

Listeria

create lists automagically

What is Listeria

- Create a dynamic list out of Wikidata information

How does it look like?

- https://en.wikipedia.org/wiki/Template:Wikidata_list

Example

```
{{Wikidata list|sparql= SELECT ?item WHERE { ?item wdt:P31 wd:Q39715 . ?item (wdt:P131)* wd:Q55 }
|columns=label:Article,description,p131:Place,P580,P582,p625,P18
|section=131
|min_section=3
|sort=label
|links=text
|thumb=128
|autolist=fallback
}}
... (This will be overwritten by ListeriaBot) ...
{{Wikidata list end}}
```

Positive sides

- daily updated lists
- see the changes on your watch list

Limitations

- one list per page
- updated on a daily base
- some communities do not support “auto generated lists” on all name spaces
- Sparql-query must list **?items**, else it does not find any data

Example on nl-wiki

https://nl.wikipedia.org/w/index.php?title=Overleg:Eerebegraafplaats_Bloemendaal&action=edit

What if it does not work?

- Check <https://tools.wmflabs.org/listeria/botstatus.php> for “your” language
