— reflectors, white paint for ...	86	— old, restoring (Anal.) ...	845	— Taunton ...	503
— screens for ...	662	— Special-smooth platino-matt, Wellington (Rev.) 128		C arbon lantern slides	
— studio and printing, Maxilyt, Griffin (Rev.)	902	— testing. By E. Valenta ...	83	— photographs for decorative purposes ...	663
A rchitectural and Topographical Society, an appeal	595	— V.R., Ilford (Rev.) ...	368	— fraud in the supply of ...	606, 612, 654
A rt, Is Photography. By H. Snowden Ward	530, 547	Bromides, brush treatment (Anal.) ...	937	— print, catatype, making ...	67
A rt Photography, Ltd., new title ...	294	— casein-pigment prints from, N.P.G. (Pat.) ...	430	— printing on ivory, single transfer. W. E. Debenham ...	14, 33, 337
A rtificial lights in photography		— colour of ...	621	— prints, developing, fermentation method ...	236
(See Arc-lamps, Flashlight, Mercury-vapour.)		— development controlling. By T. H. Greenall ...	307	— process in cold weather ...	890
A skan, dry pigment printing ...	78	— fixing bath for ...	682, 850, 865	— tissue, Autotype (Rev.) ...	780
A sphaltum and rubber for sensitising process plates,		— green tones ...	107, 732, 867	— Electric Light, Illingworth (Rev.) ...	442
J. Hartnett (Pat.) ...	707	— (Pat.) ...	946	— transfer papers, Autotype (Rev.) ...	734
A ssistants' prospects (Cor.) ...	205	— solution (Rev.) ...	427	— self-adhesive, Sichel (Rev.) ...	848
A utochrome colour screen (Anal.) ...	540	— P.O.P. tones on ...	109, 147	— three-colour (See Colour Photography). attention	941
— viewing frame, B. J. Falk (Pat.) ...	348	— reduction. By H. Smith (Cor.) ...	465	— via bromide (See Ozobrome). ...	941
— work (Soc.) ...	959	— stains, removing (Anal.) ...	879	C arbon Printing Autotype, Guide to (Rev.) ...	124
A utochromes by enclosed arc light		— sulphide-toned, reducing ...	934	Card-filing system in obtaining business, B. Bigham ...	327
— disappearance of colour from (Cor.) ...	735	— sulphide toning. By H. Baker ...	784	B. Bigham ...	204, 389, 561, 829
— Lumiere exhibition ...	53	— sulphide-sulphocyanide toning ...	571		
— reduced prices ...	257	— toning, H. W. Bennett (Soc.) ...	423		
— under microscope (Anal.) ...	460	— by re-development. By C. Welborne Piper ...	231		
(See also index to "Colour Photography" Supplement)		— two-colour. By H. D'Arcy Power ...	357, 872		
A utomatic ferrotype and button machine, Vining		— varnishing ...	209		
(Rev.) ...	244	B romoil process. By H. Baker ...	279, 302		
		— A. H. Garner (Anal.) ...	50		
		— (Soc.) ...	136, 352		
		— and Ozobrome patent (Cor.) ...	54		
		— exhibition by F. J. Mortimer at R.P.S. ...	365		
		— inks for (Anal.) ...	183		
		— materials, Ozobrome, Ltd. (Rev.) ...	711		
		— photogravure effect in (Anal.) ...	183		

	PAGE
LAC phosphate, modified process	673
Lacquering metallic surfaces	780
Ladle, print, Primus, Butcher (Rev)	351
Lamp, enlarging, Petrolite, Garrad (Rev)	461
Lantern lenses, telephoto	58
— optical, folding, Parkinson (Rev)	270
— — (Pat)	616
— projection (Pat)	366, 426
— projection in full light (Pat)	291, 328, 406
— screen, non-cracking opaque (Anal)	732
— stands collapsible. F. Van Neck (Pat)	349
— telescopic, Merito, Parkinson (Rev)	270
— — (Pat)	615
Lantern-plate, Wratten	91, 204, 719, 725
— phosphate matt. Paget (Rev)	712, 880
Lantern-slide carrier, automatic	951
Lantern-slides, carbon	59, 988
— development, physical	729
— diamidophenol	672
— direct in camera. D. Carnegie	528, 582, 603, 538
— green tones. R. L. Boyd (Cor)	866
— on Wratten plates, new methods	719, 726
— — (Cor)	830
— by re-development. By C. Welborne Piper	231
— scale in	1006
— warm-toned, advances in making	719, 726
Large direct negatives with medium-size cameras	608
— — — M.C.C. adapters for (Rev)	636
Latent image produced by X-rays, Cramer	440
Latent period in rapid hand-camera photography	80
Lectures NOT delivered at the New Gallery	753
Lens calculations by slide-rule	759
— covering-power, testing	262
— for colour reproduction	804
— portrait, Cooke Series II.A. (Rev)	846
— variable, Isostigmat, Beck (Rev)	245
— single A Harding (Cor)	295
— simplified theory of action	114
— supplementary, Griffin (Rev)	254
— uses of	414
— tests at the National Physical Laboratory	319
Lenses, Cooke, in sunk mounts (Rev)	692
— — in commercial shutters (Rev)	255
— by subsidence, Zeiss (Pat)	404
— deterioration of. By J. Moull	81
— old, notes on. By W. Michell	799
— resolving power	581
— marking for process work	309
Lens-cells, re-mounting	834
Lens-glasses, reflection from	921, 930
— — T. Bolas (Cor)	961
Lens-mounts. Dallmeyer (Pat)	825
(See also <i>Anastigmat, Telephoto.</i>)	
Level of camera recording in two directions	698, 702
— double-tube, Taylor, Taylor, and Hobson (Rev)	255
Libraries, classified list of photographic books	277
— use of copying camera in	537
Light, colour and photography, automatic demonstration of	476, 499
Light-filter, Ensign, Houghton's (Rev)	765
— graduated, Iris, Griffin (Rev)	147
— holder, Garrad (Rev)	462
— mounting	510
Lighting in Studio and At-home Portraiture (Rev)	240
Limelight used with a mantle (Cor)	206
Line Photo-engraving (Rev)	877
Linen cloth for enlargements	921
Lippmann process. (See <i>Colour Photography.</i>)	
Lithography and process	557, 1013
— on metal surfaces	974
— photo-, bitumen process	259
— — direct on stone	328
— printing on stone	404
London. By A. L. Coburn (Rev)	833, 845
L. C. C. classes in photography	185, 870
— trade school, photographic section (Cor)	865
— photographic tenders accepted	521
(See also <i>Bolt Court.</i>)	
Lumière, MM., awarded R.P.S. progress medal	115
Lumière Co., and London Cinematograph Co.	884
Lustralene, liquid. Vangnard (Rev)	147
— megilp as diluent (Cor)	74
MACDONALD, Pirie, new year card	33
— — talk on copyright and fraternity	688
Machine photographs, subduing background	875
Magnesium ribbon sheets	159
Magnifiers, adjustable focus, Harting	492
— and fixed-focus cameras	374
— misconceptions as to. By A. Lockett	670
Masonic lodge, proposed	87, 110
McIntosh, Good King, R.P.S. Carol	104
McLewee v. Marks	1016
Medals and coins, photographing	857
Megilp as diluent for Lustralene (Cor)	74
Mercury bichloride, sale of	59
Mercury-vapour lamp, Cooper-Hewitt, Sichel (Rev)	69
— in process work	443
Messina earthquake, appeal. By L. Castellani (Cor)	149
Metal, cutting up	144
— surfaces, protection. By H. S. Ryland	780
Meteorological photography	438
Metol, chemical test	374
Metol-hydroquinone concentrated developer	868, 886, 906, 927, 983
Metoquinone developer	1008
Metograph screen	575
Mezzochrome proofs in colour (Rev) 70, 105, 309, 824	324
Microscope and exposure	98
Military photography	419
Miller, C. J., London manager of Gevaert	258
Minimeter, Dega, Zimmermann (Rev)	50
Mirror, studio, accessory. A. Iser. (Pat)	502
— viewing-attachment, reflex, Soho, Marion (Rev)	386
Mirrors, parabolic	297
— reversing, treatment of	99
— selective reflection	105
Mixtures of dyes as colour sensitizers of gelatine plates. By G. Daur	572, 592, 610, 630, 649

	PAGE
Molybdenum printing papers	374
Morgan dry-mounting process	292, 325, 609
— — transfer tissue. Sichel (Rev)	901
Motor speed-recorder	458
Motoring and photography	629
Mounting, dry (See <i>Dry-mounting</i>)	
Mounts. T. S. Jacob (Pat)	366
— and mounting of to-day	236
— distinctive designs, preparing	321
— for professionals (Rev)	387
— Holdinslide, Wright (Rev)	764
— purity of, working test for	281
— removing prints from	737, 770
— slip-in, Myla. Ernst (Rev)	148
— styles in	606
— Victoria and Grosvenor, Houghtons (Rev)	712
Mounting half-tone Locks. Green	125, 575
— prints without mountant (Anal)	367
Mounting-room table	839
Museums, photographs in. By Sir M. Conway	800, 821

SUMMARY.

MM. Lumière and Seyewetz have advised a modified method of factorial development. They commence development with a solution containing little alkali, and thus giving a longer period before the first appearance. According to the time of this first appearance they modify the developer and use it for a greater or less total time. (P. 3.)

An exhibition of portraiture by Herr Dührkoop is to open in London about the middle of the present month. (P. 2.)

An American girl who shot a free-portrait canvasser through the heart has been acquitted. (P. 3.)

More "Studio Scenes."—The incident of the dissatisfied woman. (P. 8.)

A protest against some methods of the press photographer occurs with other subjects under "Correspondence." (P. 15.)

Mr. W. Foster Brigham contributes some notes giving a professional photographer's opinion of and first experience with the new "Ensyna" paper. (P. 4.)

The first portion of a paper describing experiments in colour-sensitising of chloride emulsions is given on page 5.

Anastigmat lenses and roll-film spools figure among patents of the week. (P. 9.) We shall in future give the date of application of patents, particulars of which we give on publication of the specifications.

"COLOUR PHOTOGRAPHY" SUPPLEMENT.

A recent paper by Dr. W. Merckens on the bleach-out process describes the properties of certain dyes in reference to their absorption by gelatine and other bodies. (P. 1.)

Dr. J. H. Smith has worked out, from the dimensions of the Lumière Autochrome film, the most advisable angle at which mirrors should be placed around the transparency with a view of securing the greatest rapidity of printing from the Autochrome on to bleach-out paper. In order to secure the Autochrome from injury by heat during printing, Dr. Smith conducts a thin stream of water over the glass side. (P. 2.)

A French worker has recommended the use of mercuric iodide as a substitute for the usual Autochrome intensifier. (P. 5.)

A further modification of the Kraysn mosaic filter-screen has been suggested. (P. 8.)

We quote from "Camera Craft" some points in Autochrome manipulation advised by Dr. D'Arcy Power. (P. 5.)

We give an abstract of the recent lengthy paper by Mr. H. E. Ives on the Lippmann process. (P. 7.)

EX CATHEDRA.

The Presidency of the R.P.S.

We are quite sure we express the satisfaction of many others than ourselves at the announcement in the current "Photographic Journal" that Mr. J. C. S. Mummery has consented to accept nomination for a third term of office as President. During the two years he has presided over the affairs of the R.P.S. Mr. Mummery has proved himself so thoroughly a "safe" president, and one ready to shirk no personal labour in the interests of the society, that his consent to allow himself to be nominated for President a third year should be received with marks of gratitude on the part of members. This should be all the more particularly the case in view of the intimation that building operations adjoining the society's house are immediately contemplated, and must inevitably involve negotiations in which the President's professional help will be as valuable as it was during the reconstruction of the present lecture-hall at 66, Russell Square.

"When Found, Make a Note of."

The policy of that eminent man Captain Cuttle is one which we feel constrained to re-emphasise when we read in a morning paper of a Member of Parliament having sent as a greeting to every one of his constituents a portrait of himself. Perhaps such a polite reminder of himself to his electors has been done by many another M.P., but if so, we do not happen to have heard of it. But whether that be the case or not, the incident should be entered in the photographer's diary of the year in the shape of a memorandum to approach the local Parliamentary representative or candidate, or other local personage, in sufficient time for him to consider and carry out a proposition of a similar kind. We have reason to think that many a good order, which outsiders will describe a piece of luck for those to whom it falls, is the result of careful nursing of a preconcerted plan, and of a prudent taking of time by the forelock.

* * *

An Idea in Christmas Presents.

Further, apropos of debating means of Christmas business for the next festive season, we may refer to a novelty issued by the firm of Taprell, Loomis and Co., of Chicago, in the shape of a leather letter case for the pocket, made of enamelled leather, and provided with space for the insertion of a quarter-plate print in an oval cut-out. The case is fitted with useful pockets for letters and cards, and with a mirror, it being intended as a present for the fair sex. It might, however, be caused to contain a writing tablet for memoranda, and would then possess a character which would make it suitable for presentation to men, or, at any rate, render it less useless than many of the "useful

B

Christmas presents" which fill the shop windows. The article of the Chicago firm is not intended to be cheap. It is priced at 5s. to 6s., for resale (with photograph) at 12s. 6d. or 15s. There is no doubt that photographers and the trade catering for them might attract business in the Christmas-present line by providing novelties of this kind.

The Permanency of Varnished Negatives.

In reference to our recent note on the precautions advisable in varnishing gelatine negatives, we have been much interested in examining some negatives sent to us by the firm of Fallowfield, in the Charing Cross Road. They are some of a batch brought to light by a customer of the firm, and known to be at least thirty, and probably forty-five, years old. From the labelled bottles found in the box with them, it is evident that the negatives were made and varnished with the preparations supplied at that remote date by Mr. Fallowfield in Lower Marsh, Lambeth. The negatives are wet collodion, and would appear to be as vigorous as on the day they were made. This, we think, is confirmation of the warning we gave as to the importance of ensuring the perfect dryness of the gelatine film when varnishing a negative, and, further, of taking even minor precautions to prevent access of moisture. The fact that the collodion film is far less absorbent of moisture is largely responsible for the high state of preservation of such negatives, and the maker of gelatine negatives which are desired to last will be well advised in taking every measure which will bring the conditions into correspondence with those of the collodion era.

A Dührkoop Show in London Again.

We are glad to see that a second opportunity is to be afforded of seeing a collection of the portraiture of Herr R. Dührkoop, of Hamburg. An exhibition of portraits by him will be opened at the rooms of the Royal Photographic Society, 66, Russell Square, from January 12, on which date an address relating to Dührkoop's work will be delivered by Mr. E. O. Hoppé. The last couple of years have seen quite a step forward in the pictorial quality of Herr Dührkoop's work, for, as those acquainted with its author well know, stagnation and a stereotyped style are the last things of which one would accuse our "lebhaften Freund" of Hamburg. We had the opportunity some months ago to look through a portfolio of prints by Dührkoop, selected during, perhaps, the past ten years, by a well-known art critic in Germany. A good proportion were works which Herr Dührkoop, perhaps for private reasons, has never shown in this country, but we could not help feeling that practically all should be included in a collection intended to represent the development of this talented professional photographer.

The Ideal Stereo Print.

Recently a number of stereoscopic slides by modern workers have passed through our hands, and we could not help noticing the prevalence of one very marked fault. With a very few exceptions the prints were far too hard in character. By themselves they were clean, plucky P.O.P. prints, but this is not the type desirable in a stereo slide, for the stereoscope exaggerates contrast in a marked degree. The ideal print is full of detail, but not by any means full of contrast. It should, in fact, be rather lacking in contrast, and quiet, not to say dull, in appearance. Black and white are better absent altogether, for the one will be too black and the other too white in the stereoscope. Some of the best prints we have seen were almost depressingly flat when looked at singly, but in the stereoscope this flatness quite disappeared, for the effect of relief induced by the stereo-

scopic conditions caused all the gradations to stand out, and gave what virtually amounted to an effect of contrast. It should be remembered that contrast in pictures is valuable mainly for imparting emphasis, or for giving relief to the principal features. In stereoscopic work we arrive at the same result by altogether different and less artificial means, and anything approaching an exaggerated contrast is not merely unnecessary but actually displeasing. The prints can hardly be too soft in character, provided they are full of detail and gradation.

EVEN ILLUMINATION IN THE LANTERN.

VERY curious advice is sometimes given to the user of an enlarging lantern. He is told that if the light is sufficiently intense he can improve the uniformity of the illumination by placing ground glass between the lenses of his condenser, for which purpose he has to get a circle of ground glass specially cut. If such an expedient is adopted with lights, such as oil or incandescent gas lamps, the exposure becomes prolonged to a wearisome and impracticable extent, but these are almost the only lights in general use with which any difficulty as to illumination is felt. With powerful lights, such as acetylene, limelight, or the arc lamp, exposure is short, and its prolongation by ground glass would not be so inconvenient, but then it is quite unnecessary, because there is no difficulty whatever in producing an even disc with one of these three lights. Again, with the Nernst lamp there is no trouble excepting with small aperture lenses, with which even the ground glass expedient is not very satisfactory. Difficulty in obtaining even illumination is only serious with large and irregularly shaped sources of light, and these are all weak lights. The powerful lights are all small, and the only necessary condition to good illumination is proper adjustment, which is precisely where the amateur worker with little practice breaks down. In many cases he forgets that the light requires re-adjustment when the scale of the enlargement is varied, and in any case the adjustment is more trouble to him than to the expert. When using the weaker and larger sources of light it is advisable to be content with a modest degree of enlargement. With big scales the difficulties increase, and small aperture lenses are also unsatisfactory as a general rule. With the incandescent mantle an image of the mantle meshes is often troublesome, but this is mainly due to the use of a worn-out mantle, the threads of which are very thin. A new mantle will generally get rid of this trouble, and careful adjustment will then give remarkably even illumination with a lens of not less than about $f/8$ aperture.

For effectiveness and simplicity there is much to be said in favour of the old expedient of using magnesium ribbon as the illuminant for enlarging. The best and most economical way of using it is to cut the ribbon into short lengths, say of four to five inches, and to wave the burning ribbon about systematically behind the negative. The proper system to follow is that of "hatching" the picture with lines of light, horizontally and vertically, and sometimes diagonally. It is astonishingly easy to get good illumination in this way, and the method has the further advantage of enabling us to just as easily produce an uneven degree of illumination that will compensate for the inequalities of an unevenly dense negative. An enlarging camera is, of course, the best apparatus to use when magnesium is employed in this fashion. The negative should be backed with ground glass, and about an inch behind this a second piece of glass, ground side towards negative, should be fixed. The ribbon is then moved about close behind the second piece, care being taken to cover a rectangle two inches wider and higher than the negative.

The only objection to the use of ribbon that we know of is the smoke, which is certainly troublesome in a small room. Exposure is regulated very simply by varying the number of strips of ribbon used. It may, perhaps, be as well to point out that magnesium wire is of no use for this purpose, as it will not burn regularly. The ribbon alone

is of use, and wide ribbon is better than narrow. These points are mentioned because photographers often describe magnesium ribbon as wire, perhaps not knowing that real wire is actually obtainable. We know of at least one photographer who laid in a stock of wire under the impression that it was the right thing to use.

ON A METHOD OF DEVELOPMENT WITH PYRO-GALLIC ACID WHEN DEALING WITH UNDER AND OVER-EXPOSURE.

We recently pointed out a method of development for Autochrome plates allowing of the correction of over-exposure and of the improvement of under-timed exposures. This method is based on the variation of the time of development and on the quantity of alkaline solution added to the developer, according to the degree of over-exposure. An idea of this latter is obtained from the time of appearance of the first outlines of the image in a developer containing only a very small quantity of alkali. Our method differs from that of Watkins in the use of a developing solution containing at the start very little alkali. In the Watkins method the normal developer is used, and consequently the difference of time of first appearance of the image is comparatively small, even in the cases of considerable differences of exposure. It is thus very difficult, if not impossible, in cases of slight over-exposure, to determine exactly the time required for the appearance of the image. Moreover, the composition of the bath being constant, the time of development is the only factor which can be applied in the case of over- and under-exposure, and this factor alone is very inadequate to produce a proper correction of the exposure.

The method which we suggest (it having given us very satisfactory results with Autochrome plates) has been considered by us suitable for application to ordinary plates. In this case the employment of the ammonia is not indispensable, as it is with the Autochrome plate, and we have therefore used as an alkali carbonate of soda, which is naturally preferable to the ammonia. After a number of experiments we have been led to the following formula, which appears to answer admirably for the process recommended:—

- A.—Pyro 30 gms. ... 260 grs.
 Soda bisulphite (commercial solution) 10 ccs. ... 1½ drams.
 Water 1,000 ccs. ... 20 ozs.
- B.—Soda carbonate (anhydrous) 35 gms. ... 310 grs.
 Soda sulphite (anhydrous).. 75 gms. ... 660 grs.
 Potass. bromide 5 gms. ... 44 grs.
 Water 1,000 ccs. ... 20 ozs.
- A, 10 ccs. ; B, 20 ccs. ; water, 90 ccs.

This is the normal developer, and is the formula which can be used straight-away for correctly exposed negatives.

In order to accentuate the differences between the times of exposure of plates which have received varying exposures, we

employed first only half of the normal quantity of the alkali B solution ; that is to say, the developer was made as follows :

A, 10 ccs. ; B, 10 ccs. ; water, 90 ccs.

We determined, by experiment, the relative proportions of the two solutions, A and B, which should be used in order that the time of development of plates which have received a certain multiple of the correct time of exposure may be dealt with.

The times of appearance of the image varying with the nature of the plate, we made experiments with plates of three different types of sensitiveness, namely, Lumière Blue-Label, the Lumière "Sigma" plate, and the Lumière Violet-Label. From the number of seconds, counted up to the appearance of the first outlines of the image, were found the quantities of solutions A and B to be added to the original developer. These indications are given in the following table, which applies to the developing solutions of temperatures between 15 and 17 deg. C.

Time of appearance of first outlines of image, not counting the sky.		Degree of exposure, <i>i.e.</i> , ratio of exposure given to the correct exposure.	Solution added immediately after the appearance of the first outlines.	Total time of development including time of appearance
"Sigma" and Blue-Label Plates.	Violet-Label Plates.			
Minutes. 2·25 to 2·40	Minutes. 1·55 to 2·5	8 times	20 ccs. A	Minutes. 18
2·41 to 3·15	2·6 to 2·20	4 "	10 " A	18
3·16 to 3·30	2·21 to 2·45	2 "	nil	15
3·31 to 3·50	2·45 to 3·10	normal	10 ccs. B	12
3·51 to 4·15	3·10 to 3·40	½ "	15 " B	13
more than	4·15 to 3·40	¼ "	20 " B	13

For a temperature above 17 deg. or below 15 deg. the rule of Houdaille is used.¹

With this new method of development it is possible to determine, in a very approximate way, the degree of over- and under-exposure of a plate. In the case of over-exposure the correction which can be made by means of a modified developer is such that one can obtain from plates, which have received eight to ten times the correct exposure, negatives which have their contrasts almost as good as those of plates correctly exposed.

A. AND L. LUMIERE.
 A. SEYEWETZ.

¹ "Bulletin de la Société Française de Photographie," 1904, page 97. For each degree below or above 15 deg., add to or subtract from the total time of development to the extent of 5 per cent.

AN ENLARGEMENT CANVASSER SHOT.—Shooting, she alleges, in defence of her sister, Miss Estella Stout, on December 1, in Chicago, killed Henry Hornberg, agent for a picture enlarging concern. Mrs. A. Chambers, a sister of Miss Stout, quarrelled with Hornberg, according to the police, over an enlarged picture of a third sister, who is dead, when Hornberg called to deliver it. Mrs. Chambers asserted that the picture was not a good likeness, and Hornberg,

she said, knocked her down. As she rose she saw her sister, Miss Stout, standing with a smoking revolver in her hand, and her assailant dead, with a bullet through his heart. Miss Stout admitted firing the shot, averring that she did so to save her sister's life. Both women awaited the arrival of the police and accompanied them to the police station. On December 3 the coroner's jury acquitted Miss Stout.—"Bulletin of Photography."

PROFESSIONAL EXPERIENCES WITH THE NEW "ENSYNA" PAPER.

[The following contribution, describing the use immediately made of the new paper of Messrs. Houghtons by a professional photographer, performs the necessary task of emphasising the radical difference between this and other papers. Incidentally it supplies some useful hints on the best means of taking advantage of the unique qualities of the paper. In regard to some other modifications—of practical and business importance—which can be made in the procedure, we shall shortly publish some further contributions.—Eds. "B.J."]

Messrs. HOUGHTONS have shown a great deal of courage and originality in dispensing with the puff preliminary and putting the new warm-tone developing paper fully fledged on the market. It must be said that these tactics have been well repaid by the interest aroused in what is certainly a unique product. One must give room for a word of praise to the complete organisation of the business arrangements; already every dealer has his show-card, and has had his paper on order, in some cases, four or five months. Those who doubt the possibility of imitating gelatino-chloride P.O.P. at its best should see these specimens, which are quite indistinguishable from the daylight paper.

The Value to Professionals of a "P.O.P.-by-Gaslight" Method.

Whilst the high-class professional may doubt the necessity of any paper but platinotype or carbon, it must be remembered that for a cheaper and less educated clientèle the warm, rich tones and the glossy surface of the gelatine paper are simply indispensable. Professionals supplying this class have in the past been considerably hampered by the fact that there was no cheap or effective artificial light substitute for their stock style, and not unnaturally were unable to afford an arc light installation for the few dark months round about Christmas. Gaslight papers, especially of the glossy variety, have lost considerable ground during late years among the middle-class men, owing to the quickly dying craze of the stamp merchants. The only way to overcome this has been to follow the development and washing with further operations, to convert the cold grey to a sepia, which, within very small limits, was constant. The new paper comes as a boon to either of these grades. The cheapest class can now make better prints, with perfect uniformity of depth and tone, by artificial light, which his clients will receive with all the more avidity since he can, for probably the first time in his life, assure their permanency. The middle-class man can at last obtain warm tones by development only, and, moreover, has a choice of really good colours, from photographic purple to terra-cotta. The speed with which the print can be finished is another great point that will appeal especially to the small-profits-quick-photographs establishment, and should appeal to all other grades. With bromide or gaslight papers, supposing a printer left work at seven o'clock, he would have to arrange to have finished printing and development for the day at 4.30, in order to leave time for fixing, washing, and spreading to dry. If the prints were to be toned sepia, the hour would be still earlier. With a paper washed thoroughly in five minutes, if he finished developing at 6.45 he would leave on time. We have been able to make great use of the paper in the usual Christmas hustle, and cannot but think that many overworked and worried men would have been saved a great number of their cares if supplies of "Ensyna" had been available a couple of weeks sooner.

To work this paper to the best advantage, to get the greatest possible number of prints in the shortest time, it is advisable, as with all gaslight papers, to have two assistants working together. One may be quite unskilled, and no especial brightness of intelligence is necessary on the part of the other, although he should be as near godliness as possible, inasmuch that cleanliness is essential.

The paper will be found the handiest if purchased in cut sizes; and, indeed, it proves economical, for dampness of the hands may leave stains, should the sensitive surface be touched. The yellow surface is, of course, the sensitive surface; a colour-blind person can find it by biting a corner of the paper.

Some Simple Printing Arrangements.

We have done our printing so far with an incandescent gas-fitting on a very low standard lamp. The standard is, in fact, an ordinary wall gas elbow, with flexible gaspipe attached, the threaded end being forced through a heavy square block of wood. An adapter is screwed on to the elbow, and the incandescent fitting screwed into that. We have explained this at some length, as, if an ordinary standard lamp is used, all the frames have to be raised in some way from the bench; with this arrangement the whole stands on the bench, and the frames get even illumination. We make a chalk mark so that illuminant remains in the same position, and round it draw an eight-sided figure, with each side the same length and equidistant from the light. If one always stands the printing-frames on these lines, and gives the same exposure, the results will be identical. At the proper distance of one foot from the light, eight whole-plate frames can be accommodated. Some frames will stand on end without assistance, but ours required some pieces of a thin wooden chocolate-box nailed on to form a firm base.

The exposure to be given depends entirely upon the colour required, and may be found by making test exposures in the usual way. It is exceedingly difficult, however, to tell the colour from the wet print, or indeed from the dry one, by artificial light, so that experience is by far the safest guide.

Fixing Exposures for a Given Colour.

We have chosen a good, clear, average negative as a specimen, and from it have made a series of ten prints, with exposures at one foot from the incandescent burner of ten to one hundred seconds. These have been mounted in their consecutive order and hung in the printing-room. If we wish to get an exact shade of colour from any negative, we note how many seconds the average negative required for this, and make a test exposure on ordinary bromide paper, using, of course, the usual bromide developer and different dishes and measures to those reserved exclusively for the acid solutions of the newer paper. Supposing our average negative required one second at three feet from the gas and the new one required three seconds, we know exactly the exposure for the particular colour required. For it must be remembered that the density of the bromide image depends absolutely on the exposure. With "Ensyna," however, the exposure has no effect on density, and very little on gradation, so that if it matters little what colour we get all preliminary tests may be dispensed with, and the prints exposed straight away. It is impossible for any professional printer to inadvertently under- or over-expose this paper.

If one has several frames printing round the gas at one time, with a boy attending to the length of exposure, whilst an assistant fills the frames, several dozen prints can be turned out in half an hour. The prints should, whenever possible, be made together, and then developed. If it can be avoided, never make the print, develop, fill frame, print, develop, and so on. Such procedure will surely give a plentiful crop of dark-brown

stains. The hands must be thoroughly dry whenever they touch the paper.

Development.

The tablet form of developer is the most economical, and has the advantage that only so much as will be used need be made up. Do not let the developer drop below living-room heat, or it acts extremely slowly; in some instances, in the case of a short exposure for purple tone, as long as five minutes. With the developer at from 60 deg. to 70 deg. two and a half minutes should be ample. A very flat dish of the size of the prints should be used for developing. To avoid stains, use the developer only once, and at the recommended strength. The very small quantities advised in the list of instructions are ample, so long as the dish is kept well moving. We do not find it necessary to give the preliminary soak to the print; it has no effect on the subsequent colour or gradation. A diluted developer leads to fog in case of a full-exposed print, but does not affect the colour. Re-using the developer softens the print slightly, but has no other effect except the tendency to stain noticed above. We find it best to keep one hand quite dry for placing the print in the dish, whilst the other rocks same and rinses print when ready.

The first tendency is to develop the print too far. When it appears two shades light when viewed by artificial light, the source of which should be some distance away, the developer must be thrown off quickly, and a short rinse given under the tap. If manipulating a number of prints, an assistant should now take it and slide face up in the hypo, which may be the proprietary acid article, or plain hypo. If one is working

single-handed, one soon gets the knack of completely submerging the print without touching the fixer, the slightest trace of which in the wrong place causes innumerable stains. The print loses practically nothing in fixing, but gains quite two shades in drying, as is easily seen by wetting one half of a print. The colour, too, dries richer and darker. Before the next print is fully developed the preceding one will be ready for washing, so that only one print need be in the hypo at a time, ensuring thorough fixation.

A few hand washes complete the batch, which may have the surplus moisture blotted off without fear of sticking, and be laid to dry.

If the print, from negative to mounted result, is wanted in a rush, methylated spirits can be used for quick drying without detrimental results, whilst the dry-mounting machine does the rest.

It may be useful to note that, besides altering the colour, the exposure may be used to control the result from various negatives. A short exposure will give a purple tone and contrasty result, whilst a long exposure—say, ten times as much—gives a much softer print and red-brown colour, so that various kinds of negatives may easily be suited. As we said before, one need not trouble much about the resultant tones; all are nice, clear, pure colours, very much akin to a range of carbon tissue, and indeed from a short trial of the matte paper we are almost tempted to prophesy that some studios may see fit to use this permanent artificial-light paper, with its numerous advantages, in place of the former process.

W. FOSTER BRIGHAM.

EXPERIMENTS IN COLOUR-SENSITISING CHLORIDE EMULSIONS.

(The following record of experiments made on the action of the Fritz Wentzel to the Imperial Technical High School, Berlin, for the degree of Doctor of Engineering. In the brief historical introduction the chief reference is to the work of Eder and Pizzigelli, since there is the probability that chloride emulsions may assume a more important rôle in negative and dry-plate work than they possess at present, we make an abstract translation of the Stenger. It would appear that the thesis is not published, but the

chief colour sensitiser is abridged from a thesis presented by Herr done about the year 1881, on the isochromatising of chloride emulsions, the full text of which we owe to the courtesy of Dr. E. printer is Emil Ebering, Mittelstrasse 29, Berlin, N.W. 7.)

THE dyes chosen for the following series of experiments included, of the phthalein class, eosine, erythrosin, and rose bengale, all used as their sodium salts. Of the isocyanines, ethyl-red, pinaverdol, pinacyanol (Hoechst), and the latest sensitiser, isocol (Bayer), were employed of the commercial dyes. Two others were also used, namely, cyanin L (Kahlbaum) and dicyanin (Hoechst). The dye diazo-black, often referred to as an exceedingly good red sensitiser, was used in the form of a preparation "diazoschwarz rexta," made by the Bayer Co.

The Principles involved in a Spectrograph for Chloride Emulsions.

Owing to the comparatively slight sensitiveness of chloride emulsion and to the improbability of this latter being raised on sensitising, use could not be made of an ordinary spectrograph except by enormously prolonging the necessary exposures. Moreover, the diffraction spectrograph, which in other respects gives very suitable results, proved unusable for the purpose in view, but also the construction of a prismatic apparatus called for special provisions in order to comply with requirements as to a very brilliant spectrum conjoined with the greatest possible purity in the less refrangible portions. As these properties are connected with the nature and arrangements of the optical system producing the spectrum, the laws relating to the latter require to be considered. In regard to the loss which light sustains by the reflection from the surface and by absorption in the substance of the reflecting medium, the relation

$$H = h \frac{\epsilon}{d\delta}$$

where H is the measure of the brightness of any part of the spec-

trum, ϵ the width of the slit, and $d\delta$ the dispersion angle of two colours. It will thus be seen that the brilliancy of the spectrum is in inverse ratio to its dispersion, therefore, when the brilliancy is to be a maximum a high dispersion must be dispensed with, whilst, on the other hand, the spectral decomposition should be such that even in the less refrangible parts of the spectrum there is a sufficient separation of the images of the slit. These requirements thus point to the use of a medium of slight dispersion, of small angle of refraction, and of high transparency. As the use of one prism corresponding to the above conditions limits the decomposition of the light to a small range, and as, moreover, the

quotient $\frac{d\delta}{\epsilon}$ expressing the purity of the spectrum leaves a good deal to be desired in the case of the greater width of slit, a combination with a second similar prism of acute angle and small aperture supplies the advantage of a stronger dispersion with greater angle of refraction and greater intensity of light.¹

Two identical prisms were thus used, the optical constants of which at a refraction angle of 45 deg. and at a size of 60 x 60 mm. were as follows:—

Refractive index for D.	Mean dispersion. C - F	Relative dispersion. $n - 1$	Partial dispersion.		
			$A^1 - D$	$D - F$	$F - G^1$
1.61778	0.01695	36.4	0.01025	0.01212	0.01030

As shown by the above-mentioned formula the intensity of the spectrum further stands in direct relation to the intensity of the

¹ Kayser, "Handbuch der Spektroskopie," vol. I., page 573

light used. The choice of this latter was, therefore, made with regard to the slight sensitiveness of the material employed. It was found that a Nernst light answered well, both as regards intensity, constancy, and whiteness of light. One was used on 110 volt circuit with a filament of about .4mm.; a very wide slit had still to be used in order to obtain enough exposure of the weakly sensitive chloride film. The width of slit was about 6 mm., and in comparative experiments on bromide emulsion plates was reduced to .05 mm. Finally, the brightness of the spectrum being dependent on the width of the bundle of light, prisms and lenses were selected as large as possible, and the latter of long focus in order not to give too short a spectrum. The photographic lens had a diameter of 8 cm. and a focus of 94 cm., the achromatic collimator lens was 10.5 cm. in diameter, and 134.5 cm. in focal length, these dimensions being the maximum which could be employed in the spectrograph.

The Apparatus Used.

A solid iron base supported the camera, which consisted of a long wooden body, with the photographic lens attached to the front and adjustable by rack and pinion. To the back of the camera, exactly at the height of the optical axis of the lens, a horizontal slit of 4 mm. width was placed, through which the rays of light fell upon the ground glass or sensitive film. Just behind this latter provision was made for the reception of the ground glass or dark slide, the latter in 9 x 12 cm. size. A screw adjustment permits of it being placed in several positions so that the whole series of different spectra can be photographed one after another, each plate thus being completely used. A table was fixed in front of the photographic lens, and at the height of the camera for the prisms. It is movable vertically in order to permit of any necessary adjustment of the prisms, up or down. A movable arm of the base of the apparatus which can turn concentrically with the axis of the prisms has finally the collimator lens, which latter is vertically adjustable by a screw. As the great focal length of this lens calls for an especially long collimator tube it was decided not to further complicate the apparatus, but to use it in a completely darkened room. The space between the camera and the collimator which contains the prisms was carefully covered with black cloth; and the prisms themselves given a coat of black varnish at their end-exposed surfaces and bases in order to avoid reflections. The adjustable slit was placed at the focus of the collimator lens, and in the axis of the latter, and was formed by a fixed and movable plate, the distance between which is adjusted by a micrometric screw fitted with a scale. Behind the slit the Nernst lamp was placed, whilst also a mercury-vapour lamp of quartz glass (made by Heraeus) was mounted so as to be brought into use when necessary for exposures to determine given lines.

Adjustment of the Apparatus.

The photographic lens was first focussed on infinity, and the collimator lens then turned and adjusted so that its axis coincided with that of the photographic lens. In order now to bring the two prisms into the position of minimum deviation the ground glass is removed, and the horizontal slit (thus laid bare) provisionally adjusted to a small opening. A Nernst lamp was placed behind this opening and the rays caused to pass in the reverse direction into the camera; and to leave the photographic lens as parallel rays. The prisms were now placed in the path of these parallel rays, and adjusted vertically so that they stood with their middle vertical point on the axis of the photographic and collimating lenses. A spectrum was thus formed which, after the collimator lens has been turned sideways, can be represented at its focus on a white screen in the otherwise dark room, and thus permits of the adjustment of the prisms. By turning the two prisms around the refracting edges either towards the right or left the position will soon be obtained in which the rays obtain the least deviation on passing through the prism symmetrically. In the case of the different deviations for the various colours the deviation can be a minimum for both prisms only in the case of a single colour. Regard is therefore paid to the green only as the medium spectral zone, and the adjustment for all the other colours is taken as sufficiently accurate. The position having been found the prisms are fixed once and for all to the base.

The next operation is the adjustment of the width of slit in the focus of the collimator lens and parallel with the refracting

edges of the prisms. The Nernst lamp is taken from its previous position and mounted behind the slit, and so adjusted that its luminous filament runs parallel to the slit. The rays of light coming from the slit produce a sharp spectral image in the plane of the ground glass, but they are extremely weak in intensity, particularly in the red portion.

Finally, the mercury-vapour lamp is introduced between the slit and the Nernst lamp, and with its assistance control obtained for the sharpness of the spectrum. A slight final correction is thereupon made by means of the photographic lens so that the mercury line of 546.1 appears absolutely sharp in the centre of the spectrum.

Plotting the Spectrum.

In order to obtain the correct representation of all parts of the spectrum independently of measurements in special pieces of apparatus it is necessary to plot the division of the various spectral regions according to the wave length. For this purpose a panchromatic plate was exposed in the adjusted spectrograph to the light of the quartz mercury lamp, and the characteristic lines of the metal photographed; also in order to obtain a still more exact plotting of the yellow and red parts of the spectrum the emission spectrum of helium was photographed. The superimposed spectra of the two elements allow of the recognition upon the negative of the following lines in the region 400 to 700 $\mu\mu$, which is practically the only region of importance in the experiments.

EIGHTEEN MERCURY LINES.

Wave-lengths—

404,6	407,8	433,9	434,7	435,8	491,6	495,9	536,5	542,6
546,1	567,9	576,9	579,0	587,2	588,9	608,9	615,2	636,3

FIFTEEN HELIUM LINES.

Wave-lengths—

396,5	402,6	410,0	412,1	414,4	434,0	438,8	447,1
471,3	486,0	492,2	501,6	587,6	688	707	

With the aid of these values the dispersion curve of the prism was drawn, the wave-lengths being marked on the ordinates at distances of 1 mm. = 1 $\mu\mu$. Their actual distance from each other, on the other hand, on the abscissæ of a co-ordinate scale were carried out and the points of intersection of the corresponding values connected with each other by a line. By extrapolation this curve leads in the direction towards violet up to 395 $\mu\mu$ to the characteristic maximum of gelatino-chloride of silver, and in the direction towards red up to 750 $\mu\mu$, thus permitting of the action of a specially good red sensitiser being followed. From its course the dispersion is seen to fall off so that at the blue of about 400 $\mu\mu$ a 10 $\mu\mu$ region occupies 6 mm., whereas the same number in the red at 700 $\mu\mu$ is compressed into .5 mm.

As the curves allowed of an exact reading of the position of all the wave-lengths in the spectrum, those from 395 to 750 $\mu\mu$ were ascertained, which are at a distance from each other of 5 $\mu\mu$, and the resulting values brought together in a table. From the plate above mentioned containing the superimposed spectra of mercury and helium a transparency was made, and the values corresponding to the position of the wave-lengths increasing by 5 $\mu\mu$ marked upon it by means of a dividing engine. In this way a measuring plate was obtained, and thus in the case of subsequent spectrum exposures it was necessary only to photograph the mercury lines on each plate, to bring the lines on the measuring plate over these latter, and without further trouble to be able to compare with the engraved scale.

Density Measurements.

For the purpose of measuring the density produced in the different spectral regions, and thus obtaining information as to the sensitiveness of the plates in these different parts of the spectrum, the Martens polarisation photometer was used. In this the bundle of rays passing through any desired portion of a negative is compared with a direct bundle by rotating a Nicol's prism, which brings the two illuminated fields into equality. In order to ensure that exactly equal areas of the plate are being measured, a slit diaphragm of 1 mm. width was inserted. From the angle read off—namely, that through which the analysing nicol must be turned in order to obtain equal brilliancy of the two fields—the various densities were ascer-

tained by aid of the relative intensity of the incident and transmitted light and the angle of rotation.

$$D_r = \log \frac{i}{i_0} = 2 \log \cot \alpha$$

These values may be worked out by using the table of Lohmeyer calculated for all values of α between 1 and 45. In order to pay regard to the opacity of the negative, which is independent of the silver deposit forming the image, and is caused by the material of the gelatine and by development fog, measurements were made of different under-exposed portions of the plate and the average density values noted. They possessed, on the average, the small value of $D_r = .12$. The density numbers contained in the tables are absolute, corresponding only to the silver deposit produced by the active light intensities. Plate-densities which lie within the value $D = 3.52$, corresponding to a reading of 1 deg., are taken as maximum silver deposit, since the measurement of a smaller angle is not possible with sufficient accuracy. In the curves represented, only this value is shown as the portions of maximum density lie on a scale. Further, an attempt has been made to read up to .2 deg., but this it was found could not be done, as the brownish colour of the reduced silver is difficult to compare with the greyish-black of the comparison field.

The Construction of the Sensitive Curve.

In order to show the characteristic properties of the different sensitizers, and especially a comparison of the bands of sensitiveness of the characteristic maximum, the plotting method employed by Eder and Stenger was used, the density values of the various exposures being plotted as ordinates and the wave-lengths as abscissæ, the line running through the points of intersection thus giving the curve of the plate. Since the unequal dispersion in the red part of the spectrum compresses the wave-lengths much more than in the blue and violet, the density of the plates is shown as unequally greater than would be the case by normal dispersion through a grating. Hence the density measurement of the silver deposit in the different portions of a spectral negative is not an absolutely equal measurement throughout the whole spectrum for the sensitiveness. If one were to take a graphical representation direct from the measured values the result would be a quite reversed representation of the colour-sensitiveness of the plate, since this defect of the method is most noticeable at the most sensitive part where a study of colour-sensitiveness possesses the greatest interest—that is to say, in the orange-red portion of the spectrum. Even if a representation corresponding to that of a grating cannot be had, an approximate representation may still be obtained. If the density values are plotted not according to their values as found, but in the ratio of the dispersion of the spectrum, these values will be reduced in the red portion as the dispersion falls off. Such a correction could be made, because in all test plates in the red part of the spectral regions a considerably higher density was obtained than in the blue and violet. This depended on the one side on the spectral properties of the light source employed, which is relatively rich in the orange-red rays, and is therefore in some respects to be regarded as the cause of the different relations of the special and colour-sensitiveness of the chloride plates. By aid of the treatment of the density values in the manner just described, an attempt was made to represent these values after the manner of a grating spectrum. Should the form of representation chosen, however, not be quite clear, the wave-lengths on the abscissæ system must be entered at equal distances.

Whilst the sensitiveness curves give a general idea of the greater or less activity of the sensitizers in different regions of the spectrum and for certain kinds of exposure, the production of the characteristic curves on the lines of Hurter and Driffield is still more of interest. If the densities (logarithms of the opacity of the silver deposit to light = D) of the negative be plotted on the ordinates of the chart and the logarithms of the light intensities for regularly increasing periods of exposure (log. *i.t.*) on the abscissæ, the curve passing through the points of intersection of the corresponding points gives the facts as to change taking place in the silver halide on regularly increasing intensity of light for which the silver deposited by reduction represents an absolute measure. According to the steeper or flatter form of the density curve it will be seen, by comparison with a measure chosen for that purpose, whether an emulsion works hard or soft compared

with another. As the mean portion of the curve, that corresponding to normal exposure, runs nearly in a straight line (since here alone the increase in density is approximately proportionate to log. *i.t.*) it follows that the angle of these parts of the curve to the abscissæ indicates directly the gradation of one plate in comparison with that of another.

It is obvious that the size of this angle will vary according to the wave-length of the light for which the curve of gradation is ascertained, which fact must not be disregarded in practical work. While an approximately parallel course of the curves for different wave lengths is desired as proof of the correctness of reproduction in the case of a single plate, their direction in the different parts of the spectrum obtains considerable importance, particularly in three-colour photography, since in this case the closest possible approximation to parallelism for the three-filter zones is a prime factor in the correct reproduction of colour tones.

F. WENTZEL.

(To be continued.)

ROYAL PHOTOGRAPHIC SOCIETY.

ATTENDANCE OF OFFICERS.

As usual at a date some time in advance of the annual election of officers, the Royal Photographic Society publishes in its "Journal" the attendances of Officers, Members of Council and Committeemen from December 19th, 1907, to December 7th, 1908, both inclusive. The following are the official figures:—

Council Meetings. Number of possible attend'nces.	Committee Meetings. Number of possible attendances.	Name.	No. of attendances at	
			Council Meetings	Com'ittee Meetings.
12	<i>Ex officio</i> all.	J. C. S. Mummery, A.R.I.B.A. (President)	11	14
12	—	The Right Hon. the Earl of Crawford, K.T., F.R.S.	none	none
12	—	Sir W. de W. Abney, K.C.B., D.C.L., F.R.S.	"	"
12	—	Sir Joseph W. Swan, D.Sc., M.A., F.R.S.	"	"
12	6	Maj.-Gen. J. Waterhouse, I.A.	"	1
6	<i>Ex officio</i> all dealing with finance.	J. Sterry (Hon. Treasurer till May 11th, 1908).	4	4
12	<i>Ex officio</i> all from May 11th 1908.	Leslie E. Clift (Hon. Treasurer from May 11th, 1908).	10	9

THE FORTHCOMING DRESDEN EXHIBITION.

I AM asked, as the date of the above exhibition is drawing near, to give the readers of the "B.J." some idea of what is being done, and of the developments in its activities, which are of interest to English photographers.

Already the Governments of the different countries concerned have shown great interest in the venture, and many have guaranteed, and paid in, large sums of money, varying from £50 to £2,000, in order that provision may be made for their subjects when they travel to Dresden for the purpose of studying the various aspects of the photographic industry as there set forth.

Several nations have made a special effort to be well represented, and have arranged for the erection of large important buildings in the grounds, in order that their exhibits may be appropriately housed, independent of others. This, of course, only applies to such exhibits as by the rules are not necessarily shown in conjunction with other nations. Austria has been especially forward in this branch of activity.

The photographic industries of Germany, America, Austria, France, Italy, and Belgium are exceedingly well represented, and the King of Denmark and the Czar have given their personal support in the matter.

A new and special feature of the great exhibition will be the various congresses which will be held during its continuance. A special congress will be held in the interest of each of the following branches of photography:—(1) Applied Photography; (2) Scientific Photography; (3) Pictorial Photography; (4) Professional Photography. At any rate, in the case of No. 3, this will constitute a new departure, for no world's congress of pictorial photography has ever, up to the present time, been held.

Large numbers of photographers from all parts of the world are expected to attend these congresses, and every facility will be given in the shape of reduced fares, special prices for accommodation, and the arrangement of suitable excursions to make them attractive. It is proposed to take advantage of these facilities for the purpose of visiting some of the great photographic and optical industrial centres in Germany, where the works will welcome visitors and explain their manufactures.

Entries closed on December 15, and all classes are excellently representative.

In the case of England the scientific section will show about 400 exhibits, the pictorial about 180, and the instructive and entertaining about 200. In the Ethnological Department there will be the fine collection of Sir Benjamin Stone.

It is in the trade section that England lags so lamentably behind. There seems to have been an utter lack of enterprise, and though many of our photographic industries are almost as much patronised in Germany as they are in this country, no effort has been made to show forth or increase the business. This spirit of indifference to one of the finest opportunities for business advancement in an expanding and active market is clearly shown in the fact that there are only *five* trade entrances for the whole of England.

America is very largely represented in this department, and again, as has so often been the case before, our industries are to be exploited and our trade undermined by the Yankee, thanks to our own indifference and want of hustle.

It is not even now too late for firms to come in. Several businesses

have expressed their readiness to form a sort of syndicate for exhibition purposes and to pool expenses if others signify their willingness to join. There is no doubt that a large and important exhibition can be organised, but it must be done at once, and firms should write to the general secretary (Mr. E. O. Hoppé) if they wish to move.

I shall hope to advise the readers of this paper of the various developments of the exhibition as they become manifest, and in the meantime wish to leave on their minds the impression that in the Dresden International of 1909 we are going to witness the greatest exposition of scientific, applied, and pictorial photography that the world has ever seen.

A. H. BLAKE, M.A.,

Press Secretary to the English Committee.

MORE STUDIO SCENES.

APROPOS of the semi-imaginary interviews in portrait studios which we published in the "Journal" of December 18, a correspondent sends us a copy of the "New London Journal" containing the following:—

Lady (with the elaborate politeness of extreme feminine wrath): "Sir, might I be permitted to inquire what sort of pictures you consider these? My husband sat for them here two weeks ago."

Man at the desk (promptly): "I consider them very bad pictures, madam."

Lady (fixing him with a scornful glance): "Indeed! Then what do you mean by expecting people to pay the highest price for such abominable work? Do you suppose for a moment —"

Man at the desk (smiling): "But, madam, we —"

Lady (as before, only more so): "No doubt you may find it amusing to make caricatures of people. But you can't expect them to pay you for doing so. I have come here to tell you that you will either make a decent photograph of my husband, or else —"

Man at the desk (smiling more and more): "But my dear lady, these pictures —"

Lady (indignantly): "Not another word, sir, on the subject of these pictures! I would not have them at any price. It is your duty to —"

Man at the desk (trying with difficulty to restrain his laughter): "If you will listen to me a moment —"

Lady (with flashing eyes): "I will listen to nothing, sir. I insist that you shall make good —"

Enter proprietor from the skylight.

Proprietor (regarding the grinning and apparently disrespectful man at the desk with a withering glance): "What's the matter here?"

Man at the desk (handing photographs): "This lady has just brought these pictures back —"

Lady (with dignified firmness): "Allow me to explain to your employer. These photographs which you have made of my husband are simply a disgrace. At the price you charge your customers certainly have the right to expect —"

Proprietor (also beginning to smile): "My dear madam, you are mistaken —"

Lady (in a towering rage): "Do you mean to tell me that you can't do any better than that for £1 a dozen?"

Proprietor: "Ha, ha, ha! I can do better for 12s."

Lady: "Sir!"

Proprietor (emphatically): "Much better."

Lady: "This is an insult. I shall take means —"

Proprietor (compelling himself to gravity): "I beg your pardon, but these don't happen to be our pictures at all. They were taken at Smithson's next door but one. We are Smithers, see?"

Lady (examining name on photograph): "H'm —er—well, I did make a mistake, certainly, but (energetically) I have not the slightest doubt—not the slightest—that if they had been taken here they would have been fully as bad, or even worse. Good-morning!"

ARCHDEACON COLLEY'S ADDRESS.—Mr. Drinkwater Butt, F.R.P.S., writes: "In reply to the correspondent, 'A. E. A.' of your issue of the 25th inst., I may say that the address of Archdeacon Colley is Stockton Rectory, Warwickshire; but I do not think that the rev. gentleman publishes his 'spirit' photographs in the form of lantern slides."

FORTHCOMING EXHIBITIONS.

- December 30 to January 2.—Chelmsford Photographic Society. Sec., M. J. Morison, Savernake Lodge, Chelmsford.
- December, 1908, to January, 1909.—Kiew International Photographic. Sec., S. T. Horovitz, Technical Society, Kreshtchatik, 10, Kiew, Russia.
- 1909.
- January 1 to 9.—Scottish National Photographic Salon. Sec., Robert Telfer, 138, Glasgow Road, Wishaw.
- January 6 to 27.—Northern Photographic (Manchester). Sec., S. L. Coulthurst, Broad Oak Road, Worsley, Manchester.
- January 19 to 30.—Glasgow Southern Photographic Association. Sec., Robert Lindsay, 189, Allison Street, Glasgow, S.S.
- February 1 to 13.—Glasgow and West of Scotland Amateur Photographic Association. Entries close January 20. Sec., James M'Kissack, 68, West Regent Street, Glasgow.
- February 3 to 6.—Borough of Tynemouth Photographic Society. Entries close January 23. Sec., J. R. Johnston, 29, Drummond Terrace, North Shields.
- February 8 to 13.—St. Helen's Camera Club. Entries close January 27. Sec., A. G. Else, Duke Street, St. Helen's, Lancs.
- February 10 and 11.—Cowes Camera Club. Entries close February 1. Sec., E. E. Vincent, 4, High Street, Cowes.
- February 11 to 20.—Leicester and Leicestershire Photographic Society. Sec., Harry Cross, 80, Harrow Road, Leicester.
- February 16 to 20.—Norwich and District Photographic Society. Sec., J. T. Tanner, The Lodge, Bowthorpe Road, Norwich.
- February 20 to March 20.—South London Photographic Society. Sec., H. Creighton Beckett, 44, Edith Road, Peckham, S.E.
- February 22 to March 6.—Birmingham Photographic Society. Entries close for abroad January 5, for England, February 12. Sec., Lewis Lloyd, Church Road, Moseley, Birmingham.
- March 17 to 20.—Nottingham Camera Club. Sec., E. L. Kent, 5, Radcliffe Mount, West Bridgford, Notts.

Patent News.

Process patents—applications and specifications—are treated in "Photo Mechanical Notes."

The following applications for patents have been received between December 14 and December 19:—

- WASHING APPARATUS.—No. 27,059. Improvements in photographic plate and print washing and drying machine. William Barron and George Simpen, 132, Above Bar, Southampton.
- PRINTING FRAMES.—No. 27,087. Improvements in photographic printing frames. John Wilkinson and Alfred Wilkinson, 4, St. Ann's Square, Manchester.
- CINEMATOPGRAPHS.—No. 27,120. Safety stand, or box for fire prevention or extinction. Henry Quartermain, Chertsey Road, Woking.
- VIGNETTING APPARATUS.—No. 27,229. Improved apparatus for vignetting photographic negatives in the camera. Alexander Good, 72, Ranelagh Road, Ealing, London.
- BLEACHING.—No. 27,233. Improved process for the production and reproduction of bleached images. William Francis Mansell and Walter Henry Mansell, 70, Chancery Lane, London.
- SHUTTERS.—No. 27,433. Improvements in diaphragmatic shutters having rectangular or square apertures. Siemens Bros. and Co., Ltd., and Harold William Frank Ireland, Queen Anne's Chambers, Broadway, Westminster.
- CINEMATOPGRAPH-PHONOGRAPH.—No. 27,435. Improved method of securing synchronous action of conjointly working cinematographs and talking machines. Deutsche Bioscop Ges., 111, Hatton Garden, London.
- APPARATUS.—No. 27,561. Improvements in photography and apparatus connected therewith. Archibald James Erskine, 24, Southampton Buildings, London.
- CINEMATOPGRAPHS.—No. 27,583. Improvements in or relating to apparatus for producing animated pictures by the movement of a vehicle. Witold Prus Szczepanowski and Waclaw Czernuowski, 111, Hatton Garden, London.

PRINTING.—No. 27,642. Improved device for securing register in photographic printing. Frederick Arthur Pereira and W. Butcher and Sons, Ltd., Camera House, Farringdon Avenue, London.

COLOUR PHOTOGRAPHY.—No. 27,682. Photographic camera for three-colour photography (three-plate process). Société Anonyme "La Photographie des Couleurs," Joseph Sury and Edmond Bastyns, 27, Chancery Lane, London.

BICHROMATE PRINTING.—No. 27,686. Method of preparing solutions used in the bichromate gelatine process for photographic printing. Société Anonyme "La Photographie des Couleurs," Joseph Sury and Edmond Bastyns, 27, Chancery Lane, London.

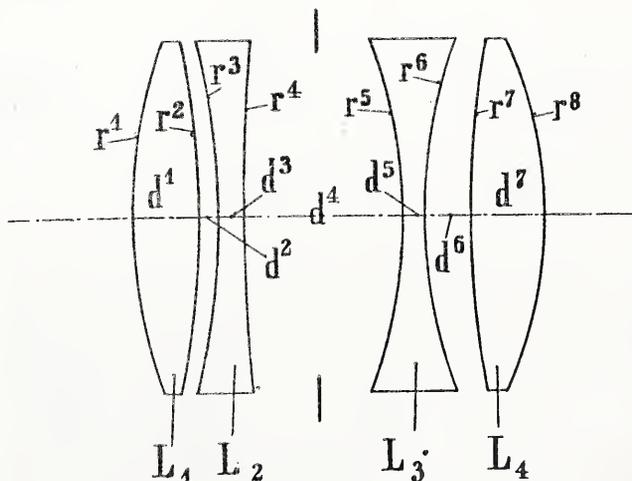

COLOUR PRINTING.—No. 27,687. Printing on paper of photographs in colour. Société Anonyme "La Photographie des Couleurs," Joseph Sury and Edmond Bastyns, 27, Chancery Lane, London.

COMPLETE SPECIFICATIONS ACCEPTED.

These specifications are obtainable, price 8d. each, post free, from the Patent Office, 25, Southampton Buildings, Chancery Lane, London, W.C.

The date in brackets is that of application in this country; or abroad, in the case of patents granted under the International Convention.

ANASTIGMAT LENSES.—No. 13,901. 1908. (July 1, 1907.) The invention relates to four-lens objectives built up of two pairs of lenses, each comprising a positive and a negative lens, leaving between them an air space in the form of a positive meniscus, and consists more particularly in the construction of an objective showing, in conjunction with great effective area or opening, a very good degree of correction, especially with regard to coma and spherical aberration. To produce this result the refractive power of the negative lens in each of the two pairs of lenses is made smaller or equal to the refractive power of the positive lens in the pairs of lenses respectively, and at the same time the focal length of one half of the objective formed by one pair of lenses is made at least twice as great as the focal length of the other half. By such construction of the objective from two halves, each of which exhibits, if examined for itself alone, considerable errors, it becomes possible to compen-

sate the errors of the two halves, and to obtain an objective of increased perfection compared with known objectives of the kind referred to, as, for instance, described in the Specification of British Patent, to Goerz and another, No. 12,859, of 1898, in which the ratio of the focal lengths of the two halves is unity, and the halves are corrected spherically, astigmatically, and chromatically.

An objective in accordance with this invention is represented on the accompanying drawing, where the two lenses forming the one half of the objective are designated L_1 , L_2 , and the lenses of the other half L_3 , L_4 . The thicknesses of the lenses and air spaces between same are indicated by d^1 , d^2 , d^3 , d^4 , d^5 , d^6 , and d^7 . The surfaces of the lenses are designated r^1 , r^2 , r^3 , r^4 , r^5 , r^6 , r^7 , and r^8 ; the same reference letters may be used hereinafter for the radii of curvature of the surfaces.

The constructional elements of an embodiment of the new objec-

tive for a focal length or distance of $f=100$ mm. are given in the following table:—

Rad.ii.	Thicknesses.	Kinds of glass.
$r^1 = + 43,478$ mm.	$d^1 = 5.2$ m.m	$n_D = 1.6141$ $n_G = 1.6280$ $n_C = 1.61586$
$r^2 = - 70,423$ mm.	$d^2 = 1.6$,,	
$r^3 = - 55,863$ mm.	$a^3 = 2$,,	$n_D = 1.6051$ $n_G = 1.6260$,, = 0,01586
$r^4 = + 163,934$ mm.	$d^4 = 12.0$,,	
$r^5 = - 41,667$ mm.	$a^5 = 1.8$,,	$n_D = 1.5513$ $n_G = 1.5672$,, = 0,01220
$r^6 = + 41,667$ mm.	$a^6 = 3.6$,,	
$r^7 = + 78,126$ mm.	$d^7 = 5.7$,,	$n_D = 1.6141$ $n_G = 1.6280$,, = 0,01688
$r^8 = - 34,439$ mm.		

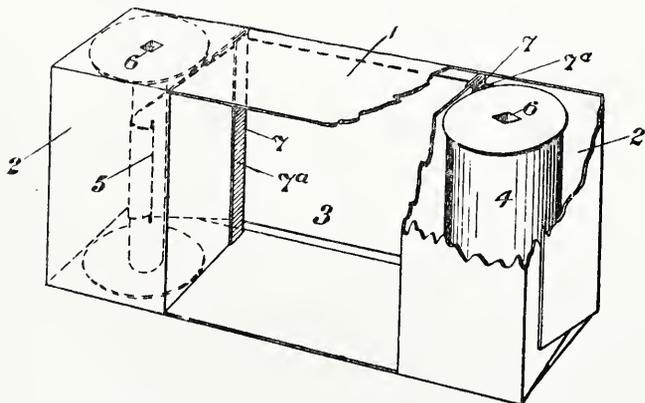

Relative aperture 1 : 3.5.

The focal length of the front combination (L^1, L^2) of the system amounts to + 109,067 mm., and the focal length of the back combination amounts to + 331,559 mm. Optische Anstalt C. P. Goertz Aktiengesellschaft, 44-46, Rheinstrasse, Friedena 1, near Berlin.

CARRYING STRAPS FOR CAMERAS.—No. 26,206. 1907 (November 27, 1907). The invention consists essentially of two leather flaps, somewhat of a T shape, which are connected together at the wide part by two adjustable straps, one at each end. These straps may be lengthened or shortened according to width of the article to be held, by means of metal slides or buckles. To the tail part of each flap aforesaid is attached the securing strap. The flaps are arranged so that one may lie flat on one side of the article to be held. The other flap is bent at right angles so that the wide part may support the camera or parcel from beneath. To a convenient part of one of the flaps is connected a metal loop or loops, which carry the shoulder straps, which are provided with the usual slides or buckle for lengthening or shortening. The free ends of the shoulder strap are provided with a swivel hook, or other suitable attachment for connecting or disconnecting the loops attached to one of the flaps. Charles Lavender, Fairbanks, Lavender, and Son, Eldon Works, Eldon Street, Walsall.

ROLL-FILM DAYLIGHT SPOOLS.—No. 14,490. 1908 (January 1, 1908). The object of the invention is to provide a means for carrying and exposing a strip of sensitive film, such as that used in roll-film cameras, and the improvement takes the form of a light-tight package, of cheap material and construction, that forms a secure protection of the film, before and after exposure, thus permitting the package to be inserted into or removed from the camera in daylight, and the roll-holder being of no value, after once using, it can be thrown away.

The invention is more particularly designed for use with the

improved form of the pocket camera known as the "Tikka," forming the subject of patent, No. 32, of 1908, but the system is applied to other forms of cameras.

In carrying out the invention a stamped-out blank of paper, cardboard, or other suitable material is creased and provided with flaps, to enable it to be shaped into a rectangular oblong package, as shown in figure, the flaps being pasted or glued down to give stability to the package and to render it light-proof. The end flaps, two of which are shown in figure, remain unfixd until the film is inserted. At each end of the package is formed a film chamber 2,

in which the film is stored both before and after exposure. Between the spool chambers a recess 3 is formed, representing the exposure aperture. The film (which is wound on a roller 4, contained in one of the spool chambers, and protected at each extremity with an opaque wrapping strip or tab) is drawn across the exposure aperture 3, as successive exposures are made, through narrow slits 7, 7 formed at the inner back angles of the spool chambers, one of the wrapping strips being shown threaded to one of the spools at 5.

These slits may be bound with cloth or velvet, 7a, 7a, to prevent scratching of the sensitive surface. It will be noted that the film, when at the focal plane, is lying adjacent to the rear wall of package and away from its front surface by practically the depth of the package. The cores of the spools are provided with key ways, 6, 6, which may be of any convenient form. Magnus Niell, Djuvsholm, Sweden.

ROLL-FILM SPOOLS.—No. 14,489. 1908 (December 27, 1907). The invention relates to an improved form of roll spool and a detachable spring for same, and the spool embodies improvements, which have the effect of considerably simplifying the winding gear on the camera. It is more particularly intended for use with the camera forming the subject of Patent No. 28,464, of 1907, but it would be quite applicable to larger cameras of that type.

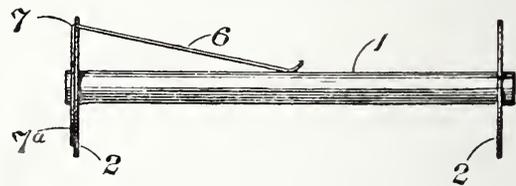

Fig. 1.

Hitherto it has been customary to form a recessed key way to the end of spool, into which a sliding key is made to engage after the spool is placed in the spool chamber of camera. This plan involves considerable trouble and cost in construction, and also has a tendency to increase the bulk of the camera owing to the depth of the sleeve in which the key stem slides.

By the improved method the centre of the spool is formed of the metal stem of core 1, which projects slightly through the end flanges 2—2, the projections being transversely slotted at 3 to receive the key on camera. The latter is simply a flat tongue 4, attached to or forming part of the winding post to which the winding handle 5 is connected. These parts partake of a simply rotary movement, and in placing a spool in position in the camera, the key is set at right angles to the body of the camera, when the spool will readily slip into position, providing its key way is set in

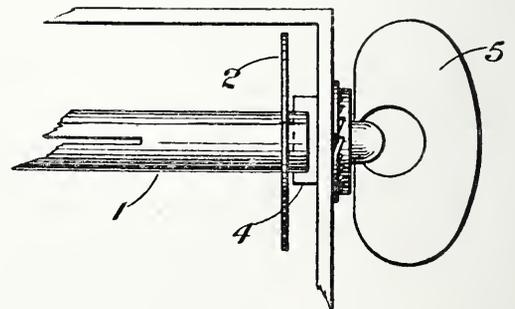

Fig. 2.

alignment to the key itself. It follows that the spool will as readily fall out of the camera when the key is in the position above referred to, and the camera inverted.

A further improvement is the adaptation of a detachable tension spring 6, which performs the function of preventing the roll of film and its backing paper from becoming loose or unwound. It is formed of a flat plate of spring metal, bent, beyond the right angle at 7, the end piece of 7a, being rather less in area than the flange of the spool, is provided with a central hole to receive the slightly projecting core of spool. The spring is made detachable and can be slipped on and off the spool very readily. The end of the plate opposite to the turned-down piece rests, with a light tension on the backing paper, when in position, and, whilst it effectively stops the paper from accidentally unwinding, it does not interfere with the ordinary winding of spool when in the

camera, at which time the spool revolves on its flanges whilst the tension spring lies idle, being prevented from turning by the wall of spool chamber. Magnus Niell, Djursholm, Sweden.

CINEMATOGRAPH METAL BANDS.—No. 24,225. 1907 (February 14, 1907). The invention has reference to improvements in or relating to cinematograph metal ribbons or "films."

In Specification No. 20,836, 1907, is described the means recommended for printing on metal with thick inks. The present invention relates to the preparation of metal films for printing photographically thereon. Metallic bands, suitably insulated by means of a substratum, are coated directly with a sensitised emulsion. The varnished band is preferably coated on both sides with the emulsion, so that it may carry two sets of pictures. For economic and physical reasons, iron, "tinned cold," is particularly suitable, by reason of its cheapness, as well as its resisting qualities and its elasticity, but any other suitable metal may be employed. By "tinning cold" is meant electrolytic tinning, which permits of coating the metal and protecting it without causing it to lose its elasticity and the rigidity which are necessary. The tinning ought to be a matt white. In place of tinning the band it may be nicked. Frederic De Mare, 122, Boulevard Leopold II., Brussels.

Analecta.

Extracts from our weekly and monthly contemporaries.

The Modification of Sulphur-toned Bromide Prints.

It may not be generally known (says a writer in "Photography and Focus" for December 29) that weak or yellowish sulphide-toned bromide prints can be altered in colour, the sepia being intensified, or the original black or grey brought back, and that very simply. For the whole of the processes four solutions are required. They are:

Mercury-bleacher.

Mercuric chloride	1 ounce.
Ammonium chloride	1 ounce.
Water (hot)	20 ounces.

Redeveloper.

Any usual bromide paper developer diluted with from four to ten times its bulk of water.

Sulphide-bleacher.

Potassium ferricyanide	120 grains.
Potassium bromide	1 ounce.
Water	20 ounces.

Sulphide-toner.

Pure sodium sulphide	2 drachms.
Water	20 ounces.

The dry sulphide-toned print is placed in a dish and evenly flooded with the mercury-bleacher, which, it may be pointed out, is the usual bleaching-bath in the ordinary form of mercurial intensification. The action of the bath is very rapid, but the bleaching which it will effect on a print that has already been sulphide-toned is only a partial one. As soon as the print has been evenly affected by this bleaching-bath, which will take from thirty seconds to one minute, it is given a thorough washing for at least ten minutes in running water. The washing must be thorough, the aim being to remove all traces of the mercury solution as thoroughly and as quickly as possible.

If the print, when finished, is to be of a black tone, we may now dilute any ordinary bromide paper developer with ten times its bulk of water, and redevelop the bleached and washed print in this until just a trace of warmth still shows, when the print may be washed and dried as usual. When dry, all trace of warmth will have gone, and a fine black print will be the result, equalling the original with, if anything, perhaps a slight increase in detail and loss of contrast.

If the print is to be toned with sulphide a second time, the developer should only be diluted with four times its bulk of water, and the print should be redeveloped as far as it will go, when a good degree of intensification will be seen to be the result. The print is well washed, and is then placed in the sulphide-bleacher,

given above, washed quickly to remove any yellowness, and then put into the sulphide-toner to darken. This is just the usual sulphide-toning process. The print is then merely washed and dried.

A Useful Print-dryer.

Mr. George C. Cantwell, writing in the December issue of "Camera Craft," gives a description of a print-drying apparatus which he says "is simple in construction, perfectly satisfactory in operation, and always ready for use. This one, which I have had in use for over two years, was made in half an hour. The ends are formed by the top and bottom of an old cheese-box, and they are nailed together in barrel form by using strips of lathing cut 30in. long. This length was decided upon because it is the width of ordinary sheeting. The strips were nailed on about every 4in. around the end pieces, and then covered with an ordinary wire screen. Around the whole was then wound two thicknesses of white cotton sheeting, made fast by stitching, and a free end of 10ft. or 15ft. allowed, on which to roll up the prints around the drum. Some good-sized auger holes were bored in each end to allow a circulation of air, and the contrivance was complete and ready for use. When about to dry prints, unroll the free end of the sheeting from the drum by rolling it along the top of a table or bench, getting the cloth smooth and flat. Lay the prints face down upon the cloth, and then roll up around the drum by rolling the latter over and over. Place aside overnight, and the prints will be bone dry, perfectly flat, and free from blotter 'whiskers' in the morning."

New Books.

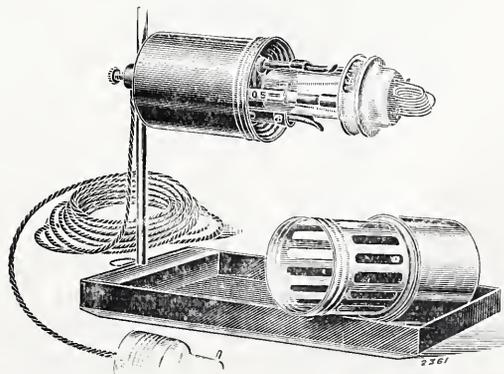

"THE SCIENTIST'S REFERENCE BOOK AND DIARY."—Messrs. Jas. Woolley, Sons, and Co., Ltd., Manchester, have issued a pocket-book containing a diary, divided into 6-day weeks (happy scientists!), and a number of useful memoranda, such as factors for volumetric analysis, atomic weights, etc. The price of the diary is 1s.

DEVELOPMENT (GASLIGHT) PAPERS.—No. 93 of "The Photo-Miniature" (Dawbarn and Ward, Limited, 6d. net) contains, among other formulæ and directions for the working of gaslight papers, a synoptic table of the numerous brands upon the market in Great Britain and America. It is a formidable production, even though one or two minor brands made in this country are not included. Our contemporary brings together a collection of hints and formulæ which makes the volume a very timely publication.

New Materials, &c.

The "Ensign"-Nernst Lamp. Sold by Houghtons Limited, 88-89, High Holborn, London, W.C.

An inexpensive and very portable form of the Nernst lamp has been introduced by Messrs. Houghtons, specially for lantern and enlarging work, on a moderate scale. The lamp costs complete only

12s. 6d., and is manufactured to give a light of about 70 candle-power when used on circuits from 200 to 250 volts. When in use the lamp measures seven inches from end to end, and is made of a form fitting

it for use on an ordinary lime-jet tray. It is a very convenient and economical illuminant for enlarging lanterns, the small area of the light giving a disc of very even illumination. The resistance is embodied in the lamp, and the filament is affixed in a way which allows of its instant removal and replacement, should such be necessary. The lamp lights up quickly without accessory means, and one last point in its favour is the attachment to the electric main, which is the ordinary plug pattern, fitting into the bayonet holder of an ordinary electric lamp.

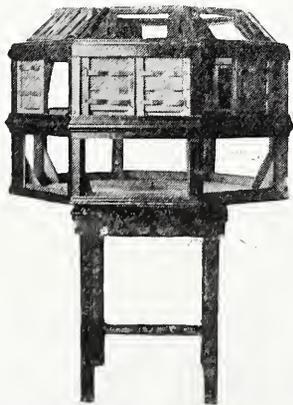

MERCK'S PYRO.—The firm of Merck, famous throughout the world as a maker of fine chemicals, has now introduced a modified form of pyrogallic acid in the crystal form. Very few people, we suppose, now buy their pyro in the light, bulky, feathery form in which it was first introduced upon the market for photographic purposes. The more solid "crystal" variety, on account of its smaller bulk and greater convenience in weighing out, possesses such obvious advantages that we may assume by far the majority of pyro-developing solutions to be made up from this product. Messrs. Merck have marketed such "crystal" pyro for some time, but they have now issued a new form of extremely fine crystals, almost of snowy-whiteness, and evidently of very high purity. These crystals thus represent the most compact form of pyro, and, to speak from our own experience of them in making a developer, possess the maximum solubility and developing activity. We can heartily recommend this pyro, which is supplied from the London house of Merck at 16, Jewry Street, E.C.

AGFA DEVELOPERS.—Messrs. Chas. Zimmermann announce a reduction in the retail prices of the following Agfa developers—viz.: Eikonogen, in tins of 1oz., reduced to 1s.; 4oz., 3s. 2d.; 8oz., 5s. 6d.; 16oz., 10s. 5d.; 32oz., 20s. Eikonogen cartridges, per box of ten, reduced to 2s. Rodinal, in bottles of 3oz., reduced to 1s. 4d.; 8oz., 2s. 8d.; 16oz., 4s. 8d. Amidol cartridges, per box of six, reduced to 1s. 10d. Glycin cartridges, per box of six, reduced to 1s. 10d. Metol cartridges, per box of six, reduced to 1s. 10d. Metol-hydrokinone cartridges, per box of ten, reduced to 2s. 6d. Hydrokinone cartridges per box of ten reduced to 2s. 6d. Pyro cartridges, per box of ten, reduced to 2s. 6d. Hydrokinone paper cartridges, per box of ten, reduced to 2s. Pyro paper cartridges, per box of ten, reduced to 2s.

New Apparatus, &c.

The "Gold-Smith" Printing Cabinet. Sold by Gold, Smith, and Co., 44, Chapel Street, Salford, Manchester.

For use with an enclosed arc lamp, Messrs. Gold, Smith, and Co. supply a printing cabinet at the very low price of £3 3s., complete with the table on which the cabinet stands. Forty half-plate frames can be used simultaneously in this cabinet, or the bottom row will take eight whole-plates instead of sixteen half-plates, if desired.

The printer can stand on one spot and turn the apparatus, which revolves upon the table on small castors, instead of walking around, thus saving time and labour, besides which the means of raising the cabinet to working level is, we think, a decided advantage. The cabinet can easily be lifted off the table, which can thus be used for other purposes.

Meetings of Societies.

MEETINGS OF SOCIETIES FOR NEXT WEEK.

MONDAY, JANUARY 4.

Weymouth Natural Science Club. French Lantern Pictures A. E. Staley & Co.
Dewsbury Photographic Society "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Stafford Photographic Society. "Lantern Slide Making." Herbert A. E. Hey.
Leek Photographic Society. Monthly Lantern Night.
Kidderminster and District Photographic Society. "Mountain Scenery in British Isles." H. Tomkinson.
Southampton Camera Club. Annual General Meeting.
South London Photographic Society. Monthly Competition—(Prints.)
Scarborough and District Photographic Society. "Lantern Slide Making." J. Pickering.
Catford and Forest Hill Photographic Society. "The Improvement of the Negative." Harold C. Hancock.

TUESDAY, JANUARY 5.

Halifax Camera Club. Dutch Lantern Pictures. A. E. Staley & Co.
Chiswick Camera Club. "Enlarged Negatives on Rotograph Negative Paper." C. H. Marriott
Otley and District Camera and Art Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Kinning Park Camera Club. Open Night.

WEDNESDAY, JANUARY 6.

Croydon Camera Club. "The Heliographic Printing Processes." W. H. Smith.
Leeds Camera Club. "Picture Making Among the Cornish Folk." W. Thomas.
Borough Polytechnic Photographic Society. "Rambles in London." H. Clifton Beckett.
Edinburgh Photographic Society. "Light and Shade." F. Campbell Noble, R.S.A.
Rochdale Amateur Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.

THURSDAY, JANUARY 7.

L.C.C. School of Photo-Engraving, Bolt Court. "The Commercial Side of a Photo-Engraving House." Arthur Cox.
Midlothian Photographic Association. "Man and Nature on an Outer Island." Illustrated. J. and R. Adam.
Rodley, Parsley, Calverley, and Bramley Photographic Society. "Bromide Pictures." H. Grainger.
Liverpool Amateur Photographic Association. "The Sun's Corona." Rev. Father A. L. Cortie, S.J., F.R.A.S.
Todmorden Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.

Commercial & Legal Intelligence.

COMPANIES REGISTERED.

NATURAL PHOTOGRAPH STUDIOS.—£6,000 (£1). To take over the business of a photographer, etc., carried on by W. Friese-Greene, at 203, Western Road, and 20, Middle Street, Brighton. Private. 203A, Western Road, Brighton. (100,757.)

DEBENHAMS, LONGMAN AND CO.—£2,000 (£1). To take over the business of art photographers carried on by W. F. Longman, A. S. Longman, and D. Welby, at 12, Clarence Street, and the County of Gloucester Studios, Gloucester, and at 3, Spa Place, Cheltenham, as Debenhams and W. F. and S. Longman. Private. The Studio, Clarence Street, Gloucester. (100,749.)

News and Notes.

THOMPSON AND LEE, technical photographers of architecture, machinery, landscape, etc., of 17, Eldon Square, Newcastle-on-Tyne, have issued a most pleasing calendar, bearing a piece of their work.

"**TELECINEMATOGRAPH.**"—The Stockholm correspondent of the *Daily Telegraph* states that an engineer of that town, named Grell, has obtained a patent for an invention by means of which not only photographs, but also animated pictures, may be sent and received by means of the ordinary telegraphic apparatus. He does not state what relation the pictures in question bear to the ordinary cinematograph film.

L.C.C. PHOTOGRAPHIC CLASSES.—At the meeting of the London County Council on December 22, the Education Committee submitted a lengthy report as to the desirability of extending the trade classes at the various Polytechnics under their control, which were commenced at the Borough Polytechnic in September, 1904, as recently

described in our columns. In the Council's Trade School for Girls at Westminster there is at the present time a photography class, and, as in April next, pupils in this class, first year girls, will pass into the second year, the Council decided to appoint an additional assistant teacher of photography at a salary of £100 a year, to form one additional class, and provide additional equipment and material.

THE LATE MRS. BARDSLEY.—The death took place last week, at Ashton, Lancs., of Mrs. Alice Wright Bardsley, photographer. The deceased lady was the daughter of the late Mr. Elijah Moss, and was well known in the town, where she had been in business for about fifteen years. Her work as a photographer was always noted for its high-class quality, and her studio was exceedingly popular. Her late mother was in the same business at Chester Square for a good many years, and she was recognised as one of the best exponents of the art of photography in the district. Previously Mrs. Bardsley's aunt, Mrs. Robinson, was the first lady professional photographer in the town. Mrs. Bardsley was, in her younger days, a contralto vocalist of some ability.

FIRE IN A CINEMATOGRAF THEATRE.—During the last few weeks there has been quite an epidemic of cinematograph fires at Berlin, which, as we have already stated, is greatly exercising the authorities, who, in consequence, contemplate the introduction of drastic measures. They complain that the fire brigade is more or less monopolised in dealing with these outbreaks, and also that the danger to the public safety is increasingly great. The latest fires happened the other evening while a cinematograph performance was in progress. On this occasion it was the electric lighting that was to blame and not the celluloid films. Fortunately, the public got quietly out of the building without any accident happening, and the firemen succeeded in getting the fire under control before any serious damage was done.

CINEMATOGRAF LEGISLATION.—In reference to the cinematograph panic at Stratford on Saturday last, reports of which have appeared throughout the daily press, Mr. Walter Reynolds, L.C.C., writes to the *Times*:—In February last, on my initiative, a deputation addressed the Home Secretary on the dangers of fires at cinematograph exhibitions. Mr. Gladstone then admitted that there was great danger in connection with such exhibitions. Though they had been very fortunate up to the present they could not shut their eyes to the fact that there might be a very serious accident, or even a catastrophe, and it was most desirable that legislative powers should be taken to put these unlicensed places throughout the country under proper authority, and he would consider whether it would be possible to deal with the matter by a short Bill in the current session. He was well aware of the importance of the matter.

Notwithstanding the right hon. gentleman's portentous forebodings which admitted a full knowledge of the risk, his department has been quite content to fall into an unheeding sleep. Even when I nudged the officials last June, by a question put for me in the House, an evasive yawn was the only answer I obtained.

Perhaps the latest cinematograph panic, at Stratford on Saturday last, where a score of people were injured through an unlicensed apparatus in an unlicensed building, will cause a rubbing of the departmental eyes. If not, I will remind the Home Office that about 200 of these unlicensed and unsupervised exhibitions are being given daily in the County of London, and somewhere about 300 in the greater Metropolitan area, besides an enormous number in every portion of the United Kingdom. And it is not an exaggeration to say that a trifling fire which is extinguished by the finger and thumb of some wide-awake operator, occurs somewhere in the country on every day in the year, and that every one of these insignificant fires has the possibilities of a Newmarket, a Barnsley, or a Boyersville disaster in it. Then it is evident the public must be protected against these Providence-tempting displays, and these dangerous shows must be compelled to adopt safety regulations.

At present no law exists under which they can be controlled. But a short Act of Parliament was practically promised to the Council's deputation in February last, and a Bill to maintain order at public meetings was passed in ten minutes the other day. Then why during two whole sessions has not the Government spent at least as many minutes over a Bill to save human life? No Bill has been passed, and, therefore, if the serious accident

should happen which the Home Secretary foreshadowed in February last, the London County Council will not have been to blame, for the Council is, and has long been, anxiously waiting for the power to do its obvious duty, but without this legislative power the Council continues to be helpless, and should Mr. Gladstone's catastrophe occur, on the Home Office must rest the entire responsibility.

Correspondence.

WHY NOT TAX PHOTOGRAPHERS?

To the Editors.

Gentlemen,—Now that Christmas has passed the professional photographer has time to look round him and begin to think, therefore now is the time to approach him to make him think, and if this letter, inserted in the columns of the good old "B.J.," succeeds in doing so, my time will not be spent in vain.

The Chancellor of the Exchequer (in common with all Chancellors of Exchequer in this year of universal trade depression) is faced with a big deficit on the yearly Budget. Now I am quite aware that no politics should enter into a trade journal, hence I am not writing in defence or otherwise of the policy of His Majesty's Government. My point is this: Mr. Lloyd George must find money somehow, and why not raise a portion, say, £250,000, by a permanent yearly tax on all photographers, in the same way that a tax is imposed on game-keepers, chauffeurs, and others—viz., a licence to use their tools—that is, in this case a licence to use a camera?

There is little doubt that many people have entered the ranks of the profession who would never have done so had a licence of this description been necessary before they attempted to master a scientific process. Hence we have—through the admission of anyone and anybody who chooses to enter it—price-cutting, overcrowding, and ruination of what was once a very remunerative profession, and the more people who enter the worse the conditions become.

Now a licence would undoubtedly deter many from starting photography, and consequently entering the professional ranks, so that a chance to improve the situation, or at least to sink no further, would present itself; whereas if the present "race to ruin" continues, heaven only knows who will survive.

The professional photographer would surely offer no objection to paying 10s. or £1 per year for such a benefit. The real amateur—who only practises photography for a hobby and as a pure luxury—could not reasonably grumble, as he would only be doing what the sportsman and motorist already have to do.

No! The people who would "kick" are the plate and paper makers and the chemists. Why? Could not the profession, if they had a fair chance, use enough plates to keep the best factories going? The inferior brands would, in any case, drop out as a natural consequence of competition sooner or later, and need not be succeeded by others as at present. Moreover, would the slow extinction of the semi-amateur cause so much trouble to the manufacturer? How many gunmakers have been ruined by the tax on firearms? Few, if any; and photo-artists are going bankrupt at the rate of two and three a week (*vide* your Commercial and Legal column). How many makers of dog foods and biscuits have been ruined by the dog tax? I have never heard of any.

Then, as to the chemist. Surely he will be able to exist without the 25 per cent. profit on photo materials. Let him keep to his original calling, which he practised before he commenced to manufacture the amateur at the expense of the professional. He has a living without photography. The professional photographer generally can only work at his own job.

Let the camera maker also join in the outcry I would say, "Are you not better employed in making a few good instruments than in turning out hundreds of cheap sets as at present?" Still, someone objects that such a proposal will mean throwing people out of

work. I would ask how many photographers will be thrown out of work if the present system continues? A glance at the advertisement columns of the "B.J." will suffice to prove that the labour supply exceeds the demand in a manifold and ever increasing volume.

Then, again, somebody says the public will suffer. Will they? At present, I presume, competition will be a guarantee that they get the best for their money, and as the "semi-pro-amateur" drops out they will, at least, get decent artistic work. The professional will have to work to keep his place among his fellows, tax or no tax. There need be no danger of exploiting the public.

My object in writing you thus is to get photographers themselves to take the matter up. I am only a country professional, but I can see that present-day methods are those of trade protection. (See the amalgamation of some of our great railways recently.) If the professional is to survive he must do something, and do it now. A petition to Mr. Lloyd George at the present time would be a very opportune proceeding. If the majority of photographers are in favour why not carry it out? I leave the matter here for the rank and file and leaders, employers and employees of the profession to thrash out the pros and cons of the case.—Yours faithfully,

December 28, 1908.

PRO TAX.

[Our opinion of our correspondent's suggestion is that, if carried out, it would not perceptibly affect the serious "amateur-pro." competition. Persons of this latter class could afford to pay for such a licence, just as well as the legitimate photographer—in many cases, better.—Eds. "B.J."]

PROFESSIONAL PHOTOGRAPHY IN BRITISH COLUMBIA.

To the Editors.

Gentlemen,—Pray accept my thanks for publishing the letter I wrote you, re Professional Photography in British Columbia, in your esteemed journal.

I venture, however, to take exception to the comments which you published at the foot thereof.

In no part of my letter did I state that your contributor, "B.J-ite," said it was not possible to get high-class apparatus out here, for the very simple reason that, as you yourself point out, B.J-ite's remarks point in quite the opposite direction.

What I did state, however, was that "your editorial comment which prefaces this article might (I did not say would) lead some of your readers to suppose that it is not possible to obtain high-class photographic materials in this Province."

My sole object in writing you was to remove any misapprehensions as to the condition of the photographic market in this Province, a condition of affairs, which I am intimately acquainted with.

Taking, as I do, an active part in the photographic interests in this Province, and also being personally acquainted with the heads of the leading photographic stores in Seattle, U.S.A., and having attended at and delivered an address before the Convention of the Photographers' Associations of the Pacific North West, which was held last year in that city, I venture to think that I know what I am talking about, and while I have no objection whatsoever to you calling me "an armchair critic," I put it to you that your editorial remarks were not fair comment.—Yours faithfully,

ARTHUR V. KENAH.

Law Chambers, Bastion Street, Victoria, B.C.

[Our correspondent in his letter did definitely say that the writer of the article was under no necessity to make use of "makeshift" apparatus, and, therefore, our comment, we consider, was called for. The writer of the article is a professional photographer; our correspondent describes himself on his note heading as "chartered accountant and auditor."—Eds. "B.J."]

CARBON PRINTING ON IVORY BY SINGLE TRANSFER.

To the Editors.

Gentlemen,—It is by no means a matter of course that "it makes no difference whether the tissue is allowed to dry spontaneously" before laying it down for development, or is not allowed to dry at all, but has had the greater part of the water extracted by alcohol. The hardening effect of drying upon the exposed gelatine may conceivably account for want of adhesion, if that method has been attempted. At all events with the alcohol extraction process the adhesion has been found perfect.

I venture to ask again if there is any previous record of the use of the alcohol extraction process, or even of the washing, drying, and rewetting process, and, if so, where it is to be found.—Yours obediently,

W. E. DEBENHAM.

[The example sent us by Mr. Debenham (December 11) conclusively proves that the pigmented film was but slightly adherent to the ivory, as it could easily be peeled off. Thus our remarks in introducing our correspondent's article on page 911 were not unwarranted. Photographers when they charge many guineas for a coloured miniature naturally want the picture to be as permanent under all condition as it is possible to make it. In the last part of Mr. Debenham's first communication, he says, "It is, of course, quite possible that others may have worked out a similar process." Now, however, he seems to doubt that. So far as we know the partial abstraction of the water by spirit had not been published.—Eds. "B.J."]

METHODS OF PRESS PHOTOGRAPHY.

To the Editors.

Gentlemen,—The following paragraph appeared in a large number of London and Provincial papers on December 26:—

PHOTOGRAPHER VEXES THE KING.

"The King exhibited some displeasure yesterday after the service in the church at Sandringham. A photographer gained access to the churchyard, and took up a position opposite the Royal exit from the church. As the King came through the porch he noticed the man with the camera, and putting up his hand his Majesty said, 'Stop, stop. I do not approve of that!' Inspector Spencer, of the King's Special Police, came up, and the photographer, looking very much abashed, was removed."

I am sure all Press photographers, whether staff, agency, or freelance, will read the above with regret. Our King can truly be called the Press photographer's friend as times without number he has invited the photographers present at a public ceremony to come nearer to obtain their pictures. Many times I have photographed the King, and, as we all know, where the King is, there is Inspector Spencer also, and on every occasion I have been treated with the greatest courtesy.

During the last few months the King has visited Chester, Leeds, and Doncaster, and on each occasion I have seen Inspector Spencer, and, along with a number of London Press photographers, have been granted good positions *inside* the barriers. Now we all know if this kind of work continues our places will be *outside* the barrier with the crowd.

I have seen instructions issued to the police at certain places stating that on no account must any permits be granted to photographers, owing to previous annoyance to which persons have been subjected.

Not only in connection with the King, but other events, for instance, previous to this year, Press photographers on presenting their card have been granted free admission to the Waterloo Cup Meeting, but this year we were asked to pay 2s. 6d. each day, total 7s. 6d., simply because a number of photographers had obtained admission the year before under false pretences. As many as five photographers came and presented cards bearing the name of a well-known morning illustrated. Only one of them was a staff man, the other had probably one print a month used. Three persons had obtained permission on saying they represented the "Daily Dispatch," and when I presented my card I was asked if all the staff was coming.

At the Welsh Eisteddfod, held at Llangollen in September, a photographer obtained admission there on a false card, and when the genuine representative came, he and I, also, had the greatest difficulty in getting admission without paying. We must always keep in mind that free passes are granted as a privilege, and, therefore, as Press photographers, we should do our utmost to see they are not abused. There is a saying that the best way to bring a man to his senses is to touch his pocket, and if these permits are refused to us on account of abuse, and we are called upon to pay 30s. admission to a racecourse, then we shall be brought to our senses, but it will be too late.

A "scoop" is all very well, but we have the future to consider, and, taking into consideration that the illustrated Press is only

a child as yet, but is growing every day, it behoves us to act in such a way as to cause the least annoyance to those with whom our business compels us to come in contact.

I apologise for taking up so much space, but I feel sure this is a matter which needs the serious consideration of every photographer, or we may get the bad name, and also the same treatment more than one has got across the Herring Pond.—Yours faithfully,
FRANCIS FIELDING.

"Daily Dispatch," Manchester.

[We thoroughly endorse our correspondent's protest.—EDS. "B.J."]

PHOTOGRAPHIC VIEWS.

To the Editors.

Gentlemen,—I observe in your "Answers to Correspondents" column in the current number of the "B.J.," a query with regard to colonial photographs. May I draw your attention to the fact that quite recently I thought over almost the whole stock of Messrs. Wilson's valuable series of negatives of Britain and the Colonies. I purpose publishing these in the various forms now on the market, viz.: Platinotype prints, silver prints, bromide, collotype, and coloured, post cards etc. etc. I have pleasure in herewith enclosing copies of Messrs. Wilson's various catalogues. Any of the views contained therein may be ordered from, in any form or process. I hope to be able to send you a new catalogue later on. You may observe I send you separate catalogues of views of Australia and South Africa.—Yours, etc.,
F. W. HARDIE.

416, Union Street, Aberdeen.

Several letters on the question of agreements between photographers and branch managers which reach us as we go to press must stand over until next week.

Answers to Correspondents.

* All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY, 24, Wellington Street, Strand, London, W.C." Inattention to this ensures delay.

* Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.

* Communications relating to Advertisements and general business affairs should be addressed to MESSRS. HENRY GREENWOOD & Co., 24, Wellington Street, Strand, London, W.C.

* For the convenience of Readers, our Publishers, MESSRS. HENRY GREENWOOD & COMPANY, of 24, Wellington Street Strand, W.C., undertake the registration of copyright photographs at a charge of 1s. 7d. each photograph, to cover cost of registration fee, form, etc. Two unmounted copies of each photograph must be sent with the fee.

PHOTOGRAPH REGISTERED:—

W. Shawcross, 108, High Street, Guildford, Surrey. Photograph of Councillor W J Lymoss.

A. W. SWEETINGHAM (Shanghai).—We are very much obliged to you for your corrections, which we see are quite needed. We are asking our publishers to see what they can do for you. We should think the issue can be rolled, and hope then it will reach you in a better condition for binding.

SULPHIDE (Shanghai).—We think there is little doubt that your failure to get a vigorous tone and proper colour is due to the use of sulphide which is stale or decomposed. Sulphide does not keep well in solution and the liquid state into which your supply of the solid sulphide had come is strong evidence that the sulphide was not fit for its purpose. We should advise you—if you cannot get fresh supplies of sulphide easily—to use the thiomolybdate substitute made by Edmund and Co.

B. DOS SANTOS LEITAO.—(1) Arc light could be used—Jandus, Jupiter, Regina, or Westminster arcs, but the ratios would require to be different. (2) A transparency of sufficient contrast—not too soft. (3) We cannot say. It is not put forward as specially

corrected. The "Cooke" is very largely used by three-colour photo-engravers. (4) No doubt the principle is good, except as regards bulk; but the instruments on the market have a limited range of movement as regards focal extension and rise of front, as compared with the best reflex of the ordinary type. Better write Messrs. Ross, Ltd.

B. C. H. (Mediterranean Fleet).—(1) The prints are really creditable work, and above the quality of much work done in a business way for the lower middle classes in this country. (2) We would advise very cautious moving, because it is just the middle-class work—the cabinet print—which has most severely suffered in competition with midget and postcards. You should be largely guided, we think, by the possibility of going into business where you could command local support and patronage from those you have already come in contact with. (3) Very good portraiture; head, and head and shoulders is regularly done with one arc, and even small groups, but for these latter more than one lamp is usually necessary. (4) With practice, it certainly is. (5) We believe you could use the phrase you speak of, but you could not use the Royal Arms. (6) As we have said, we advise you very seriously to consider whether you would be in as good a position as you are now when you have to pay rent, rates, and labour. We will be glad to help you further.

ENSYNA.—Would you kindly say who are the makers of the "Ensyna" printing paper (photographic)? I got a circular, with prices and particulars of working, but no address on it except H., Ltd., London.—AXME.

Houghtons Ltd., 88-89, High Holborn, London, W.C.

A. F. (Southampton).—The advertisement did not appear in our columns, but you may find what you want on page 973 of our issue of December 25.

DELTA.—The ferrous oxalate developer will give a very fine black tone, of greater purity than the organic developers. The more rapid the plate the blacker the tone, as a rule, and we have found the "Wratten" T.T. (Tropical Transparency) plate give a very fine black tone with developers such as Rodinal. We have not found colour of the latter to affect development, but we should naturally prefer to use a fresh clean solution for lantern work. Rodinal is not now made in solid form.

SULPHIDE TONING.—(1) Will you please tell me in your next issue why it is, in sulphide toning of bromides, that, after bleaching in the ferricyanide bath, the sulphide solution fails to bring back the picture? The formula I am using is taken from the "Almanac," page 809. (2) How far should the bleaching be carried? (3) Should the prints be over-developed? (4) Should any particular developer be used? I use metol and hydroquinone. (5) Can you recommend a good bath to give a rich warm tone? I do not like a brick-red, such as uranium gives.—QUERIST.

(1) The most common cause is stale (decomposed) sulphide solution. (2) The prints are bleached until they have a pale buff-coloured appearance. (3) Very slightly. If the thiomolybdate darkening solution be used a perfectly normal print is the best, as this bath, if anything, pulls up the brilliancy a little. (4) Metol-hydroquinone is quite satisfactory. (5) If you cannot get what you want with sulphide—you should be able to do so—the next best is the Ferguson copper process. See the "Almanac."

EXHIBITIONS.—I wish to exhibit at one or two coming photographic exhibitions some ceramic photo-enamels—I mean the more important exhibitions, where a medal or prize, if obtained, would be worth having. I am a "professional." Could you give a hint of suitable exhibitions and how to proceed?—S. C. W.

See the list of "Forthcoming Exhibitions" which appears regularly in our columns, or perhaps you could better take those which we review. See "Exhibitions" in the index published last week.

LENS FOR COPYING.—(1) I have to copy a number of paper prints (quarter-plate size), and want to make enlarged negatives (whole-plate size) on my camera; it has an extension of 22in. Will you tell me the correct focal length of lens to get? If 6in. focal length would not be too long, that would be a very useful size for photographing interiors whole-plate size.—A. R. GRAY.

(1) As you will see from the table on p. 939 of the "Almanac," a two-fold linear enlargement (which is that in your case), at a

camera extension of 21in., means a lens of 7in. focal length. A 6in. lens would require 18in. from lens to plate, 9in. from lens to print. (2) A good R.R. lens, working at $f/8$, would answer quite well, but, of course, would not cover a 1/1 plate when used at its normal extension. For this you would require a wide-angle anastigmat, costing, say, twice the price, and working only at $f/16$, which would be inconveniently slow for copying direct. We should advise you either not to combine the two in one, or else purchase a first-grade 6in. anastigmat, which, with $f/22$ or thereabouts, would cover a whole-plate.

LANTERN.—The only suggestion we can make is that the supply of the gases is not quite rightly adjusted to each other. Possibly that of the oxygen is too great. The difficulty may be got over by a little tentative manipulation of the taps. If the dissolver is out of order, you had better send it for repair to a firm such as R. R. Beard, 10, Trafalgar Road, Old Kent Road, S.E., or Newton and Co., 3, Fleet Street, E.C.

DEAD-BLACK BACKGROUND.—Could you give me any information as to how "dead-black" backgrounds are obtained? I have often seen reproductions of portraits and flowers where the background is jet-black and the image stands out clear. If you could give any information or tell me where I could get it I would be very grateful.—L. L. A.

A dead-black ground, even when specially prepared, as described in our issue of October 9, 1908, is usually not sufficient. What is necessary and is commonly used for both portraiture and smaller work is a black space behind the subject, formed by walls, floor, and ceiling all of dead-black. In some cases, perhaps, it may be practicable to block out all round the subject on a positive transparency made from the negative, and from this transparency preparing a new negative, having perfectly clear glass round the subject.

PARENT.—Write to one or two firms, such as Mr. S. H. Fry or Raines and Co., asking whether they would do what you want. We doubt it; but if necessary write us again.

LENS QUERY.—Would you be kind enough to tell me, through your valuable paper, the "B.J.," what the market value of this lens is—Cooke quick-acting portrait lens, No. 99,749? I may say I have just purchased same for 15s.—G. ALLEN.

We do not lay ourselves out to appraise the market value of lenses. If we did, it would be impossible to do so without seeing them or even knowing their size.

VALUE OF LENS.—I should be glad if you will inform me, through the "Correspondence" columns of the "Journal," what is about the probable value of a 10 x 8 Grubb studio lens, C. 2, Waterhouse stops in front of lens, and not as usually between the combinations.—G. E. B.

See reply to "G. Allen" Your best way will be to try the lens yourself and see what it is worth to you. It is evidently a very old make, by the position of the stops; but all Grubb's lens were good for the time they were made.

A TWENTY YEARS' PRINTER.—If you were a weekly servant, receiving your wage weekly, you were entitled to a clear week's notice. After receiving the notice, if you were dismissed before the week had expired you were entitled to the full week's pay. With regard to the deduction, that was illegal, unless there was an agreement that such deductions would be made.

PAVILLION.—Yes, that is so, it will certainly upset registration unless the filter plate is perfectly regular.

W. R., and others.—In our next.

LANTERN-PLATES, ETC.—1. Can printing-out lantern-plates as described in "Photography in a Nutshell," page 136, be procured now? If not, can ordinary plates be treated with any preparation to print out (contact) visibly? 2. Where can the special printing frames described be got? 3. Is there any development paper which will develop without the use of a restrainer to keep the whites clear (negative bromide paper)?—A. A.

1. The Paget Prize Plate Co. manufactured such plates some years ago, but we are not sure that they still do so. 2. Registering frames are obtainable. Messrs. Houghtons issue one—the Cherill—which doubtless could be used for plates. 3. All "gas-

light" papers require bromide in the developer, and most bromide papers are the better for it—but perhaps we do not properly understand your query. Certainly, a negative paper such as the Rotary Co.'s might be developed without bromide in the developer, but we should usually prefer to use a little.

LENS NOT WORKING TO FOCUS.—I have had given me an old portrait lens, about 4 in. in diameter and 18 in. equiv. focus. It has not, I think, been corrected, and is non-achromatic. Picture sharply focussed on ground glass, in negative are fuzzy. By placing a blue glass in front of lens while focussing I get a good sharp negative with fine perspective and in every way excellent, only for a lack of detail in shadows. I shall thank you for information by which I can have this righted, and also some means of dispensing with blue glass, the dim image making it very difficult to focus.—J. COOK.

It is clear that the lens has a chemical focus. The best thing to do is to ascertain the difference between that and the visual focus, and make the necessary alteration after focussing the subject, as was done with all the early lenses of Voigtländer. To do that, place a number of cards (six or eight) with bold print on them in a row three inches or so one behind the other. Then focus the centre one sharply and mark the sliding tube of the mount, and take a negative. Then, note which card is the sharpest in that. Next, focus on that, and again mark the tube. The distance between the two marks show the distance the lens has to be racked in or out (probably the latter) after focussing to obtain a sharp negative.

R. L. S. ON PORTRAIT PHOTOGRAPHY.—In a letter to Trevor-Haddon, the painter, under date of July 5, 1883, Robert Louis Stevenson wrote: "I have no photograph just now; but when I get one you shall have a copy. It will not be like me; sometimes I turn out a capital fresh bank clerk; once I came out the image of Ranjeet Singh; again the treacherous sun has fixed me in the character of a travelling evangelist. It's quite a lottery; but whatever the next venture proves to be—soldier, sailor, tinker, tailor—you shall have a proof. Reciprocate. The truth is, I have no appearance; a certain air of disreputability is the one constant character that my face presents; the rest changes like water. But still I am lean, and still disreputable."

AN ELECTION PORTRAIT.—Set a photographer to catch a thief must be the new rendering of the old adage, writes the "Pall Mall Gazette." The subject of a flashlight picture is often a little nervous at his first experience, but seldom with such good cause as the Pittsburg town councillor who made an involuntary record upon the camera the other day. He was keeping an appointment with a contractor in order to receive payment of certain "boodle," and just as he was counting over hundred-dollar notes in order to see that honour had been kept among thieves, there was a flare and a puff of smoke, and the unhappy servant of the public knew that he was betrayed. The photograph, we are told, "came out well," and is now going the round of prosecuting officials. The councillor is said to be a candidate at the forthcoming elections, but it is improbable that this particular likeness will be chosen for circulation by his ward committee.

**** NOTICE TO ADVERTISERS.**—Blocks and copy are received subject to the approval of the Publishers, and advertisements are inserted absolutely without condition, expressed or implied, as to what appears in the text portion of the paper.

SUMMARY.

An exhibition of "Scenes and Figures of the Coast near Messina" opens to-day at the house of the "B.J." The photographs are by Count W. von Gloeden, and can be seen daily from 10.30 to 4.30, Saturdays 10.30 to 12.30.

The Northern Photographic Exhibition, which opened at the Manchester City Art Gallery on Wednesday last, January 6, is fully reported on p. 24. Much well-known work is shown there, but much that is new and highly creditable.

In the report of the Scottish Salon, which opened on New Year's Day, we deal more particularly with the work shown there by professionals. (P. 26.)

A process of making P.O.P. for the production of contrasty prints, a device for focussing enlargements when near to the easel, and a design for a portable tripod appear among "Patents of the Week." (P. 27.)

In some editorial notes on the question of assistants or branch managers' agreements we quote the text of an agreement containing several overbearing stipulations. (P. 18.)

"The Marking of Packets of Plates and Papers" and "Agreements with Managers of Branch Studios" figure under "Correspondence." (P. 34.)

The report of a demonstration of X-ray work by Dr. C. E. K. Mees and Mr. W. H. Smith at the Croydon Camera Club appears on p. 20.

EX CATHEDRA.

From Messina to Wellington Street.

We have to announce that there is now open in the "little gallery" at the house of the "B.J." an exhibition of photographs which we have brought together under the title of "Scenes and Figures of the Coast near Messina." They represent the work of Count von Gloeden, who for years past, at his home at Taormina, has used his camera in portraying the picturesque Sicilian coast-line and the no less picturesque people, so many of whom have been suddenly overtaken by destruction. Taormina, as about the nearest place to Messina which has escaped the earthquake, has suddenly become a familiar name, yet no verbal picture can describe the beauty of its natural situation, the vistas of declivitous landscapes spied through openings in the pergolas of gardens standing on the hills. Count von Gloeden, too, has shown a poetic imagination by including in many of these pictures the nude figures of graceful Sicilian boys, who give to the scenes an idealism which causes the newspaper reports of the ruin of the neighbouring Messina to strike even a more tragic note of realism.

* * *

The Marking of Packets of Plates and Papers.

The letter by Mr. R. Ballantine on another page refers to a matter of which we have frequently heard dealers speak in complaining tones. The brands of photo-materials, papers in particular, have so multiplied of late that a dealer is taxed to no little degree to devise means of quickly producing what a customer wants. In cases of which ocular instances have been given us, the marking of the precise description of a bromide paper or P.O.P. has been none too legible, and in some cases was not easy to decipher in the subdued light prevailing behind many a dealer's counter. And when in addition to these tasks the dealer has to make certain of the price of a particular size of a particular variety of a particular brand of paper, it is not to be wondered that he feels he could appreciate the action of a manufacturer who might save him more than one half the labour of handling goods over the counter. We believe our correspondent's suggestion is one which the retail trade will thoroughly endorse.

* * *

Controlling Development with Pyro Soda.

The paper in our last issue by Messrs. Lumière and Seyewetz, on a method of development with pyrogallie acid when dealing with under and over exposure, more or less revives the old question of control in development which has been quiescent of late. The writers claim that by their method it is possible to obtain from plates that have been eight to ten times over-exposed almost as good contrast as from correctly exposed plates. For pyro-

ammonia this would be a modest claim, for, with certain methods of working with that developer, it is easy to get good results from a thirty times over-exposure. Pyro-soda is, however, the developer that Messrs. Lumière and Seyewetz use, and with this it is not quite so easy to obtain control. The correction of a ten times over-exposure, therefore, means a good deal. It will be noted that the developer contains no special ingredients, if we except the soda bisulphite solution, which up to the present is not much used in this country. The method, too, is on familiar principles, as it involves commencing with a developer weak in alkali, and then adding more alkali or more pyro as circumstances indicate. A new feature is the fact that extra bromide is not added to combat over-exposure. Probably its purpose is fulfilled by the bisulphite. Very little is said with regard to the effects of the method with under-exposure, and the procedure does not look very promising for such conditions. Yet it is certainly worth trial for over-exposure, even though there may be some theorists who say that the latter cannot be in any way corrected by modifying the process of development.

* * *

Unusual Spots on Plates.

Under this title there is a timely note in the current issue of the Ilford Company's "Photographic Scraps" as to the defects which may arise from unsuspected causes when the conditions of working depart from the normal. Round dark spots which made their appearance on the first three only of five plates developed in succession, were traced to the separation from plate solution of the developing agents proper (metol and hydroquinone) on a drop in temperature. Particles of the developers were thus deposited on the film, producing additional density, and it was only when several plates had been developed that the rocking of the dish had caused their re-solution and the return of the developer to normal conditions. As pointed out by the contributor of this note, the first impulse in such cases is to lay the blame at the door of the manufacturer, whereas a little thought will discover the fact that the abnormality is in the worker's procedure.

* * *

How Not To Run An Exhibition.

Some time ago we announced in these columns the intention of the German manufacturers of cinematograph apparatus and films to close the year with an exhibition which would at once awaken public interest in the trade and its educative possibilities, and also serve as a practical proof of the recent progress that has been made. At the time we were not altogether sanguine if public interest in the trade was sufficiently great to warrant a successful exhibition, even in exhibition-loving Germany. The result proves that our scepticism was not without good foundation. Though the energetic committee responsible for the venture has left no stone unturned, and has even gone so far as to send out, according to one report, something like six million free tickets, the exhibition is little short of a fiasco, and well deserves the contempt hurled at it by the daily press. A walk through the hall impresses the visitor with the feeling that it is much more an exhibition of odd lots gathered together by furniture dealers and such like, with a photographic stall dropped accidentally here and there to save the situation. Except that in the opinion of the promoters the word cinematograph attached to it exercised a certain attraction, the collection might equally as well have been called a general market. As one of the newspapers justly points out, it is difficult to imagine what typewriters, pianos, fountain pens, gas-cookers, boot polish, diabolos, fortune-telling contrivances, furniture, and such like can have to do with cinemato-

graphy. So far the public has been shy of accepting the generous invitation of the promoters, and the yawning stall-holders are still waiting patiently for the promised rush. But that is not the worst calamity which has befallen the enterprise. In the numerous advertisements which appear a special feature is made of an exhibition of moving pictures on a large scale. For this a special charge is made, and on the opening night a number of visitors paid the entrance fee. After sitting staring for nearly an hour at the white screen before them, on which no pictures were projected, they became somewhat impatient for the performance to begin. In answer to their clamours they were informed that the authorities had not yet given their permission to hold the performance, but that the all-important document was expected every minute. However, though the minutes flew the document never came, and there was a scene in which many uncomplimentary things were said about the exhibition. There was a general rush for the cash office, and people clamoured to have their money refunded, vowing vengeance on the directors, who were compelled to give back all the money they had received. Up to the time of writing permission to hold the performance has not been granted.

PHOTOGRAPHERS AND ASSISTANTS' AGREEMENTS.

THAT the question of branch managerships is of considerable importance, alike to employers and employees, is evident from the letters addressed to us since the appearance of the notes in our issue of December 26th. There is little question, when an operator and manager has been for a few years in the management of a branch establishment and has become familiar with the customers, and they with him, he is an important factor in the business. In fact, he quickly assumes more importance in the eyes of the clientele than the proprietor of the business himself. In the event of his leaving the establishment and opening one of his own, or entering the service of another photographer in the immediate neighbourhood, there is a great probability—supposing that he is well liked by the sitters—that many of them will follow him, and in this way the original business will be materially injured, inasmuch as his connection with it has been—no discredit to him—more or less personal.

In view of such contingencies, it is customary for photographers, when engaging their representative, to have an agreement to the effect that in the event of his leaving he shall not open a rival studio or be connected with one within a certain radius for a given period. There is nothing at all unreasonable in this practice. The man is paid for his services, and he knows the terms of the agreement upon which he is engaged. If at some future time he finds the conditions of the contract irksome, he has no reasonable ground of complaint. We are here assuming that the terms of the contract are reasonable alike to the employee and the employer. In many cases, however, that have come under our notice they have been just the reverse, so far as the employee is concerned—the conditions being all one-sided and entirely to the advantage of the employer; indeed, so much so as to defeat, we believe, the object in view.

It is a maxim of law that he who would have equity must himself give equity, but the rule is not observed in many photographers' agreements. The result is that if these latter were contested in a court of law, they would prove void and non-binding. Hence the employee is free to do whatever best suits his interests.

Of the letters we have received we may refer particularly to one from a correspondent, who has sent us a copy of an

agreement which he is expected to sign if he takes the appointment offered. We have read many unreasonable agreements, but this one quite outdoes them all. Its proposed terms are so incredible as to be little short of ludicrous, and, as it may be amusing to our readers, we give it here in extenso, only suppressing such details as might identify it:—

AN AGREEMENT made the — day of — one thousand nine hundred and eight BETWEEN — of — and elsewhere proprietor of the — Photography Studio and etc. hereinafter called the Employer of the one part and Mr. — hereinafter called the Employee of the other part

WHEREAS the Employer has at the request of the Employee agreed to employ and retain the Employee in his service as a photographer (general) in connection with his system of Photography as the Employer shall from time to time be engaged in upon the terms conditions restrictions and engagements hereinafter contained

The Employer doth hereby agree to keep and retain in his services the Employee and the Employee doth hereby agree to enter into such services and to serve the Employer in such a manner and at such places as the Employer may from time to time direct or require for three years unless determined by two months previous written notice to be given by the Employer to the Employee at any time of his intentions of determining this contract of service or on payment in lieu of notice. The Employee shall be liable to instant dismissal if he proves to be incompetent disobeys or wilfully breaks any of the conditions hereof or any standard rule of the Employer. The Employee shall receive as wages the sum or sums stated at the foot hereof and agrees to be paid in accordance with the Employer's general rule as generally adopted in his establishments (i.e.) (as at present) be paid on Wednesdays leaving so many days in hand as guarantee (as the occasion demands)

IN CONSIDERATION whereof the Employee doth hereby declare that he shall and will well and faithfully serve the Employer in the said business and will not during the continuation of such service nor after quitting such service in any way set up or exercise or be concerned either directly or indirectly as servant or master for his own benefit or that of any other person or persons whatsoever in any Photographic business the same as the business or businesses carried on by the Employer or set up no business in which postcards would make a specialty or to open any business of photography whatsoever in any town where he was heretofore employed by the Employer or in any town where the Employer is carrying on business whether in his own name or in connection with any other firm or firms company or companies especially will not at any time whatsoever divulge the business of the Employer or his patent or patents or the chemicals used in connection therewith or any of the apparatus or secrets of his business or system to any person or persons whatsoever not duly authorised by the Employer also that the Employee will not under any circumstances whatsoever permit any not duly authorised by the Employer to enter any dark room used in connection with the Employer's business and over which the Employee shall have sole (whole) and partial charge for the time being and that the doors of rooms shall always be kept locked (except when in actual use) (going in and out by the Employer or such person or persons so duly authorised by the Employer as aforesaid) Also that the key of the dark room shall not be allowed to go out of the possession of the Employee or be handed to any person or persons whatsoever not duly authorised by the Employer to have the possession of such key it being the intention that no person or persons (whatsoever) whatsoever except the Employer or those duly authorised by him shall be allowed to enter or see into any dark room aforesaid such dark room and the contents thereof being strictly private

The Employee will be held responsible and will be liable to pay for any breakages damages or losses sustained by the Employer through the carelessness of the Employee.

If at any time within the period of ten years after quitting such service the Employee doth break any of the conditions in this agreement he shall and will pay unto the Employer the sum of fifty pounds for such and every day that the Employee shall act contrary to this said agreement every such sum or sums of money to be considered and taken as liquidated and ascertained damages to be received by action or actions at law to be brought by the Employer without proving or being required to prove any special or other damages

IN WITNESS whereof the said parties to these present have hereunto set their hand the day and year first above mentioned

It will be noticed that, although the agreement is for three years, the employer is at any time at liberty to discharge the employee by giving him two months' notice. The latter is also liable to instant dismissal if he "breaks any of the conditions hereof or any standard rule of the employer." The employee is bound, according to the agree-

ment, after quitting the employer's service not to set up in business or be connected with businesses in which postcards are made a specialty of, "or open any business of photography whatsoever in any town where he was heretofore employed by the employer or in any town where the employer is carrying on business, whether in his own name or in connection with any other firms or companies," etc. He must, also, not divulge the employer's "patent or patents"—a stipulation which is somewhat amusing, seeing that all patents and their details are published and can be seen by anyone. Furthermore, he is to be held responsible and liable to pay for any breakages, etc. In the event of his breaking any of the conditions in the agreement within ten years after quitting the service, he is to pay to the employer the modest (!) sum of fifty pounds for every such day that the employee acts contrary to the agreement.

This agreement is really amusing reading, seeing that the business is evidently one in cheap portrait postcards. It purports to restrict the employee for ten years after leaving from following his calling in several large towns, whether he was or was not connected with the businesses carried on in them. It may be stated that London is mentioned as one of these towns.

As regards the validity of such an agreement as this—if the candidate for the berth signed it—there is little question in our mind that it would be pronounced null and void, as being an undue restriction of trade and against public policy. In the former article we mentioned that many agreements are so unreasonably drawn as not to be worth the paper upon which they are written, and this seems to be a case in point. It is quite possible that if this agreement were signed by some employees they might be intimidated from departing from it by fear of legal proceedings for the recovery of the fifty pounds a day, and it is possible that it was framed with that end in view.

THE SLACK SEASON.

THE slack months of January and February, by contrast with the preceding rush season, are apt to be somewhat depressing for the profession as a whole.

The amateur also, unless he be particularly enthusiastic, or favoured by the recurrence of the alleged old-fashioned winter, will find but little to do in the photographic field. Our good friends the dealers will, from the above causes, find business at a standstill. Whilst we cannot provide employment for these chief divisions of our readers, we wish to make a few suggestions as to how they can each most profitably fill in this slack time. The first-named should easily occupy his time with useful, if not directly profitable, labour. The negatives of the past year will need to be indexed and packeted for easy access in case of a re-order. Most professionals have their own pet system, so it is unnecessary for us to enter into detail. With regard to the re-orders, however, one will now have leisure to follow up previous orders, a polite letter serving as a reminder. A slight reduction on additional orders frequently induces them. Though scarcely the most suitable time of the year, it is better to do this whilst one has the time than not at all; moreover, one can take advantage of the opportunity to draw attention to specialising in the copying, enlarging, etc., of old photographs, paintings, and documents, which work is a very acceptable addition to the studio. Architectural photography, heirlooms, furniture, or any still life subjects should be mentioned. Any necessary re-decoration or alteration of premises should, if possible, be executed now. Although some undertake these expenses grudgingly, a few pounds spent discriminately in this fashion is often absolutely necessary, if the faith of one's clients and the prestige of the establishment

are to be maintained. Many studios even neglect such necessities as whitewashing dirty ceilings, repairing broken properties, and replacing spoilt or out-of-date backgrounds. It is as well to remember the old adage, "Nothing succeeds like success." Even if the reality of the latter is absent the appearance must be maintained. It is not always necessary to employ decorators to achieve this; a rigorous spring clean, which will include the rearrangement of the best and newest specimens and the destroying of any that are old and deteriorated, is often all that is necessary to improve matters. All schemes for bettering one's financial position, whether by improving the work, advertising, raising prices, or introducing novelties, should be carefully considered. Since the matter depends to such an extent upon local conditions we cannot advise more definitely.

Whilst it must be admitted that the amateur movement has received a check, the mere button-pressing variety receiving but few new adherents, the ranks of the artistic and pictorial amateur have never before been so full. We should be the last to deny the tiresome sameness of the average amateur's efforts, and it is natural that only a short time should be necessary for him to tire of them. Those who have passed this stage, however, and have learnt the delights of picture-making by photography become more enamoured as time goes on, and their knowledge of pictorial principles increases. Moreover, one's knowledge of the good and bad in the other graphic arts

becomes more critical and appreciative. Ordinary matters of everyday life, such as combinations of colours, the arrangement of domestic goods, the decoration of one's home, become developed in a fashion that is both pleasing to our friends and useful to one's self.

Dealers will find it to their interest to point out to the tiring novice the great superiority of pictorial over topographical photography. A specimen or two by a good local picture-maker, or, if that is not available, one of the volumes illustrating modern pictorial work, is frequently sufficient to raise their enthusiasm. In many cases it will be found that the amateur worker is quite unaware that such work can be produced by amateurs and by photography. We have frequently been asked if an ordinary enlargement on bromide paper from a straight negative of an artistically selected subject was a photograph. When it was explained that the only difference between it and the inquirer's own efforts was in the selection of the subject, the surprise at first amounted to unbelief. An introduction to the local photographic society will often serve to keep several customers' interest alive during the winter months, so that they will be prepared to take up their hobby with renewed vigour at the first signs of spring. A great number of amateurs owe, and admit, a very great obligation to their dealers for advice, encouragement, and help during their novitiate stage, and their gratitude usually takes the practical form of continued custom.

X-RAYS, THEORETICAL AND PRACTICAL, AT THE CROYDON CAMERA CLUB.

As previously announced, Dr. C. E. K. Mees and Mr. W. H. Smith gave a "joint and several" lecture on the above subject on the 18th ult., before a large number of local medical men and members. In the following abstract many of Dr. Mees' observations requiring the use of diagrams have been omitted, as has the entire contribution of Mr. Smith, for the same reason. The latter confined himself to a practical consideration of the working of coils and their accessories, in which he was obviously very much at home.

High Potential.

For the benefit of those with but slight knowledge of electrical matters, Dr. Mees first gave a sketch of the laws that govern the generation of the electric current, both primary and induced, and pointed out that electricity through solid conductors produces heat proportional to the square of the current; through liquids chemical dissociation and electrolysis of water. If required to pass through air or gases, the potential must be enormously extended, only currents of high potential being able to overcome the great resistance they offered, and bridge over space by means of a spark. For the production of high-tension currents he used a large enclosed Wimshurst machine under three-atmosphere air pressure, and driven by a motor, this giving a more regular current than a coil. A "Rhumkoff coil" consisted essentially of an iron core, surrounded by thick insulated wire called the "primary," around which many thousand turns of insulated fine wire were coiled, forming the "secondary." An interrupted current from any convenient generator, on passing through the "primary," induced a current of high potential in the "secondary." The mechanism for making and breaking the primary current is termed an "interrupter," or "contact-breaker." The induced current set up at the "make" is feeble; that induced at the "break," provided the break is sudden, is very large. The iron core is not instantly magnetised, or de-magnetised, either on the application, or cutting off of the current; to obtain rapid de-

magnetisation, and a consequent quick break, the interposition of a condenser is necessary. The action of a condenser is not very well understood. It has been suggested that at the "break" the current comes back with a rush in the opposite direction, inducing magnetism in the iron core in an opposite direction also, resulting in a very rapid break in the "secondary." Careful adjustment of condenser in relation to coil, spark-length, and current employed is necessary.

The "Lenard" Discharge.

The high-potential induced current passes readily through gas and air. If the sparks are passed through a sealed glass tube, and the air gradually exhausted, the results grow in interest and beauty as exhaustion proceeds. At moderate exhaustions the tube is filled with a more or less uniform glow, but as this proceeds a more diffused light becomes apparent, and concentrates round one pole in a different manner to the other. At higher vacua fluorescence appears, and the discharge from the cathode becomes of a nature distinctly different from that of the anode. At exhaustions 1-100,000th to 1-1,000,000th atmosphere, the discharge from the cathode becomes more and more important, and is known as the "Lenard discharge." This does not pass from cathode to anode, but takes a different course, travelling at right-angles to the surface of the cathode and striking the glass of the tube. An interposed cross projects a shadow; a metal windmill placed in its path revolves, and a magnet draws the discharge towards it. The accepted idea is that the Lenard-rays are actual particles of negative electricity, projected with great velocity from the cathode. If an aluminium window is placed in the wall of the tube where the projected rays strike, then the rays will pass outside, but only penetrate the air to a very slight extent.

Formation of X-Rays.

Röntgen was experimenting with the Lenard-rays, when he found that dry plates stored in proximity became fogged. Upon thinking the matter out, he came to the conclusion that the

aluminium window hit by the Lenard-rays must form a starting point, or nucleus, for some unknown, invisible rays radiating or scattering in all directions and essentially different from all previously known electric radiations. Further investigations showed that these rays (which he termed the X-rays) pass with ease through various substances, transparent or opaque, and are stopped more or less by other substances. They were observed by means of a fluorescent screen, and their shadow images recorded by photographic plates. With a large source of radiation, the shadows have naturally indistinct outlines, and it was obviously desirable to find some means of getting a smaller radiating surface. This led to the invention of the "focus tube." In a focus tube the cathode is made of a hemispherical shape, the Lenard-rays being thereby brought to a focus inside the tube on to a metal plate forming an anode, and termed the "anti-cathode."

"Hard" and "Soft" Rays.

Röntgen found that the X-rays were not all of one kind, their penetrative power widely varying with different tubes; with some, even a piece of paper was sufficient to largely arrest the rays, whilst other tubes emitted rays that penetrated bones and tissues with ease. The former he called "soft," the latter "hard," tubes now being known as soft tubes or hard tubes. A close connection between this difference and the vacuum in the tube was immediately ascertained, and an ingenious method of estimating the "spark-length" or resistance of the particular tube in use arrived at by the following means: The tube is connected to the two poles of the high-tension electric generator in the usual way, an alternative route from one pole to the other being made along a wire with an adjustable air-gap in its circuit. With a "hard tube" the high potential current will spark across a big gap in preference to bridging the exhausted tube, whilst with a "soft tube" the reverse is the case. The distance apart of the two ends of the air-gap, when sparking across it almost ceases, is the "equivalent spark-length" of the tube being tested.

An X-Ray Spectrum.

Although X-rays cannot be refracted by a prism, or lens, or reflected or deviated by any known means, only stopped, yet something in the nature of a spectrum showing varying degrees of "hardness" throughout its length can be obtained. If a focus-tube is taken with a big anti-cathode, and the Lenard-rays bent by means of a magnet, then they will impinge on a larger surface than would otherwise be the case; every point on such surface impinged on being a source of X-rays, hard rays coming from points hit by the rays suffering least deviation, and travelling with greater velocity. A camera, minus a lens, but fitted with a metal panel in front with a pinhole aperture, is placed facing the emitted stream of rays, the pinhole, so to speak, allowing a spectrum to fall on a photographic plate, or fluorescent screen, when it may be examined. A rough analogy might be drawn between X-rays and an ordinary spectrum of white light. If a blue glass is interposed in the path of the red rays, they will be nearly all stopped, and might be considered as "soft." A larger proportion of green rays will pass through, and can be deemed "harder." The blue rays, being transmitted without appreciable loss, will represent very "hard rays."

Photographic Work.

When working with X-rays, fundamental differences are at once observable as compared with ordinary photographic procedure. For instance, if a pile of bromide papers are placed in the path of the rays, they will to all intents and purposes be uniformly fogged. It follows that a dry plate will be just as much exposed at the back of the film as at the surface; a double-coated plate, having two films of equal speed, will therefore, in X-ray work, possess double the effective speed. X-ray

plates are consequently made extra rich in silver, which has a certain "stopping" power. Another plate contains a metallic salt in addition to the silver, and is opaque to the rays. It also produces secondary scattered radiation, thus attaining the same end without unnecessarily increasing the thickness of coating. At the beginning very long exposures were necessary; at present these have been so much reduced that "instantaneous" exposures are possible. The organs that move in breathing, and the heart, naturally require short exposures to prevent blurring of the shadow image.

Medical Applications.

Notwithstanding the reduction in exposure, the application of X-rays to medical and surgical cases was in many cases of a most difficult and intricate nature, especially in the study of stone in the kidney, enlargement of the heart, and incipient tuberculosis. In the case of indigestion and certain derangements of the intestines, it is possible by means of bismuth sub-nitrate to watch digestion proceeding, or the clogging of any internal passages. The sub-nitrate is very opaque to the rays, and can be compounded with some flour meal without discomfort to the patient. Modern practice employs very intense rays, all the current the particular coil in use will stand being put through, but subject to the breaking down point of the tube, which limits the pressure that can be applied. Tubes with anti-cathodes cooled with water are on the market. On the other hand, the tantalum tubes of Messrs. Siemens can be worked at white heat. An increase of power does not necessarily mean an increase of the primary current, as efficiency largely depends upon the means adopted to break such current. A rapid and very complete break meets the conditions best. For fluorescent screens, the interruptions can hardly be too rapid, though slower speeds may be found more effective for dry plates.

Contact-Breakers and Transformers.

Contact-breakers are various, the oldest form in which the magnetism of the coil core is utilised being now largely abandoned in favour of other types. Adjustable dippers, worked by a small motor; mechanical contact-breakers, such as Dr. Mackenzie Davidson's, employing a propeller blade making contact with mercury; centrifugal mercury-breaks, were examples. Miller's break, together with his highly ingenious apparatus for suppressing the induced current at the make, must also be mentioned. The electrolytic interrupter of Wehnelt gives enormous speed, but from its nature is of high resistance. It consists, broadly speaking, of a sheet of lead mounted to one pole of the generator, and a point tipped with platinum impinging thereon, and connected through the "primary" to the other pole, both being immersed in a conducting liquid. On the passage of the current gas is liberated between point and plate, and breaks contact. Another method largely adopted in America, dispensing with coils, etc., or "influence" machines, and resulting in a large current and high potential, is to use an alternating current from the main. This is first passed through a transformer, to increase the voltage to any required extent, and then through a "rectifier," which only permits the current to pass in one direction. The "Snook" transformer is based on these principles. Using a tantalum anti-cathode, a secondary current of 40 milli-amperes has been obtained, and radiographs of the heart secured in one-tenth of a second. Of course, the greater the penetrative power of the X-rays, the greater the allowable distance from the tube of the subject radiographed, and the sharper the shadows.

The Danger of X-Rays.

With such a powerful source, great care in manipulation appears to be necessary, as the risk of X-ray burns may possibly be increased. Generally speaking, however, other things being equal, the "soft tubes" are more dangerous in this respect.

than the "hard" ones. X-rays from the former are stopped very abruptly by the flesh, and their effect is to a great extent localised in a short distance. On the other hand, rays from a "hard tube," with their greater penetrative power, are not concentrated on a comparatively small area. It is therefore apparent that the "soft tubes" are better adapted to show small differences of tissue. He (the lecturer) felt bound to point out that there are dangers ever attendant on X-ray work, though he did not wish to infer that they could not be completely eliminated by observing suitable precautions. The susceptibility to their action seemed to vary largely with the individual, and it must never be forgotten that their effect was accumulative, and did not become visible for some time. Metallic lead of sufficient thickness is a complete protection. Lead glass is also a protective agent, and might usefully be interposed between the patient and the tube, over all parts except those required to be radiographed. In fact, it might be truly said that the patient now runs practically no danger at all.

Discussion.

Mr. C. W. Raffety, who entered into some highly theoretical and contentious considerations, somewhat outside the scope of the foregoing abstract, said that he was appalled that "hard rays" should be used for skin diseases, such as ringworm, with possible damage to the parts underneath. He also inquired whether it would be possible to obtain anti-cathodes to give *per se* "soft rays."

Dr. H. Critchley said that very great harm had been done by the publicity given by the lay press to dermatitis, or X-ray burns, patients being now afraid of subjecting themselves to their influence. Unfortunately, the pioneers were unaware of the risks they were running; from their sufferings a lesson had been learnt. He agreed with Dr. Mees, that to the patient there was no appreciable danger, or to the careful operator. As had been stated, the action of the rays was accumulative, and accidents to the operator might happen by his not noting

what "had been put down on the list," and in neglecting slight signs of warning. In reference to the point raised by the last speaker, he, speaking from a large experience, did not think that any evil resulted from using "hard tubes" for skin diseases. In practice he had not found it so. In the case of ringworm alone he had treated over 1,500 cases without the slightest injury resulting. X-rays were a most valuable diagnosis, and therapeutic agent of value. He looked forward to the time when electricity and serum would banish drugs altogether. Many diseases were already yielding rapidly to the X-rays; tuberculosis on the surface, for instance, like "snow before the sun."

Mr. H. Lacy said that he had a theory of his own as regards the disasters which had happened to X-ray operators. Time did not permit of his going into it. He might, however, mention that when dealing with "Tesla effects" he had noticed that those who showed the greatest variation, say, between two fingers, and could light up tubes rapidly, were the most susceptible to the action of X-rays. Such susceptibility would vary with the temperature and atmospheric conditions. He earnestly urged all operators never to run any unnecessary risks. Dr. Mees, in reply to Mr. Raffety, said that if other anti-cathodes running down the atomic weight scale were employed, less efficiency would be obtained. He doubted whether the necessity of alteration arose; it was easy to turn a "hard tube" into a "soft" one, by leaving it on one side for some time.

A most cordial vote of thanks was accorded Dr. Mees and Mr. Smith, at the instance of the President, Mr. J. M. Sellors, who incidentally apologised to the visitors for the lateness of the hour. One of the medical men present, speaking on behalf of himself and his colleagues, expressed his and their appreciation of the two most interesting and instructive lectures they had listened to. The President's apology was really unnecessary, for, if occasion had dictated, they would have sat out another two hours with pleasure.

EXPERIMENTS IN COLOUR-SENSITISING CHLORIDE EMULSIONS.

II.

Preparation of the Emulsion.

For the preparation of a gelatino-chloride emulsion the neutral method, excluding a ripening process as far as possible, was selected, on the basis partly of the author's own experience and partly of the data of Eder and Pizzighelli. Adopting an 8 per cent. gelatine solution as customary for photographic emulsions in general, a content of silver equal to 60 grms. silver nitrate pro emulsion, and an ample excess of chloride were employed on the lines of gelatino-bromide emulsion work. The silver nitrate was used in solution in water without previous admixture with gelatine, and after-addition of gelatine solution to the emulsion was omitted, since there was to be no long digestion or ripening with ammonia. A good hard emulsion gelatine (Sud No. 4,790) was placed at disposal by the firm of Stöss and Co., Ziegelhausen, Heidelberg. The following materials were separately added and brought into solution by aid of heat:—

A. Gelatine	36 grms.
Ammonium chloride	20 grms.
Distilled water	250 ccs.
B. Silver nitrate	30 grms.
Distilled water	200 ccs.

Both solutions were warmed up to 50deg. C., and the silver solution gradually added, and with constant stirring to the gelatine solution—by red light. A small sample of emulsion, placed on a glass plate, was pure white in colour by reflected light, whilst it—showing that no ripening had taken place—was orange-colour by transmitted light. The emulsion thus prepared was at once placed in a cold

room (5 to 10 deg. C.) and left for some hours (over night) in order to obtain a thoroughly firm emulsion, and thereby to guard against undesired absorption of water in the after-washing.

The following day the emulsion was pressed through a net of fine mesh, and the nodules of emulsion washed in running tap water of 12 to 14 deg. C. for five hours. The adhering water was finally drained off and squeezed out, and the emulsion put carefully away until the next day.

The plates to be coated with emulsion were cleaned in the usual way with weak soda lye, rinsed with clean water, and given a substratum of chrome-alum and gelatine solution. For this latter purpose the plates were dipped in a solution containing three grms. of gelatine in 1,000 ccs. of water, to which was added 15 ccs. of a 1 : 50 chrome-alum solution. The plates were then set up to dry spontaneously. Plates of 18 x 24 cm. (7 in. x 9 in.) were used, and were afterwards cut to 9 x 12 cm.

At the time of coating, the emulsion was rendered fluid on a water bath, passed through leather by aid of a Braun filter, and kept at 35 deg. C.

Previous experiments had shown that for a coating corresponding to that of a commercial transparency plate 12 ccs. of emulsion per 18 x 24 plate (= 426 sq. cm.) was quite sufficient when given by a coating machine, but not in the case of hard-coating if the whole plate was to be uniformly coated. On this account, despite the good density given by thin coatings of chloride emulsion, the larger quantity of 18 ccs. of emulsion was taken, about corresponding with a rapid gelatino-bromide plate. A difference in the

character of the plate from this cause can scarcely be assumed, since, at any rate for silver bromide, it has been shown* that neither the general nor colour-sensitiveness are appreciably affected by the thickness of the coating, other conditions being normal.

On each warmed glass plate 18 ccs. of emulsion are coated, uniformly distributed with a glass rod, and the coated plates placed on a levelled and cooled plate-glass to set. They were then dried in a current of air at 25 deg. C., becoming dry in four or five hours. They were packed as usual until used.

Examination of the Plates.

Examination of the undeveloped plates showed them to have a uniform white matt translucent film, which rapidly became reddish-violet in daylight. Observed in the microscope it was seen that the film was not homogeneous, but contained two different modifications of silver chloride, plainly visible in the gelatine, and differing in size. This observation led to the preparation of further emulsions under different conditions, in order to secure a separation of the two varieties of halide, but the fine grain and the flocculent forms were nevertheless obtained together in all cases, and a preparation of gelatino-chloride emulsion turned out exactly according to Eder ("Handbuch" III., 727) gave the same results.

The dry plate coated with this emulsion, exposed in the camera and developed with ferrous citrate, gave, with normal exposure and development, an extremely fine silver grain with absolute clearness of the unexposed portions, whilst by continuing development long enough to obtain increased density, that is for about five minutes, a very coarse silver grain was obtained irregularly over the whole plate. But as the fine grain only serves for the production of the image, the coarse grain stands in no kind of relation to it, and showed itself in those portions where no exposure whatever had taken place without any consequences of its coarse structure producing the effect of the usual chemical fog on dry-plates.

The instances of two modifications of silver chloride in emulsion work is by no means unknown, and indeed Stas, in his classical work on the forms of silver chloride, described four different varieties in reference to their solubility, whilst Eder has also noticed that silver chloride is more easily precipitated in a flocculent state than is silver bromide. Apart from this latter fact and from notes on the effect of ripening, nothing more exact as to the photographic behaviour of the different silver chlorides, especially in gelatine, is to be found, and it therefore appeared advisable to investigate the behaviour of these varieties in relation to their reduction.

It is also to be noticed that hand-in-hand with the development of the coarse-grained silver precipitate dichroic fog comes in. It was taken as the first assumption that restraining agents acting upon silver chloride might account for some of the fog. Such restraining agents would be the excess of ammonium chloride in the emulsion, and the sodium chloride in the developer, and therefore an experimental emulsion was made with the ammonium chloride as low as possible, whilst the sodium chloride was omitted altogether. The dichroic fog, however, made its appearance as a third modification on development for a longer time than five minutes. As the time of development is usually limited to three minutes this phenomenon, like that of the coarser silver deposit, did not come into consideration, the emulsion, after being colour-sensitised, giving perfectly good clear negatives by the customary method of working.

As regards the colour of the silver reduced from the pure gelatino-chloride of silver it should be observed that it tended to a warm bright reddish-brown, which darkened considerably on the plates drying. In the course of a number of experiments it was found that the colour was caused by the dye used for sensitising, as already noted by Eder for eosin and cyanin. This was particularly the case with pinacyanol, which gave a pure violet colour. The effect of ripening of the silver chloride had the effect upon the reduced metallic silver only of giving darker or more blackish-brown colours.

Exposure.

Means had next to be taken to obtain a measure of the sensitiveness of the emulsion, and to bring this into correspondence with the brightness of the spectrum obtained in the spectrograph. A series of times of exposure were therefore ascertained, which, in conjunc-

tion with a certain method of development, described below, gave a whole scale of different degrees of density from the smallest schwellenwert to the greatest silver deposit. By altering the width of slit, using either Nernst or mercury-vapour lamps and partly undyed, partly sensitised chloride plates, the following conditions were finally arrived at for comparative exposures of sensitised and unsensitised chloride plates. Nine exposures were given to each plate, the first and the last—these being so chosen merely for convenience in observation—being to the mercury-vapour line spectrum. The intermediate seven exposures were to a band spectrum of the Nernst lamp. In the case of exceptional intensity of the mercury-vapour lines, and when these latter were required as sharp as possible, these two spectra were made with a slit of .06mm. and an exposure of 120 seconds. The exposure for the other portions was made with a slit of .6mm. and for time according to the following table:—

<i>i.t</i> in seconds	Log. <i>i.t.</i>
15	1.18
30	1.48
60	1.78
120	2.08
240	2.38
480	2.68
960	2.98

As the arrangement of the apparatus remained the same for all subsequent exposures the light source could be taken as constant, that is to say, in the product $i.t$, $i=t$, so that the factor t is taken as a measure of the degree of exposure. The separate exposure time were so chosen that their logarithms on being graphically represented occurred at equal distances along the abscissæ of the charts.

Development Formulæ.

The formula of Eder and Pizzigelli was selected. The three solutions are:—

A.—Citric acid	150 gms.
Distilled water	700 ccs.
Ammonia (91)	160 ccs.

The ammonia is added with constant stirring until the solution is neutral or weakly alkaline, and there is then added

Citric acid	100 gms.
-------------	----------

This is dissolved and the whole solution filtered.

B.—Ferrous sulphate	100 gms.
Distilled water	300 ccs.
Sulphuric acid	3 to 4 drops.

C.—Sodium chloride (salt)	10 gms.
Water	300 ccs.

For each 9 x 12 cm. plate the developer was mixed as follows:—A, 45 ccs.; B, 15 ccs.; C, 3 ccs.

These solutions were used at a temperature of 18 deg. C, the plates being developed in total darkness for exactly 180 seconds by means of a stop watch, no coarse grain deposit or dichroic fog being produced within this time. The plates were then rinsed under the tap, fixed in 10 per cent. hypo and washed in running water.

F. WENTZEL.

(To be continued.)

CINEMATOGRAPH IN MEXICO.—A Consular report says that little difficulty is found in Tampico (Mexico) in renting rooms and halls for cinematograph and other motion picture machines. Two motion picture shows are now being operated in Tampico, and while patronised to some extent, cannot be said to return more than a fair profit. The report points out that great care should be taken before engaging in this new enterprise.

THE DRESDEN EXHIBITION.—Messrs. J. H. Dallmeyer, Limited, write:—"In the current number of THE BRITISH JOURNAL OF PHOTOGRAPHY we notice a communication from Mr. A. H. Blake, M.A., with regard to the forthcoming Dresden Exhibition. Mr. Blake there mentions that only five trade entries have been received for the whole of England. As our case is probably similar to that of many other firms, we should like to point out that our German branch, whose headquarters are Lindenstrasse 34, Berlin, S.W. 68, have taken charge of our exhibit. We believe that they will have an important stall in a prominent position."

* Stenger, "Zeit für Repro," 1907.

THE SCOTTISH FEDERATION. ANNUAL MEETING.

THE annual meeting of Scotland's representative body was held at Wishaw on Saturday, when about forty delegates were present, with fully as many associates. Mr. Symon, vice-president, presided. The secretary (Mr. John B. Maclachlan), in his report, spoke of the growth of the Federation. They started the year with forty-two societies, they closed with forty-five, and already two more had federated for 1909. The death of Horsley Hinton was referred to, and reference made to the sum the Federation collected for the Memorial Fund. The various branches of the Federation's activity were referred to and work done detailed. The whole report showed that the Federation is carrying out its original ambition of working for the good of photography in Scotland. As the financial year only finished on December 31 the treasurer (Mr. Arch. Campbell) was unable to submit a completed balance-sheet, but he submitted a cash statement, which showed a loss on the year's working, but a balance to the credit of the Federation of some £60. The portfolio secretary (Mr. J. R. Ross) and the lantern slide secretary (Mr. R. Marshall) both gave in satisfactory reports. Mr. J. A. Peebles, Dundee and East of Scotland Association, gave an invitation to the Federation to hold the next Salon (1910) in Dundee, where the members of the local association would spare no trouble to make it a success. A discussion took place anent the financial arrangements of the Salon, but after a free expression of opinion the matter was left in the hands of the Council, as also was the question of date. Office-bearers were elected as follows:—President, T. Carlaw Martin, LL.D.; vice-presidents, J. A. Peebles, Dundee and East of Scotland; and R. Telfer, Wishaw; secretary, John B. Maclachlan, Blairgowrie and District; treasurer, Arch. Campbell, Dundee and East of Scotland; auditors, J. Murdoch, C.A., and R. C. Thomson. Council: Vanessa C. Baird, Dundee and East of Scotland; A. Symon, M.A., B.Sc., Wishaw; R. Milne, Paisley; R. Marshall, Grangemouth; F. W. Kay, Aberdeen; W. H. Wilson, Glasgow Southern; Dan Dunlop, Motherwell; J. D. Ross, Brechin; R. Thomson, Midlothian; and Robt. K. Holmes (associate member), Dollar. At the Council meeting J. W. Ross was reappointed portfolio secretary and R. Marshall lantern slide secretary. It was thought advisable to appoint the Salon committee at once, instead of, as usual, waiting until the next meeting, and Messrs. Peebles, Baird, and Campbell were appointed. Mr. Baird, who acted as Salon secretary in 1906, was appointed to that office.

Exhibitions.

THE NORTHERN PHOTOGRAPHIC EXHIBITION.

The fifth exhibition of pictorial photography, held under the combined auspices of Manchester and Liverpool, was opened on Wednesday evening last at the City Art Gallery, Manchester. In former years the city of Leeds has played a part in the proceedings, but on the present occasion their co-operation had been withdrawn. The exhibition lasts from January 6 to 27 inclusive, and must certainly prove a great success in all ways. This is not a little due to the kindness of the City Fathers, who have generously placed three important rooms in the art galleries at the disposal of the photographers, and in other ways granted advantages and concessions. In thus following the lead of the Liverpool magnates they have confirmed a precedent which, it is to be hoped, will be observed by other important towns in the country. It is an official recognition of the claims of amateur photography to be considered as an important factor in the general art culture of the people.

The show numbers 671 pictures, 420 slides, and about 200 Autochromes. Naturally enough, many of these have been exhibited before, both in London and elsewhere, and in view of the limited space at our disposal we shall not be able to do more than barely refer to such works as have been criticised in former reviews. Taking the pictures more or less in the order of the catalogue, we may mention first a striking "Sunset at Sea" (4), by W. A. Hepburn, who has had the courage to preserve the hard and clear horizon that is true to the effect depicted. The luscious deep tones of the surface of the sea and the contrasting airiness of the stormy sky are its chief excellences.

M. W. Thompstone's "Impression" of Lincoln (12), though a little flat, is nice in feeling and large in style. Broader and more romantic than usual with B. Ward Thompson's landscapes, his "Tranquillity of the Silent Hills" (17) should enhance his reputation a good deal. He has other works here, some of which are in the style with which his name has become associated; but he shows a welcome broadening of pictorial idea in Nos. 145 and 146, respectively named "Repose" and "In the Dell," which are highly successful in their looseness and their depth of perspective. "The Edge of the Dunes" (19) is a sea view, sunlit, which does not include the luminary himself, but the sky has a convincing light-laden quality that betokens the blazing sun above. The work is simple and impressive. In the excellent "King Street, Manchester," (20), H. A. Knowles has also secured fine quality. Our only criticism is that the dark houses flanking the bright space of sky and distance are somewhat equally balanced. W. A. J. Hensler sends "A Wet Night in the Suburbs" (24), the charm of which is discounted by the unmitigated edge of a near and dominating tree trunk. He is entirely successful in a woodland view, called "Autumn Mists" (799), which depicts slanting sun rays shooting amongst the trees. Shipping and smoke against the clouds provide fine subject matter for John Walton's "Industry" (32). In "Winter Sunlight" (33) we have snow capitably rendered together with a nice decorative composition. This is by T. Longworth Cooper. Fred Judge's nocturne, "The Thames at Dusk" (38), with its lamps and mists, is, in our opinion, one of his most pleasing works. A farrier shoeing a horse, with the rider standing by, and a background of cottages, is the subject matter of a most effective and sunny picture by Edgar G. Lee, well composed, and entitled "At the Smithy" (50). There is a fine expanse as well as recession of planes in "Robin Hood's Bay" (54), by G. M. Carlton.

In the work of Mr. Walter J. Pearce, the exhibition has one of its strongest attractions. Mr. Pearce, with the enthusiasm characteristic of "Northerners," has likewise designed and drawn two immense and highly effective posters for the show. In his figure photographs he displays great taste and much artistic skill. "The White Robe" (69) is not only a fine photograph of a charming subject, but its lines, the disposition of its draperies, and the general lighting make it a most dignified and beautiful piece of work. Next in interest to our minds is the delicate and charming "Study of a Girl's Head" (419), which is rather more than that in reality, including, as it does, an arm and the bust. His "Fate" (417) is a nice study, but is not suggestive of its title. Other figure works by him deserve more notice than we can give them. An old style sort of landscape, with large cumulous clouds, is Arthur Smith's very pleasing "A Yorkshire Valley" (84). Miss Brenda Johnson exhibits one or two of her successful landscapes which have been already seen in London. "A Summer Day" is one of the nicest; and while we are mentioning previously exhibited works, which have already been well discussed, we may refer to J. Gale's "Le Moulin Blanc"; Mr. and Mrs. Bracewell's "The Serenade"; E. Louise Marillier's "Basket of Peonies"; Lilian G. Bland's "Cockfighting"; Dr. C. Thurstan-Holland's magnificent "End of the Valpentine"; Alex. Keighley's "Spring Pastoral," "A Word in Passing," "Corpus Christi," and "The Bridge"; P. Bale Rider's lovely "Summer" and "In Rouen"; J. C. Warburg's "Notre Dame de Vie"; "Wedded" by Aubrey Harris; Wm. Pringle's fine old street scene, "The Arrest"; by F. J. Mortimer, "All Hands Aloft" and "The Shrimping Ground"; by J. Dudley Johnston, "Snow in the City," "Snow on the Hillside," and "In a Northern City"; by Mrs. E. Peake, "The Spell" and "Seeing the World"; by J. M. Whitehead, "A Silent Guide"; by J. C. Batkin, "Dispersing the Gloom" and "Gleam and Grime"; Mrs. Barton's "Morning"; Mrs. Keene's "Motherhood" and "Bavarian Peasant," here called "The Pipe of Peace"; S. G. Kimber's "City Portal"; W. L. F. Wastell's "On the Moselle"; W. A. Clark's "In Old Caudebec"; by Chas. F. Inston, "In a Derbyshire Dale" and "The Dock"; by J. A. Sinclair, "The Inn of Cervantes," "Homewards," and "A Grey Day at Meude"; by E. T. Holding, "The Lesson," "The Song of the Lark," "The Magazine," and "The Craftsman"; by Rev. H. W. Dick, "Country Life," "An Impression of Liverpool," and "The Dwellings of the Humble"; Dan Dunlop's "Old Professor"; L. J. Steele's "Garden of Allah"; J. C. S. Mummery's "Waterside, Chesham," "A Grimy Road," and "The Barn Door"; by Furley Lewis, "Miss Adèle Baughan," "J. C. S. Mummery, Esq.," Oscar Hardee's "Isabella en Jan Wilden"; Cavendish Morton's "Hebe and

Fantasia"; Dr. Boon's "Sunlight and Flowers"; and Basil Schön's "Dingy London." All these, and others also, have been dealt with at length in our previous columns. They give the show a deal of distinction, but we must deal more particularly with the native work rather than the imported, and with such as are new to our eyes.

The Curator of the Liverpool Art Gallery, E. R. Dibden, shows two excellent portraits of artists, "H. Clarence Whaite, R.W.S., P.R.C.A." (78), and "The Late John Finnie, R.G., R.C.A." (405), the latter a spirited and highly interesting work. Miss Phyllis Dare is presented in "A Limelight Study" (106), by Geo. Dawson, in a cleverly managed effect of the stage as seen from the "wings." A little girl lying at full length upon a window sill, "To Catch the Waning Light" (148), as she reads, is an enlargement by the president, Dr. A. T. Lakin. Beyond the leaded lights is seen the garden, the details of which just give a thought too much of subject matter and rob the subject of simplicity and repose. Mrs. A. Ralli is to be congratulated upon the go and action of her "Boatmen" (122), who are managing a boat in the surf. Mr. James Shaw still produces the fruits of his visits to Rothenburg, not the least interesting of which is the old peasant, who sits with pipe, mug, and paper in a sort of cell, enjoying his "Dinner Hour" (133). Mr. Shaw's "Man of Pitch" (259) is an exercise in the pictorial charms of steam from a road repairing cauldron. His capital costume study, "The Captain's Horse" (282), has been seen before; but better than these in some respects is the "Evening Light—Caudebec" (284), which illumines half-way the rich work of the church front. The energetic secretary, S. L. Coulthurst, sends an ambitious enlargement, called "The New Gown" (261), a group of ladies before a large window. The difficulties have not been entirely overcome in the shadowy places, which are flat and monotonous. We prefer his more direct works; for example, the bright and busy water-side scene, called "The Departure" (412), which in parts is most happily composed. Two similar works are "The Quay Side" (422) and "In the Harbour" (423), which are highly pictorial and possess fine qualities, though we think that in pigmenting he has allowed relief to stand before truth of tone values here and there; and, if he will forgive us, we suggest that he cut off all the dark mass and the mast from the right side of "Toilers of the Sea" (548), and the remainder will make a fine and choice work. Of Mr. Coulthurst's two charming works, "Early Morning in the Harbour" (332) and "Evening on the Mersey" (473), we have nothing but sincere commendation. One of the simplest and best of Dr. Lakin's pictures is "A Branch" (255), a feathery feature which fills the front plane of a pretty view, showing a retiring distance of verdure and water. J. J. Phelps, a most assiduous vice-chairman, has some deftly worked oil prints. "The White Gate" (440) would be pretty enough were not the gate itself a somewhat commonplace feature. His "Inspiration" (441) depicts a sculptor who contemplates a bust, and wears an expression that betokens a surcharge of inspiration. In landscape Mr. Phelps is more happy. "Dangling Wreaths of Water Smoke" (444) is a truly fine rendering of spray from a waterfall, and in "A Grey Morning—Lincoln" (471), he carries delicacy almost to dissolving point in the scarcely perceived towers of the distant cathedral. The other vice-chairman, Rev. Hy. W. Dick, sends a pleasing variety of subjects. In "A Cottage Home" (439) we think the light too much confined to the table and figures. "London's Heat and Haze" (463) is an apotheosis of a hansom cab—a common object, treated with more grace than Mr. Wastell has treated his cab in the otherwise satisfactory "Hansom Cab" (383). Another vehicle which the Rev. Henry Dick has put to use is a motor-car, all but enveloped in smoke. He calls it "The Eclipse of the Horse" (465), and it certainly forms an object lesson in most agreeable form of the disadvantages of progress. Excellent in subject and effect is Edgar G. Lee's "Coming of the Mauretania" (291), who gives another version also of the subject in "Evening on the Tyne" (403). C. F. Stuart has a bright and taking view of "Dovedale" (300); but we do not care so much for his oil print of "The Bridge Players" (599), which is flagrantly reminiscent of the Hon. John Collier's "Whist Players." "Hooping the Wheel" (305), by T. H. Greenall, shows two wheelwrights at work in the midst of smoke. The incident has been most effectively and pictorially treated. With much pleasure we welcome P. Bale Rider's beautiful figure study, called "Beatrice" (308), which is both rich and decorative, filling the space with excellent design, and boasting of lovely lines in its composition. "Winterzeit" (316), by R. Martens, is also a beautiful work, though composition in this

case is not a strong point. In Louis Dick's "Essex Farm Road" (328) we feel that the sky is everywhere too high in tone. Much more pleasing is his broad and romantic piece, "A Lone Land" (357). E. O. Hoppé shines in his excellent portrait head which he calls "The Turf" (358). We consider it, without exception, his best work, though he has several good things here, including his "Miss Maud Allan. "Keswick" (365), by A. W. Burgess, is panoramic and fine. The Dutch cult is still with us in James McKissack's "Fairies' Harbour" (369). Much brighter and fresher than usual are J. M. Whitehead's "In the Laigh Hills" (373) and "Moorland Mists" (505). We welcome the signs of the shaking off of a mannerism. Harry Wade's capital begging mendicant, called "Old Ago and Poverty" (394), falls between the stools of figure and landscape. Trimming would save it. Desolation personified is seen in "The Lone Shieling" (410), rather a remarkable work, by R. Berry. A. R. F. Evershed appears to good advantage in his character study of "Pat" (421). His "Tramp" (432) is also excellent. "Ronaldsburn, Isle of Man" (429) is a small but dignified landscape by Thompson Carr. It is rich in colour and large in style; but it has one little blemish—a bright spot in the water that is quite out of keeping.

Of all the subjects that we have seen of the Franco-British Exhibition none is so entirely successful as W. J. Pearce's "Beneath the White Bridge" (434); the white arches, the floor of water, and the distance of stronger tone make up a charming picture.

A. F. Hirschfield's best work is undoubtedly "Teddy" (597), who wears a true schoolboy smile; but, technically, his "Italian Type" (442), a more serious youth, may be considered to surpass it. "Evening in the Dale" (468) is one of Ch. F. Inston's beautiful little oil prints, which prove how much more of artistic expression the new process evokes from him than was possible by older methods. We are glad to note that the style of subject that T. Lee Syms favoured a year or more ago has not narrowed his output into mere repetition, as is often the case when a success is made in any particular direction. He now exhibits several clever heads. "Portrait" (475) would perhaps be better for a little more illumination on the dark side. "Dreams Awaked" (511) is a nice full-faced study of a young girl. Mrs. Minna Keene sends a print that we do not think has been publicly exhibited before, representing a man, woman, and baby, and called "The Peasant's Pride" (488). It is darker than it need be, and we do not think it so taking as "Hope Springs Eternal" (490), a back view of an urchin fishing in the middle of a stream. This has humour, and is a most successful print in every way. The portraits of Dr. A. T. Lakin have a nice quality, particularly No. 498. The "Study in Red Chalk" is beautifully treated but for the hair, which is a little solid. Besides the one or two previously shown portraits by Bertram Park, we should mention his delightful "Naomi" (528). His rather sprawling "And the Night Cometh" (515) does not commend itself so much, and its allegory is entirely elusive. John Smith's portraits are distinctly good, artistically and technically, particularly that of "C. F. Stuart, Esq." (524); but when we come to Cavendish Morton we must admit the added attractiveness of a good subject, which he appears always to command. "Miss Gloria Warren" (526) is perfectly irresistible. Some fine architectural and street scenes are shown by Victor E. Morris, of which the best, in our opinion, is "The National Gallery" (535), a first-rate London view. T. R. Wingfield shows an interesting case of loose definition and delicacy of tones, which nevertheless tell firmly and convincingly, because the true tone values are correctly preserved. No one could but admire the "Portrait" (582), were he of the oldest and "straightest" school of photography. Fredk. Hollyer's vigorous "Portrait" (616) all but speaks, so lifelike is its expression. We must say a word in praise of A. Stanley Brookes's "Dinner Hour" (625), wherein a man standing entertains his mates, who are seated in the shade of a building. Presumably it is a prehistoric man who is raving in a nude state in a forest in H. G. Simmons's "Coup de Soleil" (629).

There is a large consignment of foreign works, most of which are of high merit. We have not space to particularise them, but they are a great help to the show. Gustav Mautner's are the most numerous, and include a variety of styles and subjects. There are also gems from R. Dührkoop, H. T. Winterhalter, J. H. Liebreich, L. Fleckenstein, Else Gaiduschek, W. Matthäus, R. Demachy, H. Schröter, R. Martens, and others. The last-mentioned sends the

best coloured work in "Dorfstrasse in Winter" (636), though the blue tint of the snow seems overdone.

Of the coloured prints generally we can only say that there seems to be no advance. It is all elementary and experimental, and, to our minds, must remain so, since mere tinting can never touch the fringe of what is understood by the term "colour." Perhaps "Away to the West" (186), by Arthur Marshall, gives the most satisfaction. A goodly collection of three-colour carbon prints, though they make lower artistic claims, are infinitely more interesting.

A special show of Autochromes and lantern slides are ingeniously and effectively displayed in an erection contrived by Mr. James Shaw. They are lighted by Osram lamps of 1,000 c.p., to show brilliantly even in bright daylight. Some of the finest reproductions of old masters we have yet seen come from Captain W. J. Stomm. We regret that our space has run out, and that we cannot make particular reference to the transparencies, though we may say that they are for the most part of high excellence.

The success of the show is largely due to the self-sacrificing efforts of the secretary, Mr. Coulthurst; the chairman, Dr. Lakin; vice-chairman, Mr. Phelps; and Mr. Shaw, who have, of course, been supported by others of the society. Enthusiasm is the keynote of the concern from top to bottom.

The following is the award list:—

Section 1.—Pictorial Photography: Plaques—C. Batkin, "Sunshine and Rain"; Rev. H. W. Dick, "An Impression of Liverpool"; R. Dührkoop, "Pirie MacDonald"; A. Harris, "Wedded"; E. T. Holding, "The Lesson"; E. O. Hoppé, "The Turf"; C. F. Inston, "The Dock"; Mrs. M. Keene, "Motherhood"; Cavendish Morton, "Portrait, Miss Gloria Warren"; J. A. Sinclair, "Homeward."

Hon. Mention: J. C. Batkin, "While Daylight Lasts"; Mrs. Barton, "Summer"; A. W. Burgess, "Keswick"; S. L. Coulthurst, "The New Gown"; Else Gaidusstek, "Port of Liverpool"; Oscar Hardee, "Isabella and Jan Wilden"; Mrs. Keene, "Anna"; Miss E. L. Marillier, "Basket of Peonies"; J. Renshaw, "A Silent Guide."

Section 2.—Photography in Colours: Plaque—Warburg and Hollyer, "An Indian Prince." Hon. Mention: J. D. Johnston, "The Butterfly"; Arthur Marshall, "Away to the West."

Section 3.—Autochromes: Plaque—U. M. Jones. Hon. Mention: Max Poser, Captain W. J. Stomm, and J. C. Warburg.

Lantern Slides: Plaques—Victor E. Morris, Rev. H. W. Dick, and W. A. J. Hensler. Hon. Mention: H. Wormleighton, A. G. Thistleton, A. Taylor, and R. Williamson.

THE SCOTTISH SALON.

NEW YEAR'S DAY saw the opening of the sixth annual Scottish National Salon at Wishaw. The Salon is a travelling institution, in so far that it is held in a different town each year. Perth, Glasgow, Dundee, Paisley, and Aberdeen had previously had the honour of accommodating this national exhibition, but these are towns—or should we say cities?—with picture galleries, hence they were able to house the Salon sumptuously. Wishaw, right in the heart of "the black country," has an energetic society, and it was felt that the non-gallery centres might have a trial. The society had a commodious hall in the High School; the members approached the board, and found it ready to support them. They then extended an invitation to the Federation to hold the 1909 Salon at Wishaw, pointing out that they were in the centre of a group of photographic societies, were within easy reach of Glasgow, and had suitable accommodation. The Council inspected the hall and made other inquiries. The idea of going to the smaller centres was an innovation, and the invitation was accepted. There was a considerable amount of head shaking, even amongst the neighbours who knew the energetic enthusiasm of Wishaw folks, but the Salon secretary (Mr. Telfer) and committee determined to refute the prophecies of the pessimists (there were also optimists who gave them much heartening), made complete arrangements, left no stone unturned, and trusted to the Scottish photographers to continue their support of their own exhibition. Their trust was justified by the record entry of 1,040 which met the Board of Selection, Messrs. Alex. Keighley, Arch. Cochrane, and Clouston Young, R.S.W.

The hall, draped with a neutral coloured canvas, made a good setting for the "accepted," and approval was heard on every side; even those who came to scoff remained to praise.

The Board of Selection did their work conscientiously, spent some

eleven hours at their labours, and retained for exhibition 335 pictures. The two photographers on the board are amateurs, and yet we find the profession very liberally represented on the walls, a well-deserved compliment to the high capabilities of the profession in Scotland. While naturally in this department portraiture and figure studies are in the majority (and it is perhaps the strongest section of the exhibition), yet the professionals are not restricted to that, as witness J. M. Whitehead's magnificent exhibition of those peaceful poetic landscapes associated with his name. He strikes a somewhat more dramatic note in his "Sic transit gloria mundi," and we might also note in this connection Dan Dunlop's effective arrangement of sheep in a village street, "Going to Market," or his "spacey" picture, wedding together the work of man and the glorious immensity of nature in "Salmon Fishers Bringing Home the Nets."

We do not know all the professionals exhibiting, so must of necessity be pardoned if we miss some; but as this phase of exhibition life is usually neglected we make no apology for treating it specially. J. Craig Annan is, as usual, strongly represented, and occupies the place of honour on the first wall with "A Novice." We heard a critic term this just ordinary studio work. Well, if that is so, so much the better for the studio. Personally, we regard it as a *tour de force*. It is a "costume piece," representing a figure from "The Masque of the City Arms," recently held in Glasgow. Probably its principal charm is just that quality that would be objected to by the casual glance—to wit, its severe simplicity—but no treatment could better suit the subject. Notice might also well be taken of the rendering of the texture of the fabric and the modelling of the face. In the same worker's "H. G. Wells, Esq." we have an entirely different phase of portraiture. Here the dreamily philosophic character of the sitter is truthfully, and yet simply portrayed.

William Croke (Edinburgh) is also well represented. His "Earl of Wemyss" is really one of his best efforts, and that is saying much. Amongst good work it stands out by its sheer strength. It has frequently been said that a Croke portrait, no matter what the subject, has always a majesty about it. Here, then, the photographer had a subject after his own heart; the aged peer, with aristocratic mien, has lent himself well to Mr. Croke's art, and we have a masterpiece. His other pictures are quite in his usual manner.

John Moffat only sends one picture, but it is a great portrait of the great McWhirter. The massive leonine head monopolises the picture, all else is widely subdued; the model, of course, was a splendid opportunity, but it is not everyone that would have been satisfied to treat it so simply, and in elaboration would have lain the road to failure.

J. B. Johnston is represented by his "Winter from Carlton Hill, Edinburgh," and others. This is a strong, simple transcript of the dreariness of the great city in the time of snow, and commands attention. Of his other pictures, "The Smithy" might be mentioned as an example of good grouping and lighting, and a difficult subject satisfactorily rendered.

Geo. L. A. Blair (Paisley) still retains his partiality for mist-laden landscape (of which "February" is a good example, treated with commendable restraint), seascapes, and quaint figure studies. In all he gains a goodly meed of success, but, like other of our younger workers, one has a feeling that if he would restrain his versatility and concentrate on one line of work he would do himself more justice.

The same remark applies to Dan Dunlop, who photographs nearly everything and does none of them badly enough to say "Stop," while they are all good enough to warrant the assumption that concentration would reveal even greater ability.

W. D. Brown (Lanark) has two pictures. One of them, "Out on the Deep," was sold on the opening day. Robert Burne (Glasgow) continues to specialise in his still-life studies with success, his "White Raspberries" being peculiarly successful in its rendering of the transparency of the fruit. C. D. Croke (Cupar, Fife) has a delightful rendering of childhood's "Dove" quite in the Croke manner, and that's a compliment. B. B. Martin (Dundee) makes a hit with his picture of motherhood, "The Firstborn"; the nude baby crawling at the window, the watchful mother, and the light streaming in from the diamond-framed lattice, makes a good and complete whole.

J. Peat Miller (Beith) has portraiture in which he displays a real artistic bent. P. D. Nairn (Stirling) has one picture, a virile portrait of a clergyman. J. Riley (Dundee) has the honour of being the

only exhibitor to have a colour print accepted, his "Apples" being hung. In it not only is the colour well rendered but the texture of the fruit is also satisfactorily treated.

But of the vast army of amateurs time, or rather space, fails to record their work. We will content ourselves with mentioning a few names: J. B. Anderson (Belfast), Thos. Carlyle (Paisley), W. S. Crockett (Glasgow), Mrs. R. Dunlop (Motherwell), Miss Gertrude Aitchison (Offord), J. S. Dunn (London), Dr. Evans (Newcastleton), W. C. S. Ferguson (Glasgow), Geo. A. Hall (Leith), James Hamilton (Rutherglen), Jas. M. Marcus (Kirkcaldy), A. W. Hill (Shotts), John Hepburn (Glasgow), Wm. Howatt (Glasgow), James A. Jarvis (Aberdeen), C. Kirk (Glasgow), D. Lungair (Selkirk), Rob. Marshall (Grangemouth), James McKissack (Glasgow), Peter Orr (Govan), R. B. Penman (Edinburgh), George Rose (Motherwell), Robert Thomson (Edinburgh), and many others.

Entries are to be seen from Aberdeenshire on the north to Southampton on the south, and to Belfast on the west. The custom of the Federation is to invite workers from other lands, so that the native may see what is being done in other parts. England is represented by the Horsley Hinton "In Memoriam" collection. It will be remembered that the late Mr. Hinton made his last public appearance at the last Scottish Salon, and it was a graceful act of the Council thus to memorise him. Dr. E. G. Boon's contributions amount to twenty-eight pictures, most of them portraying sunshine, a welcome relief from the mud and mist that still inspires many exhibitions.

Charles Reid (Wishaw) has the unique honour as a Scotsman of being asked to hang a collection of his work, but then he is the photographic man in Wishaw, and has been for long the representative man in picturing with the camera our domestic animals. Only twelve pictures are hung, but this part of the exhibition is decidedly popular.

The trade exhibits include a big and varied exhibit of cameras, all kinds, lanterns, and the various necessities of the photographer, from Messrs. Lizars (Glasgow), and photographs from the Autotype Company, and Wellington and Ward.

At the opening ceremony Mr. Alex. Findlay, M.P., said the Queen took a great delight and pleasure in photography, and by her recent publication of "Photographs from My Camera," had raised some £10,000 which would be devoted to the Queen's charities. All could enjoy the splendid facilities photography gave of perpetuating the beauties of nature. The benefits of photography were now felt in many fields—medicine, astronomy, microscopy, and engineering. This splendid exhibition represented the high-water mark of photography and made a good start for the New Year.

The results in the annual lantern slide competition were announced (Judges: C. F. Inston and Dr. Thurstan Holland), as follows:—Coats Challenge Shield: Paisley Philosophical Institute; 2, Grangemouth; 3, Glasgow Eastern. Associates' Competition: 1, Thos. Carlyle, Paisley; 2, R. B. Martin, Dundee and East of Scotland; 3, Robert Richmond, Glasgow Eastern. The credit of having the best individual slide in the competition (307 slides) belongs to Mr. Pollock, Glasgow Southern—a winter scene.

The official lunch was afterwards held, under the presidency of Mr. Findlay, Mr. Symon, vice-president of the Federation, being croupier.

The exhibition has a full list of entertainments, and is being well attended.

TAYLOR, TAYLOR AND HOBSON REFLEX CAMERAS.—Messrs. Newman and Guardia, Ltd., of 90-92, Shaftesbury Avenue, W., inform us that they have taken over from Messrs. Taylor, Taylor and Hobson the reflex-camera patents of the latter. It is proposed to place the Taylor, Taylor and Hobson camera on the market in the name of the "N. and G." "Princess" Reflex. The "N. and G." "Princess" Reflex is, of course, not intended to compete with the "N. and G." "Square-Reflector" Reflex, which, by the way, is the more expensive model, and has many advantages, such as the double extension, etc. For the present a small stock of cameras, manufactured by Messrs. Taylor, Taylor and Hobson, will be placed on the market at a reduced price, namely, £14 14s., and in the meantime the new model, with improvements, is receiving the attention of Messrs. Newman and Guardia, at their works, and should be ready in the course of a very short time.

FORTHCOMING EXHIBITIONS.

December, 1908, to January, 1909.—Kiew International Photographic Sec., S. I. Horovitz, Technical Society, Kreshchatik, 10, Kiew, Russia.

1909.

January 1 to 9.—Scottish National Photographic Salon. Sec., Robert Telfer, 138, Glasgow Road, Wishaw.

January 6 to 27.—Northern Photographic (Manchester). Sec., S. L. Coulthurst, Broad Oak Road, Worsley, Manchester.

January 19 to 30.—Glasgow Southern Photographic Association. Sec., Robert Lindsay, 189, Allison Street, Glasgow, S.S.

January 27 to 28.—Bedford Camera Club. Entries close January 15. Sec., K. Gammell, 21, St. Peter's, Bedford.

February 1 to 13.—Glasgow and West of Scotland Amateur Photographic Association. Entries close January 20. Sec., James M'Kissack, 68, West Regent Street, Glasgow.

February 3 to 6.—Borough of Tynemouth Photographic Society. Entries close January 23. Sec., J. R. Johnston, 29, Drummond Terrace, North Shields.

February 8 to 13.—St. Helen's Camera Club. Entries close January 27. Sec., A. G. Else, Duke Street, St. Helen's, Lancs.

February 10 and 11.—Cowes Camera Club. Entries close February 1. Sec., E. E. Vincent, 4, High Street, Cowes.

February 11 to 20.—Leicester and Leicestershire Photographic Society. Sec., Harry Cross, 80, Harrow Road, Leicester.

February 16 to 20.—Norwich and District Photographic Society. Entries close February 2. Sec., J. T. Tanner, The Lodge, Bowthorpe Road, Norwich.

February 20 to March 6.—Edinburgh Photographic Society. Entries close February 6. Exhibition Secs., Edinburgh Photographic Society, 38, Castle Street, Edinburgh.

February 20 to March 20.—South London Photographic Society. Sec., H. Creighton Beckett, 44, Edith Road, Peckham, S.E.

February 22 to March 6.—Birmingham Photographic Society. Entries close for England February 12. Sec., Lewis Lloyd, Church Road, Moseley, Birmingham.

March 17 to 20.—Nottingham Camera Club. Sec., E. L. Kent, 5, Radcliffe Mount, West Bridgford, Notts.

Patent News.

Process patents—applications and specifications—are treated in "Photo Mechanical Notes."

The following applications for patents have been received between December 21 and 31:—

WIDE-ANGLE PHOTOGRAPHS.—No. 27,701. Improved means and apparatus for obtaining a photograph embracing the complete horizon. Arthur Cyril Webb Aldis and the Improved Periscope, Limited, 11, Victoria Street, Westminster.

CINEMATOGRAPH-GRAMAPHONE.—No. 27,717. New improved indicating device for establishing synchronous running of cinematographs and gramaphones or the like. Francis Alexander Thomas, 20, Gleneagle Road, Streatham, London.

CINEMATOGRAPH-GRAMAPHONE.—No. 27,766. Improvements in or relating to apparatus for use in synchronously operating combined cinematographs and gramaphones or the like. Cecil Milton Hepworth, 111, Hatton Garden, London.

LENS.—No. 27,790. Photographic objective allowing several images of the same object to be produced. Société Anonyme de Photographie des Couleurs, 27, Chancery Lane, London.

LENS.—No. 27,793. A photographic objective of triangular prismatic form allowing several images of the same object to be produced simultaneously. Société Anonyme de Photographie des Couleurs, 27, Chancery Lane, London.

CAMERAS.—No. 27,866. Improvements in or relating to photographic pocket cameras. Armand Boreux, 20, High Holborn, London.

FILMS.—No. 27,957. Improved process of treating photographic sensitised gelatine films, or ordinary gelatine bromide prints for

reproducing any photographic image. Edward George Handel Lucas, 45, Dingwall Road, Croydon, Surrey.

SHUTTERS.—No. 28,184. Improvements in photographic curtain shutters. Edward Lander Hall, 31, Bedford Street, Strand, London.

CINEMATOGRAPHS.—No. 28,336. Improvements in apparatus for photographing and exhibiting cinematograph and mutoscopic pictures. Henry William Hamblin Palmer, 52, Stephens Road, Tunbridge Wells.

PRINTING.—No. 28,342. Improved mask for use in printing photographs. The Leto Photo-Materials Co. (1905), Limited, and John Bailey Bensley, 24, Southampton Buildings, London.

CHANGING-BOXES.—No. 28,372. Improvements in and relating to daylight loading and unloading change-boxes for photography. Rupert Richard Allen, 18, Southampton Buildings, London.

CAMERAS.—No. 28,448. Improvements in folding photographic cameras. Jules Frennet, 18, Southampton Buildings, London.

COMPLETE SPECIFICATIONS ACCEPTED.

These specifications are obtainable, price 5d. each, post free, from the Patent Office, 25, Southampton Buildings, Chancery Lane, London, W.C.

The date in brackets is that of application in this country; or abroad, in the case of patents granted under the International Convention

CONTRASTY P.O.P.—No. 9,275. 1908. (April 29, 1908.) It is known that "hard-printing" photographic papers can be obtained by the addition of ferricyanide salts, chromates and chromic acid and salts of vanadium (as catalytic agents) to the preparations of silver printing paper. Although such papers furnish fairly strong prints from faint and weak negatives, they possess the disadvantage that it is difficult to determine the correct degree of printing on account of their yellow-brown colour. Usually a print is judged according to its depth in contradistinction to the contrasting white surfaces, and considerable difficulties arise in judging a print, when there is a yellow-brown background in place of a white, especially as such yellow-brown papers require greatly over-printing, and even with the normal time required for printing, the print does not stand out sufficiently from the yellowish background.

According to this invention white hard-printing papers are produced if small quantities of the vanadic acids, vanadic acid salts, or complex compounds of the vanadic acids such as for example phosphovanadic acid, arsenovanadic acid are added to the preparations of silver printing papers. The print is treated as usual in a toning and fixing bath.

An emulsion for the manufacture of photographic printing paper in accordance with this invention may be made by successively stirring in thin streams of the three following solutions in order into a solution of 150 grams of gelatine in 1,400 ccs. of water.

I. Citric acid	35 gms.
Sodio-potassium tartrate (Seignette's salt)	3 gms.
Water	150 ccs.
Ammonium vanadate	2 gms.
II. Ammonium chloride	8 gms.
Water	50 ccs.
III. Silver nitrate	50 gms.
Distilled water	200 ccs.

The ammonium vanadate in the example may be replaced by from 3 to 5 gms. of ammonium phosphovanadate if this substance be used. August Zimmermann, 3, Lloyds Avenue, London, for the Chemische Fabrik auf Actien (vorm E. Schering), of Berlin.

STABLE HYDROSULPHITES.—No. 17,734. 1908. (August 24, 1908.) Although introduced for the dyeing industry the following process is of some photographic interest since hydrosulphites are developers of the latent photographic image, although inconvenient for this purpose on account of their great instability. According to the present invention it is found that a more permanent preparation of hydrosulphite is formed by acting with sulphur dioxide upon zinc dust, in the presence of glycerine or glucose suitably diluted with water or with a solution of zinc chloride, or calcium chloride. A reducing agent is formed which

does not possess the above mentioned disadvantages, and which possesses the property of reducing indigo at low temperatures.

In well stirred mixture of

20 lbs. zinc dust,
15 ,, glucose,
20 ,, calcium chloride solution, containing about 45 per cent. dry calcium chloride,

29 lbs. of sulphur dioxide is introduced till the zinc dust has disappeared, the heat resultant from the reaction is regulated at about 50 to 55 deg. C. The final product is a thick greyish paste which can be used directly for printing and dyeing purposes. In the aforementioned example glycerine may be substituted for glucose, and zinc chloride for calcium chloride. In the example given the weights and temperatures can be modified within certain limits. Arthur Ashworth, Fernhill Chemical Works, Bury.

FOCUSsing ENLARGEMENTS NEAR TO EASEL.—No. 21,328, 1908 (October 9, 1908). This invention has for its object to obviate the difficulty of distance from the easel by providing means for operating the focussing pinion from a point near to the screen. The device consists essentially in a bracket preferably pivoted upon the pinion spindle or an extension thereof, carrying a rotatable spindle at right angles to the pinion axis and capable of being directed towards the screen for focussing purposes, or turned towards the rear of the apparatus and out of the way. Between the spindle (which may be extensible) and the pinion, gearing is provided, so that rotation of the spindle by means, for example

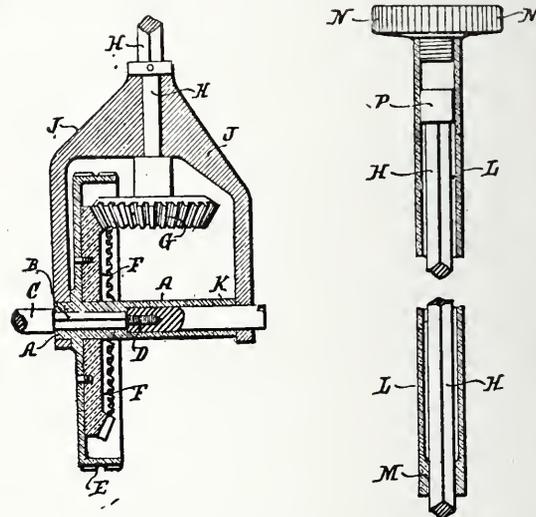

Fig. 1.

Fig. 2.

of a milled head upon its outer end will operate the pinion for focussing, the gearing being preferably so proportioned that finer adjustment is secured by rotation of the spindle than by direct rotation of the pinion.

Fig. 1 shows a sectional elevation of an example of the device. Fig. 2 a detail of the spindle (both to a considerably enlarged scale), and Fig. 3 the application of the device to the lantern.

This example is adapted more particularly for application to existing lanterns. To that end there is provided a sleeve, B, squared internally at its inner end for a part of its length commensurate with the usual length of the squared part, B, upon the end of the existing pinion spindle, C. The sleeve, A, is adapted to be held in place upon the spindle end by a grub screw, D, of greater length than usual. On the sleeve is formed a recessed milled head, E, for operating the pinion spindle, C, in usual manner, and within the recessed part of the head is fixed a bevel wheel, F, with which there gears a bevel pinion, G, carried upon a spindle, H, in a bracket, J, pivoted upon the sleeve, A, at one side (being prevented from outward movement by a face on the milled head, E) and at the other side pivoted upon the grub screw, D, there being provided a short sleeve, K, to permit of the assembly of the parts and to prevent inward movement of the bracket.

The bracket, J, may thus be turned into any position about the spindle, C, either outwards towards the screen for focussing, or out of the way towards the rear of the lantern. The spindle, C,

may be made of such length that it conveniently folds back within the length of the lantern base, and, at the same time, when moved forwards extends sufficiently for focussing purposes, or it may be made extensible in any convenient way—for example, the spindle may be squared, as shown in Figs. 1 and 2, and there may be

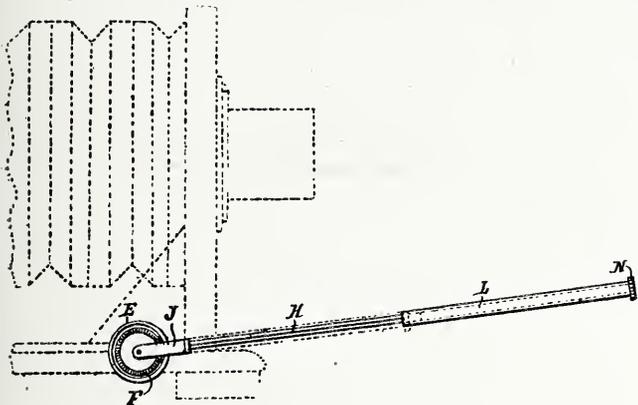

Fig. 3.

fitted over it a tube, L, bearing at its inner end a squared socket, M, to fit the spindle, and at its outer end a milled head, N, while a sleeve, P, on the spindle end fits within the tube and serves to steady the whole and prevents the tube falling off.

The bevel wheel, F, is preferably double the size of the pinion, G, thus providing a fine adjustment of two to one.

In operation, rough focussing is performed by the milled head, E, as usual, which, as will be seen in Fig. 3, is easily accessible around the bracket, J; fine adjustment is then made by means of the milled head, N, with its spindle extended towards the screen, so permitting of the operator's close approach thereto. William Pollock, 41, Renfield Street, Glasgow.

PORTABLE TRIPODS.—No. 19,198, 1908 (September 12, 1908). The invention consists of a tripod, formed in sections, as *a*, *b*, and *c*, the upper sections, which are U-shaped or channelled and pivotally connected in reverse positions by a pin, *a*¹, so that the sections *b*, with the sections *c* therein, can be turned over, and lie in the sections *a* when not required, as in the figure; but when required the ends, *b*¹, of the sections *b* can be opened out, the combination with the sections of a pin, *a*³, for entering a hole, *j*¹, in a spring, *j*, by which the sections *a* and *b*, when opened out, are secured, and made rigid by a block, *a*², which supports the pivoted ends of the sections *a* and *b*. John and Alfred Wilkinson, St. Oswald Street, Rochdale Road, Manchester.

DAYLIGHT-DEVELOPING TENT.—No. 3,790, 1908 (February 19, 1908). The invention consists of a folding developing chamber for photographic plates, wherein the device for watching the interior of the chamber consists of a hood arranged at an aperture, and having at its edges two plates or wires, the upper ends of which abut against the user's head above the ears, and the lower ends engage under the cheek-bones near the nose, the two side-parts being connected by a strap or band going round the user's head, the points of connection being between the ends of the parts. Jacob Wojciechowski, 28, Nowowielka Strasse, Warsaw.

New Trade Dames.

COVERINE.—No. 308,389. Chemical substances used in manufactures, photography or philosophical research, and anti-corrosives. Walter Carson and Sons, Grove Works, Lombard Road, Battersea, London, S.W., paint manufacturers. November 27, 1908.

PHOTOGRAPHIC CLASSES at the Cripplegate Institute, Golden Lane, E.C.—These classes are instructed by Mr. John H. Gear, F.R.P.S., and will commence the spring session on Wednesday evening, the 20th inst. They are thoroughly practical and embrace popular and useful subjects. Full particulars may be obtained by writing to the Manager. Intending students should make early application, as we understand the winter session was quite full, many being unable to gain admission.

Analecta.

Extracts from our weekly and monthly contemporaries.

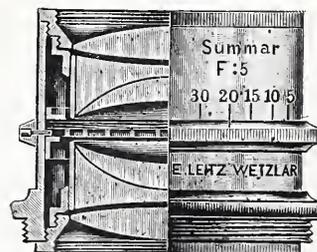

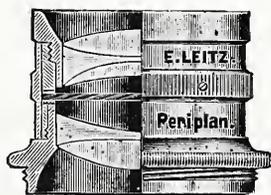

Old Platinotype-Developer for Toning P.O.P.

"Is it generally known" (says a writer in "Photography and Focus" for January 5) "that it is possible to tone P.O.P. prints in the developing solution that has been used for several platinotype prints? I hardly flatter myself that I made this discovery, though I stumbled upon it quite accidentally, never having read that it could be done, and if it is not generally known it is a useful tip for photographers who work with platinotype paper and P.O.P. Instead of throwing away the platinotype developer when they have finished their batch of prints, by keeping it in a well-corked bottle they can use it for toning P.O.P. prints as well. I suppose that a certain amount of chloro-platinite (?) is taken up by the developer with each platinotype print developed, and I found that after using the Platinotype Company's developing bath (for black tones) for three half-plate prints I was able to tone three half-plate prints on Paget-cream crayon P.O.P. in it. After that the bath went suddenly weak. I have prints toned in this way two years ago or more, which have been exposed to all sorts of daylight in frames, which still show no sign of fading or mottling. It is a good way of making use of the used baths which otherwise have to be thrown away as useless. I always use about 2oz. of solution for developing half-plate prints, made up of equal parts developing salts and water, as per the Platinotype Company's directions."

New Apparatus, &c.

The "Summar" and "Periplan" Lenses. Made by Ernst Leitz, Wetzlar, and 9, Oxford Street, London.

These lenses mark the entrance into the photographic objective trade in England of the eminent firm of Leitz, a firm whose optical work in microscopic lenses has long drawn high eulogies from experts. Messrs. Leitz, if we may judge from the few lenses we have examined, are to obtain similar commendation from photographers. The "Summar" lens, Series II., is a symmetrical anastigmat of a very high degree of correction, and working at the large apertures of *f*/5 to *f*/6. The one we have tried is No. 6, of 150mm., or 6in., focal length, *f*/6 aperture, and intended to cover 12cm. by 15cm. This it does readily, and, in fact, it can be used over a much larger plate. All its corrections seem to be of a very high order, and the single combination works well at an aperture of about *f*/11. The field of the doublet is practically flat, and a small point of light can be sharply focussed in any part of the plate, even in a half-plate camera. This should be an ideal lens for the ordinary hand camera of the non-reflex variety, for when we depend on

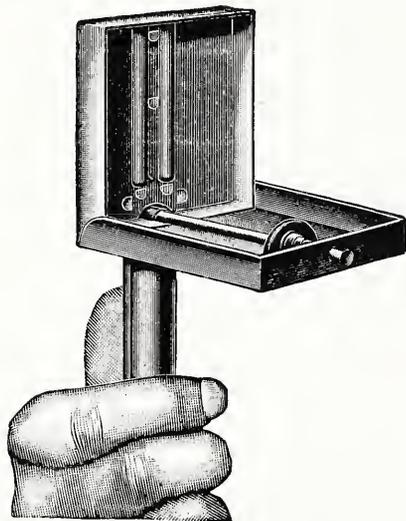

focussing by scale a lens of much greater rapidity than *f*/6 often leads to trouble, owing to its want of depth. The price of this No. 6 lens is £4 10s. in ordinary mount. A quarter-plate lens of 5¼in. focus belonging to the "Summar" Series II. has the yet larger aperture of *f*/5, and costs the same as the 6in. of *f*/6 aperture. Another 6in. lens of *f*/5 aperture is also listed at £5.

The "Periplan" is an unsymmetrical lens of full aperture of *f*/7.7, and, though a very much cheaper lens than the "Summar," its performance at full aperture leaves nothing to be desired. Even though the back combination consists only of two cemented lenses, yet this at *f*/16 gives excellent results. The lens tested is No. 3, of 150mm., or 6in., focal length, and therefore it can be well compared with the

"Summar" of the same focal length. Its covering power is almost exactly the same, and its performance at $f/7.7$ is practically equivalent to that of the "Summar" at $f/6$. The price is only £3, as against £4 10s., the difference being, of course, due to the smaller rapidity, but, still, an $f/7.7$ lens is not a slow one, and perhaps this aperture is the most generally useful of all. We can strongly recommend the "Periplan" to anyone requiring a cheap $f/8$ lens— $f/7.7$ and $f/8$ are, of course, practically the same thing. A $5\frac{1}{4}$ in. lens only costs 50s., and few lenses of such good quality are obtainable at such a price.

The "Agfa" Pocket Flashlamp. Sold by Chas. Zimmermann and Co., 9 and 10, St. Mary-at-Hill, London, E.C.

In this small flashlamp the makers have assuredly reached a point of convenience and efficacy beyond which it will be difficult to go. The lamp consists of a pair of trays of nickelled metal, which are hinged together and fixed to a metal handle some 7in. in length. In one of the trays the necessary quantity of flash-powder is placed. The novelty of the apparatus lies in the ingenious method of ignition. This is done by aid of a common Swedish safety-match, which is held by a spring clip, so that its head comes in the semi-circular hole at the back of the flash-pan. The head of the match is ignited by the upward passage against it of a strip of striking-paper actuated by spring. The match in turn ignites the powder which is placed on it, and as the ignition takes

place at the back of the pile of powder and against the metal back of the lamp, the flash is forced away from the operator. The actinic quality of the flash may be judged from the fact that at F. 11, and using a plate about 200 H. and D., the use of $1\frac{1}{2}$ gms. of powder, say 20 grains, gave a well-exposed negative. The lamp is not intended for big work by flash-powder, but for single portraits and exposures consuming up to about 40 grains of powder it is capable of giving very excellent results. Moreover, for architectural or similar technical work where it is desirable to use flash-light as an accessory means of illuminating extra dark corners, no more handy instrument than the "Agfa" lamp can be imagined. It folds up flat for the pocket, and is got ready for use in a few seconds. Not the least notable feature of the lamp is its very moderate price, 1s. 9d., complete, with firing-papers and instructions.

The Busch "Bis-Telar," Series F/7. Sold by the Emil Busch Optical Co., 35, Charles Street, London, E.C.

The original "Bis-Telar" working at $f/9$ is well known to our readers, and its usefulness as a long focus lens working at a small camera extension has been much appreciated. The new series works at larger apertures. Nos. 1 and 2, of 8in. and $10\frac{3}{4}$ in. focal length respectively, work at $f/7$, while No. $2\frac{1}{2}$, which is the one now submitted to us, has a focal length of $13\frac{1}{2}$ in. and works at $f/7.5$. The new series is therefore exceedingly well adapted to the hand camera, for either $f/7$ or $f/7.5$ is a good working aperture. No. $2\frac{1}{2}$ is listed to cover 5 x 4. This it does easily, and at $f/16$ it gives excellent definition all over the plate. At full aperture it gives fine definition in the centre, but the falling off towards the margins is not very great. Stopping down does not unduly reduce the circle of illumination, therefore small stops can be used without cutting off

the corners of the plate. The total camera extension is only 7 inches for distant objects, therefore the lens can easily be used in an ordinary double-extension quarter-plate camera or in a reflex. The price is only £4 5s., which is very moderate, while the workmanship of the objective is of the fine quality and perfect finish that characterises the lenses issued by the Emil Busch Optical Company. The No. 2 lens, which we have also tried, requires $5\frac{1}{2}$ inches camera extension, costs only £3, and may be classed as one of the most useful lenses the quarter-plate worker can possess. The new series of Bis-Telars includes five lenses with focal lengths of 8, $10\frac{3}{4}$, $13\frac{1}{2}$, 16, and 22 ins., the camera extension required with each lens being about half an inch more than half the focal length. The old series only included three lenses of 7, 10, and 14 inches focal length, so that we now have a much more varied series to select from. The new lenses can be obtained in either focussing mounts or Koilos shutters, so there is no difficulty in adapting them to hand cameras. Naturally they give some distortion, as do all telephoto lenses, but this is an almost inevitable defect with lenses of telephoto construction, and does not detract from their peculiar value. A characteristic of the Bis-Telar is its smallness. The new $13\frac{1}{2}$ inch lens only requires a $1\frac{1}{4}$ inch flange screw, and each lens is of about the same size as an R.R. of the same focal length. No. $2\frac{1}{2}$ only projects $2\frac{1}{2}$ inches from the flange and has a 2 inch hood.

New Materials, &c.

The "Agfa" Copper Intensifier. Sold by Chas. Zimmermann and Co., Ltd., 9 and 10, St. Mary-at-Hill, London, E.C.

A single solution intensifier which should find much favour with both the user and the dealer has been produced by the makers of the famous "Agfa" products, as the result of experiments made to produce an intensifier containing no scheduled poison, and therefore available for sale by photographic dealers without restriction. When, as in the present instance, the practical properties of the solution are not thereby sacrificed, the freedom to sell without fear of harassment from those working on behalf of pharmacists should add interest in the new introduction. The basis of the intensifier is a copper salt, but so far as we can judge the preparation is not purely and simply that of the copper toner containing ferricyanide which was more in use a year or two ago than at present. The intensifier is a pale yellowish powder which dissolves very readily in water, forming a clear green solution. The strength at which it is used is 5 per cent., but it is not necessary to weigh out the powder: the screw stopper is provided with a glass measuring tube holding 5gms., the dose of chemical for $3\frac{1}{2}$ oz. of water. The plate, from which the hypo has been washed, is placed in this solution and allowed to remain therein until the desired degree of intensification is reached. The solution is gradual and even in its action, and five or ten minutes gives a very considerable degree of intensification, as much as will usually be necessary. The colour of the deposit is a light chocolate brown, so that less degree of intensification than would at first be thought necessary is sufficient. The intensifier shows no sign of staining or veiling of the shadows, and is evidently a convenient, reliable, and easily applied method of intensification. The way in which it is got up for sale in bottles holding 50 gms. of the powder makes it a most convenient article for the dealer.

EDINBURGH PHOTOGRAPHIC SOCIETY.—The annual exhibition will be held in the society's hall, 38, Castle Street, from February 20 to March 6. Entries close February 6, the latest date for the reception of pictures being February 10. Sections I. and II., for framed pictures and photographs in colour, respectively, will be judged by Messrs. J. Campbell Noble, R.S.A., Archibald Cochrane and Robert Burns, A.R.S.A., and Section III. (lantern slides) by a committee appointed by the exhibition authorities, and in each section and class the society's medals will be placed at the judges' disposal for award at their discretion, their decision in all cases being final. Entry forms and full information may be obtained on application to the Exhibition Secretaries, Edinburgh Photographic Society, 38, Castle Street, Edinburgh.

New Books.

"The Science Year-book," 1909. Edited by Major B. F. S. Baden-Powell. (London: King, Sell, and Olding.) 5s.

The fifth issue of this year-book contains, among other additions, a table of the vegetable kingdom, compiled by Dr. Rendle, of the British Museum. Most of the tables, however, relate to astronomy, physics, and chemistry. There is a review of science progress in 1908, and directories of periodicals, public institutions, universities, and learned societies. The year-book provides a diary for every day in the year, as well as a monthly calendar, which is kept in review month by month by placing it next to the front cover of the volume and providing the latter with an aperture. The publication should be of frequent service to those having dealings with scientific bodies or people.

PHOTOGRAPHIC SURVEYING.—Nos. 2 and 3 of the "Internationales Archiv für Photogrammetrie," the journal of the scientific methods of survey by means of photography, are sent to us by the publisher, Carl Fromme, 2, Glockengasse, Vienna, II./1. Each number is sold at the price of 6s., or the yearly subscription for four numbers is 20s. Among the contributions are discussions of the orientation of photographic exposures made from a common view-point by Prof. A. Klingatsch; of the use of long base-lines in stereo-photogrammetric measurements, by Dr. N. Herz; on photogrammetric work in Russia, with other papers on this important field of work, the literature of which is now gathered in the pages of the "Archiv" under the editorship of Dr. E. Dolezal.

Meetings of Societies.

MEETINGS OF SOCIETIES FOR NEXT WEEK.

FRIDAY, JANUARY 8.

Lincoln Amateur Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Hill Camera Club. Mounting Competition.
Burrington Photographic Club. Development of Negatives by Members.

SATURDAY, JANUARY 9.

Bolton Amateur Photographic Society. French Lantern Pictures. A. E. Staley & Co.

MONDAY, JANUARY 11.

Whipplegate Photographic Society. "The Autochrome Process." H. W. Bennett.
Brantham Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Bradford Photographic Society. "Control in Simple Combination Printing on Bromide Paper for Pictorial Effect." Harold G. Grainger.
Southampton Camera Club. "Two Benedictine Ministers." E. W. Harvey Piper.
South London Photographic Society. "Lantern Slide Making." E. R. Bull.

TUESDAY, JANUARY 12.

Loyal Photographic Society. Opening of a One-Man Exhibition. R. Dührkoop, Address by E. O. Hoppé.
Donklands Photographic Association. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Banley Photographic Society, Y.M.C.A. "Wellington and Ward's Specialties." H. Wade.
Worthing Camera Club. "Pictorial Possibilities with a Kodak." J. W. Eadie.
Leeds Photographic Society. Annual Meeting.
Epsom and District Literary and Scientific Society. "A Surrey Ramble." Surrey Survey and Record. Fenwick Smith.
Hackney Photographic Society. "Some Models I Have Photographed and Hints on Home Portraiture." P. R. Salmon.

WEDNESDAY, JANUARY 13.

Stockport Photographic Society. "Exhibition of Thornton-Pickard Prize Slides and Apparatus." R. Hesketh.
Coventry Camera Club. Dutch Lantern Pictures. A. E. Staley & Co.
Borough Polytechnic Photographic Society. "Bromide and Gaslight Papers." W. H. Darvill.
Broydon Camera Club. Ten Minutes Lectures by Members.
Leeds Camera Club. "Autochromes." John H. Gash.
Lewes Camera Club. "The New Ozobrome." H. J. Burgess.
Bontypool and District Photographic Society. French Lantern Pictures. A. E. Staley & Co.
Saisley Philo. Inst. (Photo Section). "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.

THURSDAY, JANUARY 14.

A.C.C. School of Photo-Engraving, Bolt Court. "New Considerations on the Theory of the Cross Line Screen." M. H. Calmels.
Liverpool Amateur Photographic Association. The Prize Slides of the 1908 Competition of the Affiliated Societies will be shown.
Felbourne (London) Camera Club. "Printing and Toning in Various Processes." The President.
Wimbledon and District Camera Club. Lecture Competition.
Chelsea Photographic Society. "A Tour through Dauphiné and Savoy." Mrs. Spenser Wilkinson.
Leek Photographic Society. "Wellington and Ward's Specialties." Demonstrated. H. Wade.

Handsworth Photographic Society. "Lantern Slide Making by Contact and Reduction." J. Gough.
Glasgow E. Amateur Photographic Association. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
London and Provincial Photographic Association. "Yesterday and To-Day." Burroughs, Wellcome & Co.

SOUTHAMPTON CAMERA CLUB.—The twelfth annual meeting of the Southampton Camera Club was held on Monday evening last, under the chairmanship of the president (Mr. Wm. Borough Hill).

The annual report was read by the hon. sec., who observed that their numerical strength was the same as last year, viz., 110, and with regard to their balance at the bank, he thought they could congratulate themselves that they stood with £77 to their credit, and their liabilities were nil. The committee again desired to record the gratitude of the members to the president for his generosity in placing the club-room and the dark-room at the members' disposal. Mr. Kimber also mentioned that during the year thirty-five meetings had been held, comprising demonstrations, lectures, competitions, etc., and among the lecturers were such well-known men as Arthur Marshall, James Shaw, C. B. Howdill, W. L. F. Wastell, E. Seymour, and C. H. Hewitt. In referring to the annual subscription he mentioned that the attendance was not so good as in previous years, and for the first time they had to record a small deficit.

The report was adopted on the motion of Mr. S. G. Kimber, seconded by Count de Miremont. Mr. Trigg (hon. treas.) proposed the adoption of the financial statement, and mentioned that for the first time in the exhibition account they had to record a loss of £3 4s. 9d., but nevertheless, the balance at the bank had increased from £75 13s. 8d. to £77 3s. 1d.

Mr. Wm. Burrough Hill was for the seventh time elected as president, Mr. Kimber, in making the proposition, paying a high tribute to the keen interest Mr. Burrough Hill showed in the Club's welfare. Mr. T. P. Clark seconded, and the president briefly responded. The vice-presidents (Messrs. H. Milner White, LL.D., G. T. Vivian, A. E. Henley, and F. G. Ryder) were re-elected with the addition of Messrs. Arthur Marshall, A.R.I.B.A., and F. J. Mortimer. Mr. S. G. Kimber, F.R.P.S., was re-elected hon. sec., Mr. Trigg hon. treas., and Mr. C. Daw hon. reporter. The Committee was chosen as follows.—Messrs. T. L. Baker, C. M. Cooper, H. Ess, E. H. Irish, W. R. Kay, W. R. Olney, R. E. Parson, Dr. Purvis, F. Russell and R. Robinson.

HACKNEY PHOTOGRAPHIC SOCIETY.—At the meeting held on December 22, Mr. Stuart Woodhouse gave the results of a number of experiments he had made in after-treating bromide prints in the direction of brightening up the surface. Many methods were tried with varying success. Wax pastes, commercial and home made, were not altogether successful, the difficulty being to get an even coating. White of egg diluted with water gave a good result, as did also dilute celluloid varnish. Thinning out "Lustralene" with megilp led to megilp being used alone, and this was found to be the most satisfactory of all. A print rubbed over with megilp had its shadows brightened wonderfully, and the megilp formed a perfect medium for applying pigment if working-up was necessary. Should, for instance, a portion of the print require darkening, then megilp was first to be applied to the whole surface, after which megilp and pigment was to be applied locally. If the result was not satisfactory, it could be as easily removed. Another way of working up was to apply the megilp and pigment over the surface generally and then bring up the high-lights by wiping out. Both pastel crayon colours or the ordinary tube oil pigments could be used. It was an especial feature of this process that it permitted any amount of working up, with results that showed, as far as surface conditions went, no traces of such work having been performed. Examples shown at the meeting fully bore out what Mr. Woodhouse had said about the method, and it was considered that he had made a most valuable communication.

"WILSON" VIEWS OF NORTHERN COUNTIES.—Mr. Godfrey Hastings, 27, Ridley Place, Newcastle-on-Tyne, writes that, having purchased all the negatives of the counties of Northumberland, Durham, and Cumberland, belonging to Messrs. G. W. Wilson and Co., of Aberdeen, he can now supply postcards and other view goods from them.

Commercial & Legal Intelligence.

HALES' TOURS OF THE WORLD (UNITED KINGDOM), LTD.—The opening of too many places in various parts of the United Kingdom on long leases at tremendous rentals to secure good positions is stated to have been the cause of the trouble that has attended this company after only two years' working. The meeting of creditors was held at 33, Carey Street, on December 31, before the Official Receiver. The gross liabilities are set down, on the estimate of the officials of the company, at £13,161 19s. 7d., the ranking amount being £8,958 18s. 6d. The unsecured creditors amount to £1,378 16s. 7d. The total assets are put at £4,203 1s. 1d. The only concerns that had paid their way in London were those at Oxford Street and at Olympia, West Kensington. In the country the successful concerns were few, and in most of these cases the company held the leases, which invariably were for three years. The trading account showed that the expenses for the Kensington premises were £4,139, and the gross receipts £1,303; £2,150 were the expenses at Hammersmith, and the takings were £1,150. Manchester showed about £500 or £600 to the good; Leeds, a loss of £1,000; New Brighton, a loss of £170; Oxford Street, a profit of more than £4,000; Olympia, £700 profit; Bristol and Nottingham, a loss of £400 each; Blackpool, a loss of £1,300; and Birmingham, a small profit. The total profit on the trading was £544, but, said the Official Receiver, that was not waiting for disposal, as there were heavy expenses outside this amount, including £1,100 miscellaneous expenses, and £1,607 directors' fees. All the parties have made some nominal profit in the concern, and it would have to be thought out as to what was accountable to the syndicate. Upon a resolution of the petitioning creditor the Official Receiver was appointed liquidator. At the subsequent meeting of shareholders the Official Receiver said that the only concerns open now were at Oxford Street, London, Nottingham, which would be closed in a few weeks' time, and the Agricultural Hall. For the unsecured creditors it was a hopeless case, an all the more hopeless to the shareholders. The total deficiency is £168,958 18s. 6d. The meeting endorsed the resolution of the creditors.

INEXPERIENCE OF BUSINESS in England, together with bad trade, were the causes attributed by Joseph Valter, described in the receiving order as John Walter, of 49, Southampton Row, W.C., photographic art gallery proprietor, etc., of his failure at the first meeting of creditors, held at the London Bankruptcy Court, on December 30. No creditors were present, and debtor's representatives (Messrs. Roberts and Co.) said that the statement of affairs would be filed during the course of the day. Asked by the Assistant Official Receiver as to the amount of the liabilities, debtor's representative said that the claim of the petitioning creditor amounted to about £62, and, in addition, there was about another £12. From the report of the preliminary examination it appeared that debtor was a Russian subject, and came to England from Berlin in 1906. After closing up a clothing business because he was losing money debtor, in July, 1907, opened a picture business, and carried out photographic enlargements, etc. with a partner (Mr. Lovett), under the style of the Central Art Gallery at Southampton Row. Mr. Lovett stayed until February, 1908, when debtor bought him out and carried on the business alone until the end of October last, when he sold it for a small amount. It appeared, however, that debtor took another partner after Mr. Lovett, and this latter partnership had not been formally dissolved. Subsequently debtor went into partnership in another business and put £500 into it. It was unsuccessful, and he came out with about £53 liabilities to his name. There are no assets and no books. Debtor became aware of his insolvency in July last. The case is a summary one, and remains in the hands of the Official Receiver. Two proofs only were admitted, that of A. J. Cox, £22, and Gerhard and Hey, £54.

DISSOLUTION OF PARTNERSHIPS.—Pictorial Photo Publishing Company (Peter Peters, Abraham Stamler, Ben Stamler, and Leon Roosevelt), 79, New Briggate, Leeds, 1, Bland's Cliff, Scarborough, and 40, Market Place, Dewsbury, artists' photographers and publishers, November 25. Debts owing by the late firm will be paid by P. Peters, who will continue under the above style at 1, Bland's Cliff, Scarborough, and 40, Market Place, Dewsbury. A. Stamler, B. Stamler, and L. Roosevelt will continue under the above style at 79, New Briggate, Leeds.

NEW COMPANIES.

DEBENHAMS, LONGMANS, AND Co., LTD.—Registered December 18. Capital £2,000, in £1 shares. Objects: To take over the business of art photographers carried on by W. F. Longmans, A. S. Longman, and D. Welby, at 12, Clarence Street, and the County of Gloucester Studios, Gloucester, and at 3, Spa Place, Cheltenham, as Debenhams and W. F. and S. Longman. Private company. Registered office, The Studio, Clarence Street, Gloucester.

REGENT PHOTOGRAPH COMPANY, LTD.—Capital £100, in £1 shares. Objects: To acquire the business of photographers, dealers in photographic requisites, etc. Private company. Table A mainly applies.

PERMAGRAPHIC ENGRAVING COMPANY, LTD.—Capital £500, in £1 shares. Objects: To acquire the business of engravers carried on by H. Eagle, at 20, The Side, Newcastle-on-Tyne, as Henry Eagle and Co. Private company. Registered office, 20, The Side, Newcastle-on-Tyne.

LONDON AND PROVINCIAL REPRODUCTION COMPANY, LTD.—Capital £3,000 in £1 shares (1,500 Six per Cent. Cumulative Preference). Objects: To carry on the business of photo-engravers on wood, stone, metal, and other material, photo-lithographers, printers, etc. Private company.

KENT AND LACEY, LTD.—Capital £3,000, in £1 shares (1,500 Preference). Objects: To acquire the business of a company of the same name carried on at Singleton House, Northumberland Street, Newcastle-on-Tyne, and at 46, James Street, Harrogate, and to carry on the business of photographers, photographic artists, printers, photo-lithographers, etc. Private company. Registered office, Singleton House, Northumberland Street, Newcastle-on-Tyne.

News and Notes.

"THE BOOKSELLER."—Our contemporary of the bookselling trade, which for the past fifty years has appeared monthly, has with the New Year embarked on a career of weekly publication, which, to judge by the first number, will fully maintain its prestige in the past.

BEDFORD CAMERA CLUB.—The third annual exhibition will be held on January 27 and 28, in the Town Hall, Bedford, the exhibits to be judged by Mr. F. J. Mortimer. In the open classes, one of which will be devoted to colour work, including Autochrome and other transparencies, the awards will take the form of bronze plaques and certificates. Entry forms may be obtained from the secretary, Mr. K. Gammell, 21, St. Peter's, Bedford. Entries close January 15, but pictures will be received up to January 26.

NORTH-WEST LONDON PHOTOGRAPHIC SOCIETY.—In connection with the members' exhibition, which will be held on February 11, in the Upper Hall, 17, Camden Road, N.W., there will be one class open to all photographers in the Borough of St. Pancras. The prints may be by any process and any subject, and must be delivered to the secretary at the above address, accompanied by the necessary entrance fees, not later than February 1. Full particulars may be obtained from the secretary, Mr. H. S. Date, 3A, Woodsome Road, N.W.

SIR H. HERKOMER ON THE SNAPSHOT.—Lecturing on Monday last, Sir Herbert Herkomer referred to the failing interest for art among the people. Enormous sums paid for old masters by a few wealthy men did not engender a love of art in the country, and unless fine art were loved by the general public art could not flourish. The signs were only too marked that the love for or interest in art was on the wane with the public. Newspaper proprietors had realised this. The artist cost more than the snapshotter, and as newspapers had to "pay," the artist was sent adrift to join the unemployed. And what of the snapshotter? Once, perhaps, in a thousand times a man or woman in the act of walking, shaking hands, or tumbling off a horse might turn out passably presentable and interesting in a snapshot. But in the other 999 cases the snapshot was little short of a personal libel, against which there was no legal redress. The snapshotter, too, thrust himself where the illustrator of old would have felt it indecent to intrude. Then, also, there was the snapshotter's assertion that the camera could make no mistake. That might be so, but the snapshotter could, and did. The snapshots which practically filled the pages of illustrated papers to-day enforced his argument that the public were accepting

very inferior article for the artist's handiwork. It was a pitiful state of things.

SOUTH LONDON PHOTOGRAPHIC SOCIETY.—The annual exhibition will be held in the South London Art Gallery, Peckham Road, from February 20 to March 20. There will be three open classes, for pictorial photographs, lantern slides, and scientific and technical photographs respectively. In the two former silver and bronze plaques, and in the last one bronze plaque, will be placed at the disposal of the judges, Messrs. A. H. Blake, E. T. Holding, and F. J. Mortimer, for award at their discretion. Entries close on January 30, on or before which date entry forms, accompanied by the necessary fees, must reach the hon. sec., Mr. H. Creighton Beckett, 44, Edith Road, Peckham, S.E., from whom also entry forms and full particulars may be obtained.

LEICESTER AND LEICESTERSHIRE PHOTOGRAPHIC SOCIETY.—The annual exhibition will be held from February 11 to 20. In the open classes, as last year, bronze caskets, bronze medals, and carbon diplomas will be placed at the disposal of the judge, Mr. Arthur Marshall, to be awarded at his discretion. The exhibition will this year include a foreign section, organised in conjunction with the Birmingham Society, in which pictures will be shown free of cost to exhibitors. Further particulars and entry forms may be obtained from Mr. H. C. Cross, 80, Harrow Road, Leicester.

PIRIE MACDONALD, of New York, busy as he must be in working two studios for men only, finds time, we are glad to know, to remember friends at home and abroad, and to give his New Year greeting the personal touch which is seen in all the work to which

he puts his hand—photographic portraiture or public administration. A stern critic of waste in the photographic business, he is seen to be personally indulging what looks in the picture to be a distinct tendency to waist.

BOROUGH OF TYNEMOUTH PHOTOGRAPHIC SOCIETY.—This society will hold its fifth annual exhibition from February 3 to 6, in the Wesleyan Hall, Northumberland Square, North Shields. In the open classes the awards will take the form of silver vases, which will be placed at the disposal of the judges, Messrs. David Blount and Walter S. Corder, whose decision shall be final. Entry forms may be obtained from the secretary, Mr. J. R. Johnston, 29, Drummond Terrace, North Shields, and must be returned to him, correctly filled in, on or before January 23.

NORWICH AND DISTRICT PHOTOGRAPHIC SOCIETY.—The society's sixth annual exhibition will be held in the C.E.Y.M.S. Rooms, St. Andrew's Place, from February 16 to 20. In the open classes the awards

will take the form of bronze plaques, with the exception of the Autochrome class, in which two silver vases will be placed at the disposal of the judge, Mr. T. J. Mortimer, for the two best Autochrome slides or transparencies. Entry forms, accompanied by the necessary fees, must reach the hon. sec., Mr. J. T. Tanner, The Lodge, Bowthorpe Road, Norwich, not later than February 3, the forms together with any further information being obtainable from the same gentleman.

A PHOTOGRAPHER'S EXHIBITION.—Mr. John Moffatt, of 125, Princes Street, Edinburgh, sends us the following photograph of an exhibition of portraits of children which he has been holding for some weeks past in his studio. He has brought together a collection of

200 subjects, most of them photographed in the ordinary way of business during the past six months. The exhibition, we are not surprised to hear, has attracted a good deal of attention, and has been visited by over 800 people.

CARBON PRINTING ON IVORY BY SINGLE TRANSFER.

To the Editors.

Gentlemen,—In the article, "Carbon-printing on Ivory by Single Transfer," in No. 2,534 of the "B. J.," Mr. W. E. Debenham believes that his method is a quite new *modus operandi*. When he says: "It is, of course, quite possible that others may have worked out a similar process, and it may even have been published; but, if so, I am not aware of it." And when, in his last letter in the "B. J.," 1909, p. 14, he asks again where any previous record is to be found, I will answer to this question. Mr. Debenham is quite right in saying that no record is published in an English book or journal, but in Germany this method is known to some extent. In Prof. Eder's "Handbuch der Photographie" (Second Ed., 1896, Vol. IV., p. 382) he will find that the continuing action of light in the dark can only be arrested by "washing out the bichromate." If one cannot develop the carbon print on the same day when printed, the prescription is given to wash the bichromate well out, to dry the tissue, and the next day to work as usually (vide Hans Schmidt, Photographisches Hilfsbuch, Teil II., p. 162-3, Berlin, 1907). Regarding the transfer of carbon prints to ivory, Prof. Eder (1 c., p. 448) says: "By single transfer the ivory support is stained by the bichromate. This staining may be avoided when the sensitised and printed tissue is completely washed out before squeezeing it to the support."

Mr. Debenham's method of extracting water by spirit must hinder a perfect sticking of the tissue to the support, for we know from drying of negatives by spirit that not only is water extracted, but at the same time the honeycombed structure of gelatine is altered, pressed together, and more or less hardened.

Transferring a carbon print to ivory by single transfer I followed

this method: To ensure a better sticking to the support I add 5 parts glycerine to 100 parts of the sensitising bath, print, wash out all bichromate for two to three hours, and squeegee the print to Houghtons' Klito Print Glazer. The next day the tissue is soaked as usual, transferred to the ivory support, and developed.—Yours very faithfully,

DR. MEBES.

Berlin, January 3, 1909.

To the Editors.

Gentlemen,—I cannot accept the suggestion implied in your remarks that the miniatures that I have been supplying for many years are not to be relied upon for permanency, or that I am less scrupulous than other photographers in what I send out. I have never had a complaint or known a case of the spontaneous scaling of the image of which you speak. The picture I sent for your inspection has been subjected to far rougher treatment—lying unglazed in a drawer with other photographs—than is usually accorded to miniatures, but, except where a knife has been used, the adhesion remains perfect.

The process I described and recommended is that of the abstraction of the water by alcohol. This process you now admit has not been hitherto published. The process of drying and subsequent re-wetting was only suggested as a possible but untried alternative. Possibly your remarks were based upon some report of an attempt to use this drying process, but in that case it would still be desirable to know where any record of the attempt is to be found.—Yours obediently,

W. E. DEBENHAM.

[The suggestion is our correspondent's own. He did not state nor have we implied that the specimen sent to us was his make. We merely described it as we found it, and in our original comment upon the method referred to a danger in the process which we know to have been discovered in practice. The discussion of our comment has already exceeded the limits which the matter merits, and is now closed.—EDS. "B.J."]

"METHODS OF PRESS PHOTOGRAPHY."

To the Editors.

Gentlemen,—I read with interest in your "Journal" of last week the letter referring to the above, and think, with your correspondent, it is time that Press photographers should use a little more forethought with regard to the feelings of those with whom they come in contact.

I venture to suggest that it is not only the Press photographer that is the cause of the trouble, but that the paper which employs him should be more considerate. For instance, is it not time that they should at least have some respect for the feelings of principal mourners at funerals of their late relatives? I think it a disgrace to anyone that a husband should be made the subject of a snapshot when attending the funeral of his late wife, which is a subject often produced in the Press. Also is it not time that photography in police-courts of prisoners charged with crimes, from murder downwards (even before they are convicted), should be put down with a heavy hand? In conclusion, I beg to add that, personally, if one of these employees of such illustrated papers was to have his apparatus smashed, and, in some cases, he himself roughly handled, by the people whose feelings he is so upsetting, it might be the cause of a little more forethought in future.—Yours faithfully,

W. LINDSLEY MARSH.

The Southgate Studio, Chichester, January 3, 1909.

WHY NOT TAX PHOTOGRAPHERS?

To the Editors.

Gentlemen,—I have read with astonishment in the current issue of the "Journal" a letter from "A Country Photographer" proposing that the Government should attempt to benefit photographers by taxing them. Whom does your correspondent desire the tax to benefit? Surely not the prosperous photographers, for they do not need assistance. I presume it is the poor and struggling photographers whom he wishes to help, and it is evident that such would have the most difficulty in paying the tax, and your correspondent leaves us without evidence that they would benefit indirectly by the extinction of the competition of amateur photographers, since it would be impracticable to collect a tax from the latter, who only pursue the hobby in the seclusion of their homes, and give or sell their photographs to private friends. To such the evasion of an impost would not be a difficult matter, and would simply add a zest to an otherwise tame amusement.

The prosperous photographer would grumble and pay, and having

business ability, would probably extract the tax, together with interest thereon, from the public. It is, however, conceivable that to many poor and struggling photographers the tax would be the last straw, and would lead them to turn to the more profitable occupations of road sweeping, bus conducting, etc., or perhaps spend their last pence on cyanide of potassium, courses which might be beneficial to themselves and their fellow-creatures, thus justifying your correspondent's anticipations.—Yours faithfully,

FREE TRADER.

THE MARKING OF PACKETS OF PLATES AND PAPERS.

To the Editors.

Gentlemen,—It has occurred to me on many occasions what an advantage it would be to the photographic dealers, and also to the public in general, if the plate and paper manufacturers decided to put, on all packets of paper and plates produced by them, the price, in a prominent position. A bold round ticket is all that would be necessary. There are so many grades of plates and so many different sizes, and also an extra price for backed plates. Then in the paper—taking for an example "Velox"—there are a large number of different grades and different sizes, a number of which vary in value, and, with the conglomeration of different prices, it makes matters very confusing for the retailer. I think probably a notice in the "Journal," directed to the manufacturers of such goods, would be instrumental in overcoming the difficulty, and I think you will agree with me, in these times of so much ingenuity and so many introductions, it is most essential that the price should be put on all packages as I have indicated, for the matter of simplification.—Yours faithfully,

99, St. Vincent Street, Glasgow.

R. BALLANTINE.

December 30, 1908.

[We refer to our correspondent's letter under "Ex Cathedra."]

AGREEMENTS WITH MANAGERS OF BRANCH STUDIOS.

To the Editors.

Gentlemen,—The matter dealt with in your leader of December 25 and in "Observer's" letter of December 18 appears to me to require consideration from other points of view besides that of equity. If the agreement is a fair one the employee who signs it has no cause for complaint when the time comes for the clauses to be put into force, for it must be assumed that he signed it with a full knowledge of its effect. There can, I think, be no question that such an agreement is a quite legitimate business proceeding, though whether it is in all cases good policy to resort to it is quite another matter.

Take the case of establishments that are branches of a first-class and well-known business. If the manager leaves one of these branches and starts for himself in the same town, those who hold the views of "Observer" seem to think that all the old customers will follow the manager—whose name they probably do not even know—and desert the original firm. I doubt this very much. The name of the older firm will be as attractive as before, and if the business does eventually become transferred it will more likely than not be due to the faults of the new manager rather than to the virtues of the old one. In this case can it be argued that the latter does not deserve his good fortune? If the original firm loses owing to the rivalry of their late manager it is mainly their own fault, for they should have selected a more competent successor. Fear of competition is a sign of weakness rather than otherwise, and in at least some businesses a competitor is warmly welcomed by his more acute rivals. I have been given to understand on very good authority that in some trades the wise man always sets up his business in a street containing as many rivals as possible. For example, a butcher who sets up in a street that contains no other butchers is likely to have a hard time of it, for prospective purchasers go for preference to streets where most butchers congregate and where they can find a bigger choice in a conveniently small compass. The same thing must apply, more or less, in other businesses. If show cases and window samples serve to attract sitters to photographic studios, then the locality containing the greatest number of them will be the one that prospective sitters will explore first, and the best man will be likely to gain their orders.

All these restrictive radius agreements seem to me to be of doubtful utility from a fair business point of view, and further than this they are unpleasantly suggestive of a wish to handicap a man simply because he is a good worker.—Yours, etc.,

"ONLOOKER."

Answers to Correspondents.

- * *All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY, 24, Wellington Street, Strand, London, W.C." Inattention to this ensures delay.*
- * *Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.*
- * *Communications relating to Advertisements and general business affairs should be addressed to MESSRS. HENRY GREENWOOD & Co., 24, Wellington Street, Strand, London, W.C.*
- * *For the convenience of Readers, our Publishers, MESSRS. HENRY GREENWOOD & COMPANY, of 24, Wellington Street, Strand, W.C., undertake the registration of copyright photographs at a charge of 1s. 7d. each photograph, to cover cost of registration fee, form, etc. Two unmounted copies of each photograph must be sent with the fee.*

PHOTOGRAPH REGISTERED:—

Ingham, Winton House, Ashton-upon-Mersey. *Photograph of Mr. Charles Mills, of Manchester, as Rip van Winkle.*

DRAWING REGISTERED:—

W. Batey, 63, Woolley Lane, Hollingworth, Cheshire. *Drawing: Fire at Hollingworth Congregational Chapel, December 27, 1908.*

OLD READER, WESTON.—1. The lens appears to be a carte-de-visite portrait lens which we expect was made for the firm by an optical house, as the firm had not a reputation for its own lenses. 2. We refer you to our issue of December 25 last, p. 973.

J. S.—We should say that the mounts are impure. The fact that the prints discolour on these mounts and not on others seems to prove this.

METAL-CEMENT.—1. Please give address of retail house supplying "laminated lead," as per enclosed sample. We have tried tea-packers, but their stuff is too thin. 2. Also please state what is the best mountant for prints on above. We have tried "Stickfast Paste," but that does not retain its hold, though it seems stuck when dry, but comes off quite easily when tried.—CAMEO.

1. We should think the metal could be obtained at Stanton's Metal Warehouse, Shoe Lane, E.C. Failing there, you might try Bett's Capsule Works, City Road, E.C. 2. Try flour paste made thick and boiled for five minutes. It should be made with good flour. We think you will find it difficult to cement paper to metal so that it will adhere firmly when the metal is bent afterwards.

MARK.—In the case of postcard reproductions your best course is to approach the publishers direct. The advertisement pages of the stationery trade papers will give you the names of the more important.

EO. F. FRAMJEE.—Better apply to Fallowfields, 146, Charing Cross Road, London, W., for their booklet on ferrotypes. They and other firms, such as Bilcliff, Manchester, S.W., supply adapters for using ferrotype plates on ordinary cameras.

LANTERN SLIDES BY REDUCTION.—I am making lantern slides from half-plate negatives by using two cameras front to front—one a whole-plate triple-expansion, in which I put the negative; the other a half-plate, with carrier containing slide plate. I use a Goerz double anastigmat lens 7½ in. focus. 1. Does it make any difference which way the lens faces; if so, which should it face—the negative or the slide, and why? 2. What formulæ would you recommend for the development of such slides? 3. Please give me a formula for flashlight powder, including magnesium, chlorate of potash, and permanganate of potash?—L. S.

1. None whatever with the lens you are using, as this is of perfectly symmetrical construction. 2. This depends on whether you want warm or cold tones. You had better follow the instructions given by the plate-makers. Lantern-slide emulsions differ considerably, and one developer is not necessarily suited to all. 3. It is not necessary to use both permanganate and chlorate. One part of permanganate (finest powder) and five parts of magnesium make a good flashlight mixture. Mix with a feather on paper, and use with caution, as the mixture is explosive.

PAL ENLARGEMENTS.—We have a 12 by 10 bromide opal that is very light, due to not being fully developed, I presume. Can you inform me how I may bring it up to normal density?—F. SLACK.

We should recommend you to try the application of potass ferri-

cyanide and bromide solution (as used for sulphide toning), followed by a developer. This will give an increase in vigour, and, if not enough, bleach with mercury chloride, and follow with sulphite of soda.

E. MERCER.—Certainly an optician can shorten the focus by adding a supplementary positive lens, but the cost would very likely be the price of a second-hand portrait lens of shorter focus.

CEMENTING CELLULOID.—A time back I noticed in the "B.J." a formula for a solution to attach celluloid to glass. I now find I have lost that number, and should be much obliged if you could repeat the formula.—A. E. SAX.

A solution of gelatine in acetic acid. Soften the gelatine in water, liquefy by heat and add acetic acid (glacial). The exact proportions are not material.

ENLARGEMENTS.—1. Thanks for reply in current issue re Speed of Gaslight Paper for Enlarging. My object in using it is to get more plucky prints from thin negatives than is, I understand, possible on bromide paper. Is there any way of getting them on the latter? Mine is a three-filament Nernst lamp, and for such negatives on bromide paper I have tried reducing the light in the filament, but still get too flat prints. I have always read that for enlarging, soft thin negatives are wanted. Mine are developed largely with rodinal, and make very fair P.O.P. prints, but generally they lack sufficient contrast to please me when enlarged. I begin to think that what others call thin and hard are very different to my idea of same. 2. I notice in a reply to another correspondent you say that a positive for making negatives from wants to be flat-looking compared to an ordinary lantern slide. I have always been told that when making a transparency for the purpose of getting an enlarged negative it wants exposing and developing much more than for a positive to be used as a positive. This seems rather the reverse of your advice, or is the difference due to the one being used for enlargement and the other not?—F. C. B.

1. Yes, there is. Fully expose, over-develop and wash. Then place in

Iodine	3 grs.
Potass iodide	30 grs.
Water	10 ozs.

until the whites become strongly blue, and then fix for five minutes. If one application of the process does not lighten the print enough, a second is given. 2. As regards the positive for the preparation of a negative we cannot agree with your informant. The greater the degree of enlargement, the softer should the transparency be made.

RAPID SALTED PAPER.—1. Can you kindly inform me if I can make a plain salted paper sensitive enough for bromide enlarging? It occurs to me that if I salt and sensitise the paper with silver nitrate and then float it upon ammonium bromide (or is it potass bromide?) it would do what I want. 2. I have seen it stated somewhere that a bromide paper can be extemporised from P.O.P. in this manner.—S. E.

1. What you require is known as the solar process, and is used for the cheapest class of work. We have published formulæ, e.g., in our issue of January 11, 1907. 2. A method which has been recommended is as follows:—Immerse for five minutes in ferric sulphate, ½ oz.; ammonium bromide, ¾ oz.; distilled water, 10 ozs. Make by using 5 ozs. of hot water to dissolve each salt and mixing hot. Wash for ten minutes and dry. The P.O.P. is now a kind of gaslight paper, and is exposed and developed as is that paper.

CHEMICALS.—Re Messrs. Lumière's article on page 3 "B.J." January 1. 1. What is meant by soda bisulphite (commercial solution)? 2. Where can I get soda carbonate (anhydrous), and soda sulphite (anhydrous)?—NUMERO.

1. A solution consisting chiefly of sodium hydrogen sulphite. The Lumière N. A. Co. supply a form of it, specially prepared for photography. 2. From any large chemical dealer such as Merck, 16, Jewry Street, E.C. The Lumière N. A. Co., 89, Great Russell Street, W.C., also supply these substances, or you may take in place of them double the weight of the pure "crystallised" chemicals.

RESIDUES.—Having seen from time to time advertisements of chemical manufacturers for residues I shall be glad if you would tell me how these are obtained. I do a good deal of photography, but

up to the present have thrown away all my waste developer, etc.—**RESIDUE.**

Apply to Johnson and Sons, Manufacturing Chemists, Ltd., 23, Cross Street, Finsbury, London, E.C.; Blundell, 199, Wardour Street, Oxford Street, W.; Matthews, Price, and Co., 13, Great Queen Street, Kingsway, W.C.; or The London Refining and Metallurgical Works, Ltd., 32, Clerkenwell Road, London, E.C.

PHOTO-MICROGRAPHY.—Will you kindly mention two or three of the best books on "Photo-Micrography," say one of the 1s. handbooks and one more advanced?—C. STEPHENS.

"Photo-Micrography," by F. Martin Duncan (Hazell, Watson, and Viney, 1s.); and "Practical Photo-Micrography," by Andrew Pringle (Hiffe, 4s.).

SILVER PAPER IN THE TROPICS.—I am anxious to find out what kind of printing paper is found to be practically the best in the tropics. On the Congo, where the climate is hot and humid, we have found it extremely difficult to keep any printing paper, however well it is hermetically sealed before it leaves this country. We have found that — P.O.P. keeps a very short time, and every other kind that has been tried seems unsatisfactory. The — is fairly good, but the last lot that was sent out was bad.—H. GRATTAN GUINNESS.

No paper that contains free nitrate of silver—and all printing-out papers do—can be expected to keep for long if exposed to such trying conditions as those of the Congo. In place of using P.O.P.'s we should advise the use of bromide paper, which has far better keeping qualities than papers of the print-out class. When the paper is received only sufficient for immediate use should be taken out of the packet, which should then be re-sealed and kept air-tight. We would suggest that you try the "Ensyna" paper, the keeping properties of which should be good.

TRIMMING PRINTS IN NUMBERS.—With reference to my query some time ago *re* trimming of prints in bulk, I have read with much interest your article on the above on page 862 of the "B.J.," November 13, 1908. I enclose four prints (which you need not return) with tissue attached for your inspection. The prints, after drying on nets, are flattened twelve at a time in dry moulder, temperature about 170 degrees. The tissue, which is same size as print, is then attached. I should be glad to know if you think a small machine for trimming (this size only)—say two or three dozen at a time—could be obtained and from where. Could the pile of prints, after being put in position and pressure applied, be trimmed on the four sides without releasing the pressure, and what would be the approximate cost of same? All the prints required to be trimmed would be of ships only, and no other straight lines would obtain but those shown on the samples enclosed; of course, it would be necessary for the bottom edge to be parallel with the title and horizon. At present I am trimming with Merrit desk, but this is tedious and not altogether satisfactory. I am now turning out about 600 of these cards per week, and am anxious to hasten the trimming, as I could then turn out a larger quantity, and the sides would have the advantage of being cut clean and at perfectly right angles.—J. T.

We should think that a label-cutting machine would answer your purpose. If so, Messrs. Hughes and Kimber, West Harding Street, Fetter Lane, could supply one. R. W. Munro, Granville Works, Granville Place, King's Cross Road, is a maker of machines for cutting up photographic papers. He might be able to supply what you require. Better write to them stating your requirements. We are rather in doubt as to whether it would be worth your while to go to the cost of a machine, seeing that your output of prints is only about 600 a week.

CASH PRICES.—Some months ago, upon an amateur theatrical performance taking place in this town, I made a special reduction to the performers for cash on completion of order. They availed themselves of same, all but one, who, upon calling for the order, gave me to understand he would call in a few days and settle, and order further copies. As he did not do so, later on I sent the account, charging my full price, with a slip attached, that it was subject to a certain discount if paid in seven days, making it the reduced rate if paid in that time. He did not do so, and the full account has been sent in every month without any reply. Upon pressing him for payment, he sent the reduced price only, deducting the extra for booking, and upon pointing this out to him he refers me to his solicitors. Shall I be right in putting him in the

county court, as it is not fair to the others. I should not think of doing so had he not defied me.—CASH.

We should say that if you can prove there were two prices clearly fixed in the first instance—one for cash and one for booking—you can recover the extra amount in the county court. We doubt if it will be worth while to do so.

STAIN WITH PYRO-METOL.—Some weeks ago you published a pyro-metol formula for plates, which has proved very valuable to me in the dull weather, but the yellowness of negatives makes them dense and long printing. Will you kindly tell me how to clear the colour out of film?—EDWIN FOX.

If the stain is very decided we should recommend you to use the hypo-chlorite bath given on page 782 of the "Almanac," but it needs to be handled with care. You may save the trouble of making up the solution by using the "Stain Remover" of the Vanguard Co., which is a very reliable preparation. If slight, the chrome alum clearing bath ought to remove the colour. If you use a hypo bath of the acid type the stain ought to be negligible, aided, perhaps, by extra sulphite in the developer.

PLATINUM.—The only thing you can do is issue the bath as a made-up preparation, either yourself or through a firm manufacturing chemical specialties. From your description the bath should interest, say, Johnson and Sons, Cross Street, Finsbury, E.C., or the Vanguard Manufacturing Co., Maidenhead.

PYRO.—You might write the firms making a specialty of second-hand goods (see our advertisement pages), offering to sell *en bloc*, or you might prepare a catalogue and dispose piecemeal from a series of small advertisements.

D.—Damidophenol is cheaper. If made up as directed the solution will remain in good working condition for about a week. The best plan is to prepare a solution of sulphite neutralised with metabisulphite. Keep this in stock and add dry amidol or diamidophenol at time of use.

BROMIDE.—(1) Can you give us any reliable formula to give fairly permanent results for intensifying weak bromide prints, preferably with warm tones? (2) Is any form of mercury intensification permanent? If so, what is the formula?—BROMIDE.

(1) The chromium intensifier answers well, and gives a very good black tone. See the formula in the "Almanac," p. 784. If you want a warm tone by intensification you had better try the above, followed by sulphide toning. (2) Yes; bleach in mercury chloride solution and re-develop with ferrous oxalate developer.

P.O.P.—(1) Can you kindly give us, in your "Correspondence" column, a formula for making a concentrated toning bath, that will keep for a time, from which a little could be added to a hypo bath and so form a combined toning and fixing bath for P.O.P.? (2) Also do you know of a way to dry glossy postcards flat—that is to say, without curl—other than by squeegeeing them?—ORPING.

(1) We have not heard of such a bath, and we doubt if it is the best plan to work, as it favours deposition of the gold. You might adapt the Kodak formula, as given in the "Almanac," by dissolving the sulphocyanide along with the gold and lead acetate; but it is very likely that these salts will then interact with each other. (2) Lay face down on fine muslin of large mesh, and dry quickly in a warm room.

* * NOTICE TO ADVERTISERS.—Blocks and copy are received subject to the approval of the Publishers, and advertisements are inserted absolutely without condition, expressed or implied, as to what appears in the text portion of the paper.

SUMMARY.

Proposed Alterations in Copyright Law.—The full text of the new Copyright Bill drawn up by the Artistic Copyright Society is printed in this issue, page 44. We deal with the provisions of the Bill of special importance to photographers in an editorial article on page 38, from which it will be seen that under the proposed Act British subjects will have copyright throughout the British Dominions in all their works, whilst foreigners have copyright within the British Dominions in those of their works made within the British Dominions. It is proposed that copyright in photographs shall last for a term of thirty years after the expiration of the year in which the work was completed. In the absence of a form or agreement in writing, the copyright in any work remains with the author, except in the case of a work of fine art, which is a portrait, and of a photograph made to order for a consideration, in both which cases the copyright belongs to the person giving the order upon payment of a consideration.

Photographs marked (c) do not require to be registered, but may still be registered, in which case the mark is (R.C.). A reduction is made in the registration fee when a number of copyrights are registered at the same time. In the case of a photographer whose assistant takes a photograph the employer is to be considered the author.

Mr. H. Snowden Ward, who is at present on a lecturing tour in the U.S.A., contributes some notes on current photographic matters in America. He refers to the popularity of the "living picture" show and of good lantern lectures, to the fraternal relations existing between professional photographers, to the interest being taken in the Dresden Exhibition, and to an International Exhibition of Pictorial Photography proposed for 1910. (P. 40.)

The results obtained by F. Wentzel in colour sensitising chloride emulsions are contained in the continuation of this author's paper. (P. 41.)

The exhibition of portraits, figure studies, and landscapes, by Count von Gloeden, now being held at the house of the "B.J.," is reviewed on page 48.

Herr Dührkoop makes a magnificent show of his work at an exhibition now open at the R.P.S. (P. 48.) Mr. E. O. Hoppé, in an address on Tuesday last, gave an interesting sketch of Dührkoop's life and aims.

Further correspondence on "Agreements with Assistants" appears on page 53.

EX CATHEDRA.

An Element of Danger in Press Photography.

The Messina earthquake, like other incidents which have been repetitions of history, has afforded instances of a practice which is a menace to the public esteem in which photography is at present held as a recorder of fact. Photographs of the disaster have been offered for publication, the negatives of which could not possibly have been taken during the present outbreak. The indecent haste of the photographer to make capital out of his exposures of 1905 and 1907 has led him to overlook the fact that the earthquakes of the two latter years took place in the autumn, and that the inclusion of trees in full foliage supplied proof of their early origin. The many journals which now rely largely on photographic illustration will naturally taboo these "photographs of the earthquake," but in the hurry of publication the most punctilious of art editors may nod, and a spurious print be offered to the public. In the interests of press photography as a business in which a large number of people are employed, such attempts to pass off photographs as something which they are not cannot be too severely discouraged.

* * *

When to Vignette.

A reproduction of a vignette-photograph appears in the current issue of "Photography and Focus," on which our contemporary appropriately makes some comments on the use and abuse of the vignette in portrait photography. The photograph in question is a capital example of, first, a photograph admirably adapted for vignetting, and, secondly, of a skillful and proper execution of the process. The stupid convention of using one or two stock shapes of vignettes for all descriptions of subject is, as our contemporary points out, the bane of what should always be a most pleasing effect. In the photograph reproduced, the subject itself—a girl in a big hat—has pleasant outlines, which are left undisturbed by the vignetter, and there is no suggestion of the mechanical means by which the effect has been secured.

* * *

New Ideas in Halation.

A writer in an American contemporary treats the subject of halation in a semi-mathematical fashion, which eventually leads him to the conclusion that "halation is the result of unequal refraction at the two surfaces of the plate." If he had stopped at this stage all would have been well, and we would not have pressed him for fuller explanations of this somewhat obscure statement. Unfortunately, however, he has proceeded to draw logical conclusions from the result of his mathematical investigations, and to give practical advice of a surprising nature. His mode of reasoning is as follows:—Halation being proved to be

the result of unequal refraction at the two surfaces of the plate, its effects can be prevented in two ways—either by eliminating refraction altogether at one surface by using the usual type of absorbent backing, or by rendering the refraction equal at both surfaces, for which purpose he recommends a backing of plain transparent gelatine! Plate-makers are advised to follow up this “new field of investigation” and back their plates with gelatine. “This halation cure will have no great following until the plate-makers do their part,” and they are reminded that “the process is surely as simple as that of double coating, while it ought to be cheaper and more effective.” The most instructive part of this article is, perhaps, the lesson it teaches as to the danger of misapplied mathematics. It will be more useful as a warning to rash mathematical speculators than to practical, but perhaps non-mathematical, plate-makers. We are quite unable to follow the steps by which the writer has arrived at his fundamental fact concerning the cause of halation, and therefore cannot say at what point he has gone wrong. A very little practical acquaintance with the facts concerning halation should, however, have shown him that his final conclusion was a fallacy.

* * *

Facial Anatomy.

One frequently hears it asserted that every photographer ought to make a thorough study of the anatomy of the human body for much the same reason that artists study it. Into the pros and cons of this vexed question it is not our intention to enter here; though we may venture the opinion that no man's work was ever one jot the poorer for his having had some knowledge of the construction and action of the bones and muscles inside of which the man lives and has his being. Some workers may hold an opposite opinion, but surely even the most obstinate will agree that every operator should, in fact, if he aspires to be a successful portraitist, absolutely know at least the rudiments of the anatomy of the human face. If it is his ambition to please the ladies—and what operator has not that worthy ambition?—he must have acquired by observation and education the quick eye which enables him to divine at a glance that side or part of the face which is most striking, and which will be likely to give the sitter most pleasure.

* * *

A Hint to Operators.

The reason for this observation is that in every face there is a “best side” and a “worst side.” Perhaps this fact may not be quite so hard on us as it appears at the first blush, for it at least affords us a very comfortable excuse for our faults and shortcomings, and in future we need not be surprised to hear men put these down to their “twist” or their “bad side.” But this is an admission they will only want to make on occasion, and not to every one; and most certainly they will not want to have this failure immortalised in a photograph. Therefore the moral to the operator is clear; it is to the “good side” that he must look for his bread and butter—the side in which the muscles of the nose, lips and eyes, and the eyebrows are most graceful and perfect. Manifestly this is the side that must be photographed, and it is certainly in the operator's interest to search diligently until he has found this “good side” in the face and also in human nature.

* * *

A Novel Idea of Intensification.

Some little time ago, while looking over some old books, we came across a rather remarkable intensification formula. The instructions were to soak the negative in ammonia, then wash, and soak again in a solution of cadmium bromide,

whereupon the negative assumed a fine black colour, and was intensified, according to the author of the book in question, though probably the majority of other persons would not expect any effect at all. Such was not our conviction, so we did not go to the trouble of trying the method. The myth was an ancient one, and appeared to us to have been deservedly forgotten, but in this idea we were mistaken, for in the *Photographic Times* of last November we see that the same formula is solemnly reprinted in the form of an abstract from *Apollo*, No. 312, June, 1908. Upon discovering this we thought it worth while to test the matter for once, and we did so, with the natural and inevitable result that nothing at all happened. What the originator of the process imagined could happen we cannot think, but it is, of course, quite possible that the old writer we first consulted was not the originator, and his version may simply have been an incorrect reprint of some other formula that had some shadow of reason about it. This is, however, no excuse for responsible photographic journals of the year 1908 repeating his blunders over again. The very slightest knowledge of photographic chemistry should have been sufficient to have at least suggested that the effectiveness of the process was a matter of doubt.

THE PROPOSED NEW COPYRIGHT ACT.

We have kept our readers informed from time to time, as well as we were able, of the progress of the Artistic Copyright Society in the development of their proposed new Copyright Bill, and of the efforts of the Professional Photographers' Association to ensure that a reasonable measure of justice should be accorded to photographic works before it should be presented to Parliament. That the original draft of the proposed Bill issued to the members of the Artistic Copyright Society by their committee did not meet with our approval was evidenced by the severe criticism we felt compelled to accord it at the time of its publication, and at the same time we were not sparing in directness in our comments on the spirit in which we conceived the rights of photographers had been treated by those responsible for the promotion of the Bill. With equal candour we now acknowledge the fairness with which the Society has since met the objections raised by the representatives of photography, that is to say, the Copyright Committee of the Professional Photographers' Association, with the so far satisfactory result that the photographer in business will be able to comply with the requisite conditions.

So far the matter is in no more forward a stage than a proposed Bill to amend the law of artistic copyright, being the last of some half-dozen or so similar attempts to supersede the Act of 1862, all of which have failed either from not reaching Parliament, or, having arrived there, by meeting with one or other of the fatalities to which unofficial attempts at legislation are liable. The foremost hope of its advancement seems to be in the more or less remote prospect of the Government taking it up. Mr. Lloyd George, when President of the Board of Trade, expressed a favourable opinion of the object of the Bill, and a personal interest in it, but his removal to another office deprives the Bill of his direct assistance. But if it should successfully reach a second reading, it by no means follows that it will become law in its present state. It would have to undergo an overhauling in Committee, whence it might emerge with its provisions so altered as to change its character completely. That we are within reasonable distance of experiencing a change in our law is, therefore, by no means a foregone conclusion. Still, it behoves us to prepare for eventualities, and it is none the less a duty to study carefully what measure of justice it is proposed to

te out to us on account of its being only what may, and what will, be.

[It is a good feature of the proposed Bill that consolidates and simplifies the present laws of copyright by repealing no less than seven existing Acts. We have now copyright in engravings separately dealt with under three Acts; sculpture separately dealt with under its own Act; and paintings, drawings, and photographs also having an Act to themselves. The nature of these artistic works is obviously so similar that no difficulty should arise from grouping them together.

Comparison of the Bill (which we print in extenso elsewhere) with the Copyright Act of 1862, which will be found in the "B.J. Almanac," will show at once that the Bill is of a much more readable nature; that it contains such convolutions of verbiage as, for instance, Section 1 of the Act, which, in the early days, caused judges, counsel, and laymen alike to flounder about in search of the words; but is sufficiently simple in construction and free from obscure legal phraseology to permit any one at all above ordinary intelligence, who will devote enough perseverance to the task, to make himself acquainted with the principles adopted and the method of their application. Conciguencies of space necessarily preclude us from anything like an exhaustive criticism, which would fill many pages, so at present we will confine ourselves to briefly pounding those points which affect photographers directly, and showing the principal differences that would arise in practice if the Bill were to become law in its present state.

Persons Entitled to Copyright.—The first notable alteration in principle under the Bill occurs with regard to the status of persons entitled to copyright. At present any person, British or alien, has copyright in Britain in any artistic work of which he is the author, wherever it may have been made, subject to the one proviso that he is resident within the Dominions of the Crown. The Bill confirms this general right only so far as British subjects are concerned, excluding other residents in this country within the Dominions of the Crown. On the other hand, it extends British copyright to the author, whoever he may be or wherever resident, in his works made in any part of the British Dominions. Summarised, this implies that British subjects have copyright throughout the British Dominion in all their works. Foreigners have copyright within the British Dominions in their works made within the British Dominions.

The Definition of Copyright.—Under the present Act copyright consists in the exclusive right to copy, etc. Under the Bill (Section 2) copyright is limited to the right to copy for sale, distribution, exhibition, or hire.

Duration of Copyright.—The present Act prescribes that copyright shall endure for the life of the author and for seven years after his death. The Bill to an extent classifies the various kinds of works subject to its provisions. For original works of fine art the term is the life of the author and thirty years after his death. For certain other works, including photographs, the term is thirty years after the expiration of the year in which the work was completed.

Works made for a Consideration (Sections 5, 6, and 7).—Under the present Act, the copyright in any work made for a good or valuable consideration belongs to the person giving the consideration. The Bill provides that, with a few exceptions after referred to, the copyright in any work shall remain in the author, whether sold or disposed of by the author or not, in the absence of a formal agreement in writing. The two exceptions are the case of a work of fine art being a portrait and the case of a photograph made to order for a consideration. In both these cases the copyright is to belong to the person giving the order upon payment of the consideration.

The Right to Proceed against Infringers.—At present copyright may be described as a dormant right until registration has been effected at Stationers' Hall. There is no remedy for anything done before registration, but there is no obligation to register, and registration may be effected at any time during the existence of the copyright.

Any proceedings for infringement, therefore, must be preceded by registration, and be for acts done subsequent to registration. Under the Bill an original work of fine art is subject to no obligation whatever, but copies of an original work of fine art, and all other works included in the Act, to entitle the owner of the copyright to remedies for infringement, must bear a mark of the nature prescribed. In the case of a photograph each copy must bear the name of the owner of the copyright at the time the work was completed, the year of completion, and the mark

(C). Photographs thus marked are absolved from the necessity of registration. Registration, however, is not abolished, and in cases where it is advisable not to publish the particulars, an alternative is provided in registration, and a registered photograph complies with the conditions of the Bill if marked simply (R.C.)

The registration fee remains at 1s., but a considerable reduction is to be made for registering twelve or more copyrights at the same time.

In mounted copies it is sufficient if the prescribed mark appears on the mount.

Copyright Frauds.—The transgressor is to be severely dealt with. Every one who

Falsely marks a copy, or

Fraudulently removes a copyright mark, or

Fraudulently claims a copyright to which he is not entitled, renders himself liable to the ordinary punishment of an indictable misdemeanour, and, in addition, to a penalty not exceeding £10 for each offence.

Copyrights Existing at the Passing of the Bill (Section 23).—The copyright in existing copyright works is to endure either for the term under the present Act or that provided under the Bill, whichever is the longer.

Author of a Photograph.—Section 29, par. 9, provides that in the case of a photographer's assistant taking a photograph the employer is to be considered the author.

We do not propose to go into the methods of dealing with infringement of copyright, as these are of a highly technical legal nature, but as they apply equally to all the classes of works included within the scope of the Bill, it is reasonable to assume that its promoters have not neglected their own, and therefore our, interests in this connection.

From the foregoing it will be gathered that many of the proposed alterations affecting photographers are distinctly to their advantage, a debatable exception being the obligation to mark each photograph published, in substitution of the present simple method of registration without further obligations. It is evident that in many cases the new method will cause no inconvenience whatever when it is understood. Postcards, for instance, and many other kinds of photographs published in quantities, are usually marked with the title or with lettering of some kind. The new obligation will only need the addition of a few more letters. But whether or not in ordinary business the enforced marking will lead to serious difficulties can only be determined by experience. Another matter for discussion arises from the absence of any direct reference to the protection of unpublished photographs and other works. Presumably, the provisions as to marking were meant to apply only to published works, and if so a close examination of the Bill fails to show us that the

author of an unpublished photograph, a copy of which has accidentally drifted astray in the world and been appropriated by some enterprising person, has any remedy whatever under copyright law. This is a matter that concerns the amateur most intimately. It is one of the objects of a copyright law to provide a definite remedy for certain wrongs for which the remedy is indefinite under common law, and a copyright Act that fails to the extent that it leaves outside its provisions a large proportion of works of the nature it is supposed to include is clearly a very faulty piece of legislation.

The substitution of a definite term of duration of copyright for the present indefinite one is undoubtedly a gain from every point of view, and the provision that in the case of a photograph made to order the acquirement of the copyright is dependent upon the payment of the consideration is also helpful. The drastic nature of the punishment for fraudulently claiming copyright no honest

photographer will object to, and indeed it will be an advantage to them in clearing the good name of the profession generally from the unmerited aspersions that have been cast upon it on account of the proceedings of some of the black sheep of the flock.

Altogether photography seems to have been fairly treated as far as intentions are concerned, but we are forced to say that the drafting of the Bill is far from being as perfect as it easily might have been. Presumably, the final settlement was left to legal experts, and the Artistic Copyright Society must therefore be absolved from blame for the contradictions, discrepancies, and omissions which are apparent. The best of draftsmanship cannot guard against latent ambiguities, but ordinary care in revision would have prevented such a palpable blunder for instance, as that contained in Section 9, Sub-section 1, where a penalty is provided for an act which is not unlawful under the definition of copyright.

CURRENT PHOTOGRAPHIC MATTERS IN AMERICA.

OBSERVATIONS made on the fringe of a great continent (and the thousand miles between New York and Chicago or St. Louis, which limit my present trip, traverse no more than the fringe) must not be taken as applying to the continent as a whole, yet a few notes on things photographic, as actually seen, may have interest for British readers.

Perhaps the most notable fact is the prevalence of the ten-cent living-picture show. Cinetography has two magazines devoted entirely to its interests; such a city as Boston has scores of entertainment rooms, providing only living pictures and a few songs; greater New York has no less than five hundred and fifty buildings licensed for this form of display; and even such a little town as Nantucket, on the island of the same name, has its twice-a-night living-picture exhibition, the only periodical amusement supported by the population (in winter) of some 2,500. This show is typical of many of the smaller ones in the greater cities. Given in a shop—of the long kind common in America—it has two great blackboards outside its windows, on which are chalked the attractions of the day. “Four long new reels and three new songs, Saturday,” “The greatest entertainment ever offered for ten cents”—such are the brief announcements. From shows of this class to the elaborately produced exhibitions in gorgeous theatres, all degrees are to be found, and all seem prosperous. But they are in some disfavour with the better class of citizens, who suspect that much of their popularity is due to risky and vulgar, if not actually immoral, suggestion in the pictures and the accompanying songs. This feeling came to a head on Christmas Eve in New York, when the Mayor closed every one of the five hundred and fifty exhibitions and let it be understood that their licences would only be re-issued on written undertaking to comply with all the fire and panic regulations and the Sunday closing rules, and to omit from the programmes all pictures detrimental to public morals. As many of the buildings are condemned by the fire department as being unsafe for public exhibitions, it is anticipated that about two-thirds will remain permanently closed, a very drastic use of mayoral power in the interests of public safety.

In the highest class of lantern shows are the lectures of a few men who have specialised for years and brought this form of exhibition to a very high state of perfection. Amongst the most successful of these is Dr. Dwight L. Elmendorf, an old-time member of the New York Camera Club, who was a painter before he became a photographer, and who has made many journeys to the beauty spots of the Old World with his camera

and cinematograph. All his lantern slides are coloured, and as they are specially prepared for this purpose, from the selecting of the view to the finishing of the slide, they are a strikingly beautiful set of pictures, totally different from coloured lantern slides as known in England, even in the best days of the old colourists. With these slides, and with uncoloured living pictures, Dr. Elmendorf attracts great audiences to the largest halls in such cities as New York, Philadelphia, Washington, Boston, and Pittsburg, working six or seven evenings and two or more matinées each week. The cities are worked in series, so that each will have two or three lectures a week for from three to six weeks, and often three or four hundred people have to be turned away from halls holding fifteen to eighteen hundred persons. Another proof in a small way of the popularity of lantern lectures may be found in the fact that when I lectured on “The Land of Lorna Doone” a few days ago in a school in a country village, over forty per cent. of the whole population—or more than four hundred out of a population of less than a thousand—were in attendance.

At the time of writing Boston is the only city where I have had time for calls, and there two things are particularly striking: First, the important position of professional photography; and second, the large number of strongly individual photographers. No British city of similar standing can show such a batch of men as Garo, Wesley Hearn, H. H. Pierce, and Parkinson. And few British studios are fitted on such a lavish, luxurious, wealth-evincing, and taste-evincing scale as the best of these. There is a suggestion that photographers are men of very ample income, and there is an unusual combination of artistic individuality with good commercial management. Making a memory comparison with the conditions of fifteen, ten, or even five, years ago, there is evidence of a great, a rapid, and a continuous improvement, an increase of success, and of the sense of the dignity of the profession. This is attributed by the photographers themselves very largely to the influence of the State Conventions, which have caused competitors to “get together,” and to substitute co-operation for throat-cutting. It is the same work that is being attempted by our own P.P.A., taken up with enthusiasm and carried to great success. The result is that when I wrote asking for an appointment with one of these leaders, he replied regretting my visit was so exceedingly short, “or we would have got the boys together and had a little dinner.” Another, when I called upon him, at once said, “Come along and see some

the other boys." The spirit is right, and its results are right, in spite of the fact that the millennium has not yet fully come, and that there are still complaints of "cutting" and unfair trading in certain quarters.

The Camera Club of Boston, one of the oldest in the country, is like most of the camera clubs in America, in being used for much greater amount of serious photographic work than is usually done at the club-rooms in Britain. Its premises are planned, first, for working, not for meeting. An early morning I found a couple of amateurs collecting prints they had left lying over night; a professional lecturer, who, with his wife, was completing a set of lantern slides from the results of exposures made during the summer; and a professional photographer dealing with a sitter in the studio. No assistant or caretaker was left in charge; each member admits himself, and locks the door if he is last to leave; the studio and enlarging-room are reserved by writing name and times in a book lying in the entrance-hall, and every one seems to respect the property of the club, keeping it in good, serviceable condition.

Apparently both the professionals and the amateurs are taking the Dresden Exhibition very seriously, and are preparing for such a display of American work as has never been seen on either side of the Atlantic. They not only mean to send, but also to go, to Dresden. Pirie Macdonald is arranging a party of professionals for the Continent, with a call in London; and Frank E. Fraprie, editor of "American Photography," is planning a series of parties, all of them to tour in England on the way to Dresden, and one of them intended to include the week of the Photographic Convention in Canterbury amongst its engagements. I have assured them that they will receive hearty welcome from the photographers of the Old Country.

Another International Exhibition, having the highest possible artistic aims, is being planned for Buffalo, N.Y., as the result of an exhibition arranged there twelve months ago by "The Photo-Pictorialists," an advanced photographic society in that city. The work then shown had a convincing effect upon Dr. Charles M. Kurtz, director of the magnificent Albright Art Galleries in Buffalo. He had long been interested in and sympathetic towards the artistic efforts of photographers, and was induced to discuss the use of the galleries under his charge for an exhibition adequately representing photography. The spring of 1910 has been provisionally arranged for the show in order to avoid clashing with Dresden, and it is hoped that the efforts of the Photo-Pictorialists, supported by the worldwide connections of Dr. Kurtz amongst artistic circles, will lead

to the assembling of a truly representative show, and even to the unearthing of talent which has hitherto remained unknown. It is intended that the bulk of the exhibition shall consist of prints individually invited; but there will almost certainly be a selected section, consisting of works chosen by an international committee.

The City of Buffalo, lying at the head of New York State, on the great steel highway to the West and North, on the border of Canada, within a few miles of Niagara Falls, and in the centre of a web of railways radiating to every point of the continent, is most admirably equipped for carrying out a great international enterprise. It is a great centre of manufacture and of transport, at the foot of the Great Lakes system of navigation, and enriched by the tapping of the boundless power of Niagara. Its citizens are enormously wealthy, full of public spirit, and of pride in their great progressive city, and accustomed to welcoming conventions and congresses of national and international character. Their distance from the older centres of photo-pictorial politics is just sufficient to guarantee that the exhibition will not be controlled in the interests of any clique or "school," but will be on lines of broad, inclusive catholicity, while the equipment of the Albright Galleries and the personality of their conductor will ensure adequate treatment for such pictures as are selected.

As it is sometimes interesting "to see oursel's as ithers see us," and to know what of all the doings in our own country seems interesting to the papers and the people of another land, I cut from an issue of the "Boston Herald" during Christmas week the only paragraph that I have seen since landing that deals with any phase of European photography. It says:—

"We have seen trained fleas, and been glad they were where they were, but now flies have been impressed into service and a new interest given to the troublesome, disease-spreading companions of summer days. At the Royal Photographic Society of London last month trained flies were put through some curious feats by their educator. It seems that flies in a glass case learned, after repeated flying against the sides, that they could not escape. Some flies had been taught not to fly away when opportunity was given, and some had been trained to revolve wheels and roll balls and dumb-bells. The fly performs such work under the impression that it is walking on a continuous surface. But the fly always was a persistent, if not an 'amoosin' cuss,' as the humorist has said. Once taught a trick it will last for ever. It is to be hoped that none of these trained flies will break away and begin performing on our defenceless heads next summer."

H. SNOWDEN WARD, F.R.P.S.

EXPERIMENTS IN COLOUR-SENSITISING CHLORIDE EMULSIONS.

III.

The Properties of the Undyed Emulsion Plates.

A plate coated with the mother emulsion was first exposed in the spectrograph in order to obtain an idea of its characteristic sensitiveness. As this concerned only the violet and blue parts of the spectrum, and as the subsequent experiments on the red portion of the spectrum would apply only to portion from 490 $\mu\mu$ to the ground glass and dark-slide were slightly shifted sideways in order to include the full range of the violet. On the negative resulting from an exposure in this position, the maximum density was measured with the polarisation photometer, and it was seen that with exposure up to 120 seconds an appreciable action on the silver chloride could be seen up to 370 to 410 $\mu\mu$, whilst by longer exposure the band spread right and left, and at 960 seconds exposure extended from 360 to 450 $\mu\mu$. Contrary to gelatino-bromide of silver, the maximum of which lies at 450 $\mu\mu$, the maximum was

found among rays of shorter wave length, namely, at 395 $\mu\mu$. The density values were small, owing to the comparative unsensitiveness of the emulsion, and did not permit of any conclusion as to gradation since the times of exposure did not give readings higher than the limits of the schwellenwert. The results of this exposure are given in Fig. 1.

General Methods of Sensitising.

In trying the effect of different strengths of dye solutions, the stock alcoholic solutions of the colouring matters were diluted with distilled water to the required degree, and to the baths so obtained—except in cases where the contrary course was necessary—a few drops of ammonia added, preliminary experiments having shown, as already pointed out by Eder, that addition of ammonia favours the action upon silver chloride. The time of bathing was kept uniformly to 180 seconds, washing in running water was for the same time, and

the plates were quickly dried in a well ventilated cupboard, and were usually exposed and developed on the same day.

The Results of Bath-Sensitising with Various Dyes.

EOSIN-BATHED CHLORIDE PLATES.—Eosin solutions containing a little ammonia were used in the six strengths of 1:7,500, 1:15,000, 1:25,000, 1:50,000, 1:75,000, and 1:100,000, the plates in each case being bathed for three minutes, washed for the same time, quickly dried, exposed, and developed. The six negatives showed strong sensitising bands extending far into the blue part of the spectrum, and of length and density increasing with the concentration of the

to the bromide plate so that the sensitising band approximated to that of the general sensitiveness, it was found that in the case of silver bromide a spreading of its strong action in the blue toward the orange was observed, whilst the colour-sensitiveness moved only slightly forwards and remained within the limits of about 525 to 595. This confirmed the fact noted by Eder of the relatively great yellow-green sensitiveness of eosin chloride plates in comparison with bromide plates.

ERYTHROSIN-BATHED CHLORIDE PLATES.—Erythrosin solutions, of the strength already given for eosin, were prepared and applied to the plates. They gave strong yellow-green sensitising, even at the shortest exposure of 15 seconds. Comparison with eosin plates showed

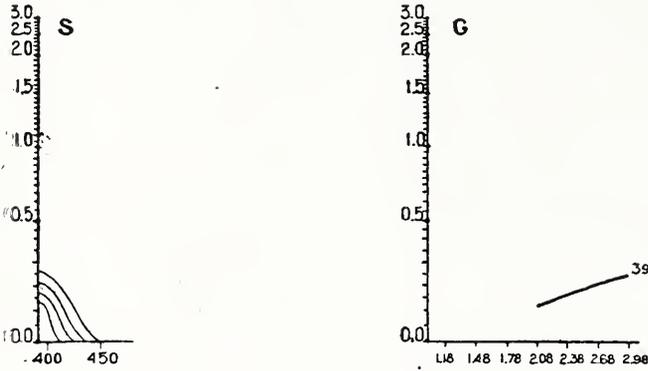

Fig. 1.

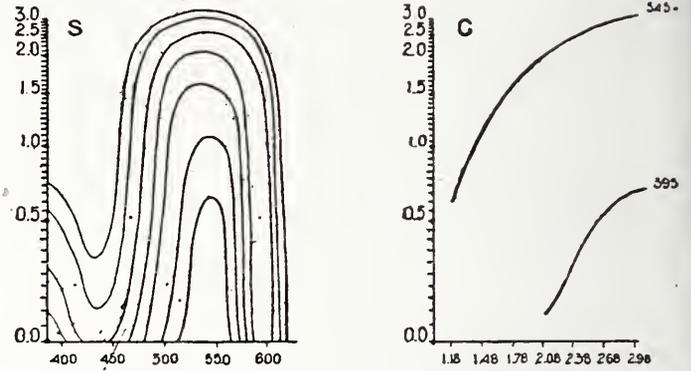

Fig. 2.

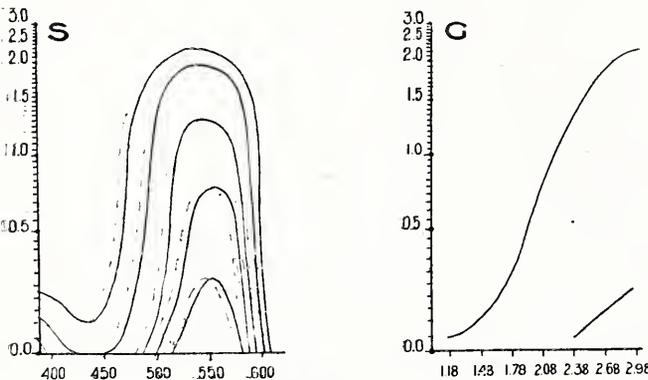

Fig. 3.

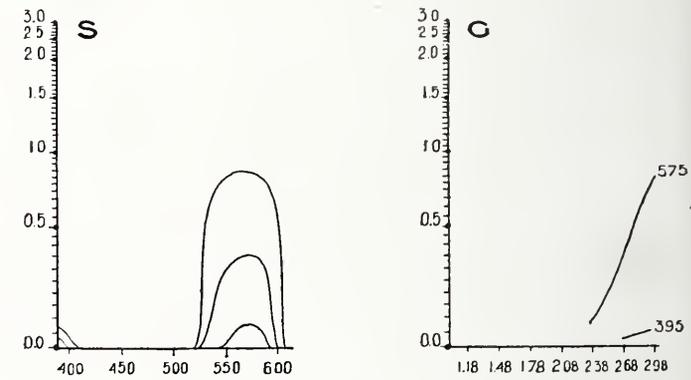

Fig. 4.

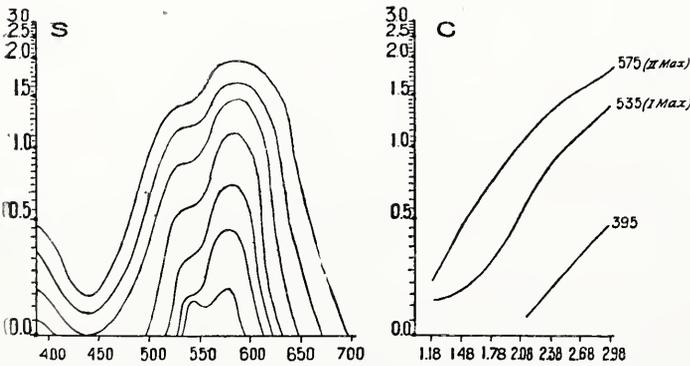

Fig. 5.

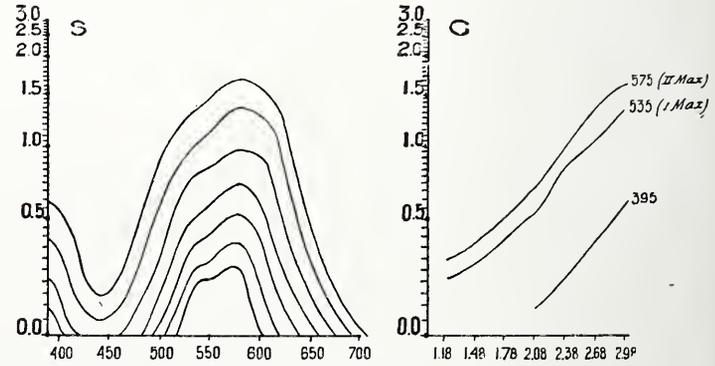

Fig. 6.

bath, becoming again weaker in the case of the 1:75,000 solution. The plate bathed in 1:50,000 showed the best sensitising, and its measurements are given in Fig. 2, from which it is seen that, even with short exposure, the sensitising for green and yellow is very strong, giving at 15 seconds' exposure practically the same density as the mother emulsion at the longer time of exposure of 960 seconds. In comparison with a bromide plate sensitised with eosin of 1:7,500 strength a slight shifting of the maximum towards blue was observable in the case of the chloride plate, whilst the sensitised region in the case of the chloride plate extended in both directions, and especially towards blue, distinctly further than in the case of the bromide, even with longer exposure. With longer exposures given

that the sensitising action was less than that of eosin. The best strength of dye solution for erythrosin was found to be 1:25,000. As regards the shifting of the maximum towards the blue the erythrosin plates behave similarly to eosin. (Fig. 3.)

ROSE-BENGAL-BATHED CHLORIDE PLATES.—The solutions were those used with eosin, but the action was far weaker than with either eosin or erythrosin, and the best result was found to be with a dilution of bath of 1:100,000, and an exposure of 60 seconds. For comparison with silver bromide a plate of the latter class was bathed in 1:30,000 rose-bengal solution, when it was found in contradistinction to the previous experiments that a shift of the maximum away from the blue was not discovered. Owing to the shortness of the

gives no conclusion as to the gradation of the plates sensitised with ethyl-red-bath. (Fig. 4.)

ETHYL-RED-BATHED CHLORIDE PLATES.—The time of bathing of three minutes was adopted and an equal time of washing. Of the different concentrations tried—namely, 1:50,000, 1:75,000, 1:100,000, and 1:200,000, the best result was obtained from 1:75,000. Two maxima were obtained as with bromide of silver—namely, at 535 and 575, becoming more plainly separated with shorter exposure. With longer exposure a somewhat indistinct gap could be recognised between them, this minimum being at about 555 μ . The course of the sensitiveness curve shows an increase of the general sensitiveness of the silver chloride, though this latter is still far behind that produced by sensitising. The former extends on longer exposure to 395 μ , for 960 seconds exposure the curve gradually rises, showing first maximum density at 515 to 545, which is followed by a second between 555 and 630. A bromide plate bathed in ethyl-red 1:50,000 showed no alteration in the position of the maxima, these being at 535 and 580. Comparison of the bands of sensitiveness of equal maximum density in the region 560 to 600 showed that in the case of silver bromide the band extended in both directions, and became

exert a remarkable dyeing action on silver chloride in comparison with the other dyes examined. At a dilution of 1:300,000 a very energetic action took place; a plate bathed in 1:200,000 was taken as the best result. The two maxima corresponding to the action of the dye on bromide plates were found to lie at 580 and 650 μ , with a more or less prominent maximum at about 615. A bromide plate bathed under the best conditions in a bath of 1:75,000 gave its maxima at 580 and 670, so that there is a shift towards the blue on the chloride plate only at the second maximum: the gaps showing between 500 and 520 in the case of the bromide plate are not so noticeable with gelatino-chloride. (Fig. 8.)

CYANIN-BATHED CHLORIDE PLATES.—Dye solutions of strengths 1:25,000, 1:50,000, 1:100,000, 1:150,000, 1:200,000, and 1:300,000 were applied, and gave almost corresponding negatives, with the exception of the last only. The composition of the bath was that recommended by Eder and Valenta for bromide plates, using an alcoholic stock solution of cyanin, diluted with distilled water and adding a little ammonia. Apparently the best result was given by a solution of 1:100,000. A bromide plate was sensitised in a 1:20,000 solution, and showed its maxima at 560 to 620, so that in the case of the

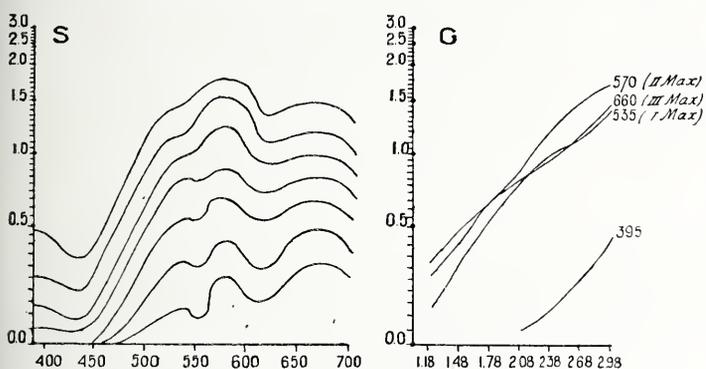

Fig. 7.

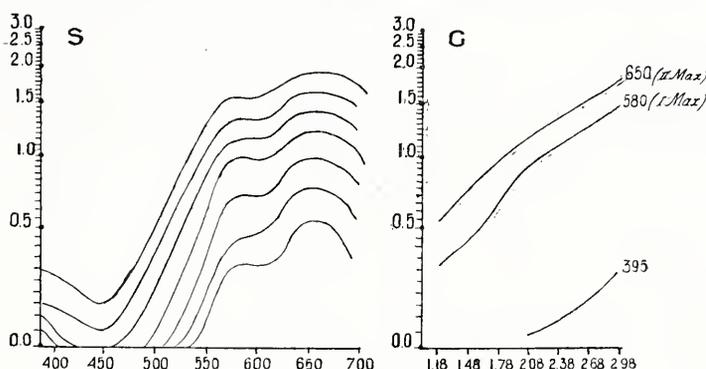

Fig. 8.

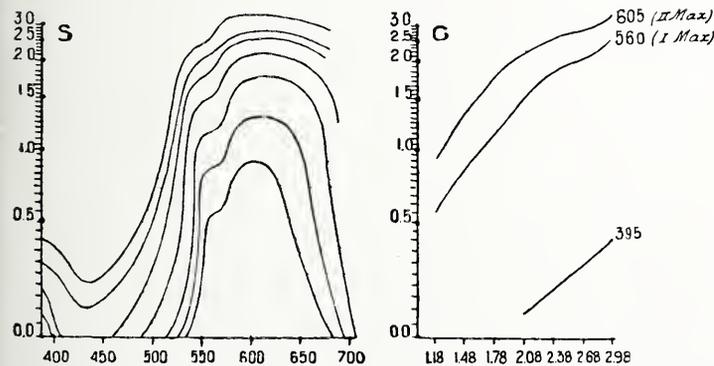

Fig. 9.

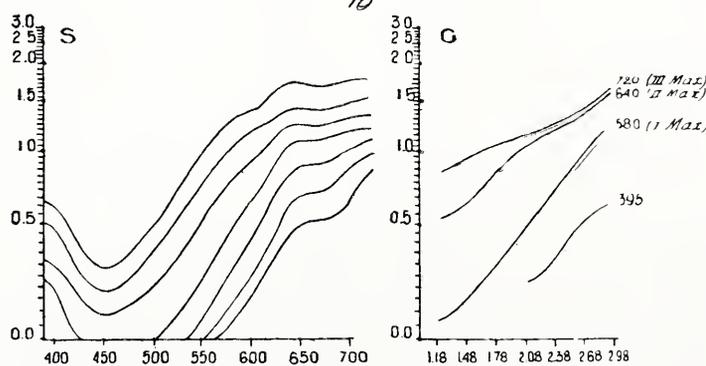

Fig. 10.

prolonged on increased exposure towards red more quickly than did that of silver chloride, but not, on the other hand, in the direction towards blue. The band of sensitiveness was more uniform in the case of the silver bromide. (Fig. 5.)

PINAVERDOL-BATHED CHLORIDE PLATES.—The use of dye baths, as given for ethyl-red, showed almost equally strong sensitiveness for all, and even the great dilution of 1:200,000 gave the same activity as the stronger solutions. Plates bathed in the 1:75,000 were measured and gave a good colour-sensitiveness, according to the length of exposure, up to 600 or 700, and containing, as in the case of silver bromide, two maxima at about 535 and 575. In the case of a bromide plate bathed in 1:50,000 pinaverdol, two maxima at 535 and 580 were obtained, so that there is only a very slight shift of the second maximum towards blue in the case of the chloride plate. (Fig. 6.)

ISOCOL-BATHED CHLORIDE PLATES.—The best results were obtained with 1:50,000 ammonia solution, though the sensitiveness bands were strongly marked in plates bathed in 1:200,000. In the case of a bromide plate bathed in 1:50,000 the three maxima lay at 530, 580, and 670, there being thus a slight shift towards the blue in the case of the chloride plate of the second and third maxima. (Fig. 7.)

PINACYANOL-BATHED CHLORIDE PLATES.—Pinacyanol proved to

chloride plate there is a shift in the second maxima about 15 μ towards the violet. (Fig. 9.)

DIYANIN-BATHED CHLORIDE PLATES.—The best effect was seen to be that with a bath of 1:150,000, three maxima not readily distinguished from each other, being seen at 580, 640, and 720. A bromide-plate was sensitised according to the directions of the Hoechst Works, washed free with alcohol instead of water, as otherwise the result was not free from fog. It showed a gap at 510 to 540, and maxima at 585, 650, and 730, a slight shift in comparison with the chloride-plate. (Fig. 10.)

DIAZO-BLACK BATHED CHLORIDE PLATES.—The stock solution of this dye was made of 1-500 strength in a mixture of equal parts-water and alcohol, and was used further diluted with water in order to give strengths of 1-2,500, 1-5,000, and 1-10,000 with the addition of a little ammonia. The plates were bathed and washed in each case for three minutes. The sensitising was almost the same in each case. Whilst in the case of the dyes hitherto examined the colour sensitiveness was unequally stronger than the characteristic sensitiveness of the silver chloride, in the case of the diazo-black the latter exceeded the colour sensitiveness, yet was not inferior in density to an unsensitised plate. Bromide-

plates bathed in 1-5,000 and 1-10,000 diazo-black showed, on full exposure, weak bands of sensitiveness with a maximum at 620, the maximum in the case of the chloride plate being at 610. The general action of the sensitiser on the chloride emulsion was so slight that it was not possible to obtain a curve of gradation nor a graphic record of the curves of sensitiveness. (No figure.)

Experiments on Emulsion Chloride Plates.

In testing the action of the dyes on plates coated with emulsion containing the latter the same formula already given was employed, the emulsion being subjected to lengthy treatment with alcohol. After washing the emulsion was freed as far as possible from adhering water, and the nodules placed in 96 per cent. alcohol. This latter was poured off after some days, replaced by fresh, and the emulsion then put aside in well-closed vessels and stored in a cool place for three months. Before being worked up the alcohol was again employed to saturate the nodules after they had been allowed to remain standing for some hours in distilled water, the emulsion liquefied, and, as it proved in this state to be much too viscous, brought to its original volume by addition of water, and, finally, filtered. Thus treated the emulsion was divided into a number of measured portions for the purpose of dyeing-up with the colouring matters already mentioned, and, further, in order to test the effect of each separate dye in different degrees of concentration. In adding the dye solutions the prescriptions used for the manufacture of orthochromatic and panchromatic bromide plates were taken as a working basis and applied to other dyes of the same class. Thus in the case of erythrosin the usual

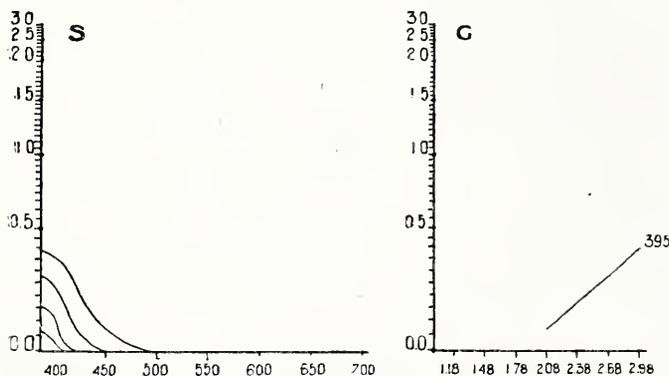

Fig. 11.

mixture of 3 ccs. of 1-500 dye solution per litre was applied also to eosin and rose bengal, whilst 3 ccs. of ethyl-red 1-1,000 added to each litre of emulsion was employed in the case of the pinaverdol, isocol, and pinacyanol, and the same quantity of cyanin emulsion as of dicyanin was used. In the case of diazo-black 30 ccs. of a 1-500 solution per litre were employed as recommended by Neuhaus.¹ Further, in the case of each of the ten dyes a smaller and greater proportion was employed, so that altogether 30 emulsions were prepared, composed as follows:—

Nos. 1 to 9, sensitised with eosin, erythrosin, and rose bengal, to the amount of 1, 3, and 6 ccs. respectively of 1-500 dye solution per litre of emulsion.

Nos. 10 to 21 sensitised with ethyl-red, pinaverdol, isocol, and pinacyanol to the extent of 1, 3, and 6 ccs. 1-1,000 dye solution per litre of emulsion.

Nos. 22 to 27, sensitised with cyanin and dicyanin to the extent of 1, 3, and 6 ccs. 1-1,000 dye solution per litre of emulsion.

Nos. 28 to 30, sensitised with diazo-black with 10, 30, and 60, ccs. dye solution 1-500.

The coating of such a number of different emulsions, most of which were more or less sensitive to all parts of the spectrum, was a task of no little practical difficulty, and, therefore, only one-half of the mother emulsion was prepared in the way described, the remainder on the following day. In order to prevent possible alteration of the proportion kept over-night it was, after setting, covered with benzole, as recommended by Homolka for such cases.² The dyeing of the emulsions in the case of the smaller quantities

necessary for the few experimental plates was carried out in such a way that the dye solutions measured in a pipette were added to the correct quantity of emulsion previously placed in an Erlenmeyer flask, the addition being made with a vigorous rotatory motion. A proper mixture was thus obtained, and it was thus possible to manipulate emulsions sensitive to the more refrangible parts of the spectrum, since after the necessary measurements which were done by aid of a dark-room lamp fitted with "flexoid" filter absorbing light up to the wave length 660, the mixing could be done in almost total darkness.

The coating of the plates containing the dye was done, as far as possible, in the shadow of the lamp, and with all possible expectation. With the exception only of the dicyanin plates, which showed only a very slight fog after developing, the whole of the exposures gave perfectly clear negatives. The coating with emulsion of the glass plates, which in this case were 13 x 12 cm. size, was done in the way already described for the undyed emulsion, as was also the drying and further operations. In order to ascertain whether any alteration in the nature of the mother emulsion, due to three months' storage under alcohol, had taken place, an unsensitised plate was exposed in the spectrum and developed. It gave a band of sensitiveness inappreciably longer and denser than that previously obtained with emulsion fresh made. (Fig. 11.)

F. WENZEL.

(To be continued.)

THE PROPOSED COPYRIGHT BILL.

The following is the draft of the Copyright Bill which has been drawn up by the Artistic Copyright Society, and is a drastic revision of the Bill which we reprinted and commented upon about two years ago. Since that time the Artistic Copyright Society, as we explain on another page, has embodied clauses in the Bill and has modified others, with the result that the Bill, as it now stands, is fair to photographers, and greatly simplifies many of the intricacies of copyright law:—

A Bill intituled An Act to Consolidate and Amend the Law Relating to Copyright in Artistic Works.

Be it enacted by the King's Most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and, by the authority of the same, as follows:—

PART I.—NATURE AND DURATION OF RIGHT.

1. Except as hereinafter provided, the author, (being a British subject,) of any work of fine art, photograph or cast from nature made after the passing of this Act, in any country whatsoever, and the author, (whether a British subject or not,) of any work of fine art, photograph, or cast from nature, made after the passing of this Act in any part of the British Dominions, and their respective assigns shall have copyright throughout the British Dominion.

2. (1.) The copyright in any work, the subject of this Act, shall consist in the exclusive right of the author or other owner of the copyright and his assigns to make, or permit to be made, for sale, distribution, exhibition or hire, any copy of such work.

(2.) All copies made in infringement of the said exclusive right shall be unlawful copies within the meaning of this Act.

3. The copyright conferred by this Act shall endure for the following terms:—

(a) In the case of an original work of fine art, for the life of the author and until the expiration of thirty years after the end of the year in which he died.

(b) In the case of a work of fine art, made by one person from any work of fine art designed by another, of a cast from nature and of a photograph, for a term commencing on the completion of such work, cast, or photograph, and continuing until the expiration of thirty years after the end of the year in which the same shall have been completed.

4. Every assignment of copyright under this Act, other than an assignment by operation of law and every licence respecting the same shall be in writing signed by the assignor or licensor.

5. (1.) In case any work of fine art, the subject of copyright under this Act, shall be a portrait made on the request of any person, for pecuniary consideration, the copyright in such portrait shall, on payment of the consideration and in the absence of agree-

¹ Eder's "Jahrbuch," 1901, page 121.

² Eder's "Jahrbuch," 1906, page 15.

ent in writing to the contrary, belong to such person. But this shall not extend to a work of sculpture intended for a place or building of a public nature.

(2.) For the purposes of this section any work shall be considered a portrait whose principal object is the likeness in any form of art of any specified person.

6. In the case of a photograph which is made to order for a valuable consideration, the person to whose order it is made shall be entitled to the copyright therein in the absence of agreement in writing to the contrary, upon payment of such consideration.

7. Except as in this Act provided, the copyright in any work the subject of this Act shall remain in the author, whether such work is sold or disposed of by such author or not, unless such copyright is expressly assigned in writing by him; or pass by operation of law.

8. (1.) If any work the subject of copyright under this Act forms part of any scene, the copying of such work, merely as forming part of such scene, shall not be deemed to be any infringement of the copyright in such work, unless the special purpose for which the scene is represented is the copying of such work.

(2.) Notwithstanding anything in this Act contained, sketches, studies, models and casts, used in executing any original work of fine art may, in the absence of agreement in writing to the contrary, be used or dealt with by the author of such work or a person claiming title through him, without infringing the copyright in such work, provided that he does not thereby repeat or imitate the main design of the work.

PART II.—INFRINGEMENTS AND REMEDIES.

9. If any person shall, without the consent in writing of the owner of the copyright when such act is done:—

- (1) Make any copy of a work, the subject of copyright under this Act: or
- (2) Sell, distribute, exhibit or let for hire, or offer or keep for sale, distribution, exhibition or hire any such copy: or
- (3) Import into or export from any part of the British Dominions any such copy:
- (4) Cause or procure any of the above acts to be done:

Such persons shall be liable at the suit of the owner of the copyright to:—

- (a) An injunction to restrain such infringement.
- (b) Damages, or at the option of the party suing, an account of profits.
- (c) Penalties of a total amount to be fixed by the jury hearing the case, or if there is no jury, by the judge, not exceeding ten pounds for each offence, together with twice the price at which such copy shall have been sold or offered for sale.
- (d) An order for delivery up on oath for forfeiture or destruction of all unlawful copies.

10. (1.) Any person having in his possession or control any unlawful copies of any work the subject of this Act, shall, upon demand in writing served upon him by the owner of the copyright, make to such owner, within forty-eight hours after service of the demand, full discovery of the name and address of the person from whom he obtained the unlawful copies, the number thereof, and the date when they were obtained, and of all invoices, accounts, and other documents relating thereto; and in default of such discovery may be summoned before a Court of Summary Jurisdiction, and ordered under a penalty of ten pounds to give such discovery within a reasonable time to be appointed by the Court.

11. Any Court of Summary Jurisdiction, on the application of the owner of the copyright in any work the subject of this Act, on being satisfied that there is reasonable ground to suspect that unlawful copies of any such work are to be found in any house, premises, or other place within its jurisdiction, shall grant a warrant to any constable to search for such suspected unlawful copies in such house, premises, or other place, between sunrise and sunset, and to seize and bring before the Court any such suspected unlawful copies, and the Court on proof that such copies are unlawful copies within the meaning of this Act, shall order them to be destroyed or delivered up as forfeited to the owner of the copyright.

12. (1.) If any person in any street or highway, or elsewhere than at a house or shop, shall hawk, carry about, sell, or offer for sale any copy suspected to be an unlawful copy of any work, the subject of this Act, every such suspected unlawful copy shall be summarily

seized by any constable, without warrant, on the request in writing of the apparent owner of the copyright in such work and at his risk.

(2.) On seizure of any such copies, they shall be conveyed before a Court of Summary Jurisdiction, and the Court on proof that such copies are unlawful copies within the meaning of this Act, shall order them to be destroyed or delivered up as forfeited to the owner of the copyright.

(3.) An order for destruction under this and the preceding section may, if the Court think fit, be made *ex parte*, and, pending the making of an order, the copies seized shall be detained by the Court.

13. All unlawful copies of any work, the subject of copyright under this Act, imported into any part of the British Dominions, shall be detained by the officers of His Majesty's Customs on receipt by them of a notice in writing from the owner of the copyright in such work declaring on oath his title to and the period of copyright in such work, or if not on oath stating such title and period and accompanied by a certificate of registration of such work. Every such notice must be accompanied by a description, photograph, sketch, or other copy of such work.

14. (1.) If any person fraudulently signs or otherwise affixes or causes to be signed or affixed upon any work of fine art, any name, initials, monogram, or distinctive mark so as to give reasonable ground for belief that such work is an original work of fine art, contrary to the actual fact, executed by an author either then alive, or who died within thirty years preceding the acts complained of, such person shall be guilty of forgery, and on conviction be liable to be kept in penal servitude for a term not less than three nor more than ten years.

(2.) If any person commits any of the following offences:—

- (a) Fraudulently sells, distributes, exhibits, lets for hire, or offers or keeps for sale, distribution, exhibition, or hire, any work of fine art so falsely signed or marked as aforesaid or permits, or causes to be done any of the said acts,
- (b) Fraudulently sells, distributes, exhibits, lets for hire, or offers or keeps for sale, distribution, exhibition, or hire, any work or the copy of any work the subject of this Act, representing, contrary to the fact, that such work or copy was executed by, or from the work of, an author then alive, or who died within thirty years preceding the acts complained of or causes to be done any of the said acts,

he shall be guilty of an indictable misdemeanour punishable by imprisonment for a term not exceeding two years, and he shall (without prejudice to any other remedy) be liable to a penalty of one hundred pounds, to be paid to the person aggrieved.

(3.) The provisions of sections 10, 11, 12 and 13 of this Act shall apply to such false or fraudulent works or copies in the same way as if they had been unlawful copies within the meaning of the Act: and any person aggrieved shall be entitled to make demand, application, request or notice thereunder whether he be the owner of the copyright or not.

15. (1.) When the author of any original work of fine art, the subject of copyright under this Act, shall have sold or otherwise parted with the possession of such work, no material alteration shall afterwards be made in such work by addition or otherwise except with the consent in writing of the author.

(2.) Neither shall it be lawful during the continuance of the copyright (except with the consent in writing of the author) to sell, exhibit, let for hire, or offer for sale, exhibition, or hire:—

- (a) any altered original work of fine art,
- (b) any copy of such altered original work of fine art,
- (c) or any altered copy of any original work of fine art as or for
 - (a) the unaltered original work of fine art,
 - (b) the copy of an unaltered original work of fine art,
 - (c) an unaltered copy of an original work of fine art of such author.

(3.) Any person who shall knowingly commit or cause to be committed any infringement of the above provisions shall be liable to a penalty not exceeding one hundred pounds to be payable to the author of the original work or his assigns, without prejudice to any other remedies of such author, or any other person aggrieved.

16. Any person who shall falsely mark or cause to be falsely marked any copy of a work requiring to be marked under this Act, with knowledge of the falsity of the mark, or who shall fraudulently

remove or cause to be fraudulently removed the copyright mark from any such work, or who shall fraudulently claim copyright, shall be guilty of an indictable misdemeanour, and shall in addition be liable at the suit of any party aggrieved to a penalty not exceeding ten pounds for every such offence.

17. (1.) In any action for infringement the person sued must deliver with his defence or at any subsequent time which the Court may appoint, particulars of any objections to the claim of the plaintiff on which he relies in support thereof; and, if one of the grounds of objection be want of title in the person suing, such particulars must state the name of the person whom he alleges to be the true author of the work or owner of the copyright, and the title and date of any alleged previous work or publication on which he relies.

(2.) On the trial of the action, in the absence of such objections, the title of the person suing shall be taken as admitted, and no evidence shall (except by leave of the Court) be admitted in proof of any alleged objection of which particulars have not been so delivered; but any particulars delivered may be from time to time amended on such conditions as to costs and otherwise as the Court shall think fit.

18. No person shall be excused from answering any question upon examination as a witness, or from making any discovery either in answer to interrogatories or of documents, on the ground that such answer or discovery may render him liable to the penalties imposed by this Act. Provided always that no answers or discovery which any person shall be compelled by this Act to make, shall be admissible in evidence against him in support of any criminal proceedings, other than those for penalties under this Act.

19. (1.) All penalties and fines which shall be incurred under this Act may be recovered, and all unlawful copies and other things which may be liable to forfeiture or destruction under this Act, may be dealt with either by action or by proceedings before a Court of Summary Jurisdiction, against the party offending, in that part of the British Dominions where the offender is found, or the Act complained of has been committed, or where the unlawful copies or other things are.

(2.) All remedies conferred by this Act shall be cumulative, but the Court or jury shall have a discretion as to awarding penalties, in addition to damages, in any case where the defendant shall prove due compliance with any demand for discovery served on him as provided by Section 10 of this Act.

(3.) The costs of all proceedings under this Act in which an infringement shall be proved, shall, unless the Court shall otherwise direct, be taxed as between solicitor and client so as to give the person aggrieved a full indemnity for all his expenses.

(4.) All false, fraudulent or unlawful works, or copies to which Sections 13, 14, or 15 of this Act apply, shall be liable to destruction, or may be ordered to be delivered up on oath as forfeited to the person aggrieved.

(5.) When any works or copies become liable to seizure, forfeiture, destruction or confiscation under this Act, such liability shall extend to and include all plates, blocks, negatives, moulds, or other similar things from which any of such works or copies were or may be produced.

PART III.—MARKING OR REGISTRATION.

20. (1.) The owner of copyright in an original work of fine art, of which copies have been issued by or with the authority in writing of such owner or his predecessors in title shall not be entitled to sue for infringement of his copyright unless he proves:—

That he and his predecessors in title respectively have taken all reasonable steps to ensure the marking of copies issued by him or them or with his or their authority in writing with one of the following marks, either:—

(a) with the name of the Author of the original work and

the mark ,

or (b) if the copyright of the original work has been registered at Stationers' Hall before Writ issued, with the mark

.

(2.) The owner of copyright in any other work the subject of

copyright under this Act shall not be entitled to sue for infringement of his copyright unless he proves:—

That he and his predecessors in the title have taken all reasonable steps to ensure that the work and the copies thereof issued by him or them or with his or their authority in writing is marked with one of the following marks, either:—

(a) with the name of the owner of the copyright when the work was completed or the copy was issued, the year

completion of the work, and the mark ,

or (b) if the copyrights in such work has been registered at Stationers' Hall before Writ issued, with the mark

.

Provided that—

(a) Where copies are mounted the above provisions shall be complied with, if the prescribed mark appears on the mount and the attachment of the work to the mount is of a permanent nature.

(b) When the owner of copyright proves that he and his predecessors in title have taken all reasonable steps to ensure the marking of copies as prescribed, but it appears that one or more copies have not been so marked, a defendant who proves that he has been misled by the absence of such mark and had no reason to believe when he committed the infringement complained of that he was infringing copyright shall not be liable to any of the provisions of this Act in respect of copies made or dealt with previous to the written notice from the owner.

(c) The above provisions shall not apply to any work in which copyright is claimed under the provisions of the International Copyright Act, 1886, or any statutory modification thereof.

21. (1.) There shall be kept at the Hall of the Stationers' Company by the officer appointed by the said Company for the purposes of the Copyright Act, 1842, a book or books entitled "Register of Owners of Copyright in Works of Art," wherein may be registered the ownership of the copyright in any work of art the subject of this Act (including original works of Fine Art first made in the United States of America by a citizen thereof), and any assignments thereof.

(2.) Application for registration and the entries in the register shall be in such forms as the Stationers' Company may from time to time prescribe.

(3.) There shall not be entered in any such register any notice of any trust, express, implied, or constructive.

(4.) The said officer shall make and keep full indexes of the entries made under this Act, arranged alphabetically so as to show (a) the title or description of the work, (b) the name of the author and (c) the name of the owner, with references to the place in the register where the full particulars of registration may be found.

(5.) The said officer shall have power, upon written application being made to him by any registered owner, and on his being satisfied of the existence of any inaccuracy in the registration, to make any correction in the name, address or description of the author or publisher, or of such owner, or in any other matter as stated in the original application for registration.

22. Save as in herein provided, the several enactments contained in Sections 11, 12, 13, and 14 of the Copyright Act, 1842, shall apply to registration under this Act in the same manner as if such enactments were here repeated at length so far as the same are applicable except that the fee for making any entry of a single copyright work or giving any certificate of a single copyright entry shall be the sum of one shilling.

In the event of a number of entries being made at one time by an owner of copyright in works dealt with under this Act, the fee shall be as follows:—

For 12 entries made together	5s.
For 36 " " " "	10s.
For 100 " " " "	£1

and certificates of such joint entries shall be issued at the same rate of charge.

PART IV.—SUPPLEMENTARY PROVISIONS AND DEFINITIONS.

23. (1.) The copyright existing in any work of fine art, photo-

graph, or cast from nature by virtue of any enactment in force immediately before the commencement of this Act, shall endure for the term limited by such enactment, or for the term fixed by this Act with respect to such works first made after the commencement of this Act, whichever is the longer.

(2.) The provisions as to registration or marking of copies of such existing works first issued after the passing of this Act, and the remedies for infringement of copyright therein and otherwise shall be the same as for works made after the commencement of this Act.

(2.) The registration of any original work of Fine Art first made in the United States of America by a citizen thereof, if effected within twelve months after the first recording of the copyright in the said United States, shall confer the same rights on the person named therein as owner as if the said work had been first made in the United Kingdom.

(4.) Nothing in this section shall diminish or prejudice any rights or interests subsisting at the commencement of this Act.

24. (1.) The Acts specified in the Schedule to this Act are hereby repealed, provided that the copyright in any existing work registered in pursuance of any enactment hereby repealed shall be deemed to be registered in pursuance of this Act.

(2.) The Patents Designs and Trade Marks Acts, 1883 to 1888, the Patents and Designs Act, 1907, and the Patents and Designs (Amendment) Act, 1907, shall not apply to any work of fine art being a design of an artistic nature to which this Act shall apply.

25. Nothing in this Act shall affect the right of any person at common law to prevent the publication of an unpublished work, except that the purchaser of an unpublished work the subject of copyright under this Act shall not be entitled at common law to prevent the publication of any copy of such work by the owner of copyright in such work.

26. A licensee shall have all the remedies for infringement possessed by an owner of copyright under this Act in so far as his interest shall extend, but no further or otherwise.

27. Nothing in this Act shall confer copyright in any profane, libellous or indecent work.

28. An agent duly authorised in writing may do for the author or his assigns or other owner of the copyright any act required or authorised by this Act to be done by them, and every act so done shall be as effectual for all purposes of this Act as if done personally by such author, or his assigns or other owner of the copyright.

29. In and for the purpose of this Act, unless the context otherwise requires,

(1.) "Work of fine art" shall mean and include every painting or drawing, sculpture, and engraving, as hereinafter defined, and any other like work of fine art, and shall include any design of an artistic nature applicable or applied to any article of manufacture whether so applicable or applied in respect of the pattern, or the shape or configuration, or the ornament thereof.

(2.) "Painting or drawing" means any painting or drawing in any medium or material, executed by hand and not by printing or any mechanical or chemical process.

(3.) "Sculpture" means any statue, sculpture, model, or cast (other than a cast from nature), carved or made in any material either in the round, in relief, or in intaglio by any process.

(4.) "Engraving" means any work executed by hand (and not by photography, or any mechanical means) upon any material whence prints or impressions of such work may be taken or multiplied immediately or mediately by any process, and includes any prints or proofs so taken.

(5.) "Original work of fine art" shall mean a work of fine art made by a person from or according to his own original design.

(6.) "Photograph" shall mean and include the photographic negatives or positives and every work produced by any photographic process upon any material whence prints or copies of such work may be taken or multiplied definitely or indefinitely, and any such work though developed or finished by hand, or by any mechanical means, and shall include any prints, proofs, or copies made therefrom.

(7.) "Cast from nature" shall mean and include all moulds of natural objects or parts of such objects and all casts made from such moulds.

(8.) "Author" shall mean the inventor, designer, engraver, or maker of any work the subject of copyright under this Act.

(9.) "Author" shall in relation to a photograph mean the person who shall himself (not being an employe or assistant) have taken the original photographic negative or positive, but in the case of a photographer who employs another person to do the work and who gives pecuniary consideration for work done, such photographer as against the person employed shall be considered the author of the work.

(10.) "Assign" includes any person claiming copyright through the author, either by express assignment, or operation of law.

(11.) "Copy" shall, subject to the provisions of this Act, mean any representation or reproduction or colourable imitation of a work, or any part thereof, or the design thereof, in the same or in any other form, and in any material and in any size; and shall include:—

- (a) A reproduction of a work of fine art by using or applying it either in the pattern, or in the shape or configuration, or in the ornamentation of any article of manufacture.
- (b) A reproduction of any other work of fine art, cast from nature or photograph by a sculpture, or of a sculpture by any other work of fine art or photograph; and
- (c) A representation of any work by a living picture, or by any other means whereby the design of the work is reproduced.
- (d) And the expression "copying" shall be construed accordingly.

30. No actions and other proceedings for any penalties under this Act shall be commenced later than 12 calendar months after the discovery of the offence.

31. (1.) This Act may be cited as "The Artistic Copyright Act, 1907."

(2.) The expression "The Copyright Acts," wherever it occurs in the International Copyright Act, 1886, or any Order in Council to be construed as part thereof, shall be deemed to include this Act.

SCHEDULE.—Acts or Parts of Acts Repealed.—8 George II., c. 13 (The Engraving Copyright Act, 1734); 7 George III., c. 38 (The Engraving Copyright Act, 1766); 17 George III., c. 57 (The Prints Copyright Act, 1777); 54 George III., c. 56 (The Sculpture Copyright Act, 1814); 6 and 7 William IV., c. 59 (The Prints and Engravings Copyright (Ireland) Act, 1836); 15 Victoria, c. 12, § 14 (The International Copyright Act, 1852); 25 and 26 Victoria, c. 68 (The Fine Arts Copyright Act, 1862).

RAPID ARTIFICIAL-LIGHT PORTRAITURE.—Mr. J. P. Bamber, of Blackpool, sends us a copy of the "Gazette-News" of his town for the 12th inst., containing reproductions of 96 different photographs taken at a recent children's fancy-dress ball. Mr. Bamber writes:—"I exposed 115 negatives of the same number of different sitters in three hours. I only had two moves out of the number. I send these to inform brother photographers what can be done with the Cooper-Hewitt mercury-tube lamp (one only). The lighting is perfect in the original prints. The children were taken one after the other, as fast as I could go."

REMOVING STUCK STOPPERS.—Re-agent bottles holding caustic alkalis, alkaline carbonates, etc., very frequently become fixed, and the usual method has been to tap the stopper with a wooden block, or the application of heat to the neck, or a combination of both. Results are poor in certain cases and often result in the fracture of the neck. The inverse process (writes R. Bolling in the "Scientific American") may be used to advantage. In other words, freeze the stopper, thus causing a contraction of the stopper from the neck. The bottles which I used for experiment had failed to open under the heating and tapping, and were bad cases of fixed stoppers. The bottles held sodium carbonate that had formed sodium silicate, an excellent cement, and so were firmly fixed. They were inverted in a mixture of crushed ice and calcium chloride, taking care that the freezing solution did not touch the lips of the bottles. After standing twenty minutes, each stopper was removed without the slightest exertion. This is the neatest and safest way to remove stoppers from bromine bottles and other corrosive chemicals.

PHOTOGRAPHIC TRADE WITH PORTUGAL.

SINCE the publication of our article ("B. J.," November 27, 1908, p. 903) on the photographic trade between Germany and Portugal a reader in Lisbon has sent us a copy of the last statistical report issued by the Portuguese Government. It relates to the year 1906, and as the figures show the shares of the various countries in the import trade of photographic apparatus and materials with Portugal, we may re-print them.

PHOTOGRAPHIC APPARATUS.

Total imports	1,129	pieces of value	£5,133

Our correspondent adds his opinion that during 1907 and 1908 the imports have increased in favour of France and Germany. He complains, in regard to apparatus, that the English goods are very dear, and further that the British makers do not adapt themselves to the market as do the French and Germans. They claim that the apparatus is better than that of other countries, but the writer further alleges that, whereas the Continental makers specially manufacture for metric sizes, the English supply apparatus based on inch measurements.

Exhibitions.

SCENES AND FIGURES OF THE SICILIAN COAST.

IN the fifty and odd examples of the work of Count von Gloeden, now on view at THE BRITISH JOURNAL OF PHOTOGRAPHY'S gallery, there is a haunting feeling of calamity which reads itself into every picture despite all one's efforts to forget the disaster of the fair lands neighbouring those depicted here. It is natural that, having such models at command and working in the very nest of classic things, Count von Gloeden should seek to rehabilitate the pictorial traditions of classicism. Accordingly, we find in most cases a deliberate posing of the model with that end in view. The result may not in every instance be absolutely happy, but it is probably much to be preferred to a rough and ready snapshotting, and its consequent æsthetic sins. There is just a question, nevertheless, whether the Count has been quite well advised to construct a tableau here and there, or even to garnish his models with fillets and wreaths, and to cause them to play antique pipes and hold antique vases. To the ordinary mind the bodily beauty of these youthful models is in itself enough to bridge the gulf of centuries and remind us that these are the sons of Antinous, still inheriting the soil that our school-days thought sacred to Homer, knowing nothing of Cook's Tours, and all thereby implied. The accessories do but remind us of the camera and of Count von Gloeden's taste and skill. It must be admitted that with one exception he never

introduces the solecism, that unforgivable shock to a hyper-sensitive mind. His pictures are always in scrupulous keeping; but for our own part we prefer such things as are classic intrinsically and not helped by artifice. For instance, a pair of sweethearts, in the modern garb of Italian peasants, is one of the choicest things in the exhibition. The girl's arms are round the somewhat diffident swain's neck, and their heads are near together, so that the whole is beautiful as a composition. The beauty of their faces and expressions completes the charm. As Morris said: "Love is enough." In this case it makes a better "classic" of this piece than the introduction of symbols or "attributes" could. To its left hangs a fine example of the *mise en scène* method, a group of youths dancing in a ring under a pergola formed upon massive columns. As a composition it is first-rate, and the atmospheric effect of the distant plains is all that could be desired; but one must not look into the individual figures, or self-consciousness will be found. The group as a whole is quite good. A very charming picture is made by a little pensive girl sitting in the sun upon some massive masonry overgrown with wistaria, whose roots are in large earthen jars. A sort of amphora figures also in another print, where it takes a foreground place and sets off the figure of a girl in the costume known to Londoners as Neapolitan. Some idea of the physical grace of these models can be had in the reclining turbaned figure, robed in a loose garment and examining a Turkish slipper. His legs are quite bare, but they are immense and statuesque in their beauty. In fact, were this a drawing we should question the accuracy of its proportions. We enjoy this work till we see the bare planks upon which the model has been arranged, and then we turn from it with "that tired feeling" which comes always when the art is not concealed.

Of the landscape subjects, the best is a fine and romantic view of stone pines over-towering some more of the half ruinous Cyclopean masonry which Count von Gloeden employs to such advantage. At the foot of it is a little figure, happily placed; but this time only as an accessory. The composition is a highly successful achievement, reminding one vividly of the painted work of Boecklin. Some views of the bay of Taormina, seen through trees, over carved stone seats upon a hillside, are particularly interesting.

PORTRAIT PHOTOGRAPHS BY R. DÜHRKOOP AT THE R.P.S.

WHEN the work of a man has been made public to the extent that Herr Dührkoop's has reached, one is prepared to find in an exhibition devoted entirely to his pictures a goodly number of things that the illustrated papers and catalogues have made readily recognisable. In Herr Dührkoop's case, however, this state of things does not obtain; for in the collection now on view at the rooms of the Royal Photographic Society, numbering ninety examples, we were surprised to find that about seventy were either quite new or as yet unacknowledged. This fact says something for the extensiveness of Herr Dührkoop's output. A survey of the prints proves also that it is not a mere choice picking that has hitherto been shown to the public. Many of these works, new to English eyes, have all the charm and qualities that astonished the London photographic world when, a year or two back, THE BRITISH JOURNAL OF PHOTOGRAPHY first adequately introduced the Hamburg artist by an exhibition in Wellington Street. Under the title "Her Baby" we have another version of the mother and child subject, so often affected by Herr Dührkoop, and with such invariable success. This one shows the mother reaching forward her face against the child's, and adopting a pose which was a favourite with Rossetti. It is so pictorial and painterlike that it might easily pass for a photographic reproduction of a painting by Bougereau, the manner of which it resembles in its clear-cut forms. We think "The Motor Cap" a most engaging portrait, with its pretty turn back of the head at full-face over the shoulder.

In writing of Dührkoop prints it is almost impossible to avoid references to painters. It is very evident that their author is an ardent student of the Old Masters. "The Old Jewels," a lady wearing a triple necklace, is alive with reminiscences of Velasquez. We have already mentioned Bougereau; we may further allude to "Virginia," a little plump girl whose face is shaded by a large hat; and the magnificent "Study"—a leaning figure with black velvet robe and hat—each as typical Rembrandts. Indeed, the last closely resembles that master's Don Tito, in face, dress, and the manner of presentment. Then we have certain seated profile figures, near

against walls, which inevitably call up memories of Whistler. We have Hals in the Burgomasters, whose traditional costume of furs and ruffs so greatly help the illusion. More than ever in "Mother and Children" we see a group designed, apparently by intention, upon the lines of a well-known Raphael, of the Madonna, Infant Christ, and St. John. To any who like the pastime, there are abundant parallels to be found of this nature. They are, of course, due to the creditable following, unconsciously, of the principles observed by the greatest artists in portraiture. These principles, which include not only those of form, but those of chiaroscuro, are in reality the backbone of Herr Dührkoop's success. This is proved by comparing works so inspired with others, good enough technically, which follow the ordinary photographic view, involving sharp perspective and other modernisms. As pictures these are by far the less satisfactory.

There are nine excellent enlargements, of which nothing can be said that is not praise. They show none of the awful falling away of the ordinary enlargement, but retain all the force and richness, and all the delicacy of modelling and gradation, that the direct prints possess. There are eight prints which the catalogue distinguishes by asterisks, with the information that they "were presented to the R.P.S. by Mr. E. O. Hoppé, on behalf of Mr. R. Dührkoop when the latter was elected a Fellow of the Society." Our readers will probably discover the exact meaning of this cryptic sentence. We cannot help them, not knowing how one may "present" a thing on behalf of some one else, nor understanding to whom the credit of the presentation is due, though we presume it must be to Mr. Hoppé, since his name stands first.

FORTHCOMING EXHIBITIONS.

December, 1908, to January, 1909.—Kiew International Photographic. Sec., S. T. Horovitz, Technical Society, Kreshtchatik, 10, Kiew, Russia.

1909.

January 6 to 27.—Northern Photographic (Manchester). Sec., S. L. Coulthurst, Broad Oak Road, Worsley, Manchester.

January 19 to 30.—Glasgow Southern Photographic Association. Sec., Robert Lindsay, 189, Allison Street, Glasgow, S.S.

January 27 to 28.—Bedford Camera Club. Entries close January 15. Sec., K. Gammell, 21, St. Peter's, Bedford.

February 1 to 13.—Glasgow and West of Scotland Amateur Photographic Association. Entries close January 20. Sec., James M'Kissack, 68, West Regent Street, Glasgow.

February 3 to 6.—Borough of Tynemouth Photographic Society. Entries close January 23. Sec., J. R. Johnston, 29, Drummond Terrace, North Shields.

February 8 to 13.—St. Helen's Camera Club. Entries close January 27. Sec., A. G. Else, Duke Street, St. Helen's, Lancs.

February 10 and 11.—Cowes Camera Club. Entries close February 1. Sec., E. E. Vincent, 4, High Street, Cowes.

February 11 to 20.—Leicester and Leicestershire Photographic Society. Sec., Harry Cross, 80, Harrow Road, Leicester.

February 16 to 20.—Norwich and District Photographic Society. Entries close February 2. Sec., J. T. Tanner, The Lodge, Bowthorpe Road, Norwich.

February 20 to March 6.—Edinburgh Photographic Society. Entries close February 6. Exhibition Secs., Edinburgh Photographic Society, 38, Castle Street, Edinburgh.

February 20 to March 20.—South London Photographic Society. Sec., H. Creighton Beckett, 44, Edith Road, Peckham, S.E.

February 22 to March 6.—Birmingham Photographic Society. Entries close February 12. Sec., Lewis Lloyd, Church Road, Moseley, Birmingham.

February 26 and 27.—Ilford Photographic Society. Entries close February 18. Sec., H. Eales, 53, Coventry Road, Ilford, Essex.

March 11 to 13.—Coventry Photographic Club. Entries close March 5. Sec., W. R. Harris, 17, Allesley Old Road, Coventry.

March 17 to 20.—Nottingham Camera Club. Sec., E. L. Kent, 5, Radcliffe Mount, West Bridgford, Notts.

April 10 to 17.—Midlothian Photographic Association. Entries close March 31. Sec., B. Sherratt, 8, Castle Terrace, Edinburgh.

Patent News.

COMPLETE SPECIFICATIONS ACCEPTED.

These specifications are obtainable, price 8d. each, post free, from the Patent Office, 25, Southampton Buildings, Chancery Lane, London, W.C.

The date in brackets is that of application in this country; or abroad, in the case of patents granted under the International Convention

COLOURING CELLULOID FOR SCREEN-PLATES.—No. 7,629, 1908 (April 6, 1908). In order to incorporate with celluloid dyes which are suitable for mosaic colour-filters, even though insoluble in spirit, the dyes (solid or in solution) are treated (in rolling, kneading, or mixing machines) with spirit holding as much water as possible. The water then serves, in the further treatment of the celluloid, as a carrier of the colours which are otherwise insoluble in celluloid. The mass, when rendered perfectly homogeneous and having had the water partially driven off it by warming it after the last addition of colour, is again reduced to film, which is then stained. The last remains of water are removed from the film in the drying process, which lasts several days, and the dyes, soluble in water, remain incorporated in the celluloid and not removed from it again in the succeeding processes of treatment. The rolling, kneading, or mixing process may be so long continued that the celluloid acquires as great a hardness as possible by the escape of water and spirit. The dried films are subsequently exposed to the vapour of strong spirit or absolute alcohol, which renders them soft and flexible enough for treatment by further rolling.

Dyes specially suitable for screen-plates and soluble in water, though difficultly soluble in spirit, are stated to be as follows:

For red, ponceau F. R. (Casella and Co., Frankfort a/M) or ponceau 4R (Höchst Farbwerke). For blue, silk blue (seidenblau R of Casella and Co., Frankfort a/M) or cotton light blue (baumwoll-lichtblau (Höchst Farbwerke).

For green, concentrated acid green (säuregrün concentriert D, Höchst Farbwerke) or naphthol green (naphtholgrün B, Casella and Co., Frankfort a/M).

For yellow, naphthol yellow (naphtholgelb S Baden Anilin u. Sodafabrik, Ludwigshafen) or acid yellow (echtgelb G of the same firm). Friedrich Lehner, 73, Weinbergstrasse, Zurich.

CINEMATOGRAPH CUT-OFF.—No. 9,711, 1908 (May 5, 1908). The invention consists in a design of mechanism for shutting off light from the lantern focussed on the film, such that it is put in action by the formation of the loop of film which follows as the result of a breakage of the film. Vincent Edward Horsman, "Cratfield," Grove Road, Wallasey, Cheshire.

CINEMATOGRAPH CAMERAS.—No. 3,798, 1908 (February 19, 1908). The invention consists of a cinematograph camera, the use of a dark box fitted with two spindles or rollers, the one spindle or roller adapted to hold the unexposed film, and the other spindle or roller to receive the film after it has been exposed, both spindles being in the one chamber. Ernest Francis Moy and Percy Henry Bastie, Greenland Place, Camden Town, London, N.W.

New Trade Names.

CALSERCH.—No. 307,325. Chemical substances used in manufactures, photography, or philosophical research and anti-corrosives. Isaac Bentley and Co., Limited, proprietors of the firm of Maburn and Co., "Sol Petros" Works, Trafford Wharf Road, Manchester, Lancs, chemical manufacturers. October 26, 1908.

THE "PHOTO-SECESSION" held an exhibition of caricatures in charcoal by Mr. Marius de Zayas, and Autochromes by Mr. J. Nilsen Laurvik, from January 4 to 16, in their galleries at 291, Fifth Avenue, New York. The exhibits included twenty-five caricatures of well-known public characters, whilst the Autochromes, thirty-six in number, included a variety of subjects, including portraits, landscape, still-life, etc.

Analecta.

Extracts from our weekly and monthly contemporaries.

The Bromoil Process.

A. H. Garner, writing in "Photography and Focus" for Jan. 12, gives his experiences in working the bromoil process as follows:— "The print having been allowed to dry for twenty-four hours, it is soaked in cold water a minute or two while the following bath is prepared. The quantities mentioned will be found to be sufficient for a whole-plate:

Potassium ferricyanide	2 grs.
Potassium bromide	9 grs.
Potassium bichromate	9 grs.
Anamonia alum	18 grs.
Ten per cent. hydrochloric acid	20 drops.
Water	2 ozs.

This is poured into a porcelain dish and the temperature raised to about 80 deg. F. As soon as the temperature has settled down to a steady 80 deg. to 84 deg., the print is placed in the dish quickly and rocked while bleaching takes place, seeing that the temperature does not drop below 80 deg. In this bath the image changes in colour, becoming a sad coloured brown and losing about one-half its strength. Two minutes should be sufficient, but four will do no harm. The solution is then poured off, and the print washed for ten minutes in running water, or frequent changes. Before this time has elapsed all trace of the solution should have vanished from the print. I attach importance to this thorough washing. Without it, results are somewhat uncertain. This and the bleaching at a high temperature are the principal features of the method.

"At this stage the print already shows some symptoms of relief, more marked in the case of some papers than others, and it would take ink readily enough in this state, although, in general, there would be a tendency for the whites to take up ink also, and so lead to discoloration and flatness. The next step, then, is to place the print in a 2½ to 5 per cent. sulphuric acid bath, at about 65 deg. to 70 deg. The former is sufficient with soft gelatine papers, the latter will be required with harder gelatines. At higher temperatures—as for instance in midsummer—it is necessary to use much weaker baths. This bath performs two functions. It softens the unaffected gelatine, so that the relief becomes more marked, and the ink takes and is repelled more vigorously: and secondly, it dissolves out the chromic salts which partly form the image. The time in this bath must be gauged by experience. Two to ten minutes are about the limits. If the bath is poured off and the print is allowed to drain in the dish, one can generally tell by the amount of visible relief whether it has been acted upon sufficiently.

"The image changes in this bath. It becomes very faint, and its colour changes to a pale yellowish brown. It is then washed in a few changes of water, and immersed in a fixing bath containing a little metabisulphite or even plain sodium sulphite. I generally use the same bath as I use for fixing bromide prints, and have not noticed any ill effects. It is then again washed, and the print is ready for pigmenting in the usual way. The whole procedure should not take more than half an hour."

A letter from Messrs. Ozobrome Ltd. regarding the use of a solution such as that given above appears under "Correspondence."

AT THE PHOTOGRAPHER'S.—More literary, perhaps, but a good deal beside the mark, are the two dialogues, "On Being Photographed," in the "Westminster" of last Saturday evening. The editor confesses to disappointment. We thought to have detected a reference to the "free sitting" in the phrase "photographed voluntarily." But no; the passage runs on:—"P. P. : Yes, you can be photographed involuntarily. Infancy, for example. *Si jeunesse le savait*, it would never consent to be photographed in the poses so embarrassing when the forgotten print reappears. Materfamilias coming out of an egg! The victims of the Press photographer, the inmates of our prisons—S. S. : Suffragettes? P. P. : No. They are photographed voluntarily, whether inside Holloway or outside."

New Apparatus, &c.

The "Dega" Minimeter. Sold by Chas. Zimmermann and Co., 9 and 10, St. Mary-at-Hill, London, E.C.

This is a most handy instrument for the rapid and accurate measurement of small quantities of liquids, such as rodinal, or other single solution developer, only a little of which is used at a time when developing an odd plate or two. The graduated measure, when used for quantities from 5 minims to, say, 1 drachm, can easily give rise to considerable errors arising from the angle at which the level of liquid is used, the quantity of liquid left in the measure, etc., and it is not practicable to measure off small quantities quickly. In both these respects the "Minimeter"—which is an improved chemical pipette—has claims to recommend it. It consists of a glass tube 7 in. in length, graduated to deliver up to 80 minims, or 5 ccs. The minim scale is graduated into 5-minim divisions, the metric scale to ½ ccs. To use the meter, all that is necessary is to drop it into the stock bottle of solution, squeeze the bulb strongly, and release it gently removing the tube when the liquid has risen to the 0-0 mark. Any desired quantity can now be delivered most accurately into a measure or other receptacle by gently deflating a projection on the top of the bulb. By so doing, air is admitted to the top of the tube, the liquid escapes and on releasing the projection the level of the slowly falling liquid is arrested at any point. For working in the dark-room the meter saves altogether the trouble of drip from bottle necks, economises developer, and increases the exactness of measurements, which, as we have said, may often be out to an unrealised extent. The "Minim meter" is sold at 1s. 9d.

New Materials, &c.

COLLOTYPE AND COLOUR POSTCARDS.—The Barton Pictorial Postcard Co., 15, St. James', Barton, Bristol, send us specimens of the work they are turning out in monochrome collotype and glossy and coloured postcards. The results, particularly in the straightforward collotype show the consistently good work of the Barton Co., by whom moderate prices for any description of card can be quoted.

COLOURED GLOSSY POSTCARDS.—The Vanguard Manufacturing Co. Ltd., Maidenhead, send us a few glossy postcards—"Rotary," as sold in the shops—printed with "Bertha" colours. The cards show great depths of tint, although coloured in the glazed condition and not treated other than with the dyes made up with water. The dyes contain the necessary mordant, and unless very heavy colours are desired such as "cardinal velvet," it is not necessary to use any medium. In the case of the deepest effects a little "glossy medium" is advised to retain the gloss. As a proof of the capabilities of the colours the Vanguard Co. offer to send a "Rotary" card (retail price 2d.), coloured with the "Bertha" dyes, post free for two penny stamps.

New Books.

"Le Salon International du Photo-Club de Paris," par C. Ménard. (Paris: Charles Mendel.) 10fr.

As a souvenir of an exhibition this volume is without doubt the most sumptuous yet attempted. Its publisher is to be commended upon its appearance, for he has spared no pains in its production. It is luxuriously illustrated by more than sixty pictures, of which a dozen or more are full-page plates on heavy surface paper. The author's part covers a large ground. M. Ménard, after having apportioned to the promoters of the Salon their due meed of praise, treats of oil-printing; studies the æsthetics of the Photo-Club; analyses carefully the psychology of the outside contributors to the exhibition; puts into relief the different processes employed, and the general character and physiognomy of the show; then, passing in review the principal works, he deals with the ideas of the workers and the tendencies of the different schools. We read with particular

pleasure and interest the parallels drawn between the two masters of the French Pictorial School, M. Robt. Demachy and M. le Commandant Puyo.

The picture of all that delights us is a full-page plate of a "Portrait," by M. René Michau, presumably from an oil-print. It represents a young lady in outdoor garments, who stands with her hand upon the knob of a door. In delicacy, richness, fine and simple design, it is surpassingly good, and it boasts also a general prettiness. Another fine thing is the "Pâtures," by M. Léonard Missonne, charming landscape of fine effect.

The volume will be studied with pleasure and profit by all lovers of photographic art.

"THE WATKINS MANUAL."—The fourth edition of Mr. Alfred Watkins's manual contains a new chapter on "Thermo-Development," in which directions are given for the construction of a chart to be used when adjusting the time of development in accordance with the temperature. Some useful notes on the exposure and development of Autochrome plates are also given. For the rest, the arrangement and text of the manual remain the same, and the chapters on exposure and development may be cordially recommended to the elementary worker as giving him a set of rules, by adhering to which he may quickly reach a far higher average of work than by following his own unaided judgment.

"THE TELEPHOTO QUARTERLY."—No. 4 of Captain Wheeler's "T.Q." is a special "Alpine issue," and contains a number of interesting contributions on "Mountain Telephotography," by J. C. Smith; "Exposure in Telephotography," by E. A. Biermann, with other notes by the editor and others. Captain Wheeler's reviews of recent introductions for telephotography are alone worth a year's subscription (1s. 6d.) for "T.Q.," the distribution of which, we are glad to hear, is from China to Peru. In America "T.Q." is now obtainable from Messrs. Tennant and Ward, 122, East 25th Street, New York; in England from Captain Wheeler, "Strathmore," Princes Road, Weybridge.

"PHOTO NOTES."—The 1908 volume of our monthly contemporary shows us the variety of topics touched upon in the course of the year. The issues show that current progress has secured discreet representation in its pages, under the editorship of Mr. C. Welborne Piper. In the January issue of the present year there is the announcement of a series of competitions, which should interest more serious and thinking workers. "Photo Notes" is sold by most photographic dealers, or is obtainable direct from the publishers, the Rotary Photographic Company, Limited, New Union Street, Moorfields, E.C.

CATALOGUES AND TRADE NOTICES.

DEMONSTRATION APPARATUS.—Messrs. Newton and Co., of 3, Fleet Street, Temple Bar, E.C., have newly issued a list of recent apparatus for optical and other demonstrations. These include a number designed by Mr. F. J. Cheshire, including an optical bench, projection spectroscope, and model eye. The list, which is sent free, should interest those having to lecture on philosophical subjects.

LANTERN SLIDES.—The latest supplementary list just published by Messrs. Newton and Co., 3, Fleet Street, Temple Bar, London, contains a large selection of sacred subjects, including one of the Pan-Anglican Congress and a number of sets, each of a few slides, to illustrate hymns sung as solos. These latter in most cases are reproductions of celebrated pictures, and are an immense improvement on the slides which often pass muster as "illustrations" of such local solos. Among the other sets are those on the Franco-British Exhibition, and modern industries such as paper-making, steel-manufacture, tanning and coal-mining. The list forms a useful addendum to Messrs. Newton's full catalogue.

THE THORNTON-PICKARD 1909 CATALOGUE.—The new full list of the Thornton-Pickard Manufacturing Co., Ltd., is a most attractive publication. It runs to nearly 120 pages, and describes a whole series of new publications, including the folding pocket cameras which the T.-P. Co. are making in Altrincham in competition with continental manufacturers. The full specification of the highest class instruments, the Ruby cameras, should particularly interest our readers, who can obtain the list free by writing to Altrincham.

Meetings of Societies.

MEETINGS OF SOCIETIES FOR NEXT WEEK.

FRIDAY, JANUARY 15.

Kinning Park Camera Club, Govan. Annual General Meeting.
Sutton Photographic Club. "Impressions of a Tour through France." J. W. S. Burmester.
Barrhead Art Club. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Aberdeen Photo Art Club. At Home.

MONDAY, JANUARY 18.

Ardrrossan and District Camera Club. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Scarborough and District Photographic Society. "A. P." Prize Slides.
Catford and Forest Hill Photographic Society. Monthly Competitions.
Stafford Photographic Society. "Yesterday and To-Day." Burroughs, Wellcome, & Co.
Cleveland Camera Club, Middlesbrough. Dutch Lantern Pictures. A. E. Staley & Co.
Kidderminster and District Photographic Society. Midland Federation's Slides.
South London Photographic Society. "Exhibition of Thornton-Pickard Prize Slides and Apparatus." R. Hesketh.
Southampton Camera Club. "On Novel Lighting Effects obtainable by Daylight in an Ordinary Room." H. Essenhigh Corke.
Bradford Photographic Society. Annual Meeting.
South London Photographic Society. "Exhibition of Thornton-Pickard Prize Slide and Apparatus." R. Hesketh.

TUESDAY, JANUARY 19.

Royal Photographic Society. "Holy Days and Fête Days in Spain." R. Falconer Jameson.
Kinning Park Camera Club, Govan. "The Process Block, Manufacture, and Printing." Angus Barclay.
Chiswick Camera Club. Lantern Lecturettes. By Members.
Hanley Photographic Society, Y.M.C.A. Lecture by J. Wright.
Liberal Border City Camera Club, Carlisle. French Lantern Pictures. A. E. Staley & Co.
Edinburgh Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.

WEDNESDAY, JANUARY 20.

Croydon Camera Club. Annual General Meeting.
Sale Photographic Society. Lantern Slide Competition.
Brecht Photographic Association. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Leeds Camera Club. "Preparation and Development of Salted Papers." W. A. McLean.
Borough Polytechnic Photographic Society. Lantern Slide Competition.

THURSDAY, JANUARY 21.

London and Provincial Photographic Association. "Preparing Objects for Photo-Micrography." J. I. Pigg.
Dundee and East of Scotland Photographic Association. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
L.C.C. School of Photo-Engraving, Bolt Court. "Some Applications of Theory to Practical Photography." C. E. Kenneth Mees, D.Sc.
Leek Photographic Society. Whist Drive.
Handsworth Photographic Society. "A Chat on China and the Customs." W. A. Mace.
Hackney Photographic Society. Whist Drive.
Maidstone and Institute Camera Club. "Various Novel Lighting Effects." H. E. Corke.
Southend-on-Sea Photographic Society. Seventh Annual General Meeting.
Rodley, Farsley, Calverley, and Bramley Photographic Society. Members' Night.
Midlothian Photographic Association. Social Evening.
Aberdeen Photo Art Club. Informal Meeting.

ROYAL PHOTOGRAPHIC SOCIETY.

MEETING held Tuesday, January 12, President (J. C. S. Mummery) in the chair.

Appropriate to the occasion of the opening of an exhibition of portraiture by Herr R. Dührkoop, Mr. E. O. Hoppé read a paper dealing with the career, aims, and methods of Herr Dührkoop, on behalf of whom he expressed regret that the author of the photographs himself was unable to be present and deliver the address with which such house exhibitions are customarily inaugurated. Herr Dührkoop, continued Mr. Hoppé, was born in Hamburg sixty years ago, and after an uneventful youth became a soldier during the time of the Franco-German War of 1870 and 1871. His first visit to Paris was with the German Army, who lay outside its walls. On his return to civil life he was, up to his thirty-fourth year, engaged in retail commercial business, in the course of which he took up photography as an amateur, and finally relinquished his business proper to become a professional photographer. He had had no professional training whatever, nor any studio practice. He had learnt all he knew from books and his own experiments, a fact which perhaps accounted for the great individuality which his work

now shows. However, for the first few years of his professional career his work was quite of the conventional order. He planted his sitters before the usual painted background, held them steady with the traditional head-rest, and it is even supposed that in this commercial pursuit he was accustomed to supply the many soldiers who were his clients with cheap miniatures of themselves for presentation to those damsels with whom they "walked out." But one fine day Herr Dührkoop discarded these time-worn methods, and announced in a notice outside his studio that henceforth his portraits would all be taken in a different style by a different method. The freshness and originality of the work which he produced from the commencement of this new era of his career make him the pioneer of really artistic portrait photography on the Continent. Throughout these years his guides in the application of the camera to portraiture have been the great masters of painting, to the study of which he has always attached the greatest importance. The help and advice of a well-known art critic and teacher, Herr Lichtwark, have been great factors in his progress. Through them he was led to abandon the studio for a "portraiture-room," lighted like any other, but perhaps the most intimate secret of his success and versatility is the fact that his aim is to express to others the delight which he himself takes in the particular beauty or characteristics of each sitter. As those who had met Herr Dührkoop well knew, he was a remarkable, almost extraordinary, personality. Always well dressed, bright, and with the freshness of perennial youth, he was able to interest his sitters, and his mental vitality, and particularly his admiration of the fair sex, were expressed in a manner which in many another man would come dangerously near extravagance and absurdity, but in the case of Dührkoop attracted and entertained his sitters.

In the year 1900 Dührkoop was officially sent by the town of Hamburg to the Paris Exposition, but confessed himself disappointed. In 1901 he first visited London, where the photographic work of the leading amateurs greatly influenced his ideas of tone values and pictorial composition. In 1904 Hamburg sent him to the St. Louis World's Fair, and while in America he visited the studios of the leading American photographers, such as Pirie MacDonald, Strauss, Mrs. Käsebier, and others. It was not until 1905 that he first exhibited at an English photographic exhibition—namely, that of Leeds—since when medals and distinctions have been awarded him at almost every leading exhibition.

For his professional work Herr Dührkoop has two studios, one in Hamburg and another in Berlin, alternately superintended by himself and his daughter, Frau Diez-Dührkoop, a lady who shares with her father much of his genius, and is his most skilful assistant. Both his studios are only lofty rooms, lighted in the ordinary way, but magnificently furnished and decorated. Without any of the ordinary photographic accessories in evidence, not even a camera, the sitter is received as would be an ordinary visitor, is entertained in conversation by Herr Dührkoop, who will give a signal later on for a camera to be brought in and placed in position. Within a few seconds a series of exposures are made, in many cases with the assistance also of a portable arc or magnesium light, which is likewise put in position by an assistant. In his method of presenting the photographs, Herr Dührkoop is equally versatile. He will supply one in platinotype, one in carbon, another in silver (matt albumen), and he will ensconce each one in a different and differently ornamented folder. When he was fifty-three he went to a technical school and learnt photogravure, and has installed a special photogravure plate-making and printing department in his Hamburg studio, from which he has published several large portfolios of photogravure portraits of German notabilities. Men, women, and children are all equally welcomed as sitters to Herr Dührkoop, and the examples of his work show the intimacy with which he can enter into the mental attitude and disposition of each class. Always unconventional, he yet succeeds in producing compositions which are harmonious and well balanced, his strong point being the power to accentuate those characteristics of the sitter which give him or her vitality and beauty.

EDINBURGH PHOTOGRAPHIC SOCIETY.—On Wednesday in last week a lecture was given by Mr. J. Campbell Noble, R.S.A., on "Light and Shade." The lecturer spoke of the importance of motive in producing works of art, and drew a number of charcoal sketches to

illustrate how different effects were obtained by altering the balance of light and shade. Mr. J. F. Duthie, the president of the society, was in the chair.

SOUTHAMPTON CAMERA CLUB.—The members of the above club enjoyed on Monday last the annual visit of Mr. E. W. Harve Piper, who gave a lecture entitled "Two Benedictine Minsters." The lecturer began by showing the plans of both edifices, and describing the differences in the structures. He pointed out that no cathedral in England retained its original Norman plan so nearly undisturbed as Norwich, which was long and narrow compared with that of Gloucester Cathedral. Mr. Piper then described alternately both the exterior and interior of the buildings in detail. He thought that the tower at Gloucester was one of the most graceful in the country, with its pierced parapet and delicate carving, which appeared like petrified lacework. Mr. Piper thought the cloister at Norwich, with the exquisitely worked tracery, were superior in design to those at Gloucester.

Commercial & Legal Intelligence

THREE MONTHS FOR A CANVASSER.—At Ayr Sheriff Court last week before Hon. Sheriff-Substitute Lockhart, Thomas Lyle Smith, of no fixed residence, having formed a scheme for fraudulently obtaining money and goods, was charged on indictment with having (1) defrauded thirteen persons in Kilwinning and Irvine by taking payment for photographs which he promised to supply and did not supply; (2) obtained board and lodgings by false pretences; (3) stolen two printing frames which he got a loan of from a chemist; and (4) obtained photographic material to the value of £1 8s. 9d., which he did not pay. The offences were committed between August 11 and September 15. The Sheriff sent the accused to prison for three months.

LIVING BY FRAUD.—A respectable-looking man named James Wilson pleaded guilty in Glasgow Sheriff Court last week to a series of charges of fraud in Ayr and Ayrshire in November last, getting subscriptions amounting to £14 by representing that he wished to secure a camera outfit for himself to follow outdoor pursuits, as he was in consumption and unable to follow his employment. An agent stated that accused was forty-five years of age, and had been a photographer's assistant in Ayr. He had never been in trouble before, and had been five weeks in prison. Wilson came to Glasgow with a considerable sum of money, but lost it through being assaulted in George Square, and was frightened to report it to the police, as he had the list of subscriptions obtained in Ayrshire on him. Sheriff Mackenzie said it appeared from the indictment that for months accused had been living by fraud on the public. Looking at the great number of the frauds committed, his Lordship could not do less than pass sentence of six months' imprisonment.

THE PARTNERSHIP between Messrs. Thos. Elisha Stagg and Alfred Mann, carrying on business as photographers at 400, High Street, Lewisham, S.E., under the style of "The Imperial Miniature and Enlargement Co.," has been dissolved from the 5th inst. All debts due or owing by the late firm will be received and paid by Mr. Stagg.

BANKRUPTCY DIVIDENDS.—Notice is given of an intended dividend in the estate of L. H. Bourlet and F. F. Bourlet (trading as Jas. Bourlet and Sons), fine art agents, etc., 17 and 18, Nassau Street, Middlesex Hospital, W. A dividend is also to be paid in the separate estate of F. F. Bourlet. Mr. Wm. Hardy (the trustee), Coventry House, South Place, Finsbury, E.C., will receive proofs up to the 31st inst. In the estate of W. G. Lewis, photographer, 1, Seymour Street, Bath, Mr. F. L. Clark, official receiver, 26, Baldwin Street, Bristol, will pay a dividend to creditors whose proofs are lodged with him on or before the 20th inst. Creditors in the estate of W. T. Radford, photographer, etc., 7, Bampton Street, Tiverton, Devonshire, will receive a dividend on lodging proofs before the 22nd inst. with Mr. A. E. Ward, official receiver, 5, Bedford Circus, Exeter. The estate of G. R. Harris (also trading as Harris and Co.), photographer, etc., 222, Broadway, Bexley Heath, Kent, has paid a first and final dividend of 1s. 2½d. in the £1. Mr. Thos. Keen, trustee, 29, King

reet, Luton, Bedfordshire, will receive proofs up to the 22nd inst. m creditors of Arthur Joseph Anderson, photographer and picture-mer, 37, Wellington Street, Luton, 36, High Town Road, Luton, 17, High Street, Leighton Buzzard, in whose estate a dividend is out to be paid.

News and Notes.

GOLD VARNISH.—A clear solution of shellac in alcohol, with an addition of picric acid and 1 per cent. of boracic acid, makes a gold varnish that produces a fine hard surface and brilliant finish on metals.—“Scientific American.”

THE LATE MR. W. E. DOWNEY.—Mr. William Edward Downey, 38, Carlyle Square, Chelsea, and of Messrs. W. and D. Downey, 57 and 61, Ebury Street, S.W., who died on November 30 last, aged 54 years, left estate of the gross value of £8,082, with net personalty £4,352.

“KNOWLEDGE.”—The reading matter in our contemporary has been nearly doubled, and each issue also contains four full-size plates on art paper. The “Aeronautics” supplement is an attractive and valuable feature. In this revised form, which takes effect with the current January issue, the price is one shilling.

MR. W. FRIESE-GREENE has patented and is now building an airship, so we read in a daily paper. The novel feature of the vessel is its “twin construction.” It consists of two elongated airbags placed side by side. There are four motors, one driving the gyroscope, another the propeller fan, and two others for emergency. A gyroscope is used for steering, its position being altered by means of steering gear attached to an ordinary ship’s wheel.

AT THE BEDFORD PARK POLYTECHNIC, Bath Road, Turnham Green, London, N.W., from January 18 the Monday evenings will be occupied with work for elementary students, 7.30 to 8.30; advanced photography, 8.30 to 9.30. In the advanced course there will be a full demonstration of “Autochrome,” “Thames,” and “Omnicolor” screen-plates for colour photography. On Wednesday evenings bromide enlarging, and on Thursday evenings negative retouching are on the programme.

PRINTING PAPER FOR THE TROPICS.—Messrs. the Lumière N.A. Company write: “Noticing in your issue of January 8 your reply on the above subject to your correspondent, H. Grattan Guinness, we beg to draw your attention to the fact that we have placed on the market a P.O.P. (“Actinos”), which has been manufactured specially to withstand climatic influences. This paper contains no free silver salts whatever, is manipulated in the ordinary way, and under the most trying tropical conditions has been found to be entirely unaffected.”

AUTOCHROMES AT THE LUMIERE HOUSE.—A collection of some 70 autochrome transparencies is to be seen at the offices of the Lumière N.A. Co., 89, Great Russell Street, London, W.C., from Monday next, January 18. Among the transparencies are the most varied descriptions of subject, from a portrait by lamplight to open panoramas and landscapes. Some of these latter, taken during spring and winter are perhaps the most exquisite examples of the process in point of delicacy and fidelity of subtle tones. Some excellent photo-mechanical reproductions of Autochromes add to the interest of the collection, which is open to visitors on presentation of card.

CLEVELAND CAMERA CLUB.—The annual exhibition will be held from February 10 to 13 in the Albert Chambers, Middlesbrough. The open section will consist of two classes, one open to all photographers, the other to members of the Yorkshire Photographic Union. The exhibits will be judged by Messrs. Percy Lund, A. Hutchinson and C. W. Richardson, who will award silver and bronze medals at their discretion. A special prize of a silver flower vase is offered for the best picture in the exhibition. Entries close February 1, by which date entry forms, accompanied

by the necessary fees, must reach the hon. sec., Messrs. F. W. Pearson and R. Walton, 39, Granville Road, Middlesbrough, from whom all further information and entry forms may be obtained.

ILFORD PHOTOGRAPHIC SOCIETY.—The annual exhibition will be held in the Town Hall, Ilford, on February 26 and 27, and will include five open classes, in which one silver and nine bronze plaques will be placed at the disposal of the judge, Rev. F. C. Lambert. Entry forms, together with the necessary fees, must reach the hon. sec., Mr. H. Eales, 53, Coventry Road, Ilford, not later than February 18, the forms being now obtainable from the same address. If desired, any exhibit will be forwarded to the Stratford G.E.R. Exhibition without additional charge.

A CORRECTION.—In our report of the Northern Photographic Exhibition (page 24 of last week’s “B.J.”) one or two slight errors have inadvertently crept in, which we now hasten to correct, with apologies to various authors of the pictures. “The Edge of the Dunes” (19) is by T. Longworth Cooper, not B. Ward Thompson; Cavendish Morton’s “Hebe” and “Fantasia” are two distinct pictures, not one as indicated in our article; whilst “Early Morning in the Harbour” (332) and “Evening on the Mersey” (473) are the work of Mrs. not Mr. S. L. Coulthurst.

THE CRIPPLEGATE PHOTOGRAPHIC SOCIETY’S Annual Exhibition, which is to be opened on March 22 by the Rt. Hon. the Lord Mayor of London, promises to be a great success this year, and we hear that in the open classes, of which there are six, one will be for “Straight Prints or Enlargements from Straight Negatives,” and one for “Prints in either Oil, Bromoil, Gum, or Ozobrome.” The judges will be Messrs. A. H. Blake, F. J. Mortimer, and J. B. B. Wellington. Arrangements have been made to transfer free of cost any pictures entered for “Cripple-gate,” which are also exhibited at the “South London” Exhibition. Entry forms and further particulars may be obtained from the Hon. Sec., H. S. Cuming, 234, North End Road, Kensington, W.

AGREEMENTS WITH ASSISTANTS.

To the Editors.

Gentlemen,—I feel rather keen about writing on this topic, as the result of not having agreements has been brought somewhat prominently to my mind during the last few days.

In this matter, as most others, there are two sides, and not unnaturally the assistants on the one side and the employers on the other are both inclined to think that only that which is to their personal advantage is the right and proper thing. Whilst belonging to the latter class, I will strive to avoid giving my side too much prominence, and content myself as far as possible with quoting an aspect of the case that has touched me personally during the last few years.

A manager-operator, after occupying this position in my studio for ten years, seeing everyone, and being known by name to every client, since it was the rather foolish custom to so distinguish him by name instead of “the operator” or “the manager,” gave in his notice just before the season, and opened two doors below in a studio that six other people (strangers) had opened and always closed again in the space of a few months. Not unnaturally there was a falling-off in receipts much greater than when the studio had previously been opened, and the old customers were constantly seen entering the new place. A modest agreement to refrain from working in certain specified streets would have been sufficient, but unfortunately, starting as a boy as he did, he gradually grew up

and filled his last position without the probability of his resigning being taken into account. Of course, under the circumstances he had as much right as anyone else to open up, but I consider that such an eventuality should be insured against by all.

If I sold my business I should be charging for the handing over of regular customers, an established name, my books, and a ready-made introduction to the town. A new man would suffer all the trials and expenses of becoming known, and would have to keep himself meanwhile. Why should I pay a man to introduce himself at my establishment, at my expense, and present him with a great part of my most valuable asset—goodwill—into the bargain?

No one can object to a new photographer starting in a town, so long as he starts fair, but to present him with ready-made customers is a rather considerable addition to his agreed-upon salary. However, our place had become somewhat old-fashioned and backward, and after a thorough overhaul we gradually, and at a great deal of expense, got back, retained, and increased our old volume of business, and now the manager's studio is empty, and the late proprietor (late manager-operator), with whom, by the way, I am on real good terms and constantly correspond, has taken a similar situation abroad. By a strange coincidence, he is called upon to resurrect a business that has gone flop owing to the late manager having opened for himself opposite, taken away most of the trade, and in all respects acted in precisely similar fashion to the former case.

I mention this at some length because these are absolute facts of recent occurrence, and it answers those optimistic assistants who say that the name of an old firm is sufficient to keep it from harm.

Personality in photography is everything. The public not unnaturally prefer the operator they know to the operator they know not.

PROVINCIAL PRO.

To the Editors.

Gentlemen,—Yours being the recognised trade photographic journal, I am sure many photographic employees, like myself, are grateful to you for calling attention to the one-sided agreements that many assistants are often compelled to sign in order to obtain an engagement. It is said that when one signs an agreement he knows at the time what he is signing. That is true; but when one has been out of employment, perhaps for months, and become "hard up," one is over-anxious to get a job, and does not duly consider the terms of the agreement. In this way employers sometimes take advantage of the unfortunate assistant. I may give a case in point. A friend of mine, being somewhat in these conditions, obtained an engagement as managing operator of a branch at a salary with commission. But to obtain it he had to sign an agreement to the effect that in the event of his leaving or being discharged he would not work for any other photographer, or be connected with photography, within twenty miles of the town hall of —, which is his native place. He was in the berth for nearly three years, and by his skill and perseverance worked up the business to such an extent that the commission amounted to more than the salary. One day the employer told him he was getting too much out of the business, and that in future the commission would be reduced by one-half, as he could get a good operator for much less than he was then paying. The operator then said that if the pay was reduced he would leave. The employer replied that if he did he could not take another appointment within twenty miles of the town, according to their agreement, which he would certainly enforce. On reading through the agreement with my friend we found that he was bound by it not to start in business for himself or be engaged by another photographer within the radius of twenty miles. Although this restriction is placed on him in the event of his giving notice, the employer can at any time discharge him with a fortnight's notice, but the radius clause still applies; so it will be seen that the employer has the man entirely in his hands. It seems to me from what I have read in your leading articles that this is such an unreasonable agreement that it would not hold good in law. I once had a somewhat similar one put before me, but I declined to sign it, and as a consequence did not get the berth. I would suggest to all employees to read through any of the agreements they may be under. Possibly many will find they are in a more independent position than they imagine to be the case.—I am, yours faithfully,

AN OPERATOR.

Yorks.

January 11, 1909.

A CORRECTION.

To the Editors.

Gentlemen,—I regret that owing to a mistake of mine the two last columns of figures in the table of my paper on the printing frame for colour-screen positives, contained in this month's "Colour Photography" Supplement, have been transposed. The last column is that of the lengths of the mirrors BC, while the second last is that of the widths BD.

With regard to the paper by Dr. Merckens, on page 1 of the same supplement, you are quite correct in pointing out in the footnote that I am joint patentee with Dr. Merckens of the two French patents quoted. The work embodied in the subject matter of these patents was carried out by us jointly in my laboratory in Zürich. The corresponding English patents, 2,461 and 7,217 of 1907, and all the corresponding foreign patents were applied for in our joint names.

I may mention that Dr. Merckens has no further claim upon any of these patents, or upon those relating to the printing frame for colour-screen positives, I having complete control over the disposal of all these patents and patent applications.—Yours faithfully,

J. H. SMITH, Ph.D., F.I.C.

MARKING PACKETS OF PLATES AND PAPERS.

To the Editors.

Gentlemen,—I have read with interest the letter of Mr. R. Ballantine and your "Ex Cathedra" note thereon in your last issue. The suggestions made therein would no doubt be of convenience to the dealers. I would, with your permission, make another suggestion with regard to the marking of the packets of plates and papers by the makers. It is that they should bear the date they were issued by them, in which case the purchaser would see if he was buying stale goods or not. I have to draw my supplies from a local dealer who does a fairly good trade. A short time back I bought four packets of P.O.P. The maker's numbers on three of them were different, and there was a very long difference between the earliest numbers and the others. On opening this one I found the outer sheets much discoloured, and the edges of the others also discoloured. With this packet I could not get good prints; the others were all that could be desired. This showed that the one packet had been a long time in stock, and had become spoilt by keeping. I had a similar experience with plates a few months ago. I bought three packets of —'s plates; all bore different numbers. Two were all right, but the plates in the third, which had a much lower number, were all stained round the edges. If that packet had been the first I had had of that brand of plates I should at once have condemned it and had no more, and so I think it would be to the interest of plate and paper manufacturers to mark the packets with the date of their issue.—Yours faithfully,

F. R. C.

BROMOIL AND THE OZOBROME PATENT.

To the Editors.

Gentlemen,—We notice that in some of the articles on the bromoil process which are published from time to time in the various photographic journals, formulæ are given for the use of a bath containing bromide, ferricyanide, and bichromate. These ingredients are claimed in Mr. T. Manly's patent, No. 17,007 of 1905, for the insolubilising of gelatine in the presence of metallic silver.

As the action in the bromoil process depends entirely upon the different degrees of tanning of the gelatine in the presence of metallic silver, it will be readily seen that the makers and users of such solutions render themselves liable to prosecution by Ozobrome, Limited, the owners of the above-mentioned patent.—Yours faithfully,

OZOBROME, LIMITED.

G. A. Collinson, Sec.

BENJAMIN SANDFORD (LIMITED) has been registered with a capital of £1,000 in £1 shares to acquire the business carried on by Mr. B. S. Taylor, at Bradford, as Hamnett and Walters; at Leeds, Colne, Halifax, and Stockton-on-Tees as Hamnett; at Rochdale and Wakefield as Taylor; and at Stockport as Moreton; and to act as photographers, etc. The first directors are Mr. B. S. Taylor, Mr. C. Bish, and Mr. A. J. Taylor.

Answers to Correspondents.

All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY, 24, Wellington Street, Strand, London, W.C." Inattention to this ensures delay.

Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.

Communications relating to Advertisements and general business affairs should be addressed to MESSRS. HENRY GREENWOOD & Co., 24, Wellington Street, Strand, London, W.C.

For the convenience of Readers, our Publishers, MESSRS. HENRY GREENWOOD & COMPANY, of 24, Wellington Street, Strand, W.C., undertake the registration of copyright photographs at a charge of 1s. 7d. each photograph, to cover cost of registration fee, form, etc. Two unmounted copies of each photograph must be sent with the fee.

PHOTOGRAPH REGISTERED:—

Gough, 94, Richmond Street, Coventry. Two Photographs of Mr. Wm. Morgan, B.Sc.

LEHOUETTES.—I enclose print of photograph on the "silhouette" principle, which I am thinking of introducing at a seaside resort in the coming season. Is it possible to copyright or protect the idea in any way? Should be grateful for any information.—INTERESTED.

Of course you cannot secure to yourself the sole right to make a type of photograph which has been known for many years. All you can do is to register a trade name for the silhouettes you may make. If you elect to call them "Profylettes," "Photosilles," or some such made-up name, you can register the word and prevent anyone else from using it for the same or a similar description of photograph.

F. S.—From your description there should certainly be a large demand for such a lamp—that is to say, if it can be made for about £1 or 30s., which should be about the first cost to market at the figure you name. We advise you to take out provisional protection. This will cost you £1. Particulars and instructions from the Comptroller of Patents, 25, Southampton Buildings, E.C. (Meanwhile, we should think a firm such as the Tress Company, which has made a specialty of studio gas lamps, would be prepared to discuss taking up the lamp.

CLOUD NEGATIVES, ETC.—A short time ago I read an article about printing clouds into landscapes, and I fancy it was in your paper. In it the writer recommended cloud negatives, the lower part of which was gradually tinted red so that it was not necessary to use a mark if the sky-line was straight—a great advantage, especially in P.O.P. printing, as it is in this case difficult to avoid a hard line. Can you tell me the makers of the cloud negatives? 2. Are negatives reduced with ferricyanide as permanent as if not reduced? 3. How does it stand as regards permanency with negative intensified by the bleaching-out and redeveloping method? 4. Is there any means of enlarging a film negative (celluloid and emulsion together) in a similar manner as the film of a glass negative is enlarged after being stripped?—C. G.

1. Such negatives were sold some years ago by the dealers, and probably are now. Better write to one of the large houses. 2. Yes. 3. Those intensified by the chromium method are fully as permanent as an untreated negative. 4. The film negative can be stripped by the method on p. 792 of the "Almanac," and allowed to expand in water before remounting. In this case it will be advisable to use less formaline in the first solution.

URHAM.—The list price of the former is £6 12s. 6d., and that of the latter £2 5s. From these prices you will be able to estimate their value, according to their condition, as we do not value second-hand goods. Both lenses are of the same type, and are good for general all-round work, but are slow for portraiture.

SUBSTITUTE FOR GROUND GLASS.—1. I believe there is a method of precipitating baryta on a gelatine film, say on a plate which has had the silver fixed out before exposure or development. Could you please oblige me with details? 2. Is there any method of

treating a bromide print on paper so that, by transmitted light, it may bear the appearance of a transparency backed with ground glass.—REYLLOC.

1. Soak the fixed and washed plate in 5 per cent. sulphuric acid, drain off and transfer to 5 per cent. barium chloride solution. 2. The print can be rendered partially transparent by ironing in vaseline with a hot iron or immersing in a mixture of castor oil (4oz.) and ether (1oz.).

W. M. HARRISON.—The only book we can refer you to is the "Art of Retouching Negatives and Finishing and Colouring Photographs," by R. Johnson (Marion and Co., 2s.).

DRYING NEGATIVES, ETC.—1. In drying negatives quickly by the formaline process (short wash in water after fixing, then pouring over the plate hot water and drying in front of fire) I have been troubled by finding the film quite loose on the plate, more particularly at the stage between the pouring over of hot water and drying in front of fire. Recently I was drying a press negative in this way when the film seemed to burst, and the whole of it shot off the plate in fragments whilst drying in front of a moderate fire. Can you explain the cause and give me remedy for this? 2. I have a number of negatives, which have been intensified (ammonia-mercury process) and put away for some time, and I find them now very much clouded over. I believe this is usually with negatives intensified in this way, and then left without varnishing. Will anything remove this cloudiness, which in many of them is in patches and not even all over the plates? Also, is there any preventive other than immediately varnishing?—SAXON.

1. Probably the formaline has been used too strong; a weaker solution, say 5 per cent., used for longer, would give a more even action throughout the film. In any case, it is not every brand of plate that will withstand such vigorous treatment. 2. We know of no remedy for the negatives. Varnishing is the best preventive, but we advise you to use a more reliable intensifier, such as the mercuric iodide, followed by a developer.

HAVERHILL.—Yours seems to be a hard case. But as you agreed to the employer holding your belongings if he advanced you the money for your fare back to London, it seems to us that he has a legal lien upon them until he is paid. The only suggestion we can make is that you refund him the money and demand your things back.

C. WHITFIELD SIMS.—Provisional patent protection will cost you £1. It is most advisable to take out a separate patent for each article. If you apply to the Comptroller, 25, Southampton Buildings, London, E.C., you can obtain a circular of instructions.

CLUB.—The notice is sufficient in regard to the studio, we think; but if you are in business after that date, we think the sitters can still claim to be taken, or have the money returned. We think you will have to take them, even if you have no studio.

GUSTAY THEILKULD (New York).—Homocol is made by the Bayer Company, Elberfeld, Germany; the others by Meister Lucius and Brüning, Höchst a/M, Germany. We advise you to write direct to these firms.

JAMES F. COYLE (Rochester, N.Y.).—Abney's "Photography with Emulsions" and Eder's "Handbuch der Photographie" (Part III.) (gelatino-bromide and gelatino-chloride emulsions) are the best two books for your purpose. We believe the former is out of print, but the latter is published by W. Knapp, Halle, a/S, Germany. A very great deal of the published matter on emulsions is out of date and of little use for practical purposes.

REVERSING LENS IN CAMERA.—I have a 5 by 4 Planex reflex camera, and use my lens from my half-plate Goerz-Anschütz (Dagor III.). The lens is really too short focus, but I have made it work by dropping it in the camera backwards reversed—that is, the front lens is inside. Would that alter the focussing of a picture in any way, because I do not get them quite sharp?—REFLEX.

In the case of the Dagor III. lens, reversal can make no difference whatever, as the lens is absolutely symmetrical in construction. We assume that the lens is not mounted in a shutter, but if it is so mounted, then the symmetry of the construction is disturbed to a slight extent. We should not, however, expect to find any appreciable difference, even in this case. With unsym-

metrical lenses reversal will, of course, make a difference, though not necessarily an appreciable one in all cases.

AMIDOL DEVELOPER.—Can you give me a formula with "Amidol" for plates and gaslight paper?—**AMIDOL.**

Make the following stock neutralised sulphite solution:—

Sodium sulphite	4 ounces.
Potass metabisulphite	1 ounce.
Water to	20 ounces.

This will keep for a long time. For use take:—

Amidol	2 to 3 grains.
Stock sulphite solution	100 minims.
Water to	1 ounce.

Add a drop or so of 10 per cent. potass bromide solution for gaslight papers.

PRESS.—A. Both instruments are of a type generally in use by professionals; ii. probably more than i. B i. The chief advantage is the great constancy, the chief drawback the need of high voltage (250) for the best results; ii. apply to A. E. Staley and Co., 19, Thavies Inn, London, E.C. C 1. For a half-plate instrument a lens of about 9in. focal length is best; ii. a good anastigmat of $f/6$ aperture is advisable. You can buy one of the above focal length for about £6.

GELATINE SHEETS.—Where can I buy thin sheet gelatine to dye for filters? I mean to dye it as it is, not to melt and mix with the dye.—**E. A. D.**

From Penrose and Co., 109, Farringdon Road, E.C., but we fancy you will have some difficulty in dyeing and drying evenly.

ALBUMEN LANTERN SLIDES.—Will you kindly inform me in which number of the "Journal" I can find instruction for making lantern slides by the "albumen process"? I believe some articles thereon have been published recently. Is this a suitable process for "stereo" transparencies?—**A. F. P.**

December 20 and 27, 1907. Our publishers can supply. The method is equally suitable for stereoscopic transparencies.

DYES.—Will you kindly tell me what filter dye will cut out the extreme red while transmitting the violet? "Crystal violet" and "filter blue" (Fuerst) both pass this red.

No dye will do this perfectly; those you name are about the worst. Methylene blue or patent blue is about the best.

J. M.—The name is Sumner, and the address, 41, Poland Street, W. You might also write Art Photographic Supply Company, Grosvenor Buildings, Steelhouse Lane, Birmingham.

HYP.—Seven pounds of hypo in three quarts of water (=19 oz. hypo per pint) is too strong. Use at least half or quarter the strength, and see that solution is not colder than 60deg. You should not have any further difficulty in fixing.

ROGERS.—A ten-shilling licence from the Excise is necessary to use a still. That will entitle you to re-distil the used methylated spirit, but you must not in any way attempt to remove the methyl or the petroleum spirit or other impurities, the addition of which is enforced by the law. Neither must you treat the spirit so as to get it beyond the strength that is obtained by simply re-distilling the spirit by simple distillation.

POISONS ACT.—I am told that I, not being a pharmaceutical chemist, must not sell an intensifier that I make, because it contains some bichloride of mercury. I have seen the Poisons Act, and see it is not included in the prohibited things. Will you please say if what I have been told is right or not?—**PROVINCE.**

Yes, it is quite right. Bichloride of mercury is what is called in the Act corrosive sublimate, which is another name for bichloride of mercury. According to the Act, you must not sell your intensifier.

LENS QUERY.—I have just bought a half-plate portrait lens second-hand, but I find it very unsatisfactory, as it will not give sharpness all over a cabinet portrait. When the middle of the body is sharp the head and feet are quite out of focus. This should not be, as the cabinet picture is not so big as the half-plate. The lens bears the name of "Bourquin, London." Can you tell me his address, as it does not appear in the P.O. Directory. If I had the address he might be able to improve the lens at a small cost.—**W. A. WARDELL.**

Bourquin has been out of business for twenty years or more.

He was not a maker of lenses, but a photographic dealer. The lenses he supplied were mostly of French make, and he, as a dealer, merely had his name upon them. You must not expect one of the old form of portrait lens of the half-plate size to take a stand cabinet portrait sharp in all parts. These old lenses had a very round field as compared with modern cabinets and carte lenses, and at the time they were made most portraits were taken sitting, and the round field then is not a disadvantage.

NEW DARK SLIDES.—I recently purchased a half-plate outfit and tried it a day or two ago on some groups which I was asked to take. As far as I know, the plates, developer, etc., were all as usual, but the plates are all fogged. Do you think that this can be due to the apparatus in any way? There are no marks of light entering, but I have been told that perhaps the dark slides, being new, have caused the fog on the plates. Is this likely to be the case?—**SEVENTY BOB.**

Not unless the plates have been in the slides for some days, even then the fog more often appears as a band opposite to the leather hinge of the shutter, the dressing in which is liable to affect the plates. In any case, a few days' exposure of the open slides to light and air will put the matter right.

CLOUDS ON BROMIDE ENLARGEMENTS.—I recollect some months ago reading a description of the method used by Mr. Gill, of Colchester, for printing clouds to bromide prints by means of cellulose negatives containing both the landscape and the cloud. I have forgotten the details, but having a large order for enlargements in which I want to insert clouds, am in hopes that you can assist me by a short summary of the process, or a reference to where I can see it.—**EXCENT.**

The article appeared in "The Photographic News" for December 28, 1906, and is summarised on p. 645 of the 1908 "B. Almanac." Though appearing under the name of "William Gill," we happen to know that Mr. Gill, of Colchester, is not the author.

SELF-DEVELOPING PLATES.—For experimental purposes I wish to prepare some plates which can be developed in water or some simple solution of a chemical. Can you give me a suitable formula, either as a bath for the plates or as a backing mixture?—**SCXXD.**

You can try mixing the constituents of, say, an amidol developer with gum or dextrine to a thin paste, and applying to the back of the plates. Another formula which has been advised is to bathe the plate for two minutes in: Hydroquinone, 1 part; acetone sulphite, 10 parts; water, 100 parts; developing in a 3 per cent solution of potassium carbonate. This is said to reduce the speed of the plate to about half. You should note that a number of patents for self-developing plates have been granted.

R. D. W.—If you told your employer that you would leave unless he gave you a holiday the day before Christmas Day you need not be very much surprised that he paid you off at the end of the week. Employees cannot expect to dictate to employers what holidays they should have. We do not see that, under the circumstances, you are entitled to a week's wages in lieu of notice. You can, of course, if you like, sue for it in the County Court, but it is very questionable if you will recover.

**** NOTICE TO ADVERTISERS.**—Blocks and copy are received subject to the approval of the Publishers, and advertisements are inserted absolutely without condition, expressed or implied, as to what appears in the text portion of the paper.

		ANSWERS TO CORRESPONDENTS ..	75

SUMMARY.

The Professional Photographers' Association has drawn up a suitable form of indentures of apprenticeship which is at the disposal of members. At the last meeting of the general committee the question of agreements as to opening within a certain radius was discussed. (P. 71.)

Some further letters on the question of agreements with assistants appear on page 74.

The Association of Professional Photographers in Blackpool have petitioned the municipal authorities in reference to the unfair competition in outdoor portrait photography which is created by the travelling photographers who flock into Blackpool during the summer months—to the number, it is estimated, of from seventy to a hundred. (Pp. 57 and 67.)

A French lady who sued a photographer for £800 damages on account of a postcard showing her attired as a clown was allowed only £8 by the court. (P. 73.)

A recent copyright case in the Manchester County Court, in which the plaintiff obtained an adverse judgment on a purely technical ground, supplies a caution as to the observance of necessary formalities when registering copyrights. (P. 71.)

A German photographer of natural history subjects, in a recent lecture on his methods, described several patterns of camera designed for working with a large-aperture lens at a great distance from the object. (P. 60.)

A recent paper by Herr K. Martin draws attention to the advantage of a lens of the telephoto type for projection purposes, owing to its permitting of a greater distance from the condenser, which latter can thus be made of greater focal length. (P. 58.)

The Australian Government are said to have made arrangements for a very extensive scheme of advertising the country by means of the cinematograph. (P. 61.)

At a recent cinematograph congress in Berlin representatives of the scholastic profession made a strong protest against the demoralising effect of many of the exhibitions, and suggested that it should be made illegal for anyone under fifteen years of age to be admitted to such entertainments after seven in the evening. (P. 58.)

We refer to a few of the obstacles in the way of marking plates with date of manufacture, as suggested last week by a correspondent. (P. 58.)

Some of the methods which may be adopted for modifying the colour of carbon lantern slides are the subject of an article on page 59.

EX CATHEDRA.

The Scottish Salon. The Salon now closed has had a most successful, if short, run, and closed amid a scene of great enthusiasm. The Coates Challenge Plaque and Associates' Plaques in the Fédération Lantern-Slide Competition were presented to the winners. The Town Clerk, who presided, delivered a short closing address, and then the assembled multitude, as with one voice, sang "Auld Lang Syne." Thus ended the sixth Scottish National Salon, which has quite maintained the prestige of its forerunners, mayhap even added to it. The Art Union realised some £36, which is not bad when it is considered that the exhibition was only open eight days. The Salon closed, dispatch was the order of the day, no time was lost, and by Monday night (the exhibition closed late on Saturday) all the pictures were packed and dispatched. Wishaw is proud of the success achieved, and prophesies that the experience gained will enable them to make the next visit of the Salon to their town an even greater success.

* * *

Restriction of Travelling Photographers. The efforts of the recently formed Association of Photographers in Blackpool towards protecting their interests from the onslaughts of travelling photographers will be watched with no little solicitude by photographers similarly placed elsewhere. That Blackpool is a pleasure resort where such competition is most keenly felt is beyond question, and the answer which is frequently made to those who complain, "Produce better work and the public will go to you," is not applicable in the present case, since price, and price alone, is the decisive factor among most of the visitors to the Lancashire seaside town. The union of local photographers are therefore petitioning the municipal authorities to allow outdoor photography to be done only by those who are ratepayers of several years' standing in the borough, and it is to be hoped that this or some effective medium course will be found practicable in restricting the operations of the travelling fraternity, among whom one may depend on finding the "bogus" photographer who takes payment without intention of supplying, and others of a similar fraudulent character.

* * *

Cinematograph Congress in Berlin. A Cinematograph Congress was held recently at Berlin at which was discussed a number of questions relating to the cinematograph as a means of public entertainment, and also as a source of income. Schoolmasters, music-hall and concert directors were represented, as well as cinematograph-film manufacturers, cinematograph manufacturers and proprietors, and cinematograph opera-

tors. The schoolmaster delegates complained of the demoralising effect many of these performances had upon the children, expressing their regret that what might be of valuable assistance to them in imparting knowledge to the young, had only too often an effect upon them which was in no way edifying. In order to overcome this evil, it was proposed to petition the police to make it illegal to admit children under fifteen years of age to cinematograph performances after seven o'clock in the evening. By this arrangement the afternoon performances could be entirely arranged on a plan suitable for children, and those objectionable films which their parents seem to demand for their own entertainment left entirely out of the programme at these afternoon performances. In self-defence, the cinematograph proprietors pointed out that the films about which all the hue and cry was made were not nearly so bad or demoralising as much of the literature which to-day is read by most youths. After considerable discussion the motion of the teachers to petition the police was carried by a majority. A few technical subjects were also discussed, principally lighting, the prevention of any outbreak of fire, and the insurance of cinematograph theatres and apparatus. Nothing of notable importance, however, resulted from these discussions.

* * *

To be Seen at Dresden.

From time to time we have evidence of how popular the camera has become with royalty, and at intervals we have also practical evidence of the enthusiasm with which they prosecute the hobby. Yet it may be news to many to know that there are so many royal devotees to the camera, and they are turning out such satisfactory work that they have decided to place their work on public exhibition, filling with it one of the sections at the forthcoming International Photographic Exhibition at Dresden. The list of these royal personages is too long to detail, though we might mention the King of Saxony, who has consented to act as protector of the exhibition, his son and his daughter, Queen Wilhelmina of The Netherlands, and also the German Crown Prince and the Crown Princess. Another interesting feature of the exhibition will be the practical demonstration of a new system of what we may call pigeon-post photography. A number of trained pigeons are to be sent off from various points in the neighbourhood of Dresden. Each pigeon will carry on its breast a small camera, weighing seventy-five grammes. This apparatus is fitted with a clock-work arrangement for working the film roll and the shutter. During the bird's flight a number of exposures will be made, and when the pigeon arrives at its destination at the exhibition, the film will be developed, and prints made on postcards, to be sold to the visitors. This new invention will probably excite more interest in military circles than among the general public; yet if the experiments prove as successful as is anticipated, they should certainly be a decided novelty to those who witness them. Visitors to this exhibition will have an opportunity of seeing the latest improved apparatus for telegraphic photography, receiving and dispatching photographs to and from the various large towns in Germany.

* * *

Telephoto Lantern Lenses.

An article in "Eder's Jahrbuch," by Herr K. Martin (of the Busch Optical Works) on the uses of telephoto lenses, calls attention to the advantages of the telephoto construction in lantern work. In any lens made on the principle of the telephoto the nodes are some way outside the objective on the side of the positive combination. If, therefore, we use such a construction, in place of the ordinary lantern lens, and with the positive element nearest the condenser, a much greater distance is required between condenser and

projector. This means that the light must be brought nearer the condenser to obtain even illumination, and this involves a consequent gain in light. This is one of the advantages of using a long-focus projector, which many workers fail to realise. Many are surprised to find that a short-focus projecting lens gives a less brightly illuminated picture than a longer-focus lens of the same or perhaps smaller aperture, though the reason is a very simple one to comprehend. Long-focus ordinary lenses have, however, the disadvantage of increasing the distance between lantern and screen. This trouble is got over if we use a short-focus lens of telephoto construction, with which the distance from slide to screen is not much greater than with an ordinary lens of the same focal length. The ideal lantern lens is one with a long "back focus" in proportion to its focal length, and this ideal is, of course, fulfilled by the reversed telephoto construction. The Busch factory are further perfecting the new "Bis-Telar" type of lens for use in lantern work. The only material objection that we can see to the adoption of lenses of this type is the matter of distortion. This defect exists with practically all lenses of the kind, and in a lantern projection it may give a very undesirable effect. Perhaps, however, opticians may find a way to obviate its effects, and the fact that in the latest pattern of "Bis-Telar" distortion is reduced, supports the expectation that they will do so.

* * *

Photography and Art.

We are accustomed to the extravagant claims of those who rank photography among the fine arts, and who make solemn comparisons between modern photographers and the old masters; in fact, we rather like such persons, for they bring humour and bathos into a section of the world that otherwise might only be dully comparing plates, lenses, and developers. We, however, cannot help thinking that a recent writer goes a little too far when he says "Photography is an art, and as an art it should be pursued or left alone." If we could take a census of the photographic world, we should probably find that those who think they pursue photography as an art amount to an insignificant percentage of the total. Are the rest to give it up on that account? This hardly seems reasonable, especially as many of the minute minority do no more than think they pursue it as an art, while of the rest only a few succeed in proving that they do.

* * *

Marking Packets of Plates and Papers.

We referred a short time ago to the advisability of manufacturers more clearly marking the brands, prices, etc., on their packets, but since then a correspondent has made the further suggestion that the makers should add the date of issue. This is a far more serious proposition, but not a new one, for we believe it has actually been tried and abandoned. The objection to it is that it hinders, if it does not prevent altogether, the sale of plates, etc., that are not of the most recent date, and the dealer is then left with a quantity of old and unsaleable—though probably quite good—materials on his hands. Some plates and papers will keep perfectly well for years; but the majority of purchasers will reject year-old plates if their age is ascertainable by inspection of the box. Even a three-months-old box will have a small chance of sale against one dated in the current month, and if the dealer keeps his newest brands out of sight he will soon gain the reputation of stocking old plates only. To protect himself, the dealer must resort to the hand-to-mouth method of keeping no stock, and only ordering small quantities as wanted. This is advantageous to no one, for even the user will prefer an old box at once to a new box that "will, perhaps, arrive to-morrow." It stands to reason that plates must be stored somewhere; if not at the dealer's, then at the manufacturer's,

f at the latter, the "date of issue" will soon mean very little, for it will not show how long they have been stored before issue. The difficulties are even greater in the case of plates exported abroad. Many of these cannot by any chance reach the users till months after issue, and plates that are obviously old will then have a small chance against undated packets from other countries. We agree most fully with our correspondent that it would be very convenient to know the age of the material we buy; but from the commercial point of view we do not see how the dating method can be carried out. It must be remembered that when quite fresh materials are necessary for special work, there is no difficulty in obtaining them. Any dealer will get them if specially ordered, while many manufacturers will supply them direct.

* * *

The Sale of Mercury Bichloride.

In a recent issue, a correspondent raised a question with regard to the sale of mercury bichloride, and in our answer we pointed out that this is called "corrosive sublimate" in the Poisons Act, and that under this name its sale is forbidden except by qualified chemists. We happen to know, however, that this difference in nomenclature is sometimes taken advantage of. We have often bought both mercury bichloride and potassium cyanide from qualified chemists; but while we have always had to sign the poisons book for the cyanide we have never been requested to do so for the other poison. We have actually raised the point at the time of purchase, and been informed that signing was unnecessary under the Act. Now both these poisons are in Part 1 of Schedule A, and signature is essential for all chemicals mentioned in this part. The only possible grounds for the exception made by the chemists is the fact that cyanide of potassium is specifically mentioned, while bichloride of mercury appears only under its old name of corrosive sublimate. This is a quibble only, for there is no possible doubt as to what is meant, and the surprising thing to us is, that chemists should raise such a dangerous quibble apparently for no better purpose than to save themselves the small amount of trouble involved in fetching the poisons book. We have heard it stated that chemists have consulted over the matter, and have come to the conclusion that mercury bichloride is not included in Part 1. We, however, doubt this information, for it is inconceivable that they could arrive at such a foolish decision which would not deserve a moment's consideration in a court of law. The Act is difficult to interpret in some respects, but not in this item. There may be a doubt as to what "preparations of corrosive sublimate" may include, but there is no doubt whatever as to what is meant by corrosive sublimate itself.

* * *

Cinematograph Entertainments.

According to the Paris correspondent of the "Globe," the cinematograph is now one of the most popular forms of entertainment in Paris. Moving picture "theatres" exist at every few yards along the boulevards, while some of the numerous buildings erected as circuses or hippodromes are now turned to account for cinematograph shows, and draw paying houses for the first time in their lives. Of late Londoners have shown tastes in the same direction, and we have frequently heard expressions of surprise at the excellence of the dramas shown on the lantern screen. When, however, we are told that the plays are in some cases written by such eminent men as Rostand, Capus, and Lavedan, while Bernhardt and Réjane have actually acted in some of them, it is evident that the makers of the films spare no expense, and leave nothing undone to ensure that they shall be good. Possibly the greatest wonderment is caused among the uninitiated by the

trick scenes, which are so numerous and such prime favourites. A little knowledge of the possibilities of photography and of cinematography is sufficient to explain many of these tricks; but still a good number of them are mysterious, even to those who think they know a good deal about the subject. The "Globe" correspondent does not reveal any of these subtle mysteries, but he is apparently not an expert photographer, for when explaining that the space within which the scene takes place is marked out by strings tacked to the floor, outside which the actors never step, he says that these strings "mark the edge of the lens!" His article, however, certainly tends to show that cinematography is by no means played out yet as an entertainment. If only these shows are kept free from vulgarity their popularity is likely to increase rather than diminish, for the possibilities of the science of cinematography are far from being exhausted. The only regrettable feature of the subject is the apparent fact that the cleverest films seem to be made in France and not in England, yet there can be no reason why English film-makers, actors, and playwrights should not work together in similar fashion and to the same end.

MODIFYING THE COLOUR OF CARBON LANTERN-SLIDES.

In an article on the production of lantern-slides by the carbon process ("B. J.," November 27, 1908), full working details were described. By this process slides can be obtained in a great variety of colours, thanks to the many tissues their manufacturers have put on the market during the last few years. There are, however, methods by which the colours yielded by the tissues themselves may be afterwards considerably modified; indeed, in some cases they can be completely altered by subsequent toning with different reagents. It is not necessary that the toning be done directly the picture is developed, as it may be postponed until any convenient occasion, and thus old slides which, when seen on the screen, may be thought capable of improvement by a modification of the tint, can easily be dealt with.

It may be explained that in the majority of cases the process of toning carbon transparencies differs entirely from that of toning silver pictures. In the case of a carbon slide—except in one or two instances—it is the gelatine and not the colouring matter that is acted upon by the reagents. Perhaps one notable exception to this should be mentioned. Supposing we have a transparency of a brown or purple colour and we desire to make it of a warmer tone. If one of the pigments in the tissue is alizarine—and most brown and purple tissues contain it—all we have to do is to treat the picture with an alkali, such as a dilute solution of ammonia, or one of carbonate of soda—the latter is preferable—and we then get a much warmer tint, due to the alkali acting on the alizarine and increasing its redness. Prints on paper, it may be mentioned, if alizarine is one of the pigments in the tissue, may have their tints warmed up in the same way.

In the case of the methods we have now in mind, however, it is the gelatine that we have to consider, and it will be recognised that where carbon slides have to be afterwards toned they should be printed in a tissue that is thin of colour—that is, contains but a small amount of pigment in proportion to the gelatine. Such conditions obtain in most of the tissues known as portrait browns and purples. The special transparency tissues, by reason of the large amount of colouring matter they contain in proportion to the gelatine, are not so suitable for our present purpose, since the light in printing does not penetrate deeply, and, therefore, we get but little thickness of gelatine in the finished picture. Furthermore, the

large amount of black overpowers any after colour that may be introduced, for it must be kept in mind that any colour or tint that may be got by toning carbon transparencies must necessarily be *plus* that of the pigment in the tissue at the beginning. At one time it was considered that nothing but the special transparency tissues were suitable for lantern transparencies, but owing to improvement in manufacturing all the ordinary ones, by reason of the fineness of division of the pigments at present employed, these latter may be used for the purpose.

A very rich, warm brown may be added by first immersing the slide in a weak solution of nitrate of silver, say one per cent., until the film is well permeated. The plate is then rinsed under the tap, and flowed over a few times with the ordinary acid pyrogallic acid intensifier, with a few drops of a solution of nitrate of silver added, as in the intensification of collodion negatives. A good formula for our present purpose is the following:—

Pyrogallic acid	40 grs.
Acetic acid	4 drams.
Water	10 ozs.

Silver Solution.

Nitrate of silver	100 grs.
Distilled water	5 ozs.

If a colder tone is desired than is given with the above, 50 grains of citric acid may be substituted for the acetic acid.

If the transparency be put into a weak solution of iodide of potassium, then rinsed under the tap, and afterwards flowed over with a dilute solution of bichloride of mercury a light red will be obtained, owing to the formation of the red iodide of mercury in the gelatine. If a yellow tint is desired the slide is first treated with a solution of bichromate of potash, and then with one of acetate of lead. Here we get the yellow chromate of lead. The tint given by this treatment is very useful for sunset effects.

By taking advantage of the iron salts a great variety of colours, or tones, is obtainable. For example, if the slide be immersed in a weak solution of sulphate of iron and, after rinsing, flowed over with one of ferrocyanide of potassium (yellow prussiate of potash), we shall get a greenish-blue in consequence of the formation of Prussian blue in the film, which may be useful for moonlight effects.

If the slide is put into a one per cent. solution of perchloride of iron until the film is permeated, then rinsed and afterwards flowed over with a two-grain per ounce solution of gallic acid, we obtain a rich velvety purple-black. By ringing the changes on the salts of iron, and also the reagents after—*e.g.*, using pyrogallic acid, infusion of nut galls, or of logwood in place of gallic acid—a great diversity of tones may be secured. A great convenience with the iron salts, as toning agents, is that if the colour when obtained, is not considered satisfactory, it can be entirely removed by immersing the transparency in dilute hydrochloric acid—say, 30 minims to the ounce of water. The picture can then be re-toned—after washing out the acid—with any of the other solutions.

Having in the foregoing indicated how by double decomposition in the gelatine film we may obtain many modifications in the colours or tones in carbon transparencies, we shall in conclusion add a few hints on the manipulatory details. In the first place, care must be taken to rinse thoroughly the film after the slide has been treated with the first solution, so as to free the surface from it before the second reagent is applied. Unless this is done there will be a danger of stains or markings on the surface. The solutions, whatever they are, should be used very dilute, and allowed time to completely permeate the film. This is more important in the case of the first solution than the second. If the requisite depth is not obtained at the first operation, it may be repeated several times if the plate be well washed between each. If the slide is an old one and was treated with alum, it is possible that the film will be hard and repellent of the solution. This trouble may, however, be overcome by putting the plate for two or three minutes in dilute ammonia—say, one part to twenty of water—and then well washing. This will remove the apparent greasiness, soften the gelatine, and permit the solutions to penetrate the film readily. If the glass of the slide has a substratum of bichromated gelatine on it there may be a tendency for the lights of the picture to become slightly tinted in the toning; this, however, may be quite obviated by putting the plate for a minute or two in very dilute hydrochloric acid, and then well washing to free the film of the acid. When slides have been toned by any of the methods just described it is as well to varnish them, as that greatly enhances their transparency, particularly in the shadows.

REFLEX AND OTHER CAMERAS FOR NATURAL HISTORY PHOTOGRAPHY.

IN the course of a recent lecture delivered before a German society, and reported in the current issue of the "Deutsche Photographen-Zeitung," Herr Max Steckel dwelt, among other matters, upon the various types of apparatus specially adapted to the requirements of the photographer of natural history subjects, and particularly of timid animals easily alarmed by the proximity of a camera. The method preferred by the lecturer, in contrast to that of the Kearton brothers and others in this country who patiently wait for hours in a property haystack or cow, was to work at a considerable distance with a telephoto lens. Distance, in fact, remarked the lecturer, was the best disguise of the presence and operations of the photographer; but the ordinary telephoto lens system was recognised by him as possessing the fatal drawback of insufficient rapidity, although Herr Steckel admitted that the latest introductions in the way of telephoto apparatus—namely, the *f*/7 "Bis-Telar" of the Busch Optical Company, and the new telephoto of the Zeiss Works—were of such recent introduction that he had not had

the opportunity of putting them to the test. Yet the fact that many animals could only be photographed towards evening, when they returned to their haunts, made it almost essential to use a lens of the largest possible aperture, whilst, in order to work at a sufficient distance, it was advisable to have a focal length of three to even six feet, though the latter, he admitted, could be regarded as a most extreme measure. Obviously, any apparatus capable even of providing an extension in the ordinary way for a lens of 36 inches focal length could not be highly portable, and, if made on the usual lines with a double or triple extension, was liable at its full length to be lacking in rigidity. Hence, the worker requiring such great focal length was compelled to adopt a mirror method such as that of the Dufour telephoto camera, a model of which was made and shown in London a year or two ago by the firm of Dallmeyer. The rays of light from the lens were reflected from one mirror on to another, and finally on to the plate, the outside dimensions of the camera being thus reduced to about half the focal length of the lens, owing

this doubling of the path of the rays. As a modification of his system, Herr Steckel had advised an apparatus such as that shown in Fig. 1, which consists of a solidly built base on the top of which a mirror, F, is fixed. Two other mirrors placed at about an angle of 45 deg. to the axis of the lens are fitted in the upper part of the camera, a focussing screen is placed vertically at V, and a dark-slide is placed in readiness for the exposure at K, the focal-plane shutter being fixed in front of it. The instant subject is thus viewed on the focussing screen, and exposure is made by a release, which first actuates the mirror S, and then the blind of the focal-plane shutter. But, as the lecturer pointed out in a vein of irony, one of the pleasures of employing the apparatus was the fact that it conferred upon the photographer the society of at least three assistants to carry it. It

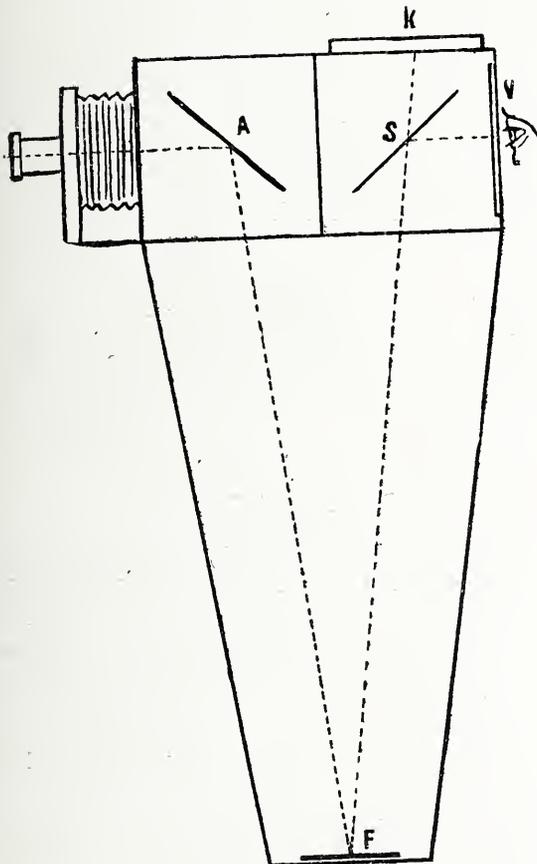

Fig. 1.

was made so that the upper and lower portions of the body could be separated, and the lens, itself also of considerable weight, carried as another parcel. The combined weight and bulk of the apparatus largely defeated its object, since the animal which the photographer might be thus stalking from a distance could hardly fail to perceive the caravan approaching, and most probably take fright. It was necessary for the members of the party to cover themselves with branches and leaves torn from trees, and in this disguise to advance cautiously to their quarry.

Although the author has obtained very satisfactory results with this apparatus, yet for convenience in transport a camera in the shape of a long, narrow box has been found preferable. In this case the reflex principle has been abandoned, and a device employed in its place by which focussing could first be done

and the subject then accurately watched so as to obtain it in proper position on the plate. The method by which this result was secured is illustrated in Fig. 2. The camera is seen to be one focussing from the rear and provided with a back, the lower half of which takes the dark-slide, whilst the upper, No. 2, carries the focussing screen. At the front of the camera is seen a rectangular frame, which is affixed to the lens, and is divided into two portions, I. and II., corresponding to Nos. 1 and 2 at the back. The subject is focussed on the ground-glass (2), and the lens then depressed so that the image is thrown upon the plate (1); the subject itself is then viewed through the sight-

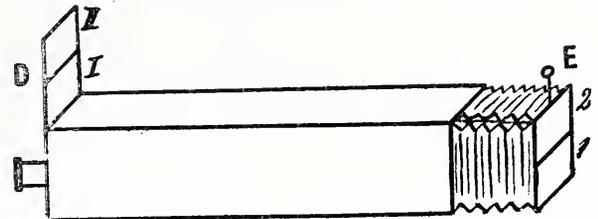

Fig. 2.

hole, E, and when everything is seen to be in readiness for exposure the release is made. The objection to this method, according to Herr Steckel, is that the plate is covered only by the blind of the focal-plane shutter, and has not the double protection which it obtains in a reflex camera. It has, however, the advantage of being used at the eye level; and in order, therefore, to secure these two conveniences in one and the same instrument the pattern of reflex shown in Fig. 3 has been designed. It will be seen that an additional mirror, F, is used in re-reflecting the image from the first mirror, S, on to a focussing

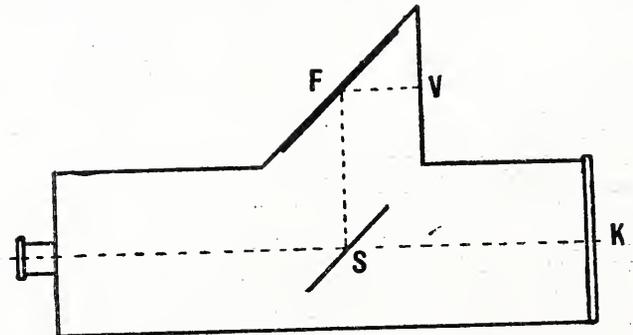

Fig. 3.

screen placed at V. On release of the mirror S in the ordinary way, the image of the subject is received on the plate at K. (It should be mentioned that this method is employed in at least two reflex cameras upon the British market—namely, the "Graflex," of Kodak, Limited, and the "Birdland," of Sanders and Crowhurst. Herr Steckel, however, appears to use this method to the exclusion of the ordinary procedure, in which the image is viewed upon the horizontal focussing screen, whereas in the two cameras mentioned it is employed as an accessory to the usual practice, and is intended to be employed when particularly desirable to use the reflex at a higher level.—Ems. "B.J.")

According to the lecturer, this type of apparatus is commendable, in that the face of the operator is excluded from view. The camera can be partly supported by a strap round the neck, leaving the worker's hands free when required, and the dark-slide is kept well covered.

PATHÉ CINEMATOGRAPHY OF AUSTRALIA.—Advices received by the Australian mail this week, which were telegraphed from Melbourne to Freemantle, the last port of call in the Commonwealth, state that the Federal Government has accepted an offer made by Messrs. Pathé Bros., of Paris, manufacturers of cinematograph films, to advertise the resources of Australia by means of special films illustrative of leading characteristics of the Common-

wealth. The Minister for External Affairs (Mr. Batchelor) states that the Commonwealth is to bear half the cost of the production of the films, and the intention is to take about fifteen pictures at a cost not to exceed £2,200. All the States will be visited. The firm guarantees the exhibition of the films in every European capital simultaneously for one week, after which smaller towns will follow, and alternately country districts.

FIELD WORK OF PHOTOGRAPHIC SURVEYING AS APPLIED IN CANADA.

[To a recent number of the "Internationales Archiv für Photogrammetrie" Captain Arthur O. Wheeler, of the Department of the Interior, Canada, contributes a useful review of the important application of photography in the surveys which have at present been made in the Dominion. In the following abridged version of his article we do not include the passages dealing with exposure and development, the details of which may be assumed to be fairly familiar to photographic readers.—Eds., "B.J."]

COLONEL A. LAUSSEDAT, member of the Institute of France and director of the Conservatoire National des Arts et Métiers, is the originator of the method as far back as 1859. He still continues his investigations, and watches its development with interest; for not long ago the writer received from him a very valuable and scientific paper, entitled "La Métrophotographie," presented to the French Society of Photography, in which he did the writer the great honour of recognising his first attempts in this direction.

The application to Canadian topographical surveys is due to Dr. E. Deville, Surveyor-General of Dominion Lands. His efforts have been attended by much success, and his valuable and complete work, entitled "Photographic Surveying," published in 1895, not only treats fully of the theory of the subject and the methods employed upon Canadian surveys, but briefly reviews its conception, progress, and the methods employed elsewhere.

In Canada the principal surveys upon which the method has been employed are:—(1) Survey of a portion of the Rocky Mountains, by Messrs. J. J. McArthur, D.L.S., and W. S. Drewry, D.L.S.; (2) survey of a portion of Alaska and the Yukon district in connection with the establishment of the boundary line between Alaska and the said district, under the superintendence of Dr. W. F. King, D.T.S., Boundary Commissioner; (3) survey of a portion of the Alberta Watershed for irrigation purposes, by the writer; (4) a number of minor surveys in the Yukon district, on the Columbia River, and in the Kootenay mining district, by Messrs. J. J. McArthur, W. S. Drewry, and A. St. Cyr; (5) a survey of the Crow's Nest coal area during the summer of 1900 by the writer. Since the summer of 1900 the writer has been engaged upon photo-topographical surveys of the Main and Selkirk ranges of the Rocky Mountains along the line of the Canadian Pacific Railway.

It is not the writer's intention to enter into the theory of the science, as space would not permit, and Dr. Deville's valuable work leaves little to be said on the subject by a beginner; but in order to understand the following notes it is necessary to say that the photographs taken are perspectives from which, by the rules of geometry and the inverse problem of perspective, contour-lines for any visible part may be reduced to a ground-plan. The elevation above a given datum and the position of the camera-station being known, any point in a view can be projected on the ground-plan. It is, however, essential that points so projected should be recognisable in two views taken at different stations, and that the two stations and the point form the apices of a fairly well-conditioned triangle. In other words, the imaginary line between the stations is a base subtending an angle of which the point to be projected is at the apex, the accuracy with which it is projected depending relatively upon the closeness of the angle to 90 degrees.

On the plan, the points are placed in position by projecting thereon the traces of the horizon and principal lines of the two views, and the lines of sight from each camera station to the said points. The intersection of the projection of the lines of sight fixes the position of the point. The traces of the horizon and principal lines are required for plotting these lines of direction.

A sufficient number of points along the ridges and dividing water-courses of the area embraced by the two views are identified and projected on the plan, care being taken to select those that will give the best definition of the ground. In order to draw the contour lines in proper position, it is necessary to have the relative elevation above datum-level of the points laid down. These elevations are based upon the elevations of the stations from which the views are taken, and are obtained directly from the photographs. The horizon-line corresponds to the altitude of the station. The elevation of any point in a photograph is proportional to its height above or below the horizon-line and the distance that its projection falls within or beyond the trace of that horizon-line. By means of the scale referred to in Mr. Deville's book, elevations are readily obtained, and subsequently contours are drawn in the proper position. Eleva-

tions should be taken out from both photographs, and thus made check one another.

The above is the fundamental principle of the method; there are however, numerous constructions that assist in obtaining elevation and definition of figures in planes parallel or inclined to the ground plane. For the most part these require the use of perspective instruments, such as the perspectograph, perspectometer, centrolinead, a photograph-board.

One of the most useful and interesting constructions is the method of squares: The perspective of a series of squares is placed upon the photograph, either by drawing or by using the perspectometer. The squares are then projected upon the plan, or such portion of the series as may be required, and the figure which it is desired to trace is drawn at sight. By this means, large streams, flowing through wide, heavily timbered valleys, can be accurately delineated from a rapidly made camera survey, where ordinary survey methods would require a party of axe-men and the expenditure of much labour and time, with results not nearly so accurate in detail. The same applies in many other cases, such as lakes, irrigation systems, towns, villages, parks, etc., provided that suitable camera stations can be obtained at a sufficient elevation to disclose the details of the area to be mapped, and that the plane of the area is near enough to the horizontal to be within the accuracy of the scale employed.

Certain figures in inclined planes can be referred to the horizontal by using the proper constructions.

Field Work.

From the foregoing, it will be seen that the results obtained depend upon the accuracy with which the camera stations are fixed in position and elevation. A triangulation carried to a greater or less degree of refinement is generally employed for this purpose. In the survey of the Alberta Watershed, a primary triangulation was projected over the area in advance of the photographing. It was carried to a fair degree of accuracy, the work being done by a 7-inch transit-theodolite reading to ten seconds and checked at intervals by carefully measured base lines. The sides of the triangles average about 15 miles. A secondary triangulation rested upon the primary and fixed the position of the principal summits. For this purpose a 4-inch transit-theodolite was used, reading to 0.01 degree. Camera stations were located by readings to or from them as found suitable.

At primary points, the signal sighted upon consisted of diamond-shaped drums of white cotton stretched upon a frame attached to a pole, 12 to 15 feet long, surmounted by a white cotton flag. The drum is raised about six feet from the ground, and measures four feet from the upper to the lower apex with the sun in the right direction; no difficulty is experienced in sighting upon either apex at a distance of 25 miles.

For secondary and camera-stations two white cotton targets, set at right angles on a centre pole with a flag, were found all that could be desired.

In timbered areas, material for the foregoing can generally be found at or near the station, and only wire for guys, cotton, and nails need be carried up. The assistant can make the signal while the surveyor does the photographing. In mountainous regions, where the stations are above timber-line, other signals must be employed chiefly rock-cairns.

It is not necessary that the views be taken at the signal; generally, more advantageous and commanding points are found at some distance.

Camera-stations may be located by one of four methods:—

(1) If close, by taking at the signal the azimuth from a convenient primary or secondary point, and measuring the distance with a tape; this is the easiest and most accurate method.

(2) If distant from the signal or an independent summit, by erecting a signal and reading upon it with the transit from outside fixed points.

(3) By taking one reading upon it from an outside fixed point, and the station two readings on other fixed points.

(4) By taking four or more readings at the station on outside fixed points.

To utilise the third and fourth methods when constructing the map the readings are plotted on tracing paper, and lines drawn in the directions obtained. The paper is shifted round until each line passes through the station to which it belongs. The point from which the lines radiate is then the location of the station on the map, and can be pricked through.

The last method may be advantageously used in the absence of an organised system of triangulation, when the survey is of an exploratory nature and is not carried to a high degree of accuracy.

Most topographical maps are referred to sea-level as a datum; it is therefore necessary that the elevation be carried from some point of known altitude and applied to all the stations of the survey. The relative elevations are obtained from vertical angular readings with the transit instrument, carried to a greater or less degree of refinement.

It will be readily conceived that a difficulty is experienced in finding camera-stations sufficiently commanding to overlook deep valleys and the streams, roadways, etc., passing through them; also, that projecting spurs will frequently obstruct the view. To obviate this difficulty and ascertain the points where contour-lines cross, traverses have been conducted up the main waterways, road-beds, and pack-trails.

The lines of direction for such traverses are obtained by angular transit-readings at each station, commencing at a point of known position, and are referred to the astronomical meridian. The elevation is carried through by vertical angular readings at each station, back and forward. For distance some pattern of stadia or micrometer is used. The ordinary chain would be impossible or too slow, requiring a large gang of axe-men and chain-bearers.

In the Alberta Watershed and Crow's Nest surveys, a modified form of the Lugeol micrometer has been employed. It is manufactured by Mr. A. Hurlimann, of Paris, and has been found to give adequate results. Sights can be taken up to one mile in length, from side to side, or point to point, of the valley at sufficient elevation to overlook the heavy timber generally found in the bottoms. It consists simply of a telescope, having a bisected object-glass, one of the halves being movable along the line of section by a screw. Two images are formed in the field by the bisected lens. Distances are determined by the number of screw-revolutions necessary to bring into optical coincidence the upper and lower targets of the reflected images. The targets are best made of white opal glass set in wooden frames, and are fastened to a rod a known distance apart: say, 15 to 20 links (10 to 13 ft.). This is called the base; it is generally furnished with an iron shoe and is stuck into the ground in a vertical position, the targets extending sideways at right angles. Attached to the screw of the movable half of the object-glass is a graduated head which measures in revolutions and hundredths the section of the screw passed over in making the coincidence of the targets. It is merely necessary to find the value of a revolution, in order to enable the distance to be determined for each reading. Tables can readily be constructed so that distances can be taken out by inspection.

The instrument is subject to error from three principal sources: (1) Error due to uneven refraction; (2) error due to wear and tear of the screw in the most used parts; and (3) error due to the base not being held perpendicular to the line of sight and the station being at a different altitude. The third error may be corrected by using the vertical angles read at each station with the transit. The first and second errors can only be reduced to a minimum by multiplying the readings.

The distance error of a traverse of this description varies from 1 in 50 to 1 in 400. By checking frequently upon the triangulation and camera work, it is all that can be desired for the purpose.

From 4 to 6 miles a day can be accomplished over very rough ground by a party of three men.

The surveyor's compass is sometimes substituted for the transit-theodolite, but is not so satisfactory, although more rapid.

The depth of the bottom of the valley below the traverse-section is measured by an aneroid barometer with sufficiently close results.

The country passed over is rapidly sketched in the field-notes of the traverse, and these notes are found very useful to show where the affluent watercourses between the ridges join a main stream, also minor details that cannot be covered by a camera.

Photographing.

The camera and mountain transit used in connection therewith are fully explained in Dr. Deville's book. It is first necessary to adjust the camera carefully, so that the true focal length may be marked by notches on the metal frame against which the plate presses. These notches are reproduced on every view taken, and give the focal length of the bromide enlargements used to plot the survey. (Figs. 1, 2, 3, and 4.) It is further necessary to obtain the readings of the spirit-levels attached to the camera when the plate to be exposed is in a true vertical position. As it is essential that the plate be vertical when the view is taken, the adjustment must be very carefully made and requires some skill.

Upon Canadian surveys a slow isochromatic plate has been used. It is manufactured by Mr. B. J. Edwards, of London, England, or by Mr. G. Cramer, of St. Louis, Missouri, U.S.A.; as the latter firm has, the writer understands, bought out the American patent of the former, both are practically the same plate. All views are photographed through an orange or lemon coloured screen, to equalise, as nearly as possible, the time of exposure required for the various coloured rays and to admit of a sufficiently long exposure to obtain detail in the shadows.

Before commencing work it is necessary to find the unit of exposure for the batch of plates about to be used. This should be done as near as possible to the field of operations, as the altitude and character of the country are factors of considerable importance.

Considerable difficulty is experienced in reaching many stations with the instruments, and the best part of the day is frequently taken up in doing so and returning; so that, when at the station, the views must be taken whether the conditions are favourable or not.

It may be laid down as a general principle "give plenty of exposure," and the writer might almost add as a general rule, "give the right exposure, and half as much more." From an under-exposed plate but little can be obtained that will be serviceable to plot from. The shadows in the negative are clear glass, giving black blotches without detail in the enlargement. What is not there cannot be brought out. On the other hand, an over-exposed plate may, by skilful treatment, be made to yield a fairly good enlarging negative. In fact, a plate exposed twice or even three times too much will still give useful results.

The Canadian cameras are oblong in shape and can be used in what is designated as either the horizontal or vertical position. In the former, the field covers about 57 degrees of arc, and it requires seven views to complete a circuit, making due allowance for overlap. In the latter, about 38 degrees of arc are covered and eleven views required. The vertical position is used to photograph deep valleys immediately below the station, which would otherwise be cut out of the field.

It is the exception that a full circuit is completed from one station, nor are stations often found where this can be done with advantage. As the writer has already stated, views cannot always be taken under the best conditions for photographing; when, therefore, a circuit has to be made from one or more stations on a hill, it is wise to commence as near as possible on the right of the sun, without allowing it to shine on the lens. By the time the last view is reached, the sun will have moved sufficiently to admit of its being taken. Photographs near the direction of the sun require longer exposure. If absolutely necessary, a view can be taken directly under the sun by cutting off the rays from the lens. In such a case, at least four times the exposure authorised by the state of light is required.

The orientation point of a view is the point selected from which to obtain the direction of the distance and horizon lines and enable their traces to be laid down on the map for plotting purposes. The azimuth of this point is obtained by an angular reading, from some convenient primary or secondary signal of the triangulation. If the position of some such signal-point can be identified in the photograph, and there is no doubt as to its recognition, it serves the purpose of an orientation point, and no other need be located. For the above purpose, a three-inch transit-theodolite, specially built by Messrs. Troughton and Simms, London, is used. It is set on the same tripod as the camera, and is conveniently arranged for carrying. (See "Photographic Surveying," by Dr. E. Deville, pp. 138 and 139.)

It is advisable to have at least two orientation points in each view, in case of one failing to come out clearly in the development of and

enlarging from the negative. Failure to identify an orientation point renders an enlargement useless for plotting.

Difficulty is frequently experienced in finding suitable points. It is of first importance that those selected should be certain of recognition. Great care should be taken that the points chosen are suitable for identification; a point may be visible in the negative and yet not appear in the enlargement. It is not wise to accept objects at a great distance, unless clear and very sharply defined. Distance, as a rule, requires less exposure than the nearer parts of the landscape, and consequently the points, if too distant, may be lost in exposing for the portion of the view required for the plot. The top of an isolated, or comparatively isolated, tree, a sharp-pointed hill, a nose or peak of rock, the gable of a house or corral, a snow-spot, and sometimes the corner of a pond are good objects. Sticks, stones, trees in the mass, rounded hills, and distant mountain points, although enticing, are very uncertain. Seen through the telescope, an object looks large, but on the plotting-photographs the same object can be obscured by the point of a needle. A rough pencil sketch added to the camera and transit-notes will materially assist identification. In the notes, the hour of the day, stage of light, time of exposure, limits, and general character of the view are entered; also, a few remarks as to the kind and relative quantities of timber in each view, thus enabling an efficient timber-map to be made.

A small dark tent is used for changing and marking plates. It is not advisable to use it until after dark or in deep twilight. If used in bright sunshine, plates may be fogged. A ruby lamp renders changing at night easy, although doing so in the dark is preferable, and merely a matter of practice. By a simple contrivance of snaps and ring, the dark tent can be hung within another tent in a very short time, and so avoid the disturbing element of wind.

It must not be supposed that a simple collection of photographic views and transit-readings, as described above, is all that is necessary to furnish the data of a topographical map. On the contrary, it is only the mechanical portion of the work. To succeed, the operator must be by nature and training a good topographer, with a cast-iron constitution. He must have the knack of finding his way like the Indian; nothing should escape his observation that will tend to an accurate delineation of the country. He must impress upon his memory and be able to recall the panorama seen from every photographic station; doubtful parts must be explored, and stations selected to give the best possible view. He must bear in mind that every part has to be seen from at least two points, sufficiently far apart and so placed that they will give a good base for plotting. It has been said that the mapping can only be done by the surveyor who does the field work; while the writer does not hold with this view entirely, there is no doubt that a better, more artistic, and more accurate map can be turned out, provided the surveyor has the necessary attainments as a draughtsman. Unfortunately men who are equally adapted to field and office work are few and far between. By taking certain precautions with the field work (such as indicating

the triangulation and orientation points upon the photographs and furnishing a plan of the triangulation points and camera-stations together with the direction of the limiting lines of each view), the writer believes that the work may be handed over to a good topographical draughtsman, who, provided he has had some experience of the field work, can turn out a fair representation of the area surveyed; but, at the same time, it will probably lack much of the vim and accuracy of detail that can only be obtained from an intimate personal knowledge.

Office Work.

The developing and enlarging of the photographs and plotting of the map do not fall within the scope of this paper, but a few words may not be amiss. Any professional photographer can develop the plates and enlarge from the negatives, more or less successfully. To obtain the needful results, however, it is desirable that the surveyor should be trained to do the work himself. He then knows what portion of the view to develop and, when enlarging, what parts to bring out most clearly.

Dr. E. Deville in his book goes carefully into the subject of developing and enlarging, and the writer can say from experiment that his instructions, based upon the best scientific observations, if carefully followed, will give good results.

On Canadian surveys most of the enlarging is done during the winter months, when daylight is short and uncertain. To obviate the difficulty, a 50 candle-power electric lamp is used with the enlarging camera described in Dr. Deville's "Photographic Surveying," and gives a steady, uniform light. The highest density of the negative may be measured by the photometer, and the time of exposure deduced from such measurement. A little practice soon enables the operator to judge the necessary exposure the moment the view is thrown upon the screen. By skilful shading of the thin portions of the negative, the denser parts are given sufficient exposure without blotting out the weaker ones and a uniform print is obtained.

Plotting the contours and drawing the map generally is the most tedious stage of the method. The time required depends to a large extent upon the scale employed and the character of the country. Mountain regions, where the features—ridges and valleys—are massive, can be more rapidly delineated than foot-hill country, which is more broken in character, and not so well defined in contour.

The scale upon which the Canadian surveys have been mapped is as follows:—Rocky Mountains' survey, $\frac{1}{20,000}$; Alberta Watershed

and Crow's Nest survey $\frac{1}{30,000}$; Alaska surveys, $\frac{1}{80,000}$. The

larger the scale the greater is the detail required for the drawing. The office work occupies at least twice the time of the field work. To offset this the field work can be accomplished in half the time required for any other method.

ARTHUR O. WHEELER.

EXPERIMENTS IN COLOUR-SENSITISING CHLORIDE EMULSIONS.

IV.

Results with Emulsions Sensitised before Coating.

EOSIN EMULSION CHLORIDE PLATES.—The best result of the emulsions above mentioned was obtained with that containing 6 ccs. dye solution 1-500 per litre, the negative of which corresponded fairly closely with the bathed plate obtained in a dye bath of 1-50,000, although on account of its relatively high content of dye it did not equal the best eosin-bathed plate as regards density. Its sensitiveness extended according to the time of exposure up to wave length 560 to 590. Like the bathed plate, it gave a maximum at about 545. (Fig. 12.)

ERYTHROSIN EMULSION CHLORIDE PLATES.—The best results were obtained with a plate containing 6 ccs. of 1:500 solution per litre of emulsion, and came near those obtained with a 1-50,000 bathed plate. The band of sensitiveness extended from 570 to 610, obtaining a maximum of action at 505 to 585, that for the bathed plate lying between 480 and 600. (Fig. 13.)

ROSE-BENGAL EMULSION CHLORIDE PLATES.—As with the two previous dyes the best results were obtained with the largest portion of dye and were, in the case of rose-bengal, superior to the result by bathing. The band of sensitiveness extended from

550 to 600, the average minimum was again about 435, and the maximum at 550, the latter having suffered a distinct shift towards the blue. (Fig. 14.)

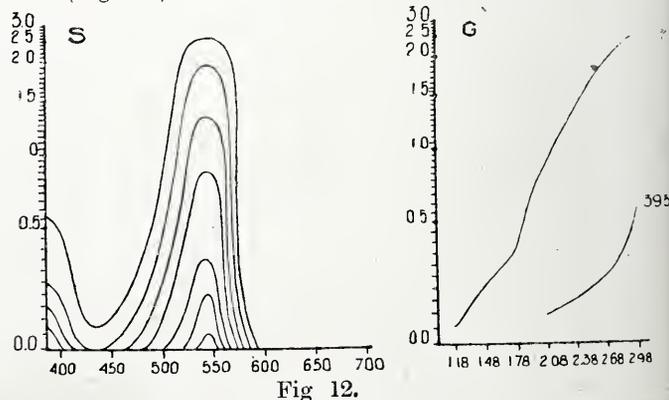

Fig 12.

ETHYL-RED EMULSION CHLORIDE PLATES.—In comparison with the bathed plates the result of all three emulsions was inferior, as

the best case with 6 ccs. 1-1,000 dye solution per litre the result is comparable with the bathed plate 1-200,000. A test was made of the commercial ethyl-red plate sold by the firm of Perutz as the "Perchromo," and it was found that its maximum lay at 530 and 580. These differed quite inappreciably from the results on the chloride emulsion, the band of sensitiveness in the yellow and orange being distinctly more uniform. (Fig. 15.)

PINAVERDOL EMULSION CHLORIDE PLATES.—These gave the best result with the largest proportion of dye. The second exposure of 30 seconds gave a maximum between 560 and 590. There was therefore no shift of the maxima compared with the bathed plate in the case of the longer exposure. (Fig. 16.)

these plates were somewhat fogged, a defect which was allowed for by measuring the fog and making necessary allowance in the density measurements of the different parts of the spectrum. The best action was given by the largest proportion of dye, and a notable distinction in comparison with the bathed plate was that the general depression of sensitiveness was not observed. The action in the green is very slight, and, as with the bathed plate, the maxima of sensitiveness lie in the same place, whilst the colour effect extends far into the red. (Fig. 20.)

DIAZO-BLACK EMULSION CHLORIDE PLATES—As these plates showed such weak action no measurements could be made. The sensitiveness appears to fall off towards the red end of the

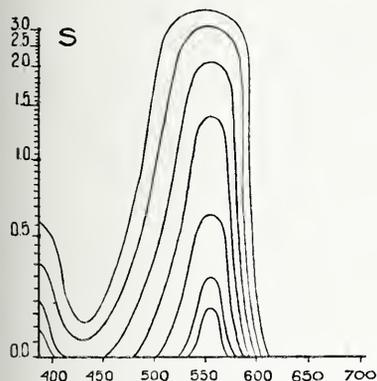

Fig. 13.

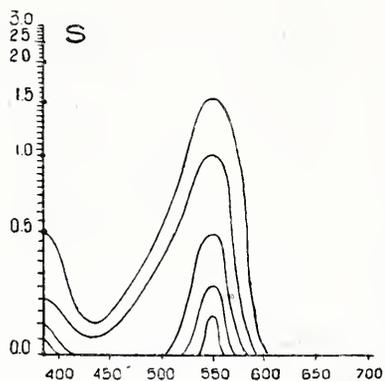

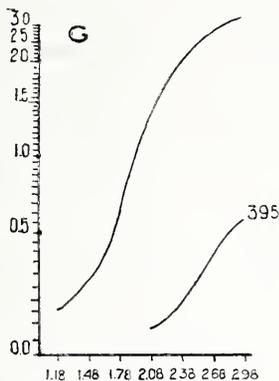

Fig. 14.

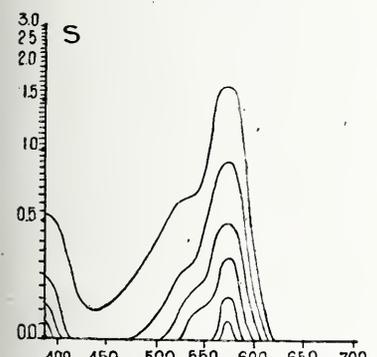

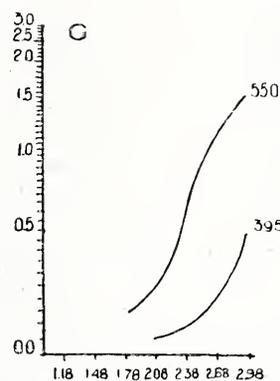

Fig. 15.

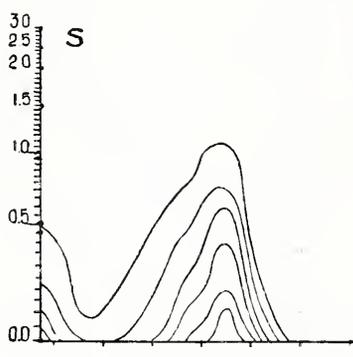

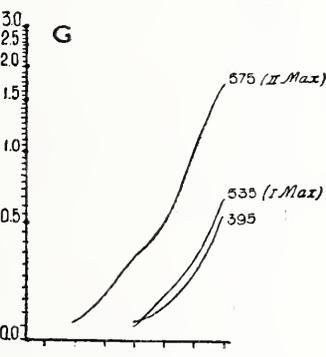

Fig. 16.

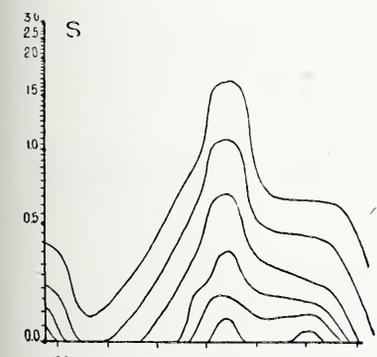

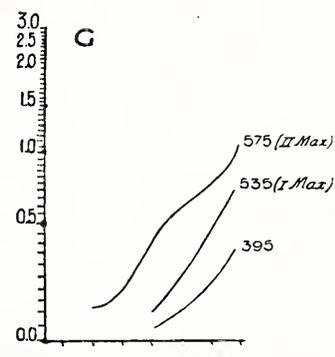

Fig. 17.

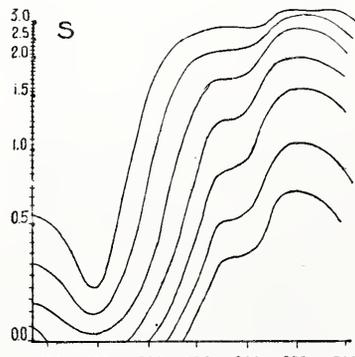

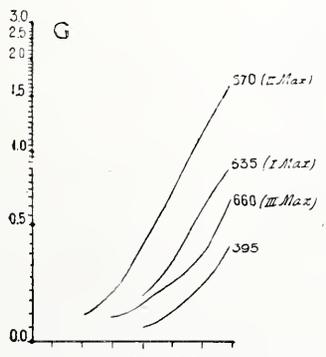

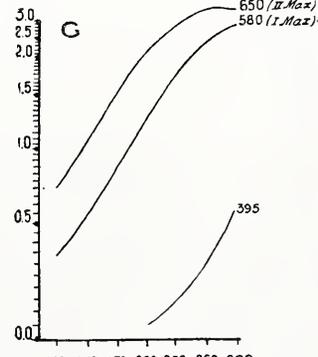

Fig. 18.

ISOCOL EMULSION CHLORIDE PLATES.—The 6 ccs. of dye gave the best result. (Fig. 17.)

PINACYANOL EMULSION CHLORIDE PLATES.—Here again the best result was given by the highest proportion of dye, the general properties of the plate being closely similar to those of the bathed plate, so that what was said in regard to it applies to the emulsion plate. (Fig. 18.)

CYANIN EMULSION CHLORIDE PLATES.—The higher proportion of dye gave the best result. The gradation of the emulsion plate is distinctly harder than that of the bathed plate, and this modified property appears to account for the densities of the general sensitiveness of the plate. (Fig. 19.)

DICYANIN EMULSION CHLORIDE PLATES.—As already mentioned,

spectrum, as no maximum of colour action could be noticed. Compared with the mother emulsion the general sensitiveness was depressed. (No figure.)

Ripened Bathed Chloride Plates.

IN order to ascertain whether, and to what extent, the state of ripening of the chloride emulsion affects the sensitising, an ammonia emulsion was prepared and digested for half an hour at 50 deg. C. The ammonia thus added to the silver nitrate solution was so adjusted that the precipitate formed was again dissolved, otherwise the conditions were the same as regards preparation, etc., as already described in the case of the unripened emulsion. A sample of the emulsion taken immediately after digestion appeared bluish-grey by transmitted light, resembling ripened silver bromide, and it

showed in the microscope a characteristic grain which was considerably coarser than the fine grain of the unripened chloride emulsion, without, however, being as coarse as that of an ordinary dry-plate. The prepared plates worked cleanly and were of practicable use, they showed, however, compared with those unripened, a dirty surface in the form of matt spots.

But exposed in the spectrograph and developed with ferrous citrate under the conditions already mentioned, the emulsion which had been treated with ammonia and digested gave much greater unevenness of sensitiveness, and at the same time greater flatness than in the case of the neutral unripened emulsion, a difference which was noticed not only in the case of the plain chloride plates, but

ing of the grain on ripening. In making comparison as regard sensitising of ripened and unripened plates the experiments were confined to the bathing method and to the two dyes, eosin and isocol. These are used in the concentrations of 1:15,000 and 1:50,000 respectively, which had been previously found best, the plates being treated as previously described.

Unripened eosin-bathed chloride plates.—Considerable sensitising took place giving maxima at 545 and 395 $\mu\mu$, with an exposure of 960 seconds. In the case of lesser degrees of exposure the sensitiveness curves ran almost parallel. (Fig. 21.)

Ripened eosin-bathed chloride plates.—The action was extremely small, the densities obtainable not being as great as with the

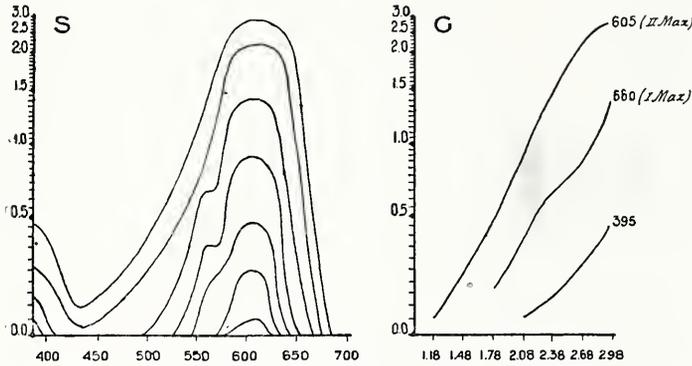

Fig. 19.

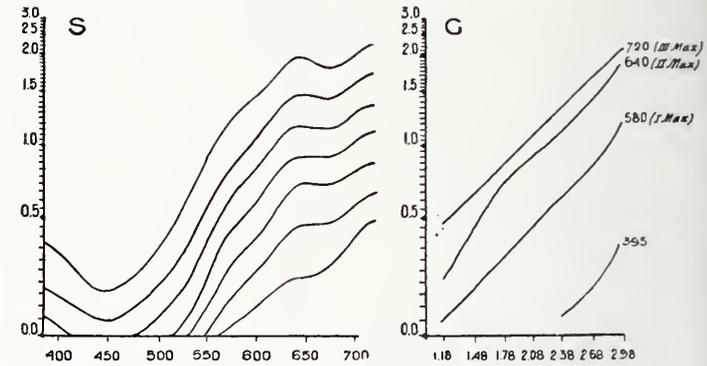

Fig. 20.

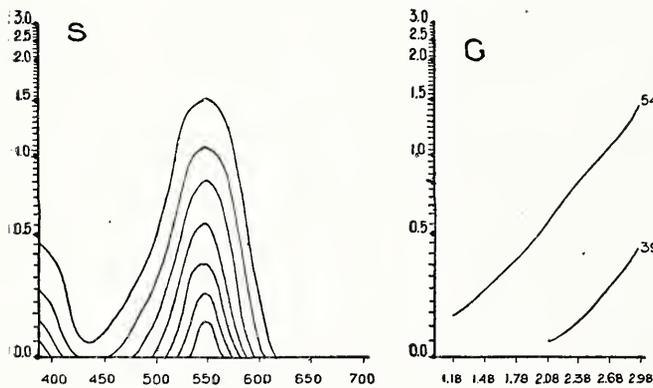

Fig. 21.

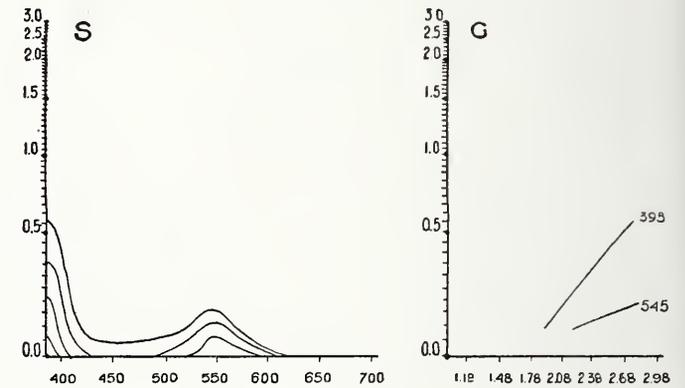

Fig. 22.

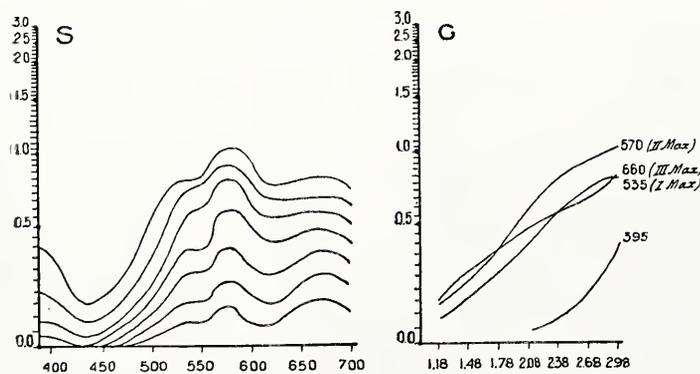

Fig. 23.

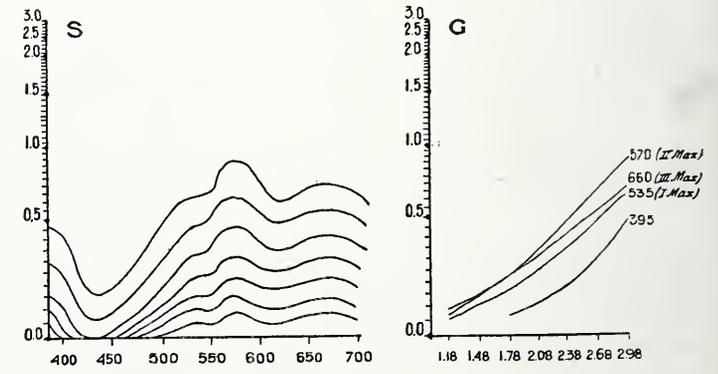

Fig. 24.

also in the subsequent bathed plates. In order to make a fairer comparison between unripened and ripened emulsions parallel experiments were made and two emulsions, one ripened and one not, were prepared in the way already described, and one put away to prevent any action of ammonia. Coating, sensitising, bathing, exposure and development were done on the same days, and as a result it was found that a stronger development of the spectral bands was noticed in the case of the ripened emulsion. In daylight the difference was equally plain, the more sensitive emulsion quickly assuming a dark blue-grey colour with a tinge of violet, whilst the other darkened more slowly and with a more reddish colour, and at the same time a more distinct odour of chlorine was noticed. The structure of the reduced silver showed the characteristic coarsen-

mother emulsion. The sensitiveness curve for an exposure of 960 seconds rose to 395 $\mu\mu$, falling then without a distinct minimum to a small maximum at about 545 $\mu\mu$ and finishing at 620 $\mu\mu$. The scale of gradation was similarly very small. (Fig. 22.)

Unripened isocol-bathed chloride plates.—The three maxima already mentioned were obtained and the sensitiveness curve quickly rose extending into the red beyond the limits of the spectrum. The gradation curve followed an almost parallel course under C. 50, whilst that of the first was somewhat flatter. (Fig. 23.)

Ripened isocol-bathed chloride plates.—The three maxima were the same as in the unripened plates, but showed a somewhat flatter curve as the colour sensitising altogether is slighter. (Fig. 24.)

F. WENTZEL.

THE BLACKPOOL PROFESSIONAL PHOTOGRAPHERS' ASSOCIATION AND TRAVELLING PORTRAIT PHOTOGRAPHERS.

reference to the unfair competition by non-resident photographers photographic canvassers who flock into Blackpool during the summer season, the Blackpool Professional Photographers' Association has addressed the following petition to the municipal authorities. The petition is signed by twenty-five professional photographers resident in Blackpool:—

We, the undersigned, being burgesses and ratepayers of this borough, wish to draw your attention to a very serious grievance which we are at present suffering from, and we humbly beseech you to help in this (to us) very pressing evil. We are all of us professional photographers residing in this borough, with studios, shops, and premises, for which we are paying rates and taxes, with rents especially large dues levied on us for water. We are also large consumers of artificial light, both gas and electricity. In the aggregate, we estimate that we pay several thousand pounds yearly, and we think we are justified in asking your help to overcome the special difficulties we are suffering from.

One of the most serious of these difficulties at the present time is the unfair competition we are having from a large number of transient photographers who make a happy hunting-ground of Blackpool in the summer months, who do not help in any way towards the welfare of the town, who merely come here for a few months to get what profit they can (much of it through misrepresentation) without paying anything in the shape of rents or rates for the privilege of doing so. They are, as a rule, a class of men who would not be employed in any respectable studio, and the amount of our losses through such men in business and prestige is incalculable.

It has been variously estimated that the number of such street photographers staying in Blackpool last year, was somewhere between 70 and 100. Now, as there are only about thirty studios in Blackpool, paying high rents and under heavy expenses—all doing their best to cater in a fair way for the needs of the public—it can be seen how badly handicapped are the professional photographers as opposed to these outsiders who pay absolutely nothing at all in the shape of rates and taxes.

There is also another very serious side to this question, and this is the grievance of the public.

The public is bluffed into paying high prices for very inferior work. Owing to these men having no reputations at stake, they care no pains in making their work permanent, and the visitors suffer the consequence.

Their modus operandi is briefly as follows:—They walk uninvited into boarding-houses, and under the pretence of coming from the nearest studios, bluff the visitors into being photographed; and as many of these men are questionable in character, it is very undesirable that they should be allowed to do so.

With due respect to the governing authorities, we would like to suggest the following remedies:—

1. A special "local licence" should be granted to outdoor photographers.

2. Applicants for such "licence" should be ratepayers for several years previous to such "licence" being granted.

3. This "licence" should not be transferable.

With regard to the local licence, it seems to us on a par with the restriction of the foreshore, which was so excellently solved by the local authorities some few years ago.

As to the second suggestion, we think it would be desirable to ward against itinerants taking a cottage or basement for a few months in the season, and so passing for bona-fide ratepayers. We think it only fair that this licence should not be transferable, in order to guard against the possibility of these men persuading a householder to procure a licence in his name for their special use.

In conclusion, we have stated our case in a moderate way, but we would like to refer to the numerous complaints that have been made to boarding-house keepers and hotel proprietors as to the annoyances caused to their patrons through the loss sustained in not getting their orders completed after previous payment for photographs, and being unable to find the men who have received their money, and complaints which the Chief of Police could largely supplement. We are confident of the sympathy and support of the public of Blackpool, and they, as well as ourselves, would like to see this kind of business under the effectual control of the local authorities.

Photo-Mechanical Notes.

An Old and a New Colour Printing Process.

Messrs. Kronheim and Co. have issued as an almanack a Baxter print produced in exactly the same way as thirty years ago. The print itself is scarcely improved by the garish design that surrounds it, but apart from that we do not think that photo-engravers need be afraid of the revival of this process, which must be both difficult and costly. The new process is the "Mezzochrome" process of the Fine Art Publishing Company, Limited, who announce the first view of the new production this week at 29A, Charing Cross Road. This is an application of the Rembrandt photogravure process to colour work, and if the colour work proves to be anything like so good as the black and white done by this process, there should be a good market for such prints, especially as they are to be sold at moderate prices.

The Commercial Side of Photo-Engraving.

Mr. Arthur Cox in his recent lecture at the Bolt Court School indulged in some plain speaking regarding costs and prices. He said it was essential to know the actual cost of work going through, and to know it accurately. He thought most engravers could not know this; if they did, he did not fear cut prices, because it was not in human nature to sell at 3d. what cost you more than 4d. He said it was foolish to try to economise by reducing wages. Men should be paid well, but must earn their money. He condemned the "scale" advocated by some American engravers, and said that a square inch rate of charging was not so insane as many people seemed to think it was; only if you sold per square inch it was necessary to know average costs per square inch. In fact, so convinced was he that a square inch rate was a reasonable proposition, that his firm were actually quoting some of their artists' work to Continental customers by the square inch, and they had found it quite satisfactory. Many questions were asked and answered, and as the cream of the photo-engraving trade was present some good should come from the lecture.

Penrose Pocket-Book and Diary for 1909.

This handy little book is to hand, and is replete with everything the photo-engraver needs in the way of formulæ and tables for his daily work; in fact, the amount of information contained in such a slim volume as well as the diary and cash columns, etc., is simply remarkable. This year there is included a free accident insurance policy, and we can only suggest that a page for personal memoranda, which most diaries now contain, would make the book a complete model of what such a pocket-book ought to be, and an example to those who think that people wish to carry about with them pages of large type advertisement mixed up with useful matter.

Two Good Books.

Messrs. Marion and Co. are offering "A Handbook to Photography in Colour" (published at 5s.) and "Practical Guide to Photo-printing and Photo-mechanical Processes" (published at 4s.) for 1s. 6d. each. To the photo-engraver both these books are most valuable, and if he does not already possess them he should take this opportunity to acquire them. It is true that Burton's book on printing is dated 1892, but it contains the clearest exposition of the processes dealt with that has ever been written, and most of the processes have not changed since the time the book was published.

MR. RICHARD SPEAIGHT left London last week for Madrid, in response to a cable received from the Private Secretary to H.M. the Queen of Spain, who has graciously consented to give a sitting from herself and children, in order to enable Messrs. Speaight to include the portraits in their exhibition entitled "Fair Children and their Mothers," which they purpose holding in their Bond Street Galleries during the coming season. It will be remembered that recently the German Crown Princess and her children gave sittings at the Royal Palace, Potsdam, to Mr. Speaight for the same purpose. The exhibition will also include portraits of the children of the Princess of Wales, the Crown Princess of Sweden and her children, and a large number of the aristocracy, for which special sittings have already been given.

Exhibitions.

AYR AMATEUR PHOTOGRAPHIC SOCIETY.

THE Ayr Amateur Photographic Society is only fifteen months old, but its members include some enthusiasts of irrepressible energy, for it has just held its first exhibition. In the Lesser Volunteer Hall, two hundred exhibits were tastefully displayed, half of these being by members of the club. In the open class Dan Dunlop came out on top in a strong class with his celebrated "Edinburgh Castle from Grayfriars." The second prize goes to James McKissack for his delightful "The Fairies' Harbour," which our Scottish readers will remember was reproduced in the catalogue of last year's Scottish Salon. "With Tottering Step," in the members' section, by John McClure, was adjudged the best picture of the show, and also gained first prize in Class II.; second prize in that class being gained by Dr. Lauder Thomson with "The Man at the Wheel." Other awards in the members' classes were:—Landscape or seascape—1, "The Mists of Early Morn," A. T. Hart; 2, "After the Rain," John McClure; h.c., A. T. Hart. Contact print—1, "Path Through the Field," R. F. Hutchison; 2, "Silence," John McClure. Outings—1, "The Hillside," John McClure; 2, "Stoney Ways," A. J. Ferguson. Mr. G. L. A. Blair, Mr. A. W. Hill (S.P.F. judges), and Mr. R. Smeaton Douglas, F.S.A., were the judges. A notable feature of the exhibition is a special loan selection by the Glasgow Photographic Art Circle direct from The Salon. A series of entertainments were run during the week.

FORTHCOMING EXHIBITIONS.

- January 6 to 27.—Northern Photographic (Manchester). Sec., S. L. Coulthurst, Broad Oak Road, Worsley, Manchester.
- January 19 to 30.—Glasgow Southern Photographic Association. Sec., Robert Lindsay, 189, Allison Street, Glasgow, S.S.
- January 27 to 28.—Bedford Camera Club. Sec., K. Gammell, 21, St. Peter's, Bedford.
- February 1 to 13.—Glasgow and West of Scotland Amateur Photographic Association. Sec., James McKissack, 68, West Regent Street, Glasgow.
- February 3 to 6.—Borough of Tynemouth Photographic Society. Entries close January 23. Sec., J. R. Johnston, 29, Drummond Terrace, North Shields.
- February 8 to 13.—St. Helen's Camera Club. Entries close January 27. Sec., A. G. Else, Duke Street, St. Helen's, Lancs.
- February 10 and 11.—Cowes Camera Club. Entries close February 1. Sec., E. E. Vincent, 4, High Street, Cowes.
- February 10 to 13.—Cleveland Camera Club. Entries close February 1. Secs., F. W. Pearson and R. Walton, 39, Granville Road, Middlesbrough.
- February 11 to 20.—Leicester and Leicestershire Photographic Society. Sec., Harry Cross, 80, Harrow Road, Leicester.
- February 16 to 20.—Norwich and District Photographic Society. Entries close February 2. Sec., J. T. Tanner, The Lodge, Bowthorpe Road, Norwich.
- February 20 to March 6.—Edinburgh Photographic Society. Entries close February 6. Exhibition Secs., Edinburgh Photographic Society, 38, Castle Street, Edinburgh.
- February 20 to March 20.—South London Photographic Society. Sec., H. Creighton Beckett, 44, Edith Road, Peckham, S.E.
- February 22 to March 6.—Birmingham Photographic Society. Entries close February 12. Sec., Lewis Lloyd, Church Road, Moseley, Birmingham.
- February 26 and 27.—Ilford Photographic Society. Entries close February 18. Sec., H. Eales, 53, Coventry Road, Ilford, Essex.
- March 11 to 13.—Coventry Photographic Club. Entries close March 5. Sec., W. R. Harris, 17, Allesley Old Road, Coventry.
- March 17 to 20.—Nottingham Camera Club. Sec., E. L. Kent, 5, Radcliffe Mount, West Bridgford, Notts.
- March 31 and April 1.—Shropshire Camera Club. Entries close March 20. Sec., Harry W. Hughes, Kingsland, Shrewsbury.
- April 10 to 17.—Midlothian Photographic Association. Entries close March 31. Sec., B. Sherratt, 8, Castle Terrace, Edinburgh.

Patent News.

Process patents—applications and specifications—are treated in "Photo Mechanical Notes."

The following applications for patents were received between January 1 and 9:—

- COLOUR PHOTOGRAPHY.—No. 50. Improvement in the preparation of plates and films for the production of coloured pictures by means of photography. Francis Martin Duncan, 39, Bradley Gardens, West Ealing, London.
- COLOUR PHOTOGRAPHY.—No. 51. Improvement relating to sensitise paper and other material capable of being sensitised for a process of colour photography. Francis Martin Duncan, 39, Bradley Gardens, West Ealing, London.
- CAMERAS.—No. 159. Improvements in photographic cameras. George Sylvester Grimston, 4, Glenluce Road, Blackheath, London.
- CINEMATOGRAPHS.—No. 161. Improvements in cinematograph film spool. James Holgate and Thomas Fox, Knottingley, Yorks.
- REFLEX CAMERAS.—No. 338. Improvements in and relating to photographic cameras of the reflex type. Herbert George Chessher, 31 Basinghall Street, London.
- CELLULOID.—No. 376. Improvements in the manufacture of non-flammable celluloid. Walter Cottrell Parkin and Alfred Williams, 71, Crescent Road, Sheffield.
- DAYLIGHT DEVELOPMENT.—No. 381. Tank for the development, fixing, and washing of photographic plates or flat films in daylight entirely without the use of a dark-room. David Russell, 6, Charles Street West, Lincoln.
- CINEMATOGRAPHS.—No. 453. Improvements in and connected with moving picture-taking viewing or projecting apparatus, and in the production of reduced image picture therefor. Rotary Photographic Co., Ltd., and Ferdinand von Madaler, 55, Chancery Lane, London.
- DARK-ROOM LAMPS.—No. 505. Improvements in photographic dark room lamps. William Wallace Beasley, professionally known as Wallace Bellasie, 63, Onslow Road, Richmond, Surrey.
- CAMERAS.—No. 513. Improvements in photographic cameras. Joseph Gant, 8, Lensden Place, Golden Lane, London.
- CAMERAS.—No. 514. Improvements in photographic cameras. Joseph Gant, 8, Lensden Place, Golden Lane, London.
- CAMERAS.—No. 515. Improvements in photographic cameras. Joseph Gant, 8, Lensden Place, Golden Lane, London.

New Trade Names.

AKLA.—No. 307,143. Cameras, plate changing boxes, developing boxes, dark-slides, and other photographic apparatus, all being goods included in Class 8. Arthur Augustus Brooks, "Cratleigh," Park Avenue, Ashton-on-Mersey, Cheshire, engineer and manufacturer. October 20, 1908.

Analecta.

Extracts from our weekly and monthly contemporaries.

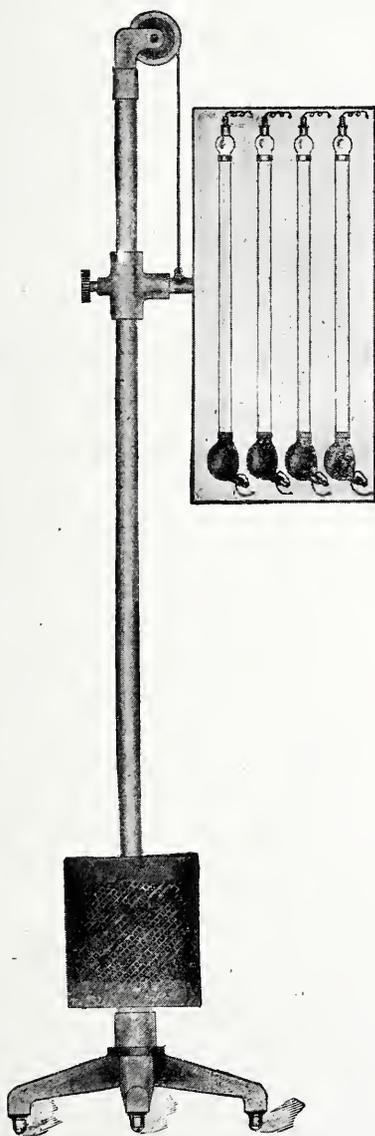

Changing "Ensyna" Prints from Purple to Brown.

An "Ensyna" print (writes Mr. Frederick Airey, in "Photography and Focus," for January 19) of a purple tone can be converted into one of a fine brown or sepia very simply. A kettle is arranged so as to send out a good jet of steam, and the finished print, which must be perfectly dry, is held in this jet an inch or two from the spout for about thirty seconds. The print must be kept moving the whole time, and if the kettle is on a fire the print should be protected from the dry heat as much as possible. The process is effective, even after the prints have been mounted. Brown tone prints do not give such satisfactory results when steamed as do those of a purple tone. The process succeeds best with the matt surface paper, the steam leaving it with a satin or carbon surface.

New Apparatus, &c.

Cooper-Hewitt Mercury-vapour Lamp for Studio and Printing. Sold by O. Sichel and Co., 52, Bunhill Row, London, E.C.

It must now be four or five years since the mercury-vapour light was first shown by the Westinghouse Company in London on behalf of the Cooper-Hewitt Company in America, since when a good many photographers, and at least as many trade printers and enlargers, have taken the light into use and have employed it with success. It need not be denied, however, that complaints of the mercury-vapour installation have been more frequent than is desirable—the chief defect being the breakdown of the tubes after a little while, or at the time of installation—yet, in common fairness, we have not known of a single instance where Cooper-Hewitt tubes, properly installed, have failed to prove satisfactory. The Westinghouse Company, owing, no doubt, to the much larger interests concerned in the business, cannot be accused of forcing the advantages of the lamps

under photographers' noses, and the adoption of the system has frequently come about from a studio proving for itself the efficiency and economy of the light. Those who visited the exhibition of portraiture by artificial light, held at the house of the "British Journal" in November, 1907, will perhaps remember the fine portraiture work done with the mercury-vapour lamp by Mr. Adolph Langfier and Mr. R. Henderson. However, the Cooper-Hewitt lamps in an improved and more convenient mounting, are now being marketed by Messrs. O. Sichel and Co., of 52, Bunhill Row, London, E.C. As sold by Messrs. Sichel, the lamps are mounted on a frame, which is detachable from the arm of the supporting standard, and thus allows of the outfit being readily transportable in a cab, the lamps themselves inside under the photographer's care, and the

standard outside. This facility is doubly useful in the case of the mercury-vapour lamp, since the small amount of current required may be taken from an ordinary connection, even from the plug of an incandescent lamp, and therefore the light may readily be used in ballrooms, private houses, and other premises where the electric supply would not be sufficient to run an arc. This particular facility of the mercury-vapour system is one not to be disregarded. In common with other methods of artificial lighting, it allows of the best portraiture being done in an ordinary room, in a basement, or anywhere, whether daylight is available or not. The importance of this fact to the professional photographer has been emphasised over and over again, but is appropriately repeated once again in connection with the present lamp, the cost of which (complete) is £20 19s. to £22 18s., (according to the voltage), from which sums Messrs. Sichel offer professional photographers a substantial discount.

The lamp, it should be mentioned, is so fitted that the lamps cannot be connected wrongly to the terminals. It is made so that it can be conveniently employed for printing, and the frame of tubes can readily be adapted for enlarging purposes, no condenser being necessary. Those interested should write Messrs. Sichel for an appointment to try the installation. It may be said, in conclusion, that the photographer, before complaining of the colour of the mercury light, should try the simple experiment of putting in one or two red incandescent lamps to supply the red rays which are lacking in the light. He need not fear, as did a recent naïve correspondent, that these red rays will "slow the light."

"The Wratten Tricolour Ink-tester." Made by Wratten and Wainwright, Croydon.

In a booklet just issued, Messrs. Wratten and Wainwright explain their motive in supplying this piece of apparatus to be the very natural one of giving three-colour block-makers the opportunity of testing for themselves the complementary inks used for the printing of the blocks. Not that Messrs. Wratten have any axe to grind in the matter, except that, with good reason, they object to their filters being blamed for shortcomings of inks. Incidentally they have something to say on the principles which must guide the choice of filters, and on the difficulties in which the neglect of those principles is liable to land the three-colour photo-engraver. Hence the "ink-tester," which consists of six squares of coloured gelatine mounted between glass to protect them from damage. The six squares are (1) the standard Wratten tricolour filters, and (2) the complementaries of these colours, or the printing colours.

The tester is intended to enable block makers and printers to examine any tricolour inks with a view to finding how nearly they resemble the theoretical colours. The inks can most conveniently be examined by proving them in solid patches superposed in pairs.

When examined through the red filter (No. 1):—

The blue ink should appear quite black.

The red ink as very light.

The yellow ink will be almost always invisible against white paper.

The defect to look for here is that the blue ink tends usually to be not black enough; any brownish appearance in the blue ink will produce brownish blacks in the finished print.

When looked at through the green filter (No. 2):—

The magenta ink should appear black.

The yellow ink almost invisible.

But the blue ink examined through this green filter is always wrong more or less. It should be theoretically almost invisible, practically it is certain to be dark. The lighter it is, assuming that it really cuts out the red when examined through the first patch, the better.

When examined through the blue filter (No. 3):—

The yellow ink should be dark.

The blue ink should be light.

These are usually satisfactory, but the magenta ink should always be quite light, and it is always dark. The lighter it is the better, provided that it looks right when examined through the yellow patch, as will be described later.

When examined through the light blue filter (No. 4):—

The scarlet patch made by proving the red on the top of the yellow should be black.

The blue ink should be quite light.

The magenta ink should be clear blue-violet.

The defects to be expected are, that the blue ink will be too dark, and the magenta ink also too dark, showing too little blue in its composition.

Through the magenta filter (No. 5):—

The blue ink should appear clear blue.

The yellow ink should be a strong scarlet.

Through the yellow filter (minus blue)—

The red ink should appear a good scarlet.

The blue ink should be a bright green.

The commonest defect to be watched for here, indeed the commonest defect of all tricolour inks, is that the blue ink, when examined through this filter, will be too dark.

To summarise the main defects to be looked for:—

It is to be expected that the blue ink will not completely absorb red. This will be shown

1. (a) By a rusty black when the three are proved one on another.

(b) By the blue ink appearing brown when examined through the No. 1 filter.

2. That the blue will not contain enough green, viz., will be too violet. To show this

(a) When examined through No. 2 filter the blue will appear too dark.

(b) When examined through No. 6 filter it will not appear a bright green.

3. That the red ink will not contain enough blue. This will be shown

(a) When examined through the No. 3 filter it will appear much too dark, appearing black.

(b) When examined through the No. 4 filter it will not appear blue, but black.

4. That the red will not absorb the green sufficiently. This will be shown

(a) By the fact that it will not appear sufficiently black through No. 2 filter.

(b) By the fact that when examined through No. 6 filter it will appear too orange and not a bright enough scarlet. Also when proved on the top of the yellow, it will give an orange not a scarlet.

These simple tests are by no means exhaustive, nor do they claim to be in any way final, but they will enable a practical worker to form a better judgment as to the value of his inks than he can expect to do when examining them only by his unaided eyesight.

The blue square also is of service to the fine etcher, who is etching from a yellow proof and not from a black proof of the yellow plate. On looking at the yellow through the blue filter it will appear black, and detail that is invisible without any filter will be easily seen. In the same way the tester is of still greater service to the prover, because he can instantly detect any variation in weight of colour in the yellow proofs by looking at them through the blue square in the tester. Differences quite imperceptible will be detected instantly if the yellow is absorbed by the blue filter, because the proof will then look black. In the same way, if it is ever necessary to prove the colours in very light weight so that they appear very pale to the eye, the appropriate square can be used to view them, when any small differences will at once be detected.

We would add, in reference to Messrs. Wratten's booklet, which, like other Wratten literature, is obtainable free, that though not specifically so described, the set of inks there proved are actually those commercial products which Messrs. Wratten have approved as being the best in hue that they know, of sufficient permanence for ordinary work and satisfactory in working on the press.

ARBUS AND BERNARDI.—Notice is given of the dissolution of the partnership between Menu Arbus and Bernard Bernardi, carrying on business as photographers, at 16, Hill Rise, Richmond, and 1, Station Buildings, Fife Road, Kingston-on-Thames. The business at Richmond will be carried on by Menu Arbus, and the business at Kingston aforesaid will be carried on by Bernard Bernardi.

New Materials, &c.

MEZZOCHROME PROOFS IN COLOUR.—There is now to be seen, at the offices of the Fine Arts Publishing Company, 29A, Charing Cross Road, London, W.C., a small exhibition of the intaglio prints in colour, issued as "Mezzochrome." They are produced by a modification of the process by which the "Burlington" Proofs are made, but in colours, and their characteristic is a new one in colour printing for, unlike half-tone and lithographic printing, the results are obtained from intaglio plates, and as a consequence obtain a rich deep deposit of ink in the shadows, at the same time as purity and brilliancy in the high-lights. Moreover, the surface of the proof is matt, and the proof can thus be issued with a plate-mark like an engraving, and produce an effect which is restful to the eye. At present the proofs issued are not numerous, but they are choice and varied. There are four of "Modern London," "The Tower and London Pool," "Night in Trafalgar Square," "Westminster Bridge, and "The Gaiety Corner." There are two of MacWhirter's landscapes, four scenes of "Point-to-Point Races," from paintings by Major G. C. Roller, the "Allegory" of Solomon J. Solomon, and the "Home of the Seabird," by Reginald Smith. These subjects are issued at the uniform and moderate price of 15s. nett per copy and have the standard outside dimensions of 34 x 26 inches. They are worthy of a visit from professional photographers and other who would obtain really artistic colour reproductions for a small sum. A booklet issued by the company contains small reproduction of all the subjects at present issued.

Meetings of Societies.

MEETINGS OF SOCIETIES FOR NEXT WEEK.

FRIDAY, JANUARY 22.

Fakenham Literary and Camera Club. French Lantern Pictures. A. E. Staley & Co.
Sutton Photographic Club. "Velox Papers." Demonstrated. Kodak, Ltd.
Aberdeen Photographic Association. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Mill Camera Club. "Eyes and Ears" Competition.

SUNDAY, JANUARY 24.

South London Photographic Society. Excursion to Northfleet.

MONDAY, JANUARY 25.

Walsall Photographic Society. Exhibition of Thornton-Pickard Prize Slides and Apparatus. R. Hesketh.
Carnoustie Photographic Association. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Stafford Photographic Society. "Elementary Photographic Chemistry." W. Bennison.
Scarborough and District Photographic Society. Lecture. Frank Foster. Lecture. T. F. Brogden.
Leek Photographic Society. Annual General Meeting.
Southampton Camera Club. *Photographo* Slides.
Bradford Photographic Society. Members' Prints.
Cripplegate Photographic Society. "The Romance of the London Streets." A. H. Blake, M.A.

TUESDAY, JANUARY 26.

Royal Photographic Society. "On the Determination of Spectrum Maxima and Minima," and "On Uniformity in Spectroscopy for Photographic Purposes and a Proposed Form of Instrument." Chapman Jones.
West Bromwich Photographic Society. "Exhibition of Thornton-Pickard Prize Slides and Apparatus." R. Hesketh.
Leith Amateur Photographic Association. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Rodley, Farsley, Calverley, and Bramley Photographic Society. Conversation.
Hackney Photographic Society. "Bromide Enlarging and Cloud Printing." G. H. Capper.
Worthing Camera Club. "A Trip to Arundel." Lecture Competition.
Hanley Photographic Society, Y.M.C.A. Members' Competition.
Blackburn and District Camera Club. "At Home and Abroad with the Camera." Alfred Taylor.
Wimbledon and District Camera Club. Annual General Meeting.
Leeds Photographic Society. "Some Avon Villages." Harold Baker.
Faversham Institute Photographic Society. French Lantern Pictures. A. E. Staley & Co.

WEDNESDAY, JANUARY 27.

Sale Photographic Society. "On Enlarging." Mr. Redfern.
Borough Polytechnic Photographic Society. Members' Night.
Portsmouth Camera Club. Dutch Lantern Pictures. A. E. Staley & Co.
Croydon Camera Club. "Models I Have Photographed." P. R. Salmon.
Leeds Camera Club. "Figure and Genre Studies." A. Cohen.
Cowes Camera Club. "Carbon Printing." W. T. Mahy.
Motherwell Y.M. Inst. Camera Club. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.

Bristol Photographic Club. Exhibition of Thornton-Pickard Prize Slides and Apparatus. R. Hesketh.
 Edinburgh Photographic Society. "Platinotype and Carbon." R. Forbes.
 North Middlesex Photographic Society. "Trimming, Mounting, and the Making of Passe-Partouts." M. Fraser Black.

THURSDAY, JANUARY 23.

London and Provincial Photographic Association. Demonstration of "Agfa" Specialties. F. C. Hart.
 C.C. School of Photo-Engraving, Bolt Court. "The Process Man—A Character Study." R. Vincent.
 Landsworth Photographic Society. "The Manipulation of Autochromes." F. E. B. Hall.
 Chelsea Photographic Society. "Cristoid Films (Development, etc.)." F. Humpherson.
 Rugby Photographic Society. "Some Picturesque Midland and Cotswold Villages." W. A. Clark.
 Liverpool Amateur Photographic Association. "Carbon Printing." Demonstrated. Ernest Scott.
 Cardiff Windsor Photographic Society. Exhibition of Thornton-Pickard Prize Slides and Apparatus. R. Hesketh.
 Greenock Camera Club. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
 North-West London Photographic Society. "The Choice of a Developer for Bromide Work." H. S. Date.
 Melbourne (Dulwich) Camera Club. "Photographs taken in the Emerald Isle." S. Savage.

PROFESSIONAL PHOTOGRAPHERS' ASSOCIATION.

A MEETING of the General Committee was held at the Royal Photographic Society, 66, Russell Square, W.C., on January 8. Present: Messrs. H. A. Chapman, J.P., H. E. Hull, A. Mackie, D. Prodger, E. Scamell, Lang Sims, S. H. Fry, and C. H. Skillman.

Mr. H. A. Chapman, J.P., President, in the chair. The Hon. Secretary said he had had inquiries for a suitable form of indentures of apprenticeship for the photographic business, and it was found that there were certain modifications it was desirable to introduce in the usual forms to make them apply to the conditions of business. He had now a very useful form, which was at the service of members.

A number of applications for advice from members were read and discussed.

Certain accounts were passed for payment.

At the members' meeting which followed a discussion took place upon the general question of covenants in agreements with assistants not to open in business within a certain distance of the employer's place of business. The Hon. Secretary said the Association was constantly having correspondence with members upon this matter. What was a reasonable distance to fix it was impossible to determine without a knowledge of the locality, but generally it was found that the member suggested a radius that was clearly open to the liability of being decided to be inoperative as being unreasonable. The President spoke at some length on the subject of alleged photographs of spirits, and suggested that an expression of opinion should come from the Association as to the character of the results that had been shown. After considerable discussion it was agreed that the matter was of such a nature that it would be of no benefit to the Association or its members to enter into the controversy.

CROYDON CAMERA CLUB.—A variegated programme of ten-minute lecturettes was given last week. The President, Mr. T. M. Sellors, first touched upon the question of employing filters when enlarging or altering contrast. It had been stated, green and yellow hardened, whilst blue softened gradation. Although he did not attach much value to the statement, he had thought it worth while to test its truth, and had accordingly made a series of exposures through green and blue gelatine filters respectively, the results of which were slightly in favour of the proposition advanced. The multiplying factor of each screen was previously found by trial and error, that of the blue being $\times 2$, the green $\times 16$. Some members, in commenting upon this, pointed out that merely increasing the duration of exposure *per se*, by the interposition of the green filter, would produce added contrasts. On the other hand, it did not necessarily follow that blue light would soften gradation; the filter used did not appreciably alter the spectrum to which bromide paper was sensitive, and it was difficult to see how it could influence results.

Mr. W. A. Long, who said he was quite a novice in the art, next showed a series of slides on the screen, of excellent quality, and possessing a wonderful range of colour, from blue, cold black, warm black, to delightful browns, the colours being obtained by modifications of the developer only. The lantern-plates are not yet on the market, and it was stated that a powerful magnification was required

to resolve their "grain," and it was only with extreme difficulty that the plates could be chemically fogged, even with hypo in the developer, and ammonia in excess.

Mr. S. J. Taylor next passed round a series of portraits taken by ordinary artificial lighting in a room. As examples of happiness of pose, good modelling, and technique they were all that could be wished for. He employed ultra-fast ortho' plates of ordinary type, and with three 60 c.p. incandescent burners in a pendant the average exposure at $f/8$ was about one minute. Several members thought Mr. Taylor was needlessly handicapping himself by not using panchromatic plates. Under the conditions stated, an exposure of a few seconds only would have sufficed. Several contributions by other members brought an interesting evening to a close.

CATALOGUES AND TRADE NOTICES.

"FRISIAN, LONDON."—The telegraphic address and telephone number of Mr. S. H. Fry are the useful inscriptions on a calendar for 1909, which further bears a representation of the premises at 5, Highbury Grove, London, N., in which that home of enlarging and trade photographic work is depicted against a sky of such Mediterranean blueness that one would ask Mr. Fry if the installations of arc lamps which we have seen in his printing and enlarging rooms are merely signs of a connoisseur's love of such things. More probably, the decorative presentment of the "Frisian establishment" is merely an example of unconscious "working-up and colouring" which Mr. Fry's staff are constantly employing for the improvement of their customers' prints and enlargements. We are glad to draw attention once again to the consistently good work of printing and enlarging in all processes turned out at 5, Highbury Grove.

AN ILFORD CALENDAR OF SPORT.—A useful and pleasant little book, containing a series of quite interesting photographs, together with no little humour, has just been issued by Ilford Ltd. under the title, "Ilford Sports and Pastimes Calendar, 1909." It provides a monthly calendar, and gives for each month in the year the reproduction of an appropriate photograph of sport as played by a couple of most versatile youngsters, who are here shown motoring, golfing, photographing, to say nothing of other exploits in the way of shooting and mountaineering. The humour is provided by the quotations under each picture drawn from literary sources as wide apart as Ovid and Charles Wesley. The photographs are in every case from negatives on the Ilford Rapid Chromatic plate. One useful table is that giving the Watkins, Wynne, and H. & D. numbers of the Ilford plates. We can advise our readers to write for single copies to the Ilford Company, whilst dealers should see they do not miss placing the booklet upon their counters.

BAYER PRODUCTS.—The Bayer Co., Ltd., have just issued a manual or booklet of their many photographic products. Obtainable free from the company at 18 to 20, Booth Street, Mosley Street, Manchester.

Commercial & Legal Intelligence.

TECHNICALITIES OF COPYRIGHT.—Some interesting particulars about the law of copyright were explained in the Manchester County Court last week. Charles Allen Clarke, author, journalist, and wholesale picture postcard dealer, of Brighton Avenue, South Shore, Blackpool, claimed £50 damages from the Continental Postcard Company, publishers, of Oxford Road, Manchester, for an alleged infringement of copyright. He also sought an account of certain postcards issued by the defendants, with an order for their delivery up to him, and an injunction restraining the defendants from repeating the infringement. Mr. H. P. Glover was counsel for the plaintiff, and Mr. Lustgarten was solicitor for the defendants.

Mr. Glover said the plaintiff claimed the artistic and literary copyright in a certain humorous postcard. This card depicted, in colours, a chemist's shop containing a display of bottles, notices about photographic materials, and in particular one containing the words "A Dark Room." Looking into the shop were a couple of "innocents." They were gazing in amazement at the notice of the dark room. The man was saying, "Dark room! That'll be for courtiers"; and the woman's reply was, "Shall we ax how much they charge?" The

plaintiff had the registered copyright of this, and between its publication in July and the end of August about 30,000 copies were sold.

Judge Parry: Thirty thousand! That's a very good sale.

Mr. Glover added that the plaintiff was asked by publishers for the rights to publish 50,000 more, but instead of consenting he entered into an agreement with a Mr. Green, under which the latter had the right of publishing the card for three years, the plaintiffs retaining the copyright and a royalty. In October the defendants published the card. This, it was now claimed, was an infringement of the copyright. The couple were there, the chemists's shop, and the "dark room" notice; and the dialogue, though slightly altered, was to the same effect. These were issued at a lower price, with the result that the sale of the plaintiff's cards practically came to an end. As the law of copyright stood a reproduction of a picture or its design, or any part thereof, was an infringement, and any person who sold, published, distributed, or even exposed such for sale, committed an infringement.

The plaintiff stated that the large sale of the card was unquestionably due largely to the fact that it was published under the name of "Teddy Ashton," the title he used in writing his Lancashire dialect sketches, in some of which reference was made to the particular couple in question, who went by the names of "Sammy" and "Sally."

Cross-examined, he admitted that, although he indicated the design of the card, he had no actual part in the sketching or painting of it. That was done by a lithographic artist named McKinnon.

A witness named Whittle said he was a partner with Mr. Clarke in the postcard business, and that this particular postcard was published by the firm which traded under the name of "Teddy Ashton."

Mr. Lustgarten contended that the registration of both the artistic and the literary copyrights in this case was bad, and that consequently the plaintiff could not succeed. It was bad in respect of the drawing, because of a mis-statement as to the author. The plaintiff ought to have registered the name of McKinnon as the author of the sketch, and in like manner he ought to have included Whittle's name with his own as publishers in registering the literary rights.

After discussing a number of High Court decisions on both sides, the Judge said there was no doubt the owner of the original design would have succeeded if he had gone about this matter in the right way, but he had made some fatal mistakes. The case was an important one to authors, artists, publishers, and others, because it showed that it was almost necessary for all laymen to have some special advice in registering copyrights. If they had no society or union to give it them they should go to a legal adviser. If they did not do that, they had only themselves to blame if things went wrong. The plaintiff had not done right in calling himself the author of the picture. Clearly, the real author must have been the actual painter. If he collaborated with the painter by providing ideas to be painted, the two must be entered as joint authors. Mr. Clarke and Mr. McKinnon should have been so entered. And it was important to artists that this should be the law, for otherwise it might be an easy thing to deprive the artist of his copyright and commercial power of living. The reading on the card raised a curious point. This, within the meaning of the Act of Parliament, constituted a book, and, in respect of this also, Mr. Lustgarten was right in arguing that the name of Mr. Whittle should have been entered in the registration, as the card was published by the firm and not by Mr. Clarke alone. He agreed that it was a technical matter, and he regretted that a technical matter of this kind should rob a man of his copyright; but there the law was, and it had to be administered. There must be judgment for the defendants, with costs.

EASTMAN KODAK COMPANY, OF NEW JERSEY.—The directors have declared an extra dividend of 2½ per cent. upon the Common Stock of the company, payable February 1, 1909, to stockholders of record at the close of business on January 13.

BANKRUPTCY AND BREACH OF PROMISE.—At the Birkenhead Bankruptcy Court last week, Samuel Thomas, photographer's assistant, came up for public examination with a statement showing £130 of liabilities and 6s. 1d. of assets. Mr. O'Hare appeared for a creditor. In reply to the Assistant Official Receiver, the debtor said he was an assistant with his brother, who carried on business in Church Street, Liverpool. He had no interest in the business beyond his salary of two guineas a week. The principal claim now against him, amounting to £109 5s. 2d., was in connection with an action for

breach of promise of marriage, in which a Miss Roberts got judgment against him at Liverpool Assizes last year. The judgment was £50 and costs. Asked whether, in defending the action, he was advised he had a good defence, the debtor replied that he had defend it to prove that he did not fall out with the young lady. He made an offer of £25 to settle the claim, but it was refused. He was not prepared to set aside any portion of his earnings to pay his creditors, as it took him all his time to keep himself. He had no prospect of further or better employment when he entered into the engagement with Miss Roberts. After the Assize trial the case was removed to the County Court, to enforce the judgment, and then filed his petition in bankruptcy. Asked as to his reason for doing so, he said the matter had been worrying him all the time and he thought the best course was to file his petition. Mr. O'Hare briefly examined the debtor, and stated that he had only offered £10 to settle the action, and not £25. The examination was closed.

PORTRAIT ENLARGEMENTS.—At the Alton (Hants) Petty Sessions last week, Robert Percy Green and Sidney Studholme, respectable individuals, were charged with obtaining by false pretences from Alice Wiltshire the sum of £1 8s. in money, with intent to defraud, at Holybourne, on October 16.

Mrs. Alice Wiltshire, the wife of the landlord of the White Horse Hotel, Holybourne, said on or about October 8, the prisoner Studholme came into the hotel and handed her his card, stating he came from the International Art School, 8, City Garden Row, City Road, London, and was employed in enlarging photographs. He asked she had a photograph that she would like to have enlarged, and she gave him one. He said it would not cost her anything to have enlarged because he wanted to do work for the principal people in the villages in order that their work should get known. On October 16 he called again at her house along with the defendant Green, who he introduced as his artist. They brought the enlargement of the photograph with them, and asked witness if she would let them frame it, the charge for which would be 25s., and 3s. for the carriage and insurance. They said the photograph would be sent to her without further trouble about a week from that date. She handed him the picture because she thought it was a genuine firm and everything was all right. She paid him the money, and Studholme gave her a receipt, which was signed in the name of Green. Witness waited a fortnight for the picture, and then sent a postcard, to which she got no reply. On November 9 she wrote a letter, which was returned "not known," and as she heard nothing further she communicated with the police, and ultimately applied for a warrant.

Frederick Charles Cunningham, of 32, Hermitage Road, Finsbury Park, said he carried on business as the British Framing Co. at City Garden Row, City Road, London. He had known the prisoners for some considerable time as traders, but had no business dealing with them until August, 1908. They were then canvassing for enlargements of photographs, and since September or October they were travelling together. They gave witness orders for the frames, but not since the beginning of November. He got his money from them. They were not connected with him in business. He gave them authority to use his address for letters, but not for any other purposes. He knew of no place called the International Art School in his neighbourhood, and the address on the card of the prisoners was the address of his business premises. He received several letters addressed to Green, and returned them because he had complained from Aldershot.

Other charges were laid against prisoners, who were committed for trial to the Assizes in March on each of the charges. Bail was fixed, the prisoners in £50 and two sureties of £50 each. Bail was not forthcoming.

NEW COMPANIES.

NATURAL PHOTOGRAPHIC STUDIOS, LTD.—Registered December 1 Capital £6,000, in £1 shares. Objects: To take over the business of a photographer, etc., carried on by W. Friese-Greene, at 203 Western Road, and 20, Middle Street, Brighton. Private company. Registered office, 203A, Western Road, Brighton.

SANGER-SHEPHERD AND Co.—£4,000 (£1). To take over the business of scientific instrument, photographic requisite, and most accessory makers and dealers carried on by E. Sanger-Shepherd, R. L. Cocks, A. F. Hills, and E. D. Doncaster, at 5-6, Gray's Inn Passage, Red Lion Street, Holborn, as Sanger-Shepherd and Co. Private: 5-7, Gray's Inn Passage, Red Lion Street, Holborn, W.C.

News and Notes.

THE UPPER BROOK STREET FINE ART ASSOCIATION, 79, Upper Brook Street, C-on-M., Manchester, advise us that in consequence of increase of business they have been compelled to extend and enlarge their premises, and have built further workshops in order to deal with the increased orders. The plans for the new workshops were passed by the Manchester Corporation prior to the operations being executed.

"ENSIGN" COMPETITION.—Lieut.-Col. H. E. Drake-Brockman, Thos. Cook and Sons, 15, Esplanade Road, Bombay, is the manager of the January "Ensign" roll film competition in which Messrs. Houghtons Ltd. offer a three-guinea camera for the best negative on "Ensign" film. The entries close on the 3rd of the month. Entrance is free, and a competition form is enclosed with every spool of "Ensign" film.

A JUDGE'S VIEW OF CANVASSERS.—Judge Hans Hamilton found fault at the Blackburn County Court last week with the practice of canvassing from door-to-door of working-men's houses for orders for articles that are more or less luxuries. The comments were made on a case in which a photographic firm sued a man for £6d., the value of an enlargement. The defence was that if there was an order it was given by the wife, and the wife, in evidence, said the agent told her the enlargement would be free. The agent, she added, was in the house an hour. In giving judgment for the defendant with costs, the Judge said the practice of trading from house-to-house among the working classes ought not to be put a stop to by Act of Parliament. The amount of money which the working classes parted with for insurance and other things—all done by canvassing from door to door—was remarkable. The people seemed to be preyed on to such an extent that the money they parted with would amply provide them all with old-age pensions at the age of 65. This class of trading ought to be put down. A man's house was his castle, and when someone came in and talked for an hour and worried a woman, when the man was absent, it seemed to him that that was not the kind of trade that was wanted in this country. Mr. Carter (representing the plaintiffs) asked whether it was the judge's view that agents should be allowed to canvass at all at people's houses. The Judge said he was referring to luxuries, such as jewellery and expensive pictures, which people should go out and buy if they required them.

A PROFESSIONAL EXHIBITION.—During the first two weeks of the New Year, Messrs. Gold, Smith, and Co., of 44, Chapel Street, Liverpool, Manchester, held an exhibition in their extensive showrooms. It would be impossible here to describe in detail the excellent goods which were to be seen and tested, this firm's motto being, "everything photographic." Several striking novelties were to be seen. About the best was a farmyard scene, the background, which extension painted in soft naturalistic colours, a small fence, a large "stone" suitable for a child to sit upon, a sparrow, a white hen and two hens, a duck and drake. A child could hardly help being happy amid such surroundings. The price of the whole "farm" is £7. Among other novel accessories for the entertainment of children were pigeons, canaries, rabbits, guinea-pigs, etc., and a fine selection of backgrounds and studio accessories manufactured for the most part on the premises, among them a fireside heater. A studio stand of very strong pattern was shown, which could be lowered to a height of 27in. for child portraiture; the full height being 44in. and the price £2 11s. Demonstrations were given of dry-mounting with the "Rito" paste, which requires no fixing solution, and sells at 3s. per pot, sufficient for 500 cabinets. An oval number to cut two sizes with one shape, and a neat press for letter-marking postcards were also shown. A "postcard while you wait" studio was to be seen in full working order with an operator in attendance, and the time from exposing the plate to delivery of the finished postcard was 13 min., but four different photographs could be done in that time. The price of the complete outfit, comprising printing machine, developing and fixing tank, dark room lamp and drying apparatus, is £5 5s. The "Jandus" arc was shown with a variety of ideas in reflectors, and exposures of 1-5 sec. on Warwick Special

Rapid plates gave fully exposed negatives. Mr. Jobson, of the Warwick Dry-plate Company, was in attendance during the whole fortnight giving practical demonstrations in the electric-light studio. As evidence of the great interest taken in the exhibition, visitors came from the Scottish Midlands, Ireland, Wales, South of England, East Coast, and Isle of Man.

DAMAGES FOR POSTCARD PUBLICATION.—Fascinatingly clothed as a clown, in white satin doublet and hose, a lady, who has since become Madame K., the wife of a Parisian business man, went to a fancy dress ball three years ago, with her sister, also then a spinster (relates the "Daily Telegraph.") At the ball a well-known photographer, who has a shop on the boulevards, thought the two graceful pierrots would make a charming picture, and took one, with their permission. They agreed to buy from him a certain number of copies. Some time afterwards they discovered that their picture was being sold on postcards, and the lady, who had by then married M. K., sued the photographer for £800 damages. Defendant replied that he had taken the picture at a ball, which was not exactly a private one, and that, having sold copies to the ladies at a specially low rate, he was entitled to make money out of the negatives. The Courts, with nice discrimination, have decided, on the whole, in favour of Madame K., but without entirely condemning the photographer. The latter was undoubtedly wrong, say the judges, in selling picture postcards of the lady, attired as a clown, without her leave. But, on the other hand, "it must be borne in mind that defendant was to a certain extent justified in imagining that he had to do with persons desiring advertisement, and that such an impression was the more plausible because, besides sitting for one picture alone with her sister, Madame K. had also sat for another in the company of a number of clowns. The attitudes of some of whom may be described at the least as singular." On these choicely expressed grounds, the Court allowed Madame K. only £8 damages, instead of the £800 for which she had asked.

FIRST EXHIBITION OF HERR DÜHRKOOP'S PICTURES IN ENGLAND.

To the Editors.

Gentlemen,—In your report of Mr. Hoppé's interesting account of Herr Dührkoop's work he states:—

"It was not until 1905 that he first exhibited at an English photographic exhibition—namely, that of Leeds." I do not think this is correct. I am of opinion that it was in April-May, 1906, that Herr Dührkoop exhibited his work at the "British Journal of Photography" office, and at the same time he also exhibited at the "The Northern," held in Manchester, and where he was awarded two plaques for "Twilight" (reproduced in the catalogue) and "Hermelin." In the "British Journal of Photography," of May 4, 1906, attention is drawn to this fact.

I do not know if I am correct in stating that Herr Dührkoop's first appearance at a photographic exhibition in England was at the 1906 Northern held in Manchester, but I do not find any mention in the Leeds catalogue of 1905, nor is his name mentioned in any of the Press notices that appeared on that exhibition. I am pleased to say that Herr Dührkoop has again sent to the Manchester Northern of 1909, and is awarded one of the fine plaques.—Yours faithfully,

S. L. COULTHURST.

[We have not the means of confirming the reference to the Leeds Exhibition, but, so far as we know, the first notable exhibit of Herr Dührkoop's work was at the exhibition of the Birmingham Photographic Society, which opened on February 24, 1906. We were so

impressed with the eighteen prints there shown that we paid a personal visit to Herr Dührkoop in Hamburg a fortnight later, and brought back the seventy prints which were shown at Wellington Street in April-May, and had further attention drawn to them by the award at the Manchester "Northern" of that year, to which Mr. Coulthurst alludes. It will be remembered that in an article, entitled "The Ordinary Room as the Professional Studio," in the "B.J." for November 16, 1906, we described and illustrated the now famous "Portraiture Rooms" at Hamburg.—Eds. "B.J."]

MEGILP AS A DILUENT FOR "LUSTRALENE."

To the Editors.

Gentlemen,—Our attention has been directed to a suggestion made by Mr. Woodhouse, at a recent meeting of the Hackney Photographic Society, that megilp was a suitable medium for "thinning out" Lustralene. We should like to point out that lead acetate (sugar of lead) forms an important constituent of megilp. This, although admirable as a drier for oil colours, is hardly suitable for use on photographic prints.

May we also mention that, in order to meet the wishes of many regular users of the paste, we have now in preparation a liquid form of "Lustralene," which will be packed in bottles similar to our well-known Glissolene. This will be a very economical form, and will probably displace the paste in boxes and tubes.—Yours faithfully,

W. ETHELBERT HENRY,
For the Vanguard Manufacturing Co.

Maidenhead (England).
January 15, 1909.

AGREEMENTS WITH ASSISTANTS.

To the Editors.

Gentlemen,—A case that I have met with shows the necessity of the agreement to protect masters and assistants alike. A learner left me after one year, being dismissed for general unsuitability. His father, like a fond, foolish parent, started him on his own, and now he turns out stuff that would disgrace any Australian aborigine with a hand camera and advertises "Late with Messrs. A. and Z." Very pleasant, and greatly to our credit. We cannot complain of monetary loss, but it being thought that we had employed such incompetents is not adding to our prestige. It may be said that such a one might start in any town; certainly, but in that case no one will suffer but himself. As it is, the public may be deluded, against the evidence of his specimens, whilst "A. and Z." suffer, most undeservedly.

Taking it all round, I think employers should protect themselves by having a fair and equitable agreement drawn up, and so long as the assistants are paid their stipulated wage I cannot see that they have a right to expect to lay the foundation of their own business into the bargain. The restricted areas, however, should be as small as is compatible with justice, whilst small, niggling stipulations, inasmuch as to confuse the main issue, should, as far as possible, be avoided. In this respect, however, I certainly think that a clause referring to loyalty to the firm should be included.

Whilst one can generally rely on the *esprit de corps* of one's assistants, this is a most important matter. If your competitor has definite information upon the volume of your business, successful styles, good customers, etc., he can frame his policy to surer advantage. In such a comparatively small thing as forwarding advertising matter, it is inadvisable for your errand boy to mention it to his chum, who occupies a similar exalted position in the photographic world, since it might give the latter's employer the hint to swamp you with something much more elaborate. In a business such as photography, or, indeed, any business, there are doubtless thousands of dodges profitably employed by their inventors that certainly would not be worth while publishing and going to the great expense of patenting; at the same time they are sufficiently valuable to warrant one's taking steps to prevent a rival filching one's brains. As has been frequently pointed out, however, in the "Journal," the agreement that strives to take unfair advantage of an assistant desirous of a job, over-reaches it by being too inclusive. At the same time photographers are not the only people that suffer from this. I have

seen the agreement between a certain world-famous firm of sellers and their provincial managers that has, amongst its clauses dealing with business secrets, commissions, etc., one that forbids the said manager to engage, either for himself or another party, in any business that they are interested in for a radius of fifty miles. Since this includes bookselling, newsagency, fancy gotyping, typewriting requisites, printing, and various agencies, there is much chance for the poor managers, unless they go to the expense of fighting the agreement. Certainly we think that this is as good an example as we have heard of undue restriction of trade; but that it is, and the law is "an ass," and beastly expensive.

A. AND

To the Editors.

Gentlemen,—As I commenced this topic, December 18, to show the fallacy of the article in the "Daily News" against "Radius Agreements," kindly allow me a little space for same purpose in reply to "Onlooker," January 8. The temperate letter in your last issue, "Provincial Pro." should prove to any candid mind that any manager opening in competition near the studio where he has worked for years cannot be otherwise than harmful to a business however old established. In that case, however, it seems the proprietors lived on the spot and so were able promptly and personally to deal with the new situation, and thus saved themselves. My letter, however, had mainly in view the matter of branch managers where the principals lived at a distance; there was not a word in my letter against fair competition by strangers, but only against the competition caused by those of "your own house." "Onlooker" does not touch this except to say that if the business eventually becomes transferred it will more than likely be due to the faults of the manager. That is practically justifying the division of the house: I do not care whether there is only a verbal agreement or a written one: if there was a definite arrangement that the manager should work in competition in the same place, to break through it is a manifest infringement. The probability is that such a one would not think of competing until he had been there some time and become known and there appeared some probability of success; but who had to pay for this but the proprietors who first took the risk? "P. P.'s" letter in last singularly but conclusively showed how sooner or later, those who act inconsiderately with their employees suffer—albeit the employers suffer too in the process. It was refreshing to read that "P. P." was still on good terms with his old faithful manager-competitor. One wonders how he would have fared if he had been obliged to shut up and go abroad for a living. It opens up the question I referred to in my letter—i.e., co-operation versus competition. How much better for all it would have been supposing this manager thought he would like to start on his own account, if he had conferred with his employer and seen if it were practicable to start elsewhere. They might then have been mutually helpful. I cannot but think, from the tone of "P. P.'s" letter, that it would have been fairly and justly considered. This co-operation is referred to in Mr. Ward's letter in your last issue on American matters. One cannot but see in our daily papers this is the truth. Our fierce competition throughout this and other countries in nearly every department of trade is causing much of the stagnation which means death. My main object in writing at all was to enforce as far as possible the almost imperative need on both sides of being guided by arrangements made in good faith in order to maintain that good feeling without which employer and employee cannot work together.—Yours, etc.

OBSERVE

SHROPSHIRE CAMERA CLUB.—The Club's third annual exhibition will be held in the Working Men's Hall, Shrewsbury, on March 1 and April 1. There are no entrance fees, and the latest day for receiving entry forms is March 20. The open section includes a class for foreign exhibits, one for colour work by any process, and one open to members of the Midland Federation only, as well as a class open to all British photographers. A silver plaque, to be awarded by a ballot of the visitors, will be given for the best picture in the exhibition. Entry forms and further particulars may be obtained from the secretary, Mr. Harry W. Hughes, Kingsland, Shrewsbury.

Answers to Correspondents.

All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY, 24, Wellington Street, Strand, London, W.C." Inattention to this ensures delay. Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given. Communications relating to Advertisements and general business affairs should be addressed to MESSRS. HENRY GREENWOOD & Co., 24, Wellington Street, Strand, London, W.C. For the convenience of Readers, our Publishers, MESSRS. HENRY GREENWOOD & COMPANY, of 24, Wellington Street Strand, W.C., undertake the registration of copyright photographs at a charge of 7d. each photograph, to cover cost of registration fee, form, etc. Two unmounted copies of each photograph must be sent with the original.

PHOTOGRAPHS REGISTERED:—

Wright & Sons, King Street, Thetford, Norfolk. *Photograph of Eveden Hill, Suffolk, Residence of Viscount Iveagh, K.P.*
 Ireland, 86, High Road, Wood Green. *Photograph of Mrs. Clark, Wood Green Crutonian, age 105 years.*
 stairs, 101, Compton Road, Dyke Road, Brighton, Sussex. *Photograph titled "John Bull at Market."*
 Taylor, Paternoster Buildings, Carnarvon, North Wales. *Two Photographs of the Rev. Evan Jones of Carnarvon.*
 Ley, 23, Northcote Road, Croydon. *Photograph of the Croydon Common Football Team.*

(Dunedin, N.Z.).—(1) The R.R. would be almost useless, because depth of focus would be totally different. You would have to stop down the anastigmat to the smaller aperture. (2) We would place them in your order—viz., A, B, C; but all are first-class lenses. A and C will cover a much larger plate better than B. On manufacture there are not many. We may name "Lens for Amateurs," by H. Orford (3s.). On general photographic optics you should get "The Optics of Photography and Photographic Lenses," by J. Traill Taylor (3s. 6d.). You can get both these from Hampton and Co., 12 and 13, Cursitor Street, London. (4) "Colour Photography," by Bolas Tallent and Senior, is good for general principles (Marion, 1s. 6d.), but there is no comprehensive book which is recent. The best is "Natural Colour Photography," by Dr. E. Koenig (price 2s.), through any London bookseller. (5) Yes, to any photographer, sending full address. It will appear end of March.

C.—The firm has an excellent reputation, but has not been the same of late, having apparently withdrawn to a large extent from the purely photographic trade. If you turn to an "Almanac" of a few years ago you will see its announcements. We believe it still at the same address.

—Nos. 1, 2, and 3 are all good and about equal. We should not use No. 4.

ALLER.—No powder is absolutely free from smoke. We advise you to use the "Agfa" with the apparatus you now have.

HOWARD.—Conditions in New Zealand are very much as here, we gather in a general way. Re Canada, see the article in the present "Almanac."

—We do not know of one. Better apply to Messrs. Geo. F. Sney and Co., 64, Oxford Street, W., who, we believe, publish the "Almanac."

THOMAS.—We are sorry to have overlooked your query last week. The highly refractive liquid to which you refer is probably carbon disulphide (index, 1.63). Phosphorus oxychloride (liquid) has a refractive index of 1.48.

TING LINEN.—I am in doubt as to whether any linen would be chemically pure enough for backing P.O.P. prints with. Would you kindly advise me if there is any special make suitable for photographic purposes?—JOHN W. MINNITT.
 We do not know of a special make, as it is not usual to mount P.O.P. prints on linen. A good linen scalded and ironed before use would be quite safe, we think.

ST.—It is within our province only to advise you in a general way. If you have already shown any journalistic aptitude you would do well to continue such work, with a view to engaging in it altogether; but if you have done nothing in it as yet we cannot encourage you to give up your present berth. You had better get the advice of some friend who is a newspaper man in your town.

INTENSIFIER.—Can you favour me with a formula for intensifying, one more reliable than the ammonia mercury process?—INTENSIFIER.

Yes, the chromium intensifier, on page 784 of the "Almanac."

FOREIGN JOURNALS.—(1) Can you supply me with any names and addresses of the principal photographic journals published in the following cities in Australia: Sydney, Melbourne, and Perth? (2) Also the principal journals in the following cities in South Africa: Cape Town and Durban?—PYRO.

(1) "Australian Photographic Journal," published by Harrington and Co., Ltd., 386, George Street, Sydney; and the "Australian Photographic Review," published by Baker and Rouse Proprietary, Ltd., 375, George Street, Sydney. (2) "South African Photographic Journal," published by E. H. Oakley and Co., Camera House, Adderley Street, Cape Town.

CONDENSER.—(1) What will be the advantage of a 4in. Herschell condenser (double convex for meniscus lenses) over a 4in. compound plano convex one, using a 4in. and 5in. cinematograph objective? Will the light from the Herschell be more powerful? (2) Would the distance between the condenser and film remain the same in both cases, or would it require to be altered to obtain the best results?—CINEMATOGRAFHER.

(1) The Herschell condenser shows less aberration than the more usual compound form, and therefore it is easier to obtain good illumination with it; also the light is nearer the condenser, and so the illumination is brighter. (2) We cannot answer this definitely. A little alteration might be required to utilise the maximum amount of light, but the amount of adjustment would probably be very small.

LANTERN LENS.—I should be grateful if you could let me know the chief differences between an ordinary photographic lens and a lantern objective.—Q. S.

An uncorrected lens of the Petzval portrait type is usually used for projection with lanterns of the less expensive kind. With others a large aperture anastigmat lens is frequently used.

SWING BACK, ETC.—(2) Would you recommend a swing back to the camera, vertical and horizontal swing? (3) State briefly the use of the swing with a modern lens, such as the above. I may state that the camera front has only a limited rise.—EXCELSIOR.

(1) The focal length is very suitable for portrait work, if you have the space, but the aperture is small. You should have $f/6$ for portraiture; better $f/4.5$. For landscape on the 10 x 8 the focal length is just about right. (2) Certainly, it is frequently of service in both portrait and landscape work, and particularly if there is also a swing front. The two in conjunction are equivalent to a considerable rise of front. (3) If the back is swung through a fairly large angle, the lens requires to be stopped down a good deal; often more so in the case of a modern flat field anastigmat than in that of an old R.R. or single lens.

RESIDUES.—We have a large tub of silver washing which we have tried to throw down with salt, and then alum, which we have often found successful when salt alone has failed, and then with hydrochloric acid, and finally suspecting that some hypo had been thrown in we tried sulphide of potass, but with all we have failed to get the silver down. Can you help us in the matter?—PERPLEXED.

We are afraid the bath is in a rather complex state after the various additions, but one thing we can tell you is that it will be well to destroy the free acid in it which is decomposing the sulphide as fast as you put it in, and we should imagine creating no little odour of sulphuretted hydrogen. We advise you to add some caustic potash or caustic soda solution until the bath (after well stirring) turns red litmus paper distinctly blue. Then add some more potass sulphide. Stir well and leave in a warm place if you can for an hour or two. If this will not precipitate the silver we fear nothing will.

W. R.—We advise you to write to Dr. E. Koenig, Meister Lucius and Brünig, Hoeschst a/M., Germany, stating your requirements.

COPYRIGHT.—Some time ago I asked for and received permission to photograph for my own use a little girl. The person giving the permission was, I think, the godmother. I have taken no money from them, but she, and also the mother of the child, have accepted gratis copies. I took it that the copyright was mine, and recently sold the copyright of one negative to an art dealer. The god-

mother is now saying I had no right to do his, and is quite sure the mother will strongly object. Should be glad of your opinion.

—COPYRIGHT.

The copyright is yours, the relatives, not having paid for the work, have no proprietary rights in it whatever. We advise you to explain the matter to them.

PUZZLED.—We cannot see that there is any objection to your naming both firms in your note-heading or in other ways, nor in your referring to the distinction of the second firm.

SPOTS ON AUTOCHROMES.—After using the permanganate solution I am much bothered with green spots of different sizes, but in the centre of each spot is a small black grain. I have tried filtering all solutions and washing water, but with no success. Can you kindly tell me the cause and cure?—E. Y. E. N.

This may be due to the use of a permanganate and acid bath kept in one solution. These ingredients should be kept in separate solutions, and only mixed just before use. If the permanganate is kept in a stoppered bottle there should be no trouble, but it will decompose and produce spots very readily if any organic matter comes into contact with it. The only other possible cause of your trouble that we can think of is dust on the plate, but we assume you guard against this.

GLAZING P.O.P., ETC.—1. Why do P.O.P. prints, glazed on plate glass in the ordinary way, lose all gloss when mounted, and have a mottled appearance on surface? 2. Please give the name of a firm which enamels prints? 3. How can prints be backed with paper to prevent them losing gloss after removal from plate glass? Should they be backed before being glazed and before being trimmed, or after?—J. KAY.

1. The disappearance of the gloss is due to the penetration of the moist mountant; it would not take place with a dry-mounting method; and should not be pronounced when using a stiff non-penetrating mountant, such as "Tixit," of the Vanguard Company. 2. Almost any of the good trade workers will do this. See our advertising pages or the section "Enlargements, Printing, and Trade Work" in the "Almanac," p. 1331. 3. The backing paper is pasted on with a stiff mountant—hot gelatine or glue is much used, before the print has become dry, and while it is still on the glass. 4. We should prefer something a little more rapid if you are thinking of studio work, say the same firm's portrait lens, Series I., No. 5, which is, however, double the price. For outdoor work you could not do better than the one you name.

A. W. W. B.—Fordhams Ltd., Walthamstow, E.

THREE-COLOUR CARBON.—Will you kindly advise me the best work on three-colour work (carbon)?—COLOUR.

There is no book on the subject. The information on the working of the process, apart from that in the instructions of the Rotary Photographic Company and the Autotype Company, is to be found in the "Colour Photography" supplement to the "B.J."

COPYRIGHT.—1. In taking orders for cards I have a request for a special subject, and reply that for a minimum order I will get it and supply. Whose is the copyright? 2. I take an order, allowing the customer to name the subjects. I get negatives and supply cards. Whose is the copyright? 3. In the above cases, does a verbal statement, such as "of course other people will have them as well," make any difference? 4. I have a request for a new negative of a stock subject, so that some slight alteration may be made, and charge a small sum for getting the negative. I take it that copyright rests in the customer. Whose property is the negative? I presume mine, although I cannot make prints, except to the customer's order.—A. E. J.

1. If the view is taken to the special order of the customer, the copyright will belong to him, but the negative to you. 2. It seems to us that the copyright in this case belongs to the customer, as he is also the author of the work. 3. All agreements with regard to copyright should be in writing. 4. If you supply a duplicate negative from a stock one, the copyright in which is yours, you still retain the copyright in that.

VARNISHING PAPER.—I have an order in hand to mount some photographs on large mounts, along with several columns of newspaper matter, and a request to varnish the newspaper to prevent it from fading, etc. Will you kindly tell me, through the "B.J.," the best way of accomplishing this, and the varnish to use?—YORKSHIRE.

After mounting both prints and newspaper cuttings in the

ordinary way, the latter must be given a coat of gelatine solution 1 or 2 per cent. strength. When this is dry the cuttings must be given a coat of "Zaponlac," from the Leto Co., which will protect them to some extent, though not from fading and yellowing entirely.

A. A.—The failure of the intensity law noted by Abney is of importance only with lights of very small intensity. It can be disregarded in conditions such as those you have been working under.

STUDIO.—My first idea of putting up a studio in the yard has been stopped by the action of the District Council surveyor, and I am endeavouring to make other arrangements. I am aware that the intention is contrary to all the usual methods, but think that proper arrangements for diffusion of the light could be controlled almost that of a north light obtained.—EVERT.

The sketch shows about the best that can be done in the circumstances. We do not know if you want the studio for general professional work, but if so, we may tell you that one only 19 x 10 ft. in the situation this will be is too small for groups, etc. It will, however, do very well for busts and three-quarter length portraits. It would also be more convenient to work if it were glazed with ground glass, as that will aid in the diffusion of the light.

DRYING NEGATIVES.—I want a formula for quick-drying negatives. I require, if possible, one which leaves no markings on the negative but which acts uniformly and dries the negative quickly. 2. Do you consider the glaze obtained on an "enameller" is equivalent to that obtained upon glass by squeegeeing, and is it necessary to harden the prints more than that for squeegeeing, using alum in water 20oz.? 3. You might also kindly say if formalin would be more suitable than alum, and if any great amount of time is gained by using an enameller than by usual squeegeeing.—A. B. BASHAM.

1. Soak the negative in two changes of methylated spirit. Then wipe off with a soft rag. The negative can then be dried quickly at some little distance from the fire. 2. The gloss obtained in the two methods is somewhat different. That by the first is the more glossy. Prints need not be specially hardened before they are passed through an enameller, but they must be perfectly dry at the time. 3. Formalin is perhaps the better of the two. In practice there is not much difference in the time, but what there is will be in favour of the enameller.

INVENTORY.—What does the inventory of a photographic business consist of? In an ordinary business I take it that it would include the plant, etc. Therefore, I think that cameras, accessories, etc., would come under that heading. But what I feel doubtful about is whether mounts, papers, frames, etc., come under that heading also. And another thing is, does the "inventory" come as an extra item when purchasing a business which is advertised at a certain figure, as some advertise "all at so much," and other things? I think to a certain extent this is left to individual circumstances, but I thought you would be able to tell me what is generally done in such matters.—CONSTANT READER.

An inventory is simply a list or catalogue of all that is included in the sale as mutually arranged. "All at" means an inclusive sum of the thing as it stands as per inventory usually supplied. **PAPER-PAINTS AND OTHERS.**—In our next.

**** NOTICE TO ADVERTISERS.**—Blocks and copy are received subject to the approval of the Publishers, and advertisements are inserted absolutely without condition, expressed or implied, as to what appears in the text portion of the paper.

SUMMARY.

We deal in an editorial article with difficulties in sulphide toning, chiefly the failure which is not infrequently experienced to get a vigorous brown tone in the sulphide bath. (P. 78.)

Dr. D'Arcy Power has recently described the method of making enlarged negatives which he has found preferable to others. He obtains better "quality" in an enlarged paper negative by aid of the ozobrome process. (P. 78.)

Mr. R. E. Blake Smith contributes an account of the result of experiments which have led to a method of silver intensification of dry-plate negatives. Before actual intensification he bleaches the negative and treats it with acid sodium sulphite solution. (P. 82.)

Picric acid combined with magnesia or soda has been patented as the constituent of a solution for simultaneous development and fixing in daylight. (P. 88.)

Mechanically engraved half-tones on wood are said to be coming in for newspaper illustration. This and other process matters are dealt with in "Photo-mechanical Notes." (P. 86.)

Some further notes on the use of the card index system in keeping the accounts of a photographic studio are quoted on page 84.

An American professional has confessed to finding portrait post-cards at four shillings a dozen prove remunerative in his business and not to injure the prices of better class work. (P. 85.)

Mr. Chapman Jones, in a paper before the R.P.S. on Tuesday evening last, aimed at the popularisation of spectrography by describing and showing a form of instrument suitable for general use. (P. 92.)

The recent decision of the High Court in the case where a publisher of cinematograph films was proceeded against for alleged infringement of dramatic copyright, has been heard in the Court of Appeal, where, however, the previous decision of Mr. Justice Jelf was upheld. (P. 77.)

Herr E. Valenta has given in "Photographische Korrespondenz" a series of factory tests for bromide paper. (P. 83.)

A writer in a recent issue of "Knowledge" has described an apparatus for measuring the time which elapses in the case of different persons between hearing or seeing any event and performing some action as quickly as possible after it. A modification of the apparatus might prove of interest in connection with the "latent period" of photographers dealing with very rapidly moving objects. (P. 80.)

EX CATHEDRA.

The R.A. Winter Exhibition.

The present exhibition at Burlington House, though it cannot be said to rank with its forerunners, includes, nevertheless, some pictures of great interest and merit. Photographers who are interested in pictorial matters should certainly make a point of seeing the large and impressive landscapes of the late David Farquharson—a painter who never quite got his due reputation. There are also some earlier works by David Murray that are educative as well as charming. The collector of all these works, the late Geo. McCulloch, was oftentimes more enthusiastic than discriminative, and out of 360 here displayed, 150 or so might well be spared; but here and there he showed great foresight in purchasing works which mark epochs in painting. Such are Bastien-Lepage's "Potato Gatherers" and Dagnan-Bouveret's "Dans la Forêt," and, more recently, Chas. Sims's masterly little work, "The Kite." To those who have studied the progress of painting through latter years, such a gathering as this is doubly interesting, as it affords an opportunity for seeing forgotten favourites and of marking the changes in one's own ideals. In the case of Burne-Jones time has not been merciful. The affected and laboured achievements of this popular painter appear now as a late Victorian boom that has slumped for ever.

* * *

Infringement of Copyright by Cinematography.

The case of Karno v. Pathé Frères, in which the question at issue was whether the representing of a play by means of a cinematograph film infringed the right of the representation of a play vested in the owner of the copyright, was taken before the Court of Appeal last week. It will be remembered from the comments made upon the case in our issue of May 8, 1908, that the action was brought by Mr. Fred Karno against the defendants for infringement of the plaintiff's copyright in a piece called the "Mumming Birds," by selling, or offering to sell, a representation of the piece in the form of a film called "At the Music Hall." Mr. Justice Jelf held that the sketch was not a dramatic piece according to the Dramatic Copyright Act, 1833; that, had it been one, a cinematographic reproduction of it would be a "representation" of it within the meaning of the Act, but that the manufacturer, by selling the film, did not "represent or cause to be represented" such a dramatic piece. Lords Justices Vaughan Williams, Farwell, and Kennedy, in dismissing the appeal, said that the point really was whether the defendants were responsible for those who put the sketch on the stage. It might, indeed, be plausibly argued that the defendants who make and sell the infringing instrument, without which the infringement could not take place, and do so with the knowledge and intention

that it will and shall be used for that purpose, do take an important part in the infringement itself, but, on the whole, the inference would be held to be too remote and too far-reaching in its consequences to be accepted. If this view is correct, then, even if the action were otherwise maintainable, it ought to have been brought, not against the defendants, but against the actual proprietors of the piratical performances impugned. It will be observed that, so far as the decision affects the position of cinematograph films claiming copyright as dramatic representations, the decision of Mr. Justice Jelf is not affected. The learned Judge held that a cinematographic film in action was a "representation" of a "dramatic piece," whence it may be perhaps assumed that original cinematograph films are entitled to protection under that same Act.

* * *

Avoiding Frozen Pipes. A very old suggestion for the prevention of frozen pipes has again found its way into the Press. It has often been pointed out that pipes of circular section are more liable to burst than those of any other section, while it has been claimed that oval and square pipes cannot. We believe that experience is against this claim. An oval pipe will soon become circular if submitted to expansion from within, and then the next frost will settle the matter. The precaution is only a temporary one, and not worth its expense or the trouble it involves. The theory of the idea is, however, a useful one to remember, because it may be applied at times. Many water-pipes have small exposed portions that are more liable to freeze than other parts, and these are the weak points at which bursts occur. It is not a difficult business to slightly flatten the pipe with a hammer at these danger points before the frost comes, nor is it a great matter to have to repeat the flattening process after the pipe has been once frozen and thawed. This is an idea that photographers may at times find useful. It often happens that the danger points are well known, from past experience, and if trouble can be obviated by five minutes' exercise with a hammer, it is quite worth while.

* * *

A New Method of Measuring Focal Length. Mr. G. F. C. Searle, F.R.S., has designed a very simple form of goniometer or angle meter, one of the uses of which is the measurement of the focal length of a lens. The principle is a very simple one, as it consists merely of measuring the angle subtended at the lens node by two points situated in the principal focal plane of the lens. The separation of the two points being known, the calculation of the focal length is, of course, an easy matter. The apparatus is scaled in radians, and it will measure up to $\frac{1}{4}$ radian (about 14 deg.), and with an accuracy of 1-4,000th of a radian, which is rather less than one minute. It is said that the apparatus works equally well with microscope objectives and telephoto lenses. A very similar method has been advocated with the theodolite as an accessory, but as theodolites are somewhat out-of-the-way instruments to photographers, the method is not well known. This little goniometer is practically a theodolite, measuring small angles in radians and large angles in tangents, but its price is only two guineas, while its uses are very varied. It could no doubt be adapted to the measurement of aperture as well as focal length, while other lens constants can also be more or less accurately expressed in the form of angles.

* * *

Dry Pigment Printing. Several of the German papers have been publishing descriptions of a so-called "Askau" process in which use is said to be made of caoutchouc and asphalt in order to form a film capable of fixing to itself a dry pigment powder in proportion to

its degree of exposure to light. Caoutchouc alone possesses too little insensitiveness: a small proportion of asphalt remedies this defect. A coating of this mixture is applied to paper, forming a sensitive material which will keep for a month. Printing, as in other dusting-processes, must be done from a positive transparency, and the exposed sheet of paper "developed" with a mixture of sea-sand and a suitable pigment, which latter adheres to the light-affected portions. The only remaining part of the process is to "fix" the print by applying a lac varnish by means of an air-brush, such as the Aerograph. The future of the process is painted in somewhat glowing colours, but apart from the fact that, unless a reverse transparency be made, the results will be reversed, and regards right and left, there is the objection in any case that the original negative cannot be printed from, usually a fatal obstacle to popular favour. In the making of photo-enamels by amateurs, there may be a useful application of the process, all the stages of the process to the point of fixing being easily carried out.

* * *

Quality in Enlarged Negatives.

Dr. D'Arcy Power contributes an interesting article to the current issue of "Camera Craft" on the relative "practicability" of the methods available for the making of enlarged negatives. He decides in favour of making a perfect P.O.P. print from the negative (he uses Soli paper), and without toning or fixing enlarging this latter on to a slow plate or thin bromide paper, which latter is then converted into an ozobrome to the improvement of its gradation. The untuned and unfixed P.O.P. print is, of course, photographed by artificial light, preliminary focusing having been done with a piece of newspaper in the place of the print. A plate of medium rapidity, such as the 26X Seed, or a smooth "platino"-bromide paper is used for the enlarged negative, and a rather weak developer of the metal class employed. In the case of the improvement of the paper negative mentioned above, the negative enlargement is used to give an ozobrome which is developed in contact with it by Mr. Manly's No. 1, or not transfer, process, using a tissue, or "plaster," of engraving black. The result is found to be a negative of full density in the high-lights, good shadow detail, and with very little granularity owing to the filling of the pores of the paper by the gelatine. We may add that Dr. Power's method is probably as cheap as any.

SULPHIDE TONING TROUBLES.

THE old trouble of bromide prints refusing to yield to the sulphide toning process is still with us, as our "Answers to Correspondents" columns show nearly every week. In one of the latest cases sodium sulphide that had liquefied was used. This often happens, as the crystals are very deliquescent; but it does not necessarily follow that the liquid is useless, for we have known excellent results to be produced with it. In the case referred to, the prints submitted to us were a very pale brown tint, and over all the heavy shadows a metallic sheen was apparent. Our correspondent described it as a collection of metallic silver in the shadows, but in this he was wrong, as it proved not to be silver at all. There is little doubt that it is silver sulphide, though not the kind of sulphide that forms the toned image. This is evident, because it is not touched by a strong bath of bichromate and hydrochloric acid, though such a bath will slowly bleach a toned image and rapidly affect a silver one. The sheen can be partially removed from the dry print by the use of hard indiarubber, and also from the wet print by rubbing with cotton-wool after the bleaching bath has been applied. This tends to show that the sheen is due to sulphide deposited on the top of the

ge from the sulphiding bath, and that it is not the result of any direct action upon the image. We took the rest of the prints, bleached it, rubbed with cotton-wool to clean off the sheen, and then redeveloped. The result was a fairly strong print, of a good brown tone, which made it evident that the sulphiding bath had had very little solvent action on the image, though our correspondent described the action of the bath as a reducing one. In some places, where the sheen had been cleaned off, a little reduction was apparent, but otherwise the density was good. The half-tones and high-lights show no apparent loss; therefore it is evident that the sulphide solution had very little solvent action (hypo). Assuming, however, that it contained a small trace of hypo, and also a very small residue of sodium sulphide insufficient to give a proper toning action, then the appearances can be accounted for with a fair amount of probability, for the hypo may be assumed to take up a very little of the silver bromide, which is changed to sulphide, and deposited in the form of a sort of varnish on the deeper parts of the image.

An interesting feature is the fact that the deposited sulphide is evidently not the same as that of the ordinary toned image. All recent work on sulphide toning has tended to show that the brown-toned image is not silver mono-sulphide, but a colloidal variety of sulphide combined with gelatine. The deposited tarnish is not, of course, formed in gelatine. It is most likely that it is actually the substance that we are familiar with on tarnished silver ware. It is similar to the silvery tarnish that often appears on old negatives, and it also has a close resemblance to the sheen that appears on uranium-toned prints, which is probably also a sulphide.

Our correspondent sent us a second print that had been treated in the same bath as the first print, but at a later date. This was in much the same state as the other, but showed much less tarnish. On bleaching and redeveloping considerable loss of density in the shadows was observed. This was only to be expected, seeing that the first print must have nearly exhausted the little sulphide contained in the toning-bath. In the particulars sent us with the prints it was stated that after use the bath was almost colourless, and this is sufficient proof of its stage of exhaustion.

A very knotty point for consideration is the nature of the faint brown, or, as some people call it, "yellow," image that the exhausted sulphide bath leaves behind. It is very slight in colour, is undevelopable, insoluble in hypo, and unaffected by a fresh strong sulphide bath. It can be chlorised, but redevelopment does not restore the black of the original bromide print. It simply gives a brown colour, varying in depth according to the amount of reduction effected by the hypo in the sulphide bath. These facts rather suggest that it is another form of sulphide of a very slight colour. It cannot well be a case of partial sulphiding simply, for then the application of a fresh bath should complete the process.

It appears to us that the facts collected are sufficient to form the foundation of a theory of the action of a stale sulphiding solution. As is well known, hypo is one of the products of decomposition of sodium sulphide, therefore some hypo must be present in most working solutions. We have tried adding hypo to a fresh solution, but a very small addition seems to make no difference whatever. If, however, the addition is beyond a certain small amount, then the colour is affected. It is lighter, and tends towards a yellow brown. When the hypo present is due to decomposition, it is evident that every increase in the quantity of hypo must represent a decrease of sulphide. When all the sulphide has gone, the remaining solution is a feeble fixing-bath that slowly removes the image altogether; but so long as any sulphide is present this action must be delayed.

With a certain excess of sulphide, the dissolved silver is probably redeposited immediately as sulphide in the parts where dissolution takes place, the net result being the formation of a sulphide image by a different method to that we intended using, and of a different colour to the one we anticipated. If the soda sulphide is further reduced, the solution of silver bromide may be more complete, and the deposition slower, the tendency then being for the sulphide to be deposited on the top of the film, and so form a tarnish effect. The tendency to deposit silver sulphide must diminish as the soda sulphide decreases by exhaustion, while the loss of silver must increase, and so the thinness of the image becomes more and more apparent until the solution is turned into a fixing solution alone.

On this theory the yellow image is formed by the action of the sodium sulphide on silver thiosulphide, and it is therefore of the same nature as the yellow stain produced in time in imperfectly fixed prints. The sulphide image that we aim at is, however, one produced by sodium sulphide acting directly on silver bromide in the presence of gelatine, and it is probable that none of this is formed at all in the presence of a sufficient quantity of hypo to encourage the other reaction. Both these sulphides are probably of a colloidal nature, and therefore amenable to treatment that the tarnish deposit resists, therefore both can be chlorised and re-developed. An important characteristic of the reduced prints is that the reduction is only obvious in the shadows. The light tones seem to escape both reduction and tarnish, probably because they are more rapidly converted to the yellow sulphide. No doubt they are attacked first, and therefore get the benefit of the maximum amount of sulphide present. The heavier tones are then more liable to reduction and to the receipt of tarnish.

NEGATIVE VARNISH.

FOR many years past there have figured in the "Almanac" formulæ for negative varnishes, in most of which, it will be noted, shellac figures largely. During the last two or three years a solution of celluloid has been introduced as a varnish for gelatine negatives, and a very good protective it is for the purpose, but it is not suitable for collodion negatives, or for collodion transparencies, as the solvents of the celluloid will also dissolve the collodion film. However, spirit varnishes are still largely used for gelatine negatives, and there is no gainsaying the fact that they form a highly protective medium, both chemically and mechanically, while they have the advantage of being cheap to make and to purchase.

From time to time we have learned from correspondents that they have failed to get the shellac to dissolve in the ordinary methylated spirit of commerce, and we may therefore refer to one or two necessary precautions. It may, in passing, be as well to mention that the ordinary commercial methylated spirit is quite as good for our present purpose as the more costly unmethylated alcohol, provided that it is of the strength of about s.g. .830, which is the strength supplied when the spirit is obtained from any reputable dealer. It will be as well here to explain that there are two kinds of shellac met with in commerce—white lac and brown lac. The former is the brown variety which has been bleached with chlorine. In its brown state it will keep indefinitely without deterioration. But after it has been bleached it undergoes a slow change and becomes more or less insoluble in spirit if kept for any considerable time. This change comes about more quickly if it is kept in a dry condition than when it is kept damp, but in any case, if the white lac be used, it should be obtained newly bleached, and, if possible, direct from the bleachers, as then its freshness is better ensured. More-

over, what is not used up at once should be put into a closed jar with a little water at the bottom to keep the contents moist.

Varnish made with white lac is nearly colourless, having only a pale straw tint. If the unbleached kind be employed the varnish will have a more or less strong reddish-brown colour. The best coloured unbleached lac is what is known in the trade as "pale orange lac," and that is the brand which should be chosen. It has a certain amount of colour, but on a negative the varnish film is so thin that it practically has no retarding effect on printing. Whatever kind of lac be used it should be understood that it will not form a clear solution, as it contains waxy and other matters which are not soluble in spirit, and consequently remain in suspension and render the solution turbid. Filtering the solution is often a tedious means of clearing it: it is better to let it clear by subsidence, decanting the bright portion, and afterwards filtering what remains. As just stated, shellac as a rule is not wholly soluble in spirit, but we have seen some samples that were entirely soluble in spirit and formed a clear and bright solution when dissolved. They were bleached on the Continent, and in the operations the insoluble portions were removed. The price of this lac, we were told, was about double that of the best white lac here, but so far as we know this kind of lac is not to be had commercially in this country—at any rate, we have been unable to obtain it of several lac bleachers to whom we have applied. It has been said by some that brown lac makes a more durable varnish than does that which has been bleached. This is an idea that we cannot confirm. Provided the lac was of good quality in the first instance and it was dissolved within a reasonable time after bleaching, it forms an equally satisfactory varnish.

Having said this much about the lac itself, we will now give a formula for a negative varnish that is hard, tough, and very protective for both gelatine and collodion negatives, and is very inexpensive to make.

White or orange lac	$\frac{1}{2}$ lb.
Sandarac	2 ounces.
Methylated spirit	3 pints.
Oil of lavender	$1\frac{1}{2}$ ounces.
Coarsely powdered, or broken up, glass	a handful.

If the bleached lac be used it should be broken up into small pieces and then well dried. The reason for this is that interstices of the pieces contain a considerable quantity of water retained in the washing after the bleaching operation. Unless this is got rid of it will, of course, reduce the strength of the spirit. Shellac by itself gives a very hard and resistant varnish, but with the small proportion of sandarac here given we have found that both its hardness and toughness is increased. It might be thought that the addition of the sandarac, which is a more brittle resin than the shellac, would interfere with the toughness of the varnish, but that is not the case, as the mixture of the two resins gives a really tougher varnish than the lac by itself. The object of the glass is merely to prevent the agglomeration of the resins as they are being got into solution.

The following is the best way of making the varnish. The spirit is first put into a Winchester quart bottle and the glass added. Then the broken up and dried lac is introduced, together with the sandarac. The whole is then well shaken together and the bottle laid on its side. The shaking up is repeated at convenient times—for the complete solution may take some days—according to the solubility of the lac. When the solution of the resins is complete the oil of lavender is added, the bottle stood aside, and the sediment allowed to subside. If after standing three or four days there is no sign of its doing so, the cork

may be loosened, the bottle stood in a vessel of water and kept warm for an hour or two. This treatment will materially aid in the subsidence. Instead of causing the insoluble portions to settle by heat, the varnish may be cleared by filtration. This, however, will be found somewhat tedious business when the lac is in the "non-subsidable" condition. Usually, if the lac is in good condition, the varnish clears itself in the course of a few days and it will be found that when the insoluble portion subsides spontaneously it can be filtered out much more quickly than when the subsidence has been aided by heat. It is quite possible, if the lac is of specially good quality, that the varnish by this formula may prove a little too thick for convenient use. In that case all that has to be done is to add a little more spirit. In making varnish it is more economical to make a fairly large quantity at a time, as there is not much more waste with a large batch than with a small bulk.

THE "LATENT PERIOD" OR PERSONAL EQUATION AS A FACTOR IN RAPID HAND-CAMERA PHOTOGRAPHY.

In a recent lecture on the Photography of Sport, given before the R.P.S., Mr. Adolphe Abrahams drew attention to the fact that to secure an exposure at precisely the right moment it is necessary for the photographer to anticipate the action, or, in other words, to visualise it a small fraction of a second before it occurs. That this must be so is evident, for there must be an interval of time between the seeing of the actual occurrence and pressing the shutter release. If we do not press until we actually see the event then the photograph must be a little late. By practice, the expert gets into the way of thinking that he sees the action exactly the right period of time before it really happens, and so secures a photograph at just the right moment. This right period is called the "latent period," and it varies with different people. Between the appreciation of any event by the agency of sight, sound, or touch, and the making of a responsive movement, there must always be such a period, though the necessity for getting into the habit of involuntarily anticipating it is met with only in certain work. The measurement of this latent period, which, in some individuals, may be as much as one-fifth of a second, has always been a matter of interest, and in "Knowledge," for January, Mr. G. G. Blake describes a simple apparatus for effecting it. In this apparatus the operator and the subject stand on opposite sides of a screen. The former touches a button, which releases a pendulum, and at the same moment throws up a small indicator above the screen, or rings a bell or gives a slight electric shock to the other person. On perceiving the signal, the subject presses a lever, which stops and clips the pendulum. The extent of its swing is then read off on a scale, and so the period is ascertained. The apparatus is clumsy, and it is obvious that the true latent period is not measured. The result is the sum of that period and of the time taken in depressing the lever, which latter time would vary considerably with different people with an apparatus of the kind illustrated. Further than this, the visual test would hardly be a fair one for a photographer, because an element of surprise comes in with the sudden appearance of the indicator. It should, however, be fairly easy to devise an apparatus that would not only measure the latent period, but also test the subject's power of anticipation.

It must not be forgotten that the latent period of practical import to the photographer is not merely his own natural period. In addition to his own personal equation, there is a certain latent period belonging to his apparatus, and this must vary with different types of cameras and shutters. For example, with the focal plane shutter, a

ving object in the centre of the plate is not exposed at moment when the button is pressed, for the slit has to vel over nearly half the plate before exposure com- nces at that point. This period will vary with the ten- l. Again, in the reflex camera, the mirror must be got of the way before the slit commences to move, and this her lengthens the period. Even with a lens shutter re is a certain short period, for the shutter does not n fully till after the pressure has been applied to the ase, and the fact that such an interval exists can be n if we look through the shutter as it is fired off. The od by which a hand-camera worker must anticipate the ical moment is therefore equal to his own latent period s that of his apparatus, and the only way to measure s is with the camera. Again, it must be remembered that problem a photographer has to solve is the catching of e phase of a movement, the whole progress of which is ble. Mr. Blake's apparatus is on the lines of a disap- ring target, and probably a good rifleman, practised in pshooting, would come off better than a photographer. etter object for the latter would be afforded by a disc,

revolving at a known speed, with an index mark upon it, similar to the arrangement often used for shutter speed- testing. The operator would press his shutter release when the index appeared to him to be opposite a fixed datum mark, and the resulting photograph would then show the interval that elapsed (if any) between the coincidence of the marks and the commencement of exposure, as well as the duration of the exposure itself. The interval would be the combined latent period of operator and camera, and by adding a simple contrivance for instantaneously stopping the rotation of the disc on the pressure of a button, the operator could ascertain his own latent period separately. If in the habit of anticipating movements, these measure- ments would probably be incorrect, so, as a check, a dis- appearing signal might be employed for a second pair of tests. A hole through disc and background, with a light behind, would serve this purpose. By these methods the efficiency of the photographer in high-speed shutter work would be very well tested, for, with a practised hand, the datum should appear to coincide with the centre of the blurred image of the index.

DETERIORATION OF PHOTOGRAPHIC LENSES.

QUESTION which, by its frequent appearance in the "Answers" column of the "Journal," is evidently one of frequent interest to readers is that of the value of old photographic lenses. It would appear that the causes which lead to the deterioration in quality—and therefore in value—of objectives are much misunderstood and unrealised by many photographers, even by those familiar with details of types of lenses which have become obsolete.

One may meet at times with an old portrait lens that is good in appearance, so far as the mount is concerned, which when used visually in the camera is found to give a well-defined image, and yet on testing by exposing a plate may be found that it is very much slower in action than its aperture would warrant. Some such lenses, bearing good Continental names, have passed through the writer's hands. On examination by placing the components on a sheet of white paper and looking through them it was seen that the pure white of the paper was degraded. It is clear that the instruments were not in this state when they left their makers' hands; they had changed since. This change may be due to one of two causes, possibly, the two combined: the balsam with which the two pieces were cemented together has become tinted, or the glasses themselves discoloured. Some samples of balsam are prone to colour with age, and some kinds of glass, if long exposed to strong light, are liable to become discoloured to a yellowish-brown tint. Such changes as these, of course, would account for lenses being slower in action than when they were first made. The slowness due to the balsam may be remedied by having the glasses re-cemented. But with regard to arising from the discoloration of the glass nothing can be done.

Another cause of slowness should be mentioned. When a lens is first issued by the maker all the surfaces of the glasses are in the highest possible state of polish, and while in that state there is little or no obstruction to the light. But if this polish becomes destroyed, this condition is altered, and the rapidity of the instrument is reduced, while at the same time the brilliancy of the image it yields is degraded. This deterioration is brought about by lack of care in handling, as, for instance, in cleaning. When dust has settled on a lens, the same care should be exercised in its removal. We have seen this in studios, when out of use, standing on the hoods with the back combination covered with dust. When the instrument

is required for use, the dust is frequently removed by the first thing that comes to hand—perhaps a duster, or maybe the focussing cloth, either of which is probably well charged with dust. Doing this once or twice may not do any very material damage, but when it is repeated continually for many years the result becomes very manifest. Its result may be easily seen if a quite new lens be compared with one of the same make that has been many years in use, or even when the outer or exposed surfaces of the glasses are compared with the inner or protected ones, which seldom require cleaning.

The writer has been more particularly referring to portrait lenses employed in the studio, but the deterioration may be much more rapid and marked in those for outdoor work—hand-cameras, for instance. These are sure to become more or less dusty in use, particularly if they are carried on a bicycle. The dust in this case is mostly road grit, which is very sharp and cutting; and if that be rubbed off, as is too often done, without proper care, the lens will become deteriorated much more quickly than it would with only studio use.

Lenses may be seriously impaired by a very slight accident, though the cause may not at first be suspected. A short time ago the writer had a portrait lens by one of the leading London makers submitted to him that would not yield so sharp a negative as it once did. On examination it was noticed that one of the cells of the back combination was slightly dented, as from a knock or fall, and on close scrutiny with a gas flame it was seen that the glass in that cell was so jammed that its image was quite out of centre; in short, that a sharp negative was an impossibility. As the accident had not cracked or chipped any of the glasses, damage from the fall was not suspected. However, the maker of the lens soon repaired the damage. All lenses, it should be noted, should fit loosely in their cells, so that they can be easily rotated: if they become jammed their performance may be, as in the case quoted, considerably impaired. In the modern anastigmats absolute correct centring of the glasses is of far greater importance than it is with some of the older forms of lenses, and a very slight injury in this direction may quite destroy the original excellence of the instrument.

Long continued exposure to damp has a pernicious action on the surfaces of lenses. A few years back the writer was shown a large portrait lens by one of our leading London makers. It had originally cost between fifty and sixty pounds, and had

been used for some years in India, which is a very trying climate for lenses. The mount was considerably oxidised, and the glasses—or the outer surfaces of them—were oxidised, and had an iridescent and spotty appearance, which is sometimes termed mildew. However, when the brass-work was re-lacquered and the glasses re-polished by the maker, the instrument was practically as good as at first.

Lenses may also suffer in quality from a quite simple cause, while the restoration to the original state is equally simple. A case in point is as follows:—A photographer of our acquaintance had a pair of C.D.V. portrait lenses by a first-class optician that were fitted on a twin-lens camera. When the carte portrait went out of fashion the camera was put aside, but one of the lenses was taken off and put to other uses—mostly enlarging. After some years' use in this way it was restored to its place on the twin-lens camera for stereoscopic work, and it

was then found that there was a marked difference in the performance of the two. The one that had lain out of use yielded a far more brilliant negative than the other, although there was no apparent reason for it in the lenses themselves. The difference, it was found, was due entirely to the inside of the mount. The dead black on the inside of the tube of the one that had been in use had, by cleaning, been rubbed to such an extent that it was, as it were, polished and reflective of light. The interiors of both mounts were re-blackened, when they once more worked in unison as they did at first.

In the foregoing it is pointed out how photographic lenses may, and frequently do, deteriorate with age and use. Although an instrument may be by a first-class optician, it does not follow that it will, after many years' use, have the same excellence that it had when first issued from the factory.

JABEZ MOULL.

THE SILVER INTENSIFICATION OF DRY-PLATE NEGATIVES.

SINCE dry plates have superseded wet plates in photography silver intensification has practically died out. Occasionally one hears of a worker who has been successful with a batch of negatives, but most attempts to add fresh silver to a dry-plate image only end in failure. It is only very rarely that the molecular state of the image on modern plates is suitable for physical development. As a general rule silver cannot be deposited from a solution upon this image. Some years ago I, after repeated failures, came to the conclusion that no physical development method was likely to prove successful, and I turned my attention to trying to discover some quite different method. As some of the readers of this article may be aware, I was quite fortunate in my research. I think it was about three or four years ago that I discovered, and published in "Photography," the method which starts with the copper bromide bleacher, and which I append at the end of this article.

Lately, however, I have returned to the physical-development method, and I am happy to say that I fancy I have solved the problem. I need not dilate on the advantages of the physical-development method; they are so obvious. The growth of the density of the negative can be watched and stopped at any point, and the operation is so simple.

Well, to come to practical details. I advise that the negative that is going to be intensified should be first well soaked in water. It is then bleached in

Potassium bichromate	65 grs.
Conc. sulphuric acid	400 minims.
Common salt	1 oz.
Water	10 oz.

and after bleaching is complete it is washed. The bleaching solution keeps well, and after use it should be poured into a bottle, corked up, and stored for future employment.

The bleached negative, after all the bichromate solution has been washed out of it, is put into a dish containing

Sodium sulphite (cryst.)	15 grs.
Conc. sulphuric acid	25 minims.
Water	5 oz.

and exposed outside the window on the sill to the daylight for about one hour. The light acting on the silver chloride of the image in the presence of sulphurous acid, which is here a "chemical sensitiser," forms one of the well-known purple photo-salts.

After this, the negative is again washed. We can now either proceed to intensification straight off, or we can first reduce

the remaining silver chloride to metallic silver by means of a redeveloper. The latter process is perhaps advisable, as it enables the intensification to be watched with greater certainty. I know of no better redeveloper than

Metol	30 grs.
Sodium sulphite (cryst.)	90 grs.
Sodium carbonate (cryst.)	1 oz.
Water	10 oz.

This solution keeps quite well if stored in a bottle with stopper greased with a little vaseline.

After redevelopment the negative is again washed. In the *middle* of this washing the negative should be put into a bath of about $\frac{1}{2}$ per cent. hydrochloric acid for something like ten minutes, if the washing water be, as it usually is, of the hard variety. The intensification proper can now proceed. As to the intensifying solution I advise:—

Pyro	2 $\frac{3}{4}$ grs.
Silver nitrate	9 grs.
Citric acid	70 grs.
Water (tap)	5 oz.

The negative is kept in this solution until sufficiently dense. Now, if after the light treatment the negative has been redeveloped, it is, after intensification, washed, fixed, and washed again. If it has not been redeveloped after the light treatment it is, after intensification, washed, bleached again, and redeveloped, and then fixed or not, as one likes. In making up the intensifying solution the silver nitrate and citric acid must be added first, and the pyro only after both have dissolved and just before the bath is going to be used. The use of distilled water is certainly not necessary. If redevelopment has not been carried out at the end of intensification, I personally prefer to bleach and redevelop after the final fixing—of course subsequent to a very thorough washing. If the silver intensifying solution is made up according to the formula of Mr. Wellington, or a similar one, then, of course, redevelopment must always follow the light treatment. I lay no stress on the particular silver solution given above, but merely suggest it as being a good one. Now, there is, in my opinion, only one untoward thing which can happen. I do not think it is at all likely, but still a yellow stain may appear on the negative after the silver bath. If this happens it does not really matter, for it is very easy to get rid of the same. The negative is first washed, and then, if redevelopment has not preceded intensification, it is put straight into the redeveloper without being previously bleached, and after the acti-

is complete it is washed. After this treatment, or if development has preceded intensification, without carrying out, the negative is put into

Bichromate-chloride bleacher	1 oz.
Water	5 oz.

about a minute or two, and before any visible action has taken place on the image, the stain will have disappeared. The negative is then washed, fixed, and washed again.

Before concluding this article, I should just like to describe briefly the cuprous bromide method of silver intensification. I have great faith in this method, for I have used it fairly often during the last few years, without it ever having failed me. The negative is first soaked in water, and is then immersed in

Copper sulphate	100 grs.
Potassium bromide	100 grs.
Conct. sulphuric acid	30 minims.
Sodium sulphite (cryst.)	15 grs.
Water	5 oz.

completely bleached. The action in this bath is

A mixture of silver bromide and cuprous bromide being formed. The negative is next washed in five changes of

Sodium sulphite (cryst.)	50 grs.
Conct. sulphuric acid	100 minims.
Water	20 oz.

The immersion should be for about three minutes in the first change and four in the subsequent ones. After this washing has been carried out the negative is immersed in a dish of water for between five and ten seconds, and is then put into

Silver nitrate	80 grs.
Conct. nitric acid	80 minims.
Water	10 oz.

and left there until all action is at an end. The action taking place in the silver bath is

At least, this is my view of the action. We get thus an image consisting of silver bromide and a silver and silver bromide lake. Some call this latter body silver sub-bromide.

The negative is now thoroughly washed, and after this bleached in the bichromate-chloride bleaching solution given above (concentrated solution). It is next redeveloped. If any yellow stains appear, they are got rid of after the final redevelopment as above described.

I ought to add that the copper bromide solution should after use be corked up in a bottle and kept for a future occasion. When it is used again, about 10 grs. of sodium sulphite (cryst.) must be added to it. The silver nitrate solution should also be kept, and can be used for several negatives without any addition to it. The sulphurous acid solution, of course, will not keep, and must be made up fresh each time, and not more than an hour before use.

R. E. BLAKE SMITH.

TESTS OF BROMIDE PAPERS.

[A paper by Herr E. Valenta in the current issue of "Photographische Korrespondenz" contains a description of the means of applying simple tests to gelatino-bromide papers with a view to forming a judgment as to the perfection or otherwise of their manufacture. The following is a translation.—Eds. "B.J."]

Among the various sensitive photographic papers those of the bromide class have of late appeared upon the market in many varieties, particularly for use in the production of picture posters, for which purpose immense quantities are used. The manufacturers which produce such paper naturally use a great deal of raw stock (baryta paper). This, and the fact that the manufacture of raw paper for the bromide process requires, as a rule, less scrupulous care than that of paper for a printing-out process, are the cause of such paper being prepared by manufacturers who are not in the special business of manufacturing raw papers for photographic purposes. In the case of raw paper which is to be used for the print-out process it is necessary that the sole, or, at any rate, the chief, constituent of it should be the best rag, and that it should contain practically no metallic particles such as those which may get into it from the brass of the Hollander machine or from the calendering rollers. These particles are usually so small that they can scarcely be recognised by the naked eye, but in the case of papers bearing emulsions containing free silver salts they give, by reduction, to black spots in the prints. In the case of bromide emulsion the presence of these particles in the paper is of less importance, since the sensitive emulsion is to some extent protected by the baryta film, and, moreover, contains no soluble silver salts which may be easily reduced.

Thus it comes about that, although the existence of minute metallic particles in the raw paper for bromide work has not the same injurious effect, yet, nevertheless, such metallic impurities should be very small and few in number, and particularly should not occur in the baryta film, since these latter give rise in the prints to white spots containing a black nucleus. The paper which is produced at the present time for bromide work by several makers is prepared from well-purified cellulose, with the addition of rag, frequently also only free cellulose, and

containing only a very small proportion of metallic particles, since these are carefully removed previously in the manufacture by a special process. Thus it frequently happens that the makers of bromide paper, in cases where the prints show spots, ascribe the blame solely and only to the paper, although in many cases defective coating or the improper composition of the emulsion is the cause. For the purpose of carrying out tests of bromide paper which is thus defective the following series of tests is recommended.

The paper is first examined as to its freedom from wood-pulp. This is done by dabbing the back of the bromide paper with a 5 per cent. solution in water of aniline sulphate. In the presence of wood-pulp the portion thus treated turns yellow. If the bromide paper under examination is packed in rolls several sheets should be cut of a size about 20 inches square and further tested as follows:—

I. From each of such sheets taken from different parts of the roll contact prints are made from a good negative, using a suitable developer, such as metol-hydroquinone.

II. On portions of each sheet also a series of exposures are given, say from one to five seconds, at a distance of, say, one metre from a sixteen candle-power incandescent lamp. These exposures are likewise developed and fixed.

III. A portion of each sheet is allowed to remain exposed to daylight.

IV. A portion of each sheet is fixed without previous exposure to light, washed, and dried.

Test I. serves as a criterion of the emulsion, whether the latter works bright and clear or flat and foggy, and, further, will show to what extent any production of spots will affect the practical usefulness of the paper.

Test II. serves for ascertaining the total number of spots by means of microscopic or other examination.

Test III. will show the occurrence of violet spots prior to the whole surface of the paper assuming a uniform tone. Such spots, on fixing the paper, become yellowish-brown. They are caused by substances which produce a sensitising of the silver bromide, and have fallen as dust upon the coated emulsion film, or on the baryta paper before coating.

Test IV. serves for the discovery of the existence of metallic particles in the paper or in the baryta film. For this purpose the fixed and washed bromide paper is flowed over in a dish with 5 to 6 per cent. acetic acid, which is allowed to act for some minutes. The paper is then removed, hung up to dry, and then placed in a 3 to 5 per cent. solution of potassium ferrocyanide, being then again dried. In the paper which has been thus treated the iron particles assume a blue colour (Berlin blue), those of copper a brown colour, due to ferrocyanide of copper. The test also renders it easy to discover whether the particles are in the paper or in the baryta film. If this method of testing has shown the presence of metallic particles in the paper, it is advisable to note the spots in the exposed and developed paper, and to then repeat test No. IV. with this latter, whereby it is possible to distinguish sharply the spots due to metallic particles and those due to other causes.

The adhesive contained in the material of the baryta film may also give rise to spots. In order to judge of the influence of this latter, some pieces of Test No. IV., after fixing, washing and drying, are soaked in 2 per cent. ammonium chloride solution, dried, and sensitised on 10 per cent. silver nitrate solution (by floating gelatine side downwards on this latter). If the paper, on then being allowed to remain in the light after fixing etc., shows no black spots other than those arising from metallic particles, it may be assumed that the sizing of the paper is not defective, and that the spots are due to the emulsion.

In regard to spots which may be due to defective coating, the following should be remarked:—The presence of particles of grease in the gelatine may be recognised by the white round spots on the prints containing no nucleus.* Particles of dust which find their way into the gelatine or baryta film may give rise to spots, just as do metallic particles in the baryta film but they, in contrast with the latter, show a nucleus.

E. VALENTA.

* In contrast with the white spots due to air-bubbles adhering to the paper when the developer is poured on, it may be noted that these latter are round and have sharp edges. That may be avoided by soaking the paper in water before development, and removing all air-bubbles from the surface by continually rocking the dish.

THE CARD SYSTEM FOR KEEPING A PHOTOGRAPHER'S ACCOUNTS.

[In pursuance of the recent notes and articles on the use of the card index system which have appeared in our columns, we reproduce an article from a recent issue of the "St. Louis and Canadian Photographer," describing the system adopted by a number of professional photographers.—Eds., "B.J."]

WHAT does the ordinary photographer use in the way of a system? About all there is to it is a register. This is a bound book in which he records day after day the orders he receives from his customers. Each order is given a number. When the negatives have been developed they are marked with their numbers and stored away. It is not customary for the photographer to keep an alphabetical list by names, so that it is often impossible to locate the negative number of some customer's old order after it has been filed away.

A modern system looks to the photographer like such a revolutionary departure from old methods that he is apt to turn it down without investigation, for no other reason than that it is new.

The system which the writer will describe in this article has already been adopted by quite a number of progressive photographers in various parts of the country. It is not as expensive as it seems at first thought. On the contrary, it will save the photographer a considerable amount of money in the course of the year. We shall have accomplished our purpose if we can only induce the photographer to use a card system in place of his present book register, though the vertical method of filing and indexing negatives and mounts represents exactly the same amount of saved time and work as the indexing of customers' records on cards.

A photographer ought to be able at any time to tell just what proofs are being made, just how many proofs are out and just how much work he has in the printing room. He should be able to find instantly any customer's account, regardless of the condition in which the work for that customer may be, either by the name of the customer or number of negative.

We use a card 5in. wide by 3in. high, which is printed on one side. It has spaces in the upper right-hand corner for the negative number, and the date, the size, description, and price of the order are written in the other spaces below. The customer's name and address occupies the upper right-hand portion of the card.

A package of these blank cards should be kept conveniently at hand in the reception room, so that the moment a customer enters the record of the order can be made directly on one of these cards.

It is a good plan to have these cards printed in two colours—white and salmon—using a white card where a sitting is to be made, and a salmon card if the photographs ordered are to be printed from an old negative.

The reception clerk keeps a memo of the last negative number used and when making out a card, whether white or salmon, the next consecutive number is set down thereon. When this card, known as the "ledger card," is made out, a second card the same size, known as the "gallery card," is made out and passed to the gallery. The "ledger" card must never leave the reception room or office, as it is the only record the office has of the transaction. Some photographers use exactly the same card for both "ledger" and "gallery" form and it is perfectly practicable to do so. Where the customer is received by a clerk or one member of the firm, and, after being passed to the gallery, is taken care of by another member of the firm, the use of the "gallery" card will save an introduction or explanation as it will convey to the gallery operator not only the customer's name and address, but the size, price, and description of the order. The knowledge of these facts on the part of the gallery operator is always a pleasing compliment to the customer, who is quick to infer that he or she is well known to everybody in the studio.

After the exposures have been made and the customer has departed, this "gallery" card accompanies the negative through the processes of developing and printing. The negatives are numbered from the card by scratching the number thereon with a pin. After printing, the proofs are delivered by to the reception room, accompanied by the "gallery" card. The "ledger" card all this time has been kept in the office, filed in a card drawer according to the date upon which proofs should be completed and mailed or delivered to the customer. For example, the customer, when leaving the studio, may have requested that proofs be mailed to her not later than the 20th of the month. The reception clerk, therefore, files the "ledger" card behind the index guide for the 20th, in addition to marking the "gallery" card with this date. On the 20th this "ledger" card will automatically come up for attention, and should the proofs not have been delivered to the reception room, the clerk will call upon the gallery or printing office for the proofs. By this simple method of "follow-up" the photographer can make sure that the requests of his customers as regards the mailing of proofs will all have proper attention.

As before stated, proofs are delivered to the reception-room accompanied by the "gallery" card. After the proofs are mailed to the customer, the "gallery" card is attached to the "ledger" card.

and filed in the card drawer ahead under the date, say the 28th, by which time the proofs should be returned to the studio. In the event of their not being returned by this date, a postal can be sent to the customer, calling his or her attention to the fact that delay in returning the proofs will necessarily mean delay in completing the order. After the mailing of such a postal, the two cards, which are still attached together, can be placed a few days further ahead in the card drawer. By keeping this up, the proofs are finally all brought in. The "gallery" and "ledger" cards are then separated, the former being placed with the proofs and returned to the printing room, the "ledger" card being again filed by date in the card drawer, according to the date upon which the mounted photographs should be ready for delivery.

When the proofs and the "gallery" card are received in the printing room, the negative or negatives which have been selected by the customer are filed away permanently by number in a negative rack. The negatives which have been rejected are destroyed. After the printing has been completed, the prints and the "gallery" card are delivered to the mounting room, after which the finished photographs, accompanied by the "gallery" card, are sent to the reception room.

Arrived there, the mounts are placed in a large envelope about 15in. long by 9½in. wide. The envelope contains a pocket in the face for holding the "gallery" card. The envelope containing the mounts is then filed in a vertical cabinet which generally, for the small photographer, consists of two or four vertical filing drawers bearing alphabetical labels, such as first drawer A-K, second drawer L-Z; or, for four drawers, first drawer A-F, second drawer G-L, third drawer M-R, fourth drawer S-Z. In each of these drawers is arranged a set of alphabetical index guides corresponding to the letters on the front of the drawers. The envelopes are placed behind these guides according to customers' names. The advantage of this method of filing mounts is that it is very economical of space. It keeps the mounts out of the way and free from dust, and yet makes them very accessible when wanted.

To revert to the disposition of the "ledger" card after the completed mounts have been received in the reception-room. This card, which has previously been filed by date, is now removed, and a postal card made out to the customer, informing him or her that the photographs are ready, and asking whether they will be called for or delivered. The "ledger" card is then filed in another card drawer labelled "Orders," indexed alphabetically by names. The card remains here until the photographs have been delivered and paid for, when it is removed and filed in another drawer labelled "Customers, 1908," indexed alphabetically by names.

After the delivery of the photographs the envelope is taken out of the vertical cabinet, the "gallery" card removed, and the envelope laid aside for further use. The "gallery" card is, therefore, filed away in another card drawer labelled "Negatives," and arranged numerically by negative numbers. It will thus be readily seen that any customer's negative can be promptly found by number or name.

Every five or seven years the photographer will want to destroy many of his old negatives, as it is comparatively certain he will never be called upon to reprint photographs from negatives taken so long as that. The filing of the "gallery" cards by number affords him a very convenient method of keeping track of the length of time he is keeping his negatives. Otherwise a photographer has nothing to guide him but the negative number, which is not very reliable if he has made several reprints therefrom without re-numbering the negative.

We have described the use of the system only as it has to do with the execution of original orders. Where a customer calls at the studio and leaves an order for a reprint from a former negative the clerical routine is taken care of in a little different way. The reception clerk makes out a "ledger" card on a salmon-coloured card. As no sitting is necessary, the customer may leave at once, and after her departure the "gallery" card may be written out. Both these cards receive the next consecutive number. Reference is then made to the card drawer labelled "Customers, 1908," or, if last year, "Customers, 1907," where, filed by name, will be found the old "ledger" card of this customer, which will give the negative number. This old number will then be entered on the new "ledger" and "gallery" cards, the former reading something like this—

Negative 8,920. Mr. Arthur Jones. 2 doz. photographs, oval, sepia, style K. From old negative No. 3,420. \$8.00.

The new "ledger" card is filed by date, and the "gallery" card goes to the printing room, where negative No. 3,420 is located and the old number removed and the new number marked thereon. The prints are made, the negative re-filed under this new number, and the "gallery" card and prints delivered to the mounting room, where, after being mounted, they are sent to the reception room and placed on file in the vertical cabinet, awaiting delivery.

So far as I have observed the card system in use by photographers, I believe it a better plan to make out a new ledger card for every duplicate order. In the case of reprints, where negatives will be re-numbered, the gallery cards should also be re-numbered, which would make a smaller quantity of the latter to be filed than of the ledger cards.

ROLAND COLE.

THE PLACE OF PORTRAIT POSTCARDS IN A PROFESSIONAL BUSINESS.

A RECENT article in the "Trade News" (U.S.A.) records the experience of a professional photographer of Salem, Ind., to the effect that the sale of many portrait postcards had not harmed his business in the way of reducing prices of his regular work.

The samples of cards are kept well out of sight, but where they can be reached quickly, and, when a customer comes in, the regular work is shown and talked about, the order taken, the sitting made, and all business completed. If the time is propitious, the postcard question is brought up at that time, but, if not, the matter is not suggested until the proofs are returned and accepted. When the order is given, and the regular business all disposed of, then the samples of postcards are brought out with a suggestion that the sitter might have some friends who live at a distance to whom she might want to send a picture, but does not care to send one of the more expensive set. If so, the postcard, which can be obtained at two for a quarter, four for a half, or a dozen for a dollar (4s.), will be just the thing, as it can be made from the same negative, and will be a very pleasing little picture. The number of times this brings orders is astonishing, and, as the cards are very inexpensive and easy to work, whatever is taken over and above the price of the original order is just so much velvet, and, in these days, if an average of 50 cents can be added to every order taken, it will make a very tidy sum at the end of the month.

But the postcard has been found to be a booster of prices instead of an influence toward lower prices, as so many photographers seem inclined to think it is. It must be worked right to have this effect, but if it is worked right it will get you higher prices for your regular work. You frequently have customers who, when asked how many pictures they want, stand and count on their fingers the number of people to whom they have to give pictures, and if two or more come, they will consult and consume a lot of time trying to determine whom they will honour with a picture and whom they will have to omit. Then when they find that they ought to give more than they had expected they will complain of the cost of the grade of work and say that they want to try to get a cheaper grade.

Right here is the time to stand strong for the high grade of work and to suggest that the customer should get the best possible grade of work for the close friends and then send the postcard pictures to those not so close, but not to think of changing the order to a cheaper picture, which will not prove as acceptable to the close friends and will not make a bit of difference to the others. Use the argument of the satisfaction of being able to distribute to the people whom one wants to please a picture that they will be proud to have go out. That the prettier the picture the more it will be prized by friends and the more it will be displayed. This is a strong argument for better work, and if it can be shown that the postcard is a good way to satisfy the lesser demands of one's friends, then they will get the higher priced pictures, and every one of these that go out is a bid for re-orders, and a demand from the friends of this customer for pictures of the same grade. If the cheap pictures are put out, the recipients, when it comes their turn, will very likely order the same grade as the ones given them.

There is money in a good grade of photographic work, but the cheaper the work the less money there is in it. It does not pay to demand more than the customer can pay, but it does pay to give and to persuade the customer to take the very best grade that he or she can afford. If the postcard is worked shrewdly it is a fine thing. If it is not worked shrewdly it can become a great nuisance. Do it right.

Photo-Mechanical Notes.

Mechanical Half-Tone Wood Engravings.

OUR readers are aware of the "Acrotones," the mechanically engraved half-tone produced by Mr. Amstütz's "Acrograph." These are produced by cutting with a V-shaped tool into celluloid placed over a carbon relief, and the width of the line is accordingly varied with the height of the underlying relief. We are now informed that wood engravings can be produced in a similar manner. In the Acrograph the tool is fixed, and the surface cut is flexible and follows the relief. Wood, however, is not flexible, so it would appear as though the tool must rise and fall according to the relief—that is, if a relief is used at all. Certainly the proof we have seen looked extremely well and as though it had been done from a photograph. We hear the method has secured substantial backing, and, if all that is claimed for it proves to be true, we ought to see much work by this method in the newspapers of the near future, for such blocks should be somewhat easier to stereotype and print than ordinary half-tones.

Pencil Drawings and Charcoal Sketches.

In reproducing these it is sometimes found that the ground photographs very mottled. This is due to the yellow colour of the varnish used by the artist as a "fixative" for pencil and charcoal work. If this trouble is encountered, wet plates should not be used, but a panchromatic plate, which will generally photograph the ground evenly without any filter. If a filter is needed, then only a light yellow one is necessary.

Making Autochromes by Enclosed Arc Light.

It has been found that the colour rendering of Autochromes, illuminated by enclosed arc when using the Lumière filter, is unsatisfactory. This is possibly due to the filter not absorbing all the ultra-violet rays in which these lamps are so rich. A filter that will give good results, however, can be made from a solution of bichromate of potash in water. This must be very dilute, from 1-15th to 1-20th of 1 per cent., according to the width of the filter cell, 1-20th per cent. serving for a cell one centimetre in width.

Reflectors of Arc Lamps

The reflectors of arc lamps are apt to become very discoloured after a time, and so the efficiency of the light is considerably impaired. To whitewash them, however, is not of much use, as the heat soon causes it to crack off, and most white paints are not very good, as they soon yellow badly. The best medium we have discovered up to now is the "Olsina" white water paint sold by Messrs. Mander Bros., which, applied thinly after it has been reduced with water to a suitable consistency, withstands the heat and keeps its colour well.

An Ink for Painting-out.

It is usual to use for painting-out, when fine-etching, either finishing ink, diluted with turpentine, or a varnish such as "Mogul" or bitumen dissolved in benzole or turpentine. The following is a recipe for this material from "Deutscher Buch and Steindruckerk Jahrbuch":—Put in a saucepan four parts of concentrated solution of bitumen in turpentine, two parts news ink, one part pitch, and keep stirring in the open over a stove until thoroughly smoothly mixed. Then allow to cool, and add turpentine until the mass is of the consistency of thick cream. Plates only need be warmed after the painting-out with this ink; it does not need dusting-in with resin.

Newspaper Half-Tones.

In most newspapers producing illustrations there is an eternal quarrel between the blockmaker, the stereotyper, and the printer, each blaming the other for the ultimate bad result. We have recently had the opportunity of examining microscopically sections of the half-tone plate, the stereotypers' matrix, and the stereo itself, and it was immediately obvious that the fault lay in the matrix, for while the block was of good section, being both deep and smooth, the matrix failed lamentably, and, making every allowance for shrinkage, it was quite clear the flong had never been beaten to the bottom of the hollows between the dots in the half-tone plate, and consequently the stereo was equally shallow, and the printer had

therefore no chance to secure a satisfactory result. Whenever there is a complaint about shallowness in blocks prepared for newspaper illustration, the test proposed by the American plate-maker appears to be one that can settle the point. He suggested that the plate should be held face downwards and smoked over a taper until there was a covering of fine black all over the plate. If now the flong, beaten into the plate, and goes properly home, the matrix will be black adhering to the surface of the points. In most cases, however, in which the half-tone plates are complained of, it will be found that the black is absent, thus showing that the flong has been driven to the bottom of the plate.

Half-Tone Blocks from Half-Tone Proofs.

A correspondent, K. Dunn, of Messrs. Penrose and Co.'s most interesting "Process Work," gives the following hint on the prevention of pattern-formation when making half-tones from a half-tone proof. It is given as the result of making hundreds of half-tone prints in the course of a year. "Place copy on the board, either in or out of frame, focus to size, then take out the ground glass and place a piece of clear glass in the dark slide, any size will do; pull a focussing cloth over your head and draw up the screen to the glass. Now if you have your half-tone print upright on the board, looking on the clear glass you will notice the pattern very strongly. If you have a boy to assist you, get him to slowly move the print round to something like an angle of 30deg. to 45deg., watching your clear glass till all pattern disappears. Put back the ground glass and focus sharp. It is very simple, and the quickest way of getting the best results from half-tone prints."

Hunter's Pocket Diary.

This diary is much improved in appearance this year, being now bound in leather, with a gold embossed monogram on the cover. There is a good deal of useful information contained in the book, though the pleasure in looking through it is somewhat discounted by its alternation with advertisements. Probably the best of the articles is "Some Hints on Drawing Up Photographs for Half-Tone Reproduction," which contains information, usually jealously guarded, that we do not remember to have seen published before.

Exhibitions.

PHOTOGRAPHS BY MEMBERS OF THE LYCEUM CLUB.

THOSE of our readers who have not yet paid a visit to the highly interesting exhibition of ladies' work at the Lyceum Club, 1, Piccadilly, will yet be able to do so, as it will remain open until the end of the month. It is well worth inspection, as not all the exhibitors are known to the general photographic world, and those that are show noteworthy work. Particularly is this the case with Miss Agnes G. Warburg, whose oil print of Wareham Bridge looks very distinctive here. The same lady's "A Rainy Day" is in every way first rate. It is a sea-shore scene, with a fine natural effect. "Won't" is the title of a clever print of a child standing partly in the sunshine from a window. It has strong and telling contrasts. Somewhat similar in subject is Mrs. Michael Foster's "Misunderstood," another little girl whose expression is most happily rendered. A good "Study in Red" of a man's head should be noted, as well as the same worker's "At the Fountain," a subject of a group of children in a print of fine quality.

Mrs. Cadby and Mrs. Keene show each seven and four works respectively. They work in diametrically opposite ways, and though it is difficult to make a preference between them, one can readily say that each would do better for a little of the other's manner, for Mrs. Cadby's are usually too feeble and Mrs. Keene's too strong in tone. One or two interesting portraits by Helen Lohman are spoiled by some childish bad lettering scrawled in the corners. A little chubby child called "Kitty" is pretty, but we cannot tell what prompted the choice of "Figures for scenes at Gordon Craig's Theatre." These so-called figures are mere "characters" cut out of thin material. One of the most interesting photographs here is Helen Sidney Woolf's "Magasinum, Ancient

umpets used in Sinhalese Religious Procession." Two natives are shown blowing these immense S-shaped instruments, which much resemble the old Roman tuba. Not the least arresting is the row of grinning natives, whose heads appear above a hedge behind, and who are mightily enjoying the "sitting" their comrades are giving the photographer. E. L. Turner and L. J. Veley show naturalistic studies; and Ella Tomlinson a nice, clean, sharp print of two old rustic characters on a settle, feeding a baby. This, as an illustration to Mrs. Gaskell's "Mary Barton." As for Mrs. Geo. Southnot, who exhibits three works, we think she might with some advantage take her husband in hand in matters photographic.

FORTHCOMING EXHIBITIONS.

- January 19 to 30.—Glasgow Southern Photographic Association. Sec., Robert Lindsay, 189, Allison Street, Glasgow, S.S.
- February 1 to 13.—Glasgow and West of Scotland Amateur Photographic Association. Sec., James McKissack, 68, West Regent Street, Glasgow.
- February 3 to 6.—Borough of Tynemouth Photographic Society. Sec., J. R. Johnston, 29, Drummond Terrace, North Shields.
- February 8 to 13.—St. Helen's Camera Club. Sec., A. G. Else, Duke Street, St. Helen's, Lancs.
- February 10 and 11.—Cowes Camera Club. Entries close February 1. Sec., E. E. Vincent, 4, High Street, Cowes.
- February 10 to 13.—Cleveland Camera Club. Entries close February 1. Secs., F. W. Pearson and R. Walton, 39, Granville Road, Middlesbrough.
- February 11 to 20.—Leicester and Leicestershire Photographic Society. Sec., Harry Cross, 80, Harrow Road, Leicester.
- February 16 to 20.—Norwich and District Photographic Society. Entries close February 2. Sec.; J. T. Tanner, The Lodge, Bowthorpe Road, Norwich.
- February 20 to March 6.—Edinburgh Photographic Society. Entries close February 6. Exhibition Secs., Edinburgh Photographic Society, 38, Castle Street, Edinburgh.
- February 20 to March 20.—South London Photographic Society. Entries close February 10. Sec., H. Crieghton Beckett, 44, Edith Road, Peckham, S.E.
- February 22 to March 6.—Birmingham Photographic Society. Entries close February 12. Sec., Lewis Lloyd, Church Road, Moseley, Birmingham.
- February 26 and 27.—Ilford Photographic Society. Entries close February 18. Sec., H. Eales, 53, Coventry Road, Ilford, Essex.
- March 11 to 13.—Coventry Photographic Club. Entries close March 5. Sec., W. R. Harris, 17, Allesley Old Road, Coventry.
- March 17 to 20.—Nottingham Camera Club. Sec., E. L. Kent, 5, Radcliffe Mount, West Bridgford, Notts.
- March 31 and April 1.—Shropshire Camera Club. Entries close March 20. Sec., Harry W. Hughes, Kingsland, Shrewsbury.
- April 10 to 17.—Midlothian Photographic Association. Entries close March 31. Sec., B. Sherratt, 8, Castle Terrace, Edinburgh.

A PHOTOGRAPHIC LODGE OF FREEMASONS.—A correspondent writes: Some years ago a suggestion was made by one of your correspondents as to the advisability of forming a photographic lodge of Freemasons, but nothing came of it. Perhaps now that so many are connected with photography—professionals, dealers, manufacturers, etc.—the time is ripe for further discussion."

"TRAVEL AND EXPLORATION."—In No. 2 of this excellently produced monthly the first place is given to an article by Colonel Sir C. H. Holdich on Dr. Sven Hedin's explorations in Central Asia, two of the illustrations to which are a full-page portrait of the explorer and a map showing the region of his travels. The volume also contains illustrated articles on "A Winter Cruise in the West Indies," by Algernon E. Aspinall; "Among the Veddas of Ceylon," by Dr. C. G. Seligmann; "Some Aspects of Morocco," by E. Ashmead Bartlett; and an amusing account of a visit to the Carpathian oil fields, entitled "The Back of Europe," by Claud G. Steel. This journal is published monthly by Witherby and Co., 325, High Holborn, London, W.C., price 1s. net.

Patent News.

Process patents—applications and specifications—are treated in "Photo Mechanical Notes."

The following Applications have been received from January 11 to 16:—

SHUTTERS.—No. 616. Improvements in focal-plane shutters. William Albert Edwards and Houghtons Ltd., 88, High Holborn, London.

EMULSION.—No. 651. Improvements in and relating to sensitive emulsion for coating papers, plates, fabrics, films, and the like. Frank William Heard and Fletcher John Mortimer Boden, 53, Waterloo Road, Leyton, London.

PORTABLE DARK-ROOM.—No. 668. Improvements in combined portable photographic apparatus and dark-room. John Bunyan Williard, 52, Chancery Lane, London.

POLISHING LENSES.—No. 698. Improvements in machines for grinding and polishing lenses and other like convex and concave surfaces. John William Pearson, 77, Market Street, Bradford.

PHOTOGRAPHING FROM A HEIGHT.—No. 709. Improvements in or relating to devices for photographing from a height. Alfred Julius Boulton (for Alfred Maul, Saxony), 111, Hatton Garden, London.

PRINTING FRAMES.—No. 773. Improvements in printing frames. Robert Alwyn Arnold Stephen Piercy, 323, High Holborn, London.

SHUTTERS.—No. 833. Improvements in shutters for photographic cameras. William Henry Burgess, 6, Bank Street, Manchester.

PAPER.—No. 883. Improvements relating to sensitised paper. Hermann Caster, 7, Southampton Buildings, London.

STENCILLING MACHINE.—No. 941. Stencilling machine. Charles Laurence Burdick, 4, Eastern Road, Wood Green, London.

COLOUR PHOTOGRAPHY.—No. 964. Improved manufacture of reproductions in colours. Bernard James Cooper, 70, Chancery Lane, London.

CAMERAS.—No. 1,037. Improvements in cameras. Daniel Walter, Grosvenor House, New Church Road, Hove, Brighton.

DIAPHRAGMS.—No. 1,139. Improvements in stops or diaphragms for photographic purposes. William Charles Masser and William Hudson, 18, Southampton Buildings, London.

CINEMATOGRAPHS.—No. 1,140. Improvements in and relating to cinematograph and similar projecting apparatus. Donald Stevenson, 36, Chancery Lane, London.

LENS MOUNTS.—No. 1,141. Improvements in lens mounts. Cyril Frederick Lan-Davis, 83, Denzil Road, Neasden, London.

COLOUR PHOTOGRAPHY.—No. 1,154. Improvements in and connected with colour photography. Louis Weigert-Sterne and Frederick William Moorf, 77, Chancery Lane, London.

COMPLETE SPECIFICATIONS ACCEPTED.

These specifications are obtainable, price 5d. each, post free, from the Patent Office, 25, Southampton Buildings, Chancery Lane, London, W.C.

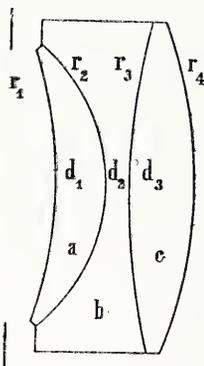

The date in brackets is that of application in this country; or abroad, in the case of patents granted under the International Convention

THREE-LENS ANASTIGMAT.—No. 13,902, 1908 (June 50, 1908). The invention relates to three-lens objectives, comprising a negative lens between, and in contact with, a biconvex lens of low dispersive power on one side and a positive meniscus on the other side, having lower dispersive and refractive power than the biconvex lens. It more particularly consists in a construction of objectives of this class in such a manner that the biconvex lens is formed of a kind of glass which has a higher refractive power than hitherto used, such refractive power resulting in a refractive index, n_D , of at least 1.615.

The effect obtained by such increase of the refractive power of the biconvex lens of the objective is due to the fact that the curvature of the contact surface between the negative lens of the objective and the biconvex lens is reduced in consequence of the

increased difference between the values of the refractive indices of the negative and the biconvex lenses. The advantage of the reduction of the curvature of the contact surface is that the astigmatic aberration, if eliminated for a certain inclination of rays entering the objective, is at the same time eliminated to a higher degree for varying inclinations of rays than in the case of greater curvature of the contact surface of the negative and the biconvex lenses, such as is found in former constructions, for instance, as described in the Specifications of British Patents, 3,041/99 and 29,447/06.

The high refractive power of the biconvex lens of the objective is preferably combined with a low refractive power of the positive meniscus, the refractive power of the last-named lens being reduced below the value hitherto used, so that the refractive index of the positive meniscus does not exceed the value 1.50. Such reduction of the refractive power of the positive meniscus of the objective likewise results in a reduction of the curvature of the contact surface between the negative lens and the positive meniscus in consequence of the increased difference between the values of the refractive indices of the negative lens and the posi-

tive meniscus. In this way it becomes possible to construct the objective so that the spherical aberration is eliminated for a great effective area or opening without introducing objectionable high spherical aberrations for intermediate zones of the objective.

An objective, in accordance with the invention, is represented in the drawing, where the three lenses forming the objective are designated a, b and c respectively. The thicknesses of the three lenses are designated d_1, d_2, d_3 respectively, and the radii of curvature of the four lens surfaces are designated r_1, r_2, r_3, r_4 respectively.

The constructional elements of two embodiments of the new objective for a focal length or distance of $f=100$ are given in the following tables:—

Radii.	Thicknesses.	Kinds of glass.
$r_1 = -12,289$ mm.		
$r_2 = -4,989$ „	$d_1 = 1,343$	$n_D = 1,5102$ $n_{c1} = 1,5202$ $v = 64.1$
$r_3 = +22,111$ „	$d_2 = 0,584$	„ $= 1,5477$ „ $= 1,5609$ $v = 53.3$
$r_4 = -12,174$ „	$d_3 = 1,751$	„ $= 1,6169$ „ $= 1,6316$ $v = 53.8$
$r_1 = -13,889$ „		
$r_2 = -6,250$ „	$d_1 = 2,0$	„ $= 1,4649$ „ $= 1,4738$ $v = 65.6$
$r_3 = -38,911$ „	$d_2 = 0,8$	„ $= 1,5164$ „ $= 1,5286$ $v = 54.1$
$r_4 = -14,117$ „	$d_3 = 2,1$	„ $= 1,6210$ „ $= 1,6349$ $v = 57.1$

The improved objective can be used either as a single objective, or as a double objective. The conditions in this regard are absolutely the same as in connection with the three-lens objective of United States Patent 528,155, on which this invention is an improvement. Optische Anstalt C. P. Goerz A.G., 44-46, Rheinstrasse, Friedenau, Berlin, and W. Zschokke, 1, Belfortstrasse, Steglitz, Berlin.

DAYLIGHT DEVELOPING AND FIXING.—No. 15,657. 1908. (July 23, 1907.) The invention relates to a product by the use of which, in solution and in combination with other solutions which may vary, it is possible to both develop and fix in a single bath, in full daylight, a photographic negative or positive. This product is a picrate, preferably either picrate of magnesia or picrate of soda. In order to obtain a developing and fixing bath with a picrate base, the following compounds may be added to the latter substance: sulphite of soda, hyposulphite of soda and diamidophenol.

In practice, however, a good result is used by employing following proportions:—Picrate of magnesia, 81 gms.; anhyd sulphite of soda, 544 gms.; hyposulphite of soda, 250 g; diamidophenol, 125 gms.

These substances reduced to powder are thoroughly mixed each other and supplied to the trade in any suitable packing instance, in glass tubes containing a quantity measured for or several baths. About 4 gms. of the mixture of powder shall be dissolved in 100 ccs. of water. A negative having plunged into this bath in the dark, the covering can then withdrawn without any risk, and development and fixing carried on quite safely in the light. Felix Jeannot, 46, Rue Rome, Paris, and Maxted Roderick Bremner, 131, Rue Martre, France.

FOUR-COLOUR STEREOSCOPIC PHOTOGRAPHY.—No. 28,764, 1 (Oct. 28, 1907.) The invention relates to an apparatus by means of which stereoscopic negatives can be taken in colours and the negatives made to produce a stereoscopic effect, the colours being obtained by decomposition of the light into four primary colours and by means of black positives.

The apparatus is composed of two exactly similar parts arranged symmetrically in relation to a plane the section of which lies in X Y. One of these parts is separated from the other first by the diaphragm D placed in the plane X Y. This diaphragm is intended to limit the luminous cone of the two lenses O and O¹ so that the plate at P may not be exposed by the lens O¹ and that at P¹ by the lens O.

The cone produced by the lens O comes in contact with the mirror screen M placed at an angle of 45 deg., which reflects a portion of the light and allows the other portion to pass through. The mirror screen M is tinted yellow and throws the light back on to an ultramarine screen E, behind which is placed the sensitive plate (horizontal frame), these two plates giving the negatives or originals of the yellow and of the ultramarine.

In the part that corresponds to the objective O¹ the mirror is tinted green and the corresponding part of the screen E is tinted red.

If the lenses employed for taking the negatives be replaced by lenses suitable for viewing after the apparatus has been turned about, and the negatives have been replaced by their positives, the colour-photograph of the objects will be re-constituted, optical synthesis of the two colours in front of each eye.

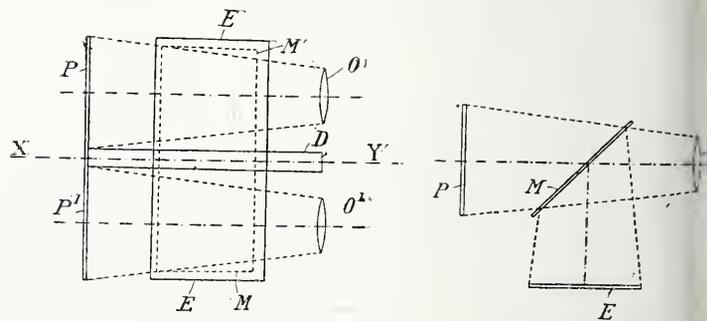

Fig. 1.

Fig. 2.

Four colours have been mentioned, but it is evident that others might be taken, provided that they are complementary of one another and divide the cycle of colours into four equal parts.

Reference is made by the patentee to Specifications, Nos. 9936 4164⁹⁹ and 29,353⁹⁷. Louis Geisler, 22, Rue de la Faisanderie, Paris, France.

HAND-CAMERA SHUTTER AND EXPOSURE METER.—No. 28,185. 19 (December 21, 1907.) The invention relates to means for enabling the exposure given to the plate to be correctly proportioned to the intensity of the light at the time of exposure, and also to the class of view or subject. The manner of carrying out the invention is as follows:—The sensitive material of an actinometer is exposed and the number of seconds noted that it takes to darken it to a standard tint. A speed regulator in connection with the shutter is then turned until the index points to a number of seconds taken

darken the sensitive material of the actinometer. After this an "iris" diaphragm pointer of the lens is turned until it is opposite the class of photographic subject it is required to take, which is indicated on the plate or table adjacent to the diaphragm. The release lever of the camera is then pressed, when it will be found at the photograph has been correctly exposed. It will thus be seen that no calculation is required to obtain accurate exposures for any given subject in accordance with the light prevailing at the time. It should, however, be understood that the sensitive material must be of sufficient degree of sensitiveness to obtain accurate results. William Booth, 160, Church Street, Eccles, Lancs.

CINEMATOGRAPH-PHONOGRAPH.—No. 22,415. 1908 (October 22, 1908). The claim is for the coupling, pneumatically and synchronically, of a cinematograph with a phonograph, by connecting the spindle of the cinematograph with an air pump or bellows, the air outlet of which is regulated by the phonograph through the intermediary of some electric, pneumatic, or mechanical device in such a manner that when the movements of the two apparatuses do not synchronise the bellows acts upon the cinematograph as a brake or as a motor to retard or to accelerate its working. The air outlet valve is in the form of a slide valve, or consists of two rotating members formed with apertures for the passage of the air, one is controlled directly by one of the apparatuses while the other is controlled by the other through the intermediary of some electric, pneumatic, or mechanical device. Casimir de Proszynski, 5, rue des Croisiers, Liège, Belgium.

CINEMATOGRAPH LANTERN.—No. 6,983. 1908 (March 30, 1908). The claim is for a lantern with hinged side and roof, so that both permit of full access to the interior of the lantern. George Robson, 1, Rochdale Road, Leyton, Essex.

WIRELESS TRANSMISSION OF PHOTOGRAPHS.—No. 11,446. 1908 (March 31, 1908). The claims are for a method for the wireless transmission to a distance of pictures, characterised by the fact that a pencil of luminous rays serves as the transmission between the transmitter and the receiver, its intensity varying in correspondence with the permeability to light of the different parts of the picture to be transmitted.

Means for carrying into practice the method comprise a transmitter wherein a pencil of luminous rays passes in succession through the several portions of the picture to be transmitted arranged upon a transparent drum and caused to move helically in front of the luminous pencil, which after traversing the picture falls upon a selenium cell inserted together with a source of electricity in the primary circuit of a transformer, the secondary circuit of which contains an arc lamp, fed with continuous current and arranged in the focus of a parabolic reflector, this lamp transmitting to the receiver a pencil of light corresponding in intensity to the fluctuations in the conductivity of the selenium cell, a receiver being also provided in which the variable pencil of light emitted by the transmitter is concentrated on a selenium cell by means of a parabolic reflector, this cell being arranged, together with a source of electricity, in the circuit of a mirror galvanometer, whose mirror fixed to the needle thereof sends a second pencil of light through a screen of a similarly graded permeability to light, which by its passage through the screen is concentrated upon a point of a sensitised film arranged on a drum which affects the same movement as the drum of the transmitter. Francesco de-Bernochi, 14, Piazza Gran Madre di Dio, Turin.

STEREOSCOPIC LENSES.—No. 10,700. 1908 (May 18, 1908). The invention relates to improvements in the apparatus forming the subject of Patent No. 27,644, of December 14, 1907. The improvements include:—

1st. The combination of two prisms (giving a total reflection), which can be rotated on themselves so as to vary the convergence of the apparatus with two other rotatable or non-rotatable prisms, the latter being carried by the plates, which also carry the objectives or lenses, which plates can be moved apart to displace the prisms and lenses simultaneously, and to permit the dimensions of the image to be varied, and the combination with the apparatus thus provided of a lens placed behind the prisms, uniting the two images and assuring the superposing of the images of points situated at different distances from the apparatus.

2nd. The use of prisms having curved faces, thereby eliminating reflection, and, provided that a suitable curvature is given to these faces, also permitting the lenses to be dispensed with.

3rd. The employment as the lenses of the apparatus of two semi-lenses, so placed that their straight edges are turned outwardly, the prisms then forming with them alone the whole optical arrangement. Luiz Augusto Teixeira de Aragao, 40, rue Peronnet, Neuilly sur Seine (Seine).

PRINTING APPARATUS.—No. 23,717. 1908 (November 5, 1908). The apparatus is for the preparation of negatives or printing surfaces, such as posters, etc., of such size that they have to be printed in sections. In order to produce satisfactory results it is necessary that the different sections should be enlarged in the same proportion, and that they should join without break, and when the design or picture is to be printed in several colours it is also necessary that the several printing surfaces for the separate colours should register exactly.

The apparatus comprises a photographic projecting device provided with suitable lenses and illuminating apparatus; a holder for the transparent negative or positive printing plate; two guiding means for the holder arranged in a plane at right angles to the optical axis and at right angles to each other; mechanisms for adjusting the holder on each of the guiding means and holding the parts in their adjusted position, whereby different portions of the printing plate can be successively placed in predetermined positions opposite the projecting device; and a holder for the sensitised surface, formed upon any suitable material; for instance, lithographic stone, zinc, aluminium, copper, or glass, which holder is mounted in two guiding means arranged in a plane transversely to the optical axis and at right angles to each other, and provided with mechanisms for adjusting the holder on each of the guiding means and holding the parts in their adjusted position, whereby different portions of the sensitised surface can be successively placed in predetermined positions for exposure to the projecting device. W. E. Lake, for William Carl Huebner, 39, Laurel Street; and George Bleistein, 197, Main Street, both of Buffalo, U.S.A.

The following complete specification, etc., is open to public inspection before acceptance under the Patents Act, 1901.

CAMERAS.—No. 28,448, 1908. Folding photographic cameras. Frennet.

New Trade Names:

VENTO.—No. 308,772. Photographic apparatus included in Class 8. Arthur Lewis Adams, trading as Adams and Co., 24, Charing Cross Road, London, W.C., manufacturer of photographic apparatus. December 11, 1908.

Analecta.

Extracts from our weekly and monthly contemporaries.

Comparisons of Colour Screen-Plates.

"R. C. B.," in an article on the "Omnicolore" plate and on a comparison of the various properties of colour plates, in "Photography and Focus" for January 26, proceeds:—"The most important question of all is that of the fidelity with which the different colours are reproduced, and here, for the present at all events, there can be no question whatever of the superiority of the Autochrome. I have exposed all three plates on the same subject under precisely the same conditions. Some colours are reproduced with the greatest fidelity by all three. Particularly does this seem to be the case with bright blue. Green, on the other hand, is very poorly reproduced, both by the Thames and by the Omnicolore. But for all-round truthfulness, the Autochrome, though not perfect, is easily first. Especially is this the case with the more subtle tones, which the Autochrome seems to yield so readily and so beautifully. Some allowances must be made for the fact that the newcomers are newcomers, but after making these and comparing them with the very first commercial Autochrome plates, it is seen that they are not so perfect a product."

New Books.

"Photographic Optics and Colour Photography." By Dr. G. Lindsay Johnson, M.A., M.D., B.S., F.R.C.S. London: Ward and Co. 7s. 6d. net.

It will be seen from the title that this is a rather ambitious work, while the sub-title, which adds "including the camera, kinematograph, optical lantern, and the theory and practice of image formation," suggests that the author has attempted to make 304 octavo pages contain rather more than can usefully be compressed into such a space. The book is well illustrated, some of the most interesting examples being Professor Dimmer's photograph of the fundus, and a three-colour photograph of an opal. The text portion is, however, too comprehensive and contains very many more or less serious errors. Some of these are doubtless clerical or printer's errors, though we feel that all cannot be thus described. Careless proof reading is no doubt responsible for the statement that Mr. J. H. Dallmeyer revised the section on telephoto lenses and for words such as "ortochrome" and "margin," but when the word "reversion" is consistently used in place of "reversal" we fear that no such excuse will hold good, though obviously the two words have quite different meanings. Some very remarkable statements are made here and there, as for instance, the one that "with few exceptions all the best reflex cameras are made by Kershaw, of Leeds, who holds the patent for the roller-blind shutter used in all of them." It is curious that this book should contain some of the same errors that we previously noted in our review of Lionel Lawrence's "General and Practical Optics." In both books the name "Unifocal" is used for "Unofocal," and both books contain a ridiculously erroneous description of the Adon lens. In Dr. Johnson's book the error is emphasised by an unfortunately detailed description which leaves no room for doubt as to the author's ignorance concerning this particular lens. We quote the paragraph: "If we turn the telephoto lens round so that the negative lens is in front, we have the condition of things found in the Adon lens. The two planes E_1 and E_2 will now be behind the combination." The planes referred to are the principal planes, and the whole arrangement is illustrated in Fig. 49. Further than this, calculations are given to show that E_1 is 10 in. and E_2 30 inches *behind* the lens.

Another very curious verbal error is the use of "astigmat" as descriptive of anastigmatic lenses. This is not a casual but a very consistent error, and apparently the author considers it the correct term. Many errors are no doubt due to careless writing, for the author must know that the method of finding the focal length given on page 83 is inaccurately described. So also is Grubb's method, for it is assumed that the sides of the camera baseboard are parallel, which they need not be. The method most strongly advocated is credited to Lionel Lawrence and involves taking the square root of a distance that cannot be accurately measured; this is a rather unsatisfactory feature. We are told that if the image moves when the lens is rotated about its node the centering is imperfect! Again, that if we reverse a plate in the dark slide halation is prevented! With regard to Autochromes we note that the author is still in doubt as to the effect of using the Lumière filter behind the lens, which subject we have referred to before in this journal, while he credits Mr. McIntosh with the suggestion that varnishing should be effected while the plate is rotating on a whirler! In another part of the book a mistake comparable with the "Adon" one occurs in connection with a comparison of the perspective of a photograph with that of vision. The relative sizes of two retinal images are compared with the measured sizes of two photographic images secured from the same standpoint, which comparison is stated to show "the immense advantage our eyes have over an ordinary camera as regards the distortion of comparatively near objects." This deduction shows little knowledge of the science of perspective. In a very remarkable passage the eye is described as being "at once an autochrome camera, a kinematograph, producing life-sized coloured pictures in motion, a photometer, a stereoscope, a range finder, a microscope, and an opera glass; while the whole apparatus is provided with a compound non-distorting rectilinear lens, working at $f/4$ or in some cases, $f/3$." . . . "Helmholtz could hardly have borne these

facts in mind. . . . But, then, Helmholtz was ever a physicist first, and only a physiologist afterwards." Poor Helmholtz!! In conclusion we must take serious exception to the statement that mixtures of magnesium with chlorate of potash or with perchlorate are "quite safe" or even "simple and harmless," and we must also draw attention to the much less important fact that the equation

does not equate. We feel tempted to apply the old quibble to the book, and to say that it contains good and also original matter, but this criticism might be too severe. Further research might reveal matter that is both good and original, but in any case it is evident that the author has attempted too much, and has been in far too great a hurry over it.

THE CATHEDRALS OF ENGLAND AND WALES.—Under this title Messrs. Gowans and Gray, Ltd., of 5, Robert Street, Adelphi, London, W.C., and 58, Cadogan Street, Glasgow, have issued two little booklets dealing respectively with the cathedrals in the northern and southern sections of England and Wales. These contain reproductions of some 120 photographs together with brief descriptive notes by Nugent M. Clougher, F.R.G.S., and which they are in no sense intended to act as "guides" will doubtless be of assistance to those who are only able to spend a very short time in the buildings to which they refer. They should also serve as a pleasant reminder to those who have been able to devote more time to their inspection.

AGENDA LUMIERE, 1909.—This yearly pocket-book of tables and formulæ, issued by MM. Lumière at Lyons, and by MM. Gautier Villars, Paris, at 1 franc, contains the revised instructions for the Autochrome process together with many useful facts and memoranda relating to the principal photographic processes.

New Apparatus, &c.

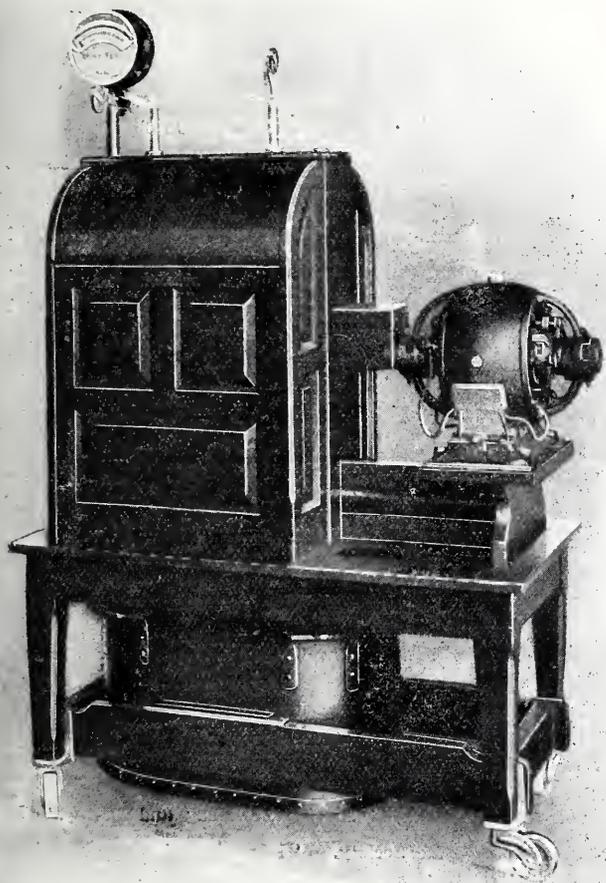

The "Aerograph" Stencilling Table and Outfit. Made by the Aerograph Company, Limited, 43, Holborn Viaduct, London, E.C.

We have recently inspected, at the factory of the Aerograph Company, a new installation, which has just been designed by them for the industrial application of the stencil method of air-brush decoration on a scale which may be as large or small as desired. Aerograph work, as employed in photographic working-up and colouring, is a craft which it would be superfluous for us to explain, but the many ways in which the Aerograph is used for industrial purposes, in conjunction with a stencil pattern or design, are, perhaps, not equally well known to those not immediately interested. The use of a stencil plate allows of a pattern being imprinted on a series of surfaces by means of the air-brush at a maximum of speed and the minimum of cost for labour. The method has been used by the Aerograph Company for such various purposes as wall-paper printing, pattern-colouring of fabrics, and the production of shop cards and window bills. And the stencil method, as we noted some months ago, has even been successfully embodied by them in a rotary machine. The new installation, however, is manufactured to enable the stencil air-brush work to be conveniently done for themselves by such trades as the printing, fancy stationery, and photographic-mount. A table measuring about 4ft. by 2ft. is provided with a glass hood, a fan in which supplies an exhaust draught which carries off quickly the spray from the Aerograph. Beneath the table-top is mounted a vertical framework, which passes through a slit in the table, and supports a pair of clamping bars in which a stencil of any size can be secured. By means of a foot-treadle, the stencil thus mounted can be instantly raised or lowered. The papers, cards, mounts, or what not to receive the design are registered in position by means of two lines of upright pins, which, in conjunction with the latitude in movement of the stencil itself, provide for any degree of adjustment. It is thus the work of a very few seconds to bring down the stencil, apply the colour from the aerograph, and raise the stencil. The coloured sheet is then picked off the pile by means of an exhaust tube, worked by the same pump which supplies the air pressure for the air-brush. By a precisely similar and equally rapid series of operations a set

plate is used in applying aerograph colouring round a disc or one to be left untouched, and the method thus gives the mounter and similar workers the opportunity to introduce two or more colours into a design at a very small cost. The whole installation, small as it is, is capable of dealing with large quantities of comparatively large work, and we should advise those who prefer to use individual methods in the preparation of their own mounts, as well as those who manufacture mounts for photographers, to avail themselves with the means provided by this latest introduction of the Aerograph Company.

"Snook" X-Ray Apparatus. Made by Newton and Co., 3, Fleet Street, London, E.C.

This apparatus, which is being manufactured by Messrs. Newton and Co. at their Hornsey Road works, represents the greatest recent innovation in radiographic practice, since it dispenses entirely with the action coil and allows of exposures which for the thick parts of the body are almost instantaneous, and this at a very much lesser percentage than can be done when a coil is used. The principle employed in the installation is the destruction of the back current in the tube, a better definition in the radiograph being thus obtained, and, at the same time, a longer life of the tube itself. The machine consists of a motor, which is driven from the ordinary continuous

current supply of the mains, and works in conjunction with a transformer supplying current of from 70,000 to 100,000 volts, the voltage being regulated by means of a resistance in the primary circuit. The secondary commutator or rectifier transmits this secondary current and affords a supply to the tube which is steady and free from reverse current. Messrs. Newton contrast the action of the "Snook" apparatus by comparing the current necessary to give, say, 60 milli-amperes through an X-ray tube of 3in. to 4in. spark-gap. In the case of a good coil a current of 60 to 70 amperes is required, working with a three-pole electrolytic brake, whereas the "Snook" installation will use about 25 amperes at 200 volts primary circuit. The installation has attracted a good deal of attention among radiographers, and has already been used in many leading hospitals. The cost of the complete outfit, arranged to work from any continuous current main, is £140.

New Materials, &c.

The Wratten Lantern Plate. Made by Wratten and Wainwright, Ltd., Croydon.

In this new introduction Messrs. Wratten and Wainwright have produced an altogether remarkable lantern plate, and one which we cannot but think marks a notable step forward in emulsion-making, the result, no doubt, of the research which the firm is constantly carrying out in its laboratory. We are naturally not in the firm's secrets as to the nature of the emulsion, but it is stated in the brief directions for the use of the plates that they are prepared without chloride, and it is therefore reasonable to assume that they will be found to possess the excellent keeping qualities of a bromide plate and thus to have at the start a point of advantage over transparency plates prepared partly or solely from silver chloride. However, this feature, advantageous as it may be from the manufacturer's or dealer's standpoint, is not our immediate interest: we are rather concerned with the working properties of the plates as we have received them.

The two distinct features of the new plates are their great clearness (freedom from veiling), and the extreme ease with which a fine series of warm tones may be obtained. It says something for the non-fogging propensities of the plate that all three of the developers recommended by the makers for the production of a black tone contain no added bromide. One of these developers is a 1:10 solution of rodinal, the second metol-hydroquinone, and the third pyrosoda. We give the formulæ below, and the lantern slide-maker will recognise that a plate which gives brilliant slides with such developers undoubtedly possesses exceptional qualities. That this is so is further proved by the fact that for the production of warm tones Messrs. Wratten employ small proportions of hypo in the developer, an addition which, with a plate of the usual type, would immediately lead to fog. The black tone, as we have said, is obtained by normal exposure in the usual way, using one or other of the developers given below. Employing the 1:10 rodinal, we found that development of two to three minutes gave us a slide of full density, of excellent transparency in the shadows, and of a long scale of gradation. The plates, too, fixed very quickly in about two minutes in a four-ounce-per-pint hypo bath. For the production of warmer tones, from warm-black to red, addition is made to the developer of a solution containing both ammonium bromide and ammonium carbonate, or of this solution together with a small proportion of 10 per cent. hypo solution. A greater degree of exposure is, of course, necessary to obtain the warm tones, and in the case of using the ammonium bromide and carbonate only a correspondingly prolonged time of development. The point of advantage, however, which we have found in our use of the plates is that it is very easy to judge the correct depth of the final tone. There is none of the considerable over-development which must usually be given in order to obtain a warm-toned slide of proper vigour. On the other hand, the slide, if anything, gains a little apparently on being fixed, but a still more pronounced advantage of the plates is discovered when using the developer containing bromide, carbonate and hypo, which gives, in a time of development very little in excess of that required for black tones, colours from rich brown to red. Here, again, there is no falling off in vigour when the plates are fixed, and there is no more difficulty in judging of the correct point at which to stop development than there is in making an ordinary black-toned slide. These facts, which our readers may put to the test themselves by taking advantage of the offer at present being made by Messrs. Wratten to send half a dozen of the plates on receipt of 3d. postage, speak for themselves as to the aid which the plates supply in the making of lantern slides which are not only first rate as regards brilliancy, but permit a range of colours which redeem the ordinary lantern-slide exhibition from monotony. It is not infrequently that we hear from readers who find it difficult to get made, in a commercial way, slides which are something better than and different from the ordinary black-toned slide of commerce made in the ordinary way with hydroquinone or pyro-ammonia development, yet the fact is not surprising when the difficulty of turning out warm-toned slides with certainty is considered, for many even of the best amateur slide-makers will confess to using several plates before they get the

desired result. We venture to suggest to those in a position to supply lantern slides in a commercial way that in the new Wratten plate they will find the means of catering for the requirements of the lantern-slide user who knows a good slide when he sees it, but has not always the patience or the leisure to make it for himself.

An idea of the speed of the plates will be obtained when we say that, using a fairly thin negative, but one not unduly so, we found that the makers' direction of 1 in. of magnesium ribbon at 3 ft. proved ample for a black-toned slide. This was equivalent, we found, to about 20 seconds at 1 ft. from a flat flame gas-burner, our ratio differing somewhat from the figure recommended by the makers, whilst we are inclined to think that the magnesium gave us a better result, particularly in the case of the longer exposure necessary for warm tones. The plates may be developed in the brightest yellow light, and, as we have said at the outset, nothing short of almost wicked treatment in development is able to fog them. The formulæ given by the makers for development are as follows:—

For black tones either of the following three developers is used:—

A 1.	Metol	44 grains.
	Hydroquinone	22 grains.
	Sodium sulphite (cryst.)	1 ounce.
	Sodium carbonate (cryst.)	1 ounce.
	Water	20 ounces.
or A 2. I.	Pyro	1 ounce.
	Sodium sulphite (cryst.)	6 ounces.
	Sulphuric acid	1 drachm.
	Water	20 ounces.
	II. Sodium carbonate (cryst.)	6 ounces.
	Water	20 ounces.
	(Equal parts of these solutions are used.)	
or A 3.	Rodinal	1 ounce.
	Water to make	10 ounces.

For the production of warm tones the following two solutions are required:—

B.	Ammonium bromide	1 ounce.
	Ammonium carbonate	1 ounce.
	Water	10 ounces.
C.	Hypo	1 ounce.
	Water	10 ounces.

For black tones use A only (normal exposure).

For warm-black use 1oz. A and $\frac{1}{2}$ dr. B ($1\frac{1}{2}$ normal exposure).

For sepia use 1oz. A and 1dr. B (2 normal exposure).

For brown use 1oz. A and $\frac{1}{2}$ dr. B (3 normal exposure); or 1oz. A, 1dr. B, and $\frac{1}{2}$ dr. C (3 normal exposure).

Further addition of C gives warmer browns. Further addition of B gives purples and reds. Fix and wash as usual.

BACKING PAPERS.—In reference to the query of a recent correspondent as to backing P.O.P. prints when squeegeeing, the Birmingham Photographic Co., Ltd., send us samples of the "Criterion" adhesive backing sheets manufactured by them at 5s. per quire of 20 by 26 sheets, and in packets of cut sizes. The paper is provided with a strong adhesive, and requires only a short soaking in water before being applied to the prints at the time of squeegeeing the latter.

CATALOGUES AND TRADE NOTICES.

SALE OF APPARATUS.—The City Sale and Exchange announce a large sale of second-hand apparatus at its depot in 81, Aldersgate Street, London, E.C. A thirty-two-page list, sent on application, gives particulars of the goods.

"FAULTS IN NEGATIVES."—The Imperial Dry Plate Company, Ltd., Cricklewood, London, N.W., have just issued a new booklet under this title for amateur photographers. It describes the mistakes which the beginner can make, and illustrates many of the defects thereby caused. The booklet runs to thirty pages, and is sent post free by the Imperial Company on application by postcard. The expenditure should save the tyro many an hour spent in puzzling over the (to him) inexplicable behaviour of a dry plate.

CATFORD AND FOREST HILL PHOTOGRAPHIC SOCIETY.—The Fourth Annual Exhibition of this society will be held on the 26th and 27th of March next. Entry forms and further particulars may be obtained from W. T. Browne, 169, Woolstone Road, Forest Hill.

Meetings of Societies.

MEETINGS OF SOCIETIES FOR NEXT WEEK.

FRIDAY, JANUARY 29.

Dundee Y.M.C.A. Photographic Society. French Lantern Pictures. A. I. Staley & Co.
Sutton Photographic Club. "Orthochromatic Plates and their Uses." A. I. Hoole.
Aberdeen Photo Art Club. "In the Land of Thule." John D. Stephen.
Bonnybridge Amateur Photographic Association. "On the Printing, Developing and Toning of Velox Papers." W. F. Slater.

MONDAY, FEBRUARY 1.

ROYAL PHOTOGRAPHIC SOCIETY.

MEETING held Tuesday, January 26, the president, Mr. J. C. S. Mummery, in the chair.

Mr. Chapman Jones read two papers, "On the determination of spectrum maxima and minima" and "On uniformity in spectroscopy for photographic purposes and a proposed form of instrument," in the first of which he dealt somewhat generally with the conditions of spectrographic photography, pointing out that inasmuch as there were many spectra and many variations of them due to the apparatus employed and the plates used, the records were necessarily comparative, and moreover were capable of further variation according to the method adopted for plotting or mapping

The particular final form, therefore, of a spectrum exposure is to be said to be an accident of circumstances. In the second part of his paper Mr. Chapman Jones discussed the form which a spectrographic camera should take in order to fit it most efficiently for the general purposes of the many photographic workers who desire to obtain for themselves, without undue expense, and with reasonable convenience, spectrographic records of filter absorptions, sensitiveness, etc. As far as possible the results of different exposures should be comparable, but the four factors of light-source apparatus, plate-sensitiveness, and method of plotting, gave an opportunity for spectrographic records to exhibit difficulties of comparison. The aim should therefore be to choose these conditions in such a way as to render comparison easy. As regards the light-source the lecturer thought that nothing could be done in the way of adopting a standard light, and that the only way was to describe the light employed as carefully as possible.

Coming to the spectrograph itself the balance of advantage lay, as he thought, with a grating instrument. For one thing the diffraction spectrum gave the red, green, and blue portions of the spectrum in approximately equal sections, and thus afforded an opportunity for comparison with the divisions of the spectrum by the three primary colour filters. The mechanical arrangement of the spectrograph which he had found to combine the maximum of efficiency with the maximum of simplicity consisted in a square of $3\frac{1}{2}$ inches internal width, or rather two tubes of this section at an angle of 18 deg. At one end was fixed the slit and at the other the dark-slide and focussing screen mounted in a sliding frame. At the angle of the two tubes the grating was mounted with a lens on each side of it. These three pieces were each mounted in a separate square frame, completely filling the tube, and at the latter, when the cover was on, might be placed in any position or pointed in any direction without disturbing the alignment of the system. In place of an adjustable slit he preferred a plate of fixed slits in a metal plate which was mounted to slide in the centre of the tube. Mr. Chapman Jones showed the results, as regards definition and length of spectrum, produced with this apparatus. Seven spectra were obtained on a quarter-plate camera running the $3\frac{1}{2}$ inch dimension of the plate and leaving a little space for the emulsion at each end. By means of several notches cut in the back of the camera it was easy to register on each plate exposure one or two prominent lines of the spectrum, and this made easier the reading of the results, and at the same time facilitated the registration of the apparatus. The results obtained with the narrower slits possessed such definition that on magnification of the diameters the division of the D and other lines was rendered very clear. C. E. K. Mees pointed out that although the grating spectrum showed a distribution of the three colours, red, green, and blue, about equal widths, yet the relative intensities which were visible by the dyes at present available for filters were actually very differently shown in the prismatic spectrum. This was due to the fact that while a red filter dye could be obtained which would pass about 80 per cent. of the red of the spectrum, the most available green dyes would pass only about 50 per cent., and the most available blue dyes less still. The prismatic spectrum roughly corresponded with these conditions. Where densities were to be measured Dr. Mees preferred a greater length of spectrum, and also thought that a spectrograph should provide means for measuring out spectra of the second order, the record of which on a quarter-plate occasionally led inexperienced workers to attribute the red-sensitiveness to the plates, the record being actually due to the blue of the second order spectrum.

C. P. Butler thought that no spectrograph which claimed to give standard measurements should contain glass in any part of the optical system, and for that reason the concave grating spectrograph was the perfect system, since the only source of error was the possible absorption of ultra-violet light by the silver film, and the latter source of error he thought was very minute. If cost was a consideration he thought that a concave grating spectrograph could be even cheaper than the instrument shown by Mr. Chapman Jones, and exposures might be made equally short. After some further discussion, in which Dr. S. E. Sheppard and Mr. E. J. Wall took part, Mr. Chapman Jones, in replying to questions, said that he was able to measure half-millimetre portions of the negative for density, and therefore, considered that a spectrum three inches in length was sufficiently long. He did not

consider that the absorption of some ultra-violet by the glass of the lens was of much importance, inasmuch as all photography had to be done with glass lenses. As regards the accuracy with which the fixed slits of his spectrographs could be made, those he showed he had made himself, and they were of the same width at the ends and in the middle when viewed with a one-inch microscopic objective. A vote of thanks to Mr. Chapman Jones brought the proceedings to a close.

CROYDON CAMERA CLUB.—The annual meeting was held on the 20th inst., and from the report and accounts submitted a very satisfactory state of things is apparent. The last exhibition was the most successful on record; the fixture list has been attractive and varied; the number of members is well above the average; and finally, instead of the deficit existing three years ago, a cash balance in hand of nearly £70. was announced. Mr. J. M. Sellors and Mr. H. M. Bennett were respectively and unanimously re-elected president and honorary secretary, with considerable acclamation. The president, on behalf of the members, then handed Mr. Bennett a handsome and weighty gold cigarette case, with a companion matchbox of the same metal. In making the presentation Mr. Sellors said that the present position of the club was almost entirely due to the unwearied work and conspicuous business ability of its honorary secretary, to whom they were under a deep debt of gratitude, a debt they could never hope to repay. It was, however, possible to record their appreciation of his personal qualities in tangible form, and the inscription engraved on the cigarette case, which read that it came "As a mark of affection and esteem," concisely and truly expressed the feeling of every member of the club. Mr. Bennett, in a few sincere words, thanked his fellow members for a memento which would always be greatly valued by him. The many real friendships he had formed more than compensated for the work which his position necessarily involved.

Commercial & Legal Intelligence.

CINEMATOGRAPH THEATRES.—The first ordinary general (statutory) meeting of Electric Theatres (1908), Ltd., was held at the "Theatre de Luxe" on January 19, Mr. Roland G. Hill presiding. The Chairman explained that the company was registered on September 16, 1908, to take over the business established by a smaller company, called "Electric Theatres, Ltd." The object of the company is to open and operate cinematograph theatres in populous districts, giving a continuous entertainment throughout the afternoon and evening, and charging at outlying theatres a uniformly low rate of admission of 3d. for adults and 2d. for children. The series of films which is repeated throughout the day and evening is entirely changed twice every week. Being extremely careful in the selection of sites, the results abundantly show that, besides an established patronage of regular customers at all our houses, the steady "drop in" from each crowded thoroughfare in which they are situated tends to aggregate a very substantial and astonishingly regular gross receipt week by week. When the business was taken over there were only two theatres running—one at Shepherd's Bush and the other at Walworth Road. Three more have been added—namely, at Deptford and Hammersmith, and the "Theatre de Luxe." The company is to open immediately two new theatres, one in Upper Street, Islington, and the other in North End Road, Waltham Green. They have also acquired the lease of the King's Hall, in Commercial Road East, and have settled terms for the lease of important premises at Tufnell Park, both of which houses they expect to have open during February. In addition, they have arranged for premises in Hackney, so that within the next six weeks they will have five new theatres, or ten in all. As they add to the houses, the ratio of net profit should be greater than at present, as the purchase price paid the old company remains the same, and standing expenses are distributed over a larger earning capacity. The company have arranged for the building of new theatres at North End, High Street, Croydon, and in the Broadway, West Ealing, both of which should be open in about three or four

months' time, and have various negotiations pending for other suitable properties.

NEW COMPANIES.

MAYBURY ROBINSON, LTD.—Capital £100, in £1 shares. Objects: To carry on the business of photographers, photographic material and implement dealers, chemical manufacturers, etc. Private company. Registered office, 71, Albany Road, Camberwell, S.E.

News and Notes.

AFFILIATION OF PHOTOGRAPHIC SOCIETIES.—A meeting of secretaries and "consuls" of affiliated societies was held at 66, Russell Square, on January 22, representatives of twenty-nine societies being present. From reports received it seemed that advantage was being taken of the interchange of lectures. A suggestion was made that questions arising out of these lectures should be forwarded to the author, through the acting secretary of the affiliation, and the replies brought forward at the next meeting of the society. The consular scheme has progressed so far that the majority of the consuls have districts allotted to them, and the compiling of suitable information is well in hand. [It would be interesting to hear what the authors of lectures think of the suggestion to convert them into perpetual information bureaux, and it would be equally interesting to know, not how many "consuls" have districts, but how many districts have "consuls," and what the latter are doing. The "consular" scheme of the affiliation, as we understand it, appears a peculiarly effective means of wasting the energy and ability of that body.—Eds. "B.J."]

THE DRESDEN EXHIBITION.—It is announced that there will be shown among the exhibits in the Swedish stand of the division—photography in the service of ethnography—the photographs taken by the explorer, Sven Hedin, on his latest voyage of discovery. In view of the great interest awakened throughout the world by the travels of Sven Hedin in the wilds of Thibet in provinces as yet entirely untouched by European civilisation, these photographs will prove of uncommon attraction in the widest circles. Scarcely inferior in interest will be the photographs taken on the Swedish Polar Expedition in the same division.

NORTH MIDDLESEX PHOTOGRAPHIC SOCIETY.—At the annual meeting of this society Mr. H. W. Fincham consented to continue as president in response to a unanimous vote, while Mr. W. G. Cauldwell retains the office of treasurer. A change of secretary, however, takes place, Mr. S. C. Puddy, who for some years has very efficiently discharged these duties, retires, being succeeded by Mr. Chas. A. Morgan, of 23, Nelson Road, Stroud Green.

TECHNICAL CHEMISTS interested, not in photography only, but in other branches of applied chemistry, will be grateful to us for reminding them of the very comprehensive index which the "Chemiker Zeitung" has just published to its "Repertorium," or abstract of current progress. The index runs to eighty pages, 13 x 12 inches, and supplies an exhaustive source of references to chemical matters of the year 1903. Section 32 is "Photo-chemistry and Photography."

PHOTOGRAPHS OF DEEP BORINGS.—Some years ago (writes a correspondent of the "Morning Post") the Hon. Charles Parsons calculated the cost of making a shaft ten or twelve miles deep in the earth's surface. A twelve-mile shaft would cost five million pounds and would take upwards of eighty years to make. As the probable temperature at this level would be considerably hotter than the boiling point of water and the shaft would have to be provided with air-locks and suitable cooling apparatus, it is not likely that Mr. Parsons exaggerated either the cost or the time to be spent in making it. But he thought it possible that the knowledge gained of the earth's strata by the construction and existence of such a shaft might be sufficient compensation. At present our knowledge is much more circumscribed, and the deepest boring known, which was made by the Austrian Government in Silesia, is only a mile and a quarter in depth. The information to be gained from borings is evidently limited in character; but an ingenious device has been invented in France to supplement it by means of photography.

M. Jean Flarin's instrument, described in the "Revue Scientifique," constructed of a brass box full of water, in which is suspended 1 means of rubber bands a small photographic apparatus of great simplicity. Beneath it is a magnetic needle and a phosphorescent disc. The disc is of calcium sulphide, which can be made to phosphoresce with a considerable degree of illumination for four or five hours by exposing it to a strong light. The box of photographic apparatus is then filled with water at the same temperature as that in the borehole. A final incision is made by the boring drill, as the photographic apparatus, with its luminous screen and its magnetic needle, are then carefully lowered to the correct spot, and a long-exposure photograph is taken, say, of twenty to thirty minutes. Thus both the direction of the compass needle and the marks made by the drill on the strata are photographed on the same plate, and when the photograph is developed the information thus disclosed reveals the exact dip and direction of the strata at the bottom of the borehole.

SOUTH LONDON PHOTOGRAPHIC SOCIETY.—Owing to special facilities which the council of the South London Art Gallery have offered to the above society in connection with their forthcoming exhibition we are asked to state that the latest date for receiving entry forms has been extended from January 30 to February 10, but all exhibitors must be delivered at the Gallery not later than February 12. The exhibition will open on February 20 and remain open for one month, lantern lectures being given on Monday, Thursday, and Saturday evenings. Entry forms may be obtained from the hon. sec., Mr. H. Creighton Beckett, 44, Edith Road, Peckham, S.E., who will be pleased to furnish full particulars on application. Arrangements have also been made whereby pictures entered for both the South London and Cripplegate exhibitions can be transferred to the latter free of cost to the exhibitor if so desired.

Correspondence.

* * We do not undertake responsibility for the opinions expressed by our correspondents.

* * Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.

AGREEMENTS WITH ASSISTANTS.

To the Editors.

Gentlemen,—I have read with interest the correspondence of "Agreements" in the last two numbers of the "B.J.," because myself, some years ago, had to sign one on entering my present situation. After arriving from my home some hundreds of miles away, I was informed I must sign an agreement. As I could not, for various reasons, afford to lose the berth, I did so. I now enclose a copy of it, and should be very glad of your advice on it. Would you consider it entails an undue restriction of trade, as the twenty miles radius mentioned includes several towns in which my employer has no business connection whatever. Also, can an employer fix a penalty of such severity as this—i.e., "£10 a week if the agreement is broken," and could he secure payment of such a sum? Also, seeing that I was under age at the time of signing (being only nineteen years of age), I am of opinion that it is not binding and of no use to my employer. Is this so?—Yours truly,
DEVONIAN.

Copy of Agreement.—I, A B, of —, —, hereby agree to engage in any photographic work, either for myself or any other persons, during my employment with C D, photographer, —, —, within a radius of twenty miles of —, and also for a period of five years after the termination of my employment with the said C D, under a penalty of the payment of ten pounds (£10) weekly to the said C D, so long as this agreement may remain broken.

[If our correspondent refers to the leading article on page 978, he will find a case quoted in which an agreement, signed by a minor, was held to be not binding, inasmuch as the defendant at the time was not of full age. This case seems to be very much on all fours with that of our correspondent.—Eds. "B.J."]

Answers to Correspondents.

All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY, 24, Wellington Street, Strand, London, W.C." Inattention to this ensures delay.

Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.

Communications relating to Advertisements and general business affairs should be addressed to MESSRS. HENRY GREENWOOD & Co., 24, Wellington Street, Strand, London, W.C.

For the convenience of Readers, our Publishers, MESSRS. HENRY GREENWOOD & COMPANY, of 24, Wellington Street, Strand, W.C., undertake the registration of copyright photographs at a charge of 1s. 7d. each photograph, to cover cost of registration fee, form, etc. Two unmounted copies of each photograph must be sent with the fee.

PHOTOGRAPH REGISTERED:—

Charles, 56, James Street, Cookstown, County Tyrone. Photograph of the Rev. P. Brennan, C.C.

S. F. S.—The discussion is still open, and it will be well that all sides should be heard. It would be impossible to frame an agreement that would be suitable for all cases, as so much must necessarily depend upon individual circumstances. What might be fair in one case might be just the reverse in another. However, we will keep your suggestion in mind when the controversy is decided.

PHOTOGRAPHING EMBROIDERY.—1. I enclose print of a table cloth which I have photographed. Would you kindly let me know what is wrong with it? It is taken with a — plate backed, in fairly good light. After developing it I find that the embroidery comes out very faint. Would it be due to the exposure or too much top light?—VINCENT CONWAY.

1. You can get greater contrast by using a plate of the "process" or "photo-mechanical" type, and developing fully. This will give greater prominence to the embroidery. It may be well, too, to lay the cloth on a grey or dark background, so as to throw up the pattern. 2. Mr. A. Mackie, 89, Albany Street, London, W.W.

BROMIDE ENLARGEMENTS.—I have a lot of enlargements which are too dark for my purpose. Some are mounted, some are unmounted. Could you kindly inform me how I could reduce them? It does not matter what colour they are when reduced.—A. LEYFORD.

About the best reducer is the (very poisonous) mixture made as follows:—A. Potass cyanide, 1 oz.; water, 10 oz. B. Potass iodide, 100 grs.; iodine, 40 grs.; water, 1 oz. Add 30 minims of B and 5 minims of A to 1 or 2 oz. of water. You can try applying this with a tuft of cotton wool to the mounted but previously moistened prints, but we think you will have to unmount these. In place of the above mixture a very weak (pale yellow) Farmer's reducer can be used, but it is apt to eat out the detail in the high-lights before it reduces the shadows.

INTENSIFYING NEGATIVES.—Some time ago I was at Tarragona, the vessel arrived one evening and left the next, so I had no choice as to days. I drove out to the Roman Aqueduct and took two photographs of it, but unfortunately it was a dull cloudy day so the negatives are flat and somewhat thin. Is there any intensifier that would increase the contrast? A mercuric one would be preferred as I print in platinotype.—J. E. G.

We should advise you to use the A formula of the chromium intensifier given on page 784 of the current "Almanac." It might be advisable first to clear the negative slightly in Farmer's reducer, but that we cannot advise with certainty as we do not know how the negative will stand it. If there is much veil or a high degree of density at present we should think it would be well.

PLATINOTYPE PRINTING.—Would you please recommend me to a book which explains thoroughly the process of platinotype printing? I am a platinotype printer to a firm here, and would like to know some information how first-class businesses work that process. Also,

I would like if you could give me any information about printing platinotypes by artificial light, either by recommending me to some book or through the medium of your paper.—GEO. T.

There is no book which tells more than is generally known of platinotype printing. As good as any of the books is "Platinotype Printing," by the late Horsley Hinton. (Hazell, Watson, Viney, Ltd., 1s.) Both arc light and mercury vapour are used for platinotype printing. You had better write the Platinotype Co. for advice as to these latter.

ACID FIXING BATH.—In fixing gaslight paper I make the following solution:—

Sulphite soda	2 oz.
Alum	1½ oz.
Acetic acid 33 per cent.	3 oz.
Water	20 oz.

This when mixed is perfectly clear. To my 40oz. fixing bath I add 3 oz. or 4 oz. of the acid sulphite solution. Now, this mixture will remain clear indefinitely if not used, but immediately I begin to place the developed prints in (after rinsing with acidulated water) the bath begins to cloud and precipitate sulphur. The cause, of course, is minute quantities of developer being carried into it. I find that a few drops of metol-hydro developer added to a little of the acid fixing bath will immediately precipitate sulphur. I have an idea that fixing in a sulphur-charged bath is not good for the prints, and should be glad if you would suggest a plan that the bath would stay clear till the end.—OTHELLO.

Your bath strikes us as being too acid. If you dissolve half an ounce of potash metabisulphite in every pint of fixing bath you will obtain a more reliable solution that will not precipitate. If only a few prints are to be treated, one-quarter ounce of the metabisulphite will do.

B.—We have written the firm in question, but must draw your attention to the caution frequently published as to sending prints to unknown firms.

E. D. LANE.—Nos. 4 and 5 are the best. Also "Practical Retouching," by Drinkwater, Butt.

TONING BROMIDE POSTCARDS.—Will you kindly let me know in "B.J." a good toning bath for postcard work bromides, as I am doing the P.O.P. cards at present, and they take too long in printing. So, to turn out my work quickly, I would prefer toning bromide postcards if I can get a nice dark tone, the same as P.O.P. cards; not a brown tone, as the sulphide toning bath. I want it for trade work, so as to turn out batches quickly.—J. BURNS.

The best toning bath we can suggest is the hypo-alum, which, with a suitable paper, will give purplish brown tones. Ensyna paper would appear to fulfil your requirements. See the article in our issue of December 11 last, or write to Messrs. Houghtons.

AUTOCHROME.—I would be greatly obliged if you could give me some idea where I am wrong in the enclosed Autochrome. It was a bright, clear transparency, the colours looking all perfect, until it went into the last two baths, H and I fixing. I do not know in which of the two the colours disappeared, as I did not look at it out of H bath, which only worked about 30sec. Is the permanganate a reducer? It was a plain solution, not acid, as per Lumière, the original formulæ.—AUTO.

There are two possible causes of your trouble, either the second development was not complete, or else the washing after the last permanganate bath was imperfect. The second development may be hindered by exposing the plate too much to light before applying the developer. This is a common source of trouble.

DAYLIGHT.—Because you were given special terms by the old firm, that does not necessarily bind the new one, and they have apparently charged their ordinary prices. In ordering the cards you should have stipulated that they should be at the same prices as you had been supplied by the old firm. If the work was bad you were justified in returning it and refusing to pay. If you are summoned in the county court you will have to prove that the work was not sufficiently good for you to accept it. That is a point the court will have to decide.

COPYRIGHT.—Over twelve months ago a certain Mr. — took a photograph of a group of school children and sold copies of same to the parents. One of these children has recently been murdered

and created a sale for cabinet photographs. As soon as the tragedy happened — is supposed to have copyrighted the negative. The parents asked us to do cabinets, and gave us the card they bought to reproduce from. — threatens legal proceedings. Are we safe in selling cabinets to those who require them?—W. C.

Certainly not. Evidently the photographer took the group "on his own," and therefore the copyright is his, even though he sold copies, and even though he has not registered until now. No one else has any right to copy the photograph.

SPECS.—For a general insight into ophthalmic optics we should recommend you to purchase a copy of "The Refraction of the Eye," by Hartridge; "An Optician's Manual," published by the Guttenberg Press; and a copy of "Elementary Optics," by Fergus, published by Blackie. As regards a wholesale house, we think that probably in starting you would obtain the best supplies from Messrs. Newbold and Bulford, of Goswell Road. These people make a specialty of provincial work, and we believe that all orders received in the morning are returned by them the same day.

COPYRIGHT.—Having long been a regular reader of your and other journals occasionally dealing with questions of copyright law as affecting photographers, I have formed the opinion that if a person is photographed in a public place or at a public function by a photographer who was not ordered to take the photograph, but is working for himself with the object of supplying newspapers with, or publishing, illustrations of public interest, the person so photographed cannot prevent or control in any way the publication of the photograph unless it shows him in a ridiculous position or in a way that would put ridicule or discredit upon him. (1) Am I right? To give a concrete instance: At a function a freelance press photographer takes a negative, prints from which he sends to various papers, some of which reproduce it. Subsequently (and in no way connected with the function) public interest is aroused in one person shown in the print, and the photographer, who has not parted with his right, again sends copies to papers, some of which again reproduce the whole, while some reproduce only that part depicting that one person. There is no question of ridicule. (2) Can this person object or make any claim against photographer or newspaper? The photographer then makes an arrangement with a picture-postcard firm, who extract from the print the portrait of the one person and sell as photo-postcards. (3) Can the person object or make any claim against photographer, publisher, or retailer?—NYHAB.

(1) You are perfectly right. (2) None whatever. (3) On copyright grounds none at all; only in common law on the ground of libel or slander. The photograph you send is perfectly inoffensive, and you need fear no action, we should say, as its publication is undoubtedly in the public interest.

REVERSING MIRROR.—I have a reversing mirror that I have repolished several times and made it look as good as when it was first silvered. The other day I attempted to do the same thing, but almost as soon as the polishing pad touched the surface the silver came off. That was not because the silver was worn out by repolishing, as it came off in flakes, showing there was a sufficiently thick film. Can you explain?—MIRROR.

The reason was that the mirror was damp. The silver is but loosely adherent to the glass when damp, and will readily come off if rubbed. Before a mirror is polished at this time of year it should be made thoroughly warm before the fire so as to completely free it from moisture.

COLOUR OF PRINT.—Will you please inform me by what process and on what paper I can get prints of the same colour and texture as the print enclosed herewith? I have tried several of the papers advertised in the "Journal" but can get nothing like it.—T. WILLS.

Prints exactly like the one sent can be obtained by the carbon process. That is the process by which that sent was produced. We know of no other that will yield a like result.

COPYRIGHT.—In the autumn I bought this business, vide the above heading, together with all the portrait and view negatives. Many of the latter my predecessor had registered the copyright in. Last week I found that a stationer in the town is publishing an album of local views, got up as a souvenir or present, and amongst them are a number the copyright in which is registered.

I have written the stationer demanding their immediate drawal and an apology, unless he is prepared to make terms with me. His reply is to the effect that he will do nothing of the kind and that I can have no copyright in my predecessor's work refers me to his solicitor. How shall I proceed?—INJURED.

If the copyright in the views that have been reproduced was duly assigned to you in writing, according to the Copyright Act, you can do nothing, as you have no copyright in the picture.

COLOURING GLASS POSITIVES.—I am taking glass positive and type pictures by the wet collodion process. I am told that at the time they were so much in vogue they were coloured. You tell me how they were done and where I can get the necessary colours for the purpose? I have tried water colour "photo tints," such as are used for paper pictures, but so far has been a miserable failure.—G. V. HUNT.

What was used for tinting glass positives was the same as is employed in the colouring of Daguerreotypes—namely, specially prepared powder colours. We are not sure they are to be had now. Possibly, however, Fallowfields may have them. Nevill Soho Square, at one time made a specialty of them, and they still stock them.

STAINED PRINTS.—Can you tell me the reason why the enclosed prints have gone to this colour in less than two months? They are on the ——— P.O.P., and were toned in a combined bath to a reddish brown tone. They were excellent when first done, and now look at them." Any explanation will be thankfully received.—T. KNOWLES.

It is very evident that the tones were obtained before the prints were completely fixed. This is a very common occurrence in the combined bath when the prints are only slightly toned. We do not advocate the use of the combined bath when the permanency of the pictures is a consideration. When prints are only slightly toned it is a good plan to fix them afterwards in a plain solution of hypo.

OPERATOR.—There is no trade union amongst photographic employers. One or two attempts have been made to form one, but without success.

A 1.—(1) If you can get the current from the main, whatever may be its price per unit, we think it will be more economical to purchase it than go to the cost of the installation of a gas engine and dynamo to generate it yourself. The necessary plant will be somewhat costly, and it will require attention when in use. (2) We should suggest that you do not buy a secondhand dynamo before having it thoroughly overhauled by an expert. Secondhand dynamos are often dear at any price. (3) The mercury-vapour lamp is only suitable for a continuous current.

SENIOR.—Of the two situations we should advise you to choose the one best from a business point of view, although with that you could not build a studio with a direct northern aspect. You do not seem to realise that the aspect of the studio is but of minor importance; it is the man who works it upon whom the quality of the work depends. We should not, for your purpose, recommend the studio to be less than 27ft. to 30ft. long, as it will be required principally for groups of several persons.

**** NOTICE TO ADVERTISERS.**—Blocks and copy are received subject to the approval of the Publishers, and advertisements are inserted absolutely without condition, expressed or implied, as to what appears in the text portion of the paper.

SUMMARY.

For the removal of stains caused by oxidation of developers Mr. E. Blake Smith has recommended a procedure in which the negative is first bleached, the stain then removed by acid permanganate solution, and the negative re-developed. (P. 100.)

Mr. Nevil Maskelyne has patented a method for the telegraphic transmission of photographs, in which the use of two instruments working in synchronism is dispensed with. The ordinary telegraphic process is used. (P. 106.)

Mr. Henry W. Bennett, in the current "Photographic Scraps," gives a formula for a combined bath, the results with which in the case of Ilford P.O.P. have been found by him to stand the test of time. (P. 104.)

Dr. W. Scheffer, in an article in Klimsch's "Jahrbuch," has pointed out the conditions for the maximum rendering of detail (resolving power) in photo-mechanical processes, such as half-tone photogravure. (P. 100.)

Under "Photo-Mechanical Notes" the claims of machine methods of etching are emphasised. Quite a number of machine etchers are in the market. (P. 105.)

The proper care of a mirror used for the making of reversed negatives in the camera is the subject of some notes on page 89.

When McIntosh gangs out Auto-chrome printing. (P. 104.)

"COLOUR PHOTOGRAPHY" SUPPLEMENT.

The properties of the newly-issued "Omnicolore" screen-plate Jouglé, Paris, are described in the results of measurements made by Dr. C. E. K. Mees and Dr. W. Scheffer. We reproduce photographs showing the structure of the plate and spectrum photographs showing the absorptions of the filter elements and the spectrum sensitiveness of the emulsion. (P. 9.)

The makers' instructions for the use of the "Omnicolore" plate are given on page 13.

The first part of the paper by Baron von Hübl on formulæ for the compensating filter to be used with the Autochrome plate particularly by artificial light appears on page 14.

The Royal Photographic Society on Tuesday evening last devoted itself to the discussion of the practical working of the Autochrome process. Most workers preferred to adhere to the Lumière instructions. (P. 16.)

Mr. B. J. Falk, the well-known New York professional photographer, is making a specialty of Autochrome portraits, which he takes by flashlight. (P. 16.)

EX CATHEDRA.

Detail in Reproductions.

The point made by Dr. Scheffer in the article from "Klimsch's Jahrbuch," of which a translation appears on another page, is of great importance to those interested in reproduction processes, and particularly in half-tone work. Dr. Scheffer shows that even in simple line reproduction it is impossible to preserve detail beyond a certain limit of reduction, and that when reproducing with the usual cross-line screen, this limit is very much sooner reached. He shows that, in order to get resolution at all, the size of the detail must be at least twice as large at the image plane as the screen period, i.e., the distance from a point on one screen-line to the same point on the next, and further, if it is desired to distinguish, for example, a circle from a similar-sized square, then the diameter of the circle must be at least ten times the length of the screen period. This information should be of the greatest use to the photo-engraver, because he could measure by the aid of a micrometer eyepiece in a microscope the size of any particular piece of detail in the picture to be reproduced, and say at once the limit of reduction it will bear with any given screen, or, on the other hand, the fineness of screen required for any given reduction. It would also enable one, when the fineness of the screen is known, by measuring the grain of the paper on which it is proposed to print, to say to what extent detail would be preserved or destroyed.

* * *

An Offer to Photographic Societies.

Our contemporary "American Photography," which unfolds between its covers "quite a few" of its former competitors, is a promoter of the interests of the American Lantern Slide Exchange, an organisation which is self-described in its name, and has run an active course for years past under the honorary management of Mr. F. C. Beach. Mr. Beach acquaints us with the desire of the Exchange to send to England a set of a hundred American slides in exchange for a similar set of English slides, each set to tour for a season in the country foreign to it, and to be returned within a year. The opportunity is one which one of the Federations, or several acting in concert, should be ready to embrace. In the North of England particularly they pride themselves on slide-making, and interchange should do good to both parties. The affiliation, federation, or individual secretary to whom this proposal is of interest should communicate direct with Mr. Beach at 361, Broadway, New York.

* * *

After-Treatment of Negative by Vapours.

In the course of some notes in the "Photographische Chronik," Herr Stolze claims several advantages for the use of vapour of ammonia in place of the ordinary weak solution of ammonia, as the darkening

agent in mercuric intensification. This he does on the ground that in the case of fuming the bleached negative the action is first quite superficial, and may be arrested at any point in its progress downward through the film; whereas in the case of a solution of ammonia or other darkening reagent penetration of the liquid right through the film takes place very quickly. It is therefore suggested that by the use of an ammonia fuming-box mercury intensification may be so conducted that a negative weak in the shadow details may have these missing portions brought up in harmony with the rest of the negative. The writer confesses that this practice necessitates leaving part of the mercurous chloride and silver chloride unaltered in the negative; but he sees no objection to this, although it is certain, we think, that the presence of these compounds cannot be conducive to permanency.

* * *

Dry Sulphide Toning.

The above mention of the use of ammonia vapour suggests a "dry" process which it has often occurred to us might be of practical value for the sulphide toning of bromide prints, not on a small scale, but in factories where prints are made by the mile on one or other of the rotary machines now largely used, chiefly for the production of postcards. The bromide image is very rapidly acted upon by all the free halogens, of which bromine vapour would be the most suitable for a dry process of toning. Without having tried the experiment—bromine vapour is not a pleasant body to employ under conditions where it can escape—we may assume that a bromide print will be very rapidly bleached in bromine vapour, and that the bleached image will be rapidly toned to the sulphide colour by exposure to an atmosphere of sulphuretted hydrogen. In solution we know this pair of substances to form a most excellent toning process, the only drawback to which is the irritating bromine fume. There need be no washing between bleaching; the sulphide destroys the bromine remaining in the print without forming any injurious products, and it is therefore conceivable that if suitable apparatus could be devised a bromine-sulphide dry-toning or wet-toning process could be made a workable accessory to the rotary developing and fixing plant. It would save the hand-toning of the separate sheets by the hypo-alum process, which was the original method of producing the commercial toned postcards, and is still, we believe, exclusively used by some firms.

* * *

Exposure and the Microscope.

The "Photographic Journal" for January contains a very interesting and useful paper by Mr. Duncan J. Reid on "Photography and the Microscope," which is devoted more particularly to the matter of calculating the correct exposure for photo-microscopic purposes. Naturally, the method is of limited application, for a general rule applicable in all cases is not possible. The author's method is for the particular conditions of axial illumination with the condenser at its critical focus, and it is one that should be easy to apply, for the only optical data required are the focal length of the objective, which is, of course, known; the magnifying power of the ocular, which is also known; and the diameter of the Ramsden circle, which is easily measured. From these data the numerical aperture is calculated. Knowing this and the total magnification, exposure is readily found with the aid of a table constructed according to information obtained as the result of a few trial exposures with some particular brand of plates, an average subject, and a standard light source. Incidentally, Mr. Reid gives some very useful tips with regard to apparatus and method of adjustment, and also a very clever explanation of numerical aperture, which is always a somewhat obscure matter to beginners with the

microscope. Among his diagrams, however, we see one taken from Sir A. E. Wright's "Principles of the Microscope," which is a striking example of a mistake that for years has been a common one in English text-books. This diagram (Fig. 11 in the paper) illustrates the Ramsden circle formed outside the eyepiece, as situated at the eye pupil of the observer, whereas it should be near the centre of the eyeball, and at the centre of rotation. If the circle is at the pupil only the centre of the field is visible and the margins of the field cannot be brought into view without moving the whole head. This is a very common error in books, and unfortunately it has often been perpetrated in instruments, some of which are so constructed as to prevent the Ramsden circle from reaching the proper place in the observer's eye.

* * *

Binocular Colour Photography.

A patent specification for "four-colour stereoscopic photography," which we printed in our issue of January 29, involves a somewhat curious condition that has been the source of many differences of opinion. The apparatus stereoscopic, one lens producing records of the blue and yellow, and the other the records of green and red. The same apparatus is afterwards used for viewing the result and the final effect, as regards colour, depends on the visual combination of the colours observed by different eyes; for example, purple will be formed by the fusion of a red image seen by one eye with a blue image seen by the other. The possibility of thus fusing two different colours has been often denied. Wheatstone denied it very emphatically, though many others have stated it to be the fact. Wheatstone states that if one eye studies a red disc and the other a blue one, then the object will appear alternately red and blue. In this he is correct, for the alternating effect is easily observed; but we believe he is altogether wrong in saying it will never appear violet. We have often made experiments on these lines, and our experience is that the disc is sometimes red, sometimes blue, and sometimes violet (or purple). It is difficult to fix the violet, and when fixed it is difficult to retain it. It is quite possible to produce it and to retain it, but the uncertainty of the result seems very unfavourable to the use of this stereoscopic method of colour combination in colour photography. Wheatstone's error is probably due to the use of a blue and yellow disc. He expected, of course erroneously, to see a green disc as the result of the combination. Naturally, only a grey one appeared, and it is not clear from his statements that he actually made the experiment at all with blue and red.

* * *

"Art" in the Nude.

It was from Germany that we imported what is called "Living Statuary," a form of music-hall entertainment that gave rise to many heated discussions in London and in the provinces. Since then Germany, which prides itself that in the advancement of its artistic ideas it has broken with all prudish conventions that only hindered its progress, has gone a stage further. In Berlin they now have what is termed "Beauty Performances," at which naked men and women dance on a stage. One wonders if in the course of time managers are to be allowed to also introduce the "Beauty Performances" into England! Be that as it may, the point we want to bring out is, that some photographers in Germany are taking a miserable advantage of this licence of the pornographic. An endless variety of illustrated publications devoted to "Nude Culture" are displayed in the booksellers' shops. They are professed photographic art studies, but our impression of the samples we have seen is that they are a disgrace to the photographers who took them and to photography. T

majority of them are the product of depraved vulgarity, which no one with any self-respect would look at, much less purchase. Of late the subject has gone too far even in advanced Germany, and an influential committee has petitioned the Prussian Parliament to take steps to prohibit such publications. One cannot help feeling keenly the injustice done to photography when it is employed to such base purposes, and in its interest, as well as in the interest of the public at large, the sooner these objectionable publications are made impossible the better.

REVERSING MIRRORS AND THEIR TREATMENT.

THE necessity for laterally reversed negatives—that is, negatives which are reversed as regards right and left—is evidently increasing, owing to the extending use of the different processes in which their employment is imperative. There are several ways of producing them, but in commercial work either a prism or a mirror is usually employed. Between these two, so far as results are concerned, there is not much to choose. The former, when of large size, is somewhat costly in comparison with the latter. A prism, with ordinary care, will last practically for ever, whereas the mirror will from time to time require to be re-silvered, and occasionally polished, as the surface, like all silver surfaces, is liable to tarnish on exposure to the atmosphere, more particularly in large towns, where the air generally contains impurities which act on the silver. However, with care a mirror will last a very long time, though it may frequently require a rub or two with the polishing pad. This is a very simple operation in the hands of those who understand it.

Last week we replied to a correspondent who told us that he had re-polished his mirror many times without mishap, but the other day, when repeating the operation, the silver all came off in flakes as soon as it was touched by the polishing pad. As not a few may now be experimenting with processes in which reversing mirrors are used, our correspondent's query suggests that it will be of service to say something on the subject.

The first thing for consideration is the glass itself. It is a mistake to suppose that, the glass of a reversing mirror being thick, it is merely a piece of ordinary plate glass, silvered on the surface. The glass of a mirror must be an optical plane, and as true as the flat surface of a lens. This condition is not found in ordinary plate glass, and it may here be mentioned that an imperfect mirror will completely upset the excellent quality of the most perfect lens. With a bad mirror a perfect lens at once becomes an inferior instrument. Supposing we have a perfect mirror, its quality may be, and often is, completely upset, though the cause is sometimes not suspected. Glass is not inflexible, and a mirror is easily bent sufficiently to quite destroy its excellence. A few years ago we were shown an expensive one of large size that had been supplied to a firm whose work required reversed negatives of the highest kind. When using this mirror, a sharp negative could not be got with a certain lens which, when used by itself, gave the finest possible definition. The cause, however, was not far to seek. The mirror was fitted in a heavy brass mount, and held in position by three set-screws. These were screwed tightly up, and as a consequence bent the glass so that it was no longer an optical flat. The screws were loosened so that the glass was quite free from pressure, and the image then obtained was as good as could possibly be desired. In an article in our last issue on the deterioration of photographic

lenses it was pointed out that if the cell of a lens became dented so that the glass was jammed, the excellence of the instrument was greatly impaired. The same thing holds good with mirrors, which must always be quite loose in their mounts.

The silver of a mirror, being a very thin coating on the outer surface of the glass, is liable, unless carefully handled, to get scratched. That is not of such serious import as many might surmise. The scratches will not affect the image any more than do scratches on lenses; all they do is to very slightly impair the brightness of the image, and therefore necessitate a corresponding slightly longer exposure of the negative in the camera. When out of actual use, the mirror should be protected from the air, as that quickly causes the silver to tarnish, particularly in such foggy weather as we have recently experienced in the metropolis; or in studios that are heated with gas or coke stoves, as the fumes given off from these latter have a very tarnishing action on silver. Most mirror-boxes, or cases, are fitted with a lid to protect it from the atmosphere and dust, and this should always be kept closed when not focussing or exposing a plate. With care in this direction, it is surprising how long a mirror will last without requiring to be re-polished. When a mirror is tarnished, the effect is that a longer exposure is required, as the image reflected by it is of a more or less yellow colour. Mirrors, when out of use, should be kept in a dry place, for if the silver film becomes damp it is but loosely adherent to the glass.

A few hints now about the polishing of mirrors, which is a more or less delicate work, and unless some little precaution be taken it may result in the destruction of the silvered surface. For the polishing, two, or better, three, polishing pads are required. A pad of this kind is merely a pledget of cotton wool tied up in fine chamois leather so as to form a soft pad. Some fine jeweller's rouge is required. This had best be obtained from such houses as supply watchmakers' and jewellers' requisites. That to be obtained at the oilshops should be avoided for our present purpose, as it usually contains such gritty matters as would quite ruin the silvered surface. The process is as follows: The mirror, and also the pads, must be perfectly dry, and it is a good plan at this time of the year to make the mirror quite warm a few minutes before polishing is commenced. Then, after removing all traces of dust with a flat camel-hair brush, a little of the rouge is dusted on, and one of the pads lightly rubbed over with a circular motion, until the tarnish is removed. The superfluous rouge is then shaken off. A little more rouge is then rubbed on one of the other pads; with this the surface is gone over very lightly, which will further enhance the polish. Finally, the third pad is used merely to remove any traces of the rouge that may remain. The pads had best be numbered Nos. 1, 2, and 3, and the first kept for the first removal of the tarnish, the second for the after-polishing, and the third for the finishing. The pads should be kept in a box, preferably a tin one, to protect them from dust, for it goes without saying that if a particle of grit is on either of the pads it would make scratches on the mirror. If kept in this way the same set of pads will serve for years; indeed, they seem after a time to improve by use as the rouge gets into the leather and so makes it a better polisher.

It was said above that a prism was more durable than a mirror, but the latter is equally so except that it will occasionally require re-silvering as the silver gets worn away with the polishing; but that is a trivial matter as compared with the first cost of a prism, particularly if it is one of large size. The price of large prisms is great; for instance, in a price list now before us one with five-inch surfaces is quoted at eighty pounds.

A NOTE ON THE REMOVAL OF RESINOUS DEVELOPER STAINS FROM NEGATIVES.

STAINS caused by the resinous oxidation products of the developing phenols can be removed, I find, by the following method, whether the stain be in the form of stain image or general stain. The negative is first soaked in water, and afterwards it is bleached completely in

Potassium bichromate	65 grs.
Conct. sulphuric acid	400 minims.
Common salt	1 oz.
Water	10 oz.

Next it is washed till no yellow colour shows, and then it is immersed for between five minutes and a quarter of an hour in

Potassium permanganate	6 grs.
Conct. sulphuric acid	30 minims.
Water	5 oz.

It is then washed in running water for two or three minutes, and then treated with

Sodium sulphite (cryst.)	6 grs.
Conct. sulphuric acid	8 minims.
Water	3 oz.

The potassium permanganate bleaches out the developer stain, but leaves in its place a manganese one, and this is removed by the sulphurous acid.

The negative is now washed for about ten minutes in running water, and then redeveloped. I recommend as a redeveloper:—

Metol	30 grs.
Sodium sulphite	90 grs.
Sodium carbonate	1 oz.
Water	10 oz.

The solution keeps well enough if stored in a bottle with a stopper greased with a little vaseline.

The exposure of the negative to the permanganate solution

should not exceed twenty minutes or so, as otherwise the film may suffer.

I believe this permanganate method is the first really satisfactory method proposed. I take it the permanganate removes the stain by oxidising it. Some years ago I proposed a solution of bleaching powder for the purpose of eliminating phenol-resin stains, but although the stains disappeared in the bleaching powder solution they were partially restored on redevelopment. Acid solutions of thiocarbamide have been proposed as eliminators of developer stains. These solutions do remove certain yellow stains from a negative, but the stains so removed are not developer stains at all. They are silver stains, or, in other words, dichroic fog. Acid thiocarbamide solutions remove these stains because they are (slow) solvents of silver, and will "reduce" away the whole of the silver image of a negative if they are given time enough to act, and will then show their efficiency (?) as developer-stain eliminators by leaving the stain image behind. A far better method than the use of thiocarbamide for removing silver stains was given in my recent article on silver intensification in this journal. Thiocarbamide is, as I have often pointed out, a most useful and hitherto quite inadequately appreciated chemical in the toning of bromide and P.O.P. prints, but it is, in my opinion, quite out of place as a stain-remover. The bichromate-chloride bleaching-bath is, as has been pointed out before, a real destroyer—probably oxidation again—of developer stains, but its action is only feeble in this respect compared with that of potassium permanganate. Mr. Chapman Jones long ago showed the futility of using merely acid solutions as a means of "clearing" away resinous developer stains.

R. E. BLAKE SMITH.

ON RESOLUTION IN THE HALF-TONE PROCESS.

[The following important paper on the possible definition of detail obtainable, not only in half-tone engraving, but by any photo-mechanical process, appears in the recently issued "Klimsch's Jahrbuch," published in this country by Messrs. Hunters, Limited. We have to thank Messrs. Klimsch for the loan of the blocks.—Eds. "B.J."]

THE following series of experiments was undertaken in order to ascertain the relation between the fineness of the ruling of a screen and that of the finest details which a particular screen is capable of "resolving"—that is, reproducing in facsimile. In order that the experiments may be better understood, some preliminary explanation should be given. The screens used had opaque and transparent lines of equal breadth. Designating, as is usual, the fineness of the screen by the number of lines per centimetre, one speaks thus of a 40, 60, or 80 line-screen, the reference being to the number of black lines per centimetre. It is better, however, in connection with the following experiments to employ the idea of the "period" of a screen as the measure of its fineness. Fig. 1 will make this clear without further explanation. As just mentioned, the screen consists of opaque and transparent lines of equal breadth. The smallest period here recurring thus consists of one black and one white line—that is to say, in Fig. 1 the portion marked as P is the period of the screen, and it is, of course, immaterial what point in the period is selected as that from which to reckon the measurement, provided that the same point in the succeeding period is taken as the end of the period. The length of the period is thus ascertained from the usual data. A screen of 80 lines per centimetre has 80 black and 80 transparent lines in this length. Its period is thus 10 mm. : 80 = .125 mm. The half-tone screen produces on the focussing screen or in the screen negative

a number of dots equal to a number of lines or periods. The distance apart of the centres of the dots is thus dependent upon the period of the screen and is equal to it. The size of the dots, on the other hand, depends on the exposure. The

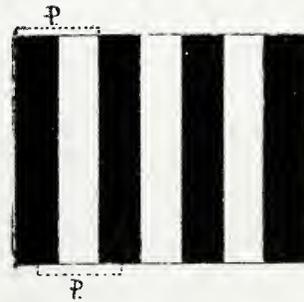

Fig. 1.

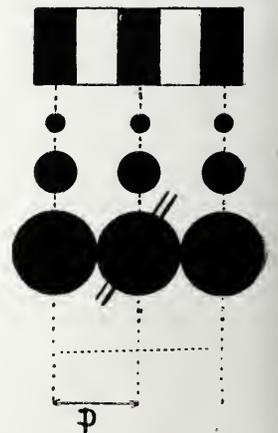

Fig. 2.

degrees of gradation of the image are the result of differences in the size of the dot throughout the image. Fig. 2 shows diagrammatically the relation of the dot to the screen. If we would produce a line system consisting of black and white lines with the screen represented in Fig. 2, or, to

clearer, by means of the maximum dot, we can only do so if we alternatively allow one screen dot to remain and remove the two. The finest detail reproduced with this screen must thus be twice the size of the screen period. Apparently the

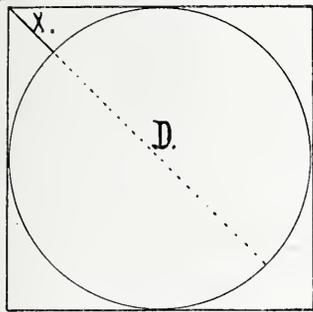

Fig. 3.

medium sized dots are capable of reproducing a line system in facsimile. This, therefore, is the "characteristic image" of the screen, and as such does not concern the question of resolution

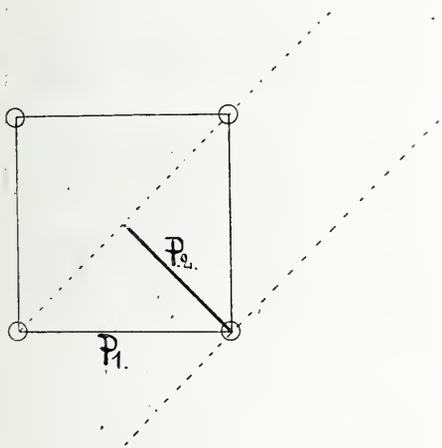

Fig. 4.

of the details. In Fig. 2 the screen period is marked P, the smallest period of image which is resolvable by this screen is marked B. The screen dot, which is dispensed with in

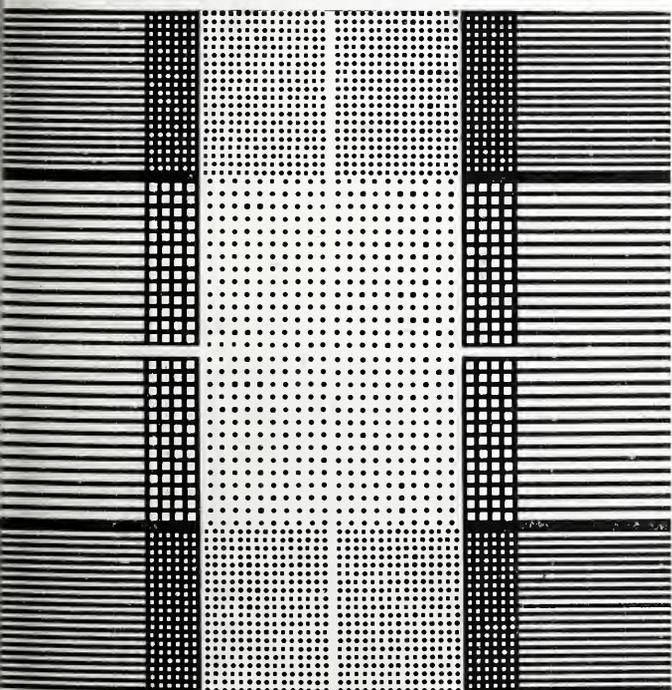

Fig. 5.

reproducing this image period, is shown with the two lines passing through it. In order to understand the following reproduction of the test chart we must further examine the conditions under which the screen is capable of reproducing squares and circles in

facsimile. Fig. 3 shows a circle of diameter D inscribed in a square, the side of which is also D. Obviously the screen must be capable of resolving the distance X (which must be of length 2P) in order that the disc and squares shall be distinguishable and their form separately recognisable.

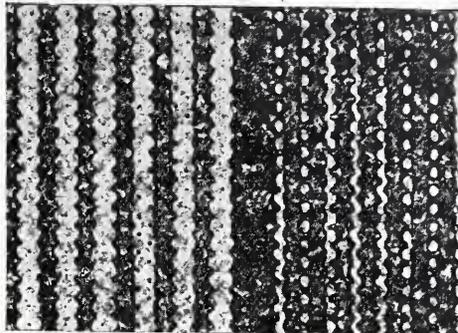

Fig. 6.

The distance X is equal to $\frac{D}{5}$, thus dots and squares must be distinguishable if their diameter and the length of their sides respectively are 10 times as great as the screen period. It is well known that the screen dots are obtained by laying two

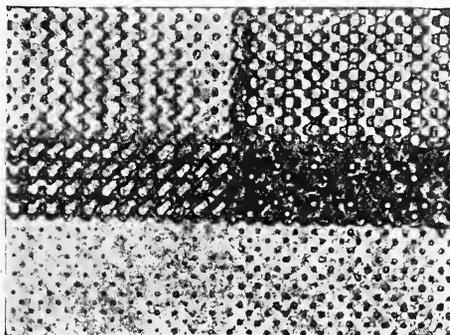

Fig. 7.

line-screens crosswise upon each other. In all the experiments here concerned the screens were crossed so that their lines formed right-angles. Clearly it is not quite immaterial how the line system to be resolved is placed in regard to the screen dots. We may define a screen-square as a square which is so formed that the centres are joined together by four neighbouring screen dots

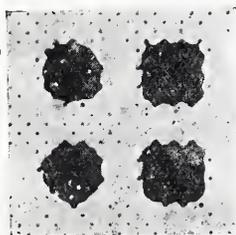

Fig 8

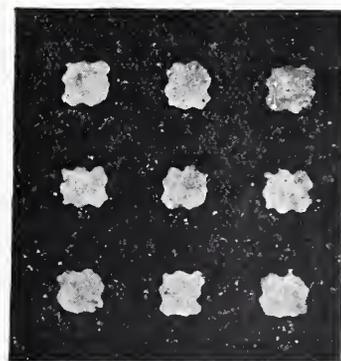

Fig. 9.

through straight lines. If the line system to be resolved runs parallel with the sides of these squares we may have to do with the screen period P_1 of Fig. 4. If however, the line system runs diagonally with the screen-squares the smaller screen period P_2 is the one necessary. The ratio of P_1 to P_2 is very simple—namely, $P_1 = P_2 \sqrt{2}$ P 14. We shall see in the following that this theoretical calculation corresponds completely with the facts. In the experiments a test chart was used as shown in Fig. 5. The breadth of the black lines, the length of side of the black squares, and the diameter of the black discs are equal

throughout the chart, and the different degrees of reduction were chosen to give exact multiples of millimetres. The enlargement of the image was so shown that in all the experiments the follow-

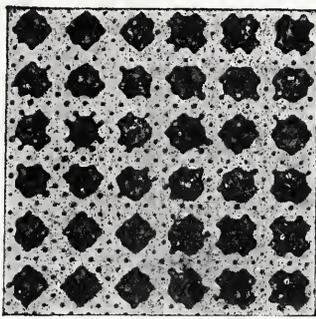

Fig. 10.

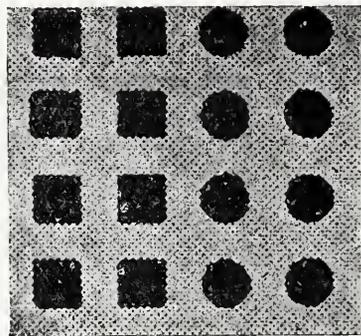

Fig. 11.

ing six enlarged dimensions of the image were employed. The breadth of one black line was—

	1	2	3	8	16	32
Breadth of line mm.	1	0.5	0.25	0.12	0.06	0.03
Length of period	2	1	0.5	0.25	0.12	0.06
	(3)	(1.5)	(0.7)	(0.35)	(0.10)	(0.09)

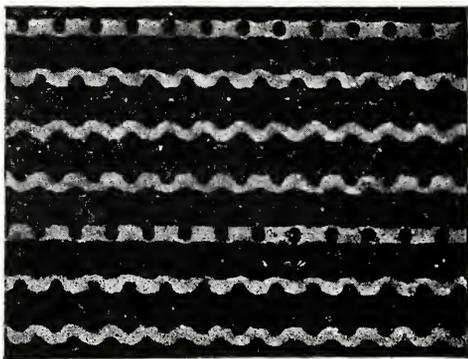

Fig. 12.

Two lengths of period occur in the test chart. In one the black elements and the interspaces are of the same size, the period in this part being thus double the width of the line. In other portions of the chart the interspace is double the breadth of the line, the period being thus three times the breadth of the line (bracketed numbers of the third row).

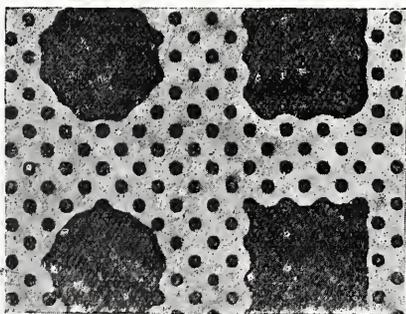

Fig. 13.

The first experiments were made with an 80 line-screen. The length of period of this screen is $P_1 = .125$ mm. $P_2 = .09$ mm. This screen would thus resolve for P_1 image period of .25 mm. : for P_2 image periods of .18 mm. Fig. 6 shows a photo-micrograph of a reproduction of the test chart on the scale of 1 : 8, and with the two periods of .25 and .35 length. According to this the periods of .25 mm. are just resolved. This corresponds completely with the above data, according to which there will be resolution of an image period which is double the size of the screen period—that is to say, an image period of twice .125. On the other half of the photo-micrograph there is the larger period which naturally is completely resolved. In Fig. 7 the scale of

reduction is 1-16th, and here in the left-hand upper portion can be seen the effect of the diagonal position referred to in Fig. 3. The fact that here a period of .18 mm. is resolved agrees with the assumptions made. The period of .12 is, of course,

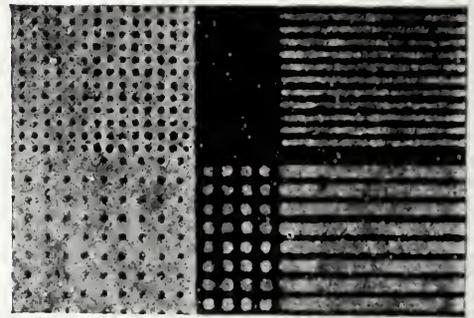

Fig. 14.

resolved. In Fig. 8 we have a position which shows two rows and two square dots. According to calculation (Fig. 3) the limit must lie exactly here, since Fig. 8 is a photo-micrograph

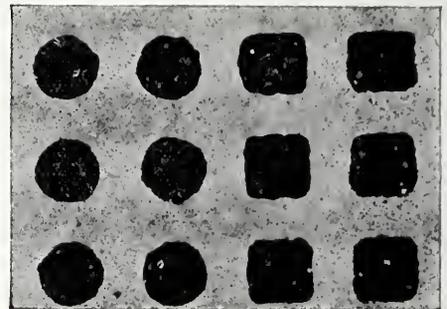

Fig. 15.

of a 1:2 reproduction of the test chart. The squares and dots are hardly to be distinguished, and their resolution is very defective. Fig. 9 shows white squares on a dark ground, the reduction

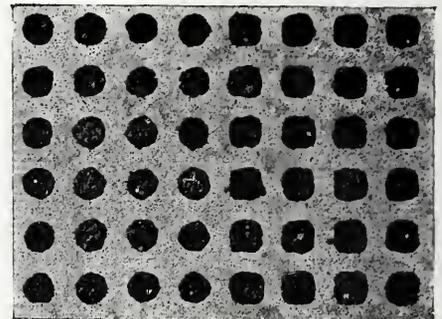

Fig. 16.

being again 1:2. These squares are even worse resolved than the black ones of Fig. 8, but the printing is partly responsible for this. Fig. 10 shows a 1:4 reproduction of the test chart

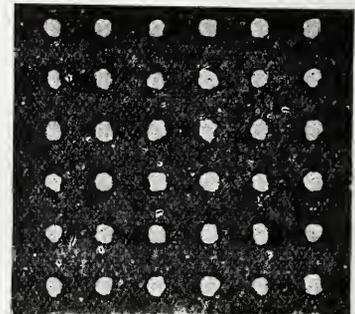

Fig. 17.

The three vertical rows of dots on the left should be discs, the squares on the right squares; but it will be seen that there is no evidence here of proper resolution. According to Fig. 3 the squares and discs should be completely resolved by the 80 line-screen if the

meter and length of side are equally 1 mm. This will be seen to be the case as shown in Fig. 11. All the photo-micrographs, nos. 6 to 11, are of reproductions with an 80 line-screen. Fig. 12 shows a reproduction with a 40 line-screen, and here lines and interspaces of equal width are again resolved on a 4 scale. Fig. 13 shows dots and squares on a 1:1 scale with 40 line-screen, but the resolution is defective; two corners of a square are fairly well resolved, but the two others are insuffi-

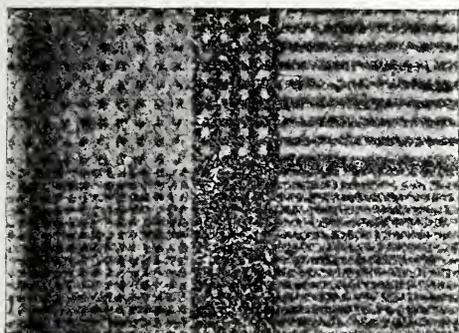

Fig. 18.

ciently so. Fig. 14 shows a line production of the test chart on a scale of 1:16; here the smallest periods are very well resolved, but the dots and circles cannot be distinguished. In this case the limit is reached not only through the appearance of the printing plate, but through the materials, paper, ink, etc., as well as the mechanical conditions of the printing; the dots and

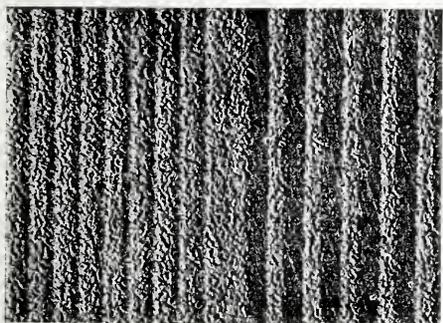

Fig. 19.

squares cannot be distinguished. The 80 line-screen used at 1:8 has resolved periods of lines and interspaces of equal breadth, and at 1:1 squares and dots are plainly distinguishable. The line reproduction resolves the corresponding periods at 1:16 and analogously the squares and discs at 1:2, as is shown in Fig. 15. Fig. 16 shows that at 1:4 the resolution of the squares and

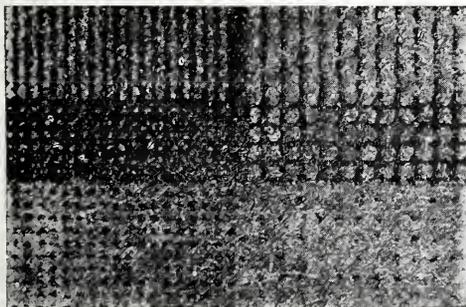

Fig. 20.

dots is quite imperfect. Fig. 17 shows white squares and discs reproduced in line at 1:4; but here again there is no difference to be seen between the discs and the squares. Fig. 18 shows the reproduction of the test chart by photogravure at 1:16; the finest periods are just resolved, and the photogravure plate in this case has been used just at the limit of resolution. If our assumptions as to resolution are correct, the grain of a photogravure plate must have a period of about .06 mm. Fig. 19 shows that this assumption is correct. The photo-

micrograph shows the grain of the photogravure plate in incident light. Numerous measurements showed that the period averaged about .07 mm.

In the case of almost all the reproductions it is noticed that the white elements of the image are represented somewhat too small and the black elements somewhat too large, which is to be explained by the reversal of the negative into a positive, which is repeatedly necessary in order to obtain the great reduction, as also to the intensification, etc., of the negatives of trans-

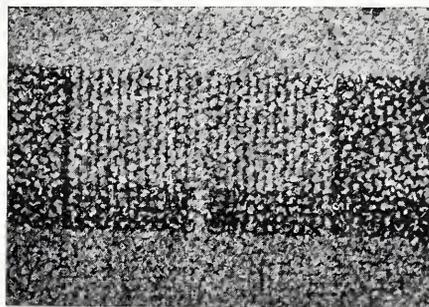

Fig. 21.

parencies. The experiments above described apply to one of the many properties of reproduction. Judging only from the results here obtained, no further conclusion may be drawn as to resolution in the respective processes, but one definite conclusion is possible. The test chart has proved itself of very great use. It is simple in design, and lends itself to quickly judging of the

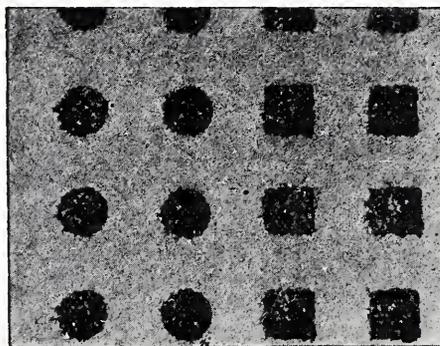

Fig. 22.

results obtained. It is, therefore, a pleasant duty to acknowledge the assistance thus rendered by Messrs. Klimsch and Co., of Frankfort-on-the-Maine, to whom the making of the chart and of the reproductions is due. The photo-micrographs were all made with the Zeiss photo-micrographic installation, using a "Planar" of 35 mm. focal length. The convenience of the instal-

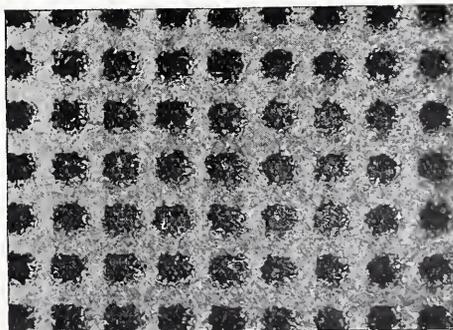

Fig. 23.

lation and the greater aperture of the "Planar" made it possible to carry out all the necessary work of the photo-micrography in a single morning. The results obtained have some importance chiefly for the half-tone process; but it is hoped that further researches may be made in other reproduction methods. With the exception of Fig. 11 all the photo-micrographs are of 25 diameters magnification. Fig. 11 is a 10-times magnification.

DR. W. SCHEFFER.

A COMBINED TONING AND FIXING BATH FOR ILFORD P.O.P.

(From "Photographic Scraps.")

ALTHOUGH many prints toned and fixed in the combined bath discolour and fade very quickly, and the fault is unquestionably in the bath used, any general condemnation of it is not justified. The condemnation should be applied to the particular bath, or to its condition at the time of using, and not to all forms of the combined bath under all circumstances.

The combined toning and fixing bath is capable of producing prints as permanent and as little liable to change in any way as any silver print can possibly be.

In order that prints toned and fixed at one operation may be thoroughly stable and show no tendency to deteriorate, it is essential that several conditions should be fulfilled. In using many of the commercial ready-made solutions, one or more of these conditions will not be satisfied, especially when a bath is used several times in succession. Prints that deteriorate quickly are the natural result.

The essential conditions are:—

1. That there should be enough gold in the solution, at the time of using, for the number of prints that it is required to tone.
2. That the bath should be sufficiently strong in hypo to fix the prints thoroughly by the time that the desired tone is reached.
3. That sufficient time should be allowed to ensure perfect fixation.
4. That the bath should be alkaline.

The most simple manner of ensuring the first requirement is to mix sufficient solution for the number of prints that it is desired to tone, and after using throw the solution away.

The practice of using the solution once only is very desirable for other reasons. A solution that is used many times in succession becomes contaminated and loaded with impurities; its composition is always a matter of extreme uncertainty. Its strength in any one constituent can never be known definitely, and its action is necessarily uncertain.

The combined bath here given is in every respect satisfactory with Ilford P.O.P., and yields very pleasing, rich, warm, purple tones. It is not, however equally satisfactory with all papers on the market. It has stood the test of several years' working in my own practice, and the prints produced by its aid have never shown the slightest tendency to deteriorate in any way.

Each constituent of the bath will keep in solution satisfactorily for a very long time; and if the following separate solutions are prepared, any desired quantity may be mixed in a few moments whenever required.

A—Hypo	1 lb.
Water, sufficient to make	32 ozs.
B—Ammonium Sulphocyanide	2 ozs.
Water to	8½ ozs.
C—Lead acetate	1 oz.
Water to make	8½ ozs.

The lead acetate should be dissolved in very hot water, as nearly boiling as possible. The solution will be cloudy, and it should be shaken up before measuring out any quantity required.

D—Gold Chloride	15 grains.
Water	3 ozs.
E—Strong Ammonia	3 drs.
Water	10 ozs.

To prepare the toning bath take three ounces of A and three drachms each of B, C, D, and E, and add sufficient water to make the total quantity up to ten ounces. This quantity of bath is sufficient for eight whole-plate prints; for fifteen half-plate; or for thirty-two quarter-plate.

It is very important that the solutions should be mixed in the order of the letters of the alphabet. The necessary quantity of A should be taken first; B added next, then C, and so on. After measuring C, the measure must be thoroughly rinsed before using it for D, and again thoroughly rinsed before measuring E.

The prints should be placed in the bath without previous washing, and they must receive constant attention and turning-over during the operation. It is absolutely essential that the solution should have free access to the surface of each print while the toning and fixing progresses.

The minimum time for the prints to remain in the bath should be

twelve minutes. This is most important to ensure perfect fixation and, consequently, stability.

Very deep printing is necessary for toning and fixing in this bath. For amateur workers or those whose silver printing is intermittent or for all who experience difficulty in obtaining uniform and good results by separate toning and fixing, this bath will be found a great boon. In addition, there is a marked saving of time by reason there being one operation only and no preliminary washing. The final washing is the same as the usual washing after fixing.

For several years I have used this method exclusively, and results have been all that could be desired. The tone is judged the prints lie in the solution, the final colour being that which they have at the time of being taken from the bath.

HENRY W. BENNETT, F.R.P.S.

THE R.P.S. CAROL

GOOD KING MCINTOSH.

Good King McIntosh arose
A gaping and a yawning,
Raised the blind, and with his nose
The window pane adorning,
Said "I canna well suppose
It will be wet this morning,
Squeezed inside a kilt and hose
I'll gang oot auto-chro-me-ing."

Striding down the Thames in style,
And nothing ever fearing,
Autochroming every mile
In spite of rustics jeering.
Now and then and once awhile,
A "drap o' somethin'" cheering
Broadened Mac's familiar smile,
And kept him from a wear-y-ing.

Thameshead down to Nore he went,
As gaily as on heather.
Kilt and plaid got sadly rent,
And roads were rough on leather.
Bonnet blew away in Kent,
In rather windy weather.
Cheery wire to home he sent:
"Me sporran holds to-geth-er-er."

When he'd lost his bonnet blue
A lens cap looked quite dandy;
When his kilt was torn quite through
The focus cloth was hardy.
When his shoes were lost to view
He picked out places sandy;
When his hose departed, too,
He rubbed his legs with bra-an-dy.

Back in Russell Square one day,
And in the best condition,
We found Mac in spirits gay,
For he'd fulfilled his mission
Worked at autochromes like play
(All with our kind permission);
Helped us once again to pay
For Annual Ex-hi-bi-tion.

NOTTINGHAM CAMERA CLUB.—The eighth annual exhibition will be held from March 17 to 20, in the Mechanics' Lecture Hall, when the awards will take the form of statuettes, eleven of which will be placed at the disposal of the judge, Mr. Furley Lewis, for award in the open classes. As previously announced, exhibits entered for the Birmingham Exhibition (February 22 to March 6) will be collected for Nottingham and thence forwarded to Sheffield (March 3 to April 4) free of charge to those exhibitors desirous of entering pictures for all three. Entry forms are now ready, and may be obtained, together with full particulars of reduced entry fees, etc. from the secretary, Mr. E. L. Kent, 3, Radcliffe Mount, West Bridgeford, Nottingham.

Photo-Mechanical Notes.

The Use of Etching Machines.

In the current number of the American "Engraving and Electro-typer" there are some disparaging comments on acid blast etching machines, it being stated that some newspaper plants in America unsuccessful with them. It is further stated that "the good thing machine is yet to come." The same remark could be made, in fact is made about the introduction of any new machine or process, but photo-engravers will be very unwise to neglect to utilise etching machines until they are absolutely perfect. There is no doubt that in capable hands any of the etching machines now on the market will do better work than the hand-rocked tubs, and in less time. Particularly is this the case with the Levy acid blast, the only thing against this machine being its high price. But all machines require not only absence of prejudice against them (which condition is not always fulfilled), but a determination to understand them thoroughly and to get the best results out of them.

Selective Mirrors.

The "Procédé" for December publishes the following note from F. Dogilbert, in order to reserve to him priority of the idea: "I am struck by the interest there would be in suppressing coloured aberrations, which introduce such a great number of aberrations in the images furnished by the most perfect lenses, I ask myself if it would be possible to realise simultaneously the selection and reversing of a mirror, on the surface of which would be deposited, for example, by electro-chemical means, a thin film of a metal or a transparent substance in a fashion to produce, thanks to the well-known properties of thin films, the absorption of any given spectral region."

Mezzochrome.

The new photogravure three-colour is perhaps a little disappointing when one expects so much from photogravure. The colours are as vigorous as they might be, and the register in some of the specimens shown is not quite perfect. Nevertheless, they are a triumph over what are produced, as is supposed, from copper rollers and printed by the rotary method at a very high speed. The chief advantage is the absence of glare which always accompanies typographic three-colour owing to the art papers on which it is printed. If the three-colour block maker wants to meet this competition he can only do so with success by the use of more pleasant papers. In other respects, probably he could hold his own with the new process, for though it might be thought that the photogravure method would give a greater depth of ink and therefore intensity of colour, this is particularly noticeable on the present specimens; and they could very well be equalled in this respect by three-colour blocks.

Exhibitions.

GLASGOW AND WEST OF SCOTLAND PHOTOGRAPHIC SOCIETY.

On the occasion of its twenty-fifth exhibition the Glasgow and West of Scotland Amateurs threw open their exhibition to non-member competitors, and set aside three classes for them; but still the members' class keeps on top with 109 entries, against the 90 entries in the open, but then in the open class the "pictures were selected by J. Craig Annan," so we know not how many were selected. This procedure is not usual in society exhibitions, but the tendency of it is to improve the quality of the exhibition, and when we see some of the work that finds a place on exhibition walls, the wish arises that the practice was more generally followed. This exhibition contains much good work, and the secretary with his selection of entries proves what a tower of strength he must be to the members, while the quality of the work shows that he is fully justified, as he is certainly willing, to help the younger members of the society. The open class occupies the small room, and the judges, Messrs. J. Craig Annan and R. M. G. Coventry, awarded plaques as follows:—"Across the Harbour" (191), James A. Angus, Glasgow; "Studiously Inclined" (206), Peter Orr, Govan; and "Childhood" (238), Mrs. James Risk, Castlecary. In the Autochrome (open) plaques are gained by "Portrait" (293), Victor L.

Alexander, Glasgow; "The Crying Girl" (copy of Greuze's painting) (301), Capt. W. J. Stomm, Harrow-on-the-Hill; and "Fruit" (304), E. L. Brown, Edinburgh. Lantern Slides (open), sets of four:—Plaques: 259, Thomas Carlyle, Paisley; 260, Capt. Stomm; and 265, James McKissack, Glasgow.

In the members' classes the awards are as follows:—Open to all Members:—Plaques: "Out in the Coming Storm" (2), A. J. Garwood; "Le Quai des Pêcheurs, Ostende" (3), Alex. G. Watson; "A Portrait Study" (5), John Currie; "The Hen Wife" (15), John McWilliam; "Mid-day Leisure" (24), Harry Thomson; "Eyemouth—Herring Smoking" (35), John Martin; "The Fishers' Harbour, Ostend" (41), James McKissack; "Winter Evening in Stratherrick" (96), W. R. Baxter. Honourable Mention: John A. Stewart and D. W. Macdonald.

Novice Class:—Plaques: "The Ferry" (131), John P. Copland; "The Shore Road" (147), Archibald N. White. Honourable Mention: William Baird, William R. Muir, and Peter W. Gibb.

1908 Outings:—Plaque: "Stirling Brig" (117), John Martin.

Autochromes:—Plaque: "Peacock Butterfly" (288g), Victor L. Alexander.

Lantern Slides:—Plaques: 268, A. J. Garwood; 272, W. R. Baxter; 279, James McKissack; 285, Arch. Watson.

Entertainments are provided in the evening during the course of the exhibition, which opened Feb. 2nd and closes 13th.

GLASGOW EASTERN AMATEURS' ASSOCIATION.

On Saturday, in their compact rooms in Landressy Street, "The Eastern" opened their annual members' exhibition. The Eastern believes in encouraging their own members in their exhibitions, presumably believing that they can see enough non-members' works at the other exhibitions in the district. The pictures are nicely displayed, and show much merit. Several of them, seen elsewhere, now announce where the artist got his encouragement. The mounting and framing are of a more than usual excellence, and show that much thought has been devoted to the "setting" of the picture.

A loan collection of six large pictures by Mr. F. J. Mortimer, London, lend a variety and massiveness to the exhibition, though they tend to dwarf the exhibits beside them.

Altogether the members are to be congratulated on their admirable little show.

The judges, Messrs. Dan Dunlop and G. L. A. Blair, made the following awards:—Landscape, etc.: 1, B. de Pellette; 2, Alex. Gault; 3, H. Collins; 4, Robert Richmond. Portraiture and Figure Studies: 1, James Hamilton (awarded plaque for best picture in the show); 2, Alex. Johnston. Outings: 1, Robert Richmond. Novice: 1, W. A. Arbuckle. Lantern Slides: 1, John Harvey; 2, Robert Richmond; 3, Archibald Campbell. Dr. Richmond's plaque for best gum print: R. de Pellette.

FORTHCOMING EXHIBITIONS.

February 1 to 13.—Glasgow and West of Scotland Amateur Photographic Association. Sec., James McKissack, 68, West Regent Street, Glasgow.

February 3 to 6.—Borough of Tynemouth Photographic Society. Sec., J. R. Johnston, 29, Drummond Terrace, North Shields.

February 8 to 13.—St. Helen's Camera Club. Sec., A. G. Else, Duke Street, St. Helen's, Lancs.

February 10 and 11.—Cowes Camera Club. Sec., E. E. Vincent, 4, High Street, Cowes.

February 10 to 13.—Cleveland Camera Club. Secs., F. W. Pearson and R. Walton, 39, Granville Road, Middlesbrough.

February 11 to 20.—Leicester and Leicestershire Photographic Society. Sec., Harry Cross, 80, Harrow Road, Leicester.

February 16 to 20.—Norwich and District Photographic Society. Sec., J. T. Tanner, The Lodge, Bowthorpe Road, Norwich.

February 20 to March 6.—Edinburgh Photographic Society. Entries close February 6. Exhibition Secs., Edinburgh Photographic Society, 38, Castle Street, Edinburgh.

February 20 to March 20.—South London Photographic Society. Entries close February 10. Sec., H. Crieghton Beckett, 44, Edith Road, Peckham, S.E.

February 22 to March 6.—Birmingham Photographic Society. En-

- tries close February 12. Sec., Lewis Lloyd, Church Road, Moseley, Birmingham.
- February 26 and 27.—Ilford Photographic Society. Entries close February 18. Sec., H. Eales, 53, Coventry Road, Ilford, Essex.
- March 11 to 13.—Coventry Photographic Club. Entries close March 5. Sec., W. R. Harris, 17, Allesley Old Road, Coventry.
- March 17 to 20.—Nottingham Camera Club. Entries close March 4. Sec., E. L. Kent, 3, Radcliffe Mount, West Bridgford, Notts.
- March 22 to 25.—Cripplegate Photographic Society. Sec., H. S. Cuming, 234, North End Road, Kensington, W.
- March 30 to April 3.—Sheffield Photographic Society. Entries close March 13. Sec., H. Merrill, 22, Harboard Road, Woodseats, Sheffield.
- March 31 and April 1.—Shropshire Camera Club. Entries close March 20. Sec., Harry W. Hughes, Kingsland, Shrewsbury.
- April 10 to 17.—Midlothian Photographic Association. Entries close March 31. Sec., B. Sherratt, 8, Castle Terrace, Edinburgh.
- April 29 to May 17.—Photo Club de Paris. Entries close March 15. Secretary General, Photo Club, 44, Rue des Mathurins, Paris.

Patent News.

Process patents—applications and specifications—are treated in Photo Mechanical Notes.

The following applications were made between January 18 and 23:—

- DEVELOPING DISH SUPPORT.**—No. 1,196. Improved means for adjustably supporting a developing dish or tray operated by clock-work mechanism for the purpose of washing plates or films and means for regulating the movement of said mechanism. Thomas Anthony Bowers and James Stanley Craik, 4, St. Ann's Square, Manchester.
- PLATES.**—No. 1,498. Improvements in photographic plates, films, papers, and the like. Henry Sonnenberg, 30, Church Street, Clapham Road, London.
- CHANGING BOXES.**—No. 1,545. Improved means in connection with boxes for photographic dry plates or films for the purpose of loading and unloading without the use of a dark-room. John Martin, 77, Chancery Lane, London.
- PLATE-HOLDER.**—No. 1,693. Appliance for holding photographic plates, papers, cards, or films for developing, fixing, toning, or washing purposes. George Trudgett, Thurston, Colchester Road, Leyton, London.
- FILTERS.**—No. 1,716. Process of manufacturing filters. Reinhold Suco, 31, Bedford Street, Strand, London.

COMPLETE SPECIFICATIONS ACCEPTED.

These specifications are obtainable, price 5d. each, post free, from the Patent Office, 25, Southampton Buildings, Chancery Lane, London, W.C.

The date in brackets is that of application in this country; or abroad, in the case of patents granted under the International Convention

TELEGRAPHIC TRANSMISSION OF PHOTOGRAPHS.—No. 658, 1908 (January 10, 1908). The invention consists essentially in a method by which the lines or tints of a picture may be translated into ordinary telegraphic signals which, having been transmitted in the ordinary way, are re-translated into the original design.

In former methods of pictorial telegraphy, the various tone values of the component dots have been telegraphed by producing equivalent variations in the transmitting current. The actual record in such cases is obtained by causing the current variations to control the intensity of a light, acting upon a photographic plate or film, at successive spots. Thus, since the transmitting and recording of the necessary impressions must occur simultaneously, the speed of transmission is limited by the comparatively slow rate at which successive photographic exposures can be made, with adequate control.

According to the present invention, all electrical and optical devices other than those ordinarily used in telegraphy and photography are dispensed with. The conversion of tone values into telegraphic

signals, and the reconversion of the latter into tone values, is done by simple mechanical means. And, at the same time, the actual transmission is effected with the greatest possible rapidity.

There is first made a photographic enlargement of the picture to be telegraphed, the magnification being twenty diameters if the picture is small. Upon this enlarged picture is laid a transparent sheet of tissue, divided by horizontal and vertical lines into squares, say, one-quarter of an inch square. This being done, it becomes evident that, to all intents and purposes, the small portion of picture enclosed by any one of the subdividing squares constitutes an evenly tinted surface. Further, it is seen that, from the deepest black of the picture to the purest white of the paper, the recognisable degrees of tint are certainly not more than six in number. If, therefore, we take the square subdivisions in regular succession, from left to right and line after line, marking upon each numerical value of the tint within it, we obtain a series of values which may be telegraphed to any distant point, and there be reproduced with certainty. All that is really necessary for the fulfilment of this purpose may be summed up as follows:—

First, the successive tints must be gauged with some degree of accuracy.

Secondly, the end of each line of tints, from right to left or from top to bottom as the case may be, must be clearly indicated.

Thirdly, the six telegraphic signals, which respectively correspond to the six tints recognised in the picture, must be sufficiently definite and concise to ensure both speed and reliability of transmission.

Those requirements being fulfilled, the telegraphic reproduction of any picture can present no difficulty.

For judging the tints in the original enlargements, standard tints for comparison may be employed.

If the picture to be transmitted is rectangular in shape, a successive line of squares will be of uniform length, and no possible mistake can arise in this respect. If, however, the margin is curved or irregular, a straight line must be drawn at the top from which the reckoning is made. Then, at the beginning of each row of squares, the number of blank spaces between the straight line and the true margin of the picture must be denoted; and, at the end of each line, some definite sign must be given. The "D Q" signal (— . . . —) will serve the purpose quite well.

To insure accuracy of transmission, it may be found advisable in practice to let each tint be represented by a sign of the signals, thus:—

. — —	(W)	=	White
. . .	(S)	=	Slight tint.
— . .	(G)	=	Grey.
— . .	(D)	=	Dark grey.
. . —	(U)	=	Ultra-grey.
. — .	(R)	=	Darkest tint.

Considering now the reconstruction of the picture at the receiving station, it is best to employ some form of typographic process capable of reproducing, at will, each of the standard tints, arranged in proper sequence.

Using this method we construct type, the faces of which are respectively fashioned so as to give impressions corresponding to the six standard tints already described. This may readily be done by forming the type-faces into lines varying in number and thickness according to the shade desired or by forming the type faces so as to produce various sizes of dots. Such type may be produced in quantities and set up in the ordinary manner, or, if preferred, they may be attached to a simple form of typewriter, and operated by the usual finger-keys. In either case, they are caused to produce regularly spaced and properly arranged impressions, corresponding to the variously tinted divisions of the original picture. These printed tints need not be upon so large a scale as the squares upon the magnified picture, or the like, used at the transmitting station. Type faces one-eighth of an inch square are large enough.

The successive tints having been thus reproduced, either by printing or type-writing, the result is a coarse reproduction of the original picture. In this state, the impression resembles an enlargement made from an ordinary half-tone printing block. All that now remains is to make a photographic reduction to the original dimensions, and the final result will resemble an ordinary half-tone picture.

This invention comprises advantages of a practical character, the importance of which is considerable. The fact that the actual process of reproduction is independent of the actual transmission provides facilities otherwise unobtainable. The telegraphic portion of the work may be done at the highest speed. The mechanical operations may be carried out at leisure. The transmission of a pictorial image will not unduly occupy the line of communication, and therefore the reproduction of that image need not be unduly hurried. With ordinary care, the results produced must be entirely reliable; and, above all, technical difficulties of every kind are absolutely removed. The only facilities and technical qualifications essential to success are those commonly available in the practice of telegraphy and photography. The Amalgamated Radio-Telegraph Company, Limited, 601, Salisbury House, London Wall, E.C., and Nevil Maskelyne, of St. George's Hall, Langham Place, London, W.

New Trade Names

...s.—No. 307,781. Chemical substances used in photography, photographic plates, and sensitised films. Eugen Albert, trading as Dr. E. Albert and Co., Schwabingerlandstrasse, 55, Munich, Germany, manufacturer of photographic materials. November 9, 1908.

...DERATION.—No. 309,126. Chemical substances used in manufactures, photography, or philosophical research, and anti-corrosives. Co-operative Wholesale Society, Ltd., 1, Balloon Street, Manchester, wholesale dealers and manufacturers. December 24, 1908.

...EROLETTE.—No. 309,015. Photographic apparatus included in Class 8. W. Butcher and Sons, Ltd., Camera House, Farringdon Avenue, London, E.C., photographic apparatus manufacturers. December 19, 1908.

Analecta.

Extracts from our weekly and monthly contemporaries.

Green Tones on Bromide and Gaslight Papers.

Mr. C. Winthrop Somerville, in an article on obtaining various tones on bromide and gaslight papers, in "The Amateur Photographer and Photographic News" for February 2, gives the following formula for green tones:—

Ferric chloride	1 gr.
Oxalic acid (saturated solution)	60 minims.
Vanadium chloride (pure)	2 grs.
Nitric acid	5 minims.
Water to make	½ oz.

then add, stirring the while—

Potassium ferricyanide	1 gr.
Water to make	½ oz.

...one from one to two minutes; the longer the immersion the lighter the green. Wash ten minutes and immerse in hypo bath of—

Hypo	2 ozs.
Boric acid	200 grs.
Water	10 ozs.

Reducing the Density of Negatives,

Mr. R. E. Blake Smith, in some notes on reducing the density of negatives, in "Photography and Focus" for February 2, says:—The negative to be reduced is first well soaked in water. It is then bleached. I recommend the bichromate-chloride bleaching solution I have often described in "Photography."

Potassium bichromate	65 grs.
Concentrated sulphuric acid	400 minims.
Common salt	1 oz.
Water to	10 ozs.

This bath is not used as it stands here, but half an ounce is taken and added to one and a half or two ounces of water. Into this diluted bleaching solution the negative is put, and the progress of the bleaching operation is carefully watched, chiefly by looking at the back of the negative. When the lighter parts have been eliminated completely it will be found that a lot of unchanged silver remains in the darker ones. When the darker parts have been

sufficiently bleached—the degree, of course, depending on the special circumstances of the particular negative—the plate is taken out of the solution and washed.

After washing is complete the remaining silver can be removed by a suitable reducing solution—i.e., one which dissolves silver without reducing silver chloride. Howard Farmer's reducer, of course, will not do. I advise:

Potassium permanganate	4 grs.
Concentrated sulphuric acid	30 minims.
Water	5 ozs.

Or—

Basic ceric sulphate	30 grs.
Concentrated sulphuric acid	45 minims.
Water	5 ozs.

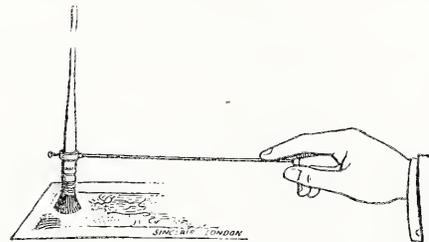

The action of both these solutions is very quick, and a few minutes' treatment only is required. . . . After all the remaining silver has been dissolved out the negative is again washed, and then redeveloped.

I know of no better redeveloper than:

Metol	15 grs.
Sodium sulphite (cryst.)	45 grs.
Sodium carbonate (cryst.)	½ oz.
Water	5 ozs.

New Apparatus, &c.

AN ADJUSTABLE HOPPER FOR "OIL" PIGMENTING.—Messrs James A. Sinclair and Co., Ltd., 54, Haymarket, London, S.W. have introduced a little accessory which will be welcomed by workers of the "oil" and "bromoil" process. It is a holder, in which any pigmenting brush, from No. 1 to No. 10, can be held when using it for the "hopping touch" on a print. The drawing clearly shows how the "hopper" is used. Any brush can be quickly adjusted into position, the handle fits nicely in the palm of

the hand, and by resting the forefinger along the wire any amount of spring may be obtained. The price is one shilling.

It should be mentioned that the four-page price list of Messrs. Sinclair describes all the necessary materials and accessories for the "oil" processes, and has proved its usefulness to those working the process by running three times out of print since its recent first issue.

New Materials, &c.

Ivoryine. Sold by Greenberg and Sons, Water Lane, Ludgate Hill, London, E.C.

Messrs. Greenberg and Sons have been good enough to send us a sample of a new material for photographic purposes, which they have just put on the market, called "Ivoryine." It is a compound with a very even matt surface, and is a very good imitation of real ivory without the grain of the latter. It has about the same flexibility as thin ivory, and about the thickness of an ordinary visiting card, so that pictures upon it require no mounting. Carbon prints can be simply developed upon it direct, without any preparation, the same as if it were matt opal glass or single transfer paper. The pictures are very effective, and also show well as transparencies. Here we have a material the use of which in carbon printing is simplicity itself, while the results are extremely pleasing. It is mentioned that the ivoryine may be used for any process in photographic printing. If, however, it is employed in silver printing it must, obviously, be coated with an emulsion such as a bromide or

chloride one. We should advise those of our readers who are on the look-out for novelties to obtain a sample of ivory. Its price is very moderate, being, for quarter-plate 2s. per dozen, half-plate, 3s. 6d. per dozen, and whole-plate 7s. 6d. per dozen.

"Royal and Rough Velox." Sold by Kodak, Ltd., Clerkenwell Road, London, E.C., and John J. Griffin and Sons, Kingsway, London, W.C.

In these two additions to the already numerous varieties of Velox paper the user of Velox is provided with the means of producing prints of "broad" quality, such as is common among bromide papers, and is, therefore, particularly useful for printing in Velox from large negatives. However, even for quite small work the texture of the new papers is by no means so pronounced as to unfit it for ordinary work; indeed, the agreeable surface will be infinitely preferred by many to that of a semi-matt or semi-glossy paper. The "Royal" is a paper of cream tint, and gives very harmonious results of great richness in the shadows and brilliance in the high lights. The "Rough Velox" is on a white paper, and gave us prints of very fine black colour. Both papers are of the "Special" order—that is, give soft results, and are several times faster than the "Vigorous" brands of Velox. In conjunction with the use of Velox of all grades, the vendors have issued an illustrated leaflet entitled "Border Printing on Velox Gaslight Paper," in which are described and shown the pleasing effects of border printing obtainable by very simple means. This leaflet will be sent post free on application, and will most certainly interest amateur users of the paper.

Commercial & Legal Intelligence

A MANCHESTER BANKRUPTCY.—At the Manchester County Court last week, in reference to the affairs of Max Muenzer, already reported in the "B.J." for Nov. 27, 1908,

Mr. Wise, barrister, made an interesting application to his Honour Judge Parry. Mr. Wise appeared for the trustees under the bankruptcy of Max Muenzer, engaged in the photo-enlargement business, in Chester Road, Manchester.

Counsel stated that his application was that a motion on behalf of the trustees should be heard by his Honour on an earlier date than March 13, the circumstances, it was alleged, being exceptional. Mr. Muenzer, said counsel, shortly before bankruptcy, appeared to have assigned the whole of his estate, which was of the value of £5,000, to a limited company, of which there were no other shareholders than the signatories to the articles of association, and of which, it was alleged, Mr. Muenzer had appointed himself managing director at a salary of £1,500 a year. No payments were made.

His Honour: Your application is on the ground that it is a fraudulent assignment?

Mr. Wise: Yes, sir.

Counsel further said that Mr. Muenzer had the assets of the company in his own hands, and it was very urgent that the motion to come before his Honour should be heard at the earliest moment.

His Honour: You say it is a one man company?

Mr. Wise: Yes. They have not even issued the seven shares. He refuses all information as to the affairs of the company, and we cannot get hold of any assets.

Mr. Wise added that a meeting of creditors was held at the Official Receiver's offices, at which these proceedings were sanctioned. Mr. Muenzer was present, and though he was asked to retire from the room, he knew all about the proceedings.

His Honour agreed to hear the motion at two o'clock on the afternoon of February 9.

The company is described as Muenzer, Ltd., formed to take over as a going concern the business of Max Muenzer at the Helios Photographic Works, Chester Road, Cornbrook.

NEW COMPANIES.

EMIL WUNSCH AKTIEGESELLSCHAFT FÜR PHOTOGRAPHISCHE INDUSTRIE.—Capital 1,000,000 marks, in 1,000 bearer shares of 1,000 marks each. Registered in Reick, near Dresden, in 1898. British address, 24-26, Holborn, E.C. T. A. Peck, of 57, Offord Road, N., is authorised to accept service.

Meetings of Societies.

MEETINGS OF SOCIETIES FOR NEXT WEEK.

FRIDAY, FEBRUARY 5.

Sunderland Photographic Association. Exhibition of Thornton-Pickard Prizes Slides and Apparatus. R. Hesketh.
Nelson League of Young Liberals. French Lantern Pictures. A. E. Staley & Sutton Photographic Club. "Photographic Shutters." E. A. Salt.
Borough Polytechnic Photographic Society. Annual Dinner.
Mill Camera Club. Portrait Competition.
Wishaw Photographic Association. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.

MONDAY, FEBRUARY 8.

Southampton Camera Club. "A Sketch of the History of English Architecture." Harold Baker.
Bradford Photographic Society. "Elementary Principles of Art Applied Photography." Alexander Keighley.
Scarborough and District Photographic Society. Portfolio of Prints (Members Cripple Gate Photographic Society. "Pictorial Lantern Slide Making." Bertie C. Wickison.
Kidderminster and District Photographic Society. Midland Federation's Portfolio.
Lancaster Photographic Society. Demonstration of "Ensyna" Paper. Young.
Attercliffe Photographic Society. Exhibition of Thornton-Pickard Prize Slides and Apparatus. R. Hesketh.
Glasgow Southern Photographic Association. "On the Printing, Developing and Toning of Velox Papers." W. F. Slater.

TUESDAY, FEBRUARY 9.

Royal Photographic Society. Annual General Meeting.
Salisbury Camera Club. French Lantern Pictures. A. E. Staley & Co.
Beeston Photographic and Art Club. Exhibition of Thornton-Pickard Prizes Slides and Apparatus. R. Hesketh.
Neath and District Photographic Society. Dutch Lantern Pictures. A. Staley & Co.
Hanley Photographic Society, Y.M.C.A. Members' Night.
Hackney Photographic Society. Results from Plates handed to Twelve Members for Developing and Printing.
Worthing Camera Club. "Various and Novel Lighting Effects." H. Esselby Corke.
Blackburn and District Camera Club. "The Camera Abroad." C. L. Fairthorpe.
Leeds Photographic Society. "The Roman Wall from Newcastle to Carlisle." E. Kitson Clark.
Epsom and District Literary and Scientific Society. "Ilford Gaslight Paper Demonstration."

WEDNESDAY, FEBRUARY 10.

Leeds Camera Club. "Enlarged Negatives or Reductions from Untoned Prints." F. Rust.
Croydon Camera Club. "A Tour in Portugal." Hugh Allen.
W. Calder and District Camera Club. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
North Middlesex Photographic Society. "A Swiss Tour." Harry Barnard.
Sale Photographic Society. "The Negative as a Means to an End." H. Pedd.
Borough Polytechnic Photographic Society. "Enlarging." A. G. Buckham.

THURSDAY, FEBRUARY 11.

Handsworth Photographic Society. Lantern Exhibition. "Agfa" Slides.
L.C.C. School of Photo-Engraving, Bolt Court. "The Production of Ordnance Survey Maps." Colonel G. N. Grant.
Liverpool Amateur Photographic Association. "Mountaineering in Sky." Henry E. Bowron.
Hull Photographic Society. Exhibition of Thornton-Pickard Prize Slides and Apparatus. R. Hesketh.
St. Andrews Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Rugby Photographic Society. Affiliation 1908 Prize Slides.
Wimbledon and District Camera Club. "Wanderings in Zoo-land." F. Marjot Duncan.
Melbourne (Dulwich) Camera Club. Photography Prize Slides.
Chelsea Photographic Society. "What I Saw in Japan." E. J. Horniman, M.P.
North-West London Photographic Society. Musical Evening and Distribution of Awards.

ROYAL PHOTOGRAPHIC SOCIETY.

MEETING held Tuesday evening last, February 2, Dr. C. E. K. Meade in the chair. The meeting took the form of a discussion upon the Autochrome process, and is therefore reported in the "Color Photography" Supplement to the present issue.

CROYDON CAMERA CLUB.—On Wednesday, the 27th ult., Mr. P. R. Salmon gave his lecture on "Models I Have Photographed." The lecturer's hints on home portraiture were interspersed with many humorous anecdotes, and the lecture was illustrated by abundance of lantern slides of excellent quality made on Alpa plates. Mr. Salmon explained that he obtained the warm brown and sepia colours on these by making a comparatively thin slide and then intensifying with mercury and ammonia. The series of slides wound up with a set of four dozen, all from one model, the negatives being taken in an ordinary room to show the diversity of effect that could be so obtained.

News and Notes.

ADON AND PROVINCIAL PHOTOGRAPHIC ASSOCIATION.—On Thursday February 11, the above association will have a very special demonstration-lecture, entitled "Gramophone and Cinematograph organised by Photographic Means," by Mr. Will G. Barker, one of the members of the association. The lecture will be very fully illustrated by means of the bioscope and gramophone.

MERCK FACTORY.—Those interested in the homes of the products which they employ should take the opportunity of seeing the views recently issued by the firm of Merck, describing the factory, which for no less a period than 240 years has been established at Darmstadt, first as a pharmacy and for nearly a hundred years past as a manufactory of "fine chemicals." Up to all this time the business has remained in the hands of the same family, and is still a private property.

THE LONDON PHOTOGRAPHIC SOCIETY.—A simple method of enlarging negatives was demonstrated before the South London Photographic Society by Mr. G. E. W. Herbert, who dispensed with the use of a transparency. In its place he used a P.O.P. print made of cloud and landscape negatives. The print was then copied on a large camera with a short focus lens, the print being illuminated by the use of magnesium ribbon burnt on each side of the negative. The demonstration produced a very successful result.

£10,000 FOR THE ROYAL INSTITUTION.—A general monthly meeting of the members of the Royal Institution was held on Monday last (21st instant), Sir James Crichton-Browne, M.D., F.R.S., treasurer and vice-president, in the chair. The treasurer announced that the sum of £10,000 had been anonymously and unconditionally placed at the disposal of the managers for the purposes of the institution for the year ending 1909; and the members passed a resolution expressing their grateful appreciation of her munificence and discernment, and the gift as a timely and noble recognition of the good works which the institution has done in the past, and is still doing, in the acquisition and diffusion of scientific knowledge, and as an incentive to maintain and extend its usefulness in the unique position which it has for more than a century occupied.

P. TONES ON BROMIDES.—In reference to a reply given last week to a correspondent who asked for a means of obtaining a P.O.P. by rapid artificial-light printing, the Falla-Gray Photo Paper Co., Park Road, Tunbridge Wells, write drawing attention to the action of users of Falla-Gray cards in obtaining such effects by the hypo-alum bath. Some cards sent are first-rate specimens of hypo-alum toning, and would probably meet our correspondent's requirements as a substitute for somewhat warm-toned P.O.P.'s, though we would call them similar to the bluish-black of the sulphocyanide-P.O.P. print. A more exact match of these latter is probably some cards submitted to us by Messrs. Droege and Co., 43, High Road, West Kensington, London, W., who produce them in quantity by a process of their own. They inform us that this allows them to produce cards which are fully as permanent as P.O.P.'s, and equal in appearance to them, within three days receipt of order, and in quantities of several thousands.

PHOTOGRAPHIC CONVENTION OF THE UNITED KINGDOM.—At the annual meeting held on the 28th inst., the arrangements for the Canterbury meeting were completed. The excursions for Tuesday, Wednesday, Friday and Saturday, July 6, 8, 9, 10, remain as originally contemplated. On Wednesday, July 7, there will be an official reception at the cathedral, the Mayor's garden party, and the annual dinner, followed by a smoking concert under the direction of the Committee of the Canterbury Chamber of Commerce. The proceedings at the evening meeting will include: A Re-union, Presidential Address (Mr. H. Snowden Ward, F.R.P.S.), a paper by the Mayor (F. Bennett-Golding, Esq., F.S.A.) on "Canterbury and its History"; a paper by Mr. C. Welborne Piper, entitled "Some Aspects of Photographic Record Work," by Mr. C. H. Bothamley, F.C.S., F.I.C.; a paper on "High-power photography," by Capt. Owen Wheeler, and a lecture demonstration by Mr. F. Martin Duncan. The Headquarters of the Convention during the week will be St. George's Hall.

TRAIT CANVASSERS.—The Kensington Ratepayers' Association has recently had under consideration the nuisance caused in the borough by hawkers of photography, etc. The association adopted a resolu-

tion asking the local authority to consider the advisability of passing a bye-law prohibiting these persons from calling at houses which display the notice that "hawkers are prohibited." The Law and General Purposes Committee of the borough council, in a report issued on Monday in regard to the matter, state that their attention has been called to the provisions contained in Section 54 (16) of the Metropolitan Police Act, 1839, which enacts that a penalty not exceeding forty shillings shall be inflicted upon "every person who shall wilfully and wantonly disturb any inhabitant by pulling or ringing any door bell or knocking at any door without lawful excuse," and empowers a police officer to take into custody without a warrant any person who shall commit any such offence within his view. It appeared to the committee that hawkers, etc., knocking or ringing the bell at any door displaying a notice that they are not required may be proceeded against under this section. In view of this the committee doubted whether, if a bye-law were framed on the lines suggested by the association, it would be approved by the Secretary of State, as the opinion has been previously expressed by him that a bye-law must not deal with an offence which is already punishable by Act of Parliament. Under the circumstances the Ratepayers' Association is to be informed that in view of the existing statutory provision the local authority does not see the necessity for passing the suggested bye-law.

"PHOTOGRAPHIC OPTICS AND COLOUR PHOTOGRAPHY."

To the Editors.

Gentlemen,—I regret to find that in my review I have inadvertently credited the author of "Photographic Optics and Colour Photography" with an error that he has not committed. Owing to a misinterpretation of the rough notes made when reading the book, I charged him with the consistent misuse of two words, "reversion" and "astigmat." I, however, discovered too late for correction that this criticism should have been concentrated on the latter word only. This is consistently (or, rather, inconsistently) used many times as an equivalent of "anastigmat," which is its very antithesis. The other word is obviously only a misprint.—Yours, etc.,

THE REVIEWER.

To the Editors.

Gentlemen,—I am much obliged for your review pointing out the errors in my book. They are all, or nearly all, already corrected in the "Errata" slip at the commencement of the volume.

I think, however, that your reviewer emphasises the errors rather too strongly. He says: "When the word 'reversion' is consistently used in the place of 'reversal,' we fear that no excuse for printers' errors will hold good." I have just gone through the section on colour photography again, and find I used "reversal" or "reversing" in every case (ten times), nor have I succeeded in finding the word "reversion" once used in the book, and I shall be greatly indebted to your reviewer if he will kindly point out the passage where the slip occurs. Again, he accuses me of using "unifocal" for "unofocal." This error only occurs once, although the word is printed ten times.

As regards the Adon lens, the error arose solely from a line having slipped out in the press. If you add after the word, "Adon lens," "when it is affixed to the objective, and the front element is removed," it will read all right. I have stated in another place "the Adon lens is a short, low power telephoto lens, having the positive element facing the light," as is naturally the case in all telephoto lenses.

Further, as regards methods of finding the focal length, your reviewer remarks: "The method most strongly advocated is credited to Lionel Laurence, and involves taking the square root of a distance that cannot be accurately measured." I do not approve of the method (although the reviewer's objection is invalid and altogether wrong); in fact, I should not have mentioned it at all had it not

been that the late Mr. Dallmeyer presented a large and expensive apparatus to the Royal Photographic Society for the benefit of members using this method. Laurance's method (not Laurence) merely cuts down Dallmeyer's, which latter is mentioned with approval in Bolas' and Brown's admirable little book on the lens. My method (the angular method) was considered much better than his own by T. R. Dallmeyer himself, since just before his death he informed me of his intention to have it adopted at his works. It is, moreover, largely used by the leading firms on the Continent.

The mistake of the magnesium powder was a printer's error. "Mg.O4" should read "4MgO."

It will be found corrected in the Errata slip.

Further, your reviewer puts a note of exclamation after the statement that varnish should be used while rotating the plate on a whirler. I got this idea from Mr. McIntosh himself, and it is an invaluable "tip." I can heartily recommend it to your readers. Again, he is surprised at the statement that if we reverse a plate we get rid of halation. This is in a large measure true, as I have tried it, the reason being that the light undergoes two reflections instead of one when the film faces the light, and therefore the film only gets 1-625th part of the light instead of the 1-25th, as in the latter case.

The remaining points he finds fault with are frivolous, and entirely without importance. They need no apology, as I am convinced of the truth of my statements. I do not intend to alter my views of perspective to suit the generally received idea. In the statements given the reviewer has evidently mixed up conjugate distortion with perspective.

If the above are the only errors your reviewer can find, it speaks very well for the accuracy of my book.

In conclusion, Mr. Editor, I am delighted at the reviewer having quoted my remarks about Helmholtz, and to the universality of the eye as an optical instrument (page 187); in fact, I am not sure whether it is not the only thing worth reading in the book.—I remain, yours very truly,

GEO. LINDSAY JOHNSON.

55, Queen Anne Street, Cavendish Square, W.

February 2, 1909.

[Dr. Lindsay Johnson has legitimate ground for complaint of his publishers, who most certainly neglected to insert the important "Errata Slip" in the copy sent to us for review. It is to be hoped that we may yet receive it. The word "reversion" occurs on page 229, but we would direct attention to the letter from the reviewer, which corrects his reference to this particular word. Dr. Johnson will pardon us for demurring to his amended description of the "Adon." To talk about the "Adon" in reference to one of these instruments which has had one of its lenses removed can only mislead a reader. The late Mr. T. R. Dallmeyer first described it, and Messrs. J. H. Dallmeyer, Ltd., supply it for use as it is, not with half of it or of the positive lens (whichever Dr. Johnson means) removed. And to represent the "Adon" lens with its nodes behind the lens, thus necessitating a greater camera extension, seems to us a remarkable view to take of a "telephoto" lens. Dr. Johnson will attach little weight to our pointing to opinions which are "generally received," yet we would hint that there is a distinct popular impression to the effect that a telephoto lens saves extension for a given focal length. If words and drawings mean anything at all, those on pages 63 and 112 show that the writer regards the Adon as a telephoto (save the mark) with the negative in front, under which condition the extension requires to be greater than equivalent focal length. We would like to refer to other points, but it is hardly fair to do so in the absence of the "Errata Slip."—Eds. "B.J."]

THE INVENTION OF THE ROLLER-BLIND SHUTTER.

To the Editors.

Gentlemen,—In the review on Dr. Johnson's book, "Photographic Optics and Colour Photography," we notice that your reviewer draws attention to the passage that, "with few exceptions, all the best reflex cameras are made by Kershaw, of Leeds, who holds the patent for the roller-blind shutter in all of them."

In order to make quite clear who the original inventor was, we beg to point out that the late Mr. J. Kershaw, of Buxton, patented over thirty years ago the "roller-blind shutter," the late Mr.

J. T. C. Chapman having assisted in bringing it to its perfect that time, as well as being the sole agent for many years.—faithfully,

JAMES E. CHAPMAN, Director,
Per pro J. T. Chapman, Limi

A MASONIC LODGE FOR PHOTOGRAPHERS.

To the Editors.

Gentlemen,—I note with great interest a note on page 87 "B.J." dated Jan. 29th, in which a Masonic Lodge is suggested for the photographic trade and profession. The subject is, I hardly say, an extremely difficult one to deal with in a newspaper, because of the well-known principles of the Order as I was connected in some way with the two previous and attempts to form a Lodge, a few notes on the subject may interest.

The attempt made ten years ago was partially successful, names were obtained, but the whole thing was squashed by the authority over us, because it was so extensively advertised.

The second attempt, about five years ago, was far more successful. Not only were thirty-seven names of photographic brethren obtained, but the matter advanced so far as to name the principal officers—eight Past Masters, who were willing to serve—and a name of the Lodge was decided upon. Having done so much, the moving spirit in the affair left the world of photography for something more remunerative, and he lost interest in it. The names were lost, and we heard nothing more of it. I can, however, remember about twenty of them, and they include many of the leading men, all good Masons. There is much more that could be said on the matter, but, in view of what has happened in the past, it is not advisable to do so. To-day the photographic Masons are scattered about, but there are no reasons why they should be brought together, just as the artists and literary men are in the "Pen and Brush Lodge."

As I said before, it is a difficult matter to deal with in a newspaper, but there can be no harm in saying that the need for such a Lodge is greater each day, and I can only suggest that one calls a meeting at Anderton's Hotel, where a room might be secured to discuss the matter. The only drawback is that the authority over us might object to an advertisement, even in the "B.J." If, however, the correspondent who wrote the note referred to cares to write to me, "care of the Editor of the 'B.J.'" I should be most happy to give him further particulars of what has been done and the names of several prominent Masons who years ago were anxious to join a "Sol Lodge."—Yours, etc.,

COPYRIGHT RELATIONS WITH AMERICA.

To the Editors.

Gentlemen,—I read through with interest your notes on the draft of the proposed new Copyright Bill. So far as I see, the only real difference is in the probable length of time the copyright may last—e.g., it may really be less than at present, where it lives more than thirty years after its production. But that is nothing to touch what is at present an injustice, viz., the registration of any registered photograph in other countries. Notable as this is extensively done in America. Two cases of the kind have recently come under my notice. An agent for an American publisher called on me, and also on a brother professional photographer. After paying for them, he said, "I suppose you would mind our publishing them?" I said, and I found my friend replied: "These photographs are registered. If you wish to publish them, you should pay a fee." To this he replied, "They are published only in America, and the registration does not hold here. All we can do is to insert your name as the photographer. So, for what costs them practically nil, they obtain other specialities that may have cost you a great deal to obtain.

PROFESSOR

P.S.—He did not say who or what he was until he had bought the photos, or one might perhaps have refused to supply without but this would be difficult in practice.

[The proposed Act claims to deal only with copyright in works made by British subjects anywhere or by foreigners resident in British Dominions. It does not touch international copyright and

provision which could be introduced into the Act could affect the Convention, to which the United States is not a subscriber. Legislation to touch our correspondent's grievance belongs to a different sphere—that of international law,—Eds., "B.J."]

THE "THAMES" COLOUR PLATE.

To the Editors.

Gentlemen,—In your "Analecta" of last week you gave an extract from a photographic contemporary as to a comparison of the "Thames" plates with others. The writer of the article which you quote bases the fairness of his comparison on the fact that he exposed all three plates on the same subject under precisely the same conditions." The conditions, which you did not mention, were: Time about noon. Stop $f/11$, indoors, exposure about an hour. Result, failure to get the greens.

It does not seem to have occurred to the writer that his comparison is about as unjust to us as it could well be, and that the failure of his attempts was due simply to over-exposure.

As far as come to our knowledge that under very similar conditions a successful exposure was made on our plate which gave excellent greens, the exposure being two minutes.

Very early in our work we were approached by a high photographic authority who told us that we should do our utmost to produce on our plate a rapid one. That we have been successful is shown by the extract herewith as to what is thought of the "Thames" plate in Germany. This testimony to our plate is corroborated by results in this country. In one case, shown personally to us, a surgical operation of extreme importance was photographed in a few seconds in perfect colour rendering upon an artificial part of the body and the part then sewn up. This plate will become historic in surgery. If such exposures are possible in the fields of science, they are possible in the many fields of artistic and applied photography.

We have now made the necessary arrangements to make two additions to our present method of manufacture: (1) we are putting the same protective coating on the same glass as the colour-screen, and (2) we are making the colour-screen in finer construction—so that there are 250,000 colour patches to the square inch. This will meet the requirements of those proposing to make lantern slides or for microscopic work. We shall of course not abandon our present method of the two glasses, which would appear to be the only way in which successful duplicates can be made.

THE THAMES COLOUR PLATE Co.,
O. S. Dawson.

The passage referred to is as follows from the "New York Herald" (Paris edition), January 3, 1909:—

Professor Dankmar Schultz-Heinke gave a lecture last evening at the War Academy, before a large and influential audience, upon the progress in colour photography. The lecturer pointed out that such progress has been made possible very largely owing to the new 'Thames' films, made in England. They are an improvement upon the plates made some years ago by the brothers Lumière in New York, with which in more or less time very good coloured photographs were produced. But with the 'Thames' plates a photograph can be taken in a few seconds, and the photograph shows the subject in its fullest natural colours. Ten days ago these plates were brought here, and all the experiments made with them produced satisfactory results.

This discovery is of great scientific worth, and experiments with these plates have been made in the clinic of Professor Virchow upon the treatment of a tuberculous lung. All the pictures taken have come out with a hitherto unknown freshness of colour. Colour photography will therefore, in the future play a considerable rôle in the world of medicine. All the photographs taken by Professor Schultz-Heinke have excited great admiration."

The writer in the "New York Herald" is, we hope, better informed on the "Thames" plate than on "the plates made some years ago by the Brothers Lumière in New York." What are the conditions?

It is not a year since the Autochrome plates arrived in this country. We are glad to hear that the "Thames" is to be issued as a screen-plate, because our experience is that the registration of separate plates will never give the same accuracy of colour as a single plate.—Eds. "B.J."]

Answers to Correspondents.

- *• All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY, 2A, Wellington Street, Strand, London, W.C." Inattention to this ensures delay.
- *• Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.
- *• Communications relating to Advertisements and general business affairs should be addressed to MESSRS. HENRY GREENWOOD & Co., 2A, Wellington Street, Strand, London, W.C.
- *• For the convenience of Readers, our Publishers, MESSRS. HENRY GREENWOOD & COMPANY, of 2A, Wellington Street, Strand, W.C., undertake the registration of copyright photographs at a charge of 1s. 7d. each photograph, to cover cost of registration fee, form, etc. Two unmounted copies of each photograph must be sent with the fee.

PHOTOGRAPHS REGISTERED:—

J. L. Sievwright, Newport, Eife. *Photograph of the late Dr. Stewart, Newport Eife.*

J. H. Nosworthy, 3, Richmond Terrace, Queen's Road, Clifton. *Photograph of "Baby and Maude."*

HALF-TONE.—Might I ask if you will be so good as to give me the following information?—Supposing that for a given stop, a 133 line screen and a screen distance of 1.32 inch, an exposure of 5 were found correct, what would the relative exposures be in altering the screen distance to two, three, four, and five thirty-seconds of an inch? Of course such wide variations would not crop up in practice, but I am anxious to know to what extent these alterations would affect the exposure; of course, it being understood that the diaphragm and other conditions remained the same. I have adopted a standard in focussing microscopically for a good strong print, and it is from this fact that my screen distancing will need altering to suit the subject.—FACTOR.

Provided other things remain the same, exposure does not alter with alteration of screen distance. If, of course, the lighting is changed exposure alters accordingly; if a smaller stop is put in the lens, this requires both a longer screen distance and a longer exposure, but the extra exposure is required by reason of the stop alteration, not by reason of the alteration of screen distance.

E. COOPER.—From the Autotype Company, 74, New Oxford Street, London, W.C.

H. HEUSNER.—We have no information as to where specimens can be obtained. We have none.

FLASHLIGHT, ETC.—1. Some two or three weeks ago I asked you if you would kindly give me formula or name of suitable substance for painting out pictures on cinematograph films as advised by Mr. Heyworth in his work on the cinematograph? 2. In using chlorate of potassium with magnesium for flashlight powder, in what proportions by weight should they be mixed? 3. When you say (page 35, "J." 8) "one part permanganate, five parts magnesium"—by weight or bulk? 4. Which burns the quicker, chlorate or permanganate, and gives the less smoke?—L. S.

1. We would suggest celluloid varnish to which some asphalt has been added to make an opaque mixture. We have also found that a solution of gelatine in acetic acid takes very firmly to celluloid, and if mixed with fine lampblack and, say, some black aniline dye, should form an effective stop-out, though we fear it might weaken the portion of film to which it was applied. Perhaps one of our readers or a maker of a special article can reply further. 2. Chlorate is generally used with antimony sulphide, also, as follows:—Magnesium powder, 3 parts; potass chlorate, 6 parts; antimony sulphide, 1 part, all by weight. 3. Yes, by weight. 4. We should say the above chlorate mixture; a quick-burning formula is magnesium and potass nitrate, equal parts. This and the permanganate are preferable to the chlorate as regards freedom from smoke, but neither are so satisfactory as the recent patented powders such as the "Agfa."

LIMERICK.—(1) The result in the brighter print is certainly quite up to the average of work under such difficult conditions. The expo-

sure has been ample; in fact, a smaller stop might have been used, and better definition of the bolt heads in the arch obtained if this latter was of importance to the customers. (2) A reasonable charge.

J. W. BATTEY.—The building is used for trade purposes—it is where you carry on your business—therefore it becomes rateable. Its size, we believe, makes no difference in that respect.

LIGHT.—All the lights you name can be used for both studio work and printing. We should say No. 4 or No. 6 is the most widely used. We advise you to get the catalogues of the respective firms; all the latter are of good standing. You can take it from us that each apparatus is capable of turning out good work.

SANDELL PLATES.—Will you kindly inform me if Sandell double or triple coated plates are still made? If so, where to be obtained?—**ZELVO.**

The plates are no longer manufactured, so far as we are aware. We believe the Sandell Films and Plates, Ltd., may still be addressed at Norwood Junction, London, S.E. Better write them.

RETOUCHING.—Can you tell me the reason of retouching showing when printed? I cannot get it right on a very thin negative, even with a No. 6 pencil. I have only been learning three months. Should be glad if you could put me right where I am wrong.—**ANNIE V.**

It is impossible to say where you are wrong without seeing examples of your work. You say you have only been learning three months. If you have been receiving instruction during that period you should have been more proficient by this time. Anyhow, your instructor would be able to set you right if shown your work. If you are not receiving instruction we should advise you to obtain a good book on the subject, such as "The Art of Retouching Negatives," by Robert Johnson (price 2s.); or "Practical Retouching," by Drinkwater Butt (price 1s.). Any photographic dealer will procure them for you.

BLACK AND WHITE, ETC.—(1) What would you consider a reliable formula and make of plate to produce a negative of extreme contrast for the purpose of copying black and white type printed matter, to be printed on to rapid bromide paper? (2) Please quote a book on the subject of manufacture of bromide, gaslight, and modern P.O.P. papers, price and publisher. (3) Can glossy bromide postcards be treated with a burnisher instead of squeegeed?—**H. DAVIES.**

(1) If you mean an emulsion formula we must tell you that they are the secrets of the dry-plate houses. You want a slow "process" or "photo-mechanical" plate. Nearly every maker produces one. A good developer is that on page 865 of the "Almanac." (2) The best we know is "Plates and Papers," by H. C. Stiefel (Iliffe and Co., 2s.). (3) Yes.

FLASHLIGHT.—I have a flashlight photograph to take in a large building, 90 feet by 80 feet. I propose placing flash-lamps in positions as per sketch below. Would this be a suitable arrangement, or can you suggest anything better? Also, if used in positions stated, how much "Agfa" powder would be required for each lamp?—**FLASHLIGHT.**

You must not use the "Agfa" powder in a lamp—that is to say, you must not blow it through a flame. It will be quite safe to ignite by a match, fuse, or electric spark, and the arrangement you show is about as good as you can get, if you shade the lens from the light A. Half an ounce to an ounce of powder would not be too much for lens with stop $f/11$ or $f/16$, and a plate about 200 H and D.

EIKONOGEN DEVELOPER.—On page 768 of the "B.J. Almanac," 1909, you give two formulæ for Eikonogen developer, which you will see contains no bromide. 1. Is it necessary to have bromide in Eikonogen developers, as in another publication on developers I have been looking up, relating to Eikonogen, it says that the bromide prevents the developer from giving too soft results, and as the developer you give in the "B.J." Almanac" contains no bromide, do they give very soft results? 2. I shall be obliged if you can give me a formula for Eikonogen that gives a negative of a nice printing contrast. 3. Also please say if you consider Eikonogen a very satisfactory developer for snapshot work, and also say if the formula on page 768 (single solution) would be most satisfactory for developing snaps? I presume the single solution is quite as good as the 2-solution given above it, and which would

you recommend to be used? If the formula given in "Almanac" gives the contrast I am requiring, in the case of exposure what should you consider should be added in the wa bromide (10 per cent. solution)? 5. Also, would you please say Eikonogen is considered a developer more suitable for general commercial work than pyro-soda; and, in the case of an exposure, which solution in the 2-solution formula for Eikonogen would have to be added in the majority. Which gives detail? Which densities? 6. I ask, in taking, say, two ounces of Eikonogen (as per 2-solution developer on page 768), how many half-penny would be considered sufficient to develop (approximately) **PLATER.**

1. It depends on the plate. Some plates will develop clear without bromide, others will not. Try the effect of half a penny per ounce of mixed developer and see the effect. Bromide tends to brighter results, not to soften, as you quote; but (2) the contrast in the negative is chiefly dependent on the time of development. Eikonogen will give contrast if used long enough. 3. Fairly. We should prefer a developer, such as metol or rodinal, for rapid exposures, or pyro-metol. 4. Up to, say, 3 or 4 grains per ounce of mixed developer. 5. Not so suitable. Eikonogen is not so readily dissolved as pyro. We should say it is used scarcely at all except for lantern-slide work, and not extensively for that. We should say not more than 40 or 60. Why don't you read the rules at the head of this column and write on one side of the paper?

DIPHENAL.—We ordered some diamidophenol and received diphenal in a liquid form. We shall be glad to know the difference, and made up some of the latter according to the formula on page 9 of the JOURNAL, using 40 min. instead of grains. This was not successful. Where are we wrong? Is diphenal suitable for bromide paper, and can you give us a formula for using it in a liquid form?—**SUSSEX.**

Diphenal is not the same body as diamidophenol. The solution you have bought is intended to be mixed with about ten times its volume of water when used as a developer. It is a pity you don't say where your developer is defective. Diphenal is not the best developer for bromide paper, as it is liable to give yellow stain.

W. W. B.—Enamelled iron vessels are not to be recommended for manipulating silver prints in. They are all right for their purpose, supposing the enamel is perfect; but it is liable to become chipped or cracked by continued use, and so the iron becomes exposed. We should say that the markings on the prints are due to their lying in contact with the bare metal while there is free silver in them.

THE LANCASHIRE AND CHESHIRE UNION.—The 1909 year-book of the L. and C.Y.U. reaches our table. It contains the rules and subjects of the union, a list of the federated societies (which number fifty-one), and of lectures and lecturers available. The number and variety of these latter show the Union to be rendering good service to the weaker societies. The terrible half-tone reproduction of a group taken on a "Union" outing might, however, have been omitted; its inclusion does not say much for the critical powers of the producers of the year-book.

**** NOTICE TO ADVERTISERS.**—Blocks and copy are received subject to the approval of the Publishers, and advertisements are inserted absolutely without condition, expressed or implied, as to what appears in the text portion of the paper.

SUMMARY.

The exhibition of photographs by Count von Gloeden representing "Scenes and Figures of the Coast near Messina," remains open at the house of "The British Journal of Photography" until Saturday, February 20. Open daily 10.30 to 4.30 (Saturdays 10.30 to 1.30) on signing the visitors' book.

The first portion of the eleventh Traill-Taylor Lecture is given this week in the shape of the discourse by Dr. E. Wandersleb on "The Regulation ('or limitation') of the Ray in Photographic Objectives." Dr. Wandersleb's lecture describes, by the aid of a series of numerical examples, the Abbe theory of "pupils" and "lukes" which provides a simplified form of dealing with matters of photographic optics, such as perspective, depth of focus, etc. Some notes explaining one or two of the terms employed appear on page 114.

The Progress Medal of the Royal Photographic Society has been awarded to MM. Lumière et ses fils for their invention of the Autochrome process, and for their photo-chemical researches. (P. 130.) A short sketch of the work of the Lumières, illustrated with portraits, appears on page 115.

The Royal Photographic Society. The report of the annual general meeting of the Society appears on page 129. The names of the officers for the forthcoming year are given on page 130.

There are signs that the Home Office are at last taking steps towards regulating cinematograph exhibitions, such as are now running in many parts of London. (P. 114.)

Under "Photo-Mechanical Notes" the making of celluloid electros from natural objects is mentioned; also a new material for mounting of half-tone and other blocks. (P. 124.)

An X-ray convention and exhibition are to be held in July next. (P. 114.)

A German patented formula for flashlight powders appears on page 127.

The telegraphic transmission of photographs and cinematography in natural colours figure under "Patent News." (P. 126.)

EX CATHEDRA.

The Purity of Photographic Chemicals. A perusal of the "Analytical Notes," which have appeared for the last year or two from the laboratories of Messrs. Evans Sons, Lescher, and Webb, of Liverpool, shows us how little cause for complaint the photographer as a rule can have in regard to the chemical substances he employs. The publication records the results of analytical tests to the number of over 9,000, among which those of substances required for photography figure. In the case of hypo a large number of tests showed that the purity of this salt averages 98 per cent.; formaldehyde solution was found to have a strength of from 36 to 39 per cent. (the nominal strength is 40 per cent.). In the cases of soda sulphite and potassium meta-bisulphite, the report as to the four samples of the latter examined is "very satisfactory"—all were found to possess a purity of over 98 per cent. Sulphite, in the case of twenty-two samples, had a purity of from 92 per cent. to 98 per cent.

* * *

Photography and Modern Literary Criticism. The modern journalist must be smart above all things, and one of the attributes of his smart descriptive writing is a wealth of simile. This, however, is nothing particularly new. The ancients, in whom the idea originated, created a heaven of their own, peopling it with gods and goddesses, using them as similes for the various ideas they would express. The modern writing man is under no such necessity; science, art, and commerce, eked out with a touch of Nature, furnish him with all the similes he requires. And in this connection photography comes in for a fair share. We have even heard it made use of to illustrate sermons, and the simile carried so far that the hearer might be forgiven for imagining that the soul's development was exactly like the development of the photographic plate. Yet it is seldom that the whole range of photography is brought into operation in the course of one short article. This has been accomplished in an article on the Edgar Allan Poe centenary by an imaginative writer, who, unfortunately, does not sign himself. We take the liberty of reproducing the paragraph in full:—

THE FADED PHOTOGRAPH.—It is merely a mundane association of ideas, a remembrance of many reproductions of portraits of Poe dating from the early days of the camera, that his astral image—our personification of his genius—somehow takes the form of a tin-type photograph, or, to be more reverent, of one of those old daguerreotypes in a folding frame with a red velvet pad to keep the glass from breaking? The daguerreotype was never clear and definite, like a silver or platinum print; it had to be looked at closely, and at certain angles; its tone to-day seems to be unpleasantly ashen, and a metallic lustre which fails to compensate us for the absence of honest black and white. But our grandfathers naturally thought of it highly. The astral Poe stands similarly in our impression as a figure vague, elusive a little, monotonously

grey save for the superimposed gilt of the neck-pin and watch-chain, with a surface texture that too closely suggests the chemicals in the dark-room of the old itinerant photographer's tent. The portrait of Robert Burns, on the other hand—Burns who in fiery fate so much resembles him—is a steel engraving, distinctly to be identified across the room, clear-cut in outline and roundly modelled, pure black and white that seems to grow more vivid with age.

* * *

Cinematograph Legislation.

Inquiries made by the L.C.C. have elicited from the Home Secretary that it is his intention to introduce into the coming session of Parliament a short Bill dealing with cinematograph exhibitions. It was reported by the Theatres and Music-Halls Committee that since the deputation waited upon the Home Secretary in March last there has been a continuous increase in the number of places which have been used for cinematograph exhibitions without any supervision or control being exercised over them, and the Committee's view that this undesirable state of things should be terminated was now shared by, among others, the Middlesex County Council, the Hackney and Stepney Borough Councils, and the Theatres Alliance. The L.C.C. think it well that Mr. Gladstone should be acquainted with the extent of the demand for legislation in this matter, and copies of the letters received from the above are to be forwarded to the Home Office.

Under-Exposure.

It is a truism to say that we cannot develop out an image which does not exist in the exposed plate, but it is not so easy to say when such an image begins to exist in the case of under-exposure. When dealing with high-speed focal-plane work we adopt special methods of development and produce results that would be quite impossible with ordinary methods of working. By similar means we could probably save many plates that we throw away as hopeless, though we have not given them the chance that we should have if they had been recognised as on a level with very rapid focal-plane exposures. If we consider what can be, and is often, done in the way of high-speed work, it seems evident that more is possible with what we call under-exposure than is commonly assumed. If we study a Wynne meter, and allow for the fastest plate listed and an aperture of $f/4$, we shall find that with a two seconds' actinometer time (which represents a very intense light), the exposure is 1-340 of a second for a normal subject. This is a fairly short exposure, but the operating photographer will cheerfully cut the exposure down to a half or a third of that amount, expose on a near object, and get a fairly good result. The methods of development employed seem to be very varied. For our own part we have obtained moderately good results by using 1 in 40 rodinal with $\frac{1}{4}$ grain bromide per ounce for times up to one hour and a half, but we doubt if any two workers employ precisely the same methods. Herr Max Wolff, in "Eder's Jahrbuch," describes some experiments on developing faint star images, showing that very opposite methods may be successful. For example, he found that 24 per cent. rodinal acting for 25 seconds gave almost as good results as 1 in a thousand glycine working for 45 minutes. We doubt if either time would be sufficient for work of the kind we are considering, but if strong rodinal is successful it would be a very desirable method. Possibly a preliminary treatment with 1 in 4 rodinal would be a good prelude to a longer treatment in a weaker restrained solution.

AN X-RAY CONVENTION and Exhibition are to be held at the University College, London University, from July 6 to 9, 1909. The proceedings are in the hands of an executive committee consisting of W. Deane Butcher, Lewis Jones, M.D., Reginald Morton, M.D. All communications to be addressed to Ernest Schofield, Organising Secretary of the Convention, 11, Chandos Street, Cavendish Square, London, W.

A SIMPLIFIED METHOD OF CONSIDERING THE ACTION OF A PHOTOGRAPHIC LENS.

THIS week we publish the first part of Dr. E. Wandersleb Traill-Taylor lecture, delivered on November 17, 1908. At the time we drew attention to the value of this lecture to the English student of photographic optics. Hitherto we have not had such an authoritative summary in English of the German method of considering the action of a lens, and to many readers the treatment adopted by the lecturer will probably be quite new. It may, therefore, be well if we draw attention to some of the points that may at first seem perplexing.

Study of the paper will show that the title, "The Regulation of the Ray," covers the limiting effects of the diaphragm, and of the lens margins, upon the light pencils that pass through the objective. The title would probably be more expressive if the word "limitation" took the place of "regulation." The same subject is dealt with by Dr. von Rohr in one of his books, under the title of "Die Strahlenbegrenzung," which can be translated as "ray limitation," and from the English point of view this is the right expression to use if we want to secure a truly descriptive title. The word "regulation" is probably a little inexact, but it is not of any consequence so long as we understand the nature of the subject.

It must be understood that until a very few years ago English text-books practically ignored this subject of "ray limitation." Practical opticians had to consider it, but text-book writers left it out, no doubt because it appeared to be a subject that could not be dissected and reduced to exact formulæ. In pre-Gauss days text-book writers used to similarly slur over the matters of focal length and conjugate foci. The student was not told that the orthodox formulæ were only approximate and not applicable in all conditions, because the study of the various conditions possible showed that the whole subject was very complex, and that universal rules and formulæ were apparently impossible. All these troubles were, however, dispelled by the Gauss theory, with its conception of principal points and planes, which reduced all matters concerning focal length and conjugates or scale of image to simplicity, and provided a system of calculation applicable to all types of lenses. The Gauss theory, however, left the question of aperture practically as uncertain as it was before, and, again, difficulties which were familiar to all serious students were glossed over because they could not be clearly formulated. Then once more a German scientific man, Professor Abbe, came to the rescue and formulated the Abbe theory of "pupils," which cleared up all questions relating to the action of the diaphragm or stop, in as simple and definite a fashion as the Gauss theory did in the case of the focal distance. The theory of "pupils," however, still leaves one matter rather indefinite. It is obvious that very oblique pencils when passing through a lens, are not limited by the stop alone. They are also vignetted or "cut off" to a greater or lesser extent by the margins of the lenses themselves and sometimes by the lens mount. To cover these further limiting conditions the theory of pupils has been amplified by the conception of "lukes," as described in Dr. Wandersleb's lecture.

Pupils and "lukes" are the two most essential features of the doctrine of "ray limitation," and the importance of these conceptions is as great as that of the principal planes and points of the Gauss theory, for the following reason:—If we understand and apply both the Gauss theory and the Abbe theory of ray limitation, then we can calculate or exactly describe the effects produced by any system of lenses without paying any regard whatever to the complex courses of the light rays within the lens.

self. We assume, of course, that the lens is a perfect one, free from aberrations, otherwise none of the simplifying conceptions of either Gauss or Abbe will apply quite exactly.

In the lecture Dr. Wandersleb also makes free use of von Rohe's conception of the "plane focussed for" (see Figs. 14, 15, and 17), which corresponds exactly with the "objective plane" described in an article in our issue of March 29, 1907. This conception still further simplifies the manner in which we need to study the mode of action of the perfect lens. As just explained, the Gauss theory and the theory of pupils and "lukes" enable us to ignore what takes place inside the lens, and we need consider only the course of the light rays before they enter the lens and after they emerge from it. When, however, we adopt the objective plane, or "plane-focussed-for," conception, we still further limit our consideration to the light rays that lie only in front of the lens. We can ignore what happens to the emergent rays, for they only produce upon the picture plane, or plate, a reduced copy of the plane projection which under the theory we assume to be formed on the objective plane.

Pupils, "lukes," and the objective plane are, therefore, the subjects that Dr. Wandersleb treats under the title of "The Regulation of the Ray," or, as we should prefer to call it, "Ray Limitation." The subject generally is by no means new excepting to English text-books. The late Mr. R. Dallmeyer made free use of it in his "Telephotography," but for years after that book appeared other English writers neglected it, with a very few exceptions. Only during the last year or two have "pupils" been considered in the more academic text-books, and even now their practical utility is seldom emphasised. It may be well to point out here that in treating of the theory of pupils Dr. Wandersleb uses the term "principal ray" to describe the ray passing through the pupil centre. This is commonly designated the "chief ray" by English writers, who apply "principal ray" only to the one passing through the principal points or nodes without deviation.

A point that is very likely to confuse readers is the conclusion with regard to depth of definition. It will be

seen that Dr. Wandersleb states and proves very clearly that depth depends solely on the size of the pupil and the distances between pupil and object, and is quite unaffected by any constructional consideration, even by focal length. This conclusion squares more or less exactly with the idea of depth propounded by Mr. Debenham some years ago, but the special conditions must not be forgotten.

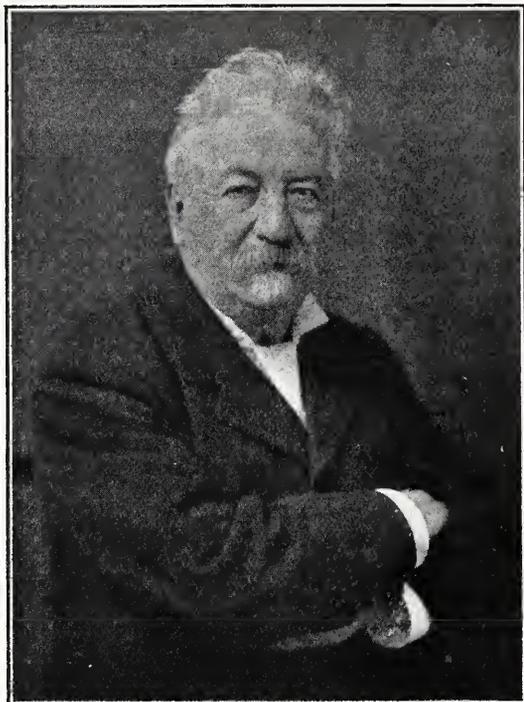

In this view of depth the construction of the lens cannot affect the question at all, but if we adopt the usual English method of comparing lenses when they are producing images of the same size, then construction may be considered to come in. When Dallmeyer stated that a telephoto lens used on a near object gave greater depth than an ordinary rectilinear of the same focal length and aperture, he was comparing the lenses when their principal points (or nodes of admission) were equi-distant from the object. In these conditions the two lenses give equal size images, but the circles of confusion in the telephoto image are smaller than they are in the other, therefore the depth is greater. If, however, we put the lenses side by side so that their entrance pupils are equi-distant from the object, then the telephoto lens gives a larger image than the other, as seen in Dr. Wandersleb's Figs. 11 and 12, and the confusion discs vary on the same scale. If we deem this variation of the discs to be permissible then the depth is equal, though if we apply a linear standard measurement to the circles (say, the usual .01in.) we must say that the depth is unequal and that the telephoto lens gives less depth than the other. From this it will be seen how much depends on the manner in which we look at the question of depth. It may be pointed out that where lenses of equal power and intensity differ constructionally in similar fashion from telephoto and ordinary symmetrical lenses, there are more points of resemblance in their behaviour when they are set at equal pupil distances than when they are at equal nodal distances from a near object. In the former case the results agree as regards perspective and relative depth, but disagree as regards scale and exposure. In the latter case scale is the only respect in which they agree.

THE AWARD OF THE R.P.S. PROGRESS MEDAL TO MM. LUMIÈRE.

The Progress Medal of the Royal Photographic Society has this year been awarded to MM. A. Lumière et ses Fils, of Lyons, on the ground (according to the words of the minute): "for the discovery of the autochrome process of colour photography and for their photochemical researches." The award, which was instituted in 1878, is granted for "important advance in the scientific or artistic development of photography," and in the former category the contributions of MM. Lumière run to such a number and touch such a diversity of photographic questions that there can be no question of the propriety of the bestowal of the medal upon the three joint directors of the famous manufactory at Lyons. For the past twenty-two years MM. Lumière have devoted their own time, that of their assistants, and the cost of a laboratory to the investigation of questions which as often as not were not directly of importance to them in their business of the manufacture of photographic products. In some cases the results of their experiments have led to the protection of the product obtained by patent, in others the subjects and results of the research have been just as applicable to one maker's goods as to another's; in others, again, the results have been negative, the record of experiment that failed; but in every instance the results have been offered freely and frankly to the world, have been trans-

lated into the language of every fortunate country which possesses a photographic Press, and in not a few instances have provided photographers with new and improved methods of work. A glance down the list of the 132 papers which have thus been published since the year 1887 shows not only the mental activity of the authors—though even this total does not include papers on pharmaceutical and medicinal subjects in the preparation of which MM. Lumière have collaborated with others. Colour photography figures in this list as early as 1893 in the form of a paper on the Lippmann process, which was followed by others on the three-colour method contemporaneously with the progress made by the Lumières in working out the methods of trichromy on paper, which, in spite of the somewhat difficult manipulation involved, produced extremely beautiful results, and afterwards underwent further simplification in the so-called L.N.A. process. However, MM. Lumière, like other people working at colour photography, recognised that methods of triple superimposition could never become widely popular, and hence the Autochrome plate, for the remarkable perfection of which the skill, patience, and perseverance chiefly of the two brothers, Auguste and Louis, are responsible. One admires the "niceness" of the principle of the Autochrome; but if MM. Lumière were at liberty to tell all

they have gone through, the award of merit to them would be for their laborious triumphs over details of manufacture. However, the impression should not be created that colour photography alone has monopolised the attention of the Lumière laboratory. Its work has included the production of new developers, the preservation of developing solutions, the toning and fixation of prints, and even such minutiae of practice as the washing of prints and the silvering of mirrors.

M. Antoine Lumière.

We should not forget, also, in this appreciation, the contribution of MM. Lumière to cinematography. In the eighties and nineties of the past century a great many designs of cinematograph machine were worked out, and many, no doubt, were used in an experimental way, notably that of Demeny, which has developed into the present type of machine, but the first public demonstration of animated photography which

was a popular success was that given by MM. Lumière in Paris in July, 1895, with the "Cinématographe" of their own design and construction. From that date cinematography as an industry was an established fact, and now MM. Lumière, the fairy godmother in the story books, have once more appeared on the scene with their non-flammable film, by aid of which the animated photograph entertainment should be robbed of its regrettable dangerous character.

Apart from the industrial progress which their experimen-

MM. Auguste and Louis Lumière.

work has promoted—a form of progress, we would say, which was quite worthy of recognition—the papers by MM. Lumière alone, and in collaboration with M. Seyewetz, have treated many photographic problems in a scientific way, and have led to a more scientific basis for much of the current photographic practice, and therefore the recognition, now embodied in the "Progress" medal of the Royal Photographic Society, will be endorsed by photographers in general.

ON THE REGULATION OF THE RAY IN PHOTOGRAPHIC OBJECTIVES.

THE ELEVENTH TRAILL-TAYLOR MEMORIAL LECTURE.

GEOMETRICAL optics, which, in contradistinction to the wave theory, makes use only of the conception of rays of light, embraces three large fields:

- (1) The purely geometrical theory of reproduction.
- (2) The theory of aberration; and
- (3) The doctrine of the regulation of the rays.

We will first briefly glance at these first two fields before entering upon our subject proper, and then turn to this latter at length.

On a lens system—for instance, a photographic system—the requisition is in most cases primarily imposed that rays of light proceeding from a point of the object will be so influenced by the system that after emergence from it they strictly intersect again to a point—the image point. This requisition in practice is in the first domain of geometrical optics—that is, in the purely geometrical theory—taken for granted, and may be stated in the following very general form:—We imagine two different spaces, I and II (Fig 1). Straight lines in these spaces we call rays, and we suppose that each ray in Space I is correlated to a definite ray in Space II. To the correlation of the rays the only condition is attached that all the rays of Space I, which intersect in *one* point, for instance the rays a_1, b_1, c_1 intersecting in o_1 , correspond to rays each to each in Space II, which likewise intersect

in *one* point, for instance, the rays a_2, b_2, c_2 , intersecting in o_2 . In this manner it is at the same time established that to each point in Space I, for instance o_1 , there corresponds a definite point o_2 in

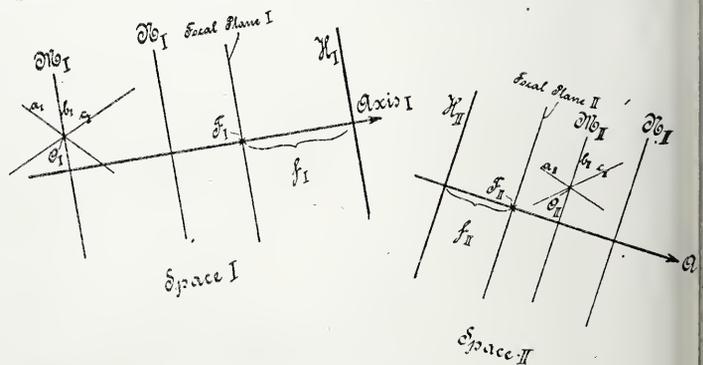

Fig. 1.

The purely geometrical theory.

Space II. From this single hypothesis a series of important geometrical conclusions are drawn: firstly, points and rays which

olly in *one* plane, for instance, M_1 of Space I, correspond to points d rays which lie wholly in *one* plane, M_1 , in Space II; or, in short, each plane in I there corresponds a plane in II. Secondly, one and only one definite group of parallel planes exists in Space I, to which group of parallel planes in Space II corresponds; of all these parallel planes, *one*—named the “focal plane”—is conjugate to the infinitely distant plane of the other space. Thirdly, one and only one ray, standing at right angles to the focal plane of Space I, corresponds to a ray in Space II, standing at right angles to the focal plane of this space. The two last rays so defined are termed the “axes.” If now, having regard to the realisation of the reproduction by centred lenses to come upon, the hypothesis be added that the axes are axes of symmetry, then each of the above-named parallel planes of Space I is reproduced exactly alike, that is to say, free from distortion, in that plane of Space II conjugate to it, and, further, in each space a definite length can be found which we call the “focal length,” and designate f_1 and

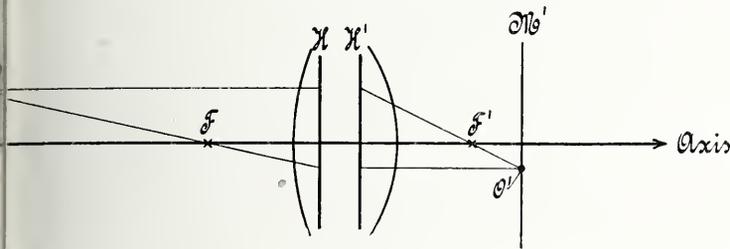

Fig. 2.

focal points and principal planes of a lens-system used for the construction of an “image-point.”

These focal lengths permit, with the assistance of the previously mentioned focal planes, of finding the conjugate point in Space II to every point in Space I, and inversely. The rules and constructions according to which this is done are identical with those which are employed when the focal points and the focal lengths of an objective are given, and when the image points corresponding to object points are to be determined.

As is easily seen, this deduction of the laws of reproduction is rendered wholly independent of the possibility and of the manner of realisation of the reproduction by lens systems; it is a pure geometrical theory, and when we name, as we generally do, the correlation of straight lines, points and planes as above defined, a reproduction, and, moreover, make use of the terms “object space” and “image space,” “object rays” and “image rays,” and so on, it is purely to facilitate expression.

The first discussion on the law of reproduction which was ren-

both media are the same. The planes lying at right angles to the axis at a distance from the focal points equal to the focal lengths are called the “principal planes,” H, H' (Fig. 2).

You are aware that solely with the assistance of the two focal points and the two principal planes to each object point the image point can be found by calculation or drawing without knowing anything whatever how the system is constructed, and that Fig. 2 shows one of the simplest methods.

It is unfortunate that in real systems these rules hold only in the case of rays close to the axis and have practical importance, without entailing further work, for very narrow apertures only and for a very small field of view of the reproducing system. For larger apertures and inclination of the reproducing pencils of rays, aberrations are generally in evidence, which prevent the formation of sharp and correct images. To discuss those aberrations, and to find means of rendering them innocuous, is the scope of the theory of aberrations, which forms the second large field of geometrical optics. It provides an inexhaustible fund of important and difficult problems, a few of the most interesting ones having been already subjects for the Traill-Taylor Lectures, viz., “On Zonal Aberration and its Consequences,” by Prof. Sylvanus P. Thompson, 1901, and “The Aberrations of Photographic Lenses,” by Mr. Chalmers, last year.

The third field of geometrical optics is the doctrine of the regulation of the rays. In this field a few occasional special questions have been dealt with at fitful intervals by Josef Petzval, Thomas Grubb, and Hermann Helmholtz. Then came Abbe, who in 1871 dealt with this problem in its most general form, and gave it its most complete solution. Since then the doctrine of the regulation of the rays has, particularly in the Zeiss Works, Ernst Abbe’s creation, found its scientific home, and has yielded interesting results. First Siegfried Czapski, then in later years especially Dr. Moritz von Rohr, have done the greatest service in elaborating and disseminating the doctrine of the regulation of rays.

Personally I have undoubtedly to thank my connection with Zeiss for the very great honour done me by the R.P.S in inviting me to give this Traill-Taylor Lecture. John Traill Taylor, to whose memory this lecture is dedicated, always regarded as worthy of his best labours the communication to the photographic public of information respecting the interesting and important researches of others, not the least being the subject of optics. Encouraged by this fact, I have the temerity to give you this evening a review of the doctrine of the regulation of the rays in photographic objectives, although I myself cannot boast of having contributed by my own research to the knowledge in this field, and although I have, to some of my hearers, not much to say that is new. But it is a fact that the methods derived from the general doctrine of Abbe in reference to

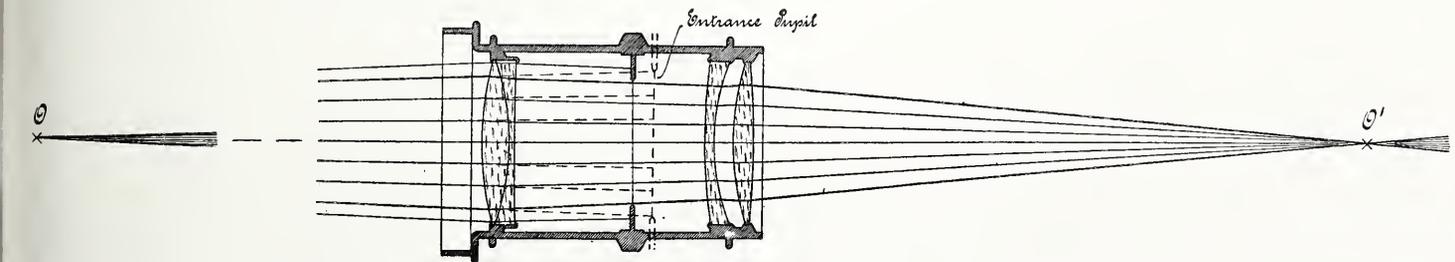

Fig. 3.

Focussed for finite distance, as usual for cabinet portraits. Aperture limited by diaphragm.

dered in this manner free from realisation through lens systems and proceeded with on purely geometrical reasoning, was the paper “On the general laws of optical instruments,” by J. Clerk Maxwell, in the year 1858. Maxwell, it is true, clung to a few reservations. In quite general form, without previous knowledge of Maxwell’s publication, Ernst Abbe was the first to deal with the problem exhaustively. We allude to his lectures in the University of Jena in the early seventies.

Long before these purely mathematical discussions the same laws had been stated as expressing certain effects of lens systems. In his celebrated “Dioptrischen Untersuchungen,” Carl Friedrich Gauss in 1800 showed that in a system consisting of any number of centred lenses a focal point lying on the axis and a focal length can be established in the object space and image space respectively. In the majority of cases the object and its reproduction lie in media of the same refractive index, that is, air. In that case the focal lengths in

the photographic objective are both interesting and valuable, not only to the scientific optician, but to the user of photographic lenses, for the reason that these methods allow of the treatment of such practical problems as rapidity, perspective, depth of definition, and “cut off” in a correct yet quite simple way.

We would enter upon the subject proper of our evening’s discourse by illustrating our remarks upon a well-known and historically celebrated photographic objective, namely, the portrait objective of Josef Petzval, which was constructed in 1840, and given to the world almost at once in such a state of perfection that it stood for decades without a rival, and even to-day alongside the modern objective retains its remarkable place. Fig. 3 is a drawing of this objective. O is an object point upon the axis, which radiates light in all directions. Let us see what rays the objective makes use of to produce an image point at O' . In the first place all rays can enter the objective which impinge upon the free front surface unimpeded by the

objective mount. Here at once a deflection of the rays due to refraction takes place, so that the pencil converges to a point lying on the right. This characteristic of the pencil is maintained as the rays pass through the successive lens surfaces. Only upon emergence from the third lens do the rays run almost parallel to the axis and are finally rendered convergent again by the fourth lens, so that they combine in the point O^1 , which is the "image" of O . The point

exists for the whole series of object points, and that this is identical with the Waterhouse or the iris diaphragm set in the objective by the constructor: this assumption can be thought to be always fulfilled in practice since the diameter of this diaphragm is reducible; for instance, we see from Fig. 5 that for an infinitely distant point lying in the axis the aperture is limited by a diaphragm of the same diameter as in Fig. 3.

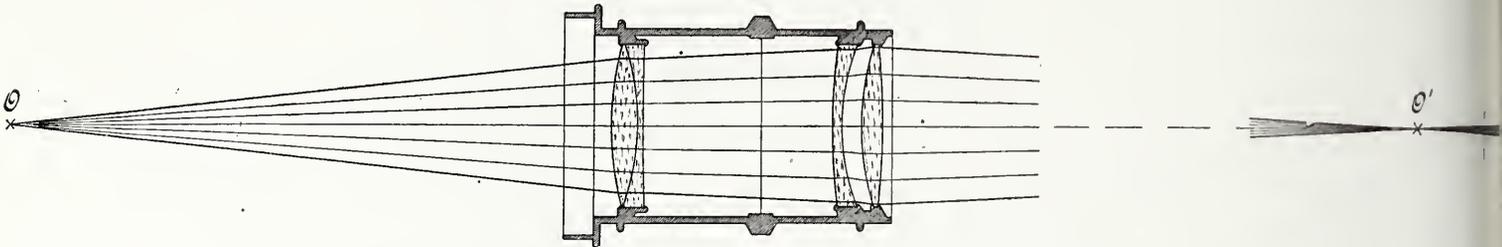

Fig. 4. Focussed for an unusually near object. Diaphragm removed: aperture limited by the mount of the back lens.

O^1 is the proper position for the focussing screen or the photographic plate.

We see that in the example the limitation of the rays contributing to the formation of the image O^1 is performed by the diaphragm, for all rays entering at the margin of the front lens are prevented by the diaphragm from proceeding further. For this reason the diaphragm—it may be a Waterhouse or an iris diaphragm—in effect acts as aperture diaphragm. Supposing the diaphragm to have a larger

In the example hitherto considered, the Petzval objective, the diaphragm has lenses situated on either side of it. Such is the case with all objectives known as double objective or doublets. In the majority of landscape lenses, particularly in the single lenses of convertible objectives, the diaphragm as viewed from the objective itself lies in front of the first lens surface, as shown in Fig. 6. Lenses with diaphragm behind them are rare, but, nevertheless, are conceivable in practice, as, for instance, where the single lens of a convertible objective is to be employed as a projection objective for powerful magnifications. In this case, to obtain a good projection the diaphragm as viewed from the object, that is to say, from the diaphragm, must lie behind the lens, Fig. 6 reversed.

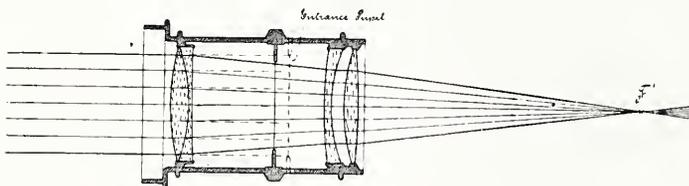

Fig 5. Focussed for an object—an infinity. Aperture limited by diaphragm.

For all considerations into which we shall enter in connection with determining the pencils of rays effectually contributing to the formation of the image it is eminently desirable to be able to delete from one's mind the course taken by the pencils within the lens system and only regard the course taken before their alteration at the first lens surface. Only in the case of a lens with front diaphragm is obvious that this can be done; though for the matter of that it is a great difficulty to apply it also in all other cases. How this is done is illustrated in Fig. 7. Suppose that various rays from a point on the diaphragm, for instance, from a point A, on the margin, or point B, in the plane of the diaphragm, proceed through the lens of the system lying in front of it towards the object. These then appear—influenced in their path by these lenses—ultimately to have proceeded from quite a different point, A and B respectively. The points A and B are therefore the virtual image points to A. and

diameter, all rays entering the first lens would go without let or hindrance to form the image O^1 , and then the margin of the first lens surface would take up the rôle of aperture diaphragm. Again, suppose that the diaphragm be entirely removed as in Fig. 4, and we follow the path of the rays which proceed from a point O , lying much nearer to the objective. The collective working effect of the first lens is then insufficient to render the rays on the right forthwith convergent. Convergence in this case only takes place at the front surface of the

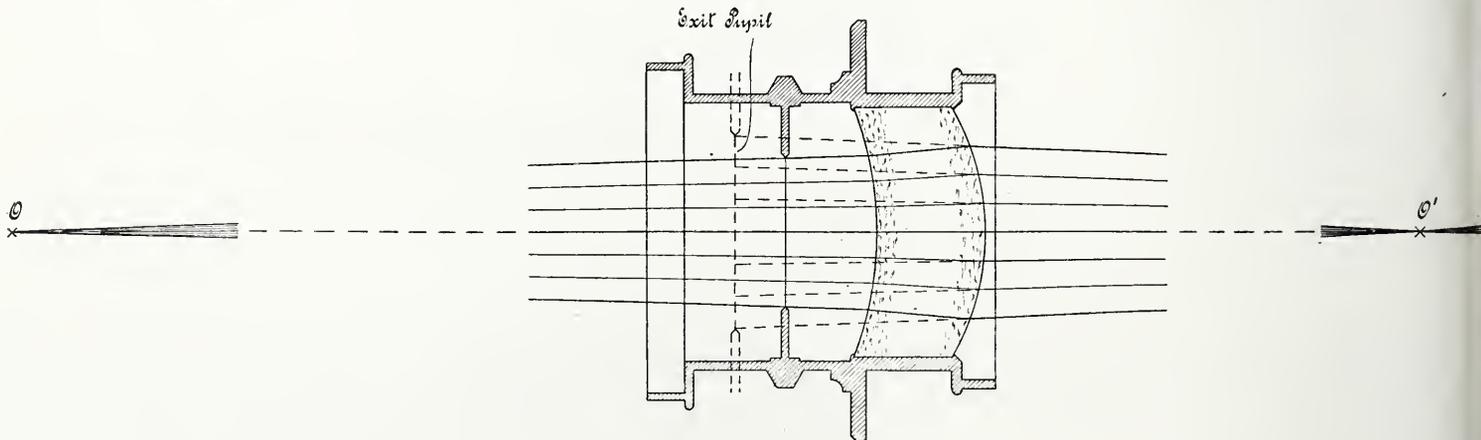

Fig. 6. Single lens with front diaphragm.

last lens. It is at once seen that now the margin of this last lens takes up the limitation of the rays, *i.e.*, becomes the aperture diaphragm, whilst in the former supposed case the margin of the first surface of the system would have this function. From these examples it will be quite clear that in one and the same lens system the effective aperture diaphragm for differently situated points on the axis may lie in quite different positions. Notwithstanding this fact, let us assume, henceforth, that only one definite aperture diaphragm

produced by the front component. In the same manner the front component produces for each point on the margin and the plane of the diaphragm a corresponding virtual image point. All these points together produce the virtual image of the diaphragm. This virtual image is shown in dotted lines behind the diaphragm. It is the same image taken up by the eye when we view the diaphragm through the front component of the double objective as with a kind of magnifier. Since we can follow the course of the rays just indicated all

rsely, it at once follows that all rays proceeding from the object directed towards this virtual image pass through the actual hragm after alteration by the front component. We give to this al image, which the lenses of the system lying in front of the hragm project from it, the name suggested by Abbe, namely, the

It will be understood from our derivation that the exit pupil is the virtual image of the entrance pupil as projected by the system as a whole.

The two pupils of a lens system have, therefore, a like importance for the selection of the rays really effective in reproducing axial

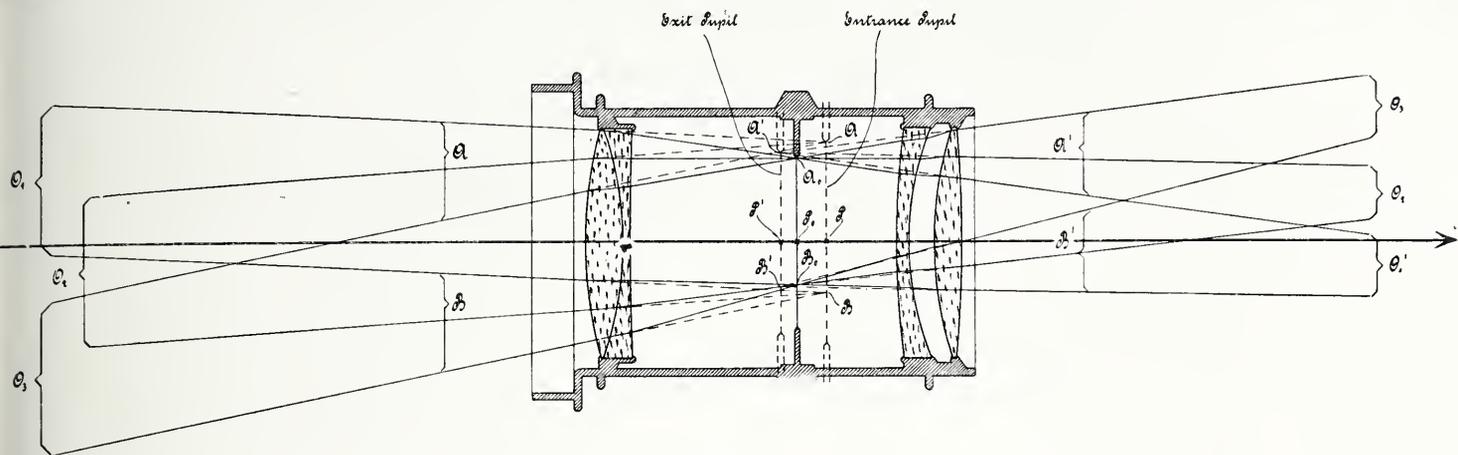

Fig. 7.
Derivation of the entrance pupil and the exit pupil in a doublet.

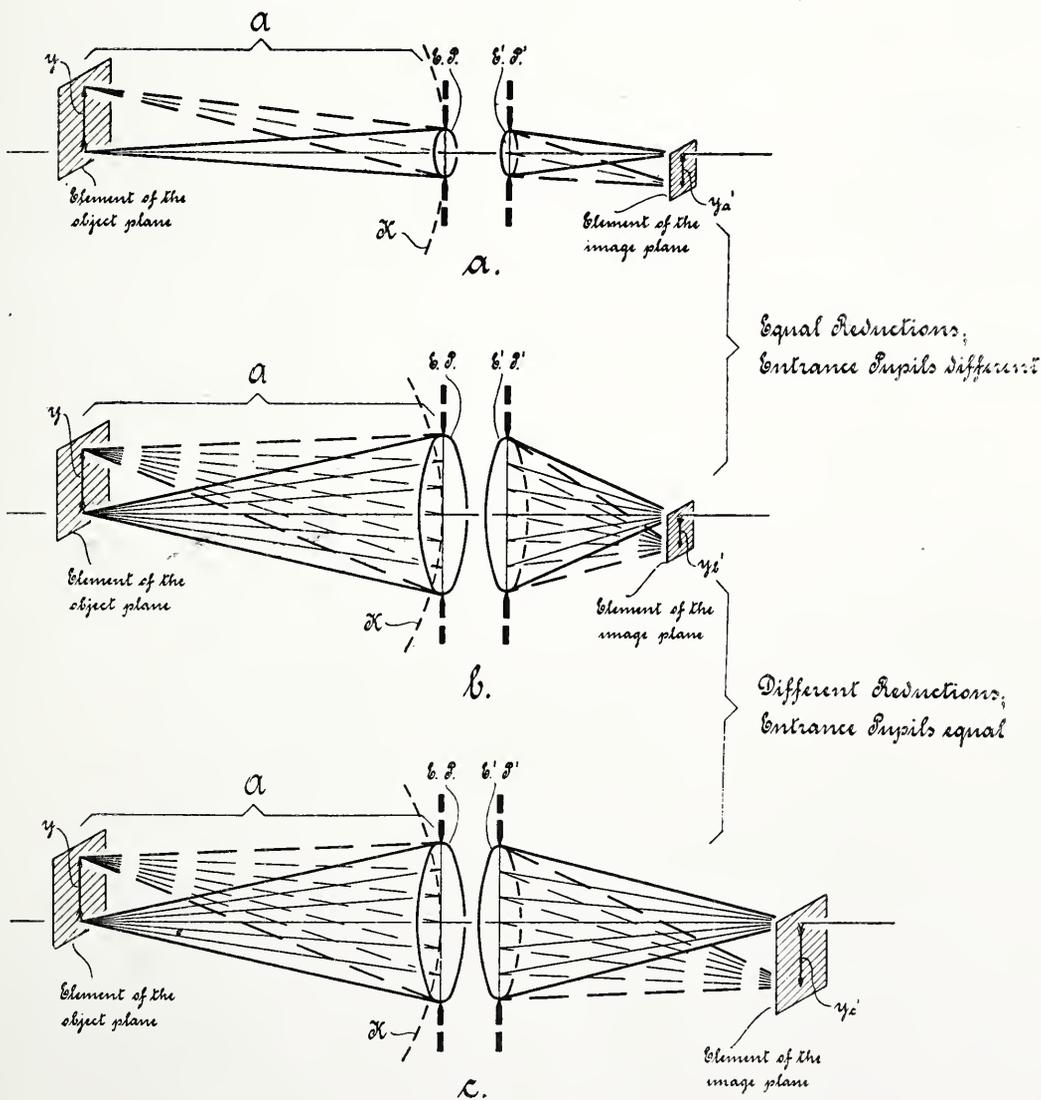

Fig. 8.
Equal near objects at equal distances from the entrance pupils.

ance pupil of the system, an easily comprehensible analogy being de use of. In the same manner the virtual image of the diaphragm projected by the lenses of the system lying behind the diaphragm is designated the *exit pupil*, and in the figure shown lies in front of the diaphragm. From it all rays which pass through the actual diaphragm appear to come on emerging from the last lens surface.

points, as have the Gauss principal points and the focal points of a lens system in all investigations as to the position and size of an image for any given object; since the introduction of the pupils frees us from the necessity of following the course of the rays within the system itself.

For our further consideration we will therefore leave the details

of the construction of the objective out of the question, and only assume that besides the principal and the focal points, or instead of these Gauss elements the position and size of object and image, we know its entrance and exit pupils. It may again be recalled to mind that in an objective with frontal diaphragm the entrance pupil is identical with the physical diaphragm itself (Fig. 6), that in objectives with middle diaphragm (Figs. 3 and 5), on the other hand the entrance pupil is in most cases an enlarged virtual image of the diaphragm, and lies in proximity to it.

The first question that obtrudes itself in the discussion of the pupils is the one dealing with relative rapidity. In Fig. 8 there are three different optical systems, characterised by their pupils by the position and size of a square object element standing at right angles to the axis and of the image element appertaining thereto. The distance A of the object from the entrance pupil, the object

$y'^2_b : y'^2_c$. They stand then inversely as the squares of their size image, other things being equal.

The comparison is somewhat simpler if it be supposed that the object be infinitely distant. Fig. 9 is intended to represent this case. The object is again in all three cases, a, b, c , identical, that is to say, it appears under the same angle w , and it illuminates the three cases with the same brightness. In a and b the sizes of the images are again equal, the entrance pupils different. The spherical surface K , which we have made use of in the foregoing consideration as a measure for the quantity of rays contributing to the reproduction, coincides with the surface of the entrance pupil since the radius of the measuring sphere is infinitely large. The quantity of light contributing to the image is here consequently the same, the ratio of the surfaces of the entrance pupils, or, what amounts to the same thing, in proportion to the squares of their diameters

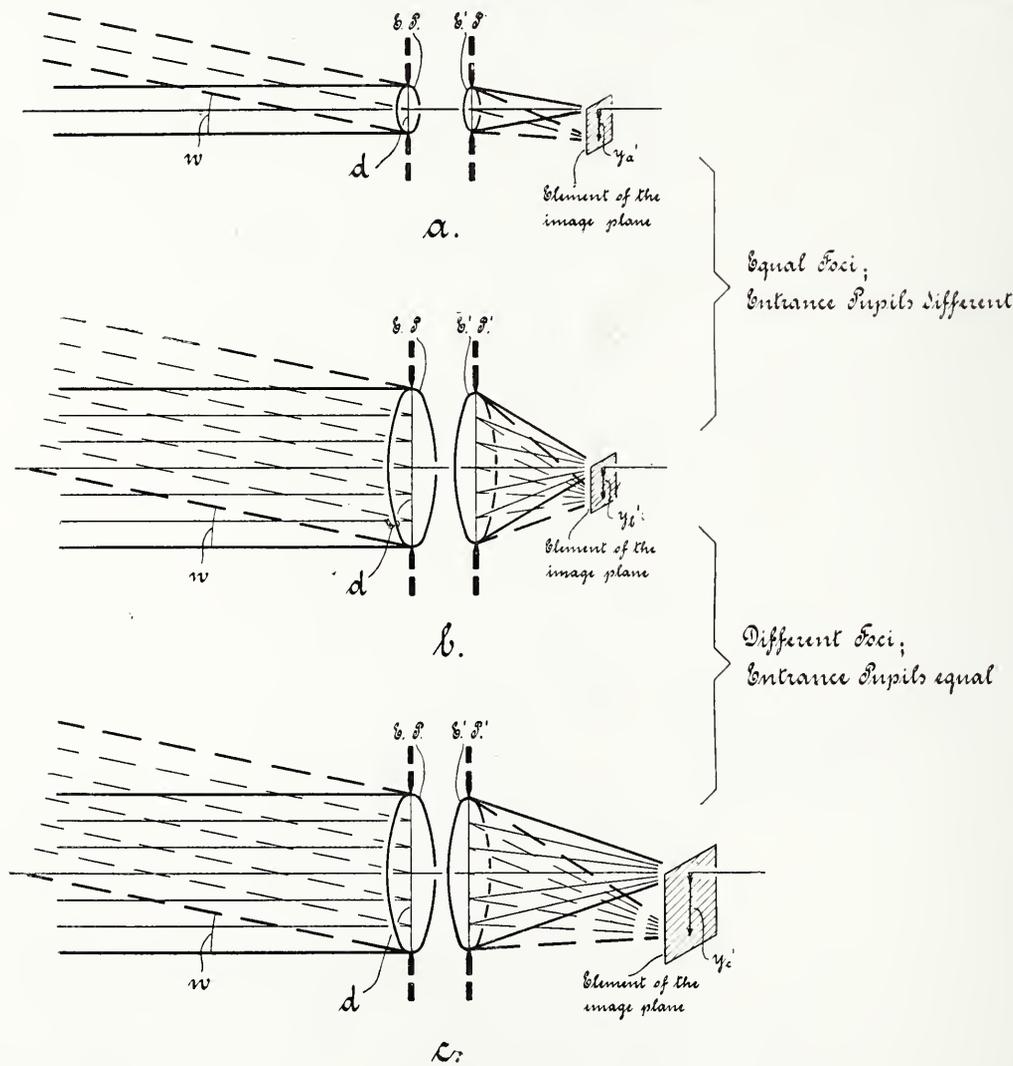

Fig. 9.

Equal objects at infinity.

itself as well as its radiating capacity, is the same in all three cases. In the cases a and b the size of image y' is the same, but the diameter of the entrance pupils is very different. It is evident that in the case b the image must appear brighter, since the quantity of light producing the image is much greater in the case of b than in the case of a , and the light is spread upon an equally larger surface. If now a sphere K be described about the object point on the axis having the radius A , the quantity of light contributing to the reproduction is measured by the part of the surface of the sphere which is limited by the rays directed towards the margin of the entrance pupil.

Let us now compare the two cases b and c . Here the diameters of the entrance pupils are equal; consequently the quantity of light entering the system from the object element is also exactly the same. This quantity of light is, however, in the case c , transferred to a larger image element than in the case b ; the two image surfaces are as the squares of their diameters $y'^2_c : y'^2_b$. The intensity of illumination of the two image elements must therefore be in the inverse ratio

The intensity of the image elements is thus in the same ratio $D^2_b : D^2_c$, other things being equal.

In the case b and c equal entrance pupils are supposed, but unequal sizes of image. Analogous to the case spoken of above the intensity of the images must consequently be in this case inversely as the square of the size of the image $y'^2_c : y'^2_b$. The size of image is expressed according to a well-known rule by the formula $y' = f \tan w$. According to our supposition the angle w is in all three cases equal, so that we have—the image sizes are as the equivalent focal lengths $f_c : f_b$. It follows that the intensity of the images in the cases b and c is inversely as the square of the focal lengths of the systems.

In the case of an infinitely distant object as represented in Fig. 9 we have the result therefore in a condensed form. Other things being equal the intensity of the image on the focussing screen or on the photographic plate is directly proportional to the square of the diameter D of the entrance pupil, inversely propor-

al to the square of the focal length; it is consequently measured by the expression $D^2 : f^2$, i.e., $(D : f)^2$. The expression in brackets, namely, the diameter of the entrance pupil over the focal length, is known as the "relative aperture" of the system.

It is readily understood from the last consideration that in the case of an infinitely distant object the "relative aperture" of the system is a reliable measure when the relative rapidities of different objectives are being compared. This fact cannot be applied indiscriminately in the case of near objects. Here cases arise where it is absolutely necessary to ascertain directly the entrance pupils and the sizes of image in order to avoid error. An example will make this quite clear. It is taken from a domain in optics, which John Traill-Taylor took a most practical interest, namely, in the domain of the telephotographic objective.

In photographing near objects it is often convenient that the distance between negative element and focussing screen shall remain unchanged, and focussing be effected by altering the distance between positive and negative elements, a requisition frequently occurring in hand cameras with fixed extension. Suppose, for example, that the object lies 3 m. in front of the entrance pupil as shown in Fig. 11. Since the focal length of the front element is 150 mm., the front element projects a 19 times reduced image of the object at O_1' , and this point O_1' lies about 8 mm. behind the focal point F_1' . By the same amount of 8 mm. must now the distance between positive and negative element be enlarged, in order that the primary image O_1' again, as in the previous case, lies 20 mm. in front of F_2 . It is only then that the sharp three times magnified secondary image from the negative element will be again

Teleobjective: $f_1 = 150 \text{ mm.}$, $f_2 = 60 \text{ mm.}$, $\Delta = 20 \text{ mm.}$ } $f_1 \times f_2 = \frac{150 \times 60}{20} = f = 450 \text{ mm.}$, $\frac{d}{f} = \frac{45}{450}$ - Relative aperture = $f/10$, Scale of reduction $D_0 = \infty$

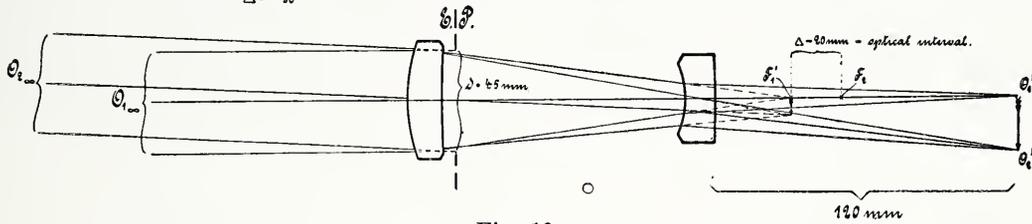

Fig. 10.

Teleobjective: $f_1 = 150 \text{ mm.}$, $f_2 = 60 \text{ mm.}$, $\Delta = 28 \text{ mm.}$ } $f_1 \times f_2 = \frac{150 \times 60}{28} = f = 320 \text{ mm.}$, $\frac{d}{f} = \frac{45}{320}$ - Relative aperture = $f/7$, Scale of reduction $D_0 = 6.3$.

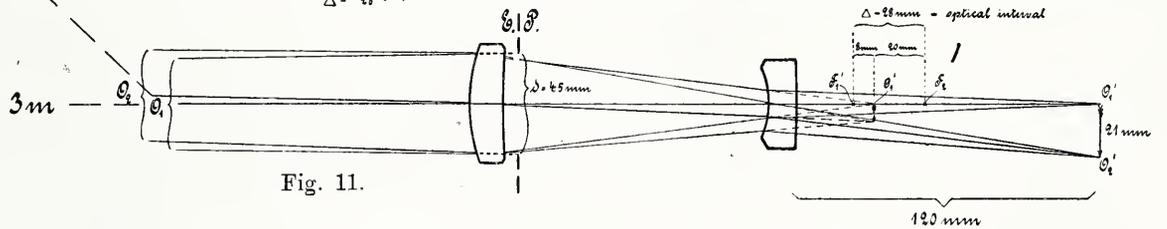

Fig. 11.

Ordinary Doublet: $f = 320 \text{ mm.}$, $\frac{d}{f} = \frac{45}{320}$ - Relative aperture = $f/7$, Scale of reduction $D_0 = 3.1$.

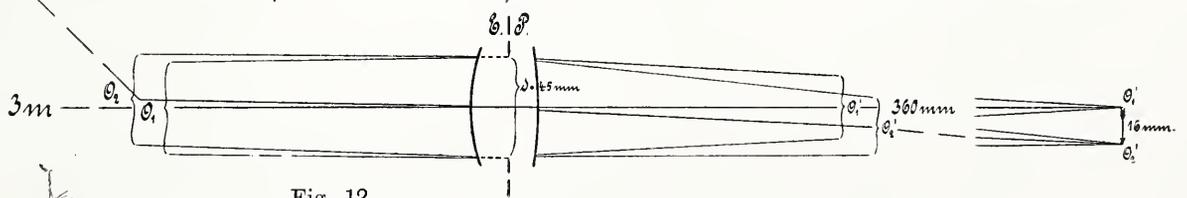

Fig. 12.

Ordinary Doublet: $f = 450 \text{ mm.}$, $\frac{d}{f} = \frac{45}{450}$ - Relative aperture = $f/10$, Scale of reduction $D_0 = 3.2$.

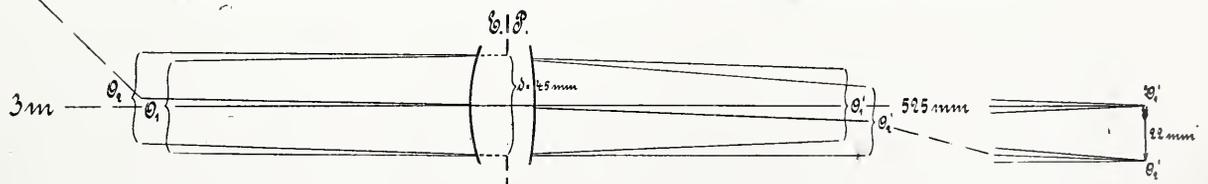

Fig. 13.

A certain type of tele-objective is represented in Fig. 10. The positive element has, say, a focal length of 150 mm., the negative of 60 mm. The distance between the two elements is adjusted, so that the focal point F_1' of the front element lies in front of the front focal point F_2 of the negative element by the amount $\Delta = 20$ mm. The image of a distant object projected by the front element at F_1' , were the negative element absent, is magnified threefold, at a distance of about 120 mm. behind the negative element. The focal length of the tele-objective as a whole is according to a well known rule $f = \frac{f_1 f_2}{\Delta} = \frac{150 \text{ mm.} \cdot 60 \text{ mm.}}{20 \text{ mm.}} = 450 \text{ mm.}$ The entrance pupil is assumed to lie in the neighbourhood of the front element and have 45 mm. diameter. The relative aperture of the system is thus $f/10$.

projected upon the focussing screen, which according to our supposition has not altered its distance from the negative element. The reduction, with which the final image is reproduced, is $\frac{19}{3} =$ about 6.3. The optical interval, contrary to the previous case, is increased by 8 mm. and amounts therefore to 28 mm. In this way the focal length of the system as a whole now amounts to $\frac{150 \cdot 60}{28} = 320 \text{ mm.}$ Since the diameter of the entrance pupil 45 mm. has remained the same throughout, the relative aperture in the new form of the objective is $\frac{45}{320} = f/7$.

We take now instead of the tele-objective two ordinary photographic objectives one after another, the entrance pupils of which are

likewise 45 mm. diameter, at the same distance of 3 m. from the same object. The first represented by Fig. 12 has, we will suppose, a focal length of 320 mm., consequently having a relative aperture of $f/7$, exactly as the tele-objective when being focussed upon the near object. It then projects an 8.1 times reduced image of the object. The second objective has, say, a focal length of 450 mm., relative aperture $f/10$, exactly the same as the tele-objective in focussing upon infinity. It then projects a 5.9 times reduced image of the object. You see, the sizes of image are in the cases of Figs. 11 and 13 almost the same, since the scales of reduction N 6.3 and 5.9 differ but very little; in the case of Fig. 12 the size of image is considerably smaller. The total quantity of light is in all three cases exactly the same.

We have consequently the result, that our tele-objective, in the case where distant focussing is effected with fixed distance between negative element and focussing screen by altering the distance between front and hinder element, has the same effect with respect to the size of image and intensity for distant and fairly near objects as an ordinary objective of 450 mm. focal length and with the relative aperture $f/10$, notwithstanding that the tele-objective has these data in reality only when focussed upon infinity whilst

to the axis of the objective sharply and free from distortion upon the plane focussing screen. If a very small region of the image near to the axis of the objective, be examined, we know that ready here in the middle of the image field no objective produces mathematical sharpness, but that circles of confusion take the place of image points, the sizes of which circles go hand in hand with spherical aberration, and aberration of the sine condition in pencils parallel to the axis. Comparing only systems of the same objective type the remnants of these aberrations are in general all the greater, the greater the relative maximum aperture of the objective. Comparing objectives, however, of different types, it is found that certain types are favourable to the extinction of the above-mentioned aberrations, whilst others are not. In this way an objective of particularly favourable sort may even, with the relative aperture $f/3$, produce the same sharpness in the middle of the field, which in another less favourable type can only be reached at, say $f/18$. It is a question, not so much of the sharpness in the middle of the image field, but rather that the image field shall have the largest possible extension, upon a plane plate, sharp and in correct drawing. Consideration only of the above-mentioned aberrations for pencils parallel to the axis is no longer sufficient; on the contrary, speci-

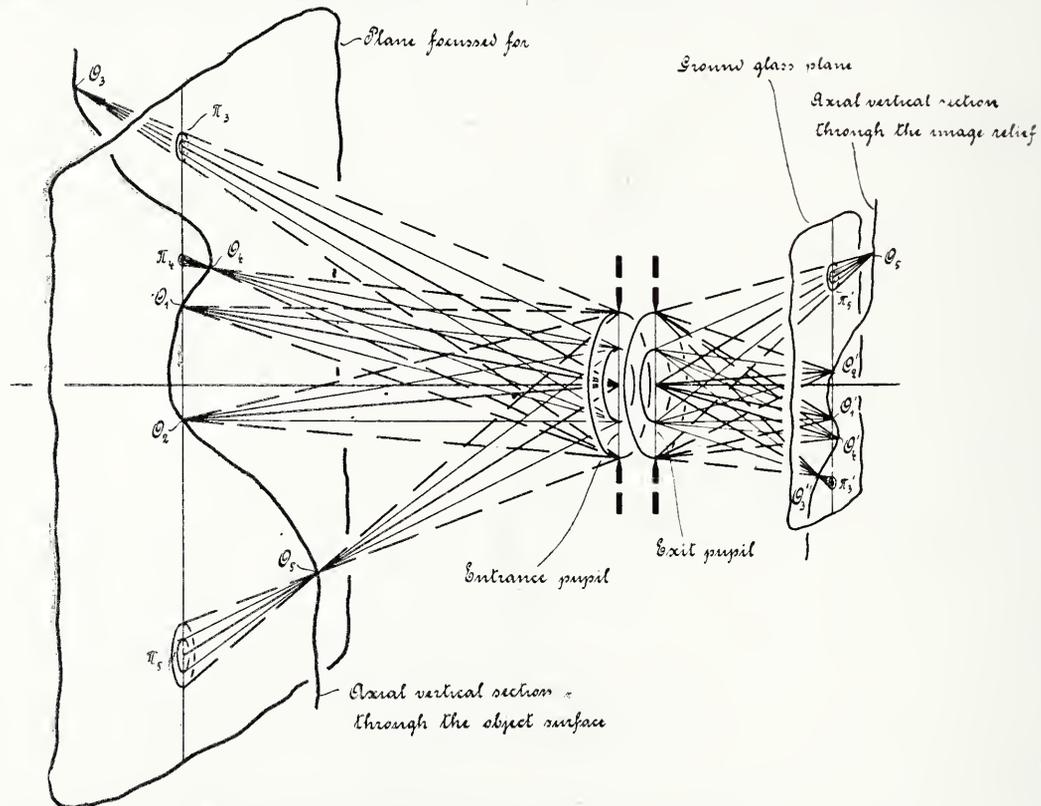

Fig. 14.

Representation of a three-dimensional object.

when focussed upon 3 m. its focal length is reduced to 320 mm., but its relative aperture enlarged to $f/7$.

We have seen hitherto that the regulation of the image-producing rays by the entrance pupil determines the rapidity of the system. With regard to a maximum rapidity it appears desirable to make the entrance pupil relatively to the focal length as large as possible. You know that in photographic objectives only in the most rare special cases has this ratio, the relative aperture, exceeded the value $f/3$, that the objective for every-day use has a maximum aperture not greatly exceeding $f/4.5$, or even $f/6.3$, and that these large apertures in ordinary use, in the majority of cases, are more or less reduced by stopping down the iris diaphragm.

The geometrical optical reasons why a regulation of image-producing pencils of rays by the entrance pupil must take place, are of two kinds. The first reason, which is in general dealt with in the most detailed manner, is that all rays, which in consequence of their too large aberrations would produce inadmissible unsharpness, must be prevented from taking part in the formation of the image. Upon this point only a few words more.

In a photographic objective care has to be taken by the constructor that it reproduces a plane object standing at right angles

errors of pencils inclined to the axis arise, and must be corrected, e.g., astigmatism, curvature of field, distortion, etc. General speaking, it may be said that those types particularly favourable to the elimination of the aberrations of pencils parallel to the axis are unfavourable to the elimination of the errors of pencils inclined to the axis, and inversely. In this way the desire for a very large available aperture is antagonistic to the desire for a very large available field of view. The constructor of an objective has, therefore, to make a compromise, yet he must always endeavour to discover objective types, the limits for the relative aperture and for the image field of which are simultaneously the largest possible. It is well known that renowned opticians have dedicated their best abilities to this end, and it is just as well recognised, what high degree of success has, particularly in the last two decades, attended their efforts in fulfilling the requisition for rapid objectives with large plane and anastigmatic image field.

It is not our intention to go further into the aberrations of objectives. The above general remarks may remind you of the fact that the regulation of the aperture of the image-producing pencils of rays by the entrance pupil, on account of aberrations, must always be reckoned with.

The second reason why in photographic objectives a regulation of image-producing rays by the entrance pupil must occur has to do with aberrations, but must be ever present also in an ideal system—that is, a system perfectly free from aberration, were such a system possible. With a view to rendering the description as simple as possible, we will assume therefore that the systems are absolutely free from aberration, an assumption we have already tacitly made above.

The second reason is the following:—In the generality of cases the task imposed on the photographic objective is, that it shall project on the focussing screen—i.e., in one plane—objects extended in space, landscapes, buildings, persons, etc. A fulfilment of this condition is conceivable only when a definite regulation of the projecting pencils takes place.

The pupils of a definite system are shown in Fig. 14. It is assumed that they are circular in shape, and that their diameter can be reduced by contracting the iris diaphragm. As before, the object lies on the left side of the drawing. Whilst we have restricted ourselves in the foregoing to considering a plane object, we will now consider an object extended in space, and select a few object points O_1, O_2, \dots, O_5 therefrom. The rays proceeding from these object points and con-

the plane focussed for a projection figure consisting of points and circles. It is self-evident that not only the points O_1 and O_2 appear correctly on the ground glass screen, but also all other configurations lying in the plane focussed for—i.e., the circles of confusion, π_3, π_4, π_5 . In this way the objective reproduces on the ground glass screen the projection figure composed of circles and points lying in the plane focussed for perfectly true on a certain definite scale of reduction. This is the whole function of the objective.

We consequently arrive at the conclusion that the representation of an object extended in space upon the plane photographic plate or focussing screen is not a point-for-point reproduction in the strict sense of the word, but an example of projection. Since the objective does nothing more than reproduce the projection figure lying in the plane focussed for on the focussing screen correctly in any scale N , we need now only concern ourselves in discussing the photography of solid objects with its projection figure in the plane focussed for. Dr. von Rohr was the first to call attention to this exceedingly simple and comprehensive method, and to put it into practice systematically.

In the further discussion of the above-mentioned projection figure in the plane focussed for, two problems must occupy our attention—

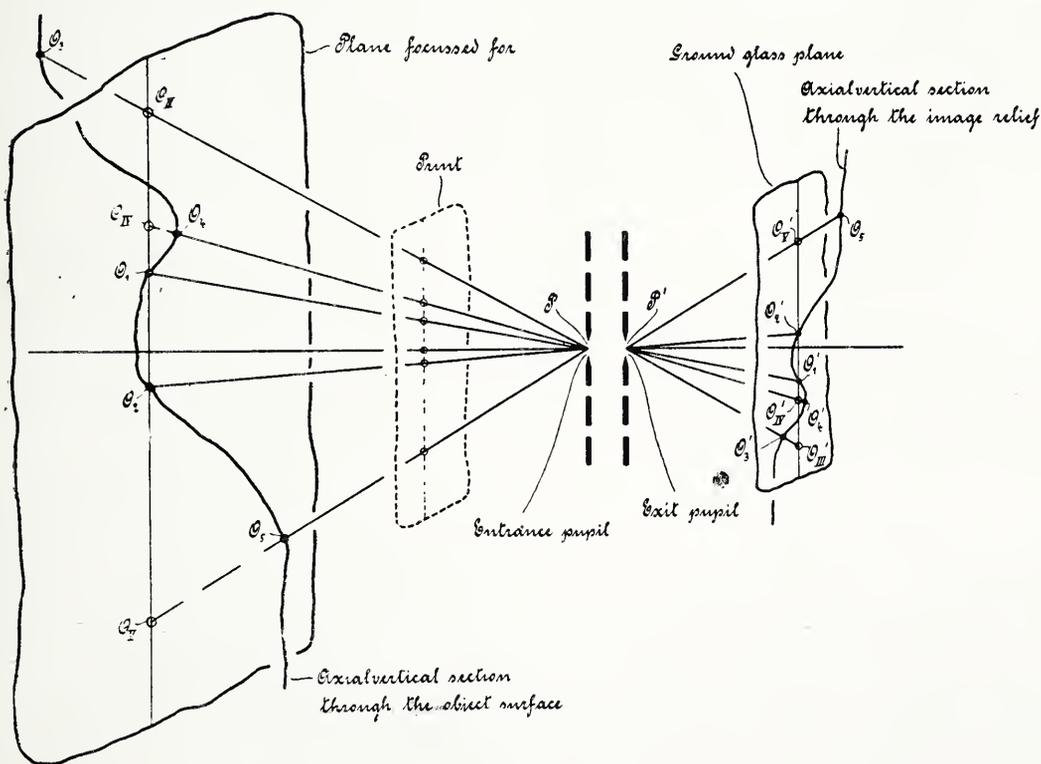

Fig. 15.
The centre of the entrance pupil as the centre of perspective.

...uting to the reproduction are again regulated by the margin of the entrance pupil, and upon emerging from the system by the margin of the exit pupil. Let us now suppose a plane drawn at right angles to the axis through the point O_1 , which lies at a medium distance from the plane of the entrance pupil. The point O_1 is sharply reproduced in the point O'_1 , and we draw through the point O_1 a plane at right angles to the axis. The system reproduces, then, the points lying in the drawn object plane sharply in the drawn image plane; for instance, O_2 in O'_2 . We will suppose that the drawn image plane coincides with the focussing screen, so that the points of the drawn object plane are sharply focussed on the screen. We call this plane therefore the "plane focussed for." Object points O_3 lying in front of the "plane focussed for" also appear sharp, as O'_3 in front of the plane of the ground glass screen; object points O_4 and O_5 behind the plane focussed for appear sharp behind the plane of the ground glass screen. On the latter plane if the pencil of rays converging on the image points O'_3, O'_4, O'_5 , appear as larger or smaller circles of confusion, π_3, π_4, π_5 . If now series of cones be formed with each object point as apex and the entrance pupil as base, these cones cut the plane focussed for in circles, which are greater the farther the object points lie in front or behind the plane focussed for. We obtain in this manner in

namely, the problem of perspective and that of depth of definition. As to perspective, we turn once again to Fig. 14. In the plane focussed for the circles of confusion, π_3, π_4, π_5 , appear as the representatives of the object points O_3, O_4, O_5 . Although these circles have a finite extension, their middle points would, nevertheless, be always considered as the points which they are said to replace. In these middle points the plane focussed for is met by rays which are directed from the object points towards the centre P of the entrance pupil. In Fig. 15 these rays alone are drawn. They are called "principal rays." In the manner represented the points of contact of the principal rays in the plane focussed for form what is known as the perspective representation of a solid object and the centre of the entrance pupil is the centre of the perspective.

We must here remember that upon the photographic plate there appears a true N -times reduced image of our projection figure; we can then place a print between the entrance pupil and the plane focussed for in such a position that seen from the centre of the entrance pupil of the system each point of the print lies in the same straight line as the object point represented by it. To establish this coincidence a certain definite position of the print has to be found; the point of the print, which lay on the axis of the objective during exposure, must lie at right angles to the centre of the entrance pupil, and

simultaneously the distance of the print from this centre must be N -times as small as the distance of the plane focussed for. It is easily comprehended that the eye must take up the same position relatively to the print as the centre of the entrance pupil, if the eye is to view the image with correct appreciation as to perspective; and must further be borne in mind that the centre of rotation of the eye must form the centre of perspective, since images are not viewed with the eye at rest, but with the eye continually in motion, so that the various points of the image can be looked at one after the other. In the majority of images this rigid rule of viewing has to be carried out at so short a distance between centre of rotation and the image—that is to say, with few exceptions at a distance equal to the focal length of the objective employed—that persons with normal vision find it impossible to obey it, and instinctively hold the image farther off from the eye. In so doing they obtain naturally quite a false impression of the object.

In Fig. 16 a few false impressions are represented in a simple manner. A, B, C is intended to be a print of a skeleton cube. When the print is situated at the correct distance from the centre P of rotation of the observing eye, a correct impression as to the print representing a cube is obtainable. This is shown in fig. 16a. If the same print be viewed from a too great distance a true impres-

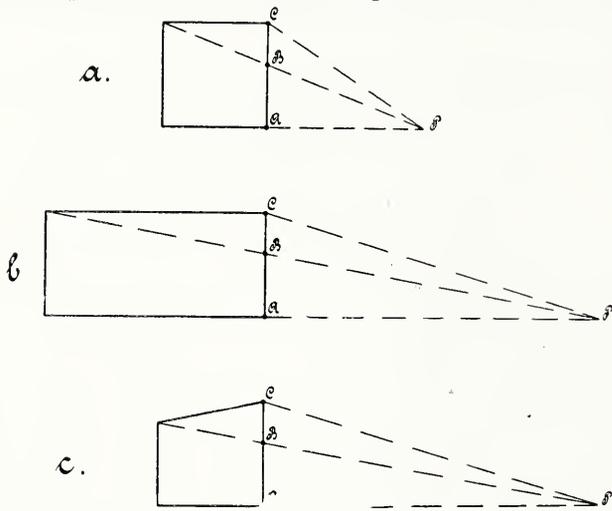

Fig. 16.

Apparent alteration of depth and form, due to increased distance between eye and print.

sion of a cube is no longer possible. Instead of this one, as shown in fig. 16, *b* or *c* will be inevitable. How such false impressions are to be avoided will be found described in a paper given by Dr. von Rohr before this society on November 10, 1903, entitled "The Verant, a new instrument for viewing photographs from the correct standpoint." For a closer study of the question connected with the perspective of photographic prints this paper—from which fig. 16 is taken—can be warmly recommended.

In the photograph of an object extended in space the centre of the entrance pupil has thus the extremely important function of forming the centre of the perspective, and it is hardly necessary to repeat here that the type of objective, provided it be free from distortion, as well as its focal length, has nothing whatever to do with the perspective of the print.

The second question which obtrudes itself in the photography of an object extended in space is that of the depth of definition. This question, too, is answered for us, when we investigate the action of the entrance pupil. As shown in detail in fig. 14, the objective projects from the object points O_3, O_4, O_5 , which do not lie in the plane focussed for, in no case sharp image points upon the focussing screen, but, on the other hand, larger or smaller circles of confusion.

DR. E. WANDERSLEB.

(To be continued.)

ERRATUM.—By an error of translation of the article by Dr. Scheffer in the "Colour Photography" supplement last week, the author was made to state the exact contrary of the fact as to the presence of filling in the 'Omnicolore' plate. The passage in the second column of Dr. Scheffer's article on page 11 should read: The colour areas do absolutely join: there is no filling material, but the edges of the areas are somewhat more transparent than the centre.

Photo-Mechanical Notes.

"Klimsch's Jahrbuch, 1909," and "The Graphic Arts Year Book, 1909."*

"KLIMSCH'S ANNUAL" maintains its lead in regard to taste and get-up. The binding is suitable, the type is good, the paper satisfactory, in the type matter there are no insets having no relation to the text, and the decoration of the latter initials, tail-pieces, etc., appears to be the work of one hand, thus preserving a pleasing uniformity throughout the pages, which is in the least monotonous. While the articles in the English "Process Year-Book" deal mainly with process matters, in the volume under review, the articles cover a wider range, dealing with everything concerning book production. In addition, in the American one there is a general section containing articles not always strictly related to the technical side of the craft, as for example, on film systems. The two most interesting articles in Klimsch's book, from the photo-mechanical point of view are, one by Dr. Scheffer dealing with the capacity of reproduction processes for rendering detail, which we recently reproduced, and one by Herr R. Russ on the screen-containing printing frame. This is the only article we can remember dealing with this matter since the controversy in the "Photogram" as to this process so long ago as 1901 and 1902. The method is that invented by Dr. Albert. He has recently sold it to one or two English firms, and it is still being actively pushed by his agent in London. We are therefore likely to hear a good deal more of the process, and hence a description is particularly welcome just now.

Other articles deal with type-setting, type-setting machine, type-founding, newspaper rotary printing, lithographic stone, negatives for litho-transfers, modern photographic lenses, steel etching, paper-making, bookbinding, end papers, steam power for printing, and the usual list of the year's books, patents, and notable events in the German printing world. Then we have the supplements all together at the end, and these comprise examples of modern reproduction processes, all excellent, also examples of new types, some of the antique founts being very good. "Klimsch's Annual" is decidedly one that those interested in book-production ought to possess.

"The American Graphic Arts Year Book" has made a notable step in advance this year in its artistic ensemble by adhering to one type throughout. The binding is also better than former ones, even though it is not so showy. But we cannot help feeling irritation at meeting all sorts of irrelevant supplements in the midst of text, and we look forward to the time when all the specimens will be placed at the end of the volume. Certainly some of the examples are extremely good; we never remember to have seen a finer colotype than the "lady with fan," while some of the half-tones probably reach the limit of possibility in this process with the means available at present. There are a very large number of three-colour plates, many of them good, others quite the reverse. The originals have something to do with this, perhaps. The articles include reviews of progress, on photography in colour, on photo-engraving matters, on lettering typography, on commercial illustration, and general matter. Many of these articles are written by Europeans. The English contributors include Wm. Gamble, H. Klein, Arthur Payne, A. L. Newton, A. J. Bull, Dr. Mees, and Joseph Goodman.

In an article on "Type Designing" there is a gem that we cannot refrain from quoting. It runs, "In America there are but few notable letter-foundries, and yet this country leads the world in type-making. The best that can be said of most English foundries in the matter of type design is that they are good copyists. Perhaps the gentleman is right with regard to some of the horrible abortions we have seen in type-founders' specimen books, but when it comes to really beautiful type where is the American type that is an improvement on old-face Caslon, or, to take a select example, have they type to equal the design of that used by the Doves Press?"

* "Graphic Arts and Crafts Year-Book." Republican Publishing Co., Hamilton, Ohio, U.S.A. Price, 5 dols. "Klimsch's Jahrbuch." Klimsch and Co., Frankfurt-on-the-Main, or Hunter's Ltd. 6s. net.

preceding two articles on type matter themselves, however, only a sufficient correction to the ridiculous claim quoted.

Two of the most interesting articles are those on "The Magnetite Plates," by G. M. Dyott, and on "Various Automatic Engraving Processes," by N. S. Amstutz. As in the case of the English Year Book, it must not be forgotten that many of the articles deal with processes and materials in which the writers have a direct pecuniary interest, though it is difficult to see how the matter for a year-book of this character could be obtained from quite impartial sources.

Celluloid Electros Direct from Natural Objects.

It is proposed to prepare electros for typographic printing direct from such objects as lace, leaves of trees, etc. The patent specification (No. 8,557. 1908) drawn up by H. Sefton-Jones for the inventors, Société Anonyme Petitcollin, of 20, Boulevard St. Denis, Paris, describes the process as follows:—The block of celluloid is first heated by heating, and is placed upon the platen of the press and covered with the lace itself, upon which is then placed a sheet of copper or perfectly smooth metal. The pressure causes the lace to press itself into the soft material. The counterpart (when required for producing an embossed print) is obtained easily by ordinary means.

Such blocks obtained by direct impression from samples of lace can be utilised with or without their counterpart to reproduce the patterns in all their fineness; sheets of patterns, samples for travellers, and so forth may thus be made by direct impression from the actual print of the lace or the like, giving the exact representation of the original samples.

In the "Bulletin de Maître Imprimeurs de France" we have seen some excellent proofs of lace done in this way, as well as of ordinary work. The use of celluloid for making duplicates of blocks has been long known, and, we believe, has had considerable use in America. Mr. Amstutz has often used his original cut celluloid blocks for printing also. The application of the process to the production of blocks for printing lace appears to be a useful and successful extension of the same idea.

Brown Stains on Wet-Plate Negatives.

A wet collodion negative, which is finished by blackening with a solution of mercuric iodide or ammonium or sodium, sometimes shows bad brown staining. This is generally due to insufficient washing between development and fixing. But it may be due to insufficient fixing, and where fixing is done by placing the plate in a bath of cyanide solution, the negative ultimately becomes so saturated as to fail to dissolve out the mercuric cyanide and silver salt first formed on placing the negative in the bath. Thus, although the negative appears fixed, it is not so really, and brown stain results. When the fixing bath is renewed it will be found that this trouble disappears.

The Fading of Coloured Originals.

It has been found that even the best modern pigments fade under the rays of the enclosed arc lamps, and some of the cheaper pigments used by artists fade very rapidly. This is a point that should be borne in mind by photo-engravers, who, when using enclosed arcs as an illuminant in making negatives for three-colour work, should be sure that the originals are not valuable, otherwise it is possible that they might be liable for damages if the colours faded while the original was in their hands for the purpose of reproduction. When it is known that the original is valuable it would be well to only use daylight for lighting it when making the negatives.

The Mounting of Blocks.

The wood mount of the photo-engraved plate has always been the despair of the printer, and numerous attempts have been made to find substitutes for it. Metal is too heavy, expensive, and more difficult to work, while various compositions that have been suggested have invariably broken down in practice, either when mounting on the plate or under the crushing strain of the printing press. Wood is extremely convenient, if only it would not warp, and it is in order to obviate this characteristic that Green's patent "locked grain clamped board" has been introduced. These boards are clamped on both sides, tongue wherever there is any joint, and the ends are clamped at the ends, and they are planed absolutely true on

both sides. They naturally cost a little more than ordinary mounting wood, and blocks so mounted should certainly be priced at an enhanced figure. But even so, the printer would certainly find them economical, both in saving time and temper, especially when printing three-colour work. We have had a mount under test for the past three months, and it has answered entirely to our satisfaction. These mounting blocks are supplied by Messrs. Green and Sons, Ltd., Electra Mills, Mildmay Avenue, London, N.

PORTRAIT ESSENTIALS.—In portraiture it is not so much the absolutely just relations of the human body or head which concern the photographer as the most striking part of the same. This is the essential—so to photograph the countenance than an agreeable impression will be produced and yet be like the original. Hence we must deviate a little from the principle set down for illumination when we come to photograph the head. We must not let the light fall directly from above upon the head, inasmuch as the upper part of the face, the forehead, by projecting over the lower part horizontally, throws the eyes in shadow. Moreover, we must greatly modify or moderate the front light, in order to preserve the beautiful concavities and elevation which together make up the glory of the human countenance. The front light must be transformed into a soft, diffuse light. The direct upper must, therefore, be shut off behind the sitter and converted into a front upper light. The side light needs but little modification, and is allowed to operate the strongest, inasmuch as it tends to round the countenance. We have, therefore, to bear in mind the following combinations: a full side light, a front upper light, and a diffuse front light.—"Der Amateur Photograph."

FORTHCOMING EXHIBITIONS.

- February 1 to 13.**—Glasgow and West of Scotland Amateur Photographic Association. Sec., James M'Kissack, 68, West Regent Street, Glasgow.
- February 8 to 13.**—St. Helen's Camera Club. Sec., A. G. Else, Duke Street, St. Helen's, Lancs.
- February 10 to 13.**—Cleveland Camera Club. Secs., F. W. Pearson and R. Walton, 39, Granville Road, Middlesbrough.
- February 11 to 20.**—Leicester and Leicestershire Photographic Society. Sec., Harry Cross, 80, Harrow Road, Leicester.
- February 16 to 20.**—Norwich and District Photographic Society. Sec., J. T. Tanner, The Lodge, Bowthorpe Road, Norwich.
- February 20 to March 6.**—Edinburgh Photographic Society. Exhibition Secs., Edinburgh Photographic Society, 38, Castle Street, Edinburgh.
- February 20 to March 20.**—South London Photographic Society. Sec., H. Creighton Beckett, 44, Edith Road, Peckham, S.E.
- February 22 to March 6.**—Birmingham Photographic Society. Entries close February 12. Sec., Lewis Lloyd, Church Road, Moseley, Birmingham.
- February 26 and 27.**—Ilford Photographic Society. Entries close February 18. Sec., H. Eales, 53, Coventry Road, Ilford, Essex.
- March 9 to 10.**—G.E.R. Mechanics' Institution, Stratford, E. (Photographic Section). Entries close February 27. Sec., A. Woolford, 16, Grove Green Road, Leytonstone, N.E.
- March 11 to 13.**—Coventry Photographic Club. Entries close March 5. Sec., W. R. Harris, 17, Allesley Old Road, Coventry.
- March 17 to 20.**—Nottingham Camera Club. Entries close March 4. Sec., E. L. Kent, 3, Radcliffe Mount, West Bridgford, Notts.
- March 22 to 25.**—Cripplegate Photographic Society. Sec., H. S. Cumming, 234, North End Road, Kensington, W.
- March 30 to April 3.**—Sheffield Photographic Society. Entries close March 13. Sec., H. Merrill, 22, Harboard Road, Woodseats, Sheffield.
- March 31 and April 1.**—Shropshire Camera Club. Entries close March 20. Sec., Harry W. Hughes, Kingsland, Shrewsbury.
- April 10 to 17.**—Midlothian Photographic Association. Entries close March 31. Sec., B. Sherratt, 8, Castle Terrace, Edinburgh.
- April 29 to May 17.**—Photo Club de Paris. Entries close March 15. Secretary General, Photo Club, 44, Rue des Mathurins, Paris.

Exhibitions.

GRANGEMOUTH AMATEUR PHOTOGRAPHIC ASSOCIATION.

THIS association held its annual exhibition of members' work in the Y.M.C.A. Hall. Over a hundred prints were exhibited by the members. The work, in the majority of instances, showed a distinct striving after effect; there was evidence of a motif, and although in cases the achievement fell far short of the aim still it was comforting to see the evidence of aim, in contradistinction to the result of promiscuous exposure. Much of this is no doubt due to the influence of the energetic secretary, Mr. R. Marshall, who has attained a wide reputation as a delineator of harbour and shipping pictures, though this year he devotes some attention to landscape and townscape. The secretary takes premier position in both landscapes and figure studies in the former with "The White Sail," well noted at the Salon, and in the latter with "Toilers," a picture of fishers hauling in their nets luminous with every light. The Glasgow Art Circle sent their exhibition panel which graced one wall, the most of the work being well known from its success at the Salon and other exhibitions. The Association is exceptionally fortunate in having a great exhibition of J. M. Whithead's work, in fact, the finest exhibition of his work we have seen, excepting of course, his recent one-man show at Glasgow. His R.P.S. medal pictures "La Tulipe" and "Where once a garden smiled"; his earlier woodland scenes and his later "gloamin'" pictures. Mr. John B. Maclachlan, Secretary of the Federation, judged the exhibition, and also gave a lecture, illustrated by limelight views, on "From Castle to Palace"—a story of "The Royal Mile," Edinburgh.

Patent News.

Process patents—applications and specifications—are treated in Photo Mechanical Notes.

The following applications for patents have been received between January 25 and 30.

AUTOMATIC MACHINES.—No. 1,728. Improvements in machines for the taking and delivering of photographs. Robert Willoughby Vining, 17, Florance Road, Ealing, London.

PRINTING-FRAMES.—No. 1,784. Improvements in photographic printing-frames. The Leto Photo Materials Co. (1905), Ltd., and John Bailey Bensley, 24, Southampton Buildings, London.

TRIPOD SCREW.—No. 1,871. New or improved screw attachment for the tripods or stands of cameras and the like. Thomas Peacock and Newman and Guardia, Ltd., 115, Cannon Street, London.

CINEMATOGRAPHS.—No. 1,981. Improvements in cinematograph machines. Matthew Baker and Will Dean, 66, Bridge Road, Hammersmith, London.

MOUNTING.—No. 2,132. Photographic mounting press. Louis Frederick Crosbie, 6, Bathurst Road, Norwich.

SCREENS.—No. 2,143. Tinted celluloid screens for use in photography. James George Potter, "Aston-Lee," Chesswood Road, Worthing.

PRINTING.—No. 2,273. Pedal press for use in connection with the exposure of photographic printing papers or the like. Louis Brochery, 37, Moorfields, Liverpool.

COMPLETE SPECIFICATIONS ACCEPTED.

These specifications are obtainable, price 3d. each, post free, from the Patent Office, 25, Southampton Buildings, Chancery Lane, London, W.C.

The date in brackets is that of application in this country; or abroad, in the case of patents granted under the International Convention

TELEGRAPHIC TRANSMISSION OF PHOTOGRAPHS.—No. 9,518, 1908 (May 2, 1908). The invention is an improvement in the method of photo-telegraphy in which the electrical transmission depends upon a series of "makes" and "breaks" of circuit due to the

occurrence of enameline or other resist on a metal or other conducting plate. The improved method is as follows:—There is prepared a piece of thick lead or other electrically conducting foil or sheeting, say, by coating the foil with fish glue or gum rendered sensitive to light with potassium bichromate, exposed to light when dry under a suitable negative and line screen, and then the unexposed fish glue or gum (i.e., the light part of the picture) is removed. The photographic image then consists of fish glue or gum lines varying in width on the foil. These lines are slightly in relief. The photograph is now placed between two polished metallic or other surfaces and compressed by suitable means such as an hydraulic or other press. This treatment forces the fish glue or gum into the foil so that the photographic surface is smooth. A metal stylus in passing over this smooth surface does not therefore jump, vibrate, or miss contact, and a superior photo-telegraphic picture is obtained. Thomas Thorne Baker, 7, St. James Avenue, Cricklewood, and 12, Whitefriars Street, E.C.

AUTOMATIC MAGAZINE STEREOSCOPE.—No. 825. 1908 (January 1908). The invention relates to apparatus permitting of stereoscopic or ordinary views being observed in succession, the apparatus being also adapted for use for projection purposes. It comprises a horizontally movable carriage carrying a holder or magazine whereby each view in succession is brought into the plane of an upright frame which is capable of being moved vertically to bring one view at a time opposite the eyepieces of the instrument and thereafter return the view to the holder.

There is improved mechanism for controlling the movement of the carriage as well as the rising and the return of each of the pictures to the holder. This mechanism consists of a crank-disk, a connecting rod, and a sway-bar for imparting vertical movement to the frame. The crank disc is provided with stop mechanism which holds the frame in its raised position and the picture placed opposite the eye-pieces as long as required. Each revolution of the crank disc produces partial rotation of a star wheel or ratchet cross which drives by rack and pinion the horizontally movable carriage. By means of the crank disc and star wheel the carriage with the holder for the pictures may be moved in one direction or the other, the carriage advancing to the extent of the distance which separates two consecutive views at each rotation of the disc. The star wheel is provided with an automatic de-clutching device by means of which it may be released from the action of the crank disc when the carriage reaches the limit of one of its movements. Furthermore, the driving disc may be de-clutched by means of a star wheel in such manner as to permit of the carriage being returned to its original position, or of displacing it rapidly in one direction or the other. A safety device is provided which prevents de-clutching until the last picture viewed has been returned to the holder or magazine. The numerous drawings are necessary for the explanation of the details of construction. Jules Richer, 25, rue Melingue, Paris.

CINEMATOGRAPHY IN COLOURS.—No. 453. 1908 (January 8, 1908). The invention relates to the method of producing animated pictures in colours on the principle of persistence of vision employed in the process described in Patent No. 23,863, 1899. The present improvements relate to methods described in the specifications Lascelles-Davidson, No. 23,863, 1899,* No. 13,468, 1902,* No. 3,729, 1903; of Friese-Greenè, No. 9,465, 1905; and of Smith, No. 26,671, 1906 ("B.J.," August 23, 1907, p. 642).

The essential part of the invention is the use of colour film travelling over the band of sensitive film (at the time of exposure) or with the positive film (at the time of projection) at about the same rate.

Instead of employing a revolving shutter fitted with, say, red and bluish-green colour screens as described in Patent No. 26,671, 1906, there is used a length but preferably an endless band of multi-coloured film, which is caused to travel in any suitable manner with, or at about the same speed as, the colour-sensitive film, the above (preferably endless) band of film being so coloured and dyed that the respective colours thereon are the size of each of the series of pictures exposed through the colour screens through the film or the like.

A series of negatives is thus obtained in which, say, the

* Stated to have lapsed.

and yellows are recorded in one negative, and, say, the blue-greens and yellows in the second, alternately throughout the length of the film.

A series of positive colour records (preferably of a neutral grey black tint) are made from the above negative colour records, and projected on the screen through any commercial projecting machine with a similarly coloured multi-coloured colour screen, so that the pictures are projected in quick succession in the desired order through their respective colours.

There can thus be obtained one picture to every complete revolution of the exposing or projecting shutter in alternate or other order of re-occurring colours which, in other words, means that when taking or projecting the colour records through their appropriate colours at, say, sixteen revolutions of the shutter per second, the pictures will also be taken, or exhibited on the screen, at the same rate of sixteen pictures a second, and not at the rate of thirty-two pictures a second with the shutter only working sixteen revolutions a second as the case would be if the gearing of the exposing or exhibiting shutter were altered as in Patent No. 671 of 1906.

It is thus possible to both take and project pictures in colours about the same speed as ordinary black and white animated pictures.

The simplest way to make the multi-coloured colour screen is to cut out, say, a length of perforated cinematograph film in hypo, roughly wash it, and then sensitize it in a bichromate bath in which has been previously added, say, a blue or bluish-green dye of suitable strength to give the intensity of colour required when finished. When the above bichromatised film is dry, it is placed in a cinematograph camera or such like (preferably without any lens affixed to same), in the usual manner the camera is pointed toward the sun or other bright light and the handle rotated, and by shielding the film from the light by hand or otherwise at every other revolution of the shutter, every other space on the film will be, say, blue (if a blue dye has been used) and every other space will be clear on the bichromatised surface being thoroughly soaked and the free dye unacted upon by light being washed out.

The same surface holding the, say, blue dye in suspension with clear spaces between is then immersed in a red or orange-red dye until the clear spaces have absorbed sufficient of the red colour to balance the blues, according to the adjustment required in relation to the colour sensitiveness of the surface about to be employed. In like manner the multi-coloured colour screen can be prepared for projection.

In all cases the ends of the multi-coloured colour screen are preferably joined to form an endless band of any suitable length; this endless band is made or caused to engage with the sprockets or other suitable parts of a cinematograph camera or projector, so that each colour (or series of colours) is accurately adjusted in the "gate" to superimpose the corresponding future negative colour records in taking the pictures, or the positive colour records for projection on the screen. William Norman Lascelles Davidson, "Harewood," Southview Road, Southwick, Brighton.

WATCH CAMERAS.—No. 5,932. 1908 (March 28, 1908). The invention consists of a camera of watch form provided with time and instantaneous shutter.

The lid of the camera carries on the outside a pointer arm pivoted in the centre and attached to a similar arm on the inside of the lid having a bent down end to act upon a part of the film carrier. The lid of the camera is stamped on the outside or marked in such a manner that the pointer arm indicates the position of the film in the camera.

An important feature of the invention consists in the film carrier of the daylight-loading type, and the manner in which it is used. The carrier is in the form of a circular box in two halves, one revolving outside the other and revolving upon it. The inner half is arranged to remain stationary within the camera, and is provided with a small hole situated immediately behind the lens. The side of this half of the box opposite to the hole above mentioned is cut away to the extent of the size of the picture required. The other half of the box is arranged to turn upon the stationary part and carries for about half its circumference a sensitised film the full length of the box and a circumferential slot is formed in nearly the extent of the other half of the side and a flange on this half

of the box is notched to take the bent arm on the camera lid which acts to turn this part of the carrier.

When the daylight-loading device is placed within the camera the two halves are so arranged together that no light can pass inside, but a slight turn to the outer and revolving half brings forward the slot in same and exposes the hole in the stationary half to the lens when a photograph may be taken on the exposed portion of the film opposite. The necessary turn to the film carrier is given by the pointer arm on the lid which operates the inner arm acting on the revolving portion of the film carrier and by turning this pointer to the next position another portion of the film is brought ready for exposure, and the already exposed portion passed into darkness between the two sides of the portions forming the daylight-loader. When the film is ready for exposure the shutter is operated in the usual manner, and the shutter completely obscures the lens during the time the film carrier is being moved, and when the whole of the film has been exposed the film carrier is moved one position further ensuring the slot in the film carrier entirely passing the hole in the non-revolving half of the daylight-loading device, which may then be removed from the camera in safety as no light can penetrate. Samuel Henry Crocker, 9, St. James Walk, London, E.C.

The following complete specification, etc., is open to public inspection before acceptance under the Patents Act, 1901:—

COLOUR SCREENS.—No. 20,971, 1908. Manufacture of colour plates or screens for colour photography. Christensen.

New Trade Names

CALCI-BLOCK.—No. 308,116. Chemical substances used in manufactures, photography, or philosophical research, and anti-corrosives. Alfred Barnett, 27, Stoke Newington Road, London, N., merchant. November 18, 1908.

MINEX.—No. 308,771. Photographic apparatus, included in Class 8. Arthur Lewis Adams, trading as Adams and Co., 24, Charing Cross Road, London, W.C., manufacturer of photographic apparatus. December 11, 1908.

EMPIRE.—No. 309,503. Photographic apparatus, included in Class 8. W. Butcher and Sons, Ltd., Camera House, Farringdon Avenue, London, E.C., photographic apparatus manufacturers. January 12, 1909.

Analecta.

Extracts from our weekly and monthly contemporaries.

Remedying Developer Stains on "Ensyna" Paper.

Mr. A. D. Weit, writing to "Photography and Focus" for February 9, says: "Having overlooked the point in the directions for 'Ensyna,' which states that fresh developer should be used for each print, I got some prints which on drying were badly stained. As they were spoilt, and so could come to no further harm, I mixed a solution of potassium bromide and potassium ferricyanide, and bleached them. I then re-developed them with metol-hydroquinone, and was agreeably surprised to see the prints restored to their original chocolate colour, but minus the old purple stains. They had lost slightly in depth, so the method would seem to be a safe way to reduce an over-developed print, as well as to get rid of stains."

FLASH POWDERS.—Dr. G. Krebs has patented a non-explosive mixture giving a flashlight with very little smoke, the basis being magnesium or aluminium powder, plus anhydrous copper sulphate or chrome alum, e.g., chrome alum, 100 gms.; magnesium powder, 100 gms.; or copper sulphate anhydrous, 150 gms.; magnesium powder, 75 gms.; aluminium powder, 25 gms. This gives much less smoke than mixtures containing chlorate and the smoke passes away rapidly so as to allow of a series of successive exposures in a room. Ger. Pat. No. 205,499, of July 26, 1904, from "Chem. Zeit." Repertorium, No. 16, 1909, p. 68.

New Books.

"The Oil and Bromoil Processes." By F. J. Mortimer and S. L. Coulthurst. London: Hazell, Watson, and Viney. 1s. net.

The literature relating to the oil printing processes is not as yet very extensive, and a treatise such as this one should be warmly welcomed. The book is essentially practical throughout, and the well-known successes of the authors with the methods described sufficiently guarantee the soundness of the advice given. So far as we can see, the book covers the ground very completely, and the only omission we note is a warning to beginners not to be too impatient. A great many failures that have come under our notice have been due simply to the worker stopping before he had properly commenced the work of pigmenting. In bromoil especially many seem to think that the first touch of the brush is going to give a clear and decided image, and when it does not do so they think the print has gone wrong and put it aside for advice upon it. The majority of the beginners that we have become acquainted with have fallen into this mistake at the start, and we therefore think that a warning on this point is very advisable. It might also have been pointed out that grain or spottiness also will very often vanish if the brush-work is continued a little longer, with perhaps a rather cleaner brush. We note that a plentiful supply of brushes is recommended, and this, according to our experience, is very good advice indeed. The authors deal quite as fully as is necessary with the different methods of brush manipulation. More detailed instructions are quite unnecessary, as every worker rapidly acquires methods of his own. There is a mistake on page 92, where it is stated that the ozobrome-oil process was first described by J. Parrack, in the "Amateur Photographer" for May 12, 1908. The first publication that we know of was in the "Photographic News" for August 16, 1907, where Mr. C. Welborne Piper dealt with it in a supplement to an article on the first bromoil process. The method there described is the same as the one given in this book, but probably better results would be produced by the modern improved ozobrome method with the preliminary acid bath. We think also it should have been mentioned that Mr. E. J. Wall suggested, in the "Photographic News" for April 12, 1907, the desirability of producing oil prints from bromide enlargements before any method of doing so had been published. We can strongly recommend this book, and advise all those interested in oil printing to obtain a copy.

"La Photo-Peinture des Agrandissements de Paysage." By L. Estéban. Office of the "Photo-Revue." Paris: Charles Mendel. Price 60c.

This little manual of the working-up of prints and enlargements in oil colours contains brief instructions and a series of hints on treating different classes of subject. The author, however, lays stress in his first line on the necessity of natural aptitude: "On devient cuisinier, mais on naît rôtisseur."

PHOTOGRAPHIC POSTCARDS.—No. 94 of "The Photo Miniature" treats of the making, in many varieties and degrees of embellishment, of the essential picture-postcard. It contains particularly full instructions for producing cards as vignettes or with borders, and, therefore, is deserving of study by those who would turn out cards which are superior to the usual commercial article. The issue of our always practical contemporary is obtainable in America from Messrs. Tennant and Ward, 122, East 25th Street, New York, and in this country from Dawbarn and Ward, 6, Farringdon Avenue, E.C.

THE CINEMATOGRAPH AS A WITNESS.—The cinematograph does more than amuse or instruct, as the case may be, and according to a message from New York in a Paris contemporary, it has just defeated an impudent and fraudulent claim. Some four years ago a boy was injured in a tramway accident, and his parents have only recently brought an action claiming £1,000 from the tramway company. The ground of the action was that the boy had been paralysed from the effects of his injuries. Counsel for the company obtained the permission of the court to show some cinematograph views of school sports, and in them was to be seen the boy winning a "Marathon" race and engaged in a boxing contest, with the result that the parents have been non-suited.

New Apparatus, &c.

SEAT, TABLE, AND BOX ACCESSORY.—Messrs. F. E. Jones and 22, Gray's Inn Road, London, W.C., have recently shown us their showroom at the above address, an accessory for the studio which can be used as either table or seat, and also forms a

in which artificial flowers, toys, etc., used in the studio can conveniently be kept. The article of furniture is handsomely made of fumed oak, the arms being attached by thumbscrews, so that they and the lid are removable when required. This most useful accessory measures 4 ft., and is sold at £4 4s.

New Materials, &c.

"Wellington" "Special Smooth" Platino-Matt Bromide Paper. Made by Wellington and Ward, Elstree, Herts.

In this new variety of their bromide papers, Messrs. Wellington and Ward have produced a material which supplies a print of graving smoothness, without a sign of gloss or roughness. "Special Smooth" describes its surface, but the tones of the print are no means dead-looking, having, on the contrary, a fine range from a brilliant high-light to rich deep shadows. For work both large and small the paper appeals to us as being equally suitable. So quite small negatives printed in it give very delicate prints, with all the detail in them that could be desired. Messrs. Wellington have so completely covered the field with papers of different surface and different tint that one might almost have thought another variety uncreatable. Yet the new "Special B" is distinct, delightful, in every way worthy to rank with the other "Wellington" materials.

PYRAXE-HAUFF.—Messrs. Fuerst Bros., 17, Philpot Lane, London, E.C., send us a sample of the new form of fine pyro crystals manufactured by Messrs. Hauff, of Feurbach, Germany. The crystals occupy one-fifteenth the space of the feathery re-sublimed variety of pyrogallic acid, but dissolve almost as quickly as this latter, and are quite equal to it in developing power. No one, we imagine, whether dealer or user, will use the bulky form in preference to crystals, one important advantage of which is the convenience with which it is weighed out without the danger of its getting in dark-room measures or dishes, or afterwards causing trouble in the shape of spots.

THE FALLOWFIELD SMOKER will be held at the Inns of Court Hall on Thursday next, February 18, at 8 p.m., Mr. F. W. Hindley in the chair. Those anxious to take advantage of the occasion to spend an enjoyable evening should communicate with Mr. J. C. Preece, with any of the Fallowfield staff at 146, Charing Cross Road. The price of the ticket is 1s. only, and the excellence of the programme on previous occasions is an assurance that the large hall of the Inns of Court should suffice to accommodate the company of friends who assemble to join with the old-established house in its annual festivity.

Correspondence.

We do not undertake responsibility for the opinions expressed by our correspondents.

Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.

SANDELL PLATES.

To the Editors.

Gentlemen,—We noticed in your correspondence columns of this week's issue a query relating to Sandell double-coated plates. We would like to inform you that these plates are still being manufactured by us, as are also our "Cristoid" films and other specialties.—Yours very truly,

London Polytechnic Photographic Society. Lantern Slide Competition.

THURSDAY, FEBRUARY 18.

London Amateur Photographic Association. "May Certain Phases of Photography be Reckoned Among the Fine Arts?" Lieut.-Col. A. Grimshaw Haywood.
London Photographic Society. Exhibition of the Midland Photographic Federation Portfolio.
London Lothian Photographic Association. "Home Portraiture for Winter Evenings." J. B. Johnston.
London School of Photo-Engraving, Bolt Court. "Oils, Colours, and Varnishes in their Relation to Lithographic Tin and Offset Printing." A. J. Rowley.
London Easton and Institute Camera Club. "A Trip to Holland with a Euryplan Lens." A. E. Staley & Co.
London Easton and Institute Camera Club. Dutch Lantern Pictures. A. E. Staley & Co.
London Strand-on-Sea Photographic Society. "Development of Negatives." Florence Bell.
London Borough of Tynemouth Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
London Weststone and District Camera Club. "Winter Sports in Switzerland." Illustrated. F. G. Curtis.
London Green Photographic Art Club. Informal Meeting.
London Hely, Farsley, Calverley, and Bramley Photographic Society. "Platinotype." Mr. Fearnley.
London London and Provincial Photographic Association. "Celestial Architecture." C. P. Butler.

ROYAL PHOTOGRAPHIC SOCIETY.

THE annual general meeting of the Society was held on Tuesday evening last, February 9, the president, Mr. J. C. S. Mummery, in the chair. The report of the council, which was discussed paragraph by paragraph, recorded a total membership of the Society of 1,071, an increase during the year of about 30 members. The income and expenditure account showed a deficit of £81 on the year, due to reduced takings at the exhibition from £847 in 1907 to £506 in 1908. A further reduction in the profit from the exhibition was due to expenditure in electrical work for the trade exhibitors. Although the exhibition was kept open six nights in the week as against three nights in previous years, the total cost was less by £55. A further item of increase in expenditure was that of £50 for house rent.

The discussion of the report, and particularly of the balance sheet and finance section, occupied the meeting until a late hour. Many of the questions put to the chairman were those which crop up with clockwork regularity on this occasion. In fact, a phonograph record of one such discussion might almost be substituted for what takes place at subsequent meetings without very greatly misrepresenting the actual proceedings, not excepting the comments of would-be professional humorists upon minor matters of grammar and propriety.

A good deal of discussion related to the opening of the Society's house on Saturday afternoons and evenings, but was met with the reply from the chairman that the council were unable to trace the existence of a demand for the use of the premises at these times consistent with the cost entailed in the way of extra staff. It was suggested that if light refreshments, such as tea and coffee and cigars were obtainable in the house an inducement to many people to join the Society would thereby be provided.

Regarding the annual exhibition, Mr. Hector Maclean again emphasised the desirability of a change of the selecting committee in the pictorial section. He thought that there should be a feeling among exhibitors that work of a more revolutionary character would be acceptable at the exhibition. He also strongly deprecated the acceptance at the last exhibition of proofs from coloured photogravure plates as well as hand-coloured photographs, such work being specifically named in the prospectus of the exhibition as ineligible.

Mr. C. P. Butler urged that on the ground of its educational value, particularly to workers in the country, the practice of naming the process by which each print was made might be revived.

Dr. Evershed, commenting on the report of the Library Committee, suggested that a regular appeal should be made for gifts of books to make good present deficiencies in the library. He thought that donations would be easily obtainable, and would save purchases in many instances.

A question having been asked as to the usefulness of the Affiliation, Mr. James A. Sinclair reminded the meeting of the great benefit done by the Society through the Affiliation, and equally to the benefit received by the society in the way of membership, support at the exhibition, etc., from members of affiliated societies. Mr. A. Mackie estimated that one-third of the present membership of the society was derived from the Affiliation.

In presenting the balance sheet, the treasurer, Mr. Leslie E. Clift, drew attention to revisions in the method of presenting many of the accounts whereby details of expenditure were more brought out separately, and the statement of accounts clearly benefits by these modifications. The treasurer dwelt upon several suggestions made during the earlier part of the evening, and then proceeded to point out, item by item, the details of the income and expenditure account.

The discussion of the society's position was raised from the sphere of accounts into that of finance by Mr. James A. Sinclair, who produced figures relating to the society's working for the past seven years, which clearly showed the present tendency of expense in several departments to rise considerably.

In reviewing the balance-sheet for the past year, he at the outset trusted his remarks would be considered as purely impersonal, for he had a keen appreciation of the work done by the Council and Officers of the Society. In comparing the balance-sheet with those which had preceded it during the past seven years, he was struck by the fact that the finances stood or fell by the result of the exhibition, whereas in the preceding periods, when the exhibition was invariably run at a loss, the Society had succeeded in making a profit. The exhibition was an important part of the Society's work, but he thought the object to be aimed at was to attain financial equi-

librium without the exhibition support, and that any profits from the exhibition should be devoted to other purposes. To show how the expenses had progressed, he pointed out that while the house account in 1902 was £431, and £410 in 1903, it had mounted up to £500 during the past year. Officers' salaries, which were £199 and £194 in 1902 and 1903 respectively, were £331 during the past year. He did not for the moment suggest that any of the officials were over-paid, nor that improper expenses had been incurred, but pointed out that these tendencies to increase had not been proportionate to the increase in the membership list.

Then with regard to the exhibition, general expenses in the cost of running had mounted up considerably—for example, in 1904 the cost of running was £660, the same amount in the following year, while in 1906 they were £784, £908 in 1907, and £893 during the past year. Having noted the tendencies, he thought it was time that the Society cried "Halt!" and possibly it would be desirable for a finance committee to consider these questions. There was only one remedy to this state of affairs—namely, to considerably increase the membership of the Society, and he would urge all those interested either in the art or science of photography to join the Society, not from any motive as to what they might get out of it, but simply that the Society should the better be enabled to work for the advancement of photography.

The figures were roughly as follows:—

Year.	Membership.	Office Salaries.		House Acc.	Light, Fuel and Heat.		Library Expenses.
		£	£		£	£	
1902	895	199	431	54	29		
1903	950	194	410	50	28		
1904	972	262	415	53	18		
1905	955	290	426	64	14		
1906	1,007	311	418	75	15		
1907	1,044	313	449	75	29		
1908	1,077	331	500	92	23		

Year.	Annual Exhibition.			Result of Year's Working.	
	Takings.	Cost.	Profit.	Including Exhibition.	Apart from Exhibition.
				£	£
1902	865	730	135	+ 156	+ 21
1903	831	697	134	+ 121	- 13
1904	696	660	36	- 94	- 129
1905	827	660	167	+ 92	- 74
1906	891	784	107	- 94	- 200
1907	1,197	908	288	+ 171	- 109
1908	925	893	31	- 81	- 112

Mr. Memory referred to the "loss" on the Journal. He thought that the Society should take steps to produce "The Photographic Journal" at a profit.

The Treasurer pointed out that the Journal was the organ of the Society's proceedings and was practically the only benefit which members of the Society in the country obtained. The cost of the Journal per member had been reduced by one shilling during the past year.

Mr. John H. Gear suggested that a first step in economy by the Society might be the discontinuance of refreshments after the meetings, the present cost of which was £25 per annum. Votes of thanks to the Council and Officers of the Society concluded the discussion, and the report of the scrutineers of the ballot was then announced as follows:—

President.

J. C. S. Mummery, A.R.I.B.A.

Vice-Presidents.

Sir W. de W. Abney.

Sir Joseph W. Swan.

The Right Hon. The Earl of Crawford. Major-Gen. J. Waterhouse.

Honorary Treasurer.

Leslie E. Clift.

Ordinary Members of Council.

T. Thorne Baker.	Furley Lewis.
A. W. W. Bartlett.	Hector Maclean.
Douglas English.	Ernest Marriage.
A. R. F. Evershed.	F. Martin-Duncan.
W. B. Ferguson.	C. E. Kenneth Mees.
T. E. Freshwater.	F. J. Mortimer.
John H. Gear.	C. Welborne Piper.
E. T. Holding.	E. Sanger-Shepherd.
G. Lindsay Johnson.	H. Snowden Ward.
Rev. F. C. Lambert.	B. Gay Wilkinson.

The president announced the award of the Progress Medal to MM. Lumière et ses Fils for their discovery of the Autochrome plate and their photo-chemical researches. A note by Major-Gen. Waterhouse describing the rise of the Lumière factory was read. Mr. T. K. Grant in accepting the award on behalf of MM. Lumière said

he was desired to express to the Society the honour which M. Lumière felt to be done them and the interest which they took in the Royal Photographic Society.

HEREFORDSHIRE PHOTOGRAPHIC SOCIETY.—The annual competition for the Pilley Cup, in connection with the Herefordshire Photographic Society, has just taken place, the award being announced this week. Mr. J. T. Ashby was the judge. There were sixteen prints, as against 34 last year sent in, and the work all round was excellent. Mr. F. C. Pritchard won the cup with "A. September Evening," also an extra award given by Mr. Page, Broad Street, Hereford; and Mr. Sinclair was awarded the cup given for the best print of a competitor who had never before won a prize. The Pilley Cup is given by the president, Mr. Councillor W. Pilley. Entries for the Blake Cup closed March 31.

SOUTHAMPTON CAMERA CLUB.—Mr Harold Baker gave an illustrated lecture on the History of English Architecture before the Southampton Camera Club last Monday evening. Mr. Baker introduced his subject by mentioning the features of English Gothic architecture from the earliest Saxon period, and described in detail the transitional characteristics of the Early English style, the Decorated and the Perpendicular. The lecturer then described and illustrated with numerous excellent slides the construction of the Saxon and Norman architectural features. The former was recognised chiefly by a triangular head to the windows, formed by two stones leaning against one another, and the latter generally was round-headed and enriched with a great variety of ornament. He then described the gradual development of the Early English architecture, and contrasted the lightness of the masonry compared with the massive Norman period, and stated that the comparative simplicity of the style did not present the complicated problems of the later work and the skill in the masonry of the thirteenth century work has never been surpassed. Mr. Baker then referred to the Decorative period and gave an interesting account showing how the development occurred, chiefly by illustrations of tracery work and the elaboration in the carving, which, in his opinion, was usually too overcrowded for good general effect. The Perpendicular style was fully described and many hints were mentioned which would enable the architect or student to recognise the various styles of Gothic architecture. The lecture throughout was most interesting, and the series of slides illustrated not only ecclesiastical buildings, but proved that secular buildings of the different periods possessed similar developments in their design.

Commercial & Legal Intelligence

LEGAL NOTICES.—The partnership subsisting between Walter Briggs and William Edward Watkins, photographers, 27, Cannon Street, Bristol, has been dissolved by mutual consent from the 2nd day of January, 1909. All debts due and owing by the late partner will be received and paid by Walter Briggs.

A first and final dividend of 1s. 3½d. in the £1 is to be paid to creditors of Arthur Joseph Anderson, photographer, ect., 37, Wellington Street, Luton, 36, High Town Road, Luton, and 7, High Street, Leighton Buzzard, Beds.

A PICTURE POSTCARD DISPUTE.—At the Clerkenwell County Court last week a claim in respect of picture postcards supplied and brought by Messrs. Hildesheimer and Co., Ltd., fine art publishers, of 96, Clerkenwell Road, E.C., against Mr. Westbrook, stationer, 158, Uxbridge Road, for £2 15s. 6d.

Mr. Lewis, solicitor for the plaintiffs, said the amount claimed was the first instalment due upon an order given by the defendant for 6,000 local views of Shepherd's Bush. Photographs were taken and proofs submitted. Upon delivery being made defendant was saying the goods were not at all as ordered.

Plaintiff's manager of the picture postcard department gave evidence. Replying to defendant's solicitor, witness said that sample cards were produced to defendant at the time. Witness said he considered the colouring was equal in every sense to the sample cards. In his opinion the printing could not be improved upon. There was nothing unusual, said witness, in some picture postcards having margins. Defendant's order did not say the cards should be without margins.

you went to buy a set of six views would you expect some with in and some without?—I should not give it a moment's deration.

defendant said he would not consider them a set if some of the had margins and the others not. He complained that the cards nothing near the sample shown him. The colour throughout not good, and was out of register. He also complained of the ing.

parts were called on both sides. One said there was nothing al in margins; whilst the other said that picture postcards not acceptable to customers except with full plates.

vidence was given as to the details complained of in colouring printing.

s Honour found in favour of defendant.

MPANY PROMOTER'S BANKRUPTCY.—At the London Bankruptcy t last week the public examination of Sigurd Svern Bojesen, ibered under a creditor's petition as a company director, of 601, bury House, London Wall, E.C., was held. The statement of s showed total liabilities of £7,388 (£4,912 unsecured), and s valued at £1,585. He had been resident in England since

He promoted the De Foest Wireless Telegraph Syndicate, also the Amalgamated Radio-Telegraph Co., Ltd. He acted anaging director of the last-named company (which had recently into voluntary liquidation) until he resigned office in October,

During August, 1908, he promoted Kosmos Photographics, to acquire a secret process for preparing paper for photographic uses. He was also a director of that company, and undertook to de £1,500 for it as working capital, but was only able to find in consequence of which the business came to a standstill. He buted his insolvency to the liquidation of the Amalgamated o-Telegraph Co., Ltd. The examination was concluded.

News and Notes.

REFUMING POSTCARDS, ETC.—For this purpose (writes the armaceutical Journal") procure a tin with a tightly fitting lid—cut-box will do quite well. Place in the bottom a few pieces of bent cotton, moistened with the desired perfume, cover with uple of sheets of filter paper, then pile up the cards as loosely possible, put on the lid, and let stand over-night in a warm . For perfume, the following is recommended as being good almost inexhaustible:—Coumarin, 10 grains; vanilin, 10 grains; tropin, 10 grains; ionone, 10 minims; hyacinthin, 5 minims; ce of milk, 30 minims; otto of rose, 5 minims; alcohol, 1 fl. e. A suitable lilac perfume would be:—Terpeneol, 2 fl. ms; oil of lignaloe, 20 minims; oil of bergamot, 10 minims; tropin, 20 grains; alcohol, 2 fl. ounces.

E.R. MECHANICS' INSTITUTION, PHOTOGRAPHIC SECTION.—The enth annual exhibition will be held in the Mechanics' Institution, ford, on March 9 and 10. Mr. John H. Gear will officiate as e, and silver and bronze medals will be placed at his disposal ward in the open classes. Entries close February 27, on or e which date all forms, accompanied by the necessary fees, must to the hon. secretary, Mr. A. Woolford, 16, Grove Green Road, onstone, N.E. Exhibits entered for this exhibition and also ited at Ilford will be collected from the latter exhibition free arge to exhibitors.

ATES AND CAMERAS IN BRAZIL.—Mr. George A. Chamberlain, S.S. Consul at Pernambuco, Brazil, reports that some years ago ican cameras and plates received a fair share of the orders sent Pernambuco, but to-day they are almost totally supplanted by ean manufacturers. The market now appears to be controlled o European manufacturers, whose plates are remarkable for hard emulsion, and the consequent high temperature they can in treatment. The sale for cameras is at present almost limite- English and German makes. Printing-out paper is mostly sup- from England, but it has found a rival lately in German tions of American papers.

Answers to Correspondents.

PHOTOGRAPHS REGISTERED:—

H. Osguthorpe, 18, King Street, Spennymoor, Durham. *Photograph of the Rev Father Michael McNamara.*

W. T. Keable, Drewett's Studio, North Street, Guildford, Surrey. *Photograph Group of the Teams in the Corporation Rifle Match at Godalming, April 17, 1907, and Photograph, Ditto, at Guildford on May 15, 1907.*

DRAWING REGISTERED:—

P. Hickie, Trading as The Card House, 88, Lyndhurst Grove, S.E. *Drawing: John Bull in Sympathy with Italy over the Earthquake.*

GAINSBOROUGH.—Either that sold for the lamp or the "Agfa" powder is as good as you can have.

HATCHED BACKGROUNDS.—I saw a portrait the other day, printed in B. and W. (no doubt platinum), no photographic background behind the figure, but a few hatched lines put in by hand. The effect was just like a pencil drawing. Has a short article appeared upon how to do these, as I think I remember reading something in the "B.J." about a year or two ago? If so, will you refer me; or, if not, kindly say are these taken against a perfectly white background, or is the figure blocked out on negative (front or back) before printing? It was printed on a large piece of the platinum or bromide paper, and then plate-marked.—WEEDEE.

The white background may be obtained either by painting round the figure, or by taking it with a white, or very nearly white, background. If with the latter method the ground is not white enough, it may be masked in printing by a cut-out mask on the back of the negative. The latter method is the simpler of the two.

CHARLES WEAVER.—We doubt if a photograph will show you more than you can see with a good focussing magnifier applied direct to the painting. You might try full exposure on a panchromatic plate through a deep filter, such as the K₃ of Wratten.

NORMAN HART.—Probably any of the water-soluble black dyes. Better write to Messrs. Mawson and Swan, Newcastle-on-Tyne, who make a specialty of supplying dyes for photographic purposes.

BRADFORDIAN.—1. A few feet to the front. 2. There is some gain in light by using such a reflector, but not enough to compensate for the distracting effect on the sitter if, as is usually the case, it is not possible to completely cover the reflector. With two arcs you can use a diffusing screen if you need it without installing a reflector, or, if you do use the latter, having it of matt-white painted metal.

L. S.—Mix potass. chlorate and antimony sulphide (previously finely powdered separately) in equal parts, add French polish to make a thick cream, and apply evenly to paper. Dry without application of heat, and cut into strips about ¼ in. broad. Another way is to soak thin blotting-paper in solution of nitre (potass. nitrate) of about 10 per cent. strength for a few minutes and dry.

J. S.—We should like to see more detail in the high lights. The exposures, we should say, were rather too much, and the development overdone, thus losing the delicate effect of the hoar frost.

"P. B."—On the tablets of photographic chemicals often appears the initial letters "P. B." What words do these initials stand for, and what is their full meaning?—IGNORANT.

"P. B.," or "B. P.," as it is also written, stands for "British Pharmacopœia," and means that the particular variety of chemical is of the standard of purity described in this publication.

FOCAL LENGTH.—1. What is the easiest plan of obtaining the focus of a lens? One way, I think, is to focus an object, say, inch-rule, on the ground glass, the exact full size, remove the lens, and divide the distance from the object to the ground glass by four. Can this be used for any lens—portrait, landscape, or R.R.—and is it fairly correct? 2. Is the varnish given in current number a hot varnish? Must the negative be heated before and after?—WEEDEE.

1. The method is not quite exact. It is more accurate, after focussing an object same size as you suggest, to mark the position of the lens front on the baseboard, and then to rack in the lens until an object at a great distance (150 times the focal length) is in sharp focus on the ground glass. The distance which the lens requires to be racked inwards is the true focal length. Both methods are applicable to any type of lens. 2. Yes, hot.

CLARENCE.—We do not know a studio which works solely by

artificial light, but there are plenty in the West End of London which do a great deal of their work—*e.g.*, Court presentation portraits—solely by artificial light. We should say the lamps most generally in use are open or enclosed arcs.

INTENSIFYING BROMIDES.—Will you please let me know if there is any satisfactory way of intensifying bromides either before or after fixing? The case I would suggest is that of a 30 x 40 enlargement, somewhat under-exposed. In this case to be able to bring up such a picture to normal appearance would be an advantage rather than to be put to the necessity of duplicating.—L. T. J. H.

Silver intensification can be used:—

A. Pyro	1 part.
Citric acid	2 parts.
Distilled water	300 parts.
B. Silver nitrate	1 part.
Distilled water	50 parts.

Flow the print with solution A sufficient to cover it. Pour off A, and (to every 50 parts) add 20 to 40 parts of B. Return to the dish and rock until print is sufficiently intensified. Then wash well and immerse for a few minutes in a fixing bath, about 1 oz. to 10. The prints must be well fixed and washed before treatment to avoid stains. The chromium intensifier given on page 784 of the "Almanac" has answered excellently in our hands for bromide work, and gives a very good black colour, often an improvement on that of the print.

ENLARGING.—Will you oblige me by information where I could get a good book or books with instructions on bromide enlarging and finishing? I may say that I know little or nothing in that branch of photography.—BROMIDE.

"Practical Photographic Enlarging," by John A. Hodges (1s.); or "Photographic Enlargements: How to Make Them," by Geo. Wheeler (1s.). Your dealer can supply either of these books, and you can also obtain some useful free literature on enlarging from firms such as Houghtons Ltd., W. Butcher and Sons, and Wellington and Ward.

B. S. J.—Messrs. F. E. Jones and Co., 22, Gray's Inn Road, E.C. The material is called "Arras" cloth.

COPYRIGHT.—1. I have copyright photograph. Can a person make a copy for his own private house (not for sale or distribution) without infringing my copyright, and what action can I take if same has been done? 2. The Copyright Act, 1862, in paragraph 6, states: Without the consent of such proprietor repeat, copy, colourably imitate, or otherwise multiply for sale, hire, exhibition, or distribution, or cause, or procure to be repeated, etc. How are the words "repeat," "copy," "exhibition," defined? Is there any legal decision on this point?—COPYRIGHT.

1. He cannot, whatever and however private the purpose. Yours is the sole right to copy. 2. We do not see that it is necessary to define them. The words are explicit enough themselves. There have been some decisions as to what is and is not a copy, *e.g.*, it has been held that the copying of part only of a photograph is an infringement, as is also the re-drawing of a photograph by an artist even though the latter may greatly alter the details. We can best refer you to the article on "Photographic Copyright" in the "Almanac" of 1906. This particular point is dealt with on page 667.

PICTURE FRAMES.—1. Will you please inform me what kind of cramp or other apparatus is usually used in the picture frame making trade for holding the moulding while jointing, also where I can obtain such apparatus? I am thinking of taking up framing as a side line, but have no experience of the work. 2. Also can you suggest a dark green stain?—FRAMING.

1. Mitre cramps for the purpose may be had from any of the large tool shops. 2. As you have had no experience in the work we would advise you to use the ordinary wood stains as sold at the oil shops. They may be had of various colours and tints. Stephen's are as good as any.

CAMERAS AND TOOLS.—In forwarding herewith the pages of the railway coaching tariff, which concern with the rules of the excepted articles, I have to request you to let me know whether camera comes under the category of excepted articles or not. The railway companies, generally, when they want to save themselves from any responsibility, include cameras under the scientific instruments, while really they can be said to be work-

men's tools. Such cases must have already come in the British courts, and hence the request. Your quoting me any case which decision in such matters is given will highly oblige GANESH R. CHOCHÉ (Jodhpur).

We cannot call to mind any case that has come before a British court in which the question raised by our correspondent is involved. In England cameras and lenses would be classed scientific instruments and not as workmen's tools.

TRUE TO SCALE PROCESS.—I shall be glad if you can give me working formula for producing the "true to scale" prints of plans, etc. 2. Also name, if any, of the publishers of a book on this process, which I believe is a kind of photo-lithography.—PLANS.

There are no books published on the "true-to-scale" method which is worked as a secret process by several firms who produce engineering plans. The procedure is as follows:—An ordinary "blue" print is made from the tracing, and, without development is laid down upon a "jellygraph" composition spread on zinc exactly in the same way as a "Fektograph." The print must remain for more than a few seconds, and it is then lifted away. The graph is then rolled over with ordinary letterpress ink, applied with a composition roller, and paper or tracing cloth applied and rolled over in order to ensure good contact. On lifting there will be a print in black of the design on a white ground. Only a few prints can be taken, about fifteen at most. The following is a formula for the graph composition: Take 8oz. of glue, dissolve and make solution up to 16 oz. with water, take 1oz. of gelatin, dissolve, and make up to 2oz. with water, mix, and add ½oz. ferric sulphate and ½oz. glycerine. Strain, and pour warm on to level zinc. When set, the mass will be ready to lay plan down on.

F. E. G.—The Thames Plate Co., 254A, High Holborn, London, E.C.

SPOTS ON NEGATIVES, ETC.—(1) What is the cause of greenish spots coming on negatives within about a fortnight of taking same? (2) How to prevent and cure same. It would not pay to vary each negative. (3) How to get sepia tones on bromide. Do you recommend sulphide toning, and must it be freshly made? I have had some in stock for two months, and I have failed to get proper warm sepia tones.—MONFAB.

(1) We should like to see a negative before saying. (3) The ordinary formula in the "Almanac" (p. 809) will give good tones with almost all papers, but there are one or two papers which do not tone well with sulphide. Try changing your paper, and you cannot get on. The sulphide solution should not be longer than a few days.

MIBLON.—We cannot say. Naturally, the authorities must see to possible previous use of a word.

C. D. V. and others.—In our next.

A TEN YEARS READER.—It seems to us that your second agreement, though verbal, cancels the first. In your letter you do not make it clear whether your employer promised to make any deficit accruing from the "piece-work" arrangement up to the salary stated in the first agreement. If he did, you may recover that in the County Court. Anyhow, you can recover any arrears that may have been due to you at the time of the piece-work arrangement. We should advise you to consult a solicitor on the matter, showing him the original agreement, and explaining to him what was agreed upon when the piece-work arrangement was come to.

**** NOTICE TO ADVERTISERS.**—Blocks and copy are received subject to the approval of the Publishers, and advertisements are inserted absolutely without condition, expressed or implied, as to what appears on the text portion of the paper.

SUMMARY.

The exhibition of photographs by Count von Gloeden representing scenes and Figures of the Coast near Messina” at the house of The British Journal of Photography” closes to-morrow at 12.30.

A paper read before the Sutton Photographic Club by Mr. Hector Maclean dealt in a popular way with the salient features of the emulsion, “Black Japine,” and “Ensyna” processes. (P. 136.)

An article in “Photo-Notes” by Mr. T. H. Greenall gives the working details for a control method of developing gaslight prints by means of which considerable latitude in exposure is secured. The prints are placed first in a highly restrained developer, and after a short immersion, transferred to a solution of eikonogen and developer without alkali. (P. 139.)

A camera for stereoscopic work in which the separation of lenses is automatically done as the camera is racked out when focussing has been worked out by the firm of Carl Zeiss. A paper by Dr. W. Scheffer describing its use appears on page 135.

Among the patents of the week is a process of emulsion-making, intended to produce a paper which may be either printed fully out or developed. A method of producing mosaic colour-screens of irregular grain by means of spherical particles of celluloid has been patented by Mr. Brasseur. (P. 145.)

The Italian Photographic Society is preparing an illustrated volume descriptive of the recent earthquake. The profits will be given to a fund being raised for the children who have been orphaned in the Sicilian disaster. The interest and help of British photographers and photographic societies are asked for. (P. 149.)

Some notes on the actual economy effected by the proper warming of the studio appear on page 134.

An American photographer has described a mirror accessory suitable for the making of firelight portraits by daylight. (P. 143.)

Our contemporary “Country Side” is making a strong advocacy of photographs of natural history subjects in preference to prepared specimens. (P. 134.)

The concluding portion of the eleventh Traill-Taylor lecture “On the Regulation of the Rays in Photographic Objectives,” by Dr. E. Wandersleb, appears on page 139.

EX CATHEDRA.

Dramatic Copyright and the Cinematograph. An article by Mr. W. S. M. Knight, barrister-at-law, in the current issue of our contemporary, the “Cinematograph and Lantern Weekly,” touches upon the

obviously anomalous position in which the law of copyright in cinematograph productions at present stands in this country. As the writer points out, none of the present Copyright Acts afford any protection to works of the “living picture” description, for the simple reason that the framers of these Acts did not foresee the invention of the animated photograph. Yet it does not seem as if there were universal freedom in regard to cinematographic films, for if we understand Mr. Knight correctly, the recent decisions of the International Copyright Conference when ratified, amount to this—that in this country the cinematograph film producers will be able to represent and reproduce the plays of British authors but not those of authors in the foreign countries which are parties to the Convention. International law so abounds in pitfalls that it is not discreet for a layman to expound it; but we imagine that, inversely, British dramatic works will enjoy protection from cinematographic infringement in the foreign countries subscribing to the Convention. In any case, the legal clouds which enshroud the rights of dramatic authors and living-picture showmen evidently need dispersal, and even then, as Mr. Knight points out, the recent decision of the Court of Appeal has laid down that so long as the manufacturer confines himself to manufacturing and selling in the ordinary course of trade to the exhibitors, neither he nor the exhibitors can be restrained from representing a copyright drama, even though the representation should actually amount to a legal infringement of the copyright.

* * *

An Automatic Stereoscopic Camera. On December 11, 1908, we had a note in this column suggesting the possibilities of a stereoscopic camera, arranged

so that the adjustable front should automatically adjust the separation of the lenses to the distance of the object. At the time we had no thought that this idea was actually being worked out, though a little more consideration might have suggested to us that somebody had probably thought of it already, and that that somebody would probably be found at the Zeiss Works. From the article by Dr. W. Scheffer, on another page, it will be seen that this was the actual state of affairs. Such a camera has been in experimental use for a year or more, and is now perfected. It will be seen that with this new camera it is possible to produce full-size stereoscopic images, which means that the camera must be well adapted to all the purposes of scientific stereoscopic photography. In this case there will

be less excuse than ever for the neglect of the stereoscopic camera in scientific work, and it is to be hoped also that the movement will be obtainable in popularly priced stereoscopic cameras.

Telephoto Optics.

A very interesting point in Dr. Wandersleb's Traill-Taylor lecture, to which we did not make reference last week, is the description of the effects of keeping a constant distance between plate and negative lens when using the telephoto lens. It is shown that even though focussing alters the true focal length of the whole combination, yet we can consider it to have preserved its focal length for infinity and treat it as equivalent to a rectilinear of that same power. From this it is apparent that a lens of the telephoto type, when used on a near object, may be exactly equivalent in action to another lens of quite different focal length. This fact was pointed out between seven and eight years ago in one of the English photographic journals in connection with lenses of the "landscape" variety, and is therefore not a new fact. Possibly it may some day be developed and lead to a further simplification of our conception of the manner in which photographic lenses work.

The "New Collecting."

Under this title Mr. E. Kay Robinson, in the "Country Side," is strongly impressing upon naturalists the greater value of the collection of photographs compared with that of preserved or stuffed specimens. Apart from humanitarian considerations, a series of photographs from life is declared to be of greater educational value than a collection of specimens. Unlike a set of specimens, an album of photographs becomes more valuable as a result of each new exposure is added. The naturalist need not be his own photographer, though it is easy enough for him to be. The opportunities for the purchase and exchange of photographs are now so great that the intimate knowledge of the life-history of an animal or plant to be acquired by photography as by no other means is at the disposal even of those not sufficiently skilled in the use of the camera. To those, on the other hand, who would find new fields of interesting work for themselves and their camera, the pages of our contemporary may be recommended for information and inspiration.

The Trimming of Stereoscopic Prints.

On several occasions we have drawn attention to the importance of correctly trimming stereoscopic prints before mounting, but when talking over the matter with practical workers we have often heard the opinion expressed that, after all, precise trimming by rule is not of much consequence, as the fault is generally imperceptible. This is, however, an altogether mistaken view to take. It is true that in some cases the fault is imperceptible unless specially looked for; but this is not the only point. The loss of the effect produced by good trimming is the defect in such cases, and this has of late been very forcibly impressed upon us by the inspection of some hundreds of slides, both commercial and competitive. In many of these it was obvious that great care had been exercised in the trimming operation, and every advantage taken of the possibilities afforded by judicious treatment. In quite a number of cases very striking results were produced with quite ordinary subjects, these effects being almost entirely due to trimming. In other cases the trimming had been neglected, and good subjects were thus allowed to give results that were some way short of being perfect. In bad cases the fault is rendered obvious by the blurred and indefinite effects produced at the margins of the prints; but it is easy to avoid this defect and yet trim improperly. Sometimes an object that obviously should

appear to be behind the mount, is seen partly in front of it, and in others, objects that might with advantage be represented as in front of the mount are seen behind. The trimming should be regulated by the subject. A hard and fast rule is applicable, and each subject should be considered individually.

HEATING THE STUDIO.

THE public have, as a rule, the firm impression that a photographer's operating-room (horrible name) is a comfortable place. This belief is not without a basis of sound reason, and does not do much credit to the foresight of those members of the profession responsible for it. The other morning a lady said to a photographer, "I was afraid to bring my little girl this morning. I expected with this glass you would be very cold, and last time she got such a chill at Mr. So-and-So's." If that does not expose a penny-wise and pound-foolish policy we do not know what does. Taking it all round, however, the proper heating of the principal apartment does present difficulties. The size is not the only one; the general draughtiness and slight partition from the outside air have also to be considered. Moreover, economy of fuel and even distribution of heat should be taken into account. An open fire is not only unduly wasteful of fuel, giving the minimum of heat for the maximum of coal consumption, but it is also the least effective and dirtiest method of utilising fuel. Certainly it is the most homely and pleasant in appearance, and for a few yards round the heat is more easily felt, but outside this radius the air is practically cold. Certainly the newer grates are much more effective than the old-fashioned sorts, and if you must have an open fire, one of the new models will pay for themselves and their fixtures in a very short time, owing to their economy. The appearance, too, is better. A gentleman told us the other day that at his country seat they used to burn 100 tons of coal a year in the old-fashioned grates, but were able to reduce it to fifty when every grate had been replaced by a modern form.

After various trials we have come to the rather obvious conclusion that enclosed stoves are undoubtedly the most efficient apparatus for the generation of heat from coal or coke. Unfortunately, there has been, until within a year or two, a dearth of patterns that were admirable, both from the point of view of utility and appearance. This is the more surprising since the stoves seen in Continental houses, especially in Holland, are really handsome. There are now, however, some fine designs obtainable from English ironmongers, and it is really worth while to spend an extra pound or two on a well-designed stove. A studio we visited recently, although filled with handsome furniture and fine wall-hangings, was absolutely spoiled by the workshop appearance of an ordinary tubular stove combustion stove. Moreover, the pipe, which went straight up through the roof, was decidedly out of the perpendicular and very rusty. This pipe, although adding greatly to the heat of the room, might well be shortened and taken straight back into a flue. If there is no provision made for a fire-grate, and this is quite a usual oversight in studios, it will usually be practicable to break into one of the house flues; the draught will prevent smoke from the other fire entering the studio.

It is economy to get a large-sized stove, for then the fire can be kept in all night, really the only wise course. It may appear a waste of fuel, but a little experiment will prove that in reality it is a saving. Instead of having a large, fiercely burning fire in the morning to raise the temperature as quickly as possible, quite a small one will more effectively keep the air at an equable temperature as long as the room is never allowed to sink to that of

side air. Not only is the time of lighting saved, but assistants can proceed to work at once. Retouchers cannot possibly do good work if they are numbed with cold, and means a good hour wasted if they wait until the place is "aired," so to speak. Moreover, "once cold, cold until next time" is the rule.

There appears to be some doubt with regard to the best method of controlling the burning of a stove, and whilst it must use common-sense to avoid putting the fire out together, it will be found that a valve in the flue can be closed with in the case of the majority of stoves. An arrangement that suits one stove will not suit another; but, generally speaking, with the top door closed and the bottom door full open, the stove gives the greatest heat and quickest combustion, which latter are varied to almost any extent by closing the bottom door more or less. Further control is given by opening the top door, whilst the slowest burning of all is achieved by opening the top door and closing

the bottom entirely. By doing this with one stove we had, we were able to use only two buckets of coke in twenty-four hours. The same stove lit each morning and allowed to die out consumed half a bucket of coal and three of coke, with the result that the temperature constantly varied.

It is advisable for a short time each morning to allow a strong current of cold fresh air to blow through the room, otherwise the air becomes too dry and stale for comfort.

It is unnecessary to itemise the many forms of closed stoves which are obtainable, but the reader may be given the names of three firms making a specialty of this class of apparatus, among which he should be able to select a suitable article. These firms are Smith and Wellstood, Ludgate Circus, London, E.C.; the London Heating and Ventilating Company, Newman Street, London, W.; and the Anthracite Stove Company, Horton Lane, Bradford.

FOCUSsing AND SEPARATION OF THE LENSES IN A STEREOSCOPIC CAMERA BY ONE AUTOMATIC MOVEMENT.

(A Paper in "Photographische Rundschau.")

When using an ordinary stereoscopic camera provided with sufficient long extension and a fixed distance between the lenses, it is found, when focussing upon near objects, that the point of subject common to the two pictures becomes less and less as the camera is to the object. In the special case of photographing a subject same size with a distance between the lenses equal to half the long side of the plate, it will be found that no part of the subject which occurs in one plate will be found in the other. By diminishing the distance between the lenses it is possible to obtain once again an amount of the

extremities of these levers move in a pair of straight grooves inclined at an angle to each other, as plainly shown in the drawing, the grooves being made in metal and fixed in the ordinary baseboard of the camera. The further the lens-board is racked out from the ground glass, the further the lower extremities of the levers are separated from each other, and therefore the nearer the lenses are brought together. This is seen very plainly in Fig. 2.

The arrangement possesses such range that it permits of objects being photographed same size, whereas it is just as

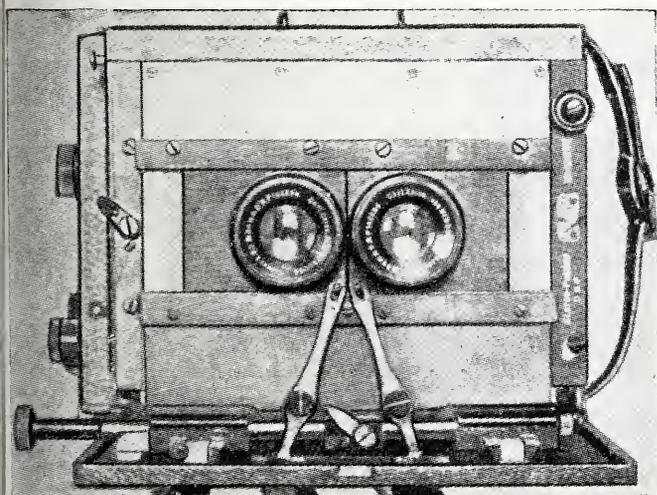

Fig. 1.
Showing the camera when set for stereoscopic negative of object, same size.

subject in both pictures. A very little consideration shows that it is possible by means of the same movement, which controls the movement of the lenses to and fro from the ground glass, also to adjust the correct distance between the lenses. There is thus provided an automatic adjustment, and the photographer has nothing more to do than to focus in the usual way. Such an arrangement was made as an experimental model more than a year ago in the Zeiss Works, and has been fully tested in a practical way by the present writer. The arrangement is shown in Fig. 1. The two stereoscopic lenses are placed on sliding panels, each connected to a two-armed lever. The lower

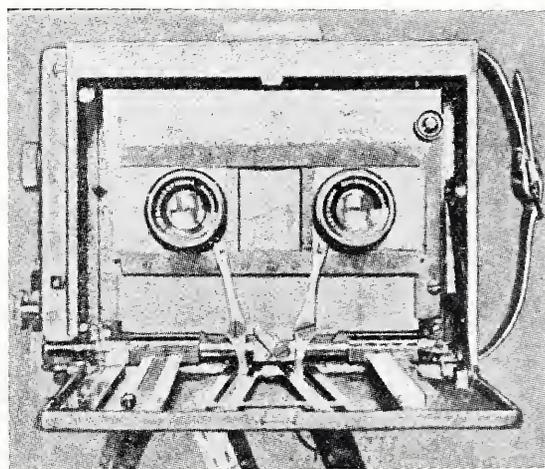

Fig. 2.
Showing the camera set for distant objects.

suitable as any other stereoscopic camera when working on distant objects. In this latter case the two lower extremities of the levers are together, and the lenses are therefore far apart (Fig. 1). The form of the above-described mechanism has been designed in order that the stereoscopic board and the lever adjustment may be embodied without further alteration in the well-known "Stereo Palms" Zeiss camera. The experiments with the first model, which was attached to a "Stereo Palms" camera, which had already been some time in use, were commenced about eighteen months ago. During this time more than 300 exposures of living insects have been made on a scale

from one-third up to natural size, and neither the adjustment for near object exposures nor any other part of the apparatus has failed. As this total number of exposures had to be made during a relatively short period during the two past summers, the total period during which the exposures were going on was about five weeks only. These particular subjects were chosen since they appeared to offer special difficulties, and for the reason also that such work calls for the greatest possible range of movements in the apparatus.

A proportion of the exposures were made with the camera on a stand, and I would here mention that the Stegemann four-legged stand with sliding head has proved extremely useful for this class of work. In spite of extraordinarily severe use, the stand is still in thorough working order, and in as good action to-day as on the first day it was used. The photography of

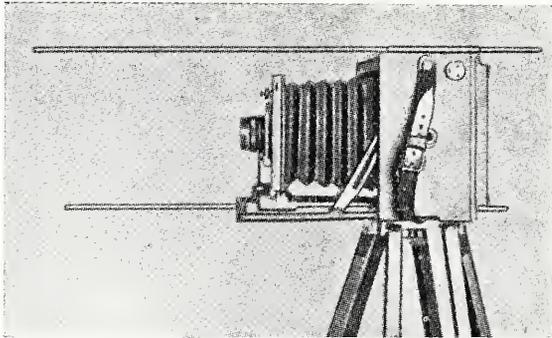

Fig. 3.

Showing camera set for reproduction, same size.

living insects requires a stand with a great degree of adjustability. It frequently happens that one subject has to be focussed from a point directly above it, whilst another requires the camera to be pointed upwards, or one has to focus an insect which may be clinging to the under side of a leaf, and it is also a prime condition that the adjustment should be made in the shortest space of time. To all these requirements the above-mentioned stand has absolutely answered.

In other cases a stand exposure was not possible, and under these conditions the arrangement shown in Figs. 3 and 4 was employed, and was found, for very near objects, more convenient than a reflex camera. It is in preparation for appearance on the market. The corresponding body of the camera is marked in three places, 1:1, 1:½, 1:⅓. On the upper left and lower

right-hand corners of the camera a metal groove is fixed which a steel rod can move. On these rods, marks corresponding to the 1:1, 1:½, and 1:⅓ markings on the body of camera are made, and the photographer, therefore, has nothing further to do than to bring the focussing adjustment and marks on the rods into correspondence. The camera is held so that the object being photographed lies exactly between the rods. The image will then be sharp and the object will lie in the centre of the image. This arrangement can also be applied to any of the "Palmos" stereoscopic cameras provided at same time it has an automatic lens board. Its use is, of course, somewhat limited; but in photographing such subjects as small insects, etc., it is preferable to a reflex camera, since the moving insect can be much better followed as it flies from place to place. In the case of the reflex camera, as soon as

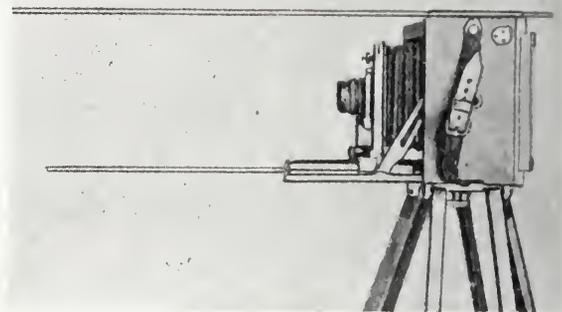

Fig. 4.

Showing the camera set for focus half scale.

object is out of the field a good deal of trouble must be got through in the way of focussing again, whilst in the case of the above-described arrangement, apart from the fixed focus, the handiness of the arrangement is preferable. Some would make an objection that the rods will frighten the insect, but a large number of successful exposures have shown that such fear need not be entertained. Even the timid dragon-fly can be photographed in this way without difficulty; in fact, the working of the apparatus shows that it provides accessory means to such work as this, and those who have once experienced the special charm of such exposures will wonder that an instrument of this kind has not been constructed long before. The prints from the negatives are best examined in the Zeiss "Verant" stereoscope.

DR. W. SCHEFFER.

THREE NEW POPULAR PRINTING PROCESSES.

(A paper read by Hector Maclean, F.R.P.S., at the Sutton Photographic Club on February 12, 1909.)

THE lecture which follows may be considered as an amplification of three others which I have already delivered at this club on various printing processes.

For instance, in my lecture of January 5, 1905, on "Photography with Chromium," I explained in some detail the theory and practice of the oil pigment process, and on two other occasions demonstrated the charming possibilities of and recent improvements in the platinotype processes; so that when to-night I make reference to the Bromoil or to the Black Japine process, I feel that it will not be necessary to go right back to the elementary bases of either of them.

What I propose doing this evening is to first give you a general idea of the Bromoil, next of the new Black Japine, and finally of the Ensyna process; and, as far as time will permit, I shall practically demonstrate the manipulations which are called for.

"Bromoil."

It will be remembered by some of you that the oil pigment process is due to the *direct* action of light on gelatine, sensitised with

bichromate of potassium, so that where much light falls the film absorbs but little water, and where little light falls the gelatine absorbs a larger proportion of the water. In this way the different opacities of a negative become registered, and incidentally, at the same time, the image swells up.

In the case of Bromoil a similar condition of the gelatine film is set up by the *indirect* action of light. That is to say, an ordinary bromide print, if bleached by a suitable mixture containing potassium bichromate, potassium bromide, potassium ferricyanide, alum, citric acid and water, and then treated with an acid bath, will assume a similar condition to that of an oil pigment print as regards its selective action in taking or repelling ink.

It may be well to here shortly outline what are the essential procedures for making a bromoil print ready for pigmentation.

Firstly: A good bromide print should be secured. For this purpose a smooth matt paper and a dilute amidol developer should be chosen. One of the easiest papers to employ is that known as "Bromoil" paper specially made by Griffin; but most ordinary papers—if of the smooth matt surface variety—will answer. T

should be freshly made—the fresher the better—say not than a week before it is bleached. It should be fixed in a fresh bath of plain hypo and then washed.

Secondly: The print, when quite dry, is bleached. Several alternative but similar mixtures have been proposed and used, as good as any is Griffin's "Bromoil" solution diluted with parts of water. In this, the bleaching takes about three

Thirdly: A short wash in water is given to remove the yellow

Fourthly: The print is placed for six minutes in sufficient quantities of pure sulphuric acid, 1 oz.; water, 1 pint; at a temperature of about 65 deg. F.

Fifthly: It is washed and fixed in hypo, 2 oz.; sodium sulphite, 20 oz.; water, 20 oz.; and again washed for five minutes.

The bleaching and after operations can be carried out in daylight. The print is now ready for pigmenting.

Pigmenting.

Shortly put, this procedure is as follows: The wet print is placed on a pad of wet blotting paper and the surface moisture removed with the image with a pad of butter muslin; or by any other convenient means.

The ink, which should be a stiff sample, is then dabbed on with a large brush until the whole of the print shows its image in rough. The print is then gone over with ink that has been mixed with Roberson's (or some other) medium. Mr. Mortimer recommends that a quiet "smudging" action of the brush should be adopted. While higher lights and half-tones may be lightened by employing a hopping action of a brush which has hardly any weight in it, the heavier shadows cannot, with advantage, be much lightened. These include all the essential procedures. Of variations and refinements there are no end. For such, amateurs are referred to various books and articles on the process. Of the latter, "The Oil and Bromoil Processes," by Mortimer and Coulter, and "How to make Oil and Bromoil Prints," published by the same author, are the most useful.

The pigments in the pots (Sinclair) are recommended in that they possess more body than do the tube colours.

When a thinner pigment is required tube colours may be used, but a yet thinner pigment is attained by the addition of the medium (Roberson's).

As for brushes, probably the most useful is the "Pole Cat," one with a bevelled edge supplied by Sinclair. The small brushes are used for "detail" work. Another pattern brush which has an adjustable spring for controlling its touch is that made by Griffin's from the design of Mr. Mortimer. The "hopper" is a device—which, however, is not a necessity—for quickly performing the operation known as hopping, i.e., giving the image a rapid succession of perpendicular touches with a brush having a level finish.

With the time at my disposal this evening I cannot go into further details, but suggest that those to whom this elastic method of making pictures on a photographic basis appeals should acquire a practical acquaintance with its procedure, so that if on an early occasion I or another member were to go more fully into the niceties of the process, they would be able to appreciate the points brought to their notice. Let me add that although a good many oil prints are characterised by vigour and freshness and at times coarseness, the process may be made to give much refinement of image. An example of this was shown only a few days ago by Mr. Gower, of Croydon, who had made a print of some old iron work for the Surrey record which contained a large amount of minute detail.

Black Japine Platinotype.

Although the bromoil process is deservedly popular for the production of what are termed personal impressions, and although it is fully and sympathetically used it is capable of producing effects of great beauty and sometimes of greater truth than might otherwise result from a purely photographic record, many will always regard it as a hindrance rather than a help, inasmuch as it makes a heavy demand upon the manual and constructive abilities of the amateur. With the great majority the charm and the supreme advantage of photography are that it will, without any artistic interference of Mr. Bernard Shaw's "clumsy hand of man," produce results which, for subtlety of tonal rendering, combined with

accuracy of drawing and infinity of detail, no brush-made or pencil-drawn picture can rival. Those who have this feeling strongly developed will never greatly care for such hybrid processes as the bromoil. For the benefit of this class of amateurs, who pin their faith on pure photography, I now draw attention to a new variety of what I think may be still termed the premier printing process—viz., platinotype, a process which, it should be remembered, has been chosen by many of the most able and distinguished workers for producing their best exhibition pictures. Hinton, Gale, Evans, Coburn—many of the leaders of the American school—and scores of other equally clever amateurs have found this process has done more justice to their conceptions than all the other ones put together.

But outside the inner circle of pictorialists there has always been a feeling that platinotype included just a little too much mystery and breadth. It had a knack of converting excessive sharpness of definition into a slightly softened rendering. This longing on the part of amateurs for more detail was, as you may remember, gratified about a couple of years ago by the introduction of the Japine platinotype process, which, at the time, I fully explained and demonstrated at a meeting of this club. The process in question produced juicy prints of great beauty and of a colour resembling Vandyke brown. This was exceedingly useful for a very large proportion of prints. But there undoubtedly remained many subjects which could not be adequately rendered in any colour but black. Even if this were not the case, the fact remains that a considerable proportion of people much prefer a black to a brown print. The former is certainly more vigorous than the latter, because black is more intensely dark than is brown. A few months ago the Platinotype Company placed at the disposal of the photographic community a new variety of Japine paper, which, while in other respects the same as the original make, produces a black image instead of a brown one. Without attempting to describe the operations involved in platinotype printing, I will now show you some examples which illustrate the differences in appearance between an ordinary and a Japine-black platinotype. As is the case with brown Japine, the development of black Japine is not so rapidly performed as with ordinary black paper.

The bath used is, however, the same, and the temperature is merely the normal one. By this I mean that the developing solution should not be less than 60deg. F.—it may considerably exceed this. So far as I am aware, the ordinary oxalate developer may be employed, but I have always found that the best results are obtained by using the special platinotype salts sold for the purpose by the Platinotype Company. A carton of these, costing a few pence, is dissolved in 48oz. of water. As regards the average amateur, with care this is enough to develop all his prints for a year, as the developing solution may be used over and over again. The best way to make it go as far as possible is to have two bottles, one for the above stock solution and the other for the used one.

When the latter has been in use it is poured back into its bottle, and the waste which has been caused by the absorptions of developer by the prints, and by other casual causes, is made up by adding an equivalent volume from the stock solution. The fixing—which are in reality clearing—baths consist of hydrochloric acid of a strength of one to sixty of water. A few minutes in three of such baths, followed by a slight wash in plain water, complete the operations.

Ensyna.

I now come to the third of the important printing processes which have been brought out during the past year. It is one which seems quite likely to become exceedingly popular, as you will probably agree when you have heard and seen what I am about to bring to your notice.

"Ensyna" is the outcome of a long series of attempts which have in past years been made to discover a means whereby a short exposure of P.O.P. could be developed, by means of a suitable developer, into an image of full strength and of satisfactory colour.

It is now several years since various means have been suggested for effecting this. One method adopted was to "bromise" the weakly printed P.O.P. and then build up the image by aid of a modified developer of hydroquinone, the resulting print being subsequently toned by means of gold chloride. This proved to be in practice uncertain and unsatisfactory. Subsequently various patent or secret developing solutions were brought out, of which the best

remembered was known as synoloids. This produced with P.O.P. a fairly satisfactory series of tones, but was very prone to blacken or darken the back of the paper, and it was altogether a dirty working solution, which, moreover, did not act with the same success with all makes of P.O.P. Anyhow, it failed to catch on.

"Ensyna" scores because, in addition to being developed with what may be termed an improved synoloid mixture, the paper itself has been expressly devised for being easily impressed with a more or less invisible image, which is readily made visible by means of the special developer sold for the purpose under the name of "Ensynoids." The special characteristic of Ensyna is that the main ingredient in its preparation is a phosphate of silver, and the chief peculiarity of the paper is that it produces the finished picture by what is termed "physical," as opposed to "chemical," development. That is to say, the faint, often imperceptible, image on the paper, which is presumably of pure silver, is built up by the deposition upon it of silver molecules which the reducer deposits. There is apparently no silver in the reducing solution, but the free phosphate of silver in the paper, being soluble in the developer, is washed out and is then in a condition to be deposited on the faint image, this deposition being inversely proportional to the densities of the negative which has been used to print from. In bromide development the action which takes place is distinctly different. What happens is that wherever light has fallen the pale molecules of silver bromide are decomposed by the developer, bromide being liberated and more or less pure silver molecules of a dark colour left behind in the gelatine film. These molecules are distributed right through the gelatine film, so that development is somewhat retarded by the time occupied for the solution to permeate the film. In a similar way fixing and washing require much time and care.

With Ensyna the conditions are very different. To commence with, the image is practically what is known as a surface one; secondly, as the developer dissolves nearly all the free silver (*i.e.*, that which has been unacted on by light), it follows that there is not much left in the paper for the hypo to remove, hence about one minute of a weak fixing bath is considered to be ample. The hypo being used for so short a time and in so weak a solution, it naturally follows that the amount of washing called for will be proportionately reducible. As a matter of practice, four minutes in running water is considered to be amply sufficient. From the foregoing particulars it will be realised that Ensyna has several points in its favour. The image is on the surface of the film, and is, or should be, for that reason more brilliant, and should exhibit greater detail than if it were partially embedded under layers of gelatine; the development being a physical one, it is reasonable to expect that the silver which is deposited is the pure metal, uncontaminated by any more or less obscure compounds of silver, and, for the reasons adduced, the whole of the operations are much more quickly completed than are similar operations with other kinds of gelatine and silver papers. Roughly speaking, six minutes may be considered an average time within which a print may be made ready for mounting. This in itself places the process far ahead of any other silver printing method, as regards the saving of time and trouble. But the most conspicuous advantages of the paper remain to be described. These are the rapidity with which it can be printed by means of almost any kind of light, either daylight or one of the innumerable forms of artificial light, and the possession in an unusual degree of that valuable characteristic known as "latitude of exposure." What this advantage means all who are accustomed to bromide, or gaslight, or platinotype printing, will understand. With either of the first two of the above-named papers it is well known that, unless

the exposure is very nearly right, it is impossible to obtain a satisfactory print. Over or under-development will make the result of a bad job, but after all the resulting picture falls short of what it might, and should, be. With Ensyna, provided that not less than the minimum of exposure is given, and that a fairly good negative is used, there is an exceedingly wide range of error permissible. For instance, I made three prints in succession from one negative under the following conditions. In each case the light was from an incandescent gas burner, and the distance at which the printing frame was placed was twelve inches. Print No. 1 had thirty seconds, No. 2 had one minute, and No. 3 had two minutes. They were all three developed in a normal developer (Ensynoid) and each one produced a fully satisfactory print, in which the variations were almost identical. The only difference between them was of colour. Thus Print 1 was a cold black, Print 2 a cool sepia, Print 3 a warm brown. It should be added that the shorter exposure the longer was the time needed in order to complete development.

This latitude is, I consider, of inestimable value, because it saves an enormous proportion of what would otherwise prove "waste." On the other hand, where pictorial need demands that a print should be of a particular colour, or "tone," it is a great convenience to be able to get this by merely increasing or decreasing the exposure. It is, however, only right to say that this variation in colour may at times be somewhat embarrassing, as, for instance, when printing several dozens of negatives, the prints from which it is desired to show as a series in an album or otherwise. At the same time, in a little practice, it should not prove difficult to ensure that the prints are practically identical in their colour, and should a print develop up too warm or too cold, by decreasing or increasing the exposure it should be easy to get right at the second time of asking. Reverting to the question of latitude of exposure, let me draw attention to some remarkable experiments, described by Mr. Thorvald Bolas in the "Amateur Photographer" of December 29, 1908, the course of which he states that, if the minimum exposure for a cold black print be five seconds, an exposure of five minutes will yield an equally good print of a warm brown colour; that is to say, the exposure in the one case is sixty times as long as in the other. Furthermore, the exposure may be increased to five hours, and yet a passable print may be obtained provided the print be washed before development, and that the developing solution be diluted with two or three times its volume of water.

Before concluding these notes it may be helpful to those who go to Ensyna a trial to add that, although Messrs. Houghtons Ltd. advise that the special fixing bath that they provide should be used, there appears to be no insuperable reason why a clear plain solution of hypo, of three ounces to the pint of water, should not be employed, or an acid fixing bath of similar strength. By all means use the makers' materials, if you can; but it must frequently happen, in out-of-the-way parts, that such items as the special Ensyna fixing bath may be unattainable.

The Ensyna print is complete when it leaves the washing water. At the same time, should it be thought desirable to alter the colour, there is nothing to prevent one from toning a print in an ordinary gold and sulphocyanide bath; or, for aught I know to the contrary, in any other of the baths usually employed for toning P.O.P.

Much more might be added respecting the variations in procedure which are possible with this paper, on which point I must have more to communicate on a future occasion.

HECTOR MACLEAN, F.R.P.S.

THE LONDON STUDIO has removed to 111, Shoe Lane, E.C., where they are in full working order. The telephone numbers are, as heretofore, 1,706 Holborn and 12,269 Central.

THE DALZIEL FOUNDRY, LTD., 2A, Plough Court, Fetter Lane, E.C., has issued a very good piece of advertising literature (the work of Mr. Frank Colebrooke) in the shape of a journal (price, "H'm, How much have you got?") entitled "Dalziel and the Dalsprites." It contains some very clever illustrations in colour by Mr. Dudley Ward, and cannot help fixing the merits of Dalziel stereos in the reader's mind.

SUTER LENSES.—Messrs. A. E. Staley and Co., 19, Thavies Inn Lane, London, E.C., inform us that they have completed arrangements with the firm of E. Suter, of Bâle, manufacturer of anastigmat lenses and high-class optical instruments, to represent him entirely for England and the colonies. The lenses made by Suter hold a very high position in the trade on the Continent, but the representation in England up to the present time has not been carried on to any extent, and it is Messrs. Staley's intention to put these lenses and to try and make a good position for them in the trade here. An English catalogue will be ready shortly.

CONTROL IN DEVELOPING GASLIGHT PRINTS.

[The following article, by Mr. T. H. Greenall, in the current issue of "Photo-Notes," calls forth from the Editor of our contemporary, Mr. C. Welborne Piper, the following comments: "It has, of course, always been known that a long exposure and a well restrained developer will produce warm tones. There is nothing new in this, but the system of tentative development adopted by Mr. Greenall permits us to turn this fact to account in the case of unintentionally over-exposed prints, and the method of control thus obtained certainly seems to be new and valuable. In the case of a number of specimens submitted to us by the author, with the article, the results produced on 'Rotox' postcards are scarcely distinguishable. The range of exposure is from 20 to 90 seconds at 10in. from an incandescent gas burner. The difference between the extreme exposures is one of colour only, and the variation is so slight that it might easily be unnoticed. Another set of examples represents a series of exposures to a Bray burner, the extremes varying from one minute to twelve. The one-minute exposure is a soft grey black and the twelve-minute one a sepia, but otherwise the prints are identical. These examples show clearly that by adopting the method no print need be wasted so long as under-exposure is avoided."]

The following is a method of working which I invariably adopt for gaslight paper, as it allows enormous latitude in exposure, and yields prints of good gradation in the high-lights and of pleasing colour and clearness in the shadows. It is true the colours will vary slightly, but those usually obtained will be either a rich warm black, or black, or engraving sepia, and as these are, for most subjects, together superior to the cold black given by ordinary development, the variation is an advantage rather than otherwise. Having roughly sorted my negatives into thin, medium, and dense, I expose a batch of six at once, allowing considerably more exposure than the same would require to yield a black print in the ordinary way. One inch of magnesium ribbon at 10in., or 40 to 60 seconds incandescent gas at 10in., is about right for average negatives, dense negatives having longer; but the exact exposure is unimportant unless a particularly warm or cold colour is specially wanted. As an example I made four prints of the same negative on 'Rotox' postcard, giving 20 seconds, 40 seconds, 60 seconds, and 90 seconds respectively, at 10in. from an incandescent gas flame, and there is very little difference in colour, whilst the gradation and density are practically alike in all. An exposure of three minutes would have given warm sepia, that is the only difference.

Development.

As the prints are exposed they are placed in the following solution at normal temperature (60deg. to 65deg. F.):—

Pyrocatechin	2 grains.
Hydroquinone	2 grains.
Sulphite of soda	20 grains.
Citric acid	2 grains.
Potass. bromide	1 grain.
Potass. carbonate	20 grains.
Water	6 ozs.

In my own practice, when I have many prints to make I dilute this further and place the prints upright in the diluted developer in a tank. After two or three minutes in the concentrated, or ten or fifteen minutes in the tank, developer, I examine the prints as

regards their lighter tones. A print which already looks pinky all over must be left to finish out in the restrained developer, as it has had long exposure, and will give a warm-coloured print of good gradation if left until it appears very strong and rich before fixing. But the majority of the prints should show either nothing at all, or a pinky deposit in the shadows only, after the above time in the restrained developer, and these are to be taken out singly as the shadow detail appears, rinsed under the tap back and front for a few seconds, and finished in the following eikonogen solution. This, it will be observed, contains no alkali, and it will bring up the high-lights even when the exposure has been one-fifth or one-tenth that required for a sepia print; at the same time, it will not block up the shadows:—

Eikonogen	10 grains.
Sulphite of soda	60 grains.
Water	2 ozs.

This solution may be used repeatedly, provided the prints are always rinsed as they are transferred to it. As to the proper moment to make the transfer, the general rule is to leave the prints to gain some shadow detail in the restrained developer, and use the eikonogen for finishing off, but a print from a contrasty negative should be changed earlier than one from a flat negative, which should be left a longer time in the restrained developer to gain increased contrast.

"The eikonogen alone would give an extremely soft and thin result, whilst the restrained developer alone would give either nothing, or 'soot and whitewash,' except in the case of those long exposures already referred to. Fixing is in the usual acid fixing bath, and it is well to bear in mind that blacks and cool sepias do not lose as much in fixing as do the warm sepias before mentioned.

"Finally, should it be desired to have 'red chalk' prints, it is only necessary to give long exposure and use the restrained developer with a little extra bromide. The eikonogen may be used to correct errors in exposure in this case also; therefore no print need be wasted, unless, of course, the negatives are hopelessly at fault to begin with."

T. H. GREENALL.

ON THE REGULATION OF THE RAYS IN PHOTOGRAPHIC OBJECTIVES.

THE ELEVENTH TRAIL-TAYLOR MEMORIAL LECTURE.

II.

THE eye, in observing the image on the focussing screen or on the print, accepts circles, however, which do not go beyond a definite size, as sharp points. The size of the circles of confusion, still permissible for this reason, are usually designated with ϵ . In the plane focussed for there are circles of confusion conjugate to them of the size $N\epsilon$. It is, therefore, sufficient to discover the conditions under which circles of confusion in the plane focussed for do not exceed the magnitude $N\epsilon$. If their origin be once more looked into (fig. 14), it is evident that the diameter of the circles are proportional to the diameter of the entrance pupil; in other words, they are greater or smaller in the same ratio, in which the entrance pupil is enlarged or reduced. They increase with increasing distance of the object points from the plane focussed for, and they are, other things being equal, all the smaller, the further the object, consequently also the plane focussed for, is removed from the entrance

pupil. In this latter case the cones forming the circles of confusion will be more acute. If we are now asked the question, how great the "near depth" and the "far depth" may be, that is to say, how far in front and behind the plane focussed for the object points may lie, without the circles of confusion representing them becoming greater than $N\epsilon$, the following formulæ can easily be found:—

$$\text{"Near depth"} = \frac{AN\epsilon}{d + N\epsilon}$$

$$\text{"Far depth"} = \frac{AN\epsilon}{d - N\epsilon}$$

in which A is the distance of the plane focussed for from the entrance pupil, and d is the diameter of the entrance pupil.

It will be remarked that in the investigation of depth of definition the type of objective has absolutely nothing whatever to do. This

fact is from time to time freely discussed in the photographic journals. It is, however, not quite superfluous to point out that also the focal length has, in reality, no influence upon the depth of definition in such images of objects extended in space, which images, to produce an impression as true to nature as possible, should be viewed at the correct distance. This is very easily seen in the following manner: If a print be brought, as shown in Fig. 15 (also in Fig. 14)

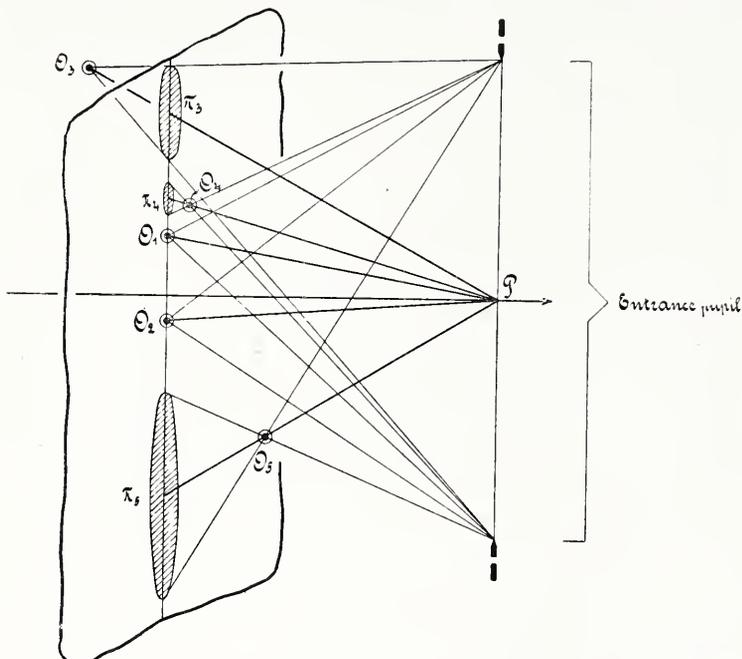

Fig. 17.

Very large entrance pupil: depth of definition very slight.

in the position necessary for the correct perspective between the object and the eye, supposed to be lying in the middle of the entrance pupil, each circle of confusion in the print, for instance, π'_5 , must appear to the eye exactly as large as the corresponding circle of confusion π_5 in the plane focussed for. If the same object and the same position and size of the entrance pupil be fixed, but an objective of shorter focal length be made use of—which from this assump-

is rationally defined, as we have done above, by a linear measure of the circles of confusion on the focussing screen. If it could, however, be supposed that exposures of objects extended into space were viewed by everybody correctly, that is to say, under the correct angle, the only correct way would be to define the depth of definition by an angular magnitude. A point O_5 is then represented as a sharp point, if its circle of confusion π_5 , in the plane focussed for, appears from the middle of the entrance pupil under an angle, which does not go beyond the angular acuteness of vision of the eye. We see, consequently, that this depth of definition is completely determined by the projection figure in the plane focussed for, that is to say, by the object and the distance and size of the entrance pupil. The objective has nothing to do, regarding any special type and specific focal length, but to fix the phenomenon. It does this all the quicker the smaller its focal length, as in that case the ratio $D : f$ is the larger, and consequently the rapidity increases.

If the entrance pupil be given a diameter which has the same order of magnitude or even greater than the distance from the plane focussed for—as shown in fig. 17—the previously defined extent, within which object points are considered sufficiently sharp, contracts into an extremely small space. For even the point O_4 , lying fairly near the plane focussed for, is represented by a circle of confusion of considerable size. The case only assumed here frequently occurs in microscopy with powerful objectives. You know that there the layer of the specimen sharply seen at one view is extremely thin, that the term "optical section" is often applied to it. With the photographic objective this extreme case, it is to be never occurs. For all that the point cannot be considered quite out of place in our discussion, for it emphasises the impossibility of getting a plane representation of a solid object, where definition and regulation of the rays be not taken into account.

We have already defined the "principal rays" as those of pencils producing the images, which before their entrance into the system are directed towards the centre of the entrance pupil,* therefore in their path in the lens system pass through the centre of the diaphragm. We will examine the principal rays a little closer, and to this end we will turn again to the example of Petzval portrait objective, Fig. 18.

As we see, all principal rays, which enter at the margin of the first lens surface, pass unobstructed through the whole system. It is therefore this margin of the first lens surface which defines

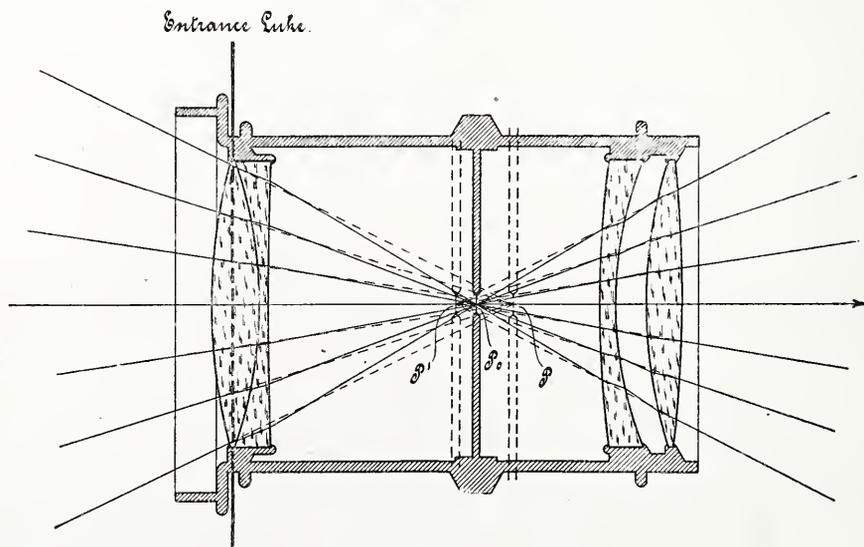

Fig. 18.

Path of the principal rays in a doublet: the margin of the front surface acting as the entrance "luke."

tion possesses naturally a larger relative aperture—the projection figure in the plane focussed for is reproduced on a smaller scale N on the plate and print. To obtain the correct impression of perspective, the print must then be placed correspondingly closer to the eye than formerly. On that account the circles of confusion, for instance, π'_5 , appear, although they have become smaller, to the eye again in the same angular size as formerly. If exposures of objects extended in space be intended to serve for purposes of measurement, in which they are to be viewed with the microscope, the depth of definition

regulates the principal rays; this is the case in the majority of double objectives. It is otherwise in landscape lenses with fr

* Here the rays are represented before entering the objective as if they strictly intersected in the centre P of the entrance pupil, likewise after emergence as if they all strictly proceeded from the centre P^1 of the exit pupil, that is, pencils of the principal rays are drawn as being perfectly free from aberrations according to the assumption already mentioned above. This assumption permitted us in our considerations at this moment. If, for example, the subject of distortion in objectives is being discussed, due regard must be paid to the fact that the pencil of principal rays is affected with aberrations.

diaphragm illustrated in Fig. 19. In this example the principal rays are only definitely regulated upon emergence from the system at the margin of the last lens surface. It is as desirable here as in image-producing pencils, dealt with above, to know or construct an opening, through which we can consider the pencil of principal rays as being already definitely regulated in their entrance into the system, whilst their direction is yet unaltered by refraction in the lenses. This allows of easy fulfilment; we determine the virtual image of the margin $A' B'$ of the last lens surface, projected by

principal rays in this way the "entrance luke" of the system.* Together with the entrance pupil the "entrance luke" forms a second important characteristic of the lens system derived from the doctrine of regulation of the rays.

In Fig. 20 the Petzval objective is represented once more. As the real lenses cannot now be regarded as essential they are indicated by dotted lines only in order to show where the essential characteristics of the system are lying—viz., the focal points F and F' , the principal planes H and H' , the entrance pupil with variable diameter

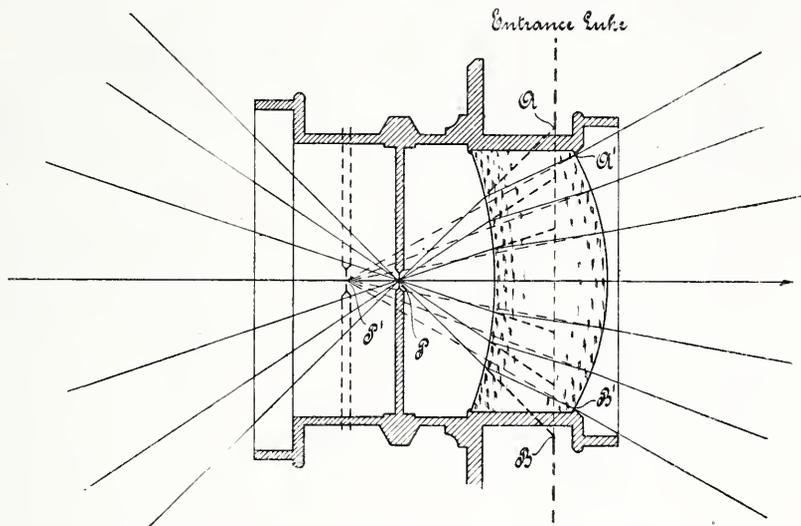

Fig. 19.

Path of the principal rays in a single lens: the virtual image of the margin of the last surface acting as the entrance "luke".

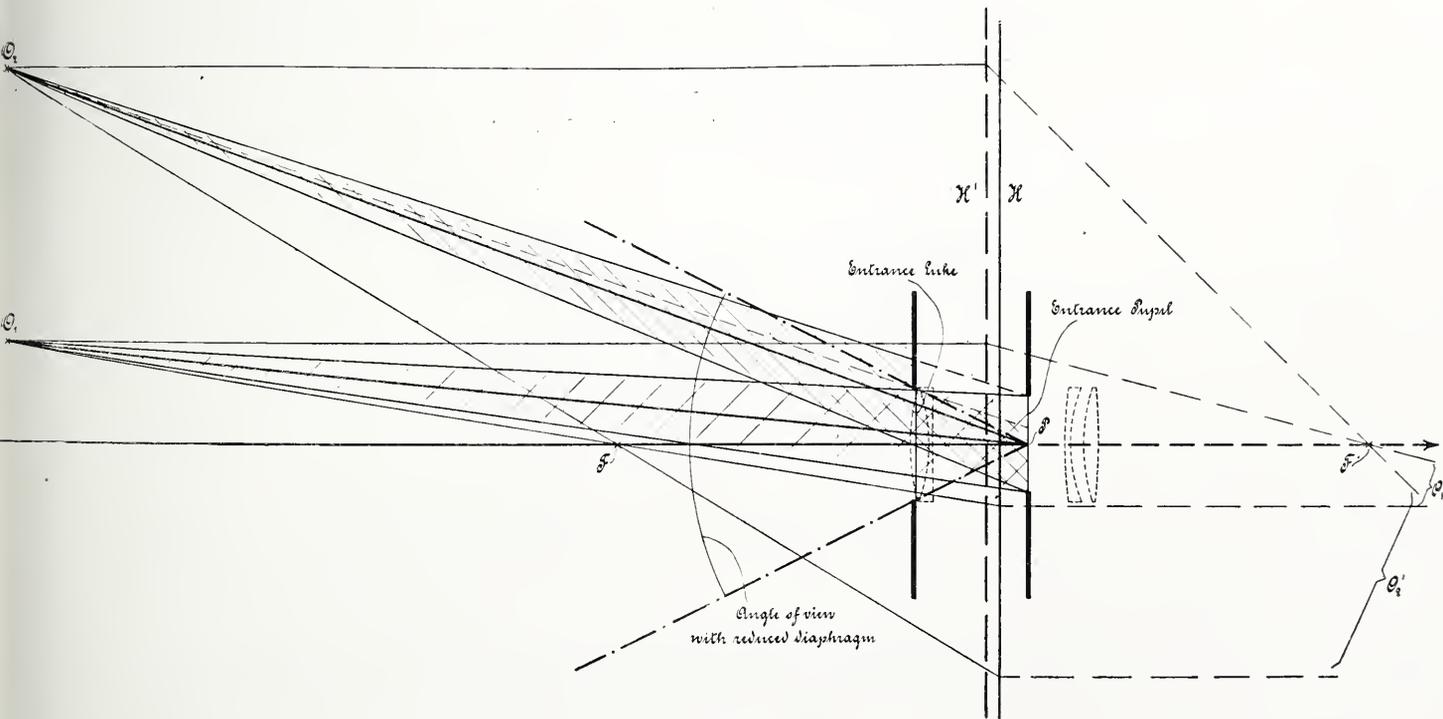

Fig. 20.

the lens, in the same way as we determined the entrance pupil of a doublet, the latter being the virtual image of the diaphragm projected by the front lens of a doublet. The virtual image of the lens margin $A' B'$ is $A B$ (Fig. 19). The same principal rays, which upon emergence pass through the margin after refraction, pass out before refraction, proceeding from P in straight lines through the virtual image $A A'$. This virtual image, therefore, can be used for definitely regulating the entering principal rays, as in the real margin of the front surface in the doublet of Fig. 18. In every case we call the real or virtual opening which regulates the entering

and the entrance luke with invariable diameter. The principal planes and the focal points are sufficient to determine in a well known way the image point for every object point, although the rays here used as construction lines are too far removed to be used by the objective itself.

The straight lines, proceeding from the centre P of the entrance pupil and passing through the margin of the entrance luke, prescribe

* I employ the German term "luke," signifying a small window such as a port-hole, on the ground that it can be readily understood to mean a more or less distant aperture which may be looked through.

the field of view with small stop. When the diaphragm is fully open, the entrance pupil has the diameter as drawn here. Examine the cone of rays having the point O_1 as apex, and the fully open entrance pupil as base. This whole cone passes through the system. This is not the case, if we consider a cone of rays issuing from an object point O_2 lying nearer to the margin of the field, for a certain portion of the rays from O_2 , directed towards the entrance pupil, is obstructed by the entrance luke. This new secondary regulation of the image-forming pencils will be discussed with the help of our last figures. In Fig. 21a, besides the object plane only the axis of the objective, the entrance pupil E.P. of variable diameter, and the

the point O we project the entrance luke into the plane of the entrance pupil we obtain as projection figure the circle CD. The part common to this circle, and the entrance pupil, evidently correctly measures the quantity of rays with which the point O reproduced by the system. Fig. 21c represents the projection figure in the plane of the entrance pupil on a three times scale. We see in this way it is quite easy to determine for any definite object point and for any definite diameter of the entrance pupil the vignette power of the entrance luke. If the entrance pupil be reduced, the outer circle, as O_{11} , of the object field becomes smaller, the inner circle $O_1 O_1$ larger, and, finally, with quite narrow diameter of

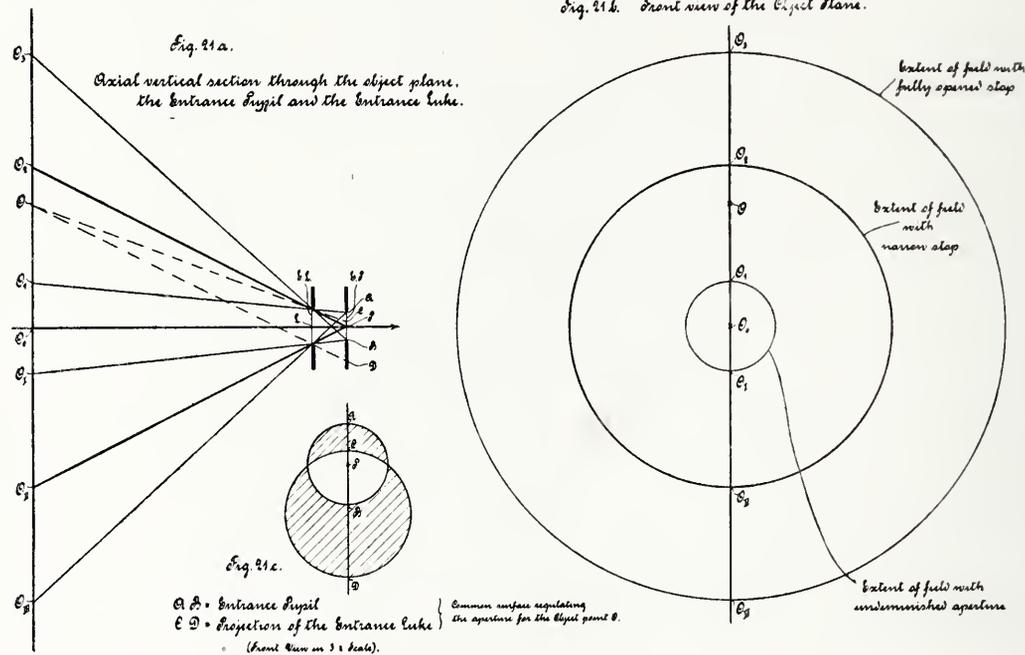

Fig. 21. Secondary aperture regulation by the entrance "luke."

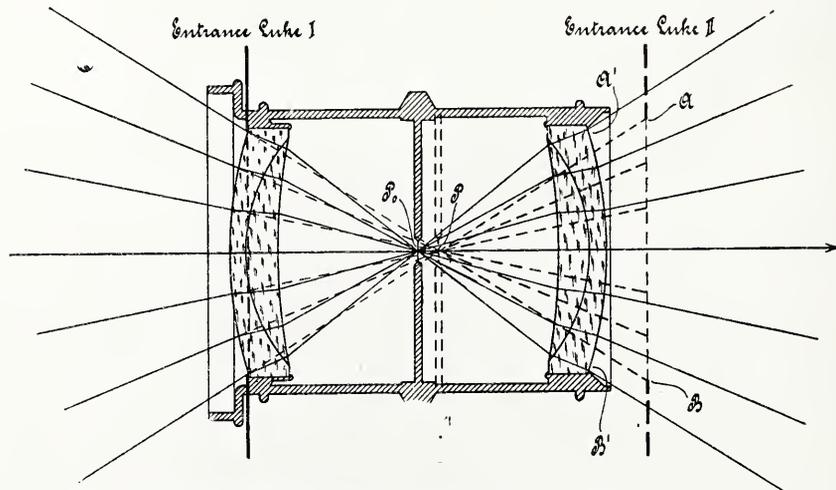

Fig. 22. Path of the principal rays in a symmetrical doublet, the margin of the front surface and the virtual image of the margin of the last surface being two concurrent entrance "lukes."

entrance luke E.L. of fixed diameter, are represented in side view, in Fig. 21b the object plane in front view. If we join the margins of the entrance pupil and the entrance luke crosswise with straight lines, these produced would cut the object plane in the circle $O_3 O_{11}$. It is evident that this circle includes all points in the object plane which send any rays at all through the system. If, on the other hand, we join the margin of the fully open entrance pupil with the margin of the entrance luke direct, such lines produced would cut the object plane in the circle $O_1 O_1$. This circle includes all object points, the rays of which are regulated only by the entrance pupil—i.e., the circle includes the field of undiminished aperture. The rays proceeding from the point O lying nearer to the margin are in part obstructed by the margins of the entrance luke. If from

entrance pupil the two circles simultaneously merge into the circle $O_2 O_{11}$. This circle is, therefore, the field with small stop. In practice two concurrent lukes have often to be dealt with. This case sometimes occurs in non-symmetrical double objectives, in symmetrical objectives always. We will go briefly into the case of symmetrical objective; it is represented in Fig. 22. On account of the symmetry of the objective to the diaphragm all principal rays which enter next the margin of the front lens, must here emerge at the margin of the hinder lens. This margin $A' B'$ is reproduced by the system as a whole in the virtual image $A B$, and this virtual image $A B$ regulates the entering rays which are directed towards the middle P of the entrance pupil behind P exactly in the same manner as the margin of the front surface in front of P . Besides

margin of the front surface, therefore the virtual image A B the margin of the last lens surface appears as a further concurrent entrance luke.

In order to determine the size of the field of view with diaphragm closed down, it is immaterial whether the front or the hinder entrance luke be employed. If, however, it be desired to determine amount of the vignetting, both entrance lukes must be projected in the object point concerned into the plane of the entrance pupil, the measure for the quantity of rays contributing to the image the point is then the surface common to the three circles in 23.

Entrance Pupil
Projection of Entrance Luke I } from the
" II } Object point

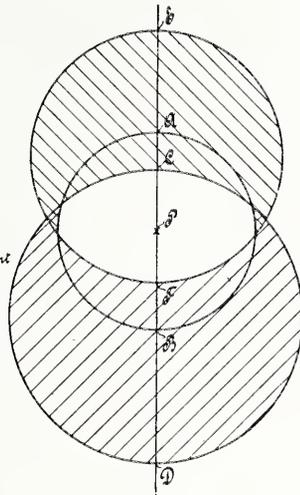

Fig. 23.

Secondary aperture regulation by two concurrent entrance "lukes." Front view of the plane of the entrance "luke."

In Figs. 20 and 21a only one entrance luke was drawn, that is why, the margin of the front lens, since the margin of the hinder would permit the passage of a wider opened pencil of principal rays, as Fig. 18 clearly shows. We represented Figs. 20 and 21a in such a manner as if only the entrance luke (E.L.) acted for vignetting oblique pencils and designated, therefore, as measure for the relative quantity of rays the surface common to the two circles in 21c. For points not lying very far laterally this is also correct. However, object points be considered which lie more distant from the axis, as, for example, the point O₁ in Fig. 20, a glance at this point will show that the lower margin of the hinder lens of the dotted virtual objective must also take part in the vignetting, a fact which can be easily observed practically in such an objective, directly the entrance pupil has been made large enough by opening out the diaphragm. The vignetting effect of the hinder margin of the lens can be deduced by supposing this hinder margin of the lens in Fig. 18 reduced by the entire system, in the same manner as in Fig. 22. The image should be termed AB; it lies, like the entrance luke II, in 22, behind the entrance pupil. If it be desired to more thoroughly investigate the vignetting occurring in points lying very distant laterally, to the essential elements in Figs. 20 and 21a, which are intended to diagrammatically substitute the Petzval objective image just referred to of the hinder margin of the lens must be taken into account in addition.

It is, however, requisite, in order to carry out a really exhaustive investigation, to consider the margin of each lens surface reproduced in the parts of the entire system lying in front of it, and the virtual images of the margins thus obtained, together with the margins of the amount lying in front of the front lens and of the sun shade, added to the essential elements in Figs. 20 and 21. If, then, from any point whatever all these real and virtual circles, some lying in front of, some behind, the point P, be projected into the plane of the entrance pupil, there results a surface common to all these projection circles and to the entrance pupil itself; this common surface being the real measure of the quantity of rays contributing to the reproduction of the point concerned.

After having thus far concerned ourselves upon the subject of vignetting, we have to add a few supplementary words to what has been said above with regard to Fig. 14. In this instance vignetting not having been touched upon, we were only considering the effects of confusion $\pi_1 \dots \pi_5$ arising in the representation of objects extended in space in the plane focussed for. It is evident

that the shape of the confusion figures π in each case must correspond with the shape of the actual opening in the plane of the entrance pupil. In the projection figure in the plane focussed for we therefore find, besides points and circles, also figures included by four or two arcs. This fact must be taken into account in some problems.

We have hitherto assumed that cutting off the pencils of rays, which proceed from the object points towards the entrance pupil, occurs only at the objective. The case can also happen with objects extended in space, that object portion R₁ lying towards the front shuts out a part of the rays, which are directed towards the entrance pupil from a portion R₂ lying behind R₁. This can especially happen in the case of portraits made at a short distance from the sitter with an objective of very large diameter. Here it may happen that portions R₂ are visible from the margin of the entrance pupil, which are shut out from the middle of the entrance pupil by portions R₁. This phenomenon had already presented itself to Sir David Brewster, and he discussed it in an elegant manner. In this case the centre of the entrance pupil ceases to be the centre of perspective for all portions of the object represented. Perhaps opportunity may arise at a future time to go more closely into this interesting problem. At any rate, the idea of the plane focussed for retains its undiminished importance.

This, Mr. President, concludes our present inquiry into the subject. It has been my aim to bring before you in a simple way some modern methods which deserve to be widely known. Lastly, I wish only to express my obligations to my colleague, Mr. Frank C. Wardall, of Jena, for the work he willingly undertook in rendering my original German text into English.

DR. E. WANDERSLEB.

A FIREPLACE ACCESSORY FOR FIREPLACE EFFECTS BY DAYLIGHT.

In the current issue of the "St. Louis and Canadian Photographer," there is a description of an accessory which may be installed in the ordinary studio for the production of firelight effects by the use of daylight only. The method appears to be that of Mr. Essenhigh Corke whose writings on and demonstrations of this branch of portraiture are probably familiar to readers of the photographic press, but from the author, Mr. Leroy Kellogg, making no mention of Mr. Corke's work it is to be presumed that the device is the result of his own experiments. Mr. Kellogg writes from Denver, Colorado, as follows:—"Of all the novel effects

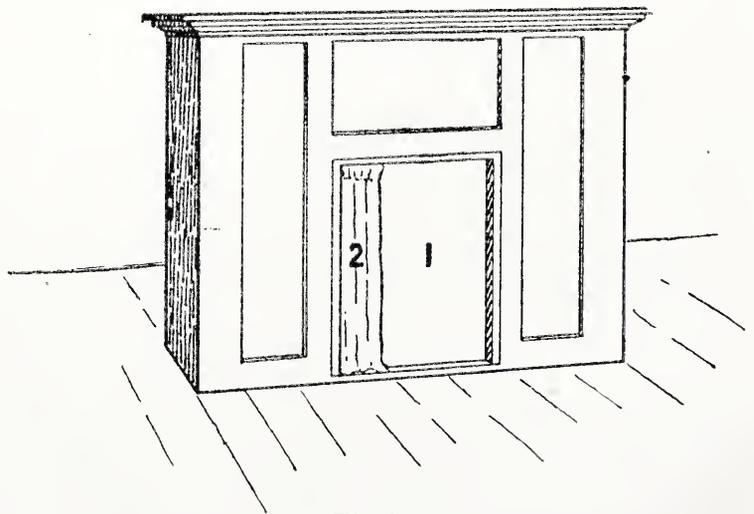

Fig. 1.

Front view of grate.

that I have most desired, none have I more often tried than firelight effects. The practical method which I have conceived and am now using has done away with failures. I now use an imitation fire grate, placed before a half-open window, and by the proper placement of two mirrors enclosed inside I am enabled to control the light, reflecting it at an angle, which enables me to obtain the desired result. One mirror reflects the light downward, the other out and upward through one thickness of tracing cloth, at an angle of from 40 to 60 degrees.

"The best effects are produced in reception or ordinary room.

The reason I suggest a reception or ordinary room is that the surroundings are more suitable for an effect of this kind, giving it a more homelike appearance.

"My first impression was that I would have to give a long exposure. This I found to be untrue—about the same exposure as that given under ordinary conditions in the operating room is right. My second impression was that my shadows would be without detail; this I found could be overcome by using plenty of daylight in the room. Be sure that no direct light from any other source strikes the subject, and that the light coming from the desired source is predominant.

"I will also state that this method is practical from a business

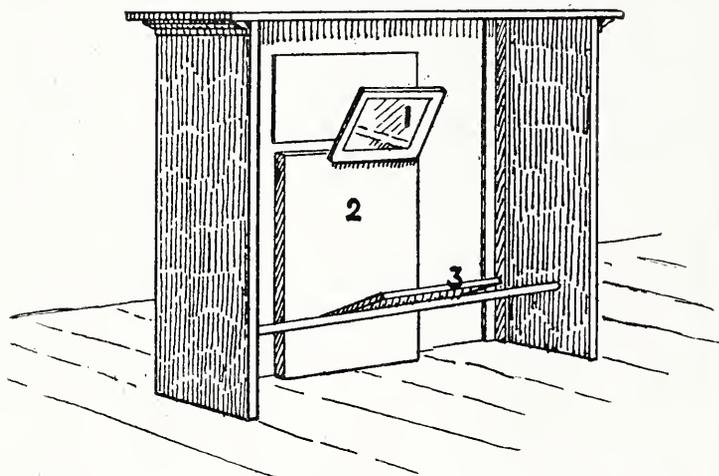

Fig. 2.
Back view of grate.

standpoint, as my second order, which amounted to the sum of \$27, fully covered all my expenses of experiments and cost of having mantel-piece made.

"Good results are also obtainable by the use and proper placement of an Aristo lamp.

"By the use of an acid chemical combination, which shall be further known as 'Fire Tone,'* which is also the result of my experiments, anyone can produce a tone which is absolutely permanent and gives the identical tone to a print that comes from the glow of a burning fireplace, which adds much to the merit of the print.

"It has been demonstrated to me that the best class of society is ever ready and willing to show its appreciation for a new style of work and willing to pay quite well for it, if it fulfils the desire for something peculiarly different in style and individuality."

Photo-Mechanical Notes.

Cutting Up Metal.

The use of the ordinary circular saw to cut up metal for printing is open to two objections, viz., the excruciating noise when cutting and the burr left on the metal, which necessitates filing afterwards. It is, however, often preferred to the guillotine, which makes no noise, and so far from burring the metal, actually puts a slight bevel on it, because it is possible with a saw to cut out a piece of metal, while the guillotine must cut straight across any metal put between its jaws, and it is therefore considered to be wasteful, especially if the spare pieces of metal are allowed to knock about, any sizes on top of each other in a pile against the wall, as is commonly the case. This waste can, however, be easily obviated if a series of vertical partitions is constructed in which to place the surplus pieces of metal. The space between the partitions need only be about 3in., height about 18in.; each pigeon-hole may be reserved for spare metal by half-inches, e.g., a space for 3in., 3½in., 4in.,

* Apparently a copper or similar toning solution. Mr. Corke uses the "Bertha" dye of the Vanguard Co.—EDS. "B.J."

and so on up to 8 or 9in. Then when one wishes a piece of metal, say, 3 x 3, a strip is cut off the whole sheet 3in. deep, 3in. cut the end of this, and the remainder put into the pigeon-hole for 3 metal. Any further plates having one dimension of 3in. can be cut off this strip without troubling to look over a heap of metal or to cut further into the new sheet, and so on for any other size. This simple method will save metal, also time in finding and cutting up any given size.

A New Process.

The "Daily News" of February 9 contained the following paragraph:—

"Art Reproduction.—A New Process.—To-day the 'Daily News' prints two pictures reproduced by an entirely new patent reproduction process. The inventor has been working at this process several years, but till to-day no blocks made by it have been reproduced in any paper either on flat or rotary presses."

All we can say from the two examples shown is that if the process is new, its results are certainly not wonderful, and it has been possible to equal these results at any time during the last fifty years. The blocks are certainly printed from a finer screen than usual in newspaper work (one is apparently 100 lines to the inch), produce similar blocks the blacks might be painted in solid before etching, and the high-lights scraped out and deep-etched. At all events if this is not the way in which the particular process is operated and it very likely is not, nevertheless results equalling those shown are very readily produced in this manner, or by scraping away shadows on the negative and blocking in the high-lights, before print on metal is made; either method, it seems to us, would though of course there may be advantages in the method which not apparent in the newspaper illustrations.

On Thursday in last week Colonel S. C. N. Grant, C.M.G., Director-General of the Ordnance Survey, lectured at Bolt School on the production of maps and plans. Describing the evolution of map production, Col. Grant showed that it had been one continuous advance towards simpler and more mechanical methods, in which photography had played an ever-increasing part, and that it was the application of photography which had reduced the expense of production from £10 to £1 in some cases. Any listener who thought that a Government department cannot be progressive without doubt came away from the lecture with a different opinion, at least in events so far as the Ordnance Survey was concerned.

Exhibitions.

CLEVELAND CAMERA CLUB.

THE sixth exhibition held under the auspices of the above club opened from February 10 to 13. The number of entries was not so good as in previous years, but the general opinion was that the standard of the work was much higher, particularly in the membership classes. The judges awarded the silver vase for the best picture at the exhibition and a silver medal in the open class to "Peace," by J. Walton, of Sunderland. "The Oracle," by O. C. Wilmot, of Sunderland, also secured a silver medal, whilst the bronze medals were awarded "The Village Baker," by N. Blake, of Bedford, "The Love Potion," by H. Lindoe, of Sunderland; and "Winter Sunshine," by J. J. Rutherford, West Hartlepool, and "Stranger in the Village," by N. Blake, Bedford, were highly commended. In the class open to members of clubs affiliated to the Yorkshire Photographic Union the number of entries was disappointing. In this section the silver medal was awarded to "Flora," by F. G. Issot, of Leeds, and the bronze medal to Dr. H. G. Drake-Brockman, of Middlesbrough, for a "Portrait Study." In the classes confined to members of the Cleveland Camera Club the following awards were made: Any subject—"On the Firth of Forth," by J. Key, silver medal; "Sunset," by J. H. Neat, Middlesbrough, bronze medal; Still life—"White Currants," by L. Natrass, Stockton, silver medal; "Chrysanthemums," by T. Brown, bronze medal. For the best three pictures illustrating life in any particular town, the silver medal was awarded to "Scarborough," by J. H. Neat. Large displays of Autochromes (by Dr. H. G. Drake-Brockman) and

er-Shepherd three-colour slides were given each evening. The
ry Photographic Company had on exhibition a good 15in. by
print made by their three-colour carbon process. W. G. Hill,
aglescliffe, had a number of excellent examples of high-speed
s, but these were not entered for competition.

FORTHCOMING EXHIBITIONS.

January 11 to 20.—Leicester and Leicestershire Photographic
Society. Sec., Harry Cross, 80, Harrow Road, Leicester.

January 16 to 20.—Norwich and District Photographic Society.
Sec., J. T. Tanner, The Lodge, Bowthorpe Road, Norwich.

January 20 to March 6.—Edinburgh Photographic Society. Exhibi-
tion Secs., Edinburgh Photographic Society, 38, Castle Street,
Edinburgh.

January 20 to March 20.—South London Photographic Society.
Sec., H. Creighton Beckett, 44, Edith Road, Peckham, S.E.

January 22 to March 6.—Birmingham Photographic Society. Sec.,
Lewis Lloyd, Church Road, Moseley, Birmingham.

January 26 and 27.—Ilford Photographic Society. Sec., H. Eales,
53, Coventry Road, Ilford, Essex.

February 9 to 10.—G.E.R. Mechanics' Institution, Stratford, E. (Photo-
graphic Section). Entries close February 27. Sec., A. Woolford,
16, Grove Green Road, Leytonstone, N.E.

February 11 to 13.—Coventry Photographic Club. Entries close
March 5. Sec., W. R. Harris, 17, Allesley Old Road, Coventry.

February 17 to 20.—Nottingham Camera Club. Entries close March 4.
Sec., E. L. Kent, 3, Radcliffe Mount, West Bridgford, Notts.

February 22 to 25.—Cripplegate Photographic Society. Sec., H. S.
Cuming, 234, North End Road, Kensington, W.

February 30 to April 3.—Sheffield Photographic Society. Entries close
March 13. Sec., H. Merrill, 22, Harboard Road, Woodseats,
Sheffield.

March 31 and April 1.—Shropshire Camera Club. Entries close
March 20. Sec., Harry W. Hughes, Kingsland, Shrewsbury.

March 10 to 17.—Midlothian Photographic Association. Entries close
March 31. Sec., B. Sherratt, 8, Castle Terrace, Edinburgh.

March 29 to May 17.—Photo Club de Paris. Entries close March 15.
Secretary General, Photo Club, 44, Rue des Mathurins, Paris.

Patent News.

*process patents—applications and specifications—are treated in
to Mechanical Notes."*

The following applications for patents have been received between
January 1 and 6:—

Patents.—No. 2,491. Improvements in camera stands and the like.
George Hana, 22, Bedford Street, Strand, London.

Patents.—No. 2,832. Improvements in or connected with photo-
graphic plates. Cavendish Morton, 77, Chancery Lane, London.

COMPLETE SPECIFICATIONS ACCEPTED.

*Specifications are obtainable, price 8d. each, post free, from the
Patent Office, 25, Southampton Buildings, Chancery Lane,
London, W.C.*

*For date in brackets is that of application in this country; or
in brackets, in the case of patents granted under the International
Convention*

Patents FOR BOTH DEVELOPMENT OR PRINTING-OUT.—No. 1,689,
1,693 (January 24, 1908). The invention relates to printing papers
of a kind which can be either printed fully out or developed in
the ordinary way. [Presumably with alkaline developers.—Eds.]
In place of organic silver salts used in print-out emulsions as ab-
sorbents of the halogen (chlorine or bromine) liberated on exposure

to light, use is made of other substances which possess the
properties called for in bodies used for this purpose: i.e. (1) it is
incapable of reduction in the light after oxidation by the liberated
halogen; (2) in the dark it does not reduce the silver salt; and (3)
it absorbs the halogen as rapidly as the latter is set free by ex-
posure to light. The substances in question are salts or derivatives
of hydrazine (NH_2NH_2) and of hydroxylamine (NH_2OH). For
example, a suitable addition to the finished and "cooled" emul-
sion may be made of neutral hydrazine sulphate, hydrazine phos-
phate, hydrazine sulphite, or other easily oxidizable salt. In
making these salts, a solution of the acid is added to hydrazine
hydrate ($\text{NH}_2\text{NH}_3\text{OH}$), using methyl orange to indicate when the
neutral point is reached.

Since chlorine, bromine, and iodine form a series of silver salts
of gradually increasing stability, the particular compound of hydra-
zine or hydroxylamine used in the preparation of the emulsion is
selected with regard to this fact. For example, in the case of
silver chloride, as the chlorine is comparatively easily absorbed,
many of the compounds of hydrazine or hydroxylamine will be found
suitable. For example, a sulphurous acid salt of a primary fatty
hydrazine (RNH.NH_2), such, for instance, as methyl hydrazine
($\text{CH}_3\text{NH.NH}_2$), may be used. With a halogen salt of greater
stability, such as silver bromide, a more active compound of hydra-
zine or hydroxylamine is desirable, such as the phosphorous acid
salt of hydrazine.

The amount of the salt used in the preparation of the emulsion
is determined by a consideration of the reducing action of the
hydrazine, each molecule of hydrazine hydrate ($\text{NH}_2\text{NH}_3\text{HO}$) being
able to reduce four molecules of silver haloid.

In collodion emulsions it is necessary to use a hydrazine salt or
compound which is itself soluble in ether-alcohol and of which
some of the hydrazides, for instance formyl hydrazine
(HCO.NH.NH_2), are examples.

From emulsions thus prepared, sensitive materials are then pro-
duced in the ordinary way.

Sensitive materials may also be produced by dipping plates or
papers prepared in the ordinary way in a solution of a hydrazine
or hydroxylamine salt or derivative.

Sensitive materials can be exposed in the camera for any time
longer than the shortest exposure necessary, up to complete
"printing-out," or they can be exposed for a short time and subse-
quently treated with a suitable developer. The developer should
be such that it will act slowly or quickly according as the sensitive
surface has been exposed for a greater or lesser time, so that it
shall penetrate all parts of the film where light has acted.—William
Hay Caldwell, of Morar Lodge, Inverness-shire.

GRAIN COLOUR SCREEN-PLATES FOR COLOUR PHOTOGRAPHY.—

No. 18,750. 1908 (September 9, 1907). The invention relates to
the making of a mosaic colour screen, the grains in which are
flat on both sides, thin, and touch each other at the edges. The
method is to employ coloured spheres, prepared as described below,
distribute them on a support, flatten them, and bind them together.
The patentee first refers to the English patents of Macdonough
(No. 5,597, 1892) and of Lumière (No. 22,988, 1904, and No. 9,100,
1906). The method of preparing the screens for which protection
is claimed is as follows:—

Blocks of celluloid or of an analogous plastic material are made
of the desired volume. If cut from sheets, cubes can readily be
obtained, with sides running from the one five-hundredth to the
one one-thousandth of an inch. If cut from threads, small cylinders
or prisms will be obtained, according to the section of the thread.
These small particles of transparent plastic material are dyed
of the proper colours and are then rolled between plates until they
assume a spherical shape. The discs may be heated, but it is
found that the heat generated by the friction will, in the case
of such small particles of celluloid, be sufficient to enable them to
assume a more or less spherical shape in a few seconds. Once
these imperfect spheres are obtained, it is well to grade them as
to size by sifting them one or more times and then again to subject
them, in separate lots, to rolling in order to obtain very perfect
spheres of equal diameter.

If made into a screen by distributing over a tacky surface, fol-
lowed by heat and pressure (the process used in making imitation

Florentine mosaics), the colour elements become irregular in shape, since the particles are not free to roll into contact with each other. To overcome the above-mentioned difficulty the following process is preferred:—A sheet of paper or similar material is thoroughly stretched on a very flat board, glass, or open frame. This paper must be coated before or after stretching with a coat of adhesive material gum, gelatine, rubber, etc. This is allowed to dry to such an extent that it loses its adhesiveness, or, at least to such an extent that the spheres of celluloid, when thrown upon it, will readily roll into contact with one another and will not be held in place where they happen to strike. Once the surface of the paper has been entirely covered with these spheres of various colours, the dry and now non-adhesive material must again be rendered adhesive. The grains (spheres) will now become adherent to the paper support, and if the adhesive material be again allowed to harden and dry, the surplus layers of spheres can be removed therefrom by brushing them off.

The result is a support covered with a single layer of coloured spheres, uniformly and symmetrically distributed. The paper bearing the spheres can now be removed from the board, glass, or frame, and be transferred face down on to a thin film of celluloid, preferably flowed on a polished metal plate. The film must be almost dry before the transfer is made. But in the case of ready-made films it is best to spray it over with a solvent or partial solvent of celluloid, so as to facilitate adhesion between the spheres and the film. The whole is now submitted to heat and pressure, which causes the spheres to flatten out, adhere together, and to the film beneath. In this manner, when celluloid grains are used, a screen is obtained in which the grains of different light-selective absorptive properties are integral with a colourless film of the same material as the grains. In order to avoid any tendency for the spheres to run into each other, the paper can have sprayed over it a thin solution of gelatine with acetic acid, or other isolating material, care being taken to pass an absorbing roller over all to clean off that part of the spheres which is to come in contact with the film; or, again, some of the spheres can be rolled in some inert powder or be coated with gelatine or like material, before being applied to the paper.

After the paper bearing the spheres has been pressed on the celluloid film, the whole is allowed to cool, and the paper is then removed by means of a suitable solvent of the adhesive material on it. Any interstices remaining in the screen can now be filled up by rubbing in appropriately coloured powder of celluloid. A thin solution of celluloid is then sprayed upon the surface which has been in contact with the paper, and the film is polished between hot metal plates.

If any interstices happen to remain between the grain, the film at such points can be daubed over with bichromated glue or gelatine. When dry, the film must be exposed to the light from the reverse side, so as to expose only the gelatine behind such interstices to the action of white light, and only such gelatine will become insolubilised. The excess gelatine can be removed with hot water, and that which remains can be dyed of some appropriate colour, thus blocking out all white light. The film in such places had best be sprayed over with celluloid and the sheet be refinished.

The film will now be ready for the various operations necessary to put upon it a sensitive photographic film, out of which is to be formed the negative or the positive. The transfer method offers many advantages. It allows one to apply monochrome bands of the different coloured spheres along the edges or at other suitable places; the uses of these bands has been indicated in prior applications of mine. It also allows one to make endless polychrome films for cinematographic purposes, or for roll film cameras, by transferring grained paper to the endless film, and after removal of the paper filling up gaps, if any, by applying similarly coloured grains. Charles Louis Adrien Brasseur, 116, Tremont Avenue, Orange, New Jersey, U.S.A.

CINEMATOGRAPH MECHANISM.—No. 21,787, 1908. (October 15, 1908.)

The invention relates to apparatus for the perforating of, photographing upon, printing upon, and projection upon a screen of cinematograph films, and other like purposes; and its object is to provide a new and improved movement for imparting a positive intermittent travelling motion to the film in the process of the operations.

In several devices for this purpose a rigid claw arm is driven by a crank connected to one end of it. The invention consists of improvements in such devices by which greater simplicity is obtained and great exactitude in working by substituting a curved stationary slot of such form as to provide a more perfect contact for the teeth. James and Colin Martin Williamson, 11, Wilton Villas, Hove.

CELLULOID MOSAIC SCREEN-PLATES FOR COLOUR PHOTOGRAPHY.—No. 21,739, 1908. (July 13, 1908.) A method of preparing a three-colour mosaic filter-screen from an engraved or etched matrix has been patented. The process consists in forming a pattern in relief on the celluloid sheet by hot pressure against the etched plate the depressions in which form the portions raised above the celluloid surface. The latter is then inked, like a printing-plate, with greasy ink or varnish which is thus applied to the raised lines or bands. The whole sheet is then treated in an alcoholic bath of dye, whereby the depressed portions are coloured, and the greasy ink is then removed. The sheet is then placed across the etched plate at right angles to its former position and a second hot pressure given, the raised lines are inked, and a second application of alcoholic colouring solution such as malachite green, carried out. A two-colour screen is obtained with lines crossing each other at right angles; the raised portions left uncovered at this stage are given a coating of dye by any suitable method, such as sensitising with a bichromated gelatine solution, exposure to light and dyeing in an aqueous dye solution. The process is completed by hot pressing the whole sheet between flat plates in order to get rid of the relief. Vereinigte-Kunstseide Fabriken A.G., Kellstedt-on-Main, Germany.

STEREOSCOPIC PHOTOGRAPHY.—No. 10,493, 1908 (May 15, 1907). The invention relates to a design of stereoscope intended for viewing a pair of stereoscopic photographs made at one exposure with

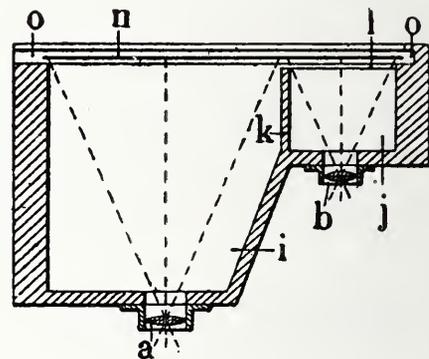

Fig. 1.

of unequal focal length. One picture is taken several times more than the other, with the object of securing better detail, and the construction of the stereoscope is therefore such that the observer is able to combine the two images in the eye. The patentee

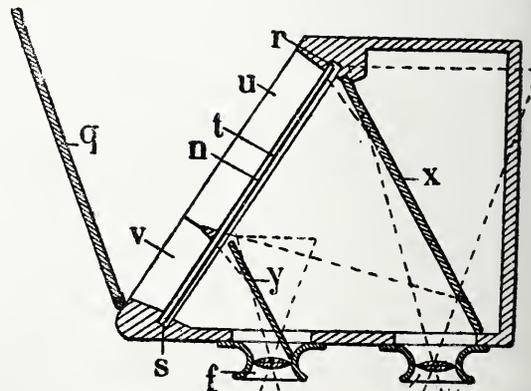

Fig. 2.

twenty-one drawings, from one of which (Fig. 2 herewith) it is seen that the stereoscope consists of two eyepieces of unequal

cal length. The transparency plate bearing the large and small pictures is placed in the grooves *u v*, and the pictures reflected in the mirrors *x* and *y*.—Georges Balmitgère, 2, Rue Philippe Grand, Paris.

New Trade Names.

B. B. (DEVICE).—No. 308,077. Chemical substances used in manufactures, photography, or philosophical research and antiseptics. Norsk Hydro-Elektrisk Kvælstofaktieselskab (a company registered under Norwegian law), Sommerrogaten 15, Christiania, and Notodden, Telemarken, Norway, manufacturers and merchants. November 17, 1908.

New Books.

Handlungen zur Geschichte des Stereoskops von Wheatstone, Brewster, Riddell, Helmholtz, Wenham d'Almeida, and Harmer." Edited by M. von Rohr. Leipzig: W. Engelmann. 2 Mk. 20.

This volume forms one of over 170, each devoted to reprints of original papers on some branch of natural science. Thus Sir Humphrey Davy's Bakerian lecture of 1807 on his electro-chemical work forms one book, and Faraday's electrical papers occupy several volumes. Dr. von Rohr, in selecting for the reading of German students the chief papers on stereoscopy, has reproduced the original drawings of Wheatstone and Brewster, and has made the writings of these founders of the doctrine of stereoscopy actually more accessible to the German reader than to the English. A large part of the volume is devoted to the papers by late F. H. Wenham on the binocular microscope, which, again, is accessible to English readers in the journals of the Microscopical Society.

INTERN SLIDES.—A second edition of the German treatise on lantern-slide work (Die Diapositivverfahren), by G. Mercator, has been published by the firm of Knapp, Halle a/S, price 2 Mk. The treatise deals with several methods of slide-making other than gelatin and chloride plates. For instance, it treats of the albumen, iron, and pigment processes, and contains a chapter on the chrome process, and on the Traube method of toning by means of dyes.

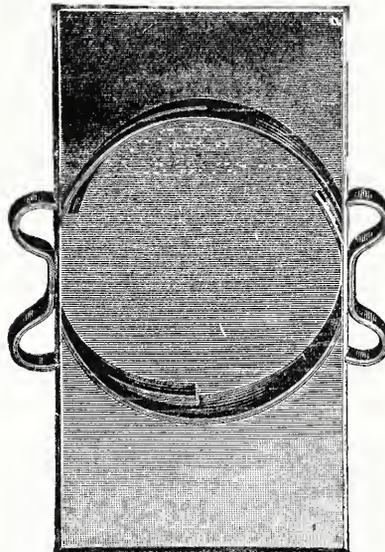

STEREOSCOPY AND THE STEREOSCOPE IN THEORY AND PRACTICE.—The title of this German text-book describes its detailed discussion of the theory of the stereoscope and the practice of stereoscopic photography. In the second edition the author, Dr. F. Stolze, has made a little change, and the volume forms a manual of its subject as we do not possess in the English language. "Die Stereoskopie" is published by Knapp, Halle, at 5 Mk.

TRAITS OF THE ARISTOCRACY.—Under the title, "Photographs of the Aristocracy," Messrs. Lafayette, Ltd., 178, New Bond Street, W., have issued a 75-page list of the celebrities photographs of whom they have at the disposal of the press for reproduction. The list, which runs to a total of 3,000 names, mostly those of the British aristocracy and foreign nobility, is divided in accordance with rules of Court precedence. It is issued to editors of illustrated newspapers, to publishers, and others engaged in press illustration, to all of whom they would prove of frequent service. Messrs. Lafayette announce that they propose issuing a monthly addendum containing particulars of the latest sittings.

O.P. TONES ON BROMIDE POSTCARDS.—In further reference to our paragraph on p. 109 of our issue of February 5, the Falla-Gray Photo-Paper Company send us samples of the cards on Falla-Gray paper, treated with hypo-alum for cold tones only, without departing from standard methods of working. The warmer tone is generally preferred.

New Apparatus, &c.

THE "IRIS" SCREEN.—Messrs. John J. Griffin and Sons, Ltd., have placed on the market an inexpensive form of graduated orthochromatic yellow screen, the usefulness of which is frequently very

marked in landscape work. The screen is made to move in its mount, so that any required amount of sky can receive an extra depth of screen.

OIL PIGMENT BRUSHES.—Messrs. John J. Griffin and Son, Ltd., advise us that under the name "Demachy" they are supplying the French "pied de biche" brushes, now used by many English workers.

New Materials, &c.

Liquid "Lustralene." Made by the Vanguard Manufacturing Co., Maidenhead.

It must be six or seven years ago since the Vanguard Co., ever purveying some useful aid to photographic print- or negative-making, introduced, as Lustralene, the peculiar paste which we have since always had at hand for beautifying or reviving matt prints by any process. Plenty of vigorous rubbing is necessary to secure the best results with "Lustralene," but the added brilliancy and richness of the print are liberal payment for the physical exercise, even if one is not thinking of quitting photography for the more profitable occupation of masseur. What particular purpose the Vanguard Co. have in view in issuing also a fluid form of "Lustralene" we do not know, though it is evident from a first trial that the new form is more quickly distributed over a large print. In all other respects we have found the new product to have the good qualities of its less fluid predecessor. It both improves the print and greatly protects it from alteration, and is a product which, when once its virtues have been recognised, the photographer will not willingly be without.

"Texo" Velox Gaslight Paper. Sold by Kodak, Ltd., Clerkenwell Road, E.C., and John J. Griffin and Sons, Ltd., Kingsway, London, W.C.

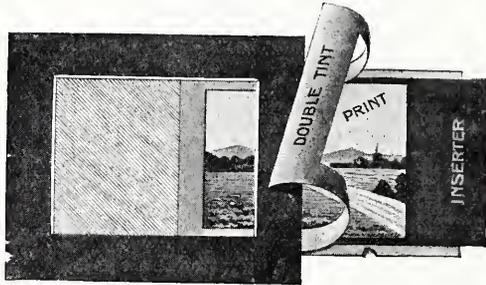

A further new variety of Velox paper is just introduced under this title. "Texo" signifying the fine linen-like surface which the paper possesses. The departure from a smooth matt is not very great. The "Texo" quality resembles that of fine cambric, and the paper thus supplies a new sensitive material which can be

used for prints, both large and small, particularly in the case of subjects in light tones, since the "grain" or texture of the paper becomes obtrusive first of all in extended areas of shadow such as a dark background. In many instances the relief which it thus affords is a distinct advantage, but we have been pleased most highly with the results from negatives in which the lighter tones predominated. The new paper is sold in two varieties, white and cream, both of which belong to the "soft" or "special" class of Velox papers, and are about three times the speed of the ordinary or "Vigorous" papers.

The "Myla" Slip-in Mounts. Made by Carl Ernst and Co., London, E.C.

In this new introduction of Messrs. Ernst the amateur photographer in particular is provided with a very pleasing form of "mounting" for his prints without, however, being put to the trouble of putting down a series of tinted papers. The "Myla" consists of a mount of the ordinary slip-in variety but embellished with a series of "cut-outs" of various art papers, selected either to harmonise or to contrast with the outer mount. Thus in the packet of assorted examples which reaches us, we find one done in two tones of grey, another in grey and white, another in two tones of

brown and others in brown and white, dark green and brown, and dark green and white. In every case the selection is made with regard to the effective display or embellishment of the print, and we cannot but express the opinion that in this embodiment of the multiple-mount method the photographic worker will find a range of mounts sufficient for the tasteful presentation of almost every variety of print. Moreover, if the inner mounts are thought inadvisable on the ground of the masking of the print or by reason of the tint, they can be removed and the full opening of the slip-in mount employed. In any case the result is neat in appearance. Since Messrs. Ernst supply only in large quantities applications for the "Myla" mounts should be made to a retail dealer or to a wholesale house.

CATALOGUES AND TRADE NOTICES.

THE PRISM.—Messrs. A. E. Staley and Co., 19, Thavies Inn, Holborn Circus, London, E.C., have now at hand No. 7 of the "Prism," the tiny magazine of optics issued by the Bausch and Lomb Co. It deals with the photography of snow pictures, and is sent by Messrs. Staley on receipt of a penny stamp.

BARGAINS IN APPARATUS.—Messrs. Houghtons Ltd. have just issued a twenty-page list of apparatus, mounts, etc., to be disposed of at their annual stock-taking sale. The list gives the usual and sale prices of roll-film, folding, box and field cameras, lenses and enlargers, shutters, tripods, cases, and a variety of sundries, all of which are offered as articles which are no longer listed in the firm's regular catalogues, or are shop-soiled samples. A visit to 88-89, High Holborn during the next few days should repay those wanting to make additions to their outfit.

BAUSCH AND LOMB FACTS AND FIGURES.—Messrs. Staley (19, Thavies Inn, Holborn Circus, E.C.) send in exchange for one penny stamp an interesting little booklet describing the rise of the Bausch and Lomb Optical Company, of New York.

MEKER BURNER AND FURNACES.—The Cambridge Scientific Instrument Company, Cambridge, England, send us a full list of these types of Bunsen burners and muffle furnaces, among which latter are several suitable for photo-enamel work.

ROYAL PHOTOGRAPHIC SOCIETY.

MEETING held Tuesday, February 16, Dr. S. E. Sheppard in the chair.

The fixture for the evening was a paper by Dr. W. Scheffer, "Stereoscopic Projection," which, however, he had not been able to prepare in time. His place was taken by Mr. E. J. Wall, who delivered a short paper on methods of stereoscopic projection, in the course of which he referred to the stereoscopic camera, and the automatic separation of the lenses as the camera is racked out to near objects, which has been devised by the Carl Zeiss Works.

He divided the methods of stereoscopic projection into two classes, the first in which the constituent pictures are projected on the same plane of the screen, but are differentiated by (a) colour, (b) polarisation, or (c) persistence of vision. In the second class the pictures were projected side by side and united in the eye of the observer by optical means. Mr. Wall confined his discussion of methods principally to (a) of the first class—namely, that in which the two pictures are projected in approximate superimposition on the screen, and are viewed by the observer by means of spectacles containing glasses complementary to each other in colour. The methods and forms

preparing these stereoscopic projection slides by the Pinatype
ss and for preparing the viewing spectacles themselves was
ibed by Dr. König in an article which appeared in the "British
nal" for November 6, 1908. By the kindness of Dr. C. E. K.
and Messrs. Wratten and Wainwright, the audience were pro-
with these spectacles, and were enabled to view a number
reoscopic projections.

discussion followed the reading of the paper, in which the
ving took part: Dr. C. E. Kenneth Mees, Dr. Walsh Owen,
s. C. P. Butler, R. R. Beard, and A. J. Newton.

BYDON CAMERA CLUB.—A capital lantern lecture was given last
by Mr. Hugh Allen, a member of the club, being a descrip-
account of a trip to Portugal with a literary friend, at the
tion of a Portuguese propaganda society, formed to further
interests of the country, and make it better known as a tourist
b. In spring and autumn it would be difficult to choose a
r holiday ground. The country is varied and beautiful, and
are many fine and extremely interesting old walled cities and
s. The peasants, if on occasion of somewhat fierce aspect,
found obliging and amiable, and fruit, flowers, and generous
everywhere in abundance. Finally, and by no means least,
are bull-fights conducted in much more humane fashion than
s the frontier. There is no goring of broken-down horses, for
ce. So far, indeed, is consideration shown to the bull, that
the darts are provided with a ball three or four inches from
point, to prevent them entering more than this distance into
lesh. Although the lecturer did not directly say so, it was
r gathered than when a sufficient number of these were in the
ct position, a pleasurable tickling sensation encouraged the
to become playfully attentive to all around him. A series of
tic slides were shown illustrating this pastime, including an
dant flying through space, in obedience to an intimation from
ull to that effect.

THAMPTON CAMERA CLUB.—At a meeting held last Monday
ng three lecturettes were given by Messrs. W. R. Kay, A. E.
y, and G. T. Vivian respectively. Mr. Councillor F. G. Ryder
led. Mr. W. R. Kay related some mountaineering experiences
Bernese Oberland, which were illustrated with some beautiful
, depicting the characteristics of the Swiss scenery. Mr. A. E.
y gave an account of a sojourn in North Wales, introducing
interesting features of Conway Castle and its immediate neigh-
ood. The slides accompanying his discourse included a view
neighbourhood of Penmanneck, where recently the noteworthy
catastrophe was supposed to have happened. The lecturette
by Mr. G. T. Vivian was an inspiration derived from reading
Doyle's well-known novel, "The White Company," and a
ptive account of Beaulieu Abbey and the surrounding district
given, introducing many of its historical associations. The
es were all well illustrated.

Commercial & Legal Intelligence

AL NOTICES.—The partnership between Frank Sydney Cham-
n and Mark Owen Athey, carrying on business as photo-
ers at 42, Queen Street, Cardiff, under the style of "Athey and
has been dissolved by mutual consent. The debts due or
are being paid by Mr. Athey.

partnership between David Samuel Childs and Frederic
Bursill, carrying on business as photo-etchers, blockmakers,
ngravers at 10, Tenter Street, Moorfields, London, under the
of the "Finsbury Colour Photo-Engraving Company, Bursill
Childs," has been dissolved by mutual consent. All debts due
being paid by Frederic Chas. Bursill, who is continuing the
ss.

receiving order, dated February 9, has been made in the case of
m Henry Bullock, photographer, etc., carrying on business at
n Road Studio, Featherstone, Yorkshire. The adjudication
on the debtor's petition was made the same day.

irst and final dividend of 9s. 7d. in the £ has been declared
t case of Louis Henry Bourlet and Frederick Francis Bourlet

(trading in co-partnership as James Bourlet and Sons at 17 and 18
Nassau Street, Middlesex Hospital, W.), fine-art agents, etc. In
the separate estate of the latter a first and final dividend of 4s. 5d
in the £ is to be paid.

A dividend is to be paid in the case of Alfred Fletcher, photo-
grapher, The Studio, Town End, Chapel-en-le-Frith, Derbyshire.
Creditors must lodge proofs on or before the 27th inst. with the
Official Receiver (Mr. A. C. Proctor), 23, King Edward Street,
Macclesfield.

addresses of the writers are given.

THREE USEFUL HINTS.

To the Editors.

Gentlemen,—I get so much useful information and so many "tips"
from the "British Journal" that I venture to make three suggestions
that may be useful to others, if not generally known.

A correspondent in the "B.J." a short time ago recommended
freezing stoppers that had become fast in the bottle; but a freezing
mixture is not always on hand. An effective method in most, if
not all, cases is to drop one or two minims of methylated spirit into
the groove made by stopper and neck of bottle, and set aside
for a short time to allow the spirit to penetrate. I recently took
out the stopper from a Winchester quart that defied all other means.
The bottle had contained a strong varnish, and had not been touched
for nearly ten years. I set it aside for the night, and next day the
stopper came out as though it had been in daily use.

A rapid method of cleaning glass is to wash with a little Monkey
Brand soap and a bit of soft rag, after which water will drain quite
evenly off the glass.

A useful vignetter can be made in a few seconds out of ordinary
corrugated packing-paper. Mark the size on smooth side (length of
vignette running across the ridges), and cut out with a sharp knife
pushed through at a very acute angle.—Faithfully yours,

Grove Lodge, Watford.

R. E. WESTON.

February 14, 1909.

A PHOTOGRAPHIC APPEAL FOR THE CHILDREN MADE ORPHANS BY THE MESSINA EARTHQUAKE.

To the Editors.

Gentlemen,—History does not record a more terrible catastrophe
than the one that destroyed the two beautiful Italian towns, Messina
and Reggio, and their enchanting surroundings. In a wonderful
impulse of charity most of the civilised nations have come with aid
to the miserable survivors. But the misfortune is so great that
no help may be said to be great enough.

Photography, which has given us new means of artistic representa-
tion and of scientific investigation, has in itself the power of becoming
an efficacious means of charity. In all civilised nations the wish
to have a souvenir of those towns, as well as of the convulsions
which destroyed them, is keen. Our society is preparing such a
publication, hoping that you will consent to distribute it.

This work and this distribution we shall do with all our heart,
as the whole income will be for the benefit of those unfortunate
children, who, through the catastrophe, have become orphans, and
who form a most unhappy multitude.

This souvenir, of so much beauty past and so much sorrow present,
will be a monograph, and bear the title, "Messina and Reggio
Before and After the Earthquake, December 28, 1908." We intend
to reproduce, with the finest processes of modern industry, all the
beautiful works of art (as they were), all the most characteristic
scenes relating to the life and topography of those marvellous and
unhappy regions.

The principal Italian photographic establishments (Alinari, Brogi,
Bertelli, Interguglielmi, Sommer, etc.) have offered their collections.
Members of our society have been sent to the ruins to take views
of their present state. The observatories of the world have promised

seismograms of the earthquake, which will explain its terrific effect. Vulcanological observatories will send us photographs of those volcanoes that now and then cause the Italian soil to quake. Engineers will give us types of the scientifically constructed edifices that will form New Reggio and New Messina. The Royal Italian Geographical Institute will furnish a chorographical map of the devastated regions. Some of our best and most competent writers, like Padre Alfani, Pasquale Villari, Gabriele D'Annunzio, Ugo Ojetti, and others have promised short descriptions, and, finally, with the aid of the embassies, we hope to be able to form a page which we propose to call "The Page of Gratitude," in which the Ships of the Nations that offered help in so sad an hour are to have their place.

The favour we request of you is to ask everyone of your readers, who are our companions in work and aspirations, to acquire a copy of our volume, which will be published in four languages (Italian, English, French, and German), and cost in Italy five francs, in all other countries six francs. In so doing they will not only possess a souvenir of the tragic and historic moment, but will also be doing a helpful act of charity.

"Let us then be up and doing," and allow us to send you, anticipatedly, our most heartfelt thanks. We hope that very soon the thanks of thousands of innocents will follow our own.

PROF. LUIGI CASTELLANI,

President of the Italian Photographic Society.

Società Fotografica Italiana, Via degli Alfani 50, Firenze.

THE "THAMES" COLOUR-SCREEN PLATE.

To the Editors.

Gentlemen,—In No. 2544 of the "B.J." you publish a letter of the Thames Colour Plate Company, in which is quoted a German judgment upon the Thames Plate. Further, you reprint a passage from the "New York Herald," January 3, 1909, referring to a lecture given by Direktor Dankmar Schultz-Hencke, on December 28, 1908, in the War Academy at Berlin.

I beg to state *that all said* in the "New York Herald," January 3, 1909, referring to the Thames Plate is strictly invented. The whole content is a bold forgery of the reporter. Direktor Schultz-Hencke only said: "Ten days ago a new colour-plate, 'The Thames,' has been issued in England, for the samples of which I am indebted to Dr. Mebes. I can only show you a photo-micrograph of the colour-screen"—which was then projected. All the other slides which excited the greatest admiration were Autochromes, taken by Miss Mary Kundt. The lady photographer of Professor Hans Virchow has not yet tried any "Thames" plates. The colour-photographs, alluded to and shown in the month of October, 1908, in the War Academy, were taken on Autochromes.

Direktor Schultz-Hencke and myself have together tried the Thames. Eight photographs of a colour chart with grey scale were taken; plate speed Watkins P. 17 adopted; exposure correct; registration succeeded fairly; colour rendering absolutely unsatisfactory.

—Yours very truly,

DR. ME BES.

Berlin, N. 4.

February 8, 1909.

[Without any desire to question Dr. Mebes' bona-fides, but only to obtain a complete and authoritative correction of the statements to which we gave currency in our issue of February 5, we referred to Herr Schultz-Hencke, whose reply in German we have translated below.—Eds. "B.J."]

To the Editors.

Gentlemen,—Acknowledging the receipt of yours of the 10th inst., I beg to inform you that I had already seen the paragraph in question in the "British Journal." Had not Dr. Mebes, on his own initiative, already sent you a letter, I should certainly have done so. But as the opportunity is now afforded me to reply, I should like to put the correction into slightly different form—namely, as follows: It was a misconception on the part of the reporter of the "New York Herald" to state, as he did, that the pictures which I showed at my lecture at the Kriegsakademie, on December 28, were taken on the "Thames" plate. They were in every case Autochrome results, obtained in the School of Photography, under my direction and by my assistant, Fräulein Kundt. The only exhibit of the "Thames" plate which I showed was a photo-micrographic

enlargement of the screen, and I added that up to that time, in a of repeated trials, it had not been possible to obtain on the "Thames" plate a result which was at all satisfactory. The experimental question were made in collaboration with Dr. Mebes, by whom plates were kindly obtained.

D. SCHULTZ-HENCKE

Photographische Lehranstalt des Lettc Vereins,
6, Victoria Luise Platz, Berlin, W. 30.

Answers to Correspondents

- All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY, 24, Wellington Street, Strand, London, W.C." Inattention to this ensures delay.
- Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.
- Communications relating to Advertisements and general business affairs should be addressed to MESSRS. HENRY GREENWOOD & CO., 24, Wellington Street, Strand, London, W.C.
- For the convenience of Readers, our Publishers, MESSRS. HENRY GREENWOOD & COMPANY, of 24, Wellington Street, Strand, W.C., undertake the registration of copyright photographs at a charge of 1s. 7d. each photograph, to cover cost of registration fee, form, &c. Two unmounted copies of each photograph must be sent with the fee.

PHOTOGRAPHS REGISTERED:—

- H. Smith, 17, Grimshaw Street, Darwen. Photograph (combination) containing Six Church Views.
- H. Osguthorpe, 18, King Street, Spennymoor, Durham. Photograph of the Father Michael McNamee.

SALE OR RETURN.—About last August I took negatives to supply postcards to a firm of shopkeepers. I sent what views I liked, and they sold them, subject to 25 per cent. commission. (A certain date a relative of their family took over their business, paid accounts for them, and paid part of mine. The rest was carried forward. I did not know that the business was his relative's), so when I presented my account since the firm was given up, one in the late firm said this is So-and-so's. So of course, I gave to him, and he said he (the relative) was not a he owed me anything, and takes no notice of my account, which has been presented several times. The understanding with the old firm was what was not sold was to be returned to me, nothing in this case has, so what I want to know is how to proceed?—C. D. V.

As the dealings were with the old firm, it is to it that you should look for payment for what may be due to you.

GERMAN.—(1) We are sorry we cannot say. Better apply to a stationery journal, such as the "Stationery Trades Journal," Warwick Lane, E.C. (2) Neyroud and Sons' Advertising Office, 14-18, Queen Victoria Street, London, E.C.

PORTRAIT LENS.—I have seen a No. 3 Ross portrait lens advertised for £5 18s. 6d. Would this be the same lens as listed at £18 or an earlier pattern? A reply will oblige.—Ross.

It is impossible to answer your query without seeing the lens. From its price we should surmise that it is one of the earlier makes. The old No. 3 has a somewhat smaller diameter than those of the same number of more modern construction, probably a somewhat rounder field. Your best course is to obtain the maker's opinion of it.

R. S.—It is difficult to say any one is the "best." The most useful advice we can give you is to obtain the makers' catalogues and study them alongside the article in the current "Almanac." You would also derive assistance from our issue of June 14, 1908, which described every make of instrument then on the market.

ACCESSORIES.—Can you advise me as to a composition for use on balustrade and pedestal, etc., for photographic purposes? It appears to be quite different to the composition on fire-harder and more gritty.—A. T. HONEY.

Different makers of photographic accessories use different positions. Possibly that on yours may be ordinary plastic.

is; it is used by many. We have seen some that appears somewhat of the character of builders' cement. The various makers of this class of accessories do not publish the compositions they employ.

Q. L. E.—Would you be kind enough to give me a good formula (idol) for black and white; also formula for sepia tone?—**NEWHAM.**

Although you do not say so (you should at least take the trouble to express your meaning), we presume you refer to a developer and toner for bromide paper. The developer is made as follows. Prepare the following stock solution:—

Sodium sulphite	4 ounces.
Potass metabisulphite	1 ounce.
Water to	20 ounces.

Use later:—

Amidol	2 to 3 grains.
Stock solution	100 minims.
Water to	1 ounce.

The toning formulæ are:—

Ammonium bromide	300 grains.
Potass ferricyanide	300 grains.
Water	20 ounces.
Sodium sulphide (pure)	100 grains.
Water	20 ounces.

Place the fixed and washed prints in A solution. Wash for a few minutes in water, and then immerse in B solution until toned. The B solution will not keep long.

TONING BATH.—With reference to the combined bath for P.O.P. given in the "B.J." the week before last, can you suggest, or can you give me, a formula with more solution? For instance, 1 oz. would not be enough to tone eight 12 by 10 at the same time conveniently. Of course, it would be easy to double the quantity of water and keep the prints in for twenty-four minutes. But by doing it this way time would not be saved, which, of course, is a great thing, especially in cold weather!—**EN AVANT.**

We can only suggest that you use double quantities throughout, of chemicals as well as water. Some baths may work rather more quickly, but it is not desirable that they should tone in less than a few minutes.

ADON.—Could you inform me as to what aperture the combination of an "Adon" and an Aldis $f/6$ (5 $\frac{3}{4}$ in.) works at?—**TELEPHOTO.**

We cannot answer this definitely, but if the front lens of the "Adon" is 2in. or over, the aperture should remain unaltered. You had better write to Messrs. Dallmeyer, who can, of course, give you the information at once.

EXPOSURE-METER, ETC.—1. I sometimes do a little "portraiture in the home," but the lighting conditions are so extremely variable that I find some difficulty in arriving at a reliable and correct exposure, and an ordinary actinometer is so slow, under the circumstances, as to be in many cases useless. Is there any other instrument made that will, under the conditions, give the exposure rapidly and accurately, and if so the price of same, or can you advise me of any other method of arriving at the desired result? What size head should I be able to get without distortion using a first-class R.R. lens of 20in. focal length working at $f/8$, and at what distance from sitter? 3. If the back component of lens is 2 $\frac{1}{4}$ in. diameter and the shutter opening 2 $\frac{1}{2}$ in., the distance between the lens and shutter being 1in., would the shutter speed be reduced reduce the effective aperture of the lens or affect it in any way?—**ENQUIRER.**

1. We know of no better method than the use of an actinometer, such as that of Watkins or Wynne, using the quarter tint in each case; or you might find it of advantage to employ a still lighter tint. For a rapid determination of the exposure, the eyepiece actinometer supplied by Staley and Co. should be serviceable, but it requires a little practice to master the method of use.

This question is very vague. In a studio 20ft. long the head could photograph about 1in. high, and the distance between lens and sitter would be none too much. In a 15ft. studio you could not have much more than 10ft. or 11ft. between lens and sitter, and this is about the minimum desirable. The head would measure about 2in. We doubt if you could get a larger

head than this without obvious distortion. 3. All depends on the position of the shutter with regard to the lens and the angle of view. If at the back of the lens it will probably vignette very oblique light-pencils if a fairly wide angle is included. If close to the stop it will probably not affect the aperture at all.

E. HERRIDGE AND Co.—We do not know the firms. You might get the names of some from the "Almanach" issued by Schwier, of Weimar, price 1 M.

R. OWEN.—About the best simple book you can get is "Chemistry for Photographers," by C. F. Townsend (Dawbarn and Ward, Ltd., 1s. net).

J. C. JENNINGS (Montreal).—Thanks for your suggestion. Messrs. Mawson and Swan, Mosley Street, Newcastle-on-Tyne, make a special feature of supplying small quantities of dyes.

TONING FORMULÆ.—Please inform me, as I am a new subscriber, if any of Dr. Sedlaczek's formulæ for toning bromides have appeared in the paper. If so, the number and date, also price of back numbers.—**T. R. WILLIS.**

We translated the chief of Dr. Sedlaczek's formulæ in two articles which appeared in the "B.J." for August 10 and 17, 1906. Our publishers can no doubt supply these numbers at 2 $\frac{1}{2}$ d. each, post free.

BLISTERS IN SULPHIDE TONING.—I am troubled a great deal by bromide prints blistering after sulphide toning. The only remedy I find is to plunge them into an alum bath, after rinsing quickly, on leaving the sulphide bath. Is this liable to cause fading or in any other way detrimental to the prints, as I notice the "perfume" of sulphur is stronger even so?—**GAZOOST.**

It is certainly not wise to use an alum bath after the sulphide bath, as to do so tends to fix the sulphide in the print. The proper stage at which to harden the prints is when fixing or immediately after fixing. A combined fixing and hardening bath which has been found suitable when prints are being sulphide-toned is that made with chrome alum given on page 780 of the "Almanac." One remedy for blistering is to transfer prints from the sulphide solution into methylated spirit, mixed with a certain amount of water. This would be less open to objection than the alum.

LENS QUERY.—Would you be so kind as to tell me the following? I have a Ross symmetrical whole-plate lens, 8in. focus, with rotating stops, numbered 1, 2, 3, 4, 5. Now, as I intend making a trial with colour plates ("Thames," say), I am at a loss to know what f number to use on a Wynne meter. Can you tell me the equivalent f numbers to correspond with 1, 2, 3, 4, 5 on above-mentioned lens?—**SALVO LOMB HUTCHISON.**

We cannot, as the stops are not numbered according to the universal system. What you will have to do is to measure the aperture in the stops and divide it into the focal length (8 inches) of the lens. That will give you the f values.

BACKGROUNDS.—(1) Is it possible to get rid of creases on canvas backgrounds on roller? I have two or three behind one another, and it is worse when I have left it rolled up for a time. (2) Will painting a white canvas reflector with ordinary white paint improve the lighting?—**MONFAB.**

(1) You do not say whether the backgrounds are flatted oil or distemper. In either case it is difficult to get rid of creases when once they are formed. The best thing to do with the backgrounds now will be to strain them on wooden frames. (2) Yes, if the canvas is dirty or discoloured. But it will be better to paper the canvas with white paper. When that gets dirty it can easily be repapered.

ECONOMY.—If both lenses are used at same aperture the drawing and depth of focus will be the same. The field covered may be a little better in one case than another. It depends on the lenses themselves. Certainly it will be an advantage as regards arranging an interior subject to use an anastigmat of, say, $f/6$ aperture, and many of such lenses of 9 inches focus will cover a 12 x 10 plate when stopped down.

S. E.—The faces are about as well rendered as you can expect in such work. We should anticipate better results by using a thin train of powder on one side and a shorter one or a flash on the other. This should obviate the sharp shadows on the stage. If the powder is spread out in a train it should not be necessary to

use a diffusing screen. The powder you name is as good as any, and can be fired with a taper or by electric ignition.

S. C. BONNERGI (Kalighat, Calcutta).—It is out of our province to do what you request, but we have asked two reliable firms to write you with their advice and offers.

CYMRO.—We should advise you to use the two lamps, which should give a very good light for heads and busts, and are better adaptable by using them a little apart for groups of three or four.

ART PHOTOGRAPHER.—Apparently the Postmaster-General will take exception to photographs such as the one you send.

ROTTJOUR.—It is not easy to account for the markings, but they can hardly be caused by the use of amidol or by intensified negatives. Some look to us as if the prints had overlaid each other in one or other of the processes, but that will not explain the oval marks. We advise you to send some to the makers of the paper.

UNSHARP COPIES.—In making a copy from a coloured miniature recently I used an iso plate also a thick yellow screen over the hood of the lens. On development the negative was very much out of focus. I took off the screen and found the focussing quite correct. I then took one without screen quite all right, and again replacing screen took another quite out of focus exactly like the first. The screen is dark yellow, and took twenty times more exposure. Can you give me the reason? The camera back was screwed down in each case to avoid any shifting of focus.—**ALPHA**.

Most probably the yellow screen is at fault, not optically flat. If you use a small stop you should be able to use it and still get a sharp copy.

CRYSTALS AND OTHERS.—In our next.

C. C.—Mr. J. C. Stevens, 38, King Street, Covent Garden, London, W.C.

NOTICE TO LEAVE.—I get my wages weekly and I intend giving my master a week's notice when I leave. Is it sufficient, or can he refuse to accept it, and if he does refuse shall I be safe in going?—**DOUBTFUL**.

If you are a weekly servant you must give your employer a clear week's notice of your intention to leave. That is all that is necessary. If, however, you are under an agreement for a definite period you can only leave under the terms of that agreement, whatever they may be.

ENQUIRER.—Charles Bowen, glass dealer, 58, Grove Road, Holloway, N.

P. P. A.—At present I am an amateur, but I intend shortly to commence business as a professional. Will you please inform me if I can be elected a member of the Professional Photographers' Association, as if so I should like to join at once, as it might be of assistance to me?—**AT PRESENT AN AMATEUR**.

Only members of the profession are eligible for membership, and until you are a bonâ fide one you are not eligible.

COPYING A COPYRIGHT PICTURE.—A customer has brought us a picture to copy. He tells us that he believes there is no copyright in it. We, however, fancy there is, and he is very anxious for us to copy it at once. To this we demurred, but he said he would give us an indemnity against any proceedings. This we have accepted, and made the copy. A friend now tells us that we are still liable for infringement if the picture should turn out to be a copyright one. Can you kindly tell us if that is the case, and oblige?—**F. AND J.**

Yes, you are still liable to action if the picture is copyright. The indemnity will not protect you from that, and you will have to take the consequences. If, however, the agreement is rightly drawn out and duly stamped you can recover any expenses you may be put to from the party who agreed to indemnify you in the matter—that is, of course, supposing he is in a position to pay them.

DISCOLOURED PRINTS.—Enclosed please find three prints that have been returned by a sitter. They were only sent out three months ago. They are on _____'s gaslight paper, and you will see that the lights have gone to a brownish colour. My printer tells me that she is sure they were well washed, but can that be true, as they have gone in this way?—**STAINS**.

What your printer tells you may be perfectly correct as regards

the washing given to the prints. The cause of the discoloration is that they were not thoroughly fixed before they were washed, so that the insoluble hypo silver compounds were not converted by the hyposulphite of soda into the soluble condition.

LICENSEE.—It must not be taken for granted that all patents are sealed are valid. If many of them were contested in a court of law they would be found invalid, and it is not impossible that the one, the specification of which you enclose a copy, would be so. As you have taken a licence to work under the patent cannot now contest its validity. In taking the licence you have practically admitted that. Considering the subject from a business point of view, we should say that you had better help in sustaining the patent rather than attempt to upset it.

ACTION FOR PAYMENT.—Some months ago I received an order from a firm here to copy some plans and cannot get payment. They say they did not give the order for them. The order was written on their usual memorandum forms and signed by the then manager, who has since left. They say that they will not be answerable for what he did. Can I recover?—**A. A.**

If the order was written on the firm's usual forms and signed by the general manager you will recover the debt in the County Court. The fact that the former manager has left makes no difference.

THE BALHAM CAMERA CLUB will hold its second annual exhibition on Saturday, February 20, 1909.

THE CANVASSING FRAUD IN THE LIVERPOOL DISTRICT.—We are glad to see the "Liverpool Echo" giving publicity to the fraudulent methods of the enlargement canvassers who are at work in the neighbourhood of New Ferry and Port Sunlight. A correspondent writes: "In a case which came under my observation the canvasser promised most emphatically that if a photograph was given him he would have an enlargement taken from it and charge absolutely nothing. This marvellous offer and the exceedingly 'taking' manners of the tout so influenced a young lady of the house that she parted with a photograph. One can imagine her surprise when a week or two later another man appeared with a copy of the enlargement (wretchedly executed, by the way), and insisted that he would give the enlargement, providing a frame was purchased for 12s. 6d. This unexpected proposal being received with indignation, he so terrorised the young lady with threats of proceedings that she was induced to part with a sum of money to settle the matter. If this sort of thing constitutes an indictable offence, I trust the police will prevent such extortion from people who can ill-afford to lose money in this way. Here is the best way of dealing with the above-named knavish trick. When the bland-spoken representative of 'The High Art Company'—or whatever they choose to call themselves—visits you with his specious offer, thank him heartily (writes 'D. C. R.') and tender him a photograph you do not value. When subsequently the 'artist' brings you the enlargement give him nothing for his trouble, but the reminder that his picture and expensive frame dodge is as old as the hills, and has been exposed over and over again. If everyone acted thus the swindle would soon cease."

** NOTICE TO ADVERTISERS.—Blocks and copy are received only to the approval of the Publishers, and advertisements are inserted absolutely without condition, expressed or implied, as to what appears in the text portion of the paper.

SUMMARY.

Some of the obstacles in the way of the two-colour method of stereoscopic projection are dealt with in an editorial article. (P. 154.)

For the making of three-colour carbon prints, Messrs. Edgar Clifton and A. E. Wells have patented the use of supplementary dye-baths in conjunction with a telescopic method of observing the three constituent images before they are finally and permanently assembled. (P. 163.)

Other patents are for a stereoscopic camera, which obviates the necessity to reverse the negatives, and a camera for photography by carrier-pigeon. (P. 164.)

Mr. Snowden Ward, in some notes on "Current Photographic Matters in America," gives an instance of the kind of enterprise which an English technical worker emigrating to the States or Canada would possess. He quotes the advice of a New York professional to photographers who think they can do better in America. (P. 155.)

At the Royal Photographic Society on Tuesday evening Mr. E. A. Salt, in a valuable paper, showed the speeds and efficiencies of commercial photographic shutters as measured by an apparatus of his own design and construction. He also described a very simple method of shutter-speed measurement devised by Mr. W. H. Smith. (P. 167.)

Two members of the staff of the Canadian Survey have described the method adopted for the determination of heights in plotting from photographs. (P. 158.)

An American worker advises the making of magnesium ribbon into a coarse net for convenience in burning. (P. 159.)

In the correspondence column, "Cinematograph Profits," "Conditions in South Africa," and the "Thames" colour-plate are referred to by our readers. (P. 169.)

The photo-chemical and photographic section of the forthcoming Congress of Applied Chemistry has already secured promises of several papers. The hon. secretary of the photo-chemical committee is Mr. Chapman Jones. (P. 154.)

Reviews of the exhibitions now being held at Birmingham, Edinburgh, and South London appear on Page 150.

Preliminary particulars of the meeting of the Photographic Convention, to be held at Canterbury from July 5 to 10, under the presidency of Mr. Snowden Ward, are given on Page 159.

The first two volumes of a comprehensive and descriptive work on the animal kingdom is now in course of publication in Germany. Some examples of the illustrations and notes on the volume are given on Page 156.

EX CATHEDRA.

"Copyright Property."

In a literary magazine the other day we came upon the phrase "copyright property" used in the course of an article on the relics of a writer whose centenary was the subject of illustration by photography. The expression was evidently intended to suggest that certain articles being the property of a certain person, the right to photograph them or to issue copies of such photographs was the possession solely of that person. Of course, there is nothing in copyright law to justify this implication. Actually the person enjoys the sole right because he takes care to prevent any one from producing a photographic copy, but if by some means or other such a copy is made, the Copyright Act does not on that account dispossess the photographer of proprietorship in his work. Conditions resembling these are not likely to occur in practice, but correction of a phrase likely to mislead may perhaps be pardoned.

Anastatic Photography.

According to a report of the Royal Dublin Society given in "Nature," Playertype seems to have been rediscovered by E. E. Fournier-d'Albe. It is described as a new process of contact photography, but the only new feature about it appears to be the second application of the same Playertype method of printing to the production of the positive. The negative is produced in the usual way by laying a plate film down on the subject and exposing the back of the plate. The result is said to be a "faint negative, much fogged." This negative is developed "with a view to the utmost hardness," which must be a rather difficult operation. A positive is then made from the negative by applying the same principle, and the result is said to be a good reproduction of the original. If still foggy, two more reversals will give a final result "in bold black and white, perfectly free from fog, and free from defects inseparable from all work done with a lens."

* * *

A New Stereoscopic Idea.

The imagination of the inventor seems to be inexhaustible in matters pertaining to stereoscopy, and our "Patents Column" often contains abstracts that suggest more imagination than practical knowledge. Of late there have been several patents concerning the production of a pair of stereoscopic images that overlap one another. The object of these has not yet become manifest, but we fear the results will have much the same fate as Dr. Smee's photographs in "binocular perspective," which anticipated the idea of these patents half a century or more ago. A quite recent patent develops a somewhat newer idea. In this case it is proposed to make two pictures on quite different scales with lenses of unequal focal length. This,

of course, involves the use of complicated special apparatus both for taking and viewing, and the only advantage claimed is that the results will show much better detail. It is not quite clear why they should do so, for good lenses will produce all the detail that can reasonably be required on the usual small equal-sized images. The advantage seems to be problematical, while the disadvantages are fairly obvious. In one of the proposed forms of camera the lenses are at unequal distances from the subject. This may mean differences in both depth and perspective. In another form the lenses are equi-distant from the subject, but then two plates have to be used. The viewing apparatus is of necessity more complex than the ordinary stereoscope, and it may be considered a matter of doubt whether those who find difficulty in combining ordinary equal size pictures will not find even greater difficulties in the case of unequal pictures.

The Congress of Applied Chemistry.

The first meeting of this International Congress to be held in London, has been fixed for May 27 to June 2, under the presidency of Sir William Ramsay,

F.R.S. The inaugural meeting in the Albert Hall is to be presided over by the Prince of Wales. In the photo-chemistry and photography section the president of the English Committee is Sir Wm. Abney, the vice-president Sir H. Trueman Wood, the hon. secretary Mr. Chapman Jones, and the committee, Messrs. Geo. E. Brown, James Cadett, E. Howard Farmer, Dr. C. E. Kenneth Mees, Prof. R. Meldola, F.R.S., A. J. Newton, E. Sanger-Shepherd, John Spiller, Sir Joseph W. Swan, F.R.S., Prof. J. M. Thomson, F.R.S., General J. Waterhouse, I.A. The following communications have been promised:—Dr. C. E. Kenneth Mees, Report on "The Present Condition of Sensitometry"; Mr. A. J. Newton, Report on "The Present Condition of Etching Methods"; Dr. S. E. Shepard, Report on "Colloid Chemistry in Relation to Photography"; Mr. C. W. Gamble, "A Note on Gelatine"; Mr. A. D. Cowper, B.Sc., "Photographic Methods as Applied to the Spectrophotometry of the Luminous Discharge"; Dr. Lüppo-Cramer, "On the Latent Image as Produced by Light, Röntgen Rays, Radium Rays," etc.; Prof. Dr. Coehn, "On the Photo-chemical Preparation of Sulphuric Acid."

THE COLOUR METHOD OF STEREOSCOPIC PROJECTION.

THE slides shown at the R.P.S. last week in illustration of the method of stereoscopic projection, described by Dr. König in our issue of November 6, 1908, suggested many interesting problems, and rendered it very evident that there is plenty of scope for further experiments. Some of the pictures could not be combined by the audience, others showed relief of a most exaggerated type, and in several cases a very unpleasant effect was produced by the appearance of the combined solid image a long way in front of the screen. All these defects are common in ordinary stereoscopic slides when the mounting and trimming is at fault, and it may be of interest to try and trace the source of these troubles in the lantern images.

Assume that the right-hand one of the two stereo images is printed in green and seen through a red screen placed in front of the right eye, while the left-hand picture is printed in red and seen by the left eye through a green screen. The two pictures are bound in rough register and projected together upon the screen, and it is obvious that the adjustment of this register, or want of register, is the factor that takes the place of mounting and trim-

ming in the case of the ordinary slide. The picture cannot coincide in all parts. One must overlap the edge of the other, and the green right-hand picture may overlap the red either on the right or on the left. In other words, one picture must be displaced laterally with regard to the other, and a good deal must depend on the degree and direction of the overlap. Suppose the green picture to be displaced to the right, it is obvious that if the amount of overlap is too great, say over $2\frac{1}{2}$ inches, it will be impossible to combine the pictures in the eye. This means that the overlap existent in the actual slide must not be magnified by the lantern to a greater amount than $2\frac{1}{2}$ inches. Assuming this amount of overlap not to be exceeded, then the combined solid image should appear to be situated behind the lantern screen. Suppose, however, we alter the register so that the green image overlaps the red on the left. The amount of overlap on the screen can then not affect the power of combining the images, for there is practically no limit to the amount of convergency that we can give to the visual axes, but the combined image must then appear to be in front of the screen. Where the images exactly register on the slide the resulting combined image points must appear to be in the plane of the lantern screen, and so, by adjusting the amount and direction of the overlap, we can get the same control over the final result that we exercise in trimming an ordinary stereoscopic print. If, however, we wish to keep the whole picture behind the screen, then all the green image must be to the right of the red one, and this may lead to an excessive amount of overlap if the lantern gives too much enlargement. It thus appears that the distance of the lantern from the screen is a matter to be taken into consideration when the best possible effect is to be obtained. A more difficult problem is the avoidance of exaggerated relief. This is a common defect in slide representing near objects, because it is generally impossible to mount such slides with a sufficiently small amount of separation. The result is of necessity observed under too small an angle of convergence. In the case of the projected lantern images it is obvious that they must always be observed under a very small angle of convergence; unless, of course, the images are crossed so that the green image is well to the left of the right one which condition, as already pointed out, will introduce other objectionable features. It seems evident then that the only satisfactory way of avoiding distortion is to make the negatives under a small angle of convergency which means that objects very near the camera must be avoided. It would appear likely that long focus lenses might be usefully employed in making slides of this type but without actual trial it is difficult to say whether they would be beneficial or not.

Another method of getting over the trouble of exaggeration would be to reduce the size of the projected image, and bring the audience nearer the screen; but this would be a rather unsatisfactory expedient. It is worth remembering that sometimes in ordinary stereoscopy on very near objects, the only proper separation for the mounted prints is practically nil, if exaggeration is to be avoided. This means that it is impossible to effect the mounting at all with ordinary prints, but the colour method renders correct mounting possible. Some of the slides shown at the lecture were practically low-power photomicrographs, and under the conditions of viewing they showed enormous exaggeration. It should, however, be possible to produce a slide of a similar subject that, when viewed in the hand, would be free from this defect. It would be interesting to experiment in this direction, and it might be found that the colour method gets over a difficulty that is sometimes rather a serious one with ordinary methods of working.

CURRENT PHOTOGRAPHIC MATTERS IN AMERICA.

A Cinematograph Trust.

THE closing of over five hundred cinematographic exhibitions in New York, as mentioned in my last note, has led to a curious result, which throws an interesting side-light on the extent of what is known here as the "moving picture" business. A trust, or syndicate, has been formed to take over the businesses of this class in New York city, to reduce the number of shows, reduce total expenditure, and (incidentally) comply with the demands of the Mayor and the fire department. The trust is capitalised at £3,000,000, and is intended to manufacture films as well as to control and conduct exhibitions. As there are already at least two or three motion-picture concerns with capitalisation running into millions of dollars each, there is some speculation as to whether all are to be included, or, if not, which are to be left out, and what they will do about it.

The Mayor's objections to the exhibitions have been on the ground of public danger and public morals. Most of the houses closed in Christmas week have been allowed to re-open, temporarily and conditionally. They can all, of course, satisfy the censor of morals by withdrawing such films as are risky, but many of them cannot arrange matters so as to satisfy the fire department. Many, perhaps most, of the exhibitions are held in stores, or shops, which are long, narrow rooms, of 100 ft. to 120 ft. by 20 ft. to 40 ft., with only one entrance. Generally, the screen is at the further end, and the lantern close to the door, so that in case of fire or panic the only exit leads past the centre of trouble. Some of the shows are in old-fashioned lecture-halls, with the main entrance under the middle of the gallery, so that the exit is immediately under the cause of any difficulty that may arise.

Danger of Inflammable Film.

The extent of the business is so great that daily papers discuss its interests editorially almost as if they were affairs of State, and within the last few days they have been calling upon inventors to produce a non-inflammable film. Their text has been a fire which took place in Omaha last week, when an errand-boy who was carrying a handful of loose film ran against a man with a lighted cigar. The films flared up, were snuffed, and the result was that in a very short time films to the value of £30,000 were destroyed, and the building was damaged to the extent of £10,000. Such an important paper as the "Albany Evening Journal" heads its editorial "A Need of the Time," when appealing for the non-inflammable film; and the extent of a film-fire that is possible in a city of some 130,000 inhabitants away in the centre of the United States goes to show the importance of the industry. Another interesting fact is that there are two active weekly newspapers devoted to the moving-picture business, and apparently they are much better supported than the two weeklies that deal with photography as a whole.

Should Photographers Emigrate?

In England I am often asked for advice by men and women who think of emigrating to the United States to seek positions as operators, printers, retouchers, or receptionists. My general advice is like that of "Punch" to those about to marry: "Don't." As a rule, the man who cannot succeed as a photographer in Britain, will find it a still harder fight in America. Recently I have been talking over this matter with some of the best men in New York, and the advice they give can be fairly summed up in the words of one of them, himself an Englishman, who has been established here for twenty years and has made a good "pile." He says: "If you know a young fellow of twenty-two to twenty-five, who is a good photo-

grapher, healthy and strong, ready to do anything, and to stick to it through disappointment and hard knocks, send him along. I would give such a fellow a good job any day; but I can't engage him in England, because the alien contract law is so strict. A man of thirty should hesitate, however good he is; and a man of thirty-five should not come at all, unless he has some people he knows quite well to come to. A man of thirty-five or upwards, who is not so successful in his own country as to want to stay there, will nine times out of ten break his heart here."

Old Country versus New.

One of my friends here, from England many years ago, says: "I came here and had an awful uphill time for a while, but at last had exactly a thousand dollars in the bank, and seven hundred to pay for a trip to the old home. When I got there, my best friend, who started with nothing at the same time as I did, had saved a thousand pounds, and not worked nearly so hard. He had shorter hours, took summer holidays, and worked in a way that he could enjoy; while I had been fighting every minute, working hard and living hard; and he had saved just five times as much as I had."

Chances in the Newest Places.

This same friend tells how, a few years ago, he urged his young son to go afield in search of adventure and profit. The lad was an expert all-round photographer, and set off with a companion of similar stamp and training. They investigated several towns and cities in the Eastern and Middle States, then crossed into Canada and took one of the railway lines to "rail-head," the furthest point it reached. There they found that tickets could be obtained for stage-waggons, going further West, and at the final waggon-terminus, as there was no photographer, they rigged up a dark-room and began a business with out-door and "at home" work. Soon they were able to rent a house and store, and before long, finding that much of their work was being sent 1,500 miles to be reproduced in half-tone, they induced their parents to invest about £1,600 to set them up fully in photographic and photo-mechanical work. In the very few years that they have been there, the railway has gone through their little town, the town has grown considerably, and the boys have "made good," saving enough to buy the freehold of their premises. They had the inestimable advantages of good training, youth, energy, and parents' financial backing, which enabled them to search at leisure for an opening, and to capitalise the business when capital became necessary.

The American Convention

of The Photographers' Association of America is to be held in Rochester, a fortnight later than our own P.C.U.K., from July 19-24. To complete their arrangements, the officers have just spent a week in Rochester, where they have been entertained by the Rochester members of the Association, and by the manufacturers. The visit closed on Friday, January 15, with a dinner to the Committee, at The Rochester Club. The Rochester Chamber of Commerce has taken a very active, helpful part in arranging for the Convention, and is rejoicing in the idea that it will bring to the city some 3,000 visitors, who will be influential in spreading the fame of a city which aims at being one of the great leaders in many lines of manufacture.

Caricatures at the Little Galleries.

True to its principle of attempting to show photographers all that they ought to see—and not merely photography—the Photo-Secession devoted its January exhibition to caricatures by Marius de Zayas. Wonderfully clever and bold, they may perhaps best be imagined by British readers if they think of the

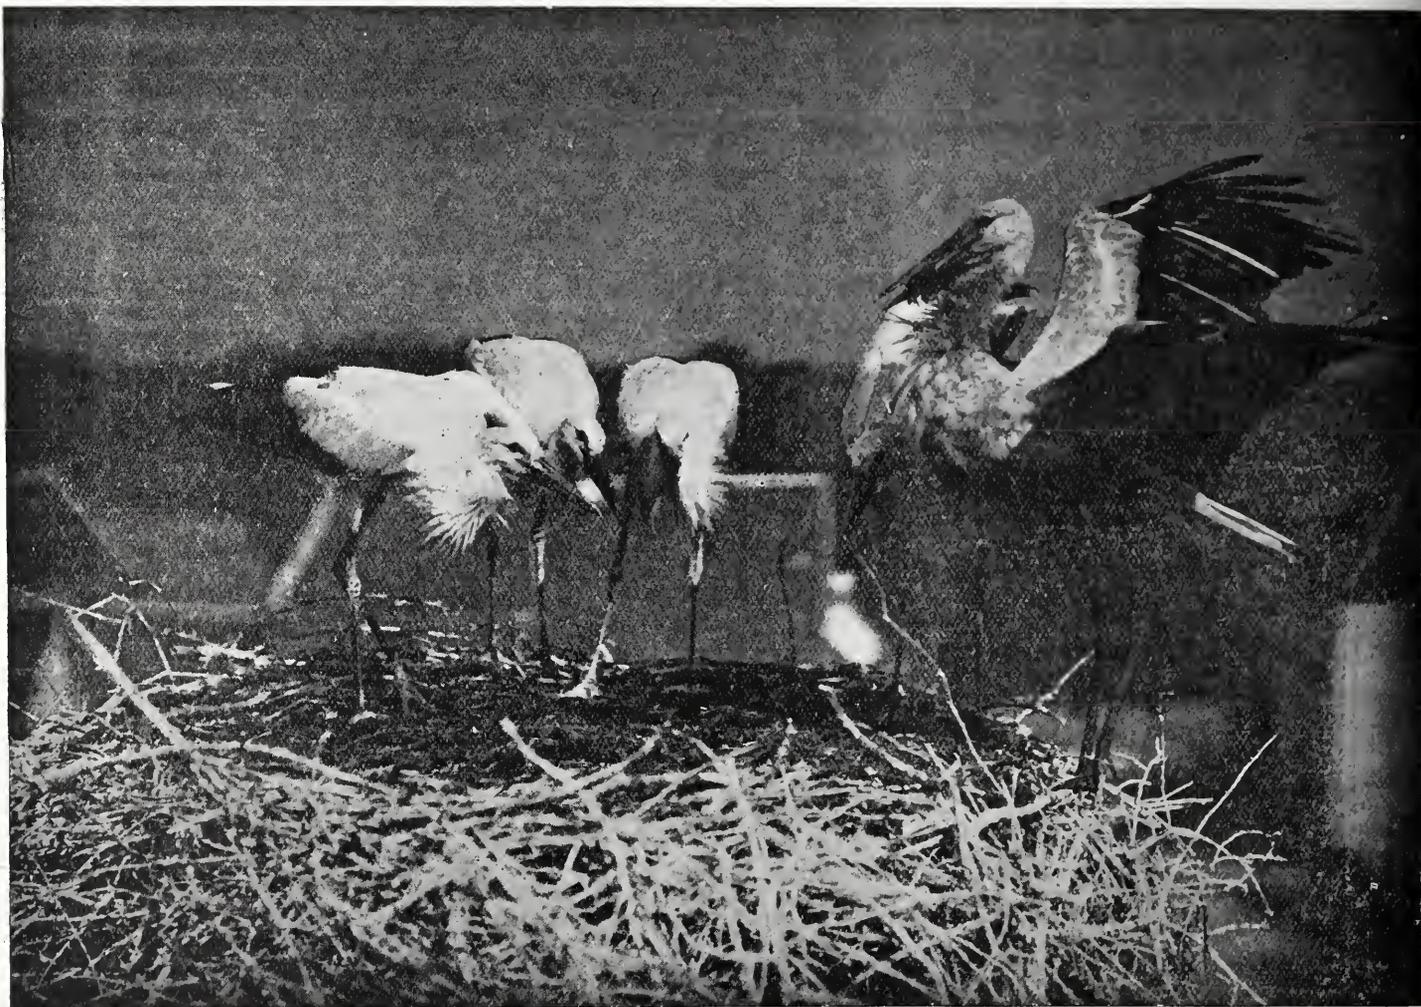

work of S. H. Sime, denuded of much of its detail, and done in black-and-white on grey or brown boards. Exactly what lesson is intended for photographers, I don't know. They may learn that an immense power of character drawing can be secured without detail; and, perhaps, too, that power may be

used kindly or cruelly. W. T. Stead has said that a character sketch should show a man as he appears to himself at his best and not as he seems to his enemies at his worst, and this is a good rule for portraiture, even when it broadens to caricature.
H. SNOWDEN WARR

PHOTOGRAPHIC PICTURES OF THE ANIMAL WORLD.

Of the many branches of science to which photography has rendered service perhaps none has more directly benefited, in the estimation of the public, than that of zoology. The natural history of animals, tame and wild, has interested everybody from the cradle: zoology, as an abstract science, burdened with Latin names, only a very few of us. It was not easy to read the writings of zoologists, who apparently took the view that as soon as their subject was made interesting to Mr. John Smith and his son Master Jack, it ceased to have a scientific value. But when photography arrived to serve the laudable purpose of gilding the zoological pill a large public has been found to take an interest in the habits and life-histories

graphic instruction provided by the photographic illustration. The days of our youth the salient features of the members of the animal kingdom were impressed, in silhouette fashion, upon our minds by verses which crudely described birds and beasts which were never likely to see out of a zoo. Now we have such as Mr. Kearton to introduce us to the fur and feathered folk to be met if we know where to look for them, in our own country. In this, as in most other branches of education, it is made more difficult for the student to form a wrong impression, and at the same time there is opportunity afforded to cultivate the student's own power of observation.

Stork's Nest, with Four Young. By M. Auerbach, Leopoldshafen a. Rh.

of the animal kingdom which all the specimens in all the museums would never have developed in them, for the quite obvious reason that it is a good deal easier to interest oneself in the ways and doings of, say, the water rat, than in the most perfect specimen of the *arvicola amphibious* in the Natural History Museum at South Kensington. Your writer on natural history nowadays has no cause to be less instructive or less scientific, but he is at the immense advantage of being able, by aid of the camera, to make the dry bones of the text-book supply the living subject—or at any rate the next thing to it. And so we have had books of natural history adapted for the reading of the non-scientific person and even of the child of tender years solely on account of the

In point of date we, in this country, have led the way in the popularisation of natural history by means of photography, and the Christmas catalogues and booksellers' shelves bear witness to the popularity of photographic natural history as the subject of a gift book. But it must be confessed that German writers, even though they may have been later in realising the advantages of this method of study, have in the end undertaken their labour with a degree of patience and thoroughness which is quite characteristic of writers and publishers in Germany. The infinite capacity of taking pains is, perhaps, the most distinguishing feature of the Teutonic type of genius, with the result, as readers of photographic text-books know, that the comprehensive treatises of Eder, Valenta

Silver Gull. By Steenhuizen, Wossenaar.

subject and has provided a text-book of reference which tells the student everything that is worth knowing on its subject.

So much by way of introduction to a volume, or, rather, a series of volumes, which does in a systematic way what the many admirable books in this country have done individually in the domain of the photographic record of animal life. Under the title "Lebensbilder aus der Tierwelt"* publication has commenced (and has already taken the form of two large volumes) of a systematic record of animal life, illustrated, with not a single exception, by photographs, in the majority of cases obtained of the animal in its natural surroundings. The series is to be completed in two further volumes, the third dealing with amphibious animals, reptiles, and fishes, and the fourth with invertebrate animals. The two volumes before us supply sufficient proof that the whole series will represent a most comprehensive treatment on modern lines of the animal kingdom. The illustrations have many of them been taken specially for the work, or have been accumulated by the publishers by means of a competition which has been held yearly for the past few years in Germany in order to secure pictures by isolated workers in this department of photography. The editor of the volume is himself a natural history photographer of long experience, some of the most excellent illustrations in the books are from his camera, and a considerable portion of the text is written by him. For the rest a number of writers and photographers have contributed on subjects which they have made specially their own, and we see in the volumes photographs familiar to English readers of Mr. Douglas English and Mr. R. B. Lodge. The liberality of illustration applies not only to the animals themselves, but also to their habitats. A total of nearly 2,000 photographs in all has been accumulated for the purposes of the publication, and, as is pointed out in a circular describing the volumes, their appearance has already supplied a stimulus to this form of nature study, and has provided a form of sport which is no less exciting than that of the hunter, but is without objection from the humanitarian standpoint. As a fair example of the 250 illustrations which accompany each of the two volumes we have selected three by Herr Meerwarth and his colleagues, a paper by one of whom, Herr Steckel, we translated in abridged form some

Young Fox. By H. Meerwarth, Beddingen b. Braunschweig.

and other German writers have no counterpart for inclusiveness of material and arrangement of information in any language, and he same holds good of almost every department of science and technology; the great book in England is the work of an individualist usually describing his original work, but the great book in Germany is the work of someone who has assimilated the whole

weeks ago. It gave a description of the long focus types of camera such as the author and others have found necessary in the photography of many timid subjects.

* "Lebensbilder aus der Tierwelt," edited by H. Meerwarth, published by R. Voigtlander, Leipsic. Two volumes 9½ by 7, each about 600 pages, with many illustrations and supplementary plates. Pt. I., Mammals. Pt. II., Birds. Each 14 marks.

THE DETERMINATION OF HEIGHTS IN PLOTTING FROM PHOTOGRAPHS.

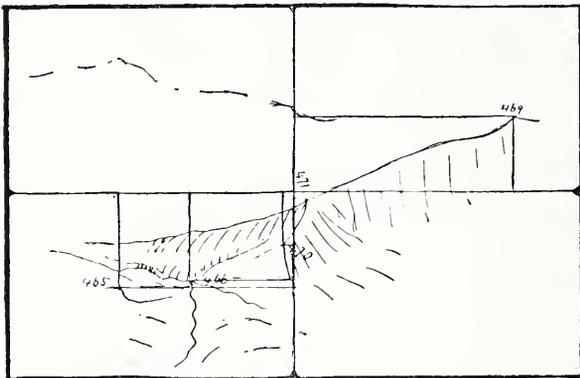

[The following description of the methods adopted in the Canadian Survey in reading off heights from photographs is contributed to the "Archiv für Photogrammetrie."]

In the mountainous portion of Western Canada the photographic method of surveying is adopted by the Geological Survey. The instruments used include transits for the triangulation, and a smaller pattern for use with the camera. The camera is a modified form of the Deville pattern in which the camera box is racked back to the plate. The standard size of plate used is 4½ in. by 6½ in., and for plotting, the pictures are enlarged two diameters.

After the triangulation is completed and laid on the map sheet, camera stations are added and the work of plotting begins. To make a contoured map the determination of the heights of points along the ridges and bottom of slopes is essential. These are selected from the pictures and their position on the ground plan

This is a simple instrument, consisting of a swinging arm transparent celluloid attached to a fixed arm projecting from a base. This base is a bar on which are two slides. The outer one is a flat rule with spring clips under which the strips of paper are held. This rule is set at the focal length of the picture, measured from the centre around which the swinging arm turns. An inner slide is provided with a scale of the map in feet. It has also an adjustment so that it can be shifted across the bar.

When the swinging arm is at right angles to the outer rule parallel to the base bar the scale on the other slide is adjusted so that the height of the station under the ruled line on the swinging arm can be read. A permanent mark should be made on the outer rule for

From Sta. A 6.

Fig. 1.

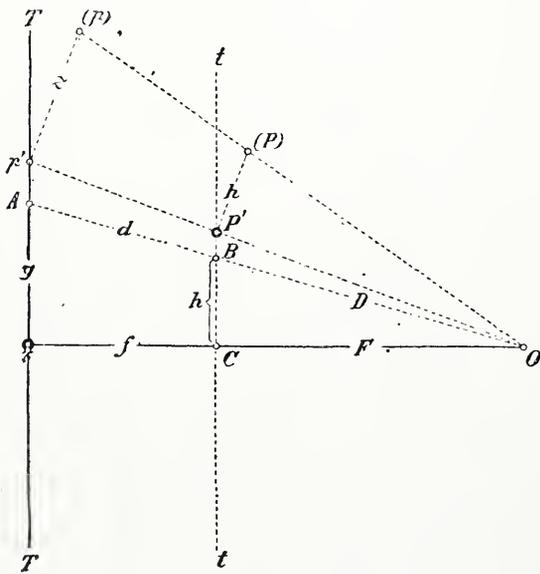

Fig. 3.

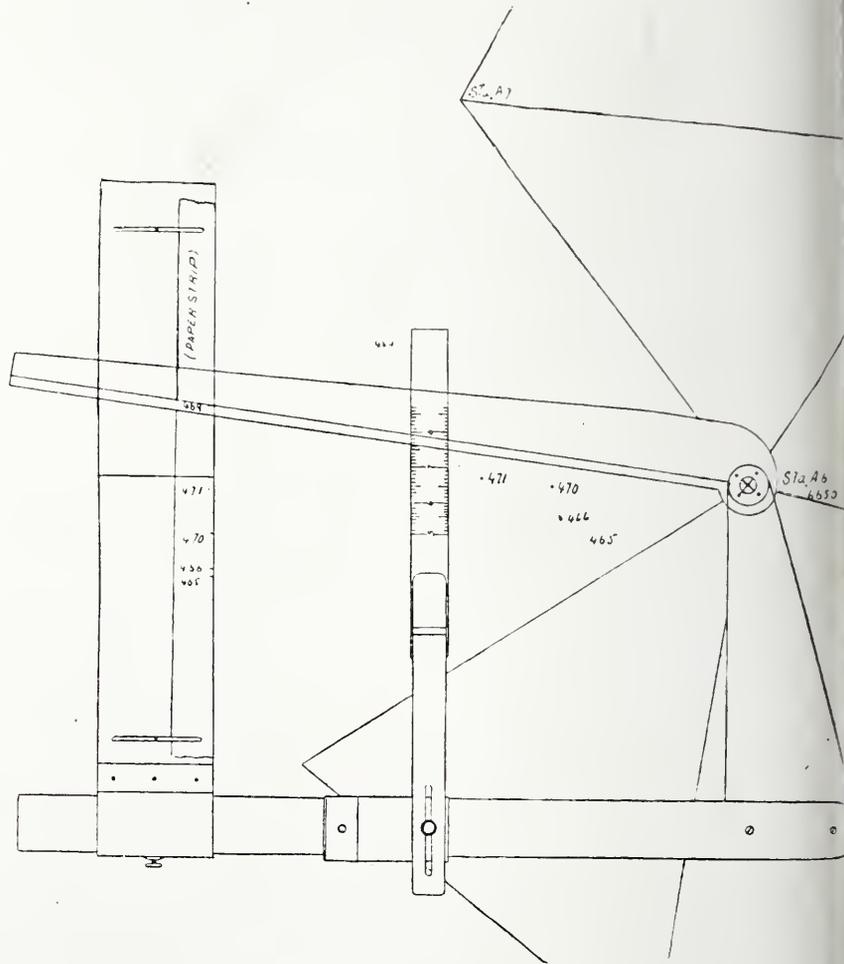

Fig. 2.

plotted in the usual way by intersection. If the pictures are clear and from well selected points a great number may be chosen that may be seen from two stations.

The determination of the heights of these points represents considerable time and trouble. To facilitate the computation, Mr. Matheson has devised an instrument to do most of the work.

In the picture the principal lines representing the centre and the horizontal plans are marked by notches or points on the frame of the picture. The projection of the selected points on the principal lines of the picture is transferred to strips of paper, those on the horizontal line being used to plot their position on the map and those on the vertical line transferred to the outer arm of the computer.

position of the swinging arm to represent the principal point in the picture.

The instrument should be made true so that the scale will give the same reading when moved along the bar.

The computer is used by placing it on the map with the centre of the swinging arm above the station point and the edge of the outer arm or rule on the trace of the picture plane, or if the bearing of the centre of the picture is plotted, the permanent mark on the outer bar representing the centre of the picture should come above the line of bearing.

The sketch shows the computer placed in position to determine heights for points shown in a picture from Sta. A6. The points numbered in the sketch are plotted on the map and their pro

s on the vertical line transferred to the strip of paper shown
ched to the outer bar or rule. The swinging arm is moved to
1 of the marks on the strip of paper representing the position
ve or below the horizon, and the slide which carries the scale is
1 moved up to each position, as plotted on the map. The height
ach point is then read from the scale under the ruled line on the
ging arm.

1 the sketch the station is given the height of 6,650ft., which
1 on the scale. Point No. 469 is to be determined. The
e carrying the scale is moved so that the edge of the scale
hes the point on the map showing the position of 469, and the
ging arm is brought to the mark on the edge of the paper strip
esponding to the ordinate of the picture point No. 469 above
horizon. The scale now reads 7,910ft., the height of the point.
operation for each of the other points in the picture is quickly
e, and the degree of closeness to which the heights can be read
ends on the fineness of the graduation of the scale, and also the
e on which the map is being plotted.

D. B. DOWLING.
H. MATHESON.

he following note is appended by the "Archiv für Photogram-
rie":—The theoretical basis for the above-described apparatus
s follows: Let T T be the image plane at the distance f (distance
he image) from the station O, with the chief point Ω , and let
e the situation of a point fixed photogrammetrically, then the
tive height above the station is known from the values of the
inates, z , from the similar triangles, $O P^1 (P)$ and $O p^1 (p)$.

$$h : z = D : d \quad h = \frac{D}{d} z \quad (1).$$

ough the point P let fall a perpendicular, tt , on $O \Omega$, draw
n Ω the z ordinates and join $O A$. The distance, $B C$, on
ives the required relative height, since the triangles $O C B$ and
A are similar, and therefore

whence $C B : z = D : d$,
 $C B = \frac{D}{d} z \quad (2).$

m equations (1) and (2) $C B = h$. The instrument is fitted at
T with a scale, to which a paper strip, fastened with the x
inates marked on it, is fastened. tt represents a movable
ided scale, and $O A$ is provided with an arm, which is pivotted
O. If the zero point of the scale is at C, then from the inclina-
t of the edge of the scale the relative height, h , can be read off.
ails for the construction of apparatus based on the above prin-
e have been available in Austria for years past.

MAGNESIUM RIBBON SHEETS.

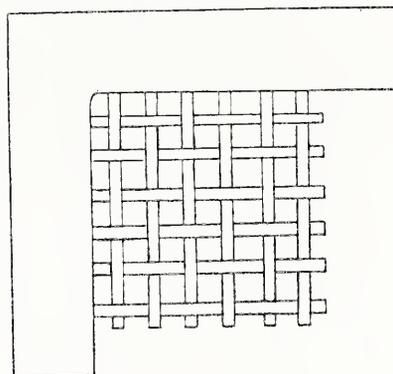

G. W. B.," writing in the "Camera," recommends a method
using magnesium ribbon for enlarging or other photo-illuminating
poses, which we do not recollect to have seen suggested before
ctly in this form. Writing of magnesium ribbon as an illuminant
says:—

The light has the great disadvantage, from a photographic stand-
nt, of emanating from a single point and so casting harsh shadows,
dering it unfit for use in ordinary portraiture. In addition, it is
sumed rather slowly and requires long posing with the attendant
of movement. Its chief advantages are: It is absolutely fire-
of, it keeps indefinitely, and is affected but little, if at all, by
side influences, such as dampness, which soon destroys most flash
ders. In addition, it is as nearly smokeless as can be desired.
ese good qualities should be sufficient to keep it in the "armamen-
um" of the amateur who wishes to be prepared to meet any and
conditions. Since its use is out of question as an illuminant for
traiture of the regular kind, it occurred to me to see if I could
a way to overcome its other fault, that of slow burning. When
picture to be taken is such that the light is close to the face of
model the amount necessary is but an inch or so, which burns in
aw seconds and requires no special precautions; but when the light
istant, say twelve or fifteen feet from the subject, one must use
times as much as a yard of ribbon, which, burned as one long
ce, would take several minutes.

After some experimenting I hit upon the following solution,
hich, if it does not give the ribbon the speed of a flash sheet, at

least makes it practicable for quite a number of effects. The elimina-
tion of its chief disadvantage, that of slowness, together with the
fact that it burns as quietly as a match or candle, and is entirely safe
and free from the puff of fire and smoke that accompany flash-sheets
and powders, should help to give it some popularity.

"Out of thin tin or sheet aluminium two frames were made,
shaped like a carpenter's square. This is the entire apparatus. After
determining the amount of ribbon to be employed it is torn into short
lengths, and these are woven together into a net with meshes about
 $\frac{1}{2}$ inch wide. The number of pieces into which a given length must
be divided is equal to double the square root of its length in inches.

Thus a piece of 36 inches long would make twelve pieces each of
3 inches. The free ends on two adjoining sides are then fastened in
the tin frame by pasting a strip of paper over them and the other
frame clamped on top. The lower free corner can now be lit, and
the whole will burn like a piece of paper and about as fast, giving
a very intense light. The figure will make the arrangement clear.
The most convenient way to light the ribbon, which does not readily
ignite from a match, is to put a bit of cotton soaked in alcohol in a
small dish, and after lighting push it under the ribbon. To prevent
the burning mass from dropping out of its frame the latter is best
suspended at an angle of about 45 degrees by any convenient means,
and not left to hang vertically."

PHOTOGRAPHIC CONVENTION OF THE UNITED KINGDOM.

PRELIMINARY NOTICE OF THE ARRANGEMENTS FOR JULY 5 TO 10.

A PRELIMINARY circular announcing the proceedings of the Con-
vention which will meet at Canterbury from July 5 to 10, under the
Presidency of Mr. H. Snowden Ward, F.R.P.S., has now been
issued by the Honorary General Secretary and Treasurer of the
Convention, Mr. F. A. Bridge, East Lodge, Dalston Lane, London,
N.E., from whom copies may be obtained on application.

PROGRAMME.

Monday, July 5. Morning and Afternoon—Conducted parties
to places of interest in and around the City. Evening at 8—A
few words of welcome by the Mayor of Canterbury. The President,
H. Snowden Ward, Esq., F.R.P.S., will deliver his inaugural
address, after which the Annual General Meeting will be held.

Tuesday, July 6. Excursion—A driving tour through the
villages of Bridge, Patixbourne, Bekesbourne, Littlebourne, Wing-
ham, Ickham, Wickhambreux, Fordwich and Sturry. Evening at
8.30—A lecture by F. Bennett-Goldney, Esq., F.S.A., on "Canter-
bury and its history," followed by a meeting of the new Council.

Wednesday, July 7. Morning at 11—Visit to the Cathedral;
Official Reception by the Rev. Canon Moore, D.D., on behalf of the
Dean and Chapter. Afternoon, 3 to 5—The Right Worshipful F.
Bennett-Goldney, Esq., Mayor of Canterbury, and the Mayoress,
will give a garden party at his residence, "Abbots Barton," at
which the official Convention Group will be taken. Evening at 7—
The Annual Dinner will take place at the County Hotel, followed
by a smoking concert, under the auspices of the Canterbury Chamber
of Commerce.

Thursday, July 8. Excursion to Rochester. Evening at 8.30—
A paper by Mr. C. Welborne Piper, and a paper by Mr. C. H.
Bothamley, F.C.S., F.I.C., on "Some Aspects of Photographic
Record Work."

Friday, July 9. Excursion to Rye and Winchelsea. Evening

at 8.30—a paper by Captain Owen Wheeler on “High-power Tele-photography,” and a lecture by Mr. F. Martin Duncan on “Colour Photography applied to Natural Science.”

Saturday, July 10. Excursion to Maidstone.

GENERAL ARRANGEMENTS.

Place of Meeting.—The headquarters of the Convention during the week will be St. George's Hall (St. George's Gate). Here the Exhibition and the Evening Meetings will be held, and a large dark-room (for changing only) will be available to members at all reasonable times during the meeting.

Exhibitions.—The usual Trade Exhibition of Pictures and Apparatus will be arranged for. There will also be a special Exhibit of Survey and Record Photography.

N.B.—On Wednesday and Thursday, July 7 and 8, the Canterbury Camera Club will hold its Annual Photographic Exhibition.

Canterbury Cathedral.—The usual fee for photographing in the enclosed parts of Canterbury Cathedral is 5s. per day. The Dean and Chapter, however, have kindly granted special facilities for members of Convention at a nominal charge.

Excursions.—The Excursions will be inexpensive; ample time will be allowed for photography; and every effort will be made to obtain permission (where necessary) to enable the members to photograph the various objects of interest in the localities visited.

Reception Committee.—The Mayor and several other members of the Corporation, the Committee of the Canterbury Chamber of Commerce, and the Canterbury Camera Club are taking great interest in the Meeting, and are doing their best to obtain as many facilities as possible for the members during their visit.

Accommodation.—For further particulars, list of hotels and apartments, dark-rooms, dealers, etc., etc., see the official illustrated handbook, which will be issued to members as soon as possible.

During the Convention week, the Seventh Exhibition of the Canterbury Camera Club will be held. The judges will be Mr. H. Snowden Ward and Mr. F. J. Mortimer. Members of the Convention are invited to exhibit.

Full particulars and entry forms may be obtained from the Exhibition Secretary, B. J. Fisk-Moore, St. George's Gate, Canterbury.

Exhibitions.

SOUTH LONDON PHOTOGRAPHIC SOCIETY.

THE annual exhibition of this active society is again housed in the South London Art Gallery in the Peckham Road, and very well indeed the Hanging Committee have used the materials at their disposal. On a series of panels covered with arras cloth they have displayed the 393 exhibits which form the pictorial classes. Scientific and technical work—and, shame to say, the invitation section—are relegated to a somewhat dark statuary gallery, where they consort with a stall of the publications of Messrs. Hazell, Watson, and Viney and a screen of very excellent enlargements on “Wellington” papers.

This year the division of the members' classes into subjects is dropped, and therefore we miss the strong class of architecture which has invariably been a feature of the South London; yet it is to be doubted if the usual amount of good work of this kind can be discovered scattered throughout the members' work.

Dr. A. R. F. Evershed, the President of the society, sends a number of pictures, the best of which is undoubtedly “The Tramp” (No. 53), to which a gold medal and bronze plaque are awarded. Apparently the exhibitor has used throughout a lens giving diffused definition, the softness of which is all to the good of the medalled picture, but tends to feebleness in the case of most of the others. “Vanity” (No. 31) is an instance. It represents a girl and a very blank space. Mr. E. R. Bull, who has usually been a strong exhibitor of architectural work, also this year has a mannerism in the shape of a grain or fabric effect in his prints—in most cases somewhat too pronounced. A number of members have chosen their subjects in Trafalgar Square, but we fail to find one example which comes near to some of the big impressions which Mr. A. H. Blake has obtained here with his camera, nor to the strong yet dainty work which the late Mr. W. J. Warren exhibited perhaps ten years ago.

Mr. R. Jamieson, in “The Guardian of the Square” (No. 62), his guardian lion so close to the edge of the picture that the lines which occupy the strongest part of the composition are missing in evidence. The same mistake can be seen in “The Sentinel” (No. 130), where the subject is Hyde Park Corner. One of the pictures which is technically first-rate is “A Chester Row” (No. 70) by W. E. Murray, but it would have gained by losing a good deal of the subject on the left-hand side. No. 78, by E. Pady, shows a flight of steps in Trafalgar Square; while they are well rendered, the dwarfed appearance of the National Gallery on the top of the picture makes one wonder whether this is really a happy selection. A landscape, “Off to the Fishing Grounds” (No. 90), by E. W. Taylor, has plenty of go and motion in it, but gets no award. “The Keston Pass” (No. 101), by F. R. Hatch, is another good piece of work, showing the photographer's appreciation of tone values in different planes of the landscape. Near to it is an awful example of multiple-mounting (No. 105), whilst No. 106, immediately below, a print which in its own tones and in the very nice mounting in light greys, quite bears out the title of its producer, H. E. Goode, “Soft in her sombre livery came still evening on.” A very striking and sound piece of work is No. 114, “Park Lane,” by E. Pady, has evidently seized on a piece of naturally beautiful lighting. The work of Gideon Clark is mostly in very light, delicate, sometimes “washy” tones which generally are well suited to the subject, though we think that this year's photographs do not come up to the previous work which Mr. Clark has shown. Of his exhibits, we think the one most after his accustomed manner, namely, “Adeed” (No. 336), which has “bigness” and dignity, and receives a bronze plaque in the open class, and we do not care at all for the view of six posts and some distant detail which is called “No. 192—An Impression” (No. 192).

In the open classes one exhibitor who has made the most of a simple subject under naturally beautiful lighting is H. Feathers in “The Gabled Cottage” (No. 195). Among other well-known exhibitors in this class are B. Ward Thompson—we like best his “Corner in Robin Hood's Town” (No. 207)—Aubrey Harris, Mr. Mrs. Bracewell, J. C. Warburg, Miss A. B. Warburg, J. M. Whitehead, and R. Dührkoop. Miss Edith L. Willis shows quite a *de force* in “The Snowstorm” (No. 228), and we thank Mr. Aubrey Harris for the delicious humour of “The Darning Lesson” (No. 231), which, however, goes without an award. But perhaps the exhibitor whose work we like best is Mrs. E. Peake, whose “Seeing the World” (No. 260) is a fine example of massed tones. We hardly think that this is a piece of straightforward photography, but whatever the means taken to produce the result, they are at least hidden: the print would appear to be in platinotype. In “The Spell” (No. 266), to which the silver plaque is awarded, the photographer has probably had less control, but for a good deal of effect the models must be thanked. J. Hepburn shows one picture, “The Lesson” (No. 289), a beautiful example of both composition and technique, with all the perfection of an engraving, but gets no award. Another model who has stood the photograph good stead is that of “The Drinker” (No. 292) by A. W. Whitehead. J. C. Warburg, in “The Rabbit Shop” (No. 302), seems to re-echo a picture of Mr. Eustace Calland's, “The Doctor's Shop.” Both are delicate vignettes of a quaint shop-front. The work of J. Whitehead is represented by three examples, the best of which is “A Silent Guide” (No. 321), poignant in its suggestion of solitude.

The awards made by the judges, Messrs. F. J. Mortimer, E. Holding, A. H. Blake, and E. J. Wall were as follows:—

MEMBERS' CLASSES.—Gold medal and bronze plaque, No. 53, “The Tramp,” Dr. A. R. F. Evershed.

Bronze plaques: No. 27, “Beatrice,” P. Bale Rider; No. 75, “Chantry Stairway,” E. R. Bull; No. 76, “In Liseux,” P. Bale Rider; No. 94, “Westward Bound,” H. Crieghton Beckett; No. 106, “Park Lane,” E. Pady; No. 118, “Off Greenwich,” E. W. Taylor; No. 128, “Unto the Haven Where They Would be,” Gideon Clark.

Commended: No. 2, “Miss Disdain,” Miss M. A. Craigie-Halket; No. 41, “Wild Rose,” C. Hemstead; No. 57, “Staple Inn,” Gideon Clark; No. 70, “A Chester Row,” W. E. Murray; No. 78, “Steps, Trafalgar Square,” E. Pady; No. 171, “Spring,” Dr. A. R. F. Evershed; No. 173a, “St. Paul's,” F. W. Berry; No. 177, “The Tide,” Gideon Clark; No. 178, “A. L. C.—Profile,” Dr. A. R. F. Evershed; No. 184, “The National Gallery,” E. Pady; No. 192, “Springtime,” J. S. Dunn.

CLASSES.—Silver Plaques: No. 266, "The Spell," Mrs. E. No. 285, "Mother and Child," R. Dührkoop.
 Bronze plaques: No. 205, "Staple Inn on the Night of Decem-1908," H. G. Firmin; No. 228, "The Snowstorm"; No. 278, "Screeching Revolution," A. W. Ward; No. 297, "Across the Beverley Minster," C. H. Hewitt; No. 321, "A Silent Guide," Whitehead; No. 336, "Aberdeen (the Upper Dock)," Gideon

commended: No. 203, "Christchurch Priory," E. Pady; No. 207, "Corner in Robin Hood's Town," B. Ward Thompson; No. 220, "Ch Parade," Miss Agnes B. Warburg; No. 227, "At the Old Gate," Aubrey Harris; No. 249, "The Village Smithy," J. n; No. 253, "Chain Harrowing," Mrs. C. Maud; No. 263, "Woman of Sorrow," Dr. A. R. F. Evershed; No. 304, "Con-10n," R. Dührkoop; No. 309, "A Stranger in the Village," n Blake; No. 365, "Sunshine and Shadow on a Cottage Wall," 1atherstone.

SCIENTIFIC AND TECHNICAL, CLASS G.—Bronze plaques: No. 407, e photographs illustrating the life history of a kingfisher, Alfred

commended: No. 410, Four stereo radiographic transparencies, Rodman, M.D.; No. 412, Four Autochrome slides, H. G. Drake-1man.

MEMBERS' LANTERN SLIDES.—Bronze plaques: No. 7, Various, n Clark; No. 9, London Views, H. Creighton Beckett.

commended: No. 6, Architectural, E. R. Bull; No. 8, Various, n Clark; No. 11, Various, F. W. Berry.

OPEN CLASS, LANTERN SLIDES.—Bronze plaques: No. 27, Miscel-1as, S. Nemirowsky; No. 38, W. A. J. Hensler.

commended: No. 21, Studies of the Song Thrush, Alfred Taylor; 1, Architecture, G. J. T. Walford; No. 36, T. Archer; No. 39, r Studies, F. A. Tinker.

EDINBURGH PHOTOGRAPHIC SOCIETY.

annual exhibition of the Edinburgh Photographic Society was ed in the Society's Rooms, 38, Castle Street, Edinburgh, on day, February 20. The exhibition is this year an open one, a late exhibition for members only having been held in the autumn. hus dividing their activities into two parts, the Hanging Com- ee have been enabled to do much greater justice to the works itted. The result is a most interesting collection of photo- hs. In Class A (portrait and figure studies) medals have been ded to W. S. Webster for a portrait (No. 5), to J. McKissack very fine Dutch study, "At the Harbour, Volendam" (No. 48), to John Hepburn for "A Village Smithy" (No. 50). Mr. ster's portrait is a characteristic study of Sir George Reid, late dent of the Royal Scottish Academy. The pose is natural unconventional, and the picture well deserves the award given . The same may be said of Mr. McKissack's Dutch study, h, in addition to showing excellent technical work, is well com- and full of atmosphere. Mr. Hepburn's "Smithy" is a strong of work, executed in broad masses, and showing a very striking entration of light, but it would have been improved had the out- of the horse's head not been so entirely lost in the gloom of the y. It is entirely free from the "staginess" of his other pictures, e of which, "The Village Fiddler" (No. 4), is awarded hon- ion. Hon. mention is also made of work by John Moffat (two res), Kenneth Bishop, James Hamilton, and B. Ward Thomp- . Mr. Moffat's pictures are both oil prints of great beauty and technical excellence, one a portrait of Mr. John McWhirter, (No. 6), and the other, "Now waiting patient the sweet hour st," a charming portrayal of an old lady absolutely simple and ified. It might well have been granted the higher award. In ion to these two pictures mentioned, Mr. Moffat also shows is class a well-composed group, "Her First Lesson." Other x worthy of mention are two portraits (Nos. 31 and 35) by Porter ins, "My Old Dutch" (No. 38) by G. L. A. Blair, three figure cts (Nos. 47, 53, and 54), cleverly executed, though slightly trical, by R. Forbes, and a couple of good portraits (Nos. 16 26) by Charles Croke. A very fine portrait, a direct 20 by 24 , is also shown not for competition by W. Croke.

the landscape section two medals are given—one to A. Edding- for a very beautiful study of birches (No. 62), executed in oil, which, though slightly marred by a lack of firmness in the

treatment of the upper branches, stands out as one of the best land- scapes in the room. It is run very close by "A Summer Cloud," another fine bromoil, also by Mr. Eddington, a splendid sweep of sand, sea, and sky, very simple and full of breadth and atmosphere, yet does not seem to have caught the fancy of the judges. The other medal is awarded to B. Ward Thompson for a fine representa- tion of mountains and clouds, "Here comes a roller up the glen." There is a rich tone and quality about the print, but the beauty of the sky seems to have been obtained at the expense of the mountain side, which is much overprinted. Mr. Thompson has three other good prints, notably "Since Clouds Dispersed" (No. 123), which in many respects is superior to his medalled print. Hon. mention is also made of a fine bromoil of W. C. S. Fergusson, "The Estuary" (No. 55), and two good pictures by Mr. McKissack, "The Beguinage- Gateway" (No. 103) and "The Fishers' Harbour, Ostend" (No. 113).

A very striking picture is "The Proclamation," by John Moffat (No. 63), a fine and in many ways a great representation of an historic event. Pictorial representations of such scenes are so often dull and dreary in their ugliness, and of no interest to any but those who can recognise themselves or their friends in the crowd, that it is refreshing to find someone who has subordinated such ideas and dwelt rather on the massing of his lights and shadows and the giving of dignity to a great historic event. There is no niggling or undue care over details, but a real sense of breadth and design. This is one of a number of oil prints in the exhibition, and emphasises the fact that in the hands of a good worker it is a process capable of great things. Good work is also shown by Blair Matheson, W. J. Croall, J. A. Angus, and R. Marshall. The judges were Mr. J. Campbell Noble, R.S.A., Mr. Robert Barns, A.R.S.A., and Mr. Archibald Cochrane.

The colour section is poor, and no awards were made, while in the lantern section medals were given to W. A. Taylor and W. A. I. Hensler, and hon. mention was made of slides by R. Marshall and P. Carlyle.

BIRMINGHAM PHOTOGRAPHIC SOCIETY.

On Monday evening, February 22, the 24th annual exhibition of the Birmingham Photographic Society was opened by Dr. J. Hall Edwards, in the fine suite of galleries in New Street, again lent by the Royal Society of Artists. The President, Mr. Harold Ho-1croft, M.A., welcomed Dr. Hall Edwards's return to active work in the interests of the society, after the terrible suffering he had endured from the constant use of X-rays for surgical purposes.

A general review of the exhibition produces the impression that it is scarcely equal to some of its predecessors, especially as the sizes of the photographs hung seem rather smaller than usual. A more careful examination proves, however, that the general average is very high, but no one worker stands out very boldly from the others. The popularity of the newer processes of oil-printing is shown by the large number of photographs in this medium. To some extent this has produced a falling off in several exhibitors' work, as some of them have deserted methods they have mastered and are familiar with, in favour of the new process, which is as yet unfamiliar to most. No doubt before the next exhibition comes round the flexibility of the new process will enable them to leave their former successes far behind. The oil prints prove that the process has a great future before it, but many examples show the faults of its qualities; its chief characteristic seems to be rich, luscious shadows, and the ease with which these are obtained has led to piling on the ink to such an extent as some- times to destroy the aerial perspective. The collection of large landscapes by the late Horsley Hinton gives distinction to the grouping, and as they are all very large they form good centres of interest. The impression left on the mind after seeing them once more after an interval of some years, is that although they were epoch-making in their day, and exercised a remarkable influence on photographers, they are already being left behind. This shows that photography is not a dead thing but a living and moving force.

The judges, Messrs. F. J. Mortimer, F.R.P.S., and W. J. Wain-1wright, A.R.W.S., evidently had a difficult task, if we judge by the rather lavish awards.

In the Members' Class A, Mrs. Barton receives a medal for No. 4,

a portrait of W. Nevelle, Esq. In this case we do not agree with the judges' decision, as No. 1, "John Tunstall, M.D.," seems to us much more satisfactory in every way, and in spite of its slovenly mounting, free from technical defects which seriously injure No. 4. W. A. Clark is awarded a medal for No. 11, "In Old Caudebec," a very pleasant rendering of sunshine and old buildings, but a slight darkening of the pavement in the immediate foreground would have increased the sunny effect. No. 13, "The Sea of Steps," the well-known steps to the chapter-house at Wells, is a decidedly good rendering of a difficult subject, but the light through the arch at the top of the steps might be brightened with great advantage. No. 16, "Good Morning," is a very dainty little "bit" of sunshine and creepers on a cottage wall.

J. Cruwys Richards is one of the converts to oil printing, and shows two remarkably vigorous heads (Nos. 20 and 22) of an old man, but he has not yet acquired the mastery over the new method that he has long had over his old love, multiple gum, as we see in No. 19, "Erin Disconsolate," one of his strongest works. Harold Baker, who after a long interval again exhibits, has evidently caught the oil fever very badly, as he sends no fewer than thirty-two, mostly bromoils, all architecture and landscape subjects. He has been, perhaps, most successful in rendering the effect of sunshine on old plaster in "Cowl Street, Evesham," No. 36, and in grey misty effects in "Morning, Whitby," No. 40, and "Grey Avonspeace," No. 42.

Dr. Hall Edwards shows an excellent portrait, Dr. Hill-Norris, the inventor of the first dry plate (No. 56). P. Bale Rider receives a medal for "Portrait Study" (No. 59), but we much prefer his "In Rouen" (No. 58). In spite of some technical defects peculiar to oil printing it is very strong and vigorous.

W. T. Greatbatch does not do himself justice this year; he shows three portraits of the same lady gathering flowers, with the face against the sky, an effect almost impossible to render successfully by photography. P. F. Storrs has a good group of Dutch pictures, one of which, "Eels" (No. 71), secures an award. Mrs. Arbutnot has deserted her former vein of delicate, dainty studies, and her work suffers in consequence and has become quite ordinary in character. "Portrait of the Archbishop of Canterbury" (No. 76) fails to do justice to the distinguished sitter. Lewis Lloyd, the indefatigable honorary secretary, receives a well-earned award for "In a Liverpool Dock" (No. 77), in which the rigging of the boats gives distance to the buildings beyond. "Geoffrey" (No. 79) is a charming boy's head by H. Kenway.

"St. Martin's in the Fields" (No. 82), by R. S. Clarkson, which receives an Hon. Mention, is a good example of the many pictures to be secured in London. R. W. Rennie is another convert to oil, and shows several portraits in this medium which, however, betray haste in their production; the best, "Little Miss Muffett" (No. 94), receives a medal. Thomas Clarke obtains a well deserved medal for "Homeward Bound" (No. 97), a string of donkeys crossing the sands at Tangier. It is full of a delicate sense of light. W. Howard Coley does not show quite as good work this year as before; some of his large oil prints are of quite an unpleasant colour and overpower their good qualities. C. R. M. Parr, one of the pioneers of oil printing, shows a fine strong print of woods in driving rain, "Now is the Winter of our Discontent" (No. 114); A. E. Baylis in his four oil prints shows fine mezzotint quality; "Bruges" (No. 124) takes an Hon. Mention.

The Novices' Section shows quite a lot of really good work.

In the Open section there is a goodly number of fine things, the judges having given seven medals and sixteen certificates. James Cawwood receives a medal for "Reverie" (No. 188), a dark print of yellow tone of Whitby. R. J. Delf in "Sunshine in Old Whitby" (No. 241), has a very charming rendering of sunshine on broken pavement, which gains a medal. One of the finest and strongest pictures in the whole exhibition, "G. A. Storey, Esq.," R.A., by Bertram Park (No. 257), received a medal. It is one of the finest oil prints we have ever seen and is run very close by "Naomi" (No. 263), by the same worker; the flesh tones are exquisitely managed. J. M. Whitehead sends several of his well-known moorland studies, which, beautiful as they are, are becoming a little monotonous. Mrs. Barton receives a certificate for her "Morning" (No. 295), one of the most completely satisfactory and charming things she has produced.

The Foreign section is decidedly small this year, no doubt to so much of the best work being reserved for Dresden. "Linen Chest" (No. 22), by Dr. L. L. Klientjes, is a beautiful work with a figure at a cupboard, quite a "Dutch" subject.

The Autochrome section show little if any advance on last year. The local societies continue to show decided progress, the award going to Walsall.

The lantern slides are pronounced the strongest and best ever had by the Birmingham Society.

The exhibition remains open till March 6, and local photographers cannot fail to learn much from the many fine photographs.

The list of awards is as follows:—

MEMBERS' SECTION: MEDALS.—Mrs. G. A. Barton, "W. Nevelle, Esq.," W. A. Clark, "In Old Caudebec"; P. F. Storrs, "Eels"; H. W. Rennie, "Little Miss Muffett"; Thomas Clarke, "Homeward Bound"; W. J. Harrison, "In Rye Harbour".

MEMBERS' SECTION: CERTIFICATES.—P. B. Rider, "Beatrice"; Mary C. Eames, "Who said Pensions?"; R. S. Clarkson, "St. Martin's in the Fields"; Thomas Clarke, "Scarborough Pier"; Lewis Lloyd, "In a Liverpool Dock"; C. R. M. Parr, "Now is the Winter of our Discontent"; A. E. Baylis, F.R.I., "Bruges"; B. F. Crewdson, "Noel Siabod"; B. F. Crewdson, "Seascale."

MEMBERS' SECTION C (BEGINNERS): MEDALS.—H. Ryland, "Primitive Bridge"; H. E. Wilmot, "The Wave."

CERTIFICATES.—F. S. Worsley, "The Windmill"; T. H. Duff, "Old Dutch."

OPEN SECTION: MEDALS.—James Gale, "Low Tide on the East Coast"; R. J. Delf, "Sunshine in Old Whitby"; Bertram Park, "G. A. Storey, R.A."; A. W. Ward, "Mad, Screeching Revolution"; J. M. Whitehead, "A Silent Guide"; Mrs. Ambrose Rennie, "In the Market"; James Cawwood, "Reverie."

OPEN SECTION: CERTIFICATES.—A. T. Bartlett, "Threading the Needle"; W. Pringle, "Street Scene, Chioggia"; C. F. Grindley, "The Woodcutter"; J. C. Warburg, "Notre Dame de Valenciennes"; Miss Margaret Venables, "Dreams of the Days that Were"; C. Hewitt, "On the Arun"; W. Chater Lea, "A Normandy Interior"; Kenneth F. Bishop, "It Won't go Wight"; W. Chater Lea, "What Shall we put Next?"; J. C. Warburg, "Cutting Out"; J. Hamilton, "Daisy"; Mrs. Barton, "Morning"; Mr. and Mrs. Bracewell, "The Serenade"; Dr. Evershed, "The White Hull"; Norman Blake, "A Stranger in the Village"; J. C. Warburg, "White Domes."

OPEN SECTION: FOREIGN.—"The New Born," Martin Kaufmann (medal); "The Linen Chest," Dr. L. L. Klientjes (medal); "Japanese Study," G. Mautner (medal); "Sparkling Ice," A. E. Mann; "Prague," G. Mautner; "Village in Winter," Harany Gyorgy; "Portrait Study," E. Muller.

COLOUR SECTION: MEDALS.—"An Indian Spinner" (Autochrome), J. C. Warburg; "Autumn" (Autochrome), A. Renfrew; "Butterfly" (colour print), J. D. Johnstone. Certificates.—"Orange Stall" (Autochrome), J. C. Warburg; "An Autumn Afternoon" (Autochrome), W. H. Coley; "River Scene" (Autochrome), P. W. Gibb; "Oranges and Bananas" (colour print), E. Burder.

LOCAL SOCIETY COMPETITION.—Medal for best set of eight prints, Walsall; medal for best print in sets, Birmingham Technical School, Walsall.

CERTIFICATES.—Handsworth, A. E. Cope; Bournville, W. Davison; Small Heath, B. Brotherton; Erdington, T. A. Sanderson; Brierley Hill, A. Gibbons; King's Heath and Moseley, W. H. Hamman; Walsall, Mrs. W. Bullock; Worcester, F. H. Horniblow; Aston, A. E. Law; Bournville and District, W. Frith; Technical School, T. Fairfield.

LANTERN SLIDES: MEDALS.—T. Carlyle, "Speed"; L. Lloyd, "The Iron Horse"; J. E. Hall, "The Crypt, Aquilon"; W. Clark, "The Shadow"; A. G. Thistleton, "The Daisy Chain." Certificates.—W. A. Clark (2), C. McKenna, W. A. Hensler, A. Thistleton, R. Hancock, E. Welburn, E. Bull, R. W. Berry, Claypole, J. D. Berwick.

SCIENTIFIC SECTION: MEDALS.—"Life History of Heron," G. Booth; "Life History of Owl," A. Taylor. Certificates.—Radiographs, J. Hall-Edwards; Fungi (6 slides), R. Hancock.

SURVEY SECTION.—1st, Thos. Clarke; 2nd, G. W. Wood, Junior.

Patent News.

process patents—applications and specifications—are treated in Photo Mechanical Notes.

The following applications for patents have been received between January 8 and 13:—

CINEMATOGRAPHS.—No. 3,048. Improvements in and relating to combined spools and casings for cinematograph films. Frank Ernest Butcher and Francis William Baker, 322, High Holborn, London.

WINDOW CARDS.—No. 3,244. Photographic show cards, window tickets, price tickets, menus, invitation cards, and the like. Henry Thomas George and Charles Natkiel, 18, Edwards Road, Walthamstow, London.

SHUTTERS.—No. 3,349. Improvements in photographic shutters. Arthur Dawkins and George Evans, Prudential Buildings, Corporation Street, Birmingham.

CINEMATOGRAPHS.—No. 3,443. Improvements in apparatus for photographing and exhibiting cinematograph and mutoscopic pictures. Henry William Hamblin Palmer, 52, Stephen's Road, Tunbridge Wells.

LENSES.—No. 3,444. Improvements in the process of producing lenses of uniform subsidence. Carl Zeiss, 29, Margaret Street, Regent Street, London.

COLOUR-SCREEN.—No. 3,601. Manufacture of a screen for colour cinematography. Carl Späth, Birkbeck Bank Chambers, Southampton Buildings, London.

DEVELOPING.—No. 3,632. Improved method of placing photographic plates in developing, fixing, or washing tanks in the dark-room. Sidney Herbert Nathan, 50, Harrington Gardens, London.

COMPLETE SPECIFICATIONS ACCEPTED.
The specifications are obtainable, price 8d. each, post free, from the Patent Office, 25, Southampton Buildings, Chancery Lane, London, W.C.

date in brackets is that of application in this country; or in brackets in the case of patents granted under the International Convention

THREE-COLOUR CARBON PRINTS.—No. 23,615, 1907 (October 25, 1907). The invention relates to improvements in the methods of colour photography, consisting in superimposing transparent photographs or photographic elements so that the assemblage gives more or less natural colour effects, the superimposed photographs or photographic elements being mounted together so as to form a transparency, or being mounted for viewing by reflected light. The invention is directed to obtaining in a completed heliochrome a truer colour effect than is (in most cases) practicable by merely superimposing the usual developed reliefs or so-called "colour carbon" transparencies as obtained by the ordinary and well-known methods. With this end in view, the principal improvements consist, firstly, in a system of temporary reconstitution of the colour effect with over-staining if required so as to produce a heliochrome while the element is on a temporary support; and secondly, of viewing the heliochrome under conditions which obviate the disturbing influence of the thickness of the supports and their separation, separation being necessary if the colour elements are wet.

The following description applies to a three-colour photograph, but it will be understood that the invention is equally applicable to two-colour and four-colour work.

We make individual components of the composite heliochrome, the various photographic elements or the various individual photographs as relief in coloured gelatine, by what is commonly known as the "carbon" process. In order, however, to obtain a truer effect than would be obtained by merely superimposing the usual developed reliefs, we adjust or regulate the tints of the elements in the following manner:—

To increase the intensity of any one transparency, we soak it in a solution of a dye of similar colour or tint and rinse away the excess of soluble dye. To locally increase the intensity of any one transparency, we apply locally a solution of a dye having a similar colour or tint, either by means of a brush or mop or by means of a spray

apparatus, air-brush apparatus, or aerograph. After such local treatment the excess of soluble dye must be rinsed away.

In other cases we alter or modify the tints of the "carbon" reliefs by treatment with dyes of a different colour. Thus the yellow relief may be tinged with a red or orange or blue dye, the blue relief or element may be treated with a solution of yellow dye to render it greener, and again the red relief may be rendered more purple by treatment with a blue or violet dye.

It will be understood that there are many soluble colour dyes which would be suitable for such general, or local, treatment, and also that the strength of the dye solutions is widely variable under different conditions, but the following may be taken as typical examples:—

As the blue dye.

Induline blue,
Lyons blue, or
Hoffmann's violet (blue shade).

As the yellow dye.

Naphthol yellow, or
Berberine.

As the orange dye.

Chrysoidine, or
Aurine.

As the red dye.

Alizarine (with alumed reliefs),
Cochineal red (or carmine with ammonia), or
Magdala red.

Approximately, the strength of the dye solutions would be 25 parts of the dye per 1,000 parts by weight. Ordinarily the solvent would be water, but a variable amount of alcohol may be added, which need, however, seldom, if ever, exceed one-half.

Treatment with dyes is not an operation of the nature of ordinary retouching, but part of the system of temporary reconstitution of the colour effect, so as to produce a heliochrome while each element is on its temporary support, and of viewing the temporarily constituted heliochrome under conditions which eliminate the disturbing influence of the thickness of the supports and their separation. In order to attain this end in viewing the temporarily constituted heliochrome we proceed as follows:—The constituent elements having been developed, as usual, and each being on a plate of glass previously waxed (or French-chalked), and, if considered desirable, also collodionised, the reliefs are arranged one over the other, i.e., are superimposed, in a composite frame consisting of a sufficient number of carriers (for a three-colour photograph three carriers would be provided) arranged over each other and provided with adjustments controlled by convenient handles for bringing the several photographs exactly in register, since, as the adjustment has ordinarily to be made while the reliefs are damp or wet, the plates in that case must not be in absolute contact.

If a thin, flexible celluloid film is used as support of the colour element, it must be strained in its frame. In case celluloid is used the collodion coating must be omitted.

The separation when the reliefs are damp or wet, the fact that the substance of the glass intervenes, and the distance between the eyes of an observer, all tend to render the assembled images confused or out of register. In order to obviate this inconvenience and to enable the effect of the colour combination to be properly judged, we prefer to view the temporary combination by a telescope adjusted at a convenient distance. Inspection having taken place, any required adjustment of the colours is made as specified above, and further inspection followed by colour adjustment may be repeated as often as may be considered necessary.

In the telescopic axis we may interpose such reflectors as are desirable for shortening the range, and in practice we prefer to bring the eyepiece (which is preferably of the type known as a diagonal eyepiece) of the telescope near to the registering frame, so that the observer shall have the adjusting handles of the frame immediately before him. The colour elements, when finally adjusted for tint and colour depth, may then be successively transferred to a prepared paper by any proceeding well known to colour printers by the "carbon" process, but we prefer to use a thin translucent paper or a film of celluloid or the like, prepared or surfaced with gelatine after the manner of "double transfer paper," as the permanent support of the assembled "carbon" colour elements, as by this course the obtaining of register is facilitated.

The thin translucent paper or celluloid bearing all the carbon colour elements may be stripped from the final glass plate or other temporary support when all is dry, so as to yield a transparent heliochrome, or while the assemblage is on the glass or other support it may be backed up with one thickness of paper or more to form a thin or thick support in the manner well known to carbon printers.

To facilitate the exact registering of the constituent parts of the composite heliochrome we adjust two objective crosses or more, or an equivalent such as black crossing lines on a white disc, in the scene so that the images of the cross lines come conveniently to the margins or corners of the negative plates. The register marks are photographically produced, and therefore all mechanical inaccuracies in making them are entirely obviated.—Edgar Clifton, 3, Beaufort Villas, London Road, Enfield, and Arthur Ernest Wells, 73, New Cavendish Street, London, W.

STEREOSCOPIC CAMERAS.—No. 2,142. 1908 (January 30, 1908).—The invention consists of an optical device applicable to the lenses of stereoscopic cameras for the purpose of avoiding the necessity to reverse the negatives.

It relates to the application of two tetrahedra respectively to the two lenses of a stereoscopic camera in such manner that their faces, inclined at 45 deg. to the perpendicular faces, have the effect of reflecting the images towards the lens, whilst simultaneously inverting them in the vertical and the lateral direction, so that the double

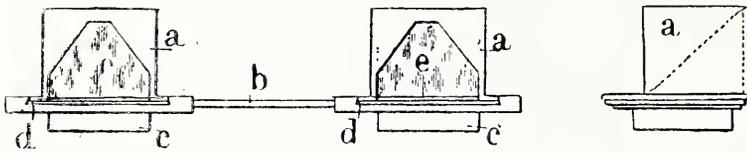

Fig. 1.

Fig. 2.

inversion effected by the lenses restores the two images to their exact position.

By the application of these two tetrahedra (since the images become reversed in the two senses) the negative obtained on the plate is rectified both in the lateral and in the vertical direction, and consequently the two images of this negative occupy their exact respective positions—that is to say, the images produced on the negative do not present any inversion. Consequently the necessity for subsequent transposition of the images is avoided.

The device comprises two tetrahedra adapted to be mounted respectively opposite the two lenses of the photographic apparatus. Each tetrahedron is contained within an envelope or case *a* open on the two sides corresponding to the entrance and exit of the light rays. These two envelopes or casings *a* are adjustably mounted upon a plate *b* presenting two tubulures *c* capable of adapting themselves to the two tubular casings containing the objectives of the apparatus. These two casings *a* may, for example, slide in recesses *d* in the plate *b*, as is shown in Fig. 1. This movability of the two casings *a* permits of the regulation of the position of the luminous pencils emerging from the two tetrahedra with respect to

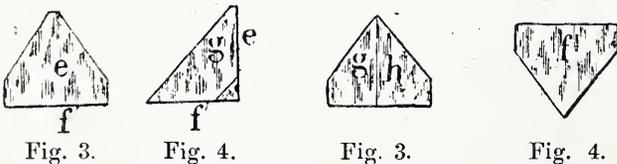

Fig. 3.

Fig. 4.

Fig. 3.

Fig. 4.

the optical axes of the objectives. Each tetrahedron presents two mutually perpendicular faces, *e*, *f*, and two other faces, *g*, *h*, each inclined at an angle of 45 deg. to the two preceding faces, as is shown in Figs. 3 to 6. The two tetrahedra are mounted in their envelopes *a* in such manner that the faces *f*, for example, are parallel to the objectives of the apparatus. The faces *e* then constitute the entrance faces of the light rays. The special disposition of the inclined faces, *g*, *h*, has for effect to reflect the images while simultaneously reversing them, both in the vertical and in the lateral direction.

The instrument is mounted upon the stereoscopic camera, as shown in Fig. 7. In this case the apparatus must be held in making an exposure in a position perpendicular to the directions of the object to be photographed. The light rays coming from this object enter the faces *e* of the two tetrahedra, and thereupon reflected from the inclined faces *g*, *h*, emerge through the faces *f*,

and finally pass through the objectives of the camera. As above mentioned, the images reflected from the inclined faces *g*, *h*, are initially reversed in the vertical and also the lateral direction then they are again reversed in both directions by the lenses. The negative thus obtained, viewed in the stereoscope, will thus give

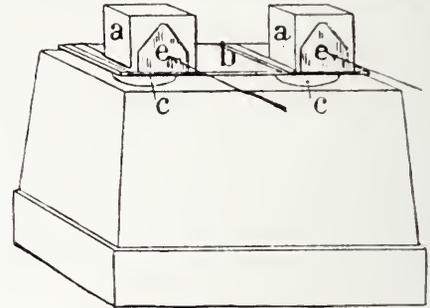

Fig. 7.

the stereoscopic effect on the condition that the glass face of the slide is turned towards that side on which are situated the eye pieces of the stereoscope. This negative thus presenting no inversion, permits of a positive being directly obtained, as in Autochrome photography.

In the case of ordinary photography positives are direct obtained in a single operation from this negative without the necessity of inverting the two images. It is true that these mirrors will have the effect of producing an inversion of the images; such inversion, however, is only in the lateral sense, i.e., the right and left hand portions will become interchanged. In order to rectify this inversion, therefore, it is only necessary, in printing the positive to place the sensitised surface against the back of the negative instead of against the front, and there is no objection to this method in the case of thin negatives, such as films. The adoption of these mirrors or prisms is, however, purely optional.—Jules Richard, 25, Rue Melingue, Paris.

DAYLIGHT DEVELOPING APPARATUS.—No. 23,148, 1908 (October 19, 1908). The invention consists of a box or chamber for the development of plates, etc., the essential feature being that the vessel receiving the developing or fixing fluid (which vessel is provided opposite sides with red windows) is composed of two parts capable of being drawn out and connected in a light-tight manner. Between these parts the aperture for the insertion and withdrawal of plates is arranged. Alfred Hamburger, 117 Burggasse, Vienna and Heinrich Imhof, 206 Hernalser Hauptstrasse, Vienna.

CARRIER-PIGEON CAMERA.—No. 13,128, 1908 (June 20, 1907). The invention relates to a method of and means for taking photographs of landscapes, and it consists essentially in attaching to a bird (say a carrier pigeon) a photographic camera provided with means for actuating the shutter and causing the bird to direct its flight over the landscape to be photographed. The carrier pigeon is taken to a place from which in its homeward flight it passes over the landscape of which the photograph is to be taken. As the speed of the pigeon is known, the time within which the landscape will be above the desired place can be determined with sufficient accuracy. According to the time thus determined, a shutter mechanism is so adjusted as to effect the exposure at the proper time. As an example of such mechanism, an air bag may be provided which, by slowly discharging the air, releases a lever controlling the shutter mechanism.

Drawings and description are given of the mechanism for the release of the shutter after a stated interval of time. Julius Neubronner, Cronberg, Taunus, Germany.

CINEMATOGRAPH MECHANISM.—No. 23,274, 1908 (October 31, 1908). The invention relates to the Maltese-cross feed mechanism, whereby the cross and feed drum can be rotated independently of the driving action by rotation of their bearing frame. Alfred Dussek and Duskes Kinematographen und Film-Fabriken, 46 Friedrichstrasse, Berlin.

CINEMATOGRAPH MECHANISM.—No. 23,811, 1908 (November 6, 1908). The invention provides means whereby the film is allowed to pass freely past the aperture without positive engagement with guides. This is effected by utilising the normal elasticity of the film, the latter being so bent during a portion of its passage that the elastic reaction causes it to bear smoothly against a guide surface having

erture for the passage of the light. The requisite bending he film is produced by means of the guiding device (rollers, e-plate, or the like), past which the film travels to the aper- d guide way. Alfred Duskes and Duskes Kinematographen Film-Fabriken, 46 Friedrichstrasse, Berlin.

ATOGRAPH-PHONOGRAPH.—No. 23,276, 1908 (October 31, 1908)). ording to the invention, the method of securing synchronism he actions of a cinematographic machine and sound-recording aine working in conjunction but mechanically unconnected each other, is by causing a visual sign moving synchronously one of the machines to be projected in the form of a shadow mage to a sign moving synchronously with the other machine, by so controlling the action of one of the machines that the tions of the signs preserve a predetermined relation to each r. Alfred Duskes and Duskes Kinematographen und Film- riken, 46 Friedrichstrasse, Berlin.

New Trade Names.

E. ALBERT AND Co. COLLODION EMULSION (DEVICE).— 308,899. Chemical substances used in photography, photo- phic plates, and sensitised films. Eugen Albert, trading as E. Albert and Co., Schwabingerlandstrasse 55, Munich, Ger- ay, Doctor of Natural Science. December 16, 1908.

WORLD IN MOTION (DEVICE).—No. 308,983. Cinematograph s bearing taken photographs. Weisker Bros., 4, 6, 8, and 10, de Street, Liverpool, cinematograph specialists. December 19, 1908.

New Apparatus, &c.

Sinclair "Efficient" Dark-room Lamp. Sold by James A. Sinclair and Co., Ltd., 54, Haymarket, London, S.W.

el and ingenious as are the almost innumerable patterns of oom lamp few constructors of this essential item in the rapher's equipment have realised the fact that novelty or ity *per se* is a less desirable quantity than efficiency in one o points which are very largely disregarded. For the lamp i has just been placed on the market by Mr. Sinclair's firm y be justly claimed that its virtues are precisely those of

cal usefulness even though it exhibits no essential departure a type of lamp which has been made in various forms. The of its good features, however, is that the lamp is of ample the illuminating area of the front being 11in. by 9½in., and of each of the side windows 7in by 6in. Thus, in addition e working bench getting a full illumination, the shelves and spaces in the dark-room, which frequently are inconveniently are in this case well lighted. The size, again, allows of an ervoir of ample capacity being used without the chance of eating or the necessity of frequently refilling. The burner, ver, is one of the well-known duplex pattern supplied with

large table lamps, and is adjustable from the outside and provided with a lever extinguisher. The next feature for which the lamp should be commended is the excellent way in which all leakage of white light is provided against. The grooves for the light-filters are provided with a double cover, and, further, are made broad enough to take even the thickest filters or safe-lights, which again are much further than usual from the lamp itself and so are better insured against danger by heat. The cut-off of white light is equally thoroughly done in the case of the chimney.

Although such a recital as the above of these characteristics of the lamp cannot show it to be a revolution in this class of apparatus, the step in advance which the makers have actually taken is in giving first-rate attention to the apparently minor points which make a dark-room lamp really satisfactory in use.

Complete with two fabric-filters, one yellow and one red, for each window (six filters in all), burner and glass chimney, the lamp is sold at 21s. If supplied for the electric light a duplex switch is provided, by means of which the light may be obtained either outside or inside the lantern, as desired. In the oil lantern white light is immediately accessible by opening one of the side doors, which is hinged to the lamp body for this purpose.

The Thornton-Pickard Three-Bar "Imperial" Set. Made by the Thornton-Pickard Manufacturing Co., Ltd., Altrincham.

The half-plate "Imperial" set issued by the Thornton-Pickard Co. during the past year or two at an inclusive price of 70s. has been the recipient of much favourable appreciation, our own among the number, and anyone who has handled or used the camera will confirm us in describing it as an instrument *de luxe* at a popular price. In the instrument to be issued during the present season the Thornton-Pickard Co. have made a small modification which is not, however, without its importance. It consists in the addition to the front of three brass bars which, apart from strengthening the bearings of the lens panel, give an extra handsome appearance to the instrument, and on this latter account alone should enhance

it in the dealers' eyes since appearance, as everyone knows, goes a considerable way towards effecting a sale. However, there is more in the three-bar feature than is suggested in either of the above two reasons for its adoption. The Thornton-Pickard Co. have registered the three-bar design of front and have thus associated it with the reputation of their many other descriptions of camera and other photographic apparatus, and the present model of the "Imperial" set in no way belies the good opinions which its predecessors have obtained for it, whilst the three brass bars, far from having the sinister association which this material when taking a spherical form may have for many people, provide an outward and visible sign of the excellence of the manufacture.

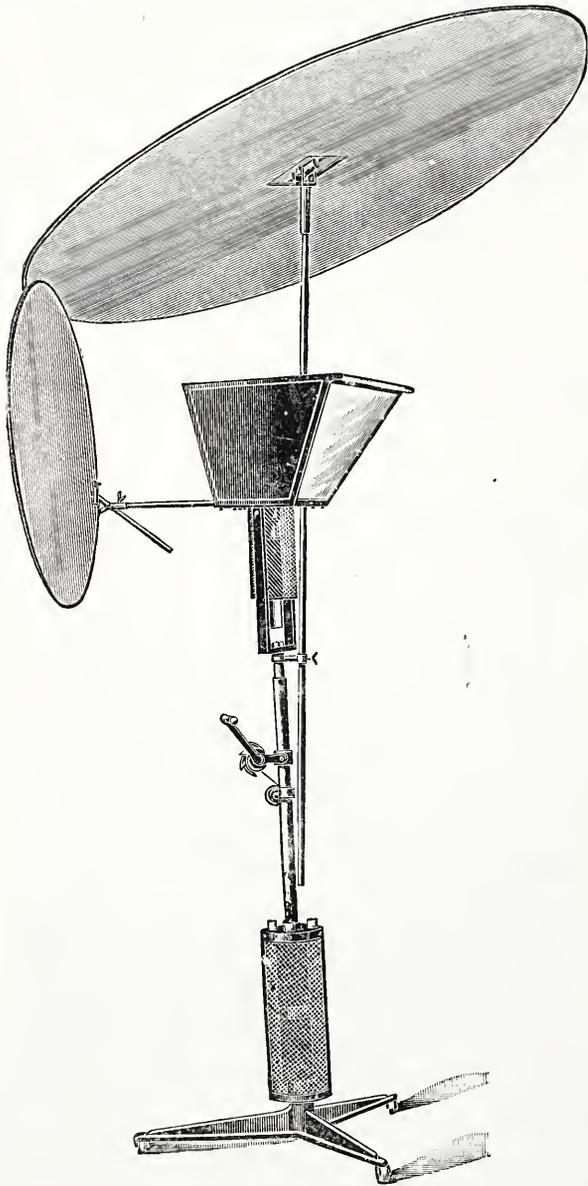

In short, the Thornton-Pickard Co. would advise intending pur-

chasers to ask their dealer for the 70s. camera set with the three brass bars, a set many features of which we have dwelt upon in previous notices, and which we find most fully described on pages 41 to 45 of the catalogue obtainable on application to the company.

The prices of the outfit thus modified remain the same, namely, 70s. with Thornton-Pickard "Rectoplanat," 75s. with Beck "Symmetrical," and 80s. with Thornton-Pickard "Pantoplanat," in each case with one dark-slide, three-fold tripod, and Thornton-Pickard time and instantaneous shutter with speed indicator.

The "Regina" Studio Arc Lamp. Sold by Marples, Leach, and Co., Ltd., Adnil Buildings, Artillery Lane, Bishopsgate Street Without, London, E.C.

In this new artificial light for the studio which is just being introduced to photographers, photo-printers, and photo-engravers, the principle adopted is a further development of the enclosed arc. The arc is not merely placed in a glass cylinder resting on a circular plate and covered more or less completely above, but is contained in a glass chamber of dome or bell shape which is fastened by an air-

tight lute to a circular metal platform, which latter, bell, carbons and all, forms part of the rod and connected levers serving for the adjustment of the arc. This form of construction gives a very compact lamp, but the distinct and distinguishing feature of the "Regina" lamp is the perfect enclosure of the arc and the highly actinic light thus produced even without a great span between the carbons. The glass cover of the arc forms a chamber which the air can enter or escape from only by the valve for the purpose.

The lamp is constructed to work with four ampères of current giving a light of great visual power, which is used whilst posing and focussing the sitter, but for the actual exposure use is made of a "foot contact," by which the arc is caused to take its full

current of ten ampères and to give the full power of light. Pressing with the foot upon the "foot contact" instantly makes this chamber in the light, although the gain is chiefly in the actinic rays and the light therefore does not "jump up" to such an extent as to disturb the sitter. The "foot contact" may be attached to any convenient length of flexible connection and thus brought close to the camera. The general appearance of the lamp is shown in the drawing, in which are seen the two reflecting screens recommended by the makers as specially suited for the lamp, but not indispensable, the lamp being adaptable to any system of screens, used with an arc of high intensity. The comparatively small size of the lamp and the absence of loose parts fit it excellently for taking about for such work as portraiture at large gatherings or at a sitter's home.

The lamp is supplied for voltages from 110 to 220, and for direct or alternating current. As regards the cost of using it as a studio light the following figures from an illustrated prospectus issued by Messrs. Marples, Leach may be quoted.

The working costs of the "Regina" studio lamp are as follows on the basis that for every operation, grouping, etc., 10 minutes are reckoned, which for portraits is quite sufficient:

Current consumption per hour, 220 volts, 4 amps. = .880 K.W. at 2d. = 1.76d. per hour.

Increased current consumption during exposure, 220 volts, 16 amps. = 3.520 at 2d. = 7.04d. per hour.

Cost of carbons for 50 hours, 1 No. 40 carbon at 2d. per hour .04d.

1 No. 83 Arc enclosure globe for 100 hours at 1s. 3d. per hour .15d.

Cost for One Exposure.

Current consumption in 10 min.29
" " " during exposure for 10 sec. ¹01
Cost of carbon for 10 min.007
Globe replacement for 10 min.02

Expenses for exposure .327
(less than one-third of a per cent.)

This circular should be consulted for some general hints in the use of the lamp, some examples of portraiture done with it, and the full list of prices, from which latter, we understand, discounts are offered to bona-fide professional photographers. The lamp is evidently one which embodies most careful design and excellent workmanship, and we hope very shortly to report more particularly as to the photographic intensity of the light. Meanwhile, Messrs. Marples, Leach have the lamp on exhibition in their showroom in Artillery Lane, close to Liverpool Street Station.

New Materials, &c.

MOUNTING PAPERS.—Messrs. F. E. Jones and Co., 22, Gray's Inn Road, London, W.C., have prepared a sample book of art papers suitable for mounts, folders, etc., and obtainable in thick or thin quality at a uniform moderate price of 4s. and 8s. per ream respectively. The sample pieces are of fair size—up to 8½ inches—and thus allow of their effect with prints of various sizes and colours being readily judged. Colour and texture in some instances are excellent, and the selection is a most useful one for the professional who wants tasteful mounting for prints of every kind. The "Studio" papers, which are rather cheaper, require the same comment. They also are for mounts and folders. "Folio" covers are of a "matter" description, "Linen" boards a pleasant class of paper, and "Vellum" boards still another desirable mounting material. Messrs. Jones further increase the usefulness of their portfolio by including specimens of tissues and endpapers. The whole volume is a most valuable guide to the photographer, to whom it should be worth many times the price charged for it. Yet Messrs. Jones offer to refund the money if the portfolio is returned, or to credit the sum on an order of 5s. worth of mounting materials being placed. "And that," as the Gilbert and Sullivan ballad runs, "is like to happen soon."

¹ The exposure does not occupy ten seconds, but this period is reckoned as the time the higher current is in use.

CATALOGUES AND TRADE NOTICES.

MILD PHOTOGRAPHY.—The current issue of the "Prism," the Sch and Lomb magazine sent by Messrs. Staley for one penny ap, is devoted to the portraiture, mostly outdoors, of Iren.

BARGAINS AT FALLOWFIELDS.—A long list of apparatus and materials now being offered by Messrs. Fallowfield at very great reductions on the list prices reaches us from 146, Charing Cross Rd, W. The list includes a variety of dry-plates and printing frames, storage boxes and cases, printing frames, dark-room lamps, trays, washing and fixing apparatus, chemicals, cameras and accessories, photo-button and ferrotype accessories, enlargers, camera cases, tripods, lenses, shutters, albums, and mounts, of which latter an additional closely printed list describes a very extensive series of lines obtainable at a great reduction.

ROYAL PHOTOGRAPHIC SOCIETY.

Meeting held Tuesday, February 23, the Rev. F. C. Lambert, M.A., in the chair.

Paper on "Some Points in Photographic Shutters and a Simple Tester Popularly Explained" was read by Mr. E. A. Salt. The lecturer prefaced his remarks by giving a brief and discursive

review of the different types of commercial shutters obtainable—namely, the roller-blind, diaphragm, iris, and focal-plane. He discussed the action of these shutters in reference to the range of speeds obtainable, ability to give constant speeds under differing climatic conditions, and, lastly, the efficiency or effective duration of exposure as compared with the total duration. In this connection he showed, by means of diagrams, the high efficiency of the roller-blind shutter, and, among diaphragm shutters, of the Staley "Compound," the efficiency of which was almost 100 per cent. In the matter of focal-plane shutters, the efficiency of which was usually assumed to be ideal, he suggested that under certain conditions, for example, with a large aperture lens and the blind at a distance from the plate which was adopted in practice in the case of at least one shutter, the efficiency might be appreciably diminished over portions of the plate on either side of the centre. He alluded to some of the remarkable statements made by writers on shutters. One, extolling a certain shutter, estimated its efficiency at fifteen times that of a good diaphragm shutter, equivalent, at a moderate computation, to five times perfection.

The chief portion of the paper, however, dealt with the shutter-testing apparatus which the lecturer had devised and himself constructed. It embodied the principle for the measurements of shutter speeds described by Sir William Abney, in which the image of an illuminated slit is caused to fall on a plate rotating at a known speed. In the apparatus devised by Mr. Salt this method was carried out in a greatly simplified way. The plate was secured on a horizontal table, mounted upon a gramophone motor, the image being received through a horizontally mounted lens by means of a mirror placed at an angle of 45 degrees to the lens axis. Illumination of a vertical strip of ground-glass was supplied by means of an incandescent burner, a carrier for the shutter being placed immediately next the slit of light on the side towards the camera. It was found that the motor would rotate with regularity at two revolutions per second, which allowed of exposures up to 1-100th of a second being measured with accuracy, the total angular size of the image being read off on a protractor. The diagrams obtained with the apparatus showed at the same time the period of effective action of the shutter, and a number of very interesting results obtained with shutters of various types working over a range of speeds was shown.

Mr. Salt also described and exhibited a very simple piece of apparatus for the measurement of shutter speeds devised by Mr. W. H. Smith, of the Platinotype Company. It consisted simply of a board above a small aperture, in which was placed vertically a glass tube, through which a current of air could be blown. Held in the aperture of the board by a light spring was a very thin plate of mica, to the under side of which a tiny brush, saturated with aniline colour, was fixed. Below the brush, but just out of contact with it, a drum was caused to revolve at a constant known speed. The measurement of the shutter speed was made simply by laying the shutter upon the aperture in the board, turning the current of air upon it, and immediately releasing. The mirror-plate was thus depressed and the brush caused to remain in contact with the revolving drum whilst the shutter remained open. A record of the distance traversed by the drum during this time was thus obtained, and the speed of the shutter ascertained by a very simple calculation.

After some discussion the meeting was brought to a conclusion by Mr. C. P. Butler showing a series of absorption spectra by Professor Lowell, which pointed to the possible existence of chlorophyll on the more distant planets, Mars, Jupiter, and Uranus. Confirmation was needed, as spectra of specimens of chlorophyll prepared in the laboratory were not exactly similar, but the observation pointed to the existence of vegetable life upon these planets.

CROYDON CAMERA CLUB.—The session would never be complete without a demonstration on transparencies for enlarged negatives by Mr. F. W. Hicks, who knows how to make an evening, avowedly for the benefit of the newer members, interesting to all. Metol was the developer preferred, and a soft negative sought. Daylight in the lecturer's opinions gave far superior results to those obtained with the enlarging lantern.

In the inevitable discussion which followed on the relative merits of carbon *versus* dry-plates for the transparency, a majority of the best workers considered the latter the best, all things being taken into account, although it was recognised that a closer reproduction of gradation was possible when carbon was the intervening medium.

Reticulation had troubled many, whilst others never experienced a sign of it, though in no case had the precaution of collodionising the tissue been adopted, and procedure appeared much the same. The president, Mr. J. M. Sellors, invariably squeegeed the tissue on plain glass, but used a little hydrochloric acid in the water; he secured perfect adhesion, and no reticulation. A dry-plate, however, permitted more modification than the carbon process. Dr. Mees, in answer to a question, said that grain in an enlarged negative might to a great extent be softened or diffused by making the transparency on a fine grain plate.

HACKNEY PHOTOGRAPHIC SOCIETY.—At the meeting on the 16th inst., Mr. W. L. F. Wastell gave a most instructive lecture on the "Bromoil" process. He advised the use of amidol for developing the bromide print. Exposure should be so adjusted as to allow the print to be developed to finality. But although the best result was only obtained from a perfect print, yet a very good one could often be got from a print that was not perfect, the oil print obtainable from it being a great improvement on the original. In an example shown by the lecturer, a print quite useless as a bromide print was made to yield a very satisfactory oil print. After development the bromide print should be thoroughly fixed and washed, as traces of hypo left in the film would be injurious to the success of the after process. As to the choice of bromide paper, many otherwise excellent makes were unsuitable for bromoil, and it was therefore necessary to select the right kind. He had been most successful with Messrs. Griffin's special "Bromoil" paper. Mr. Wastell then described and demonstrated the process through all the stages from the bromide print to the finished oil print, and gave many useful hints as to the choice of brushes, pigments, etc., and their use.

EDINBURGH PHOTOGRAPHIC SOCIETY DINNER.—The eighth annual dinner in connection with the Edinburgh Photographic Society was held in the Carlton Hotel, Edinburgh, on February 18, under the chairmanship of Mr. J. F. Duthie, president of the Society. Upwards of 60 ladies and gentlemen were present, the company including Mr. Campbell Noble, P.S.A., Mr. Hippolyte J. Blanc, R.S.A., Mr. Robert Burns, A.R.S.A., Mr. Archibald Cochrane, Councillor M'Arthy, Mr. F. P. Moffat, and Mr. J. D. Brown, who had charge of the arrangements.

The judges at the exhibition—Messrs. Campbell Noble, Burns, and Cochrane—who were the guests of the evening, were toasted on the call of the chairman. Mr. Duthie said the proper kind of photographic exhibition was one where pictures of merit were chosen and awards of equal merit given. If they wanted to get a good exhibition numerically, the principal thing was to get good judges—and this year they had been exceptionally fortunate in that respect. Mr. A. J. Watson, Glasgow, proposed "The Edinburgh Photographic Society," and Mr. Blanc, R.S.A., in the course of his reply, referred to the many practical difficulties which faced amateur photographers in the early days of the development of the art. On Friday evenings he used to prepare his half-dozen plates. His camera was like a trunk. He had it still. He had the boldness once to mount to the top of Ben Lomond with it. Sadly enough, when he got there he could see nothing. If he might be allowed a joke, he viewed the mist but missed the view. In those days, he said, men put their hearts into the work, and the evolution of the chemistry and the art of photography were to them special studies. Some would say that photography was not an art, but he was not of that opinion. He appealed to all intelligent citizens, and asked if the Society was not one which should be encouraged. It was easier to knock down than it was to build up, and he advised the members to disregard those who were disposed to dissociate themselves from the Society.

A NEW DEVELOPER AND A COMPETITION.—A new developer suitable for plates, papers, and lantern slides is just being introduced by the Brugg Chemical Works, Limited, Brugg, Switzerland. It is known as Pyramidol, may be used repeatedly, and resembles hydroquinone, without, however, the tendency to inertness at low temperature possessed by hydroquinone. Moreover, Pyramidol is used in much weaker solution. A book of articles and formulæ for the new developer is sent free by the makers on application, and it contains also particulars of the competition in which about £125 will be given in prizes.

Commercial & Legal Intelligence

LEGAL NOTICES.—It is intended to pay a dividend in the case of Edgar Wilkinson, photographer, carrying on business at 1 Arcade, Norwich, and residing at 218, College Road, 1 Norwich. The last day for receiving proofs by Mr. E. H. Havelock, trustee, 4, Charterhouse Square, E.C., is March 2.

A first and final dividend of 6½d. in the pound is to be paid in the case of William Haddon, publisher and picture postcard dealer, 6, Bradley Street, Burnt Tree, Tipton, Staffordshire.

A meeting of creditors in the case of William Henry B. B. photographer, etc., of Station Road, Featherstone, Yorkshire held at the Official Receiver's office, Wakefield, on February 18. The gross liabilities were £192 and the deficiency £125. Bankruptcy was ascribed his failure to want of capital and losses on house purchase contracts. No resolution was passed, and the estate was left in the hands of the Official Receiver as trustee. The public examination is fixed for March 4.

A MANCHESTER BANKRUPTCY.—At the Lancashire Chancery Court sitting in Manchester on February 18, Vice-Chancellor Leigh-Jones had before him the debenture holders' action *Rajar, 1907, Limited v. Muenzer, Limited*. The defendant company, as already mentioned in our columns, was formed by a Mr. Max Muenzer, who carried on a number of photographic businesses in Manchester and elsewhere, and whose affairs have been recently investigated in the Bankruptcy Court. Mr. Acton appeared for the trustee in bankruptcy, and Mr. Cunliffe for *Rajar, Limited*.

Mr. Cunliffe stated that a receiver was originally appointed on his application *ex parte*, and had been continued pending the hearing of an application by the trustee in bankruptcy to set aside an assignment of assets by Mr. Muenzer to the company. There was a long inquiry before his Honour Judge Parry as to whether *Rajar, Limited*, had been guilty of conspiracy and fraud with a view to defeat the creditors. His Honour Judge Parry found that there had been no fraudulent conspiracy, though *Rajar, Limited*, had been indiscreet and their representative had acted improperly in remaining upon the committee of inspection at the time when he was taking the debentures which formed the subject of the present proceedings. However, the Judge acquitted the company from any charge of conspiracy. He (Mr. Cunliffe) suggested that his Honour should make certain findings of fact with a view to assist the Vice-Chancellor in dealing with the matter, and Judge Parry accordingly found that there was no evidence that the company (*Muenzer, Limited*) had any property or assets which were property assigned by the bankrupt, which was now the property of the trustee; that the company was a sham erected by Muenzer for the purpose of avoiding the payment of his creditors; and that the trustee's title related back to July 3, 1908, and he was entitled to recover all property of the bankrupt at the date of the assignment to *Muenzer, Limited*, and all property created in the course of trading. His Honour expressed the view that the receiver should hand over to the trustee all the property in his possession, and then the trustee should bring before him all bona fide claims against the company.

Mr. Cunliffe added that in addition to the plaintiffs there were two gentlemen who claimed to have debentures. Judge Parry's decision left it open to his clients to put in a claim with respect to subsequently acquired property so far as they did not represent assets transferred by Muenzer.

Mr. Acton said he agreed. Judge Parry was desirous it should be mentioned that it was not a judgment, but merely a finding of fact which he hoped would be of assistance to the Vice-Chancellor. The Vice-Chancellor: So they are.

Mr. Cunliffe said his clients were quite willing to withdraw from the receiver.

Mr. Grierson, the receiver, who was present in Court, stated that he had neither paid nor received anything, but the books had been kept together. Money had come in and been used for the payment of wages and so on. There had been no claims against the bailiffs in possession.

The Vice-Chancellor directed that the receiver be discharged from passing his accounts, and remarked that he was quite satisfied that Judge Parry should deal with cases of this sort.

News and Notes.

PHOTOGRAPHIC SOCIETY.—The secretary is now Mr. H. Sheard, St. Edward Street, Leek. The meeting-place is the Leek Club.

WAX-TOWN TOPICS, the very live organ of the Oberg Camera Club, New York, has changed its title to "Photographic Topics." The current issue contains "Twelve and Don'ts," by Mr. Alfred Stieglitz.

ROUGH POLYTECHNIC PHOTOGRAPHIC SOCIETY.—This society, which has its headquarters at 103, Borough Road, S.E., is holding a special exhibition of members' work on March 25, 26, and 27. Mr. C. Tilney has consented to officiate as judge, and Mr. A. J. Day will give a lecture each evening, entitled "A tour through the world," which will be illustrated with eighty Autochrome lantern slides.

FRIDAY LABOUR.—A return has been presented to Parliament containing reports from His Majesty's representatives abroad as to the position in foreign countries respecting a weekly rest day. From the reports it appears that in Italy the weekly rest can be given to photographers in photographic shops on a day other than Sunday, and a system of rotation. In the canton of Zurich, in Switzerland, photographic establishments are allowed to be opened between 10 and 12 o'clock on Sundays in summer, and for a longer period in winter. Assistants in these every third Sunday at least must be entirely free.

PHOTOGRAPHIC REGISTRATION OF SOUNDS.—Dayton C. Miller, in a paper before the Baltimore Physical Society, U.S.A., writes:—"In making large scale records, showing the details accurately, of sound waves having frequencies ranging from 500 to 10,000, the phonograph and oscillograph methods seem unsuitable. The new direct mechanical method has given satisfactory results: a small steel cylinder, 1 mm. in diameter, is arranged to receive motion, with a minimum of reaction effects, which is proportional to the displacement of a sensitive diaphragm. A minute diaphragm with its plane in the axis of the cylinder, reflects light through a special camera, and at a distance of 30 cm. gives waves 15 cm. in length which show great detail."

FALLOWFIELD SMOKER.—Even in the large hall of the Inns Court Hotel, which this year was the scene of the Fallowfield Smoker, the accommodation was none too great, a tribute to the success of good programmes which the entrepreneurs of the Charing Cross Road have provided on past occasions. Mr. F. W. Hindley, in the chair, was supported by many familiar figures in the photographic trade, and the numerous company remained until a late hour, entertained by an excellent programme of music, recitals, and other amusements of hand. The whole proceedings, in the hands of Mr. Hindley, secretary, and Mr. J. C. Preece, assistant secretary, went off with enjoyable smoothness, and served to emphasise the vigour and activity of the firm of Fallowfield.

SMITH AND Co., commercial photographers, 159, Stroud Green, London, N., advise us they have removed to more convenient premises at 18, Marquis Road, Stroud Green.

"PUSHAXE" COMPETITION.—From Messrs. Fuerst Bros., 17, Abchurch Lane, London, E.C., we have received the list of winners in the competition organised in connection with the "Pushaxe" single-solution universal developer. Messrs. William Grove and Walter Barnett acted as judges. The plate and printing used by each competitor follow the name in each case:—

I. (landscape or general subject, instantaneous exposure).—First prize, £30, A. Rose, 60, Bartholomew Road, Camden Town, N.; second prize, £15, Thomas Fletcher, 177, Beresford Street, Camberwell, S.E.; third prize, £4, H. Selby, 912, Tottenham Road, Lower Tottenham, Imperial Isochrom, Kodak velvet.

II. (best studio negative portrait, any exposure).—First prize, £25, Henrick Hofman, 8, Westwick Gardens, Shepherd's Bush, W.; second prize, £10, Winter Sons, 12A, Springbridge Road, Ealing, Imperial special sensitized Kodak matt; third prize, £3, George R. Henderson, 162, Tottenham Street, Hebburn-on-Tyne, Mawson and Swan, Rotograph.

III. (copy of an oil painting, time exposure).—First prize,

£20, Edgar G. Lee, 17, Eldon Square, Newcastle-on-Tyne, Wratten and Wainwright isochromatic, Birmingham Photo Company's Criterion bromide; second prize, £5, Herbert A. Game, 17, Pembroke Place, Bayswater, W., Edwards's ortho. snapshot, Velox special portrait; third prize, £2, John Maddison, R.D.S., 149, Grange Road East, Middlesbrough, Barnet ortho., Paget self-toning.

Class IV. (lantern slide plain).—First prize, £1, Edgar G. Lee, 17, Eldon Square, Newcastle-on-Tyne, Edwards's iso instantaneous, Mawson lantern plate.

Correspondence.

A DISCLAIMER FROM MESSRS. RAINES AND CO.

To the Editors.

Gentlemen,—It has been brought to our knowledge that a Stockton-on-Tees firm of polish manufacturers, with a name only slightly different from our own, is offering enlargements to users of its product, in return for a certain number of coupons—obtainable, of course, from the wrapping of the product in question.

May we therefore beg the hospitality of your columns to announce to your readers that we are in no way connected with the scheme? We make this request, because some years ago, when the same firm was running a competition, we received a certain number of entries, thus proving that the similarity of the two names was confusing to the postal authorities.—Thanking you in anticipation, we are, Gentlemen, yours faithfully,

RAINES AND CO.

Photographic Works, Ealing, London, W.

February 17, 1909.

SOUTH AFRICA AND PHOTOGRAPHIC ASSISTANTS.

To the Editors.

Gentlemen,—Just a few words to my fellow assistants. Trade in this colony is in a most deplorable state, and is likely to remain so for the next ten years at least. Competition is very keen, wages very low indeed, living is also very dear, and the climate somewhat trying. The prospects are very remote. You are required to do the same amount of work as in England for comparatively less money. Hours are about the same. If you ever do come out here, do not accept an agreement which binds you down in any way. You may not like your employer and the class of work, and perhaps you will want to get away. I advise any assistant (retoucher or operator) not to accept an engagement for less than £20 per month at least, which is equivalent to £8 per month in England. See that your passage is paid out to the colony, and also passage home, if you are to stay here for a lengthy period. This is usually allowed, but have it in black and white. There are lots of good men here being paid most ridiculous wages, so little that they will probably never get back to Old England again.

Photographers are closing their businesses in every direction. Talking of undue restriction in agreements, you have only to glance at a few. You would find ample evidence of the unfairness of the employer. I may mention that all new processes, not forgetting colour photography, we never come in touch with here, only by reading the articles in the "B.J." We just retouch and operate; we go back, not forward. There is no room for printers. Colonials can do all that is required in that direction, and at low wages.

Concluding, I must thank the "B.J." for this space I have occupied. I hope soon to be back in good Old England, where I can follow the profession and enjoy it.—Yours truly,

F. COLLETT.

Cape Town.

CINEMATOGRAPH PROFITS—£7,000 FOR A NEGATIVE.

To the Editors.

Gentlemen,—That one half of the world does not know how the other half lives is wonderfully true of the photographic world. The photographer whose work sells at high prices cannot understand how the man who sells "stickybacks" can make a living, and the cheap man, who relies on a large number of sitters daily, cannot understand how the man who gets only two or three sitters daily can

make enough to pay the rent; yet all seem to go on from year to year, notwithstanding the ever-present grumble of bad business.

But what would anyone unconnected with the cinematograph business say to paying £7,000 for one film? Yet the film of the Burns-Johnson prize fight has just changed hands at that figure, and even this marvellous figure only represents the rights for Great Britain. If we take account of the sale of the rights of this one film for the whole world we get a figure that is almost unbelievable, and this for one single negative film.

These enormous figures take one's breath away. They seem so utterly impossible, and it seems so absolutely impossible to make a profit on such a transaction, after taking into consideration the comparative short life of such a film, that one can hardly believe it is a sound business proposition. Yet not only is the idea sound but extremely profitable, so profitable, in fact, that not only were people willing to give £7,000 for one spool of films, but the rush to buy was so great that at least two would-be purchasers journeyed all the way to Marseilles to meet the boat from America, so that their offers might be considered first.

Before me as I write are two telegrams, and a reply. In them we read the answer to our riddle. The first telegram is from the purchasers of the film to the manager of a music-hall, and it reads: "What is your best offer for sole rights to use Burns-Johnson film in ——— for ONE WEEK?" The reply was: "We offer £100 for rights for one week." But this offer was not accepted, for in the second telegram I read: "Cannot accept less than £200. Wire if you accept."

Think what this means: £200 for one week's hire of a film, which only runs a few minutes. If we multiply £200 by the number of music-halls at which this film will be shown we see where the profit comes in, even after paying £7,000 for the film. After seeing these figures, who dare say that there is no money in photography?

Cinematography is the photographer's legitimate business, but it is only considered by a very few of us. These figures, which the writer can vouch for, show that there is a lot of money to be made from this side of the business, a business which is rapidly increasing, and one that is not overcrowded. The work may be difficult and hard, but with prizes such as the above it is well worth consideration.

Cinematograph halls are springing up all over the country, and good films are in great demand. Many people have made, and are making, fortunes, both by running these halls and hiring films. At present there seems to be more prizes than blanks. Why not enter for a prize?

ENTRE NOUS.

THE "THAMES" COLOUR PLATE.

To the Editors.

Gentlemen,—After reading the letters in the "B.J." of February 19 re the "Thames" plate from Dr. Mebes and Dr. Schultz-Hencke, I feel constrained, in common fairness, to ask you to favour me with the insertion of my experiences with the plate under similar conditions to those referred to in the paragraph from "New York Herald" of January 3, and which evidently were due to a reporter's error.

In the first place, may I say that I have not the slightest interest in the "Thames" plate, except to welcome any good colour plate? My only reason for writing is to try and correct or prevent an injustice being done to the "Thames" plate through such an unfortunate mistake. I am engaged in obtaining colour photographs as records in connection with surgical research, and you will quite understand that unless a result is trustworthily correct in colour rendering it is of no value to us.

As soon as the "Thames" plates were placed on the market I obtained a box of four from one of the local dealers. A plate from this box was exposed on a pathological specimen of unique interest. This specimen was one in which certain delicate features needed very accurate rendering to be of any real value. The exposure was calculated on a basis of $\frac{1}{8}$ of the exposure necessary for an Autochrome. The result was a most remarkably colour correct and very transparent record. It was shown at a pathological meeting in this city, later in London, and on every hand it was spoken of in the highest terms, and not by men who were themselves photographers, but often by surgeons, who simply looked for an accurate rendering, and very critical even at that.

Now I do not even suggest that I could not have obtained an equally good result on an Autochrome plate. As a matter of fact,

I have many equally good results on that magnificent triumphant photography, the Lumière Autochrome plate. It is only common fairness to a firm, who have been the victims of an unfortunate journalist's mistake, to stand up and point out that, "in my hands I have obtained satisfactory results in the 'Thames' plates, and similar conditions to those mentioned in the 'New York Herald' unfortunate paragraphs." One does not doubt for a moment that Dr. Mebes' plates were Autochromes, and not "Thames" plates. I have only one regret, and that is, that at the present time my colleagues has gone abroad and taken the plate with him, if necessary I can substantiate my remarks by showing him the plate in question. When in London a few weeks ago I showed the plate at the Royal Photographic Society, and also at the College of Surgeons, to a few who were interested.—Faithfully

S. E. BOTTOMLEY, F.R.S.

27, Oakwood Avenue, Roundhay, Leeds.

February 22, 1909.

To the Editors.

Gentlemen,—We have read the letters in your issue of February 19 from Dr. Mebes and Professor Dankmar Schultz-Hencke. The letter from the "New York Herald" was kindly sent to us by a member of the Council of the Royal Photographic Society, and as the result of the experiment in Professor Virchow's laboratory only corroborates what has been done under more difficult conditions in this country, we saw no reason to doubt its accuracy.

Although we shall not trouble you again in the matter, we say that we have sent to Berlin for the fullest report of Professor Schultz-Hencke's lecture at the War Academy, and if any of our readers feel sufficient curiosity to read it they can do so at our office.—Yours faithfully,

THE THAMES COLOUR PLATE CO.

(Oliver S. Dawbarn)

Answers to Correspondents.

PAINTING REGISTERED:—

T. B. Allanson, Esplanade Cottage, Bridlington. *Painting (Oil) of Loss of the Boats at Flamborough, Yorkshire.*

PHOTOGRAPHS REGISTERED:—

Wm. Warrington, 38, Church Street, Liverpool. *Two Photographs of Bobby and Two Photographs of Group, Bobby Andrews, Vincent Walker, White.*

F. G. Steggle, Stanley House, Midsomer Norton, near Bath. *Photograph, L. C. Ellis & Frays: Group of Policemen and others Stationed there during the*

T. A. A. Morrison, Scotsman Buildings, 23, North Bridge Street, Edinburgh. *Group of Mr. Harold Bennet C. C., Unionist Candidate for South Edinburgh.*

F. A. FISCHER (Genoa).—Mr. J. W. Beaufort, Easy Row and Beaufort Studio, New Street, Birmingham, who can supply in quantities at short notice. The best book on the subject is "Photography" by W. Ethelbert Henry (Daubarn and Ward, Ltd., 1s.).

VIGIL.—1. If you have no connection among photographers and newspapers, you will obviously have to spend money in advertising offers to photographers and advising newspapers that you can supply. This and office outlay will be your chief first cost. You had better get prices and figure it out for yourself. 2. In the newspapers you will find listed in Willing's "Press Guide," many have their own men; others handle outside photographers who work chiefly. 3. Yes. Application to the police and other authorities. 4. Travel the newspapers. 5. Ten shillings and upwards. 6. Usually it is not.

MENFAB.—1. You cannot have a better formula for an Autochrome bath. 2. It is not all easy to say what is the cause in the case of a negative, but it looks as though there was a large flare over part of the plate. Try using a larger stop, and see if you get rid of the trouble. 3. In the case of the stop, a long lens would most probably avoid the distortion. If you care to examine the lens we will examine it.

E. K.—You had best get "Magnesium Light Photography," by Mortimer (Dawbarn and Ward, Ltd., 1s.).

PHOTOGRAPHS OF PUMPKINS.—I photographed a private garden last summer with pumpkins grown by the "One and All" Club. The negative was offered for sale to them for publication, but they did not require it. I see they have reproduced it in their magazine. Can I claim?—C. E.

If you register the copyright in your photograph you can

n further publication, but you cannot recover for copies prior to registration.

1. Certainly they can if the subject is not one that is orthochromatic methods. You want the gradation and to be as correct as possible. The same materials and as are used in ordinary photography are suited to stereo but you must aim at rather softer results. 2. This seems suitable focus. If the lenses are good ones the results be just as perfect as those produced in a bigger camera. We should not consider it necessary. 4. We know the camera to be a thoroughly good one, but have not seen it.

DRD.—We can only advise you to apply to one or other of the enlarging firms doing club work. They might be able to supply you with specimens of circulars, etc.

—In the circumstances you name we advise you to select a lens of the folding focal-plane type. If second-hand, the lens is likely to be any the worse. Your best course is to look up the makers given under "Cameras, Hand," in the "Almanac," 1909.

GRAPHOSCOPE FOR AUTOCHROMES.—I have lately been viewing autochrome transparencies (quarter-plate size) with a single lens, about 4¼ in. in diameter, and have been struck by a decidedly stereoscopic effect, and also by the apparently life-like of the picture when it is looked at by the eye at some distance from the lens; and I should like to get or to make an apparatus of the kind which would show my Autochromes under the best conditions. I should be much obliged if you could tell me in your next number the size and focus of the lens which would be likely to give the best result, and whether you know of any firm which makes a speciality of this kind of apparatus.—J. M. J.

—I find that the best effect is obtained with a reading lens of 4¼ in. diameter, and the focal length of such a lens is just about 12 in. Some stereoscopes are made with eye-pieces that can be turned through 180 deg., and when so turned the apparatus is equivalent to a graphoscope, and has the same effect as is produced upon ordinary single pictures. This would probably be of your purpose, otherwise we think you cannot do better than use a reading lens. You can, of course, buy a graphoscope complete fitted for viewing single pictures from any optician.

(Belfast).—By no means as good.

DR.—Kindly give a quick-acting developer for focal-plane autochromes (one solution) from 1-90 sec. upwards, also for stand development.—SNAPS.

—A pyro-metol developer is as good as any, say the formula given in the Imperial Company's Handbook. For stand development use a Kodinal or any clean developer, with some extra sulphite, and it will answer well.

INTENSIFICATION.—In the "B.J." of the 29th ult. you have answered my question about intensifying negatives. I tried the solutions (chromium and amidol) and yesterday tried the intensifier. I tried first on a cut film by a well-known maker, of the kind that I generally use. This bleached and darkened perfectly. Then in the same solution I put another film of the same subject taken on the same occasion. This would not bleach. I used some fresh chromium solution in another dish and transferred the film to it. Still no result. Another film was put into the same lot of solution. No result; and just as I was going to give it up it suddenly bleached. Two other films acted like this, and although I kept them in the chromium solution for four or five hours they appeared to be quite unchanged. I even tried to warm the solution without avail. Can you tell me the cause?—J. E. G.

—A formula recommended in our previous answer can only be used once, and must be mixed immediately before use. Films can be troublesome with A. Try the B formula and repeat if necessary, but do not keep the solution ready mixed. It is best to keep a 4 per cent. solution of bichromate and a 2 per cent. solution of hydrochloric acid and mix equal parts immediately before use. You should then have no trouble.

PRINTING.—(1) Can you tell me the cause of the dark spots on the enclosed sulphide-toned bromide prints? Sometimes

they appear during development, but more often in the bleach. I have tried several makes of paper and have also changed the developer from M.Q. to a made up one, but cannot get rid of the difficulty. I use sulphite of soda, alum, and acetic acid in fixing bath, rinse prints between developing and fixing, and well wash afterwards. I might add that I use porcelain dishes which are constantly cleaned with acid. (2) How many cabinet prints could with safety be fixed in hypo, 2 lb.; water, 70 oz?—"CLAREMONT."

(1) If the stains appear during development it would seem that they must be due to something in the bromide paper. Possibly it is handled too much before use, or else becomes contaminated by contact with the negatives. Try cleaning the latter and varnish them if they are not already varnished. (2) Your fixing bath is much too strong. Instead of 2 lb. in 70 oz. we should use 1 lb. in 80 oz. It is impossible to say how many prints can be fixed with safety. We should throw away the bath as soon as it became discoloured, but washing between development and fixing will keep it clear for a long time. If you allow 1 lb. of hypo. per gross of prints you will be on the safe side without being unduly extravagant, considering the price of hypo.

F. W. D.—So far as we can see, your only course is to practise a very quick manipulation of the ball. Perhaps the makers of the shutter can advise you further.

CINEMATOGRAPH.—I am writing to you, for I think you are the most likely people who could inform me on the following matter. I am desirous of becoming a cinematograph operator, and am at a loss who to apply to for a situation. If you could enlighten me I should be obliged, for I am not aware of any cinematograph periodical being published. I am seventeen years of age.—A. L. GRUNWELL.

Better apply to one or two of the cinematograph firms such as those advertising in the "Kinetograph," published at 1d. weekly, by E. T. Heron and Co. 9, Tottenham Street, Tottenham Court Road, London, W.

TONING BLUE PRINTS.—Can you tell me a method of toning ferro-prussiate (blue prints) like the enclosed? I have heard that catechu and borax will tone them, but cannot get anything like the result here obtained. I have only recently become a subscriber to your valuable paper, and must say I am more than satisfied with the fare supplied every week. If you cannot inform me how to obtain the result, can you suggest any other simple way of toning blue prints?—FERRO-GALLIC.

We have obtained tones almost identical with that of the print you send by the borax and catechu method, but the process is slow and not at all certain. There is not a really satisfactory method of toning blue prints which can be worked in a regular way. A better plan would be to prepare a print on sepia paper and tone that by one of the commercial green toners on the market.

LARGE PHOTOGRAPHS.—Can you give me name and address of firm where I could obtain large photographs, say, 15 x 12 or larger, on hire or to purchase? I require a large assortment of subjects of all descriptions, as, for instance, tea-growing, etc., coffee-growing, biscuit manufacturing, fruit gathering, fruit packing in tins, etc., and such like subjects.—BELFAST.

Better write one or two large publishers of views such as Valentine, Dundee, Frith, Reigate, the Photochrome Company. If these cannot supply you we can only suggest that you insert a small advertisement stating your wants.

CINEMATOGRAPH.—(1) I should be greatly obliged if you would inform me of the most practical book on the manipulation of the cinematograph which has come under your notice. (2) Also from whom to hire up-to-date films for public exhibition.—F. PARKER.

(1) You should get the "A.B.C. of the Cinematograph," by Cecil M. Hepworth (Hazell, Watson, Viney, 1s.) (2) Messrs. Butcher and Sons, Camera House, St. Bride Street, E.C.

INTERIORS.—I have an offer to photograph the interior of a rather large music-hall. As I have had no experience in such a large place before should be very grateful for a little information. (1) I have to photograph the stage. There are two arc-lamps, one on each side. Would that be sufficient? (2) They also want a picture taken from the stage. The place is rather dark. Would it be best to get flash lamps? If so, how should I place them? I suppose magnesium ribbon would do. If so, how much should I require? How should I use it? I have to use a half-plate wide-angle lens. Should I require to use light for the gallery, bal-

cony, and pit, or would it be sufficient to only light up the pit?—**STAGE.**

(1) With the two arcs supplemented, say, by the usual stage lighting, you should be able to dispense with the other light for the stage, giving an exposure of, say, one minute at $f/16$ on an extra-rapid plate. The arcs alone will probably give too mixed a lighting. We think you should endeavour to secure the illumination ordinarily used on the stage. (2) For the view of the hall from the stage you will certainly require flashlight, best obtained by means of a flash powder laid in a thin train on either side of the proscenium, and, if possible, at a fair height. Difficult to advise you as to quantity, but with lens and plate as above $\frac{1}{2}$ to 1 oz. in all will probably not be excessive for a large hall with dark galleries. The powder is laid in a shallow metal trough and fired with a taper, taking care that the light does not fall direct on the lens.

PATENTS.—Some four or five months ago I invented and had made what has proved an extremely useful piece of apparatus. I have been giving it a thorough trial preparatory to putting on the market. Only this week I have been making inquiries as to patenting and selling, when to my disgust on opening a trade paper this morning I find a somewhat similar piece of apparatus put on sale by a photographic firm and labelled "fully protected." Now, my apparatus in detail is rather better in my idea, but I suppose the other people have properly "settled my hash." What I wish to ask you is, may I continue to use my apparatus, or must I come to some arrangement with the people who have beaten me by a head? I am feeling frightfully upset about it, and should be very glad of your kind advice.—"PIPPED."

It seems that you have been forestalled. If, however, you can prove prior use or publication of your invention previous to the lodging of the provisional specification by the other people, it will not interfere with you. If you cannot do that you will have to make some arrangement with the patentees or let your invention slide.

COPYRIGHT.—We want to know if it is compulsory to stamp or print the word "Copyright" on photographs we have made copyright? A photograph of ours is made copyright, but a print got into a publisher's hands not stamped or printed with the word copyright on, and the publisher holds he is not responsible and had a right to reproduce photographs not so stamped or printed.—**T. BENNETT AND SONS.**

The publisher is quite mistaken. There is no obligation to mark copies. He is in no way excused from the infringement.

AIR-BRUSH.—I am a middle-class operator-retoucher, but aspire to a better post. Do you consider that proficiency in the use of the air-brush is essential or of great use to one who wishes to include working up enlargements among his other qualifications? The price is high and I hesitate.—**ASPIRANT.**

Yes, air-brush work is so largely used now that you could not afford to be without it in doing good class work.

HYPHO RESIDUES.—Would you be good enough to let me know how to break down hypo? I use a great quantity, and consequently want to save the residue. When you put the reply in the "Journal" please let same be in full detail from taking the hypo out of the bath up to getting the residue dry ready to send to the refiners, and oblige **SYD DARBY.**

No elaborate details are necessary. All that has to be done is to add sulphide of potassium (liver of sulphur) to the used hypo until no further precipitate is thrown down. It is a good plan after some sulphide has been added to take out a little of the solution and pass it through a filter, and if a further addition of the sulphide to the clear solution produces no further turbidity, it will be known that all the silver has been precipitated. The whole is then allowed to stand for a few days for the sulphide to subside, when the clear portion is poured off and the residue dried. It is then ready for the refiner.

CARBON TROUBLE.—I should be pleased if you could advise me how to avoid the appearance of the crystal specks on enclosed carbon print. I use the matt opal glasses for support and take every care that it is perfectly clean before I flow the collodion over and leave it until it sets at the pouring off corner and appears matt at the opposite corner. One carbon worker advises the use of water which has been previously boiled, as he says the air bell's

from cold water cling to the collodion. I have tried this method and although better I cannot get absolutely free from the specks. I may also say that I take great care in squeegeeing the tissue over the **CRYSTALS.**

The trouble is not due to the cause you suspect. The spots are due to air-bubbles being enclosed between the tissue and the paper when the paper is applied, and this can be easily avoided. In future soak the picture on the glass in water for a few minutes, then bring the softened transfer in contact with it under the water, remove and squeegee together. Be careful to see that no small particles of air adhere to the tissue while in the latter water.

RIGHT TO PHOTOGRAPH.—Having recently taken photograph of an old mansion from the public highway, can you inform me whether the proprietor can legally restrain me from selling reproductions of the same, and also whether he could do so if he were a tenant, and not proprietor?—**R. J. CLOSE.**

He cannot do so in either case.

GLOSSY.—We believe Charles Tyler and England Bros. Appear Messrs. Butcher and Sons, Camera House, St. Bride Street, London. **D. ODENHEIMER (Philadelphia).**—The only drawings available in the patent specifications of the various cameras, and in relation to these you must bear in mind that you will be liable to prosecution if you construct the apparatus even for your own use. Do you wonder that makers should decline to supply you with drawings of their instruments?

Owing to pressure upon our space, several Answers to Correspondents are unavoidably held over.

THE SOUTH LONDON PHOTOGRAPHIC SOCIETY'S EXHIBITION opened on Saturday last, February 20, at the Art Gallery, Peckham Road, and will continue open daily from 2 to 10 (Sundays included) until March 20, admission free. An interesting feature of the exhibition is the series of lantern lectures announced, the subjects, as well as the names of the lecturers, being calculated to draw large audiences. These will begin at 8.15 in every instance, except the last on March 20, which will be at 9, being preceded by the distribution of the exhibition awards by Mr. C. T. Harris, J.P., C.C., at 8. The lectures are as follows:—

February 27.—"The Victoria Falls." J. F. East.

March 1.—"A Tour in Devon," illustrated with Autochrome slides. A. J. Woolway.

March 3.—"London, Ancient and Modern." H. Creighton Beckett.

March 4.—"The Thames, from the Source to the Sea," illustrated with Autochrome slides. J. McIntosh.

March 6.—"The South of Ireland and Killarney." C. H. O'Brien.

March 8.—"The Glorious West Country." Chas. R. Rowland.

March 10.—1908 affiliation prize slides.

March 13.—"Three Men in a Boat (Gee, Jay, and Cee)." Leo Clark.

March 15.—(1) "Phases of Fish Life"; (2) "Methods of Fish Photography." Francis Ward, M.D.

March 17.—"Seaside and other Children and Children's Growth." Victor Emmett.

March 18.—"An Idyllic Minster—Wells." E. W. Harvey.

March 20.—"A Chat on Architecture." Edgar R. Bull.

**** NOTICE TO ADVERTISERS.**—Blocks and copy are received only on the approval of the Publishers, and advertisements are accepted absolutely without condition, expressed or implied, as to what appears in the text portion of the paper.

SUMMARY.

The special Colonial and Foreign Issue of "The British Journal of Photography" will be published on the 26th inst. Elsewhere in this issue a list of the countries and towns, to which this number is sent direct, is given.

Mr. F. W. Speaight has originated and designed an improvement in London whereby the Horse Guards Parade will be remodelled and extended towards St. James's Park so as to form a great decorative scheme containing the statues of military characters in English history, many of which are scattered through London. Some illustrations of the proposed improvement appear on p. 177, and on p. 174 we point out how public work of this kind helps the photographer and raises the status of his calling.

Mr. Richard Thirsk, in an article on commercial conditions in Germany, comments upon the over-production from which German manufacturers are at present suffering. (P. 176.)

A great scheme for displaying news-photographs in public-houses is said to be afloat. (P. 185.)

Mr. Hall-Edwards has announced the possibility of photographing ordinary light through an opaque body. (P. 185.)

A method for the rapid finishing-off of oil or bromoil prints has been given by Professor A. Albert. (P. 173.)

Mr. C. H. Hewitt, in the "A.P.," has described how to produce a photogravure effect in Bromoil, and, in the Ilford "Scraps," Mr. Harold Baker has expressed his preference for ordinary printer's ink for Bromoil. (P. 183.)

"COLOUR PHOTOGRAPHY" SUPPLEMENT

The concluding portion of Baron von Hübl's paper on Autochrome plates gives the formulæ for compensating filters for use with arc lamps, Nernst light, and incandescent gaslight. (P. 17.)

Further experiments on the "Omnicolore" plate, by Dr. Scheffer, indicate that the method of mutual repulsion of two different inks described in the patent is not that employed in the manufacture. (P. 18.)

M. Cheron has designed a three-lens one-exposure camera of very portable form. It is intended for the making of transparencies, to be viewed in colour on the screen by the additive method of projection. (P. 20.)

A photo-micrograph, showing the structure of the "Aurora" mosaic filter-plate, is given on p. 23. The materials for preparing the plate are issued commercially.

Dr. J. H. Smith announces that he has worked out a sensitiser for each-out colours, which enables him to obtain a paper more rapid than P.O.P. (P. 23.)

EX CATHEDRA.

The "B.J." Colonial Issue.

It will be seen from the announcement in another page that our publishers—those "sordid men whom hope of gain allures"—are this year repeating their issue of a special Colonial and Foreign number of the "B.J.," and are placing the publication upon a basis which, from an advertiser's standpoint, is even more satisfactory than last year's. The list of photographers and photographic dealers the world over, to each of whom this "Colonial" issue of March 26 will be posted direct, now numbers, after removal of deadheads, and additions made within the past six months, a still larger total. In sending what will be doubtless a bulky issue to this large extra number, our publishers more than substantiate their claim that the issue is "special" in a specially commercial sense, an argument which will be endorsed by those who tested the *bona fides* of last year's number. Advertisers will have the advantage of following up their announcement of a year ago, in addition to addressing themselves to new buyers. The list of the places of the earth to which this issue will go should be sufficient indication that since the appearance of last year's number the staff of the "B.J.," despite minor interruptions such as the publication of a book called the "B.J. Almanac," have not rested from their task of creating a link between British manufacturers and buyers in every land.

* * *

Finishing Off Oil Prints.

The final stage, namely, the drying, in the making of the print by either the oil or Bromoil process requires some considerable time for its completion, since the oily pigment, which many workers apply fairly liberally, does not dry very quickly, and if handled in the mounting or trimming with insufficient care may be easily smudged and the print thereby ruined. Professor A. Albert, in a note in "Photographische Korrespondenz," describes the method which he has found satisfactory for bringing the print into a hard, dry state. The wet print is laid face up on a glass plate and secured to the latter by four strips of gummed paper, being then put aside to dry spontaneously, which it does within twelve or twenty-four hours. The surface is then freely dusted over with French chalk (talc), the excess removed with a soft brush or tuft of cotton wool, and the print then flowed over or painted with a solution of shellac in alcohol until there is no further repulsion of the shellac by the strong portions of the print. The veiling of the pigment by the French chalk is removed by this varnishing, and the varnish dries very quickly, the film being so thin that there is scarcely any effect upon the matt surface of the print. When the shellac coating is dry the surface may be given a thin coat of a very fine grain matt varnish, and, when this is dry, the print removed from the glass and

mounted. In this latter operation the print is first laid for about twenty minutes between wetted sheets of paper (filter paper), a good paste then applied to the back, and the print pressed into adhesion.

* * *

Colour Cinematography at the "Palace."

The admission into the programme of the Palace Theatre of Varieties of the Smith-Urban cinematograph pictures in natural colours marks another era in the application of photography to entertainment and instruction. The demonstrations at the house of the Urban Company, and more recently at the Royal Society of Arts, have shown the remarkable success of the method, and the eulogiums which technicians have passed upon the process have been repeated with added emphasis by the Press and public who have seen the projections from the auditorium of the handsome theatre in Cambridge Circus, which again leads the way in introducing to the public this latest triumph of the cinematograph.

* * *

Speaight Portraiture of "Fair Children."

We recently saw, at the studios of Messrs. Speaight, a few of the portraits of the children of English, Spanish, and German Royal Families, made by Mr. Richard Speaight for the forthcoming exhibition to be held during May, June, and July at 157, New Bond-street. For these portraits special sittings have been granted, and the exhibition, apart from offering a most interesting collection of portraits of future monarchs and other children of noble birth, will demonstrate with what great success Mr. Speaight has embraced the opportunity of portraying his sitters after his own inclination.

* * *

The Art of Scientific Research.

In "Nature" for February 18, 1909, there is a very interesting abridged report of an address by Dr. L. A. Bauer, the late President of the Philosophical Society of Washington, which address might be studied with profit by many of those who take an interest in photographic research. The subject is the "Meaning and Method of Scientific Research," and Dr. Bauer draws special attention to the fact that such important subjects as "discovery," "experiment," "investigation," and "observation" are completely neglected in the "Encyclopædia Britannica," and, apparently, in most other English works of reference. For a philosophic treatment, he says, he frequently gets more satisfaction out of the older encyclopædias than from our modern ones, and he especially commends Sehler's "Physikalisches Wörterbuch," published in 1824-45, in which twenty-eight pages are devoted to "observation" and forty-four to "experiment." There is nothing in the address directly bearing upon photographic research, but the general principles are, or should be, the same in research of all kinds, and the mistakes so often made are of the same nature. The blunder of thinking that "an established formula satisfying the observed phenomenon within certain limits represents a law of nature" is made just as often by photographic investigators as by others. The danger of neglecting what we are pleased to call "abnormal features" is as great in photographic problems as in the magnetic ones referred to by Dr. Bauer, and it is just as difficult to follow the law of observation which enjoins the use of "such a method or scheme of observing as will yield but one definite result." One of the maxims laid down by Dr. Bauer is that "it is as important to make research work known as to do it" is perhaps not so often disregarded by photographers, who may, indeed, sometimes be suspected of being so eager to publish that they fail to do the work properly. We

have often thought that it would be a very great thing if some one of our many clever modern investigators would stop his own researches for a time, in order to write a short treatise on the science of research for the benefit of less skilled investigators. If he could only teach us how to look for facts and how to recognise them when found, he would render a very great service.

* * *

Stops and Shutters.

Mr. E. A. Salt, in his lecture on shutters, drew attention to the fact that while with a blind shutter a reduction of the iris leaves the efficient exposure exactly the same, with an iris shutter the efficient exposure increases as the stops are reduced. This has an important bearing on the use of the stops, though that fact may not be quite apparent at first sight. So long as the efficient exposure remains the same the stops preserve their ordinary value, but if the efficient exposure changes then the stops change their value as regards intensity. Suppose we consider the case of an iris shutter working at an efficiency of one-third when set to a high speed. Assume its full aperture to be equivalent to $f/5.6$. Then with a lens aperture of $f/11$ the efficiency is increased to two-thirds, or is doubled. In the ordinary way a reduction of aperture from $f/5.6$ to $f/11$ reduces the intensity of the light to one-quarter, but as in this case it has doubled the shutter efficiency the light intensity is only halved. If this fact is not known it is certain that the photographer will assume that by opening out his lens stop from $f/11$ to $f/8$ he doubles the exposure, and probably not one in a hundred ever realises that it is necessary to open out to $f/5.6$. It will be noticed that this peculiarity of the iris has both advantages and disadvantages. If we want all the light we can get, it is disadvantageous not to be able to get more beyond the $f/5.6$ aperture. If, on the other hand, we want all the depth we can get, it is certainly an advantage in stopping down to $f/11$ only halves the light available at $f/5.6$. It must not be assumed that the aperture scale is upset in a similar proportion throughout. In the usual case $f/22$ will reduce the light available at $f/11$ to one-third, while $f/44$ will very approximately reduce the light available at $f/22$ to one-quarter. At the smallest apertures the stops regain their relative values, and the same variations only exist with the larger apertures.

MR. F. W. SPEAIGHT.

MR. F. W. SPEAIGHT, the senior director of Messrs. Speaight and the partner in that concern whose functions are appropriately described as in the nature of stage-management, has found a new field for his energy and architectural pursuits. It was only the other day that the Marble Arch was brought safely through its operation of excision from the Park, and Mr. Speaight's name thereby permanently associated with a great improvement in London: but his attention is directed to the opportunities of quite Imperial significance which have long been neglected in the Horse Guards Parade, where Mr. Speaight proposes to create one stroke a new decorative space and a Valhalla of military heroes. The scheme is ambitious, but there are probably fewer obstacles to its realisation than there were in the case of the Marble Arch improvement. The success of this latter scheme, upon which its author was very properly congratulated officially by the Professional Photographers' Association, can be ascribed to nothing else than the personality behind it, but it provides the very best example of the part a photographer can and, on grounds of public policy, should take in the affairs of his town. In the case of the great majority of men it will be found, if inquiries

shed deep enough, that the motive of public action is not merely altruistic. Commercial expediency actuates it, personal preference may prompt it, or it may even be done because conditions render it incumbent upon a person, and a decent way of avoiding it can be found. None of us expect to be accepted as philanthropists in these days, and we do a cynical public will quickly undeceive us. Our reason for gratitude, however, to Mr. Speaight—whose activities we have no object in attempting to discover—is that, as a director of a photographic establishment, he has earned recognition for his public work from the highest quarters, and has emerged victorious from a struggle which a committee would probably have preferred to shirk; and this in London, which in its hugeness is as hard to be taken to a state of appreciation as the giant in the fairy fables. One hears discussed at times the claims of photographers to be regarded as professional men, but how rarely does one observe a share taken in public affairs in a way which ranks the photographer with the professional classes in the public estimation. That recognition need not necessarily be obtained along the path of election to the local governing bodies. Indeed, nowadays that is the least profitable direction in which to seek it. But the success which has followed the many unofficial yet public services performed by Mr. Speaight during the past twenty years shows that there are plenty of opportunities for those who will see them, and that those who cleverly profit by them are not only helping themselves, but are incidentally raising the status of professional photography.

SOME HINTS ON BUSINESS NOVELTIES.

At the present being about the time when enterprising photographers are, or ought to be, casting about for such ideas which would be useful in their businesses during the coming season, and arranging matters accordingly, it may be opportune for us to make one or two suggestions as to the production of novelties, particularly in small country towns. Many photographers appear to have settled down to a groove, and continue supplying the cabinet silver prints of time immemorial varied by an occasional enlargement. It is true that many of them during the past few years have made a specialty of post-card portraits, midget, and such things, which have no doubt brought a certain amount of "grist to the mill," but it has been at the expense of the prices of other styles, and at the same time has lowered to a greater or less extent the status of the business.

The most desirable novelties to be introduced at the present time are such as would command an enhanced price for the work, and at the same time raise the reputation of the studio. This may frequently be done by making a feature of side-lines quite apart from the ordinary run of business. Many photographers in their price-lists quote cyanotype and carbon pictures at very much higher prices than those of their usual silver prints, and they are a good paying line. But, as a rule, this class of picture is not so prominently brought before customers as it might be in middle-class studios, the latter process in particular. Some, indeed, seem to discourage it rather than otherwise. In many of the highest class studios the majority of the work turned out is by one or other of these two processes—but that is by the way. It does not follow because a thing may not be quite new that it will not be a novelty when introduced. The carbon process is by no means a new one, but there are some applications of it that would be novelties if introduced in any middle-class portrait establishments, and might

figure as attractive and profitable side-lines in the window or show cases. We remember a few years back seeing in a north-western suburb a large show-case filled with portraits in quite a dozen distinct colours, such as bright green, vivid red, rich blue, bright crimson, and other colours. In the show-case was the simple announcement, "Photographs in all colours." It served its purpose, for whenever we passed during the few weeks the specimens were on view there were always people looking at them; the novelty of the colours called attention to the studio. The pictures were, of course, by the carbon process, as by any other it would be impossible to get some of the colours shown, or the same rich transparency in the shadows by any of the methods of doing bromide prints. We merely mention this case to illustrate how old things may be converted into novelties which attract attention.

With the carbon process, no matter what the colour may be, all the prints will be of the same uniform tint, which cannot be said of all colours depending upon toning. There is no other process of photography that can be applied to so many different purposes as can carbon. Some of them might prove a good side-line in many middle-class businesses. It may be remembered that a few years ago pictures on wood plaques with a gold or silver ground were exploited more or less as a secret process, under the name of "Metallines." They were merely carbon pictures transferred to the plaques. Since then gold and silver transfer papers have been introduced, and pictures on them would be novelties in many places. Photographs on watch-cases and similar things are done by the carbon process. Carbons on wood panels for decorative purposes are very effective, and what is more they can be French polished, and if the white polish be used the lights of the picture are but little, if at all, degraded. A few weeks ago we reviewed a material just put on the market ("Ivory"). Carbon prints developed on this by the single transfer process are very pretty as well as novel, as they can be seen equally well either by reflected light or as transparencies, and require no mounting whatever.

In connection with the above suggestions it should be remembered that the convenience in working of the carbon process is now far greater than it was some years ago. Makers supply the tissue in small quantities ready sensitised, so that no chemicals beyond a solution of common alum is required in the manipulation—warm water only being the developer. The spirit sensitiser introduced by the Autotype Company a couple or so years ago greatly aids in the working of the process, as it permits of small quantities of tissue being sensitised, dried, and made ready for printing upon in from a quarter to half-an-hour. It is simply applied to the surface with a Blanchard brush, one of which is supplied with each bottle of sensitiser. The Blanchard brush is simply a piece of glass—say a quarter-plate—with a piece of flannelette folded loosely over one end and secured by an indiarubber band. In use a little of the solution is put into a small dish or saucer, the brush dipped into it just to wet it, and then passed over the surface of the tissue, first lengthwise and then crosswise to equalise the coating. The tissue is then hung up to dry (in the dark, as a matter of course), which will take about twenty minutes to half-an-hour. In a warm place it will dry in a quarter of an hour or less. Any solution that may be left in the dish should be thrown away, and not returned to the stock bottle.

The method is very economical in use, as only just sufficient to evenly wet the surface of the tissue is required and no more. With the spirit sensitiser all the trouble of sensitising the tissue and the difficulty sometimes experienced in getting tissue dried in good condition are avoided, and the process is reduced to the greatest simplicity.

THE PHOTOGRAPHIC YEAR IN GERMANY.

THE year which has just closed will long be remembered in Germany as one of the blackest recorded in the annals of its history. This is the more striking when we remember that during the last decade or so the photographic manufacturers of this country, as also the professionals, have experienced a period of almost unexampled prosperity. In fact, this prosperity may truthfully be described as phenomenal when we recall the fact that it is only within comparatively recent years that Germany entered the lists as a serious competitor in the various photographic markets. From very small beginnings the nation has forged steadily ahead, continuously increasing its energies, and at the same time its output, until at the present time it has succeeded in making good much of the long start which other nations had on it; and, as far as Great Britain is concerned, Germany has become its most serious rival, with perhaps the single exception of the United States. Germans are now competing keenly with Englishmen in most of those markets which at one time the latter were almost justified in considering as a monopoly of their own. Wherever they have gone, the Germans have shown a spirit of enterprise and daring, and they have been rewarded with success. The various causes which have contributed to their unprecedented success form an interesting as well as highly instructive subject, with which I hope to deal on a future occasion. Meantime, I must confine myself within the limits of a brief review of the past year's working as it appears in the various reports now being published. Most of these go to prove that the success which the Germans have succeeded in winning for themselves is a fickle jade, and there is more than the suggestion of much rueful head-shaking over the methods hitherto employed in wooing her.

With only very few exceptions, the yearly reports of the various manufacturing concerns tell a tale of misfortune, and some of disaster. All of them indicate very conclusively that the prosperity of the German photographic industry has from various causes received a severe shock. Whether or not this check will be only temporary remains to be seen, though the outlook in the year just begun is not particularly sanguine, nor is it likely to improve so long as the war-cloud hangs threateningly in the Near East, keeping business in an unsatisfactory state of uncertain suspense. However that may be, there is assuredly much ground for believing that, after all, the often-repeated rumours circulating in Germany as well as abroad concerning the shaky condition of German finance are based upon more than an imaginary foundation. I have heard it repeatedly asserted on good authority that many of these businesses which sprang suddenly into existence during the booming days are not established upon the soundest or the most satisfactory commercial lines. And I have also heard it more than hinted that, unless there is an immediate change in the situation, some of these businesses will before long be compelled to submit to the inevitable. Some idea of the present condition may be gathered from the fact that few of the factories are working full time. A large number have been compelled to reduce their staffs, some of them retaining less than half of the employees they had little more than a year ago. This reduction has naturally been accompanied by evil results both for the workers and the employers. The former have no alternative but to join the large army of unemployed, thus helping to increase the difficulties of the great economic problem which German statesmen are trying vainly to solve; whereas the latter find public confidence in their various undertakings shattered, and in consequence public support so tardy that their shares are fast becoming a glut in the stock market. This means that a final appeal has to be made to the bankers, who become more and more the dictators in those concerns with which they are mixed up, until finally they wrest the power

out of the hands of the original proprietors, becoming, in all intents and purposes, the owners.

An army of investigators, among them university professors and others, are diligently studying to discover the various causes which are responsible for the present depression. Most of them are agreed in tracing it back to the money crisis in the United States early last year. That, doubtless, was not without effect on the conditions here; but, in my opinion, it is only a very small part of the cause. If German manufacturers had been on a sounder commercial footing, the money crisis in the United States could not have had any more effect upon them than it had upon England or France, for instance; certainly it never could have paralysed them, as it is said to have done. To hold to such an argument is almost tantamount to asserting that the financial ruin of the United States would mean the commercial ruin of Germany—an argument which reflects no great credit on Germany, or on any other country which could be so foolish as to permit itself to become so entirely dependent upon the fortunes of any other country. It is just possible that these investigators would come nearer to the truth if they permitted themselves to become a little more introspective and less prospective; if they sought for the cause at home instead of abroad. What Germany is suffering from just now in all departments of her manufacturing industries is nothing more nor less than the evil results following upon a period of over-production. Totally regardless of the possible or the probable demands of the market, she has gone on manufacturing at a rate out of all proportion to her capacity to dispose of her manufactures. The busy hive of workers was kept producing night and day, and all went well so long as the boom lasted. Now that the markets have been over-stocked, and the stock rooms filled to overflowing, which is the same as saying that much of the capital has been sunk in dead stock, a halt has been called for Germany. Until this mass of surplus stock has been disposed of, and part of the capital recovered, even a resumption only brings in a part of the sum originally laid out on it, and must necessarily remain at a standstill.

This over-production has been the means of bringing about another evil, equally great in itself, which I fear may be intended to damage German credit somewhat on the buying market itself. In order to get a return for their dead stock, German manufacturers have been at their wit's end to find purchasers for it. In their eagerness to secure these buyers they have entered into blind competition against each other, cutting prices under-selling, until prices have gone down so low that the none of them are able to get even a small margin of profit on their goods. In many instances the prices obtained can scarcely be considered to cover the cost of the material in the article, so that there is a deficit which must be paid for out of the manufacturer's capital. No profound economist is required to predict exactly how far business can be carried on by continually drawing upon the capital, or what the inevitable ending of such principles must be. And the unfortunate circumstance attending such a method is that, while these traders are ruining the markets for themselves, they are at the same time creating innumerable difficulties for others to overcome before trade can again settle down into more satisfactory channels.

There can be little doubt that in the end the German manufacturers will themselves be hardest hit as a consequence of the business methods they have adopted. Their extraordinary eagerness to get hold of the markets at any price has been frequently accompanied by a total disregard of the ordinary business precautions. They have not always been over-scrupulous in giving credit or to whom they gave it, and now the price they are paying for temporary success is an enormous sum of money.

ing out in bad debts, which in itself might well cripple business.

As the present economic crisis is general, applying equally to nearly all manufacturers, it naturally follows that, in consequence of the shortness of money in the country resulting from that the amateur photographic trade has dwindled away very considerably. Thus the manufacturers of photographic articles have been deprived of a source of home revenue which they had reasonably hoped would help to cover their losses abroad. For the same reason the studios in Germany have not been coming nearly as much material of late, and the proprietors of these latter have also suffered very badly. The people in the country have not the money to spend on what they term an article of luxury, and the general grumble among photographers that the past year was one of the very worst on record. Besides the money scarcity, there have been other influences at work, all of which have helped to make the lot of the photographer still harder. Direct and indirect taxes have gone up rapidly within the last few years, increasing very considerably the cost of living; and, what may even be worse than that, since it acts more directly, the numerous large stores established throughout the country have nearly all of them added to their manifold activities that of photography. They have departments for the supply of amateurs and also studios. These studios have become very popular with the people, possibly because they are convenient and cheap. Certainly it is not for the sake of the work turned out of them, which, so far as I have seen it, is certainly cheap and nasty. Prices in these store studios have been cut down to starvation point, doubtless be-

cause the warehouses are able to buy on more advantageous terms than the professional photographers. The latter find it hopeless to strive against these formidable competitors, and many take the gloomy view that ultimately the warehouses will ruin the whole of the photographic profession. At present the warehouses are bidding fair to accomplish this end. They have brought about an entirely new economic position in the profession, the working out of which may, unfortunately, go hard against photographers and their assistants, unless something unexpected happens to divert the new current. What that something may be short of legislation is a knotty problem to which no one has yet been able to suggest a reasonable solution.

Apart from this business crisis, the year that has just gone was not productive of anything of particular note. No outstanding inventions or discoveries have marked its progress in the field most directly associated with professional photography. In its scientific department German workers have been diligent in improving tele-photography, in which some progress has been made; and in that branch which they are making all their own, Röntgen photography, they have succeeded in bringing it to such a stage of perfection that instantaneous photographs may now be taken by it, and more wonderful still is the fact that by its means a photographic record can now be made of the beating of the heart. But all this means more to the medical and scientific world than to the photographic profession.

Much is expected from the exhibition to be held at Dresden. It is hoped that this event will rouse a new interest in the trade and the profession, giving to both a new impetus and new life.

RICHARD THIRSK.

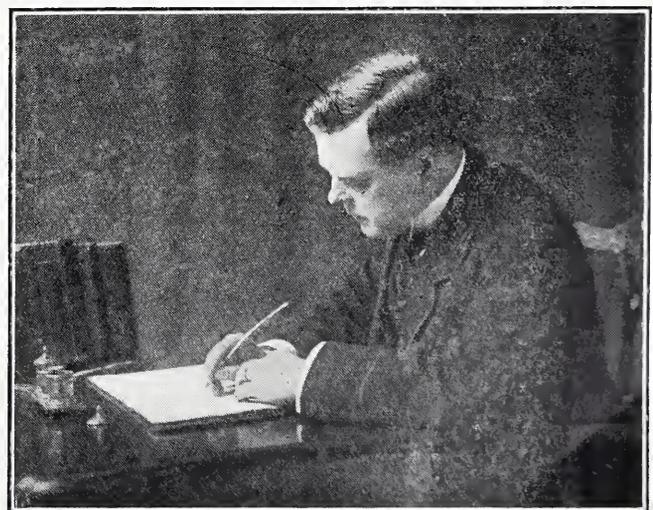

MR. F. W. SPEAIGHT'S SECOND SCHEME FOR AN IMPROVEMENT OF LONDON.

ABOUT the time these lines are being written there is being given, by Mr. F. W. Speaight, at the galleries of his firm, Messrs. Speaight, Ltd., 157, New Bond Street, a Press and private view of drawings and plans relating to an important

Speaight in 1905, and by him brought before two Governments, a Progressive and a Moderate London County Council, and the governing bodies of the City of Westminster, and the Boroughs of Marylebone and Paddington, and, as every Londoner knows, carried out in fact last year. It was immediately following

From a photograph showing the view from the Horse Guards Parade in the direction of the Park as it is at present.

Mr. F. W. Speaight.

suggested improvement of London upon which Mr. Speaight, assisted by Mr. C. E. Mallows, M.R.I.B.A., has been engaged for the past year. It will be within the recollection of many readers that the suggestion for the improvement of the junction of Park Lane, Oxford Street, and Edgware Road, by detaching the Marble Arch from the Park, was made by Mr.

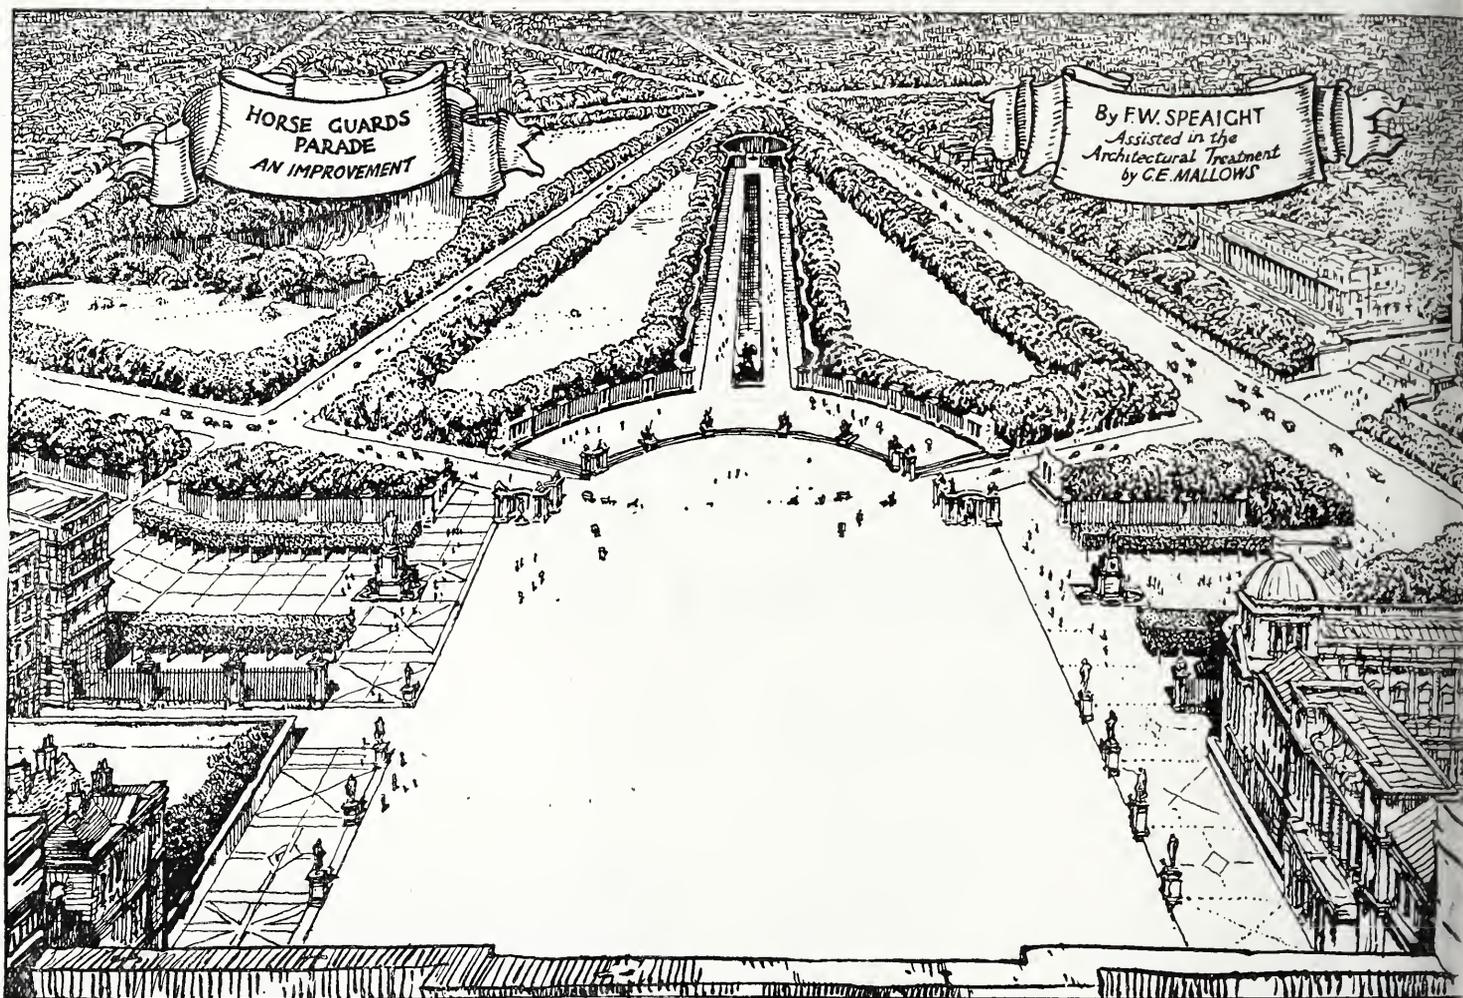

the completion of the Marble Arch improvement, and arising out of the congratulatory phrase of the Right Hon. John Burns—"There is more of the same work to be done"—that Mr. Speaight conceived the idea of this second improvement, which is, in a word, to give shape and beauty to the Horse Guards Parade, and to form, as an extension of it towards Buckingham

Palace, an allée in which may be placed the statues of British military heroes which are at present scattered about London, many in vortexes of traffic, where they can be inspected only at risk of sudden death by motor-car.

The drawing shows the Horse Guards Parade and its surroundings as they would appear if the proposed improvement were carried out. On the extreme right is the York Column, at the foot of Waterloo Place, with Carlton House Terrace next to it. The centre of the drawing contains the Parade ground remodelled into a *Place* of real form and design, and beyond it the canal extending from the apsidal end of the Parade to Marlborough Gate, and flanked by statues commemorative of famous military characters in the early history of England.

acquiring a public house or other property for an ordinary street widening."

Already artists and art critics, such as Mr. Hamo Throcroft and Mr. M. H. Spielmann, have expressed their commendation of Mr. Speaight's scheme, but perhaps the most convincing eulogium is that of Mr. E. F. Knight, the war correspondent who writes that the execution of the plan "would make of it one of the most beautiful and stately open places in the world cities. I think that there could be no more fitting a place which to bring together the now scattered statues of our military heroes. This British Valhalla under the open sky would command the attention of visitors to London and Londoners themselves to linger and admire; and to read the inscriptions on these monuments

The Horse Guards Parade.—A bird's-eye view, showing how it would appear if the suggested improvement were carried out.

In a book published yesterday Mr. Speaight dedicates this improvement "to his fellow-citizens in the hope that by its realisation, dignity may be added to the capital of the British Empire, and a suitable position allocated to the memorials of the soldiers who have fought their country's battles," and in a brief foreword points out that the suggested scheme "would endow London with an ornament of much magnificence. It would compare favourably with the Piazza del Popolo in Rome, the Siegesallee in Berlin, or, one might even say, the world-famous Place de la Concorde in Paris, thus giving to the greatest capital in the world a distinction hitherto denied it, and it would figure as a noble complement to the Victoria Memorial and the Mall immediately contiguous. The cost of the improvement amounts to £59,000 odd, a sum not in excess of that frequently paid in

erected in memory of those who fought gloriously England would be likely to inspire our own young men with a sense of the military duties which they owe to their fatherland."

The public work of Mr. Speaight since the time when a youth of eighteen he founded the Holborn Saturday League for the benefit of the working class, has been so various, and has been brought to such successful issues, that one may find sanguine of the present important improvement in the topography of London being carried out. It will be inevitably delayed in its passage through Government departments, but from the great publicity being accorded it in all sections of the Press, there would seem every reason to prophesy for it a speedier accomplishment than in the case of the Marble Arch

THE "PHOTO-SECESSION" held a "one-man" show of photographs, by Baron A. De Meyer, in their exhibition galleries at 291, Fifth Avenue, New York, from February 4 to 22. The collection,

though small, was representative of the Baron's well-known work in monochrome, and also included twelve colour transparencies of "still-life" subjects.

PHOTOGRAPHING ANIMALS UNDER WATER.

A recent report from the U.S.A. Bureau of Fisheries on "The Photography of Aquatic Animals in their Natural Environment," published in an abridged form in the "Scientific American," from which journal we obtain the following account of the method, described by its inventor, Professor Jacob Reighard, of the University of Michigan.—Eds., "B.J."]

It is difficult for operators to photograph submerged objects with a camera placed in the water, and to result in only partial success, and this but rarely. Failure is due to the fact that the photograph is made through the surface of contact of two media, water and air, of very different refractive indices. If this surface is not perfectly smooth the light from an object beneath it is, upon emergence, refracted unequally at different points of the surface, and cannot form a clear image on the ground glass.

Whether the water is smooth or rough, its surface reflects a part of the light which strikes it, and thus acts as a mirror. This reflected light makes it impossible, except under unusual conditions, to obtain photographs of submerged objects. To obtain such photographs the surface of the water must be smooth, and light reflected from the surface must not enter the camera.

The method with which submerged objects are to be photographed is to remain above the surface of the water, means must

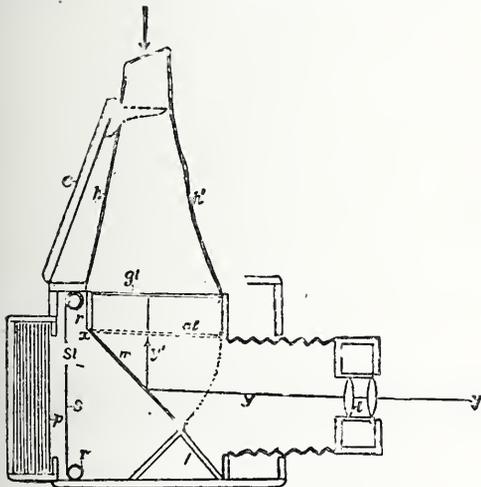

camera must be shifted until it does. The operator will see also the shadow of the screen. This should not fall on the object to be photographed. The screen should, if possible, be adjusted by slanting it or moving one of the poles so that the sun strikes it nearly edgewise, but yet does not strike that face of it which is toward the camera. If this adjustment is properly made, the shadow of the screen is a very narrow band, which lies beneath the screen and a little nearer the camera than its lower edge. The full sunlight then falls on the object, while the rays from distant objects, which would otherwise be reflected into the camera from the surface of the water, are cut off. If the sunlight is permitted to fall on that face of the screen which is toward the camera, it is reflected from the screen to the surface of the water and thence into the camera. A picture taken under these conditions may show, besides the object under the water, also the screen itself, although this image of the screen is usually so faint that it does not interfere with the use of the picture for scientific purposes.

When the screen has been properly set, the operator has merely to adjust the camera and make the exposure in the customary way. If the subjects are fish they will usually have been frightened away, but if the fish are engaged in nest building or in some other occupation that attracts them to a particular spot, they will, in most cases, return after a time varying from five minutes to an hour. The operator has merely to remain quiet until this happens. The photographer may focus his camera on the spot to which the fish is likely to return and then withdraw and operate the camera from a distance by pulling a string or pressing a bulb when the fish returns. The method is of most use in securing photographs of the nests and habits of fish in shallow water, yet the writer has succeeded by means of it in making some satisfactory photographs of fish on the nest.

If the surface of the water is not smooth it may be made so by a water-glass, which may be constructed as follows: A square frame is made of heavy galvanised iron, and measures 3½in. deep and 12in. on each side within. One of its edges (the top) is turned outward ¾in. and then downwards ½in. to form a lip. This stiffens the frame and tends to prevent water from sloping into it. The lower edge of the frame is turned outwards about ½in. to form a flat surface, against which the glass, 13in. square, is bedded in aquarium cement. After the glass is in position four trough-shaped pieces are soldered to the sides of the frame and to one another in the manner shown in the figure. The free edges of these pieces project inward beneath the lower surface of the glass and support it. Before the pieces are soldered into place cement is placed between them and the lower face of the glass. The whole border of the glass is thus bedded in cement on both surfaces and at the edge. To protect the glass when not in use a flat cover is provided, which fits against its lower face. Such a water-glass may be floated over the object to be photographed, and a screen set up independently of it, or the screen may be attached to the glass itself. For the latter purpose a piece of ½in. band iron may be bent to form the three sides of a rectangle, 8in. by 12in., and this may be rivetted as a bail to the inside of the frame, about 8in. from one side. The bail should turn on the rivets so that it may be depressed into the frame when not in use. A screen may be formed by raising the bail and tying a piece of black cloth from it to the opposite side of the frame. In shallow, running water it is desirable to support the water-glass from the bottom in order that it may not sink so much as to displace or distort the object to be photographed. It may be supported on four iron rods which run through metal sleeves soldered to the four corners of the frame. The rods may be fixed in any position in the sleeves by means of set screws, and may project upward far enough to support the upper edge of the screen.

The writer has used water-glasses of this type varying in size from 1 to 3 ft. square. The size most suitable for field photography is 2ft. square, since this may be transported by hand.

The method described is suited only to shallow water, where the camera may be supported from a firm substratum. In deeper water the unsteadiness of the boat would interfere with the manipulation

Ground glass; h, h', hood; l, lens; m, mirror in position during focusing; m', mirror, showing position during exposure; p, sensitive plate; r and r', rollers of focal plane shutter; s, the shutter; sl, slot in shutter; x, hinge on which mirror turns; y, y', ray of light traversing the lens and reflected from the mirror to the ground glass.

and (1) greatly to reduce the amount of reflected light entering the camera from the surface of the water, and (2) to render the surface of the water smooth. We may consider first the case in which the surface of the water is smooth, so that it is necessary only to minimise surface reflection.

The method to be described is best adapted to objects in water more than 2 or 3 ft. deep, and the best results are obtained when the water is less than a foot in depth and when the camera is one foot from the object. It can be focussed. Since the objects to be photographed are usually in motion, and since the surface of the water may at any time be roughened by a puff of wind, it is best to use a lens of a speed less than f8. The operator should first select the point from which the picture is to be taken. He should, of course, have the sun behind or to one side. If possible he should stand on the bank or on some fixed support which extends above the surface of the water.

If the operator is unable to find a fixed emergent support he may stand on the exposure while standing in the water. The camera may be held in the hand, or may be supported on a tripod which can be sunk to the bottom. As the legs of the tripod are likely to sink into the bottom they should be extended to their full length. Where the bottom is firm an elevated position may be obtained for the camera by using a tripod with legs some 10ft. long, such as dealers use in making pictures of large groups. In such tripods one may use a ladder by which the camera may be reached.

When the operator has placed his camera and roughly adjusted it, he should set up a screen to cut off the light reflected from the surface of the water into the camera. Any piece of dark fabric, blanket, shawl, or for small objects even a coat, may be used.

The screen is mirrored in the surface of the water. The object to be photographed should fall within the limits of this mirrored image as seen from the camera. If it does not, the screen or the

of a water-glass or screen. It might be possible, however, to construct a boat of which the water-glass and the screen should form constituent parts. The method described permits only of views at angles of from about 48 deg. to 90 deg. to the water's surface. Since it is not practicable to place the camera far above the water at these angles or to use screens of very large size, the pictures that may be taken are of near objects, and the field covered by them is of limited extent. If a water-glass is used, the camera must be near it, and the field is limited by its frame. The method is, however, the only one known to the writer for certain kinds of work.

A camera for submerged use, made after the ordinary type, must be securely closed before submerging it, in order to protect the lens and the plates from the action of the water. While the camera is under water it is not possible to remove the plates or plate-holder in order to substitute a ground glass for them. In subaquatic photography the objects to be photographed are all near, and if instantaneous work is to be done the lens must be very rapid. It is therefore important to be able to focus accurately on the ground glass under water, and this might be accomplished by using two identical cameras (twin camera) united so as to form one instrument. One of these contains the plates, and has a lens provided with a shutter. The other camera carries the ground glass. The same focussing mechanism operates both cameras, so that when a sharp image is formed on the ground glass of the one an identical image strikes the sensitive plate in the other when the shutter is operated. One of the cameras serves merely as a focussing finder of full size. A camera of this type, properly constructed of metal, could undoubtedly be used successfully under water, though it has the disadvantage of being unnecessarily cumbersome and expensive.

A 7 x 5 camera of the reflex type just described, with a magazine holder for twelve plates, was used by the writer to obtain submarine photographs at Tortugas, Fla., during the season of 1907.

The apparatus was carried to a boat, or, if it was to be operated near shore, to the shore. In working with the help of a boat the operator wades on or near the coral reef with his head and shoulders above the water. The boat, with an attendant on board, is anchored near. The operator, with the help of a water-glass, now seeks a favourable place for operations. As he moves about the reef the fish at first seek shelter in the dark recesses of the coral reef, but if he selects a favourable place and remains quiet they soon reappear. They are at first wary, but soon grow bolder, and after half an hour or so pay but little attention to him. There is a great difference in wariness among different species of fish. At first only one or two species appear, demoiselles and slippery-dicks usually, then the number of species gradually increases until the shyest butterfly-fish and parrots come within 6ft. or 8ft. of the operator. He then has the camera passed to him from the boat. It floats with the upper part of the hood protruding, and may be easily turned toward any point on the horizon, or even tilted so as to be pointed at a considerable angle upward or downward. The operator has now merely to direct the camera at the fish, while he focusses with his right hand. He must often wait some time before the fish come to the point selected or assume the desired attitude. Often they may be enticed by throwing in a bait of crushed sea urchins or pieces of crawfish. They are in constant motion, so that he must as constantly focus. He often misses a long-awaited opportunity because the fish moves on or takes a wrong attitude before he has had time to focus sharply; but when the favourable time comes he presses the release stem and the exposure is made. JACOB REIGHARD.

CANVASSING FRAUDS AT CARDIFF.—Three hundred and fifty photographs, of all kinds and all sizes, were displayed at the Cardiff Police Court on February 26. It was alleged that they were photographs sent to be enlarged, and never afterwards seen by their owners, and they had been found by the police in the house of Charles Hodge, who has traded in Cardiff as the Phoenix Portrait Company for some time, and who was charged with stealing moneys from a number of persons by means of a trick. The alleged offences had been committed in connection with what was known as the photographs enlargement business. Hodge called at the houses, and after securing a photograph, to be enlarged at a price fixed, and a deposit, was not seen again, nor were the photographs returned. The prisoner was remanded, bail being accepted, prisoner in £20. and two sureties in £20 each.

Photo-Mechanical Notes.

Half-Tone Blocks from Continuous-Tone Negatives.

WITH reference to the allusion recently made by a writer in this column to Dr. Albert's new process in the review of Klimm's "Jahrbuch," it has occurred to me that some abstract of the allusion on the "copying screen" by R. Russ would be of interest to our readers.

After going into the functions of the cross-line screen in ordinary screen-negative making to some extent, Herr Russ points out that it has been desired to print direct, without the aid of a dot matrix, on metal, but that there was not the same spreading action in colloid solution sensitised with bichromate that there is in iodine or bromide of silver films.

In 1893 Dr. Albert thought of obtaining this sideways action by a change of angle of the light falling on the plate, and therefore he constructed the first form of frame, which he called the "Walraster" (oscillating screen). This frame contained a cross-line screen, the negative, and the sensitised metal plate, and was held in two rings so arranged that it could be turned in two axial right angles to one another. If light falls upon the screen separately while the frame is at rest separate points only will be formed, but if the frame is turned sideways the points will become elongated, according to the direction in which the frame is turned. If it is turned in all directions the dots will spread sideways in all directions, and so ultimately join up. With a negative between the screen and the sensitised metal plate, a certain exposure will give isolated dots all over the plate while the screen is at rest. If we now move the frame we shall cause the joining-up to commence at first in the extreme shadows, and gradually throughout the lower tones to the middle tones, according to the length of the exposure and the density of the different parts of the negative, leaving isolated dots under the densest parts of the negative. Advantage is taken of this principle to vary the character of the reproduction in a similar way to that employed in ordinary half-tone negative-making, though in the latter case it is done by the use of shadow and high-light stops.

The movement of the frame can be exactly regulated in either or both directions, so that the shape of the dots may be varied. Power is provided by a small electric motor.

This form of apparatus has been in use for many years at some of the principal establishments in Germany for three- and four-colour reproduction work, but Herr Russ states that Dr. Albert has now improved upon it by constructing what he calls a "Drehrasche" that is, a revolving screen. In this form of apparatus the screen (opposite to the centre of which, at a suitable distance away, is the light source) remains in one plane. The frame moves during exposure in this plane by means of suitable direction rails, in eccentric circles, so that the motion is sideways, to and fro, or up and down. Each motion can be given independently, or the motions can be combined so that either a horizontal, a vertical, an elliptical, or a circular motion may be given. The principles which govern the sizes or shapes of the dots produced are the same as in the earlier frame. By varying the amount of time the frame is at rest and the time it is in motion, so will the dots be more or less joined up. It is thus quite easy to obtain dots of circular or square shape, those of elliptical shape, such as are obtained in the ordinary screen negative by slit stops.

The great advantage of the method is said to be the sharpness of the results, as the metal plate is in direct contact with the continuous-tone negative. This is particularly useful for oil painting in which the brush-marks must be shown, or for water-colour on rough paper or fabrics. It is also claimed that the colour rendering of a continuous-tone negative is better than that of a direct screen negative.*

Dr. Albert has now applied the process to chromo-lithography. It is clear that, by varying the exposure with the apparatus, he can make from the same negative several different kinds of prints, giving varying amounts of tone. It is said also that he has been able to overcome the objectionable screen pattern formed by printing screen

* This is probably only true in cases where the contrasts are excessive for screen negative making.—A. J. N.

a pictures one on top of the other, either by using a special n, or by peculiar use of the ordinary screens. connection with the process is used also the cold enamel method inting, which Dr. Albert calls "Drakotypie." In this a solution sin first covers the plate, which is then coated with the ordinary omated fish-glu solution. After printing development takes as usual, and leaves some of the resin coating visible, which, ft the plate is dried, is dissolved away by alcohol, since the ular resin resist used is not soluble in either benzole or turpen- the resist remaining where it is protected by the insoluble fish- on top. The glue may now be removed and a dot print remains ed of the resin resist. This resist is said to be equal, if not or, to the best enamels, and as there is no heating required, it les zinc to be used without the difficulties occasioned by the ng in the ordinary enamel process.

* * * * *
 The first account we have of this process, or a similar one, was contribution to the "Process Photogram" of 1901, page 115. his it was stated that the screen was placed between the plate the negative, and the light source moved instead of the frame. he "Process Photogram" for 1902, p. 129, there was a further nunication from apparently the same correspondent, in which ave a diagram showing the screen in this case placed above the tive and the negative itself in contact with the metal plate. or as I am aware, that is all that has been published here about process, and all that we have heard of it in England until the ent activity of Dr. Albert's agent in pushing the sale of the ess, which has now been taken up by one or two important firms.

A. J. NEWTON.

PHOTO-MECHANICAL PATENTS.

The following patents have been applied for:—
 PHOTO-ENGRAVING.—No. 3,194. Method for the production of photo-
 engraved printing rolls or printing bands. Eduard Mertens, 322
 High Holborn, London.
 PRINTING-PLATES.—No. 3,699. Process for preparing printing-plates.
 Hans Strecker-Aufermann, 72, Cannon Street, London.

Exhibitions.

QUEEN'S PARK AMATEUR PHOTOGRAPHIC ASSOCIATION.

Queen's Park Amateur Photographic Association (Glasgow) held its annual exhibition last week, when a strong collection of work met the judges, Messrs. Arch. Cochrane and J. E. Christie. A championship trophy was won by "Youth," the joint production of P. Mitchell and J. McClure. The classes included one for painting, the bronze plaque in this being won by J. Prentice. Bronze plaques were won by John Baird (2), Arch. Muir, P. Mitchell and J. McClure, P. Mitchell, S. W. Graham, J. McClure, H. W. Wilson. The loan section was a strong one, and included pictures by the late Horsley Hinton, Messrs. F. M. Sutcliffe, Geo. Hilderley, J. Digby Annan, G. L. A. Blair, Thos. Carlyle, A. W. Hill, Dan Dunlop, Mrs. R. Dunlop, J. M. Whitehead, Peter Orr, James Kissack, W. J. Hart, W. S. Crocket, and W. C. S. Ferguson.

MENNISTOUN AMATEUR PHOTOGRAPHIC ASSOCIATION.

Mennistoun Amateur Photographic Association (Glasgow) held its eighth annual exhibition in their rooms, when the quality of the work showed an improvement, but the quantity a decrease. Messrs. Arch. Cochrane and Dan Dunlop judged. In the open class bronze plaques were awarded Geo. Wackless ("Astonished," a delicate portrait) and R. Ure ("A Hillside Farm," a good "gum" example); highly commended, Thos. Carlyle and W. S. Crocket. In the class confined to associates of the Scottish Federation, the silver plaque was awarded (in a strong class) to Wm. C. S. Ferguson ("Eventide," a characteristic example of this worker's "oils"); bronze plaques to Mrs. Hamilton ("Daisy," a delicate child portrait) and Thos. Carlyle ("Westward Ho!" a breezy shipping picture); highly commended, W. S. Crocket and P. D. Nairn. The members' championship—the McGibbon challenge shield—was won by G. R. Johnstone; bronze plaques by W. Foulds, W. Ellis,

R. Stevenson, J. Paterson, and D. Rowan; and highly commended by D. Rowan (3), J. Paterson (2), W. Young (2), and D. McAulay. The Glasgow Photographic Art Circle panel, consisting of 30 selected pictures, was on exhibition, and there was also a loan collection of lantern slides.

FORTHCOMING EXHIBITIONS.

- February 20 to March 6.—Edinburgh Photographic Society. Exhibition Secs., Edinburgh Photographic Society, 38, Castle Street, Edinburgh.
- February 20 to March 20.—South London Photographic Society. Sec., H. Creighton Beckett, 44, Edith Road, Peckham, S.E.
- February 22 to March 6.—Birmingham Photographic Society. Sec., Lewis Lloyd, Church Road, Moseley, Birmingham.
- March 9 to 10.—G.E.R. Mechanics' Institution, Stratford, E. (Photographic Section). Sec., A. Woolford, 16, Grove Green Road, Leytonstone, N.E.
- March 11 to 13.—Coventry Photographic Club. Entries close March 5. Sec., W. R. Harris, 17, Allesley Old Road, Coventry.
- March 17 to 20.—Nottingham Camera Club. Sec., E. L. Kent, 3, Radcliffe Mount, West Bridgford, Notts.
- March 22 to 25.—Cripplegate Photographic Society. Sec., H. S. Cuming, 234, North End Road, Kensington, W.
- March 30 to April 3.—Sheffield Photographic Society. Entries close March 13. Sec., H. Merrill, 22, Harboard Road, Woodseats, Sheffield.
- March 31 and April 1.—Shropshire Camera Club. Entries close March 20. Sec., Harry W. Hughes, Kingsland, Shrewsbury.
- April 10 to 17.—Midlothian Photographic Association. Entries close March 31. Sec., B. Sherratt, 8, Castle Terrace, Edinburgh.
- April 27 to May 1.—Maidstone and Institute Camera Club. Sec., J. Harris, 23, Knight rider Street, Maidstone.
- April 29 to May 17.—Photo Club de Paris. Entries close March 15. Secretary General, Photo Club, 44, Rue des Mathurins, Paris.

Patent News.

Process patents—applications and specifications—are treated in Photo Mechanical Notes."

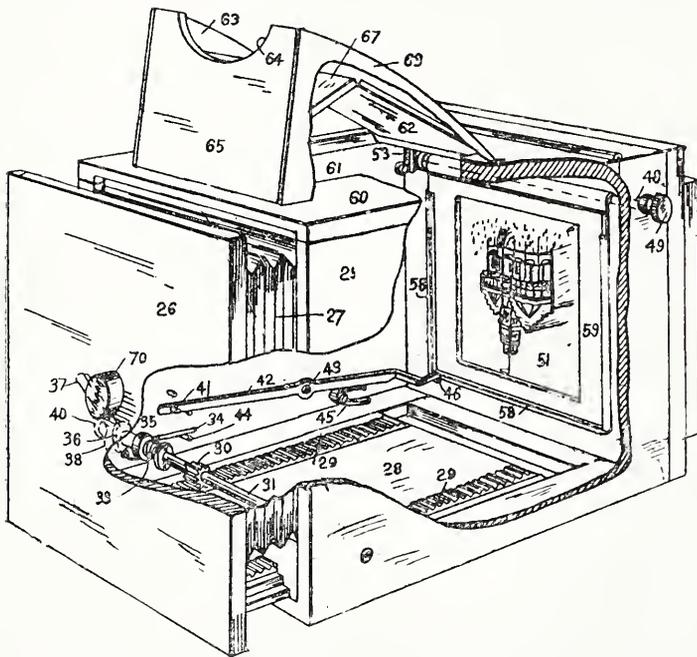

- The following applications for patents have been received between February 15 and February 20:—
- CINEMATOGRAPHS.—No. 3,721. Improvements in the arrangement of cinematograph curtains. Harry Stanley Marks, 56, Ludgate Hill, London.
- CINEMATOGRAPHS.—No. 3,722. Improvements in and relating to cinematograph apparatus. Harry Stanley Marks, 56, Ludgate Hill, London.
- SCREENS.—No. 3,762. Improvements in screens for use with cinematograph magic lanterns and other optical projection apparatus. Mario Ganzini, 4, South Street, Finsbury, London.
- REFLECTING DEVICE.—No. 3,763. Improvements in reflecting devices for use in photographic studios. Adalbert Iser, 231, Strand, London.
- SHUTTERS.—No. 4,005. Improvements in shutters for photographic apparatus. Bernhard Evertz, 345, St. John Street, London.
- CINEMATOGRAPH-PHONOGRAPH.—No. 4,126. Improvements in apparatus for taking and displaying photographs of moving objects and for photographically recording and reproducing sounds. Eugène Augustin Lauste, 24, Southampton Buildings, London.
- EXPOSURE METER.—No. 4,243. Improvements in exposure-indicators for photographic plate-holders. William Phillips Thompson, 6, Lord Street, Liverpool.

COMPLETE SPECIFICATIONS ACCEPTED.

These specifications are obtainable, price 8d. each, post free, from the Patent Office, 25, Southampton Buildings, Chancery Lane, London, W.C.
The date in brackets is that of application in this country; or abroad, in the case of patents granted under the International Convention
 FULL SIZE FOCUSING CAMERAS.—No. 7,512. 1908 (February 12, 1908). The invention relates to cameras of the type in which a

full size image is focussed, not on a ground glass, but on a white opaque surface placed in the focal plane, the image being viewed from an aperture or through an eye-piece in the front part of the camera. In place of the flexible blind of a focal-plane shutter which has been suggested for the opaque focussing the inventors employ a rigid sheet or plate, hinged and released so that it effects the release of a focal-plane or other shutter. Mechanism is also provided whereby a single adjustment compensates for the distance between the sensitive plate and the surface focussed upon. The figure shows one of several forms of camera embodying the invention.

In operation the camera is set by the leaf 51 being depressed with the stop end 46 securing in position showing the white opaque surface 51 towards the lens. If an instantaneous picture is required the shutter is also set in front of the plate or film, and the whole is ready for action. The desired picture is focussed on the opaque surface 51 of the leaf being seen through the eye holes 68 by the operator leaning over the back of the camera with his forehead resting in the concave 64, the image appearing in an uninverted position, though actually it is inverted. The focal distance is adjusted by the manipulation of the milled head 40. But to ensure that the surface of the photographic plate or sensitive film will at the proper moment occupy the position of the

opaque surface 51, the camera is operated as follows:—The lever 37 is pressed forwardly until finger 34 reaches stop pin 41, causing the grip 38 to hold on collar of spindle 31 and to revolve it so as to draw the panel 26 with lens 70 backward the proper distance. This movement releases the catch 46 and allows the leaf 51 to fly up out of the way, which movement again operates by pendant 53 the spring of the shutter 56 to expose the plate. Joseph Gaut, 3, Cary Street, Leichhardt, near Sydney, New South Wales; and Harrington and Company, Ltd., 386, George Street, Sydney, New South Wales.

TRIMMING PRINTS.—No. 11,709. 1908 (May 29, 1908). The invention relates to the addition to the type of print trimmer in which a graduated board is pressed down against a pivotted blade, of a transparent guide in the form of a narrow strip of celluloid, which is fixed to the outside edges of the board with its straight top edge in alignment with the cutting edge of the fixed shear. The print can thus be stripped between the board and the transparent guide, and there is no need to raise the guide every time a print is trimmed, as is necessary when the guide covers the whole board. If desired, the celluloid may be ruled with a series of parallel lines whereby prints may be trimmed with a margin of any desired width round the picture. John Merrett, Trowbridge, Wilts.

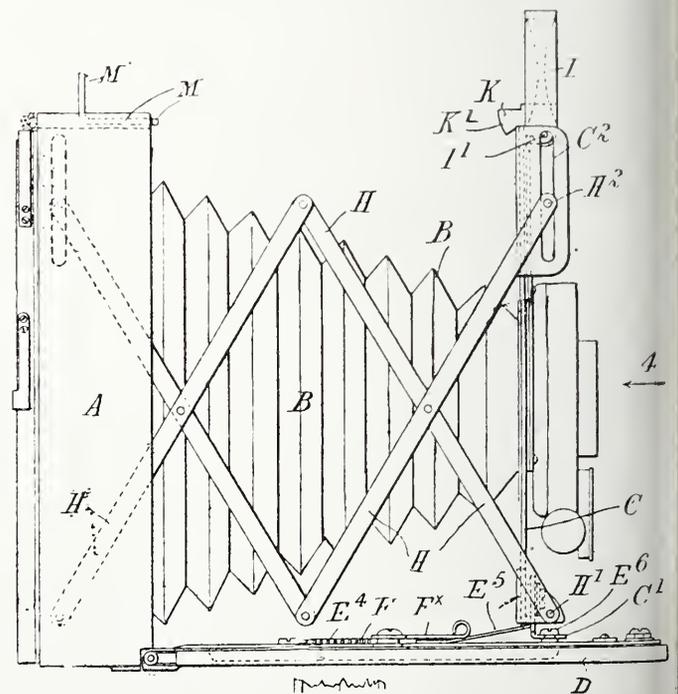

CAMERA BASEBOARD RUNNERS.—No. 26,535, 1908 (December 8, 1908). The invention consists of the device whereby a continuous line of runners is provided for the front of a camera, both on the body or case and on the hinged or falling baseboard. A gap is thus avoided, but the baseboard may nevertheless be folded into the

body when closing the camera. The device consists in mount the runners in the body so that they may move or slide back with the baseboard as it is folded, and move or slide out as the baseboard is extended to join up with the runners mounted there. Thus the movable body runners may be mounted in a sliding plate and connected by side links with the runners on the baseboard, the ends of the runners being in contact. The folding closing up of the baseboard forces the runners inwards out of way of it closing, and the opening of the baseboard draws them outwards again over the hinge so as to avoid a gap between the ends of the two sets of runners. The Thornton-Pickard Manufacturing Company, Limited, Arthur Gray Pickard, and Francis Slinger, all of Altrincham, Cheshire.

FOLDING CAMERAS.—No. 5,630, 1908 (February 18, 1908). The invention relates to folding cameras, in which a lazy-tongs connect the front and back of the camera is employed. The hinged baseboard is not provided with guides for the lazy-tongs, but the latter, attached to the front of the camera, is left free to move to either side, as well as up and down, so that the front can be given both a "rising" and "cross" movement. This is done by means of a foot (to which the lens front can be attached), which is guided in grooves in the baseboard and actuated by rack and pinion for focussing. The camera is further provided with self-folding and self-erecting view-finder, and a signing-pin likewise moving in conjunction with the latter.

The operations of opening, closing, and focussing the camera are as follows:—

If the camera is closed, the folding baseboard, D, which is acting as a lid or cover for protecting the front, C, and interior of the camera, is released from its fastening, M, and pulled down in

position at right angles to the back of the camera body, in which position it may be held against further opening movement by suitable means. The lens front, C, is then pulled out until it reaches the position aforesaid. When it is desired to focus, the focussing plate (viewed from the front, C, holding the lens) is moved backwards and forwards by the focussing device. To close the camera, the lens front, C, is released from its catch or catches, and pushed back home into the camera body, together with the lazy-tongs that are connected to it. The baseboard is then folded up into position, and engaged and detained by the catch, M, or any suitable kind of catch, and the camera is compactly closed into very small dimensions. Arthur Lewis Adams, 24, Charing Cross Road, London, W.C.

CINEMATOGRAPH MECHANISM.—No. 7,620, 1908 (April 6, 1908). In place of the usual two-armed spring a form of clutch is provided which bears not at two places only, but all round the spool plate

thus gives a more uniform pressure sufficient to enable the roller to drive the spool, but allow of a gentle slipping action. On Lewis, 4, Wilde Street, Liverpool.

Analecta.

Extracts from our weekly and monthly contemporaries.

Photogravure Effect in the Bromoil Process.

H. HEWITT, writing in "The Amateur Photographer and Photographic News" for March 2, says:—"If a little care is exercised a true plate-mark may be impressed round a bromoil print with a white margin. The oil or bromoil print, which should be green pigmented if possible only a few hours, is damped on a block, and laid down on the bed of a copper-plate press, on a sheet of card-board cut exactly to the size of the plate-mark required. The print a mask of thin paper is placed, the opening showing, of course, the exact amount of the picture required. The plate employed in photogravure printing is now laid over the whole, the impression pulled in exactly the same way as a copper-plate impression would be. If the precautions are observed, the whole of the ink leaves the gelatinised paper and adheres to the plate paper, the finest details being preserved. Prints which it is proposed shall be transferred in this way are better done in some ink which does not dry with great rapidity. The Rawlins inks, thinned if necessary with double-boiled oil instead of a siccative, will be found satisfactory, though any of the inks prepared for the process will answer for transferring is done within an hour or two of pigmentation. The Sinclair inks prints a couple of days old, have transferred very readily. Papers which have a fine grain, such as the special oil paper, Nos. 1 and 2 of the Autotype Company, will produce the best printed prints in which that grain is repeated, the reason being that the brush action in pigmenting leaves a little of the ink in the hollows than on the projections of the gelatinised surface, and when all this ink is transferred to the smooth paper the granular effect is retained."

Inks for Bromoil.

Harold Baker, in an excellent paper on the Bromoil process, in the March issue of "Photographic Scraps," says:—"The ink is important, and I have succeeded best with ordinary printer's ink, sold in pound tins. A pound tin should last for years. A great variety of colours is not necessary. One of good quick-drying half-tone black, one of burnt umber, and a small one of red will give an almost endless variety of cold black, warm black, innumerable browns, and reds. It is well to choose a bright red, as it is 'degraded' by the addition of burnt umber and black. In all cases quick-drying colours should be used. A small quantity of ink is taken out of the tin with a palette-knife, or squeezed out on to the tile or piece of opal, and spread out thinly. If a picture is to be made, the several colours must be mixed thoroughly with the palette-knife. The ink must be very stiff, like butter, but sometimes it will need thinning."

Films from Glass Negatives.

The "Photographic Monthly" for March Mr. Fred G. Palmer gives the following method of obtaining films from glass negatives:—"Take a piece of glass, 5 x 4, if a 1/4-plate is being treated, and

while the gelatine is being soaked off the negative in the hydrofluoric acid bath, the selected piece of glass must be thoroughly cleaned, washed in water and dilute nitric acid, then in alcohol, after which dried and carefully polished with a dry flannel. Now, with a wad of damp wool draw a line about 1/2 inch in width all round the edge. Next pour on a coat of photographic collodion and set aside to dry.

While that is drying, remove the gelatine upon which is the important photograph, from the acid bath, and after washing it in two or three changes of water, plunge it into a bath of 50 per cent. alcohol and 50 per cent. water, in which it will be contracted to its original size. Next, place it in a good sized basin of water, in which the collodion-covered plate has been already placed, and float it into position on it. There is great necessity, of course, to remove all air bubbles, by gently pressing with the fingers and smoothing them away towards the edges. Lift out, and, when drained, set aside to dry; when that is thoroughly accomplished, coat again with collodion. Let this set hard, and when that stage is reached a sharp knife may be run all round the plate about one-quarter of an inch from the edge.

The collodion will peel off and the negative will be between the two layers, safely preserved from wet, easily handled, perfectly flat, and may be used on either side.

New Books.

"The South African Photographic Annual, 1909." Edited by H. Mudie Thomson. Cape Town: Central News Agency, Ltd. London: A. Henderson.

THE editor explains in the preface to this album of photographic reproductions that he has roughly divided his space between the pictorial work of South Africans and that of other countries of similar climatic and geographical features, for which reason "the leading British workers could not be enlisted, on account of the widely different atmosphere in which they exercise their splendid talent." If a production which for some incomprehensible reason is given the place of honour on the frontispiece is indigenous to the tonic air of the Cape Colony—well, thank Heaven for the much-abused weather of the British Isles!

Treating the whole collection in regard to the claim made for its distribution, viz., the advancement of pictorial photography "in a land of many restrictions and few encouragements," it must be confessed that it were better for the student of photographic pictorialism that he should never see many of the photographs here reproduced, certainly not in a volume in which no discrimination is offered between good and bad, where Dührkoop's "Twilight," very badly reproduced, rubs shoulders with dozens of examples of the most ordinary kind of work. This is not to advance photography. The South Africans have "Photograms of the Year"; if they will not learn from that, they certainly will not from this scrapbook of half-tones, which suffers in the first place from containing too many pictures, and in the second from the absence of distinction between good and bad. Curiously enough, we can find no representation of the only South African photographer whose work is at all known here—Mrs. Caleb Keene.

AN INTERNATIONAL EXHIBITION OF PICTORIAL PHOTOGRAPHY was held in New York, under the auspices of the National Arts Club, from February 2 to 20. The British section was well represented, Messrs. J. Craig Annan, Walter Benington, Archibald Cochrane, George Davison, and Frederick H. Evans being amongst the exhibitors, whilst earlier photographic work was illustrated by a selection from the photographs of the late David Octavius Hill and Mrs. Julia Cameron. The American exhibit was also a strong one, including, amongst many others, the names of C. Yarnall Abbott, A. L. Coburn, Frank Eugene, Benedict F. Herzog, Mrs. Gertrude Käsebier, Joseph T. Keiley, W. B. Post, Eduard J. Steichen, Alfred Stieglitz, Mrs. Eva Watson Schütze, and Clarence H. White. France was represented by MM. Robert Demachy, R. Le Bégue, and Major Puyo: whilst the Austrian and German exhibit included the works of Hans Watzek, Hugo Henneberg, Heinrich Kühn, T. and O. Höfmeister, and Baron A. de Meyer.

New Apparatus, &c.

Baby Accessories. Sold by F. E. Jones and Co., 22, Gray's Inn Road, London, W.C.

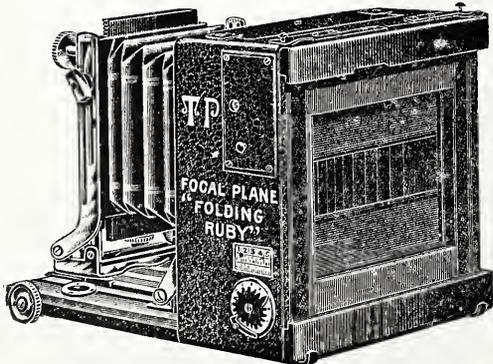

The miniature set of furniture shown in the accompanying illustration is supplied by Messrs. Jones specially for the portraiture of children in the studio, and very attractive the little table, settee, and other articles look, both in a photograph and when shown to the

fond mamma who has brought with her children to be photographed. Made in fumed oak, the set is sold complete at £4, inclusive of carriage and packing. Messrs. Jones keep a set on view in their showrooms, and can deliver within three to four weeks.

The Focal-plane "Folding Ruby" Hand-camera. Made by the Thornton-Pickard Manufacturing Co., Ltd., Altrincham.

A new model of the popular "Folding Ruby" camera of the Thornton-Pickard factory has been newly introduced with a focal-plane shutter built into the body of the apparatus, thereby fitting the camera for purposes of the most rapid photography without depreciating its value for ordinary hand-camera work, as well as for use upon a stand. In these three respects the "Folding Ruby" is admirably designed. Its special feature is the front, which provides abnormal rise, fall, and swing, and, in addition, very great extension. Moreover, it allows of the camera being used with lenses of the shortest focus, the baseboard for this purpose being made to drop forward so as to avoid cutting off the field of view by its projection. These features, which have obtained for the "Folding Ruby" a high degree of popularity, are embodied unaltered in the focal-plane

pattern. The focal-plane shutter is of the three-slit type, the medium aperture—about one inch—being for moderately fast exposures from 1-25th to 1-140th of a second. On pressure of a stud on the left of the camera this slit is wound out of the way, and the narrower slit—about one-quarter of an inch in width—brought into operation and employed for the most rapid exposures from 1-200 to 1-1,000 of a second. The two slits are rapidly interchangeable, but while the camera is set for the use of one the other cannot be used except by intentionally making the change. Lastly, there is a third

aperture in the blind the full size of the plate, which is a with equal convenience and allows of focussing being done on ground glass. The tension scale of the focal-plane shutter is with two sets of numbers, red and black, serving for the adjustment of the speed when using each slit separately. Time exposures of course, be given with the lens shutter, which is a Bau & Lomb "Automat," or a time exposure may be commenced with lens shutter and concluded, if thought desirable, by means of focal-plane.

The dimensions of the focal-plane "Folding Ruby," when in the quarter-plate size, are $4\frac{1}{2} \times 5\frac{3}{8} \times 5\frac{3}{8}$ in the quarter-plate size, not great dimensions for a camera which gives a total extension from lens to plate of 1 by taking advantage of the extending struts of the front. In the quarter-plate size, with three double dark-slides, focal-plane "Sunbeam" ever-set shutter, brilliant reversible finder and level, the price of the camera is £8 15s., if fitted with "Aplanat" lens, $f/7.7$; £10 in 5×4 ; £11 in postcard size; £13 5s. in half-plate. The Thornton-Pickard Co.'s list gives prices of the apparatus fitted with other standard lenses.

New Materials, &c.

"With risks of failure so extremely small, Successes really are quite *Certain-all*."

Thus sing Messrs. Ilford, Limited, of a new single-solution developed just introduced by them as "Certinal." This solution is diluted with from 10 to 30 times its volume of water for developing negatives, 1:20 being the strength advised for exposures. This we found to bring up the image in full detail a few seconds, and to give a negative of good printing density less than ten minutes. As Messrs. Ilford, Ltd., point out, "Certinal" is a developer of the rapid class—i.e., it rapidly brings up the image and builds up density steadily. Its action we found to be very clean and free from fog, both in the case of negatives and of lantern plates, for the development of which "Certinal" acts excellently. It is sold in bottles containing three ounces of the concentrated solution, at 1s. 6d. free 1s. 6d.

CATALOGUES AND TRADE NOTICES

COOKE LENSES.—The latest list just issued by Taylor, and Hobson, Leicester, very conveniently specifies the series of Cooke lenses now made, from the $f/8$ lenses (Series V) to the $f/4.5$ anastigmat, in all of which the three-lens system of construction is followed. It may be noted that the price of the new convertible Cooke is now reduced to £15 15s., or £19 19s., in "Volute" shutter. The price-list, which also shows the price of spirit-level and focussing magnifier made by Messrs Taylor, and Hobson, is sent free on application.

"PUSHAXE" COMPETITION.—By an error of transcription in the report of last week gave the name of one of the judges "William Grove" instead of as "Mr. William Crooke."

CITY SALE DINNER.—The 21st annual dinner of the City Exchange, of Fleet Street, Lime Street, Aldersgate Street, and Abchurch Lane, was held in the Manchester Hotel on February 27, Mr. Green, the proprietor of the firm, taking the chair. After the Royal Society concert the company then adjourned to the Windsor Room, where a concert was held, to which several well-known artists contributed. During the interval Mr. Robbins, the manager of the Sloan depot, proposed the health of Mr. and Mrs. Green, who responded to with great enthusiasm and musical honours. The "Firm" was then proposed by Mr. A. W. Ibbott, the manager of the Fleet Street branch, and the oldest employee of the firm mentioned the fact that he had been with the City Exchange for a period of twenty years, and interested his hearers in a short history of the progress and expansion of the firm during that time. The evening's entertainment concluded with the singing of "Auld Syne" and the charring of Mr. Green round the room by the staff. A flashlight photograph was taken at the dinner.

Meetings of Societies.

MEETINGS OF SOCIETIES FOR NEXT WEEK.

FRIDAY, MARCH 5.

Y.M.C.A. Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.

MONDAY, MARCH 8.

Yarmouth and District Camera Club. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.

Hampton Camera Club. Demonstration of "Ensyna." C. Robinson.

Southampton Camera Club. "Combination Printing." G. W. Lester.

Southampton Camera Club. "Rembrandt and his Work." W. R. Kay.

Southampton Camera Club. "Hand Camera Work in the Field." A. Pulford.

Southampton Camera Club. "Pigmoil." J. H. Liebreich.

TUESDAY, MARCH 9.

Southampton Camera Club. "The Absorption and Scatter of Light by Photographic Negatives Measured by Means of Marten's Polarisation Photometer." André Callier, Ghent. To be read by C. E. Kenneth Mees, D.Sc.

Southampton Camera Club. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.

Southampton Camera Club. Sale by Auction of Members' Superfluous Goods.

Southampton Camera Club. "Some Chronicles of an Ancient Kingdom." R. Mackay.

Southampton Camera Club. Y.M.C.A. Annual Meeting.

Southampton Camera Club. Lecturettes. J. Linley.

WEDNESDAY, MARCH 10.

Yarmouth and District Camera Club. Dutch Lantern Pictures. A. E. Staley & Co.

Yarmouth and District Camera Club. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.

Yarmouth and District Camera Club. "Some Tests of Photographic Shutters." E. A. Salt.

Yarmouth and District Camera Club. "Photographic Don'ts." J. Susans.

Yarmouth and District Camera Club. "Stereoscopic Photography." H. A. Files.

Yarmouth and District Camera Club. "Peeps at Life in the East." J. W. Hadfield.

Yarmouth and District Camera Club. "Bromide Toning." R. Matthews.

THURSDAY, MARCH 11.

Yarmouth and District Camera Club. "Controlled Prints on Satino Paper." L. Casson.

Yarmouth and District Camera Club. French Lantern Pictures. A. E. Staley & Co.

Yarmouth and District Camera Club. "Some Experiences of Lithography and Photo-Lithography." J. Widdop.

Yarmouth and District Camera Club. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.

Yarmouth and District Camera Club. Whist Drive.

Yarmouth and District Camera Club. "Light and Colour." L. Cumming, M.A.

Yarmouth and District Camera Club. "Finishing the Print." The President.

Yarmouth and District Camera Club. "Combination Printing." Ernest Luman.

Yarmouth and District Camera Club. "Celestial Photography." A. G. Mountfort.

Yarmouth and District Camera Club. "The Bromoil Printing Process." H. W. Jennie.

Yarmouth and District Camera Club. "The Oil Process." Chas. F. Stuart.

ROYAL PHOTOGRAPHIC SOCIETY.

Meeting held Tuesday, March 2, Mr. C. P. Butler in the chair.

Mr. F. Martin-Duncan read a paper upon "The application of photography to scientific research," in which he dealt particularly

with the use of the camera in biological research, illustrating the

practical and educational value of photographs in reference to plant

life. A brief discussion followed the paper in which Messrs. T. E.

Shwater, Oliver S. Dawson, and the Rev. F. C. Lambert took

part.

CRIPPLEGATE PHOTOGRAPHIC SOCIETY.—The tenth annual exhibition

will be held from March 22 to 25 inclusive, in the large hall of the

Cripplegate Institute, Golden Lane, E.C., the latest date for receiving

entries being March 6. Special attention is called to two of the open

classes—namely, Class F, which is for straight prints from straight

negatives, and Class G, for pictures in the oil, bromoil, ozobrome,

and gum processes only. Silver and bronze plaques will be placed at

the disposal of the judges, Messrs. F. J. Mortimer, A. H. Blake,

and J. B. B. Wellington, for award, and the society's medal will be

awarded to the best trade exhibit. Pictures now being exhibited at

the South London Exhibition will be collected free of charge to exhibitors

if so desired. Full particulars and entry forms may be obtained

from the secretary, Mr. H. S. Cuming, Cripplegate Photographic

Society, Cripplegate Institute, Golden Lane, London, E.C.

News and Notes.

L.C.C. CLASSES IN PHOTOGRAPHY.—A report from the Education Committee of the L.C.C. on the Council's schools shows that there is a class for photography at the Trade Schools for Girls, which is attended by twelve pupils, eight holding scholarships, three paying fees, and there being one free place. A new class for photography is to be opened here on April 1. The committee urge the Council to pass a resolution urging additional support from national funds for technical institutes and scholarships.

FELIX SCHOELLER, JR.—This well-known manufacturer of paper for photographic processes has established, at 10, George Yard, Lombard Street, E.C., a London branch, under the management of Mr. Kurt Schmidt, hitherto managing director of the firm. Inquiries and correspondence relating to business in Great Britain should be addressed to Mr. Schmidt.

NEWS PHOTOGRAPHY, PUBLIC-HOUSES ADVERTISING.—According to an article in last Friday's "Financial News," the latest development in press photography is a limited company, which anticipates making money by getting ahead even of the daily illustrated papers. The following account of the scheme is given as emanating from some one intimately concerned in its exploitation:—

"Our business is to be done, first of all, in London, and with the public-houses. There is hardly a public-house in London whose walls are not decorated with advertisements of one kind or another, for which no payment whatever is made. We intend altering this. We have already entered into scores of contracts to affix to the walls of a public-house a large rectangular frame. This will surround a border of pictorial advertisements, for which a charge will be made. The advertisements will include, besides the ordinary matter now appearing in a public-house free, local trade announcements, theatres, etc., but no reading matter will be allowed. The central space of the frame will be reserved for photographs of current events—in fact, of events which take place during the day, and which in the ordinary course would not be available to the public until the next morning. A special feature will be made of such items as movements of royalty, racecourse meetings, weddings, law-court cases, football, and cricket matches, and the like, and the fact that pictures of these events will be on view within an hour or so of their occurrence is bound to attract the public.

"The pictures will be changed four times a day. In order to keep up the supply we shall employ about twenty photographers. Ten, say, will constitute a free-lance corps, going where they please, and sending in anything of interest. The other ten will remain in the office until sent out by the editor to report pictorially anything that may arise. All photographs will be sent in to a central depot, where they will be developed, and then, after being passed by the editor, will be distributed by means of messengers mounted on bicycles. London will be divided into about 50 districts, and these messengers will be allotted a district containing a certain number of pubs, any long-distance requirements being satisfied by motor-car. We shall naturally require a huge staff, but the support we have already received, not only from public-house keepers in London, but also in the suburbs, ensures the success of the scheme. We shall probably float with a capital of £500,000, and our energies will not be confined to the Metropolis. We start here, but are making our way to Birmingham and Manchester. In fact, there is no limit to the scope of the undertaking. Each centre will be considered on its merits, local topics being adequately treated."

THE AFFILIATION OF PHOTOGRAPHIC SOCIETIES.—The new Affiliation Executive Committee, consisting of Messrs. F. C. Boyes, J. Brown, C. Churchill, W. Davenport, A. Herbert Lisett, F. J. Mortimer, C. H. Oakden, P. Bale Rider, W. H. Wilshire, and Dr. A. R. F. Evershed, at their first meeting dealt with many matters of importance to the affiliated societies. For the better conduct of the work the following sub-committees were appointed: Consular and Federation Committee, Lecture Committee, and Press Committee. Arrangements were made as to the house exhibition of the prints selected in the recent competition. The exhibition is to be opened by the chairman on March 10 at 8 p.m. It was decided to

call a combined meeting of secretaries and "consuls," to be held on March 26. Mr. P. Bale Rider was re-elected chairman of the Executive Committee for the coming year.

PHOTOGRAPHY THROUGH OPAQUE MATERIALS.—Dr. Hall Edwards, in opening the Birmingham Photographic Society's exhibition last week, made the announcement that it had been found possible to take a photograph by means of ordinary light through $\frac{3}{4}$ in. of iron. The details of the process he was not in a position to divulge, but they would be forthcoming shortly.

STREATHAM EXHIBITION.—The members of the local society are holding their third annual exhibition on March 11, 12, and 13 at the Hall, 2, Ambleside Avenue (close to Streatham Station). Catalogues of admission can be had free from the hon. sec., F. E. Huson, 56, Salford Road, Streatham Hill.

THE DRESDEN INTERNATIONAL EXHIBITION.—It has now been finally fixed that the official opening of the Dresden Exhibition will take place at 11.30 on May 1. and that the King of Saxony will perform the ceremony. Most countries will be represented by Ministers or important officials. Amongst these are Canada, New Zealand, Austria, Russia, Belgium, Italy, Spain, Sweden, and all the German Governments. Sir B. Stone, who is greatly interested in getting together a large collection of prints, as well as the L.C.C., will both furnish a splendid loan collection of topographical and record work.

AMONG THE LECTURES to be given in connection with the South London Photographic Society's Exhibition is one on Monday, March 8, on "The Glorious West Country," by Mr. Chas. R. Rowe, M.J.L., formerly assistant editor of "Photography." He is very enthusiastic upon the charms and attractions of the West, and has written and illustrated a number of West Country books and guides. He will be pleased to repeat the lecture during the week in any London suburb without fee, and any organisation desirous of accepting the offer should communicate with him at 83, Edith Avenue, Plymouth.

"ENSIGN" COMPETITION.—Mr. Cyril Panting, Survey Department, Nairobi, British East Africa, is the winner of the "Ensign" roll-film competition for February. Houghtons, Ltd., offer a three-guinea camera every month for the best negative on "Ensign" film. The entries close on the third of the month. Entrance is free, and a competition form is enclosed with every spool of "Ensign" film.

THE FREE SITTING.—Some of our leading citizens (writes the "Edinburgh Evening Despatch") are much moved at present by the enterprise of a leading firm of London photographers, who are sending round a deputy armed with a camera to take them all without money and without price in any attitude, standing, sitting, or lying down. One of the honoured clients, a member of the Town Council, in a restaurant recently, was explaining the generous offer to a fellow-luncher, and he added: "I wonder what is behind it all?" "I should think," said the fellow-luncher, who takes life quite seriously "the Criminal Investigation Department."

NATIONAL POSTAL PHOTOGRAPHIC SOCIETY.—The secretary, Mr. F. Gardner, advises us of his change of address to 32, Popple Street, Sheffield.

REPAIRS TO APPARATUS.—Mr. Alfred B. Allen, 20, Endell Street, Long Acre, London, W.C., whose long experience in the repair of cameras of all kinds, shutters, lanterns, cinematographs, and other photographic apparatus has long been at the disposal of the trade, now intimates that private commissions entrusted to him will have his best attention. Mr. Allen is also prepared to give expert services in the way of examining and purchasing apparatus, or will act for purchasers abroad in selecting and buying apparatus.

FREE PORTRAITS IN YORKSHIRE.—A letter appears in the "Yorkshire Post" of Tuesday last, giving an account of the all too well-known methods of the free portrait canvassing firms. In this instance the people were trading as the King Edward Fine Art Photographic Co., or the King Edward Enlarging Co., of 65, Louis Street, Leeds; works, 55, Cobourg Street, Leeds, the name of M — Kelly being given as proprietor. A representative of the company took £4 15s. for payment in advance of a frame for an enlargement, the frame being of the usual trashy character and valued by a picture-framer at 5s.

Correspondence.

THE PIN-HOLE AND THE BOOK.

To the Editors.

Gentlemen,—My attention has just been drawn to the section dealing with pin-hole photography in Dr. Lindsay Johnson's "Photographic Optics," recently reviewed in your columns. He ascribes to me a discovery to which candour compels me fully to say that I cannot lay claim. I am credited with having written in the "British Journal of Photography" "that the thickness of the perforated plate always reduces its effectivity" (*sic*), and it is therefore due to your readers that I should correct the statement.

Of course, a thick plate diminishes the angular field of view and the circle of complete illumination; it also has the effect of degrading the crispness of the image owing to the appreciable reflection and scattering of light from the sides of the aperture. If the word "effectivity" has reference to these defects of the thick plate, the discovery referred to dates back to the days of Da Vinci and Porta.

I would also take this opportunity of repudiating the pin-hole exposure rule quoted on the same page. It is some satisfaction, however, to be misrepresented in such good company. On "Photographic Optics"

$$r = \sqrt{d\lambda}$$

is given as Lord Rayleigh's formula for the best relation between the radius of the pin-hole (r) and the camera extension (d). Surely Lord Rayleigh's final conclusion was that the formula

$$r = \sqrt{9d\lambda}$$

gives the best results.

This, perhaps, is a minor matter, but it may be well to point out that on this same page 3 the letter d is used with two different significations in dealing with the same topic, and the unhappy not only possible obfuscation of the student but actual serious error on the part of the author, for the constant in equation (4) is 0.81. It must have twice this value, 1.62.

In the domain of pin-hole photography diffraction is habitual sinning against than sinning. "Photographic Optics" bears testimony to this generalisation, witness the statement taken from that "diffraction is due to the light waves being retarded by striking the edge of the pin-hole. Shade of Fresnel!

Again, "the image . . . is impaired by the diffraction (rings?)," p. 2. As a matter of fact, under the proper conditions an image may be better, thanks to the influence of diffraction, than it would be if diffraction did not exist, i.e., than it would be if it travelled radially.

On Page 4 an apology is made for the pin-hole in the statement "Moreover, a pin-hole does not give rise to point images of point objects? If so, why bother about the resolving power of lenses?"

As a devotee to "Stenopaic Photography," I feel I owe it to you to say that such cavalier treatment as it usually receives in books should not pass unnoticed and unchallenged.

DOUGLAS CARPENTIER.

THE "THAMES" PLATE.

To the Editors.

Gentlemen,—Will you kindly allow me a last answer to the letter of Mr. S. E. Bottomley and the Thames Colour Plate Company, No. 2547 of the "B.J." I am very much astonished by Mr. Bottomley's venture to write: "One does not doubt for a moment that Dr. Mebes's plates were Autochromes, and not 'Thames' plates." Has he not read that Director Schultz-Hencke stated that the plates experimented with were "Thames" plates directly bought of the Thames Colour Plate Company by order, December 5, 1908, or does Mr. Bottomley believe that I cannot discriminate between an Autochrome and a "Thames" plate? In favour of Mr. Bottomley we will suppose that the words are a *lapsus calami* and no intention to question our belief.

too, have not the slightest personal or commercial interest in colour plate company. As the Thames Colour Plate Company again to the experiments in Prof. Hans Virchow's laboratory, sorry to repeat my first statement: this report, too, is false. Photographic work in Prof. Virchow's laboratory is done by the photographische Lehranstalt des Lette Hauses" through its lady, and I have been positively informed by Director Schultz-

As soon as the Thames Colour Company are in possession of a full report of the lecture, every interested English reader will agree with us that the "New York Herald" has been badly misled by a reporter who had no idea of colour photography at all. Yours very truly,
DR. MEBES.

February 28, 1909.

Dr. Mebes misreads Mr. Bottomley's letter. Dr. Mebes, in his letter of February 8, wrote that the exhibited photographs were on chrome plates. Mr. Bottomley, in his letter of February 26, went out of his way to acquiesce in this. Therefore, the writer of the above letter has no cause for indignation.—Eds. "B.J."]

THE RABBIT SHOP" AND "THE VILLAGE INN."

To the Editors.

Gentlemen,—In your review of the South London Exhibition you refer to my print "The Rabbit Shop" as seemingly a re-echo of Mr. Calland's "Doctor's Shop." I do not remember any print of that name; but there is a print of Mr. Calland's called the "The Village Inn," which is strikingly similar to mine, so much so that it might be a re-echo of the other. I should be glad, therefore, if you would allow me to state that neither print owes anything to the other, however much both may have been inspired by Whistler. My print was made in February, 1905, and the print in April, 1905. Mr. Calland's was exhibited, I believe for the first time, in the autumn of the following autumn.—Yours truly,

J. C. WARBURG.

I wrote from memory as regards the title of the picture, which, Mr. Warburg reminds us, was, we believe, "The Village Inn."—Eds. "B.J."]

Answers to Correspondents.

PHOTOGRAPHS REGISTERED:—

England, 21, High Street, High Wycombe, Bucks. Photograph of Wm. Barton, Chair Manufacturer, High Wycombe. Photograph of Sir J. Thomas, Paper Manufacturer, Wooburn Green, Bucks.
& Stocks, Langholme Road, East Boldon, Durham. Photograph of Thomas Burt, M.P. Photograph of C. Fenwick, M.P.
Aitken & Co., 9, Forth Street, Edinburgh. Fourteen Photographs: Shearing Sheep together; Driving wet Harris Tweed; Spinning and Carding Wool; "Waulking" (old method); Dying wet Harris Tweed; "Waulking" (new method); Woman Scouring Harris Tweed by the Hands; Scouring wet Harris Tweed in Harris with the feet; Men Shearing Sheep in Harris; Women Springing; Crofter carrying Piece Harris Tweed to the Scouring; Crofter in Harris carrying wet Harris Tweed from the Scouring; Old Crofter Weaving Harris Tweed, and Young Crofter Weaving Harris Tweed.

POSITIVES.—(1) I had given me to copy one of the little glass photographs, with the emulsion on the front and blacked at the back. The face and hands were coloured and a little basket on the table was gilded. It was 2in. by 2½in. in size. (2) After copying (negatives now in my possession) the photograph (evidently by the wet plate process) had the picture accidentally taken off the glass. How can I best restore the photograph to be like the original, or at least as near as possible to it? Would it be necessary to make another by the wet plate process from the enlarged negative I have or make a crystoleum?—S. BELTON.

Without seeing the picture we cannot say anything about it. (2) We don't understand what you mean by "the picture accidentally taken off the glass." If the negative is a collodion negative the best imitation of it would be one by that process. We are not at all sure that we really clearly understand either of your queries.

—In producing carbon pictures on matt surface opal glass by the single transfer process, no substratum is required. The matt surface of the glass gives a good tooth to the tissue. It would be different if it were not for the tooth.

THE VANDYKE PROCESS.—Will you kindly describe, or indicate where I can find a description of, the Vandyke process, as used for the reproduction of Ordnance maps at Southampton?—J. FLETCHER.

For first exact description see "Indian Survey Report" for 1899 and 1900, page 26. See also "Process Engravers' Monthly" for 1907, page 180; article by E. R. Grills. Also brief description in current "Penrose Pocket Book and Diary," page 104.

LENS QUERY.—I should esteem it a great favour if you could tell me something of the merits of the two following lenses I have had offered me for sale. The inscription on the mounts are: (1) "Ross, London, 13,279"; (2), "102,541, A. Laverne and Co., Clement and Gilmer, Sucrs., Paris. Panorthoscopique, No. 1." If you cannot give me any information from this meagre description do you think the makers would oblige? Also, could you give me their correct addresses?—S. THOMAS.

We cannot. Your best way would be to write to the makers of the lenses. They will then perhaps refer to the numbers in their factory books and tell you what the lenses are. The address of the former is North Side, Clapham Common; that of the latter is 140, Faubourg St. Martin, Paris.

CANADIAN STUDIO.—I intend to put up a photographic studio in Wilkie, Sask., Canada. I should be very glad if you would give me the following information. I have a plot of land in the above town, of which I am showing a plan. I would like to know how to light studio and colour of blinds for controlling light. The light is very strong, both summer and winter. I intend putting building as per dotted lines. Part of this building will be used for dwelling. I hope the information will be lucid enough.—J. B. WARBURTON.

Supposing the dotted lines are to the scale of the solid ones, the sketch shows that the studio will have excellent proportions. If you adopt the lean-to form, the north-west side should be the glazed one. About 14ft. of glass, side and top, will be ample. The roof glass need not be carried higher than from 18in. or 2ft. from the ridge. Dark green will be a good colour for the blinds. You will find Bolas's book on "The Photographic Studio and its Construction" useful to you, as it gives several sketches of different forms of studios. It is published by Marion and Co., price 2s.

LENSES.—I have an R.R. lens for taking street views. (1) If I take the front combination off and only use the back one, will it make a difference to picture? (2) If so, what difference? (3) Also, is it better for copying to use only the back combination?—F. MC.

(1) Yes. (2) The focal length is about doubled—i.e., the image given of a given object is twice the size on the ground glass, less subject is included, and the camera extension must be about doubled. Also the working aperture is half—i.e., the exposure must be four times. (3) No, except in the case of a very large original, which is so placed that the camera cannot be brought close enough for a copy of the required size. In the case of copying same, half, one-third size, and so on, the whole lens should be used.

WHOLE-PLATE HAND-CAMERA WORK.—I have a 1-1 plate field camera, and I wish to adapt it to hand-camera or snap-shot work. How can I best get a focussing scale engraved upon it, and what kind of a view-finder do you recommend? The lens I use is a Dallmeyer Stigmatic, Series II., 10½-inch focus.—DOUGAL CRATUR.

The lens is very unsuitable for hand-camera work, since the depth of focus is so small in the case of a lens of such great focal length. However, if you supply Messrs. Dallmeyer with the correct focal length, they can prepare and engrave a scale, or you can make one yourself for different distances, either by trial or calculation. But we should advise you to think twice before adopting the lens for the purpose. Our own preference is for one of the direct-vision type of view-finders, as large a one as you can get.

PHOTO-ENGRAVING.—It is my intention to start an engraving business in London shortly, and I shall be glad if you will kindly enlighten me on the following: (1) Is a licence necessary in England, and if so, what is the amount of same and to whom should it be sent? (2) To whom should I apply for the necessary papers for the purpose of registering the style or designation under which I intend carrying on business? (3) Would the safe-lights, stated on p. 765, "B.J.A.," 1909, answer equally well and permanently for liquid lamps?—LICENCE.

(1) None is necessary. (2) If you wish to register a trade name you should apply to the Comptroller-General of Patents, Designs,

and Trade Marks, 25, Southampton Buildings, London, W.C. (3) Yes, they can be used in solution in glass cells.

Geo. J. HUGHES.—(1) So far as we know, no materials or specimens are available at present. (2) c/o American Express Company, Waterloo Place, London, W.

J. INGHAM AND SONS.—Messrs. Bender and Co., 21, Berners Street, Oxford Street, London, inform us that they have managed the English business for some years, hold stock of dies, and are executing orders.

ELECTRIC STUDIO.—One arc lamp would be sufficient for portraiture or two for groups. The high power incandescent lamps are of no use. Several firms supply arc lamps specially for portrait use. See our advertisement pages.

COPYRIGHT.—Your kind advice on the following would be esteemed. A photographs for a firm and supplies prints from negatives. A holds the copyright, but hands over negatives to firm for convenience. A sells his business to B, with the copyright. Does this hold good, as the firm disputes his right?—COPYRIGHT.

It is unfortunate that the negatives have changed hands. In the absence of clear evidence that they are lent only to the firm, the copyright has become null and void, and neither party owns it. It will be very difficult for B to lay claim to the copyright if he has not got the negatives, even if the transference of the copyright has been formally carried out (as it requires to be) in writing.

EXCELSIOR.—(1) We do not know for certain, but we should expect it to be for a plate 13 x 18 cm. Messrs. Zeiss, Jena, could inform you. (2) We should certainly select A. (3) Five or six inches.

PRISMATIC DISPERSION COLOUR PROCESS.—(1) Reference, page 715, "B.J.A." of 1908, M. Raymond's method of photography in colours by prismatic dispersion, is the method therein indicated one that can be followed out by an ordinary amateur, or is it merely a laboratory experiment like that of Lipmann? (2) Is an 8-degree angled prism a suitable one? (3) I have a line screen, 135 lines to the inch. Would this do, or is it absolutely necessary to have a cross line one? (4) Ought the prism to touch the plate? (5) Where can one get the 60-degree Schultze screen, and what would be the price of one about 5½ in. by 3½ in.?—E. Y. E. N.

(1) The method is only of experimental interest. (2) M. Cheron, who has worked out the process in its best form, uses a prism of 12 degrees angle. (3) The screen would answer for experimental work. (4) No, the screen is placed in the focus of the first lens. See M. Cheron's article in the "Colour Photography" Supplement, January 3, 1908. (5) Messrs. John J. Griffin and Sons, Kingsway, London, W.C.

COLLOTYPE.—Would you kindly inform me of a good book to read on the colotype process?—COLLOTYPE.

"Practical Colotype," by A. W. Fithian (2s. 6d.).

COLOURING LANTERN SLIDES.—Could you oblige me by telling me where I could get lantern slides coloured at a reasonable price, either private or firm?—B. F.

Dorrett and Martin, Belle Vue Road, Upper Tooting, S.W.; Alfred Underhill, 32, Clarendon Road, Croydon; and M. Darton and Co., 8, Ribblesdale Road, Hornsey, N.

EXPLOSIVE CHEMICALS.—Some time ago I bought of a chemist some surplus stoppered bottles. I required the bottles only, but some had portions of chemical in them without labels. I took one of these for use, what looked like about 4 oz. of soda inside. I emptied this into a bucket, and to get rid of it I took some to the tap outdoors to dissolve with water, as I thought, to throw afterwards down the sink. But after a few seconds this exploded with terrible force, the liquid burning my face very badly. I may mention it also blew the bottom out of bucket. Now, as I am only acquainted with chemicals for photographic uses I shall feel very grateful to you if you can explain what this chemical is called; also if there is a book on explosive chemicals which photographers are likely to use.—15-YEAR SUBSCRIBER.

It is impossible for us to say. Many chemical bodies are decomposed by water. The only books are those on explosives used for military and other purposes; but they would not be of any use in your case.

CLEANING OFF VARNISHED NEGATIVES.—May we ask you to kindly advise us what is the best method and medium for removing the films from very old wet and dry plates, some of them being varnished?—CLARENCE.

For the varnished negatives the best mixture is a solution of

10 per cent. caustic potash or caustic soda in methylated which the negatives are given a soak for a few minutes put in very hot water. In the case of unvarnished negative treatment is not necessary, and about the best means is to pickle in spirit of salt mixed with about an equal volume afterwards scrubbing the film off with a stroke or two of and rinsing in clean water.

J. W. C.—We have written the firm on the matter.

SULPHIDE TONING.—What is the cause of various defects in toning of bromide prints—viz. (1) a harsh orange color some few have been toned; (2) also the cause of bluish which appear after they are dry?—SULPHIDE.

1. This must be due to exhaustion of sulphide bath. not use the same bath for a number of prints in succession.

2. If you are using ferrous oxalate as the developer patches may appear if the developer is not completely out before bleaching in the ferricyanide and bromide however, ferrous oxalate is not being used the blue spots due to iron specks in the washing water. The best remedy a piece of flannel over the tap to filter out the specks.

E. W. A.—We do not think anything would be gained eight jets. When the burners are one behind the other ones have little, if any, effect if the number exceeds for same condenser is used for both the film and the slides, the latter are put close against the condenser the former well away from it, so that it may intersect the cone of narrow part. It should be possible to arrange matters with use of any supplementary lens, but a smaller condenser would result in a loss of light.

COPYRIGHT.—(1) Will you kindly tell me what is the difference any, between copyrighting and registering a photograph cost of doing one or the other, or both if necessary, both in the country and abroad? I have a photograph which I should like to protect against illegitimate use if it is not too expensive see from your paper that registering costs only 1s. 7d. Would that be sufficient to give me a remedy against anyone using my photograph that did not belong to them?—SAPANALAH.

(1) Registration is the formal act of claiming copyright is necessary to protection, for the reason that no action is sustained in respect of infringement done before registration. Certainly. It is the cost of registering one photograph and course the protection applies to that one only.

LENS QUERY.—Kindly let me know the value of a Wray the following inscribed on mount:—"Wray, London N.A.L. No. 9936." The full aperture is f/8. and is lens. What size plate does it cover, and is it a rapid one it be used for instantaneous work?—D. McMONAGLE.

The letters "N.A.L." signify "Narrow Angle Lens." The lens is constructed for 5 x 4 plates. Like all similar however, it will not give straight lines at the margin of It is as quick as any other form of lens having the same aperture therefore it can be used for rapid exposures. The list is 30s.

PLANS, and others.—In our next.

COLLOTYPE.—Morgan and Kidd, Richmond; London Street Co., Regent Street, London, W.; and Harvey, Barton, Lower Church Lane, St. Michael's, Bristol.

* * * NOTICE TO ADVERTISERS.—Blocks and copy are received to the approval of the Publishers, and advertisements are accepted absolutely without condition, expressed or implied, as to what the text portion of the paper.

SUMMARY.

Our publishers desire us to remind advertisers of the forthcoming Colonial and Foreign issue of the "British Journal," which will appear March 26. The latest date for the receipt of copy is Friday March 19.

In instance of the friendly relations existing between professionals in America is provided by a recent practical conference between Messrs. Dillaye and Steffens. (P. 190.)

A book which the portrait photographer should add to his library "Composition in Portraiture," a review of which, in the shape of an article, appears on page 192.

A suggestion has been made to use a solution of paraffin for softening untoned proofs sent to a customer from being finished and copied by another photographer. (P. 190.)

Some of the expedients which may be used in avoiding unsightly enlargements in enlarged negatives or prints are the subject of an article on page 190.

F. Dillaye has given some further working details as to the use of the permanganate method for the making of enlarged paper negatives direct by reversal. (P. 194.)

Some help in sulphide toning is provided in the current "Photography." (P. 198.)

Douglas Carnegie describes a modification of the grease spot photometer employed for photometric measurements. (P. 197.)

Some dyes and the method of making them into filters for photographic work figure in an article by Professor F. C. C. Hansen, Copenhagen. (P. 195.)

W. Scheffer describes a reflex accessory to the large photo-micrographic camera of Zeiss, which possesses some notable advantages for practical work. (P. 193.)

New formulæ for flash powders figure with other matters under "Patent News." (P. 201.)

Some notes on "The Camera and the Eye" allusion is made to matters of vision of some photographic importance. (P. 191.)

R. J. Wallace, the author of numerous papers on sensitometry, has joined the Cramer Dry Plate Company, to establish an investigation laboratory. (P. 189.)

Malcolm Arbuthnot is now showing a selection of his work in the offices of the "A.P." (P. 200.)

Details of Mr. Arthur Payne's method of preparing photo-engraving direct in the camera on the metal plate have been published in our patent specification. (P. 198.)

Another machine for acid-blast etching of half-tone plates has been patented. (P. 199.)

EX CATHEDRA.

The Colonial Issue of the "B.J."

In further reference to the special colonial and foreign issue of the "British Journal," which will appear on March 26, we may draw the attention of manufacturers and others to the fact that a review of the latest introductions in the way of apparatus and materials will be one feature of the number. Articles or samples sent for notice should reach the Editors not later than March 17, and be accompanied by any electros necessary for illustration. As already announced in our pages, the arrangements for the distribution of the special extra edition among English-speaking photographers and photo-dealers have been very completely made, and advertisers will have the satisfaction of knowing that the whole of those on our colonial and foreign lists, which have been corrected and supplemented since last year, will have the Colonial Number directly posted to them by Messrs. Greenwood. The list of the countries thus covered is sufficient to show the wide area of customers.

Argentine Republic	Dominican Republic	Orange River Colony
Bahamas	Eastern Siberia	Paraguay
Barbados.	Ecuador	Peru
Basutoland	Egypt	Philippines
Bechuanaland	Fiji	Prince Edward Island
Bermudas	Guatemala	Puerto Rico
Bolivia	Hayti Republic	Quebec
Brazil	Honduras	Queensland
British Columbia	India	Rhodesia
British East Africa	Jamaica	Salvador
British Guiana	Japan	Sandwich Islands
British New Guinea	Malacca	Siam
British North Borneo	Manitoba	Sierra Leone
Burma	Mauritius	South Australia
Cape Colony	Natal	Straits Settlements
Ceylon	New Brunswick	Tasmania
Chili	Newfoundland	Transvaal
China	New South Wales	Trinidad
Cochin China	Mediterranean	Uruguay
Colombia	Mexico	Venezuela
Corea	New Zealand	Victoria
Costa Rica	Nicaragua	Western Australia
Cuba	North-West Territories	Windward Islands
Delagoa Bay	Nova Scotia	Zanzibar
	Ontario	

The text portion of the "Journal" will contain extra pages and features of special interest to readers in distant countries.

* * *

Mr. R. J. Wallace.

We hear of the establishment of an investigation laboratory for the Cramer Dry Plate Company, of St. Louis, U.S.A., by Mr. Robert James Wallace, who, since he has been in the Photo-physics section of the Yerkes Observatory, has contributed many scientific papers of practical photographic import. Mr. Wallace and Mr. Cramer both say that they have been led to this step by the demonstration given by

Dr. C. E. Kenneth Mees of the great practical value of such a department in connection with a dry-plate works. As Mr. Wallace and Dr. Mees are in correspondence, it is probable that their work will not be duplicated, and that the results achieved on each side will be made available quickly on both sides of the Atlantic. There is a certain satisfaction, too, in knowing that the American pioneer in this line is of good British extraction.

* * *

How they Fraternise in America.

The way in which American photographers compare notes and go into council for their mutual aid would astonish some of our English professionals. Quite recently the redoubtable Mr. Strauss, of St. Louis, became dissatisfied with certain qualities in his negatives, and, regarding Mr. Steffens, of Chicago, as the best portrait negative maker in the States—"if not on earth"—asked his advice, which was given in the form of a visit and a series of demonstrations, with Mr. Strauss's own apparatus, materials, exposure, etc. This sort of practical and most generous helpfulness exemplifies a spirit that cannot be too widely spread. A large number of American professionals have learned the truth, quoted by Mr. Steffens, that "the man who is afraid of having his brains picked usually makes precious poor picking," and they are only too glad to communicate anything they know to a brother professional.

* * *

Defacing Proofs as a Preventive against Toning.

At one time or another various dodges have been recommended for the purpose of preventing prints sent as proofs from being utilised by the customer to the disadvantage of the photographer. A rubber-stamp impression—PROOF—does not enhance the appearance of the photographs, and is therefore but little used. We read in the "Bulletin of Photography" that the process adopted by an American studio in the case of untuned proofs is as follows:—A little paraffin is dissolved in benzine (light petroleum oil or "petroleum ether") and a small cross drawn on the face with a fine brush. This cannot be seen on the proof, but it prevents the toning solution reaching the paper, and therefore fulfils the useful, if limited, purpose of rendering the prints useless. But proofs are frequently copied, and to prevent such use perhaps the best means is to write the number of the negative in small plain characters close to the face, using copying ink.

* * *

Wanted—A Stereoscopic Camera.

There is now every sign that stereoscopic photography is once more becoming popular, for stereo cameras of various new patterns are rapidly appearing upon the market, and there can be no doubt that the demand controls the supply as much in this case as it does in others. We have not yet, however, seen the particular type of camera that we have so often demanded on our own account—that is, the long extension stereo camera with the adjustable front, which is required for use with near objects and is also so useful for producing transparencies on one plate without any cutting. It is, we think, very regrettable that the adjusting front should be so much neglected, even in the case of the highest priced cameras. Though not always wanted, yet when it is, it is wanted very badly, and we know of several would-be purchasers who are simply waiting for the appearance of the ideal type of camera at a moderate price, and of at least one who is making a camera for himself in despair of ever finding one in the hands of the dealers. There are several long extension cameras adaptable for stereo work obtainable, but their long exten-

sion is not available when used for binocular purposes and they have as a rule neither an adjustable front nor a fixed front that is quite as wide as it might be. It should be possible to bring the lenses as near together as possible to reduce the separation to about two inches, and also to separate them to the full width of the front. The stereo division should be adaptable for use at either single or double extension, and even if this means the provision of two divisions of differing length it is no great matter. The triple extension type of camera is a most desirable one, because it permits focussing at either back or front and a half-plate camera of this type that will permit the use of stereo plates when desired is in practice most desirable. We live in the hope that we may yet see a camera of the kind described put upon the market at a moderate price.

ON SUBDUING GRANULARITY IN ENLARGEMENTS.

THERE is not much to complain of at the present time with regard to the coarseness of the grain of plates of the most rapid type. It was different a decade or so ago, when an extra rapid plate meant a considerable amount of granularity of the image. Thanks, however, to the skill of the plate-makers that is a thing of the past with most brands of extra rapid plates at present on the market. We now get exceedingly quick plates with a grain almost as fine as that of plates of ordinary rapidity. Still the grain of the ultra-rapid plates, although not visible when the negative is examined by the eye, may show in a marked degree if an enlargement is made of it to a degree of, say, ten or twelve diameters. The granularity is usually more pronounced if the enlargement is made by artificial light, as in the enlarging lantern, than when diffused daylight is employed.

It is by no means an uncommon thing for a photographer to have to produce an enlargement, say a life-size head, from an original which may be of the cabinet size or smaller, and very often from a paper print. This, of course, is a great magnification. If it were only three or four diameters the coarseness of the grain would in many instances pass almost unnoticed, but with the great magnification it may become most objectionable. The question for consideration is how may the granularity be reduced to a minimum, for it is obvious that when the grain is very conspicuous it entails a considerable amount of extra work in the way of finishing in monochrome or colour.

We shall first consider the case where an enlarged negative is required to be afterwards printed from the ordinary way. In this case it will be necessary to prepare a transparency, say by contact printing on a dry plate, or by the carbon process. If in making the enlarged negative from the transparency the lens be slightly out of focus, the sharpness of the image will be materially impaired, but the granularity will be less conspicuous than if the image were sharply focused, and if the enlargement is not great it will scarcely be noticeable. It may be thought by some that making an enlargement a little out of focus would be as objectionable as would be the granularity, but in practice this is not the case, for if the eyes and the darker parts are strong and bold the picture will seem sharper than really is, and what is more, if these portions be retouched and sharpened up in the print with water colour, it will be the general appearance of the picture greatly for the better. It is in the lighter portions that the granularity is so conspicuous. The enlarged negative can, of course, be retouched and much of the coarseness got rid of that way. In the development of the enlarged negative it should be made strong and vigorous, so as to get

as bold as possible in the print, as they then do as a rule exhibit the granularity visible in the other ones. In connection with this method of ameliorating granularity, we may mention one case which came to our notice some few years ago. For publication purposes it was required to enlarge a number of old wax-plate negatives of very artistic landscapes. Of course, the negative showed the grain of the paper very strongly, and it was necessary that this should be suppressed as far as possible in the enlargements. The originals were of the half-plate size, and the enlargements were of 16 by 13. The method pursued was as follows:—

On transparencies were made from the small negatives, and from them the enlarged negatives were produced. In making them a R.R. lens, having a great deal of spherical aberration, was employed. The lens was by a very bad one from an optician's point of view, as it could not yield crisp definition unless it was well stopped down, but in this case it was worked at its full aperture. The enlarged negatives were made of considerable vigour in the development. The finished pictures, when issued to the public, showed very little granularity; indeed, not more, if so much, as was seen in prints made direct from the original negatives.

Another way of reducing the apparent granularity when an enlarged negative of a portrait is used is to mask out the background entirely and print in another with a diluted tint, for it is in the background that the granularity is always the most conspicuous, and if that be got rid of and another introduced the rest of the picture is found to be much improved in appearance. Still another way of subduing the grain in enlarged negatives may be mentioned. Here again it is assumed that the negative has been made tolerably strong in the development. It is put into the printing frame and a print made. When about half printed the blacks will have considerable vigour, while the lighter portions are but very faint and show but little of the granularity. At this point, between the negative and the partially made print, a sheet or two of thin celluloid are interposed and the printing continued to the proper depth. In this way much of the pronounced granularity will be got rid of and a good result obtained. The first printing secures the necessary sharpness and detail, while the second produces a certain amount of diffusion, which greatly reduces the granularity without materially interfering with the definition of the more prominent portions secured in the first.

In the foregoing we have been assuming that enlarged negatives are employed, but at the present time the greater number of enlargements have to be made direct from the original on bromide paper, and here we have not the same scope for getting over the trouble. One very general way is to make the enlargement with the lens slightly out of focus, as mentioned when dealing with the enlarged negative. But there is a marked difference between a picture taken with a lens that gives critical definition, put out of focus, and one that has a certain amount of spherical aberration worked at its best focus. This is well exemplified in the portrait lenses, in which spherical aberration ("diffusion of focus") can be introduced at will. A lens with a good amount of spherical aberration is best to use when granularity is to be reduced to a minimum, and this is what is, optically speaking, an inferior instrument, but at the same time be the best photographic tool in the circumstances. Most R.R. lenses, even those by good makers, are not free from spherical aberration, and an image focussed with a small stop will not be at its sharpest when that be removed and the image examined with the full aperture. Advantage may be taken of this to reduce the granularity in enlarging. The image is focussed with the smallest stop, and, say, half the exposure made; then

the stop is removed and the necessary exposure completed with the full aperture. The first exposure will secure the necessary detail in the thinner parts of the negative, and the second will yield a certain amount of diffusion in the grain, thereby reducing its conspicuousness. Another plan sometimes adopted is to slightly alter the focus of the picture by moving the easel, carrying paper slightly backward or forward after a portion only of the exposure has been made.

THE CAMERA AND THE EYE.

SOME time ago we drew attention to the fact that while many writers and lecturers have laid much emphasis on the resemblance of the eye to the camera, it is possible to push this comparison to an extreme and so neglect the even more important and more interesting points of difference between the two. Lately, however, we have been reminded that it is equally possible to go too far in the opposite direction, and to lay overmuch stress on differences that do not exist. A well-known writer, when recently considering the effects of the strained perspective produced when we view a photograph from too great a distance, came to some remarkable conclusions. In considering the case of a prone man lying with his feet towards the camera—a favourite subject for showing the eccentric side of photography—it is pointed out that a photograph produced with a six-inch lens may represent the feet as four times as large as the head. These proportions are then compared with those of the retinal images produced in the eye as the result of placing the eye in the position of the lens, when, by a process of mathematics, it is deduced that the image of the feet would be only about one-third larger than that of the head, which means that the relative proportions in the retinal image would be about the same as those of the natural object. Upon this obviously wrong foundation, due to misapprehension and miscalculation, is built up a eulogy of the eye as a drawing instrument far superior to the camera. The first principles of visual optics, however, show very clearly that the proportions of the retinal images in a case such as that considered must be practically the same as those of the camera image, even if we make an allowance for the difference due to the curvature of the retina. One of the points of resemblance between the eye and the camera has thus been perverted into a point of material difference.

But setting aside such optical fallacies, it should be obvious that the method of looking at the problem which we have just criticised is not in line with actual conditions. There is little reason in making a comparison between the retinal image and the photographic image; it should be made between the retinal images formed when looking at the object and looking at the photograph, and these are, of course, identically the same if we take up the right view-point in both cases. Even in the case of a photograph of a subject such as that described, all the quaint effects of disproportion disappear if we take the right view-point. The disappearance of an unnatural effect is very strikingly displayed if we make a stereoscopic photograph and examine it in the stereoscope, and, if our memory is not at fault, two excellent examples of just such a subject are published by Messrs. Underwood and Underwood. In the erroneous comparison to which allusion has just been made, a very important point of difference between the eye and the camera is overlooked. In the latter both lens and plate occupy fixed positions, and in the case of the eye it is customary to consider the conditions to be analogous, though, as a matter of fact, they are not. The lens in the eye is a moving one, and

when we visually compare the proportions of near and distant objects we do not compare them as they appear from the lens, but from a point some way behind it; that is, from the centre about which the lens of the eye, and the whole eye, in fact, is continually rotating. To reproduce the conditions of the camera the eye must be kept fixed on one point of the object, and this unnatural condition of "fixed" or "indirect" vision gives a less distinct and also a larger image than that ordinarily produced in easy and natural "mobile" or "direct" vision. Here we touch upon one of the most important differences between the eye and the camera. In the latter the image is projected from one fixed point, while in the former we have practically two overlapping images projected almost simultaneously from two different points of view. In

other words, we may say that we have a 15.5 mm. and a 9 mm. lens working together simultaneously on the subject, so that our final impression of an object may be described as a conglomeration of views obtained from different distances. This is a far more complex arrangement than the camera, and the attempt to simplify considering the eye to be equivalent to a camera with a 15.5 millimetre lens is perhaps the worst course that can be taken. We shall be nearer the truth if we consider the focal length to be 9 millimetres, but in order not to be misled we must really leave such partially true comparisons alone and consider the eye as it is, that is, as an optical instrument which behaves in an essentially different fashion from the camera that we are accustomed to use in photography.

COMPOSITION IN PORTRAITURE.*

"Of the making of books there is no end." So said somebody once, but who, and when, we do not know. With regard to books upon art principles applied to photography it is painfully true. The astonishing thing is that poor affairs in the way of photography continue to be produced, in spite of all the literature showing a thousand and one golden rules and royal roads and short cuts. And another surprising thought is that anything of any artistic value at all was ever produced in earlier days before this mass of oracular enlightenment was offered to a favoured public. It must not be denied that books, lectures, and so forth, do here and there brighten a dullard and enlarge the mind of a narrow-viewed aspirant; but, for our own part, we believe that their chief use lies in the accretion of cash or kudos to their promoters. The latest comes from America, and is written by "Sidney Allan," better known in photographic circles as Sadakichi Hartmann. It is no less useful than its forerunners, and, like them all, raises hopes of exposition in the matter of art. We believe that these books are largely purchased by a public who feel that art is a mystery to which they have not the key, but that in the magic pages they will find it; that they have only to read in order to be master of those esoteric mysteries which differentiate a mere man from an artist. We are not sure that the authors themselves are not also honestly under this impression, since they so often start off with promises to put the matter in a nutshell—a thing which they infer nobody before has succeeded in doing. Mr. Allan, for example, says in his introduction: "I am of opinion that most books on this subject, excellent as they may be, have treated it in too pedantic and pedagogical a manner. The theories of these writers are too elaborate, involved, clogged up, as it were, to be of practical use. No man can remember all they say about obliterated verticals and circular attraction, etc., particularly a photographer, who cannot gradually construct and improve a composition. Why not talk in plain English?" All this may be true, but it smacks of the cheap-jack. And the aspersions upon technical language are ill-bestowed, for these matters cannot be written of at all without theorising, and theories are useless unless expressed with care and exactitude. After all, if we must have books on art, they had better be the treatises of Da Vinci, Reynolds, Goethe and Ruskin than the colloquial prattle books that can be read in half a day and forgotten in half an hour. Mr. Sidney Allan says many true and good things; but his "plain English," such as it is, doesn't cut at the core of the matter any swifter than the language of the literary and artistic giants we have named. The fact is that whilst many have written *about art*, nobody has actually written

art itself. It is an incommunicable thing. A man has it or hasn't it, and there's an end of the matter. Mr. Allan knows this well enough, for he says, "No painter really argues out things while he paints. He feels them intuitively. As a painter said to me one day, 'We do things, and then you come down and talk about how we have done it, when we hardly know it ourselves.'"

"His art knowledge must be second nature with him, or is of no use at all."

"The good taste of the photographer must decide these questions, a certain subtle instinct for what is right or wrong. Nobody else can do it for him."

"The best way to learn is to try and assume attitudes and work with your own body and face before a mirror. I am convinced you will learn more in half an hour than by the study of a dozen books on composition."

"The remainder" (all in addition to mere principles) "necessarily must be left to years of experience and experiment. Only in that fashion will my readers arrive at the mastery of composition, not merely of its fundamental principles, but at its intricate subtleties and marvellous possibilities."

The moral of this is that the rare part cannot be acquired. Principles are dry bones. The breath that can make them live is born with the artist. But the man who has this breath can flout and subvert the principles and charm us still. Many photographers have done so. As the author himself admits, "leaving old methods and old points of view (beg pardon, 'new points')." To revert to them is, therefore, no more fruitful of success than to invent new ones. Photography has opened a number of new doors to artistic effect that it has made it impossible to learn new principles. This little book cannot tell any one how or when to employ these principles—new or old; that is the intuitive part necessary to the photographer.

What the book does do is to get together reproductions of portraits, both paintings and "photos," to use the author's term. These range from Botticelli to Dührkoop, and in themselves are highly interesting. It then classifies and describes the examples, praising here and condemning there. If a reader should be anxious to learn which of this endless variety of poses and arrangement is intrinsically bad or good, he is driven up against the author's own preference as a final criterion. It will never be otherwise. He will find every pose he has ever thought of, every scheme of lighting he has ever seen, represented, and receiving some sort of honourable recognition. Where, then, does he stand? He looks in vain for the royal road, the golden rule. He must not blame the author, but himself, for inasmuch as what he wishes to learn cannot be written.

We have said that the book contains many good and

* "Composition in Portraiture," by Sidney Allan (Sadakichi Hartmann). New York. Tennant & Ward, 122 East 25th St.

A few of these are aphorisms worthy to be written in letters of gold, and displayed in every studio:—
 "good print proves to be the result of what has happened in the studio previous to pressing the bulb."
 "The hands in the large majority of portraits look like those of heroes."

"The hand without the wrist is not beautiful. It is rather ugly-looking."

"Holding a fan, a flower, a book, etc., is always effective, but I do not like any line at statuettes and crystal balls."

"Some of our advanced professionals, when they try to do an artistic trick, you will find two or three flat tints in the foreground against an opaque background. They have fallen into the common error of mistaking darkness and monotone effects for artistic effect."

"It is my contention that the most natural light effect would be the most effective one for portraiture."

"The majority of portraits to-day look as if the people depicted were mulattoes or quadroons, which is not particularly pleasing to the sitters."

"In such observations as these that the real educative value of the book lies. They sound a sane note. Mr. Allan has our commendation of his views when he deprecates the modern custom of cropping a head, or a part of a head, not where tradition points as the proper place in the field, but encroaching from the side or top in a manner suggested by the unsymmetrical characteristics of modern portrait art. This is one of those developments that have been introduced not so much by artistic as by advertising motives, and we shall be glad to see it pass away for the childish practice it represents. The Japanese are not portrait painters, and a portrait is all the more successful for resembling a Kakemono."

"In most matters the author displays a welcome common-sense independence of opinion. Only in two instances do we venture to disagree with him. One is in his extravagant praise of Whistler's portrait of Carlyle, which forms a frontispiece. Mr. Allan asks us to notice how all the details of dress have been minutely indicated; how the outline has been accentuated against the background; how naturally the figure is seated, and how well it has been placed in space. There is an atmosphere around the figure."

"One feels that this person is seated in a room, and so on. There is too much hero-worship about this. As a matter of fact, the points indicated can easily be shown to be downright faults. The figure is as flat as paper, which it resembles, as though cut out and pasted against the wall. As to being naturally seated,

surely nobody but a lunatic would naturally seat himself close to a wall in this manner. There is less feeling of air and space than in most painted portraits. Whistler made the unfortunate mistake of trying to repeat a former success. His "Mother," which is a fine and subtle work, was bought by the French nation, and Whistler wanted to "do it again." But his Carlyle is not a repetition of the qualities of the "Mother." Nor is it a dignified and manly likeness of the Chelsea sage. The work has a spurious reputation induced by the widespread reproductions that sell cheek by jowl with other specious works, and the magic name of Whistler alone brings it upon many a wall. We consider it anything but a good example to set before photographers, who, in fact, are admonished in this very book against several of its characteristics. Mr. Allan also much admires Boldini's portrait of Whistler, in which we find it difficult to see more than a clever and superficial virtuosity joined to a particularly unhappy composition.

The other point whereupon we differ is that portraits by certain old masters named were probably less good as likenesses than photographs are to-day. It is because the photograph is characteristic of a moment only, and all the accidentals which that moment bursts upon the sitter, that likenesses are often unconvincing in camera work. The general and typical truth of the painted portrait allows a truer rendering of the sitter's personality and character. In such a case as that of Velasquez the truth of his likeness is proved by the many portraits of Philip IV., which are far more like each other than as many photographs would have been.

Besides the numerous half-tone blocks, the book is illustrated with many diagrams, a few of which we seem to have seen before in an article by Mr. Sutcliffe, of Whitby. Their source is not acknowledged, however, although mention is once made to an English photographer whose name is forgotten as the originator of two plans of a studio showing lighting arrangements.

The chief utility of a book of this sort is its reiteration of the well-established modes that painters in past times have proved to be the best. With these modes it is a case of a survival of the fittest and of the safest, for those who have not the artistic equipment necessary for pioneer work. We recommend the little volume on account of the author's sound observations and reflections, and of his thorough appreciation of the principles practised by the old masters, of whom he gives copious illustration.

His warnings and frank criticism of many fads of modern photographic work are refreshing and salutary.

A REFLEX CAMERA FOR PHOTO-MICROGRAPHIC WORK.

In the construction of this camera the condition to be fulfilled was to produce an instrument by means of which the image could be focused on the ground glass, and at the same time all the necessary adjustments of the microscope and the illuminating apparatus conveniently made by the operator without changing his position. It was also required that the dark-slide should stand over the plate uncovered ready for exposure in order that the photograph might be taken on the instant of a given phenomenon being seen on the ground glass. Fig. 1 shows the solution of this problem. Two mirrors, A and B, are mounted in a wooden box; the light coming from the microscope through O is reflected at A and B, and brought to a focus on the ground glass M. The eye-piece of the microscope is connected with O by means of a light-tight funnel-piece. At V is placed the blind-shutter, which is released by the movement of the mirror A from its position DE into the position DE¹, the movement taking place from the axis D—that is to say, the shutter being released when the mirror takes up the position DE¹. On the shutter being released, the image is brought to a focus on the plate P, stand-

ing with the shutter of the dark-slide, CC, withdrawn. All light is excluded from the portion R of the apparatus, except that admitted when the shutter is worked. Also, if the shutter is entirely removed from the camera, the mirror A in the position DE serves to reflect all the light coming from the microscope to M, and completely protects the plate from light action. This is important when giving exposures of considerable length, as will be seen later.

Fig. 2 shows the practical form which has been given to the apparatus as a part of the large Zeiss camera for photo-micrography. The front conical part of the camera is replaced by the new form of construction just described. As shown in the figure, the latter is adaptable without modification to the large Zeiss photo-micrographic camera. The funnel-piece is shown at O forming a light-tight connection between the microscope and the reflex attachment. At H is the lever serving to raise the mirror A (Fig. 1); K is a catch holding the mirror in the position DE¹; the blind-shutter is fixed at V. The connection of the apparatus with the hinder portion of the bellows is exactly

the same as that of the two portions of the large photo-micrographic camera, and the reflex attachment is thus interchangeable with the usual conical front portion of this apparatus. The dark-slide is placed at C, the position being so chosen that the optical path from O to M is the same length as that from O to C. This arrangement allows the operator to adjust both the coarse and fine focussing, the stage-movements, the Abbe illuminating apparatus, and the other lighting accessories on the optical bench all with the right hand whilst at the same time watching the effect of this adjustment on the ground glass. In making a photo-micrographic exposure the shutter is first wound, the dark-slide inserted at C, and the shutter of this latter with-

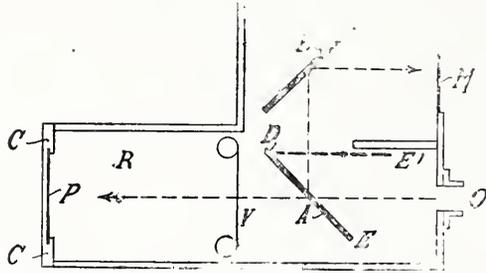

Fig. 1.

drawn, and at the moment when it is desired to make the exposure the lever H pressed down with the left hand.

The apparatus was originally constructed for the purpose of making photographs of quickly moving objects, and was successfully used both by transmitted light as well as by dark field illumination for taking quickly moving objects with the image in the centre of the plate. It was soon seen that the apparatus possessed advantages not only for instantaneous exposures, but also for all kinds of photo-micrographic work. The facility of focussing up to the moment of exposure is of great service, since alterations in the adjustment have frequently to be made, and every photo-micrographer has realised the trouble and incon-

venience of the image coming out of focus shortly before during the exposure. For example, in the case of making exposure of a diatom in very oblique lighting, the mirror be put down during exposure in order to control the adjustment of the light. For work involving exposures of considerable length of this latter kind, in which special adjustments have to be made, this feature of the apparatus is very convenient. regards the objection that with the above apparatus it is necessary to work at a constant extension, the writer's experience has been that this is of no importance. For the past six months

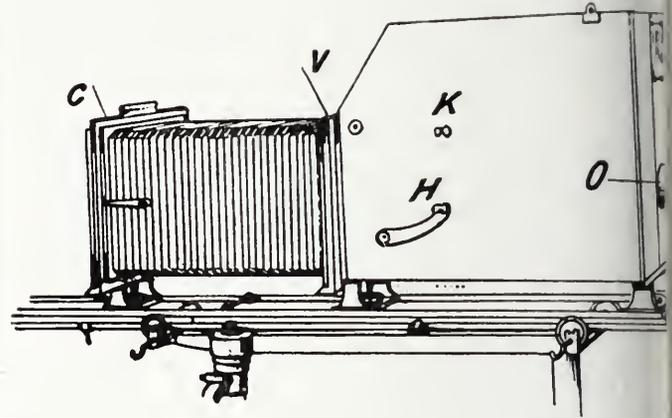

Fig. 2.

kinds of exposures of the most varied description have been made with a fixed bellows extension of one metre, and in a single case was there any need for a different extension. The great advantage of keeping to one fixed extension is that at any subsequent time the degree of enlargement is ascertainable. The first model of the reflex micrographic camera was made according to the drawings of the author by Mr. Schermann in Berlin, and has been in frequent use for six months past without giving any cause for dissatisfaction.

DR. W. SCHEFF

ENLARGED PAPER NEGATIVES DIRECT BY REVERSAL.

[Continued interest appears to be taken in reversal methods, such as that used in the Autochrome process, for the preparation of enlarged paper negatives direct. We recently published ("B.J.," October 23, 1908, p. 811) three different methods producing this result, and still earlier a note by M. Maes ("B.J.," March 20, 1908, p. 215), in which bichromate was used as a reversing solution. In the current issue of the "Bulletin Belge," M. Dillaye, in commenting upon M. Maes' method, explains that the crux of the problem lies not in the formulæ, but in certain minor precautions which must be taken in using them. An abridged translation of M. Dillaye's paper is given below.—Eds "B.J."]

On exposing the bromide paper, the enlargement on which is to be converted into a negative, the time given must be somewhat more than when making a bromide enlargement. The time may be increased by two-thirds, or even double may be given. In developing the enlargement it is essential that the image should be obtained through the whole thickness of the film—that is to say, until the black portions, the shadows in the positive, reach the paper support. For this purpose a highly restrained developer is employed working slowly and without fog. A suitable formula for this purpose is as follows:—

Water (distilled)	300 ccs.
Diamidophenol	2 gms.
Sulphide of soda (anhydrous)	10 gms.
Potassium boro-bromide solution	20 gms.
Sodium bisulphite (liquor)	10 ccs.

This developer is used at a temperature of 68 to 72 deg. F. The development should be watched, not by reflection, which gives not the slightest indication of the density required, but by transmitted light, the paper being held up to the light, and development stopped at the moment when the details in the deepest

shadows of the picture commence to choke up so as to be indistinguishable from the general tone of this portion. Suppose that double the ordinary exposure is given, and the bath is at a temperature of 68 to 72 deg. F. as above directed, the time of exposure will be 5 to 7 minutes, and with a developer containing the bromide given above there is no risk of fog. After development, the enlargement is rinsed once or twice with water, and is then placed, gelatine side uppermost, on a sheet of ebonite, or, if this is not obtainable, a sheet of glass or a board previously covered with black paper soaked in water in order to get it to lie flat. This precaution, which is frequently omitted from the instructions for making reversed paper negatives, is of the first importance. If it is neglected, almost certain failure is invited, owing to the action of the light on the back of the paper. Thus mounted on a black support, the paper is exposed to daylight for a short time. In proportion to the action of the light on the positive print, the high-lights of the latter become grey, then yellowish, and finally of a rose or lilac tint. The action should be allowed to go on up to the point when even the darkest shadows have a rose appearance.

much exposure is better than too little. The eye, more-
 will quickly get accustomed to this control. As a rough
 e, it may be said that placing the enlargement 12 inches
 a window in midday December light with grey sky, a suffi-
 degree of exposure is 20 minutes, or, at the least, a quarter
 f 1 hour. In midsummer light 4 to 5 minutes will be about
 time, or 30 seconds if the exposure is made to direct light
 ide the window. The longer the exposure the more rapidly
 certainly the negative may be intensified. Exposure having
 done, the negative is taken into the dark-room, and the
 ining part of the process carried out.

pendent upon the temperature, the paper negative will have
 me more or less dry during exposure. In order to avoid
 ible stains, it should be placed in a dish of water, and
 wed to remain there for at least 30 seconds, although longer
 do it no harm. The first development and all after-opera-
 are preferably done in the same glass dish, the cleanliness
 hich is a very essential part of the process. In place of the
 romate reversing solution, the use of which involves nitric
 as a clearing bath, I much prefer to use the permanganate
 od adopted in the Autochrome process. The following two
 tions are made separately. Each keeps indefinitely:—

—Potassium permanganate	2 gms.
Water	500 ccs.
—Sulphuric acid (pure)	10 ccs.
Water	500 ccs.

al parts of A and B are mixed a few minutes before use.
 water being poured off the enlargement, the reversing mix-
 is poured on, and the dish kept in movement. The positive
 ge gradually disappears, usually two or three minutes elaps-
 before it is totally gone, but it is convenient to give a time
 minutes in order to ensure that the action is complete. It
 n lies until there is a considerable deposit of oxide of man-
 ese on the print; the final negative image can be seen by
 ection, and better still by transmitted light. The perman-
 ate bath is thrown away, the prints well rinsed, and a clear-
 bath applied of:—

Water	1,000 ccs.
Potash alum (powder).....	10 gms.
Sodium bisulphite (liquid)	25 ccs.

This solution may be used over and over again until exhausted.
 Its action is to remove the manganese peroxide from the print,
 and at the same time to harden the gelatine. A few seconds
 suffice to restore the original white of the paper, but it is con-
 venient to use the solution for a fixed time of 2 minutes. During
 its action the print should be turned over several times, in order
 that the liquid may come into contact with the back as well
 as the front. In thus handling the prints, it is well to use a
 celluloid or ebonite forceps, in order to avoid stains, which may
 easily arise by handling the prints with the fingers. The clear-
 ing action having been completely performed, the print is well
 rinsed, and seen to contain the negative image, at first light grey
 on a perfectly white ground. This image, of course, consists of
 the unreduced bromide, its greyness being due to change which
 the light has made in it. It is now reduced to metallic silver
 by application of a developer. Theoretically, this developer
 should act whatever its composition and whether or not it con-
 tains potassium bromide. In the case of making negatives by
 this method on plates or films, theory accords well with practice,
 since the transparency of the support allows of the progress of
 the first development being followed with some degree of cer-
 tainty. But it is not so with paper. The opacity of the paper pre-
 vents us from seeing exactly what we are doing. I know that some
 writers speak of developing paper negatives until the image is
 just visible on the back, but my experience is that such visibility
 is simply deceptive, even in the case of very thin papers. It cer-
 tainly is in the case of the Lumière B paper, which I have used
 throughout in my work, and I have never been able to obtain,
 even with twice, three, or five times the exposure necessary for a
 good positive print, this much described appearance of the image
 on the back.

All this, apropos of the developer, which should be applied for
 the second development of the paper. This should be highly re-
 strained, so as to allow of the action being stopped at any desired
 point. It is used at a temperature of 68 to 72 deg. F., and it will
 be seen that the negative gradually develops with all its tones
 and details, the process taking about 30 minutes. If it should
 be found that for a proper degree of contrast a longer time than
 this is needed, it is a sign that exposure to daylight has been too
 short. It is quite certain that if the process be carried out as
 herein described, failure is impossible. F. DILLAYE.

LIGHT-FILTERS AND SOME HISTOLOGICAL DYES FOR PHOTO-MICROGRAPHIC WORK.

[A paper by Professor F. C. C. Hansen, of the Normal Anatomical Institute of Copenhagen University, in the "Zeitschrift für wissenschaftliche Mikroskopie."]

THOUGH there are doubtless plenty of good light-filters for
 photo-micrographic work, the following notes and formulæ
 would be of service. The use of aniline dyes as light-filters is,
 course, very general, as shown by the excellent textbooks on
 subject by Neuhauss, and by Kaiserling, and by the formulæ
 in the encyclopædias of photo-micrography.
 The most convenient form in which to prepare a light-filter
 ordinary work is undoubtedly as a dyed gelatine film ob-
 tained by fixing and washing a photographic dry-plate. Neu-
 hauss advises this course, and I invariably adopt it in my own
 work. The dyes to be specially recommended have been exam-
 ined by me, as by many others, first with the spectroscope
 simply, and afterwards by further photographic tests. I confine
 myself for the present to the light-filters which are suited par-
 ticularly for the ordinary descriptions (yellow-green-sensitive) of
 throsin orthochromatic plates—that is to say, those which

transmit blue, violet, yellow, and orange rays. Among these
 are the following:—

1. Naphthol Yellow S, in strong solution in water containing 3 parts per 1,000 of acetic acid.
2. Light Green F (Lichtgrün F), in 2 per cent. or 3 per cent. solution in water with 3 parts per 1,000 of acetic acid.
3. Naphthol Green B, in 2 to 3 per cent. solution in water to which 2 parts per 1,000 of ferrous sulphate is added; this latter addition, according to my experience, affecting the colour favourably.

The gelatine plates are kept in motion in one or other of these solutions until it is seen, by means of the pocket spectroscope, that the film gives a suitable absorption. A little practice enables this to be done quite readily. Usually 10 or 15 minutes' immersion in the dye solution is ample for the desired intensity of colour. The plate is then rinsed superficially in distilled

water and set up to dry. Two such differently dyed plates are cemented together with a thick solution of Canada balsam in xylol, the precaution being taken to make each gelatine film perfectly dry by careful warming over a spirit lamp. The two plates are then kept pressed together with clips for some days at a temperature of 105 deg. to 125 deg. F., and are finally bound with paper edging.

I prefer the sulpho-acids, Naphthol Yellow S and Light Green F, to the basic green dyes, as they are more amenable to use with gelatine.

The simple naphthol yellow filter allows red, orange, green and yellow-green rays to pass through almost unaltered, as does also Martin's yellow, which, like picric acid, is used as a yellow filter. But if a plate of Naphthol Yellow S be combined with one of Light Green G, an excellent yellow-green filter is obtained of great transparency and relatively sharp transmission. Except for a weak band in the red, which may be neglected in practice, the filter passes only the yellow-green and green, the transmission region being from about 540 to 510 $\mu\mu$. I have used this filter for over a year in place of the Zettnow filter with great success. The filter is very bright, is convenient in use as a yellow filter, and gives better negatives with achromats.

A similar filter passing the yellow-green and green, but transmitting no red, is prepared by combining a screen of Naphthol Yellow S with one of Naphthol Green B. The absorption takes place more uniformly from both ends of the spectrum; the portion transmitted is somewhat broader, corresponding approximately to 560 to 510 $\mu\mu$ —that is, little yellow, but more favourable action in the yellow-green and green. The brilliancy of the filter is not quite as great as that prepared from Light Green F and Naphthol Yellow S. For most purposes I prefer this latter filter to the other.

If this latter filter is combined with a screen lightly stained with Naphthol Green B, the band of transmission in the red is filled up without the brilliancy suffering. For this purpose I first dye a plate in the ordinary way with Light Green F, rinse, and then dye this same screen-plate in the Naphthol Yellow S solution (which, naturally, should then be thrown away). The twice-dyed plate, when dry, is then cemented to the plate dyed with Naphthol Green B. This filter is very useful for certain purposes, and has greater brilliancy than the filter prepared only with Naphthol Green B and Naphthol Yellow S.

According to my experience, the filter of Light Green F and Naphthol Yellow S is more efficient than the other green filters, and also than the Zettnow filter.

As is well known, blue filters are employed for certain purposes in photo-micrography through which blue and violet rays can pass, whilst all others, particularly green, yellow-green, yellow and orange, are cut off. The ammonia copper solution is used in this way as a blue filter.

A convenient dry colour filter for the blue and violet rays is prepared from a combination of Water Blue and erythrosin. I stained a fixed and washed dry-plate for about 10 to 15 minutes in a 1 per cent. solution of Water Blue (Grübler), which has been acidified with a little sulphuric acid to the extent of 1 to

2 parts per 1,000. The plate is then rinsed and stood up. A second plate is bathed for 10 to 15 minutes in $\frac{1}{2}$ per cent. solution in water of erythrosin (blue tint), rinsed, and dried. The erythrosin must be of a bluish description, having only a slight absorption in the violet and blue (on this account most eosins are quite unsuitable), whilst the erythrosin should have a maximum absorption in the yellow-green and green. The Water Blue screen being cemented to a screen suitably stained with Erythrosin B, a filter is obtained which, disregarding a weak transmission band in the red, allows only blue and light to pass from about F (485 μ) to H (397 μ), the filter being of great brilliancy.

* * * * *

It is a well known fact that black, blue-black, or, in the lighter tones, greyish colour tones, are desirable in microscopical preparations which are being photographed. Such stains are provided by the various methods, using an iron and chrome haematoxyline. The use of these compounds is inconvenient for ordinary purposes, and therefore the aluminium haematoxyline has obtained a considerable degree of favour. I have recommended iron haematoxyline¹ and chrome alum haematoxyline solutions, as well as ferri-cochineal solution, for the reason that their use is much easier and quicker than the ordinary haematoxyline method, whilst the colour tones are black or blue-black, and of very good gradation. I can, therefore, recommend these dyes for photo-micrography. Apart from the iron haematoxyline being highly permanent, the optical effect is that of a blue-black, or, in the lighter tones, of grey. For ordinary observations the tones are just as suitable as the stains ordinarily used. We have employed these stains in our work in Copenhagen almost exclusively for the past two years, and the preparations have been found to behave most satisfactorily as regards permanence to light and other agents. Even screens which have been stained very quickly endure subsequent staining with strong colours, such as concentrated picric acid used in a well-known combination of acid fuchsin and picrin,² and there is no danger in the case of my dye solutions to over-dye, the staining nucleus persisting even in the case of quite rapid dyeing with concentrated picric acid. Also there is an absence of reddish brown tone colours, such as are produced when using aluminium haematoxyline.

On the other hand, the colour gradations, for example, in preparations of muscles and of protoplasm, are more greyish and soft. The particulars given in my note in the "Zeitschrift für wissenschaftliche Mikroskopie," Vol. XXII., 1905, have been fully confirmed by other microscopists in Copenhagen, and particularly for photo-micrography these dyes have been almost exclusively used with great success. It should also be mentioned that microscopic preparations which are to be used for micro-photography should most advisably be dyed black or blue-black, a point which has been brought to my notice by the Carl Zeiss Works of Jena.

ROYAL PHOTOGRAPHIC SOCIETY.—An exhibition of photographs by members of the Affiliated Societies is now open to the public free at the house of the Royal Photographic Society, 66, Russell Square, W.C., and will remain open daily from 11 to 5 (Saturdays 11 to 2) until April 10. The prints are selected from the 1908 competition and form the basis of a lecture by W. J. Morgan, R.B.A., of Birmingham, who criticised them, and in some cases made sketches to illustrate the points raised in his criticisms. These sketches are hung under the photographs to which they refer accompanied by Mr. Morgan's remarks, and at the close of the exhibition the whole collection, together with the lecture, will be circulated amongst the societies comprising the affiliation.

CINEMATOGRAPH LEGISLATION.—Kensington Borough Council sent a circular letter to the other twenty-seven London Borough Councils with reference to cinematograph and similar entertainments. They say that they have considered circulars from other metropolitan local authorities, and, while they are in agreement with the expressed as to the desirability of the places referred to being subject to licence, they consider that any legislation should apply to the whole country and not to London only, and that not only the places where the entertainments are held be licensed, but the steps should also be taken to ensure that only competent persons be allowed to operate the apparatus. A communication to this effect has been addressed to the Home Secretary.

A MODIFICATION OF THE HURTER AND DRIFFIELD PHOTOMETER.

photometer is to photography what the precision balance is to chemistry—an ultimate court of appeal. Very few, if any, photographic investigations are satisfactory unless at some time or other there has been a trial at the bar of the photometer. Unfortunately for photography, however, measurements with the Hurter and Driffield photometer (at any rate, with the simple type of photometer) is within the reach of the average amateur of humble means are not only very fatiguing, but at the same time lack precision and certitude that characterise gravimetric measurements; in photometry “the personal equation” seriously asserts itself. Any modification of the photometer, therefore, which tends to lighten the strain involved in its use, and to minimise the influence of the personal factor, is to be welcomed. This article describes a modification of the Hurter and Driffield photometer, which, as regards myself at any rate, has been instrumental in greatly diminishing the fatigue of observation, and at the same time in increasing confidence in the measurements obtained.

The modification consists in substituting for the customary Besen grease-spot indicator, with its two widely separated and obliquely viewed mirror images (Fig. 1), a paraffin-block indi-

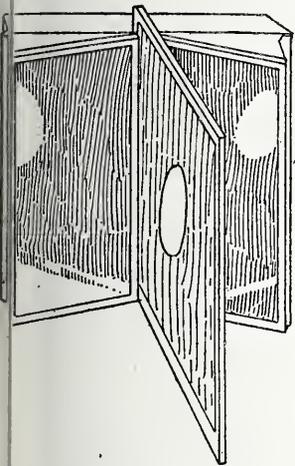

Fig. 1.

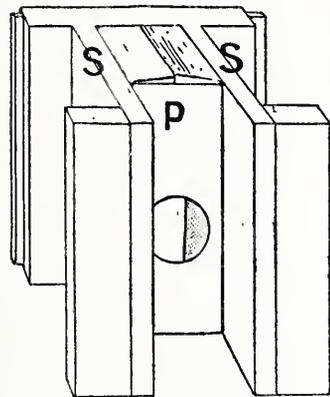

Fig. 2.

icator, as first used by Joly. With this indicator (Fig. 2) the illuminations to be compared are brought into contact; a single *coup d'œil* simultaneously commands them both; the strain of maintaining, or trying one's best to maintain, a mental record of the impression produced by one of the mirror images during the interval occupied in transferring visual fixation to the other image is obviated.

As I could not find any instructions bearing on the manufacture, best dimensions, etc., of the Joly photometric indicator, I had to experiment on the subject for myself, and my experience may prove acceptable to any who may care to try for themselves the modification here advocated.

Two homogeneous plates of wax must first be cast. The most stable material, in my hands, proved to be the wax of which carriage-lamp candles are made. I was unsuccessful in getting satisfactory slabs with the paraffin sold in mass by the chemical dealers. In solidifying from the molten state non-homogeneity invariably resulted, owing, I take it, to the separate crystallisation of eutectic.

The carriage candles (purchasable at a penny apiece) are first cut up, and the wicks removed. The wax is then melted in a casserole and heated well above its melting-point. As a mould I used one of those lantern troughs which are made by squeezing a piece of rubber between two glass plates held by a wooden frame. The plates were removed from their frame, and their outer surfaces rubbed over with a pledget of wool wetted with

glycerine. Replacing the glycerined plates in their frame, the trough was immersed, nearly to the level of its open mouth, in a print-washer, through which cold water was kept circulating. The molten wax was poured into the water-cooled trough, and then violently stirred with a knitting-needle till it became pasty and was on the point of setting solid. This rapid cooling and agitation during cooling of the molten wax seem essential to the attainment of a good homogeneous block.

When quite set the block is easily removed from its mould by pulling the glasses out of the frame and then sliding them off the wax. The block is then planed down to nearly the required thickness. A jack plane is held foot uppermost in a vice and the block pushed over the blade. (The planing of wax will be found by the exoteric a delectation of no mean order.) By means of a tenon saw the planed block is cut into two smaller blocks of about the required size, say 30 mm. by 40 mm. To get these two small blocks of precisely the same desired thickness I pushed them between the parallel jaws of a calliper set to give the required dimension. The edges of the jaws, of course, acted as two plane-irons. In this and all subsequent manipulation great care must be exercised in keeping the wax clean and out of contact of the wax shavings produced in the earlier stages of manufacture.

Experiments were made with a view to determine the best thickness of the wax slabs for use in the H. and D. photometer. I finally adopted a thickness of just over 6 mm. Slabs thinner than this necessarily gave a rather small field of view, and the resultant illumination was somewhat too dim for the purposes of easy comparison.

A piece of smooth tin-foil, cut very slightly smaller than the wax plates, is now sandwiched between them, and they are then joined hermetically by running a hot knitting-needle round their four smaller faces. One of these faces—the face which is to be observed in actual use—is now planed down till the tin-foil is reached, and a perfectly smooth and regular surface—divided medially by a sharp line of tin—is attained. The indicator is finally fixed in a wooden frame or holder painted dead-black and so constructed as to fit into the cursor box of the photometer. The sides SS of this frame are, of course, perforated by circular apertures of the same diameter as those in the sides of the cursor box. A small brass plate (P), perforated with a circular aperture of about 10 mm. diameter and fixed in contact with the front face of the indicator, completes the process of manufacture.

As a sample of the degree of constancy and accuracy of the results furnished by an indicator thus constructed, I quote from my notebook some measurements of relative densities of patches secured in the course of an investigation on pinhole exposures:—

Scale readings	Series A.	Series B.	Difference.
.....	.06	.45	.39
„	.23	.62	.39
„	.33	.71	.38
„	.37	.75	.38
„	.45	.85	.40
„	.55	.95	.40
„	.30	.68	.38

The measurements of Series A were taken with a thin indicator (wax plates each 4 mm. in thickness). In Series B the indicator had the dimensions I finally selected as most appropriate to the H. and D. photometer (each plate just over 6 mm. thick). The observations were taken on different days, and (by altering the relative intensities of the two albo-carbon lights of the photometer) the zero reading on the scale was purposely made to differ on the two occasions. The approximate constancy of the values in the difference column is, I think, quite satisfactory

when it is remembered that the second decimal places in the readings given under A and B are not engraved on the H. and D. scale, but are eye-appraised. Furthermore, it must be noted that the A results were obtained with an indicator which was finally rejected as being composed of too thin plates and affording too feeble illumination.

In the following table are given some density readings taken with the same zero point on two different occasions and using the indicator constructed from 6 mm. slabs:—

1.13	1.14		1.19	1.2
.8989		1.31	1.31
1.04	1.03				

These results show a far better accordance than I (with my very occasional and intermittent photometric practice) was formerly in the way of obtaining with the conventional Bunsen indicator.

DOUGLAS CARNEGIE.

FAILURES IN SULPHIDE TONING.

THE failure of the bleached print to tone in the sulphide bath is, perhaps, the most common defect of the sulphide-toning process. The following article, therefore, in the current issue of "Photo-Notes," on the cause, prevention, and remedy for this trouble, should reduce the number of prints thus unnecessarily wasted:—

The cause of this is the deterioration of the sodium sulphide, which has very uncertain keeping properties when dissolved. As the sulphide decomposes, hypo is formed, and as soon as this reaches a certain amount, the toning action is upset. The first effect when decomposition is becoming serious is the production of a yellow brown image. The next stage is an apparent failure to act, nothing but a faint yellowish image being produced. The final and most serious stage is not merely failure to act, but an action of the wrong kind, for the bleached image gradually disappears. When this hopeless stage is reached, the sulphide solution is acting as a fixing bath, and, of course, no remedy is possible.

The yellow brown images produced by the slightly stale sulphide are, perhaps, not pleasing in colour, but they suit some subjects, and may be considered to be as permanent as the ordinary results. We are inclined to think that they tend to improve in colour by keeping, but it is difficult to be sure of this. When the toning solution fails to act, a remedy is possible if the solution is not too far gone, or the print is not left in it too long. The proper toning action is very rapid, and if no effect is observed in the first half-minute it is hopeless to expect that any toning action will commence later. It is also useless to substitute a fresh bath for the stale one, because, as a matter of fact, though no visible change has taken place, nevertheless the image has been changed more or less completely. The stale solution has changed it to a sulphide, but to one of the wrong kind, and practically colourless; therefore a fresh sulphide solution will have no effect at all.

Before we can attempt anything in the way of re-toning, we must re-convert the image to a silver salt, and to do this we want a very powerful bleacher. The best to employ is bichromate and hydrochloric acid, using ten grains of potassium bichromate and twenty minims of strong acid to every ounce of solution. The print is washed free from the sulphide solution, and then put into the bleacher, which will act very slowly. About ten minutes should be sufficient, but as it is difficult to see the change, it is better to give half-an-hour, and so make sure of sufficient action taking place. After this the print is washed and re-developed, and re-development will also be a slow operation as a general rule. Whether it is so or not depends on the amount of sulphiding action that took place in the stale sulphide solution. In any case we generally find it best to start with a strong rodinal developer of a strength of about 1 in 5. This may at once do all that is required; if not we try a short exposure to a strong light, and if this fails to yield sufficient density in five minutes we let the print soak in the developer for another ten minutes, then wash and transfer it to an ordinary strong bromide paper developer such as amidol or metol hydroquinone.

If none of the image has been destroyed by the hypo in the sulphide solution, we shall, by these means, produce a good strong result which may be black if the re-development has been rapid, or a fine rich brown if the development was slow. If desired, we can

then re-tone, using quite fresh solutions; but, as a rule, the tone arrived at in the process of re-development is a far finer than any possible by sulphiding methods, and it may be well to leave it alone.

Most people, we believe, throw away prints that have failed to tone under the impression that their case is hopeless. Restoration, however, is quite possible if the stale sulphide has not been allowed to act too long. It is especially necessary to be cautious when using the white crystalline variety of sulphide, for the deterioration of the solution cannot be detected by observation. Even if it is faintly of sulphuretted hydrogen, it does not follow that it is spoiled perfectly. A weak solution of working strength will not kill the image, and the stock solution should be made of 10 per cent. strength at least. Twice that strength is still safer.

Photo-Mechanical Notes.

Photo-Etched Blocks Direct on the Metal Plate.

THE patent specification relating to the process of making printing blocks direct in the camera according to the method invented by Mr. Arthur Payne has now been published (No. 28,415, 1900). It will be seen that the process, as here described in the inventor's own words, consists in the interposition between the metal plate and a sensitive emulsion of a collodion or other film, the plate being treated so that this film prevents chemical action between the emulsion and the metal, and acts as a resist to the etching process. This technical description will continue the interest of the photographer by a preliminary illustrated account of the process which we gave in our issue of June 19 last, when some of the first blocks to be made by the process were used in illustration.

The following are extracts from Mr. Payne's description of the process:—

When my process is used in the production of printing blocks either in line or half-tone, and for intaglio or relief printing processes, I take the copper or zinc or other metallic plates, silver, brass or steel, that are also occasionally used, and polish the surface of the metal and clean it free from grease by any of the well-known methods at present in use. The polished or grained surface of the metal plate is then coated with a substratum, for which I prefer to use a 2 per cent. collodion, such as is made by dissolving pyroxyline in a mixture of equal parts of methylated ether, 70 per cent. ethyl alcohol .90 per cent., and I prefer to slightly colour the collodion by the addition of a small quantity of a strong solution of the aniline dye known as brilliant green in ethyl alcohol. I do not, however, restrict myself to the use of this particular dye, but it is not an essential part of the invention that any dye should be used, for it is only used as a convenience, and the plain collodion serves as an efficient substratum. Though I prefer to use a collodion substratum, yet I do not restrict myself to this particular, for other substrata that prevent chemical action between the emulsion and the metal and act as a resist to the etching fluid may be used, such as bitumen, gum dammar, or celluloid, either singly or in combination.

I next proceed to coat the surface to which the substratum has been applied with a very thin film of fine grained gelatin-iodide silver emulsion prepared with a hard gelatine, preferably without the addition of chrome alum or other hardening agent. If required, the emulsion may be made colour-sensitive by any of the usual methods.

This thin film of emulsion must allow the light to penetrate through the film to the substratum, so that when the plate is exposed in the camera and afterwards developed the silver image will have penetrated right through the film to the substratum. The above description describes the manner in which the plates prepared: they are used in the following manner:—

GENERAL MANIPULATIONS.

The prepared plate is exposed in the camera in the usual manner either with the use of a half-tone screen when such is required for the production of half-tone printing blocks, or without the half-tone screen when line blocks are being made. It is then developed by the timing system of development, either with an acid developer,

As ferrous oxalate, or an alkaline developer, such as glycin. I prefer to develop the plate for three minutes with the following glycin developer used at a temperature of 65deg. F. :—

Sodium sulphite cryst.	1¼ ounce
Glycin	½ ounce.
Potassium carbonate coml. : anhydrous.	2½ ounces.
Potass. bromide	30 grains.
Distilled water	30 fluid ounces.

At other times of development, other temperatures, and differently compounded developers may be used so long as the image is sufficiently developed that it penetrates the film, though for some special applications of the invention this penetration is not always essential. The plate is then washed with running water for half a minute.

From this point onwards the manipulations vary according to the particular work for which the process is being used.

METHOD No. 1.

If the object is to obtain a positive image from a negative "original," such as in the making of a positive half-tone relief block on a continuous tone-negative, or if an intaglio line or half-tone block is being made from a positive "original," then after the photographic image is prepared, as stated in "General Manipulations," it is fixed by immersing the plate in a fixing-bath (made by dissolving 4oz. of "hypo" in 20 fluid ounces of water) for about half a minute, which is usually sufficient to thoroughly fix the thin film emulsion. The film is then washed with water, about one minute's washing usually being sufficient with running water, and the plate then ready for immersion in the "hardening" bichromate solution, which is referred to later on.

METHOD No. 2.

If a negative image has been obtained upon the plate, and it is required to convert it into a positive image, or *vice versa*, the washed negative (or positive), prepared as described in "General Manipulations," is treated for a suitable time, usually half a minute, with a "reducer," such as the well-known "reducer" made dissolving

Potass. permanganate	15 grains.
Sulphuric acid	75 minims.
Distilled water	20 ounces,

which dissolves all the developed silver image out of the film and leaves the undeveloped silver haloids in the film. The plate is then washed with running water for about half a minute and exposed to daylight, or other suitable actinic light, for a few, say five, seconds, and the plate again developed, preferably in daylight or strong actinic light, with ferrous oxalate developer, or the before-mentioned glycin developer, or any of the well-known developers which do not render the gelatine insoluble so as to prevent subsequent development with hot water. The plate must be developed with the glycin or other developer until the image is developed right through the film, and three to five minutes is usually sufficient when developing in daylight with the glycin developer at a temperature of 65deg. F., but a slightly prolonged development is not harmful.

The plate is again washed with running water for half a minute, and then "fixed" in the manner already described, the plate again washed with running water until free from "hypo," usually for about one minute, and then it is "cleared" by means of the well-known "hypo and ferricyanide reducer," or by a very weak solution of the before-mentioned acidified permanganate "reducer," the object of the "clearing" being to remove all traces of the previously developed silver that may have been left on those portions of the image or "resist" which will be subsequently dissolved away with hot water, for the presence of any slight veil or fog in the clear portions of the image would harden the gelatine when it is immersed in the bichromate solution and prevent the resist being properly developed. This plate is then washed with running water for about one minute.

GENERAL MANIPULATIONS.—CONCLUSION.

Assuming that a good clear image is obtained by either of the above-mentioned methods, as already described, and that the lines and clear spaces are quite free from "fog," it is immersed for half a minute in the following bichromate solution, used at a temperature of 60deg. F. :—

Potassium bichromate cryst.	½ ounce
Potash alum. cryst.	12 grains.
Distilled water	12½ fluid ounces.

This solution has the well-known property of hardening the gelatine in the presence of the metallic image, or other solutions that have a similar catalytic action may also be used for this purpose. The plate is then rinsed with water and developed like a carbon print in hot water of a temperature of about 120deg. F., first allowing the film to remain in the water for a minute or two, and then assisting the removal of the soluble portions of the film by agitating the plate in the water, or by gently brushing the surface of the film with a soft camel-hair brush or similar soft material whilst the film is immersed in the hot water.

When all the soluble gelatine has been removed the plate is fastened to a "whirler" and the surplus water driven off by centrifugal force, then the plate is dried at a gentle heat by revolving it face downwards over a "hot plate" or a flat Bunsen burner. The film rapidly dries, and when dry is cooled and the collodion or other substratum removed from those portions of the plate that are not protected by the gelatine resist by gently wiping the surface of the film with a pad of cotton wool moistened with a solvent of the substratum. A mixture of equal parts of meth. ether .720+ethyl alcohol 90 per cent. being used for collodion and for celluloid, meth. ether .720 for gum dammar, and benzole for bitumen. When the collodion substratum is used, it is advisable to finally wipe the plate with a pad of cotton wool moistened with ethyl alcohol after the collodion has been removed with the mixture of ether and alcohol.

The plate is then ready to be etched in the usual manner, the collodion or other substratum and gelatine film forming an efficient resist, after which it may be mounted and printed from in the usual manner.

This process may also be used for the production of engraved metallic plates for ornamentation, such as illuminated or memorial brasses, or for ornamental metallic fittings of any description, or for name plates, engraved dials, etc., either in intaglio or relief, made in the manner already described, and if required the hollows may be filled in with coloured wax or other suitable material. This process may be used in engraving or etching glass or similar substances by preparing the surface to be engraved with a suitable substratum and light sensitive emulsion, which is exposed in the camera and then treated as before mentioned to form a suitable resist.

Mechanical Etching.

A method of acid-blast etching, which has been recently patented, claims as a novel feature the delivery of the acid from a nozzle having at its narrowest cross-section orifices through which air is sucked or introduced by pressure. The etching chamber has in its lower part an air compartment and a liquid compartment serving a series of upwardly directed nozzles which have their lower orifices in the liquid compartment and their air-intake orifices in the air compartment.

The patentee, M. Piolunkowski, of 17, Schwind Strasse, Munich, in his specification (No. 18,540, 1908), says that :—

It has already been proposed to etch metal plates by projecting or spraying the etching liquid against the under-surface thereof in a more or less finely divided state, the liquid being sucked by an air current into a laterally perforated nozzle, and then carried out of the nozzle in the form of spray by the air current. It has, however, been found that when the liquid is sprayed in this manner the fine particles of liquid are only projected upwards with comparatively low velocity against the under-surface of the plate, the available energy having been largely expended in converting the liquid into spray. The liquid, therefore, adheres to the surface against which it is thrown, and the injurious effect on the edges of the etched lines is still produced. It is not possible to materially increase the velocity of the particles by increasing the pressure of the air current, since the suction effect of the air current ceases when the pressure at the entrance of the nozzle exceeds about two atmospheres, the minimum pressure in the apparatus being then more than normal atmospheric pressure. Moreover, the temperature of the air would at this pressure rise to about 176deg. F., and this would render it quite impracticable to carry out the process without very considerable modifications.

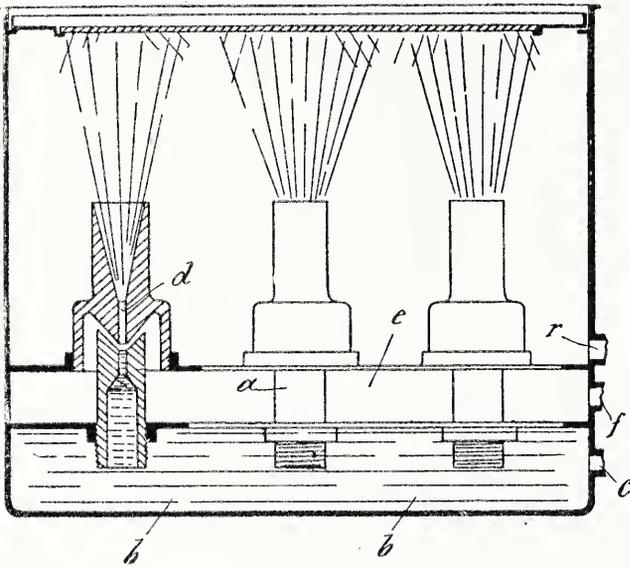

The present invention overcomes these difficulties by propelling the liquid itself through the nozzle instead of sucking it in by a current of air, the air being, according to the invention, admitted at the smallest cross-section of the nozzle. Energy is thus directly impressed on the particles of liquid, and the latter can be projected:

against the plate with very considerable velocity without excessive expenditure of power and without materially raising the temperature.

The particles of liquid projected against the plate at this high velocity immediately rebound, and therefore only act upon the plate during exceedingly brief periods without adhering to the surface. The lines produced in this manner are very sharp and free from irregularities produced by the liquid penetrating under the "ground" at the edges.

For the purposes of the invention, the nozzle is preferably constructed as shown in the annexed drawing, but though this construction of the nozzle has been found specially suitable for the process, it does not itself form part of the invention. Similar constructions have been previously used for producing spray for other purposes. The drawing represents an apparatus comprising three nozzles, the container and one of the nozzles being shown in section.

The lower orifice of each nozzle, *a*, is in the compartment, *b*, at the bottom of the container or etching chamber. The etching liquid

is forced into this compartment at *c* at suitable regulatable pressure. At the narrowest part of the bore, *d*, the latter communicates with ducts leading to a chamber, *e*, into which air can be forced at *f* at suitable regulatable pressure.

The production of spray is most effective when the ducts are downwardly inclined towards the central bore of the nozzle, as shown in the drawing. By suitably regulating the pressure of the liquid and air the velocity of the issuing jet can be regulated, and also the degree of fineness of the particles of liquid, and it is thus possible to etch more or less deeply and more or less rapidly, as required, but always with the particles travelling at such speed that they do not remain in adhesion with the plate.

The liquid rebounding from the plate can be carried away at *r* and cleansed so that only absolutely pure liquid is used for etching.

One advantage of the improved process lies in the fact that if suitable supply cocks are provided water can be projected against the plate through the same nozzles for washing purposes, so that a separate washing chamber is unnecessary.

CATALOGUES AND TRADE NOTICES.

LANCASTER REFLEX CAMERAS.—Messrs. J. Lancaster and Son, Camera Buildings, Broad Street, Birmingham, have issued a new circular descriptive of the well-known "Plano-reflex" camera, the long extension and other movements of which render the camera a universal instrument of this type. The list, which is very fully illustrated, is worth getting.

BINOCULARS AND BIRD-STALKING.—Messrs. Ross, Limited, have published, and send gratis on application, a sixteen-page treatise by Charles Dixon, entitled "The Ross Bird-stalker." It is a monograph on the advantages, possibilities, and use of the prism binocular in field natural history.

Exhibitions.

PHOTOGRAPHS BY MR. ARBUTHNOT.

A COLLECTION of photographs, described as "A Series of Impressions Rendered by Photography," by Malcolm Arbuthnot, has been open at the "Little Gallery" of "The Amateur Photographer and Photographic News," 52, Long Acre, W.C. Many of these pictures will be recognised by visitors as those by which Mr. Arbuthnot has achieved a notoriety of a sort. They are displayed in places of honour upon the walls, as though their author and the hangers of the gallery consider them the finest things of the collection. We ourselves do not think so, and we believe our opinion is the general one. Mr. Arbuthnot proves by this display that he is a capable worker, gifted with a strong sense of the queer and the odd in sights and faces that meet his gaze. This faculty may be amusing to its owner, but, of course, nobody can claim that it is art. It is art *per se*, those things that are most successful in this gallery are the quiet and commonplace ones, chiefly some portraits. "C. Alison, Esq." (3), is quite good, and so is "An Old Man" (19), and two ecclesiastics, called respectively "The Smile" (23) and "Brother Z——" (25). "The Donkeyman" (41), "To Leeward" (43), and "The Beach" (32), are still unsurpassed, because of their naturalness and simple strength of realism. But before Mr. Arbuthnot's character-heads and the subjects that have attracted him by their quaint design, we can only feel that it is not beauty that affects him in his outlook, but the mere whimsicality of things. The temperament that makes this preference is a common one enough, when it is joined to the artistic temperament we may get a Wirtgen or a Van Beer's, but of itself it is opposed to aesthetics. It can be said that in any one or two cases the quaint things here are made to justify their existence as pictures by any beauty of treatment. "The Topsail Yard" (29) and "The Low Ebb" (35) are examples of things both interesting and queer in themselves, but certainly not lovely. "The Hermit" (39) is childish and trite in idea.

In his landscapes there is an absolute want of relation in tones, and this lack is only filled by flatness and dullness of effect. A better thing could have been made with such a subject as "A Thames Boat on water" (36), unless it is meant that a thunderstorm is impending in which case the thing is perfect. "The River Medway" (37) shows the bridge, the ship, and the near boats all in the same hard edged dark tones, though they are obviously in retiring planes. The stretched-out foreground, which we had hoped was a sin of the painter is shown also in one or two cases with detrimental effect.

FORTHCOMING EXHIBITIONS.

- February 20 to March 20.—South London Photographic Society. Sec., H. Creighton Beckett, 44, Edith Road, Peckham, S.E.
- March 11 to 13.—Coventry Photographic Club. Sec., W. R. Harris, 17, Allesley Old Road, Coventry.
- March 17 to 20.—Nottingham Camera Club. Sec., E. L. Kent, Radcliffe Mount, West Bridgford, Notts.
- March 22 to 25.—Cripplegate Photographic Society. Sec., H. Cuming, 234, North End Road, Kensington, W.
- March 30 to April 3.—Sheffield Photographic Society. Entries close March 13. Sec., H. Merrill, 22, Harboard Road, Woodsear, Sheffield.
- March 31 and April 1.—Shropshire Camera Club. Entries close March 20. Sec., Harry W. Hughes, Kingsland, Shrewsbury.
- April 10 to 17.—Midlothian Photographic Association. Entries close March 31. Sec., B. Sherratt, 8, Castle Terrace, Edinburgh.
- April 27 to May 1.—Maidstone and Institute Camera Club. Sec., J. Harris, 23, Knightrider Street, Maidstone.
- April 29 to May 17.—Photo Club de Paris. Entries close March 17. Secretary General, Photo Club, 44, Rue des Mathurins, Paris.

A PHOTOGRAPHIC society has been formed at Johannesburg under the name of the Photographic Art Circle, the membership being confined to those interested in the pictorial side of photography. The Hon. Secretary is Mr. Harold Smith.

Patent News.

Process patents—applications and specifications—are treated in "Photo Mechanical Notes."

The following applications for patents were made betweenbruary 22 and 27:—

ENLARGING.—No. 4,479. Improvements in apparatus for enlarging photographs and the like. Ralph Winwood Robinson and Leonard Leslie Robinson, 4, South Street, Finsbury, London.

CINEMATOGRAPHS.—No. 4,534. Improvements in feeding mechanisms for cinematograph cameras, printers, and perforators. Ernest Francis Moy and Percy Henry Bastie, Greenland Place, Camden Town, London.

SCREEN-PLATES.—No. 4,713. Improvements in the manufacture of regular grain three-colour screen-plates for direct colour photography. Charles Frederick Emil Fenske, 21, The Pavement, Thornton Heath, Surrey.

PHOTOCOPYING.—No. 4,735. Improvements in photographic copying apparatus. Edmund Edward Fournier D'Albe, 11, Sunbury Gardens, Rathmines, Dublin.

LANERN SLIDES.—No. 4,745. Improved method of carrying and exposing lantern slides or films. William Morton, "Strathcona," Campbell Street, Wishaw.

PHOTOCOPYING.—No. 4,790. Improvements in photographic or heliographic copying apparatus. A. W. Penrose and Co., Ltd., and William Hamble, 28, New Bridge Street, London.

CINEMATOGRAPH-PHONOGRAPH.—No. 4,899. Improvements in apparatus for producing audible moving pictures, pieces of music, and other performances by the aid of two or more devices such as moving-picture apparatus, phonographic apparatus, and the like. Franz Ewald Thormeyer, 65, Chancery Lane, London.

COMPLETE SPECIFICATIONS ACCEPTED.

These specifications are obtainable, price 8d. each, post free, from the Patent Office, 25, Southampton Buildings, Chancery Lane, London, W.C.

The date in brackets is that of application in this country; or abroad, in the case of patents granted under the International Convention

SWINGING AND FALLING CAMERA FRONT.—No. 11746, 1908 (May 30, 1908). The mechanism of the front comprises two similar sets of arms or cantilevers, each set pivoted on or attached to any fixed or movable support on the body of the camera so as to swing in planes parallel to the axis of the lens, and having certain members which may be unfolded and extended between and along which the camera "front" or lens-board, or the camera "back" may be fixed or moved; and also provided with devices for locking them

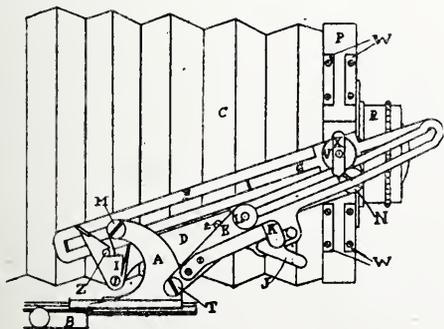

Fig. 1.

in certain positions, and for moving and fixing the "front" in or out of parallelism with the "back," or for moving and fixing the "back" in or out of parallelism with the "front," as the case may be. Fig. 1 represents the arms and "front" swung forward. Fig. 2 shows the arms unfolded. The first claim is for the combination with a camera "front" or "back," having side-pivots, of two similar sets or systems of arms or cantilevers, each consisting of two or more members, one of which is supported on the other

member or members of the corresponding set, being pivoted or otherwise movable thereon, and supporting the corresponding side of the "front" or "back" at its side-pivot, which may be moved along the member, and clamped thereto at any desired point, being provided with a nut or other binding device for that purpose, the other member or members of the same set being pivoted at one of their ends to suitable and different points of a fixed or movable part of the camera, in such a manner that the member to which the "front" or "back" is attached may be folded against the other member or members, or extended and supported from that end or ends of the said member or members which is not

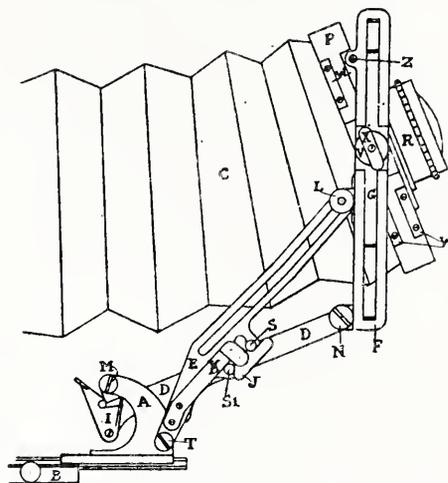

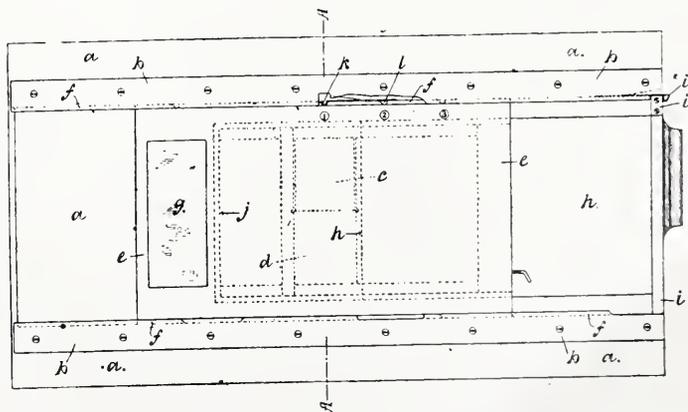

Fig. 2.

pivoted to the camera, bolts, or other means being provided for binding or locking the several members together, or to a part of the camera, in any desired position, and so that all the members of both sets may be swung or moved on their respective pivots or attachments, in parallel planes and in the direction of the axis of the lens, carrying the "front" or "back" with them, whereby the "front" or "back" is supported with capability of adjustment both for focussing the photographic image and for raising or lowering the lens, or the sensitive photographic film. For a proper description of the construction the full specification is necessary. John Arthur Harrison, 28, Chippendale Street, Cast'e Boulevard, Nottingham.

REPEATING-BACK CAMERA.—No. 2,739, 1908 (February 7, 1908). In the drawing *a* is the back or frame of the back of the camera, *e* is the frame of the "dark slide" carrying the sensitive plate, the flanges, *f*, of which slide in grooves formed between the back plate of the frame *a*, and the metal strips *b*.

c is the window or aperture in the back of the frame *a*, it being

of the full depth required for the plate; *d* is the shutter which operates in connection with it, so arranged as to close the lower half of the aperture, or the upper half, as the case may be, at will; or, it may be removed entirely, so that the whole depth of window is operative.

When the slide is in position in the back *a*, and it is desired to expose a portion, the slide *e* itself is moved along certain distances or stages corresponding with the width of the aperture or window

c, so as to give exposure on different parts of the plate in stages, and a spring catch *k* which is fixed on the frame *a*, is adapted to engage in notches *l* on the flange *f* when the slide has been moved to the required position.

When this has been exposed, the slide *e* can be further slid along the back *a*, so as to bring another notch *l* under the catch *k*. In this position another portion of the plate will be opposite the window *c*. Then, when this is exposed, the slide can be moved to its furthest position, namely, to the end of the frame or back *a*, and in which position, the last part of this plate will be exposed.

When the several successive exposures have been made along one edge of the plate, and the slide closed over its shutter *h*, and removed, the shutter *d* is changed from one end or other of the window *c*, and then the slide is again placed in position, and exposures made along the other edge of the plate or film. William Laurence Parkinson, 5, Commutation Row, Liverpool.

CINEMATOGRAPH-PHONOGRAPH.—No. 16,611, 1908 (August 6, 1908).

The claim is for an apparatus for synchronising cinematographs and talking machines, comprising in combination a system of electric incandescent lamps, contacts connected with the same, a rotatable collector-disc adapted to be driven by a cinematograph, a collector having segments adapted to be coupled with a talking machine, and means for electrically connecting the segments of the collector with the electric lamps through the collector-disc. Jules Greenbaum, 236, Friedrichstr., Berlin.

FLASH POWDERS.—No. 14,692. 1908 (July 10, 1908). A patent has

been taken out for the use of insoluble, or nearly insoluble, metallic salts of thoria, in conjunction with magnesium or aluminium metals, as a rapid or slow flash powder. The compounds of thoria with the acids of the heavy metals which are found most suitable are the chromate and the tungstate. The chlorate and perchlorate are also found suitable. The nitrate, on account of its acid reaction and hygroscopic nature, is unsuitable for a flashlight powder, even when put up separately from the magnesium powder, since under these conditions the salt cakes together. Chromate of thorium in the two forms, one containing some water of crystallisation, the other none, both produce a very rapid flash (difference from chromate of cerium). A suitable formula for a flash powder is 30 to 35 parts of magnesium powder mixed with 70 parts of thorium chromate. For a slow-burning powder one part of magnesium is mixed with two parts of thorium tungstate. Salts of peroxide of thorium may be produced by precipitating nitrate of thorium with hydrogen peroxide in a solution containing also the acid which it is desired to combine with the thoria. Thus a solution of thorium hydroxide in perchloric acid gives a gelatinous precipitate of perchloride on addition of hydrogen peroxide heating the solution to 140 deg. Fahr. and rapidly cooling. This compound forms a white, brittle, glassy mass, which is easily powdered and keeps well in the air. It does not cake, and may be easily mixed with magnesium. Carl Beltige, 18, Schlesische Strasse, Berlin.

THREE-COLOUR CINEMATOGRAPHY.—No. 11,791, 1908 (May 30, 1908).

According to the invention, when taking a picture, or series of pictures, a translucent film or screen divided into successive series of primary colours is disposed between a colour-sensitive film and the lens, this translucent screen being preferably arranged closely to the sensitised film, and being intermittently travelled in conjunction therewith between each period of exposure in such a manner that successive exposures are effected through successive primary colour divisions.

The film or screen may either be continuous or it may consist of a suitable length of film wound from one spool on to another, and each series of colour divisions thereon is composed of the three primary colours—red, green, and blue-violet. The extent of each colour-division is equal to the area of the sensitised film affected during an exposure.

In order to reproduce animated pictures in the natural colours, transparencies or positives are produced from the sensitised film in the usual manner, and the aforesaid colour screen is interposed at a suitable point between the film provided with photographs and the screen upon which the images are projected, preferably adjacent to the film. The translucent film is adapted to be travelled synchronously with the positive film, and so that the colour divisions occupy the same positions relatively to the positive

film as they occupied when the negative was taken. Will Friese-Greene, 203, Western Road, Brighton; and Friese-Greene Patents, Ltd., 64, Victoria Street, London.

New Trade Names.

THOMAS A. EDISON (Signature).—No. 305,781. Chemical substances used in manufactures, photography, or philosophical research and anti-corrosives. Edison Manufacturing Co., Orange, New Jersey, U.S.A., manufacturers. August 26, 1908.

Analecta.

Extracts from our weekly and monthly contemporaries.

A Lady's Developer.

In "Photography and Focus" for March 9, Miss Alice M. Percival writes: "The best non-staining developer I have found so far is pyrocatechin. I use it in the ordinary pyro-soda formula, simply substituting pyrocatechin for pyrogallie acid. The stock solution of pyrocatechin does not keep so well as pyro, but it will keep in good working order for at least a month or six weeks. It goes bad in that time, but its developing power does not seem to be impaired, though with longer keeping it goes off entirely. The brown developer does not stain fingers or plates in the slightest. The sodium carbonate solutions used in developers roughen and spoil the appearance of one's fingers, and as almost all developers contain these or similar substances, it is wise to keep one's fingers out of the solution as much as possible, even when a non-staining developer like pyrocatechin is being used."

Exposure and Development of "Ensyna" Paper.

In "Knowledge" of March Mr. Chapman Jones writes on the behaviour of "Ensyna" paper under somewhat abnormal conditions.

By increasing the exposure the resulting image becomes more dense and with diminishing contrast.

The image may be printed out, but if fixed straight away it will lose the greater proportion of its density.

After printing out, a short development in a diluted paper will give an image that will change little, if at all, in the fixing process. Such an image is a very reddish shade of brown and flat, unless the negative is unduly hard; but, of course, the paper is not intended for such treatment.

The makers say that "the tone is entirely governed by the exposure and not by the development." This appears to be true if development is always carried to the same degree of image density, and one would endeavour to do in making many duplicates. But this does not appear to be no exception to the rule that the more of the work is done by the exposure and the less by the development the more dense is the image. With sufficient exposure the image on development is red and gradually passes through sepia to a blue black, but one tint will correspond to the most suitable amount of development. With the same exposure, development may be stopped at the reddish brown, sepia, purple, or black stage, and if these latter over-developed prints are reduced by dissolving away a part of the image, they will retain their colour, and in this way differently coloured images are obtainable with the same exposure; but obviously such prints will not all have the same scale of gradation.

With under-exposure only the black or colder tints are obtainable, with a tendency to excessive contrast.

Increased exposure, as usual, tends to flatness of image.

It is of interest to note that there appears to be no sign of reversal within an enormous range of light action, exposure and development being interchangeable, with the limitations as to colour, gradation, and density, and the difference in constitution between the merely printed-out and the developed image, noted above. I have exposed some of the paper under clear glass to daylight for periods up to about two days, during a part of which time the sun shined directly upon it. After a certain exposure, when an almost black colour is obtained, further exposure seems to be without effect. The colour loses nothing on fixing, nor does it change materially

ted with the developer supplied for the paper. It will, of course, be understood that such treatment as is here described is suitable for the getting of ordinary prints. For this purpose very few seconds' exposure and development as directed cannot be improved upon.

A Developer for "Ensyona,"

F. G.," writing to the "Pharmaceutical Journal" of March 6, 1909:—"A very short series of experiments proved that a very simple developing solution, consisting of 2 grains each of pyroacetone sulphite to each fluid ounce of distilled water, produced perfectly satisfactory prints of even richer tone than was obtained by the special developer supplied. The pyro and acetone solution may be somewhat slower in action than the special developer supplied by the makers, but the resulting prints are in no way inferior. It is, moreover, that the tone is somewhat influenced by the strength of the developer, as, when diluted to half the above strength, a darker brown was obtained. The fixing solution should be acid, similar to that ordinarily used for gaslight papers. A strength of from two to three ounces of 'hypo' to the pint is sufficient, to which a quarter of an ounce of potassium metabisulphite may be added. Although the makers state that thirty seconds suffice for fixing, I do not find that any harm results from allowing a longer time, from two to three minutes."

New Books.

Photographischer Almanach, 1909. Edited by H. Spörl. Leipzig: Ed. Liesegang (M. Eger). Mk. 1.

This twenty-ninth issue of "Liesegang's Almanach" contains as a special feature a portrait of Dr. Lüppo-Cramer, who is apparently cogitating upon radio-latent images. The letterpress of the "Almanach" amounts to 144 pages, and in that space well accomplishes the not inconsiderable task of providing some articles of current interest, facts of outstanding items of progress, reviews of new apparatus, and a directory of photographic societies in Germany and Austria.

Photographie au Charbon. By G. A. Liebert. Paris: Gautier-Villars. Fr. 2.75.

The original publication on which the present work is based was written by M. H. Liebert, the father of the author. It appeared in 1876, at which time pigment printing was in its infancy. M. Liebert has produced a very comprehensive work on the carbon process only, as that word is generally understood. Gum-bichromate, the powder process, ozotype and ozobrome, and the various other processes are to be treated in subsequent manuals devoted to "la photographie par les procédés pigmentaires." If the present work may be taken as a criterion of what is to follow, the series would provide a most inclusive treatise on methods of pigment printing. M. Liebert commences with the making of tissue, describes various commercial tissues, and then turns to the details of the single and double transfer methods, in the course of which he provides the most detailed instruction in the sensitising of tissue, printing and development upon various temporary and final supports. The later portions of the volume relate to the by-paths and applications of carbon work, such as transparencies, miniatures, multi-colour work, combination printing, and the making of carbon engravings. The volume is one of the most complete we have seen.

THE MIDLOTHIAN PHOTOGRAPHIC ASSOCIATION will hold its second exhibition in the Synod Hall, Castle Terrace, Edinburgh, from March 10 to 17 inclusive. Of the six classes two are confined to members, one to associates of the Scottish Photographic Federation, the remaining three being open to all photographers. In this last class one is devoted to colour photography, both prints and transparencies. Twelve plaques will be placed at the disposal of the exhibitors. Mr. Robert Burns, A.R.S.A., for award, which number may be increased at his discretion. Entries close March 31, on or before that date all entry forms, accompanied by the necessary fees, must be sent to the exhibition secretary, Mr. B. Sherratt, 8, Castle Terrace, Edinburgh, who will be pleased to send entry forms and full particulars to intending exhibitors.

New Apparatus, &c.

An Automatic Folding and Portable Dark Room. Made by Nicolas Wladimiroff, 20, Rue Emile Augier, Paris.

Of the many ingenious pieces of apparatus for the development of plates in full daylight which we have seen we cannot call to mind any which exhibits such an ingenious design as this. Whether there is likely ever to be an appreciable demand for such an apparatus is another matter. However convenient it may be to develop a plate in daylight, the many sacrifices which the use of a developing chamber entail are rightly considered by many photographers to be too great a price to pay for the alleged convenience. The tourist, when he wishes to develop *en route*, usually contrives to make his hotel bedroom into a dark room for the nonce, develops and washes briefly, and sets his negatives in a position where they will be dry in the morning. As a means of testing the correctness of an exposure there is no doubt that there is something to be said for a portable developing chamber, but the real difficulty, and one which no inventor has yet surmounted, is a certain and convenient means of conveying home the wet negative secure from dust and other damage.

However, this is not to say that, within these limitations, M. Wladimiroff has not designed a piece of apparatus which, as we have said, is above all things ingenious. It is a folding box which when erected forms a chamber $7\frac{1}{2} \times 7\frac{1}{2} \times 9\frac{1}{2}$ inches, in the top of which a lensless eye-piece is fitted. This latter is provided with a pair of opaque diaphragms which in the ordinary way form a light trap to each eye-piece. When, however, the eyes are allowed to rest in the rubber ends of the tubes the bridge of the nose presses upon a rubber knob which opens the diaphragms. To the sides of the box are affixed two sleeves allowing of the workers' hands being admitted without access of light into the apparatus. The bottom of the box contains a sheet of ruby glass, whilst the front is likewise provided with two ruby panes. To one side a shelf is attached by a spring hinge on which the developing dish may be laid during the earlier part of development. On holding the dish in the hand for a moment and releasing the shelf the density of the negative may be judged by the ruby window in the floor of the chamber. The whole apparatus is collapsible and folds into about the space of three whole-plate dark-slides. The price for 9×12 cm., or quarter-plate, is £2; for 13×18 cm., or 7×5 plate, £3; and for 18×24 cm., or whole-plate, £4.

New Materials, &c.

A BRINGER OF BUSINESS.—Like the flowers that bloom in the spring, *tra la*, Messrs. Walter Pearce and Co., of St. George's Press, Brentford, bring promise of sunshine, business profit, and other agreeable things which should result from a discreet use of the very distinctive printed booklet just produced by them under the title of "When Spring Flowers Bloom." In addition to the things which the poet has associated with the spring season—or perhaps as a result of the combined action of them and Messrs. Walter Pearce and Company—a visit to the photographer's studio should be numbered, and if a reminder of the fact takes the very graceful form of this "Spring Flowers" booklet, the aspiration should be at once a fact. Messrs. Pearce, in accordance with their usual practice, have produced a dainty piece of printing, only one edition of which they issue in a given district. The letterpress may be modified to fit the photographer's own conditions, and at the moderate prices at which these booklets are done by Messrs. Pearce their use should be a source of profit to a photographer with any kind of fairly good clientele.

VICTOR TROPICAL PAPER.—A correspondent writes us for the address of a bromide or chloride paper, placed on the market under this name. Inquiries in the trade having proved fruitless in discovering the source, we should be glad if the manufacturer or agent could communicate with us, when we will forward his letter to our correspondent.

Commercial & Legal Intelligence

EASTMAN KODAK COMPANY, OF NEW JERSEY.—In addition to the usual quarterly dividends, payable on April 1, the directors of the Eastman Kodak Company, of New Jersey, have declared an extra dividend of 5 per cent. upon the Common Stock, also payable on that date to stockholders of record on March 2.

LEGAL NOTICES.—A supplementary dividend of 8½d. in the £ is to be paid to the creditors of Wm. Tapscott Radford, photographer, etc., 7, Bampton Street, Tiverton, Devonshire.

NEW COMPANIES.

H. A. DUPUY AND Co.—Registered January 18. Dealers in patents and apparatus for transmitting photographs by electricity, 31, Lombard Street, E.C. Partnership from January 18 "until the particular business for which the firm is constituted is completed." General partner: I. Hendrickx, 31, Lombard Street, E.C. Limited partner: W. H. O. Ainslie, Ingledene, Foxley Lane, Purley, Surrey, contributing £500 in cash.

Meetings of Societies.

MEETINGS OF SOCIETIES FOR NEXT WEEK.

FRIDAY, MARCH 12.

Acton Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Aberdeen Photographic Art Club. "A P." Prize Slides.
Sutton Photographic Club. "Colour Photography." A. E. Bawtree.

MONDAY, MARCH 15.

Kingston-on-Thames Photographic Society. Dutch Lantern Pictures. A. E. Staley & Co.
Catford and Forest Hill Photographic Society. Monthly Competitions. Criticism by A. H. Lisett. Affiliation Prize Lantern Slides.
Southampton Camera Club. "Thornton Pickard Prize Slides and Apparatus, with descriptive remarks." R. Hesketh.
Bradford Photographic Society. Five minute Papers by Members.
Scarborough and District Photographic Society. "Gothic Architecture." A. S. Tetley.
Kidderminster and District Photographic Society. *Photography* Prize Slides.
Attercliffe Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Stafford Photographic Society. Midland Photographic Federation, Lantern Slides.

TUESDAY, MARCH 16.

Royal Photographic Society. "The Romance and Humour of Invention." A. H. Dunning.
Chiswick Camera Club. "A Chat on Pictorial Photography." W. E. Walker.
Leeds Photographic Society. "A Swiss Holiday." Gilbert Middleton.
Hanley Photographic Society, Y.M.C.A. "Gum Bichromate." Mr. Brand.
Sheffield Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Kinning Park Camera Club, Govan. "Mounting and Framing the Exhibition Print." James M'Kissack.
Hackney Photographic Society. "Gum Bichromate Printing." C. Wille.

WEDNESDAY, MARCH 17.

Leeds Camera Club. "Platinotype Demonstration." Rev. Joseph Beanland.
Leicester and Leicestershire Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Croydon Camera Club. Annual Sale of Members' Surplus Photographic Apparatus.
North Middlesex Photographic Society. "Home Portraiture." M. Fraser Black.
Sale Photographic Society. Print Criticisms.
Borough Polytechnic Photographic Society. Lantern Slide Competition.

THURSDAY, MARCH 18.

Richmond Camera Club. French Lantern Pictures. A. E. Staley & Co.
Rodley, Farsley, Calverley and Bramley Photographic Society. Y.P.U. Print Portfolio.
Chichester Photographic Society. "On the Printing, Developing, and Toning of Velox Papers." W. F. Slater.
Maidstone and Institute Camera Club. "A Holiday Tour with the Camera." F. Argles.
Southend-on-Sea Photographic Society. "Flashlight Portraiture." Randolph Goodwin.
Folkestone and District Camera Club. Lecture Competition.
London and Provincial Photographic Association. "The New 'Aurora' Colour Plate." E. Fenske.
Midlothian Photographic Association. "Exposure and Development." Ben. Sherratt.
L.C.C. School of Photo-Engraving, Bolt Court. "The Design and Construction of Photographic Cameras." Arthur S. Newman.
Liverpool Amateur Photographic Association. "Spring under Italian Skies." J. Dudley Johnston.
Handsworth Photographic Society. "Autochrome Slides." F. E. B. Hall.
Aberdeen Photographic Art Club. Informal Meeting.

ROYAL PHOTOGRAPHIC SOCIETY.

MEETING held Tuesday, March 9, the president (Mr. J. C. Mummery) in the chair.

In connection with the opening of a house exhibition of competitive prints by members of affiliated societies, a short paper was read by Mr. Bale Rider, in which the aims of the Affiliation were referred to and some particulars given of the work represented on the wall. This can be more appropriately referred to when we review the exhibition, as we shall do next week.

The paper down for the evening was on "The Absorption and Scatter of Light by Photographic Negatives Measured by Means of Marten's Polarisation Photometer." by M. André Callier, of Ghent. Dr. C. E. K. Mees had translated the paper, but in place of the full text gave an abstract dealing more particularly with the practical application of M. Callier's experiments. M. Callier's work has been made primarily to ascertain the amount of light scattered from the surface of negatives with a view to ensuring accuracy of photometric measurements. This scatter, however, has also an effect in modifying the contrasts of enlargements made by projecting a negative, it being always found that the projected image has greater contrast than the negative from which it is derived, and similarly the positive produced by projection shows greater contrast than that printed by contact. This fact had been emphasised long ago by Mr. Vero C. Driffield, who gave one explanation of it in the "British Journal," 1894, p. 714, but the explanation there given did not account for the considerable amount of contrast obtained in practice. M. Callier's measurements, however, of the amount of light scattered from the surface of a negative illuminated by transmitted light did account for the degree of contrast observed. This scatter could be obviated by first completely diffusing the light illuminating the negative, to do which efficiently it was necessary to place opal glass in contact with the film of the negative. Varnishing would go some little way towards obviating the scatter, but not completely. Some transparencies were shown illustrating the result obtained in accordance with M. Callier's work, and the subject was then to an interesting discussion, in which the Rev. F. C. Lambert, Mr. S. E. Sheppard, Messrs. A. J. Newton, E. J. Wall, C. P. Butler and Oliver S. Dawson took part.

CROYDON CAMERA CLUB.—Dr. Mees, on the 24th ult., lectured upon "The Photography of Coloured Objects," and Mr. S. Wratten last week gave an exposition on the new "Wratten Lantern plate."

Dr. Mees initiated a new departure by bringing with him a powerful electric rotary-fan, which, affixed to one of the ventilators, created an atmospheric disturbance of no mean order. He explained that an appliance would keep the room clear of tobacco smoke. It was most effectual in this respect, and also in materially lowering the temperature. Several members conveniently near the door quickly slipped out and returned with overcoats on; those not so fortunately situated shivered and went varied shades of blue as the evening progressed. Whether the more abundant supply of oxygen was responsible or not, the lecture itself, although the blackboard was never in requisition, was one of the most interesting ever given in the club rooms, and it would be almost impossible to attempt to epitomise it. As the lecture was avowedly a dress rehearsal for a little gratis pamphlet to be issued in the spring, the lecturer particularly asked for criticisms or suggestions. Little of either was offered, or indeed could be, offered. A very ingenious form of reflector spectroscopy was employed for projecting the spectrum. The filament of a Nernst lamp was (by means of an objective and mirror) focussed on the screen, no condensers being used. The mirror was removable in an instant, bringing a silvered grating into operation and furnishing a very even spectrum on the screen. Perhaps of the experiments shown the most instructive were illustrations of the variation of the luminosity curve at great and small intensities, and those showing that coloured objects do not obey the same laws as pure spectrum colours. A series of cards dyed to match different parts of the spectrum showed striking differences in reflecting value. For instance, a red card placed in the red portion of the spectrum glowed bright, a green card in the green portion became distinctly darker, whilst a blue card in its own region had the least reflecting value of all. The clear deduction to be drawn from this experiment is that the luminosity curve of coloured objects is different

that of the pure spectrum, and Dr. Mees stated it departs much from the curve of the plate, a pure spectrum being closer.

Wratten, on March 3, had an easy task in illustrating the uses of the new lantern-plate, which in quite Christian spirit regarded as good for evil. Capital warm shades are obtainable with hypo developer, generally a deleterious addition, and even thioamide, which causes reversal with ordinary emulsions, only on the plate by giving bright bluish-purple tones. Judging from pictures shown on the screen, most developers seem suitable, hydroquinone, rodinal, rytol, and pyro soda each affording results. Warm tones can also be secured in the usual way. It is pointed out that with a normal bromo-iodide plate it was impossible to obtain really warm tones by development. If chloride of silver was incorporated, its solubility in ammonium bromide, and the rate rendered these easy of attainment. Such addition unfortunately impaired the keeping qualities of the plate. Having regard to the fact that the solubility of a substance depends not only on its nature but on the surface it exposes, their laboratory had developed out an emulsion of such microscopic fineness that the hitherto insoluble bromide was capable of being dissolved by the restrained developer, the consequent deposition of silver in solution giving the warm tones sought.

CKNEY PHOTOGRAPHIC SOCIETY.—The twentieth annual report of the society was submitted to the members at the annual general meeting on the 2nd inst. The report and accounts were very satisfactory, progress having been made in all respects. Officers and Council for the ensuing year were made as follows:—President, J. Linley; Secretary, Walter Selfe; Assist. Hon. Sec., A. D. Fort; Excursion Secretary, S. Woodhouse; Curator, W. H. Witts; Lanternist, F. Morrison; Treasurer, H. W. Lane; Council, A. Akerman, A. Capper, G. Caudle, E. Farmer, A. J. Linford, W. Rawson, F. E. Roofs.

STERHAM PHOTOGRAPHIC SOCIETY.—At a meeting held on Tuesday the 2nd inst., Mr. W. Firth, vice-president, in the chair, Mr. J. Hart, representing Messrs. Charles Zimmermann and Co. (Photographic), Ltd., gave a series of demonstrations illustrating the uses of the well-known "Agfa" photographic chemicals and specialties. After dealing briefly with the necessity of pure chemicals for photographic use, Mr. Hart proceeded to take a flashlight picture of the members present, using for the purpose "Agfa" flashlight lantern and the "Dega" Electroflash. The resulting negative (developed with rodinal) showed that the methods employed, although exceedingly simple, were very efficient, producing a soft harmonious effect, without crudeness of lighting. In addition to rapid fixing, sensitization, and reduction, Mr. Hart demonstrated the use of "Agfa" Neutral Toning and Fixing Salts, pointing out how the product in question fulfilled the requirements of a number of photographers who find the need of a simple combined toning and fixing bath. At the same time it was pointed out that permanent prints were obtained with the salts in question, sulphur toning being possible.

The above lecture-demonstration, it may be added, has been voted the most successful and instructive by the many societies before which it has been given during the past season, and though the few remaining dates are booked, society secretaries who may wish to secure a good trade fixture for next winter's programme may be desired to put themselves in communication with Mr. Hart in good time before the autumn.

News and Notes.

BAKELITE.—It is announced that Dr. Baekeland, the inventor of the bakelite paper, has prepared oxy-benzyl-methylene glycol-anhydride, and for short "bakelite," and that this substance possesses properties which should make it a good substitute for celluloid.

SPECIALTY BUSINESS.—According to "Abel's Weekly," the Messrs Selby, two young Englishwomen, who have become successful photographers in New York city, make a specialty of taking pictures of dogs. Appointments are made for these furry-coated creatures the same as for persons, and the posing is done with as much care and care as when a society bride is facing the camera. Dogs are not easy to photograph successfully, and they do not always lend

themselves to studio posing. The reason that these young women have done so well with their unique line of photography is because both are great lovers of dogs, and they know how to get on with animals. Usually their pictures, all of which are taken in their Fifth Avenue studio, are of the dogs alone, though sometimes they pose the dog and the owner together.

M. TANQUEREY AND "TRUTH."—Mr. Labouchere's organ, of the date of March 3, contains the following amusing letter, received, as it states, from the "genial rogue," Tanquerey, of "free portrait" fame:—

"MY DEAREST LABOU,—Now, now, you are getting off the track. You forget that on many occasions during the past fifteen years you have called me 'my old friend, Tanquerey.' Why this sudden change? Surely your customers will not understand you. Of course I have a thick hide, and lucky I have, for the numerous poisoned arrows you have sent me across the water would certainly have done harm to others. But Tanquerey is too tough to be touched by them.

"I am sorry that the French police will not help you either. My case has been tried years ago and found perfectly honourable and legal. It is too bad, *n'est ce pas*, but it can't be helped, and you must grunt and bear it. I will tell you that I have 500,000 customers to-day in England, who are sending me orders every day. I suppose those good people do not read 'Truth.' . . ."

"I take the statement," our contemporary proceeds, "about the 500,000 customers to belong to the same order as those in Tanquerey's circulars and his press extracts, including the alleged testimonial from 'Truth.' Be the number what it may, he is, of course, right in assuming that his customers are not readers of 'Truth,' and he thereby demonstrates how much better it would be for many people if they were.

"In the meantime, it is a comfort to learn, as I do every week, that 'Truth' has saved a certain number of the more intelligent class from falling into Tanquerey's clutches. One of my readers, forwarding one of his circulars the other day, asked what new trick he is now working under cover of offering to supply, not only a portrait, but also a frame, 'free.' There is no particular new trick about it. It only means that you will have to pay for the free portrait and frame under the head of carriage, packing, Customs duties, etc. For years past Tanquerey has been enabled to supply free portraits on these terms, and if he now throws in a frame at the same price, it only shows what a profit he must have made out of a 'free' portrait on those terms."

Correspondence.

* * We do not undertake responsibility for the opinions expressed by our correspondents.

* * Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.

ASSISTANTS' PROSPECTS.

To the Editors.

Gentlemen,—My attention has been much attracted lately to the number of advertisements appearing in your columns week by week for pupils and apprentices. Surely this is a good indication (or bad, should I say?) of the present unhappy state of our profession. Now glance at the columns headed "Situations Wanted." What do we see? Advertisements one after the other, column after column, all assistants out of employment. The conclusion one is forced to arrive at is that employers cannot afford to engage salaried assistants, but endeavour to get their work done by learners whenever possible. The ultimate result will be, naturally, that these apprentices and pupils will shortly be thrown on the market, to swell the already overcrowded ranks of despairing "unable-to-find-positions" assistants.

There is a good deal in the daily press about the unfortunate clerk, some even asserting that tram conductors and road-sweepers are better off. I think one could easily say that, as regards prospects and salaries, photographic assistants are very much in the same plight as clerks.

There is also a firm who advertises regularly in your journal (noted chiefly for the egotistical and bombastic form its announcements take)

who recently advised photographers to dismiss their assistants and send all printing, finishing, etc., to them. Surely the poor assistant finds it hard enough to live without people seeking to "take the bread out of his mouth" in this manner. Were I an employer, this firm would get precious little work of mine to do.

I beg to remain, yours truly,
AN UNDERPAID ASSISTANT.

FREE PORTRAITS IN YORKSHIRE.

To the Editors

Gentlemen,—My clients, the King Edward Fine Art Engraving Company, have seen me relative to the letter of Mr. W. H. Jennings in your issue of the 2nd inst. The facts, as set forth in the said letter, may have been those which he was told, but are not consistent with what actually took place. An order was taken for an enlarged water-colour portrait and carved polished oak frame complete for the sum of £4 15s., which sum was a fair and reasonable price for high-class work of this character, and such could not be supplied for a less price. On the proof and frame being submitted to Miss Griffiths, she expressed her appreciation and approval. Mr. Jennings's letter would lead your readers to believe the sum of £4 15s. was paid for a frame only, and they will readily understand the important part of the work, both in time and skill, is in the process of enlargement, and the care consequent thereon. The reference to the brooch incident is no doubt referred to for some purpose best known to Mr. Jennings, as the wish of my clients for the loan of the brooch was only for the purpose of the work to be done. My clients carry on a large business, have received numerous testimonials as to their straightforward conduct and good work, and many of such have come from the neighbourhood of Driffield, where numerous orders have been satisfactorily executed.—Yours, etc.,

89, Albion Street, Leeds,

EDWARD F. MAUD.

March 8, 1909.

[We insert the above letter at length, although parts of it refer to matters not touched upon in our abridged extract from the "Yorkshire Post." Our correspondent having addressed an almost identical letter to the "Yorkshire Post," it is fitting that we should print also the reply thereto by the writer of the original letter, Mr. William H. Jennings, of Driffield. The following is the reply from this gentleman to Mr. Maud's letter:—

"To the Editor of the 'Yorkshire Post.'

"SIR,—Mr. Maud states that 'an order was taken for an enlarged water-colour portrait and carved polished oak frame complete for the sum of £4 15s.'

"His client's letter to me of February 23 states: 'Re your remarks, "he tried to get an order for water-colour," this we must say is an error of Miss Griffiths; as a matter of fact, our Mr. Kelly never canvassed for an order. He might have said or promised to see her portrait would be made in water-colour without paying extra £3 3s. for same.'

"It is not conceivable that Mr. Maud would knowingly state that his clients did what their own letter expressly repudiates and asserts they did not do, and it must be assumed they did not inform him of the fact.

"My purpose was simply to set out the actual facts of the transaction. I am satisfied that Miss Griffiths, who has been for upwards of 20 years in the service of my family, has correctly stated what took place, and it rests with Mr. Maud to explain how his version and that of his clients come to be in flat contradiction.—Yours, etc.,

"Driffield,

"WILLIAM H. JENNINGS."

"March 5.]"

THE USE OF LIMELIGHT WITH A MANTLE.

To the Editors.

Gentlemen,—Some little time ago you copied from the pages of "Nature" a letter by Mr. C. E. S. Phillips advocating the enduing of artificial limes with gas mantles with a view to the increase of intrinsic luminosity. Will you permit me to inquire, through your correspondence column, if any of your readers have tested the virtue of this suggestion; and, if so, what their experiences have been?

Having recently had occasion to test a new lantern jet just placed on the market, I took the opportunity of photometrically testing Mr. Phillips's suggestion, and I uniformly found that the presence of the mantle wrought no measurable improvement in the light obtained. I experimented both with ordinary hard limes and the

artificial (magnesium oxide) "limes" sold under the trade name "Mabor limes."

The mantled lime placed on an ordinary blow-through jet balanced against a very steady ejector jet, and the luminosities of the two radiants were compared in a H. and D. photometer provided with a Joly paraffin block photometer head. (The diaphragms and diffusing ground glasses were, of course, removed from the side of the photometer.) A reading was first taken for the mantled lime. The mantle was then removed from the lime and another reading was taken at once without any alteration of the gas and oxygen supply to the two jets.—Yours truly,

DOUGLAS CARNEGIE

Answers to Correspondents

- All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY, 24, Wellington Street, Strand, London, W.C." Inattention to this ensures delay.
- Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.
- Communications relating to Advertisements and general business affairs should be addressed to MESSRS. HENRY GREENWOOD & COMPANY, 24, Wellington Street, Strand, London, W.C.
- For the convenience of Readers, our Publishers, MESSRS. HENRY GREENWOOD & COMPANY, of 24, Wellington Street, Strand, W.C., undertake the registration of copyright photographs at a charge of 1s. 7d. each photograph, to cover cost of registration fee, form, etc. Two unmounted copies of each photograph must be sent with the fee.

PHOTOGRAPHS REGISTERED:—

- G. S. Pearce, Victoria Road, Diss, Norfolk. *Photograph of the Screen at Mary's Church, Diss.*
- Wm. Marshall, 31, Hart Street, Henley-on-Thames. *Photograph entitled "After the Dip" Photograph of the King on Lou ch at Henley Regatta 1887, when Prince of Wales. Photograph of Tomb in Greys Church, near Henley-on-Thames.*
- R. T. and J. Elliott, Market Street, Hexham. *Combination Photograph containing Eight Photographs in connection with the Roachburn Colliery Disaster.*

PAINTING REGISTERED:—

- G. Wilson, 34, Horsforth Avenue, Bridlington, Yorkshire. *Oil Painting representing an occurrence at Flamborough in which six men were drowned.*

COPYRIGHT IN DUPLICATES.—Recently I sold the sole postcard rights of the enclosed two photographs to two different firms, one to each of them. What I want to know is: Would one of the photographs be held as a "colourable imitation" of the other, as defined by the Copyright Act, and have I thereby infringed the postcard rights of one of the firms?—CAMPO.

So far as the strict letter of the Copyright Act is concerned, a photographer is at liberty to make any number of negatives from a subject, and, even though they may be closely similar, to register the copyright in each separately. At any rate, there has never been a case to show that he cannot. On the other hand, quite apart from copyright considerations, we think that any breach of contract could probably be sustained against you by the firm in respect of your selling to another an almost identical photograph. So far as imitating the pose and costume of the subject, you or anybody else has the right to produce a similar photograph so long as he works from the living model.

POSTCARDS OF CHINA.—I enclose postcard copied from a set of 10. Am I liable in any way if I issue such and similar as postcard MAYPOLE.

If there is copyright in the design of the article, we think the photograph will be an infringement of it. This follows from a portion of the Copyright Act which lays down that a reproduction in some other form of art, e.g., of a painting by a plaster cast, is nevertheless a copy. If the age of the article is such that no right can now be existing in it, there can, of course, be no restriction as to copying it and issuing postcards.

COLLOTYPE.—Will you please outline the colotype process, or give the name of a text-book on the process, and where I could obtain the same?—COLLOTYPE.

"Practical Collotype," by A. W. Fithian (Iliffe, 2s. 6d.).

MAGNESIUM LIGHT.—1. There is no electric light in this town, should like to be able to take a sitter by artificial light in an emergency. I have tried magnesium ribbon, but the exposure is

so have some magnesium powder, but as it cannot be moved during exposure like the ribbon, I propose to rig up a frame red with tissue paper, at an angle of about 60 deg. with the r, and behind this to fire off the powder, using reflectors on low side, and also on floor. Do you think this would do? der is expensive, so any hints would be thankfully received. s there any danger of the powder exploding by concussion, such rapping a bottle of it on the floor?—FLASHLIGHT.

We should advise you to improve on your idea by making a l-sized box with a front of tracing cloth, in order to enclose the es from the powder. You could fit into the floor of the box of the convenient 1s. 9d. "Agfa" flash lamps which we re-ed some few weeks ago. This will supply a convenient means gniting the flash powder. 2. Except by deliberate means, there ot.

LARGE.—1. If the photographer was paid in the ordinary way his work, of course the death of the sitter does not allow him nnex the copyright. 2. He may obtain, by gift or purchase, a ten assignment of the copyright from the executors or assigns. ou do not tell us the essential point, viz., who is the proprietor he copyright in the photograph you are asked to enlarge. If person who gives you the order is the proprietor, obviously ave no liability. You have simply to carry out your cus-er's orders.

—We must refer you to our advertisement columns, in which will find the addresses of some who do what you require.

ED PRINT.—I should be very much obliged if you would advise if anything can be done to remove the spots on the enclosed t. It is one very much prized, and I should like to remove n, if possible.—T. CHIDLEY.

here is no chemical method of removing the spots without aging the colouring. The spots are only superficial, and do not v on the coloured portion. They can be removed by carefully ping them away with a penknife, or by rubbing them off with ean ink-eraser. As they show only on the vignettted portion, as the paper has a matt surface, but little trace of the spots remain if the work is carefully done.

—Most of the people handle news-photograph's. Try Mr. agustin Rischgitz, Linden Gardens, Bayswater, W.

ES.—(1 and 2) Consult a booklet on the process, issued by owfield's, 146, Charing Cross Road. (3) The celluloid is dipped spirit and hot-rolled in contact with the photographs. (4) cher and Sons, Camera House, Farringdon Avenue, E.C.

—You should use a stronger bath, which will give you softer ults.

INCENT.—It depends on the location of a studio. For inland es, May and onwards; seaside places, not until June or y, when the busy season commences.

M.—We know of no such complete list.

TO SCALE PROCESS.—On February 12 you kindly gave me ticulars of the true to scale process, and although I have followed ections I have not been very successful. I enclose specimen t, but the trouble is to get it clear. Would you please tell further (1) whether the mixture containing sulphate of iron st be made up fresh every time, as I find it goes brown through dation in a day or so? (2) Whether the operation ought to be ed on in yellow light? (3) I find better results by adding more ver than you give, but it makes the film too tender. Any further t you can give me I shall be glad.—PLANS.

(1) The mixture need not be made fresh every time, but the k is kept in a tin, and at least a quarter of the new composition dded to any that has been used before. A slight brown colour s not matter. (2) It is not necessary to carry out the operations a yellow light. (3) The probable remedy would be to add a le more glycerine, which would keep the film more moist. It ld appear from the example that either the ink used or the od of rolling up may have something to do with the result. lhaps a stiffer ink or sharper rolling might prove better. This ult from an early attempt is distinctly promising, and with ctice we have no doubt you will soon improve upon it.

IE TO SCALE" PROCESS.—I am engaged as a photographer and e engineering printer (plans, etc.), and would like you to give me er working particulars of "True to Scale" process. Seeing

your reply to "Plans" of February 12, 1909, I have tried to do this process but I find that the ink takes on the ground of the print. I would like to ask you the following questions: 1. How long must elapse after placing print on jelly, and must it be done in dark room? 2. Must inking up take place at once; and must fresh ink be rolled on surface for every print? 3. Can a different print be placed on pad without remelting? 4. Does a print require to be taken first on negative paper and then blue positives be made from this?—BLUE PRINTS.

1. Only a sufficient time must elapse to place the print down on the jelly completely, lifting up from the end first placed down—that is to say, it must not remain on the jelly more than a second or so. The work need not be done in a dark-room. 2. Inking must take place at once, and fresh ink must be rolled on the surface for every print. 3. A different print cannot be placed without remelting, and the addition of some new jelly. 4. The blue print is the ordinary blue print made from tracings, and is, therefore, itself a negative blue print, undeveloped, only exposed.

CARBON PICTURES ON VELLUM.—I shall be very pleased if you can enlighten me on the following: In your article on Carbon Printing in the "B.J." for January 17, 1908, instructions are given for transferring on to vellum. Can you tell me: 1. Where the vellum is obtainable. 2. Whether the transferring can be done with the dry moulder in place of the rolling press? 3. If so, would the procedure be the same? 4. Can I get the other articles of this series at your publishers?—D. E. T.

1. The vellum paper is sold in small quantities by the Auto-type Company, 74, New Oxford Street, W.C. The importers only supply it by the ream. 2. We should say so, though we have not tried it ourselves. 3. Yes, precisely, though too much heat should not be used, as that might affect the indiarubber coating of the temporary support. 4. Yes, we send you a copy of the index, 1908. If you mark articles our publishers can supply at 2½d. per copy. 5. Say 5s. to 7s. 6d. each. It depends on the expenses incidental to making.

S. PROSSI.—We think if you expose more fully you will not get the trouble. Yours is not the general experience. The light is deficient in red, but then, complexions are not pure red in colour.

ABER.—1. See our issue December 18, 1908, p. 975. 2. Illustrations Bureau, 12, Whitefriars Street, E.C.

APPRENTICESHIP.—As a photographer, I wish to take on an apprentice, but never having served an apprenticeship myself, I am at a loss to know what the term of years is, and the commencing salary, and how much per year it increases, and also what he would get when out of his time.—P. M.

There are no set rules with regard to apprenticeships. It is simply a matter of arrangement between the parties. The term may be for any period—three, five, or seven years. The salary, necessarily, is governed by the amount of premium, if any, paid with the apprentice. What the apprentice would get when out of his time, of course, will depend upon his ability and somewhat upon the status of the photographer with whom he served his apprenticeship.

H. D. WILSON.—There are no up-to-date books on emulsion-making, and those by Abney, Eder, etc., are not of much use for present-day commercial work. Knowledge of emulsion-making is dearly bought nowadays—by practice.

S. G. L.—We should advise the pair of A lenses.

COLD ENAMEL.—Will you kindly oblige with the composition of a resin resist suitable for the cold enamel method of printing referred to in the "Photo-Mechanical Notes" last week? 1. If it is a patented process, kindly suggest a resin solution which would answer the purpose. Is the coating homogeneous or a grain (as in photogravure)? 2. I cannot see what there is to prevent the solvent finding its way beneath the small dots, dissolving the resist, and washing the glue away (in the manner a carbon tissue would be acted upon if not transferred). 3. How would the glue be removed from the dots before etching?—COLD ENAMEL.

1. The resist used by Dr. Albert is a secret. A solution of shellac in spirit can be used, or a saturated solution of dragon's blood resin in spirit, or a 35 per cent. solution of bitumen in

benzole may be used. Penrose and Co. sell the solution ready prepared under the name "Redcol." There is no grain produced, but a homogeneous film. 2. Provided the film is properly dry, and the spirit that is used to dissolve away the shellac contains no water, that is, there will be no difficulty unless the plate is left in the spirit too long. 3. The glue resist is removed by scrubbing with a soft scrubbing-brush and water. It need not be removed, as the acid would soon remove it.

MONTAGUE COOPER.—Charles Bowen, glass dealer, 58, Grove Road, Holloway, London, N. We fancy he buys only within a certain radius of London, so that you might try the effect of the advertisement later.

HOW NOT TO PREPARE A LECTURE.—I have been asked to give a lecture on photography. As I cannot afford to purchase the "History of Photography," would you inform me where I can obtain information of this character? When did Daguerre begin the working of "types?" Who made the first wet plates? Also dry plates? Who first thought of and actually printed from negatives, etc.? How was paper prepared before albumen, and who thought of albumen? What was it Fox Talbot did? As you see, I am entirely ignorant of the History of Photography; and do not for a minute expect you to use your journal to answer these queries; but should be much obliged if you could tell me where to obtain same. Thanking you for a speedy reply in this week's Friday, March 12, "Journal," if possible.—**JINKS.**

We think you are unwise in consenting to undertake the duties of instructing an audience. The best (and cheapest) course we can suggest is the purchase of No. 60 of "The Photo-Miniature"—"Who discovered Photography?" Price 6d.

BOOKS ON LIGHTING.—I should esteem it a favour if you will inform me where I can obtain the best book on lighting and posing (illustrated). I have no objection to price, providing it is an excellent publication dealing with all classes of lighting. Further, I should like to purchase a book on children's portraiture, posing, etc., perhaps you will inform me of this also.—**LIGHTING.**

"Artistic Lighting," by James Inglis, 2s. 6d., and the "Lighting in Photographic Studios," by P. C. Duchochois, 1s., are about the two best. No. 2 of the "Photo Miniature," "The Pose in Portraiture" is a good book on its subject, but is out of print; though enquiry at a large dealer's might secure one. 2. None that we know of.

CONSTANT READER.—1. We certainly consider the fee a very moderate one. If your customer can get anybody to make a journey and supply whole negatives and print for 1s. 6d. we should advise you to let the photographer who will work at this price have all he can get. He will not grow very fat on it. 2. A suitable material can be found in the unbleached "sheeting" which large furnishing drapers can supply up to 8ft. width.

RETURN TO BUSINESS.—Owing to my health I left photography three years ago, but having recovered I wish to return to photography and would be much thankful if you would kindly give me a few helpful advices on the following subject. 1. Where I intend settling there is already a good photographer and no room for two, but an opening for cheap work at 6d., etc. Would it be possible to do it and better work also together, or better keep to one? 2. What lamp would you advise me to buy—enclosed arc or mercury-vapour? I have been told the latter is very expensive to keep owing to breakage of the tubes. 3. Are the cheaper papers and chemicals now on the market as permanent as dearer ones?—**A RIP VAN WINKLE.**

1. Better not mix the good and cheap work. 2. The mercury-vapour consumes very little current, but is, as you say, liable to the expense of tubes which go wrong. 3. If you mean, are the results as permanent, we say yes, certainly. The chief difference is in the quality of fine surface or range of gradation.

EMPLOYEE'S COMPENSATION.—Would you be kind enough to reply to the following? What amount of compensation can an assistant legally claim who has met with an accident while in the service of his employer, and in the performance of his duties; such accident necessitating a more or less prolonged absence from business, and the services of a doctor with the extra expenses

of medicine, etc.? In the event of the accident causing a permanent injury or disablement, can the assistant further compensation for this?—**FAIRPLAY.**

In the case of total disablement an employee earning than one pound a week is entitled to one-half his salary that must not exceed twenty shillings a week. No compensation is payable until after the first week's disablement. On pp. 554 and 555 (February 22 and July 26 respectively) of our volume for 1907, are articles fully dealing with the subject to which your correspondent is referred, as they deal with it far more than the limited space in this column will permit.

DAMAGED NEGATIVE.—1. I find that chromium intensifier after leaving a hole in the film. Can you account for this?—**ENTHUSIAST.**

1. We can only account for this on the assumption that the film contained a patch of decomposed and soluble gelatine. This seems to be no other possible explanation.

PHOTO-MICROSCOPY.—1. When a photo-micrograph is said to be x 700 does this mean that the objective used gave x 700 in the microscope? If so, by doubling the distance (between the objective and the eyepiece) and using the objective only, I should get a picture x 1,400? 2. What multiplication do 1 in. and 1-10 in. objectives give in the microscope? 3. Is it possible to use glass as a temporary support for double transfer carbon print? Thanking you in anticipation.—**TRICOLOUR.**

1. It means that the objective and ocular together give a magnification of 700. Thus a 1-10 objective and No. 7 eyepiece would give about this magnification. With a high-power objective correction is as a rule only at its best for one particular distance, which means a particular magnification. Greater magnifications can then be satisfactorily produced only by varying the ocular. 2. A 1/4 objective gives an initial magnification of about 40, and a 1-10 one of about 100, the initial magnification being the size of the image at 10 in. from the objective. 3. It is more usual to employ opal, but glass may be used; the surface being ruled over with a solution of yellow beeswax, 60 grs.; yellow rosin, 180 grs.; rectified spirit of turpentine, 10 ozs.

INVENTOR.—The idea seems a good one, and the way to turn it to your best advantage, as you have not the capital to manufacture the thing on a commercial scale, will be to obtain provisional protection for it, and then get some of the large houses to purchase the invention from you. The cost of a provisional protection is only 10s.

W. COX.—We are quite unable to say whether there is any copyright in the photograph or not. The only way of learning that is by searching the register at Stationers' Hall. The fee for the search is 1s. only. We may say that in all probability the copyright in the picture has been registered.

DEATH OF A BUCKIE PHOTOGRAPHER.—The death occurred suddenly last week of Mr. William Clark, of Buckie, N.B. He was a native of Buchan, and had been in business in Buckie for thirty-one years. He was a Town Councillor for several terms, and as convener of the Lighting Committee did good work. Mr. Clark was very popular in the town, and was an enthusiastic Freemason, having been D.W.M. for several terms. He was 51 years of age.

**** NOTICE TO ADVERTISERS.**—Blocks and copy are received subject to the approval of the Publishers, and advertisements are inserted absolutely without condition, expressed or implied, as to what appears on the text portion of the paper.

SUMMARY.

The "B.J." Colonial Number.—Advertisers taking advantage of special issue are advised by the publishers that matter for dis-continued announcements should arrive to-day, Friday.

business feature of the reflex camera used for studio portraiture mentioned on p. 211.

Some further American notes by Mr. H. Snowden Ward deal with Canadian matters and instance the enterprise shown in cine-graphy. (P. 213.)

The annual general meeting of the P.P.A. was held last week, Mr. Lang Sims was elected president for the forthcoming twelve months in succession to Mr. H. A. Chapman. (P. 217.)

Mr. A. W. Everest has suggested a modification of the method of Mr. W. H. Smith for testing shutter speeds whereby a record of the efficiency is obtained. (P. 226.)

Mr. H. E. Smith has taken out a further patent dealing with the use of thiomolybdate compounds for sulphide toning of P.O.P. (P. 220.)

Among other patent news is the Dufay process of making a screen-plate for colour photography. (P. 221.)

Facilities for illustrative prints are often afforded nowadays in principal advertising. (P. 210.)

A touch of pathos is contained in the account given by a Paris correspondent of the "B.J." of the aged M. Guerry, maker of the well-known shutter of that name. (P. 216.)

Details of making panoramic prints from a series of separate negatives have been given by a practical American worker. (P. 214.)

The action of the sulphide bath is found by a correspondent not to be the action of the solution in sulphide toning. (P. 225.)

Some notes on the lighting of bas- and alto-reliefs are given on p. 212.

A slow plate and small stop provide a means of photographing in-cluded thoroughfares, which may not be known to some. (P. 211.)

The proper selection of an illuminant is a point not to be over-looked in commercial enlarging. (P. 211.)

EX CATHEDRA.

The Colonial and Foreign Number.

Next week's issue of the "British Journal" is now in a very advanced state, both as regards the enlarged text portion and the arrangements of our publishers for despatching it immediately on publication to photographers in all parts of the English-speaking world. Among other attractive features, the issue will contain an account of a quite new process and principle of toning of bromide prints and lantern slides, worked out by Mr. C. Welborne Piper. Mr. Harold Baker contributes a practical treatise on the bromoil process, and, in addition to other articles dealing particularly with photographic conditions abroad, the issue will contain a review of the most recent introductions in the way of apparatus and materials upon the photographic market.

* * *

Varnishing Bromide Prints.

Unvarnished bromide prints, toned or untoned, are liable to become disfigured in the course of time by a metallic-looking deposit of sulphide produced by gas fumes, etc. Varnishing will prevent this appearance, and a solution of celluloid will form a quite invisible varnish that gives no gloss whatever. It is quite efficient as a protection, but its presence cannot be detected even when it partially overlaps the mount. To prepare it, clean some old celluloid films, and then cut up the celluloid into small pieces. Put these in a wide-mouthed bottle, and fill with amyl acetate. When dissolved, a thick, syrupy liquid should be formed, and the relative amounts of celluloid and amyl acetate should be adjusted until the result is of about the consistency of treacle. The older this syrup is, the better varnish it makes, therefore it is well to make up a good supply. For use, pour a little of the syrup into another bottle, and thin down with either alcohol or amyl acetate until the consistency is convenient for application with a camel-hair brush. Two or more coats can be applied to the print, and it should be carried over the margins so as to seal the edges. The varnish dries more quickly when thinned with alcohol, but it must not then be applied to Autochromes. For these nothing but amyl acetate may be used.

* * *

Spring Weather.

At the moment of writing the weather is rather that of mid-January than of spring, but though delayed, the better weather cannot be much longer in coming. At all events, if the temperature remains low, the hours of daylight are longer and the light is brighter. Nature is just about to clothe herself in fresh garments, and there is the usual springtime feeling that freshness and brightness is in accord with the season. This is perhaps a delicate way of suggesting that in the

studio and reception-room, and above all in the showcase and shop window, a "spring cleaning" is as essential as in the home, the meadow, or the woodland. There is no reason why the photographer, in his sphere, should be lagging behind the housewife or Nature in their own. During bad weather little leakages occur in the glass roofing of the studio, and stains on paintwork and on blinds become apparent as the light brightens. Blinds may need renewing, curtains may be taken down, washed and replaced, while draperies and heavier curtains may be sent to be cleaned or dyed. At all events, a pound or two spent now, even though the outlay may mean some little effort, will prove a profitable investment, for the attractiveness or otherwise of business premises influences one's customers far more than the majority of professional workers realise. We constantly see things allowed in establishments which the proprietors would not tolerate for a moment in their own homes, and we often think an advantage would be gained if a photographer would take up his wife one day, and get her to give a candid opinion on things from the spring cleaning point of view.

* * *

Photographs in Advertising Pleasure Resorts.

One of the features of recent advertising has been the use of booklets and literature by municipal bodies, railway companies and similar corporations interested in drawing visitors to the coast or inland watering places in this country. Even the residential districts around large centres of population are similarly taking means to attract householders, all of which suggests opportunities for the use of photographic illustration which the photographer should take steps to embrace. It must be confessed that many of the views put forward as attractions to seaside resorts are of a somewhat colourless description, chiefly from the fact that they do not partake of anything in the nature of a demonstration of persons actually enjoying their visits to these places. The railway companies chiefly fall back on the artist's ability to show Mr. and Mrs. Jones and the little Joneses at the zenith of their yearly excursion to Wartlebury-on-the-Sea. But the camera should be able to supply illustrative matter of this sort much more convincing in its realism, and one may question whether photographers in seaside places avail themselves of the opportunities of taking such photographs which occur during the months of the early summer before the annual invasion of paterfamilias and his belongings about July or August. The assistance of his friends should give the photographer the means of making figure studies on beach, river, or promenade, which should, if possible, have some landmark of the town as a background, and should prove far more attractive from an advertising point of view than the usual views of photographs of well-known show places which are at present the general rule.

* * *

The Non-Return of Specimens.

Complaints continuing to reach us of the non-return of specimens to those applying to persons or firms whose names appear under a box number, our publishers desire us to repeat an announcement which we hope will apply an effectual check to this abuse of our advertisement pages. Advertisements asking for specimens must give the full name and address of the advertiser, and those replying to announcements of either class must take the sole responsibility for the safe return of their specimens. In future we will not insert under a box number advertisements asking for specimens to accompany the statement of an applicant's qualifications, and we reserve the right to delete such request from advertisements to appear under a box number. This rule, we believe, will relieve assistants of

any cause for complaint, and will defeat the aim of advertisers who, under a cloak of anonymity, obtain specimens which they have no intention of returning. Non-return of specimens, we believe, is due, in most cases, to gross and inexcusable carelessness. On the other hand, we do hold the applicant entirely innocent in the matter. His omission to enclose a stamped and addressed wrapper and to mark distinctly each of his specimens with name, he is not infrequently the sole cause of the injustice of which he so loudly complains. If assistants generally will observe the above conditions, and if they will cooperate with our publishers in refusing to send specimens to a box number, instances of retention of specimens will be things of the past.

* * *

A Substitute for Ground Glass.

A formula which was more in use fifty or twenty years ago than at present may be mentioned for the information of several correspondents asking for a suitable means of backing up large glass transparencies with a semi-transparent deposit. An emulsion of carbonate of lead in collodion permits of this being readily done. A solution of acetate or nitrate of lead is made, and carbonate of soda solution added to it, so as to precipitate the lead as carbonate. The precipitate is washed first with water, and finally with alcohol, and is then added to plain collodion, in which it is well shaken up. The exact proportion to add is judged by one or two trial coatings on a sheet of glass. Although the lead carbonate is about the best pigment, others, such as "Fard's Spanish White" (bismuth trinitrate) or "Baume's White" (alum white) may be used.

* * *

Positives on Bromide Opals.

More use might well be made by progressive photographers of the bromide opals to be obtained from one or two manufacturers in both the matt and glossy varieties. The former provides the more beautiful results, suitable both for landscapes, particularly snowscapes, and portraits. One precaution which needs to be taken in making opals is to avoid any staining of the white margin, with which they are best printed. Even when every care is taken a rim of thickened emulsion makes it difficult to avoid a dark band at the edge of the plate. One method of removing such marking is to apply powdered pumice with a piece of dry flannel to the dry plate. Better, however, to use a bleaching solution of iodine, which is painted on to the discoloured portions with a piece of flannel, and the plate, after a rinse, given a brief immersion in the fixing-bath.

* * *

Reduction of Danish Customs Duties.

While France is increasing her tariff on such an extent that it will ultimately be quite impossible for foreigners to do business in the country, Denmark has gone in for a policy of reduction. Politicians of the latter country seem to be of the opinion that free trade is better for the nation than a system of high tariff walls, and, after much debate, they have revised all their import duties, with the result that, according to the new laws that have just come into force, these show a general reduction all round. The imposts on photographic apparatus and manufactures have also been considerably reduced, and it is to be hoped that the better conditions now afforded to the trade will encourage our own manufacturers to take every advantage of this opportunity of doing business with Denmark. Another advantage which the revised tariff offers is, that all goods are now to be reckoned according to the decimal system, which simplifies the whole subject, enabling manufacturers to calculate more easily the exact amounts payable on the various articles. The monetary unit is a

one of 100 öre. In the country itself one spends a
 one exactly as we spend a shilling in England, yet the
 change value of a krone is about 1s. 1½d., or 18 kroner
 the sovereign. From this one may without any diffi-
 ty calculate the tariff on the principal articles of photo-
 phic manufacture. The duty on photographic apparatus
 70 öre per kilogramme; for mounts of all kinds, 30 öre
 kilogramme; while the same weight of plates and
 ss preparations is charged 28 öre; films of celluloid,
 atine, or similar material, 70 öre; and the duty on
 nting papers of all kinds is 30 öre per kilogramme. It
 calculated that this reduction on tariffs will cost the
 te something like seven million kroner, yet it expects
 be more than recouped by the increased business encour-
 d under the more favourable conditions.

* * *

The Vertical Camera. The manifold uses for a camera placed
 so that the lens points vertically down-
 rds will have been appreciated by those who have had
 asion to employ this method when photographing coins,
 ells, jewellery, or similar small objects which require
 rangement before the lens. At various more or less
 note periods of photography the particular usefulness of
 s device has been emphasised, but even to-day there are
 bably few users of the device. Nevertheless, even when
 gravings or photographs have to be copied at odd times
 daylight, the use of a stand to which the camera can
 vertically fixed greatly simplifies methods of working
 d lighting, particularly when the copying has to be done
 m a large and heavy volume, which could not readily
 put up in the vertical position. When all that is neces-
 y is to open it out and lay it on the table, the work
 the photographer is greatly lightened.

* * *

The Stable Photography. Most people are acquainted with the
 clever focal-plane work accomplished by
 Mr. G. W. Beldam in photographing
 cketers, but some very exceptional examples are now to
 seen in "Fry's Magazine" in a series of articles on
 he Secret of the Golf Swing," by Dr. Carruthers and
 Beldam. In these Mr. Beldam has attempted the
 ously difficult task of making a series of exposures at
 erent periods of the swing of the golf club, and the
 cess he has attained is certainly remarkable. To secure
 different phases of one particular stroke is distinctly
 notable achievement. The bare statement that "by
 arate timing the shutter of the camera was released at
 erent points in each swing" may be satisfying to those
 o are not familiar with the difficulties of such a pro-
 ure, but to photographers it means the accomplishment
 a very difficult feat, and Mr. Beldam deserves all con-
 tulations upon his success.

* * *

The Reflex of the Studio. Opinions differ in the practice of profes-
 sional portraiture as in everything
 else, and we have heard of portrait
 photographers who have made trial of the reflex camera
 the studio and can see no advantage in it. On the
 er hand, those who have given it the longest trial speak
 st enthusiastically of its advantages, particularly in the
 ography of children, or adult sitters photographed
 h some animal pet. The low point of view which is
 essary when using a reflex of the ordinary type is
 an insuperable obstacle to the use of this system,
 e at least one pattern of instrument is made in which
 focussing-screen is at the side in a vertical position,
 if our memory serves us rightly there is nothing to
 vent this camera being placed on its side if it is
 ired to use it after the normal fashion of a reflex. But

one business argument, which we do not recollect to have
 heard before in favour of the reflex, was mentioned to us
 the other day by a photographer who habitually uses both
 the instrument and the business argument. It was to
 allow the mother or friend of the sitter to look at the
 picture on the ground glass, when the inevitable comment
 is, "I see it is in colours," which gives the photographer
 the opening to reply that if the sitter wishes it he can
 supply the print in colours, a suggestion which in many
 instances leads to an increased order.

* * *

Improvement of Enlargements. By one means or another the best of
 results in a direct enlargement are made
 easy nowadays for the photographer,
 chiefly perhaps by the great variety of papers—hard and
 soft working, rough and smooth, etc.—at his disposal.
 So much so is this the case that the photographer doing
 his own enlargements may be led to neglect the power
 which lies at his hands in the direction of a suitable
 illuminant for the enlargement. When arc light or day-
 light is available a negative of the same vigorous type
 which is used for collodio-chloride or carbon printing can
 be made to give an enlargement of suitable softness,
 whereas, on the other hand, the negative which is so far
 on the side of thinness that it is difficult to get even a
 good P.O.P. print from it, can, if enlarged with a weak
 and yellowish light such as that of an oil lamp, be made
 to give a surprisingly good enlargement, and we know
 that in commercial enlarging it is common for an oil-en-
 larging installation to be kept purposely for such almost
 hopeless cases. The papers, too, of cream or ivory tone,
 which are now supplied by almost every maker, help in
 securing softness from vigorous negatives, and this result
 may be further accentuated by employing the ordinary
 method of sulphide toning, which, to a slight but still
 perceptible extent, softens the character of the enlarge-
 ment.

* * *

Exposures in Crowded Streets. A recent query suggests the usefulness
 of a hint which is no doubt one of those
 old wrinkles unknown to many of the
 less experienced workers in photography, namely, the use
 of a very slow plate in conjunction with a small stop when
 a photograph has to be taken in a thoroughfare crowded
 with traffic. In this case exposure may run to five or ten
 minutes or a quarter of an hour, but so long as an eye
 is kept on persons who may halt for some time in the field
 of view, in which case they must either be moved on or
 the lens capped, a photograph may be obtained from
 which all signs of the busy traffic will be absent. A
 process-plate is a suitable one for work of this kind, and
 a stop as small as f/44 or f/64 should be used. A subse-
 quent precaution is to dilute the developer somewhat, as
 plates of this type tend to hardness of gradation.

* * *

Filling the Space of the Print. One of the commonest defects to be seen
 in professional portraiture, not only of
 the lower-priced order, but even among
 the work of men who secure comparatively high prices
 for their prints, is the way in which the portrait, whether
 three-quarter length or head and shoulders, occurs on the
 print. We are not now speaking of any ambitious scheme
 of composition, but simply of the fact that in many
 instances the raising of the figure an inch or so on the
 print would give an altogether improved rendering to the
 portrait. As in mounting a print, it is a good plan to
 leave more space below the print than above it, so the
 same rule, if followed in the case of placing the portrait
 itself within the space of the print, will avoid the appear-
 ance of the sitter being in the act of slipping away which

is often noticeable. In former days, when there was nothing but a cabinet or a carte print or mount, there was some excuse for allowing such a state of things, caused at the time of making the exposure, to persist in the print, but with the present-day latitude in the way of sizes both of print and mount, there is every opportunity to correct mistakes of this kind.

PHOTOGRAPHING BAS- AND ALTO-RELIEFS.

It is no uncommon thing for a portrait photographer to be called upon to depict something quite out of the usual rut of ordinary studio portraiture, and in such circumstances it is not uncommon that, owing to the photographer's unacquaintance with the craft, the result obtained does not give the satisfaction expected. We were forcibly reminded of this fact on seeing a photograph of a bas-relief which had been made by a portraitist whose ordinary pictures were really excellent, though such could not be said of the one in question. It is true that the picture was good so far as the photography was concerned; all the detail was there, but it was like a map or tracing of the design, being quite devoid of the modelling and rotundity of the original. This, by the way, was a head and bust of a female figure, which was said to be nearly life-size. It was certainly not such a reproduction as would meet with the approval of the sculptor who executed the original work. Its fault was simply in the lighting of the bas-relief. Had it been skilfully lighted, the result would have been quite different, and would have shown that it was from an actual bas-relief, and would not have appeared as if it were from an almost flat surface.

We shall now give a few practical hints on the illumination of bas- and alto-relievos when they have to be photographed, so as to avoid this flat appearance, for the benefit of such as may be quite inexperienced in this particular class of work. In the first place, after the subject has been placed in a suitable position in the studio, all direct front light should be stopped out; also all the light from one side of the studio. That being done, the next thing is to arrange the curtains on the other side so that the subject is lighted with a strong direct side-light coming only from a somewhat narrow opening. When thus illumined, it will be seen that the proper appearance of rotundity is obtained, but it may, in these circumstances, be that the cast shadow may seem a little too strong and abrupt. If that is the case the curtains should be opened a little more in advance of the subject—that is to say, nearer the camera, so as to admit a little more front-side light. That will soften the shadows without destroying any of the relief. On no account should light from the other side of the studio or any direct front light be admitted. The light must be all from one direction, and from one only, simply being made broader or narrower as occasion may require.

In the foregoing it has been assumed that the subject to be depicted is a white or light-coloured one, but it may be that it is a dark one, such as bronze or possibly carved oak or other dark wood. In that case the same system is followed, though with some little modification. The light must still be from one direction only, but should not be so abrupt as before. More front-side light should be admitted, and then if the shadows, as is possible with very dark objects, seem too deep and heavy they may be softened by a reflecting screen arranged in such a way that it throws back only just enough light to soften them and no more. The reflected light should be used only to just give transparency but nothing more, as the shadows should be strong but yet possess transparency. In arranging the reflector care must be taken that no false lights are produced. With dark subjects, particularly if they are in high relief, a very full exposure should always be given, otherwise, although

the lighting may be perfect, the result will not be satisfactory, as the shadows will be lacking in transparency, and therefore seem dark and heavy.

In the case of alto-relievos, the same system is followed, but here the lighting should be still less abrupt—that is, more front-side light should be employed and a somewhat wider area, otherwise the strong cast shadows from the more prominent portions may interfere with detail in the others. That will be obviated by so regulating the curtains that the high side-front light is admitted through a wider opening. In the foregoing it has been assumed that the work is done in the photographer's studio. It sometimes happens, however, that it has to be done in that of the sculptor. In that event the photographer is usually relieved of the matter of lighting, as the sculptor will prefer doing it himself in such a way as will give the proper modelling in the subject—usually the lighting will be the same as that in which the work was executed by him. It will then be shown to its best advantage.

Instead of having a bas or alto-relievo to deal with it may be a marble or bronze statue or bust that has to be portrayed. In this case the photographer will feel more at home, because the work does not differ materially from ordinary portraiture. In the case, say, of a marble figure, the lighting should be so arranged that the shadows are stronger than would be desirable in the portrait of a similar, so as to obtain the necessary rotundity. But while the shadows are made strong and pronounced, the lights must not be neglected. They must not be white and bald. If they appear to be so when the shadows seem to be right they may be subdued by the interposition of a tissue paper, or thin muslin, screen between the light and the subject. This may be held in the hand and utilised during a portion of the exposure only.

In the case of bronze subjects it is not quite such a sailing as in the case of, say, marble. Here the lighting should be as before—from one direction only. The light will be a high side-front light, but with a broader area than is desirable with light objects, such as marble or painted. In this way the shadows can be obtained with all the necessary transparency, and usually without recourse to reflectors, though in some instances the latter may be found necessary. One thing to be specially avoided in depicting bronze subjects is reflections from the brighter portions. It is impossible to lay down any set rule in this matter, as so much must necessarily be governed by the general character of the subject that has to be dealt with. But the work will be much simplified if it is kept in mind that the angle of reflection is always equal to the angle of incidence. If the angle be, we will say, of 45 degrees, which as a rule is a suitable one for what we are now considering, the light will be reflected at a similar angle, and quite away from the lens. If it should so happen that the bronze object has several reflecting portions which send the light at several angles it will be a good plan to soften the light somewhat by the aid of a tissue-paper screen, or an ordinary muslin head screen which may be used with advantage.

It sometimes happens that a bas-relief has to be photographed *in situ* in some building, such as a church or cathedral, where the subject is lighted from several directions. Here the photographer will often find himself handicapped in getting the best possible result. By applying the system above explained the work may generally be successfully accomplished by borrowing the studio two or three curtains, and then, with the aid of string, pins, tacks, and the like, the subject can usually be so enclosed that it is practically illumined from one direction, and all direct front light stopped away, or at least so far subdued that it has little or no effect on the photographic plate.

NOTES FROM AMERICA.

Business in Canada is excellent. Last year was good on the whole, with a quiet gap in the spring and early summer, heavy trade in the autumn and early winter, a very slack Christmas season, which usually sell in great numbers for Christmas presents, and a strong revival in this branch of the trade at the beginning of the new year.

The Kodak factory is the greatest manufacturing business in Canada, but there are reports of constantly increasing imports from England of the higher qualities of leuses, cameras, dry apparatus, plates, and papers. Importers here are of opinion that the business of the home country with the Dominion may be increased very materially in the next few years if manufacturers give their attention to the matter, because there is a constantly growing feeling of preference for British-made goods whenever they can be obtained of similar quality and design to those made in the States. They say that the only preference for American-made goods is where they are preferred design.

A Political Note.

It is difficult or impossible to speak with Canadian traders without dropping into tariff reform. They almost all seem strongly convinced that a tariff would be of great value in England; not for the reasons that may appear at first sight, but mainly as a means of negotiation with tariff countries. For instance, they point to the fact that many British goods are imported into the States, in spite of the duty, while many others (of which no equivalent is made in the States) are barred out by tariff difficulties. Means of bargaining would, it is argued, reduce the duty on many things shipped into the States, and encourage trade in many British lines. Thus the argument is not Canadian, but, pro-British.

Tariff Reform in the U.S.

On the American side of the border there seems to be a growing feeling in favour of modified tariff, for many people are realising that, while some are manufacturers, all are consumers. The tariff has fostered manufactures, but has forced consumers to pay enormously "fancy" prices for goods which have no equivalents made on this side. They also feel strongly the injustice of having to pay much higher prices for goods manufactured in America than are paid for the same goods when sold in Britain. The British consumer benefits by the free and competitive prices of "dumped" goods, and the British manufacturer, who can buy "dumped" raw material, beats the American competitor in the markets of the world; so that there is a growing feeling of soreness at the inelasticity of the American tariff and at its effect upon the consumer. But the fact that the United States are still teeming with undeveloped natural resources, there would probably be a very strong tariff reform party; and even as it is, there is the possibility that considerable modifications, favourable to British photographic manufacturers, may be made before very long.

A Canadian Camera

It will be on the market in the early summer is the invention of Mr. W. J. Johnson, who is manufacturing it in Toronto. The Kodak, Limited, holds the patents for the rest of the world. It is called the Cirkut, and makes panoramic pictures as large as an arc as may be desired up to a complete circle. I have seen very fine examples of its direct work, up to pictures 18 ft. by 16 in., and the camera will be made to take 40 ft. by 41 in. The most important picture made up to the present is a panorama of the fleet saluting H.R.H. the Prince of Wales, below the Citadel of Quebec, on his recent visit to Canada. The Prince expressed his high appreciation of the print which was sent to him, and any judge of photography

must agree, for the picture is full of detail and gradation, sharp, well lighted, well exposed, and altogether excellent in technique as well as in historical interest.

Mr. George Eastman's Benefactions.

It was announced at the meeting of directors of the Rochester City Hospital a couple of days ago that Mr. Eastman had given £80,000 to the funds, thus lifting the Hospital out of financial difficulties and enabling it to make large extensions and improvements in the buildings. The local papers point out that Mr. Eastman's known gifts during 1908 amount to £124,000, and during the past few years to £184,000. The first great gift was a few years ago, when he built a home for the Mechanics' Institute, at a cost of £45,000. This was followed by the building of a physical and biological laboratory for the University of Rochester, at a cost of £15,000, after which he gave two parks to the city, at a combined cost of £22,000, and contributed the same amount to the funds of two local hospitals (£10,000 to one and £12,000 to the other).

It is known that Mr. Eastman is a very generous subscriber to local charities and educational institutions, both anonymously and in his own name, so that his benefactions in recent years have gone well beyond the million dollars (£200,000). Another fact, noted locally, is that his gifts are always as unostentatious as possible, and usually are only allowed to be announced when he is away from the city. Though his last subscription was given late in 1908, the directors of the Hospital were forbidden to make the fact public until Mr. Eastman had sailed for Europe.

Cinematographic Enterprise.

Recently I wrote about the enormous development of "moving picture" work in this country. An incident that has just come to my knowledge illustrates the keenness of even amateur cinematographers. Mr. J. Horace McFarland, a wealthy printer and bookbinder, is a great leader in civic reforms and "good road" movements, and is also a most industrious maker of "photographic records." He has 15,000 carefully made, classified, and indexed "record" negatives from his own camera and from those of people he employs, as well as a large collection of cinematographic films. When the great Italian earthquake disaster was announced, he wired to a well-known photographer-lecturer who was on a lecture tour, asking him to drop his lecture engagements immediately and proceed to Italy at once to make the most complete possible record of the disaster, by cinematograph and camera. Carte blanche was given as to time, expense, places to be visited, etc., and in this way it is likely that an American amateur will obtain the most complete and perfect record that is made of the greatest disaster known in history.

The Camera in Civic Work.

Mention of Mr. McFarland reminds me that readers of "The British Journal" know little or nothing of the power his camera has proven in the way of beautifying American cities and removing eyesores.

To a far greater extent than in older lands, one is liable to find in America strange juxtapositions of the grand and the sordid. A great palace of commerce may stand between two vacant plots, partially screened by hideous poster-covered hoardings and devoted to the accumulation of waste and garbage. Mr. McFarland's camera pilloried certain cities so effectively that the officials were moved to lessen the nuisances. Private persons, too, cleared up their waste plots, planted them as simple gardens, trained climbing roses and other plants, instead of circus posters, over such hoardings as needed

to remain, and generally made great improvement. Mr. McFarland then photographed the improved plots, and contributed articles to some of the popular magazines, illustrated with pairs of views of the same scenes before and after improvement.

The next step was to form a league of civic betterment, encouraging its members to use their influence for the removal of eyesores and to employ their cameras on the objectionable,

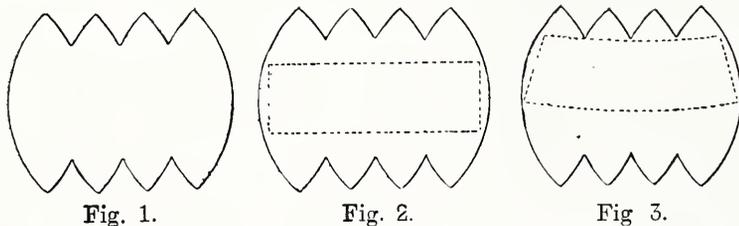

and upon the improved sites, for the encouragement of others to do likewise. The league has had an enormous influence suppressing the advertisements that disfigured places of natural beauty and in making cities more sightly. And in removing the eyesores it has removed many a breeding-place of disease. Truly a great achievement for one initiator, with the camera as his instrument and witness.

H. SNOWDEN WARD, F.R.P.S.

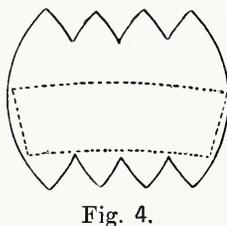

PANORAMIC PHOTOGRAPHY.

[The making of one long panoramic print from a series of negatives is an operation which is capable of frequent application in business photography; and, therefore, although there is nothing essentially new in the method, the following detailed description of the *modus operandi* as contributed to "Camera Craft" by a practical worker should be of value to many less experienced readers.—Eds. "B.J."]

In panoramic photography one has a mine of keen enjoyment; and, in overcoming, after the selection of a suitable natural view, what may be termed the difficulties of panoramic perspective, another source of pleasurable enjoyment for one's photographic skill. This effect of panoramic perspective, considering it as an inherent defect to be minimised as much as possible, results from attempting to portray, on a flat surface, a scene which should be presented to the eye on a curved surface. In making a panoramic picture to be viewed flat, one is practically photographing a portion of the inside of a sphere; and the final result will be comparable to the actual view much as would a

generous section of the rind of a huge orange laid out flat, or as suggested in Fig. 1; with this difference, that the picture would not show any breaks between the segments, but would be rendered continuous and more or less falsified as to perspective. Of course, this does not matter in the upper or sky portion of the picture, but in the foreground it is objectionable. The remedy lies in keeping the foreground as much as possible free from subject matter that is favourable to such distortion; in other words, keeping it somewhat unobtrusive as to material, particularly such as contains well defined lines lying parallel to the base of the picture. Again returning to the comparison with the

orange peel, it is plainly evident that our view point, our lens, should be at such an elevation and at such distance that it will be very near to the centre of our imaginary orange. So located, one will be using that portion of the view corresponding to the part of the rind enclosed within the dotted line as shown in Fig. 2; and the minimum amount of so-called panoramic perspective will be secured. It would require no small amount of space to explain just what causes and constitutes this distortion that is inherent in a set of negatives intended for panoramic printing. Perhaps the idea can be best conveyed by a simple statement to the effect that, in such a set of negatives, each

negative must of necessity have its own individual and separate horizon; that is, its separate horizon as distinguished from the same horizon were the entire view encompassed in one exposure from the same view point. To harmonise as much as possible these "separate horizons" becomes an important part of the work.

Precautions in Placing the Camera.

If the camera be so low or so high that it must be pointed upward or downward, one secures results such as are indicated by the dotted lines in Figs. 3 or 4. In making panoramic pictures by means of successive exposures on two or more plates this fault can be entirely overcome by so setting up the camera

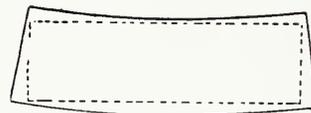

Fig. 5.

Fig. 6.

that the optical centre of the lens is directly over the tripod screw upon which the camera is revolved or rotated for several exposures. If this is not done, let us say in pointing the camera downward as from the top of a hill, the result will appear as in Fig. 5 after the negatives have been printed so as to join up properly in the print. The print in turn will have to be trimmed as shown by the dotted line in Fig. 6, entailing a large loss of subject matter as well as a curved horizon as shown by dotted line in Fig. 7.

Panoram versus Wide-Angle.

On the other hand, for fear that my readers may think the subject is being made too deep and too burdened with difficulties, I would say that a good panoramic picture is much

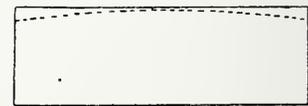

Fig. 7.

same as one would get by taking one of his ordinary landscape prints, trimming away generous portions of the sky and foreground, and enlarging the remainder. The similarity would be more pronounced if the picture so treated were one that was taken with a lens of not too long focus. And the reader naturally asks: "Why not make them in that way?" The answer is: owing to the fact that the wide angle lens, in taking the extreme ends of the picture, similar to looking from the corner of our eye, produces, as it really must, a somewhat false impression upon the corresponding portions of the plate. In addition, many of the most pleasing subjects for panoramic work would require an extreme wide angle lens, which the photographer

it not possess; and sometimes the subject, from the only available standpoint, might even be beyond the scope of any made. The objection to any form of enlarging lies in the fact that good detail and definition are required, the wide angle character of the work necessitating that the eye of the beholder be brought quite close to the picture for the best results.

Suitable Kinds of Foreground.

What has been said above indicates a fairly elevated position for the camera, one that will give comparatively pronounced perspective near the centre of the picture, and one high enough to look very near foreground objects. Clumps of shrubbery, regular rock formation, and the like, will do no harm and help to pick up what might otherwise prove an uninteresting expanse of earth or water in the foreground. Care should be taken, however, to see that such objects either show their base together with a support, or be left out of the picture entirely. Small objects springing from the base line of the picture are distracting, and more objectionable than tops of bushes and the like, in the immediate foreground. In seascape or off-shore pictures the foreground should include a generous portion of the land at one end of the view; and including a narrow bit of the beach along the bottom of the picture will help to preserve the character of the scene.

Dividing Up the Panoramic Picture.

When the view selected and the location of the camera determined, set up the camera and proceed to pick out the several objects for separate exposures. The tripod top should be perfectly level, and any cutting off of the foreground or sky portion of the view should be accomplished by means of the rising and falling of the camera. The several negatives should be so made that they overlap at least one inch. If two pencil marks be drawn on the ground glass, one at each end, an inch from the edge of the frame, they will help greatly. Select the first or left-hand view and observe on the ground glass some object that lies almost upon the line at the left-hand side of the screen; then the tripod screw and rotate the camera until this selected object comes just upon the pencil line at the right-hand side of the screen, and again pick out a new object near the left-hand pencil mark; and so on for the number of plates required. If a very large image of a house should come right where a joining is to be made, avoid making it at that point by starting the first exposure further around to the left, or by making one of the later exposures in the series include a smaller portion of the house, and of course lapping further than the prescribed inch with its neighbours. It is best so to arrange that the joints will be in such parts of the view that a slight want of success in putting them together will not be so plainly observable as it would be the case with the side of a house. Trees, rough roads, anything of an irregular character, are best.

The own way of working is to carry a large circular piece of cardboard and place it between the tripod top and the camera, slightly anchoring it to the former by means of a few bits of string that have previously been gummed on both sides and allowed to dry. After the several exposures have been selected, turn the camera to first position and draw a pencil mark on the cardboard tripod top along the side of the camera, rotate to next position, draw another line, and so on. This obviates the necessity of removing the focussing screen during the actual exposing of the plates, as I have merely to rotate the camera in accordance with the guide lines previously drawn. If I wish to use the card for a new series of exposures, the new set of lines may be drawn with a pencil of a different colour or the lines may be broken, the original series being ignored.

The Best Sequence of Lightings.

To avoid harshness and intense shadows, as well as to secure good detail, I would advise full exposures. When this is not possible on account of moving figures, running water, or the

like, one must depend upon an accelerated developer consistent with the shortened exposure. Each of the several plates should be timed exactly alike; and I might add that the most pleasing effects are secured if the first exposure of the series happens to come at that point of the compass where the sun's rays fall almost on the front combination of the lens, working around for the successive exposures until the sun is directly behind the camera.

Development of the Negatives.

The plates of any one series should all be developed at the same time and in the same tray. A sufficiently large tray not being at hand, one may be constructed out of a few pieces of thin board lined with a sheet of oil-cloth. Such a tray will answer admirably for a temporary make-shift; but the careful worker will find the making of panoramic pictures so interesting that he will provide himself with a well-made one, long enough to hold the three or four plates generally used. Development, of course, depends upon the exposure given and the paper to be employed. My own preference is for an ordinary two-solution pyro formula. By giving full exposures, starting development with a small amount of alkali and adding it tentatively, full detail combined with good printing quality is assured. When the exposure has had to be made slightly shorter than could be desired, dilution of the developer and the addition of a little metol will bring out all that can be secured, and without danger of too much density in the high-lights.

Before going into the matter of printing the negatives, I wish

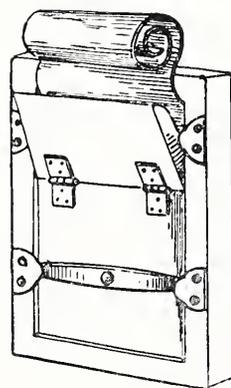

Fig. 8.

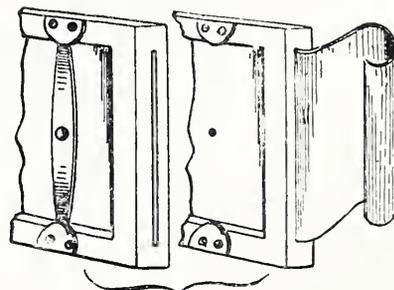

Fig. 9.

to caution the reader that, like the matter already set down, the written word will appear many times more formidable than the actual work. My desire is that the reader may be assured of success with his first essays, to the end that he will be encouraged to continue his efforts.

Preparing the Negatives for Printing.

The negatives being ready, lay them out in their proper order and, with strips of gummed black paper, mask off the tops and bottoms of each to a horizontal line common to them all. Also mask off the extreme end of each negative with some opaque paper, allowing it to extend eight or ten inches beyond. This surplus paper can be used as a shield, roll form, to protect the ends of the printing paper while it is being exposed in the printing frame. An ordinary frame may be used by slightly rounding off the under side of the back at the ends, as shown in Fig. 8, where the protecting roll of opaque paper is also illustrated. Rounding off this corner prevents the paper being crumpled up or broken by the sharp bend it would otherwise have to make when the back is closed. Another plan is to saw a slot in the end of the printing frame with a key-hole saw, as shown in Fig. 9. This allows the extra paper to extend through without being bent, and these ends can easily be protected with two envelopes made of black or non-actinic paper. When in use they should have their ends inserted through the slots in the frame just far enough to be caught and held when the frame is closed.

This last plan is, of course, more suitable for developing paper, as it does not permit of a ready examination of the depth of printing as when using printing-out paper.

Vignetting Which Does Not Show.

The whole secret of success lies in so vignetting together the ends of the negatives that the joints are not perceptible. In all the books and articles heretofore published dealing with the work in hand the use of a straight-edge has been advised for vignetting. That is all wrong, for the reason that the most trifling variation from uniformity in the depth of printing at the vignetting point discloses itself in a straight line that is either too light or too dark, a fatal sign. Were this slightly perceptible difference in depth other than a straight line, it would pass unnoticed, even under close scrutiny. Using my own method, I am often at a loss to determine just where the joint was made originally, when I come to print from the same negatives later. The vignetting should be done with two strips of card, each as long as the frame is wide, two inches wide, and with saw-like teeth along one edge. These teeth should be one-half inch long and a like distance from centre to centre. The printing should be done in the shade or under two thicknesses of tissue paper, pasted over the front of the frame. These vignetting strips are shown in position in Fig. 10.

Adjusting the Vignetting Cards.

Place the first negative in the frame with the paper in position, and lock the back of the frame at that end. Then, holding the frame, open end up, up to a subdued light, adjust one of the

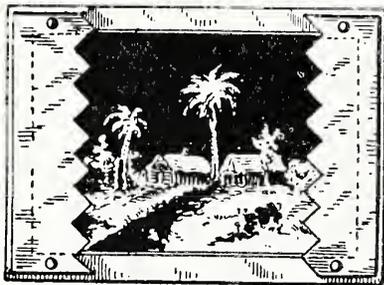

Fig. 10.

saw-toothed cards approximately over the point of junction. Fasten in position with a couple of drawing-pins, roll the balance of the paper in the opaque extension, or slip into the protecting envelope, as the case may be, close and lock the remaining half of the back, and make the exposure. For the next section, the masked edges at top and bottom will permit of a ready adjustment of the paper horizontally; and, again using transmitted light, one can easily match up a tree-top or other outline at the joining point with the section already printed. Closing in turn each end of the frame as before, meanwhile adjusting the two vignetting cards, proceed with the printing. Should a slight mistake be made in the first adjustment of a vignetter card, it can be corrected at any time while examining the progress of the printing. The wavy or zigzag character of the vignettted joints proves very deceptive to the eye, totally obliterating the effect of double printing so often seen in joints made with a straight-edge vignette.

If a number of prints are to be made from the same set of negatives, the work can be greatly facilitated by numbering the vignetting cards and marking the number and position of each on the edge of the printing frame. This done, they can be removed and replaced in their correct position as often as required.

If the printing is being done on developing paper, it will be necessary to hold the frame over a ruby light during each adjustment of the negative and paper; and, for a guide, one must lightly sketch in on the back of the paper just those outlines at the point of junction, as well as the masked-off edges at top and bottom. After one has familiarised himself with the work in

printing-out paper, developing paper will prove as simple and equally satisfactory.

Panoramic Enlargements

To make enlargements from panoramic negatives, mask the ends of each right up to the joining lines, but do so on the glass side of the negatives. Doing this last permits of a slight vignetting effect in the printing. Put the first section in the enlarging camera, make the exposure, but, before removing the paper from the easel, lightly sketch in the prominent objects at the joining point, using a soft pencil and working on the reverse of the print. These pencil-marks are easily removed with the tip of a finger while the prints are wet. Remove the paper from the easel, and put the next negative into the camera. Adjust the ruby cap on lens, pin next section of paper in position on easel so that the sketched outline on surface of paper corresponds with the outline of the image about to be exposed. Expose and proceed in the same manner with the remaining sections. After a very little practice one can make such enlargements very rapidly and with practically no loss of time or material.

RICHARD A. TOWER

M. GUERRY, THE SHUTTER-MAKER.

MR. JOHN ARNALL, a reader of the "British Journal" whose studio is in the Boulevard Bonne-Nouvelle, Paris, writes to us recently as follows:—

"I have been living some years as a professional photographer, and have always been a user of the Guerry shutter. One morning early in 1906 I wanted two or three of these instruments repaired. Knowing few people I took up the Directory in a café, and found the home of the well-known accessory was in the Avenue de la République. Meeting a taxi-cab, I sought the address, mounted five flights of stairs, and was ushered into the presence of perhaps the oldest of professional shutter-makers. Since that time I have been several times, and have quite looked forward to my visits to Avenue de la République. It may interest the readers of the "B.J." to have my impressions. M. Guerry is a fine type of the French mechanic. Nearly seventy years of age, M. Guerry still assembles all his shutters, and his aged wife parcels and despatches them; but he has been a terrible invalid for nearly twenty years. For six years he has not left his rooms on the fifth floor, suffering since the age of fifty from tuberculosis in the bones. Piece by piece each leg has been taken away, one to the hip, the other to below the knee. Now awaiting a further operation for cataract, he is still wheeled by his devoted wife from his *salle à manger* to his *atelier*, where he goes daily through his work. I wonder if any of the readers of the "B.J.," as they pass the ball of the little velvet flap which brings us photographers our daily bread, can picture this pair of *braves gens*.

"His wife points to him and says: 'He was a fine strong man once. Fought as a National Guard in the defence of Paris when the Germans were besieging the town.' M. Guerry escaped the butchery which was meted out to so many of the National Guards after the fall of the Commune. I have listened by the hour to the fine old man's account of the stirring times of his younger days. 'Why at your age,' I asked, 'do you not sell your patents and retire?'

"'Ah, Monsieur, we have much competition now, and we are old, but our orders are more than we can execute.' Some young photographers will not be able to get their Guerry shutters so quickly, but in the competition to be faced to-day let us look back at the gallant old pair who, through peace and war, have furnished us with the best of shutters, and now still bravely work five stories above the busy life of Paris, one never to descend again till he is borne to that long rest that awaits us all after a life spent as industriously and as bravely, I hope, as that of M. Guerry and his brave wife."

THE L.C.C. EDUCATION COMMITTEE have decided to add photography to the list of technological subjects for examination in connection with the award of evening exhibitions in science and technology. The City and Guilds of London provide examinations in this subject, and it is intended to utilise this examination for the purpose of the award of the L.C.C. exhibitions.

**PROFESSIONAL PHOTOGRAPHERS' ASSOCIATION.
ANNUAL GENERAL MEETING.**

Annual General Meeting of the Professional Photographers' Association was held on Friday, March 12, at the Royal Photographic Society. In the unavoidable absence of the president, Mr. A. Chapman, J.P., Mr. Alfred Ellis, senior past president, took the chair.

After reading the notice convening the meeting, the Hon. Secretary read the Report of the Committee. (The text of the report will appear next week.—Eds. "B.J.")

In the discussion that followed, Mr. T. C. Turner (Hull) said at the committee meeting that had preceded the present meeting the fault had been referred to of getting the editors of provincial newspapers to insert letters and notes of warning in other forms of the fraudulent free-portrait system. It had occurred to him that if the matter were sent to him in the form of a cutting from a responsible trade or other newspaper there would be a better chance of it being inserted. Coming to him in that form, the editors would be less likely to look upon it as an advertisement or something of that nature intended primarily to benefit the photographers in their business. Perhaps the editor of the "B.J.," to whom they had written already, might be induced to increase our indebtedness by publishing a series of short articles bearing on the subject, explaining the nature of the fraud, exposing the methods employed, and indicating the legal and other means available for dealing with it. These articles would be valuable to photographers, who would be glad to see them republished in the columns of the provincial press which would reach thousands of people of the class who are being victimised.

Mr. Turner then gave an interesting account of the doings of a firm of free-portrait mongers who had worked his locality, and of the methods of obtaining orders and of extorting their demands, saying that this firm never faced legal proceedings, and upon the latest threat of an appeal to the law abandoned the case.

Mr. P. Lankester (Tunbridge Wells) thought it was not generally known to photographers that these travelling agents could not legally canvass unless they had a pedlar's licence.

Mr. A. Ellis said the local police should be aware of this fact, and that photographers when they found their town being canvassed should give information to the police.

Mr. Lang Sims agreed with Mr. Turner's suggestion, but was of the opinion that only a small proportion of the class of people who are victimised either bought or read a local paper. He thought that a local professional photographers' association, such as that established at Blackpool, could do more effectual work by putting notices in their windows, distributing handbills, etc.

The Hon. Secretary said the first difficulty the Association had was that these swindles took place in country towns, and it was quite impossible to conduct a campaign from London; but there was not the slightest doubt that the local photographers of any town could effectually stamp out the disease at a very slight expenditure, if they could be induced to act together. Unfortunately, however, photographers did not seem capable of fraternising even when their individual and collective interests demanded that they should do so, and too often when any one photographer took the matter up with the others, instead of coming to his aid, passively, if not actively, opposed him. A local association could get plenty of assistance if they showed themselves in earnest. The matter came within the scope of the trade council or association. There was no doubt to be obtained from that source. The local press would do it if enough fuss was made to make the matter one of local interest, and the police would help—in most places were anxious to do so—if an opportunity were made for them to take action. The fault of getting the injured persons to give evidence was referred to in the report, but, he thought, a little tactful stirring up of the emotions of the ladies who had been fooled ought to get over their shyness. The committee were quite willing in any case where there appeared a chance of successful proceedings to pay a reasonable proportion of the legal expenses. It was not policy to require them to bear the entire expense. They had to leave some responsibility on those who were immediately benefiting in order to ensure that the proceedings were carried out without unnecessary expense.

Mr. H. C. Spink (Brighton) suggested that a leading photographer in each town should be appointed as a kind of agent to bring to the notice of the committee any matters affecting the interests of photographers of the town and act under advice.

Mr. Ellis thought that was impracticable. The committee were not able to judge, either of the personality or standing of most of the members. The selection would create a great amount of jealousy, and they would probably be told in many cases that they had selected absolutely the last man in the town they should have selected.

Mr. F. A. Bridge said in most towns there was a chamber of commerce, trade council, or tradesmen's association. It was their business to deal with matters that adversely affected the trade of the town, and those who carried it on. He was quite sure they could get efficient assistance from these bodies.

Mr. W. Illingworth (Northampton) spoke in favour of the establishment of local branches of the Association.

The motion for the adoption of the report was then put and carried unanimously.

The Treasurer's statement of accounts, showing an excess of income over expenditure of about £10, and accumulated funds of £194, was read by Mr. Lang Sims, and its adoption carried.

Messrs. C. St. J. Vaughan and Frank Turner were re-elected auditors, and were thanked for their past services.

The Chairman then announced the names of the president and committee for the ensuing year.

President: Lang Sims.

Members of Committee:

London.	Country.
Bridge, F. A.	Birtles, T. (Warrington).
Chase, H. Gordon.	Comley, Hy. J. (Stroud).
Ellis, Alfred.	Gill, Wm. (Colchester).
Elliott, Ernest C.	Hawkings, W. H. (Plymouth).
Fry, S. Herbert.	Illingworth, W. (Northampton).
Hull, H. Edmonds.	Lankester, P. (Tunbridge Wells).
Langfrier, L.	Moffat, F. P. (Edinburgh).
Mackie, Alexander.	Protheroe, L. R. (Bristol).
Scamell, Edgar.	Robinson, R. W. (Redhill).
Skillman, C. H.	Spink, H. C. (Brighton).
Spreight, R. N.	Turner, T. C. (Hull).
Willson, R. Fellows.	Warrington, W. (Liverpool).

Mr. Ellis then referred to the work done by the president during his year of office, and said that the thanks of the members should be conveyed to him. This had, however, already been done in committee, and he had also been presented by the committee with a gold replica of the centre of the president's badge of office. It was his duty now to vacate the chair in favour of Mr. Lang Sims, who had been elected as their president for the ensuing year.

Mr. Lang Sims thereupon took the chair, and, in investing him with the presidential badge, Mr. Ellis wished him a happy and prosperous year of office. He also remarked that if Mr. Lang Sims did as well in his new office as he had hitherto done as treasurer, they would be well served indeed.

Mr. Sims heartily thanked Mr. Ellis for the kindly terms he had used in installing him in the chair. He also thanked the members for the great honour placed upon him, and he trusted he would carry on the duties of president to their entire satisfaction, and if he did that he felt sure it would be to his own.

He would like to preface his address by reference to those gentlemen who had gone before him. He held in his hand, he said, a copy of the original appeal made to the profession for the formation of the Professional Photographers' Association. They would be surprised to hear the names of that provisional committee, which were: Thomas Bedding (chairman), Alexander Mackie (Vice-chairman), Harold Baker, H. Walter Barnett, Robert Beckett, F. A. Bridge, G. R. Cleare, H. J. Dalby, J. Dane, R. H. U. Ellis, E. Stanmore Gibbs, W. Green, H. Hallier, Fredk. Hollyer, H. E. Hull, E. D. Lavender, E. Milner, H. W. Newton, W. G. Parker, Lang Sims, W. E. Wright, William Grove (Hon. Treasurer), Alfred Ellis (Hon. Sec.), and P. E. Marshall (Hon. Solicitor). Of that number there were only five who are now connected in an official way with their association. The appeal then made to the profession generally gave as its principal objects:—

To watch parliamentary and public action, affecting the interests of professional photographers.

To consider the Factory Act in its influence on photographic labour.

To secure uniform and equitable terms of fire insurance.

To maintain the photographer's right to the negative.

To regulate the apprenticeship system.

To suppress price cutting.

To protect photographers in the sale of poisons.

To regulate manufacturers' discounts, etc., etc.,

and he thought when they looked at this they might well congratulate themselves on the large number of these items which had been tackled by them more or less successfully. They had had with them as many as 62 shining lights of their profession officially, that is to say, the men who had been on the committee, and who had used their influence in furthering the success of the Association. The object of the Association quoted had, he claimed, been carried out to the advancement of the profession. In looking back, they must feel with him that their association had been fortunate in its presidents, and when they scanned the list and noted that four out of the seven were still with them, their united wish was that they might long continue to uphold the interests of the profession which they each adorned. Mr. Bedding was now in America. He hoped he might be successful and prosper. William Grove and Martin Jacolette were gone for ever, but their influence would, he thought, ever remain. William Grove, by nature mild, courteous, and kind—a worker rather than a talker. Martin Jacolette was of a different type; robust, energetic, and outspoken, both splendid units of a committee. The Association had accomplished many things as an association that could not possibly have been done by an individual; its power and influence had been demonstrated in many ways, which have been dealt with in successive annual reports. They should, too, welcome the evidence of more interest shown in their annual election of officers and committee. It was seldom that the secretary received a nomination from a London or country member. This might, of course, indicate that the members of the committee were considered by the members to be sufficiently representative, and that no change was desired, but he thought it would be healthier if there were some competition to get upon the executive, and he felt sure that those members having seats would value them more if there was some competition to obtain them.

As regarded the future, their report indicated there was much to be done, but the members could rest content with the assurance that when opportunities arose of doing something for the benefit of the profession to which they all belonged, their president and executive would do all in their power to further those interests, and uphold the principles and ideals which had been aimed at since the foundation of the society in 1901.

Mr. Dickinson proposed a cordial vote of thanks to the committee for their services rendered during the past year. From the reports they had had he was quite sure that the members of the committee had more than done their duty during the past year. Mr. Frank Turner seconded.

Mr. S. H. Fry responded, and said how glad they all were of the opportunity they had had of doing the work for the members, and he and his brother officers were glad to know that their efforts were appreciated.

The Chairman said they welcomed very heartily the new members of committee. They were very pleased to see them present that evening, and he felt certain from what he had heard they would be very useful members of the executive.

Mr. Ellis proposed that a very hearty vote of thanks be given to the hon. secretary and hon. treasurer. Mr. Mackie gave a considerable amount of time and labour to his duties, as also did Mr. Lang Sims, and they were deserving of their highest appreciation and thanks. Mr. Lankester seconded.

Messrs. Mackie and Lang Sims replied in acknowledgment.

An interesting letter was read to the meeting from Mr. Arthur L. Taylor, of Lake St. Cairns, N. Queensland, giving his experiences of professional photography in that part of the globe.

The meeting then terminated with the usual vote of thanks to the chairman.

On the night previous to the meeting a semi-private dinner of the members of the committee of the Association was held at the Florence Restaurant, Rupert Street, the president, Mr. H. A. Chapman, presiding. Among those present were: Messrs. Alfred Ellis, T. C. Turner, Frank Turner, Richard N. Speaight, Lang Sims, W. Illingworth, S. H. Fry, Gordon Chase, H. C. Skillman, F. Wiedhofft, R. Fellows Willson, A. Edwards, George E. Brown, and A. Mackie.

The toast of "The Association" was given by Mr. George E.

Brown, Editor of THE BRITISH JOURNAL OF PHOTOGRAPHY, who said that it was a pleasure to congratulate the Association upon a year's work done. He ventured to think, under conditions which were frequently not the most encouraging.

The difficulties by which the professional photographer is harassed at the present time were of a kind which were exceedingly difficult to deal with, while in many instances photographers had come into the business without sufficient training for it and found themselves at a loss to make their way. The work of the Association had thus been doubly difficult, but he thought there was nevertheless, a record in its favour on which it had reason to be congratulated. If it had done nothing more than obtain, as it had obtained, the modifications in the bill for the alteration of the law of copyright it had fully justified its existence, and he hoped that the very valuable services which it had rendered to the whole professional photographic world in that particular matter would never be lost sight of. He proposed the toast of "The Association," coupling with it the name of the president, Mr. Chapman, and the hon. sec., Mr. Mackie.

Mr. Chapman in acknowledging the toast said that the stress and burden of the day of what had been accomplished by the association had not been borne upon his shoulders, but upon the shoulders of those who had been more closely in touch with them in the villages of London. The amount of good that had been done, as they might not have all seen, was most creditable, but speaking for himself he was only able to pay flying visits to town and wished he could take them more often. He wished that one and all who obtained their living by photography could mould themselves into one great society for the welfare and benefit of their profession. He decided to make one or two suggestions that might, perhaps, be an attention; though it was very difficult in the long, long years that he had been in the business. He had found it had been very difficult to obtain the confidence of those in the same line as himself. He did not know how it was, but a little jealousy, a little feeling one way towards the other, hindered the good fellowship and continued welfare of them all as a body. He would that it were possible to eliminate these little spirits of jealousy. As Dickens put it, the eightpenny ones would not talk to the shilling ones, by reason of being cut by the half-crown ones. He thanked Mr. Brown for so kindly proposing the toast.

Mr. Mackie said they were all very grateful to Mr. Brown for his sympathetic references to the work done and the accuracy in which it had been summarised. They all worked in their profession and Mr. Brown had always been one of their best friends, or rather the organ he represented, and they had not merely to thank him for his sympathy, but THE BRITISH JOURNAL OF PHOTOGRAPHY for the active support given. The difficulties Mr. Brown referred to were undoubtedly too true; united they were strong, divided they were weak. Mr. Brown alluded to the work they had done, including the Copyright Bill, and he thought he was justified in saying that if the Professional Photographers' Association had done nothing more during the whole of its career than have successfully brought this to a clear issue, it had justified its existence and justified the whole of the money collected.

The President said he had much pleasure in proposing the toast of "The President-elect." In humorous terms, he said that the gentleman had his deepest sympathy, for he did not know what he had taken upon himself.

Mr. Lang Sims in responding expressed thanks to all for the cordial reception of the toast, and said he did not quite agree with the chairman's remarks. He, however, knew he meant well, and he could assure the committee that he did not fear his year's office, which the members proposed to honour him with on the morrow. It would be his endeavour to do the best he could in the interests of the Association, for as they knew from its very inception he had taken some small interest with others in endeavouring to improve and advance the status of the profession as a whole, and he thought that if they had not quite succeeded they had done remarkably well, especially when it was realised that the present membership of the Association numbered 600 photographers. Other members could look back to those years before the Association started and realised that it was hardly possible such success could have been attained. They had to try to do all possible to improve the position of photographers, and in the high position in which they proposed to honour him he would endeavour to follow

footsteps of the presidents who had preceded him. Some excellent men had gone before him, and he felt the honour was too great for him to take upon himself, but he would certainly do his utmost to fulfil his duties in the manner of perfection as had been of his predecessors. He thanked the members again for the high appreciation and honour shown him, and for the manner in which they had received the toast.

Mr. S. H. Fry, in proposing the toast of "The Past Presidents," said he had been carefully primed up in his subject and informed of the names of the past presidents. He should like to preface his remarks by saying that he did not quite take the note of pessimism intimated by their president in proposing the health of the President-elect. He liked to agree with everybody if he could, but he could not quite agree with some of the remarks passed, and he hoped the new president would not take too seriously the opinion of an officer who had preceded him. He hoped the new president would not get this tincture of pessimism. They wanted a little more boldness. He deplored the somewhat milk-and-water tone of their annual report, and he did hope the new president would add a sparkle into their mineral water. Mr. Ellis, their senior president, than whom no one has done more for the Association, had had a policy, and he had pushed it home. Mr. Turner in turn has pushed his policy home, and he did hope that they would continue in a way that would advance the Association to greater strength, and that each succeeding president would emulate the past presidents and have a good fighting policy.

Mr. Ellis quite agreed with Mr. Fry that although the photographic profession, like many other professions, was somewhat shrouded by a cloud there was no need for them to take a pessimistic view of the Professional Photographers' Association. They must bear in mind first that their profession was in some respects different from the majority of trades and businesses of this country. It behoved them, one and all, to do their best for their profession, and it should be the ambition of every president of this society to endeavour to bring it as near as possible into line with other professions, such as the medical and similar professions. They should endeavour, if possible, to make their profession such as to become a desirable society, making it absolutely impossible that anyone could practise without proper qualifications and evidence of fitness for the profession. That should be their one great standard to have continually before them, and he hoped that idea would be pushed forward in every possible way. He regretted that during their short existence they had lost some of their best men. He was not wishing upon this to cause a damper upon the present gathering, but simply just to bear in mind a little remembrance of those who had worked for them, and who had gone before them.

Mr. T. C. Turner (Hull) said he desired to associate himself with the sentiments expressed by Mr. Ellis. There was not the slightest doubt the Association was a personal factor, a governing influence in the matter of the photographic profession, and the proof of this was that the most alive men belonged to their Association, and they should have great hopes in the future from the fact that the Association is and has been attracting to itself the best men, artistic and business alike, and there was not the slightest doubt in his mind that they would gradually gather to themselves so large a body of professional photographers of the country that they would become an even more living force than they were to-day.

Mr. Ellis proposed the toast of "The Press." "The Press" to him meant, to a great extent, "The British Journal of Photography," because ever since the foundation of their society that journal had been very kind to them, and had been practically their lifeline to the photographic profession. In drinking this toast he desired, therefore, to couple with it the name of their esteemed friend, Mr. George E. Brown, the Editor of the "B.J.," and he desired not only to wish to offer their regard for that gentleman, but to acknowledge their deep indebtedness to the "B.J." for its help and assistance. Without the help of that paper he felt that they would not have been known to anything like the extent they were at present. Through that paper they had become known not only in Great Britain, but as far as India, South Africa, Australia, Asia, China, and practically all parts of the world. They had also to acknowledge, in addition, the kindness of the provincial press in helping them to suppress one of the worst nuisances of the profession, that of the free portrait trade.

Mr. Brown replied in suitable terms and thanked the members and also Mr. Ellis for his kind words. He was not absolutely unselfish in advancing the interests of the Association. Their interests were identical, so that whatever made for the prosperity of the P.P.A. was to the interest of his paper. He also thought the interests of the Association were furthered by the Association's quarterly "Members' Circular."

Mr. Lang Sims proposed the toast of "The Visitors," coupling with it the names of Mr. Kendall and Mr. W. A. Sims, who replied in suitable terms.

Mr. Mackie regretted their honorary solicitor, Mr. Percy Marshall, was not able to be with them that evening, but he felt sure he expressed the best thanks of all to that gentleman for his kindly efforts in the direction of furthering the interests of the Association.

During the evening songs, etc., by the following, enhanced the enjoyment of the evening:—Mr. Kendall, "My Old Shako," "A

MR. R. LANG SIMS,
The New President of the P.P.A.

"Chip of the Old Block"; Mr. Lang Sims, "Eileen"; Mr. Frederick Henley, "The Sentry's Song" from "Iolanthe," "The Jug of Punch"; Mr. Alfred Ellis, Humorous Stories; Dr. Nikola, Sleight-of-hand tricks; A. W. Edwards, "The Sergeant of the Line," "The Arrow and the Song."

Mr. R. Lang Sims, who has been elected to the presidency of the Professional Photographers' Association, has been one of the first to be connected with that body and one of the most consistent and hard working members of the committee. Though still a young man, Mr. Sims commenced studio work in 1879 with Mr. Godbold at St. Leonards-on-Sea, and after being with the London Stereoscopic Co., took a position in the year 1880 with Messrs. Heath and Bullingham, of Plymouth, establishing his present business at Brixton in the year 1886. In this quarter of London he has for many years been a prominent man in local politics and administrative work. He is a member of the Lambeth Borough Council and chairman of the present library committee of that body. In 1907 his services as whip for the members of the Conservative party on the Council were recognised by a presentation of plate. Mr. Sims

is also the Immediate Past Master of the Lambeth Borough Council Lodge of Freemasons, and a member of the executive council of the Lifeboat Saturday Fund.

Exhibitions.

THE AFFILIATION EXHIBITION AT THE R.P.S.

AN exhibition of works by members of the affiliated societies was a happy thought, and we are pleased to say that it has proved an artistic success. It is the first concerted action, we believe, of the various societies who, although they make up an important body, cannot so far have had much in common with each other. Even this show would have failed in any advantage except to the London affiliated societies, were it not for the fact that it is to go the round, en bloc, as an accompaniment to a lecture by Mr. W. J. Morgan, R.B.A. As it now appears it is a very pleasing collection, numbering many works that have already earned praise in Regent Street. A good many appear to be new, however. "Il Maestro," by T. Fitz-Gibbon Forde (Sunderland P.A.), is a very striking portrait of a fine head, and "On the Wear," by Eastern Lee (Wearside C.C.), is a charming view of good composition and excellent effect. These two things strike us as being the best of those we have not seen before.

A most interesting feature of the exhibition is the number of sketches furnished by Mr. Morgan to demonstrate his meaning when criticising the pictures. His sketches are good and "slick," and in every case appear to be apt and of valuable suggestion. But we doubt whether the most "modern" of pictorial photographers who promote developments will endorse the artist's views as we do. Mr. Morgan brings the wayward and erring picture back to the safe lines of tradition. He places figures and heads where artists have been used to expect them; he cuts off foregrounds, suppresses angles and hard lines, and so on—as an artist would; but all that is quite opposed to the modern developing spirit which has crossed the sea to settle here, and which seeks for something quite different—something that boasts its chief merit in being *different* at all costs from what has gone before, even the cost of beauty, thus putting photographers upon the level of millinery which has produced the bee-hive hat. We trust Mr. Morgan's sketches and criticisms will do something to strengthen, by endorsing, British hopes and aims.

Patent News.

Process patents—applications and specifications—are treated in "Photo Mechanical Notes."

The following applications for patents were made between March 1 and 6:—

CINEMATOGRAPHS.—No. 4,982. Copying device for cinematograph band films. Alfred Duskes and Duskes Kinematographen and Film-Fabriken G. m. b. H., 231, Strand, London.

CINEMATOGRAPHS.—No. 5,004. Improved construction of cinematograph, kinoscope, or like apparatus. William Speirs Simpson, 175, Fleet Street, London.

DEVELOPMENT.—No. 5,025. Improved developing, washing, toning, or like purpose photographic apparatus. William Laurence Parkinson, Tower Building, Water Street, Liverpool.

LANTERN SLIDE CARRIERS.—No. 5,090. Improvements in or relating to lantern slide carriers. Robert Rigby, 46, Lincoln's Inn Fields, London.

TRIPODS.—No. 5,159. Improvement in photographic camera tripod legs. John Wilkinson and Alfred Wilkinson, 4, St. Ann's Square, Manchester.

FLASHLIGHT.—No. 5,230. Improvements in photographic flashlight apparatus. James Hill and John Edwin Sharples, 55, Market Street, Manchester.

COMPLETE SPECIFICATIONS ACCEPTED.

These specifications are obtainable, price 8d. each, post free, from the Patent Office, 25, Southampton Buildings, Chancery Lane, London, W.C.

The date in brackets is that of application in this country; or

abroad, in the case of patents granted under the International Convention.

THIOMOLYBDATE SULPHIDE TONING.—No. 12,341, 1908 (June 6, 1908). Further experiments with thiomolybdates and allied salts—the of which for toning photographic prints on bromide and gaslight printing papers forms the subject of the present inventor's form patent, No. 22,218 of 1907 (published in "B.J.," November 6, 1907, p. 855)—have shown that these salts can also be used for toning photographic prints on ordinary silver printing-out paper. Toning is effected after the print has been fixed in hypo (sodium thiosulphate) or any equivalent reagent, and the effect is to restore the original density of the print to a large extent, and to tone it to a rich purple-brown or black tone, comparable with the tone hitherto obtained by the use of salts of gold and platinum.

As an example of the toning solutions, we may take ammonium thiomolybdate in an aqueous solution with ammonia added in approximately the same proportion as for toning bromide prints. The average time required for prints in the toning bath is about five minutes. Both the strength and proportions of the reagent and the period in the bath will of course vary with the nature of the prints to be toned and the effects desired.

The fixing bath may be a solution of hypo, either made alkaline with a little ammonia or not, or the fixing may be effected in other known baths, such as those containing sodium sulphite or ammonia. The print is thoroughly washed after fixing, and is then of an unpleasant yellowish-brown colour. The toning solution when applied restores the density of the print and tones it to a pleasant tone, which varies according to the form of printing-out paper used. As there is, however, some loss of depth in prints fixed and then toned by this process, it is necessary to print them somewhat deeper than would be done for ordinary gold toning. Gelatin-chloride papers take a tone which is a rich photo-brown when dried and purple-brown on drying. Collodio-chloride papers give a tone which is nearly black on drying, like prints toned with platinum salts: these latter papers should be printed only a little more deeply than when gold toning is used, and hypo is the best fixing agent. Albumen papers give about the same tone as the collodio-chloride ones, but should generally be printed more deeply than these. Plain salted papers usually give greyish tones varying to a warm brown according to the nature of the sizing substance used in the paper.

After toning, the prints may be rinsed and then immersed in a bath of ammonia (3 to 5 ccs. of .880 ammonia to 100 ccs. of water) for about two minutes, in order to clear the whites of the prints. After this, a final washing for about 15 minutes in water completes the process.

With some printing-out papers it appears to be unnecessary to wash out the soluble silver salts from the print before fixing; the omission of this step seems to make no difference to the prints toned by this process.

But with most papers it will be found safest to wash the prints first in running water until it is no longer made milky, and then to immerse the prints in a bath of sodium chloride (common salt) of about 10 per cent. strength for a few minutes (ten minutes, for example), then to again wash thoroughly before fixing. Instead of sodium chloride, other haloid alkali salts or mixtures of them, such as are already known and used in treating prints before toning with gold chloride, may generally be used in the present process, but sodium chloride is as a rule all that is needed; sodium phosphate (Na_2HPO_4) may be used with advantage instead of sodium chloride in some cases, and the method of use is just the same, except that it is rather important (though not absolutely essential) to make the solution of the phosphate with distilled water.

When prints are found after a time to change colour or to become some extent, or if the whites tend to become yellow, this is usually due to insufficient fixing or to fixing in a too bright light, or to insufficient washing. Such slight defects can be avoided by care and thoroughness in the treatment of the prints, and are not defects in the toning process.

When ammonia baths are used for fixing a great deal of time may be saved in the process, as is already known, because the prolonged washing necessary to eliminate hypo from the prints when hypo is used is needless. The prints need only be rinsed after ammonia fixing before they are toned by the present process. It is better to use, say, three or four successive baths of ammonia made up to a

to 5 per cent. strength for fixing, and the print should be left in each bath for three or four minutes; even with this precaution the time occupied in the fixing and washing is much less than when hypo is used. It is well to gently rub over the surface of the print with cotton wool or the like after the final washing to remove any deposit which may have been formed by the action of the ammonia on the tap water.

Besides the thiomolybdates, thiotungstates and the like recommended for toning according to the former patent application, salts such as thioantimonates have been tried, but the results are usually not so good. Harry Edmund Smith, 3, Ezra Buildings, Ezra Street, Columbia Road, London, E.

SLIGHT DEVELOPMENT.—No. 16,203, 1903 (July 30, 1908). A plate-holder 1, preferably made of metal or other material unaffected by the chemicals used in the developing of the photographic plate, is here shown with the body portion 2 containing the plate 3, the plate being suitably held in place by the springs 4. 5 is a frame extending around the body portion 2 of the holder, and having the inwardly turned U-shaped flange 6 extending around the frame 5. There are grooves in the frame 5 across the top thereof, in which are inserted the bars 8 and 9, the bar 9 being capped with a cloth strip 10 along the upper edge. 11 are springs inserted in the grooves under the bars 8 and 9, and pressing the bars upwardly against the flange 6 where it extends across the top of the frame 5, the frame being slotted at 12 along the top thereof for the insertion of the screen 13. 14 is an outer frame having the bottom thereof corresponding in shape to the plate-holder 1, and encasing the lower end of the plate-holder. 15 are teats or indentations along the bottom of the casing. 16 is an inwardly turned U-shaped flange extending around the outer frame, this frame being slotted along the top thereof at 17. 18 is a groove along the top of the frame on the front side thereof, the groove having a felt strip 19 instead herein to close the recess between the flange 16 and the outer frame along the top. 20 is a felt strip inserted in a suitable groove

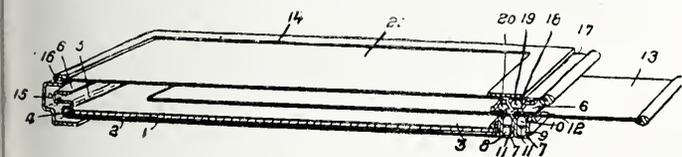

Fig. 1.

along the top of the outer frame on the back, and pressing against the top of the plate-holder 1 to prevent the admission of light between the outer frame and the holder. 21 are spring clips projecting to the rear from the sides of the outer frame 14, these clips springing behind the plate-holder 1 and securely holding the same against the outer frame 14. 22 is a transparent coloured slide inserted through the slot 17 in the top of the outer frame 14, and sliding in the U-shaped recess formed by the flange 16 and completely covering in the plate-holder 1.

To develop a plate in daylight, after it has been exposed in a camera, the holder containing the plate and having the regular opaque slide 13 covering the plate is placed in the outer frame 14 by fitting the bottom of the holder into the correspondingly formed bottom of the outer frame, and then springing the top of the holder between the clips on the sides of the outer frame, so that the clips spring behind the holder and hold it in place.

The slide 13 is then withdrawn from the plate-holder, leaving the transparent coloured slide 22 protecting the plate from any injurious rays of light.

The outer frame with the holder secured thereto is then immersed in a developing solution, the teats along the bottom of the outer frame spacing it from the holder, so that the developing solution may enter from the back around the bottom of the holder, and in turn over the top, where it will spread over the plate in the interior thereof and develop the same, the transparent coloured slide enabling the operator to determine when the plate is properly developed and ready for removal to the fixing solution. Ralph Emerson de Lury, Ottawa, Ontario, Canada.

PRINTING FRAMES.—No. 27,087, 1908 (December 14, 1908). This invention relates to an improvement in or is applicable to that class of photographic printing frames in which the back is retained by curved springs as are pivotted at one end as at *c*, and the opposite end *c^x* depressed and passed under the clips *d*: being securely

retained in position by the central portion of the spring pressing on the back.

It has been found in practice that if springs made of steel, or metal liable to corrosion, are employed, which are usually enamelled, plated, or otherwise protected from corrosion, the protecting material is soon rubbed off the ends of the springs by the friction on the clips exposing the bare metal which rusts or corrodes. In order to avoid this, brass springs have been employed, but these are not reliable, and frequently break.

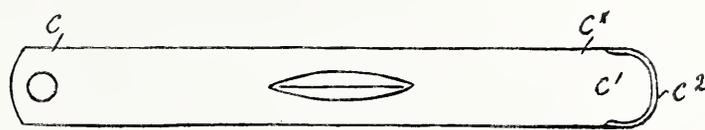

Fig. 1.

Fig. 2.

According to the invention, and to enable springs to be employed without the disadvantages hereinbefore named, a depression is formed in the centre *c¹* of the end *c^x* of the spring *c*, with the edge *c²* slightly turned up so that when the ends *c^x* are passed under the clips *d*, the edge, which is narrow, is the only part of the spring that engages with the clip, thereby preventing the enamel being worn off the end of the spring. John Wilkinson and Alfred Wilkinson, St. Oswald Street, Rochdale Road, Manchester.

SCREEN-PLATES FOR COLOUR PHOTOGRAPHY.—No. 11,698, 1908 (June 4, 1907). The present invention relates to an improved method of producing a "dot" screen—in contradistinction to a line screen—the actual shape of the dots being of minor importance, as they may be square, round, or of other shape. The object is to form a screen in which the dots shall be evenly arranged, each dot being of even intensity of colour, and the surface of the whole screen being a perfect plane, whereby no distortion is caused, the dots being side by side and arranged without any superposition or blank spaces in the desired relative position and order so that the different colours of the screen balance each other and form a perfectly neutral surface giving the sensation of white.

To obtain this result the following principle is utilised:—

If on any support or background impermeable to greasy materials are printed lines, points, or figures, in such greasy material, which must be sufficiently liquid to enable it to be applied to the support by any suitable printing process, and if on the whole surface of the support on which the greasy substance has been distributed, is applied a varnish which does not dissolve or mix with the greasy material, such, for instance, as a solution of gum lac in alcohol, the solution or varnish will coat well the whole surface of the support, but naturally will not adhere to it, except at the places where there is no greasy material. Everywhere where it meets the soft greasy material it will cover it, without, however, becoming connected to it or incorporated into it.

Consequently, if after the varnish has dried the support thus treated is submitted to the action of a solvent of the greasy material, such, for instance, as benzine, or turpentine essence, the previously applied greasy printing or impression will be dissolved with the greatest ease by slight rubbing or sponging, and the solvent will carry away and remove from the support, together with the greasy substance, also those portions of the alcohol varnish which covered the greasy substance but were unable to adhere to it or consequently to the support, so that only the adhering portions of the varnish will be left on the support.

This principle, applied to photo-printing as already stated, enables polychromatic screens for colour photography to be manufactured in an optically correct manner.

A convenient method of carrying out the process is as follows:—

A bichromated gelatine or like film on a flexible or rigid support is exposed in the ordinary manner to light behind a screen and in contact with the same, the screen being constituted either by alternately transparent and opaque lines parallel to each other, or by square or other shaped points, according as it is desired to

obtain a ruled coloured screen or a screen with regular or irregular coloured points. This plate is subjected to the ordinary washing and preparing operations, then it is amply impregnated with a coloured aqueous solution of one of the three colours which are to form the final screen, for instance orange red, which amply colours the gelatine in the portions which have remained soluble and were not exposed to the action of light during the printing of the plate. Then the latter is inked by ordinary method with a greasy substance of suitable fluidity, used for this kind of impressions, which greasy material will be preferably of black colour, so as to enable the work to be more easily followed. The greasy substance will adhere only to the portions which had been exposed, which will be exactly those which have not absorbed the red orange colour. Pulls are then printed by means of a quick printing machine with mechanical inking, in the well-known manner. This printing is effected on gelatine-coated glass if the original plate is on a flexible support, and on gelatine film if, on the contrary, the printing plate is rigid, but in any case the two gelatine surfaces will be left for the desired time in contact, so as to obtain sufficient intensity of the transferred orange red lines.

If a ruled screen has been used for the original plate the printing will result in a series of transparent lines coloured red orange, separated from each other by greasy lines of opaque black colour. Before complete drying of the greasy lines colourless alcohol varnish is poured on the printed surface, and then as soon as the varnish is dry the plate is submitted to the action of a solvent, such as turpentine essence, which will eliminate the black greasy lines and those portions of the alcohol varnish which, owing to the greasy substance, have been unable to adhere. The plate thus treated will then have only a series of red orange lines covered with alcohol varnish and separated from each other by colourless lines not covered with varnish.

On the screen thus formed is printed, making use this time of a second collotype plate saturated in its non-exposed portions with, for instance, a blue-violet aqueous solution, a second temporary greasy network intended ultimately to be removed like the first, care being taken that the lines of the second impression intersect those of the first at a right or other angle. The same will happen for this second impression as happened for the first, that is to say, there will be obtained a series of continuous greasy lines separated from each other by violet-blue lines, but the latter will not be continuous, as at the points where the printing plate was in contact with the colourless varnish covering the orange-red lines on the screen, the colourless varnish will prevent the contact of the two gelatinous surfaces, and consequently will prevent the colouring in blue-violet colour of the gelatine at the points covered by the varnish.

Before the complete drying of this second impression a layer of colourless alcohol gum-lac varnish is applied to the screen, the varnish adhering only to the points not covered with greasy substance, that is to say, only to the points coloured blue-violet.

A washing with turpentine will eliminate the greasy material and leave on the plate a series of continuous red lines, and a series of broken blue-violet lines crossing the red lines, the said two series of lines being covered with colourless varnish. There will be left between the two series of lines colourless intervals intended to receive the third green-colour, which can be applied with the greatest ease, for instance, by bringing the plate into contact with a thick layer of gelatine or any other pad saturated with green solution.

The screen having been thus prepared, that is to say, carrying its three colours, of which two are covered with colourless varnish, it will merely remain to remove this varnish, which is now superfluous, and which can be effected with the greatest facility by subjecting the screen to the dissolving action of absolute alcohol, or by any other suitable method of elimination. There will thus be left on the screen only the original layer of gelatine entirely coloured over the whole of its surface, without superposition or black portions, with an infinite number of coloured lines or dots arranged in due position, calculated for the purpose of an optically correct photographic selection, and having an absolute transparency, since the layer of gelatine has no foreign substance, alcohol varnish, or greasy substance, which could affect its transparency.

The colours can, of course, be arranged on the plate in any order, proportion, or number.

The screens obtained could be directly sensitised for the purpose

of obtaining prints in colours adhering to the screen network, used as independent screens and brought into contact with the sensitive panchromatic layer of an ordinary photographic plate. Lou Dufay, Villa Jeane Simonne, Rue Andre, Chantilly, France.

CINEMATOGRAF CUT-OFF.—No. 21,308, 1908 (October 9, 1908). The invention consists of a safety light cut-off for cinematographs, consisting of a shutter hinged so that it can be swung to open, or close, the opening for the light passing to the film. A so-called "catch-plate" is pivotted so as to be caught and moved by the continued paying out of one portion of the film after breakage of the film, and there are means connecting the shutter and the catch plate to a common spindle or axis about which the catch plate is pivotted, so that the movement of the catch plate caused on the breaking of the film closes the shutter, the weight of the catch plate and shutter and the arrangement of the connections of the same being so adjusted that there is a slight excess moment tending to hold the shutter open when in the fully opened position whilst a slight movement caused as just mentioned alters the position of the catch plate, shutter, and connections so as to produce a greater excess moment to close and keep the shutter closed by gravity. John William Harris, 86, Pemberton Street, Dewsbury Road, Leeds.

New Trade Names.

WESTON.—No. 310,198. Chemical substances used in manufacturing photography, or philosophical research and anti-corrosives. The Weston Chemical Co., Ltd., 13, Abchurch Lane, London, E.C. 4, manufacturers. February 5, 1909.

KANTELU.—No. 309,273. Photographic camera exposure recorder. James Hillmann, Rodwell Lodge, Basils Road, Stevenage, Herts., stockbroker's manager. January 1, 1909.

VAIDO.—No. 310,399. Photographic apparatus included in Class 1. Arthur Lewis Adams, trading as Adams and Co., 24, Charing Cross Road, London, W.C., manufacturer. February 11, 1909.

New Books.

"Electric Lamps." By Maurice Solomon. London: Archibald Constable and Co., Limited. 6s. net.

Although this text-book is only written in reference to the photographic use of electric lamps, it nevertheless contains a great deal of information for the photographer who uses electric lighting either for the illumination of his premises or for portraiture in the studio, from which it is evident that the author deals both with the various incandescent electric lamps and with the arcs and mercury-vapour tubes. The earlier chapters of the work are taken up with the general principles of illumination by artificial light and the measurement of the illumination produced, a very different thing, of course, from the candle-power of lamps. The manufacture and properties of the electric filament lamps next come under consideration, and lead to some interesting comparisons between the carbon-filament lamps, the Nernst lamps, and the new lamps, such as the Tungsten lamps, in which there is a metallic filament. The facts, as we find them comparatively stated, have a practical significance for the user, e.g., on p. 165: "By over-running a carbon filament lamp one obtains always a worse life at a better efficiency; by over-running a Nernst lamp it is possible that the worse life is obtained without any advantage in efficiency." The non-electrical reader may not be able to follow the author everywhere when he discusses the causes of such differences, but the practical facts are clearly enough stated.

In the chapter on the relative cost of systems of lighting the writer emphasises the difficulty of obtaining figures which are really useful guides, the conditions under which a light is used, the life of the lamp, cost of renewals, etc., introducing many factors which require to be taken into consideration. In comparing electric light with gas (p. 304), he writes: "Although, when the cost of lighting is considered, the gas mantle is still the cheaper, the difference is now no longer so marked, and the gulf is not now so broad that it cannot be bridged by the other advantages which electric lighting possesses." Such a statement as this has been made possible by the new and economical tungsten and tantalum lamps, but there is still plenty of scope for inventors of still more efficient electric lamps before the theoretical yield, one candle-power for .08 watt, has been

hed, and the author concludes a very clear and incisive review of present-day systems of electric lighting by expressing the hope that England will be found in the van of progress of the industry which was founded by Sir Humphry Davy, but has been chiefly developed by French, German, and American technicians.

"Photographische Praxis." By Hans Schmidt. Berlin: Union Deutsche Verlagsgesellschaft.

In this work the author has provided a "second-step" manual for the German amateur photographer, and in consequence we find matters of mere elementary importance relegated to the background to make room for the subjects which may be expected to interest an amateur who has already obtained some knowledge of his subject.

Thus the types of lenses and shutters come in for rather detailed consideration, and more than one half of the book is taken up by a discussion of the properties, selection, and testing of these and other items of the photographer's equipment. In fact, so thoroughly is this section treated that a large supplemental plate appended to the book to serve as a means of testing both the resolving power of a lens and the speed of a shutter. The later chapters deal with the equipment of the dark-room, the testing of plates and papers, exposure, development, and the characteristics of developers, and, lastly, the making of prints and enlargements. In all these sections of his subject the author gives a large measure of attention to the reasons for and against the various methods.

"ESSENTIALS IN PORTRAITURE."—A little book which every portrait photographer ought to put on his shelf and take down for reference when he has an odd half-hour is the latest number of the "Photo-miniature," just issued under this title. It deals very fully and by means of much useful illustration with the factors concerned in the making of a good photographic portrait—tone, texture, light, and shade. The author, Mr. Sadakichi Hartmann, has drawn upon works of the old masters to give point to his analyses of some very modern photographic portraiture. The volume is not one to be glanced over and put aside, but its study will repay the earnest portraitist who is eager to find out wherein the greatness of a portrait consists. The "Photo-miniature" is published in America by Tennant and Ward, 122, East 25th Street, New York, and in London by Dawbarn and Ward, 6, Farringdon Street, E.C.

A SPECIAL MEMORIAL NUMBER of "La Fotografia Artistica," dealing with the recent Sicilian earthquake, has been issued, and contains reproductions of a large number of photographs taken before and after the disaster. The number is published at the price of 2 lire by Cav. Annabale Comminetti, 1, Via Accademia, Turin, and the proceeds from the publication going to a fund for the relief of sufferers from the earthquake.

CATALOGUES AND TRADE NOTICES.

MAY, ROBERTS, AND CO.—A very comprehensive list of amateur photographers' requisites has been issued by Messrs. May, Roberts & Co., and can be had by addressing them at 7, Clerkenwell Road, London, or 16, Westmoreland Street, Dublin. The list runs to over 100 large pages (11 x 8 inches) and contains particulars of a number of useful appliances which are the specialties of the firm.

PHOTOGRAPHIC DYES.—A most useful catalogue of the Hoeschst dyes, all specially manufactured for photographic purposes has just been issued by Messrs. Fuerst Bros., 17, Philpot Lane, London, E.C. The catalogue conveniently divides the dyes into sensitizers (pinachrome, etc.), for filters, dyes for staining gelatine, etc., dyes for dark-room lights, and dyes for three-colour taking and projection filters. Other useful data are those relating to the solubility of the various dyes. Altogether, this list of the notable manufactures of the firm. Messrs. Fuerst Lucius and Brüning is one which every one employing dyes for manufacturing or experimental purposes will wish to have on hand. Messrs. Fuerst Bros. send it post free on application.

THE TELLA CAMERA COMPANY, of 68, High Holborn, London, W.C., have just issued their spring-clearance list of second-hand photographic apparatus and accessories, which is well worth the attention of those who are now overhauling their photographic outfit in view to making necessary additions thereto. The list includes a large variety of cameras (hand, stand, field, reflex, etc.) and lenses of most of the well-known makers, together with shutters, rollers, changing-boxes, tripods, enlargers, lanterns, and a number of useful sundries. These are all offered at prices considerably

below cost, and, as the firm state that all are in good working order, should prove value for money to their purchasers. The Tella Company state also that they take every description of photographic apparatus in exchange for new or second-hand goods of any make.

THE CITY SALE AND EXCHANGE, of 90 to 94, Fleet Street, London, E.C., send us a copy of the list of bargains which are now being offered to the photographic public at their annual spring sale. A special feature of the list is the variety of studio cameras of various patterns and sizes which are offered at considerably reduced prices. The other items include a large variety of cameras (hand, stand, and field), lenses, enlarging apparatus, lanterns, and numerous sundries, together with an assortment of microscopes, field glasses, etc.

ROYAL PHOTOGRAPHIC SOCIETY.

MEETINGS held Tuesday, March 16, the president (Mr J. C. S. Mummery) in the chair.

A lantern lecture, entitled "The Romance and Humour of Invention," was given by Mr. A. H. Dunning, who dealt, in a very interesting way, with many inventions of a mechanical kind, some of great industrial importance and others amusing in their quaintness. On the proposition of the chairman, a hearty vote of thanks was accorded to the lecturer.

Commercial & Legal Intelligence.

CANVASSING FRAUDS AT ARBROATH.—William Hutchinson, Market-gate, Arbroath, was fined £2, or a month's imprisonment, at Arbroath Police Court last week. His connection having severed with a Glasgow firm of portrait artists and frame manufacturers, he secured a photograph for enlargement and 2s. 6d. from a woman, representing that he was acting on behalf of his old firm. He appropriated the money, and the woman, of course, received no enlargement. The prosecutor stated that accused had obtained no less than £2 13s. 6d. by such methods.

FOUR MONTHS FOR A FRAUDULENT CANVASSER.—As much as between £4 and £5 a week was estimated by a witness at the South-Western Police Court, recently, as the sum which a man had been making by defrauding servant girls by taking money for photographs which he never supplied. The prisoner, Joseph Lemoine, at one time engaged on the music-hall stage, living in Greyhound Road, Kensal Rise, was charged on remand with obtaining money by a trick from Alice Cover, a housemaid, at 7, Briar Walk, Putney. The prisoner carried on an extensive system of fraud, extracting money from domestic servants by representing that it was a payment for a dozen cabinet portraits. The girls were led to believe that a Regent Street firm of photographers would subsequently arrange with them to call at the studio. The prisoner carried with him as sample plates a number of cabinet pictures, which Detective Muller said were only cuttings from illustrated newspapers pasted on cardboard. A representative of the firm stated that the prisoner must have been making about £4 or £5 a week for several months. Mr. de Grey committed him to prison for four months, with hard labour.

PHOTOGRAPH CANVASSER'S CLAIM.—At Blyth County Court, last week, Thomas Scott, now of Consett, sued the Northern Photographic Company for alleged wrongful dismissal.

Plaintiff said he was engaged on November 16 as a canvasser for the defendants in the Hirst district, at 25s. a week, the money to be paid fortnightly. He was out daily, and called at the Hirst office for his wages at the end of the first fortnight. It was pretended that the defendants had no money on hand at the time, and plaintiff was asked to call on the Monday. This plaintiff did, but he had to return on the Tuesday, and he then saw one of the principals, Mr. Dorman. Mr. Dorman asked, "How have you the conscience to call for £2 10s. when you have only returned £2 2s. 6d. in business?" Eventually Mr. Dorman asked plaintiff how much he would take to clear out, and plaintiff offered to accept £4. Nothing came of it, however, and at the end of three weeks an agent called upon him for the samples belonging to the firm. Plaintiff continued to canvas during the whole of the following week. His claim was for four weeks' wages at 25s. a week, and one week's wages in lieu of notice, £6 5s. altogether.

Joseph Dickinson, manager for the company at Ashington, stated that during the first week plaintiff only obtained one order for 9s. Witness told plaintiff that would never do for the company, but at plaintiff's request he was allowed to go on another week. In the second week he got another order for 9s. Witness told plaintiff he had to consider himself finished. Plaintiff refused to sign the clearance paper, and said he would have a fortnight's notice.

His Honour held that the plaintiff was wrongfully dismissed at the end of the second week, but he considered that the amount paid into court, £3 15s., satisfied the claim.

Costs were given for defendant.

LEGAL NOTICE.—A notice of intended dividend has been issued in the case of Joseph Harriott, photographer, of 10, Chapel Street, and 15, High Street, Warwick. Proofs must be sent to the Trustee, Mr. C. J. Bland, 8, High Street, Coventry, by the 29th inst.

MR. PHILIP G. HUNT, Postcard Printer, of 34, Paternoster Row, London, E.C., and Balham, has recently taken over the negatives and connection of Messrs. Renaud and Co., postcard publishers, of Chorlton-cum-Hardy. They comprise views of North Wales, Aberystwyth, and Manchester district, Yorkshire, Ireland, Bournemouth, and Weymouth, among other places of interest in the United Kingdom. Customers requiring postcards, view-books, etc., printed in collotype, "Real Photo," "Toned Glossy," and "Coloured" processes should write to Mr. Hunt for prices and samples for the coming season.

News and Notes.

PATHÉ CINEMATOGRAPHY OF AUSTRALIA.—Advices by this week's Australian mail are to the effect that the Commonwealth Government, which has already made arrangements with Pathé Frères, Limited, to show pictures of Australian life in the chief capitals of Europe, has been informed that the firm intend to extend their operations to the Federal States. This will necessitate an important manufacturing installation, and it is believed that employment will be given to a considerable number of expert workers. In the meantime experts are engaged with the films illustrative of the Commonwealth's resources, and which are being taken by the firm in conjunction with the Federal Government.

THE GENIAL TANQUEREY.—The "Yorkshire Post" has had sent to it some correspondence between a gentleman in Hunslet and the Société Artistique de Portraits, A. Tanqueray, Directeur, of Paris. The gentleman in Hunslet received from Mr. Tanqueray a typewritten circular, dated January 23, headed "Portrait and frame free," in which there was offered one of "a limited number of our portraits, handsomely framed," the Paris firm having decided, "in order to introduce this new style of work in your country," to send a limited number of sepia portraits "to prominent people absolutely free of charge." The next paragraph of the circular, however, says that the Paris firm will "make you" such a portrait handsomely framed "entirely free of charge," though it adds, "the only favour we ask of you in return is to recommend our portraits to your friends and acquaintances." The man in Hunslet sent a photograph, and on February 3 received a typewritten note saying the portrait was completed, and asking for "eight shillings to pay for all expenses of fixing, packing, Custom House duties, express charges from Paris to your home, and all general expenses." He had not bargained for the charge, and refused to pay it, demanding the return of his photograph and the gratis enlargement. He duly received the former, but not the latter. On reading the correspondence, the "Yorkshire Post" fails to see that there was any actual breach of contract. The circular was entirely misleading, no doubt, but it was really to "make" and not to "send" free of packing and other charges.

GOLFING PHOTOGRAPHS.—Mr. A. C. M. Croome writes in the "Morning Post" of a most interesting series of photographs in "C. B. Fry's Magazine," representing Harry Vardon driving a golf ball. So exactly does one picture take up the tale where its predecessor left it that unless the artist, Mr. G. W. Beldam, had stated the contrary, one would imagine that the series had been taken by a cinematograph machine. As a fact, Vardon drove ten balls; each time Mr. Beldam shot him at a slightly different moment in his swing, and the ten balls were all retrieved from practically the same place about a furlong down the centre of the course. In distributing one's admiration one hardly knows what to place first, but last. The machine-like accuracy with which Vardon repeated his motions is equalled only by the delicacy with which Mr. Beldam timed his part of the business.

SIXTEEN LEHIGH VALLEY RAILROAD EMPLOYEES, at Hazleton, U.S.A., lost their jobs recently as the result of a railroad detective photographing them while drinking in defiance of orders. The spotter had his camera inside his vest, and from a pocket in his trousers manipulated the bulb. He could stand carelessly at the bars of saloons and not arouse suspicion, but all the while he had the camera peeping at his victim, who was snapped while taking a drink. It is said that nearly all of fifty-two employees summoned before Superintendent Raleman for a hearing pleaded guilty, and were let off with a reprimand when they promised to abstain from intoxicants hereafter. Sixteen who denied their guilt were discharged.

THE CAMERA HOUSE ATHLETIC CLUB held their second annual dinner at Anderton's Hotel on Saturday, the 6th inst. Mr. W. F. Butler presided, and after dinner a concert was given, which was voted a hearty success. The professional talent was exceedingly strong, the comic songs of Mr. George Buck being enthusiastically encored, while the waltz song from "Tom Jones," rendered by Miss Brogan, was excellent. Among other artists, Mr. Percy Stanhope, with a very loquacious entertainment, was well received. Mr. Fred Everill, Mr. Jefferson Nell, and Mr. Markham Ashberry all helped toward the

ending of a very pleasant evening. During the evening the usual lists were given, that for the King and Queen being very heartily responded to. In spite of the inclement weather, the number present was over 150, among them many ladies helping to make the evening a very pleasant one.

PHOTOGRAPHIC SURVEY AND RECORD OF SURREY.—The annual meeting will be held on March 20, at 4 p.m., in the club room of the Borough Polytechnic, 103, Borough Road, London, S.E., when the report of the council and accounts for the past year will be submitted. At 7 p.m. there will be a lantern lecture dealing with the work of the association. The meeting is open to all who are interested in the work and aims of the survey, and it is hoped that members, in addition to being present themselves, will secure the attendance of friends. The secretary is Mr. Frank F. Wood, 11, Milton Road, Clifton, who will at any time be glad to give information to those interested in the work or who are desirous of becoming members of the association.

Correspondence.

We do not undertake responsibility for the opinions expressed by our correspondents.

Correspondents should never write on both sides of the paper. No notice is taken of communications unless the names and addresses of the writers are given.

THE BANE OF CHEAPNESS.

To the Editors.

Gentlemen,—Last spring the question was asked, "Is photography a profession or a trade?" Instead of a definite answer the subject went into prices charged for portrait postcards. Permit me to answer the question this way. In some hands photography is a respectable profession, with others a trade, and with some only a temptible employment.

The first I define as those who have a place of business, and let be known, and depend on such customers as visit their rooms for their work, and who never descend to solicitation, and have no passers nor clubs. All honour to such, but they are few. The second class are mere traders, who try dodges to catch customers. The third party will write and ask all the Provosts of Scotland for a sitting, the fourth will ask all the J.P.s. They are so anxious to have a portrait of all these worthies just to look at!! Another watches the death-roll and writes condoling with friends, and asks if they will have a photograph of the deceased, because they can enlarge it so cheap and nice, and, of course, leave the local photographer alone. The fifth was to reveal the names of these traders it would surprise your readers and shame the traders.

The third and contemptible class have degraded photography down to the lowest level, and beneath a trade. Some of this class have degraded the trade, while others have not. The public are gulled by their cheap rubbish. Some are local (for a time), others are on "the tramp," with a tent, or hire a shop or cellar, gather all they can, and then depart to pastures new. The "company" may be only one man. Of course, cheapness and rubbish are the foundations they build on. Even a local man will advertise small numbers of cabinet photographs at 3d. or 4d. each. How they live is a puzzle. Poor creatures! I wonder they don't learn to cobble shoes or shave faces for a night, and thus eke out a living. (I give them the hint gratis.)

When there is another class—viz., those whom I will call mean imitators. In a small town of 5,000 to 7,000 there may be a dozen of these sham amateurs who cater for all the work they can get. You may find the chemist, tailor, cobbler, draper, postman, hawker, boy, etc., etc. Just fancy the meanness of a chemist doing live postcard stamp photos at 6d., and yet none dare sell chemicals, or be trained as a chemist to sell poisons. Of course, all these go for the cheap lines, and the productions are soon faded away, to the regret of any that value them. But in this low gutter trade of photographs any pedlar can buy a camera and commence employment. I don't know any trade that is so degraded in work, want of skill, and low prices. I cannot describe all the evils, and I need not suggest a remedy. I have noticed what others have written in the "B.J." I will say, that it is time the public were protected. All the means of canvassing, with its detestable frauds, should be abolished. Not only those properly trained should be allowed to charge the public any price. All amateurs should pay a licence and be fined if

they charge for their work. Then a trained man who has a place of business, when he cuts down prices, should be asked the reason, and a deputation of P.P.A. wait on him and raise a subscription to tide him over a difficulty if he has any. Is the above impracticable? It is hard lines to see our once reputable calling, not only "gone to the dogs," but to the donkeys. For obvious reasons I sign myself

DISGUSTED.

A TEXT-BOOK FOR AMATEUR LECTURERS.

To the Editors.

Gentlemen,—It was unfortunate that the reader who wanted a book for a lecture on the history of photography was pressed for time. "Photo-Miniature" seems too trivial for the purpose, whilst others are beyond reach of most of us. I strongly advise him to get "Romance of Modern Photography" (5s., Seeley and Co., London), which treats pleasantly and exhaustively of all he asks, and is illustrated with rare photographs. Illustrations include mammoth American photograph, first Daguerreotype, first paper negative by Fox Talbot, first wet plate by Scott Archer (1851), criminal photographs, colour photographs, cinematographic films, etc. The book was published last year, 1908.—Yours, etc.,
E. WEST.
64, Ravenhurst Street, Camp Hill, Birmingham.

FAILURES IN SULPHIDE-TONING.

To the Editors.

Gentlemen,—I observe the extract from "Photo Notes" which appears on p. 198 of your issue of the 12th inst. I am not sufficient of a chemist to say whether the statement is correct that hypo is formed as the result of decomposition of sodium sulphide, but I am assured by more than one authority that such is not the case. Assuming that there is such an action, and that we start with, say, the usual 2 per cent. solution, and that as the result of such decomposition we eventually have half sulphide and half hypo, or even a preponderance of the latter, I do not see that the refusal of prints to darken is accounted for, and certainly a very large proportion of hypo added to a normal solution of sulphide does not have any such effect.

The following record of experiments may perhaps be of interest:—

Prints were bleached in the usual ferricyanide and bromide bleacher, washed, and toned in a 1 per cent. solution of sodium sulphide, to which hypo was added in the proportions of $\frac{1}{2}$, 1, 2, 4, 8, and 16 per cent., and not in a single instance did the prints refuse to darken up, although it will be seen that in the last case there was sixteen times as much hypo as sulphide, and sufficient to form an ordinary fixing-bath—in other words, the sulphide did its work before the hypo had time to attack the bleached image. The effect was inappreciable until a strength of 4 per cent. was reached, and from this point the image gradually became yellower, but even with the 16 per cent. bath there was a considerable darkening up, although the colour was a very unpleasant yellowish brown. It would thus appear to be established that the refusal of prints to darken in the sulphide bath is not necessarily due to the presence of hypo, either from decomposition of the sulphide or otherwise.

Theoretically, it would seem possible for traces of hypo in the prints to react with the ferricyanide of the bleacher and interfere with the toning, but on washing a "Royal" bromide print for fifteen minutes—a very short time for such a thick paper—the toning was quite perfect. The effect of adding hypo to the bleaching bath was then tried, with the following results:—

Half-grain and 1 grain to 4oz. of bleacher had scarcely an appreciable effect; 2 grains and 4 grains to the same quantity of bleacher had the effect of destroying some of the finer details; and 8 grains absolutely prevented any darkening in the sulphide. The bleached image in this case was still of the ordinary yellow colour and of apparently the usual depth.

It seems thus to be proved that contamination of the bleacher with hypo is a more probable source of the trouble than a similar contamination of the sulphide bath.

This decomposition of the sulphide and impure sulphide theory has been so frequently put forward that perhaps this record of a few very rough experiments will induce someone with time at his disposal to investigate the subject thoroughly.—Yours faithfully,

Chiswick,

J. BROWN.

March 17, 1909.

MEASURING SHUTTER SPEEDS BY THE METHOD OF MR. W. H. SMITH.

To the Editors.

Gentlemen,—Referring to your article on shutter testing in the "B.J." of the 5th inst., and having seen the diagram of Mr. Smith's shutter tester shown by Mr. Salt at the Croydon Camera Club last night, it occurs to me that, as shown in the diagram, while the length of time the shutter is open (less a fraction of time for the inked indicator to reach the drum) is recorded, no test of the relative efficiency of the shutter during the opening and closing is recorded.

May I suggest this could be done by having inked indicator always on the drum, the indicator to be shaped somewhat thus

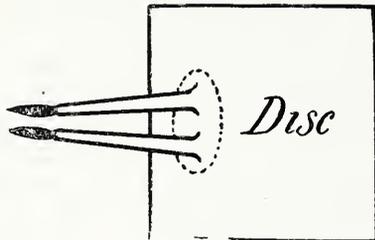

Fig. 1.

Then air reaching the disc and causing the joints to expand would, while recording the duration of exposure, also record the length of time the shutter was working at full aperture by some such lines as these:—

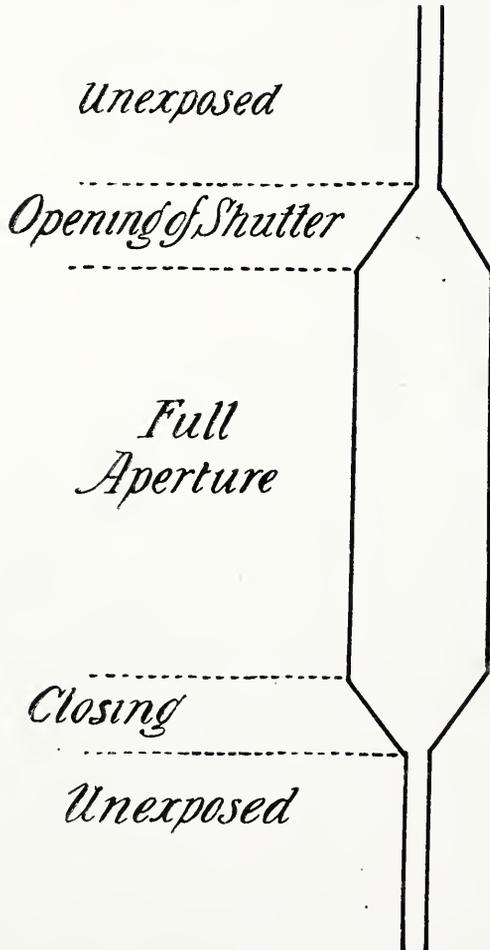

Fig. 2.

--Apologising for troubling you, yours truly,
7, Westhorpe Street, Putney, S.W. ARTHUR W. EVEREST.
March 11, 1909.

ASSISTANTS' PROSPECTS.

To the Editors.

Gentlemen,—The number of advertisements appearing in the columns of the "B.J." only shows the very good medium and how much used the paper is as an employment bureau for those in the trade. I should rather imagine that "Underpaid Assistant" is one

of those despairing ones who go about with a long face. There are plenty of excellent positions open to men who are not afraid of work and who do not expect too much for a start. I am firmly convinced that no photographer, despite the bad times the trade has experienced during the last year, need be out of work for long, for there are numbers of openings for men with enterprise, both at home and abroad. There are no doubt far too many assistants who have not a thorough grasp of the trade, and it is for them to seek to improve their knowledge. It is quite evident who the firm is that your correspondent refers to, and we consider that their style of advertising is remarkably good; and further that, instead of taking the bread out of anyone's mouth, they are really creating a demand for photography and finding work for assistants.

We very much doubt if "Underpaid Assistant" will ever become an employer if the style of his letter indicates his character. He had better "buck up," as we say in Yorkshire.—Yours truly,

NIL DESPERANDUM AND Co., York

BIBLICAL KNOWLEDGE AS A QUALIFICATION FOR TECHNICAL EDITORS.

To the Editors.

Gentlemen,—Under the heading "Composition in Portraits," you say, on page 192 of your last issue, "Of the making of books there is no end." So said somebody once, but who, and when we do not know."

May I be permitted to point out, gentlemen, that in literary circles it is accepted as an axiom that a quotation must be made correctly, or not at all?

May I, further, ask why, when Editors of photographic journals quote from the Bible, the quotation is invariably incorrect?

And, again, may I ask why, in quoting from that book, they invariably acknowledge that they do not know from whence comes the quotation?

Surely, these questions answer themselves!

A short time ago the agile and accomplished Editor of your contemporary, "Photography," came an awful "cropper" over a quotation (incorrect) from the Book of Job, although he admittedly fancied that in his weekly "Questions and Replies" he himself was the very personification of Job. Nor did he know whom he was quoting.

To personify Job, as he does, is more than I think you can claim, gentlemen, for you once got so impatient over trifling questions addressed to you as to reply in your columns to a trusting correspondent who wanted to thin Canada balsam to "add a little turpentine and stand in a warm place." The italics are mine and the inference is plain.

But, after all, you are too clever for me. You have left me a line of retreat. You say, "So said somebody once, but who, and when, we do not know." Nobody knows. This is your line of retreat; you can explain it away.

The statement, gentlemen, which you have not quoted, and which is more to the point than is yours, is, by consensus of opinion, attributed to Solomon.

I often admire your caustic and pretty wit, and two very recent instances will illustrate my point, viz.:—Dr. Kenneth Nesbit's ventilator, in your last issue, and Mr. McIntosh's now immortal sporan. But, in the present case, as regards wit, you are not and cannot expect to be, in it with Solomon. Any way, if you do not give the credit to Solomon, you might have given it to "The Preacher." You say, "Of the making of books there is no end," but "The Preacher" puts it with far greater incisiveness and wit when he says, in Ecclesiastes xii., 12, "Of making many books there is no end."

I trust that the "awful example" set by yourselves and the Editor of "Photography" will be enough to warn the Editor of the "P.N." and "P.N.," and of "The Photogram," to keep clear of quotations (?) from a book which does not appear to have been thought of in the curriculum of education of editors of photographic journals.—Your obedient servant,
W. R. BLAIR.

Duffield, Derby,
March 15, 1909.

[The only grain of comfort we can derive from Mr. Blair's justifiable, yet gentle, remonstrance is that it may, indeed, be a means of saving both our more youthful and senior confrères from like misadventures.—Eds. "B.J."]

Answers to Correspondents.

PHOTOGRAPHS REGISTERED:—

Harrison, J., Perrers Road, Hammersmith, London, W. *Photograph of Rev. Dixon, Bantam-weight Boxer*
 Verbury, J., Hanover Street, Edinburgh. *Three Photographs of the Rev. Lewis Davidson.*
 Hoffman, West Cliff Studio, Freeland Road, Clacton-on-Sea. *Photograph: Wave Splash, Clacton-on-Sea.*
 Turnbull, 620, Eglinton Street, Glasgow. *Two Photographs: Canadian Curlers and Ice Rink Club; and Canadian Curlers, both at Crossmyloof Rink Glasgow.*

THORBURN.—We are unable to say. We should advise you to put your query to the "Cinematograph Journal," or, better still, perhaps, to the makers of the apparatus.

FOR.—1. The factor is 40. 2. See the table and rules in the "Almanac," p. 931.

LINE.—Try E. Herridge and Co., Staines; or Birmingham Building Warehouse, Great Hampton Street, Birmingham.

L. O.—We do not know for certain, but we imagine the solution simply one of potassium bromide, containing some boric acid and an additional restrainer. We would suggest that some potassium rate could be used for the same purpose.

E.—We are sorry we are unable to help you. We can only refer you to the British firms who in our columns announce these articles, they are made up into frames.

TEO. PRINTS.—Would you kindly tell me where I could obtain stereoscopic views of the "White City," also the great "Earthquake"?—**EN.**

Try Underwood and Underwood, Heddon Street, Regent Street, W.

TO.—1. We gave you the names of the only two books of importance. See also "Composition in Portraiture," reviewed last week, and also under "New Books" on another page. 2. Flashlight or a flash lamp is used, as a rule.

—1. We can only refer you to the formula on page 821 of the "Almanac." The Vanguard "Lustralene" ought to meet your wants. 2. The more ether added, the finer the grain.

P.O.P.—I have about 9 doz. postcards and some P.O.P., stale and discoloured as sample sent herewith; they are over twelve months old. Can you advise me of any profitable way of using this material? I believe it is not easy to restore it to proper condition. Is it any use bleaching the paper and removing the silver, or resensitising by any process, or can you suggest any profitable way for it?—**STALE.**

We should say that the only profitable way of dealing with the paper is to fix it and add the fixing bath to your residues. It may be possible to turn the paper to some account, but we cannot suggest any method, and we doubt if any attempt to utilise it would cost more than the purchase of new paper.

LANTERN SLIDE.—I should be greatly obliged if you will inform me as to the cause of the deterioration of the lantern slide enclosed, also if there is any remedy; the slide is three years old and has been kept in a dry place.—**STAIN.**

The effect is no doubt due to condensation of moisture in the lantern. The slide should have been varnished. There is no remedy so far as we know.

QUESTION OF CHARGES.—The following extract from a letter received this morning may be of interest to your readers:—"I belong to a literary society which enrolls some excellent amateur photographers, but, owing to the crippling charges which are occasionally made by professional photographers, we are depending more and more upon co-operation amongst ourselves. I am a great admirer of 'Live and let live,' and fully recognise the artistic and material excellence of much photographic work done for me, but gold can be bought too dearly." The writer of the criticism: "A photographic charges wants a monument in a village church four or five miles distant photographed. He desires three 10 x 8 B. and platinumotype prints, full of detail, suitable for reproduction. The price I am charging him is 31s. 6d. and cost of the hire of conveyance. After correspondence he agrees to pay my charge for the prints and half the cost of conveyance. Now, I know from previous issues of the "Journal" when the question of prices crop up you say: "You must be the best judge of that, and charge according to

the class of business you do," which, of course, is very true, but exceedingly vague. I believe I am recognised as a photographer doing a refined class of business. Will you kindly give your opinion on the charges?—**VELLUM.**

We should consider the charge very moderate if the work is good. While the price is less than many would charge, it is more than some would quote. As we have said on many previous occasions, there are no universal rates for this class of work.

SALARY.—I am about to finish my apprenticeship. If, after stating what I can do, you would kindly advise me as to the salary I could reasonably ask in applying for situation, I would feel greatly indebted to you. I can retouch very well, work up enlargements in sepia and B. and W., Aristo and bromide printing and toning, copying. I have taken several photographs, both in studio and outdoor, but I have had very little personal operating to do. Although I assist very often out of doors, I have not had much practice in the studio. Still, I could assist and "take" in absence of principal, if necessary. I might say that in retouching and working-up enlargements the modelling and stipple is, without doubt, excellent. Age 21. What salary may I ask?—**APPRENTICE.**

Without seeing specimens of the work you can do we can give no definite opinion as to the salary you should ask. As you seem to have had no experience in studio work we should think you should not ask more than about 25s. a week to begin with.

ARTIFICIAL LIGHT.—I want to add night portraiture for bazaars, etc. Will you kindly inform me: *a.* How many incandescent gas burners are necessary if the usual half-circle reflector is used? *b.* To work with a No. 2 Multisecto (Fallowfield's patent), is a Ross half-plate R.R. working at *f*/5.8, suitable, or must it be a portrait lens?—**IN THE DARK.**

a. Eight or ten can be used, but the more burners there are the shorter will be the exposure. The usual reflector will be useful in the even diffusion of the light. *b.* The R.R. lens can be used, but it will require about double the exposure that a portrait lens would.

HYPOTHELIATOR, ETC.—1. I have seen instructions for quick washing of plates by repeated immersion in a very weak solution of permanganate of potash. Would this method do for eliminating hypo from bromide prints, or would it leave a stain? 2. If I coated some wooden trays with asphalt, pure rubber, and mineral naphtha, as directed in the "Year Book," would it do for developing plates and fixing same? also for bromide developing, fixing, and washing (of course using separate trays). or would the coating come off and spoil my work in any way? 2. Where can I obtain the asphalt, rubber, etc., and what is the cost?—**TRAYS.**

1. It can be used, but care is needed to avoid brown stains in the prints. Such stains are almost certain to be produced, though they are readily removed with a weak solution of oxalic acid. But our advice to you is to give a thorough fixation of the prints in 4oz. per pint hypo, and wash in running water. In these circumstances, even if the washing is short, the prints will have every chance of being permanent. 2. The trays would be suitable. 3. You can buy the materials from a large drug store, or from a house such as Messrs. John J. Griffin and Sons, which supplies photo-engravers.

CAMERA.—Can you give me any information about this little camera I herewith send you? 1. What aperture does it work at? 2. How can it be used as a Graphoscope? 3. Where can films be obtained for it?—**T. H. D.**

1. The aperture with cap and stop on appears to be about *f*/30, and without stop about *f*/9. 2. The camera is evidently intended for use with a roll film, and when used as a "graphoscope" a positive film image would be inserted in place of the negative, and the backing plate of vulcanite and the circular plate in back of camera would both be removed. The lens cap being also taken away and the camera held back to the light the image could be observed through the lens. Strictly speaking, this would not turn it into a graphoscope, as that properly consists of a large lens through which both eyes can observe the photograph. 3. We cannot answer this. You had better write to some of the big dealers and ask them if they can help you. The camera is an old idea and we fear that films may no longer be obtainable.

GREEN TONES.—Could you through the medium of your valued paper inform me of a formula for toning bromide prints to

a bright green—one which could be relied upon for an even tone when doing large batches?—"BRISTOL."

The best formula we know is that given in the "Almanac," page 810, but we think you will find some difficulty in getting even tones in the case of large batches. For this purpose a green carbon tissue would be more reliable.

TITLES ON NEGATIVES.—Enclosed please find post-card. We should be pleased to know the method that is employed in printing titles on them.—"ANGLAIS."

The usual method is to have the words forming the title set up in type and photographed on a "process" plate. The subject negative having been made with a clear margin round it, a strip of the title negative is laid down on this margin by stripping, and the clear margin then filled up with "photopake" or other blocking-out mixture except over the strip of title, which is made dense enough in the first instance to print white. If a clear portion in a landscape negative cannot be found (in cases where the title has to appear on the view) a portion must be cut out with a sharp knife.

RETOUCHING MEDIUM.—Can you say why the retouching medium, after successful use for some time, now reduces the density of negatives on application with finger-tip in the usual way?—"ENTHU."

This defect may arise either from thickening of the medium (in which case thin with amyloacetate), or more probably, the negatives are now being insufficiently washed after fixation or intensification. Impurity of the washing water is another possible cause. It is advisable to wipe the negatives whilst wet (after washing) with a tuft of cotton wool. Again, the trouble may be avoided by applying the medium all over the negative, when the reduction will be imperceptible.

B. DOS SANTOS LEITAO.—There is only one maker, Messrs. Sanger Shepherd and Co. See their catalogue in the current "Almanac."

CARBON PROCESS.—Will you kindly tell me (1) a book published on carbon printing and developing, and the price for same; (2) how much would an outfit for the working of carbons cost and the best house to deal with for same?—H. S. BURTON.

(1) There are several good text-books: "A B C Guide to Auto-type Permanent Photography," by J. R. Sawyer, 1s.; "Carbon Printing," by E. J. Wall, 1s.; "Practical Carbon Printing," by Thos. Illingworth, 1s. (2) From a few shillings upwards. See the list of makers on p. 1,330 of the current "Almanac."

COPYING PAINTINGS.—I have a number of oil paintings to copy in a room situated as sketch (size about 24ft., size of skylight about 10ft. by 6ft.) from about 12 o'clock to 2. Sun is about — position. Could you tell me about best position to place pictures, also about the exposure in good light, 12 to 2, with anastigmat Staley 10 $\frac{3}{4}$ in. lens at $f/44$, reducing to about one-eighth, using Imperial "Process" plates, H. and D. 12, or would you recommend a different plate?—H. C.

As the room is square, we should say the best place to put the pictures would be diagonally between B and D, as seen in the sketch. Instead of using process plates, you would, in copying oil paintings, find isochromatic ones far preferable. One or two trial plates would tell you better than we can as to the exposure necessary.

LENS QUERY.—I am intending to open a photographic studio here (size 27 by 12), and would be very much obliged if you would inform me what lens would be most suitable for general work—that is, cabinet bust, three-quarter, and full length—and also that most suitable for whole-plate groups and single figures (both in studio)?—BEGINNER.

If you are limited to one lens, the most generally useful in a studio 27ft. long would be a portrait lens ($f/4$) of about 14in. or 15in. focus. A good one of that focus will cover the whole plate, and can be used also for full-length cabinets.

NEGATIVES STRIPPING.—(1) The probable reason of films stripping from glass after negatives come out of stock less than a year old? The negatives in question were hardened in alum bath after fixing. (2) We believe you recommend the use of formalin in preference to alum. What strength solution is advisable (a) for plates, (b) for papers? (c) Can the solution be used repeatedly?

(d) Must plates be washed free from hypo before its use? (e) the case of P.O.P., will prior use affect toning? (3) The address of firm from whom to obtain strong 12in. glass cylinder?—E. E. F.

(1) Over-hardening will cause stripping, which will be helped by storage in a warm dry place. (2) For (a) or (b), 5 or 10 per cent. solution—i.e., formalin 5 or 10 parts per 100 parts of water. Yes. (d) Not necessarily. (e) The bath can be used before toning. (3) A chemical apparatus house, such as A. H. Baird, Lothian Street, Edinburgh.

COLOURING.—1. Would you recommend the working-up and colouring of enlargements as a lucrative profession to capable artists? 2. Is the profession of B. and W. artists already overcrowded? 3. What is the average wage of a B. and W. artist?—EASEL.

1. No, we cannot, as competition in that class of work is very great at the present time. 2. We should say that it was, judged from the number of advertisements of those wanting employment that appear in our columns weekly. 3. The greater portion of this kind of work is now paid for as "piece work."

A DISPUTED ORDER.—I am a photographer, but have lost my studio, and am now in a very poor way, taking postcards. A stationer came to me and asked me to take one dozen views of the rectory snow (cover in all about four miles). He said he would give me several gross at 1d. each. I took him proof, with which he was pleased, and ordered 1,000. He would not pay in advance for the whole or portion of them. Being, as I say, in a small way, I could not get the blank cards, etc., without some cash; told him so, and offered to take 25 per cent. for cash, but he would not pay. In a week's time I was able to do 200, and he then said he would not have them, as it was too late, and did not do business in that way. Can I make him pay for the taking of the negatives? What would be a reasonable charge?—POSTCARD.

If you did not stipulate that the cards were to be paid for wholly or in part in advance, we do not see that you could claim payment till the order was completed. Postcards such as these are of passing interest only, and if you were a long time in executing the order it is not altogether surprising that it was cancelled. In that case, it is doubtful if you can recover anything for taking the negatives. That is a matter the County Court will decide if you think it well to take it there.

DEVELOPING P.O.P.—Would you kindly give me a method of development of partially printed P.O.P. prints? I saw one some time ago, which said soak the prints in a 10 per cent. solution of bromide of potash for five minutes, then develop with M.Q. I tried this method, but prints almost immediately developed quite black. Also, I tried a method as given in "B.J. Almanac"—hypo-quinone, 24 grs.; citric acid, 60 grs.; soda acetate, 1 $\frac{1}{2}$ oz.; water, 30 oz.—but before development was complete the back of the print went a muddy brown colour. I have not got a print handy to send one. Your advice on this would be esteemed.—S.D.

The mistake you made in the first (bromide) process was in the developer. This should be the highly restrained formula given on page 835 of the "Almanac." Most of the acid-developer formulas are apt to stain the backs of the prints. You should look up the numerous articles on this subject which have appeared in the "Almanacs" during the past year or two.

* * NOTICE TO ADVERTISERS.—Blocks and copy are received subject to the approval of the Publishers, and advertisements are inserted absolutely without condition, expressed or implied, as to what appears in the text portion of the paper.

COLONIAL NUMBER. SECOND YEAR.

This special issue of the BRITISH JOURNAL is posted direct to photographers throughout the British Colonies and foreign countries.

SUMMARY.

1909 Photographic Market. The announcement of our intention to review the new apparatus and materials just coming upon the English photographic market has compelled us to devote a considerable proportion of this issue to this purpose. (Pp. 241-258.)

Hint to Colonial Readers. We publish some photographs and slides sent to us by recipients of last year's and the present Colonial Number." (P. 238.)

Process Workers. Under this week's "Photo-Mechanical Notes" the new bitumen process for chromo-litho work is dealt with: with some other hints. (P. 259.)

In order to give an idea to our Colonial readers of the present preferences as regards mounts and mounting among photographers of the better class we describe the tendency of the recent movement towards more artistic mounting and describe specifically a commercial mount of the better class. (P. 236.)

Some tested formulæ, which, for good reasons, differ somewhat from those commonly recommended, are given on page 232.

A new method of obtaining the effects of sulphide-toning as well as of other warm tones in bromide prints from lantern slides has been worked out by Mr. Welborne Piper. (P. 231.)

The photographic conditions in British Columbia to be realised by photographic traders are the subject of a comprehensive article by Mr. L. Haweis) which commences page 233.

A brief review of the state of things photographic in Japan is given for us by Mr. Thomas B. Blow, of Kyoto. (P. 236.)

The excellent work done by the Professional Photographers' Association is described in the annual report of the committee printed on page 239.

Some of the practical methods which the photographer may avail himself of in arranging the studio "foreground" are mentioned in an article on page 230.

A practical note on the use of acid amidol for stand development is contributed by Mr. G. T. Harris. (P. 235.)

A note on the advantage of reflections in the floor of the studio for photographic portraiture appears on page 230.

EX CATHEDRA.

To Our Readers Here and Across the Seas.

In this special and enlarged issue we are able to present a review of the most recent introductions upon the photographic market in the way of apparatus and materials. This special section will be found to contain reports of goods introduced as recently as a day or two before the final closing of these pages for the press, and we can therefore offer it to our colonial and foreign friends as the most convenient and up-to-date source of reference they can have, and also as a demonstration of the great energy and enterprise of the English makers and vendors. Yet even our review, lengthy as it is, does not exhaust the output of new goods appearing in the present season. Later issues of the "B.J." must be left to describe other introductions, but we hope that photographers in all parts of the globe into whose hands this number directly comes will see in it a link between themselves and the many British firms whose names figure prominently in these pages.

Farmer's Reducer.

This well-known reducer is very commonly prescribed to be made by adding a little ferricyanide solution to the ordinary fixing bath, and quite recently we have seen the strange advice given to use an acid fixing bath. Both recommendations are bad ones, because too much hypo speedily decomposes the ferricyanide, and the presence of an acid very greatly accelerates this decomposition. The hypo solution used should not be more than one quarter the strength of an ordinary fixing bath; that is, it should not exceed a strength of 1oz. in 20, and acids should be most carefully kept out of the way. A little alkali will do no harm, in fact it may assist the reducer to work, but an acid will only upset the action. Its effect will be manifest by the speedy change of colour of the reducer from yellow to blue, whereas a properly compounded bath will keep yellow for quite a long time.

Control of Over- Exposed Plates.

Of late years a fallacy has obtained to the effect that wrong exposure cannot be counteracted by any modification of development, in spite of the fact that not long ago, when development by inspection was the rule, many workers very successfully demonstrated methods of combating very extreme over-exposure. Recently it occurred to us that it might be worth while to try the method of development used when making warm-tone lantern slides. Two very rapid plates were exposed, a small stop being used so as to bring the times of exposure well under control. One plate was exposed for 5 seconds, which proved to be a correct exposure for normal development, and the other plate given twenty times this exposure on the same subject. The second plate was then developed with

a very strong metol-hydroquinone developer, to which equal parts of ammonium carbonate and ammonium bromide were added in the proportion of about 12 grains of each to every ounce of developer. Development was very prolonged, and the result was a negative as good as the other in all respects, excepting that it was rather thin and of a warmish tone. This was intensified, and in the end the ten minutes' exposure negative printed a little harder, if anything, than the five seconds' exposure.

* * *

Polished Furniture in the Studio.

In looking over a somewhat large number of professional portraits the other day we were impressed with the fact that, fine as they were, they would have been still more effective had they been free from a certain spottiness caused by reflections from the polished furniture. The almost glassy surface of new French polish reflects so much light that in some cases the reflections on the chair or table are the brightest points in the picture. It is quite possible to use furniture which will give a rich effect—very much to be desired of course—without this distracting spottiness. The late Valentine Blanchard, we believe it was, who kept in the studio a few pieces of fine glass-paper, and when the caretaker had diligently beeswaxed the chairs, he would take off a little of the shine by the judicious application of this. Many people are now using, in their houses, furniture which is wax polished instead of being brightly polished, and the effect is exceedingly good, while the furniture is not so likely to show every finger-mark. Chairs, tables, and other furniture used as accessories might with advantage be so finished. While we would suggest less polish on the furniture, we would, however, advocate more on the floor. If a parquet floor is laid down, or the very excellent substitute, the modern linoleum, indurated or inlaid, it may be waxed, and when in good condition will give reflections in full-length portraits and groups which greatly increase the interest and pictorial quality of the work. With such a floor, one little word of caution is necessary. Do not have small rugs laid on it, or some unfortunate client, thoughtlessly stepping quickly on to such a rug, may find himself losing his grip of the floor.

* * *

Wooden Developing Dishes.

Few workers know the comfort and convenience of wooden developing dishes. They are very inexpensive, for though they may cost as much to make really well as a "porcelain" dish costs, they last well and are not liable to fracture as is earthenware. For developing batches of plates they have the great advantage that, the bottom of the dish being flat, the plates do not slip about and over each other. They are considerably lighter to handle than earthenware, and in the winter are warmer for the hands and also for the developer, the temperature of which naturally drops as soon as poured into a cold dish. To be effective such dishes should be well made, carefully grooved and dovetailed together, and should be made of well-seasoned hardwood. On the whole, a wooden bottom is to be preferred to glass, for the same reason that the wood is preferable to earthenware. We have recently had some small dishes made for holding a number of hand-camera exposures side by side in a row, the bottom of the dish being fitted with small wooden pegs to keep the plates from sliding over each other when lifting them out for examination during development. Wooden dishes need handling with a certain amount of care, for though they will not break, their joints, if subjected to any strain, will tend to open and become leaky. Paraffin wax may be run into the joints with a hot flat-iron, but under ordinary circumstances such luting is quite unnecessary.

FOREGROUNDS IN PORTRAIT PHOTOGRAPHY.

WHILST not of such moment as the background, since it occurs only in full-length figures, yet the foreground can do almost as much towards making or marring the result. Continuous foregrounds are perhaps the best for landscape and plain grounds. They are, however, somewhat in the way, and certainly tend to untidiness. About the best way of dealing with them when attached to backgrounds on stretchers is to tack a light lath on the extreme end of the foreground and another under the foreground, midway between the frame and the front lath. The lath will not show, nor will the slight ridge made by the middle piece, when the foreground is in use, be noticed. The lath, which should be of one-inch by quarter-inch stuff, should be longer by about six inches than the width of the foreground. The latter, when out of use, is lifted by this middle strip and hooked on to two hooks, fixed in the correct position on the frame. Whilst this method is very quick and effective for grounds on frames, "there being nothing," as the advertisements say, "to get out of order," those grounds that are on the theatrical-roller system, i.e., have the roller at the bottom, are more difficult to arrange. The other method of rolling at the top is, nor can be, satisfactory, unless expensive metal rollers are used. With the former system the roller is placed to hang an inch or two off the floor, and the foreground is tacked, or preferably glued, to the roller. The cords are arranged in the usual way (for full details of this system see "B.J.," December 15, 1905, or "B.J.A.," p. 100, 1907), and it will be found that foreground and ground roll up together.

Continuous foregrounds, however, add greatly to cost, and one separate foreground is frequently used for several different canvases. A piece of washable background—both of dark grey colour may be used, but it soon ruck up and looks bad. At each end of one studio we know the floor has been covered with plain green cork carpet. This can be used for almost any ground, interior or exterior, and, without being incongruous, wears well, and washes easily. For very light grounds or plain blacks the foregrounds are used as first described, and are, of course, placed over the cork. Another substance likely to be equally useful would be a plain middle tone cocoa matting, or a carpet felt could be laid. The plain surfaces of these materials are much better than any but a very retiring pattern carpet for interiors, and are equally satisfactory for exteriors.

With the panelled background now so frequently used in the best studios, parquet, or an inlaid "lino" of panel pattern, is suitable, but has the drawback that a separate foreground must be provided for all the outdoor scenes.

An almost plain carpet can be used to good effect occasionally, or a self-coloured rug may be pressed into service. The new wool carpet squares are very excellent, the ground being in several designs self-coloured, with a colored border only.

The chief drawback to what might be termed universal foregrounds as opposed to the painted ones is the all-over sameness which is so unnatural for out of doors. If accessories, such as a wall seat, or anything occupying a certain amount of space, are used, this will not matter, but where the angle between background and floor shows very much a better and more pleasing effect will be obtained by breaking up this sameness. A grass mat in not too sharp focus is useful, or imitation leaves may be used with effect; and for child pictures flowers may be strewn about. Bought from the millinery department of a store this would be expensive in sufficient numbers, but inquiries in the right quarters will generally enable one to buy damaged specimens at something like one penny each. One of the illustrations in the first edition of the late H. P. Robinson's book,

Historical Effect in Photography," is an albumen print of a girl on a most elaborate "real" foreground, consisting of gravel path, turf, and ferns. This arrangement was made up of fresh-gathered greenery, etc., arranged on a table placed on castors for convenience in travelling to the studio. Whilst not expecting many moderns to find time or take the trouble to make up such a foreground, yet the table, at any rate, is worth notice. For children or animals they are a great advantage. A supply of small pebbles, at any rate, can be kept at hand without much trouble, and with logs of wood are very useful. A box of clean hay, though very messy afterwards, leads to

some happy romps with the children. The pebbles are particularly useful for a seashore background. Such a background must, however, have its own foreground, since the tone of the sands is so light, and any break would be badly noticeable. A good sea background is a *rara avis*, but in the event of one being possessed, wonders in the realistic line can be done with the help of the foreground. The pebbles are simple, but odds and ends such as corks, a bit of net, and seaweed should be at hand, whilst coming more under the head of "accessories" we should like to mention a fisherman's "crab-pot" as a valuable aid to posing children singly or in small groups.

NEW TONING METHOD FOR BROMIDE PRINTS AND LANTERN SLIDES.

A method of producing warm-toned lantern slides by giving prolonged exposure and developing with a highly restrained developer, usually containing ammonium carbonate, and some other ingredients, is well known to all photographers, and not very many practise it. Some consider it to be a troublesome process, as the precise tone that will be attained can hardly be prophesied with any certainty in the case of a large negative, and the actual tone cannot be seen until the slide is dry. Further than this, the process is with some plates rather slow one. It can, however, be reduced to a system for any particular brand of plates, and while recently working with such a system for use with Messrs. Wratten and Wainwright's recently introduced lantern plates, it occurred to me that a method of producing a warm tone by development of a freshly exposed plate should be equally practicable, and possibly less troublesome, in the case of a black-toned slide that had been bleached to a bromide or cyanide of silver, and on trial this supposition proved quite correct. It appears that if we produce a black-tone slide and then bleach it with potassium ferricyanide and bromide, we are amenable to precisely the same process of warm-tone development that in the ordinary way we should apply in the case of a bromide. The procedure is, however, far more convenient, and we can work in a good light, and development and exposure can proceed at the same time. I have not experimented very much with the process, and the procedure up to the present has been to compound a developer that will give the tone required by the ordinary method, and then apply it to the bleached slide and allow development to proceed in full light. Possibly it would be better to adopt the ordinary method of exposing the slide for a given time and then develop in a safe light. As a negative is used, the exposure could be adjusted with great accuracy, for it should be the same for a given colour for any negative. In any case, the method has given very satisfactory results, and the process can certainly be recommended with the attention plates referred to above. The toned plates should be fixed and well washed. They lose a little in fixing, but regain their original density on drying.

These experiments on toning lantern slides naturally suggested that the same procedure might be applicable to bromide prints, and on trial this proved to be the case. An exactly similar method was adopted, but in the case of the bromide prints I found that strong black-tone prints gave the best results. There seems to be a little difficulty in getting red tones on prints, but no doubt this is possible. Using a strong iron 10 rodinal developer with as much ammonium carbonate as could be got into it—the quantity seems to be limited in the case of this developer by the formation of a precipitate—on exposing during the whole period of development, I obtained browns and sepias not very different from those

generally expected with hypo-alum toning. They are certainly much better than the tones usually produced with ordinary sulphide toning methods, while the process is just as easy. It is quicker than hypo-alum toning, and might easily be carried out on a big commercial scale. It is only necessary to find out how far and in what way the tone can be controlled and the conditions that will give the most useful results. Whether fixing is necessary I am unable to say, but I recommend it as a desirable precaution. Much must, however, depend upon how nearly the process of development is carried to completeness. Warm tones can, of course, be obtained on bromide papers by long exposure and restrained development, just as in the case of lantern slides, but it is not easy to obtain good tones, and in any case the procedure is a very long one and somewhat uncertain.

Another developer that has given excellent results is hydroquinone, with ammonium carbonate in place of the usual alkali solution. The following formulæ have worked very well:—

A.—Hydroquinone	160 grs.	36.5 gms.
Potass. metabisulphite	90 grs.	20.5 gms.
Potass. bromide	20 grs.	4.6 gms.
Water	10 oz.	1,000 ccs.
B.—Ammonium carbonate	1 oz.	100 gms.
Water	10 oz.	1,000 ccs.

A mixture of equal parts of these two solutions forms a very useful developer.

As regards the bleaching solution, one consisting of 10 grs. bichromate and 5 minims hydrochloric acid in every ounce has given the most satisfactory results in my hands. After bleaching the prints are well washed, and are then immersed in the developer and allowed to develop in a good light. Development is slow at the start, but when it has once begun it progresses rapidly. The tone darkens as the time of development is prolonged, and this is one way of controlling the colour. Another is to modify the developer by varying the proportions of A and B. With two parts A, one part B, and one part water development is slower, and we can stop at a light red-brown tone. With two parts A and three parts B development is quicker, and a deep brown is quickly reached.

Very good warm browns are produced when potass. ferricyanide is the bleacher, while with the ferricyanide and bromide bleacher purplish browns are more readily obtained. When copper chloride is the bleacher black tones only are produced, which effect is somewhat of a mystery.

The density reduces a little in fixing, but it must be remembered that the tones become much darker on drying, and even if a print appears to have lost too much in the fixing-bath it will probably be all right when dry. Natural surface or glossy

papers give the richest results; matt papers are apt to appear rather muddy in the shadows, just as they do with sulphide toning.

It may be noted that the actual procedure adopted in this new toning process is open to unlimited variations, and the

range of tones obtainable is probably unlimited also. We use many different bleachers and many different developers, the only essential common feature in all cases being the use of ammonium carbonate either as the accelerator or in addition to the usual accelerator.

C. WELBORNE PIPER

SOME TESTED FORMULÆ FOR COMMON PHOTOGRAPHIC PROCESSES.

THE following formulæ can, from personal experience, all be recommended as reliable. In some respects they differ from the usual well-known formulæ; but there is a reason for the difference in all cases, and the modifications that have been made have all been devised to produce either more constant results or solutions with better keeping qualities.

Sulphite of Soda: A Stock Solution which Keeps Well.

As is well known, a solution of sulphite of soda will not keep very long, and very quickly becomes useless for such a purpose as the preparation of an amidol developer. The following solution will, however, keep a very long time. It can be relied upon for some months for any of the purposes for which sulphite is commonly used:—

Sulphite of soda	2 ozs.	200 gms.
Potass. metabisulphite	2 drams.	25 gms.
Water	10 ozs.	1,000 ccs.

These should be dissolved in water at about 90 deg. F., and, when dissolved, the solution should be raised to the boiling point and then allowed to cool.

N.B.—This solution is the one referred to as the "neutral sulphite solution" in the following amidol and pyro developer formulæ.

Amidol (Diamidophenol) Developer.

The following will be found to be an excellent developer for bromide paper or lantern slides:—

Neutral sulphite solution	1 oz.	100 ccs.
Water	3 ozs.	300 ccs.
Amidol or diamidophenol (added, dry)	8 grains.	1.8 gms.
Potassium bromide (10 per cent. solution)	10 minims.	2 ccs.

It will be noticed that this solution contains 2 grains amidol and $\frac{1}{4}$ grain bromide to every ounce of developer. This is a good strength for most positive processes, but for negatives the quantity of amidol can be doubled with advantage.

The advantages of this formula over others in which plain sulphite is used are, first, the fact that we take advantage of the keeping qualities of the neutral sulphite solution, and can always prepare fresh developer at a moment's notice by adding the dry amidol and the bromide as required. Second, that the mixed developer will keep better during use than the ordinary formula, and can be used for a greater number of prints in succession.

Pyro-Soda Developer.

Make up two solutions according to the following formulæ:—

A.—Neutral sulphite solution	14 ozs.	700 ccs.
Pyro (sublimed or cryst.)	160 grs.	18 gms.
Water to make	20 ozs.	1,000 ccs.
B.—Soda carbonate	4 ozs.	200 gms.
Water to make	20 ozs.	1,000 ccs.

Take equal parts A and B, and add two parts water.

This developer will produce negatives free from pyro stain, and 4 to 6 minutes' development at normal temperature with full exposure will yield soft negatives full of detail and well suited to enlarging. The advantages of the developer are

its cleanliness and the extraordinary keeping qualities of the A solution.

When stronger negatives are required, the developer can be made up by taking equal parts of A, of B, and of water, or equal parts of A and B alone can be used, this giving a developer containing 4 grains pyro to the ounce.

The mixed solution can be used for several plates in succession, if a little extra time is given for development in each case.

It will be noticed that in making up A solution 14 parts of sulphite solution must be added to 6 parts of water, which is equivalent to adding 7 parts to 3. If less sulphite solution is taken, a slightly quicker developer is obtained, but the result will show pyro stain in the lights.

It is as well to use freshly made neutral sulphite solution in making up the A solution if absolute freedom from stains is desired.

Rodinal Developer for Very Rapid Exposures.

Very brief focal-plane exposures are of necessity much underexposed, and the use of a very dilute developer involves a development of many hours—possibly twelve, or more.

A 1 in 40 rodinal developer containing $\frac{1}{4}$ grain bromide in every ounce will produce fairly good results in a comparatively short time, half an hour's development in a tank being sufficient for most ordinary cases, while an hour and a half will generally suffice in a case where the conditions are at the worst. The shorter time will suffice for a 1-250th second exposure made in a good light at an aperture of about $f/6$, while the other time should give very fair results when the light is very dull, other conditions being the same. A good result is considered to be one suited to bromide enlarging with an incandescent lantern.

Greater density than is desirable for this purpose will require still longer development.

The water used should be either boiled water that has been allowed to cool down or distilled water. The latter is best, but the former is quite serviceable, and far better than unboiled tap-water, which requires longer times of development.

Chromium Intensification.

This method of intensification has many advantages over the older ones with mercury. The risks attaching to the use of such a virulent poison as mercury bichloride are avoided. The process can be applied to lantern slides, or bromide prints, as well as to negatives, without introducing warm tones. The results are not affected by traces of hypo left as the consequence of imperfect washing, and the process can be repeated several times if extra density is required.

Make up the two following solutions:—

A.—4 per cent. solution of potassium bichromate	
= 1 oz. bichromate in water to make 25 ozs.	
= 40 gms. bichromate in water to make 1,000 ccs.	
B.—2 per cent. solution of hydrochloric acid	
= $\frac{1}{2}$ fl. oz. strong acid in water to make 25 ozs.	
= 20 ccs. strong acid in water to make 1,000 ccs.	

Separate solutions must be made, as a mixture of the two will not keep well.

For use with bromide prints and lantern slides, or with new

that only require a slight increase in density, about equal at given by one application of mercury and ferrous oxalate, equal parts of A and B and bleach the image in the mixture.

Then wash until all yellow bichromate stain has vanished a clean buff-coloured image is left: about 20 minutes in any type of washer will be enough for this. Then apply a developer containing no bromide.

The best developer is amidol or diamidophenol, but metol or quinone is also very serviceable. It is as well to use a developer of about twice the strength (i.e., half the dilution) of the ordinary one used for negative work. Exposure to light is not necessary, but the process of development can be hastened by placing it in a strong light; there is, however, a risk of over-acting in strong sunlight. The plate should not be exposed to anything but very weak light prior to covering it with the developer, otherwise development may be greatly delayed or prevented altogether.

After development, the plate is well washed and dried. The process can then be repeated, if necessary; but the increase in printing density is generally much greater than it appears to be when judged by inspection only, so a trial print should be made.

At the outset the image is seen to be very weak, the bleaching solution should be modified. Instead of taking equal parts of A and B, make up bleacher as follows:—

A	5 parts.
B	2 parts.
Water to make	20 parts.

This solution can only be used once, and must only be mixed before use, as it rapidly loses its bleaching power. The bleached image is treated precisely as described before.

Stains.—Stains may be produced by applying the process to perfectly fixed images, by undue exposure to light during printing the bleached image, by imperfect washing between printing and development, and by excessively strong light acting on the developer during development. If a plate is properly fixed, but not well washed, no stain will be produced if the developer is allowed to act long enough. If the solution turns brown from the action of the hypo, it should be replaced with fresh.

Sulphide Toning.

The usual method of sulphide toning bromide prints is to immerse in a solution containing potassium ferricyanide and sodium sulphide, and then treat the print with a solution of soda sulphide. The results are often unsatisfactory, and the following methods can be more strongly recommended:—

Old Sepia Tones.—Soak the print in water until limp, and immerse in following bath for six minutes, keeping dish in motion and print well covered all the time:—

Ammonium bichromate	1 oz.	50 gms.
Ammonium bromide	1 oz.	50 gms.
Water to	20 oz.	1,000 ccs.

Pour off this solution and rinse print once under the tap, then bleach in bath B:—

B.—Ammonium bichromate	$\frac{1}{2}$ oz.	25 gms.
Ammonium bromide	$\frac{1}{2}$ oz.	25 gms.
Potass. ferricyanide	2 oz.	100 gms.
Ammonia .880	1 dram.	6 ccs.
Water to	20 oz.	1,000 ccs.

When bleaching is finished, wash out yellow stain and treat the brown image left with a 5 per cent. solution of pure white crystalline soda sulphide.

Warm Sepia Tones.—Proceed exactly as before, with the exception that bath C is substituted for B:—

C.—Ammonium bichromate	1 oz.	50 gms.
Ammonium bromide	1 oz.	50 gms.
Water to	20 oz.	1,000 ccs.
Nitric acid (concentrated)	20 mms.	2 ccs.

If either B or C get slow in action, the former can be revived by adding a few drops of ammonia and the latter with a drop or two of nitric acid.

The mixed solutions will not keep well, but they can readily be made up when required if we keep stock solutions of 1 in 10 bichromate, 1 in 10 bromide, and 1 in 5 ferricyanide. The sulphide keeps best in a 1 in 5 solution, but cannot be relied on for very long.

An Improved Farmer's (Hypo-Ferricyanide) Reducer.

Many workers fail to make Farmer's reducer of hypo and potassium ferricyanide work satisfactorily, and complain that it affects the image unequally, and unduly increases contrast. They are further troubled by the speedy decomposition of the mixed solution. If, however, equal weights of potassium ferricyanide and ammonium bromide are substituted for the plain solution of ferricyanide, and if too much hypo is not used, there will be small cause for these complaints. The following is a good formulæ:—

A.—Potassium ferricyanide	1 oz.	100 gms.
Ammonium bromide	1 oz.	100 gms.
Water to	10 ozs.	1,000 ccs.
B.—Hypo	1 oz.	50 gms.
Water to	20 oz.	1,000 ccs.

One part of A to eight parts of B will give a reducer of a very useful strength for general purposes. Where very slight reduction is required, A can be diminished to half the quantity, while it can be increased if a strong effect is required. Care must be taken to apply the reducer only to plates that are either full of hypo solution, or else quite free from it. If the hypo has been only partially removed by washing, the reducer will have an uneven effect. When required only for the purpose of removing surface fog the plate should be merely dipped in the solution, and then be immediately held under the tap. Solution A keeps very well for a long time, but the mixed reducer will not keep, though far better in this respect than the ordinary formula.

BRITISH COLUMBIA AS A FIELD FOR BRITISH PHOTOGRAPHIC ENTERPRISE.

THE appearance of the Solomon Islands walking down Piccadilly or Fleet Street in a seedy top-hat and a smile would probably elicit a less favourable comment, or more comment of the other kind, than he would on his native soil. He would understand a little of the ridicule of an enlightened populace as he would the moral concern of the police. He would not at once comprehend why on Fleet Street he should be subjected to insults, or why on his native strand, beneath the spreading breadfruit trees, he could bask, happy in the admiration of the

dark sex, and the envy of his fellows. Other countries, other manners!—that's a fact.

For, indeed, I once read that in some of the South Sea Islands there used to be, and for all I know to the contrary there may still be, a brisk trade done in antiquated, damaged, and otherwise disreputable top-hats. At this time, I am not sure whether these art-savages even had the chance of other discarded head-gear, such as bowlers or wideawakes, caps or panamas. But if top-hats were the fashion, it is tolerably

certain that other styles would have been at a discount. Why they wanted top-hats, or what perspicuous beachcomber started the craze, I do not know, and it does not matter. But what does matter, and matters very much, is that they wanted them, they paid for them, and they got them.

And the moral of that is, as the Red Queen might have said to Alice, "If you don't supply the demand, you can't demand the supply."

* * * * *

Trade calls—by wire, 'phone, and mail; by mutual interest and tariff-rebates; by the thousand-and-one exigencies and economies of modern life—but only one thing is called to prosper, and that is the need supplied.

Now, if I have lingered over and elaborated, possibly *ad nauseam*, such an obvious truism, it is because that in the matter of things photographic English houses, as a whole, are not supplying Canada with the goods she needs. For three reasons: Firstly, because in many respects the exact needs of the country are not known; secondly, because the knowledge of how best to supply those needs is imperfect; thirdly, because although having the goods and knowing how best to supply them, they are unable to compete with Uncle Sam and his methods.

A Continent of Countries.

In the first place, the exact needs of the country are, in many respects, not known, because Canada, for all commercial purposes, is not a country, but a continent of countries. The conditions of the East and West are not those of the Middle-West and North-West. Extremes of temperature and water are the vogue. In the North-West Territories, for instance, the water is reported as exceedingly hard; but step over into British Columbia, and you have varying conditions of temperature and climate all the way to the coast, where the water is so soft at times and in places that after washing it becomes almost impossible to be rid of that soapy feel usually associated with unrinsed hands. Although in the interior of B.C. there is what is known as the dry-belt, in which Kamloops, a divisional point of the C.P.R., is situated, the coast climate is mild and something damp, as might be expected with a rainfall in the neighbourhood of forty inches in latitude 50 deg. The coast—and this properly includes Vancouver Island—is largely the resort in the winter of those who wish to avoid the rigours of the North-West; and although cold snaps occur, very low temperatures are the exception. Consequently, it is unreasonable to expect, within limits, the same work from the same emulsions on the coast as away up in Edmonton.

Water Supplies and Emulsions.

I could multiply parallels, but one suffices; and I would like to remind photographic manufacturers that hard and soft water affect their emulsions, not in the same way, of course, but to just as large an extent as hard and soft water affect tea. In the tea trade even Macaulay's schoolboy would have known that the contents of a packet of tea, priced and figured alike but taken one from each of two districts where the water materially differs, will be found to be variously blended in order to obtain as nearly as possible the same result, namely, the satisfaction of purchasers in both places. Is it too much to suggest that photographic manufacturers avoid sending goods where the quality of the water will be against them? The water of most localities may, if you know how, be improved for the purpose of infusing tea; this may also be done, to a limited extent, for chemical processes, but few photographers can be expected to take this precaution in the matter of washing-water, during which operation, for reasons more or less obscure, a blister-crop most usually makes its appearance.

Plate-makers have already taken some account of the heat their goods are likely to be subjected to. Hence, one firm will advertise that its plate emulsion is almost "special hard" for the tropics. Should not some inquiry be made into the water

of the district where makers intend to push their goods? If they know that their plates are liable to frill, and do not know how to remedy this in their manufacture, they should at least plump for a hardening-fixing bath. If they know that their paper is liable to blister, they should at least say something about a preference for the hypo-alum bath, and a caution against sulphiding. It is true that in many cases an alum bath occupies a position in the makers' published formulæ, but ever more stress should be laid upon its necessity in certain water localities, or the emulsion should be of such a character as to render such procedure unnecessary under all except extraordinary conditions. In this and other ways many disappointments would be avoided on both sides.

It is, however, to be noted that most photographers who do not know the name recognise the conditions, and know how to compete for them. On the other hand, it is up to the manufacturer, for his own sake, to make his wares as universally useful as science permits; that is, he must make the manipulation of his plates and papers as easy as possible, in order to checkmate the amateur who, having treated his products unfairly, proceeds to use them. He, at any rate, will not be bothered with them under the conditions he fairly or unfairly imposes, and thus becomes a patron of some other product which will have the advantage, in his eyes, of sustaining a reputation for results in spite of treatment which (to give him the benefit of the doubt) adverse circumstances may not enable him to better.

At the same time, I wish to convey no erroneous impression of the conditions prevailing on this coast, N.B., or anywhere else in Canada, any more than I would belittle manufactures which, having been pushed here, have fallen down on account of unfair treatment, general unreasonableness, or lack of patience on the part of the user.

To give a concrete instance, I give the figures from an official analysis of the water supplied to the city of Vancouver, which analysis shows the extreme softness of the water, due to the freedom from carbonates and sulphates of calcium and magnesium. This water must not be taken as an average of those of the Pacific Slope, since purity of water is affected by the atmosphere, soil, and general surroundings:—

ANALYSIS OF VANCOUVER CITY WATER.
December, 1908.

Colours	Clear.
Turbidity	Nil.
Reaction	Neutral.
TOTAL SOLIDS	2.52 GRS. PER GALLON.
Volatile	0.98 " "
Fixed	1.54 " "
Chlorine	0.42 parts per 1000.
Ammonia, free	0.001 " "
Ammonia Albuminoid	0.009 " "
Nitrates	0.07 " "
Nitrites	Trace.

In further indication of the account which requires to be kept of water conditions, the following may be quoted from the February "Bulletin" for the present year, issued by the Aurora Company in connection with its printing papers:—

"Our demonstrators have frequently called our attention to the great difference in water in various parts of the country (the States and Canada). There is being used for photography everything but salt water. Water in one locality will be found to be upon analysis just a little different from water in any other locality, due largely to the nature of the ground over which it flows or comes in contact with. If the water is contaminated to a great extent it will not produce a perfectly balanced chemical solution. Where water conditions are very bad all active emulsions used in the manipulation may be mixed with water purified by boiling and then allowing it to settle. The importance of good water cannot be over-estimated, as the impurities found in some water make a perfect chemical balance impossible, and the

mical balance of any formula is destroyed the results obtained by the use of same are bound to suffer." part from theory, for instance, there are at present being sold here two English brands of plates in particular, one of which is, according to some accounts, perfectly satisfactory proving a hardening fixing-bath is used, according to others unsatisfactory, which statement of opinion I have in one or two cases traced to the fact that the user prefers the simplicity of the simple hypo fixer. For the other brand of plate, however, as far as my own experience and inquiries are concerned, a special fixer appears to be generally unnecessary; and, in the case of photographers whose drying arrangements are effective, it is suggested that the acid fixer has little practical advantage over the plain hypo bath. After all, there is no real advance apart from simplicity, as every improvement, photographic and other, testifies. But in all this there is nothing new; moreover, in every case the individual decides what plates, papers, and formulæ suit him best. The most a manufacturer can do is to render his goods generally applicable as he can to the conditions he knows exist, and leave as little room for accidents as may be. If it were not so, to what otherwise attribute the magnificent business built up by the Kodak Company, known over the whole of this continent as "The Trust." Catering so extensively for the amateur, every new move is in the direction of simplicity of methods and machines whose use points to the elimination of all probable error; of supplying the exact needs of the country; of reducing all processes to a rule-of-thumb and leaving as little

as possible to the barbarous imagination of the unlearned community of beginners.

Simplifying Working Conditions.

But the "Trust" is not confining itself to the amateur trade. It has invaded for many years tentatively, and latterly forcefully enough, the ground previously covered, but in most cases neglected, by other firms. Like Homer, they also nod occasionally, as when, for instance, they list goods at retail prices in the Old Country cheaper than the professional can buy them in this country wholesale. But their wares are good, and they have boasted that if they are not, and if they do not win out on quality, let the best man win. For instance, the "Seed" plate, almost universally accepted in Canada and the States as the best plate, is put out with formulæ which, for the professional, at any rate, are a model of excellence and caution. You may expect this of the "Trust." They have the goods and they have the ground, and they have the ground because they know it and supply its needs. But they only exist as a "Trust" owing to a lack of competition. If they cannot buy out the competition, failing trade agreements, they, as other firms of other trades, must cut prices and give discounts, and this they are beginning already to do, not extensively, but, again, tentatively; but only because they know the ground is worth having, and not because they have large stocks of unsaleable goods to unload.

L. HAWES.

(To be continued.)

TANK DEVELOPMENT WITH ACID DIAMIDOPHENOL.

TANK development has been so much in the air of late that I feel there is no need to apologise for adding my further experiences with it to the mass of information already existing. When writing on stand development in these pages some months ago I mentioned the satisfaction amidol had given me on one occasion when developing a considerable number of plates in dipping-baths, and although this was some ten years ago, I have, curiously enough, never used amidol in a similar manner since, until last autumn. Having had a long experience of tank development with pyro-soda, I elected to try diamidophenol by way of a change, and also with the object of finding out whether I was missing any more advantageous method by adhering to pyro-soda.

The formula I made up was:—

Sodium sulphite	500 grs.
Potassium metabisulphite	100 grs.
Potassium bromide	10 grs.
Diamidophenol	50 grs.
Water	40 oz.

Three dipping-baths were used, each containing 40 oz. One of these dipping-baths had 400 grs. of sodium sulphite and 200 grs. of potassium metabisulphite in place of the quantities given above, and any plates suspected of over-exposure were first developed in the more restrained bath. The time of development was the normal solution necessary to give good printing density averaged about ten minutes.

I used this formula continuously in developing my landscape plates last autumn, and could find no single fault with it. In all things considered, more reliable than pyro-soda. The negatives were of excellent quality and gradation, and no developing marks of any description ever made their appear-

ance. When using pyro-soda for tank development I have occasionally been troubled with transverse marks of slightly less density than the rest of the plate; these crossed the plate towards the top and bottom of the tank, but were so faint that they showed only in the sky portion of the negative. I made every endeavour to trace the cause of them, but without success. As I have said, it was only occasionally they troubled me, and after one plate developing with these marks the plates following would be quite free, although developed in the same bath. With acid diamidophenol I never saw anything approaching uneven development.

The practice of acidifying amidol and diamidophenol solutions has undoubtedly improved their usefulness in a very marked manner, not only by increasing their stability in solution, but by the ready way in which rapidity of development may be regulated. Personally, I regard either acid amidol or acid diamidophenol as the best all-round developer one can possibly use.

Historical Note.

I would like to take this opportunity of drawing attention to the fact that acid amidol solutions were advocated and used by the late A. R. Dresser some sixteen or seventeen years ago, and he published a formula containing amidol and potassium metabisulphite in the pages of the "British Journal of Photography," or in the "Almanac." He used rather a large proportion of metabisulphite to secure keeping in solution, and neutralised it at the time of development to the extent he thought desirable. It is interesting to note that he prognosticated a great future for amidol as an all-round developer, and especially as a developer for bromide paper.

G. T. HARRIS, F.R.P.S.

HIGH-CLASS SECOND-HAND APPARATUS.—Messrs. Adams and Co., 1, Charing Cross Road, London, England, have opened a new department for the sale and exchange of high-class photographic apparatus. The aim of the department is to be able to supply first-

class apparatus only, thoroughly examined, so that it may be purchased with confidence. At the same time Messrs. Adams will be pleased to exchange well-known good instruments for their own distinctive manufactures in cameras and other apparatus.

PHOTOGRAPHIC CONDITIONS IN JAPAN.

THE progress of commercial and professional photography in Japan has been very rapid, and has taken a firm hold of the people. Portraiture (including groups) is the principal phase of it, and I should say that there will be nearly as many professional photographers in the moderate-sized and large towns of Japan as we find in England; but they do not exist in the villages at all. Quite fair average work is done, but almost entirely in silver, and the work is small, being principally confined to C.D.V. and cabinets, and a fair number of bromide enlargements are made. A few of the higher class men in cities like Tokio, Kyoto, Osaka, Kobe, and Yokohama work in platinum, but carbon is almost unknown, though during the last two years ozobrome has taken a place. It will be seen, therefore, that quite a large quantity of photographic material has been required, and until quite recently all has been imported, principally from England, Germany, and the United States. Now an attempt (and it seems a serious one) is being made to produce dry-plates in Japan, but so far none are on the market; but I believe engineers and experts from England are now in Japan superintending the erection of the factory and machinery, which I am told is the joint concern of the large firm of Asanuma and several of the leading photographers. It may be interesting to trace what has been done in the dry-plate way in Japan. The first attempt was made by Mr. Yoshida many years ago in Tokio, but it had no success: this was, of course, in the days of hand-coating. Then Mr. Burton, in conjunction with Mr. Kajima and others, started a little factory; but this was never commercially successful, and only very slow plates were ever made, and it closed: this was some four or five years before Mr. Burton's death. Then it is reported that the large photographic house of Konishi made an essay, but the goods, I think, were never put on the market. So up to the present every plate has been imported, and Japan must have been an excellent market for England principally, the plates used being Marion and Ilford mostly, but later the American "Seed" plates have taken a firm hold. It is very questionable whether plate-making in Japan will be a great success; certainly there will be over three months in each year when it will be practically impossible to work on account of climatic conditions. Though papers are now being coated in Japan, yet still there is a very large import. Konishi is the principal paper-coater. He makes a paper called "Celloidin," a silver paper, usually toned with platinum; and another silver paper called "Pullatype," to imitate platinum; also P.O.P. No bromide is yet made, so all is imported. It is said that bromide paper will be produced at the dry-plate factory above mentioned. Platinum papers are also made, but the quality leaves something to be desired. The first attempt was made in Burton's time, with salts imported from the Platinotype

Company; but this plan soon ceased, and the salts now are made in Japan. There is still one branch of paper construction to be mentioned. Vast numbers of about 12 by 10 scapes have been produced by one or two firms for colouring and to be sold to the foreign tourists who pass through Japan in such numbers each spring and autumn. This trade is a very large one, and the prints were made entirely on albumen paper; this is now being replaced by collotype prints, and for the better class work bromide paper is used. The colouring is very skillfully done in aniline colours. The tourists take also large numbers of coloured lantern slides, which are made principally by the wet collodion process. The whole of this trade is in the hands of a few firms like Tamamura and Kimbei, of Yokohama, and Tamamura, of Kobe.

Chemicals.—Some of these are made in the chemical works in Osaka and Tokio, but the bulk are imported almost entirely from Germany.

As to lenses, Dallmeyer and Ross held the field here till the advent of the Jena lenses, and are still very much used. Zeiss lenses are now everywhere, and the Goertz follows. The firm of Krauss and Co., of Paris, had the enterprise to establish a branch house in Tokio years ago, and so one sees many Krauss-Zeiss lenses on the market and in use.

Mounts are, I believe, all made in Japan, of course, from imported materials, or mostly so.

I think these remarks cover most of the commercial ground, and it will be seen that Japan is still a good field for an English manufacturer. I think it has not had the attention it should have: it would pay the large firms to send their traders here.

The amateur side is not so favourable. The Japanese have not been bitten by the snapshot fever. The number of photographic societies is small, and though time has not permitted me to get exact figures, yet in Kyoto there are three societies with fifty to sixty members, about the same in Tokio, and about six other societies scattered in the largest towns throughout the country. Their work is nearly all in silver, and some of the best has been illustrated in, I think, "Photograms of the Year" from time to time; but the Japanese amateur has not struck out any special line for himself, as one would have expected from the very original art that the country possesses.

Colour photography has found very few votaries (indeed of course, here I am excluding the foreigner in Japan)—two or three in Tokio, whose work I have not seen; one in Kyoto, Mr. Nakai, who has done a few marvellous things. Mr. Nakai, though a professional, is as keen in this as any amateur, and is a very skilled worker in all branches.

THOMAS B. BLOW

MOUNTS AND MOUNTING OF TO-DAY.

Up to about five years ago one could think of photographic mounts without the question of the method of mounting entering one's mind—but the advent of the adhesive dry-mounting process opened up such wide possibilities as to gradually completely alter the style of mounting in good-class studios. So much so has this been the case that more change has taken place in the mounts used by professional photographers during the past five years than during any similar period. And it may, therefore, be useful to Colonial readers in particular, to describe the chief general feature of these changes,

and then to particularize somewhat some of the styles in commercial mounts which are now enjoying a large measure of application.

Limp Mounts.

Dry-mounting has rendered commercially possible the use of a limp paper mount. Amateurs, together with a very few of the more advanced professionals, had, indeed, used such a mount, but the slight amount of adhesion that could be obtained without cockling the mount militated against its general use. A good

unt was, of necessity, a fairly stout one—and thus it was that new method has been made the most of by going to the other extreme, and one has seen Japanese vellum paper taken up by the majority of the leading men. The machine used for the mounting could also be used for making a plate-mark impression, and, for the time, it appeared as though the mount people were merely to act as agents for the papermakers.

The Cosway Style.

Just about the same time as dry-mounting came into general use the so-called Cosway style of printing was introduced. This should be explained for the benefit of those who have not yet seen it, is effected by the use of negatives of borders similar to designs wherewith Cosway and other portrait painters of his period surrounded their pictures. By the use of masks these border negatives (which are obtainable, by the way, from the Photochrome Company) are printed on the one piece of paper—generally in sepia, platinotype, or carbon. The double prints thus made are most frequently mounted on Japanese vellum and signed, either in pencil or else by means of an embossing die, with the photographer's name.

And a Modification

It will readily be seen that such a method had two disadvantages. One, that it tended to a general sameness in the shows of competing photographers, and the other, that there was too much business in it for the mount manufacturers! The latter, therefore, led to suggest that if the border design were made a part of the mount instead of a part of the print, it would save the double printing, and, moreover, the photographer's name and address could, if desired, be incorporated in the design. These mounts, either printed in copperplate or in litho imitation thereof, are offered by most of the mount manufacturers at the present time, though in the full dark variety are perhaps not quite as popular as they were. They are obtainable printed either in sepia or a cream toned paper—or in black on a white paper—generally hand-made, and frequently left with the rough deckle edges. The margins are generous, a cabinet print being placed on a 12 by 10 paper—and, what is specially praiseworthy, the manufacturers have at last realised that the proper place for a print is slightly above the centre of its mount, and the design has been printed accordingly.

Folder or Portfolio Mounts.

Resulting from the use of the limp paper mount is the folder or portfolio cover, enclosing the photograph. Photographers in a certain way of business have blocks from specially drawn designs embodying their names, printed on the covers, but the smaller man has offered to him ready-made designs wherein his name can be printed in ordinary letterpress type.

Art Paper Mounts

The use of Japanese vellum paper as a mount was soon followed by that of "art paper"—why photographers term it thus is a mystery; the printer and papermaker know it as "cover" paper. These papers, chiefly of Transatlantic origin, come in attractive neutral colours in many shades of brown, grey, and green—and also with surfaces of varying texture. They were used by amateurs for the mounting of pictorial photographs before they were adopted by professionals; but dry-mounting has made them available for commercial use, and they are now deservedly popular. The papers are sometimes used singly, but more frequently two papers are used, one to give a tint around the photograph similar to the dia-tint paste-down of the old-fashioned plate-sunk mount. So successful have been these mounts employing two shades of paper that at least several manufacturers are producing them "ready-made," so as to save the photographer the trouble of making them himself.

Other Mounts.

Although the above described mounts are now in general use, it must not be thought that the older forms are obsolete. On the contrary, new designs are still being brought out, and designs, too, that are in accordance with the desire for a plain and tasteful setting for the photograph. Gold is now very sparingly used—even the bevels of mounts are coloured to harmonise with the mounts instead of being gilt, as they would have been up to but a few years ago.

In order to convey to distant photographers an impression of

the styles in mounts for better-class photographs now available, a representative of the "British Journal of Photography" paid a visit to some of the leading houses in the mount trade. It was seen that the universal tendency is towards mounts without ornament, but beautiful in themselves. Any decoration is of the simplest kind; colour and texture of the mount-board are almost wholly relied on to supply the really charming effects now obtainable. It is general now to find the space for the print a little raised above the centre, thus avoiding the dropped appearance when the print is actually central in the mount. There is a great vogue for mounts which in design and substance serve also as frames. Whilst circle prints are fast going out, ovals and mounts for oval prints are in great favour, and many styles are made up for both oval and rectangular pictures, in each of which varieties they are frequently also made in combinations of grey and white for black prints, or cream and brown for sepias. As regards the tendency to light or dark in the better-class mounts, one large house with every means of testing the pulse of professional use, described light mounts as in rather greater favour than dark boards. From these general impressions we may turn to particularise, premising our remarks by the intimation that every mount we refer to is one of some distinctive style or special merit; none are of the cheapest kind.

Messrs. Marion and Co., of 22-23, Soho Square, London, have been mount manufacturers for so many years that it was of especial interest to observe the newer styles of their production. In almost every mount of theirs, and of other firms which we shall mention, ample margin is provided all round the print, more at the bottom, for the sake of avoiding the dropped appearance.

A very popular cream mount with plain rectangular plate-mark enclosing a rectangular or oval design printed delicately in sepia is provided in Nos. 2,096-2,108. No. 2,206, with pebbled margin and crinkled edge, is a little less formal. Nos. 2,162-4 are 10 x 8 mounts for "square" or oval cabinets, the only decoration being an embossed plate-mark of simple design, which looks well both in matt, white, and brown board. Nos. 2,024-32 are in rough white with a plain moulded plate-mark and bevelled edges, made for oval, circle and "square" prints and very delicate and nice. No. 2,310 is a similar but more expensive mount with rounded corners and moulding-like embossed plate-mark.

"Antique" paper mounts with the natural rough edge and plain plate-mark (Nos. 1,772 to 1,780), Messrs. Marion still find popular for good work, though they are not cheap. No. 1,796 is a pale buff mount of this class. For dark "Antique" papers, e.g., No. 1,980-1, sold about 12 x 10 for cabinet prints, there is still a large call, though now the "linen surface" mounts in dark (No. 2,195), medium (No. 2,149), and white (No. 2,144) are coming in and give very artistic effects. A mount of frame character is No. 2,187, also of linen surface, with embossed centre surround for the print and bevelled coloured edge. No. 1,890 is a board of similar substantial weight with embossed dark edge for the print, oval, circular, or "square." No. 2,212 is in like style, but narrower shape and linen surface. In folder mounts they have some most harmonious designs, numbers of linen-surface papers, with paper inset of natural edge and with attached thinner paper for the print. Very dainty are the No. 1,990 dark covers with light inset board bearing medium tint extending a little over a plate-mark. These latter mounts are supplied separately, Nos. 2,060-67, for "squares" and ovals in a series of sizes. Our references to Messrs. Marion's excellent series must close with that to No. 2,033, a very dainty folder with light inset mount bearing delicate design.

Messrs. Houghtons Ltd., whose entrance into the mount trade as universal providers but a year or two ago has set them right abreast of the new styles, showed to us a series of boards embodying a frame effect. They (No. 9,002) are made up in three colours, grey, brown, and buff, and provide a neat margin of colour round the print and a similar band, with bevel to match, round the edges of the mount. In the series No. 7,003 (brown, buff, and light and dark grey) the print gets the same neat border, whilst the edging of the mount takes the form of a moulded corrugated border.

In the No. 7,018 series a somewhat plainer but quite as effective style is adopted, the space for the print being plate-marked in place of being provided with a different tint. The outside moulded border harmonises very nicely with the green, white, brown, or buff board. Still another variety is provided by No. 7,002, in which the moulded border surrounds the print (oval or "square")

immediately, the outside edges of the mount being bevelled to match and the corners rounded.

In thin vellum effect mounts, either with plain plate-mark or with a neat design within the plate-mark, series Nos. 8,005 and 8,006 are very nice indeed, whilst in folder mounts of "art" paper with inset and tissue, the 8,010 series of Houghtons contains some very choice varieties. This firm also supplies a very small and choice selection of mounting papers (the "Ruskin") sold singly or made up into mounts.

The firm of Jonathan Fallowfield, 146, Charing Cross Road, London, has long been a leading house for mounts, and its recent styles in white canvas-surface and thin mounts, as also in portrait mounts with moulded tint border round the plate-mark, are deserving of notice. This well-known house further makes a specialty of the midget and smaller slip-in mounts as used for the very small sizes of pictures made with the Fallowfield "Multi-secto" back. These they issue in an enormous series of sizes, shapes, and styles.

Messrs. L. Trapp and Co., Milton House, Chiswell Street, London, E.C., make a special line of art mounting papers, one notable series of which is the "Duplex," the two sides of which, as the name indicates, are of different tints. They are very choice

linen-surface boards. "Cosway" mounts in light and dark figure in four varieties, a light one of which (No. 1) we speak like. The "Tokio Vellum" mounts with bevelled plate-mark a most pleasing surface, whilst in the "art linen" papers (Nos. 1 to 4), the No. 3 (light brown) presents a very handsome appearance.

Messrs. Trapp's "Empire" mounts are made in six tints (Nos. 1 to 6), a dark green) and of linen texture, with a space of different for the print, and a similar border to the mount. In folder mounts, too, the firm's linen-surface and white papers are to excellent effect, e.g., the "Gainsborough" series.

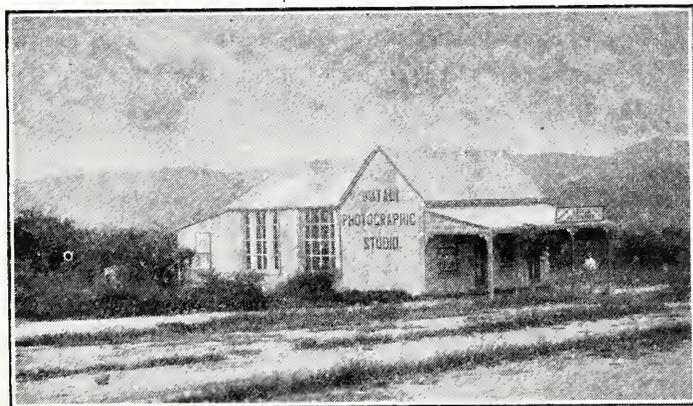

Lastly, we should not omit to mention the folder mounts of Messrs. F. E. Jones and Co., 22, Gray's Inn Road, London, which are up with very nice regard indeed to the harmonious blending of the tints and the effective display of the photograph. These particular mounts have the inset paper, as also the tint paper attached to it, with their natural edges or may be had without this rough edge at a somewhat lower price.

But our notes have already over-run the limits of their scope even though we have had to pass over mount houses such as O. Sichel and Co., 32, Bunhill Row, London, E.C., Carl Ernst and Co., 27-31, Earl Street, Finsbury, London, E.C., both of which should be included when making inquiries for mounts.

SOME PLACES WHERE THIS COLONIAL ISSUE GOES.

[Thinking that photographs of one or two establishments which will receive this "Colonial and Foreign" issue of the "B.J." would be of interest, we recently addressed a few requests to houses taken at random from different sections of our list. We are able to find space for some of the views sent in reply, and for some extracts from the letters which, in almost every case, have expressed the writer's satisfaction at having the British photographic market, as it were, brought to his door.—Eds. "B.J."]

"We are practically on the fringe of Empire," writes Mr. J. M. Mein, of Main Street, Umtali, Rhodesia, "and far from the latest improvements. Nearly all my portraits are done in C.C. paper,

Studio of J. M. Mein, Umtali, Rhodesia.

which, I find, gives most satisfaction. Our chief difficulty is the intense heat—125 deg. to 130 deg. F. in the studio."

Another Rhodesian reader, Mr. L. F. Moore, of Livingstone, in

Establishment of L. F. Moore, Livingstone, N.W. Rhodesia.

addition to his business proper of dispensing and photographic chemist, is auctioneer, stationer, tobacconist, an official of the High Court of N.W.R., and editor and proprietor of the only weekly

paper of Barotzeland and N.W. Rhodesia. He writes: "So far as I know, I am the only dealer in this territory in photographic goods. My chief business is developing and printing. Films are cheap in use; plates do not amount to 10 per cent. of the whole. But the films perish quickly in this atmosphere—very humid from November to March, desiccatingly dry the other six months. We could do with a good line of carton, not too expensive, developers which will solve quickly. Also a good dark-room lamp, more portable than the hock-bottle pattern

"My trouble in dealing with direct English firms is that it is not always possible to make up an order which justifies trouble and expense of shipping, and therefore we have to deal with the coast Bulawayo. We should prefer to deal direct, and I suggest the

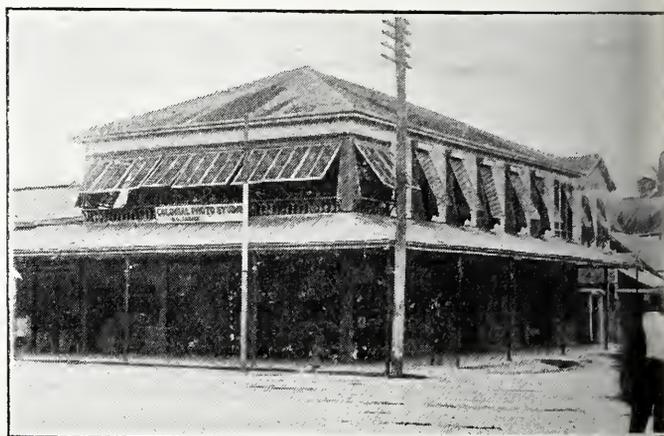

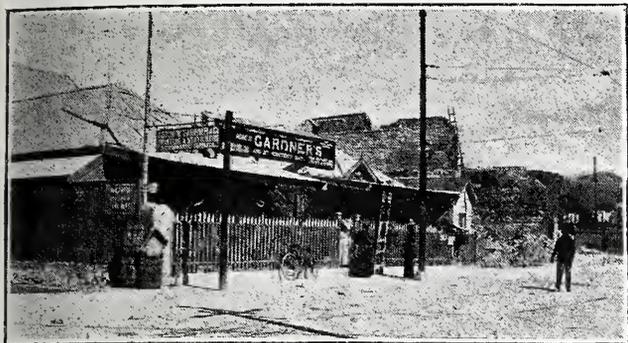

Photo-Stores of Q. G. Jardin, Georgetown, British Guiana.

pointment of an agent at the coast, who would receive and forward both orders to the maker and goods from the maker, and thus reduce freight charges to the minimum."

From Georgetown, British Guiana, Mr. Q. G. Jardin sends a photograph of his "Colonial Photo. Stores," where he has been established some twelve years. The only plates used are Ilford "Ordinary," "Empress," "Special Rapid"; P.O.P., also Ilford bromide papers, Wellington. Much self-toning paper is used. Films are very much asked for, but no one imports them, on account of their rapid deterioration in the climate. If imported in small supplies by every mail a trade might perhaps be done."

In Kingston, Jamaica, the photographic department of Messrs.

V. Gardner and Co. is in the charge of Mr. A. Hitchins, formerly of Marion and Co., who writes that his firm's chief trade in the West Indies is in Seeds and Ilfords. He suggests the advisability of a firm supplying with every box of plates sold hints and directions for their use under the trying conditions of the tropics. The photo-

Temporary Premises of A. W. Gardner and Co., Kingston, Jamaica.

graph shows the temporary place of business of his firm during the rebuilding of the store wrecked in the earthquake. As evidencing, however, the business done in photographic supplies, it may be mentioned that Messrs. Gardner provide dark and enlarging rooms for amateurs, institute instruction classes in general photography and special branches such as photo-micrography, and aim to make their office a rendezvous of amateur photographers in the West Indies. As a matter of fact, to come nearer home, we can spare space only for a reference to the house of Collis and Williams, of Valletta, Malta, founded in 1890 as a chemist's, and now in the proprietorship of Mr. A. L. Barrett. The firm has supplied photographic goods for the past twenty years, the makes being almost entirely British. "Maltese professionals," writes Mr. Barrett, "appreciate the soundness and reliability of British-made goods. With amateurs (who are chiefly English and migratory) the trade is in cameras of the most portable type, especially for roll films. Soldiers and sailors who do portrait work for their regiments and ships launch out into stand-cameras of portable design. There is little call for sundries which are not necessities. Some English manufacturers make the mistake of appointing a single photographic dealer 'sole local agent.' Professional jealousy prevents other dealers passing their large orders through such an agent. They therefore encourage other makers to their utmost, and when they have to obtain the taboos they find themselves charged full retail price, or nearly so, and have the feeling that probably the 'sole agent' is working off his oldest stock for their benefit, or else they find that the 'sole agent' is so fearful of old stock that he only holds enough for his own wants and cannot supply dealers."

THE PROFESSIONAL PHOTOGRAPHERS' ASSOCIATION. ANNUAL REPORT.

The following is the report of the Committee of the Professional Photographers' Association adopted at the Annual General Meeting reported in our last issue:—
 There have been sixty-five admissions to membership during the year, but there have been fourteen losses through resignation or members having removed, leaving no address, and there are twenty-two names of members on the list who are owing last, as well as this year's subscription. According to past experience, a considerable proportion of these will still be in default at the time of taking up of the list for the new "Handbook," and will have to be omitted.
 The prevailing depression in trade has naturally severely affected professional photography, and in many cases where the subscription is more than twelve months in arrear it is probable that the member has given up business without informing us of the fact, and our communications are retained by his successors, and not returned to us through the post as they should be.
 A feature of the year is the increase in proportion of applications for membership from photographers in business in India and the Colonies. Although obviously members over the seas are not able to avail themselves of some of the advantages of membership enjoyed by home members, as some compensation the Committee con-

sider it their duty to give their assistance to such members in directions that in the ordinary way would be outside the scope of a trade association, and, taking into consideration the difficulties under which many photographers in distant parts of the Empire have to conduct their operations, have instructed the Hon. Secretary to include as reasonable matters for assistance questions which strictly fall within the technical rather than the trade side of the photographic business.

The Committee have not relaxed their efforts for the suppression of the free-enlargement system and other canvassing systems of hardly less objectionable nature; but, although in many cases the advice and assistance given to our members have been the means of paralysing the business for a time in a locality, many of the cases brought to the notice of the Association, where there has been a reasonable prospect that proceedings would be successful, and where we were quite prepared to bear a large proportion of the costs, have fallen through entirely on account of the impossibility of inducing those swindled to come forward and give evidence. These frauds are generally perpetrated on people in humble life, who refuse to come forward either on account of being ashamed of acknowledging their folly or from a natural fear of anything to do with law and lawyers. As one of the most efficacious methods of advertising the nature of the fraud is the report of a prosecution or an action in the County Court in the local press, the Committee urge upon members the importance of reporting to the Hon. Secretary at once any good case they may hear of where the injured person is willing to give evidence, and where, with the assurance of a contribution from the Association, there is a chance of a successful prosecution.

The Committee note with satisfaction that a number of the professional photographers at Blackpool have formed a local Association for the purpose of dealing with a local matter affecting their interests that could not be effectively dealt with except by local action. Similar local grievances exist in many towns, especially seaside towns, that could be equally well attacked if the photographers of the town acted together, and it is quite certain that such practices as the free-portrait swindle could be rendered unprofitable in any locality by means that are available and might be adopted if the local photographers could be induced to act together. The Committee commend the example of the Blackpool photographers to the members.

The Committee have had occasion to issue impressive warnings to members in regard to dealings with advertisers in the technical newspapers of secondhand apparatus where the amount for the article advertised has to be prepaid, or where in other ways the advertiser has his customer at his mercy, but, in spite of these warnings, an increasing number of cases is brought to our notice where our members have failed to obtain redress for their grievances without recourse to law. It is usually found that even when the law provides a remedy, the circumstances of the case are such that it is quite impracticable to take proceedings owing to the cost and trouble necessary to incur being out of proportion to the amount involved.

At the invitation of the Newspaper Society, it has been agreed to hold a conference to go into the question whether some better understanding could be arrived at with regard to the dealings of the Press with photographers, and especially with regard to the question of payment for unauthorised productions. It is hoped that some arrangement is possible that will be advantageous to both sides, particularly in the direction of preventing the necessity of appealing to law in matters that should and could without difficulty be made subject to custom.

The draft of the proposed new Copyright Bill, promoted by the Artistic Copyright Society has now been issued in its completed state, and has been printed *in extenso* in THE BRITISH JOURNAL OF PHOTOGRAPHY. A comparison of this with the original draft which was also printed in the "B.J." will bear testimony to the success of the efforts of our Copyright Sub-Committee in securing reasonable copyright conditions for photographers.

The Association's work in connection with the matter is at an end, but, should the Bill become law, as the provisions are so different from those of the present law, it is reasonable to anticipate that the Office of the Association will have a very busy time in assisting members to grasp the new principles, and in helping those who have gone astray through not doing so.

The Insurance arrangements of the Association with the Fine Art and General Insurance Co. continue to be taken advantage of, the number of policies against Fire and Employers' Liability taken out by members being about 240, the annual premiums being approximately £200, and the commission of 5 per cent. allowed us by the Company helping our funds to the extent of nearly £10.

The thanks of the Association are due to the Royal Photographic Society for allowing the meetings to take place at their house, and to the Editor of THE BRITISH JOURNAL OF PHOTOGRAPHY for publishing notices, reports, and other information relating to the Association. The Committee also wish to express their indebtedness to the Hon. Solicitor, Mr. Percy E. Marshall, for valuable assistance rendered.

By order of the Committee,

ALEXANDER MACKIE,

Hon. Secretary.

89, Albany Street, London, England.

Patent News.

Process patents—applications and specifications—are treated in "Photo Mechanical Notes."

The following applications for patents have been received between March 8 and 13:—

CINEMATOGRAPH-PHONOGRAPH.—No. 5,528. Combined cinematograph and phonograph for (a) recording, and (b) reproducing movement and sound simultaneously. Arthus W. Deurance, Teesdale Cottage, Elms Park, Loughborough.

CINEMATOGRAHS.—No. 5,554. Improvements in the manufacture of ribbons for the projection of living or moving pictures. Sherard Osborn Cowper-Coles, 82, Victoria Street, Westminster.

STUDIOS.—No. 5,614. Improvements in and relating to photographic rooms, studios, and the like. Antoine Bogey, Andre Guggia, and Joseph Lambert, 18, Southampton Buildings, London.

CINEMATOGRAPH-PHONOGRAPH.—No. 5,682. Improved means for securing synchronous movement in moving-picture and talking-machines. William Cecil Jeapes, 55, Chancery Lane, London.

DISPROPORTIONATE PHOTOGRAPHS.—No. 5,736. Apparatus and means for making disproportionate photographs. John James Wright, 237, Eastbourne Avenue, Gateshead.

COPYING.—No. 5,801. Improvements in photographic copying machines. Paul Hamburg, 65, Chancery Lane, London.

CINEMATOGRAHS.—No. 5,945. Means for taking and exhibiting cinematograph pictures. Otto Pfenninger, 105, Hythe Road, Brighton.

COMPLETE SPECIFICATIONS ACCEPTED.

These specifications are obtainable, price 8d. each, post free, from the Patent Office, 25, Southampton Buildings, Chancery Lane, London, W.C.

The date in brackets is that of application in this country; or abroad, in the case of patents granted under the International Convention.

Owing to the large demand made upon our (increased) space this week by the reviews of new apparatus and materials we are compelled to hold over the usual descriptions of articles or processes of which the patent specifications have just been published.

New Trade Names.

PERFECTA.—No. 301,963. Photographic cameras. The Thornton-Pickard Manufacturing Co., Ltd., Atlantic Road, Altrincham, Cheshire.

New Books.

"A BOOK ON LIGHTING, IN STUDIO AND AT-HOME PORTRAITURE."—There are so few books on the lighting of the sitter that this new work by M. Klary, a well-known photographer of Paris, should be welcome, since it explains by means of plenty of diagrams and examples, the methods which the author has used with much success for years past. The instruction is concise and to the point, and the volume is obtainable, price 6s., from Messrs. Marion and Co., 22 and 23, Soho Square, London, England.

Commercial & Legal Intelligence

NEW COMPANIES.

AMERICAN BOUDOIR STUDIOS, LTD.—Capital, £1,000, in £1 shares. Objects: To take over the business of art photographers carried on by H. O. Dean and C. Clark, at 119, Upper Tooting Road, S.W., the American Boudoir Studios. Private company. Registered office, 119, Upper Tooting Road, S.W.

Correspondence.

MR. W. H. SMITH'S "SHUTTER SPEED" RECORDER.

To the Editors

Gentlemen,—I am afraid Mr. A. W. Everest's suggested modification, though distinctly ingenious, would not be found practicable. I gather the idea is, that the spreading action of the two brushes would be roughly proportional to the opening of the shutter, and the amount of air consequently passed. Assuming such spreading action would occur, the method has disadvantages. The brushes would have to possess resistance to opening or they would drive widely apart at the first impact (my own impression is they would merely flatten on the drum), and a fairly strong current of air would be necessary, involving friction between the sector-leaves and probable slowing of speeds.

Mr. Everest also infers that in Mr. Smith's model the reading will be less by the fraction of time occupied by the inked indicator in reaching the drum, but it is doubtful whether this would introduce error. A column of air is set in motion, and the "lag" of the indicator on completion of the exposure would probably introduce an error in the opposite direction. Both would be infinitesimal; with a small air-orifice brought down centrally, no resistance to the free action of the sector-leaves can occur, except momentarily at the beginning and end of exposure. The air-pressure required, moreover, is very small.

The suggestion made to allow the brush to be always in contact with the drum—readings being secured by a shift of its position—has been already thought of, and is well worthy of attention. Pressure of other matters has prevented Mr. Smith from arriving at the final form to be given to the apparatus. From its simplicity and ease of manipulation it is most certainly well worth working out. It does not pretend to give "efficiencies"; to ascertain these the photographic method appears to be the only one at present feasible. If, however, characteristic diagrams of any particular type of shutter at various speeds are once found, it would be sufficient in subsequent tests of the same type to obtain records of the speeds only.—Yours truly,

E. A. SALT.

THE BOGUS COUPON GAME IN TORONTO.—The "Toronto Globe," of March 3, announces that the first arrest in a move on the part of the police against a number of alleged dishonest photo-coupon agents who have been a source of considerable trouble to the public and photographers during the past month or so, was made when Howard Leadley, alias "Hub" Henry, of 176, Maria Street, West Toronto, was taken into custody on a charge of fraud preferred by John A. Lord, photographer, at 386½, Yonge Street. Leadley had been employed by Mr. Lord selling coupons for photographs, collecting 25 cents on each as his commission. According to the police, he had been inducing people to buy the coupons by reducing the price named in the contract, from \$2 to \$1, entirely without the consent of the photographer. The purchasers on presenting the coupons found that they had practically worthless paper. Several days ago it was said, a resident on Dundas Street purchased a coupon from Leadley, and told him that if he came back again he might succeed in selling another. The coupon was presented at the studio and refused. When Leadley returned to the house a policeman was sent for and he was arrested. There are said to be several other men working the same game, but as they seldom sign to the coupons the name by which they are known to the photographer it has been somewhat difficult to catch them.

NEW APPARATUS AND MATERIALS.

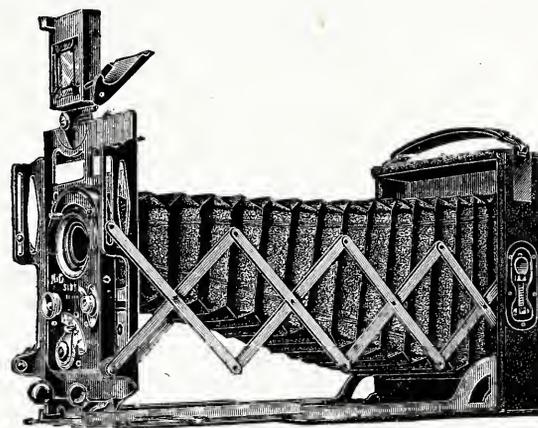

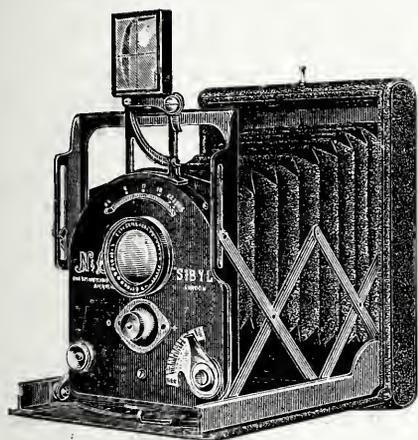

In this section we give reports upon the many new introductions on the British market. In some cases the new articles are variations of well-known products; in several instances they are absolutely new departures in construction. All, however, have come under our personal trial or examination, and for this reason the difficulty of drawing distinctions between competing goods is felt by ourselves acutely as by any one, since the fact is forced upon us that one manufacture is suited for one particular purpose, another for another, and that every article needs to be considered on its merits—and its price—seeing that individual requirements are as varied as human nature itself. And so it comes that we must ask for a careful reading of every page of this issue—advertisements and text—in which our foreign and colonial readers in particular should be assured of considerable pleasure and profit.

"Sibyl" Quarter-Plate "Special" and "De Luxe" Pocket Cameras. Made by Newman and Guardia, 17 and 18, Rathbone Place, London, England.

We have on a previous occasion reviewed the $3\frac{1}{2}$ by $2\frac{1}{2}$ pocket camera which has been made by Messrs. Newman and Guardia for three years as the "Sibyl." That camera was designed of the $2\frac{1}{2}$ size in order to provide, in the minimum of space, a hand-camera of full range of movements, and, though our own choice is size, the makers have found the quarter-plate more popular; therefore, in designing two new models of the camera of this size, the "Special" and the "De Luxe," the latter a double-

The rise of front which, in the "Special," as in the Nos. 5 and 6 instruments, is provided for the upright plate only, is 1 in., the shutter has the range of speeds $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, 1-16, 1-32, 1-64, 1-100 second, and a direct-vision finder of the same pattern is fitted. The whole instrument, in short, has the same practical features and perfection of mechanical construction as the first model, being made entirely in metal, leather-covered, with rounded corners and slipping into the pocket like a cigar case. Its outside dimensions are 6 in. x 4½ in. by 1½ in., and its weight just under 20 ozs. Its price, with the Goerz lens, is £16 16s., or with the Zeiss, £17 17s.

The double extension "De Luxe," or No. 1 model of the Sibyl, is

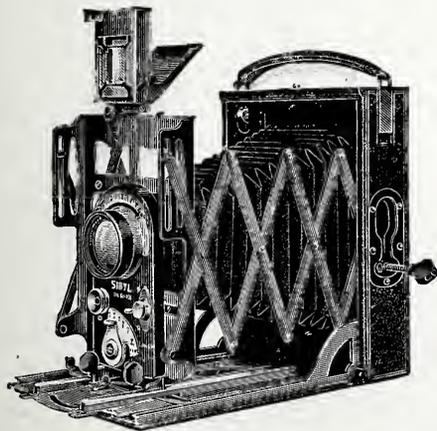

extension instrument, they have provided facilities additional to those in the original model now designated the "No. 5" (Tessar), the "No. 6" (Cooke), in reference to the lenses they carry. The "Sibyl" Special is designed on the same lines as the Nos. 5 and 6, that is to say, the front is carried on lazy-tongs, and, on the board being let down, runs out to its place almost by its own weight, requiring a touch to snap it into a position, which is most convenient. As in the $3\frac{1}{2}$ by $2\frac{1}{2}$ size, the focus may be left set at any point from infinity to two yards, and the camera is obtained set

not quickly described, since it contains several new features. The general type of construction is the same, the metal base, the rigid lazy-tongs extension. The focus plate as before is adjustable for both plates and films, and focussing scales for the whole and the half lens (long focus) provided to work with the same index which, as in the "Special," is provided with depth of field indicator. The front is brought into position somewhat differently. It is drawn forward by the pair of handles a little further than necessary, and caused to engage on the focus-plate by being pushed back. For the long extension all that is necessary is to release and pull forward the focus plate, when the same lines in the "De Luxe" on the side of the camera provides the adjustment for focus.

In the "De Luxe" pattern the front is made narrower, and is mounted so that in addition to the ample rise the upright way of the plate, both rise and fall, the landscape way is obtained; in each case equal to about one-quarter the dimension of the plate. The finder is very ingeniously contrived with a mirror at back of it, serving to use the finder at a low level, while when using the camera at the eye level the mirror is turned out of the way. The lens frame of the finder is marked to indicate the subject, included both "upright" and "landscape" way of the plate, and with both long and normal focus. The finder also carries two levels, and further on being turned down neatly stows itself away on the camera front.

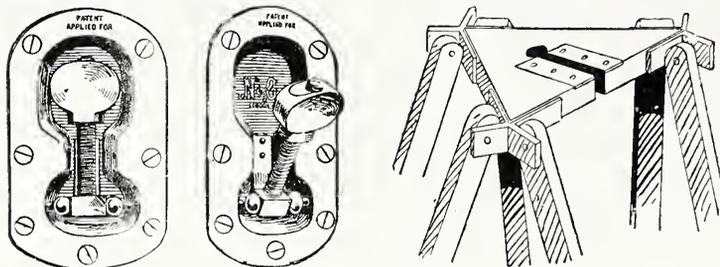

The lens for which the "De Luxe" Sibyl is adapted is the Zeiss Series VIIA of $f/6.3$ aperture, and 5 in. focal length. This gives a long focus lens of 9 in. when the back combination alone is used. Messrs. Newman and Guardia adopt the convenient bayonet joint method of securing the front combination, which thus can be instantly removed, and is put for the time being in a place provided for it in the back-frame of the camera.

One further novel and useful feature must be mentioned. In order to provide against the two disabilities of a loose tripod screw and the short bush for it, which a light and compact camera entails, Messrs. Newman and Guardia secure the tripod screw permanently to the camera by means of a recessed metal shell, which is made to form part of the back body of the camera. The two drawings show the

same index when re-opened. In the present "Special" model features are added to the focussing adjustments. In the first place a "depth scale" is provided, showing the area of correct focus for every stop of the lens, and secondly, the focussing plate is provided with an adjustment for setting the focus either for plates (in single metal dark slides), or for films in a film pack. Lastly, the camera will take the large aperture lenses, the $f/4.8$, Goerz 1B. "Color" or the Zeiss $f/4.5$ Tessar, the former of 5 in. and the latter of 6 in. focal length. The other adjustments remain the same.

tripod screw lying flush in this shell; and being raised. The tripod head to receive the screw is either cut away, as shown in last drawing (which is of the N. and G. "Eifel" stand), or is provided with a keyhole-shaped aperture, through the large part of which the screw is introduced, slipped over into the constructed portion, and made fast with the nut. The arrangement accomplishes the desir-

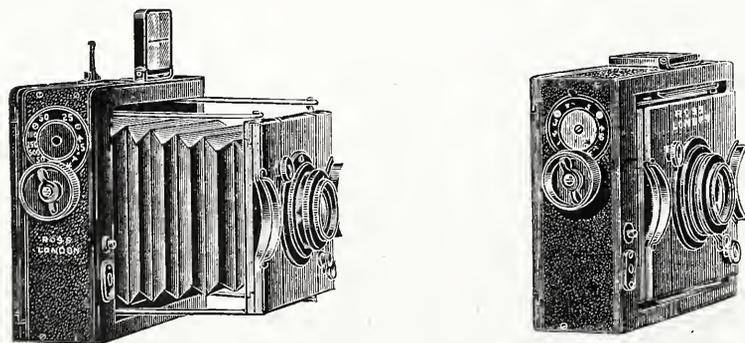

able end of providing a quick attachment of the camera to the tripod, a thing which is all the more necessary in the case of the "De Luxe" Sibyl, which is as eminently fitted for use on stand as in the hand.

Although allowing the use of a 9in. lens, the camera is very little larger than the "Special" pattern, but yet provides most conveniently a full range of movements, every one of which is embodied in workmanship which is the perfection of strength and ease. Complete, with Zeiss lens, the price is £21.

The "Panros" Folding Focal-plane Camera. Made by Ross, Limited, 3, North Side, Clapham Common, London, England.

In this new folding focal-plane camera the old-established firm of Messrs. Ross, Limited, appear in the market with an instrument which has the very greatest claims to consideration among Press photographers and other hand-camera workers using a camera which, while highly portable, is capable of being used for the most varied kinds of work. In general construction and appearance the camera itself does not differ greatly from other instruments of this type. It has, however, a corrugated bellows, thereby securing the advantage of cut-off of oblique rays, and it is further provided with a light-tight air-valve cut into the back, and thus preventing the blind of the shutter being dragged forward into the camera when the bellows are quickly extended—a minor matter, but nevertheless one which makes for the long and proper working of the shutter. The chief interest, however, centres in the shutter, which combines a series of good features which would seem to represent the *ne plus ultra* of instruments of this kind. In the first place, the shutter is of the

self-capping variety, the plate being kept covered except at the instant of exposure or when purposely set to time. In the second place, all the adjustments are made by the one winding-key of the camera, and the speed can be altered either before or after setting the shutter, and without any other adjustment than slightly pulling out the milled head of the winding-key, which is of size and gearing such that about a half-turn winds the shutter. "Bulb" exposures are made by turning the winder to "T" on the dial when the shutter opens, fully uncovers the plate on pressure of the release, and covers it again on pressure being released.

In addition to this, the mechanism of the shutter is such that on setting the aperture to a certain width the distance between the two blinds is locked, and no alteration in the width is possible while the shutter remains at this setting. Further, by turning the winged nut seen within the hollow of the winding-key the shutter (when in the down position) is opened to time, and is closed again by quickly

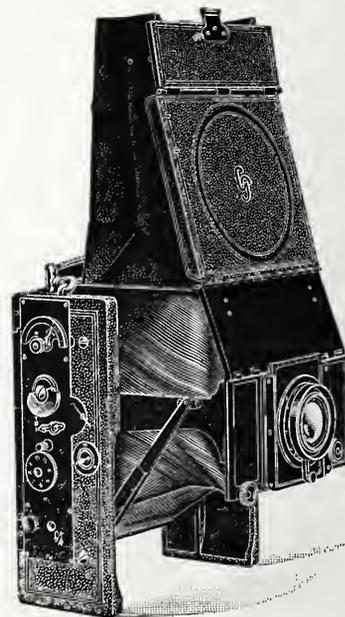

turning the outside rim of the winder. This modification can be made whether the shutter is set or run down, and it will be understood that after uncovering the shutter to focus, the latter will remain at the original setting. This is undoubtedly a great convenience to the Press photographer, who may, for example, take the precaution to focus a subject on the ground glass itself immediately before giving a very rapid exposure. In this case the manipulation necessary, additional to exchanging the dark slide for the focusing screen, is to first release the shutter, then give a half-turn to the inner winged nut, and after focussing to give the slightest twist to the outside winding-key, which lowers the blind again, while a further half-turn of the key resets the shutter. These operations are far more rapidly made in practice than they can be described, and the shutter is evidently of a kind which it is most difficult to derange.

The dark-slides supplied with the camera are worthy of special commendation as regards the spring which is used to keep the slide in position, and is inserted unpierced into the dark-slide, and, therefore, should be assured of constant use without splitting. Further, the space at the mouth of the slide is made of good depth, so that a finger-hole can be provided whereby to lift the plate quickly from the slide, and at the same time to provide an efficient push cut-off of such depth that the insertion of the shutter, even skew-wise, into the slide will not admit light to the plate.

The camera is supplied with the Ross "Homocentric" lens, Series III., *f*/6.3, in focussing mount, adjustable focal-plane shutter for time or instantaneous exposures, three solid double-dark slides and black leather carrying case, in quarter-plate size, with 6in. lens, £12 17s. 6d.; 5 x 4, with 6in. lens, £14; and postcard size, with 6½in. lens, £14 10s.; or fitted with "Homocentric" lens, Series I., *f*/5.6, instead of Series III. as above, the prices are £13 17s. 6d., £15, and £16 5s. respectively.

The "Goerz" Folding Reflex Camera. Made by C. P. Goerz Optical Works, Ltd., 1 to 6, Holborn Circus, London, England.

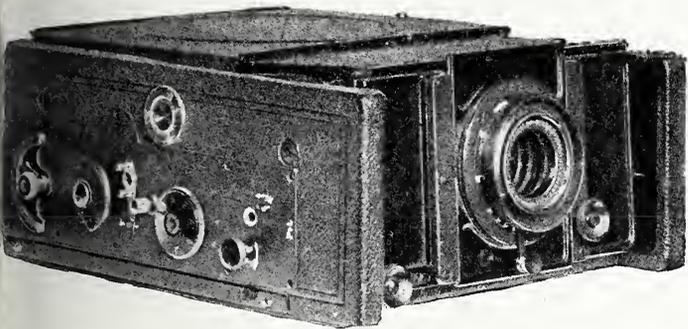

Messrs. Goerz, whose reputation in the matter of folding focal-plane hand-cameras is of longer standing than that of any other firm, and second to none in the design and substantial manufacture of their instruments, have made quite a departure in bringing out a reflex camera. That the Goerz factory should produce photographers with a reflex instrument was a natural assumption,

but that they should start by essaying the doubly difficult task of providing a camera of this type which would fold up was perhaps not to be expected, and therefore the mechanical perfection of the new Goerz reflex is all the more a matter for congratulation. The new camera is made in one size only, 5 x 4in., and measures when closed 7¼ x 7 x 3¾, weighing, without the lens, 4lb. 10oz.

The back body of the camera carries the focal-plane shutter, which is of the Goerz latest pattern, giving both the most rapid exposures and automatic time exposures. Two rigid arms fixed in the back frame hold the front of the camera, and are turned downwards

When the camera is folded, so that the lens points straight down, the user carries it by the strap. The operation of opening the camera ready for use consists simply in grasping the lens and swinging it upwards and outwards until it comes into the normal position. This operation at the same time automatically depresses the mirror, and leaves the ground-glass in the position for exposure so that the camera may be carried folded with the shutter set for a plate ready for exposure, and be ready for action within a second or two. Similarly, to close the instrument the two side

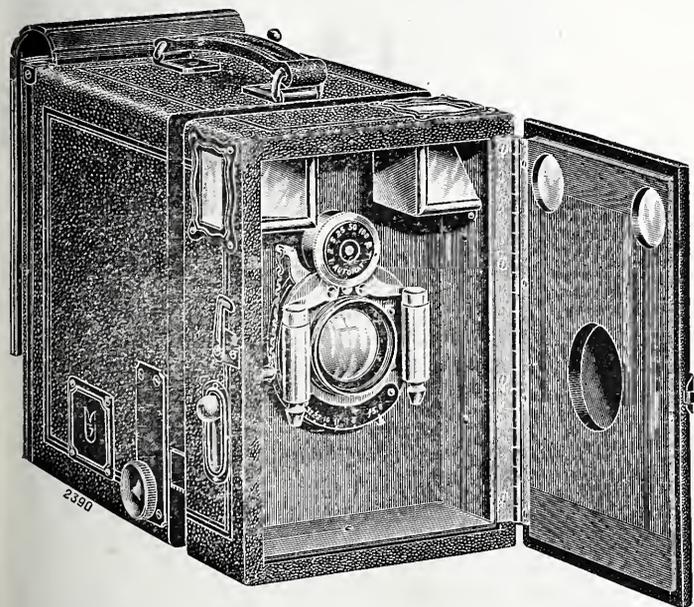

panels have simply to be pressed downwards and the lens returns to its normal position.

The movement of the mirror and the quick adjustment by which the lens is raised or lowered by a half-turn of the milled screw are points to be mentioned, as is also the rigid manner in which the focusing screen is held in a solid metal frame on all sides. In other words, the camera realises the conditions which are necessary for a reflex camera of precision, while its lightness and portability bring it almost into line with a folding focal-plane camera of the ordinary type. The price of the instrument complete with Goerz astigmat is £24 16s.

The "Houghton" Envelope Camera. Made by Houghtons, Ltd., 88 and 89, High Holborn, London, England.

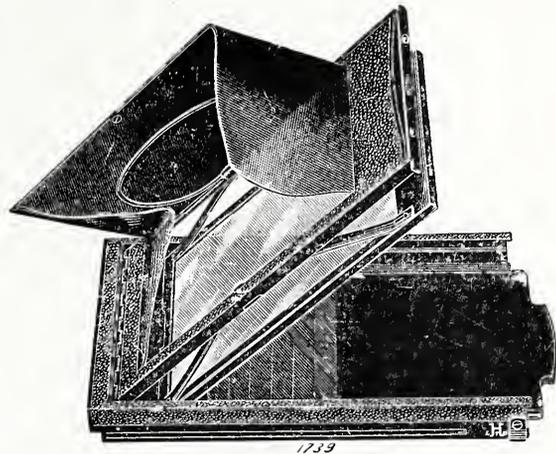

Specially built to take the envelope adapter introduced by Messrs. Houghtons eighteen months or so ago, this camera is of the box form shown in the drawing, and provided with movements in the way of focusing, finders, etc., which are familiar to users of "Holborn" instruments. Among these we may mention the convenient adjustment whereby, when the lens is capped, the finders are darkened. The camera, which, like others of Messrs. Houghtons which

we have reviewed in this number, is made at their London works, finished in polished mahogany and brass, and presents a handsome appearance when opened, although when closed for actual work it is conveniently inconspicuous. The envelope adapter provides a very compact setting for the sensitive plate, and keeps the camera both light and small, the dimensions of the quarter-plate being under 7½ x 6 x 4½ inches. The price complete with focussing screen and hood, R.R. lens, and "Simplex Auto" shutter, is £2 10s.,

whilst Nos. 2, 3, and 4 of the series, with other shutters and lenses, are marketed at 63s., 70s., and 90s.

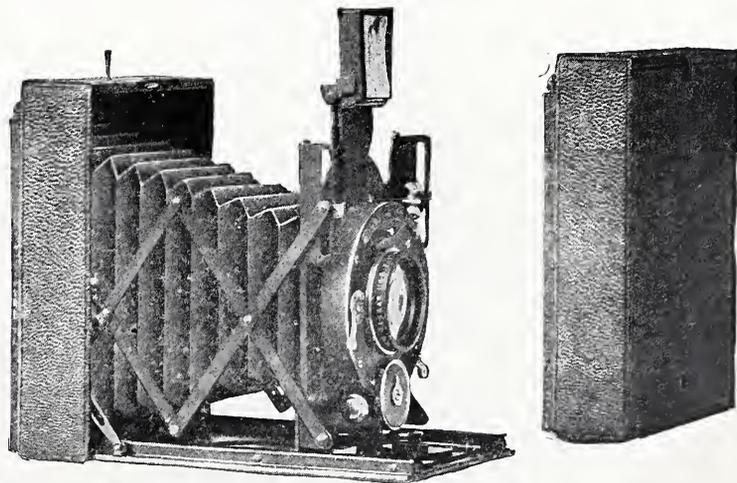

The above system of carrying plates or films to any convenient number ready for exposure in a simple apparatus no bigger than an ordinary dark-slide has been very conveniently embodied in the "Houghton" envelope and adapter, described in these pages at the time of its introduction, but we should record the improvement

in the form of envelope by which the plate or film is more expeditiously inserted. The present form of the adapter is shown in the drawing, the ground glass focussing screen being safely carried between the wooden back forming the focussing hood and the shutter of the adapter. The spring catch is so designed that the adapter is instantly opened to receive the envelope and as instantly closed. The system is applied by Messrs. Houghtons to a variety of sizes of cameras up to half-plate, the price of a quarter-plate adapter varying from 10s. 6d. to 17s. 6d., whilst the envelopes cost 2s. per dozen, unloaded, or 3s. per packet of ten charged with "Ensign" flat films.

The "Vesta" Pocket Camera, 1909 Model. Made by Adams and Co., 26, Charing Cross Road, London, England.

In these columns last year, and later in the "Almanac," we described the Adams' "Vesta" pocket camera, and were compelled to admire the extraordinarily small space within which a full range of movements is provided as a "triumph of construction." Yet since then the makers have still further improved upon the original design, and although in outward appearance the difference is small, the advantage from the practical standpoint is very considerable. The im-

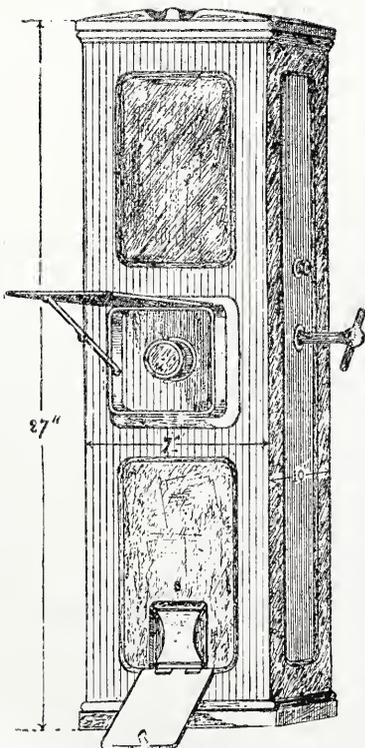

provement lies chiefly in the fact that whereas in the original model the lens front, on being withdrawn from the back frame, was undetached, and had to be affixed to the studs in the baseboard; in the present model the front is held and guided, and has only to be pulled out until it engages the spot prepared for it. As the drawing shows, Messrs. Adams employ a lazy-tongs system to hold the front, but they do not confine each set of arms of the lazy-tongs to run only in a set groove. On the contrary, they mount the camera front on a foot which runs in a pair of grooves, but the front itself is able to slide sideways on this foot, thus giving a rising front movement

when a picture is being taken "landscape way" of the plate. This is possible owing to the latitude of movement permitted by the lazy-tongs, and the practical result is that the front can be made almost the full width of the baseboard, and thus take a large-aperture lens at the same time that it may be given rising front each way, and to an extent of one-quarter the height of the plate. Rise of front being an indispensable movement for all classes of work, and a $f/4.5$ lens being rightly regarded as little short of a *sine qua non* in hand-camera photography, it is due to Mr. Adams to say that the use of these two valuable facilities in one and the same instrument is possible in no other camera, which can be called a pocket instrument. More bulky cameras will do it; others of very small proportions will do one or the other, but not both; but the "foot" principle of constructions in the "Vesta" permits of the great rise each way even when an $f/4.5$ lens is used, and even in the small size of $3\frac{1}{2}$ by $2\frac{1}{2}$.

Focussing in the new model is done by a thin cogged disc attached to the "foot," and gearing with the rack on the baseboard; the adjustment for focus is much more easily done than with a rack and pinion. A mirror, also added to the direct-vision finder, allows of the camera being used low down. It is turned out the way against its supporting plate, and the finder-lens on the camera being closed, automatically folds itself against the lens front without being touched, likewise erecting itself when the camera is opened. The camera is provided with two bushes for attachment to a tripod, has the same shutter as before, giving a range of speeds from $\frac{1}{2}$ to 1-200, as also time and bulb, and complete with Zeiss $f/6.3$ Tessar costs £11 11s., in $3\frac{1}{2}$ by $2\frac{1}{2}$ size; £13 10s. in quarter-plate. With the Zeiss $f/4.5$ Tessar instead of the $f/6.3$ lens, £1 15s. and £2 2s. respectively must be added to these prices.

The Automatic Ferrotypes and Photo-Button Photo-Machine. Made by W. Vining, 2a, Loftus Road, Shepherd's Bush, London, England.

A close inspection of this piece of apparatus and a demonstration of its working have convinced us of the very simple and substantial nature of the working mechanism and of the range of adjustments provided in the apparatus in order to permit of its use under different conditions of light and weather. The machine takes the form of a wooden pillar about 1ft. square and about 2ft. 3in. high, the

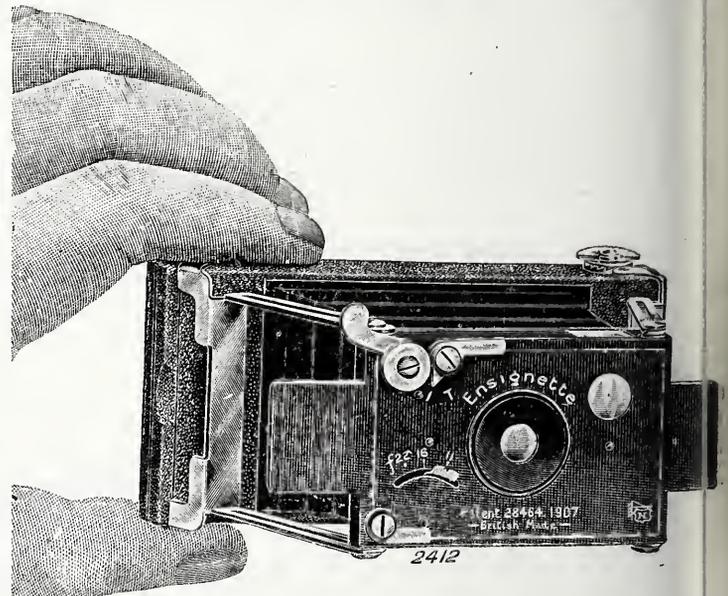

whole of the mechanism is immediately accessible, and the motive power is provided by a small clockwork motor, which is wound for each exposure with a single turn of the key, seen on the right. The plates are contained in a column detachable from the apparatus and holding 100 plates. Any number of these columns can be carried separately, and can be fitted into the machine in full daylight. The operation in making a portrait occupies less than a minute; the

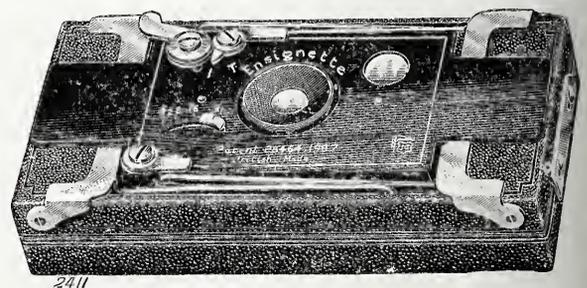

sitter is placed at the right distance from the lens, and the operator of the machine, having wound the motor, has then only to press the release and do nothing more until the plate is delivered from the plate at the base of the apparatus. The order in which the operations thus automatically take place are as follows:—Sitter to keep still till bell rings; bell rings, and plate is carried to developer; plate remains in developer for from five to forty-five seconds, according to temperature; plate is removed to fixing bath, which is placed that it cannot possibly splash into the developer; plate is taken out of fixer and passed through outlet of apparatus, when the operator gives it a rinse in a bucket of water, puts it in its frame, and hands it to the purchaser, the photograph drying within a minute or so. The process of putting through the pictures thus takes very little more than half a minute, or in cold weather, where a longer time of development is necessary, something under two minutes, thus providing a considerable output of photographs, since the moment one sitter has left his position the photographer is free to look after for the next, while the machine is developing and finishing the photograph. The mechanical work which the apparatus has to do is very slight, the mechanism being counterbalanced, and the operator is further safeguarded from making mistakes by the indicators which prevent him moving a fresh plate when one is already in position, and which further prevent him starting an exposure without the machine being fully wound. The apparatus is most substantially made, and is one we can recommend for its usage for outdoor photography in any part of the world.

The "Ensignette" Vest-Pocket Folding Camera. Made by Houghtons, Ltd., 88 and 89, High Holborn, London, England.

A complete self-contained roll-film camera, which measures under 4in. by 2in. and is scarcely more than $\frac{3}{4}$ in. in thickness, is what

Messrs. Houghtons have achieved in this instrument, which, fitted with a single lens, is issued at the moderate price of 30s. the camera takes a picture $2\frac{1}{4}$ x $1\frac{1}{2}$, the roll-holder accommodates

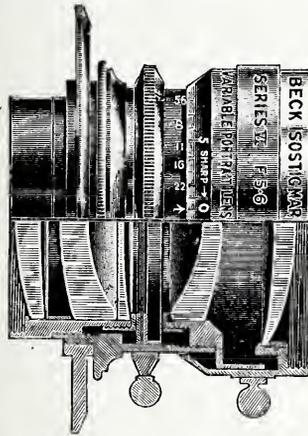

spool of six exposures. The little instrument is fitted with a lens and instantaneous shutter, a brilliant view-finder, a rotating diaphragm plate, giving the apertures $f/11$, $f/16$, and $f/22$. Although designed primarily for use in the hand—the short focal length of the lens dispenses with the need of focussing and allows of objects

ft. distant being photographed—the camera can be stood on a flat surface, both for vertical pictures or those landscape way of the plate, which latter purpose a small folding leg is attached. The instrument is made throughout in metal, and is strongly though lightly constructed. While it is a perfectly practical instrument, giving natives which will stand a considerable degree of enlargement, the pleasing fact remains that it can be carried without inconvenience in the upper waistcoat pocket, in connection with which fact it must be remembered that it is a complete instrument, and has only to be opened out on its nickelled struts to be ready for taking a picture. It is now perhaps thirty years ago since the efficiency of such small instruments was pointed out, but it has been left for Messrs. Houghtons to provide a portable camera of this kind at a very popular price. The camera may also be had with an "Ensign" anastigmat lens working at $f/5.6$ for 70s., whilst a fixed focus lens, giving a postcard picture from the "Ensignette" negative, is supplied for 5s. 6d.

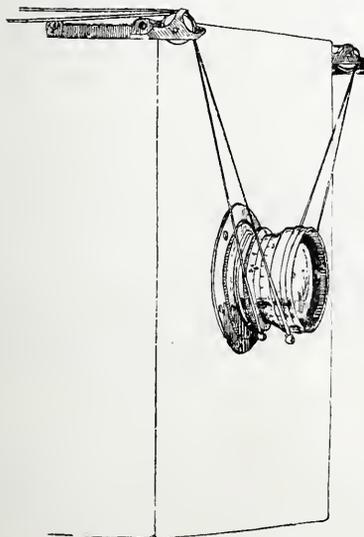

The Isostigmat Series VI. Variable Portrait Lens, $f/5.6$. Made by R. and J. Beck, Ltd., 68, Cornhill, London, England.

In this new series of the Isostigmat anastigmats the makers have provided a feature of special importance to the professional portrait photographer—that is to say, an adjustment is supplied by which certain degrees of unsharpness can be introduced at will, and—what perhaps most useful—repeated at will. Such a provision may

often be employed to good advantage in portrait photography, and it is not too much to say that a good deal of the very best portraiture has been done with lenses giving more or less diffused definition.

This lens, when the special variable adjustment is not in use, behaves as a very well corrected anastigmat, and at full aperture

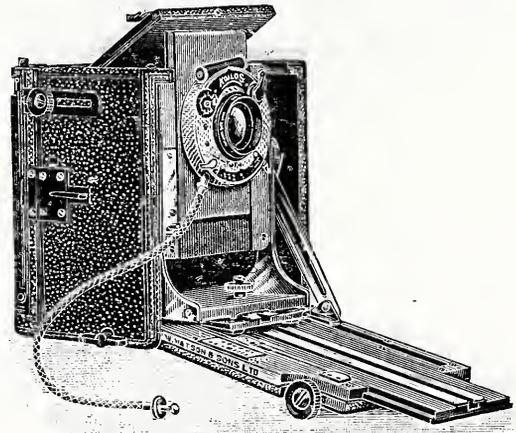

We find the $9\frac{1}{2}$ inch lens submitted to us covers a half-plate with surprisingly good definition. The adjustment provided is a variable separation between the front two lenses. By turning the lens-rod the separation is increased or diminished at will, and so varying degrees of diffusion can be introduced. A scale is provided which enables us to record the amount of adjustment found to be

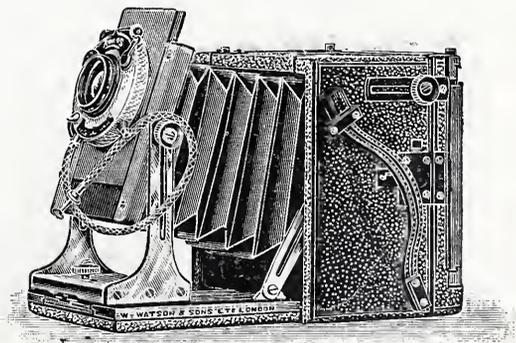

desirable for particular purposes, and so it is always possible to return to any particular degree of diffusion at will. The objective is well finished, the mount being brass, and the price is very moderate, £7 7s. for a $9\frac{1}{2}$ inch lens working at $f/5.6$ not being out of the way. The 12 inch lens costs £14, and the 17 inch £22. The hood-ring, and also the iris-ring, are so fitted that by a system of cords and pulleys the adjustments both of aperture and definition can be made from the back of the camera while focussing, and the prices include these fittings. For portraiture this should be a very useful lens, and the fact that it will also serve all the purposes of an anastigmat adds greatly to its value.

The "Alpha" Camera, New Model. Made by W. Watson and Sons, Ltd., 313, High Holborn, London, England.

In this new model of their well-known hand-stand camera, Messrs. Watson have provided most completely for the requirements of those using a camera both in the hand and on a stand. The base-board drops and the camera can then be actuated by an auxiliary rack and pinion placed at the back near to the plate, a very convenient movement when using a wide-angle lens. At the normal and full extension focussing is done with the front pinion which provides for a total distance from lens to plate of 12 in. in the quarter-plate size. The front rises in its struts, and has a further

rise of nearly an inch by means of the lens panel, and is also given a swing movement, the total range being ample for all descriptions of work. There is also a swing-back of ample movement, and, of course, the usual reversing back. The camera is, in fact, most conveniently fitted for the most varied photographic purposes, but measures, when closed, under $5\frac{1}{2} \times 6 \times 4$ inches. It is substantially, though not heavily, built, and costs in quarter-plate size, complete with three double slides and finder, £8 8s., an extra charge of 15s. being made for the rack and pinion focussing when using the wide-angle movement. Messrs. Watson fit with the usual lenses and shutters, including their own "Holostigmat," the series I.a of which

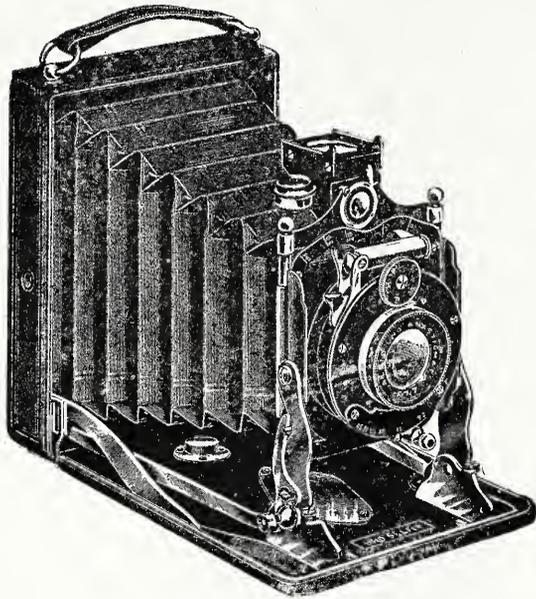

has the great advantage of providing an $f/4.5$ lens, the separate components of which may be used as excellent $f/9$ single lenses. Thus the No. 5 "Holostigmat" of $5\frac{3}{8}$ inch focus gives single lenses of $8\frac{1}{2}$ and 10 inches focal length.

The "Uno-Selfix" Pocket Camera. Sold by W. Butcher and Sons, Ltd., Camera House, Farringdon Avenue, London, England.

In this camera the principle of automatic opening into the position of focussing on objects at infinite distance is adopted, and the camera requires no other movement to obtain it in the right posi-

tion for exposure than pressure upon the knob and the pulling down of the baseboard. The front erects itself into a very rigid position, and focussing is then done up to 10ft. distance by means of the mount of the lens, which is the Aldis $f/7.7$ "Uno" anastigmat. The camera is provided with everset shutter, giving time, bulb, and three instantaneous exposures, folding reversible view-finder, spirit level, and two bushes for the tripod screw. Complete with two single metal slides with ebonised shutters, the price is £3 15s.; extra

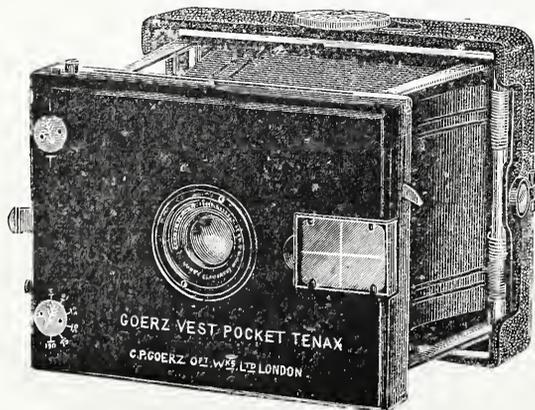

single slides, 1s. 6d. each. It will also take the "Premo" film pack by use of an adapter, 5s., and is a very excellent example of this type of hand-camera.

The miniature "Selfix" is made by Messrs. Butcher, and is a tiny member of this series of self-erecting cameras which takes plates $2\frac{5}{16} \times 1\frac{3}{8}$ in. (4.5×6 cm.). The little camera measures only $2\frac{3}{4} \times 3\frac{1}{2} \times 1\frac{1}{4}$ in., and on opening the baseboard comes out to the position of focus. The shortness of focus of the lens allows of all objects no nearer than 6ft. to be in focus. Complete, with double finder for horizontal and vertical pictures, time, bulb, and instantaneous shutter, single achromatic lens, and two single metal slides, the price of the camera is 2 guineas. It can be supplied with Goerz "Dagor" $f/6.8$ complete for £7.

The Goerz "Tenax" Vest Pocket Camera. Made by C. P. Goerz, Optical Works, Ltd., 1 to 6, Holborn Circus, London, England.

In this beautifully made camera, taking plates $2\frac{3}{8} \times 1\frac{3}{8}$ in. ($6 \times 4\frac{1}{2}$ cm.), the makers have scored a triumph in small folding cameras of the highest class. The camera extends on four struts, which are fitted

with strong coiled springs, so that the front comes forward simply on unlatching, and is most rigidly held before the plate. The camera is fitted with a Goerz Series III. "Dagor" of 75 mm. (3ins.) focus, with shutter mounted in it. Both front and back combination can be unscrewed from the mount with the aid of a metal tool carrying at its extremity a pair of fine points exactly fitting two tiny apertures in the lens mount. The shutter has adjustments for time exposures and for a series of instantaneous of $\frac{1}{2}$, 1-10, 1-25, 1-50, 1-75, and 1-100 of a

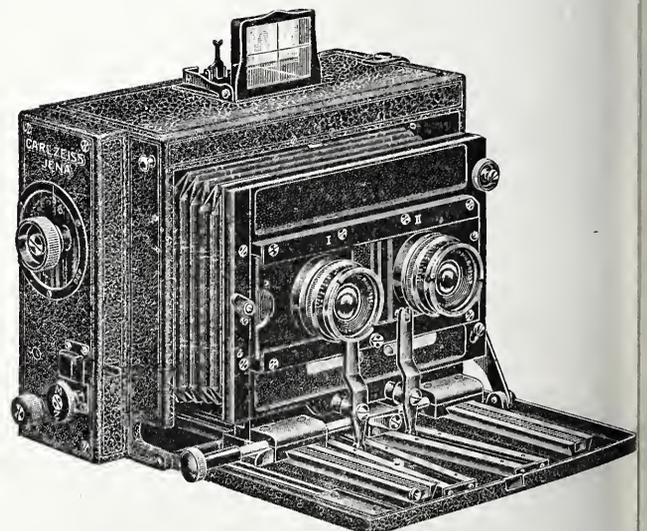

second. There is also a sliding shutter which covers the lens and another which gives the three apertures of $f/6.8$, $f/11$, and $f/22$. The view-finder, of the direct-vision type, pushes out from the front and part of the latter when returned before closing the camera. The eye-piece at the back of the instrument magnifies the image through the view-finder.

Perhaps the most novel feature of the camera is the focusing mechanism, which is done by racking forward the frame which the supporting springs of the front are attached. The movement is not great, and, as Messrs. Goerz rightly point out, for the great majority of work it is best to keep the focus at, say, six inches when almost everything else will be in focus with a lens of short focal length. They indicate this "best" point in red on the focussing disc, but provide a scale for objects from three yards to infinity. The whole apparatus is, as we have said, beautifully made and has the mechanical precision which is absolutely essential in an apparatus of this kind. It is sold, complete with hooded focusing screen, soft leather case, and six metal slides, which latter are of book pattern, giving, as is necessary, a very accurate register and allowing of the slides being quickly loaded. The price of the camera is £10.

Messrs. Goerz supply a special enlarging apparatus for the "Tenax" negatives, consisting of camera (carrying paper up to 7×5 ins.) dark slide, condenser, and paraffin lamp, for £4 10s.; the lens of the "Tenax" itself being used as the objective.

The Zeiss Automatic Stereoscopic Lens-board Accessory. Made by Carl Zeiss, Jena, Germany, and 29, Margaret Street, London, England.

The very ingenious device of Dr. W. Sheffer, described by himself in a recent article in the "B.J.," whereby the separation of the pair of stereoscopic lenses is automatically adjusted by the focusing pinion of the camera, has now been put on the market by the firm of Carl Zeiss as a separate accessory, which is carried in a leather case measuring $4\frac{1}{2}$ in. by $4\frac{1}{2}$ in. by $1\frac{1}{2}$ in. The illustration shows it fitted to the camera in place of the ordinary lens board. Its addition is the work only of a few seconds, the camera being racked out to its greatest extension and the panel slipped into place with the points of the levers in the grooves on the camera baseboard, these grooves being sold with the accessory panel. On racking the camera in and out when focussing no adjustment of the distances between the lenses is necessary. The grooves themselves control this and relieve the photographer himself from the necessity

of supervising this necessary condition to the best stereoscopic result. When taking objects same size the distance between the lenses is 1 3-16ths, whilst when photographing distant objects it is 2 5-16ths. As the lenses cannot be in the sunk type of mount, owing to the necessity for bringing them close together, it is necessary to remove the automatic panel when closing the camera, an operation which, owing to the mechanical perfection of the workmanship, is just as smooth and rapid as the insertion. Complete with two grooves the price of the panel is £3 15s., ready for adjustment to a Zeiss 9 centimetre stereo "Palmas" or to other suitable instruments. The

s stereo "Palmos," when thus fitted with the accessory panel, is a most efficient and convenient instrument for stereoscopic work.

"Acto-Midg" Magazine Hand Camera. Sold by W. Butcher and Sons, Ltd., Camera House, Farringdon Avenue, London, England.

This magazine hand-camera includes quite a number of novel features, chief among which is the provision on the top of the camera of an actinometer, the time taken for the paper to darken the standard tint being used as the number to which to set the meter. Thus, an actinometer number of 4 seconds means that the shutter pointer is to be set to 4, which is the same thing as 1/4 sec. The diaphragm scale is similarly turned to the class of subject being photographed, portraits and near objects being set at *f*/11, and clouds and open seascapes at *f*/32. Street scenes, on the other hand, are worked with a lens at *f*/16. These

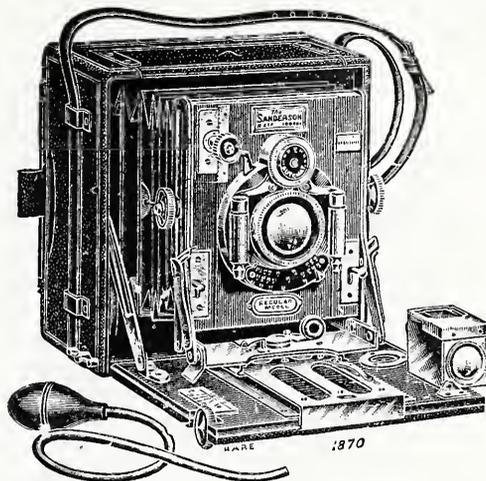

movements are calculated so as to give the plate a sufficient degree of exposure, and should be of much use to the amateur worker for his purpose. At the same time, it is necessary, in the case of moving objects, to use the shutter at a greater speed than is warranted by the actinic value of the light, but in such cases the readings of the exposure-meter give the worker a useful indication as to the amount to which he can reduce the correct exposure. The camera is further provided with an automatic signal, which shows a red light when a plate has been exposed. The magazine carries 12 plates, which are changed by a very simple movement, is fitted with a reversible brilliant finder, bushes for vertical and horizontal pictures, and, at the price of £2 2s., with single achromatic lens. For £3 3s. the camera is fitted with "Aldis" anastigmat working at *f*/7.7, and fitted in mount focussing objects up to 6ft.

The "Sanderson" Hand and Stand Camera, 1909 Model. Made by Houghtons, Ltd., 88 and 89, High Holborn, London, England.

While it would be superfluous to describe the full list of movements of this pioneer of hand-cameras of the wider range of movements, attention may be drawn to one or two additional features of the 1909 model as evidence of the makers' determination to leave no stone unturned in giving the camera every convenience which is of real practical use to the photographer. In the present model a rack and pinion adjustment is provided for the camera when used in the wide-angle position—that is to say, on that portion of the lens board which forms part of the back body of the camera. In the place of the hand adjustment, which formerly had to be made, the camera, when being thus used for wide-angle work, is conveniently racked by a small screw projecting slightly from the back body. The rising front in the "Regular" and "Tropical" models is now brought more into line with the *de luxe* pattern by having a rack and pinion adjustment for the rising front. And, further, the reversing back is now released from the body by pressure upon a single stud, which actuates the two spring catches which secure

the back, a movement which is certainly a convenience, as frequently when the camera is being held in the hand it is something of an inconvenience to raise both springs at the same moment.

The prices of the "Sanderson" with these additions and its already well-known features remain the same, and are described in the special booklet which Messrs. Houghtons issue.

The "Trio" Aldis Lens. Made by Aldis Bros., Sparkhill, Birmingham, England.

In last year's Colonial Number we reviewed and described the "Duo" Aldis lens, a special front combination which, when used with the back combination of an ordinary Aldis lens, gives a doublet of approximately double the focal length and double the covering power. The "Trio" is a similar front combination designed to increase the focal length only one and a half times, and it is thus better suited to cameras that will not extend sufficiently to enable the "Duo" to be used. The "Trio" submitted to us is intended for use with the well-known and popular No. 2 Aldis, Series 2, of 5 3/4 in. focal length and *f*/6 aperture. On changing the front combination for the "Trio" we have an 8 3/4 in. doublet, working at a full aperture of about *f*/9, and, according to the makers, giving very fine definition over a 7 in. circle. As a matter of fact, however, we find it behaves very well indeed over a half-plate, and the circle is sufficiently large to enable a much larger plate to be covered with smaller stops. The corrections of this modified doublet are very good indeed, astigmatism being absent, while the field is very flat. A small point of light can be sharply focussed in any part of the 7 in. circle. As in the case of the "Duo," the spare combination is provided with a brass protecting cap, and the mounting and finish are fully up to the well-known standard set by Messrs. Aldis in their other lenses. The prices of the "Trio" are as follows:—

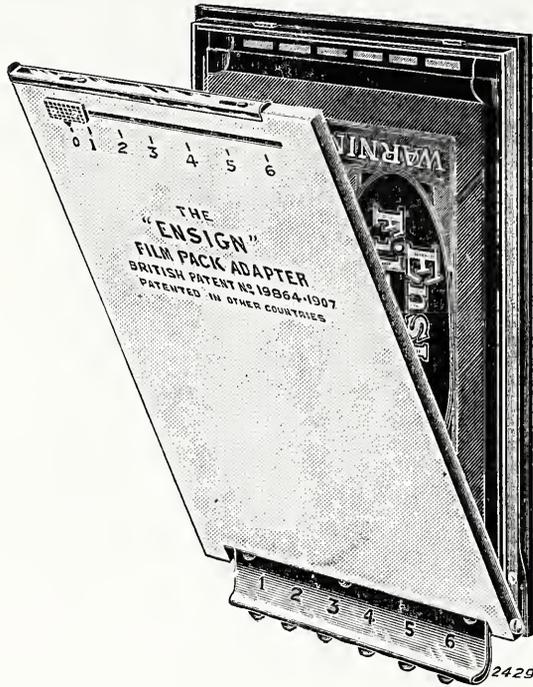

No. of corresponding Aldis lens.	Focus.	Plate covered sharply at full aperture.	Approximate back focus from face of lens board when set for distant objects.	Price inclusive of cap and brass case into which the front combination screws
2	8.75	6 1/2 x 4 3/4	8	£ s. d. 1 2 6
2A	9.75	7 x 5	8.75	1 13 6
7	11.25	9 x 7	10.5	1 7 6

It may be mentioned that all existing Aldis lenses can be fitted with "Duo" or "Trio" special fronts. There has been no change in the Aldis patent construction since its first inception, though, of course, the brass work standards have been changed once or twice. Hence it is generally advisable to send an Aldis lens—especially if of early date—to be fitted up, but the results will always be just as good whether the lens is of early date or quite recently issued.

The "Ensign" Film-Pack and Adapter. Made by Houghtons Ltd., 88 and 89, High Holborn, London, England.

The users of cut films will be interested in hearing of this latest device (for the exposure of flat films, purchased ready for use in a pack) which is made by Messrs. Houghtons at their London works, and has just been put on the market. The adapter consists of a chamber of light metal measuring only 6 x 3 3/4 x 3/8 inch, or scarcely

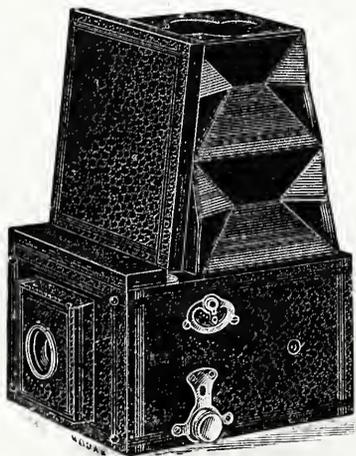

half the size of a double slide. The adapter is provided with a series of 6 keys, any one of which is pressed down as the shutter of the slide is withdrawn, and thus leaves ready for exposure in the camera that particular film. The action we have found most simple and certain. As the box may be re-loaded by the user himself after

development, this convenience of exposing the films in any order may frequently have an advantage. The film is held very flat in the focal-plane, and may thus be recommended for users of large-aperture lenses, where perfect evenness of the sensitive surface is a great consideration. In quarter-plate size the price of the adapter is 25s., and of the pack of 6 "Ensign" films, ready for use, 1s. 9d.

The No. 2 "Premograph" Reflex Camera. Made by Kodak, Limited, 57-61, Clerkenwell Road, London, England.

The somewhat more elaborate model of the ingenious little reflex camera which was placed upon the market a year ago by the Kodak Company, at the price of £2 2s., should go still further to impress the advantages of the reflex principle upon the very large public who must have extreme lightness in any camera they carry. The No. 2 "Premograph," which has been out some little time, is very little heavier than its predecessor, and, as for size, is only 4½ in. by 5½ in. by 6¾ in. when closed. It is opened for use simply by touching the lever at the back, a movement which automatically erects the hood. The new "Premograph" is fitted with an R.R. lens working

at $f/8$, and a shutter giving a series of exposures from ½ to 1-100th second, as well as time exposures. The lens is automatically capped (to exclude dust) on being racked in by the pinion, which latter also has the very convenient movement of being depressed flush with the

side of the camera and locked in, so that it cannot be accidentally damaged. The shutter is of the same simple and efficient pattern as in the former "Premograph," consisting simply of two jaws, one carrying the mirror, the operation of exposing being performed by the rising of the first mirror, followed by the second jaw. The camera is re-set for exposure without the film being uncovered. The camera is made to take either small dark slides or the convenient "Premograph" film pack, and the price of the No. 2 "Premograph," which is made in the quarter-plate size only, is £4 4s.

"Ensign" Box-Form Film Cameras. Made by Houghtons Ltd., 88 and 89, High Holborn, London, England.

A new series of the convenient and saleable box-form of film camera has just been designed and placed on the market by Messrs. Houghtons to provide a series of cameras which, from first to last, are of substantial British make. These box-form "Ensigns" are made in three sizes—the 2¼ A for pictures 2¼ x 2¼ inches, the 2¼ B for pictures 3¼ x 2½ inches, and the 2½ for pictures 4½ x 2½ inches—while there is also a quarter-plate size. The cameras are very substantially built of hard wood, the film-holding chamber being removable from

the side of the camera, thus providing easy access for reloading, but being firmly locked by a spring and two separate catches. The fittings include a single achromatic lens, "everset" shutter, giving time and instantaneous exposures, two ground-glass view-finders, and a leather handle for carrying. The 2¼ B and the 2½ sizes are further provided with adjustable diaphragm plates, giving apertures from $f/11$ to $f/32$. The substantial make and good appearance of the instruments are quite what one would expect from camera makers of the experience of Messrs. Houghtons, and the new series should find purchasers in all parts of the globe, both for the cameras and for the "Ensign" film used in them. The prices of the three sizes named above are 5s., 10s., and 12s. 6d.

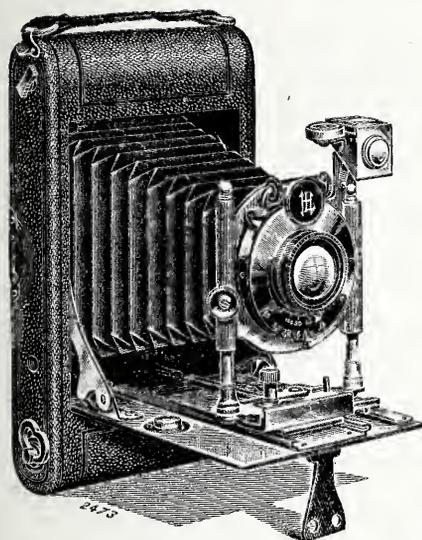

The "Multi-speed" Diaphragm Shutter. Made by the Multi-speed Shutter Co., 324, East 65th Street, New York, U.S.A.

This is an entirely new form of lens shutter which, judging from the sample prints sent to us with it, is capable of producing very remarkable results. It is claimed that it will give exposures from 1-2000 second, and that such exposures with an aperture of $f/16$ will give fully exposed plates with all detail in shadows, summer and winter, sun or no sun. Not yet having had the opportunity of putting the shutter to practical tests, we cannot comment on these claims any further than to say that the specimen prints are mostly of winter subjects requiring very high speeds, and that the results are as good as can be desired. The possibility of very high speeds is indicated by the construction of the four shutter blades. These move continually in the one direction during the time of an exposure. Each blade is double, being pivoted in the centre, and the aperture being covered by one end of it at the beginning of the exposure and by the other at the end. There is thus a check on the return of the blade as in the usual form of iris shutter. The motive power is a powerful coiled spring, and for the low speeds an air brake is brought into play to control the timing. Irregularities due to variations of the spring tension are allowed for by a rather cleverly devised arrangement. Instead of setting the marked speeds on the speed indicator to an index point in

position a series of such points is provided, each being marked with a letter. The proper one to use is then indicated by the position taken by the zero when the spring is relaxed. The shutter can be set to bulb or time and is fitted with both trigger and "Antinous" release. The shutter gives low speeds of very long duration and works with no vibration and quite noiselessly. The shape of the aperture is a four-armed star, which, of course, means a high efficiency. We hope shortly to be able to make some tests of the shutter in practice and then it will be possible to go into more detail. For the present we can only say that the new speed is quite an innovation in the design and construction of bellows shutters, and is evidently of a kind which may be expected with an efficient response to the claims made for it by its makers. A shutter which gives a full range of speeds from the fastest to the lowest, and yet dispenses with the large dust-raising noisy blind of the focal-plane shutter, is certainly one to commend itself at once to every kind of photographer.

"Folding Pocket Cameras. Made by Houghtons, Ltd., 33 and 35, High Holborn, London, England.

The well-known firm of High Holborn has this year, among a series of new designs in cameras, introduced two models of all-popular folding film camera, one, the 000, being fitted with the "Simplex Auto" shutter, whilst the 00 has the Bausch & Lomb "Automat." The 000 is a somewhat cheaper line of instrument, but has all the movements which are called for in a camera of this description—namely, rise and cross front movement, reversible finder and level, infinity catch and diaphragm. It is made in the quarter-plate and postcard sizes, at prices of 45s. in the former, which includes an R.R. lens working at

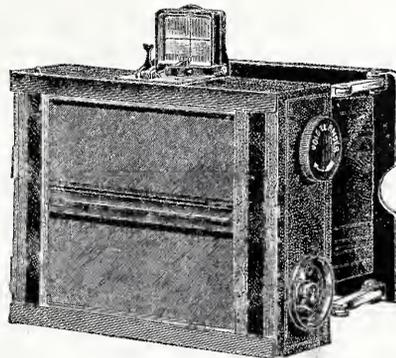

at 70s. in the latter, complete with Beck $f/8$ R.R. The roll-up portions of the cameras, like the other parts, are very well substantially made, and the instruments in practical usefulness, reliability, and appearance can take their place with any cameras of the kind. The 00 series, shown in the drawing, are priced at from 35s. for the quarter-plate, to 127s. 6d. in the postcard size, this having $f/5.8$ anastigmat, and, as already stated, the B. and L. shutter giving exposures from 1-100th to 1 second, in addition to the bulb.

"Voigtlander Focal-Plane Camera. Made by Voigtlander and Son, 12, Charterhouse Street, London, England.

This instrument of the still popular folding focal-plane type has been fitted with a new pattern of focal-plane shutter, which brings us to almost the acme of simplicity the adjustment necessary for this type of shutter. The shutter is wound by the large milled wheel seen in the drawing, about one half-turn sufficing to set the shutter.

This latter is of the self-capping variety, the plate being covered except at the moment of exposure. The adjustment of the shutter is made most easily by the disc and pointer seen in the drawing below the winding key. To set the shutter for time, all that is necessary is to point the arrow on the central disc to the 'Z', when pressure on the release opens the shutter and a pressure closes it. On turning the arrow to point to M,

instantaneous exposures are given on pressure of the release. These latter are altered simply by grasping the central spindle of the lower disc and turning it to any position on the scale of apertures marked below it, the width of these apertures being seen through a small hole in the circular plate. Both this adjustment and that of time to instantaneous, and *vice versa*, are made while the shutter is set,

and are the work of an instant only. The working of the blind is light in the extreme, and the shutter is certainly as convenient a form of the focal-plane as can be imagined. The price of the camera with this new shutter, and with the "Heliar" $f/4.5$ of 15 cm. focal length, and three double dark-slides, is £14 10s., made in metal. A similar instrument, of half-plate size, made in wood, is sold at £17 complete, with "Collinear" Series II., of 20 cm. focal length, working at $f/5.4$, and with three double slides.

A $3\frac{1}{2} \times 2\frac{1}{2}$ Reflex. Sold by Ross, Ltd., 3, North Side, Clapham Common, London, England.

We have several times expressed our approval of the $3\frac{1}{2}$ by $2\frac{1}{2}$ size for a reflex camera, not only on the ground that the smaller instrument provides a most convenient size of image for lantern slides, but also for the optical reason that enlargements of a given size taken on a $3\frac{1}{2} \times 2\frac{1}{2}$ plate with a $4\frac{1}{2}$ -inch lens will compare favourably in sharpness with those on a quarter-plate made with a $5\frac{1}{2}$ -inch. In this instrument the camera is made to take the picture the landscape way of the plate, and the focussing hood takes the ingenious form of a perfectly close hood, provided with a single magnifying eye-

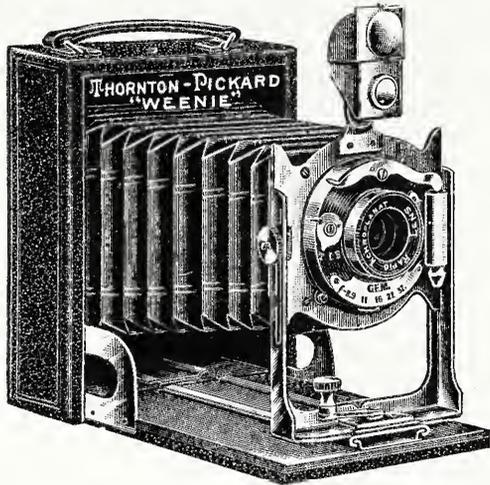

piece. The hood is quickly collapsible, and, being attached to a separate frame, can be removed in an instant from the ground glass, which can thus be cleaned, and, further, gives access to the mirror. The camera is provided with a very rigid extension, allowing of a total length between lens and plate of $7\frac{1}{2}$ inches, and it is fitted with a focal-plane shutter of adjustable slit aperture, giving a very wide range of exposures. Fitted with three double slides and Ross $f/6.3$, 5-inch focus, "Homocentric," the price is £14, or with $f/5.6$ "Homocentric," £15. With $4\frac{1}{2}$ -inch Ross-Zeiss "Tessar," $f/4.5$, the price is £15.

The Thornton-Pickard "Weenie" Folding Camera. Made by the Thornton-Pickard Manufacturing Co., Ltd., Altrincham, England.

Under this name the Thornton-Pickard Co. have newly introduced, at very moderate prices, a series of four pocket cameras, two of single and two of double extension; the A (single-extension) have burnished brass fittings, leather bellows, and rising and falling front. There is infinity catch and focussing scale up to 5ft., and the Thornton-Pickard "Eclipse" shutter giving time, bulb, and a series of instantaneous exposures, and operated by both finger and pnet-

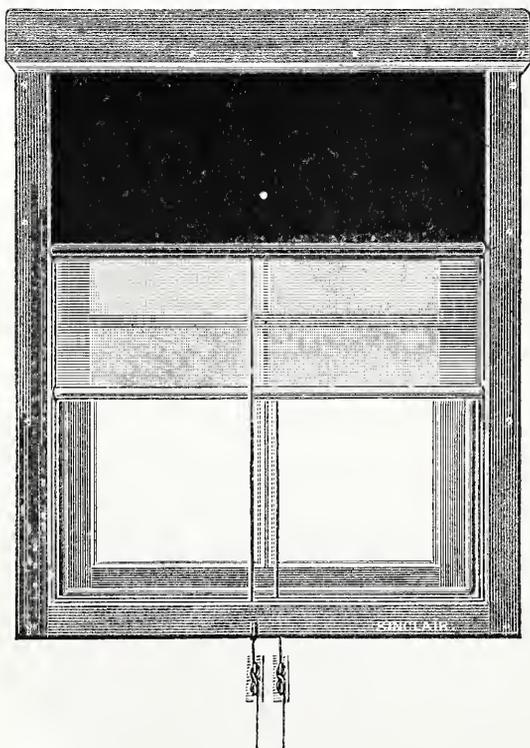

matic release. A reversible finder, two single slides, and two bushes for the tripod screw are included at the price of 25s. only, complete with single lens, whilst for 30s. the camera is fitted with an R.R. The double extension instruments are of similar pattern, but allow of double the focus, and are priced at 35s. and 40s., with single and R.R. lens respectively. The instruments at these modest prices are

really well made, the brasswork nicely finished, and for the sum of 10s. extra—an advisable expenditure, we think—can be had with the firm's patent "Cantilever" front, giving a great rise of the lens, as also all the necessary swinging movement—in fact, as much adjustment in these two ways as can usually be obtained on a stand camera. The illustration shows the ordinary pattern of the camera.

The Sinclair Dark Room Blind. Made by James A. Sinclair and Co., Ltd., 54, Haymarket, London, England.

One of those things which we all at times make, or get made for ourselves, usually in a rather unsatisfactory way, has been done very well indeed by Mr. J. A. Sinclair's firm, which now provides a special wooden frame containing two grooves, in one of which a red blind

works, and in the other a black, no trace of light being admitted when both blinds are down. We commend the system of providing a red blind for handling sensitive papers, and of giving the photographer total darkness wherein he can use a constant dark-room lamp for oil or gas, and so work much more satisfactorily than with the varying illumination of daylight. The frames are supplied of any size, complete with grooves for fitting to a window frame. One measuring about 5ft. x 4ft. costs £3 10s.; 7ft. x 4ft., £4 4s.

The Thornton-Pickard "Safety" Magazine Cameras. Made by the Thornton-Pickard Manufacturing Co., Ltd., Altrincham, England.

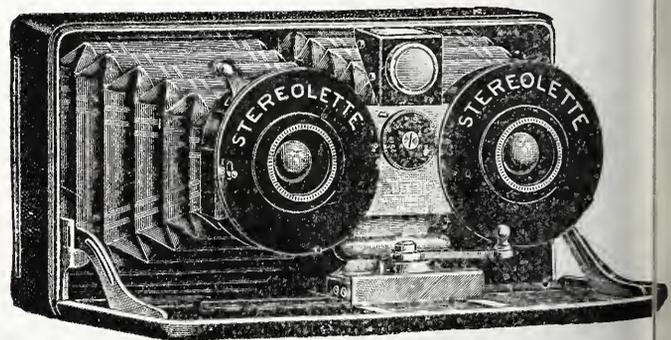

This series of magazine cameras is another instance of the excellent value in cameras of this description being turned out from the Altrincham factory. The changing mechanism is the same in all, and one which we can commend for its reliability. Exposed plates may be removed without disturbing those unexposed. The camera is solidly built, and covered in a good black grain leatherette, is provided with two reversible brilliant finders, and in the cheaper patterns—21s. to 35s.—with the Thornton-Pickard "Eclipse" shutter.

The A series—25s. to 40s.—have the "Sunbeam" shutter, giving in addition to the time, bulb, and instantaneous exposures, the very convenient automatic time-exposures of 1/8, 1/4, 1/2, 1, 2, and 3 seconds. A further De Luxe model of the camera is fitted with focussing scale, is brass-bound in the working parts, and has a detachable lens-panel giving immediate access to all parts of the lens and shutter. Cameras of this range of movement demonstrate the remarkable value for the sum of £1 or 30s. which is now offered by manufacturers.

The "Sterelette" Cameo Camera. Sold by W. Butcher and Sons, Ltd., Camera House, Farringdon Avenue, London, England.

Messrs. Butcher have this season provided the amateur worker with a variety of stereoscopic cameras and accessories at popular prices such as have not previously been at his disposal. Their special handbook, "Stereoscopic Pictures and How to Make Them," which is sent free on application, should be studied as an elementary introduction to stereoscopic photography, and as showing the very complete equipment, from the camera to printing accessories and viewing instruments, which Messrs. Butcher are able to offer. In the "Cameo Sterelette" a plate 4 1/2 x 1 3/4 in. is used (107 x 45 mm.).

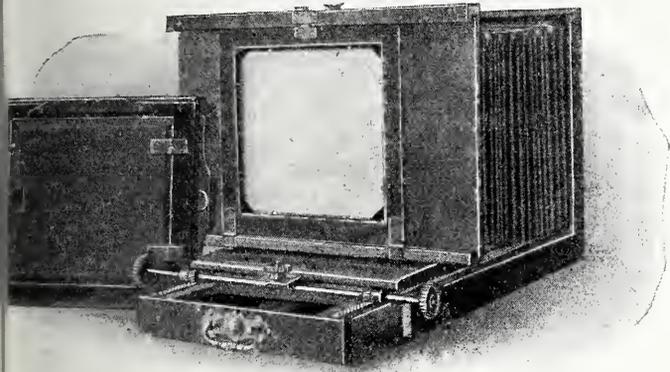

The tiny instrument is made throughout of light metal, and measures, when closed, under 3 3/4 x 5 1/2 in., and is barely 1 1/4 in. thick. It is provided with double everset shutter, having time, bulb, and instantaneous adjustments, level, brilliant finder and focussing scale from infinity to 4ft. At the price of £3 10s. the camera is fitted with a pair of R.R. lenses working at f/8, whilst for £8 it is supplied with f/6.8 anastigmats, and at £12 with Goerz f/6.8 "Dagors." It has a rising front and convenient diaphragm adjustment acting on both lenses simultaneously. The camera is designed to take

dark-slides, or, with special focussing screen, a film-pack ter.

"Millais" Studio Cameras. Made by the Camera Construction Company, Eagle Works, Durham Grove, Hackney, London, England.

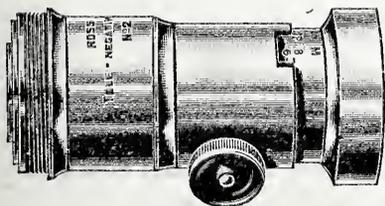

These are a new series of two studio cameras made in 9½ by 8½ 12 by 10 sizes. The smaller, which we have examined, provides total extension of close on 30in., obtained by a substantial and smooth working rack and pinion, and by an additional draw-out which is worked from the back of the camera. There is rise of lens, and the lens panel, which is 7in. square, allows of the largest size being used. The focussing screen is hinged on the lower side

to drop on the camera baseboard, and the single dark-slides and the camera back are very ingeniously made so as to take either whole-plate, one half-plate, two half-plates side by side, or two quarter-plates on the single half-plate, a range of movements sufficient for ordinary work of an average studio. Two slides are provided for each camera, and the outfit in its substantial construction does not belie the favourable impression created by its appearance. In the 8½ size the price is £7 5s., extra slides 18s. In the 12 by 10 size the price is £9, extra slides 25s.

"Ross" Telephoto Attachment. Made by Ross, Limited, 15, North Side, Clapham Common, London, England.

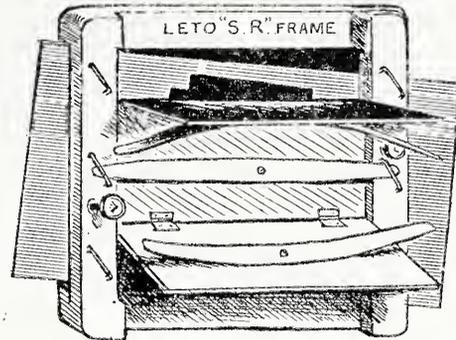

This is a very perfectly finished telephoto lens mount, the one submitted to us being fitted with a 7-inch Homocentric positive of f/6.3 aperture, and two negatives of 3 and 2½ inches focus respectively. The settings are made in several sizes, to suit various positive and negative lenses, and are fitted with focussing rack and pinion, and a sliding shutter showing the separation of the optical elements, while another sliding shutter is engraved on the complete instrument to show the approximate magnification. The complete objective is less bulky than many telephoto combinations of the ordinary type, and is highly convenient to use. Five different settings or tube mounts are available, and combinations of 1¾, 2¼, and 3 inches focus for use with any first-class anastigmat can be used as the positive element, the Homocentric being specially recommended. Messrs. Ross also supply a remarkably light and effective telescopic lens hood,

It screws into the front of the positive lens. This is an extremely simple and effective attachment, and trials have shown that the complete telephoto outfit as submitted to us is one of very great value and capable of producing the finest possible results, even though we are obliged to try it in conditions which were the reverse of favourable. The prices of the settings vary from £2 10s. to £3 12s. 6d., and the negative elements cost from £1 15s. to £3 5s. The extendible lens hood is only 15s., at which price it is by no means an expensive

The "Leto" S. R. (self-registering) Printing Frame. Sold by the Leto Photo. Materials Co., Ltd., 3, Rangoon Street, London, England.

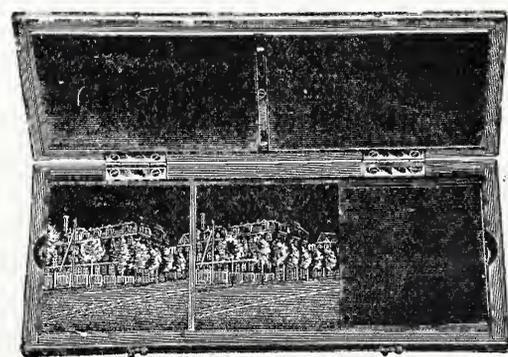

A printing frame of quite novel and distinct pattern has been introduced under this name, and provides facilities, such as photographers will appreciate, for double printing and for taking off prints from portions of negatives. The frame is built square, and provided on each side with a slot in which a register card is placed serving to fix the negative in a given place or to mask a portion of each negative. This adjustment once made, the card is clamped by

the two set screws, and any number of identical prints can then be taken off without further attention. The back of the frame is made in three pieces hinged together so that a full two-thirds of the print may be examined from either side at one time, the form of construction allowing of any part of the print being scrutinised during printing. This very convenient frame is made in two sizes: No. 1, 6½ in. square, and taking negatives up to half-plate size, and No. 2, 8½ in. square, taking those up to whole-plate. The prices, 6s. and 7s. 6d. respectively, include the necessary reversible carriers for smaller negatives.

The "Primus" Stereoscopic Transparency Printing Frame. Sold by W. Butcher and Sons, Ltd., Camera House, Farringdon Avenue, London, England.

In this little accessory the makers have conveniently provided for the printing, from the undivided stereoscopic negative, of a transparency by contact, ready for observation in the stereoscope. This is done by making the frame of such dimensions that when the negative is pushed to one end and the transparency plate to the other the portions which overlap come exactly opposite the central opening, which is provided with a brass sliding shutter. The relative positions of negative and transparency having been reversed, a second exposure is given and the plate developed. The frame is

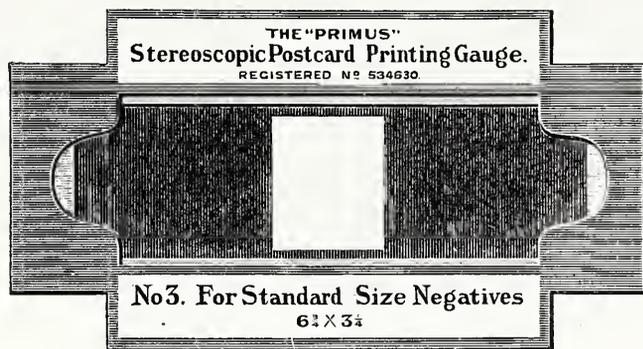

made of a size for the "Stereolette" Camera (4½ x 1¾) for 4s. 6d., or of the standard, 6¾ x 3¼, plate at 6s. 6d., in each case being well made in polished wood, and provided with spring contact pressure board.

Stereoscopic Postcard Printing Gauges. Sold by W. Butcher and Sons, Ltd., Camera House, Farringdon Avenue, London, England.

The principle of the transparency frame just mentioned is extended in these cases to development or printing-out papers. The gauge consists of a stout cardboard in which is an aperture the size of the stereoscopic picture, say 1½ in. in the case of the "Stereolette." There are two series of stops on the gauge, one for the negative and another for the postcard. In printing, the negative is

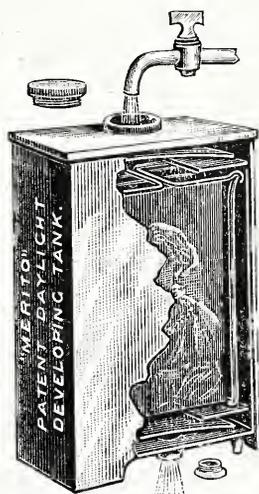

pushed up to the right-hand stop and the postcard to its left-hand stop, exposure given either by printing-out or exposing to artificial light, and the relative positions of postcard and negative reversed—that is to say, the postcard pushed to the right-hand stop and the

negative to the left. A second exposure gives the complete stereoscopic card, which is then toned or developed. These very inexpensive and convenient gauges are supplied for negatives 4 1/4 x 1 3/8, 1s. 3d. each, for postcard negatives 5 1/2 x 3 1/2, 1s. 3d. each, and for 6 3/4 x 3 1/2, 1s. 6d. each.

The "Merito" Developing Tank. Made by W. L. Parkinson, Ltd., 5, Commutation Row, Liverpool, England.

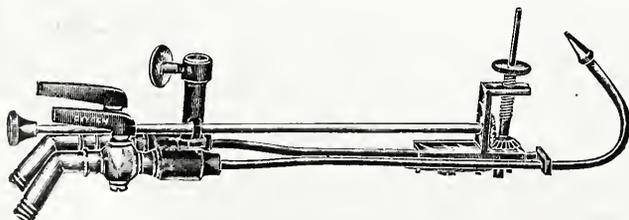

In this new pattern of developing apparatus the developing tank proper is covered by a second inverted tank which protects the contents of the first from light, while, however, the inner tank can

have the developer run off from the bottom, and hypo or water run in from the top, in each case by means of a screw-cap. The quarter-plate tank is made to hold six plates, and costs 6s. 6d.; other sizes in proportion. The apparatus is well made in nickelled metal, and its excellent feature of providing the means of using it as a washer as well as a developing tank should recommend it to the amateur worker.

The Beard Oxygen Acetylene Jet. Made by R. R. Beard, 10, Trafalgar Road, Old Kent Road, London, England.

Mr. Beard, whose long practical experience in the lantern trade qualifies him for the task, has designed a limelight jet in which

acetylene is used in place of coal gas, the jet thus serving for use in many places where coal gas is not obtainable. It can, however, be used for coal gas, although at the expense of efficiency.

The acetylene generator should be one of the gas-holder type which allows automatic generation of the gas. The oxygen is admitted to the gas at a pressure not below 5lbs. per square inch, and up to 15lbs. the higher the pressure the greater the light. In

lighting the jet it is advised that the oxygen be turned on and then the acetylene. The adjustment of the gases is done by the two taps, but, as a rule, only adjustment of the acetylene is required. Over 2,000 candle-power has been obtained by this method and where only a small but powerful point of light is required stands first of all other illuminants, except electric arc. The price is £1 5s.

Express" and "Victo-Superbe" Stand Camera Outfits. Made by Houghtons, Ltd., 88 and 89, High Holborn, London, England.

The movements which a camera issued at such low price as 57s. 6d. in half-plate size—complete with lens, shutter and tripod—possesses, surprises those of us who recollect the prices which were paid for similar facilities fifteen or twenty years ago. In the "Empress" set Messrs. Houghtons cater for the purchaser of a modest purse, yet they provide an instrument which has great range of front, swing front, swing back, and double extension to the total length from lens to plate of 17 inches. The back, too, is hinged forward for wide-angle work, and the whole outfit, though not advanced as an example of the fine cabinet-making which is met in the "Sanderson" and other cameras of the firm, is nevertheless made to withstand a good deal of wear, and is yet sold complete with R.R. f/8 lens and one slide at the price we have named, 57s. 6d., or £2 7s. 6d. in quarter-plate, and £4 12s. 6d. in whole-plate.

In the "Victo-Superbe," which is sold in half-plate size only, complete with Beck f/8 R.R. lens, roller-blind shutter, tripod and one double slide, at £4 4s., we obtain, at the same time as a more substantial construction, the added convenience of a rack and pinion adjustment for the wide-angle movement. This convenience in a camera at a price intermediate between the popular 70s. sets and the high-priced instruments should recommend this variety of the "Victo" to users who appreciate, as we do, the convenience of the back rack and pinion.

The "Ibso" Diaphragm Shutter. Sold by Ross, Ltd., 3, Northside, Clapham Common, London, England.

To this very convenient diaphragm shutter, in addition to the usual time adjustments, is fitted with a setting, C, on turning the plate to which the shutter is locked, that is to say, pressure on the release does not open the aperture. A camera thus provided is secure against

accidental exposure of the film or plate by the closing of the release board, and the adjustment serves the further purpose of preventing the plate being exposed when the camera is in the hands of strangers. Including the "Antinous" release, the price of the shutter is 12s.

The Double Protar Series IV. Anastigmat. Made by Carl Zeiss, Jena, Germany; and 29, Margaret Street, London, England.

This series of lenses has been brought out to replace the famous Series VI. Protar, having the same aperture as those lenses, viz., f/6.3, and, being like them, convertible. They are, moreover, marketed at a price substantially lower than that of the Series VI., and are obtainable with foci of from 3.4 to 16 inches. The specimen submitted to us has a focal length of 5 1/2 inches, and full aperture of f/6.3, and a test on the camera shows that it covers a half-plate at full aperture with critical definition right to the corners, which, we believe, is more than the makers claim for the lens. The combinations are of 10 inches focal length, and give very fine definition indeed over the same size plate at their full aperture, 2.5.

s particular objective, on account of its symmetry, should be specially well adapted to near work, and its performance, leaves nothing to be desired in any of the conditions in which we tested it. It is very small and compact, and the photographer could hardly possess a more useful lens for general all-round work. A spare hood is supplied for use when the front combination is removed and the back one alone is being employed. It should be added that the lens is made, in a number of cases, with components of dissimilar focal lengths. Thus the No. 4-3 of 5.4 inches focus and $f/7$ aperture, has combinations of 9.1 and 9.8 focal length. Its price is £6 10s.

"Premo" Film Pack Developing Tank. Made by Kodak, Ltd., Clerkenwell Road, London, England.

This tank developer accommodates twelve films such as those included in the "Premo" film pack, which are placed bent, as shown in the illustration, each in a separate division of the beehive-shaped

Here they get even exposure to the developer, since the tank is provided with a water-tight lid which allows of its being opened at intervals. The tank and rack are strongly made in polished metal, and cost in quarter-plate, postcard, or 5 x 4 size (holding twelve films), 16s.; or to take six 7 x 5 films, 18s. 6d.

Sanders "Shafta" Camera. Made by Sanders and Co., 71, Shaftesbury Avenue, London, England.

Under this name a camera of the hand-stand pattern has just been introduced on the market primarily for use in natural history photography, although its movements in no way unfit it, but rather well qualify it, for all descriptions of photography with an instrument of hand or stand type. It possesses rack and pinion extension in three directions, giving a length of bellows of 16½ in. from lens to plate in the 5 x 4 size. This movement towards both back and front enables the camera to be supported on the tripod head in the most convenient position when at the full extension. The back swings both up and over a considerable angle, whilst the front is given a full rise, and is also able to swing to any degree. The shutter fitted is the "Ornton-Pickard" roller-blind, both it and all the other portions of the camera being of black finish, with the exception of the outer ring, which is of the dark green leather adopted in the same makers' "Birdland" reflex camera. The instrument thus is inconspicuous in appearance, even to the lens, which is supplied in a leather mount. Complete with reversing back, brilliant finder, and focusing scales, and three double dark-slides, but without lens or filter, the price of the camera is £4 10s. in quarter-plate size, £5 10s. in 5 by 4, and £6 10s. in half-plate.

"Moss-Abingdon" Acetylene Generator. Made by R. J. Moss & Sons, 98-99, Snow Hill, Birmingham, England.

This new generator is made for use with ordinary lump carbide. The apparatus is a combination of the "Moss" and the well-known "Abingdon," and the makers claim that it combines the best features of both. It certainly works with wonderful steadiness; there is no up and down movement, with consequent variation of pressure and fluctuating light, but a steady, gradually downward movement only as the carbide is used up. This also shows how the carbide is used, and is one feature which should recommend it to lanternists. An entire absence of mechanism or rubber rollers is a most welcome point, and should be specially valuable to lanternists in remote districts. The generator is made in three sizes, 1½ lb., and 2½ lb., and is listed at prices as follows:—1½ lb. £22s. 6d.; 1½ lb., 26s.; 2½ lb., 32s. 6d. Messrs. Moss have introduced a square tank pattern of all their generators. They have a good appearance, and as the gas outlet tap is placed in one

of the corners it is less liable to be damaged in transit, besides which the gas is taken by a straight pipe from the top of the condenser chamber, therefore a stoppage by water (condensed) in the pipes is almost impossible.

The "Quick-Change" Anti-Reflection Telephoto Attachment. Sold by A. E. Staley and Co., 19, Thavies Inn, Holborn Circus, London, England.

Both lightness and efficiency are obtained in a new design of the telephoto tube (if we can call it a tube) which Messrs. Staley have just introduced. In place of mounting the negative lens at the rear end of a solid tube a skeleton framework is employed consisting of two metal rings, one carrying the negative lens and the other made to engage with the back portion of the positive. The attachment of the negative element is thus quite as rigid as when a tube is used, whilst the advantage of dispensing with the solid wall of the tube is that reflected rays from the positive lens, instead of falling upon the surface of the negative element, fall upon the bellows of the camera by which they are absorbed or intercepted. The idea is very simple, but it should certainly make for more brilliant results in telephoto negatives, while it has the further advantage of reducing the weight of the telephotographer's outfit.

"Kibitz" Folding Cameras. Sold by A. E. Staley and Co., 19, Thavies Inn, Holborn Circus, London, England.

In this series of folding pocket-cameras, which Messrs. Staley are fitting with their own and other standard lenses, the focussing movement is very ingeniously controlled by a system of lazy-tongs levers connecting the back frame and the front, the focussing scale being on one side of the back frame of the camera. The construction has the good feature of allowing the focussing scale to be left set for objects at any given distance, and on the camera being re-opened it is pulled out and automatically caught again in focus for these objects. The cameras have good rise of front one way of the plate, a very neat direct-vision finder, which folds over into the camera, and, in the 3½ by 2½ size, accomplishes these facilities in the small space of slightly less than 5 by 3½ by 1½ inches. The instruments are made in quarter-plate and other sizes, and are also obtainable as stereoscopic cameras.

The Steinheil "Triplar" Anastigmat $f/3.8$. Sold by A. E. Staley and Co., 19, Thavies Inn, Holborn Circus, London, England.

This new lens of the old-established Munich firm of opticians is sold in five sizes, from 3 in. to 16 in. focal length, the aperture of this last and longest focus lens being $f/4$. The shortest focus lens, 3 in., is intended chiefly for cinematograph work, and covers a plate ¾ in. square. The longer focus instruments are specially suitable for hand-camera work and studio portraiture. The lens, which is of the triplet type, gives very crisp definition and evenly illuminated field, whilst its covering power fits it also for photographs of groups, and, in conjunction with a negative attachment, for telephotography. The lens is supplied in a focussing mount of very good mechanical construction. The prices of the "Triplar" range from £4 for the 3 in. lens to £18 5s. for the 12 in. lens, suitable for use as a cabinet portrait lens.

The Ross-Zeiss "Tessar" Cinematograph Lens. Made by Ross, Ltd., 3, North Side, Clapham Common, London, England.

This is an $f/3.5$ lens of three inches focal length, specially designed for use in the cinematograph camera, and in the small circle of 3½ inches that it covers its quality is fully up to the standard which we expect with the "Tessar." This should prove a most valuable lens for the purpose that it is intended to fulfil, and the advantage of a rapidity of $f/3.5$ in cinematograph work needs no comment. The angle that the small cinematograph picture subtends is, of course, not large, but within this small angle the lens defines perfectly at full aperture.

The Airole Double Action Pump. Made by the Airole and Litho Syndicate, Ltd., 35, St. Bride Street, London, England.

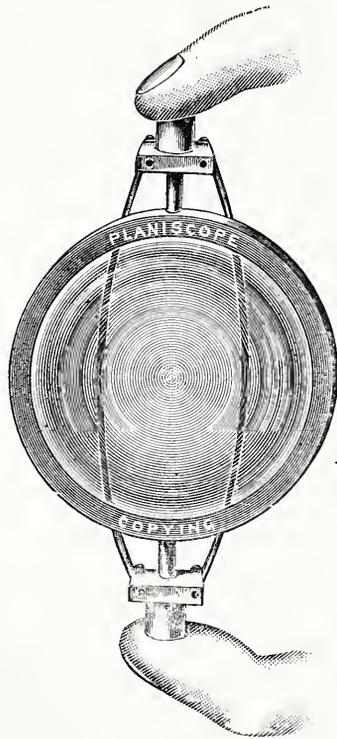

This convenient force pump is an addition to those already made by the Airole Company for use with the well-known air-brushes of their manufacture, and has the good feature that the lever is active in both directions of the stroke, and, with a minimum of exertion, gives a pressure of three atmospheres. The reservoir is provided

with pressure gauge and a pair of connections allowing of two air-brushes being worked from it. It is very substantially made, and sold at the price of £4 10s.

The "Moto" Dark-Room Lamp. Sold by W. Butcher and Sons, Ltd., Camera House, Farringdon Avenue, London, England.

This new pattern of dark-room lamp, very strongly built, somewhat on the design of a motor-car lamp, is made entirely of metal, the reservoir, which carries a good size burner, being outside, and the lamp being provided with two circular safelights (ruby and amber) $3\frac{1}{4}$ inches in diameter, either or both of which may be used. One good feature of the lamp is the large handle, enabling it to be conveniently carried about the dark-room.

NEW MODEL PLANISCOPIES.—The various supplementary lenses supplied by Messrs. John J. Griffin and Sons, Ltd., Kingsway, London, England, for the conversion of the amateur photographer's own lens into a wide-angle, portrait, or telephoto instrument, are now issued of the new form shown in the drawing, whereby attachment to a lens hood or barrel, which may be smaller than the "Planiscope" lens, is quite conveniently done. The pair of

nickelled springs, when compressed by the two plungers, form a spring attachment which holds the lens firmly in position, and yet allows of even a comparatively small lens being grasped with equal firmness. As before, the "Planiscope" are issued at the price of 5s. each for lenses from $1\frac{1}{4}$ to $1\frac{1}{2}$ inches, 6s. 6d. each for lenses from $1\frac{1}{2}$ to $1\frac{3}{4}$ inches, and 7s. 6d. for lenses from 2 to $2\frac{1}{4}$ inches.

THE 1909 "N. AND G." REFLEX CAMERA.—In the new model of this renowned standard instrument a somewhat important alteration has been made, namely, the introduction of a different pattern of hood. Hitherto the hood of the N. and G. reflex has been erected on two aluminium struts pulled up from each side of the camera, and supporting the wooden nose-piece from which the ground glass was observed either with or without the aid of a magnifier. In the new pattern this type of hood has been entirely discarded, and the more usual collapsible form held by a light metal strut is employed, the hood itself folding up and being covered when out of use by the hinged top of the camera to which is fixed a carrying strap. The ground glass is thus fully protected, and the alteration does not affect the convenience with which the ground glass is rendered accessible for dusting or wiping. The base of the hood is fixed to a metal frame, which is instantly detached as in fact is the complete hood, the upper portion being held to the inside of the hinged back of the camera by a couple of studs sliding in struts.

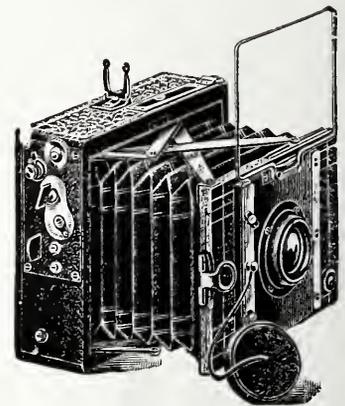

In addition to this change, a release for the shutter is provided

on each side of the camera, and further a camera strap is provided on the side and top of the camera, the spring catch of the lid being of the full strength and length necessary to hold the lid

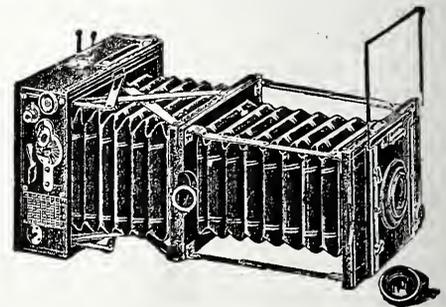

closed. Messrs. Newman and Guardia, Ltd., we may add, have just removed to 17 and 18, Rathbone Place, Oxford Street, London, England.

"NETTEL" FOLDING CAMERAS.—An example of the series of old-focal-plane cameras sold under this name by May and Co., 22, St. Paul's Road, Seacombe, Liverpool, England, shows that the instruments are designed with careful regard to practical require-

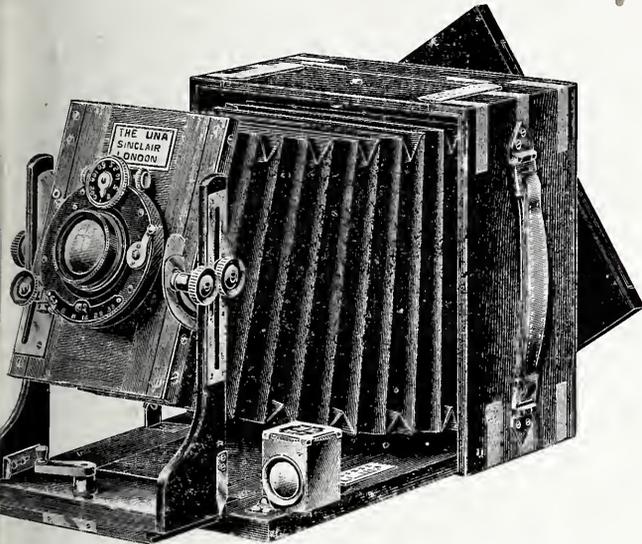

ments. Focussing is done by means of a milled screw on the back of the camera which operates a series of levers reducing or increasing the extension. An extension piece giving an additional distance of $6\frac{1}{2}$ in. is supplied for use with the "Nettel," and is a useful acces-

sory in doing telephoto or long-focus work, since it closes the dimensions of $4\frac{1}{2} \times 6 \times 1\frac{1}{2}$ in. The "Nettel" cameras are adapted for the use of single or double metal slides or for the convenient envelope adapter.

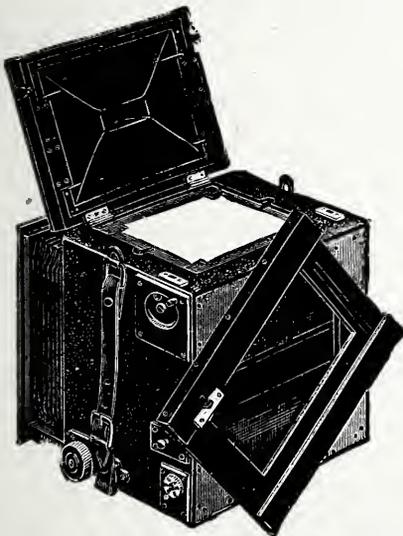

THE REVOLVING BACK "UNA" CAMERA.—Messrs. James Sinclair and Co., Ltd., 54, Haymarket, London, England, have added to the convenience of their very practical and well-made "Una" camera, a revolving back which allows of the plate, while sitting for exposure in the dark slide and with the shutter of the latter drawn, being quickly changed from the upright into the landscape position, a point of importance to the hand-camera worker. Further, a central swing front is now provided which, while not in a way depreciating the rigidity of the front, which the makers have

a feature of the camera, provides the greatest range in the f swing. This latter is brought into action simply by loosening the screw, and is fixed at any point by tightening it again. In this position the front can be raised or lowered just as though the

panel were in its usual vertical position. These improvements do not increase the bulk of the camera, and the quarter-plate outfit complete with lens and shutter ranges from £7 17s. 6d., in the standard model to £8 7s. 6d. for the polished teak, brass-bound model as illustrated.

THE LANCASTER "PLANO-REFLEX."—The 1909 model of this square format rotating back, double-extension reflex, the features of which have previously been described, has an extra convenience given to it by the provision of an automatic mask which works underneath the focussing screen and shows the exact picture, upright or hori-

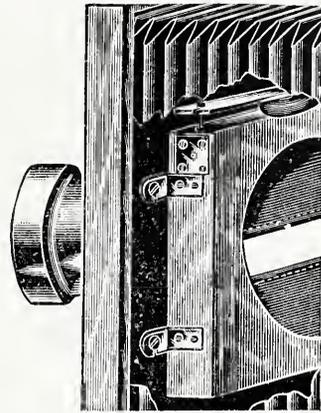

al, being thrown upon the plate. The camera is now made in quarter-plate, 5 x 4, postcard, half-plate, and 7 x 5 sizes, the price, without lens or dark slide, being £7 15s. in the quarter-plate

THE ROSS HOMOCENTRIC CINEMATOGRAPH LENS.—In this lens the makers supply a cinematograph lens of 3in. focal length, but of aperture f/4.8, and covering a circle of 4½in. This is a very highly corrected lens, of quality equal to the well-known "Homocentrics" of other types, and it would obviously be well adapted for use on a ½ x 2½in. plate. On such a plate it would include a moderately wide angle, and might be of exceptional value at times. The small cinematograph picture is, of course, covered perfectly at full aperture, and for this kind of work a better lens can hardly be wished for, excepting when a larger aperture such as that of the Ross "Tessar" is required.

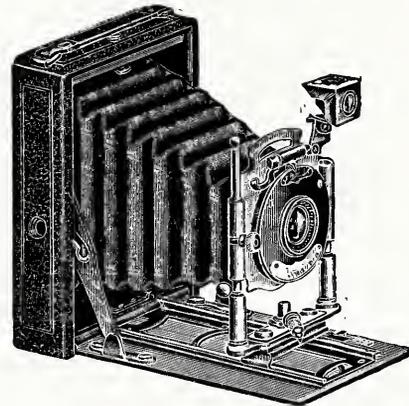

THE THORNTON-PICKARD PATENT SILENT STUDIO SHUTTER, NEW MODEL.—In the 1909 pattern of this shutter an improvement has been made in the lever release which renders the action of the shut-

ter still more smooth and certain. An ebonite tap is also provided on the pneumatic release, so that when keeping the shutter open for focussing or when giving long time exposures, the shutter may be

opened by pressure on the ball and the tap turned off in order to keep the shutter open as long as may be desired. The simple action of the shutter, two separate blinds, each rolling up on its own roller, gives a very silent action, and allows of exposures from ½-sec. long as desired. The shutter is sold for lens hoods from 2in. to 5in. diameter at prices from 20s. 6d. to 47s. 6d.

"ELF" FOLDING POCKET CAMERAS.—The series of cameras sold under this name by The Tella Camera Co., 68, High Holborn, London, England, is introduced to us in the shape of the 3½ x 2½ size instrument, which conveys the idea of the compactness of the camera in the fact of its outside dimensions being 4¾ x 3½ x 1½ inches.

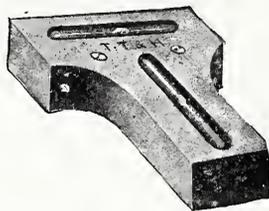

The extended camera, however, provides considerable rise of front, reversible finder focussing to 6ft., and time, bulb, and instantaneous shutter. The plates are carried in the convenient single metal holders, three of which are included in the price of the apparatus, which is 37s. 6d.

COOKE LENSES IN COMMERCIAL SHUTTER.—A form of mounting of the Cooke lens, which many photographers will appreciate, is that recently introduced by Messrs. Taylor, Taylor, and Hobson, of Stoughton Street, Leicester, England—namely, the supply of the lens in two separate cells, which can be screwed direct into the front and back tubes of a number of the popular diaphragm shutters, such as the Bausch and Lomb, "Volute," "Automatic," and "Unicum" in the No. 1 sizes, the 2A "Koilos," the No. 1 "Compound," and the Kodak "Automatic." The owners of these shutters may thus obtain a Cooke anastigmat in two separate parts which require only screwing into the shutter to be in correct optical adjustment.

DRY MOUNTING MACHINES.—Messrs. Hyde and Co., Chester, England, have introduced a new machine exactly on the same lines as their No. 1, now used in many parts of the world with great satisfaction. It is not convenient for every one to have a machine so large and so heavy as the No. 1 machine, which mounts 20 x 14 at one pressure. The present machine, No. 9, therefore has a platen 15½ x 12, and will take a mount 17½ between the uprights. This covers all sizes of enlargements usually made, and gives a very large range to the photographer. A print 20 x 16

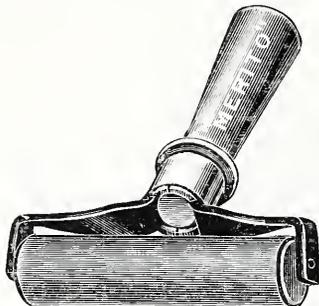

can with a little manipulation be mounted, and one of 24 x 15½ is quite easily arranged for. The price of the machine is £5 5s.

DOUBLE TUBE LEVELS.—Messrs. Taylor, Taylor, and Hobson, Ltd., Stoughton Street, Leicester, England, have long made special patterns of spirit levels for cameras, presumably as an outlet for the beautiful mechanical workmanship which characterises their lens mounts and other optical manufactures. A new pattern of level is that shown in the illustration which is designed for camera-

makers and others who require a double-tube level of as compact a form as possible. The level looks better than the usual square pattern, and may be obtained either bright, lacquered, or nickelled. Moreover, the level has that nice steadiness of movement which fits it for practical work, a level which is ultra-sensitive to the slightest tilt of the camera is a nuisance for practical photography. The price of the level is 3s.

THE "MERITO" ROLLER SQUEEGEE.—A special pattern of roller squeegee of very strong construction is made by Messrs. W. L. Parkinson, Ltd., 5, Commutation Row, Liverpool, England. It embodies the means of providing a very free-running roller. The rubber

band is prevented from shifting by means of a brass ferrule at each end of the roller, and, further, the arms of the squeegee are fastened to the handle by a plan which ensures very great strength. The squeegee is altogether an article to stand hard wear and tear, and is sold in the 6in. size at 1s. 6d.

THE "CHALLENGE" TRIPLE EXTENSION TROPICAL OUTFIT.—A brass-bound pattern of the excellent half-plate camera issued for the home market at the popular price of 75s. is made by Messrs. Lizars, of 101 and 107, Buchanan Street, Glasgow, Scotland, for £4 15s., inclusive of lens, time and instantaneous shutter, tripod, and double slide. The camera in its tropical edition is brass-bound, and with the woodwork of teak. The great rise of front—3¼in.—and the total extension of 24in., together with the wide-angle movement for the use of short focus lenses, render it an excellent piece of apparatus for the most varied descriptions of photography.

THE BEARD PRESSURE REGULATOR.—A modified form of this well-known gas regulator has been introduced by Mr. Beard, to provide for those occasions when the regulator is required for other purposes than limelight. In the new model the pressure can be adjusted to meet these wants. The regulator is fitted with two pressure gauges, one showing the pressure contained in the cylinder and the other the outlet of the regulator pressure. To adjust the outlet pressure the milled head is turned until the index of gauge shows the required amount. This should be done while the regulator is in use. Price £3 3s.

P. AND M. BACKGROUNDS.—A number of specimens of this standard make of background have recently been shown to us by Mr. C. A. Rudowsky, 89, Chiswell Street, London, England, who for many years past has been supplying them to professional photographers in all parts of the world. The series, we were interested in observing, is kept quite up to date in style and suitability to modern requirements, and the backgrounds in flatted oil or dis-

temper are sold in 8ft. x 8ft. size at a price of 45s. exterior 50s. interiors. Foreground pieces, 6ft. x 8ft., of the same quality are supplied at 15s. each.

A WATER TROUGH FOR PROJECTION LANTERNS.—For use in lantern for cutting off the heat rays, especially when projecting chrome slides or for the cinematograph, a tank has been made by Mr. R. R. Beard, with circulating tubes. It can be fitted above the lantern or in any more suitable position. The use keeps the slides or films cool, prevents scorching or burning, and will be found a most efficient method of preventing fire when the cinematograph is used. The tank has been in use at the Royal Photographic Society's Exhibition Rooms with the best results.

IN THE 1909 MODEL of the "Argus" reflex camera of Messrs. W. Watson and Sons, particulars of which we have given on past occasions, an improvement has been made of real convenience to the many workers employing the camera for Press and similar descriptions of photography—namely, the provision of a rack and pinion adjustment to the rising front. The camera retains many other good features as the instant accessibility of the ground glass for cleaning, and the automatic covering of the plate by the mirror after each exposure whilst the shutter is rewound.

A STUDIO SETTEE.—Of accessories for the professional photographer, of which Messrs. F. E. Jones and Co., 22, Gray's Inn Road, London, England, have originated a number of varieties, a new piece of furniture in the shape of a handsome settee of the Quatorze style is the latest introduction of this firm in this section. The article of furniture, which is made in solid mahogany, is of ornamental pattern, prices and freightage being obtainable on application to Messrs. Jones and Co.

RUBBER LANTERN TUBING.—The Thornton-Pickard Co. have now commenced to supply a rubber tube, either black or red polished of the same superior quality sent out with their various shutters as also a further special quality under the name of "Arabesque," which is recommended for its greater durability. Those using gas, either from the mains or from cylinders, for enlarging or lantern work, may be glad to obtain their supplies of tubing from this photographic house.

WASHABLE STUDIO ACCESSORIES.—A novel departure in accessories for the studio in the way of casement windows, etc., is made by Messrs. W. L. Parkinson, Ltd., 5, Commutation Row, Liverpool, England, by whom a series of these goods is now made in wood, lightly but strongly constructed. They are supplied of any required tone or colour, and are readily cleaned when dirty. The price ranges from £4 4s. for a casement window fitment.

A MINIATURE DEVELOPING TANK.—Messrs. Sanders and Co., 71, Shaftesbury Avenue, London, England, supply this neat little developing tank, which is made to take plates for cameras such as the "Blocknote"—that is, of size 1¼in. by 2in. It accommodates twelve plates, each held in a separate dipper. The tank is very nicely made in copper, and is fitted with a light-tight hinged lid. The price is 5s.

THE NEW "BROWNIE" CAMERA.—The latest addition to the "Brownie" series of cameras is one taking a quarter-plate and supplied inclusive of achromatic lens (with three stops), tank finders, time and instantaneous shutter, and two bushes for the tripod screw, at the price of 17s. 6d. The camera is made to take the No. 3 Folding "Brownie" or the No. 3 "Bull's Eye" black spools.

Wellington "Contrasty Enammo" Bromide Paper. Made by Wellington and Ward, Elstree, Herts, England.

In this new brand of bromide paper the makers have specially had in view the press photographer, the final destination of whose work—the half-tone proof—calls for extra vigour and brilliancy in the print, even though the adverse conditions under which he has frequently to work make against a negative of corresponding character. The paper is treated as regards exposure and development exactly as the ordinary Wellington "Enammo" paper, which has long been a standard article, but the results have much more pronounced vigour, their quality in this respect being perhaps slightly more marked than the Wellington S.C.P. (gaslight) paper. We found the paper to confirm the accepted high standard of the Elstree factory in the matters of cleanness of working and freedom

surface markings, and to give prints of fine vigour, and blue-colour. The paper should meet with general approbation in photography, despite the fact that in their "Carbon Surface" the makers provide a paper of the semi-glossy kind, which is fairly suitable for originals to be reproduced in half-tone.

Label "Zigo (Self-Toning) Paper. Made by Thomas Illingworth and Co., Willesden Junction, London, England.

This new variety of their well-known "Zigo" paper Messrs. Illingworth, whose name has become deservedly associated with self-P.O.P. of excellent quality, have effected further improvement in their manufacture, the result of which is, first, to facilitate production of a good tone in a plain hypo bath, and, secondly, greatly improved keeping qualities to the paper. So far as the first of these two claims we can fully confirm it, since the "Label" Zigo, printed from a decent negative—the self-toning of P.O.P. requires a negative of somewhat greater vigour than ordinary kind—gives very rich purple-brown tones on immersion in the plain hypo bath. The test of time alone can decide makers' claims as to keeping qualities, but our Colonial readers will see the easy and inexpensive means of applying to the makers a sample of the paper, and testing its behaviour on arrival at its destination. The paper is made in one surface only, the velvet or glossy variety, which is now perhaps the most popular description of surface for photographic papers in England.

Wellington "Press" Plate. Made by Wellington and Ward, Welwyn, Herts, England.

These plates Messrs. Wellington and Ward have catered particularly to the press photographer in providing an emulsion of very fine grain, yet one which yields full density in a short time of exposure, and also fixes rapidly. The maker of "news photographs," having usually to do his work under conditions which do not afford opportunities for meditation, is naturally anxious to use a paper which can be quickly put through to the wash water without loss of its quality, and this, in our experience of the new Wellington plates, can be done. The plates give clean, bright negatives of fine grain, and their properties, apart from the needs of the press photographer, are those which eminently qualify them for hand-work.

"Happy Thought" Camera Polish. Made by The Vanguard Manufacturing Co., Maidenhead, England.

The happy thought is that of the Vanguard Co., which in this connection to its numerous preparations for all kinds of photographic uses has added a means of reviving the woodwork of cameras, the photographer's furniture or panelling, in addition to a renovating action upon camera bellows, cases, or any kind of other goods. The preparation in practical use sustains the long-established reputation for efficiency, and should be a material of use to the photographer on many occasions. It is put up in tins, which sell in England at sixpence, post free eightpence, in larger quantities.

AUTOTYPE TISSUES AND TRANSFER PAPERS.—To the already long list of tissues which the carbon printer has at his disposal from the Autotype Co. a further seven varieties have just been added. These are: "Ivory black" (No. 94), "Cold bistre" (No. 102), "Turner sepia" (No. 142), "Green sepia" (No. 143), "Grey green" (No. 145), "Rembrandt sepia" (No. 160), and "Vandyke brown" (No. 169). Of these the "Ivory black" gives a print of bold, rich colour of great richness in the shadows, but preserving its fine grain and character in the more delicate passages. An excellent tissue for general work, and, of course, particularly for snow landscapes. The "Bistre" and "Turner sepia" are both tissues of distinctive colour, the latter more so than the former, as it is of a character which is perhaps a little too vivid for the taste of most photographers as a rule. The "Bistre," on the other hand, is a rich, old brown, which is very suitable for portraiture, particularly for the people. Of the other tissues, we like best the "Green" (it must be difficult for the Autotype Co., or anybody else, to give names for nuances of sepias) and the "Rembrandt sepia." The former has a tinge of olive green in its composition, but prints with the other tissues would be very acceptable for the portraiture work of a professional studio. A series of new transfer papers are still to be added, difficult to describe in words. No. 73, a dead-matt single

transfer paper of a pale tone, has a very nice surface and colour, whilst No. 74 is a slightly deeper cream and of albumen-like surface. No. 2,020 is a rough matt double transfer paper, whilst No. 75 is a cream tone semi-glossy paper also for the double transfer method.

AEROGRAPH WORK ON ENLARGEMENTS.—As an illustration of the remarkably effective use made of the Aerograph air-brush in professional photography, we may point out a pair of prints shown to us a day or two ago, one of which—a direct enlargement from a very defective negative—is a piece of work absolutely hopeless from a commercial point of view, being defaced by scratches and quite a variety of markings. A companion print, however, vignettted and worked up with the aerograph, has given a result which is almost incredibly different from the original. The enlargers, Messrs. Raines and Co., of Ealing, London, England, who keep seven aerographs in constant use, have not only removed the irritating background, the scratches and markings, but also the hand and braceleted arm of the lady, her waistband, and other portions of her attire, the untidiness of which had defaced the original photograph. Another example in colours of aerograph working up, also by Messrs. Raines, has shown the effective use to be made of the air-brush method in this department of finishing photographic enlargements.

THE AUTOTYPE OIL-PRINTING PAPER.—A third variety of paper for the oil-printing process has been introduced by The Autotype Co., 74, New Oxford Street, London, England, in succession to the two "medium rough" papers which we have lately noticed. The new paper, No. 3, is a "white smooth," of surface perhaps best described as semi-matt—that is to say, of the almost dead smooth texture possessed by many of the bromide papers now made. Like the previous papers, it is readily sensitised, both in the ordinary way and with the Autotype Co.'s spirit sensitiser (which latter is the more convenient plan), and possesses plenty of toughness under the pigmenting brush. Damage of the gelatine surface is impossible, short of really ruthless treatment with the inking brushes, and the "oil" worker may take advantage of this paper and the two others in getting the maximum of quality given by the process. The paper is sold in the usual sizes, most useful of which perhaps are the 9 x 7 and 12½ x 10½, the prices of which are 1s. 6d. and 3s. 6d. per packet of one dozen sheets respectively.

AUTOCHROME PLATES.—An announcement which will interest all photographers, and particularly those in the Colonies, is that just made by the Lumiere N. A. Co., 89, Great Russell Street, London, England, of the reduction in the price of the Lumiere Autochrome plates to the extent of about 33 per cent. Four quarter-plates are now sold at 3s. instead of 4s. 6d., as formerly, and simultaneously with this reduction a modified method of treatment has been worked out by the makers, the full account of which we must postpone for the "Colour Photography" Supplement, which appears with next week's issue of the "B.J." Sufficient to say that in place of the six operations and a corresponding number of solutions, the plate simply requires two baths—one a developer and the other a reversing solution. This modification should still further popularise the use of the plates, which still hold the premier position among the materials at present available for the making of colour transparencies direct in the camera at one exposure.

"SATIN" GOLDONA (SELF-TONING) P.O.P.—This new variety of the Goldona P.O.P. evidently represents a response on the part of the makers to the demand for papers of the satin-like surface, something like a waxed print of the old days, and with somewhat more texture to it than the almost obsolete albumen print, although with all the detail of that process. Such subtleties of surface are difficult to describe, but the prints which we have made on the new Goldona show us that the makers, Messrs. John J. Griffin and Sons, Ltd., Kingsway, London, England, have secured this very pleasing quality with much success. Moreover, the rich brown tone given by the paper on simple fixation in a plain hypo bath harmonises with the surface. It may be added that during the present year each packet of the paper will contain a copy of the "Goldona" manual, which deals fully with the results obtainable with the self-toning papers.

SULPHIDE TONING "SCALOIDS."—To the series of compressed "Scaloid" chemicals manufactured by Messrs. Johnson and Sons, of 23, Cross Street, London, England, a set for sulphide-toning has been added, the use of which follows the usual method of bleaching

and treating in a darkening or toning bath, each bath being prepared by dissolving one "Scaloid" in 2ozs. of water. The preparation, as those who have used developers, etc., of Messrs. Johnson's manufacture do not need to be assured, provides a most convenient and reliable means of sulphide-toning bromide prints, the tablet method being particularly applicable in this case, since half of the troubles and failures with the sulphide-toning method are due to the use of an exhausted bleaching bath, or to a sulphiding solution which has become stale. The "Scaloids" are put up in boxes containing sufficient to make 48ozs. of toning bath.

THE OZOBROME PROCESS.—A new booklet of the Ozobrome process, the convenient method of making carbon prints direct from bromides, introduced and marketed by Ozobrome, Ltd., 122, Allcroft Road, Kentish Town, London, England, contains one or two revisions of the instructions which should be noted by those already working the process, whilst others may obtain the booklet gratis in order to familiarise themselves with this simplified form of carbon printing. When working from a veiled or flat bromide print it is convenient to use the following bath:—

Water	25 ozs.	1,000 ccs.
Citric acid	60 ozs.	5 gms.
Chrome alum	180 ozs.	15 gms.

The plaster (i.e. tissue) is immersed in this bath for not less than 15 seconds before being placed in contact with the bromide print.

THE "THAMES" COLOUR PLATE.—We learn that the Thames Colour Plate Company are now proceeding to coat the emulsion direct on to the filter plate, the plate being thus obtainable as a single-screen plate. A recent example of the manufacture which has come into our hands is a colour-photograph of the acetylene spectrum—the red, green, and blue—which are rendered with great intensity and transparency. A more important advance on the part of the makers is, however, the production of a plate of much finer structure—viz., one containing 250,000 colour points per square inch of area and of very regular formation. Plates of this finer grain are put forward specially for photo-micrographs, the makers finding that the screen as at present made is fine enough for lantern projection.

ELECTRIC LIGHT CARBON TISSUE.—Messrs. Thomas Illingworth and Co., Willesden Junction, London, England, in order to adapt their material to the now very general use of enclosed arc lamps for professional and trade printing of all kinds, have produced a special variety of carbon tissue of the quality of which we have had an opportunity of practically judging. The tissue is one which gives an enhanced degree of contrast, and thus obviates the flattening or softening effect of an intensely actinic printing light such as the enclosed arc. Carbon printers will no doubt be interested in making trial of a tissue specially lending itself to the production of brilliant prints.

BROMIDE AND GASLIGHT PAPERS.—Two new brands of gaslight and bromide paper, named respectively "Cello-chlor" and "Cello-brom," are just introduced by Mr. C. A. Rudowsky, 89, Chiswell Street, London, England. The papers are characterised by a very nice matt surface, and an ordinary amidol or metol-hydroquinone developer gives prints of rich gradation and fine black tone. They are certainly both papers of high quality. Sample prints and papers are obtainable from Mr. Rudowsky at the above address.

GRIFFIN'S P.O.P.—The makers, Messrs. John J. Griffin and Sons, Ltd., recommend this newly introduced P.O.P. of theirs for giving bright and vigorous prints, though our short experience of it has discovered that the results certainly do not tend to hardness, but have a certain soft brilliance which admirably fits the average hand-camera negative. The paper tones very readily, gives a very nice tone in the gold-sulphocyanide bath, and appears to require but little gold.

LINGRAIN-CHAMOIS BROMIDE PAPER.—The new "Chamois" variety of this paper of fine linen-like surface possesses a full cream colour, which goes well with the broken texture of the print, even if no toning is done, but still more so if the print is sulphide-toned by the usual method. Messrs. John J. Griffin and Sons, Ltd., Kingsway, London, England, who manufacture these papers, list both at the standard prices.

THE WELLINGTON "PORTRAIT SPEEDY" PLATE.—In speed these plates do not fall much short of the new "Press" plate of the Wel-

lington factory, of which we have been able to write in praise elsewhere, but they have an even finer grain, and give a negative of the highly graduated character necessary for portrait work. Their rapidity of fixation is a further good point in their favour.

"GRAMME" DRY PLATES.—In introducing these new plates, Messrs. John J. Griffin and Sons, Ltd., Kingsway, London, England, have to offer a product which is both highly sensitive and negatives of all necessary contrast. The plates are boxed in dozens for the convenience of small users, at the price of 6s. in quarter-plate size; 1s. 2d. in half-plate.

Despite the length to which these reviews have run, several had to be held over for lack of space.

CATALOGUES AND TRADE NOTICES.

TYLAR'S CATALOGUE.—The large 550-page list of W. Tylar, 41, High Street, Aston, Birmingham, England, is quite unique among photographic price lists, for Mr. Tylar, while cataloguing certain standard goods, is nothing if not original, and practically every page of the catalogue describes apparatus which is a special line with him. To mention only a few:—The clock, which at the end of a selected time caps the lens of an enlarger; a "liner" for putting lines round prints or mount openings; portable shelves and tables for dark rooms; cloud-catching shutter; in addition to many novel pieces of apparatus in the way of cameras, wadding-tanks, and dark-room lamps. One particularly useful accessory is the pocket bradawl and screwdriver of a size for manipulating the tiny screws used on cameras, which latter Mr. Tylar also supplies. The catalogue is obtainable, price 2s., which amount is refunded on receipt of an order to a total of £2 during the period the catalogue is in vogue.

THE BUTCHER 1909 EXTRA LIST.—The supplementary list of many novelties in apparatus, mounts, etc., introduced by Messrs. Butcher, is particularly worth getting, first by those who value experience the fascination of stereoscopic photography. Messrs. Butcher also have quite a series of new lines in cameras, and one very attractive and saleable series of goods is the bric-a-brac frame furniture consisting of useful articles made in fumed oak with space left for the insertion of an enlargement. These take the form of bookshelves, firescreens, or useful cupboard, and are sold at very moderate prices. The list is one which dealers ought not to omit to get.

THE LIZARS CATALOGUE.—The large 200-page list of this well-known Scottish photographic house has just appeared in a new edition, which includes full descriptions of the firm's many special manufactures in the way of hand, stand, and reflex cameras and other appliances. Messrs. Lizars, whose head establishment is at 101-107, Buchanan Street, Glasgow, Scotland, are also universal providers of photographic goods, and their new list shows them to be quite in touch with the latest requirements of photographers. The twenty pages of hints and formulæ (pp. 1 to 197) should be specially appreciated by Colonial workers.

CHEMICAL APPARATUS.—As a reference book for the many uses of chemical apparatus and chemical substances which a photographer of experimental tastes may require, the very full catalogue of Mr. A. H. Baird, 33 to 39, Lothian Street, Edinburgh, Scotland, is as useful a book of the kind as can be had, while many of the appliances illustrated, such as the patent automatic wheel, gun-taps and stop-cocks for gas and water, gasburners, hot-ter funnels, and drying cabinets are items of equipment which photographers, who would have the best, may be advised to investigate.

Mr. CHAS. J. MILLER, who for some five years past has held the position of manager of the photographic department of the Fairy Photographic Company, has relinquished this post in order to take up the duties of general manager of the London branch, which Messrs. L. Gevaert and Co., the well-known Antwerp manufacturers of photographic papers, are establishing very shortly. Mr. Miller will carry with him the best wishes of his many friends in the photographic trade in thus taking up the representation of the famous Continental house.

Photo-Mechanical Notes.

Spots in Collodion Emulsion.

found that emulsion is much more liable to spots in dry weather, and one large firm has therefore installed an apparatus to steam into the dark-room when the hygrometric condition of the sphere falls below a certain degree. Since they have taken this precaution spots have disappeared. To those working in a small dark-room a barber's scent-spray might be used with advantage. This has been found of great service in laying the dust in dusty dark-rooms.

A Convenient Varnish.

A solution of gum dammar in benzole, recommended by M.M. for Autochromes, forms a most suitable varnish for the negative used in process work. It need not be made up in a strength greater than 5 per cent., and is then filtered and allowed to settle; the clear liquid decanted off for use. The advantage of this varnish is that it can be used cold, and that it will take pencil with ease for retouching purposes if required. If it is desired very tough, then after it is set will make it so.

Photography of Catalogue Objects

The operator in a process studio frequently fails when photographing objects for catalogues, by reason of the incorrect lighting. Accustomed to copy pictures which require to be lighted perfectly on both sides, he overlooks the fact that solid objects must be lighted mainly from one side, so that the slight shadows thrown give necessary relief to an object in the round. The light should also be rather more from above than below, striking at an angle of about 45 degrees. The avoidance of too much front light, too much top light, and too much light from below would make a marked improvement in much of the technical photography that we have seen.

Photo-lithography by Bitumen Process.

A good deal of fine chromo-lithography has been, and is being done, by the grained bitumen process. A notable example of this is the view of Nuremberg, now being sold by Messrs. Winsor & Newton, and other print sellers. The process is as follows:—The metal plate is coated with bitumen solution and then exposed to a continuous-tone negative. This, on development, leaves a surface of reticulated grain, which is then prepared and printed in the lithographic manner. The irregular grain gives the lithographic artist an excellent opportunity of putting in hand work where it being conspicuous. The methods have hitherto been practically secret, but exact formulæ were given at a recent meeting at the L.C.C. School of Photo-Engraving and Lithography, by Mr. Guy Symmons, Manager of the Photographic Department of Messrs. Alf. Cooke, Leeds, who are one of the firms, if not the only firm, working such a process in England. They are as follows:—

	For aluminium.	For zinc.	For stone.
Asphalt	7 gms.	7 gms.	5.6 gms.
Chloroform	100 ccs.	100 ccs.	100 ccs.
Benzole	9 "	8 "	5 "
Alcohol	35 "	36 "	28 "
Ether	50 "	50 "	50 "

Only benzole that can be used in the above is the yellow benzole obtained from the gas works. Messrs. Fox and Co., Chemists, Bethnal Green Road, supply this readily. The whole of the grain lies with this substance.

It will be seen that the formula varies slightly according to the material on which it is coated, but variation in the grain may be obtained by varying the formula. If too coarse, more benzole must be added, and if too fine, more alcohol. The ingredients should be dissolved in the order shown, and the last items should be added very gradually drop by drop while stirring all the time. The coating of the plates should be done in a room at a temperature of 60° F., absolutely free from any draughts of air, and the plate warmed throughout by blood heat, slightly warmer at the bottom than at the top. Pouring should be done through a funnel direct on to the plate, coating from left to right, rocking the plate all the time. The plates will keep for months when coated, if put away in a dark cupboard.

A great drawback to the method is the long exposure required, a negative not at all dense 1½ hours in bright sunshine is

not too much or an equivalent exposure to arc lamps is necessary. This runs to much more if the light is at all weak. The developer is as follows:—

Benzole	8 ccs.
French turpentine	50 ccs.
Aniline oil	1 cc.

and a good deal may be done when developing the plate in the way of removing unnecessary work, when the operation is performed by a capable man.

Analecta.

Extracts from our weekly and monthly contemporaries.

A Vignetter Amenable to Control.

In "The Amateur Photographer and Photographic News" for March 23, Mr. H. E. Corke describes a form of vignetting card, the method of preparing which allows of very nice adjustment of the negative, while at the same time it leaves the negative untouched. Place the negative in a printing frame as usual, and as a precaution firmly attach the negative to the printing frame with small pieces or strips of gummed paper. Then take a piece of thin cardboard and cut a hole in the centre, just as in making an ordinary serrated shape, but pay no regard to the actual shape of the hole, which should, however, be a good deal larger than the actual size of the proposed vignette. This card is then attached to the front of the printing frame with drawing pins. Next paste a piece of tracing-paper over the hole, procure some opaque paint, such as yellow ochre or Indian-red, and mix into a thick cream with water and ordinary office gum.

Then, while holding the printing frame up to a window or to a gas flame, and looking through the negative, as if we were using a retouching desk, we can apply the paint to the tissue-paper, working backhanded, as it were. It will thus be seen that the utmost precision is possible as to the actual shape. The edges of the vignette can be made to register more softly by either applying the innermost line of paint less thickly or by making uneven brushmarks, similar to rough serrations. For the purpose of local control of printing density also, this same method is extremely valuable. Any part of the negative which prints too darkly can be effectively restrained by the application of a dab or two of colour on the tracing-paper.

WE HUMBL Y APOLOGISE to all concerned for any omission or compression this week of regular features of the "B. J." As a rule we include in each issue:—

- News and Notes—items of what is happening.
- Commercial and Legal—reports of trade disputes, cases of fraud, etc.
- Patent News—accounts of new inventions.
- Photo-Mechanical Notes—practical hints and trade news of photo-engraving and "process" matters.
- Correspondence—views of our readers.
- Answers—and advice to correspondents on technical and business matters.
- Reviews—of new books, apparatus, and materials.

Analecta—quotations of notable items from other British journals. In addition to articles and notes contributed by British writers, and translations of the best matter in the French and German journals.

The very complete Index to the annual volume is a feature of the "B. J.," the volumes of which thus become storehouses of readily accessible information.

Colour Photography.—The first issue of the "B.J." in every month is enlarged to find space for extra pages recording the progress in colour photography. This "Colour Photography" Supplement serves the purpose of a separate publication in this important branch of photography.

Regrets—Held over.—Several articles specially written for this issue must be held over. These include:—"Press Photography in Canada," by David J. Howell; "Bromil Printing," by Harold Baker. Colonial readers will please note that these will appear in issues of the "B.J." immediately succeeding the present one.

Answers to Correspondents.

- * * All matters intended for the text portion of this JOURNAL, including queries, must be addressed to "THE EDITORS, THE BRITISH JOURNAL OF PHOTOGRAPHY, 24, Wellington Street, Strand, London, W.C." Inattention to this ensures delay.
- * * Correspondents are informed that we cannot undertake to answer communications through the post. Questions are not answered unless the names and addresses of the writers are given.
- * * Communications relating to Advertisements and general business affairs should be addressed to MESSRS. HENRY GREENWOOD & Co., 24, Wellington Street, Strand, London, W.C.
- * * For the convenience of Readers, our Publishers, MESSRS. HENRY GREENWOOD & COMPANY, of 24, Wellington Street, Strand, W.C., undertake the registration of copyright photographs at a charge of 1s. 7d. each photograph, to cover cost of registration fee, form, etc. Two unmounted copies of each photograph must be sent with the fee.

WARDER.—If the inventor obtain only a provisional protection for his invention he has no right to mark it "Patent." He renders himself liable to a penalty of twenty pounds for doing so. Of course, as no patent was granted, you, or anyone else, can make the apparatus, not only for your own use but for sale.

J. J. J.—Any good, smooth, hard surface paper is suitable for colotype. Hard enamel papers, such as are very generally used in lithographic printing, are also very suitable. From what you say we do not think your trouble is due to the paper but to the plates. The coating is too hard, so that the water does not get into the gelatine film, hence the ink takes all over the plate. It may be that the plates are over-exposed.

NON-PHOTOGRAPHER.—Although you paid the photographer to come to your house to take the groups, and paid him the travelling expenses as per agreement, the negatives are his property, and he is quite justified in refusing to give them up. The point has been decided in the Law Courts several times. You are not justified in withholding payment for duplicates because the photographer will not give the negatives up to you: He can recover the amount in the County Court.

ALBUMEN PRINTS.—I am anxious to turn out prints like those done by professional photographers twenty or thirty years ago on albumenised paper. I have got some of —'s ready sensitised paper, but can only obtain red brown tones, and if I tone beyond that the prints go grey and have a mealy look. I got some unsensitised paper and sensitised it myself in a 60-grain silver bath, and with it I got rather deeper tones, but not the deep purple I want. I used the acetate of soda toning bath and employed it freshly mixed, so that the fault would not lie with that.—COUNTRY PRO.

A probable source of your trouble is that you have used the toning bath while it was too new. The acetate bath should not be used until it has stood for twelve to twenty-four hours after mixing, or it is likely to yield mealy prints. Another cause of your trouble may be the negatives. For albumen paper much more vigorous negatives are required than for P.O.P. Unless they be of that type it will be impossible to obtain the rich purple black of old.

STUDIO QUERY.—I am thinking of having a studio built as plan sent; should be greatly obliged if you would advise me on the following points:—(1) Should any alteration in the plan or situation, or the light, be made? This light I copied from the plan given in your paper last May, 1908. Do you think this is sufficient when the partition (dotted line on plan) is taken down for larger groups? (2) Which do you consider is the best end to operate from? (3) Could you advise any book on what kind of curtains to use, and how to fix them; also how to arrange them in lighting for the best effects?—A NEW READER.

The form of studio is good. There will be enough light for groups when the partition is removed. (2) The camera had best be put at the north-west end of the studio. (3) If you refer to page 659 of the "B. J." for August, 1907, you will find an article on the "Studio and its Blinds," which describes a method of arranging and fixing blinds, very applicable for a studio of the kind shown in your sketch.

A number of answers are held over until next week.

COLONIALS AND OTHERS, PLEASE NOTE.

MAY we address a word or two on this number of "The British Journal of Photography"? Though we take this occasion to review many new introductions in the way of apparatus and materials and have therefore to make short shrift of some regular features this issue should show you that the "B.J." is primarily a journal of photographic information. We sometimes lay stress on this feature by advertising it as "the photographic journal with the reading interest which is to say that our policy is to leave to others reproduction of what is alleged to be "pictorial photography," and to disseminate with the articles which repeat the matter of a good shilling text-book. But if you are interested in keeping in touch with new methods, processes, and materials, as they arise, our claim is that the service rendered by the fifty-two weekly numbers of the "B.J." is wonderfully cheap at the price of 13s., for which sum our publishers (public philanthropists) send the "B.J." direct, post free, for one year.

We make a point of giving the news of the trade and the profession, of dealing with the money-making side of photography, and of investigating quickly the new departures in any branch of camera work which appears of industrial or scientific interest. The "Correspondence" columns of the "B.J." provide every week some of the most interesting reading in the paper—side-lights on trade methods, experiences of practical photographers—and form a means of communication between distant workers which is open to all without fear or favour.

Scarcely less in interest are the "Answers to Correspondents," which are given by one or other of the staff of the "B.J.," care being obtained, if needed, from outside experts—a much appreciated feature of the journal, so we are led to believe.

Of our comments each week under "Ex Cathedra," and our determination to be as soon as any other journal—if possible, a little sooner—with news of photographic progress, it behoves us to say little, but to let our readers judge for themselves from the journal. These features may not impress the reader as intensely novel, but their solid value to the photographer at home and abroad has been attested over and over again by readers who have grown to our age during the fifty-five years throughout which the "B.J." has regularly appeared.

* * * * *

The publishers desire to draw the attention of photographers and photographic dealers abroad to their standing offer to send "The British Journal of Photography" free for one month from date of receipt of professional or trade card.

The annual subscription to the "British Journal," posted direct by the publishers, is 13s. (thirteen shillings).

Some foreign equivalents:—Canada, United States, Cuba, Hawaii, Philippine Islands, Porto Rico, etc., 3 dollars 17 cents; German Empire and possessions, 13 marks 26 pfennig; France and colonies, 16 francs 35 cents; Russia, 6 roubles 13 copecks.

Back numbers of the "British Journal" can be obtained when still in print for 3d., post free. Application in each of the above cases should be made to Messrs. Henry Greenwood and Company, Publishers, 24, Wellington Street, Strand, London, England.

* * NOTICE TO ADVERTISERS.—Blocks and copy are received subject to the approval of the Publishers, and advertisements are inserted absolutely without condition, expressed or implied, as to what appears in the text portion of the paper.

The British Journal of Photography.

The Oldest Photographic Journal in the World.

ESTABLISHED 1854. PUBLISHED EVERY FRIDAY. PRICE TWOPENNY.

SUMMARY.

Easter Holidays. Next week, in consequence of the holidays, "B.J." will be published on Thursday morning at 9 a.m. Advertisements to appear in that issue must arrive not later than post on Tuesday, April 6.

L. Haweis in the conclusion of his article on "British Columbia as a Field for British Photographic Enterprise," deals with such important questions as sampling, means of access to the coast, etc. He dwells on the coming greatness of the Canadian photographic industry. (P. 263.)

A short review of what is being done in Canada in the way of photographic work is contributed by Mr. David J. Howell. The Canadian and weekly press of Toronto and Montreal are the largest consumers of news photographs. (P. 265.)

A new method of preparing a mosaic screen-plate of coloured shellac has been patented. A means of determining the period of correct development has also been the subject of a patent. (P. 269.)

C. H. Hewitt has worked out a substitute for the Bromoil bath. (P. 270.)

American paper has given formulæ for preparing prints on parchmentised paper. (P. 267.)

Very work with the camera in general, and that of Surrey in particular, was the subject of the address by Mr. Hector Maclean in last week. Some very useful advice on the kind of photographic work desirable for such record collections was given. (P. 266.)

"COLOUR PHOTOGRAPHY" SUPPLEMENT.

Martin Duncan has recorded the result of a year's continuous working with the Autochrome plate. (P. 25.)

M. Lumière, while announcing reduction in the price of the Autochrome plate, have worked out a two-solution method of development. (PP. 26 and 32.)

Decisions and working methods of some members of the R.P.S. on the manipulation of the Autochrome plate are given on page 29.

Dr. von Hübl, in a lengthy article on the use of the Autochrome plate in the photography of objects illuminated by various artificial lights, has given formulæ for viewing- and taking-filters to be used when obtaining facsimile results. (P. 26.)

EX CATHEDRA.

An Opportunity for Professional Photographers. We learn on good authority that there are some good openings for photographers in the districts lying within reach of the Persian Gulf, especially in Bagdad. Although there is a constantly increasing demand for good portraiture, almost the only ones to supply it are itinerant photographers, who pay periodical visits to the various districts, without, however, making any serious attempt to organise business. The natives themselves have not so far taken to professional photography, though with the growing enthusiasm among amateurs it is only reasonable to expect that they may do so before very long. Therefore no time could be more favourable than the present for those who care to embark upon enterprises abroad. Another reason why intending photographers should establish themselves on the ground at once is the fact that the new Bagdad Railway is nearing its completion, and it is practically certain that this event will bring with it a large influx of Europeans, desirous of sharing in the profits to be had out of the country, and it goes without saying that photographers will add their quota to the number. Besides the possibilities awaiting portrait photography, there are indications that a good business might be done in pictorial postcards. The craze is catching on, and so far very little has been done in that line in the country itself. Most of the local views, for which there is always a demand in the press, are taken by chance tourists, or representatives of commercial houses during their journeys in the country.

* * *

Failures in Sulphide Toning. Mr. J. Brown, in a letter published in our columns of March 19, questions the formation of hypo in a decomposed solution of sodium sulphide, referred to in an abstract from "Photo Notes" published in our issue of March 12. In a leader on January 29 we dealt with the same matter, and pointed out how the presence of hypo in the sulphide bath accounted for the apparent refusal of prints to darken. There is, we believe, no room to doubt that sodium sulphide does decompose to hypo, for a completely decomposed solution will fix a bleached image out of existence. Mr. Brown's experiments on the effects of adding hypo to the sulphide bath do not form a parallel case to that of a decomposed sulphide bath, because he has the full amount of sulphide required present all the time. When the hypo is only formed from the sulphide by decomposition we have a very different state of affairs. The sulphide is steadily diminishing, and the serious trouble occurs when it is getting near the vanishing point. We see no cause to doubt that the explanation given in our leader is the correct one. That is, that the trouble is due to the replacement of sulphide by hypo. Mr.

Brown's theory that hypo in the bleacher is the cause is quite untenable. This would, as he says, destroy the finer details, and, in fact, the solution would form a reducer. When loss of image is apparent in sulphide toning it is not in the fine details that it commences, but in the deepest shadows, and this is only accounted for by the hypothesis that the hypo is present in the nearly exhausted sulphide.

Mr. A. R. Dresser and Amidol.

We were very glad to note Mr. G. T. Harris's reference last week to the use of amidol by the late Mr. A. R. Dresser, a notable worker who is too often forgotten. His formula will be found in the ALMANAC for 1894, page 761. We do not, however, think Mr. Dresser styled it an acid formula, or knew that an acid formula would act. He simply attempted to preserve the amidol in the same manner that he was accustomed to preserve pyro, that is, by dissolving one ounce of metabisulphite and one ounce of the developing agent in ten ounces of water. With this he used a 20 per cent. solution of potassium carbonate as an accelerator, and the final working solution was not acid, but alkaline. If he had used sodium instead of potassium carbonate he would have obtained a developer, acid to phenolphthalein, neutral to litmus, and alkaline to methyl orange, which would have corresponded very nearly with the modern acid amidol. So far as we know, he never tried an acid solution for developing at all, and, in any case, he very soon abandoned his 10 per cent. solution altogether, and fell back on dry amidol used with a stock solution of soda sulphite. We remember trying his metabisulphite formula on his recommendation, and finding, as he very soon found himself, that its keeping qualities were not very good. Mr. Dresser was, as Mr. Harris states, a very strong advocate of amidol, and so also was Mr. E. Hawkins, another prominent and very successful worker of the time. Mr. Dresser's work was remarkable for its size, and also for its boldness of treatment. His prints were, we believe, all bromide enlargements; but, unfortunately, he was devoted to uranium toning, and so probably few of the results are now in existence. Many were, however, varnished, and possibly these are still presentable. It would be very interesting to see them again and note how they compare with present-day work, but we have no idea where they are to be found. As a prolific and energetic worker he was unrivalled, and probably no other exhibitor ever secured such an array of medals.

* * *

Testing the Covering Power of a Lens

When a lens is said to cover a certain size plate there is always some uncertainty as to what is meant. A lens may "cover" a plate in three senses. First, it may give a disc of light big enough to contain the plate, without producing either sharp definition or even illumination over its whole surface. Many very poor lenses will "cover" fairly large plates in this fashion. Again, a lens may give fairly even illumination over a large plate without sharp definition to the margins. This is the case with many lenses of moderately good quality. They are so constructed that the full aperture is effective at fairly wide angles, but they are not very well corrected for oblique light at large apertures, though when stopped down they perform excellently. Then we have a third type of lens, so finely corrected that it will cover a very large plate with critical definition yet will not illuminate the whole of that plate evenly. The average photographer always interprets "covering power" as descriptive of the size of plate covered quite sharply to the corners at full aperture. This is what he also assumes the manufacturer to mean, but sometimes he is disappointed by finding that

the lens will not do so much, and sometimes he is surprised to find that it will apparently do much more. Generally he expects too much from a cheap variety of lens, and thinks he has gained more than he expected when he has obtained a good one. In the latter respect he is generally mistaken. A first-class anastigmat will generally cover, in all senses of the term, the plate it is listed to cover, but though it may cover a very large plate with critical definition it will generally be found that the illumination is not very good at the corners. This fact is often missed because with some subjects the falling-off is not very apparent. The test is to fix the lens in a large camera and expose a plate at full aperture, and then make a properly exposed and developed gaslight print from the negative. This will once reveal how large an area is covered with fine definition, but it may not indicate clearly the state of the illumination. To test this, a much under-exposed print should then be made, being developed as far as it will go. The centre of this will probably show no image at all, while the margins will be fully exposed owing to their thinness in the negative, which thinness is due to the falling-off of the illumination in the camera. These points will thus reveal the covering qualities of the lens very clearly.

ASSISTANTS AND APPRENTICES.

A LETTER in our correspondence columns a fortnight ago calls attention to a subject that is of considerable interest to those who contemplate entering the photographic profession as a source of livelihood, and more especially to parents or guardians who may be considering whether photography offers good prospects for their children or wards. The writer directs attention to the number of advertisements that appear in our weekly columns for pupils and apprentices, and arrives at the conclusion "that employers cannot afford to engage salaried assistants but endeavour to get their work done by learners whenever possible. The ultimate result," he adds, "will be, naturally, that these apprentices and pupils will shortly be thrown on the market to swell the already overcrowded ranks of assistants unable to find positions." We are afraid there is much that is perfectly true in what our correspondent says. Our advertisement columns, week by week, are a pretty fair criterion of the current state of the photographic labour market. Glancing through those that appeared in our last issue, we notice that there are somewhere about three times the number of those who are seeking employment than there are of situations vacant. That is certainly not encouraging to those who may be thinking of joining the ranks of photographic assistants. On reading through the advertisements one can form an opinion of the salary that many will be content with. For example, there are several operator-retouchers and managers, who claim to be experienced in all branches of the business, offering their services at wages varying from twenty-five to thirty-five shillings a week. This, one would think, is not a very alluring prospect to those who may be contemplating enlisting in the profession—till, there is the fact.

This state of things has undoubtedly, in great measure, been brought about by the fact that at the present time there is so little to be learnt in photography before a superficial knowledge of the art is acquired such as will enable presentable results to be obtained, and that, no doubt, has conduced greatly to so much competition in the labour market for employment. Any craft that is easy of acquirement is certain to entail low wages. It was different before the advent of gelatine photography—plates and papers. Then there was much to be learnt before a

worker could become really proficient, but when he had done so he could generally command a remunerative salary, and that without much difficulty. In the letter above referred to, and from which we are quoted, the writer refers to the system of taking apprentices and pupils with the sole object of getting work done for learners instead of by paid assistants, and we are sorry to say there is a good deal of truth in what he says. That would not be so very bad, after all, if those who take apprentices really did teach them their business, but a large proportion of them do not. They merely teach the work they want done, such as printing, toning, mounting, and perhaps retouching and copying, and nothing more. The most important part of the business—namely, studio work, management of sitters, is often not a subject of tuition, and, as a consequence, when the apprentice is out of his hands he often finds that he is unable to get an engagement as an operator, as he knows little or nothing of studio work. Many of those who take apprentices with the sole view of getting their work done at small cost evidently do not fully realise the obligations they are under, and the consequences to them if the apprentice is not thoroughly taught his craft. Supposing the apprentice is to be taught photography, say, in a portrait business. One of the most important parts of that is the studio work and the dealing with sitters, and that is the part that some do not properly teach the apprentice. The master attends to that part of the business himself, and so does not require the assistance of the apprentice in that direction. The con-

sequence not infrequently is that, when the apprentice has served his term, he finds that instead of being, as he should be, a proficient photographer, he is but a printer, and only qualified to take an engagement for that kind of work. In such cases the law will give him redress.

When a master has covenanted to teach an apprentice his trade, he is bound by law to do so in its entirety, and not in part only. If he does not do so, the apprentice, or those who apprenticed him, can sue for the return of the premium, if any, paid, also for damages for the young fellow's loss of time while he ought to have been learning his trade. It is not necessary that the term of apprenticeship be completed before action is taken, for if it is found that the apprentice is not being properly taught his trade, the master can be summoned before a magistrate, who has the power to adjudicate in cases of masters and apprentices, and if he thinks the complaint proved, he can order the return of the premium, if any, paid, or any part thereof, and also cancel the indenture and thus set the apprentice free. This is a thing that some, who take apprentices with the main object of getting their work done cheaply, may advisedly consider more seriously than they may have done, whilst apprentices and their friends should be cautioned not to pay money for indentures, unless with very good references as to the *bona fides* of the selected master. And in particular they should not forget that, so far as the middle-class type of photography is concerned, there is very little in it that cannot be picked up.

BRITISH COLUMBIA AS A FIELD FOR BRITISH PHOTOGRAPHIC ENTERPRISE.

II.

How Not to Sample to Professionals

In order to popularise a brand of English plates and papers the makers recently distributed free samples, each packet containing four pieces, and this they did in respect of all grades. There is, however, a general opinion among professional photographers that the experience gained by the trial of only four plates or pieces of paper is hardly sufficient to justify an order of several gross—a state of affairs quickly remedied by the "rust," which proceeded to scatter free packets of a dozen. One man is reported to have refused flatly to experiment with their plates or papers unless he could deal with samples indiscriminately selected from several packets of a dozen taken from different shipments. He was promptly supplied with what was required by the agent for the English firm in question. Individual idiosyncrasies have, no doubt, to be dealt with according to circumstances, and the case I quote is, of course, an exceptional one.

Criticisms of Canadian Wholesalers.

In the second place, the knowledge of how best to supply the needs of this country is imperfect, because English manufacturers are largely dependent upon agents and middlemen, who, for reasons good, bad, and indifferent, are up against propositions which, although they know them, they have (in some cases which have come to my knowledge) neither the live business methods nor the capital satisfactorily to exploit the goods they are agents for, in order to overcome them. I will interpolate here a criticism from the "Canadian Courier" of January 23, 1909:—

Judging by the remarks of the Canadian Trade Commissioners in Great Britain and other places, Canadian exporters are not living up to their opportunities. The Department of Trade and Commerce at Ottawa, through its excellent "Weekly Report," is doing much

to explain these opportunities and to show the line along which the exporter may develop. The limited capital in most Canadian enterprises, the limited knowledge of the methods necessary to successful exporting, and the limited experience Canadians have had in this work can be overcome but slowly. They will be overcome in time, no doubt. In the Report for January 4 Mr. Ray writes from Birmingham that Canadian goods are not being sold in Great Britain to the extent of our opportunity. Mr. Harrison Watson, writing from London, complains that Canadian exporters are discourteous, and do not even answer letters addressed to them. No one may peruse these excellent weekly reports without a growing conviction that we are still amateurs in the export business.

To this I would add that the remarks apply in some measure to Canadian importers as well.

It is generally accepted here in the West that most Eastern Canadian agents do not cross the Rockies. But I want to be fair. There are reasons in plenty why this is the case; but I am tempted to suggest that some of these reasons would only weigh with agents (who, besides having the goods of others, have also their own to push), and not with the proprietors who were in a position or had the mind to push their own goods. Also, it must be remembered that the travelling proposition west of the Rockies is one of increased expense, for rail rates through the mountainous regions of the Rockies and Selkirks are considerably higher than those prevailing eastward. After Calgary the stopping-places of travellers become less frequent; indeed, many representatives skip the whole bunch from Calgary to Vancouver and Victoria on the Island, not even troubling to visit New Westminster, a town of ten thousand inhabitants, south of Vancouver, on the Fraser River. One man recently informed me that to travel the whole of British Columbia and Alberta would take him but six weeks, and his visits presumably were to every druggist and photographer in the two provinces.
