; and such eclipses will wear more southerly by degrees, contrary to what happens in the present case.

The eclipse, for example, of 1736 in September, had its centre in the *expansum*, and let about the middle of its obscurity in Britain; it will wear in at the north pole, and in the year 2600, or thereabouts, go off into the *expansum* on the south side of the earth.

The eclipses therefore which happened about the creation are little more than half way yet of their ethereal circuit; and will be 4000 years before they enter the earth any more. This grand revolution seems to have been intirely unknown to the ancients.

It is particularly to be noted, that eclipses which have happened many centuries ago, will not be found by our present tables to agree exactly with ancient observations, by reason of the great anomalies in the lunar motions; which appears an inconceivable demonstration of the non-eterernity of the universe. For it seems confirmed by undeniable proofs, that the moon now finishes her period in less time than formerly, and will continue, by the centripetal law, to approach nearer and nearer the earth, and to go sooner and sooner round it: Nor will the centrifugal power be sufficient to compensate the different gravitations of such an assemblage of bodies as constitute the solar system, which would come to ruin of itself, without some new regulation and adjustment of their original motions\*.

We

\* There are two ancient eclipses of the moon, recorded by Ptolemy from Hipparchus, which afford an undeniable proof of the moon's acceleration. The first of these was observed at Babylon, Decem. 22d, in the year before Christ 383; when the moon began to be eclipsed, about half an hour before the sun rose, and the eclipse was not

We are credibly informed from the testimony of the ancients, that there was a total eclipse of the sun predicted by Thales to happen in the fourth year of the 48th Olympiad, either at Sardis or Miletus in Asia, where Thales then resided. That year corresponds to the 585th year before Christ; when accordingly there happened a very signal eclipse of the sun, on the 28th of May, answering to the present 10th of that month, central through North America, the south parts of France, Italy, &c. as far as Athens, or the isles in the Ægean sea; which is the farthest that even the Caroline tables carry it; and consequently make it invisible to any part of Asia, in the total character; though there are good reasons to believe that it extended to Babylon, and went down central over that city. We are not however to imagine, that it was set before it past Sardis and the Asiatic towns, where the predictor lived; because an invisible eclipse could have been of no service to demonstrate his ability in astronomical sciences to his countrymen, as it could give no proof of its reality.

For a farther illustration, Thucydides relates, That a solar eclipse happened on a summer's day in the afternoon, in the first year of the Peloponnesian war, so great, that the stars appeared. Rhodius was victor in the Olympic games the fourth year of the said war, being also the fourth of the 87th Olympiad, on the 428th year before Christ. So that the eclipse must have happened in the 431st year before Christ; and by computation it appears, that on the third of August there was a signal eclipse which would have past over Athens, central about 6 in the evening, but which our present tables bring no farther than the ancient Syrtes on the African coast, above 400 miles from Athens; which suffering in that case but 9 digits, could by no means exhibit the remarkable darkness recited by this historian; the centre therefore seems to have past Athens about 6 in the evening, and probably might go down about Jerusalem, or near it, contrary to the construction of the present tables. These things are only obviated by way of caution to the present astronomers, in re-computing ancient eclipses; and they may examine the eclipse of Nicias, so fatal to the Athenian fleet; that which overthrew the Macedonian army, &c.

In any year, the number of eclipses of both luminaries cannot be less than two, nor more than seven; the most usual number is four, and it is very rare to have more

than six. For the sun passes by both the nodes but once a-year, unless he passes by one of them in the beginning of the year; and if he does, he will pass by the same node again a little before the year be finished; because, as these points move  $19\frac{1}{2}$  degrees backward every year, the sun will come to either of them 173 days after the other. And when either node is within 17 degrees of the sun at the time of new moon, the sun will be eclipsed. At the subsequent opposition, the moon will be eclipsed in the other node, and come round to the next conjunction again ere the former node be 17 degrees past the sun, and will therefore eclipse him again. When three eclipses fall about either node, the like-number generally falls about the opposite; as the sun comes to it in 173 days afterward; and six lunations contain but four days more. Thus, there may be two eclipses of the sun, and one of the moon, about each of her nodes. But when the moon changes in either of the nodes, she cannot be near enough the other node at the next full to be eclipsed; and in six lunar months afterward she will change near the other node: in these cases there can be but two eclipses in a year, and they are both of the sun.

A longer period than the above mentioned, for comparing and examining eclipses which happen at long intervals of time, is 557 years, 21 days, 18 hours, 30 minutes, 11 seconds; in which time there are 6890 mean lunations; and the sun and node meet again so nearly as to be but 11 seconds distant; but then it is not the same eclipse that returns, as in the shorter period above mentioned.

*A List of Eclipses, and historical Events, which happened about the same times, from*  
RICCIOLUS.

Before CHRIST.

754	July	5	But, according to an old calendar, this eclipse of the sun was on the 21st of April, on which day the foundations of Rome were laid; if we may believe Taruntius Firmianus.
721	March	19	A total eclipse of the moon. The Assyrian empire at an end; the Babylonian established.

not over before the moon set: But, by most of our astronomical tables, the moon was set at Babylon half an hour before the eclipse began; in which case, there could have been no possibility of observing it. The second eclipse was observed at Alexandria, Septem. 22d, the year before Christ 201; where the moon rose so much eclipsed, that the eclipse must have begun about half an hour before she rose: Whereas, by most of our tables, the beginning of this eclipse was not till about 10 minutes after the moon rose at Alexandria. Had these eclipses begun and ended while the sun was below the horizon, we might have imagined, that as the ancients had no certain way of measuring time, they might have been so far mistaken in the hours, that we could not have laid any stress on the accounts given by them. But as, in the first eclipse, the moon was set, and consequently the sun risen, before it was over; and in the second eclipse the sun was set, and the moon not risen, till some time after it began; these are such circumstances as the observers could not possibly be mistaken in. Mr Struyk, in the following catalogue, notwithstanding the express words of Ptolemy, puts down these two eclipses as observed at Athens; where they might have been seen as above, without any acceleration of the moon's motion, Athens being 20 degrees west of Babylon, and 7 degrees west of Alexandria.

*Fig. 1.*

*Fig. 2.*

*Fig. 3.*

Before Christ.			
585	May	28	An eclipse of the sun foretold by Thales, by which a peace was brought about between the Medes and Lydians.
523	July	16	An eclipse of the moon, which was followed by the death of Cambyses.
502	Nov.	19	An eclipse of the moon, which was followed by the slaughter of the Sabines, and death of Valerius Publicola.
463	April	30	An eclipse of the sun. The Persian war, and the falling off of the Persians from the Egyptians.
431	April	25	An eclipse of the moon, which was followed by a great famine at Rome; and the beginning of the Peloponnesian war.
431	August	3	A total eclipse of the sun. A comet and plague at Athens.
413	August	27	A total eclipse of the moon. Nicias with his ship destroyed at Syracuse.
394	August	14	An eclipse of the sun. The Persians beat by Conon in a sea-engagement.
168	June	21	A total eclipse of the moon. The next day Perseus, king of Macedonia, was conquered by Paulus Emilius.

After Christ.			
59	April	30	An eclipse of the sun. This is reckoned among the prodigies, on account of the murder of Agrippinus by Nero.
237	April	12	A total eclipse of the sun. A sign that the reign of the Gordians would not continue long. A sixth perfection of the Christians.
306	July	27	An eclipse of the sun. The stars were seen, and the emperor Constantius died.
840	May	4	A dreadful eclipse of the sun. And Lewis the Pious died within six months after it.
1009	-----	-----	An eclipse of the sun. And Jerusalem taken by the Saracens.
1133	August	2	A terrible eclipse of the sun. The stars were seen. A schism in the church, occasioned by there being three Popes at once.

We have not enumerated one half of Ricciolus's list of portentous eclipses; and for the same reason that he declines giving any more of them than what that list contains, namely, that it is most disagreeable to dwell any longer on such nonsense: the superfluous of the ancients may be seen by the few here copied.

Eclipses of the sun are more frequent than of the moon,

because the sun's ecliptic limits are greater than the moon's; yet we have more visible eclipses of the moon than of the sun, because eclipses of the moon are seen from all parts of that hemisphere of the earth which is next her, and are equally great to each of those parts; but the sun's eclipses are visible only to that small portion of the hemisphere next him whereon the moon's shadow falls.

The moon's orbit being elliptical, and the earth in one of its focuses, she is once at her least distance from the earth, and once at her greatest, in every lunation. When the moon changes at her least distance from the earth, and so near the node that her dark shadow falls upon the earth, she appears big enough to cover the whole disk of the sun from that part on which her shadow falls; and the sun appears totally eclipsed there for some minutes: but when the moon changes at her greatest distance from the earth, and so near the node that her dark shadow is directed towards the earth, her diameter subtends a less angle than the sun's; and therefore she cannot hide his whole disk from any part of the earth, nor does her shadow reach it at that time; and to the place over which the point of her shadow hangs, the eclipse is annular, the sun's edge appearing like a luminous ring all around the body of the moon. When the change happens within 17 degrees of the node, and the moon at her mean distance from the earth, the point of her shadow just touches the earth, and the eclipsed sun totally to that small spot whereon her shadow falls; but the darkness is not of a moment's continuance.

The moon's apparent diameter, when largest, exceeds the sun's, when least, only 1 minute 38 seconds of a degree; and in the greatest eclipse of the sun that can happen at any time and place, the total darkness continues no longer than whilst the moon is going 1 minute 38 seconds from the sun in her orbit, which is about 3 minutes and 13 seconds of an hour.

The moon's dark shadow covers only a spot on the earth's surface, about 180 English miles broad, when the moon's diameter appears largest, and the sun's least; and the total darkness can extend no farther than the dark shadow covers. Yet the moon's partial shadow or penumbra may then cover a circular space 4900 miles in diameter, within all which the sun is more or less eclipsed, as the places are less or more distant from the centre of the penumbra. When the moon changes exactly in the node, the penumbra is circular on the earth at the middle of the general eclipse; because at that time it falls perpendicularly on the earth's surface; but at every other moment it falls obliquely, and will therefore be elliptical; and the more so, as the time is longer before or after the middle of the general eclipse; and then, much greater portions of the earth's surface are involved in the penumbra.

When the penumbra first touches the earth, the general eclipse begins; when it leaves the earth, the general eclipse ends: from the beginning to the end the sun appears eclipsed in some part of the earth or other. When the penumbra touches any place, the eclipse begins at that place, and ends when the penumbra leaves it. When the moon changes in the node, the penumbra

goes over the centre of the earth's disk as seen from the moon; and consequently, by describing the longest line possible on the earth, continues the longest upon it; namely, at a mean rate, 5 hours 50 minutes; more, if the moon be at her greatest distance from the earth, because she then moves slowest; less, if she be at her least distance, because of her quicker motion.

To make several of the above and other phenomena plainer, (Plate XLVI. fig. 3.), let  $S$  be the sun,  $E$  the earth,  $M$  the moon, and  $AMP$  the moon's orbit. Draw the right line  $Wc$  12 from the western side of the sun at  $W$ , touching the western side of the moon at  $c$ , and the earth at 12: draw also the right line  $Vd$  12 from the eastern side of the sun at  $V$ , touching the eastern side of the moon at  $d$ , and the earth at 12: the dark space  $ce12d$  included between those lines is the moon's shadow, ending in a point at 12, where it touches the earth; because in this case the moon is supposed to change at  $M$  in the middle between  $A$  the apogee, or farthest point of her orbit from the earth, and  $P$  the perigee, or nearest point to it. For, had the point  $P$  been at  $M$ , the moon had been nearer the earth; and her dark shadow at  $e$  would have covered a space upon it about 180 miles broad, and the sun would have been totally darkened, with some continuance; but had the point  $A$  been at  $M$ , the moon would have been farther from the earth, and her shadow would have ended in a point about  $e$ , and therefore the sun would have appeared like a luminous ring all around the moon. Draw the right lines  $WXdb$  and  $VXcg$ , touching the contrary sides of the sun and moon, and ending on the earth at  $a$  and  $b$ : draw also the right line  $SXM12$ , from the centre of the sun's disk, through the moon's centre, to the earth at 12; and suppose the two former lines  $WXdb$  and  $VXcg$  to revolve on the line  $SXM12$  as an axis, and their points  $a$  and  $b$  will describe the limits of the penumbra  $YY$  on the earth's surface, including the large space  $aob12a$ ; within which the sun appears more or less eclipsed, as the places are more or less distant from the verge of the penumbra  $aob$ .

Draw the right line  $y12$  across the sun's disk, perpendicular to  $SXM$  the axis of the penumbra: then divide the line  $y12$  into twelve equal parts, as in the figure, for the twelve digits or equal parts of the sun's diameter; and, at equal distances from the centre of the penumbra at 12 (on the earth's surface  $YY$ ) to its edge  $aob$ , draw twelve concentric circles, as marked with the numeral figures 1 2 3 4 &c. and remember that the moon's motion in her orbit  $AMP$  is from west to east, as from  $s$  to  $t$ . Then,

To an observer on the earth at  $b$ , the eastern limb of the moon at  $d$  seems to touch the western limb of the sun at  $W$ , when the moon is at  $M$ ; and the sun's eclipse begins at  $b$ , appearing as at  $A$  in Plate XLVII. fig. 1. at the left hand; but, at the same moment of absolute time to an observer at  $a$  in Plate XLVI. fig. 3. the western edge of the moon at  $c$  leaves the eastern edge of the sun at  $V$ , and the eclipse ends, as at the right hand  $C$ , Plate XLVII. fig. 1. At the very same instant, to all those who live on the circle marked 1 on the earth  $E$ , in Plate XLVI. fig. 3. the moon  $M$  cuts off or darkens a twelfth part of the sun  $S$ , and eclipses him one digit, as at 1 in

Plate XLVII. fig. 1.: to those who live on the circle marked 2 in Plate XLVI. fig. 3. the moon cuts off two twelfth parts of the sun, as at 2 in Plate XLVII. fig. 1.; to those on the circle 3, three parts; and so on to the centre at 12 in Plate XLVI. fig. 3. where the sun is centrally eclipsed, as at  $B$  in the middle of fig. 1. Plate XLVII.; under which figure there is a scale of hours and minutes, to shew at a mean rate how long it is from the beginning to the end of a central eclipse of the sun on the parallel of London; and how many digits are eclipsed at any particular time from the beginning at  $A$  to the middle at  $B$ , or the end at  $C$ . Thus, in 16 minutes from the beginning, the sun is two digits eclipsed; in an hour and five minutes, eight digits; and in an hour and 37 minutes, 12 digits.

By Plate XLVI. fig. 3. it is plain, that the sun is totally or centrally eclipsed but to a small part of the earth at any time; because the dark conical shadow  $e$  of the moon  $M$  falls but on a small part of the earth; and that the partial eclipse is confined at that time to the space included by the circle  $aob$ , of which only one half can be projected in the figure, the other half being supposed to be hid by the convexity of the earth  $E$ ; and likewise, that no part of the sun is eclipsed to the large space  $YY$  of the earth, because the moon is not between the sun and any of that part of the earth: and therefore to all that part the eclipse is invisible. The earth turns eastward on its axis, as from  $g$  to  $b$ , which is the same way that the moon's shadow moves; but the moon's motion is much swifter in her orbit from  $s$  to  $t$ : and therefore, although eclipses of the sun are of longer duration on account of the earth's motion on its axis than they would be if that motion was stopt, yet, in four minutes of time at most, the moon's swifter motion carries her dark shadow quite over any place that its centre touches at the time of greatest obscuration. The motion of the shadow on the earth's disk is equal to the moon's motion from the sun, which is about  $30\frac{1}{2}$  minutes of a degree every hour at a mean rate; but so much of the moon's orbit is equal to  $30\frac{1}{2}$  degrees of a great circle on the earth; and therefore the moon's shadow goes  $30\frac{1}{2}$  degrees. or 1830 geographical miles on the earth in an hour, or  $30\frac{1}{2}$  miles in a minute, which is almost four times as swift as the motion of a cannon-ball.

As seen from the sun or moon, the earth's axis appears differently inclined every day of the year, on account of keeping its parallelism throughout its annual course. In Plate XLVII. fig. 2. let  $EDON$  be the earth at the two equinoxes and the two solstices,  $NS$  its axis,  $N$  the north pole,  $S$  the south pole,  $AEQ$  the equator,  $T$  the tropic of Cancer,  $t$  the tropic of Capricorn, and  $ABC$  the circumference of the earth's enlightened disk as seen from the sun or new moon at these times. The earth's axis has the position  $NES$  at the vernal equinox, lying towards the right hand, as seen from the sun or new moon; its poles  $N$  and  $S$  being then in the circumference of the disk; and the equator and all its parallels seem to be straight lines, because their planes pass through the observer's eye looking down upon the earth from the sun or moon directly over  $E$ ; where the ecliptic  $FG$  intersects the equator  $AE$ . At the summer solstice, the earth's axis has the position  $NDS$ ;

and

and that part of the ecliptic  $FG$ , in which the moon is then new, touches the tropic of Cancer  $T$  at  $D$ . The north pole  $N$  at that time, inclining  $23\frac{1}{2}$  degrees towards the sun, falls fo many degrees within the earth's enlightened disk, because the sun is then vertical to  $D$ ,  $23\frac{1}{2}$  degrees north of the equator  $EQ$ ; and the equator with all its parallels seem elliptic curves bending downward, or towards the south pole, as seen from the sun; which pole, together with  $23\frac{1}{2}$  degrees all round it, is hid behind the disk in the dark hemisphere of the earth. At the autumnal equinox, the earth's axis has the position  $NOS$ , lying to the left hand as seen from the sun or new moon, which are then vertical to  $O$ , where the ecliptic cuts the equator  $EQ$ . Both poles now lie in the circumference of the disk, the north pole just going to disappear behind it, and the south pole just entering into it; and the equator, with all its parallels, seem to be straight lines, because their planes pass through the observer's eye, as seen from the sun, and very nearly so as seen from the moon. At the winter solstice, the earth's axis has the position  $NVS$ ; when its south pole  $S$  inclining  $23\frac{1}{2}$  degrees toward the sun, falls  $23\frac{1}{2}$  degrees within the enlightened disk, as seen from the sun or new moon, which are then vertical to the tropic of Capricorn  $t$ ,  $23\frac{1}{2}$  degrees south of the equator  $EQ$ ; and the equator, with all its parallels, seem elliptic curves bending upward; the north pole being as far hid behind the disk in the dark hemisphere, as the south pole is come into the light. The nearer that any time of the year is to the equinoxes or solstices, the more it partakes of the phenomena relating to them.

Thus it appears, that from the vernal equinox to the autumnal, the north pole is enlightened; and the equator, and all its parallels, appear elliptical as seen from the sun, more or less curved as the time is nearer to, or farther from, the summer solstice; and bending downwards, or towards the south pole; the reverse of which happens from the autumnal equinox to the vernal. A little consideration will be sufficient to convince the reader, that the earth's axis inclines towards the sun at the summer solstice; from the sun at the winter solstice; and sidewise to the sun at the equinoxes; but towards the right hand, as seen from the sun at the vernal equinox; and towards the left hand at the autumnal. From the winter to the summer solstice, the earth's axis inclines more or less to the right hand, as seen from the sun; and the contrary from the summer to the winter solstice.

The different positions of the earth's axis, as seen from the sun at different times of the year, affect solar eclipses greatly with regard to particular places; yea, so far as would make central eclipses which fall at one time of the year invisible if they fell at another, even though the moon should always change in the nodes, and at the same hour of the day; of which indefinitely various affections, we shall only give examples for the times of the equinoxes and solstices.

In the same diagram, (Plate XLVII. fig. 2.), let  $FG$  be part of the ecliptic, and  $IK, ik, ik$ , part of the moon's orbit; both seen edgewise, and therefore projected into right lines; and let the intersections  $NODE$

be one and the same node at the above times, when the earth has the mentioned different positions; and let the spaces included by the circles  $Pppp$  be the penumbra at these times, as its centre is passing over the centre of the earth's disk. At the winter solstice, when the earth's axis has the position  $NVS$ , the centre of the penumbra  $P$  touches the tropic of Capricorn  $t$  in  $N$  at the middle of the general eclipse; but no part of the penumbra touches the tropic of Cancer  $T$ . At the summer solstice, when the earth's axis has the position  $NDS$  ( $iDk$  being then part of the moon's orbit, whose node is at  $D$ ) the penumbra  $p$  has its centre at  $D$ , on the tropic of Cancer  $T$ , at the middle of the general eclipse, and then no part of it touches the tropic of Capricorn  $t$ . At the autumnal equinox, the earth's axis has the position  $NOS$ , ( $iDk$  being then part of the moon's orbit), and the penumbra equally includes part of both tropics  $T$  and  $t$  at the middle of the general eclipse: at the vernal equinox it does the same, because the earth's axis has the position  $NES$ ; but, in the former of these two last cases, the penumbra enters the earth at  $A$ , north of the tropic of Cancer  $T$ , and leaves it at  $m$ , south of the tropic of Capricorn  $t$ ; having gone over the earth obliquely southward, as its centre described the line  $AOm$ : whereas, in the latter case, the penumbra touches the earth at  $n$ , south of the equator  $EQ$ , and describing the line  $nEq$ , (similar to the former line  $AOm$  in open space), goes obliquely northward over the earth, and leaves it at  $g$ , north of the equator.

In all these circumstances, the moon has been supposed to change at noon in her descending node: Had she changed in her ascending node, the phenomena would have been as various the contrary way, with respect to the penumbra's going northward or southward over the earth. But because the moon changes at all hours, as often in one node as in the other, and at all distances from them both at different times as it happens, the variety of the phases of eclipses are almost innumerable, even at the same places; considering also how variously the same places are situated on the enlightened disk of the earth, with respect to the penumbra's motion, at the different hours when eclipses happen.

When the moon changes 17 degrees short of her descending node, the penumbra  $P$  18 just touches the northern part of the earth's disk, near the north pole  $N$ ; and, as seen from that place, the moon appears to touch the sun, but hides no part of him from sight. Had the change been as far short of the ascending node, the penumbra would have touched the southern part of the disk near the south pole  $S$ . When the moon changes 12 degrees short of the descending node, more than a third part of the penumbra  $P$  12 falls on the northern parts of the earth at the middle of the general eclipse: Had the change been as far past the same node, as much of the other side of the penumbra about  $P$  would have fallen on the southern part of the earth; all the rest in the *expansion*, or open space. When the moon changes 6 degrees from the node, almost the whole penumbra  $P$  6 falls on the earth at the middle of the general eclipse. And lastly, when the moon changes in the node at  $N$ , the penumbra  $PN$  takes the longest course possible on the earth's disk; its centre

centre falling on the middle thereof, at the middle of the general eclipse. The farther the moon changes from either node, within 17 degrees of it, the shorter is the penumbra's continuance on the earth, because it goes over a less portion of the disk, as is evident by the figure.

The nearer that the penumbra's centre is to the equator at the middle of the general eclipse, the longer is the duration of the eclipse at all those places where it is central; because, the nearer that any place is to the equator, the greater is the circle it describes by the earth's motion on its axis: And so, the place moving quicker, keeps longer in the penumbra, whose motion is the same way with that of the place, though faster, as has been already mentioned. Thus (see the earth at  $D$  and the penumbra at 12) whilst the point  $b$  in the polar circle  $abcd$  is carried from  $b$  to  $c$  by the earth's diurnal motion, the point  $d$  on the tropic of Cancer  $T$  is carried a much greater length from  $d$  to  $D$ ; and therefore, if the penumbra's centre goes one time over  $c$  and another time over  $D$ , the penumbra will be longer in passing over the moving place  $d$  than it was in passing over the moving place  $b$ . Consequently, central eclipses about the poles are of the shortest duration; and about the equator of the longest.

In the middle of summer, the whole frigid zone, included by the polar circle  $abcd$ , is enlightened; and if it then happens, that the penumbra's centre goes over the north pole, the sun will be eclipsed much the same number of digits at  $a$  as at  $c$ ; but whilst the penumbra moves eastward over  $c$ , it moves westward over  $a$ ; because, with respect to the penumbra, the motions of  $a$  and  $c$  are contrary: For  $c$  moves the same way with the penumbra towards  $d$ , but  $a$  moves the contrary way towards  $b$ ; and therefore the eclipse will be of longer duration at  $c$  than at  $a$ . At  $a$  the eclipse begins on the sun's eastern limb, but at  $c$  on his western: At all places lying without the polar circles, the sun's eclipses begin on his western limb, or near it, and end on or near his eastern. At those places where the penumbra touches the earth, the eclipse begins with the rising sun, on the top of his western or uppermost edge; and at those places where the penumbra leaves the earth, the eclipse ends with the setting sun, on the top of his eastern edge, which is then the uppermost, just at its disappearing in the horizon.

If the moon were surrounded by an atmosphere of any considerable density, it would seem to touch the sun a little before the moon made her appulse to his edge, and we should see a little faintness on that edge before it were eclipsed by the moon: But as no such faintness has been observed, it seems plain, that the moon has no such atmosphere as that of the earth. The faint ring of light surrounding the sun in total eclipses, called by Cassini *la chevelure du soleil*, seems to be the atmosphere of the sun; because it has been observed to move equally with the sun, not with the moon.

Having been so prolix concerning eclipses of the sun, we shall drop that subject at present, and proceed to the doctrine of lunar eclipses; which, being more simple, may be explained in less time.

That the moon can never be eclipsed but at the time

of her being full, and the reason why she is not eclipsed at every full, has been shewn already. In Plate XLVI. fig. 3. let  $S$  be the sun,  $E$  the earth,  $RR$  the earth's shadow, and  $B$  the moon in opposition to the sun: In this situation the earth intercepts the sun's light in its way to the moon; and when the moon touches the earth's shadow at  $v$ , she begins to be eclipsed on her eastern limb  $x$ , and continues eclipsed until her western limb  $y$  leaves the shadow at  $w$ : At  $B$  she is in the middle of the shadow, and consequently in the middle of the eclipse.

The moon, when totally eclipsed, is not invisible if she be above the horizon and the sky be clear; but appears generally of a dusky colour, like tarnished copper, which some have thought to be the moon's native light. But the true cause of her being visible is the scattered beams of the sun, bent, into the earth's shadow by going through the atmosphere; which, being more or less dense near the earth than at considerable heights above it, refracts or bends the sun's rays more inward, the nearer they are passing by the earth's surface, than those rays which go through higher parts of the atmosphere, where it is less dense according to its height, until it be so thin or rare as to lose its refractive power. Let the circle  $fgbi$ , concentric to the earth, include the atmosphere whose refractive power vanishes at the heights  $f$  and  $i$ ; so that the rays  $Wfw$  and  $Viv$  go on straight without suffering the least refraction: But all those rays which enter the atmosphere between  $f$  and  $k$ , and between  $i$  and  $l$ , on opposite sides of the earth, are gradually more bent inward as they go through a greater portion of the atmosphere, until the rays  $Wk$  and  $Vl$  touching the earth at  $m$  and  $n$ , are bent so much as to meet at  $g$ , a little short of the moon; and therefore the dark shadow of the earth is contained in the space  $moagn$ , where none of the sun's rays can enter: All the rest  $RR$ , being mixed by the scattered rays which are refracted as above, is in some measure enlightened by them; and some of those rays falling on the moon, give her the colour of tarnished copper, or of iron almost red hot. So that if the earth had no atmosphere, the moon would be as invisible in total eclipses as she is when new. If the moon were so near the earth as to go into its dark shadow, suppose about  $po$ , she would be invisible during her stay in it; but visible before and after in the fainter shadow  $RR$ .

When the moon goes through the centre of the earth's shadow, she is directly opposite to the sun: Yet the moon has been often seen totally eclipsed in the horizon when the sun was also visible in the opposite part of it: For, the horizontal refraction being almost  $34$  minutes of a degree, and the diameter of the sun and moon being each at a mean state but  $32$  minutes, the refraction causes both luminaries to appear above the horizon when they are really below it.

When the moon is full at 12 degrees from either of her nodes, she just touches the earth's shadow, but enters not into it. In Plate XLVII. fig. 3. let  $GH$  be the ecliptic,  $ef$  the moon's orbit where she is 12 degrees from the node at her full;  $cd$  her orbit where she is 6 degrees from the node,  $ab$  her orbit where she is full in the node,  $AB$  the earth's shadow, and  $M$  the moon. When

the

the moon describes the line *ef*, she just touches the shadow, but does not enter into it; when she describes the line *cd*, she is totally, though not centrally, immersed in the shadow; and when she describes the line *ab*, she passes by the node at *M* in the centre of the shadow, and takes the longest line possible, which is a diameter, thro' it: And such an eclipse being both total and central is of the longest duration, namely, 3 hours 57 minutes 6 seconds from the beginning to the end, if the moon be at her greatest distance from the earth; and 3 hours 37 minutes 26 seconds, if she be at her least distance. The reason of this difference is, that when the moon is farthest from the earth, she moves slowest; and when nearest to it, quickest.

The moon's diameter, as well as the sun's, is supposed to be divided into twelve equal parts, called *digits*; and so many of these parts as are darkened by the earth's shadow, so many digits is the moon eclipsed. All that the moon is eclipsed above 12 digits, shew how far the shadow of the earth is over the body of the moon, on that edge to which she is nearest at the middle of the eclipse.

It is difficult to observe exactly either the beginning or ending of a lunar eclipse, even with a good telescope; because the earth's shadow is so faint and ill defined about the edges, that when the moon is either just touching or leaving it, the obscuration of her limb is scarce sensible; and therefore the nicest observers can hardly be certain to four or five seconds of time. But both the beginning and ending of solar eclipses are visibly instantaneous; for the moment that the edge of the moon's disk touches the sun's, his roundness seems a little broke on that part; and the moment she leaves it, he appears perfectly round again.

In astronomy, eclipses of the moon are of great use for ascertaining the periods of her motions; especially such eclipses as are observed to be alike in all her circumstances, and have long intervals of time between them. In geography, the longitudes of places are found by eclipses: But for this purpose eclipses of the moon are more useful than those of the sun, because they are more frequently visible, and the same lunar eclipse is of equal largeness and duration at all places where it is seen. In chronology, both solar and lunar eclipses serve to determine exactly the time of any past event: for there are so many particulars observable in every eclipse, with respect to its quantity, the places where it is visible (if of the sun) and the time of the day or night, that it is impossible there can be two solar eclipses in the course of many ages which are alike in all circumstances.

From the above explanation of the doctrine of eclipses it is evident, that the darkness at our Saviour's crucifixion was supernatural. For he suffered on the day on which the passover was eaten by the Jews, on which day it was impossible that the moon's shadow could fall on the earth; for the Jews kept the passover at the time of full moon: Nor does the darkness in total eclipses of the sun last above four minutes in any place; whereas the darkness at the crucifixion lasted three hours, Matth. xxviii. 15. and overspread at least all the land of Judea.

With regard to the method of calculating and projecting eclipses, we must refer the reader to the astronomical tables of Mr Ferguson and others. When the principles are explained, the application and use of the tables is a matter of small difficulty, and easily acquired by a little practice.

## CHAP. XVII. *Of the fixed Stars.*

THE stars are said to be fixed, because they are generally observed to keep at the same distances from each other: their apparent diurnal revolutions being caused solely by the earth's turning on its axis. They appear of a sensible magnitude to the bare eye, because the retina is affected not only by the rays of light which are emitted directly from them, but by many thousands more, which, falling upon our eye-lids, and upon the aerial particles about us, are reflected into our eyes so strongly as to excite vibrations not only in those points of the retina where the real images of the stars are formed, but also in other points at some distance round about. This makes us imagine the stars to be much bigger than they would appear, if we saw them only by the few rays which come directly from them, so as to enter our eyes without being intermixed with others. Any one may be sensible of this, by looking at a star of the first magnitude through a long narrow tube; which, though it takes in as much of the sky as would hold a thousand such stars, yet scarce renders *that* one visible.

The more a telescope magnifies, the less is the aperture through which the star is seen; and consequently the fewer rays it admits into the eye. Now since the stars appear less in a telescope which magnifies 200 times, than they do to the bare eye, inasmuch that they seem to be only indivisible points, it proves at once that the stars are at immense distances from us, and that they shine by their own proper light. If they shone by borrowed light, they would be as invisible without telescopes as the satellites of Jupiter are; for these satellites appear bigger when viewed with a good telescope than the largest fixed stars do.

The number of stars discoverable, in either hemisphere, by the naked eye, is not above a thousand. This at first may appear incredible; because they seem to be without number: But the deception arises from our looking confusedly upon them, without reducing them into order. For, look but steadfastly upon a pretty large portion of the sky, and count the number of stars in it, and you will be surpris'd to find them so few. Or, if one considers how seldom the moon meets with any stars in her way, although there are as many about her path as in other parts of the heavens, he will soon be convinced that the stars are much thinner sown than he was aware of. The British catalogue, which, besides the stars visible to the bare eye, includes a great number which cannot be seen without the assistance of a telescope, contains no more than three thousand, in both hemispheres.

As we have incomparably more light from the moon than from all the stars together, it were the greatest absurdity

furdity to imagine that the stars were made for no other purpose than to cast a faint light upon the earth; especially since many more require the assistance of a good telescope to find them out, than are visible without that instrument. Our sun is surrounded by a system of planets and comets; all which would be invisible from the nearest fixed star. And from what we already know of the immense distance of the stars, the nearest may be computed at 32,000,000,000,000 of miles from us, which is farther than a cannon-bullet would fly in 7,000,000 of years. Hence it is easy to prove, that the sun, seen from such a distance, would appear no bigger than a star of the first magnitude. From all this it is highly probable, that each star is a sun to a system of worlds moving round it, though unseen by us; especially as the doctrine of a plurality of worlds is rational, and greatly manifests the power, wisdom, and goodness of the great Creator.

The stars, on account of their apparently various magnitudes, have been distributed into several classes, or orders. Those which appear largest, are called *stars of the first magnitude*; the next to them in lustre, *stars of the second magnitude*; and so on the *sixth*, which are the smallest that are visible to the bare eye. This distribution having been made long before the invention of telescopes, the stars which cannot be seen without the assistance of these instruments, are distinguished by the name of *telescopic stars*.

The ancients divided the starry sphere into particular constellations, or systems of stars, according as they lay near one another, so as to occupy those spaces which the figures of different sorts of animals or things would take up, if they were there delineated. And those stars which could not be brought into any particular constellation, were called *unformed stars*.

This division of the stars into different constellations or asterisms, serves to distinguish them from one another, so that any particular star may be readily found in the heavens by means of a celestial globe; on which the constellations are so delineated, as to put the most remarkable stars into such parts of the figures as are most easily distinguished. The number of the ancient constellations is 48, and upon our present globes about 70. On Senex's globes are inserted Bayer's letters; the first in the Greek alphabet being put to the biggest star in each constellation, the second to the next, and so on: By which

means, every star is as easily found as if a name were given to it. Thus, if the star  $\gamma$  in the constellation of the ram be mentioned, every astronomer knows as well what star is meant as if it were pointed out to him in the heavens.

There is also a division of the heavens into three parts. 1. The Zodiac ( $\text{Ζωδιακὴς}$ ) from  $\text{Ζωδίου}$ , *zodion*, an animal, because most of the constellations in it, which are twelve in number, are the figures of animals: As *Aries* the ram, *Taurus* the bull, *Gemini* the twins, *Cancer* the crab, *Leo* the lion, *Virgo* the virgin, *Libra* the balance, *Scorpio* the scorpion, *Sagittarius* the archer, *Capricornus* the goat, *Aquarius* the water-bearer, and *Pisces* the fishes. The zodiac goes quite round the heavens: it is about 16 degrees broad, so that it takes in the orbits of all the planets, and likewise the orbit of the moon. Along the middle of this zone or belt is the ecliptic, or circle which the earth describes annually as seen from the sun; and which the sun appears to describe as seen from the earth. 2. All that region of the heavens, which is on the north side of the zodiac, containing twenty-one constellations. And, 3. That on the fourth side, containing fifteen.

The ancients divided the zodiac into the above twelve constellations or signs in the following manner. They took a vessel with a small hole in the bottom, and having filled it with water, suffered the same to distil drop by drop into another vessel set beneath to receive it; beginning at the moment when some star rose, and continuing until it rose the next following night. The water fallen down into the receiver they divided into twelve equal parts; and having two other small vessels in readiness, each of them fit to contain one part, they again poured all the water into the upper vessel, and observing the rising of some star in the zodiac, they at the same time suffered the water to drop into one of the small vessels; and as soon as it was full, they shifted it, and set an empty one in its place. When each vessel was full, they took notice what star of the zodiac rose; and though this could not be done in one night, yet in many they observed the rising of twelve stars or points, by which they divided the zodiac into twelve parts.

The names of the constellations, and the number of stars observed in each of them by different astronomers, are as follow.

The ancient Constellations.		<i>Ptolemy.</i>	<i>Tycho.</i>	<i>Hevelius.</i>	<i>Flamsteed.</i>
Ursa minor	The Little Bear	8	7	12	24
Ursa major	The Great Bear	35	29	73	87
Draco	The Dragon	31	32	40	80
Cepheus	Cepheus	13	4	51	35
Bootes, <i>Arctophilax</i>		23	18	52	54
Corona Borealis	The Northern Crown	8	8	8	21
Hercules, <i>Engonastu</i>	Hercules kneeling	29	28	45	113
Lyra	The Harp	10	11	17	21
Cygnus, <i>Gallina</i>	The Swan	19	18	47	81
Calliopea	The Lady in her Chair	13	26	37	55
Perseus	Perseus	29	29	46	59
Auriga	The Waggoner	14	9	40	66
Serpentarius, <i>Ophiuchus</i>	Serpentarius	29	15	40	74

Serpens

The ancient Constellations.		Ptolemy.	Tycho.	Hevelius.	Flamsteed.
Serpens	The Serpent	18	13	22	64
Sagitta	The Arrow	5	5	5	18
Aquila, <i>Vultur</i>	The Eagle	15	12	23	71
Antinous	Antinous		3	19	
Delphinus	The Dolphin	10	10	14	18
Equulus, <i>Equi scythio</i>	The Horse's Head	4	4	6	10
Pegasus, <i>Equus</i>	The Flying Horse	20	19	38	89
Andromeda	Andromeda	23	23	47	66
Triangulum	The Triangle	4	4	12	16
Aries	The Ram	18	21	27	66
Taurus	The Bull	44	43	51	141
Gemini	The Twins	25	25	38	85
Cancer	The Crab	23	15	29	83
Leo	The Lion	35	30	49	95
Coma Berenices	Berenice's Hair		14	21	43
Virgo	The Virgin	32	33	50	110
Libra, <i>Chebe</i>	The Scales	17	10	20	51
Scorpius	The Scorpion	24	10	20	44
Sagittarius	The Archer	31	14	22	69
Capricornus	The Goat	28	28	29	51
Aquarius	The Water-bearer	45	41	47	108
Pisces	The Fishes	38	36	39	113
Cetus	The Whale	22	21	45	97
Orion	Orion	38	42	62	78
Eridanus, <i>Fluvius</i>	Eridanus, <i>the River</i>	34	10	27	84
Lepus	The Hare	12	13	16	19
Canis major	The Great Dog	29	13	21	31
Canis minor	The Little Dog	2	2	13	14
Argo Navis	The Ship	45	3	4	64
Hydra	The Hydra	27	19	31	60
Crater	The Cup	7	3	10	31
Corvus	The Crow	7	4		9
Centaurus	The Centaur	57			35
Lupus	The Wolf	19			24
Ara	The Altar	7			9

rays near its middle, is liable to several changes, and is sometimes invisible. Another is near the ecliptic; between the head and bow of Sagittarius: it is small, but very luminous. A third is on the back of the Centaur, which is too far south to be seen in Britain. A fourth, of a smaller size, is before Antinous's right foot; having a star in it, which makes it appear more bright. A fifth is in the constellation of Hercules, between the stars  $\zeta$  and  $\eta$ , which spot, though but small, is visible to the bare eye, if the sky be clear and the moon absent.

*Cloudy stars* are so called from their misty appearance. They look like dim stars to the naked eye; but through a telescope they appear broad illuminated parts of the sky; in some of which is one star, in others more. Five of these are mentioned by Ptolemy. 1. One at the extremity of the right hand of Perseus. 2. One in the middle of the Crab. 3. One unformed, near the sting of the Scorpion. 4. The eye of Sagittarius. 5. One in the head of Orion. In the first of these appear more stars through the telescope than in any of the rest, although 21 have been counted in the head of Orion, and above 40 in that of the Crab. Two are visible in the eye of Sagittarius without a telescope, and several more with it. Flamsteed observed a cloudy star in the bow of Sagittarius, containing many small stars; and the star  $d$  above Sagittarius's right shoulder is encompassed with several more. Both Cassini and Flamsteed discovered one between the Great and Little Dog, which is very full of stars visible only by the telescope. The two whitish spots near the south pole, called the *Magellanic Clouds* by Sailors, which to the bare eye resemble part of the Milky Way, appear through telescopes to be a mixture of small clouds and stars. But the most remarkable of all the cloudy stars is that in the middle of Orion's Sword, where seven stars (of which three are very close together) seem to shine through a cloud, very lucid near the middle, but faint and ill defined about the edges. It looks like a gap in the sky, through which one may fee (as it were) part of a much brighter region. Although most of these spaces are but a few minutes of a degree in breadth, yet, since they are among the fixed stars, they must be spaces larger than what is occupied by our solar system; and in which there seems to be a perpetual uninterrupted day among numberless worlds, which no human art ever can discover.

Several stars are mentioned by ancient astronomers, which are not now to be found; and others are now visible to the bare eye which are not recorded in the ancient catalogues. Hipparchus observed a new star about 120 years before Christ; but he has not mentioned in what part of the heaven it was seen, although it occasioned his making a catalogue of the stars; which is the most ancient that we have.

The first new star that we have any good account of, was discovered by Cornelius Gemma on the 8th of November *A. D.* 1572, in the chair of Cassiopea. It sur-

passed Sirius in brightness and magnitude; and was seen for 16 months successively. At first it appeared bigger than Jupiter to some eyes, by which it was seen at mid-day: afterwards it decayed gradually both in magnitude and lustre, until March 1573, when it became invisible.

On the 13th of August 1596, David Fabricius observed the *Stella Mira*, or wonderful star, in the neck of the Whale; which has been since found to appear and disappear periodically, seven times in six years, continuing in the greatest lustre for 15 days together; and is never quite extinguished.

In the year 1600, William Jansenius discovered a changeable star in the neck of the Swan; which, in time, became so small as to be thought to disappear entirely, till the years 1657, 1658, and 1659, when it recovered its former lustre and magnitude; but soon decayed, and is now of the smallest size.

In the year 1604 Kepler and several of his friends saw a new star near the heel of the right foot of Serpentarius, so bright and sparkling, that it exceeded any thing they had ever seen before; and took notice that it was every moment changing into some of the colours of the rainbow, except when it was near the horizon, at which time it was generally white. It surpassed Jupiter in magnitude, which was near it all the month of October, but easily distinguished from Jupiter, by the steady light of Jupiter. It disappeared between October 1605 and the February following, and has not been seen since that time.

In the year 1670, July 15, Hevelius discovered a new star, which in October was so decayed as to be scarce perceptible. In April following it regained its lustre, but wholly disappeared in August. In March 1672 it was seen again, but very small; and has not been visible since.

In the year 1686 a new star was discovered by Kirch, which returns periodically in 404 days.

In the year 1672, Cassini saw a star in the neck of the Bull, which he thought was not visible in Tycho's time, nor when Bayer made his figures.

Many stars, besides those above mentioned, have been observed to change their magnitudes: and as none of them could ever be perceived to have tails, it is plain they could not be comets; especially as they had no parallax, even when largest and brightest. It would seem, that the periodical stars have vast clusters of dark spots, and very slow rotations on their axes; by which means, they must disappear when the side covered with spots is turned towards us. And as for those which break out all of a sudden with such lustre, it is by no means improbable that they are suns whose fuel is almost spent, and again supplied by some of their comets falling upon them, and occasioning an uncommon blaze and splendour for some time; which indeed appears to be the greatest use of the cometary part of any system\*.

Some

\* *M. Maupertuis, in his dissertation on the figures of the celestial bodies, (p. 61.—63.), is of opinion that some stars, by their prodigious quick rotations on their axes, may not only assume the figures of oblate spheroids; but that, by the great centrifugal force arising from such rotations, they may become of the figures of mill-stones;*

Some of the stars, particularly Arcturus, have been observed to change their places above a minute of a degree with respect to others. But whether this be owing to any real motion in the stars themselves, must require the observations of many ages to determine. If our solar system changeth its place, with regard to absolute space, this must in process of time occasion an apparent change in the distances of the stars from each other: and in such a case, the places of the nearest stars to us being more affected than those which are very remote, their relative positions must seem to alter, though the stars themselves were really immoveable. On the other hand, if our own system be at rest, and any of the stars in real motion, this must vary their positions; and the more so, the nearer they are to us, or swifter their motions are, or the more proper the direction of their motion is for our perception.

The obliquity of the ecliptic to the equinoctial is found at present to be above the third part of a degree less than Ptolemy found it. And most of the observers after him found it to decrease gradually down to Tycho's time. If it be objected, that we cannot depend on the observations of the ancients, because of the incorrectness of their instruments; we have to answer, that both Tycho and Flamsteed are allowed to have been very good observers; and yet we find that Flamsteed makes this obliquity  $2\frac{1}{2}$  minutes of a degree less than Tycho did about 100 years before him: and as Ptolemy was 1324 years before Tycho, so the gradual decrease answers nearly to the difference of time between these three astronomers. If we consider, that the earth is not a perfect sphere, but an oblate spheroid, having its axis shorter than its equatorial diameter; and that the sun and moon are constantly acting obliquely upon the greater quantity of matter about the equator, pulling it, as it were, towards a nearer and nearer co-incidence with the ecliptic; it will not appear improbable that these actions should gradually diminish the angle between those planes. Nor is it less probable that the mutual attractions of all the planets should have a tendency to bring their orbits to a coincidence: but this change is too small to become sensible in many ages.

#### CHAP. XVIII. *Of the Division of Time. A perpetual Table of New Moons. The Times of the Birth and Death of CHRIST. A Table of remarkable Eras or Events.*

THE parts of time are *Seconds, Minutes, Hours, Days, Years, Cycles, Ages, and Periods.*

The original standard, or integral measure of time,

is a year; which is determined by the revolution of some celestial body in its orbit, *viz.* the sun or moon.

The time measured by the sun's revolution in the ecliptic, from any equinox or solstice to the same again, is called the *Solar or Tropical Year*, which contains 365 days, 5 hours, 48 minutes, 57 seconds; and is the only proper or natural year, because it always keeps the same seasons to the same months.

The quantity of time measured by the sun's revolution, as from any fixed star to the same star again, is called the *Sidereal year*; which contains 365 days 6 hours 9 minutes  $14\frac{1}{2}$  seconds; and is 20 minutes  $17\frac{1}{2}$  seconds longer than the true solar year.

The time measured by twelve revolutions of the moon, from the sun to the sun again, is called the *lunar year*; it contains 354 days 8 hours 48 minutes 36 seconds; and is therefore 10 days 21 hours 0 minutes 21 seconds shorter than the solar year. This is the foundation of the epact.

The *civil year* is that which is in common use among the different nations of the world; of which, some reckon by the lunar, but most by the solar. The civil solar year contains 365 days, for three years running, which are called *common years*; and then comes in what is called the *bissextile or leap-year*, which contains 366 days. This is also called the *Julian year*, on account of Julius Cæsar, who appointed the intercalary-day every fourth year, thinking thereby to make the civil and solar year keep pace together. And this day, being added to the 23d of February, which in the Roman calendar was the sixth of the kalends of March, that sixth day was twice reckoned, or the 23d and 24th were reckoned as one day, and was called *bis sextus dies*; and thence came the name *bissextile* for that year. But in our common almanacks this day is added at the end of February.

The *civil lunar year* is also common or intercalary. The common year consists of 12 lunations, which contain 354 days; at the end of which, the year begins again. The *intercalary, or embolismic year* is that wherein a month was added, to adjust the lunar year to the solar. This method was used by the Jews, who kept their account by the lunar motions. But by intercalating no more than a month of 30 days, which they called *Ve-Adar*, every third year, they fell  $3\frac{1}{2}$  days short of the solar year in that time.

The Romans also used the *lunar embolismic year* at first, as it was settled by Romulus their first king, who made it to consist only of ten months or lunations, which fell 61 days short of the solar year, and so their year became quite vague and unfixed; for which reason, they were forced to have a table published by the high-priest, to inform them when the spring and other seasons began.

*or be reduced to flat circular planes, so thin as to be quite invisible when their edges are turned towards us; as Saturn's ring is in such positions. But when very eccentric planets or comets go round any flat star, in orbits much inclined to its equator, the attraction of the planets or comets in their perihelions must alter the inclination of the axis of that star; on which account it will appear more or less large and luminous, as its broad side is more or less turned towards us. And thus he imagines we may account for the apparent changes of magnitude and lustre in those stars, and likewise for their appearing and disappearing.*

But Julius Cæsar, as already mentioned, taking this troublesome affair into consideration, reformed the kalendar, by making the year to consist of 365 days 6 hours.

The year thus settled, is what we still make use of in Britain; but as it is somewhat more than 11 minutes longer than the solar tropical year, the times of the equinoxes go backward, and fall earlier by one day in about 130 years. In the time of the Nicene Council, (A. D. 325), which was 1444 years ago, the vernal equinox fell on the 21st of March; and if we divide 1444 by 130. it will quote 11, which is the number of days which the equinox has fallen back since the Council of Nice. This causing great disturbances, by unfixing the times of the celebration of Easter, and consequently of all the other moveable feasts, Pope Gregory XIIIth, in the year 1582, ordered ten days to be at once struck out of that year; and the next day after the 4th of October was called the 15th. By this means the vernal equinox was restored to the 21st of March; and it was endeavoured, by the omission of three intercalary days in 400 years, to make the civil or political year keep pace with the solar year for time to come. This new form of the year is called the *Gregorian account*, or *new style*; which is received in all countries where the pope's authority is acknowledged, and ought to be in all places where truth is regarded.

The principal division of the year is into *months*, which are of two sorts, namely, *astronomical* and *civil*. The astronomical month is the time in which the moon

runs through the zodiac, and is either *periodical* or *synodical*. The periodical month is the time spent by the moon in making one complete revolution from any point of the zodiac to the same again; which is  $27^d 7^h 43^m$ . The synodical month, called a *lunation*, is the time contained between the moon's parting with the sun at a conjunction, and returning to him again, which is  $29^d 12^h 44^m$ . The civil months are those which are framed for the uses of civil life; and are different as to their names, number of days, and times of beginning, in several different countries. The first month of the Jewish year fell according to the moon in our August and September, old style; the second in September and October; and so on. The first month of the Egyptian year began on the 29th of our August. The first month of the Arabic and Turkish year began the 16th of July. The first month of the Grecian year fell according to the moon in June and July, the second in July and August, and so on, as in the following table.

A month is divided into four parts called *weeks*, and a week into seven parts called *days*; so that in a Julian year there are 13 such months, or 52 weeks, and one day over. The Gentiles gave the names of the sun, moon, and planets, to the days of the week. To the first, the name of the *Sun*; to the second, of the *Moon*; to the third, of *Mars*; to the fourth, of *Mercury*; to the fifth, of *Jupiter*; to the sixth, of *Venus*; and to the seventh, of *Saturn*.

Days in the year —————			354	Days in the year —————		354
The Arabians add 11 days at the end of every year, which keep the ſame months to the ſame ſeaſons.						

A day is either natural or artificial. The natural day contains 24 hours; the artificial the time from ſun-riſe to ſun-ſet. The natural day is either *aftronomical* or *civil*. The aftronomical day begins at noon, becauſe the increaſe and decreaſe of days terminated by the horizon are very unequal among themſelves; which inequality is likewiſe augmented by the inconfancy of the horizontal refractions, and therefore the aftronomer takes the meridian for the limit of diurnal revolutions, reckoning noon, that is, the inſtant when the ſun's centre is on the meridian, for the beginning of the day. The Britiſh, French, Dutch, Germans, Spaniards, Portugueſe, and Egyptians, begin the civil day at midnight; the ancient Greeks, Jews, Bohemians, Sileſians, with the modern Italians, and Chineſe, begin it at ſun-ſetting; and the ancient Babylonians, Perſians, Syrians, with the modern Greeks, at ſun-riſing.

An hour is a certain determinate part of the day, and is either equal or unequal. An equal hour is the 24th part of a mean natural day, as ſhewn by well-regulated clocks and watches; but theſe hours are not quite equal as meaſured by the returns of the ſun to the meridian, becauſe of the obliquity of the ecliptic and ſun's unequal motion in it. Unequal hours are thoſe by which the artificial day is divided into twelve parts, and the night into as many.

An hour is divided into 60 equal parts called *minutes*, a minute into 60 equal parts called *ſeconds*, and theſe again into 60 equal parts called *thirds*. The Jews, Chaldeans, and Arabians, divide the hour into 1080 equal parts called *ſcruples*; which number contains 18 times 60, ſo that one minute contains 18 ſcruples.

A cycle is a perpetual round, or circulation of the ſame parts of time of any fort. The *cycle of the ſun* is a revolution of 28 years, in which time the days of the months return again to the ſame days of the week; the ſun's place to the ſame ſigns and degrees of the ecliptic on the ſame months and days, ſo as not to differ one degree in 100 years; and the leap-years begin the

ſame courſe over again with reſpect to the days of the week on which the days of the months fall. The *cycle of the moon*, commonly called the *golden number*, is a revolution of 19 years; in which time, the conjunctions, oppoſitions, and other aſpects of the moon, are within an hour and half of being the ſame as they were on the ſame days of the months 19 years before. The *indiction* is a revolution of 15 years, uſed only by the Romans for indicating the times of certain payments made by the ſubjects to the republic: It was eſtabliſhed by Conſtantine, A. D. 312.

The year of our Saviour's birth, according to the vulgar æra, was the 9th year of the ſolar cycle, the firſt year of the lunar cycle, and the 312th year after his birth was the firſt year of the Roman indiction. Therefore, to find the year of the ſolar cycle, add 9 to any given year of Chriſt, and divide the ſum by 28, the quotient is the number of cycles elapſed ſince his birth, and the remainder is the cycle for the given year: If nothing remains, the cycle is 28. To find the lunar cycle, add 1 to the given year of Chriſt, and divide the ſum by 19; the quotient is the number of cycles elapſed in the interval, and the remainder is the cycle for the given year: If nothing remains, the cycle is 19. Laſtly, ſubtract 312 from the given year of Chriſt, and divide the remainder by 15; and what remains after this diviſion is the indiction for the given year: If nothing remains, the indiction is 15.

Although the above deficiency in the lunar circle of an hour and an half every 19 years be but ſmall, yet in time it becomes ſo ſenſible as to make a whole natural day in 310 years. So that, although this cycle be of uſe, when the golden numbers are rightly placed againſt the days of the months in the kalendar, as in our Common Prayer Books, for finding the days of the mean conjunctions or oppoſitions of the ſun and moon, and conſequently the time of Eaſter; it will only ſerve for 310 years, old ſtyle. For as the new and full moons anticipate a day in that time, the golden numbers ought

to be placed one day earlier in the kalendar for the next 310 years to come. These numbers were rightly placed against the days of new moon in the kalendar, by the council of Nice, A. D. 325; but the anticipation, which has been neglected ever since, is now grown almost into 5 days: And therefore, all the golden numbers ought now to be placed 5 days higher in the kalendar for the old style than they were at the time of the said council; or 6 days lower for the new style, because at present it differs 11 days from the old.

Days.	Jan.	Feb.	March	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	
1	9		9	17	6					11		19

31						17	6	6	14	3			
		9		9			14	3		11			19

In the above table the golden numbers under the months stand against the days of new moon in the left-hand column, for the new style; adapted chiefly to the second year after leap-year, as being the nearest mean for all the four; and will serve till the year 1900. Therefore, to find the day of new moon in any month of a given year till that time, look for the golden number of

that year under the desired month, and against it you have the day of new moon in the left-hand column. Thus, suppose it were required to find the day of new moon in September 1769; the golden number for that year is 3, which I look for under September, and right against it in the left-hand column you will find 30, which is the day of new moon in that month. *N. B.* If all the golden numbers, except 17 and 6, were set one day lower in the table, it would serve from the beginning of the year 1900 till the end of the year 2199. The table at the end of this chapter shews the golden number for 4000 years after the birth of Christ, by looking for the even hundreds of any given year at the left hand, and for the rest to make up that year at the head of the table; and where the columns meet, you have the golden number (which is the same both in old and new style) for the given year. Thus, suppose the golden number was wanted for the year 1769; look for 1700 at the left hand of the table, and for 69 at the top of it; then guiding your eye downward from 69 to over-against 1700, you will find 3, which is the golden number for that year.

But because the lunar cycle of 19 years sometimes includes five leap-years, and at other times only four, this table will sometimes vary a day from the truth in leap-years after February. And it is impossible to have one more correct, unless we extend it to four times 19 or 76 years; in which there are 19 leap-years without a remainder. But even then to have it of perpetual use, it must be adapted to the old style; because, in every centennial year not divisible by 4, the regular course of leap-years is interrupted in the new; as will be the case in the year 1800.

The cycle of Easter, also called the *Dionysian period*, is a revolution of 532 years, found by multiplying the solar cycle 28 by the lunar cycle 19. If the new moons did not anticipate upon this cycle, Easter-day would always be the Sunday next after the first full moon, which follows the 21st of March. But, on account of the above anticipation, to which no proper regard was had before the late alteration of the style, the ecclesiastic Easter has several times been a week different from the true Easter within this last century: which inconvenience is now remedied by making the table, which used to find Easter for ever, in the Common Prayer Book, of no longer use than the lunar difference from the new style will admit of.

The earliest Easter possible is the 22d of March, the latest the 25th of April. Within these limits are 35 days, and the number belonging to each of them is called the *number of direction*; because thereby the time of Easter is found for any given year.

The first seven letters of the alphabet are commonly placed in the annual almanacks, to shew on what days of the week the days of the months fall throughout the year. And because one of those seven letters must necessarily stand against Sunday, it is printed in a capital form, and called the *dominical letter*: The other six being inserted in small characters, to denote the other six days of the week. Now, since a common Julian year contains 365 days, if this number be divided by 7

(the

(the number of days in a week) there will remain one day. If there had been no remainder, it is plain the year would constantly begin on the same day of the week; but since one remains, it is plain, that the year must begin and end on the same day of the week; and therefore the next year will begin on the day following. Hence, when January begins on Sunday, *A* is the dominical or Sunday letter for that year: Then, because the next year begins on Monday, the Sunday will fall on the seventh day, to which is annexed the seventh letter *G*, which therefore will be the dominical letter for all that year: and as the third year will begin on Tuesday, the Sunday will fall on the sixth day; therefore *F* will be the Sunday letter for that year. Whence it is evident, that the Sunday letters will go annually in a retrograde order thus, *G, F, E, D, C, B, A*. And, in the course of seven years, if they were all common ones, the same days of the week and dominical letters would return to the same days of the months. But because there are 366 days in a leap-year, if this number be divided by 7, there will remain two days over and above the 52 weeks of which the year consists. And therefore, if the leap-year begins on Sunday, it will end on Monday; and the next year will begin on Tuesday, the first Sunday whereof must fall on the sixth of January, to which is annexed the letter *F*, and not *G*, as in common years. By this means, the leap-year returning every fourth year, the order of the dominical letters is interrupted; and the series cannot return to its first state till after four times seven, or 28 years; and then the same days of the months return in order to the same days of the week as before.

From the multiplication of the solar cycle of 28 years into the lunar cycle of 19 years, and the Roman indication of 15 years, arises the great Julian period, consisting of 7980 years, which had its beginning 764 years before Strauchius's supposed year of the creation (for no later could all the three cycles begin together) and it is not yet completed: And therefore it includes all other cycles, periods, and æras. There is but one year in the whole period that has the same numbers for the three cycles of which it is made up: And therefore, if historians had remarked in their writings the cycles of each year, there had been no dispute about the time of any action recorded by them.

The Dionysian or vulgar æra of Christ's birth was about the end of the year of the Julian period 4713; and consequently the first year of his age, according to that

account, was the 4714th year of the said period. Therefore, if to the current year of Christ we add 4713, the sum will be the year of the Julian period. So the year 1769 will be found to be the 6482d year of that period. Or, to find the year of the Julian period answering to any given year before the first year of Christ, subtract the number of that given year from 4714, and the remainder will be the year of the Julian period. Thus, the year 585 before the first year of Christ (which was the 584th before his birth) was the 4129th year of the said period. Lastly, to find the cycles of the sun, moon, and indication for any given year of this period, divide the given year by 28, 19, and 15; the three remainders will be the cycles sought, and the quotients the numbers of cycles run since the beginning of the period. So in the above 4714th year of the Julian period, the cycle of the sun was 10, the cycle of the moon 2, and the cycle of indication 4; the solar cycle having run through 168 courses, the lunar 248, and the indication 314.

The vulgar æra of Christ's birth was never settled till the year 527, when Dionysius Exiguus, a Roman abbot, fixed it to the end of the 4713th year of the Julian period, which was four years too late. For our Saviour was born before the death of Herod, who fought to kill him as soon as he heard of his birth. And, according to the testimony of Josephus (*B. xvii. ch. 8.*) there was an eclipse of the moon in the time of Herod's last illness; which eclipse appears by our astronomical tables to have been in the year of the Julian period 4710, March 13th, at 3 hours past midnight, at Jerusalem. Now, as our Saviour must have been born some months before Herod's death, since in the interval he was carried into Egypt, the latest time in which we can fix the true æra of his birth as about the end of the 4709th year of the Julian period.

As there are certain fixed points in the heavens from which astronomers begin their computations, so there are certain points of time from which historians begin to reckon; and these points or roots of time are called *æras* or *epochs*. The most remarkable æras are, those of the Creation, the Greek Olympiads, the building of Rome, the æra of Nabonassar, the death of Alexander, the birth of Christ, the Arabian Hegira, and the Persian Jeddigid: All which, together with several others of less note, have their beginnings to the following table fixed to the years of the Julian period, to the age of the world at those times, and to the years before and after the year of Christ's birth.

A Table of remarkable *Æras* and Events.

	Julian Period	Y <sup>r</sup> of the World.	Before Christ.
1. The creation of the world	706	0	4007

In fixing the year of the creation to the 706th year of the Julian period, which was the 4007th year before the year of Christ's birth, we have followed Mr Bedford in his scripture chronology, printed A. D. 1730, and Mr Kennedy in a work of the same kind, printed A. D. 1762.—Mr Bedford takes it only for granted that the world was created at the time of the autumnal equinox: But Mr Kennedy affirms, that the said equinox

was at the noon of the fourth day of the creation-week, and that the moon was then 24 hours past her opposition to the sun.—If Moses had told us the same things, we should have had sufficient data for fixing the æra of the creation: But, as he has been silent on these points, we must consider the best accounts of chronologers as entirely hypothetical and uncertain.

TABLE, shewing the Golden Numbers, (which is the same both in the Old and New Style), from the Christian Æra, to A. D. 4000.

CHAP. XIX. *A Description of the Astronomical Machinery serving to explain and illustrate the foregoing part of this Treatise.*

THE ORRERY, (Plate XLVII. fig. 4.) This machine shews the motions of the sun, Mercury, Venus, earth, and moon; and occasionally the superior planets, Mars, Jupiter, and Saturn, may be put on; Jupiter's four satellites are moved round him in their proper times by a small winch; and Saturn has his five satellites, and his ring which keeps its parallelism round the sun; and by a lamp put in the sun's place, the ring shews all its various phases already described.

In the centre, No. 1. represents the sun, supported by its axis, inclining almost 8 degrees from the axis of

the ecliptic, and turning round in 25½ days on its axis, of which the north-pole inclines toward the 8th degree of Pices in the great ecliptic, (No. 11.), whereon the months and days are engraven over the signs and degrees in which the sun appears, as seen from the earth, on the different days of the year.

The nearest planet (No. 2.) to the sun is Mercury, which goes round him in 87 days 23 hours, or 87½ diurnal rotations of the earth; but has no motion round its axis in the machine, because the time of its diurnal motion in the heavens is not known to us.

The next planet in order is Venus, (No. 3.), which performs her annual course in 224 days 17 hours, and turns round her axis in 24 days 8 hours, or in 24½ diurnal rotations of the earth. Her axis inclines 75 degrees from the axis of the ecliptic, and her north pole inclines

towards

towards the 20th degree of Aquarius, according to the observations of Bianchini. She shews all the phenomena described in Chap. I.

Next, without the orbit of Venus, is the Earth, (No. 4.), which turns round its axis, to any fixed point at a great distance, in 23 hours 56 minutes 4 seconds, of mean solar time; but from the sun to the sun again, in 24 hours of the same time. No. 6. is a syderal dial plate under the earth, and No. 7. a solar dial-plate on the cover of the machine. The index of the former shews syderal, and of the latter, solar time; and hence the former index gains one entire revolution on the latter every year, as 365 solar or natural days contain 366 syderal days, or apparent revolutions of the stars. In the time that the earth makes  $365\frac{1}{4}$  diurnal rotations on its axis, it goes once round the sun in the plane of the ecliptic; and always keeps opposite to a moving index (No. 10.) which shews the sun's daily change of place, and also the days of the months.

The earth is half covered with a black cap, for dividing the apparently enlightened half next the sun from the other half, which, when turned away from him, is in the dark. The edge of the cap represents the circle bounding light and darkness, and shews at what time the sun rises and sets to all places throughout the year. The earth's axis inclines  $23\frac{1}{2}$  degrees from the axis of the ecliptic, the north pole inclines toward the beginning of Cancer, and keeps its parallelism throughout its annual course; so that in summer the northern parts of the earth incline towards the sun, and in winter from him; by which means, the different lengths of days and nights, and the cause of the various seasons, are demonstrated to sight.

There is a broad horizon, to the upper side of which is fixed a meridian femicircle in the north and south points, graduated on both sides from the horizon to  $90^\circ$  in the zenith or vertical side. The edge of the horizon is graduated from the east and west to the south and north points, and within these divisions are the points of the compass. From the lower side of this thin horizon-plate stand out four small wires, to which is fixed a twilight-circle 18 degrees from the graduated side of the horizon all round. This horizon may be put upon the earth, (when the cap is taken away), and rectified to the latitude of any place; and then, by a small wire called the *solar ray*, which may be put on so as to proceed directly from the sun's centre towards the earth's, but to come no farther than almost to touch the horizon. The beginning of twilight, time of sun-rising, with his amplitude, meridian altitude, time of setting, amplitude then, and end of twilight, are shewn for every day of the year, at that place to which the horizon is rectified.

The Moon (No. 5.) goes round the earth, from between it and any fixed point at a great distance, in 27 days 7 hours 43 minutes, or through all the signs and degrees of her orbit, which is called her *periodical revolution*; but she goes round from the sun to the sun again, or from change to change, in 29 days 12 hours 45 minutes, which is her *synodical revolution*; and in that time she exhibits all the phases already described.

When the above mentioned horizon is rectified to the

latitude of any given place, the times of the moon's rising and setting, together with her amplitude, are shewn to that place as well as the sun's; and all the various phenomena of the harvest-moon are made obvious to sight.

The Moon's orbit (No. 9.) is inclined to the ecliptic, (No. 11.), one half being above, and the other below it. The nodes, or points at  $0$  and  $180^\circ$ , lie in the plane of the ecliptic, as before described, and shift backward through all its signs and degrees in  $18\frac{1}{2}$  years. The degrees of the moon's latitude to the highest at *NL* (north latitude) and lowest at *SL*, (south latitude), are engraven both ways from her nodes at  $0$  and  $180^\circ$ ; and as the moon rises and falls in her orbit according to its inclination, her latitude and distance from her nodes are shewn for every day, having first rectified her orbit so as to set the nodes to their proper places in the ecliptic; and then, as they come about at different, and almost opposite times of the year, and then point towards the sun, all the eclipses may be shewn for hundreds of years, (without any new rectification), by turning the machinery backward for time past, or forward for time to come. At 17 degrees distance from each node, on both sides, is engraven a small sun; and at 12 degrees distance, a small moon; which shew the limits of solar and lunar eclipses: and when, at any change, the moon falls between either of these suns and the node, the sun will be eclipsed on the day pointed to by the annual index, (No. 10.); and as the moon has then north or south latitude, one may easily judge whether that eclipse will be visible in the northern or southern hemisphere; especially as the earth's axis inclines toward the sun or from him at that time. And when, at any full, the moon falls between either of the little moons and node, she will be eclipsed, and the annual index shews the day of that eclipse. There is a circle of  $29\frac{1}{2}$  equal parts (No. 8.) on the cover of the machine, on which an index shews the days of the moon's age.

There are two femicircles (Plate XLVIII. fig. 1.) fixed to an elliptical ring, which being put like a cap upon the earth, and the forked part *F* upon the moon, shews the times as the earth turns round within them, and they are led round it by the moon. When the different places come to the femicircle *AeEbB*, they have tides of flood; and when they come to the femicircle *CEd*, they have tides of ebb; the index on the hour-circle (No. 7. Plate XLVII.) shewing the times of these phenomena.

There is a jointed wire, of which one end being put into a hole in the upright stem that holds the earth's cap, and the wire laid into a small forked piece which may be occasionally put upon Venus or Mercury, shews the direct and retrograde motions of these two planets, with their stationary times and places, as seen from the earth.

The whole machinery is turned by a winch or handle, (No. 12.), and is so easily moved, that a clock might turn it without any danger of stopping.

To give a plate of the wheel-work of this machine, would answer no purpose, because many of the wheels lie so behind others as to hide them from sight in any view whatever.

The COMETARIUM, (Plate XLVIII. fig. 2.) This curious

Fig. 1.

Fig. 2.

Fig. 3  
FERGUSON'S ORRERY

W. Bell Sculp.

Fig. 1.

Fig. 2.

Fig. 3.

curious machine shews the motion of a comet or excentric body moving round the sun, describing equal areas in equal times, and may be so contrived as to shew such a motion for any degree of excentricity. It was invented by the late Dr Defaguliers.

The dark elliptical groove round the letters *abcdefghijklmnop* is the orbit of the comet *Y*: this comet is carried round in the groove according to the order of letters, by the wire *W* fixed in the sun *S*, and slides on the wire as it approaches nearer to, or recedes farther from the sun, being nearest of all in the perihelion *a*, and farthest in the aphelion *g*. The areas, *aSb*, *bSc*, *cSd*, &c. or contents of these several triangles, are all equal; and in every turn of the winch *N*, the comet *Y* is carried over one of these areas; consequently, in as much time as it moves from *f* to *g*, or from *g* to *b*, it moves from *m* to *a*, or from *a* to *b*; and so of the rest, being quickest of all at *a*, and slowest at *g*. Thus the comet's velocity in its orbit continually decreases from the perihelion *a* to the aphelion *g*; and increases in the same proportion from *g* to *a*.

The elliptic orbit is divided into 12 equal parts or signs, with their respective degrees, and so is the circle *nppqrstu*, which represents a great circle in the heavens, and to which the comet's motion is referred by a small knob on the point of the wire *W*. Whilst the comet moves from *f* to *g* in its orbit, it appears to move only about five degrees in this circle, as is shewn by the small knob on the end of the wire *W*; but in as short time as the comet moves from *m* to *a*, or from *a* to *b*, and it appears to describe the large space *no* or *no* in the heavens, either of which spaces contains 120 degrees, or four signs. Were the excentricity of its orbit greater, the greater still would be the difference of its motion, and *vice versa*.

*ABCDEFGHIKLM* is a circular orbit for shewing the equable motion of a body round the sun *S*, describing equal areas *ASB*, *BSC*, &c. in equal times with those of the body *Y* in its elliptical orbit above mentioned; but with this difference, that the circular motion describes the equal arcs *AB*, *BC*, &c. in the same equal times that the elliptical motion describes the unequal arcs, *ab*, *bc*, &c.

Now, suppose the two bodies *Y* and *1* to start from the points *a* and *A* at the same moment of time, and, each having gone round its respective orbit, to arrive at these points again at the same instant, the body *Y* will be forwarder in its orbit than the body *1* all the way from *a* to *g*, and from *A* to *G*; but *1* will be forwarder than *Y* through all the other half of the orbit; and the difference is equal to the equation of the body *Y* in its orbit. At the points *aA*, and *gG*, that is, in the perihelion and aphelion, they will be equal; and then the equation vanishes. This shews why the equation of a body moving in an elliptic orbit, is added to the mean or supposed circular motion from the perihelion to the aphelion, and subtracted from the aphelion to the perihelion, in bodies moving round the sun, or from the perigee to the apogee, and from the apogee to the perigee in the moon's motion round the earth.

This motion is performed in the following manner by the machine, (Plate XLVIII. fig. 3.). *ABC* is a wooden bar, (in the box containing the wheel-works, above which are the wheels *D* and *E*, and below it the elliptic plates *FF* and *GG*; each plate being fixed on an axis in one of its focuses, at *E* and *K*; and the wheel *E* is fixed on the same axis with the plate *FF*. These plates have grooves round their edges precisely of equal diameters to one another, and in these grooves is the cat-gut string *gg*, *gg* crossing between the plates at *b*. On *H*, the axis of the handle or winch *N* in fig. 2. is an endless screw in fig. 3. working in the wheels *D* and *E*, whose numbers of teeth being equal, and should be equal to the number of lines *aS*, *bS*, *cS*, &c. in fig. 2. they turn round their axes in equal times to one another, and to the motion of the elliptic plates. For, the wheels *D* and *E* having equal numbers of teeth, the plate *FF* being fixed on the same axis with the wheel *E*, and the plate *FF* turning the equally big plate *GG* by a cat-gut string round them both, they must all go round their axes in as many turns of the handle *N* as either of the wheels has teeth.

It is easy to see, that the end *b* of the elliptical plate *FF* being farther from its axis *E* than the opposite end *I* is, must describe a circle so much the larger in proportion, and therefore move through so much more space in the same time; and for that reason the end *b* moves so much faster than the end *I*, although it goes no sooner round the centre *E*. But then the quick-moving end *b* of the plate *FF* leads about the short end *kK* of the plate *GG* with the same velocity; and the slow-moving end *I* of the plate *FF* coming half round as to *B*, must then lead the long end *k* of the plate *GG* as slowly about: so that the elliptical plate *FF* and its axis *E* move uniformly and equally quick in every part of its revolution; but the elliptical plate *GG*, together with its axis *K*, must move very unequally in different parts of its revolution; the difference being always inversely as the distance of any point of the circumference of *GG* from its axis at *K*: or in other words, to instance in two points, if the distance *kK* be four, five, or six times as great as the distance *Kb*, the point *b* will move in that position four, five, or six times as fast as the point *k* does, when the plate *GG* has gone half round; and so on for any other excentricity or difference of the distances *kK* and *Kb*. The tooth *I* on the plate *FF* falls in between the two teeth at *k* on the plate *GG*, by which means the revolution of the latter is so adjusted to that of the former, that they can never vary from one another.

On the top of the axis of the equally-moving wheel *D* in fig. 3. is the sun *S* in fig. 2.; which sun, by the wire fixed to it, carries the ball *1* round the circle *ABCD*, &c. with an equable motion, according to the order of the letters: and on the top of the axis *K* of the unequally-moving ellipsis *GG*, in fig. 3. is the sun *S* in fig. 2. carrying the ball *Y* unequally round in the elliptical groove *abcd*, &c. *N. B.* This elliptical groove must be precisely equal and similar to the verge of the plate *GG*, which is also equal to that of *FF*.

In this manner machines may be made to shew the

true motion of the moon about the earth, or of any planet about the sun, by making the elliptical plates of the same eccentricities, in proportion to the radius, as the orbits of the planets are, whose motions they represent; and so their different equations in different parts of their orbits may be made plain to sight, and clearer ideas of these motions and equations acquired in half an hour, than could be gained from reading half a day about such motions and equations.

The IMPROVED CELESTIAL GLOBE, (Plate XLIV. fig. 2.). On the north pole of the axis, above the hour-circle, is fixed an arch *MKH* of  $23\frac{1}{2}$  degrees; and at the end *H* is fixed an upright pin *HG*, which stands directly over the north pole of the ecliptic, and perpendicular to that part of the surface of the globe. On this pin are two moveable collets at *D* and *H*, to which are fixed the quadrantal wires *N* and *O*, having two little balls on their ends for the sun and moon, as in the figure. The collet *D* is fixed to the circular plate *F*, whereon the  $29\frac{1}{2}$  days of the moon's age are engraven, beginning just under the sun's wire *N*; and as this wire is moved round the globe, the plate *F* turns round with it. These wires are easily turned, if the screw *G* be slackened; and when they are set to their proper places, the screw serves to fix them there so as in turning the ball of the globe, the wires with the sun and moon go round with it; and these two little balls rise and set at the same times, and on the same points of the horizon, for the day to which they are rectified, as the sun and moon do in the heavens.

Because the moon keeps not her course in the ecliptic, (as the sun appears to do), but has a declination of  $5\frac{1}{2}$  degrees on each side from it in every lunation, her ball may be screwed as many degrees to either side of the ecliptic as her latitude or declination from the ecliptic amounts to at any given time; and for this purpose *S*, Plate LI. fig. 2. (by mistake omitted to be inserted in the proper plate) is a small piece of pasteboard, of which the curved edge at *S* is to be set upon the globe at right angles to the ecliptic, and the dark line over *S* to stand upright upon it. From this line, on the convex edge, are drawn the  $5\frac{1}{2}$  degrees of the moon's latitude on both sides of the ecliptic; and when this piece is set upright on the globe, its graduated edge reaches to the moon on the wire *O*, by which means she is easily adjusted to her latitude found by an ephemeris.

The horizon is supported by two femicircular arches, because pillars would stop the progress of the balls when they go below the horizon in an oblique sphere.

To rectify this globe. Elevate the pole to the latitude of the place; then bring the sun's place in the ecliptic for the given day to the brazen meridian, and set the hour-index to XII at noon, that is to the upper XII on the hour-circle; keeping the globe in that situation, slacken the screw *G*, and set the sun directly over his place on the meridian; which done, set the moon's wire under the number that expresses her age for that day on the plate *F*; and she will then stand over her place in the ecliptic, and shew what constellation she is in. Lastly, fasten the screw *G*, and laying the curved edge of the pasteboard *S* over the ecliptic below the moon, adjust the moon to her latitude over the graduated edge of the pasteboard; and the globe will be rectified.

Having thus rectified the globe, turn it round, and observe on what points of the horizon the sun and moon balls rise and set, for these agree with the points of the compass on which the sun and moon rise and set in the heavens on the given day; and the hour-index shews the times of their rising and setting; and likewise the time of the moon's passing over the meridian.

This simple apparatus shews all the varieties that can happen in the rising and setting of the sun and moon; and makes the fore-mentioned phenomena of the harvest-moon plain to the eye. It is also very useful in reading lectures on the globes, because a large company can see this sun and moon go round, rising above and setting below the horizon at different times, according to the seasons of the year; and making their appulses to different fixed stars. But in the usual way, where there is only the places of the sun and moon in the ecliptic to keep the eye upon, they are easily lost sight of, unless they be covered with patches.

The PLANETARY GLOBE, (Plate XLIX. fig. 1.) In this machine, a terrestrial globe is fixed on its axis standing upright on the pedestal *CDE*, on which is an hour-circle, having its index fixed on the axis, which turns somewhat tightly in the pedestal, so that the globe may not be liable to shake; to prevent which, the pedestal is about two inches thick, and the axis goes quite through it, bearing on a shoulder. The globe is hung in a graduated brazen meridian, much in the usual way; and the thin plate *N, NE, E* is a moveable horizon graduated round the outer edge, for shewing the bearings and amplitudes of the sun, moon, and planets. The brazen meridian is grooved round the outer edge; and in this groove is a slender semi-circle of brass, the ends of which are fixed to the horizon in its north and south points: this semi-circle slides in the groove as the horizon is moved in rectifying it for different latitudes. To the middle of this semi-circle is fixed a pin, which always keeps in the zenith of the horizon, and on this pin the quadrant of altitude *q* turns; the lower end of which, in all positions, touches the horizon as it is moved round the same. This quadrant is divided into 90 degrees from the horizon to the zenithal pin on which it is turned, at 90. The great flat circle or plate *AB* is the ecliptic, on the outer edge of which the signs and degrees are laid down; and every fifth degree is drawn through the rest of the surface of this plate towards its center. On this plate are seven grooves, to which seven little balls are adjusted by sliding wires, so that they are easily moved in the grooves, without danger of starting them. The ball next the terrestrial globe is the moon, the next without it is Mercury, the next Venus, the next the sun, then Mars, then Jupiter, and lastly Saturn. This plate, or ecliptic, is supported by four strong wires, having their lower ends fixed into the pedestal, at *C, D, E*, the fourth being hid by the globe. The ecliptic is inclined  $23\frac{1}{2}$  degrees to the pedestal, and is therefore properly inclined to the axis of the globe which stands upright on the pedestal.

To rectify this machine. Set the sun, and all the planetary balls, to their geocentric places in the ecliptic for any given time, by an ephemeris; then set the north point of the

the horizon to the latitude of your place on the brazen meridian, and the quadrant of altitude to the fourth point of the horizon; which done, turn the globe with its furniture till the quadrant of altitude comes right against the sun, viz. to his place in the ecliptic; and keeping it there, set the hour-index to the XII next the letter C; and the machine will be rectified, not only for the following problems, but for several others which the artist may easily find out.

**PROBLEM I.** *To find the amplitudes, meridian altitudes, and times of rising, culminating, and setting, of the sun, moon, and planets.*

Turn the globe round eastward, or according to the order of signs; and as the eastern edge of the horizon comes right against the sun, moon, or any planet, the hour-index will shew the time of its rising; and the inner edge of the ecliptic will cut its rising amplitude in the horizon. Turn on, and as the quadrant of altitude comes right against the sun, moon or planets, the ecliptic cuts their meridian altitudes in the quadrant, and the hour-index shews the times of their coming to the meridian. Continue turning, and as the western edge of the horizon comes right against the sun, moon, or planets, their setting amplitudes are cut in the horizon by the ecliptic; and the times of their setting are shewn by the index on the hour-circle.

**PROB. II.** *To find the altitude and azimuth of the sun, moon, and planets, at any time of their being above the horizon.*

Turn the globe till the index comes to the given time in the hour-circle, then keep the globe steady, and moving the quadrant of altitude to each planet respectively, the edge of the ecliptic will cut the planet's mean altitude on the quadrant, and the quadrant will cut the planet's azimuth, or point of bearing on the horizon.

**PROB. III.** *The sun's altitude being given at any time either before or after noon, to find the hour of the day, and variation of the compass, in any known latitude.*

With one hand hold the edge of the quadrant right against the sun; and, with the other hand, turn the globe westward, if it be in the forenoon, or eastward if it be in the afternoon, until the sun's place at the inner edge of the ecliptic cuts the quadrant in the sun's observed altitude; and then the hour-index will point out the time of the day, and the quadrant will cut the true azimuth, or bearing of the sun for that time: The difference between which, and the bearing shewn by the azimuth compass, shews the variation of the compass in that place of the earth.

**THE TRAJECTORIUM LUNARE**, Plate XLIX. fig. 2. This machine is for delineating the paths of the earth and moon, shewing what sort of curves they make in the ethereal regions. *S* is the sun, and *E* the earth, whose centres are 81 inches distant from each other; every inch answering to a million of miles. *M* is the moon,

whose centre is  $\frac{24}{350}$  parts of an inch from the earth's in this machine, this being in just proportion to the moon's distance from the earth. *AA* is a bar of wood, to be moved by hand round the axis *g* which is fixed in the wheel *Y*. The circumference of this wheel is to the circumference of the small wheel *L* (below the other end of the bar) as  $365\frac{1}{2}$  days is to  $29\frac{1}{2}$ , or as a year is to a lunation. The wheels are grooved round their edges, and in the grooves is the cat-gut string *GG* crossing between the wheels at *X*. On the axis of the wheel *L* is the index *F*, in which is fixed the moon's axis *M* for carrying her round the earth *E* (fixed on the axis of the wheel *L*) in the time that the index goes round a circle of  $29\frac{1}{2}$  equal parts, which are the days of the moon's age. The wheel *Y* has the months and days of the year all round its limb; and in the bar *AA* is fixed the index *I*, which points out the days of the months answering to the days of the moon's age, shewn by the index *F*, in the circle of  $29\frac{1}{2}$  equal parts at the other end of the bar. On the axis of the wheel *L* is put the piece *D*, below the cock *C*, in which this axis turns round; and in *D* are put the pencils *e* and *m*, directly under the earth *E* and moon *M*; so that *m* is carried round *e*, as *M* is round *E*.

Lay the machine on an even floor, pressing gently on the wheel *Y*, to cause its spiked feet (of which two appear at *P* and *P*, the third being supposed to be hid from sight by the wheel) enter a little into the floor to secure the wheel from turning. Then lay a paper about four feet long under the pencils *e* and *m*, cross-wise to the bar; which done, move the bar slowly round the axis *g* of the wheel *Y*; and as the earth *E* goes round the sun *S*, the moon *M* will go round the earth with a duly proportioned velocity; and the friction-wheel *W* running on the floor, will keep the bar from bearing too heavily on the pencils *e* and *m*, which will delineate the paths of the earth and moon. As the index *I* points out the days of the months, the index *F* shews the moon's age on these days, in the circle of  $29\frac{1}{2}$  equal parts. And as this last index points to the different days in its circle, the like numeral figures may be set to those parts of the curves of the earth's path and moon's, where the pencils *e* and *m* are at those times respectively, to shew the places of the earth and moon. If the pencil *e* be pushed a very little off, as if from the pencil *m*, to about  $\frac{1}{2}$  part of their distance, and the pencil *m* pushed as much towards *e*, to bring them to the same distances again, though not to the same points of space; then, as *m* goes round *e*, *e* will go as it were round the centre of gravity between the earth *e* and moon *m*; but this motion will not sensibly alter the figure of the earth's path or the moon's.

If a pin, as *p*, be put through the pencil *m*, with its head towards that of the pin *g* in the pencil *e*, its head will always keep thereto as *m* goes round *e*, or as the same side of the moon is still obverted to the earth. But the pin *p*, which may be considered as an equatorial diameter of the moon, will turn quite round the point *m*, making all possible angles with the line of its progress, or line of the moon's path. This is an ocular proof of the moon's turning round her axis.

The TIDE-DIAL, Plate L. fig. 1. The outside parts of this machine consist of, 1. An eight-sided box, on the top of which the corners is shewn the phases of the moon at the octants, quarters, and full. Within this is a circle of  $29\frac{1}{2}$  equal parts, which are the days of the moon's age accounted from the sun at new moon, round to the sun again. Within this circle is one of 24 hours divided into their respective halves and quarters. 2. A moving elliptical plate, painted blue, to represent the rising of the tides under and opposite to the moon; and has the words, *high water, tide falling, low water, tide rising*, marked upon it. To one end of this plate is fixed the moon *M* by the wire *W*, and goes along with it. 3. Above this elliptical plate is a round one, with the points of the compass upon it, and also the names of above 200 places in the large machine (but only 32 in the figure, to avoid confusion) set over those points in which the moon bears when she raises the tides to the greatest heights at these places twice in every lunar day: And to the north and south points of this plate are fixed two indexes *I* and *K*, which shew the times of high water, in the hour circle, at all these places. 4. Below the elliptical plate are four small plates, two of which project out from below its ends at new and full moon; and so, by lengthening the ellipse, shew the spring-tides, which are then raised to the greatest heights by the united attractions of the sun and moon. The other two of these small plates appear at low water when the moon is in her quadratures, or at the sides of the elliptical plate, to shew the neap-tides; the sun and moon then acting cross-wise to each other. When any two of these small plates appear, the other two are hid; and when the moon is in her octants, they all disappear, their being neither spring nor neap-tides at those times. Within the box are a few wheels for performing these motions by the handle or winch *H*.

Turn the handle until the moon *M* comes to any given day of her age in the circle of  $29\frac{1}{2}$  equal parts, and the moon's wire *W* will cut the time of her coming to the meridian on that day, in the hour circle; the XII under the sun being mid-day, and the opposite XII midnight: Then looking for the name of any given place on the round plate (which makes  $29\frac{1}{2}$  rotations whilst the moon *M* makes only one revolution from the sun to

the sun again) turn the handle till that place comes to the word *high water* under the moon, and the index which falls among the forenoon hours will shew the time of high water at that place in the forenoon of the given day: then turn the plate half round, till the same place comes to the opposite high-water mark, and the index will shew the time of high water in the afternoon at that place. And thus, as all the different places come successively under and opposite to the moon, the indexes shew the times of high water at them in both parts of the day: And, when the same places come to the low-water marks, the indexes shew the times of low water. For about three days before and after the times of new and full moon, the two small plates come out a little way from below the high-water marks on the elliptical plate, to shew that the tides rise still higher about these times: And about the quarters, the other two plates come out a little from under the low-water marks towards the sun, and on the opposite side, shewing that the tides of flood rise not then so high, nor do the tides of ebb fall so low, as at other times.

By pulling the handle a little way outward, it is disengaged from the wheel-work, and then the upper plate may be turned round quickly by hand, so as the moon may be brought to any given day of her age in about a quarter of a minute; and by pushing in the handle, it takes hold of the wheel-work again.

On *AB*, (fig. 2) the axis of the handle *H*, is an endless screw *C*, which turns the wheel *FED* of 24 teeth round in 24 revolutions of the handle: This wheel turns another *ONG* of 48 teeth, and on its axis is the pinion *PQ* of four leaves, which turns the wheel *LKI* of 59 teeth round in  $29\frac{1}{2}$  turnings or rotations of the wheel *FED*, or in 708 revolutions of the handle, which is the number of hours in a synodical revolution of the moon. The round plate, with the names of places upon it, is fixed on the axis of the wheel *FED*; and the elliptical or tide-plate with the moon fixed to it, is upon the axis of the wheel *LKI*; consequently, the former makes  $29\frac{1}{2}$  revolutions in the time that the latter makes one. The whole wheel *FED*, with the endless screw *C*, and dotted part of the axis of the handle *AB*, together with the dotted part of the wheel *ONG*, lie hid below the large wheel *LKI*.

## A S T

## A S Y

ASTROP-WELLS, in Northamptonshire, were recommended by the physicians Willis and Clever, for the cure of the scurvy, asthma, &c.

ASTROSCOPE, an instrument composed of two canes, having the constellations delineated on their surfaces, whereby the stars may be easily known.

ASTRUM, with chemists, signifies that virtue which accrues to things from their preparation; and among ancient physicians, certain medicines in the figure of round cakes impressed with asterisks.

ASTUR, in ornithology, a synonyme of a species of falco. See FALCO.

ASTURIA, a maritime province of Spain, lying along

the bay of Biscay, with Galicia on the west, and Biscay on the east. It gives the title of prince to the eldest son of the king of Spain.

ASTYNOMI, in Grecian antiquity, magistrates in Athens, corresponding to the ædiles of the Romans; they were ten in number. See ÆDILE.

ASYLUM, a sanctuary, or place of refuge, where criminals shelter themselves from the hands of justice. The asyls of altars and temples were very ancient; and likewise those of tombs, statues, and other monuments of considerable personages: Thus, the temple of Diana at Ephesus was a refuge for debtors, the tomb of Theseus for slaves. The Jews had their asyls

*Fig. 2.*

*Fig. 1.*

*W. Bl. del.*

- asyla, the most remarkable of which were, the six cities of refuge, the temple, and the altar of burnt-offerings.
- ASYMMETRY**, the want of proportion between the parts of any thing, being the contrary of symmetry. See **SYMMETRY**.
- ASYMPTOTE**, in geometry, a line which continually approaches nearer to another; but, though continued infinitely, will never meet with it: Of these there are many kinds. In frickness, however, the term *asymptotes* is appropriated to right lines, which approach nearer and nearer to some curves of which they are said to be *asymptotes*; but if they and their curve are indefinitely continued, they will never meet.
- ASYMPTOTIC space**, the same with hyperbolic space. See **HYPERBOLIC**.
- ASYNDETON**, in grammar, a figure which omits the conjunctions in a sentence; as in *veni, vidi, vici, ET* is left out.
- ATARAXY**, a term used by the stoics and sceptics, to denote that calmness of mind which secures us from all emotions arising from vanity and self-conceit.
- ATAXY**, in a general sense, the want of order: With physicians, it signifies irregularity of crises and paroxysms of fevers.
- ATCHE**, in commerce, a small silver coin used in Turkey, and worth only one third of the English penny.
- ATCIEVEMENT**, in heraldry, denotes the arms of a person, or family, together with all the exterior ornaments of the shield; as helmet, mantle, crest, scrolls, and motto, together with such quarterings as may have been acquired by alliances, all marshalled in order.
- A TEMPO GIUSTO**, in music, signifies to sing and or play in an equal, true, and just time. See **TIME**.
- ATHAMADULET**, the prime minister of the Persian empire, as the grand vizier is of the Turkish empire. He is great chancellor of the kingdom, president of the council, superintendent of the finances, and is charged with all foreign affairs.
- ATHAMANTA**, in botany, a genus of the pentandria digynia class. The fruit is oblong and streaked. The species are 10, only one of which, *viz.* the libanotis or mountain stone-parley is a native of Britain. The root of the athamanta meum or spignel, a native of Italy, is an useful aromatic and carminative, though little regarded in the present practice.
- ATHANASIA**, in botany, a genus of the syngenesia polygamia equalis class. There are ten species of this genus, most of them natives of Africa.
- ATHANASIAN creed**, that supposed to be composed by Athanasius. See **CREED**.
- ATHANATI**, in Persian antiquity, a body of cavalry, consisting of ten thousand men, always complete. They were called *athanati*, because, when one of them happened to die, another was immediately appointed to succeed him.
- ATHANOR**, in chemistry, a kind of fixed and large digesting furnace, made with a tower, so contrived as to keep a constant moderate heat for a considerable time, which may be increased or diminished at pleasure.
- ATHEISM**, a person who does not believe the existence of a Deity. Many people, both ancient and modern, have pretended to atheism, or have been reckoned atheists by the world; but it is justly questioned whether any man seriously adopted such a principle. These pretensions, therefore, must be founded on pride or affectation.
- ATHELING**, **ADELING**, **EDLING**, **ETHLING**, or **ETHELING**, among our Saxon ancestors, was a title of honour properly belonging to the heir apparent, or presumptive, to the crown. This honourable appellation was first conferred by king Edward the Confessor on Edgar, to whom he was great uncle, when, being without any issue of his own, he intended to make him his heir.
- ATHENA**, a plaster made of aloes, myrrh, and gumm ammoniac, and recommended by some ancient physicians in wounds of the head.
- ATHENÆA**, in Grecian antiquity. See **PANATHENÆA**.
- ATHENÆUM**, in antiquity, a public place wherein the professors of the liberal arts held their assemblies, the rhetoricians declaimed, and the poets rehearsed their performances.
- These places, of which there were a great number at Athens, were built in the manner of amphitheatres, encompassed with seats, called *cunei*. The three most celebrated Athenæa were those at Athens, at Rome, and at Lyons, the second of which was built by the emperor Adrian.
- ATHENREE**, a town of Ireland, in the county of Galway, and province of Connaught, situated about ten miles eastward of the city of Galway, in 8° 50' W. long, and 53° 14' N. lat.
- ATHENS**, anciently the capital of Attica, so famous for its learned men, orators, and captains, now called *Setines*. It stands upon a plain watered by the rivers Ilissus and Eridanus, about 40 miles east of the isthmus of Corinth: At present it is said to contain 10,000 inhabitants, three parts of which are Christians. The town does not lie round the castle as anciently, but on the north-west side of it. Here a Greek metropolitan resides. Among the many remains of antiquity, is the temple of Jupiter Olympius, and temple of Minerva, called *Parthenion*, which last is still entire, and converted into a Turkish mosque, which, as later travellers assure us, is the finest temple in the world. This city, as all the rest of Greece, is subject to the Turks. E. long. 24° 15' N. lat. 38° 5'
- ATHERINA**, in ichthyology, a genus of fishes of the order of abdominales. The characters of this genus are these: The upper jaw is plain; the rays of the branchiostee membrane are six; and the side-belt or line shines like silver. The species are two, *viz.*
1. The hepsetus, with about 12 rays in the fin next the anus. It is found in the Mediterranean.
  2. The menidea, with 24 rays in the fin next the anus. This is a very small pellicid fish, with many black points interspersed;

- terperfed; it has many teeth in the lips, but none in the tongue or jaws. It is found in the fresh waters or Carolina, and spawns in April.
- ATHEROMA**, in medicine, a tumour without pain or discolouring of the skin, containing, in a membranaceous bag, matter like pus, intermixed with hard and stony corpuscles, &c.
- ATHERTON**, a town of Warwickshire, situated about ten miles north of Coventry, in  $1^{\circ} 30'$  W. long. and  $52^{\circ} 40'$  N. lat.
- ATHLETÆ**, in antiquity, men of remarkable strength and agility, disciplined to perform in the public games. This was a general term, under which were comprehended wrestlers, boxers, runners, leapers, throwers of the disc, and those who practised in other exercises exhibited in the Olympic, Pythian, and other solemn sports, wherein there were prizes allotted for the conquerors.
- ATHLONE**, a strong town in the county of Westmeath, in the province of Connaught in Ireland, situated on the river Shannon, about 60 miles west of Dublin, in  $8^{\circ} 5'$  W. long. and  $53^{\circ} 20'$  N. lat.
- ATHOL**, a district of Perthshire in Scotland, from whence the ancient and noble family of Murray takes the title of duke.
- ATHOS**, a celebrated mountain, situated in the province of Macedonia, on a peninsula, which stretches into the Ægean sea, near the gulf of Contestia, being an entire chain of mountains extended near seven miles in length, and three in breadth. It is now called Monte Santo, from the 22 monasteries, besides cells and caves, upon it, containing near 6000 monks and hermits; no woman is allowed to come within sight of their convents. It is situated 70 miles east of Salonichi, or Thessalonica, and pays considerable tribute to the Turks, it being under the protection of the bostangi basha; on this chain formerly stood five cities. N. Lat.  $40^{\circ} 10'$  E. long.  $26^{\circ} 20'$ .
- ATHY**, a town of Ireland, in the county of Kildare and province of Leinster, situated on the river Barrow, about 10 miles south of Kildare, in  $7^{\circ} 5'$  W. long. and  $53^{\circ}$  N. lat.
- ATIGNY**, a small town of Champaign in France, situated on the river Aisne, about 20 miles south of Rheims, in  $4^{\circ} 40'$  E. long. and  $49^{\circ} 25'$  N. lat.
- ATINGUACU**, in ornithology. See **CUCULUS**.
- ATLANTIC OCEAN**, that bounded by Europe and Africa on the east, and by America on the west.
- ATLANTIDES**, in astronomy. See **PLEIADES**.
- ATLAS** the name of a ridge of mountains, running from east to west through the north of Africa, from whence the Atlantic Ocean took its name.
- ATLAS**, in architecture, the same with telamon. See **TELAMON**.
- ATLAS**, in anatomy, the name by which some call the first vertebra of the neck; so called in allusion to Mount Atlas. See p. 167.
- ATLAS**, in matters of literature, denotes a book of universal geography, containing maps of all the known parts of the world.
- ATMOSPHERE**, the vast collection of air which surrounds the earth for a great height. For the height and other properties of the atmosphere, see **PNEUMATICS**.
- ATOM**, in philosophy, a particle of matter, so minute as to admit of no division. Atoms are the *minima natura*, and are conceived as the first principles or component parts of all physical magnitude. See **CHEMISTRY**.
- ATOMICAL philosophy**, or the doctrine of atoms, a system which, from the hypothesis that atoms are endued with gravity and motion, accounted for the origin and formation of things. This philosophy was first broached by Mofchus, some time before the Trojan war; but was much cultivated and improved by Epicurus, whence it is denominated the Epicurean philosophy. See **EPICUREAN**.
- ATONICS**, in grammar, words not accented. See **ACCENT**.
- ATONY**, in medicine, a defect of tone or tension, or a laxity or debility of the solids of the body.
- ATRA BILIS**, black bile, one of the humours of the ancient physicians; which the moderns call melancholy.
- ATRACYLIS**, in botany, a genus of the syngenesia polygamia æqualis class. The corolla is radiated, and each corolla of the radius has five teeth. The species are three, none of which are natives of Britain.
- ATRAGENE**, in botany, a genus of the polyandria polygynia class. The calix has four leaves; the petals are 12; and the seeds are caudated. There are three species, all natives of the east.
- ATRAPHAXIS**, in botany, a genus of the hexandria digynia class. The calix has two leaves; the petals are two, and sinuated; and there is but one seed. There are two species; viz. the spinosa, a native of Media; and the undulata, a native of Æthiopia.
- ATRÆTI**, in medicine, infants having no perforation in the anus, or persons imperforated in the vagina or urethra.
- ATRI**, a town of the Farther Abruzzo, in the kingdom of Naples, situated in  $15^{\circ} 20'$  E. long. and  $42^{\circ} 40'$  N. lat.
- ATRICAPILLA**, in ornithology, a trivial name of a species of mucicapæ; and also of a species of motacilla. See **MUSICAPA**, and **MOTACILLA**.
- ATRICES**, or **ATTRICES**, in medicine, tubercles about the anus, reckoned a kind of condylomata.
- ATRICI**, in surgery, small sinuses in the extremity of the intestinum rectum, which do not perforate into its cavity.
- ATRIPLEX**, in botany, a genus of the polygamia monœcia class. The calix of the hermaphrodite flower has five leaves; it has no corolla; the stamina are five, and the stylus is divided into two parts; there is but one depressed seed. The calix of the female flower has two leaves; it has no corolla nor stamina; the stylus is divided into two parts; and there is but one depressed seed. The species are 12, of which eight are natives of Britain; viz. the portulacoides, or sea-purslain; the lacinatea, or jagged sea-orache; the hastata, or spear-leaved orache; the cresta, or wild orache; the patula, or narrow-leaved orache; the ferrata, or indented

indented sea-orache; the littoralis, or grafs-leaved orache; and the pedunculata, or stalked sea-orache.

**ATROPA**, in botany, a genus of the pentandria monogynia class. The corolla is shaped like a bell; the stamina are distant; the berry is globular, and consists of two cells or apartments. The species are five; viz. 1. The mandragora, or mandrake, a native of Spain and the East. The mandrake is divided into male and female. The male mandrake has a very large, long, and thick root; it is largest at the top or head, and from thence gradually grows smaller. Sometimes it is single and undivided to the bottom: but more frequently it is divided into two, sometimes into three, or more parts. From this root there arise a number of very long leaves, broadest in the middle, narrow towards the base, and obtusely pointed at the end; they are of a foot or more in length, and five inches or thereabouts in breadth; they are of a dusky and disagreeable green colour, and of a very fetid smell. The female mandrake perfectly resembles the other in its manner of growth: but the leaves are longer and narrower, and of a darker colour, as are also the seeds and roots. Authors have spoken very largely and idly of the virtues of this plant. The most common quality attributed to it, is that of rendering barren women fruitful: but we have no tolerable foundation for this: what we certainly know of it is, that it has a soporific virtue like that of opium; and the bark in small doses, Herman assures us, has often been known to do great service in hysterical complaints; but it should be used sparingly, otherwise it will often bring on convulsions, and many other mischievous symptoms. The ancients used it when they wanted a narcotic of the most powerful kind. 2. The balladonna, or deadly nightshade, a native of Britain: the berries are poisonous. 3. The physalodes, a native of Peru. 4. The frutescens, a native of Spain; and, 5. The arborescens, a native of America.

**ATROPHY**, in medicine, a disease, wherein the body, or some of its parts, do not receive the necessary nutriment, but waste and decay incessantly. See **MEDICINE**.

**ATTACHING**, or **ATTACHMENT**, in English law, the taking or apprehending of a person, by virtue of a writ or precept.

**ATTACHMENT out of the Chancery**, is obtained upon an affidavit made, that the defendant was served with a subpoena, and made no appearance; or it issueth upon not performing some order or decree.

**ATTACHMENT out of the Forest**, is one of the three courts held in the Forest. The lowest court is called the *court of Attachment*, or *wood note court*; the mean, *swan note*; and the highest, the *justice in eyre's seat*. This attachment is by three means, by goods and chattels, by body, pledges, and mainprize, or the body only. This court is held every forty days throughout the year, whence it is called the *forty-days court*.

**ATTACHMENT of privilege**, is by virtue of a man's privilege to call another to that court whereto he him-

self belongs, and in respect whereof he is privileged to answer some action.

**ATTACHMENT honorum**, in the old English statute books, imports a distress taken upon the goods or chattels of a person sued for a personal estate, or debt, by the legal attachiators, or bailiffs, as a security to answer the action.

**ATTAINERD**, in Scots law. See **TREASON**.

**ATTAIN**, in law, a writ which lies against a jury that have given a false verdict in any court of record, in a real or personal action, where the debt or damages amount to above forty shillings.

**ATTAIN**, among farriers, a knock or hurt in a horse's leg, proceeding either from a blow with another horse's foot, or from an over-reach in frosty weather, when a horse being rough-shod, or having shoes with long calkers, strikes his hinder feet against his fore-leg.

**ATTAINED**, in law, is applied to a person's being found guilty of any crime or offence, especially treason or felony, by due course of law.

**ATTELABUS**, in zoology, a genus of insects belonging to the order of coleoptera or beetle-kind. It has four wings, of which the superior is crustaceous, and serve as a sheath or cover to the inferior, which are membranous. The head tapers behind, and is inclined; the feelers turn thicker toward the apex. The species are 13; viz. 1. The coryli is black, with red elytra or crustaceous wings. 2. The avellanæ is black, with the breast, feet, and clytra red. 3. The curculionoides is black, with red elytra and breast. The above three species frequent the leaves of the hazel and siber nut-trees. 4. The furinamenfis has a double indentation (or two teeth) in the top of the elytra. It is a native of Surinam. 5. The pensilvanicus is black, with red elytra, a black belt round the middle, and another towards the apex of the elytra. It is a native of Philadelphia. 6. The melanurus is black, with testaceous elytra black at the apex. It is a native of Sweden. 7. The betulæ has laticatory or springy legs, and the whole body is of a dark-red colour. It frequents the leaves of the birch-tree. 8. The formicarius is black, with red elytra, and a double white belt toward the base. It is a native of Europe. 9. The sipyus is green, with a hairy breast, and a double yellow belt upon the elytra. 10. The apiarius is bluish, with red elytra, and three black belts. It is a native of Germany. 11. The mollis is yellowish and hairy, with pale elytra, and three belts. It is a native of Europe. 12. The ceramboides is of a blackish red colour, and the elytra is furrowed. It frequents the spongy boletus, a species of mushroom. 13. The buprestoides is of a dark-red colour, with a globular breast, and nervous elytra. It is a native of Europe.

**ATTENUANTS**, medicines which resolve the viscosity of the humours; thereby promoting their circulation, as well as the discharge of all noxious or excrementitious matter.

**ATTESTATION**, the act of affirming or witnessing the truth of something, more especially in writing.

**ATTIC**,

**ATTIC**, any thing relating to Attica, or to the city of Athens: thus Attic salt, in philology, is a delicate poignant sort of wit and humour peculiar to the Athenian writers; Attic witness, a witness incapable of corruption, &c.

**ATTIC**, in architecture, a sort of building wherein the roof or covering is not to be seen; thus named, because the buildings at Athens were generally of this form.

**ATTIC order**, a small order raised upon a large one, by way of crowning, or to finish the building; or it is, according to some, a kind of rich pedestal, sometimes used for the conveniency of having a wardrobe, or the like; and instead of columns, has only pilasters of a particular form, and sometimes no pilasters at all.

The name Attic is also given to a whole story into which this order enters; this little order being always found over another greater one.

**ATTIC bases**, a peculiar kind of base used by the ancient architects in the Ionic order; and by Palladio, and some others, in the Doric.

**ATTIRE**, in botany. See **ANTHERÆ**.

**ATTIRE**, in hunting, signifies the head or horns of a deer. The attire of a stag, if perfect, consists of bur, pearls, beam, gutters, antler, fur-antler, royal, fur-royal, and croches; of a buck, of the bur, beam, brow-antler, advancer, palm, and spellers.

**ATTITUDE**, in painting and sculpture, the gesture of a figure or statue; or it is such a disposition of their parts as serves to express the action and sentiments of the person represented.

**ATTLEBURY**, a market-town of Norfolk, about eighty miles north-east of London, situated in 40° E. long. and 52° 30' N. lat.

**ATTOCK**, a city on the eastern frontiers of Persia, capital of a province of the same name, and situated on the river Attock, in 72° E. long. and 33° N. lat.

**ATTOLLENS**, in anatomy, an appellation given to several muscles, otherwise called *levator* and *elevator*.

**ATTORNEY**, a person who by consent, commandment, or request, takes heed, fees, and takes upon him the charge of other mens business, in their absence. Attorney is either general or special: Attorney-general is he that by general authority is appointed to all our affairs or suits; as the attorney-general of the king, which is nearly the same with procurator Cæsaris in the Roman empire. Attorneys-general are made either by the king's letters-patent, or by our appointment before justices in eyre, in open court. Attorney special or particular, is he that is employed in one or more causes particularly specified. There are also, in respect of the divers courts, attorneys at large, and attorneys special, belonging to this or that court only.

Attorneys in common law, are nearly the same with proctors in the civil law, and solicitors in courts of equity. Attorneys sue out writs of process, or commence, carry on, and defend actions, or other proceedings, in the names of other persons, in the courts of common law. None are admitted to act without

having served a clerkship for five years, taking the proper oath, being enrolled, and examined by the judges. The attorney-general pleads within the bar. To him come warrants for making out patents, pardons, &c. and he is the principal manager of all law-affairs of the crown.

**Letter of ATTORNEY.** See **LETTER**.

**Warrant of ATTORNEY.** See **WARRANT**.

**ATTOURNMENT**, or **ATTORNMENT**, in law, a transfer from one lord to another of the homage and service a tenant makes; or that acknowledgment of duty to a new lord.

**ATTRACTION**, in natural philosophy, an indefinite term, applicable to all actions whereby bodies tend towards one another, whether in virtue of their weight, magnetism, electricity, impulse, or any other latent power. See **MECHANICS**, **ELECTRICITY**, &c.

**Electric Attractions.** See **CHEMISTRY**.

**ATTRIBUTE**, in a general sense, that which agrees with some person or thing; or a quality determining something to be after a certain manner. Thus, understanding is an attribute of mind, and extension an attribute of body. That attribute which the mind conceives as the foundation of all the rest, is called its essential attribute: thus extension is by some, and solidity by others, esteemed the essential attributes of body or matter.

**ATTRIBUTES**, in theology, the several qualities or perfections of the Divine nature, as wisdom, power, justice, goodness, &c.

**ATTRIBUTES**, in logic, are the predicates of any subject, or what may be affirmed or denied of any thing.

**ATTRIBUTES**, in painting and sculpture, are symbols added to several figures, to intimate their particular office and character. Thus, the eagle is an attribute of Jupiter; a peacock, of Juno; a caduceus, of Mercury; a club, of Hercules; and a palm, of Victory.

**ATTRITION**, the rubbing or striking of bodies one against another, so as to throw off some of their superficial particles.

**AVA**, a kingdom of India, beyond the Ganges, situated on the north east part of the bay of Bengal, between the countries of Arracan on the north, and Pegu on the south.

**AVALON**, a town of Burgundy in France, situated in 2° 50' E. long. and 47° 25' N. lat.

**AVARIA**, in the customs of Turkey and Persia, money exacted from Christians or Europeans, to be quit of some false accusation formed on purpose.

**AVAST**, in the sea-language, a term requiring to stop, or to stay.

**AVAUNCHERS**, among hunters, the second branches of a deer's horns. See **HEAD**.

**AUBAGNE**, a town of Provence in France, situated about seven miles southward of Marseilles, in 5° 30' E. long. 43° 15' N. lat.

**AUBANE**, in the customs of France, a right vested in the king of being heir to a foreigner that dies within his dominions.

By this right the French king claims the inheritance of all foreigners that die within his dominions, notwithstanding

- withstanding of any testament the deceased could make. An ambassador is not subject to the right of aubane; and the Switz, Savoyards, Scots, and Portuguese, are also exempted, being deemed natives and regnicoles.
- AUBE**, a river of France, which, arising in the fourth-east part of Champagne, runs north-west, and falls into the Seine below Plancy.
- AUBIGNE**, a town of France, in the province of Berry, and government of Orleans, situated in  $2^{\circ} 20' E.$  long. and  $47^{\circ} 3' N.$  lat.
- AUBIN**, or *St Aubin*, a town of Brittany in France; its *W.* long. being  $1^{\circ} 30'$ , and *N.* lat.  $48^{\circ} 15'$ .
- AUBIN**, in horsemanship, a broken kind of gait, between an amble and a gallop, accounted a defect.
- AUBURN**, a market-town in Wiltshire, situated about 24 miles west of Reading, in  $1^{\circ} 40' W.$  long. and  $51^{\circ} 30' N.$  lat.
- AUBUSSON**, a town a France, in the province of Marche, and government of Lyonois: *E.* long.  $2^{\circ} 15'$ , and *N.* lat.  $45^{\circ} 55'$ .
- AUCTION**, a kind of public sale, very much in use for household-goods, books, plate, &c. By this method of sale the highest bidder is always the buyer. This was originally a kind of sale among the ancient Romans, performed by the public crier *sub hasta*, e. under a spear stuck up on that occasion, and by some magistrate, who made good the sale by delivery of the goods.
- AUCTION by inch of candle.** See **CANDLE.**
- AUDE**, a river of France, which, taking its rise in the Pyrenees, runs northwards by Alet and Carcassone; and from thence turning eastward through Languedoc, falls into the Mediterranean, a little to the north-east of Narbonne.
- AUDIANISM**, the same with anthropomorphism. See **ANTHROPOMORPHITES.**
- AUDIENCE**, given to ambassadors, ceremonies observed in courts, at the admission of ambassadors, or public ministers, to a hearing.
- In England, audience is given to ambassadors in the presence-chamber; to envoys and residents, in a gallery, closet, or in any place where the king happens to be. Upon being admitted, as is the custom of all courts, they make three bows, after which they cover and sit down; but not before the king is covered and fat down, and has given them the sign to put on their hats.
- When the king does not care to have them covered, and sit, he himself stands uncovered; which is taken as a slight.
- At Constantinople, ministers usually have audience of the prime vizier.
- AUDIENC.-court**, a court belonging to the archbishop of Canterbury, of equal authority with the arches-court, though inferior both in dignity and antiquity. The original of this court was, because the archbishop of Canterbury heard several causes extrajudicially at home in his own palace; in which, before he would finally determine any thing, he usually committed them to be discussed by men learned in the civil and canon laws, whom, thereupon, he called his auditors;
- and so in time it became the power of the man who is called *causarum negotiorumque audientie Cantuariensis auditor, seu officialis.*
- Chamber of AUDIENCE.** See **CHAMBER.**
- AUDIT**, a regular hearing and examination of an account by some proper officers, appointed for that purpose.
- AUDITOR**, in a general sense, a hearer, or one who listens and attends to any thing.
- AUDITOR**, according to our law, is an officer of the king, or some other great person, who, by examining yearly the accounts of the under-officers, makes up a general book, with the difference between their receipts and charges, and their allowances to allocations.
- AUDITOR of the receipts**, is an officer of the exchequer who files the tellers bills, makes an entry of them, and gives the lord-treasurer a certificate of the money received the week before. He also makes debentures to every teller, before they receive any money, and take their accounts. He keeps the black book of receipts, and the treasurer's key of the treasury, and sees every teller's money locked up in the new treasury.
- AUDITORS of the revenue**, or of the exchequer, officers who take the accounts of those who collect the revenues and taxes raised by parliament, and take the accounts of the sheriffs, excheators, collectors, tenants, and customers, and set them down in a book, and perfect them.
- AUDITORS of the press and impress**, are officers of the exchequer, who take and make up the accounts of Ireland, Berwick, the mint, and of any money impressed to any man for the king's service.
- AUDITORS collegiate, conventual, &c.** officers formerly appointed in colleges, &c. to examine and pass their accounts.
- AUDITORY nerves**, in anatomy. See p. 249.
- AVAIL of marriage**, in Scots law, that casualty in ward-holding, by which the superior was intitled to a certain sum from his vassal, upon his attaining the age of puberty, as the value or avail of his tocher. See **SCOTS LAW**, tit. *Of casualties due to the superior.*
- AVEIN**, a town in the duchy of Luxemburg, remarkable for a victory which the French obtained over the Spaniards in 1635.
- AVELLANA**, in botany. See **CORYLUS.**
- AVELLANA purgatrix**, a name sometimes given to the fruit of the ricinus. See **RICINUS.**
- AVELLANE**, in heraldry, a cross, the quarters of which somewhat resemble a filbert-nut. Sylvanus Morgan says, that it is the cross which ensigns the mound of authority, or the sovereign's globe.
- AVELLINO**, a town of the kingdom of Naples, and province of Principata, situated about 25 miles east of the city of Naples, in  $15^{\circ} 20' E.$  long. and  $41^{\circ} N.$  lat.
- AVE-MARIA**, the angel Gabriel's salutation of the the Virgin Mary, when he brought her the tidings of the incarnation.—It is become a prayer or form of devotion in the Romish church. Their chaplets and rosaries are divided into fo many ave-maries, and fo

many pater-nosters, to which the papists ascribe a wonderful efficacy.

**AVENA**, oats, in botany, a genus of the triandria digynia class. The calix has a double valve; and the awn on the back is contorted. The species are 13, six of them natives of Britain; viz. 1. The nuda, or naked oats. 2. The fatua or bearded oat-grafs.

3. The pratensis, or meadow oat-grafs. 4. The pubescens, or rough oat-grafs. 5. The elatior, or tall oat-grafs. 6. The flavescens, or yellow oat-grafs. It is remarkable, that the native place of the fatua, or common oat, cultivated in our fields, is almost totally unknown. Anson says, that he observed it growing wild or spontaneously in the island of Juan Fernandez. But a vague observation from an author of that kind is not to be depended on.

**AVENACEOUS**, something belonging to, or partaking of the nature of oats.

**AVENAGE**, in law, a certain quantity of oats paid by a tenant to a landlord, instead of rent, or some other duties.

**AVENOR**, an officer belonging to the king's stables, who provides oats for the horses. He acts by warrant from the master of the horse.

**AVENS**, in botany. See **CARYOPHILLUS**.

**AVENTURE**, in law books, means a mischance, causing the death of a person without felony.

**AVENUE**, in gardening, a walk planted on each side with trees, and leading to an house, garden-gate, wood, &c. and generally terminated by some distant object. See **GARDENING**.

**AVERAGE**, in commerce, signifies the accidents and misfortunes which happen to ships and their cargoes, from the time of their loading and sailing to their return and unloading; and is divided into three kinds.

1. The simple or particular average, which consists in the extraordinary expences incurred for the ship alone, or for the merchandizes alone. Such is the loss of anchors, masts, and rigging, occasioned by the common accidents at sea; the damages which happen to merchants by storm, prize, shipwreck, wet, or rotting; all which must be born and paid by the thing which suffered the damage. 2. The large and common average, being those expences incurred, and damages sustained, for the common good and security both of the merchandizes and vessels, consequently to be borne by the ship and cargo, and to be regulated upon the whole. Of this number are the goods or money given for the ransom of the ship and cargo, things thrown overboard for the safety of the ship, the expences of unloading for entering into a river or harbour, and the provisions and hire of the sailors when the ship is put under an embargo. 3. The small averages, which are the expences for towing and piloting the ship out of, or into harbours, creeks, or rivers, one third of which must be charged to the ship, and two thirds to the cargo.

Average is more particularly used for a certain contribution that merchants make proportionably to their losses. It also signifies a small duty which those merchants, who send goods in another man's ship, pay to the master for his care of them over and above the

freight. Hence it is expressed in the bills of lading, paying so much freight for the said goods, with primage and average accustomed.

**AVERANCE**, or **AURANCHE**, a sea-port town in Normandy, in France, situated in  $1^{\circ} 20'$  W. long. and  $48^{\circ} 40'$  N. lat.

**AVER-CORN**, that conveyed to the lord's granary by his tenants.

**AVERDUPOIS**, or **AVOIRDUPOIS-WEIGHT**, a sort of weight used in England, the pound whereof is made up of sixteen ounces. See **WEIGHT**.

This is the weight for the larger and coarser commodities, such as groceries, cheese, wool, lead, &c. Bakers, who live not in corporation-towns, are to make their bread by avoirdupois-weight, those in corporations by troy weight. Apothecaries buy by avoirdupois-weight, but sell by troy. The proportion of a pound avoirdupois to a pound troy is as 17 to 14.

**AVERIA**, in a general sense, signifies any cattle, but is used in law for oxen, or horses of the plough.

*Replegiare de AVERIIS*. See **REPLEGIARE**.

**AVERNI**, among ancient naturalists, certain lakes, grottoes, and other places, which infect the air with poisonous steams or vapours, called also *mephites*.

**AVERRHOA**, in botany, a genus of the decandria pentagynia class. The calix has five leaves; the petals are five, open at top; and the apple or fruit is pentagonal, and divided into five cells. The species are three, all natives of India.

**AVERHOISTS**, the followers of Averhoes, a celebrated commentator of Aristotle, who denied the natural immortality of the soul, and yet pretended to acquiesce in the Christian doctrine concerning it.

**AVERRUNCI**, in the ancient heathen theology, an order of deities among the Romans, whose peculiar office it was to avert danger and exile. Apollo and Hercules are supposed to be of this order.

**AVERSA**, a town of Naples, in the province of Lavoro, situated about 17 miles south of Capua, in  $14^{\circ} 45'$  E. long. and  $41^{\circ} 15'$  N. lat.

**AVES**, some small islands, belonging to the Dutch, on the coast of Terra Firma, in South America.

**AVESNES**, a little fortified town of Hainault, in the French Netherlands; situated about 21 miles south of Mons, in  $3^{\circ} 40'$  E. long. and  $50^{\circ} 10'$  N. lat.

**AUGMENT**, in grammar, an accident of certain tenses of Greek verbs, being either the prefixing of a syllable, or an increase of the quantity of the initial vowels.

**AUGMENTS**, in mathematics. See **FLUCTIONS**.

**AUGMENTATION**, in a general sense, is the act of adding or joining something to another with a design to render it large.

**AUGMENTATION** is also used for the additament or thing added.

**AUGMENTATION** was also the name of a court erected 27 Hen. VIII. so called from the augmentation of the revenues of the crown, by the suppression of religious houses; and the office still remains, wherein there are many curious records, tho' the court has been dissolved long since.

**AUGMENTATION**, in heraldry, are additional charges

- to a coat-armour, frequently given as particular marks of honour, and generally borne either in the escutcheon or a conton; as have all the baronets of England, who have borne the arms of the Province of Ulster in Ireland.
- AUGRE**, or **AWGRE**, an instrument used by carpenters and joiners to bore large round holes; and consisting of a wooden handle, and an iron blade terminated at bottom with a steel bit.
- AUGSBURGH**, a considerable city of Swabia, in Germany; situated in 11° E. long. and 48° 20' N. lat. It is an imperial city, and remarkable for being the place where the Lutherans presented their confession of faith to the emperor Charles V. at a diet of the empire held in 1550, from hence denominated the *Augsburg confession*.
- AUGUR**, an officer among the Romans appointed to foretell future events, by the chattering and feeding of birds. There was a college or community of them, consisting originally of three members with respect to the three Luceres, Rhamenfes, and Tatienses: afterwards the number was increased to nine, four of whom were patricians and five plebeians. They bore an augural staff or wand, as the sign of their authority; and their dignity was so much respected, that they were never deposed, nor any substituted in their place, though they should be convicted of the most enormous crimes. See **AUGURY**.
- AUGURY**, in antiquity, a species of divination, or the art of foretelling future events, is distinguished into five sorts. 1. Augury from the heavens. 2. From birds. 3. From chickens. 4. From quadrupeds. 5. From portentous events. When an augury was taken, the augur divided the heavens into four parts, and having sacrificed to the gods, he observed, with great attention, from what part the sign from heaven appeared. If, for instance, there happened a clap of thunder from the left, it was taken as a good omen. If a flock of birds came about a man, it was a favourable presage; but the sight of vultures was unlucky. If, when corn was sown before the sacred chickens, they crouded about it, and eat it greedily, it was looked upon as a favourable omen; but if they refused to eat and drink, it was an unlucky sign. See the article **DIVINATION**.
- AUGUST**, in chronology, the eighth month of our year, containing thirty-one days. August was dedicated to the honour of Augustus Cæsar, because, in the same month, he was created consul, thrice triumphed in Rome, subdued Egypt to the Roman empire, and made an end of civil wars; being before called *Sexatilis*, or the sixth from March.
- AUGUSTA**, or **AUSTA**, an island in the gulph of Venice, on the coast of Dalmatia; situated in 17° 40' E. long. and 42° 35' N. lat.
- AUGSTBURG**, a city of Germany, in upper Saxony, upon the river Chop, six leagues south of Dresden.
- AUGUSTALES**, in Roman antiquity, an epithet given to the flames or priests appointed to sacrifice to Augustus after his deification; and also to the ludi or games celebrated in honour of the same prince on the fourth of the ides of October.
- AUGUSTALIA**, a festival instituted by the Romans in honour of Augustus Cæsar, on his return to Rome, after having settled peace in Sicily, Greece, Syria, Asia, and Parthia; on which occasion they likewise built an altar to him, inscribed *Fortuna reduci*.
- AUGUSTALIS Præfectus**, a title peculiar to a Roman magistrate who governed Egypt, with a power much like that of a proconsul in other provinces.
- AUGUSTINE**, or **St. AUGUSTINE**, the capital town of Spanish Florida in North America; situated near the frontiers of Georgia, in 81° W. long. and 30° N. lat.
- CAPE-AUGUSTIN**, a cape of Brazil, in South America; lying in 35° W. long. and 8° 30' S. lat.
- AUGUSTINS**, a religious order in the church of Rome, who follow the rule of St. Augustin, prescribed them by pope Alexander IV. Among other things, this rule enjoins to have all things in common, to receive nothing without the leave of their superior; and several other precepts relating to charity, modesty, and chastity. There are likewise nuns of this order.
- The Augustins are clothed in black, and at Paris are known under the name of the *Religious of St. Genevieve*, that abbey being the chief of the order.
- AUGUSTINUS**, the name of Janfenius's treatise, from which are collected the five famous propositions enumerated under the article **JANSENISM**.
- AVIARY**, a place set apart for feeding and propagating birds. It should be so large, as to give the birds some freedom of flight; and turfed, to avoid the appearance of foulness on the floor.
- AVICIENNA**, in botany. See **BONTIA**.
- AVIGLIANO**, a small town of Piedmont in Italy; situated about seven miles west of Turin, in 7° E. long. and 44° 40' N. lat.
- AVIGNON**, a large city of Provence in France, situated on the east side of the river Rhone, about 20 miles south of Orange, in 4° 40' E. long. and 43° 50' N. lat. It is an archbishop's see, and, with the whole district of Venaissine, subject to the pope.
- AVIGNON-BERRY**, a name by which some call the fruit of the lycium, used in dying yellow. See **LYCIUM**.
- AVILA**, a beautiful city of Old Castile in Spain, situated 50 miles N. W. of Madrid, in 5° 20' W. long. and 40° 50' N. lat.
- AVILES**, a sea-port town of Austria in Spain, in 6° 40' W. long. and 43° 30' N. lat.
- AVIS**, bird, in zoology. See **NATURAL HISTORY**.
- AVIS arctica**. See **LARUS**.
- AVIS nivis**. See **LOXIA**.
- AVIS paradisi**. See **MUSICAPAPA**.
- AVIS polyglotta**. See **TURDUS**.
- AVIS rabo**. See **PELICANUS**.
- AVIS rabos**. See **PHAETON**.
- AVIS venti**. See **MARGUS**.
- AVIS** is also the name of an order of knighthood in Portugal, instituted by Sancho the first king, in imitation of the order of Alcantara, whose great cross they wear.
- AVISO**, a term chiefly used in matters of commerce, to denote an advertisement, an advice, or piece of intelligence. See **ADVICE**.

- AUKLAND**, a market-town on the river Ware, in the bishopric of Durham, situated about 12 miles S. W. of the city of Durham, in  $1^{\circ} 25' W.$  long. and  $54^{\circ} 40' N.$  lat.
- AULCESTER**, a market-town of Warwickshire, situated about fourteen miles south-west of Warwick, in  $1^{\circ} 50' W.$  long. and  $53^{\circ} 20' N.$  lat.
- AULIC**, an epithet given to certain officers of the empire, who compose a court which decides, without appeal, in all processes entered in it. Thus we say, *aulic council, aulic chamber, aulic counsellor.*
- The aulic council is composed of a president, who is a catholic; of a vice-chancellor, presented by the archbishop of Mentz; and of eighteen counsellors, nine of whom are protestants, and nine catholics. They are divided into a bench of lawyers, and always follow the emperor's court; for which reason they are called *justitium imperatoris*, the emperor's justice, and aulic council. The aulic court ceases at the death of the emperor, whereas the imperial chamber of Spire is perpetual, representing not only the deceased emperor, but the whole Germanic body, which is reputed never to die.
- AULIC**, in the Sorbonne and foreign universities, is an act which a young divine maintains upon being admitted a doctor in divinity. It begins by an harangue of the chancellor, addressed to the young doctor, after which he receives the cap, and presides at the aulic, or disputation.
- AULUS**, a Grecian long measure, the same with stadium.
- AUMBRY**, a country-word denoting a cup-board.
- AUME**, a Dutch measure for Rhenish wine, containing forty English gallons.
- AUNCEL-WEIGHT**, an ancient kind of balance, now out of use, being prohibited by several statutes, on account of the many deceits practised by it. It consisted of scales hanging on hooks, fastened at each end of a beam, which a man lifted up on his hand. In many parts of England, auncel-weight signifies meat sold by the hand, without scales.
- AUNE**, a long measure used in France to measure cloths, stuffs, ribbons, &c. At Rouen it is equal to one English ell; at Calais, to 1.52; at Lyons, to 1.016; and at Paris, to 0.95.
- AUNIS**, a maritime province of France, on the western shore of the Bay of Biscay, having the province of Poitou on the north, and Sainthoigne on the south.
- AVOCATORIA**, a mandate of the emperor of Germany, addressed to some prince, in order to stop his unlawful proceedings in any cause appealed to him.
- AVOIDANCE**, in the canon law, is when a benefice becomes void of an incumbent, which happens either in fact, as by the death of the person; or in law, as by cession, deprivation, resignation, &c. In the first of these cases, the patron must take notice of the avoidance, at his peril; but in avoidance by law, the ordinary is obliged to give notice to the patron, in order to prevent a lapse.
- AVON**, a river of England, which, taking its rise in Wiltshire, runs by Bath, where it becomes navigable, and continues its course towards Bristol, below which city it falls into the Severn.
- AVON** is also a river, which, rising in Leicestershire, runs south-west by Warwick and Evesham, and falls into the Severn at Tewksbury in Gloucestershire.
- AVOSETTA**, in ornithology. See *RECURVIROSTRA.*
- AVOWEE**, one who has a right to present to a benefice. See *ADVOWSON.*
- He is thus called in contradistinction to those who only have the lands to which the advowson belongs for a term of years, or by virtue of intrusion or disseisin. See *INTRUSION, &c.*
- AVOWRY**, in law, is where a person disseised sues out a replevin; for then the distrainer must vow, and justify his plea, which is called his avowry. See *REPLEVIN.*
- AURA**, among physiologists, signifies a vapour or exhalation, such as those which arise from mephitical caves. See *MEPHITIS*, and *EXHALATION.*
- AURA VITALIS**, in chemistry, a term used by Helmont, for what others call the *flamma vitalis*, or *vital flame.*
- AURA**, in ornithology, the trivial name of a species of vulture. See *VULTURE.*
- AURACH**, a town of Swabia in Germany, situated about 15 miles east of Tubingen, in  $9^{\circ} 20' E.$  long. and  $48^{\circ} 25' N.$  lat.
- AURANCHES**, a large, strong, and well fortified city of France in the Lower Normandy, situated in  $1^{\circ} 16' W.$  long. and  $48^{\circ} 41' N.$  lat.
- AURANTIUM**, in botany. See *CITRUS.*
- AURATA**, in ichthyology, the trivial name of a species of sparus. See *SPARUS.*
- AURATUS eques**. See *EQUES AURATUS.*
- AURAY**, a sea-port town of Brittany in France, situated about 18 miles south-east of Port-Lewis, in  $2^{\circ} 45' W.$  long. and  $47^{\circ} 40' N.$  lat.
- AURELIA**, in natural history, the same with what is more usually called *chrysalis*, and sometimes *nymph*. See *CHRYMALIS.*
- AURELIANA**, in botany. See *PINAX.*
- AURENGBAD**, a large city in the province of Viſnapour in India, on this side the Ganges; E. long.  $5^{\circ} 30'$ , and N. lat.  $19^{\circ} 15'$ .
- AUREOLA**, in its original signification, signifies a jewel, which is proposed as a reward of victory in some public dispute. Hence, the Roman schoolmen applied it to denote the reward bestowed on martyrs, virgins, and doctors, on account of their works of supererogation; and painters use it to signify the crown of glory, with which they adorn the heads of saints, confessors, &c.
- AUREUS**, a Roman gold coin, equal in value to twenty-five denarii.
- AURICH**, a town of Westphalia in Germany, situated about 12 miles north-east of Embden, in  $6^{\circ} 50' E.$  long. and  $53^{\circ} 40' N.$  lat.
- AURICHALCUM**, or *ORICHALCUM*. See *ORICHALCUM.*
- AURICLE**, in anatomy, that part of the ear which is prominent from the head, called by many authors *auris externa*. See p. 295.

**AURICLES** are likewise two muscular bags situated at the basis of the heart. See p. 279.

**AURICULA**, in botany, a synonyme of the dodecatheson and several other plants. See **DODECATHEON**, **PRIMUM**, **ARENARIA**, &c.

**AURICULARIS DIGITUS**, the little finger, so called, because it is used commonly to pick the ear.

**AURIGA**, the *Wagoner*, in astronomy, a constellation of the northern hemisphere. See **ASTRONOMY**, p. 486.

**AURILLAC**, a neat and well-built city of France, in the Upper Avergne, noted for its trade in bone-lace: it is situated in  $30^{\circ} 31'$  E. long and  $54^{\circ} 44'$  N. lat.

**AURIPIGMENTUM**, orpiment, in natural history. See **ORPIMENT**.

**AURISCALPIUM**, an instrument to clean the ears, and serving also for other operations in disorders of that part.

**AURORA**, the morning-twilight, or that faint light which appears in the morning, when the sun is within eighteen degrees of the horizon.

**AURORA BOREALIS**, is an extraordinary meteor, shewing itself in the night time, in the northern part of the heavens. See **PNEUMATICS**, *Of Meteors*.

**AURUM**, gold, in natural-history. See **CHEMISTRY**, *Of metals*.

**AUSPEX**, a name anciently used for augur. See **AUGUR**.

**AUSTRAL**, something relating to the south: thus the six signs on the south side of the equinoctial are called *austral signs*.

**AUSTRAL FISHS**, a small constellation of the southern hemisphere, invisible to us.

**AUSTRIA**, a circle of Germany, comprehending the arch-duchy of Austria, also Styria, Carinthia, Carniola, Tyrol, Trent, and Brixen. It is bounded by Bohemia and Moravia on the north; by Hungary, Sclavonia, and Croatia on the east; by the dominions of Venice on the south, and by Bavaria on the west.

**AUSTRIAN NETHERLANDS**. See **NETHERLANDS**.

**AUTHENTIC**, something of acknowledged and received authority. In law, it signifies something clothed in all its formalities, and attested by persons to whom credit has been regularly given. Thus we say, authentic papers, authentic instruments.

**AUTHOR**, properly signifies one who created or produced any thing. Thus God, by way of eminence, is called the author of nature, the author of the universe.

**AUTHOR**, in matters of literature, a person who has composed some book or writing.

**AUTHORITY**, in a general sense, signifies a right to command, and make one's self obeyed. In which sense, we say, the royal authority, the episcopal authority, the authority of a father, &c. It denotes also the testimony of an author, some apophthegm or sentence of an eminent person quoted in a discourse by way of proof.

Authority is represented, in painting, like a grave matron sitting in a chair of state, richly clothed in a garment embroidered with gold, holding in her right-hand a sword, and in her left a sceptre. By her side is a double trophy of books and arms.

**AUTO DE FE**, act of faith. See **ACT** *of faith*.

**AUTOGRAPH**, denotes a person's hand-writing, or the original manuscript of any book, &c.

**AUTOMATUM**, or **AUTOMATON**, an instrument, or rather machine, which by means of springs, weights, &c. seems to move itself, as a watch, clock, &c. Such also were Archytus's flying dove, Regiomontanus's wooden-eagle, &c.

**AUTUMN**, the third season of the year, when the harvest and fruits are gathered in.—Autumn is represented, in painting, by a man at perfect age, clothed like the vernal, and likewise girded with a starry girdle; holding in one hand a pair of scales equally poised, with a globe in each; in the other a bunch of divers fruits and grapes. His age denotes the perfection of this season; and the balance, that sign of the zodiac which the sun enters when our autumn begins.

**AUTUMNAL POINT**, is that part of the equinox from which the sun begins to descend towards the south pole.

**AUTUMNAL SIGNS**, in astronomy, are the signs Libra, Scorpio, Sagittarius, through which the sun passes during the autumn.

**AUTUMNAL EQUINOX**, that time when the sun enters the autumnal point.

**AUTUN**, a city of Burgundy in France, situated on the river Arroux, in  $4^{\circ} 15'$  E. long. and  $46^{\circ} 50'$  N. lat.

**AUVERGNE**, a territory of the Lyonois in France; lying between the Bourbonnois on the north, and the Cevennes on the south.

**AUX**, in astronomy, the same with the apogee of the ancients, or the aphelium of the moderns. See **APOGÆUM** and **APHELIUM**. It also denoted the arch of the ecliptic, intercepted between the first degree of Aries and the apogee.

**AUX**, or **AUGH**, in geography, the capital city of Gascony in France. It is one of the richest archbishop's sees in France, though but a small town; situated in  $20^{\circ}$  E. long. and  $43^{\circ} 40'$  N. lat.

**AUXERRE**, a city of Burgundy, in France, situated on the river Yonne, in  $3^{\circ} 35'$  E. long. and  $47^{\circ} 40'$  N. lat.

**AUXILIARY**, whatever is aiding or helping to another.

**AUXILIARY VERBS**, in grammar, are such as help to form or conjugate others; that is, are prefixed to them, to form or denote the moods or tenses thereof; as *to have* and *to be*, in the English; *être* and *avoir*, in the French; *ho* and *sono* in the Italian, &c.

In the English language, the auxiliary verb *am*, supplies the want of passive verbs.

**AUXONE**, a small city of Burgundy, in France, situated on the river Soane, about seven miles west of Dole, in  $5^{\circ} 22'$  E. long. and  $47^{\circ} 15'$  N. lat.

**AWARD**, in law, the judgment of an arbitrator, or of one who is not appointed by the law a judge, but chosen by the parties themselves for terminating their difference. See **ARBITER**.

**AWL**, among shoe-makers, an instrument wherewith holes are bored through the leather, to facilitate the stitching or sewing the same. The blade of the awl is usually a little flat and bended, and the point ground to an acute angle.

**AWME**, or **AUME**, a Dutch liquid measure containing

- eight steckans, or twenty verges or verteels, equal to the tierce in England, or to one sixth of a tun of France.
- AWN**, in botany. See **ARISTA**.
- AWNING**, in the sea-language, is the hanging a sail, tarpaulin, or the like, over any part of the ship, to keep off the sun, rain, or wind.
- AX-VETCH**. See **SECURIDACA**.
- AXBRIDGE**, a market-town of Somersetshire, situated about eight miles north-west of Wells, in  $3^{\circ}$  W. long. and  $51^{\circ} 30'$  N. lat.
- AXEL**, a small fortified town of Dutch Flanders, situated about 20 miles west of Antwerpt, in  $3^{\circ} 40'$  E. long. and  $51^{\circ} 20'$  N. lat.
- AXILLA**, in anatomy, the arm-pit, or the cavity under the upper part of the arm.
- AXILLA**, in botany, the angle formed by a branch and the stem, or a leaf and the branch.
- AXIM**, a town on the Gold Coast of Guinea, where the Dutch have a fort and factory, called *St. Anthony*:  $4^{\circ}$  W. long. and  $5^{\circ}$  N. lat.
- AXIOM**, in philosophy, any plain, self-evident, and received notion, that cannot be made more plain and evident by demonstration. It is also an established principle in some art or science.
- AXIOPOLIS**, a town of Bulgaria, subject to the Turks. It stands upon the river Danube.
- AXIS**, in geometry, the straight line in a plain figure, about which it revolves, to produce or generate a solid: thus, if a semi-circle be moved round its diameter at rest, it will generate a sphere, the axis of which is that diameter.
- AXIS**, in astronomy, is an imaginary right line supposed to pass through the centre of the earth, and the heavenly bodies, about which they perform their diurnal revolutions.
- AXIS**, in conic-sections, a right line dividing the section into two equal parts, and cutting all its ordinates at right angles. See **CONIC SECTIONS**.
- AXIS**, in mechanics. The axis of a balance is that line about which it moves, or rather turns about. Axis of oscillation is a right line parallel to the horizon, passing through the centre about which a pendulum vibrates. See **MECHANICS**.
- AXIS** in *peritrochio*, one of the five mechanical powers, consisting of a peritrochium or wheel concentric with with the base of a cylinder, and moveable together with it about its axis. See **MECHANICS**.
- AXIS**, in optics, is that particular ray of light coming from any object which falls perpendicularly on the eye. See **OPTICS**.
- AXIS**, in architecture, spiral axis, is the axis of a twisted column drawn spirally, in order to trace the circumvolutions without.
- Axis of the Ionic capital, is a line passing perpendicularly through the middle of the eye of the volute. See **ARCHITECTURE**.
- Axis of a vessel is an imaginary right line passing through the middle of it perpendicularly to its base, and equally distant from its sides.
- AXIS**, in anatomy, the second vertebra of the neck, so called from the head's turning on it like an axis.
- AXIS**, in zoology. See **CERVUS**.
- AXMINSTER**, a market-town of Devonshire, situated about 22 miles east of Exeter, in  $3^{\circ} 15'$  W. long. and  $50^{\circ} 40'$  N. lat.
- AXUMA**, a city of Ethiopia in Africa, situated in  $38^{\circ}$  E. long. and  $15^{\circ}$  N. lat.
- AXUNGIA**, in a general sense, denotes old lard, or the driest and hardest of any fat in the bodies of animals: But, more properly, it signifies only hogs-lard.
- AXUNGIA folii**, in natural history, the same with the Silesian earth.
- AXUNGIA vitri**, SANDIVER, or SALT of glass, a kind of salt which separates from the glass while it is in fusion. It is of an acrimonious and biting taste. The farriers use it for cleaning the eyes of horses. It is also made use of for cleaning the teeth; and is sometimes applied to running ulcers, the herpes, or the itch, by way of desiccative.
- AXYRIS**, in botany, a genus of the monœcia triandria class. The calix of the male is tripartite; it has no corolla. The calix of the female consists of two leaves; it has two styli, and one seed. The species are 4, none of them natives of Britain.
- AYAMONTE**, a sea-port town of Andalusia, in Spain, situated near the mouth of the river Guadiana, in  $8^{\circ} 5'$  W. long. and  $37^{\circ}$  N. lat.
- AYENIA**, in botany, a genus of the gynandria pentandria class. The calix has two leaves; the petals are in the form of a star, with long unguis; and the capsule has five cells. There are three species, all natives of the W. Indies.
- AYRY**, or **AERY** of hawks, a nest or company of hawks, so called from the old French word *aire*, which signified the same.
- AZAB**, in the Turkish armies, a distinct body of soldiery, who are great rivals of the Janizaries.
- AZALEA**, in botany, a genus of the pentandria monogynia class. The corolla is bell-shaped; the stamina are inserted into the receptacle; and the capsule has five cells. The species are six, most of them natives of America.
- AZAMOR**, a maritime city of Africa, in the kingdom of Morocco, and province of Duquela, situated in  $6^{\circ} 30'$  W. long. and  $32^{\circ} 50'$  N. lat.
- AZAROLUS**, in botany. See **CRATÆGUS**.
- AZARUM**, in botany. See **ASARUM**.
- AZAZEL**, the scape-goat, in Jewish antiquity. See **SCAPE-GOAT**.
- AZED**, in the materia medica, a kind of camphor. See **CAMPHOR**.
- AZERADACH**, in botany. See **MELIA**.
- AZIMUTH**, in astronomy, an arch of the horizon, intercepted between the meridian of the place and the azimuth, or vertical circle passing through the centre of the object, which is equal to the angle of the zenith, formed by the meridian and vertical circle; or it is found by this proportion, as the radius of the tangent of the latitude of the place, so is the tangent

- of the sun's or star's altitude, for instance, to the cosine of the azimuth from the south, at the time of the equinox. To find the azimuth by the globe, see **GEOGRAPHY**.
- Magnetical AZIMUTH**, an arch of the horizon intercepted between the azimuth, or vertical circle, passing through the centre of any heavenly body, and the magnetical meridian. This is found by observing the object with an azimuth-compass.
- AZIMUTH-compass**, an instrument adapted to find, in a more accurate manner than by the common sea-compass, the sun or stars magnetical amplitude, or azimuth. See **COMPASS**.
- AZIMUTH-dial**, one whose style or gnomon is at right angles to the plane of the horizon.
- AZIMUTH-circles**, called azimuths, or vertical circles, are great circles of the sphere, intersecting each other in the zenith and nadir, and cutting the horizon at right angles in all the points thereof.
- AZOGA ships**, are those Spanish ships commonly called the *quick-silver ships*, from their carrying quick-silver to the Spanish W. Indies, in order to extract the silver out of the mines of Mexico and Peru. These ships, strictly speaking, are not to carry any goods unless for the king of Spain's account.
- AZONI**, in ancient mythology, a name applied by the Greeks to such of the gods as were deities at large, not appropriated to the worship of any particular town or country; but acknowledged in general by all countries, and worshipped by every nation. These the Latins called *dei communes*. Of this sort were the sun, Mars, Luna, &c.
- AZOPH**, in geography. See **ASOPH**.
- AZORES**, islands in the Atlantic ocean, between 25° and 33° W. long. and between 36° and 40° N. lat. They belong to the Portuguese, and are sometimes called the Western Isles, as lying westward of Europe.
- AZOTH**, in ancient chemistry, the first matter of metals, or the mercury of a metal; more particularly that which they call the *mercury of philosophers*, which they pretend to draw from all sorts of metallic bodies.
- AZURE**, in a general sense, the blue colour of the sky. See **SKY** and **BLUE**.
- AZURE**, among painters, the beautiful blue colour, with a greenish cast, prepared from the lapis lazuli, generally called *ultramarine*.
- With greater propriety, however, azure signifies that bright blue colour prepared from the lapis armenus, a different stone from the lapis lazuli, though frequently confounded together. This colour is, by our painters, commonly called *Lambert's blue*.
- AZURE**, in heraldry, the blue colour in the arms of any person below the rank of a baron. In the escutcheon of a nobleman, it is called *sapphire*; and in that of a sovereign prince, *Jupiter*. In engraving, this colour is expressed by lines, or strokes drawn horizontally.
- AZURIUM**, the name of a chemical preparation from two parts of mercury, one of sulphur, and a fourth of sal ammoniac, mixed in a mortar, put into a glass vessel, and set over the fire till a bluish smoke arises, &c.
- AZYGOS**, in anatomy, a vein rising within the thorax on the right side, having no fellow on the left; whence it is called *azygos*, or *vena sine pari*. See **ANATOMY**, p. 237.
- AZYMITES**, in church-history, Christians who administer the eucharist with unleavened bread. This is an appellation given by the Latin to the Greek church; who also call the Armenians and Maronites, who use unleavened bread in their office, by the name of *Azymites*.
- AZYMOUS**, something unfermented, as bread, &c. made without leaven.

## B A B

## B

## B A C

- B AAR**, a country of Swabia in Germany, in the principality of Furstberg, near the source of the Danube and the Necker.
- BABELMANDEL**, a little island at the entrance of the Red-sea, from the Indian ocean; from whence the straits of Babelmandel take their name.
- BABOON**, in zoology, a synonyme of the simia sphinx. See **SIMIA**.
- BABYLON**, a celebrated city of antiquity, supposed to have been situated on the river Euphrates, though not on its present channel; in 44° E. long. and 32° N. lat. But of this once so flourishing a city, there are now no remains; nor is even the place where it stood certainly known.
- BABYLON** was also an ancient city of Egypt, supposed to have stood where Grand Cairo does at present.
- BABYROUSSA**, in zoology, a synonyme of a species of *fus*. See **SUS**.
- BACA**, a town of Granada, in Spain, situated about 48 miles north-east of the city of Granada, in 3° W. long. and 37° 30' N. lat.
- BACALIAU**, or **BARCALLAO**. See **BARCALLAO**.
- BACCA**, berry, in botany, is used to signify such fruits as consist of a pericarpium full of juice and seeds, without any valves.
- BACCARAT**, a town of Lorraine upon the Meuse, between Nanci and Estival.

- BACCASERAI**, the capital city of Crim-Tartary, situated about 80 miles west of the straits of Kassa, in 35° E. long. and 45° 15' N. lat.
- BACCEM**, or **BACIAM**, a sea-port town of Cambaya, in the Hither Peninsula of India. It belongs to the Portuguese, and is situated in 73° E. long. and 19° 20' N. lat.
- BACCHÆ**, in antiquity, priestesses of the god Bacchus. They were likewise called *menader*, on account of the frantic ceremonies used in their feasts; as also *thyader*, which signifies *impetuous* or *furious*. They celebrated the orgies of their god covered with skins of tigers and panthers, and running all the night, some with their hair loose, with torches in their hands, others crowned with vine and ivy leaves, carrying a thyrsus or rod, turned about with ivy, in their hand. Along with them went cymbal-players and drummers, while they themselves, seized with enthusiasm, made hideous lamentations.
- BACCHANALIA**, feasts celebrated in honour of Bacchus by the ancient Greeks and Romans; of which the two most remarkable were called the *greater* and *lesser*. The latter, called *lenæa*, from a word signifying a *wine-press*, were a preparation for the former, and were held in the open fields about autumn; but the greater, called *Dionysia*, from one of the names of Bacchus, were celebrated in the city, about the spring-time. Both these feasts were accompanied with games, spectacles, and theatrical representations; and it was at this time the poets contended for the prize of poetry. Those who were initiated into the celebration of the feasts, represented, some Silenus, others Pan, others satyrs; and in this manner appeared in public night and day, counterfeiting drunkenness, dancing obscenely, committing all kinds of licentiousness and debauchery, and running over the mountains and forests, with horrible shrieks and howlings, crying out, *Io Bacche*. Livy informs us, that during the Bacchanalian feasts at Rome, such shocking disorders were practised under the cover of the night, and those who were initiated were bound to conceal them with an oath, attended with horrid imprecations, that the senate suppressed them first in Rome, and afterwards throughout all Italy.
- BACCHARAC**, or **BACHERAC**. See **BACHERAC**.
- BACCHARIS**, in botany, a genus of the syngeneia polygama superflua class. The receptacle is naked, and the pappus bristly; the calix is imbricated and cylindrical; the hermaphrodite stamens are intermixed with the female ones. The species are seven, all natives of warm climates.
- BACCHIUS**, in ancient poetry, a kind of foot composed of a short syllable, and two long ones, as the word [āvāri]. It takes its name from the god Bacchus, because it frequently entered into the hymns composed in his honour. The Romans called it likewise *enotrius*, *tripodius*, *salans*.
- BACHARIS**, in botany. See **BACCHARIS**.
- BACHELOR**. See **BACHELOR**.
- BACHERAC**, a town of the Palatinate of the Rhine, situated on the western shore of that river, in 7° E. lon.
- and 50° N. lat. It is remarkable for excellent wine, from thence called *Bacherac*.
- BACHIAN**, one of the Molucca islands, situated under the equator, in 125° E. long. It belongs to the Dutch.
- BACHU**, a sea-port town of the province of Chirwan, or Shirvan, in Persia. It is situated on the western shore of the Caspian sea, in 49° E. long. and 40° N. lat.
- BACK**, in anatomy. See **BACK-bone**.
- BACK**, in the menage. To *back a horse*, or mount a horse *a dos*, in French, is to mount him bare-backed, or without a saddle.
- BACK-bone**, or **SPINE**. See **ANATOMY**, p. 166, 167.
- BACK-gammon**, an ingenious game played with dice and tables, to be learned only by observation and practice.
- BACK painting**. See **PAINTING**.
- BACK-staff**, in the sea-navigating. See **NAVIGATION**.
- BACK-stays**. See **STAYS**.
- BACK-tack**, in Scots law: When a wadsetter, instead of possessing the wadset-lands, grants a tack thereof to the reverfor for payment of a certain sum in name of tack-duty, that tack is called a *back-tack*. See **SCOTS LAW**, tit. *Redeemable rights*.
- BACK-worm**, in falconry. See **FILANDERS**.
- BACULE**, in fortification, a kind of portcullis, or gate, made like a pit-fall with a counterpoise, and supported by two great stakes. It is usually made before the corpa-de-guard, not far from the gate of a place.
- BACULOMETRY**, the art of measuring accessible or inaccessible heights, by the help of one or more baculi, staves, or rods. See **GEOMETRY**.
- BACULUS divinatorius**. See **VIROGUA DIVINA**.
- BADAJOX**, a large fortified town of Spanish Estremadura, situated on the river Guadiana, in 7° 20' W. long. and 38° 45' N. lat.
- BADALON**, a town of Catalonia, in Spain, situated on the Mediterranean, about ten miles east of Barcelona, in 2° 15' E. long. and 41° 15' N. lat.
- BADEN**, the name of several towns: 1. Of one about 20 miles north of Strasbourg, capital of the margraviate of the same name, and remarkable for its hot baths. 2. Of another town of Swabia, in the Briggow; where are likewise several hot baths. 3. Of one in Switzerland, about 14 miles north-west of Zurich. 4. Of one in the circle of Austria, about 15 miles south of Vienna.
- BADENNOCH**, an inland country of Invernessshire in Scotland, lying between Aberdeenshire and Lochaber.
- BADENWEILLER**, a town of Germany, in the Briggow, near the Rhine.
- BADGER**, in zoology, the English name of a species of Ursus. See **URSUS**.
- BADGER**, in old law-books, one that was licensed to buy corn in one place, and carry it to another to sell, without incurring the punishment of an engrosser.
- BADIANE**, or **BANDIAN**, the seed of a tree which grows in China, and smells like anise-seed. The Chinese, and the Dutch in imitation of them, sometimes use the badiane to give their tea an aromatic taste.

**BADIS**, a fortress of Livonia, subject to Russia, and situated 20 miles west of Revel, in 23° E. long. and 59° 15' N. lat.

**BÆTUS**, in ichthyology. See **COTTUS**.

**BÆTYLIA**, anointed stones, worshipped by the Phœnicians, by the Greeks before the time of Cecrops, and by other barbarous nations. They were commonly of a black colour, and consecrated to some god, as Saturn, Jupiter, the Sun, &c.

**BÆZA**, a large city of Andalusia in Spain. situated on the river Guadalquivir, in 3° 15' W. long. and 37° 40' N. lat.

**BAFFETAS**, or **BASTAS**, a cloth made of coarse white cotton-thread, which comes from the East Indies. That of Surat is the best.

**BAFFIN'S Bay**, a gulph of North America, running north-east from Cape Farewell in West Greenland, from 60° N. lat. to 80°.

**BAG**, in commerce, a term signifying a certain quantity of some particular commodity; as a bag of almonds, for instance, is about three hundred weight; of anise-seeds, from three to four hundred, &c.

Bags are used in most countries to put several sorts of coin in, either of gold, silver, brass, or copper. Bankers, and others, who deal much in current cash, label their bags of money, by tying a ticket or note at the mouth of the bag, signifying the coin therein contained, the sum total, its weight, and of whom it was received. Tare is allowed for the bag. See **TARE** and **TRET**.

**BAG**, among farriers, is when, in order to retrieve a horse's lost appetite, they put in an ounce of asa-fœtida, and as much powder of safin, into a bag, to be tied to the bit, keeping him bridled for two hours, several times a-day; as soon as the bag is taken off, he will fall to eating. The same bag will serve a long time.

**BAGDAT**, a strong town of Turkey, on the frontiers of Persia, situated on the river Tigris, in the province of Iracaarabic; it was formerly capital of the Saracen empire, and lies in 43° E. long. and 33° 20' N. lat.

**BAGGAGE**, in military affairs, denotes the cloaths, tents, utensils of divers sorts, provisions, and other necessaries belonging to the army.

Before a march, the waggons with the baggage are marshalled according to the rank which the several regiments bear in the army; being sometimes ordered to follow the respective columns of the army, sometimes to follow the artillery, and sometimes to form a column by themselves. The general's baggage marches first; and each waggon has a flag, shewing the regiment to which it belongs.

**BAGNAGAR**, the capital of Golconda, in the Hither Peninsula of India, formerly the residence of the kings of Golconda, now subject to the mogul; in 77° 30' E. long. and 16° 30' N. lat.

**BAGNIALUCK**, a large city of Bosnia in European Turkey, situated in 18° 15' E. long. and 44° N. lat.

**BAGNIO**, an Italian word, signifying a bath: We use it for a house with conveniencies for bathing, cupping, sweating, and otherwise cleaning the body; and some-

times for worse purposes. In Turkey, it is become a general name for the prisons where the slaves are inclosed, it being usual in these prisons to have baths.

**BAGNOLIANS**, in church-history, a sect of heretics, who in reality were Manichees, though they somewhat disguised their errors. They rejected the Old Testament, and part of the New, held the world to be eternal, and affirmed that God did not create the soul when he infused it into the body.

**BAGPIPE**, a musical instrument of the wind kind, chiefly used in country-places, especially in the North. It consists of two principal parts; the first a leathern bag, which blows up like a foot-ball, by means of a port-vent, or little tube, fitted to it, and stopped by a valve: the other part consists of three pipes or flutes; the first called the *great pipe*, or *drone*; the second, the *little one*; which pass the wind out only at the bottom; the third has a reed, and is played on by compressing the bag under the arm, when full, and opening or stopping the holes, which are eight, with the fingers. The little pipe is ordinarily a foot long; that played on, 13 inches; and the port-vent, six.

**BAGRE**, in ichthyology, the trivial name of a species of silurus. See **SILURUS**.

**BAGUETTE**, in architecture, a small round moulding, less than an astragal, and so called from the resemblance it bears to a ring.

**BAHAMA**, or **LUCAYA ISLANDS**, a number of islands lying in the Atlantic Ocean, between 21° and 27° N. lat. and between 73° and 81° W. long.

These islands, whereof twelve are of a considerable extent, take their name from Bahama, one of the largest of them, lying between 78° and 81° W. long. and between 26° and 27° N. lat.

**BAHAR**, or **BARRE**, in commerce, weights used in several places in the East Indies.

There are two of these weights, one the great bahar, with which they weigh pepper, cloves, nutmegs, ginger, &c. and contains five hundred and fifty pounds of Portugal, or about five hundred and twenty-four pounds nine ounces avoirdupois weight. With the little bahar, they weigh quicksilver, vermilion, ivory, silk, &c. It contains about four hundred and thirty-seven pounds nine ounces avoirdupois weight.

**BACHAREN**, an island in the Persian gulf, in 50° E. long. and 26° N. lat.

**BAHIR**, a Hebrew term signifying famous or illustrious; but particularly used for a book of the Jews, treating of the profound mysteries of the cabbala, being the most ancient of the rabbinical works.

**BAHUS**, a city of Sweden, capital of a province of the same name, and situated about 20 miles north-west of Gottenburgh, in 11° E. long. and 58° 20' N. lat.

**BAJA**, a town of Italy, in the kingdom of Naples, and province of Lavoro, situated in 14° 40' E. long. and 41° 6' N. lat.

**BAJADOR**, a cape on the west coast of Africa, in 15° W. long. and 27° N. lat.

**BAIL**, in Scots law: When a prisoner is set at liberty upon some person's becoming surety for his appearance

to stand trial under a penalty, he is said to be *admitted to bail*. See SCOTS LAW, tit. *Crimes*.

*Clerk of the BAILS*, is an officer belonging to the court of the King's Bench: he files the bail-pieces taken in that court, and attends for that purpose.

**BAIL**, or **BALE**, in the sea-language. The seamen call throwing the water by hand, out of the ship or boat's-hold, *bailing*. They also call those hoops that bear up the tilt of a boat, its *bails*.

**BAILIAGE**, or **BAILIWICK**. See **BAILIWICK**.

*Water BAILIAGE*, an ancient duty paid to the city of London, for all goods brought into, or carried out of, the port.

**BAILIE**, in Scots law, a judge anciently appointed by the king over such lands not erected into a regality as happened to fall to the crown by forfeiture or otherwise, now abolished. It is also the name of a magistrate in royal boroughs, and of the judge appointed by a baron over lands erected into a barony. See SCOTS LAW, tit. *Inferior judges, &c.*

**BAILIFF**, an officer appointed for the administration of justice within a certain district, called a *bailiwick*.

**BAILIFFS-errant**, such as are appointed by the sheriff, to go up and down the country, to serve writs and warrants, summon country-courts, sessions, assizes, and the like.

**BAILIFFS of franchises**, those appointed by every lord within his liberty to do such offices therein as the bailiff-errant does at large in the country.

There are also bailiffs of forests, and bailiffs of manors, who direct husbandry, fell trees, gather rents, pay quit-rents, &c.

*Water-BAILIFF*, an officer appointed in all port-towns, for the searching of ships, gathering the toll for anchorage, &c. and arresting persons for debt, &c. on the water.

**BAILIWICK**, that liberty which is exempted from the sheriff of the county; over which liberty the lord thereof appoints his own bailiff, with the like power within his precinct, as an under-sheriff exercises under the sheriff of the county: Or it signifies the precinct of a bailiff, or the place within which his jurisdiction is terminated.

**BAILO**, thus they style at Constantinople the ambassador of the republic of Venice, who resides at the Porte. This minister, besides his political charge, acts there the part of a consul of Venice.

**BAIOCAO**, a copper-coin, current at Rome, and throughout the whole state of the church, ten of which make a julio, and an hundred a Roman crown.

**BAIRAM**, in the Mahometan customs, a yearly festival of the Turks, which they keep after the fast of Ramazan.

The Mahometans have two bairams, the great and the little. The little bairam holds for three days, and is seventy days after the first, which follows immediately the ramazan. During the bairam, the people leave their work for three days, make presents to one another, and spend the time with great manifestations of joy. If the day after ramazan should be so cloudy as to prevent the sight of the new moon, the

bairam is put off to the next day, when it is kept, even if the moon should still be obscured; when they celebrate this feast, after numerous ceremonies, or rather strange mimickries, in their mosque, it is concluded with a solemn prayer against the infidels, to extirpate Christian princes, or to arm them against one another, that they may have an opportunity to extend the borders of their law.

**BAIT**, in fishing. See **FISHING**.

**BAITING**, in falconry, is when a hawk flutters with her wings, either from perch or fist, as if it were striving to get away.

**BAJULUS**, an ancient officer in the court of the Greek emperors. There were several degrees of bajuli, as the grand bajulus, who was preceptor to the emperor; and the simple bajuli, who were sub-preceptors.

**BAKAL**, a great lake in the middle of Siberia, on the road from Mufcovy to China.

**BAKER**, a person whose occupation or business it is to bake bread. See **BAKING**.

**BAKEWELL**, a large market town of Derbyshire, about 150 miles from London. It is a good market for lead.

**BAKING**, the art of preparing bread, or reducing meals of any kind, whether simple or compound, into bread.

The various forms of baking among us may be reduced into two, the one for leavened, the other for unleavened bread; for the first, the chief is manchet-baking, the process whereof is as follows.

The meal, ground and bolted, is put into a trough, and to every bushel are poured in about three pints of warm ale, with barm and salt to season it: this is kneaded well together with the hands through the brake; or for want thereof, with the feet, through a cloth; after which, having lain an hour to swell, it is moulded into manchets, which scorched in the middle, and pricked at top, to give room to rise, are baked in the oven by a gentle fire.

For the second, sometimes called cheat-bread baking, it is thus: some leaven (saved from a former batch) filled with salt, laid up to sour, and at length dissolved in water, is strained through a cloth into a hole made in the middle of the heap of meal in the trough; then it is worked with some of the flour into a moderate consistence; this is covered up with meal, where it lies all night. and in the morning the whole heap is stirred up, and mixed with a little warm water, barm, and salt, by which it is seasoned, softened, and brought to an even leaven: it is then kneaded, moulded, and baked, as before.

**BAKING of porcelain**. See **PORCELAIN**.

**BALA**, in geography, a market-town of Marionethshire, about 16 miles south from Denbigh, in 3° 40' W. long. and 52° 55' N. lat.

**BALÆNA**, or **WHALE**, in zoology, a genus of the mammalia class, belonging to the order of cetæ. The characters of this genus are these: The balæna, in place of teeth, has a horny plate in the upper jaw, and a double fistula or pipe for throwing out water. The species are four; viz. 1. The mysticetus, which has many turnings and windings in its nostrils, and has no fin on the back. This is the largest of all animals; it is often

- often 100 feet long: the head is very large in proportion to the body; and the lower jaw is much wider than the upper one: the ears are situated below the eyes. In the belly, it has two dug's a little before the vulva; there are two large fins on the breast; and the tail is forked. The mylicticus contains such a large quantity of fat, that a ship is often loaded with the blubber obtained from a single fish. It is a native of the Greenland Ocean. It feeds chiefly upon the medusa, a small sea-insect. See *MEDUSA*. The substance called whale-bone is got from the upper lip, and towards the throat of this and all the other species of whales. See *PLATE LI. fig. 1.* For the manner of taking whales, see *WHALE-FISHERY*. 2. The phyfalus, has a double pipe in the middle of the head, and a thick fat fin on the lower part of the back, besides the two fins on the breast; it has no teeth; and the belly is smooth. The phyfalus inhabits the European and American oceans: it feeds upon herrings and other small fish. 3. The boops has a double pipe in its snout, three fins like the former, and a hard horny ridge on its back. The belly is full of longitudinal folds or rugæ. It frequents the northern ocean. 4. The musculus has a double pipe in its front, and three fins; the under jaw is much wider than the upper one. It frequents the Scotch coasts, and feeds upon herrings—Linnæus makes the physeter and delphinus, which are ranked among the whales by some writers, two distinct genera. See *PHYSETER* and *DELPHINUS*.
- BALAGNA**, a town of Muscovy, in the province of Novogorod, situated on the river Wolga, in 45° E. long. and 56° 30' N. lat.
- BALAMBUAN**, a sea-port town of the isle of Java, in Asia, which gives name to the channel called the *Streights of Balambuan*.
- BALAM-PULLI**, in botany. See *TAMARINDUS*.
- BALANCE**, or *BALANCE* See *BALLANCE*.
- BALANGIAR**, the capital city of Tartary, north of the Caspian sea.
- BALANUS**, in zoology, the trivial name of a species of lepas. See *LEPAS*.
- BALANUS**, in anatomy, a term sometimes used for the glans penis, as well as for the clitoris.
- BALANUS**, in pharmacy, denotes a suppository. See *SUPPOSITORY*.
- BALASS**, or *BALLAS*, the name of a kind of ruby. See *RUBY*.
- BALAUSTIA**, in botany. See *PUNICA*.
- BALBASTRO**, a city of Arragon, in Spain, situated upon the river Sinca, fifty miles north-east of Saragoffa.
- BALBEC**, a town of Asiatic Turkey, situated at the foot of mount Libanus, in 37° 30' E. long. and 33° N. lat.
- BALCHA**, a city of Ubbec Tartary, situated on the frontiers of Persia, in 65° 20' E. long. and 37° N. lat.
- BALCONY**, in architecture, a projecture in the front of a house, or other building, supported by pillars or consoles, and encompassed with a balustrade.
- BALDACHIN**, or *BALDAQVIN*, in architecture, a building in form of a canopy, supported by pillars, and frequently used as a covering to insulated altars. Some also use the term baldachin for the shell over a door.
- BALDIVIA**, or *VALDIVIA*, a sea-port town of Chili, in South America, situated on the South Sea, in 80° W. long. and 40° S. lat.
- BALDNESS**, a defect of hair, owing to the want of a sufficient supply of nutritious juice.
- BALDOC**, a market-town in Hertfordshire, about 38 miles north of London, in 15° W. long. and 51° 55' N. lat.
- BALE**, in commerce: Any goods packed up in cloth, and corded round very tight, in order to keep them from breaking, or preserve them from the weather, is called a *bale*.
- A bale of cotton yarn is from three to four hundred weight; of raw silk, is from one to four hundred; of lockram or dowlafs, either three, three and a half, or four pieces.
- BALE-GOODS**, among the English merchants, are all such as are imported or exported in bales; but the French give that name to certain hard-wares, and other sort of merchandize, which come to Paris, and are commonly made by bad workmen, of indifferent materials.
- BALI**, an island in the East Indies, situated in 114° E. long. and 7° 30' S. lat. This island, and the east end of the island of Java, form a streight about a mile over, of extremely difficult passage.
- BALISORE**, a small sea-port of the Hither India, situated on the north-west part of the bay of Bengal, in 85° 15' E. long. and 21° 30' N. lat.
- BALISTA**, or *BALLISTA*. See *BALLISTA*.
- BALISTES**, in ichthyology, a genus of fishes belonging to the order of amphibia nantes. The characters are these: The head is flat; there are eight teeth in each side, and the two anterior ones are longest; in the place of gills, the balistes has an aperture immediately above the pectoral fins; the body is flat, the scales are joined together by the skin, and the belly is keeled. The species of this genus are eight; viz. the balistes monoceros, whose head-fin consists of but one ray, and the tail rays are carinated. It is called the *Unicorn-fish* by Caselby, and is found in the Asiatic and American seas. 2. The hispidus, whose head-fin is uniradiated; and there is a round black spot in the tail-fin. The body is rough and bristly towards the tail. The spine or horn is situated between the eyes; the snout is subulated; and instead of a belly-fin, it has a jagged sharp spine. This species is a native of Carolina. 3. The tomentosus, whose head-fin is biradiated, and the body of it towards the hind-part is hairy. It is a native of America. 4. The papillosus, has a biradiated back-fin, and a papillus body. 5. The verrucosus, has a triradiated back-fin; and the tail is full of little warts. In place of a belly-fin this species has a large, thick, warty ray. It has 25 small reversed sharp spines at the side of the tail, disposed in four rows. It is a native of India. 6. The aculeatus has a triradiated back-fin; and the spines of the tail lean upon each other. It is also a native of India. 7. The vetula, has a triradiated back-fin; the belly-fin is longitudinal,

- tudinal, and somewhat carinated; and the tail-fin is forked. It is found at Ascension Island. 8. The ringens, has a triradiated back-fin; there are three folds on each side of the head, and the tail-fin is forked. This species is likewise found at Ascension Island.
- BALIVO** *amovendo*, in law, was a writ for removing a bailiff from his office, for want of having sufficient land in his bailiwick to answer the king and his people, according to the statute of Westminster, 2 reg. Orig. 78.
- BALK**, among builders, is sometimes used for the summer-beam of a house; sometimes for the poles and rafters, which support the roofs of barns, &c.; and sometimes for the beams used in making sea-holds.
- BALK**, in agriculture, denotes a ridge, or bank between two furrows.
- BALKE**, or **BALKHE**, a city of Asia, in the Ustec Tartary, situated upon the river Dilhas, in 68° E. lon. and 36° 40' N. lat.
- BALL**, in a general sense, a spherical and round body, whether it be so naturally, or turned into that figure by the hand of an artist: Thus we say, a tennis-ball, foot-ball, cotton-ball, &c.
- BALL**, in the military art, comprehends all sorts of bullets for fire-arms, from the cannon to the pistol. See **GUNNERY**.
- Cannon-balls are of iron; musquet-balls, pistol-balls, &c. are of lead. The experiment has been tried of iron balls for pistols and fuses, but they are justly rejected, not only on account of their lightness, which prevents them from flying strait, but because they are apt to furrow the barrel.
- BALL** and *socket* is an instrument made of brass, with a perpetual screw, so as to move horizontally, vertically, and obliquely; and is generally used for the managing of surveying, and astronomical instruments.
- BALL** of a *pendulum*, the same with bob. See **BOB**.
- BALL**, among printers. See **PRINTING**.
- Puff-BALL**, the English name of the lycoperdon. See **LYCOPERDON**.
- BALLAD**, or **BALLET**, a kind of song, adapted to the capacity of the lower class of people; who, being mightily taken with this species of poetry, are thereby not a little influenced in the conduct of their lives. Hence we find, that seditious and designing men never fail to spread ballads among the people, with a view to gain them over to their side.
- BALLANCE**, or **BALANCE**, in mechanics, one of the simple powers, which serves to find out the equality or difference of weight in heavy bodies. See **MECHANICS**.
- Hydrostatical BALLANCE**. See **HYDROSTATICS**.
- BALLANCE** of *trade*, in commerce, the equality between the value of the commodities bought of foreigners, and the value of the native productions transported into other nations. See **COMMERCE**.
- BALLANCE** of a *clock*, or *watch*. See **CLOCK** and **WATCH** MAKING.
- BALLANCE** *fish*. See **SQUALUS**.
- BALLANCER**, in the history of insects, a style, or oblong body, ending in a protuberance or head, found under each wing of the two-winged flies; these serve to poise the body of the fly.
- BALLAST**, a quantity of stones, gravel, or sand, laid in a ship's hold, to make her sink to a certain depth into the water, and sail upright. The ballast is sometimes one quarter, one third, or one half, according to the difference of the bulk of the ship. Flat vessels require the most ballast. Ships are said to be in ballast, when they have no other loading. Masters of vessels are obliged to declare the quantity of ballast they bear, and to unload it at certain places. They are prohibited unloading their ballast in havens, roads, &c. the neglect of which has ruined many excellent ports.
- BALLASTAGE**, or **LASTAGE**. See **LASTAGE**.
- BALLERUS**, in ichthyology, the trivial name of a species of cyprinus. See **CYPRINUS**.
- BALLET**. See **BALLAD**.
- BALLIAGE**, or **BALLIAGE**. See **BAILLIAGE**.
- BALLICONNELL**, a town of Ireland, about 11 miles north-east of Cavan, 7° 50' W. long. 54° 6' N. lat.
- BALLIMORE**, a town of Leinster in Ireland, surrounded entirely with a marsh.
- BALLISHANNON**, a large town of the county of Donegal, and province of Ulster in Ireland, situated about ten miles south of the town of Donegal, in 8° 30' W. long. and 54° 25' N. lat.
- BALLISTA**, in antiquity, a military machine used by the ancients in besieging cities, to throw large stones, darts, and javelins.
- It resembled our cross-bows, though much larger and superior in force.
- From this engine, stones of a size not less than mill-stones, were thrown with so much violence, as to dash whole houses in pieces at a blow. It is described thus: A round iron cylinder was fastened between two planks, from which reached a hollow square beam, placed cross-wise, and fastened with cords, to which were added screws; at one end of this stood the engineer, who put a wooden shaft with a big head into the cavity of the beam; this done, two men bent the engine by drawing some wheels: When the top of the head was drawn to the outmost end of the cords, the shaft was driven out of the ballista, &c.
- BALLISTES**, in ichthyology. See **BALISTES**.
- BALLOON**, or **BALLON**, in a general sense, signifies any spherical hollow body, of whatever matter it be composed, or for whatever purposes it be designed. Thus, with chemists, balloon denotes a round short-necked vessel, used to receive what is distilled by means of fire; in architecture, a round globe on the top of a pillar; and among engineers, a kind of bomb made of paste-board, and played off in fire-works, either in the air or on the water, in imitation of a real bomb.
- Balloon, in the French paper trade, is a term for a quantity of paper, containing 24 reams. It is also the name of a sort of brigantine used in the kingdom of Siam.
- BALLOON**, in geography, a town of France, in the diocese of Mans, upon the banks of the Orne, 50° E. lon. 48° 10' N. lat.

**BALLOTA**, in botany, a genus of the didymia gymnospermia class. The calix has four teeth; the superior lip of the corolla is concave and crenated. There are four species, *viz.* the nigra, or stinking horehound, a native of Britain; the alba and lanata, both natives of Europe; and the suaveolens, a native of America.

**BALLOTADE**, in the menage, the leap of a horse between two pillars, or upon a straight line, made with justness of time, with the aid of the hand, and the calves of the legs; and in such a manner, that when his fore-feet are in the air, he shews nothing but the shoes of his hinder-feet without jerking out.

**BALLS**, or **BALLETS**, in heraldry, a frequent bearing in coats of arms, usually denominated according to their colours, bezants, plates, hurts, &c. See **BEZANTS**.

**BALLUSTER**, a small kind of pillar used for ballustrades. See **ARCHITECTURE**.

**BALLUSTRADE**, a series or row of ballusters, joined by a rail; serving as well for a rest to the elbows, as for a fence or inclosure to balconies, altars, staircases, &c. See **ARCHITECTURE**.

**BALM**, in botany. See **MELISSA**.

**BALM**, or **BALSAM**. See **BALSAM**.

**BALNEUM**, a term used by chemists to signify a vessel filled with some matter, as sand, water, or the like, in which another is placed that requires a more gentle heat than the naked fire. Thus *balneum arenosum*, called also *balneum siccum*, and sand-heat, is when the cucurbit is placed in sand, in ashes, or filings of steel. *Balneum maris*, or *maris*, is when the vessel, containing the ingredients to be distilled, &c. is put into a vessel of water; which is made to boil; so that no greater heat than that of boiling water can be communicated to the substance to be treated. And *balneum vaporis*, or *vaporarium*, is, when two vessels are disposed in such a manner, that the vapour, raised from the water contained in the lower, heats the matter contained in the upper.

**BALOTADE**, or **BALLOTADE**. See **BALLOTADE**.

**BALOWA**; a city of Asia, in the kingdom of Decan.

**BALSAM**, or **NATIVE BALSAM**, an oily, resinous, liquid substance, flowing either spontaneously, or by means of incision, from certain plants. There are a great variety of balsams, generally denominated from the substances from which they are obtained. See **CHEMISTRY**, *Of resins and balsams*.

**BALSAMICS**, in pharmacy, softening, restoring, healing and cleansing medicines, of a gentle attenuating nature.

Balsamics may be used, both internally and externally, in all diseases of the head, nerves, stomach, &c.

**BALSAMINA**, in botany, the trivial name of a species of impatiens. See **IMPATIENS**.

**BALSAMITA**, in botany, a synonyme of a species of xeranthemum. See **XERANTHEMUM**.

**BALSARA**, in geography, the same with Baffora. See **BASSORA**.

**BALTIC sea**; that lying between Sweden on the north, and Germany and Livonia on the south.

**BALTIMORE**, a town of the county of Corke, and province of Munster, in Ireland, situated about five miles north of Cape Clear, in  $9^{\circ} 15'$  W. long. and  $51^{\circ} 15'$  N. lat.

**BALZANE**. See **WHITEFOOT**.

**BAMBERG**, a city of Franconia, in Germany,  $10^{\circ} 50'$  E. long. and  $50^{\circ} 15'$  N. lat.

The bishop of Bamberg is sovereign of the city and district round it, for sixty miles in length, and forty in breadth.

**BAMBOE**, in botany, the trivial name of a species of arundo. See **ARUNDO**.

**BAMFFF**, or **BANFF**, a town of Scotland, which gives name to a county, lying between Aberdeenshire and Murray, along the southern bank of the river Spey.

The town is situated at the mouth of the river Do-vern.

**BAMPTON**, a market-town of Oxfordshire, situated on the river Isis, about ten miles south-west of Oxford,  $1^{\circ} 35'$  W. long. and  $51^{\circ} 30'$  N. lat.

**BAMPTON** is also the name of a market-town in Devonshire, twenty miles north of Exeter, in  $3^{\circ} 40'$  W. long. and  $51^{\circ} 5'$  N. lat.

**BAN**, or **BANN**. See **BANN**.

**BAN**, in commerce, a sort of smooth, fine muslin, which the English import from the E. Indies. The piece is almost a yard broad, and runs about twenty yards and a half.

**BANBURY**, a large borough-town in Oxfordshire, twenty miles north of Oxford, in  $1^{\circ} 20'$  W. long. and  $52^{\circ} 5'$  N. lat.

**BANC**, or **BENCH**, in law, denotes a tribunal, or judgment-seat: Hence, king's-banc is the same with the court of king's-bench, and common banc with that of common pleas. See **KING'S BENCH** and **COMMON PLEAS**.

**BANCA**, an island of the E. Indies, separated from the south-east part of that of Sumatra by a very narrow channel, in  $105^{\circ}$  E. long. and  $3^{\circ}$  S. lat.

**BANCALIS**, a sea-port town on the east coast of Sumatra, in  $99^{\circ}$  E. long. and  $2^{\circ}$  N. lat. It is a Dutch settlement.

**BANCOCK**, a city of the kingdom of Siam, in  $101^{\circ}$  E. long. and  $13^{\circ} 30'$  N. lat.

**BAND**, in a general sense, some small, narrow ligament, wherewith any thing is bound, tied, or fastened.

**BAND**, in architecture, a general name for any flat, low member, or moulding, that is broad, but not very deep.

**BAND of soldiers**, in military affairs, those who fight under the same flag or ensign.

**Trained BANDS**. See **TRAINED BANDS**.

**BAND of pensioners** are a company of 120 gentlemen, who receive a yearly allowance of a hundred pounds for attending on his majesty on solemn occasions.

**BAND** is also the denomination of a military order in Spain, instituted by Alphonfus XI. king of Castile, for the younger sons of the nobility; who, before their admission, must serve ten years, at least, either

- in the army, or at court; and are bound to take up arms for the catholic faith against the infidels.
- BAND**, in surgery, a fillet, swath, or piece of linen cloth, wherewith either to cover or surround certain parts that stand in need of assistance; and is, in this sense, the same with what is otherwise called a *roller*.
- BANDA**, or **LANTOR**, the chief of the Banda islands in the E. Indies, where nutmegs grow, in 126° E. long. and 4° 30' S lat.
- BANDAGE**, in surgery, a fillet, roller, or swath, used in dressing and binding up wounds, restraining dangerous hæmorrhages, and in joining fractured and dislocated bones. See **SURGERY**.
- BANDALEER**, or **BANDELEER**, in military affairs, a large leathern belt, thrown over the right shoulder, and hanging under the left arm; worn by the ancient musqueteers, both for the sustaining of their fire-arms, and for the carriage of their musquet-charges, which being put up in little wooden cases, coated with leather, were hung, to the number of twelve, to each bandeleer.
- BANDELET**, or **BANDLET**, in architecture, any little band, or flat moulding, as that which crowns the Doric architrave.
- BANDER-ABASSI**, in geography. See the article **GOMBROU**.
- BANDER-CONGO**, a sea-port town on the eastern side of the Persian gulf: E. long. 54° 50', and N. lat. 27°.
- BANDERET**, a general, or one of the commanders in chief of the forces.
- This appellation is given to the principal commanders of the troops of the canton of Bern in Switzerland, where there are four banderets, who command all the forces of that canton.
- BANDEROLL**, a little flag, in form of a guidon, extended more in length than breadth, used to be hung out on the masts of vessels, &c.
- BANDITII**, a term peculiarly denoting companies of highwaymen, common in Italy and France; but sometimes also used, in a more general sense, for robbers, pirates, out-lawed persons, ruffians, &c.
- BANDO**, the same with **ASMER**. See **ASMER**.
- BANDORA**, the capital of the island of Salfet, or Cononin, on the west coast of the Hither India: E. long. 72° 30', and N. lat. 19°.
- BANDORA** is also the name of an ancient musical instrument, with strings, resembling a lute. See **LUTE**.
- BANGLE ears**, an imperfection in a horse, remedied in the following manner. Place his ears in such a manner as you would have them stand; bind them with two little boards so fast that they cannot stir, and then clip away all the empty wrinkled skin close by the head.
- BANDY-LEGGED persons** are such whose feet are distorted, turning either inward or outward on either side.
- BANGOR**, a city of Carnarvonshire, in North Wales: W. long. 4° 15', and N. lat. 53° 20'.
- It is a bishop's see, and situated on the sea-side, about 30 miles west of St. Asaph.
- BANGUE**, or **BEND**. See **BEND**.
- BANIALUCH**, or **BAGNALUCH**, a city of European Turkey, the capital of Bosnia, upon the frontiers of Dalmatia, near the river Setina: E. long. 18° 20', N. lat. 44° 20'.
- BANIANA**, a city of India, upon the road from Surat to Agra.
- BANIANS**, a religious sect in the empire of the Mogul, who believe a metempsychosis; and will therefore eat no living creature, nor kill even noxious animals; but endeavour to release them, when in the hands of others.
- BANJAR**, a river in the island of Borneo, in the mouth of which is a floating island, where the East-India company have a factory.
- BANILLA**, or **VANILLA**. See **VANILLA**.
- BANISHMENT**, a kind of punishment, whereby the guilty person is obliged to leave the realm.
- BANK**, in commerce, a common repository, where many persons agree to keep their money, to be always ready at their call or direction; or certain societies or communities, who take the charge of other peoples money, either to improve it, or to keep it secure.
- There are banks of various kinds, and different in the nature of their constitutions and establishments: Some are instituted wholly on the public account, and put under the direction of the magistrates, as the famous bank of Amsterdam, where the money deposited therein shall be always kept for the use of the proprietors, and shall never be let out for profit or advantage.
- Payments made by assignments upon this bank, are valued from 3 to 6 *per cent* above the payment of the money in specie, arising from an opinion that the proprietors entertain of the equity of its administration; for judging themselves secure, that their money lies always ready at hand, they seldom draw out large sums, but make their mutual payments by transferring the sums from one man's account to another.
- A second sort of bank, is such as consists of a company of monied men, who being duly established, and incorporated by the laws of their country, agree to deposit a considerable fund, or joint stock, to be employed for the use of the society; as lending money upon good security, buying and selling bullion, gold and silver, discounting bills of exchange, &c.
- A third sort, is the banks of private men, or partnerships, who deal in the same way as the former, upon their own single stock or credit. There are public banks established in most of the trading cities of Europe, as in Venice, London, Paris, Amsterdam, Hamburg, &c. The bank of Venice is the most ancient. It is established by a solemn edict of the commonwealth, which enacts, That all payments of wholesale merchandise, and letters of exchange, shall be in bank-notes; that all debtors shall be obliged to carry their money to the bank, and all creditors receive their money from the bank; so that payments are performed by a simple transfer from the one person to the other. In matters of retail, effective payments are sometimes made, which do not diminish, but rather augment

- augment the flock, by reason of the liberty of withdrawing their money at pleasure, &c.
- BANKAFLET**, a game at cards, which being cut into as many heaps as there are players, every man lays as much money on his own card as he pleases; and the dealer wins or looses as many as his card is superior or inferior to those of the other gamblers.
- The best card is the ace of diamonds; the next to it, the ace of hearts; then the ace of clubs; and, lastly, the ace of spades: And so of the rest of these fuits in order, according to their degree.
- The cheat lies in securing an ace, or any other sure winning card; which are somehow marked, that the sharper may know them.
- BANKER**, a person who traffics and negotiates in money; who receives and remits money from place to place by commission from correspondents, or by means of bills or letters of exchange.
- BANKISH**, a province of the Mogul's dominions, in the north part of the Hither India, lying fourth west of the province of Cassimere.
- Commission of BANKRUPTCY.* See **COMMISSION.**
- BANN**, or **BAN**, in the feudal law, a solemn proclamation or publication of any thing. Hence the custom of asking, or bans, before marriage. See **MARRIAGE.**
- BANN**, in military affairs, a proclamation made in the army by beat of drum, sound of trumpet, &c. requiring the strict observance of discipline, either for the declaring a new officer, or punishing an offender.
- BANN** of the empire, an imperial proscription, being a judicial punishment, wherewith such as are accessary to disturbing the public peace are judged unworthy of the immunities and protection of the empire, and are out-lawed or banished, &c.
- BANNAGHER**, a town of Ireland, in the king's county, and province of Leinster, situated on the river Shannon, 8° W. long. and 53° 10' N. lat.
- BANNER** denotes either a square flag, or the principal standard belonging to a prince.
- BANNERET**, an ancient order of knights, or feudal lords, who, possessing several large fees, led their vassals to battle under their own flag, when summoned thereto by the king.
- BANNISTERIA**, in botany, a genus of the decandria trigynia class. The calix is divided into 5 parts, with a nectarium at the base of each; the petals are roundish and unguiculated; the capsule contains 3 membranaceous alated seeds. The species are 7, all natives of America.
- BANNIMUS**, the form of expulsion of any member from the university of Oxford, by affixing the sentence up in some public place, as a denunciation of it.
- BANNOCK**, a kind of oat-cake, baked in the embers, or on a stone placed before the fire: It is common in the northern parts of this kingdom.
- BANNUM**, in law, signifies the utmost bounds of a manor or town;
- BANQUET**, a feast or entertainment, where people regale themselves with pleasant foods, or fruits. It signifies also a little bank, or raised way.
- BANQUET**, in the menage, that small part of the branch of a bridle that is under the eye, which being rounded like a small rod, gathers and joins the extremities of the bitt to the branch, and that in such a manner, that the banquet is not seen, but covered by the cope, or that part of the bitt that is next the branch.
- BANQUET-line**, an imaginary line drawn, in making a bitt, along the banquet, and prolonged up or down, to adjust the designed force or weakness of the branch, in order to make it stiff or easy.
- BANQUET**, or **BANQUETTE**, in fortification, a little foot-bank, or elevation of earth, forming a path, which runs along the inside of a parapet, upon which the musqueteers get up, in order to discover the counter-carp, or to fire on the enemy in the moat, or in the covert-way.
- BANSTICLE**, in ichthyology. See **GASTEROSTEUS.**
- BANTAM**, the capital of a large kingdom, and a port-town of great trade, situated on the north-west coast of the island of Java, in 105° E. long. and 6° 30' S. lat.
- BANTAM-work**, a kind of painted or carved work, resembling that of Japan, only more gaudy.
- BANTON**, in geography, one of the Philippine islands.
- BANTRY**, a town of Ireland, situated on a bay of the same name, in the county of Cork, and province of Munster, in 9° 20' W. long. and 51° 30' N. lat.
- BANZA**, a city of Africa, the capital of the kingdom of Congo.
- BAPAUME**, a fortified town of the French Netherlands, about 12 miles south-east of Arras, in 3° E. long. and 50° 10' N. lat.
- BAPTISM**, in matters of religion, a sacrament, by which a person is initiated into the Christian church. See **RELIGION.**
- BAPTISM**, in the sea-language, a ceremony in long voyages on board merchant-ships, practised both on persons and vessels who pass the tropic or line for the first time. The baptizing the vessel is simple, and consists only in washing them throughout with sea-water; that of the passengers is more mysterious. The oldest of the crew, that has past the tropic or line, comes with his face blacked, a grotesque cap on his head, and some sea-book in his hand, followed by the rest of the sea-men dressed like himself, each having some kitchen-utensil in his hand, with drums beating. He places himself on a seat on the deck, at the foot of the main-mast. At the tribunal of this mock magistrate, each passenger not yet initiated, swears he will take care the same ceremony be observed, whenever he is in the like circumstances: Then by giving a little money by way of gratification, he is discharged with a little sprinkling of water, otherwise he is heartily drenched with streams of water poured upon him; and the ship-boys are inclosed in a cage, and ducked at discretion.
- The seamen on the baptizing a ship, pretend to a right of cutting off the beak-head, unless redeemed by the captain.

**BAPTISMAL**, something belonging to baptism; thus, we say, *baptismal vow, fonts, presents, &c.*

**BAPTISTS**, in church-history, the name by which the Anabaptists love to distinguish themselves. See **ANABAPTISTS**.

**BAPTISTERY**, in ecclesiastical writers, a place in which the ceremony of baptism is performed. In the ancient church, it was one of the exedrae, or buildings, distinct from the church itself, and consisted of a porch or anti-room, where the persons to be baptized made their confession of faith; and an inner room where the ceremony of baptism was performed.

**BAR**, in a general sense, denotes a slender piece of wood, or iron, for keeping things close together.

**BAR**, in courts of justice, an inclosure made with a strong partition of timber, where the council are placed to plead causes. It is also applied to the benches where the lawyers or advocates are seated, because anciently there was a bar to separate the pleaders from the attorneys and others. Hence our lawyers, who are called to the bar, or licensed to plead, are termed barristers, an appellation equivalent to licentiate in other countries.

**BAR**, in law, a plea of a defendant, which is said to be sufficient to destroy the plaintiff's action.

**BAR**, in heraldry, an ordinary in form of the fess, but much less.

It differs from the fess only in its narrowness; and in this, that the bar may be placed in any part of the field, whereas the fess is confined to a single place. See Plate LI. fig. 4.

**Bar-gemcl**, that is a double bar, called by the French *jumelles*, and by the Latin writers *jugaria fasciola*, and *justitia bijuges*, is a diminutive of the fess. See Plate LI. fig. 5.

**BAR**, in the menage, the highest part of that place of a horse's mouth, situated between the grinders and tusks; so that the part of the mouth which lies under and at the side of the bars, retains the name of the gum. A horse with sensible bars has a fine light mouth, with an even and firm appui. See **APPUI**.

**To BAR a vein**, in farriery, is an operation performed upon the veins of the legs of a horse and other parts, with intent to stop the malignant humours. It is done by opening the skin above it, disengaging it, and tying it both above and below, and striking between the two ligatures.

**BAR**, in music, a stroke drawn perpendicularly across the lines of a piece of music, including between each two a certain quantity or measure of time, which is various as the time of the music is either triple or common. In common time, between each two bars is included the measure of four crotchets; in triple, three. The principal use of bars is to regulate the beating of time, in a concert. See **TIME** and **MEASURE**.

**BAR**, in hydrography, denotes a bank of sand, or other matter, wherby the mouth of a river is in a manner choaked up.

The term **bar** is also used for the strong beam wherewith the entrance of an harbour is secured: This is more commonly called boom.

**BAR, BARRA**, in commerce. See **BARRA**.

**BAR**, or **BAR-LE-DUC**, in geography, a duchy belonging to France, lying north-west of Lorraine, on both sides the river Maese, whereof Bar-le-duc is the principal town; in  $5^{\circ} 15' E.$  long. and  $48^{\circ} 40' N.$  lat.

**BAR** is also a town of Podolia, in Poland; situated in  $28^{\circ} E.$  long. and  $48^{\circ} 20' N.$  lat.

**BAR** is also the name of two towns in France; the one in Champagne, upon the Aube; and the other in Burgundy, upon the Seine.

**BARABINSKOI**, a country of Tartary, tributary to the Muscovites.

**BAR-MASTER**, among miners, the person who keeps the gage, or dish, for measuring the ore.

**BAR SHOT**. See **SHOT**.

**BARACKS**, or **BARRACKS**. See **BARRACKS**.

**BARACOA**, a town on the north-east part of the island of Cuba in North America, in  $76^{\circ} W.$  long. and  $21^{\circ} N.$  lat.

**BARALIPTON**, among logicians, a term denoting the first indirect mode of the first figure of syllogism. A syllogism in baralipton, is when the two first propositions are general, and the third particular, the middle term being the subject in the first proposition, and the predicate in the second.

**BARALLOTS**, in church-history, a sect of heretics at Bologna in Italy, who had all things in common, even their wives and children.

Their facility in complying with all manner of debauchery, made them get the name *obedientes*, compliers. **BARANCA**, a port-town of Terra Firma, in South America; situated about 30 miles up the river Grande, in  $75^{\circ} 30' W.$  long. and  $11^{\circ} N.$  lat.

**BARANGI**, officers among the Greeks of the lower empire. Cujas calls them in Latin *procuratores*, and others give them the name of *securigeri*. It was their business to keep the keys of the city-gates, where the empire resided.

**BARANWAHR**, a town of Lower Hungary, not far from the Danube, in  $20^{\circ} E.$  long. and  $46^{\circ} 20' N.$  lat.

**BARAPICKLET**, bread made of fine flour, and kneaded up with barm, which makes it very light and spongy. Its form is round, about a hand-breadth.

**BARATHRUM**, in antiquity, a deep dark pit at Athens, into which condemned persons were cast headlong. It had sharp spikes at the top, that no man might escape out, and others at the bottom to pierce and torment such as were cast in.

**BARB**, or **BARBE**, in commerce. See **BARBE**.

**BARBA**, in botany, a word often used in composition with some other, to form the trivial names of several plants, as *barba jovis*, *barba caprae*, &c.

**BARBACAN**, or **BARBICAN**, an outer defence, or fortification to a city or castle, used especially as a fence to the city, or walls; also, an aperture made in the wall of a fortress, to fire through upon the enemy.

**BARBACAN** is also used to denote a fort at the entrance of a bridge, or the outlet of a city, having a double wall with towers.

**BARBALIA**, in botany, a genus of the didynamia angiosperma. The calix consists of four divisions; the capsule

capsule is quadrangular, with two elastic valves, and two seeds. There are six species, none of them natives of Britain.

**BARBACAN**, in architecture, a canal, or opening left in the wall, for water to come in and go out, when buildings are erected in places liable to be overflowed, or to drain off the water from a terras, or the like.

**BARBADOES**, one of the British Caribbee Islands, lying eastward of all the rest, in  $59^{\circ} 30'$  W. long. and  $13^{\circ}$  N. lat. being only 25 miles in length, and about 15 in breadth.

**BARBADOES-TAR**, a mineral fluid of the nature of the thicker fluid bitumens, of a nauseous, bitterish taste, very strong and disagreeable smell, found in many parts of America trickling down the sides of the mountains, and sometimes floating on the surface of the waters. It has been greatly recommended in coughs, and other disorders of the breast and lungs.

**BARBANCON**, a principality of Hainault.

**BARBARA**, among logicians, the first mode of the first figure of syllogisms.

A syllogism in barbara, is one whereof all the propositions are universal and affirmative; the middle term being the subject of the first proposition, and attribute in the second. For example,

**BAR.** Every wicked man is miserable;

**BA.** All tyrants are wicked men;

**RA.** Therefore all tyrants are miserable.

**BARBARIAN**, a name given by the ancient Greeks and Romans to all who were not of their own country, or were not initiated in their language, manners, and customs.

In this sense the word signified with them no more than foreigner; not signifying, as among us, a wild, rude, or uncivilized person.

**BARBARISM**, in a general sense, a rudeness of language or behaviour.

**BARBARISM**, in grammar, an offence against the purity of style or language; or an ungrammatical way of speaking or writing, or contrary to the true idiom of any particular language.

**BARBARY**, a large tract of Africa, extending along the Mediterranean, from  $2^{\circ}$  W. long. to  $30^{\circ}$  E. long. that is, from the river Mulvia, which separates it from Morocco, to Egypt.

It comprehends the countries of Algiers, Tunis, Tripoli, and Barca.

**BARBASOTE**, a sea-port of Africa in the kingdom of Fez, at a little distance from Ceuta. See *CEUTA*.

**BARBE**, in commerce, a barbary horse, greatly esteemed for its beauty, strength, and swiftness. Barbies are commonly of a slim shape, and have very thin legs; they retain their vigour to the last, and are therefore much prized for coachmen. They are used both for the saddle and the coach.

**BARBE**, in the military art: To fire in barbe, means to fire the cannon over the parapet, instead of firing through the embrasures; in which case the parapet must not be above three feet and a half high.

**BARBE**, or **BARDE**, is an old word, denoting the armour of the horse of the ancient knights and soldiers,

who were accoutred at all points. It is said to be an armour of iron and leather, wherewith the neck, breast, and shoulders of the horse were covered.

**BARBED**, in a general sense, bearded like a fish-hook, set with barbs; also shaved or trimmed.

**BARBED**, and **CRESTED**, in heraldry, an appellation given to the combs and gills of a cock, when particularized for being of a different tincture from the body.

A barbed cross, is a cross, the extremities whereof are like the barbed irons used for striking of fish. See Plate LI. fig. 6.

**BARBELICOTÆ**, in church-history, a sect of gnostics, who affirmed that an immortal Eon had commerce with a virgin called Barbelath, to whom he granted successively the gift of prophecy, incorruptibility, and eternal life.

**BARBER**, one who makes a trade of shaving or trimming the beards of other men for money.

**BARBERINO**, a town of Tuscany in Italy, situated upon the river Siera, in  $11^{\circ}$  E. long. and  $44^{\circ} 5'$  N. lat.

**BARBERRY**, in botany. See *BERBERIS*.

**BARBICAN**, or **BARBACAN**. See *BARBACAN*.

**BARBLE**, or **BARBEL**. See *BARBEL*.

**BARBLES**, or **BARBS**, in farriery, the knots or superfluous flesh, that grow up in the channels of a horse's mouth; that is, in the intervals that separate the bits, and lie under the tongue.

**BARBOTINE**, a feed called *semen fantonicum*, & *semen contra vermes*; in English, worm feed. See *WORM-SEED*.

**BARBORA**, a maritime city of Africa, in the kingdom of Adel, upon the streights of Babelmandel.

**BARBUDA**, one of the British Caribbee Islands, about 20 miles long, and 12 broad, in  $61^{\circ}$  W. long. and  $18^{\circ}$  N. lat.

**BARBUS**, in ichthyology. See *CYPRINUS*.

**BARBUSINSKOI**, a city of Asia in the Russian empire, situated upon the eastern bank of the lake Baikal.

**BARBY**, a town of Upper Saxony, in Germany, upon the Elbe.

**BARBYLA**, in botany. See *PRUNUS*.

**BARCA**, a country lying on the Mediterranean, between Tripoli and Egypt; a barren desert for the most part.

**BARCALON**, an appellation given to the prime minister of the king of Siam. The barcalon has in his department every thing relating to commerce, both at home and abroad. He is likewise superintendant of the king's magazines.

**BARCELONA**, the chief city of Catalonia, in Spain. It is situated in a large plain along the shore of the Mediterranean; being divided into the new and old town, separated from each other by a wall and ditch:  $2^{\circ}$  E. long. and  $41^{\circ} 20'$  N. lat.

**BARCELONETA**, a town of Piedmont, now subject to France:  $6^{\circ} 40'$  E. long. and  $44^{\circ} 35'$  N. lat.

**BARCELOR**, or **BASELOR**, a port-town on the coast of Malabar, in  $74^{\circ} 15'$  E. long. and  $13^{\circ} 30'$  N. lat.

**BARCELOS**, a town of the province of Entre-Minhoduro, in Portugal, about 30 miles north of Porto, in  $9^{\circ} 15'$  W. long. and  $41^{\circ} 20'$  N. lat.

- BARD**, a poet among the ancient Gauls and Britons, who celebrated the praises of heroes, with a view to inculcate virtue, and sometimes to terminate a difference between two armies at the point of engagement. It is disputed wherein the bards differed from the druids: Some pretend that these were the priests and philosophers of the nation, and that those were only the poets and historians; but it is more probable that druid was a general word, comprehending the priests, the judges, the instructors of youth, and the bards or poets.
- BARBARA**, in botany. See **ARCTIUM**.
- BARDED**, in heraldry, the same with caparisoned.
- BARDELLE**, in the menage, a saddle made in the form of a great saddle, but only of cloth stuffed with straw, and tied tight down with packthread, without either leather, wood, or iron. In Italy they trot their colts with such saddles.
- BARDESANISTS**, in church-history, Christian heretics of the second century, who maintained that the devil was a self-existent independent being; that Jesus Christ was not born of a woman, but brought his body with him from heaven; and denied the resurrection of the body.
- BARDEWICK**, a town in Lower Saxony in Germany, about seven miles north of Lunenburg. It is subject to the elector of Hanover, and situated in  $10^{\circ} 6' E.$  long. and  $53^{\circ} 40' N.$  lat.
- BARDS**, **BARDI**. See **BARD**.
- BARDS**, in the art of cookery, broad slices of bacon, with which pullets, capons, pigeons, &c. are sometimes covered, before they are roasted, baked, or otherwise dressed.
- BARDT**, a port-town of Pomerania, in Germany; it is subject to Sweden, and situated in  $13^{\circ} 20' E.$  long. and  $54^{\circ} 20' N.$  lat.
- BAREITH**, a town of Franconia in Germany, &c. in the margraviate of Culbach; in  $12^{\circ} 20' E.$  long. and  $50^{\circ} N.$  lat.
- BARENTON**, a town of lower Normandy in France.
- BAR-FEE**, a fee of twenty pence which every prisoner acquitted of felony pays to the goaler.
- BARFLEUR**, a town and cape of Normandy, in France, about 12 miles east of Cherbourg; in  $1^{\circ} 15' W.$  and  $49^{\circ} 47' N.$  lat.
- BARGE**, in naval affairs, a boat of state and pleasure, adorned with various ornaments, having bales and tilts, and seats covered with cushions and carpets, and benches for many oars; as the lord-mayor's barge, a company's barge, an admiral's barge, &c. It is also the name of a flat-bottomed vessel employed for carrying goods in a navigable river; as those upon the river Thames, called *west-country barges*.
- BARGE**, in ornithology. See **SCOLOPAX**.
- BARGE-couples**, in architecture, a beam mortised into another, to strengthen the building.
- BARGE-course**, with bricklayers, a term used for that part of the tiling which projects over without the principal rafters, in all forts of buildings, where there is either a gable or a kirkin-head. See **GABLE** and **HEAD**.
- BARGEMONT**, a town of Provence in France, in the diocese of Frejus.
- BARILLIA**, a kind of Spanish pot-ash, used in the glaiz-trade.
- BARING** of trees, in agriculture, the taking away some of the earth about the roots, that the winter-rain and snow-water may penetrate further into the roots. This is frequently practised in the autumn.
- BARJOLS**, a town of Provence in France, in  $6^{\circ} 50' E.$  long. and  $43^{\circ} 36' N.$  lat.
- BARPICINI**, or **SUONI BARPICINI**, in music, signify in general any low, grave, or deep sound.
- BARK**, in the anatomy of plants, the exterior part of trees, corresponding to the skin of an animal. See **AGRICULTURE**, p. 43.
- BARK**, or **JESUIT'S BARK**, is a name given by way of eminence to the quinquina. See **QUINQUINA**.
- BARK**, in navigation, a little vessel with two or three triangular sails; but, according to Guillet, it is a vessel with three masts, *viz.* a main-mast, fore-mast, and mizen-mast. It carries about two hundred tons.
- BARKAN**, a town of Hungary, remarkable for two victories which the Christians obtained there over the Turks, the one in 1664, and the other in 1683.
- BARKARY**, a tan-house, or place for keeping bark.
- BARK-binding**, a distemper incident to trees, cured by flitting the bark, or cutting along the grain.
- BARK-galling**, is when the trees are galled with thorns, &c. It is cured by binding clay on the galled places.
- BARK-longue**, or **BARCA longa**, a small low sharp-built, but very long vessel without a deck. It goes with sails and oars, and is very common in Spain.
- BARKHAMSTEAD**, a market-town in the west part of Hertfordshire, about eighteen miles west of Hertford, in  $4^{\circ} W.$  long. and  $51^{\circ} 40' N.$  lat.
- BARKING**, a fishing town of Essex, situated on the river Thames, about eight miles east of London.
- BARKING** of trees, the peeling off the rind or bark. This must be done, in our climate, in the month of May, because at that time the sap of the tree separates the bark from the wood. It would be very difficult to perform it at any other time of the year, unless the season was extremely wet and rainy, for heat and dryness are a very great hindrance to it.
- BARKLEY**, a market-town of Gloucestershire, about fifteen miles south-west of Gloucester, in  $2^{\circ} 35' W.$  lon. and  $51^{\circ} 40' N.$  lat.
- BARKWAY**, a market-town in Hertfordshire, under the meridian of London, and fifteen miles south of Cambridge.
- BARLEDUC**, the capital of the duchy of Bar. See **BAR**.
- BARLEMONT**, a town of Hainault, in the French Netherlands, situated on the river Sambre, about fifteen miles south of Mons. in  $3^{\circ} 40' E.$  long. and  $50^{\circ} 10' N.$  lat.
- BARLETTA**, a port-town of Barri, in the kingdom of Naples, situated on the gulf of Venice, twenty-two miles west of Barri, in  $17^{\circ} E.$  long. and  $41^{\circ} N.$  lat.
- BARLEY**, in botany. See **HORDEUM**.

**BARLEY-corn**, the least of our long-measures, being the third of an inch.

**BARLOVENTO Isles**, the same with the Caribbees.

**BARM**, the same with yest. See **YEST**.

**BARNABITES**, a religious order, founded in the sixteenth century by three Italian gentlemen, who had been advised by a famous preacher of those days to read carefully the epistles of St Paul. Hence they were called *clerks of St Paul*, and *Barnabites*, because they performed their first exercise in a church of St Barnabas at Milan. Their habit is black, and their office is to instruct, catechise, and serve in mission.

**BARNACLE**, in ornithology, a species of goose. See **ANAS**.

**BARNACLES**, in farriery, an instrument composed of two branches joined at one end with a hinge, to put upon horses noses when they will not stand quietly to be shod, bled, or dressed.

**BARNARD-CASTLE**, a town of the bishopric of Durham, in 1° 3' W. long. and 54° 26' N. lat.

**BARNET**, a market-town of Middlesex (part of it in Hertfordshire) ten miles north-west of London, in 10' W. long. and 51° 42' N. lat.

**BARNSTABLE**, a port-town of Devonshire, situated on the river Tan, about thirty miles north of Exeter, in W. long. 4° 10', and 51° 42' N. lat. It sends two members to parliament.

**BAROCHE**, a port-town of the hither India, in the province of Cambaya; situated sixty miles north of Surat, in 72° 5' E. long. and 22° 15' N. lat.

**BAROCO**, in logic, a term given to the fourth mode of the second figure of syllogisms. A syllogism in baroco has the first proposition universal and affirmative, but the second and third particular and negative, and the middle term is the predicate in the two first propositions. For example,

*Nullus homo non est bipes :*

*Non omne animal est bipes :*

*Non omne animal est homo.*

**BAROMETER**, a machine for measuring the weight of the atmosphere, and the variations therein, in order to determine the changes of the weather. See **PNEUMATICS**.

**BARON**, a degree of nobility next below a viscount, and above a baronet. It is probable that formerly all those were barons who had lordships with courts-baron, and soon after the conquest all such sat in the house of peers; but they being very numerous, it grew an order and custom, that none should sit but such as the king thought fit to call up by writ, which ran *pro hac vice tantum*. This state of nobility being very precarious, they at length obtained of the king letters patent; and these were called *barons by patent*, or *creation*, the only way now in use of making barons, unless when the son of a lord, in his ancestor's life-time, is summoned by a writ.

On solemn occasions, barons wear a coronet, represented in Plate LI. fig. 19.

**BARON by tenure**, one who held certain territories of the king, who still retained the tenure in chief to himself.

**BARONS of the exchequer**, the four judges to whom the

administration of justice is committed, in causes between the king and his subjects, relating to matters concerning the revenue. They were formerly barons of the realm, but of late are generally persons learned in the laws. Their office is also to look into the accounts of the king, for which reason they have auditors under them. See **AUDITOR**.

**BARONS of the cinque-ports** are members of the house of commons, elected by the five ports, two for each port. See the article **CINQUE-PORTS**.

**BARON and FEME**, in our law, a term used for the husband in relation to his wife, who is called *feme*; and they are deemed but one person; so that a wife cannot be witness for or against her husband, nor he for or against his wife, except in cases of high treason.

**BARON and FEME**, in heraldry, is when the coats of arms of a man and his wife are borne per pale in the same escutcheon, the man's being always on the dexter side, and the woman's on the sinister; but here the woman is supposed not an heiress, for then her coat must be borne by the husband on an escutcheon of pretence. See **PALE** and **ESCUTCHEON of pretence**.

*Prendre de BARON*. See **PRENDRE**.

**BARONET**, a modern degree of honour, next to a baron, created by K. James I. in order to propagate a plantation in Ulster in Ireland, for which purpose each of them was to maintain thirty soldiers in Ireland, for three years, after the rate of eight pence sterling per day to each soldier. The honour is hereditary, and they have the precedence of all knights, except those of the garter, bannerets, and privy-counsellors. They are styled *baronets* in all writs, and the addition of *Sir* is attributed to them, as the title of *Lady* is to their wives. No honour is created between barons and baronets.

**BARONY**, the honour and territory which gives title to a baron, whether he be a layman or a bishop.

**BAROSCOPE**, the same with barometer. See **BAROMETER**.

**BARR**, or **BAR**. See **BAR**.

**BARR-dice**, false dice, so contrived as not readily to turn up certain sides.

**BARRA**, in commerce, a long-measure used in Portugal and some parts of Spain, to measure woolen clothes, linen cloths, and ferges. There are three sorts, the barra of Valencia, 13 of which make 12½ yards English measure; the barra of Castile, 7 of which make 6½ yards; and the barra of Aragon, 3 of which make 2½ yards English.

**BARRACAN**, in commerce, a sort of stuff, not diapered, something like camblet, but of a coarser grain. It is used to make cloaks, furtouts, and such other garments, to keep off the rain.

**BARRACKS**, or **BARACKS**, places for soldiers to lodge in, especially in garrisons.

**BARRATOR**, in law, a common mover of maintainers of suits and quarrels, either in courts, or elsewhere in the country. A man cannot be adjudged a barrator for bringing any number of suits in his own right, though they are vexatious. Barrators are punished by fine and imprisonment.

**BARRATRY**, in law, signifies the fomenting quarrels and law-suits.

**BARRATRY**, in a ship-matter, is his cheating the owners. If goods delivered on ship-board, are embezzled, all the mariners ought to contribute to the satisfaction of the party that lost his goods, by the maritime law; and the cause is to be tried in the admiralty. In a case, where a ship was insured against the barratry of the master, &c. and the jury found that the ship was lost by the fraud and negligence of the master, the court agreed, that the fraud was barratry, though not named in the covenant; but that negligence was not.

**BARREAUX-Fort**, a fortress of Savoy, having Montmelian on the north, and Grenoble on the south, situated in 5° 30' E. long. and 45° N. lat.

**BARREL**, in commerce, a round vessel, extending more in length than in breadth, made of wood, in form of a little tun. See **TUN**.

It serves for holding several sorts of merchandize.

Barrel is also a measure of liquids. The English barrel, wine-measure, contains the eighth part of a tun, the fourth part of a pipe, and one half of a hog-head; that is to say, it contains thirty-one gallons and a half: A barrel, beer-measure, contains thirty-six gallons; and, ale-measure, thirty-two gallons. The barrel of beer, vinegar, or liquor preparing for vinegar, ought to contain thirty-four gallons, according to the standard of the ale quart.

**BARREL** also denotes a certain weight of several merchandizes, which differs according to the several commodities: A barrel of Essex butter weighs one hundred and six pounds; and of Suffolk butter, two hundred and fifty-six pounds. The barrel of herrings ought to contain thirty-two gallons wine measure, which amount to about twenty-eight gallons old standard, containing about a thousand herrings. The barrel of salmon must contain forty-two gallons. The barrel of eels the same. The barrel of soap must weigh two hundred and fifty-six pounds.

**BARREL**, in mechanics, a term given by watch-makers to the cylinder about which the spring is wrapped: And by gun-smiths to the cylindrical tube of a gun, pistol, &c. through which the ball is discharged.

**BARREL**, in anatomy, a pretty large cavity behind the tympanum of the ear, about four or five lines deep, and five or six wide.

**Thundering BARRELS**, in the military art, are filled with bombs, grenades, and other fire-works, to be rolled down a breach.

**BARRENNESS**, the same with sterility. See **STERILITY**.

**BARRERA**, in botany, a genus of the pentandria pentagynia class. The calix has five divisions, and the petals five, with long filiform claws. There is but one species, *viz.* the copenfis, a native of Æthiopia.

**BARRI**, a city of the kingdom of Naples, and capital of a province of the same name, situated on the gulf of Venice, in 17° 40' E. long. and 40° 40' N. lat.

**BARRICADE**, a warlike defence, consisting of empty barrels and such like vessels, filled with earth, stones, carts, trees cut down, against an enemy's shot, or assault;

but generally trees cut with six faces, which are crossed with battoons as long as a half-pike, bound about with iron at the feet.

**BARRIER**, in fortification, a kind of fence made at a passage, retrenchment, &c. to stop up the entry thereof, and is composed of great stakes, about four or five feet high, placed at the distance of eight or ten feet from one another, with transoms, or over-thwart rafters, to stop either horse or foot, that would enter or rush in with violence: In the middle is a moveable bar of wood, that opens and shuts at pleasure. A barrier is commonly set up in a void space, between the citadel and the town, in half moons, &c.

**BARRIER** has been also used to signify a martial exercise of armed men, fighting together with swords, within rails or bars, which inclosed them.

**BARRING a vein**, in farriery, an operation performed upon the veins of a horse's legs, and other parts of his body, with intent to stop the course, and lessen the quantity of the malignant humours that prevail there.

**BARRISTER**, in common law, a person qualified, and impowered to plead and defend the cause of clients, in the courts of justice. They are of two sorts, the outward, or outer-barristers, who, by their long study in and knowledge of the law, which must be for a term of seven years at least, are called to public practice, and always plead without the bar.

The inner-barristers are those, who, because they are either attorney, solicitor, serjeant, or council to the king, are allowed, out of respect, the privilege of pleading within the bar. But at the rolls, and some other inferior courts, all barristers are admitted within the bar.

Barristers, in the English laws, amount to the same with licentiates and advocates in other countries, and courts, where the civil, &c. laws obtain.

**BARROW**, in the salt-works, wicker-cases, almost in the shape of a sugar-loaf, wherein the salt is put to drain.

**BARRULET**, in heraldry, the fourth part of the bar, or the one half of the clofset: An usual bearing in coat-armour.

**BARRULY**, in heraldry, is when the field is divided bar-ways, that is across from side to side, into several parts. See **Plate LI. fig. 7.**

**BARRY**, in heraldry, is when an escutcheon is divided bar-ways, that is, across from side to side, into an even number of partitions, consisting of two or more tinctures, interchangeably disposed: It is to be expressed in the blazon by the word *barry*, and the number of pieces must be specified; but if the divisions be odd, the field must be first named, and the number of bars expressed.

**BARRY-BENDY** is when an escutcheon is divided evenly, bar and bend-ways, by lines drawn transverse and diagonal, interchangeably varying the tinctures of which it consists. See **Plate LI. fig. 8.**

**BARRY-PILY** is when a coat is divided by several lines drawn obliquely from side to side, where they form acute angles.

**BARTER**, or **TRUCK**, is the exchanging of one commodity

modity for another ; in doing of which the price of one of the commodities, and an equivalent quantity of the other, must be found either by practice, or by the rule of three.

*Quest. 1.* How many pounds of cotton, at 9 d. per lb. must be given in barter for 13 C. 3 Q. 14 lb. of pepper, at 2 l. 16 s. per C. ?

*Ans.* Find the price or value of the commodity whose quantity is given, as follows.

	C	Q.	lb.	L.	s.
	13	3	14	at	2 16
2 l.	26				
16 s.	10 8				
2 Q.	1 8				
1 Q.	14

*Secondly,* Find how much cotton, at 9 d. per lb. 38 l. 17 s. will purchase, as under.

d.	lb.	L.	s.
If 9 :	1 ::	38	17
		20	
		777	
		12	

9)9324(

*Ans.* 1036 lb. = 9 1

If the above question be wrought decimally, the operation may stand as follows :

C.	L.	C.
If 1 :	2.8 ::	13.875
		2.8
		111000
		27750
.0375)	38.8500	(1036 = 9 1 <i>Ans.</i>
	37 5	
	1350	
	1125	
	2250	
	2250	

The value or price of the goods received and delivered in barter being always equal, it is obvious, that the product of the quantities received and delivered, multiplied into their respective rates, will be equal.

Hence arises a rule which may be used with advantage in working several questions ; namely, Multiply the given quantity and rate of the one commodity, and the product divided by the rate of the other commodity quotes the quantity sought ; or divided by the quantity quotes the rate.

*Quest. 2.* How many yards of linen, at 4 s. per yard, should I have in barter for 120 yards of velvet, at 15 s. 6 d. ?

*Yds.*      *Sixp.*      *Sixp.*      *Yds.*  
120 × 31 = 3720, and 8)3720(459 *Ans.*

**BARTHOLOMEW**, or *St BARTHOLOMEW*, one of the Caribbee iflands, situated in 62° 5' W. long. and 18° 6' N. lat.

**BARTON**, a market-town in Lincolnshire, situated on the southern shore of the Humber, 30 miles south-east of York, in 15' W. long. and 53° 40' N. lat.

**BARTON** is also used, in the west of England, for the demefne lands of a manor ; also for the manor-houfe ; and in some parts for out-houfes, &c.

**BARTSIA**, in botany, a genus of the didynamia angiospermia class. The calix has two coloured emarginated lobes ; the corolla is less than the calix, and the superior lip is longest ; the capsule has two cells. The species are 4, of which the *viscosa*, or marsh eye-bright cow-wheat, and the *alpina*, or mountain eye-bright cow-wheat, are natives of Britain.

**BARUA**, a city of Abyssinia, in Africa, the capital of the kingdom of Barnagassa.

**BARULES**, in church-history, certain heretics, who held that the Son of God had only a phantom of a body ; that souls were created before the world, and that they lived all at one time.

**BARUTH**, an Indian measure, containing seventeen gantans : It ought to weigh about three pounds and an half English avoirdupois.

**BARYTONUM**, in the Italian music, the same with our bass. See **BASS**.

**BAS-RELIEF**. See **BASSO-RELIEVO**.

**BASALTES**, in natural history, called also *coticula*, *lapis heraclius*, and *lapis lydius*, a kind of marble, of a very fine texture, of a deep glossy black, resembling that of polished steel, and mixed with no other colour, nor any extraneous matter. The most remarkable quality of this marble is its figure, being never found in strata, like other marbles, but always standing up in the form of regular angular columns, composed of a number of joints, one placed on and nicely fitted to another, as if formed by the hands of a skilful workman. It is remarkably hard and heavy, will not strike fire with steel, and is a fine touch-stone. See Plate LI. fig. 20. The basalties was originally found in columns in Ethiopia, in fragments in the river Tmolus, and some other places ; we now have it frequently, both in columns and small pieces, in Spain, Russia, Poland, near Dresden, and in Silesia ; but the noblest store in the world seems to be that called the *Giant's causeway*, in Ireland, where it rises far up in the country, runs into the sea, crosses its bottom, and rises again on the opposite land.

**BASANUS**, or **BASANITES**, names used by ancient writers for the basalties.

**BASARUCO**, in commerce, a small base coin in the East Indies, being made only of very bad tin. There are, however, two sorts of this coin, a good and a bad ; the bad is one sixth in value lower than the good.

**BASE**, in geometry, the lowest side of the perimeter of a figure : Thus, the base of a triangle may be said of any of its sides, but more properly of the lowest, or that which is parallel to the horizon. In rectangled triangles, the base is properly that side opposite to the right angle.

**BASE** of a *solid figure*, the lowest side, or that on which it stands.

**BASE** of a *conic section*, a right line in the hyperbola and parabola, arising from the common intersection of the secant plane, and the base of the cone.

*Altern* **BASE**. See **ALTERN**.

**BASE**, in architecture, is used for any body which bears another, but particularly for the lower part of a column and pedestal. See **ARCHITECTURE**.

**BASE**, in fortification, the exterior side of the polygon, or that imaginary line which is drawn from the flanked angle of a bastion, to the angle opposite to it.

**BASE**, in gunnery, the least sort of ordnance, the diameter of whose bore is  $1\frac{1}{2}$  inch, weight 200 pound, length 4 feet, load 5 pound, shot  $1\frac{1}{2}$  pound wt. and diameter  $1\frac{1}{2}$  inch.

**BASE** *line*, in perspective, the common section of a picture, and the geometrical plane.

*Distinct* **BASE**, in optics. See **FOCUS**.

**BASE** of the *heart*, in anatomy, denotes its upper part.

**BASE**, or **BASS**, in music. See **BASS**.

**BASE** *point*, in heraldry. See **POINT**.

**BASELLA**, in botany, a genus of the pentandria triogynia class. It has no calix; the corolla has 6 divisions; and there is but one seed in the capsule. The species are 3, *viz.* the rubra, alba, and lucida, all natives of India.

**BASEMENT**, in architecture, a base continued a considerable length, as round a house, room, &c. See **ARCHITECTURE**.

**BASHAW**, a Turkish governor of a province, city, or other district.

Bashaws include beglerbegs, and sometimes sangiacbegs, though a distinction is sometimes made, and the name *bashaw* is appropriated to the middle sort, or such as have two ensigns or horse-tails carried before them. Those who have the honour of three tails, are called *beglerbegs*; and those who have only one, *sangiacbegs*.

The appellation *bashaw* is given by way of courtesy to almost every person of any figure at the grand signior's court.

**BASIENTO**, a river of the kingdom of Naples, which rises near Potenza in the Basilicate, waters that province, and runs into the gulf of Tarento.

**BASIGLOSSUS**, or **BASIOGLOSSUS**. See **BASIOGLOSSUM**.

**BASIL**, in geography, a city and canton of Switzerland, near the confines of Alsace, situated on both sides the river Rhine.

The city is large, populous, and fortified; being situated in  $7^{\circ} 40'$  E. long. and  $47^{\circ} 40'$  N. lat.

**BASIL**, in botany. See **OCYMMUM**.

**BASIL**, among joiners, the sloping edge of a chissel, or of the iron of a plane, to work on soft wood : They

usually make the basil  $12$  degrees, and for hard wood  $18$ ; it being remarked, that the more acute the basil is, the better the instrument cuts; and the more obtuse, the stronger and fitter it is for service.

*Order of St BASIL*, the most ancient of all the religious orders, was very famous in the east. It passed into the west about the year 1057, and was held in great esteem, especially in Italy. As to their rules, the Italian monks of that order fast every Friday in the year : They eat meat but three times a week, and then but once a-day : They work all together at certain hours of the day : Their habit is nearly like that of the Benedictines, and they wear a small beard like the fathers of the mission.

**BASILARE** *os*, in anatomy, the same with *os sphenoides*. See **SPHENOIDES**.

**BASILIC**, in ancient architecture, a term used for a large hall, or public place, with aisles, porticos, galleries, tribunals, &c. where princes sat and administered justice in person.

**BASILICA**, in anatomy, the interior branch of the axillary vein, running the whole length of the arm.

**BASILICATE**, a province of the kingdom of Naples, having the Terra di Barri on the north, and the province of Calabria on the south.

**BASILICI**, a denomination given in the Greek empire to those who carried the emperor's orders and commands.

**BASILICON**, in pharmacy, an epithet for a great many compositions to be found in the ancient medicinal writers : But it more particularly denotes an official ointment, composed of wax, resin, pitch, and oil of olives, from thence called *tetrapharmacum*. It is much used in wounds.

**BASILICS**, a body of the Roman laws, translated into Greek. The basilics comprehend the institutes, digests, code, novels, and some edicts of Justinian and other emperors.

**BASILICUS**, in astronomy, *cor leonis*, a fixed star of the first magnitude in the constellation Leo. See **LEO**.

**BASILIDIANS**, in church-history, a branch of gnostics, who maintained that Christ's body was only a phantom, and that Simon the Cyrenean suffered in his stead.

**BASILIGOROD**, a city of the Russian empire, in Muscovitish Tartary, situated upon the banks of the Wolga.

**BASILISCUS**, in zoology, the trivial name of a species of lacerta. See **LACERTA**.

**BASILISK**, in military affairs, a large piece of ordnance, being a 48-pounder, and weighing about 7200 pounds. Those of the French were 10 feet long, and those of the Dutch 15. The French do not call any more of that calibre.

**BASINGSTOKE**, a market-town of Hampshire, about 16 miles north-east of Winchester, in  $1^{\circ} 15'$  W. lon. and  $51^{\circ} 20'$  N. lat.

**BASIOGLOSSUS**, in anatomy, a muscle arising from the base of the os hyoides.

**BASIS**, *base*, in geometry. See **BASE**.

- BASIS**, among physicians, denotes the principal ingredients in compound medicines.
- BASKET**, a machine made of twigs interwoven together, in order to hold fruit, earth, &c. It denotes an uncertain quantity, as a basket of medlars is two bushels, of asa foetida from 20 to 50 pound weight.
- BASKETS of earth**, in the military art, called by the French *corbeilles*, are small baskets used in sieges, on the parapet of a trench, being filled with earth. They are about a foot and a half high, about a foot and a half diameter at the top, and 8 or 10 inches at bottom; so that being set together, there is a fort of embrasures left at their bottoms, through which the soldiers fire, without exposing themselves.
- BASKET-FISH**. See **ASTERIAS**.
- BASKET-SALT**, that made from salt-springs, being purer, whiter, and composed of finer grains than the common brine-salt.
- BASKET-TENURE**, a tenure of lands by the service of making the king's baskets.
- BASKIRI**, a country of Muscovitish Tartary, bounded on the north by the Tartars of Tumen, on the east by Barabinkoi, on the south by the mountain Sortora, and on the west by the dutchy of Bulgaria.
- BASON**, in anatomy. See **PELVIS**.
- BASON**, in hydraulics, a reservoir of water, used for various purposes: Thus we say, *The bason of a jet d'eau, the bason of a fountain*, and likewise *the bason of a port or harbour*.
- BASON**, in Jewish antiquities, the laver of the tabernacle, made of the brass looking-glasses belonging to those devout women that watched and stood centinels at the door of the tabernacle.
- BASON**, in mechanics, a term used by glass-grinders for a dish of copper, iron, &c. in which they grind convex glasses, as concave ones are formed on spheres: And by hatters for a round iron mould, in which they form the matter of their hats; and also for a leaden one for the brims of hats, having an aperture in the middle, of a diameter sufficient for the largest block to go through.
- BASONS of a balance**, the two scales or dishes fastened to the extremities of the string; the one to hold the weight, and the other the thing to be weighed.
- Sale by the BASON**, at Amsterdam, is a public sale made by authority, over which presides an officer, appointed by the magistrates. It is so called, because, before the lots are delivered to the highest bidder, they commonly strike on a copper bason, to give notice that the lot is going to be adjudged.
- BASQUE**, or **LABOUR**, the south-west division of the province of Gascony, in France.
- BASS**, in music, that part of a concert which is most heard, which consists of the gravest and deepest sounds, and which is played on the largest pipes or strings of a common instrument, as of an organ, lute, &c. or on instruments larger than ordinary, for that purpose, as bass-voils, bassoons, bass-hautboys, &c. The bass is the principal part of a musical composition, and the foundation of harmony; for which reason it is a matter of
- xim among musicians. That when the bass is good, the harmony is seldom bad.
- Thorough-Bass** is the harmony made by the bass-voils, or theorbos, continuing to play both while the voices sing, and the other instruments perform their parts, and also filling up the intervals when any of the other parts stop. It is played by cyphers marked over the notes, on the organ, spinet, harpsicord, &c. and frequently simply and without cyphers on the bass-viol and bassoon.
- Counter-Bass** is a second or double bass, where there are several in the same concert.
- BASS**, in geography, a steep rock, with an old fort, accessible only at one place, lying on the coast of E. Lothain in Scotland, at the mouth of the frith of Forth.
- BASSAIM**, or **BACCEIM**, a port-town of the Hither India, subject to the Portuguese, situated in 71° 5' E. long. and 19° 30' N. lat.
- BASSANUS**, in ornithology. See **PELICANUS**.
- BASSEE**, a town of French Flanders, upon the confines of Artois, situated in 3° 30' E. lon. and 50° 53' N. lat.
- BASSEMPOIN**, a town of Gascony, in France.
- BASSET**, a game at cards, said to have been invented by a noble Venetian, for which he was banished.
- The persons concerned in it are a dealer, or banker; his assistant, who supervises the losing cards; and the punter, or any one who plays against the banker.
- BASSIGNY**, the fourth east division of the province of Champagne, in France. See **CAMPAIGN**.
- BASSOON**, a musical instrument of the wind-sort, blown with a reed, furnished with eleven holes, and used as a bass in a concert of hautboys, flutes, &c.
- To render this instrument more portable, it is divided into two parts, whence it is also called a fagot. Its diameter at bottom is nine inches, and its holes are stopped like those of a large flute.
- BASSORA**, a large city of Asia, situated below the conflux of the Tigris and Euphrates, in 53° E. long. and 30° 20' N. lat.
- BASSO-RELIEVO**, or **BASS-RELIEF**, a piece of sculpture, where the figures or images do not protuberate, jet, or stand out far above the plane on which they are formed.
- Whatever figures or representations are thus cut, stamped, or otherwise wrought, so that not the entire body, but only part of it is raised above the plane, are said to be done in relief, or relievo; and when that work is low, flat, and but a little raised, it is called low relief: When a piece of sculpture, a coin, or a medal, has its figure raised so as to be well distinguished, it is called bold, and we say its relief is strong.
- BASS-VIOL**, a musical instrument of the like form with that of a violin, but much larger. It is struck with a bow as that is, has the same number of strings, and has eight stops, which are subdivided into semi-stops: Its sound is grave, and has a much nobler effect in a concert than that of the violin.
- BASTERNA**, a sort of vehicle, much the same with our chariot, used by the ancient Roman ladies. This was a different carriage from the lectica, which it succeeded,

needed, inasmuch as the *lectica* was borne on mens shoulders, whereas this was drawn by beasts.

**BASTIA**, the chief city of the island of Corsica. It is a good port, situated on the north-east part of the island, in  $9^{\circ} 40'$  E long. and  $42^{\circ} 20'$  N. lat.

**BASTILLE**, a castle for state prisoners in Paris, answering to the Tower of London.

**BASTIMENTOS**, small islands on the coast of Darien, in South America, lying a little to the eastward of Porto Bello.

**BASTION**, in the modern fortification, a huge mass of earth, faced usually with sods, sometimes with brick, and rarely with stone, standing out from a rampart, whereof it is a principal part, and is what, in the ancient fortification, was called a bulwark. See **FORTIFICATION**.

*Solid BASTIONS* are those that have the void space within them filled up entirely, and raised of an equal height with the rampart.

*Void and hollow BASTIONS* are those that are only surrounded with a rampart and parapet, having the space within void and empty, where the ground is so low, that if the rampart be taken, no retrenchment can be made in the centre, but what will lie under the fire of the besieged.

*Flat BASTION*, is a bastion built in the middle of the curtain, when it is too long to be defended by the bastion at its extremes.

*Cut BASTION* is that whose point is cut off, and instead thereof has a re-entering angle, or an angle inwards with two points outwards, and is used either when without such a contrivance the angle would be too acute, or when water or some other impediment hinders the carrying on the bastion to its full extent.

*Composed BASTION* is when two sides of the interior polygon are very unequal, which makes the gorges also unequal.

*Deformed BASTION* is when the irregularity of the lines and angles makes the bastion out of shape, as when it wants one of its demigorges, one side of the interior polygon being too short.

*Demi BASTION* is composed of one face only, and but one flank, and a demigorge.

*Double BASTION* is that which is raised on the plane of another bastion.

*Regular BASTION* is that which has its true proportion of faces, flanks, and gorges.

**BASTION DE FRANCE**, a fortress in the kingdom of Tunis, subject to France. It is situated about 80 miles west of the city of Tunis, in  $8^{\circ}$  E. long. and  $36^{\circ} 30'$  N. lat.

**BASSTOIGNE**, a town of the Netherlands, in the province of Luxemburg, situated in  $5^{\circ} 26'$  E. long. and  $50^{\circ}$  N. lat.

**BASTON**, in law, one of the servants to the warden of the Fleet prison, who attends the king's courts with a red staff, for taking into custody such as are committed by the court. He also attends on such prisoners as are permitted to go at large by licence.

**BASTON**, or **BATON**, in architecture, a moulding in the base of a column, called also a tore.

**BASTON**, or **BATON**, in heraldry, a kind of bend, having only one third of the usual breadth.

The *baston* does not go from fide to fide, as the bend or scarf does, being in the form of a truncheon. Its use is a note or mark of *bastardy*. See **PLATE LI.** fig. 9.

**BASTONADE**, or **BASTINADO**, a kind of punishment inflicted by beating the offender with a stick. This sort of beating, among the ancient Greeks and Romans, was the punishment commonly inflicted on criminals that were freemen, as that of whipping was on the slaves. We find some instances of this sort of discipline among the Hebrews; and it is a penalty used in the east even at this day.

**BAT**, in zoology. See **VESPERTILIO**.

**BAT**, **BATE**, or **BATZ**, a small copper coin, mixed with a little silver, current in several cities of Germany: it is worth four cruzers. It is also a coin in Switzerland, current at five livres, or one hundred sols, French money.

**BATABLE ground**, that land which lay between Scotland and England, when the kingdoms were distinct, to which both nations pretended a right.

**BATACALO**, a fort and town on the eastern coast of the island of Ceylon, in  $81^{\circ}$  E. long. and  $8^{\circ}$  N. lat.

**BATAVIA**, the capital of all the Dutch colonies and settlements in the East Indies. It is situated on the east part of the island of Java, and has an excellent harbour, in  $106^{\circ}$  E. long. and  $6^{\circ}$  S. lat.

**BATCHELOR**, or **BACHELOR**, a man who still continues in the state of celibacy, or who was never married.

**BATCHELOR** was anciently a denomination given to those who had attained to knighthood, but had not a number of vassals sufficient to have their banner carried before them in the field of battle; or, if they were not of the order of bannerets, were not of age to display their own banner, but obliged to march to battle under another's banner. It was also a title given to young cavaliers, who having made their first campaign, received the military girdle accordingly. And it served to denominate him who had overcome another in a tournament, the first time he ever engaged.

*Knights BATCHELORS* were so called, as being the lowest order of knights, or inferior to bannerets.

**BATCHELORS**, in an university-sense, are persons that have attained to the baccalaureate, or who have taken the first degree in the liberal arts and sciences. Before a person can be admitted to this degree at Oxford, it is necessary that he study there four years; three years more may intitle him to the degree of master of arts; and in seven years more he may commence bachelor of divinity. At Cambridge the degrees are usually taken much the same as at Oxford, excepting in law and physic, in either of which the bachelor's degree may be taken in six years. In France, the degree of bachelor of divinity is attained in five year's study; that is, in two years of philosophy, and three of divinity.

**BAT-FOWLING**, a method of catching birds in the night, by lighting some straw, or torches, near the place

place where they are at root; for upon beating them up, they fly to the flame, where being amazed, they are easily caught in nets, or beat down with bulhes fixed to the end of poles, &c.

**BATENBOURG**, a town of the United Provinces, situated upon the Maefe, between Ravenstein and Mezen.

**BATH**, a sufficient quantity of water collected in some convenient receptacle, for people to wash in, either for health or pleasure.

Baths are distinguished into natural and artificial, and natural again into hot and cold. The chief hot baths in our country are those at Bath, near Wells, in Somersetshire; and those at Buxton and Matlock in Derbyshire.

In the city of Bath are four hot baths: one triangular, called the cross bath, the heat of which is more gentle than that of the rest, because it has fewer springs in it; the second is the hot bath, which was formerly much hotter than the rest, but it was then not so large as at present: the other two are the King's and Queen's Bath, divided only by a wall; the last having no spring, but receives its water from the King's Bath: each of these is furnished with a pump, to throw out the water upon the diseased, where that is required.

These waters abound with a mineral sulphur; they are hot, of a bluish colour, and strong scent; they do not pass through the body like most other mineral waters; though if salt be added, they purge presently. On settlements, they afford a black mud, which is used by way of cataplasm in aches, and proves of more service to some than the waters themselves: The like they deposit on distillation, and no other: The cross-bath preys on silver, all of them on iron, but none on brass.

The use of these baths is found beneficial in disorders of the head, as palsies, &c. in cuticular diseases, as leprosy, &c. obstructions, and constipations of the bowels, the scurvy and stone, and in most diseases of women and children; they are used as a last remedy in obstinate chronic diseases, where they succeed well, if they agree with the constitution of the patient.

Of the three hot European waters of note, *viz.* Aix-la-Chapelle, Bourbon, and Bath, the first abounds more eminently in sulphur, which makes its heat, nau- seousness, and purgative faculty so great, that few stomachs can bear it.

The Bourbon are of a middle nature, between the Aix-la-Chapelle and the Bath waters; being less hot, nau- seous, and purgative than those of Aix-la-Chapelle; but more so than the Bath waters.

Cold baths were by the ancients held in the greatest esteem; and though they were long banished out of medicine, the present age can boast of abundance of noble cures performed by them, and such as were long attempted in vain by the most powerful medicines.

The cold bath is serviceable in most chronic disorders; it always acts the part of a diuretic; and will do more, especially plunging over head in sea-water, in the cure of melancholy, madness, and particularly that occasioned by the bite of a mad dog, than any other medicine.

Artificial baths are various, according to the various occasions; as aqueous baths, vaporous baths, drybaths, &c. Aqueous baths are made from common plants, and other emollient, resolvent, and nervine substances; consisting sometimes of milk and emollient herbs, with rose-water, &c. when the design is to humectate, or when it is only to cleanse, it consists of bran and water alone; and when it is for an excessive pain or tumour, &c. in these cases it consists of a decoction of roots, plants, and some spirit of wine.

In vapour-baths the design of which is to promote a perspiration, the steam or fume of some decoction is received upon some part of the body for that purpose. In these baths there is no part of the patient's body plunged into the decoction, only those parts which require it are properly disposed to receive the steams of some proper fomentation. Of this kind are the bagnios, where persons are made to sweat by the heat of a room, and pouring on of hot water.

Vapour-baths are of singular service in cold distempers, anasarca's, œdematous tumours, paralytic cases, swellings of the testicles, &c.

Dry baths are made of ashes, salt, sand, shreds of leather, &c. This bath is successful in provoking sweat in a plentiful manner, the patient being placed conveniently for the reception of the fumes: They are found useful in removing old obstinate pains, and are very effectual in venereal complaints.

**BATH**, in Hebrew antiquity, a measure of capacity, containing the tenth part of an omer, or seven gallons and four pints, as a measure for things liquid; or three pecks and three pints, as a measure for things dry.

**BATHS**, in architecture, superb buildings, erected for the sake of bathing.

Those buildings, among the ancients, were most pompous and magnificent; such were those of Titus, Paulus Æmilius, and Dioclesian, whose ruins are still remaining.

**BATH**, in geography, a city of Somersetshire, situated on the river Avon, ten miles east of Bristol, in 2° 30' W. long. and 51° 30' N. lat.

**BATH** is also the name of a town in Hungary, in 20° 40' E. long. and 46° N. lat.

**Knights of the BATH**, a military order in England, supposed to have been instituted by Richard II. who limited their number to four: However, his successor, Henry IV. increased them to forty-six. Their motto was *tres in uno*, signifying the three theological virtues.

This order received this denomination from a custom of bathing, before they received the golden spur. It is seldom ever conferred but at the coronation of kings, or the inauguration of a prince of Wales or Duke of York. They wear a red ribbon beltwise.

The order of the bath, after remaining many years extinct, was revived under George I. by a solemn creation of a great number of knights.

**BATH-KOL**, the daughter of a voice. So the Jews call one of their oracles, which is frequently mentioned in their books, especially the Talmud, being a fantastical way of divination invented by the Jews themselves, not unlike the *fortes virgiliane* of the heathens. How-

ever, the Jewish writers call this a revelation from God's will, which he made to his chosen people, after all verbal prophecies had ceased in Israel.

**BATH-metal**, a mixed metal, otherwise called *prince's metal*. See **PRINCE'S METAL**.

**BATH-water**. See the article **BATH**.

**BATHA**, the name of two towns, the one in Barbary, in the kingdom of Algiers, and the other in Hungary, upon the banks of the Danube.

**BATHING**, the washing, soaking, suppling, refreshing, moistening, &c. the body, or any part thereof, in water, liquor, &c. for pleasure or health. See **BATH**.

**BATHING a falcon**, is when, weaned from her ramage fooleries, she is offered some water to bathe herself in a basin, where she may stand up to her thighs. By this means she gathers strength and boldness.

**BATHMUS**, in anatomy, denotes the cavity of a bone, fitted to receive the prominence of another bone.

**BATICALA**, in geography, a kingdom of India, upon the coast of Malabar, to the north of the kingdom of Canara.

**BATIS**, in zoology, the trivial name of a species of raja. See **RAJA**.

**BATMAN**, in commerce, a kind of weight use at Smyrna, containing six oke of four hundred drams each, which amount to sixteen pounds, six ounces, and sixteen drams of English weight.

**BATON**, or **BASTON**. See **BASTON**.

**BATRACHITES**, or **FROG-STONE**, a kind of gem mentioned by the ancients, and so called from its resembling the colour of a frog.

**BATRACHOMYOMACHIA**, the battle of the frogs and the mice, the title of a fine burlesque poem, usually ascribed to Homer.

The subject of the work is the death of Psycharpax, a mouse, son to Toxartes, who, being mounted on the back of Phisgnathus, a frog, on a voyage to her palace, to which she had invited him, was seized with fear, when he saw himself in the middle of the pond, so that he tumbled off and was drowned. Phisgnathus being suspected to have shaken him off with design, the mice demanded satisfaction, and unanimously declared war against the frogs.

**BATTA**, a province of the kingdom of Congo in Africa, which is watered by the river Barbela.

**BATTALIA**, denotes an army drawn up in order of battle.

**BATTALION**, a small body of infantry, ranged in form of battle, and ready to engage.

A battalion usually contains from 5 to 800 men; but the number it consists of is not determined. They are armed with firelocks, swords, and bayonets; and divided into thirteen companies, one of which is grenadiers. They are usually drawn up with six men in file, or one before another. Some regiments consist but of one battalion, others are divided into four or five.

**BATTEL**, a town of Suffex, six miles north of Hastings, in 35° E. long. and 50° 55' N. lat.

**BATTEN**, a name that workmen give to a scantling of

wooden stuff, from two to four inches broad, and about one inch thick; the length is pretty considerable, but undetermined.

This term is chiefly used in speaking of doors and windows of shops, &c. which are not framed of whole deal, &c. with syles, rails, and pannels like wainscot, but are made to appear as if they were, by means of these battens, bradded on the plain board round the edges, and sometimes cross them, and up and down.

**BATTENBURY**, a town of Dutch Guelderland, situated on the north shore of the river Maese, almost opposite to Ravenstein, in 5° 30' E. long. and 51° 45' N. lat.

**BATTERING**, the attacking a place, work, or the like, with heavy artillery.

To batter in breach, is to play furiously on a work, as the angle of a half-moon, in order to demolish and make a gap therein. In this they observe never to fire a piece at the top, but all at the bottom, from three to six feet from the ground.

The battery of a camp is usually surrounded with a trench, and pallisades at the bottom, with two redoubts on the wings, or certain places of arms, capable of covering the troops which are appointed for their defence. See **BATTERY**.

**BATTERING-pieces**, or pieces of battery. See **CANNON** and **GUNNERY**.

**BATTERING-ram**, in antiquity. See **RAM**.

**BATTERING-rans**, in heraldry, a bearing, or coat of arms, resembling the military ensign of the same name. See **PLATE LI. fig. 10.**

**BATTERY**, in the military art, a parapet thrown up to cover the gunners, and men employed about the guns, from the enemy's shot. This parapet is cut into embrasures, for the cannon to fire through. The height of the embrasures, on the inside, is about three feet; but they go sloping lower to the outside. Their wideness is two or three feet, but open to six or seven on the outside. The mass of earth that is betwixt two embrasures, is called the *merlon*. The platform of a battery is a floor of planks and sleepers, to keep the wheels of the guns from sinking into the earth; and is always made sloping towards the embrasures, both to hinder the reverse, and to facilitate the bringing back of the gun.

**BATTERY of mortars** differs from a battery of guns, for it is sunk into the ground, and has no embrasures.

**Cross-BATTERIES** are two batteries, which play athwart one another, upon the same thing, forming there an angle, and beating with more violence and destruction; because what one bullet shakes, the other beats down.

**BATTERY sunk or buried**, is when its platform is sunk, or let down into the ground, so that there must be trenches cut in the earth, against the muzzles of the guns, for them to fire out at, and to serve for embrasures.

**BATTERY d'enslade**, is one that scours, or sweeps the whole length of a straight line.

**BATTERY en echarpe** is that which plays obliquely.

*BATTERY de reserve*, that which plays upon the enemy's back.

*Camerade BATTERY* is when several guns play at the same time upon one place.

*BATTERY*, in law, the striking, beating, or offering any violence to another person, for which damages may be recovered.

*BATTEURS d'escrime*, or *SCOUTS*, are horsemen sent out before, and on the wings of an army, one, two, or three miles, to make discoveries.

*BATTLE*, a general engagement between two armies, in a country sufficiently open for them to encounter in front, and at the same time.

Other great actions, though of a longer duration, and even attended with a greater slaughter, are only called fights.

*Naval BATTLE*, the same with a sea-fight, or engagement between two fleets of men of war.

Before a naval battle, every squadron usually subdivides itself into three equal divisions, with a reserve of certain ships out of every squadron to bring up their rear. Every one of these, observing a due birth and distance, are in the battle to second one another; and the better to avoid confusion and falling foul of each other, to charge, discharge, and fall off, by threes or fives, more or less, as the fleet is greater or smaller. The ships of reserve are instructed either to succour and relieve those that are any way in danger; or to supply, and put themselves in the place of those that shall be made unserviceable.

As for a fleet consisting but of few ships, when obliged to fight in an open sea, it should be brought up to battle in only one front, with the chief admiral in the middle of them, and on each side of him the strongest and best provided ships of the fleet.

*BATTLE* is also used figuratively, for a representation of a battle in sculpture, painting, and the like.

*BATTLE-royal*, in cock-fighting, a fight between three, five, or seven cocks all engaged together, so that the cock which stands longest gets the day.

*BATTLE-ax*, a kind of halbard, first introduced into England by the Danes.

*BATTLEMENTS*, in architecture, are indentures or notches in the top of a wall or other building, in the form of embrasures, for the sake of looking through them.

*BATTOLOGY*, in grammar, a superfluous repetition of some words or things.

*BATTON*, *BATOON*, or *BASTON*. See *BASTON*.

*BATTERY*, in commerce, a name given by the Hanse towns to their country-houses and warehouses in foreign countries. The principal batteries were at London, Arhangel, Novogorod, Lisbon, Venice, and Antwerp.

*BATTUS*, an order of penitents at Avignon, and in Provence, whose piety carries them to exercise very severe discipline upon themselves, both in public and private.

*BATUECOS*, or *LOS BATUECOS*, a people of Spain in the kingdom of Leon, that inhabit the mountains be-

tween Salamanca and Corica, and are thought to be descended from the Gotlis

*BATZ*, a copper coin mixed with some silver, and current at different rates, according to the alloy, in Nuremberg, Basil, Fribourg, Lucerne, and other cities of Germany and Switzerland.

*BAVARIA*, one of the circles of the German empire, lying between Austria on the east, and Swabia on the west.

The duke of Bavaria is one of the nine electors. See *ELECTOR*.

*BAVAY*; a small town in the province of Hainalt in French Flanders, about twelve miles south-west of Mons, in 3° 40' E. long, and 50° 25' N. lat.

*BAUHINIA*, in botany, a genus of the decandria monogynia class. The calix has five divisions, and is deciduous; the petals are open, oblong, and inserted by claws into the calix. The species are eight, all natives of the Indies.

*BAVINS*, in the military art, denote brush-faggots, with the brush at length.

*BAUM*, in botany. See *MELISSA*.

*BAURAC*, a name anciently used for nitre.

*BAUTZEN*, the chief town of Lusatia in Germany, about thirty-five miles north-east of Drefden, in 14° 30' E. long, and 51° 15' N. lat.

*BAWLING*, among sportsmen, the same with babbling. See *BABBLING*.

*BAY*, in geography, an arm of the sea shooting up to the land, and terminating in a nook. It is a kind of lesser gulf, bigger than a creek, and is larger in its middle within than at its entrance. The largest and most noted bays in the world are those of Biscay, Bengal, Hudson's, Panama, &c.

*BAY*, among farmers, a term used to signify the magnitude of a barn; as, if a barn consists of a floor and two heads, where they lay corn, they call it a *barn of two bays*. The bays are from fourteen to twenty feet long.

*BAY* denotes likewise a pound head, made to keep in store of water for driving the wheels of the furnace or hammer belonging to an iron-mill, by the stream that comes thence through a flood-gate, called the *pen-flock*.

*BAY* is also one of the colours of the hair of horses, inclining to red, and coming pretty near the colour of a chestnut. There are five different gradations of the bay-colour, viz. chestnut-bay, light-bay, yellow-bay or dun-bay, bloody-bay, which is also called scarlet-bay, and the brown-bay.

*BAY*, among huntmen. Deer are said to stand at bay, when, after being hard run, they turn head against the hounds.

*BAY-tree*. See *LAURUS*.

*BAY-salt*. See *SALT*.

*BAYEUX*, a city of Normandy in France, about fifteen miles north-west of Caen, in 50° W. long, and 49° 20' N. lat.

*BAYONET*, in the military art, a short broad dagger, formerly with a round handle fitted for the bore of a firelock, to be fixed there after the soldier had fired; but they are now made with iron handles and rings;

that

- that go over the muzzle of the firelock, and are serewed fast, so that the soldier fires with his bayonet on the muzzle of his piece, and is ready to act against the horse.
- BAYONNE**, a large city of Gascony in France, situated on the river Adour, near the bay of Biscay, in  $1^{\circ} 20' W.$  long, and  $43^{\circ} 30' N.$  lat.
- BAYS**, in commerce, a sort of open woollen stuff, having a long nap, sometimes frized, and sometimes not. This stuff is without wale, and is wrought in a loom with two treddles, like flannel. It is chiefly manufactured at Colchester and Bocking in Essex, where there is a hall called the *Dutch bay-hall* or *raw-hall*. The exportation of bays was formerly much more considerable than at present that the French have learned to imitate them. However, the English bays are still sent in great quantities to Spain and Portugal, and even to Italy. Their chief use is for dressing the monks and nuns, and for linings, especially in the army. The looking-glass makers also use them behind their glasses, to preserve the tin or quicksilver; and the case-makers, to line their cases. The breadth of bays is commonly a yard and a half, a yard and three quarters, or two yards, by 42 to 48 in length. Those of a yard and three quarters are most proper for the Spanish trade.
- BAZAR, BAZARI, or BAZAARD**, a place designed for trade among the eastern nations, particularly the Persians, some of which are open at top, like the market-places of Europe; others are covered with high-vaulted ceilings, and adorned with domes to give light. In the first, they sell only the less precious and most bulky commodities; whereas, in the latter, are the shops of those merchants who sell jewels, rich stuffs, wrought plate, &c.
- BAZAS**, a town of Guienne in France, about thirty miles south of Bourdeaux, in  $25' W.$  long, and  $44^{\circ} 20' N.$  lat.
- BAZAT, or BAZA**, in commerce, a long, fine, spun cotton, which comes from Jerusalem, whence it is also called *Jerusalem-cotton*.
- BDELLIUM**, is a gummy resinous concreted juice, brought from Arabia and the E. Indies, in globes of different figures and magnitudes. It is of a dark reddish brown colour, and, in appearance, somewhat resembles myrrh; and is recommended as a sudorific, diuretic, and uterine; and in external applications, for maturing tumours, &c. In the present practice, it is scarce otherwise made use of, than as an ingredient in theriaca.
- BEACHY-HEAD**, a cape or promontory on the coast of Suffex, between Hastings and Shoreham.
- BEACON**, any public signal, to give warning against rocks, shelves, invasions, &c.
- BEACONAGE**, a tax or farm paid for the use and maintenance of a beacon. Trinity-house is empowered to levy this tax by act of parliament.
- BEACONFIELD**, a market-town of Buckinghamshire, twenty-two miles west of London, in  $30' W.$  long, and  $51^{\circ} 30' N.$  lat.
- BEAD**, a small glass ball, made in imitation of pearl, and used in necklaces, &c.
- BEAD**, in architecture, a round moulding, commonly made upon the edge of a piece of stuff, in the Corinthian and Roman orders, cut or carved in short embossments, like beads in necklaces.
- BEAD-proof**, among distillers, a fallacious way of determining the strength of spirits, from the continuance of the bubbles, or beads, raised by shaking a small quantity of them in a phial.
- BEAD-roll**, among papists, a list of such persons, for the rest of whose souls they are obliged to repeat a certain number of prayers, which they count by means of their beads.
- BEADLE**, a messenger or apparitor of a court, who cites persons to appear and answer in the court to what is alledged against them.
- BEADLE** is also an officer at an university, whose chief business it is to walk before the masters with a mace, at all public processions.
- BEAGLE**, the name of a particular kind of hunting-dogs, of which there are several sorts, viz. the southern beagle, which is something less than the deep-mouthed hound, and something thicker and shorter; the fleet-nothern, or cat-beagle, which is smaller and of a finer shape than the southern beagle, and is a hard runner: There is also a very small beagle, not bigger than a lady's lap-dog.
- BEAK**, the bill or nib of a bird.
- BEAK**, in architecture, the small fillet left on the head of a larmier, which forms a canal, and makes a kind of pendant.
- Chin* **BEAK**, a moulding the same as the quarter-round, except that its situation is inverted: This is very frequent in modern buildings, though few examples of it are found in the ancient.
- BEAK, or BEAK-head**, of a ship, that part without the ship, before the fore-castle, which is fastened to the stem, and is supported by the main knee.
- BEAKED**, in heraldry, a term used to express the beak or bill of a bird. When the beak and legs of a fowl are of a different tincture from the body, we say beaked and membered of such a tincture.
- BEAKING**, among cock-fighters, is when one cock holds another by his bill, and strikes him with his spurs or gafflers at the same time.
- BEAM**, in architecture, the largest piece of wood in a building, which lies across the walls, and serves to support the principal rafters of the roof, and into which the feet of these rafters are framed.
- BEAMS of a ship** are the great main cross-timbers which hold the sides of the ship from falling together, and which also support the decks and orlops: The main beam is next the main-mast, and from it they are reckoned by first, second, third beam, &c. the greatest beam of all is called the *mid-ship beam*. See **SHIP**.
- BEAM-compass**, an instrument consisting of a square wooden or brass beam, having sliding sockets, that carry steel or pencil points; they are used for describing large circles, where the common compasses are useless.

**BEAM**, in heraldry, the term used to express the main horn of a hart or buck.

**BEAM**, among hunters, the main stem of a deer's head, or that part which bears the antlers, royals, and tops.

*Chamber-Beam.* See *CHAMBER-BEAM*.

**BEAM** is also the name of a sort of fiery meteor in the shape of a pillar; also a ray of the sun.

**BEAM-filling**, in building, the filling up of the vacant space between the rafter and roof, with stones or bricks laid between the rafters on the rafter, and plastered on with loam, where the garrets are not pargeted, or plastered, as in country places, where they do not parget or plaster their garrets.

**BEAM of an anchor**, the longest part of it, called also the *shank*.

**BEAM-feathers**, in falconry, the longest feathers of a hawk's wing.

**BEAM** also denotes the lath, or iron, of a pair of scales; sometimes the whole apparatus for weighing of goods is so called: Thus we say, it weighs so much at the king's beam.

**BEAM of a plough**, that in which all the parts of the plough-tail are fixed. See *AGRICULTURE*.

**BEAM**, or **ROLLER**, among weavers, a long and thick wooden cylinder, placed length-ways on the back-part of the loom of those who work with a shuttle.

That cylinder, on which the stuff is rolled as it is weaved, is also called the beam or roller, and is placed on the fore-part of the loom.

**BEAN**, in botany. See *VICIA*.

**BEAR**, in zoology. See *URSUS*.

**BEAR**, in astronomy. See *URSA*.

**BEAR**, in heraldry. He that has a coat of arms is said to bear in it the several charges or ordinaries that are in his escutcheon.

**BEAR**, in gunnery. A piece of ordnance is said to come to bear, when it lies right with, or directly against the mark.

**BEARALSTON**, a borough of Devonshire, situated on the river Tamar, about ten miles north of Plymouth, in 4° 30' W. long. and 50° 35' N. lat. It sends two members to parliament.

**BEAR's-breech.** See *ACANTHUS*.

**BEARD**, the hair growing on the chin, and adjacent parts of the face, chiefly of adults and males. See *ANATOMY*, p. 256.

Various have been the ceremonies and customs of most nations in regard of the beard. The Tartars, out of a religious principle, waged a long and bloody war with the Persians, declaring them infidels merely because they would not cut their whiskers after the rite of Tartary: And we find, that a considerable branch of the religion of the ancients consisted in the management of their beard. Ecclesiastics have sometimes been enjoined to wear, and at other times have been forbid the wearing, the beard; and the Greek and Romish churches have been a long time by the ears, about their beards. To let the beard grow, in some countries, is a token of mourning, as to shave it is the like in others.

The Greeks wore their beards till the time of Alex-

ander the Great, that prince having ordered the Macedonians to be shaved, for fear it should give a handle to their enemies. The Romans did not begin to shave till the year of Rome 454. Nor did the Rufians cut their beards till within these few years, that Peter the Great, notwithstanding his injunction upon them to shave, was obliged to keep on for a number of officers to cut off, by violence, the beards of such as would not otherwise part with them.

**BEARD of a comet**, the rays which the comet emits towards that part of the heaven to which its proper motion seems to direct it, in which the beard of a comet is distinguished from the tail, which is understood of the rays emitted towards that part from whence its motion seems to carry it.

**BEARD of a horse**, that part underneath the lower mandible on the outside and above the chin, which bears the curb. It is also called the chuck.

It should have but little flesh upon it, without any chops, hardness, or swelling, and neither too high raised nor too flat, but such as the curb may rest in its right place.

**BEARDED husk**, among florists, is a husk, hairy on the edges.

**BEARDING of wool.** See *WOOL*.

**BEARER**, in architecture, a post, or brick-wall, trimmed up between the two ends of a piece of timber, to shorten its bearing, or to prevent its bearing with the whole weight at the ends only.

**BEARER of a bill of exchange**, the person in whose hands the bill is, and in favour of whom the last order was made.

When a bill is made payable to the bearer, it is understood to be payable to him in whose hands it is, after it becomes due. See *BILL*.

**BEARERS**, in heraldry. See *SUPPORTERS*.

*Cross-BEARERS.* See *CROSS*.

**BEARING**, in navigation and geography, the situation of one place from another, with regard to the points of the compass; or the angle which a line drawn through the two places, makes with the meridians of each.

**BEARING**, in the sea language. When a ship sails towards the shore, before the wind, she is said bear in with the land or harbour. To let the ship sail more before the wind, is to bear up. To put her right before the wind, is to bear round. A ship that keeps off from the land, is said to bear off. When a ship that was to windward comes under another ship's stern, and so gives her the wind, she is said to bear under her lee, &c. There is another sense of this word, in reference to the burden of a ship; for they say a ship bears, when having too slender or lean a quarter, she will sink too deep into the water with an over light freight, and thereby can carry but a small quantity of goods. See *NAVIGATION*.

**BEARING of a piece of timber**, among carpenters, the space either between the two fixed extremes thereof, when it has no other support, which they call bearing at length, or between one extreme and a post, brick-wall, &c. trimmed up between the ends to shorten its bearings.

*High BEARING cock*, one larger than the cock he fights with.

*BEARING claws*, among cock-fighters, the foremost toes of a cock. If these are hurt or gravelled, he cannot fight.

*BEARN*, a province in the south of France, bounded by Gascony on the North, and by the Pyrenean mountains, which separate it from Spain, on the south.

*BEAST* among gamesters, a game at cards, played in this manner: The best cards are the king, queen, &c. whereof they make three heaps, the king, the play, and triole.

Three, four, or five may play; and to every one is dealt five cards. However, before the play begins, every one stakes to the three heaps. He that wins most tricks, takes up the heap called the play: He that hath the king, takes up the heap so called; and he that hath three of any sort, that is, three fours, three fives, three sixes &c. takes up the triole heap.

*BEAST* in a general sense, an appellation given to all four-footed animals, fit either for food, labour, or sport.

*BEASTS of burden*, in a commercial sense, all four-footed animals which serve to carry merchandizes on their backs. The beasts generally used for this purpose, are elephants, dromedaries, camels, horses, mules, asses, and the sheep of Mexico and Peru.

*BEASTS of the chase* are five; viz. the buck, the doe, the fox, the roe, and the martin.

*BEASTS and fowls of the warren*, are the hare, the coney, and the pheasant, and partridge.

*BEASTS of the forest* are the hart, hind, hare, boar, and wolf.

*Rother-BEASTS*. See *ROTHER*.

*BEAT*, in a general signification, signifies to chastise, strike, knock, or vanquish.

This word has several other significations in the manufactures, and in the arts and trades. Sometimes it signifies to forge and hammer, in which sense smiths and farriers say, to beat iron; sometimes it means to pound, to reduce into powder: Thus we say, to beat drugs, to beat pepper, to beat spices; that is to say, to pulverise them.

*BEAT of drum*, in the military art, is to give notice by beat of drum of a sudden danger; or, that scattered soldiers may repair to their arms and quarters, is to beat an alarm, or to arms; also to signify, by different manners of sounding a drum, that the soldiers are to fall on the enemy; to retreat before, in, or after an attack; to move, or march, from one place to another; to treat upon terms, or confer with the enemy; to permit the soldiers to come out of their quarters at break of day: to order to repair to their colours, &c. is to beat a charge, a retreat, a march, &c.

*BEATIFIC VISION*. See *VISION*.

*BEATIFICATION*, among papists, an act by which the pope declares a person beatified, or blessed after death.

This is the first step towards canonization, and differs from it; because in the former, the pope does not act as a judge, determining the state of the beatified, but only gives a privilege to certain persons to honour him by a particular religious worship, without incurring the penalty of superstitious worship; whereas in

canonization, the pope speaks like a judge, and determines upon the state of the canonized.

No person can be beatified till fifty years after death. All certificates or attestations of virtues and miracles are examined before the congregation of rites: The examination continues for several years, after which his holiness decrees the beatification. The corpse and relics of the future saint are thenceforth exposed to the veneration of every body; his images are crowned with rays, and a particular office is set apart for him.

*BEATING, or PULSATION*, in medicine, the reciprocal agitation or palpitation of the heart or pulse. See *PULSE*.

*BEATING gold and silver*. See *GOLD-BEATING*, &c.

*BEATING* with hunters, a term used of a stag, which runs first one way, and then another. He is then said to beat up and down.

The noise made by conies in rutting time is also called *beating or tapping*.

*BEATS*, in a watch or clock, are the strokes made by the fangs or pallets of the spindle of the balance, or of the pads in a royal pendulum. See *WATCH-MAKING*.

*BEAUCAIRE*, a town of Languedoc, situated on the western shore of the river Rhone, about seven miles north of Arles; in 4° 40' E. long. and 43° 40' N. lat.

*BEAVER*, in zoology. See *CASTOR*.

*BEAUFORT*, a town of the duchy of Anjou in France, situated 15 miles east of Angers; in 15° E. long. and 47° 30' N. lat.

*BEAUFORT* is also a town of Savoy, about 30 miles east of Chamberry; in 6° 40' E. long. and 45° 30' N. lat.

*BEAUGENCY*, a town of Orleans, in France; situated on the river Loire, about 5 miles south-west of Orleans, in 1° 36' E. long. and 47° 48' N. lat.

*BEAUJEU*, a town of the Lyonois in France, about 25 miles north-west of Lyons; in 4° 30' E. long. and 46° 15' N. lat.

*BEAUJOLIS*, the south-east division of the Lyonois, and so called from Beaujeu.

*BEAUMARIS*, a market town of Anglesey in Wales; situated about nine miles north of Bangor, in 4° 15' W. long. and 53° 25' N. lat.

*BEAU-MASS*. See *MASS*.

*BEAUMONT*, a town of Hainalt, about 17 miles south-east of Mons; in 4° 15' E. long. and 50° 20' N. lat.

*BEAUMONT* is also a town of France, about 16 miles south of Alençon; in 5° E. long. and 48° 20' N. lat.

*BEAUNE*, a town of Burgundy in France, situated in 5° 20' E. long. and 47° 2' N. lat.

*BEAUTY*, in its native signification, is appropriated to objects of sight. Objects of the other senses may be agreeable, such as the sounds of musical instruments, the smoothness and softness of some surfaces; but the agreeableness called beauty belongs to objects of sight.

Objects of sight are more complex than those of any other sense: In the simplest, we perceive colour, figure, length, breadth, thickness. A tree is composed of a trunk, branches, and leaves; it has colour, figure, size, and sometimes motion: By means of each of these particulars, separately considered, it appears beauti-

ful; but a complex perception of the whole greatly augments the beauty of the object. The human body is a composition of numberless beauties arising from the parts and qualities of the object, various colours, various motions, figures, size, &c. all united in one complex object, and striking the eye with combined force. Hence it is, that beauty, a quality so remarkable in visible objects, lends its name to every thing that is eminently agreeable. Thus, by a figure of speech, we say, a beautiful found, a beautiful thought, a beautiful discovery, &c.

Considering attentively the beauty of visible objects, two kinds are discovered. The first may be termed intrinsic beauty, because it is discovered in a single object, without relation to any other; the other may be termed relative, being founded on the relation of objects. Intrinsic beauty is a perception of sense merely; for to perceive the beauty of a spreading oak, or of a flowing river, no more is required but singly an act of vision. Relative beauty is accompanied with an act of understanding and reflection; for we perceive not the relative beauty of a fine instrument or engine, until we learn its use and destination. In a word, intrinsic beauty is ultimate; and relative beauty is that of means relating to some good end or purpose. These different beauties agree in one capital circumstance, that both are equally perceived as belonging to the object; which will be readily admitted with respect to intrinsic beauty, but is not so obvious with respect to the other. The utility of the plough, for example, may make an object of admiration or of desire; but why should utility make it beautiful? A natural propensity of the human mind will explain this difficulty: By an easy transition of ideas, the beauty of the effect is transferred to the cause, and is perceived as one of the qualities of the cause: Thus a subject void of intrinsic beauty, appears beautiful by its utility; a dwelling-house void of all regularity, is however beautiful in the view of convenience: and the want of symmetry in a tree, will not prevent its appearing beautiful, if it be known to produce good fruit.

When these two beauties concur in any object, it appears delightful. Every member of the human body possesses both in a high degree.

The beauty of utility, being accurately proportioned to the degree of utility, requires no illustration: But intrinsic beauty being more complex, cannot be handled distinctly without being analysed. If a tree be beautiful by means of its colour, figure, motion, size, &c. it is in reality possessed of so many different beauties. The beauty of colour is too familiar to need explanation. The beauty of figure is more; for example, viewing any body as a whole, the beauty of its figure arises from regularity and simplicity; viewing the parts with relation to each other, uniformity, proportion, and order, contribute to its beauty. The beauties of grandeur and motion must be considered separately. See **GRANDEUR**, and **MOTION**.

We shall here make a few observations on simplicity, which may be of use in examining the beauty of single objects. A multitude of objects crowding into the

mind at once, disturb the attention, and pass without making any lasting impression: In the same manner, even a single object, consisting of a multiplicity of parts, equals not, in strength of impression, a more simple object comprehended in one view. This justifies simplicity in works of art, as opposed to complicated circumstances and crowded ornaments.

It would be endless to enumerate the effects that are produced by the various combinations of the principles of beauty. A few examples will be sufficient to give the reader some idea of this subject. A circle and a square are each perfectly regular; a square, however, is less beautiful than a circle; and the reason is, that the attention is divided among the sides and angles of a square; whereas the circumference of a circle, being a single object, makes one entire impression: And thus simplicity contributes to beauty. For the same reason, a square is more beautiful than a hexagon or octagon. A square is likewise more beautiful than a parallelogram, because it is more regular and uniform. But this holds with respect to intrinsic beauty only; for in many instances, as in the doors and windows of a dwelling-house, utility turns the scales on the side of the parallelogram.

Again, a parallelogram depends, for its beauty, on the proportion of its sides: A great inequality of its sides annihilates its beauty: Approximation toward equality hath the same effect; for proportion there degenerates into imperfect uniformity, and the figure appears an unsuccessful attempt toward a square. And hence proportion contributes to beauty.

An equilateral triangle yields not to a square in regularity nor in uniformity of parts, and it is more simple. But an equilateral triangle is less beautiful than a square; which must be owing to inferiority of order in the position of its parts; the order arising from the equal inclination of the sides of such an angle, is more obscure than the parallelism of the sides of a square. And hence order contributes to beauty not less than simplicity, regularity, or proportion.

Uniformity is singular in one circumstance, that it is apt to disgust by excess. A number of things destined for the same use, as windows, chairs, &c. cannot be too uniform. But a scrupulous uniformity of parts in a large garden or field, is far from being agreeable.

In all the works of nature, simplicity makes a capital figure. It also makes a figure in works of art: Profuse ornament in painting, gardening, or architecture, as well as in dress or in language, shows a mean or corrupted taste. Simplicity in behaviour and manners has an incanting effect, and never fails to gain our affection. Very different are the artificial manners of modern times. A gradual progress from simplicity to complex forms and profuse ornament, seems to be the fate of all the fine arts; resembling behaviour, which from original candor and simplicity, has degenerated into duplicity of heart and artificial refinements. At present literary productions are crowded with words, epithets, figures: In music, sentiment is neglected for the luxury of harmony, and for difficult movement.

With regard to the final cause of beauty, one thing is evident, that our relish of regularity, uniformity, proportion,

portion, order, and simplicity contributes greatly to enhance the beauty of the objects that surround us, and of course tends to our happiness. We may be confirmed in this thought, upon reflecting, that our taste for these particulars is not accidental, but uniform and universal, making a branch of our nature. At the same time, regularity, uniformity, order, and simplicity, contribute, each of them, to readiness of apprehension, and enable us to form more distinct ideas of objects than can be done where these particulars are wanting. In some instances, as in animals, proportion is evidently connected with utility, and is the more agreeable on that account.

Beauty, in many instances, promotes industry, and as it is frequently connected with utility, it proves an additional incitement to enrich our fields and improve our manufactures. These, however, are but slight effects, compared with the connections that are formed among individuals in society by means of beauty. The qualifications of the head and heart are undoubtedly the most solid and most permanent foundations of such connections: But, as external beauty lies more in view, and is more obvious to the bulk of mankind than the qualities now mentioned, the sense of beauty has a more extensive influence in forming these connections. At any rate, it concurs in an eminent degree with mental qualifications, in producing social intercourse, mutual good-will, and consequently mutual aid and support, which are the life of society. It must not however be overlooked, that the sense of beauty does not tend to advance the interests of society, but when in a due mean with respect to strength. Love, in particular, arising from a sense of beauty, loses, when excessive, its social character; the appetite for gratification, prevailing over affection for the beloved object, is ungovernable, and tends violently to its end, regardless of the misery that must follow. Love, in this state, is no longer a sweet agreeable passion; it becomes painful, like hunger or thirst, and produceth no happiness, but in the instant of fruition. This suggests an important lesson, that moderation in our desires and appetites, which fits us for doing our duty, contributes at the same time the most to happiness; even social passions, when moderate, are more pleasant than when they swell beyond proper bounds.

BEAUTY, in architecture, painting, and other arts, is the harmony and justness of the whole composition taken together.

BEAUVIN, a city of Burgundy, in France, about 15 miles north of Chalons, in  $4^{\circ} 50'$  E. long. and  $47^{\circ}$  N. lat.

BEAUVOIR, a port-town of France, about 25 miles south-west of Nants, in  $2^{\circ}$  W. long. and  $47^{\circ}$  N. lat.

BEAUVOIS, a city of the isle of France, about 43 miles north of Paris, in  $2^{\circ} 20'$  E. long. and  $4^{\circ} 30'$  N. lat.

BECAH, or BEKAH, in Hebrew antiquity, a Jewish coin, equal to  $13\frac{1}{2}$  d. of our money.

BECALM, in a general sense, signifies to appease, to allay.

BECALM, in the sea language. A ship is said to be be-

calmed, when there is not a breath of wind to fill the sails.

BECANER, the capital of the territory of Becar in India, situated on the river Ganges, in  $83^{\circ}$  E. long. and  $28^{\circ}$  N. lat.

BECCABUNGA, in botany, the trivial name of a species of veronica. See VERONICA.

BECHICS, medicines designed to relieve coughs, being the same with what we call *expectorants* and *pectorals*.

BECHLIN, a town of Bohemia, in  $15^{\circ}$  E. long. and  $40^{\circ} 14'$  N. lat.

BECKENRIEDT, a town of Switzerland in the canton of Underwald.

BECZAU, a town of Bohemia, upon the river Topel.

BED, a machine for stretching and composing the body on, for ease, or sleep, consisting generally of feathers inclosed in a ticken case. There are varieties of beds, as a standing-bed, a fettee-bed, a tent-bed, a truckle-bed, &c.

BED of justice, in the French customs, a throne upon which the king is seated when he goes to the parliament. The king never holds a bed of justice unless for affairs that concern the state, and then all the officers of parliament are clothed in scarlet robes.

BED of the carriage of a great gun, a thick plank, that lies under the piece; being, as it were, the body of the carriage.

BED, in masonry, a course, or range of stones; and the joint of the bed is the mortar between two stones, placed over each other.

BED, in gardening, square or oblong pieces of ground, in a garden, raised a little above the level of the adjoining ground, and wherein they sow seeds, or plant roots.

Hot-BED. See HOT-BED.

Lords of the BED-CHAMBER, in the British customs, ten lords who attend in their turns, each a week; during which time they lie in the king's bed-chamber, and wait on him when he dines in private.

BEDAL, a market-town of Yorkshire, eight miles south of Richmond, in  $1^{\circ} 20'$  W. long. and  $54^{\circ} 20'$  N. lat.

BEDLE. See BEADLE.

BEDEREPE, a customary service, by which tenants were anciently bound to reap their landlord's corn in harvest-time.

BEDFORD, the county-town of Bedfordshire, situated on the river Ouse, about 22 miles south-west of Cambridge, in  $20'$  W. long. and  $52^{\circ} 10'$  N. lat.

BED-MOULDING, in architecture, a term used for those members of a cornice, which are placed below the coronet; and now usually consists of an ogee, a list, a large boutine, and another list under the coronet.

BEDOUINS, in the Arabian customs, tribes of Arabs, who live in tents, and are dispersed all over Arabia, Egypt, and the north of Africa.

BEDWIN, a borough-town of Wiltshire, about 18 miles north-west of Salisbury, in  $1^{\circ} 40'$  W. long. and  $51^{\circ} 25'$  N. lat.

BEE,

BEE, in zoology. See APIS.

BEE-EATER, in zoology. See MEROPS.

BEECH, in botany. See FAGUS.

BEECH-GALLS, hard protuberances found on the leaves of the beech, wherein are lodged the maggots of a certain fly.

BEECH-MAST, the fruit of the beech-tree, said to be good for fattening hogs, deer, &c.

BEECH-OIL, an oil drawn by expression from the mast of the beech-tree, after it has been shelled and pounded. This oil is very common in Picardy, and used there, and in other parts of France, instead of butter; but most of those who take a great deal of it, complain of pains and a heaviness in the stomach.

BEELE, a kind of pick-ax, used by the miners for separating the ores from the rocks in which they lie: This instrument is called a *tubber* by the miners of Cornwall.

BEEER, a common and well-known liquor, made with malt and hops. See BREWING, &c.

BEER, among weavers, a term that signifies nineteen ends of yarn, running all together the whole length of the cloth.

BEER MEASURE. See MEASURE.

BEESTING, a term used by country-people for the first milk taken from a cow after calving.

BEEET, in botany. See BETA.

BEEETLE, in the history of insects. See SCARABÆUS.

BEEETLE also denotes a wooden instrument for driving piles, &c. It is likewise called a *flamper*, and by sailors a *rammer*.

BEFORT, a town of Alsace, subject to France, and situated about 15 miles north of Basil, in 7° E. long. and 47° 35' N. lat.

BEG, or BEY, in the Turkish affairs. See BEY.

BEGGAR, one who begs alms.

BEGHARDI, a certain sect of heretics, which arose in Germany, and in the low Countries, about the end of the 13th century. They made profession of the monastical life, without observing celibacy; and maintained, that man could become as perfect in this life, as he shall be in heaven; that every intellectual nature is of itself happy, without the succour of grace; and that he who is in this state of perfection ought to perform no good works, nor worship the host.

BEGLERBEG, a governor of one of the principal governments in the Turkish empire. There are two sorts of beglerbegs: The one have a certain revenue assigned upon the cities, boroughs, and villages of their government, which they raise by power of the commission granted to them by the sultan; the others have a certain rent paid by the treasurer of the grand signior. They are become almost independent; and have under their jurisdiction several fangiacs or particular governments, and begs, agas, and other officers who obey them.

BEGONIA, in botany, a genus of the polygamia monœcia class. The hermaphrodite flower has no calix; the corolla has 5 petals; it has many stamina, and 3 styli, the male has likewise no calix; the corolla has

4 petals; and has a great number of stamina. There is but one species of begonia, viz. the obliqua, a native of India.

BEGUARDI, or BEGHARDI. See BEGHARDI.

BEGUINS, congregations of devout young women, who maintain themselves by the work of their hands, leading a middle kind of life between the secular and religious. These societies consist of several houses placed together in one inclosure, with one or more churches, according to the number of beguins.

There is in every house a prioress, without whose leave they cannot stir out. Their vow is conceived in these terms: *I promise to be obedient and chaste, as long as I continue in this beguinnage*. They observe a three years novitiate before they take the habit, and the rector of the parish is their superior, but can do nothing without the advice of eight beguins.

They are established in several parts of Flanders.

BEHEADING, a capital punishment, inflicted by cutting off the head with an ax, sword, &c.

Among the Romans, beheading was a military punishment, performed at first with an ax, but afterwards with a sword, as done at present in Holland and France. In England the ax is preferred; and in Scotland they use, for this purpose, a machine called a *maiden*.

BEHEN, in botany. See CUCUBALUS.

BEJA, a city of Alentejo, in Portugal, in 8° 40' W. long. and 37° 55' N. lat.

BEICHLINGEN, a city of Thuringia, in the circle of Upper Saxony in Germany, in 11° 25' E. long. and 51° 20' N. lat.

BEILA, a town of Piedmont in Italy, about thirty-two miles north of Turin; E. long. 7° 45', and N. lat. 45°.

BEILSTEIN, a town of the landgraviate of Hesse in Germany, situated about 32 miles north of Mentz, in 8° E. long. and 50° 30' N. lat.

BEIZA, or BEIZATH, in Hebrew antiquity, a word signifying an egg, was a certain measure in use among the Jews. The beiza was likewise a gold coin, weighing forty drachms, among the Persians, who gave out, that Philip of Macedon owed their king Darius a thousand beizaths or golden eggs, for tribute-money; and that Alexander the Great refused to pay them, saying, that the bird which laid these eggs was flown into the other world.

BELAC, a small city of la Marche, in the Lyonnais; E. long. 1° 15', and N. lat. 46° 15'.

BELAY, in the sea-language, is to make fast the ropes in their proper places.

BELCASTRO, a city of Calabria, in the kingdom of Naples; E. long. 17° 15', and N. lat. 39° 15'.

BELCOE, a town of Ireland, situated on Loch-ninny, in the county of Fermanagh, and province of Ulster; W. long. 8° 6', and N. lat. 54° 5'.

BELEM, a fortrefs on the north side of the river Tagus, about three miles west of Lisbon.

BELEMNITES, in natural history, a substance concerning the nature of which there has been much dispute. Some maintain it to be a petrified animal; others

- will have it to be a fossil, &c. Linnæus refers the belemnites to the class of shells with several cells. The shape of the belemnites is sometimes conical, sometimes cylindrical; and they commonly consist of a black horny kind of substance. Their length is from two to eight inches; and their diameter from the sixth part of an inch to two or three inches. The inward part consists of rays; and there is generally a cell at the large end, and a furrow running from top to bottom. Dr Plott says, that when scraped or burnt, they smell like horn. They are generally hollow about an inch deep, and filled with gravel. Their colour is various; some are ash-coloured, others bluish. They are commonly found in gravel-pits. See Plate LI. fig. 21.
- BELZHERO**, the capital of a province of the same name, in Russia, situated on the south-east shore of the white lake; E. long. 36°, and N. lat. 60° 50'.
- BELFAST**, a port-town of Ireland, in the county of Antrim, and province of Ulster; W. long. 6° 15', N. lat. 54° 38'.
- BELFRY**, that part of a steeple where bells are hung, or the timber frame whereby they are supported.
- BELGARDEN**, a town of Eastern Pomerania, in Germany, subject to Prussia; E. long. 16° 5', and N. lat. 54°.
- BELGOROD**, the capital of a province of the same name, in Russia, situated almost in the middle of that empire; E. long. 37°, and N. lat. 51° 20'.
- BELGOROD** is also a fortified town of Bessarabia, in Turkey, situated on the Black-sea, at the mouth of the river Neister; E. long. 31°, and N. lat. 46° 30'.
- BELGRADE**, the capital of the province of Servia, in European Turkey, situated on the south side of the Danube, in E. long. 21° 20', and N. lat. 45°. It was yielded to the Turks in 1739.
- BELI oculus**, in natural history. See **OCULUS**.
- BELIEF**, the assent of the mind to the truth of any proposition. See **METAPHYSICS**.
- BELL**, a well known machine, ranked by musicians among the musical instruments of percussion.
- The metal of which a bell is made, is a composition of tin and copper, or pewter and copper; the proportion of one to the other is almost twenty pounds of pewter, or twenty-three pounds of tin, to one hundred weight of copper.
- Bell-metal is prohibited to be imported, as are hawk-bells, &c.
- The constituent parts of a bell are the body or barrel, the clapper on the inside, and the ear or cannon on which it hangs to a large beam of wood.
- Diving-BELL**. See **PNEUMATICS**.
- BELL-foundry**. See **FOUNDRIE**.
- BELL-flower**, in botany. See **CAMPANULA**.
- BELL-weed**, in botany. See **JACEA**.
- BELLADONA**, in botany, the trivial name of a species of atropa. See **ATROPA**.
- BELLCLAIRE**, a town of Ireland, in the county of Sligo, and province of Connaught, about twenty-three miles south-west of Sligo; W. long. 9° 5', and N. lat. 53° 55'.
- BELLE**. A town in French Flanders, about twelve miles north-east of Lille; E. long. 2° 40', N. lat. 50° 45'.
- BELLENTS**, a city of Switzerland, in 9° E. long. and 46° N. lat.
- BELLESME**, a town of the Orleanois in France; E. long. 40', N. lat. 48° 30'.
- BELLEY**, a town of Burgundy in France, situated on the frontiers of Savoy, about sixteen miles north-west of Chambery; E. long. 5° 20', N. lat. 45° 40'.
- BELLEVILLE**, a town of the Lyonois, in France, about nineteen miles north of Lyons; E. long. 4° 45', N. lat. 46° 8'.
- BELLIDIASTRUM**, in botany, a synonyme of a species of doricum. See **DORONICUM**.
- BELLIDIOIDES**, in botany, a synonyme of a species of chrysanthemum. See **CHRYSANTHEMUM**.
- BELLING** of hops denotes their opening and expanding themselves. See **HOPS**.
- BELLIS**, or **DAISY**, in botany, a genus of the syngenesia polygamia superflua class. The receptacle of the bellis is naked and conical; it has no pappus; the calix is hemispherical, with squamæ of an equal size; and the seeds are oval. There are two species; viz. the hortenensis, a native of several parts of Europe; and the perennis, or common daisy, a native of Britain. The leaves of the perennis have a subacid taste, and are recommended as vulneraries, and in asthma and hectic fevers.
- BELLEISLE**, an island on the coast of Britany, in France; in 3° W. long. and 47° 20' N. lat.
- BELLISLE** is also an island of America, on the coast of New Britain.
- It gives name to the straits which separate Newfoundland from New Britain; in 58° W. long. and 52° N. lat.
- BELLON**, a distemper common in countries where they smelt lead-ore. It is attended with languor, intolerable pains and sensation of gripings in the belly, and generally costiveness.
- Bells, poultry, &c. as well as men, are subject to this disorder: Hence a certain space round the smelting houses is called bellon-ground, because it is dangerous for an animal to feed upon it.
- BELLONARI**, in Roman antiquity, the priests of Bellona, who, in honour of that goddess, used to make incisions in their body; and, after having gathered the blood in the palm of their hand, give it to those who were partakers of their mysteries.
- BELLONIA**, in botany, a genus of the pentandria monogynia class. The corolla is rotated; the capsule consists of one cell inclosing many seeds. There is but one species, viz. the aspera, a native of America.
- BELLOWING**, among sportsmen, denotes the noise of roes in rutting-time.
- BELLOWS**, a machine so contrived as to expire and inspire the air by turns, by enlarging and contracting its capacity.
- This machine is used in chambers and kitchens, in forges, furnaces, and founderies, to blow up the fire: It serves also for organs and other pneumatic instruments.

ments, to give them a proper degree of air: All these are of various constructions, according to their different purposes; but in general they are composed of two flat boards, sometimes of an oval, sometimes of a triangular figure: Two or more hoops, bent according to the figure of the boards, are placed between them; a piece of leather, broad in the middle, and narrow at both ends, is nailed on the edges of the boards, which it thus unites together; as also on the hoops which separate the boards, that the leather may be easier open and fold again; a tube of iron, brass, or copper is fastened to the undermost board, and there is a valve within that covers the holes in the under-board to keep in the air.

Each pair of bellows imported is valued in the book of rates at three shillings and four pence, and pays duty  $7\frac{7}{10}\%$  *d.* whereof  $6\frac{7}{10}\%$  *d.* is drawn back on exportation. See PNEUMATICS.

**BELLUNA**, the capital of the Bellunese, in the dominions of Venice, about 40 miles north of Padua; in  $12^{\circ} 40'$  E. long. and  $46^{\circ} 20'$  N. lat.

**BELLY**, in anatomy, the fame with what is more usually called abdomen. See p. 256.

**BELOAR**, a stone, otherwise called widuris. See WIDURIS.

**BELOMANCY**, a sort of divination by means of arrows, practised in the east, and particularly in Arabia.

Belomancy has been performed different ways, whereof one was this: Suppose a parcel of arrows, eleven or more of them being put into a bag; these were afterwards drawn out, and according as they were marked or not, they judged of future events.

**BELONE**, in ichthyology, the trivial name of a species of efox. See ESOX.

**BELT**, in the military art, a leathern girdle for sustaining the arms, &c. of a soldier.

**BELTS**, in astronomy, two zones, or girdles, surrounding the body of the planet of Jupiter, more lucid than the rest, and of unequal breadth.

**BELTS**, in geography, certain freights between the German ocean and the Baltic. The belts belong to the king of Denmark, who exacts a toll from all ships which pass through them, excepting those of Sweden, which are exempted.

**BELTURBET**, a town of Ireland, in the county of Cavan in the province of Ulster, situated upon the river Earn, about eight miles north of Cavan; in  $7^{\circ} 35'$  W. long. and  $54^{\circ} 7'$  N. lat.

**BELTZ**, the capital of a palatinate of the same name, in the province of Red Russia, in Poland; in  $24^{\circ}$  E. long. and  $50^{\circ} 5'$  N. lat.

**BELVIDERE**, in the Italian architecture, &c. denotes either a pavilion on the top of a building, or an artificial eminence in a garden; the word literally signifying a *fine prospect*.

**BELVIDERE**, in geography, the capital of a province of the same name, on the western coast of the Morea, in  $22^{\circ}$  E. long. and  $37^{\circ}$  N. lat.

**BEMA**, in ecclesiastical antiquity, denoted the most sacred part of a church, or that where the altar stood.

It was also used for the bishop's throne, as well as for the ambo. See AMBO.

**BEMBER**, a chain of mountains, dividing India from Tartary.

**BEMSTER**, a market-town of Dorsetshire, about twelve miles north-west of Dorchester, situated in  $2^{\circ} 50'$  W. long. and  $50^{\circ} 45'$  N. lat.

**BEN**. See BEHEN.

**BEN of Judea**, a name sometimes used for benzoin. See BENZOIN.

**BENAVARRE**, or **BENHUARRI**, a town of Aragon in Spain, situated in  $10'$  E. long. and  $42^{\circ} 5'$  N. lat.

**BENBECULA**, one of the western isles of Scotland.

**BENCALIS**, or **BANCALIS**. See BANGALIS.

**BENCH**, or **BANC**, in law. See BANC.

*Free BENCH* signifies that estate in copyhold-lands, which the wife, being espoused a virgin, has, after the decease of her husband, for her dower, according to the custom of the manor. As to this free-bench, several manors have several customs; and in the manors of East and West Enbourne, in the county of Berks, and other parts of England, there is a custom, that when a copyhold tenant dies, the widow shall have her free-bench in all the deceased husband's lands, whilst she lives single and chaste: but if she commits incontinency, she shall forfeit her estate: Nevertheless, upon her coming into the court of the manor, riding on a black ram, and having his tail in her hand, and at the same time repeating a form of words prescribed, the steward is obliged, by the custom of the manor, to readmit her to her free-bench.

*Widow's BENCH*. See WIDOW.

*Amiable BENCH*. See AMIABLE.

**BENCHERS**, in the Inns of court, the senior members of the society, who are invested with the government thereof.

**BENCOOLEN**, a town and fort on the south-west coast of Sumatra, belonging to the E. India company, from whence great quantities of pepper are imported. It is situated in  $101^{\circ}$  E. long. and  $4^{\circ}$  S. lat.

**BEND**, in heraldry, one of the nine honourable ordinaries, containing a third part of the field when charged, and a fifth when plain. It is sometimes, like other ordinaries, indented, ingrailed, &c. and is either dexter or sinister.

**BEND dexter** is formed by two lines drawn from the upper part of the shield on the right, to the lower part of the left, diagonally. It is supposed to represent a shoulder-belt, or a scarf, when worn over the shoulder. See Plate LI. fig. 11.

**BEND sinister** is that which comes from the left side of the shield to the right: This the French heralds call a *barre*.

*In BEND*, is when any things, borne in arms, are placed obliquely from the upper corner to the opposite lower, as the bend lies.

*Parti per BEND*, *Point in BEND*, &c. See PARTI and POINT.

**BENDER**, a town of Bessarabia, in European Turkey, situated on the river Neister, in  $29^{\circ}$  E. long. and  $46^{\circ} 40'$  N. lat.

**BENDERICK**, a sea-port town, situated on the Persian gulf.

**BENDIDIA**, a festival, not unlike the Bacchanalia, celebrated by the Athenians in honour of Diana.

**BENDING**, in a general sense, the reducing a straight body into a curve, or giving it a crooked form.

The bending of timber-boards, &c. is effected by means of heat, whereby their fibres are so relaxed that you may bend them into any figure.

**BENDING**, in the sea-language, the tying two ropes or cables together: Thus they say, *bend the cable*, that is, make it fast to the ring of the anchor; *bend the sail*, make it fast to the yard.

**BENDITTO**, a town of the Mantuan in Italy, situated near the south shore of the river Po, about twelve miles south-east of Mantua, in 11° 20' E. long. and 45° N lat.

**BENDELET**, in heraldry, the same with cottice. See **COTTICE**.

**BENDS**, in a ship, the same with what is called wails, or wales; the outmost timbers of a ship's side, on which men set their feet in climbing up. They are reckoned from the water, and are called the first, second, or third bend. They are the chief strength of a ship's sides, and have the beams, knees, and foot-hooks bolted to them.

**BENDY**, in heraldry, is the field divided into four, six, or more parts, diagonally, and varying in metal and colour.

The general custom of England is to make an even number, but in other countries they regard it not, whether even or odd. See Plate LI. fig. 12.

**Counter BENDY** is used by the French, to express what we ordinarily call bendy of six per bend sinister, counter-changed.

**Barry Bendy**. See **BARRY**.

**Paly Bendy**. See **PALY**.

**BENE**, or **DE BENE ESSE**. See **DE BENE ESSE**.

**BENCAPED**, among sailors. A ship is said to be bencaped when the water does not flow high enough to bring her off the ground, out of the dock, or over the bar.

**BENEDICITE**, among ecclesiastical writers, an appellation given to the song of the three children in the fiery furnace, on account of its beginning with the word *benedicite*.

**BENEDICTINS**, in church-history, an order of monks, who profess to follow the rules of St. Benedict.

The benedictins, being those only that are properly called monks, wear a loose black gown, with large wide sleeves, and a capuche, or cowl, on their heads, ending in a point behind. In the canon law, they are styled black friars, from the colour of their habit.

The rules of St. Benedict, as observed by the English monks before the dissolution of the monasteries, were as follows: They were obliged to perform their devotions seven times in twenty four hours, the whole circle of which devotions had a respect to the passion and death of Christ: They were obliged always to go two and two together: Every day in lent they were obliged to fast till six in the evening, and abated of

their usual time of sleeping and eating; but they were not allowed to practise any voluntary austerity without leave of their superior: They never conversed in their refectory at meals, but were obliged to attend to the reading of the scriptures: They all slept in the same dormitory, but not two in a bed; they lay in their cloaths: For small faults they were shut out from meals; for greater, they were debarred religious commerce, and excluded from the chapel; and as incorrigible offenders, they were excluded from the monasteries. Every monk had two coats, two cowls, a table-book, a knife, a needle, and a handkerchief; and the furniture of their bed was a mat, a blanket, a rug, and a pillow.

**BENEDICTION**, or **BLESSING**. The Hebrews, under this name, understand the present usually sent from one friend to another, as also the blessing conferred by the patriarchs, on their death-beds, upon their children.

The privilege of benediction was one of those early instances of honour and respect paid to bishops in the primitive church. The custom of bowing the head to them, and receiving their blessings, was become universal. In the western churches there was anciently a kind of benediction which followed the Lord's prayer; and after the communion, the people were dismissed with a benediction.

**BENEDICTUS**, among physicians, an epithet given to several medicines, on account of their lenitive qualities; thus we meet with *aqua benedicta*, *benedictum laxativum*, *vinum benedictum*, &c.

**BENEDITTO SACCO**. See **SACCO**.

**BENEFICE**, in an ecclesiastical sense, a church endowed with a revenue for the performance of divine service; or the revenue itself assigned to an ecclesiastical person, by way of stipend, for the service he is to do that church.

All church-preferments, except bishoprics, are called benefices; and all benefices are, by the canonists, sometimes styled dignities: But we now ordinarily distinguish between benefice and dignity, applying dignity to bishoprics, deanries, archdeaconries, and prebendaries; and benefice to parsonages, vicarages, and donatives.

Benefices are divided by the canonists into simple and sacerdotal: In the first there is no obligation but to read prayers, sing, &c. such are canonries, chaplainships, chantries, &c.: The second are charged with the cure of souls, or the direction and guidance of consciences; such are vicarages, rectories, &c.

The Romanists again distinguish benefices into regular and secular.

Regular or titular benefices are those held by a religious, or a regular, who has made profession of some religious order; such are abbeys, priories, convents, &c.; or rather, a regular benefice is that which cannot be conferred on any but a religious, either by its foundation, by the institution of some superior, or by prescription: For prescription, forty years possession by a religious makes the benefice regular.

Secular benefices are only such as are to be given to secular priests, *i. e.* to such as live in the world, and are

are not engaged in any monastic order. All benefices are reputed secular, till the contrary is made to appear. They are called secular benefices, because held by seculars; of which kind are almost all cures.

**BENEFIT of Clergy.** See **CLERGY**.

**BENESCHAW**, the name of two towns; the one in the kingdom of Bohemia, and the other in Silesia.

**BENEVENTE**, a town of Leon, in Spain, situated on the river Esla, about 40 miles south of the city of Leon, in 6° W. long. and 42° 10' N. lat.

**BENEVENTO**, the capital of the Farther Principate, in the kingdom of Naples, about 34 miles north-east of the city of Naples; situated in 15° 30' E. long. and 41° 15' N. lat.

**BENEVOLENCE**, in morals, signifies the love of mankind in general, accompanied with a desire to promote their happiness. See **MORALS**.

**BENEVOLENTIA regis habenda** is the ancient form of purchasing the king's pardon and favour, on submission, in order to be restored to place, title, or estate.

**BENFIELD**, a town of Alsace, in Germany, about 15 miles south of Strasburg; situated in 7° 30' E. long. and 48° 25' N. lat.

**BENGA**, one of the Molucca islands. See **MOLUCCA**.

**BENGAL**, the most easterly province of the Mogul's empire, lying at the bottom of a large bay, which takes its name from this province.

It is one of the most fertile provinces in India, being yearly overflowed by the Ganges, as Egypt is by the Nile.

**BENGUELA**, a kingdom upon the western coast of Africa between Angola and Jaga. It is also the name of the capital of that kingdom.

**BENJAMIN**, the same with benzoin. See **BENZOIN**.

**BENJAR**, the most considerable river of the island Borneo, which, arising near the middle of that island, runs southwards, and falls into the great South Sea.

**BENIN**, the capital of a country of the same name, on the coast of Guinea; situated in 5° E. long. and 7° 30' N. lat.

**BENSHEIM**, a town of Germany, situated on the east-side of the river Rhine, about 10 miles east of Worms, in 8° 30' E. long. and 49° 40' N. lat.

**BENTHEIM**, the capital of a county of the same name, in the circle of Westphalia; situated in 7° 15' E. long. and 52° 25' N. lat.

**BENTIVOGLIO**, a town in the territory of Bologna, in Italy, about 10 miles north of that city, situated in 12° E. long. and 44° 30' N. lat.

**BENZOIN**, in materia medica, a concrete resinous juice, obtained from a large tree growing naturally in both the Indies. The resin is brought from the East Indies in large masses, composed of white and light-brown pieces, with yellowish specks: It easily breaks betwixt the hands. That which is whitest is most esteemed. It has very little taste; but its smell is very fragrant and agreeable, especially when heated. The principal use of benzoin is in perfumes, and as a cosmetic; and enters in substance only into one official composition, the balsamum tranauaticum. But its flowers, which is a white saline concrete obtained by committing it to

the fire in proper vessels, are recommended in disorders of the breast; and in this intention they are made an ingredient in the paregoric elixir, pectoral elixir, and pills, and in the troches of sulphur.

**BERAMS**, a coarse cloth, all made with cotton-thread, which comes from the East Indies, and particularly from Surat.

**BERAR**, an inland province of India, on this side the Ganges, lying westward of Orixa.

**BERAUN**, a town of Bohemia, situated in 14° E. long. and 50° 2' N. lat.

**BERAY**, a town of Normandy, in France, situated in 1° 20' W. long. and 49° 6' N. lat.

**BERBERII**, the **PALSY**, in medicine. See **PALSY**.

**BERBERIS**, in botany, a genus of the hexandria monogynia class. The calix consists of six leaves or pieces; the petals are six, with two glands at the unguis; it has no stylos; and the berry contains two seeds. There are two species, viz. the vulgaris, or barberry or piperidge-bush, a native of Britain; and the cretica, a native of Candia. The inner bark, which is bitter, is said to be of use in the jaundice. The berries, which are gratefully acid, have been given with success in bilious fluxes, and diseases proceeding from heat, acrimony, or thinness of the juices.

**BERCHEROIT**, or **BERKOITS**, a weight used at Archangel, and in all the Russian dominions, to weigh such merchandizes as are heavy and bulky: It weighs about 364 pounds English avoirdupois weight.

**BERENGARIANS**, a religious sect of the XIth century, which adhered to the opinion of Berengarius, who, even in those days, strenuously asserted, that the bread and wine in the Lord's supper is not really and essentially, but only figuratively, changed into the body and blood of Christ.

**BERENICE**, a port-town of Egypt, now called Suez.

**BERENICE'S HAIR**, *coma Berenices*. See **COMA**.

**BERE-REGIS**, a market-town in Dorsetshire, about 10 miles north-east of Dorchester, in 2° 20' W. long. and 50° 40' N. lat.

**BERESOWA**, a town of Muscovy, in Samogitia, situated upon the river Oby.

**BERG**, a dutchy of Westphalia, in Germany, lying on the eastern shore of the river Rhine, which separates it from Cologne.

**BERG of St. Winox.** See **WINOXBERG**.

**BERGAMO**, a town in the territories of Venice, in Italy, about 25 miles north-east of Milan, in 10° E. long. and 45° 40' N. lat.

**BERGAMOT**, the name of a fragrant essence extracted from a fruit which is produced by ingrafting a branch of a lemon-tree upon the stock of a bergamot-pear. It is also the denomination of a coarse taffery, manufactured with flocks of silk, wool, cotton, hemp, ox, cow, or goats hair, and supposed to be invented by the people of Bergamo.

**BERGAS**, a town of European Turkey, in Romania, in 28° E. long. and 41° 17' N. lat.

**BERGEN**, the capital of a province of the same name, in Norway: It is a considerable port-town on the German ocean, in 6° E. long. and 60° N. lat.

**BERGEN** is also the name of the capital of the isle of Rugen, on the coast of Pomerania, in  $14^{\circ}$  E. long. and  $54^{\circ} 15'$  N. lat.

**BERGEN-OP-ZOOM**, a fortified town of Dutch Brabant, about 20 miles north of Antwerp, in  $4^{\circ} 5'$  E. long. and  $51^{\circ} 30'$  N. lat.

**BERGERACK**, a city of Guienne in France, situated on the river Dordonne, about 40 miles east of Bourdeaux, in  $20^{\circ}$  E. long. and  $44^{\circ} 55'$  N. lat.

**BERG-GRUEN**, a kind of green ochre, used in painting.

**BERGHMOT**, an assembly, or court, held upon a hill in Derbyshire, for deciding controversies among the miners.

**BERGZABERN**, a town of Lower Alface, about five miles south of Landau, in  $8^{\circ}$  E. long. and  $49^{\circ} 5'$  N. lat. It is subject to France.

**BERKSHIRE**, a county in England, lying on the south side of the river Thames, opposite to Oxfordshire and Buckinghamshire. It gives the title of earl to a branch of the Howard family.

**BERLIN**, the capital of the king of Prussia's dominions in Germany, situated on the river Spree, in the marquisate of Brandenburg; in  $14^{\circ}$  E. long. and  $52^{\circ} 30'$  N. lat.

**BERLIN** is also the name of a kind of chariot, so called from the city of Berlin.

**BERME**, in fortification, a space of ground left at the foot of the rampart, on the side next the country, designed to receive the ruins of the rampart, and prevent their filling up the fosse. It is sometimes palisaded, for the more security; and in Holland it is generally planted with a quick-set hedge. It is also called *li-ziere*, *relais*, *foreland*, *retraite*, *pais de fouris*, &c.

**BERMUDA-ISLANDS**, a cluster of very small islands, in the Atlantic ocean, lying almost in the shape of a shepherd's hook, in  $65^{\circ}$  W. long. and  $32^{\circ} 30'$  N. lat.

**BERMUDIANA**, in botany, a synonyme of the *ixia*. See *IXIA*.

**BERN**, a town of Bohemia, about 15 miles west of Prague, in  $14^{\circ}$  E. long. and  $50^{\circ}$  N. lat.

**BERN** is also the name of a city and canton in Switzerland; the former being situated in  $7^{\circ} 20'$  E. long. and  $47^{\circ}$  N. lat.

The Canton of Bern is by far the most extensive and powerful of all Switzerland: Their government is aristocratical and their religion protestant, according to the Presbyterian form.

**BERNARDIA**, in botany, a synonyme of the *adelia*. See *ADELIA*.

**BERNARDINES**, an order of monks, founded by Robert abbot of Moleme, and reformed by St. Bernard. They wear a white robe with a black scapulary; and when they officiate they are clothed with a large gown which is all white, and hath great sleeves, with a hood of the same colour.

**BERNAW**, the name of three towns in Germany, one in the electorate of Brandenburg, another in the bishopric of Ratibon, and the third in the Upper Palatinate.

**BERNBURG**, a town of Anhalt, in the circle of Upper Saxony, situated in  $12^{\circ} 20'$  E. long. and  $51^{\circ} 50'$  N. lat.

**BERNERA**, one of the western isles of Scotland, lying in lat.  $56^{\circ} 48'$ .

**BERNICOLA**, in ornithology, the trivial name of a species of anas. See *ANAS*.

**BERNICLE**, in zoology. See *LEPAS*.

**BERRY**. See *BACCA*.

**BERRY**, in geography, a territory of the Orleanois, having Tourain on the west, and the Nivernois on the east.

**BERRY-POINT**, a cape at the entrance of Torbay in Devonshire.

**BERSELLO**, or *BRESELLO*, a town of the Modenese, in Italy, situated on the river Po, about 14 miles north-east of Parma; in  $11^{\circ}$  E. long. and  $44^{\circ} 40'$  N. lat.

**BERTH**, or *BIRTH*, among sailors. See *BIRTH*.

**BERTRAND**, or *ST. BERTRAND*, a city of Gascony, in France, situated on the river Garonne, about 45 miles south of Tolouse, in  $30^{\circ}$  E. long. and  $43^{\circ} 15'$  N. lat.

**BERVY**, a sea-port town and borough of Scotland, situated on the German ocean, about 22 miles south-west of Aberdeen, in  $2^{\circ} 5'$  W. long. and  $56^{\circ} 50'$  N. lat.

**BERWICK**, a borough-town on the borders of England and Scotland, situated on the north side of the river Tweed, in  $1^{\circ} 40'$  W. long. and  $55^{\circ} 30'$  N. lat. It sends two members to parliament.

**North-BERWICK**, a town of Scotland, situated at the entrance of the frith of Forth, about 17 miles east of Edinburgh, in  $2^{\circ} 27'$  W. long. and  $56^{\circ} 5'$  N. lat.

**BERYL**, in natural history, called by our lapidaries *aqua marina*, is a pellucid gem of a bluish green colour, found in the East Indies and about the gold mines of Peru: We have also some from Silesia, but what are brought from thence are oftener coloured crystals than real beryls; and when they are genuine, they are greatly inferior both in hardness and lustre to the oriental and Peruvian kinds.

The beryl, like most other gems, is met with both in the pebble and columnar form, but in the latter most frequently. In the pebble form it usually appears of a roundish but flattened figure, and commonly full of small flat faces, irregularly disposed. In the columnar or crystalline form it always consists of hexangular columns, terminated by hexangular pyramids. It never receives any admixture of colour into it, nor loses the blue and green, but has its genuine tinge in the degrees from a very deep and dully to the palest imaginable of the hue of sea-water.

The beryl, in its perfect state, approaches to the hardness of the granet, but it is often softer; and its size is from that of a small tare to that of a pea, a horse-bean, or even a walnut. It may be counterfeited by reducing burnt copper to an impalpable powder, and melting it with crystalline glass or calcined crystal, in the proportion of one dram to a pound of glass.

**BERYL-crystal**, in natural history, a species of what Dr. Hill calls *ellipsonacrofylla*, or imperfect crystals, is of an extreme pure, clear, and equal texture, and scarce ever subject to the slightest films or blemishes. It is ever constant to the peculiarity of its figure, which is that of a long and slender column, remarkably tapering.

- ing towards the top, and very irregularly hexangular. It is of a very fine transparency, and naturally of a pale brown; and carries no evident marks of distinction from all brown crystals, that our lapidaries call it, by way of eminence, the *beryl-cryſtal*, or ſimply the *beryl*.
- BES**, or **BESSIS**, in Roman antiquity, two thirds of the as. See **As**.
- BES** alſo denotes two thirds of the jugerum. See **JUGERUM**.
- BESALLE**, ſignifies the father of a grand-father.
- BESAILE**, in law, a writ that lies where the great-grand-father was ſeized in fee of any lands, &c. at the time of his death; and after his deceaſe, a ſtranger enters thereon, the ſame day, and keeps out the heir.
- BESANCON**, the capital of Franche Comte in France, ſituated in 6° E. long. and 47° 20' N. lat.
- BESANT**, or **BEZANT**, a coin of pure gold, of an uncertain value, ſtruck at Byzantium, in the time of the Chriſtian emperors; from hence the gold offered by the king at the altar, is called *beſant* or *biſant*.
- BESANTS**, in heraldry, round pieces of gold, without any ſtamp, frequently borne in coats of arms. See **Plate LI.** fig. 14.
- BESIERS**, a city of lower Languedoc in France, about two miles north of the Mediterranean, and fifteen north-eaſt of Narbonne, in 3° E. long. and 43° 25' N. lat.
- BESLERIA**, in botany, a genus of the didymia angioſpermia claſs. The calix is divided into five parts; and the berry globular, and contains many feeds. The ſpecies are three, *viz.* the *melitifolia*, the *lutea*, and the *criftata*, all natives of America.
- BESORCH**, a coin of tin, or ſome alloyed metal, current at Ormuſ, at the rate of  $\frac{3}{7}$  parts of a farthing ſterling.
- BESSARABIA**, a province of Turkey in Europe, lying about the ſeveral mouths of the Danube.
- BESSIS**. See **BES**.
- BESSY**, one of the Molucca iſlands, ſituated in the Indian ocean, in 1° 50' S. lat.
- BESTAIL**, or **BESTIAL**, in ancient ſtatutes, all kinds of beaſts, or cattle, eſpecially thoſe purveyed for the king's proviſion.
- BESTIARII**, in Roman antiquity, ſuch as fought againſt beaſts, or thoſe who were expoſed to them by ſentence of the law. There were four kinds of beſtarii; the firſt were thoſe who made a trade of it, and fought for money; the ſecond were ſuch young men as, to ſhew their ſtrength and dexterity in managing their arms, fought againſt beaſts; the third kind was, where ſeveral beſtarii were let looſe at once, well armed, againſt a number of beaſts; and the fourth kind were thoſe condemned to the beaſts, conſiſting either of enemies taken priſoners in war, or as being ſlaves, and guilty of ſome enormous crime; thoſe were all expoſed naked, and without defence.
- BESTRICIA**, a city of Tranſylvania, remarkable for the gold mines near it; it is ſituated in 22° E. long. and 48° N. lat.
- BETA**, the beet, in botany, a genus of the pentandria digynia claſs. The calix has four leaves; it has no corolla; the feeds are ſhaped like kidneys, and are ſituated within the baſe of the calix. There are two ſpecies, *viz.* the *maritima* or ſea-beet, a native of Britain; and the *vulgaris* or green beet of Bauhinus, which is chiefly cultivated for culinary uſe. Decoctions of the *vulgaris* looſen the belly; and hence have been ranked among the emollient herbs. The juice expreſſed from the roots is a powerful errhine.
- BETANCOS**, a city of Galicia in Spain, in 8° 50' W. long. and 43° 15' N. lat.
- BETAW**. See **BETUE**.
- BETEL**, or **BETLE**, in botany, the trivial name of a ſpecies of piper. See **PIPER**.
- BETELFAGUI**, a town of Arabia Felix, about thirty-five leagues from Mocha.
- BETHLEHEM**, once a flouriſhing city of Paleſtine, but now only a poor village, is ſtill much frequented, as being the place of our Saviour's birth; it is ſituated in 36° E. long. and 31° 30' N. lat.
- BETHLEHEM** is alſo the name of a town of Brabant, in the Auſtrian Netherlands, about two miles north of Louvain, ſituated in 4° 35' E. long. and 51° N. lat.
- BETHLEHEMITES**, in church-hiſtory, a religious order, called alſo *ſtar-bearers*, becauſe they were diſtinguiſhed by a red ſtar with five rays, which they wore on their breaſt, in memory of the ſtar that appeared to the wiſe men, and conducted them to Bethlehem.
- BETHUNE**, a little fortified town of Artois, in the French Netherlands, about thirteen miles north of Arras, ſituated in 2° 35' E. long. and 50° 32' N. lat.
- BETLIS**, a city in the north of Curdiſtan, ſituated on a ſteep rock, at the fourth end of the lake Van, on the frontiers of Perſia and Turkey, in 45° E. long. and 37° 30' N. lat.
- BETONY**, in botany, the Engliſh name of the betonica, and of ſeveral ſpecies of veronica. See **BETONICA** and **VERONICA**.
- BETROTHMENT**, among civilians, the ſame with *efpouſals*.
- BETUE**, or **BETAW**, a territory in Dutch Guelderland, between the rivers Maefe and Lech, ſuppoſed to be the ancient Batavia.
- BETULA**, or **BIRCH-tree**, in botany, a genus of the monocœia tetrandria claſs. The calix of the male flower has but one trifid leaf, and incloſes three flowers; the corolla conſiſts likewiſe of one leaf cut into four ſegments. The calix of the female is trifid, and incloſes two flowers; and the feed is membranous, and alated on each ſide. The ſpecies are five, *viz.* the *alba* or birch-tree, a native of Britain; the *nigra*, and *lenta*, both natives of America; the *nana*, a native of Lapland, Ruſſia, and Sweden; and the *alnus*, likewiſe a native of Lapland. The bark of the *alba*, or common birch-tree, is a highly inflammable ſubſtance; but its medical virtues are little known. Upon boring the trunk in the beginning of ſpring, a ſweetiſh juice iſſues forth in great quantities; one branch will bleed an Engliſh gallon or more in a day. This juice is chiefly recommended in ſcorbutic diſorders, and other

foulnesses of the blood: Its most sensible effect is to promote the urinary discharge.

**BEVECUM**, a town of Brabant in the Austrian Netherlands, about seven miles south of Louvain, situated in  $4^{\circ} 45'$  E. long. and  $50^{\circ} 45'$  N. lat.

**BEVEL**, among masons, carpenters, &c. a kind of square, one leg whereof is frequently crooked, according to the sweep of an arch or vault. It is moveable on a centre, and so may be set to any angle.

**BEVEL-angle**, any other angle besides those of ninety or forty-five degrees. See **ANGLE**.

**BEVELAND**, the name of two islands, in the province of Zealand, in the United Netherlands.

The are called North and South Beveland; and lie between the eastern and western branches of the Scheld.

**BEVERLY**, a borough-town of Yorkshire, about seven miles north of Hull, in  $12'$  W. long. and  $53^{\circ} 50'$  N. lat. It sends two members to parliament.

**BEVILLE**, in heraldry, a thing broken or opening like a carpenter's rule: Thus we say, he beareth argent, a chief bevillé, vert, by the name of *berverlis*. See **PLATE LI.** fig. 13.

**BEUTHEN**, the name of two towns in Silesia, one of which is famous for a silver mine.

**BEWDLEY**, a borough-town of Worcestershire, situated on the river Severn, about twelve miles north of Worcester, in  $2^{\circ} 20'$  W. long. and  $52^{\circ} 25'$  N. lat. It sends only one member to parliament.

**BEWITS**, in falconry, pieces of leather, to which a hawk's bells are fastened, and buttoned to his legs.

**BEXOQUILLO**, a name sometimes given to the white ipecacuanha.

**BEY**, among the Turks, signifies a governor of a country or town. The Turks write it *begh*, or *bek*, but pronounce it *bey*.

This word is particularly applied to a lord of a banner, whom, in the same language, they call *sangiac-beg* or *bey*. Every province in Turkey is divided into seven sangiacs, or banners, each of which qualifies a bey; and these are all commanded by the governor of the province, whom they also call *begler-beg*, that is, lord of all the beghs or beys of the province: These beys are much the same as bannerets were formerly in England.

**BEY of Tunis**, the same with the dey of Algiers, is the prince or king of that kingdom.

**BEYLAN**, a town of Syria, upon the road from Aleppo to Constantinople.

**BEZANS**, cotton cloths, which come from Bengal; some are white, and others striped with several colours.

**BEZANTLER**, the branch of a deer's horns next below the brow-antler.

**BEZOAR**, in natural history, is a stony concretion found in the stomach of several animals of the goat kind. It is composed of concentric coats surrounding each other, with a small cavity in the middle, containing a bit of wood, straw, hair, or the like substances.

There are two kinds of bezoar. The first, which is brought from Persia and the East Indies, is found in the stomach of the capra bezoardica, and esteemed by physicians to be the best. It is called *oriental bezoar*, and is of a shining dark-green or olive-colour, and has an even smooth surface. On removing the outer coat, that which lies underneath is likewise smooth and shining. It is generally less than a walnut.

The second kind, called *occidental bezoar*, is brought from the Spanish West Indies, has a rough surface, and less of a green colour than the oriental. It is likewise much heavier, more brittle, and of a looser texture; the coats are thicker, and, on breaking, exhibits a number of stria curiously interwoven. The occidental is generally larger than a walnut, and sometimes as big as a goose-egg.

The great value of this stone in Persia and the East, and the little use it is found to be of in Europe, has made many suspect that the true kind is never brought to us. Many of them are indeed evidently made by art. The usual mark to distinguish its being of a good quality, is its striking a deep green colour on white paper that has been rubbed with chalk. But it is of little importance to say much on this subject. The stone is nothing more than a morbid concretion, much of the same nature with the human calculus, of no smell or taste, indigestible in the stomach of the animal in which it is found, and scarce capable of being acted upon by any of the juices of the human body; and, notwithstanding its many boasted virtues, it cannot be considered in kind other light than as an absorbent of the weakest kind. However, bezoar, on account of its high price, if it serves no other purpose, is of an excellent use in the apothecaries bill.

**BEZOARDIC**, an appellation given to whatever partakes of the nature of bezoar; also to compound medicines whereof bezoar makes an ingredient.

**BIA**, in commerce, a name given by the Siamese to those small shells which are called cowries throughout almost all the other parts of the East Indies. See **COWRIES**.

**BIAFAR**, a kingdom of Africa in Negritia, bounded on the West by the kingdom of Benin, on the north by that of Medra, and on the east and south by the kingdom of Mujac.

**BIALGOROD**, a town of Bessarabia, upon the Niester. It is likewise called Akerman; E. long.  $32^{\circ} 20'$ , N. lat.  $46^{\circ} 24'$ .

**BIALGRODKO**, the capital of the Ukraine, situated upon the river Pnetz.

**BIARU**, a cape on the north-east part of the island of Macassar, in the Indian Ocean.

**BIAS**, or **BIASS**, in a general sense, the inclination or bent of a person's mind to one thing more than another. It also signifies the lead or weight put into a bowl, that draws or turns the course of it any way to which the bias looks.

**BIATHANATY**, the same with suicides, or *selos de se*. **BIBERSBERG**, a town of Upper Hungary, fifteen miles north of Presburg; E. long.  $17^{\circ} 30'$ , and N. lat.  $49^{\circ} 35'$ .

**BIBIO**, in zoology, the trivial name of a species of tipula. See **TIPULA**.

**BIBITORY muscle**, the same with the *adductor oculi*. See **ADDUCTOR**.

**BIBLE**, a name applied by Christians, by way of eminence or distinction, to the collection of sacred writings, or the holy scriptures of the Old and New Testament; known also by various other appellations, as, the Sacred Books, Holy Writ, Inspired Writings, Scriptures, &c. The Jews stiled the Bible (that is, the Old Testament) *mikra*, which signifies *Lesson*, or *Lecture*.

This collection of the sacred writings, containing those of the Old and New Testament, is justly looked upon as the foundation of the Jewish as well as the Christian religion. The Jews, it is true, acknowledge only the scriptures of the Old Testament, the correcting and publishing of which is unanimously ascribed, both by the Jews and Christians, to Ezra. Some of the ancient fathers, on no other foundation than that fabulous and apocryphal book, the second book of *Esdra*s, pretend, that the scriptures were entirely lost and destroyed at the Babylonish captivity, and that Ezra restored them all again by divine revelation. What is certain is, that in the reign of Josiah there was no other book of the law extant besides that found in the temple by Hilkiah; from which original, by order of that pious king, copies were immediately written out, and search made for all the other parts of the scriptures, (2 Kings xxii.); by which means copies of the whole became multiplied among the people, who carried them with them into their captivity. After the return of the Jews from the Babylonish captivity, Ezra got together as many copies as he could of the Sacred writings, and out of them all prepared a correct edition, disposing the several books in their proper order, and settling the canon of scripture for his time. These books he divided into three parts. 1. The Law. 2. The Prophets. 3. The *Cetubim*, or *Hagiographia*, i. e. *The holy writings*.

I. The Law contains, 1. Genesis. 2. Exodus. 3. Leviticus. 4. Numbers. 5. Deuteronomy.

II The writings of the Prophets are, 1. Joshua. 2. Judges, with Ruth. 3. Samuel. 4. Kings. 5. Isaiah. 6. Jeremiah, with his Lamentations. 7. Ezekiel. 8. Daniel. 9. The twelve minor Prophets. 10. Job. 11. Ezra. 12. Nehemiah. 13. Esther.

III. And the *Hagiographia* consists of, 1. The Psalms. 2. The Proverbs. 3. Ecclesiastes. 4. The Song of Solomon. This division was made for the sake of reducing the number of the sacred books to the number of the letters in their alphabet, which amount to twenty-two. At present, the Jews reckon twenty-four books in their canon of scripture, in disposing of which the law stands as it did in the former division, and the prophets are distributed into the former and latter prophets.

The former prophets are, Joshua, Judges, Samuel, Kings.

Vol. I. Numb. 23.

The latter prophets are,

Isaiah, Jeremiah, Ezekiel, and the twelve minor prophets.

And the *hagiographia* consist of,

The Psalms, the Proverbs, Job, the Song of Solomon, Ruth, the Lamentations, Ecclesiastes, Esther, Daniel, Ezra, the Chronicles.

Under the name of Ezra, they comprehend *Nehemiah*. It is true this order hath not always been observed, but the variations from it are of little or no moment.

The five books of the law are divided into fifty-four sections. This division many of the Jews hold to have been appointed by Moses himself; but others, with more probability, ascribe it to Ezra. The design of this division was, that one of these sections might be read in their synagogues every sabbath-day. The number was 54, because in their intercalated years, a month being then added, there were 54 sabbaths. In other years, they reduced them to 52, by twice joining together two short sections. Till the persecution of Antiochus Epiphanes, they read only the law; but the reading of it being then prohibited, they substituted in the room of it 54 sections out of the Prophets; and when the reading of the law was restored by the Maccabees, the section which was read every sabbath out of the law, served for their first lesson, and the section out of the prophets for their second. These sections were divided into verses, of which division, if Ezra was not the author, it was introduced not long after him, and seems to have been designed for the use of the Targumists, or Chaldee interpreters; for after the return of the Jews from the Babylonish captivity, when the Hebrew language had ceased to be their mother tongue, and the Chaldee grew into use instead of it, the custom was, that the law should be first read in the original Hebrew, and then interpreted to the people in the Chaldee language, for which purpose these shorter sections or periods were very convenient.

The division of the scriptures into chapters, as we at present have them, is of much later date. Some attribute it to Stephen Langton, archbishop of Canterbury, in the reigns of John and Henry III. But the true author of the invention was Hugo de Sancto Caro, commonly called Hugo Cardinalis, because he was the first Dominican that ever was raised to the degree of cardinal. This Hugo flourished about the year 1240. He wrote a comment on the scriptures, and projected the first concordance, which is that of the vulgar Latin Bible. The aim of this work being for the more easy finding out any word or passage in the scriptures, he found it necessary to divide the book into sections, and the sections into subdivisions; for till that time the vulgar Latin Bibles were without any division at all. These sections are the chapters into which the Bible hath ever since been divided. But the subdivision of the chapters was not then into verses, as it is now. Hugo's method of subdividing them was by the letters A, B, C, D, E, F, G, placed in the margin at an equal distance from each other, according to the length of the chapters. The subdivision of the chapters into verses, as they now stand in our Bibles, had its original from a famous Jewish rabbi, named Mordecai Nathan, about the year 1445. This rabbi, in imitation of Hugo Cardinalis, drew up a concord-

ance to the Hebrew Bible, for the use of the Jews. But though he followed Hugo in his division of the books into chapters, he refined upon his invention as to the subdivision, and contrived that by verses: this being found to be a much more convenient method, it has been ever since followed. And thus, as the Jews borrowed the division of the books of the holy scriptures into chapters from the Christians, in like manner the Christians borrowed that of the chapters into verses from the Jews.

The order and division of the books of the Bible, as well of the Old as the New Testament, according to the disposition made by the council of Trent, by decree I. session iv, are as follow; where we are to observe, that those books to which the asterisks are prefixed, are rejected by the Protestants, as apocryphal. See APOCRYPHA.

- Genesis,
- Exodus,
- Leviticus,
- Numbers,
- Deuteronomy,
- Joshua,
- Judges and Ruth,
- 1 Samuel, or 1 Kings,
- 2 Samuel, or 2 Kings,
- 1 Kings, otherwise called iii. Kings,
- 2 Kings, otherwise called iv. Kings.
- 1 Chronicles,
- 2 Chronicles,
- 1. EIdras, (as the LXX and Vulgate call it), or the book of Ezra,
- 2 EIdras, or (as we have it) the book of Nehemiah.
- \* Tobit,
- \* Judith,
- EIther,
- Job,
- Psalms,
- Proverbs,
- Ecclesiastes,
- Song of Solomon,
- \* The book of Wisdom,
- \* Ecclesiasticus,
- Isaiah,
- Jeremiah and \* Baruch,
- Ezekiel,
- Daniel,
- Hosea,
- Joel,
- Amos,
- Obadiah,
- Nahum, which we place immediately after Micah, before Habakkuk.
- Jonah, which we place immediately after Obadiah.
- Micah,
- Habakkuk,
- Zephaniah,
- Haggai,
- Zechariah,
- Malachi,
- \* 1 Maccabees,
- \* Maccabees.

The books of the New Testament are,

- The Gospel of {
  - St Matthew,
  - St Mark,
  - St Luke,
  - St John,
- The acts of the Apostles.
  - the Romans,
  - the Corinthians I.
  - the Corinthians II.
  - the Galatians,
  - the Ephesians,
  - the Philippians,
  - the Colossians,
  - the Thessalonians I.
  - the Thessalonians II.
  - Timothy, I.
  - Timothy, II.
  - Titus,
  - Philemon,
  - the Hebrews.
- The general Epistle of {
  - St James,
  - St Peter, I.
  - St Peter, II.
  - St John, I.
  - St John, II.
  - St John, III.
  - St Jude,

The Revelations of St John.

The apocryphal books of the Old Testament, according to the Romanists, are, the book of Enoch, (see Jude 14.) the third and fourth books of Esdras, the third and fourth books of Maccabees, the prayer of Manasseh, the Testament of the twelve Patriarchs, the Psalter of Solomon, and some other pieces of this nature.

The apocryphal books of the New Testament are the epistle of St Barnabas, the pretended epistle of St Paul to the Laodiceans, several spurious gospels, Acts of the Apostles, and Revelations; the book of Hermas, intitled the Shepherd, Jesus Christ's Letter to Abgarus, the epistles of St Paul to Seneca, and several other pieces of the like nature, as may be seen in the collection of the apocryphal writings of the New Testament made by Fabricius.

The books which are now lost, and cited in the Old Testament, are these, the book of the *Righteous*, or of Jasher, as our version of the Bible has it, (Josh. x. 13. and 2 Sam. i. 18.); the book of the wars of the Lord, (Numb. xxi. 14.); the annals of the kings of Israel, so often cited in the books of the Kings and Chronicles. The authors of these annals were the prophets, who lived in the kingdoms of Judah and Israel. We have likewise but a part of Solomon's three thousand proverbs, and his thousand and five songs, (1 Kings iv. 32.); and we have entirely lost what he wrote upon plants, animals, birds, fishes, and reptiles.

Ezra; in the opinion of most learned men, published the scriptures in the Chaldee character: For that language being grown wholly into use among the Jews, he thought proper to change the old Hebrew character for it, which hath since that time been retained only by the Samaritans, among whom it is preserved to this day.

Prideaux is of opinion that Ezra made additions in several parts of the Bible, where any thing appeared necessary for illustrating, connecting, or completing the work; in which he appears to have been assisted by the same spirit in which they were first written. Among such additions are to be reckoned the last chapter of Deuteronomy, wherein Moses seems to give an account of his own death and burial, and the succession of Joshua after him. To the same cause our learned author thinks are to be attributed many other interpolations in the Bible, which created difficulties and objections to the authenticity of the sacred text, no ways to be solved without allowing them. Ezra changed the names of several places which were grown obsolete, and instead of them put their new names, by which they were then called, in the text. Thus it is that Abraham is said to have pursued the kings who carried Lot away captive, as far as Dan; whereas that place in Moses's time was called Laish; the name Dan, being unknown till the Danites, long after the death of Moses, possessed themselves of it.

The Jewish canon of scripture was then settled by Ezra, yet not so but that several variations have been made in it. Malachi, for instance, could not be put in the Bible by him, since that prophet is allowed to have lived after Ezra; nor could Nehemiah be there, since mention is made, in that book, of Jaddus, as high-priest, and of Darius Codomannus, as king of Persia, who were at least an hundred years later than Ezra. It may be added, that in the first book of Chronicles, the genealogy of the sons of Zerubbabel is carried down for so many generations as must necessarily bring it to the time of Alexander, and consequently this book could not be in the canon in Ezra's days. It is probable, the two books of Chronicles, Ezra, Nehemiah, Esther, and Malachi, were adopted into the Bible in the time of Simon the Just, the last of the men of the great synagogue.

As the Jews were very backward in having any intercourse with strangers, it was a long time before their sacred books came to be known and read in other nations. Josephus ascribes the little that is said of the Jews by pagan writers to this, that the latter had no opportunity of being acquainted with their historians, for want of a translation of their books into the Greek language. Aristotle indeed pretends, that there was an imperfect version of the scriptures before the time of Demetrius Phalerus; and that Theopompus intending to insert a part of them in his verses, was deprived of his understanding; but of this there is no proof.

The Jews, upon their return from the Babylonish captivity, having brought with them their Chaldaic or Assyrian language, which from that time became their mother-tongue, gave birth to the Chaldee translations, or rather paraphrases of the Bible, called *Targum*. See *TARGUM*.

*Greek Bible.* It is a matter of dispute among authors whether there was a Greek version of the Old Testament more ancient than the Septuagint. See *SEPTUAGINT*.

Before our Saviour's time, there was no other Greek version of the Old Testament, besides that which went under the name of the Septuagint: But after the establishment of Christianity, some authors undertook new translations, under pretence of making them more con-

formable to the Hebrew text. The first who performed this design was the Jewish proselyte Aquila, of the city of Synope in Pontus, disciple to Rabbi Akiba, who put it in execution the twelfth year of the emperor Adrian, A. D. 128. St Epiphanius pretends, that being excommunicated after his conversion, for adding himself to judicial astrology, he set about this version out of hatred to the Christians, and with a wicked design of corrupting the passages of the prophets relating to Jesus Christ. St Jerom says, his version is made word for word, and with too scrupulous a nicety.

The second Greek version after the Septuagint is that of Symmachus, a Samaritan by birth, who first turned Jew, then Christian, and at last Ebionite. He composed it, according to Epiphanius, in the reign of the emperor Severus. His version was more free than the rest; for he applied himself chiefly to the sense, without translating word for word; wherefore his version comes nearer the Septuagint than that of Aquila. The third Greek version is that of Theodotus of Ephesus. It is said he was a disciple of Marcion, and that, having had some difference with those of his sect, he turned Jew. The version of this author was the best of the three, because he kept a just medium between Aquila and Symmachus, not confining himself so servilely to the letter as the first did, nor wandering so far from it as the second did.

There were, besides these, three other Greek versions, whose authors are unknown.

*Syriac Bible.* The Syrians have in their language a version of the Old Testament, which they pretend to be of great antiquity. A great part of it, they say, was made in Solomon's time, and the rest in the time of Abgarus king of Edessa. They relate, that Hiram king of Tyre desired Solomon to communicate the use of letters and writing to the Syrians, and to get translated for them the sacred books of the Hebrews; which Solomon complied with, and sent them the Pentateuch, Joshua, Judges, Ruth, Samuel, Psalms, Proverbs, Ecclesiastes, Solomon's Song, and Job, which were the only books then extant; the remaining books of scripture, they add, were translated into Syriac after the death of Christ, by the care of Abgarus king of Edessa. But this account is looked upon as fabulous. It is true, the Syriac version which we have now must be very ancient, since it is often cited by the fathers. Dr Prideaux is of opinion, it was made within the first century; that the author of it was some Christian of the Jewish nation; and that it is the best translation of the Old Testament. This version is not always agreeable to the original; but in some places is more conformable to the Samaritan Pentateuch, and in some to the version of the Septuagint. In the Psalms, the translator has taken the liberty to leave out the ancient titles and inscriptions of each psalm, instead of which he gives an abstract of the contents of each psalm.

*Latin Bible.* It is past dispute, that the Latin churches had, even in the first ages, a translation of the Bible in their language, which being the vulgar language, and consequently understood by every one, occasioned a vast number of Latin versions. Among all these, there was one which was generally received, and called by St Jerom the vulgar, or common translation. St Au-

fin gives this version the name of the Italic, and prefers it to all the rest: But we reserve a distinct article for this version. See *VULGATE*.

St Jerom undertook to revise and correct the Latin version of the Bible; but, having afterwards attained to a more perfect knowledge of the Hebrew language, he set about a new translation of some books of the Old Testament from the Hebrew; and continuing, at the solicitation of his friends, to translate the rest, he at last perfected an entire new version of all the books contained in the Hebrew canon. In his translation, he followed, as nearly as he could, the version of the Septuagint, and retained the very expressions of the ancient vulgar Latin, as far as was consistent with purity of style and true Latinity. This translation was so highly applauded by the Christian church, that some authors have pretended it was brought to perfection by the inspiration of the Holy Ghost. But St Augustine looked upon the author to be so well skilled in the Hebrew language, as to be able to undertake, and bring to perfection such a work by the strength of his own abilities. St Jerom's version was soon received in many churches; and in the sixth century it became as general, and in as great esteem, as the ancient Vulgate.

It was not till the sixteenth century that any new Latin translations were made of the Bible from the Hebrew text. Sanctes Pagninus, a Dominican monk, was the first who undertook a new version of the books of scripture from the modern Hebrew text. His design was encouraged by pope Leo X.; and his version made its first appearance at Lyons in the year 1527. It adheres too scrupulously to the words of the text, which makes it obscure, and favour of barbarity in many places. He is likewise often misled as to the sense, having affected too much to follow the explications of the Jewish Rabbins. It is however a very useful work, and very proper to explain the literal sense of the Hebrew text. Arias Montanus, when he compiled the edition of the *Biblia Polyglotta*, revised this translation of Pagninus.

Cardinal Cajetan, though not versed in the Hebrew, undertook a translation of some parts of the Bible by the assistance of two persons well skilled in that language, the one a Jew, the other a Christian. After him Isidore Clarius, a monk of Mount Cassin, set himself to reform the vulgar version of the Bible after the Hebrew text; in the doing of which he pretends to have corrected above eight thousand passages of the Bible. Besides these translations, made by catholic authors, there are some likewise performed by protestant translators; the first of whom was Sebastian Munster. His version is more intelligible, and in much better Latin, than that of Pagninus. Huetius bestows on him the character of a translator well versed in the Hebrew, and whose style is very exact and conformable to the original. The translation of Leo Juda, a Zuinglian, printed at Zurich in 1543, and afterwards by Robert Stephens in 1545, is written in a more elegant style than that of Munster; but he often departs from the literal meaning of the Hebrew text for the sake of an elegant Latin expression. However, in this he has not taken so great a liberty as Sebastian Castalio, who undertook to give the world an elegant Latin version of

the Bible: But there are critics who censure him for departing from the noble simplicity and natural grandeur of the original, and deviating into an affected effeminate style, overcharged with false rhetoric, and not always true Latinity. The version of Junius and Tremellius, has much more of the true natural simplicity: The chief Hebraisms are preserved in it, and the whole is strictly conformable to the Hebrew text. We must not forget the version of Theodore Beza, a protestant divine of Geneva, in the sixteenth century. Sebastian Castalio found fault with this version, and Beza wrote an apology for it about the year 1564.

*Arabic BIBLE.* The Arabic versions of the Bible are of two sorts; the one done by Christians, the other by Jews. There is one of the Old Testament, whose author is supposed to be Saadias Gaon, a Jew of Babylon, who wrote the same about the year of Christ 900. Of this whole work the Pentateuch alone is printed. The Jews have another Arabic version in Hebrew characters, which Erpenius published in Arabic characters at Leyden in the year 1622. Among the Arabic translations done by Christians, there is one printed in the polyglots of Paris and London; but both the author, and the time when it was written, are unknown. It must have been made since the publication of the Koran, because the author, in many places, has evidently followed it. In this version the Pentateuch is translated from the Hebrew text; Job, from the Syriac; and the rest from the Septuagint, and two other versions of the Pentateuch, the manuscripts of which are in the Bodleian library. There are also some Arabic translations of the Psalms; one printed at Genoa in 1516, the other at Rome in 1619: And there is a manuscript version of the prophets in this language preserved in the Bodleian library.

The gospel being preached in all nations, there is no doubt, but that the Bible, which is the foundation of the Christian religion, was translated into the respective languages of each nation. St Chryostom and Theodoret both testify, that the books of the Old and New Testament had been translated into the Syrian, Egyptian, Indian, Persian, Armenian, Æthiopic, Scythian, and Samaritan languages. Socrates and Sozomen tell us, that Ulphilas bishop of the Goths, who lived about the middle of the fourth century, had translated the holy scriptures into the Gothic language; and pope John VIII. gave his approbation to the version of the holy scriptures made into the Sclavonian.

*Æthiopic BIBLE.* The Æthiopic version of the Old Testament is made immediately from the Greek text of the Septuagint; and there is a very plain agreement between this translation and the Alexandrian manuscript: The order of the chapters, the inscriptions of the Psalms, and every thing else being exactly alike. The Æthiopians attribute this version to Frumentius, the apostle of Æthiopia, sent thither by Athanasius bishop of Alexandria.

*Coptic or Egyptian BIBLE.* The Coptic or Egyptian translation is likewise made from the Greek of the Septuagint, in which the Egyptian translator so punctually followed the Greek text, that he refused to make use of the labours of Origen and others, who had been at the pains

pains to compare the Greek version with the Hebrew text. We are quite in the dark as to the author and the time of this version, but probably it is very ancient, since we cannot suppose the Egyptian church was long without a translation of the scriptures in their mother tongue.

*Persian and Turkish Bible.* There are several versions of the Bible in the Persian language, most of which are in manuscript. There is a translation of the Psalms by one father John, a Carmelite; and another of the same book done from the Latin by the Jesuits. Walton, in the London Polyglott, has published the Gospels, translated by one Simon the son of Joseph, a Christian of Persia, who lived in the year 1341. We have likewise some manuscript translations of the Bible in the Turkish language, particularly a version of the New Testament printed at London in the year 1666.

*Armenian and Georgian Bible.* The Armenians have an old translation of the scriptures in their language, taken from the Greek of the Septuagint. Three learned Armenians were employed about it, in the time of the emperor Arcadius, viz. Moses surnamed the Grammarian, David the Philosopher, and Mampræus. The Armenians, in 1666, procured an edition of the Bible in their language to be made at Amsterdam, under the direction of an Armenian bishop. Another was printed at Antwerp in 1670, by the procurement of Theodorus Patræus, and the New Testament separately in 1668.

The Georgians have likewise a translation of the Bible in the old Georgian language: But as this language is known only to a very few persons, and the people of the country are extremely ignorant, there is scarce any one who either reads or understands this version.

Whilst the Roman empire subsisted in Europe, the reading of the scriptures in the Latin tongue, which was the universal language of that empire, prevailed every where. But since the face of affairs in Europe has been changed, and so many different monarchies erected upon the ruins of the Roman empire, the Latin tongue has by degrees grown into disuse; whence has arisen a necessity of translating the Bible into the respective languages of each people; and this has produced as many different versions of the scriptures in the modern languages, as there are different nations professing the Christian religion. Hence we meet with French, Italian, Spanish, German, Flemish, Danish, Slavonian, Polish, Bohemian, and Russian or Muscovite Bibles; besides the Anglo-Saxon and modern English and Irish Bibles.

*French Bible.* The oldest French Bible we hear of is the version of Peter de Vaux; chief of the Waldenses, who lived about the year 1160. Raoul de Presse translated the Bible into French in the reign of Charles V. king of France, about the year 1380. Besides these, there are several old French translations of particular parts of the scripture. The doctors of Louvain published the Bible in French at Louvain, by order of the emperor Charles V. in 1550. There is a version by Isaac le Maître de Sacy, published in 1672, with explanations of the literal and spiritual meaning of the text, which was received with wonderful applause, and has been often reprinted. As to the New Testaments in

French, which have been printed separately, one of the most remarkable is that of F. Amelotte of the oratory, composed by the direction of some French prelates, and printed with annotations in the year 1666, 1667, and 1670. The author pretends he had been at the pains to search all the libraries in Europe, and collate the oldest manuscripts. But, in examining his work, it appears that he has produced no considerable various readings, which had not before been taken notice of either in the London Polyglott or elsewhere. The New Testament of Mons printed in 1665, with the archbishop of Cambray's permission, and the king of Spain's licence, made a great noise in the world. It was condemned by pope Clément IX. in 1668, and by pope Innocent XI. in 1679, and in several bishoprics of France at several times. The New Testament published at Trevois in 1702, by M. Simon, with literal and critical annotations upon difficult passages, was condemned by the bishops of Paris and Meaux in 1702. F. Bohours, a Jesuit, with the assistance of F. F. Michael Teller, and Peter Bernier, Jesuits likewise, published a translation of the New Testament in 1697: But this translation is, for the most part, harsh and obscure, which was owing to the author's keeping too strictly to the Latin text from which he translated.

There are likewise French translations published by Protestant authors; one by Robert Peter Olivetan, printed at Geneva in 1535, and since often reprinted with the corrections of John Calvin and others; another by Sebastian Castalio, remarkable for particular ways of expression never used by good judges of the language. John Diodati likewise published a French Bible at Geneva in 1644; but some find fault with his method, in that he rather paraphrases the text than translates it. Faber Stapulenſis translated the New Testament into French, which was revised and accommodated to the use of the reformed churches in Piedmont, and printed in 1534. Lastly, M. John Le Clerc published a New Testament in French at Amsterdam in 1703, with annotations taken chiefly from Grotius and Hammond; but the use of this version was prohibited in Holland by order of the States-General, as tending to revive the errors of Sabellius and Socinus.

*Italian Bible.* The first Italian Bible published by the Romanists, is that of Nicolas Malerme, a Benedictine monk, printed at Venice in 1471. It was translated from the Vulgate. The version of Anthony Brucioli, published at Venice in 1532, was prohibited by the council of Trent. The Calvinists likewise have their Italian Bibles. There is one of John Diodati in 1607 and 1641, and another of Maximus Theophilus in 1551, dedicated to Francis de Medicis duke of Tuscany. The Jews of Italy have no entire version of the Bible in Italian; the inquisition constantly refusing to allow them the liberty of printing one.

*Spanish Bible.* The first Spanish Bible that we hear of, is that mentioned by Cyprian de Valera, which he says was published about the year 1500. The Epistles and Gospels were published in that language by Ambrose de Montefin in 1512; the whole Bible by Cassiodore de Reyna, a Calvinist, in 1569; and the New Testament,

dedicated to the emperor Charles V. by Francis Enzinas, otherwise called Driander, in 1543. The first Bible which was printed in Spanish for the use of the Jews, was that printed at Ferrara in 1553, in Gothic characters, and dedicated to Hercules d'Est duke of Ferrara. This version is very ancient, and was probably in use among the Jews of Spain before Ferdinand and Isabella expelled them out of their dominions in 1492.

*German Bible.* The first and most ancient translation of the Bible in the German language, is that of Ulphilas bishop of the Goths, about the year 360. This bishop left out the books of Kings, which treat chiefly of war, lest it should too much encourage the martial humour of the Goths. An imperfect manuscript of this version was found in the abbey of Verden near Cologne, written in letters of silver, for which reason it is called *Codex Argentus*; and it was published by Francis Junius in 1665. The oldest German printed Bible extant, is that of Nuremberg, printed in 1447; but who the author of it was, is uncertain. John Emzer, chaplain to George duke of Saxony, published a version of the New Testament in opposition to Luther. There is a German Bible of John Eckius in 1537, with Emzer's New Testament added to it; and one by Ulembergius of Westphalia, procured by Ferdinand duke of Bavaria, and printed in 1630. Martin Luther, having employed eleven years in translating the Old and New Testament, published the Pentateuch in 1522, the historical books and the Psalms in 1524, the books of Solomon in 1527, Isaiah in 1529, the Prophets in 1531, and the other books in 1530: He published the New Testament in 1522. The learned agree, that his language is pure, and the version clear, and free from intricacies: It was revised by several persons of quality, who were masters of all the delicacies of the German language. The German Bibles which have been printed in Saxony, Switzerland, and elsewhere, are for the most part the same as that of Luther, with very little variation. In 1604, John Piscator published a version of the Bible in German, taken from that of Junius and Tremellius: But his turn of expression is purely Latin, and not at all agreeable to the genius of the German language: The Anabaptists have a German Bible printed at Worms in 1529. John Crelius published his version of the New Testament at Racovia in 1630; and Felbinger his, at Amsterdam, in 1660.

*Flemish Bible.* The Flemish Bibles of the Romanists are very numerous, and for the most part have no author's name prefixed to them, till that of Nicolas Vinck, printed at Lovain in 1548. The Flemish versions made use of by the Calvinists till the year 1637, were copied principally from that of Luther. But the synod of Dort having in 1618 appointed a new translation of the Bible into Flemish, deputies were named for the work, which was not finished till the year 1637.

*Danish Bible.* The first Danish Bible was published by Peter Palladius, Olaus Chrysofom, John Synningius, and John Maccabæus, in 1550, in which they followed Luther's first German version. There are two other versions, the one by John Paul Resenius bishop of Zealand, in 1605; the other, being the New Testament only, by John Michel, in 1524.

*Swedish Bible.* In 1534 Olaus and Laurence published a Swedish Bible from the German version of Martin Luther. It was revised in 1617, by order of king Gustavus Adolphus, and was afterwards almost universally followed.

*Bohemian, Polish, Russian or Muscovite, and Slavonian Bibles.* The Bohemians have a Bible translated by eight of their doctors, whom they had sent to the schools of Wittenberg and Basil, on purpose to study the original languages. It was printed in Moravia in the year 1539. The first Polish version of the Bible, it is said, was that composed by Hadewich wife of Jagellon, duke of Lithuania, who embraced Christianity in the year 1390. In 1599, there was a Polish translation of the Bible published at Cracow, which was the work of several Divines of that nation, and in which James Wieck, a Jesuit, had a principal share. The Protestants, in 1506, published a Polish Bible from Luther's German version, and dedicated it to Uladissaus IV. king of Poland. The Russians or Muscovites published the Bible in their language in 1581. It was translated from the Greek by St Cyril, the apostle of the Slavonians; but this old version being too obscure, Ernest Gliik, who had been carried prisoner to Moscow after the taking of Narva, undertook a new translation of the Bible in the Slavonian; who dying in 1705, the Czar Peter appointed some particular divines to finish the translation: But whether it was ever printed, we cannot say.

*English-Saxon, and modern English Bibles.* If we inquire into the versions of the Bible of our own country, we shall find that Adelm bishop of Sherburn, who lived in 709, made an English-Saxon version of the Psalms; and that Eadfrid, or Ecbert, bishop of Lindisferne, who lived about the year 730, translated several of the books of scripture into the same language. It is said likewise, that venerable Bede, who died in 785, translated the whole Bible into Saxon. But Cuthbert, Bede's disciple, in the enumeration of his master's works, speaks only of his translation of the Gospel; and says nothing of the rest of the Bible. Some pretend, that king Alfred, who lived in 890, translated a great part of the scriptures. We find an old version in the Anglo-Saxon of several books of the Bible, made by Elfric abbot of Malmesbury: It was published at Oxford, in 1699. There is an old Anglo-Saxon version of the four Gospels, published by Matthew Parker, archbishop of Canterbury, in 1571, the author whereof is unknown. Dr Mill observes, that this version was made from a Latin copy of the old Vulgate.

As to the English versions of the Bible, the most ancient is that of John de Trevisa, a secular priest, who translated the Old and New Testament into English, at the request of Thomas lord Berkeley: He lived in the reign of Richard II. and finished his translation in the year 1357. The second author, who undertook this work, was the famous Wickliff, who lived in the reigns of Edward III. and Richard II. The manuscript of his version is in several libraries in England. In the year 1534, an English version of the Bible, done partly by William Tindal, and partly by Miles Coverdale, was brought

brought into England from Antwerp. The bishops found great fault with this translation; upon which a motion was made in convocation for an English translation of the Bible to be set up in all churches. This motion, though opposed by bishop Gardiner and his party, succeeded at last. The king gave orders for setting about it with all possible haste, and within three years the impression of it was finished. Cromwell procured a general warrant from the king, allowing all his subjects to read it; for which Cramer wrote his thanks to Cromwell, 'rejoicing to see the work of reformation now risen in England, since the word of God did now shine over it all without a cloud.' Cromwell likewise gave out injunctions, requiring the clergy to set up Bibles in all their churches, and to encourage the people to read them. In 1542, an act passed for restraining the use of the Bible. The preamble sets forth, that 'many seditious and ignorant people had abused the liberty granted them for reading the Bible; and that great diversity of opinions, animosities, tumults, and schisms had been occasioned by perverting the sense of the scripture. To retrieve the mischiefs arising from hence, it is enacted, that a certain form of orthodox doctrine be set forth, as a standard of belief; and that Tindal's false translation of the Old and New Testament be suppressed, and forbidden to be read in any of the king's dominions.' In the reign of Edward VI. Fuller mentions another translation of the Bible, printed in two editions; the first in 1549, the other in 1551, but neither of them divided into verses.

In the reign of queen Elizabeth came out the Bishops Bible, so called, because several of that order were concerned in that version. The work was divided into several parcels, and assigned to men of learning and character. Most of the divisions are marked with great initial letters, signifying either the name or the titles of the persons employed. Archbishop Parker had the principal direction of this affair; he revised the performance, and perhaps put the finishing hand to it. He likewise employed several critics in the Hebrew and Greek languages, to review the old translation, and compare it with the original.

The last English Bible is that called King James's Bible, which proceeded from the Hampton-court conference in 1603, where many exceptions being made to the Bishops Bible, king James gave orders for a new one, not, as the preface expresses it, for a translation altogether new, nor yet to make of a bad one a good one, but to make a good one better; or of many good ones, one best. Fifty-four learned persons were appointed for this office by the king, as appears by his letter to the archbishop, dated in 1604, which being three years before the translation was entered upon, it is probable seven of them were either dead, or had declined the task, since Fuller's list of the translators makes but forty-seven, who, being ranged under six divisions, entered on their project in 1607. It was published in 1610, with a dedication to king James, and a learned preface, and is commonly called king James's Bible. After this all other versions dropped, and fell into disuse, except the Epistles and Gospels in the Common-prayer book, which were

still continued, according to the bishops translation, till the alteration of the Liturgy in 1661, and the Psalms and hymns, which are to this day continued as in the old version.

The judicious Selden, in his Table-Talk, speaking of the Bible, says, 'The English translation of the Bible is the best translation in the world, and renders the sense of the original best, taking in for the English translation the bishops Bible, as well as king James's. The translators in king James's time took an excellent way. That part of the Bible was given to him who was most excellent in such a tongue, (as the Apocrypha to Andrew Downs) and then they met together, and one read the translation, the rest holding in their hands some Bible either of the learned tongues, or French, Spanish, Italian, &c. If they found any fault, they spoke; if not, he read on.' King James's Bible is that now read by authority in all the churches in England.

*Irish Bible.* Towards the middle of the sixteenth century, Bedell, bishop of Kilmore, set on foot a translation of the Old Testament into the Irish language; the New Testament and the Liturgy having been before translated into that language. The bishop appointed one King to execute this work, who, not understanding the oriental languages, was obliged to translate it from the English. This work was received by Bedell, who, after having compared the Irish translation with the English, compared the latter with the Hebrew, the LXX. and the Italian version of Diodati. When this work was finished, the bishop would have been himself at the charge of the impression, but his design was stopped upon advice given to the lord-lieutenant and the archbishop of Canterbury, that it would prove a shameful thing for a nation to publish a Bible translated by such a despicable hand as King. However, the manuscript was not lost, for it went to press in the year 1685.

**BIBLIOTHECA**, in its original and proper sense, denotes a library, or place for depositing books.

**BIBLIOTHECA**, in matters of literature, denotes a treatise, giving an account of all the writers on a certain subject: Thus, we have bibliothecas of theology, law, philosophy, &c.

There are likewise universal bibliothecas, which treat indifferently of all kinds of books; also select bibliothecas, which give an account of none but authors of reputation.

**BIBLISTS**, so the Roman-catholics call those Christians that make scripture the sole rule of faith; in which sense, all protestants either are, or ought to be, biblists.

**BIBRACH**, an imperial city of Swabia in Germany, about twenty miles south-west of Ulm; E. long. 9° 30', and N. lat. 48° 12'.

**BICANER**, a city of Asia, in the country of the Mogul, upon the Ganges. It is the capital of the province of Baear; E. long. 87° 20', N. lat. 28° 40'.

**BICAUDA**, in ichthyology, a name given to the xiphias, or sword-fish. See **XIPHIAS**.

**BICE**,

**BICE**, or **BISE**, among painters, a blue colour prepared from the lapis azurinus.

Bice bears the best body of all bright blues used in common work, as house-painting, &c. but it is the palest in colour. It works indifferently well, but inclines a little to sandy, and therefore requires good grinding. Next to ultramarine, which is too dear to be used in common work, it lies best near the eye of all other blues.

**BICEPS**, in anatomy, the name of several muscles: As the biceps humeri, or cubiti, biceps tibiz, &c.

**BICHET**, a quantity, or measure of corn, which differs according to the places where it is used. The bichet is not a wooden measure, as the minot at Paris, or the bushel at London, but is compounded of several certain measures. It is used in many parts of France, &c.

**BICHET**, a certain quantity of land, namely, as much as may be sown by a bichet of corn.

**BICKERN**, the beak-iron of an anvil. See the article ANVIL.

**BICLINIUM**, in Roman antiquity, a chamber with two beds in it; or when two beds only were round a table. See TABLE.

**BICORNIS**, in anatomy, a name for the os hyoides. See HYOIDES.

**BICORNIS musculus**, a name for the extensor carpi radialis.

**BIDDING** of the banns, the same with what is otherwise called asking. See MARRIAGE.

**BIDDING**, in a commercial sense, the offering a sum of money, or a certain price, for any ware or merchandise; and when any thing is sold by auction, a person who has a mind to have it, must offer something more for it than the person who bids last.

**BIDDER**, he that bids money for any merchandise that is selling by auction: The best, or last bidder, is he who offers most money for it. See SALE.

**BIDENS**, in botany, a genus of the syngenesia polygamia equalis class. The receptacle is paleaceous; the pappus has erect scabrous awns; and the calix is imbricated. There are thirteen species, only three of which, viz. the tripartita or trifid water-hemp agrimony, the cornua or whole-leaved water-hemp agrimony, and the minima or least water-hemp agrimony, are natives of Britain. The leaves of the bidens are recommended for strengthening the tone of the viscera, and as an aperient; and said to have excellent effects in the dropy, jaundice, cachexies, and scorbutic disorders.

**BIDENTAL**, in Roman antiquity, a place blasted with lightning, which was immediately consecrated by an haruspex, with the sacrifice of a bidens. This place was afterwards accounted sacred, and it was unlawful to enter it, or to tread upon it; for which reason it was commonly surrounded with a ditch, wall, hedge, ropes, &c. See the next article.

**BIDENTALES**, in Roman antiquity, priests instituted to perform certain ceremonies and expiations when thunder fell on any place. Their principal office was the sacrificing a sheep of two years old, which, in La-

tin, is called *bidens*; from whence the place struck with thunder got the name of *bidental*.

**BIDON**, a liquid measure, containing about five pints of Paris, that is, about five quarts English wine-measure. It is seldom used but among ships crews.

**BIEL**, a town of the canton of Bern in Switzerland, situated at the north-end of a lake to which it gives name, about fifteen miles north-west of the city of Bern, in 7° E. long. 47° 15' N. lat.

**BIELSKI**, a town of Polachia in Poland, about sixty-two miles south of Grodno; E. long. 24°, and N. lat. 53°.

**BIELSKI**, or **BIHELA**, is also a town of Smolensko, in Russia; E. long. 35°, and N. lat. 56° 40'.

**BIER**, a wooden machine for carrying the bodies of the dead to be buried. See BURIAL.

**BIENNE**, in geography. See BIEL.

**BIGA**, in antiquity, a chariot drawn by two horses abreast. Chariot-races, with two horses, were introduced into the Olympic games in the 93d Olympiad: But the invention was much more ancient, as we find that the heroes in the Iliad fight from chariots of that kind.

**BIGAMY**, the possession of two husbands or two wives at the same time. See SCOTTS LAW, tit. *Crimis*.

**BIGEN**, the name of a kingdom and city in Japon, in the island Niphon.

**BIGGLESWADE**, a market-town in Bedfordshire, situated on the river Ivel, about eight miles south-east of Bedford; W. long. 20°, N. lat. 52° 5'.

**BIGHT**, among seamen, denotes one roll, or round, of a cable or rope, when coiled up.

**BIGNESS**, or **MAGNITUDE**. See MAGNITUDE.

**BIGNONIA**, in botany, a genus of the didymia angiosperma class. The calix consists of five segments, and is shaped like a cup; the faux of the corolla is bell-shaped, and divided into five segments; the pod has two cells, and the seeds are membranaceous, and alated. The species are seventeen, all natives of America and the Indies.

**BIGOREE**, the fourth division of the province of Gascony, in France.

**BIGOT**, a person foolishly obstinate and perversely wedded to any opinion, but particularly an opinion of a religious nature.

**BILANDER**, a small flat-bottomed vessel, with only one large mast and sail, and its deck raised half a foot above the plat-board.

**BILATERAL**, in a general sense, denotes something with two sides. Hence,

**BILATERAL COGNATION**, is kinship both by the father and mother side.

**BILAWS**. See BY-LAWS.

**BILBOA**, the capital of the province of Biscay, in Spain, situated near the mouth of the river Ibaical, which, falling into the sea a little below it, forms a good harbour; in 3° W. long. and 43° 30' N. lat.

**BILBOWS**, a punishment at sea, answering to the stocks at land. The offender is laid in irons, or stocks, which are more or less ponderous according to the quality of the offence of which he is guilty.

**BILDESTON**, a market-town of Suffolk, about ten miles south-east of Bury, E. long 40', and N. lat. 52° 20'.

**BILDGE** of a ship, the bottom of her floor, or the breadth of the place the ship rests on when she is aground. Therefore, bildge-water is that which lies on her floor, and cannot go to the well of the pump: And bildge-pumps, or burr-pumps, are those that carry off the bildge-water. They likewise say the ship is bildged, when she has some of her timber struck off on a rock or anchor, and springs a leak.

**BILE**, a yellow, bitter juice, separated from the blood in the liver, collected in the porus bilarius and gall-bladder, and thence discharged by the common-duct into the duodenum.

The bile is properly of two kinds, and is distinguished by the names of *cystic* and *hepatic*. The hepatic bile is thin, almost insipid, and scarce coloured; the cystic bile is thicker, more coloured, and very bitter. See **ANATOMY**, p. 265.

**BILEDULGERID**, one of the divisions of Africa, having Barbary on the north, and Zaara or the Desert to the south.

**BILZVEST**, a town of Westphalia, in Germany, about seven miles south-east of Ravensburg, E. long. 9° 15', N. lat. 52°. It is subject to the king of Prussia. **LGE.** See **BILDGE**.

**BILIARY ducts.** See **ANATOMY**, p. 265.

**BILIMBI**, in botany, a synonyme of the averterhoa. See **AVERRHOA**.

**BILINGUIS**, in a general sense, signifies one that speaks two languages; but in law, is used for a jury that passes in any case between an Englishman and a foreigner, whereof part ought to be English, and part strangers.

**BILOUS**, in general, denotes something belonging to, or partaking of, the nature of bile. Hence,

**BILIOUS fevers** are those occasioned by the over-copiousness, or bad qualities of the bile. See **MEDICINE**, *Of fevers*.

**BILIOUS colic.** See **MEDICINE**, *Of colics*.

**BILL**, an instrument made of iron, edged in the form of a crescent, and adapted to a handle. It is used by plumbers, to perform several parts of their work; by basket-makers, to cut the largest pieces of chefnut-trees and other wood; and by gardeners, to prune trees. When short, it is called a *band-bill*, and when long, a *hedge-bill*.

**BILL**, in Scots law, has two general significations: Every summary application in writing, by way of petition, to the court of session, is called a *bill*. But the word more commonly denotes a short obligation or mandate, by which one person obliges himself to pay a sum of money to another, or his order, against a certain time; or by which one person draws upon another for a sum payable to a third person: By this last kind of bill, money-matters are commonly transacted betwixt the inhabitants of different countries, and is called a *bill of exchange*: When the parties concerned live in Scotland, it is termed an *inland bill*. As to the solemnities of bills, methods of negotiating them, their le-

gal privileges, &c. See **SCOTS LAW**, tit. *Obligations by word and writ*.

**BILL** signifies also a paper, either written or printed, in very large characters, which is posted up in some open and public place, to give notice of the sale of any merchandize, or ship, or of the sailing of any vessel into foreign parts.

**BILL in trade**, both wholesale and retail, as also among workmen, signifies an account of merchandizes or goods delivered to a person, or of work done for one.

**Settled BILL**, a bill, at the bottom of which they to whom the goods are delivered acknowledge that they have received them; that they are satisfied with the price, and promise to pay it.

**BILL of credit**, that which a merchant or banker gives to a person whom he can trust, empowering him to receive money from his correspondents in foreign countries.

**BILL of entry**, an account of the goods entered at the custom-house, both inwards and outwards. In this bill must be expressed, the merchant exporting or importing; the quantity of merchandize, and the divers species thereof; and whither transported, or from whence.

**BILL of lading**, an acknowledgment signed by the master of a ship, and given to a merchant, &c. containing an account of the goods which the master has received on board from that merchant, &c. with a promise to deliver them at an intended place for a certain salary. Each bill of lading must be treble, one for the merchant who loads the goods, another to be sent to the person to whom they are consigned, and the third to remain in the hands of the master of the ship.

It must be observed, however, that a bill of lading is used only when the goods, sent on board a ship, are but part of the cargo: For when a merchant loads a whole vessel for his own personal account, the deed passed between him and the master of the ship is called *charter-party*. See **CHARTER-party**.

**BILL of parcels**, an account given by the seller to the buyer, containing the particulars of all the sorts and prices of the goods bought.

**BILL of sale**, is when a person wanting a sum of money, delivers goods as a security to the lender, to whom he gives this bill, empowering him to sell the goods, in case the sum borrowed is not repaid, with interest, at the appointed time.

**BILL of store**, a licence granted at the custom-house to merchants, by which they have liberty to carry, custom-free, all such stores and provisions as they may have occasion for during their voyage.

**BILL of sufferance**, a licence granted to a merchant, at the custom-house, suffering him to trade from one English port to another, without paying custom.

**Bank-BILL**, a private instrument whereby private persons become intitled to a part in the bank-stock. See **BANK**.

**BILL** denotes also a declaration in writing, expressing either some wrong the complainant has suffered by the defendant, or else a fault that the party complained of has committed against some law or statute of the realm.

- This bill is sometimes exhibited to justices at the general assizes, by way of indictment, or referred to others having jurisdiction; but more especially is addressed to the lord-chancellor, for inconscionable wrongs done. It contains the thing or fact complained of, the damage sustained, and a petition or process against the defendant for redress; and is used both in criminal and civil cafes. In a criminal case, the words *BILLA vera* are indorsed by the grand jury upon a presentment, thereby signifying, that they find the same made with probable evidence, and on that account worthy of farther consideration.
- BILL** in *parliament*, a paper containing propositions offered to the houses to be passed by them, and then presented to the king to pass into a law.
- BILL of attainder.** See **ATTAINDER**.
- BILL of appeal.** See **APPEAL**.
- BILL of mortality.** See **MORTALITY**.
- BILLARD**, a name given, in some parts of the kingdom, to the young fish of the gadus-kind. See **GADUS**.
- BILLERECA**, a market-town of Essex, about twenty miles east of London, in E. long. 20', and N. lat. 51° 35'.
- BILLET**, in heraldry, a bearing in form of a long square. They are supposed to represent pieces of cloth of gold or silver; but Guillim thinks they represent a letter sealed up; and other authors take them for bricks.
- Billeté* signifies that the escutcheon is all over-strewed with billets, the number not ascertained. See *Plate LI. hg. 15.*
- BILLET-wood**, small wood for fuel, cut three foot and four inches long, and seven inches and a half in compass; the assize of which is to be inquired of by justices.
- BILLETING**, in military affairs, is the quartering of soldiers in the houses of a town or village. And, among fox-hunters, it signifies the ordure and dung of a fox.
- BILLIARDS**; an ingenious kind of game, played on a rectangular table, covered with green cloth, and placed exactly level, with little ivory balls, which are driven by crooked sticks, made on purpose, into hazards or holes, on the edge and corners of the table, according to certain rules of the game.
- BILLINGHAM**, a market-town of Northumberland, about twenty-five miles north-west of Newcastle, in W. long. 1° 40', and N. lat. 55° 20'.
- BILLITON**, an island in the E. Indian ocean, lying south-west of Bornæa, in 1° 12' S. lat.
- BILLON**, in the history of coins, a composition of precious and base metals, where the latter predominate. Wherefore gold under twelve carats fine, is called billon of gold; and silver under six penny-weight, billon of silver. So little attention was paid formerly to the purity of gold and silver, that the term billon of gold was applied only to that which was under twenty-one carats; and billon of silver to that which was lower than ten penny-weight.
- BILLON**, in geography, a town of the Lower Auvergne, in the Lvonnois in France, about ten miles south-east of Clermont; E. long. 3° 25', and N. lat. 45° 40'.
- BILSDON**, a market-town of Leicestershire, about seven miles south-east of Leicester; W. long. 50', and N. lat. 52° 40'.
- BILSEN**, a town of Germany, about six miles west of Mæstricht; E. long. 5° 30', and N. lat. 51°.
- BIMEDIAL**, in mathematics. If two medial lines, as AB and BC. commenfurable only in power, containing a rational rectangle, are compounded, the whole line AC will be irrational, and is called a first bimedral line.

- See Euclid. lib. X. prop. 38.
- BIMINI**, one of the Lucaya-islands, in N. America, to the fourth of the Bahama-islands.
- BIMLIPATAN**, a port-town of Golconda in India, where the Dutch have a factory. It is situated on the west side of the bay of Bengal, in 83° E. long. and 18° N. lat.
- BINARY arithmetick**, that wherein unity, or 1 and 0 are only used.
- This was the invention of M. Leibnitz, who shew'd it to be very expeditious in discovering the properties of numbers, and in constructing tables: and Dangecourt, in the history of the royal academies, gives a specimen of it concerning arithmetical progressions; where he shews, that because, in binary arithmetick, only two characters are used, therefore the laws of progression may be more easily discovered by it than by common arithmetic.
- All the characters used in binary arithmetick are 0 and 1, and the cipher multiplies every thing by 2, as in the common arithmetic by 10. Thus 1 is one; 10, two; 11, three; 100, four; 101, five; 110, six; 111, seven; 1000, eight; 1001, nine; 1010, ten; which is built on the same principles with common arithmetic.
- The author, however, does not recommend this method for common use, because of the great number of figures required to express a number; and adds, that if the common progression were from 12 to 12, or from 16 to 16, it would be still more expeditious.
- BINARY measure**, in music, is a measure which is beaten equally, or where the time of rising is equal to that of falling. This is usually called common time. See **MUSIC**.
- BINARY number**, that composed of two units.
- BINDBROKE**, a market-town of Lincolnshire, about twenty-five miles north-east of Lincoln; E. long. 6', and N. lat. 53° 32'.
- BINCH**, a little fortified town of Hamault, ten miles east of Mons; E. long. 4° 20', and N. lat. 50° 30'.
- BIND**, a country-word for a stalk of hops.
- BIND of eels**, a quantity, consisting of 250, or 10 strikes, each containing 25 eels.
- BINDING**, in a general sense, the fastening of two or more together by a vinculum or bond.
- Book-BINDING.* See **BOOK-BINDING**.
- BINDING**, among fencers, denotes the securing the adversary's sword, which is effected by a pressure and spring from the wrist.

**BISHOP'S-CASTLE**, a borough-town in Shropshire, situated on the river Ony, about 15 miles south-west of Shrewsbury, in 3° W. long. and 52° 30' N. lat.

**BISHOP AND HIS CLERKS**, some little islands and rocks on the coast of Pembrokehire, not far from St David's, very fatal to mariners.

**BISHOP'S-STORTFORD**, a market-town in Hertfordshire, 30 miles north of London, and only 10 miles north-east of Hertford; in 20° E. long. 51° 30' N. lat.

**BISHOPING**, a term among horse-couriers, to denote the sophistications used to make an old horse appear young, a bad one good, &c.

**BISHOPRIC**, the district over which a bishop's jurisdiction extends, otherwise called a diocese.

In England there are twenty-four bishoprics, and two archbishoprics; in Scotland, none at all; in Ireland, eighteen bishoprics, and four archbishoprics.

**BISIGNANO**, a city of Hither Calabria, in the kingdom of Naples; in 16° 45' E. long. and 39° 50' N. lat.

**BISKET**, a kind of bread prepared by the confectioners, of fine flour, eggs, and sugar, and rose or orange-water; or of flour, eggs, and sugar, with aniseeds and citron-peel, baked again and again in the oven, in tin or paper moulds. There are divers sorts of biscuits, as feed-biscket, fruit-biscket, long biscket, round biscket, naples-biscket, sponge-biscket, &c.

*Sea-Biscket* is a sort of bread much dried by passing the oven twice, to make it keep for sea-service. For long voyages they bake it four times, and prepare it six months before the embarkation. It will hold good a whole year.

**BISMILLA**, a solemn form used by the Mahometans at the beginning of all their books and other writings, signifying, *In the name of the most merciful God.*

**BISMUTH**, a ponderous brittle semi-metal, resembling zinc and the regulus of antimony, but differing greatly from them in quality. It dissolves with vehemence in the nitrous acid, which only corrodes the regulus of antimony; and is scarce soluble in the marine acid, which acts strongly on zinc. A calx and flowers of bismuth have been recommended as similar in virtue to certain antimonial preparations; but are at present of no other use than as a pigment or cosmetic.

Bismuth is sometimes found native, in small compact masses, of a pale lead-colour on the outside, but a silvery white within. It attenuates the parts of all other metals, and thereby promotes their fusion. When dissolved in strong acids, it yields the famous cosmetic magistery, and is a very valuable ingredient in the mixed metals used in casting types, and for bell-metal.

Bismuth is very common in Germany, and not uncommonly found in the tin-mines of Cornwall, though little known, or at least regarded, there.

**BISNAGER**, the capital of a province of the same name in the higher peninsula of India; in 78° E. long. and 14° N. lat.

**BISNOW**, or **BISCHNOU**, a sect of the Banians in the East Indies; they call their god Ram-ram, and give him a wife: They adorn his image with golden chains, necklaces of pearls, and all sorts of precious stones.

They sing hymns in honour of their god, mixing their devotion with dances and the sound of drums, flagelets, brazen basons, and other instruments. This sect lives wholly upon herbs and pulses, butter and milk.

**BISOCHI**, or **BIZOCHI**. See **BIZOCHI**.

**BISOMUM**, or **DISOMUM**, in Roman antiquity, a sepulchre, or vault, containing two dead bodies. On the tombs of the primitive Christians were wont to be inscribed the words *bisomi*, or *trifomi*, or *quadrisomi*, &c. that by these means they might the easier calculate the number of their dead.

**BISON**, in zoology, the trivial name of a species of bos. See **Bos**.

**BISQUET**, or **BISKET**. See **BISKET**.

**BISSACRAMENTALES**, a denomination given to Protestants, on account of their allowing of only two sacraments, *viz.* baptism and the eucharist.

**BISSECTION**, in geometry, the division of a line, angle, &c. into two equal parts.

**BISSELEUM**, among ancient naturalists, denotes the oil of pitch, more properly called *pitchaleum*. See **PISSELEUM**.

**BISSEXTILE**, in chronology, a year consisting of 366 days, being the same with our leap-year. See **ASTRONOMY**, *Of the division of time.*

**BISTER**. See **BISTRE**.

**BISTI**, in commerce, a small coin of Persia: Some say that it is among the current silver coins of Persia, and worth only a little above three farthings of our money; others speak of it again as a money of account.

**BISTORTA**, in botany, the trivial name of a species of polygonum. See **POLYGONUM**.

**BISTOURY**, in surgery, an instrument for making incisions, of which there are different kinds, some being of the form of a lancet, others straight and fixed in the handle like a knife, and others crooked with the sharp edge on the inside. See **SURGERY**.

**BISTRE**, or **BISTER**, among painters, denotes glossy foot, pulverised and made into a kind of cakes, with gum-water. It is used to wash their designs. See **WASHING**.

**BIT**, or **BITT**, an essential part of a bridle. Its kinds are various. 1. The mufrol, snaffle, or watering-bit. 2. The canon-mouth, jointed in the middle. 3. The canon with a fast mouth, all of a piece, only kneed in the middle, to form a liberty or space for the tongue; fit for horses too sensible, or ticklish, and liable to be continually bearing on the hand. 4. The canon-mouth, with the liberty in form of a pigeon's neck; proper where a horse has too large a tongue. 5. The canon with a port mouth, and an upset or mounting liberty; used where a horse has a good mouth, but large tongue. 6. The scatch-mouth, with an upset; ruder but more secure than a canon-mouth. 7. The canon-mouth with a liberty; proper for a horse with a large tongue, and round bars. 8. The masticadour, or flaving-bit, &c. The several parts of a snaffle, or curb-bit, are the mouth piece, the cheeks and eyes, guard of the cheek, head of the cheeks, the port, the welts, the campanel or curb and hook, the bosses, the bolsters and rabbits, the water-chains, the side-bolts,

bolts, and rings, kirbles of the bit or curb, trench, top-rol, flap, and jeive. The importation of bits for bridles is now prohibited.

**BIT** also denotes the iron part of a piercer, augre, and the like instruments.

**BIT of a key**, the part which contains the wards. See **WARDS**.

**BIT, or BITTS**, in ship-building, the name of two great timbers, usually placed abast the manger, in the ship's loof, through which the crafts piece goes: The use of it is to belay the cable thereto, while the ship is at anchor.

**BITCH**, the female of the dog kind. See **CANIS**.

**BITONTO**, a city of the province of Barri, in the kingdom of Naples, situated about eight miles south-west of Barri, in 17° 40' E long. and 41° 20' N. lat.

**BITTACLE**, on ship-board, a square box standing before him that steers the ship, with the compas placed therein, to keep and direct the ship in her course.

**BITTER**, an epithet given to all bodies of an opposite taste to sweetness. For the medical virtues of bitters, see **MATERIA MEDICA**.

**BITTER**, a sea-term, signifying any turn of the cable about the bits, so as that the cable may be let out by little and little. And when a ship is stopped by a cable, she is said to be brought up by a bitter. Also that end of the cable which is wound about the bits is called the bitter end of the cable.

**BITTER-APPLE**, in botany. See **COLOCYNTHIS**.

**BITTER-SALT**. See **EPSOM-SALT**.

**BITTER-SWEET**, in botany. See **SOLANUM**.

**BITTER-WATERS**. See **WATER**.

**BITTER-WINE**. See **WINE**.

**BITTERN**, in ornithology. See **ARDEA**.

**BITTERN**, in the salt-works, the brine remaining after the salt is concreted: This they ladle off, that the salt may be taken out of the pan, and afterwards put in again; when, being farther boiled, it yields more salt. See **SALT**.

**BITUMEN**, in natural history. See **ASPHALTUM**.

**BIVALVES**, a term sometimes used for such shells as consist of two pieces. It is also an appellation given to such pods, or capsules, as consist of two valves inclosing the seeds.

**BIVENTER**, in anatomy, called also digastric, or two-bellied, a muscle of the lower jaw. See p. 222. col. 1.

**BIUMBRES**, in geography, the same with the *amphiscii*. See **AMPHISCII**.

**BIXA**, in botany, a genus of the polyandria mongynia class. The corolla consists of 10 petals; the calix has five teeth; and the capsule is rough, and double-valved. There is but one species, viz. the orellana, a native of America.

**BIZARRO**, in the Italian music, denotes a fanciful kind of composition, sometimes fast, slow, soft, strong, &c. according to the fancy of the composer.

**BIZOCHI, or BISOCHI**, in church-history, certain heretical monks, said to have assumed the religious habit contrary to the canons, rejected the sacraments, and maintained other errors.

**BIZU**, a town of Barbary, in Africa, in the kingdom of Morocco.

**BLACK**, a well known colour, supposed to be owing to the absence of light; all the rays thereof being absorbed by the black bodies. See **OPTICS**.

**BLACK**, among dyers, one of the five simple and mother colours used in dying. It is made differently, according to the several qualities of the stuffs that are to be dyed. For stuffs of a high price, as woolen cloth an ell and a half or an ell and a quarter wide, broad and narrow rattens, fine woollen druggets, &c. they must use a black made of the best woad and indigo, inclining to a bluish brown. The goodness of the composition consists in there being not above six pounds of indigo ready prepared to each ball of woad, when the latter, being in the tub, begins to cast its blue flower; and in not being heated for use above twice; after which it must be boiled with alum, tartar, or ashes of lees of wine, then maddred with common madder, and lastly the black must be given with gall-nuts of Aleppo, copperas, and funiach. As for more indifferent stuffs, such as small rattens, and thalpoons, as they cannot pay for the expence of madding it is sufficient that they be well boiled with woad, and afterwards blacked with gall and copperas. There is likewise jesuits black, which is made with the same ingredients as the good black, but without having first dyed the stuff blue.

**German BLACK**, called by some Frankfort black, is made with the lees of wine, burnt, washed afterwards in water, then ground in mills made for that purpose, with ivory, bones, or peach-stones, also burnt. It comes from Frankfort, Mentz, and Straßburg, either in lumps or powder, and must be chosen moist, without having been wetted, of a fine shining black, soft, friable, light, and with as few shining grains as possible.

**Ivory BLACK**, otherwise called velvet black, is burnt ivory, which becoming quite black, and being reduced to thin plates, is ground in water, and made into troches, to be used by painters, and by jewellers, who fet precious stones, to blacken the ground of the collets, and give the diamonds a teint or soil. In order to be good, it ought to be tender, friable, and thoroughly ground.

**Bone-BLACK** is made with the bones of oxen, cows, &c. and is used in painting; but is not so much esteemed as ivory black.

**Hart's-BLACK**, that which remains in the retort after the spirits, volatile salt, and oil, have been extracted from hart's-horn. It answers the purposes of painters almost as well as ivory-black.

**Spanish BLACK** is nothing but burnt cork: It is used in several works. It should be light, and have as few grains of sand mixed with it as possible.

**Lamp-BLACK, or Lam-BLACK**, the sooty smoke of rosin. There is some in powder and some in lumps, and is mostly brought from Sweden and Norway, and pays duty 1l. 10s. 4<sup>00</sup>/<sub>100</sub>d. the hundred weight. It is used on various occasions, particularly for making the printer's ink, for which purpose it is mixed with oil of walnuts, or linseed, and turpentine, all boiled together.

**Earth-BLACK**, a sort of coals found in the ground, with which the painters and limners use to paint in fresco, after it has been well ground.

- There is also a black made with gall nuts, copperas, or vitriol, such as common ink. And a black made with silver and lead, which serves to fill up the cavities of engraved things.
- Carrier's Black**, a black made with gall-nuts, four beer, and old iron, termed the first black. The second black, which gives the gloss to the leather, is composed of gall-nuts, copperas, and gum-arabic.
- Black-bank**, in geography, a town of Ireland, about seven miles south of Armagh, in  $6^{\circ} 50'$  W. long. and  $54^{\circ} 12'$  N. lat.
- Black-berry**, in botany. See **RUBUS**.
- Black-book of the exchequer**. See **EXCHEQUER**.
- Black-burn**, a market-town of Lancashire, about nine miles east of Preston, in  $2^{\circ} 20'$  W. long. and  $53^{\circ} 40'$  N. lat.
- Black-cap**, in ornithology, the English name of the *Muscicapa utricapilla*. See **MUSCICAPA**.
- Black-eagle**. See **FALCO**.
- Black-forest**, a part of Swabia, divided from Switzerland by the river Rhine.
- Black-game**. See **TETRAO**.
- Black-mail**, a link of mail, or small pieces of metal or money. In the counties of Northumberland, Cumberland, Westmoreland, and several parts of Scotland, it was formerly taken for a certain rent of money, corn, cattle, or other consideration, paid by poor people near the borders, to persons of note and power, allied with some moss-troopers, or known robbers, in order to protect them from pillage.
- Black-order**. See **ORDER**.
- Black-rod**. See **ROD**.
- Black-sea**, the same with the Euxine sea, lying north of Natolia, between  $29^{\circ}$  and  $44^{\circ}$  E. long. and  $42^{\circ}$  and  $46^{\circ}$  N. lat.
- Black-tin**. See **TIN**.
- Black-water**, the name of two rivers in Ireland; one of which runs through the counties of Cork and Waterford, and falls in Youghal bay; and the other after watering the county of Armagh, falls into Lough Neagh.
- BLACKS**, in physiology. See **NEGROES**.
- BLADDER**, in anatomy. See p. 266. col. 2.
- Air-BLADDER**, in physiology. See **AIR**.
- Oil-BLADDERS**. See **OIL**.
- BLÆRIA**, in botany, a genus of the tetrandria monogynia class. The calix is divided into four segments, as also the corolla; the stamina are inserted into the receptacle; and the capsule has four cells, containing many seeds. There is but one species, *viz.* the *crucoides*, a native of the cape of Good Hope.
- BLÆFART**, in commerce, a small coin, current at Cologne, worth something more than a farthing of our money.
- BLAIN**, among farriers, a distemper incident to beasts, being a certain bladder growing on the root of the tongue, against the wind-pipe, which swells to such a pitch as to stop the breath. It comes by great chafing and heating of the stomach. and is perceived by the beast's gaping and holding out his tongue, and foaming at the mouth. To cure it, cast the beast, take forth his tongue, and then, slitting the bladder, wash it gently with vinegar and a little salt.
- BLAIR of Athol**, a small town of Athol in Scotland, situated about twenty-eight miles north of Perth.
- BLAIRIA**, in botany. See **VERBENA**.
- BLAKEA**, in botany, a genus of the dodecandria monogynia class. The calix has five leaves; the petals are six; the antheræ are connected; and the capsule has six cells. There is only one species, *viz.* the *trinerxia*, a native of Jamaica.
- BLAMONT**, a town of Lorraine, about twenty-eight miles south-east of Nancy, in E. long.  $6^{\circ} 45'$  and N. lat.  $48^{\circ} 33'$ .
- BLANC**. See **BLANK**.
- BLANCH-holding**, in Scots law, a tenure by which the vassal is only bound to pay an elufury yearly duty to his superior merely as an acknowledgment of his right. See **SCOTS LAW**, tit. *The several kinds of holdings.*
- Carte-BLANCHE**. See **CARTE**.
- BLANCHING**, in a general sense, denotes the art of bleaching or whitening.
- BLANCHING** of copper is done various ways, so as to make it resemble silver. If it be done for sale, it is felony by 8 and 9 William III. chap. xxvi.
- BLANCHING**, in coinage, the operation performed on the planchets or pieces of silver, to give them the requisite lustre and brightness. They also blanch pieces of plate, when they would have them continue white, or have only some parts of them burnished.
- Blanching, as it is now practised, is performed by heating the pieces on a kind of peel with a wood fire, in the manner of a reverberatory; so that the flame passes over the peel. The pieces being sufficiently heated and cooled again, are put successively to boil in two pans, which are of copper: In these they put water, common salt, and tartar of Montpellier. When they have been well drained of this water in a copper sieve, they throw sand and fresh water over them; and when dry, they are well rubbed with towels.
- BLANCHING**, among gardeners, an operation whereby certain fallers, roots, &c. are rendered whiter than they would otherwise be.
- It is this: After pruning off the tops and roots of the plants to be blanched, they plant them in trenches about ten inches wide, and as many deep, more or less, as is judged necessary; as they grow up, care is taken to cover them with earth, within four or five inches of their tops: This is repeated from time to time, for five or six weeks, in which time they will be fit for use, and of a whitish colour where covered by the earth.
- BLANCHING** also denotes the operation of covering iron plates with a thin coat of crust of tin.
- BLANCO**, or **Cape-BLANCO**, a promontory of Peru, in S. America, W. long.  $81^{\circ}$ , and S. lat.  $3^{\circ} 45'$ .
- BLANCO** is also the name of one of the Antille-islands, on the coast of Terra Firma, in W. long.  $64^{\circ}$ , and N. lat.  $12^{\circ}$ .
- Cape-BLANCO** is also a promontory of Africa, in  $18^{\circ}$  W. long. and  $20^{\circ}$  N. lat.
- BLANFORD**, a market town of Dorsetshire, ten miles north

- north of Pool, in  $2^{\circ} 20'$  W. long. and  $50^{\circ} 50'$  N. lat.
- BLANES, a port-town of Catalonia in Spain, E. long.  $2^{\circ} 40'$ , N. lat.  $41^{\circ} 30'$ .
- BLANK, or BLANC, properly signifies white. See WHITE.
- BLANK, in commerce, a void or unwritten place which merchants sometimes leave in their day-books or journals.
- BLANK-bar, in law, the same with common bar. See BAR.
- BLANK-verse, in the modern poetry, that composed of a certain number of syllables, without the assistance of rhyme. See VERSE and RHIME.
- Point-BLANK. See POINT-blank.
- BLANKENBURG, a town of Dutch Flanders, eight miles north-east of Ostend, in  $3^{\circ}$  E. long. and  $51^{\circ} 20'$  N. lat.
- BLANKENBURG is also the name of a town in lower Saxony, about forty-five miles south-east of Wolfembutle, in  $11^{\circ} 15'$  E. long. and  $51^{\circ} 50'$  N. lat.
- BLANKET, a coverlet for a bed. A stuff commonly made of white wool, and wrought in a loom like cloth; with this difference, that they are crossed like ferges.
- When they come from the loom, they are sent to the fuller; and after they have been full'd and well cleaned, they are nap'd with a fuller's thistle.
- There are blankets made with the hair of several animals; as that of goats, dogs, and others.
- French blankets, called *Paris mantles*, pay duty 12s. 11d. each, if coloured and the manufacture of France; otherwise only 5s.  $1\frac{6}{10}$ d. If uncoloured, and the manufacture of France, they pay each 9s.  $8\frac{2}{10}$ d. otherwise only 3s.  $10\frac{2}{10}$ d. Blankets imported into France, pay a duty of importation according to their fineness; namely, those of fine wool, six livres *per piece*; those of coarse and middling wool, three livres. None can be imported but by the way of Calais and St Vallery.
- BLANOS, a maritime town of Spain in Catalonia, near the mouth of the river Tordera.
- BLANQUILLE, in commerce, a small silver coin current in the kingdom of Morocco, and all that part of the coast of Barbary; it is worth about three-half-pence of our money.
- BLARE, in commerce, a small copper coin of Bern, nearly of the same value with the ruz.
- BLAREGNIES, a town of the Austrian Netherlands, about seven miles south of Mons; E. long.  $3^{\circ} 55'$ , and N. lat.  $50^{\circ} 30'$ .
- BLASIA, in botany, a genus of the cryptogamia algae class. The calix of what is called the male is cylindrical, and full of grains; the calix of the female is naked, and inclosing a roundish seed sunk in the leaves. There is but one species, *viz.* the pusilla, or dwarf blasia, a native of Britain.
- BLASPHEMY, an indignity or injury offered to the Almighty, by denying what is his due, and of right belonging to him; or by attributing to the creature that which is due only to the Creator.
- BLAST, in a general sense, denotes any violent explosion of air, whether occasioned by gun-powder, or by the action of a pair of bellows.
- BLASTS, among miners, the fame with damp. See DAMPS.
- BLAST, or BLIGHT, in husbandry. See BLIGHT.
- BLASTING, a term used by miners for the tearing up rocks which lie in their way, by the force of gun-powder.
- BLATTA, or COCKROCHE, a genus of insects belonging to the order of hemiptera, or such as have four semicrustaceous incumbent wings. The head of the blatta is inflected towards the breast; the antennæ, or feelers, are hard like bristles; the elytra and wings are plain, and resemble parchment; the breast is smooth, roundish, and is terminated by an edge or margin; the feet are fitted for running; and there are two small horns above the tail. This insect resembles the beetle; and there are 10 species; *viz.* 1. The gigantea is of a livid colour, and has square brownish marks on the breast. It is found in Asia and America, and is about the size of a hen's egg. 2. The alba is red, and the margin of the breast is white. It is found in Egypt. 3. The surinamensis is livid, and the breast edged with white. It is a native of Surinam. 4. The americana is of an iron colour, and the hind part of the breast is white. The wings and elytra are longer than its body. It is found in America and the fourth of France. 5. The pivea is white, with yellow feelers. It is a native of America. 6. The africana is ash-coloured, and has some hairs on its breast. It is found in Africa. 7. The orientalis is of a dusky ash colour, has short elytra, with an oblong furrow in them. This species is frequent in America. They get into chests, &c. and do much hurt to cloaths; they infest people's beds in the night, bite like bugs, and leave a very unfavoury smell behind them. They avoid the light, and seldom appear but in the night time. The female resembles a kind of caterpillar, as it has no wings: She lays an egg of about one half the bulk of her belly. They eat bread, raw or dressed meat, linen, books, silk-worms and their bags, &c. Sir Hans Sloane says, that the Indians mix their ashes with sugar, and apply them to ulcers in order to promote the suppuration. 8. The germanica, is livid, and yellowish, with two black parallel lines on the breast. It is found in Denmark. 9. The lapponica, is yellow, and the elytra are spotted with black. It is found in Lapland, and feeds upon cheese, fishes, &c. 10. The oblongata, is of an oblong figure; the colour is livid and shining; and it has two black spots on the breast. The feelers are red and clavated; and the feet are very hairy. It is a native of America.
- BLATTA *byzantia*, in pharmacy. See UNGUIS.
- BLATTARIA, in botany. See VERBASCUM.
- BLAVET, or PORT-LEWIS, a port-town of Brittany in France, situated at the mouth of the river Blavet; W. long.  $3^{\circ}$ , and N. lat.  $47^{\circ} 40'$ .
- BLAWBUREN, a town of Swabia, in Germany, about eleven miles east of Ulm; E. long.  $9^{\circ} 45'$ , and N. lat.  $48^{\circ} 24'$ .

**BLAYE**, a fortress of Guienne, in France, situated on the river Garonne, about twenty-one miles north of Bourdeaux; W. long. 45', and N. lat. 45° 70'.

The intention of it is, to hinder any ship from going to Bourdeaux without permission.

**BLAZE**, a white spot in a horse's face.

**BLAZE**. See **BLARE**.

**BLAZONING**, or **BLAZONRY**, in heraldry, the deciphering the arms of noble families.

The word originally signified the blowing or wind-

ing of a horn, and was introduced into heraldry as a term denoting the description of things borne in arms, with their proper significations and intendments, from an ancient custom the heralds, who were judges, had of winding an horn at jousts and tournaments, when they explained and recorded the achievements of knights.

**BLAË**, in the anatomy of plants, the inner rind or bark. See **AGRICULTURE**, Part I.

## B L E A C H I N G.

**BLEACHING** is the art of whitening linen cloth, thread, &c.; which is conducted in the following manner by the bleachers of this country.

After the cloth has been sorted into parcels of an equal fineness, as near as can be judged, they are latched, linked, and then steeped. Steeping is the first operation which the cloth undergoes, and is performed in this manner. The linens are folded up, each piece distinct, and laid in a large wooden vessel; into which is thrown, blood-warm, a sufficient quantity of water, or equal parts of water and lye, which has been used to white cloth only, or water with rye-meal or bran mixed with it, till the whole is thoroughly wet, and the liquor rises over all. Then a cover of wood is laid over the cloth, and that cover is secured with a post betwixt the boards and the joisting, to prevent the cloth from rising during the fermentation which ensues. About six hours after the cloth has been steeped in warm water, and about twelve in cold, bubbles of air arise, a pellicle is formed on the surface of the liquor, and the cloth swells when it is not pressed down. This intestine motion continues from thirty-six to forty-eight hours, according to the warmth of the weather; about which time the pellicle or scum begins to fall to the bottom. Before this precipitation happens, the cloth must be taken out; and the proper time for taking it out, is when no more air-bubbles arise. This is allowed to be the justest guide by the most experienced bleachers.

The cloth is then taken out, well rinsed, disposed regularly by the selvage, and washed in the put-mill to carry off the loose dust. After this it is spread on the field to dry: When thoroughly dried, it is ready for bucking; which is the second operation.

Bucking, or the application of salts, is performed in this manner. The first, or mother lye, is made in a copper, which we shall suppose, for example, when full, holds 170 Scots gallons of water. The copper is filled three fourths full of water, which is brought to boil: just when it begins, the following proportion of ashes is put into it, *viz.* 30 lb. of blue, and as much white pearl-ashes; 200 lb. of Marcott ashes, (or, if they have not these, about 300 lb. of Castuh); 300 lb. of Muscovy, or blanch ashes; the three last ought to be well pounded.

This liquor is allowed to boil for a quarter of an hour, stirring the ashes from the bottom very often; after which the fire is taken away. The liquor must stand till it has settled, which takes at least six hours, and then it is fit for use.

Out of their first, or mother-lye, the second, or that used in bucking, is made in this manner. Into another copper, holding, for example, 40 Scots gallons, are put 38 gallons of water, 2 lb. soft soap, and 2 gallons of mother-lye; or, for cheapness, in place of the soap, when they have lye which has been used to white linen, called *white-linen lye*, they take 14 gallons of it, leaving out an equal quantity of water. This is called *bucking-lye*.

After the linens are taken up from the field dry, they are set in the vat or cave, as their large vessel is called, in rows, endwise, that they may be equally wet by the lye; which, made blood-warm, is now thrown on them, and the cloth is afterwards squeezed down by a man with wooden shoes. Each row undergoes the same operation, until the vessel is full, or all the cloth in it. At first the lye is put on milk-warm, and, after standing a little time on the cloth, it is again let off by a cock into the bucking-copper, heated to a greater degree, and then put on the cloth again. This course is repeated for six or seven hours, and the degree of heat gradually increased, till it is, at the last turn or two, thrown on boiling hot. The cloth remains after this for three or four hours in the lye; after which the lye is let off, thrown away, or used in the first buckings, and the cloth goes on to another operation.

It is then carried out, generally early in the morning, spread on the grass, pinned, corded down, exposed to the sun and air, and watered for the first six hours, so often, that it never is allowed to dry. Afterwards it is allowed to lie till dry spots appear before it is watered. After seven at night it gets no more water, unless it be a very drying night. Next day, in the morning and forenoon, it is watered twice or thrice if the day be very dry; but if the weather be not drying, it gets no water: After which it is taken up dry if the green be clean; if not, it is rinsed, mill-washed, and laid out to dry again, to become fit for bucking.

This alternate course of bucking and watering, is performed for the most part, from ten to sixteen times, or more, before the linen is fit for fourcing; gradually increasing the strength of the lye from the first to the middle bucking, and from that gradually decreasing it till the fourcing begins. The lyes in the middle buckings are generally about a third stronger than the first and last.

Souring, or the application of acids to cloth, is the fourth operation. It is difficult to say when this operation should commence, and depends mostly on the skill and experience of the bleacher. When the cloth has an equal colour, and is mostly freed from the sprat, or outer bark of the lint, it is then thought fit for fourcing; which is performed in the following manner. Into a large vat or vessel is powered such a quantity of buttermilk, or four milk, as will sufficiently wet the first row of cloth; which is tied up in loose folds, and pressed down by two or three men bare-footed. If the milk is thick, about an eighth of water is added to it; if thin, no water. Sours made with bran, or rye-meal and water, are often used instead of milk, and used milk-warm. Over the first row of cloth a quantity of milk and water is thrown, to be imbibed by the second; and so it is continued till the linen to be soured is sufficiently wet, and the liquor rises over the whole. The cloth is then kept down by covers filled with holes, and secured with a post fixed to the joist, that it may not rise. Some hours after the cloth has been in the sour, air-bubbles arise, a white scum is found on the surface, and an intestine motion goes on in the liquor. In warm weather it appears sooner, is stronger, and ends sooner, than in cold weather. Just before this fermentation, which lasts five or six days, is finished, at which time the scum falls down, the cloth should be taken out, rinsed, mill-washed, and delivered to the women to be washed with soap and water.

Washing with soap and water, is the fifth operation; and is performed thus. Two women are placed opposite at each tub, which is made of very thick staves, so that the edges, which slope inwards, are about four inches in thickness. A small vessel full of warm water is placed in each tub. The cloth is folded so that the selvage may be first rubbed with soap and warm water lengthways, till it is sufficiently impregnated with it. In this manner all the parcel is rubbed with soap, and afterwards carried to be bucked.

The lye now used has no soap in it, except what it gets from the cloth; and is equal in strength to the strongest formerly used, or rather stronger, because the cloth is now put in wet. From the former operation these lyes are gradually made stronger, till the cloth seems of an uniform white, nor any darkness or brown colour appears in its ground. After this the lye is more speedily weakened than it was increased; so that the last which the cloth gets, is weaker than any it got before.

But the management of sours is different; for they are used strongest at first, and decreased so in strength, that the last four, considering the cloth is then always taken up wet, may be reckoned to contain three fourths of water.

From the bucking it goes to the watering, as formerly, observing only to overlap the selvages, and tie it down with cords, that it may not tear; then it returns to the four, milling, washing, bucking, and watering again. These operations succeed one another alternately till the cloth is whitened; at which time it is blued, starched, and dried.

This is the method used in the whitening fine cloths. The following is the method used in the whitening of coarse cloths.

Having sorted the cloths, according to their quality, they are steeped in the same manner as the fine, rinsed, washed in the mill, and dried before boiling.

In this process, boiling supplies the place of bucking, as it takes less time, and consequently is thought cheapest. It is done in the following manner: 200 lb. cashub ashes, 100 lb. white Muscovy, and 30 lb. pearl-ashes, boiled in 105 Scots gallons of water for a quarter of an hour, as in the process for the fine cloth, makes the mother or first lye. The cloth-boiler is then to be filled two thirds full with water and mother-lye, about nine parts of the former to one of the latter; so that the lye used for boiling the coarse cloth, is about a third weaker than that used in bucking the fine. Such a quantity of cloth is put into the foregoing quantity of lye, when cold, as can be well covered by it. The lye is brought gradually to the boil, and kept boiling for two hours; the cloth being fixed down all the time, that it does not rise above the liquor. The cloth is then taken out, spread on the field, and watered, as mentioned before in the fine cloth.

As the salts of the lye are not exhausted by this boiling, the same is continued to be used all that day, adding, at each boiling, so much of the mother-lye as will bring it to the same strength as at first. The lye by boiling loses in quantity somewhat betwixt a third and a fourth; and they reckon that in strength it loses about a half, because they find in practice, that adding to it half its former strength in fresh lye, has the same effect on cloth. Therefore some fresh lye, containing a fourth part of the water, and the half of the strength of the first lye, makes the second boiler equal in strength to the first. To the third boiler they add somewhat more than the former proportion, and go on still increasing gradually to the fourth and fifth, which is as much as can be done in a day. The boiler is then cleaned, and next day they begin with fresh lye. These additions of fresh lye ought always to be made by the master-bleacher, as it requires judgment to bring succeeding lyes to the same strength as the first.

When the cloth comes to get the second boiling, the lye should be a little stronger, about a thirtieth part, and the deficiencies made up in the same proportion. For six or seven boilings, or fewer, if the cloth be thin, the lye is increased in this way, and then gradually diminished till the cloth is fit for fourcing. The whitest cloth ought always to be boiled first, that it may not be hurt by what goes before.

In this process, if the cloth cannot be got dry for boiling, business does not stop as in the fine; for after the coarse

coarse has dreeped on racks made for the purpose, it is boiled, making the lye strong in proportion to the water in the cloth.

The common method of fourcing coarse linen is, to mix some warm water and bran in the vat, then put a layer of cloth, then more bran, water, and cloth; and so on, till the cave is full. The whole is tramped with mens feet, and fixed as in the former process. A thousand yards of cloth, yard-broad, require betwixt four and six pecks of bran. The cloth generally lies about three nights and two days in the four. Others prepare their four twenty-four hours before, by mixing the bran with warm water in a separate vessel; and before pouring it on the cloth, they dilute it with a sufficient quantity of water. After the cloth is taken from the four, it ought to be well washed and rinsed again. It is then given to men to be well soaped on a table, and afterwards rubbed betwixt the rubbing-boards. When it comes from them, it should be well milled, and warm water poured on it all the time, if conveniency will allow of it. Two or three of these rubbings are sufficient, and the cloth very seldom requires more.

The lye, after the fourcing begins, is decreased in strength by degrees; and three boilings after that are commonly sufficient to finish the cloth. Afterwards it is starched, blued, dried, and bittled in a machine made for that purpose, which supplies the place of a calendar, and is preferred by many to it.

This method used in the bleaching of our coarse cloths, is very like that practised in Ireland for both fine and coarse. The only material difference is, that there the bleachers use no other ashes but the kelp or caslub. A lye is drawn from the former by cold water, which dissolves the salts, and not the sulphureous particles of the kelp ashes. This lye is used till the cloth is half whitened, and then they lay aside the kelp-lye for one made of caslub ashes.

In the preceding history of bleaching we may observe, that it naturally divides itself into several different branches or parts, all tending to give linen the degree of whiteness required. How they effectuate that comes next to be considered.

The general process of bleaching divides itself into these different parts. 1. Steeping and milling. 2. Bucking and boiling. 3. Alternate watering and drying. 4. Souring. 5. Rubbing with soap and warm water, starching, and bluing. We shall treat of these different parts in their order.

### STEERING.

GREEN linen, in the different changes which it has undergone before it arrives at that state, contracts a great foulness. This is chiefly communicated to it by the dressing composed of tallow and sown, which is a kind of slumery made of bran, flour, or oat-meal seeds. The first thing to be done in the bleachfield is to take off all that filth which is foreign to the flax, would blunt the future action of the salts, and might, in unskilful hands, be fixed in the cloth. This is the design of steeping.

To accomplish this end, the cloth is laid to steep in blood-warm water. A smaller degree of heat would not dissolve the dressing so soon; and the greater might coagulate and fix, in the body of the linen, those particles which we design to carry off. In a few hours the dressing made use in weaving is dissolved, mixed with the water; and, as it had acquired some degree of acidity, before application, it becomes a species of ferment. Each ferment promotes its own particular species of fermentation, or intestine motion; the putrid ferment sets in motion the putrefactive fermentation; the vinous ferment gives rise to the vinous fermentation; and the acid ferment to the acetous fermentation. That there is a real fermentation going on in steeping, one must be soon convinced, who attends to the air-bubbles which immediately begin to arise, to the scum which gathers on the surface; and to the intestine motion and swelling of the whole liquor. That it must be the acetous fermentation, appears from this, that the vegetable particles, already in part fouled, must first undergo this process.

The effect of all fermentations is to set the liquor in motion; to raise in it a degree of heat; and to emit air-bubbles, which, by carrying up some of the light oleaginous particles along with them, produce a scum. But as the dressing is in small quantity in proportion to the water, these effects are gentle and slow. The acid salts are no sooner separated, by the acetous fermentation, from the absorbent earth, which made them not perceptible to the tongue in their former state, than they are united to the oily particles of the tallow, which likewise adhere superficially, dissolve them, and render them, in some degree, miscible with water. In this state they are soon washed off by the intestine motion of the liquor. The consequence of this operation is, that the cloth comes out freed in a great measure from its superficial dirt; and more pliant and soft than what it was.

Whenever this intestine motion is pretty much abated, and before the scum subsides, bleachers take out their cloth. The scum, when no more air-bubbles rise to support it, separates, and falls down; and would again communicate to the cloth great part of the filth. But a longer stay would be attended with a much greater disadvantage. The putrid follows close upon the acetous fermentation: When the latter ends, the former begins. Were this to take place, in any considerable degree, it would render the cloth black and tender. Bleachers cannot be too careful in this article.

The first question that arises to be determined on these principles is, What is the properest liquor for steeping cloth? Those used by bleachers are plain water; white-linen lye and water, equal parts; and rye-meal or bran mixed with water. They always make use of lye when they have it.

After steeping, the cloth is carried to the puttock-mill, to be freed of all its loose foulness. There can be nothing contrived so effectual to answer the purpose as this mill. Its motion is easy, regular, and safe. While it presses gently, it turns the cloth; which is continually washed with a stream of water. Care must be taken that no water be detained in the folds of the linen, otherwise that part may be damaged.

## BUCKING AND BOILING.

THIS is the most important operation of the whole process, and deserves a thorough examination. Its design is to loosen, and carry off, by the help of alkaline lixives or lyes, that particular substance in cloth, which is the cause of its brown colour.

All ashes used in lye, the pearl excepted, ought to be well pounded, before they are put into the copper; for the Marcock and Calhub are very hard, and with some difficulty yield their salts. As these two last contain a very considerable proportion of a real sulphureous matter, which must in some degree tinge white cloth; and as this is dissolved much more by boiling, than by the inferior degrees of heat, while the salts may be as well extracted by the latter. The water should never be brought to boil, and should be continued for some time longer under that degree of heat. The pearl-ashes should never be put in till near the end, as they are easily dissolved in water.

If the salts were always of an equal strength, the same quantities would make a lye equally strong; but they are not. Salts of the same name differ very much from one another. The Muscovy ashes are turning weaker every day, as every bleacher must have observed, till at last they turn quite effete. A decoction from them when new, must differ very much from one when they have been long kept. Hence a necessity of some exact criterion to discover when lyes are of an equal strength. The taste cannot serve, as that is so variable, cannot be described to another, and is blunted by repeated trials. The proof-ball will serve the purpose of the bleachfield sufficiently; and, by discovering the specific gravity, will show the quantity of alkaline salts dissolved. But it cannot show the dangerous qualities of these salts; for the less caustic and less heavy this liquor is, the more dangerous and corrosive it may be for the cloth.

The third lye, which they draw from these materials by an infusion of cold water, in which the taste of lime is discoverable, appears plainly to be more dangerous than the first. The second lye, which they extract from the same ashes, and which is reckoned about a third in strength, when compared to the first, must be of the same nature; nor should it be used without an addition of pearl-ashes, which will correct it.

It is taken for a general rule, That the solution of any body in its menstruum is equally diffused through the whole liquor. The bleachers depending on this, use equal quantities of the top and bottom of their lye, when once clear and settled; taking it for granted, that there is an equal quantity of salts in equal quantities of the lye. But if there is not, the mistake may be of fatal consequence, as the lye may be in some places stronger than what the cloth can with safety bear. That general law of solution must have taken its rise from particular experiments, and not from reasoning. Whether a sufficient number of experiments have been tried to ascertain this point, and to establish an undoubted general rule, may be called in question.

“But, says Dr Home, when I had discovered that

lime makes part of the dissolved substance, and reflected how long its grosser parts will continue suspended in water, there appeared stronger reasons for suspecting that this rule, though it may be pretty general, does not take place here; at least it is worth the pursuit of experiment.

“I weighed at the bleachfield a piece of glass in some cold lye, after it had been boiled, stood for two days, and about the fourth part of it had been used. The glass weighed 3 drachms  $1\frac{1}{2}$  grains in the lye, and 3 drachms  $7\frac{1}{2}$  grains in river-water. The same glass weighed in the same lye, when almost all used, 2 grains less than it had done before. This shows, that the last of the lye contained a third more of the dissolved body; and, consequently, was a third stronger than the first of the lye.

“As this might, perhaps, be owing to a continuation of the solution of the salts, I repeated the experiment in a different way.

“I took from the surface some of the lye, after the salts were dissolved, and the liquor was become clear. At the same time I immersed a bottle, fixed to a long stick, so near the bottom, as not to raise the ashes there, and, by pulling out the cork by a string, filled the bottle full of the lye near the bottom. The glass weighed in river-water 3 drachms  $38\frac{1}{2}$  grains; in the lye taken from the surface 3 drachms  $34\frac{1}{2}$  grains; and in the lye taken from the bottom 3 drachms  $31\frac{1}{2}$  grains. This experiment shows, that the lye at the bottom was, in this case,  $\frac{2}{3}$  stronger than the lye at the surface.

“At other times when I tried the same experiment, I found no difference in the specific gravity; and therefore, I leave it as a question yet doubtful, though deserving to be ascertained by those who have an opportunity of doing it. As the lye stands continually on the ashes, there can be no doubt but what is used last must be stronger than the first. I would, therefore, recommend, to general practice, the method used by Mr John Christie, who draws off the lye, after it has settled, into a second receptacle, and leaves the ashes behind. By this means it never can turn stronger; and he has it in his power to mix the top and bottom, which cannot be done so long as it stands on the ashes.”

Having considered the lye, let us next inquire how it acts. On this inquiry depends almost the whole theory of bleaching, as its action on cloth is, at least in this country, absolutely necessary. It is found by experiment, that one effect they have on cloth, is the diminishing of its weight; and that their whitening power is, generally, in proportion to their weakening power. Hence arises a probability, that these lyes act by removing somewhat from the cloth, and that the loss of this substance is the cause of whiteness. This appears yet plainer, when the bucking, which lasts from Saturday night to Monday morning is attended to.

There are various and different opinions with regard to the operation of these salts: That they act by altering the external texture of the cloth, or by separating the mucilaginous parts from the rest, or by extracting the oil which is laid up in the cells of the plant. The last is the general opinion, or rather conjecture, for none of them deserves any better name; but may we venture to affirm, that it is so without any better title to pre-  
em-  
nence,

nence, than what the others have. Alkaline salts dissolve oils, therefore these salts dissolve the cellular oil of the cloth, is all the foundation which this theory has to rest on; too slight, when unsupported by experiment, to be relied on.

Dr Home endeavours to settle this question by the following experiments and observations.

“Wax, says he, is whitened by being exposed to the influence of the sun, air, and moisture. A discovery of the changes made on it by bleaching, may throw a light upon the question.

“Six drachms of wax were sliced down, exposed on a fourth window, Sept. 10. and watered. That day being clear and warm, bleached the wax more than all the following. It seemed to me to whiten quicker when it had no water thrown on it, than when it had. Sept. 15. it was very white, and 1 drachm 3 grains lighter. 3½ drachms of this bleached wax, and as much of unbleached, taken from the same piece, were made into two candles of the same length and thickness, having cotton wicks of the same kind. The bleached candle burned one hour thirty-three minutes; the unbleached three minutes longer. The former run down four times, the latter never. The former had an obscure light and dull flame; the latter had a clear pleasant one, of a blue colour at the bottom. The former when burning seemed to have its wick thicker, and its flame nearer the wax, than the latter. The former was brittle, the latter not. It plainly appears from these facts, that the unbleached wax was more inflammable than the bleached; and that the latter had lost so much of an inflammable substance, as it had lost in weight; and consequently the substance lost in bleaching of wax is the oily part.

“As I had not an opportunity of repeating the former experiment, I do not look on it as entirely conclusive; for it is possible that some of the dust, flying about in the air, might have mixed with the bleached wax, and so have rendered it less inflammable. Nor do I think the analogical reasoning from wax to linen without objections. Let us try then if we cannot procure the substance extracted from the cloth, show it to the eye, and examine its different properties. The proper place to find it, is in a lye already used, and fully impregnated with these colouring particles.

“I got in the bleachfield some lye, which had been used all that day for boiling coarse linen, which was tolerably white, and had been twice boiled before. There could be no dressing remaining in these webs. No soap had ever touched that parcel; nor do they mix soap with the lye used for coarse cloth. Some of this impregnated lye was evaporated, and left a dark-coloured matter behind. This substance felt oily betwixt the fingers, but would not lather in water as soap does. It deflagrated with nitre in fusion, and afforded a tincture to spirit of wine. By this experiment the salts seem to have an oily inflammable substance joined with them.

“Could we separate this colouring substance from these salts, and exhibit it by itself so that it might become the object of experiment, the question would be soon decided. Here chemistry lends us its assistance. Whatever has a stronger affinity or attraction to the salts

with which it is joined, than this substance has, must set it at liberty, and make it visible. Acids attract alkaline salt from all other bodies; and therefore will serve our purpose.

“Into a quantity of the impregnated lye mentioned in the former experiment, I poured in oil of vitriol. Some bubbles of air arose, an intestine motion was to be perceived, and the liquor changed its colour from a dark to a turbid white. It curdled like a solution of soap, and a scum soon gathered on the surface, about half an inch in thickness, the deepness of the liquor not being above six inches. What was below was now pretty clear. A great deal of the same matter lay in the bottom; and I observed, that the substance on the surface was precipitated, and showed itself heavier than water, when the particles of air, attached to it in great plenty, were expelled by heat. This substance was in colour darker than the cloth which had been boiled in it.

“I procured a considerable quantity of it by skimming it off. When I tried to mix it with water, it always fell to the bottom. When dried by the air, it diminished very much in its size, and turned as black as a coal. In this state it deflagrated strongly with nitre in fusion; gave a strong tincture to spirit of wine; and when put on a red-hot iron, burnt very slowly, as if it contained a heavy ponderous oil; and left some earth behind.

“From the inflammability of this substance, its rejecting of water, and dissolving in spirit of wine, we discover its oleaginous nature; but from its great specific gravity we see that it differs very much from the expressed or cellular oil of vegetables; and yet more from their mucilage. That it dissolves in spirit of wine, is not a certain argument of its differing from expressed oils; because these, when joined to alkaline salts, and recovered again by acids, become soluble in spirit of wine. The quantity of earthy powder left behind after burning, shows that it contains many of the solid particles of the flax. The substance extracted from cloth by alkaline lyes appears then to be a composition of a heavy oil, and the solid earthy particles of the flax.

“In what manner these salts act so as to dissolve the oils, and detach the solid particles, is uncertain; but we see evidently how much cloth must be weakened by an improper use of them, as we find the solid particles themselves are separated.”

It is necessary that cloth should be dry before bucking, that the salts may enter into the body of the cloth along with the water; for they will not enter in such quantity, if it be wet; and by acting too powerfully on the external threads, may endanger them.

The degree of heat is a very material circumstance in this operation. As the action of the salts is always in proportion to the heat, it would appear more proper to begin with a boiling heat, by which a great deal of time and labour might be saved. The reason why this method is not followed, appears to be this. If any vegetable or vegetable substance is to be softened, and to have its juices extracted, it is found more proper to give it gentle degrees of heat at first, and to advance gradually, than to plunge it all at once in boiling water. This last degree of heat is so strong, that when applied at once to a vegetable, it hardens, instead of softening its texture. Dried

vegetables are immediately put into boiling water by cooks, that these substances may preserve their green colour, which is only to be done by hindering them from turning too soft. Boiling water has the same effect on animal substances; for if salt beef is put into it, the water is kept from getting at the salts, from the outside of the beef being hardened.

But when we consider, how much of an oily substance there is in the cloth, especially at first, which will for some time keep off the water, and how the twisting of the threads, and closeness of the texture, hinders the water from penetrating, we shall find, that if boiling water were put on it at once, the cloth might be liable, in several parts, to a dry heat, which would be much worse than a wet one. That the lyes have not access to all parts of the cloth, at first, appears plainly from this, that when it has lain, after the first bucking, till all the lyes are washed out, it is as black, in some parts, as when it was steeped. This must be owing to the discharge of the colouring particles from those places to which the lye has access, and to their remaining where it has not. It would seem advisable, then, in the first bucking or two, when the cloth is foul, to use the lye considerably below the boiling point; that by this soaking or maceration, the foulness may be entirely discharged, and the cloth quite opened for the speedy reception of the boiling lye in the buckings which follow.

The lyes should likewise be weakest in the first buckings, because then they act only on the more external parts; whereas, when the cloth is more opened, and the field of action is increased, the active powers ought to be so too. For this reason they are at the strongest after some sourings.

The only thing that now remains to be considered, is, the management of the coarse cloth, where boiling is substituted in place of bucking. This species of linen cannot afford the time and labour necessary for the latter operation; and therefore they must undergo a shorter, and more active method. As the heat continues longer at the degree of boiling, the lyes used to the coarse cloth must be weaker than those used to the fine. There is not so much danger from heat in the coarse as in the fine cloth, because the former is of a more open texture, and will allow the lye to penetrate more speedily. In the closer kinds, however, the first application of the salts should be made without a boiling heat.

#### ALTERNATE WATERING AND DRYING.

AFTER the cloth has been bucked, it is carried out to the field, and frequently watered for the first six hours. For if during that time, when it is strongly impregnated with salts, it is allowed to dry, the salts approaching closer together, and, assisted by a greater degree of heat, increasing always in proportion to the dryness of the cloth, act with greater force, and destroy its very texture. After this time, dry spots are allowed to appear before it gets any water. In this state it profits most, as the latter part of the evaporation comes from the more internal parts of the cloth, and will carry away most from those parts. The bleaching of the wax, in a preceding

experiment, helps to confirm this; for it seemed to whiten most when the last particles of water were going off.

This continual evaporation from the surface of the cloth shows, that the design of the operation is to carry off somewhat remaining after the former process of bucking. This appears likewise from a fact known to all bleachers, that the upper side of cloth, where the evaporation is strongest, attains to a greater degree of whiteness than the under side. But it is placed beyond all doubt by experiment, which shews, that cloth turns much lighter by being exposed to the influence of the sun, air, and winds, even though the salts have been washed out of it.

What, then, is this substance? As we have discovered in the former section, that the whitening, in the operation of bucking, depends on the extracting or loosening the heavy oil, and solid particles of the flax; it appears highly probable, that the effects of watering, and exposition to the sun, air, and winds, are produced by the evaporation of the same substance, joined to the salts, with which composite body the cloth is impregnated when exposed on the field. That these salts are in a great measure carried off or destroyed, appears from the cloth's being allowed to dry without any danger, after the evaporation has gone on for some time. "If we can show, says Dr Home, that oils and salts, when joined together, are capable of being exhaled, in this manner, by the heat of the atmosphere, we shall reduce this question to a very great degree of certainty.

"Sept. 10. 1 exposed, in a south-west window, half an oz. of Castile soap, sliced down, and watered. Sept. 14, when well dried, it weighed but 3 dr. 6 gr. Sept. 22. it weighed 2 dr. 2 gr. Sept. 24. it weighed 1 dr. 50 gr. It then seemed a very little whiter; but was much more mucilaginous in its taste, and had no degree of saltiness, which it had before.

"It appears from this experiment, that soap is so volatile, when watered, and exposed to air not very warm, that it loses above the half its weight in fourteen days. The same must happen to the saponaceous substance, formed from the conjunction of the alkaline salts, heavy oil, and earthy particles of the flax. The whole design, then, of this operation, which, by way of pre-eminence, gets the name of *bleaching*, is to carry off, by the evaporation of water, whatever has been loosened by the former process of bucking.

"Against this doctrine there may be brought two objections, seemingly of great weight. It is a general opinion amongst bleachers, that linen whitens quicker in March and April, than in any other months: But as the evaporation cannot be so great at that time, as when the sun has a greater heat; hence the whitening of cloth is not in proportion to the degree of evaporation; and therefore the former cannot be owing to the latter. This objection vanishes, when we consider, that the cloth which comes first into the bleachfield, in the spring, is closely attended, having no other to interfere with it for some time; and, as it is the whitest, gets, in the after buckings, the first of the lye; while the second parcel is often bucked with what has been used to the first. Were the fact true, on which the objection is founded, this would

be a sufficient answer to the objection. But it appears not to be true, from an observation of Mr John Christie, That cloth laid down in the beginning of June, and finished in September, takes generally less work, and undergoes fewer operations, than what is laid down in March, and finished in June.

“The other objection is, That cloth dries much faster in windy weather than in calm sunshine; but it does not bleach so fast. This would seem to show, that the sun has some particular influence independent on evaporation. In answer to this objection, let it be considered, that it is not the evaporation from the surface, but from the more internal parts that is of benefit to the cloth. Now, this latter evaporation must be much stronger in sunshine than in windy weather, on account of the heat of the sun, which will make the cloth more open; while the coldness of windy weather must shut it up, so that the evaporation will all be from the surface. Clear sunshine, with a very little wind, is observed to be the best weather for bleaching; a convincing proof that this reasoning is just.

“It would seem to follow as a corollary from this reasoning, that the number of waterings should in general be in proportion to the strength of the lye; for the stronger the lye is, the more there is to be evaporated; and the greater the danger, in case the cloth should be allowed to dry. But there is an exception to this general rule, arising from the consideration of another circumstance. It is observed, that cloth, when brown, dries sooner than when it becomes whiter, arising from the closeness and oiliness which it then has, not allowing the water a free passage. Perhaps that colour may retain a greater degree of heat, and in that way assist a very little. Cloth therefore, after the first buckings, must be more carefully watered than after the last.

“It follows likewise from this reasoning, that the soil of the bleachfield should be gravelly or sandy, that the water may pass quickly through it, and that the heat may be increased by the reflection of the soil: for the success of this operation depends on the mutual action of heat and evaporation. It is likewise necessary that the water should be light, soft, and free from mud or dirt, which, not being able to rise along with the water, must remain behind. When there is much of this, it becomes necessary to rinse the cloth in water, and then give it a milling, to take out the dirt; else it would be fixed in the cloth by the following bucking, as it is not soluble by the lye.

“This operation has more attributed to it by bleachers than it can justly claim. The cloth appears, even to the eye, to whiten under these alternate waterings and dryings; and these naturally get the honour of it, when it more properly belongs to the former operation. Here lies the fallacy. Alkaline salts give a very high colour to the decoctions, or infusion of vegetables. This is probably owing to the solution of the oleaginous colouring particles of the plant; which particles, being opened and separated by the salts, occupy a greater space, and give a deep colour to the liquor. The cloth participates of the liquor and colour. Hence bleachers always judge of the goodness of the bucking by the deepness of its

colour. The rule, in general, is good. I observe, that in those buckings which continue from the Saturday night to the Monday morning, the cloth has always the deepest colour. When that cloth has been exposed some hours to the influence of the air, these colouring particles, which are but loosely attached to it, are evaporated, and the linen appears of a brighter colour. This operation does no more than complete what the former had almost finished. If its own merit were thoroughly known, there would be no occasion to attribute that of another operation to it. Thread, and open cloths, such as diaper, may be reduced to a great degree of whiteness, after one bucking, by it alone. No cloth, as would appear, can attain to a bright whiteness without it.

“Since the only advantage of watering is the removal of the salts, and what they have dissolved, might we not effluatate this by some cheaper, and more certain method? For it occupies many hands; and must depend altogether on the uncertainty of the weather; so that, in the beginning of the season, the bleacher is often obliged to repeat his buckings without bleaching. We might take out the alkaline salts by acids; but then the other substance would be left alone in the cloth, nor would any washing be able to remove it. Mill-washing appears a more probable method of taking out both salts and oils; and it would seem that this might, in a great measure, supply the place of watering; but upon trial it does not succeed. Two parcels of linen were managed equally in every other respect, except in this, that one was watered, and exposed to the influence of the air, and the other was only mill-washed. This method was followed until they were fit for fouring. The cloth which had been mill-washed, had a remarkable green colour, and did not recover the bright colour of the pieces managed in the common way, until it had been treated like them for a fortnight. The green colour was certainly owing to a precipitation of the sulphureous particles, with which the lye is impregnated, upon the surface of the cloth; owing to the salts being washed off more speedily than the sulphur, to which they are united in the lye. The attachment betwixt these two bodies we know is very loose, and the separation easily made. Evaporation then alone is sufficient to carry off these sulphureous particles.”

## SOURING.

It is well known to all chymists, that alkaline salts are convertible, by different methods, into absorbent earths. Frequent solution in water, and evaporation of it again, is one of these. This transmutation then of these salts, which are not volatilised or washed away, must be continually going on in the cloth under these alternate waterings and dryings of the former process; not much indeed after the first two or three buckings; because the salts, not having entered deep into the cloth, are easily washed off, or evaporated. But when they penetrate into the very composition of the last and minutest fibres, of which the first vessels are made, they find greater difficulty of escaping again, and must be more subject to this transmutation. But if we consider the bleaching

bleaching ashes as a composition of lime and alkaline salts, we must discover a fresh fund for the deposition of this absorbent earth. The common caustic, a composition of this very kind, soon converts itself, if exposed to the open air, into a harmless earthy powder.

Frequent buckings and bleachings load the cloth with th's substance. It becomes then necessary to take it out. No washing can do that, because earth is not soluble in water. Nothing but acids can remove it. These are attracted by the absorbent earth, join themselves to it, and compose a kind of neutral imperfect salt, which is soluble in water; and therefore easily washed out of the cloth. The acid liquors commonly used are butter-milk, which is reckoned the best, four milk, infusions of bran, rye-meal, &c. kept for some days till they sour. Sour whey is thought to give the cloth a yellow colour.

The linen ought to be dried before it is put in the four, that the acid particles may penetrate, along with the watery, through the whole. A few hours after it has been there, air-bubbles arise, the liquor swells, and a thick scum is formed; manifest signs of a fermentation. The following experiment, says Dr Home, shews the degree of heat which attends it.

“ May 25. I put a thermometer of Fahrenheit's into some butter-milk, of which the bleachers were composing their fours, and which stood in a vat adjoining to another, where the milk was the same, and the fouring process had been going on for two days. After the thermometer had been twenty minutes in the butter-milk, the mercury stood at 64 degrees. In the fouring vat it rose to 68 degrees. An increase of 4 degrees shews a pretty brisk intestine motion

“ To what are all these effects owing? To the acetous fermentation going on in those vegetable liquors, whose acids, extricating themselves, produce heat, intestine motion, and air-bubbles. As the change is slow, the process takes five or six days before it is finished. During this time the acid particles are continually uniting themselves to the absorbent earth in the cloth. That this fermentation goes on in the liquor alone, appears from this consideration, that the same effects, *viz.* air-bubbles, and scum, are to be seen in the butter-milk alone. The only effect then it has is, by the small degree of heat, and intestine motion, which attend it, to assist the junction of the acid and absorbent particles. We shall presently see, that this process may be carried on, to as great advantage, without any fermentation; and therefore it appears not absolutely necessary.

“ When these absorbent particles are fully saturated, the remaining acids may unite with, and have some small effect in extracting the colouring particles. This appears from the two following experiments.

“ Sept. 20. A piece of cloth which had been steeped, weighing 41½ gr. was put into a half-pound of butter-milk, whigged, and well soured, by a mixture of water, and by boiling. Sept. 24. When taken out, and washed in water, it appeared a very little whiter. The mineral acids, as will appear afterwards, whiten cloth, even though they are very much diluted.

“ Just before the acetous fermentation is finished, the cloth should be taken out; otherwise the scum will fall

down, and lodge in the cloth, and the putrefaction which then begins will weaken it. This appears from the following experiment.

“ Sep. 16. A piece of cloth, weighing 42 gr. was laid in butter-milk unwhigged. Novem. 15. The milk had a putrid smell. The cloth was a little whiter, but very tender; and weighed, when well washed in warm water and dried, 40 gr.”

All the fours made of bran, rye-meal, &c. ought to be prepared before use; for by this means so much time will be saved. Besides, when the water is poured upon the cloth, and bran, as is done in the management of coarse cloth, the linen is not in a better situation than if it had been taken up wet from the field; and by this means the acid particles cannot penetrate so deep. Again, this method of mixing the bran with the cloth, may be attended with yet worse consequences. All vegetable substances, when much pressed, fall into the putrefcent, and not the acetous fermentation. This often happens to the bran pressed betwixt the different layers on the linen, which must weaken the cloth. Hence, all fours should be prepared before the cloth is steeped in them; and none of the bran or meal should be mixed with the cloth.

The fours are used strongest at first, and gradually weakened till the cloth has attained to its whiteness. In the first fourings, there is more of the earthy matter in the cloth, from the many buckings it has undergone, than what there can be afterwards. As the quantity of this matter decreases, so should the strength of the four. There is not, however, the least danger, at any time, from too strong a four.

What is most wanted in this operation is a more expeditious and cheaper method of obtaining the same end. As it takes five or six days, it retards the whitening of the cloth considerably; and as bleachers are obliged to send for milk to a great distance, it becomes very dear. This last consideration makes them keep it so long, that, when used, it can have no good effect; perhaps it may have a bad one.

There is one consideration that may lead us to shorten the time. It is observed, that the fouring process is sooner finished in warm than in cold weather. Heat quickens the fermentation, by aiding the intestine motion. The vats therefore should not be buried in the ground, as they always are, which must keep them cold; there should rather be pipes along the walls of the room, to give it that degree of heat, which, on trial, may be found to answer best. There are few days in summer so hot as is necessary; and the beginning and end of the season is by much too cold. That this is no ideal scheme, the following fact is a sufficient proof: There are two vats in Salton bleachfield, adjoining to a partition-wall, at the back of which there is a kitchen fire. In these vats the fouring process is finished in three days, whereas it lasts five or six days in the others placed round the same room.

This improvement, though it shortens the time of fouring a very little, yet it no remedy against the scarcity and dearth of milk fours. Such a liquor as would serve our purpose, must be found either among the vegetable

table acids, which have no further fermentation to undergo, or among the mineral acids. The former are a large class, and contain within themselves many different species; such as the acid juice of several plants, vinegars made of fermented liquors, and acid salts, called *tartars*. But there is one objection against these vegetable acids: They all contain, along with the acid, a great quantity of oily particles, which would not fail to discolour the cloth. Besides, the demand of the bleachfields would raise their price too high.

The mineral acids have neither of these objections. They are exceedingly cheap, and contain no oil. "I will freely own, says Dr Home, that at first I had no great opinion of success from the mineral, from two reasons; their want of all fermentation, which I then looked on as necessary; and their extreme corrosiveness. But the experience of two different summers, in two different bleachfields, has convinced me, that they will answer all the purposes of the milk and bran fours; nay, in several respects, be much preferable to them. I have seen many pieces of fine cloth, which had no other fours but those of vitriol, and were as white and strong as those bleached in the common way. I have cut several webs through the middle, and bleached one half with milk, and the other with vitriol; gave both the same number of operations, and the latter were as white and strong as the former."

The method in which it has been hitherto used is this. The proportion of the oil of vitriol to the water, with which it is diluted, is half an ounce, or at most three quarters, to a gallon of water. As the milk-fours are diminished in strength, so ought the vitriol-fours. The whole quantity of the oil of vitriol to be used, may be first mixed with a small quantity of water, then added to the whole quantity of water, and well mixed together. The water should be milk-warm; by which means the acid particles will penetrate further, and operate sooner. The cloth should then be put dry into the liquor.

It is observed, that this four performs its task much sooner than those of milk and bran; so that Mr John Chrystie, in making the trial, used to lay the milk-fours twenty-four hours before the vitriol. Five hours will do as much with this four, as five days with the common fort. But the cloth can receive no harm in allowing it to remain for some days in the four; but rather, on the contrary, an advantage. The cloth is then taken out, well rinsed, and mill-washed in the ordinary way.

The liquor, while the cloth lies in this four, is less acid the second day than the first, less the third than the second, and so diminishes by degrees. At first it is clear, but by degrees a mucilaginous substance is observed to float in it; when put into a glass. This foulness increases every day. This substance, extracted by the acid, is the same with what is extracted by the alkaline salts, and blunts the acidity of the former, as it does the alkalinefency of the latter. Hence the liquor loses by degrees its acidity. But as the acid salts do not unite so equally with oily substances as the alkaline do, the liquor is not so uniformly tinged in the former as in the latter case, and the mucous substance presents itself floating in it.

It is observed, that, in the first souring, which is the strongest, the liquor, which was a pretty strong acid before the cloth was put in, immediately afterwards becomes quite vapid; a proof how very soon it performs its task. But in the following operations, as the linen advances in whiteness, the acidity continues much longer; so that in the last operations the liquor loses very little of its acidity. This happens although the first buckings, after the first sourings, are increased in strength, while the fours are diminished. There are two causes to which this is owing. The texture of the cloth is now so opened, that although the lyes are strong, the alkaline salts and absorbent earth are easily washed out; and the oily particles are, in a great measure, removed which help to blunt the acidity of the liquor.

Two objections are made against the use of vitriol-fours. One is, that the process of souring with milk is performed by a fermentation; and, as there is no fermentation in the vitriol-fours, they cannot serve the purpose so well: The other, that they may hurt the texture of the cloth. The answer to the former objection is very short; that the vitriol-fours operate successfully without a fermentation, as experience shews; and therefore in them a fermentation is not necessary.

As to the latter objection, that oil of vitriol, being a very corrosive body, may hurt the cloth; that will vanish likewise, when it is considered how much the vitriol is diluted with water, that the liquor is not stronger than vinegar, and that it may be safely taken into the human body.

That it may be used with safety, much stronger than what is necessary in the bleachfield, appears from the following experiment with regard to the stamping of linen. After the linen is boiled in a lye of ashes, it is bleached for some time. After this, in order to make it receive the colour, it is steeped in a four of water and oil of vitriol, about fifteen times stronger than that made use of in the bleachfield; for, to 100 gallons of water are added two and a half of oil of vitriol. Into this quantity of liquor, made so warm as the hand can just be held in it, is put seven pieces of 28 yards each. The linen remains in it about two hours, and comes out remarkably whiter. The fine cloth often undergoes this operation twice. Nor is there any danger if the oil of vitriol is well mixed with the water. But if the two are not well mixed together, and the oil of vitriol remains in some parts undiluted, the cloth is corroded into holes.

Let us now take a view of the advantages which the vitriol-fours must have over the milk. The latter is full of oily particles, some of which must be left in the cloth: But the case is worse when the scum is allowed to precipitate upon the cloth. The former is liable to neither of these objections.

The common fours hasten very fast to corruption; and if, from want of proper care, they ever arrive at that state, must damage the cloth very much. As the milk is kept very long, it is often corrupted before it is used; and, without acting as a four, has all the bad effects of putrefaction. The vitriol-fours are not subject to putrefaction.

The milk takes five days to perform its task, but the vitriol-

vitriol-fours do it in as many hours; nay, perhaps as many minutes. Their junction with the absorbent particles in the cloth must be immediate, whenever these acid particles enter with the water. An unanswerable proof that the fact is so, arises from the circumstances which happen when the cloth is first steeped in the vitriol-four; the cloth has no sooner imbibed the acid liquor than it loses all acidity, and becomes immediately vapid. This effect of vitriol-fours must be of great advantage in the bleachfield, as the bleachers are at present hindered from enjoying the season by the tediousness of the souring process. The whole round of operations takes seven days; to answer which they must have seven parcels, which are often mixing together, and causing mistakes. As three days, at most, will be sufficient for all the operations when vitriol-fours are used, there will be no more than three parcels. The cloth will be kept a shorter time in the bleachfield, and arrive sooner at market.

The milk-fours are very dear, and often difficult to be got; but the vitriol are cheap, may be easily procured, and at any time.

There is yet another advantage in the use of vitriol, and that is its power of whitening cloth. Even in this diluted state, its whitening power is very considerable. We have already seen, that it removes the same colouring particles, which the alkaline lyes do. What of it then remains, after the alkaline and absorbent particles are neutralized in the cloth, must act on these colouring particles, and help to whiten the cloth. That this is really the case, appears from the following fact. Mr Chryslie being obliged to chuse twenty of the whitest pieces out of a hundred, five of the twenty were taken out of seven pieces which were bleached with vitriol.

From both experience and reason, it appears, that it would be for the advantage of our linen-manufacture to use vitriol in place of milk-fours.

#### HAND-RUBBING with Soap and Warm Water, RUBBING-BOARDS, STARCHING, and BLUING.

AFTER the cloth comes from the souring, it should be well washed in the washing-mill, to take off all the acid particles which adhere to its surface. All acids decompose soap, by separating the alkaline salts and oily parts from one another. Were this to happen on the surface of the cloth, the oil would remain; nor would the washing-mill afterwards be able to carry it off.

From the washing-mill the fine cloth is carried to be rubbed by womens hands, with soap and water. As the liquors, which are generally employed for souring, are impregnated with oily particles, many of these must lodge in the cloth, and remain, notwithstanding the preceding milling. It is probable, that all the heavy oils are not evaporated by bleaching. Hence it becomes necessary to apply soap and warm water, which unite with, dissolve, and carry them off. It is observed, that if the cloth, when it is pretty white, gets too much soap, the following bleaching is apt to make it yellow; on that account they often wring out the soap.

It is a matter worth inquiring into, whether hard or soft soap is best for cloth. Most bleachers agree, that

hard soap is apt to leave a yellowness in the cloth. It is said, that the use of hard soap is discharged in Holland. As there must be a considerable quantity of sea-salt in this kind, which is not in the soft, and as this salt appears prejudicial to cloth, the soft soap ought to be preferred.

The management of the coarse cloth is very different, in this operation, from fine. Instead of being rubbed with hands, which would be too expensive, it is laid on a table, run over with soap, and then put betwixt the rubbing-boards, which have ridges and grooves from one side to another, like teeth. These boards have small ledges to keep in the soap and water, which washes the cloth. They are moved by hands, or a water-wheel, which is more equal and cheaper. The cloth is drawn, by degrees, through the boards, by men who attend; or, which is more equal and cheaper, the same water-wheel moves two rollers, with ridge and groove, so that the former enters the latter, and, by a gentle motion round their own axis, pull the cloth gradually through the boards.

This mill was invented in Ireland about thirty years ago. The Irish bleachers use it for their fine, as well as coarse cloth. These rubbing-boards were discharged, some years ago, in Ireland, by the Trustees for the manufactures of that country, convinced from long experience of their bad effects. But as proper care was not taken to instruct the bleachers by degrees in a safer method, they continued in the old, made a party, and kept possession of the rubbing-boards. There were considerable improvements made in them in this country; such as the addition of the ledges, to keep the cloth moist; and of the rollers, which pull the cloth more gradually than mens hands. These improvements were first made in Salton bleachfield.

The objections against these rubbing-boards, are unanswerable. By rubbing on such an unequal surface, the solid fibrous part of the cloth is wore; by which means it is much thinned, and in a great measure weakened before it comes to the market. As a proof of this, if the water which comes from the cloth in the rubbing-boards be examined, it will be found full of cottony fibrous matter. These boards give the cloth a cottony surface, so that it does not keep long clean. Again, they flatten the threads, and take away all that roundness and firmness, which is the distinguishing property of cloth bleached in the Dutch method.

For these reasons they must be very prejudicial to fine cloth, and should never be used in bleaching it. As they seem to be, in some measure, necessary to lessen the expence of bleaching coarse linen, they ought never to be used above twice, or thrice at most. They might be rendered much more safe, by lining their insides with some soft elastic substance, that will not wear the cloth so much as the wooden teeth do. Mr Chryslie at Perth has lined his boards with short hair for some years past, and finds that it answers very well.

After the coarse linen has undergone a rubbing, it should be immediately milled for an hour, and warm water poured now and then on it to make it lather. This milling has very good effects; for it cleans the cloth of all

all the dirt and filth which the rubbing-boards have loosened, and which, at the next boiling, would discolour the cloth. Besides, it is observed, that it makes the cloth less cottony, and more firm, than when whitened by rubbing alone.

The last operation is that of starching and bluing. It often happens, that the cloth, when exposed to the weather to be dried after this operation, gets rain; which undoes all again, and forces the bleacher to a new expence. To remedy this inconvenience, Mr Chrystie, some years ago, invented the dry-house, where the cloth may be dried, after this operation, in any weather. This invention meets with universal approbation.

#### A METHOD OF BLEACHING SAFELY WITH LIME.

Dr Home has found by repeated trials, that alkaline salts added to lime, diminish its power of weakening and corroding cloth; and that in proportion to the quantity of these salts added to the lime. This composition, as it is not so dangerous as lime alone, so it is not so expeditious in whitening. When equal parts of each are used, the whitening power is strong, and the weakening power not very considerable; so that they might be used with safety to bleach cloth, in the proportion of one part of lime to four of pure alkaline salts. This fully accounts for an observation made by all bleachers, That the bleaching salts, when mixed together, operate safer and better than when used separately. For the corrosive power of the Muscovy, Marcast, and Cashub ashes is corrected by the pearl ashes, and the whitening quality of the latter is increased by that of the former.

There is not a more corroding substance, with regard to animals, than alkaline salts and lime joined together, especially when fused in the fire. This is the composition of the common caustic. But lime, and lime-water alone, preserve animal substances in a sound entire state. It appears then surprising, that salts and lime should be found so little destructive of cloth, when lime, or lime-water alone, destroys it so remarkably. But that this is a fact, is made evident by many experiments, and has been practised both with success and safety, by a bleacher who gives the following account of his method of bleaching with lime.

“ First, says he, I steep the cloth in warm water for twenty-four hours; then clean it in a washing mill, of all the dressing, or fowen, as the vulgar term it. Afterwards I buck the cloth with cow-dung and water, and bleach it with this for three days; then clean it again, and boil it with a lye made of Cashub ashes. A pound to each piece of 18 or 20 yards long is sufficient. This I do twice, as no lime ought to be given to cloth before it is a full third whitened; it by no means advances the whitening of the cloth, but, on the contrary, protracts it: For, instead of loosening the oil and dirt in the cloth, when brown, it rather fixes them; just as when fine cloth is bucked with over-warm-lyes in the first buckings. Lime is by no means fit for discharging the oil in the cloth, but for cleaning it of the dead part, commonly called *sprat*. The cloth, being cleaned, is

laid upon a dreeper. It must not be drier before bucking with lime, otherwise it will take in more than can be got out again before the next application: For as I have observed already, that lime is only fit for discharging the dead part, bucking thus wet make it rest on the outside of the cloth. I take a lippy of the finest and richest powdered lime that can be got, of the brightest white colour, as poor lime does more hurt than good, to thirty pieces of the above length; and make a cold lye of it, by stirring and pouring water off the lime, until all be dissolved, but the dross, which is thrown away: Then I add a little soap, which makes the lye have the nearest resemblance to milk that breaks in boiling, of any thing I can think of: For this soap blunts the hotness of the lime. Then I take the cloth, and dip it in the lime-lye; and that moment out again, and lay it on a dreeper until it be bucked; then put it on the field, watering it carefully: for if allowed to dry, it is much damaged. This is done always in the morning; as it cannot be done at night, in regard of the hot quality of the lime, which soon heats the cloth, and tenders it. If a hot sunshine follows, it has great effect: for lime is just like all other materials for bleaching, that have more or less effect according as the weather is good or bad. I take it up the second day after bucking, and give it a little milling, or hand-bleaching, or bitting, commonly called *knocking*; and lay it on the field again, watering it carefully as before. The effect is more visible the second than the first day. As all cloth when limed should have a great deal of work, otherwise more than half the effect is lost; and not only that, but a great deal of labour and pains is requisite to take the lime out of the cloth again; it must never be exposed on the Sabbath day, but carefully kept wet always while used in this way. Thus bucking for three or four times at most, is sufficient for any cloth, except that made of flax pulled either over-green, or which grows in a drougthy season, or perhaps not so well heckled as it should be. This sort occasions great trouble and expence to the bleacher. But the most effectual and expeditious way I ever found for this kind, was, after boiling, to take a little of the warm lye, and mix a very small quantity of lime with it, and draw the cloth through that as hot as possible, and put it on the field directly, watering it carefully. This will clean it of the *sprat* surprisngly. Then I boil it with pearl ashes, and give it the last boil with soap.

“ There are innumerable mistakes in the use of lime committed by the vulgar, who are ignorant of its quality and effects. They know only this in general, that it is a thing which whitens cloth cheap, and is easy purchased; therefore they will use it. Some of them begin whitening of their cloth with it, which I have already observed to be wrong, and given reasons for it, and continue it until the cloth is bleached; give it a boil or two at most, and then wash it up while the gross body of the lime is in the substance of the cloth. This makes limed cloth easily distinguishable from unlimed, as the former has a yellowish colour, and is full of a powder. Besides, as lime is of a very hot corroding nature, it must by degrees weaken the cloth. The bad effects of this substance do not end here. When the cloth is put on board, it contracts

tracts a dampness, which not only makes it yellow, and lose any thing of colour it has, but directly rots it. And although it should escape this, which it is possible it may, by a quick and speedy passage; yet whenever it is put in any warehouse, it will meet with moisture there, especially if the winter-season should come on before it is disposed or made use of. These I take to be the prin-

cipal reasons for so much complaint in bleaching with this material."

The whole art and safety in using the lime, according to this method, depends on the junction of the alkaline salts, during the bucking, to the particles of lime which were on the surface of the cloth.

## B L E

**BLEAK**, the English name of the fish called cyprinus. See **CYPRINUS**.

**BLECHINGLY**, a borough-town of Surry, about twenty miles south of London; W. long. 20', and N. lat. 51° 20'.

**BLECHNUM**, in botany, a genus of the cryptogamia filices. The seeds and parts of fructification of this fern lie in small lines under the plaits of the leaves.

The species are two, *viz.* the occidentale, a native of America; and the orientale, a native of China.

**BLEEDING**, in surgery. See **SURGERY**.

**BLEEDING** at the nose. See **HEMORRHAGE**, and **MEDICINE**.

**BLEEDING** is also used for the drawing out the sap of plants, otherwise called tapping. See **TAPPING**.

**BLEKING**, the most south-easterly province of Sweden, having the Baltic on the south, Smaland on the north, and the province of Schonen on the west.

**BLEMISH**, a term in hunting, when the hounds or beagles finding where the chace has been, make a proffer to enter, but return.

**BLEMYES**, or **BLEMMYES**, a fabulous people of Ethiopia, said to have had no heads; their eyes, mouth, &c. being situated in their breasts.

**BLENCH** or **BLANCH**. See **BLANCH**.

**BLEND**, or **BLENDE**, a mineral substance resembling lead-ore, but containing very little of that metal.

**BLEND-WATER**, called also *morebough*, a distemper incident to black cattle, comes either from the blood, from the yellows, or from the change of ground.

In order to cure it, take bole armoniac, and as much charcoal dust as will fill an egg-shell, a good quantity of the inner bark of an oak, dried and pounded together to a powder, and give it to the beast in a quart of new milk and a pint of earning.

**BLENHEIM**, a village of Swabia in Germany, situated on the west side of the Danube, three miles north-east of Hockstet, and twenty-seven miles north-east of Ulm; E. long. 10° 25', N. lat. 48° 40'.

**BLENNIUS**, in ichthyology, a genus of fishes belonging to the order of jugulares; the characters of which are these: The head slants or declines to one side; there are six rays in the membrane of the gills; the body tapers toward the tail; the belly-fins have only two blunt bones; and the tail-fin is distinct. The species are 13, *viz.* 1. The galeria, with a transverse membranous crest upon the head. It is found in the European seas. 2. The cristatus, with a longitudinal bristly crest betwixt the eyes. 3. The cornutus, with a simple ray above the eyes, and a single back-fin. The

## B L I

above two are natives of the Indies. 4. The ocellaris, with a furrow betwixt the eyes, and a large spot on the back-fin. 5. The gattorgine, with small palmed fins about the eye-brows and neck. It is about seven or eight inches long. These two last are found in the European seas. 6. The superciliosus, with small fins about the eye-brows, and a curved lateral line. It is a native of India. 7. The phycis, with a kind of crested nostrils, a cirrus or beard on the under lip, and a double fin on the back. It has seven rays in the gill-membrane; the anus is surrounded with a black ring; and the tail is roundish. 8. The pholis has a smooth head, a curve line upon the sides, and the upper jaw is larger than the under one. The two last are found in the Mediterranean sea. 9. The gunnellus has 10 black spots on the back-fin. It is found in the Atlantic Ocean. 10. The mustelaris has three rays on the fore-part of the back-fin. It is a native of India. 11. The viviparus has two tentacula at the mouth. 12. The lumpenus has several dusky-coloured areolæ running across its body. The two last are found in the European seas. 13. The ranius, with six divisions in the belly-fins. It is found in the lakes of Sweden. It is remarkable, that when this fish appears in the lake, all the other fishes retire; and what is worse, it is not fit for eating.

**BLEYME**, an inflammation arising from bruised blood on a horse's sole and the bone of the foot, towards the heel. Of these there are three sorts: The first being bred in spoiled wrinkled feet, with narrow heels, are usually seated in the inward or weakest quarter. In this case the hoof must be pared, and the matter let out; then let oil of mercurial be poured in, and the hoof be charged with a remolade of foot and turpentine.

The second sort, besides the usual symptoms of the first, infects the gristle, and must be extirpated, as in the cure of a quarter bone, giving the horse, every day, moistened bran, with two ounces of liver of antimony, to divert the course of the humours, and purify the blood.

The third sort of bleyemes, is occasioned by small stones and gravel between the shoe and the sole. In this case the foot must be pared, and the matter, if any, let out: If there be no matter, then the bruised sole must be taken out; but if there be matter, the fore must be dressed like the prick of a nail.

**BLIGHT**, in husbandry, a disease incident to plants, which affects them variously, the whole plant sometimes perishing by it, and sometimes only the leaves and

and blossoms, which will be scorched and shrivelled up, the rest remaining green and flourishing.

Some have supposed that blights are usually produced by an easterly wind, which brings vast quantities of insects eggs along with it, from some distant place, that, being lodged upon the surface of the leaves and flowers of fruit-trees, cause them to shrivel up and perish.

To cure this distemper, they advise the burning of wet litter on the windward side of the plants, that the smoke thereof may be carried to them by the wind, which they suppose will stifle and destroy the insects, and thereby cure the distemper.

Others direct the use of tobacco-dust, or to wash the trees with water wherein tobacco-stalks have been infused for twelve hours; which they say will destroy those insects, and recover the plants.

Pepper-dust scattered over the blossoms of fruit-trees, &c. has been recommended as very useful in this case; and there are some that advise the pulling off the leaves that are distempered.

The true cause of blights seems to be continued dry easterly winds for several days together, without the intervention of showrs, or any morning dew, by which the perspiration in the tender blossom is stopped; and if it so happens, that there is a long continuance of the same weather, it equally affects the tender leaves, whereby their colour is changed, and they wither and decay.

The best remedy for this distemper, is gently to wash and sprinkle over the tree, &c. from time to time with common water; and if the young shoots seem to be much infected, let them be washed with a woollen cloth, so as to clear them, if possible, from this glutinous matter, that their respiration and perspiration may not be obstructed. This operation ought to be performed early in the day, that the moisture may be exhale before the cold of the night comes on: Nor should it be done when the sun shines very hot.

Another cause of blights in the spring, is sharp hoary frosts, which are often succeeded by hot sunshine in the day time: This is the most sudden and certain destroyer of the fruits that is known.

**BLIGHTED corn.** See **SMUT.**

**BLIND.** See **BLINDNESS.**

**PORE-BLIND, or pur-BLIND.** A person who is very short-sighted is said to be *pur-blind*.

**MOON-BLIND,** denotes horses that lose their sight at certain times of the moon.

**BLIND** is also used figuratively, for things without apertures; Thus we say, *a blind wall, a blind alembic,* &c.

**BLIND,** among traders, a kind of false light which they have in their warehouses and shops, to prevent too great a light from diminishing the lustre of their stuffs.

**BLIND, BLINDE, or BLEND.** See **BLEND.**

**BLINDS, or BLINDES,** in the art of war, a sort of defence commonly made of ozers, or branches interwoven, and laid across, between two rows of stakes, about the height of a man, and four or five feet asunder, used particularly at the heads of trenches, when they are extended in front towards the glacis; serving to shelter the workmen, and prevent their being overlooked by the enemy.

**BLINDNESS,** a total privation of sight, arising from an obstruction of the functions of the organs of sight, or from an intire deprivation of them. See **MEDICINE, Of the gutta serena, &c.**

**BLINDNESS,** in farriery. When a horse becomes blind, it may be thus discerned: His walk or step is always uncertain and unequal, so that he does not set down his feet boldly when led in one's hand: But if the same horse be mounted by an expert horseman, and if he be a beast of metal, then the fear of the spurs will make him go resolutely and freely; so that his blindness can hardly be perceived.

**BLISTER,** in medicine, a thin bladder containing a watery humour, whether occasioned by burns, and the like accidents, or by vesicatories applied to different parts of the body for that purpose.

Cantharides, or Spanish flies, applied in the form of a plaster, are chiefly used with this intention. See **CANTHARIDES.**

**BLITE,** in botany. See **BLITUM.**

**BLITH,** a market-town in Nottinghamshire, about 18 miles north-west of Newark; in 1° W. long. and 53° 25' N. lat.

**BLITUM,** in botany, a genus of the monandria digynia class. The calix consists of three segments; there are no petals; and the seed, which is single, is inclosed in the calix, which becomes a kind of berry. The species are two; *viz.* the capitatum, a native of Tyrol; and the virgatum, a native of Tartary and Spain.

**BLOATING,** among physicians. See **ΕΜΦΥΣΜΑ.**

**BLOCK,** a large mass of wood, serving to work or cut things on.

**BLOCKS,** on ship-board, is the usual name of what we call pulleys at land. They are thick pieces of wood, some with three, four, or five shivers in them, through which all the running ropes run. Blocks, whether single or double, are distinguished and called by the names of the ropes they carry, and the uses they serve for.

Double blocks are used when there is occasion for much strength, because they will purchase with more ease than single blocks, though much slower.

Block and block is a phrase signifying that two blocks meet, in hauling any tackle, or halliard, having such blocks belonging to them.

Fifth-block is hung in at a notch at the end of the davit. It serves to hale up the flocks of the anchor at the ship's prow.

Snatch-block is a great block with a shiver in it, and a notch cut through one of its cheeks, for the more ready receiving of any rope; as by this notch the middle-part of a rope may be reeved into the block, without passing it endwise. It is commonly fastened with a strap about the main-mast, close to the upper deck, and is chiefly used for the fall of the winding tackle, which is reeved into this block, and then brought to the capstan.

**Block,** among bowlers, denotes the small bowl used as a mark.

**Block,** in falconry, the perch upon which they place the hawk. It ought to be covered with cloth.

**BLOCKADE,** in the art of war, the blocking up a place,

place; by posting troops at all the avenues leading to it, to keep supplies of men and provisions from getting into it; and by these means proposing to starve it out, without making any regular attacks.

To raise a blockade, is to force the troops that keep the place blocked up, from their posts.

**BLOIS**, a beautiful city of Orleansois, about 30 miles south-west of Orleans; situated on the north shore of the river Loire, in one of the finest countries in France; in  $1^{\circ} 20'$  E. long. and  $47^{\circ} 35'$  N. lat.

**BLOMARY**, or **BLOOMARY**, in metallurgy, the first forge through which iron passes, after it is melted out of the ore.

**BLONIC**, a town of Poland, about 20 miles west of Warsaw; in  $20^{\circ} 30'$  E. long. and  $52^{\circ}$  N. lat.

**BLOOD**, a well known fluid, which circulates through the arteries, veins, &c. of animal-bodies, and nourishes all their parts.

Blood is composed of a thin watery liquor called *serum*, and a thick red part called *crassamentum*, which, when viewed by the microscope, appears to consist of red globules of a certain determined magnitude. These globules are generally believed to be of the same magnitude in all animals that have red blood.

As blood is originally derived from our aliment, it must consist of the same principles, and consequently abound with salts and oils. The salts of the blood are partly of the fixed neutral kind, and partly such as are rendered semi-volatile by the heat and motion to which they are subjected: Both irritate the sensible nervous parts of animals; for it is well-known that any kind of salt applied to the eye gives great uneasiness. From these qualities of blood the late learned and celebrated Dr Whytt concluded that it must be well fitted to communicate a gentle stimulus to those sensible nerves which terminate on the internal surface of the auricles and ventricles of the heart; and consequently that the contraction of the heart is principally owing to this cause. The diameter of a red globule is computed to be about  $\frac{1}{250}$  part of an inch. See **CIRCULATION**; and for the analysis of blood, see **CHEMISTRY**.

Authors are not agreed in regard to the quantity of blood contained in the human body; some making it only 10 pounds, whilst others make it to be 20, 60, or even 100 pounds: But then these last comprehend the juices of the lymphatic vessels under the term blood. As to the quantity of current blood in a horse, the ingenious Dr Hales found it be, at a low computation, 1105 cubic inches, or 42.2 pounds.

*Spitting of Blood.* See **HÆMORRHOE** and **MEDICINE**.

*Ebullition of the Blood*, a disease in horses, which proceeds from want of exercise, and gives rise to outward swellings, frequently mistaken for the farcin.

**BLOOD running itch** happens to a horse by the blood's being over-heated by hard riding or other labour. As the blood gets between the skin and the flesh, it makes a horse rub and bite himself, and if neglected will turn to a grievous mange.

**BLOOD of Christ**, the name of a military order instituted at Mantua in 1608. The number of knights

was restricted to twenty, besides the grand master. Their device was, *Domine probasti me*, or, *Nihil hoc, trifle, recepto*.

**BLOOD of Christ** is also the name of a congregation of nuns at Paris.

*Dragon's Blood.* See **DRAGON**.

*Blood-snake.* See **ÆGUIS**.

*Blood-stone.* See **HÆMATITES**.

*Blood-suit*, a mulct or fine for shedding of blood.

*Blood-wort*, in botany. See **SANGUINARIA**.

*Bloody flux.* See **DYSENTERY**, and **MEDICINE**.

**BLOOM**, a mass of iron after having undergone the first hammering, called *blomy*. See **BLOMARY**.

**BLOSSOM** denotes the flowers of plants, but more especially of fruit-trees.

**BLOSSOM**, or **PEACH-COLOURED**, in the menage, a term applied to a horse that has his hair white, but intermixed all over with sorrel and bay hairs. Such horses are so insensible and hard both in the mouth and the flanks, that they are scarce valued; besides, they are apt to turn blind.

**BLOW**, in law, any kind of stroke, whether given with the hand or a weapon. See **BATTERY**.

*Blow-pipe*, or *blowing pipe*, a hollow tube, used by several artificers; as enamellers, glass-makers, &c.

**BLOWING**, in a general sense, denotes an agitation of the air, whether performed with a pair of bellows, the mouth, a tube, or the like.

*Blowing of glass*, one of the methods of forming the divers kinds of works in the glass-manufacture. See **GLASS**.

It is performed by dipping the point of an iron blowing-pipe in the melted glass, and blowing through it with the mouth, according to the circumstances of the glass to be blown.

*Blowing of tin* denotes the melting its ore, after being first burnt to destroy the mundic.

**BLOWING**, among gardeners, the same with the blossoming of plants, or putting forth their flower-leaves.

**BLUBBER** denotes the fat of whales and other large sea-animals, whereof is made train-oil.

**BLUE**, otherwise called *azure*, is one of the primitive colours of the rays of light. See **OPTICS**.

*Painters Blue* is made different according to the different kinds of painting. In limning, fresco, and miniature, they use indifferently ultramarine, blue-ashes, and smalt: These are their natural blues, excepting the last, which is partly natural, and partly artificial.

In oil and miniature, they also use indigo prepared; as also a fictitious ultramarine. See **ULTRAMARINE** and **INDIGO**.

Enamellers, and painters upon glass, have also blues proper to themselves, each preparing them after their own manner.

**Turnsole BLUE** is used in painting on wood, and is made of the seed of the turnsole: The way of preparing it is, to boil four ounces of turnsole in a pint and half of water in which lime has been slacked.

**Flanders BLUE** is a colour bordering on green, and seldom used but in land-kips.

To write on paper or parchment with BLUE ink. Grind blue with honey, then temper it with glair of eggs, or gum made of isinglafs.

BLUEING of metals is performed by heating them in the fire, till they assume a blue colour; particularly practised by gilders, who blue their metals before they apply the gold and silver leaf.

To dye skins BLUE. Boil elder-berries or dwarf-elder, then smear and wash the skins therewith, and wring them out; then boil the berries, as before, in a solution of alum-water, and wet the skins in the same manner once or twice; dry them, and they will be very blue.

Dyers BLUE is one of their simple or mother-colours, used in the composition of others. It is made of woad, indigo, and a pastel brought from Normandy. Some dyers heighten their blue, by adding Brazil and other woods.

A BLUE for painting or staining of glass. Take fine white sand twelve ounces, zaffer and minium of each three ounces; reduce them to a fine powder in a bell-metal mortar; then putting the powder into a very strong crucible, cover it and lute it well, and, being dry, calcine it over a quick fire for an hour; take out the matter and pound it; then to sixteen ounces of this powder add fourteen of nitre powder; mix them well together, and put them into the crucible again; cover and lute it, and calcine for two hours on a very strong fire.

Prussian BLUE. This blue is next to ultramarine for beauty, if it be used in oil: This colour does not grind well in water.

BLUE bice is a colour of good brightness, next to Prussian blue; and also a colour of a body, and will show pretty well in the pencil.

Saunders BLUE is also of very good use, and may serve as a shade to ultramarine or the blue bice, where the shades are not required to be very deep, and is of itself a pleasant blue, to be laid between the light and shades of such a flower as is of a mazarine blue.

A fine BLUE from Mr Boyle. Take the blue leaves of rue, and beat them a little in a stone mortar with a wooden pestle; then put them in water, juice and all, for fourteen days or more, washing them every day till they are rotten; and at last beat them and the water together, till they become a pulp, and let them dry in the sun. This is a fine blue for shading.

Indigo-BLUE. This makes the strongest shade for blues of any other, and is of a soft warm colour, when it has been well ground, and washed with gum-water, by means of a stone and a muller.

Lacmus, or Litmus BLUE. This is a beautiful blue, and will run in a pen as free as ink. It is made of lacmus, and prepared thus: Take an ounce of lacmus, and boil it in a pint of small-beer wort, till the colour is as strong as you would have it; then pour off the liquor into a gallipot, and let it cool for use. This affords a beautiful colour, has extraordinary effects, and is a holding colour; if it be touched with aqua-fortis, it immediately changes to a fine crimson, little inferior to carmine.

BLUE-Japan. Take gum-water, what quantity you please, and white lead a sufficient quantity; grind them well upon a porphyry; then take isinglafs size what quantity you please, of the finest and best smalt a sufficient quantity, mix them well; to which add, of your white lead, before ground, so much as may give it a sufficient body; mix all these together to the consistence of a paint.

BLUE-bottle, in botany. See CYANUS.

BLUE-cap, in ichthyology. See SALMO.

BLUE-mantle, in heraldry, the title of a pourfivant at arms.

BLUFF-HEAD, among sailors. A ship is said to be bluff-headed, that has an upright stern.

BLUNDERBUSS, a short fire-arm with a wide bore, capable of holding a number of bullets at once.

BLUSHING, a suffusion, or redness of the cheeks, excited by a sense of shame, on account of a consciousness of some failing or imperfection.

B MI, in music, the third note in the modern scale. See SCALE and MUSIC.

B MOLLARRE, or MOLLE, one of the notes of the scale of music, usually called soft or flat, in opposition to b quadro. See B QUADRO.

BOA, in zoology, a genus of serpents, belonging to the order of amphibia. The characters of this genus are, that the belly and tail are both furnished with scuta. The species are ten, viz. 1. The contortrix, has 150 scuta on the belly, and 40 on the tail; the head is broad, very convex, and has poison-bags in the mouth, but no fang, for which reason its bite is not reckoned poisonous: The body is ash-coloured, interspersed with large dusky spots; and the tail is about a third of the length of the body. This serpent is found in Carolina. 2. The canina, has 203 scuta on the belly, and 77 on the tail; it is greenish, and variegated with white belts. It is a native of America, and lodges in the hollow-trunks of trees, and is about two feet long. The bite of the canina is not poisonous. 3. The bipale, is of a dull yellow colour, and is found in Asia. It has 179 scuta on the belly, and 120 on the tail.—4. The constrictor, has 240 scuta on the belly, and 60 on the tail. This is an immense animal; it often exceeds 36 feet in length; the body is very thick, of a dusky white colour, and its back is interspersed with 24 large pale irregular spots; the tail is of a darker colour; and the sides are beautifully variegated with pale spots. Besides, the whole body is interspersed with small brown spots. The head is covered with small scales, and has no broad laminae betwixt the eyes, but has a black belt behind the eyes. It wants the large dog-fangs, and of course its bite is not poisonous. The tongue is fleshy, and very little forked. Above the eyes, on each side, the head rises high. The scales of this serpent are all very small, roundish, and smooth. The tail does not exceed one eighth of the whole length of the animal. The Indians, who adore this monstrous animal, use the skin for cloaths, on account of its smoothness and beauty. There are several of these skins of the above dimensions preserved, and to be seen in the different mu-

seums of Europe, particularly in the library and botanic garden of Upsal in Sweden, which has of late been greatly enriched by count Grillinborg. The flesh of this serpent is eat by the Indians, and the negroes of Africa. Piso, Margraave, and Kempter give the following account of its method of living and catching its prey. It frequents caves and thick forests, where it conceals itself, and suddenly darts out upon travellers, wild beasts, &c. When it chuses a tree for its watching-place, it supports itself by twisting its tail around the trunk or a branch, and darts down upon sheep, goats, tigers, or any animal that comes within its reach. When it lays hold of animals, especially any of the larger kinds, it twists itself several times round their body, and, by the vast force of its circular muscles, bruises and breaks all their bones. After the bones are broke, it licks the skin of the animal all over, besmearing it with a glutinous kind of saliva. This operation is intended to facilitate deglutition, and is a preparation for swallowing the whole animal. If it be a stag, or any horned animal, it begins to swallow the feet first, and gradually sucks in the body, and last of all the head. When the horns happen to be large, this serpent has been observed to go about for a long time with the horns of a stag sticking out from its mouth. As the animal digests, the horns putrify and fall off. After this serpent has swallowed a stag or a tyger, it is unable for some days to move; the hunters, who are well acquainted with this circumstance, always take this opportunity of destroying it. When irritated, it makes a loud hissing noise. This serpent is said to cover itself over with leaves in such places as stags or other animals frequent, in order to conceal itself from their sight, and that it may the more easily lay hold of them. See Plate LII. fig. 1.—5. The murina, has 254 scuta on the belly, and 65 on the tail. The colour of it is a light blue, with round spots on the back. It is a native of America, and its bite is not poisonous. 6. The scytale, has 250 scuta on the belly, and 70 on the tail. The body is ash-coloured and bluish, with round black spots on the back, and black lateral rings edged with white. This serpent is a native of America; and, like the constrictor, though not so long, twists itself about sheep, goats, &c. and swallows them whole. 7. The cenchria, has 265 scuta on the belly, and 57 on the tail. It is of a yellow colour, with white eye-like spots. It is a native of Surinam, and its bite is not poisonous. 8. The ophrias, has 281 scuta on the belly, and 64 on the tail; the colour is nearly the same with that of the constrictor, but browner. The place where this serpent is to be found is not known; but its bite is not venomous. 9. The enydris, has 270 scuta on the belly, and 105 on the tail. The colour is a dusky white, and the teeth of the lower jaw are very long; but its bite is not poisonous. It is a native of America. 10. The hortulana, has 290 scuta on the belly, and 128 on the tail. It is of a pale colour, interperfed with livid wedge-like spots. It is a native of America, and its bite is not poisonous.—For the nature and qualities of serpents in ge-

neral, their method of propagation, &c. see NATURAL HISTORY.

BOAR, a male swine. See SUS.

BOAR, in the menage. A horse is said to boar, when he floots out his nose as high as his ears, and tosses his nose in the wind.

BOARD, a long piece of timber, sawed thin for building and several other purposes. See TIMBER.

Barrel-BOARDS, imported from Ireland, Asia, or Africa, pay only 11.  $\frac{1}{2}$  d. the hundred; but if imported from elsewhere, they pay 1s. 5.  $\frac{1}{2}$  d. Clap-boards pay 4s. 9.  $\frac{1}{2}$  d. the hundred; but if imported from Ireland, Asia, or Africa, only 2s. 10.  $\frac{1}{2}$  d. Pipe-boards pay 5s. 8.  $\frac{1}{2}$  d. the hundred; but if from Ireland, &c. only 3s. 10.  $\frac{1}{2}$  d. Scale-boards pay 8s. 5.  $\frac{1}{2}$  d. the hundred weight; and  $\frac{1}{2}$  d. more if imported in foreign bottoms.

BOARD, among seamen. *To go aboard*, signifies to go into the ship. *To slip by the board*, is to slip down by the ship's side. *Board and board*, is when two ships come so near as to touch one another, or when they lie side by side. *To make a board*, is to turn to windward; and the longer your boards are, the more you work into the wind. *To board it up*, is to beat it up, sometimes upon one tack, and sometimes upon another. *She makes a good board*, that is, the ship advances much at one tack. *The weather-board*, is that side of the ship which is to windward.

BOARD is also used for an office under the government: thus we say, the board of trade and plantations, the board of works, ordnance, &c.

BOARDING a ship, is entering an enemy's ship in a fight.

In boarding a ship, it is best to bear up directly with him, and to caufe all your ports to leeward to be beat open; then bring as many guns from your weather side as you have ports for; and laying the enemy's ship, on board, loof for loof, order your tops and yards to be manned and furnished with necessaries; and let all your small shot be in a readiness; then charge at once with both small and great, and at the same time enter your men under cover of the smoke, either on the bow of your enemy's ship, or bring your midship close up with her quarter, and so enter your men by the shrouds: or if you would use your ordnance, it is best to board your enemy's ship athwart her hawse; for in that case you may use most of your great guns, and the only those of her prow. Let some of your men endeavour to cut down the enemy's yards and tackle, whilst others clear the decks, and beat the enemy from aloft. Then let the scuttles and hatches be broke open with all possible speed to avoid trains, and the danger of being blown up by barrels of powder placed under the decks.

BOAT, a small open vessel, commonly wrought by rowing.

BOATSWAIN, a ship-officer, to whom is committed the charge of all the tacklings, sails, and rigging, ropes, cables, anchors, flags, pendants, &c. He is also to take care of the long-boat and its furniture, and to steer her either by himself or his mate.

Fig. 1. BOA

- He calls out the several gangs and companies aboard, to the due execution of their watches, works, spells, &c. He is likewise provost-marshal, who sees and punishes all offenders sentenced by the captain, or a court-martial of the fleet.
- BOATSWAIN'S MATE** has the peculiar command of the long boat, for the setting forth of anchors, weighing or fetching home an anchor, warping, towing, or mooring; and is to give an account of his store.
- BOB**, a term used for the ball of a short pendulum.
- BOBARTIA**, in botany, a genus of the triandria digynia class. The calix is imbricated; and the corolla consists of a double-valved glüma. There is but one species, *viz.* the indica, a native of the Indies.
- BOBBIN**, a small piece of wood turned in the form of a cylinder, with a little border jutting out at each end, bored through to receive a smaller pivot. It serves to spin with the spinning-wheel, or to wind thread, worsted, hair, cotton, silk, gold, and silver.
- BOBBING**, a method of fishing. See **FISHING**.
- BOBBIO**, a town of the Milanese, in Italy, about twenty-eight miles south-east of Pavia; E. long. 10°, N. lat. 44° 35'.
- BOCA**, in ichthyology. See **SPARUS**.
- BOCA-CHICA**, the entrance into the harbour of Carthage, in South America, defended by several forts.
- BOCA DEL DRAGO**, a strait between the island of Trinidad and New Andalusia, a province of Terra Firma. See **TERRA FIRMA**.
- BOCARD**, among logicians, the fifth mode of the third figure of syllogisms, in which the middle proposition is an universal affirmative, and the first and last particular negatives, thus:  
 Bo Some sickly persons are not students;  
 Ca Every sickly person is pale;  
 Do Therefore some persons are pale that are not students.
- BOCCONIA**, in botany, a genus of the dodecandria monogynia class. There is only one species, *viz.* the frutescens, a native of America.
- BOCE**, in ichthyology. See **SPARUS**.
- BOCHARA**, a large town of Ussbec Tartary, situated on the river Oxus, about sixty miles west of Samarcand, in 65° E. long. and 40° N. lat.
- BOCKHOLT**, a town of Munster, in Westphalia, situated in 6° 20' E. long. and 51° 40' N. lat.
- BOCK-LAND**, in the Saxons time, is what we now call freehold lands, held by the better sort of persons by charter or deed in writing; by which name it was distinguished from folkland, or copy-hold land, holden by the common people without writing.
- BODKIN**, a small instrument made of steel, bone, ivory, &c. used for making holes.  
 The small gros, or twelve dozen, of bodkins pays on importation 1s. 3<sup>4</sup>/<sub>8</sub>d.; if of iron or steel, 4s. 8<sup>3</sup>/<sub>8</sub>d.; and if of brass, only 3<sup>3</sup>/<sub>8</sub>d.
- BODMIN**, a borough-town of Cornwall, about twenty-six miles north-east of Falmouth, in 5° 10' W. long. and 50° 32' N. lat. It sends two members to parliament, and gives the title of viscount to the earl of Radnor.
- BOEDROCH**, a town of Hungary, about an hundred miles south-east of Buda, and situated on the north-east shore of the Danube, in 20° 15' E. long. and 46° 15' N. lat.
- BODY**, in physics, an extended solid substance, of itself utterly passive and inactive, indifferent either to motion or rest. See **MATTER**, and **MECHANICS**.
- Colour of BODIES.* See **OPTICS**.
- Descent of BODIES.* See **MECHANICS**.
- Division of BODIES.* See **CHEMISTRY**.
- BODY**, with regard to animals, is used in opposition to soul, in which sense it makes the subject of anatomy.
- BODY**, among painters, as to bear a body, a term signifying that the colours are of such a nature, as to be capable of being ground so fine, and mixing with the oil so intirely, as to seem only a very thick oil of the same colour.
- BODY**, in the manege. A horse is chiefly said to have a good body, when he is full in the flank. If the last of the short ribs be at a considerable distance from the haunch bone, although such horses may, for a time, have pretty good bodies, yet, if they are much laboured, they will lose them; and these are properly the horses that have no flank. It is also a general rule, that a man should not buy a light-bodied horse, and one that is fiery, because he will soon destroy himself.
- BODY**, in the art of war, a number of forces, horse and foot, united and marching under one commander.
- Main Body of an army*, the troops encamped in the centre between the two wings, and generally infantry: the other two bodies are the vanguard and the rear-guard; these being the three into which an army, ranged in form of battle, is divided.
- BODY**, in matters of literature, denotes much the same with system, being a collection of every thing belonging to a particular science or art, disposed in proper order: thus, we say, a body of divinity, law, physics, &c.
- BOEDROMIA**, in Grecian antiquity, a festival celebrated yearly by the Athenians in the month Boedromion; for the ceremonies of which, see *Potter's Arch. Græc.* b. ii. c. 20.
- BOEDROMION**, in chronology, the third month of the Athenian year, answering to the latter part of our August and beginning of September.
- BOERHAAVIA**, in botany, a genus of the monandria monogynia class. It has no calix; the corolla consists of one bell shaped plaited petal; and there is but one naked seed. There are six species, all natives of the Indies.
- BOESCHOT**, a town of the Austrian Netherlands, situated in Brabant, about twelve miles north-east of Malines, in 4° 40' E. long. and 51° 5' N. lat.
- BOG** properly signifies a quagmire, covered with grass, but not solid enough to support the weight of the body.
- BOG**, in geography, a river of Poland, which, running south-east through the province of Podolia and Buziac Tartary, falls into the Euxine sea between Oczakow and the mouth of the Boristhenes.
- BOG**, or **BOG OF GICHT**, a small town of Scotland,

near the mouth of the river Spey, situated in  $2^{\circ} 23'$  W. long. and  $57^{\circ} 40'$  N. lat.

**BOGARMITÆ.** See **BOGOMILI.**

**BOGDOI,** a great nation of Tartary in Asia. The Chinese call them eastern Tartars; and in the Mogul's country they are called Niuchi or Nuchi.

**BOGHO,** or **BUEIL,** a town in the county of Nice, in Piedmont, situated on the frontiers of France, about twenty-five miles north-west of Nice, in  $6^{\circ} 45'$  E. long. and  $44^{\circ} 12'$  N. lat.

**BOGOMILI,** or **BOGARMITÆ,** in church-history, a sect of heretics, which sprung up about the year 1170. They thought that but seven books of the scripture are to be received, that the use of churches, of the sacrament of the Lord's supper, and all prayer, except the Lord's prayer, ought to be abolished; that the baptism of Catholics is imperfect; that the persons of the Trinity are unequal, and that they sometimes made themselves visible to those of their sect. They said, that devils dwelt in the churches, and that Satan had resided in the temple of Solomon from the destruction of Jerusalem to their own time.

**BOGOTO,** the capital of New Granada, in Terra Firma, situated in  $74^{\circ}$  W. long. and  $4^{\circ}$  N. lat.

**BOHEA,** in commerce, one of the best kinds of tea that come from China. There are three sorts of it: the first is bought at Canton for 80 tals *per picē*; the second for 45; and the third for 25. See **TEA.**

**BOHEMIA,** a kingdom subject to the house of Austria, bounded by Saxony on the north, by Poland and Hungary on the east, by Austria on the south, and by Bavaria and part of Saxony on the west. It lies between  $12^{\circ}$  and  $17^{\circ}$  E. long. and  $48^{\circ}$  and  $52^{\circ}$  N. lat.

**BOHEMIAN Bole.** See **BOLE.**

**BOHOL,** one of the Philippine islands, in Asia; E. long.  $122^{\circ}$ , N. lat.  $10^{\circ}$ .

**BOJANO,** a city of Molise, in the kingdom of Naples, about fifteen miles north of Benevento; E. long.  $15^{\circ} 20'$ , and N. lat.  $41^{\circ} 20'$ .

**BOJARS** denote Russian noblemen. See **RUSSIA.**

**BOIGUACU,** in zoology, a synonyme of the boa constrictor. See **BOA.**

**BOIL,** or **FURUNCLE,** in surgery. See **FURUNCLE.**

**BOILING,** or **EBULLITION,** the agitation of a fluid body, arising from the application of fire. See **CHEMISTRY.**

**BOIQUIRA,** the American name for the rattle-snake.

**BOIS de soignies,** the forest of Soignies, in the Austrian Netherlands, and province of Brabant, about three miles south-east of Brussels.

**BOISLEDUC,** called by the Dutch Hertogenbosch, a large fortified town of Dutch Brabant, situated on the river Bonnel, about twenty-three miles north-east of Breda; E. long.  $5^{\circ} 20'$ , and N. lat.  $51^{\circ} 45'$ .

**BOKHARAH,** **BOCAR,** or **BOGHAR,** a city of Tartary, in the country of the Uzbeks, near Gihun and Bikunt.

**BOLES** are viscid earths, less coherent and more friable than clay, more readily uniting with water, and more freely subsiding from it. They are soft and unctuous to the touch, adhere to the tongue, and by degrees melt in the mouth, impressing a light sense of

atrangency. There are a great variety of these earths, the principal of which are the following.

1. Armenian bole, when pure, is of a bright red colour, with a tinge of yellow: It is one of the hardest and most compact of the bodies of this class, and not smooth and glossy like the others, but generally of a rough dusty surface. It does not effervesce with acids.

2. French bole is of a pale red colour, variegated with irregular specks of white and yellow. It is much softer than the Armenian, and slightly effervesces with acids.

3. Bole of Blois is yellow, remarkably lighter than the most of the other yellow earths, and effervesces strongly with acids.

4. Bohemian bole is of a yellow colour, with a cast of red, and generally of a flaky texture. It is not acted on by acids.

5. Lemnian earth is of a pale red colour, and slightly effervesces with acids.

6. Silesian bole is of a brownish yellow colour, and acids have no sensible effects upon it.

These and other earths, made into little masses, and stamped with certain impressions, are called *terre sigillata*. These earths have been recommended as astringent, sudorific, and alexipharmic. But these, and many other virtues that have been ascribed to them, appear to have no foundation. They are still used in fluxes and complaints of the first passages.

**BOLETUS,** in botany, a genus of the cryptogamia fungi class. This mushroom is horizontal, spongy, and porous below. There are 14 species, of which seven are natives of Britain, *viz.* the suberosus, or cork boletus; the fomentarius, or spongy boletus; the verficolor, or striped boletus; the albus, or white boletus; the igniarius, or hard boletus, or touchwood; the bovinus, or brown boletus; and the luteus, or yellow boletus.

**BOLINGBROKE,** or **BULLINGBROKE,** a market-town of Lincolnshire, about twenty-five miles east of Lincoln; E. long.  $15^{\circ}$ , N. lat.  $53^{\circ} 15'$ .

**BOLISLAW,** a town of Bohemia, about thirty miles north-east of Prague; E. long.  $14^{\circ} 40'$ , N. lat.  $50^{\circ} 25'$ .

**BOLLARDS,** large posts set into the ground, on each side of a dock. On docking or undocking ships, large blocks are lashed to them; and through these blocks are reeved the transporting hawfers to be brought to the capstons.

**BOLLITO,** a name by which the Italians call a sea-green colour in artificial crystal. To prepare this colour, you must have in the furnace a pot filled with forty pound of good crystal, first carefully skimmed, boiled, and purified, without any manganese: then you must have twelve ounces of the powder of small leaves of copper, thrice calcined, half an ounce of zaffer in powder; mix them together, and put them at four times into the pot, that they may the better mix with the glass, stirring them well each time of putting in the powder, for fear that it should swell too much and run over.

**BOLOGNA,**

**BOLOGNA**, a city of Italy, fifty miles north of Florence. It is about five miles in circumference, and is remarkable for its magnificent churches and monasteries, as well as for its university, which is one of the most considerable in Europe; E. long.  $11^{\circ} 40'$ , and N. lat.  $44^{\circ} 30'$ .

**BOLOGNE**. See **BOULOGNE**.

**BOLONIAN stone**, is a sulphureous kind of stone, about the bigness of a walnut, found near Bologna; which, when duly prepared by calcination, makes a species of phosphorus. See **PHOSPHORUS**.

**BOLSENNÄ**, a town of the pope's territories in Italy, about forty-five miles north of Rome, at the north end of a lake to which it gives name; E. long.  $13^{\circ} 45'$ , and N. lat.  $42^{\circ} 40'$ .

**BOLSLAW**, a town of Bohemia, situated on the river Slezra, about thirty miles north-east of Prague; E. long.  $14^{\circ} 45'$ , and N. lat.  $50^{\circ} 24'$ .

**BOLSTERS** of a saddle, those parts of a great saddle which are raised upon the bows, both before and behind, to hold the rider's thigh, and keep him in a right posture.

**BOLSWAERT**, a town of West Friesland, in the United Provinces, about eighteen miles south-west of Lewarden; E. long.  $5^{\circ} 20'$ , and N. lat.  $53^{\circ} 10'$ .

**BOLT**, among builders, an iron fastening fixed to doors and windows. They are generally distinguished into three kinds, viz. plate, round, and spring bolts.

Bolts in gunnery are of several sorts; as, 1. Transum bolts, that go between the cheeks of a gun-carriage, to strengthen the transums. 2. Prife-bolts, the large knobs of iron on the cheeks of a carriage, which keep the hand-spike from sliding when it is pointing up the breech of a piece. 3. Traverse-bolts, the two short bolts that being put one in each end of a mortar-carriage, serve to traverse her. 4. Bracket-bolts, the bolts that go through the cheeks of a mortar, and by the help of quoins keep her fixed at the given elevation. And, 5. Bed-bolts, the four bolts that fasten the brackets of a mortar to the bed.

Bolts in a ship are iron pins, of which there are several sorts, according to their different makes and uses. Such are drive-bolts, used to drive out others. Ray-bolts, with jags or bars on each side, to keep them from flying out of their holes. Clench-bolts, which are clenched with rivetting hammers. Forelock-bolts, which have at the end a forelock of iron driven in, to keep them from starting back. Set-bolts, used for forcing the planks, and bringing them close together. Fend or fender-bolts, made with long and thick heads, and struck into the uttermost bends of the ship, to save her sides from bruises. And ring-bolts, used for bringing to of the planks, and those parts whereto are fastened the breeches and tackles of the guns.

**BOLT** of canvas, in commerce, the quantity of twenty-eight ells.

**BOLT** rope. See **ROPE**.

**BOLTING**, a term formerly used in our inns of court, for the private arguing of causes. An ancient and two barristers sat as judges; and three students, bringing each a case, out of which the judges chose one to be

argued, the students first began to argue it, and after them the barristers. It was inferior to mootings. See **MOOT**.

**BOLTON**, a market-town of Lancashire, about twenty-seven miles north-east of Liverpool; W. long.  $2^{\circ} 20'$ , and N. lat.  $53^{\circ} 35'$ .

**BOLUS**, an extemporaneous form of a medicine, soft, coherent, a little thicker than honey, and the quantity of which is a little morsel or mouthful; for which reason it is by some called *bucella*.

Whatever is fit for internal use, either by itself, or when mixed with other substances, provided it is capable of the above mentioned consistence, is a proper material for the composition of a bolus. Such are soft substances more or less thick, as conserves, electuaries, robs, pulps, extracts; syrups and liquid substances, as oils, spirits, essences, elixirs, &c. The dose of bolus may be extended from one dram to one dram and a half, or two drams.

**BOLZAS**, a sort of ticking which comes from the East-Indies.

**BOMAL**, a town of Luxemburg, in the Austrian Netherlands, situated on the river Ourt, about 20 miles south of Liege; in  $5^{\circ} 30'$  E. long. and  $50^{\circ} 20'$  N. lat.

**BOMB**, in military affairs, a large shell of cast iron, having a great vent to receive the fusee, which is made of wood. The shell being filled with gunpowder, the fusee is driven into the vent or aperture, within an inch of the head, and fastened with a cement made of quick-lime, ashes, brick-dust, and steel-silings, worked together in a glutinous water; or of four parts of pitch, two of colophony, one of turpentine, and one of wax. This tube is filled with a combustible matter, made of two ounces of nitre, one of sulphur, and three of gunpowder dust, well rammed. To preserve the fusee, they pitch it over, but uncase it when they put the bomb into the mortar, and cover it with gunpowder dust; which having taken fire by the flash of the powder in the chamber of the mortar, burns all the time the bomb is in the air; and the composition in the fusee being spent, it fires the powder in the bomb, which bursts with great force, blowing up whatever is about it. The great height the bomb goes in the air, and the force with which it falls, makes it go deep into the earth.

**BOMB-CHEST**, a kind of chest usually filled with bombs, sometimes only with gunpowder, placed under ground to tear it and blow it up in the air, with those who stand on it. It was set on fire by means of a faucille fastened at one end, but is now much disused.

**BOMB-BATTERY**. See **BATTERY**.

**BOMBARD**, a piece of ordnance anciently in use, exceedingly short and thick, and with a very large mouth. There have been bombards which have thrown a ball of 300 pound weight. They made use of cranes to load them.

The bombard is by some called *basilisk*, and by the Dutch, *donderbus*.

**BOMBARDIER**, a person employed about a mortar. His business is to drive the fusee, fix the shell, load and fire the mortar.

**BOMBARDMENT**, the havock committed in throwing bombs into a town or fortrefs.

**BOMBARDO**, a musical instrument of the wind kind, much the same as the bassoon, and used as a bass to the hautboy.

**BOMBASINE**, a name given to two sorts of stuffs, the one of silk, and the other crossed, of cotton.

Bombasine of silk pays duty on importation as other foreign silks. See **SILK**. That of cotton pays each piece, not exceeding 15 yards, if narrow, 1l. 3s. 1<sup>7</sup>/<sub>10</sub>d. but if broad, 1l. 6s. 11<sup>4</sup>/<sub>10</sub>d.

**BOMBAST**, in composition, is a serious endeavour, by strained description, to raise a low or familiar subject beyond its rank; which instead of being sublime, never fails to be ridiculous. The mind, in some animating passions, is indeed apt to magnify its objects beyond natural bounds. But such hyperbolical description has its limits, and, when carried beyond these, it degenerates into burlesque, as in the following example:

*Sejanus.* — Great and high

The world knows only two, that's Rome and I.

My roof receives me not; 'tis air I tread,

And at each step I feel my advanc'd head

Knock out a star in heaven.

*Sejan. Ben. Johnson, act 5.*

A writer who has no natural elevation of genius is extremely apt to deviate into bombast: He strains above his genius, and the violent effort he makes carries him generally beyond the bounds of propriety.

**BOMBAX**, or **COTTON-TREE**, in botany, a genus of the monodelphia polyandria class. It has but one stylius; the stigma consists of five lobes; the capsule has five cells; and the seeds are downy. There are three species, *viz.* the pentandrum, the ceiba, and the heptaphyllum, all natives of the Indies. The cotton-tree grows generally above 60 feet high, and is so thick that the Indians dig canoes which hold several men out of the whole wood. There are hollows in different parts of the trunk which contain large quantities of water, which is of great use to travellers in the hot climates where there is often a scarcity of water. For the method of making cotton, see **COTTON**.

**БОМБАХ**, in zoology, a synonyme of a species of conus. See **CONUS**.

It is sometimes used for silk or cotton. It is likewise applied by Linnaeus to signify such insects as have incumbent wings and feelers resembling a comb.

**BOMBAY**, an island on the west coast of the hither peninsula of India, situated in 72° 20' E. long. and 18° 30' N. lat. It is about seven miles long, and twenty in circumference; and is the property of our East-India company.

**BOMB-KETCH**, a small vessel built and strengthened with large beams for the use of mortars at sea.

**BOMBUS**, in medicine, a resounding and ringing noise in the ear.

**BOMBYLIUS**, in zoology, a genus of insects belonging to the order of diptera. The rostrum is long, bristly, and bivalved; the bristles being fixed between the horizontal valves. There are five species, *viz.* 1. The major, with black wings. 2. The medius, with

a yellowish body, white behind, and the wings spotted with yellow. 3. The minor, with unspotted wings.

4. The ater, has red wings, but a little blackish at the base; and green feet. The above four are natives of Europe. 5. The capensis, with the wings spotted with black, an ash-coloured body, and white behind.

It is a native of the Cape of Good Hope.

**BOMENE**, a port-town of Zeland, in the United Provinces, situated on the northern shore of the island of Schouen, opposite to the island of Goree; in 4° E. long. and 51° 50' N. lat.

**BOMMEL**, a town of Dutch Guelderland, situated on the northern shore of the river Waal, about four miles north-east of Nimeguen; in 5° 50' E. long. and 52° N. lat.

**BOMONICI**, in Grecian antiquity, young men of Lacedæmon, who contended at the sacrifices of Diana which of them was able to endure most lashes; being scourged before the altar of this goddess.

**BON**, in geography, a town of the electorate of Cologne, in Germany, situated on the western shore of the river Rhine, about 12 miles south of Cologne; in 7° E. long. and 50° 35' N. lat. It is a small but well fortified town, and has a fine palace, which the elector of Cologne makes his usual residence.

**BON** is also the name of one of the Molucca islands, lying west of Coram.

**BONA**, in geography, a port-town of the kingdom of Algiers, in Africa, about 200 miles east of the city of Algiers; in 8° E. long. and 36° N. lat.

There is also a cape called Bona on the same coast to the eastward, almost opposite to Sicily.

**BONA-FIDES**, in law: When a person performs any action, which he believes at the time to be just and lawful, he is said to have acted *bona fide*.

**BONA MOBILIA**, the same with moveable goods or effects.

**BONA NOTABILIA**, are such goods as a person dying has in another diocese than that wherein he dies, amounting to the value of 5l. at least; in which case the will of the deceased must be proved, or administration granted in the court of the archbishop of the province, unless by composition, or custom, any dioceses are authorized to do it, when rated at a greater sum.

**BONA PATRIA**, an affize of country men, or good neighbours, where twelve or more are chosen out of the country to pass upon an affize, being sworn judicially in the presence of the party.

**BONA**, in geography, a cape of Africa, near Tunis, in the Mediterranean sea.

**BONAIRE**, an island near the coast of Terra Firma, in South America, situated in 67° W. long. and 12° 30' N. lat. It is subject to the Dutch, who traffic from thence with the Caracoo-coast.

**BONAROTA**, in botany, the trivial name of a species of *pæderota*. See **PÆDEROTA**.

**BONASIUS**, in zoology, the trivial name of a species of *bos*. See **BOS**.

**BONAVENTURA**, a sea-port town in Popayan in South America, upon the South sea.

**BONAVISTA**, one of the Cape Verd Islands, subject to Portugal; in 23° W. long. and 16° 30' N. lat.

**BOND**,

**BOND**, in Scots law, a formal writing by which a person binds himself to pay a certain sum of money to another, or to perform a certain deed, under a penalty. Bonds respecting money are divided into heritable and moveable. See *LAW*, tit. *Heritable and moveable rights*.

**BOND**, in carpentry, a term among workmen; as, to make good bond, means that they should fasten two or more pieces together, either by tenancing, mortising, or dovetailing, &c.

**BONDAGE**, properly signifies the same with slavery; but, in old law-books, is used for villenage. See *VILLENAGE*.

**BOND-MAN**, the same with villain. See *VILLAIN*.

**BONDLOUR**, a city of Natolia in Asia.

**BONDUC**, in botany, the trivial name of a species of guilandria. See *GUILANDRIA*.

**BONE**, in anatomy. See *PART I*.

**BONE-ACE**, an easy but licking game at cards, played thus: The dealer deals out two cards to the first hand, and turns up the third, and so on through all the players, who may be seven, eight, or as many as the cards will permit; he that has the highest card turned up to him, carries the bone, that is, one half of the stake, the other remaining to be played for: Again, if there be three kings, three queens, three tens, &c. turned up, the eldest hand wins the bone: But it is to be observed, that the ace of diamonds is bone-ace, and wins all other cards whatever. Thus much for the bone; and as for the other half of the stake, the nearest to thirty-one wins it; and he that turns up or draws thirty-one, wins it immediately.

**BON-ESPERANCE**, the same with the Cape of Good-hope. See *GOOD-HOPE*.

**BONGO**, or *BUNGO*, the capital of one of the islands of Japan, to which it gives name; in 132° E. long. and 32° 30' N. lat. It is a sea port town, situated on the east side of the island, opposite to the island of Tonfa, from which it is separated by a narrow channel.

**BONIFACIO**, in geography, a port-town of Corfica, situated at its south end, in 9° 20' E. long. and 41° 20' N. lat. It is one of the best towns in the whole island, and gives name to the strait between Corfica and Sardinia.

**BONIS non amovendis**, in law, is a writ directed to the sheriffs of London, &c. charging them, that a person, against whom judgment is obtained, and prosecuting a writ of error, be not suffered to remove his goods until the error is determined.

**BONNET**, in a general sense, denotes a cover for the head, in common use before the introduction of hats. See *HAT*.

Bonnets are still used in many parts of Scotland.

**BONNET**, in fortification, a small work, consisting of two faces, having only a parapet with two rows of palisades, of about ten or twelve feet distance: It is generally raised before the salient angle of the counterescarp, and has a communication with the covered way, by a trench cut through the glacis, and palisades on each side.

**BONNET à pretre**, or *Priest's BONNET*, in fortification,

is an out-work, having at the head three salient angles, and two inwards. It differs from the double tenaille only in this, that its sides, instead of being parallel, are like the *queue d'aronde* or swallow's tail, that is, narrowing, or drawing close at the gorge, and opening at the head.

**BONNET**, in the sea-language, denotes an addition to a sail: Thus they say, *lace on the bonnet*, or *shake off the bonnet*.

**BONNEVILLE**, a town of Savoy, situated on the north side of the river Arve, about twenty miles south-east of Geneva, in 6° 10' E. long. and 46° 18' N. lat.

**BONNY**, among miners, a bed of ore, differing only from a squa as being round, whereas the squa is flat. See *SQUA*.

**BONONIAN**. See *BOLONIAN*.

**BONOS-AYERES**. See *BUENOS-AYRES*.

**BONTIA**, in botany, a genus of the didymia angiospermia class. The calix is divided into five pieces; the corolla is bilabiate, with the superior labium emarginate, and the inferior consists of three deep-cut segments; the berry, which is of the drupa kind, is oval, oblique at the apex, and contains but one plaited seed. The species are two, *viz.* the daphnoides and the germinata, both natives of the Indies.

**BONZES**, Indian priests, who, in order to distinguish themselves from the laity, wear a chaplet round their necks, consisting of an hundred beads, and carry a staff, at the end of which is a wooden bird. They live upon the alms of the people, and yet are very charitably disposed, maintaining several orphans and widows out of their own collections. The Tonquinese have a pagod, or temple, in each town, and every pagod has at least two bonzes belonging to it; some have thirty or forty. The bonzes of China are the priests of the Fohists, or sects of Fohi; and it is one of their established tenets, that there are rewards allotted for the righteous, and punishments for the wicked in the other world; and that there are various mansions, in which the souls of men will reside, according to their different degrees of merit. The bonzes of Pegu are generally gentlemen of the highest extraction.

**BOOK**, the general name of almost every literary composition; but, in a more limited sense, is applied only to such compositions as are large enough to make a volume. As to the origin of books or writing, those of Moses are undoubtedly the most ancient that are extant: But Moses himself cites many books that behaved to be wrote before his time. See *CHARACTER*.

Of profane books, the oldest extant are Homer's poems, which were so even in the time of Sextus Empiricus; though we find mention in Greek writers of seventy others prior to Homer; as Hermes, Orpheus, Daphne, Horus, Linus, Mufcus, Palamedes, Zoroaster, &c.: but of the greater part of these there is not the least fragment remaining; and of others, the pieces which go under their names are generally held, by the learned, to be supposititious.

Several sorts of materials were used formerly in making

making books: Plates of lead and copper, the barks of trees, bricks, stone, and wood, were the first materials employed to engrave such things upon as men were willing to have transmitted to posterity. Josephus speaks of two columns, the one of stone, the other of brick, on which the children of Seth wrote their inventions and astronomical discoveries: Porphyry makes mention of some pillars, preserved in Crete, on which the ceremonies practised by the Corybantes in their sacrifices were recorded. Hesiod's works were originally written upon tables of lead, and deposited in the temple of the Muses, in Bœotia: The ten commandments, delivered to Moses, were written upon stone; and Solon's laws upon wooden planks. Tables of wood, box, and ivory, were common among the ancients: When of wood, they were frequently covered with wax, that people might write on them with more ease, or blot out what they had written. The leaves of the palm-tree were afterwards used instead of wooden planks, and the finest and thinnest part of the bark of such trees, as the lime, the ash, the maple, and the elm; from hence comes the word *liber*, which signifies the inner bark of the trees: and as these barks were rolled up, in order to be removed with greater ease, these rolls were called *volumen*, a volume; a name afterwards given to the like rolls of paper or parchment.

Thus we find books were first written on stones, witness the Decalogue given to Moses: Then on the parts of plants, as leaves chiefly of the palm-tree; the rind and barks, especially of the tilia, or phillyrea, and the Egyptian papyrus. By degrees wax, then leather, were introduced, especially the skins of goats and sheep, of which at length parchment was prepared: Then lead came into use; also linen, silk, horn, and lastly paper itself.

The first books were in the form of blocks and tables; but as flexible matter came to be wrote on; they found it more convenient to make their books in the form of rolls: These were composed of several sheets, fastened to each other, and rolled upon a stick, or *umbilicus*; the whole making a kind of column, or cylinder, which was to be managed by the *umbilicus* as a handle, it being reputed a crime to take hold of the roll itself: The outside of the volume was called *frons*; the ends of the *umbilicus*, *cornua*, which were usually carved, and adorned with silver, ivory, or even gold and precious stones: The title *σύλλαβος*, was struck on the outside; the whole volume, when extended, might make a yard and a half wide, and fifty long. The form which obtains among us is the square, composed of separate leaves; which was also known, though little used, by the ancients.

To the form of books belongs also the internal æconomy, as the order and arrangements of points and letters into lines and pages, with margins and other appurtenants: This has undergone many varieties; at first the letters were only divided into lines, then into separate words, which, by degrees, were noted with accents, and distributed, by points and stops, into periods, paragraphs, chapters, and other divisions. In some countries, as among the orientals, the lines began from the right and ran leftward; in others, as the northern and western nations, from left to right; others, as the Greeks, followed both directions, alternately going in the one, and returning in the other, called *boustrophædon*: In most countries, the lines run from one side to the other; in some, particularly the Chinese, from top to bottom. See COMPOSITION.

## B O O K - K E E P I N G .

**BOOK-KEEPING** is an art, teaching how to record and dispose the accounts of business, so as the true state of every part, and of the whole, may be easily and distinctly known.

Though the number and kinds of books used in this art be in some measure arbitrary, there are three which can never be dispensed with by those whose trade is complex or extensive, *viz.* the *Waste-book*, *Journal*, and *Ledger*.

### I. Of the WASTE-BOOK.

The *Waste-book* is a register, containing an inventory of a merchant's effects and debts, with a record of all his transactions, narrated in a plain, simple style, and in the exact order of time as they succeed one another.

The *Waste-book* opens with the *inventory*; which consists of two parts: First, the *effects*, that is, the money a merchant has by him, the goods he has on hand, his share in ships, houses, farms, &c. with the debts due to him; the second part of the inventory is the debts due by him to others: The difference betwixt which and the effects, is what merchants call *net stock*. When a man begins trade, the inventory must be gathered from a survey of the particulars that make up his real estate; but must afterwards be collected from the balance of his old books, and carried to the new. This inventory is the first thing narrated in the *Waste-book*, as being the source and spring whence all subsequent transactions flow.

After the inventory is fairly narrated in the *Waste-book*, the transactions of trade come next to be jotted down;

down; which is a daily task, to be performed as they occur; and should be done distinctly, that is, every thing should be clearly and exactly expressed.

If no subsidiary books are kept, the Waste-book should contain a record of all the merchant's transactions and dealings in a way of trade; and that not only of such as are properly and purely mercantile, but of every occurrence that affects his stock, so as to impair or increase it; such as, private expences, servants fees, house-rents, money gained or lost on wagers, legacies, and the like. By such occurrences as these, a merchant as effectually becomes so much poorer or richer, as by the result of any branch of his trade. And the ends proposed in book-keeping can never be gained; if such things pass unrecorded.

II. Of the JOURNAL.

THE *Journal* is the book wherein the transactions recorded in the Waste-book are prepared to be carried to the Ledger, by having their proper debtors and creditors ascertained and pointed out.

One great design of the *Journal* is, to prevent errors in the Ledger; a thing of the worst consequence in book-keeping; which yet, without the help of this book, would be almost inevitable. For, suppose a person should attempt to form the *Debtors* and *Creditors* from the Waste-book in his mind, and at the same time post them to the Ledger, he shall find his thoughts so much embarrassed and over-charged, by attending at once to so many different things as occur here, that, were he an accountant of very great experience, he could not well miss of falling into frequent blunders. This makes it necessary to divide the task, and do at twice what cannot be performed at once, without such hazard of mistakes; that is, first to write out the *Debtors* and *Creditors* in a separate book by themselves, and afterward transfer them to the Ledger. The work by this means being divided into parts, becomes more simple, and consequently more easy, and so may be performed with greater certainty of its being right. Again, after the *Journal* is filled up, the *Journal* facilitates the work required in revising and correcting it; for, first the *Waste-book* and *Journal* are compared, and then the *Journal* and *Ledger*. Whereas, to revise and correct the *Ledger* immediately from the *Waste-book*, would be a matter of no less difficulty than to form it without the help of a *Journal*. Lastly, The *Journal* is designed as a fair record of a merchant's business; For neither of the other two books can serve this purpose; not the *Ledger*, by reason both of the order that obtains in it, and also on account of its brevity, being little more than a large Index. Nor can the *Waste-book* answer this design; for being written up in the time of business, and commonly too by different hands, it can neither be fair and uniform, nor very accurate.

The *Journal* is a kind of middle book betwixt the other two; it looks back to the one, and forward to the other. With the *Waste-book* it agrees in form, being ruled after the same manner. The order also and succession of things is the same in both. The thing then

that distinguisheth the two books is the style; that of the one being natural, and that of the other artificial. In the *Journal*, persons and things are charged *Debtors* to other persons or things as *Creditors*; and in this it agrees with the *Ledger*, where the same style is used, but differs from it as to form and order: So that it agrees with the *Waste-book* in those very things wherein it differs from the *Ledger*; and on the other hand, it agrees with the latter in that very point wherein it differs from the former.

But an example of the *Waste-book* turned into the *Journal* form, will give a clearer idea than can be conveyed by words.

WASTE-BOOK.

Before proceeding to give rules for writing in the *Journal*, it will be necessary to take notice, that every case or example of the *Waste-book*, when entered in the *Journal*, is called a *Journal post* or *entry*: Thus the examples above make up three distinct posts. Again, a post is either simple or complex. A *simple post* is that which has

has but one Debtor and one Creditor, as the first of these above. A *complex post* is either when one Debtor is balanced by two or more Creditors, as in the second post; or when two or more Debtors are balanced by one Creditor, as in the third post; or when several Debtors are balanced by several Creditors, and then the post is said to be complex in both its terms. This being premised, the rules to be observed are these following.

- I. In a simple post, the debtor is to be expressly mentioned, then the creditor, and, lastly, the sum, all in one line: After which follows the narrative, or reason of the entry, in one or more lines, as in the first of these three posts above.
- II. In a complex post, the several Debtors or Creditors are expressed in the first line, by Sundries, or Sundry Accounts, and the rest of the line filled up as in the

former rule. After which, the several Debtors or Creditors must be particularly mentioned, each in a line by themselves, with their respective sums subjoined to them; which are to be added up, and their total carried to the money-columns, as in the second and third posts.

The Journal, as described and exemplified above, is the form that was first in use among merchants; and is still the most common: but some make their Journal just a fair copy of the Waste-book, with the Debtors and Creditors written out on the margin, which is ruled large for that purpose. We shall here subjoin the three preceding posts done after this way; which, to one who understands the common method, will be sufficient instruction.

### Of the Terms DEBTOR and CREDITOR.

THE nature and use of the terms *Debtor* and *Creditor* will be obvious, from the considerations following.

I. Accounts in the Ledger consist of two parts, which in their own nature are directly opposed to, and the reverse of one another; which therefore are set fronting one another, on opposite sides of the same folio. Thus, all the articles of money received go to the left side of the Cash-account, and all the articles or sums laid out are carried to the right. In like manner, the purchase of goods is posted to the left side of the account of the said goods, and the sale, or disposal of them, to the right, &c.

II. Transactions of trade, or cases of the Waste-book, are also made up of two parts, which belong to different accounts, and to opposite sides of the Ledger: *e. g.* If goods are bought for ready money, the two parts are, the goods received, and the money delivered; the former of which goes to the left side of the account of said goods, and the latter to the right side of the Cash-account.

III. These two different parts, in cases of the Waste-book, are not opposed to one another, as the two sides of the Ledger-accounts are; but, on the contrary, have

a mutual connection and dependence, the one being the ground, condition, or cause of the other. Thus, in the preceding example, when goods are bought for ready money, the receipt of the goods is the cause of parting with the money; and, on the other hand, the delivering of the money is the condition on which the goods are received.

From these three observations, it is plain, that, in order to post a case of the Waste-book to the Ledger, the first thing the accountant must do, is, to divide the case into its parts, and then to think with himself, to which account, and to what side, each of these parts is to be carried; and when the entry is actually made, the connection of the parts with one another must be expressed in each of the accounts to which they are transported. Now, since in speaking and writing things must have names whereby they may be expressed and written, it is necessary that two words or terms be contrived, and appropriated to these two different parts, that have the same relation to one another as the parts themselves have, which may at once characterise and distinguish the parts from one another, point out and ascertain to what side of the Ledger each of them is to be carried, and withal express their relation to, and dependence upon one another.

The Italians at first for this purpose pitched upon the terms

terms Debtor and Creditor, because their common acception comes nearer to the thing here meant than any other they could think on. By means of these terms, the two parts, in any case of the Waste-book, when posted to the Journal, are denominated, the one the *Debtor*, and the other the *Creditor*, of that post. And when carried from thence to the Ledger, the Debtor, or Debtor part, is entered upon the left side (hence called the *Debtor side*) of its own account, where it is charged Debtor to the Creditor part. Again, the Creditor, or Creditor part, is posted to the right side, or Creditor-side of its account, and made Creditor by the Debtor part. Hence Italian book-keeping is said to be a method of keeping accounts by double entry, because every single case of the Waste-book requires at least two entries in the Ledger, *viz.* one for the Debtor, and another for the Creditor.

We shall illustrate what has been said by two examples. *First*, Suppose a merchant buys a pipe of wine for ready money, the two parts in this case are, the wine received, and the money delivered for it, which are characterised by the terms *Debtor* and *Creditor* in the Journal post thus: *Wine Dr to Cash*; where the meaning is, (though to express it so is needless), that as *Wine is Dr to Cash*, so *Cash is Cr by Wine*. And accordingly when carried to the Ledger, the *Wine-account* is charged *Dr to Cash*, and the *Cash-account* is made *Cr by Wine*. Again, *2dly*. Admit the merchant sells this pipe of wine for present money, in this case the two parts are the same as before; but when clothed with Debtor and Creditor, will stand inverted thus: *Cash Dr to Wine*. And accordingly, in the Ledger, the *Cash-account* is charged *Dr to Wine*, and the *Wine-account* gets credit by *Cash*. From all which it is evident, the terms *Debtor* and *Creditor* are nothing else but marks or characteristics stamped upon the different parts of transactions in the Journal, expressing the relation of these parts to one another, and shewing to which side of their respective accounts in the Ledger they are to be carried.

**RULES relating to Debtor and Creditor.**

- I. A thing received upon trust, is *Dr* to the person of whom it is received.
  - II. The person to whom a thing is delivered upon trust, is *Dr* to the thing delivered.
  - III. A thing received, is *Dr* to the thing given for it.
  - IV. In antecedent and subsequent cases, parts that are the reverse of one another in the nature of the thing, are also opposed in respect of terms.
  - V. In cases where personal and real *Drs* or *Cr*s are wanting, the defect must be supplied by fictitious ones.
  - VI. In complex cases, the sundry *Drs* or *Cr*s are to be made out from the preceding rules jointly taken.
- We now proceed to the particular application of *Debtor* and *Creditor* in the several branches of trade, *viz.*
- I. *Proper trade*, which a merchant carries on for himself.
  - II. *Factorage*, which he manages for another, called his *Employer*.
  - III. *Partnership*, which is carried on by a trustee, in name of all the partners.

**1. IN PROPER TRADE.**

*Proper trade* is either domestic or foreign. *Proper domestic trade*, is that which a merchant carries on by himself, without the help of a factor. *Proper foreign trade*, is the business that occurs to a merchant by employing a factor.

*1st, Debtor and Creditor applied in proper domestic trade.*

*Proper domestic trade*, comprehends the *inventory*, *buying*, *selling*, *bartering*, *receiving money*, and *paying money*. To each of these we shall assign a distinct problem; and, to prevent burdening the learner's memory, we shall deliver the several cases as compendiously as possible, subjoining to each problem such notes as seem necessary for clearing any thing that requires further illustration.

*N. B.* As we refer from the cases and notes of each problem, to the examples of the *Waste-book* and *Journal*, by the dates, so we have made use of letters and numbers, as references from them to the cases and notes of the problems, which the reader will easily observe.

**Prob. 1. A. Debtor and Creditor applied to the inventory.**

The *inventory* consists of two parts, and accordingly is journalized at twice, *viz.* 1. *Sundrys Drs to Stock*. The several *Drs* are, *Cash*, for the merchant's ready money; *Goods on hand*, for their respective values; *Per sons*, for their debts due to him. 2. *Stock Dr to Sundrys*. The several *Cr*s are, the persons to whom the merchant owes. Compare the *Waste-book* and *Journal*, *Jan. 1*.

*Note*, *Stock* is a fictitious term used instead of the merchant's name.

**Prob. 2. B. Debtor and Creditor applied in buying.**

In buying one single commodity there are seven distinct cases, (*viz.* three simple, and four complex): in all which the goods bought and received are *Dr*; but the *Cr* varies according to the terms of purchase.

- Case 1. When goods are bought for ready money, the entry is, *Goods bought Dr to Cash*. *Jan. 6*.
- 2. When goods are bought, and paid for by giving the seller a bill or note upon a third person, *Goods bought Dr to the Acceptor*, *viz.* the said third person.
- 3. When goods are bought on time, *Goods bought Dr to the Seller*. *Jan. 10 Oct. 21*.
- 4. When goods are bought for part money, part bill. *Goods bought Dr to Sundrys*, *viz.*  
  - To *Cash*, for the sum paid,
  - To *Acceptor*, for value of the bill.
- 5. When goods are bought for part money, part on time. *Goods bought Dr to Sundrys*, *viz.*  
  - To *Cash*, paid in part,
  - To *Seller*, for the rest. *Jan. 15*.
- 6. When goods are bought for part bill, part time. *Goods bought Dr to Sundrys*, *viz.*  
  - To *Acceptor*, for value of the bill,
  - To *Seller*, for the rest.
- 7. When goods are bought for part money, part bill, part time,  
  - Goods bought Dr to Sundrys*, *viz.*  
    - To *Cash*, for the sum paid,

To *Accepter*, for value of the bill,

To *Seller*, for the rest. Feb. 2.

Note 1. When two or more kinds of goods are bought from one person at the same time, there will be two or more Drs, viz. the several kinds of goods bought, each for their value. And the same variety of cafes will occur here as when one single commodity is bought, so that, if the sundry goods be bought for ready money, or on bill, or on time, the entry will be,

*Sundries* Drs, { To *Cash*, if bought for ready money. Feb. 16.  
                  { To *Accepter*, if on bill,  
                  { To *Seller*, if on time.

But if the sundry goods are bought for part money, part bill, or for part money, part time, or for part bill, part time, &c. it is best to retieve the cafe into two entries, viz. first charge the *Credits* Dr to the *Seller*, for their full value, as if they had been bought on time; and then make the *Seller* Dr to *Cash*, or to the *Accepter*, or to both, (as the nature of the cafe is), for the part paid. Thus, suppose the goods are bought for part money, part bill, part time, the two entries will be,

1. *Sundries* Drs to the *Seller*, for their respective values of the goods.  
2. *Seller*, Dr to *Sundries*, viz.  
          To *Cash*, for the sum paid,  
          To *Accepter*, for value of the bill.

Note 2. If you buy goods to be received some time afterward; and, in prospect of this, advance some part of the price to the seller: in this case, charge the *Seller* Dr to *Cash*, for the sum advanced; and when you receive the goods, make them Dr to the seller, for their full value. Or if immediately upon receiving them you deal with the seller, then make *Goods* received Dr to *Sundries*, viz. to the *Seller*, for the sum formerly advanced; and to *Cash*, for the sum now paid. In bargains of this nature, there is commonly a penalty agreed on to be paid by the seller in case of non-performance. Now, if in this case the seller happen to fail, you the buyer, upon receiving payment of the advanced money and penalty, enter *Cash* Dr to *Sundries*, viz. to the *Seller*, for the sum advanced, and now recovered, and to *Profit and Loss*, for the penalty; or, instead of using the general account, *Profit and Loss*, you may credit in the *Buyer* an account, under the title of *Residual of Bargains*, which is to be made *Debtor* for all the penalties of this nature you pay, and get *Credit* for all you receive. May 13. If you buy goods to be received afterwards, without advancing any part of the price; it is sufficient to take a note of them in a pocket-book; and when you receive them, they are booked as goods presently bought.

Prob. 3. C. Debtor and Creditor applied in selling.

Selling is just the reverse of buying, and has the same variety of cafes, viz. seven; whereof three are simple, and four complex: in all which, the goods sold and delivered are Cr; but the Dr varies according to the conditions of sale.

Case 1. When goods are sold for ready money, the entry is, *Cash* Dr to *Goods* sold. Feb. 25.

2. When goods are sold on bill or note, *Accepter* Dr to *Goods* sold. March 17. See Note 7.

3. When goods are sold on time, *Buyer* Dr to *Goods* sold. March 1.

4. When goods are sold for part money, part bill, *Sundries* Drs to *Goods* sold, viz.

*Cash*, for the sum received.  
*Accepter*, for value of the bill. March 22.

5. When goods are sold for part money, part on time, *Sundries* Drs to *Goods* sold, viz.

*Cash*, received in part,  
*Buyer*, for the rest. March 4.

6. When goods are sold for part bill, part time, *Sundries* Drs to *Goods* sold, viz.

*Accepter*, for value of the bill,  
*Buyer*, for the rest.

7. When goods are sold for part money, part bill, part time,

*Sundries* Drs to *Goods* sold, viz.  
*Cash*, for the sum received,  
*Accepter*, for value of the bill,  
*Buyer*, for the rest.

Note 1. Thus the entries in buying and selling one single commodity are just the reverse of one another: and this also holds in buying and selling two or more kinds of goods; which we shall therefore pass, referring the learner to the cafes of buying in the preceding problem.

Note 2. If you sell goods to be delivered, not presently, but some time afterward, and receive money for advance, charge *Cash* Dr to the *Buyer*, for the sum received; and when you deliver the goods, charge the *Buyer* Dr to *Goods*, for their full value. But if, upon delivery of the goods, you immediately receive the remaining part of their price, enter *Sundries* (viz. the *Buyer*, for the sum received for advance, and *Cash*, for the sum now received) Drs to the *Goods* delivered. If you find you cannot perform the bargain, and be oblig-

ged to return the money advanced, and pay the penalty, make *Sundries* (viz. the *Buyer*, for the sum advanced, and *Profit and Loss*, or *Refusal of Bargains*, for the penalty) Drs to *Cash* now paid.

Note 3. If you sell a ship, house, &c. enter *Cash*, or the *Buyer*, Dr to *Cash* *Ship* or *House*, for the price they are sold at.

Note 4. If you lend goods to *A. B.* and leave it to his choice, whether to keep or return them, erect an account under the title of *Supplies-accounts*, and charge it Dr to the goods lent off. If the goods be returned, reverse the former entry. If he keep them, charge *A. B.* Dr to *Supplies-accounts*, for the value of the goods lent him. If he sends up the price, charge *Cash* Dr to *Supplies-accounts*. May 7. June 16.

Prob. 4. D. Debtor and Creditor applied in bartering.

Barter, or the exchanging of goods for goods, is nothing else but buying and selling blended together; the cafes of which, if the goods received and delivered be of equal value, are these four.

Case 1. When one commodity is received for another delivered, enter *Wares* received Dr to *Wares* delivered. April 10.

2. When one commodity is received for two or more delivered, enter *Wares* received Dr to *Sundries*, viz. to the several *wares* delivered, for their respective values.

3. When two or more sorts of wares are received for one delivered, enter *Sundries* (viz. the several *wares* received, each for their value) Drs to *Wares* delivered. April 16.

4. When several wares are bartered with *A. B.* for several, make two entries, and that whether the wares received and delivered be of equal value or not.

1. *A. B.* Dr to *Sundries*, viz. to each fort delivered, for their respective values.

2. *Sundries* (viz. each fort received, for their respective values) Drs to *A. B.* April 30.

Note 1. Supposing the goods received and delivered are not in themselves of equal value, but that the deficiency is made up by money or bill, or the one merchant gives the other credit for the difference: upon this supposition there will be several other cafes; such as, 1. *Wares* received, for part wares, part money. 2. For part wares, part bill. 3. Part wares, part time. 4. Part wares, part money, part time, &c. In all which cafes, the *Wares* received are Dr to *Sundries*. The particular Drs in each cafe are as follows.

Case 1. { To *Wares* delivered, for their value,  
          { To *Cash*, for the sum paid.

2. { To *Wares* delivered, for their value,  
          { To *Accepter*, for the bill.

3. { To *Wares* delivered, for their value,  
          { To *dealer*, for the rest.

4. { To *Wares* delivered, for their value,  
          { To *Cash*, for the sum paid,  
          { To *Dealer*, for the rest.

Note 2. On the other hand, wares in barter may go off, or be delivered, 1. For part wares, part money. 2. For part wares, part bill. 3. Part wares, part time. 4. Part wares, part money, part time, &c. In all which cafes, *Sundries* are Drs to the *Wares* delivered. The particular Drs in each cafe are the same with the Drs in the cafes immediately preceding, as follows.

Case 1. { *Wares* received, for their value,  
          { *Cash*, for the sum received. April 22.

2. { *Wares* received, for their value,  
          { *Accepter*, for the bill.

3. { *Wares* received, for their value,  
          { *Dealer*, for the rest.

4. { *Wares* received, for their value,  
          { *Cash*, for the sum received,  
          { *Dealer*, for the rest.

Prob. 5. E. Debtor and Creditor applied in receiving money.

In all cafes of this nature, *Cash* is Dr; but the Cr varies, according to the terms on which the money is received.

*Cash*

Case 1. When you receive money for goods presently sold, the entry, as already mentioned in the first case of selling, is, *Cash* Dr to *Goods* sold, for their value. Feb. 25.

2. When you borrow, or take up money at interest, enter *Cash* Dr to the *Lender*, for the sum received, mentioning the rate of interest, and time of payment.

3. When you get money, whether as payment of a debt, or taken up at interest, and receive it, not from the debtor or lender, but upon his assignation from a third person, enter *Cash* Dr to the *Assigner*, not to him that pays it.

4. When you receive money, as payment of goods formerly sold, or in payment of an accepted bill or note, or any other debt, where neither discount nor interest is allowed, enter *Cash* Dr to the *Payer*, for the sum received, mentioning whether in full or in part. Feb. 5. March 23. April 6. July 30. Aug. 3. Nov. 12.

5. When you receive money, as payment of an accepted bill or note, or any other debt, (except for goods formerly sold), *per advance*, and upon that account allow discount, or abatement on any other consideration, enter *Sundries* Drs to the *Payer*, viz.

*Cash*, for the sum received,  
*Profit and Loss*, for the sum discounted or abated.  
Nov. 12.

6. When, in receiving payment for goods formerly sold, you allow discount or abatement; if the account of said goods be closed in the *Ledger*, enter as in the last case: but if the said account be yet open, enter thus, *Sundries* Drs to the *Buyer*, viz.

*Cash*, for the sum received,  
*Goods*, for the sum discounted or abated. April 1.

7. When you receive money, as interest of a sum formerly lent, the principal being continued, enter *Cash* Dr to *Profit and Loss*, or to *Interest account*, for the sum received. Sept. 10.

8. When you receive both principal and interest, enter *Cash* Dr to *Sundries*, viz.  
To the *Borrower*, for the principal,  
To *Profit and Loss*, or to *Interest account*, for the interest Nov. 8.

9. When you receive money as the premium for insuring another man's ship or goods at sea, enter *Cash* Dr to *Insurance account*, or to *Profit and Loss*.

10. When you receive money as the price of a ship, house, or estate, presently sold, or as the freight, or the rent of them, supposing the hiring out of the ship, or setting of the house, &c. not to be booked, enter *Cash* Dr to such a *Ship*, *House*, or *Estate*. Sept. 1.

11. But if the hiring out of the ship, house, or estate, was formerly booked, the entry for money received as freight or rent will be, *Cash* Dr to the *Freighter* or *Tenant*.

12. When you receive money, in legacy or compliment, or with an apprentice, or as gained on a wager, or by exchange of money, &c. for which nothing goes out, enter *Cash* Dr to *Profit and Loss*, or to *Stock*.

Note 5. It commonly happens that legacies are not paid presently: and in this case you must charge the executor A. B. Dr to *Profit and Loss*, till you receive payment; and then discharge him by *Cash*, or the *Thing* received. June 3.

Prob. 6. F. Debtor and Creditor applied in paying money.

In all cases of this nature, *Cash* is Cr; but the Dr va-

ries, according to the terms on which the money is delivered.

Case 1. When you pay money for goods presently bought, the entry (as already stated in the first case of buying) is, *Goods* bought Dr to *Cash*, for the sum paid. Jan. 6.

2. When you lend or give out money at interest, enter the *Borrower* Dr to *Cash*, for the principal, mentioning the rate of interest, and time of payment. March 10. August 6.

3. When, by order of your creditor, you pay money to any person, enter the *Assigner* (not the *Assignee*) Dr to *Cash*, for the sum paid.

4. When you pay for goods formerly bought, or pay an accepted bill or note, or any other debt, where neither discount nor interest is allowed; enter the *Receiver* Dr to *Cash*, for the sum paid, mentioning whether in full or in part. Jan 15. Jan. 30. March 10. and 23. May 3. June 8. June 22. and 29.

5. When you pay an accepted bill or note, or any other debt, (except for goods formerly bought), *per advance*, and upon that account have discount allowed you, or abatement on any other consideration; enter *Receiver* Dr to *Sundries*, viz.

To *Cash*, for the sum paid,  
To *Profit and Loss*, for the sum discounted.

6. When, in paying for goods formerly bought, you have discount or abatement allowed; if the account of said goods in the *Ledger* be closed, enter as in the last case; but if the said account be yet open, enter thus, *Receiver* Dr to *Sundries*, viz.

To *Cash*, for the sum paid,  
To *Goods*, for the sum discounted or abated.

7. When you pay the interest of a sum formerly borrowed, the principal being continued in your own hand; enter *Profit and Loss*, or *Interest account*, Dr to *Cash*, for the sum paid.

8. When you pay both principal and interest, enter *Sundries* Drs to *Cash*, viz.  
*Lender*, for the principal,  
*Profit and Loss*, or *Interest account*, for the interest.

9. When a ship or goods you have formerly insured happens to be lost, and thereupon you pay the value to the owners, enter *Insurance account* Dr to *Cash*, for the sum paid.

10. When you pay for a ship, house, or estate, presently bought; or pay repairs, taxes, or other charges on them: enter *Ship*, *House*, or *Estate*, Dr to *Cash*, for the sum paid.

11. When you pay charges on goods, as freight, portage, &c. enter *Goods* Dr to *Cash*, for the sum paid.

12. When you pay charges that relate to trade in general, such as warehouse rent, shop-rent, shop-keepers wages, postage of letters, &c. enter *Charges of merchandise* Dr to *Cash*. July 2. July 5.

13. When you pay your landlord rent for a dwelling-house, servants their wages, or make any disbursements for you self or family; as all expences of this nature should be collected in a small book by themselves; so, when you bring them to the *Journal*, enter thus: *House-expences* Dr to *Cash*, for the total. Nov. 14. Dec. 30.

14. When you pay upon losing a wager; or when you lose upon exchange, that is, put off a piece of coin for less than it cost you: or when you give away money in charity, or any other way not yet mentioned, for which nothing comes in; enter *Profit and Loss* Dr to *Cash* *ditto* 22.

Note 1. An affignation differs as to its nature, and form from a bill or note; but the general entry the same with respect to all of them. In an affignation there are three persons concerned: 1. He who gives the affignation, called the *Affignor*. 2. He in whom the affignation is given, or by whom it is payable, called the *Affignee*. 3. He to whom it is payable, called the *Affignee*. Here we shall propose two or three cases not yet taken notice of. 1. Suppose you pay a debt to *Samuel Neely*, by an assignment on *Peter Funtwell*, the entry is, *Samuel Neely* Dr to *Peter Funtwell*. 2. If *A. B.* give an assignment on or bill on you to *M. S.* which you do not pay or credit in your case, charge *A. B.* Dr to *M. S.* 3. If *E. F.* give you an assignment of bill on *G. H.* which he does not pay, charge *G. H.* Dr to *E. F.* 4. If *N. H.* draw a bill on you to *G. L.* payable to himself, or to a certain day, which you pay, present upon having discount allowed you, in this case, make *N. H.* Dr to *Sundries*, viz. to *Cash*, for the sum paid, and *Profit and Loss*, for the sum discount.

Note 2. If you pay a debt with goods, instead of money, the goods delivered, and not *Cash*, will be Cr. As, 1. If you pay *A. B.* in goods, for goods formerly bought, or for a bill you have formerly accepted, and that whether in full or part, enter *A. B.* Dr to the *Goods*, for their value. 2. If you pay him the same account, part goods, part money, charge *A. B.* Dr to *Sundries*, viz. to *Goods*, for their value, and to *Cash*, for the rest. 3. If you give him goods above the debt, and he presently pay you back the balance in money, enter *Sundries* (viz. *A. B.* for the sum of the debt, and *Cash*, for the balance) Dr to *Goods*, for their full value. 4. If you give him goods above the debt, but do not presently receive the balance, enter simply *A. B.* Dr to *Goods* delivered, for their value. 5. If you pay interest of a bond, or sum borrowed, with goods, charge *Profit and Loss* Dr to the *Goods* delivered, &c.

Note 3. To prevent filling up your *Ledger* with accounts for every small dealer, you may erect a general account, under the title of *Debts general*, and charge it Dr for all such petty debts, mentioning in each entry the account to which, the person's name, and sum; and give it credit for all the payments, expressing also the accounts by which, with the persons names, and sums of money. To this credit-side also carry all such small debts you owe, and debit the account as you pay. Or, if you incline to be more distinct, erect two general accounts; one, *Debts*, and the other, *Debts payable*. Charge the former with all the petty debts due to you, and give it credit as you receive payment. Make the latter Cr for all the small debts due by you to others, and charge it Dr as you pay.

Note 4. In like manner, to save in opening an account in the *Ledger* for every person you may have a bill upon, or who may have one on you, erect two general accounts; one, by the title of *Bills receivable*, and the other, *Bills payable*, and charge the former Dr for all the bills accepted, and payable to you, and give it credit as you receive payment. *March 19.* Make the latter Cr for all the bills you accept, and charge it Dr as you pay. *Sept. 3. Sep. 10.*

Note 5. If a person have an account already opened in your *Ledger*, or if you are not to use the general accounts.

Note 5. The entries mentioned in this and the preceding problem, with respect to wagers, *Capote*, that is, the bet, and the *Wager*, are to be entered before the wager is looked; which indeed is the bet way; if the wager is every way to be determined. But if you enter into a wager that cannot be soon decided, and thereupon confine the bet in a third person's hands; in this case, it is proper to erect an account under the title of *Wagers account*, and charge it Dr to *Cash*, for the sum confined. If you gain the wager, and receive the bet, enter *Cash* Dr to *Wagers account*, for the sum received; if you lose, make *Profit and Loss* Dr to *Wagers account*, for the sum formerly confined, and now lost. Sometimes the bets are confined in one of the parties hands. Thus, in *April 1734*, two gentlemen in *London* entered into a wager concerning the resolution of *Danzon*, by the *Russians*; whereupon one of them confined 100 guineas in the other's hands, upon condition that he should pay him three guineas a day till the city should be taken or surrendered. In this case, if you receive the 100 guineas, enter *Cash* Dr to *Wagers account*; and when the wager is determined, make *Wagers account* Dr to *Cash*, for all you pay him. If you confined the 100 guineas, charge *Wagers account* Dr to *Cash*; and when the wager is decided, make *Cash* Dr to *Wagers account*, for all you receive back.

Note 6. These accounts, viz. *Refusal of bargains*, *Interest*, *Bottomry*, *Refinance*, *Blank contracts*, &c. of the same nature with the general account *Profit and Loss*, being nothing else but particular branches of it; and the only design of keeping them distinct is, in order to know what is gained or lost on each of these several heads.

Note 7. When a ship or goods you have insured to another happens to be lost at sea, and thereupon you pay the value; after this the subject lost becomes your own; and if any of the wreck be recovered, enter the *Thing* recovered Dr to *Insurance account*, for its value, and charge *Insurance account* Dr to *Cash*, for what you expect in fratch of it.

Note 8. If you have frequent occasion to deal in outlandish money, or pieces not current, you may erect an account under the title of *Foreign coin*, or, particularly, *Spanish coin*, &c. and charge it Dr for what pieces you receive, and give it credit as you put them off. *March 21. March 23.*

Note 9. If any parcel of goods happen to be damaged or lost, or liquor to be spilled, &c. charge *Profit and Loss* Dr to the *Account of the goods of liquor*, for the value of the same, and give it credit as you receive the same. *Sec.*

Note 10. We shall now conclude proper domestic trade, by reminding the learner, in putting any case to the *Journal*, carefully to consider, whether it be confined in any of its parts to some preceding one; otherwise no rules, but every particular case, can be fully charged to direct his practice. For if the parts of a former and subsequent case be the reverse of one another, they must also be opposite in respect of terms, notwithstanding whatever particular rules may seem to vary. Thus, suppose *A. B.* accept a bill payable to you, and thereupon you charge not *A. B.* but the general account *Bills receivable* Dr; it is plain, that when you receive payment, you must enter *Cash* Dr, not to *A. B.* but to *Bills receivable*, notwithstanding what is said, *prob. 5. case 4.*

See *March 17.* and 23. Again, admit you accept a bill payable to *A. B.* and thereupon credit, not *A. B.* but the general account *Bills payable*; it is evident, that when you pay, you must charge not *A. B.* but *Bills payable*. *Dr to Cash*, notwithstanding *prob. 6. case 4.* See *Sept. 3.* and 10.

adly, Debtor and Creditor applied in proper foreign trade.

Proper foreign trade comprehends, 1. The shipping of goods to a factor. 2. Advices concerning them from the factor. 3. Returns made by the factor to you.

Prob. 1. G. Debtor and Creditor applied in shipping off goods to a factor.

In all cases, *voyage* to — is Dr; but the Cr varies, according as the goods shipped off are already entered in your books, or presently bought; and that again, either for ready money, or on time, &c.

Case 1. If you ship off goods which are already entered in your books, enter

*Voyage* Dr to *Sundries*, viz.

To the respective *Goods*, for their value,  
To *Cash*, for custom, insurance, and all other charges.

2. If you buy a cargo for ready money, and ship it off immediately, without entering the purchase in your books, enter *Voyage* Dr to *Cash*, for prime cost, and all charges.

3. If you buy goods on time, and ship them off, without entering them in your books, enter

*Voyage* Dr to *Sundries*, viz.

To *Seller*, or *Sellers*, for value of the goods,  
To *Cash*, for charges at shipping.

4. If you ship off a cargo, made up partly of goods taken from your own warehouse, partly of goods bought, on time, enter

*Voyage* Dr to *Sundries*, viz.

To *Sundries* your own, for their value,  
To *Seller* or *Sellers*, for value of the goods bought,  
To *Cash*, for all charges. *Jan. 21.*

Note 1. Several other cases may be supposed; such as, 1. When a cargo consists of goods, part your own, part bought for ready money. Or, 2. Part your own; the rest bought, part for ready money, part on time. *July 9.* Or, 3. All bought, part for ready money, part on time. Or, 4. Part your own, part bought, part immediately received in barter, or as payment of a debt. But the way of journalising these and the like cases, may be easily gathered from what is already said; and therefore we shall leave them to the learner's exercise.

Note 2. If you do not pay charges at shipping immediately, you must credit the *Person* to whom it is due, and not *Cash*; or, if you please, erect a general account, under the title of *Debts payable*, or *Charges payable*, and charge *Voyage* Dr to it, and as you pay enter it Dr to *Cash*.

Note 3. As *Payage* is to be debited for all charges, or whatever augments the cost; so it must be credited by whatever lessens the same, such as drawbacks on re-exported goods. *Sept. 28.*

Note 4. Instead of the title, *Voyage to* —, some use *Adventure to* —, or *Adventure to* — per such a bill; as, *Adventure to Barbadoes per the Neptune*.

Prob. 2. H. I. Debtor and Creditor applied, upon advice from your factor, A. B.

H § 1. The cases of the first advice.

In all cases of the first advice, *Voyage* to — is Cr; but the Dr varies, according to the nature of the advice.

Case 1. If the first advice be, That *A. B.* has received your goods, but sold none of them, enter *A B m* account of goods Dr to *Voyage*, for the sum the said voyage was formerly charged with.

2. If the first advice be, That *A. B.* has received the goods, and sold them for ready money, enter *A B m* account current Dr to *Voyage*, for the neat proceeds; that is, the sum due to you, after the factor's commission and all charges are deducted. *Sept. 28.*

3. If the first advice be, That the goods are received, and all sold on time, enter *A. B. my account on time* Dr to *Voyage*, for the neat proceeds.

4. If the first advice be, That they are received, and all sold, part for ready money, part on time, enter *Sundries* Drs to *Voyage*, viz.

*A. B. my account current*, for the money in his hands,  
*A. B. my account on time*, for the debts outstanding.

5. If the first advice be, That the goods are not only received and sold, but a cargo shipped in return, and now at sea; here there are three varieties. 1. If the value of the cargo inward, with charges paid by the factor, be equal to the neat proceeds, enter *Voyage* inward Dr to *Voyage* outward, for the neat proceeds. 2. If the factor overplus the neat proceeds, enter *Voyage* inward Dr to *Sundries*, viz. to *Voyage* outward for the neat proceeds, and to *Factor my account current*, for the rest. 3. If he underplus the neat proceeds, enter *Sundries* (viz. *Voyage* inward, for its value, and *A. B. my account current*, for the rest) Drs to *Voyage* outward. June 18

6. If the first advice be, whether from the factor or any body else, That the ship and cargo is lost at sea, there will be also three varieties. 1. If the goods lost were not insured, enter *Profit and Loss* Dr to *Voyage*, for the whole value. 2. If the goods lost were all insured, charge the *Insurer*, or *Cash*, if you get present payment, Dr to *Voyage*. 3. If part of the goods only were insured, make *Sundries* (viz. the *Insurer*, or *Cash*, for the value insured, and *Profit and Loss*, for the rest) Drs to *Voyage*, for the whole loss.

I. § 2. *The cases of the second advice.*

In journalizing a second or third advice, respect must be had to the entry that was made upon the advice immediately preceding; for whatever was then Dr, must be now made Cr. And therefore, supposing the first or former advice was, That the factor had received the goods, but sold none of them, the entry to be made upon a second advice will be as in the cases following.

*Case 1.* If the second advice be, That the goods formerly received are now sold, in whole or in part, for ready money, enter *A. B. my account current* Dr to *ditto my account of goods* for neat proceeds.

2. If the second advice be, That goods received formerly are now sold in whole or in part, on time, enter *A. B. my account on time* Dr to *ditto my account of goods* for neat proceeds.

3. If the second advice be, That goods formerly received are now sold, part for ready money, part on time, enter *Sundries* Drs to *A. B. my account of goods*, viz.

*A. B. my account current*, for the money in his hands.

*A. B. my account on time*, for the outstanding debts.

But if the former advice had been, That the factor had sold your goods on time, then upon this supposition, the advice that comes next, whether second or third, is journalized as follows.

*Case 1.* If the next advice be, That the factor has now received payment of the debts outstanding, enter *A. B. my account current* Dr to *ditto my account on time*, for the sum received by him.

2. If the next advice be, That he has indeed received payment of the debts, but was obliged to allow abatement, for inlack of goods, or for other reasons, enter

*Sundries* Drs to *A. B. my account on time*, viz.  
*A. B. my account current*, for the sum received by him;

*Profit and Loss*, for the sum abated.

Prob. 3. K. L. Debtor and Creditor applied, when returns are made you by the factor.

Returns are made in goods or bills.

K. § 1. *The cases of returns in goods.*

*Case 1.* If the factor ship off, and consign goods to yourself, advising you thereof by post, before the arrival of the ship, enter *Voyage from*—Dr to *A. B. my account current*, for coit and charges of the cargo, as per factor's invoice.

2. If the factor ship off goods for yourself, of which you have no advice, or of which you book no advice, prior to the arrival of the ship, enter

*Goods received* Dr to *Sundries*, viz.

To *A. B. my account current*, for coit and charges, as per invoice,

To *Cash*, for new charges paid here.

3. If your factor *A. B.* at *Leghorn* ship off goods not to yourself, but by your order, to *C. D.* your factor at *Lisbon*, and advise you thereof, by sending you a copy of the invoice, enter *Voyage from Leghorn to Lisbon* Dr to *A. B. my account current*, for coit and charges, as per invoice.

*Note 1.* The entries in this problem suppose that you have received the account of sales, and debited the account current, for neat proceeds; which naturally leads to give the account current credit here, and shows how the Dr part of a prior entry is reversed, or becomes Cr in a posterior one.

*Note 2.* There are two or three cases relative to these mentioned, which we shall here take notice of. 1. When the ship and cargo mentioned in *case 1.* arrives, you enter *Goods received* Dr to *Sundries*, viz. to *Voyage* hitherto, for what it was charged with, and to *Cash*, for charges paid here. Or, if you please, first charge *Voyage* Dr to *Cash*, for charges, see July 9; and then discharge the *Voyage* by the *Goods*, see July 10. Or, if you dispose of all or any part of the cargo on the key, viz. before the voyage be discharged in your books, enter the *Buyer*, or *Cash*, or *Thing received*, Dr to the *Voyage*. See July 9. 2. If the said ship and cargo should happen to be lost at sea, then if the goods be not insured, you enter *Profit and Loss* Dr to *Voyage* inward, for what it was charged with. But if the cargo be insured, charge the *Insurer*, or *Cash* if you get present payment, Dr to *Voyage*, &c. 3. If a cargo consigned to you happen to be lost at sea, which you have notice of before any entry is made in your Books; in this case, enter *Profit and Loss*, the *Insurer*, or *Cash*, Dr to *A. B. my account current*, for the value lost.

L. § 2. *The cases of returns in bills.*

*Case 1.* If you draw upon your factor, and receive present money for the bill, enter *Cash* Dr to *A. B. my account current*, for value of the bill

2. If you draw upon your factor, and give the remitter a day for payment; or if you owe the remitter, and give him the bill as payment; enter the *Remitter* Dr to *A. B. my account current*, for the value of the bill July 15.

3. If you draw upon your factor *A. B.* payable to your factor *C. D.* charge *C. D. my account current* Dr to *A. B. my account current*, for value of the bill.

4. If your factor remit you a bill, for which you receive present payment, enter *Cash* Dr to *A. B. my account current*, for the value of the bill.

5. If your factor remit you a bill, payable at single or double ufance, or any other time after date or sight; upon getting the bill accepted, enter *Bills receivable* Dr to *A. B. my account current*, for value of the bill. Sept. 30.

6. If your factor *A. B.* by your order, remit a bill to your factor *C. D.* charge *C. D.* my *acct* current Dr to *A. B.* my *acct* current, for value of the bill.

## 2. IN FACTORAGE.

FACTORAGE comprehends three things: 1. The receipt of the employer's goods. 2. The disposal of them. 3. Returns made for them.

Prob. 1. *M.* Debtor and Creditor applied upon the receipt of goods.

WHEN you turn factor, and have goods consigned to you by your employer; upon receiving the goods, enter *A. B.* his *acct* of goods Dr to *Cash*, for freight, custom, or other charges you pay. Aug. 10.

Note 1. If there be but one kind of goods, name it; as, *A. B.* his *acct* of *Tea*; *A. B.* his *acct* of *Tea*, &c.

Note 2. Instead of the title *A. B.* his *acct* of goods, some use *A. B.*'s *file* or *A. B.*'s *file per job* or *job*, as *A. B.*'s *file per the* &c.

Note 3. In the following set of books, in regard to *Warehouse* is supposed to be kept, the consigned goods are enumerated in the *Warehouse*; but in real business, or where an *Invoice-book* is kept, the common practice is, to copy them directly into it; and in the *Warehouse*, to mention only the money paid for freight, or other charges, without taking any notice of the names or quantity of the goods. Thus, the entry in the *Warehouse*, Aug. 10, inserted in this manner, would stand as follows.

Paid freight, custom, wharriage, portrage, &c. of sundry goods for the *Grain*, *John Tomlin* in master, consigned from *Herman Van Beck of Amsterdam*, for sale and returns, 141. 121. 6d.

Prob. 2. *N.* Debtor and Creditor applied in disposing of your employer's goods.

Case 1. WHEN you sell all, or any part of your employer's goods, for ready money, enter *Cash* Dr to *A. B.* his *acct* of goods, for the sum received. Aug. 17.

2. When you sell all, or any part of his goods, on time, charge the *Buyer* Dr to *A. B.* his *acct* of goods, for the sum due. Aug. 23.

3. When you take all, or any part of his goods, to yourself at the current price; or when you put off his goods in barter, for others which you take to yourself; enter *Goods received* Dr to *A. B.* his *acct* of goods, for their value.

4. When all your employer's goods are disposed of, balance his *acct* of goods; that is, charge *A. B.* his *acct* of goods Dr to *Sundries*, viz. to *Cash*, for any charges paid by you, not yet booked; or to the *person* or *persons* to whom they are due, if not yet paid; and to *Profit and Loss*, for your commission; and to *A. B.* his *acct* on time, for the outstanding debts, if any; and to *A. B.* his *acct* current, for the employer's ready money in your hands. Aug. 23.

5. When you receive payment of the outstanding debts, enter as in *proper trade*, viz. *Cash* Dr to the *Buyers*; but if you be obliged to make abatement, for defect in weight or measure, or bad markets, &c. enter

*Sundries* Drs to the *Buyer*, viz.

*Cash*, for the sum received,

*A. B.* his *acct* current, for the sum abated.

6. When you receive payment of a debt on your employer's account, you must not only give the buyer or payer credit as directed above, but at the same time charge *A. B.* his *acct* on time Dr to ditto his *acct* current, for the whole sum of the debt, whether any abatement be allowed or not.

Note 1. If you allow abatement to the buyers, while the *accounts* of goods is yet open, you may charge *A. B.* his *acct* of goods Dr to the *Buyers*, for the sum abated.

Note 2. When you pay the persons mentioned in *case 4.* who get credit at balancing the *acct* of goods, such as packers, peelers, porters, coopers, dyers, bookers, &c. enter as in *proper trade*, viz. *Receiver* Dr to *Cash*; but if they allow abatement, this being your employer's profit, not your own, charge the *Receiver* Dr to *Sundries*, viz. to *Cash*, for the sum paid, and to *A. B.* his *acct* current, for the sum abated. Aug. 31.

Prob. 3. *O. P.* Debtor and Creditor applied when you make returns to your employer.

Returns are made either in goods or bills.

O. § 1. The cases of returns in goods.

Case 1. WHEN you buy up goods for ready money, and ship them off for your employer, enter

*A. B.* his *acct* current Dr to *Sundries*, viz.

To *Cash*, for prime cost, and charges paid,

To *Profit and Loss*, for your commission.

2. When you buy goods on time, and ship them off for your employer, enter

*A. B.* his *acct* current Dr to *Sundries*, viz.

To *Sellers*, for prime cost of the goods,

To *Cash*, for charges, as custom, insurance, &c.

To *Profit and Loss*, for your commission.

3. When you take goods of your own, and valuing them at the current price, ship them off for your employer, enter

*A. B.* his *acct* current Dr to *Sundries*, viz.

To *Goods* sent off, for their value,

To *Cash*, for charges at shipping,

To *Profit and Loss*, for your commission.

Note 1. There may be several other cases; as, 1. When the goods shipped off are bought, part for ready money, and part on time, May 18. 2. When part of them are bought for ready money, part of them your own. Aug. 30. 3. When part of them are bought on time, the rest being your own. 4. When part of them are bought for ready money, part on time, part of them your own. All which being compounds of the cases mentioned, can prove no difficulty to the learner.

Note 2. The *Journal Entry* is the same, whether the goods shipped off be in return for goods sold by you, or in answer to your employer's commission, when you have none of its effects or money in your hand. May 18. The entry is also the same, whether the goods shipped off be consigned to himself, or by his order to his factor, or any other person.

Note 3. If the charges on shipping are not presently paid, the Cr will be to *Cash*, but the person to whom they are due, May 18. Aug. 30. Or, if you please, the general account, *Debit* payable, or *Charges payable*. And when you pay, enter the *Receiver*, or *Charges payable*, Dr to *Cash*, May 22. But if abatement be allowed you, this being your employer's advantage, not your own, enter the *Receiver*, or *Charges payable*, Dr to *Sundries*, viz. to *Cash*, for the sum paid, and to *A. B.* his *acct* current, for the sum abated. Aug. 31.

Note 4. In like manner, when you pay for the goods mentioned *case 2.* enter as in *proper trade*, viz. the *Sellers* Drs to *Cash*; but if abatement be allowed you, you must charge the *Sellers* Drs to *Sundries*, viz. to *Cash*, for the sum paid, and to *A. B.* his *acct* current, for the sum abated.

## P. § 2. The cases of returns in bills.

Case 1. WHEN your employer draws a bill on you, which you accept and pay on sight, enter *A. B.* his *acct* current Dr to *Cash*, for value of the bill.

2. When your employer draws a bill on you, payable at 1 or 2 usance, enter *A. B.* his *acct* current Dr to *Bills payable*, for value of the bill. Sept. 3.

3. When you draw upon your employer, enter *Cash*, if you receive present money for the bill; or, if not, the *Remitter* Dr to *A. B.* his *acct* current, for value of the bill. May 31.

4. When you remit a bill to your employer, for which you pay ready money, enter *A. B.* his *acct* current Dr to *Cash*, for value of the bill. Sept. 8.

5. When you remit a bill to your employer, which you either procure on time, or receive in payment of a debt due to you by the drawer, enter *A. B.* his *acct* current Dr to the *Drawer*, for value of the bill.

6. When

6. When your employer remits a bill to you, enter *Cash*, if you receive present payment; or, if not, *Bills receivable*, Dr to *A. B. his account current*, for value of the bill.

*Note 1.* When you pay the bill mentioned in *case 2.* enter *Bills payable* Dr to *Cash*. *Sept. 10.*

*Note 2.* Charge *A. B. his account current* Dr to *Cash*, for all charges you pay in making returns, such as postage.

*Note 3.* Having now shewn how to keep *factory-accounts* in your own books, along with your other business, it will not be improper to observe, that these accounts may also be kept, by help of the *Sales book*, without bringing any thing to your *Ledger*, or other books, except the *account current*, thus: Turn the *Sales-book* into a folio-form; and when you receive the consigned goods, enter them on the Dr side, mentioning their quantity, mark, and number, with the charges you pay; to which side also carry all after charges, abatements made to buyers, and your own commission. On the Cr side, enter the *sales*, mentioning the names of the buyers on time; and, as they pay, mark the article as paid on the margin; or, which will do just as well, never draw out the sums to the money columns, till you receive payment. In your *Ledger*, give *A. B. his account current* credit for all the money you receive for his goods, and make the same account Dr for all the charges paid by you, abatements made to buyers, your own commission, and returns made to your employer. But though this method may now and then be used with respect to small consignments; yet the conducting of large concerns in *factory* requires the use of all the five books mentioned at the beginning of this chapter.

*Note 4.* When you cannot dispose of your employer's goods to advantage, and thereupon by his order ship them off to a factor of your own, in expectation of a better market, the regular method in this case is, 1. When you ship off the goods, enter *Voyage to*—for account of your *Employer*. Dr to *Cash*, for charges paid at shipping. 2. When you have advice from your factor, that he has received them, enter your *Employer his account of goods* in the hands of *factor*, or rather your *Employer his account of goods* at such a place, Dr to *Voyage* thither, for charges of the said voyage. 3. When you have advice that he has sold them, e. g. for ready money, enter your *Employer his account current* at—Dr to *ditto his account of goods* at—, for neat proceeds. The entry in any other case will be obvious to one who understands *proper trade* and *factorage*, as explained above. But though this be the regular method, yet in real practice, the best way, in our opinion, is, when you ship the goods, to charge the employer's *account of goods* (as they stand in your *Ledger*) Dr to *Cash*, for charges at shipping, making no more entries, till you receive the *Account of sales*, and then charge *A. B. his account of goods*, for the neat proceeds; and discharge *A. B. his account current* at—, as returns are made to you by your factor.

### 3. IN PARTNERSHIP.

PARTNERSHIP is that branch of trade which is ma-

naged and carried on by a trustee, in the name, and for the account of the partners; that is, when a joint stock, made up by two or more merchants, is deposited in the hands of one person, to be employed by him in a way of commerce, according to instructions.

Merchants, upon entering into *partnership*, generally chuse one of their own number, to whom they commit the management of their company-concerns; who, on account of his being partner, as well as manager or doer for the company, is called *partner-trustee*; and shares of gains and losses that happen, according to his share of the stock; and must allow his proportion of all charges, even of his own commission, since, in quality of trustee, he serves himself as partner equally with the rest.

The accounts of the company's affairs may be kept by the trustee in his own books, along with the accounts of his own private business; or they may be kept in separate books allotted for that purpose. The former is common practice, in matters of small concern, or short adventures; the latter is used by fixed companies, whose trade is considerable, or who have the prospect of dealing long that way.

Hence it is obvious, that each partner will have occasion to keep an account in his own books, of every thing he gives in and receives from the company, and also of what he owes to the company, or they to him: and, on the other hand, it will be the business of the trustee, not only to keep clear accounts with the persons he deals with, in buying up and disposing of goods for the company; but he must also keep distinct accounts, with respect to the partners, shewing what share each of them gives in, and what part of neat proceeds is due to them, and likewise what every one of them owes to the company, or the company to them. These things premised,

1. We shall shew how a partner keeps the accounts which he has occasion for.

2. The way how a trustee keeps the accounts of the company's affairs in his own books.

3. The manner of keeping company-accounts in books, apart, that contain nothing else.

1. How a partner keeps the accounts he has occasion for.

The *Ledger-accounts* described.

A merchant concerned as partner in a company, must keep the two *Ledger-accounts* following; in which observe, that *A. B.* represents the trustee's name.

1. *A. B. my account in company.* This account is Dr for your inputs, and proportion of all charges, and Cr for your share of neat proceeds.

2. *A. B. my account proper.* This is a personal account, being charged and discharged exactly as such, for the mutual debts and payments betwixt you and the trustee.

*Note 1.* *A. B. my account in company*, is a general title, that may represent one or more kinds of goods; and that whether in the trustee's custody, or by him sent to sea. But different authors title this account differently. Some chuse to express it thus: *Goods in the hands of A. B.*; or particularly, *Broad cloth in the hands of A. B.* If it be a sea-adventure, you may use the title, *A. B. my account of Voyage to*—. If the company be

be fixed, the title may be taken from the commodity they deal in, as *Account in Wine-company, account in Tobacco-company, &c.*; or from the place they trade to, as *Account in East-India company, &c.*

*Note 7.* Instead of *A. B. my account proper*, some write *A. B. my account-current*; some too write *A. B. his account current*; and others title this account simply by the trustee's name. But though the titles of accounts are in some fort arbitrary, or as he merchant pleases, yet it is suitable or congruous, that they carry in them some badge of distinction, shewing to what class of accounts they belong.

We now proceed to a particular application of Dr and Cr in the cases that most commonly occur on this head, which shall be confined to the two problems following.

**Prob. 1. Q.** Debtor and Creditor applied, when you give in your share of stock to the trustee.

*Case 1.* If you give in just your own part; and that either, 1. In money, or in goods presently bought for ready money; or, 2. In goods presently bought on time; or, 3. In goods already entered in your books, enter *A. B. my account in company Dr*

To *Cash*, if you give in money, or pay for goods, *Off. 4.*

To *Seller*, if you buy goods on time,

To *Goods proper*, if the goods were formerly your own.

2. If you find both your own part and the trustee's, enter *Sundries (viz. A. B. my account in company, for your own part, and A. B. my account proper, for his part) Drs*

To *Cash*, if you give in money, or pay for goods,

To *Seller*, if you buy the goods on time,

To *Goods proper*, if you give in goods formerly your own, *Off. 9.*

3. If the trustee provide both your part and his own, enter *A. B. my account in company Dr to ditto my account proper*. And when you pay him, charge *A. B. my account proper Dr to Cash*. But if he demand interest, make *Sundries (viz. A. B. my account proper, for the debt, and Profit and Loss, for the interest) Drs to Cash*.

*Note 1.* There may be several other varieties in *case 1.* besides those mentioned; as, 1. When you give in part money, part goods presently bought on time. 2. When you give part in money, part goods of your own. 3. When you give in goods, part bought on time, part your own. 4. When you give in part money, part goods bought on time, part goods of your own. In all which cases, enter *A. B. my account in company Dr to Sundries*, as follows.

- |           |   |   |
|-----------|---|---|
| Variety 1 | [ | To <i>Cash</i> , for the sum given in.            |
|           | ] | To <i>Seller</i> , for value of the goods bought. |
| 2.        | [ | To <i>Cash</i> , for the sum given in.            |
|           | ] | To <i>Goods proper</i> , for their value.         |
| 3.        | [ | To <i>Seller</i> , for value of the goods bought, |
|           | ] | To <i>Goods proper</i> , for their value.         |
| 4.        | [ | To <i>Cash</i> , for the sum given in.            |
|           | ] | To <i>Seller</i> , for value of the goods bought, |
|           | ] | To <i>Goods proper</i> , for their value.         |

*Note 2.* The like varieties may be supposed in *case 2.* In journalising of which, the best method is, first to enter *A. B. my account in company Dr to Sundries*, as in the former note, for the whole value of the money, and goods given in; and then, in another entry, charge *A. B. my account proper Dr to ditto my account in company*, for the trustee's part. And when the trustee pays you for his part, enter *Cash Dr to A. B. my account proper, Off. 11.* But if he pay you also interest, make *Cash Dr to Sundries, viz. to A. B. my account proper, for the debt, and to Profit and Loss, for the interest.*

**Prob. 2. R.** Debtor and Creditor applied, when goods in company are disposed of, and you receive all or part of your share of neat proceeds.

*Case 1.* If you have advice of sales, and at the same

time receive your share of neat proceeds; which may be either in money, bills, or goods; enter *Cash, Bills receivable, or Goods received, Dr to A. B. my account in company, for value received, Off. 9. and 20.*

2. If you have only advice of sales on time, without receiving any thing, enter *A. B. my account proper Dr to ditto my account in company*, for your share of neat proceeds due to you; and when you receive payment, charge *Cash, Bills receivable, or Goods, Dr to A. B. my account proper*, for value received. But if the trustees had been obliged to allow abatement to the buyers, or had any of the debts outlanding proved bad, then, in this case (if the account in company be yet open, enter *Sundries (viz. Cash Bills receivable &c.* for the sum received, and *A. B. my account in company, for your share of the sum abated or lost) Drs to A. B. my account proper*. If the account in company be balanced, charge *Profit and Loss Dr* for your share of the abatement, or of the loss.

3. If the goods are sold, part for ready money, part on time, and thereupon you receive your share of money received, enter *Sundries (viz. Cash, for the sum you receive, and A. B. my account proper, for your share of sales on time) Drs to A. B. my account in company.*

4. If part of the goods only are sold, you may put off the booking of it till further advice; unless it be for ready money, of which you immediately receive your share: in which case, enter *Cash Dr to A. B. my account in company, for the sum you receive.*

5. If you withdraw your share of stock, or any part of it, enter *Cash, or Goods withdrawn, Dr to A. B. my account in company, for the sum or value withdrawn.*

6. If after the goods are disposed of, you take up only your share of neat gain, continuing your share of stock as a fund for a new adventure, charge *Cash Dr to Profit and Loss, for the sum received, and let the account in company stand as it is.*

*N. B.* This is the ordinary case in fixed companies.

*Note 1.* There may be other varieties in *Cases 1. & 2.* besides those mentioned, viz. 1. You may receive, as your share of neat proceeds, part money, part bill; and then *Sundries* are *Drs, viz. Cash, and Bills receivable, Off. 9.* 2. You may receive part money, part goods; and then the *Drs* are, *Cash, and Goods received, Off. 20.* 3. You may receive part bill, part goods; and then the *Drs* are, *Bills receivable, and Goods received.* 4. You may receive part money, part bill, part goods; and then there will be three *Drs, viz. Cash, Bills receivable, and Goods received.*

*N. B.* If the person on whom you get the bill have an account in your Ledger, make him *Dr*, and not *Bills receivable.*

2. How a trustee keeps the company's accounts in his own books.

The Ledger accounts described.

A Trustee who keeps the company's accounts in his own books, has occasion for the three *Ledger-accounts* following, in which *A. B.* represent your partner's name.

1. *Goods in company with A. B. or Sales in company with A. B.* or particularly *Sugar in company with A. B.* This account is debited for the value of the goods brought into company, for all charges, and your commission: it is credited as you dispose of the goods, in the same manner as if the goods were your own.

2. *A. B. his account in company.* This is credited for your partner's imputs, his share of charges, and proportion of neat gain at close: it is debited for his share of neat

neat proceeds, and his proportion of losfs, if any, when the company accounts are finished.

3. *A. B. his account proper.* This is a personal account, which is debited and credited for the mutual debts contracted and payments made betwixt you and partners.

*Note 1.* If the company deal in foreign trade, you who manage as trustee will have occasion for other accounts, viz. *Voyage in company, Factor our account current, &c.* all which are used the same way as their parallels in proper foreign trade.

*Note 2.* As you must keep an account in company, and an account proper, for each partner; fo, if these be compared with the accounts of the like name kept by the partners, they will be found exactly the reverse of one another; that is, the Dr side of the accounts kept by you will be the same with the Cr side of those kept by partners; and on the other hand, the Cr side of the former will be exactly the Dr side of the latter.

*Note 3.* Instead of the title *A. B. his account proper*, a great manufye *A. B. his account current.* And it must be owned the merchant is at liberty to do in this as he inclines; it comes to the same thing in the issue, only the one title is more distinctive than the other.

Prob. 1. S. Dr and Cr applied, when goods are brought into company.

*Case 1.* If the goods are bought, (which is either from you the trustee, or from a partner, or from a neutral person,) enter twice; viz. 1<sup>st</sup>, *Goods in company Dr To Goods proper*, if bought of yourself, } for value of  
 To Partner's account proper, if of a partner, }  
 To Cash, or Seller, if of a neutral person } bought.

2<sup>dy</sup>, Charge each partner *his account proper Dr to ditto his account in company*, for his part of the purchase *Of. 26. Nov 22*

*Note.* When you pay a neutral person for goods bought on time, charge the said Person Dr to Cash; and there is no second entry. *Of. 27. Nov. 25.* But if he allow you discount or abatement, enter twice; namely, 1. *Seller Dr to Sundries*, viz. to Cash, for the sum paid, and to *Goods in company*, for the sum discounted or abated. 2. Each partner's account in company Dr to ditto his account proper, for his share of the sum discounted or abated.

*Case 2.* If each partner bring in just his own part of goods to company, enter once; viz.

*Goods in company Dr to Sundries*, viz.

To *Goods proper*, for value of your share,

To each Partner *his accounts in company*, for value of their shares.

*Note 1.* This is shorter than to enter as if the goods were bought, though the way would also be right, and prove the same in effect.

*Note 2.* Enter also above, if the partner give in each his own part in money, with which you buy goods; or, which is the same thing, if upon buying of the goods each partner intially pay down his part of the price, only Cash, and not *Goods proper*, will be Cr for your own part. *Of. 22.*

*Note 3.* But if you intirely book the money received from the partners, enter Cash Dr to Sundries, viz. to each partner's account in company. And when you buy the goods, charge *Goods in company Dr to Cash*, for their value; and there is no second entry.

*Case 3.* If you or partner pay charges on goods brought into company, as carriage, insurance, &c. this augments the cost, and must be entered as the cost, namely, 1<sup>st</sup>, *Goods in company Dr*

To Cash, if paid by you, *Of. 25. Nov 1.*

To Partner, *his account proper*, if paid by him.

2<sup>dy</sup>. Each partner *his account proper Dr to ditto his account in company*, for his share of the said charges.

Prob. 2. T. Debtor and Creditor applied, when goods in company are disposed of.

*Case 1.* If goods in company are sold, (which is either to you the trustee, or to a partner, or to a neutral person,) a double entry is necessary; viz. 1<sup>st</sup>,

*Goods proper*, if sold to yourself,

*Partner's account proper*, if to him on time, } Dr

*Cash*, or *Buyer*, if to a neutral person,

To *Goods in company*, for their value in the sale.

2<sup>dy</sup>, Each partner *his account in company Dr to ditto his account proper*, for his share of the sale. *Of. 29. Nov. 1. and 30. Dec. 2. 18. and 28.*

*Note 1.* The entries are the same when you receive freight for a ship in company. *Of. 35. Dec. 27.*

*Note 2.* When you receive payment for goods in company formerly sold to a neutral person, charge Cash Dr to the Buyer; and there is no second entry. *Nov. 1. Dec. 13.* But if you allow discount or abatement to the buyer, a double entry is necessary; namely, 1<sup>st</sup>, *Sundries* (viz. Cash, for the sum received, and *Goods in company*, for the sum discounted or abated) Drs to the Buyer; 2<sup>dy</sup>, Each partner *his account proper Dr to ditto his account in company*, for his part of the discount or abatement. *Dec. 20.*

*Note 3.* If goods in company be damaged, destroyed, or lost, enter *Sundries* (viz. each partner *his account proper*, for their respective shares of the damage or loss, and *Profit and Loss*, for your own share) Drs to *Goods in company*.

*Case 2.* If goods in company are disposed of in barter, for other goods of the same value brought into it, charge *Goods in company* received Dr to *Goods in company* delivered; and there is no second entry. *Dec 7.*

*Note 1.* If the goods to be received and delivered be of different values, a double entry will be necessary: As, suppose a trustee engaged in company with *A. B.* each  $\frac{1}{2}$ , should deliver 80 l. worth of broad cloth, in company, for tobacco to the value of 100 l.; in this case he enters twice: 1<sup>st</sup>, *Tobacco in company Dr to Sundries*, viz. to *Broad cloth in company*, 80 l. and to *Cash*, or *Dealer*, 20 l.; 2<sup>dy</sup>, *A. B. his account proper Dr to ditto his account in company*, 10 l. for his share of the money now laid out due to *Dealer*. Again, invert the supposition, and admit, that he delivers broad cloth in company to the value of 100 l. and receives 80 l. worth of tobacco, the rest in money, or due by his dealer; in this case he enters also twice: 1<sup>st</sup>, *Sundries* (viz. *Tobacco in company*, 80 l. and *Cash*, or *Dealer*, 20 l.) Drs to *Broad cloth in company*; 2<sup>dy</sup>, *A. B. his account in company Dr to ditto his account proper*, 10 l. his part of money received, or due by *Dealer*.

*Note 2.* If you barter goods in company, for others which you take to yourself, enter also twice: 1<sup>st</sup>, *Goods proper* received Dr to *Goods in company* delivered; 2<sup>dy</sup>, Each partner's account in company Dr to ditto his account proper, for his part of sale. In like manner, if you barter goods of your own, for others which you bring into company, enter twice; viz. 1<sup>st</sup>, *Goods in company* received Dr to *Goods proper* delivered; 2<sup>dy</sup>, Each partner *his account proper Dr to ditto his account in company*, for his part of purchase.

*Case 3.* If you or partner withdraw just your or his exact part of goods in company remaining unfold, enter once, viz.

*Goods proper*, if withdrawn by you,

*Partner's account in company*, if by him, } Dr

To *Goods in company*, for their value in company.

*Dec. 24.*

Note 1. If you or partner withdraw more or less than your or his exact part, you must account the goods sold, and enter as in *Case 1*.

Note 2. When goods in company are all sold, or part sold, and the rest withdrawn, in that all are disposed of, make a double *Journal entry*; viz. *1<sup>st</sup>*, Goods in company Dr to Sundries, viz. to Cash, or Charges of merchandise, for any charges not yet booked, such as cellar-rent, &c. and to Freight and Loss for your own commission, or for interest of money advanced by you; 2<sup>dy</sup>, Each partner *his account-proper* Dr to ditto *his account in company*, for his part of the whole. Nov. 1.

X. B. This is also to be done, if it be a voyage in company.

**Prob. 3. U. Debtor and Creditor applied in payments betwixt trustee and partners.**

*Case 1.* If you the trustee receive payment of partner in money, charge Cash Dr to partner *his account-proper*, for the sum received. Oct. 27. Nov. 25.

2. If partner give you his bill on E. F. charge Cash, or Bills receivable, or E. F. Dr to partner *his account proper*, for value of the bill.

3. If you draw on partner, charge Cash, or E. F. viz. the man you deliver the bill to, Dr to partner *his account proper*, for value of the bill.

4. If you pay partner in money, charge partner *his account-proper* Dr to Cash, for the sum paid. Nov. 4. and 17.

5. If you give partner your bill on E. F. charge partner *his account proper* Dr to E. F. for value of the bill.

6. If partner draw on you, charge partner *his account proper* Dr to Cash, if you pay at sight; if not, to Bills payable.

7. If, in adjusting shares in company, one partner pay into another, charge partner receiver *his account proper* Dr to partner payer *his account proper*, for the sum. Nov. 27. and 25.

N. B. The entry is the same, if you draw a bill upon one partner payable to another.

8. If partner make payment to E. F. of a debt due by the company, charge E. F. Dr to partner *his account proper*. Nov. 25.

**Prob. 4. V. Debtor and Creditor applied, when the company send goods to sea.**

*Case 1.* If the goods sent to sea have been formerly brought into company, and stand already entered in the books, upon shipping them off make a double entry; 1<sup>st</sup>,

Voyage in company to ——— Dr to Sundries, viz.

To Goods in company, for their value,  
To Cash, for charges, as custom, insurance, &c.

2<sup>dy</sup>, Each partner *his account-proper* Dr to ditto *his account in company*, for his share of charges only.

Note. If partner pay the charges, the Voyage is charged Dr, not to Cash, but to partner *his account-proper*.

*Case 2.* If the goods sent to sea are presently bought, (which is either from you, from a partner, or from a neutral person), enter also twice; namely, 1<sup>st</sup>,

Voyage in company to ——— Dr to Sundries, viz.

To Goods proper, if bought of you,  
To Partner *his account-proper*, if of a partner,  
To Cash, or Seller, if of a neutral person;  
And

To Cash, for charges, if paid by you,  
To Partner *his account-proper*, if by him.

2<sup>dy</sup>, Each partner *his account-proper* Dr to ditto *his account in company*, for his part of the whole.

Note 1. If each partner find just his own part of goods sent to sea, you may enter thus: 1<sup>st</sup>, Voyage in company to ——— Dr to Sundries, viz. To Goods proper, for your share; to each partner *his account in company*, for their respective

shares; and to Cash, for charges, if paid by you, or to partner *his account-proper*, if paid by him; 2<sup>dy</sup>, Each partner *his account-proper* Dr to ditto *his account in company*, for his part of charges.

Note 2. But if each partner bring in such goods as they have proper for the intended voyage, without regard to their just proportions, being refused to adjust that matter with money, the best way is, to consider the goods as bought, and enter accordingly; viz. 1<sup>st</sup>,

Voyage in company to ——— Dr to Sundries, viz.  
To each partner *his account-proper*, for value of the goods brought in by them,

To Goods proper, for value of those given in by you;  
And,  
To Cash, for charges, if paid by you.

To partner *his account proper*, if by him.  
2<sup>dy</sup> Each partner *his account-proper* Dr to ditto *his account in company*, for their respective shares of the cargo and charges, and not for the value of the goods given in by them. Nov. 13.

*Case 3.* If you or partner commission your or his factor, to ship off goods to company's factor; upon receiving the invoice, enter twice; 1<sup>st</sup>,

Voyage in company to ——— Dr

To Factor my account-current, if commission-  
ed by you.

To Partner *his account-proper*, if by him.

2<sup>dy</sup>, Each partner *his account-proper* Dr to ditto *his account in company*, for his part of the whole.

**Prob. 5. X. Debtor and Creditor applied, upon advice from company's factor.**

*Case 1.* If you receive per advice from factor the account of sales, enter twice; viz. 1<sup>st</sup>, Factor our account-current Dr to Voyage in company, for the amount of neat proceeds. 2<sup>dy</sup>, Each partner *his account in company* Dr to ditto *his account-proper*, for his share of the whole.

*Case 2.* If factor in Jamaica advise you, that because he could not dispose of the goods to advantage, he has, according to orders, shipped them off to your factor at Carolina, enter twice; namely, 1<sup>st</sup>, Voyage in company to Jamaica, for value of the cargo outward, and to Factor at Jamaica our account-current, for new charges paid by him. 2<sup>dy</sup>, Each partner *his account-proper*, Dr to ditto *his account in company*, for his share of new charges.

*Case 3.* If the cargo outward be lost at sea, there are three varieties. 1. If none of the goods be insured, enter Sundries (viz. each partner *his account in company*, for his part of the loss, and Profit and Loss, for your own part) Drs to Voyage in company; and no second entry.

2. If the goods be all insured, enter twice; viz. 1<sup>st</sup>, Charge the Insurers, or Cash if you get present payment, Dr to Voyage in company. 2<sup>dy</sup>, Charge each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the Insurers. 3. If only part of the goods be insured, enter also twice; 1<sup>st</sup>, Sundries (viz. Insurers, or Cash, for the value insured; each partner *his account in company*, for his share of the loss; and Profit and Loss, for your own share) Drs to Voyage in company. 2<sup>dy</sup>, Each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the insurers.

3. If only part of the goods be insured, enter also twice; 1<sup>st</sup>, Sundries (viz. Insurers, or Cash, for the value insured; each partner *his account in company*, for his share of the loss; and Profit and Loss, for your own share) Drs to Voyage in company. 2<sup>dy</sup>, Each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the insurers.

3. If the cargo outward be lost at sea, there are three varieties. 1. If none of the goods be insured, enter Sundries (viz. each partner *his account in company*, for his part of the loss, and Profit and Loss, for your own part) Drs to Voyage in company; and no second entry.

2. If the goods be all insured, enter twice; viz. 1<sup>st</sup>, Charge the Insurers, or Cash if you get present payment, Dr to Voyage in company. 2<sup>dy</sup>, Charge each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the Insurers. 3. If only part of the goods be insured, enter also twice; 1<sup>st</sup>, Sundries (viz. Insurers, or Cash, for the value insured; each partner *his account in company*, for his share of the loss; and Profit and Loss, for your own share) Drs to Voyage in company. 2<sup>dy</sup>, Each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the insurers.

3. If only part of the goods be insured, enter also twice; 1<sup>st</sup>, Sundries (viz. Insurers, or Cash, for the value insured; each partner *his account in company*, for his share of the loss; and Profit and Loss, for your own share) Drs to Voyage in company. 2<sup>dy</sup>, Each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the insurers.

3. If the cargo outward be lost at sea, there are three varieties. 1. If none of the goods be insured, enter Sundries (viz. each partner *his account in company*, for his part of the loss, and Profit and Loss, for your own part) Drs to Voyage in company; and no second entry.

2. If the goods be all insured, enter twice; viz. 1<sup>st</sup>, Charge the Insurers, or Cash if you get present payment, Dr to Voyage in company. 2<sup>dy</sup>, Charge each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the Insurers. 3. If only part of the goods be insured, enter also twice; 1<sup>st</sup>, Sundries (viz. Insurers, or Cash, for the value insured; each partner *his account in company*, for his share of the loss; and Profit and Loss, for your own share) Drs to Voyage in company. 2<sup>dy</sup>, Each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the insurers.

3. If only part of the goods be insured, enter also twice; 1<sup>st</sup>, Sundries (viz. Insurers, or Cash, for the value insured; each partner *his account in company*, for his share of the loss; and Profit and Loss, for your own share) Drs to Voyage in company. 2<sup>dy</sup>, Each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the insurers.

3. If the cargo outward be lost at sea, there are three varieties. 1. If none of the goods be insured, enter Sundries (viz. each partner *his account in company*, for his part of the loss, and Profit and Loss, for your own part) Drs to Voyage in company; and no second entry.

2. If the goods be all insured, enter twice; viz. 1<sup>st</sup>, Charge the Insurers, or Cash if you get present payment, Dr to Voyage in company. 2<sup>dy</sup>, Charge each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the Insurers. 3. If only part of the goods be insured, enter also twice; 1<sup>st</sup>, Sundries (viz. Insurers, or Cash, for the value insured; each partner *his account in company*, for his share of the loss; and Profit and Loss, for your own share) Drs to Voyage in company. 2<sup>dy</sup>, Each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the insurers.

3. If only part of the goods be insured, enter also twice; 1<sup>st</sup>, Sundries (viz. Insurers, or Cash, for the value insured; each partner *his account in company*, for his share of the loss; and Profit and Loss, for your own share) Drs to Voyage in company. 2<sup>dy</sup>, Each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the insurers.

3. If the cargo outward be lost at sea, there are three varieties. 1. If none of the goods be insured, enter Sundries (viz. each partner *his account in company*, for his part of the loss, and Profit and Loss, for your own part) Drs to Voyage in company; and no second entry.

2. If the goods be all insured, enter twice; viz. 1<sup>st</sup>, Charge the Insurers, or Cash if you get present payment, Dr to Voyage in company. 2<sup>dy</sup>, Charge each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the Insurers. 3. If only part of the goods be insured, enter also twice; 1<sup>st</sup>, Sundries (viz. Insurers, or Cash, for the value insured; each partner *his account in company*, for his share of the loss; and Profit and Loss, for your own share) Drs to Voyage in company. 2<sup>dy</sup>, Each partner *his account in company* Dr to ditto *his account-proper*, for his share of the sum received from, or due by the insurers.

**Prob. 6. Y. Debtor and Creditor applied, when returns are made by factor.**

*Case 1.* If you receive returns in goods, enter twice; namely, 1<sup>st</sup>, goods in company received Dr to Sundries, viz. to Factor our account-current, or to Voyage in company.

pany, if not yet discharged, for value of goods; and to *Cash*, for charges here, if paid by you, or to partner *his account-proper*, if by him). 2dly, Each partner *his account-proper* Dr to *ditto his account in company*, for his share of said charges.

Case 2. If you have return in bills, enter once; namely, *Cash*, if remitted to you, and paid at sight, }  
*Bills receivable*, if remitted to you at usance, } Dr  
*Partner his account proper*, if remitted to him, }

To *Factor our account current*, for value of the bill.

Case 3. If you or partner remit a bill to the factor, enter once, viz. *Factor our account current* Dr  
*To Cash*, or the *Drawer*, if remitted by you, } for value  
*To Partner his account proper*, if by him, } of the bill.

Prob. 7. Z. Debtor and Creditor applied in admitting a new partner.

THE entries to be made in admitting a new partner not being reducible to distinct cases, we shall explain the matter by a particular example. Suppose then yourself, as trustee, already in company with one partner *A*. each one half, for 300 *l*. and that you agree with *B*. to admit him as a third partner, upon his paying in 100 *l*. as his  $\frac{1}{3}$  share of stock; upon this supposition, the entries to be made are as follows.

1st, You may either let the account of *Goods in company* stand as it is, till the goods are sold, or balance it, by charging *Goods in company* with *A*. and *B*. Dr to *Goods in company* with *A*.

2dly, Charge *A*. *his account in company* Dr to *ditto his account proper*, 50 *l*. for his one half of the sale to *B*.

2dly, If *B*. presently pay in his share of stock, there are three varieties. 1st, If he pay the whole to you, charge *Cash* Dr to *B. his account in company*, 100 *l*.

2dly, If he pay the whole to *A*. charge *A. his account proper* Dr to *B. his account proper*, 100 *l*. 3dly, If he pay one half to you, and the other to *A*. charge *Sundries* (viz. *Cash*, 50 *l*. paid in to you, and *A. his account proper*, 50 *l*. paid to him) Drs to *B. his account in company*.

4thly, If *B*. do not pay in his share of stock presently, then charge *B. his account proper* Dr to *ditto his account in company*, 100 *l*.; and when he pays, discharge *his account proper*, as above.

### III. Of the LEDGER.

THE *Ledger* is the principal book, wherein all the several articles of each particular account, that lie scattered in the other books according to their dates, are collected and placed together, in spaces allotted for them, in such manner, that the opposite parts of every account are set directly fronting one another, on opposite sides of the same folio.

The *Ledger* is the chief or principal book of accounts, as being that which immediately answers the end of book-keeping. For, as has been already observed, the *Journal* is only preparatory or introductory to the *Ledger*; and the *Waste book* contains only the matter of accounts, without either the form or order; whereas the *Ledger* has all the perfection of form and order aimed at in book-keeping, affording a ready answer to all the demands of

the inquisitive merchant; and is therefore justly esteemed the principal book of the three. It is called the *Ledger*, (an Italian word that signifies *art* or *dexterity*), because in it the artificial part of book-keeping chiefly appears.

The *Ledger*, in opposition to the scattered order of things in the *Waste-book*, has all the particular articles of each account collected and placed together; and that in such a manner, as to have the opposite articles separated, and set fronting one another on opposite sides of the same folio. Thus, the opposite articles of the *Cash-account* are, the sums of money received, and the sums laid out; which accordingly stand, the former on the Dr side, and the latter on the Cr side of the same folio. Again, in an account of goods, the prime cost and charges go to the Dr side, and the sales to the Cr side; by comparing of which, appears the gain or loss: and so in other accounts.

The *Ledger* folios are divided into spaces, for containing the accounts; on the head of which are written the titles of the accounts, marked *Dr* on the left-hand page, and *Cr* on the right: Below which stand the articles, with the word *To* prefixed to the Dr side, and the word *By* on the Cr side. Upon the margin are recorded the dates of the articles, in columns allotted for that purpose. The money-columns are the same as in the other books. Before them stands the folio-column, which contains figures directing to the folio where the correspondent *Ledger-entry* of each article is made; for every thing is twice entered in the *Ledger*, viz. on the Dr side of one account, and again upon the Cr side of some other account; so that these figures mutually refer from the one to the other, and are of use in examining the *Ledger*.

For the ready finding any account in the *Ledger*, it has an alphabet, or index, wherein are written the titles of all accounts, with the number of the folios where they stand.

Note. If the *Ledger-accounts* be numbered, 1, 2, 3, &c. according to their order; these numbers may be inserted in the Folio-column and Index, and used instead of the folio figures. We have numbered the accounts of the following *Ledger*, but have not made this use of them; our design being only to refer, by means of them, to the *Ledger-accounts* as occasion requires.

*How the Ledger is filled up from the Journal.*

To transport immediately from the *Waste-book* to the *Ledger*, would, as has been formerly observed, be a complex task, and require too great a measure of thought and attention; but the former being first reduced to a *Journal*, the transferring from it to the *Ledger* becomes easy, and may be performed by the following

### R U L E S.

1. TURN to the Index, and see whether the debtor of the *Journal* post to be transported be written there: If it be not, insert it under its proper letter, with the number of the folio to which it is to be carried.

2. Upon the folio, and in the head of the space allotted for the account, write the title in a large text letter

for ornament, making it *Dr* on the left side of the folio, and *Cr* on the right.

3. Record the date in the columns on the margin of the *Dr* side, and write the *Cr* with the word *To* prefixed to it, immediately below the title, or other articles formerly posted; and complete the entry in one line, by giving a short hint of the nature and terms of the transaction, carrying the sum to the money-columns; and insert the quantity, if it be an account of goods, &c. in the inner columns, and the referring figure in the folio-column.

4. Turn next to the creditor of the Journal post, and proceed in the same manner with it, both in the Index and Ledger; with this difference only, that the entry is to be made upon the *Cr* side, and the word *By* prefixed to it.

5. The post being thus entered in the Ledger, return to the Journal, and, on the margin, mark the folios of the accounts, writing the folio of the *Dr* above, and the folio of the *Cr* below, a small line drawn between them, thus, 3. These marginal numbers in the Journal are a kind of Index to the Ledger, and are of use in examining the books, and on other occasions.

6. In opening the accounts in the Ledger, follow the order of the Journal; that is, beginning with the first Journal post, allow the first space in the Ledger for the *Dr* of it, the next for the *Cr*, the third for the *Dr* of the following post, if it be not the same with some of those already opened; and so on till the whole Journal be transported.

The above six rules are formed for simple posts, where there is but one *Dr* and one *Cr*; but may easily be applied to complex ones: *e. g.* In posts where only one of the terms is complex, the simple term is entered *Dr* to, or *Cr* by Sundries, or Sundry-accounts, referring to the Journal for particulars. And the single *Drs* or *Cr*s of the complex term, are each of them, in their respective accounts, entered *Dr* to, or *Cr* by the simple term. Again, in posts where both terms are complex, each particular *Dr* and *Cr* are entered *Dr* to, or *Cr* by, Sundry accounts, with a reference to the journal, as before. And here observe, that an article of Sundry-accounts has no referring figure in the folio-column, because it refers to several accounts: But this defect is supplied by the marginal numbers of the Journal, which must still be consulted before the particulars of the indefinite article can be known.

#### *How to transpose an account from one folio to another.*

WHEN the space allotted for an account proves too little: that is, when either the *Dr* or *Cr* side, or both, are so charged and filled with articles, that they can hold no more; the account must be transposed to a new space: Which may be done by one or other of the methods following.

1. In all accounts that have inner columns for the quantities, such as Account of goods, &c. add up both

the *Dr* and *Cr* sides, and charge the new account *Dr* to the old, for the total of the *Dr* side; and make the old account *Dr* to the new, for the total of the *Cr* side. Thus the old account will be evened; that is, the sums and quantities on both sides will be equal; and the new account will exhibit the same sums and quantities on its *Dr* and *Cr* sides, that the old did, before it was transposed.

2. In accounts that have no inner columns, such as Personal accounts, Cash-account, Profit and Loss, &c. where the difference betwixt the two sides is only considered, it is sufficient, after adding up both sides, as before, to carry the balance or difference only to the new account, by making it *Dr* to the old, for the said balance, if the *Dr* side of the old be heaviest; but if the *Cr* side be heaviest, then charge the old account *Dr* to the new. See N<sup>o</sup> 1. and 61.

*Note.* The number of the folio on which the new account is opened, must be inserted in the Index, and also in the folio-column of the old account; and again, the folio-number of the old must be written in the folio-column of the new; that the accountant may readily turn from the one to the other, as occasion requires.

#### *How the Books are examined.*

AN accountant should be at all imaginable pains in filling up the books, to make them exact and correct: But as errors must happen, the examination of the books after they are written up becomes absolutely necessary.

1. The Waste-book being the first and fundamental book, the only means left for discovering errors in it, are, a careful reading of it, and comparing it with the accountant's memory, or the Book of letters, or Letters of correspondents, Bills, Invoices, &c.; or perhaps some accident or circumstance may happen to bring things to remembrance. And this, with casting up the sums of money anew, is all that can be done.

2. In revising the Journal, compare each post with the Waste-book, to see if the sums of money be right, and whether the narrative or reason of the entry be justly expressed. Next, Consider whether the true *Dr* and *Cr* are assigned; and, after having thus narrowly examined the posts, and corrected what happens to be wrong, return to the Waste-book, and, on the margin opposite to the revised post, make a dash with the pen, thus, /, to signify that the Journal has been compared with it, and found right.

3. The Ledger is revised or examined, by comparing it with the Journal, in the manner following. Take the Journal, and, beginning with the first post, turn (as the marginal numbers direct) to the folio of the Ledger where the *Dr* of the said post stands, and see whether it be duly entered: And, upon finding it right, return to the Journal, and affix to the marginal number of the said *Dr* a dot or point, thus [.] , to shew that it has been examined. Next, Turn to the folio where the *Cr* is posted, and, upon finding it right, or after correcting it if wrong, return to the Journal, and affix a dot to its referring figure

figure in the margin, for the same purpose as before. If there be more Drs or Crs in the post, proceed the same way with each of them. And thus go on with the next post, and after it with the third, &c. till the whole Journal and Ledger be compared.

As every thing is twice entered in the Ledger, once upon the Dr side of one account, and again upon the Cr side of some other account; it is plain, that the total sum of all the money on the Dr sides will be precisely equal to the total sum of all upon the Cr sides: And therefore the accountant, after revising the books, is next, for further satisfaction, to add up the Dr sides of the whole Ledger into one sum, and the Cr sides into another. If they agree, it is highly probable that all is right; if they differ, something is unquestionably wrong.

This addition of the Dr and Cr sides is, by merchants, called the *Trial-balance*; and ought to be made, not simply by taking the sum of every page, but by summing the Dr and Cr sides of every account separately, and then adding these on every page into one sum. By going to work in this manner, you lose no labour; for when you come afterwards to close the accounts, instead of adding their Dr and Cr sides anew, you take their sums from the trial-balance.

If, after the revise is made, the totals of the Dr and Cr sides agree, the accountant may, without further trial, conclude the books to be right. But if they differ, his next step is to examine the Ledger by itself. Which is done thus: Beginning with the first account, compare the first article on the Dr side with its counter-part (to which the referring figure directs), and, upon finding them right, or making them so, affix a dot to the end of the sum, or in the folio or month column of each of them, thus [ . ], to signify that they have been compared. Proceed in like manner with all the other articles on the Dr side, and next with those upon the Cr side; and then go on to a new account, and from it to the following, till the whole Ledger be finished. Here observe, that, in prosecuting the examination, all the dotted articles you come to are to be omitted, as having been compared already. The Ledger, being thus examined, if the corrections of the errors found bring the sums of the Dr and Cr sides to a balance, the books may now be presumed right; but if not, something is still wrong: And there is no way left to discover the mistake, but a more careful research of the books.

This revising or examination is what merchants call *Pricking of the books*; and should not be put off till the Ledger is filled up, but performed weekly, and in due order; that is, the Waste-book should be revised, before it be posted to the Journal; and the Journal ought to be examined, before it be transported to the Ledger; and the revising of the Ledger finished, before the balance is begun.

#### *How Errors are corrected.*

In explaining the method of correcting errors, we shall join the Waste-book and Journal together, because the manner of correcting is the same in both; and then shew the way of correcting mistakes in the Ledger.

I. Errors in the Waste-book and Journal may be reduced to six classes, and corrected as follows.

1<sup>st</sup>, If the errors be the omission of a whole post, the way to correct or supply the defect is, to write it in a separate place by itself, with a reference to it from the place where it should have been. 2<sup>dly</sup>, If only a word or two be wanting, they may be interlined or written upon the margin. 3<sup>dly</sup>, If a whole post be repeated, or twice written, it is corrected by cancelling one of them; but the cancelling ought to be done in such a slight manner, that the original writing may still be legible and distinct. 4<sup>thly</sup>, In like manner, if only a word or sentence be repeated, let one of them be slightly cancelled. 5<sup>thly</sup>, If there be any wrong name, word, or figure, the best way is, to let the wrong name, word, or figure, stand as they are, but correct the mistake by a note on the margin or foot of the page. 6<sup>thly</sup>, If you commit a mistake, and presently discover it in the very time of writing, the handsomest way of correcting it is, not to alter or cancel any thing, but to write the post or sentence anew, beginning with such a phrase as this, *I say*; as in the following example: *Sold A. B. I say, Bought of A. B.*

II. Errors in the Ledger are of four sorts. 1<sup>st</sup>, When an article is entered upon a wrong account: This is to be corrected, first, by making the other side of the said account Dr to, or Cr by Error, for the sum of the said article; which rectifies this account: After which, the article must be entered in due form in the account to which it belongs; or rather make the correction thus, *viz.* charge the one account Dr to the other, for so much *per error*. By either of these methods, the error is removed, and the purity of the books restored. 2<sup>dly</sup>, When an article is entered in the right account, but upon the wrong side; that is, upon the Dr side, when it should have been upon the Cr side, or *vice versa*; to correct this, the first thing to be done is, to remove the error, by making the other side of the said account Dr to, or Cr by Error, for the sum of the article: After which, the article must be entered anew upon the right side, as if no such blunder had happened. 3<sup>dly</sup>, When there is an error in a sum of money: This, if it be too little, is corrected by a new charge on the same side, for the defect; and if it be too much, the mistake is rectified by a discharge on the opposite side for the excess, *viz.* the account is debited or credited to, or by *ditto person, or ditto goods*, for so much short-posted, or overcharged. 4<sup>thly</sup>, When an article is quite forgot, or neglected, errors of this nature are easily adjusted, *viz.* by making the entry omitted; only observe, that it is not to be eroded in betwixt two former entries; in order to make it possess the place it would have done, had it come regularly in; for though the order, whatever it be, can occasion no error in the issue, yet this interlining would look more confused and irregular than the disorder of the date, which any person skilled in book-keeping will easily perceive to have happened through mistake.

*Of balancing the Ledger, and raising from it an Inventory, to begin a new Set of Books.*

MERCHANTS commonly once a-year balance or close their Ledger, and raise from it the materials of an Inventory to a new set of books, for the ensuing year.

Now,

Now, to make the method of doing this plain and intelligible to a learner, it must be observed, that, by the word *Balance*, merchants understand the difference betwixt the sums on the Dr and Cr sides of any account. Which difference being entered on the defective side, the account is said to be balanced; that is, to have the sums of the Dr and Cr sides evened, or made equal. And the sides of the several accounts throughout the Ledger being thus evened, and the total sums formally set down on the foot of the accounts, the Ledger is said to be balanced, closed, or finished. Again, in order to understand how the new Inventory is formed from the old Ledger, it must be observed, that these balances or differences of the sides of accounts, are of different kinds. In some accounts, the balance is, the gain or loss made upon the sale of goods; in some, the balance is, the price of goods remaining unsold; and in others, it is a debt due to, or by the merchant, &c. Now, balances of the first kind, *viz.* of gain or loss, must be distinguished from the rest, and carried to the Profit and Loss account; which being done, the balance or difference of its sides, will be the gain or loss made upon one year's trade, and goes to the Stock-account. All the other kinds of balances must be brought together into one space or folio, under the title of *Balance-account*, and are the very articles of which the Inventory is made up. The most natural method of balancing the Ledger is, first to point out what is contained upon the Dr and Cr sides of each account, and consequently what the balances are; and then, to shew the mercantile and approved way of going to work, in closing the Ledger, collecting the balances, and converting them into a new Inventory. This we shall do in the form of problems.

### P R O B. I.

*What the Balances in the Accounts of proper Trade are.*

#### § 1. *What the Balances in proper domestic Trade are.*

##### 1. *Cash-account*, N<sup>o</sup> 1. and 61.

CONTAINS, upon the Dr side, the ready money which the merchant had at first, or when the books were begun; together with all he has received since that time. The Cr side contains all the payments he has made, or the money he has given out. So that the difference of the two sides is, the ready money he has by him; and therefore this account is closed, by being credited by Balance, for the said difference.

##### 2. An *Account of Goods*, N<sup>o</sup> 2. 3. 11. 12. 14. 18. 20. 21. 27. &c.

Contains upon the Dr side, the prime cost and charges; and, upon the Cr side, the sale or disposal of them. So that there are here three varieties. 1. When the goods are all disposed of, which is known by the inner columns being equal, the difference of its sides is, the gain or loss made upon the sale; and so is closed, by charging it Dr to Profit and Loss, for the gain, if the Cr side be heaviest; or giving it credit by Profit and

Loss, for the loss, if the Dr side be heaviest. N<sup>o</sup> 2. 11. 14. 18. &c. 2. When none of the goods are disposed of, which will appear by the Cr side being empty, then it is closed by Balance, for the whole sum on the Dr side. N<sup>o</sup> 21. 27. &c. 3. When only part of the goods are disposed of, which will appear by the inequality of the quantity-columns; this case requires commonly two closing entries, *viz.* First, the account must be credited by Balance, for the goods remaining, valued at the prime cost; which equals the inner columns: After this, if the money-columns be unequal, it must be made Dr to, or Cr by Profit and Loss, for the gain or loss made upon what are sold; which evens the outer columns, and closes the accounts. N<sup>o</sup> 3. 12.

*Note 1.* If the goods are of different kinds or prices, as they should be distinguished, when posted to the Ledger, by different numbers, or separate inner columns; so care must be taken, in balancing the account, to mention the kind of goods remaining unsold, and to value them at their own prices.

*Note 2.* A merchant may, at any time, know what goods he has on hand, by comparing the inner columns of the Accounts of Goods, without being put to the trouble of inspecting his warehouse, and weighing or measuring the goods themselves.

*Note 3.* If there be inlack or outcome of goods, that is, defect or excess in weight or measure, it will happen, when the goods are all disposed of, that the inner columns will not be equal. In this case, the balance or equality must be restored, by inserting as much in the deficient column as will make it equal to the other, writing the words *Inlack, Broke, Lost in weight, Ullaged, Outcome*, or the like, before it, as the reason why it is added: but nothing goes to the money-columns.

##### 3. *Plate and Jewels.*

This account contains, on the Dr side, the things of that kind you are possessed of; and, like an account of goods remaining on hand, is closed, by being credited by Balance.

##### 4. *Personal accounts*, N<sup>o</sup> 5. 6. 7. 9. 10. 13. 15. &c.

Contain, upon the Dr side, the debts due by the person to the merchant, with the payments made upon any other score by the merchant to him. The Cr side contains the payments made by the person to the merchant, with the debts due by the merchant to the said person, upon any other dealings. So that there are here two cases. 1<sup>st</sup>, If the Dr side be heaviest, the difference is a debt due by the person to the merchant. N<sup>o</sup> 13. 24. &c. 2<sup>dly</sup>, If the Cr side be heaviest, the difference is a debt due by the merchant to the person. N<sup>o</sup> 15. 57. And in both cases the account is closed, by making it Dr to, or Cr by Balance, for the difference of its sides.

##### 5. *Bills receivable*, N<sup>o</sup> 25.

This is a general personal account, and contains upon the Dr side, bills accepted, and payable to the merchant. The Cr side contains the payments he has received. So that the difference of its sides (if there be any) is, what is yet unpaid: And the account is closed, by giving it credit by Balance, for the said difference.

##### 6. *Bills*

6. *Bills payable*, N° 52.

This is an account of the same nature with the former; and contains, upon the Cr side, the bills accepted by the merchant, payable to others; and, upon the Dr side, the payments he has made. So that the difference of the sides (if there be any) is the bills yet unpaid: And the account is closed, by charging it Dr to Balance.

7. *Bills of Exchange*.

This account exhibits, on the Cr side, all the bills you draw on your factors or correspondents; and the Dr side shows what of them are accepted, protested, or yet outstanding; and is closed, if the sides happen to be unequal, by being debited to Balance, for the bills outstanding, viz. the bills of whose acceptance you have hitherto had no advice.

8. *Bonds*.

This account exhibits, on the Dr side, all the bonds you have received, and on the Cr side, what of them are paid, or out-standing; and is closed, if the sides happen to be unequal, by being credited by Balance, for the bonds yet unpaid.

9. *Suspense-account*, N° 34.

Contains, upon the Dr side, the goods sent off; and upon the Cr side, either the same goods returned, or advice from your correspondent that he designs to keep them, or the price sent up. So that either the sides of this account are equal, and then the account closes of itself; or, if there be any difference, it is owing to your having hitherto had no advice concerning some of the goods sent off; and in this case the account is closed, by being credited by Balance, for the said difference.

10. *Foreign Coin*, N° 26.

Contains, upon the Dr side, the value at which the several pieces are received; and on the Cr side, the value at which they are put off. In closing this account, there are three cases. 1<sup>st</sup>, If the pieces are all disposed of, the account is closed, by being debited or credited to or by Profit or loss, for the gain or loss made by them. 2<sup>dly</sup>, If none of the pieces are yet disposed of, it is closed by being credited by Balance, for the whole value on the Dr side. 3<sup>dly</sup>, If part of them are disposed of, and part of them yet on hand; in this case, the account must first be credited by Balance, for value of the pieces on hand; and if after this the money-columns still remain unequal, it must be debited or credited to or by Profit and Loss, for the said difference; which is the gain or loss made upon the pieces disposed of.

11. *Wagers Account*.

Contains, upon the Dr side, the consignments made when the wagers were entered into. The Cr side contains the decisions of the wagers. So that here occur two varieties, viz. 1<sup>st</sup>, If all the wagers are determined, the difference of the sides will be the gain made upon those decided in favour of the merchant; and the account is closed, by being charged Dr to Profit and Loss, for the said difference. 2<sup>dly</sup>, If any of the wagers are yet undecided, the account must first be credited by Balance for them: After which, if the sides are still un-

equal, it must be charged Dr to Profit and Loss, for the difference.

12. *Deceased Person's Estate*.

The Dr side of this account exhibits the legacies, bills, or debts, you the executor have paid on account of the person deceased; and the Cr side shows what he died possessed of: And the account is closed, by being made Dr to Profit and Loss, for the difference of its sides; which is the sum that falls to you the executor.

13. *Accounts of Ships, Houses, and other Possessions*, N° 4.

Contain, upon the Dr side, what they cost at first, or are valued at, with all charges, such as repairs, or other expences laid out upon them. The Cr side contains, (if any thing be writ upon it), either what they are sold or exchanged for, or the profits arising from them; such as freight, rent, &c. Here there are three cases. 1<sup>st</sup>, If nothing be written upon the Cr side, it is closed, by being credited by Balance. 2<sup>dly</sup>, If the Cr side be filled up, with the price of the ship, house, &c. sold, or otherwise disposed of, then the difference of the sides is the gain or loss made upon the sale; and the account is closed, by being debited or credited to or by Profit and Loss. 3<sup>dly</sup>, If the Cr side contain only the freight or rent; in this case, first charge the ship, house, &c. Dr to Profit and Loss, for the freight or rent; and then close the account with Balance. N° 4.

14. *House-expences, Charges of Merchandize, Refusal of Bargains, Interest-account, Insurance-account*, and all others of the like nature, that are disbursements for which nothing comes in, or pure incomes for which nothing goes out. N° 65. 42. 35.

Contain, upon their Dr sides, the articles of loss, and upon the Cr sides the articles of gain; and are closed, by being debited or credited to or by Profit and Loss, for the difference of their sides.

15. *Profit and Loss*, N° 38.

Contains, upon the Dr side, the articles of loss, and on the Cr side the articles of gain. To this account are carried, not only whatever comes in course to it from the Journal, but also all the articles of gain and loss that occur in closing the Ledger-accounts. After which, the Dr and Cr sides being added up, their difference is the neat gain or loss made since the books were begun; and therefore this account is closed, by being debited or credited to or by Stock, for the difference of its sides.

16. *Stock-account*, N° 8.

As gathered from the Journal, contains, upon the Dr side, the debts due by the merchant when the books were begun. The Cr side contains his ready money, effects, and debts due to him at the same time. But then, to this account, as it now stands, there is brought, at closing of the Ledger, the difference of the sides of the Profit and Loss account. After which, the Dr and Cr sides being added up, and compared, their difference will be the merchant's present neat stock; and the account is closed by Balance.

§ 2. *What the Balances in proper Foreign Trade are.*

P R O B . II.

*What the Balances in Factory-accounts are.*

1. *Voyage to, or from ———, N° 16. 40. 47.*

Contains, upon the Dr side, the prime cost and charges of the cargo. The Cr side is either empty, or it contains the receipt or disposal of the goods by the factor, or perhaps returns made for them. There are therefore here two cases. 1<sup>st</sup>, If the Cr side be empty, the ship is still at sea, or, at least, there has been as yet no advice of her arrival; and the account is closed, by giving it credit by Balance. 2<sup>dly</sup>, If the Cr side be filled up, the difference of the sides is the gain or loss made upon the voyage; and accordingly the account is closed by being made Dr or Cr to or by Profit and Loss. If the sums of the sides happen to be equal, there is neither gain nor loss on the voyage; and the account closes of itself.

2. *A. B. my Account of Goods.*

Contains, upon the Dr side, the goods consigned to, and received by the factor; and on the Cr side, the disposal of the said goods. This account balances exactly as an *Account of goods in proper domestic trade.*

3. *A. B. my Account on Time.*

Contains, upon the Dr side, the debts due to the factor, for my goods sold by him on time. The Cr side contains the payments made by debtors to the factors. So that, if there be any difference of the sides, it is the debts yet out-standing: And the account is closed, by giving it credit by Balance.

4. *A. B. my account-current, N° 41. 53.*

Contains, upon the Dr side, the money in the factor's hands, received by him of the sales of my goods, with the remittances I had sent him, or payments I have made him upon any other account. The Cr side contains the payments or remittances he has sent me, with the debts I owe him upon any other score. In closing this account, there are two cases. 1<sup>st</sup>, If the inner columns, which contain the foreign money, be equal; then, if there be any difference between the outer columns, it is the gain or loss made by exchange; which flows from the different rates of exchange at which these debts have been charged and discharged: And the account in this case is closed, by being made Dr to or Cr by Profit and Loss, for the difference of the outer columns. 2<sup>dly</sup>, If the inner columns are unequal, they must first be brought to an equality, by making the account Dr to, or Cr by Balance, for their difference, valuing the foreign money at the current rate of exchange; which difference is a debt due by the factor if the Dr side be heavier, but due to the factor if the Cr side be heavier. If after this the outer columns are unequal, their difference is, the gain or loss made by exchange; and the account must be closed, by making it Dr to or Cr by Profit and Loss, for the said difference.

1. *A. B. his Account of Goods, N° 48.*

This account contains, upon the Dr side, the charges paid by the factor. The Cr side contains the sale or disposal of the goods. In closing this account, there are five varieties. 1<sup>st</sup>, If the goods are all sold, and all the money received, this account is balanced, by being charged Dr, first to Profit and Loss, for the factor's commission, at so much *per cent.* after which, the difference of the sides is, the money due to the employer; and is closed, by being again charged Dr to *A. B. his Account-current*, for the said difference. 2<sup>dly</sup>, If the goods are all sold, but no money yet received, it is closed, by being made Dr to Profit and Loss, for the factor's commission, and to *A. B. his Account on Time*, for the out-standing debts due to him. 3<sup>dly</sup>, If the goods are all sold, and only part of the money received, it is closed, by being made Dr to Profit and Loss, for the factor's commission; to *A. B. his Account on Time*, for the out-standing debts; and to *A. B. his Account-current*, for the employer's money in factor's hands. 4<sup>thly</sup>, If none of the goods be yet sold, it is closed, by giving it credit by Balance, for the sum of the charges on the Dr side. 5<sup>thly</sup>, If only part of the goods are sold, and so the account unfinished, the best way to close it is, by a double balance; that is, first charge it Dr to Balance, for the sum upon the Cr side; and then give it credit by Balance, for the charges on the Dr side. Thus the account will appear in the new books in the same state that it did in the old.

2. *A. B. his Account on Time, N° 49.*

Contains, upon the Cr side, the debts due by those who bought the employer's goods; and as these debts are paid in to the factor, it is charged Dr to *A. B. his Account-current*, for the said payments; and therefore, if, at closing of the Ledger, there be any difference of its sides, it is the debts yet out-standing; and is closed, by being charged Dr to Balance, for the said difference.

3. *A. B. his Account-current, N° 36. 50.*

Contains, upon the Dr side, the money laid out by the factor for the employer's use, as in answering his bills, or remitting bills to him, or otherwise. The Cr side contains the money in the factor's hands belonging to the employer. So that the difference of its sides is, the debts due by the factor to *A. B.* or by *A. B.* to him; and the account is closed, by being made Dr or Cr to or by Balance.

*Note.* If the factor dispose of the employer's good on trust, to persons with whom he has private dealings of his own, it will be proper, in closing their accounts, to divide the balance into two parts, *viz.* one due for the employer's goods, and the other due to or by himself.

## P R O B . III.

*What the Balances in Company-accounts are.*

§ 1. *What the Balances in the Accounts kept by a Partner are.*

1. *A. B. my Account in Company, N° 54.*

CONTAINS, upon the Dr side, the partner's inputs, and share of charges; upon the Cr side, the returns made; and the difference is the gain or loss. In balancing this account, there are two cases. 1<sup>st</sup>, If the account be finished, *i. e.* if the goods be sold, and returns made, it is closed, by being made Dr or Cr to or by Profit and Loss. 2<sup>dly</sup>, If the account be yet unfinished, the best way is, to close it with a double balance: that is, to make it Dr to Balance, for the sum of the Cr side, and give it credit by Balance, for the sum of the Dr side.

2. *A. B. my Account-proper, N° 55.*

This account is merely personal, and closed with Balance, for the difference of its sides; which is the debt due to, or by the company.

§ 2. *What the Balances of the Accounts kept by a Trustee in his own Books are.*

BEFORE the trustee close the company's accounts, he ought to make the double Journal entry following, if it be not done already; namely, 1<sup>st</sup>, Goods in Company, or Voyage, &c. Dr to Sundries, *viz.* to Cash, for all charges not yet stated to account, such as cellar-rent, &c. and to Profit and Loss, for his own commission, at so much *per cent.* 2<sup>dly</sup>, Each partner's Account-proper Dr to his Account in Company, for their respective shares of the above charges and commission. These entries being made, the balances of the accounts are as follows.

1. *Goods in Company, N° 58. 62. 71. 74.*

CONTAINS, upon the Dr side, the prime cost of the goods stocked in, with all charges, and the trustee's commission. The Cr side contains the disposal of them. The difference of the sides is gain or loss, to be divided amongst the partners. Here there are three cases. 1<sup>st</sup>, If the goods be all sold, the account is closed, by being debited or credited to or by Sundries, *viz.* to, or by each partner's Account in Company, for their shares of the gain or loss; and to, or by Profit and Loss, for the trustee's own share. 2<sup>dly</sup>, If none of the goods are sold, then the account is closed, by being credited by Sundries; *viz.* by each partner's Account in Company, for their shares of the goods unsold; and by Balance, for the trustee's share. 3<sup>dly</sup>, If part of the goods are sold, and part of them yet remain not disposed of, this case is a compound of the two former; and accordingly the account is closed, by making the entry mentioned in the first case, for the gain or loss on those sold; and then, by making the entry mentioned in the second case, for those not disposed of.

2. *Voyage in Company, N° 66.*

CONTAINS, upon the Dr side, the value and charges of the goods sent to sea. The Cr side contains the receipt or disposal of them by the factor. The difference of the sides is gain or loss. Here there are three cases. 1<sup>st</sup>, If the Dr and Cr sides be equal, then the account closes of itself. 2<sup>dly</sup>, If one of the sides exceed the other, then the account is closed, by being made Dr or Cr to or by Sundries; *viz.* to, or by each partner's Account in Company, for their shares of the gain or loss; and to, or by Profit and Loss, for the trustee's share. 3<sup>dly</sup>, If nothing be yet writ upon the Cr side, then the account is closed, by being credited by Sundries, *viz.* by each partner's Account in Company, for their shares of the goods at sea; and by Balance, for the trustee's share.

3. *Factor our Account of Goods.*

CONTAINS, upon the Dr side, the company's goods consigned to, and received by the factor. The Cr side contains the disposal of them. The difference of the sides is gain or loss made upon the sale of them. This account has the same varieties, and is balanced the same way with Goods in company.

4. *Factor our Account-current.*

CONTAINS, upon the Dr side, what money belonging to the company is in the factor's hand. The Cr side contains the returns he has made in goods or bills. The difference is the debt due to or by the factor. This account is closed, by being made Dr or Cr to or by Balance, for the said difference.

5. *Partner his Account in Company, N° 59. 69. 70.*

CONTAINS, upon the Cr side, the partner's inputs, with his share of charges, and of gain at close. The Dr side contains returns for inputs disposed of, or goods remaining unsold, with the partner's share of losses, if any. This account, after the preceding accounts are balanced, will always close of itself; as is evident by considering what goes to the two sides of it: so that if the balance of this account fail, the accountant may conclude, for certain, that something in the company's accounts is wrong, or at least some mistake has happened in closing them.

6. *Partner his Account-proper, N° 60. 67. 68.*

IS a personal account, the difference of whose sides is the debt due to or by the partner, and is closed with Balance.

*Note.* If the design of balancing the company-accounts be, not in order to know the state of the company's affairs, but only that the old Ledger may be finished, and the accounts carried to new books; the accountant, in this case, may either balance them as above directed; or he may, if he pleases, close all of them by a double balance; which is the easiest and shortest way, and will have the same effect in the issue.

§ 3. *What the Balances of the Accounts kept by a Trustee in separate Books are.*

1. *Goods in Company, and Voyage in Company,*

HAVE the same things upon their Dr and Cr sides, as when

when kept in books along with other business; but are closed with *Profit and Loss in Company*, for the gain or loss; and with partners *Accompts in company*, for their respective shares of goods remaining unsold, or at sea.

#### 2. *Cash in Company*,

Contains, upon the Dr side, the sums of money given in by partners, and received from dealers for goods sold; the Cr side contains the sums laid out; so that the difference of its sides is the money on hand; and is closed with *Balance in company*.

#### 3. *Partner his Account in Company*,

Contains the same thing upon its Dr and Cr sides respectively, as when kept in books along with other business; and, after the accounts of goods and voyages are balanced, will always close of itself.

#### 4. *Partner his Account proper*.

This and all personal accounts, as they contain the same things upon their Dr and Cr sides, as their parallels, in proper trade, so they are all closed with *Balance in company*.

#### 5. *Profit and Loss in Company*.

The difference of its sides is the gain or loss made upon company-trade, and must be charged Dr to the trustee his Account-proper, for his commission; after which it is closed, (if no Stock-account is kept), by being made Dr or Cr to or by Sundries, *viz.* Each partner *his account in company*, for the respective shares of gain or loss. But if you keep a *Stock-account in company*, then this account is closed with it; and the *Stock-account* is again closed with the partners *Accounts in company*.

#### 6. *Balance in Company*,

Contains, upon the Dr side, the company's ready money in the trustee's hand, with the debts to the company, whether by partners or dealers; the Cr side contains the debts due by the company, and that whether to partners or to dealers: And if the books have been rightly kept, and duly balanced, the two sides of this account will always equal one another to a farthing.

*Note.* If you incline the goods remaining unsold, or at sea, should appear upon the *Balance-account*, you must close the *Account of goods and Voyages with Balance in company*, for the value of the quantity not disposed of, or at sea; and you may close the partners *Accounts in company* (which in this case will not close of themselves), either with their *Accounts proper*, or with *Balance in company*, as you please.

*How the Balances are collected, the Ledger closed, and a new Inventory formed.*

WHEN you design to balance your Ledger, in order to begin a new set of books, proceed in the manner following.

Take two sheets or folios of loose paper, rule them like the Ledger, and write on the heads or tops of them, the titles of the two following *Accounts*, *viz.* on the head of the one, *Profit and Loss Dr*, and *Contra Cr*;

on the other, *Balance Dr*, and *Contra Cr*. Then, beginning with the *Account of cash*, go over every account in the Ledger, (omitting only the *Accounts of Profit and Loss and Stock*, which must be left open to the last), and carry the articles of gain or loss found on any of them, to the *Profit and Loss sheet*; and the articles of debt, or goods remaining, to the *Balance sheet*, without touching the accounts themselves: *e.g.* Taking from the *Trial-balance* the sums of the Dr and Cr sides of the *Cash-account*, subtract the one sum from the other, and on the *Balance sheet*, make *Balance Dr to Cash*, for their difference, being the ready money in your hands. Again, in an *Account of goods* that are all sold, taking the sums of the Dr and Cr sides, subtract the one from the other, and on the other sheet, make *Profit and Loss Dr or Cr to or by the said Account of Goods*, for the difference of its sides. And in this manner proceed with every other account in the Ledger, according to their nature, as explained in the last section.

Having advanced thus far, your next step is, to add up the Dr sides of the *Profit and Loss sheet*, and the *Profit and Loss account* in the Ledger, into one sum, and their Cr sides into another; and, on the said sheet, make *Profit and Loss Dr or Cr to or by Stock*, for their difference: Which difference being carried to the *Stock-account*, add up its Dr and Cr sides, and carry their difference to the *Balance sheet*. Which being done, the total sums of the Dr and Cr sides of the *Balance sheet* will be equal to a farthing, if the books be right, and the balancing work truly performed: As may be thus demonstrated.

It is obvious, that the *Balance sheet*, before the balance of the *Stock-account* is brought to it, contains, upon the Dr side, the money and goods you have on hand, or at sea, or in the hands of factors, with the debts due to you; the articles on the Cr side are the debts due by you to others: So that the difference of its sides is your present worth, or neat stock. Now, if the balance of the *Stock-account* be also equal to your present neat stock, it is plain, that it will even the sides of the *Balance-account*. But that it is so, appears thus.

Your present neat stock is equal to your neat stock when the books were begun, with the addition of the gain, or diminution of the loss, made since that time: but the difference of the sides of *Stock-account*, before the balance of *Profit and Loss-account* be brought to it, is your neat stock when the books were begun; and the balance of *Profit and Loss-account*, is the gain or loss made since that time; which, consequently, being brought to *Stock-account*, makes the balance of *Stock-account* equal to your present neat stock; and therefore the balance of *Stock-account* evens the sides of *Balance-account*.

If, after the balance of *Stock-account* is brought to *Balance-account*, the sides happen to be still unequal, there has unquestionably some error been committed; which you must find out by a careful review of the balancing work: for here the error must lie, since the books are supposed to have been examined, and found right, or made so, before the balancing was begun. On the other hand, if the sides of *Balance-account* be equal,

all may be presumed right. There is not, indeed, an absolute certainty in the case: for, if you imagine two mistakes committed, either both in the articles of Profit and Loss, or both in the articles of Balance, or one in the former, and the other in the latter, both excesses, or both defects, equal, and on opposite sides, it is plain this would not impede the equality of the Dr and Cr sides of the Balance-account. But then this is so great a chance, that it is more than probable such a thing can never happen, and pass too, without being discovered.

Having brought the two sides of the Balance-account to an equality, which is the test of every thing being right, proceed to close the Ledger-accounts, thus. First, to the Profit and Loss account, transfer the articles on the Profit and Loss sheet. Next, at the end of the Ledger, erect an Account of Balance, into which transcribe the Balance sheet. After which, return to the beginning of the Ledger, and giving the Cash-account credit by Balance, for your ready money, draw a line cross the money-columns on each side, at the foot of the account; below which set down the total sums, which will be now equal. Proceed in like manner with all the following accounts, transferring to each the respective articles that belong to them, from the two sheets of loose paper, inserting the referring figures in the folio-column, and writing the total sums on the foot of the account; by which means all the accounts in the Ledger will come to be balanced and closed; that is, evened and finished.

But here it will be proper to observe, that merchants,

in balancing their Ledger, do not all go the same way to work. For some, instead of proceeding according to the above directions, close their Ledger-accounts, and post the closing entries to the Accounts of Profit and Loss, and Balance, all at the same time. And it must be owned, that this way, practised with care, will well enough answer the purpose; but to post the closing entries in the first place, and then to close the accounts, seems to be the surer and better method.

The Ledger being now closed, the next thing to be done is, to begin a new set of books; in order to which, a new inventory must be fetched from your old books, as the foundation of your future trade in the new. Now, it is plain, at first view, that the several articles on the Dr side of the Balance-account, being the particular items of your effects, and debts due to you, make up the first part of the Inventory; and the several articles on the Cr side, except the last, being the debts due by you to others, make up the second part of it: and accordingly in your new Journal, the several particulars on the Dr side must all of them be made Drs to *Stock*, and *Stock* Dr to the several particulars on the Cr side; and *Stock*-account in your New Ledger will stand thus:

*Stock* Dr,  
 To *Jacob Russel*,  
 To *H. V. Beck*,  
 &c.

*Contra* Cr,  
 By *Cash*,  
 By *Indian chints*,  
 &c.

## W A S T E - B O O K .

Edinburgh, the 1st of January 1769.

	l.	s.	d.
An Inventory of the money, goods, and debts belonging to me A. B. as also of the debts due by me to others, viz. -

## Of the SUBSIDIARY BOOKS used by MERCHANTS.

THOUGH all merchant-accompts may be kept by the *Waste-book*, *Journal*, and *Ledger*, alone: yet men of great business find it convenient, either for abridging these, or for other ends, to use some others, generally called *subsidiary* or *subservient Books*; the most common of which are these nine following, viz.

1. *The Cash-book.*

THIS book is kept in a folio form, like the *Ledger*, and serves to abridge the *Cash*-account there. On the left-hand page, or *Dr* side, *Cash* is charged *Dr* for all the sums received; and on the right-hand page, *Cash* is made *Cr* for all the sums paid. Once a week, or, which is more ordinary, once a month, this book is posted to the *Ledger*; or, if you please, first to the *Journal*, by two entries, viz. *Cash* *Dr* to *Sundries*, for all the receipts, and *Sundries* *Dr* to *Cash*, for all the payments. By this means the *Cash*-account in the *Ledger* will be so far contracted as to consist of 12 lines, viz. one for each month in the year. A specimen of this book follows.

		1769.		<i>l.</i>	<i>s.</i>	<i>d.</i>
<i>July</i>		<i>Cash, Dr.</i>				
1	To <i>George Hill</i> , received in full for lead,	90	00	00		
5	To <i>John Scot</i> , in part for sugar,	109	10	00		
12	To <i>Robert Hunter</i> , for <i>A. B.</i> 's bill on him,	30	00	00		
18	To <i>Port wine</i> , received for 1 pipe,	26	10	00		
31	To <i>James Neil</i> and <i>comp.</i> in full for tobacco,	100	00	00		
				356	00	00

		1769.		<i>l.</i>	<i>s.</i>	<i>d.</i>
<i>July</i>		<i>Contra, Cr.</i>				
3	By <i>George Duncan</i> , paid in full for canary,	100	00	00		
11	By <i>R. Richmond</i> and <i>Co.</i> in part for dowlas,	60	00	00		
20	By <i>Samuel Smith</i> , paid him <i>R. Blair</i> 's bill,	100	00	00		
25	By <i>Holland</i> , for 2 pieces, at 18 <i>l.</i>	30	00	00		
31	By <i>Charges of merchandize</i> ,	56	202			
	By <i>House-expences</i> ,	36	00	00		
				298	02	02

*Note*, Merchants that have cash-keepers must beware to write any thing in the *Cash-book* themselves; for if they do, the cash-keeper is no more accountable for what is stated in the book; and therefore the master, in case of money delivered to him; in the cash-keeper's absence, must keep it till he come home; and then deliver it to him, and see him enter it in the book himself.

2. *The Book of Charges of Merchandize.*

THIS book is only paged, and designed to abbreviate the *Cash-book*. It contains particular charges on goods and voyages; such as, carriage, custom, freight, cranage, wharfage, &c.: As also other expences that affect trade in general; such as, warehouse-rent, shop-rent, accountant's wages, postage of letters, and the like. At the end of each month

the money-columns of this book are added up, and the sum carried to the credit-side of the *Cash-book*.

*N. B.* At the same time you post the monthly sums of this book to the *Cash* book, you must debit the several accounts of goods and voyages for their particular shares of charges; which is done by passing the following entry in the *Journal*, namely, *Sundries* (viz. the several accounts of goods and voyages for their respective shares) *Dr* to *Charges of merchandize*. The remaining part of these charges will be such as relate to trade in general, being chargeable to no particular account, and will of course fall into the general account of *Profit and Loss*, when the account of *Charges of merchandize* in the *Ledger* is closed, at balancing the books. The form of this book follows,

		1769.		<i>l.</i>	<i>s.</i>	<i>d.</i>
<i>July</i>		<i>Charges of Merchandize, Dr.</i>				
1	To <i>Cash</i> , paid for freight of 10 tuns of iron,	18	00	00		
3	To <i>ditto</i> , paid custom of <i>ditto</i> ,	20	15	02		
8	To <i>ditto</i> , paid other petty charges on <i>ditto</i> ,	0	18	00		
12	To <i>ditto</i> , paid portrage of goods bought of <i>A. B.</i>	0	02	06		
	To <i>ditto</i> , paid the stationers for paper,	2	4	00		
18	To <i>ditto</i> , paid postage of letters,	0	10	06		
27	To <i>ditto</i> , paid rent of 2 cellars,	3	18	00		
31	To <i>ditto</i> , paid charges on 12 bales of skins,	9	0	00		
				56	02	02

*The Book of House-expences.*

THIS book is also paged, and designed likewise to ease the *Cash-book*. It contains all disbursements for family-provisions, servants wages, house-rent, apparel, utensils, &c. The money-columns of this book are also added up at the end of each month, and the sum transferred to the credit side of the *Cash-book*.

*N. B.* If goods are brought from the shop for the use of the family, this more properly belongs to the *Waste* book, and is not to be inserted here. A specimen of this book follows.

		1769.		<i>l.</i>	<i>s.</i>	<i>d.</i>
<i>July</i>		<i>House-expences, Dr.</i>				
1	To <i>Cash</i> , paid for new cloaths, hat, and shoes,	10	00	06		
10	To <i>ditto</i> , paid for fix drinking-glasses,	0	00	09		
17	To <i>ditto</i> , paid for earthen-ware,	0	03	00		
25	To <i>ditto</i> , paid for 12 dozen bottles,	1	00	00		
31	To <i>ditto</i> , paid pocket-expences,	9	09	00		
	To <i>ditto</i> , paid the housekeeper,	15	06	09		
				36	00	00

4. *The Invoice-book.*

THIS book, which is used chiefly by factors, is paged, and contains doubles or copies of the invoices of goods sent to sea, or of goods received from abroad. The form of an invoice is as follows.

London.

London, 1<sup>st</sup> July 1769.

Invoice of 8 boxes indigo, and 4 boxes spices, shipped per the Bonaventure, Robert Hay master, for Leith, by order, and for account of A. B. merchant there.

A. B. INDIGO 8 boxes.

Commission on ditto at 1 <sup>1</sup> / <sub>2</sub> per cent.	0 10 00
	111 00 35 <sup>1</sup> / <sub>2</sub>

Errors excepted, per M. S.

N. B. When a merchant in Britain ships off imported goods, such as tobacco, to Holland, or other places, for sale, the invoice sent to the factor usually contains only the marks, numbers, and quantity shipped, but nothing of the prime cost or charges; which in this case could not be easily ascertained; and the want thereof is pretty well supplied by instructing the factor not to sell under such a price. But invoices of all kinds of manufactures and goods consigned from Britain to North America or the West Indies, generally exhibit prime cost and all charges; which is necessary, not only as it serves for a sort of directory to the factor, but still more so, in regard British goods are frequently sold in those places at so much advance on the invoice prices.

5. The Sales-book.

This book too is chiefly used by factors; and into it is posted, from the Waste-book, the particular sales of every consigned cargo; by which means the several articles of a sale, that lie scattered in the Waste-book, are brought together, and represented under one view, and they in a manner more full and minute than they are collected in the Ledger account. This book exhibits the sales of every consignment separately, and by themselves; to which are subjoined the respective charges, such as freight, custom, the factor's commission, as

also abatements allowed to buyers, &c. whose sum subtracted from the gross amount of sales, gives the neat proceeds. From this book, when a cargo is sold off, an account of sales is drawn out, in order to be transmitted to the employer. If the consignment consist but of one kind of goods, the Sales-book may be ruled and written up as in the following example.

Ritterdam, 1<sup>st</sup> June 1765.

Sales of 6 pack serges, containing 4380 yards, received per the Friendship, Samuel Sharp master, for account of A. B. merchant in Glasgow, North Britain.

1769		Guil	St D.
June 2.	Sold Frederick Gordon, at 1 month, Packs. Pieces. Yards.		
	N <sup>o</sup> 1	19	743
		4	643
			1386 at 7 stivers. 48; 00 00
28	Sold for ready money,		
	N <sup>o</sup> 2	17	717
		3	18 730
		5	14 830
		6	16 717
			2994 at 6 stivers 8; 8 00 00
	Total 4380	138	06 00 00
	C H A R G E S .		
	Freight and average,	G. St. D.	25 10 00
	Custom and waiters dues,		31 00 00
	Scout-freight, and other small charges,		3 00 00
	Measuring, at 4 stivers per 100 yards,		8 14 00
	Charges in selling, and pack-house-rent,		4 04 00
	Commission, at 2 per cent.		27 13 00
	Neat proceeds, (errors and bad debts excepted,) carried to the credit of his Account-current,		1283 05 00

If the consigned cargo consists of two or more kinds of goods, the Sales book must be ruled with columns for the different sorts of goods; and the heads of these columns must be titled with the names and quantities of the goods from the invoice.

6. The Bill-book.

The design of this Bill-book, or Month-book, is to furnish a merchant with a ready way of knowing the time when bills or other debts become payable to or by him. It consists of 12 folios, one for each month in the year. The left-hand page contains the debts that fall due to the merchant in the month on the top, and the right-hand page contains the debts payable by him to others in the same month; as in the annexed specimen.

Days	1769.	l.	s.	d.
	January, to receive.			
1	Of Edward Finch, 600 crowns, at 54d. bill,	135	00	00
10	Of Robert Banks, for lintseed, -	86	10	00
23	Of George Hally, for Norwich stuffs,	35	00	00
31	Of John Short, 2539 guilders, 19 stivers, } at 34 s. 5d. Flemish per L. Sterling, }	246	00	00
				Days

Days	1769.	l.	s.	d.
	January, 10 pay.			
3	To <i>Simon Smith</i> , 3000 crowns, at 56 d. } bill of <i>G. F.</i> }	70	00	00
12	To <i>James Jeffery</i> , for sundry goods, }	68	13	04
25	To <i>James Martin</i> and company, }	125	00	00
30	To <i>James Halley</i> , for oil, }	76	09	10

*N. B.* Upon the payment of any sum, merchants either cancel the line, or, which is better, they write the word *Received* or *Paid* upon the margin, or use some mark of their own, to signify that the sum to which it is affixed is paid.

### 7. The Receipt-book.

In this book a merchant takes receipts of the payments he makes. The receipt should contain the date; the sum received, expressed in words at large, and also in figures in the money-columns; the reason why; and whether in full or in part; and must be signed by the person receiving. But there is no occasion to mention the merchant's name; for the book being his own, sufficiently implies that. This book is pagged, and the form of it is as follows.

	l.	s.	d.
Received, July 1. 1769, in part for sugar, } the sum of one hundred thirty six pounds, }	136	00	00
per <i>John Stewart</i> .			
Received, this 4th of July 1769, in full for } indigo, the sum of forty eight pounds ten } shillings, }	48	10	00
per <i>Tho. Green</i> .			
Received, July 6. 1769, in part for lead, } twenty pounds, for my master <i>David Douglas</i> , }	20	00	00

Received, July 10. 1769, in full for co- } peras, thirty six pounds twelve shillings, for } self and company, }	36	12	00
Per <i>David Duff</i> .			
Received, July 11. 1769, forty-five pounds } twelve shillings and nine pence, in full for to- } bacco fold the 10th of January last, for self } and partner, }	45	12	09
Per <i>Simon Trusty</i> .			
Received, July 12. 1769, the sum of fifty } pounds, by order, and for the account of } <i>George Grant</i> , }	50	00	00
Per <i>Nath. Smith</i> .			

### 8. The Copy-Book of Letters.

It is very imprudent in any person to send away a letter of business, without keeping a double of it to himself; and there-

fore, to prevent the bad consequences of such a careless practice, merchants are provided with a large book, in *folio*, into which is copied *verbatim* every letter of business before it be sent off. So that this book, together with the letters received (which must also be carefully kept in files or boxes,) makes a complete history of all the dealings that pass betwixt a merchant and his correspondents; which may be very useful and necessary on many occasions.

### 9. The Pocket-book.

This is a small book, of a portable size, which a merchant carries in his pocket when business calls him abroad to a tavern, a fair, the country, or other places. In this he sets down the bargains he makes, the expences he is at, the debts he pays, or sums he receives, with every other part of business he transacts while abroad; as also any occurrence or piece of news he thinks worth while to record. And when he comes home to his counting-house or shop, he transfers the things contained in this book, each to their proper places in the Waste-book, or Books Subsidiary.

Factors of great business sometimes keep another small book, called the *Memorandum book*. Into this book is copied, from letters as they come to hand, short notes of the several commissions for buying goods contained in them; and as the commissions are effected, the notes are crossed, or have some mark affixed to them. This is more convenient in doing business, than to be continually running to the letters themselves. Suppose a merchant of Lisbon, by his letter, give a commission for buying goods, a note of it in the *Memorandum book* will stand thus.

Lisbon, 15th June 1769.

Out of *Carlos Popham's* letter an order for 4000 yards of serges, at 8 d. or 8½ d. per yard, 20 dozen stockings, not above 36 s. per dozen, &c.  
All which to be packed and shipped for Lisbon, consigned to himself, and marked *G. P.*

In like manner factors may, and those much employed generally do, take a note, from the letters of advice, of all the goods consigned to them, either in a separate place of this book, or in another book of the same nature. By this means a factor has daily under his eye, both the time when such a ship may be expected, and the goods the brings: And so is in a readier way of minding to look out for a merchant for them before hand, than if he had only the letter as his remembrancer. An example follows.

Naples, 18th June 1769.

In the *Prosperity*, *Robert Wilson* master, silks for account of *Anthony Carew*, marked *A. C.* N<sup>o</sup> 122 to 140.

The above are the subsidiary books most in use: But a merchant is not tied down or restricted to them; he may keep some, and neglect others, or invent more, as the nature of his business requires, and he finds convenient.

*Addendum to the article B O O K.*

All foreign bound books pay duty on importation 14s. for every 112 lb. As to unbound books, they are commonly entered by the hundred weight, and pay, if French, 13s. 6 $\frac{4}{5}$  d. but if from any other country, only 7s. 7 $\frac{1}{2}$  d. It is also to be observed, that all popish books are prohibited to be imported; as are all English books printed abroad, unless with the consent of the proprietor of the copy.

*Common-place-Book.* See *COMMON-PLACE-BOOK*.

*Text-Book.* See *TEXT*.

*Book binding.* The art of gathering and sewing together the sheets of a book, and covering it with a back, &c. It is performed thus: The leaves are first folded with a folding-stick, and laid over each other in the order of the signature; then beaten on a stone with a hammer, to make them smooth and open well, and afterwards pressed. They are sewed upon bands, which are pieces of cord or packthread; six bands to a folio book, five to a quarto, octavo, &c. which is done by drawing a thread through the middle of each sheet, and giving it a turn round each band, beginning with the first, and proceeding to the last. After this the books are glued, and the bands opened and scraped, for the better fixing the pasteboards; the back is turned with a hammer, and the book fixed in a press between two boards, in order to make a groove for fixing the pasteboards; these being applied, holes are made for fixing them to the book, which is pressed a third time. Then the book is at last put to the cutting press, betwixt two boards, the one lying even with the press, for the knife to run upon, the other above it, for the knife to run against: After which the paste-boards are squared.

The next operation is the sprinkling the leaves of the book, which is done by dipping a brush into vermilion and sap-green, holding the brush in one hand, and spreading the hair with the other; by which motion the edges of the leaves are sprinkled in a regular manner, without any spots being bigger than the others.

Then remains the covers, which are either of calfskin, or of sheep-skin; these being moistened in water, are cut out to the size of the book, then smeared over with paste made of wheat flour, and afterwards stretched over the pasteboard on the outside, and doubled over the edges withinside; after having first taken off the four angles, and indented and platted the cover at the head-band: which done, the book is covered, and bound firmly between two bands, and then set to dry. Afterwards it is washed over with a little paste and water, and then sprinkled fine with a brush, unless it should be marbled; when the spots are to be made larger, by mixing the ink with vitriol. After this the book is glazed twice with the white of an egg beaten, and at last polished with a polishing-iron passed hot over the glazed cover.

*BOOKSELLER*, one who trades in books, whether he prints them himself, or gives them to be printed by others.

Bookfellers are in many places ranked among the members of universities, and entitled to the privilege of students, as at Tubingen, Salisburg, and Paris, where they have always been distinguished from the vulgar and mechanical traders, and exempted from divers taxes and impositions laid upon other companies.

The traffic of books was anciently very inconsiderable, in so much, that the book-merchants of England, France, and Spain, and other countries, were distinguished by the appellation of *stationers*, as having no shops, but only stalls and stands in the streets. During this state, the civil magistrates took little notice of the bookfellers, leaving the government of them to the universities, to whom they were supposed more immediate retainers; who accordingly gave them laws and regulations, fixed prices on their books, examined their correctness, and punished them at discretion.

But when, by the invention of printing, books and bookfellers began to multiply, it became a matter of more consequence, and the sovereigns took the direction of them into their own hands; giving them new statutes, appointing officers to fix prices, and granting licences, privileges, &c.

*BOOKING*, among merchants, the making an entry of any thing in a Journal. See *BOOK-KEEPING*.

*BOOM*, in the sea-language, a long piece of timber with which the clew of the studding-fail is spread out; and sometimes the boom is used to spread or boom out the clew of the mainmast.

*Boom-spars*, imported from the British plantations, are free; if from Ireland, Asia, or Africa, they pay 6s. 5d. the hundred; and if from elsewhere, 9s. 6 $\frac{1}{2}$ d. *BOOM* denotes also a cable stretched athwart the mouth of a river or harbour; with yards, topmasts, battling or spars of wood lashed to it, to prevent an enemy's coming in.

*BOOMING*, among sailors, denotes the application of a boom to the sails.

A ship is said to come booming forwards, when she comes with all the fail the can make.

*BOOPHTHALMUS*, a kind of agat with large circles in it, bearing some resemblance to an ox's eye, from whence it has got this name.

*BOOPS*, in zoology, the trivial name of a species of batæna. See *BALÆNA*.

*BOOT*, a well known cover for the leg, made of leather.

*BOOT-tree*, or *BOOT-last*, an instrument used by shoemakers to widen the leg of a boot. It is a wooden cylinder slit into two parts, between which, when it is put into the boot, they drive by main force a wedge or quoin.

*BOOTES*, a constellation of the northern hemisphere, consisting of 23 stars, according to Ptolemy's catalogue, of 18 in Tycho's, of 34 in Bayer's, of 52 in Helvelius's, and of 54 in Mr Flamsteed's catalogue. See *ASTRONOMY*, p. 486.

*BOOTY*, whatever is taken from an enemy in time of war.

*BOPIART*, a town of the electorate of Triers, situated on the west shore of the Rhine, about eight miles south of Coblenz: E. long 7° 10', N. lat. 50° 20'.

**BOQUEROON**, an island in the E. Indian ocean, lying north-east of Borneo, in N. lat.  $3^{\circ}$ .

**BOQUINIANS**, in church-history, a sect of heretics, so called from Boquinus their founder, who taught that Christ did not die for all mankind, but only for the faithful, and consequently was only a particular Saviour.

**BORA**, in natural history, a name used by some for the Bufonites. See **BUFONITES**.

**BORAGO**, in botany, a synonyme of the anchusa. See **ANCHUSA**.

**BORAK**, a fabulous animal, said to be of a middle nature between an afs and a mule, and to have carried Mahomet in his aerial journeys from Jerusalem into heaven.

**BORASSUS**, in botany, a genus belonging to the order of palmæ flabellifoliæ. The borassus, of which there is but one species, has palmated and plaited leaves, and is a native of India.

**BORAX**, the name of a saline substance brought from the E. Indies in large masses, composed partly of large crystals, but chiefly of smaller ones, partly white and partly green, joined together, as it were, by a greasy yellow substance, intermingled with sand, small stones, and other impurities. The purer crystals, exposed to the fire, melt into a kind of glass, which is nevertheless soluble in water.

This salt, dissolved and crystalized, forms small transparent masses. The origin of this salt is not known; but experiments have clearly shewn, that it consists of a fixt alkaline salt, the same with the basis of sea-salt, in some degree neutralized by another saline substance, which is supposed to exist no where but in borax itself.

The medical virtues of borax are little known: In doses of half a dram to two scruples, it is supposed to be diuretic, emmenagogue, and a promoter of delivery.

**BORBONIA**, in botany, a genus of the diadelphia decandria class. The calix is pointed and prickly; and the stygma is emarginated. There are six species of borbonia, which is a kind of broom, all natives of America.

**BORBORITES**, in church-history, a sect of gnostics, in the second century, who, besides embracing the errors of these heretics, denied the last judgment.

Their name comes from the Greek, [*Borhoros*], *filth*, on account of a custom they had of daubing their faces and bodies with dirt and filth.

**BORCH**, a town of lower Saxony, in Germany, about fourteen miles north-east of Magdeburg: E. long.  $12^{\circ} 14'$ , N. lat.  $52^{\circ} 25'$ .

**BORCHLEON**, or **LOORS**, a town of the bishopric of Liege in Germany, about fifteen miles north-west of the city of Liege: E. long.  $5^{\circ} 30'$ , N. lat.  $50^{\circ} 50'$ .

**BORDAT**, in commerce, a small narrow stuff, which is manufactured in some parts of Egypt, particularly at Cairo, at Alexandria, and Damietta.

**BORDER**, in gardening, is made to inclose parterres, that they may not be injured by walking in them.

Borders are made either circular, strait, or in cants;

and are turned into knots, scrolls, volutes, and other compartments. They are rendered very ornamental by the flowers, shrubs, yews, &c. that are raised in them. They are always laid with a sharp rising in the middle; because, if they are flat, they are no ways agreeable to the eye: And as for their breadth, the largest are allowed five or six feet, and the lesser commonly four. There are four sorts, 1. Those continued about parterres, without any interruption. 2. Those cut into compartments and convenient distances by small passages; these two are raised in the middle, and adorned with flowers and shrubs. 3. Even and flat ones, without flowers. And, 4. Quite plain borders, only fanded, as in parterres of orangery.

**BORD-FREE**. See **FREE**.

**BORD-halfpenny**, a small toll, by custom paid to the lord of the town for setting up boards, tables, booths, &c. in fairs and markets.

**BORD-lands**, the demesnes which lords keep in their hands for the maintenance of their board or table.

**BORD-lose**, a service required of tenants to carry timber out of the woods of the lord to his house. It is also used to signify the quantity of provision which the bordarii or bordenmen paid for their bord lands.

**BORD-service**, the tenure of bord-lands, by which some lands in certain places are held of the bishop of London, and the tenants now pay sixpence *per acre*, in lieu of finding provision anciently for their lord's table.

**BORDURE**, in heraldry, a cutting off from within the escutcheon all round it about  $\frac{1}{4}$  of the field, serving as a difference in a coat of arms, to distinguish families of the same name, or persons bearing the same coat. See Plate LI. fig. 16.

If the line constituting the bordure be strait, and the bordure be plain, then in blazoning you must only name the colour of the bordure.

Bordures are sometimes ingrailed, gbonated, inverted, &c. See **INGRAILED**, &c.

If the border be charged with any part of plants or flowers, the term is verdoy of trefoils, or whatever flower it be. If it consists of ermins, vary, or any of the furs, they say *perlew of ermins*, &c. If the bordure be charged with martlets, the word is charged with an enalyron of martlets, &c.

Bordures are symbols of protection, favour and reward; and as such kings bestow them on those they have a value for.

**BORE**, among engineers, denotes the diameter of the barrel of a gun or cannon, or rather its whole cavity.

**Square BORE**, among mechanics, a square piece of well-tempered steel, fitted into a handle, serving to widen holes, and make them perfectly round.

**BOREAL**, in a general sense, something relating to the north. Thus,

**BOREAL signs**, in astronomy, are the first six signs of the zodiac, or those northwards of the equinoctial.

*Aurora BOREALIS*. See **PNEUMATICS**.

**BOREAS**, a Greek name, now in common use for the north wind.

Pezron observes, that anciently boreas signified the north-east wind, blowing at the time of the summer solstice.

- solstice.** **BORAS** is represented in painting like an old man with a horrible look, his hair and beard covered with snow or hoar frost, with the feet and tail of a serpent.
- BOREASMI**, in Grecian antiquity, a festival kept by the Athenians in honour of Boreas.
- BOREEL**, a cape on the north part of New Zealand, in the South Sea, lying west by south from the most southerly part of South America.
- BORGO**, a town of Finland, in the province of Nyland, upon the northern coast of the gulph of Finland.
- BORGO DI SESIA**, a town of Italy, in the duchy of Milan, situated upon the Sesia.
- BORGO DE ST SEPULCHRO**, a town of Tuscany, about fifty miles east of Florence, near the head of the Tiber: E. long.  $13^{\circ}$ , and N. lat.  $43^{\circ} 30'$ .
- BORGO DE VAL DE FARO**, a town of Italy, in the duchy of Parma, about twenty miles south-west of that city; E. long.  $10^{\circ} 36'$ , and N. lat.  $44^{\circ} 35'$ .
- BORGO-FORTE**, a town of the Mantuan, in Italy, situated at the confluence of the rivers Po and Menzo, about eight miles south of Mantua; E. long.  $11^{\circ}$  N. lat.  $44^{\circ} 50'$ .
- BORGO ST DOMINGO**, a city of Italy, in the duchy of Parma, about ten miles north-west of that city; E. long.  $10^{\circ} 31'$ , N. lat.  $44^{\circ} 50'$ .
- BORIA**, a city of Arragon, in Spain, about thirty-five miles north-west of Saragoffa; W. long.  $2^{\circ}$ , and N. lat.  $41^{\circ} 40'$ .
- BORING**, in a general sense, the art of perforating, or making a hole through any solid body.
- BORING of water-pipes.** The method of boring water-pipes is as follows. The poles of alder, which is a very useful wood in making pumps, water-pipes, &c. being laid on horfes or trellis of a foot height, to rest the auger upon while they are boring, they set up a lath to turn the least end of the poles, to sit them to the cavities of the great end of the others. They turn the small ends of the poles about five or six inches in length, to the size they intend to bore the bigger ends about the same depth, *viz.* five or six inches. This is designed to make a joint to shut each pair of poles together, the concave part being the female part, and the other part the male of the joint. In turning the male part, they turn a channel in it, or a small groove at a certain distance from the end; and in the female part, they bore a small hole to fit over this channel. This being done, they bore the poles through; and to prevent them from boring out at the side, they stick great nails at each end to be a guide in boring. It is usual, however, to bore them at both ends; so that if a pole be crooked one way, they can bore it through, and not spoil it.
- BORING**, in farriery, an operation in use for the cure of wrenched shoulders in horfes. It is this; having cut a hole in the skin, over the part affected, they blow it with up a tobacco-pipe, as a butcher does a shoulder of veal; after which they thrust a cold flat iron, like the point of a sword-blade, eight or ten inches up between the shoulder-blade and the ribs: This they call boring.
- BORING**, in mineralogy, a method of piercing the earth with scooping irons, which being drawn back at proper times, bring up with them samples of the different strata through which they have passed; by the examination of which the skilful mineralist will be able to guess whereabouts a vein of ore may lie, or whether it will be worth while to open a mine there or no.
- BORIQUE**, one of the Caribbee islands, lying south-east of Porto Rico, in  $64^{\circ} 30'$  W. long. and  $18^{\circ}$  N. lat.
- BORISSOW**, a town of Poland, in the duchy of Lithuania, situated upon the river Berozina.
- BORISTHENES**, in geography. See **NIEPER**.
- BORITH.** See **KALI**.
- BORMIO**, a territory of the Grisons, in Italy, having the dominions of Venice on the south.
- BORNE**, a market-town in Lincolnshire, about 20 miles south of the city of Lincoln; in  $20^{\circ}$  W. long. and  $52^{\circ} 40'$  N. lat.
- BORNEO**, a large island in the Indian ocean, situated between  $107^{\circ}$  and  $117^{\circ}$  E. long. and between  $7^{\circ} 30'$  N. lat. and  $4^{\circ}$  S. lat.
- Its figure is almost round, and computed to be 2500 miles in circumference, and consequently containing a greater number of square acres than any island in the known world.
- BORNEO** is also the name of the principal town of the above island, situated on a bay at the north-west part, in  $111^{\circ} 30'$  E. long. and  $4^{\circ} 30'$  N. lat.
- BORNHOLM**, an island in the Baltic Sea, situated on the coast of Schonen, in Sweden, about 43 miles north-east of the island of Rugen, in  $15^{\circ}$  E. long. and  $55^{\circ} 15'$  N. lat.
- BORNEO**, or **BOURNOU**, the name of a town and country of Nigritia, in Africa. This country abounds in cattle, millet, and cotton. It lies between  $15^{\circ}$  and  $24^{\circ}$  E. long. and between  $10^{\circ}$  and  $20^{\circ}$  N. lat.
- BORNEO** is also the name of a lake, in the river Niger, where it traverses the above-mentioned country.
- BOROUGH**, in Scots law, is a body corporate made up of the inhabitants of a certain tract of ground erected by the sovereign, and endowed with a limited jurisdiction, and certain privileges. They are divided into boroughs royal, of regality, and of barony. See **LAW**, tit. *Inferior Judges and Courts of Scotland*.
- BOROUGH-ENGLISH**, a customary descent of lands or tenements, in certain places, by which they descend to the youngest instead of the eldest son; or, if the owner have no issue, to the younger instead of the elder brother. This custom goes with the land, although there be a devise or feoffment at the common law to the contrary. The reason of this custom, says Littleton, is, because the youngest is presumed in law to be least able to provide for himself.
- BOROUGH-HEAD**, or **HEADBOROUGH**, called also borough-holder, or burholder, the chief man of the *decenna*, or hundred, chosen to speak and act in behalf of the reit.
- Headborough also signifies a kind of head constable, where there are several chosen as his assistants, to serve warrants, &c. See **CONSTABLE**.

**BOROUGH BRIDGE**, a town in the North Riding of Yorkshire, about 15 miles north-west of York; in 1° 15' W. long. and 54° 10' N. lat.

**BOROZALL**, or the zail of the Ethiopians, a disease epidemic in the countries about the river Senega. It principally affects the pudenda, but is different from the *lucæ veneræ*. It owes its rise to excessive venery: In the men this distemper is called *afab*, and in the women *afabatus*.

**BORRAGE**. See *ANCHUSA*.

**BORRELLISTS**, in church-history, a Christian sect in Holland. They reject the use of churches, of the sacraments, public prayer, and all other external acts of worship. They assert, that all the Christian churches of the world have degenerated from the pure apostolical doctrines, because they have suffered the word of God, which is infallible, to be expounded, or rather corrupted, by doctors, who are not infallible. They lead a very austere life, and employ a great part of their goods in alms.

**BORSALO**, a kingdom of Africa, in Nigritia: It extends along the north side of the river Gambia, as far as Tantacondé.

**BOS**, in zoology, a genus of quadrupeds belonging to the order of pecora. The characters of this genus are taken from the horns and teeth. The horns are hollow within, and turned forward, in the form of crescents: There are eight fore-teeth in the under jaw, and none in the upper, their place being supplied by a hard membrane; and there are no dog-teeth in either jaw. Linnæus enumerates six species, *viz.* 1. The taurus, including the bull and cow, has cylindrical horns, bent outwards, and loose dewlaps. The bull or male is naturally a fierce and terrible animal. When the cows are in season, he is perfectly ungovernable, and often altogether furious. When chafed, he has an air of fullen majesty, and oft treads up the ground with his feet and horns. The principal use of the bull is to propagate the species; although he might be trained to labour, his obedience cannot be depended on. A bull, like a stallion, should be the most handsome of his species. He should be large, well made, and in good heart; he should have a black eye, a fierce aspect, but an open front; a short head; thick, short, and blackish horns, and long shaggy ears; a short and straight nose, large and full breast and shoulders, thick and fleshy neck, firm reins, a straight back, thick fleshy legs, and a long tail well covered with hair. Castration remarkably softens the nature of this animal; it destroys all his fire and impetuosity, and renders him mild and tractable, without diminishing his strength; on the contrary, after this operation, his weight is increased, and he becomes fitter for the purposes of plowing, &c.

The best time for castrating bulls is at the age of puberty, or when they are eighteen months or two years old; when performed sooner, they often die. However, it is not uncommon to castrate calves a few days after birth. But such as survive an operation so dangerous to their tender age, generally grow

larger and fatter, and have more courage and activity than those who are castrated at the age of puberty. When the operation is delayed till the age of six, seven, or eight years, they lose but few of the qualities of bulls, are much more furious and untractable than other oxes, and when the cows are in season, they go in quest of them with their usual ardor. See Plate L.II. fig. 2.

The females of all those species of animals which we keep in flocks, and whose increase is the principal object, are much more useful than the males. The cow produces milk, butter, cheese, &c. which are principal articles in our food, and besides answer many useful purposes in various arts.

Cows are generally in season, and receive the bull, from the beginning of May to the middle of July. Their time of gestation is nine months, which naturally brings the veal or calves to our markets from the beginning of January to the end of April. However, luxury has fallen upon methods of interrupting this natural course, and veal may be had almost every month in the year.

Cows, when improperly managed, are very subject to abortion. In the time of gestation, therefore, they ought to be observed with more than ordinary care, lest they should leap ditches, &c. Neither should they be suffered to draw in the plough or other carriage, which is a practice in some countries. They should be put into the best pasture, and should not be milked for six weeks or two months before they bring forth their young. The calf should be allowed to suck and follow its mother during the first six or eight days. After this it begins to eat pretty well, and two or three sucks in a day will be sufficient. But if the object be to have it quickly fattened for the market, a few raw eggs every day, with bottled milk, and a little bread, will make it excellent veal in four or five weeks. This management of calves applies only to such as are designed for the butcher. When they are intended to be nourished and brought up, they ought to have at least two months suck; because the longer they suck, they grow the stronger and larger. Those that are brought forth in April, May, or June, are the most proper for this purpose; when calved later in the season, they do not acquire sufficient strength to support them during the winter.

The cow comes to the age of puberty in 18 months, but the bull requires two years: But although they are capable of propagating at these ages, it is better to restrain them till they be full three years. From three to nine years those animals are in full vigour; but when older, they are fit for nothing but to be fed for the butcher. A milk cow ought to be chosen young, fleshy, and with a brisk eye.

The heaviest and most bulky animals neither sleep so profoundly, nor so long as the smaller ones. The sleep of the ox is short and slight; he wakes at the least noise. He lies generally on the left side, and the kidney of that side is always larger than the other. There is great variety in the colour of oxen. A reddish or black colour is most esteemed. The hair should be glossy, thick, and soft; for, when otherwise, the animal is either not in health, or has a weakly constitution. The best time for inuring

inuring them to labour is at the age of two and a half or three years.

The ox eats very quick, and soon fills his first stomach; after which he lies down to ruminate, or chew the cud. The first and second stomachs are continuations of the same bag, and very capacious. After the grafs has been chewed over again, it is reduced to a kind of mafs, not unlike boiled fpinage, and under this form it is sent down to the third stomach, where it remains and digests for fome time; but the digestion is not fully completed till it comes to the fourth stomach, from which it is thrown down to the guts. The contents of the first and second stomachs are a collection of grafs and other vegetables roughly macerated; a fermentation however soon commences, which makes the grafs swell. The communication between the second and third stomach is by an opening much smaller than the gullet, and not fufficient for the paffage of the food in this ftate. Whenever then the two first stomachs are distended with food, they begin to contract, or rather perform a kind of re-action. This re-action compresses the food, and makes it endeavour to get out: Now the gullet being larger than the paffage between the second and third stomachs, the pressure of the stomach necessarily forces it up the gullet. The action of ruminating, however, appears to be in a great measure voluntary; as animals of this kind have a power of increasing the re-action of their stomachs. After the food undergoes a second mastication, it is then reduced into a thin pulp, which easily passes from the second to the third stomach, where it is still further macerated; from thence it passes to the fourth, where it is reduced to a perfect mucilage, every way prepared for being taken up by the lacteals, and converted into nourishment. What confirms this account of chewing the cud is, that as long as these animals suck or feed upon liquid aliment, they never ruminate; and in the winter, when they are obliged to feed upon hay and other dry victuals, they ruminate more than when they feed-upon fresh grafs.

Bulls, cows, and oxen, are fond of licking themselves, especially when lying at rest. But this practice should be prevented as much as possible; for as the hair is an undigestible substance, it lies in the stomach or guts, and is gradually coated by a glutinous substance, which in time hardens into round stones of a considerable bulk, which sometimes kills them, but always prevents their fattening, as the stomach is rendered incapable of digesting the food so well as it ought.

The age of these animals may be distinguished by the teeth and horns. The first fore-teeth fall out at the age of six months, and are succeeded by others of a darker colour, and broader. At the end of sixteen months, the next milk-teeth likewise fall out; and at the beginning of the fourth year all the fore-teeth are renewed, and then they are long, pretty white, and equal: However, as the animal advances in years, they become unequal and blackish. At the end of three years, the horns of oxen fall off, and new ones arise, which continue as long as they live. The horns of oxen four years of age are small pointed, neat, and smooth, but thickest near the

head: This thick part next season is pushed further from the head by a horny cylinder, which is also terminated by another swelling part, and so on, (for as long as the ox lives, the horns continue to grow); and these swellings become so many annular knots by which the age may easily be reckoned: But, from the point to the first knot must be counted three years, and every succeeding knot only one year.

Ox-beef is very nourishing, and yields a strong aliment; the flesh of a cow, when well fattened and young, is not much inferior. Bull-beef is hard, tough, and dry; for which reason it is not much used for food. Veal is well tasted, easy of digestion, and rather keeps the body open as otherwife.

The northern countries of Europe produce the best cattle of this kind. In general, they bear cold better than heat; for this reason, they are not so plenty in the southern countries. There are but few in Asia to the south of Armenia, or in Africa beyond Egypt and Barbary. America produced none till they were carried there by the Europeans. But the largest are to be met with in Denmark, Podolia, the Ukrain, and among the Calmuck Tartars; likewise those of Ireland, England, Holland, and Hungary, are much larger than those of Persia, Turkey, Greece, Italy, and Spain; but those of Barbary are least of all. In all mountainous countries, as Wales, the Highlands of Scotland, the black cattle are exceedingly small, but hardy, and when fattened make excellent beef. In Lapland, they are mostly white, and many of them want horns. The bull, cow, and ox, generally live about 14 or 15 years.

2. The bonafus, has a long mane; its horns are bent round towards the cheek, and not above a span in length. It is about the size of a large bull, and is a native of Africa and Asia. When enraged, he throws out his dung upon dogs or other animals that annoy him; the dung has a kind of caustic quality which burns the hair off any animal it falls upon.

3. The bison, has likewise a long thick mane, which covers the whole neck and breast on each side. The horns are turned upwards, and exceedingly large; there is a large protuberance or bunch on the back; his eyes are red and fiery, which gives him a furious aspect. He is fierce, cruel, and so bold that he fears nothing. It is unsafe to hunt him but where the trees are large enough to hide the hunters. He is a native of Mexico and Florida.

4. The grunniens, or hog-cow, has cylindrical horns, bent backwards. The body is so hairy, that the hair hangs down upon its knees like a goat. The tail has a kind of mane on each side. The colour of the body is black; but the front is white. It has bristles on its back, tail, and hind-legs. It is an inhabitant of the North of Asia.

5. The bubalis, or buffalo, has large black horns bent backward and inward, and plain before. The hair on the back is very hard, but thinly scattered over the body. It is a native of Asia. But they are tamed in Italy, and used for the same purposes as black cattle in other countries. They draw carriages, and are guided

by a rope tied to a ring thrust through their noses. The buffalo is larger than an ox, has a thicker body, and a very hard hide. His pace is slow; but he will carry a great burden. They feed in herds like cows, and yield plenty of milk, of which very good butter and cheese is made. Their flesh is pretty good, but not to be compared to beef. The wild buffalo is a very fierce and dangerous animal; he often attacks travellers, and tears them to pieces. However, they are not so much to be feared in woods as in the plains; because their horns, which are sometimes ten feet long, are apt to be entangled in the branches of trees, which gives those who are surpris'd by them time to escape. They are excellent swimmers, and will cross the largest river without any difficulty. They run wild in great troops on the coast of Malabar, for which reason strangers are allowed to hunt and kill them at pleasure.

6. The indicus, or little Indian buffalo, has horns shorter than its ears, a bunch on its back, and no mane. It is about the size of a calf six months old, and used in the East Indies for drawing coaches, &c.

**BOSA**, or **Bossa**, a town of Sardinia, situated on its western coast, at the mouth of a river of the same name; in 8° 30' E. long. and 40° 15' N. lat.

**BOSCAGE**, the fame with a grove, or thicket.

**BOSGAGE**, in a law sense, is that food which trees yield to cattle, as mast, &c. But Manwood says, to be quit of bosgace, is to be discharged of paying any duty for wind-fall wood in the forest.

**BOSGAGE**, among painters, denotes a landscape representing much wood and trees.

**BOSCHETTO**, in geography, a territory in the isle of Malta: And likewise an estate belonging to the grand masters of that order, about two miles from Civita Vecchia, in Italy.

**BOSEA**, in botany, a genus of the pentandria digynia class. The calix consists of five leaves; it has no corolla; and the fruit is a dry, compressed, membranaceous berry. There is but one species, viz. the yervamora, a native of the Carribbee-islands.

**BOSNA-SERAJO**, the capital of the province of Bosnia, in 19° E. long. and 44° N. lat.

**BOSNIA**, a frontier province of Christendom, divided between the House of Austria and the Turks; that part of it lying eastward of the river Unna, belonging to the Turks; and the rest of it, lying westward of that river, to the Austrians.

**BOSPHORUS**, in geography, denotes, in general, a narrow sea, or channel, separating two continents, and serving as a communication between two seas.

**BOSPHORUS** is more particularly used for the straits of Constantinople, which divides Europe from Asia.

This was the original Bosphorus; so called because oxen could swim over it: And from the resemblance between it and the freights of Kassa, these last were anciently called the *Cimmerian*, as the former were the *Thracian Bosphorus*.

**BOSQUETS**, in gardening, groves so called from *boschetto*, an Italian word, which signifies a little wood.

They are compartments in gardens, formed by branches of trees, disposed either regularly in rows, or wildly and irregularly, according to the fancy of the owner. A bosquet is either a plot of ground inclosed with palisades of horn-beam, the middle of it being filled with tall trees, as elm or the like, the tops of which make a tuft or plume; or it consists of only high trees, as horse-chestnut, elm, &c. The ground should be kept very smooth and rolled, or else covered with grass, after the manner of green-plots. In planting bosquets, care should be taken to mix the trees which produce their leaves of different shapes, and various shades of green, and hoary or meally leaves, so as to afford an agreeable prospect. Bosquets are only proper for spacious gardens, and require a great expence to keep them up.

**BOSS**, or **Bosse**, in sculpture. See **RELIEVO**.

**BOSSAGE**, in architecture, a term used for any stone that has a projecture, and is laid rough in a building, to be afterwards carved into mouldings, capitals, coats of arms, &c.

Bossage is also that which is otherwise called rustic work, and consists of stones which advance beyond the naked, or level, of the building, by reason of indentures or channels left in the joinings. These are chiefly used in the corners of edifices, and thence called *rustic quoins*. The cavities or indentures are sometimes round, sometimes chain-framed, or bevelled, sometimes in a diamond form, and sometimes inclosed with a cavetto, and sometimes with a listel.

**BOSSINEY**, a borough-town of Cornwall, situated on the Irish channel, about fifteen miles north-west of Launceston: W. long. 5°, and N. lat. 50° 40'.

It sends two members to parliament.

**BOSSORA**, or **Bassora**, a large port-town of Asiatic Turkey, in the province of Eyraç Arabic; situated on the western shore of the river Euphrates, about forty miles north-west of the gulph of Persia, or Boffora, in E. long. 47°, and N. lat. 30°.

**BOSSUPT**, a town of Brabant, in the Austrian Netherlands, about eight miles south of Louvain: E. lon. 4° 30', and N. lat. 50° 52'.

**BOSTANGIS**, in the Turkish affairs, persons employed in the garden of the seraglio, out of whose number are collected those who are to row in the Grand Signior's brigantines, when he has a mind to divert himself with fishing, or take the air upon the canal. They who row on the left hand are only capable of mean employments in the gardens; but they who row on the right hand may be promoted to the charge of *bostangi-bachi*, who has the general intendency of all the Grand Signior's gardens, and commands above ten thousand *bostangis*.

**BOSTON**, a port-town of Lincolnshire, situated near the mouth of the river Witham, about twenty-six miles south-east of Lincoln: E. long. 5', and N. lat. 53°.

**Boston**, is also the name of the capital of New-England, situated on a peninsula, at the bottom of a fine bay, covered with small islands and rocks, and defended by a castle and platform of guns: W. long. 71°, and N. lat. 42° 24'.

It is a flourishing town, wherein are ten churches,

fix of them belonging to independents. The number of its inhabitants are computed to be about fourteen thousand.

**BOSWORTH**, a market town of Leicestershire, situated about eleven miles south-west of Leicester: W. long. 1° 25', and N. lat. 52° 45'.

**BOTALE** *foramen*, in anatomy, a name given to the

*foramen ovale*, from Botall, physician to Charles IX. to whom the discovery of it is ascribed. See *FORAMEN ovale*.

**BOTANIST**, a person skilled in botany. See *BOTANY*.

**BOTANOPHILI**, persons who have treated of plants, not as botanists, but as gardeners, physicians, &c.

B O T A N Y.

**BOTANY** is that branch of natural history which treats of the uses, characters, classes, orders, genera, and species of plants.

Before we explain the most approved method of dis-

tinguishing plants, it will not be improper to inquire into the nature of the science, and what useful or ornamental purposes may be expected from the cultivation of it.

SECT. J. USES O R B O T A N Y.

**WHEN** this science is carried no further than to distinguish one plant from another, its uses are few and uninteresting. However, even this exercise is attended with some advantages. It is the first, and a necessary step towards discovering those of a more noble kind. It is the rudiments of the science; and must therefore be acquired before we can expect to arrive at any improvement that may be useful to mankind. This part of botany is likewise more complete and systematic than many other branches of natural history. By means of the classical and generic marks, we are enabled in a few minutes to discover the name of any plant, from whatever quarter of the globe it may be brought. This is exceedingly curious, and altogether incredible to people unacquainted with the nature of the science. When we have learnt the name, we are then in a capacity of consulting authors with regard to the peculiar properties of the plant, so far as they are known.

Besides, there is an elegance and symmetry in plants, which give rise to many agreeable emotions. Their parts, like those of animals, are possessed of all the beauties of utility, regularity, uniformity, order, and proportion. Neither is there any class of natural bodies in which the beauty of variety makes such a capital figure. This variety is chiefly exhibited in the magnitude, figure, colour, odour, and taste of vegetables. It is therefore natural to expect, that the study of botany should have some influence in improving our taste.

But as botany is confessedly a branch of natural history, the botanist ought not to confine his researches to the mere names and characters of plants. He ought to inquire into their qualities. These qualities, indeed, when we talk of vegetables in general, are exceedingly numerous, and the investigation of many of them attended with such difficulty, that no person, however industri-

ous, can ever expect to unfold the whole. But this circumstance does not afford any argument for losing sight of utility altogether. On the contrary, it is the only thing that can give dignity to the science, or entitle it to be ranked as a branch of natural history. There is but little pleasure in studying a science which is already carried to its highest pitch of improvement. The prospect of discovering any thing that may be useful to mankind stimulates our industry, and makes us prosecute our researches with vigour and alacrity.

A botanist, or an inquirer into the nature and properties of vegetables, ought to direct his views principally towards the investigation of useful qualities. For this purpose, in examining plants, he should consider whether they be possessed of any qualities which may render them of use in food, in medicine, or in any of the arts. These are objects worthy the attention of philosophers. Let us examine the assistance that may be expected from the study of botany with regard to these important articles.

1. **Food**.—Many animals are endowed with an instinctive faculty of readily distinguishing whether the food that is presented to them be noxious or salutary. Mankind have no such instinct. They must have recourse to experience and observation. But these are not sufficient to guide us in every case. The traveller is often allured by the agreeableness of smell and taste to eat poisonous fruits. Neither will a general caution not to eat any thing but what we know from experience to be salutary, answer in every emergency. A ship's company, in want of provisions, may be thrown upon an uninhabited coast, or a desert island. Totally ignorant of the nature of the plants which they meet with;—diseases, or scarcity of animals, may render it absolutely necessary to make use of vegetable food;—the consequence is dreadful: They  
 mult

mult first eat, before any certain conclusion can be formed. This is not the description of danger arising from an imaginary situation. Before the vegetables that grow in America, the East and West Indies, &c. became familiar to our sailors, many lives were lost by trials of this kind: Neither has all the information received from experience been sufficient to prevent individuals from still falling a prey to ignorance or rashness.

If the whole science of botany were as complete as some of its branches, very little skill in it would be sufficient to guard us infallibly from committing such fatal mistakes. There are certain orders and classes which are called *natural*, because every genus and species comprehended under them are not only distinguished by the same characteristic marks, but likewise possess the same qualities, though not all in an equal degree. For example: Shew a botanist the flower of a plant whose calix is a double-valved glume, with three stamina, two pistils, and one naked seed, he can pronounce with absolute certainty, that the plant from which the flower was taken bears seeds of a farinaceous quality, and that they may be safely used as food. In like manner, shew him a flower with twelve or more stamina, all inserted into the internal side of the calix; though it belonged to a plant growing in Japan, he can pronounce, without hesitation, that the fruit of it may be eat with safety. On the other hand, show him a plant whose flower has five stamina, one pistil, one petal or flower-leaf, and whose fruit is of the berry kind, he will tell you to abstain from eating it, because it is poisonous. Many other examples might be given: but we shall reserve them till we come to the medical qualities.

Facts of this kind make botany not only a respectable, but a most interesting science. The French and some other nations use a greater variety of vegetable food than the British. This practice is attended with many advantages. The greater number of vegetables that are made use of in any country, the poor have the greater number of resources when there happens to be a scarcity of any particular kind. It likewise affords an opportunity of a more universal cultivation. When agriculture or gardening is confined to few plants, there is great hazard from bad seasons and other unavoidable accidents, besides the certain loss arising from allowing such soils as are improper for raising the usual plants to lie unemployed. Though we are principally influenced by example in introducing the culture of new plants; yet the advice and direction of the botanist may be useful. From his knowledge of the qualities of plants that grow in other countries, he is enabled to guess, with tolerable exactness, whether they will agree with the soil or climate in which they are proposed to be cultivated. He can do more: he can point out what particular species of the plant will be most easily naturalized. Besides, without having recourse to the example of foreign countries, the botanist can point out a number of plants that grow wild in his own country, which might be cultivated with advantage, as food either for men or cattle. For example, in the whole class called *didelphia* by Linnæus, which includes the polygala, or milk-wort; the anthyllis, or kidney-vetch;

the orobus, or heath-pease; the lathyrus and vicia, which comprehend a number of plants of the vetch-kind; the ornithopus, or bird's-foot; the hedyсарum, or St-foin; the atragalus, or wild liquorice; the medicago, or lucern; the lotus, or bird's-foot trifol, &c.; the leaves are excellent food for cattle, and the seeds may be used either by men or cattle. In like manner, all the seeds of the grass-kind, which belong to the triandria class of Linnæus, and are very numerous, make excellent food for men, and the leaves afford the best pasture for cattle. Many of the plants belonging to this class are not cultivated in this country, though we have a great variety of them growing wild.

It has been frequently observed, that poor people, during a scarcity of corn, have been induced to fill their bellies with substances that were both pernicious and loathsome, while they were trampling under their feet plants that would at once have afforded good nourishment and been highly grateful. This conduct could proceed from nothing but their ignorance of the nature and effects of these plants, and from their not being able to distinguish the noxious ones from the salutary. It is the duty of every man to point out the remedy for calamities of this kind, especially when it is not impossible that the causes which produced them may exist in some future period. For this purpose, we shall subjoin a short list of native plants that may be eat with safety and advantage.

*Salicornia Europæa*, or marsh-samphire, jointed glasswort, or saltwort. This plant grows plentifully near the sea-coasts, and eats very well with salt and vinegar. *Veronica becubunga*, or common brook-lime. This plant, which grows in marshes, is commonly gathered in the spring, and eat as a salad.

*Valeriana locusta*, lamb's-lettuce, or corn-fallet, grows in corn-fields and pasture-grounds. The leaves are reckoned more wholesome than the common lettuce cultivated in our gardens.

*Scirpus maritimus*, or round-rooted cyperus, grows near the sea-shores. The root consists of a number of knots, which, after being dried and grinded, have been frequently used as bread when provisions were scarce.

*Bromus scaberrimus*, or field brome-grass, grows in vast quantities in rye-fields, especially after the rye is cut down. The seeds of this plant, mixed with grain of a better quality, make very good bread: But if the quantity of brome-grass seeds be great, the people who use the bread are apt at first to be affected with a slight degree of intoxication; but this effect ceases, after being a little accustomed to the food.

*Festuca fluitans*, or flote-sfucue-grass, grows in ditches and marshy places. In Sweden and Germany, the seeds are used in broths and gruels, on account both of their nutritive quality and agreeable flavour. When grinded, and made into bread, they are esteemed little inferior to wheat or oats.

*Triticum repens*, common wheat-grass, dog's-grass, quick-grass, or couch-grass, grows so plentifully in our fields, that it is a great object with farmers to root it out. The roots of this plant, after being washed, dried, and grinded, have often been used as bread in a dearth of corn.

With regard to the other kinds of grafs, the feeds of them may be fafely ufed as food; but fome of them are fo fmall, that a fufficient quantity cannot eafily be collected.

Campanula, or bell-flower. Nine or ten fpecies of bell-flower grow in Britain. Both the roots and leaves, when boiled, efppecially before the ftalk grows up, may be ufed.

Chenopodium bonus henricus, common Englifh mercury, or all-good, grows almoft every where. This plant is ufed in broth by the country-people, in place of cabbage or other pot-herbs. When the young leaves and ftalks are dreffed with butter, they are not inferior, in their flavour and nutritive power, to afparagus or fpinage.

Eryngium maritimum, fea-holly, or eryngo, generally grows near the fea-shore. The young twigs, prepared as afparagus, are grateful to the tafte, very nourifhing, and give vigour to the body.

Daucus carota, wild carrot, or bird's-neft, grows in every field. It is the fame fpecies with the carrot cultivated in gardens, and is equally nourifhing.

Heracleum sphondylium, or cow-parfnip. The inhabitants of Poland and Lithuania make a fermented liquor of the feeds and leaves, which the poorer fort ufe as ale. The inhabitants of Cambrata eat the ftalks, after peeling off the bark.

Carum carvi, or caraways, grows in meadows and paffure-grounds. The young roots of this plant are more agreeable to the tafte than the parfnip, and therefore might be of great fervice to the poor in a dearth of provisions.

Convallaria polygonatum, or sweet-smelling Solomon's-feal, grows in the cliffs of rocks. The roots are made into bread, and eat by the inhabitants of Lapland, when corn is fcarce. The Turks ufe the young ftalks as afparagus.

Bunium bulbocastanum, earth-nut, kipper-nut, pig-nut, or hawk-nut, grows plentifully on lea-grounds, the banks of rivers, fides of hills, &c. The roots are very fweet, afford excellent nourifhment, and may be eat either raw, boiled, or roasted.

Vaccinium uliginofum, the great bilberry-bush, grows upon high grounds. The berries are much eat by children; but when taken in too great quantity, are apt to occafion a giddinefs and headach.

Vaccinium myrtillus, black whorts, whortle-berries, or bilberries, grows in woods. The berries have a fine flavour, and may be eat with fafety.

Vaccinium vitis idæa, red whorts, or whortle-berries, grows on hills. The berries are eat in the autumn, and many people make an excellent jelly of them.

Polygonum viviparum, fmall bitort, or fnake-weed, grows upon high grounds. The roots may be prepared into bread. In Lapland and the northern parts of Europe, it is principally eat along with the flich of ftags and other wild animals.

Spergularia arvenfis, or corn-fpurry, grows in corn-fields, efppecially in fandy foils. In Norway, they collect the feeds of this plant, and make them into bread.

Sedum rupestre, or St Vincent's rock ftone-crop, grows on high grounds. The Swifs cultivate this plant, and ufe it as a pot-herb.

Prunus padus, wild clufter-cherry, or bird's-cherry, grows in woods and hedges. Some people eat the berries with falt.

Prunus spinofa, the black-thorn, or floe-tree, grows in hedges and woods. The berries are very auftere; but the leaves are tender, and, when gently toafted, may be ufed in place of tea.

Prunus cerasus, or black-cherry, grows likewise in woods and hedges. The berries are eat both in a crude and dried ftate. When this plant is wounded, a gum exfudes from it nearly of the fame quality with gum-arabic. Dr Hafelquift informs us, that above 100 men, when befieged in an Egyptian town, were preferved alive for more than two months, without any other fuffenance than they derived from the ufe of this gum.

Cratægus aria, or the white bean-tree, grows in woods. The berries are eat by the peafants; and in Sweden they are prepared and ufed as bread when there is a fcarcity of corn.

Cratægus oxycantha, the white thorn, or hawthorn, grows every where in woods and hedges. The berries, when dried and grinded, are fometimes made into bread; but it is apt to bind the belly too much.

Sorbus aucuparia, the quicken-tree, or mountain-afh, grows in woods. Very good cyder is made of the berries; and, when dried, they make very wholefome bread.

Rofa canina, red-flowered dog's-rose, or hip-tree, grows in hedges. The berries afford excellent nourifhment, and may either be eat in a crude ftate, or dried and made into bread.

Spiræa filipendula, or drop-wort, grows in paffure-grounds and the fides of hills. The roots of this plant, which are compofed of fmall tubercles like peafe, when dried and grinded, make tolerably good bread.

Ranunculus ficaria, pile-wort, or leffer celadine, grows in paffure-grounds, &c. The Norwegians collect the leaves in the fpring, and ufe them in broth.

Origanum vulgare, or wild marjoram, grows in hedges and among brush-wood. The leaves of this plant, when toafted, and infufed in boiling water, have fuch a refemblance to tea, that it is difficult to make a diftinction. As tea is fo univerfally ufed in diet, it is much to be regretted that the ladies cannot be prevailed upon to prefer this or fome other of our own plants, and thereby fave fome millions fterling annually to their country.

Stachys palustris, or clown's all-heal, grows in marfhes and the banks of rivers. The roots are fucculent, and may be ufed either boiled, or dried and made into bread.

Melampyrum arvenfe, or purple cow-wheat, grows in corn-fields. Bread is fometimes made of the feeds; but it is a little bitter.

Sinapis arvenfis, wild muftard, or charlock, grows plentifully in corn-fields, &c. The leaves of this plant are often ufed in broth.

Crambe maritima, or fea-colewort, grows in fandy ground near the fea-shore. The leaves, when young and tender, may be ufed in place of cabbage; but when top old, are apt to make the head giddy.

Malva rotundifolia, or dwarf-mallow, and malva fylveftris, or common mallow, are every where to be met with. The leaves of both thefe plants may be ufed in broth.

*Orobus tuberosus*, wood-pease, or heath-pease, grows in pasture-ground, woods, hedges, &c. The roots, when boiled, or made into bread, afford excellent nourishment.

*Pisum maritimum*, or sea-pease. In the year 1655, when a great famine prevailed in England, the poor people in Oxfordshire lived principally upon the seeds of this plant.

*Trifolium repens*, or white clover, grows in meadows and pasture-grounds. The flowers of this plant, when dried, make tolerably good bread.

*Trifolium pratense*, purple or honeysuckle clover. The Scotch, when oppressed with a famine, used bread made of the flowers of this plant. And indeed bread may be made of the flowers of every plant belonging to the class called *diadelphia*, which comprehends near 600 species.

*Hipocheris maculata*, or spotted hawkweed, grows on high pasture-grounds. The peasants of Norway use the leaves as cabbage.

*Sonchus oleraceus*, or common sow-thistle. The young leaves eat exceedingly well when boiled.

*Trapopodon pratense*, or yellow goat's-beard, grows in meadows and pasture-grounds. The roots, when dug up before the plant flowers, have a fine flavour, and are very nourishing.

*Aretium lappa*, or burdock. The young stalks, when the bark is taken off, eat, when boiled, like asparagus. Some people use them in a crude state, with oil and vinegar.

*Carduus palustris*, or marsh-thistle. Almost all the species of thistle may be used in the same manner as the burdock.

*Urtica dioica*, or common nettle. The use of this plant as a pot-herb is well known.

*Quercus robur*, or common oak. Acorns, during a famine, have often been made into bread.

*Fagus sylvatica*, or beech tree. Bread has sometimes been made of the nuts; but unless they be well dried, the bread made of them will produce a slight degree of intoxication.

*Corylus avellana*, or the hazel-nut tree. Every body knows the agreeable flavour and nutritive quality of hazel nuts.

*Pinus sylvestris*, or Scots fir. The Norwegians and others make bread of this tree in the following manner: They select such trunks as are most smooth and have least resin; they take off the bark, then dry it in the shade, and afterwards toast it over a fire, and grind it into meal. They generally mix with it a little oat-meal or barley. This bread, made of fir bark, is not only used in a scarcity of provisions, but is eat at all times by the poorer sort.

*Lichen islandicus*, or eryngo-leaved liver-wort, grows among heath and upon high grounds. The inhabitants of Iceland have long used this plant, both boiled, and in the form of bread.

*Lichen vellens*, or fleecy liver-wort, grows upon hills. In time of famine, the inhabitants used this plant for food.

Fungus, or mushroom. The species of this plant are very numerous. Some of them are used by the rich; rather as a seasoning, than as food. When taken in too great quantity, they are absolutely indigestible; and, unless thrown up from the stomach, will prove as fatal as the most deadly poison. The poor, therefore, who would be very apt to fall into this error, had better refrain from the use of mushrooms altogether.

From this short list of esculent plants that grow wild in our own country, we see how liberally we are provided with resources in case of a scarcity of the vegetables usually cultivated for food, and at the same time the advantages that might be derived from a very slight degree of knowledge in botany. Many of these plants grow best in soils which cannot be employed for raising corn of any kind. Besides, they are exceedingly hardy, and suffer but little from seasons, which in a great measure destroy the more delicate plants which we cultivate with so much labour and expence. It may be further remarked, that many improvements in agriculture and the useful part of gardening might be expected from propagating a taste for researches into the nature and properties of vegetables.

2. MEDICINE.—It is an unhappy circumstance, that the bulk of physicians in all ages have been more remarkable for their attachment to the abstruse and useless parts of the science, than to the nature and cure of diseases, the proper objects of their profession. Instead of disputing in folio how such a plant cures such a disease, had they exerted their industry and genius in ascertaining the fact, and then proceeded to make further inquiries into the qualities of other simples, the practice of physic would not have been a thing of such a fluctuating nature as it ever has been, and still continues to be.

Many practitioners, some of them men of considerable abilities, affect to despise the science of botany, alledging that it affords no assistance to their art; and that it is very useless to load their memories with a long catalogue of hard names, without being a whit the wiser with regard to the medical properties. Besides, they imagine every single genus and species of the whole vegetable tribes to be possessed of peculiar and distinct properties; and that it would require the labour of a whole life time to ascertain the virtues of a few plants.

It must indeed be confessed, that the writers and teachers of botany have not been sufficiently careful to prevent reflections of this kind. The technical part of the science ingrosses their chief attention: If the virtues are talked of, it is only in a cursory manner: The only thing that can render the science respectable, is either totally omitted in their systems, or dispatched in a line or two. But we are happy to find, that the science begins now to get some footing in this country. By the industry and spirit of a worthy Professor\*, the taste has been propagated

\* Dr John Hope professor of medicine and botany in the university of Edinburgh. Immediately after the Doctor's admission to the botanical chair, he offered gold and silver medals to his students for the best collections of indigenous plants

gated in a few years far beyond what could have been expected, especially when the state of the country before that period is taken into consideration.

We have no doubt of being able to shew, that botany, even in its present state, is so far from lying open to the objections brought against it by those who are either unacquainted with it, or affect to despise it as useless and trifling, that we have little reason to hope for any extensive insight into the medical virtues of plants by any other means.

In order to bring the numerous tribes of vegetables under certain classes or denominations, various methods have been adopted by different authors. Some have classed them by the figure of their roots; some by the caulis or stems; some by the leaves. Linnæus has preferred the parts of fructification, because these are not only the most essential, but likewise the most universal.

This method of classing is preferable to any that has been proposed, on many accounts. It is found by experience, that plants which are distinguished by the same characters in the flower and fruit, have precisely the same qualities, though not always in an equal degree as to strength or weakness; so that, upon inspection of the flower and fruit, a botanist can determine *à priori* the effects that will result from the plant when taken into the stomach. Here then is a foundation for natural classes. In order, therefore, to determine the medical virtues of all the plants belonging to a natural class, the physician has nothing further to do than to ascertain, by a set of clear and unquestionable experiments, the virtues of any one of them. This greatly shortens the labour of investigation. Supposing the number of known species to be 20,000, by ascertaining the virtues of one genus, at a medium, you determine the virtues of 12 species. But, by ascertaining the virtues of one genus belonging to a natural order, the virtues of perhaps 300 or 400 species are ascertained. Again, by ascertaining the virtues of one genus belonging to a natural class, you discover the virtues of perhaps 800 or 1000 species.

As this branch of the materia medica has been hitherto greatly neglected, we shall subjoin a few examples of natural orders and classes, with the virtues they are supposed to possess.

The *STELLATÆ* of Mr Ray, which make the 44th natural order of Linnæus, are said to be all diuretics. Of these, the rubia and asperula are remarkable for their diuretic and detergent qualities, and as such are admitted into both the Edinburgh and London dispensatories. The asparin, gallium, &c. possess the same qualities, though not perhaps in an equal degree.

The *ASPERIFOLIÆ* of Ray, belong to the pentandria monogynia class, with one petal and four seeds, of Linnæus, and form his 43d natural order. The plants of this order are said to be astringent and styrenary. Under it the following genera are comprehended: Tourne-

fortia, ceriathæ, symphytum, pulmonaria, borrago, cynoglossum, anchusa, lithospermum, myofotis, heliotropium, asperugo, lycopsis, echium.

The plants included under the *PENTANDRIA*, with one stylos, one flower-leaf, and which bear berries, form the 33d natural order, and are generally poisonous. To this order belong all the solana, or night-shades; the mandragora and atropa, which are well known to be poisonous; the hyocyamus and datura occasion madness and death; the verbaicum intoxicates and kills fishes.

The *UMBELLATÆ*, which make the 22d natural order, are said to be aromatic, resolvent, and carminative, especially those that grow in a dry soil; but such of them as grow in a wet soil are said to be poisonous. The virtues reside in the roots and seeds. To this order belong the daucus creticus, gentiana alba, filer montanum, ammi verum, petroselinum macedonicum, &c.

The roots of the plants belonging to the *HEXANDRIA* class, are either esculent or poisonous. These qualities may be distinguished by the taste and smell. In the 7th, 8th, 9th, and 10th natural orders, the following poisonous plants of the hexandria class are enumerated, *viz.* the leucocium, galanthus, panacratium, amaryllis, fritillaria, corona imperialis, gloriofa, convallaria, hyacinthus, aloes, &c. The allium, cepa, and parum, are acrid; and, when taken in too great a quantity, are highly corrosive; but, as this hurtful quality is owing to a volatile alkaline substance in the roots, when they are roasted or boiled it flies off, and they may be eat with safety.

The fruit of all the plants belonging to the *ICOSANDRIA* class, which are enumerated in the 36th, 37th, 38th, and 39th natural orders, are esculent, and not one of them poisonous. To this class belong the eugenia, punica, cerasus, crategus, pyrus, rosa, fragaria, &c.

The plants belonging to the *POLYANDRIA* class, or the 23d natural order, are mostly poisonous, *e.g.* the nymphaea, argemone, papaver, adæra, boconia, euphorbia, delphinium, staphisagria, aconitum, nigella, crithra, aquilegia, helleborus, &c.

The leaves of the plants belonging to the *DIDYNAMIA GYMNOSPERMIA*, or 55th natural order, are said to be cephalic and resolvent. This order contains the ajuga, teucrium, hyssopus, lavendula, mentha, lamium, betonica, ballota, leonurus, origanum, thymus, melissa, dracocephalum, &c.

The plants belonging to the *TETRADYNAMIA* class, or the 57th natural order, are antiscorbatic, and a little acrid; *e.g.* the lepidium, cochlearia, raphanus, cardamine, sinapis, erysimum barbarea, silybrium, &c.

All the plants of the *MONODELPHIA* class, which form the 32th natural order, are emollient and mucilaginous. Whoever knows the qualities of the althea and malva, knows the qualities of the whole class, which comprehends about 180 species. The emollient and mucilaginous virtues are not confined to the leaves or any par-

plants prepared in the manner of a hortus siccus. The consequence of this plan fully answered his expectations. In a few years, he was in possession of many more plants than were ever formerly supposed to grow in Scotland. After this acquisition, the Dr judiciously changed the object of his medals, and offered them for the best accounts of the sensible qualities and medical virtues of any number of native plants. But we are sorry to find, that no gentlemen have hitherto become candidates for these medals since they were offered upon this sensible and useful plan.

particular part, but are diffused through the whole plant.

The *DIADELPHIA* class forms the 55th natural order. This class comprehends above 500 species; and, as was observed above, the seeds of every one of them are esculent, the leaves afford excellent pasture for cattle, and not one of them have any poisonous quality.

The *SYNGENESIA* class, or 21st natural order, contains a very great number of species. The virtues of some plants belonging to this class are said to differ considerably. The *bardana*, *carlina*, *fusilago*, *arnica*, *cichorium*, *scorzoneria*, *taraxacum*, &c. are supposed to be deobstruent, and are kept as such in the shops. But the greatest number of them are bitter and stomachic; *e. g.* the *abanthium* *abrotanum*, *artemisia*, *fantolina*, *bellamita*, *tanacetum* *eupatorium*, *matricaria*, *chamomilla*, *acemella*, *verbescina*, &c.

The *GYNANDRIA DIANDRIA*, or 4th natural order, are said to excite venery; *e. g.* the *orchis*, *fatyrium*, *serapias*, *herminium*, *ophrys*, *epidendrum*, &c. The roots of these are used with this intention by practitioners.

The *AMENTACEÆ ACIFOLIÆ*, or 15th natural order, are resinous; *e. g.* the *pinus*, *abies*, *juniperus*, *cupressus*, &c. They are all warm stimulants and diuretics.

The virtues of the *CRYPTOGAMIA* class, which comprehends the 61st, 62d, 63d, and 64th natural orders, are mostly of a fuscipicious nature. Hardly any of the filices are esculent; their smell is disagreeable, and they are said to kill worms. All the musci, except the lichen islandicus, are improper for food. Some of the fungi are eat; but they are a very dangerous food.

Plants which have their nectaria separate from the flowers, are commonly poisonous; *e. g.* the *epimedium*, *nigella*, *aquilegia*, *aconitum*, *monotropa* *helleborus*, &c.

Those plants which are called *laetescens*, from their oozing out a whitish juice upon being wounded, are generally poisonous; *e. g.* the *euphorbia*, *papaver*, *periploca*, *cynanthum*, &c. But those which are called *semisufculosa* by Tournefort, are of a milder nature; *e. g.* *lactuca*, *hieracium*, *crepis*, *leontodon*, &c.

Besides natural classes and orders, which presuppose some acquaintance with botany, we are provided with other means of discovering the general qualities of plants. The sensations of smell and taste give us some intimation of the nature and qualities of plants. An agreeable taste or smell is seldom accompanied with noxious qualities; on the other hand, when these senses are disagreeably affected, the qualities are generally more or less noxious, being either purgative, emetic, or poisonous. Plants that have a sweet taste are generally nutritive; those that have a salt taste are warm and stimulant. Plants of an acrid taste are corrosive; but, when deprived of their acrimony by drying, some of them become fit for food. Bitter plants are alkaline, stomachic, and sometimes of a fuscipicious nature. Acid plants are cooling, and allay thirst; but those of an austere taste are astringent.

Even the colour and aspect of plants throw some light upon their nature. Flowers or fruit of a red colour are generally acid. Yellow flowers indicate a bitter taste. Plants that have green flowers are crude; those of a pale

colour are commonly insipid; those of a white colour are generally sweet; and those whose flowers have a gloomy and dismal aspect, are mostly poisonous.

These examples naturally suggest the following observations.—The Creator of the universe hath endowed us with sufficient abilities for investigating the virtues of plants, and applying them to the cure of diseases and other useful purposes, even on the supposition that we were obliged to ascertain the virtues of every single plant by experiments. But this labour, though practicable in a course of years, and under proper regulations, is greatly abridged. The information afforded by the senses is considerable. Our inquiries are still further assisted by the general distribution of vegetables into tribes and families. The mutual relation and connection of these tribes depend not upon fancy or conjecture: The relations are so strongly marked by the familiarity of their flowers, fruit, and sensible qualities, that they are conspicuous at first sight.

A person unacquainted with medicine, from this view of the virtues of plants, will be apt to imagine, that botany is the only road to that science; and of course that every physician must either be a good botanist, or a bad practitioner. The thought is natural, and, with some limitation, not unjust. The common practice of physic does not require an extensive skill in the virtues of plants. A certain number of vegetables and other substances are kept in the shops, and recommended for particular purposes in dispensaries and books of practice. It is the business of the practitioner to have a general acquaintance with these, and to prescribe them according to the custom of the times. But investigations into the nature and properties of simples or drugs, require more time than can be bestowed by men of business. Whenever any science is converted into a trade, and the study of it confined to people who must live by it, there is little prospect of improvement. This has been the fate of physic. Every body dispenses medicines; but few are none inquire into their virtues. Some valuable medicines have been discovered. But by whom? Not by physicians; but by savages, old women, priests, and chymists. Until, therefore, the study of physic be considered as a branch of natural history, and cultivated by people who have time to make experiments, the science must continue to be vague, desultory, and limited in its utility.

Botany has always been considered as a branch of natural history. But, as was formerly observed, the useful part of it hath been too much neglected. The virtues of plants may be successfully investigated without an extensive knowledge in all the branches of the medical art. To propagate a taste for inquiries into the nature and properties of vegetables, would therefore lay the most solid foundation for improvements in medicine.

3. ARTS.—The application of the qualities of vegetables to the various mechanical arts affords a most extensive field for useful observation. There are few plants, however different in their nature, but are found by experience to be not only the most proper, but essentially necessary, in some particular art or employment.

The qualities which render vegetables so generally applicable to mechanical employments are principally these: Softness

Pl. Jaff.

Softness or hardness of texture, elasticity, inflammability, astringency, colour, &c. Hence some plants are proper for domestic utensils, others for dying, tanning, &c. Some may be apt to think that qualities of this kind are not the proper objects of botany. But if the natural historian be at liberty to neglect useful qualities, he deserves little thanks for expatiating on those that are useless. It would be foreign to our design in this place, to enumerate the particular plants that are used for the various purposes of the mechanic. We shall however, by way of specimen, subjoin a list of plants that change the colour of cloths and other substances.

## LIST of DYING PLANTS.

## Y E L L O W.

*Curcuma*, or turmeric. This plant grows in the East Indies; the root of it tinges a rich yellow colour; but it is not very durable.

*Rumex maritimus*, or golden dock, grows on roadsides, &c. The root dyes a fine yellow.

*Thalictrum flavum*, or meadow-rue, grows in marshes, on the banks of rivers, &c. Both the root and the leaves dye a very deep yellow.

*Urtica dioica*, or common nettle. The country people dye eggs a beautiful yellow with the roots of this plant at the feast of Easter.

*Santalum album*, or white sanders. The wood of this tree, which is a native of the East Indies, dyes a good yellow.

*Lawsonia inermis*, or alkanna, is a small shrub cultivated in Asia and Africa. The stem and branches of this plant afford an excellent yellow; the natives paint their bodies with it. The root, prepared with quick-lime, gives a fine shining red. The natives use it for dying their teeth, nails, faces, the mains of their horses, leather, &c.

*Morus tinctoria*, or fustic, grows in America. The wood of this tree is in great esteem among dyers for the fine yellow it affords.

*Rhamnus frangula*, or the black berry-bearing alder, grows in woods and hedges. The bark tinges a dull yellow; and the unripe berries dye woollen stuffs green.

*Rhamnus catharticus*, or purging buck-thorn, grows wild in woods and hedges. The bark gives a beautiful yellow.

*Rhamnus minor*, grows in the southern parts of Europe. The berries give an excellent yellow.

*Rhus Coriaria*, or fennel, grows in Italy, &c. The bark of the stem gives a yellow colour, and the bark of the root a yellowish red.

*Berberis vulgaris*, barberry or pepperidge-bush. The root of this plant gives an excellent yellow to cloth; and the bark gives leather a beautiful yellow colour.

*Prunus domestica*, or common plumb-tree. The country people use the bark for dying their cloth yellow.

*Pyrus malus*, or apple-tree. The dyers use the bark for giving cloth a yellow colour.

*Carpinus betulus*, the horn or hard beam tree, horse or horn-beach tree, grows in woods. The bark is used as a yellow dye.

*Reseda luteola*, or bafe-rocket, grows in pasture grounds, meadows, and especially on a chalky soil. This herb, which is a native of Scotland, gives cloth a most beautiful yellow colour, and is much used by dyers, who import it in large quantities, though it might be easily cultivated in our own country.

*Serratula tinctoria*, or saw-wort, grows in woods and meadows. This plant gives the same colour with the *reseda*, and, though not so beautiful, is much used by dyers.

*Hierachium umbellatum*, or narrow-leaved bushy hawkweed, grows in woods, hedges, and gravelly soils. This plant gives a very fine yellow.

*Acanthus mollis*, is a native of Italy. It appears that this plant was used by the ancients for dying yellow.

*Et circumtextum croceo velamen acantho.* VIRG.

*Bidens tripartita*, or trifid water hemp-agrimony, grows in marshy places. This plant gives a pretty elegant yellow.

*Xanthium strumarium*, or lesser burdock, grows near dunghills. When this plant is boiled entire, together with the fruit, it gives a pretty good yellow.

*Salix pentandra*, or sweet willow. The dried leaves give a fine yellow.

*Betula alba*, or birch-tree. The leaves give a faint yellow colour to cloth.

*Stachys silvatica*, or hedge-nettle, grows in woods and hedges, and gives a yellow colour to cloth.

*Centaura jacea*, or common knapweed, grows in pasture and barren grounds. This plant is often used as a succedaneum for the *ferratula* or saw-wort.

*Polygonum perfoliatum*, dead or spotted arismatt, grows in corn-fields, &c. and dyes cloth yellow.

*Lyfimacha vulgaris*, yellow willow-herb, or loose-strife; grows in marshes, and on the banks of rivers. This herb said to dye yellow.

*Scabiola fucifca*, or devil's-bit, grows in meadows and pasture-grounds. The dried leaves give a yellow colour; but it is seldom used.

*Anthyllus vulneraria*, kidney-vetch, or ladies-finger, grows on dry pasture-grounds. The country people use this plant for dying their cloth yellow.

*Lichen juniperus*, or juniper-liverwort, grows on the trunks and branches of trees. *Lichen parietinus*, or common liver-wort, grows on walls and the bark of trees. *Lichen candelarius*, or yellow liverwort. These three species of liverwort are used by the common people for dying their stuffs yellow.

*Anthemis tinctoria*, or common ox-eye, grows on high grounds. The flowers give a bright yellow colour.

*Cherophyllum sylvestre*, wild cicely, or cow-weed, grows in hedges, &c. The umbel or tops and flowers of this plant give an excellent yellow.

*Thapsia villosa*, or deadly carrot, grows in Spain; and its umbel is used as a yellow dye by the inhabitants of that country.

*Geniſta tinctoria*, green wood, dyers-weed or wood-waxen, grows in pasture-grounds, &c. The flowers are much used as a yellow dye.

*Hypericum perforatum*, or St. John's wort, grows among brush-wood and in hedges. The flowers are used as a yellow dye, but it is not much esteemed.

*Calendula officinalis*, or garden marygold. The dried flower-leaves are sometimes used as a yellow dye: Their expressed juice, boiled with alum, makes an excellent yellow paint.

## R E D.

*Rubia tinctorum*, or madder, grows in the southern parts of Europe. The roots are much used by dyers for giving a red colour to cloth.

*Gallium boreale*, or crosswort madder; *gallium verum*, yellow ladies bed-straw, or cheese-vening. Both these plants grow plentifully in our own country; and their roots are used for dying cloth red.

*Lithospermum tinctorium*, grows in France. The root gives a red colour, but it is not easily fixed.

*Rumex acetosa*, or common sorrel, grows in meadows and pasture-grounds. The root is used by apothecaries for tinging decoctions, &c. with a red colour; but it is not used by dyers.

*Cæsalpina Brasiliensis*, or Brazil wood, is a native of the East Indies. The wood is commonly used by the dyers for giving a red colour.

*Calamus rotang*, or dragon's blood, is an East-India fruit. The inspissated juice is principally used by apothecaries for giving a red tinge to their medicines.

*Bixa orellana*, grows in both the Indies. The seeds of this tree are much used as a red dye, and the natives of America paint their bodies with them.

## P U R P L E.

*Cæsalpina vesicaria*. The wood of this tree gives a purple dye. The *cæsalpina sappan* is used for the same purpose. The *ligoum rubrum*, or Fernambuca wood, gives likewise a reddish purple dye.

*Origanum vulgare*, or wild marjoram, grows in woods, &c. The tops of this plant are used for dying cloth purple.

*Carthamus tinctorius*, is an annual plant, and a native of Egypt. The corolla of this plant give a fiery red colour to cloth; but they are principally used for dying silks.

## B L U E.

*Indigo tinctoria*, or woad. This plant grows wild in corn-fields, and gives a blue colour to cloth.

*Indigofera tinctoria*, or indigo, grows in the East Indies. The blue dye given to cloth by this plant is preferable to any other; because it is of so fixed and durable a nature, that it is not affected either by acid or alkaline substances.

*Galega tinctoria*, is a perennial plant of Zeylon. Hermannus affirms, that the blue obtained from this plant is even preferable to the indigo, although it has never hitherto been used by Europeans.

*Fraxinus excelsior*, or common ash-tree. The bark tinges water blue; and the inner bark is said to give cloth a very good blue colour.

## V I O L E T.

*Hæmatoxylon campechianum*, or logwood, grows in the West Indies, and gives cloth a violet colour. It is, however, chiefly used as a basis for some other colours.

*Empetrum nigrum*, black-berried heath, crow or crane-berries, grows on high grounds. The berries, boiled with alum, are used as a purple dye.

## G R E E N.

*Senecio jacobæa*, or common raywort, grows in pasture-grounds, &c. The whole plant is used, before it begins to flower, for dying cloths green.

*Chærophyllum sylvestre*, or wild cicely. This plant, when the tops are taken off, dyes cloth a beautiful green.

*Iris germanica*, grows in the southern parts of Europe. The expressed juice of the corolla gives a green dye.

## B L A C K.

*Lycopus europæus*, or water horehound, grows in marshy places. The juice of this plant gives a black dye of such a fixed nature, that it cannot be washed out.

*Asæa spicata*, herb-christopher, or barberries, grows among brushwood. The juice of the berries, when boiled with alum, affords a fine black ink.

*Genipa americana*, is an American tree. The unripe berries tinge cloths with a deep black. The natives dye their mouth with these berries, to give them a terrible aspect to the enemy. It remains fixed for many days.

*Quercus*, or oak-tree. The capsule of the oak, on account of their great slipticity, are used for fixing and improving the mineral black. They are used both by dyers and curriers.

THIS short sketch of the utility of botany with regard to Food, Medicine, and the Arts, will be sufficient to suggest the many advantages that may be expected from the cultivation of it. The objects presented by the science are curious, respectable, and useful. The natural history of plants is not even confined to the above important articles. It is strictly connected with agriculture and gardening. The structure of vegetables, the soils that naturally produce particular kinds, things that promote or retard their growth, are essential parts of their natural history. Hence a school of botany, especially when sufficient attention is paid to the useful part of the science, merits the highest encouragement from the public, and ought to be attended by farmers, landed gentlemen, gardeners, &c. as well as by physicians and philosphers.

S E C T. II. *Of the METHOD of reducing PLANTS to CLASSES, ORDERS, GENERA, and SPECIES; and of investigating their GENERIC and SPECIFIC NAMES by certain MARKS or CHARACTERS.*

WE observed in the former section, that in the progress of this part of botany many different methods had been followed by different authors. Cæsalpinus, Ray, Bauhinus, Van Royan, Ricinus, Tournefort, Linnæus, Sauvages, have each adopted a peculiar method of characterizing and classing plants. It would be foolish to distract the attention of the reader by an explanation of all these methods. We shall therefore proceed to explain that of Linnæus, which is perhaps the only one now taught in Europe.

This method of reducing plants to classes, genera, and species, is founded upon the supposition that vegetables propagate their species in a manner similar to that of animals. Linnæus endeavours to support this hypothesis

by the many analogies that subsist between plants and animals, which shall be more particularly pointed out in the third section. It is from this circumstance that Linnæus's system of botany has got the name of the *sexual system*. The names of his classes, orders, &c. are all derived from this theory. He calls the stamina of flowers the *males*, or the male parts of generation; and the pistils *females*, or the female parts of generation. Plants whose flowers contain both male and female parts, are said to be *hermaphrodites*, &c. His classes, orders, and genera, are all derived from the number, situation, proportion, and other circumstances attending these parts, as will appear from the following scheme.

S C H E M E of the SEXUAL SYSTEM.

See Plate LIII.

Either publicly, *i. e.* have visible flowers.

*Monoclinia*, males and females in the same bed:—*i. e.* The flowers are all hermaphrodite, having stamina and pistils in the same flower.

*Diffinitas*, the males or stamina unconnected with each other.

*Indifferentissimus*, the males or stamina having no determinate proportion betwixt each other as to length.

1. MONANDRIA, *i. e.* one male or stamen in a hermaphrodite flower.
2. DIANDRIA, — two males or stamina.
3. TRIANDRIA, — three males.
4. TETRANDRIA, — four males.
5. PENTANDRIA, — five males.
6. HEXANDRIA, — six males.
7. HEPTANDRIA, — seven males.
8. OCTANDRIA, — eight males.
9. ENNEANDRIA, — nine males.
10. DECANDRIA, — ten males.
11. DODECANDRIA, — eleven males.
12. ICOSANDRIA, — twenty, or more males inserted into the calix, and not into the receptacle.

13. POLYANDRIA, — all above twenty males inserted into the receptacle.

*Subordinatio*, two of the males or stamina uniformly shorter than the rest.

14. DIDYNAMIA, — four males, two of them uniformly shorter than the other two.

15. TETRADYNAMIA, — six males, two of which are uniformly shorter than the rest.

*Affinitas*, the males or stamina either connected to each other, or to the pistillum.

16. MONDELPHIA, the males or stamina united into one body by the filaments.

17. DIADELPHIA, the stamina united into two bodies or bundles by the filaments.

18. POLYADELPHIA, the stamina united into three or more bundles by the filaments.

19. SYNGENESIA, the stamina united in a cylindrical form by the antheræ.

20. GYNANDRIA, the stamina inserted into the pistillum.

*Diclinia*, males and females in separate beds; *i. e.* plants that have male and female flowers in the same species.

21. MONOCIA, male and female flowers in the same plant.

22. DIOECIA, male flowers in one plant, and females in another, of the same species.

23. POLYGAMIA, male, female, and hermaphrodite flowers in the same species.

Or clandestinely, *i. e.* whose parts of fructification are invisible.

24. CRYPTOGAMIA, the flowers invisible, so that they cannot be ranked according to the parts of fructification.

These

These twenty-four classes comprehend every known genus and species. It is an easy matter to class a plant belonging to any of the first eleven classes, as they all depend on the number of stamina or male parts, without regard to any other circumstance. The 12th class requires more attention. When the stamina amount to above 20, a tyro will be apt to imagine that the plant belongs to the polyandria class. In reducing plants of this kind to their classes, particular regard must be had to the insertion of the stamina. If they are inserted into the calix or cup, the plant belongs to the icofandria class; if to the receptacle or basis of the flower, it belongs to the polyandria.

The 14th class is likewise in danger of being confounded with the 4th. In the 4th, the number of stamina is the same with that of the 14th. But, in the 14th, two of the stamina are uniformly much shorter than the other two; at the same time each particular stamen belonging to the different pairs stands directly opposite to one another.

The 15th class may be mistaken for the sixth, as they consist of the same number of stamina. But in the 15th, four of the stamina are uniformly longer than the other two; and these two are always opposite to each other.

## O R D E R S.

In the first thirteen classes, the orders, which are inferior divisions, and lead us a step nearer the genus, are taken from the pistils or female parts, in the same manner as the classes from the stamina: Monogynia, digynia, trigynia, tetragynia, &c. *i. e.* one, two, three, four, &c. female parts: When the pistils or female parts have no stalk or filament like the stamina, they are numbered by the stigmata or tops of the pistils, which in that case adhere to the capsule in the form of small protuberances, as may be observed in the flowers of the poppy, &c.

The orders of the 14th class are derived from a different source. The plants belonging to it have their seeds either inclosed in a capsule, or altogether uncovered. Hence they naturally admit of a division into the following orders, *viz.* *gymnospermia*, comprehending such as have naked seeds; and *angiospermia*, which comprehends such as have their seeds covered, or inclosed in a capsule.

The 15th class is divided into two orders, *viz.* the *siliucosa*, or those which have a short siliqua or pod; and the *siliquosa*, or those which have a longer siliqua.

The orders of the 16th, 17th, 18th, and 20th classes, are taken from the number of stamina, *e. g.* monodelphia pentandria, decandria, polyandria, &c.

The SYNGENESIA, or 19th class, consists of plants whose flowers are compounded of a great number of small flowers or floscules inclosed in one common calix. The orders of this class are,

*Polygamia aequalis*, or such whose floscules are all furnished with stamina and pistils.

*Polygamia spuria*, comprehends those which have hermaphrodite floscules in the disk, and female floscules in the margin. This circumstance is made the foundation of the three following orders. 1. *Polygamia superflua*, includes all those whose hermaphrodite flowers in the

disk are furnished with stigmata, and bear seed; and whose female flowers in the radius likewise produce seeds. 2. *Polygamia frustranea*, include such as have hermaphrodite seed-bearing floscules in the disk; but whose floscules in the radius, having no stigmata, are barren. 3. *Polygamia necessaria*, is the reverse of the former: The hermaphrodite flowers in the disk want stigmata, and are barren; but the female floscules in the radius are furnished with stigmata, and produce seeds.

*Polygamia segregata*, many floscules inclosed in one common calix, and each of the floscules likewise furnished with a perianthium proper to itself.

*Monogamia*, this order consists only of seven genera, *viz.* the strumphia, seriphium, corymbium, jafone, lobelia, viola, and impatiens; none of which have properly compound flowers, but are ranked under this class purely from the circumstance of having their stamina united by the antheræ.

The orders of the 21st class are partly taken from the number of stamina, and partly from the names and characters peculiar to some of the other classes, *e. g.* monœcia triandria, monœcia syngenesia, monœcia gynandria. The orders of the 23d are all taken from claffical characters, *e. g.* polygamia monœcia, polygamia œcicia, and polygamia triœcia.

The 24th, or CRYPTOGAMIA class, is divided into the four following orders: 1. *Filices*, comprehending all plants that bear their seed in the back or edges of the leaf, and those that are called *capillary plants*. 2. *Musci*, which comprehends all the moss kind. 3. *Alge*, including the lichens, fuci, and many others whose parts of fructification are either altogether invisible or exceedingly obscure. 4. *Fungi*, comprehending all the mushroom tribe.

Having thus explained the method of reducing plants to their classes and orders, we shall proceed to inform the young botanist how to investigate the genus. This depends upon minuter distinctions, and requires more attention. But it is impossible to investigate the genera, without being previously acquainted with a considerable number of terms. All the terms necessary for this purpose belong to the parts of fructification. To attempt to give an idea by words of the parts to which particular terms are applied, would not only be difficult, but, in a great measure, useless, especially to such as are totally ignorant of botany. We shall therefore give a list of the terms themselves, with proper references to the figures of the things signified by them, which will both be shorter, and more intelligible than the most accurate description that language is capable of.

*List of Terms belonging to the Flowers and Parts of Fructification. See Plate LIV.*

FIG. 1. *Spatha*, a species of calix opening longitudinally when the flower breaks through it.  
2. *Spadix*, a species of receptacle peculiar to palm-trees, which consists of fruit-bearing branches included in a spatha.

Fig.

3. a, *Gluma*, another species of calix, belonging chiefly to grasses and corns, and consists of different valves; b, *arista*, or awn.
4. a, *Umbella universalis*, comprehends the whole flowers, &c. arising from a common centre, and resembling a large fan. b, *Umbella partialis*, or a smaller parcel of the flowers, &c. resembling a small fan. c c, *Involucrum universale*, a species of calix in which the whole flowers were inclosed before their blowing. d d, *Involucrum partiale*, a lesser calix, which includes a smaller bundle of flowers, and which, before their blowing, is inclosed in the involucre universale. Examples of these are found in the hemlock, carrot, &c.
5. c, *Calyptra*; b, *operculum*; a, *capitulum*. These terms are peculiar to mosses.
6. *Amentum*, a species of calix, e. g. in the willow, birch-tree, &c.
7. *Strobilus*, a pericarpium or capsule composed of an amentum, an example of which occurs in the magnolia.
8. *Fungi*. a, *Pileus*; b, *volva*; c, *stipes*. These two are mostly applied to the parts of mushrooms.
9. a, *Receptaculum commune nudum*, the common receptacle, or base of the flower, when the stamina, pistil, capsule, &c. are taken off.
10. *Receptaculum commune paleis imbricatum*, or common receptacle imbricated or tiled with paleæ, or membranaceous lamellæ.
11. *Corollæ monopetalæ*. a, *Tube*; b, *limbus*; i. e. a, the tube; b, the edge or margin of a monopetalous corolla. The corolla signifies the flower-leaf, when it consists but of one, and the whole flower-leaves, when it consists of more.
12. Is a flower laid in a proper position for shewing its different parts. a, *Germen*, which includes the seeds and capsule in which they are inclosed; b, *stylus*, which is a continuation of the germen; c, *stigma*, or top of the stylus; d d d d d, *filamenta*, or threads; e e e e e, *antheræ*. The filamenta and antheræ, considered as a whole, are called *stamina*; and the germen, stylus, and stigma, as a whole, are called *pistillum*. f f f f f, *Petalæ*, or flower-leaves.
13. a, *The unguis*, or claws; b, *the laminae*, or plates of a polypetalous corolla, or corolla consisting of several flower-leaves.
14. a, *Nectarium campanulatum in narcissæ*, or bell-shaped nectarium of the narcissus. Nectarium is applied to every glandular part of a flower which secretes a sweet juice. Their structure is very different in different plants.
15. *Nectarium cornuta in aconitæ*, horned nectarium of the monkhood.
16. *Horned nectarium in the calix of the tropeolus*.
17. a a a, *Nectarium in parnassia*, the nectarium of the parnassia grass are six in number, each of which have thirteen stili, with round buttons on their tops.
18. a, *Perianthium*, that species of calix which is contiguous to the fructification; b, *germen*; c, *stylus*; d, *stigma*; e e, *filamenta*; f f, *antheræ debicentes*, or antheræ shedding the pollen or dust; g, *antheræ*

Fig.

- integra*, i. e. the appearance of the anthera before it sheds the pollen.
19. a, *The filament*, and b, *the anthera*, separated from the flower.
  20. a, One grain of the pollen magnified by a microscope; b, *halitus elasticus*, i. e. an elastic aura supposed to be necessary for impregnating the seeds.
  21. a, *Germen*; b, *stylus*; c c, *stigma*.
  22. *Folliculus*, i. e. a pericarpium consisting only of one valve, opening longitudinally, and in which the seeds do not adhere to the future, but are inclosed in a particular receptacle a.
  23. *Legumen*, is a double-valved pericarpium, having the seeds fixed on'y to one of the sutures a a.
  24. *Siliqua*, is a double-valved pericarpium with the seeds fixed to both sutures or margins a b.
  25. *Pomum*, a pericarpium without any valve, but made up of a pulpy substance, and containing a capsule in which the seeds are inclosed, as in the apple, &c. a, *The pericarpium*; b, *the capsule*, or seed case.
  26. a, *Drupa*, or a pericarpium containing a nut or stone, and having no valve, e. g. plumbs, &c. b, *the nucleus*, or stone.
  27. *Bacca*, or berry, is a pericarpium containing naked seeds dispersed through the pulpy part.
  28. *Capfula apice debicentis*, a capsule opening at the top to allow the seeds to fall out.
  29. Four capsules included in a common pericarpium. a a, *The valves*; b b, *the dissepimentum*, or partition which separates the different seed-capsules from one another; c, *columnella*, or central column by which the capsules are connected.
  30. A capsule cut open longitudinally, to show the receptacle of the seeds.
  31. *Pappus*, a kind of corona or crown which is either hairy or penniform, and connected to the seeds of some plants, by means of which they are blown about by the wind. a, *Pappus pilosus*, or pappus resembling a hair; b, *pappus plumosus*, or feathered pappus; c, *semen*; d, *stipes*. The dandelion, and many plants of the syngenesia class, afford examples of these parts.

Terms belonging to the Pedunculus or Foot-stalks of Flowers.

32. *Corymbus*, i. e. flowers upon alternate pedunculi and foot-stalks, elevated proportionally above each other.
33. *Racemus*, a pedunculus or foot-stalk furnished with lateral branches.
34. *Spica*, alternate sessile flowers [i. e. flowers without any particular foot-stalk, but inserted directly into one common to the whole], upon a common foot-stalk, as in the scirpus.
35. *Verticillus*. This term is applied to such plants as have clusters of flowers at different distances surrounding the caulis or stem; as in several species of mint.
36. *Panicula*, i. e. flowers placed sparsely upon separate foot-stalks, as in oats, &c.

When these terms are understood, the genus may be easily investigated. But in order still further to assist the young botanist, we shall give a systematic description of a few common plants belonging to different classes.

## DIANDRIA MONOGYNIA.

## VERONICA, OF SPEEDWELL.

The **CALIX** is a perianthium (18), divided into four parts or segments, and persistent (i. e. does not fall off till the seeds are ripe); the segments are sharp and lance-shaped.

The **COROLLA** (11) consists of one rotated petal; The *tubus* (11) is about the same length with the calix; the *limbus* (11) is plane, and divided in four oval segments, the lowest of which is narrower than the rest, and the one immediately opposite broader.

The **STAMINA** (12) are two, narrower below, and inclined upwards; the antheræ (12) are oblong.

The **PISTILLUM** (12) has a compressed germen (12), a filiform or thread-like stylus (12), about the same length with the stamina, and a little declined to one side: The stigma (12) is simple.

The **PERICARPIUM** (12) is a heart-shaped capsule, compressed at the top, and having two cells or partitions, and four valves.

The **SEEDS** are roundish and numerous.

## ICOSANDRIA POLYGAMIA.

## FRAGARIA, OF STRAWBERRY.

The **CALIX** is a perianthium, consisting of one plain leaf, divided into ten segments, each alternately narrower.

The **COROLLA** has five roundish open petals inserted into the calix.

The **STAMINA** are twenty in number, subulated or tapering, shorter than the corolla, and inserted into the calix. The antheræ are lunulated, or shaped like a crescent.

The **PISTILLUM** consists of many small germina, collected into a little head or knob. The styli are simple, and inserted into the sides of their respective germina. The stigmata are simple.

The **PERICARPIUM** is wanting in this plant. But the common receptacle of the seeds, which supplies the place of a pericarpium, is a roundish oval berry, plain at the base, pretty large, soft, pulpy, coloured, and deciduous, i. e. falls off before the seeds be ripe.

The **SEEDS** are small, pointed, very numerous, and dispersed through the superficial part of the receptacle.

## DIDYNAMIA ANGIOSPERMIA.

## DIGITALIS, OF FOX-GLOVE.

The **CALIX** is a perianthium, divided into four deep cut segments, which are roundish, sharp at the top, persistent, and the highest one is narrower than the rest.

The **COROLLA** consists of one bell-shaped petal; the *tubus* is large, open, ventricose or bellied at the back-side; the base is cylindrical and narrow: The *limbus* is small, and divided into four segments; the superior segment is more open and more emarginated than the rest,

The **STAMINA** are four, subulated (44), inserted into the base of the corolla, and inclined to the same side; two of them are longer than the other two: The antheræ are divided into two parts, and pointed at the top.

The **PISTILLUM** consists of a germen sharp at the top, a simple stylus situate like the stamina, and an acute stigma.

The **PERICARPIUM** has an oval capsule, of the same length with the calix, sharp at the top, having two cells, and two valves which burst open at both sides.

The **SEEDS** are many and small.

## TETRADYNAMIA SILIQUOSA.

## SINAPIS, OF MUSTARD.

The **CALIX** is a perianthium consisting of four open or spreading leaves; the leaves are linear (43), concave, furrowed, disposed in the form of a cross, and deciduous.

The **COROLLA** consists of four cruciform petals: The petals are roundish, plain, open, entire or not emarginated, with erect linear ungues (13) scarcely so long as the calix.

The **NECTARIA** (14, &c.), or *glandula nectarifera*, are four, of an oval figure, one of which is situate on each side betwixt the short stamina and stylus, and likewise one on each side between the long stamina and the calix.

The **STAMINA** have six subulated, erect filaments, two of which are of the same length with the calix, and always opposite to each other, and the other four are uniformly longer: The *antheræ* are erect, and sharp at the top.

The **PISTILLUM** has a cylindrical germen; the stylus is of the same length with the germen, and the same height with the stamina; the stigma is entire, with a little knob or button.

The **PERICARPIUM** is an oblong, scabrous, double-celled, two-valved pod, gibbous, and full of little protuberances on the under parts: The *dissipimentum* (29) is large, compressed, and often twice the length of the valves.

The **SEEDS** are many and round.

## MONODELPHIA POLYANDRIA.

## MALVA, OF COMMON MALLOW.

The **CALIX** is a double perianthium: The exterior one consists of three lanceolated, loose, persistent leaves; the interior has but one large, broad, persistent leaf, divided into five segments.

The **COROLLA** has five plain leaves, united at the base, heart-shaped, and premoise (54).

The **STAMINA** consist of numerous filaments, united into a cylindrical form below, loose above, and inserted into the corolla: The antheræ are kidney-shaped.

The **PISTILLUM** has an orbicular germen, a cylindrical, short stylus, and many bristly stigmata of an equal length with the stylus.

The **PERICARPIUM** consists of several distinct capsules joined by an articulation, resembling a depressed globe,

and

and opening from within when ripe: The receptaculum is a kind of column binding the capsules together.

The SEEDS are solitary, and kidney-shaped.

## SYNGENESIA POLYGAMIA AEQUALIS.

### LEONTODON, or DANDELION.

The common CALIX is oblong, and imbricated: The interior scales are linear, parallel, equal, and open at the top; the exterior scales are fewer in number, and frequently reflected at the base.

The compound COROLLA is uniform and imbricated.

The small hermaphrodite corollae are very numerous and equal.

The corolla proper to each floccule consists of one ligulated (*i. e.* plain and expanded outwards), linear, truncated (*i. e.* terminated by a transverse line), and five-toothed petal.

The STAMINA consist of five very small capillary filaments: The antheræ are connected together, and form a cylindrical tube.

The GERMEN of the pistillum is situate below the proper corolla. The stylus is filiforme, and nearly of the same length with the corolla: The stigmata are two, and turned back in a spiral form.

This plant has no pericarpium.

The SEEDS are solitary, oblong, rough, and terminated by a long pappous stip (31).

The receptacle, or common base of the floccules (9), is naked, and full of small hollow points.

## GYNANDRIA PENTANDRIA.

### PASSIFLORA, or PASSION-FLOWER.

The CALIX is a perianthium consisting of five plain, coloured leaves, similar to those of the corolla.

The COROLLA consists of five plain obtuse semi-lanceolated leaves, of the same magnitude and figure with those of the calix.

The nectarium is a triple corona, the exterior of which is longest, furrounding the stylus within the petals, and flattened above.

The STAMINA are five, subulated, open, and connected to the stylus at the base of the germen: The antheræ are oblong, obtuse, and incumbent.

The PISTILLUM consists of an erect cylindrical stylus, upon the top of which an oval germen is placed: The styli are three, thicker, and wider above: The stigmata are roundish knobs.

The PERICARPIUM is a fleshy, suboval, one-celled berry, resting upon the stylus.

The SEEDS are numerous, oval, and each of them inclosed in a small membrane.

## MONOECIA TETRANDRIA.

### URTICA, or COMMON NETTLE.

The CALIX of the male flowers is a four-leaved perianthium; the leaves are roundish, concave, and obtuse.

The COROLLA has no petals; but there is a small urceolated (*i. e.* an inflated skin, gibbous on each side) nectarium in the centre of the flower.

The STAMINA consists of four subulated open filaments, of an equal length with the calix, and one of them is placed between each leaf of the calix: The antheræ have no cells.

The CALIX of the female flowers is a double-valved, oval, concave, erect, persistent perianthium.

The COROLLA is wanting.

The PISTILLUM has an oval germen, no stylus, and a downy stigma.

They have no pericarpium.

The SEED is single, oval, shining, and a little compressed.

These examples will not only illustrate most of the generic terms, but will likewise fix them in the mind more successfully than any formal explanation. A careful perusal of them will enable any person to understand the descriptions in the *Genera Plantarum* of Linnæus, although he should not be much acquainted with the Latin language.

But the young botanist, after advancing this far, must still be conducted a step further. Though he may be able to reduce plants to their classes, orders, and genera, he is hitherto totally ignorant of the specific characters. Before he be able to investigate the species, he must again submit to learn a considerable number of terms necessary for that purpose.

### List of Terms necessary for investigating the Species of Plants.

#### SIMPLE LEAVES.

Fig.

37. *Orbiculatum*, globular.
38. *Subrotundum*, roundish.
39. *Ovatum*, shaped like an egg.
40. *Ovals*, oval or elliptical.
41. *Oblongum*, oblong.
42. *Lanceolatum*, in the form of a dart, or tapering on each side to a point.
43. *Lineare*, like a line, or of the same breadth and thickness throughout.
44. *Subulatum*, tapering to a point, like an awl.
45. *Reniforme*, shaped like a kidney.
46. *Cordatum*, like a heart.
47. *Lunulatum*, resembling a crescent or half-moon.
48. *Triangulare*, three-cornered.
49. *Sagittatum*, like an arrow.
50. *Cordato-sagittatum*, resembling both a heart and an arrow.
51. *Hastatum*, like a spear or lance.
52. *Fissum*, cut in at the top.
53. *Tribolium*, consisting of three (55) lobes.
54. *Premorsum*, *i. e.* as if a piece were bit out of the fore-part of the leaf.
55. *Lobatum*, consisting of lobes, or segments cut to the middle of the leaf, and convex at the edges.
56. *Quinangulare*, consisting of five angles.

57. *Erosum*,

Fig.

57. *Erosum*, as if eroded or eat irregularly by some corrosive substance.
58. *Palmatum*, resembling a hand.
59. *Pinnatum*, divided into pieces resembling fins.
60. *Laciniatum*, with many cuts or indentures in the margin.
61. *Sinuatim*, having wide sinuses or hollows in the margin.
62. *Dentato-sinuatum*, having sinuses and divisions resembling teeth.
63. *Retrorsum sinuatum*, hollowed and bent backwards.
64. *Partitum*, when the divisions or segments reach near the base of the leaf.
65. *Repandum*, a waving but undivided margin.
66. *Dentatum*, toothed, *i. e.* when the tops of the segments are remote from each other.
67. *Serratum*, when the segments uniformly incline to the extremity.
68. *Duplicate-ferratum*, doubly serrated, *i. e.* when the lesser segments incline to the extremities of the larger ones.
69. *Duplicate-crenatum*, doubly crenated, (74)
70. *Cartilagineum*, when the margin of the leaf has a cartilaginous or gristly texture.
71. *Acute-crenatum*, sharp segments having no determinate inclination to either extremity.
72. *Obtuse-crenatum*, the same with the above, only the segments are blunt.
73. *Plicatum*, plaited, or consisting of regular folds.
74. *Crenatum*, segments having no inclination to either extremity.
75. *Crispum*, when the margin is larger than the disc, and formed into a kind of waves.
76. *Obtusum*, blunt at the top.
77. *Acutum*, sharp, or pointed.
78. *Acuminatum*, when the leaf tapers to a sharp point at the top.
79. *Obtusum acumine*, having a short subulated point.
80. *Emarginatum acute*, having sharp divisions at the top of the leaf.
81. *Unciforme marginatum*, having wedge-shaped divisions at the top.
82. *Retusum*, having blunt sinuses.
83. *Pilosum*, covered with long distinct hairs.
84. *Tomentosum*, interwoven with soft hairs, and often of a white colour.
85. *Hispidum*, having brittle rough bristles diffusely scattered upon the disc of the leaf.
86. *Ciliatum*, having parallel bristles round the margin.
87. *Rugosum*, full of rugæ or wrinkles.
88. *Venosum*, having veins or nerves consisting of many ramifications.
89. *Nervosum*, when the veins or nerves are extended from the base to the top without any branches.
90. *Papillosum*, covered with vesicles, bladders, or hollow points.
91. *Linguiforme*, like a tongue, *i. e.* fleshy, linear, obtuse, convex below, and having frequently a cartilaginous margin.
92. *Acinaciforme*, resembling a kernel;—compressed,

Fig.

- fleshy, having one edge narrow and convex, and the other thicker and more straight.
93. *Dolabriforme*, resembling an ax;—compressed, roundish, gibbous on the outside, with a sharp edge, which is a little blunter below.
94. *Deltoides*, an irregular rhomboidal figure. See the leaf of the black poplar.
95. *Triquetrum*, having three plain sides.
96. *Canaliculatum*, having a deep longitudinal furrow.
97. *Sulcatum*, having several deep furrows.
98. *Teres*, cylindrical, or like a cylinder.
99. *Binatum*, when a simple petiolus has two leaves connected to its apex.
100. *Ternatum foliis sessilibus*, three sessile leaves (*i. e.* having no petioli) connected to one common petiolus.
101. *Ternatum foliolis petiolatis*, three leaves upon a common petiolus, each having at the same time a separate petiolus.
102. *Digitatum*, or resembling fingers, *i. e.* when a simple petiolus has two, three, four, or more leaves connected to its apex.
103. *Pedatum*, a bifid or forked petiolus, having small leaves connected to its interior side.
104. *Pinnatum cum impari*, small leaves connected to the sides of a simple petiolus, terminated by an odd leaf.
105. *Pinnatum abruptum*, neither terminated by an odd leaf nor a cirrus.
106. ——— *alternatum*, when the small leaves rise higher and higher alternately upon the petiolus.
107. ——— *interrupte*, when the pinnated leaves are alternately larger and smaller.
108. ——— *cirrhosum*, when the common petiolus ends in a cirrus.
109. ——— *conjugatum*, when the common petiolus has only two leaves connected.
110. ——— *decursum*, when the small leaves run along the petiolus.
111. ——— *articulate*, when the common petiolus is jointed.
112. *Lyratum*, like a harp, *i. e.* when the leaf is transversely divided into segments, the superior of which are larger than the inferior, and the inferior ones are more distant from each other.
113. *Biternatum*, or *duplicate-ternatum*, when the common petiolus has three ternated (100) leaves fixed to it. The epimedium is an example of this.
114. *Bipinnatum*, or *duplicate-pinnatum*, when the common petiolus gives off pinnated (104) petioli from its sides.
115. *Triternatum*, or *triplicate-ternatum*, when the common petiolus sends off from its sides three biternated (113) leaves.
116. *Tri-pinnatum sine impari*, when the common petiolus has three or more bipinnated (114) leaves fixed to its sides, not terminated by a single leaf.
117. ——— *cum impari*, the same with the former, only terminated by a single leaf.

*Terms respecting the Determination of Leaves.*

- Fig.  
 118. *Inflexum*, when the leaves bend or arch upwards upon the caulis or stem.  
 119. *Erectum*, when the leaves make a very acute angle with the caulis.  
 120. *Pateu*. This term is applied to leaves which make a more obtuse angle with the caulis than the former.  
 121. *Horizontale*, when the leaves stand at right angles with the caulis.  
 122. *Reclinatum*, or *reflexum*, when the leaf bends down, so that the apex is lower than the base.  
 123. *Revolutum*, when both sides of the leaf are rolled backwards in a spiral form.  
 124. *Seminale*, seed-leaves, or dissimilar leaves. They are the lobes of the seed, which in many plants arise entirely out of the ground, and are always the first that appear above the surface. See AGRICULTURE, p. 41.  
 125. *Caulinum*, such as arise immediately from the caulis or stem.  
 126. *Ranecum*, such as arise from a branch of the caulis.  
 127. *Florale*, such as arise from the same place with the flower.  
 128. *Peltatum*, when the petiolus is inserted, not into the edge or base, but into the disk of the leaf.  
 129. *Petiolatum*, when the petiolus is inserted into the margin of the base.  
 130. *Scissile*, when the leaf has no petiolus, but is immediately connected to the caulis.  
 131. *Decurrens*, when the base of a scissile (130) leaf is extended downwards along the caulis; as in the verbena, carduus, &c.  
 132. *Amplexicaule*, when the base of the leaf embraces the caulis on all sides.  
 133. *Perforatum*, when the base of the leaf entirely furrounds the caulis, so that the caulis seems to perforate the leaf.  
 134. *Comatum*, when the opposite leaves run into one another, and furround the caulis, as in the eupatorium.  
 135. *Vaginans*, when the base of the leaf forms a cylindrical tube investing the caulis.  
 136. *Articulatum*, in the form of joints, *i. e.* when one leaf arises from the apex of another.  
 137. *Stellata*, radiated like a star, *i. e.* when more than two leaves furround a verticillated (35) caulis.  
 138. *Quaterna, quina, sena, &c.* are species of stellated (137) leaves, when there are four, five, or six, &c. leaves furrounding the caulis.  
 139. *Opposita*, when the leaves of the caulis are exactly opposite to one another.  
 140. *Alternata*, when the leaves rise alternately higher upon the caulis.  
 141. *Acerosa*, linear, persistent leaves, as in the pinus or fir-tree, &c.

- Fig.  
 142. *Imbricata*, when the leaves rest upon one another like tiles on a roof.  
 143. *Fasciculata*, when many leaves rise from the same point, as in the larynx.  
 144. *Frons*. This term is applied to a species of trunk, which consists of branches and leaves, and sometimes the fructification, all united together: It is peculiar to the filices, or ferns, and the palmæ.  
 145. *Spathulatum folium*, is a roundish leaf, with a narrow linear base.  
 146. *Parabolicum folium*, like a parabola, *i. e.* having its longitudinal diameter longer than the transverse, and growing narrower from the base till it terminates in an oval figure.

*Terms relating to the Caules or stems. Plate LVII.*

147. *Squamosus culmus*. The culmus is a trunk or stem peculiar to grasses; and *squamosus culmus* is a scaly culmus.  
 148. *Repens caulis*. The caulis or stem is a species of trunk peculiar to herbaceous plants, and supports the leaves or parts of fructification: *Repens caulis* is a stem which gives out small roots on every side, as it runs along the surface of the ground, or upon another plant.  
 149. *Scapus*, is a species of trunk which supports the parts of fructification, but has no leaves.  
 150. *Articulatus culmus*, a culmus (147) with many joints.  
 151. *Volubilis caulis*, a caulis (148) which runs in a spiral form upon the trunk or branch of another plant, &c.  
 152. *Dichotomus caulis*, a caulis (145) uniformly dividing into branches.  
 153. *Brachiatus caulis*, a caulis having opposite decussating branches, resembling arms.

*Terms relating to the Frutera or supports of Leaves.*

154. a, *Cirrhus*, a spiral thread which connects the plant to any other body. b, *Stipula*, or little scales at the base of the petiolus or pedunculus. c, *Glandule concavae*, small hollow glands for secreting a liquor.  
 155. a, *Glandula pedicellate*, small glands, each supported by a pedunculus.  
 156. a, *Bractea*, or flower-leaf, which differs in shape from the other leaves of the plant b.  
 157. a, *Spina simplex*, a simple thorn or prickle. b, *Spina triplex*, or three prickles proceeding from one. *Spina* is applied to such thorns as are protruded from the wood of the plant.  
 158. *Aculeus simplex*. Aculeus is a prickle not protruded from the wood, but only fixed to the bark. It is said to be *simplex*, when it rises single.  
 159. *Aculeus triplex*, a triple aculeus (158).  
 160. *Opposita folia*, or opposite leaves. a, The *axilla* or arm-pit.

## Terms relating to Roots.

Fig.

161. *Bulbus squamifus*, when the root is composed of imbricated or tiled scales or plates, as in the lily-root.
162. *Bulbus solidus*, consisting of a solid substance.
163. *Bulbus tunicatus*, consisting of coats lying above one another, as in the onion.
164. *Tuberosa radix*, a root consisting of a great many little knots, as in the filipendula.
165. *Fusiformis radix*, like a spindle, *i. e.* oblong, thick, and tapering to a point below, as in the root of the carrot.
166. *Ramosa radix*, having many lateral branches.
167. *Repens radix*, a root which creeps horizontally, and sends off every where smaller roots at different distances.

THESE are the principal terms necessary for understanding Linnæus's description of the specific characters of plants.—To make the reader acquainted with the manner in which these terms are used, we shall give a few examples.

## Class II. DIANDRIA.

Order, MONOGYNIA.

Genus, VERONICA, or SPEEDWELL.

Species, *Veronica arvensis*, has solitary flowers, cut, sessile (130), and cordated (46) leaves.

*Veronica agrestis*, has solitary flowers, cut, cordated (46), and petiolated (129) leaves.

## Class XVI. MONODELPHIA.

Order, POLYGYNIA.

Genus, MALVA, or MALLOW.

Species, *Malva spicata*, has tomentose (84), crenated (74), and cordated (46) leaves, and oblong hairy spicæ (34).

*Malva sylvestris*, has an erect (119) herbaceous caulis (148), with acute (74), seven-lobed (50) leaves, and hairy pedunculi and petioli (129).

## Class XIX. SYNGENESIA.

Order, POLYGAMIA ÆQUALIS.

Genus, CARDUUS, or THISTLE.

Species, *Carduus helenioides*, or *melancholy thistle*, has lanceolated (42), toothed (66), amplexicaule (132) leaves, with unequal ciliated (86) small spines (158).

## Class XXIV. CRYPTOGAMIA.

Order, FILICES.

Genus, ASPLENIUM, or MAIDENHAIR.

Species, *Asplenium trichomanes*, has a pinnated (104) frons (144); the pinnae (104) are roundish (38) and crenated (74).

To these examples we shall add a complete description of a plant reduced to its class, order, genus, and species, with figures of all the parts necessary for that purpose.

## RHEUM PALMATUM, or True Rhubarb. See Plate LVIII.

The flower of this plant has no CALIX.

THE COROLLA *dd*, consists of one petal, narrower at the base, not perforated, and divided in the margin into six obtuse segments, one less and one larger alternately; the petal is marcescent, *i. e.* decays, but does not fall off till the seeds be ripe.

THE STAMINA *ee*, consist of nine capillary filaments inserted into the corolla, and about the same length with it. The *antheræ* are didymous, (*i. e.* appear to be double), oblong, and obtuse.

THE PISTILLUM *f*, has a short three-sided germen. It can hardly be said to have any styli; but has three reflected, plumose stigmata.

THE PERICARPIMUM is wanting.

Each flower contains but one large, three-sided, acute seed *g*, with a membranaceous edge.

The number of stamina determines this plant to belong to the ENNEANDRIA class; and the number of STIGMATA fixes its order to be TRIGYNIA. The other parts of the above description clearly demonstrate the genus to be the Rheum or Rubarb, and sufficiently distinguish it from the Laurus, Tinus, Cassia, and Butomus, the only other genera belonging to this class.

THE SPECIFIC mark is taken from the leaves, which are PALMATED (58), and sharp and tapering at the points. There are but five species of Rheum, none of whose leaves are palmated, except the species now described.

But though the above description be sufficient for ascertaining the genus and species of this valuable plant, there are other reasons for giving a complete botanical description of the whole parts of it. The true rhubarb, though of the most extensive use in medicine, was never known in this country till the year 1762, when Dr Mounsey brought some seeds from Russia, and gave them to Dr Hope professor of medicine and botany in Edinburgh. Dr Hope sowed them in the botanical garden, and collected about 30 seeds from one of the plants, which rose to eight feet in height. This plant is now propagating in the botanic garden, in the garden of Sir Alexander Dick, and many other gardens in Scotland. The root is found, by repeated trials, to be equally powerful in its operation as the best foreign rhubarb; and we have the greatest reason to hope, that in a short time this plant will be so universally cultivated as to prevent the future importation of it. The first botanic description we have of the true rhubarb was published by Dr Hope in the philosophical transactions for the year 1765\*; which we shall translate into English.

\* Vid. Phil. Transf. for the year 1765.

The *ROOT* *a*, is of the brachy kind, and perennial.

The *LEAVES* of (which *b* in the plate is an outline) are about sixteen in number, grow near the root, about two feet long, and are furnished with petioli or foot-stalks.

—The petioli are about a foot long, cylindrical, plane above, smooth, of a green colour, but in some places interperfed with small, narrow, purple spots; at the bafe of the leaf, the petiolus terminates in three or five large nerves or ribs, which are prominent above; the leaves are ovated, deep cut, with fharp lacinia or fegments; the fuperior part of the bafe is green, the inferior of a whitifh green, and both are a little rough.

The *CAULIS* or *STEM* is erect, fowewhat cylindrical, fitulofus or hollow within, jointed, fheathed, rough, ftriated, about eight feet high, and about two inches over near the bafe. It has fourteen joints, each of which, from the bafe to the ninth joint, is furnifhed with a reflected leaf, placed alternately, gradually diminishing as they rife higher, and the petiolus forms a kind of fheath, which embraces the ftem.

The *PEDUNCULOR* *FOOT-STALKS* of the flowers, which are numerous, arife from the axil or arm-pits of the leaves, are almoft erect, unequal, ftriated, cylindrical, plainifh at the bafe, and out of their fides other

foot-ftalks arife, to be diftributed in the fame manner. *c*, is a flowering branch feparated from the ftem.

The *TASTE*, *ODOUR*, and *COLOUR* of the *ROOT* are precifely the fame with thofe of the foreign rhubarb.

The *TASTE* of the *FLOWERS* is astringent, herbaceous and fubacid; they have no fenfible fhell.

The *TASTE* of the *LEAVES* is bitterifh, astringent, and herbaceous; the tafte of the *RIBS* or *NERVES* is acid, bitterifh, and very ungrateful;—the tafte of the *STEM* is a little four.

WE have now pretty fully explained the method of reducing plants to claffes, orders, genera, and fpecies, according to the fexual fyftem of Linnæus. The manner in which this explanation has been executed was fuggelted by the difficulties which naturally occur to a perfon unacquainted both with the fubject and the fyftem. Although this manner has not, fo far as we know, been hitherto attempted, we hope it will not be the lefs acceptable to the public, efpecially as it is likely to be more ufeful to the botanical fudent.

It only now remains to make the reader more fully acquainted with the origin and nature of the fexual fyftem.

### SECT. III. OF THE SEXES OF PLANTS.

AS many philofophers and botanifts deny that fuch a thing as the diftinction of fexes takes place in vegetables, it will be neceffary to give a narration of the arguments employed by both parties on this fubject. We fhall begin with the arguments in favour of the fexes.

LINNÆUS, like every perfon attached to a particular doctrine or theory, is at great pains in tracing the notion of fexes in plants to the remotef periods of antiquity. He informs us, that Empedocles, Anaxagoras, and other ancient philofophers, not only attributed the diftinction of fexes to plants, but maintained that they were capable of perceiving pleafure and pain.

Hippocrates and Theophrastus are next introduced as diftinguifhing the conyza, the abies, the flix, &c. into male and female. The latter of thefe writers affirms, that the fruit of the female palm will not germinate unlefs the pollen of the male be fhaked over the fpatha of the female, previous to the ripening of the feed.

Diofcorides takes notice of a male and female mandragora, mercurialis, ciftus, &c.

Pliny does not confine his views of fex to animals, but exclaims, that every thing this earth produces is characterized by the diftinction of fex.

From the days of Pliny to thofe of Cæfalpinus, who lived in the 16th century, the analogy between the vegetable and animal feems to have been entirely neglected. Cæfalpinus tells us, that the males of the oxycedrus, taxus, mercurialis, urtica, and cannabis, are barren; and that the females of thefe plants only bear fruit.

After Cæfalpinus, we find Dr Grew and Sir Thomas Millington engaged in a converfation concerning the uti-

lity of the ftamina and ftyli of plants. The refult of this converfation was the mutual agreement of thefe two eminent naturalifts, that the ftamina and ftyli of vegetables were analogous to the organs of generation in animals, and that they were adapted by nature to anfwer the fame purpofes. Dr Grew, in his anatomy of plants, after enumerating the analogies between plants and animals, concludes, that the pollen probably emits certain *vivific* effluvia, which may ferve for the impregnation of the feeds.

Mr Ray gave a further fanction to the doctrine of fexes, by concurring with Grew, and adding fome further illuftrations from analogy.

In the year 1695, Camerarius attempted to prove the fexes of plants. But, as he trufted folely to the palm-tree, and withal feemed to be doubtful as to the authenticity of the fact, he cannot be confidered as having done any thing in confirmation of the fexual hypothefis.

Mr Morland, in the year 1703, adopted the fame hypothefis; but gave it a new modification, by fuppofing that the pollen contained the feminal plant in miniature; and confequently, that one pollen at leaft behaved to be conveyed into every feparate feed before it could be properly impregnated. Analogy and the ftructure of the parts are the only arguments he employs.

Some years after this, Mr Geoffroy wrote a treatife on the fexes of plants: But as he advanced nothing new, we fhall take no further notice of him.

Vaillant, in the 1717, judiciously confidering that the caufal in the ftylus of moft plants was too narrow to admit the pollen itfelf, republished Dr Grew's theory of impregnation by means of a fubtile feminal aura.

This

These are the sentiments of the principal botanists with regard to the generation of plants, till the celebrated Linnæus made his appearance as a botanical writer, who has extended the idea so far as to compose a complete system upon it.

Although Linnæus can have no claim to the supposed discovery of the sexual hypothesis, his being precisely the same with that of Dr Grew; yet, as he is the chief supporter and improver of this doctrine, we shall give a succinct narration of the arguments he makes use of in order to prove that vegetables propagate their species by a regular commerce of sexes.

In a treatise, intitled, *Sponsalia Plantarum*, published as an inaugural dissertation by Wahlbom, in the first volume of the *Amenitates Academicæ*, all the arguments made use of by Linnæus in his *Fundamenta Botanica* and other works, are collected and arranged in one view. But as Wahlbom honestly attributes all the merit of this dissertation to his great master, we shall here drop his name altogether, and give the arguments as the property of Linnæus, by whom they were originally employed.

Linnæus, then, first attempts to show, that vegetables are endowed with a certain degree of animal life; and, secondly, that they propagate their species in a manner similar to that of animals.

"That vegetables are really animated beings," says he, "must be obvious at first sight; because they possess all the properties contained in that accurate definition of life laid down by the great Dr Harvey, namely, *Vita est spontanea propulsio humorum*. But universal experience teaches, that vegetables propel humours or juices: Hence it is plain that vegetables must be endowed with a certain degree of animal life."

Not trusting solely to a syllogism founded on a definition, Linnæus proceeds to support the life of vegetables by arguments drawn from the following particulars in their œconomy; the first of which he intitles

"*Nutritio*.—The very idea of nutrition implies a propulsion of humours, and, of course, the idea of life. But vegetables derive their nourishment from the earth, air, &c. and consequently must be considered as living creatures.

"2. *Ætas*.—Every animal must not only begin to exist, and have that existence dissolved by death, but must likewise pass through a number of intermediate changes in its appearance and affections. *Infancy, youth, manhood, old age*, are characterized by *imbecillity, beauty, fertility, dotage*; are not all these vicissitudes conspicuous in the vegetable world? Weak and tender in *infancy*; beautiful and salacious in *youth*; grave, robust, and fruitful in *manhood*; and when *old age* approaches, the head droops, the springs of life dry up, and, in fine, the poor tottering vegetable returns to that *dust* from whence it sprung.

"3. *Motus*.—No inanimate body is capable of self-motion. Whatever moves spontaneously is endowed with a living principle; for motion depends on the spontaneous propulsion of humours, and where-ever there is a spontaneous propulsion of humours, there also is life. That vegetables are capable of motion is evident from the following facts: Plants, when confined within doors, al-

ways bend towards the light, and some of them even attempt to make their escape by the windows. The flowers of many plants, especially those of the syngenesia class, pursue the sun from east to west, rejoicing in his beams. Who then can deny that vegetables are possessed of living and self-moving powers?

"4. *Morbus*.—The term *disease* means nothing more than a certain corruption of life: It is well known, that vegetables are subject to diseases as well as animals: When over-heated, they turn thirsty, languish, and fall to the ground: When too cold, they are tormented with the chilblain, and not unfrequently expire: They are sometimes afflicted with cancers; and every plant is infested with lice peculiar to its species.

"5. *Mors*.—Death is opposed to life, the former being only a privation of the latter. Experience shows, that every living creature must die. But, as vegetables are daily cut off by internal diseases and external injuries; as they are subject to death from the attacks of hunger, thirst, heat, cold, &c. with what propriety could vegetables be thus said to die, unless we allow that they previously lived?

"6. *Anatomia*.—Under this article we are referred to Malpighius and Grew for the organic fibres, membranes, canals, vesicles, &c. of plants, as additional proofs of their living powers.

"7. *Organizatio*.—Vegetables not only propel humours, but also prepare and secrete a number of different juices for the fruit, the nectar, &c. analagous to the various secretions in animal bodies."

From these facts and observations, Linnæus concludes, that plants are unquestionably endowed with life as well as animals; and then proceeds in the following manner to shew how these animated vegetables propagate their species.

After discussing the long exploded doctrine of equivocal generation, he lays hold of another maxim of Dr Harvey, viz. *Omne vivum ex ovo*.—"It being fully evident," says he, "from the foregoing chain of reasoning, that vegetables are endowed with life, it necessarily follows, agreeable to this maxim of Harvey's, that every vegetable must in like manner derive its existence from an egg. But as vegetables proceed from eggs, and as it is the distinguishing property of an egg to give birth to a being similar to that which produced it, the seeds must of course be the eggs of vegetables.

"Granting then that the seeds of vegetables are intended by nature to answer the same end as the eggs of animals, and considering at the same time that no egg can be fecundated without receiving an impregnation from the male, it follows, that the seed or eggs of vegetables cannot be fecundated by any other means. Hence also the necessity of vegetables being provided with organs of generation. But where are these organs situated? The answer is easy:—We have already found impregnated seeds within the flowers of plants; and it is natural to expect that the *genitalia* should not be at a great distance. Now, as *copulation* always precedes *birth*, and every *flower* precedes the *fruit*, the *generating faculty* must be ascribed to the *flower*, and the *birth* to the *fruit*. Again, as the *antheræ* and *stigmata* are the only essen-

RHEUM PALMATUM  
OR  
TRUE RHUBARB.

A. Belli Sculp.

1850

THE HISTORY  
OF  
THE TOWN

J. Bell Sculp.

tial parts of flowers, these parts must necessarily be the organs of generation."

Being thus far advanced, Linnæus affirms, that the antheræ are the testes, and that the pollen performs the office of the male semen. These affirmations he attempts to establish by the following arguments; the first of which he terms

"1. *Præcedentia*.—The antheræ, or vegetable testes, always precede the fruit; and as soon as the antheræ come to maturity, which constantly happens before the maturity of the fruit, they continue to throw out their pollen as long as the flower lasts; but decay and fall off whenever the fruit comes to perfection.

"2. *Situs*.—The antheræ of all plants are uniformly situate in such a manner that the pollen may with the greatest facility fall upon the stigma or female organ.

"3. *Tempus*.—The antheræ and stigmata always flourish at the same time, whether the flowers be of the hermaphrodite or dioicous kind.

"4. *Localumenta*.—When the antheræ are dissected, they discover as great a variety of structure as the pericarpia or seed capsules: For some of them have one cell, as the mercury; some two, as the hellebore, &c.

"5. *Castratio*.—If all the antheræ be cut off from an hermaphrodite plant, just before the flowers begin to expand, taking care at the same time that no plant of the same species grows near it, the fruit will either prove entirely abortive, or produce barren seeds.

"6. *Figura*.—When the pollen of different plants is examined by the microscope, it exhibits as great a variety of figures as is discoverable in the seeds themselves.

"The accumulated force of these arguments", concludes Linnæus, "amounts to a full demonstration that the antheræ are the testes, and that the pollen is the semen or genera of vegetables.

"The male organ being thus investigated, we hope," says Linnæus, "that none will hesitate to pronounce the stigma to be the female organ, especially when the following observations are sufficiently attended to.

"The pistillum is composed of the germen, stylus, and stigma. The germen being only a kind of rudiment of the future fetus or seed, ceases to exist as soon as the flower comes to maturity. Neither is the stylus an essential part, as many flowers have no stylus. But no fruit ever comes to maturity without the assistance of the stigma. It follows, that the stigma must be the female organ adapted by nature for the reception of the pollen or impregnating substance. This will appear still clearer from the following chain of reasoning.

"1. *Situs*.—The stigmata are always situate so that the pollen may with most ease fall upon them. Besides, it is remarkable, that in most plants (though not in all) the number of the stigmata exactly corresponds with the localumenta or cells of the pericarpium.

"2. *Tempus*.—Here the observation, that the stigmata and antheræ constantly flourish at the same time, is repeated.

"3. *Decidentia*.—The stigmata of most plants, like the antheræ, decay and fall off as soon as they have discharged their proper function; which evidently shows,

that their office is not to ripen the fruit, but solely to answer the important purpose of impregnation.

"4. *Abscissio*.—The argument here is precisely the same with the castration of the antheræ; and the result is likewise the same, namely, the destruction of the fruit.

"These arguments," concludes Linnæus, "are sufficient to demonstrate, that the stigma is the female organ of generation, or that organ which is suited for the reception and conveyance of the semen to the vegetable eggs. Hence, plants may be said to be in actu veneris, when the antheræ, or testiculi, spread their pollen over the stigma or female vulva."

To show how the coitus of vegetables is effected, is our author's next object of investigation. He affirms, that the pollen is conveyed, by means of the wind or insects, to the moist stigma, where it remains until it discharges a subtile fluid, which, being absorbed by the vessels of the stigma, is carried to the seeds or ova, and impregnates them. His proofs are taken from the following particulars.

"1. *Oculus*.—When the flowers are in full blow, and the pollen flying about, every one may then see the pollen adhering to the stigma. This, he illustrates by mentioning as examples the viola tricolor, iris, campanula, &c.

"2. *Proportio*.—The stamina and pistilla, in most plants are of equal heights, that the pollen, by the intervention of the wind, may, with the greater facility, fall upon the stigma.

"3. *Locus*.—The stamina of most plants surround the pistillum, to give the pollen an opportunity of falling on the stigma at every breeze of wind. Even in the monœcia cials, the male flowers stand generally above the female ones, to afford an easier conveyance of the pollen to the stigma.

"4. *Tempus*. It is remarkable that the stamina and pistilla constantly appear at the same time, even in plants belonging to the monœcia cials.

"5. *Pluvie*.—The flowers of most plants expand by the heat of the sun and shut themselves up in the evening or in rainy weather. The final cause of this must be, to keep the moisture from the pollen, lest it should be thereby coagulated, and of course prevented from being blown upon the stigma.

"6. *Palmicola*.—That the cultivators of palm trees were in use to pull off the spadices from the males, and suspend them over the spathe of the females, is attested by Theophrastus, Pliny, Prosper Alpinus, Kempfer, and many others. If this operation happened to be neglected, the dates were four and destitute of nuts. Kempfer adds this singular circumstance, that the male spadix, after being thoroughly dried and kept till next season, still retained its impregnating virtue.

"7. *Flores nutantes*.—As the pollen is specifically heavier than air, such flowers as have their pistillum longer than the stamina, hang down, or incline to one side, e. g. the fritillaria, campanula, &c. An easy admission of the pollen to the stigma, is the final cause of this appearance.

"8. *Submersi*.—Many plants that grow below water, emerge when their flowers begin to blow, and swim

upon the surface till they receive their impregnation, and then sink down.

“9. *Omnium florum genuina consideratio*.—Here a number of particulars are recited. We shall confine ourselves to those that are most striking and applicable to the subject.

“When the flowers of the male hemp are pulled off before those of the female are fully expanded, the females do not produce fertile seeds. But as a male flower is sometimes found upon a female plant, this may be the reason why fertile seeds are sometimes produced even after this precaution has been observed.

“The tulip affords another experiment to the same purpose.—Cut off all the anthers of a red tulip before the pollen is emitted; then take the ripe anther of a white tulip, and throw the pollen of the white one upon the stigma of the red; the seeds of the red tulip being thus impregnated by one of a different complexion, will next season produce some red, some white, but most variegated flowers.”

In the year 1744, Linnæus published a description of a new genus, which he called *peloria*, on the supposition of its being a *hybrid* or *mule* plant, *i. e.* a plant produced by an unnatural mixture of two different genera. The root, leaves, caulis, &c. of this plant are exceedingly similar to those of the antirrhinum linaria; but the flower and other parts of fructification are totally different. On account of its similarity to the linaria in every part but the flower, Linnæus imagined it to have been produced by a fortuitous mixture of the linaria with some other plant, although he has never yet been able to descend on the father. This doctrine of the production of *mule* plants has since been greatly prized and carefully propagated by Linnæus and the other supporters of the sexual hypothesis. In the third volume of the *Annuitate Academica*, there is a complete dissertation, intitled, *Plantæ Hybridæ*, wherein the doctrine of *vegetable mules* is much improved and extended. This dissertation contains a list of 47 mules, with their supposed fathers and mothers. For example,

The VERONICA SPURIA is said to be a *mule* plant *begot* by the verberna officinalis upon the veronica maritima.

The delphinium hybridum, a *mule* *begot* by the aconitum napellus upon the delphinium elatum.

The arctotis calendula, a *mule* *begot* by the calendula pluvialis upon the arctotis trifida.

The asclepias nigra, a *mule* *begot* by the cynanchum acutum upon the asclepias vincetoxicum, &c.

From the examples given in this dissertation, Linnæus draws this singular conclusion, that only two species of each genus existed *ab origine*; and that all the variety of species which now appear have been produced by unnatural embraces betwixt species of different genera.

Under this head, Linnæus likewise quotes from Ray the story of Richard Baal gardener at Brentford. This Baal sold a large quantity of the seeds of the brassica florida to several gardeners in the suburbs of London. These gardeners, after sowing their seeds in the usual manner, were surprised to find them turn out to be plants of a different

species from that which Baal made them believe they had purchased; for, instead of the brassica florida, the plants turned out to be the brassica longifolia. The gardeners, upon making the discovery, commenced a prosecution of fraud against Baal in Westminster-hall. The court found Baal guilty of fraud, and decreed him not only to restore the price of the seeds, but likewise to pay the gardeners for their lost time, and the use of their ground. “Had these judges (says Linnæus) been acquainted with the sexual hypothesis, they would not have found Baal guilty of any crime, but would have ascribed the accident to the fortuitous impregnation of the brassica florida by the pollen of the brassica longifolia.”

Linnæus next proceeds to celebrate the utility of insects, because they convey the pollen of the male to the stigma of the female. “In this way,” says he, “it is reasonable to think that many dioicous plants are impregnated. Nay, even the hermaphrodites themselves are greatly obliged to the different tribes of insects, which, by fluttering and treading in the corolla, are constantly scattering the pollen about the stigma.

“Upon the whole,” then, concludes Linnæus, “the coitus of vegetables is evident to a demonstration. This coitus is nothing more than the conveyance of the pollen to the stigma, to which it adheres till it bursts and discharges a subtile elastic fluid. This fluid or aura is absorbed by the vessels of the stylus, and carried directly to the ovarium or germs, where the mysterious work of impregnation is fully completed.”

THESE are the arguments employed by Linnæus and other advocates for the sexual commerce of vegetables.—Let us next attend to those employed by the opposers of this hypothesis.

It is admitted by Pontedera, Dr Allston, &c. that some of the ancients applied the terms *male* and *female* to several plants. But then they deny that these terms conveyed the same ideas to the ancients that they do to the moderns. *Male* and *female*, when applied to plants, were to the ancients mere terms of distinction, serving only as trivial names to distinguish one species or variety from another. The ancients were ignorant of the very characters which constitute the difference between what is called a male and female plant among the moderns. Theophrastus, Dioscorides, Pliny, and, in a word, the whole ancient botanical writers, confound the very notion of the modern sexes; they call the real female, or seed-bearing plant, the *male*; and the male, or barren plant, the *female*. Nay, they have even applied the terms *male* and *female* to many plants which bear nothing but hermaphrodite flowers.

Such is the nature of this controversy, that it cannot be determined with any degree of certainty, but by experiments made upon dioicous plants. If a female plant can produce fertile seeds without having any communication with the pollen of the male, the use of this pollen, with respect to the impregnation of seeds, must of necessity be entirely superseded.

Now, both Camerarius and Dr Allston tried these experiments with the same success. Those two eminent botanists took female plants of the mercury, spinage, and  
hemp,

hemp, transplanted them at a great distance from any males of the same genus, and besides had them inclosed by double rows of hedges. The result was, that each of these plants produced great quantities of fertile seeds. Tournefort made the same trial upon the lupulus, Miller upon the bryony, and Geoffroy upon the mays; and all of them declare that the seeds of these plants were as fertile as if they had been surrounded by a thousand males.

Linnæus, in his first argument for the coitus of plants, refers every man to the evidences of his senses.

“Do we not see, (says he) the stigma of almost every hermaphrodite flower covered over with the pollen or impregnating substance? Do not we see the parietaria, the urtica, &c. by violent explosions, discharging their pollen in the open air, that it may be carried in that vehicle to the stigmata of their respective females?”—All this is admitted by the opposers of the sexes; but then they deny that these explosions, &c. are intended to create any intercourse between the male and the female; and further alledge, that this ejection of the pollen is intended by nature to throw off something excrementitious, or at least something, which, if retained, would prove noxious to the fructification.

Linnæus takes his second argument from the proportion which the stamina bear to the stylus, alledging that they are generally of the same height.—This observation is not only contrary to experience, but, allowing it to be universal, no conclusion can be drawn from it either for or against the sexual hypothesis.

The third argument is taken from the locus or situation of the stamina with respect to the stylus; “and as the male flowers in the monoecia class stand always above the female flowers, it must be concluded (says Linnæus) that the intention of nature, in this disposition of the parts, is to allow a free and easy access of the pollen to the stigma.”—But the stamina cannot be said to surround the pistillum in the monoandria and diandria classes: And the position of the male flowers in the monoecia class is a mere chimera; for in the ricinus, one of the examples which Linnæus mentions in confirmation of his doctrine, the female flowers stand uniformly some inches above the males.

That the stamina and pistilla generally come to perfection at the same time, and that this happens even in the dioecious plants, is Linnæus's fourth argument. But, as it is acknowledged by Linnæus himself, that there are many exceptions with respect to this fact, the opposers of the sexual hypothesis alledge that it carries the best answer in its own bosom.

The fifth argument is founded on the circumstance of some flowers shutting up their petals in rainy or moist evenings.—But many flowers do not shut themselves up, either in the night or moist weather, as the passion-flower, &c. The lychnis noctiflora, mirabilis peruviana, &c. open their flowers in the night, and shut them at the approach of the sun. Hence this is another final cause evidently perverted to support a favourite hypothesis.

We come now to the culture of the palm-tree, which is the sixth and most plausible argument employed by the sexualists. Herodotus, Theophrastus, Pliny, and some others, have informed us, that the female palm-tree, unless

a male grows sufficiently near it, or unless the pollen be artificially conveyed to the female spathe, will produce nothing but four dates and unferile seeds. This fact is partly denied by Pere-Labat and Tournefort. The former of these authors expressly affirms, that a female palm-tree, in the garden belonging to the monastery at Martinico, produced most excellent fruit, although there was not a male within six miles of it: From which he concludes, that the presence of the male is not necessary to render this tree fruitful, whatever may be pretended by ancient or modern naturalists. Herodotus relates, that the people of Babylon, when the male was at too great a distance from the female, made a rope pass from the boughs of the one to the boughs of the other, to afford an opportunity to the culices and other insects to pass along the rope, and convey some kind of impregnating influence from the male to the female. Tournefort, when he was in that country, inquired at the most intelligent people of the place, as to the truth of this relation; but received for answer, That they had never heard of any such matter. Even the favourers of the sexual hypothesis give very different accounts of the method of cultivating palm-trees in those countries. Vesslingius, who resided many years in Egypt, denies that any artificial method is employed for fructifying the palm-trees in that country. Thus Vesslingius expressly contradicts Herodotus and many others. In a word, almost every different author gives a different account of this story. Amidst so many contradictions concerning the culture of palm-trees, the opposers of the sexes conclude, that the whole story is a vulgar error, taken for granted by some learned men, spuriously fathered upon others, and swallowed down without examination by their credulous readers.—As we have not seen any answer to Mylesius's letter on this subject, our observations upon it shall be reserved till this historical view of the controversy be finished.

The seventh argument of Linnæus is taken from the *fores nutantes*.—The pistils of these flowers, according to Linnæus, are always longer than the stamina, and nature has assigned them this penile posture, that the pollen, which is specifically heavier than air, may the more conveniently fall upon the stigma.—But the pistils of the campanula, lilium, and many other *fores nutantes*, are not longer than the stamina. Besides, granting this were uniformly the case; yet, as the pollen is heavier than air, this posture must of necessity either make the pollen miss the pistillum altogether, or, at any rate, it can only fall upon the back part of the pistil in place of the stigma; and, of course, such a direction would rather tend to frustrate than promote the impregnation of the seed.

The eighth argument is taken from the *planta submersa*, which are said to emerge as soon as their flowers begin to blow, lest the pollen should be coagulated or washed off by the water.—But many submarine and aquatic plants fructify entirely below water; and, supposing they did not, the same argument would equally prove it to be the intention of nature, that the pollen should be blown away by the winds, as that it should be subservient to the impregnation of the seed.

The ninth and last argument is intitled *Omniium forum genuina consideratio*; which is nothing more than a collection of vague observations upon the structure and occurrency of particular plants, some of them true, others false, but all of them evidently thrust in as supports to a favourite hypothesis.

HAVING thus given a pretty full historical view of the controversy concerning the sexes of plants, we shall now lay before our readers a few observations that have occurred from the perusal of it.

It may be observed in general, that the facts and arguments adduced by the sexualists are by far too few to admit of any general induction. Nay, most of them are merely accidental, many of them not being uniform even in the same species; and the final causes of the whole are unnatural, and tortured so as best to answer the purposes of a theory, which, for all that hath yet been said, merits no higher appellation than that of a whimsical conjecture.

First, then, Linnæus's reasoning is of a mixt nature, partly analogical, partly founded on observation. He sets out with an attempt to prove, that plants are endowed with a certain degree of animal life; and his fundamental reason is, because, agreeable to Dr Harvey's definition of life, they *spontaneously propel humours*.—Strange, that a man of Linnæus's capacity, or indeed of any capacity at all, should seriously employ an argument pregnant with every degree of absurdity!—Stranger still that he should take up near twenty pages in illustrating and drawing conclusions from such an argument!—If Harvey has given a vague and unintelligible definition of life, can that be a sufficient excuse for laying hold of such a definition in order to fortify an unstable hypothesis? But, were Harvey's definition more accurate than it is, and were vegetables actually possessed of living powers, it is easy to conceive how the life of vegetables might be a proper test of, or contradiction to, the received definition: But, how a definition, which, from the complex and intricate nature of the subject defined, must necessarily be vague and precarious, can be employed in confirmation of any general theory, exceeds the powers of common apprehension.

But let us examine this notable definition a little further: What idea of life does a *spontaneous propulsion of humours* convey? If Harvey means to say, that men and other animals regulate the motion of their blood, and the secretions of their different humours, by certain exertions of the sentient principle, such a meaning is contradicted by universal experience; so far is this from being the case, that the most abstract attention cannot render us conscious of these motions. Again, if he means, that every body is endowed with life, whose organs are suited to propel humours, then the term *spontaneous* is absurd, because it ascribes intellectual powers to the organs themselves, than which nothing can be more ridiculous. Besides, allowing the organs to enjoy an independent faculty of propulsion, what does this propulsion mean when applied to vegetables? Surely nothing more than a power of conveying certain liquors from the root to the superior parts of the plant. A wet

cloth, with one end in contact with the water in any vessel, and the other hanging over its side, will do the same; so will a sponge, so will a bed of loose sand, so will a sugar loaf, &c; but it is to be hoped, that mankind have more sense than to believe that a bit of cloth, or a sugar loaf, are animated beings.

As conscious of the lameness and futility of his reasoning on this subject, Linnæus endeavours further to corroborate the life of vegetables by analogies drawn from their nutrition, age, motions, diseases, death, anatomy, and organization. In these nothing new or remarkable occurs, excepting the uncommon method of reasoning, and the still more whimsical purposes to which this reasoning is applied. We shall take notice of his arguments under the articles of *motion* and *death*, which indeed are the chief of those which do not depend more or less upon the above definition.

Under the former of these, Linnæus informs us, that plants, when confined within doors, always bend towards the light; and that many flowers, particularly those of the syngenesia class, pursue the course of the sun from east to west. This inclination of flowers towards the light, Linnæus would have us to believe are real intances of the living powers and spontaneous motion of plants.—This phenomenon, however, may be easily accounted for, independent of any idea of life. Every body knows, that a certain degree of heat relaxes the tone of the vegetable organs, and at the same time proportionally evaporates the fluids which these organs contain. Now, to whatever side of the plant that heat is principally applied, there of necessity must also be the greatest flaccidity of the fibres, and the greatest evaporation of the fluids; of course, from the law of gravitation, the flower, indeed the whole plant, must incline towards that side from whence the light or heat proceeds. The slightest observation is sufficient to convince us of the propriety of this method of accounting for the inclination of heavy flowers supported by weak stems, towards the rays of the sun. If a pot of flowers be put loosely into a glass, and allowed to remain a little time in an apartment where a fire is burning, as soon as the fibres begin to be enervated, they all, unless obstructed by some other cause, bend towards the fire. Hence the absurdity of ascribing this phenomenon to a sentient and living principle, which is more easily and with more certainty explained by the common laws of mechanism.

Let us next attend to Linnæus's argument under the article of *death*. After telling us, with much solemnity, that death is only a privation of life, and that vegetables *die* of many grievous distempers, he thus concludes; "With what propriety," says he, "could vegetables be thus said to *die*, unless it be allowed that they previously *lived*?" However, if the life of vegetables hath no other support than this trifling quibble, (for it merits not the name of argument), we are afraid that every man of common sense will conclude, that they never were endowed with *life*, and consequently cannot, with any more propriety than an ordinary figure of speech can bestow, be said to *die*.

Having in this manner attributed living powers to vegetables, Linnæus, in the next place, makes an effort to

show

flow, that they enjoy the faculty of generation. But what process of argumentation does he employ? He lays hold of another maxim of Dr Harvey: *Omne vivum ex ovo*, says Harvey. "Now," adds Linnæus, "we have already proved that vegetables *live*; and therefore they must in like manner derive their origin from eggs. Again, no eggs can be fertilized without receiving an impregnation from the semen of the male: And hence the eggs or seeds of vegetables must likewise be impregnated by the male vegetable semen, in order to their fertilization. Further, it is an essential property of an egg to produce a creature of the same species with that from which itself was produced: Hence the seeds are the eggs of vegetables. Besides, as the antheræ and stigmata are the only essential parts of a flower, it follows, that these parts are the organs of generation." In this way Linnæus goes on till he finds the antheræ to be the testes; the pollen, the semen; and the stigma, the female organ of generation.

But, as we have already shewn that Linnæus has remarkably failed in the proof of his first point, namely, that vegetables are endowed with life, his subsequent reasoning which rests solely on the supposition of the living powers of vegetables, must of course fall to the ground.

However, allowing a *spontaneous propulsion of humours* to be a perfect definition of life, philologists are far from being agreed with regard to the propriety of Harvey's second maxim. *Omne vivum ex ovo* may be applied to a great variety of animals. But to this day it remains a very doubtful point, whether man and most quadrupeds derive their existence from the same source. Hence the impropriety of drawing an analogy from a property not universal even among the animal creation in order to support an imaginary one among the vegetable tribes.

When our author comes to explain the manner in which the *coitus* of vegetables is performed, he tells us, that the pollen may be seen lying upon the top of the stigma in most hermaphrodite flowers, where it is dissolved by the moisture which constantly adheres to that part; and after this dissolution, that the *seminal aura* contained in the pollen is absorbed by the stigma, and so conveyed directly to the seeds.

This account of the *coitus* lies open to two objections. First, Admitting that the pollen may be seen adhering to the stigmata of most hermaphrodite plants, and admitting likewise that moisture causes the pollen to burst and discharge a *subtile fluid*, still a very natural question occurs with regard to the absorbing quality of the stigma. It is true, that the top of the stigma is generally covered with moisture. But does not this indicate that the proper office of the stigma is to secrete and propel rather than to absorb moisture? It will be the more readily admitted, that the vessels of the stigma are not suited to absorb, if it be considered that the moisture of the stigma is subjected to a constant evaporation, and of course must always stand in need of new supplies of this liquor, which can flow from no other source than the internal vessels of the stigma itself. It may indeed be alledged, that the stigma is furnished with two sets of vessels, one for absorbing the seminal fluid, another for secreting the dissolving

moisture. No body, however, has ever pretended to shew that the stigma is possessed of any peculiar vessels for absorbing; whereas every man's eyes will convince him that it is possessed of secreting vessels: Hence, until the absorbing quality of the stigma be sufficiently proved, the possibility of an impregnation in this way must at least remain problematical.

2dly, Linnæus makes the appearance of the pollen adhering to the stigmata of hermaphrodite flowers an ocular demonstration of an actual *coitus*. Granting this to be an ocular demonstration of the *coitus* of vegetables, should not the pollen be likewise seen adhering to the stigmata of dioicous plants? But the appearance of pollen upon the stigmata of dioicous plants has never yet been discovered. We may, therefore, fairly conclude, that if the appearance of pollen upon the stigmata of hermaphrodite flowers be an ocular demonstration of the *coitus* or copulation of plants, the want of that appearance, or no pollen's being ever seen upon the stigmata of dioicous flowers, must likewise be an ocular demonstration of the contrary!

In supporting theoretical opinions, mankind are extremely apt to render the subject ridiculous by pushing them too far. No man ever blundered more remarkably in this respect than Linnæus. He is not satisfied with attributing life and a generative faculty to plants: He must likewise attempt to prove, that this generative faculty is so strong and vigorous, as to enable them to produce hybrids or *mules*, by means of unnatural mixtures.

In support of this notion, he tells us, that, when the antheræ of a red tulip are cut off, and the ripe antheræ of a white one are shaken over the stigma of the red one, the seeds of the red tulip, by this artificial impregnation, will produce flowers streaked with red and white. Of this fact no body who knows any thing of the nature of tulips, and the changes to which the colour of their flowers are liable, will entertain any doubt. But this change of colour is evidently ascribed to a wrong cause; for the same change would unquestionably happen whether the antheræ of the white tulip had been shaken over the stigma of the red one or not. When tulips blow for the first time, their petals are generally of one uniform colour. For several succeeding seasons this original colour continues to vary, in so much that, by certain methods of culture, the colour of the flower may be varied without end. Linnæus, in his systematic works, wisely cautions his readers not to find any distinctions upon the colour of plants, which, he observes, is subject to such numberless alterations from culture, soil, and other casual incidents, that it can never furnish the botanist with any permanent or uniform marks. With what propriety, then, Linnæus attributes the change in the colour of this tulip to his artificial impregnation, is submitted to the consideration of his warmest admirers.

The first hint of *mules* was taken from a plant the figure and disposition of whose leaves, &c. resembled the *antirrhinum linaria*, or common yellow toad-flax: but attended with this peculiarity, that its parts of fructification were entirely dissimilar. Linnæus, when the plant was first presented to him, imagined it to be some kind

of deception. But, after a more accurate examination, the notion of a *spurious* issue opportunely came to his aid. The thought pleased him on a double account: It had a direct tendency to corroborate his favourite hypothesis, and laid the foundation of another still more extravagant. Now, thinks he, by this inflexible discovery, we shall be enabled to take a dry and rigid plant from the mountain's top, make it copulate with a moist and spongy aquatic, and their offspring will participate of the rigidity and hardness of the former, together with the moisture and flaccidity of the latter; and hence mankind shall soon be blessed with an easy purchase of their united virtues when flourishing in the intermediate vale! More wonderful still, we shall cause the plants which dwell upon the frozen mountains of Greenland to *intermarry* with the more delicate and wayward inhabitants of the torrid zone, and the constitutions of their children shall be so moulded and attempered, that they will live most comfortably in every temperate clime!—Not contented with extracting two theories out of this single plant, Linnæus forms a third still more wild and fantastical: "From this curious phenomenon," says he, "it is natural to think, that only two species of each genus existed *ab origine*, and that all the variety of species which now appear are only the span of fortuitous commixtures!"

If either the fortuitous or artificial copulation of two different species were capable of producing a third perfectly distinct from the other two, the number of species would be infinite. According to our author, every blast of wind, every butterfly, would daily produce hundreds of new species. Neither the gardener nor husbandman could purchase seeds with safety, unless they could discover, from inspection, whether they had been impregnated by the semen of the same, or of a different species. Linnæus would have us to believe, not only that different species of the same genus copulate together, but even that genera belonging to different classes engender, and beget mules. For example, he makes the *poterium hybridum* a mule, *begot* by the agrimonia eupatoria upon the *poterium sanguiforba*. The agrimonia belongs to the dodecandria digynia class, and the *poterium* to the monœcia polyandria. Now, let any man seriously consider the unavoidable consequences that would follow on the supposition that this wanton prostitution of sexes really existed among vegetables. In the first place, it would be impossible to reduce botany to any regular system; for every season would produce such a troop of new and strange plants, as would confound every scheme or method of classification that ever was, or ever will be invented. A botanist, for instance, carefully collects and preserves the seeds of the *poterium*, in order to raise that plant next season; but, after sowing the seeds, to his utter astonishment, not a single *poterium* appears, but every one of them is metamorphosed into a species of agrimonia, a plant so totally different that it cannot even be arranged under the same class. 2dly, Linnæus is obliged to confess, that his *vegetable mules*, are not subjected to that perverse law of nature, which cruelly prevents animal mules from propagating their species. On the contrary, his vegetable mules enjoy all the sweets of mutual em-

braces, and all the comforts that arise from a numerous progeny! It is a happy circumstance that the œconomy of nature is not influenced by the whims and caprices of those very ingenious and learned gentlemen whose heads are constantly hunting after hypothetical phantoms. There is hardly a general theory of the œconomy of animals, or vegetables, which, on the supposition of its truth, would not in a very short time extirpate both animals and vegetables from the face of the earth. In the theory under consideration, we have not only mules produced by different genera and species, but these very mules successfully propagating their kinds, and subject to be metamorphosed *ad infinitum* by subsequent impregnations. This would be strange work indeed! How unlike the œconomy of nature!—Let us take an example, and trace it through a few metamorphoses. A nettle receives an impregnation from an oak, the seed falls to the ground, a plant of a very uncouth aspect springs up; it is no longer a nettle, neither is it an oak; but then it makes an excellent *mule*! This mule next receives an impregnation from a turnip; the seed now brings forth neither a nettle, an oak, nor a common mule, but something so monstrous that no language can afford a name for it! These are a few of the consequences that would inevitably happen, if this theory of sexual embraces were really founded in nature.

It is natural to think, that no author would venture to publish a theory of this kind, without having previously made a great variety of successful experiments. If plants were really capable of unnatural commixtures, any person might make many hundred mules in the space of twelve months. But we can affirm with confidence, that Linnæus never made a single *vegetable mule* in his life. He has indeed collected forty-seven plants which he calls mules. Why? not because they were produced by an artificial or fortuitous impregnation; but because the leaves, stem, or parts of fructification have a resemblance to some other genus or species; even of these forty-seven he acknowledges that thirteen cannot be depended upon. The only attempts he has made to produce mules, have been confined to a few hermaphrodite plants: When endeavouring to *impregnate* a plant, Linnæus proceeds in this manner: He lays hold of a hermaphrodite plant just before the flowers begin to blow; unfolds the petals, cuts off all the stamina, and then with his own hands performs the office of a male plant, by shaking the pollen of a different species over its pistillum. This operation being finished, he sows the seeds next season:—Now, if Linnæus's theory were just, these seeds should produce mules, or plants which cannot be referred to any of the two species upon which the experiment was made. But all the changes he has ever been able to produce by his manual impregnations are confined to the colour of the flower; a different streak or shade in the petals passes with him for a mule or mixture of the species, although, in other parts of his works, he positively declares, that generic or specific differences can never be taken from the colour of flowers, as it is constantly liable to a thousand changes from causes that are merely fortuitous.

But no experiment can be made with any degree of candour upon hermaphrodite flowers. No man can determine  
with

with certainty what changes the young seeds may undergo, what injury they may suffer, by prematurely forcing open their petals and cutting off the stamina. If a pregnant animal be wounded, and in a part too intimately connected with the fœtus, what reason have we to hope for a beautiful or well-proportioned offspring? One thing however is certain, that if the office of the stamina, as is alleged by the opposers of the sexes, be to separate and carry off noxious or excrementitious matter from the fruit, the retention of this matter would of itself introduce a change into the colour of the future plant; because in that case the seeds would not be properly purged or rectified, being prematurely deprived of the vessels destined for that purpose.

We shall now examine the famous story of Baal the gardener at Brentford, related above in the historical view of the controversy. Linnæus accuses Baal's judges of ignorance, because they convicted him of fraud. But, would not any judge smile to hear himself branded with ignorance, or a partial administration of justice, merely because he paid no regard to the sexual commerce of plants in his decisions? It is happy for mankind that judges are obliged to decide according to law or equity, and not according to the hypothetical whims of the naturalist.—But, even supposing Baal's judges to have had a perfect knowledge of the sexual commerce of vegetables, and to have been at full liberty to determine the point of law upon that medium, if they had acquitted Baal of fraud, or at least of negligence, we should have been inclined to doubt both of their integrity and ingenuity.—It is acknowledged, that great quantities both of the *brassica florida* and *brassica longifolia* were raised that season in Baal's garden. A seedsmen or gardener, in packing up many parcels of different seeds, by the simple error of putting a wrong mark upon any of the parcels, would produce a mistake similar to this of Baal's. But, whether the circumstance took its rise from negligence or fraud, belongs not to our present inquiry. Even upon Linnæus's own principles, it is far from being clear of absurdity, how, by a casual impregnation, the species of a plant could be entirely changed. For, by the analogy of all animals, nay, taking our analogy from Linnæus's vegetable mules, this fortuitous impregnation should have only produced a mule, or mixture of the two species, and not a perfect metamorphosis of either. Hence it may be fairly concluded, that this famous story, upon which the sexualists lay so much stress, instead of strengthening, tends to the final destruction of that hypothesis in support of which it was originally adduced.

Of a similar nature is the story contained in Mylius's letter to Dr Watson. This gentleman writes to his correspondent, "that a female palm tree grew many years in the garden belonging to the Royal Academy at Berlin, without producing any ripe or fertile fruit; that a male branch, with its flowers in full blow, was brought from Leipsic, which is about twenty German miles from Berlin, and suspended over the female; the result of this operation was, that the female, that very year, produced roo ripe and fertile fruit. The same experiment being repeated the following year, 2000 ripe fruit were pro-

duced."—Not to call Mylius's veracity in question, we shall allow the fact to be as he has related it: Nevertheless it is far from being satisfactory. Berlin is not the native climate of palm-trees. Mylius informs us, that this palm bore flowers and fruit for thirty years before the experiment was tried; but the fruit never came to full maturity. Now it is well known, that many exotic plants, particularly those of the larger kinds, seldom produce ripe fruit in a climate which is not adapted by nature for their nourishment, unless they are assisted by artificial culture, and have grown in that climate for a great number of years. Mylius's palm-tree had carried unripe fruit for the space of thirty years. Now, according to the usual course of exotics, it is natural to think that, during all this time, the fruit was every season making gradual advances towards perfection: It might so fall out, then, that at the very season when the male branch was suspended over the female, the plant had arrived at the highest degree of perfection it could ever acquire in the climate of Berlin; and of course, the accidental circumstance of suspending the male branch over it, at this critical period, might give rise to the deception of attributing the perfection and fertilization of the fruit to the presence of the male branch. The circumstance of the tree's bringing forth only 100 ripe fruit the first year, and 2000 the second, remarkably favours this account of the matter.

However, be this as it will, the experiment is so very defective, that no conclusion can be drawn from it either for or against the sexual hypothesis. To convince any thinking person, that the fertility of this tree was solely owing to some impregnating virtue derived to it from the male branch, a branch should have been suspended over the female one year, omitted the next, and so on alternately for a course of years, or (as Linnæus would express it), giving her a husband one year, and depriving her of that gratification the next: After treating the female in this manner for several years, if it had uniformly happened, that the fruit was fertile every year the male branch was suspended over it, and unfertile every year that the suspension of the male branch was omitted, then indeed there would have been a foundation for concluding, that there was some connection between the fertility of the fruit and the presence of the male branch. But as this necessary step has been neglected, the experiment is incomplete, and the conclusion drawn from it uncandid and precipitate.

We cannot conclude our remarks on this theory, without hazarding a few observations on the truly miraculous effects which Linnæus ascribes to the wind. In accounting for the impregnation of all the dioecious and most of the hermaphrodite plants, recourse is constantly had to the wind, which is said to convey the pollen of the male to the stigmata of the female. When the female again is at such a distance as to render the carriage of the pollen suspicious or impossible, our author is not discouraged by this circumstance, but confidently asserts, that some insect has been rummaging amongst the stamina of the male, carries off a quantity of the pollen adhering to its legs, and, unconscious of its precious load, flies from flower to flower till it arrives at the unmarried female, where

where stopping to take another bait, it luckily deposits some of this adhering pollen directly upon the stigma of the female!—

Here it is proper to observe, that generation is one of the capital, and indeed one of the most important laws of nature that we are acquainted with. The laws of nature are all fixed, steady, and uniform in their operation. None of the effects produced by them are subject to those uncertainties which always result from chance or any fortuitous train of circumstances. But is there any thing in nature more unsettled, desultory, and capricious, than the direction and motions of the wind? Can we form a conception of any thing more casual and fortuitous than the wild and wayward paths of insects? The very supposition, therefore, that nature has left the generation of at least a tenth part of the whole vegetable tribes to these accidental causes, must be unphilosophical, whimsical, and absurd. We will be the more readily convinced of the absurdity of this doctrine, when it is considered that many of the monoecious and dioecious plants are of the utmost importance to the human race, and the consequent impropriety that the fructification of these should be subject to the sport of the winds.

After all, it requires the utmost stretch of fancy to conceive the possibility of a regular impregnation by means of the wind, even when the male and female are within 500 yards of each other, which is a much more favourable supposition than two, three, or according to some authors, a dozen miles. Conceive then a male and female hemp, or any other dioecious plant, growing 500 yards asunder. Let the male and female flowers, which, by the by, is not always the case, blow at the same time. Well, the antheræ are fully ripe; the pollen is discharged; and the stigma, as our author expresses it, *gaping wide* for its reception. Now, even this favourable supposition is subject to so many accidents, and pregnant with such a troop of improbabilities, that it is absolutely impossible, upon any principles of belief hitherto invented, to be fully persuaded that the pollen, in such circumstances, can be thus conveyed on the wings of the wind, directly to the stigma, a point in most plants just not invisible.—To accomplish a regular impregnation in this way, whenever the antheræ are ripe, the wind must blow in a direct line from the male to the female; if the blast be too strong, it will overthrow the mark; if too weak, it will fall short of it; if any vegetable or other body higher than the plants themselves intervene, the progress of the pollen will be intercepted;—if it rains, the pollen will be beat to the ground;—the least tremor of the air, or smaller blast reflected from any other quarter, will infallibly alter the direction of this fluctuating pollen.—Nay, supposing Linnaeus, or any other expert botanist, should take his station by the male plant, having his pockets loaded with pollen; suppose him further to take every advantage of wind and weather, and aiming at the female, let him, for hours together, throw at her repeated handfuls of this fructifying pollen, it is a thousand to one, if, at the distance of 500 yards, a single grain of pollen would touch any part of the female, and many millions to one against its falling directly upon the stigma of her respective flowers. In a word, this theory

of impregnation by the wind, is a palpable refuge of ignorance, invented with a view to account for the fructification of dioecious plants, which Linnaeus knew to be a formidable barrier standing in opposition to the sexual hypothesis. How far that obstacle is removed by this vague subterfuge, is submitted to the judgment of every candid inquirer.

Upon the whole, we have endeavoured to show, that every fact or experiment Linnaeus has employed to support his theory of the procreation of vegetables by means of sexual embraces, is either false, or accidental; and that the conclusions drawn from them are unnatural, and often strained to such a pitch of extravagance as renders them truly ridiculous.

The only argument that now remains to be examined, is drawn from the analogy betwixt animals and vegetables. That many beautiful analogies may be traced betwixt the animal and vegetable, is an undeniable truth. But, in reasoning upon a physical subject, which admits of a clear determination by experiment: to trust solely or chiefly to analogical deductions, is an evident mark either of a bad reasoner or an unstable hypothesis. The very nature of analogy presupposeth some radical difference in the subjects between which the resemblance subsists. If the analogy be supported by facts and experiments, they mutually strengthen the evidence. But, if the analogy be not supported by facts and experiments, or, if the experiments contradict the analogy, which is the case with the theory under consideration; in either of these instances the analogy is carried beyond its proper limits, and affords no argument in favour of the hypothesis. Without the concurrence of facts, how can we be certain but that the very property we contend for constitutes the essential difference betwixt the two subjects? Without facts, how can we be certain but that generation by the intercourse of sexes is the identical characteristic by which an animal and vegetable are distinguished? These principles are applicable even in the case of a perfect and uniform analogy, but acquire an accumulated force when the analogy is partial and incomplete, which is evidently the case with regard to the sexual commence of vegetables.

For example, to complete the analogy in dioecious plants, a male should be uniformly found growing by the side of the female; and besides, at the age of puberty, or as soon as the antheræ come to maturity, the male flower should be situated in such a manner, that the pollen could not possibly miss the stigmata of the female flowers, from whatever quarter the wind might blow: the same thing should take place with regard to the monoecious flowers. But this is not the analogy presented to us by nature. On the contrary, the males and females seldom grow in the neighbourhood of each other. Nothing is more common than to meet with large beds of males growing in one place, and large beds of females at the distance of some miles from them, pointing out, as it were, that no necessary connection, no mutual affection, no natural dependence subsisted between these males and females; but rather that nature intended, for some purpose or other, that they should be kept at a distance.

Further, the sexualists, in support of their theory, are

are obliged to have recourse to the unpardonable impropriety of employing a double analogy, the one betwixt the animal and vegetable, the other betwixt two different tribes of vegetables. In order to account for the propagation of the musci, fungi, and, in a word, the whole cryptogamia class, whose parts of generation are either wanting altogether, or invisible to our eye-sight, Linnæus maintains, that, this circumstance notwithstanding, they propagate their species by a regular and uniform commerce of sexes. "As it has been proven (says he) that all those plants whose organs of generations are visible, propagate their species by male and female embraces; therefore all those whose organs are less subject to our observation, must likewise propagate in the same way." Before such reasoning as this can admit even of a decent apology, before the sexualists attempt to shew that such plants enjoy the faculty of generation, it is incumbent on them to prove that they are possessed of generating organs.

According to the doctrine of sexes in vegetables, another capital defect, or rather redundancy, occurs in the analogy between the animal and vegetable. It is one of the most benevolent and useful laws in nature, that *mules*, or such animals as are produced by the unnatural mixtures of two different kinds, are deprived of the capacity of propagating their monstrous species. It is true, Linnæus's *mules* are not obliged to comply with this law; they are not animal but *vegetable mules*; and consequently may freely transmit their monstrous issue to posterity! As they are not objects of rewards or punishments, they cannot be answerable for the horrid consequences of turning the whole vegetable world into confusion, and covering the face of the earth with monsters horrible to behold!

It is a trite observation, that no fault is more common among bad writers than to render their arguments ridiculous by hunting down metaphors or analogies till every shadow of resemblance be lost. It is equally true, that this blunder occurs in almost every page of Linnæus's works. But it is peculiarly unlucky when an analogy is of such a nature that it necessarily runs into obscenity when treated in this manner. In pursuing a sexual analogy, the utmost delicacy of expression is required. This however is exceedingly difficult, especially when the analogy is pushed beyond its natural limits. But, in pursuing the *Sponsalia Plantarum*, one would be tempted to think, that the author had more reasons than one for relishing this analogy so highly. In many parts of this treatise, there is such a degree of indelicacy in the expression as cannot be exceeded by the most obscene romance-writer. For example, in p. 103. he says, "The calix is the *bride-chamber* in which the stamina and pistilla solemnize their nuptials;" "Vel, si mavis CUNNUS, seu LABIA ejusdem, inter quæ organa genitalia masculina & feminina, delicatissimæ istæ partes, foventur & ab externis injuriis muniuntur!—Corolla est *aulæum*, vel potius *nymphe*!—Filamenta sunt *vasa spermatica*, quibus succus ex planta secretus in antheras transfertur!—Antheræ sunt TESTICULI.—Pollen, seu pulvis antherarum, *genitura* & *vermiculis seminalibus* respondet.—Stigma est *vulva*, in qua

"agit *genitura* maris, quæque hanc excipit.—Stylus est *vagina*, vel potius pars illa quæ *tubæ Fallopiæ* respondet.—*Germen* est *ovarium*; continet etiam femina subventanea seu non fecundata ante *copulam*—*Pericarpium* est *ovarium fecundatum*."—In p. 90, &c. we meet with *virginæ vulva lascivæ hians—æstra venereæ agitata, pistillum stigmatæ hiat, RAPACIS INSTAR DRACONIS, nisi nisi masculinum pulverem affectat.*" &c. It is impossible to do justice to these expressions in any translation.

Besides the obscenity of these passages, it would be no difficult task to show that the analogies are entirely without foundation. The calix is made to represent no less than three things of very opposite natures; first, it is analogous to the *chamber of the bride*, then to the *female organ*, and last of all to the *LABIA*. What analogy is there betwixt the *corolla* of a plant and the *nymphe* of an animal? Where is the analogy between the *pollen* and the animalcules in *femine masculino*? &c.

There is not any science which has so little connection with theory as botany. Theorists may perplex and confound, but never can have the least tendency to assist the botanic student. A man would not naturally expect to meet with disgusting strokes of obscenity in a system of botany. But it is a certain fact, that obscenity is the very basis of the Linnæan system. The names of his classes, orders, &c. convey often the vilest and most unnatural ideas. For example, *diandria*, the name of his second class, is thus explained by Linnæus, "mariti duo in eodem conjugio; seu stamina duo in flore hermaphrodito;" i. e. *one female married to two males; or two stamina in a hermaphrodite flower*. The number of males goes on increasing till the 13th class, the plants belonging to which are said to have from 20 to 1000 husbands to one wife!—We might ask Linnæus, where is the analogy in this supposition? The syngenesia class is thus defined by Linnæus: "Mariti genitalibus socius constituerunt; seu stamina antheris in cylindrum coacta;" i. e. *the males have made a covenant with their testes; or the stamina are united by the anthers in the form of a cylinder*. The characters of the orders are still worse. *Polygamia frustranea*, the name of an order of the syngenesia class, is thus defined: "Frustranea dicitur, cum femine maritata, fertiles sunt, et speciem propagare queunt; castrata, impregnari nequeunt." Men or philosophers can smile at the nonsense and absurdity of such obscene gibberish; but it is easy to guess what effects it may have upon the young and thoughtless.

But the bad tendency upon morals is not the only evil produced by the sexual theory. It has loaded the best system of botany that has hitherto been invented, with a profusion of foolish and often unintelligible terms, which throw an obscurity upon the science, obstruct the progress of the learner, and deter many from ever entering upon the study.

Upon the whole, we must conclude, that the distinction of sexes among vegetables has no foundation in nature; or, at least, that the facts and arguments employed in support of this doctrine, when examined with any degree of philosophical accuracy, are totally insufficient to establish it.

**BOTARGO**, a kind of saufage, made with the eggs and blood of the sea-mullet, a large fish common in the Mediterranean. The best kind comes from Tunis in Barbary: It must be chosen dry and reddish. The people of Provence use a great deal of it, the common way of eating it being with olive oil and lemon juice. There is also a great consumption of botargo throughout all the Levant.

Botargo pays on importation  $2\frac{8}{10}$ d. the pound; whereof  $2\frac{2}{10}$ d. is repaid on exportation.

**BOTATRISSA**, in ichthyology, a synonyme of a species of gadus. See **GADUS**.

**BOTE**, in our old law books, signifies recompence or amends: Thus man-bote, is a compensation for a man slain.

There are likewise house-bote and plough-bote, privileges to tenants, of cutting wood for making ploughs, repairing tenements, and likewise for fuel.

**BOTELESS**, or **BOOTLESS**, is when an offender was said to be without emendation, when no favour can acquit him; as in the case of sacrilege.

**BOTHNIA**, the name of two provinces in Sweden, distinguished by the epithets east and west, and lying on each side the Bothnic gulf, which takes its name from them.

**BOTRYTIS**, in botany, a synonyme of a species of mucor. See **MUCOR**.

**BOTTLE**, a vessel proper to contain liquors, made of leather, glass, or stone. There are bottles of boiled leather, which are made and sold by the case-makers. Those among the ancient Hebrews were generally made of goat skin, with the hair on the inside, well pitched and stuck together; the mouth of the bottle was through the animal's paw that furnished the matter of it.

There are now in use bottles of fine glass which are commonly covered with ozier, and others of thick glass which are not covered. Formerly all those bottles made in France held exactly a pint Paris measure (or about a quart of our English wine measure); but since the tavern-keepers sell most of their wine in such bottles, notwithstanding an ordinance to the contrary, that one would think the glassmakers had entered into an agreement with them not to make any bottles that hold the full measure, there are none but what hold less, and some considerably so. See **GLASS-MAKING**.

In commerce, bottles of earth or stone pay  $11\frac{5}{10}$ d. each dozen, on importation; whereof  $10\frac{1}{10}$ d. is repaid on exporting them. Glass bottles covered with wicker, pay 6 s.  $7\frac{2}{10}$ d. the dozen; whereof 6 s.  $2\frac{2}{10}$ d. is repaid on exporting them. Glass bottles covered with leather, pay 1 l. 9 s.  $11\frac{7}{10}$ d. the dozen; whereof 1 l. 7 s.  $10\frac{1}{10}$ d. is repaid on exporting them. Glass bottles uncovered, pay 1 s.  $5\frac{2}{10}$ d. the dozen; 1 s.  $4\frac{7}{10}$ d. being repaid on exporting them. Bottles made of flint-glass, pay 8 d. for each pound weight; and those made of green glass, only 2 d. for each pound weight. Bottles made of wood, called *sucking-bottles*, pay by the gross, or twelve do-

zen, 1 s.  $11\frac{1}{10}$ d.; whereof 1 s.  $8\frac{7}{10}$ d. is repaid on exporting them.

**BOTTOM**, in a general sense, denotes the lowest part of a thing, in contradistinction to the top, or uppermost part.

**BOTTOM**, in navigation, is used to denote as well the channel of rivers and harbours, as the body or hull of a ship: Thus, in the former sense, we say, a gravelly bottom, clayey bottom, sandy bottom, &c. and in the latter sense, a British bottom, a Dutch bottom, &c.

By statute, certain commodities imported in foreign bottoms pay a duty called petty customs, over and above what they are liable to if imported in British bottoms.

**BOTTOMRY**, in commerce, a marine contract for the borrowing of money upon the keel or bottom of a ship, that is to say, when the master of a ship binds the ship itself, that if the money be not paid by the time appointed, the creditor shall have the said ship.

**BOTTOMRY** is also where a person lends money to a merchant, who wants it in traffic, and the lender is to be paid a greater sum at the return of the ship, standing to the hazard of the voyage. On which account, though the interest be greater than what the law commonly allows, yet it is not usury, because the money being furnished at the lender's hazard, if the ship perishes, he shares in the loss.

**BOTTOMY**. A cross bottomy, in heraldry, terminates at each end in three buds, knots or buttons, resembling, in some measure, the three-leaved grass: on which account Segouin, in his *Treſor Heraldique*, terms it *croix treſſee*. It is the badge of the order of St Maurice. See Plate LI. fig. 17.

**BOTWAR**, a town of Wirtemberg, in the circle of Swabia in Germany, situated about fifteen miles south-east of Hailbron: E. long.  $9^{\circ} 15'$ , and N. lat.  $49^{\circ}$ .

**BOTZEN**, a very beautiful town of Germany, in the Tyrolse.

**BOTZENBOURG**, a town of Germany, situated upon the Elbe, in the duchy of Mecklenburg, in  $11^{\circ} 23'$  E. long. and  $53^{\circ} 34'$  N. lat.

**BOVA**, a town of the kingdom of Naples in Italy, about twenty miles south east of Reggio: E. long.  $16^{\circ} 15'$ , and N. lat.  $38^{\circ} 10'$ .

**BOUCHAIN**, a fortified town of Hainaut, in the French Netherlands, about seven miles north of Cambray: E. long  $3^{\circ} 15'$ , and N. lat.  $50^{\circ} 30'$ .

**BOUCHE** of court, the privilege of having meat and drink at court, free. This privilege is sometimes only extended to bread, beer, and wine; and was anciently in use as well in the houses of noblemen, as in the king's court.

**BOUGE**, in commerce, a sort of fine, white, and clear flamine, of which shirts are made for most of the monks, who use none made of linen.

**BOUGH** denotes much the same with branch. See **BRANCH**.

**BOUILLON**, a strong town with a castle, about three leagues from Sedan, on the river Semoy: It is capital of a duchy of the same name, situated between the duchy

- duchy of Luxemburg and bishoprick of Liege: E. lon. 5°, and N. lat. 49° 49'.
- BOUILLON**, in the menage, a lump or excrescence of flesh, that grows either upon, or just by, the frush, insomuch that the frush shoots out, just like a lump of flesh, and makes the horse halt; and this we call the flesh blowing upon the frush. Menage horses, that never wet their feet, are subject to these excrescences, which make them very lame. See *FRUSH*.
- BOVINES**, a small town in the province of Namur, in the Austrian Netherlands, about ten miles south of Namur: E. long. 4° 50', and N. lat. 50° 20'.
- BOVINO**, a small city of the Capitanato, in the kingdom of Naples, about sixty miles east of the city of Naples: E. long. 16° 15', and N. lat. 41°.
- BOVISTA**, in botany, a synonyme of the lycoperdon. See *LYCOPERDON*.
- BOULDER-wall**, a kind of wall built of round flints or pebbles, laid in a strong mortar, and used where the sea has a beach cast up, or where there are plenty of flints.
- BOULETTE**, in the menage. A horse is called *boulette*, when the fetlock, or pollern-joint, bends forward, and out of its natural situation; whether through violent riding, or by reason of being too short jointed, in which case the least fatigue will bring it.
- BOULOGNE**, or *BLOGNE*, a port-town of France, situated in the province of Picardy, on the English channel: E. long. 1° 30', and N. lat. 50° 40'.
- BOULTINE**, a term which workmen use for a moulding, the convexity of which is just one fourth of a circle, being the member next below the plinth in the Tuscan and Doric capital.
- BOUNCE**, in ichthyology, the English name of a species of squalus. See *SQUALUS*.
- BOUNDS of lands**. See *ABUTTALS*.
- BOUNTY**, in commerce, a premium paid by the government to the exporters of certain British commodities, as sail-cloth, gold and silver lace, silk stockings, fish, corn, &c.
- The happy influence which bounties have on trade and manufactures is well known: Nor can there be a more convincing proof of the good intentions of the government under which we live, than the great care that is taken to give all possible encouragement to those who shall establish, or improve, any hazardous branch of trade.
- BOURBON**, or *MASCARENHA*, an island in the Indian ocean, about one hundred miles east of Madagascar, and subject to France: E. long. 54°, and S. lat. 21°.
- BOURBON-ARCHEBAUT**, the capital of the duchy of Bourbon, in the Lyonsis, in France: E. long. 3° 10', and N. lat. 46° 35'.
- BOURBON-LANCY**, a town of Burgundy, in France; in 3° 46' E. long. and 46° 33' N. lat.
- BOURBOURG**, or *BOURBORCH*, a town of the French Netherlands, about 10 miles south-west of Dunkirk; in 2° 10' E. long. and 50° 50' N. lat.
- BOURDEAUX**, the capital of all Guienne and Gascony, situated on the river Garonne, in 40° W. long. and 44° 50' N. lat.
- BOURDINES**, a town of the Austrian Netherlands, 10 miles north-east of Namur; in 5° E. long. and 50° 35' N. lat.
- BOURDONNE'E**, in heraldry, the same with *pomée*. See *POMÉE*.
- BOURG**, the capital of the island of Cayenne, a French colony on the coast of Guiana, in South America; in 52° W. long. and 5° N. lat.
- BOURG-EN-BRESSE**, the capital of Bresse, in the province of Burgundy, in France, 36 miles W. of Geneva, and 32 north of Lyons; in 5° 5' E. long. 46° 20' N. lat.
- BOURG-SUR-MER**, a town of Guienne, in France, 15 miles north of Bourdeaux, in 3° W. long.
- BOURGES**, the capital of the territory of Berry, in the Orleansis, in France, situated about 50 miles south-east of Orleans; in 2° 30' W. long. and 47° 10' N. lat.
- BOURGET**, a town of Savoy, six miles north of Chamberry; 5° 55' E. long. and 45° 45' N. lat.
- BOURIGNONISTS**, the name of a sect among the Low Country Protestants, being such as follow the doctrine of Antoinette Bourignon, a native of Lisle, an apostate of the Roman Catholic religion.
- The principles of this sect bear a very near resemblance to those of the Quakers or Quakers.
- BOURO**, an island in the Indian Ocean, subject to the Dutch; E. long. 124°, and S. lat. 3° 30'.
- BOUT**, in the menage. A horse is said to be a-bout, when he is overdone, and quite spent with fatigue.
- BOUTANT**, or *ARCH-BOUTANT*, in architecture, an arch, or part of an arch, abutting against the reins of a vault to prevent its giving way.
- A pillar BOUTANT* is a large chain or pile of stone, made to support a wall, terrace, or vault.
- BOUTE**, in the menage. A horse is called *bouté*, when his legs are in a straight line from the knee to the coronet: Short-jointed horses are apt to be *bouté*; and, on the other hand, long-jointed horses are not.
- BOUTON**, an island in the Indian Ocean: E. long. 121° 30', and lying between 4° and 5° S. lat.
- BOUVILLON**, a city of Luxemburg, in the Austrian Netherlands, about 40 miles west of Luxemburg: E. long. 5° and N. lat. 49° 55'.
- BOW**, a weapon of offence made of steel, wood, horn, or other elastic substances, which, after being bent by means of a string fastened to its two ends, in returning to its natural state, throws out an arrow with prodigious force.
- The use of the bow is, without all doubt, of the earliest antiquity. It has likewise been the most universal of all weapons, having obtained amongst the most barbarous and remote people, who had the least communication with the rest of mankind.
- The figure of the bow is pretty much the same in all countries, where it has been used; for it has generally two inflexions or bendings, between which, in the place where the arrow is drawn, is a right line. The Grecian bow was in the shape of a  $\pi$ , of which form we meet with many, and generally adorned with gold or silver. The Selylian bow was distinguished.

tinguished from the bows of Greece and other nations, by its incurvature, which was so great, as to form an half moon or femicircle. The matter of which bows were made, as well as their size, differed in different countries. The Persians had very great bows made of reeds; and the Indians had also, not only arrows, but bows made of the reeds or canes of that country; the Lycian bows were made of the cornel tree; and those of the Æthiopians, which surpassed all others in magnitude, were made of the palm-tree.

Though it does not appear, that the Romans made use of bows in the infancy of their republic, yet they afterwards admitted them as hostile weapons, and employed auxiliary archers in all their wars.

In drawing the bow, the primitive Grecians did not pull back their hand towards their right ear, according to the fashion of modern ages, and of the ancient Persians, but, placing their bow directly before them, returned their hand upon their right breast. This was also the custom of the Amazons.

The bow is a weapon of offence amongst the inhabitants of Asia, Africa, and America, at this day; and in Europe, before the invention of fire-arms, a part of the infantry were armed with bows. Lewis XI. first abolished the use of them in France, introducing, in their place, the halbard, pike, and broad sword. The long bow was formerly in great vogue in England, and many laws were made to encourage the use of it. The parliament under Henry VII. complained of the disuse of long bows, heretofore the safeguard and defence of this kingdom, and the dread and terror of its enemies.

Bow is also an instrument formerly used at sea for taking the sun's altitude; consisting of a large arch of ninety degrees graduated, a shank or staff, a shade vane, a sight vane, and an horizon vane. It is now out of use.

Bow, among builders, a beam of wood or brass, with three long screws, that direct a lath of wood or steel to any arch; chiefly used in drawing draughts of ships, and projections of the sphere; or where-ever it is requisite to draw large arches.

Bow, in music, a small machine, which, being drawn over the strings of a musical instrument, makes it resound. It is composed of a small stick, to which are fastened eighty or an hundred horse-hairs, and a screw which serves to give these hairs the proper tension. In order that the bow may touch the strings briskly, it is usual to rub the hairs with rosin.

Bow, among artificers, an instrument so called from its figure; in use among gunsmiths, locksmiths, watch-makers, &c. for making a drill go. Among turners, it is the name of that pole fixed to the ceiling, to which they fasten the cord that whirls round the piece to be turned.

Bow-STAVES, imported from the British plantations, are free; if from Ireland, Asia, or Africa, they pay 15s. 4 $\frac{1}{2}$ d. for every 120; and if from any other country, 1l. 2s. 10 $\frac{8}{10}$ d. for the same number.

Bows of a saddle are two pieces of wood laid archwise to receive the upper part of a horse's back, to give the saddle its due form, and to keep it tight.

The fore-bow, which sustains the pommel, is com-

posed of the withers, the breasts, the points or toes, and the corking. See WITHERS, &c.

The hind-bow bears the troufequin or quilted roll. The bows are covered with sinews, that is, with bulls pizzels beaten, and so run all over the bows to make them stronger. Then they are strengthened with bands of iron to keep them tight, and, on the lower side, are nailed on the saddle-straps, with which they make fast the girths.

Bow of a ship, that part which begins at the loof, and compassing ends of the stem, and ends at the stern-molt part of the fore-castle.

If a ship have a broad round bow, they call it a bold bow. If she has a narrow thin bow, they say she has a lean bow.

BOW-LINE. See BOWLING.

BOW-PIECES are the pieces of ordinance at the bow of a ship.

Rain-bow. See RAIN-BOW, and OPTICS.

Bow-BEARER, an inferior officer of the forest, who is sworn to make inquisition of all trespasses against vert or venison, and to attack offenders.

BOWE, a market-town of Devonshire, about twelve miles north-west of Exeter; W. long. 4°, and N. lat. 50° 45'.

BOWELS, in anatomy, the same with intestines. See p. 250, &c.

BOWER, in gardening, a place under covert of trees, differing only from an arbour, as being round or square, and made with a kind of dome or ceiling at top; whereas the arbour is always built long and arched.

BOWER, in the sea-language, the name of an anchor carried at the bow of a ship. There are generally two bowers, called first and second, great and little, or best and small bower. See ANCHOR.

BOWESS, or BOWET, in falconry, a young hawk, when she draws any thing out of her nest, and covets to clamber on the boughs.

BOWGE, or BOUCHE of court. See BOUCHE.

BOWL denotes either a ball of wood, for the use of bowling; or a vessel of capacity, wherein to hold liquors.

Bowls and buckets of wood, imported, pay a duty of 9 $\frac{1}{2}$ d. the dozen; whereof 8 $\frac{3}{4}$ d. is repaid on exporting them.

BOWLDER *Jones*, small stones, of a roundish figure, and no determinate size, found on the sea-shore and banks or rather channels of rivers.

BOWLING, the art of playing at bowls. The first thing to be observed in bowling is, the right chusing your bowl, which must be suitable to the ground you design to run on. Thus, for close alleys, the flat bowl is the best; for open grounds of advantage, the round biased bowl; and for plain and level wards, the bowl that is as round as a ball. The next is to chuse your ground; and, lastly, to distinguish the risings, fallings, and advantages of the places where you bowl.

BOWLING, or BOW-LINE, in a ship, a rope made fast to the leech or middle part of the outside of the sail: it is fastened by two, three, or four ropes, like a crow's foot,

foot, to as many parts of the sail; only the mizen bow-line is fastened to the lower end of the yard. This rope belongs to all sails, except the sprit-sail and sprit-top-sail. The use of the bow-line is to make the sails stand sharp or close, or by a wind.

Sharp the bow-line, is hale it taught, or pull it hard. Hale up the bow-line, that is, pull it harder forward on. Check or ease, or run up the bow-line, that is, let it be more slack.

**BOWLING-bridles**, are the ropes by which the bow line is fastened to the leech of the sail.

**BOWLING-knot**, a knot that will not slip, by which the bow-line bridle is fastened to the cringles.

**BOWLING-green**, a kind of parterre, laid with fine turf, designed for the exercise of bowling. See **BOWLING**.

**BOW-net**, among sportsmen. See **NET**.

**Bow-saw**, among artificers. See **SAW**.

**BOWSE**, in the sea-language, signifies as much as to hale or pull. Thus bowling upon a tack, is haling upon a tack. Bowse away, that is, pull away all together.

**BOW-SPRIT**, or **BOLT-SPRIT**, a kind of mast, resting slopewise on the head of the main stern, and having its lower end fastened to the partners of the fore-mast, and farther supported by the fore-stay. It carries the sprit-fail, sprit-top-sail, and jak-staff; and its length is usually the same with that of the fore-mast.

**BOW-SPRIT-LADDER**. See **LADDER**.

**BOWYERS**. artificers whose employment or occupation it is to make bows. There is a company of bowyers in the city of London, first incorporated in 1623.

**BOX**, in its most common acceptation, denotes a small chest or coffer for holding things.

Fire-boxes, or tinder-boxes, pay, on importation, a duty of 3s. 10 $\frac{3}{4}$ d. the gross; whereof 3s. 4 $\frac{1}{2}$ d. is repaid on exportation. Wooden money-boxes pay 3s. 7 $\frac{1}{2}$ d. the gross; whereof 3s. 2 $\frac{1}{2}$ d. is repaid on exportation. Nest-boxes pay 11s. 6 $\frac{1}{2}$ d. the gross; whereof 10s. 1 $\frac{1}{2}$ d. is repaid. Pepper-boxes pay 4s. 3 $\frac{1}{2}$ d.; whereof 3s. 9 $\frac{1}{2}$ d. is repaid. French boxes, for marmalade or jelly, pay each dozen 3s. 4 $\frac{1}{2}$ d.; whereof 1s. 9 $\frac{1}{2}$ d. is repaid. Sand-boxes pay 3s. 10 $\frac{1}{2}$ d. the gross; whereof 3s. 4 $\frac{1}{2}$ d. is repaid. Snuff-boxes, if of wood, pay 2s. 4 $\frac{1}{2}$ d. the dozen; whereof 2s. 1 $\frac{1}{2}$ d. is repaid; if of horn, they pay 4s. 9 $\frac{1}{2}$ d. the dozen; 4s. 3 $\frac{1}{2}$ d. being drawn back: if of ivory or tortoise-shell, they pay 9s. 6 $\frac{1}{2}$ d. the dozen; whereof 8s. 7 $\frac{1}{2}$ d. is drawn back. Soap-boxes pay 7s. 8 $\frac{1}{2}$ d. the shock, containing sixty boxes. Spice-boxes pay 1s. 1 $\frac{1}{2}$ d. the dozen. Tobacco-boxes, pay 5s. 9 $\frac{1}{2}$ d. the gross. Touch-boxes, covered with leather, pay only 6 $\frac{1}{2}$ d. the dozen; but if the leather be the most valuable part, they pay 6s. 11 $\frac{1}{2}$ d. for every 20s. value upon oath: if covered with velvet, they pay 2s. 10 $\frac{1}{2}$ d. the dozen: and if of iron, or other metal gilt, they pay 3s. 10 $\frac{1}{2}$ d. the dozen: in all which cases, a proportionable draw-back is allowed.

Box is also used for an uncertain quantity or measure: thus a box of quicksilver contains from one to two Vol. I. Numb. 28.

hundred weight; a box of prunellas, only 14 pounds; a box of rings for keys, two gros, &c.

**Box of a plough**, the cross-piece in the head of a plough, which supports the two crow-flaves. See **PLOUGH**.

**Box**, or **BOX-TREE**, in botany, the English name of the buxus. See **BUXUS**.

**BOXBERG**, a town of Germany in Franconia, belonging to the elector palatine.

**BOXTEL**, a town of Dutch Brabant, situated on the river Bommel, about eight miles south of Boisleduc, in 5° 16' E. long. and 51° 30' N. lat.

**BOXTHUDE**, a town of the duchy of Bremen, in Germany, about fifteen miles west of Hamburg, and subject to the elector of Hanover; E. long. 9° 16', and N. lat. 53° 50'.

**BOYAR**, a term used for a grandee of Russia and Transylvania.

Becman says, that the boyars are the upper nobility; and adds, that the Czar of Muscovy, in his diplomas, names the boyars before the waywodes. See **WAYWODE**.

**BOYAU**, in fortification, a ditch covered with a parapet, which serves as a communication between two trenches. It runs parallel to the works of the body of the place, and serves as a line of contravallation, not only to hinder the sallies of the besieged, but also to secure the miners. But when it is a particular cut that runs from the trenches to cover some spot of ground, it is drawn so as not to be enfiladed, or scourged by the shot from the town.

**BOYER**, a small vessel of burden, resembling a smack, with only one mast and a bolt-sprit.

**BOYES**, idolatrous priests among the savages of Florida.

Every priest attends a particular idol, and the natives address themselves to the priest of that idol to which they intend to pay their devotion.

The idol is invoked in hymns, and his usual offering is the smoke of tobacco.

**BOYNE**, a river of Ireland, which, taking its rise in Queen's county, in the province of Leinster, runs north-east by Trim and Cavan, and falls into the Irish channel, a little below Drogheda.

**BOZOLO**, a town of the duchy of Mantua, about 12 miles south-west of that city; E. long. 11°, and N. lat. 44° 40'.

**B QUADRO**, **QUADRATO**, or **DURALE**, in music, called by the French *b quarre*, from its figure  $\square$ . This is what we call B natural or sharp, in distinction to B mol or flat. See **FLAT**, and **SHARP**.

If the flat  $b$  be placed before a note in the thorough bass, it intimates, that its third is to be minor; and if placed with any cipher over a note in the bass, as  $b6$ , or  $b5$ , &c. it denotes, that the fifth or sixth thereto are to be flat. But if the quadro  $\square$  be placed over any note, or with a cipher, in the thorough bass, it has the contrary effect; for thereby the note or interval thereto is raised to its natural order.

**BRABANT**, a large province of the Netherlands, lying eastward of Flanders; the greater part of it is subject

- to the house of Austria, the capital Brussels; and the rest to the Dutch, their capital Bréda.
- BRABEJUM**, in botany, a genus of the tetrandria monogynia class. The corolla is below the fruit, and consists of four petals. It has no calix; the fruit is a hairy drupe, of an oval figure. There is only one species, *viz.* the stellatiferum, a native of Æthiopia.
- BRABEUTES**, or **BRABEUTA**, in antiquity, an officer among the Greeks, who presided at the public games, and decided controversies that happened among the antagonists in the gymnastical exercises. The number of brabeutes was not fixed; sometimes there was only one, but more commonly they amounted to nine or ten.
- BRACCIANO**, a town of St Peter's patrimony, about twelve miles north of Rome, situated on the west side of a lake, to which it gives name; E. long. 13<sup>o</sup>, and N. lat. 42<sup>o</sup>.
- BRACE** is commonly taken for a couple or pair, and applied by hunters to several beasts of game, as a brace of bucks, foxes, hares, &c.
- BRACE**, or **BRASSE**, is also a foreign measure, answering to our fathom. See **FATHOM**.
- BRACE**, in architecture, a piece of timber framed in with bevil joints, the use of which is to keep the building from swerving either way. When the brace is framed into the kingpoles or principal rafters, it is by some called a strut.
- BRACES**, in the sea-language, are ropes belonging to all the yards of a ship, except the mizen, two to each yard, reeved through blocks that are fastened to pennants, seized to the yard arms. Their use is either to square, or traverse the yards. Hence to brace the yard, is to bring it to either side. All braces come astward on, as the main-brace comes to the poop, the main-top-sail brace comes to the mizen-top, and thence to the main sheavens: The fore and fore-top-sail braces come down by the main and main-top-sail stays, and so of the rest. But the mizen-bywline serves to brace to the yard, and the cross-jack braces are brought forwards to the main sheavens, when the ship sails close by a wind.
- BRACED**, in heraldry, a term for the intermingling three choronzels. See Plate LI. fig. 18.
- BRACELET**, an ornament worn on the wrist, much used among the ancients: It was made of different materials, and in different fashions, according to the age and quality of the wearer.
- Bracelets are still worn by the savages of Africa, who are so excessively fond of them, as to give the richest commodities and even their fathers, wives, and children, in exchange for those made of no richer materials than shells, glass, beads, and the like.
- Bracelets of glass pay 3s. 8<sup>1</sup>/<sub>2</sub>d. the small gross, containing twelve bundles or dickers; and, if of the French manufacture, they pay 4s. 1<sup>1</sup>/<sub>2</sub>d. for the same quantity: A proportionable drawback is allowed in each case.
- BRACHLEUS**, in anatomy, the name of a muscle. See p. 197.
- Coraco-BRACHIALIS**, in anatomy, the name of a muscle. See p. 196.
- BRACHIONUS**, in zoology. See **LABELLA**.
- BRACHIUM**, or **ARM**, in anatomy, one of the superior extremities of the human body, comprehending the **SCAPULA**, the **OS HUMERI**, the **CUBIT**, and the **HAND**. See these articles.
- BRACHMINS**, a sect of Indian philosophers known to the ancient Greeks by the name of *Gymnosophists*. The ancient brachmins lived upon herbs and pulse, and abstained from every thing that had life in it. They lived in solitude without matrimony, and without property; and they wished ardently for death, considering life only as a burden. The modern brachmins make up one of the casts or tribes of the banians. They are the pre-ests of that people, and perform their office of praying and reading the law, with several mimical gestures, and a kind of quavering voice. They believe, that, in the beginning, nothing but God and the water existed, and that the supreme Being, desirous to create the world, caused the leaf of a tree, in the shape of a child playing with its great toe in its mouth, to float on the water. From its navel there issued out a flower, whence Brama drew his original, who was intrusted by God with the creation of the world, and presides over it with an absolute sway. They make no distinction between the souls of men and brutes, but say the dignity of the human soul consists in being placed in a better body, and having more room to display its faculties. They allow of rewards and punishments after this life; and have so great a veneration for cows, that they look on themselves as blessed, if they can but die with the tail of one of them in their hand. They have preserved some noble fragments of the knowledge of the ancient brachmins. They are skilful arithmeticians, and calculate, with great exactness, eclipses of the sun and moon. They are remarkable for their religious austerities. One of them has been known to make a vow, to wear about his neck a heavy collar of iron for a considerable time: Another to chain himself by the foot to a tree, with a firm resolution to die in that place: And another to walk in wooden shoes, stuck full of nails on the inside. Their divine worship consists chiefly of processions, made in honour of their deities. They have a college at Banara, a city seated on the Ganges.
- BRACHYGRAPHY**, the art of short-hand writing. See **SHORT-HAND**.
- BRACHYPTERA**, a term used by Willoughby, to denote those hawks which have their wings so short, as not to reach to the end of the tail: Of this kind are the goshawk, sparrow-hawk, &c.
- BRACHYPYRENIA**, in the history of fossils, a genus of septaria, with a short roundish nucleus. See **SEPTARIA**.
- BRACHYTELOSTYLA**, in natural history, the name by which Dr Hill calls those crystals, which are composed of a short hexangular column, terminated at each end by an hexangular pyramid. See **CRYSTAL**.
- BRACKET**, among carpenters, &c. a kind of wooden stay, serving to support shelves, and the like.

**BRACKETS**, in a ship, the small knees, serving to support the galleries, and commonly carved. Also the timbers that support the gratings in the head, are called brackets.

**BRACKETS**, in gunnery, are the cheeks of the carriage of a mortar: they are made of strong planks of wood, of almost a semicircular figure, and bound round with thick iron plates; they are fixed to the beds by four bolts, which are called bed-bolts; they rise up on each side of the mortar, and serve to keep her at any elevation, by means of some strong iron bolts, called bracket-bolts, which go through these cheeks or brackets.

**BRACKLAW**, the capital of the palatinate of Bracklaw, in Podolia, in Poland, situated on the river Bog, an hundred and ten miles east of Kamianec: E. long. 29° 20', and N. lat. 48°.

**BRACKLEY**, a borough-town of Northamptonshire, about fifteen miles south-west of Northampton: W. lon. 1° 15', and N. lat. 52°.

It sends two members to parliament.

**BRACTEA**, in natural history, denotes a spangle, or thin flake of any substance.

**BRACTEA**, in botany. See **FLORAL LEAF**.

**BRACTEARIA**, in natural history, a genus of talcs, composed of small plates in form of spangles, each plate either being very thin, or fissile into very thin ones.

Of this genus there are a great many species, called, from their different colours, *mica aurea*, or gold-glimmer; and *mica argentea*, silver-glimmer, or catsilver, &c.

**BRAD**, in geography, a town of Slavonia, situated on the north side of the river Save, eighteen miles south of Pofega: E. long. 18° 40', and N. lat. 45° 20'.

**BRADFIELD**, a market-town in Essex, fourteen miles north of Chelmsford: E. long. 30', and N. lat. 51° 54'.

**BRADFORD**, a market-town in Wiltshire, about nine miles west of the Devizes: E. long. 2° 40', and N. lat. 51° 20'.

**BRADFORTH**, a market town of Yorkshire, thirty miles fourth-west of York: W. long. 1° 35', and N. lat. 52° 40'.

**BRADNICH**, a market town of Devonshire, ten miles north of Exeter: W. long. 3° 35', and N. lat. 50° 45'.

**BRADS**, among artificers, a kind of nails used in building, which have no spreading heads, as other nails have. They are distinguished, by iron-mongers, by six names, as joiner's-brads, flooring-brads, batten-brads, bill-brads, or quarter heads, &c. Joiner's-brads are for hard waisteot, batten brads are for soft waisteot; bill-brads are used when a floor is laid in haste, or for shallow joists subject to warp. See **NAIL**.

**BRADYPUS**, or sloth, a genus of quadrupeds belonging to the order of bruta. The characters are these: They have no fore-teeth in either jaw; the dog-teeth are blunt, solitary, and longer than the grinders; they have five grinders on each side. The body is covered with hair. There are only two species of bradypus, viz. 1. The trid. & lis, or American

sloth, has a short tail, and only three toes on each foot. It is about the size of a fox. The body is covered over with hair of a grey colour; the face is naked; the throat is yellowish; the fore-feet are longer than the hind-feet; the claws, which are three on each foot, are compressed, and very strong; and they have no mammae on the breast; they have no external ears, but only two winding holes. This species is a native of America, and feeds upon the tender leaves of trees, and particularly the leaves of the cecropia. It never drinks, and is terrified at rain. It climbs trees with great ease; but its motion on the ground is so slow, that it can hardly walk fifty paces in a day, and from this circumstance it is called a *Sloth*. It makes a most disagreeable noise, resembling that of a young cat. See **PLATE LIX.** fig. 1. 2. The didactylus, or Ceylon sloth, has two toes on each foot, and no tail: The head is round; the ears are large; and it has two mammae on the breast: The body is covered with ash-coloured hair. It has the same disagreeable cry with the American sloth, and is a native of Ceylon.

**BRAG**, an ingenious and pleasant game at cards, where as many may partake as the cards will supply; the eldest hand dealing three to each person at one time, and turning up the last card all round. This done, each gambler puts down three stakes, one for each card. The first stake is won by the best card turned up in the dealing round; beginning from the ace, king, queen, knave, and so downwards. When cards of the same value are turned up to two or more of the gamblers, the eldest hand gains; but it is to be observed, that the ace of diamonds wins, to whatever hand it be turned up.

The second stake is won by what is called the brag, which consists in one of the gamblers challenging the rest to produce cards equal to his: Now it is to be observed, that a pair of aces is the best brag, a pair of kings the next, and so on; and a pair of any sort wins the stake from the most valuable single card. In this part consists the great diversion of the game; for, by the artful management of the locks, gettures, and voice, it frequently happens, that a pair of fives, treys, or even duces, out-brags a much higher pair, and even some pairs royal, to the no small meriment of the company. The knave of clubs is here a principal favourite, making a pair with any other card in hand, and with any other two cards a pair royal.

The third stake is won by the person who first makes up the cards in his hand one and thirty; each dignified card going for ten, and drawing from the pack, as usual in this game.

**BRAGA**, the capital of the province of Entre-minhuro, in Portugal, situated on the river Cavado, 32 miles north of Porto: W. long. 8° 40', and N. lat. 41° 20'.

**BRAGANZA**, a city of the province of Tralofmontes, in Portugal, situated on the river Sabor, in 7° W. long. and 41° 50' N. lat.

**BRAGGET**, a kind of drink made of malt, honey, and spices, much used in Wales.

**BRAIL**, or **BRAILS**, in a ship, are small ropes made

- use of to furl the sails across: They belong only to the two courses and the mizen sail; they are reeved through the blocks, seized on each side the ties, and come down before the sail, being at the very skirt thereof fastened to the cringles; their use is, when the sail is furled across, to hale up its bunt, that it may the more easily be taken up or let fall. Hale up the brails, or brail up the sail, that is, hale up the sail, in order to be furled or bound close to the yard.
- BRALLOW**, a town of Podolia, in Poland, situated on the river Bog, 40 miles north of Bracklow; E. long. 29°, and N. lat. 48° 50'.
- BRAIN**, in anatomy. See p. 233, &c.
- BRAIN LE COMPTE**, a town of Hainaut, in the Austrian Netherlands, fifteen miles south-east of Brussels, and nine north-east of Mons; E. long. 4°, and N. lat. 50° 40'.
- BRAINTREE**, a market-town of Essex, 12 miles north of Chelmsford; E. long. 35°, and N. lat. 51° 50'.
- BRAKE** denotes female fern, or the place where it grows: Also a sharp bit or snaffle for horses; and a baker's kneading trough: Also an instrument with teeth, to bruise flax or hemp.
- BRAKEL**, a town of the bishopric of Paderborn, in the circle of Westphalia, in Germany; E. long. 9°, and N. lat. 51° 40'.
- BRALROENS**, one of the Sunda-Islands, lying north-east of Java, in 4° 30' N. lat.
- BRAMA**, in ichthyology, the trivial name of a species of cyprinus. See **CYPRINUS**.
- BRAMANT**, a town of Savoy, 35 miles north-west of Turin; E. long. 6° 45', and N. lat. 45°.
- BRAMBER**, a borough-town of Suffex, about 16 miles south-east of Grinstead; W. long. 15°, and N. lat. 50° 50'. It sends two members to parliament.
- BRAMBLE**, or **BRAMBLE-BUSH**, in botany, the English name of the *rubus*. See **RUBUS**.
- BRAMBLE-NET**, otherwise called *hallier*, is a net to catch birds in, of several sizes; the great meshes must be four inches square; those of the least size are three or four inches square; and those of the biggest five. In the depth, they should not be above three or four inches; but as for the length, they may be enlarged at pleasure; the shortest being eighteen feet long.
- BRAMBLE**, or **BRAMBLING**, in ornithology, the English name of a species of *fringilla*. See **FRINGILLA**.
- BRAMINS**, the name of the priests among the idolatrous Indians; the successors of the ancient brachmans. See **BRACHMANS**.
- BRAMPORE**, a town of the Hither Peninsula of India; E. long. 77°, and N. lat. 21° 30'.
- BRAMPTON**, a market-town of Cumberland, about six miles north-east of Carlisle; W. long. 2° 40', and N. lat. 54° 50'.
- BRAMYARD**, a market-town of Herefordshire, about 12 miles north-east of Hereford; W. long. 2° 30', and N. lat. 52° 20'.
- BRAN**, the skins or husks of corn, especially wheat ground, separated from the flour by a sieve or boulder. It is of wheat-bran that sarch-makers make their sarch. The dyers reckon bran among the not-colouring drugs, and use it for making, what they call, *the four waters*, with which they prepare their several dyes.
- BRANCH**, in botany, an arm of a tree, or a part, which, sprouting out from the trunk, helps to form the head or crown thereof.
- BRANCHES of a bridle**, in the manege, are two pieces of iron bended, which, in the interval, between the one and the other, bear the bit-mouth, the cross-chains, and the curb; so that on one end they answer to the head-stall, and on the other to the reins, in order to keep the horse's head in subjection. With regard to their form and structure, branches are either straight, in form of a pistol, for young horses to form their mouth; or, after the countable of France's fashion, proper for a horse that carries his head well. Some are in form of a gigot or leg, which will prevent horses from carrying too low: Some in form of a bent knee, contrived for horses that arm themselves against the operation of the bit; and others after the French fashion, which is hardly about  $\frac{1}{3}$  of an inch at the sevile hole, and kneed  $1\frac{1}{4}$  inch at the jarret or ham.
- It is to be observed, 1. That the farther the branch is from an horse's neck, the more effect it will have. 2. That short branches, *cæteris paribus*, are ruder, and their effects more sudden, than those of longer. 3. That the branch is to be proportioned to the length of a horse's neck; and one may sooner err in chusing one too short than too long.
- BRANCHES of ogives**, in architecture, are the arches of Gothic vaults. These arches traversing from one angle to another diagonal wise, form a cross between the other arches, which make the sides of the square, of which the arches are diagonals.
- BRANCH of a trench**. See **BOYAU**.
- BRANCH of a mine**. See **GALLERY**.
- BRANCH-STAND**, with falconers, a term used to signify the making a hawk leap from tree to tree, till the dog springs the game.
- BRANCHER**, among sportsmen, a young hawk, newly taken out of the nest, that can hop from bough to bough.
- BRANCHIÆ**, or **GILLS**, in the anatomy of fishes, the parts corresponding to the lungs of land-animals, by which fishes take in and throw out again a certain quantity of water, impregnated with air. All fishes, except the cetaceous ones and the petromyzum, are furnished with these organs of respiration; which are always eight in number, four on each side the throat. That next the heart is always the least, the rest increasing in order as they stand near the head of the fish.
- Each of these gills is composed of a bony lamina, in form of a semicircle, for the most part; and on its convex side stand the leaves or lamellæ, like so many sickles. The whole convex part of the lamellæ is beset with hairs, which are longest near the base, and decrease gradually as they approach towards the point. There are also hairs on the concave side of the lamellæ, but shorter than the others, and continued only to its middle.

The convex side of one lamina is fitted into the concave side of the next superior one; and all of them are connected together by means of a membrane, which reaches from their base half-way their height, where it grows thicker, and in some measure resembles a rope. The rest of the lamina is free, and terminates in a very fine and flexible point.

As to the use of these gills, they seem to be designed to receive the blood protruded from the heart into the aorta, and convey it into the extremities of the lamellæ; from whence being returned by veins, it is distributed over the body of the fish.

**BRANCHIARUM foramina**, apertures of the gills. In most fishes there is only one aperture; in the cartilaginous ones, these apertures are ten in number, five on each side; and in the petromyzon or lamprey, there are no less than fourteen of these apertures, seven on each side.

As to the cetaceous fishes, they have no aperture of this kind; and the reason seems to be, because they are furnished with lungs.

**BRANCHIDÆ**, in Grecian antiquity, priests of the temple of Apollo, which was at Dydimus in Ionia, a province of lesser Asia, towards the Ægean sea, upon the frontiers of Caria. They opened to Xerxes the temple of Apollo, the riches whereof he took away. After which, thinking it unsafe to stay in Greece, they fled to Sogdiana, on the other side of the Caspian sea, upon the frontiers of Persia, where they built a city, called by their own name; but they did not escape the punishment of their crime: For Alexander the Great having conquered Darius king of Persia, and being informed of their treachery, put them all to the sword, and razed their city, thus punishing the impiety of the fathers in their posterity.

**BRANCHON**, a town of the Austrian Netherlands, about eight miles north of Namur: E. long.  $4^{\circ} 50'$ , and N. lat.  $50^{\circ} 32'$ .

**BRANCHUS**, a defluxion of humours upon the fauces, being a species of catarrh.

**BRANDEIS**, a town of Bohemia, situated on the river Elbe, ten miles north-east of Prague: E. long.  $14^{\circ} 25'$ , N. lat.  $50^{\circ} 15'$ .

**BRÄNDENBURG**, a city of the marquisate of Brandenburg in Germany, situated on the river Havel, twenty-six miles west of Berlin: E. long.  $13^{\circ}$ , N. lat.  $52^{\circ} 25'$ .

It was once the capital of Brandenburg; but is now on the decline, since Berlin supplanted it.

**BRANDON**, a market-town of Suffolk, ten miles north of Bury: E. long.  $45'$ , N. lat.  $52^{\circ} 30'$ .

It gives the title of duke to his grace the duke of Hamilton.

**BRANDRITH**, a trevet, or other iron utensil, to fit a vessel on over the fire.

**BRANDY**, a spirituous and inflammable liquor, extracted from wine and other liquors, by distillation. See **CHEMISTRY**, *Of spirituous fermentation, and distilling*.

Wine-brandy, made in France, is esteemed the best in Europe. They make it where ever they make wine,

and for that purpose use wine that is pricked rather than good wine. The chief brandies for foreign trade, and those accounted best, are the brandies of Bourdeaux, Rochelle, Cogniac, Charenton, the île of Rhe, Orleans, the county of Blaisois, Poitou, Touraine, Anjou, Nantes, Burgundy, and Champagne.

**BRANLIN**, in ichthyology, a species of salmon, with several transverse black streaks, resembling the impression of so many fingers.

**BRANSKA**, a town of Transylvania, situated on the river Marih: E. long.  $23^{\circ} 15'$ , and N. lat.  $46^{\circ}$ .

**BRASEM**, in ichthyology, a fish otherwise called *acara* peba.

**BRASIDIA**, an anniversary solemnity at Sparta, in memory of Brasidas, a Lacedæmonian captain, famous for his achievements at Methone, Pylos, and Amphipolis. It was celebrated with sacrifices and games, wherein none were permitted to contend, but free-born Spartans. Whoever neglected to be present at the solemnity was fined.

**BRASIL**, or **BRAZIL**, a large maritime country of South America, lying between  $35^{\circ}$  and  $60^{\circ}$  W. lon. and between the equator and  $35^{\circ}$  S. lat.

It is bounded by the Atlantic ocean and the river Amazon on the north, by the same ocean on the east, by the river of Plate on the south, and by Paraguay on the west; being computed to be 2500 miles in length, and 700 miles in breadth. The Portuguese have now the sole dominion of this extensive country, where, besides sugar and tobacco, there are rich mines of gold and diamonds; from whence his Portuguese majesty draws a very considerable revenue.

**BRASIL wood**, or **BRAZIL wood**, an American wood of a red colour, and very heavy. It is denominated variously, according to the places from whence it is brought: Thus we have brasil from Fernambouco, Japan, Lamon, &c.

The brasil-tree ordinarily grows in dry barren places, and even in the cliffs of rocks: It is very thick and large, usually crooked and knotty: Its flowers, which are of a beautiful red, exhale a very agreeable smell.

Though the tree be very thick, it is covered with so gross a bark, that when the savages have taken it off, the wood or trunk, which was before the thickness of a man, is scarce left equal to that of his leg.

This wood must be chosen in thick pieces, close found, without any bark on it, and such as, upon splitting, of pale becomes reddish, and, when chewed, has a saccharine taste. It is much used in turned work, and takes a good polish: But its chief use is in dyeing, where it serves for a red colour: It is a spurious colour, however, that it gives, and easily evaporates and fades; nor is the wood to be used without alum and tartar. From the Brasil of Fernambouco, is drawn a kind of carmine, by means of acids: There is also a liquid lacca made of it, for miniature.

**BRASLAW**, the capital of a palatinate of the same name, in the province of Lithuania in Poland: E. lon.  $26^{\circ}$ , N. lat.  $56^{\circ} 20'$ .

**BRASS**, or, as the French call it, *yellow copper*, is a factitious metal, made of copper and zinc, or lapis calaminaris. See *CHEMISTRY, Of zinc*

**Corinthian BRASS** has been famous in antiquity, and is a mixture of gold, silver, and copper. L. Mummius having sacked and burnt the city of Corinth, 146 years before Christ, it is said this metal was formed from the immense quantities of gold, silver and copper wherewith that city abounded, thus melted and run together by the violence of the conflagration.

**BRASS-colour**, one prepared by the braziers and colourmen to imitate brads. There are two sorts of it, the red brads, or bronze and the yellow or gilt brads: The latter is made only of copper-filings, the smallest and brightest that can be found; with the former they mix some red ochre, finely pulverized; they are both used with varnish.

**BRASSE**, in ichthyology, the English name of the perca lucioperca. See *PERCA*.

**BRASSICA**, or **CABBAGE**, in botany, a genus of the tetradynamia filiquota class. The calix is erect and connivent; the seeds are globular; and there is a nectariferous gland between the pillulum and the short stamina, and between the calix and the long stamina. There are ten species of this plant, most of which are excellent pot-herbs, and cultivated in our gardens.

**BRASSICAVIT**, or **BRACHICAVIT**, in the menage, is a horse whose fore-legs are naturally bended archwise: being so called by way of distinction from an arched horse, whose legs are bowed by hard labour.

**BRAVA**, or *Pareira-BRAVA*. See *PAIREIRA BRAVA*.

**BRAULS**, Indian cloths with blue and white stripes. They are otherwise called turbants, because they serve to cover those ornaments of the head, particularly on the coast of Africa.

**BRAUNAU**, or **BRANAU**, a town of Bavaria in Germany, about twenty five miles south-west of Passau.

**BRAUNSBURG**, a town of Prussia, situated on the Baltic sea, about thirty miles south-west of Koningzburg: E. long. 20°, N. lat. 54° 15'.

**BRAVO**, one of the Cape verd islands: W. long. 25°, N. lat. 14°.

**BR AURONIA**, in Grecian antiquity, a festival in honour of Diana, surnamed *Brauronia*, from its having been observed at Brauron, an Athenian borough.

This festival was celebrated once in five years, being managed by ten men, called, in Greek, [*ieropoioi*]. The victim offered in sacrifice was a goat, and it was customary for certain men to sing one of Homer's iliads. The most remarkable persons at this solemnity were young virgins, habited in yellow gowns, and consecrated to Diana. It was unlawful for any of them to be above ten, or under five years of age.

**BRAWN**, the flesh of a boar soured or pickled; for which end the boar should be old; because the older he is, the more horny will the brawn be.

The method of preparing brawn is as follows: The boar being killed, it is the flitches only, without the legs, that are made brawn; the bones of which are to be taken out, and then the flesh sprinkled with salt, and laid in a tray, that the blood may drain off: Then

it is to be salted a little, and rolled up as hard as possible. The length of the collar of brawn, should be as much as one side of the boar will bear; so that when rolled up, it will be nine or ten inches diameter.

The collar being thus rolled up, is to be boiled in a copper, or large kettle, till it is so tender, that you can run a straw through it; then set it by, till it is thorough cold, and put it into the following pickle. To every gallon of water, put a handful or two of salt, and as much wheat bran: Boil them together, then drain the bran as clear as you can from the liquor; and when the liquor is quite cold, put the brawn into it.

**BRAY**, a town of Champaign in France, about 16 miles north of Sens: E. long. 3° 20', N. lat. 48° 25'.

**BRAY** is also the name of a port town of the county of Wicklow, and province of Leinster, in Ireland; W. long. 6° 16', N. lat. 53° 12'.

**BRAYLE**, among sportsmen, a piece of leather slit to put upon the hawk's wing, to tie it up.

**BRAZED**, in heraldry, a term serving to describe three cheverons, one clasping another.

**BRAZEN**, something consisting of brads, or formed out of it. See *BRASS*.

**BRAZIER**, an artificer who makes or deals in all kinds of brads-ware.

**BRAZIL**. See *BRAZIL*.

**BRAZING**, the folding or joining two pieces of iron together by means of thin plates of brads, melted between the pieces that are to be joined. If the work be very fine, as when two leaves of a broken saw are to be brazed together, they cover it with pulverized borax, melted with water, that it may incorporate with the brads powder, which is added to it: The piece is then exposed to the fire without touching the coals, and heated till the brads is seen to run.

**BRAZING** is also the joining two pieces of iron together by beating them hot, the one upon the other, which is used for large pieces by farriers, &c.

**BRAZZA**, a town and island on the coast of Dalmatia, in the Gulph of Venice; E. long. 18°, N. lat. 43°.

**BREACH**, in fortification, a gape made in any part of the works of a town by the cannon or mines of the besiegers, in order to make an attack upon the place. To make the attack more difficult, the besieged, on the breach with crow-fer, or stop it with chevaux de frize.

A practicable breach, is that where the men may mount and make a lodgement, and ought to be fifteen or twenty fathoms wide. The besiegers make their way to it, by covering themselves with gabions, earth-bags, &c.

**BREACH**, in a legal sense, is where a person breaks through the condition of a bond or covenant; or an action upon which, the breach must be assigned: And this assignment must not be general, but particular; as, in an action of covenant for not repairing houses, it ought to be assigned particularly what is the want of reparation; and in such certain manner, that the defendant may take an issue.

**BREAD**, a mass of dough, kneaded and baked in an oven. See **BAKING**.

Bread ought to be well kneaded, and seasoned with a little salt, otherwise it is accounted very unwholesome.

We find bread sometimes made of rye, oats, barley, or vetch-flour; but of all others, that prepared from wheat affords the most wholesome nourishment. In several parts of Asia, Africa, and America, they make bread of maize-flour; besides which, the Americans make bread of the cassava root. See **CASSAVA**.

Some are of opinion, that corn growing in gravelly and light lands, makes better bread than that which grows in deep and low grounds.

**French-BREAD**. To make good French bread, for every two quarts of flour, add six spoonfuls of ale yeast; also milk and water, warmed; a bit of butter, and a little salt; make them pretty light, and letting them rise before the fire, bake them in a quick oven.

Some put the yolks of six eggs, and the whites of two, to this quantity; but others think the bread better without them.

Foreign bread, or bisket, pays duty on importation 1s. 7 $\frac{1}{2}$ <sup>3</sup>/<sub>4</sub>d. for every 112lb. whereof 1s. 5 $\frac{3}{4}$ <sup>3</sup>/<sub>4</sub>d. is repaid on exporting it again.

**BREAD-ROOM**, in a ship, that destined to hold the bread, or bisket.

The boards of the bread-room should be well joined and caulked, and even lined with tin plates, or mats. It is also proper to warm it well with charcoal, for several days before the bisket is put into it; since nothing is more injurious to the bread than moisture.

**BREAD**, in scripture style, is taken for every sort of food. The ancient Hebrews had several ways of baking bread, as baking it under the ashes, between two fires made of cow-dung, and in an oven. The Jews had, besides their leavened and unleavened bread, their shew-bread, bread of affliction, &c. See the articles **LEAVENED**, &c.

**BREADTH**, in geometry, one of the three dimensions of bodies, which multiplied into their length constitutes a surface.

**BREAK**, in a general sense, signifies to divide a thing into several parts with violence.

In the art of war, to break ground, is to open the trenches before a place.

Among sportsmen, to break a horse in trotting, is to make him light upon the hand in trotting, in order to make him fit for a gallop. To break a horse for hunting, is to supple him, to make him take the habit of running.

**BREAKING**, in a mercantile style, denotes the not paying one's bills of exchange, accepted, or other promissory notes, when due; and absconding, to avoid the severity of one's creditors. In which sense, breaking is the same with becoming bankrupt. See **BANKRUPT**.

**BREAKING BULK**, in the sea language, is the same with unloading part of the cargo.

**BREAM**, in ichthyology, the English name of the cyprinus brama. See **CYPRINUS**.

**BREAST**, in anatomy, denotes the fore-parts of the thorax. See **ANATOMY**, p. 227.

**BREASTS**, or **MAMMÆ**, in anatomy. See **ANATOMY**, p. 227.

**BREAST-PLATE**, in antiquity, a piece of armour worn to defend the breast, originally believed to be made of hides, or hemp twisted into small cords, but afterwards made of brass, iron, or other metals, which were sometimes so exquisitely hardened, as to be proof against the greatest force.

**BREAST-PLATE**, in the menage, the strap of leather that runs from one side of the saddle to the other, over the horse's breast, in order to keep the saddle tight, and hinder it from sliding backwards.

**BREAST-PLOUGH**, one so fashioned that a man may shove it before him.

**BREAST-WORK** the fame with parapet. See **PARAPET**.

**BREATH**, the air inspired and expelled again in the action of respiration.

**BREATH**, or **WIND**, in the menage, sometimes signifies the easy respiration of an horse, and sometimes it implies the ease and rest or repose of a horse; as, give your horse breath, that is, do not ride him down; give that leaping horse a long breathing-time between the turns or repetitions of his menage, &c.

**BREATHING**, the same with respiration.

**BRECHIN**, a borough-town of the county of Angus in Scotland, about 15 miles north-east of Dundee; W. long. 2° 20', north lat. 56° 40'.

**BRECON**, or **BRECKNOCK**, a borough-town of Brecknockshire, in Wales; W. long. 3° 25', N. lat. 52°.

**BREDA**, the capital of Dutch Brabant, about 30 miles north-east of Antwerp; E. long. 4° 40', N. lat. 51° 40'. It is a strong fortified town.

**BREECHES**, a kind of close garment or covering for the thighs, hips, &c. worn by the modern Europeans.

The breeches are peculiar to the male sex, and answer, in some measure, to the femoralia of the Romans.

**BREECH** of a great gun, or cannon, the end next the touch-hole.

**BREECHINGS**, in the sea-language, the ropes with which the great guns are lashed, or fastened to the ship's side.

They are thus called, because made to pass round the breech of the gun.

**BREEDING**, in a general sense, the producing, nourishing, and educating all manner of young animals.

**BREEDING of horses**. See **EQUUS**.

**BREEZE**, a shifting wind, that blows from sea or land for some certain hours in the day or night; common in Africa and some parts of the E. and W. Indies.

The sea breeze is only sensible near the coasts; it commonly rises in the morning, about nine, proceeding slowly in a fine small black curl on the water, towards the shore; it increases gradually till twelve, and dies about five. Upon its ceasing, the land-breeze commences, which increases till twelve at night, and is succeeded in the morning by the sea-breeze again.

**BREEZE**, in brick-making, small ashes and cinders, sometimes made use of instead of coals, for the burning of bricks: But as this does not so well answer the end, the use of it is prohibited by 12 George I. cap. xxxv.

**BREEZE**,

- BREEZE**, is also the name of an insect, called the gad-fly, or horse-fly. See **FLY**.
- BREGENTS**, or **BERGENTS**, a town situated at the east end of the lake of Constance, in the county of Tyrol in Germany; E. long.  $9^{\circ} 40'$ , and N. lat.  $47^{\circ} 26'$ .
- BREGMA**, in anatomy, the same with finciput. See **ANATOMY**, p. 154.
- BREIDEWICK**, a cape on the south-west of Iceland, in the northern ocean.
- BREMEN**, the capital of the duchy of the same name, in Lower Saxony, situated on the river Weser, in  $8^{\circ} 20'$  E. long. and  $53^{\circ} 25'$  N. lat.
- This city and duchy belongs to the king of Great Britain, as elector of Hanover.
- BREMERVHOIDE**, a fortified town of the duchy of Bremen, about seventeen miles north of Bremen; E. long.  $8^{\circ} 35'$ , and N. lat.  $53^{\circ} 48'$ .
- BREMGARTEN**, a town of Switzerland, in the county of Baden, about twelve miles west of Zurich; E. long.  $8^{\circ} 15'$ , and N. lat.  $47^{\circ} 20'$ .
- BREMINGHAM**, in geography. See **BIRMINGHAM**.
- BRENBERG**, in geography. See **BERNSBURG**.
- BRENT**, in geography, a market town of Devonshire, situated twenty-seven miles south-west of Exeter; W. long.  $4^{\circ} 7'$ , and N. lat.  $50^{\circ} 30'$ .
- BRENT GOOSE**, a species of goose with a black neck, and a white collar round; usually confounded with the barnacle, though in reality a distinct species.
- It is a little larger than the common duck, and is described by authors under the name of *anas torquata*.
- BRENTA**, a liquid measure used at Rome.
- BRENTE**, in geography, a river which, taking its rise in the bishopric of Trent, in Germany, runs south-east through the Venetian territories, and falls into the Adriatic sea, opposite to Venice.
- BRENTFORD**, a market-town of Middlesex, about seven miles west of London; W. long.  $7'$ , and N. lat.  $51^{\circ} 26'$ .
- BRENTWOOD**, or **BURNTWOOD**, a market town of Essex, about fifteen miles east of London; E. long.  $15'$ , and N. lat.  $51^{\circ} 35'$ .
- BREPHOTROPHIUM**, an hospital for the maintenance of children; not unlike our foundling-hospital. See **HOSPITAL**.
- BRESCIA**, a city of Italy, about thirty miles north of Cremona; E. long.  $10^{\circ} 35'$ , and N. lat.  $45^{\circ} 30'$ .
- It is a bishop's see, and subject to Venice.
- BRESELLO**, a town of the duchy of Modena, in Italy, situated on the southern shore of the river Po, about twenty five miles north-west of Modena; E. long.  $11^{\circ}$ , and N. lat.  $44^{\circ} 46'$ .
- BRESICATE**, in commerce, a kind of bays, of which there is some trade carried on with the negroes, between the river Gambia and Sierra Leone. The best sorts for that purpose are the blue and the red.
- BRESLAW**, the capital of Silesia, situated upon the river Oder, in  $16^{\circ} 50'$  E. long. and  $51^{\circ} 5'$  N. lat.
- BRESMA**, in ichthyology, a name used by some for the bream. See **BREAM**.
- BRESSE**, a territory of Burgundy, in France; it is bounded by Franche Comte on the north, by Savoy on the east, by Dauphine on the south, and by the Lyonois on the west.
- BRESSICI**, in geography. See **BRESSE**.
- BRESSVIRE**, a town of Poitou, in the Orleansois, in France, situated about thirty-five miles north-west of Poitiers; W. long.  $30'$ , and N. lat.  $46^{\circ} 50'$ .
- BREST**, in geography, an excellent port-town of Brittany in France; W. long.  $4^{\circ} 30'$ , and N. lat.  $48^{\circ} 25'$ .
- BREST**, or **BREAST**, in architecture, a term sometimes used for the member of a column, more usually called *torus*. See **TORUS**.
- BREST-SUMMERS**, in timber buildings, are pieces in the outward thereof, into which the girders are framed: this, in the ground-floor, is called a cell; and, in the garret-floor, a beam.
- As to their size, it is the same with that of girders. See **GIRDERS**.
- BRESTE**, or **BRESSICI**, the capital of the palatinate of Bresicci, and of Polesia, in Poland, situated on the river Bog, about eighty miles east of Warfaw; E. long.  $24'$ , and N. lat.  $52^{\circ}$ .
- BRETESSE**, in heraldry, denotes a line embattled on both sides.
- BRETON**, or **CAPE-BRETON**, an American island, subject to the English, and separated from New-Scotland by a narrow strait called Canso: it is about one hundred miles in length, and fifty in breadth, and is situated between  $61^{\circ}$  and  $62^{\circ}$  W. long. and between  $45^{\circ}$  and  $48^{\circ}$  N. lat.
- BRETVEIL**, a town of Normandy, in France, about thirty-five miles south of Rouen; E. long.  $1^{\circ}$ , and lat.  $48^{\circ} 50'$ .
- BRETVEIL** is also the name of a town in Picardy, about six leagues from Amiens.
- BREUBERG**, a country and town of Germany, in the circle of Franconia, situated upon the banks of the Maine.
- BREVE**, in law, is any writ directed to the chancellor, judges, sheriffs, or other officers, whereby a person is summoned, or attached, to answer in the king's court, &c.
- BREVE PERQUIRERE**, the purchasing of a writ or licence for trial in the king's courts; whence comes the present usage of paying 6s. 8d. fine to the king in suit, for money due on bond, where the debt is 40l. and of 10s. where it is 100l. &c.
- BREVE DE RESTO** is a writ of right, or licence, for a person ejected, to sue for the possession of the estate detained from him.
- BREVE**, in music, a note or character of time, in the form of a diamond or square, without any tail, and equivalent to two measures or minims.
- BREVET**, in the French customs, denotes the grant of some favour or donation from the king, in which sense it partly answers to our warrant, and partly to letters-patent.
- BREVIARY**, a daily office, or book of divine service, in the Romish church. It is composed of matins, lauds, first, third, sixth, and ninth vespers, and the compline, or post communion.

The breviary of Rome is general, and may be used in all places; but on the model of this various others have been built, appropriated to each diocese, and each order of religious.

The breviary of the Greeks is the same in almost all churches and monasteries that follow the Greek rites: the Greeks divide the psalter into twenty parts. In general, the Greek breviary consists of two parts; the one containing the office for the evening, the other that of the morning, divided into matins, lauds, first, third, sixth, and ninth vespers, and the compline; that is, of seven different hours, on account of that saying of David, *Septies in die laudem dixi tibi*.

The institution of the breviary is not very ancient; there have been inserted in it the lives of the saints, full of ridiculous and ill-attested stories, which gave occasion to several reformations of it, by several councils, particularly those of Trent and Cologne; by several popes, particularly Pius V. Clement VIII. and Urban VIII.; and also by several cardinals and bishops, each lopping off some extravagances, and bringing it nearer to the simplicity of the primitive offices. Originally, every body was obliged to recite the breviary every day; but by degrees the obligation was reduced to the clergy only, who are enjoined, under penalty of mortal sin and ecclesiastical censures, to recite it at home, when they cannot attend in public. In the XIVth century, there was a particular reserve granted in favour of bishops, who were allowed, on extraordinary occasions, to pass three days without re-hearing the breviary.

This office was originally called *curfus*, and afterwards the *breviarium*; which latter name imports,

that the old office was abridged, or rather, that this collection is a kind of abridgment of all the prayers.

The breviaries now in use are innumerable; the difference between them consists principally in the number and order of the psalms, hymns, pater-nosters, ave-Maries, creeds, magnificats, cantemus's, benedictus's, canticamus's, nunc dimittis's, miserere's, hallelujah's, gloria patri's, &c.

**BREVIARY**, in Roman antiquity, a book first introduced by Augustus, containing an account of the application of the public money.

**BREVIATOR**, an officer under the eastern empire, whose business it was to write and translate briefs.

At Rome those are still called breviators, or abbreviators, who dictate and draw up the pope's briefs.

**BREVBUS a rotulis liberandis**, a writ or command to a sheriff to deliver to his successor the county, with the appurtenances, and the rolls, writs, and other things to his office belonging.

**BREVIER**, among printers, a small kind of type or letter between bourgeois and minion.

**BREVIUM custoi**. See **CUSTOS**.

**BREVORDT**, a town of Guelderland, in the United Netherlands, situated about twenty-five miles south-east of Zutphen, in 6° 35' E. long. and 52° N. lat.

**BREWER**, a person who professes the art of brewing.

There are companies of brewers in most capital cities; that of London was incorporated in 1427, by Hen. VI. and that of Paris is still older.

**BREWER'S-HAVEN**, a good harbour at the north end of the island of Chiloe, on the coast of Chili, in South America; W. long. 82°, and S. lat. 42°.

**BREW HOUSE**, a place for brewing. See **BREWING**.

## B R E W I N G.

**BREWING** is the operation of preparing ale or beer from malt. Before we treat of this operation, it will be necessary to explain the nature of malt, and the method of making it.

### O F M A L T.

THAT species of fermentation which is called the *vinous fermentation*, is only produceable by the juices of vegetable substances. The sugar or saccharine matter is the cause of this fermentation. If sugar be added to water in the proportion of 1 to 3, a proper vinous fermentation is excited. When this saccharine matter is extracted from vegetables, they immediately lose their fermentative power. Most plants either naturally contain this saccharine matter, or are capable of acquiring it by a certain method of treatment. This process of converting vegetable substances into a sugar is known by the name of *malting*.

VOL. I. Numb. 28.

Though most vegetable substances be convertible into malt, barley is found by experience to be the most proper for undergoing this operation.

As the converting of grains into malt, is only a part of the progress towards their germination, it may be performed by committing them for some time to the earth. But the ordinary method is to steep the barley for some time in water, and then to expose it in heaps on the floor of a barn till it begins to heat: after which, it must be spread out in thin layers, to prevent putrefaction. It ought to continue in this situation till the plume or bud is just about to escape from the seed, and then it is considered as perfectly malted; that is, the seeds are converted into a sweet, moist substance. This change of taste, or malting, keeps exact pace with the progress of the plume; hence one half of the seed is frequently malted, while the other undergoes no change. If the plume be allowed to shoot fully out, the seeds immediately lose their saccharine taste, and are changed into insipid

hollow bags. When feeds are thus sufficiently malted, they must be dried in malt-kilns, the fuel of which should smoke as little as possible.—The husks must now be broke open by malt-milns, and then infused or mashed in warm water, in order to extract the saccharine substance; the heat applied should be very slow and gradual. Thus the malt is dissolved, and lies till the liquor be sufficiently tinctured. When the malt is too long diffused, so that an acetous fermentation begins to take place, it is called *blinking*, or *foxing*, by brewers.

This tincture obtained from the infusion of grinded malt, is commonly known by the name of *wort*.

We shall now give an account of this process in the language and manner of the actual brewer, which will probably be more acceptable than treating it in a philosophical manner.

### Of making MALT.

THE barley must be put into a leaden or tiled cistern, that holds five, ten, or more quarters, and covered with water four or six inches above the barley, to allow for its swell. Here it must lie five or six tides, as the maltster calls it, reckoning twelve hours to the tide, according as the barley is in body or in drines. The way to know when it is enough, is to take a corn, end-ways, between the fingers, and gently crush it; and if it be in all parts mellow, and the hulk opens, or starts a little from the body of the corn, then it is enough. The nicety of this is a material point; for if it be infused too much, the sweetness of the malt will be greatly taken off, and yield the less spirit, and will cause deadness and founess in ale or beer in a short time, for the goodness of the malt contributes much to the preservation of all ales and beers. Then the water must be well drained from it, and it will come equal and better on the floor, which may be done in twelve or sixteen hours in temperate weather, but in cold near thirty. From the cistern, it is put into a square hutch or couch, where it must lie thirty hours; then it must be worked night and day in one or two heaps, as the weather is cold or hot, and turned every four, six, or eight hours, the outward part inwards, and the bottom upwards, always keeping a clear floor, that the corn that lies next to it be not chilled; and as soon as it begins to come or spire, then turn it every three, four, or five hours, as was done before, according to the temper of the air, which greatly governs this management; and as it comes or works more, so must the heap be spread and thinned larger to cool it. Thus it may lie and be worked on the floor in several parallels, two or three feet thick, ten or more feet broad, and fourteen or more in length, to chip or spire, but not too much nor too fast; and when it is come enough, it is to be turned twelve or sixteen times in twenty four hours, if the season is warm, as in March, April, or May; and when it is fixed, and the root begins to be dead, then it must be thickened again, and carefully kept often turned and worked, that the growing of the root may not revive, and this is better done with the shoes off than on: And here the workman's art and diligence in particular is tried, in keeping the floor clear,

and turning the malt often, that it neither moulds nor acre-spire, that is, that the blade does not grow out at the opposite end of the root; for, if it does, the flower and strength of the malt is gone, and nothing left behind but the acre-spire, hulk, and tail: Now, when it is at this degree, and fit for the kiln, it is often put into a heap, and let lie twelve hours before it is turned, to heat and mellow, which will much improve the malt if it is done with moderation, and after that time it must be turned every six hours during twenty-four; but if it is overheated, it will become like greafe and be spoiled, or at least cause the drink to be unwholesome. When this operation is over, it then must be put on the kiln, to dry four, six, or twelve hours, according to the nature of the malt; for the pale sort requires more leisure, and less fire, than the amber or brown sorts: Three inches thick was formerly thought a sufficient depth for the malt to lie on the hair-cloth; but now six is often allowed it; fourteen or sixteen feet square will dry about two quarters, if the malt lies four inches thick, and here it should be turned every two, three, or four hours, keeping the hair cloth clear: The time of preparing it from the cistern to the kiln is uncertain, according to the season of the year; in moderate weather, three weeks are often sufficient. When the malt is dried, it must not cool on the kiln, but be directly thrown off, not into a heap, but spread wide in an airy place, till it is thoroughly cool; then put it into a heap, or otherwise dispose of it.

There are several methods used in drying of malts, as the iron-plate frame, the tile-frame, that are both full of little holes; the brags-wired, and iron-wired frame, and the hair-cloth. The iron and tiled ones were chiefly invented for drying of brown malts, and saving of fuel; for these, when they come to be thorough hot, will make the corns crack and jump by the fierceness of their heat, so that they will be roasted or scorched in a little time; and after they are off the kiln, to plump the body of the corn, and make it take the eye, some will sprinkle water over it, that it may meet with the better market: But if such malt is not used quickly, it will slacken and lose its spirits to a great degree, and perhaps, in half a year or less, may be taken by the whools and spoiled. Such hasty dryings, or scorchings, are also apt to bitter the malt, by burning its skin, and therefore these kilns are not so much used now as formerly. The wire-frames indeed are something better, yet they are apt to scorch the outward part of the corn, that cannot be got off so soon as the hair-cloth admits of, for these must be swept when the other is only turned at once; however, these last three ways are now in much request for drying pale and amber malts, because their fire may be kept with more leisure, and the malt more gradually and better dried. But by many the hair-cloth is reckoned the best.

Malts are dried with several sorts of fuel; as the coak, Welch coal, straw, wood, and fern, &c. But the coak is reckoned by most to exceed all others for making drink of the finest flavour and pale colour, because it sends no smoke forth to hurt the malt with any offensive tang, that wood, fern, and straw are apt to do

in a lesser or greater degree; but there is a difference even in what is called coak, the right sort being large pit-coal charred or burnt in some measure to a cinder, till all the sulphur is consumed and evaporated, which is called choak; and this, when it is truly made, is the best of all other fuels. But if there be but one cinder as big as an egg, not thoroughly cured, the smoke of this one is capable of doing damage, which happens too often by the negligence or avarice of the choak-maker: There is another sort, by some wrongly called choak, and rightly named culm or Welch-coal, from Swanzev in Pembrokeshire, being of a hard stony substance, in small bits, resembling a shining coal, and will burn without smoke, and by its sulphureous effluvia cast a most excellent whiteness on all the outward parts of the grainy body: In Devonshire their marble or grey fire-stone is burnt into lime with the strong fire that this culm makes, and both this and the chalked pit-coal afford a moderate and certain fire to all malt that is dried by it. Straw is the next sweetest fuel; but wood and fern are the worst.

Some take a peck or more of pease, and malt them with five quarters of barley, to mellow the drink: Beans are used for the same purpose; but they do not come so soon, nor mix so conveniently with the malt, as the pea.

Barley is not fit to make malt of till it is fully mellowed and sweated in the mow, and the season of the year is ready for it, without both which there can be no assurance of good malt. This untimely making of malt often occasions bad ales and beers; for such malt retaining some of its barley nature, or that the season of the year is not cold enough to admit of its natural working on the floor, is not capable of producing a true malt, but will cause its drink to sink in the cask instead of growing fit for use, as not having its genuine malt nature to cure and preserve it, which all good malts contribute to as well as the hop.

Mellilet, a most stinking weed that grows among barley, if not thoroughly cleaned from it before malting, makes the drink so heady, that it is apt to intoxicate the unwary by drinking a small quantity: Besides, it gives a nauseous flavour to the liquor.

#### *To know good from bad Malts.*

FIRST, break the malt-corn across between the teeth, in the middle, or at both ends, and if it tasteth mellow and sweet, has a round body, breaks soft, is full of flour all its length, smells well, and has a thin skin, then it is good. Secondly, take a glass near full of water, and put in some malt; if it swims, it is right; but if any sinks to the bottom, then it is not true malt, but steely, and retains somewhat of its barley nature; this, however, is not an infallible rule, because, if a corn of malt is cracked, split, or broke, it will then take the water and sink; but an allowance may be given for such incidents, and still room enough to make a judgment. Thirdly, malt that is truly made will not be hard and steely, but of so mellow a nature, that, if forced against a dry board, it will mark, and cast a white colour almost like chalk. Fourthly, malt that is not rightly made will be

part of it of a hard-barley nature, and weigh heavier than that which is true malt.

#### *Of the Nature and Use of Pale, Amber, and Brown Malts.*

THE pale malt is the slowest and slackest dried of any, and where it has had a leisure fire, a sufficient time allowed it on the kiln, and a due care taken of it, the flour of the grain will remain in its full quantity, and thereby produce a greater length of wort than the brown high-dried malt. It may be brewed either with spring or common well water.

The amber-coloured malt is that which is dried in a medium degree, between the pale and the brown, and is very much in use, as being free of either extreme. Its colour is pleasant, its taste agreeable, and its nature wholesome, which makes it be preferred by many as the best of malts; this by some is brewed either with hard or soft waters, or a mixture of both.

The brown malt is the soonest and highest dried of any, even till it is so hard, that it is difficult to bite some of its corns asunder. This malt, by some, is thought to occasion the gravel or stone, and is by its steely nature less nourishing than the pale or amber malts, being very much impregnated with the fiery particles of the kiln, and therefore its drink sooner becomes sharp and acid than that made from the pale or amber sorts, if they are all fairly brewed: For this reason the London brewers mostly use the Thames or New River waters to brew this malt with, for the sake of its soft nature, whereby it agrees with the harsh qualities of it better than any of the well or other hard sorts, and makes a luscious ale for a little while, and a but-beer, or porter, that will keep very well five or six months; but after that time it generally grows stale, notwithstanding there be ten or twelve bushels allowed to the hoghead, and it be hopped accordingly.

Pale and amber malts dried with coak or culm, obtain a more clean, bright, pale colour, than if dried with any other fuel, because there is not smoke to darken and sully their skins or hulks, and give them an ill relish, which those malts have, more or less, that are dried with straw, wood, or fern, &c. The coak or Welch coal also makes more true and compleat malt than any other fuel, because its fire gives both a gentle and certain heat, whereby the corns are in all their parts gradually dried; and therefore of late these malts have gained such a reputation, that great quantities have been consumed in most parts of the nation for their wholesome nature and sweet fine taste.

Next to the coak-dried malt, the straw dried is the sweetest and best tasted: This, it must be acknowledged, is sometimes well malted, where the barley, wheat, straw, conveniences, and the maker's skill, are good; but as the fire of the straw is not so regular as the coak, the malt is attended with more uncertainty in its making, because it is difficult to keep it to a moderate and equal heat, and also exposes the malt in some degree to the taste of the smok.

Brown malts are dried with straw, wood, and fern,

*See* the straw-dried is the best; the wood-fort has a most ungrateful taste, and few can bear it, but the necessitous, and those that are accustomed to its strong smoky tang; yet it is much used in some of the western parts of England.

The fern-dried malt is also attended with a rank disagreeable taste from the smok of this vegetable.

### *Of grinding Malts.*

THIS article well deserves the notice of all brewers, for on it the goodness of our drink greatly depends; because, if it is ground too small, the flour of the malt will be the easier and more freely mixed with the water, and will cause the wort to run thick; therefore the malt must be only just broke in the mill, to make it emit its spirit gradually, and incorporate its flour with the water in such a manner, that first a stout beer, then an ale, and afterwards a small beer may be had at one and the same brewing, and the wort run off fine and clear to the last. Many are likewise so sagacious as to grind their brown malt a fortnight before they use it, and keep it in a dry place, that it may become mellow, by losing in a great measure the fury of its harsh fiery particles, and its steely nature, which this sort of malt acquires on the kiln. However, this, as well as many other hard bodies, may be reduced by time and air into a more soluble, mellow, and soft condition, and then it will imbibe the water, and give a natural kind tincture more freely, by which a greater quantity and stronger drink may be made than if it was used directly from the mill, and be much smoother and better tasted. But pale malts will be fit for use at a week's end, because the leisureness of their drying endows them with a fineness from the time they are taken off the kiln to the time they are brewed, and supplies in them what time and air must do in the brown sorts. This method of grinding malt so long beforehand cannot be so conveniently practised by some of the great brewers, because several of them brew two or three times a week; but now most of them grind their malts into the tun by the help of a long, descending, wooden spout; and here they save the charge of emptying or uncasing it out of the bin, and also the waste of a great deal of the malt-flour, that is lost when carried in baskets. A steel hand-mill, will, by the help of only one man, grind six or eight bushels in an hour, and will last a family many years without hardening or cutting. There are some old fashioned stone hand-mills in being, that some prefer to the iron ones, because they alledge that these break the corn's body, when the iron ones only cut it in two, which occasions the malt, so broke by the stones, to give the water a more easy, free, and regular power to extract its virtue, than the cut-malt can that is more confined within its hull. Notwithstanding, the iron ones are now mostly in use, for their great dispatch and long duration. In the country they frequently throw a sack of malt on a stone or brick floor as soon as it is ground, and let it lie, giving it one turn, for a day or two, that the stones or bricks may draw out the fiery quality it received from the kiln, and give the drink a soft mild taste.

### *Of the Nature of several Waters, and their Use in Brewing.*

WATER is a matter of great importance in brewing wholesome fine malt-liquors. Now, the more simple and freer every water is from foreign particles, it is the better.

Spring-waters are in general liable to partake of those minerals through which they pass. At Uppingham in Rutland, their water is said to come off an alsen rock, and so tinges their beer with its saline quality, that it is easily tasted at the first draught. But that which will lather with soap, or soft water, that percolates through chalk, or a grey fire-stone, is generally accounted best; for chalk in this respect excels all other earths, because it communicates nothing unwholesome to the waters, but absorbs any minerals that may accompany the water that runs through them: For which reason they throw in great quantities of chalk into their wells at Aislebury to soften their water, which, coming off a black sand-stone, is so hard and sharp, that it will often turn their beer sour in a week's time; so that in its original state it is neither fit to wash nor brew with, but so long as the alkaline particles of the chalk hold good, they put it to both uses.

River-water is less liable to be loaded with metallic, petrifying, or saline particles, than the well or spring sorts, especially at some distance from the spring head, because the rain-water mixes with and softens it. But in running, it often collects gross particles, from oozy muddy mixtures, particularly near town, which make the beer subject to new fermentations, and grow foul upon any alteration of the weather, as the Thames-water generally does; yet this, for its softness, is much better than the hard sort; however, both these waters are used by some brewers. But where river-water can be had clean in a dry time, when no great rain has lately fell out of rivulets, or rivers that have a gravelly, chalky, sandy, or stony bottom, free from the disturbance of cattle, &c. and in good air, it may then justly claim the name of a most excellent water for brewing, and will make a stronger drink with the same quantity of malt than any of the well-waters; inasmuch that that of the Thames has been proved to make as strong beer with seven bushels of malt, as well-water with eight; and so are all river-waters in a proportionable degree, and, where they can be obtained clean and pure, drink may be drawn fine in a few days after tunning.

Rain-water is very soft, of a most simple and pure nature, and the best diluter of any, especially if received free from dirt and mortar that often mix with it as it runs off tiled roofs; this is very agreeable for brewing of ales that are not to be kept long, but for beers that are to remain some time in the casks, it is not so good, being apt to putrify the fœculent of any.

Pond waters. This includes all standing waters, chiefly from rain, and are good or bad according to circumstances; for where there is a clean bottom, and the water lies undisturbed from the tread of cattle, or too many fish, in an open found air, in a large quantity, and  
where

where the sun has free access, it is then nearly as good as rain or river-waters. But where it is in a small quantity, or full of filth (especially the fling-tench) or is so disturbed by cattle, as to force up mud and filth, it is then the most foul and disagreeable of all others: So is it likewise in long dry seasons, when our pond-waters are so low as to oblige us to strain it through sieves before we can use it, to take out the small red worms and other corruptions that stagnant waters are subject to.

### The London Method of Brewing.

#### Stout Butt-beer or Porter.

THIS is the strongest porter that is brewed from brown malt, and often fold for forty shillings the barrel, or six pounds the butt out of the wholesale cellars: The liquor (for it is six-pence forfeit in the London brew-house if the word *water* is named) in the copper designed for the first mash, has a two-bushel basket, or more, of the most hully malt thrown over it, to cover its top, and afterwards its boiling; this must be made very hot, almost ready to boil, yet not so as to blister, for then it will be in too high heat; but, as an indication of this, the foul part of the liquor will ascend, and the malt swell up, and then it must be parted, looked into, and felt with the finger or back of the hand, and if the liquor be clear, and of such heat as can be but just endured, it is then enough, and the stoker must damp his fire as soon as possible, by throwing in a good parcel of fresh coals, and shutting his iron vent-doors; immediately on this, they let as much cold liquor or water run into the copper as will make it all of a heat, somewhat more than blood-warm; this they pump over, or let it pass by a cock into an upright wooden square spout or trunk, and it directly rises through the holes of a false bottom into the malt, which is worked by several men with oars for about half an hour, and is called the first and stiff mash: While this is doing, there is more liquor heating in the copper, that must not be let into the mash-tun till it is very sharp, almost ready to boil; with this they mash again, then cover it with several baskets of malt, and let it stand an hour before it runs into the under-back, which, when boiled an hour and a half with a good quantity of hops, makes this stout. The next is mashed with a cooler liquor, then a sharper, and the next blood-warm or quite cold; by which alternate degrees of heat, a quantity of small beer is made after the stout.

#### To make Porter, or Butt-beer, to have a fine Tang.

THIS, of late, has been improved two ways: First, by mixing two bushels of pale malt with six of brown, which will preserve butt beer in a mellow condition, and cause it to have a pleasant sweet flavour: And, secondly, further to improve and render it more palatable, they boil it two hours and a half, and work it two days as cold as possible in the tun; at last, they stir it, and put a good handful of common salt into the quantity of a butt: Then, when the yeast has had one rising more, they tun it.

#### Strong Brown Ale, called Stitch.

MOST of this is the first running of the malt, but yet

of a longer length than is drawn from the stout; it has but few hops boiled in it, and is sold for eight-pence per gallon at the brew-house out of the tun, and is generally made to amend the common brown ale with, on particular occasions.

#### Common Brown Ale and Starting-beer.

THEY take the liquors from the brown ale as for the stout, but draw a greater quantity from the malt than for stout or stitch; and after the stiff and second mashes, they cap the goods with fresh malt, to keep in the spirit, and boil it an hour; after this, small beer is made of the same goods. Thus also the common brown starting butt-beer or porter is brewed, only boiled with more hops an hour and a half, and worked cooler and longer than the brown ale, and a shorter length drawn from the malt. But it is customary after the brown ale, or when a quantity of small beer is wanted, or is to be brewed better than ordinary, to put so much fresh malt on the goods as will answer that purpose.

#### Pale and Amber Ales and Beer.

As the brown malts are brewed with river, these are brewed with well or spring-liquors. The liquors are by some taken sharper for pale than brown malts, and, after the first scalding liquor is put over, some lower the rest by degrees, to the last, which is quite cold, for their small beer; and for butt-beers, there is no other difference than the addition of more hops, and boiling, and the method of working.

#### Entire Guile Small Beer.

ON the first liquor they throw some hully malt, to shew the break of it, and when it is very sharp, they let in some cold liquor, and run it into the tun milk-warm; this is mashed with thirty or forty pulls of the oar, and let stand till the second liquor is ready, which must be almost scalding hot to the back of the hand; then run it by the cock into the tun, mash it up, and let it stand an hour before it is spent off into the under-back: These two pieces of liquor will make one copper of the first wort, without putting any fresh malt on the goods; the next liquor to be blood-warm, the next sharp, and the next cool or cold; for the general way in great brew-houses is, to let a cool liquor precede a sharp one, because it gradually opens the pores of the malt and goods, and prepares the way for the hotter liquor that is to follow.

*The several Lengths or Quantities of Drinks that have been made from Malt, and their several Prices, as they have been sold at a common Brew-house.*

For stout-beer, is commonly drawn one barrel off a quarter of malt, and sold for thirty shillings per barrel from the tun. For stitch or strong brown ale, one barrel and a firkin, at one and twenty shillings and four pence per barrel from the tun. For common brown ale, one barrel and a half, or more, at sixteen shillings per barrel, that holds thirty-two English gallons from the tun. For entire small beer, five or six barrels off a quarter, at seven or eight shillings per barrel from the tun. For pale and amber ale, one barrel and a firkin, at one shilling per gallon, from the tun.

*A Method practised by a Victualler, for Brewing Ale or October Beer, from Nottingham.*

His copper holds twenty-four gallons, and the mash-tub has room enough for four or more bushels of malt. The first full copper of boiling water he puts into the mash-tub, there to lie a quarter of an hour, till the steam is so far spent that he can see his face in it; or, as soon as the hot water is put in, throws a pail or two of cold water into it, which will bring it at once into a temper; then he lets three bushels of malt be run leisurely into it, and stirred or mashed all the while, but as little as can be, or no more than just to keep the malt from clotting or balling; when that is done, he puts one bushel of dry malt at the top, to keep in the vapour or spirit, and so lets it stand covered two hours, or till the next copper-full of water is boiling hot, which he lades over the malt or goods three hand-bowls full at a time, that are to run off at the cock or tap by a very small stream before more is put on, which again must be returned into the mash tub till it comes off exceeding fine; for, unless the wort is clear when it goes into the copper, there are little hopes it will be so in the barrel; which leisure way obliges him to be sixteen hours in brewing these four bushels of malt. Now between the ladings-over he puts cold water into the copper to be boiling hot, while the other is running off; by this means his copper is kept up near full, and the cock spending to the end of brewing his ale or small beer, of which only twenty-one gallons must be saved of the first wort that is reserved in a tub, wherein four ounces of hops are put, and then it is to be set by. For the second wort we will suppose there are twenty gallons of water in the copper boiling hot, that must be all laded over in the same manner as the former was, but no cold water need here be mixed; when half of this is run out into a tub, it must be directly put into the copper with half of the first wort, strained through the brewing-sieve as it lies on a small wooden loose frame over the copper, to keep back those hops that were first put in to preserve it, which is to make the first copper twenty-one gallons; then, upon its beginning to boil, he puts in a pound of hops in one or two canvas or other coarse linen bags, somewhat larger than will just contain the hops, that an allowance may be given for their swell; this he boils away very briskly for half an hour, when he takes the hops out and continues boiling the wort by itself till it breaks into particles a little ragged, and then it is enough, and must be dispersed thro' the cooling-tubs very thin: Then put the remainder of the first and second wort together, and boil that the same time, in the same manner, and with the same quantity of fresh hops, as the first was. The rest of the third or small-beer wort will be about fifteen or twenty gallons more or less, which he mixes directly with some cold water to keep it free of excise, and puts it into the copper as the first liquor to begin a second brewing of ale, with another four bushels of malt as he did before, and so on for several days together if necessary; and at last there may be some small-beer made.

#### *The Nature and Use of the Hop.*

This vegetable was formerly thought to be an un-

wholesome ingredient. Indeed, when the hop, in a dear time, is adulterated with water, in which aloes, &c. have been infused, in order to make the old hops recover their bitterness, and seem new, then they are to be looked on as unwholesome; but the pure new hop, when properly managed, has no hurtful qualities. But if the hops are boiled in strong or small worts beyond their fine and pure nature, the liquor suffers, and will be tanged with a noxious taste, both ungrateful and unwholesome to the stomach; and, if boiled to a very great excess, they will be apt to cause reachings. It is for these reasons that we advise the boiling two parcels of fresh hops in each copper of ale-wort; and, if there were three for keeping beer, it would be so much the better for the taste, health of body, and longer preservation of the beer in a sound smooth condition. For this purpose, some make a bag, like a pillowber, and boil the hops in it half an hour; then take them out, and put in another bag of the like quantity of fresh hops, and boil them half an hour more; by which means there is an opportunity of boiling both wort and hops a due time, saving the trouble of straining them through a sieve, and securing the seeds of the hops at the same time from mixing with the drink; afterwards they boil the same bags in the small beer, till the substance of it is got out; but observe that the bags be made larger than what would just contain the hops, otherwise it will be difficult to boil out their substance. It is true, that here is a charge increased by the consumption of a greater quantity of hops than usual; but then how greatly will they answer the desired end of enjoying fine-palated wholesome drink, that, in a cheap time, will not amount to much, if bought at the best hand; and, if we consider their after-use and benefit in small beer, there is not any loss at all in their quantity: But, where it can be afforded, the very small beer would be much improved if fresh hops were also sifted in the boiling of this as well as the stronger worts. Hence may appear the hardships that many are under of being necessitated to drink of those brewers malt-liquors, who, out of avarice, boil their hops to the last, that they may not lose any of their quintessence.

After the wort is cooled and put into the working-vat or tub, some throw fresh hops into it, and work them with the yeast, at the same time referring a few gallons of raw wort to wash the yeast through a sieve to keep back the hop. This is a good way where enough of hops have not been sufficiently boiled in the wort, or to preserve it in the coolers where it is laid thick.

When hops are dear, many use the seeds of worm-wood instead of them: Others use the daucus or wild-carrot seed that grows in our common fields, which many of the poor people gather and dry in their houses, for the purpose of selling them to the brewers: Others use horehound, which indeed is a fine bitter, and grows on several of our commons.

Hops have a fine grateful bitter, which makes the drink easy of digestion; they also keep it from running into such cohefions as would make it ropy, vapid, and sour; and therefore are not only of great use in boiled, but in raw worts, to preserve them sound till they can be

put into the copper, and afterwards in the tun, while the drink is working.

Here then it must be observed, that the earthy part of the hop is the cause of that rough, harsh, unpleasant taste which accompany both ales and beers that have the hops so long boiled in them, as to tincture their worts with their mischievous effects; for, notwithstanding the malt be ever so good, the hops, if boiled too long in them, will be so predominant as to cause a bad taste.

### *Of boiling Malt-liquors.*

ALTHOUGH it has been formerly said, that an hour and a half is requisite for boiling of October beer, and an hour for ales and small beer; yet it is to be observed, that an exact time is not altogether a certain rule in this case, for, when loose hops are boiled in the wort so long till they all sink, their seeds will arise and fall down again: the wort also will be curdled, and broken into small particles if examined in a hand-bowl, but afterwards into larger, as big as great pins heads, and will appear clean and fine at the top. This is so much a rule with some, that they regard not time, but this sign, to shew when the wort is boiled enough; and this will happen sooner or later, according to the nature of the barley, and its being well malted; for, if it comes off chalks or gravels, it generally has the good property of breaking or curdling soon; but, if off tough clays, then it is longer, which, by some persons, is not a little valued, because it saves time in boiling, and consequently the consumption of the wort.

It is also to be observed, that pale malt-worts will not break so soon in the copper as the brown worts; but, when either of their worts boil, it should be to the purpose, for then they will break sooner, and waste less, than if they are kept simmering, and will likewise work more kindly in the tun, drink smoother, and keep longer.

Now all malt-worts may be spoiled by too little or too much boiling: If too little, then the drink will always taste raw, mawkish, and be unwholesome in the stomach, where, instead of helping to dilute and digest our food, it will cause obstructions, cholics, head-achs, and other diseases: Besides, all such under-boiled drinks are certainly exposed to itacene's and founes's, much sooner than those that have had their full time in the copper. And if they are boiled too long, they will then thicken and not come out of the copper fine and in a right condition, which will cause it never to be right clear in the barrel.

But to be more particular, no ale-worts, boiled less than an hour, can be good; because, in an hour's time, they cannot acquire a thickness of body any ways detrimental to them; and, in less than an hour, the ramous viscid parts of the ale cannot be sufficiently broke and divided, so as to prevent its running into cohesions, ropiness, and founes's; because in ales there are not hops enough allowed to do this, which good boiling must in a great measure supply, or else such drink can never be good; for then its cohesive parts being not thoroughly broke and comminuted by time and boiling, remain hard,

and in a good measure indigestible in the stomach: How ignorant then are those people, who, in tipping of such liquor, can praise it for excellent good ale, only because its taste is sweetish, (which is the nature of such raw drinks), believing it to be the pure effect of the genuine malt, and not perceiving the brewer's avarice and cunning, to save the consumption of his wort by shortness of boiling, tho' to the great prejudice of the drinker's health?

In boiling, both time and the curdling or breaking of the wort should be consulted; for if a person was to boil the wort an hour, and then take it out of the copper before it was rightly broke, it would be wrong management, and the drink would not be fine and wholesome; and if it should boil an hour and a half, or two hours, without regarding when its particles are in a right order, then it may be too thick; so that due care must be had to the two extremes, to obtain it in its due order; therefore, in October and keeping beers, an hour and a quarter's good boiling is commonly sufficient to have a thorough cured drink; for generally in that time it will break and boil enough; because in this there is a double security by length of boiling, and a quantity of hops shifted; but in the new way there is only a single one, and that is by a double or treble allowance of fresh hops boiled only half an hour in the wort; and for this practice a reason is assigned, that the hops, being endowed with discreet aperitive qualities, will, by them and their great quantity, supply the defect of underboiling the wort; and that a farther convenience is here enjoyed by having only the fine, wholesome, strong, floury, spirituous parts of the hop in the drink, exclusive of the phlegmatic, earthy parts which would be extracted, if the hops were to be boiled above half an hour; and therefore there are many now that are so attached to this new method, that they will not brew ale or beer any other way, thinking, that if hops are boiled above thirty minutes, the wort will exhibit some of their bad qualities.

The allowance of hops for ale or beer cannot be exactly adjusted without coming to particulars, because the proportion should be according to the nature and quality of the malt, the season of the year it is brewed in, and the length of time it is to be kept.

For strong brown ale brewed in any of the winter-months, and boiled an hour, one pound is but barely sufficient for a hoghead, if it be tapped in three weeks or a month.

If for pale ale brewed at that time, and for that age, one pound and a quarter of hops; but if these ales are brewed in any of the summer-months, there should be more hops allowed.

For October or March brown beer, a hoghead made from eleven bushels of malt boiled an hour and a quarter, to be kept nine months, three pounds and a half ought to be boiled in such drink at the least.

For October or March pale beer, made from fourteen bushels, boiled an hour and a quarter, and kept twelve months, six pounds ought to be allowed to a hoghead of such drink, and more if the hops are shifted in two bags, and less time given the wort to boil.

*Of Foxing or Tainting Malt-Liquors.*

FOXING is a misfortune, or rather a disease, in malt-drinks, occasioned by divers means, as the nastiness of the utensils, putting the worts too thick together in the backs or coolers, brewing too often and soon one after another, and sometimes by bad malts and waters, and the liquors taken in wrong heats, being of such pernicious consequence to the great brewer in particular, that he sometimes cannot recover and bring his matters into a right order again in less than a week or two, and is so hateful to him in its very name, that it is a general law among them to make all servants that name the word *Fox* or *Foxing* in the brew-house to pay six-pence, which obliges them to call it *Reynard*; for, when once the drink is tainted, it may be smelt at some distance somewhat like a *Fox*: It chiefly happens in hot weather, and causes the beer and ale to be tainted to acquire a fulsome sickish taste, that will, if it is received in a great degree, become ropy like treacle, and in some short time turn sour.

And here we shall mention the great value of the hop in preventing and curing the fox in malt-liquors. When the wort is run into the tub out of the mashing-vat, it is a very good way to throw some hops directly into it before it is put into the copper, and they will secure it against sourness and ropiness, that are the two effects of foxed worts or drinks, and are of such power in this respect, that raw worts may be kept some time, even in hot weather, before they are boiled, and which is necessary where there is a large quantity of malt used to a little copper; but it is certain that the stronger worts will keep longer with hops than the smaller sorts: So likewise, if a person has fewer tubs than are wanted, and he is apprehensive his worts will be foxed by too thick lying in the coolers or working tubs, then it will be a safe way to put some fresh hops into such tubs, and work them with the yeast, or, in case the drink is already foxed in the vat or tun, new hops should be put in and worked with it, and they will greatly fetch it again into a right order; but then such drink should be carefully taken clear off from its gross nasty lee, which being mostly tainted, would otherwise lie in the barrel, corrupt, and make it worse.

Some sift quick-lime into foxed drinks while they are working in the tun or vat, that its fire and salt may break the cohesions of the beer or ale, and burn away the stench that the corruption would always cause; but then such drink should be a peg at the bottom of the vat be drawn off as fine as possible, and the dregs left behind.

*Of fermenting and working of Beers and Ales.*

THOUGH a small quantity of yeast be necessary to ferment and fine the wort; yet it is in itself of a poisonous nature, and if beat into the wort too often or in too large a quantity, by its stupifying and narcotic quality, it makes the liquor too heady, that five bushels of malt may be equal in strength to six. But liquor made in this manner is extremely unwholesome.

It is alleged indeed, that beating the yeast into wort gives it a fine relish, or it makes the ale bite of the yeast; but the true reason is, to further its sale, on account of its intoxicating quality. But some people are so fond of white thick ale, that they often kill themselves by drinking it; nor is their humour much different as to the common brewers brown ale, who, when the customer wants a hoghead, they put in immediately a handful of salt, and another of flour, and so bring it up; this is no sooner on the filling than it is tapped, that it may carry a froth on the top of the pot, otherwise they despise it. See CHEMISTRY, *Of fermentation.*

*Of working and fermenting London Stout Beer and Ale.*

THE yeast is at once put into the tun to work the stout-beer and ale with; by this means, and the shortness of time we have to ferment our strong drinks, we cannot make reserves of cold worts to mix with and check the too forward working of those liquors. The strong beer brewed for keeping is suffered to be blood-warm in the winter, when the yeast is put into it, that it may gradually work two nights and a day at least, for this will not admit of such a hasty operation as the common brown ale, because, if it is worked too warm and hasty, such beer will not keep near so long as that fermented cooler. The brown ale has, indeed, its yeast put into it in the evening very warm, because it is often carried away the very next morning. The pale or amber ales are often kept near it, not quite a week under fermentation, for the better incorporating the yeast with the wort.

*Of forwarding and retarding the Fermentation of Malt-liquors.*

IN case beer or ale is backward in working, it is customary to cast some flour out of the dusting-box, or with the hand, over the top of the drink, which will become a sort of crust or cover to help to keep the cold out: Others put in one or two ounces of powdered ginger, which heats the wort and brings it forward: Others take a gallon stone-bottle and fill it with boiling water, which, being well corked, is put into the working tub, where it communicates a gradual heat for some time, and forwards the fermentation: Others reserve some raw wort, which they heat and mix with the rest; but then care must be taken, that the pot in which it is heated has no manner of grease about it, lest it should impede, instead of promoting the working; but, for retarding and keeping back any drink that is too much heated in working, the cold raw wort is the most proper of any thing to check it; though some are known to put one or more pewter dishes into it for that purpose; or, it may be broke into several other tubs, where, by its shallow lying, its fury will be abated. Others again, to make drink work that is backward, will take the whites of two eggs, and beat them up with half a quartern of good brandy, and put it either into the working-vat, or into the cask, which will quickly bring it forward, if a warm cloth is put over the bung. Others tie up bran in a coarse thin cloth, and put it into the vat, where, by its spongy nature, it absorbs a quantity of the drink, and breeds a heat to forward its working.

Some brewers take off all the top-yeast first, and then, by a peg near the bottom of the working-tub, draw off the beer or ale, so that the dregs are by this means left behind. This is very right, in ales that are to be drank soon; but in beers, that are to lie nine or twelve months in a butt or other cask, there certainly will be wanted some *faces* or sediments for the beer to feed on, else it will consequently grow hungry, sharp, and eager; and therefore, if its own top or bottom are not put into a cask with the beer, some other artificial composition, or lee, should supply its place, that is wholesomer, and will better feed with such drink, than its own natural settlement; and therefore, there are here inserted several receipts for answering this end.

*Of artificial Lees for Stout or Stale Beer to feed on.*

THIS article is of very great importance in the curing of our malt-liquors. The general misfortune of the porter or keeping-beers drinking hard and harsh, is partly owing to the nasty foul *faces* that lie at the bottom of the cask, compounded of the sediments of malt, hops, and yeast. Wheat is, by many, put into such beer to feed and preserve it, as being reckoned a substantial alkali; however, it has been proved, that such wheat in about three years time has eat into the very wood of the cask. Others hang a bag of wheat in the vessel, that it may not touch the bottom; but, in both cases, the wheat is discovered to absorb and collect the acid qualities of the beer, yeast, and hop. Hence it is, that such whole wheat is loaded with the qualities of the unwholesome settlements or grounds of the beer, and becomes of such a corroding nature, as to do mischief; and, for that reason, some hang a bag of the flour of malted oats, wheat, pease, or beans, in the vessels of beer, as being of a lighter and mellow body than the whole wheat or its flour, and more natural to the liquor: But whether it be raw wheat or malted, it is supposed, after this receptacle has emitted its alcalous properties to the beer, and taken in all it can of the acid qualities thereof, that such beer will in time prey upon that again, and so communicate its pernicious qualities to the liquor.

*Composition for feeding Porter or Keeping-Beers.*

TAKE a quart of French brandy, or as much of English, that is free from any burnt tang, or other ill taste, and is full proof; to this put as much wheat or bean-flour as will knead it into dough, put it in long pieces into the bung-hole, as soon as the beer has done working, or afterwards, and let it gently fall piece by piece to the bottom of the butt; this will maintain the drink in a mellow freshness, keep italeness off for some time, and cause it to be the stronger as it grows aged.

*Another.*

TAKE one pound of treacle, or honey, one pound of the powder of dried oyster-shells, or fat chalk, mix them well, and put it into a butt, as soon as it has done working, or some time after, and bung it well; this will both fine and preserve the beer in a soft, smooth condition for a great while.

*Another.*

TAKE a peck of egg-shells, and dry them in an oven, break and mix them with two pounds of fat chalk, and mix them with water wherein four pounds of coarse sugar have been boiled, and put it into the butt as aforesaid.

*To fine and preserve Beers and Ales, by boiling an Ingredient in the Wort.*

IN each barrel-copper of wort, put in two quarts of whole wheat as soon as possible, that it may soak before it boils; then strain it through a sieve, and put the wort in cooling-tubs: Thus there will be extracted a gluey consistence, which, being incorporated with the wort by boiling, gives it a more thick and ponderous body, and, when in the cask, soon makes a sediment or lee, as the wort is more or less loaded with the weighty particles of this fizy body; but if the wheat were first parched, or baked in an oven, it would do better, as being rather too raw as it comes from the ear.

*To stop the Fret in Malt-liquors.*

TAKE a quart of black cherry-brandy, and pour it in at the bung-hole of the hoghead, and stop it close.

*To recover deadish Beer.*

WHEN strong drink grows flat, by the loss of its spirits, take four or five gallons out of a hoghead, and boil it with five pounds of honey, skim it, and, when cold, put it to the rest, and stop it up close: This will make it pleasant, quick, and strong.

*To make Rale Beer drink new.*

TAKE the herb horehound, stamp it and strain it, then put a spoonful of the juice (which is an extremely good pectoral) to a pitcher full of beer, let it stand covered about two hours, and drink it.

*To fine Malt-liquors.*

TAKE a pint of water, half an ounce of unslacked lime, mix them well together; let it stand three hours, and the lime will settle to the bottom, and the water be as clear as glass; pour the water from the sediment, and put it into your ale or beer; mix it with half an ounce of ising-glass, first cut small and boiled; and in five hours time, or less, the beer in the barrel will settle and be clear.

*Receipt for making Balls for fining, feeding, preserving, relishing, and colouring Malt Drinks, Wines, and Cyders.*

*Brown Balls.*

ALABASTER, or marble calcined into a powder, two pounds. Oyster-shells, a little calcined and freed from their brown or dirt-coloured outside, one pound. Pure fat chalk, well dried, one pound. Horse-bean flour, first freed from the hulls, one pound. Red saunders, four ounces. Grains of paradise, half an ounce. Florenine orris-root, half an ounce. Coriander-seed, a quarter of an ounce. Cloves, in number six. Hops, half an ounce. The best itaple incised ising-glass, two ounces. The first runnings of the molasses, or treacle, two pounds.

*Pale Balls,*

ARE made in the same manner, and with the like quantity of every thing, except a pound or two of fine sugar made into a syrup, instead of the molasses, and omitting the faunders.

*N. B.* The powders are to be pretty fine, and the balls dried very gradually without heat for the first three or four days upon brown paper laid over a large sieve bottom, and turned often. Afterwards they may be put into the sun, or at a proper distance from the fire, in order to dry them thoroughly; and the quantity of the hops may be augmented, or wholly omitted, at discretion, according as the liquor requires.

Put as much water to your glass as will just cover it, in order to open its body, letting it stand so twelve hours; then add the following infusion to it, and gradually dissolve the whole over a gentle fire. Then strain it off hot among some of the powder, adding the rest by a little at a time, with some of the treacle or syrup likewise alternately, till you beat the whole into a stiff mass, out of which form balls weighing four ounces each.

*The infusion.*—Pour a pint of boiling water upon the coriander-seed, and cloves bruised, and the hops well rubbed. Cover them close, and let it stand twelve hours, then strain for the use aforesaid.

*The number of balls for each cask.*—Powder one of the balls and put it into a pin or half a firkin; into a firkin, two; into a kilderkin, three; into a barrel, six; and so on in proportion as the cask is larger or lesser, stirring them well in; and, if the liquor has age enough, so that it will bear racking, it should be first served in, and then they will answer much better.

*Of the Cellar or Repository for keeping Beers and Ales.*

It is certain, that the weather has not only a power or influence in brewing, but also after the drink is in the barrel, hogshead, or butt, in cellars, or other places, which is often the cause of forwarding or retarding the sweetness of malt-liquors; for if we brew in cold weather, and the drink is to stand in a cellar of clay, or where springs rise, or waters lie or pass through such a place, these will check the due course of the drink, chill, flat, deaden, and hinder it from becoming fine. So likewise, if beer or ale is brewed in hot weather, and put into chalky, gravelly, or sandy cellars, and especially if the windows open to the south, south-east, or south-west, then it is very likely it will not keep long, but be muddy and stale: Therefore, to keep beer in such a cellar, it should be brewed in October, that the drink may have time to cure itself before the hot weather comes on; but, in wet and damp cellars, it is best to brew in March, that the drink may have time to fine and settle before the winter weather is advanced. Now, cellars should have double or treble doors, that the outer one may be shut before the inner one is opened, to keep the air out. If a cellar be kept dry, and have double doors, it is reckoned warm in winter, and cool in summer. But the best of cellars are thought to be those in chalks, gravels, or

fands; and particularly in chalks, which are of a drying quality more than any other, and consequently dissipate damps; which contributes much to the good keeping of the drink, for all damp cellars are prejudicial to the preservation of beers and ales, and sooner bring on the rotting of the casks and hoops than the dry ones. Besides, in such inclosed cellars and temperate air, the beers and ales ripen more kindly, are better digested and softened, and drink smoother: But, when the temperature of the air in the cellar is unequal, the drink soon grows stale. Though malt-liquor be truly brewed, yet it is often spoiled in a bad cellar, that occasions such alternate fermentations as to make it thick and sour, though it sometimes happens that after such changes it fines itself again. To prevent these commotions of the beer, some brew their pale malt in March, and their brown in October; because the pale malt, having not so many fiery particles in it as the brown, stands more in need of the summer's weather to ripen it, while the brown sort, being more hard and dry, is better able to defend itself against the winter-colds that will help to smooth its harsh particles; yet, when they happen to be too violent, horse-dung should be laid to the windows as a fortification against them.

Some are of opinion, that October is the best of all other months to brew any sort of malt in, by reason there are so many cold months directly following, that will digest the drink and make it much excel that brewed in March, because such beer will not want that care and watching, as that brewed in March absolutely requires, by often taking out and putting in the vent-peg on change of weather; and, if it is always left out, then it deadens and palls the drink; yet, if due care is not taken in this respect, a thunder or stormy night may mar all, by making the drink ferment and burst the cask; for which reason, as iron hoops are most in fashion at this time, they are certainly the greatest security to the safety of the drink thus exposed; and next to them is the chestnut-hoop; both which will endure a shorter or longer time, as the cellar is more or less dry, and according to the management attending them: The iron hoops generally begin to rust first at the edges, and therefore should be rubbed off, and be kept from wet as much as possible.

*Of Cleaning and Sweetening of Casks.*

In case your cask is a butt, then with cold water rinse out the lees clean, and have ready boiling or very hot water, which put in, and, with a long stale and a little birch fastened to its end, scrub the bottom as well as you can: At the same time let there be provided another shorter broom of about a foot and a half long, that with one hand may be so employed in the upper and other parts as to clean the cask well: So in a hogshead, or other smaller vessel, the one-handed short broom may be used with water, or with water, sand, or ashes, and be effectually cleaned; the outside of the cask about the bung-hole should be well washed, lest the yeast, as it works over, carry some of its filth with it.

But, to sweeten a barrel, kilderkin, firkin, or pin, in the great brewhouses, they put them over the copper-hole

hole for a night together, that the steam of the boiling water or wort may penetrate into the wood; this way is such a furious searher, that unless the cask is new-hooped just before, it will be apt to fall to pieces.

*Another Way.*

TAKE a pottle, or more, of stone-lime, and put it into the cask; on this pour some water, and stop it up directly, shaking it well about.

*Another Way.*

TAKE a long linen rag, and dip it in melted brimstone; light it at the end, and let it hang pendant with the upper part of the rag fastened to the wooden bung; this is a most quick and sure way, and will not only sweeten, but help to fine the drink.

*Another.*

OR, to make your cask more pleasant, you may use the vintners way thus: Take four ounces of stone brimstone, one ounce of burnt allum, and two ounces of brandy; melt all these in an earthen pan over hot coals, and dip therein a piece of new canvas, and instantly sprinkle thereon the powders of nutmegs, cloves, coriander, and anise seeds: this canvas set on fire, and let it burn hanging in the cask fastened at the end with the wooden bung, so that no smoke comes out.

*For a musty Cask.*

BOIL some pepper in water, and fill the cask with it scalding hot.

*To prepare a new Vessel to keep Malt liquors in.*

A NEW vessel is most improperly used by some ignorant

people for strong drink, after only once or twice scalding with water; which is so wrong, that such beer or ale will not fail of tasting thereof for half, if not a whole year afterwards. To prevent this inconvenience, when your brewing is over, put up some water scalding hot, and let it run through the grains; then boil it and fill up the cask, stop it well, and let it stand till it is cold; do this twice; then take the grounds of strong drink and boil in it green walnut-leaves and new hay or wheat-straw, and put all into the cask, that it be full, and stop it close: After this, use it for small beer half a year together, and then it will be thoroughly sweet and fit for strong drinks.

*Wine-casks.*

THESE are the cheapest of all others to furnish a person readily with, as being many of them good casks for malt-liquors, because the sack and white-wine sorts are already seasoned to hand, and will greatly improve becs and ales that are put in them: But beware of the Rhenish wine casks for strong drinks; for its wood is so tinctured with this sharp wine, that it will hardly ever be free of it; and therefore such cask is best used for small beer: the claret cask will a great deal sooner be brought into a serviceable state for holding strong drink, if it is two or three times scalded with grounds of barrels, and afterwards used for small beer for some time. But to cure a claret-cask of its colour and taste, put a peck of stone-lime into a hoghead, and pour upon it three pails of water; bung immediately with a wood or cork-bung, and shake it well about a quarter of an hour, and let it stand a day and night, and it will bring off the red colour, and alter the taste of the cask very much.

## B R E

## B R I

BREY, a town of the bishopric of Liege, in Germany, about sixteen miles north of Maeltricht; E. long.  $5^{\circ} 40'$ , and N. lat.  $51^{\circ} 15'$ .

BREYNIA, in botany, a synonyme of the capparid. See CAPPARIS.

BRIANCON, a town of Dauphiny, in France, situated about forty-five miles south-east of Grenoble; E. long.  $6^{\circ} 20'$ , and N. lat.  $47^{\circ} 50'$ .

BRIAR, in botany, the English name of a species of rosa. See ROSA.

BRIARE, a town of the Isle of France, situated on the river Loire, about seventy-five miles south of Paris; E. long.  $2^{\circ} 45'$ , and N. lat.  $47^{\circ} 40'$ .

BRIBE, a gift given to a person for doing or forbearing any action that he ought to do or forbear.

BRIBERY. See LAW.

BRICIANI, those of the order of that name. This was a military order, instituted by St Bridget, queen of Sweden, who gave them the rules and constitutions of those of Malta and St Augustin. This order was approved by pope Urban V. They were to fight for the burying of the dead, to relieve and assist widows, orphans, the lame, sick, &c.

BRICK, a fat reddish earth, formed into long squares, four inches broad, and eight or nine long, by means of a wooden mould, and then baked or burnt in a kiln, to serve the purposes of building.

Bricks are of great antiquity, as appears by the sacred writings, the tower and walls of Babylon being with them.

In the east, they baked their bricks in the sun; the Romans used them unburnt, only leaving them to dry for four or five years in the air.

The Greeks chiefly used three kinds of bricks; the first whereof was called [*aidoron*,] i. e. of two palms; the second, [*tetradoron*], of four palms; the third, [*pentadoron*], of five palms. They had also other bricks, just half each of those, to render their works more solid, and also more agreeable to the sight, by the diversities of the figures and sizes of the bricks.

Pliny says, that to make good bricks they must not consist of any earth that is full of sand or gravel, nor of such as is gritty or stony; but of a greyish sand, or whitish chalky clay, or at least of a reddish earth: He also adds, that the best season for making bricks is the spring; because, if made in summer, they will

be subject to crack, and be full of chinks. He directs, that the loam of which bricks are made be well steeped and wrought with water.

**BRICKS**, among us, are various, according to their various forms, dimensions, uses, method of making, &c. the principal of which are, Compass-bricks, of a circular form, used in fleying of walls: Concave, or hollow bricks, on one side flat like a common brick, on the other hollowed, and used for conveyance of water: Feather-edged bricks, which are like common flat bricks, only thinner on one edge than the other, and used for penning up the brick pannels in timber buildings: Cogging bricks are used for making the indented works under the coping of walls built with great bricks: Caping bricks, formed on purpose for capping of walls: Dutch or Flemish bricks, used to pave yards, stables, and for soap-boilers vaults and cisterns: Clinkers, such bricks as are glazed by the heat of the fire in making: Sandel or famel-bricks, are such as lie outmost in a kiln, or clamp, and consequently are soft and useless, as not being thoroughly burnt: Great bricks are those twelve inches long, six broad, and three thick, used to build fence-walls: Plaster or buttress bricks, have a notch at one end, half the breadth of the brick; their use is to bind the work which is built of great bricks: Statute-bricks or small common bricks, ought, when burnt, to be nine inches long, four and a quarter broad, and two and a half thick; they are commonly used in paving cellars, sinks, hearths, &c.

Bricks are burnt either in a kiln or clamp. Those that are burnt in a kiln, are first set or placed in it, and then the kiln being covered with pieces of bricks, they put in some wood to dry them with a gentle fire; and this they continue till the bricks are pretty dry, which is known by the smoke's turning from a darkish colour to a transparent smoke: They then leave off putting in wood, and proceed to make ready for burning, which is performed by putting in brush, furze, spray, heath, brake, or fern-faggots; but before they put in any faggots, they dam up the mouth or mouths of the kiln with pieces of bricks (which they call *shin-leg*) piled up one upon another, and close it up with wet brick-earth, instead of mortar.

The shing they make so high, that there is but just room above it to thrust in a faggot; then they proceed to put in more faggots, till the kiln and its arches look white, and the fire appears at the top of the kiln; upon which they slacken the fire for an hour, and let all cool by degrees. This they continue to do, alternately heating and slacking, till the ware be thoroughly burnt, which is usually effected in forty-eight hours.

About London they chiefly burn in clamps, built of the bricks themselves, after the manner of arches in kilns, with a vacancy between each brick, for the fire to play through; but with this difference, that instead of arching, they span it over by making the bricks project one over another on both sides of the place, for the wood and coals to lie in till they meet, and are bounded by the bricks at the top, which close all up.

The place for the fuel is carried up strait on both sides, till about three feet high; then they almost fill it with wood, and over that lay a covering of sea-coal, and then overspan the arch; but they strew sea coal also over the clamp, betwixt all the rows of bricks; lastly, they kindle the wood, which gives fire to the coal; and when all is burnt, then they conclude the bricks are sufficiently burnt.

*Oil of BRICKS*, olive oil imbibed by the substance of bricks, and afterwards distilled from it. This oil was once in great repute for curing many diseases, but is now entirely laid aside.

**BRICKING**, among builders, the counterfeiting of a brick-wall on plaster, which is done by smearing it over with red ochre, and making the joints with an edged tool; these last are afterwards filled with a fine plaster.

**BRIDE**, a woman newly married. Among the Greeks it was customary for the bride to be conducted from her father's house to her husband's in a chariot, the evening being chosen for that purpose, to conceal her blushes; she was placed in the middle, her husband sitting on one side, and one of her most intimate friends on the other; torches were carried before her, and she was entertained in the passage with a song suitable to the occasion. When they arrived at their journey's end, the axle-tree of the coach they rode in was burnt, to signify that the bride was never to return to her father's house. Among the Romans, when a bride was carried home to her husband's house, she was not to touch the threshold at her first entrance, but was to leap over it.

**BRIDEGROOM**, a man newly married, the spouse of the bride.

The Spartan bridegrooms committed a kind of rape upon their brides; for matters being agreed on between them two, the woman that contrived and managed the match, having shaved the bride's hair close to her skin, dressed her up in man's cloaths, and left her upon a mattress; this done, in came the bridegroom, in his usual dress, having supped as ordinary, and stealing as privately as he could to the room where the bride lay, and untying her virgin-girdle, took her to his embraces; and having staid a short time with her, returned to his companions, with whom he continued to spend his life, remaining with them by night as well as by day, unless he stole a short visit to his bride, which could not be done without a great deal of circumspection, and fear of being discovered.

**BRIDEWELL**, a work-house, or place of correction for vagrants, strumpets, and other disorderly persons.

These are made to work, being maintained with clothing and diet; and when it seems good to their governors, they are sent by passes into their native countries; however, while they remain here, they are not only made to work, but, according to their crimes, receive, once a fortnight, such a number of stripes as the governor commands. Yet to this hospital several hopeful and ingenious lads are put apprentices, and prove afterwards honest and substantial citizens.

**BRIDGE**, a work of masonry or timber, consisting of one

one or more arches, built over a river, canal, or the like, for the convenience of crossing the same.

Bridges are a sort of edifices very difficult to execute, on account of the inconvenience of laying foundations, and walling under water. The parts of a bridge are the piers, the arches; the pavement, or way over for cattle and carriages; the foot-way on each side, for foot passengers; the rail or parapet, which incloses the whole; and the butments or ends of the bridge on the bank.

The conditions required in a bridge are, that it be well-designed, commodious, durable, and suitably decorated. The piers of stone-bridges should be equal in number, that there may be one arch in the middle, where commonly the current is strongest; their thickness is not to be less than a sixth part of the span of the arch, nor more than a fourth; they are commonly guarded in the front with angular sterlings, to break the force of the current: the strongest arches are those whose sweep is a whole semicircle; as the piers of bridges always diminish the bed of a river, in case of inundations, the bed must be sunk or hollowed in proportion to the space taken up by the piers (as the waters gain in depth what they lose in breadth) which otherwise conduce to wash away the foundation and endanger the piers: To prevent this, they sometimes diminish the current, either by lengthening its course, or by making it more winding; or by stopping the bottom with rows of planks, stakes, or piles, which break the current. It is also required that the foundation of bridges be laid at that season of the year, when the waters are lowest; and if the ground be rocky, hard gravel, or stony, the first stones of the foundation may be laid on the surface; but if the soil be soft sand, it will be necessary to dig till you come to a firm bottom.

Among the bridges of antiquity, that built by Trajan over the Danube is allowed to be the most magnificent; it was composed of twenty arches, of an hundred and fifty feet in height, and their opening from one pier to another was an hundred and sixty feet: The piers of this fine bridge are still to be seen in the Danube, being erected between Servia and Moldavia, a little above Nicopolis.

Among modern bridges, that of Westminster, built over the river Thames, may be accounted one of the finest in the world: It is forty-four feet wide, a commodious foot way being allowed for passengers, on each side, of about seven feet broad, raised above the road allowed for carriages, and paved with broad moor-stones, while the space left between them is sufficient to admit three carriages and two horses to go abreast, without any danger. Its extent from wharf to wharf is 1220 or 1223 feet, being full three hundred feet longer than London-bridge. The free water-way under the arches of this bridge is eight hundred and seventy feet, being four times as much as the free water-way left between the sterlings of London-bridge: This disposition, together with the gentleness of the stream, are the chief reasons why no sensible fall of water can ever stop, or in the least

endanger the smallest boats in their passage through the arches.

It consists of thirteen large and two small arches, together with fourteen intermediate piers.

Each pier terminates with a salient right angle against either stream: the two middle piers are each seventeen feet in thickness at the springing of the arches, and contain three thousand cubic feet, or near two hundred tons of solid stone; and the others decrease in width equally on each side by one foot.

All the arches of this bridge are semicircular; they all spring from about two feet above low-water mark; the middle arch is seventy-six feet wide, and the others decrease in breadth equally on each side by four feet.

This bridge is built of the best materials; and the size and disposition of these materials are such, that there is no false bearing, or so much as a false joint in the whole structure; besides that, it is built in a neat and elegant taste, and with such simplicity and grandeur, that, whether viewed from the water, or by the passengers who walk over it, it fills the mind with an agreeable surprize. The semioctangular towers, which form the recesses of the foot-way, the manner of placing the lamps, and the height of the balustrade, are at once the most beautiful, and, in every other respect, the best contrived.

But the most singular bridge in Europe is that built over the river Tave in Glamorganshire. It consists of one stupenduous arch, the diameter of which is 175 feet, the chord 140, the altitude 35, and the abutments 32. This magnificent arch was built by William Edward, a poor country-mason, in the year 1756.

Bridges are either built of stone or timber, as is judged most convenient.

*Stone-BRIDGES* consist of piers, arches, and butments, made of hewn stone, sometimes also intermixed with bricks.

*Wooden-BRIDGES* are composed of beams and joists, supported by punchions, well cramped and bound together.

*Russhen-BRIDGES* are made of great bundles of rushes, bound fast together, over which planks are laid, and fastened: these are put over marshy places, to serve for a crossing ground.

*Pendent or hanging-BRIDGES*, called also philosophical bridges, are those not supported by posts or pillars, but hung at large in the air, sustained only at the two ends or butments.

*Draw-BRIDGE*, one that is fastened with hinges at one end only, so that the other may be drawn up; in which case, the bridge stands upright, to hinder the passage of a ditch or moat.

*Flying or floating BRIDGE*, is generally made of two small bridges, laid one over the other in such a manner, that the uppermost stretches and runs out, by help of certain cords, running through pulleys placed along the sides of the under bridge, which push it forwards, till the end of it joins the place it is intended to be fixed on.

**BRIDGE of boats**, boats made of copper, and joined side by side, till they reach a-crofs a river, which being covered with planks, are fastened with stakes or anchors.

**BRIDGE of communication** is that made over a river, by which two armies, or forts, which are separated by that river, have a free communication with one another.

**Floating BRIDGE**, a bridge made use of, in form of a work in fortification, called a redoubt, consisting of two boats, covered with planks, which are solidly framed, so as to bear either horse or cannon.

**BRIDGE**, in gunnery, the two pieces of timber which go between the two tranfums of a gun-carriage, on which the bed rests.

**BRIDGE**, in music, a term for that part of a stringed instrument over which the strings are stretched. The bridge of a violin is about one inch and a quarter high, and near an inch and a half long.

**BRIDGE-TOWN**, the capital of the island of Barbadoes: West lon.  $56^{\circ}$ , and North lat.  $13^{\circ}$ . It has commodious wharfs for unloading goods, also some forts and castles for the defence of the place.

**BRIDGE-NORTH**, a borough-town of Shropshire, situated on the river Severn, about fifteen miles south-east of Shrewsbury: West lon.  $2^{\circ} 30'$ , and North lat.  $52^{\circ} 40'$ . It sends two members to parliament.

**BRIDGEWATER**, a large borough-town of Somersetshire, situated near the mouth of the river Evil, in  $3^{\circ}$  West long. and  $51^{\circ} 15'$  North lat. It sends two members to parliament.

**BRIDLE**, in the menage, a contrivance made of straps or thongs of leather and pieces of iron, in order to keep a horse in subjection and obedience.

The several parts of a bridle are the bit, or snaffle; the head-stall, or leathers from the top of the head to the rings of the bit; the fillet, over the fore-head and under the fore-top; the throat-band, which buttons from the head-band under the throat; the reins, or long thongs of leather that come from the rings of the bit, and being cast over the horse's head, the rider holds them in his hand; the nose band, going through loops at the back of the head-stall, and buckled under the cheeks; the trench; the cavesean; the martingal; and the chaff-halter.

Bridles imported pay a duty of 4s.  $9\frac{4}{5}$ d. the dozen; whereof 4s.  $3\frac{7}{10}$ d. is repaid on exporting them again: besides which they also pay 6s. for every 20s. value upon oath, without any drawback.

**BRIDLE-HAND** is the horseman's left hand, the right hand being the spear or sword hand.

*To swallow the BRIDLE*, is said of a horse that has too wide a mouth, and too small a bit-mouth.

**BRIDON**, or **SNAFFLE**, after the English fashion, is a very slender bit-mouth, without any branches. The English make much use of them, and scarcely use any true bridles except in the service of war. The French call them bridons, by way of distinction from bridles.

**BRIDPORT**, a borough and port-town of Dorsetshire, situated about ten miles west of Dorchester; W. long.  $3^{\circ}$ , and N. lat.  $50^{\circ} 40'$ .

It sends two members to parliament.

**BRIEF**, in Scots law, a writ issued from the chancery, directed to any judge-ordinary, commanding and authorizing that judge to call a jury to inquire into the case mentioned in the brief, and upon their verdict to pronounce sentence.

*Apofolical BRIEFS*, letters which the pope dispatches to princes, or other magistrates, relating to any public affair.

These briefs are distinguished from bulls, in regard the latter are more ample, and always written on parchment, and sealed with lead or green wax; whereas briefs are very concise, written on paper, sealed with red wax, and with the seal of the fisherman, or St Peter in a boat.

**BRIEG**, a town of Silesia, about twenty miles south-east of Breslaw; E. long.  $17^{\circ} 20'$ , and N. lat.  $50^{\circ} 50'$ .

**BRIENNOIS**, the southern division of the duchy of Burgundy, in France.

**BRIEUX**, a port-town of Britany, in France, situated on the English channel, about thirty miles west of St Malo; W. long.  $2^{\circ} 50'$ , and N. lat.  $48^{\circ} 40'$ .

**BRIGADE**, in the military art, a party or division of a body of soldiers, whether horse or foot, under the command of a brigadier.

An army is divided into brigades of horse and brigades of foot: a brigade of horse is a body of eight or ten squadrons; a brigade of foot consists of four, five, or six battalions.

The eldest brigade has the right of the first line, and the second the right of the second, and the two next take the left of the two lines, and the youngest stand in the centre.

**BRIGADE-MAJOR**, is an officer appointed by the brigadier, to assist him in the management and ordering of his brigade.

**BRIGADIER** is the general officer who has the command of a brigade. The eldest colonels are generally advanced to this post. He that is upon duty is brigadier of the day. They march at the head of their own brigades, and are allowed a serjeant and ten men of their own brigade for their guard.

**BRIGADIERS**, and **SUB-BRIGADIERS**, are posts in the horse-guards.

**BRIGANDINE**, a coat of mail, a kind of ancient defensive armour, consisting of thin jointed scales of plate, pliant and easy to the body.

**BRIGANTINE**, a small light vessel, which can both row and sail well, and is either for fighting or giving chase. It hath about twelve or fifteen benches for the rowers, one man to a bench; all the hands aboard are soldiers, and each man hath his musquet lying ready under his oar.

**BRIGG**, a market-town in Lincolnshire, about twenty-four miles north of Lincoln; W. long.  $20'$ , and N. lat.  $53^{\circ} 40'$ .

**BRIGHTELMSTONE**, a little port-town in Suffex, about seven miles south-west of Lewes; W. long.  $10'$ , and N. lat.  $50^{\circ} 50'$ .

**BRIHUEGA**, a town of New Castile, in Spain, about forty-three miles north-east of Madrid; W. long.  $3^{\circ} 20'$ , and N. lat.  $41^{\circ}$ .

**BRILL**, or **BRIEL**, the capital of the island of Voorn, in Holland, situated about twelve miles south of the Hague; E. long. 4°, and N. lat. 51° 50'.

**BRILLIANT**, in a general sense, something that has a lucid and bright appearance.

**BRILLIANT**, in the menage, a brisk, high-mettled, stately horse, is called brilliant, as having a raised neck, a fine motion, excellent haunches, upon which he rises, though never so little put on.

**BRIM** denotes the utmost verge or edge, especially of round things.

**BRIM**, in country affairs. A sow is said to brim, or to go to brim, when she is ready to take boar.

**BRIMSTONE**. See **SULPHUR**, and **CHEMISTRY**.

**BRIMSTONE-marble**. See **MARBLE**.

**BRIN**, a city of Moravia, dependent on Bohemia, about thirty miles south-west of Olmutz: E. long. 16° 20', and N. lat. 49° 40'.

**BRINDISI**, a port-town of the kingdom of Naples, situated on the gulph of Venice, about thirty-five miles north-west of Otranto; E. long. 18° 45', and N. lat. 40° 40'.

**BRINE**, water replete with saline particles; or pickle. **BRINE-water**, a salt water, which being boiled, turns into salt.

Brine taken out of brine-pits, or brine-pans, used by some for curing or pickling of fish, without boiling the same into salt, and rock-salt without refining it into white-salt, are prohibited by 1 Anne, cap. xxi.

**BRINGING-IN a horse**, in the menage, the same as to say, keep down the nose of a horse that boars, and tosses his nose in the wind; this is done by means of a good branch. See **BANQUET**, and **WIND**.

**BRION**, an island of North America, in the gulph of St Lawrence.

**BRIONES**, a small town of Old Castile, in Spain, situated on the river Ebro.

**BRIONI**, the name of three islands in the Adriatic sea, upon the western coast of Istria. They belong to the Republic of Venice.

**BRIONNE**, a town of Normandy, in France, situated on the Rill, about ten leagues from Rouen.

**BRISAC**, a fortified town of Swabia, in Germany, situated on the eastern shore of the river Rhine, about thirty miles north of Strafburg; E. long. 7° 15', and N. lat. 48° 10'.

*New BRISAC*, a fortress on the western shore of the Rhine, opposite to Old Brisac. It is situated in Alsace, and belongs to the French.

**BRISGOW**, a territory of the circle of Swabia, in Germany, situated on the east side of the Rhine, opposite to the Upper Alsace, whereof Fribourg and Brisac are the chief towns.

**BRISTLE**, a rigid glossy kind of hair, found on swine, and much used by brushmakers, &c.

Bristles, rough and undressed, pay a duty of 1 s. 2<sup>6</sup>/<sub>10</sub> d. the dozen pound, whereof 1 s. 2<sup>0</sup>/<sub>10</sub> d. is drawn back on exporting them; whereas dressed bristles pay a duty of 2 s. 4<sup>7</sup>/<sub>10</sub> d. the dozen pound, whereof 2 s. 1<sup>7</sup>/<sub>10</sub> d. is drawn back on exportation.

The whiskers of cats are also sometimes called bristles; as are the quills of the porcupine.

**BRISTOL**, a city and port-town of England, situated partly in Gloucestershire, and partly in Somersetshire; W. long. 2° 40', and N. lat. 51° 30'.

It stands on the river Avon, about ninety miles west of London, and is a town of the greatest foreign trade of any in Britain next to London. It is also a bishop's see, sends two members to parliament, and gives the title of earl to the noble family of Harvey.

*New BRISTOL*, the capital of the county of Bucks, in Pennsylvania, about twenty miles north of Philadelphia. It is situated on the river Delaware, in 75° W. long. and 40° 45' N. lat.

**BRISTOL-water**. These waters are the fourth in degree amongst the waters which are esteemed warm. The waters of Bath are the first, Buxton the second, and Matlock the third.

Bath waters are beneficial, when the secretions from the blood are diminished; Bristol, when too much increased: Bath attenuates powerfully; Bristol increases: Bath is spirituous, and helps defects; Bristol is more cooling, and suppresses plenitude, with its consequences, inflammations and hemorrhages.

If we may judge of the contents of Bristol waters, from their effects, which are exceedingly detensive and healing; they partake chiefly of chalk, lapis calcarius, and calaminaris, the virtues of which are too dry to cleanse; they fill ulcers with flesh, and cicatrize them.

But whatever the substances are that impregnate them, it is plain they are very subtle, and that there is but little of a terrestrial part in them, from their specific lightness above other waters: Yet when we consider how agreeable to the sight, smell and taste; how clear, pure and soft they are; their gentle degree of heat, so adapted to sundry diseases; it must be concluded, that those waters do imbibe some salutary particles in their passage through the earth; and, from the many cures yearly wrought by them, that they have an undoubted title to a place in the first class of medicinal waters.

The diseases in which Bristol waters are properly prescribed, are internal hemorrhages and inflammations, blood-spitting, dysentery, and immoderate flux of the menses, purulent ulcers of the viscera: Hence, in consumptions, the dropsy, scurvy with heat, stone, gravel, strangury; the habitual gout, scorbutic rheumatism, diabetes, slow fevers, atrophy, pox, cancer, gleet in both sexes, king's evil, &c.; in all these disorders, Bath waters are not only improper, but hurtful; they rouse the too languid, and quicken the too lazy circulation; they allay the heat, and restrain the too rapid motion of the blood. Those impregnate the phlegmatic, these attemperate the choleric constitution. Bath water seems to be adapted to the maladies of the stomach, guts, and nerves; Bristol, to those of the lungs, kidneys, and bladder: Again, Bath waters are at variance with a milk course; and the Bristol can never be judiciously directed, but when they may be joined with reason and success.

The Bristol waters are taken medicinally only during the hot months, as from April to September.

**BRISTOL-flower**, in botany, a name sometimes given to the hichnis. See **LICHNIS**.

**BRITAIN**, or **GREAT-BRITAIN**, the most considerable of all the European islands, lies between 50° and 60° N. lat. and between 2° E. long. and 6° W. long.

The general division of Britain, is into South and North Britain, or England and Scotland.

**New BRITAIN**, a large country of North America, called also *Terra Labrador*, has Hudson's bay and frait on the north and west; Canada and the river of St Lawrence, on the south; and the Atlantic ocean on the east.

It is subject to Great-Britain, but yields only skins and furs.

**BRITANNICA**, in botany, the trivial name of a species of *Rumex*. See **RUMEX**.

**BRITANY**, a province of France, surrounded by the English channel and the bay of Biscay, on the north, west, and south; and bounded on the east by the province of Orleansois.

**BRITE**, or **BRIGHT**, in husbandry. Wheat, barley, or any other grain, is said to brite, when it grows over ripe, and shatters.

**BRITTLENESS**, that quality of bodies, on account of which they are denominated brittle, or which subjects them to be easily broken.

Brittle bodies are likewise very hard and durable, barring accidents; and it is remarkable, that tin, though tough in itself, makes all other metals brittle, when mixed with them.

**BRIVE LA GAILLARDE**, a town of France in the Limousin, upon the Couzeze.

**BRIXEN**, a city of Tyrol in Germany, about fifty miles north-east of Trent: E. long. 11° 45', N. lat. 46° 45'.

**BRIZA**, a genus of the triandria digynia class. There are five species of Briza, two of which are natives of Britain, *viz.* the media or middle quaking grass, and the minor or small quaking-grass. They grow in pasture-grounds.

**BRIZE**, in husbandry, denotes ground that has lain long untilled.

**BRIZE-vents**, shelters used by gardeners who have not walls on the north-side, to keep cold winds from damaging their beds of melons. They are inclosures about six or seven feet high, and an inch or more thick; made of straw, supported by stakes fixed into the ground, and props across on both inside and outside; and fastened together with willow twigs, or iron-wire.

**BROADALBIN**, a district or county of Perthshire, in Scotland, bordering upon Argyleshire: It gives the title of earl to a branch of the noble family of Campbell.

**BROAD-side**, in the sea-language, denotes a volley of cannon, or a general discharge of all the guns on one side of a ship at once.

**BROCADE**, or **BROCADO**, a stuff of gold, silver, or silk, raised and enriched with flowers, foliages, and

other ornaments, according to the fancy of the merchants or manufacturers.

Formerly the word signified only a stuff, wove all of gold, both in the warp and in the woof, or all of silver, or of both mixed together; thence it passed to those of stuffs in which their was silk mixed, to raise and terminate the gold or silver flowers: But at present all stuffs, even those of silk alone, whether they be programs of Tours or of Naples, fattins, and even taffeties or lustrings, if they be but adorned and worked with some flowers, or other figures, are called brocades.

**BROCADE-shell**, the English name of a species of limax. See **LIMAX**.

**BROCATEL**, or **BROCADEL**, a kind of coarse brocade; chiefly used for tapestry.

**BROCCOLI**, a kind of cabbage cultivated for the use of the table; the manner of dressing which is this: When their heads are grown to their full bigness, they are to be cut off, with about four inches of the tender stem; the outer skin is then to be stripped off the stem, after which they are to be washed, and boiled in a clean linnen cloth, as is practised for cauliflowers.

They are tenderer than any cauliflower, though very like them in taste.

**BROCK**, among sportsmen, a term used to denote a badger.

A hart too of the third year is called a brock, or brocket; and a hind of the same year, a brocket's sister.

**BROD**, a town of Sclavonia, situated on the river Save, about sixteen miles south of Pofega: E. long. 18° 50', N. lat. 45° 20'.

**BRODERA**, or **BRODRA**, a city of Asia, in the country of the Mogul and kingdom of Gazurat, where there is a great trade in cotton cloths: E. long. 73° 30', N. lat. 22° 25'.

**BRODIUM**, a pharmaceutical term, signifying the same as jusculum, or the liquor in which some solid medicine is preserved, or with which something else is diluted.

**BROGLING for eels**, the same with sniggling. See **SNIGGLING**.

**BROGLIO**, a town of Peidmont in Italy, situated near the frontiers of Provence, about twenty five miles north-west of Nice: E. long. 6° 42', N. lat. 44° 12'.

It is the capital of a county of the same name.

**BROITSCHIA**, a city of Asia in Indostan, about twelve leagues from Surat.

**BROKEN wind**, among farriers, is a malady that happens to a horse when he is suffered to stand too long in the stable, without exercise: By this means he contracts gross and thick humours in such abundance, that, adhering to the hollow parts of his lungs, they stop his wind-pipe.

This distemper is known by the horse's heaving and drawing up his flanks together, and blowing wide his nostrils.

To cure this disorder, take the guts of a hedge-hog, dry

dry them, and pound them to powder, and give the horse two or three spoonfuls of it in a pint of wine or strong ale; then mix the rest with anise-seed, liquorice, and sweet butter, of which make round balls, or pills, and give him two or three of them after drink, and let him fast two or three hours.

**BROKER**, a name given to persons of several and very different professions, the chief of which are exchange-brokers, stock-brokers, pawn-brokers, and brokers, simply so called, who sell household-furniture, and second-hand apparel.

**Exchange-BROKERS** are a kind of agents, or negotiators, who contrive, propose, and conclude bargains between merchants, and between merchants and tradesmen, in matters of bills of exchange, or merchandise, for which they have so much commission. These, by the statute of 8 and 9 William III. are to be licensed in London by the Lord Mayor, who gives them an oath, and takes bond for the faithful execution of their offices. If any person shall act as broker, without being thus licensed and admitted, he shall forfeit the sum of 500 l. and persons employing him 5 l. and brokers are to register contracts, &c. under the like penalty: Also brokers shall not deal for themselves, on pain of forfeiting 200 l. They are to carry about with them a silver medal, having the king's arms, and the arms of the city, and pay 40s. a year to the chamber of the city.

The exchange brokers make it their business to know the alteration of the course of exchange, to inform merchants how it goes, and to give notice to those who have money to receive or pay beyond sea; they are the proper persons for negotiating the exchange, and when the matter is accomplished, that is, when the money for the bill is paid, and the bill delivered, they have for brokerage 2s. for 100 l. sterling.

They reckon at Paris, among the city-officers, who are employed under the jurisdiction of the provost of the merchants, and *eschevins* or aldermen, three sorts of brokers.

1. The brokers of horses for the carriage of merchandise by water; they are established for the navigation, and take care to examine the horses used to draw the boats up the river; to fet the horses together, to oblige the carriers to repair their boats, or to break such as are no longer fit to serve.

2. Sworn wine-brokers on the keys, to examine and taste all the wine that arrives there.

3. Brokers of bacon and lard. These are established to examine those sorts of merchandises, as they are landed or unloaded, and to answer for their goodness to the buyer, and to the seller, for the price of his wares.

**Stock-BROKERS**, are those who are employed to buy and sell shares in the joint stock of a company, or corporation.

As the practice of stock-jobbing has been carried on to such an excess as became not only ruinous to a great number of private families, but even affected, or at least might soon affect, the public credit of the nation, the legislature thought fit to put a stop to it, or at

least to bring it within certain bounds, and under some regulation, by statute 7 George II. c. viii. sect. 1. **PAWN-BROKERS**. Persons who keep shops, and lend money upon pledges to necessitous persons, and most commonly at an exorbitant interest. They are more properly styled pawn-takers, or tally-men, sometimes fripers, or friperers. These are meant in 1 Jac. I. cap. xxi. sect. 5. where it is declared, that the sale of goods wrongfully taken to any broker, or pawn-broker in London, Westminster, Southwark, or within two miles of London, does not alter the property.

And sect. 7. If a broker, having received such goods, shall not, upon request of the owner, discover them, how and when he came by them, and to whom they are conveyed, he shall forfeit the double value thereof, to be recovered by action of debt, &c.

In the cities of Italy, there are companies established by authority for the letting out money on pawns, called *mounts of piety*; a title little becoming such institutions, as the loan is not gratis. In some parts of Italy, they have also mounts of piety of another kind, wherein they only receive ready money, and return it again with interest, at a certain sum *per annum*.

At Bologna, they have several such mounts, which are distinguished into frank and perpetual; the interest of the former is only four *per cent.* that of the latter, seven.

**BROKERS** are also those who sell old household-furniture, and wearing apparel, &c.

**BROMELIA**, or pine apple, in botany, a genus of the hexandria monogynia class. The calix is divided into three segments; it has three petals, and there is a scaly nectarium at the base of each petal; the berry has three cells. There are five species of bromelia, *viz.* the ananas or common pine-apple, which is a native of Surinam and New Spain; the pinguin, a native of Jamaica and Barbadoes; the karatos, *lingulata*, and nudicaulis, all natives of the southern parts of America.

**BROMSGROVE**, a market-town in Worcester-shire, about ten miles north of Worcester: W. long. 2° 5', N. lat. 52° 26'.

**BROMLEY**, a market-town of Kent, ten miles south-east of London: E. long. 5', N. lat. 51° 25'.

**BROMLEY** is also the name of a market-town of Staffordshire, about ten miles east of Stafford: W. long. 1° 50', N. lat. 52° 45'.

**BROMOIDES**, in botany. See *FESTUCA*.

**BROMUS**, in botany, a genus of the triandria digynia class. The calix is double-valved; the spica is oblong and cylindrical; the awn is below the apex. There are 17 species, eight of which are natives of Britain, *viz.* the scaberrimus or field brome-grass, the arvensis or corn brome-grass, the ciliatus or wall brome-grass, the sterilis or barren brome-grass, the giganteus or tall brome-grass, the ramosus or wood brome-grass, and the pinnatus or spiked brome-grass.

**BRONCHIA**, in anatomy, the ramifications of the trachea. See p. 280. (col. 2.) & p. 281.

**BRONCHOCLE**, in surgery, a tumour arising in the anterior part of the neck. See *SURGERY*.

**BRONCHOTOMY**, in surgery, an incision made in the aspera arteria, or wind-pipe, which is necessary in many cases, and especially in a violent quinsey, to prevent suffocation from the great inflammation or tumor of the parts. It is also called laryngotomy and tracheotomy. See **SURGERY**.

**BRONCHUS**, according to Galen, is the aspera arteria which reaches from the larynx to the lungs, consisting of the bronchia.

Sometimes it is put for the whole aspera arteria; and Hippocrates uses it to signify the throat.

**BRONTÆ**, or **THUNDER-STONES**, in natural history. See **BELEMNITES**.

**BRONTIUM**, in Grecian antiquity, a place underneath the floor of the theatres, in which were kept brazen vessels full of stones and other materials, with which they imitated the noise of thunder.

**BRONTOLOGY** denotes the doctrine of thunder, or an explanation of its causes, phenomena, &c. together with the prefaces drawn from it. See **THUNDER**, and **ELECTRICITY**.

**BRONZE**, a compound metal, consisting of one part of tin, ten of copper, and a little zinc. See **CHEMISTRY**.

**BRONZES**, a name given by antiquarians to figures either of men or beasts, to urns, and, in general, to every piece of sculpture which the ancients made of that metal. We likewise give the name of bronzes to statues or bulks cast of bronze, whether these pieces be copies of antiques, or original subjects.

Among medallists, all copper medals bear the name of bronze.

**BRONZING**, the art of varnishing wood, plaster, ivory, &c. so as to give them the colour of bronze. See **VARNISHING**.

**BROOD**, the young of fish, fowls, &c.

**BROODING**, the act of a hen in hatching her eggs. See **HATCHING**.

**BROOK**, a little river or small current of water.

A brook is distinguished from a river inasmuch as a river flows at all times, whereas a brook flows at some particular seasons only.

**BROOK-LIME**. See **ANAGALLIS**.

**BROOM**, in botany. See **GENISTA**.

**Butchers-BROOM**, the English name of the ruscus. See **SPARTIUM**.

**Spanish-BROOM**, in botany. See **SPARTIUM**.

**BROOM-FLOWER**, *ordre de la genisse*, an order instituted by St Louis, king of France, to shew the esteem which he had for the queen his wife, who, the evening before his queen's coronation, received this order himself.

**BROOM-RAPE**, in botany. See **OROBANCHE**.

**BROOMING**, or **BREAMING**, *of a ship*, the washing and burning off all the filth that she has contracted on her sides with weeds, straw, broom, or the like, when she is on the careen, or on the ground. See **CAKEENING**.

**BROTHEL**. See **STEWS**.

**BROTHER**, a term of relation between male children, sprung from the same parents, or from the same father, or the same mother.

The ancients used the term brother, indifferently, to almost all who stood related in the collateral line, as uncles and nephews, cousins-german, &c.

According to the laws of Moses, the brother of a man, who died without children, was obliged to marry the widow of the deceased, in order to raise up children to him, that his name and memory might not be extinct. See the article **WIDOW**.

Among us, it is customary for kings to give the title brother to each other.

In the civil law, brothers, *fratres*, in the plural number, sometimes comprehends sisters.

**BROTHER** is also a customary term for priests of the same persuasion to address one another by; but it is more particularly used to denote the relation between monks of the same convent, as father Zachary: In English, we more usually say, Friar Zachary, from the French word *frere*, brother. Preachers also call their hearers, my brethren, or my dear brethren; and sometimes they use the singular number, and say, my brother.

This appellation is borrowed from the primitive Christians, who all called each other brothers: but it is now principally used for such of the religious as are not priests; those in orders are generally honoured with the title of father, whereas the rest are only simply brothers.

**BROTHERS-GERMAN**. See **GERMAN**.

**BROTHERS OF THE ROSS-CROSS**. See **ROSICRUCIAN**.

**BROUCK**, the name of a town of Germany, in the circle of Westphalia, upon the river Roer; and likewise of a town of Switzerland, upon the banks of the Aar.

**BROUERSHAVEN**, a port-town of Zeland, in the united Netherlands, situated on the north side of the island of Schonen, about nine miles south-west of Helvoetsluys: E. lon.  $3^{\circ} 55'$ , and N. lat.  $51^{\circ} 50'$ .

**BROW**, or **EYE-BROW**, an hairy arch extended over the orbit of each eye. See p. 291. col. 1.

**BROW-POST**, among builders, denotes a beam which goes across a building.

**BROW-ANTLER**, among sportsmen, that branch of a deer's horn next the tail.

**BROWALLIA**, in botany, a genus of the didynamia angiospermia class. The calix has five teeth; the limbus of the corolla is divided into five equal and open segments; and the capsule is unilocular.

**BROWN**, among dyers, painters, &c. a dusky colour, inclining towards redness. Of this colour there are various shades or degrees, distinguished by different appellations; for instance, Spanish-brown, a sad-brown, a tawney-brown, the London brown, a clove-brown, &c.

Spanish-brown is a dark dull red, of a horse-flesh colour. It is an earth, and is of great use among painters, being generally used as the first and priming colour that they lay upon any kind of timber-work in house-painting. That which is of the deepest colour, and freest from stones, is the best. Though this is of a dirty brown colour, yet it is much used, not to colour any garment, unless it be an old man's gown;

gown; but to shadow vermilion, or to lay upon any dark ground behind a picture, or to shadow yellow berries in the darkest places, when you want lake, &c. It is best and brightest when burnt in the fire, till it be red hot, although, if you would colour any hare, horse, dog, or the like, it should not be burnt; but, for other uses, it is best when it is burnt; as for instance, for colouring wood, posts, bodies of trees, or any thing else of wood, or any dark ground of a picture. See DYING.

**BROWNISTS**, in church-history, a religious sect, which sprung up in England towards the end of the XVth century. Their leader was one Robert Brown, born at Northampton. They separated from the established church, on account of its discipline and form of government. They equally disliked episcopacy and presbyterianism. They condemned the solemn celebration of marriages in churches, maintaining, that matrimony being a political contract, the confirmation of it ought to proceed from the civil magistrate. They rejected all forms of prayer, and held, that the Lord's prayer was not to be recited as a prayer; being given only as a model, upon which to form our prayers.

**BRUCA**, the name of a river and sea-port town of Sicily, in the valley of Noto.

**BRUCHSAL**, a town of the bishopric of Spire, in the palatinate of the Rhine, in Germany: E. lon.  $8^{\circ} 30'$ , and N. lat.  $49^{\circ} 15'$ .

**BRUCHUS**, in zoology, a genus of insects belonging to the order of coleoptera. The feelers are filiform, and gradually increase in thickness. There are seven species, viz. the pisi, has grey elytra interspersed with white spots, and a white fundament with two black spots. It is a native of North America, and destroys whole fields of pease: It is now found in several of the southern parts of Europe; where it does great injury to the corn. 2. The theoloma with whitish elytra interspersed with black points. It frequents the theoloma or chocolate trees in the East Indies. 3. The glidifera, with striated elytra of the same length with the belly, a pitch-coloured body, and green feelers. It is a native of America. 4. The bacriss, with smooth elytra, a hoary body, and the hind part of the thighs oval. It frequents the palm-trees of Jamaica. 5. The granarius, has black elytra; the fore-feet are red, and the hind-feet are dentated. It frequents the seeds of plants in different parts of Europe. 6. The semiparius is black, with the base of the feelers and fore-feet testaceous. It is about the size of a louse, and a native of Europe. 7. The peticornis, with comb-shaped feelers longer than the body. It is a native of Barbary and China.

**BRUGES**, a city and port-town of Flanders, eleven miles east of Ostend, and twenty-four north-west of Ghent: E. lon.  $3^{\circ} 5'$ , and N. lat.  $51^{\circ} 16'$ .

There is a navigable canal from Ostend to Bruges, which has still the best foreign trade of any town in Flanders.

**BRUISE**, in surgery, the same with contusion. See CONTUSION, and SURGERY.

**BRUMALIA**, in Roman antiquity, festivals of Bacchus celebrated twice a-year; the first on the twelfth of the calends of March, and the other on the eighteenth of the calends of November. They were instituted by Romulus, who, during these feasts, used to entertain the senate. Among other heathen festivals which the primitive Christians were much inclined to observe, Tertullian mentions the brumæ or brumalia.

**BRUNELLA**, in botany. See PRUNELLA.

**BRUNIA**, in botany, a genus of the pentandria monogynia class. The flowers are aggregated; the filaments of the stamina are inserted into the unguis of the petals; the stigma is bifid, and the seeds are single. There are six species, all natives of Æthiopia.

**BRUNSBUTTEL**, a port-town of Holstein, in the circle of Lower Saxony, in Germany, situated at the mouth of the river Elbe: E. lon.  $8^{\circ} 42'$ , and N. lat.  $54^{\circ} 10'$ . It is subject to Denmark.

**BRUNSFELSA**, in botany, a genus of the pentandria monogynia class. The corolla is long and shaped like a tunnel; the berry is unilocular, and contains many seeds.

**BRUNSWICK**, the capital of the duchy of Brunswick, in the circle of Lower Saxony, in Germany, situated on the river Ocker, about 35 miles east of Hanover: E. lon.  $10^{\circ} 30'$ , and N. lat.  $52^{\circ} 30'$ .

The elector of Hanover is styled duke of Brunswick, though he has no property in, or dominion over, the city of that name, which belongs to the duke of Brunswick Wolfenbüttele.

**BURNTISLAND**, a parliament-town on the coast of Fife, in Scotland, about ten miles north-west of Edinburgh; W. long.  $3^{\circ}$ , and N. lat.  $56^{\circ} 12'$ .

**BRUSH**, an instrument made of bristles, hair, wire, or small twigs, to clean cloaths, rooms, &c. and also to paint with. There are various sorts of them, distinguished by their shape or use. In the choice of painters brushes, observe whether the bristles are fall bound in the stocks, and if the hair be strong and lie close together; for if they sprawl abroad, such will never work well; and if they are not fall bound in the stock, the bristles will come out when you are using them, and spoil your work, as may be seen where the loose hairs of the brush have lain up and down in the colours laid on, to the great detriment of the work.

Wine-brushes are of use for scrubbing those silver, copper, and brass pieces, which are to be gilded over, in order to clear them perfectly from any dirt, rust, or filth, which may adhere to them, and, if not brushed off, would hinder the closing of the gold with them. They are therefore used by gilders, silversmiths, &c. and are usually sold by ironmongers. Beard-brushes pay a duty, on importation, of 1s.  $3\frac{4}{10}$ d. the gross or twelve dozen; whereof 1s.  $1\frac{1}{4}$  is drawn back on exporting them. Comb-brushes pay 2s.  $6\frac{8}{10}$ d. for the same number; and of this 2s. 3d. is repaid. Head-brushes pay 1s.  $3\frac{8}{10}$ d. the dozen; rubbing-brushes  $3\frac{8}{10}$ d. the dozen; weavers-brushes  $11\frac{8}{10}$ d. for the same number; in all which a proportional drawback.

drawback is allowed. However, it is to be observed, that brushes are among the number of goods prohibited to be imported.

**BRUSSELS**, the capital of the province of Brabant, and of all the Austrian Netherlands. It is situated on the river Senne, and is the see of a bishop; W. long.  $4^{\circ} 6'$ , and N. lat.  $50^{\circ} 50'$ .

It is a strong fortified town, and agreeably situated, which, together with the viceroy's residence, occasions a great resort of nobility and gentry.

**BRUTE**, an animal guided mostly by mere instinct, and comprehends all animals, excepting mankind.

**BRUTON**, a market-town in Somersetshire, about ten miles south-east of Wells; W. long.  $2^{\circ} 35'$ , and N. lat.  $51^{\circ} 15'$ .

**BRYANSBRIDGE**, a town of Ireland, in the county of Clare, and province of Connaught, situated on the river Shannon, about eight miles north of Limerick.

**BRYGMUS**, among physicians, a grating noife made by the gnashing of teeth.

**BRYONIA**, in botany, a genus of the monœcia s yngeneia class. The calix of the male has five teeth; the corolla is divided into five segments; and there are three filaments. The calix of the female is likewise toothed; the corolla has five divisions; the stylus is trifid; and the berry is roundish, and contains many seeds. There are six species of bryony, only one of which, *viz.* the alba, or white bryony, is a native of Britain. The root is a strong cathartic, and, applied externally, is said to be a powerful discutient.

*Black Bryony.* See TAMUS.

**BRYUM**, in botany, a genus of the cryptogamia musci class. The anthera is covered with an operculum; the calyptra is smooth. There are 41 species, most of them natives of Britain.

**BUBALIS**, in zoology, the trivial name of the buffalo, a species of the bos. See Bos.

**BUBBLE**, in philosophy, small drops or vesicles of any fluid filled with air, and either formed on its surface, by an addition of more of the fluid, as in raining, &c.; or in its substance, by an intestine motion of its component particles. Bubbles are dilatate or compressible, *i. e.* they take up more or less room, as the included air is more or less heated, or more or less pressed from without, and are round, because the included air acts equally from within, all around.

**BUBBLE**, in commerce, a cant term given to a kind of project for raising of money on imaginary grounds, much practised in France and England in the years 1719, 1720, and 1721.

The pretence of those schemes was the raising a capital for retrieving, setting on foot, or carrying on some promising and useful branch of trade, manufacture, machinery, or the like: To this end proposals were made out, shewing the advantages to be derived from the undertaking, and inviting persons to be engaged in it. The sum necessary to manage the affair, together with the profits expected from it, were divided into shares or subscriptions, to be purchased by any disposed to adventure therein.

Bubbles, by which the public have been tricked,

are of two kinds, *viz.* 1. Those which we may properly enough term trading-bubbles; and, 2. Stock or fund-bubbles. The former have been of various kinds; and the latter at different times, as in 1719 and 1720.

**BUBO**, in ornithology, the trivial name of a species of ftrix. See STRIX.

**BUBO**, or **BUBOE**, in surgery, a tumour which arises, with inflammation, only in certain or particular parts to which they are proper, as in the arm-pits and in the groins. See MEDICINE, and SURGERY.

**BUBON**, in botany, a genus of the pentandria digynia class. The fruit is oval, striated, and hairy. There are four species, and none of them natives of Britain.

**BUBONOCELE**, or **HERNIA INGUINALIS**, in surgery, a tumour in the inguen, formed by a prolapsus of the intestines, omentum, or both, through the processes of the peritonæum, and rings of the abdominal muscles. See SURGERY.

**BUBONIUM**, in botany, a synonyme of the inula. See INULA.

**BUCANEPHYLLON**, in botany, the name by which Plukenet calls the farfaccna. See SARRACENA.

**BUCARDIA**, or **BUCARDITÆ**, in natural history, a kind of figured stones, formed in the cavities of the larger cockles, and resembling, in some measure, a heart at cards.

**BUCARIZA**, a town of the kingdom of Hungary, in Croatia, upon the Adriatic sea, in a gulf that takes the same name.

**BUCA ferrea**, in botany, a name given by Micheli to the ruppia of Linnaeus. See RUPPIA.

**BUCCAL**, something belonging to the cheeks: Thus, the buccal glands, are those dispersed over the inner side of the cheeks.

**BUCANEERS**, those who dry and smoke flesh or fish, after the manner of the Americans.

This name is particularly given to the French inhabitants of the island of St Domingo, whose whole employment is to hunt bulls, or wild boars, in order to fell the hides of the former, and the flesh of the latter.

The buccaneers are of two sorts: The buccaneers ox-hunters, or rather hunters of bulls and cows; and the buccaneers boar-hunters, who are simply called hunters; though it seems, that such a name be less proper to them than the former; since the latter smoke and dry the flesh of wild boars, which is properly called buccaneering, whereas the former prepare only the hides, which is done without buccaneering.

Buccaneering is a term taken from Buccan, the place where they smoke their flesh or fish, after the manner of the savages, on a grate or hurdle, made of Brazil wood, placed in the smoke, a considerable distance from the fire: This place is a hut, of about twenty-five or thirty feet in circumference, all surrounded and covered with palmetto leaves.

**BUCANEERS** also signify those famous adventurers of all the nations in Europe, who join together to make war against the Spaniards of America, cruising about in privateers, to take all the vessels and small craft they can meet with.

**BUCCHARI**, a town of Ithria upon the Adriatic sea, belonging to the house of Austria.

**BUCCHARI**, or **BOUCHARI**, is also the name of a large province of Asiatic Tartary, situated between 78° and 90° E. lon. and 34° and 44° N. lat.

**BUCCELLARII**, an order of soldiery under the Greek emperors, appointed to guard and distribute the ammunition-bread; though authors are somewhat divided as to their office and quality. Among the Visigoths, bucellarius was a general name for a client or vassal who lived at the expence of his lord. Some give the denomination to parasites in the courts of princes, some make them the body-guards of emperors, and some fancy they were only such as emperors employed in putting persons to death privately.

**BUCCHINA**, an ancient musical and military instrument. It is usually taken for a kind of trumpet; which opinion is confirmed by Feltus, by his defining it a crooked horn, played on like a trumpet. Vegetius observes, that the buccina bent in a semicircle, in which respect it differed from the tuba or trumpet. It is very hard to distinguish it from the cornu or horn, unless it was something less, and not quite so crooked; yet it certainly was of a different species, because we never read of the cornu in use with the watch, but only the buccina. Besides, the sound of the buccina was sharper, and to be heard much farther, than either the cornu or the tuba. In scripture, the like instrument, used both in war and in the temple, was called rams-horns, kiren-jobel, and sopheroth hagjobelim.

**BUCCHINUM** or **TRUMPET-SHELL**, a genus of shell-fish belonging to the order of vermes testaceæ. This animal is one of the snail kind. The shell is univalve, spiral, and gibbous. The aperture is oval, ending in a small strait canal. Linnæus enumerates about sixty species, most of which are found in the southern seas.

**BUCCO**, in ornithology, a genus belonging to the order of picæ. The beak is cultrated, turned inwards, compressed on the sides, and emarginated on each side at the apex; and there is a long slit below the eyes. The nostrils are covered with feathers. The feet have four toes, two before and two behind. There is but one species, viz. the capensis, which is of a reddish colour, with a yellow belt round the shoulders, and a black one round the breast. It is found at the Cape of Good-Hope.

**BUCCULA**, in antiquity, denotes the umbo, or most prominent part in the middle of a shield; so called, because usually fashioned like the mouth or face of a man or other animal.

**BUCENTAUR**, a galley, or large galley of the doge of Venice, adorned with nine pillars on both sides, and gilt over from the prow to the stern. This vessel is covered over head with a kind of tent, made of purple silk. In it the doge receives the great lords and persons of quality that go to Venice, accompanied with the ambassadors and counsellors of state, and all the senators seated on benches by him. The same vessel serves also in the magnificent ceremony of ascension-

day, on which the Duke of Venice throws a ring into the sea to espouse it, and to denote his dominion over the gulph of Venice.

Bucentaur is also the name of a ship, as great and so magnificent as that of the Venetians, built by order of the elector of Bavaria, and launched on a lake, which is six leagues in length.

**BUCEROS**, in ornithology, a genus belonging to the order of picæ. The beak is convex, cultrated, very large, and ferrated outwards: The fore-head is naked, with a bony gibbosity. The nostrils are behind the base of the beak. The tongue is sharp and short. The feet are of the gressarii kind, i. e. the toes are distinct from each other. There are four species of the buceros, viz. 1. The bicornis, with a flat bony fore-head, and two horns before. The body is black, and about the size of a hen; but the breast, belly and thighs are white. There is a white spot on the wing; the tail is long, with ten black prime feathers, and the four outermost on each are white. The feet are greenish, with three toes before and one behind. It is a native of China, and called Calao by Willoughby and other authors. 2. The hydrocorax, or Indian crow of Ray, has a plain bony fore-head without any horns. The body is yellowish, and blackish below. It inhabits the Molucca isles. 3. The rhinoceros, has a crooked horn in the fore-head joined to the upper mandible. It is a native of India, and feeds upon carion. 4. The nasutus, has a smooth fore-head. It is about the size of a magpye, and is a native of Senegal.

**BUCH**, a town of Guienne, in France, which gives its name to a territory called *le Capitulat de Buch*.

**BUCHAN**, a country or district of Aberdeenshire, in Scotland: It gives the title of Earl to the noble and ancient family of Erskine.

**BUCHNERA**, in botany, a genus of the didymia angiosperma class. The calix has five teeth; the corolla is divided into five equal heart-shaped segments; and the capsule is bilocular. There are three species, viz. The americana, a native of Canada and Virginia; the asiatica, a native of Ceylon and China; and the Africana, a native of Æthiopia.

**BUCHAW**, an imperial city of Swabia, in Germany, about twenty-five miles south-west of Ulm: E. long. 9° 40', and N. lat. 48° 51'.

**BUCHAREST**, a town of Wallachia, subject to the Turks: E. lon. 26° 30', and N. lat. 44° 20'.

**BUCHORN**, a city of Swabia, in Germany, situated on the east side of the lake of Constance, and about twelve miles east of the city of Constance: E. long. 9° 20', and N. lat. 47° 40'.

**BUCIOCHE**, in commerce, a sort of woollen cloth manufactured in Provence, which the french ships carry to Alexandria and Cairo.

**BUCK**, in zoology. See **CERVUS**.

**BUCK-BEAN**, in botany. See **MENYANTHES**.

**BUCK-THORN**, the English name of the rhamnus.

**BUCK-WHEAT**. See **POLYGONUM**.

**BUCKET**, a small portable vessel, to hold water, often made of leather for its lightness and easy use in cafes of fire.

It is also the vessel let down into a well, or the sides of ships, to fetch up water.

**BUCKING**, the first operation in the whitening of linen yarn or cloth. See p. 564.

**BUCKINGHAM**; a borough-town of Buckinghamshire, about forty-six miles north-west of London: W. lon. 1° 10', and N. lat. 51° 50'.

It sends two members to parliament.

Buckinghamshire has Northamptonshire on the north; Bedford, Hertford, and Middlesex, on the east; Berkshire, from which it is divided by the river Thames, on the south; and Oxfordshire, on the west.

**BUCKLE**, a well known utensil, made of divers sorts of metals, as gold, silver, steel, brass, &c.

The fashion or form of buckles is various; but their use, in general, is to make fast certain parts of dresses, as the shoes, garters, &c.

Buckles for girdles pay a duty of 3s. 10 $\frac{3}{4}$ d. the gross, or twelve dozen; whereof 1s. 4 $\frac{1}{2}$ d. is drawn back on exportation. Buckles for girts pay likewise a duty of 1s. 5 $\frac{1}{4}$ d. the gross; and both these pay somewhat more, if of brass. But it is to be observed, that all buckles are prohibited to be imported.

**BUCKLER**, a piece of defensive armour used by the ancients. It was worn on the left arm, and composed of wickers woven together, or wood of the lightest sort, but most commonly of hides, fortified with plates of brass or metal. The figure was sometimes round, sometimes oval, and sometimes almost square. Most of the bucklers were curiously adorned with all sorts of figures of birds and beasts, as eagles, lions; nor of these only, but of the gods, of the celestial bodies, and all the works of nature; which custom was derived from the heroic times, and from them communicated to the Grecians, Romans, and Barbarians.

*Victive* **BUCKLERS**. Those consecrated to the gods, and hung up in their temples, either in commemoration of some hero, or as a thanksgiving for a victory obtained over an enemy; whose bucklers, taken in war, were offered as a trophy.

**BUCKNHAM**, or **BUCKENHAM**, a market-town of Norfolk, about nine miles east of Thetford: E. long. 1° 50', N. lat. 52° 30'.

**BUCKOR**, a province of the E. Indies, situated on the river Indus, having the province of Multan on the north, and Tatta on the south.

**BUCKRAM**, in commerce, a sort of coarse cloth made of hemp, gummed, calendered, and dyed several colours. It is put into those places of the lining of a garment, which one would have stiff, and to keep their forms. It is also used in the bodies of womens gowns; and it often serves to make wrappers to cover cloths, serges, and such other merchandises, in order to preserve them and keep them from the dust, and their colours from fading. Buckrams are sold wholesale by the dozen of small pieces or remnants, each about four ells long, and broad according to the pieces from which they are cut. Sometimes they use new

pieces of linen cloth to make buckrams, but most commonly old sheets and old pieces of sails.

Carrick buckrams pay a duty of 5 $\frac{3}{4}$ d. the short piece; whereof 5 $\frac{1}{4}$ d. is repaid on exporting it. East-country buckram pays 1s. 2 $\frac{1}{2}$ d. the roll or half-piece; whereof 1s. 2 $\frac{1}{2}$ d. is drawn back. French buckram pays 1l. 13s. 10 $\frac{3}{4}$ d. the dozen pieces; whereof 1l. 00s. 1 $\frac{1}{4}$ d. is repaid. Fine German buckrams pay 2s. 4 $\frac{1}{2}$ d. the piece; whereof 2s. 1 $\frac{1}{2}$ d. is drawn back on exportation.

**BUCKSTALL**, a toll to take deer, which must not be kept by any body that has not a park of his own, under penalties.

**BUCOLIC**, in ancient poetry, a kind of poem relating to shepherds and country affairs, which, according to the most generally received opinion, took its rise in Sicily. Bucolics, says Vossius, have some conformity with comedy. Like it, they are pictures and imitations of ordinary life; with this difference, however, that comedy represents the manners of the inhabitants of cities, and bucolics the occupations of country people. Sometimes, continues he, this last poem is in form of a monologue, and sometimes of a dialogue. Sometimes there is action in it, and sometimes only narration; and sometimes it is composed both of action and narration. The hexameter verse is the most proper for bucolics in the Greek and Latin tongues. Mochus, Bion, Theocritus, and Virgil, are the most renowned of the ancient bucolic poets.

**BUD**, among gardeners, that part of a seed which first begins to sprout, or rather the leaves first put forth: These in some plants are two; in others, four; and in others again, six, or even more.

**Bud** is also used for the sprout from whence a branch arises.

**Bud**, in country-affairs, likewise denotes a weaned calf of the first year; so called, because the horns are then in the bud.

**BUDA**, the capital of lower Hungary, about 130 miles south-east of Vienna: It stands on the side of a hill, on the south-west side of the Danube, and is well fortified and defended by a castle, esteemed one of the strongest fortresses in Hungary: E. long. 19° 20', N. lat. 52° 25'.

**BUDESDALE**, a market-town of Suffolk, about thirteen miles north-east of Bury: E. long. 1° 10', and N. lat. 52° 25'.

**BUDDLE**, in mineralogy, a large square frame of boards, used in washing the tin ore. See **WASHING**.

**BUDDLEIA**, in botany, a genus of the tetrandria monogynia class. The calix and corolla are each divided into four parts; the stamina are inserted into the receptacle; the capsule has four cells, and contains many seeds. The species are two, viz. the occidentalis, and americana, both natives of America.

**BUDDLING**, the act of cleansing, or washing any ore. See **WASHING**.

**BUDGE-barrels**, among engineers, small barrels well hooped, with only one head; on the other end is nailed a piece of leather, to draw together upon strings like a purse. Their use is for carrying powder along with

with a gun or mortar, being less dangerous, and easier carried, than whole barrels. They are likewise used upon a battery of mortars, for holding meal-powder.

**BUDINGEN**, the capital of a county of the same name in Germany, situated in the circle of the upper Rhine, about twenty miles north-east of Frankfort.

**BUDOVA**, a city of Dalmatia, situated on the gulf of Venice, in  $19^{\circ} 20'$  E. long. and  $42^{\circ} 15'$  N. lat.

It is a bishop's see.

**BUDWEIS**, a town of Bohemia, situated on the river Muldaw, about sixty-five miles south of Prague: E. long.  $14^{\circ} 20'$ , N. lat.  $49^{\circ}$ .

**BUDZIAC TARTARY**, a country subject to the Turks; situated on the rivers Neister, Bog, and Nieper; having Poland and Russia, on the north; Little Tartary, on the east; the Black-sea, on the south; and Bessarabia, on the west.

**BUEN-AYRE**. See **BONAIRE**.

**BUENOS-AYRES**, one of the most considerable Spanish ports on the east coast of South America, situated on the southern shore of the river Plata, and about fifty leagues from its mouth; and yet here the river is full seven leagues broad: W. long.  $60^{\circ}$ , S. lat.  $36^{\circ}$ .

It is a strong fortified town

**BUEN-RETIRO**, a palace near Madrid, belonging to the king of Spain.

**BUFF**, in commerce, a sort of leather prepared from the skin of the buffalo, which, dressed with oil, after the manner of shammy, makes what we call buff-skin. This makes a very considerable article in the French, English, and Dutch commerce at Constantinople, Smyrna, and all along the coast of Africa. The skins of elks, oxen, and other-like animals, when prepared after the same manner as that of the buffalo, are likewise called buffs.

Of buff-skin, or buff-leather, are made a sort of coats for the horse or gens d'arms of France, bandoliers, helms, pouches and gloves.

In France, there are several manufactories designed for the dressing of those sort of hides, particularly at Corbeil, near Paris; at Niort, at Lyons, at Rone, at Etanepus, at Cone.

**BUFFALO**, in zoology. See **Bos**.

**BUFFET** was anciently a little apartment, separated from the rest of the room by slender wooden columns, for the disposing of china, glass-ware, &c.

It is now properly a large table in a dining-room, called also a side-board, for the plate, glasses, bottles, basons, &c. to be placed on, as well for the service of the table, as for magnificence. In houses of persons of distinction in France, the buffet is a detached room, decorated with pictures relative to the subject, with fountains, cisterns and vases. It is commonly faced with marble or bronze.

**BUFFOON**, a droll or mimic who diverts the public by his pleasantries and follies.

**BUFO**, in zoology, the trivial name of a species of rana. See **RANA**.

**BUGONIA**, in botany, a genus of the diandria monogynia class. The calix is four-leaved; the petals are

four; and the capsule is unilocular, and contains two seeds. There is but one species, viz. the tenuifolia or bastard chick-weed, a native of Britain.

**BUG**, a river, which, taking its rise in red Ruffia in Poland, runs northward to Breste; and then, turning westward, falls into the Weisel, or Vistula, below Warfaw.

**BUG**, or **BUGG**, in zoology, the English name of a species of cimex. See **CIMEX**.

**BUGEN**, a town of Japan, the capital of the kingdom of that name, in the isle of Ximo.

**BUGEY**, a territory in France, being the south division of Bresse; in Burgundy, on the frontiers of Savoy.

**BUGGASINS**, in commerce, a name given to buckrams made of callico: these pay a duty, on importation, of 1s.  $2\frac{1}{2}$ d., the half piece; whereof 1s.  $\frac{1}{2}$ d. is drawn back on exportation.

**BUGGERS**, in church-history, the same with bulgarians, a sect of heretics which, amongst other errors, held, that men ought to believe no scripture but the New Testament; that baptism was not necessary to infants; that husbands who conversed with their wives could not be saved; and that an oath was absolutely unlawful.

**BUGGERER**, a person who is guilty of the crime of buggery. See the next article.

**BUGGERY**, is defined by Sir Edward Coke to be a carnal copulation against nature, either by the confusion of species, that is to say, a man or woman with a brute beast; or sexes, as a man with a man, or man unnaturally with a woman. It is said this sin against God and nature was first brought into England by the Lombards; and anciently, according to some writers, it was punishable with burning; but others say, with burying alive. It is, by statute, felony without benefit of clergy, and is always excepted out of a general pardon.

**BUGIA**, a port-town of the kingdom of Algiers, in Africa, situated about sixty miles east of the city of Algiers; E. long.  $4^{\circ}$ , N. lat.  $35^{\circ} 30'$ .

**BUGIE**, a port-town of Egypt, situated on the western shore of the Red-sea, almost opposite to Ziden, the port-town to Mecca, and about 100 miles west of it; E. long.  $36^{\circ}$ , N. lat.  $22^{\circ}$ .

**BUGLE**, in botany. See **ANJUGA**.

**BUGLOSS**, in botany. See **ANCHUSA**.

*Viper's* **BUGLOSS**, in botany. See **ECHINUM**.

**BUGULA**, **BUGLE**, in botany. See **ADJUGA**.

**BUHL**, a little fortress in Swabia, about six miles south-east of Stollhoffen, and nineteen north-east of Strafburg.

**BUILDING**, a fabric erected by art, either for devotion, for magnificence, or for conveniency.

**Regular BUILDING**, is that whose plan is square, the opposite sides equal, and the parts disposed with symmetry.

**Irregular BUILDING**, that whose plan is not contained with equal or parallel lines, either by the accident of situation, or the design of the builder, and whose parts are not relative to one another in the elevation.

*Insulated*

*Insulated BUILDING*, that which is not contiguous to any other, but is encompassed with streets, open squares, or the like.

*Engaged BUILDING*, one surrounded with other buildings, having no front to any street or public place, nor any communication without, but by a common passage.

*Interred or sunk BUILDING*, one whose area is below the surface of the place on which it stands, and of which the lowest courses of stone are concealed.

**BUILDING** is also used for the art of constructing and raising an edifice; in which sense it comprehends as well the expences, as the invention and execution of the design.

As for the materials of buildings, they are either stone, as marble, free-stone, brick for the walls, mortar, &c. or of wood, as fir, cypress, cedars for pillars of upright uses, oak for summers, beams, and crop-work, or for joining and connection. See ARCHITECTURE.

**BUL**, in the ancient Hebrew chronology, the eighth month of the ecclesiastical, and the second of the civil year; it has since been called Marhevan, and answers to our October.

**BULAC**, a town of Egypt, situated on the eastern shore of the river Nile, about two miles west of Grand Cairo, of which it is the port-town, and contains about four thousand families; E. long. 32°, and N. lat. 30°.

It is a place of great trade, as all the vessels going up and down the Nile make some stay here: it is also in this place that they cut the banks of the Nile every year, in order to fill their canals, and overflow the neighbouring grounds, without which the soil would produce neither grain nor herbage.

**BULAFU**, a musical instrument consisting of several pipes of wood, tied together with thongs of leather so as to form a small interstice between each pipe. It is used by the negroes of Guinea.

**BULB**, or **BULBOUS ROOT**, in the anatomy of plants, expresses a root of a round or roundish figure, and usually furnished with fibres at its base.

Bulbous roots are said to be solid, when composed of one uniform lump of matter; tunicated, when formed of multitudes of coats, surrounding one another; squamose, when composed of, or covered with lesser flakes; duplicate, when there are only two to each plant; and aggregate, when there is a congeries of such roots to each plant.

**BULBOCASTANUM**, in botany. See **BUNIAM**.

**BULBODIUM**, in botany, a genus of the hexandria monogynia class. The corolla is shaped like a tunnel, and consists of five petals; the claws of the petals are narrow. There is but one species, viz. the vernum, a native of Spain.

**BULBOSE**. See **BULB**.

**BULEUTÆ**, in Grecian antiquity, were magistrates answering to the decuriones among the Romans. See **DECURIO**.

**BULGAR**, the capital of the province of Bulgar, in

Russia, situated on the river Wolga; E. long. 51°, and N. lat. 54°.

**BULGARIA**, a province of Turkey in Europe, bounded by the river Danube, which divides it from Wallachia and Moldavia on the north, by the Black Sea on the east, by Romania on the south, and by Servia on the west. Its chief city is Nicopolis.

**BULGARIAN language**, the same with the Sclavonic.

**BULIMY**, a disease in which the patient is affected with an insatiable and perpetual desire of eating; and, unless he is indulged, he often falls into fainting fits. It is also called *fames canina*, canine appetite.

**BULITHUS**, a stone found either in the gall-bladder, or in the kidneys and bladder of an ox. See **BOS**.

**BULK of a ship**, the whole content in the hold for the stowage of goods.

**BULK-HEADS** are partitions made athwart the ship with boards, by which one part is divided from the other; as the great cabin, gun-room, bread-room, and several other divisions. The bulk-head afore is the partition between the fore-castle and gratings in the head.

**BULL**, in zoology. See **BOS**.

**BULL**, in astronomy. See **ASTRONOMY**, p. 486, 487.

**BULL'S-EYE**, among seamen, a small, obscure, sublimine cloud, ruddy in the middle, that sometimes appears to mariners, and is the immediate forerunner of a great storm at sea.

**BULL-FINCH**, in ornithology. See **LOXIA**.

**BULL-FROG**, in zoology, See **RANA**.

**BULL-HEAD**, in ichthyology. See **COTTUS**.

**BULL**, among ecclesiastics, a written letter, dispatched, by order of the pope, from the Roman chancery, and sealed with lead, being written on parchment, by which it is partly distinguished from a brief. See the article **BRIEF**.

It is a kind of apostolical rescript, or edict, and is chiefly in use in matters of justice or grace. If the former be the intention of the bull, the lead is hung by a hempen cord; if the latter, by a silken thread. It is this pendent lead, or seal, which is, properly speaking, the bull, and which is impressed, on one side, with the heads of St. Peter and St. Paul, and on the other with the name of the pope and the year of his pontificate. The bull is written in an old, round, gothic letter, and is divided into five parts, the narrative of the fact, the conception, the clause, the date, and the salutation, in which the pope styles himself *servus servorum*, i. e. the servant of servants.

These instruments, besides the lead hanging to them, have a cross, with some text of scripture, or religious motto, about it. Bulls are granted for the consecration of bishops, the promotion to benefices, and the celebration of jubilees, &c.

**BULL in cæna Domini**, a particular bull read every year, on the day of the Lord's supper, or Maundy Thursday, in the pope's presence, containing excommunications and anathemas against heretics, and all who disturb or oppose the jurisdiction of the holy see.

After

After the reading of the bull, the pope throws a burning torch into the public place, to denote the thunder of this anathema.

**Golden BULL**, an edict, or imperial constitution, made by the emperor Charles IV. reputed to be the magna charta, or the fundamental law of the German empire.

It is called golden, because it has a golden seal, in the form of a pope's bull, tied with yellow and red cords of silk: upon one side is the emperor represented sitting on his throne, and on the other the capital of Rome. It is also called Caroline, on Charles IV's account. Till the publication of the golden bull, the form and ceremony of the election of an emperor were dubious and undetermined, and the number of the electors not fixed. This solemn edict regulated the functions, rights, privileges, and pre-eminences of the electors. The original, which is in Latin, on vellum, is preserved at Frankfurt: this ordinance, containing thirty articles, or chapters, was approved of by all the princes of the empire, and remain still in force.

**BULLA**, in zoology, a genus belonging to the order of vermes testaceæ. It is an animal of the snail-kind: The shell consists of one valve, convoluted, and without any prickles; the aperture is narrowish, oblong, longitudinal, and entire at the base; the columella is smooth and oblique. There are twenty-three species, most of them natives of the Asiatic and Atlantic oceans.

**BULLÆ**, in Roman antiquity, ornaments at first given only to the sons of noblemen; though afterwards they became of more common use. This ornament was first given by Tarquinius with the prætexta to his son, who had, with his own hand, at fourteen years of age, killed an enemy. Thus we find the bulla was a sign of triumph. Macrobius relates, that the children of freed men were allowed to wear the prætexta, and, instead of the golden bulla, a leathern one, about their necks: Those bullæ were made hollow within to inclose amulets against envy, &c. When the youth arrived at fifteen years of age, they hung up their bullæ about the necks of their gods lars. We are farther informed, that the bullæ were not only hung about the necks of young men, but of horses also.

**BULLEN**, a term used by country people for hemp-stalks peeled.

**BULLET**, an iron or leaden ball, or shot, wherewith fire-arms are loaded. See **BALL**.

**BULLINGBROKE**, in geography. See **BOLINGBROOK**.

**BULLION**, uncoined gold or silver in the mass.

Those metals are called so, either when smelted from the native ore, and not perfectly refined; or when they are perfectly refined, but melted down in bars or ingots, or in any unwrought body, of any degree of fineness.

When gold and silver are in their purity, they are so soft and flexible, that they cannot well be brought into any fashion for use, without being first reduced and hardened with an alloy of some other baser metal.

To prevent these abuses, which some might be

tempted to commit in the making of such alloys, the legislators of civilized countries have ordained, that there shall be no more than a certain proportion of a baser metal to a particular quantity of pure gold or silver, in order to make them of the fineness of what is called the standard gold or silver of such a country.

According to the laws of England, all sorts of wrought plate in general, ought to be made to the legal standard; and the price of our standard gold and silver is the common rule whereby to set a value on their bullion, whether the same be in ingots, bars, dust, or in foreign specie: whence it is easy to conceive that the value of bullion cannot be exactly known, without being first assayed, that the exact quantity of pure metal therein contained may be determined, and consequently whether it be above or below the standard.

Silver and gold, whether coined or uncoined, (tho' used for a common measure of other things), are no less a commodity, than wine, tobacco, or cloth; and may, in many cases, be exported as much to the national advantage as any other commodity.

**BULLOCK**, the same with an ox, or gelded bull. See **BOS**.

**BULLY-TREE**, in botany. See **CHRYSEOPHYLLUM**.

**BULTEL**, a term used to denote the refuse of meal after dressing, or the cloth wherein it is dressed, otherwise called butler-cloth.

**BULWARK**, in the ancient fortification. See **RAMPART**.

**BUMICILLI**, a religious sect of Mahometans in Egypt and Barbary, who pretend to fight with devils, and commonly appear in a fright and covered with wounds and bruises. About the full moon they counterfeit a combat in the presence of all the people, which lasts for two or three hours, and is performed with asagais, or javelins, till they fall down quite spent; in a little time, however, they recover their spirits, get up, and walk away.

**BUNGAY**, a market-town of Suffolk, situated on the river Wavenny, about thirty-two miles north-east of Bury: E. lon. 1° 35', and N. lat. 52° 35'.

**BUNGO**, or **BONGO**. See **BONGO**.

**BUNIAS**, in botany, a genus of the tetradynamia siliquosa class. The pod is deciduous, quadrangular, and the angles are unequal and terminate in sharp points. There are four species, only one of which, viz. the cakile, or sea-rocket, is a native of Britain.

**BUNDLE**, a collection of things wrapped up together. Of baste-ropes, harness-plates, and glover's knives, ten make a bundle; of humberg yarn, twenty skeans; of basket-rods, three feet about the band.

**BUNIAM**, in botany, a genus of the pentandria digynia class. The corolla is uniform; the umbella is thick; and the fruit is oval. There is but one species, viz. the bulbocastanum, earth-nut, kipper-nut, pig-nut, or hawk-nut, a native of Britain.

**BUNK**, or **BUNKEN**, in the materia medica. See **LEUCACANTHA**.

**BUNT** of a sail, the middle part of it, formed designedly into a bag or cavity, that the sail may gather

- more wind. It is used mostly in top-sails, because courses are generally cut square, or with but small allowance for bunt or compass. The bunt holds much leeward wind, that is, it hangs much to leeward.
- BUNT LINES** are small lines made fast to the bottom of the sails, in the middle part of the bolt-rope, to a cringle, and so are reeved through a small block, seized to the yard. Their use is to trice up the bunt of the sail, for the better furling it up.
- BUNTING**, in ornithology, the English name of a species of fringilla. See **FRINGILLA**.
- BUNTINGFORD**, a market town of Hertfordshire, about twelve miles north of Hertford: W. long. 5', and N. lat. 51° 55'.
- BUNTZLAU**, or **BUNTZEL**, the name of two towns in Germany: the old town is situated on the river Elbe, and new town, which is become the most considerable, upon the Gizare, eight leagues from Lignitz, in 16° 26' E. long. and 51° 12' N. latitude. There is likewise a town of that name in Silesia.
- BUONO**, as **TEMPO-BUONO**, in music, signifies a certain time or part of the measure, more proper for certain things than any other, as to end a cadence or pause, to place a long syllable or syncoped dissonance, concord, &c. In common time of four times to a bar, the first and third is one *buono tempo*, as the second and last are called *tempo di cattiva*.
- BUOY**, at sea, a short piece of wood, or a close-hooped barrel, fastened so as to float directly over the anchor, that the men, who go in the boat to weigh the anchor, may know where it lies.
- BUOY** is also a piece of wood, or cork, sometimes an empty cask, well closed, swimming on the surface of the water, and fastened, by a chain or cord, to a large stone, piece of broken cannon, or the like, serving to mark the dangerous places near a coast, as rocks, shoals, wrecks of vessels, anchors, &c.
- There are sometimes, instead of buoys, pieces of wood placed in form of masts, in conspicuous places; and sometimes large trees are planted in a particular manner, in number two at least, to be taken in a right line, the one hiding the other, so as the two may appear to the eye no more than one.
- Stream the BUOY** is to let the anchor fall while the ship has way.
- T<sup>o</sup> BUOY up the cable** is to fasten some pieces of wood, barrels, &c. to the cable, near the anchor, that the cable may not touch the ground, in case it be foul or rocky, lest it should be fretted and cut off.
- BUOYANT**, something which, by its aptness to float, bears up other more ponderous and weighty things. See **BUOY**.
- BUPHAGA**, in ornithology, a genus belonging to the order of picæ. The beak is freight and quadrangular; the mandibles are gibbous, entire, and the gibbosity is greater on the outside. The feet are of the ambulatory kind. The body is greyish above, and of a dirty yellow below; the tail is shaped like a wedge. It is a native of Senegal; and frequently perches upon oxen, and picks out the worms from their backs.
- BUPHTHALMUM**, a genus of the syngenesia polyga-
- mia superflua class. The receptacle is paleaceous; the margin of the pappus is obsolete; the sides of the seeds are margined; and the stigmata of the hermaphrodite floccules are undivided. The species are ten, none of which are natives of Britain.
- BUPL EURUM**, in botany, a genus of the pentandria digynia class. The involucreum of the umbells is large and five-leaved; the fruit is striated, compressed, and roundish. The species are seventeen, only two of which are natives of Britain, viz. the rotundifolium, or thorrow-wax; and the tenuissimum, or the least hare's-ear.
- BUPRESTIS**, in zoology, a genus of insects belonging to the order of coleoptera. The feelers are like bristles, and about the length of the breast; the lead is half retracted into the thorax. There are twenty-seven species of this insect, most of them natives of the Indies.
- BUQUOI**, a town of Artois, in the French Netherlands, situated on the confines of Picardy: E. long. 2° 40', and N. lat. 50° 12'.
- BUR**, a broad ring of iron, behind the place made for the hand on the spears used formerly in tilting, which bur was brought to rest, when the tilter charged his spear.
- BURBAS**, in commerce, a small coin at Algiers, with the arms of the dey struck on both sides: it is worth half an asper.
- BURCHAUSEN**, a town of Germany, in the lower Bavaria, situated on the river Saltz: E. long. 13° 25', and N. lat. 48° 5'.
- BURDEN**, or **BURDON**, in music, the drone or bals, and the pipe or string which plays it: Hence that part of a song, that is repeated at the end of every stanza, is called the burden of it.
- A chord which is to be divided, to perform the intervals of music, when open and undivided, is also called the burden.
- BURDEN of a ship** is its contents, or number of tons it will carry. The burden of a ship may be determined thus: multiply the length of the keel, taken within board, by the breadth of the ship, within board, taken from the midship-beam, from plank to plank, and multiply the product by the depth of the hold, taken from the plank below the keelson, to the under part of the upper deck plank, and divide the last product by 94, then the quotient is the content of the tonnage required. See **FREIGHT**.
- BURDO**, that kind of mule produced between a horse and a she-ass. See **MULE**.
- BURDOCK**, in botany, the English name of the xanthium. See **XANTHIUM**.
- BURDUGNO**, a town of the Morea, situated on the river Vasilipotom, near Mistra.
- BUREN**, a town of Dutch Guelderland, about sixteen miles west of Nimeguen: E. long. 5° 20', and N. lat. 52°.
- BUREN** is also the name of a town in Westphalia in Germany, about five miles south of the city of Paderborn: E. long. 8° 25', and N. lat. 51° 35'.
- BURFORD**, a market-town of Oxfordshire, about fif-

teen miles west of Oxford: W. long.  $1^{\circ} 40'$ , N. lat.  $51^{\circ} 40'$ .

It gives the title of earl to the noble family of Beaulerc.

**BURGH**, a town of Zutphen, in the Dutch Netherlands, situated upon the Old Iffel, about eighteen miles east of Nimegueu: E. long.  $6^{\circ} 10'$ , and N. lat.  $52^{\circ}$ .

**BURGA**, a cape of Algiers in Africa, running out into the Med terranean sea.

**BURGAGE**, an ancient tenure in boroughs, whereby the inhabitants, by custom, hold their lands, &c. of the king, or other superior lord of the borough, at a certain yearly rent: Also a dwelling-house in a borough, was anciently called a burgage.

**BURGEON**, a term used by gardeners in the same sense with bud. See **BUD**.

**BURGESS**, an inhabitant of a borough, or one who possesses a tenement therein.

In other countries, burgeses and citizen are confounded together; but with us they are distinguished: The word is also applied to the magistrates of some towns.

Burgeses is now ordinarily used for the representative of a borough-town in parliament.

**BURGGRAVE** properly denotes the hereditary governor of a castle or fortified town, chiefly in Germany.

**BURGH**. See **BOROUGH**.

**BURGH-bote** signifies a contribution towards the building or repairing of castles, or walls, for the defence of a borough, or city.

**BURGH-breche** is properly the breaking open a burgh, house, inclosure, &c. and in the laws of Canute, cap. lv. signifies a fine imposed upon a community of a town for a breach of the peace. According to Rastallus, burgh-breche is, to be quit of trespasses committed against the peace, in city or borough.

**BURGHMESTERS**. See **BURGMAS**.

**BURGHMASTER**, among miners. See **BARNMASTER**.

**BURGHMOTE**, the court of a borough.

**BURGLARY**, a felonious breaking and entering into the dwelling-house of another person in the night-time, with an intent to commit some felony, whether the same be executed, or not.

The like offence committed by day, is called house-breaking.

Burglary is an offence excluded the benefit of clergy, and may be committed by taking away goods from a dwelling-house, any person being therein; or breaking any shop, warehouse, &c. though in the day-time, and taking goods from thence of five shillings value, if no person be therein.

**BURGLES**, a town of Transylvania, about thirty miles north of Claufenburg, subject to the house of Austria: E. long.  $22^{\circ} 40'$ , and N. lat.  $47^{\circ} 40'$ .

**BURGMAS**, the chief magistrate of the great towns in Flanders, Holland, and Germany. The power and jurisdiction of the burgomaster is not the same in all places, every town having its particular customs and regulations: At Amsterdam there are four chosen by the voices of all those people in the senate,

who have either been burgomasters or echevins. Their authority resembles that of our lord-mayor and aldermen; they dispose of all under-offices that fall in their time, keep the key of the bank, and enjoy a salary but of five hundred guilders, all feasts, public entertainments, &c. being defrayed out of the common treasury.

**BURGOO**, a dish frequent at sea, being made of oat-meal, or greets, boiled in water till they burst, and then some butter added.

**BURGOS**, the capital of Old Castile in Spain, about one hundred and ten miles north of Madrid: W. long.  $4^{\circ} 5'$ , and N. lat.  $42^{\circ} 30'$ .

**BURGOV**, a town of Swabia in Germany, about twenty miles west of Augsburg: E. long.  $10^{\circ} 20'$ , N. lat.  $48^{\circ} 30'$ .

**BURGUNDY**, or **BURGOGNE**, a province or government in France, having Champaign on the north, and Dauphine on the south.

**BURIAL**, the interment of a deceased person.

The rites of burial are looked upon in all countries, and at all times, as a debt so sacred, that such as neglected to discharge it were thought accursed: Hence the Romans called them *justi*, and the Greeks [*nomima, dikasta, hesia*,] &c. words implying the inviolable obligations which nature has laid upon the living to take care of the obsequies of the dead. Nor are we to wonder, that the ancient Greeks and Romans were extremely solicitous about the interment of their deceased friends, since they were strongly persuaded, that their souls could not be admitted into the Elysian fields till their bodies were committed to the earth; and if it happened that they never obtained the rites of burial, they were excluded from the happy mansions—for the term of an hundred years. For this reason it was considered as a duty incumbent upon all travellers who should meet with a dead body in their way, to cast dust or mould upon it three times, and of these three handfuls, one at least was cast upon the head. The ancients likewise considered it as a great misfortune if they were not laid in the sepulchres of their fathers; for which reason, such as died in foreign countries had usually their ashes brought home, and interred with those of their ancestors. But notwithstanding their great care in the burial of the dead, there were some persons whom they thought unworthy of that last office, and to whom therefore they refused it: Such were, 1. Public or private enemies. 2. Such as betrayed, or conspired against their country. 3. Tyrants, who were always looked upon as enemies to their country. 4. Villains guilty of sacrilege. 5. Such as died in debt, whose bodies belonged to their creditors. And, 6. Some particular offenders, who suffered capital punishment.

Of those who were allowed the rites of burial, some were distinguished by particular circumstances of disgrace attending their interment: Thus persons killed by lightening were buried apart by themselves, being thought odious to the gods; those who wasted their patrimony, forfeited the right of being buried in the sepulchres of their fathers; and those who were guilty

of self-murder were privately deposited in the ground, without the accustomed solemnities. Among the Jews, the privilege of burial was denied only to self-murderers, who were thrown out to rot upon the ground. In the Christian church, though good men always desired the privilege of interment, yet they were not, like the heathens, so concerned for their bodies, as to think it any detriment to them, if either the barbarity of an enemy, or some other accident, deprived them of this privilege. The primitive Christian church denied the more solemn rites of burial only to unbaptized persons, self-murderers, and excommunicated persons who continued obstinate and impenitent, in a manifest contempt of the church's censures.

The place of burial among the Jews was never particularly determined. We find they had graves in the town and country, upon the highways, in gardens, and upon mountains. Among the Greeks, the temples were made repositories for the dead in the primitive ages; yet the general custom in latter ages, with them, as well as with the Romans and other heathen nations, was to bury their dead without their cities, and chiefly by the highways. Among the primitive Christians, burying in cities was not allowed for the first three hundred years, nor in churches for many ages after, the dead bodies being first deposited in the atrium or church-yard, and porches and porticos of the church: hereditary burying-places were forbidden till the 12th century. As to the time of burial, with all the ceremonies accompanying it, see the article FUNERAL RITES.

**BURICK**, a town of the duchy of Cleves, in the circle of Westphalia in Germany, situated on the river Rhine, about twenty miles south of Cleves: E. long.  $6^{\circ} 5'$ , N. lat.  $51^{\circ} 35'$ .

**BURLESQUE**, a species of composition, which, tho' a great engine of ridicule, is not confined to that subject; for it is clearly distinguishable into burlesque that excites laughter merely, and burlesque that excites derision or ridicule. A grave subject, in which there is no impropriety, may be brought down by a certain colouring so as to be risible, as in Virgil Traveltie; the author first laughs at every turn, in order to make his readers laugh. The Lutrin is a burlesque poem of the other sort, laying hold of a low and trifling incident to expose the luxury, indolence, and contentious spirit of a set of monks. Boileau, the author, turns the subject into ridicule by dressing it in the heroic style; and affecting to consider it as of the utmost dignity and importance. Though ridicule is the poet's aim, he always carries a grave face, and never once bewrays a smile. The opposition between the subject and the manner of handling it, is what produces the ridicule; and therefore, in a composition of this kind, no image professedly ludicrous ought to have quarter, because such images destroy the contrast.

Though the burlesque that aims at ridicule, produces its effects by elevating the style far above the subject, yet the poet ought to confine himself to such images as are lively, and readily apprehended. A strained elevation, soaring above the ordinary reach of fan-

cy, makes not a pleasant impression. The mind is soon disgusted by being kept long on the stretch. Machinery may be employed in a burlesque poem, such as the Lutrin, the Dispensary, or Hudibras, with more success and propriety than in any other species of poetry. For burlesque poems, though they assume the air of history, give entertainment chiefly by their pleasant and ludicrous pictures: It is not the aim of such a poem to raise sympathy; and for that reason, a strict imitation of nature is not necessary. And hence, the more extravagant the machinery in a ludicrous poem, the more entertainment it affords.

**BURLINGTON**, a sea-port town in the East Riding of Yorkshire, situated on the German ocean, about thirty-seven miles north-east of York: E. long.  $10^{\circ}$ , and N. lat.  $54^{\circ} 15'$ .

It gives the title of earl to a branch of the noble family of Boyle.

**New BURLINGTON**, the capital of New-Jersey, in North America; situated in an island of Delaware river, about twenty miles north of Philadelphia: W. long.  $74^{\circ}$ , and N. lat.  $40^{\circ} 40'$ .

**BURMANNIA**, in botany, a genus of the hexandria monogynia class. The calix is shaped like a prism, coloured and divided into three segments, with membranaceous angles; the petals are three; the capsule is three-celled; and the seeds are very small. There are only two species, none of them natives of Britain.

**BURN**, in medicine and surgery, an injury received in any part of the body by fire. See MEDICINE, and SURGERY.

**BURNET**, in botany. See POTERIUM, and SANGUISORBA.

**BURNHAM**, a market-town of Norfolk, about 25 miles north-west of Norwich: E. long.  $50'$ , and N. lat.  $52^{\circ}$ .

**BURNING**, the action of fire on some pabulum, or fuel, by which the minute parts thereof are put into a violent motion, and some of them assuming the nature of fire themselves, fly off *in orbem*, while the rest are dissipated in form of vapour, or reduced to ashes. See FIRE.

**BURNING**, or **BRENNING**, in our old customs, denotes an infectious disease, got in the stews by conversing with lewd women, and supposed to be the same with what we now call the venereal disease.

In a manuscript of the vocation of John Bale to the bishopric of Ossory, written by himself, he speaks of Dr. Hugh Weston, who was dean of Windfor, in 1556, but deprived by cardinal Pole for adultery, thus: "At this day is lecherous Weston, who is more practised in the arts of breech-burning, than all the whores of the stews. He not long ago brought a beggar of St. Botolph's parish." See STEWS.

**BURNING**, in antiquity, a way of disposing of the dead, much practised by the ancient Greeks and Romans, and still retained by several nations in both the East and West Indies.

Eulathius assigns two reasons why burning came to be of so general use in Greece; the first is, because bodies were thought to be unclean after the soul's departure,

parture, and therefore were purified with fire. The second reason is, that the soul, being separated from the gross and unactive matter, might be at liberty to take its flight into heaven. The body was rarely burnt without company, for besides the various animals they threw upon the pile, we seldom find a man of quality consumed without a number of slaves and captives, which, in barbarous times, they used to murder for that purpose: and in some parts of the East Indies it is customary, at this day, for wives to throw themselves into the funeral pile with their deceased husbands. At the funerals of emperors, generals, &c. who had their arms burnt with them, the soldiers made procession three times round the funeral pile with shouts and trumpets, to express their respect to the dead. During the burning also, the dead person's friends stood by, called on the deceased, and poured out libations of wine, with which, when the pile was burnt down, they extinguished the remains of the fire; and having collected the bones of the deceased, washed them with wine, and anointed them with oil. When the bones were discovered, they gathered the ashes that lay close to them, and both were repositied in urns, either of wood, stone, earth, silver, or gold, according to the quality of the deceased. See URN.

**BURNING**, among surgeons. See CAUTERIZATION.

Burning is much practised by the people of the East Indies, particularly those of Japan, who use the moxa for this purpose. See MOXA.

**BURNING-glass**, a convex or concave glass, commonly spherical, which being exposed directly to the sun, collects all the rays falling thereon into a very small space, called the focus; where wood, or any other combustible matter being put, will be set on fire. See OPTICS.

**BURNING-mountains**. See VOLCANO.

**BURNING of colours**, among painters. There are several colours that require burning; as first, lamp-black, which is a colour of so greasy a nature, that, except it is burnt, it will require a long time to dry.

The method of burning, or rather drying, lamp-black, is as follows: Put it into a crucible over a clear fire, letting it remain till it be red hot, or so near it that there is no manner of smoke arises from it.

Secondly, Umber, which if it be intended for colour for a horse, or to be a shadow for gold, then burning fits it for both these purposes.

In order to burn umber, you must put it into the naked fire, in large lumps, and not take it out till it is thoroughly red hot; if you have a mind to be more curious, put it into a crucible, and keep it over the fire till it be red hot.

Ivory also must be burnt to make black, thus: fill two crucibles with shavings of ivory, then clap their two mouths together, and bind them fast with an iron wire, and lute the joints close with clay, salt, and horse-dung, well beaten together; then set it over the fire, covering it all over with coals: let it remain in the fire, till you are sure that the matter inclosed is thoroughly red hot: then take it out of the fire; but do not open the crucibles till they are perfectly

cold; for were they opened while hot, the matter would turn to ashes; and so it will be, if the joints are not luted close.

**BURNISHER**, a round, polished piece of steel, serving to smooth and give a lustre to metals.

Of these there are different kinds of different figures, straight, crooked, &c. Half burnishers are used to folder silver, as well as to give a lustre. See SOLDERING.

**BURNISHING**, the art of smoothing or polishing a metalline body, by a brisk rubbing of it with a burnisher.

Book-binders burnish the edges of their books, by rubbing them with a dog's tooth. Gold and silver are burnished, by rubbing them with a wolf's tooth, or by the bloody stone, or by tripoli, a piece of white wood, emery, and the like. Deer are said to burnish their heads, by rubbing off a downy white skin from their horns, against a tree.

**BURNLEY**, a market-town of Lancashire, about 27 miles south-east of Lancaster: W. long. 2° 5', and N. lat. 53° 40'.

**BURR**, the round knob of a horn next a deer's head.

**BURRE**, **BOUREE**, or **BOREE**, a kind of dance composed of three steps joined together in two motions, begun with a crotchet rising. The first couplet contains twice four measures, the second twice eight. It consists of a balance and coupee.

**BURREGREG**, a considerable river of the kingdom of Fez, in Africa; which taking its rise in the Atlas mountains, falls into the ocean not far from the straits of Gibraltar.

**BURR-PUMP**, or **BILGE-PUMP**, differs from the common pump, in having a staff 6, 7, or 8 feet long, with a bar of wood, whereto the leather is nailed, and this serves instead of a box. So two men, standing over the pump, thrust down this staff, to the middle whereof is fastened a rope, for 6, 8, or 10 to hale by, thus pulling it up and down.

**BURROCK**, a small weir or dam, where wheels are laid in a river, for the taking of fish.

**BURROW**, or **BOROUGH**. See BOROUGH.

**BURROWS**, holes in a warren, which serve as a cover for hares, rabbits, &c.

**BURSA**, or **PRUSA**, in geography, the capital of Bithinia, in Asia Minor, situated in a fine fruitful plain, at the foot of mount Olympus, about an hundred miles south of Constantinople: E. long. 29°, and N. lat. 40° 30'.

**BURSA-pastoris**, in botany. See THLASPI.

**BURSAR**, in a general sense, signifies a treasurer or purse-keeper, especially in a monastery.

**BURSE**, in a commercial sense, a place for merchants to meet in, and negotiate their business publicly, with us called exchange. See EXCHANGE.

**BURSTEN**, denotes a person who has a rupture. See RUPTURE.

**BURTON**, in geography, the name of two market-towns, the one in Staffordshire, and the other in Lincolnshire; the former being situated about 18 miles east of Stafford, in 1° 36' W. long. and 52° 40' N. lat.

- N. lat. and the latter, thirty miles north of Lincoln, in 30° W. long. and 53° 40' N. lat.
- BURTON** is also the name of a market-town in West-morland, about thirty miles fourth-west of Appleby: W. long. 2° 35', N. lat. 54° 10'.
- BURTON**, in the sea-language, a small tackle consisting of two single blocks, and may be made fall any where at pleasure, for hoisting small things in and out; and will purchase more than a single tackle with two blocks.
- BURY**, in geography, a market-town of Lancashire, about 30 miles fourth-east of Lancaster: W. long. 2° 20', N. lat. 53° 36'.
- BURY** St EDMUNDS, or St EDMUND'S BURY, the county-town of Suffolk, about twelve miles east of Newmarket, and seventy north-east of London: E. long. 45', N. lat. 52° 20'.
- BURY** is also a term sometimes used for the hole or den of some animal under ground, more usually called burrow.

- Thus we say, the bury of a mole, rabbit, &c.
- BUSH**, a term used for several shrubs of the same kind growing close together: thus we say, a furze-bush, bramble-bush, &c.
- BUSH** is sometimes used, in a more general sense, for any assemblage of thick branches interwoven and mixed together.
- Burning-BUSH**, that bush wherein the Lord appeared to Moses at the foot of mount Horeb, as he was feeding his father-in-law's flocks.

As to the person that appeared in the bush, the text says, "That the angel of the Lord appeared unto him in a flame of fire, out of the middle of the bush:" but whether it was a created angel, speaking in the person of God, or God himself, or (as the most received opinion is) Christ the Son of God, has been matter of some controversy among the learned. Those who suppose it no more than an angel, seem to imply that it would be a diminution of the majesty of God, to appear upon every occasion, especially when he has such a number of celestial ministers, who may do the business as well. But considering that God is present every where, the notification of his presence by some outward sign in one determinate place, (which is all we mean by his appearance), is in our conception less laborious (if any thing laborious could be conceived of God) than a delegation of angels upon every turn from heaven, and seems in the main to illustrate rather than debase the glory of his nature and existence. But however this be, it is plain that the angel here spoken of was no created being, from the whole context, and especially from his saying, "I am the Lord God, the Jehovah," &c. since this is not the language of angels, who are always known to express themselves in such humble terms as these, "I am sent from God; I am thy fellow-servant," &c. It is a vain pretence to say, that an angel, as God's ambassador, may speak in God's name and person; for what ambassador of any prince ever yet said, "I am the king?" Since therefore no angel, without the guilt

of blasphemy, could assume these titles; and since neither God the Father, nor the Holy Ghost, are ever called by the name of angel, *i. e.* a messenger, or person sent, whereas God the Son is called by the prophet Malachi, (chap. iii. 1.), "The angel of the covenant;" it hence seems to follow, that this angel of the Lord was God the Son, who might very properly be called an angel, because in the fulness of time he was sent into the world in our flesh, as a messenger from God, and might therefore make these his temporary apparitions, prefaces and forerunners, as it were, of his more solemn mission.

The Mahometans believe, that one of Moses's shoes, put off by him as he drew near the burning bush, was placed in the ark of the covenant, in order to preserve the memory of this miracle.

**BUSHEL**, a measure of capacity for dry things, as grain, fruits, dry pulse, &c. containing four pecks, or eight gallons, or one-eighth of a quarter.

A bushel, by 12 Henry VII. c. 5. is to contain eight gallons of wheat; the gallon eight pounds of troy-weight; the ounce twenty sterlings, and the sterling thirty-two grains, or corns of wheat growing in the middle of the ear.

At Paris, the bushel is divided into two half bushels; the half bushel into two quarts; the quart into two half quarts; the half quart into two litrons; and the litron into two half litrons. By a sentence of the provost of the merchants of Paris, the bushel is to be eight inches two lines and a half high, and ten inches in diameter; the quart four inches nine lines high, and six inches nine lines wide; the half quart four inches three lines high, and five inches diameter; the litron three inches and a half high, and three inches ten lines in diameter. Three bushels make a minot; six, a mine; twelve, a septier; and an hundred and forty-four, a muid. In other parts of France the bushel varies.

Oats are measured in a double proportion to other grains, so that twenty-four bushels of oats make a septier, and 288 a muid. The bushel of oats is divided into four picotins, the picotin into two half quarts, or four litrons. For salt, four bushels make one minot, and six a septier; for coals, eight bushels make one minot, sixteen a mine, and 320 a muid; for lime, three bushels make a minot, and forty-eight minots a muid.

**BUSKIN**, a kind of shoe, somewhat in manner of a boot, and adapted to either foot, and worn by either sex.

This part of dress, covering both the foot and mid-leg, was tied underneath the knee; it was very rich and fine, and principally used on the stage by actors in tragedy. It was of a quadrangular form, and the sole was so thick, as that, by means thereof, men of the ordinary stature might be raised to the pitch and elevation of the heroes they personated. The colour was generally purple on the stage: herein it was distinguished from the sock, worn in comedy, that being only a low common shoe. The buskin seems to have

have been worn, not only by actors, but by girls, to raise their height: travellers and hunters also made use of it, to defend themselves from the mire.

In classic authors, we frequently find the buskin used to signify tragedy itself, in regard it was a mark of tragedy on the stage.

It is also to be understood for a lofty strain, or high style.

**BUSS**, in maritime affairs, a small sea-veffel, used by us and the Dutch in the herring-fishery, commonly from forty-eight to sixty tons burden, and sometimes more: A busk has two small sheds or cabins, one at the prow, and the other at the stern; that at the prow serves for a kitchen.

Every busk has a master, an assistant, a mate, and seamen in proportion to the vessel's bigness: the master commands in chief, and without his express order the nets cannot be cast, nor taken up; the assistant has the command after him; and the mate next, whose business is to see the seamen manage their rigging in a proper manner, to mind those who draw in their nets, and those who kill, gut, and cure the herrings, as they are taken out of the sea: The seamen do generally engage for a whole voyage in the lump. The provision which they take on board the busks, consist commonly in biscuit, oat-meal, and dried or salt fish; the crew being content for the rest with what fresh fish they catch. See **FISHERIES**.

**BUST**, or **BUSTO**, in sculpture, &c. a term used for the figure or portrait of a person in relieve, shewing only the head, shoulders, and stomach, the arms being lopped off: it is usually placed on a pedestal or console.

M. Felibien observes, that though, in painting, one may say a figure appears in busto, yet it is not properly called a bust; that word being confined to things in relievo. The bust is the same with what the Latins called *herma*, from the Greek *hermes*, Mercury, the image of that god being frequently represented in that manner by the Athenians.

**BUSTARD**, in ornithology. See **ORIS**.

**BUSTUARI**, in Roman antiquity, gladiators who fought about the bustum, or funeral pile of a deceased person of distinction, in the ceremony of his obsequies.

This custom was found to be less barbarous than the first practice was of sacrificing captives at the bustum, or on the tomb of warriors; instances whereof we meet with both in Roman and Greek antiquities: the blood spilt on this occasion, was supposed to appease, by way of sacrifice, the infernal gods, that they might be more propitious to the manes of the deceased.

**BUSTUARLE** *мочехя*, according to some, women that were hired to accompany the funeral, and lament the loss of the deceased: but others are of opinion, that they were rather the more common prostitutes, that stood among the tombs, graves, and other such lonely places.

**BUSTUM**, in antiquity, a pyramid or pile of wood upon which were anciently placed the bodies of the deceased, in order to be burnt. Some authors say, that it was properly called bustum after the burning,

*quasi beneustum*; that before the burning it was called *pyra*, and during the burning, *rogus*.

The bustum in the Campus Martius was encompassed round with white stone, and an iron rail.

**BUTCHER**, a person who slaughters cattle for the use of the table, or who cuts up and retails the same.

Among the ancient Romans, there were three kinds of established butchers, whose office was to furnish the city with the necessary cattle, and to take care of preparing and vending their flesh. The *suarii* provided hogs; the *pecuarii* or *boarii*, other cattle, especially oxen; and under these was a subordinate class, whose office was to kill, called *lanii*, and *carnifices*. To exercise the office of butcher among the Jews with dexterity, was of more reputation than to understand the liberal arts and sciences. They have a book concerning shamble-constitution; and in case of any difficulty, they apply to some learned rabbi for advice; nor was any allowed to practise this art, without a licence in form; which gave the man, upon evidence of his abilities, a power to kill meat, and others to eat what he killed; provided he carefully read every week for one year, and every month the next year, and once a quarter during his life, the constitution above mentioned. We have some very good laws for the better regulation and preventing the abuses committed by butchers. A butcher that sells swine's flesh meazled, or dead of the murrain, for the first offence shall be amerced; for the second, have the pillory; for the third, be imprisoned and make fine; and for the fourth, abjure the town. Butchers not selling meat at reasonable prices, shall forfeit double the value, leviable by warrant of two justices of the peace. No butcher shall kill any flesh in his scalding-house, or within the walls of London, on pain to forfeit for every ox so killed, 12d. and for every other beast, 8d. to be divided betwixt the king and the prosecutor.

**BUTCHER-BIRD**, in ornithology. See **LANIUS**.

**BUTCHER'S-BROOM**, in botany. See **RUSCUS**.

**BUTE**, an island of Scotland, lying in the mouth of the frith of Clyde, south of Cowal in Argyleshire. It gives the title of earl to a branch of the Stuart family. Bute and Cathness send only one member to parliament between them, each choosing in its turn, whereof Bute has the first.

**BUIEO**, in ornithology, the trivial name of a species of falco. See **FALCO**.

**BUTLER**, the name anciently given to an officer in the court of France, being the same as the grand echanfon, or great cup-bearer of the present times.

**BUTLER**, in the common acceptation of the word, is an officer in the houses of princes and great men, whose principal business is to look after the wine, plate, &c.

**BUTLERAGE** of wine, is a duty of two shillings for every ton of wine imported by merchants strangers; being a composition in lieu of the liberties and freedoms granted to them by king John and Edward I. by a charter called *charta mercatoria*.

Butlerage was originally the only custom that was payable upon the importation of wines, and was taken and received by virtue of the regal prerogative, for  
the

the proper use of the crown. But for many years past, there having been granted by parliament subsidies to the kings of England, and the duty of butlerage not repealed, but confirmed, they have been pleased to grant the same away to some nobleman, who, by virtue of such grant, is to enjoy the full benefit and advantage thereof, and may cause the same to be collected in the same manner that the kings themselves were formerly wont to do.

**BUTIMENTS**, in architecture, those supporters or props on or against which the feet of arches rest.

**BUTMENT** is also the term given to little places taken out of the yard or ground-plot of a house, for a buttery, scullery, &c.

**BUTOMUS**, in botany, a genus of the enneandria hexagynia class. It has no calix; the corolla consists of six petals; and the capsules are six, containing many seeds. There is but one species, *viz.* the umbellatus, flowering-rush, or water-gladiole, a native of Britain.

**BUTRINTO**, a port-town of Epirus, or Canina, in Turkey in Europe, situated opposite to the island of Cosu, at the entrance of the gulph of Venice: E. long. 20° 40', N. lat. 39° 45'.

**BUTT**, in commerce, a vessel or measure of wine, containing two hogheads, or 126 gallons. See **PIPE**.

**BUTT**, or **BUTT-ENDS**, in the sea-language, are the fore-ends of all planks under water, as they rise, and are joined one end to another.

Butt-ends in great ships are most carefully bolted; for if any one of them should spring or give way, the leak would be very dangerous and difficult to stop.

**BUTTER**, a fat unctuous substance, prepared from milk by heating or churning it.

It was late ere the Greeks appear to have had any notion of butter; their poets make no mention of it, and yet are frequently speaking of milk and cheese.

The Romans used butter no otherwise than as a medicine, never as a food.

The ancient Christians of Egypt burnt butter in their lamps instead of oil; and in the Roman churches, it was anciently allowed, during Christmas time, to burn butter instead of oil, on account of the great consumption of it otherwise.

For the making of butter, when it has been churned, open the churn, and with both hands gather it well together, take it out of the butter-milk, and lay it into a very clean bowl, or earthen pan; and if the butter be designed to be used sweet, fill the pan with clear water, and work the butter in it to and fro, till it is brought to a firm consistence of itself, without any moisture. When this has been done, it must be scotched and sliced over with the point of a knife, every way as thick as possible, in order to fetch out the smallest hair, mote, bit of rag, strainer, or any thing that may have happened to fall into it. Then spread it thin in a bowl, and work it well together, with such quantity of salt as you think fit, and make it up into dishes, pounds, half pounds, &c. The newer the butter is, the more wholesome and pleasant it is; and that which is made in May, is esteemed the best.

There are as many sorts of butter, as there are different milks of animals whereof to make it: That of the cow is most in use. It is used every where, and there is hardly any sauce made without it. The northern people, however, make more use of it than others.

Every barrel of butter, imported from abroad, pays a duty of 3s. 10<sup>s</sup>/<sub>100</sub>d whereof 3s. 4<sup>s</sup>/<sub>10</sub>d. is drawn back on exporting it. Irish butter pays only a duty of 1s. 11<sup>s</sup>/<sub>100</sub>d. the hundred weight; whereof 1s. 8<sup>s</sup>/<sub>100</sub>d. is drawn back on exporting it.

**BUTTER** among chemists, a name given to several preparations, on account of their consistence resembling that of butter; as butter of antimony, of arsenic, of wax, of lead, of tin. See **CHEMISTRY**.

**BUTTER-BUR**, in botany. See **PETASITES**.

**BUTTER-FISH**. See **BLENNIUS**.

**BUTTERFLY**, the English name of a numerous genus of insects. See **PAPILIO**.

**BUTTERFLY-FISH**, a species of the blennius. See **BLENNIUS**.

**BUTTERFLY-SHELL**, in natural history. See **VOLUTA**.

**BUTTERIS**, in the menage, an instrument of steel, fitted to a wooden handle, wherewith they pare the foot, or cut the hoof of a horse.

**BUTTER-MILK**, a kind of serum that remains behind, after the butter is made.

**BUTTER-WORT**, in botany. See **PINGUICULA**.

**BUTTERY**, a room in the houses of noblemen and gentlemen, belonging to the butler, where he deposits the utensils belonging to his office, as table linen, napkins, pots, tankards, glasses, cruets, salvers, spoons, knives, forks, pepper, mustard, &c.

**BUTTOCK** of a ship, is that part of her which is her breadth right aft, from the tack upwards; and a ship is said to have a broad or a narrow buttock, according as she is built broad or narrow at the transum.

**BUTTON**, an article of dress, serving to fasten cloaths tight about the body, made of metal, silk, mohair, &c. in various forms. Metal-buttons are either cast in moulds, in the manner of other small works, (*see* **FOUNDERY**), or made of thin plates of gold, silver, or brass, whose structure is very ingenious, though but of little use.

Buttons of all sorts are prohibited to be imported.

**BUTTON**, among gardeners, denotes much the same with bud. See **BUD**.

**BUTTON**, in the menage. Button of the reins of a bridle, is a ring of leather, with the reins passed thro' it, which runs all along the length of the reins. To put a horse under the button, is when a horse is stopped without a rider upon his back, the reins being laid on his neck, and the button lowered so far down that the reins bring in the horse's head, and fix it to the true posture or carriage. It is not only the horses which are managed in the hand that must be put under the button; for the same method must be taken with such horses as are bred between two pillars, before they are backed.

**BUTTON'S bay**, the name of the north part of Hudson's bay, in North America, whereby Sir Thomas

Buttoft

Button attempted to find out a north-west passage to the East Indies. It lies between 80° and 100° W. long, and between 60° and 66° N. lat.

**BUTTRESS**, a kind of butment built archwise, or a mass of stone or brick, serving to prop or support the sides of a building, wall, &c. on the outside, where it is either very high, or has any considerable load to sustain on the other side, as a bank of earth, &c.

Buttresses are used against the angles of steeples and other buildings of stone, &c. on the outside, and along the walls of such buildings as have great and heavy roofs, which would be subject to thrust the walls out, unless very thick, if no buttresses were placed against them. They are also placed for a support and butment against the feet of some arches, that are turned across great halls in old palaces, abbeys, &c.

**BUTZAW**, a town of Lower Saxony, in Germany; it stands upon the river Varnow, on the road from Schwerin to Rostock.

**BUXTON**, a place in the peak of Derbyshire, celebrated for medicinal waters; the hottest in England, next to Bath.

**Buxton-wells**. The strata of earth and minerals, in the parts adjacent to Buxton, are peat-moss, blue clay, iron, and coal, mixed with sulphur and brazil.

The warm waters there, at present, are the bath, which takes in several warm springs; St Ann's well, a hot and cold spring rising up into the same receptacle; and Bingham-well.

These waters greatly promote digestion, unless they are drunk too long, in which case they relax the stomach, and retard digestion; they are well adapted to obstructions of every kind, whence they produce surprising effects in gouty, rheumatic, athritic, and scorbutic pains. As this water is warm, highly impregnated with a mineral steam, vapour, or spirit, it is signally beneficial to cramps, convulsions, dry asthma, the bilious colic, stiffness, &c.

They advise both drinking and bathing in the use of these waters; only the last is of bad consequence in the gout, inward inflammations, fevers, dysentery, large inward tumours, or in an outward pressure of the body.

**BUXUS**, in botany, a genus of the monœcia tetrandria class. The calix of the male consists of three leaves; and the corolla has two petals: The calix of the female has four leaves; the petals are three; it has three stamens; and the capsule has three cells containing two seeds. There is but one species, *viz.* the sempervirens, or box-tree, a native of Britain. A decoction

Vol. I. No 29.

3

of the leaves and wood has been recommended as a powerful sudorific; but is not now used by practitioners. The wood is of a hard close texture, and is greatly used by mechanics for tools of various kinds.

**BUYS**, a town of Dauphine, in France, situated on the confines of Provence; E. long. 5° 20', and N. lat. 44° 25'.

**BUZZARD**, in ornithology, the English name of several species of the hawk kind. See **FALCO**.

**BYGHOF**, or **BYGOW**, a city of Lithuania in Poland, situated on the river Nieper; E. long. 30°, and N. lat. 52°.

**BY-LAWS**, or **BYE-LAWS**, private and peculiar laws for the good government of a city, court, or other community, made by the general consent of the members.

All by-laws are to be reasonable, and for the common benefit, not private advantage of any particular persons, and must be agreeable to the public laws in being.

**BYRLAW**, or **BURLAW laws**, in Scotland, are made and determined by neighbours, elected by common consent in byrlaw courts. The men chosen as judges, are called byrlaw or burlaw men, and take cognizance of complaints between neighbour and neighbour.

**BYRRHUS**, in zoology, an order of insects belonging to the order of coleoptera. The feelers are clavated, pretty solid, and a little compressed. There are five species, all of which are to be found on particular plants, and principally distinguished from each other by the colour and figure of the elytra or crustaceous wing-cases.

**BYSSUS**, in botany, a genus of mosses belonging to the cryptogamia alga. The character is taken from this circumstance, that they are covered with a simple capillary filament or down, resembling soft dust. The species are 15, all natives of Britain.

**BYSSUS**, in antiquity, that fine Egyptian linen whereof the tunics of the Jewish priests were made.

Philo says, that the byssus is the clearest and most beautiful, the whitest, strongest, and most glossy sort of linen; that it is not made of any thing mortal, that is to say, of wool, or the skin of any animal, but that it comes out of the earth, and becomes always whiter, and more shining, when it is washed as it should be.

**BYZANT**. See **BEZANT**.

**BYZANTIUM**, the ancient name of Constantinople.

See **CONSTANTINOPLE**.

**BZO**, a town of Africa, in the kingdom of Morocco.

Page 127. column 2. end of the first paragraph, read *Plate XI. fig. 2.*; and at the end of the next paragraph, *Plate XI. fig. 2.*

End of the article АМѢИЗВОУНА, read *Plate XII. fig. 2.*

*St Andrew's day.* For the *thirteenth*, read the *thirtieth* of November.

Page 466. col. 1. l. 52. for *vkA*, read *ikA*.

Page 467. col. 1. l. 12. supply *Plate XLIII. fig. 4.* to which the reference-letters and figures in the paragraph belong.

Page 468. col. 1. l. 26. for *fig. 3.* read *fig. 5.*

In fig. 9. of Plate LI. the *Baston*, or *Bastard-bar*, is represented in a wrong direction. It should run thus, .

Bos. End of par. 2. *del.* Plate LII. fig. 2. which is

not a figure of the common bull, but of the *Bizon*, described p. 625. col. 2.

In the article BRETON, for *subject to the English*, read *subject to the British.*

Plate 47. represents a different Orrery from the one described. The right one will be engraven, and delivered in due time.

BOOK-KEEPING. A variety of preliminary Problems, Cases, &c. referred to by the letters and numbers which the reader will observe subjoined to the examples in the *Waste-book*, were by accident omitted in the printing; but will be printed and given in proper time, with directions for inserting them. —*So that this and the preceding article may be expunged from this list when the book is bound.*

\* \* \* It is humbly hoped, that the above faults, with others which may have escaped notice, or are here omitted as trivial, will be candidly deemed venial in a work so complex, so various, and so extensive as the present.
