In 1868 the first Act was passed requiring the qualification of the seller of poisons, known as "The Pharmacy Act, 1868." The preamble states: "Whereas it is expedient for the safety of the public that persons keeping open shop for the retailing, dispensing, or compounding of poisons, and persons known as chemists and druggists should possess a competent practical knowledge of their business"; and Section I. provides: "It shall be unlawful for any person to sell or keep open shop for retailing, dispensing, or compounding poisons, or to assume or use the title 'chemist and druggist,' or chemist, or druggist, or pharmacist, or dispensing chemist, or druggist in any part of Great Britain, unless such person shall be a pharmaceutical chemist or a chemist and druggist within the meaning of this Act, and be registered under this Act." The 17th Section of this Act constitutes the Poison Law of Great Britain, and provides for the manner of selling poisons. This Act does not extend to Ireland, there having been no society in Ireland corresponding with the "Pharmaceutical Society of Great Britain," but in 1870 "the Sale of Poisons (Ireland) Act" was passed, the 2nd Section of which is a copy of the 17th Section of the Pharmacy Act, 1868. In 1875, Ireland advanced to the position of having a "Pharmaceutical Society" of its own, called into existence specially for the purpose of remedying the "inconvenience" which existed throughout Ireland of a great deficiency "of establishments and shops for the sale of medicines and compounding of prescriptions," and to this body was given the exclusive right of keeping open shop for the sale of poisons; but

in Ireland there survived the old "chemists and druggists" who were in business on their own account at the passing of the Act—a hard dying set, who were not registered at the time, and under cover of whose existence many of their assistants and apprentices ventured to go into business on their own account, and from the difficulties which the Society had to encounter were permitted to go into and carry on business. These combined, and in 1890 an Act was passed enabling them to continue the business of druggist on passing an examination after service, which was fixed by the Act at four years, but having no right to compound medical prescriptions. So much for the history of legislation. The requirement that the proprietor shall be a person qualified in law has been the outcome of healthy and natural development, of slow, cautious, and steady growth of public opinion, and that being so it is not expected that the steps will be retraced; but, admittedly, perfection is not reached. Accidents do happen, and poisons are carelessly distributed, but it is shown that the public have been well served, that many misadventures have been averted through the care of a specially trained body of licensed poison sellers, and that the restrictions have not in anywise inconvenienced the public.

The two fixed principles of the laws affecting the sale of poisons are:—

1. That the proprietor keeping open shop shall be qualified by experience, education, and examination.

2. That when any sale is made by "any apprentice or servant," the proprietor is the responsible person.

Recent attempts at legislation indicate the intention of the Government to reverse this principle. The "Bill to Regulate the Sale of Poisonous Substances" recently introduced and dropped, and also the amendment proposed by the Lord Chancellor to the "Pharmacy Act (1868) Amendment Bill" were both steps to the reversal of the principle which is the essence of the present law.

The first provided for free trade in "poisonous substances," providing that the seller should label them as required by the Poisons Act for poisons. The Privy Council has power to place these poisons in the Schedule, but refuse to do so; and to cover its position it distinguishes them as "poisonous substances," but requires the seller to treat them and describe them as "poison." Surely that is evidence enough that they are poisons and should be placed in the Schedule? If the public are encouraged to look to the huxter and general merchant for "poisonous substances" which are to be labelled "poison," and are equally dangerous with those that are scheduled, it is not likely that they will appreciate the distinction between "poisonous substances," so regularly sold and labelled, and the scheduled poison, which can only be sold by traders having a certificate of "competent knowledge," or that purchasing their white vitriol, sugar of lead, and vitriol in one shop they will understand why they must go to another for their sublimate and white arsenic. Opposed to the "inconvenience" of the individual, the fact of having to go to a qualified person, charged with responsibility, is both a safeguard to the public and a caution to the buyer; and the sense of responsibility and liability to be deprived of his licence exact a discrimination on the part of the seller which is a very important factor of safety to the public. As regards the second proposition of the Government, the Pharmaceutical Society of Ireland has complained that unqualified sellers, when prosecuted, incorporate themselves under the Companies Acts, as companies which have been ruled to be outside the Pharmacy Acts, and then continue to sell poisons. The remedy attempted was to fully legalise such companies and place them on the registers of the Societies, thus placing a company of seven or more unqualified proprietors on an equal, or rather a more favourable, footing than the individual who had fulfilled all the requirements of the law at an expenditure of time, study, and money. The Society's objection to these two propositions is not to be assumed to be a desire of monopoly, but having had the charge and responsibility of this class of business as regards Ireland continuously for several centuries, and specially as a legal trust since 1875, while the like may be said for the Pharmaceutical Society of Great Britain, we are warranted in protesting against a reversal of the principle, which was adopted by the public after consideration, for Great Britain, in 1868, and confirmed and readopted in Ireland in 1875 and 1890.

The sale of poison is but a fractional part of the business of the pharmaceutical chemist or registered druggist, and so far as the profits are concerned the majority would probably gladly surrender them with their responsibilities, but it is an essential part of their business and cannot be surrendered; but what they do value is the confidence of the public and the status and prestige

which are theirs by virtue of having attained to the qualification required by the public, and they cannot agreeably see others sharing that position without any such sacrifices as they have made to attain it. Their position is that of continually standing between the public and risk, exercising and inculcating caution, and supplying information, benefits the extent of which neither the craft nor the public can be aware. Two instances to illustrate what I mean:—(a) Mr. R. H. Parker, of Maida Vale, writes me: "A young gentleman wished to be supplied with some morphine, said he was a medical student and seemed straightforward, but I hesitated and finally refused to supply. I learned afterwards that he was 'wrong in the head' was under the charge of a keeper, whom he had thrown off his guard and escaped into the street, and went round to all the chemists he could find to try and get morphine. Fortunately the other chemists were equally careful, and the lunatic was found and placed in his keeper's charge. He said he would have swallowed 100 grains of morphine if he could have got it." (b) During the writing of this paper I was asked for twopennyworth of laudanum. On inquiring as to the purpose for which it was wanted, I was informed "To give a couple of drops to the baby; it is always crying with pains." The sale was refused and the person advised to consult a doctor. And I have just received a letter from Mr. J. H. Webb, of Luton, in which he says, "The two cases following well illustrate the advantage to the public of the qualified seller: (1) We were asked for sulphuric acid, but on inquiry found it was to be used as a gargle, so supplied sulphurous. (2) Carbolic acid asked for and refused, because it was to be used 'to bathe the eyes with.' These cases are, I think, typical. Had the customers gone to the druggist they would without doubt have received what they asked for, and legally no blame would be attached for the disastrous and possibly fatal results."

The Poison Act provides a schedule of poisons in two parts. Part 1, containing poisons in exceptional demand, which may not be sold promiscuously but in such a way that the sale can be traced from the seller to the buyer and from the buyer to the seller, and not unless the buyer is known or vouched to the seller. In these cases I have always thought the date of the sale should be placed on the label as a help in investigation afterwards if it should be necessary, the second part containing poisons in general demand. Labelling is required in every case with the name of the poison, the word "poison," and the name and address of the seller. The seller being, in the case of a private business, the proprietor, but in the case of a company "the hand that sells"; for this reason we are told that a company cannot sell. The Schedule might be improved by placing preparations containing the poisons of the first part, if not over a defined strength, in the second part of the Schedule. Transactions, in the ordinary course of wholesale dealing, are exempted from some of the provisions of Section 17, and from the operation of the Pharmacy Act in both countries, but the Amendment Act, 1890, makes no exception in favour of the wholesale dealer as to qualification.

Wholesale dealing is not defined; "The Apothecaries Act," 1791, exempts sales of arsenic over 1 lb., and the "Arsenic Act," 1850, exempts sales of arsenic over 10 lbs. from their provisions, indicating a line between wholesale and retail. Wholesale dealing may be defined as (1) a sale to a person qualified to sell by retail; or (2) to a manufacturer for use in the processes of his business; or (3) to Bodies who usually buy by contract, but in no case should it extend to the individual for domestic or personal use.

Poisons in proprietary preparations come under the regulations for the sale of poisons generally. The judges have laid down if there is enough poison in the quantity sold to destroy life, it is a sale of the poison. As regards labelling it is often overlooked that the name of the poison contained should be on the container, the obvious advantage of this requirement being, that in case of a misadventure the doctor when called in will have the immediate knowledge of the poison the effects of which he has to deal with, and for this reason I consider it essential that the label should be affixed to the container and not to the "external wrapper or cover."

Patent medicines are exempt from the provisions of the Pharmacy Acts, but not from those of the Poisons Acts. This enables anyone to sell a patented poison, and attempts have been made to get scheduled poison patented under special names, but by the activity of the British Society, they have been frustrated.

Poisons in prescriptions may not be left out of a paper such as this. They are properly exempted from the "poison" label under

the Poisons Act, and are properly dispensed under authority of the prescriber on the first occasion, but how about repetitions without subsequent authority? This is a matter often discussed by dispensing chemists, and on which I believe they would be glad of a binding rule. Of course there are many prescriptions in which poisons are prescribed which may be considered as free from any risk from repetition and treated accordingly, but the sleeping and composing draughts easily lead to habits which are with difficulty thrown off, and by which an appetite is created, developing in many cases a craving or a mania for the drug. I believe the prescription should be restricted by the prescriber indicating for how long and how often it may be repeated; and for the prevention of its being repeated at other establishments contrary to indication, the chemist first dispensing should retain the prescription and not be at liberty to give a copy or to dispense other than as ordered, or on any account knowingly supply the same or similar drug to the patient. At present the repetition is at the discretion of the patient. We are sometimes asked by friends to reduce the strength of the medicine supplied, and even our City Coroner censured one of our body because when selling chloroform he had not reduced it with spirit. This is a course which in no way should be commended, for assuming that we were able for any time to carry on the deceit, it would be a very serious matter when the medicine was supplied elsewhere of its proper strength. There is also the risk of the patient increasing the dose believing the medicine was losing its effect. The procuring of an extra supply from different houses would be prevented by the prescription being retained by the chemist first dispensing.

There are the medicated wines, not strong enough to be treated as poisonous substances, and yet just as mischievous in their insidious creation of a morbid habit. It might be open to the Society to prosecute in these cases, but so long as physicians order, and chemists cannot sell them without the excise licence, it would be a serious matter to interfere with the ability of the patient to procure; besides, in Ireland, the Poisons Act, which requires proper labelling, is properly a Police Act, and they should interfere in the first instance, and prove that they are poisons within the meaning of the Act and have them labelled accordingly. I refer to the coca wines, which vary in strength up to $1\frac{1}{4}$ grain of cocaine in each wineglassful.

In these days of shopping by post the sale of poisons through the post must be recognised as inevitable. As regards the poisons of the first part of the Schedule, I believe it to be strictly illegal, as the requirements of the Act cannot be complied with; but, as regards the second part it is not so. It is, however, a question whether it is wise to allow the supplying of poisons to strangers through the post; to known customers it is different. Poisoning of lands and hounds may be accomplished in this way, throwing suspicion on all the local druggists and affording no clue to the police of the district. I have met with a gentleman whose trouble in life was to prevent the supply of chlorodyne to his wife. Wherever he went his first care was to warn the chemists of the neighbourhood not to supply, but she got the list of chemists outside the district, money was sent with the order, and the chlorodyne came by the next mail. Sometimes it was sent via some soft goods trader, and came with some purchases from the latter, and so got in despite her husband's watchfulness. When she failed locally she ordered from England and Scotland or wherever she could get a chemist's address.

So far I have only dealt with distribution by sale, as that is all which is legally provided for; but the distribution of poison otherwise than by sale is very extensive—by public bodies, municipal, parochial and charitable, and also by the public.

As regards the former of these I have not been able to get such information as I expected, my impression having been that the method of distribution by sanitary officers was, to say the least, careless. My correspondent, however, does not confirm that view, although Sir R. Thorne Thorne informs me that the Local Government Board "issue no instructions," and I am informed by correspondence "that the practice of the sanitary authorities and local boards of the (London) metropolis differs in the various localities, and that, in fact, each authority used its own discretion in the matter, which is equivalent to saying that they do as they like." This correspondent adds that in the district from which he wrote, "the practice of distribution to the public is discouraged as much as possible, and very little carbolic acid is allowed to go out of the hands of the sanitary officers. In the few cases where it is given out, the containing vessel is carefully labelled with the name of the article

and the word 'poison.'" I wrote the Medical Officer of Health of the capitals of the four provinces in Ireland, and received replies from Belfast and Dublin which correspond with what is reported from London. The dispensing of poisonous liniments and lotions at our dispensaries is certainly not what it should be. It is the frequent experience of the chemist to handle bottles which have been used for dispensing liniments and lotions that are commonly employed as containers of beverages, and not infrequently with the original label still on. I inquired of four leading mineral water makers "if they could confirm my opinion that mineral water bottles are largely employed by the poor for the carrying of medicines supplied at dispensaries, and that frequently poisonous liquids, liniments, lotions and carbolic acid are dispensed in them." Three reply practically alike—"That no such practice obtains," and "quite apart from this, however, the system of washing adopted by all large firms would preclude the possibility of danger through a bottle so used being refilled with aerated water." I did not suggest a danger to the public from the use of unwashed bottles, but the reference to "large firms" implies that the same vouching cannot be given to "small firms." The reply of the fourth is as follows:—"You are quite right in what you say about the use of mineral water bottles are put to, and to our knowledge they are used for all the purposes stated in your letter." As a specific instance, I had myself presented to me a mineral water bottle for a repetition of a prescription which had been dispensed in it at an hospital dispensary, the prescription being for 2 ozs. liniment of aconite. Having written to persons who are engaged in such dispensing, one writes: "As far as I am aware, it is the practice in all hospitals in town to put liniments and lotions into whatever bottles the patients bring, the only precaution taken being to put a poison label on. It is rather hard to see what the hospital authorities can do in the matter, because they cannot be expected to supply the patients with bottles, and, on the other hand, the poor people in a great many instances cannot be expected to buy special liniment bottles." Another correspondent who has had varied experience, referring to one dispensary, says: "Any old noggin bottle or lemonade bottle was given, as they could not use mixture bottles, for if the liniments contained oils, etc., they would be useless for future use." In another case he says: "I am glad to say only an odd liniment or lotion was ordered; these had to be dispensed with just a poison label attached, for want of others, as the only label generally stocked was 'a tablespoonful three times a day,' and when liniment labels were ordered they were usually crossed out as being a luxury which added to the expense," and adds, "I always made it a point to tell them in the case of all poisonous preparations to pour down the sewer or sink when done with." I am informed that in country districts matters are even worse. The most frequently used bottles at dispensaries are the whisky noggin and half pint. Such being the case, it argues well for the intelligence of the necessitous poor that so few accidents occur. The difficulty of "prescribing regulations as to the keeping, dispensing, and selling of poisons" which the Government are inclined to impose on the Privy Council is very great, for what would be convenient under one set of circumstances would not be convenient under another, and what would suit one business house would not suit another, or even the same house at another time. The Pharmaceutical Society of Great Britain, which has power to make regulations of this character, drew up certain suggestions, but only adopted them as recommendations. Those recommended have been generally followed. The only law is that contained in the Irish Apothecaries Act, which prohibits arsenic being kept "in the shop or room wherein" medicines are compounded. Extending the principle of this restriction, I think it might be enacted that poisons may not be kept or sold in the shop or room in which groceries and excisable liquors are sold, or in bottles in common use for the containing of beverages.

The great bulk of accidents as such occur, I believe, through the neglect by the public of reasonable caution, and the fact that there is no legal obligation on them probably encourages the idea of their irresponsibility. Lately it occurred that a cyclist, seeing "what he thought was a barrel of water near the road, drank some of the contents, but discovered when it was too late that it was arsenical weed killer." A similar accident occurred in Newry Barracks a couple of years ago. I doubt if in either case the preparation was coloured with soot and indigo. If it had it would hardly have been partaken of. The question of storage more nearly affects the public than the seller who, conscious of his responsibility, will always adopt such precautions as the nature and

extent of his business requires. In conclusion, I would recommend :—

(a) That "wholesale dealing" should be defined as :—

1. A sale to a person qualified to sell by retail.
2. A sale to a manufacturer for use in the processes of his business.
3. A sale to public bodies, who usually buy by contract.

(b) That the principle of qualification of the proprietor should not be departed from.

(c) That "poisonous substances" recognised to be poison should be added to the Poison Schedule.

(d) That potent and seductive poisons in prescriptions should not be repeated, excepted to the special direction of the prescriber.

(e) That poisons may not be kept or sold in the shop or room in which groceries and excisable liquors are kept or sold, or in bottles in common use for the containing of beverages.

(f) That a legal as well as a moral obligation should rest on the public as to storing and distributing poisons.

Although I have undertaken the responsibility of this paper at the request of the Pharmaceutical Council, I desire to acknowledge that my colleagues are not responsible for any of my recommendations, as I have had no opportunity of submitting them for their review.

A discussion on Mr. Downes' paper having taken place his recommendations were approved by the sectional meeting, on the motion of Professor J. W. Moore, M.D., President of the section, seconded by Professor Thrift, F.T.C.D., and they were subsequently adopted at the general meeting by the Congress.

EXTRACTS FROM CONSULAR REPORTS.

THE QUANTITY OF SUGAR produced from beetroot at different periods in the history of the beetroot sugar industry in Russia—viz., from the year 1800 to the season of 1897-98—is set forth in an interesting report by Consul H. Smith, dealing with that subject. In the early years of the industry, $\frac{1}{2}$ lb. of sugar was extracted from 12 poods (4 cwts.) of roots. In 1830 this had risen to 6 lbs., in 1848 to 15 lbs., in 1863 to 22 lbs., in 1872 to 29 lbs., in 1882 to 35 lbs., in 1892 to $42\frac{1}{2}$ lbs, and at the present time to $44\frac{1}{2}$ lbs. These figures clearly demonstrate not only the great advance which has been made in the improvement of machinery used in the trade, but also in the scientific cultivation of the beetroot, a cultivation which has been so scientifically carried out that the sugar yielding part has been brought practically to a state of perfection.

THE FACTORY which was established on a very extensive scale a little over a year ago in the Uddevalla Consular District (Sweden), for the purpose of producing caustic soda and bleaching powder, has, according to the report of Vice-Consul Thorburn, up to the present proved but an experimental affair. None of its products have as yet appeared in the market, and nothing has been done beyond putting up new machinery. It is hoped, however, by the promoters that success will finally attend the electrical process employed, and if so, it is expected that it will be colossal, as the power for electrical purposes and the raw material are there in unlimited quantities.

FRESH FLOWERS to the weight of 1,326,000 kilos (1244 tons) were imported into Germany during 1897 from the Cape.

MANUFACTURERS OF CHEMICALS in the Palatinate, it is reported, complain that the low duties in Germany allow the so-called "English-red" to be imported to their detriment. Substitutes for indigo and madder are made at a large establishment called the "Badischer Aniline and Soda Company," at Ludwigshafen.

THE PENCIL INDUSTRY of Bavaria was first established at the beginning of the eighteenth century, and now supplies the whole world. The chief seat of the pencil trade in Germany is at Nuremberg, where the well-known firm of Faber has its factory.

FROM THE BAVARIAN VACCINATION STATISTICS it appears that in 1897, out of 164,800 children 150,942 were vaccinated for the first time, and 147,714 of them successfully. Of the 13,858 children who were not subjected to vaccination, 1050 evaded the law purposely, while the remainder were excused on medical grounds or

were absent from home or not to be traced. Of the 124,277 persons liable to be vaccinated for the second time, 120,523 were successfully operated upon, and only 235 persons evaded the law wilfully. Calf lymph was used, and in 1896 eighty-eight calves sufficed to produce 484,000 portions of lymph.

SCHWEINFURT IN BAVARIA is reported to be the seat of the largest firm in Europe for making steel balls for bicycle bearings. The two factories owned by the firm there produce annually 2,000,000 gross with 600 men working 10 hours a day.

A STRIKING DECREASE IN TOBACCO CULTURE, owing to the disuse of pipe smoking in favour of cigars and cigarettes, and partly also to the low prices for tobacco, is reported from South Germany. In the districts of Fürth and Würzburg there were planted with tobacco in 1890, 896 hectares; in 1895, 557 hectares; and in the two following years, 477 and 344 hectares respectively. In Thuringia the falling-off is from 132 hectares in 1894 to 102 in 1897.

THE STATE EXPENDITURE ON EDUCATION in Germany has increased during the last eight years (1890-97) by nearly £3,500,000. Of this increase religious expenditure accounted for £430,000; universities, £580,000; higher education, £320,000; elementary education, £1,470,000; art and science, £186,000; technical education, £107,000; religion and education, £150,000; medical expenditure figuring last and least with £43,000 of an increase. The chief item of increase was elementary education. The charge to the State under this heading was only £225,000 in 1871. In 1887-88 it had risen to £1,333,000. In 1890-91 charges were transferred from the communes to the State, which then had to pay £2,900,000 towards elementary education, a sum which has since risen to £3,300,000. The State contributions are so organised that, while it bears the greater part of the charges for schools in the country districts, the town schools are made more than self-supporting.

THE FINANCE MINISTER OF GERMANY calls attention to the fact that, under the head of Commercial Education, the receipts in 1890-91 amounted to £2500 and the expenditure to £93,000, while in 1897-98 the figures were £30,000 and £195,000 respectively.

THE FOREIGN OPIUM TRADE in China is reported by Acting Consul-General Mansfield to be slowly dying a natural death. It is his opinion that in a few more years the Indian drug will at best be an exotic luxury consumed only by a few rich connoisseurs. Native opium is being used in largely increasing quantities, and the quality is said to be steadily improving. Prices vary very slightly, and as the native article is so much cheaper than the foreign drug, competition between the two is rapidly becoming impossible. The falling off in the net import for 1897 was 446 chests.

THE IMPORT OF MORPHINE into Shanghai in 1897 was no less than 68,000 oz. Its yearly increase undoubtedly shows that the morphine habit is gaining ground among the Chinese, while the consumption of opium is increasing, despite the fact that the import of Indian opium is falling-off.

FOR THE MONTH OF JULY of the present year the imports of chemicals, dye-stuffs and tanning substances from foreign countries and British possessions into the United Kingdom decreased to the extent of £12,523, compared with the import of the same month last year, while for the seven months ending July 31, there was a decrease of £491,960. The exports of chemicals, and chemical and medicinal preparations for July, 1898, increased by £7626, but for the seven months ending with July the returns show a decrease of £232,233 on the corresponding period of the previous year.

THE EXPORT OF OLIVE OIL to England from Gallipoli from January 1 to June 30, of the years 1897-98, show a great difference, being 1247 Imperial tuns in the former, and 93 in the latter period. Russia, on the other hand, took a greater quantity in 1898 than in 1897, viz., 204 and 633 Imperial tuns respectively. Russia's portion, however, was restricted to really first-class burning oils which could not be found elsewhere, and for which high premiums over current rates were in many cases willingly paid. The total quantity of oil exported during the first six months of the two years was 2161 and 1163 Imperial tuns respectively.

PRACTICAL PHARMACOGRAPHY.

CASCARILLA.

Cascarilla Bark.—Ecorce de Cascarille.—Cascarillarinde.

MACROSCOPIC CHARACTERS.

Cascarilla bark is obtained from *Croton eluteria*, Benn. It occurs in commerce in quilled pieces, which vary considerably in size in different importations, consisting sometimes almost entirely of slender quills, apparently obtained from young branches, and in other consignments of thicker quills obtained from the trunk. The slender pieces usually present a greyish white or chalky appearance, the epidermal or corky layer separating more or less in places, and exposing a dull brown surface marked with longitudinal striæ and a few transverse furrows which vary much in number in different pieces, being few or almost absent in some pieces and in others more numerous. These markings are also evident in a less degree on the parts where the corky layer has exfoliated. The inner surface is nearly smooth or very faintly striated. The larger pieces are frequently dotted over with the black apothecia of one or more species of lichen. The smaller quills are about the size of a goosequill, and the larger rarely exceed in size the littlefinger. The usual length of the quills is from two or three inches, in bold specimens sometimes attaining five inches. The fracture is dark brown, short, and somewhat resinous, exhibiting under a good lens numerous thin whitish medullary rays, but no groups of sclerenchymatous cells, the cortical portion is usually of a paler colour and thus affords a line of demarcation, which is rather exaggerated and too straight in the figure B. The odour

A

B

Cascarilla.—A. Outer surface of bark. B. Transverse section, slightly magnified.

of the bark is slight, though very fragrant when burnt. The taste is aromatic and bitter. Cascarilla is not easily mistaken for other barks on account of its characteristic flavour. A bark somewhat similar to it but possessing emetic properties was at one time imported (*Pharm. Journ.* [3], iv., p. 810). The quills resemble the larger quills of cascarilla in size and in the presence of lichen apothecia, but have a pale buff, not chalky-white, appearance externally and the corky layer does not exfoliate. The inner surface is pinkish-brown and more distinctly striated, it is not aromatic or bitter, and the tincture is darkened by solution of ferric chloride. Under the microscope it is seen to differ in the presence of numerous roundish groups of sclerenchymatous cells. These cells and the laminated structure of the bark can be seen with the aid of a good lens.

MICROSCOPIC CHARACTERS

Cork.—Consists of tabular cells, the older portion having thickened tangential walls. Between the cork and the cortical parenchyma is a narrow band of phelloderm.

Cortical parenchyma.—This is made up of tangentially extended thin-walled parenchyma containing a large number of oil receptacles, which are only distinguishable by the nature of their contents. Some of the cells contain cluster crystals and isolated crystals of calcium oxalate; others are filled with a dark brown resinoid substance; the larger proportion are filled with small starch grains.

Cascarilla.—Transverse Section.*—c. Cork. o. Cortical parenchyma, p. Phloem. l. Oil receptacles. s. Bast-fibres. q. Phloem rays. r. Medullary rays. (After Berg.) x abt. 40.

Phloem.—The phloem rays are usually only a few cells broad; they consist of thin-walled parenchyma with strands of obliterated sieve tubes and scattered bast fibres, which are isolated except in the primary phloem, where they are found in small groups. The rays are gathered into wedge-shaped masses caused by the gradually widening of some of the medullary rays. A large number of cells, which are extended vertically, contain a dark brown resinous substance. In the inner phloem the medullary rays are one or two cells broad; the cells are thin-walled and many of them contain cluster crystals of calcium oxalate. The phloem parenchyma is rich in starch, which is found, for the most part, in small isolated grains, but compound grains are by no means uncommon.

Cascarilla.—1. Transverse section of cork and phelloderm. 2. Cork in surface view. 3. Transverse section of phloem—b. Bast-fibre. h. Resin cells. m. Medullary ray. s. Sieve tube strand. 4. Tangential section of phloem—m. Medullary ray with cluster crystal. h. resin cells. 5. Resin mass which has fallen out of cell. 6. Fragment of bast-fibres. 7. Starch. 8. Crystals of calcium oxalate. (After Moeller) x abt. 180.

Distinctive Characters.—The dark-brown resin receptacles of cortex and phloem. The scattered isolated bast-fibres and obliterated sieve tubes. Two kinds of crystals of calcium oxalate—isolated and clustered. The presence of cluster crystals in medullary rays. The absence of stone cells.

* NOTE.—This illustration does not indicate the cells containing the resinoid matters in the phloem, and it fails to show the relative number of oil receptacles in the cortex and the bast-fibres, which in both cases are much more numerous than represented.

THE PHARMACOPŒIA AS A STANDARD.

ACCORDING to Professor TICHBORNE, whose luminous address to the Institute of Public Health is fully reported at page 244, the new Pharmacopœia is intended by those responsible for its production to be a work of reference, first for the medical man, and indirectly for the analyst. Pharmacists apparently are nowhere in this connection, despite the fact that the preface to the work states that the General Medical Council has always desired, in the British Pharmacopœia, "to afford to the members of the medical profession and those engaged in the preparation of medicines throughout the British Empire one uniform standard and guide, whereby the nature and composition of substances to be used in medicine may be ascertained and determined." This passage, of course, is quoted from the preface to the 1867 Pharmacopœia, and the fact that it is so quoted for the second time seems to indicate that the General Medical Council desires to manifest a continuity of purpose in the matter. The only reference to analysts in the preface to the 1898 Pharmacopœia is in connection with the employment by that possibly useful body of public servants of Imperial and metric vessels for purposes of measurement. Whilst making due allowance, therefore, for the fact that Professor TICHBORNE was a member of the Pharmacopœia Committee of the General Medical Council, we must demur to the inference that may be gathered from his paper, that the Pharmacopœia is not intended as a work of reference for the pharmacist. It would also appear to be but very "indirectly" intended as a work of reference for the analyst.

How far the Pharmacopœia is to be regarded as a standard is, of course, a disputed point. The Medical Acts are silent on the point, the Sale of Food and Drugs Acts are equally unsatisfactory aids to a solution of the problem, and the only British Act which refers to the matter is the Pharmacy Act, 1868, which stipulates that "any person . . . who shall compound any medicines of the British Pharmacopœia, except according to the formularies of the said Pharmacopœia, shall, for every such offence, be liable to pay a penalty or sum of five pounds." Such penalty must be sued for, recovered, and dealt with in the manner provided by the Pharmacy Act, 1852, for the recovery of penalties under that Act, that is to say, the Registrar of the Pharmaceutical Society must sue the alleged offender, by the authority of the Council of the Society. But this power to

institute proceedings for compounding official medicines according to other than official formularies has never been exercised, and up to the present time the clause quoted has remained a dead letter. A similar provision is found in the Pharmacy Act (Ireland), 1875, but we are not aware that it has been rigorously enforced in the sister isle. The fact remains, however, that it is illegal in the United Kingdom to compound any medicines official in the British Pharmacopœia except in strict accordance with the directions printed in that work, and there is little reason to doubt that pharmacists as a class loyally observe the requirements of the law in that respect.

But in the course of time the British Pharmacopœia has come to represent the custom of the country, and it is now generally accepted that a purchaser asking for any medicine that happens to be official in the Pharmacopœia, without stating anything to the contrary, ought to receive the medicine compounded according to the formularies of that work. Otherwise, it is more than probable that the courts of law would decide that the medicine sold is not of the nature, substance, and quality of the article demanded, and therefore that the sale has been to the prejudice of the purchasers. In fact, the existing position appears to be that if a purchaser asks for, say, compound tincture of rhubarb, he is to be understood to ask for the Pharmacopœia preparation known by that name, and in default the seller infringes that section of the Sale of Food and Drugs Act, 1875, which provides that "no person shall sell any compound article of food or compounded drug which is not composed of ingredients in accordance with the demand of the purchaser." But public analysts have induced some magistrates to go beyond this, convictions having been obtained for the sale of non-compounded drugs which were not in accordance with the Pharmacopœia requirements. Such convictions would appear to be irregular, even if the substance sold be required for medicinal purposes, whilst if, say, sodium bicarbonate be required for domestic or experimental purposes, it cannot seriously be contended that the Pharmacopœia article alone must be supplied. But even with regard to compounded drugs much uncertainty exists, for if custom alone endues the Pharmacopœia with authority as a standard under the Sale of Food and Drugs Acts, what is to be done if the preparation asked for is one of which the formula has been altered in the new Pharmacopœia? Custom demands the preparation official a few months ago, the Pharmacopœia article differs; may it not then be assumed that the purchaser who is supplied with the latter suffers prejudice, and would it not be unreasonable to punish the seller for supplying what his customers have been in the habit of receiving for so many years past? Clearly the matter is in a paradoxical position and, for the sake of chemists and druggists more than anyone else, the sooner there is definite legislation on this point the better.

THE SALE OF POISONS.

THE comprehensive paper read by the President of the Pharmaceutical Society of Ireland, at the Public Health Congress (see p. 246), is full of interest to all pharmacists in the United Kingdom, and those whose acquaintance with the historical aspect of the subject treated in the paper is deficient should not hesitate to spare the comparatively limited time required for careful perusal of the paper. It is also important to note that Mr. DOWNES' recommendations were adopted at a general meeting of the Congress.

ANNOTATIONS.

THE NOTES ON THE B.P., which have been appearing in the Journal for some time past, are the subject of some complimentary remarks from a reader, who states that he followed them with much interest and profit when studying for the Minor examination. He is now commencing work for the Major examination, "notwithstanding the passing of the Pharmacy Acts Amendment Act," and expresses the opinion that the new series of B.P. notes will create and foster a desire on the part of students to become pharmaceutical chemists. That opinion is, of course, supported by the fact that in pharmacy as in other professions the man who works most thoroughly for a given examination is most likely to proceed to a higher one. The object kept in view in preparing the explanatory notes in the "Students' Page" has been to encourage thoroughness, and it is gratifying to find that the desired end has been attained in a considerable number of cases. With regard to a suggestion by the same correspondent that Major students should be helped in their home-reading, the Editor will be glad to have the opinions of readers as to what direction such assistance should take. The articles on practical pharmacography, physico-chemistry, etc., have been specially written with a view to assisting advanced students, but further suggestions will always be gladly entertained.

INSTRUCTION IN SCIENCE is being further encouraged by the Scotch Education Department, which has issued a circular containing proposals for the recognition of higher grade science schools. The idea is to encourage such instruction in combination with a sound scheme of general education, and it is proposed to make grants on conditions to the managers of schools which provide a satisfactory course of instruction, extending over not less than three years, to pupils who have obtained a merit certificate or otherwise satisfy the Department of their capacity to profit by such advanced instruction. The Department must be satisfied that the school possesses sufficient laboratory accommodation, and a workshop or room specially adapted and equipped for instruction in the use of tools. A course of instruction extending over at least three years must be submitted to and approved by the Department, which must also be satisfied that the teachers have a competent knowledge of the subjects which they are to teach, and that they have had experience in treating the subject experimentally. As a rule, not more than forty pupils in a class may be instructed by one teacher at one time, nor more than twenty-five in practical work. Each period of practical instruction shall be of at least one hour and a-half in duration. The schools must not be conducted with a view to private profit, they must be specially approved as required by the educational circumstances of the district, and must also be accessible to pupils of all classes who show the requisite attainments.

THE FEMININE INVASION of pharmacy continues to be encouraged in that section of the public press which devotes its attention especially to women's needs. The latest article on the subject appears in *Woman*, and that, singularly enough, is free from serious errors. The writer commences with the statement that in order to succeed as a pharmaceutical chemist three things are necessary—money, brains, and business capacity. The amount required of the first-named essential is fixed at a thousand pounds—three hundred for fees and the cost of board and lodging for three years, and the remainder for establishing or purchasing a business. A weak point in the article is the statement that "A source of emolument which should not be lost sight of is the securing of apprentices." Even though a pharmacist

should act on the classic suggestion to make money—honestly if possible, but missing no opportunity of making it—he or she should at least have the decency to abstain from accumulating pelf at the expense of pupils or their guardians. It is only fair to state, however, that whilst girls are informed that a hundred guineas (*sic*) is a very ordinary premium, and told they should, when fully qualified as pharmacists, do all in their power to obtain apprentices, they are also advised to spare no pains to help those apprentices forward. To those who propose starting on their own account, the following hints are given as being likely to prove useful: "Take nothing for granted; investigate everything—yourself when purchasing a business. If you have not the necessary technical knowledge yourself, get some qualified and trustworthy person to overhaul the books. Indeed, it would be better in every case to entrust this task to a reliable accountant. The neighbourhood should be examined as critically as the books. Some neighbourhoods are going up, others are going down. If the inhabitants are leaving, business is leaving also. If from want of means you cannot go at once into a first-class locality, select a new and rising neighbourhood, where people live all the year round, rather than where they congregate for a half-season." Boys might do worse than act upon this advice, as well as girls.

INFRINGEMENT OF THE MEDICAL ACT is probably much more common than are convictions for such infringement, just as is the case in connection with the Pharmacy Acts, but despite the difficulties which seem inevitable in all such cases, a conviction has been secured at Norwich, in which apparently the defendant gave himself away by the misuse of a comma. Thus, the *Times* reports that at the Norwich Police Court an individual who has conducted a large practice in that city as a herbalist, under the title of "Dr. Matthews and Son," was summoned at the instance of the Medical Defence Union for wilfully and falsely using the name and title of "doctor," and for using the title of "surgeon." The evidence showed that over the defendant's place of business the name of "Dr. Matthews and Son" was painted, while on his bill-heads he described himself as "surgeon, accoucheur, etc." It was urged by the prosecuting counsel that the comma after the word "surgeon" showed that the defendant intended to represent himself as such. It was submitted for the defence that these proceedings constituted persecution, and that the Medical Defence Union was moved by some envious members of the faculty in Norwich, but the magistrates decided that in using the word "surgeon" the defendant had committed an infringement of the law. He was, therefore, fined one pound and costs with an alternative of seven days' imprisonment. On the following day, he was proceeded against by the Apothecaries' Society for acting as an apothecary and supplying medicines without the necessary qualification. Judgment was given for the plaintiff Society by consent, and Judge Willis, in giving judgment, said that the law under which the proceedings were taken was an extremely wise one; it was most important that persons who undertook the care of other people's health should be duly qualified for the purpose. He could see no persecution in the matter; the law existed and must be obeyed.

THE MEDICAL AUTHORITIES are reported to have resolved to prosecute even more stringently than has previously been the case in their campaign against unqualified assistants. It is stated that the General Medical Council has been appealed to on the point whether it would be an offence for a qualified medical man to assist in the administration of anæsthetics by an unqualified dental practitioner. The reply is said to allow of no doubt whatever upon

the subject, the Registrar of the Council declaring that not only would it be an offence, but that the Dental Committee would recommend the Council to investigate closely every case of the kind reported to it. Administration under such circumstances will therefore presumably be declared to be infamous conduct.

THE MEDICAL PROFESSION is reminded by the *Medical Press* of its repeated warnings to the profession "against the rapid invasion of its official privileges by the holders of sham diplomas." Amongst such diplomas are apparently included the certificates vouching for qualification held by dentists, pharmacists, nurses, and others, who are alleged to have already seized, or to be trying to seize, "a portion of the medical territory." By some these remarks by one of the least of our medical contemporaries might be considered impudent, but we prefer to regard them as indicative of the absence on a holiday of those responsible for the proper conduct of the paper. The cause of this particular outburst, by the way, is the decision of the Spectacle Makers' Company to take steps to secure that persons who deal in spectacles should know something about their business, and we are told that the latest advance of the "enemy" is the establishment by that Company of "a sham diploma in spectacle making, which will entitle every druggist who desires to make money by the sale of a few dozen of spectacles, to go through the farce of an examination, and thereafter to hang up in his shop an illuminated parchment, which will appear to the unsophisticated customer as a portentous official authorisation of the trader to advise on all optical and ophthalmic specialties." This diatribe, which, with slight alteration, might with equal fitness apply to some certificates granted by a medical corporation, is not the sort of thing to check progress, and the step taken by the London City Guild which is attacked undoubtedly tends in the direction of progress. Chemists and dentists should not fail to note that a medical organ of some pretension refers to them as "holders of sham diplomas."

GREGORY'S POWDER is a mixture of which the correct composition ought to be well known at the present day, but there appears to be a persistent tendency in certain quarters to confuse magnesium oxide and carbonate, and to assume that the latter may without disadvantage be used in place of light magnesia. A case under the Sale of Food and Drugs Act was heard at Lambeth a few days ago, in which the defendant—Charles Gadd—who was incorrectly described as a chemist, was charged with selling Gregory's powder containing 32.41 per cent. of magnesium carbonate and only 34.43 per cent. of light magnesia. The defence, ludicrously enough, was that the powder had been compounded according to the British Pharmacopœia, but that by exposure to air the light magnesia had absorbed carbon dioxide and become converted into carbonate. Mr. Frederick Davis, Principal of the Imperial College of Chemistry, was called in support of the above statement, and is reported by the *Standard* to have stated that "when exposed to the atmosphere calcined magnesia absorbed carbonic acid gas and became converted into carbonate. The time during which the change would take place would vary, as it would depend upon the state of the atmosphere at the time." Questioned by the magistrate as to the quantity of carbonate he would expect to find in Gregory's powder, this witness replied "Generally 15 per cent." He also accounted for the presence of the very much larger proportion found in the powder sold by the defendant by the supposition that "it had been kept too long." It is almost inconceivable that such evidence could be given by anyone possessing even an elementary knowledge of the rudiments of chemistry, and it is not surprising to find that the magistrate—

Mr. Hopkins—was sceptical, his decision being that the defendant must pay a fine of forty shillings and costs.

JOSEPHUS STILL SURVIVES, and in the *Daily Mail* of Wednesday he poses as a champion of chemists as against doctors. Commencing with the obvious truism that a subject affecting the interest of the public to a momentous extent is that of dispensing by doctors, he proceeds to alarm the world at large by the assertion that "at present it can be used in the hands of the unscrupulous to smother crime." "It" presumably means dispensing by doctors, and the world at large is now doubtless gasping at the idea suggested by Josephus. Continuing, he says: "There is not the division of labour between the doctor and the chemist there should be. The doctor should prescribe and the chemist dispense, and there ought to be no departure from this rule, but at present, dispensing by the chemist is the exception, save in the West-end of London and fashionable resorts. In 1868 the Pharmacy Act came into force, wherein it decreed that before a chemist be permitted to dispense and sell scheduled poisons he must prove himself capable by passing a very stringent and searching examination in chemistry, pharmacy, materia medica, and dispensing. Since then 90 per cent. of the chemists have passed these examinations, yet the bulk of dispensing is done by the doctors, who have but a smattering of the art." But the gravest point, according to Josephus, is that through inadvertence or by design the medical man may send medicine improperly dispensed, or containing some poisonous drug by which his patient becomes very ill or dies. "In the one case he can explain his error away; but in the latter he can sign the death certificate and for ever hush up the true cause of decease." And so ends this chapter of horrors.

SIR JOHN LUBBOCK is nothing if not interesting, and his address to the International Congress of Zoologists, on Tuesday last, was as full of interest as anything he has yet said or published. Few people, he remarked, seem to realise how much science has done for man; and still fewer how much more it would do if permitted. More students, he thinks, would doubtless have devoted themselves to science if it were not so systematically repressed in our schools; if boys and girls were not given the impression that the field of discovery is well-nigh exhausted. But far from that being the case, much of the land surface of the globe is still unexplored; the ocean is almost unknown; our collections contain thousands of new species waiting to be described, and the life history of many of our commonest species remain to be investigated or have only recently been discovered. As an instance in point, Sir John referred to the common eel, the life history of which, until quite recently, was absolutely unknown. Aristotle pointed out that eels were neither male nor female, and that their eggs were unknown. That remained true until a few years ago. No one had ever seen the egg of an eel, or a young eel less than five centimetres in length. But we now know, thanks mainly to the researches of Grassi, that the parent eels go down to the sea and breed in the depths of the ocean in water not less than three thousand feet below the surface. There they adopt a marriage dress of silver and their eyes considerably enlarge, so as to make the most of the dim light in the ocean depths. In the same regions several small species of fishes had been regarded as a special family known as *Leptocephali*. Those also were never known to breed. It now appears that they are the larvæ of eels, that known as *Leptocephalus brevirostris* being the young of our common fresh-water eel. When it gets to the length of about an inch it changes into one of the tiny eels known as elvers, which swarm in thousands up our rivers. Thus the habits of the eel reverse those of the salmon.

Notes on the Conference at Belfast.

By M. B. P. C.

DR. SYMES expresses the views of all who attended the Belfast Conference in a letter he has addressed to the *Northern Whig*, wherein he states that the great success of the recent meeting was largely due to local effort, as was in some measure acknowledged by the earnest vote of thanks accorded to the local committees (ladies and gentlemen); to the Lord Mayor of Belfast and his family; to Principal Hamilton, of the Queen's College; to members of the medical profession and others whose generosity and display of good feeling all will long remember. Speaking for himself, as President at the Belfast meeting, Dr. Symes adds his acknowledgments to the Press generally, and particularly to that of Belfast, for the way in which it recognised the broad principle that, although the Conference dealt with matters relating to the profession of pharmacy, its work was of public interest and tended to the welfare of the community at large. In conclusion he says: "Adding to this the charming weather, the delightful scenery, the extensive and interesting manufactures with which we were made familiar, and the excellent hotel accommodation at a most moderate tariff, it would be difficult to find the individual who did not leave Belfast with the most pleasant recollections of his or her visit."

THE RECEPTION AT QUEEN'S COLLEGE, being held after the conclusion of the first day's business instead of the night before as usual, was probably more largely attended on that account, since so many members and friends find it difficult to arrive before the commencement of the Sessions of Conference. The exhibition of old herbals by Mr. R. M. Young, J.P., attracted much attention, the members who witnessed the demonstration on colour photography by Professor Letts vouched for the interest taken in that subject, and Mr. John Wylie's lecture and practical demonstrations on interference phenomena were also well attended. But the concert in the Great Hall of the College proved the chief attraction of the evening, taking precedence even over the refreshment room, which is saying a great deal. It was only possible to move about the hall with great difficulty, and a place of much larger dimensions could easily have been filled by the company assembled. The artistes were too numerous for individual mention, but their efforts were greatly appreciated generally, as well as those of the string band of the Royal Irish Rifles, which enlivened the proceedings at intervals during the evening.

THE GARDEN PARTY in the Botanic Gardens Park was on a grander scale than anything the members of the Conference had been accustomed to. The invitations issued by the Right Hon. the Lord Mayor and Lady Mayoress were eagerly sought after, and some fifteen hundred residents of Belfast and district were present to meet the visitors from afar. The Park was closed to the public for the occasion, and the manner in which the visitors were entertained can only be described as princely. Even the weather seemed as though it had been expressly arranged for the occasion, and everything combined to render the garden party one of the most memorable incidents of the week. Enjoyment was depicted on every countenance, and it almost seemed as if the proceedings at the headquarters the same evening were much livelier than they would have been had the garden party not been held.

THE CONCERTS at the Grand Central Hotel were pleasantly varied, but both grave and gay songs and recitations were equally well received. Without any desire to appear invidious in singling out any of the performers for special reference, it may be stated that Mrs. Theodore Wright was in great request, and an Irish jig was prettily danced by Master Hicks and Miss Gillen, who were dressed in appropriate costumes. Mr. Tom White, the genial representative of Messrs. Harker, Stagg, and Morgan, was busily engaged, together with other hospitable Irishmen, in finding performers and looking after the comfort of those present at the smoking concert, and the proceedings terminated in what was probably a more cordially noisy fashion than any similar affair in the past.

THE OFFICIAL PROGRAMME, which was presented to everyone attending the Sessions of Conference, was specially compiled by Messrs. James Tate and James Guiler, of Belfast. The outcome of their labours was an exceedingly handy guide to the city, as well as to the week's proceedings, and as it was most tastefully printed in colours by Messrs. Olley and Co., many of the copies distributed will doubtless be kept as pleasant reminders of a week happily spent. It should be mentioned, by the way, that this official programme and guide was printed and distributed gratis by Messrs. Olley and Co. Mr. R. A. Jones, pharmaceutical chemist, also distributed free copies of his interesting guide to the Carlingford Lough district.

THE EXCURSION TO GARRON TOWER was, beyond doubt, the great event of the Belfast meeting, on the social side. Unfortunately, there were numerous applications for tickets long after the time at which it would have been reasonable to refuse to supply them, and in consequence of that the general comfort was to some extent interfered with at meal times, on account of the difficulty experienced in providing at a moment's notice for so many more than were originally expected. All's well that ends well, however, and doubtless no one but the energetic local secretary, Mr. McKnight, has since thought much about the inconvenience caused by the unexpected crush. The route chosen for the excursion, along the Antrim coast from Larne to Garron Tower, could not well have been bettered, the weather was again well in hand, and the whole of the members of the large party, seated in innumerable coaches, were in the best of good spirits.

HUMOUROUS INCIDENTS were plentiful, the chief being connected with the erratic conduct of the motor car that was to have conveyed the presidential party to Garron Tower. A brilliant start was made, after all the coaches had passed on, but in view of the tendency displayed by the vehicle to steer its own course towards the sea, it was unanimously decided to exchange into what was not inappropriately described as a "Chinese junk on wheels." The old and new presidents and their suite then sailed majestically along, being saluted with storms of applause as they passed the more ordinary vehicles, one by one. Then a piper was met on the road who made a collection on the strength of an anticipated performance of "The Wearing of the Green." But when the performance commenced, the only tune that piper could approach within measurable distance of was "The Campbells are Coming." Disappointed ones in the unfortunate audience, therefore, as well as others who had paid the piper to go away, were inclined to suggest that their money should be returned, a most improbable thing under the circumstances. Amusement was also caused by the picture of distinguished Conference officials racing down a slope at Garron Tower, whilst several more or less prominent individuals rolled down the self-same slope inadvertently.

THE SPEECHES AT GARRON TOWER—after luncheon, of course—were many and brilliant, and after they had all been disposed of a photograph of the party was taken in duplicate by Messrs. Lafayette's representative. The drive was then resumed until Glenariff was reached, when all but the extra large sized visitors proceeded to walk or scramble up the beautiful glen, duly impressed with the beauty of their surroundings, but not unmindful of the fact that tea was waiting at the other end. Those who progressed best were rewarded by a capital meal, others were less fortunate, and a few were perforce compelled to await their return to Belfast ere food was attainable. But unbroken merriment was maintained to the end, and everybody was satisfied that the day had been well spent, thanks to the arrangements made by their Ulster hosts.

OF THE MINOR EVENTS in the programme it must suffice to say that they all passed off satisfactorily. The ladies were well looked after during the Sessions of Conference, being shown over the premises of Messrs. Robinson and Cleaver, linen manufacturers; Messrs. Marcus, Ward and Co.'s printing works, the York Street Flax Spinning Mill, Messrs. William Ewart and Co.'s Brookfield Linen Mill, and the Linfield Weaving Factory. Miss Watson, Mrs. Payne, and Mrs. Clotworthy were prominent amongst the members of the Ulster Ladies' Committee, and there were no shortcomings so far as their arrangements were concerned. Gallaher's Tobacco Factory, Harland and Wolff's Shipbuilding Yard, and the Belfast Rope Works were visited in turn on the Friday, and after that the members of the Conference dispersed once more, some to labour and some to play, but all imbued with a strong feeling of gratitude towards those who had done their best to make the meeting of 1898 a success and a record.

THE CONFERENCE PHOTOGRAPHS, taken by Messrs. Lafayette, of Belfast, are much more numerous than usual. Time was when one photograph, taken on the excursion day, was deemed enough. On this occasion, however, two photographs were taken outside the Queen's College, after luncheon on the Tuesday; four at least record incidents at the garden party; and two show practically the whole of the party assembled in the grounds at Garron Tower. One of the last mentioned is decidedly better than the other, but all the photographs are good, and those taken outside the Queen's College are excellent. A photograph of the Ulster Ladies' Committee is particularly fine, and should find a large sale amongst the more sentimental members of the Central Executive of the Conference.

ABSENTEES from the Belfast meeting unfortunately included the Presidents of the British and Irish Pharmaceutical Societies. The word "unfortunately" is used advisedly, for both gentlemen missed an excellent opportunity of making the acquaintance of a large number of prominent pharmacists in the two islands, and of exchanging views with them on matters of pressing importance to pharmacy at the present time. Much difficulty was experienced by lay reporters in finding an appropriate name for the Conference—all assuming that the meeting must be "a" Conference held by some Society or Association—and their assumption was practically justified by the fact that the Belfast meeting was virtually a conference of the British and Irish Societies, with a few outsiders thrown in, but without the official heads of the two statutory bodies being in attendance. There seems little reason to doubt that in course of time both Societies will find it desirable to hold their annual meetings at different centres each year, and the advantage of so doing will be great.

PHARMACY IN IRELAND.

[From our Belfast Correspondent.]

SOME TIME AGO a Belfast house obtained the contract for the supply of some drugs to the Cork Union. When the locality of the tender was announced a section of the Guardians raised the cry "Orange Pills," which being interpreted probably implies "green pills for green people." This is sufficiently rancorous, though it is not without precedent, as during the illness of Frederick the Noble some partisans in their violent animus against Sir Morell Mackenzie declared the doctrine of "German doctors for German Kings." In the former instance, however, reason prevailed, although a few persons found it a very "bitter pill" to swallow. "Rebel" Cork has latterly chosen the commercial capital as its exemplar, and there are suggestions to abolish the conveyance of the wounded to medical aid per hack-car and stretcher and follow the Belfast method, instituting an ambulance van and corps and placing the fire brigade in charge of it.

A TECHNICAL INSTITUTE FOR BELFAST is just now on the tapis, a deputation of Councillors having visited England to acquire information as to what is most suitable. In the absence of technological schools supported by the Corporation the Working Men's Institute has for many years ably, though much handicapped financially, held the pass for hundreds of artisans, apprentices, etc., and to some advantage, as the Schools of Science and Art at South Kensington can testify by the many Belfast students who have won an entrance to those halls of learning. The success and high position to which the Institute has attained is chiefly due to Mr. Robert Barklie, F.C.S., who, formerly being an analyst of note, is an interesting and able lecturer on chemical science. He was assistant in the Queen's College to the late Professor Andrews.

MR. BARKLIE'S LECTURES are not a sodden mass of dry detail, nor does he hesitate if occasion prompt to relieve the tedium of science by the gaiety of humour. The vast stock of modern apparatus and appliances for practical and experimental demonstrations are hardly surpassed by any school in Ireland. It is felt that Mr. Barklie's long experience and numerous qualifications will justify his selection as head of the new Institute.

YOUR FARMER, though in the main a very shrewd fellow, has always shown himself stubbornly averse to profiting by the teachings or discoveries of science. Of late, however, the chemic-agricultural style of farming is beginning to gain favour. As a result of spraying with copper sulphate the crop of tubers has doubled. A necessary part of a farmer's equipment now is a book of blue litmus paper, to test the spraying solution as to when sufficient lime is present. Cases of poisoning have occurred, due to negligence. One man, finding the tube of the machine becoming plugged, applied his mouth to the orifice and sucked down a good supply of sulphate; two children ate some berries that had received a portion of the spray, whilst another farmer got some of the solution into a fresh cut. Medical treatment obviated in each case a fatal termination. It is also stated that an outbreak of fever at Ballymena is attributed to the consumption of cabbages which were accidentally sprayed.

AN OUTBREAK OF MEASLES in Valencia Island has been the unhappy cause of disagreement between two knights of the lance. Dr. Letters, a Scot, has declared that the epidemic was due to an inaccurate diagnosis at the commencement. Dr. Trant considers this a *casus belli*, and has opened hostilities in Tralee law courts. It is not easy to understand how the characteristic rash could have been mistaken, but an inadvertence is a liability from which none are exempt. But when doctors disagree, who shall decide?

PROFESSOR LORRAINE SMITH having made a bacteriological examination of a well of water owned by the Belfast Board of Guardians found that it contained 200 bacteria per cubic centimetre. It would seem that this is not an excessive population as drinking-water goes. It might be probable that the banishment of bacteria, etc., would not reduce the earth to universal Edenic convalescence. The physical constitution of the European has become inured to all the diseases and their complications which medical science has discovered, and it would, perhaps, be as disastrous to suddenly withdraw them from the sphere of their influence as to suddenly introduce them to primitive man.

The emaciated, anæmic, fibrous-looking clerk of to-day, who has not missed one disease since childhood that can properly fall to the lot of an average adult, is a prodigy of health and virility when compared with bulky primeval man, who would become an easy prey to the most innocent bacillus.

THE JULY PHARMACEUTICAL EXAMINATIONS have resulted in ten candidates being successful in the final, and eight failing. About the same proportions were maintained in the Preliminary, twelve passing out of a score.

THE ANNUAL CONGRESS of the Institute of Health opened its sessions on August 18, in Trinity College, Dublin. Sir Chas. Cameron presided, and gave an eloquent address. The members were afterwards presented to the Lord Lieutenant, and an exhibition illustrative of the objects of the Congress was given at the Royal University. Rather strangely, the president and his lecture referred to phthisis as a "preventable disease." It is certain that it is a most malignant and prevalent scourge amongst linen manufacturing operatives, being a source of great mortality in Belfast. There has always been much confusion amongst the humbler classes as to what is hereditary and "brought on." If the former it is usually neglected, being referred to as the "act of God" and therefore invincible. Consumption and cancer are thus treated. Yet I knew of a man who "brought on" cancer of the lip, by putting, when drunk, a new clay pipe in his mouth, nor could the disease be eradicated by operation, proving ultimately fatal.

THE REGISTRAR-GENERAL (Dr. Grimshaw) gave an address on "Preventive Medicine and Vital Statistics," in reference to which Lord Iveagh uttered the fervent prayer that England would soon "take her place more worthily alongside France, Germany and America in the pursuit of the highest research in preventive medicine."

FOR THE ALLEGED INFRINGEMENT of a sulphuric acid concentration patent, Thomas Webb, of Manchester, sued Kynoch and Co., Cordite Works, Arklow, for damages. The Master of the Rolls gave judgment in favour of plaintiff. In the Court of Appeal four judges were equally divided, so the original decision stands pending a further appeal to the House of Lords.

THE SPREAD OF THE MORPHINE HABIT in America has given rise to some uneasiness. A writer commented that his countrymen were becoming much more nervous and excitable than the French. He viewed with satisfaction the introduction of milder medicines of the same class, such as phenacetin. I do not know if it is much resorted to in Ireland, but cases have come under my eyes which are illustrative of its incurable fascination. One gentleman consented to take a sea voyage of some months. During the latter part of the passage, however, he suffered agonies, and the ship had hardly been berthed before he went like a sprinter for the nearest chemist. On one occasion I remarked semi-jocosely to a periodic purchaser what would he do if I refused him. He did not say, but he told me that he had known such a case occurring where the victim of the habit being at the seaside had to walk three miles, but the chemist not only refused it but gave him a stinging lecture on his effeminacy. The poor fellow was so humiliated that he positively never touched morphine again! "If it had been me," said my customer, "I would have hauled that chemist over the counter and broken his shop to pieces with him."

THE SOCIETY FOR THE EXTENSION OF UNIVERSITY TEACHING IN BELFAST held an executive meeting lately. The results of examinations were submitted, and medals and certificates awarded. Professor Letts lectured during the session on the "Chemistry of Heat, Light, and Electricity," Mr. R. Lloyd Praeger, M.R.I.A., on "Plant Life as Illustrated by British Wild Flowers." With one exception, Professor Letts' lecture were the most popular, having an average attendance of 84, whilst the botanical lectures had 27.

THE IRISH FIELD NATURALISTS have completed their second triennial excursion, this time in the vicinity of Kenmare, County Kerry. The Club Union embraces the naturalists of Limerick, Cork, Dublin, and Belfast. Some English conchologists accompanied the party; archaeology, geology, and botany were all represented. The zoologists were in great expectation over the

"only home in Great Britain" of the spotted slug (*Geomalacus*). This was at Laugh Inchiquin, but alas! he had retired into the clefts of the rocks. The most agreeable occupation fell to the lot of botanists and geologists. The arbutus and juniper flourished on the banks of the Kenmare estuary, the Royal fern on the peninsulas of the island, whilst the pipewort, waterwort, and lobelia of great size grew abundantly in the lake. Some specimens of pennywort had spikes 31 inches long, the roof of one cottage being overgrown with it. Certain classes of the flora of the south and west of Ireland, which are characteristic of Southern Europe, as well as other species of American and Alpine origin, are not found elsewhere in the British Islands. This is a subject of investigation amongst naturalists. Irish spurge spreads itself along the south and west coast, flaming forth in bright green or orange red. It is also found in Devonshire and South-west Europe. *Saxifraga geum*, peculiar to the Pyrenees, grows here on the adjacent mountains.

THE PRESIDENT OF THE QUEEN'S COLLEGE has received a communication from Her Majesty's Commissioners for the Exhibition of 1851, in which the college is next session given the nomination to a science research scholarship of the annual value of £150, tenable for two years. The nominee to be an alumnus of the college.

THE BELFAST LIBRARY COMMITTEE has consented to receive, on behalf of the local pharmacists, the selection of volumes provided as a gift out of the "Bell and Hills Fund."

SELECTED FORMULÆ.

TONIC ASEPTIC HAIRWASH.

Mix acid tannic, 5, with formalin, 20, and add sulphuric acid, 5. The resulting reddish precipitate is washed with water until the sulphuric acid is quite removed, when it is dried. Five parts of this precipitate are dissolved in 100 parts alcohol, and perfumed. It forms a permanently red solution, which does not stain the skin or anything else.—*Pharm. Post*, xxxi., 247.

FLUID GLYCERIN SOAPS.

(a) Dissolve transparent soft soap, 2 (prepared without resin), in alcohol, 1, and water, 1, and filter; add glycerin, 1½, to the filtrate, also perfume as desired. (b) Dissolve soft soap, 1 (manufactured from elain), in glycerin, 1; add alcohol, 90 per cent., 6 to 8; and then perfume.—*Pharm. Post*, xxxi., 247.

COCAINE PREPARATIONS FOR DERMATOLOGICAL WORK.

Dusting Powder for Lupus, etc.—Cocaine hydrochloride, 0.5 to 1; magnesium carbonate to 50. *Cocaine Oil.*—Cocaine, 1; almond oil, 50. *Cocaine Soap.*—Cocaine, 1; superfatted soap to 50. Recommended by Unna for eczema.—*Pharm. Post*, xxxi., 247.

KLEEWAIN'S APERIENT PILLS.

Extract cascara, extr. rhei, rec., āā 3 Gm.; podophyllini, 0.5 Gm.; extr. belladonnae, 0.5 Gm.; pulv. cascara sagr. q.s. to make 50 pills.—*Deutsch. Amerik. Apoth. Ztg.*, xix., 31, through *Pharm. Centralh.*

FORMOFORM DUSTING POWDER.

Aufrecht states that the dusting powder known as formoform has the following percentage composition:—Formaldehyde, 0.13; thymol, 0.1; zinc oxide, 34.44; starch, 65.27.—*Pharm. Zeit.*

GAULTHERIA PROCUMBENS IN HORTICULTURE.

It will interest pharmacists to hear that *Gaultheria procumbens* is recommended in the *Garden* as being extremely valuable for bedding purposes in carpeting, being very effective at all seasons. It does well in most soils except those in which lime predominates, and is also useful in the rock-work. At Kew, a bed containing a few plants of the winter flowering *Hamamelis japonica* is carpeted with *Gaultheria*, and the effect produced is described as being very striking.

DISINFECTION OF DEJECTA.

Zinc sulphate, 100 grammes; sulphuric acid, 5 grammes; oil of mirbane, 2 C.c.; indigo blue, 0.5 gramme. Five grammes of this mixture to be used at a time.—*Pharm. Centralh.*, xxxix., 216.

PHOTOGRAPHIC NOTES.

A NOVEL FERROCYANIDE PROCESS possessing many points of photographic interest has been devised by F. Carter. The fabric is coated with the usual ferrocyanide and ferric ammonium-citrate mixture and exposed and developed in the usual manner. The fabric is then washed and treated after the manner of dycrs when adjective dyes are used. Briefly, the print is first washed in weak caustic soda solution till the blue is decomposed, then washed in hot water, then given three minutes' immersion in a hot solution of phosphate of soda, with the purpose of improving the colour of the finished picture. After washing for a short time in hot, then in cold, and again in hot, water it can be placed in the dye bath (at a temperature of 160° F.), to which gluc size has been added with the purpose of keeping the whites clear. When the print is thus placed, the dye is added and the heat raised to 180°; when the desired shade is reached, the print is withdrawn, passed through a bath of neutral soap to clear the whites, then rinsed in hot, and finally in cold, water. Resorcin green gives a green colour, gallo-cyanine a violet and blue, alizarine a purple; alizarine brown, sepia tones; or logwood or other naturally formed dyes may be used. It will be seen that, provided the paper would stand the treatment, there is no reason why ordinary blue prints should not be treated in this manner to obtain a variety of colours; in any case, the facilities offered for printing in various colours upon any cotton fabric should make the process valuable for many purposes to the possessors of suitable negatives.—*British Journal of Photography*.

FILM USERS can obtain from Messrs. Beck a handy means for the safe storage of films when on tour, or in cases where it is advisable to specially protect films from salt air or damp. For the sum of fivepence, including postage, they will supply a tin box, which (when filled with films, of which it holds forty 00 Frenas) is made air-tight by cementing with a strip of surgeon's plaster, which might also be utilised for re-sealing plate boxes, so often the victims of domestic curiosity.—M. C. F., in *Photo. News*.

ENLARGING FROM FILM NEGATIVES.—Dr. E. Vogel recommends the following procedure for obtaining good enlargements from film negatives that show imperfections in the celluloid. Strip the gelatin film from the support by Lainer's method with an alkaline solution of formalin in the following proportions:—Water, 200 C.c.; caustic potash, or caustic soda, of a solution 1:3, 15 C.c.; formalin, 4 C.c. After five to ten minutes' immersion in the above, the negative is transferred without washing to a five per cent. bath of hydrochloric acid. The negative should remain five to ten minutes in the acid bath, and may then be stripped. The stripping will be facilitated if the gelatin film has been cut through near the margin of each of the four sides before immersion in the formalin bath. The stripping should be done in the acid bath by rolling off the gelatin film with the fingers, and this should be done as soon as the film shows signs of leaving the support. Transfer the film to a dish of water, pass a glass plate beneath the film, and lift the two in contact from the bath. Shift the film to the edge of the plate and turn over a strip about a Mm. in width. This will keep the film in position whilst it is stood up on the opposite edge to dry. With ordinary care this method of stripping is almost free from danger to the film.—*British Journal of Photography*.

FLUID GELATIN.—The *Photographische Chronik* mentions that a German patent has been granted for the preparation of gelatin fluid at ordinary temperatures as follows:—Chloral hydrate, 250 Gm.; gelatin, 400 Gm.; water, 1000 Gm. After standing forty-eight hours the solution is ready for use, and, if necessary, it may be cleared by decantation. The solution may be used for photographs.—*British Journal of Photography*.

A NOVEL TONING AND FIXING PROCESS is due to A. E. Wade, who claims that it both improves the appearance or finish of photographic prints and their resisting capacity to time, in being exposed to vitiating atmospheric conditions in storage, etc., and under various other circumstances of ordinary contact. By the use of his combination solution for fixing and toning, and which, in addition, completes the photograph with greater effect, a considerable degree of economy is assured, and what is of immense importance in general photographic manipulation consists in the fact that the

employment of the dangerously poisonous sulphocyanide of ammonium becomes unnecessary by the application of his combination solution. The great active principle of the solution—as composed of appropriate proportions, varying for specific purposes, of chloride of gold, nitrate of lead, nitrate of potash, hyposulphite of soda, flowers of sulphur, and quicklime respectively—is secured by the employment of ordinary water treated by the following special process, viz., the water while in a boiling condition is saturated, or acted upon till saturated, with smoke obtained by the burning of ordinary bituminous coal, or the smoke may be obtained from anthracite or other carbonaceous fuel. After passing the smoke through the boiling water until it becomes thoroughly saturated with it, and then allowing it to cool, the above-named ingredients are incorporated with the fluid thus treated in requisite proportions. The mixture is now agitated, and, after allowing it to subside or clear, the insoluble sediment is filtered off, and the solution is now complete for its intended functions. The prints treated with it are absolutely permanent, whereas those treated with other existing solutions will fade in probably less than two years. Another of its great properties is that the whole of the solution, once prepared, can be entirely used up without adding to its strength, and at the same time the solution thus prepared will remain fit for use at any time during a number of years. Finally, one of its valuable qualities consists in the fact that no previous washing of the prints is required in using it, and besides, it absorbs silver from the paper, which, where previous washing is necessary, would produce a waste, whereas in this process it will help to enrich the solution and to considerably improve the tone of the picture treated with it.—*British Journal of Photography*.

A SUBSTITUTE FOR HYPO.—To those who object to the use of hypo for reducing negatives, in consequence of the long washing required after reduction, the following I can recommend:—Potassium ferridcyanide, 12 grains; sulphocyanide of ammonia, 24 grains; water, 2 ozs. By the use of this reducer a few minutes' washing under the tap is quite sufficient, and no fear need be entertained as to its permanency. If the negative wants but slight reduction, reduce the proportion of ferridcyanide accordingly.—P. R., in *Photographic News*.

CLEANING FILMS OFF OLD NEGATIVES.—The gelatin film is best removed from old negatives or lantern slides which are going to be used for opaline glasses or covers for slides, by allowing them to soak for a day or two in cold water, and then placing in hot water for a few minutes. In this latter the film will quickly dissolve. If the gelatin is wished to be removed in a hurry, soaking in a strong solution of acetic acid ("glacial" acid mixed with an equal volume of water) will enable you to rub it off with a rag.—G. E. B., in *Photographic News*.

TRANSPARENT SPOTS ON NEGATIVES.—It occasionally happens that drops of water are accidentally sprinkled on the films of unvarnished negatives. The result, after the second drying, is a series of spots of greater transparency than the surrounding film. To remove them, the entire negative should be re-wetted for some time, and on again drying the spots will not be so much in evidence. By alternately wetting and drying a negative its density can be reduced to some extent.—T. K., in *Amateur Photographer*.

P.O.P. ON PLATE GLASS.—It may not generally be known among "tyros" that an absolutely sure and never-failing safeguard against P.O.P. prints adhering to the glass support when dry is the following:—Clean your glass as you usually do, and when you think it is "quite clean," take a sponge or tuft of cotton, and rub vigorously with pure benzine. If this is done, and a final polishing is given with chamois or clean duster, the glass will be chemically clean, and the prints will almost "walk" off when dry.—LINO, in *Amateur Photographer*.

WARMING DEVELOPERS.—In cold weather the action of the developer may be greatly accelerated by warming it. Of course, if the developer is warmed, the fixing solution should also be warmed, as well as the washing water between development and fixation. If this is not done, the plates are liable to frill, caused by changing the plates from luke-warm developer to ice-cold water. By the time fixation is complete, the solution will have become cold, and the final washing can then be proceeded with in the ordinary way.—L. T., in *Amateur Photographer*.

DENTAL NOTES.

SILVER NITRATE IN SUPERFICIAL DECAY.

Dr. Cox, in the *Stomatological Gazette*, writes: There are many cases where patients will come—showing a little white streak just above the border line of the gum on the buccal surface of the molars and bicuspids. It is simply superficial. My advice in these cases is not to put on the rubber dam, but simply a napkin in the mouth to keep the moisture from the teeth, dissolve a little nitrate of silver, rub it on the streak, then play the hot air syringe on it and notice the result. Nitrate of silver is also recommended for applying to prepared cavities in molars before inserting the filling, care being taken not to use it too near the pulp. Ammonol is finding favour in the hands of many dentists for allaying pain in cases of pulpitis and periostitis. It is claimed that four ten-grain doses given at intervals of an hour will prove a sure remedy, giving relief in those distressing cases, and allowing the patient to obtain a good night's rest, after which the tooth can be treated in the usual way.

HOW TO TAKE IMPRESSION OF MOUTH WITH UNDERCUT TEETH.

In taking impressions of the mouth where teeth are undercut so much that a drag is likely to result, the following method answers perfectly. Syringe and cleanse the undercut tooth, mix some plaster of Paris thin, fill up the undercut with it, allow the plaster to harden, and then trim up. Smear over a little vaseline, then take impression, and afterwards remove plaster from undercut and place in model.—*Ohio Dental Journal*.

SPHEROIDING OF AMALGAMS.

Mr. Thos. Fletcher, whose name is so well and favourably known to dentists, states in *Ash's Quarterly*, in his review of Mr. Ernest A. Smith's recent manual of 'Dental Metallurgy,' that spheroiding of amalgams is not due to change of volume. A few experiments will prove that this is not so. When there is a decided change of volume, as with precipitated silver amalgams, packing in tubes will show that there is no spheroiding. The whole surface lifts the edges rising above the level of the tube to practically the same extent as the centre. Where true spheroiding occurs it will be found that as the centre rises the edges draw inwards and the plug becomes leaky; the space is easily seen with a magnifying glass. He also writes: "That the only method at present known for treating zinc that has become unworkable through continued use is to heat it to incipient redness, throw a small quantity of hydrochloric acid on the surface, and stir with a stick. About two tablespoonfuls will render a large ladleful of thick zinc perfectly fluid. This, however, does not remove iron, which can only be separated by redistilling the zinc, which, of course, is impracticable on a small scale.

WOOLLY ASBESTOS AS AN INVESTMENT MATERIAL.

Woolly asbestos well saturated with water forms an investing material which in many cases is superior to plaster and sand, and may be used without a moment's delay. It can be dried and the wax burnt out, solder applied, and completed in less time than it takes plaster and sand to set. It can be used over again and again, and is inexpensive.—*International Dental Journal*.

PAINLESS DENTISTRY.

Dr. Clyde Payne, writing on the above subject in the *American Journal of Dental Science*, recommends the following for obtunding sensitive dentine:—Potass. carb., glycerin, cocaine, and acid carbolic in a saturated solution. He considers it the next best thing to cataphoric medication. His directions are: Apply the rubber dam, dry out the cavity thoroughly, dry it out with alcohol; place a drop of the obtundent into the cavity, and throw a continuous blast of hot air on it. Keep it up for five minutes, when the cavity can be excavated painlessly. He uses the following for hypodermic injections in extractions and other operations in the mouth: Cocaine, 15 grains; glycerin, 5 drachms; nitro-glycerin, 1/10 of a grain; sulphate of morphia and atropia, 1 grain; carbolic acid, 3 drops; distilled water to make 2 ounces. He writes, there is sufficient glycerin to localise the cocaine, holding it in opposition to the parts a sufficient length of time to complete the operation, and not long enough to act as an irritant and cause swelling. In patients of poor circulation swelling sometimes occurs, but it is not accompanied with any pain and subsides as soon as

the anæsthetic has become absorbed. The nitro-glycerin stimulates the heart just in proportion as the cocaine depresses it. The sulphate of morphia and atropia overcome the after pain. The carbolic acid keeps the solution. Dr. Payne gives the names of some of the most prominent dentists in America who use this anæsthetic.

FILLING DECIDUOUS TEETH.

In the *American Dental Weekly*, Dr. Gilbert recommends the following method for overcoming the many difficulties experienced in filling children's teeth: Place some cement powder upon the slab, also a little of the fluid, and besides these a little chloro-stopping. Make a thin mixture of the cement, then add to it the chloro-stopping, mixing in more of the powder until a thick putty-like consistency is obtained. Now dry the mouth as well as possible, then immediately pack the place and finish with burnishers.

DEATH FROM PYÆMIA FOLLOWING ATTEMPT AT TOOTH EXTRACTION.

A chemist's assistant aged eighteen years endeavoured to extract some roots of a left upper molar by means of a sharpened wooden penholder. After these attempt he suffered severe pain in the neighbourhood of the roots and some swelling, which progressively increased in size, involving the adjacent cheek. Three days later a blackish slough commenced to form, and the patient applied for treatment to the Dental Hospital of London, where he was ordered a mouth wash. Two days later (April 27) he again went to the hospital, when a blackish slough was present, separated by a distinct line of demarcation from the surrounding tissues, which were much inflamed. The slough occupied the region of the upper left molar extending inwards towards the palate, involving it to an area about the size of a shilling. The temperature was 102.6, pulse 120, the tongue foul, and patient looked ill. He was sent to Charing Cross Hospital, where he was anæsthetised, and the slough was freely scraped away and the tissues freely cauterised with pure carbolic. In spite of this treatment, another slough formed, the adjacent teeth became loose, the bone was stripped and laid bare by burrowing pus, which could be freely squeezed out. The parts were again freely scraped. Owing to great respiratory embarrassment during anæsthesia, tracheotomy was performed. The edges of this wound also showed signs of sloughing; gradually the patient sank, and on May 16 he died. The post-mortem examination showed multiple visceral abscesses, etc.—*Dental Record*.

EUGENOL WITH ZINC OXIDE.

Some interesting remarks by Dr. S. Blair Luckie on the properties of eugenol mixed with zinc oxide are given in *Items*. If properly mixed, that is, as much of the oxide used as the fluid will take up without becoming crumbly, a filling may be inserted that will last as long as the best cement. In mixing, a condition will appear as though no more of the oxide could be added without producing the crumbling alluded to, but by patting the mass with the spatula, plasticity will return. It hardens more rapidly in the mouth than on the slab and will retain its quality as a filling material better in the tooth, the filling will present good margins and has comparatively good edge strength. Dr. Luckie has given it four years' trial and has not noticed any wasting in last than after one year's wear. It is most suitable for approximal cavities. It also forms an excellent material for deep or sensitive cavities to build other stoppings; is a good covering for dressings when avoidance of pressure is necessary, or where an antiseptic or thermal protector is required. Hubbock's zinc oxide is recommended.

FIXING THE RUBBER DAM.

In order to get the rubber dam well up on the neck of the tooth so as to obtain a clear view of the cervical margin of the cavity to be filled, wrap a piece of dental floss or thread twice round the tooth and push well up on the neck of the tooth, then tie. Let this remain for a couple of days, and then the application of the dam can be made with ease and little discomfort to the patient, and affords a perfect view of the parts to be operated on. The *Dental Office and Laboratory* says, "Care should be exercised that the patient does not wear the ligature too long, or disastrous effects may follow on account of its tendency to work upwards."

NOTICES TO CORRESPONDENTS.

All Communications for the 'Pharmaceutical Journal' must be Addressed to the Editor, 17, Bloomsbury Square, London, W.C., and not in any case to individuals supposed to be connected with the Editorial Staff no responsibility can be accepted unless this rule be observed. Communications for the Current Week's Journal should reach the Office not later than Wednesday, but news can be Received by Telegraph until 4 p.m. on Thursday.

ADVERTISEMENTS AND ORDERS for copies of the 'PHARMACEUTICAL JOURNAL' must be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Cheques and money orders should be made payable to "Street Brothers."

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size; clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

QUERIES addressed to the Editor will be replied to in the Journal as early as possible after receipt, though not necessarily in the next issue. Replies cannot be sent by post, even though stamped envelopes accompany the queries.

LETTERS TO THE EDITOR.

THE DISCUSSION ON THE B.P.

Sir,—In common, I think, with many others, I was disappointed at the premature collapse of the Pharmacopœia discussion at Belfast. With your permission I will therefore take this opportunity of replying to some of the criticisms on my paper. With regard to the separation of strychnine and brucine in the estimation process for nux vomica, I think my point was hardly understood. No amount of washing appears to free the precipitate absolutely from brucine, whilst the bitter taste persists in the filtrate. Prolonged washing, moreover, causes a considerable diminution in weight, with a probable loss of strychnine. Results, therefore, will differ in accordance with each analyst's idea as to the proper quantity of acidulated water to be used for washing the precipitate. Mr. Farr condemns the reprecipitation process, but will he tell us how we are to know when the strychnine precipitate is sufficiently free from brucine for all practical purposes?

Ext. Physostigmatis.—In the absence of any definite standard of weight for the finished product in the process for this preparation, there will undoubtedly be variance in the potency of samples from different sources.

Concentrated liquors.—Mr. Umney says that the B.P. process does exhaust the drugs. It may in some cases, but I have before me now a sample of liq. chirate conc. made strictly in accordance with the Pharmacopœia, and the residual marc is certainly not exhausted.

Syr. ferri phosphatis cum quinina et strychnina.—I have so far found the B.P. process satisfactory, as have others. Mr. Martindale's objection to the precipitation process is, however, worthy of consideration.

Tincture of Strophanthus.—On the strength of a journalistic note I made the tentative suggestion that this tincture did not differ so widely from the 1890 preparation as would appear from the formula. Mr. Farr says that there is practically no difference in the exhaustion of the drug, whether a strong or weak alcoholic menstruum be used; and as I have no experimental data to compare with this I accept his conclusions.

Ol. Lavand. Exot.—I hear from a distiller that "he doubts if it is at all possible to obtain an oil of the B.P. density, seeing that the average does not exceed 0.875".

Ung. Hydrarg. Nit.—The B.P. process may not be a perfect one, but I have obtained good results by its use. Two points are of importance, the quality of the olive oil used and the preparation of the mercury solution in an open vessel, so that the former may be rapidly carried away.

Ung. Staphisagrie.—It may be remembered that Mr. Balmanno Squire some time ago stated as the result of experiments that the activity of stavesacre was entirely due to the oil, and if that be so, it would be well if the present wasteful and troublesome process were modified as suggested in my paper. I wish to thank the members of the Conference for their kind reception of a hastily prepared paper, and you, sir, for allowing me to reply in your Journal.

Exeter, August 23, 1898.

H. WIPPELL GADD.

THE TESTING OF THYROID GLAND.

Sir,—In a paper read before the British Pharmaceutical Conference, at Belfast, August, 1898 (*P. J.*, lxi., p. 159), by Mr. McWalter, the following statement is made:—"Thyroid gland tablets should be suspected unless they show traces of iodine. Dissolve a tablet in water and add some drops of strong nitric acid, afterwards a few drops of chloroform, which ought to show, after agitation, the characteristic violet tint." We desire to call attention to the fact that this method of testing thyroid gland is impracticable and misleading. In the first place, thyroid glands are not soluble in water, and furthermore, any iodine which may be liberated by the above test would not be detected, owing to the precipitation of albuminous matters which form an emulsion with the chloroform. A recognised method of testing, which is both practicable and accurate, is conducted as follows: Powdered thyroid gland is thoroughly incorporated with a mixture of equal parts of dried sodium carbonate and potassium nitrate, and fused in a crucible. The white fused mass is then dissolved in a little water, the solution filtered, a few drops of chloroform added, and after acidifying with dilute sulphuric acid, the mixture is shaken. When even traces of iodine are present the chloroform will then show the characteristic violet tint. (Compare also Baumann, *Zeitschrift für Physiolog. Chemie*, xxii., 2). In corroboration of these remarks we may note the following observations:—1. By the method of testing which we have indicated a distinct iodine reaction was obtained with one thyroid gland "tablet," whereas by the method proposed by Mr. McWalter no reaction was obtained even when ten times this amount was used for the test. 2. Parallel experiments with such small amounts of free iodine as may readily be detected in a simple solution by the violet coloration imparted to chloroform have shown that it cannot be so detected in the presence of albuminous matters, etc., such as are contained in the thyroid gland, even when the amount of iodine is considerably increased.

London, August 19, 1898. BURROUGHS, WELLCOME AND Co.

LIQUORES CONCENTRATI.

Sir,—May I be allowed to ask Mr. J. C. Hyslop which part of his contradictory advice he expects dispensers to follow. That, to think and work in terms of the metric system instead of the Imperial, which the B.P. still terms the present system, or that conveyed in the sermon on wifely obedience to the B.P. commands? His ideas must surely be in a state of chronic confusion, a confusion further evidenced by the application of the text pointing clearly to military obedience of the "theirs not to reason why, theirs not to make reply" type; and yet again, by the assurance that, to all intents and purposes, the B.P. does not concern dispensers. On his own authority he states that the liquores concentrati are not introduced for the convenience of the dispenser, and but partly for that of the prescriber, thus leading to the conclusion that they may be prescribed, but not dispensed, and therefore dispensers need not bother about them any more. But as good wives are not dumb, driven cattle, they are apt to ask why their convenience is not consulted, as it is the duty of a husband to do so? Therefore, let Mr. J. C. H. find, if he can, an adequate answer to the question, Why are the "nine of the more successful" liquores concentrati (confessedly resembling the liquids which manufacturers call concentrated infusions) not made of such strength that one fluid drachm diluted to one fluid ounce may be prescribed and dispensed in place of the corresponding infusion? Of course, making the reservation as to minor respects, etc., already granted in the B.P. In conclusion, allow me to correct the erroneous idea, that in quoting doses which included the absurdity of fragments or recurrent decimals, I implied any lack of arithmetical capacity on the part of the compilers. On the contrary it was their superabundance of that same capacity which I credited with leading them to a too zealous pursuit of per cent. solutions or liquors. Indeed they deserve the

highest praise for tackling such a task as the B.P. arithmetic now is. But what is to be said of one who misreads the simple statement that "liquores concentrati B.P. are uniformly 1 to 9," as meaning ten liquores? To say the least of it, it does not show much gain in "brain"; one of the prospective gains to be got by thinking in terms of the metric system.

August 23, 1898.

FLUID-DRACHM (140/25).

THE "MAJOR" EXAMINATION AS AN ANALYTICAL QUALIFICATION.

Sir,—One of your contemporaries has recently published an article on the utilisation of the Major examination. It suggests raising the standard so as to make it a qualification for an analytical chemist. I think this an excellent idea. As the Major stands, it is for all business purposes useless. Why not then adopt this suggestion, add on a course of food and general analysis, and allow present Major men to sit for the additional part only? It need not attempt to supplant the F.I.C., but simply give to men who from their training are specially qualified for food and drugs analysis a recognised standing. From the stringency of the F.I.C. regulations they will never be able to supply the amount of analytical chemists required at the present day; and who are better qualified to supply the want than well-trained scientific Major men? A rearrangement of the syllabus is all that is required, sufficient mathematical, physiological, and chemical knowledge being ensured. This opens out an excellent subject for discussion at our provincial centres, their final resolutions being reported to the Council.

August 23, 1898.

ANALYST (140/26).

* * * Everyone who proposes to become an analytical chemist should, if possible, become connected with the Institute of Chemistry.—[Ed. P. J.]

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms, and the registered number added in each instance should be quoted in any subsequent communication on the same subject.

B.P. ALTERATIONS.—No such book has yet been published. [Reply to W. T.—15/15.]

BOTANICAL.—*Scutellaria galericulata* and *Gnaphalium uliginosum*. [Reply to D. S. N.—15/9.]

HOLMES' 'BOTANICAL NOTE-BOOK.'—The book is supplied by Dulau & Co., Soho Square, London, W. [Reply to STUDENT.—15/16.]

MEDICAL.—The matter is beyond our province. You should consult a medical man. [Reply to TROUBLED ONE.—15/22.]

ARSENICAL PASTE.—White arsenic, 4; air-slaked lime, 4; potassium carbonate, 12; camphor, 1/4; soft soap, 4; water, *q.s.* to make a stiff paste. It is not necessary to colour the arsenic. [Reply to AESTAS.—15/18.]

ANALYSIS.—If you require advanced practical instruction, beyond what can be obtained at the School of Pharmacy, your best plan is to work in some private laboratory for a time. There is no better all-round text-book than the latest edition of Valentin's 'Course of Practical Chemistry' (Churchill, 9s.). [Reply to M. P. S.—15/17.]

ANALYTICAL CHEMIST.—No legal qualification is required to enable anyone to practise as an analytical chemist, but it is desirable to be connected with the Institute of Chemistry. Write to the Secretary of the Institute, 30, Bloomsbury Square, London, W.C., for particulars. [Reply to G. R. T.—15/21.]

RAT POISON.—It appears to consist of oatmeal with a small proportion of arsenic, coloured with indigo and made into a paste with beef dripping or some similar fat. [Reply to E. W. H.—14/23.]

OIL FOR CRICKET BATS.—Linseed oil with or without the addition of a little oil of turpentine is what is generally used. During the winter the bats should be kept in a dry atmosphere. A good bat deserves as much care as a violin. [Reply to ATHLETICUS.—15/3.]

LINIMENTUM MYRISTICÆ.—The London Hospital formula is:—Volatile oil of nutmeg, 1; olive oil, 3. Guy's Hospital formula is:—Expressed oil of nutmeg, 1; olive oil, 3. The former should serve your purpose. [Reply to G. W.—15/10.]

CAPTOL.—You are not likely to find the word "captol" in "any dictionary or chemical work." If, however, you had referred to the index of the last volume of the *P. J.* you would have found all you want to know on page 163—of the issue for Feb. 19, 1898. It is a condensation product of tannin and chloral. You can obtain it from any wholesale house which deals in new remedies. [Reply to W. S.—15/4.]

LIQUOR BISMUTHI.—The opalescence you refer to may be removed by suspending a little finely powdered animal charcoal in the solution before filtering. The filtrate will then run through bright. Probably you did not test your bismuth oxynitrate before using it; if it gave the cloudiness you describe, it would not answer the B.P. test and therefore should not have been used for making the liquor. [Reply to A. E. M.—15/6.]

HARDENING ANIMAL TISSUES.—Chromic acid, in 0.2 to 0.5 per cent. solution, is most rapid and energetic in its action, but potassium bichromate (2 to 5 per cent.) is also largely used. In both cases begin with weak solutions and proceed gradually to stronger ones. Alcohol alone is inferior to chromic acid or its salts. Formaldehyde is extremely useful for hardening nervous tissue. Refer to Lee's 'Microtome's Vade-Mecum' or Squire's 'Methods and Formulæ' for details. [Reply to BIOLOGY.—15/11.]

FRENCH PREPARATIONS.—"Eau lactuc" is presumably the *eau distillée de laitue* or *hydrolatum lactucæ* of the French Codex. It is prepared by distilling bruised lettuce (*Lactuca capitata*, DC., and *L. virosa*, L.), with twice its weight of water and collecting a weight of product equal to that of the lettuce taken. *Sirope d'ether* of the Codex is prepared by mixing simple syrup, 70 Gm.; 90 per cent. alcohol, 5 Gm.; distilled water, 23 Gm.; and sulphuric ether, 2 Gm. *Coton hydrophile* is absorbent cotton-wool. [Reply to AJAX.—15/19.]

F.L.S. and F.C.S.—The letters "F.L.S." stand for "Fellow of the Linnean Society." To become a "Fellow of the Chemical Society" you must be elected after nomination by Fellows. Write to the Secretary of the Society, Burlington House, Piccadilly, London, W., for particulars. The examinations in science conducted under the auspices of the Science and Art Department are open to everyone without the necessity of previously passing an examination in arts. The degree of B.Sc. is granted by the London, Victoria, Durham, and most other Universities in the United Kingdom. Write to the Registrars for particulars of the examinations. [Reply to SUBSCRIBER.—15/20.]

INFORMATION WANTED.

AMERICAN MIXTURE.—A medical correspondent wishes to be informed what is the composition of this mixture. It was prescribed for him by another medical man, who admitted that he did not know what the mixture contained.

CORRECTION

JOHN RADCLIFFE, M.D.—An obvious error occurs in the article on Dr. Radcliffe, published last week, James I., being referred to as having been king in Radcliffe's time instead of James II. The writer of the article had omitted to correct the error in the proof sent to him.

Pharmacy and the Allied Sciences.

REVIEW OF CURRENT WORK.

O. Doebner has applied the production of alkyl-naphto-cinchonic acids by the reaction of pyruvic acid ($C_3H_4H_3$) and β -naphthylamine with aldehydes for the determination of citral in essential oils. In that way he has confirmed the observation otherwise made by Schimmel and Co. and others that lemon-grass oil (*Andropogon citratus*) contains from 80 to 82 per cent. of citral, while the amount of citral in lemon oil (*Citrus limonum*) does not exceed 7 or 8 per cent., and is still less in other oils. When oil containing a considerable amount of citral is treated with pyruvic acid and β -naphthylamine in alcoholic solution, citryl-naphto-cinchonic acid separates in characteristic yellow crystalline laminae, melting at $197^\circ C$.

From oil containing less citral the citryl-naphto-cinchonic acid is accompanied by methyl-naphto-cinchonic acid melting at $310^\circ C$. and much less soluble in alcohol. When the oil operated upon contains other aldehydes besides citral, the corresponding alkyl naphto-cinchonic acids are produced—lemon oil, for instance, yielding some citronellyl naphto-cinchonic acid melting at $225^\circ C$.

Though citral has hitherto been known only in the optically inactive form, Doebner's observations point to the probability that aldehydes isomeric with citral would yield different compounds of the kind above referred to, and hence it was desirable to examine lemon-grass oil in that respect, but it was found that an acid melting at $197^\circ C$. was the only product, showing that citral was the only aldehyde present in any considerable amount. Citral being optically inactive the optical laevo-rotation of lemon-grass oil must therefore be due to terpenes or other bodies than aldehydes.

Assuming that citral is the only aldehyde present in lemon-grass oil, it would follow that by condensation with acetone and alkaline reagents by Claisen's method the same products would be obtainable as from pure citral, viz, pseudo ionone, $C_9H_{15} \cdot CH = CH \cdot CO \cdot CH_3$, and ionone, $C_{13}H_{20}O$. That conclusion is in accord with Tiemann's observation, that by condensation with acetone, lemon-grass oil yields a very pure pseudo-ionone.

In the specification of an English patent it is stated that the product of the action of chloride of lime upon a mixture of lemon-grass oil, acetone and alcohol differs from pseudo-ionone, and does not yield ionone when treated with sodium bisulphate, but is converted into one or more different ketones, having the formula $C_{13}H_{20}O$. Doebner disputes this statement, and brings forward evidence to show that lemon-grass oil does not contain isomers of citral, and that the product obtained by the action of chloride of lime is essentially identical with that obtained by acting upon citral. The only difference is that the product from lemon-grass oil has some rotatory power, which is due to an admixture of the

optically-active terpenes in lemon-grass oil, amounting to about 18 per cent.

In order to determine the citral in lemon-grass oil, and to establish its identity, comparative experiments were made with 40 grammes of citral and the same quantity of lemon-grass oil. By heating with 24 grammes pyruvic acid and 40 grammes β -naphthylamine dissolved in 200 C.c. absolute alcohol, citral yielded 40 grammes, or citryl-naphto-cinchonic acid, melting at $197^\circ C$., and from the mother liquor about 4 grammes of mixed acids melting at 140° - $160^\circ C$., which gave on fractional crystallisation, among other products, an acid melting at $225^\circ C$., and having the composition of citronellyl naphto-cinchonic acid. The lemon-grass oil yielded 32 grammes citryl naphto-cinchonic acid, corresponding to 82 per cent. citral, and 3 grammes of mixed acids melting at 240° - $260^\circ C$.

Pseudo-ionone was prepared by treating citral and acetone with barium hydrate, and compared with the product obtained by acting upon lemon-grass oil with chloride of lime and some cobalt nitrate, the boiling points of the crude products at 25 Mm. were between 160° and 175° , and in the latter case 140° to 170° at 22 Mm. After purification by treatment with sodium bisulphite, the respective boiling points were 158° - 164° and 157° - $163^\circ C$., at 22 Mm., the specific gravity was in the former case .900 at $18^\circ C$., in the latter .901, and the semi-carbazon compounds melted at 142° and 139° - $140^\circ C$., the only difference between the two products being the optical activity of the product from lemon-grass oil.

It was ascertained that in the treatment of an alcoholic solution of lemon-grass oil and acetone with chloride of lime and cobalt nitrate, the first action gives rise to the formation of chloroform and calcium hydrate, and at that stage no pseudo-ionone is produced, though by continued digestion the calcium hydrate effects condensation of the citral and acetone exactly as in Claisen's reaction.

Further comparative experiments showed that the ketone of violet odour obtained by treatment with chloride of lime is identical with the ionone obtained by acting upon pseudo-ionone obtained from citral. Like ordinary commercial ionone it contains, as Tiemann has shown, two stereo-isomeric modifications, ionone boiling at 123° - 124° at 11 Mm., and β -ionone boiling at 127° - $128^\circ \cdot 5$ at 10 Mm. The presence of the former was proved by the formation of the brom-phenyl-hydrazone melting at 142° - $143^\circ C$., and the latter by the semi-carbazon melting at 148° - $149^\circ C$. By treatment of the pseudo-ketone obtained from lemon-grass oil by the chloride of lime method with concentrated sulphuric acid it is chiefly converted into the β -ionone. On the ground of these results, Doebner concludes that the statement made in the above-mentioned specification as to the violet oil containing no ionone is incorrect. He considers that its identity with ionone is proved, as well as the fact that inactive citral is the only aldehyde present in lemon-grass oil to any considerable extent, and that the doubt which gave rise to the foregoing experiments has now been completely removed.—*Berichte*, 130, 1888.

Gabriel Bertrand communicates a lengthy Biochemical account of his researches on the formation of Production of Sorbose. Sorbose, a sugar which was first found by Pelouze in 1852. He concludes that sorbose does not exist as such in the juice of mountain ash berries, but is formed by oxidation from sorbite, contained in the juice, under the influence of a bacterium analogous to or identical with the *Bacterium xylinum* of Brown. On cultivating this bacterium in a suitable medium containing sorbite a yield of 80 per cent. of the theoretical yield of sorbose has been obtained.—*Ann. de l'Inst. Pasteur*, xii., 385.

PHOTO-MICROGRAPHY.—VI.

BY EDMUND J. SPITTA, L.R.C.P. LOND., M.R.C.S. ENG., F.R.A.S.

Underneath the condenser some arrangement always exists to reduce its aperture. This is done either by the use of the iris diaphragm or by a metallic plate perforated by several holes of different sizes. This plate revolves so truly that the centre of each hole is in the axis of the microscope; so, too, with the iris diaphragm, for when that is shut down its aperture should be central in the same manner. Some microscopists prefer the wheel diaphragm, as it is called, and others the iris; both have their advantage and disadvantage. The objection to the use of the iris diaphragm is the fact that in the older forms there was no means to show to what extent it had been closed, so that when using the specimen again the process of ascertaining what sized aperture gave the best results had to be repeated *de novo*; whereas, if the wheel diaphragm had been used the size of the hole giving the best definition could have been noted for future reference. In the Zeiss and other modern microscopes this is got over by graduating the arc through which the handle of the iris is made to turn. Underneath the diaphragm, or in some cases immediately above it, is some arrangement to carry coloured glasses; obliquely or otherwise cut diaphragms; and some suitable arrangement for obtaining annular light. This latter usually consists of a ring of brass having three radii passing from the periphery to the centre, such centre being rigid and of any size desired. Seeing, however, that the size of this stop has to be varied with each lens that is used it is very obvious a large number of these stop diaphragms must be employed by the microscopist, and inasmuch as they are rather expensive it becomes troublesome. It was to get over this difficulty I designed the arrangement shown in a previous article. Several sizes and several shapes are supplied with this little piece of apparatus, so that the microscopist can readily suit each lens as he thinks fit.

It should perhaps be mentioned here, as the most suitable place, that the method adopted by different makers to support the mirror varies very much. In Zeiss's microscopes the mirror is a fixture so far as relates to its movements from side to side about the axis of the microscope. But many makers fix it on an arm to enable the operator by pushing the mirror bodily on one side to send a very oblique beam on to the condenser. The object of this is to obtain very oblique light, and to further this object and shut off extraneous rays a diaphragm with a segmentally cut side—crescent moon fashion—drops into the receptacle for diaphragms underneath the condenser. In Messrs. Zeiss's microscopes the fixing of the mirror deprives the microscopist of obtaining oblique light in the manner just described, so the firm have added an ingenious arrangement, which is placed underneath the condenser and holds the iris diaphragm. To obtain oblique light all that the microscopist has to do is to close the iris to a sensible degree, and then by turning a handle displace its centrality to any given amount he may desire, and in any direction too, because the apparatus is capable of revolving on its axis about that of the microscope itself; so oblique light can be obtained in any azimuth desired. When finished with, the centrality of the iris diaphragm with the axis of the microscope is known to be re-obtained by turning the same handle backwards until a distinct click is heard, such click gently restraining any other movement. It is a subject of regret that the mirrors provided by many makers are made with too thick glass; such a fault is apt to give more than one image of the lamp-flame, which is very troublesome. One side of the mirror is flat and the other concave. I shall explain their several uses in dealing with different classes of specimens. Speaking generally,

the plane side is mostly used for high powers, but in photo-micrography the mirror is only employed when using a vertical apparatus.

The description of the microscope, although not entirely exhaustive, must here cease, and the means employed for holding coloured glasses or a small trough filled with a coloured fluid, which enables one to obtain monochromatic light, described. I have always employed a Bunsen holder for this purpose, and have no reason to find fault with it, except that to make it additionally steady it is safer to have a small leaden weight to place upon the base.

With respect to the selection and use of coloured glasses and light filters; they are employed for two distinct purposes: (1) Obtaining monochromatic light, by which is meant light of one colour, be it what it may; and (2) To obtain more colour contrast between objects and their surroundings.

Those who have given any attention to optics will readily acknowledge that colour is only an empirical name given to light of certain wave length. Thus red light consists of undulations of the luminiferous ether, amounting to about 40,000 to the inch, whereas with violet light, which appears at the other end of the spectrum, the pulsations reach the stupendous total of over 64,000 for the same space. In the theory of microscopical vision the wave length of the light used becomes an important factor, and lines that are so close as to be invisible in red light may become readily visible when seen in violet. Hence it is obvious the shorter the wave length of the light used, the greater the powers of resolution of the objective. This equally applies in photography, and is so well recognised that in the best text-books the number of lines capable of being seen with ordinary illumination are given in comparison to those capable of being photographed in the violet ray. Professor Abbe goes so far as to enunciate a law that the greatest number of lines per inch that can be resolved with any lens, using oblique light, which renders them more apparent still, is to be found by multiplying its numerical aperture by twice the number of the undulations of the colour of the illuminant per inch. This, with an objective of 1.40 N. A., and with violet light, amounts to about 180,880 per inch, but if with axial light, it might fall a few hundreds. These amounts here given are only approximations, for to be accurate, the exact, not the approximate, wave length of the colour used must be employed.

No glass is monochromatic, and hence light of one wave length cannot be obtained by its use; in fact, this can only be procured by the use of a prism of dense glass to break up white light into its component colours. This method gives colours of great purity and definite wave length, but is difficult to arrange, because the beam is too narrow to anything like fill the field of the microscope, and cannot in some cases be made to do so even with the paralysers. For that reason a more powerful set of prisms has to be employed, giving greater dispersion, but the illumination then is so feeble that, unless sunlight or electric light be used, the specimen cannot be seen with sufficient clearness to be properly focussed.

The next best arrangement to obtain monochromatic light is by the use of a trough made entirely of glass, the vessel having parallel sides, and being filled with solutions of certain strength and different substances, according to the result required. These are held *in situ* by the Bunsen holder. Zeiss makes excellent troughs for this purpose, but some that are sold by Mason, of Clapham, are much cheaper, and it is not easy in any way to detect their inferiority.

Coloured glasses are only used when it is required to increase the colour contrast between the object and its surroundings. Take, for instance, some bacilli of tuberculosis feebly stained red

on a blue ground. For this purpose a colour glass would be used to enrich the contrast. Some would employ a deep orange, but it has been my experience that better results are obtained with a not too deep green. If too deep, the bacillus might suffer in depiction by appearing clogged and dirty, failing to show the characteristic solution in its continuity, called segregation; but if a green glass of somewhat feeble density be employed, such errors are lost and the result required is obtained. The photographer has here, then, in the selection of his screen, much scope for individuality, and it takes some time and experience to produce the best photographic results; for, be it remembered, every change of glass means a different time of exposure, but of that we shall speak in the proper place.

The next subject is the means adopted for preventing the heat of the limelight acting upon the microscope itself. This may be done in two ways, the first of which is shown in the "elevation" of our table and its arrangements, and the second in the "plan." It has been already stated that very frequently I use my apparatus without any auxiliary condenser—or paralysed as it is sometimes called—thinking that the results at times are better and the field flatter without it than with it. Sometimes, however,

FIG. 1.

to illuminate equally in all parts, considerable difficulty is experienced, especially with high powers and occasionally with low ones. When this is the case the shield is removed from its foot, and a tray substituted which holds a water trough of some considerable size. (This water trough has been omitted in both diagrams for fear of rendering them too complicated, as it is obvious its position is shown by the brass foot, which as before explained is made to take either the protecting shield or the trough as may be required.) This trough should be about 2 inches in width and long enough—say 6 inches—to contain a plentiful supply of cold boiled water or glycerin, whichever be preferred. Boiled water is employed because it contains less air than fresh water and bubbles are not so readily formed.

The auxiliary condenser as shown in diagram (Fig. 1) is a wood-cut from a photograph of the original, and is seen to consist of a firm pedestal supporting a double rack work motion held in command by two milled headed screws. One raises the condenser and the other moves it laterally. With some manufacturers they make the condenser mounted on a pillar which can only be raised or lowered, the side to side motion being obtained by pushing the

whole stand. This I have found so objectionable that I devised the apparatus just spoken of, which was made by Mr. Mason, the optician I have previously referred to as residing in Clapham, and which enables the photographer to centre his condenser with the greatest of ease. This is best done by placing the iris diaphragm over the front of the condenser, and having closed it to a pin's point, to turn the light on. Removing the objective and opening the iris of the condenser, the eye is placed at the end of the microscope, which is covered by the top of a pill-box with a central hole pierced in it. Looking down this central aperture the nearly closed iris diaphragm can be distinctly seen, and has only to be moved by the two milled headed screws until in the centre of the field. The lenses of the condenser should be particularly loose in their cells—so that they rattle freely on shaking—for being of short focus they are necessarily in close approximation with the limelight, and are exposed to an intense heat.

As yet I have not spoken of the shutter shown in the elevation of the apparatus temporarily fixed in the air. This consists of a piece of zinc supported by an iron arm, perforated by a screw fixing into a vertical support attached below to a somewhat solid foot. It is moveable from the table, being easily lifted out of the way. When dealing with high powers it should be placed in the position shown in the diagram, namely, that the shutter falls quite close to

FIG. 2.

the iris diaphragm; whereas if low powers of over an inch be employed, it must be pushed further up the table so that it intercepts the light between the objective and the specimen, for if this is not done too much stray light passes into the objective and causes fogging of the plate after drawing the slide before commencing to photograph.

The limelight and its stand, Fig. 2, have yet to be described; I have already mentioned the jet I use with much satisfaction as the high pressure form of mixed gas jet designed and made by Mr. Beard. It slides on to the pin of the stand marked L S, just the same as other jets do on the pin in the limelight lantern. This is a convenience in one way because the jet can be used in an ordinary lantern for ordinary demonstration purposes, but it has the disadvantage of not being absolutely steady on the pin before referred to. To get over this difficulty an additional screw was made, and which is seen in the front of the apparatus fixing on the pin in the front just as the ordinary screw fits on it behind. By this means the jet is rigidly held. The ordinary arrangement for "turning" the lime is of course present, and in addition a handle for turning both gases down when not exposing technically known as the "cut off." Underneath the jet itself is seen the stand which Mr. Mason has made on the same lines as that of the

moveable condenser already described, one screw serves to shift the lime from side to side, the other raises it from below upwards, or *vice versa*, whereas the to and fro motion to push the lime nearer or further from the microscope is obtained by bevelling the wide foot of the stand itself so as it will pass evenly and smoothly through two guides fixed on to the baseboard of the apparatus itself. When using quite low powers there are those who prefer an ordinary, what is called "blow through" or safety jet, which is built on quite a different principle, and is used with the ordinary house gas from the main, a stream of oxygen being passed through it as it impinges on the lime. No accident can possibly happen with this form of jet so long as the oxygen is controlled by a regulator, for if too much oxygen be turned on at any given moment it will practically blow the light out, which is of no serious moment. With the mixed jet, however, which is far more powerful, it is very necessary that each gas bottle should have its own regulator, and it is good for them to be "matched" by Mr. Beard himself. On the tube side of each regulator there is an additional tap, which I find of great convenience, for there are times when one may want to shut off the gas temporarily, or even say in any emergency, and this can be done with far greater speed by these common taps than by shutting off the cylinders themselves. To start the light, having placed the lime upon the pin made for its support, the screws which regulate the amount of gas passing into each pipe of the jet are screwed completely down, both gases gently turned on at the cylinder, and if gauges are used as shown in the diagram, they can be watched to see when the taps are sufficiently turned. The "cut off" handle is then placed horizontal, which means both gases, if not controlled by the screw-down valves in the tube of the jet to which reference has been made, would rush on towards the lime. We undo first the red one, which permits the hydrogen or coal gas to pass to the jet and thus impinge on the lime.

It is then lighted. Still leaving the "cut off" untouched, slowly turn on the oxygen screw-down-tap on the jet until the light is quite bright. These two screws must now be slowly turned one against the other till the best light is obtained. If too much oxygen be put on, the light will fade and require more hydrogen, but I recommend anyone using the mixed light having a few lessons before attempting it. With Beard's jet very little "snapping" occurs, but in some forms made by other makers the slightest misproportion of oxygen will produce it. There is no danger in this snap in a well-appointed jet, but I venture to suggest to any of our readers who are contemplating buying this form of illumination only to go to best makers or to Mr. Beard himself. Cheap jets are always to be avoided. Different forms of "cut off" exist, most of which are very good, another excellent one being sold after the name of the illustrious photo-micrographer Mr. Pringle, and supplied by Messrs. Newton, of Fleet Street.

With respect to the regulators and gauges little need be said, save that the ones I have used have always been manufactured by Beard, at once a sufficient guarantee for their excellence. I must not omit to mention a few points concerning the gas bottles, seeing that they have to hold such enormous pressure, which, as a matter of fact, in a full-charged bottle is about eight times the amount employed in a modern locomotive. I strongly advise every purchaser of one of these cylinders to go to the headquarters of the leading gas compressors in England—I refer to Messrs. Brin's, of Horseferry Road, Vauxhall. Their cylinders may be considered absolutely safe, both for carriage and use, because the company have made the most careful and exhaustive tests and elaborate and costly experiments that can possibly be designed to

ensure perfect workmanship, perfect material, and perfect testing. No expense has been spared in this department, and whether the customer orders it or not his cylinder is periodically overhauled and tested, being destroyed if showing the least signs of weakness.

I regret to say that one London firm apparently does not feel bound by the recommendation following the careful and rigorous investigations of the Board of Trade, and has been known to lend out cylinders made of metal which is positively and absolutely condemned by the Board in question. This is a subject which should occupy the attention of every lanternist and user of the limelight, and they should avoid having anything to do with cylinders badly made. The only advice that can be given in the matter, seeing it is impossible for a customer to analyse the steel of the cylinder sent to him, is to have no compressed gas except from those who not only conform with the regulations of the Board of Trade in question, but who mainly were the investigators in the whole subject from the first. I refer to Brin's Oxygen Co., of whom I have already spoken; and in saying this it must be distinctly understood the writer has no interest directly or indirectly in the company, but merely makes this statement as a guide to those he is attempting by these notes to assist.

One more point also should not be overlooked, seeing that the greatest danger is caused by mixing oxygen and hydrogen unless in a properly appointed jet. So it is exceedingly dangerous to have interchangeable cylinders, that is to say, those that can be filled to-day with oxygen and to-morrow with hydrogen, for it is very obvious that an explosive mixture may thereby be readily formed which, the instant the unfortunate operator applies a light, causes an explosion hardly less terrific than that of dynamite or gunpowder.

Brin's Oxygen Co. have now for some years instituted a plan which utterly prevents any possible accident of this description, for the oxygen cylinders have a right-handed thread, and those for coal-gas a left-handed one. It is, therefore, impossible for any employé accidentally to fill a cylinder used for one gas with the other, for the screws will not fit, and cannot be made to do so. In closing these remarks I regret to say that firms still exist in London who sell both gases cheaper, and as a matter of fact not so pure, who still refuse to adopt these ingenious precautions, which leads us once more very obviously to select the same firm, even if it were for this reason alone.

With respect to electric light as an illuminant, I must confess to have had but little experience. A few photo-micrographers are said to employ it, but others, it is known, have relinquished its use. An excellent lamp has been quite lately brought out by the firm of Ross and Co., of Bond Street, which possesses all adjustments, and is most safely protected by very perfect insulation. The incandescent system of electric lighting does not seem to answer very well; its area of illumination is too diffuse, for be it known the theoretical ideal is always to have as near a point of light as possible.

PYRALOXINE.—Mielck gives the name of pyraloxine to a pyrogallol which has been subjected to oxidation. The preparation owes its origin to observations made by Unna in dermatological practice that the action of pyrogallol is merely due to its product of oxidation, a circumstance which seems to be confirmed by the fact that pyraloxine possesses all the healing action of pyrogallol, while it is free of the irritating properties of pyrogallol. Pyraloxine is a black powder sparingly soluble in water and quite insoluble in alcohol and ether. Its chemical nature has not yet been definitely ascertained.—*Zeit. d. allg. aest. Apoth. Ver.*, li., 549.

NOTE ON THE USE OF CLINICAL THERMOMETERS AND THEIR INDICATIONS.

BY B. S. PROCTOR.

Though the use of clinical thermometers is a medical rather than a pharmaceutical subject, it is quite desirable that pharmacists should be acquainted with the use of instruments now in such common sale in pharmacies, and be able to give some guidance to the customers who purchase them.

During my recent illness I had pretty constantly to keep watch upon my temperature, and observed several points which were to me unexpected, and, I think, of sufficient general interest to make them worthy of record.

At the commencement of my attack (influenza) the temperature was 102°·0, sufficiently high to be considered by my medical attendant as a notable symptom in a patient of my age, and after the subsidence of this pyrexia I began to experience subnormal temperatures, such as 96°·0 to 97°·0. At this stage the doctor advised my getting open-air exercise when weather was favourable and my temperature not below 97°·0 nor above 99°·0, directing me not to go out without fortifying myself with fl. ζ iss. of sherry and a biscuit or two. Thus were commenced the daily observations, which were continued at such times as my ailments prevented my attendance at my place of business, and thus was raised the question, What is the ordinary range of temperature in health and disease?

I found abundant records of the high temperatures of patients suffering from fevers, but very scanty notice of subnormal observations. The clearest statement I have met with, in the absence of a medical library, is the following by Dr. Robson Roos in his work entitled "Waste and Repair in Modern Life, 1897." He notes the temperature after a long fast was 96½°, remarking, "This temperature, if discovered in a sick person, would be regarded as that of collapse; and if the thermometer marked only 95° there would certainly be extreme danger."

My temperature was many times not only down to but below 95°·0, without my feeling conscious of any dangerous condition, and my medical attendant saw only cause for care but none for anxiety. Several other medical friends to whom I have mentioned my observation seemed to have little knowledge or experience of subnormal temperatures; some of them say that medical men habitually look for high temperatures when there is fever, but rarely think about the other end of the scale, and probably often miss the low indications from the habit of being satisfied with having the mercury shaken down to 98° or so, and only noting that the patient does not show any unusual feverish heat.

That the low temperatures are not commonly observed is also proved by the graduations on the ordinary clinicals only going down to 95°. My conviction is that more general observation of the low temperatures is desirable. Finding my own temperature fall below 95°, I was desirous to know how far below, and I looked over a stock of clinicals numbering six or seven dozen, and found only two graduated so low as 94°, with the exception of one very old instrument, which was inconvenient, as its date of manufacture was before the introduction of registering indices, thus making personal observations much more troublesome and less reliable.

One of the first points to take my attention was the constant fall of temperature consequent upon exercise. Taking a walk, half a mile or so and back, the reading would be a degree or two lower, and would rise again soon after a short interval of rest. I then observed that the temperature fell in a similar manner when my exercise was taken in the house, by walking about the rooms, up and down stairs, etc.; and having obtained leave I took my walk outside in fine weather, even when my temperature was low;

the effect being the same in either case, I concluded that it did not result from exposure to the wintry air, nor to a reaction after the stimulation of the sherry and biscuit which preceded the open air exercise, but which did not precede that taken in the house.

A.	Temperature observed was
On one occasion immediately before walking	95°·3
Immediately on return	94°·7
After quarter hour's rest	96°·4
After three hours' rest and food	98°·1

A great many observations were taken and not recorded, but simply reported to the doctor, the common range being about 97°·0 in the forenoon, and 98°·6 in the evening, though some days ranged from 94°·6 to 99°·0.

A few weeks later (during January, 1898), several readings were below 94°·0, probably as low as 93°·0, but as 94°·0 was the lowest graduation, the observations below this point could only be estimated by comparison with the scale above.

Cold sensation of hands and feet corresponded generally with low readings of the thermometer kept for five minutes under the tongue, though I could never predict with any certainty whether the indications would be high or low. The evening temperature would often rise to 99° or 100° without any febrile sensations or discomfort. The most certain way of combating a subnormal condition was rest, food, and external warmth, and the most constant causes of the low temperature were physical exercise (not violent), an empty stomach, and exposure to a cold atmosphere. Mental work did not produce the lowering effect which followed bodily exercise. The sherry and biscuit, though in small dose was always followed by prompt rise, and no subsequent fall of temperature was observed except with physical work or want of food. As in the above observation, a few hours in the easy chair by the fireside showed a steady rise till another meal was due. Take in illustration another day.

B.	Temperature found.
After breakfast of coffee and toast	97·8
„ after reading newspaper in an easy chair	97·5
„ lunch (of fl. ζ iss. sherry and biscuit)	98·9
„ short walk (? a mile)	95·6
„ dinner (invalids fare, fish or chicken with two teaspoonful of whiskey in half a tumbler of soda water)	98·7
„ three hours' rest	97·0
„ tea and toast	98·6
„ a game of Chantilly (requiring thought and attention but not hard study)	98·6
„ supper (a slice of cold chicken and bread, fl. ζ iii. of whiskey with hot water)	98·5

In this case the sherry and biscuit raised the temperature 1°·4; the dinner and whiskey 3°·1; and the tea 1°·6; in these three cases I was subnormal, probably wanting food, but at night when the temperature was normal, the food with whiskey had no notable effect upon it. The bodily exercise lowered it 3°·3, but the mental exercise produced no such result. The lowering effect of physical exercise strikes one as being contrary to general experience, as it is contrary to our sensations. If it be that this only occurs when the available vital energy is deficient, it looks plausible to conclude that a call upon the body for mechanical force may subtract energy which should otherwise take the form of heat, and that the subnormal temperature taken as an indication of vital debility would have that indication confirmed by the further reduction consequent upon moderate exertion. This, however, being a speculation founded upon the experience of one individual, should be regarded, not as a conclusion, but rather as the starting point for other observations.

At another time the pulse rate was compared with the temperature, thus:—

C

	November 21.		November 22.	
	Temp.	Pulse.	Temp.	Pulse.
Before breakfast.....	97.2	64		
After „	98.4	66	98.6	72
„ lunch	98.3	68	98.0	64
„ walk	97.6	64	96.7	68
„ dinner	98.0	68		
„ tea	98.8	72	98.0	66
„ supper	99.0	72	98.6	

The meals were of the same light character as those noted above. The observations were not so systematic as they should have been if I had contemplated publishing a note on the subject, but I give them for what they are worth, as I am not likely to go through another such illness and recover to tell my experiences.

As the most notable point is the fall of temperature with exercise, I tabulate some results:—

D.

	Nov. 15.	Nov. 16.	Nov. 18.	Nov. 19.	Dec. 12.
Thermometer before walk	97.0	97.3	98.2	97.8	95.3
„ after „	95.6	96.0	97.0	96.2	94.7
„ after rest	97.8	98.4	—	98.2	96.4
„ after rest and food....	—	—	—	—	98.1

With the idea that the fall of the thermometer during a walk might be partly due to exposure to a cold atmosphere, two observations are recorded with this point eliminated, the one (already noted) in which the exercise consisted in walking about the house, the staircase and passages being a few degrees colder than the room in which I had been sitting; in the other case an hour's work at wood carving, an occupation which I had adopted as a light physical employment capable of being undertaken in the sitting room involving no exposure to cold, but sufficient exercise to cause perspiration when continued for an hour or so. This was taken in the evening, the temperature before the work was 98°·8 and after it 97°·5; after an hour's rest 98°·4.

These imperfect notes will, I hope, be of some interest and possibly of some use to others, and I trust their many shortcomings will be excused on the ground of their being drawn up from mems. of observations made for the guidance of my doctor and myself while I was suffering from a complication of complaints.*

I should expect an observer in good bodily health would not experience the frequent and considerable variations which I have done from apparently trifling causes. And if invalids do find the same it suggests that the effect of food should have more attention in all cases, and that the effect of exercise should not be overlooked in such patients as are not confined to bed. Diarrhoea and vomiting appear to have lowering effects also, but I have not notes enough on these points to attempt a definite statement.

I may add in conclusion that since my partial recovery of health and my removal from Newcastle-on-Tyne to Bradford-on-Avon, my temperature continues generally subnormal, ranging between 94°·6 and 99°·0, usually low in the morning and normal in the evening. A set of observations taken at the present time to compare my experience in as nearly normal health as an old man is likely to attain to, with those indications jotted down when I was an invalid, gave me the figures in the table below. My condition was much as usual and my exercise was arranged to include a couple of hours' boating on the Avon, by way of a varia-

* Commencing with influenza a few years ago, followed by returns of the same each winter since; in each case accompanied by liver derangement, and in this last case with an inflammatory condition affecting the stomach, liver, and intestines.

tion from my more customary walk through the country roads and fields, and the thermometer was noted more systematically to show how it was affected by food, exercise, rest, etc.

The observations were as follows:—

E.

August 17, 1898.	Hour.	Temperature.
Before rising in the morning	7.15 a.m.	94.9
After dressing	8.0	95.6
After breakfast	9.45	96.0
After walking from dwelling-house to boathouse (½ mile)	11.0	94.5
After resting ¼ hour	11.25	95.6
After rowing ¼ hour	12.0	96.8
After fl. 3/8ss. sherry and biscuit	12.20 p.m.	98.4
After rowing 25 minutes, an oar in each hand and the thermometer under my tongue	12.45	98.4
After walking home (½ mile)	1.20	98.0
After dinner	2.30	98.2
After rest	5.0	98.0
After tea	6.35	98.5

In this case the day commenced subnormal, and only got up to healthy standard after noon.* The walk to the boathouse at the time heat was low reduced it by 1°·5, the walk back when the heat was normal only reduced it by 0°·4. Half an hour's rowing raised the temperature by 1°·2, i.e., from 95°·6 to 96°·8. Sherry and biscuit had their customary effect of raising the indication by 1°·6, i.e., from 96°·8 to 98°·4, and the temperature remained normal when the exercise was resumed, and continued for twenty-five minutes. It would appear that the temperature when once up to normal is less liable to fluctuation than when subnormal.

The points I wish to emphasise are:—

That clinicals should have their graduations continued down a few degrees lower, say to 92°.

That observations of low temperatures should be more systematically made.

That temperatures a few degrees below normal should not be stated to indicate a dangerous condition unless other circumstances also point to danger.

That records of observations similar to the above, undertaken by competent observers, both in good health and in bad, would be valuable.

That pharmacists must include many men who would be competent observers, with facilities for the task, and free from preconceived conclusions (such as total abstinence pledges, etc.), which so often vitiate results.

That pharmacists selling clinicals should be able to give some instructions for their use and some guidance regarding their indications.

To these I might add the questions, If the temperature were high from a febrile condition, would physical exertion reduce it, as found to be the case with subnormal temperatures, as noted in table D? Or would the exercise aggravate its supernormal condition?

When the temperature of a fever patient is taken by a nurse, professional or otherwise, is sufficient regard paid to the effect of food just taken or just wanted by the patient, or to other trifling circumstances which may temporarily influence the morning or the evening temperature? The difference between a quarter of an hour before and after a cup of tea might just make the difference between apparent improvement and an exacerbation of the fever.

* Next morning it commenced at 98.4 before rising, though I had no reason to anticipate a different indication from that of August 17, and after a little walking exercise it fell to 97.2.

JOHN RADCLIFFE, M.D.

FOUNDER OF THE RADCLIFFE LIBRARY, OXFORD.

(Continued from page 224.)

According to his biographers, after reading the prescriptions of the official physicians, Radcliffe pronounced the Queen "a dead woman." If he did, his prognosis proved to be as correct as his diagnosis had been.

A couple of years or so before the death of Queen Mary a financial disaster befell Radcliffe, the story of which is worth telling, partly because it throws some light on his average gains, and partly because the comment which he made on it has been ascribed to more than one other physician, but it undoubtedly first came from Radcliffe's lips. One of his intimates—for he had them of all kinds—was Betterton, the actor. In an evil hour Radcliffe allowed himself to be persuaded by him to join him in freighting a vessel with a cargo to be disposed of profitably abroad. Radcliffe's venture was to the tune of £5000, and it must be repeated that £5000 then would mean £15,000 or £20,000 now. It was wartime. The ship was captured by the French, and Betterton was ruined. When the news of his loss was brought, "Radcliffe was carousing, after his wont, with several boon companions of the first quality," at one of his favourite hostelrys—the Bull's Head, in Clare Market—about the last London locality where toppers of any "quality" could be found carousing now. On hearing the melancholy news the company ceased from their merriment and began to condole with the victim of misplaced confidence. But Radcliffe bade them go on with their toasts, and took the matter very lightly, saying that to recoup himself for his loss he had only to go up 250 pairs of stairs. If the words are to be taken literally, this would make his average fee to be £20 for every pair of stairs ascended. About the very time of this loss he was lavishing money in benefactions to his alma mater, more than £1000 on exhibitions alone.

In William's joy over Radcliffe's cure of his favourite, Albemarle, the King not only bestowed on the successful physician the money gift already mentioned, but offered him a baronetcy. Radcliffe declined it, on the plea, it is alleged, that he was unmarried and childless, and intended never to marry. But he had had then a narrow escape from matrimony, and under circumstances which turned him, at least for the time being, into a misogynist. He was forty-three when his first recorded proposal of marriage was made. The lady was twenty-four, beautiful, and the daughter of a rich citizen, who was well pleased to marry her to a famous physician, known to be worth £30,000. The father offered £15,000 with his daughter's hand, and after his death the rest of his fortune was to be his son-in-law's. Everything was settled, when Radcliffe (with his trained medical eye) discovered that the young lady was on the way to become a mother, having loved her father's book-keeper not wisely but too well. Of course, Radcliffe broke off the match. However, he advised that the young lady's hand should be given where she had already given her heart. The father consented, and endowed with suitable means the re-united pair, who lived happy and prosperous ever after.

The health of William III. had always been indifferent. Constitutionally he was asthmatic and consumptive. Macaulay says of him, as Pope said of himself, that his life was a long disease. As the century rolled on towards its close his maladies increased, and his life was more than once in danger. When he consulted Radcliffe in 1697 the latter spoke to him with his usual bluntness. If His Majesty would give up his visits to the Earl of Bradford, with whom he was in the habit of toying, and placed himself in Radcliffe's hands, his life might be protracted for three or four years, but not longer. Whether William followed Radcliffe's advice or not, he does not seem to have been offended by his physician's frankness. But when Radcliffe was sent for two years later, either his blunt familiarity overshot the mark or illness had made the King abnormally sensitive. His nether limbs were so dreadfully swollen as to provoke Radcliffe to make the imprudent remark, "I would not have your Majesty's two legs for your Majesty's three kingdoms." William was so offended by this plain-spokenness that he would never allow Radcliffe to be consulted again, and doubtless the King's physicians, while they continued to give their patient Radcliffe's "diet-drinks," were only too glad to be rid of the presence of so formidable a rival. In William's last illness, therefore, Radcliffe was not called in, and even he could not have protracted the King's span of life beyond the limit which he had years before assigned to it as the utmost possible. William died in the February of 1702, and Queen Anne reigned in his stead.

Radcliffe's sayings and doings in the new reign will be told subsequently.

The accession of Queen Anne found Radcliffe at the head of his profession, though many of his brethren regarded, and continued to regard him, as an ignorant pretender, who owed his advancement chiefly to loud self-assertion and, above all, to good luck. But the highest personages in the land, with one exception, delighted to have recourse to his proved medical skill. The exception was the Queen herself. She had never forgiven him for his refusal to come to her on one occasion when she fancied herself ill, and when, as recorded in Chapter I., he excused himself for not rushing to her side by declaring—how unlike the procedure of the courtly physicians of later times!—that she had nothing the matter with her but "the vapours." It was in vain that her Lord High Treasurer and virtual Prime Minister, the sagacious Godolphin, to whom the Queen's life was personally and politically important, tried to persuade her to reinstate Radcliffe in his former post as her principal physician. Anne was one of the most obstinate of women, and would not forgive or forget the slight put upon her by one of her "hired servants." The time came, as will be seen, when even this stubborn queen had to plead for the services of the arrogant and masterful physician. Even as it was, Radcliffe was found to be secretly indispensable. The Queen professed to pin her faith on the famous and witty Dr. Arbuthnot, who was the physician of her husband, Prince George of Denmark. But Arbuthnot appears all along to have recognised Radcliffe's rare medical insight. It was probably due to the unenvious Arbuthnot that Radcliffe was privately consulted whenever there was, or seemed to be, anything seriously the matter with the Queen. Radcliffe, his biographer says, "received large sums out of the secret service money"—how oddly the statement reads now!—"for the prescriptions behind the curtain."

In "The Epistle to Dr. Arbuthnot, being the Prologue to the Satires," one of the very finest of Pope's compositions, the poet apostrophises him as

Friend to my life! (which did not you prolong,
The world had wanted many an idle song).

But long before Arbuthnot became Pope's friend and physician Radcliffe had been the poet's medical preserver. Pope was in his sixteenth year, and Queen Anne had been only a year or two on the throne, when the young poet, in his father's house at Binfield in Windsor Forest, became a prey, through over-study, to a despondency which seemed to him a prelude to the grave. So serious was the attack that he wrote to his friends announcing that he had not long to live. Fortunately one of them, a certain Abbé Southcote, a member of an old Roman Catholic family, bethought him of consulting, on behalf of his young friend, the famous Dr. Radcliffe. Radcliffe saw at once what was amiss with the over-excited and over-studious youth. He prescribed not drugs but a careful regimen, less study and a daily ride in the Forest. His advice was followed. The youthful Pope recovered his health and spirits, and to Radcliffe primarily rather than to Arbuthnot we owe "the many an idle song" of the poet's grateful distich.

The story of Pope's cure affords one of the few glimpses which have been given of Radcliffe's methods of medical practice. In another of about the same date we have a view of his treatment of that then terrible scourge, the smallpox, for his skill in dealing with which he is said to have been more successful than the illustrious Sydenham himself. The great Duke of Marlborough's son and heir, the Marquis of Blandford, was struck down by smallpox at Cambridge, where he was an alumnus of the University. His anxious mother, the formidable Sarah, came to Radcliffe and begged him to proceed to Cambridge and do his best for her boy. Radcliffe declined on the plea that he had some serious cases of illness among aristocratic patients on hand which would not allow him to leave London, and the journey to Cambridge was not the light matter which it has become in these railway days. But he would be happy to lay down a plan of the operations to be followed by the Cambridge physicians in the treatment of their high-born patient. The difference between Radcliffe's method and that which in opposition to his advice was followed by the Cambridge physicians, resentful no doubt of the interference of the London doctor, is thus stated by his biographer in language not very elegant, but sufficiently intelligible.

"It was his practice to give his patients who were ill of that disease (the smallpox) as much air as could be well allowed them, and to set open their chamber-windows, instead of stifling them in the summer season, and also to set down strong broths

and rich cordials in his regimen that the pustules might be forced out and filled the sooner. This was contrary to the methods in vogue with the physicians at the University, who instead of keeping them (the patients) in full strength, that Nature might operate and take its proper course, weakened them by letting them blood and darkening their chambers for fear of their catching cold."

The youthful Marquis grew worse instead of better. Duchess Sarah then made a last appeal to Radcliffe to proceed to Cambridge and see her son. Having read the letter from her son's tutor, in which the treatment of him by the Cambridge physicians was described as diametrically opposite to that recommended by himself, Radcliffe is represented as giving the sorrowful mother the following extraordinary reply, one certainly characteristic of the strange man: "Madam, I should only put you to a great expense to no purpose, for you have nothing to do for his Lordship now but to send down an undertaker to take care of his funeral, for I can assure your Grace he is dead by this time of a disease called 'The Doctor,' and would have recovered of the smallpox without the intervention of that unfortunate malady" (his Cambridge treatment to wit). And, sure enough, according to the admiring and, it is to be hoped, the veracious Pittis, as soon as her Grace reached "St. James's House" there arrived a messenger with the news of her son's death.

This seems to have been Radcliffe's procedure always. He had to be called in as soon as a malady declared itself. If not, and medical advice was sought elsewhere, he professed himself powerless. The other physician or physicians had bungled the case. The patient had been treated for the wrong disease, or if for the right one, with the wrong remedies. The great Radcliffe had been called in too late; there was no hope of the patient's recovery if the disease was a dangerous one. The fame of Radcliffe's own success was enhanced by the result of his predictions of other physicians' failures. "Confide in thyself and others will confide in thee," said Mephistopheles to the young student in Faust's chamber who asked for advice as to his medical future, and on this principle Radcliffe acted, and found it answer. And he avenged himself on his professional brethren who called him an ignorant, if lucky, quack, by treating them with the contempt of which an illustration has just been given. Here is another. The child of an eminent London surgeon was taken ill of what Radcliffe's biographer calls "an empuesma in the side." The father had called in Dr. Gibbons, who, as an old rival of Oxford days, was Radcliffe's special aversion; "Nurse Gibbons" was his favourite name for him. The boy grew worse, and Radcliffe was sent for. Then the old story was repeated. "Nurse Gibbons" had quite mistaken the disease. The boy was already killed to all intents and purposes, and Radcliffe could do nothing for him. But stop! He could render him a posthumous service. He could suggest an appropriate design for his tomb, with an appropriate inscription. The father assented. Perhaps Radcliffe offered to pay for what would be a standing insult to his enemy Gibbons. Accordingly, so runs the story as told by Pittis, when the young victim of Gibbons' blundering was buried in Covent Garden churchyard, there was placed over his remains "a stone with the figure of a child laying one hand on his side; '*Hic dolor*, here's my pain,' and pointing with the other to a death's head, where was inscribed '*Ibi medicus*, there's my physician!'"

Radcliffe took dislikes to places as well as persons. At one time he cried up Bath and its waters to the great profit of the city of Prince Bladud. Then, for some unassigned reason, he fell foul of it, and transferred his patronage to Tunbridge Wells. There is still extant a pamphlet (dated 1705) in which a loyal "citizen of Bath" reproached in no unmeasured language the doctor's desertion of Bath, the freedom of which had been bestowed on Radcliffe, who had praised it, the pamphleteer said, "when sober." Had this sudden dislike of Bath anything to do with Radcliffe's attitude when in 1708 Queen Anne's husband, the stupid but amiable Prince George of Denmark, suffering from asthma and more particularly from dropsy, was sent to Bath to drink the waters? They revived considerably his health and spirits, and the Queen was delighted with the change for the better. But Radcliffe shook that wise head of his and predicted disaster. "It might be," he is said to have told the Queen, "a rule among surgeons to apply caustics to such as were burned or scalded,"—a glimpse of the surgical treatment of those old days—"but it is very irregular among physicians to drive out and expel watery humours from the body by draughts of the same element." We have said he "told the Queen," for there had been a relapse

since the Bath waters were drunk, and Prince George, being dangerously ill, Anne, sacrificing her old resentment, had called the infallible Radcliffe in at the eleventh hour, and pleaded hard with him to save her beloved husband's life. Radcliffe had now his revenge for past slights. The Prince's "watery humours" had been improperly dealt with, he declared. Radcliffe had been consulted too late in the day, and there was no hope for the royal patient. He is actually reported as speaking to his sovereign in the following strain, with something like brutal frankness. All that he could do for the Prince was to administer "such hypnotics and anodynes as should make him go out of the world with the greatest ease, since he had been so tampered with that nothing could keep the Prince alive more than six days." And of course, Pittis records that the poor Prince died punctually on the sixth day. Queen Anne, it is added, would never visit Bath again, and Radcliffe's spite at the pleasant city was doubtless gratified by the royal abstinence.

It is pleasant to turn from these illustrations of Radcliffe's occasional asperity and egotism to instances of his beneficence, if not of his munificence. When his life was ending, he accused himself of being too fond of money, and of too great reluctance to part with it. He kept his munificence for posthumous exhibition, but his benefactions during life were not inconsiderable. Early in Queen Anne's reign—and the reader must always remember that the value of money was then at least three or four times as great as now—he settled on the Society for the Propagation of the Gospel in Foreign Parts £50 a year for ever. His High Church and Jacobite zeal prompted his gift of £520 to the non-juring clergy, and £300 to the Scotch episcopal clergy in sympathy with their maltreatment by their established Presbyterian brethren. In making these gifts he insisted that the donor's name should remain unknown. Tory pamphleteers, especially when subjected to Whig persecution, were favourite objects of his bounty, and he helped Sacheverell at the time of his famous prosecution. To a lively boon-companion, fretted into ill-health by impecuniosity, he presented 500 guineas instead of a prescription, and it did him much more good. One kindly act to a distressed cleric, far more deserving than Sacheverell, ought to be held in remembrance for its result. Bingham was a fellow of University College, Oxford, and was driven from it by preaching a sermon which, very unjustly, it seems, was suspected of contravening the orthodox doctrine of of the Trinity. Radcliffe bought and presented to him a living in Hampshire. It was worth only £100 a year, but it was in the vicinity of Winchester and the fine Cathedral Library which Bishop Morley had founded there. Thus the frugal scholar was furnished not only with the means of living but with access to the material for his monumental work, the '*Origines Ecclesiasticæ, or Antiquities of the Christian Church*,' which never has been and probably never will be superseded. Bingham, it may be added, was, like Radcliffe, a Wakefield man. In 1707, the year before the inestimable boon to Bingham, Radcliffe is said to have been worth £80,000 in the money of that time, with a magnificent yearly income from his profession, and he invested much of his wealth in the purchase of estates in various parts of England. Yet rightly or wrongly, in spite of his wealth and his liberal donations to all and sundry, he is represented as parsimonious in small things. Of the stories told in illustration of this alleged tendency of his is that of the paviour who had to dun him for payment of some work performed in front of his house. Radcliffe resisted on the plea that the man had spoiled his pavement and then covered it with earth to hide the bad work. "Doctor," replied the man, "mine is not the only bad work the earth hides." The retort was one after Radcliffe's own heart, and the witty paviour was paid without more ado.

To 1709 belongs a curious episode in Radcliffe's career. Hitherto he had escaped the tender passion. His appearance as a wooer with matrimonial intentions, already chronicled in this article, seems to have been more commercial than amatory. Bacchus—not Venus—was the deity whom Radcliffe worshipped. But in his sixtieth year he was bewitched by the charms of a young and lovely lady whom he had cured of a long and dangerous fever. Her name is not given, and little more of the affair is known than that she did not encourage the advances of her elderly admirer, and that he made himself the talk of the town by his peculiar and public parade of his senile passion. Steele, who loved him not, as a Jacobite and for other reasons, seized the opportunity to ridicule in the *Tatler*, thus:—

"This day, passing through Covent Garden, I was stopped in the Piazza by Pacolet to observe what he called 'the triumph of love and youth.' I turned to the object he pointed out, and there

I saw a gay, gilt chariot drawn by fresh prancing horses, the coachman with a new cockade and the lacqueys with insolence and plenty in their countenances. I asked immediately, 'What young heir or lover owned that glittering equipage?' But my companion interrupted, 'Do not you see there's the mourning Æsculapius?' 'The mourning?' said I. 'Yes,' said Pacolet, 'he is in deep mourning, and is the languishing, hopeless lover of the divine Hebe, the emblem of youth and beauty.'" What follows is still better worth quoting, since it records the view of Radcliffe's professional career taken by such a man as Steele, familiar with the talk of the town. Pacolet continues:—

"You are not so ignorant as to be a stranger to the character of Æsculapius as the patron and most successful of all who profess the Art of Medicine. But as most of his operations are owing to a natural sagacity or impulse, he has very little troubled himself with the Doctrine of Drugs, but has always given Nature more room to help herself than any of her learned assistants, and consequently has done greater wonders than is in the power of Art to perform, for which reason he is half deified by the people and has even been courted by all the world."

Then comes an account of Radcliffe's medical attendance on and cure of the cruel fair one, who repelled Æsculapius's advances.

(To be continued.)

POWDERED DRUGS IN THE U.S. PHARMACOPŒIA, 1900.*

BY PROFESSOR H. H. RUSBY, M.D.

The application of the microscope to the examination of drugs may now be regarded as an established usage. It is true that a great majority of the practising pharmacists of the present time have not been properly trained for making such examinations, but this is equally true of all the higher processes of recent development, and will at all times be so. In every epoch it must be the expectation of pharmacists either to work up to the newer methods of work, or to employ assistants of more recent training to supplement their own more or less superannuated abilities; otherwise our profession could not be classed as a progressive one. These assistants, becoming proprietors in turn, will find themselves compelled to call in a still later class of graduates to perform for them a similar class of services.

All first-class pharmaceutical schools now train their students in microscopical work, and the manifest utilisation of this training is in the examination of drug-powders. The demand naturally existing in the work of the pharmacy for such examinations would in itself be powerful enough to bring them into employment, but if this were not so, they would still find so important use in special test-cases, that suitable provisions for them in the Pharmacopœia would be called for. From every point of view, therefore, the revision committee has been compelled to give its attention to this subject.

The form which this treatment should take, and the extent to which it should be carried, have been subjects for anxious thought to the committee. The following alternatives were considered: (1) Whether to extend microscopical treatment to all the official drugs, or to restrict it for the present to those concerning which special requirements were known to exist, and to extend the list hereafter as new requirements arose. (2) Whether, in the treatment of a particular drug, to present a full description of its anatomy or to restrict the description to the differentials which would suffice to meet the special uses for which the description was devised.

In discussing these alternatives, the decision of the first was found to depend upon that of the second. In discussing this, it was considered that no description, however carefully devised to secure completeness, would be likely to do so. Obscure characters would be certain to be missed, and these might prove to be the very ones most needed when the occasion arose. Furthermore, the attempt to escape this possibility could only result in extending the descriptions to a formidable length. Such extension would tend to prove repulsive to those for whom the work was intended, as well as to conceal the essential points from busy practitioners. Utility and economy thus appeared to unite in indicating the abbreviated form of description. Since this decision was reached by our own Committee the British Pharmacopœia has made its appearance, with more or less complete histological descriptions,

and this has been met by expressions of doubt in high circles as to the utility of the method.

It will be seen that this decision at once determined the limitation of the subjects to those in regard to which such necessities were known to exist. These necessities represented the following classes of cases:—

- (a) The detection of drugs used as adulterants or substitutes.
- (b) The selection of the variety, when more than one variety was in the market, as in the case of *Pilocarpus*, the *P. selloanus* having been determined since the Pharmacopœia was published to be practically worthless.
- (c) The differentiation of closely related and every similar drugs.
- (d) The detection of damaged goods.
- (e) The determination of the proper season of collection.

Acting along these lines, a list was made up, of which the more important articles are here given in the hope that its publication may lead to its extension.

Work upon these problems has already proceeded to a considerable extent. Many of them have been satisfactorily solved, while failure, apparently final, has resulted in one or two cases.

In performing this work, existing literature has been searched for the requisite characteristics. When such were found, the task was assigned to certain members of the committee of ascertaining their sufficiency, or of making selection when several tests were found recorded. When such records were not encountered the study was taken up as an original problem by some person to whom the work was assigned. All reports obtained in these ways were then submitted to test by the other members of the committee, and their final report, resulting from such tests, published for outside criticism.

Portions of the materials used by the committee, verified and preserved pure by the most scrupulous care, were supplied to any competent parties desiring to investigate the subjects. Some of this material has gone to foreign investigators.

As the amount of time and labour required for the study of these original problems was very great, the funds of the revision committee, to the extent of several hundred dollars, have been expended in making compensation.

The list of problems is here appended—

Aconitum.—To distinguish the Japanese.

Althæa.—To detect the addition of starches and starch-bearing articles.

Anisum.—To distinguish fennel.

Anthemis.—To distinguish various compositæ, as cotula and matricaria.

Apocynum.—To distinguish the other species.

Arnica Flores.—To distinguish the Mexican, so-called, and the well-known European adulterants.

Asclepias.—To distinguish the so-called *A. decumbens*.

Aspidium.—A complete description must be published to distinguish it from the large number of ferns which have been said, with probable truth, to be used to adulterate it.

Aspidosperma.—To distinguish the "red quebracho."

Belladonnæ Folia, Hyoscyamus and Stramonium.—To distinguish these three from one another and to distinguish the second from digitalis and from comfrey leaves, mullein leaves and inula leaves.

Belladonnæ Radix.—To distinguish from *Phytolacca* and from *Medicago*.

Buchu.—To detect the long buchu.

Calumba.—To detect bryony and gentian.

Cannabis Indica.—To distinguish the male from the female, and also the plant grown outside of the East Indies.

Capsicum.—A complete description required to detect the numerous and various adulterants.

Caryophyllus.—To distinguish the stalks and the fruit, as well as the exhausted cloves.

Cascarilla.—To detect the bark of other species of croton.

Castanea.—To distinguish the European chestnut and to detect the chestnut-oak, and to detect leaves collected at the wrong season.

Chirata.—To detect the false chirata.

Cimicifuga.—To distinguish the other species and to detect the *Actæas*.

Cinnamon.—To distinguish the different cinnamons from one another and to detect clove-bark.

Coca.—To distinguish the two varieties.

Colocynthis.—To detect the seeds.

* Read before the New York State Pharmaceutical Association, and reprinted from the *Druggists' Circular*.

- Conium.**—To detect the herbage.
- Convallaria.**—To distinguish the European and American, which are probably distinct species.
- Cubeba.**—A complete description is required, as the adulterants are so numerous and varied.
- Cusso.**—To distinguish the male.
- Cypripedium.**—To distinguish *Hydrastis*, *Caryophyllum*, and valerian.
- Digitalis.**—To detect the leaves of *Inula*, *Verbascum*, *Symphytum*, *Solanum nigrum*, and *Solanum tuberosum*.
- Dulcamara.**—To detect hop-stems.
- Eucalyptus.**—To detect the junior leaves. (Solved.)
- Euonymus.**—To distinguish the stem-bark, and to detect quillaja. (Solved.)
- Frangula.**—To distinguish the other rhamnus barks. (Solved.)
- Gelsemium.**—To detect the stem. (Solved.)
- Gentiana.**—To detect other species.
- Geranium.**—To detect tormentilla and bistorta.
- Glycyrrhiza.**—To distinguish between the Spanish and the Russian.
- Gossypii Radicis Cortex.**—To detect *Behmeria* and *Fagus* barks; also the bark of the stem and bark improperly collected.
- Granatum.**—To distinguish the barks of the root and stem and rind of the fruit.
- Guaiaci Lignum.**—To detect the sap-wood and to distinguish the two species. The entire subject of its adulteration, which seems to be very general, requires investigation.
- Hæmatoxylon.**—To detect wood which has been subjected to fermentation processes for dyeing purposes.
- Hamamelis.**—To detect leaves collected at the wrong season.
- Hedeoma.**—To distinguish *Mentha pulegium*.
- Humulus.**—To detect the removal of the lupulinum.
- Hydrastis.**—To distinguish *Caulophyllum*.
- Ipecacuanha.**—To detect the Carthagen variety.
- Juglans.**—To detect the stem-bark, bark collected at the wrong season and black walnut bark. (Solved.)
- Krameria.**—To distinguish the two official species and *Ceanothus*.
- Linum.**—To distinguish that deprived of oil.
- Macis.**—To distinguish nutmeg and wild or Bombay mace. (Solved.)
- Marrubium.**—To distinguish the *M. supinum*.
- Matico.**—To distinguish the other species, which are largely used to adulterate.
- Matricaria.**—(Same as *Anthemis*).
- Melissa.**—To distinguish patchouli leaves.
- Menispermum.**—To detect pareira and berberis roots.
- Mentha Piperita.**—To detect spearmint.
- Pareira.**—To detect the cissampelos and various other false varieties.
- Pilocarpus.**—To differentiate the several species.
- Prunus Virginiana.**—To distinguish the choke-cherry bark and bark collected at the wrong season. (Solved.)
- Quassia.**—To distinguish the two species. (Solved.)
- Rhamnus Purshiana.**—To distinguish the other species of *Rhamnus*. (Solved.)
- Rheum.**—A complete description of a good sample should be given, as the case of adulteration, though common, is not so frequent as the offering of an article of defective quality.
- Rhus Glabra.**—The substitution of fruits of other species.
- Rhus Toxicodendron.**—To distinguish ampelopsis.
- Rumex.**—To distinguish canaigre.
- Salvia.**—To detect the stems.
- Sambucus.**—To distinguish the European. This problem is solved as to substitution, but an admixture cannot be detected.
- Sanguinaria.**—To distinguish *Chelidonium*, and to detect *Sanguinaria* collected at the wrong season.
- Sassafras.**—To distinguish the stem-bark. (Solved.)

- Scutellaria.**—To distinguish the official from other marketed species.
- Senega.**—To distinguish the roots of *P. Alba*, *Cynanchum*, gentian and *Gillenia*.
- Senna.**—To distinguish the two varieties.
- Sinapis.**—A complete description is here also required.
- Spigelia.**—Phlox-root should be distinguished. In this connection we should discuss the advisability of endorsing the use of other tropical species, as the *S. marilandica* is growing so scarce.
- Stramonii Folia.**—If the *S. tatula* is not also to be accepted, the two should be distinguished.
- Stramonii Semen.**—The admixture of hyoscyamus seed should be detected.
- Strophanthus.**—To distinguish the *S. kombé* from the other species found in market.
- Triticum.**—To distinguish the stems of *Cynodon* and of species of *Carex*.
- Ulmus.**—To detect the European barks.
- Uva Ursi.**—To detect the leaves of the *A. alpina* and of species of *vaccinium*.
- Veratrum viride.**—To distinguish the *V. album*. (This attempt utterly failed.)
- Viburnum.**—To distinguish the two official barks, the stem-bark from the root-bark, and from the barks of various unofficial specimens.

AN AUTOMATIC WATER-MERCURY AIR-PUMP.

Babo's model of an automatic air-pump devised some years ago has been favourably mentioned by Kraft and Weilandt as giving excellent results with a small amount of mercury when used by them in their work on the temperature of sublimation of various organic substances in a vacuum of the cathode light. The pump consists essentially of a modified form of Sprengel's well-known apparatus connected with a water-pump, and is no larger in dimensions than an ordinary mercury barometer. The pump appeared as shown when made for the authors by C. Desaga, of Heidelberg. The apparatus is easily worked by those accustomed to automatic mercury pumps. It is first connected by a tube to the water pump at (c), and evacuated to 10 to 20 millimetres' pressure; the lower cock (e) is then cautiously opened to allow the passage of so much air, which has been dried and filtered through cotton wool, that in the left hand narrow tube globules of mercury rise at regular intervals. The pumped-up mercury passes by the two wider tubes, which form a U tube. It is of great importance in the continual working of the apparatus to have the second tap (g), by means of which the falling mercury is very readily regulated. The raised mercury passes through the four left-hand tubes which form the Sprengel pump, and is connected with the apparatus to be evacuated. The sucked-out air passes through the sixth tube (d) to the water pump. The fifth tube contains enough mercury in the wider part of it to seal the tube (f), so that entrance of air to the vacuum is rendered impossible. Should too much mercury be raised in the narrow left-hand tube it flows over into the next tube, and thus the mercury in the various parts of the pump remains always at the same level. The pump is one of the best for many purposes, and is well adapted for quickly drying hygroscopic substances in desiccators. The price of the apparatus is 45 marks.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany,
Austria, Italy, Russia, Switzerland, Canada, the
United States, South America, India,
Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, SEPTEMBER 3, 1898.

PHARMACY IN MODERN GERMANY.

THE belief that the position of the apotheker in Germany is as a rule better than that of the average chemist and druggist in this country has long since ceased to have the foundation that it once possessed. A comparative consideration of the conditions now affecting persons engaged in the practice of pharmacy leads to the conclusion that in both countries the changes brought about by increased facility of communication and other economic influences, have operated in like manner and have given rise to similar difficulties. In regard to the point in which difference has been most marked—the limitation of the number of pharmacies under the system of governmental concession—the tendency at the present time is to replace that system by one giving absolute freedom of action to all persons having the requisite qualification for carrying on business on their own account. The chief, if not the only obstacle, is to settle the mode in which existing concessions, constituting saleable property, are to be abolished with due compensation. In other respects there are to be found among German pharmacists the same forms of complaint that are met with here—the detrimental influences of trade competition and of the increased sale of proprietary medicines, an assumed disparity between the interests of pharmacists in town and country, as well as several other minor grievances, form the subject matter of arguments for reform as frequently in the pages of German pharmaceutical journals as in our own.

The analogy between the two countries in this respect is very distinctly shown by the proceedings at the general meeting of the German Apotheker Verein, which has just been held at Cologne. Among the subjects mentioned in the annual report of the Council as being of prominent importance, the regulation of the practice of pharmacy occupies the first place as demanding reform. Closely connected with this is the claim for State representation similar to that enjoyed by the medical profession, and here the comparison between Germany and our own country is in our favour, inasmuch as the Pharmaceutical Society of

Great Britain and that of Ireland occupy to some extent the position of governmental departments charged with the performance of public duties relating to the practice of pharmacy. The only ground for complaint as to want of representation is therefore the too frequent neglect of the opportunity afforded for being represented. Educational reform is also a subject that occupies much attention in Germany, and gives rise to much difference of opinion. The sale of medicinal preparations assumed to be of a harmless nature has recently been developed in Germany by certain firms who supply grocers, hairdressers, publicans, and general dealers with cabinets containing supplies of these articles for retail sale. This practice, together with the sale of secret remedies and the ready-made medicines put up in doses, is strongly opposed by the members of the Apotheker Verein as being a distinct infringement of the pharmacist's business.

In the motions brought forward for discussion at the general meeting in Cologne last week suggestions were made for reducing the annual subscription in the case of certain members of the Verein, and to give up the publication of the *Archiv der Pharmaci*, this latter step being advocated on the ground that the incomes of country pharmacists had been so much reduced by trade competition that they had no inclination to engage in scientific work, and did not find the *Archiv* of any practical value to them. The support given to these suggestions was but slender, and they were strenuously opposed by the majority. Dr. VOGT, speaking as a member of the Council, urged that although the pharmacist is naturally disposed to attach great value to small things, the general conduct of pharmaceutical affairs should not be directed by narrow-minded views. He contended that if good was to be done it would be not by separation into different classes but by unanimous co-operation for maintaining for all equal rights and equal obligations. Admitting the good intent of the suggestions, he protested against the proposal to distinguish between pharmacists by their ability to keep an assistant and, on that ground, to decide whether they could afford to pay the subscription to the Verein. Referring to the democratic constitution of the body, he argued that if a desirable delegate could not afford to attend the meetings it was for those who supported his opinions to provide the means by which he could represent them. In regard to the proposal to give up the *Archiv* several speakers objected that it would be a serious departure from one of the first principles of the Verein, to promote science and, at least, to prove that some of their body carried out research which claimed recognition outside their ranks. It was pointed out that the argument that the country apotheker had no time to read the *Archiv* or to carry out scientific work was inconsistent with the complaint that he had nothing to do. The President, Herr FROELICH, amidst great applause, expressed his conviction that the publication of the *Archiv* was a duty which the German Apotheker Verein owes to pharmacy generally—a duty which it could not on any account abandon without sacrificing its position and credit throughout the world. After some further remarks by the supporters of the motion, the result of the discussion was declared by the President to be decidedly in favour of the view that no useful purpose would be served by establishing two classes of pharmacists, on purely financial grounds, which would necessarily be the consequence of adopting the proposals brought forward.

THE COMING SESSION.

IN a few short weeks all the local pharmaceutical associations which are now dormant will have recommenced operations, and those responsible for the conduct of affairs are doubtless already considering their programmes for the coming winter session. It appears useful, therefore, to indicate how the activities of those local bodies can be usefully directed, for it is above all things desirable that on matters of importance in pharmaceutical politics the opinion of the whole country should as far as possible be expressed at one and the same time. This is one of the main ideas involved in the federation of local pharmaceutical associations, and in proportion as that idea can be realised will the value of federation be manifested. The foremost point for consideration at meetings to be held in the immediate future should, beyond question, be how to increase the strength and importance of the Pharmaceutical Society, now that the passing of the Pharmacy Acts Amendment Act has removed all obstacles in the way of chemists and druggists who desire to become members of the Society. For it will not suffice to assume that all those who have been deterred heretofore from joining the Society will at once rush into the ranks. Explanation and persuasion will often be required, and we can conceive of no better way of beginning the winter campaign than by holding a series of meetings all over the country, inviting the whole trade thereto, and then taking advantage of the opportunity to explain the new position and urge outsiders to come in. At present the Society includes half the chemists in business; let each one do his best to bring in a new member, and before another year has passed the Society will in reality be fully representative of the craft.

The most important result of such an influx of new members will naturally be the supply of greater means of defence, and local associations would do well, in the second place, to consider how those means of defence can best be organised. As a matter of fact, our existing organisation is far from perfect, so that improvement is possible and essentially desirable, whether there be a considerable influx of new members or not. A complete scheme implies a knowledge of all the registered chemists in each district, with facilities for calling them together at a moment's notice. It should also be known how many belong to the Pharmaceutical Society and why the rest do not. What is wanted, indeed, is a census of the trade, which should furnish all the information required on any and every point. A third matter requiring general consideration is the education and training of apprentices. The educational schemes followed in different parts of the country need to be rendered as far as possible uniform, so that similar results should be obtained wherever pharmaceutical students are employed. There should at least be agreement with regard to what pupils should study during the respective years of their engagement, so that a common basis of knowledge might be possessed by all pharmaceutical students at the expiration of their term of pupilage. Beyond this question, many other problems present themselves for attack. Several were suggested at the Belfast meeting of delegates of local associations (see *ante*, p. 225), and others will naturally arise from those in due course. But whatever they may be, the great thing is to have them discussed everywhere at or about the same time, for in that way alone can the maximum of good be effected.

ANNOTATIONS.

UNLIMITED LIMITED LIABILITY is the subject of an article in *Bluckwood's Magazine*, the writer of which points out that to such an extent has the rage for the company form of business pervaded all ranks of society, that there is scarcely a linendraper or oilman with a ten-year-old business but harbours the ambition of converting it into a limited liability concern; selling it to the public for a large capital sum, representing far more than the individual labour and intelligence of a lifetime could enable him to accumulate. On the least occasion of plausibility the breasts of respectable private citizens are fired with the possibilities of a company, and as a result lucky numbers, gambling systems, betting combinations, even plain swindling, have all suffered in reputation from the formidable allurements of limited liability. "Is it perhaps some private person who in ingenious despair tries the effect of some hitherto unsuspected substance on his rapidly falling hair, and by self-hypnotism persuades himself that the lamentable decay is arrested? Straightway you receive by post the prospectus of 'Brown's Κηπιτον Limited,' capital so much in one-pound shares, Board of Directors So-and-so, brokers, bankers, and all complete. Long before the first new hairs on the vendor's head have time to grow, the public are invited to participate in the boon offered, not in the form of a bottle of the composition to amend their beauty, but as proprietors at the rate of one pound per share. Does the public hesitate, and determine to buy a bottle and try the effect of the stuff before subscribing to its proprietorship? Never a bit of it. The public is a strange collection of whims, but it is a great buyer of shares. Many of its members are bald, but more hasten to be shorn. Moreover, there is a promoter at them who knows more of their ways than a collie dog does about sheep."

THE NEW JURY LISTS will be exhibited on the doors of the various chapels and churches throughout the country on Sunday next and the two following Sundays, and will include the names of all persons liable to serve as jurymen in England and Wales, probably with the addition of the names of some persons who are not so liable. Those lists can be inspected by anyone, and it should be noted that unless objection is made to the overseers during the above-mentioned time by persons who are exempted from serving, their names will be returned to the Clerks of the Peace, and they will be bound to serve as special and common jurymen for the coming year. Among those who are exempt are persons over sixty years of age and pharmaceutical chemists. *Verb. sap.*

THE PETROLEUM FLASH-POINT CONTROVERSY still continues in the *Times*, and the idea suggests itself that the warmth displayed in the verbal duel between Sir Frederick Abel and Dr. John Attfield may in some measure account for the long-continued high temperatures recently experienced in the metropolis. The gist of the whole matter is that Dr. Attfield has directed attention to the fact that the Abel-Letheby-Attfield report of June 4, 1868, recommended 100° as the flash-point for ordinary petroleum, but that Sir Frederick Abel subsequently gave way on the point and acquiesced in the fixing of the flash-point at 73°. Dr. Attfield's view of Sir Frederick's drop from 100° to 73° is that it was "an error of judgment," and in response to his opponent's somewhat weak disclaimer he speaks of Sir Frederick as "an adept in raising side issues to main positions, in trailing red herrings across good scents, and in escaping from his antagonists in a cuttlefish cloud of ink." Inasmuch as the facts of the case

appear to be in Dr. Attfield's favour, the attempt that has been made to dispute his position in the matter would certainly appear to justify him in the use of even stronger language than that quoted above. But, really, the temperature is much too high at present for this kind of thing to be maintained with safety.

POISONING CASES have been rife during the recent hot spell, suicides constituting the great majority, as may well be imagined. But two instances of death by misadventure single themselves out for special reference, by reason of the carelessness displayed. In one, a child appears to have gone to the kitchen tap to draw some water and, finding a bottle containing carbolic acid standing on the copper adjoining the sink, she swallowed a portion of the contents, with a fatal result. In explanation it was stated that the bottle was "usually" kept on a shelf out of the way of the children, but no one could say why that rule had been broken. The next case was even worse, for the landlord of a public-house had left a jar containing strong hydrochloric acid standing outside his premises, and a young child playing about in the vicinity very naturally drank some of the corrosive fluid, death occurring in a few hours.

SALICYLIC CORN SOLVENT is hardly likely to become a strong favourite amongst would-be suicides, but a case has recently been recorded where an attempt was made to terminate existence with such a fluid. The woman who took it is reported to have made three previous attempts on her life, and though her lips were blistered in the present case, no worse result appears to have followed. Successful suicides are reported to have taken hydrochloric acid, potassium cyanide, carbolic acid, laudanum, weed-killer, and hydrocyanic acid respectively. In the last-mentioned case, no evidence seems to have been given at the inquest with regard to the source of the poison, though that would appear to be a very essential point in a case of suicide by hydrocyanic acid.

ANOTHER GREGORY'S POWDER CASE is reported in the *Morning Advertiser*, according to which the Prosser Roberts Drug Company, of Walworth Road, London, was summoned at Lambeth Police Court by the Newington Vestry for selling to the prejudice of the purchaser Gregory's powder, which was not of the nature, substance, and quality of the article demanded by the purchaser. The sample of Gregory's powder purchased at the defendant's shop was certified by the public analyst to consist of rhubarb and ginger, 33 parts, and official magnesium carbonate, 67 parts. The British Pharmacopœia, of course, requires Gregory's powder to be made entirely with light or heavy magnesia. For the defence it was said that the assistant who mixed the powder was to blame, but Mr. Hopkins promptly ordered the defendants to pay a fine of 40s. and costs. It would almost appear as if the permission given in the Pharmacopœia to use heavy magnesia in place of light magnesia, when a less bulky powder is desired, has been widely misinterpreted of late, but the use of magnesium carbonate in this connection has never been officially recognised.

THE SAYINGS OF JOSEPHUS, referred to in last week's issue, have evoked a reply from a "Physician and Surgeon," who is seemingly a person of quite a superior sort. He asks the Editor of the *Daily Mail* to be permitted to say to "Josephus" that he, "now a qualified medical practitioner of no small experience (*sic*), was obliged to pass a more difficult examination in chemistry (practical and theoretical), materia medica, medical therapeutics, and physiology in relation to the action of drugs on the human

frame" than is, he learns, ever required from dispensing chemists. In addition, he was obliged to attend a practical (?) course of dispensing and to pass an examination in that subject also. He is careful, however, to abstain from explaining what the "practical course of dispensing" was like, and with regard to the examination in that subject he is equally reticent. That is perhaps as well under the circumstances. Regarding the last paragraph of the Josephus letter, wherein the question of death certificates is delicately referred to, "Physician and Surgeon" asks the honourable portion of the public to join with him in treating the "insult with the contempt it deserves."

AFTER-DINNER ORATORY is the subject of some gentle chaff by the editor of the *Practitioner*, in a note on the annual dinner of the British Medical Association, at Edinburgh. Why on earth, he asks, do gentlemen, conspicuously benevolent or, at any rate, inoffensive in private life, consider themselves bound to inflict on their fellow-creatures at public dinners tedious harangues containing "an infinite deal of nothing," and made still more dismal by faulty elocution? "It is not as if the exercise were pleasing to themselves; on the contrary, it is in most cases painfully evident that it causes them more or less acute suffering. But as the fakir swings himself up by hooks under his shoulder-blades, or stretches himself on a bed of sharp spikes, the ordinary Briton gets on his legs after dinner, and goes through the performance which the custom of his country demands of him." Continuing, the writer asks why the speaking after public dinners should not be done by hired orators, just as the singing is done by artistes engaged for the purpose? He feels sure this simple reform would prevent a vast amount of needless suffering which the present system inflicts on speakers, hearers, and reporters.

PUBLIC RESPECT FOR THE MEDICAL ART is increasing year by year according to Sir Thomas Grainger Stewart, in his presidential address to the British Medical Association, but the *Saturday Review* of the same week had occasion to observe that "belief in doctors seems to be diminishing." Referring to this curious coincidence, Mr. Malcolm Morris points out that, in another part of his address, Sir Thomas appears to agree with this opinion of the *Saturday Reviewer*. For, speaking of the anti-vaccination agitators, he says "to these a very considerable section of the English public has given heed rather than to the medical profession." It should be noted, by the way, that exemption from vaccination can now be secured in London at a charge of one shilling per child, that being the amount the Metropolitan magistrates have decided to charge for each certificate showing they are satisfied the applicant has a conscientious objection. The *Daily News* unkindly suggests that the charge should be one shilling plain, eighteenpence coloured.

"PHARMACISTS OR ANALYSTS?" is the heading of an article in the *Chemical Trades Journal*, in which it is remarked that the fact of the analytical profession having been more securely established—as a profession—during the last decade, by raising the standards of qualification, seems "to act on the brethren of the pestle and the pill machine like a red rag on a bull." This interesting statement is the result of a perusal by the editor of the Manchester organ of what he refers to as "some interesting and half-amusing correspondence in the pages of a pharmaceutical contemporary, in which great lamentation is made over the fact that passing the 'Major' examination only carries with it 'the empty title of pharmaceutical chemist,' instead of the 'more substantial

qualification of analytical chemist.” “The general tone of the correspondence,” observes the writer in the *Chemical Trades Journal*, “conveys the impression that since the passing of the Pharmacy Acts Amendment Act, the expenditure of time and trouble which is necessary in order to earn the title of ‘pharmaceutical chemist’ is not worth the candle,” and to him this seems peculiar, “because chemists are jealous enough of their ‘rights,’ and woe be to the unqualified person who endeavours to trade as a chemist. If the title be so empty, why guard so closely the vacuous realms of pharmacy?” These remarks should be carefully considered by those to whom they are intended as a reply, and they should pause to consider whether it is altogether wise to disparage the value of their own qualification.

THE TITLE “ANALYTICAL CHEMIST,” it is pointed out, means anything or nothing, for there is nothing to prevent anyone setting up as an analytical chemist. Any pharmacist doing so will, of course, have to depend for success upon having educated himself to be a skilful and trustworthy analyst; and his reputation will depend upon his merits, unaided by any factitious diploma purveyed for his special benefit by the Pharmaceutical Society. If he wants to pose as a fully qualified analyst, he must attain the standard expected by the public by registering himself as a Fellow of the Institute of Chemistry. We quite agree that to add on to the Major “such things as analyses of milk, water, urine, coal, coke, etc.,” will not make an analyst of the aspirant to pharmaceutical honours. “If he will study the syllabus of the Institute of Chemistry examinations, he will perhaps grasp this. At the same time, the fact that he feels the qualifications are beyond him affords no justification for making the Major a back-door entrance to the title of analytical chemist. Surely it is enough that he is not debarred from undertaking analytical work without official qualification. If so be that the newly-fledged ‘Major’ is not contented with pharmacy, he can practise as an analyst, when, if he has any merit, he will reap his reward, and if he has not, he will have learnt a lesson that will do him more good than money. There is no need for the Pharmaceutical Society to create a diploma behind which he may hide his incapacity.” This is quite to the point, and the remarks quoted should be taken to heart by pharmaceutical aspirants for analytical honours.

THE OUTBURST BY THE “MEDICAL PRESS,” to which we had occasion to refer last week, was attributed by us to the probable absence on a holiday of those responsible for the proper conduct of the paper. In this week’s issue of the *Medical Press* such is acknowledged to have been the case, for in an apologetic note, the Editor states that certain “strong and . . . indefensible language . . . would not have been published by us but that in consequence of the absence of some of our editorial staff on holiday, it was overlooked.” Inasmuch, however, as this apology is not directly addressed to chemists and dentists, who, it will be remembered, were referred to as “holders of sham diplomas,” our readers should continue to bear the matter in mind.

THE STUDENTS’ NUMBER of the *Pharmaceutical Journal* will be published next week, and secretaries and principals of educational institutions, who have not yet sent in particulars of courses of study suitable for pharmaceutical students, are requested to do so at once. Several articles written especially for Minor and Major students will be published in that issue, and it is believed that it will prove to be at least as useful for the intended purpose as any former number mainly addressed to students.

THE TSAR’S RESCRIPT does not appear to have any direct interest to pharmacists as such, but the *Daily Chronicle*, in a reminiscence of English Quakerism, shows that the ideas on which the rescript is based may, in part at least, have been suggested many years ago by an English pharmacist—William Allen, first president of the Pharmaceutical Society. Whilst, in the words of the Imperial rescript, “the humanitarian ideas” of the Tsar Nicholas II. “have been won over” to the Gospel of Peace, it is not made known by whom that amazing conversion has been effected. But the Tsars of all the Russias, though the most august and isolated of mortals, have always, by a strange paradox, been easily accessible to visitors with a “mission,” and the official head of rigid Greek Orthodoxy has, on more than one occasion, been under the influence of religious revivalists. This was notably so in the case of the Tsar Alexander I., who visited England in 1814, and on that occasion was approached in the cause of peace by a little group of members of the Society of Friends.

THE CHIEF OF THESE, as the *Daily Chronicle* points out, was William Allen, “a man whose name is honourably connected with the anti-slavery and every good cause, and whose financial assistance was often invoked by the father of Queen Victoria.” Not only Alexander I. of Russia, but the King of Prussia also, was in London in 1814, and Friend Allen decided to proclaim Quaker principles to both of them. “The interview with the King of Prussia could not be called encouraging, for after arriving by appointment at St. James’s Palace the good Friends were told that the King had been up all night and was much hurried, and that their only chance of seeing him was as he passed along the corridor on his way to his carriage. Undismayed they waited. One of the Friends began a little address to the King, but he, ‘without waiting for the conclusion of the sentence, said war was necessary to procure peace.’”

THE RUSSIAN MONARCH, however, received the peace overtures more favourably. “He was quite alone when he received Friend Allen and two others at the Pulteney Hotel, talking partly in English, partly in French. The Emperor said that ‘the Lord had made him acquainted with spiritual religion,’ and he inquired into the tenets of Quakers, adding that if any of them should visit St. Petersburg they were to come direct to him without any further introduction. This is what, four years later, Friend Allen did, and he had other later interviews at Vienna in 1822, when the Tsar was on his way to the Congress of Verona. The talk between them was intimately religious, with interludes of prayer, as Allen in his diary records.” A year later, however, Allen, writing to the Tsar in a tone of some disappointment, says: “It seems due to the affection I have so long cherished for thee to produce a candid statement of reports currently circulated and universally believed. It is said that the Emperor of Russia, who has patronised the societies, in England and America, for the promotion of universal peace, has now become the secret and open abettor of war.” He acknowledges that he does not believe the evil speakers, but tells them, on the contrary, that it is his “firm belief that the first wish of the Emperor’s heart is to be made instrumental in preserving the peace of Europe.” In 1825 the Emperor died, three-quarters of a century before the world was ready for the peace programme which his successor has now promulgated, but not, it would seem, before Friend Allen’s ideas had become firmly implanted in his mind, to be transmitted later to his successor, Nicholas II.

PHOTOGRAPHIC NOTES.

RED STAINS ON PRINTS.—Having a batch of prints which were of a reddish hue when dry, W. T. was at a loss to find out where the discoloration came from until he had been developing with pyro one day, and had some toning to do afterwards, which let him into the trouble. He thoroughly believes in the maxim, "Cleanliness is next to godliness," and has everything clean and well washed both before and after using. His solutions were new and clean, but he had a pyro stain on his fingers which would not give way to soap and water, and that caused all the mischief, for, after finishing toning, he found the sulphocyanide had removed the pyro from his fingers and deposited it on the prints, turning them pink.—*Amateur Photographer.*

SUBSTITUTES.—It is a very good thing to know that, should a certain chemical, or portion of our photographic kit, suddenly go astray; we have only to go into another room, or some other part of the house, to find something which will take its place. That, of course, we cannot always do, but there are, nevertheless, several things used below stairs which, in case of accident, come in wonderfully handy. For instance, Brunswick black, usually kept in the housemaid's cupboard, and periodically used on the grates, is a fine thing for blocking out skies or any other portion of a negative. Apply the black as thin as possible, and, if in good condition, it will dry in a few minutes.—T. P., in *Amateur Photographer.*

TO CLEAN OLD NEGATIVE GLASS FOR ENAMELLING.—The usual method is to soak in strong soda solution, when the film will sometimes come off in one piece, but with soft gelatin (or when the negative has not been alumed) it comes away in fragments, or forms a soft, sticky mass, very difficult to remove. After soaking the negative in the soda solution, stand it up to dry without washing, then at any time afterwards, by simply placing it in warm water, the film will float off in one piece.—C. A. M., in *Amateur Photographer.*

A FEW DARK ROOM HINTS.—Many amateurs do not pay sufficient attention to their dark rooms. One frequently requires to change plates in the daytime. If one can obtain a small room for this purpose, a good method of converting it into a dark room is to have a frame made so that, with indiarubber packing round the edge, it will tightly fit the window. The frame, can of course, be made to any depth, and prepared ruby cloth (sold at all photographic dealers) tacked across it, shutting out all light. Such a frame could be taken down when desired. A bench or table is a requisite article of furniture, and a few shelves. A periodical clearance of old bottles is desirable. Some amateurs seem to highly value their old empty bottles. But you need not throw them away, for your photographic dealer would doubtless be pleased to send his boy round and collect them. Your bench or table should be fitted with one or two drawers, in such a position where liquids would not be likely to come in contact with anything placed in the drawers, which would serve as a receptacle for plates, paper, etc. Be tidy, and always keep a few cloths in a handy place in case of any upset of liquids.—J. A. R., in *Amateur Photographer.*

DEVELOPING LARGE PLATES.—Fasten a hook-screw into the roof of dark room, then drive a nail into each of the four corners of a square board of a size to suit plate to be developed; attach board to hook by string, and adjust to a suitable height. Place dish with plates upon this arrangement, pour on developer, and commence gently swinging it to and from you, from side to side, and from corner to corner, or any way that might suggest itself, and you will greatly lessen the aching of arms after developing a 12 by 10 or 15 by 12 plate. Of course, this method can be used with advantage for smaller size plates.—H. J. F., in *Amateur Photographer.*

MOUNTING GLOSSY P.O.P.—Cut out a piece of cardboard measuring $\frac{1}{4}$ in. less all round than print to be mounted. Place this on the back of the print (which is, of course, face downwards), and then apply paste to the $\frac{1}{4}$ -in. margins of print thus obtained. Then take print, and squeegee firmly to mount. Even if gloss is removed to some extent by the application of paste, it will only be noticeable along the margin applied, and this margin will add to rather than detract from the effectiveness of the print thus mounted.—H. P. E., in *Amateur Photographer.*

THE CERTIFICATION OF OPTICIANS.

The optical trade of this country is entering upon a new era, and we appear to be within measurable distance of the time when no optician of repute will sell spectacles until he has first proved by examination his knowledge of optics. This is as it should be, for so-called opticians have so far, to a very great extent, been in utter darkness as regards the subjects they treat and the articles they deal in. No one, who gives the matter a moment's thought, can doubt that, up to now, the optical trade has been conducted almost entirely in a manner opposed to the interests of the spectacle wearing public, and entirely contrary to the interests of the trade itself. The initiative of the new movement has at length been taken by the Worshipful Company of Spectacle Makers who, by their recent action of instituting examinations in optics, show themselves determined to be, not only in name but in fact, the head of the optical industry of this country.

It would be difficult to conceive any movement of much greater or more far-reaching importance to the public than the supervision of the manner in which its optical needs are catered for, and it is the aim of the Spectacle Makers' Company to provide a class of men competent to supply visual aids to the mutual benefit of both the public and the trade. Hundreds of chemists and druggists throughout the country handle optical goods, and they are taking a laudable interest in the new movement. All, but especially those who have conducted this branch of their business on intelligent and scientific lines, have invariably found it extremely profitable.

In a matter which treats of the eyesight of the community, there can be no doubt of the necessity of certification before a person is to be allowed to practise, so that the public may be guaranteed against incompetence or quackery, and not the least important is the knowledge needed to enable the optician to discriminate between cases for which he can supply glasses and those that require treatment by an oculist.

The scope for the development of the trade may be considered practically illimitable, when it is judged by the fact that not more than 4 per cent. of the population have truly emmetropic or normal eyes, and that, of the remaining 96 per cent. who are ametropic, more than a half could be using glasses with advantage to their health and working capacities. Moreover, after forty years of age every one must become presbyopic, and therefore, a wearer of glasses. Those who conduct the optical business on the high plane commensurate with its importance must reap a reward hardly realisable by those who to-day deal in spectacles and eye-glasses as if they were articles of ordinary merchandise.

The knowledge of their visual needs, and the means of properly supplying them should be within easy reach of the public, and this can only be achieved by there being in every city, town, and village in the kingdom a sufficiency of intelligent and competent opticians.

It is quite clear that the S.M.C. scheme will eventually have the effect of closing the trade to all except those who possess the diploma, the possession of which, in the eyes of the public, means optical competence, and we sincerely trust that the chemists and druggists of Great Britain are alive to the possibilities that can accrue from its possession.

The effort required to secure the diploma should be well within the capacity of chemists and druggists, but in this connection attention must be directed to the fact that after July, 1899, the ull syllabus, as hereafter described, will be compulsory to all candidates, whilst previous to that date examinations for those who have been in the trade as principals or assistants for seven years will be held on the modified syllabus hereafter given.

The official prospectus issued to the trade states that it is the object of the Spectacle Makers' Company to advance the status and knowledge of the optician and to re-associate with the Guild all who possess the necessary technical ability. As it would be exceedingly difficult, and even invidious, to define how far the scheme of the Company should go in including those who deal in other things as well as spectacles, it has been arranged that all those—whether principals or assistants—who can conform to the regulations will be admitted to the Guild and be granted a diploma of membership. The Guild, therefore, offers its diploma to every one who can prove, by examination, his possession of the necessary technical knowledge. The syllabus is certainly excellent; while sufficiently comprehensive it is not too difficult, and will, we think, meet with general approval.

The regulations of the S.M.C. as regards the granting of the diplomas stipulate that a theoretical and practical examination must be passed by candidates approved by the Optical Committee of the Company on the recommendation of two well-known members of the craft. It has been the general practice at the inauguration of similar schemes to make some easement in favour of masters and assistants of old experience. The Committee, however, considers that even such persons should be examined and approved in the subjects specially relating to spectacles, and which are given at length in the following syllabus. Seven years must have been spent in the optical business to qualify for the modified examination. After July 1, 1899, these exceptions will cease and the full syllabus must form the basis of the examination.

Modified Syllabus.

The modified syllabus is as follows:—

OPTICS RELATING TO VISION.—General anatomy of the human eye. The course of light passing through the media of the eye alone and modified by lenses, cylinders, and prisms. Hypermetropia; myopia; astigmatism; presbyopia. Instruments commonly used for determining the refraction of the eye:—Trial lenses, test types, astigmatic chart, the optometer. The principle of the ophthalmoscope. The theory of retinoscopy. The principle of and various forms of spectacles.

PRACTICAL WORK IN VISUAL OPTICS.—Testing a plane surface; measurement of focal length of spherical, cylindrical, and compound lenses; use of the spherometer; determination of the axis of a cylinder and the angle of deviation of a prism; analysing and neutralising simple and compound lenses and lenses combined with cylinders or prisms; transposing; centering and adjustment of spectacle lenses and frames; taking of face measurement for spectacles. Knowledge of the materials and of the workmanship employed in the manufacture of lenses and frames; use of pebble tester. Reading of oculists' prescriptions; writing of orders for lenses and frames. The 'Optician's Handbook.'

Full Syllabus.

The full syllabus includes the above and, in addition, the following:—

ARITHMETIC AND ALGEBRA.—Addition; subtraction; multiplication; division. Highest common factor; least common multiple; elementary fractions; simple equations; simultaneous equations. Elementary use of logarithms and reciprocals. Hall and Knight's "Elementary Algebra."

TRIGONOMETRY.—The measurement of angles; trigonometrical ratios of certain angles; simple problems connected with the above. Use of tables of natural sines, cosines, and tangents. Hamblin Smith's 'Elementary Trigonometry.'

HEAT.—A simple knowledge of the construction and uses of instruments for measuring temperature, atmospheric pressure, and moisture. D. E. Jones' 'Lessons in Heat and Light.'

LIGHT.—Elementary laws of light; simple laws of refraction; the index of refraction; refraction as applied to lenses and prisms; conjugate foci; formation of images; umbra and penumbra; conditions of achromatism. Simple laws of reflection; reflection as applied to mirrors. Photometry. D. E. Jones' 'Lessons in Heat and Light.'

OPTICAL INSTRUMENTS.—Their elementary theory and construction. The photographic camera. The optical lantern. Simple and compound microscopes. Refracting and reflecting telescopes; the opera glass. The stereoscope. The spectroscope. Nautical and surveying instruments. D. E. Jones' 'Lessons in Heat and Light.'

PRACTICAL WORK WITH OPTICAL INSTRUMENTS.—The photometer, determination of the brightness of light by the shadow and grease-spot-photometer.

OPTICAL LENSES.—Testing for focal length, conjugate foci, spherical and chromatic aberration, astigmatism, centering, magnifying power, field of view.

THE OPTICAL BENCH.—Simple experiments thereon with convex and concave lenses and mirrors. The Vernier and slide rule and their practical use. D. E. Jones' 'Lessons in Heat and Light.'

NOTE.—The Candidates will be examined in one and one only of the following subjects; the choice lying with the Candidate:—

A. THE CAMERA.—Experiments with lenses adapted to a photographic camera: the construction of various kinds of photographic lenses and the use and requirements of each; use and calculation of stops. Traill Taylor's 'The Optics of Photography and Photographic Lenses.'

B. THE MICROSCOPE.—Experiments with simple and compound microscopes; the use of water and oil immersion lenses; determination of their aperture and magnifying power; the use of the substage illuminator; the measurement of the index of refraction of a plate of glass or crystal by means of a microscope; the use of the eye-piece and stage micrometer. 'The Microscope and Microscopical Methods,' by Gage, Comstock Publishing Company, Ithaca, New York.

C. THE SEXTANT.—Its use; method of correction and adjustment, including tests—that arc and image are in the same plane—that horizon-glass is set—that axis of telescope is parallel to plane of arc—that the two mirrors are parallel with Vernier at zero. 'Practical Physics,' Glazebrook and Shaw.

Qualification for Examination.

All those entering for the examination must either be actual Freemen of the Spectacle Makers' Company or must undertake to become so when passed by the examiners and approved by the Committee. If not already paid, the amount of the admission fee and stamp duty, which will be payable when the Freedom of the Company is taken up, must be deposited with the Clerk of the Company at least fourteen days before the announced date of the examination. No examination fee will be charged, but the Examiners and the Committee will have power to recommend the Clerk to retain from the deposit an amount not exceeding £1, if the candidate has not acted with "bonâ fides." This amount will be added to the prize fund. With this exception, the deposit will always be returned in full to unsuccessful or unavoidably absent candidates.

Company's Fees.

The fee payable under the special scheme of the Company by those who take up the Freedom is £1 10s., to which must be added the Government stamp duty which has to be collected by the Company from new members, and which at present is fixed by the Fiscal Authorities at £1 or £3. The total amount to be deposited before examination and subsequently devoted to the admission fee and stamp will therefore be either £4 10s., or £2 10s. when formal apprenticeship can be shown. The only other necessary payment by Freemen is the subscription of 1s. per quarter (quarterage) paid by all members.

Committee.

The following constitute the present Optical Committee of the Company:—

Members of the Court of the Company.

The Master, The Right Honourable The Lord Mayor, Lieut.-Col. HORATIO D. DAVIES, V.D., M.P.

The Upper Warden, WILLIAM H. E. THORNTHWAITTE, Esq., F.R.A.S. (*Chairman*).
The Renter Warden, Colonel SIR REGINALD HANSON, Bart., M.A., LL.D., M.P., Alderman of the City of London.

SIR MARCUS SAMUEL, Alderman of the City of London.

Nominated by the above.

G. LINDSAY JOHNSON, Esq., M.A., M.D., F.R.C.S. (*Examiner*). W. A. DIXEY, Esq., THOMAS FIELD, Esq., H. TRENTHAM MAW, Esq., M.D. A. A. WOOD, Esq., A.K.C., F.C.S., C.C.

Nominated by the Astronomer Royal.

Professor SILVANUS P. THOMPSON, F.R.S. (*Examiner*).

Elected Members.

JAMES AITCHISON, Esq. JOHN BROWNING, Esq., F.R.A.S. (*President B.O.A.*).
HENRY HARRIS, Esq. HENRY C. KEMP, Esq. GEORGE PAXTON, Esq. (*Examiner*).
R. F. W. SCHMIDT, Esq., F.R.G.S., B.O.A.

Courses of Instruction.

For those who need optical instruction in order to pass the examination, arrangements have been made by the S.M.C. to hold classes at the Northampton Institute, Clerkenwell. Lectures on applied optics and heat will be given from 7 to 8 and on visual optics from 8 to 10 every Monday evening, commencing September 26. The course will continue during the educational year. There will also be classes in optical laboratory work, practical calculations, and advanced work on the principal optical instruments. Full particulars as to fees, etc., can be obtained at the Institute.

In addition to the classes mentioned, Mr. Lionel Laurance, who is the Instructor of Visual Optics at the official classes, holds private classes at his rooms, No. 1, Vernon Place, Bloomsbury, London, for those who may find the official classes not suitable. For gentlemen residing in the provinces who would find a lengthy stay in London impossible, Mr. Laurance offers to conduct instruction partly by correspondence and partly by personal tuition in London and some of the larger provincial centres.

The Spectacle Makers' Company also intends having occasional lectures, meetings, and exhibitions for the craft. Dr. Lindsay Johnson gave at the Mansion House a lecture on "The Development of Optics During the Present Century," and at the same place, by permission of the Lord Mayor, who is Master of the Company, there will be held in October an exhibition of optical instruments and goods, which promises to be a great success. Colonel T. Davies Sewell, Clerk of the Company, Guildhall, London, can be addressed for a full prospectus of the regulations, syllabus, etc., or for any further information in connection therewith. The promoters of the scheme show a most earnest desire to induce the best class of men to compete for the diplomas. They give every reasonable facility for their acquirement as regards fees, methods of examination, and arrangements made for technical instruction, and there is but little doubt that in the near future the public will seek the certificated optician in preference to the mere unqualified retailer of spectacles.

BRITISH PHARMACEUTICAL CONFERENCE, 1898.

MEETING OF THE ULSTER EXECUTIVE.

A meeting of the Ulster Executive Committee was held at 10, Garfield Chambers, Royal Avenue, on Tuesday, August 23, Mr. J. C. C. PAYNE, J.P., presiding. The Honorary Local Secretary (Mr. R. W. McKnight) having read the minutes of the previous meeting, which were passed, and the routine business having been transacted, the following resolution was unanimously passed:—"That the best thanks of the members of the Ulster Executive Committee of the British Pharmaceutical Conference be accorded to the Lord Mayor and the Lady Mayoress for their great kindness and consideration in delaying the date of their garden party so that invitations to it might be extended to the members of the Conference. The garden party in a marked degree contributed to the social success of the meeting. The Executive Committee also wishes to thank Mr. David Henderson for the trouble he took on behalf of the Conference. It was also agreed "That the best thanks of the members of the Ulster Executive Committee of the British Pharmaceutical Conference be accorded the President of the Queen's College, Belfast, for his great kindness in granting the use of the College buildings, which proved so appropriate for the holding of the meetings, as well as for his kindness in giving a welcome to the delegates on the opening day." The Honorary Secretary was instructed to write to the following firms thanking them on behalf of the Committee for their kindness in allowing the members of the Conference and their friends over their works, and for the attention shown them:—The York Street Flax Spinning Company; the Belfast Ropeworks Company; Messrs. William Ewart and Sons; Gallaher, Ltd.; Messrs. Robinson and Cleaver; Ulster Spinning Company; Messrs. Marcus Ward and Co.; and Messrs. Harland and Wolff, Ltd.

A hearty vote of thanks was also passed to the *Pharmaceutical Journal* for its admirable report of the Conference proceedings.

DINNER AT BELFAST.

On Thursday evening, August 25, Mr. J. C. C. PAYNE, J.P. (President-elect of the B.P.C.), gave a dinner to the members of the Ulster Executive Committee. After justice had been done to the good things provided, the host gave the first toast, viz., "The Health of the Secretaries," coupled with the names of Mr. R. W. McKnight, Mr. Rankin, Dr. Fielden, and Mr. J. Guiler.

Mr. McKnight, Hon. Local Secretary, said that although he responded to this toast he did not deserve to have his name coupled with it. He always made it a rule, which he thought was thoroughly Irish, "never to participate in anything that would not give him fun." It had been a great source of pleasure to him to act as Secretary to the Executive Committee and Local Secretary for the Conference, and if in gaining amusement by it he had done any solid work that merited approval he was doubly pleased. Mr. Payne and he took the credit of inducing so many bachelors and

unmarried ladies to Belfast for the Conference. Two years ago, at Liverpool, Mr. Payne informed the Conference that the prettiest girls in the world were to be found in Ireland, and as he (the speaker) did not wish all the beauty to be on one side, as he was then unmarried, he told the English and Scotch ladies that Ireland was also famous for its handsome men. Accordingly, they came and saw, and he hoped they did not go away disappointed.

Dr. FIELDEN, Secretary of the Conversazione Committee, said it gave him very much pleasure to respond to the toast. He was glad to know that the function with which he had something to do turned out so successfully. He had been connected with many functions in the Queen's College, but he had never been associated with any that gave him more pleasure.

Mr. GUILER, Secretary of the Drives Committee, also responded in a neat speech. The toast of our "Musical Friends" was responded to by Mr. ISAAC NICHOLL, M.P.S.I., in a happy manner. The "Health of the Treasurer" (Mr. S. Gibson) was enthusiastically drunk, who responded in his usual vigorous and happy style. He said that his duties were very light indeed, as the money flowed in upon him freely. The guarantee fund would more than cover expenses.

The toast of the "Chairman (Mrs. Clotworthy), and the Hon. Secretary (Miss Watson) of the Ladies Committee" was responded to by Mr. JOHN WATSON in appropriate terms, who also proposed the toast of the evening, the "Health of the B.P.C." coupled with the name of the Host, Mr. J. C. C. Payne the President-elect." Mr. PAYNE thanked Mr. Watson and the company for the toast, and assured them that he appreciated the honour that had been conferred on him by his election as President of the Conference. He would do his best to fill the position with credit to himself and the Conference over which he would preside. He thanked the Committee for the very great assistance which they had given him in carrying out the arrangements of the Belfast meeting, which seemed to give so much all-round satisfaction to the delegates and members of the Conference. He was delighted to have them present that evening as his guests.

The "Health of the United States of America," coupled with the name of Mr. McMann, an American gentleman present, was drunk enthusiastically, and responded to by Mr. McMann in a characteristic and racy manner, who, before sitting down, gave "The Queen," which was drunk in good old British style. The party then withdrew to the drawing-room, where they were entertained by Mrs. Payne, Miss Payne, and Miss Houston, Mr. J. Nicholl, Dr. Fielden, and others to a fine musical programme. Thus concluded the B.P.C. meeting in Belfast. The Ulster Committee are prepared on no very distant date to offer another invitation, which, if accepted, will be even more successful than the last.

PHARMACY IN IRELAND.

[From our Dublin Correspondent.]

PHARMACY IN DUBLIN during the past week has had what one of our Scotch councillors describes as an "unco guid time." Between papers by the President and the "professor," flattering notices thereon in the local newspapers, and a general look in at the pleasures as well as the profits accruing, the star of Mount Street, Lower, was never more in the ascendant. The utmost gratification is felt at the very full account of the Health Congress given in last Saturday's *Pharmaceutical Journal*, and it is thought the lessons to be drawn from Messrs. Downes and Tichborne's contributions to the Conference will be far-reaching.

LAST WEEK'S EXHIBIT OF DRUGS AND CHEMICALS at the annual Horse Show in Ball's Bridge was very far ahead of previous similar displays. There were samples of linseed meal and oil from Messrs. Paul and Vincent, Caledonian sheep dip, linseed of all kinds from Messrs. H. M. Leask and Co. Messrs. Hayes, Conyngham and Robinson had at Stand 42 a large collection of their pharmaceutical products, which looked to advantage. A not less attractive turn-out was seen at Stand 82, which the "Vinolia" people occupied with a choice variety of their specialties in powders, creams, soups, etc. The Bovine Company had on view samples of their world-famed wares, and the "Dargi Dash," a new preparation of therapeutic qualities, attracted much attention. Up to August 27, when the show closed, the daily attendance steadily increased, and those who were so fortunate as to secure space for

exhibition purposes are congratulating themselves on the result of the publicity obtained.

WHAT, IS BEING ASKED, has become of the newly-started P. A. T. A. in Dublin? Two months ago, at a meeting held in the Pharmaceutical Society's house in Mount Street, those present resolved to form a permanent branch of the Association, and to hold meetings monthly in future under the presidency of Dr. Walsh, proprietor of Messrs. Graham's State pharmacy, in Westmoreland Street, but since then nothing has been heard of the matter. As Dr. Walsh is anything but a figurehead, and takes a keen interest in things pharmaceutical, the suspension of meetings is somewhat curious, and gives rise to some inquiries.

MANY READERS WILL LEARN with regret of the death of Mr. Robert Ferrall, father of Mr. Ferrall, the courteous Registrar to the Pharmaceutical Society of Ireland. The deceased gentleman was well known and widely respected, and the news of his demise is heard with general sorrow, whilst to Mr. Ferrall, his son, are tendered numerous expressions of condolence.

DR. ROCHE, OF KINGSTOWN, is responsible for the very important statement made at Dublin last week that not a few of the deaths which occur in our midst are due to the accidental or the deliberate use of poisonous drugs. He stated that he has already been in communication with the criminal authorities in the matter, but found some difficulty in advancing his views. Judging from Dr. Roche's remarks, he feels strongly on the point and seems to have a clear line of argument in connection. Prejudice, however, is hard to break down, and coroner's juries are proverbially conservative in their verdicts. It is to be hoped Dr. Roche will not weary in well doing, and that he will continue his efforts to awaken the authorities to a proper sense of their duty to the public. Already he has the support of the medical and pharmaceutical bodies, and it is only a matter of perseverance to bring about the inquiry sought by the learned gentleman.

THE LOCAL GOVERNMENT BOARD in their time have issued some strange circular orders, observes a correspondent of the *Irish Times*, but few are so ill-timed as one just at present going the rounds of the Irish Poor Law Unions, which deals with the supply of medicines and directs the Guardians to notify their respective contractors that all drugs must in future be supplied according to the latest edition of the British Pharmacopœia. As most contractors have entered into bonds from the end of last March to a corresponding date in 1899, and have tendered at prices in accordance with the B. P. of 1885, it would seem to press hardly on the contractors that they should now be directed to supply medicines according to a standard which was not in existence at the time they tendered.

CHANGES AND TRANSFERS IN DUBLIN have of late been frequent. A new medical hall is in course of opening by Dr. Laird, of Limerick, at the corner of Henry Street and Sackville Street. Another temple of Galen is about to be erected in the neighbourhood of Leeson Street. Mr. Harry Harris, of Johnston's pharmacy, has forsaken the retail for the wholesale trade, and now represents Messrs. Thacker and Hoffe, druggists. Mr. Carrol has left Hamilton, Long and Co.'s State Pharmacy, and is now at Kiloh's, of Cork. Mr. J. B. Alister has become a director of Hamilton, Long and Co.'s concern, and Dr. Merrin, Councillor of the Pharmaceutical Society, has taken a new house in Harcourt Street.

PHARMACISTS IN DUBLIN are beginning to talk about the re-opening of the Pharmaceutical Society's evening meetings, which were so successful last year. It is understood that the popular president has in view several new features for the ensuing Session, but like a wise man he is waiting to mature them before declaring his "policy." It may, however, be stated that due regard to the social aspect of the question will be had by Mr. Downes, who on the principle of "all work and no play making Jack a dull boy" will not forget his duty in this respect.

DR. MCWALTER, in the course of his remarks last week at the Health Congress on President Downes' able paper on legislations regarding the sale of poisons, struck a responsive chord when he condemned so strongly the growing fondness of the poor for methylated spirit as a cheap intoxicant. He stated that in a

quarter of a pint of the spirit, which could be purchased for three-halfpence from any grocer or huxter who paid the excise licence of ten shillings a year, was as much alcohol as was contained in a half-pint of whisky, and that the "blending" by water was known by the wretched consumers to lessen the evil smell and taste so dear to their nostrils and palate, as well as to "stretch" the beverage. His plea to have s.v.m. put on the Poison Schedule will, it is hoped, be soon brought under the notice of the Privy Council, and the assurance of Dr. Moore that any recommendation in the matter made by the Pharmaceutical Society would receive the anxious attention and support of the President and Fellows of the Royal College of Surgeons in Ireland will no doubt have due weight with the representatives of the Government.

RECENTLY THE POOR LAW GUARDIANS at Listowel, County Limerick, resolved to appoint as their drug contractor a Mrs. English, proprietress of a local medical hall, notwithstanding that her tender was considerably in excess of other tenders received. Irish chivalry was aroused, and for once in the century Ireland and the English went hand in hand. The Local Government Board refused to see it in the same light, and insisted on the lowest tender being accepted. The guardians manfully stood by their guns, and declined to appoint anyone else but the lady. Quietly the Local Government Board stated that they "regretted" the selection, and as a result the guardians have meekly informed that body they are now receiving medicine from their former contractor (a Dublin firm), and suffer no inconvenience. As things go, the lady bids fair to be left in the lurch by her quondam supporters.

MR. EDWARD EDWIN GLANVILLE, a promising young Dublin chemist, who assisted Signor Marconi in his experiments with wireless telegraphy, was last week killed by falling from the edge of a cliff on Rathlin Island into the sea underneath, a distance of over 300 ft. When the body was recovered it was literally in pieces, the limbs, neck, and back being broken, and the trunk a mass of bruised flesh. It is supposed that Mr. Glanville, while using a narrow goat path, missed his footing and fell.

SELECTED FORMULÆ.

REMEDIES FOR FRECKLES AND SUNBURN.

(1) Poppy seed oil, 1, emulsify with solution of lead subacetate, 2; mix with benzoin tincture, 1; tincture of quillaya, 5; spirit of nitrous ether, 1; rose water, 95. (2) Dilute nitric acid, 7; eau de Cologne, 115; neroli oil, $\frac{1}{2}$; peroxide of hydrogen, 60; glycerin, 100; cochineal solution, $3\frac{1}{2}$, mix and dilute to 325 with water. After fourteen days filter the solution. To be applied with a linen rag and allowed to dry. (3) Rose water, 25; zinc sulphocarb. 2; glycerin, 25; eau de Cologne, 5. Misc. (4) Bismuth subnit., 2; powdered gum arabic, 4; mix and gradually add to a mixture of rose water, 30; glycerin, 20; tincture of benzoin, 10. To be shaken before use, and painted on the freckles.—*Pharm. Post*, xxxi., 247, after *Pharm. Ztg.*

GARFIELD TEA.

Herb. tritici. herb. hepaticæ, āā 15, fol. sennæ, 225.—*Pharm. Post*, xxxi., 247.

CEMENT FOR RUBBER TYRES.

(a) Caoutchouc, 30; chloroform, 600. (b) Caoutchouc, 30; resin, 12; tereb. venet, $5\frac{1}{2}$; ol. terebinth., 110. The caoutchouc is cut up fine, melted with the resin, and the oil of turpentine added. For use mix a and b. Another recipe is caoutchouc, 9, dissolved in chloroform, 60, and finely-powdered mastich, 15, is added.—*Pharm. Post*, xxxi., 247.

VERMIFUGE FOR CHILDREN.

Benzonaphthol, 30 grains; santonin, 30 grains; sacchar alb., 120 grains. Divide into 20 powders. Two to five powders to be taken daily.—*Med. News.*

OINTMENT FOR BOILS.

L. Duncan Bulkley, in the *Clinical Review*, recommends the following application for boils:—Phenol, 5 to 10 grains; fluid extract of ergot. 1 to 2 drachms; powdered starch, 2 drachms;

zinc oxide, 2 drachms; rose water ointment, 8 drachms. This ointment is to be spread thickly on a piece of absorbent cotton, and laid over the boil; it may remain on for twelve hours or more. If there is any discharge, gentle cleansing of the surface may be practised, but squeezing should be avoided. Frequently the boil aborts under this treatment, but if not, it ruptures spontaneously, and quickly heals.—*Intern. Med. Mag.*, vii., 64.

PRESERVING ANATOMICAL SPECIMENS.

Slices of organs from 3 to 5 Cm. thick are placed for three to five days in the following mixture:—Formalin, 200; water, 1000; potassium nitrate, 15; potassium acetate, 30. They are then removed, the fluid drained off, and the specimens placed in alcohol 80 per cent. for six hours. After this they are kept permanently in a mixture of water, 2000; glycerin, 400; potassium acetate, 200; and kept in a dark place. By this means the natural aspect and the colours are well preserved. As some shrinking naturally takes place, cavities should be packed with absorbent cotton, which should be removed when the process is complete.—*Bost. Med. Surg. Journ.*, Dec. 16, 1897.

PHENOSALYL.

According to Sibut, this is composed of phenol, 80; salicylic acid, 10; lactic acid, 20; menthol, 1. Mix the phenol with the acids, heat until melted, then add the menthol.—*Bullet. de la Soc. Roy. de Pharm. de Brux.*

NAPHTHOL CAMPHOR.

Naphthol in fine powder, 1; camphor, 2. Warm gently together until melted. Filter and preserve the liquid in well-covered yellow glass bottles.—*Bull. de la Soc. Pharm. de Sud-ouest*, xx., 133.

HÆMORRHOIDAL OINTMENT.

Cocaine hydrochloride, 1·20; morphine hydrochloride, 0·30; atropine sulphate, 0·24; tannic acid, 1·20; vaseline, 30·00; rose oil, q.s. Mix.—*Pharm. Post*, xxxi., 30.

ELECTRO-PLATING FOR ALUMINIUM.

Before plating, the article should be dipped in a bath of dilute soda or potash, or in hydrochloric acid, diluted 1 to 10, and then scrubbed in pure water. According to Lanseigne and Leblanc, the following baths will give good results: *Gold*: Gold chloride, 40 grammes; potassium cyanide, 40 grammes; sodium phosphate, 40 grammes; distilled water, 2 litres. *Silver*: Silver nitrate, 20 grammes; potassium cyanide, 40 grammes; sodium phosphate, 40 grammes; distilled water, 1 litre. *Copper*: Copper chloride, 300 grammes; potassium cyanide, 450 grammes; sodium phosphate, 450 grammes; distilled water, 5 litres. *Nickel*: Nickel chloride, 70 grammes; sodium phosphate, 70 grammes; distilled water, 1 litre. These baths should be warmed to between 60° and 70° C. during the whole operation. The anodes of the batteries should be of the same metal as is in solution in the bath.—*Journ. de Pharm.* [6], ix., 77, after *Rev. de Chim. Indust.*

LINIMENT FOR PERSPIRING HANDS.

Borax, salicylic acid, of each 15; boric acid, 5; glycerin and alcohol, of each 60. Apply with friction three times a day. If desired, eau de Cologne may be substituted for a portion of the alcohol.—*Bullet. de Pharm. de Sud-ouest*, iii., June, 1898, 309.

DENTAL POWDER.

Calcium carbonate, 60 grammes; magnesia carbonate, 4 grammes; powdered orris root, 2 grammes; oil of peppermint, 6 drops.—*Zahnt. Ref. org.*, xviii., 130.

DENTAL WASH AND TOOTH POWDER.

Eau de Botot.—Fructus anisi stellati, 100; caryophyll, 25; cortex cinnam., 25; coccus cacti, 5; vanilla, 1·5; aqua rosæ, 300; spiritus, 1000. Filter and add tinct. ambergris, 1·5; ol. menthæ piper., 5.

OINTMENT FOR MUMPS.

The following ointment is said to be useful in mumps: ℞ ichthyol, plumbi iodidi, āā gr. 48; ammon. chloridi, gr. 30; vaselini, ʒi. M. ft. ung. Sig., Apply with friction over swollen glands three times daily.—*Practitioner*, lxi., 109.

NOTICES TO CORRESPONDENTS.

All Communications for the 'Pharmaceutical Journal' must be Addressed to the Editor, 17, Bloomsbury Square, London, W.C., and not in any case to individuals supposed to be connected with the Editorial Staff no responsibility can be accepted unless this rule be observed. Communications for the Current Week's Journal should reach the Office not later than Wednesday, but news can be Received by Telegraph until 4 p.m. on Thursday.

ADVERTISEMENTS AND ORDERS for copies of the 'PHARMACEUTICAL JOURNAL' must be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Cheques and money orders should be made payable to "Street Brothers."

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course no necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size; clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

QUERIES addressed to the Editor will be replied to in the Journal as early as possible after receipt, though not necessarily in the next issue. Replies cannot be sent by post, even though stamped envelopes accompany the queries.

LETTERS TO THE EDITOR.

A YELLOW FEVER REMEDY.

Sir,—Fortunately during the six years I have lived in British Honduras there has been no yellow fever, so that I cannot speak from experience, but the remedy (oil and lime juice) mentioned some weeks ago by the *Standard* correspondent is a very favourite one among the old-fashioned Creoles. Several people have told me that they were cured by it.

Belip, British Honduras, July 28, 1898.

J. H. TWEEDY.

THE TESTING OF THYROID GLAND.

Sir,—Messrs. Burroughs, Wellcome and Co. take exception to a test for thyroid tablets which I suggested at the recent meeting of the B.P.C., and which is that of the International Pharmaceutical Congress. I freely confess that their preparations do not readily answer the test, but require a much more delicate one: yet most active preparations will be found, I think, to do so, if allowance be made for the modification of colour which the presence of albuminoids entails.

Dublin, August 27, 1898.

J. C. McWALTER.

FRENCH LAVENDER OIL AND THE BRITISH PHARMACOPŒIA, 1898.

Sir,—Mr. H. Wippell Gadd, in his paper on the galenicals of the new Pharmacopœia, read at the Belfast meeting of the British Pharmaceutical Conference (see *P. J.*, August 13, 1898, page 178), stated "with regard to the compound tincture of lavender and also to spirit of lavender, it has been noted that foreign oils are not now excluded from the Pharmacopœia, but as it is difficult to meet with an ol. lavand. exot. which conforms to the official tests, the concession does not appear to amount to much." In the short discussion which followed the reading of this paper I stated that I had no knowledge of any difficulty in obtaining French lavender oil corresponding to the characters of the Pharmacopœia. Time did not permit of Mr. Gadd further explaining his statement at Belfast, and in the printed reply published in your paper last week (see page 259, August 27), he states that "he hears from a distiller" that "he (the distiller) doubts if it is at all possible to obtain oil of the B.P. density, seeing that the average does not exceed 0·875." Having had very many opportunities of examining lavender oils obtained from the south of France from almost every district and from the leading distillers and distributors, I think it well to state that I have not found on any one occasion a pure oil of lavender that did not correspond to the pharmacopœial requirements for specific gravity—that is to say,

not below 0.885. Mr. Gadd gives no results of his own examinations of French oils, but it would be interesting to know the other characters, such as optical rotation and ester percentage of the oils referred to by him as having a specific gravity of about 0.875. The following results of the examination of 15 samples carried out during the last 12 months taken without selection, show in my opinion the true characters, specific gravity, optical rotation, and ester percentage of pure French oils. It should be noted also that those oils which consist of a mixture of true lavender (*Lavandula vera*) with spike lavender (*Lavandula spica*) have a still higher specific gravity, due to the presence of borncol and other alcohols.

Characters of French Lavender Oils (Lavandula Vera).

No.	Sp. gr. at 15° C.	Optical rotation in a tube of 100 Mm.	Ester percentage.
1	.8889	-5	31.2 per cent.
2	.8860	-7.5	31.15 "
3	.8908	-8	33.25 "
4	.8856	-7.5	38.7 "
5	.8874	-5.5	33.75 "
6	.8878	-6.5	39.5 "
7	.8864	-7.5	38.2 "
8	.8880	-8	35.2 "
9	.8930	-6.5	38.2 "
10	.8870	-5	32.2 "
11	.8870	-6	38.7 "
12	.8884	-7	36.1 "
13	.8892	-7.5	35.1 "
14	.8856	-8	35.3 "
15	.8887	-7	41.6 "

It will be evident from the above that there can be no difficulty in obtaining lavender oils answering the Pharmacopœial requirements, and I should view with the very greatest suspicion an oil having so low a specific gravity as 0.875, and should expect to find its other characters (optical rotation, ester percentage) differ widely from pure French lavender oil. Adulteration with turpentine would be indicated by increase in optical rotation and decrease in specific gravity and ester percentage.

London, S.E., August 30, 1898.

JOHN C. UMNEY.

AQUA SPIRÆA ULMARIÆ.

Sir,—I shall be obliged if you will permit me to correct an error in my communication on "Meadowsweet" (*ante*, p. 239). The crystalline substance collected inside the condenser, not on the cone. My quondam coadjutor in Manchester writes: "I imagine the substance deposited in distilling meadowsweet would be something like we used to get in distilling elder flowers—a sort of otto, seems worthy of notice."

Kew, August 27, 1898.

R. G. MUMBRAY.

CORRECTIONS.

Sir,—Kindly allow me to correct two printers' errors in my letter of last week. Under syr. ferri phosphatis cum quinina et strychnina, the word "satisfactory" should have been "unsatisfactory." Under ung. hydrarg nit, the last clause of the second sentence should read, "so that the 'fumes' may be rapidly carried away."

Exeter, August 29, 1898.

H. WIPPELL GADD.

A DISCLAIMER.

Sir,—Your annotation upon the Gregory's powder case heard at the Lambeth Police Court on the 18th inst., and contained in your current issue, is, to say the least, eminently misleading, and calculated to do me considerable damage professionally. Taking the points *seriatim* as they appear in your Journal: First, that which I said was that calcined magnesia exposed to a moist atmosphere charged with carbonic acid would eventually be converted into hydrate-carbonate of magnesia; secondly, in reply to the magistrate, I stated that a medical man would expect to get calcined magnesia in Gregory's powder, but in commercial samples of this preparation I had found an average of 15 per cent. of carbonate; thirdly, I remarked the calcined magnesia may have been exposed too long prior to making the Gregory's powder. I

also stated that in supposed calcined magnesia of commercial quality 10 per cent. of carbonate is frequently present.

London, August 29, 1898.

FREDERICK DAVIS.

** Our remarks, which we see no reason to modify, were based on the report published in the *Standard*, a daily paper of some repute, to the editor of which the above letter would more appropriately have been addressed.—[Ed., P.J.]

THE BRITISH PHARMACOPŒIA, 1898.

Sir,—If the following error in B.P., 1898, has not been anticipated, perhaps I may be permitted a niche in your columns. In the assay of opium—page 237, line 30—the 1 C.c. of decinormal volumetric solution equivalent is not 0.0285 gramme, but 0.028305. It is evident that the designer of the assay process has calculated the molecular weight of morphine (anhydrous), $C_{17}H_{19}NO_3$, but has used the atomic weights of the 1885 B.P.

Royal Dispensary, Edinburgh, August 31, 1898. G. SIMPSON.

CORRECTION.

SYNTHESIS OF ALBUMIN.—In Mr. A. H. Allen's paper, printed last week, page 243, column 1, for "Lüberküln" read "Lieberkühn."

ANSWERS TO QUERIES.

PUBLISHERS OF BOOKS.—Maisch's 'Organic Materia Medica' is published by Henry Kimpton, London; and Collin's 'Détermination des Poudres Officinales,' by Octave Doin, 8, Place de l'Odéon, Paris. [Reply to L. R.—15/25.]

SALE OF STRYCHNINE.—Yes, if the purchaser is known to you or introduced by some person known to you. See the Society's Calendar, page 40. [Reply to RODINAL.—15/32.]

TANK SPECIMENS.—Write to the Director of the Biological Laboratory, Plymouth, or to Mr. James Hornell, Biological Station, Jersey. [Reply to SOCIUS.—15/31.]

PRACTICAL BOTANY.—We understand that when the sections are not already cut, they are to be cut "by hand" by the candidates. [Reply to H. E. E.—15/30.]

HOLMES' 'BOTANICAL NOTE-BOOK.'—It is recommended because it enables students to describe plants for themselves, and is the most practical book for that purpose. [Reply to H. E. E.—15/29.]

DECOLORISING HONEY.—This is not at all easy. Dilution and digesting with animal charcoal will remove the colour, but it reappears on evaporating off the added water. Possibly the addition of a little peroxide of hydrogen and then exposing to strong sunlight will bleach it; or, if this does not answer, try allowing it to percolate slowly through a long column of granular animal charcoal. We note that most of this year's honey is very dark. Of course when the honey crystallises it will appear much lighter in colour than it is in the liquid state. [Reply to MEL ANG.—15/28.]

SHAVING CREAM.—White castile soap, 1 ounce; rose water, 4 ounces; oil of theobroma, 2 drachms; oil of sweet almonds, 2 drachms; tincture of benzoin, 1 drachm; tincture of quillaia, 1 drachm; oil of myrcia acris, 5 minims; oil of neroli, 5 minims; glycerin, *q.s.* Shred the soap, dissolve it in the water, add the oil of theobroma and the almond oil previously melted, also the quillaia tincture. Then transfer to a mortar and stir until cold, adding enough glycerin to bring the paste to the required consistency. Lastly, add the essential oils and the benzoin tincture. [Reply to JEANETTE.—15/12.]

MINOR EXAMINATION.—1. You will find a list of suitable books in next week's Journal. 2. The standard of the two examinations is the same. 3. You must pass the First examination or its equivalent and submit a certified declaration that for three years you have been practically engaged in the translation and dispensing of prescriptions. [Reply to J. G.—16/1.]

OUR BLOOMSBURY SCHOOL.

BY H. J. HENDERSON
Pharmaceutical Chemist.

The completion of the Major course at the "Square" places the Pharmaceutical Council in a position to judge whether the curriculum, as extended a year ago, has been a success. Undoubtedly it has from an examination point of view. I venture to think that a brief review of the work done, and the manner in which it was done, may be interesting to those who take an interest in our School of Pharmacy. I would have it plainly understood that these remarks of mine are made in no disparaging spirit. They are written in the hope that, by pointing out the difficulties which I and others encountered, the way may be smoothed for those students who will follow after us, and help to improve our School in some slight degree. The extension of the course was a step in the right direction, and in the near future I hope to see it again extended.

One year for the Minor and one year for the Major would enable students to do the work to their own satisfaction, which, in my opinion, is far better than satisfying any Board of Examiners. The class of men who attend the "Square" would welcome the change. Parents who seek primarily an institution in which their sons may be trained, not to pass an examination merely, but to be a credit to our ancient and honourable calling, naturally gravitate towards Bloomsbury Square. They take it for granted that the Pharmaceutical Council understands the subject better than they do themselves, and they prefer to trust to their judgment. It is a matter of small moment to them whether the course is for fifteen months or two years. A two years' course would do much to minimise the chances of failure, indeed under the existing regulations, and this assertion applies with special force to the advanced course, the chances of failure are very great indeed. The student finds it impossible to complete his work, and I will endeavour to show why.

Botany.

The advanced botany course extends from October to the end of March. It is admitted by all who understand the subject that systematic botany to be studied successfully must be studied in the field and from fresh specimens. It is very evident that from October to March is the very worst time of the year to do this, flowers are scarce and difficult to obtain, the student is pressed for time, and has not the leisure to make a botanical excursion into the country, indeed, he can scarcely find time to visit the Botanic Gardens in Regent's Park. To do the latter he must neglect his practical work in the chemical laboratory, which he hardly cares to do. The only course open to him is to cram it up from books and illustrations, which is a pitiable state of things. The professor does his best to meet the difficulty by providing spirit specimens which are but a poor substitute, the smell of the spirit is extremely offensive, and the flowers are in many cases macerated out of all recognition, moreover, the spirit has extracted all their colours, so that they are absolutely useless from a recognition point of view. A gloom settles over the class whilst working with these, which the fog which seems to perpetually turn up on botany morning does not tend to disperse. The microscopical work in this subject is good, but more time is needed to do it thoroughly. To cut, mount, and sketch the sections which are set is impossible in the four hours which are at our disposal every week. The lectures by Professor Green are everything that one could wish for, speaking easily and fluently, he makes the subject very interesting, moreover, he has a very encouraging manner when one becomes disheartened with

the work. His kindness to me when I was wildly floundering in that delightful little story concerning the life history of the gametophyte, and its equally exasperating neighbour the sporophyte, I shall never forget.

Chemistry.

In this subject I think it would be advantageous to students entirely ignorant of the rudiments of analysis if one or two lectures were given at the beginning of the elementary course, treating of the methods usually adopted in the analysis of simple salts, the treatment of soluble and insoluble substances, etc. The Council would do well to include an elementary text-book on analysis in the list of books recommended by them, such as Professor Tilden's 'Practical Chemistry' (Longmans, Green and Co.), or Briggs and Stewart's 'Analysis of a Simple Salt' (University Correspondence College Press). The latter I consider most suitable for a beginner. Having read carefully through this little work, which can easily be done in one evening, the student should then perform each experiment described in the text twice, for he will often find that he obtains by chance the first time the effect which he should obtain, but on repeating the experiment he is astonished to find that the test has failed.

I well remember performing the test for quinine by the formation of the iodo-sulphate for the first time. I obtained that very beautiful precipitate. Shortly afterwards a friend of mine informed me that he could not obtain those golden black scales. I attempted to show him how easy it was, but to my chagrin and his intense amusement that precipitate refused to form. That experiment taught me a lesson which I have never forgotten, therefore I advise the young analyst to perform each experiment twice, by so doing he becomes familiar with the conditions under which precipitates will not form. Dry tests are given a prominent place in Briggs and Stewart's little work; these, I regret to say, are often neglected by the student, or are performed in such a hasty and slovenly manner as to be worthless. I wonder how many times a trace of manganese has been missed because the student has neglected to fuse his salt on platinum foil with sodium carbonate and potassium nitrate? Much valuable information may be derived from an article on "flame tests" which appeared in the *Pharmaceutical Journal* some time ago. This article first opened my eyes to the possibilities of flame testing and served to introduce me to this delightful and beautiful realm in qualitative analysis. It is a mistake to commence analytical chemistry with an advanced work; the student becomes bewildered with the multitude of tests given, and his lack of knowledge prevents him from picking out the important ones. Practical chemistry is well taught at the "Square," there is no stint of material, and every facility is offered to a man who works, for obtaining a good knowledge of the subject.

Dr. J. Norman Collie makes a journey periodically round the laboratory, taking notes of each student's work and assisting them by his counsel and advice. His courteous old-world manner, coupled with a patience Job might well envy, commands the respect and esteem of all who come in contact with him. At the end of the Major course, a general desire was evinced by the men to possess a portrait of him. On being approached he signified his willingness to sit; the students then subscribed and the necessary arrangements were made. He then expressed a wish to be allowed to present each subscriber with a copy, in such a graceful and diplomatic manner that to refuse would have been impossible. His action was warmly appreciated and will never be forgotten. I left the laboratory with regret, for my life there was a very happy one.

To stroll into the laboratories in the morning, and after clearing up, to have a smoke and a gossip with a chum, to hear the old joke of the candidate who tried to varnish his pills in a lemon-squeezer (fact), then to settle down to work at one of the most interesting subjects extant, all go to make up an ideal existence.

Pharmacy and Materia Medica.

These subjects were treated in a most masterly manner, and nothing that I could say would do justice to the careful and systematic way in which they were taught. The way in which the barks, seeds, etc., were prepared for cutting displayed the extreme care which was taken in attending to the most minute details. Professor Greenish makes his work a labour of love, and I feel sure that every student who had the pleasure of working under him warmly appreciated his efforts. The materia medica syllabus for the Major is a very unsatisfactory one. For instance, it says that the microscope will be introduced for the examination of certain drugs. Surely it is not asking too much to have these certain drugs specified, and why a candidate should be expected to cram up the assay of such galenicals as extract. cinchonæ liquidum I fail to understand. No one ever attempts to remember them after the examination; it would be far better if students were required to show that they possessed a practical knowledge of those processes in the laboratory and the principles upon which they are based. The syllabus is too delightfully vague altogether.

Physics.

This is the unsatisfactory subject. The apparatus is totally inadequate for lecture experiments and more fit to amuse and astonish children than for educational purposes. The lantern was never once used in the lectures on light, because the lecture theatre could not be darkened. There is no excuse for this, blinds could be easily fitted for a small outlay. Lectures on light without lantern demonstrations are about as useful as a steamship with a broken screw shaft. The lecturer is handicapped by apparatus that has a most exasperating habit of refusing to work at critical moments, and by a course which is far too short. He struggled bravely along, however, and did his very best under the circumstances, and he shares in the honour of our splendid percentage of passes. The remedy that I would suggest to alter the existing state of affairs is a simple one, and its great charm is it would cost nothing. Instead of the physical apparatus being kept locked up, let it be placed in a spare room to which the students may always have access. They would then be able to perform any experiments, and by so doing would discover the faults in the apparatus, and could repair it under the supervision of the lecturer, to their own advantage and to the advantage of those who may follow after them.

Many little inexpensive pieces of apparatus could be constructed with which many interesting and instructive experiments could be performed, which the students would willingly present to the School. We are not inconsistent, we thoroughly appreciate the generosity of the Council and their action in carrying on the School at a loss, and I firmly believe that if the Council were to make an appeal to those men who have in the past been educated in our School to subscribe towards a small physical laboratory, £500 could be easily raised, if every man subscribed a sovereign. I should like to see the question discussed in the correspondence columns, for I believe that opinions would be expressed which would show that the chemist is not the selfish apathetic creature that he is supposed to be.

PRESCRIPTION READING.

BY JOSEPH INCE.

A grateful change has come over the art of teaching which has influenced every branch of instruction. One looks back with regret on the dreary methods once in vogue of conveying the smallest knowledge of French and German in the longest period of time, when these two living languages were thought to be best imparted by means of unconnected sentences, lists of genders with innumerable exceptions, followed by the monotonous repetition of irregular verbs. The regret is converted into sorrow, on the recollection how Latin—a dead language—was made unnecessarily defunct. There still lingers in the minds of the youth of pharmacy a repulsion to this last-mentioned study, partly, perhaps, because their teacher has not loved his occupation, and in consequence taught mechanically; but chiefly because in many cases they have been removed too soon from school, when the drudgery, inseparable from all commencements, had scarcely been surmounted and before they could realise the advantage or the pleasure such knowledge could bestow. It would be idle to discuss the bearing of Latin upon pharmacy; our examination system has made a certain amount of scholarship imperative.

Thus far at least an aspirant to pharmaceutical qualification must have gone: when a physician writes a prescription for a patient in the well-known semi-classical manner the intending dispenser must be able to understand what has been written before he can rightly fulfil the intentions of the prescriber. These intentions are expressed in technical contracted Latin, definite and perfectly intelligible when once mastered—far more definite than instructions conveyed in English and less liable to be misunderstood. How thoroughly technical are these professional documents may be seen in witnessing the surprise of a strictly classical student on his first introduction to this branch of medicine. Clearly the practice of the Romans did not antedate that of the B.P. Still more curious are his conscientious efforts to render stock medical directions into elegant Ciceronian. He soon learns that he must adapt himself to circumstances, and accept the traditional phraseology in which they are couched.

Seeing, then, that we have a distinct study before us, an acquaintance with which is indispensable to every pharmacist, how shall the tyro enter upon the task? It is presumed and taken for granted that enough progress has been made in Latin as has been sufficient to satisfy the claims of the Preliminary examination. That must come first—that minimum of knowledge must be in the possession of an apprentice or assistant, else these remarks will be of no practical service, and the position is hopeless.

Just as the young botanist collects specimens of plants and flowers, let the young pharmacist collect autograph prescriptions—originals if possible, or failing that, copies made by a competent and friendly hand. Specially note—and let it be an encouragement to an inexperienced student—that the simple act of collecting does not imply nor demand practical knowledge of the subject; it relates, in the first instance, to the getting together of materials for subsequent use. It is preferable to mount each prescription singly, and not to arrange in book or album form, in which latter case they speedily get damaged, dog-eared, and to some extent illegible. The collection (one hundred being a fair serviceable number) should be mounted on thick cardboard, faced with white demy, and backed by thin dark-brown paper.

One uniform size should be preserved; $7\frac{1}{4}$ by $4\frac{3}{4}$ inches will be found convenient. Thin starch paste answers better for this class of work than that sold by stationers or made from flour. Blots

(ink in the wrong place) and stains may be removed by damping the part affected, and carefully erasing by means of the sharp edge of a razor. Give mounted autographs an annual spring cleaning with a soft sponge and distilled water; dry with a clean, very soft, smooth cloth. It is wonderful what a restoration in general appearance may be thus effected.

Continuing the work of collecting at your leisure and as opportunity occurs, leave the reading of autographs alone at first and turn your attention to printed formulæ and medical directions. Begin, that is, with some good reference text-book and try to write out, with proper terminations, the series of printed prescriptions there given in contracted Latin, and compare what you have done with those printed in full in another section, generally towards the end. More than a little courage is required not to refer to the correctly printed copy until you have personally done your best.

However tedious this may appear it will be found an admirable method of preparation—most helpful and a distinct gain of time.

Having done with these printed exercises, get hold of six autograph prescriptions, more are not necessary, and turn them into a grammar lesson, thus:—

(a) Find out by the aid of a dictionary the nominative case of each noun: its gender and declension.

(b) Ascertain the conjugation to which the verbs belong, and their four principal parts, present, perfect, supine and infinitive.

(c) Learn the proper declension of the adjectives, and note the noun with which they agree.

(d) Class the remaining words under their grammatical headings, as adverbs, pronouns, prepositions, and the like.

All this an apprentice or junior assistant can do perfectly by himself, and he is advised to do it, for such preparation will save him from that painful hesitancy and uncertainty which tracks many pharmacists through life.

May the writer be allowed to say that he advances no theory but speaks from personal experience.

At this stage, the general arrangement and construction of Latin prescriptions should be studied. Any good manual will describe their almost invariable character. *R.*, meaning recipe, take thou, being at the heading, all the quantities mentioned as grains, scruples, drachms, ounces, or drops, must be put in the accusative case, according to the rule, that an active transitive verb governs that case. The ingredients mentioned, solid and liquid, must be put in the genitive. Frequently there is a second genitive depending on, and therefore governed by the first, as:—

R. Linimenti Saponis, unciam. [3i].

Consult any good vocabulary for words of unusual occurrence, and note that the government of recipe ends with the last line of the prescription proper—generally before the words *Misce fiat*. Directions begin a new independent sentence, thus—“Twentydrops in a wineglass of water” should be translated

Guttæ viginti (not guttas) ex aquæ.
Cyatho vinoso sumendæ. [Not sumendas.]

Practice will soon make clear sundry other peculiarities. By way of example, here is one prescription worked out for a beginner's use:—

R. Chlorat. Potass. ʒj.
-Syr. Simpl. ʒj.
Aquæ. ʒiij.
M. ft. mist. Sumat coch. j. parv. ter in die.

R. Pulv. Doveri gr. vii.
Hydr. c. Cret. gr. iv.
In pil. duas stat. sumend.

R. Magnes. Ust. ʒss.
P. Rhei gr. xv.
Syr. Zingib. ʒss.
Tr. Ejud. ℥xx.
Acid. Hydroc. dil. ℥v.
Aq. ad ʒij.

Haust. p. horas duas S.

Recipe, Chloratis Potassæ, drachmam.
Syrupi Simplicis, unciam.
Aquæ, uncias tres.

Misce fiat mistura. Sumat cochleare unum parvum ter in die.

Recipe, Pulveris Doveri, grana sex.
Hydrargyri cum Cretâ, grana quatuor.
In pilulas duas statim sumendas.

Recipe, Magnesiæ ustæ, drachmam dimidiam.
Pulveris Rhei, grana quindecim.
Syrupi Zingiberis, semi-drachmam.
Tincturæ Ejudem, minima viginti.
Acidi Hydrocyanici diluti, minima v.
Aquæ ad, ʒij.

Haustus post horas duas sumendus.

Note the unfortunate contraction—

Acid. Hydroc. dil.

which may be mistaken for—

Acidum Hydrochloricum dilutum.

Take thou of—

Potassium Chlorate 1 drachm.
Simple syrup 1 ounce.
Water 3 ounces.

Mix and make a mixture (or) let a mixture be made.
Let (the patient) take one teaspoonful three times a day.

Take thou of—

Dover's powder 6 grains.
Mercury with Chalk 4 grains.

(Divide) into two pills to be taken immediately.

Take thou of—

Calcined Magnesia ½ drachm.
Powdered Rhubarb 15 grains.
Syrup of Ginger ½ drachm.
Tincture of the same 20 minims.
Dilute Hydrocyanic Acid 5 minims.

Water sufficient to make two ounces.
The draught to be taken in (after) two hours.

Nouns.

Acidum, i, n. subs., 2nd decl.
Aqua, æ, f. subs., 1st.
Chloras, atis, m. subs., 3rd.
Cochleare, is, plur. cochlearia, n. subs., 3rd.
Creta, æ, f. subs., 1st.
Dies, ei, m. subs., 5th.
Doverus, i, m. subs., 2nd (latinised).
Haustus, ūs, m, subs., 4th.
Hora, æ, f. subs., 1st.
Hydrargyrum, i, n. subs., 2nd.
Magnesia, æ, f. subs., 1st.
Mistura, æ, f. subs., 1st.
Pilula, æ, f. subs., 1st.
Potassa, æ, f. subs., 1st.
Pulvis, eris, m. subs., 3rd.
Rheum, ei, n. subs., 2nd.
Syrupus, i, m. subs., 2nd.
Tinctura, æ, f. subs., 1st.
Zingiber, eris, n. subs., 3rd.

Verbs.

Diluo, ui, utum, ere, 3rd conjug.; dilutus, a, um, part. past.
Fio, factus sum, fieri, neut. pass. irregular; fiat, fiant, let it or them be made [literally].
Misceo, ui, ixtum and istum, ēre, 2nd.

Misce, imperat. 2nd person sing.
 Recipio, cēpi, ceptum, cipere, 3rd.
 Recipe, imperat., 2nd person sing.
 Sumo, sumpsi, sumptum, ere, 3rd.
 Sumat, let (*the patient take*), 3rd pers. sing. subjunctive.
 Sumendus, a, um (to be taken), gerundive.
 Uro, ussi, ustum, ere, 3rd, to burn.
 Ustus, a, um, part. *calcined* in pharmacy.

Adjectives.

Duo, æ, o, numeral adj.
 Hydrocyanicus, a, um.
 Parvus, a, um.
 Simplex, icis.
 Unus, a, um, gen. unius.

Various.

Ad, prep., governing accusative, distinguish from add, for adde.
 Cum, prep., ablative.
 Idem, eadem, idem., gen. ejusdem, pron.
 In, prep., in die, ablative, in pilulas, accus. (*meaning into*).
 Post, prep. accusative, *after*; frequently "in," as *in two hours*.
 Statim, adv.
 Ter, adv. of time.

Signs of Quantity.

Drachma, æ, f. subs., 1st decl.
 D. dimidia, or semi-drachma.
 Granum, i, n. subs., 2nd.
 Grana quatuor, sex, quindecim.
 Minimum, i, n. subs., 2nd.
 Minima quinque, viginti.
 Uncia, æ, f. subs., 1st.
 Unciæ duæ, tres.

All the above quantities to be put in the accusative case, being governed by Recipe.

From these preliminaries and initial work we may turn to the direct study of manuscript prescriptions. An autograph should never be read with the finger drawn across the lines—the invariable habit of the beginner. Leave that mode to the blind man reading the Bible by the wayside. Nothing injures a manuscript so much as that nervous trick. Never underline or mark the formula with a pencil, or smear the corners by constant holding between the finger and thumb. Treated as they should be, mounted recipes may be kept for years in very fair preservation. The handwriting will in too many instances form a serious difficulty. For this reason, the general superintendence and help of a competent adviser are invaluable, if, indeed, not indispensable. No youth at the outset can unaided decipher the strange caligraphy in which medical formulæ are presented; to accomplish this, varied experience and constant observation are required.

Surely, now that so many thoroughly trained men adorn our ranks, there are few centres where such an adviser would not willingly lend his services. If any apprentice or assistant, or associated number, will collect and mount no less than one hundred autograph prescriptions, and send them to me, I will gladly write them out in an uncontracted form and translate the English directions contained, in full technical Latin. From this offer I exclude collections I have forwarded to various Associations, for the work must be the students' own, in the execution of which aid from every possible source may be obtained.

These suggestions are meant only for those who have not the privilege of attending a public course; beyond doubt, class teaching under the guidance of an efficient demonstrator is of paramount advantage.

MATHEMATICS FOR PHARMACEUTICAL STUDENTS.

The importance of the study of mathematics as a mental training can scarcely be overstated. In particular, it is of the greatest value as a preparation for the study of physics and chemistry; it is not too much to say that for anything like advanced studies in these subjects, a fair degree of familiarity with mathematics is quite indispensable. Here, however, we are only concerned with the place that should be occupied by the study of mathematics in the preliminary acquirements of the pharmaceutical student; and it is a subject of far more importance to such students than has commonly been recognised in the past.

It is a matter for congratulation that, after August, 1900, the present "First" examination, in which there is no more mathematics than is included in elementary arithmetic, will come to an end, and be replaced by an examination in which elementary algebra and Euclid are necessary subjects. It is clear, however, that if a certain amount of mathematical knowledge will be a good thing for students then it is equally so now. Anyone who has been concerned with teaching chemistry and physics to pharmaceutical students is well aware that much more difficulty is encountered by those who have no knowledge of elementary algebra and Euclid than by those who have some little acquaintance with these subjects; and it cannot be too emphatically urged on students that they will be well repaid for the time and labour expended in mastering the elements of these two branches of mathematics.

The student who intends later to work for the Minor examination cannot be recommended to content himself with less mathematics than the first book of Euclid, with a due proportion of "riders," or problems to be solved by himself and depending on those proved in the text; and algebra up to and including simple equations. We may here note that almost all of the usual school books dealing with these subjects are about equally suitable; but Collins's 'Euclid' can be recommended as containing a good collection of riders, while Todhunter's smaller 'Algebra' may be mentioned as following a good arrangement of the subject. If the student intends also to work for the Major, he should carry his mathematical studies beyond the limits just named; but we shall return to this point below.

The study of Euclid will make the student acquainted with the process of logical proof of a proposition; it is most important that, whether he has done much or little of this subject, he should have studied what he has done so thoroughly as to be perfectly familiar with it; to have thoroughly mastered and to understand the first ten propositions is of far more value than to have a superficial acquaintance with the whole book. In the study of an experimental science such as chemistry, it is essential to a proper knowledge of the subject that the learner should not accept deductions and conclusions drawn from experiments merely because they have the authority of general acceptance, but he should be able to check them for himself. As an example we may take the proof of the composition of water. The student can make experiments similar to those on which our knowledge of the matter rests; he cannot at first, however, perform them with the accuracy that is necessary for an actual investigation of the subject, and he may quite legitimately accept the statements of more experienced workers as to what experiments they have performed and what the results of those experiments have been. But he must not accept in the same way their theoretical conclusions from their experiments; he must follow the reasoning and be himself convinced by it; he should not only know what is the composition of water, but he should know that he knows it, and in order that he may have due confidence in his conviction of the correctness of the reasoning, he

must have some familiarity with processes of reasoning such as are employed in proving the propositions of Euclid, and in the working of riders.

The study of algebra is also of value as mental training; but its more immediate use to the student of chemistry and physics is that it gives him methods of working many of the problems that arise in these subjects by far simpler methods than he must otherwise employ. It familiarises him with the idea of a number of separate phenomena being all special instances of the working of a general principle; he learns to express the various quantities that are concerned in these phenomena by general formulæ, and by the use of such formulæ to at once arrive at other facts which could only be found by far more cumbersome methods if algebraical processes were not employed. As an instance we may take the application of the laws of Boyle and Charles. According to the former law, at any constant temperature, the volume of a gas varies inversely as the pressure, or in other words, the product of the pressure and the volume is always the same. This is expressed algebraically by saying that $p_v = a$ constant, where p stands for the numerical value of the pressure, and v similarly for the volume. In the often-occurring problem, where we know the volume that a gas occupies (say v_1) under a given pressure (p_1), and it is required to know what volume it will occupy under another pressure (p_2), the temperature being unchanged, we proceed as follows:—Calling the required volume v_2 , we know that $p_2 v_2 = p_1 v_1$; therefore by simple algebra $v_2 = \frac{p_1 v_1}{p_2}$, and by substituting the

given values in the general expression $\frac{p_1 v_1}{p_2}$, we have the answer

at once. According to Charles's law, if a given volume of a gas at 0° C. is heated, it expands by $1/273$ of its volume at 0° C. for every degree C. through which it is heated; or if it is cooled, it contracts $1/273$ of its volume at 0° C. for every degree C. through which it is cooled, if the pressure remains the same. Denoting its volume at 0° by V_0 , the number of degrees through which it is heated or cooled by t , and its volume at the new temperature by V_t , we can put $V_t = V_0 + 1/273 V_0 t$. Instead of the vulgar fraction $1/273$, it is more convenient to employ the equivalent decimal fraction 0.00367 , and we put $V_t = V_0 + 0.00367 V_0 t$; or $V_t = V_0 (1 + 0.00367t)$: and by transposing this we have $V_0 = \frac{V_t}{1 + 0.00367t}$. It is to be noted that if the gas is cooled,

t has the negative sign, and this case is included in the general formulæ just given. These two formulæ enable us at once to find the volume occupied by a gas at any temperature when we know its volume at 0° , and *vice versa*. But these formulæ can be easily combined with the one given above for Boyle's law, and we can solve such a problem as the following:—If we have a known volume of a gas at any known temperature and pressure, what volume will it occupy at 0° C., and under normal atmospheric pressure (760 Mm. of mercury)? Call its present temperature t° C., its pressure (in Mm. of mercury) p , its present volume V_{pt} , and the required volume V_0 . By the formula for Boyle's law, $V_t = \frac{p \cdot V_{pt}}{760}$, where V_t is the volume it would acquire

if the pressure were changed to 760 Mm., the temperature remaining the same. Then if the temperature is brought to 0° while the pressure remains at 760 Mm., $V_0 = \frac{V_t}{1 + 0.00367t}$, but since $V_t = \frac{p \cdot V_{pt}}{760}$,

we can put $V_0 = \frac{p \cdot V_{pt}}{760(1 + 0.00367t)}$. Substituting the given values

in this general formula, we obtain the required volume at once.

Various other problems can be at once solved by this formula, but it is not necessary to stop to point them out.

There are many other questions connected with the early stages of chemistry and physics, for dealing with which algebraical methods are the best. But enough has probably been said on this matter, and we pass on to consider the requirements of the Major student. Anyone who purposes to go on to the further study of chemistry and physics that is necessary for the higher examination should carry his knowledge of algebra up to the solving of quadratic equations of one unknown quantity and simple equations of two unknown quantities. As regards Euclid no definite point need be fixed, but the further he has gone in this subject the better; in addition he should have at least sufficient knowledge of trigonometry to understand such common terms as sine, cosine, etc.

The instances are simply innumerable in which the use of formulæ is advantageous or necessary in the study of light, heat, magnetism, and electricity. Experimental physics consists almost entirely of measuring certain quantities, and from these calculating others which do not themselves admit of direct measurement. No one can properly learn physics who does not perform some of these experiments, or at the least, see them performed on the lecture table; and in working out the results, the use of symbols and formulæ greatly simplifies the process. It will be sufficient to indicate two or three instances; thus, to find the focal length of a convex lens, we measure the distances from it of an object and its image formed by the lens, and employ the formula $\frac{1}{f} = \frac{1}{u} + \frac{1}{v}$

u and v being respectively the distances measured, and f the focal length; the same formula holds good for other focal lengths besides those of convex lenses. For such simple experiments as measuring the angle of a prism, or finding the refractive index of a block of glass by means of pins and a sheet of paper, both geometry and the rudiments of trigonometry are necessary; in the more delicate method of finding a refractive index by means of the spectrometer, the results are worked out by means of a general formula, and the sines of certain angles are used in the calculation. Turning to electricity and magnetism, Ohm's law is usually expressed by symbols in the form $C = \frac{E}{R}$, where C represents

the numerical value of the current, E the electromotive force, and R the resistance. Joule's law, again, connecting the heat evolved in a circuit with the current and the resistance, takes the form $H = C^2 R$; by the use of these formulæ many new facts are easily deduced, and have received independent proof. It would be easy to multiply indefinitely instances of this kind; but enough has been said to show the necessity of a pharmaceutical student having some acquaintance with elementary mathematics.

ARISTOL FOR BURNS.—For superficial burns aristol dusted on the surface is an excellent remedy. For more extensive and deeper lesions the following ointment should be applied: Aristol, 1; olive oil, 2; dissolve and add vaseline, 8. The wound should first be rendered perfectly aseptic by washing with a weak solution of boric acid or phenol, and all blisters should be emptied of their contents. After drying with absorbent cotton the powder or ointment of aristol should be applied. When the latter is used the edges of the parts dressed should also be dusted with powdered aristol. The whole should be covered with aseptic gauze coated with the ointment, and then bandaged up with plain sterilised gauze and wool. The dressings should be renewed every three days.—*Therap. Gaz.* [3], 13, 476.

THE STUDY OF POWDERED DRUGS.

The rapid advances which have been made in chemical knowledge, as exhibited in the large number of synthetic remedies which from time to time are put upon the market, appeal so strongly to the imagination of some pharmacists as to cause them to think that, because chemistry increases in importance, botany must necessarily decrease. A little consideration of the great number of remedies derived from the vegetable kingdom, and of the varying uses to which they are put in the practice of medicine, will at once convince the most sceptical that there is little fear that they will be displaced by synthetic products for many years to come. One need only allude to coca leaves, cascara sagrada, strophanthus, eucalyptus oil, and araroba, all remedies introduced into medical use during this generation, to show that there is no reason to doubt that many valuable medicaments still remain to be discovered for the healing of mankind. A more general study of plant analysis is likely to lead to much more fruitful and more immediate results, so far as remedial agents is concerned, than is the prosecution of synthetic chemistry. In saying this it is not intended to depreciate the latter, but there is reason to think that it is claiming so much attention as to interfere with the pursuit of systematic plant analysis.

In order to be properly equipped for the pursuit of plant analysis and for the control of the supply of crude drugs, as well as for the manufacture of efficient liquid and solid preparations from them, the pharmacist must possess a knowledge of botanical histology. Otherwise he will either have to rely upon the dealer from whom he obtains his materials or place his faith in external characteristics which are not infrequently modified by methods of collection and preparation for the market, as well as by the influence of varying soils and climates. And there is always a danger, as experience has shown, that a substance somewhat similar in appearance may be inadvertently collected in place of the genuine article. Above all it is desirable that the pharmacist should be able to judge of the purity of the powders which he almost invariably obtains from the manufacturing druggist. If the current of wholesale manufacturing pharmacy is not to entirely swamp the true art and craft of pharmacy, the technical training of the pharmacist must rest upon the assured rock of science, and it must be acquired in a manner which will permit of him becoming interested in it beyond the mere desire to pass his examinations. This can be done if means are taken to provide a proper progression of his studies.

In the case of vegetable histology as applied to drugs it generally happens that the student—the examinee of the immediate future—devotes at most a few hours to the subject, trusting to the chance of being able to satisfy the examiner, and is careless of any thought of the possible use of the knowledge in his future work. But even if desirous of conscientiously mastering the subject to the utmost of his opportunities, he too frequently becomes bored by the number of details of structure, the respective significance of which he is unable to appreciate because of the lack of that previous knowledge of general botanical histology which alone can bring them into proper perspective.

There can be no doubt that a pretty good acquaintance with the anatomy of flowering plants obtained by practical work with the microscope is an essential to the acquisition of a sound knowledge of the histology of drugs. In order to obtain this the student should first make himself thoroughly familiar with the various kinds of cells and vessels and the tissues which they form—epidermis, cork, fundamental parenchyma, endodermis, pericycle, phloem, xylem, medullary rays and pith as well as the varieties of stereom.

He should then make himself acquainted with the anatomical characteristics of roots, stems, leaves, flowers, fruits and seeds as exhibited in the types found in the usual biological text-books, at the same time learning to recognise with ease the different tissue systems both by means of their elements and the reactions the elements give with reagents. Then he should pass on to study in detail the various peculiarities of the different cells; the varieties of thickening of epidermal cells, and the appearance of their walls in surface view; the forms and sculpturing of lignified elements, stone-cells, vessels, fibres; the frequency, characters, and disposition of hairs and glands; the nature and disposition of cell contents, crystals and their composition, starch and its size and form of granules, inulin, tannin, resins, and oils. This is beyond what is required for educational work in biology. It is to be remembered that in the use of anatomy as applied to the recognition of plants every detail is of value, just as every reaction in the identification of a chemical is of value, but in the latter case the knowledge is so well tabulated, because the subject has been so well worked, that it often suffices to apply a few crucial tests while the others are ignored. In the anatomy of plants, however, so much remains unknown that the anatomist dare not overlook a single character without running the risk of falling into error. It is not sufficient to learn a few distinctive features to be sure of recognising a particular drug, for unless it agrees in every particular in accordance with botanical principles, there is every reason to conclude that it is derived from some other plant.

Following on, it is advisable, as far as time will allow, that as many plant structures as possible should be submitted to examination in order that some of the many abnormalities of plant structure should come under observation. This is of considerable importance because subsequently it will be found that the anatomy of many drugs does not at all conform to the type specimens of the ordinary biological class, and unless the student is prepared by a course such as is suggested, he will fall into the error of ascribing undue significance to characters which may be ordinal or generic, and he may overlook specific characters. Another reason why he should proceed beyond the study of type specimens is that he may learn something of the mortification that plant members undergo by secondary growth. Roots and stems when mature depart in the arrangement and character of their tissues very considerably from the typical structure of the first year. Cells are lignified, the epidermis disappears and is replaced by cork, deposits are formed, roots assume the apparent arrangements of stems, and other changes take place.

While pursuing these studies the use of the microscope and micro-chemical reagents and stains will become familiar. Comparatively few reagents are really requisite, but the action of each of them upon all kinds of tissue should be well understood. It will be found that some of them greatly assist in bringing into prominence other features than those for which they are specifically used. The most generally useful book for those who intend subsequently to follow up the study of the histology of drugs, is Strasburger's 'Practical Botany,' translated by Hillhouse. A much more useful work in some respects is Gérard's 'Traité Pratique de Micrographie,' of which, unfortunately, there is no English translation. A somewhat smaller and a little more systematic English work on similar lines is a desideratum.

LACTOPHENINE IN INFANTILE BRONCHO-PNEUMONIA.—Lactophenine combined with benzoic acid may be prescribed thus: Lactophenine, 15 centigrammes; benzoic acid, 5 centigrammes. One such powder to be given every four hours in tea.—*Pediat.*, v., 93.

BRITISH ASSOCIATION.

MEETING AT BRISTOL.

THE British Association met at Bristol this week, for the third time in the history of that city, and on Wednesday last

The Presidential Address

was delivered by Sir William Crookes, F.R.S., V.P.C.S., who, after a few brief introductory remarks, proceeded to deal with the question of

FOOD SUPPLY.

He said: Many of my statements you may think are of the alarmist order; certainly they are depressing, but they are founded on stubborn facts. They show that England and all civilised nations stand in deadly peril of not having enough to eat. As mouths multiply, food resources dwindle. Land is a limited quantity, and the land that will grow wheat is absolutely dependent on difficult and capricious natural phenomena. I am constrained to show that our wheat-producing soil is totally unequal to the strain put upon it. After wearying you with a survey of the universal dearth to be expected, I hope to point a way out of the colossal dilemma. It is the chemist who must come to the rescue of the threatened communities. It is through the laboratory that starvation may ultimately be turned into plenty.

The food supply of the kingdom is of peculiar interest to this meeting, considering that the grain trade has always been, and still is, an important feature in the imports of Bristol. The imports of grain to this city amount to about 25,000,000 bushels per annum—8,000,000 of which consist of wheat.

What are our home requirements in the way of wheat? The consumption of wheat per head of the population (unit consumption) is over 6 bushels per annum; and taking the population at 40,000,000, we require no less than 240,000,000 bushels of wheat, increasing annually by 2,000,000 bushels, to supply the increase of population. Of the total amount of wheat consumed in the United Kingdom we grow 25 and import 75 per cent.

So important is the question of wheat supply that it has attracted the attention of Parliament, and the question of national granaries has been mooted. It is certain that, in case of war with any of the great Powers, wheat would be contraband, as if it were cannon or powder, liable to capture even under a neutral flag. We must therefore accept the situation and treat wheat as munitions of war, and grow, accumulate, or store it as such. It has been shown that at the best our stock of wheat and flour amounts only to 64,000,000 bushels—fourteen weeks' supply—while last April our stock was equal to only 10,000,000 bushels, the smallest ever recorded by "Beerbohm" for the period of the season. Similarly, the stocks held in Europe, the United States, and Canada, called "the world's visible supply," amounted to only 54,000,000 bushels, or 10,000,000 less than last year's sum total, and nearly 82,000,000 less than that of 1893 or 1894 at the corresponding period. To arrest this impending danger, it has been proposed that an amount of 64,000,000 bushels of wheat should be purchased by the State and stored in national granaries, not to be opened, except to remedy deterioration of grain, or in view of national disaster rendering starvation imminent. This 64,000,000 bushels would add another fourteen weeks' life to the population; assuming that the ordinary stock had not been drawn on, the wheat in the country would only then be enough to feed the population for twenty-eight weeks.

I do not venture to speak authoritatively on national granaries. The subject has been discussed in the daily press, and the recently published Report from the Agricultural Committee on National Wheat Stores brings together all the arguments in favour of this important scheme, together with the difficulties to be faced if it be carried out with necessary completeness.

More hopeful, although difficult and costly, would be the alternative of growing most, if not all our own wheat supply here at home in the British Isles. The average yield over the United Kingdom last year was 29·07 bushels per acre, the average for the

last eleven years being 29·46. For twelve months we need 240,000,000 bushels of wheat, requiring about 8,250,000 acres of good wheat-growing land, or nearly 13,000 square miles, increasing at the rate of 100 square miles per annum, to render us self-supporting as to bread food. This area is about one-fourth the size of England.

A total area of land in the United Kingdom equal to a plot 110 miles square, of quality and climate sufficient to grow wheat to the extent of 29 bushels per acre, does not seem a hopeless demand. The total area of the United Kingdom is 120,979 square miles; therefore, the required land is about a tenth part of the total. It is doubtful, however, if this amount of land could be kept under wheat, and the necessary expense of high farming faced, except under the imperious pressure of impending starvation, or the stimulus of a national subsidy or permanent high prices. Certainly these 13,000 square miles would not be available under ordinary economic conditions, for much, perhaps all, the land now under barley and oats would not be suitable for wheat. In any case, owing to our cold, damp climate and capricious weather, the wheat crop is hazardous, and for the present our annual deficit of 180,000,000 bushels must be imported. A permanently higher price for wheat is, I fear, a calamity that ere long must be faced. At enhanced prices, land now under wheat will be better farmed, and therefore will yield better, thus giving increased production without increased area.

The burning question of to-day is, What can the United Kingdom do to be reasonably safe from starvation in presence of two successive failures of the world's wheat harvest, or against a hostile combination of European nations? We eagerly spend millions to protect our coasts and commerce; and millions more on ships, explosives, guns, and men; but we omit to take necessary precautions to supply ourselves with the very first and supremely important munition of war—food.

To take up the question of food supply in its scientific aspect, I must not confine myself exclusively to our own national requirements. The problem is not restricted to the British Isles—the bread-eaters of the whole world share the perilous prospect—and I do not think it out of place if on this occasion I ask you to take with me a wide, general survey of the wheat supply of the whole world.

Wheat is the most sustaining food grain of the great Caucasian race, which includes the peoples of Europe, United States, British America, the white inhabitants of South Africa, Australasia, parts of South America, and the white population of the European colonies. Of late years the individual consumption of wheat has almost universally increased. In Scandinavia it has risen 100 per cent. in twenty-five years; in Austro-Hungary, 80 per cent.; in France, 20 per cent.; while in Belgium it has increased 50 per cent. Only in Russia and Italy, and possibly Turkey, has the consumption of wheat per head declined.

In 1871 the bread-eaters of the world numbered 371,000,000. In 1881 the numbers rose to 416,000,000; in 1891, to 472,600,000, and at the present time they number 516,500,000. The augmentation of the world's bread-eating population in a geometrical ratio is evidenced by the fact that the yearly aggregates grow progressively larger. In the early seventies they rose 4,300,000 per annum, while in the eighties they increased by more than 6,000,000 per annum, necessitating annual additions to the bread supply nearly one-half greater than sufficed twenty-five years ago.

How much wheat will be required to supply all these hungry mouths with bread? At the present moment it is not possible to get accurate estimates of this year's wheat crops of the world, but an adequate idea may be gained from the realised crops of some countries and the promise of others. To supply 516,500,000 bread-eaters, if each bread-eating unit is to have his usual ration, will require a total of 2,324,000,000 bushels for seed and food. What are our prospects of obtaining this amount?

According to the best authorities, the total supplies from the 1897-98 harvest are 1,921,000,000 bushels. The requirement of the

516,500,000 bread-eaters for seed and food are 2,324,000,000 bushels; there is thus a deficit of 403,000,000 bushels, which has not been urgently apparent owing to a surplus of 300,000,000 bushels carried over from the last harvest. Respecting the prospects of the harvest year just beginning, it must be borne in mind that there are no remainders to bring over from last harvest. We start with a deficit of 103,000,000 bushels, and have 6,500,000 more mouths to feed. It follows, therefore, that one-sixth of the required bread will be lacking, unless larger drafts than now seem possible can be made upon early produce from the next harvest.

The majority of the wheat crops between 1882 and 1896 were in excess of current needs, and thus considerable reserves of wheat were available for supplementing small deficits from the four deficient harvests. But bread-eaters have also eaten up the reserves of wheat, and the 1897 harvest being under average, the conditions become serious. That scarcity and high prices have not prevailed in recent years is due to the fact that since 1889 we have had seven world crops of wheat and six of rye abundantly in excess of the average. These generous crops increased accumulations to such an extent as to obscure the fact that the harvests of 1895 and 1896 were each much below current requirements. Practically speaking, reserves are now exhausted, and bread-eaters must be fed from current harvests—accumulation under present conditions being almost impossible. This is obvious from the fact that a harvest equal to that of 1894 (the greatest crop on record, both in acre-yield and in the aggregate) would yield less than current needs.

It is clear we are confronted with a colossal problem that must tax the wits of the wisest. When the bread-eaters have exhausted all possible supplies from the 1897-98 harvest, there will be a deficit of 103,000,000 bushels of wheat, with no substitution possible unless Europeans can be induced to eat Indian corn or rye bread. Up to recent years the growth of wheat has kept pace with demands. As wheat-eaters increased, the acreage under wheat expanded. The world has become so familiarised with the orderly sequence of demand and supply, so accustomed to look upon the vast plains of other wheat-growing countries as inexhaustible granaries, that, in a light-hearted way it is taken for granted that so many additional acres can be added year after year to the wheat-growing area of the world. We forget that the wheat-growing area is of strictly limited extent, and that a few million acres regularly absorbed, soon mount to a formidable number.

The present position being so gloomy, let us consider future prospects. What are the capabilities as regards available area, economic conditions, and acreage yield of the wheat-growing countries from whence we now draw our supply?

For the last thirty years the United States have been the dominant factor in the foreign supply of wheat, exporting no less than 145,000,000 bushels. This shows how the bread-eating world has depended, and still depends, on the United States for the means of subsistence. The entire world's contributions to the food-bearing area have averaged but 4,000,000 acres yearly since 1869. It is scarcely possible that such an average, under existing conditions, can be doubled for the coming twenty-five years. Almost yearly, since 1885, additions to the wheat-growing area have diminished, while the requirements of the increasing population of the States have advanced, so that the needed American supplies have been drawn from the acreage hitherto used for exportation. Practically there remains no uncultivated prairie land in the United States suitable for wheat-growing. The virgin land has been rapidly absorbed, until at present there is no land left for wheat without reducing the area for maize, hay, and other necessary crops.

It is almost certain that within a generation the ever increasing population of the United States will consume all the wheat grown within its borders, and will be driven to import, and, like ourselves, will scramble for a lion's share of the wheat crop of the world. This being the outlook, exports of wheat from the United States are only of present interest, and will gradually diminish to a vanishing point. The inquiry may be restricted to such countries as probably will continue to feed bread-eaters who annually derive a considerable part of their wheat from extraneous sources.

But if the United States, which grow about one-fifth of the world's wheat, and contribute one third of all wheat exportations, are even now dropping out of the race, and likely soon to enter the list of wheat-importing countries, what prospect is there that other wheat-growing countries will be able to fill the gap, and by enlarging their acreage under wheat, replace the supply which the

States have so long contributed to the world's record? The withdrawal of 145,000,000 bushels will cause a serious gap in the food supply of wheat-importing countries, and unless this deficit can be met by increased supplies from other countries there will be a dearth for the rest of the world after the British Isles are sufficiently supplied.

Next to the United States, Russia is the greatest wheat exporter, supplying nearly 95,000,000 bushels.

Although Russia at present exports so lavishly, this excess is merely provisional and precarious. The Russian peasant population increases more rapidly than any other in Europe. The yield per acre over European Russia is meagre—not more than 8.6 bushels to the acre—while some authorities consider it as low as 4.6 bushels. The cost of production is low—lower even than on the virgin soils of the United States. The development of the fertile though somewhat over-rated, "black earth," which extends across the southern portion of the empire and beyond the Ural Mountains into Siberia, progresses rapidly. But, as we have indicated, the consumption of bread in Russia has been reduced to danger point. The peasants starve and fall victims to "hunger typhus," whilst the wheat growers export grain that ought to be consumed at home.

Considering Siberia as a wheat grower, climate is the first consideration. Summers are short—as they are in all regions with continental climates north of the 45th parallel—and the ripening of wheat requires a temperature averaging at least 65° Fahr. for fifty-five to sixty-five days. As all Siberia lies north of the summer isotherm of 65° it follows that such region is ill adapted to wheat culture unless some compensating climatic condition exists. As a fact, the conditions are exceptionally unfavourable in all but very limited districts in the two westernmost governments. The cultivable lands of Western Siberia adapted to grain bearing neither equal in extent nor in potential productive powers those of Iowa, Minnesota, and Nebraska. There are limited tracts of fair productiveness in Central Siberia and in the valleys of the southern affluents of the Amoor, but these are only just capable of supporting a meagre population.

Prince Hilkoﬀ, Russian Minister of Ways and Communications, declared in 1896 that "Siberia never had produced, and never would produce, wheat and rye enough to feed the Siberian population." And a year later Prince Krapotkin backed the statement as substantially correct.

Those who attended the meeting of the British Association last year in Canada must have been struck with the extent and marvellous capacity of the fertile plains of Manitoba and the North-West provinces. Here were to be seen 1,290,000 acres of fine wheat-growing land yielding 18,261,950 bushels, one-fifth of which comes to hungry England. Expectations have been cherished that the Canadian North-West would easily supply the world with wheat, and exaggerated estimates are drawn as to the amount of surplus land on which wheat can be grown. Thus far performance has lagged behind promise, the wheat-bearing area of all Canada having increased less than 500,000 acres since 1884, while the exports have not increased in greater proportion. As the wheat area of Manitoba and the North-West has increased the wheat area of Ontario and the Eastern provinces has decreased, the added acres being little more than sufficient to meet the growing requirements of population. We have seen calculations showing that Canada contains 500,000,000 acres of profitable wheat land. The impossibility of such an estimate ever being fulfilled will be apparent when it is remembered that the whole area employed in both temperate zones for growing all the staple food crops is not more than 580,000,000 acres, and that in no country has more than 9 per cent. of the area been devoted to wheat culture.

The fertility of the North-west Provinces of the Dominion is due to an exceptional and curious circumstance. In winter the ground freezes to a considerable depth. Wheat is sown in the spring, generally April, when the frozen ground has been thawed to a depth of three inches. Under the hot sun of the short summer the grain sprouts with surprising rapidity, partly because the roots are supplied with water from the thawing depths. The summer is too short to thaw the ground thoroughly, and gate-posts or other dead wood extracted in the autumn are found still frozen at their lower ends.

Australasia, as a potential contributor to the world's supply of wheat, affords another fertile field for speculation. Climatic conditions limit the Australian wheat area to a small portion of the southern littoral belt. Professor Shelton considers there are still

50,000,000 acres in Queensland suitable for wheat, but hitherto it has never had more than 150,000 acres under cultivation. Crops in former days were liable to rust, but since the Rust in Wheat conferences and the dissemination of instruction to farmers, rust no longer has any terrors. I am informed by the Queensland Department of Agriculture that of late years they practically have bred wheat vigorous enough to resist this plague. For the second season in succession the wheat crop last year was destroyed over large areas in Victoria; and in South Australia the harvest averaged not more than about $3\frac{3}{4}$ bushels per acre after meeting Colonial requirements for food and seed, leaving only 684,000 bushels for export. In most other districts the yield falls to such an extent as to cause Europeans to wonder why the pursuit of wheat-raising is continued.

New Zealand has a moist climate resembling that of central and southern England, while South Australia is semi-arid, resembling western Kansas. Only two countries in the world yield as much wheat per acre as New Zealand—these are Denmark and the United Kingdom. Notwithstanding the great yield of wheat, due to an equable climate, New Zealand finds fruit and dairy farming still more profitable. The climatic conditions favourable to wheat are also conducive to luxuriant growths of nutritious grasses. Thus the New Zealander ships his butter more than half-way round the world, and competes successfully with western Europe.

During the last twenty-seven years the Austro-Hungarian population has increased 21.8 per cent., as against an increase of 54.6 per cent. in the acreage of wheat. Notwithstanding this disparity in the rates of increase, exports have practically ceased by reason of an advance of nearly 80 per cent. in unit consumption. There can be little doubt that Austro-Hungary is about to enter the ranks of importing nations, although in Hungary a considerable area of wheat land remains to be brought under cultivation.

Roumania is an important wheat-growing country. In 1896 it produced 69,000,000 bushels, and exported 34,000,000 bushels. It has a considerable amount of surplus land which can be used for wheat, although for many years the wheat area is not likely to exceed home requirements.

France comes next to the United States as a producer of wheat; but for our purpose she counts but little, being dependent on supplies from abroad for an average quantity of 14 per cent. of her own production. There is practically no spare land in France that can be put under wheat in sufficient quantity to enable her to do more than provide for increase of population.

Germany is a gigantic importer of wheat, her imports rising 700 per cent. in the last twenty-five years, and now averaging 35,000,000 bushels. Other nations of Europe, also importers, do not require detailed mention, as under no conceivable conditions would they be able to do more than supply wheat for the increasing requirements of their local population, and, instead of replenishing, would probably diminish, the world's stores.

The prospective supply of wheat from Argentina and Uruguay has been greatly overrated. The agricultural area includes less than 100,000,000 acres of good, bad, and indifferent land, much of which is best adapted for pastoral purposes. There is no prospect of Argentina ever being able to devote more than 30,000,000 acres to wheat; the present wheat area is about 6,000,000 acres, an area that may be doubled in the next twelve years. But the whole arable region is subject to great climatic vicissitudes, and to frosts that ravage the fields south of the 37th parallel. Years of systematised energy are frustrated in a few days—perhaps hours—by a single cruelty of nature, such as a plague of locusts, a tropical rain, or a devastating hail storm. It will take years to bring the surplus lands of Argentina into cultivation, and the population is even now insufficient to supply labour at seed time and harvest.

During the next twelve years, Uruguay may add a million acres to the world's wheat fields; but social, political, and economic conditions seriously interfere with the agricultural development.

At the present time South Africa is an importer of wheat, and the regions suitable to cereals do not exceed a few million acres. Great expectations have been formed as to the fertility of Mashonaland, the Shire Highlands, and the Kikuyu plateau, and as to the adaptation of these regions to the growth of wheat. But wheat culture fails where the banana ripens, and the banana flourishes throughout Central Africa, except in limited areas of great elevation. In many parts of Africa insect pests render it impossible to store grain, and without grain-stores there can be little hope of large exports.

North Africa, formerly the granary of Rome, now exports less than 5,000,000 bushels of wheat annually, and these exports are on the decline, owing to increased home demands. With scientific irrigation, Egypt could supply three times her present amount of wheat, although no increase is likely unless the cotton fields of the Delta are diverted to grain growing. In Algeria and Tunis nearly all reclaimed lands are devoted to the production of wine, for which a brisk demand exists. Were this land devoted to the growth of wheat, an additional 5,000,000 bushels might be obtained.

The enormous acreage devoted to wheat in India has been declining for some years, and in 1895 over 20,000,000 acres yielded 185,000,000 bushels. Seven-eighths of this harvest is required for native consumption, and only one-eighth on an average is available for export. The annual increase of population is more than 3,000,000, demanding an addition to the food-bearing lands of not less than 1,800,000 acres annually. In recent years the increase has been less than one-fourth of this amount.

In surveying the limitations and vicissitudes of wheat crops, I have endeavoured to keep free from exaggeration, and have avoided insistence on doubtful points. I have done my best to get trustworthy facts and figures, but from the nature of the case it is impossible to attain complete accuracy. Great caution is required in sifting the numerous varying current statements respecting the estimated areas and total produce of wheat throughout the world. The more closely official estimates are examined, the more defective are they found, and comparatively few figures are sufficiently well established to bear the deductions often drawn. In doubtful cases I have applied to the highest authorities in each country, and in the case of conflicting accounts have taken data the least favourable to sensational or panic-engendering statements. In a few instances of accurate statistics their value is impaired by age; but for 95 per cent. of my figures I quote good authorities, while for the remaining 5 per cent. I rely on the best commercial estimates derived from the appearance of the growing crops, the acreage under cultivation, and the yield last year. The maximum probable error would make no appreciable difference in my argument.

The facts and figures I have set before you are easily interpreted. Since 1871 unit consumption of wheat, including seed, has slowly increased in the United Kingdom to the present amount of six bushels per head per annum; while the rate of consumption for seed and food by the whole world of bread-eaters was 4.15 bushels per unit per annum for the eight years ending 1878, and at the present time is 4.5 bushels. Under present conditions of low acre yield, wheat cannot long retain its dominant position among the food-stuffs of the civilised world. The details of the impending catastrophe no one can predict, but its general direction is obvious enough. Should all the wheat-growing countries add to their area to the utmost capacity, on the most careful calculation the yield would give us only an addition of some 100,000,000 acres, supplying at the average world-yield of 12.7 bushels to the acre, 1,270,000,000 bushels, just enough to supply the increase of population among bread-eaters till the year 1931.

At the present time there exists a deficit in the wheat area of 31,000 square miles—a deficit masked by the fact that the ten world crops of wheat harvested in the ten years ending 1896 were more than 5 per cent. above the average of the previous twenty-six years.

When provision shall have been made, if possible, to feed 230,000,000 units likely to be added to the bread-eating populations by 1931—by the complete occupancy of the arable areas of the temperate zone now partially occupied—where can be grown the additional 330,000,000 bushels of wheat required ten years later by a hungry world? What is to happen if the present rate of population be maintained, and if arable areas of sufficient extent cannot be adapted and made contributory to the subsistence of so great a host?

Are we to go hungry and to know the trial of scarcity? That is the poignant question. Thirty years is but a day in the life of a nation. Those present who may attend the meeting of the British Association thirty years hence will judge how far my forecasts are justified.

If bread fails—not only us, but all the bread-eaters of the world—what are we to do? We are born wheat-eaters. Other races, vastly superior to us in numbers, but differing widely in material and intellectual progress, are eaters of Indian corn, rice, millet, and other grains; but none of these grains have the food value, the concentrated health-sustaining power of wheat, and it is on

this account that the accumulated experience of civilised mankind has set wheat apart as the fit and proper food for the development of muscle and brains.

It is said that when other wheat exporting countries realise that the State can no longer keep pace with the demand, these countries will extend their area of cultivation, and struggle to keep up the supply *puri passu* with the falling-off in other quarters. But will this comfortable and cherished doctrine bear the test of examination?

Cheap production of wheat depends on a variety of causes, varying greatly in different countries. Taking the cost of producing a given quantity of wheat in the United Kingdom at 100s., the cost for the same amount in the United States is 67s., in India 66s., and in Russia 54s. We require cheap labour, fertile soil, easy transportation to market, low taxation and rent, and no export or import duties. Labour will rise in price, and fertility diminish as the requisite manurial constituents in the virgin soil become exhausted. Facility of transportation to market will be aided by railways, but these are slow and costly to construct, and it will not pay to carry wheat by rail beyond a certain distance. These considerations show that the price of wheat tends to increase. On the other hand, the artificial impediments of taxation and customs duties tend to diminish as demand increases and prices rise.

I have said that starvation may be averted through the laboratory. Before we are in the grip of actual dearth the chemist will step in and postpone the day of famine to so distant a period that we, and our sons and grandsons, may legitimately live without undue solicitude for the future.

It is now recognised that all crops require what is called a "dominant" manure. Some need nitrogen, some potash, others phosphates. Wheat pre-eminently demands nitrogen, fixed in the form of ammonia or nitric acid. All other necessary constituents exist in the soil, but nitrogen is mainly of atmospheric origin, and is rendered "fixed" by a slow and precarious process which requires a combination of rare meteorological and geographical conditions to enable it to advance at a sufficiently rapid rate to become of commercial importance.

There are several sources of available nitrogen. The distillation of coal in the process of gas-making yields a certain amount of its nitrogen in the form of ammonia, and this product, as sulphate of ammonia, is a substance of considerable commercial value to gas companies. But the quantity produced is comparatively small; all Europe does not yield more than 400,000 annual tons, and, in view of the unlimited nitrogen required to substantially increase the world's wheat crop, this slight amount of coal ammonia is not of much significance. For a long time guano has been one of the most important sources of nitrogenous manures, but guano deposits are so near exhaustion that they may be dismissed from consideration.

Much has been said of late years, and many hopes raised by the discovery of Hellriegel and Wilfarth, that leguminous plants bear on their roots nodosities abounding in bacteria endowed with the property of fixing atmospheric nitrogen; and it is proposed that the necessary amount of nitrogen demanded by grain crops should be supplied to the soil by cropping it with clover and ploughing in the plant when its nitrogen assimilation is complete. But it is questionable whether such a mode of procedure will lead to the lucrative stimulation of crops. It must be admitted that practice has long been ahead of science, and for ages farmers have valued and cultivated leguminous crops. The four-course rotation is turnips, barley, clover, wheat—a sequence popular more than two thousands years ago. On the continent, in certain localities, there has been some extension of microbe cultivation; at home we have not reached even the experimental stage. Our present knowledge leads to the conclusion that the much more frequent growth of clover on the same land, even with successful microbe-seeding and proper mineral supplies, would be attended with uncertainty and difficulties. The land soon becomes what is called "clover sick," and turns barren.

There is still another and invaluable source of fixed nitrogen. I mean the treasure locked up in the sewage and drainage of our towns. Individually the amount so lost is trifling, but multiply the loss by the number of inhabitants, and we have the startling fact that, in the United Kingdom, we are content to hurry down our drains and water courses, into the sea, fixed nitrogen to the value of no less than £16,000,000 per annum. This unspeakable waste continues, and no effective and universal method is yet contrived of converting sewage into corn. Of this barbaric waste of manurial constituents Liebig, nearly half a century ago, wrote in

these prophetic words: "Nothing will more certainly consummate the ruin of England than a scarcity of fertilisers—it means a scarcity of food. It is impossible that such a sinful violation of the divine laws of Nature should for ever remain unpunished; and the time will probably come for England sooner than for any other country, when, with all her wealth in gold, iron, and coal, she will be unable to buy one-thousandth part of the food which she has, during hundreds of years, thrown recklessly away."

The more widely this wasteful system is extended, recklessly returning to the sea what we have taken from the land, the more surely and quickly will the finite stocks of nitrogen locked up in the soils of the world become exhausted. Let us remember that the plant creates nothing; there is nothing in bread which is not absorbed from the soil, and unless the abstracted nitrogen is returned to the soil, its fertility must ultimately be exhausted. When we apply to the land nitrate of soda, sulphate of ammonia, or guano, we are drawing on the earth's capital, and our drafts will not perpetually be honoured. Already we see that a virgin soil cropped for several years loses its productive powers, and without artificial aid becomes infertile. Thus the strain to meet demands is increasingly great. Witness the yield of forty bushels of wheat per acre under favourable conditions, dwindling through exhaustion of soil to less than 7 bushels of poor grain, and the urgency of husbanding the limited store of fixed nitrogen becomes apparent. The store of nitrogen in the atmosphere is practically unlimited, but it is fixed and rendered assimilable by plants only by cosmic processes of extreme slowness. The nitrogen which with a light heart we liberate in a battleship broadside, has taken millions of minute organisms patiently working for centuries to win from the atmosphere.

The only available compound containing sufficient fixed nitrogen to be used on a world-wide scale as a nitrogenous manure is nitrate of soda, or Chili saltpetre. This substance occurs native over a narrow band of the plain of Tamarugal, in the northern provinces of Chili, between the Andes and the coast hills. In this rainless district for countless ages the continuous fixation of atmospheric nitrogen by the soil, its conversion into nitrate by the slow transformation of billions of nitrifying organisms, its combination with soda, and the crystallisation of the nitrate, have been steadily proceeding, until the nitrate fields of Chili have become of vast commercial importance, and promise to be of inestimably greater value in the future. The growing exports of nitrate from Chili at present amount to about 1,200,000 tons.

The present acreage devoted to the world's growth of wheat is about 163,000,000 acres. At the average of 12.7 bushels per acre this give 2,070,000,000 bushels. But thirty years hence the demand will be 3,260,000,000 bushels, and there will be difficulty in finding the necessary acreage on which to grow the additional amount required. By increasing the present yield per acre from 12.7 to 20 bushels we should with our present acreage secure a crop of the requisite amount. Now from 12.7 to 20 bushels per acre is a moderate increase of productiveness, and there is no doubt that a dressing with nitrate of soda will give this increase and more.

The action of nitrate of soda in improving the yield of wheat has been studied practically by Sir John Lawes and Sir Henry Gilbert on their experimental field at Rothamstead. This field was sown with wheat for thirteen consecutive years without manure, and yielded an average of 11.9 bushels to the acre. For the next thirteen years it was sown with wheat and dressed with 5 cwt. of nitrate of soda per acre, other mineral constituents also being present. The average yield for these years was 36.4 bushels per acre—an increase of 24.5 bushels. In other words, 22.86 lbs. of nitrate of soda produce an increase of one bushel of wheat.

At this rate, to increase the world's crop of wheat by 7.3 bushels, about 1½ cwt. of nitrate of soda must annually be applied to each acre. The amount required to raise the world's crop on 163,000,000 acres from the present supply of 2,070,000,000 bushels to the required 3,260,000,000 bushels will be 12,000,000 tons distributed in varying amounts over the wheat-growing countries of the world. The countries which produce more than the average of 12.7 bushels will require less, and those below the average will require more; but, broadly speaking, about 12,000,000 tons annually of nitrate of soda will be required, in addition to the 1½ million tons already absorbed by the world.

It is difficult to get trustworthy estimates of the amount of nitrate surviving in the nitre beds. Common rumour declares the supply to be inexhaustible, but cautious local authorities state that at the present rate of export, of over one million tons per annum,

the raw material "caliche," containing from 25 to 50 per cent. nitrate, will be exhausted in from twenty to thirty years.

Dr. Newton, who has spent years on the nitrate fields, tells me there is a lower class material, containing a small proportion of nitrate, which cannot at present be used, but which may ultimately be manufactured at a profit. Apart from a few of the more scientific manufacturers, no one is sanguine enough to think this debatable material will ever be worth working. If we assume a liberal estimate for nitrate obtained from the lower grade deposit, and say that it will equal in quantity that from the richer quality, the supply may last, possibly fifty years, at the rate of a million tons a year; but at the rate required to augment the world's supply of wheat to the point demanded thirty years hence, it will not last more than four years.

I have passed in review all the wheat-growing countries of the world, with the exception of those whose united supplies are so small as to make little appreciable difference to the argument. The situation may be summed up briefly thus:—The world's demand for wheat—the leading bread-stuff—increases in a crescendo ratio year by year. Gradually all the wheat-bearing land on the globe is appropriated to wheat growing, until we are within measurable distance of using the last available acre. We must then rely on nitrogenous manures to increase the fertility of the land under wheat, so as to raise the yield from the world's low average—12·7 bushels per acre—to a higher average. To do this efficiently and feed the bread-eaters for a few years will exhaust all the available store of nitrate of soda. For years past we have been spending fixed nitrogen at a culpably extravagant rate, heedless of the fact that it is fixed with extreme slowness and difficulty, while its liberation in the free state takes place always with rapidity and sometimes with explosive violence.

Some years ago Mr. Stanley Jevons uttered a note of warning as to the near exhaustion of our British coalfields. But the exhaustion of the world's stock of fixed nitrogen is a matter of far greater importance. It means not only a catastrophe little short of starvation for the wheat-eaters, but indirectly, scarcity for those who exist on inferior grains, together with a lower standard of living for meat-eaters, scarcity of mutton and beef, and even the extinction of gunpowder.

ARTIFICIAL PRODUCTION OF NITRATE.

There is a gleam of light amid this darkness of despondency. In its free state nitrogen is one of the most abundant and pervading bodies on the face of the earth. Every square yard of the earth's surface has nitrogen gas pressing down on it to the extent of about seven tons—but this is in the *free* state, and wheat demands it *fixed*. To convey this idea is an object-lesson, I may tell you that, previous to its destruction by fire, Colston Hall, measuring 146ft. by 80ft. by 70ft., contained 27 tons weight of nitrogen in its atmosphere; it also contained one-third of a ton of argon. In the free gaseous state this nitrogen is worthless; combined in the form of nitrate of soda it would be worth about £2,000.

For years past attempts have been made to effect the fixation of atmospheric nitrogen, and some of the processes have met with sufficient partial success to warrant experimentalists in pushing their trials still further; but I think I am right in saying that no process has yet been brought to the notice of scientific or commercial men which can be considered successful either as regards cost or yield of product. It is possible, by several methods, to fix a certain amount of atmospheric nitrogen; but to the best of my knowledge no process has hitherto converted more than a small amount, and this at a cost largely in excess of the present market value of fixed nitrogen.

The fixation of atmospheric nitrogen, therefore, is one of the great discoveries awaiting the ingenuity of chemists. It is certainly deeply important in its practical bearings on the future welfare and happiness of the civilised races of mankind. This unfulfilled problem, which so far has eluded the strenuous attempts of those who have tried to wrest the secret from Nature, differs materially from other chemical discoveries which are in the air, so to speak, but are not yet matured. The fixation of nitrogen is vital to the progress of civilised humanity. Other discoveries minister to our increased intellectual comfort, luxury, or convenience; they serve to make life easier, to hasten the acquisition of wealth, or to save time, health, or worry. The fixation of nitrogen is a question of the not far distant future. Unless we can class it among certainties to come the great Caucasian race will cease to be foremost in the world, and will be squeezed out

of existence by races to whom wheaten bread is not the staff of life.

Let me see if it is not possible even now to solve the momentous problem. As far back as 1892 I exhibited, at one of the soirées of the Royal Society, an experiment on "The Flame of Burning Nitrogen." I showed that nitrogen is a combustible gas, and the reason why when once ignited the flame does not spread through the atmosphere and deluge the world in a sea of nitric acid is that its igniting point is higher than the temperature of its flame—not, therefore, hot enough to set fire to the adjacent mixture. But by passing a strong induction current between terminals the air takes fire and continues to burn with a powerful flame, producing nitrous and nitric acids. This inconsiderable experiment may not unlikely lead to the development of a mighty industry destined to solve the great food problem. With the object of burning out nitrogen from air so as to leave argon behind, Lord Rayleigh fitted up apparatus for performing the operation on a larger scale, and succeeded in effecting the union of 29·4 grammes of mixed nitrogen and oxygen at an expenditure of one horse-power. Following these figures it would require one Board of Trade unit to form 74 grammes of nitrate of soda, and therefore 14,000 units to form one ton. To generate electricity in the ordinary way with steam engines and dynamos, it is now possible with a steady load night and day, and engines working at maximum efficiency, to produce current at a cost of one-third of a penny per Board of Trade unit. At this rate one ton of nitrate of soda would cost £26. But electricity from coal and steam engines is too costly for large industrial purposes; at Niagara, where water power is used, electricity can be sold at a profit for one-seventeenth of a penny per Board of Trade unit. At this rate nitrate of soda would cost not more than £5 per ton. But the limit of cost is not yet reached, and it must be remembered that the initial data are derived from small scale experiments, in which the object was not economy, but rather to demonstrate the practicability of the combustion method, and to utilise it for isolating argon. Even now electric nitrate at £5 a ton compares favourably with Chili nitrate at £7 10s. a ton; and all experience shows that when the road has been pointed out by a small laboratory experiment, the industrial operations that may follow are always conducted at a cost considerably lower than could be anticipated from the laboratory figures.

Before we decide that electric nitrate is a commercial possibility, a final question must be mooted. We are dealing with wholesale figures, and must take care that we are not simply shifting difficulties a little further back without really diminishing them. We start with a shortage of wheat, and the natural remedy is to put more land under cultivation. As the land cannot be stretched, and there is so much of it and no more, the object is to render the available area more productive by a dressing with nitrate of soda. But nitrate of soda is limited in quantity, and will soon be exhausted. Human ingenuity can contend even with these apparently hopeless difficulties. Nitrate can be produced artificially by the combustion of the atmosphere. Here we come to finality in one direction; our stores are inexhaustible. But how about electricity? Can we generate enough energy to produce 12,000,000 tons of nitrate of soda annually? A preliminary calculation shows that there need be no fear on that score; Niagara alone is capable of supplying the required electric energy without much lessening its mighty flow.

The future can take care of itself. The artificial production of nitrate is clearly within view, and by its aid the land devoted to wheat can be brought up to the 30 bushels per acre standard. In days to come, when the demand may again overtake supply, we may safely leave our successors to grapple with the stupendous food problem.

And, in the next generation, instead of trusting mainly to food-stuffs which flourish in temperate climates, we probably shall trust more and more to the exuberant food-stuffs of the tropics, where, instead of one yearly sober harvest, jeopardised by any shrinkage of the scanty days of summer weather or of the few steady inches of rainfall, Nature annually supplies heat and water enough to ripen two or three successive crops of food-stuffs in extraordinary abundance. To mention one plant alone, Humboldt—from what precise statistics I know not—computed that, acre for acre, the food-productiveness of the banana is 133 times that of wheat—the unripe banana, before its starch is converted into sugar, is said to make excellent bread.

Considerations like these must in the end determine the range and avenues of commerce, perhaps the fate of continents. We must develop and guide Nature's latent energies, we must utilise

her inmost workshops, we must call into commercial existence Central Africa and Brazil to redress the balance of Odessa and Chicago.

THE LATEST ACHIEVEMENTS OF SCIENCE.

Having kept you for the last half hour rigorously chained to earth, disclosing dreary possibilities, it will be a relief to soar to the heights of pure science and to discuss a point or two touching its latest achievements and aspirations. The low temperature researches which bring such renown to Professor Dewar and to his laboratory in the Royal Institution have been crowned during the present year by the conquest of one of Nature's most defiant strongholds. On May 10 last Professor Dewar wrote to me these simple but victorious words: "This evening I have succeeded in liquefying both hydrogen and helium. The second stage of low temperature work has begun." Static hydrogen boils at a temperature of 238° C. at ordinary pressure, and at 250° C. in a vacuum, thus enabling us to get within 23° C. of absolute zero. The density of liquid hydrogen is only one-fourteenth that of water, yet in spite of such a low density it collects well, drops easily, and has a well-defined meniscus. With proper isolation it will be as easy to manipulate liquid hydrogen as liquid air.

The investigation of the properties of bodies brought near the absolute zero of temperature is certain to give results of extraordinary importance. Already platinum resistance thermometers are becoming useless, as the temperature of boiling hydrogen is but a few degrees from the point where the resistance of platinum would be practically nothing, or the conductivity infinite.

Several years ago I pondered on the constitution of matter in what I ventured to call the fourth state. I endeavoured to probe the tormenting mystery of the atom. What is the atom? Is a single atom in space solid, liquid, or gaseous. Each of these states involves ideas which can only pertain to vast collections of atoms. Whether, like Newton, we try to visualise an atom as a hard, spherical body, or, with Boscovitch and Faraday, to regard it as a centre of force, or accept the vortex atom theory of Lord Kelvin, an isolated atom is an unknown entity difficult to conceive. The properties of matter—solid, liquid, gaseous—are due to molecules in a state of motion. Therefore matter as we know it involves essentially a mode of motion; and the atom itself—intangible, invisible, and inconceivable—is its material basis, and may indeed be styled the only true matter. The space involved in the motions of atoms has no more pretension to be called matter than the sphere of influence of a body of riflemen—the sphere filled with flying leaden missiles—has to be called lead. Since what we call matter essentially involves a mode of motion, and since at the temperature of absolute zero all atomic motions would stop, it follows that matter as we know it would at that paralysing temperature probably entirely change its properties. Although a discussion of the ultimate absolute properties of matter is purely speculative, it can hardly be barren, considering that in our laboratories we are now within moderate distance of the absolute zero of temperature.

I have dwelt on the value and importance of nitrogen, but I must not omit to bring to your notice those little known curiously related elements which during the past twelve months have been discovered and partly described by Professor Ramsay and Dr. Travers. For many years my own work has been among what I may call the waste heaps of the mineral elements. Professor Ramsay is dealing with vagrant atoms of an astral nature. During the course of the present year he has announced the existence of no fewer than three new gases—krypton, neon, and metargon. Whether these gases, chiefly known by their spectra, are true unalterable elements, or whether they are compounded of other known or unknown bodies, has yet to be proved. Fellow-workers freely pay tribute to the painstaking zeal with which Professor Ramsay has conducted a difficult research, and to the philosophic subtlety brought to bear on his investigations. But, like most discoverers, he has not escaped the flail of severe criticism.

There is still another claimant for celestial honours. Professor Nasini tells us he has discovered, in some volcanic gases at Pozzuoli, that hypothetical element coronium, supposed to cause the bright line 5316.9 in the spectrum of the sun's corona. Analogy points to its being lighter and more diffusible than hydrogen, and a study of its properties cannot fail to yield striking results. Still awaiting discovery by the fortunate spectroscopist are the unknown celestial elements aurorium—with a characteristic line at 5570.7—and nebulum, having two bright lines at 5007.05 and 4959.02.

The fundamental discovery by Hertz of the electro-magnetic waves predicted more than thirty years ago by Clerk Maxwell, seems likely to develop in the direction of a practical application which excites keen interest—I mean the application to electric signalling across moderate distances without connecting wires. The feasibility of this method of signalling has been demonstrated by several experimenters at more than one meeting of the British Association, though most elaborately and with many optical refinements by Oliver Lodge at the Oxford meeting in 1894. But not until Signor Marconi induced the British Post Office and foreign governments to try large scale experiments did wireless signalling become generally and popularly known or practically developed as a special kind of telegraphy. Its feasibility depends on the discovery of a singularly sensitive detector for Hertz waves—a detector whose sensitiveness in some cases seems almost to compare with that of the eye itself. The fact noticed by Oliver Lodge in 1889, that an infinitesimal metallic gap subjected to an electric jerk became conducting, so as to complete an electric circuit, was rediscovered soon afterwards in a more tangible and definite form and applied to the detection of Hertz waves by M. E. Branly. Oliver Lodge then continued the work, and produced the vacuum filing-tube coherers with automatic tapper-back, which are of acknowledged practical service. It is this varying continuity of contact under the influence of extremely feeble electric stimulus alternating with mechanical tremor, which, in combination with the mode of producing the waves revealed by Hertz, constitutes the essential and fundamental feature of "wireless telegraphy." There is a curious and widely-spread misapprehension about coherers, to the effect that to make a coherer work the wave must fall upon it. Oliver Lodge has disproved this fallacy. Let the wave fall on a suitable receiver, such as a metallic wire or, better still, on an arrangement of metal wings resembling a Hertz sender, and the waves set up oscillating currents which may be led by wires (enclosed in metal pipes) to the coherer. The coherer acts apparently by a species of end-impact of the oscillatory current, and does not need to be attacked in the flank by the waves themselves. This interesting method of signalling—already developing in Marconi's hands into a successful practical system which inevitably will be largely used in lighthouse and marine work—presents more analogy to optical signals by flash-light than to what is usually understood as electric telegraphy; notwithstanding the fact that an ordinary Morse instrument at one end responds to the movements of a key at the other, or, as arranged by Alexander Muirhead, a siphon recorder responds to an automatic transmitter at about the rate of slow cable telegraphy. But although no apparent optical apparatus is employed, it remains true that the impulse travels from sender to receiver by essentially the same process as to that which enables a flash of magnesium powder to excite a distant eye.

The phenomenon discovered by Zeeman, that a source of radiation is affected by a strong magnetic field in such a way that light of one refrangibility becomes divided usually into three components, two of which are displaced by diffraction analysis on either side of the mean position and are oppositely polarised to the third or residual constituent, has been examined by many observers in all countries. The phenomenon has been subjected to photography with conspicuously successful results by Professor T. Preston in Dublin and by Professor Michelson and Dr. Ames and others in America.

It appears that the different lines in the spectrum are differently affected, some of them being tripled with different grades of relative intensity, some doubled, some quadrupled, some sextupled, and some left unchanged. Even the two components of the D lines are not similarly influenced. Moreover, whereas the polarisation is usually such as to indicate that motions of a negative ion or electron constitute the source of light, a few lines are stated by the observers at Baltimore, who used what they call the "small" grating of 5 inches width ruled with 65,000 lines, to be polarised in the reverse way.

Further prosecution of these researches must lead to deeper insight into molecular processes and the mode in which they affect the ether; indeed already valuable theoretic views have been promulgated by H. A. Lorenz, J. Larmor, and G. F. Fitzgerald, on the lines of the radiation theory of Dr. Johnstone Stoney; and the connection of the new phenomena with the old magnetic rotation of Faraday is under discussion. It is interesting to note that Faraday and a number of more recent experimenters were led by theoretical considerations to look for some such effect; and though the inadequate means at their disposal did not lead to success,

nevertheless a first dim glimpse of the phenomenon was obtained by M. Fievez, of the Royal Observatory at Brussels, in 1885.

It would be improper to pass without at least brief mention the remarkable series of theoretic papers by Dr. J. Larmor, published by the Royal Society, on the relationship between ether and matter. By the time these researches become generally intelligible they may be found to constitute a considerable step towards the further mathematical analysis and interpretation of the physical universe on the lines initiated by Newton.

In the mechanical construction of Röntgen ray tubes I can record a few advances: the most successful being the adoption of Professor Silvanus P. Thompson's suggestion of using for the anti-cathode a metal of high atomic weight. Osmium and iridium have been used with advantage, and osmium anti-cathode tubes are now a regular article of manufacture. As long ago as June, 1896, X-ray tubes with metallic uranium anti-cathodes were made in my own laboratory, and were found to work better than those with platinum. The difficulty of procuring metallic uranium prevented these experiments from being continued. Thorium anti-cathodes have also been tried.

Röntgen has drawn fresh attention to a fact very early observed by English experimenters—that of the non-homogeneity of the rays and the dependence of their penetrating power on the degree of vacuum; rays generated in high vacua have more penetrative power than when the vacuum is less high. These facts are familiar to all who have exhausted focus tubes on their own pumps. Röntgen suggests a convenient phraseology; he calls a low vacuum tube, which does not emit the highly penetrating rays, a "soft" tube, and a tube in which the exhaustion has been pushed to an extreme degree, in which highly penetrating rays predominate, a "hard" tube. Using a "hard" tube, he took a photograph of a double-barrelled rifle, and showed not only the leaden bullets within the steel barrels, but even the wads and the charges.

Benoit has re-examined the alleged relation between density and opacity to the rays, and finds certain discrepancies. Thus, the opacity of equal thicknesses of palladium and platinum are nearly equal, whilst their densities and atomic weights are very different, those of palladium being about half those of platinum.

At the last meeting of the British Association visitors saw—at the McGill University—Professors Cox and Callendar's apparatus for measuring the velocity of Röntgen rays. They found it to be certainly greater than 200 kilometres per second. Majorana has made an independent determination, and finds the velocity to be 600 kilometres per second with an inferior limit certainly of not less than 150 kilometres per second. It may be remembered that J. J. Thomson has found for cathode rays a velocity of more than 10,000 kilometres per second, and it is extremely unlikely that the velocity of Röntgen rays will prove to be less.

Trowbridge has verified the fact, previously announced by Professor S. P. Thompson, that fluor-spar, which by prolonged heating has lost its power of luminescing when re-heated, regains the power of thermo-luminescence when exposed to Röntgen rays. He finds that this restoration is also effected by exposure to the electric glow discharge, but not by exposure to ultra-violet light. The difference is suggestive.

As for the action of Röntgen rays on bacteria, often asserted and often denied, the latest statement by Dr. H. Rieder, of Munich, is to the effect that bacteria are killed by the discharge from "hard" tubes. Whether the observation will lead to results of pathologic importance remains to be seen. The circumstance that the normal retina of the eye is slightly sensitive to the rays is confirmed by Dorn and by Röntgen himself.

The essential wave-nature of the Röntgen rays appears to be confirmed by the fact ascertained by several of our great mathematical physicists that light of excessively short wave-length would be but slightly absorbed by ordinary material media, and would not, in the ordinary sense, be refracted at all; in fact, a theoretic basis for a comprehension of the Röntgen rays had been propounded before the rays were discovered. At the Liverpool meeting of the British Association several speakers, headed by Sir George Stokes, expressed their conviction that the disturbed electric field caused by the sudden stoppage of the motion of an electrically charged atom yielded the true explanation of the phenomena extraneous to the Crookes high vacuum tubes—phenomena so excellently elaborated by Lenard and by Röntgen. More recently, Sir George Stokes has re-stated his "pulse" theory, and fortified it with arguments which have an important bearing on the whole theory of the refraction of light. He still

holds to their essentially transverse nature, in spite of the absence of polarisation, an absence once more confirmed by the careful experiments of Dr. L. Graetz. The details of this theory are in process of elaboration by Professor J. J. Thomson.

Meantime, while the general opinion of physicists seems to be settling towards a wave or ether theory for the Röntgen rays, an opposite drift is apparent with respect to the physical nature of the cathode rays; it becomes more and more clear that cathode rays consist of electrified atoms or ions in rapid progressive motion. My idea of a fourth state of matter, propounded in 1881*, and at first opposed at home and abroad, is now becoming accepted. It is supported by Professor J. J. Thomson†: Dr. Larmor's theory‡ likewise involves the idea of an ionic substratum of matter; the view is also confirmed by Zeeman's phenomenon. In Germany—where the term cathode ray was invented almost as a protest against the theory of molecular streams propounded by me at the Sheffield meeting of the British Association in 1879—additional proofs have been produced in favour of the doctrine that the essential fact in the phenomenon is electrified radiant matter.

The speed of these molecular streams has been approximately measured, chiefly by aid of my own discovery nearly twenty years ago, that their path is curved in a magnetic field, and that they produce phosphorescence where they impinge on an obstacle. The two unknown quantities, the charge and the speed of each atom, are measurable from the amount of curvature and by means of one other independent experiment.

It cannot be said that a complete and conclusive theory of these rays has yet been formulated. It is generally accepted that collisions among particles, especially the violent collisions due to their impact on a massive target placed in their path, give rise to the interesting kind of extremely high frequency radiation discovered by Röntgen. It has, indeed, for some time been known that whereas a charged body in motion constitutes an electric current, the sudden stoppage, or any violent acceleration of such a body, must cause an alternating electric disturbance, which, though so rapidly decaying in intensity as to be practically "dead beat," yet must give rise to an ethereal wave or pulse travelling with the speed of light, but of a length comparable to the size of the body whose sudden change of motion caused the disturbance. The emission of a high-pitched musical sound from the jolting of a dustman's cart (with a spring bell hung on it) has been suggested as an illustration of the way in which the molecules of any solid not at absolute zero may possibly emit such rays.

If the target on to which the electrically charged atoms impinge is so constituted that some of its minute parts can thereby be set into rhythmical vibration, the energy thus absorbed reappears in the form of light, and the body is said to phosphoresce. The efficient action of the phosphorescent target appears to depend as much on its physical and molecular as on its chemical constitution. The best known phosphori belong to certain well-defined classes, such as the sulphides of the alkaline-earthly metals, and some of the so-called rare earths; but the phosphorescent properties of each of these groups are profoundly modified by an admixture of foreign bodies—witness the effect on the lines in the phosphorescent spectrum of yttrium and samarium produced by traces of calcium or lead. The persistence of the samarium spectrum in presence of overwhelming quantities of other metals, is almost unexampled in spectroscopy; thus one part of samaria can easily be seen when mixed with three million parts of lime.

Without stating it as a general rule, it seems as if with a non-phosphorescing target the energy of molecular impact reappears as pulses so abrupt and irregular that, when resolved, they furnish a copious supply of waves of excessively short wave-length, in fact the now well-known Röntgen rays. The phosphorescence so excited may last only a small fraction of a second, as with the constituents of yttria, where the duration of the different lines varies between the 0.003 and the 0.0009 second; or it may linger for hours, as in the case of some of the yttria earths, and especially with the earthy sulphides, where the glow lasts bright enough to be commercially useful. Excessively phosphorescent bodies can be excited by light waves, but most of them require the stimulus of electrical excitement.

It now appears that some bodies, even without special stimulation, are capable of giving out rays closely allied, if not in some cases identical, with those of Professor Röntgen. Uranium and

* *Phil. Trans.*, Part 2, 1881, pp. 433-4.

† *Phil. Mag.*, October 1897, p. 312.

‡ *Phil. Mag.*, December, 1897, p. 506.

thorium compounds are of this character, and it would almost seem from the important researches of Dr. Russell that this ray-emitting power may be a general property of matter, for he has shown that nearly every substance is capable of affecting the photographic plate if exposed in darkness for sufficient time.

No other source for Röntgen rays but the Crookes tube has yet been discovered, but rays of kindred sorts are recognised. The Becquerel rays, emitted by uranium and its compounds, have now found their companions in rays—discovered almost simultaneously by Curie and Schmidt—emitted by thorium and its compounds. The thorium rays affect photographic plates through screens of paper or aluminium, and are absorbed by metals and other dense bodies. They ionise the air, making it an electrical conductor; and they can be refracted and probably reflected, at least diffusively. Unlike uranium rays, they are not polarised by transmission through tourmaline, therefore resembling in this respect the Röntgen rays.

Quite recently M. and Mdme Curie have announced a discovery which, if confirmed, cannot fail to assist the investigation of this obscure branch of physics. They have brought to notice a new constituent of the uranium mineral pitchblende, which in a four hundred fold degree possesses uranium's mysterious power of emitting a form of energy capable of impressing a photographic plate and of discharging electricity by rendering air a conductor. It also appears that the radiant activity of the new body, to which the discoverers have given the name of polonium, needs neither the excitation of light nor the stimulus of electricity; like uranium, it draws its energy from some constantly regenerating and hitherto unsuspected store, exhaustless in amount.

It has long been to me a haunting problem how to reconcile this apparently boundless outpour of energy with accepted canons. But as Dr. Johnstone Stoney reminds me, the resources of molecular movements are far from exhausted. There are many stores of energy in Nature that may be drawn on by properly constituted bodies without very obvious cause. Some time since I drew attention to the enormous amount of locked-up energy in the ether; nearer our experimental grasp are the motions of the atoms and molecules, and it is not difficult mentally so to modify Maxwell's demons as to reduce them to the level of an inflexible law, and thus bring them within the ken of a philosopher in search of a new tool. It is possible to conceive a target capable of mechanically sifting from the molecules of the surrounding air the quick from the slow movers. This sifting of the swift moving molecules is effected in liquids whenever they evaporate, and in the case of the constituents of the atmosphere, wherever it contains constituents light enough to drift away molecule by molecule. In my mind's eye I see such a target as a piece of metal cooler than the surrounding air acquiring the energy that gradually raises its temperature from the outstanding effect of all its encounters with the molecules of the air about it; I see another target of such a structure that it throws off the slow moving molecules with little exchange of energy, but is so influenced by the quick moving missiles that it appropriates to itself some of their energy. Let uranium or polonium, bodies of densest atoms, have a structure that enables them to throw off the slow moving molecules of the atmosphere, while the quick moving molecules, smashing on to the surface, have their energy reduced and that of the target correspondingly increased. The energy thus gained seems to be employed partly in dissociating some of the molecules of the gas (or in inducing some other condition which has the effect of rendering the neighbouring air in some degree a conductor of electricity) and partly in originating an undulation through the ether, which, as it takes its rise in phenomena so disconnected as the impacts of the molecules of the air, must furnish a large contingent of light waves of short wave length. The shortness in the case of these Becquerel rays appears to approach without attaining the extreme shortness of ordinary Röntgen rays. The reduction of the speed of the quick-moving molecules would cool the layer of air to which they belong; but this cooling would rapidly be compensated by radiation and conduction from the surrounding atmosphere. Under ordinary circumstances the difference of temperature would scarcely be perceptible, and the uranium would thus appear to perpetually emit rays of energy with no apparent means of restoration.

The total energy of both the translational and internal motions of the molecules locked up in quiescent air at ordinary pressure and temperature is about 140,000 foot-pounds in each cubic yard of air. Accordingly the quiet air within a room 12 feet high, 18 feet wide, and 22 feet long contains energy enough to propel a one-

horse engine for more than twelve hours. The store drawn upon naturally by uranium and other heavy atoms only awaits the touch of the magic wand of science to enable the twentieth century to cast into the shade the marvels of the nineteenth.

MONIUM—A NEW ELEMENT.

Whilst placing before you the labours and achievements of my comrades in science I seize this chance of telling you of engrossing work of my own on the fractionation of yttria, to which for the last eighteen years I have given ceaseless attention. In 1883, under the title of "Radiant Matter Spectroscopy," I described a new series of spectra produced by passing the phosphorescent glow of yttria, under molecular bombardment *in vacuo*, through a train of prisms. The visible spectra in time gave up their secrets, and were duly embalmed in the *Philosophical Transactions*. At the Birmingham meeting of the British Association in 1886 I brought the subject before the Chemical Section, of which I had the honour to be President. The results led to many speculations on the probable origin of all the elementary bodies—speculations that for the moment I must waive in favour of experimental facts.

There still remained for spectroscopic examination a long tempting stretch of unknown ultra-violet light, of which the exploration gave me no rest. But I will not now enter into details of the quest of unknown lines. Large quartz prisms, lenses, and condensers, specially sensitised photographic films capable of dealing with the necessary small amount of radiation given by feebly phosphorescing substances,* and above all tireless patience in collating and interpreting results, have all played their part. Although the research is incomplete I am able to announce that among the groups of rare earths giving phosphorescent spectra in the visible region there are others giving well-defined groups of bands which can only be recorded photographically. I have detected and mapped no less than six such groups extending to λ 3060.

Without enlarging on difficulties, I will give a brief outline of the investigation. Starting with a large quantity of a group of the rare earths in a state of considerable purity, a particular method of fractionation is applied, splitting the earths into a series of fractions differing but slightly from each other. Each of these fractions, phosphorescing *in vacuo*, is arranged in the spectrograph, and a record of its spectrum photographed upon a specially prepared sensitive film.

In this way, with different groups of rare earths, the several invisible bands were recorded—some moderately strong, others exceedingly faint. Selecting a portion giving a definite set of bands, new methods of fractionation were applied, constantly photographing and measuring the spectrum of each fraction. Sometimes many weeks of hard experiment failed to produce any separation, and then a new method of splitting up was devised and applied. By unremitting work—the solvent of most difficulties—eventually it was possible to split up the series of bands into various groups. Then, taking a group which seemed to offer possibilities of reasonably quick result, one method after another of chemical attack was adopted, with the ultimate result of freeing the group from its accompanying fellows and increasing its intensity and detail.

As I have said, my researches are far from complete, but about one of the bodies I may speak definitely. High up in the ultra-violet, like a faint nebula in the distant heavens, a group of lines was detected, at first feeble and only remarkable on account of their isolation. On further purification these lines grew stronger. Their great refrangibility cut them off from other groups. Special processes were employed to isolate the earth, and using these lines as a test, and appealing at every step to the spectrograph, it was pleasant to see how each week the group stood out stronger and stronger, while the other lines of yttrium, samarium, ytterbium, &c., became fainter, and at last, practically vanishing, left the sought-for group strong and solitary. Finally, within the last few weeks, hopefulness has emerged into certainty, and I have absolute evidence that another member of the rare earth groups has been added to the list. Simultaneously with the chemical and spectrographic attack, atomic weight determinations were constantly performed.

As the group of lines which betrayed its existence stand alone, almost at the extreme end of the ultra-violet spectrum, I propose

* In this direction I am glad to acknowledge my indebtedness to Dr. Schuman, of Leipzig, for valuable suggestions and detail of his own apparatus, by means of which he has produced some unique records of metallic and gaseous spectra of lines of short wave-length.

to name the newest of the elements monium, from the Greek *μόνος*, alone. Although caught by the searching rays of the spectrum, monium offers a direct contrast to the recently discovered gaseous elements, by having a strongly marked individuality; but although so young and wilful, it is willing to enter into any number of chemical alliances.

Until my material is in a greater state of purity I hesitate to commit myself to figures: but I may say that the wave-lengths of the principal lines are 3120 and 3117. Other fainter lines are at 3219, 3064, and 3060. The atomic weight of the element, based on the assumption of R_2O_3 , is not far from 118—greater than that accepted for yttrium and less than that for lanthanum.

I ought almost to apologise for adding to the already too long list of elements of the rare earth class—the asteroids of the terrestrial family. But as the host of celestial asteroids, unimportant individually, become of high interest when once the idea is grasped that they may be incompletely coagulated remains of the original nebula, so do these elusive and insignificant rare elements rise to supreme importance when we regard them in the light of component parts of a dominant element, frozen in embryo, and arrested in the act of coalescing from the original protyle into one of the ordinary and law-abiding family for whom Newlands and Mendeleeff have prepared pigeon-holes. The new element has another claim to notice. Not only is it new in itself, but to discover it a new tool had to be forged for spectroscopic research.

Further details I will reserve for that tribunal before whom every aspirant for a place in the elemental hierarchy has to substantiate his claim.

OF PSYCHIC RESEARCHES.

These, then, are some of the subjects, weighty and far-reaching, on which my own attention has been chiefly concentrated. Upon one other interest I have not yet touched—to me the weightiest and the farthest reaching of all.

No incident in my scientific career is more widely known than the part I took many years ago in certain psychic researches. Thirty years have passed since I published an account of experiments tending to show that outside our scientific knowledge there exists a force exercised by intelligence differing from the ordinary intelligence common to mortals. This fact in my life is, of course, well understood by those who honoured me with the invitation to become your President. Perhaps among my audience some may feel curious as to whether I shall speak out or be silent. I elect to speak, although briefly. To enter at length on a still debatable subject would be unduly to insist on a topic which—as Wallace, Lodge, and Barrett have already shown—though not unfitted for discussion at these meetings, does not yet enlist the interest of the majority of my scientific brethren. To ignore the subject would be an act of cowardice—an act of cowardice I feel no temptation to commit.

To stop short in any research that bids fair to widen the gates of knowledge, to recoil from fear of difficulty or adverse criticism, is to bring reproach on science. There is nothing for the investigator to do but to go straight on, “to explore up and down, inch by inch, with the taper his reason”; to follow the light wherever it may lead, even should it at times resemble a will-o'-the-wisp. I have nothing to retract. I adhere to my already published statements. Indeed, I might add much thereto. I regret only a certain crudity in those early expositions which, no doubt justly, militated against their acceptance by the scientific world. My own knowledge at that time scarcely extended beyond the fact that certain phenomena new to science had assuredly occurred, and were attested by my own sober senses, and better still, by automatic record. I was like two-dimensional being who might stand at the singular point of a Riemann's surface, and thus find himself in infinitesimal and inexplicable contact with a plane of existence not his own.

I think I see a little farther now. I have glimpses of something like coherence among the strange elusive phenomena; of something like continuity between those unexplained forces and laws already known. This advance is largely due to the labours of another association of which I have also this year the honour to be President—the Society for Psychical Research. And were I now introducing for the first time these inquiries to the world of science I should choose a starting-point different from that of old. It would be well to begin with telepathy; with the fundamental law, as I believe it to be, that thoughts and images may be transferred from one mind to another without the agency of the recognised organs of sense—that knowledge may enter the human mind

without being communicated in any hitherto known or recognised ways.

Although the inquiry has elicited important facts with reference to the mind, it has not yet reached the scientific stage of certainty which would entitle it to be usefully brought before one of our sections. I will, therefore, confine myself to pointing out the direction in which scientific investigation can legitimately advance. If telepathy take place we have two physical facts—the physical change in the brain of A, the suggester, and the analogous physical change in the brain of B, the recipient of the suggestion. Between these two physical events there must exist a train of physical causes. Whenever the connecting sequence of intermediate causes begins to be revealed the inquiry will then come within the range of one of the sections of the British Association. Such a sequence can only occur through an intervening medium. All the phenomena of the universe are presumably in some way continuous, and it is unscientific to call in the aid of mysterious agencies when with every fresh advance in knowledge it is shown that ether vibrations have powers and attributes abundantly equal to any demand, even to the transmission of thought. It is supposed by some physiologists that the essential cells of nerves do not actually touch, but are separated by a narrow gap which widens in sleep while it narrows almost to extinction during mental activity. This condition is so singularly like that of a Branly or Lodge coherer as to suggest a further analogy. The structure of brain and nerve being similar, it is conceivable there may be present masses of such nerve coherers in the brain whose special function it may be to receive impulses brought from without through the connecting sequence of ether waves of appropriate order of magnitude. Röntgen has familiarised us with an order of vibration of extreme minuteness compared with the smallest waves with which we have hitherto been acquainted, and of dimensions comparable with the distances between the centres of the atoms of which the material universe is built up; and there is no reason to suppose that we have here reached the limit of frequency. It is known that the action of thought is accompanied by certain molecular movements in the brain, and here we have physical vibrations capable from their extreme minuteness of acting direct on individual molecules, while their rapidity approaches that of the internal and external movements of the atoms themselves.

Confirmation of telepathic phenomena is afforded by many converging experiments, and by many spontaneous occurrences only thus intelligible. The most varied proof, perhaps, is drawn from analysis of the sub-conscious workings of the mind, when these, whether by accident or design, are brought into conscious survey. Evidence of a region below the threshold of consciousness has been presented, since its first inception, in the *Proceedings of the Society for Psychical Research*; and its various aspects are being interpreted and welded into a comprehensive whole by the pertinacious genius of F. W. H. Myers. Concurrently our knowledge of the facts in this obscure region has received valuable additions at the hands of labourers in other countries. To mention a few names out of many, the observations of Richet, Pierre Janet, and Binet (in France), of Breuer and Freud (in Austria), of William James (in America) have strikingly illustrated the extent to which patient experimentation can probe subliminal processes, and can thus learn the lessons of alternating personalities and abnormal states. Whilst it is clear that our knowledge of sub-conscious mentation is still to be developed, we must beware of rashly assuming that all variations from the normal waking condition are necessarily morbid. The human race has reached no fixed or changeless ideal; in every direction there is evolution as well as disintegration. It would be hard to find instances of more rapid progress, moral and physical, than in certain important cases of cure by suggestion—again to cite a few names out of many—by Liébeault, Bernheim, the late Auguste Voison, Bérillon (in France), Schrenck-Notzing (in Germany), Forel (in Switzerland), van Eeden (in Holland), Wetterstrand (in Sweden), Milne-Bramwell and Lloyd Tuckey (in England). This is not the place for details, but the *vis medicatrix* thus evoked, as it were, from the depths of the organism, is of good omen for the upward evolution of mankind.

A formidable range of phenomena must be scientifically sifted before we effectually grasp a faculty so strange, so bewildering, and for ages so inscrutable, as the direct action of mind on mind. This delicate task needs a rigorous employment of the method of exclusion—a constant setting aside of irrelevant phenomena that

could be explained by known causes, including those far too familiar causes, conscious and unconscious fraud. The inquiry unites the difficulties inherent in all experimentation connected with *mind*, with tangled human temperaments and with observations dependent less on automatic record than on personal testimony. But difficulties are things to be overcome even in the elusory branch of research known as Experimental Psychology. It has been characteristic of the leaders among the group of inquirers constituting the Society for Psychical Research to combine critical and negative work with work leading to positive discovery. To the penetration and scrupulous fair-mindedness of Professor Henry Sidgwick and of the late Edmund Gurney is largely due the establishment of canons of evidence in psychical research, which strengthen while they narrow the path of subsequent explorers. To the detective genius of Dr. Richard Hodgson we owe a convincing demonstration of the narrow limits of human continuous observation.

It has been said that "Nothing worth the proving can be proved, nor yet disproved." True though this may have been in the past, it is true no longer. The science of our century has forged weapons of observation and analysis by which the veriest tyro may profit. Science has trained and fashioned the average mind into habits of exactitude and disciplined perception, and in so doing has fortified itself for tasks higher, wider, and incomparably more wonderful than even the wisest among our ancestors imagined. Like the souls in Plato's myth that follow the chariot of Zeus, it has ascended to a point of vision far above the earth. It is henceforth open to science to transcend all we know of the matter, and to gain new glimpses of a profounder scheme of Cosmic Law.

An eminent predecessor in this chair declared that "by an intellectual necessity he crossed the boundary of experimental evidence, and discerned in that matter, which we in our ignorance of its latent powers, and notwithstanding our professed reverence for its Creator, have hitherto covered with opprobrium, the potency and promise of all terrestrial life." I should prefer to reverse the apophthegm, and to say that in life I see the promise and potency of all forms of matter.

In old Egyptian days a well-known inscription was carved over the portal of the temple of Isis:—"I am whatever hath been, is, or ever will be; and my veil no man hath yet lifted." Not thus do modern seekers after truth confront Nature—the word that stands for the baffling mysteries of the universe. Steadily, unflinchingly, we strive to pierce the inmost heart of Nature, from what she is to re-construct what she has been, and to prophesy what she shall yet be. Veil after veil we have lifted, and her face grows more beautiful, august, and wonderful, with every barrier that is withdrawn.

MEDICAL JOTTINGS.

OWING TO THE RECENT ORDINANCE of the General Medical Council forbidding the employment of unqualified assistants, doctors have found considerable difficulty this holiday season in obtaining temporary substitutes to take charge of their patients. Instances have occurred however, which show that the new regulation is often ignored. In one case of ptomaine poisoning at Hackney it was proved at the coroner's inquest that the principal was away from home, and left his patients in the charge of two assistants, one of whom was unqualified, and in this case the burden of attendance was thrown on him. In another case where a child died of meningitis, following a fall, the jury returned a verdict as to the cause of death, and added a rider censuring the doctor for neglecting the patient and for sending an unqualified practitioner to visit the child, and asked that a report of the proceedings should be sent to the General Medical Council.

IT HAS BEEN DECIDED by the Committee to close the Edinburgh Medical School for Women for the present. The policy of the school authorities had been to provide classes for women students exclusively in all subjects of the curriculum with the exception of physics and physiology (specially excepted by the University Court) in compliance with the University regulations. It was found, however, that these regulations had been altered and permission granted for the holding of mixed classes in connection with the Medical School for Women at Minto House, and that a large majority of the women studying medicine in Edinburgh were attending these mixed classes, with the result that it became

impossible for the authorities to continue to provide expensive separate classes, involving guarantees to lecturers and the provision of suitable premises, and an adequate staff, when the ground was cut from under their feet by the much cheaper expedient of mixed classes. The result is to be regretted, as six out of the seven women who have taken the degrees of M.B., C.M., at the University of Edinburgh, were entirely educated at the Edinburgh School of Medicine for Women, of which Dr. Sophia Jex-Blake is the Dean.

IT HAS BEEN DECIDED to increase the accommodation at Cambridge University for the teaching of pharmacology, which has long been regarded by the teachers of the Medical Faculty as an indispensable part of the medical curriculum. The Pharmacological Laboratory at Cambridge has only been in existence a few years, but as an evidence of its value as an institution for teaching, as well as research, it may be mentioned that one of the two gold medals given by the University of Edinburgh for a thesis for the degree of M.D. has been awarded to Dr. Andrew Balfour for work done in this laboratory.

SIR THOMAS SMITH, who lately resigned his post as professor of surgery to St. Bartholomew's Hospital, will deliver the inaugural address at the next session of the Abernethian Society. Sir Thomas has chosen for his subject, reminiscences of his forty eight years' association with St. Bartholomew's Hospital.

IF THE REPORT BE TRUE of a recent occurrence at the Royal Infirmary, Glasgow, there seems to be great need for the disciplinary powers of the authorities to be exerted. It is stated that a young member of the resident hospital staff, who had made himself somewhat obnoxious to his colleagues, was one night on his way to his rooms, when he was waylaid and forcibly taken before a masked mock tribunal, where a trial was held and the charges against the unpopular doctor declared proved. He was sentenced to the order of the bath, his clothes were forcibly removed, and he was carried to and plunged into a cold bath, where he was left. The cause of offence was stated to be that the doctor had refused to receive in the wards under his charge certain cases which he considered should be treated elsewhere.

DENTAL NOTES.

The Editor of the *Dental Weekly* points out "How often writers and speakers fail to mention the use of floss silk as a means of dental prophylaxis. The use of the tooth brush is freely insisted on, while the floss silk, which is far more important, is not mentioned. The tooth brush, as it is usually applied, does not reach the parts that are mostly the first to become attacked with caries, viz., between the teeth. Floss silk when passed between does it more effectively than anything else, and dentists would do well to urge on patients the frequent cleaning between the teeth where approximal fillings have been inserted."

Professor Ramsay has been writing in the *Nineteenth Century* respecting the importance of the use of pure anæsthetics. Many of the disagreeable after-effects following the administration of anæsthetics is, to a certain extent, often due to impurities or careless handling. Impurities are: 1. Those of manufacture; 2. Due to subsequent decomposition. The first can always be avoided by using only that of reliable makers, but the second rests principally with those using the drug. After a bottle containing chloroform is opened, oxidation readily takes place, with the formation of hydrochloric acid and carbonyl chloride, the presence of which gives rise to coughing and painful respiration. Ether, according to Professor Ramsay, also decomposes after prolonged exposure to air. A sharp-smelling compound is formed, which probably is ethyl peroxide. Coughing and an abnoxious flavour denote the presence of this body. Professor Ramsay suggests the addition of a little slaked lime to the chloroform bottle to correct the presence of these impurities. The addition of a little mercury to ether oxidises and so precipitates the ethyl peroxide as a dirty-black precipitation.

Save all your surplus amalgam and roll into small pellets of different sizes while soft—they will prove very useful when filling large cavities by embedding them in the soft amalgam. It reduces the tendency to shrink, and is a saving of material.—Mackenzie, *Brit. Journ.*

A Basis of Knowledge for Pharmaceutical Students

IN view of the fact that pharmaceutical students too frequently enter upon courses of study at schools of pharmacy whilst ill-fitted to benefit by the instruction there given, the opportunity has been taken to ask those responsible for the arrangement of the courses of study what elementary knowledge, in their opinion, a student should possess. The answers to that question are summarised below, and it will be noted that there is a fairly general agreement amongst them. The most obvious requirements are a fair grounding in elementary chemistry, botany, and physics, together with a good all-round knowledge of mathematics. Add to that a proficiency in reading Latin prescriptions and a close practical acquaintance with the British Pharmacopœia, and the student will probably be as well prepared for his final school course as it is possible for him to be.

Mr. F. H. ALCOCK, of Birmingham, a former Bell Scholar, thinks that a student, having passed his "First" examination, which should be one which included Euclid, algebra, and advanced arithmetic, should, on commencing his pupilage, begin at once with the studies which will concern him when "out of his time," and he has attained the legal minimum age. He should certainly be familiar with common drugs and chemicals, and by examining these during dusting, etc., have cultivated the powers of observation and reflection. He should know how to handle a microscope and the common utensils of the dispensing department, *i.e.*, to measure accurately, to hold the scales correctly, to spread a blister, to prepare a plaster shape, to know a plaster iron infusion pot, suppository and other moulds, to gauge at sight the capacity of a bottle, and the right size cork to fit it. The fact that many pupils seldom see a prescription should not debar him from making himself master of the grammar of one, but to whom is he to look for aid? Most certainly his principal; for if the latter cannot assist him he is not a fit and proper person to take pupils. The writer does not favour the plan of leaving every subject until the pupilage expires and then going to a school and cramming the necessary knowledge into a period of six months or more. A gradual training, such as is required when a student desires to sit for the grand scholarships which the Society offers, is held to be decidedly the best road to success at the Minor or Major or Maximus (*i.e.*, the avocation of a pharmacist). Mr. Alcock also says he is often consulted by pharmacists and their pupils, and has invariably recommended that the latter should go to a competent teacher for at least one afternoon per week from the moment they enter pharmacy until they leave their pupilage, taking one subject or two for one quarter and changing the subject as he acquires proficiency in its rudiments and can continue its study by himself. A lesson in *materia medica*, with some roots, barks, etc., before him, makes a lasting impression on the young student, if it is made interesting. Similarly a botanical lesson with some plants, razor, microtome, slides, and microscope. In pharmacy the preparation of a copaiba emulsion or an effervescing mixture. These create a desire to do work properly and to avoid carelessness. As he gets nearer the close of his pupilage he could attend oftener, and no doubt if a man of ability he would have learnt sufficient to follow the lectures and demonstrations of a school of

pharmacy and quickly understand the system of teaching used, fall in with it and become a complete master of his subjects, and, having banished nervousness, be prepared to meet his examiners with pleasure and success. In place of the competent pharmacy teacher (which could be his principal), attendance at technical schools where chemistry and botany are carefully taught would be a good plan. It is, however, a pity that they are required at these schools to read for special examinations of the Science and Art Department, which certainly do not assist him in expanding his mind and making his studies profitable. One fruitful source of difficulty with the young man who has not previously prepared himself before entering a school is that he is so overwhelmed by the difficult names he is called upon to know and use constantly, that he is at least a month or more in a state of bewilderment, a result arising from a want of knowledge of the meaning of the words themselves and their derivation.

Mr. JOHN CRUICKSHANK, Secretary of the Aberdeen Pharmaceutical Association, explains that students, before entering the Pharmacy Department at Gordon's College, must have an elementary knowledge of botany and chemistry. He says: "Our Education Committee in its deliberations for the establishing of pharmacy classes at Gordon's College has all along had in view the fact that at a great many pharmacy schools the cram system is too much in evidence, and that the knowledge their students possess is merely evanescent. What we have principally in view is the fact that in nearly every town and village throughout the kingdom students can attend botany and chemistry classes under the Science and Art Department. In Aberdeen apprentices serve five years. During the first year we consider they have quite enough to do getting up to the work of the shop, assuming, of course, that they have already passed the Preliminary examination. In the second year of their apprenticeship we encourage them to take up elementary botany and chemistry (Science and Art). The third year they take the more advanced course, then during the remaining two years they go to the evening pharmacy classes, when they will have had a full course in all the Minor subjects, extending each year from the end of September well into April. After this and with a good shop training, where they have to make most if not all the galenic preparations of the B.P., they may now enter a full course at a school of pharmacy with every prospect of making a creditable appearance at the examination, and of lasting effect in after life."

Mr. WILLIAM KIRKBY, of Owens College, Manchester, thinks that, until the time comes when a two years' course of instruction is provided for pharmaceutical students, it will be necessary, if a student is to get all the benefit he should out of a pharmacy school, for him to have some previous knowledge of elementary chemistry and botany. The present arrangement requires the attendance of a man at classes on *materia medica* and pharmaceutical chemistry at the same time that he is getting up his elementary botany and chemistry. These technical subjects cannot possibly be properly apprehended unless a considerable knowledge of chemistry and botany has already been acquired. It should be urged upon all who really desire to make themselves efficient to attend classes of general instruction in these subjects.

Mr. R. C. COWLEY, of the Liverpool School of Pharmacy, finds that, in the case of some youths, the Minor examination is looked upon as a night-mare, a something that must be got over before reaching the desideratum of getting into business, and which may be put off to some future period, when possibly a kind providence will endow them with the necessary energy to put their shoulder to the wheel for just that period of time necessary to imbibe the minimum amount of knowledge required to satisfy the examiners. Evidently this type of man is eminently unsuited for the calling in life he has selected; a calling which requires a man, in order to make it a successful one, to have a reservoir of knowledge of various kinds to draw on, especially as the medical man continues to know less and less of pharmacy and its allied subjects. As our pharmaceutical examinations do not necessitate a compulsory course of training beforehand, apart from the hypothetical three years, this man will be, like the poor, always with us, and the writer is inclined to think that a compulsory curriculum would hardly eradicate him. Fortunately there are others of a different stamp, who, from their earliest entrance into the business, see the necessity for education, and apply themselves accordingly. It is of serious import that masters do not often impress on their apprentices the necessity of applying themselves to study during this period of their lives, and, what is worse to my mind, some do not allow the necessary time nor even foster the habit of study in those placed under their charge. The youth is fortunate who is placed under a master who tries to incite the love of study in his pupil, as it is extremely difficult to forget the work learned during one's pupilage, and those who take advantage of their fortunate position will not be afterwards handicapped thereby. But alas! it is often otherwise. The first step necessary to ensure success is to have a sound mathematical training. The writer has often seen men puzzling over a simple problem in volumetric analysis, and every examiner has doubtless seen the same. The next step is to make the best possible use of their time during their apprenticeship. There are dotted all over the country science and art schools, where a sound elementary knowledge may be obtained in most of the subjects necessary for the pharmaceutical examinations. Before seriously settling down to read up for the "Minor" a student should endeavour to reach the "Advanced" stage, or of course its equivalent. A young man who has honestly and conscientiously pursued this course should not have to go up for his examination twice. Sometimes a man may happen to scrape through his examination who should not, and sometimes a man who is well able to pass may, through sheer nervousness, fail. Those are the faults of examination, but of all tests of knowledge it is the best yet known. It is not suggested that education is the sole salvation of the present state of pharmacy, nor is it maintained that a successful student always makes a successful business man, but it is asserted that the present condition of pharmacy will yet be beneficially assisted by education, and that, other conditions being equal, the man with the widest knowledge of the sciences has a better chance of becoming a successful business man than the one who has just managed to scrape through his examinations.

Mr. CHARLES TURNER, F.C.S., of the Manchester College of Pharmacy, finds in actual experience that students for the Minor come to him in many cases knowing nothing of chemistry, botany, and the allied sciences; possibly half have done a certain amount of work and a few have seriously studied. He is of opinion that a student should, if possible, attend classes once a week as soon as he is eighteen or nineteen years of age. Such men should afterwards move into a more advanced class and will do better than average students from a technical school. All

schools of pharmacy should have a section devoted to junior students, and help the apprentices in the neighbourhood. In country places, however, this is impossible, and in that case apprentices and junior assistants are advised to join technical classes where possible, and gain a knowledge of the things which come to their hand, the names of flowers, etc.; if they cannot do that or obtain help let them learn from small books (Roscoe's, Scott's, or Edmund's 'Botany,' etc.) the principles of the life of the plants he sees, and the nature of the common drugs and chemicals he handles every day.

Mr. A. EBERLIN, Hon. Secretary of the Nottingham and Notts. Chemists' Association, states that the Council of the Association considers that a student should have taken a course of chemistry and passed an examination equivalent to the "elementary stage" of the Science and Art Department, prior to entering upon a special course of instruction.

Dr. MUTER, of the South London School of Pharmacy, is strongly in favour of a stringent Preliminary examination, including mathematics, and he considers that all young men during their apprenticeship should chiefly devote their time to attaining a perfect knowledge of the Pharmacopœia, and leave the sciences until they have an opportunity of studying them under competent guidance. So writes Mr. W. H. Dodd, Secretary to the School, in Dr. Muter's absence on a holiday.

Mr. C. EDWARD SAGE, F.C.S., Red Lion Square, London, is of opinion that Minor students should have passed the Preliminary examination or its equivalent, and in addition they should at least possess the knowledge of mathematics, physics, and chemistry, which is required of candidates for the London matriculation examination. Nothing is more tiring to the teacher, or irksome to a candidate over twenty years of age, than for the former to have to teach and the latter to learn Latin declensions, rule of three, and percentage, and the rudiments of chemistry and physics. Another point to which students would do well to pay attention is the study of the Pharmacopœia. In these days so many chemists buy nearly everything and the apprentices have little chance of learning their B.P. by practical experience, and in consequence they often start studying for their Minor with only a smattering of knowledge of the book which is published "by authority."

Mr. G. S. V. WILLS, F.L.S., M.P.S., of the Westminster College of Chemistry and Pharmacy, considers that the student should pass the "First" or Preliminary examination, and that having passed that examination, he should be able to read abbreviated Latin prescriptions in full. Having served three years' apprenticeship he should possess a fair knowledge of dispensing, and have made most of the ordinary galenical preparations in the Pharmacopœia. He ought to acquire an elementary knowledge of chemistry, pharmacognosy, and botany, such as can be obtained from any ordinary text-book, and though not absolutely essential, a course of postal tuition would lay a foundation upon which the superstructure could be thoroughly and substantially built in a very short space of time.

Mr. WATSON WILL, F.C.S., of the Metropolitan College of Pharmacy, expresses the opinion, based on nearly twenty years' experience, that for anyone to be successful with his work it is necessary for him to possess a sounder educational knowledge

than that demanded by our present miserable Preliminary examination, and that he should have an acquaintance with algebra and mathematics. A thorough knowledge obtained from practical experience of the processes of manufacture of B.P. preparations is also essential, in other words, a sound apprenticeship with a practical pharmacist. During apprenticeship the student should, if possible, attend Science Classes, and acquire a knowledge of botany and chemistry both from the theoretical and practical stand-points. The writer has always found that young men who have had the above advantages have invariably turned out the most brilliant students combined with high success in business. One of the greatest failings in the young pharmacist's education lies chiefly at the door of the individual who takes him as an apprentice, and rarely, if ever, educates him.

Mr. FRANK R. DUDDERIDGE, of the North of England School of Chemistry and Pharmacy, Newcastle-on-Tyne, thinks a student should commence the study of the sciences embraced in the Minor syllabus as soon as he begins his apprenticeship, the Preliminary examination to be taken previously. The practical details of the various processes in pharmacy should be performed by him in the course of his daily duties, as many of the B.P. preparations as possible being actually made by himself. He should gain the theoretical side by attendance at elementary classes during the winter evenings, such as are provided at his, the writer's, own and other schools of pharmacy, taking instruction also in elementary chemistry and botany, one or two subjects being studied during each year of his apprenticeship, at the close of which he should attend a full-time day course at a school of pharmacy for six months, and with reasonable application be able to pass the Minor at his first attempt.

Mr. W. B. COWIE, Ph. C., of the Edinburgh Central School of Chemistry and Pharmacy, considers that every student should have an elementary knowledge of chemistry, physics, and botany, and also a good general experience in dispensing, before entering a school of pharmacy. The average student, however, possesses none of these. In most cases his knowledge of the science subjects has been culled from Attfield and Bentley, without assistance or supervision. The result is that he is frequently far astray, and when he commences to study under teachers he has much to unlearn. Regarding dispensing, the average student on entering is at best but a mechanical mixer, and has had no experience in preparing pharmacopœial compounds.

Mr. G. E. SKERRY, M.A., of the City School of Chemistry and Pharmacy, is of opinion that under the present system many students waste their time, owing to their apprenticeship, and he would recommend an intermediate examination which might be passed between the first and second years of apprenticeship. This would, he thinks, not only raise the tone of the profession considerably, but give full occupation to apprentices at a very critical time. Continuing, he says, it is somewhat difficult to fix the amount of knowledge that should be possessed by a student before entering on a course at a school of pharmacy, but he should, at least, possess an elementary knowledge of chemistry, as regards non-metals, together with a practical acquaintance with the analysis of single salts. He should also have some acquaintance with botanical terms, gained by a study of a few wild flowers, and above all a practical knowledge of pharmacy, which should be, but often is not, possessed by a student who has served his apprenticeship.

Mr. R. B. GREAVES, F.C.S., of the Sheffield College of Pharmacy says that a student joining a pharmaceutical school for even a six-month course, without having some previous knowledge of his work, even though he be successful at his examination, can only have a very sorry idea of his calling. The most lamentable weakness of the average student of pharmacy is his defective knowledge or absolute ignorance of elementary mathematics. This accounts in a very great measure for the deplorably large number of rejections so familiar to everybody. For the more thoroughly grounded the candidate is in elementary mathematics the more easily and intelligibly does he grasp every detail of his work and the more invariably is he successful. In addition, before joining a school of pharmacy a student should be very forcibly impressed with the importance of acquiring an elementary knowledge of theoretical non-metallic chemistry, and especially some acquaintance with ordinary analytical processes.

Mr. B. KEEN, Ph. C., of Bristol, finds that those youths who have had a good general education, especially in mathematics, make most progress when they come to science.

Mr. GEORGE CLAYTON, F.C.S., of the Northern College of Pharmacy, thinks it is advisable that the student should have a good knowledge of elementary general chemistry, for instance, that which comes within the scope of the Science and Art Examinations first and second stages, and the same with regard to his botany, then he should be well acquainted with the Pharmacopœia, especially being conversant with the practical details of the galenic preparations therein. He feels sure a student who is familiar with these subjects would make satisfactory progress afterwards in the care of a good teacher.

Dr. A. B. GRIFFITHS, of the Brixton School of Pharmacy having had great experience in teaching students during the past fifteen years, firmly believes that the Preliminary examination should be made almost as difficult as the London matriculation. He says students of pharmacy have (as a rule) an extremely poor knowledge of arithmetic and mathematics. He is frequently being asked the meaning of the word "inversely" (law of gravitation, law of Boyle, law of gaseous diffusion, etc.), and finds very few "Minor" students can solve a problem in square root. He should say that 90 per cent., at least, of the "Major" students know nothing of sines, tangents, etc. (light and electricity). The best students are found to be those who have previously attended science classes (night classes) and who have conscientiously worked at the preliminary subjects either at school or afterwards.

Mr. FREDERICK DAVIS, of the Imperial College of Chemistry, is of opinion the student should be well grounded in an elementary knowledge of the British Pharmacopœia, gained by making the galenic preparations of that work during his apprenticeship and by the dispensing of prescriptions. An elementary knowledge of chemistry and botany would also be of great value.

Mr. STOKES DEWSON, of the Central School of Pharmacy, thinks pharmaceutical students should have a fair knowledge of elementary chemistry and of elementary botany, and should know enough elementary algebra to be able to solve simple equations before they commence a course of pharmaceutical instruction.

Pages for Pharmaceutical Students

CHAPTERS IN ORGANIC CHEMISTRY.

PRELIMINARY.

The division of chemistry into inorganic and organic was originally based upon the belief that compounds belonging to the latter class could not be produced artificially in the laboratory, but only resulted from the intervention of the so called vital force. The term organic chemistry is still retained, but it is frequently qualified by defining it as the chemistry of the carbon compounds, for Wöhler in 1828, by his synthesis of urea, showed that living matter was not essential to the formation of organic substances.

The thoughtful student must, however, be struck by the fact that the chemistry of the carbon compounds comprises a very much larger proportion of the whole field of chemistry than that of any other element. The cause of this is to be found in the capacity of carbon atoms to combine with each other, forming systems having a number of valencies which may be saturated by combination with various elements or groups. The formation of the immense number of carbon compounds depends then upon this property and the tetra-valency of carbon. For if an element is univalent, when two atoms of it are combined there is no further possibility of development as the valencies of both are satisfied, thus

If the element were divalent, the formation of a simple chain is possible having in any case only two valencies unsaturated

In the case of a trivalent element the number of possible compounds would be increased, and still more so in the case of a tetravalent element like carbon. No other element exhibits this property of forming a nucleus or chain of atoms to anything like the same extent. An interesting comparison is provided by the element silicon. Silicon and carbon are both tetravalent, and both fall in the same vertical column in the periodic arrangement of the elements. In their simpler compounds many analogies are also evident. The two oxides, CO_2 and SiO_2 , form with water the two acids, H_2CO_3 and H_2SiO_3 . Two simple hydrides are known, CH_4 and SiH_4 , and their halogen compounds are also similar in formula and constitution. Silicon also possesses the power to build up compounds like carbon, but only to a comparatively limited extent. For example, compounds such as tetra-methyl-silicane, $Si(CH_3)_4$, like tetra-methyl-methane, $C(CH_3)_4$, and hexa-ethyl-silicane,

In certain other cases silicon can replace carbon, as in silico-oxalic acid, $Si \cdot O \cdot OH$ analogous to ordinary oxalic acid, and in silico-propionic acid, $C_2H_5 \cdot SiO \cdot OH$.

The other elements exhibit the property of forming such compounds either not at all or to a less marked extent than silicon. Hence we do not meet in inorganic chemistry with the complex reactions and decompositions that present such difficulties for the beginner in organic chemistry. The complexities are, however, not so great as they seem at first sight, according to the systematic manner in which the main properties of

the carbon compounds can be arranged. From this it follows that by the proper study of a comparatively few typical bodies the student becomes possessed of information which not only relates to these particular bodies, but can be applied almost directly to the elucidation of the properties of a large number of other substances genetically related to the bodies already studied. In organic compounds the same element or group of elements may have very different properties according to the manner in which it is combined in the molecule. In order to explain these differences, constitutional formulæ are employed. These formulæ serve to show in a graphic manner not only the relative positions in which we suppose the constituent atoms to be grouped, but also the class of compound to which the substance belongs, but also, by inference, what reactions the substance will exhibit. It should never be forgotten that such constitutional formulæ with lines or dots to represent the atomic linkings are purely hypothetical. They are merely conventional methods of recording or recalling to the mind in a comprehensive manner certain facts or reactions represented by the formula. The student should never use a formula unless he can clearly explain it, and give at the same time the experimental results by which it is justified.

The necessity for practical work in organic chemistry cannot be too strongly impressed upon the student. It is absolutely essential to the proper comprehension of the subject and should be pursued to the utmost limits possible with the resources at his disposal. Much valuable work can be done with comparatively simple apparatus, and with a little improvising and a few additions the ordinary set of apparatus, costing about twenty shillings, will suffice for elementary purposes. Directions for carrying out typical experiments will be found in most elementary text-books; for example, those of Remsen, Perkin and Kipping, and Wade. The student will derive more valuable information from such a course of practical work than he could possibly acquire by reading alone. It will serve to make him familiar with the appearance and properties of a number of organic substances, and will materially facilitate his comprehension of facts and reactions which he is not able to verify by direct experiment.

ESSENTIALS OF VEGETABLE HISTOLOGY AS APPLIED TO PHARMACOGNOSY.

INTRODUCTORY.

Notwithstanding the improved state of pharmaceutical education the microscope has not yet attained that position in the practice of pharmacy which it has in the practice of medicine. Among medical men it is now regarded as an absolutely essential tool in the prosecution of every-day work, and the medical student is as much obliged to possess one as he is to possess his dissecting instruments. Among pharmacists it is regarded for the most part as a somewhat expensive toy, though there are a few who concede that occasionally it may be a useful aid in obscure cases of drug adulteration. When the fact is apprehended that there is a science of vegetable comparative anatomy, just as there is of animal comparative anatomy, it must be plain that it is a branch of study having a most important practical bearing upon pharmacognosy. The limits of variation in anatomical structure permit of being very definitely fixed according to known biological laws. Many histological features

of drugs therefore acquire a significance of much more value than such macroscopical characters as size, colour, and markings.

It would appear then that the pharmacist should avail himself without delay of the assistance of the microscope as a valuable tool for the identification of vegetable drugs. The management of the instrument is very readily acquired, and the technique of vegetable histology is by no means difficult to master. Further—it is a branch of study which does not require a laboratory, as it can be prosecuted in the ordinary dwelling room without any inconvenience. For those who are unable to take out a collegiate course in vegetable histology, it is proposed to sketch out a course of study which will serve the double purpose of giving an insight into general plant anatomy and a practical knowledge of the structure of official drugs.

So many articles and books have been written on the structure and use of the microscope that it is unnecessary to repeat such matters here. It may be well, however, to mention a few points which are the outcome of personal experience, and may conduce to the comfort of other workers.

The microscope should be provided with a tube of the length of about 160 Mm., that is to say, of the continental type. It is rarely possible to use the instrument in the inclined position because of the necessity for the frequent use of reagents. The longer tubes (250 Mm., of the English models cause considerable fatigue to the neck and back when used for any length of time. There are so many good English and continental makers that there is really no difficulty in obtaining at a moderate price an instrument in every way satisfactory for the use of the pharmacist. Two objectives are essential, namely, a 1 inch or $\frac{3}{4}$ inch, and a $\frac{1}{2}$ inch or $\frac{1}{3}$ inch. By some workers the $\frac{1}{2}$ inch objective is preferred to the 1 inch, or $\frac{3}{4}$ inch, but as it does not give so large a field it does not permit of the relations of the various tissues being seen to so great advantage as with a lower power. With two eye-pieces, a shallow and a deep one, and a draw tube the worker is provided with powers of magnification adequate for any work which he may have to undertake in this particular branch of microscopy. Of course, it is necessary when buying a microscope to bear in mind the possibility of its future use in bacteriology. Therefore, a stand should be purchased which is thoroughly rigid in all positions and which admits of the subsequent addition of an Abbe illuminator.

Amongst minor accessories, besides the usual glass slips and thin cover-glasses there will be required a good razor, hollow ground on one side and not too flexible, two or three needles in handles, a pair of forceps which close when pressure is applied, a pair of dissecting scissors with long shanks, one or two fine round sable brushes for handling sections, and a few thin glass rods and pipettes. Many other little implements may be thought desirable at first, but experience will show that those enumerated are all that are really useful. Sable brushes are the most efficient section lifters that can be desired, if only a little patience is expended upon in manipulating them when they are first used. For the staining and washing of sections nothing can excel, for cleanliness as well as for the ease with which sections are seen, the lids of one ounce white opal covered pots. One piece of apparatus calls for more notice than it usually receives, namely, the hone. The kind which is best adapted for sharpening the razor is that used by razor-setters. It is a white stone, often traversed by a large net work of fine lines, upon a substratum of slate. The cost of it perhaps will not appear to be proportionate to the purpose for which it is needed. But when it is remembered that good sections can only be obtained when the razor is in the pink of condition an extra shilling or two will prove not to

be badly invested in a good hone. The setting of the razor is one of the greatest stumbling blocks to be encountered at the outset of the study of the histology of drugs. The material is so difficult to bring to the best condition for sectioning that the razor edge suffers to a very great extent in a very short time, and the defect is not remedied by simple stropping, but recourse must be had to the stone. Considerable care in the setting of the razor is really necessary, because the better it is done the better sections will be obtained.

In the series of articles now commenced, it is proposed to treat in order, as far as possible, of the temporary mounting and examination of specimens; imbedding and section cutting; clearing; staining and permanent mounting; reagents and their uses; cell walls, their characters and reactions; cell contents, their characters and reactions; tissue systems and their elements; the practical examination of drugs under the divisions of roots, rhizomes, stems, barks, leaves, flowers, fruits, seeds, starches, hairs, glands, etc. Any suggestions with which readers may favour the Editor will receive careful consideration, and any questions which they may feel inclined to ask will be answered as satisfactorily as the present state of knowledge on the subject permits.

EXPLANATORY NOTES ON THE B.P.*

Acetanilidum.—When aniline is heated with glacial acetic acid aniline acetate is first formed. By heating this for some hours in a flask fitted with a reflux condenser one molecule of water is eliminated and acetanilide is produced.

Just as ammonia (from which aniline may be regarded as derived by substitution of the phenyl radicle, C_6H_5 , for one hydrogen atom) forms ammonium acetate by reaction with acetic acid.

By prolonged heating—

The very slight solubility of acetanilide in water should be remembered for purposes of practical dispensing. Heated with solution of potash it undergoes hydrolysis, a molecule of water being taken up again. Consequently aniline and acetic acid are regenerated, the latter combining with the alkali to form potassium acetate.

By adding a few drops of chloroform and warming the mixture, phenyl isocyanide is produced. This reaction is characteristic of all *primary amines*, i.e., bodies derived from ammonia by the replacement of one hydrogen atom by a group or radicle. The primary amines contain, therefore, the group NH_2 .

Note that this reaction (Hofmann's) only occurs in presence of free alkali, and is of interest in showing the difference between the constitution of isomeric cyanides and isocyanides. The phenyl-isocyanide produced in the reaction above probably has the nitrogen linked directly to the phenyl radicle $\text{C}_6\text{H}_5\text{-N-C}$, on account of its production from aniline $\text{C}_6\text{H}_5\text{-NH}_2$, while phenyl cyanide would have the carbon directly united to the phenyl radicle $\text{C}_6\text{H}_5\text{-C-N}$.

Solution of bromine produces an insoluble brom-acetanilide. A similar reaction does not occur with phenacetin (*q.v.*), because in the latter the hydrogen atoms remaining in the aromatic nucleus are "protected" by the presence of the ethoxy group ($\text{O}\cdot\text{C}_2\text{H}_5$).

Acidum Aceticum.—The darkening produced in the test for formates would be due to the precipitation of metallic silver through the reducing action of formic acid. The permanganate

* NOTE—This series of articles should be read in conjunction with the series referring to the 1885 B.P., and published in the *P. J.* during 1897 and the earlier portion of the current year.

test is based upon the fact that the tarry matters, like most other organic substances, reduce the potassium permanganate and consequently destroy the crimson colour of the solution, while acetic acid is not oxidised by that body in the cold. Inspection of the formula for acetic acid, CH_3COOH , readily shows why it is not easily oxidised, for the carbon atom in the carboxyl group is already fully oxidised and the other exists as a paraffin residue, and it is well known that such alkyl groups are only oxidised with difficulty.

Acidum Aceticum Glaciale.—The increase in specific gravity by the addition of water is progressive until the mixture contains 77 per cent. acid and 23 per cent. water. This proportion corresponds to the formation of the hydrate, $\text{CH}_3\text{COOH}\cdot\text{H}_2\text{O}$, and the fluid has a sp. gr. of 1.075. If the dilution be continued, the sp. gr. falls progressively from this point, and when the mixture contains 46 per cent. acetic acid the sp. gr. is 1.058, or the same as the original glacial acid.

Acidum Arseniosum.—When arsenious anhydride dissolves in water, the solution behaves as if it contains the corresponding arsenious acid formed by combination of water with the anhydride.

The formula As_4O_6 —just double the one used for simplicity in the equation above—is based upon the vapour density determination, the sp. gr. of its vapour being 198. When silver nitrate is added to a solution of arsenious acid in water—without addition of acid or alkali—silver nitrate is produced, but only partly precipitated because of its solubility in the nitric acid simultaneously liberated in the double decomposition—

The test is rendered much more delicate by using the solution of silver ammonio-nitrate, since the nitric acid is hereby neutralised. Silver iodide, which is also yellow, is easily distinguished by its insolubility in both nitric acid and ammonia.

In the volumetric test, solution of the anhydride is facilitated by adding sodium bicarbonate. Some of this bicarbonate is converted into carbonate during the ebullition. The presence of an alkali, to neutralise the arsenic and hydriodic acids produced during the titration, is necessary for the completion of the reaction—

The alkaline carbonates and hydroxides react with iodine, and hence the bicarbonate is employed, since this salt does not absorb iodine during the titration. The addition of the three drops of hydrochloric acid is intended to remove the carbonate produced during the solution of the arsenic, partly by conversion into sodium chloride and partly by reversion to bicarbonate through the carbonic acid formed by the action of the hydrochloric acid.

If any sulphide be present in the anhydride as an impurity it dissolves in solution of ammonia forming a thio-salt corresponding to the arsenites *i.e.*, $(\text{NH}_4)_3\text{AsS}_3$, in which sulphur replaces the oxygen. When the solution is acidulated with hydrochloric acid, yellow arsenic sulphide is precipitated, because the free acid corresponding to this thio-salt is unstable and decomposes into H_2S and As_2S_3 .

The formation of soluble alkali thio-salts by the sulphides of arsenic, antimony, and tin, and their decomposition by addition of acid, is utilised in qualitative analysis to effect the separation of these metals from the other metals precipitated with them by sulphuretted hydrogen in acid solutions. Compare your analytical tables and memoranda.

Acidum Benzoicum.—The present Pharmacopœia recognises the acid of artificial origin as well as the acid obtained from benzoin. When toluene (methyl-benzene), $\text{C}_6\text{H}_5\cdot\text{CH}_3$, is boiled in a flask fitted with a reflux condenser with chromic or nitric acid the methyl group is gradually oxidised to carboxyl with formation of benzoic acid $\text{C}_6\text{H}_5\text{COOH}$. This occurs not only with toluene but also with all derivatives of benzene having one side chain, no matter what the composition of this side chain may be. For example, propyl benzene, $\text{C}_6\text{H}_5\text{—CH}_2\cdot\text{CH}_2\cdot\text{CH}_3$, benzaldehyde, $\text{C}_6\text{H}_5\text{—C}\cdot\text{O}\cdot\text{H}$, and cinnamic acid, $\text{C}_6\text{H}_5\text{—CH}\cdot\text{CH}\cdot\text{COOH}$, all yield benzoic acid by oxidation, the side chain being oxidised while the aromatic nucleus remains unattacked. The latter is only oxidised by energetic oxidising agents at an elevated temperature. The oxidation of toluene is effected comparatively slowly. If benzyl chloride,

$\text{C}_6\text{H}_5\text{CH}_2\text{Cl}$, be first prepared the oxidation of this body can be carried out much more quickly than that of the original hydrocarbon. This method is consequently adopted commercially. To prepare the benzyl chloride *boiling* toluene is submitted to the action of chlorine preferably exposed to strong light. This causes substitution to occur in the side chain; if chlorination be carried out at a low temperature and in the dark the substitution takes place in the benzene nucleus, and quite another compound results, *viz.*, chlor-toluene, $\text{C}_6\text{H}_4\text{Br}\cdot\text{CH}_3$. This statement is of general application to the action of bromine and chlorine on the homologues of benzene, and should be carefully remembered with the reservation that *in actual practice* a small quantity of the derivative contrary to the rule is usually obtained. In the present case a little chlor-toluene is formed, and by subsequent oxidation yields chlor-benzoic acid, $\text{C}_6\text{H}_4\text{Cl}\cdot\text{COOH}$. The fact that the chlorine remains in the oxidised product is a proof that the substitution was effected in the benzene nucleus and not in the side chain (*vide infra*, test for chlorobenzoic acid). Note carefully the effect on the oxidisability of the side chain produced by the entrance of the chlorine atom in benzyl chloride. The entrance of various elements and groups often profoundly modifies the behaviour of the compound towards reagents, and this is frequently utilised in synthetic processes.

In the urine of herbivorous animals, such as the ox and horse, hippuric acid is found in place of the uric acid of the urine of carnivorous animals. Hippuric acid is benzoyl-amido-acetic acid.

Acetic acid, $\text{CH}_3\cdot\text{COOH}$.

Amido-acetic acid, $\text{NH}_2\text{CH}_2\cdot\text{COOH}$.

Benzoyl-amido acetic acid, $\text{C}_6\text{H}_5\text{CO NH}\cdot\text{CH}_2\text{COOH}$.

When this is boiled with dilute hydrochloric acid hydrolysis occurs, with formation of benzoic and amido-acetic acids.

As a point in nomenclature note that the benzoyl radicle bears the same relationship to benzoic acid as acetyl (CH_3CO) to acetic acid. When the hydrolysis is completed the benzoic acid can be filtered off, leaving the amido-acetic acid in solution as hydrochloride. Amido-acetic acid or glycocholl, as it is called (because it has a sweet taste and was originally obtained from colloid substances like gelatin), is an example of a body which is capable of acting as a base by virtue of its ammonia residue, or as an acid, because it contains replaceable hydrogen in a carboxyl group.

Benzoic acid from hippuric acid, unless very carefully purified, has an unpleasant odour indicative of its origin. It is probably sometimes mixed with some benzoic acid from benzoin in order to cover this odour. The careful application of dry heat in an open tube reveals the presence of most impurities, since these for the most part are not volatile like benzoic acid, but remain behind and carbonise. If any chlorobenzoic be present (*vide supra*) it will be decomposed by ignition with calcium carbonate, a proportionate quantity of calcium chloride being formed. (Compare methods for determination of halogens in organic compounds in your text-book). Dilute nitric acid will convert the excess of calcium carbonate into soluble calcium nitrate and dissolve any calcium chloride which may have been formed. The latter may then be detected in the usual manner by the formation of silver chloride. The detection of cinnamic acid, which occurs sometimes in the acid prepared from benzoin, depends upon its oxidation to benzaldehyde, $\text{C}_6\text{H}_5\text{C}\cdot\text{O}\cdot\text{H}$. When fully oxidised cinnamic yields benzoic acid, but the intermediate stage of oxidation to benzoic aldehyde is easily observable under the conditions described.

The last test serves to detect not only cinnamic and hippuric acid, but almost every other form of organic impurity. Permanganate of potassium in neutral solution has no action on benzoic acid, for in this compound the side chain is fully oxidised, and the benzene nucleus is unaffected by the reagent (*cp.* acidum aceticum) under the conditions mentioned. Compounds, like the other two acids mentioned, having side chains not fully oxidised are oxidised by the permanganate with consequent discharge of the pink colour. Note that in neutral solution the permanganate is reduced to the state of hydrated manganese dioxide, $\text{MnO}_2\cdot\text{H}_2\text{O}$, which forms a brownish precipitate, while in acid solution the oxidation is more energetic, and the manganese is reduced to the state of manganous oxide, MnO , which in presence of acid dissolves to form the corresponding salt, *e.g.* MnSO_4 and MnCl_2 .

ADDRESS TO STUDENTS.

SINCE last the opportunity was taken in these columns to address pharmaceutical students especially, considerable changes have been effected in the regulations affecting pharmacy, new Bye-laws having been adopted by the Pharmaceutical Society and approved by the Privy Council, while the Pharmacy Acts have been amended in several important particulars. The alterations in the Bye-laws affect students in more ways than one, for though the new stipulations regarding their preliminary education will not come into force for two years from the present date, all who have recently been apprenticed to the craft are personally interested in the changes affecting the qualifying examination and the conditions of membership of the Pharmaceutical Society. It may also be urged here that, inasmuch as the standard of the Preliminary examination is being raised primarily in the interests of students themselves, all who have not yet passed that examination will do well, for their own sake, to enter for an examination of as high and comprehensive a character as will be compulsory two years hence.

Since many students who read these lines may not be acquainted with the future requirements, it may be as well to explain that after August, 1900, persons desiring certificates of competent skill and qualification to be registered as chemists and druggists under the Pharmacy Act, 1868, must produce a certificate of having passed an examination in English grammar and composition, Latin, one modern foreign language, and also in arithmetic, algebra, and Euclid. Such examination must be conducted by an approved examining body and the advanced standard will assimilate the requirements in respect of preliminary education with those enforced by the medical authorities. It will be observed that no scientific subject is included in the syllabus, so that the standard of the Matriculation examination of the University of London will not be quite attained, but the latter will of course be one of the approved examinations, and students are strongly urged to rest content with nothing short of the London University certificate as the

beginning of their professional career. For the more a student learns before he enters upon the period of pupilage the smoother will be his path subsequently and the brighter his prospects of success.

After satisfying this first test of general school knowledge, the student will naturally set about gaining the best technical training he can. No better place can offer itself for that purpose than the establishment of a first-class chemist and druggist. There he should make the most of his opportunities during the next few years, supplementing the shop training by attending lectures on chemistry, botany, and physics, whilst also devoting as much time as possible to practical experimental work in those sciences, as well as practical pharmacy. And then reason suggests that he should devote twelve months to a systematic course of study at some recognised institution, prior to presenting himself for the qualifying examination. Home work alone has sufficed in many instances to prepare the candidate for this ordeal, but at a heavier cost than is usually recognised at the time, for, however thoroughly the solitary student may work at home, he is apt to proceed in the most roundabout manner; he thus wastes much valuable time and misses much that would prove of incalculable advantage to him in not having the guidance of experts in his studies and the stimulating assistance of association with fellow students, day by day.

In any case he will arrive sooner or later at his immediate goal—the examination room, and must there prove, to the satisfaction of the assembled examiners, that he possesses such knowledge of his business as will fully meet the statutory requirements, and that he is fit to be entrusted with the control of a pharmacy, the preparation and dispensing of medicaments and the distribution of poisonous substances. The Minor examination is now no mean test of a candidate's capacity and it is rendered all the more severe inasmuch as he must satisfy the examiners that besides possessing a sound knowledge of botany, materia medica, chemistry, physics, posology, and the law relating to the sale of poisons, he is fully competent to translate and dispense prescriptions. Serious weakness in any one branch will be sufficient to ensure failure. To avoid that it is essential that deep rather than surface knowledge should be possessed by the candidate. The best safeguard against the annoyance of failure, apart from honest and systematic work, is an extended range of general knowledge, acquired as far as possible before joining the ranks of pharmacy and added to continually during the period of pupilage. Even though the Preliminary examination passed be the London Matriculation test, much more can yet be done—in the direction of extending one's acquaintance with mathematics, acquiring dexterity of manipulation, and so forth—to facilitate progress later in life, and the more thoroughly the student continues to work from the very outset of his career the greater will be his satisfaction when, a few years later, he gains his diploma as a legally qualified chemist and druggist.

Above all, students should bear in mind that this qualification represents the minimum requirement held to be indispensable, in the public interest, for all persons carrying on business as chemists and druggists. That is the palladium of the craft, the only ground for distinguishing it from other trade occupations. It is therefore the duty of every chemist and druggist to uphold the standard of qualification, however much the particular class of business carried on may differ from high-class pharmacy.

ANNOTATIONS.

SOMETHING SENSATIONAL was expected from Sir William Crookes in his presidential address to the British Association, but nothing so surprising as that he should pose as an authority on the food supply of the world. Assuming the accuracy of the numerous figures he quotes, one marvels at the industry which has enabled him to attain such a comprehensive grasp of a subject of the highest economic importance, yet quite out of his ordinary range. The gist of his conclusions in this matter is that danger threatens the Caucasian race through the possibly near exhaustion of the world's stock of fixed nitrogen, as assimilated by that race as wheat-eaters. Such exhaustion, he points out, is a matter of far greater importance than the coming scarcity of British coal prophesied by Mr. Stanley Jevons, for "it means not only a catastrophe little short of starvation for the wheat-eaters, but indirectly, scarcity for those who exist on inferior grains, together with a lower standard of living for meat-eaters, scarcity of mutton and beef, and even the extinction of gunpowder."

THE ARTIFICIAL PRODUCTION OF NITRATE, however, is well within the bounds of possibility, and it is shown that Niagara alone is capable of supplying the required electric energy to produce nitrate by combustion of the atmosphere, without much lessening its mighty flow. The problem is to generate enough energy to produce twelve million tons of sodium nitrate annually, and on that score Sir William thinks the future can take care of itself. "The artificial production of nitrate is clearly within view, and by its aid, the land devoted to wheat can be brought up to the thirty bushels per acre standard. In days to come, when the demand may again overtake supply, we may safely leave our successors to grapple with the stupendous food problem." But both the present and future generations must develop and guide Nature's latent energies, and utilise her inmost workshops, Central Africa and Brazil being called into commercial existence to redress the balance of Odessa and Chicago.

MONIUM—ANOTHER NEW ELEMENT—is Sir William Crookes' personal contribution to the recent brilliant achievements of science, which he so ably summarises. This element owes its detection to the spectroscope, and its discovery is the latest outcome of an extended investigation of a series of spectra produced by passing the phosphorescent glow of yttria, under molecular bombardment *in vacuo*, through a train of prisms. The spectrum of monium has been revealed high up in the ultra-violet, where, "like a faint nebula in the distant heavens, a group of lines was detected, at first feeble and only remarkable on account of their isolation. On purification, the lines grew stronger, and within the last few weeks absolute evidence has been obtained that another member of the rare earth group has been added to the list. The name "monium" (from the Greek *μόνος*, alone) fitly indicates the isolation of the lines distinguishing the new element, almost at the extreme end of the ultra-violet spectrum. The wave-lengths of the principal lines are 3120 and 3117, and the atomic weight of the element is not far from 118—between that of yttrium and lanthanum.

OF PSYCHIC RESEARCH much less was said in Sir William's address than most people would have liked. He thinks he sees a little further now than when he took part many years ago in certain psychic researches, and he has glimpses of something like coherence among the strange elusive phenomena then new to

science, and not yet accepted by any but a select few. He believes that telepathy is possible—that thoughts and images may be transferred from one mind to another without the agency of the recognised organs of sense, and that knowledge may enter the human mind without being communicated in any hitherto known or recognised ways. It is pointed out that some physiologists think the essential cells of nerves do not actually touch, but are separated by a narrow gap which widens in sleep while it narrows almost to extinction during mental activity. "This condition is so singularly like that of a Branly or Lodge coherer as to suggest a further analogy. The structure of brain and nerve being similar, it is conceivable there may be present masses of such nerve coherers in the brain whose special function it may be to receive impulses brought from without through the connecting sequence of ether waves of appropriate order of magnitude.

"RÖNTGEN'S RESEARCHES have familiarised us with an order of vibration of extreme minuteness compared with the smallest waves with which we have hitherto been acquainted, and of dimensions comparable with the distances between the centres of the atoms of which the material universe is built up; and there is no reason to suppose that we have here reached the limit of frequency." It is known that the action of thought is accompanied by certain molecular movements in the brain, and here we have physical vibrations capable from their extreme minuteness of acting direct on individual molecules, while their rapidity approaches that of the internal and external movements of the atoms themselves." Confirmation of telepathic phenomena is held to be afforded by many converging experiments, and by many spontaneous occurrences only thus intelligible. But be that as it may, the phenomena are without doubt dependent on physical causes, and we are told that it is unscientific to call in the aid of mysterious agencies to account for them when with every fresh advance in knowledge the ether vibrations are shown to have power and attributes abundantly equal to any demand, even to the transmission of thought.

DR. D. MORRIS, C.M.G., D.Sc., lately Assistant Director of the Royal Gardens at Kew, has now been formally appointed by the Secretary of State for the Colonies, Commissioner of Agriculture for the West Indies, to preside over the new Agricultural Department, which has been constituted as a charge on Imperial funds in accordance with the recommendation of the West India Royal Commission, and the recent vote of the House of Commons. Dr. Morris leaves this country for Barbados by the Royal Mail Steamer "Orinoco," from Southampton on the 21st instant, and his official address after that date will be "Commissioner, Imperial Department of Agriculture, Barbados, West Indies."

THE NEW B.P. was under consideration at the annual meeting of the Canadian Medical Association, held in Quebec last month. Dr. T. D. Reed, of Montreal, urged that the book should be carefully studied and adopted as the absolute standard for the Dominion, and in view of the fact that no date had been named for the coming into force of the new work, he moved that, "whereas a revised edition of the British Pharmacopœia has been issued containing numerous and important changes, and whereas uncertainty exists as to the date when the British Pharmacopœia, 1898, is to be considered in force, the Canadian Medical Association in annual meeting assembled, recommends that October 1, 1898; be taken as the date on and after which in the absence of instructions otherwise, physicians' prescriptions should be compounded with the

preparations of the British Pharmacopœia, 1898." This motion appears to have been adopted, after some more or less complimentary opinions on the British Pharmacopœia had been aired. Though that work is pretty generally followed in Canada, its authority is not unquestioned there. Dr. MacNeill is reported as saying that the United States Dispensatory includes all that is best in the British, French, and German Pharmacopœias, and that it is very extensive and full of information. If the B.P. is to be taken as the standard, it should, he thinks, be improved and extended. Ultimately Dr. Roddick moved the appointment of a Committee to impress the matter upon the attention of the Federal authorities, and that was agreed to.

THE PROTEST OF ARBROATH CHEMISTS against the dispensing of medicines at the local infirmary by a person who possessed no statutory qualification for such work, has proved of little avail, having resulted only in the appointment as dispenser and nurse of another person without any pharmaceutical qualification, at the magnificent salary of thirty pounds per annum. The directors were recently reported to be considering whether they could arrange for the employment of "a nurse legally qualified to dispense medicines," but as the name of the person appointed does not appear in the Register of Chemists and Druggists for the current year, we can only conclude that a legal qualification was felt to be too expensive a luxury for the poor of Arbroath.

RULES FOR THE PRESCRIPTION COUNTER are more often understood than expressed, when they exist at all, but it is undoubtedly better to have them printed and suspended in a prominent place in every dispensing department. The following rules, which occupy a prominent position over the prescription counter of a Detroit pharmacy, are copied from the *Bulletin of Pharmacy* in the hope that they may prove useful, if only as suggestions, to some of our readers:—

"I. Keep the prescription scales clean, and when not in use keep them covered.

"II. Keep the dispensing bottles well filled and always perfectly clean.

"III. Keep everything in its proper place.

"IV. After using a utensil, or a dispensing bottle, do not leave it on the prescription counter, but place it back where it belongs.

"V. When compounding prescriptions do not carry on a conversation with anyone.

"VI. Keep customers out from behind the prescription case.

"VII. Label every package of drugs sent out, and when poison, be sure and give the antidote.

"VIII. When compounding prescriptions do not let your mind wander off to something else, but remember that you hold in your hands the life of a human being, and act accordingly.

"IX. Always charge prescriptions, or any other goods, before wrapping them up."

THE HAMPSTEAD ANALYST, Mr. A. W. Stokes, finds much less to complain of than others in similar positions, for he reports that, out of three hundred and ten samples of food, drugs, and disinfectants analysed by him during the quarter ending March 25 last, only two were found to be adulterated. The drugs examined numbered fifty-five samples, consisting of about twenty different articles; some of these were general articles in stock, others were made up from special prescription. In all cases they were found to be genuine, of full strength, and properly compounded. In no case was a cheaper material substituted for any part of the drug

asked for. "It is very satisfactory to know," observes the analyst, "that if, in spite of his salubrious surroundings, anyone at Hampstead needs physicking, there is a reasonable certainty of his getting pure drugs."

A DEMONSTRATION HAS BEEN GIVEN before the Surgical Section of the British Medical Association in Edinburgh by Mr. Geo. Peters, of Toronto, of a new method of making casts of living objects, anatomical subjects and pathological specimens. The process consists in spraying melted paraffin wax over the whole surface of the object, cooling it by spraying ice-cold water at the same time, strengthening the mould with plaster of Paris and removing it in as many sections as the nature of the subject calls for. The advantages of the system are, minuteness of detail on the surface of the cast and the absence of the compressing effects so noticeable when plaster of Paris or other heavy materials are used.

A GOOD STORY is told of a Birmingham lady who recently took her daughter to a local physician for advice. According to the *Medical Times*, the girl was suffering from what is known as "general lowness." There did not appear to be much the matter with her, but she was pale and listless, and did not care about eating or doing anything. The doctor, after due consultation, prescribed for her a glass of claret three times a day with her meals. The mother, who was somewhat deaf but apparently heard all he said, bore off her daughter determined to carry out the doctor's orders to the very letter. In ten days they were back again, and the girl looked quite a different creature. She was rosy cheeked, smiling, and the picture of health. The doctor congratulated himself upon the keen insight displayed in his diagnosis, but was somewhat disconcerted when he learnt that owing to the mother's deafness his instructions had been mistaken for carrots, which the girl had obediently eaten three times a day.

THE PADWICK CRICKET COLLECTION, which is now announced as being in the market, is noteworthy as having been formed by the late Mr. T. Padwick, pharmaceutical chemist, of Redhill, who died a few months ago. A catalogue of this remarkable collection, extending to twenty octavo pages, has been issued by Mr. Alfred J. Gaston, of 133, Ditchling-rise, Brighton. Mr. Padwick probably spent many hundreds of pounds on his library, for he appears to have bought everything at all bearing on the subject. According to a note in the *Times*, the earlier of the rarities include James Love's "Cricket," an heroic poem published in 1770, and "The Kentish Cricketers," also a poem, issued in 1773, neither of which was known to the bibliographer Lowndes. There are two copies of Hoyle's "Games," 1775, a copy of the *New Universal Magazine* (one of the many rivals of the *Gentleman's*) for 1752, containing "the rules of the game at cricket, as settled by the Cricket Club in 1744, played at the Artillery Ground, London," with a folding plate depicting the game—one of the earliest representations of cricket with two stumps and the old-fashioned club bat. There are also North's "Nottingham Cricket Matches," 1771-1829; Sutton's "Nottingham Matches," 1771-1853; one complete and several incomplete sets of Fred Lillywhite's "Guide," and at least one copy of probably every book dealing with or relating to the game published during the last half century. The pictures, photographs, and engravings bearing on the game of cricket are also very numerous, the most important being, perhaps, "A Cricket Match," said to be by Morland, and over 100 years old, taken from the Cricketer's Arms, Chertsey.

How to Become a Pharmacist in Great Britain.

Legal Requirements and Hints on Procedure.

In Great Britain the legal qualification for carrying on the business of pharmacy is that of "chemist and druggist." The conditions of registration as a chemist and druggist are that the candidate must be of the full age of twenty-one years, he must have been engaged for at least three years in the translation and dispensing of prescriptions, and have passed a simple scholastic examination in Latin, English, and arithmetic, followed by the Minor or qualifying examination, which tests his knowledge of chemistry, physics, botany, materia medica, prescription-reading, dispensing, practical pharmacy, and the poison regulations. To secure the higher title of "pharmaceutical chemist" he must subsequently pass the Major examination, the subjects of which are advanced chemistry, physics, botany, and materia medica.

As pointed out in the last Student's Number of the *Pharmaceutical Journal*, the first step in any properly arranged course of technical education is to show proof of satisfactory school training. This, the would-be pharmacist should do by passing one of the scholastic examinations specified in the list on page 308, preference being given to the Matriculation examination of the University of London. The period of pupilage need not exceed three years, but the student will benefit if he should be apprenticed for a longer period, so long as the indentures include a clause permitting him to attend day classes during the last year. Apprenticeship in a good all-round business is strongly recommended, as under such circumstances the peculiar value of the pharmaceutical training is better brought out than is otherwise possible. As soon as apprenticeship is entered upon a copy of the pamphlet 'Advice to Students' should be obtained from the Secretary of the Pharmaceutical Society, 17, Bloomsbury Square, London, W.C., who will send it free on application. This pamphlet contains detailed information as to the best way of studying chemistry, botany, materia medica, and pharmacy during apprenticeship.

The book that should most engage the student's attention from the outset of his career is the British Pharmacopœia; he should compare the drugs, chemicals, and galenical preparations in the pharmacy with the official descriptions, commit doses to memory, and learn the thousand and one facts that must be known sooner or later. The practical study of chemistry should also be commenced during this first year, and the mysteries of prescription Latin, concerning which the article by Mr. Ince (see p. 281) should be consulted, will serve to fill up odd moments. During the second year of pupilage the student's knowledge of chemistry may be applied in the interpretation of passages in the Pharmacopœia that were not clear when first attacked. Attfield's 'Chemistry' and the "Explanatory Notes on the B.P.," now appearing in these pages, will be found the best guides in this direction. Botany should be studied practically in the fields and lanes, with Holmes' 'Botanical Note Book' and John's 'Flowers of the Field' as constant companions. This might be followed by a course of lectures on botany, accompanied by practical work. Chemistry, however, should receive the lion's share of attention, and the B.P. constitute the student's chief text-book. Materia medica and practical pharmacy may be attacked systematically the third year, with the aid of the most recent text-books, though numerous facts bearing on both subjects should have been already accumulated. It will also be found advantageous, as has been repeatedly urged, to prepare for the Jacob Bell Scholarships

examination. The subjects of this examination—Latin, French or German, English, arithmetic, chemistry, pharmacy, and botany—should all be more or less familiar to the student, and the mere attempt to win one of the scholarships will result in incalculable benefit to the candidate, whether he be actually successful or not.

The next step will probably be to take a college course in preparation for the qualifying examination. Particulars of the various institutions where suitable courses are conducted will be found at page 317 *et seq.* Nine to twelve months should be devoted to preparation for the Minor, and as much more time should be spared subsequently for further study, prior to entering for the Major examination. Whilst the Minor qualification confers the title of "chemist and druggist," and is all that is legally necessary to practise pharmacy without let or hindrance, while entitling the successful candidate to be elected to full membership of the Pharmaceutical Society, passing the higher examination gives the right to the title "pharmaceutical chemist," and exempts the holder from all jury service.

The Cost of a Pharmaceutical Training.

With regard to the question of cost, the initial expense will be the "premium" which will be required by the would-be apprentice's master. As has been pointed out on many occasions, probably no step in the young pharmacist's life requires greater circumspection than this pupilage or apprenticeship. When the duties and obligations are properly carried out by the contracting parties on both sides, the apprentice will learn more, and his receptive mind will receive more lasting impressions than at any other period of his career. A pharmacist who takes an apprentice into his business virtually has the power of training him into a good, an indifferent, or a bad pharmacist, and no one should take an apprentice with a premium unless he has the opportunity, the capability, and the intention of teaching his pupil the rudiments of his art and business. It is to ill-directed apprenticeships that much of the indifference and lack of interest in the craft displayed among the junior members can be attributed; and also, to a still greater degree, the large number of failures at the examinations. The principal who "turns out" his apprentices well trained and well equipped for their future career, confers a benefit not only on his individual pupils, but also on the pharmaceutical body as a whole. Such tuition and supervision for a period of three years cannot, however, be had for less than £80 to £100. To this must be added the cost of clothing and pocket money, books, and the fees for classes in elementary chemistry, botany, and physics. The total cost may be set down approximately as follows:—

FEES FOR SCHOOL, LECTURES, ETC.

	£	s.	d.
Elementary Course	30	0	0
Advanced "	18	0	0
Books (at least)	8	0	0
Examination Fees, Minor	5	5	0
" " Major	3	3	0
Apparatus	2	0	0
Maintenance for 62 weeks at 30s.	98	0	0
Clothing and incidental expenses	15	0	9
	174	8	0
Premium for 3 years' pupilage	100	0	0
Clothing and incidental expenses for 3 years' pupilage ..	50	0	0
Total cost of pharmaceutical training	324	8	0

This scheme of cost is intended to give a fair average, and may obviously be modified, according to circumstances.

The Student's Library.

To every pharmaceutical student the choice of suitable text-books is a difficult matter. It is important to distinguish between text-books and books of reference. The economical will content themselves with the former, and these notes apply largely to such students as wish for trustworthy books that will enable them to get a thorough knowledge of their work without putting them to unnecessary expense. The Minor requirements will be considered first, and at the outset it may be stated that if a wise choice of books is made for the work of the qualifying examination but few more will be needed to cover the Major work.

CHEMISTRY.—Newth's 'Inorganic Chemistry' (Longmans; 6s. 6d.). Attfield's 'Manual' (Gurney and Jackson; 15s.). Owens College 'Laboratory Tables' (Coinish; 1s. 6d.). Wade's 'Introduction to the Study of Organic Chemistry' (Sonnenschein; 7s. 6d.). Woodward's 'Chemical Arithmetic,' Part I. (Simpkin, Marshall; 2s.).

BOTANY.—Scott's 'Introduction to Structural Botany' (A. and C. Black; 3s. 6d.). Green's 'Manual,' vols. I. and II. (Churchill; 7s. 6d. and 10s. 6d.). Bower's 'Practical Botany for Beginners' (Macmillan; 3s.). Wishart's 'Botanist's Vade-Mecum' (Livingstone; 2s. net); Holmes' 'Botanical Note Book' (Dulau, 3s.).

PHARMACY.—1898 British Pharmacopœia (Spottiswoode, 10s. 6d.); Squire's 'Companion to the British Pharmacopœia' (Churchill, 12s. 6d.); Proctor's 'Lectures on Practical Pharmacy' (Churchill, 14s.); Lucas' 'Practical Pharmacy' (Churchill, 12s. 6d.).

MATERIA MEDICA.—Southall's 'Materia Medica' (Churchill, 6s.).

PHYSICS.—Aldous' 'Elementary Course of Physics' (Macmillan; 7s. 6d.); Everett's 'Physics' (Blackie; 3s. 6d.).

LATIN.—Ince's 'Latin Grammar of Pharmacy' (Baillièrè; 5s.).

The foregoing selection can be depended on as the best that is attainable at present. Passing to a more detailed discussion of this subject, it may be stated that the extreme popularity of Newth's 'Chemistry' is of itself a recommendation. The first part treats of the fundamental principles and theories of chemistry, the rest of the book deals with the metals and non-metals, giving just the required information in a comparatively small space. Bloxam's 'Chemistry' (Churchill, 18s. 6d.), is more suitable as a book of reference, whilst Ramsay's 'Elementary Systematic Chemistry' (Churchill, 4s. 6d.), does not contain enough information for examination purposes. Attfield's 'Manual' is too well known to need many remarks, it will be found useful in preparing samples of pure chemicals, *e.g.*, potassium permanganate, and for elementary quantitative analysis. Chemical arithmetic frequently offers some difficulty to Minor candidates. A perusal of Woodward's 'Chemical Arithmetic,' Part I., will render the subject not only clear but interesting. Wade's well-written book contains more information than is wanted for the Minor, but as it is the best Major text-book, the student will do well to use it in his Minor work, and pick out what is required. After working through the qualitative tables in 'Attfield,' no better course is open than to follow the Owens College tables for a time; the explanatory footnotes given are extremely helpful.

In botany the study of Scott's first volume is to be recommended in the first instance. In this little book the main elementary principles of the science are set forth in fascinating language, and the three higher groups of plants, the dicotyledons, the monocotyledons, and the gymnosperms, illustrated by the type system by means of the wallflower, the lily, and the spruce fir; afterwards Green's first volume will be read with greater profit. The second volume is necessary for its chapters on physiology. Bower's 'Practical Botany' is the best laboratory companion, as it gives full directions for section-cutting, and the preparation of the necessary microscopical slides. For the field-botanist no handier books have yet been written than Wishart's 'Botanist's Vade Mecum' and Holmes's 'Botanical Note Book.' A satisfactory all-round English work on pharmacy is still a desideratum. Proctor's 'Lectures on Practical Pharmacy' is at present the best, Lucas' 'Practical Pharmacy' is also officially recommended. Squire's 'Companion to the British Pharmacopœia' gives invaluable information concerning incompatibles and other dispensing notes, besides

practical remarks on the chemical and vegetable materia medica of the British Pharmacopœia. It should, however, be remembered that the British Pharmacopœia itself is the most important book on pharmacy, and year by year the student should increase his own notes on those official preparations which he has prepared. There will be found from time to time a series of articles on this subject in the Students' Page of this Journal. At present the best book on materia medica, apart from the Pharmacopœia, is Barclay's edition of Southall's book, but the appearance of Professor Greenish's work on the subject is awaited with interest. A good plan by which habits may be fixed on the mind consists in filling in the names of places on a blank map, and on the opposite page writing the names of the drugs found in the places mentioned. Examiners are fond of asking the precise locality of out-of-the-way parts of the globe, *e.g.*, Teshimkent. In physics again we have to deplore the absence of a suitable book. Everett's 'Physics' (Blackie, 3s. 6d.) is useful, but the new work by Aldous is much more comprehensive and simply written. The student will also have to rely largely on the first part of Newth's 'Chemistry.' It goes without saying that Ince's 'Latin Grammar of Pharmacy' (Baillièrè, 5s.) is the book on the Latinity of prescriptions.

For the Major course the student cannot do better than invest in the following books, in addition to those recommended for Minor work:—

CHEMISTRY.—Woodward's 'Arithmetical Chemistry,' Part II. (Simpkin, Marshall; 3s. 6d.). Valentin's 'Qualitative Chemical Analysis' (Churchill; 9s.). Clowes and Coleman's 'Quantitative Analysis' (Churchill; 10s.).

BOTANY.—Scott's 'Structural Botany,' vol. II. (A. and C. Black; 3s. 6d.).

MATERIA MEDICA.—(For those who can read French) Collin's 'Guide Pratique pour la détermination des Poudres Officinales' (Octave Doin; 4s.); Maisch's 'Materia Medica' (Kimpton, 10s. 6d. net).

PHYSICS.—Glazebrook's 'Heat and Light' (Cambridge Press; 5s.). Tutorial Series, 'Hydrostatics'; 'Electricity and Magnetism' (Clive, 3s. 6d. each).

It may be added that it is highly necessary to acquire the foregoing works on chemistry. The first treats of Avogadro's law, specific heat and vapour densities, etc., including much of the physical side of chemistry. It exactly fits the Major requirements. Valentin's is the best all-round work on practical chemistry, and Clowes and Coleman will be wanted for volumetric and gravimetric analysis; the directions in the latter as to manipulation are alone worth more than the price of the book. Every word in Scott's second volume should be known; after this no better book can be read than Green's second volume, as regards the lower forms of plant life from vascular cryptogams down to algæ, fungi, and bacteria. Green's Manual gives all the necessary matter connected with the physiology of plants. The town student will do well to arrange, if possible, with a friend in the country to have a regular supply of fresh flowers, when they are in season. Collin's little work imparts valuable information in the newer department of pharmacognosy, *viz.*, the examination of powdered vegetable drugs. The monographs on the more potent drugs in the Pharmacopœia should receive close attention, and the descriptions should be compared with actual specimens. Physics is the least satisfactory subject. In the first place, the syllabus demands a knowledge of the subject that cannot adequately be acquired in a six months' course. The only way to tackle this subject is by choosing from the text-books given above just the information demanded by the syllabus. There is no time to pick up the connecting links. Having now considered in detail the various publications that will help a student to obtain the knowledge he requires, a final word of advice may be added as to note-books. It is best to write only on one side of the page and to use well-bound books, quarto size, with good paper. A student should seek to make his notes as complete as possible, so that in after life they may be of real service to him when the Minor and Major are events of the long ago.

Particulars of Examinations, Scholarships, and Prizes,

FIRST EXAMINATION.

(For Registration as Apprentices or Students.)

Fee Two Guineas.

This examination will be held, at the following centres, at 11 o'clock, on the second Tuesdays in January, April, July, and October:—

Aberdeen	Carnarvon	Lancaster	Nottingham
Birmingham	Cheltenham	Leeds	Oxford
Brighton	Darlington	Lincoln	Penzance
Bristol	Dundee	Liverpool	Peterborough
Cambridge	Edinburgh	London	Plymouth
Canterbury	Exeter	Manchester	Sheffield
Cardiff	Glasgow	Newcastle	Shrewsbury
Carlisle	Hull	Northampton	Southampton
Carmarthen	Inverness	Norwich	York

Also at the following centres in July only:—

Jersey; Guernsey; Isle of Man (Douglas); Orkney (Kirkwall).

Candidates must give notice to the Registrar in London, on a printed form of application, which can only be obtained from him, and pay the fee not less than fourteen days prior to that on which the examination is to be held. Each candidate must at the time of entry state at which of the centres he desires to present himself.

The examination is wholly in writing, and comprises the following

Subjects.

LATIN.—Grammar; translation of simple sentences from English into Latin. Translation into English from Cæsar, 'De Bello Gallico,' Book I., or Virgil, 'Æneid,' Book I. [In each examination paper passages from both of these authors will be given, but a candidate is required to translate from one author only.]

ARITHMETIC.—Numeration; the first four rules—simple and compound; reduction; vulgar and decimal fractions; simple and compound proportion; a thorough knowledge of the British and metrical systems of weights and measures; percentages and stocks. [In each examination a paper question will be given involving a knowledge of the metrical system, which every candidate will be required to attempt.]

ENGLISH.—Grammar and composition. [In awarding marks, spelling and the quality of the handwriting are taken into account.]

Time Allowed.

Latin, 11 a.m. to 12.30 p.m.; arithmetic, 12.30 p.m. to 2 p.m.; English, 3 p.m. to 4.30 p.m.

CERTIFICATES IN LIEU.

The Boards of Examiners are empowered to accept in lieu of the First examination of the Society a certificate of having passed at one examination, all the compulsory subjects of any one of the following examinations, provided Latin, Arithmetic, and English were included in the subjects of the examination for which the certificate was granted:—

University of Oxford.

Junior or Senior Local Examinations.
Responsions.
Moderations.
Examination for a Degree in Arts.

University of Cambridge.

Junior or Senior Local Examinations.
Higher Local Examinations.
Previous Examinations.
Examination for a Degree in Arts.

University of Durham.

Junior or Senior Local Examinations.
Registration Examination for Medical students.
Examination for Students at the end of the first year.
Examination for a Degree in Arts or Science.

University of London.

Matriculation Examination.
Preliminary Scientific (M.B.) Examination.
Examination for a Degree in Arts or science.

Victoria University.

Entrance Examination in Arts of the Faculty of Medicine.
Preliminary Examination.

University of Edinburgh.

Junior or Senior Local Examinations.
Preliminary Examination for Graduation in Science or Medicine and Surgery.
Examination for a Degree in Arts or Science.

University of Aberdeen.

Junior or Senior Local Examinations.
Preliminary Examination for Graduation in Medicine or Surgery.
Examination for a Degree in Arts.

University of Glasgow.

Junior or Senior Local Examinations.
Preliminary Examination for Graduation in Medicine or Surgery.

University of St. Andrew's.

Junior or Senior Local Examinations.
Preliminary Examination for Graduation in Medicine or Surgery.
Examination for a Degree in Arts.

University of Dublin.

Public Entrance Examinations.
Examination for a Degree in Arts.

Royal University of Ireland.

Matriculation.
First University Examination.
Second University Examination.
Examination for a Degree in Arts.

Queen's University in Ireland.

Local Examinations for Men and Women
Entrance or Matriculation Examination.

Previous Examination for B.A. Degree.
Examination for a Degree in Arts.

Oxford and Cambridge Schools' Examination Board.

Certificate.

Royal College of Surgeons of England.

Preliminary Examination for the Membership or for the Fellowship.

Royal Colleges of Physicians and Surgeons of Edinburgh.

Preliminary Examination in General education, conducted by a Board appointed by these two Colleges combined.

Faculty of Physicians and Surgeons of Glasgow.

Preliminary Examination in General Education.

Royal Colleges of Physicians and Surgeons in Ireland.

Preliminary Examination.

Apothecaries' Hall of Ireland.

Preliminary Examination in General Education.

Intermediate Education Board for Ireland.

Senior, Middle, and Junior Certificates.

Owens College.

Junior Students' General Examination.

College of Preceptors.

Examination for a First or Second Class Certificate.

Incorporated Law Society.

Preliminary Examination in General Knowledge.

University of Wales.

Matriculation Certificate.

University of the Cape of Good Hope.

Matriculation Examination.

Scotch Education Department.

The Honours and First Grade Leaving Certificates are accepted, provided the Certificates in English, Latin, and Arithmetic are all obtained at any one Annual Examination.

SPECIAL NOTICE.—Each certificate must be forwarded to the Registrar with the fee of two guineas for the approval of the Board of Examiners, and must have been so approved by the Board of Examiners before the candidate will be eligible to enter his name for the Minor examination. (See instructions to candidates below.) After August, 1900, the above examination will be discontinued, and in place thereof a certificate of having passed an examination of the London Matriculation standard will be required.

MAJOR AND MINOR EXAMINATIONS.

The Boards of Examiners in London and in Edinburgh will meet at the end of September or the beginning of October, 1898, and in January, April, and July, 1899. The dates of the commencement of the examinations are duly announced in the *Pharmaceutical Journal*.

SPECIAL NOTICE.—Each candidate must state, at the time of giving notice, whether he desires to be examined in London or in Edinburgh. Richard Bremridge, Registrar, 17, Bloomsbury Square, London, W.C.

The written and practical portions of the examinations precede the oral portions.

Instructions to Candidates.

Each candidate must give notice and pay the fee to the Registrar in London on or before the fifteenth day of September or December, 1898, and the fifteenth day of March and June, 1899, and he will receive due notice of the date on which he will be required to present himself for examination.

When giving notice (for the first time), a candidate for the Minor examination must have attained the full age of twenty-one years, and must have been registered as having passed the First examination. He will at the same time be required to produce a registrar's certificate of birth, and a certified declaration that for three years he has been registered and employed as an apprentice or student, or has otherwise for three years been practically engaged in the translation and dispensing of prescriptions.

The printed form on which this declaration is to be made can only be obtained from the Registrar in London.

The attention of candidates who desire to submit, for the approval of the Boards of Examiners, the certificates of other examining bodies in lieu of the First examination, is specially directed to the regulation that these certificates must have been approved by the Boards of Examiners before such candidates will be eligible to enter their names for the Minor examination.

MODIFIED EXAMINATION.

Persons entitled to enter for the Modified examination, and desirous of so doing, should apply to the Registrar for particulars. No person is eligible for this examination who did not register for the same on or before December 31, 1869.

MINOR EXAMINATION

For Registration under the Pharmacy Act, 1868, as Chemists and Druggists, and entrance to the Pharmaceutical Society as "Member."

Fee Five Guineas.*

The Council of the Pharmaceutical Society recommends that all candidates before presenting themselves for examination should receive a systematic course of instruction occupying a period of not less than six months; and that such period of study should include at least sixty lectures in chemistry, eighteen hours' work in each week in practical chemistry, forty-five lectures and demonstrations in botany, and twenty-five lectures and demonstrations in materia medica.

The following are the subjects of examination:—

Botany.

The candidate will be required to recognise any of the plants specified in the list appended to this schedule; to refer any flowers that may be shown to him to their class and sub-class; to possess a general knowledge of the internal structure of stems, leaves, and roots, and their parts, and of the elementary tissues of which they are composed; to describe a cell, its structure and usual contents; to explain the thickening of cell-walls, and to describe the manner in which cells are combined to form tissues. To distinguish between roots and stems, and to name such important modifications of either as present distinguishing characteristics. To name correctly such leaf shapes as are shown, and to recognise appendages or any important modifications of the leaf. To have a practical knowledge of the various arrangements of leaves or flowers in the bud, and of the different kinds of phyllotaxis and of inflorescence; to understand the principles of branching, and the different kinds of branch systems. To possess a general knowledge of the processes of reproduction of plants, and to describe those of phanerogams and ferns. To name and describe the arrangements of the parts of the flower, the number, position and shape of the floral envelopes and of the organs of reproduction; to name and describe the different kinds of fruits, and the various modes of dehiscence and kinds of placentation. To have a general knowledge of the physiology of plants, and to describe the functions of the roots, stems and leaves. To be acquainted with the materials which form the food of plants, and to understand the part played by starch, sugar, and aleurone grains in the life of the plant. To recognise, by means of the microscope, sections of stems of dicotyledonous, monocotyledonous and cryptogamic plants; spiral, reticulated and scalariform vessels; as well as the simpler structures, such as stomata, pollen grains and hairs.

List of Plants for Recognition.

Aconitum Napellus	Valeriana officinalis	Mentha viridis
Papaver Rhoeas	Achillea Millefolium	" Pulegium
" somniferum	Anthemis nobilis	Rosmarinus officinalis
Brassica alba	Matricaria Chamomilla	Daphne Laureola
Cochleria Armoracia	Taraxacum officinale	" Mezerium
Althæa officinalis	Menyanthes trifoliata	Juniperus Sabina
Ruta graveolens	Borago officinalis	Taxus baccata
Cytisus Scoparius	Atropa Belladonna	Colchicum autumnale
Rosa canina	Datura Stramonium	Arum maculatum
Bryonia dioica	Hyoscyamus niger	Avena sativa
Æthusa Cynapium	Solanum Dulcamara	Hordeum vulgare
Conium maculatum	Digitalis purpurea	Triticum sativum
Foeniculum capillaceum	Lavandula vera	Aspidium Filix-mas
Ænanthe crocata	Mentha piperita	

Chemistry and Physics.

The candidate will be expected to possess an elementary knowledge of the following subjects:—

(a) The law of the conservation of energy; the law of gravitation; the balance; specific gravity; atmospheric pressure; the barometer, air-pump, and siphon; the law of Boyle; temperature; thermometer; the law of Charles; the law of gaseous diffusion; W. Meyer's method for determining vapour densities.

(β) The chief characteristics of chemical action, the distinction of elements and compounds; the laws of chemical combination by weight and volume; the hypothesis of Avogadro; atomic weight and molecular weight; chemical formulæ and nomenclature; valency; the distinction between metals and non-metals.

(γ) The general characters of the non-metals; the chief methods of preparation and the typical reactions of the following non-

metallic elements and compounds:—Hydrogen, oxygen, ozone, water, peroxide of hydrogen; chlorine, bromine and iodine, and their compounds with hydrogen and oxygen; fluorine, hydrofluoric acid; nitrogen, ammonia, the oxides of nitrogen, nitrous acid, nitric acid; sulphur, sulphuretted hydrogen, sulphurous and sulphuric anhydrides and acids, thiosulphuric acid; phosphorus, phosphine, the oxides and oxy-acids of phosphorus, the chlorides of phosphorus; silicon, silica, fluoride of silicon, silicofluoric acid; boron, boric acid. The usual impurities in those of the above-named substances that are included in the British Pharmacopœia.

(δ) The general characters and classification of the metals, and the general methods of forming oxides and salts; the sources, the usual methods of extracting, and the chief properties of the under-mentioned metals and the principal modes of preparation, properties, adulterations, and contaminations of such of their compounds as are described in the British Pharmacopœia,—potassium, sodium ammonium lithium, barium, calcium, magnesium, zinc, aluminium, iron, chromium, manganese, arsenium, antimony, tin, copper, bismuth, lead, silver, mercury, gold and platinum.

(ε) Carbon, its oxides, cyanogen, hydrocyanic acid, cyanide of potassium, ferrocyanide and ferricyanide of potassium, oxalic acid. The chief methods of preparing marsh gas, ethylene, alcohol, aldehyde, acetic acid, acetate of ethyl, spirit of nitrous ether, nitrite of amyl, hydrate of chloral, chloroform, iodoform, ether; the principal properties, reactions, and mutual relations of these compounds. The candidate will also be expected to possess a general knowledge of the methods of estimating carbon, hydrogen, and nitrogen in organic compounds, and of obtaining molecular formulæ.

Note.—Candidates will be expected to solve simple problems relating to the weight and volume, under conditions of temperature and pressure, of elements and compounds concerned in chemical reactions.

Chemistry.—PRACTICAL EXAMINATION.

To determine the specific gravity of liquids and solids, to be familiar with the general construction and use of the thermometer and barometer.

To recognise by chemical tests the more important non-metallic elements and compounds, as well as the metals and salts indicated in the foregoing list; to detect the chief impurities in those that are included in the British Pharmacopœia; to recognise by their physical properties those which possess well-defined characteristics.

To identify by chemical tests the organic compounds before enumerated, and, in addition, tartaric and citric acids, starch, cane sugar, grape sugar, salicin, quinine, morphine and strychnine; and to detect the impurities in such as are included in the British Pharmacopœia.

To perform those volumetric determinations which are described in the British Pharmacopœia.

To be familiar with the construction and use of the balance, and to have a practical knowledge of the British and Metric Systems of Weights and Measures.

To quantitatively determine the total alkaloids in cinchona bark, and in the tincture and extract of nux vomica, and the morphine in opium.

The candidate will further be expected to have a practical acquaintance with the methods of preparing the more important inorganic substances, including the non-metals and their compounds, and such metallic compounds as are included in the British Pharmacopœia, and also the following organic compounds:—Ether, chloroform, spirit of nitrous ether, nitrite of amyl, acetate of ethyl, and hydrocyanic acid, so that he may be able to explain to the examiner the operations involved in their preparation, and, if called upon, to perform the operations or certain stages of them himself.

Materia Medica.

The candidate is required to recognise specimens of any crude drug mentioned in the British Pharmacopœia or in the annexed list, and to describe their methods of production and their characteristics so far as may be necessary to detect adulteration or substitution. He must be familiar with their geographical sources, the botanical and zoological names of the plants and animals yielding them, the natural orders to which they belong, and the localities from which they are obtained. The candidate will be required to name their chief active constituents and also the official preparations into which they enter.

* After August, 1900, the examination fee will be ten guineas.

Roots.	Tussilago Farfara	Cryptogamic Substances.
Althæa officinalis	Spigelia marilandica	Lycopodium clavatum, etc.
Inula Helenium	Marrubium vulgare	Fucus vesiculosus
Alkanna tinctoria	Solanum Dulcamara	Chondrus crispus
Bryonia alba et dioica	Euphorbia pilulifera	Animal Substances.
Rhizomes, etc.	Convallaria majalis	Spongia officinalis
Helleborus niger	Flowers.	Coccus Lacca
Sanguinaria canadensis	Calendula officinalis	Mylabris Cichorii
Iris florentina	Pyrethrum cinerariæfo- lium, etc.	Sepia officinalis
Allium sativum	Arnica montana	Castor Fiber
Veratrum album	Fruits.	
Acorus Calamus	Punica Granatum	Hairs.
Agropyron (Triticum) repens	Cuminum Cyminium	Mucuna pruriens
Barks.	Capsicum annuum	Juices, etc.
Berberis vulgaris	Laurus nobilis	Acacia Catechu
Cinnamodendron corti- cosum	Piper longum	Lactuca virosa (Lactuca- rium)
Simaruba amara	Vanilla planifolia	Aloe spicata, etc.
Erythrophlaeum guineense	Seeds.	Curare (Woorari)
Quillaia Saponaria	Paullinia sorbilis (Guar- ana)	Gum-Resins.
Prunus serotina	Trigonella Fœnum-græ- cum	Boswellia Carterii, etc.
Ulmus campestris	Dipteryx odorata	Euphorbia resinifera
Ulmus fulva	Pyrus Cydonia	Oleo-Resins,
Cinnamomum Cassia	Strychnos amara	Pistacia Torebinthus
Coto	Hyoseyamus niger	Resins.
Herbs.	Amomum Melegueta	Callitris quadrivalvis
Grindelia Squarrosa et robusta	Areca Catechu	Pinites succinifer
		Calamus Draco

Prescriptions.

The candidate is required to read without abbreviation auto-graph prescriptions; translate them into English; understand the grammatical construction of the Latin; and render a literal as well as an appropriate translation of the directions for use. To detect errors, discover unusual doses, and have a general knowledge of posology. To calculate percentages and other quantities occurring in prescriptions; also to render in good Latin ordinary prescriptions written in English.

Practical Dispensing.

To weigh, measure, and compound medicines; write the directions in concise language in a neat and distinct hand; to finish and properly direct each package.

[In awarding marks in this subject the time taken by the candidate in doing the work is taken into account.]

Pharmacy.*

The candidate will be required to possess a general knowledge of the following branches:—

(a) Operations requiring the use of heat. Evaporation, with particular reference to the preparation of extracts and inspissated juices; special characters and modes of preparing the various classes of extracts; influence of surface temperature and pressure upon the rate of evaporation; water, steam and sand baths; distillation, ordinary, fractional, and destructive; distinctive characters and objects of each; official preparations illustrating the various kinds of distillation, apparatus employed, the retort and receiver, still and worm, Liebig's condenser, principles on which they are constructed and used. Sublimation, its objects and applications in pharmacy; official products of sublimation, calcination and fusion. Desiccation, temperature best suited for drying particular drugs, loss in drying vegetable drugs, forms of drying ovens, principles on which they are constructed and used.

(b) Disintegration of solid substances: cutting, bruising and pulverisation; apparatus employed, principles indicating which is to be adopted in particular instances; methods for controlling the degree of comminution, sieves and sifting, trituration, levigation, elutriation, granulation, including methods for producing certain chemicals, as fine powders, small crystals, scales, etc. Solution: its nature, solvent power of various menstrua, influences of (a) temperature; (b) state of division of the substance to be dissolved; (c) time; (d) position of the substance in the menstruum; lixiviation, infusion, digestion and decoction; maceration, percolation and displacement, principles on which the successful performance of these processes depend; form and materials for percolators and other vessels employed. Filtration, objects and methods, filtering media, means of expediting filtration; dialysis: its application in pharmacy, construction and use of the dialyser. Expression, methods of obtaining the juices from plants; recovery of the residual liquids from tincture marcs, etc., screw, hydraulic and other presses. The principles involved in the dispensing of medicines, particularly with reference to the best excipients and methods for forming pill masses, the preparation

and nature of emulsions, the most suitable emulsifying agents, and the best means of suspending insoluble substances in liquids.

(γ) The candidate will also be required to show a practical knowledge of the processes, and understand the principles of the processes by which the official preparations belonging to the following classes are made, viz., collodions, confections, decoctions, dilute acids, extracts (solid and liquid), glycerins, infusions, juices, liniments, lotions, mixtures, ointments, pill masses, plasters, powders (simple and compound), solutions, spirits, suppositories, syrups, tinctures, vinegars, waters and wines. He must be able to conduct such of the operations, or parts of them, as may be required by the examiner. A knowledge of the proportion of active ingredient or crude material in official preparations containing aconite, antimony, arsenic, belladonna, Calabar bean, cantharides, hydrate of chloral, chloroform, caustic potash and soda, colchicum, digitalis, elaterinum, ergot, iodine, iodoform, ipecacuanha, lead, mercury, nux vomica, opium, phosphorus, scammony, stramonium squill, alkaloids and alkaloidal salts.

Candidates will be required to enumerate the poisons contained in Schedule A of the Pharmacy Act, 1868, and those since added thereto, in pursuance of the provision contained in Section II. of that Act, viz. :—

- (a) Poisons within Part I. of the Schedule.
- (b) Poisons within Part II. of the Schedule.

They will be required to describe minutely the conditions required upon the sale by retail of poisons both in Part I. and Part II. of Schedule A; and to write the proper entry required, according to Schedule F of the Act, for the sale of a poison coming within Part I. of Schedule A. They will also be required to state the conditions imposed on the sale of scheduled poisons by wholesale and for export; and upon the sale of a scheduled poison when forming an ingredient in a medicine dispensed.

A knowledge of the conditions imposed on the sale of arsenic by the Arsenic Act will also be required.

Candidates must not take into the examination rooms or laboratories any books or any notes or memoranda, whether written or in print.

MAJOR EXAMINATION.

For registration as Pharmaceutical Chemists under the Pharmacy Act, 1857 Pharmaceutical Chemists, whilst in practice, are exempt in England and Wales from service on all Juries and Inquests under the Juries Act, 1862.

Fee Three Guineas.

The examination in the respective subjects may be oral, practical, or in writing.

Chemistry and Physics.

In addition to the subjects indicated by the Schedule for the Minor examination the candidate will be expected to possess a knowledge of the most important facts connected with—

1. The physical constitution of the three states of matter; liquefaction of gases, critical point; the diffusion of gases and liquids, dialysis; methods for determining vapour densities; solution.

2. The dynamical theory of heat; heat and temperature; sources, development and propagation of heat; radiation, diathermancy and athermancy, separation of heat from light; latent heat; boiling point, distillation; freezing mixtures; specific heat; calorimeters; relation of specific heat to atomic weight; thermometers, the air thermometer; methods of determining exceedingly high and low temperatures.

3. The undulatory theory of light; reflection; refraction; propagation of light, the photometer; mirrors and lenses, the microscope; decomposition of white light by a prism; the spectroscope, spectrum analysis; double refraction; polarisation, the polariscope; influence of light in promoting chemical change, the principles of the ordinary photographic processes.

4. The methods of producing magnetism; magnetic induction. Sources of electricity, frictional electricity; the electroscopes; electric induction; electric machines; the Leyden jar; voltaic electricity; the principal forms of voltaic batteries; the galvanometer; chemical effects of current; electrolysis; measurement of current, Ohm's law; voltameter; secondary currents, secondary batteries; thermo-electricity; the thermopile; production of heat and light from electricity; electromotors; dynamo-machines.

5. The history of the atomic theory; the hypothesis of Avogadro; the methods by which the standard atomic weights

* The 1898 Pharmacopœia will be official in the January examination, 1899.

have been determined; dissociation; specific volume; the periodic law.

6. Classification of carbon compounds; rational formulæ; isomerism. The characteristics and constitution of the chief typical organic compounds. The constitution, sources, methods of preparation, properties, reactions and mutual relations of the following organic compounds:—Cyanogen derivatives.—Urea, cyanuric acid, uric acid. Hydrocarbons.—The principal members of the paraffin, olefine, acetylene and benzene series; their chief haloid and nitro-derivatives. Theory of isomerism in paraffin and benzene series. Paraffin derivatives.—Distinction of primary, secondary and tertiary alcohols; the chief primary monohydric alcohols; glycol; glycerin (glycerol); mannite; acetaldehyde, chloral; chloral hydrate; acetone; ether; the principal acids of the acetic series; oleic acid; glycollic and lactic acids; oxalic, succinic, malic, tartaric, racemic and citric acids; ethylamine; acetamide; glycocine; cane sugar; grape sugar; milk sugar; maltose; starch and cellulose. Benzene derivatives.—Phenol sulphonic acid; phenol; resorcin (resorcinol); aniline; benzaldehyde; salicylaldehyde; benzoic acid; salicylic acid. The principal properties of the terpenes and camphors, essential oils, resins. The characteristics of naphthalene and its derivatives. The processes of alcoholic, acetic, lactic and ammoniac fermentation. The properties and decomposition products of the principal glucosides, alkaloids, and other substances of definite chemical composition in the British Pharmacopœia.

Chemistry.—PRACTICAL EXAMINATION.

The candidate will be expected to be able—

To analyse mixtures containing three metallic salts; to estimate the nitrogen in organic compounds by the soda-lime process; to determine melting and boiling points. To perform the operations (or certain stages of them) necessary for the preparation of cyanogen, artificial urea, ethyl chloride, iodoform, ethylene, ethylene dibromide, acetaldehyde, formic acid, oxalic acid, nitrobenzene, aniline, benzoic acid, the nitrophenols. To recognise by their chemical reactions, and to determine, where necessary, by the Pharmacopœial gravimetric or volumetric methods, the strength and purity of the most important of the inorganic and organic compounds (including crude drugs and galenical preparations) described in the British Pharmacopœia. To detect and separate the most important alkaloids, alkaloidal salts and glucosides, and to separate in the pure state morphine from opium and strychnine from nux vomica.

In the practical portion of the Major examination standard works of reference are provided for the use of candidates, at the discretion of the examiner. No other books or memoranda are allowed.

Botany.

In addition to what is required for the Minor, the candidate is expected to possess an intimate acquaintance with the parts of the flower, fruit and seed; to describe the structure and development of the pollen and of the ovule, and to trace the steps by which the latter is transformed into the seed. To have an intimate knowledge of the structure of cells, whether isolated or in combination, to form tissues; of the contents of cells in their various stages of development; and a general knowledge of the origin of gums, acids, and mineral and other secretions of plants. To be familiar with the composition of the cell wall, its chemical nature, properties, and reactions; with the changes it undergoes in the formation of wood, cork, and mucilage, and in the processes of thickening and cuticularisation. To possess a knowledge of the general principles of classification, the system of Linnæus, and of the natural system founded upon that of De Candolle. To be able to distinguish practically the natural orders included in the schedule appended below, and such of the leading genera of each of these orders as are therein specified; also to refer to their respective orders or genera such specimens included in the schedule as may be shown to him. To possess a general knowledge of the method of reproduction in cryptogams, and to describe that of mosses; to be familiar with the development of the spores in these plants, and to be able to compare the different organs with the corresponding organs in phanerogams; to possess a knowledge of the alternation of generations in the cryptogams, and the modifications under which this is represented in the phanerogams. To have a practical acquaintance with the use of the microscope, and by means of it to recognise the various tissues found in the plant, the reproductive organs of cryptogams and phanerogams, and the more important cell contents.

Schedule.

RANUNCULACEÆ. Anemone Helleborus Aconitum	POTENTILLACEÆ. Potentilla Rosa Pyrus	GENTIANACEÆ Erythraea Menyanthes	EUPHORBACEÆ Euphorbia Buxus
PAPAVERACEÆ Papaver Chelidonium	CUCURBITACEÆ Ecbalium Bryonia	CONVOLVULACEÆ Solanum Solanum Physalis	CUPULIFERÆ Fagus Quercus Corylus

ROSACEÆ Prunus Spiræa			

Materia Medica.

This comprises a practical knowledge of the methods of estimating the value of important drugs, of distinguishing commercial varieties of the same, and of separating such of their active principles as are official in the British Pharmacopœia.

The candidate is also expected to have a general acquaintance with the active constituents of all important drugs, and to possess a general knowledge of the chemical properties of the official alkaloids, glucosides, resins, and essential and fixed oils.

The microscope will be introduced for the examination of certain drugs.

EXAMINATION FEES.

	£	s.	d.
First Examination	2	2	0
Minor Examination	5	5	0
Major Examination	3	3	0

All fees must be paid at the time of giving notice to attend an examination, and no portion of a fee will, under any circumstances, be returned.

Reduced Fees.

Persons who have failed to pass an examination, or who have failed to attend an examination at the time appointed, may, on payment of reduced fees, re-enter for examination.

The reduced fees payable are as follows:—

(a) In the case of a person who has attended an examination and failed to pass:—

First Examination	1	1	0
Minor Examination	3	3	0
Major Examination	2	2	0

(b) In the case of a person who has failed duly to attend an examination at the time appointed.....ONE GUINEA.

(c) In the case of a person who shall have proved to the satisfaction of the Council or the Boards of Examiners (by production of medical certificate or otherwise) that failure to attend was occasioned by unavoidable or proper causes.....ONE SHILLING.

SUBSCRIPTIONS TO THE PHARMACEUTICAL SOCIETY.

	Annual Subscription.
	£ s. d.
Persons who have passed the First examination, or whose certificates have been accepted in lieu thereof, are eligible to be elected "Student Associates" of the Society.....	0 10 6
Persons who have passed the qualifying examination, or who have been registered as chemists and druggists in business before August 1, 1868, are eligible to be elected "Members" of the Society.)	1 1 0
Life Composition fee for Members	10 10 0
All subscriptions are due on election, and on January 1st in each succeeding year.	

PRIVILEGES OF SUBSCRIBERS TO THE SOCIETY.

Members and Student-Associates of the Society are supplied with the Journal of the Society regularly as published, free of charge. They have also the use of the Library and Museum.

Members have a voice in the administration of the Benevolent Fund of the Society, and, in case of need, may receive assistance therefrom. Student-Associates are eligible, under certain conditions (see below), to compete for the Jacob Bell Scholarships, the Manchester Pharmaceutical Association Scholarship, and the Herbarium Prize.

PRIZES AND SCHOLARSHIPS.

Council Examination Prizes.

Pharmaceutical chemists who were members of the Society at the time of passing the Major examination are entitled to compete for the following prizes at the end of the session in which they passed the Major examination:—

FIRST PRIZE.—Pereira Medal in silver, and a present of books value £5, or thereabouts, given by the late Thomas Hyde Hills in memory of Jacob Bell.

SECOND PRIZE.—The Pharmaceutical Society's Medal in silver.

THIRD PRIZE.—The Pharmaceutical Society's Medal in bronze.

SUBJECTS OF EXAMINATION.—Materia medica, botany, and chemistry.

The next competition for these prizes will take place in April, 1899, after the ordinary meeting in that month of the Boards of Examiners.

The Registrar communicates with each person entitled to compete, requiring not less than three days' notice of his intention to present himself for examination, and no person will be admitted to compete unless he shall have given the required notice.

The examination is a written one, and competitors may be examined in London or Edinburgh.

The Council selects and appoints special Examiners, who set the questions, examine the answers, and report the result direct to the Council.

The Jacob Bell Memorial Scholarships.*

TWO BELL SCHOLARSHIPS are offered annually, and come into operation at the commencement of the session in October, and the scholars shall for that session be pupils in the Pharmaceutical Society's School.

ANNUAL VALUE OF SCHOLARSHIPS.—Each scholarship is of the annual value of thirty pounds, and is tenable for one year only; each scholar may, however, at the termination of his year of tenure, apply for free admission to the next ensuing advanced course in the Society's School. The payment will be made in two moieties; the first to be paid when the scholar enters upon his studies in the School, and the second at the expiration of five months. In addition to the endowment, the Council provides for the Bell scholars free laboratory instruction and admission to the lectures, and books of the value of five pounds—given by the late Thomas Hyde Hills—are divided equally between them.

SUBJECTS OF EXAMINATION.—*Latin*: Virgil; the first three books of the *Aeneid*; Latin prescriptions; translations of Latin into English and English into Latin; translations from any Latin pharmacopœia, and parsing. *French or German*. *English*: Composition and parsing. *Arithmetic*: The first four simple and compound rules, fractions, and decimals; the British and metrical systems of weights and measures. *Elementary Chemistry, Pharmacy, and Botany*.

CONDITIONS OF THE COMPETITION.—Each competitor must give notice to the Secretary on or before June 1.

The notice must be accompanied by

- (a) A registrar's certificate of birth.
- (b) Testimonials from present or previous employers, or masters, as to capability, industry, and general conduct.
- (c) A declaration that the competitor has passed not less, or has been engaged not less than three years in the pharmacy of a registered pharmaceutical chemist, or chemist and druggist. (The form on which this declaration is to be made can only be obtained from the Secretary, 17, Bloomsbury Square, London, W.C.)

* A scholar is supposed to be commencing his studies, or at least to have made only that progress which may be reasonably looked for during an apprenticeship. The object of the examination is to ascertain that the candidate has such an amount of ability, and affords evidence of having made such use of it in the acquirement of elementary knowledge, as will justify the expectations of his proving a successful student, who may do credit to the appointment, and become a useful and accomplished member of the pharmaceutical body.

At the time of giving notice the competitor must be a subscribing "Student-Associate" of the Society.

On the day on which the examination is held the competitor must be not less than 20 or more than 22 years of age.

No person to whom a Manchester Pharmaceutical Scholarship has been awarded is permitted to compete for a Bell Scholarship.

The examination for these scholarships takes place on the second Tuesday in July, at the same centres as for the First examination. It will be wholly in writing, and will be conducted under the same conditions as the "First" examination, and such safeguards as the Council may from time to time deem expedient. The written papers must be distinguished by a motto, and not by the name of the candidate.

The examination will be conducted by two or more persons appointed by the Council, and the award made (subject to the approval of the Council) by a Committee consisting of the President, the Vice-President, and the said examiners.

Manchester Pharmaceutical Association Scholarship.

One Scholarship is offered annually, and will be presented at the commencement of the Session of the Pharmaceutical Society's School in October. The scholar shall for that session be a pupil in the Society's School, or in case he may elect, he shall be a pupil in any provincial school of pharmacy approved by the Council of the Society.

The Scholarship is of the value of about £26 (the income arising from a sum of £750), which is to be expended for instruction in the Society's School, or in the provincial school selected by the scholar and approved by the Council of the Society.

SUBJECTS OF EXAMINATION.—*Latin*: Virgil; 'Æneid,' first three books, or Cæsar, 'De Bello Gallico,' first three books of Commentaries; * Latin prescriptions; translation of Latin into English and English into Latin; translations from any Latin pharmacopœia, and parsing. *French or German*. *English*:—Composition and parsing. *Arithmetic*:—The first four simple and compound rules, fractions and decimals; the British and metrical systems of weights and measures. *Elementary Chemistry, Pharmacy, and Botany*.

CONDITIONS OF THE COMPETITION.—Each competitor must give notice to the Secretary on or before June 1.

The notice must be accompanied by

- (a) A registrar's certificate of birth.
- (b) Testimonials from present or previous employers or masters as to capability, industry, and general conduct.
- (c) A declaration that the competitor has passed not less, or has been engaged not less than three years in the pharmacy of a registered pharmaceutical chemist, or chemist and druggist, in Lancashire, Cheshire, or the High Peak Parliamentary Division of Derbyshire. (The form on which this declaration is to be made can only be obtained from the Secretary, 17, Bloomsbury Square, London, W.C.)

At the time of giving notice the competitor must be a subscribing "Student-Associate" of the Society.

On the day on which the examination is held the competitor must be not less than nineteen or more than twenty-one years of age. The examinations are held at the same time and centres as for the Jacob Bell Scholarships, and the award made in the same manner and by the same persons as in the case of those scholarships.

No person to whom a Bell Scholarship has been awarded is permitted to compete for the Manchester Pharmaceutical Association Scholarship.

The Redwood Scholarship.

The Redwood Scholarship is offered annually in April to pharmaceutical chemists who are desirous of obtaining advanced instruction in chemistry and chemical pharmacology, with a view to conducting original investigations in these subjects.

The scholar will receive the sum of £20, and will be provided, free of cost, with a working bench, apparatus and materials in the Society's Research Laboratory, and will be required to work under the supervision of the Director, and to observe the rules and regulations of the Research Laboratory. The nomination of the scholar will be made by the Research Committee after ascertaining the candidate's fitness by means of an examination in chemistry and

* Passages from both authors are given, but a candidate is only required to translate from one author.

materia medica, or in such other manner as the Committee may think fit. The nomination of the Research Committee will be submitted for the approval of the Council who elects the scholar.

A Redwood scholar may be re-elected on the recommendation of the Research Committee.

The holder of a Jacob Bell Memorial Scholarship, if he be a pharmaceutical chemist, will be eligible for election as a Redwood scholar after the expiration of his Bell Scholarship.

Applications for the Redwood Scholarship must be sent to the Secretary of the Pharmaceutical Society not later than the 25th day of April in each year.

The Burroughs Scholarship.

The Burroughs Scholarship is offered annually in April to pharmaceutical chemists who are desirous of obtaining advanced instruction in chemistry and pharmacy, with a view to conducting original investigations in these subjects.

The scholar receives the sum of £26, and is provided, free of cost, with a working bench, apparatus, and materials in the Research Laboratory. He is required to work under the supervision of the professor of chemistry, and to observe the rules and regulations of the laboratory. The nomination of the scholar is made by the School Committee after ascertaining the candidate's fitness by means of an examination in chemistry and pharmacy, or in such other manner as the Committee may think fit. The nomination of the Committee is submitted for the approval of the Council, who elects the scholar.

Applications for the Burroughs Scholarship must be sent to the Secretary of the Pharmaceutical Society not later than April 25 in each year.

Herbarium Prize.

A Silver Medal is annually offered by the Council for the best Herbarium, collected in any part of the United Kingdom, the Channel Islands, or the Isle of Man, between the first day of January in one year and the first day of July in the year following, and should there be more than one possessing such an amount of merit as to entitle the collector to reward, a second prize consisting of a Bronze Medal, and also Certificates of Honour, will be given at the discretion of the Council. In the event of none of the collections possessing sufficient merit to justify the Council in awarding medals or certificates, none will be given.

Competitors must be subscribing "Student-Associates" of the Society, and under twenty-one of age.

The collections must consist of phanerogamous plants and ferns, arranged according to the natural system adopted in some work on British botany (such as that of Babington or Hooker), and be accompanied by lists, arranged according to the same method.

No collection may contain more than 150 specimens, which must be carefully selected and mounted so as to display the characteristic features of the more prominent and typical genera of the chief British natural orders. The name of each plant, its habitat, and the date of collection, must be stated on the paper on which it is mounted.

Each collection must be accompanied by a note, containing a declaration signed by the collector, and certified by his employer, or a pharmaceutical chemist to whom the collector is known, to the following effect:—The specimens which accompany this note were collected by myself, between the 1st day of January, 18—, and the 1st day of July, 18—, and were named and arranged without any other assistance than that derived from books.

The merits of the collections will be estimated not so much by the number of plants as by the correctness with which they are named, and by their being typical specimens. The manner in which they are preserved and mounted will also be taken into account.

The collections must be forwarded to the Secretary of the Society, 17, Bloomsbury Square, so that they may be received by him not later than the first day of July, indorsed "Herbarium for Competition for the Prize." After the Prize Distribution in October, they will be retained one month, under the care of the Curator of the Museums, and then returned to the collectors, if required.

How to Become A Pharmacist in Ireland.

Great Britain and Ireland have distinct Pharmacy Acts, and their examination regulations differ to some extent. Moreover, pharmaceutical certificates granted in either of the British Isles are not recognised in the other.

Preliminary Examination.

The Preliminary examination of the Pharmaceutical Society of Ireland is held on the first Tuesday of January, April, July, and October. The following are the compulsory subjects:—

LATIN.—To translate into English and parse sentences from a Latin author:—Cæsar's 'Commentaries,' First Book; or Virgil's 'Æneid,' First Book. To translate an easy English sentence into Latin.

ENGLISH.—English grammar, including orthography and parsing. To write on a subject selected by the Examiner, and to write from dictation.

ARITHMETIC.—The first four rules, simple proportion, vulgar fractions, and decimals. To describe the British weights and measures, and the metric system.

ALGEBRA.—As far as simple equations, inclusive.

GEOMETRY.—Including the first book of Euclid.

ELEMENTARY THEORETICAL CHEMISTRY.—Chemical Action: Illustrations and examples; simple and compound substances; atoms and molecules; chemical symbols and nomenclature; formulæ and equations; general nature of acids, bases, and salts. Combustion: Structure and properties of flame. Water: Proofs of composition; methods of purification. The Air: Its constitution; reasons for considering it a mixture and not a compound. The chief physical and chemical characters, with methods of preparation of the following elements and compounds: Hydrogen, oxygen (and ozone), nitrogen, carbon, chlorine, sulphur, nitrous oxide, nitric oxide, nitric acid, ammonia, carbon dioxide, carbon monoxide, marsh gas, olefiant gas, hydrochloric acid, sulphur dioxide, sulphurous acid, sulphuric acid, sulphuretted hydrogen.

In addition, candidates must pass in one of the following optional subjects:—

ELEMENTARY PHYSICS AND MECHANICS.—Sound, light and heat, as given in Ganot's 'Elementary Course of Natural Philosophy'; mechanics of solids and fluids, comprising the elements of statics, dynamics, and hydrostatics.

THE RUDIMENTS OF BOTANY.—Oliver's 'Lessons in Elementary Botany.' Part I.

FRENCH, GERMAN, or any other modern language.

As in the case of the British Preliminary, certificates of certain other examining bodies are accepted in lieu of this examination.

The fee for this examination is £2 2s., which should be lodged in the Bank of Ireland to the credit of the Pharmaceutical Society of Ireland, and the receipt sent with the candidate's application to the Registrar, at the Society's office, 67, Lower Mount Street, Dublin; not later than the Tuesday fortnight preceding the day of examination. The optional subject selected should be stated, and the application be accompanied by a certificate of birth. A candidate who has failed to pass is at liberty to present himself for re-examination six months later on payment of 10s. 6d.

Assistants' Certificates.

These certificates are granted on passing the Preliminary or its equivalent and a special examination in the following subjects:—

PRESCRIPTIONS.—Candidates will be required to read autograph prescriptions, translate them into English, render a correct translation of the directions for use, and detect unusual doses.

PRACTICAL DISPENSING.—To weigh, measure, and compound medicines, write the directions in suitable language, finish, and properly direct each package.

MATERIA MEDICA AND QUALITY OF SPECIMENS.—To recognise the Pharmacopœia chemicals in frequent demand, and specimens

of roots, barks, leaves, fruits, resins, and gums in ordinary use; also to estimate the quality of each specimen submitted, and its freedom from adulteration.

PHARMACY.—To recognise the preparations of the Pharmacopœia which are not of a definite chemical nature, such as extracts, tinctures, and powders, and give the proportions of the more active ingredients. The candidates will also be examined in the Sale of Poisons (Ireland) Act.

Rejected candidates may present themselves again after a lapse of six months, on payment of 10s. 6d. A necessary condition in the case of all candidates is that they must have been engaged for four years in an open pharmacy kept (a) by a pharmaceutical chemist or an apothecary in Ireland, or (b) by a pharmaceutical chemist or chemist and druggist in Great Britain, or (c) he may have served two years in a registered druggist's or chemist and druggist's shop in Ireland, and two years subsequently in an open pharmacy.

Registered Druggists.

Registered druggists may sell poisons, but are not entitled to compound medical prescriptions. The qualification of "registered druggist" is acquired by passing an examination testing the candidate's knowledge of English orthography and composition, arithmetic, the weights and measures of the British Pharmacopœia, the appearance and properties of the various drugs and chemicals in general use, and the Irish Poisons Act. The candidate must previously have served a four years' apprenticeship with a pharmaceutical chemist, licentiate apothecary, registered chemist and druggist, or registered druggist; and be twenty-one years of age. The examination fee is £2 2s., and there is a registration fee of the same amount.

The Pharmaceutical Licence.

If, besides complying with all the conditions for the assistant's examination, the candidate has attained the age of twenty-one years, passed the Preliminary not less than twelve months previously, and attended a course in practical chemistry of not less than three month's duration, including 100 hours' practical work at the bench, and a course in botany of *materia medica*, he will have fulfilled all the conditions imposed on those who seek to pass the final examination and acquire the right to term themselves "pharmaceutical chemists." This qualification is superior to the British "chemist and druggist," as it gives the holder the extra advantage of enjoying a monopoly in compounding medical prescriptions.

The following are the examination subjects:—

BOTANY.—To recognise the principal indigenous plants used in medicine, to refer them to their natural orders, and to give the definitions and the distinctive characters of their several parts.

MATERIA MEDICA.—To recognise specimens of the drugs of the Pharmacopœia, to describe their characters and active principles, name the sources from which they are obtained, and the official preparations into which they enter; and to detect adulterations.

GENERAL AND PHARMACEUTICAL CHEMISTRY.—The elementary laws of chemistry and physics, including chemical equations. To recognise the chemical substances of the Pharmacopœia; to describe the processes by which they are obtained; qualitative analysis (including the tests of the Pharmacopœia) and volumetric analysis; and to submit to a practical examination in those subjects.

PRACTICAL PHARMACY.—To translate Latin prescriptions; to detect dangerous doses; to compound and dispense correctly; to explain the processes of making the non-chemical preparations of the Pharmacopœia, and to recognise them; and to have an intimate knowledge of the Sale of Poisons (Ireland) Act, 33 and 34 Vict. chap. 26, 1870.

A clear fortnight's notice must be given to the Registrar, the fee of £5 5s. being also paid, and proofs submitted that the candidate has fulfilled the different requirements of the Society. He will then be summoned in due course to attend the examinations, which are held at Dublin on the second Wednesday and following days of January, April, July, and October. If unsuccessful, the candidate can try again after the lapse of six months on payment of £1 11s. 6d.

Further particulars respecting the Irish examinations, etc., are published in the Society's Calendar (1s. 8½d., post free), which can be obtained from the Registrar, 67, Lower Mount Street, Dublin.

HOW TO BECOME A DENTIST.

Dental students are registered at the office of the General Medical Council, 299, Oxford Street, London, W., in the same manner as medical students, and subject to the same regulations as regards preliminary examinations, but in the case of dental students professional study may commence by pupilage with a registered dental practitioner. Students who commenced their professional education by apprenticeship to dentists entitled to be registered or by attendance upon professional lectures before July 22, 1878 (when dental education became compulsory), shall not be required to produce evidence of having passed a preliminary examination. Candidates for a diploma in dental surgery shall produce certificates of having been engaged during four years in professional studies and of having received three years' instruction in mechanical dentistry from a registered practitioner. One year's *bond-fide* apprenticeship with a registered dental practitioner after being registered as a dental student may be counted as one of the four years of professional study. The three years of instruction in mechanical dentistry or any part of them may be taken by the dental student either before or after his registration as a student, but no year of such mechanical instruction shall be counted as one of the four years of professional study unless taken after registration.

For the sake of simplicity the various stages that have to be considered by anyone wishing to become a dental surgeon may be conveniently divided into three divisions: 1. The Preliminary Examination in General Education; 2. Professional Education which must extend over four years after registration; 3. The Examination.

(1) PRELIMINARY EDUCATION.

The General Medical Council requires that anyone applying for registration as a dental student shall have passed an examination in the following subjects:—

(a) English language, including grammar and composition.

(b) Latin, including grammar, translations from specified authors, and translations of easy passages not taken from such authors.

(c) Mathematics, comprising (a) arithmetic; (b) algebra as far as simple fractions inclusive; (c) geometry, the subject matter of Euclid, Books i., ii., and iii., with easy deductions.

(d) One of the following optional subjects:—(a) Greek, (β) French, (γ) German, (δ) Italian, (ε) any other modern language, (ζ) logic.

Marks not exceeding 5 per cent. of the total marks obtainable in this section of the examination may be assigned to candidates who show a competent knowledge of shorthand. All the subjects included in the Preliminary examination must be passed in at one time, but this rule does not apply to those who, previous to January, 1892, have passed a part of any preliminary examination recognised by the Council. On and after the first day of January, 1899, logic will be omitted from the list of optional subjects.

A complete list of the examining bodies both in Great Britain, the Colonies, and abroad, whose examinations in general education are recognised by the General Medical Council, can be obtained from the offices of the Council. It is anticipated that the standard of the Preliminary examination will be raised in 1900.

(2) PROFESSIONAL EDUCATION.

This consists of instruction in general surgery and medicine, dental surgery, and mechanics, and should be commenced by an apprenticeship to a registered dentist. The mechanical training must extend over three years. Too much importance cannot be attached to the student receiving a thorough training in dental mechanics. A student should register his name at the offices of the General Medical Council as soon as he commences his mechanical training, apply for a registration form, fill it in correctly, and send it with pass certificate of Preliminary examination to the Council's offices. In the case of those who commenced their professional education by apprenticeship to a dentist's, entitled to be registered or by attendance upon professional lectures before July 22, 1878, it is not necessary for them to produce a pass certificate of preliminary education. After three years' apprenticeship the hospital career should be entered upon by the student entering both a general and dental hospital. At this stage it is advisable for a student to register as a medical student, not

necessarily to take a medical and surgical qualification, but to ensure his being able to do so at some future time should he so desire. The work which he does at the general hospital for the dental qualification, and which is much the same as that required for the general qualification, will count as part of the medical curriculum. The importance of taking every advantage of the facilities afforded for obtaining a thorough grounding in both general and dental knowledge during the two years' hospital course cannot be too forcibly impressed upon students. It is the period that lays the foundation of success in after life; realising this, the schools generously offer, both in prizes and appointments, and through their several teachers, every encouragement for the student to acquire a thoroughly sound knowledge of the various subjects that he will not only have to pass in when examination time comes round, but will enable him in future to conduct his practice in such a manner as will make him in every way a worthy member of the profession.

(3) THE EXAMINATIONS.

There are four examining bodies in Great Britain which grant diplomas in dental surgery.

- (1) The Royal College of Surgeons, England.
- (2) The Royal College of Surgeons, Edinburgh.
- (3) The Faculty of Physicians and Surgeons, Glasgow.
- (4) The Royal College of Surgeons of Ireland.

The Royal College of Surgeons, England, demand three examinations, while those of Edinburgh, Glasgow, and Ireland demand two. In all other matters they only differ in minor details. The diploma of the Royal College of Surgeons, England, is the one most sought after, and is regarded as the best dental diploma in the world. Candidates going up for examination at this college must produce the following certificates.

PRELIMINARY SCIENCE EXAMINATION.

1. Of having received instruction at an institution recognised for the purpose, in chemistry, physics, and practical chemistry. This instruction may be taken prior to the date of registration as a dental student

FIRST PROFESSIONAL EXAMINATION.

2. Of having been engaged during a period of not less than three years in acquiring a practical familiarity with the details of mechanical dentistry, under the instruction of a competent practitioner, or under the direction of the superintendent of the mechanical department of a recognised dental hospital, where the arrangements for teaching mechanical dentistry are satisfactory to the board of examiners in dental surgery. In the case of qualified surgeons, evidence of a period of not less than two instead of three years of such instruction will be sufficient. This instruction may be taken prior to the date of registration as a dental student.

3. Of registration as a dental student by the General Medical Council, 299, Oxford Street, London, W.

4. Of having attended at a recognised dental hospital and school. (a) A course of lectures on the following: Dental metallurgy, practical dental metallurgy, dental mechanics, practical dental mechanics, including the manufacture and adjustment of six dentures and six crowns.

SECOND PROFESSIONAL EXAMINATION.

5. Of having been engaged during four years in the acquirement of professional knowledge subsequent to the date of registration as a dental student.

6. Of having attended, at a recognised dental hospital and school, a course of dental anatomy and physiology, a separate course of dental histology, including the preparation of microscopical sections, a course of dental surgery, a separate course of practical surgery, a course of not less than five lectures on the surgery of the mouth.

7. Of having attended, at a recognised dental hospital or in the department of a recognised general hospital, a practice of dental surgery during two years.

8. Of having attended, at a recognised medical school, a course of lectures on anatomy, physiology, practical physiology, surgery, medicine.

9. Of having performed dissections at a recognised medical school during not less than twelve months.

10. Of having attended, at a recognised hospital or hospitals, the practice of surgery and clinical lectures on surgery during two winter sessions.

11. Of being twenty-one years of age.

Certificates of professional studies will be required to show that students have attended the courses of professional study to the satisfaction of the teachers. The examinations are both oral and written in the above subjects. The attendance on the various lectures at both the general and dental hospitals and school can all be completed within the two years.

Besides the London dental schools and hospital the following are recognised in Great Britain:—

- Manchester.—Victoria Dental Hospital, Devonshire Street, All Saints.
 Liverpool.—Liverpool Dental Hospital and School of Dental Surgery.
 Birmingham.—Dental Hospital, 71, Newhall Street.
 Newcastle-on-Tyne.—Dental Hospital and School, 37, Nelson Street.
 Devon and Exeter Dental Hospital.
 Sheffield.—Dental Department, Sheffield Royal Hospital.
 Edinburgh.—Dental Hospital and School, 31, Chambers Street.
 Glasgow.—Dental Hospital, 5, St. Vincent Street.
 Ireland.—Dental Hospital of Ireland, Lincoln's Place, Dublin.

All information as to fees, etc., can be obtained by writing to the deans of the various hospitals and schools.

The important subject of students receiving a thorough mechanical training has of late years occupied the attention of the dental schools and those most competent to consider the matter, and with a view to correct what has long been a weak point in the dental education of this country, the principal dental schools have, for an additional fee, undertaken to teach dental mechanics. Not only should students receive a good training in dental mechanics, but they should likewise receive a thorough grounding in general mechanical principles.

This can only be acquired by a proper course of technical training. Realising this, several of the more prominent members of the dental profession established a recognised school, the Institute of Dental Technology and School of Mechanical Dentistry, London, where, under the guidance of skilled instructors in all the various branches of mechanics, dental students may obtain a thorough and comprehensive mechanical training. Two classes of students are admitted—those who take the three years' course in mechanics in accordance with the requirements of the dental diploma, and those who intend to become dental mechanics only. The latter have to serve an apprenticeship of five years. All particulars as to attendance, fees, etc., can be obtained from the principal, 4, Langham Chambers, All Souls' Place, London, W.

LONDON UNIVERSITY SCIENCE DEGREES.

For the sake of the increasing number of pharmaceutical students who are desirous of taking a degree in science, the following concise account of the procedure to be followed in connection with the degrees granted by the University of London is reprinted from the *Chemical News*:—

Candidates for any degree in this University must have passed the Matriculation examination. No exemption of this rule is allowed on account of degrees obtained or examinations passed at any other university. This and all other examinations of the University, together with the prizes, exhibitions, scholarships, and medals depending upon them, are open to women on exactly the same conditions as to men.

There are two examinations for matriculation in each year; one commencing on the second Monday in January, and the other on the second Monday in June.

The examination is conducted by means of printed papers; but the examiners are not precluded from putting, for the purpose of ascertaining the competence of the candidates to pass, *viva voce* questions to any candidate in the subjects in which they are appointed to examine. These examinations may be held not only at the University of London, but also, under special arrangement, in other parts of the United Kingdom, or in the Colonies.

Every candidate for the Matriculation examination must, not less than five weeks before the commencement of the examination, apply to the registrar for a form of entry, which must be returned not less than four weeks before the commencement of the examination, accompanied by a certificate showing that the candidate has completed his sixteenth year, and by his fee for the exami-

nation. As no candidate can be admitted after the list is closed, any candidate who may not have received a form of entry within a week after applying for it must communicate immediately with the registrar, stating the exact date of his application and the place where it was posted.

Every candidate entering for the Matriculation examination for the first time must pay a fee of £2 to the registrar. If a candidate withdraws his name, or fails to present himself at the examination, or fails to pass it, the fee shall not be returned to him, but he shall be allowed to enter for any subsequent Matriculation examination upon payment, at every such entry, of an additional fee of £1, provided that he comply with the regulations in the preceding paragraph.

Candidates are not approved by the examiners unless they have shown a competent knowledge in each of the following subjects:—Latin. Any one of the following languages:—Greek, French, German, Sanskrit, or Arabic. The English Language, and English History, with the Geography relating thereto. Mathematics. Mechanics. One of the following branches of Science:—Chemistry, Sound, Heat and Light, Magnetism and Electricity, Botany.

The Examination in Chemistry is—chemistry of the non-metallic elements; including their compounds, their chief physical and chemical characters, their preparation, and their characteristic tests.

A Pass Certificate, signed by the registrar, will be delivered to each successful candidate after the report of the examiners has been approved by the Senate.

If in the opinion of the examiners any candidates in the Honours division of not more than twenty years of age at the commencement of the examination possess sufficient merit, the first six among such candidates will receive an exhibition of £30 per annum for the next two years; the second among such candidates will receive an exhibition of £20 per annum for the next two years; and the third will receive an exhibition of £15 per annum for the next two years; such exhibitions are payable in quarterly instalments, provided that on receiving each instalment the exhibitor declares his intention of presenting himself either at the two examinations for B.A., or at the two examinations for B.Sc., or at the Intermediate examination in laws, or at the Preliminary Scientific M.B. examination and Intermediate examination in medicine, within three academical years from the time of his passing the Matriculation examination.

Under the same circumstances, the fourth among such candidates will receive a prize to the value of £10 in books, philosophical instruments, or money; and the fifth and sixth will each receive a prize to the value of £5 in books, philosophical instruments, or money.

Any candidate who may obtain a place in the Honours division at the Matriculation examination in January is admissible to the Intermediate examination either in arts or in science in the following July.

INTERMEDIATE EXAMINATION IN SCIENCE.

The Intermediate examination in science will commence on the second Monday in July.

No candidate (with the exception of such as have obtained Honours at the Matriculation examination in the preceding January) is admitted to the examination within one academical year of the time of his passing the Matriculation examination.

The fee for this examination is £5.

Examination for Honours.

Candidates for honours in chemistry will be examined in inorganic chemistry, treated more fully than in the Pass examination. In addition, they will be examined practically in simple qualitative analysis. This examination will consist of six hours' examination by two printed papers and of six hours' practical work.

In the examination for honours, the candidate, not being more than twenty-two years of age at the commencement of the Pass examination, who most distinguishes himself will receive an exhibition of £40 per annum for the next two years.

B.SC. EXAMINATION.

The B.Sc. examination will be held on the fourth Monday in October.

Candidates for this examination are required to have passed the Intermediate examination in science at least one academical year previously.

The fee for this examination is £5.

Examination for Honours.

For the examination for honours in chemistry two papers will be set and a two days' practical examination.

The candidate, being not more than twenty-three years of age, who most distinguishes himself in chemistry, will receive £50 per annum for the next two years, with the style of university scholar.

DOCTOR OF SCIENCE.

The examination for the degree of Doctor of Science takes place annually within the first twenty-one days of June.

No candidate is admitted to the examination for the degree of D.Sc. until after the expiration of two academical years from the time of his obtaining the degree of B.Sc. in the University.

Every candidate for this degree must state in writing the special subject within the purview of the Faculty of Science, as set out in the programme of the B.Sc. examination, upon a knowledge of which he rests his qualification for the doctorate; and with the form of entry he shall transmit an original dissertation or thesis (at least six copies), printed, type-written, or published in his own name, treating scientifically some special portion of the subject so stated, embodying the result of independent research, or showing evidence of his own work, whether conducted independently or under advice, and whether based on the discovery of new facts observed by himself, or of new relations of facts observed by others, or generally tending to the advancement of science. Every candidate may further specify any printed contribution or contributions to the advancement of science which he has at any time previously published. If the dissertation or thesis be approved by the examiners the candidate shall be required to present himself at the University upon such day or days within the first twenty-one days of June as may be notified to him, and shall, at the discretion of the examiners, be further tested, either orally or practically, or by printed questions, or by all of these methods, with reference both to the special subject selected by him and to the thesis.

PRELIMINARY SCIENTIFIC (M.B.) EXAMINATION.

This examination takes place twice in each year—once, for Pass and Honours, commencing on the second Monday in July; and once for Pass candidates only, commencing on the third Monday in January.

No candidate shall be admitted to this examination unless he shall have passed the Matriculation examination. Not less than five weeks before the commencement of the examination he must apply to the registrar for a form of entry, which must be returned not less than four weeks before the examination, accompanied with the candidate's fee.

The fee for this examination is £5.

NOTES ON MEDICAL EDUCATION.

When once it has been decided that medicine is to be one's career it is of the utmost importance to ascertain the best way of entering the profession. The general course of the medical student's career is very precisely defined for him by the regulations of the General Medical Council, which is the body established by Act of Parliament for the regulation of medical education and for the maintenance of the Register of qualified medical practitioners. It is not an examining nor an educational body, but concerns itself with the various examining bodies, of which there are more than twenty in the United Kingdom, and with the standard of the medical curriculum at each of the recognised educational institutions. No one can be legally qualified unless his name is on the Register, and the General Medical Council has decided that in order to become registered it is necessary to pass a satisfactory examination in medicine, surgery, and midwifery, and that this examination must be preceded by a course of study extending over a period of at least five years.

Every medical student must be registered by the General Medical Council at the commencement of his studentship, and must have passed a preliminary examination in general education. If he is studying at a medical school attached to some university, he will most likely utilise the matriculation examination for this purpose.

In this connection it is well to bear in mind that as a five years' medical curriculum is now compulsory on all students, it takes no longer to obtain a degree at a university than to obtain the diploma

of the collegiate bodies, and it will be an advantage to the student if he has passed the entrance examination (which is obligatory in all cases) at the particular university where he intends to graduate.

He must also produce evidence that he has commenced medical study. The Students' Register is kept by the Branch Registrars of the Medical Council, namely, in England, Mr. H. E. Allen, B.A., LL.B., 299, Oxford Street, London, W.; in Scotland, Mr. James Robertson, 48, George Square, Edinburgh; in Ireland, Mr. S. Wesley Wilson, 35, Dawson Street, Dublin.

It is difficult to give advice of general application as to the choice of a university or school, since so much depends upon the circumstances of the individual, his residence, family connections, and pecuniary resources. When the medical school to be attended has been selected, the candidate should put himself in communication with the Dean, who will always be found ready to give advice as to the mode of entry, and as to the cost of and the best way to prepare for the degree or diploma to which the candidate aspires.

It is impossible in the space available to give details as to the various requirements of the examining bodies and to the relative value of the different diplomas and degrees, but there is no doubt that the double qualification granted by the Conjoint Board of the London Royal Colleges is one of the most useful, as it not only qualifies for the Army and Poor Law appointments, but the London hospitals generally refuse to elect as physicians any who are not members of the Royal College of Physicians of London, or as surgeons those who are not Fellows of the Royal College of Surgeons of London, and consulting practice in the metropolis depends almost entirely upon the possession of a hospital appointment.

The cost of medical education naturally varies, though, according to the *British Medical Journal*, it should not be expected that a student would be able to pass through the prescribed curriculum and obtain the necessary degrees or diplomas for an expenditure of less than £1000. In former years it was sometimes possible for the student to earn something during the last year or two, but this has now become extremely difficult, and the attempt ought not to be encouraged. The five years now prescribed is all too short a period within which to crowd the immense number of subjects with which the student is expected to become familiar. There are of course scholarships at the universities and the other medical schools, but such prizes are for the few. The expenditure is made up from three principal sources—the fees charged by the medical schools for instruction, the fees charged by universities or corporations for granting of degrees or diplomas, and the expenditure on living. The last named is, of course, the most considerable and that which varies most according to the habits of the student, and the general cost of living ruling in the place in which his medical college or school is situated. The fees paid to medical schools for the full curriculum vary and range from a little under £100 to £150. From £30 to £50 must be added for various necessary additional expenses—for extra classes, materials used in practical work, instruments, books, and subscriptions to clubs. The fees to be paid for degrees or diplomas vary very much, but they may be set down at about £50. The cost of living may be assumed at about £100 per annum, and it is a mistake to attempt to cut down the expenses of living to a point below the general standard of the community to which the student for the time belongs.

For further details as to the requirements of the examining bodies and the particulars of the various medical schools, their number of beds available for clinical teaching, appointments open to students, the teaching staffs, etc., etc., we must refer our readers to our advertisement pages and also to the students' numbers of the *Lancet* and *British Medical Journal*, which naturally devote more space to these subjects than we have room for.

PHENOL SULPHORICINATE IN LARYNGEAL TUBERCULOSIS.—Phenol sulphoricinate is not a chemical compound, but a solution of pure phenol in the so-called sulphoricinic acid. The local application of phenol sulphoricinate produces a burning sensation lasting from half an hour to half a day. No toxic action or dangerous after effects were noticed. Solutions of 20 or 30 per cent., according to circumstances, were used by Magenau, who concludes that although not of great service in tubercular affections of the larynx, the remedy appears to be quite harmless and recommends further trials as favourable results are evidently possible with it.—*Munich. Med. Woch.*, xlv., 1018.

Where Pharmaceutical Students can Study.

LONDON SCHOOLS.

The following brief particulars concerning classes and courses of laboratory instruction suitable for pharmaceutical students are intended to give students a general idea of the facilities that are offered. Fuller particulars may be obtained in any case by writing to the Secretary of the School. In some towns not mentioned in the list classes are arranged in connection with local pharmaceutical associations or in public institutions:—

School of Pharmacy, 17, Bloomsbury Square, London, W.C.—**STAFF:** *Botany.*—Professor J. Reynolds Green, Sc.D., F.R.S., F.L.S., and Mr. E. C. Horrell. *Chemistry.*—Professor J. Norman Collie, Ph.D., F.R.S., F.I.C., and A. Lapworth, Ph.D., D.Sc. (Lond.). *Materia Medica and Pharmacy.*—Professor Henry G. Greenish, F.I.C., F.L.S., and Mr. F. A. Upsher Smith. Applications for admission should be addressed to the Secretary of the Pharmaceutical Society at the above address.

BOTANY.—The Elementary Course will extend from October 6, 1898, to the end of June, 1899, the lectures being delivered on Thursdays and Fridays at 12 o'clock. The laboratory work will be held on Friday mornings, commencing at half-past 9, and will be conducted by the demonstrator under the supervision of the professor. The Advanced Course will extend from October, 1898, to the end of March, 1899. From October to December lectures will be delivered on Thursdays and Fridays at 2 o'clock, and from January to March on Thursdays only, at the same hour. The laboratory work will be held on Thursday mornings from half-past 9 till 1; and will be conducted by the demonstrator under the direction of the professor. The laboratory work in connection with both courses will be so arranged as to illustrate and supplement the lectures, and it will include the dissection of plants and the practical study of their morphology; their histological features, the study of their structure by means of the microscope; the preparation and appropriate treatment of sections, and the methods of investigation; the practical study of the chief physiological processes; the features of the several natural orders comprised in the subjoined schedules, and the mode of representing them by means of diagrams and formulæ. It will include also the revision of the subject matter of the lectures. The gardens of the Royal Botanic Society, Regent's Park, will be open for purposes of study to all students of the School. **FEES:** Elementary course, £5 5s.; advanced course, £3 3s.

CHEMISTRY AND PHYSICS.—The lectures on elementary chemistry are delivered by the professor on Wednesday and Saturday, and those on physics by the assistant lecturer on Monday mornings at half-past 9 o'clock. The lectures on advanced chemistry will be on Monday and Tuesday at 12 o'clock, and those on physics by the assistant lecturer on Thursday at 12 o'clock. The Elementary Course, which commences in October and terminates at the end of June, has reference to the principles of chemistry as illustrated by the properties of the non-metals and metals, special attention being paid to those which are of importance in medicine and the arts. It also includes a consideration of the elements of organic chemistry, and of heat, besides those other parts of physics which are closely related to chemistry. The Advanced Course, which is more particularly intended for advanced students, commences in October, and terminates at the end of March. It includes lectures on the atomic theory and the determination of atomic weights, organic chemistry, and also lectures and demonstrations in light, electricity, and magnetism. All the lectures are fully illustrated by experiments. Revision classes will be held from time to time, as required. The lectures on physics will include practical demonstrations in the use of physical instruments. Elementary students are strongly recommended to enter in October, but in the case of a student who is unable to commence work in October and is

obliged to enter at a later date, the professor will be glad to render him every assistance in supervising his work in those portions of the subject which have already been discussed in the preceding lectures. FEES: Elementary course, £5 5s.; advanced course, £3 3s.

PRACTICAL CHEMISTRY.—The chemical laboratories are open from 9 a.m. until 5 p.m. daily. On Saturdays they are closed at 2 o'clock. These laboratories are fitted up with every convenience for the study of the principles of chemistry by personal experiment. They are specially designed for the student of pharmacy, but are equally well adapted for the acquirement of a knowledge of chemistry in its applications to medicine, manufactures, or analysis. A complete elementary course of instruction occupies about nine months, students working not less than three hours daily; a complete advanced course, including the higher branches of quantitative analysis, occupies about six months. FEES: Elementary course (3 hours daily), £12 12s.; advanced course, (3 hours daily) £9 9s.

MATERIA MEDICA.—The Elementary Course of lectures in this subject will be delivered on Tuesdays at half-past 9 o'clock, commencing on October 4, 1898, and extending to the end of June, 1899. Each lecture will be followed by practical work in the histological laboratory, which will be conducted by the demonstrator under the supervision of the professor. The Advanced Course of lectures will be delivered on Wednesdays at 12 o'clock, commencing on October 5, 1898, and terminating at the end of March, 1899. The lectures will be preceded by practical laboratory work. FEES, £3 3s. for each course,

PHARMACY.—The lectures on this subject will be delivered on Mondays and Tuesdays at half-past 2 p.m., commencing on October 4, 1898, and extending to the end of June, 1899. Each lecture will be followed by practical work in the laboratories. The subject matter will be divided into pharmacy and dispensing. The first of these divisions will include lectures on, and practical instruction in, the performance of all pharmaceutical operations, such as evaporation, distillation, sublimation, calcination, fusion, desiccation, disintegration, solution, dialysis, crystallisation, granulation, precipitation, decantation, filtration, clarification, infusion, digestion, decoction, maceration, percolation, and expression, as well as in the production of all classes of galenic preparations, such as medicated waters, dilute acids, collodions, confections, etc. Under dispensing will be included practice in the reading of prescriptions, the detection of errors and unusual doses, and systematic instruction in the weighing, measuring, compounding, and finishing off of medicines. All operations that can be performed at the dispensing counter, such as the various methods of coating pills, preparing tablets and tablet triturates, lozenges, suppositories, etc., will be practised by the student, who will thus be afforded an opportunity of acquiring a sound knowledge of this branch of his business. During the course of instruction in pharmacy and dispensing modern appliances for the pharmaceutical laboratory and the dispensing counter will be described, and, if possible, practically used, special attention being directed to such apparatus as the retail pharmacist may advantageously employ in the daily routine of his calling.—FEE: £6 6s.

PRIZES.—At the end of June bronze medals and certificates of honour are offered for competition by students who have attended the elementary course, and at the end of March silver medals and certificates of honour are open for competition by students who have attended the advanced course. The silver medallists are presented by Mr. Thomas Hanbury with a copy of 'Pharmacographia' and of 'Science Papers,' in memory of his brother, the late Daniel Hanbury, F.R.S. For particulars of scholarships see pp. 312 *et seq.*

Birkbeck Literary and Scientific Institution, Breams Buildings, Chancery Lane, E.C.—Complete courses are arranged for the instruction of students in chemistry, biology, and experimental physics, in conformity with the requirements of the Intermediate and Final B.Sc., the Preliminary Scientific (M.B.), and the Intermediate M.B. examinations of the University of London, of the Conjoint Examining Board of the Colleges of Physicians and Surgeons, and the Minor and Major examinations of the Pharmaceutical Society. Special attention is given to lecture experiments and to individual practical work in each subject. The chemical, biological, and physical laboratories have been recently much enlarged. They are excellently equipped, and accommoda-

tion is now provided for fifty students in each laboratory. Special prospectuses will be forwarded by the Secretary on application.

British Institute of Preventive Medicine, Chelsea Gardens, Grosvenor Road, S.W.—STAFF, Bacteriological Department, Allan Macfadyen, M.D., B.Sc.; R. T. Hewlett, M.D., M.R.C.P.; A. G. R. Foulerton, F.R.C.S., D.P.H. (Camb.). Chemical Department, A. Harden, Ph.D. Antitoxin Department, G. Dean, M.D.; A. Salter, M.D., D.P.H. Photo-Micrography, J. Barnard. The winter session will commence on October 3, and the summer session on May 1. There are courses of instruction in bacteriology lasting three months and six weeks (FEE £8 8s. and £5 5s. respectively), bacteriology in relation to hygiene, water analysis, photo-micrography, etc. A practical laboratory course illustrating the principles of hygiene will commence in October, FEE £15 15s. The laboratories in the new building are now in full working order and are open daily from 10 to 5 o'clock for instruction and research. The work is under the supervision of the director, A. Macfadyen, M.D., to whom application should be made for further particulars.

Brixton School of Chemistry and Pharmacy, 12, Knowle Road, Brixton, London.—PRINCIPAL, Dr. A. B. Griffiths, F.R.S. (Edin.), F.C.S. At this school day and evening classes are held for the Minor and Major examinations. Tuition is afforded in chemistry, botany, materia medica, pharmacy, physics, and prescription reading. Every student receives assistance in his work, and every endeavour is made to secure a successful issue. The school is fitted with the best appliances, and there are also collections of materia medica specimens, microscopic preparations of drugs, rare chemicals, essential oils, etc. Medals and certificates are awarded to successful students. There are also special classes for ladies preparing for the Apothecaries' Hall examination. Particular attention is paid to practical work (chemistry, botany, and dispensing).

City School of Chemistry and Pharmacy, 27, Chancery Lane, London, E.C.—STAFF: Mr. F. A. Hocking, B.Sc., Ph.C.; Mr. Dallas, M.A. (Honours); Mr. Lee, B.A., B.Sc. (Lond., with honours); Mr. M. J. Cole, etc. Day Classes are held in all subjects for the Minor examination, including chemistry, physics, and pharmacy, materia medica, botany, prescription-reading, microscopy, vegetable histology, analytical chemistry, practical pharmacy, Latin, mathematics, geology and biology (practical and theoretical), the courses beginning in January, April, June and October respectively. FEE for the six months' course, £12 12s. Evening Classes for the Minor are also held. Six months' FEE, £7 7s. The next term commences September 12, but students can join during September and October. An open Scholarship, tenable for six months, entitling the holder to free tuition, is awarded annually in October to a student reading for the Minor examination. Full details will be supplied by the Principal or Secretary.

Imperial College of Chemistry, 49 and 51, Imperial Buildings, Ludgate Circus, E.C.—PRINCIPAL, Mr. Frederick Davis. Classes (day, 10 to 5; evening 5 30 to 8) are held in chemistry, biology, botany, materia medica, microscopy, pharmacy, physiology, prescriptions, sanitary science, and hygiene. Minor FEES, £10 10s. Especial private tuition may be arranged for any desired subject. Major course, £6 6s. A thoroughly fitted pharmacy is now added to the College for practical work, and a department for experimental physics. The analysis of foods and drugs is now taught at this College.

Metropolitan College of Pharmacy, 162, Kennington Park Road, London, S.E.—PRINCIPAL, Mr. Watson Will. Demonstrators, Messrs. G. T. Branch, H. Lucas, and F. Filmer De Morgan. Secretary, Mr. W. S. Carver. Day Classes are held in chemistry (inorganic, organic, and practical), materia medica, pharmacy, botany, vegetable histology, and physics. Hours, from 9 a.m. to 6 p.m. There are three sessions, winter, from September 1 to December 31; spring, from January 1 to April 10; Summer, April 12 to July 24. FEES; Minor course, £10 10s.; Major course, £6 6s.; Major evening course, from September 1 to following July, FEE £12 12s.; Minor evening course, £3 3s. Evening classes (7 to 10 p.m.) are held in chemistry (inorganic, organic, and

practical), pharmacy, materia medica, botany, physics, prescription reading, and histology. Minor courses similar to day. Extra evenings may be taken for practical work.

South London School of Pharmacy, Limited, 325, Kennington Road, London, S.E.—STAFF; Dr. Muter, F.R.S. (Edin.), F.I.C., etc.; Mr. W. H. Dodd, F.C.S., etc.; Mr. W. F. Mawer, F.C.S., M.P.S.; Mr. F. Armstrong; Mr. J. Thomas, B.Sc. (Lond.), First Class Honours in Chem. and Physics; and Mr. A. C. M. Muter, A.I.C., F.C.S. The school premises include a chemical laboratory, fully fitted for both quantitative and qualitative analysis; a very complete museum of drugs, chemicals, and plants; and a laboratory for the manufacture of pharmaceutical preparations, fully fitted with all the necessary technical fittings, such as stills, steam-pans, etc., so that students can practically manufacture the preparations of the Pharmacopœia and gain knowledge not hitherto attainable outside the laboratory of a manufacturer. In this department is also a fully-furnished dispensary, where students can obtain thorough practice in the art of dispensing in all its branches. There are also rooms specially furnished with microscopes and all appliances for practical biology; and also with full sets of electrical, optical, and thermal instruments. The lecture rooms, etc., are in a separate building from the laboratories, so as to be free from fumes. The laboratories open at 9 a.m., and go on at intervals all day until 6 p.m., except between 1.30 and 2.30 p.m., when there is an interval. Work ceases at 1 p.m. on Saturdays. The session lasts from the beginning of October in each year until the middle of July in the following year. A fresh course of lectures (commencing at the foundation of each subject) is begun in October, January, and April. FEES.—Minor course: Lectures and classes in chemistry, chemical physics, botany, materia medica, Latin, and pharmacy, £5 5s. Major course: Lectures and classes in organic chemistry, physics, botany, and materia medica, £3 3s. No ordinary student can attend the theoretical classes without also taking the practical work, the fees in the practical department for both Minor and Major divisions being £3 3s. per month, and for the special extra academical tutorial term, open only to students of the school, £4 4s. for either Minor or Major. Compounding fees for every necessary subject either for Minor or Major (theoretical and practical): £12 12s. for the first term (about 3½ months), £8 8s. for a second, or any subsequent term. Students having once "compounded" can remain in the school as long as they please on payment of the practical fees only. No students are admitted to the school who have not passed the First examination of the Pharmaceutical Society or an equivalent preliminary examination.

The Students' Laboratory, 40, Lamb's Conduit Street, W.C.—TEACHERS: T. A. Ellwood, F.I.C., F.C.S.; C. E. Sage, F.C.S. M.P.S. In connection with this laboratory classes are held to prepare students for the examinations of the Pharmaceutical Society, the system employed being devised to ensure individual teaching and personal attention to each student in both practical and theoretical work. The laboratory is open every evening except Saturdays, from 6.30 to 9.30 p.m. FEES for three months: One night weekly, £1 11s. 6d.; two nights weekly, £2 17s. 6d.; three nights weekly, £4 4s.; four nights weekly, £5 5s.; five nights weekly, £6 6s. During the winter months a class is held for teaching more advanced practical work, the analysis of foods, drugs, water, and commercial products.

Westminster College of Chemistry and Pharmacy, Trinity Square, Borough, London, S.E.—PRINCIPALS, Mr. G. S. V. Wills, F.L.S., Ph.C., and Mr. H. Wootton, B.Sc. (Lond.) Secretary: Mr. E. Walden. Day Classes are held in chemistry and physics, materia medica, botany, pharmacy, and dispensing. The college is open from 9 to 5 daily, and the time not devoted to lectures and tutorial classes is occupied in practical work in the various subjects. FEES:—Minor complete course £8 8s.; six months, £12 12s.; twelve months, £15 15s. For the latter fee a student is taught until he can pass both Minor and Major examinations. Major course, three months, £6 6s.; six months £10 10s. Evening Classes, for the Preliminary, Minor, and Major examinations, and practical work are held every Tuesday, Wednesday, and Thursday from 7 till 9. FEE, Minor course, three months, 10s. 6d. It may be mentioned that the PEREIRA MEDAL was two years ago awarded to a student of this school, Mr. W. A. Knight, an honour of which the principals are justly proud.

PROVINCIAL SCHOOLS.

BARROW-IN-FURNESS.

Barrow-in-Furness Higher Grade School.—At the Barrow Higher Grade School technical classes are held on Monday, Tuesday, Thursday, and Friday evenings, commencing September 12, in theoretical and practical chemistry, physiology, and hygiene. Further particulars may be obtained from the Secretary, Mr. C. F. Preston, town clerk.

BIRMINGHAM.

Birmingham Municipal Technical School, Suffolk Street, Birmingham.—Day Classes are held in theoretical and practical chemistry for chemists and druggists. Teachers, Mr. C. J. Woodward, B.Sc., and Mr. W. Russell, F.I.C. FEE, 5s. per session. Evening Classes are held in botany. TEACHER, Mr. J. W. Oliver. FEE, 3s. 6d. per session; and also in physics. TEACHERS, Dr. Sumpner, and Mr. P. C. Coultas, A.R.C.Sc., etc. FEE, 5s. per session.

Central School of Pharmacy, 90, New Street, Birmingham.—Mr. F. Stokes Dewson holds classes for the pharmaceutical examinations—Major, Minor, and Preliminary. The classes are held day and evening. Practical pharmacy and dispensing receive special attention.

Mason University College, Birmingham.—TEACHERS: Professors Percy F. Frankland and Hillhouse, and Mr. Dencer Whittles. Day classes are held in chemistry, botany, materia medica, pharmacy, etc. FEES: Chemistry (from October to March and a weekly tutorial class) £5 5s.; organic chemistry suitable for Major students (April to June), £1 11s. 6d.; botany (spring and summer terms), £2 2s.; systematic botany (summer term), £1 1s.; materia medica and pharmacy, £1 1s.

Temple Chambers Tutorial Classes.—PRINCIPAL, Mr. F. H. Alcock, F.I.C., Pereira Medallist. Tutorial Classes for pharmaceutical students are held at the Analytical Laboratory, Temple Chambers, Broad Street Corner, Birmingham. The laboratories are conveniently arranged for the practical study of the subjects necessary for the Minor and Major qualifications. Special attention is paid to synthetical and analytical chemistry, pharmacy and dispensing, pharmacognosy, the assay of drugs and their preparations, microscopy, and vegetable histology. The fees are dependent upon the hours of attendance and subjects required. For full-time students the fees are 7 guineas per quarter. As each student works independently, he may begin when he pleases.

BRADFORD.

Bradford Technical College.—Head of Department and Lecturer in Chemistry, Mr. Walter M. Gardner; Assistant Lecturer and Demonstrator, Mr. A. B. Knaggs; Lecturer in Botany, Biology, and Materia Medica, Mr. W. West. Day and Evening Classes are held in chemistry (inorganic and organic), qualitative chemical analysis, quantitative chemical analysis, botany, practical botany, organic materia medica, pharmacy, and biology. A special pharmaceutical course has been arranged, including the above subjects and extending over two (evening) sessions. It is adapted for students who are preparing for the Minor examination of the Pharmaceutical Society, and an inclusive fee, at a reduced rate, is charged to students who enter for the full course.

BRISTOL.

University College.—TEACHERS: Professors Sydney Young, D.Sc. (Lond.), F.R.S.; A. P. Chattock, M.I.E.E.; C. Lloyd Morgan, F.G.S.; and Messrs. F. E. Francis, B.Sc., Ph.D.; E. Jackson, M.A., B.Sc., Ph.D.; L. N. Tyack; S. H. Reynolds, M.A.; G. Brebner; A. B. Prowse, M.A.; and F. W. Stoddart, F.I.C. Day and Evening Classes are held at the University College in chemistry (organic and inorganic), experimental physics, and botany. There are also chemical and physical laboratories.

CAMBRIDGE.

Cambridge Pharmaceutical Association.—Classes in botany and chemistry are held at the Technical Institute, from October to May, in conjunction with the Science and Art

Department of Kensington. Further information may be obtained from Mr. E. Saville Peck, 30, Trumpington Street, Cambridge.

EXETER.

Exeter School of Pharmacy, at the Exeter Technical and University Extension College.—PRINCIPAL, A. W. Clayden, M.A. Chemistry, W. H. Lewis, M.A. Pharmacy and Botany, A. H. Ware, M.P.S. Full instruction is given in all subjects required for the Minor examination. The Session commences in the first week of October and terminates at the end of June. INCLUSIVE FEE, £10 10s. The above fee is for full-time work during the whole Session, but arrangements may be made enabling advanced students to join at any time for a reduced fee. Evening classes are also held. For prospectus and particulars, apply to the Secretary of the College at the Albert Memorial Museum, Exeter.

LANCASTER.

Lancaster Municipal Technical School. The Storey Institute.—Instruction in elementary and organic chemistry by means of lectures, fully illustrated by experiments, classes, and of practical work in the laboratory, is given in connection with this school.—LECTURER, Dr. Schloesser, assisted by Mr. Ayrton. Lectures on botany, fully illustrated, are also given by Mr. W. Wyatt, Ph.C. Further particulars may be obtained from the principal, Dr. A. Schloesser.

LEEDS.

Leeds Technical School (in connection with the Leeds Institute of Science, Art, and Literature), Cookridge Street.—A large number of students in pharmacy attend this school. The courses in theoretical and practical chemistry are under Mr. R. E. Barnett, B.Sc., A.R.C.S., assisted by Mr. R. W. Ferguson, A.R.C.S. That in physics is under Mr. J. E. Tindall, B.Sc. Mr. N. Walker conducts the botany class. Practical work in chemistry, physics, and botany is offered in addition to the lecture courses. The lecture fees are from 2s. 6d. per session, and the laboratory fees from 7s. 6d. The classes are held in the evenings between 7 and 9.45. Prospectuses of the classes with other information may be obtained from Mr. Arthur Tait, Secretary.

LIVERPOOL.

Liverpool School of Pharmacy, 6, Sandon Terrace, Upper Duke Street, Liverpool.—PRINCIPAL, Mr. R. C. Cowley, assisted by demonstrators. Day Classes are held in all the subjects of the Minor and Major examinations. FEES: Minor course, £10 10s.; Major course, £9 9s. Once a week classes are held, one evening for juniors and one for advanced students. The fee for this class for a course is £3, or for the whole session £7 10s. The course of study in this school is controlled by the Council of the Liverpool Chemists' Association.

University College, Liverpool, School of Pharmacy, Brownlow Hill.—PRINCIPAL, Professor R. T. Glazebrook, M.A., F.R.S. DEAN, Professor A. M. Paterson, M.D. PROFESSORS AND LECTURERS, Chemistry: Professor J. Campbell Brown, D.Sc., F.C.S., F.I.C.; T. Lewis Bailey, Ph.D.; Charles A. Kohn, B.Sc., Ph.D.; A. W. Titherley, B.Sc., Ph.D. Physics: Professor Oliver J. Lodge, D.Sc., LL.D., F.R.S.; James L. Howard, D.Sc. Botany: Professor R. J. Harvey Gibson, M.A., F.L.S.; Charles E. Jones, B.Sc. Materia Medica: Professor W. Carter, LL.B., M.D., B.Sc., F.R.C.P.; Prosper H. Marsden, F.C.S. Pharmacy: Prosper H. Marsden, F.C.S. A complete courses of instruction for the examinations of the Pharmaceutical Society of Great Britain may be taken in University College. The session consists of a first course, beginning in October, and a second course, commencing in May. The Manchester Pharmaceutical Association Scholarship, of the annual value of about £26, may be held in this school. Lectures and practical instruction are provided in all the essential subjects, and there are well-equipped museums of chemical, botanical, and materia medica specimens. Courses may be taken out separately; or a composition fee of £17 may be paid, covering the entire Junior course. Students paying the composition fee are required to complete the course within three sessions from the date of payment. Applications for admission and all inquiries must be addressed to the Registrar, University College, Liverpool.

MANCHESTER.

Manchester College of Pharmacy, 225A and 227A, Oxford Street, Manchester.—PRINCIPAL, Mr. Charles Turner. Day Classes are held in prescription reading, and Latin, practical dispensing, pharmacy, materia medica, botany, chemistry and physics. FEES: Minor course (January to April), £9 9s.; (April to July), £9 9s.; (second Monday in August to January), £11 11s. Major course: £6 6s.; second Monday in August to January), £7 7s. Evening Classes are held in chemistry, Latin, physics, practical chemistry and dispensing, botany, materia medica, and pharmacy. The fees are, Minor course: (January to July), £4 4s.; (September to December), £3 3s. Major course: (January to July), £3 3s.; (second Monday in August to January), £2 10s. A Once a Week Class is held in practical chemistry, dispensing, pharmacy, chemistry, Latin, physics, botany, and materia medica. The fees for this class are: Minor course (January to July), £4 4s.; (August to December), £3, students under twenty pay two-thirds of these fees. Major course: (January to July), £3 3s.; (second Monday in August to December), £2 10s.

Northern College of Pharmacy, 100, Burlington Street, Manchester.—TEACHERS: Messrs. George Clayton and Frederick Lawson. The method of instruction comprises lectures and tutorial classes. Full Time and Afternoon Classes are held in organic and inorganic chemistry, physics (theoretical), practical chemistry, practical pharmacy, dispensing, theoretical pharmacy, botany, materia medica, prescription reading, theoretical chemistry, microscopy, and prescription Latin. FEES.—Minor course, (day), January to April, £9 9s.; April to July, £9 9s.; September to January, £10 10s.; (afternoon), January to July, £4 4s.; September to December, £2 10s. Major course, January to April, £5 5s.; April to July, £5 5s.; September to January, £6 6s. Evening Classes are held in theoretical chemistry, physics, Latin, practical chemistry, dispensing, botany, materia medica, microscopy, and pharmacy. The fees for these classes are: Minor course, January to July, £4 4s.; September to December, £2 10s. Major course, January to July, £3 12s. 6d.; September to January, £2 5s.

Owens College, Manchester.—PRINCIPAL, A. Hopkinson, LL.D. Pharmaceutical department. TEACHERS, Professors A. Schuster, H. B. Dixon, W. H. Perkin, D. J. Leech, and F. E. Weiss, Mr. W. Kirkby, and Mr. J. Grier. Day Classes are held in physics, chemistry (inorganic, organic and practical), materia medica, pharmacy, pharmaceutical chemistry, botany, practical botany, pharmacy law. The first year (October, 1898, to July, 1899) is devoted to the subjects for the Minor examination, and the second year (October, 1898, to March, 1899) to courses suitable for students preparing for the Major examination. FEES: A composition fee of £17 17s. admits to the College courses for the first year, and of £15 15s. for the second year. Students may pay for the classes separately. An entrance exhibition of £10 is awarded on the results of a competitive examination in elementary botany and chemistry. It is open to students entering for the full pharmaceutical course. Intending candidates must give notice to the Registrar on or before September 20. A prize of £5 will be offered at the end of the first year, for competition among students proceeding to the course for the Major examination. The Manchester Pharmaceutical Scholarship, value about £26, is also tenable at this College.

NEWCASTLE-ON-TYNE.

North of England School of Chemistry and Pharmacy, 55, Northumberland Street, Newcastle-on-Tyne.—PRINCIPAL, Mr. Frank R. Dudderidge, M.P.S. Day and Evening Classes are held in all subjects of the Minor and Major examinations. FEES: Full time classes, £8 8s.; evening classes, £3 3s.; Wednesday afternoon class, £3 3s. The fees are in each case per term of three months. A special weekly class for junior assistants and apprentices is held by Mr. Dudderidge. The fees for this class are £1 1s. for each subject, or £3 3s. for all. Apprentices are encouraged to take three or four consecutive winter courses of six months each, so as to prepare a sound groundwork of examination subjects. Classes for Medical and Veterinary Students: Chemistry, botany, materia medica, pharmacy, etc., are also held. PRIZES (competitive

examination at the end of each winter course), offered, of books, to apprentice students.

NOTTINGHAM.

University College, Nottingham.—By arrangement with the Nottingham and Notts Chemists' Association, a course of twenty experimentally illustrated lectures on pharmaceutical chemistry, extending over two terms and embracing the requirements of the Minor examination, will be delivered on Monday evenings at eight o'clock, by Dr. F. S. Kipping, F.R.S., assisted by Mr. R. M. Cavan, B.Sc., F.S.C. Each student will be entitled to three hours per week laboratory practice (or more by arrangement). FEE, 15s. per term. All students before going will be required to satisfy the authorities that they already possess a grounding in elementary chemistry. A class in botany will be held on Tuesday at 8 p.m., in the first and second term, by Professor Carr, M.A., assisted by Mr. E. A. Smith, B.Sc. FEE for the course 15s. Practical dispensing, to be arranged for the second term. A course of lectures on organic chemistry will be arranged for the third term. Further particulars can be obtained from Mr. A. Eberlin, Hon. Sec., 2, Chapel Bar, Nottingham. A prize fund to the value of £5 per annum, the gift of Messrs. Newball and Mason, Nottingham, is available, and will be distributed by the Council on the result of the session's work. All students joining these classes must be associates of the N.N.C.A.

PLYMOUTH.

Plymouth, Devonport, Stonehouse and District Chemists' Association, 7, Whimble Street, Plymouth.—Summer classes in botany are conducted by Mr. O. A. Reade from May to September inclusive. There are lectures at the rooms of the Association every Thursday at 8 p.m., on general morphology, histology, and outlines of classification, which are illustrated by microscope and lantern. Field botany every fourth Wednesday as arranged. Prizes are given annually for the best sets of herbaria collected locally. The winter classes for students which have hitherto been held under the auspices of this Association have now been transferred to the Municipal Technical Schools. Under this arrangement special classes will be held in physics, pharmacy and materia medica; such classes constituting together with those already held under Science and Art regulations a complete course of preparation for the Minor examination. Assuming that the pupil has previously passed his Preliminary examination, this course extends over three years as follows:—First year: Elementary botany; elementary inorganic chemistry; elementary inorganic chemistry, practical; elementary physics (special class). Second year: Advanced botany (special class); advanced inorganic chemistry; advanced inorganic chemistry, practical; theoretical pharmacy, and Pharmacy Act (special class). Third year: Dispensing with prescription Latin (special class); organic chemistry (special class; materia medica (special class); pharmaceutical preparations (special class).

READING.

Reading College.—Day and evening classes are held in connection with this college in mathematics and physics, pharmaceutical and agricultural chemistry, biology, botany, etc. The chemical laboratory is open daily from 10 a.m. to 5 p.m., and in order that Dr. Luxmoore may personally direct the work of all students, he requires each one to arrange with him at the beginning of the session or term the hours of attendance. Particulars may be procured from the Principal of the College.

SHEFFIELD.

Sheffield College of Pharmacy, 118, Princess Buildings, The Moor, Sheffield.—TEACHERS, Messrs. Robert B. Greaves and J. W. J. Turner. Day Classes are held in chemistry and physics, practical chemistry, botany, pharmacy, materia medica, prescription reading, organic chemistry, dispensing, and practical pharmacy. FEES, Minor (full course), £8 8s. (short course), £4 10s.; Major (full course), £7; (short course), £4. Evening Classes are held in botany, chemistry, and practical chemistry. The fee per term is £1 10s. inclusive. Winter session commences September 15, for evening students, and for ordinary day classes October 3.

Sheffield School of Pharmacy.—With a view to improving and extending pharmaceutical education in the district, the Council of the Sheffield Pharmaceutical and Chemical Society has made arrangements with the Sheffield University College authorities for the teaching of chemistry and botany, this being a preliminary step towards the establishment of a complete pharmaceutical curriculum in this district. The teaching of materia medica and pharmacy will for the present be carried on as heretofore at the Sheffield School of Pharmacy, Surrey Street, Sheffield. Students intending to take out either the elementary or advanced courses should send in their names without delay to the School Secretary, Mr. S. T. Rhoden, 33, Church Street, Sheffield, to whom all fees must be paid in advance. CHEMISTRY (PRACTICAL AND THEORETICAL).—On Wednesday evenings from 6 p.m. to 9 p.m. at University College, commencing Wednesday, October 12, 1898. Professor: W. Carleton Williams, B.Sc., F.I.C. Demonstrator: George Young, Ph.D., F.R.S.E. The chemistry course will consist chiefly of practical work in the laboratory, supplemented by about twenty lectures or demonstrations. As each student works independently in the laboratory the course of practical work will be arranged to suit the various requirements of every member of the class. Advanced students will work at quantitative analysis, organic preparations, and organic analysis. Fee for full course, from October to April, £1 10s. BOTANY (ELEMENTARY).—At University College on Tuesday evenings at 8 o'clock, to commence October 11, 1898. Lecturer: B. H. Bentley, B.A. A course of twenty lectures will be given dealing with the structure, physiology of numerous typical plants, including flowering plants, ferns, fungi, and algæ. Fee for full course, 10s. 6d. BOTANY (ADVANCED).—Professor A. Denny, F.L.S. Demonstrator: B. H. Bentley, B.A. A course of practical instruction for advanced students will be given in the Biological Laboratory, University College, on Thursday evenings, from 6.30 to 9.30 p.m., commencing October 13, 1898. Classes held in the Sheffield School of Pharmacy, 37, Surrey Street. MATERIA MEDICA.—Lecturer: John Austen. Assistant Lecturer E. C. Exell. A course of lectures and demonstrations in vegetable and animal materia medica will commence on Monday, October 17, at 8.15 p.m. The substances dealt with will be such as are official in the British Pharmacopœia and others in ordinary use in pharmacy. Students will be able to examine all specimens at the time they are under discussion. Practical work will form an important feature in the class; the use of the microscope as an aid in detecting adulterations and admixtures being illustrated; same instrument will also be used to show how the main facts vegetable histology may be demonstrated from drugs in everyday use. Students are invited to bring their microscopes and accessories on the evenings set apart for this purpose, as well as to report on any points of interest noted during home work. Fee for course, £1 1s. PHARMACY.—Lecturer: C. F. Carr. A series of twenty lectures will be delivered on Friday evenings, at 8.30 p.m., commencing October 14. The course will be divided into three divisions. (1) The description and explanation of pharmaceutical processes and operations by which galenic medicines are produced in the form in which they are prescribed by physicians, including desiccation, infusion, decoction, maceration, percolation, expression, filtration, evaporation, distillation, solution, saponification, disintegration, extraction, etc. (2) Chemistry of the Pharmacopœia, including alcohols, ethers, salts, and liquors, with explanations of the decomposition taking place in their manufacture. (3) Pharmacy laws, with special reference to the sale of poisons. FEE for the course, 10s. 6d. EXAMINATIONS AND PRIZES.—Examinations will be held at the end of each of these courses, both at University College and at the Sheffield School of Pharmacy. The examinations will be open to pharmaceutical students who have maintained a regular attendance and have satisfied the lecturers with their work. On the result of these examinations, prizes and certificates of merit will be awarded.

WOLVERHAMPTON.

Wolverhampton Technical School.—Classes in theoretical and practical chemistry are held in connection with this Institution nearly all the year round for the elementary, advanced, and honours examinations. There is also a class for students of botany. TEACHER: Mr. Whitehouse. Further particulars may be obtained from the Secretary.

SCOTTISH SCHOOLS.

ABERDEEN.

Robert Gordon's College.—Day and evening classes for the Minor Course are held in connection with the local pharmaceutical association, lectures on botany, materia medica, pharmacy, chemistry, prescription-reading and the poison laws being delivered daily during the term. Special subjects can be selected by students, for which proportional charges are made.

DUNDEE.

Technical Institute.—Classes are held in chemistry (theoretical and practical) and in materia medica. **TEACHERS:** Chemistry, Dr. Lumsden, J. K. Wood, B.Sc., J. Foggie, F.C.S. **Materia medica:** Robert Smith, B.Sc. Special arrangements are made for pharmaceutical students.

EDINBURGH.

Edinburgh Central School of Chemistry and Pharmacy, 26, Clyde Street.—**TEACHERS:** Wm. B. Cowie, Geo. Senter, and A. C. Cameron, assisted by competent demonstrators. Junior course for Minor (day and evening)—**Theoretical:** Courses of lectures are given on chemistry, physics, pharmacy, botany, materia medica, pharmaceutical Latin, and pharmacy law. **Practical:** Chemical analysis (inorganic, organic, and volumetric); physics (balance, hydrostatics, etc.); pharmacy and dispensing. **Senior course for Minor (day and evening).**—**Theoretical and practical:** In addition to junior course, thorough revision is given in all the required subjects. **Major course:** Special arrangements are made to suit the requirements of students. The full time courses commence in October, January, and April. The evening courses commence early in September. The course for "First" examination commences in October, January, and April. **FEE** per quarter for Minor or Major course, £8 8s. (day); £3 3s. (evening); and £1 1s. for "First" courses. These classes provide courses of study extending over six months (day) and over one year (evening), and are adapted for students entering with or without previous knowledge of the subjects required in the Minor and Major examinations.

Edinburgh Royal Dispensary and School of Pharmacy, West Richmond Street.—**TEACHERS:** William Duncan, W. G. Mackenzie, C. M. German, and G. Simpson, pharmaceutical chemists. The school premises, which were specially built and furnished for the teaching of pharmaceutical students, include chemical laboratories, lecture rooms, museums, and a dispensary, in which pupils have ample opportunities of gaining experience in practical pharmacy and dispensing. The session lasts from October to July, being divided into three terms, commencing October, January, and April. **FEES:** £8 8s. a term. **Chemistry:** The lectures are delivered on Mondays, Wednesdays, and Fridays, from 10 to 11. **Practical chemistry:** Daily, from 2 to 5. **Physics:** Mondays, Wednesdays, and Fridays, from 12 to 1. **Botany (including practical work):** Mondays, Wednesdays, and Fridays, from 11 to 12. **Microscopic work and lantern demonstrations:** Wednesdays, 9 to 10; and Thursdays, 5 to 6. **Materia medica:** Tuesdays and Thursdays, from 10 to 11. **Practical pharmacy and dispensing:** Daily, 9 to 10. **Theoretical pharmacy and prescription reading:** on Tuesdays and Thursdays, from 11 to 1. **Evening Classes** are also held on Mondays, Tuesdays, and Thursdays. **FEES:** £3 3s. a term.

GLASGOW.

Glasgow School of Pharmacy, 180, West Regent Street, Glasgow.—**PRINCIPAL,** John Lothian. **DEMONSTRATORS,** William Brown; Bertram Cockburn. **TEACHERS (Preliminary Class),** Walter Blythe, M.A.; A. Campbell Law. The school was last year transferred to more commodious premises and equipped on the most modern principles. For the Minor and Major examinations full courses of instruction by day classes commence October 3, and continue to the end of March. Short advanced classes are held from April to July and from the middle of August to the end of September in preparation for the July and October examinations. For the Minor, lectures in all the subjects are delivered in the mornings from 10 a.m. to 1 p.m., and a class is formed in practical phar-

macy. Practical chemistry classes are held in the afternoon from 2 p.m. to 5 p.m. The practical chemistry, botany and pharmacography classes for the Major examination are held every morning, and lectures for the same examination can be arranged. The evening classes for the Minor examination are conducted in three stages—junior, intermediate, and senior, so that students can enter at any time, the whole of the work in each of these sections being systematically covered. Evening classes for the First examination are held twice weekly, on Tuesday and Thursday evenings. **FEES,** Minor or Major day classes, £8 8s. per quarter; evening classes (3 evenings per week) £3 3s. per quarter; preliminary class, 10s. 6d.

Glasgow and West of Scotland School of Pharmacy (Central School of Pharmacy), 157, St. Vincent Street, Glasgow.—**PRINCIPALS:** T. Mackenzie, M.P.S.; T. S. Barrie, Ph.C. Assisted by J. Manson, M.P.S.; A. M. Ferguson, M.A. Day Classes are held in theoretical and practical chemistry, physics, botany, including vegetable histology, materia medica, prescription reading, theoretical and practical pharmacy, and dispensing. **FEES,** Minor or Major course, £8 8s. per quarter. Evening Classes are held on Tuesdays, Wednesdays, and Fridays for the Minor examination, and on Tuesdays, Thursdays, and Fridays for the Major. These classes include all the subjects taken in the day courses, both theoretical and practical. **FEES,** Minor and Major courses, £2 2s. two nights a week per quarter; £3 3s. three nights a week per quarter. Students do not require to have an elementary groundwork, as the subjects are taught from their foundation.

IRISH SCHOOLS.

BELFAST.

Belfast School of Applied Chemistry, Dublin Road, Belfast.—**STAFF:** Chemistry, Mr. S. Templeton, Assoc. R.C.Sc., F.I.C., Principal; botany, Mr. W. A. Rice, B.A.; materia medica and pharmacy, Mr. J. Harper, L.P.S.I., M.P.S. (Great Britain); preliminary subjects, Mr. J. T. Leslie. Full courses of instruction for the Minor and Irish Licence examinations begin in the last week of September and the first week of January. Day and evening classes. **FEES:** Chemistry (lectures and tutorial work), £2 2s.; practical chemistry (100 hours), £4 4s.; botany and materia medica, £2 2s.; pharmacy, £2 2s.; compounded fee for all subjects, £8 8s. Evening students, £2 2s. per quarter for two evenings weekly. Classes are also held for the Preliminary and Druggists' Licence.

DUBLIN.

School of Chemistry and Practical Pharmacy, 67, Lower Mount Street, Dublin.—**DIRECTOR,** Professor Tichborne, LL.D., F.I.C., assisted by Mr. P. Kelly, M.P.S.I. The Irish Pharmaceutical Council established this school about ten years ago in order to obviate the serious inconvenience caused to pharmaceutical students through the discontinuance of evening lectures by the medical schools. Everything in the way of chemistry likely to be of service to the pharmaceutical student in his profession is included in the course, which comprises the general principles of chemistry and chemical physics, qualitative chemistry, volumetric analysis, urine testing, public health chemistry, air analysis, etc. The school is a very popular one with students, and the accommodation has had to be extended from time to time, and, owing to the crowded state of the school recently, a number of additional benches have been provided.

School of Botany and Materia Medica, 67, Lower Mount Street, Dublin.—**DIRECTOR,** Professor Ninian Falkiner, M.B., Fellow and Examiner in Materia Medica, Royal College of Physicians, Ireland. The lectures are given twice a week in the evenings, but besides there are demonstrations in Trinity College Botanic Gardens. These classes are so highly prized that, although only three years in operation, over one hundred and thirty students have taken advantage of them.

PROCEEDINGS UNDER THE PHARMACY ACTS.

PHARMACEUTICAL SOCIETY *v.* ACME CHEMICAL CO., LTD.

The Acme Chemical Co., Ltd., Tonbridge, was summoned at the Tonbridge Petty Sessions on Tuesday, at the instance of the Pharmaceutical Society, for unlawfully selling poison otherwise than is provided in Section 17 of the Pharmacy Act, 1868.

Mr. H. A. Darbishire presided over the magisterial deliberations, and with him on the Bench were Viscount Hardinge, Captain Down, R.N., Colonel Henderson, Mr. C. Fitch Kemp, D.L., Mr. H. J. Wood, and Mr. J. Stanford.

Mr. Roland E. Vaughan Williams, barrister, instructed by Messrs. Flux, Thompson and Flux, solicitors to the Pharmaceutical Society, prosecuted, and Mr. A. H. Neve, jun., solicitor, Tonbridge, defended on behalf of the Company.

Mr. Neve, who entered a plea of not guilty, raised a preliminary objection. Under the section it was possible for four or five offences to have been committed, and he was entitled to have it distinctly stated in the summons what offence his clients were charged with.

The Bench waived this objection, and Counsel for the prosecution, in opening the case, said the summons was taken under Section 17 of the Pharmacy Act, an Act passed for the protection of the public. What he alleged against the company was that they sold one of the poisons contained in the first part of Schedule A of the Act, the particular poison being arsenic and its preparations, and he should prove, he thought, to their satisfaction, that two of the requirements of the Section had not been complied with. In the first place, the purchaser was unknown to the defendants who sold the arsenic; in the second place, he was not introduced to them; and more than that, no signature of the purchaser was affixed to any poison Book in the form F, as was required by the Act. He submitted that if he proved that, a conviction must follow. The defendants were a limited company carrying on business at Tonbridge in the manufacture of weed-killers. The weed-killer in question was a powder, and contained practically 70 per cent. of arsenic. The quantity bought was a tin containing 1 lb. 14 ozs., and of that 1 lb. 5 ozs. was pure arsenic. It was an exceedingly dangerous poison, and wherever an infringement of the Act was made it was the duty of the Society to take action. But the defendants were previously cautioned. On July 10, 1893, the Society's solicitors wrote a letter of caution, and the Company replied, undertaking to take every possible precaution in future against the infringement of the Act. Finding afterwards that the defendants were not doing so, however, the Society deemed it their duty to institute the present prosecution. Accordingly they instructed Mr. Moon, Clerk to the Registrar of the Society, to write a letter to the Company ordering one tin of weed-killer, and the tin containing the amount of arsenic that he had described was received by return of post on July 26. If he proved his case he did not think the Bench would feel that an infliction of the full penalty would be too severe, for although the defendants at first gave an undertaking to comply with the law, a mere undertaking like that was not sufficient to protect them if they disregarded it.

Charles Weston Langley Flux, solicitor to the Pharmaceutical Society, then proved the writing of the letters to the defendant company, and the receipt of the replies, the letters being produced and read out in Court.

Harry Moon, clerk to the Registrar of the Pharmaceutical Society, living at 1, St. Margaret's Road, Brockley, Kent, deposed to writing and receiving a tin of the weed-killer, produced. He was not asked to sign any book or form, and did not do so, and, so far as he knew, was not known to the defendant company.

Ernest John Eastes, 61, Chancery Lane, Fellow of the Institute of Chemistry and a pharmaceutical chemist, deposed to analysing the tin of weed-killer. He found that it contained 1 lb. 14 ozs. of a whitish powder, consisting mainly of a mixture of arsenic and caustic soda. There was 1 lb. 5 ozs. of arsenic, or 70 per cent. of the whole. There was sufficient arsenic, improperly distributed, to kill 4000 or 5000 people. It was very slightly coloured, and, in his opinion, not sufficiently to comply with the provisions of the Arsenic Act.

Mr. Neve addressed the Bench at considerable length on behalf of his clients. He maintained that both upon the law and facts the prosecution should fail. The Act was framed to deal with individuals dealing in poisons, and he argued that neither Section 17 nor any other portion of the Act could apply to corporate bodies. He cited, in support of his contention, a judgment in the Court of

Appeal, which was afterwards ratified in the House of Lords, which held that Sections 1 and 15 of the Act only applied to individuals and not corporate bodies, and contended that Section 17 was precisely the same. The Act stipulated that the purchaser must be known to the seller, but nothing was laid down as to how he should be known. In this case Mr. Moon had gained such a fame in connection with similar prosecutions that the Company knew who he was; therefore the poison was not sold to a man unknown to the Company.

Mr. Williams said he was bound to admit that Section 15 did not apply to a corporation or limited company, but in the case which had been cited by his friend, it was particularly laid down that Section 17 stood upon a different footing. Lord Selborne, the then highest judge in the land, expressed the firm opinion that Section 17 of the Act did apply to corporate bodies as well as individuals, and no judgment had ever been appealed against on that point since that expression of opinion.

No witnesses were called for the defence, and the Bench, after a brief retirement, announced, through the Chairman, that they were unanimously of opinion that there ought to be a conviction. The Company would therefore be fined £5 with costs.

Mr. Neve asked the Bench to state a case for a higher Court on the point as to the application of the words in the Section applying to a corporate body, and the Bench consented.

LETTERS TO THE EDITOR.

DEODORISING PROPERTIES OF OLEUM RUSCI.

Sir,—A weak solution of glue was exposed to the air until it became partially putrescent. The smell was neutralised by the addition of a few drops of the oleum rusci. Blotting-paper dipped in the solution and dried remains perfectly sweet.

Kew, August 31, 1898.

R. GOODWIN MUMBRAY.

FRENCH LAVENDER OIL AND THE B.P., 1898.

Sir,—With reference to the question of the specific gravity of French lavender oil, over which Mr. R. Wippell Gadd and Mr. John C. Umney are at variance, I quite agree with Mr. Umney as to the possibility of obtaining oils answering to the Pharmacopoeial requirements. In fact, during the past eighteen months I have not had one sample having a specific gravity below 0.885. The figures given in the following table were obtained with samples examined during the past six months:—

No.	Sp. gr. at 15° C.	Optical rotation, 100 Mm. tube.	Linalyl acetate.
1.....	0.8925	—5° 40'	30.8 per cent.
2.....	0.8887	—7° 45'	34.7 "
3.....	0.8884	—7° 30'	36.0 "
4.....	0.8865	—10° 0'	22.5 "

The first three samples are genuine oils, No. 4 is either a very poor sample or an adulterated one, and yet the sp. gr. is above the B.P. limit. Merely determining the specific gravity of French lavender oil is of little value, as mixtures of spike oil and turpentine oil can be prepared having the same sp. gr. as the genuine oil.

Liverpool, September 6, 1898.

EDWIN DOWZARD.

THE OBSERVATION OF SCIENTIFIC FACTS.

Sir,—Without wishing to preach a homily upon total abstinence, or in the least intending to carry on a correspondence upon the subject in your Journal, I cannot allow the uncalled for and possibly unintentional imputation cast by Mr. B. S. Proctor upon those who have the good sense and wisdom to become pledged abstainers to pass unquestioned. In the summary of his "Note on the Use of the Clinical Thermometer" (p. 266) Mr. Proctor distinctly infers that those who take total abstinence pledges are thereby incapacitated from being competent observers of scientific facts, "free from preconceived conclusions and vitiated results." Such an unjust reflection upon a very large, and I am glad to say increasing, class of the community hardly becomes one holding so responsible and influential a position as our friend in a business which of all others demands a clear head and a steady hand. As one of the "weak" individuals, I can only say, after many years' experience, that some of the cleverest and best assistants I have had have been pledged abstainers, and I would unhesitatingly

recommend any young man desiring to study his own best interest, mental and physical, to join the ranks of total abstainers, with the full assurance that it is a step he will never regret.

Brighton, September 3, 1898.

EDWIN B. VIZER.

* * Mr. Vizer's letter is published mainly for his own satisfaction—for unless we are open to be charged with total abstinence from perception, which is perhaps more frequently exercised than abstinence from alcohol—we fail to perceive that Mr. Proctor drew any inference casting imputation upon the class of pledged abstainers to which Mr. Vizer refers. Indeed, Mr. Vizer's letter appears to support the proposition that preconceived conclusions may vitiate the results of observation. [Ed., P. J.]

CHEMISTS' ASSISTANTS' UNION.

Sir,—Any assistant who has not yet received a copy of the rules of the above union can now do so by applying to the secretary. There is every indication that this movement is going to be a large and successful one, and gentlemen who intend to join are asked to send in their names at once, that they may be submitted for approval to the council meeting next Thursday, September 15. Nominations for provincial secretaries will also be submitted to the same meeting. Every town of more than 20,000 inhabitants will have its local secretary, and any gentleman who will kindly undertake the duties (which are not very onerous) is asked to communicate with me at once. A large general meeting will be held in London early in October (of which due notice will be given), at which it is hoped the work of this union will be thoroughly explained. Every assistant who can is expected to attend. I shall be happy to do all I can in supplying further information to those who write me.

Horse Shoe Hotel,
Tottenham Court Road, London.
September 6, 1898.

C. E. PICKERING,
Honorary Secretary.

ANSWERS TO QUERIES.

SANITARY INSPECTORS.—We have no information on the subject. [Reply to C. M. S.—14/26.]

EDELWEISS.—It is the *Leontopodium alpinum*, N.O. Compositæ. [Reply to D. D.—16/5.]

SOLVENTS FOR CELLULOID.—It is soluble in strong alcohol, ether, acetone, amyl acetate, etc. [Reply to H. J. P.—16/7.]

METHYLATED SPIRIT IN LINIMENT.—It is illegal to use the spirit in the case you mention. [Reply to REX.—16/9.]

CAPSICI FRUCTUS.—It is, of course, a printer's error in the B.P. monograph, and should read "two-celled fruits," not "wo-celled fruits." [Reply to BORLY.—16/8.]

GERMINATION OF SEEDS.—It has been observed occasionally and is probably due to exposure of the fruit to sunlight at the natural time of germination. [Reply to A. W.—15/33.]

MEDICAL BOOKS.—Possibly Alexander's 'Treatment of Epilepsy,' 7s. 6d.; Gower's 'Clinical Lectures on Nervous Diseases,' 7s. 6d.; Gower's 'Manual of Diseases of the Nervous System,' 35s.; or Gray's 'Treatise on Nervous and Mental Diseases,' 21s., will suit your purpose. [Reply to A. R.—15/24.]

PLATINOTYPE "P.O.P."—The letters P.O.P. are an abbreviation for printing-out paper, and have by custom been accepted as meaning a paper coated with an emulsion of chloride and an organic salt, generally the citrate of silver with some free nitrate of silver. The platinotype process is founded on the action of light on ferric oxalate, which reduces it to ferrous oxalate, which in turn acts on chloro-platinite of potash, giving a faint image, which is developed to full intensity by the reducing action of the ferrous oxalate when dissolved in the developer, which may be neutral potassium oxalate, or with additions, so that the term platinotype P.O.P. is not correct. The developing salts of the Platinotype Company are a special and secret preparation, but are generally supposed to be a mixture of neutral potassium oxalate, 4 parts, and potassium ortho-phosphate, 4 parts; this quantity should be dissolved in 100 parts water. [Reply to PHILOMEL.—15/27.]

COCA WINE.—Why do you assume that it need not be labelled "poison"? As a matter of fact it is a question whether in certain cases the sale ought not to be registered, as being a sale of cocaine—a poisonous vegetable alkaloid. [Reply to W. B. W.—16/3.]

MISCIBLE GINGERINE.—Dissolve it in proof spirit so as to make a strong tincture, then mix with light magnesium carbonate or calcium phosphate, in the proportion of one ounce to the pint, rubbing the powder to a smooth paste in a mortar with a little of the tincture, and adding the rest gradually. Then add an equal quantity of water, shake well at intervals for a few hours, allow to settle, decant, and filter if necessary. [Reply to W. E. G.—16/2.]

CLOUD NEGATIVES.—To obtain cloud negatives it is advisable to use colour-sensitive plates, such as the Ilford chromatic, or Edwards isochromatic, the medium rapidity should be chosen. The camera should be directed to the sky, preferably including about one inch of landscape at the bottom of the plate. The lens must be focussed for the clouds or infinity and a stop of F/11 or F/16, according to the brightness of the sky inserted. Under these conditions with an exposure of about $\frac{1}{50}$ of a second good results can be obtained for all ordinary clouds. When the clouds are very light, as in the cirrus, or cirro-stratus, commonly known as the mackerel or mare's-tail skies, then it is advisable to use a yellow screen so as to absorb of the blue light reflected from the sky, and thus give greater contrast in the negative. This yellow screen may be obtained commercially, or can be made by taking a lantern plate, fixing without exposing and developing, washing thoroughly, and then soaking for fifteen minutes in a saturated aqueous solution of picric acid, then rinsing and drying. This screen should be placed inside the camera behind the lens, and the exposure increased to about one-fifteenth of a second. The development of a cloud negative presents little difficulty. There should be a little more bromide in the developer, and the negative should not be developed too long so as to be too dense. To use a cloudy negative, that is, to print it into a landscape, first of all print the landscape on to a piece of paper, then with a pair of fine scissors carefully cut the sky portion of this print, this may be thrown away—as the landscape portion only is required. Print in the usual way the landscape on a piece of paper, remove the negative, and print from the printing frame. Adjust the cut out landscape or mask, as it is called, carefully over the cloud negative, having allowed the mask to blacken completely by exposure to light, and then place the cloud negative and mask on the landscape print, making the mask exactly coincide with the outlines of the landscape, and print not too deeply. If a white line shows at the join, cover up the cloud and landscape, and expose the horizon to light for a short time. [Reply to BENE.—15/26.]

OBITUARY.

WINTER.—On August 23, John Billingsby Winter, Chemist and Druggist, Manningtree. Aged 68.

THOMAS.—On August 25, Thomas Rees Thomas, Chemist and Druggist, Burry Port, South Wales. Aged 48. Mr. Thomas was an Associate of the Pharmaceutical Society.

WESTWATER.—On August 25, George Westwater, Chemist and Druggist, Lochgelly, N.B. Aged 39.

HADFIELD.—On August 27, William Perkins Hadfield, Pharmaceutical Chemist, Newark-on-Trent. Aged 86. Mr. Hadfield had been a member of the Pharmaceutical Society since 1853, and was the oldest and one of the most respected tradesmen in the town. He served his apprenticeship with Mr. R. M. Dale, Chemist, Nottingham, and afterwards was assistant to Mr. Snow, Chemist, Newark, whom he left to accept an appointment with the firm of Messrs. Hearon, McCulloch and Francis, Wholesale Druggists, London. Subsequently he returned to Newark and commenced in business on his own account at the corner of Bridge Street and the Market Place. He was one of the old Town Commissioners, a Director of the old Waterworks, and a Trustee of the Newark Minor Charities; he was also one of the originators of the Mechanics' Institution, Newark.

KITCHING.—On September 1, Charles Kitching, Chemist and Druggist, Oakengates, Salop. Aged 53.

KEMP.—On September 5, John Kemp, Chemist and Druggist, Lincoln. Aged 64.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Iodine in Cod-Liver Oil. E. Reboul describes in detail a method of determining the amount of iodine present in cod-liver oil. Into a 150 C.c. flask are introduced 25 Gm. oil, 25 Gm. alcoholic potassium hydroxide, and 10 Gm. KNO_3 . A reflux condenser is attached and the flask heated for one hour on a water-bath to effect saponification. The liquid is then evaporated to dryness in a porcelain capsule and afterwards calcined over a Bunsen burner. Potassium nitrate is added from time to time, until a white residue is obtained. The ash is dissolved in dilute hydrochloric acid, transferred to a 250 C.c. flask, and about 10 C.c. of ferric chloride solution are added, together with enough water to two-thirds fill the vessel. The latter is placed in communication with a flask containing 50 C.c. of a 5 per cent. solution of potassium iodide. The first vessel is heated and ebullition continued for a few minutes until the ferric chloride has displaced all the iodine which is absorbed by the potassium iodide solution. The free iodine is estimated in the usual way by means of centinormal sodium thiosulphate.—*Bull. de Phar. du Sud-Est.*, iii., 292.

Carl E. Smith recommends the following method of assaying crude carbolic acid for disinfecting purposes. Dilute 1 Gm. of sample to 100 C.c. with water, and, when mixed, measure 2 C.c. (=0.02 Gm. of sample) into a 100 C.c. stoppered flask. Add 10 C.c. of water, 12 C.c. of N/10 bromine solution and 2 C.c. of HCl. After half an hour's shaking add 2 C.c. KI test solution, avoiding loss of bromine; shake and run in N/10 $Na_2S_2O_3$ solution until the solution is decolorised. If cresols are present the solution becomes yellow again on standing, probably due to the breaking down of an addition product of tribrom-cresol and bromine or iodine. Thiosulphate must be added until, after prolonged shaking, the solution remains colourless. The number of C.c. required deducted from 12 gives the number of C.c. of N/10 bromine solution consumed by 0.02 Gm. of sample. The following table gives the volume of N/10 bromine solution required for 0.02 Gm. of sample containing 85 per cent. of phenol and cresols, in different ratios, and 10 per cent. of tar oils, the bromine absorbed by these being included:—

Chiefly Phenol	11.0 C.c.
Phenol $\frac{3}{4}$; Cresol $\frac{1}{4}$	10.65 C.c.
Phenol $\frac{2}{3}$; Cresol $\frac{1}{3}$	10.3 C.c.
Phenol $\frac{1}{2}$; Cresol $\frac{1}{2}$	9.95 C.c.
Chiefly Cresol	9.6 C.c.

The paper gives useful information concerning the calculation of results by the appearance of the precipitate that is formed during the process. The author prefers this modification of Koppeschaar's process, because the fractional distillation method is too lengthy for pharmaceutical purposes.—*Am. Journ. Pharm.*, lxx., 369.

Chemistry of Aloes. In a short but pithy article Alfred R. L. Dohme, Ph.D., sums up the results of investigations performed by himself, also by Professor Tschirch and his pupil, G. Pedersen, dealing with the chemistry of aloes. The following main points are brought forward:—(1) Socotrine, Curaçoa, and Cape aloes gave respectively 7.5, 18.5, and 4.5 per cent. of aloin. (2) Curaçoa aloes is as efficient as the Socotrine variety and is cheaper; moreover, it forms the greater portion of the so-called Socotrine aloes of commerce. (3) The resin of aloes is an ester, and varies according to the variety of aloes. The varying constituent is the acid, the alcoholic part—alo-resinotallol—is the same

in the two varieties so far examined, viz., Barbadoes and Cape aloes. (4) Aloin contains emodin, to which its laxative property is probably due. (5) Many laxative drugs, e.g., senna, cascara sagrada, rhubarb, buckthorn, besides aloes, owe their laxative properties to the emodin or some similar substance, derived from anthraquinone and isomeric with it. Work is now in progress to show the exact relationship of anthraquinone to the well-known laxatives.—*Am. Journ. Pharm.*, lxx., 398.

Germination of Spores. In order to clear up the contradictory statements of previous observers as to the effect of light on the germination of fern and moss spores, Fred de Forest Heald has attacked the subject experimentally. He shows that under ordinary conditions of temperature (19° to 21° C.) and inorganic nourishment, moss and liverwort spores are unable to germinate in the dark. The same kinds of spores when subjected to the more strongly refrangible rays of the spectrum behave the same as in darkness. Organic nourishment, in the form of either peptone or grape sugar, will cause moss spores to germinate even in complete darkness. Moss protonemata attain a considerable size in the dark by a saprophytic nourishment, although the vigour of growth is below the normal. Under the ordinary conditions mentioned above, fern spores cannot germinate in the dark, unless a higher temperature is attained (say 32° C.). On the other hand the spores of *Equisetum* germinate apparently as well in darkness as in light and at the ordinary temperature. Among plants employed in the investigation *Funaria hygrometrica*, *Bryum pendulum*, and *Mnium cuspidatum* represented mosses, and *Marchantia* the liverworts; *Equisetum arvense* furnished the spores for the experiments on the *Equisetums*, and among fern spores tried were those of *Ceratopteris thalictroides* and *Alsophila loddigesii*.—*Bot. Gazette*, xxvi., 25.

Test for Saffron. Henry Kraemer gives directions for distinguishing between crocus, carthamus, and calendula by means of the well-known sulphuric acid test. With crocus only the stigmas become blue immediately, and in half a minute the solution becomes blue, gradually changing first to a violet, then to a deep wine-red colour. The flowers of carthamus turn yellow; the solution remains colourless for a few minutes, then becomes yellow, and after a much longer time assumes a deep wine-red colour. Calendula flowers turn brown or blackish brown, as if charred, but the solution behaves much the same as carthamus.—*Am. Journ. Pharm.*, lxx., 386.

Foliar Structures of Pilularia. Duncan S. Johnson, of the John Hopkins University, has studied in detail the development of the foliar structures of *Pilularia globulifera*, and compared the results with those of *Marsilea quadrifolia*. He finds that the leaf of *Pilularia* develops, like *Marsilea* and many other leptosporangiate ferns, by a two-sided apical cell, arising on the right and left sides alternately of the dorsal surface of the stem, near the apex. No indication of a rudimentary lamina could be found in the leaf. The sporocarp of *Pilularia* is a branch of the leaf, arising in an anterior marginal cell at the base of the latter. He concludes that the sporocarp of *P. globulifera* is essentially the equivalent of a *Marsilea* sporocarp in which the number of sori has been reduced to two pairs, and will probably be found to correspond even more closely in development with those *Marsileas* like *M. polycarpa*, which also have a small number of sori. Morphologically, the capsule may be considered as equivalent to a branch of the leaf in which the marginal cells have given rise to sporangia instead of a lamina.—*Bot. Gazette*, xxvi., 1.

THE INFLUENCE OF CRYPTOGRAMS ON CHEMICAL ACTION.

At the meeting of the Apotheker Verein in Cologne Dr. Partheil delivered an interesting address on this subject. Commencing with the phenomenon of alcoholic fermentation—which has been known and applied from time immemorial, but not understood as involving disappearance of sugar with production of alcohol and carbonic acid until Lavoisier's time, when the change was represented by Gay Lussac by the equation $C_6H_{12}O_6 = 2C_2H_6O + 2CO_2$,—he pointed out that it was not until 1835 the influence of yeast as a living organism was recognised by Cagniard de Latour, and about the same time by Schwann. Pasteur detected the existence in the air of yeast germs which could be cultivated, and that observation led him to conclude that fermentation cannot take place without the aid of organisms. Still more recently Buchner has shown that this proposition is incorrect, and he has done much to establish Liebig's chemical theory of fermentation.

By triturating yeast with sand and pressing out the liquid contents of the cells, Buchner obtained an albuminoid product different from living protoplasm, which he calls zymase. It is capable of exciting fermentation, and its action is not hindered by chloroform. On adding alcohol to a solution of zymase, it is converted into an insoluble modification, and on heating the expressed liquid from yeast, flocculi of albumin separate at about 40°-50° C., the liquid then becoming inactive. The liquid also becomes inactive when kept for several days, but it can be dried in a vacuum at a temperature not exceeding 35 C., and obtained in the form of powder resembling dried egg albumin, and in that condition can be kept without change.

The liquid expressed from yeast causes the fermentation of cane malt, grape, and fruit sugar just in the same manner as yeast does, but it does not cause lactose or mannite to ferment. It also causes fermentation of glycogen, which is not the case with yeast according to Koch and Hosaenus.

Various kinds of yeast capable of giving rise to different products by fermentation can be cultivated in the same manner that individuals are cultivated by selection, and this procedure has been followed in the production of wine from malt. But yeast, which produces the zymase capable of exciting alcoholic fermentation, is not the only fungus that has this capability. Thus, for instance, the *Bacillus fitzianus* produces ethyl-alcohol from glycerin; *Bacillus ethaceticus* ferments glycerin, mannite, arabinose or glyceric acid, with production of ethyl-alcohol and acetic acid; and the *Bacillus pneumoniae*, of Friedlander, acts in a similar manner upon saccharine solutions.

Many other bacilli are capable of producing alcohol, but the processes by which this is effected have not hitherto been turned to practical account. Some of the homologues of ethyl alcohol are produced in a similar manner. Normal butyl alcohol is produced from glycerin under the influence of *Bacillus butylicus*, as first shown by Fitz and since confirmed by Emmerling. Mould fungi can also excite alcoholic fermentation under certain conditions, and in the same manner as yeast, glycerin and succinic acid being produced together with alcohol, much in the same proportions as in yeast fermentation, and recently Emmerling has observed that this effect is produced by *Mucor racemosus*.

Passing to those cryptogams which produce acids, as in the case of mother of vinegar, first observed in 1837 by Kützing, who ascribed the action to *Ulvinia aceti*, Pasteur showed that this effect was dependent on the presence of *Mycoderma aceti*. In 1878 Hansen observed that acetous fermentation can be produced by several kinds of bacteria, and that it is not necessary to have a

specific ferment for each kind of fermentation as had been supposed. *Bacterium aceti* and *Bacterium pasteurianum* were examined by him morphologically, and subsequently he identified *B. kützingianum*, Henneberg, *B. oxydans*, and *B. acetosum* and Beijerinck *B. rancens*.

Chemically, the acetous fermentation is a process of oxidation represented by the equation—

Pasteur showed that the bacteria producing acetic acid can also convert acetic acid into carbonic acid and water, and the fact was confirmed by A. J. Brown in the case of *B. aceti*, thus opening a wide field for investigation of a practical tendency. Butyric fermentation of sugar was elucidated in 1861 by Pasteur, who showed that it took place in two consecutive stages. Lactic acid or calcium lactate is first produced, and under the influence of the "vibrion butyrique," lactic acid is broken up into butyric acid, carbonic dioxide, and hydrogen—

As an especially important feature of this process, Pasteur observed that the excitant of butyric fermentation is capable of living without air. The exact morphological investigation of it was carried out by Grazmowski, who gave it the name of *Clostridium butyricum*. In 1884, Hucppe showed that in butyric fermentation, as in the acetous fermentation, several distinct species are concerned. Beijerinck afterwards classed the butyl bacteria in the family of Granulobacter, and distinguished the excitant of butyl-alcohol fermentation as *Granulobacter butylicum*, from those producing butyric fermentation, *Gr. saccharobutylicum* and *Gr. lactobutylicum*. Emmerling obtained butyric acid from glycerin by fermentation under the influence of *Bacillus boeopricus*.

Oxalic acid is produced by various mould fungi; for instance, *Aspergillus niger*, as shown by Wehmer, and Zopf showed that it is produced by a typical yeast, *Saccharomyces hansenii*.

At a very early period nomadic herdsmen must have observed that the milk obtained from their cattle soon became sour when kept, and therefore lactic acid must have been familiar to them, but it was not until 1780 that Scheele observed the difference between it and acetic acid, and it was only in 1857 that Pasteur ascribed its production to the action of a peculiar organism. He showed that this organism is capable of turning milk sour, and he pointed out the difference in the action upon saccharine liquids as compared with alcoholic fermentation. But it was not until 1877 that Lister obtained a pure culture of the ferment producing lactic acid, and named it *Bacterium lactis*, which is probably identical with the *Bacillus acidi lactis* of Hueppe. Several other producers of lactic acid were identified by Hueppe, and among them *Micrococcus prodigiosus*.

The chemical process of lactic acid formation is not exactly represented by the following equations—

since the conversion is attended with an abundant evolution of gas, moreover different kinds of bacteria give rise to the production of different quantities of acid.

Of the two known isomeric forms of lactic acid, only the ethylidine compound, $CH_3-CH(OH)-COOH$ is produced by fermentation so far as is yet known, and of the three stereoisomeric forms of it the optically inactive acid is the one generally produced. In 1889, Nencki and Silber described an anaerobic fungus which produces dextralactic acid in saccharine solutions, and they named it *Micrococcus acidi paralactici*. In the following year

Schardinger found the *Bacillus acidi laevolactici*, which ferments dextrose, saccharose, lactose, and glycerin with production of laevolactic acid. Apparently the producers of laevolactic acid occur less frequently than those producing the dextro or the inactive acid. Some pathogenic fungi are capable of producing laevolactic acid, and sometimes the nature of the acid produced admits of the kind of fungus being inferred. Thus, for instance, Blachstein found that *Bacterium coli commune* produces dextrolactic acid in nutritive media containing peptone and glycose, while *Bacillus typhi abdominalis* produces, under the same conditions, laevolactic acid. But in regard to this point it is necessary to bear in mind that the kind of lactic acid produced depends upon the conditions of nutrition. Thus Péré found that when pepton was replaced by an ammonia salt both the above-mentioned kinds of bacteria produced laevolactic acid.

The production of citric acid from grape sugar by fermentation is especially interesting. It takes place, as Wehmer showed about five years since, under the influence of two organisms closely related to the mould fungi and resembling in appearance *Pencillium glaucum*. They are named *Citromyces glaber* and *C. pfefferianus*. Recently Wehmer has reported that *Pencillium luteum* and *Mucor pyriformis* are also capable of producing citric acid. From a chemical point of view this process is unique in giving rise to a product which contains an abnormal carbon chain, while all other kinds of fermentation give rise to acids with normal chain. The acid is produced abundantly from sugar, under the influence of the fungus with access of oxygen. From comparison of the empirical formulæ of dextrose and citric acid the process is apparently one of simple oxidation.

but when the constitutional formulæ are compared, it is evident that the change must be attended with transposition of at least one carbon atom.

The production of citric acid by fermentation is practically carried out at the Fabriques de Produits Chimiques de Thann et de Mulhouse.

Other instances of chemical processes excited by the influence of cryptogamic organisms are the production of nitrates by the nitrifying fungi, the breaking up of indican in the production of indigo by the *Bacillus indigogenus* into indigglucin, and indigo white, also the formation of carbon bisulphide by *Schizophyllum lobatum*.

Pasteur's observation that when spores of *Pencillium glaucum* are added to a solution of ammonium racemate mixed with a trace of phosphate, the liquid gradually becomes more and more laevorotatory and eventually contains only the laevorotatory salt, led him to conclude that some promoters of fermentation have a selective capacity. The mould fungus separates racemic acid into its optically different components, using up the one for its food and leaving the other unacted upon. Fischer and Thierfelder have observed exactly similar conditions in the behaviour of stereoisomeric hexoses towards yeast, and even unorganised

ferments manifest the same selective capacity. Such enzymes appear to have, in relation to the objects attacked by them, a configuration similar to that of a key to a lock.

Glyceric acid is affected by *Pencillium glaucum* exactly in the same manner as racemic acid, as shown by Lewkowitsch in 1883, and Frankland and Frew found that *Bacillus ethaceticus* acts in the opposite direction, consuming the laevo acid and leaving the dextro acid unacted upon.

Inactive lactic acid is, on the contrary, converted in the same manner into dextro lactic acid by *Pencillium glaucum*, and Lewkowitsch has also shown that inactive mandelic acid is converted into the dextro form by *Pencillium glaucum*, while *Saccharomyces ellipsoideus* yields the laevo acid. From inactive leucin Schulze and Likiernik obtained laevo leucin by the action of *Pencillium glaucum* and from inactive glutamic acid Schulze and Bosshard obtained laevo glutamic acid.

The doctrine that the production of organic compounds is the result of a peculiar vital force had long been overthrown by Wohler's synthesis of urea, when Pasteur again gave it some position in chemistry by his proposition that fermentation cannot take place without living organisms. Since then Buchner's discovery that alcoholic fermentation takes place without living yeast, and that the action of its zymase may be regarded as a purely chemical process, has begun to call in question what remains of that doctrine, and the question presents itself whether the effects produced by cryptogams will not turn out to be chemical processes set up by substances analogous to zymase.

"STARCH-FREE" GLUTEN PREPARATIONS.

BY A. J. COWNLEY.

The question that has been raised in the medical press and by Dr. Victor G. L. Fielden at the British Pharmaceutical Conference as to the quality of the various commercial preparations of gluten supplied for use in the dietary of diabetic patients suggests the advisability, in continuance of Dr. Paul's remarks at the Belfast meeting, of giving the results of the analyses that were made some time since of most of the commercial "glutens." These preparations were examined in Dr. Paul's laboratory for a high medical authority, who naturally was surprised and concerned at the large amount of starch which was found by analysis to be so discordant with the claims made for these so-called starch-free glutens. The following were the results obtained:—

Gluten Preparations.	Starch per cent.
Gluten Macaroni	65.2
Gluten Vermicelli	62.1
"Gluten"	62.1
Gluten Flour	61.2
Gluten Bread	37.4
Gluten Bread	63.0
Gluten Flour	2.8
Bran Biscuits	14.3
Gluten Flour	5.4
Gluten Flour	63.5
Bran Biscuits	19.8
Bran Biscuits	14.4
Bran Biscuits	6.7
Gluten Flour	63.4

It is evident from these analyses that there is much room for improvement in the preparation of diabetic gluten food, since the majority of the samples examined show the presence of an inordinate amount of amylaceous material. In this respect, indeed, many of the samples were very little different from ordinary wheaten flour.

PHOTO-MICROGRAPHY.—VII.

BY EDMUND J. SPITTA, L.R.C.P. LOND., M.R.C.S. ENG., F.R.A.S.

Before describing how to take an actual photograph with the microscope, it is first necessary to say a few words upon the subject of magnification. One frequently meets with the remark "magnified so many diameters," and we must all have heard of a microscope being able to magnify so many "hundreds of times." To explain the difference implied by these two terms, let us consider Fig. 1.

An enlarged image of the object A B C D, we will say, is cast upon a receiving screen at a given distance, and shown as E F G H. If, now, a pair of compasses be taken, it will be seen that E G is twice A B, G H twice B C, F H twice D C, and E F twice A D. It is not difficult to understand the dotted lines, L K M and O K P are drawn equally dividing E G and F H, and E F and G H respectively.

Then E L and L G each equal A B, G P and P H each equal B C; and so on with the other sides. A little more attention and it is evident that there are four squares, each equalling A B C D; so this object is said to be magnified four areas or four "times."

FIG. 1.

But it is equally obvious that A B C D is only magnified twice in each direction—twice from above downwards, and twice from side to side. Hence, when speaking in what is termed linear measure, the object is said to be magnified two diameters. This holds good for any magnification. Consider, for example, Fig. 2. Here the little square α is magnified five diameters in the amplified picture by its side, but the large picture has twenty-five little squares in it, so it is said to be twenty-five "times" as large.

For reasons which need not here be discussed, scientists always speak in linear measurement, employing the term "diameters" in

FIG. 2.

preference to using terms of superficial valuation, such as so many "areas" or so many "times." Objectives, therefore, as well as eye-pieces, are said to magnify in terms of diameters.

We now pass on to describe how to ascertain the amount of diameters an object is magnified when seen in the microscope or when photographed on the plate.

If we use apochromats this is a very simple matter, for each

objective is of an accurate focus, and so the initial magnifying power is easily known, and so, too, with each compensating eye-piece. Here follows a list of the amounts universally adopted for the standard magnifying power of objectives of different foci. It will be convenient for future reference:—

A lens of 1 inch or 24 Mm. focus magnifies 10.5 diameters.							
"	$\frac{2}{3}$	"	16	"	"	15.5	"
"	$\frac{1}{2}$	"	12	"	"	21.0	"
"	$\frac{1}{3}$	"	8	"	"	31.0	"
"	$\frac{1}{4}$	"	6	"	"	42.0	"
"	$\frac{1}{5}$	"	4	"	"	63.0	"
"	$\frac{1}{6}$	"	3	"	"	83.0	"
"	$\frac{1}{2}$	"	2	"	"	125.0	"

What this really means is that if any lens of exactly an inch focus is placed on the microscope and a piece of ground glass held at a distance from it of 10 inches, the magnification of the object is 10.5 diameters.

Now to calculate the final amount of the amplification of the image as seen in the microscope when the eye-piece is added it is only necessary to multiply the initial power of the lens by the initial power engraved on the eye-piece, and the result is the total amount of the magnification as seen by the normal eye when looking through the instrument. This, then, is the simple rule for visual purposes when using apochromats. But when we come to photo-micrography, where the image is projected on to the plate or the ground glass, another factor comes into play—it is the length of the camera extension employed. If the ground glass be placed at ten inches from the eye-piece it will be found, although the object is seen reversed, the resulting magnification is exactly similar to what is visually seen on looking down the instrument, and so equals the initial magnification of the objective multiplied by that of the eye-piece. But when the length of the camera extension is increased the amplification is then directly in accordance with the amount of the camera stretch beyond this ten inches. For example, if we place an object on the stage and use the inch objective with a six eye-piece we should find the object would be magnified 63 diameters on the ground glass held at 10 inches from the eye-piece; but if now it be removed to 20, inasmuch as 20 divided by 10 gives a quotient of 2 our 63 diameters' magnification would become 126. Similarly, if we drew out our camera 30 inches, as 30 divided by 10 gives a quotient of 3, our object would now be magnified 189 diameters. It is seen, therefore, to be a very simple matter to judge the amount of magnification an object has received when using the perfected system of the apochromatic series of lenses. This, be it understood, is not due to apochromatism considered as such, but because all objectives are really of the focus stated. But when employing achromatics, which are not so perfect in their focal lengths, both as respects the objective as well as the eye-piece, another method has to be employed.

Place any power—say an achromatic one inch, which very likely is really a two-third inch—on the microscope, and use first what is called an "A" eye-piece. Having procured a stage micrometer (which is only another name for a cover-glass ruled with lines by a diamond a definite distance apart and fixed on an ordinary 3 x 1 slip), and having focussed any two of the lines which are separated by an interval thought to be of convenient size, the ground glass is placed at a distance of 10 inches from the eye-piece. We then take a pair of compasses and measure directly the interval of those lines apart, and divide it by the distance which we know exists between the two lines on the micrometer. It is very obvious that the quotient thus obtained is the linear magnification produced by the lenses—the objective and the eye-piece—as they then stand. It is the same, in point of fact, as would be seen by the normal eye looking down the instrument through the eye-piece, save that it is reversed in position.

This process is repeated with each eye-piece, and with each objective in succession. It is now very evident that we can apply the figures thus obtained; whenever we use a similar combination of objective and eye-piece, always recollecting that the figures only apply to the camera length of ten inches. If this be increased the magnification is augmented in just the same way, and just the same manner as already explained when employing apochromatics. The photographer should do these computations for his photographically corrected achromatic objectives and his eye-pieces with the greatest of care, as when once done—provided the tube-length of the microscope is kept the same, and the camera length does not exceed ten inches—the results will be always correct.

Taking the Photograph.

We now proceed to show how to take a photograph with each power, and to make the explanation more comprehensive and explicit, it is proposed to take a series of well-known "test objects" as types of the different objects which lend themselves to photo-micrography.

We commence with the proboscis of a blow-fly, or ordinary blue-bottle, one of the most common test objects for an inch with an A or B eye-piece if using achromats, or an inch with a 4 or 6 compensating eye-piece if we elect to employ apochromatics. Either of these eye-pieces will furnish us with two reasonable sized photographs of this interesting object when using a 10-inch camera, but if we desire to photograph the finer details of its structure it will be necessary to substitute a half-inch in place of the inch, because its N. A. being greater will reveal more delicately the minutest details. So, too, we may have to employ a 1/6th to show distinctly some of the finest hairs which exist on the membrane that stretches between the two lobes of the organ, and we shall consider each separately. To commence with it is necessary to centre the limelight, which means that the brightest point of the lime shall be brought into the centre of the field of view in the optical axis of the microscope. This is effected by the milled-headed screws, which raise or lower the light or move it from side to side. This finished (with the microscope horizontal), the lowest power substage condenser (focus about $\frac{1}{2}$ inch, and N. A. 48) is placed in such a position as to give critical light. Shut now the iris diaphragm as closely as it will allow, and lower the condenser again until the minute aperture of the iris is seen with a low power eye-piece and 1-inch objective. Most probably the hole will not be central—if not, it must be made so by using the adjusting screws. Re-open now the iris, and re-obtain critical light. Adjust the lime once again till its brightest part is seen in the centre of the field. The image of the lime becomes now very objectionable, and far too bright for the eye to stand, so it is best at this juncture to place a green glass between it and the condenser. Lowering a condenser reduces its working aperture, but seeing the aperture of the condenser in use is higher than that of the inch objective, we may lower it until the field is equally illuminated without fear of losing definition. Still, if we desire, for some special effect or reason, to use the absolute critical image, we must broaden out the lime image by the use of the auxiliary lens, placing it in position as shown in the diagram (about two inches from the lime), moving the rack adjustment up and down and from side to side until the light is evenly distributed over the field. The iris may have to be reduced in aperture when using the inch objective or the object might suffer from what is called "flooding of light." It is not often in my experience that critical light is required to be used with so low a power, for the simple reason that an inch objective is mostly employed to give a general view of an object, the relation of the many

parts to the whole, rather than the details of any particular portion. The principal occasion with an inch objective for requiring critical light is when photographing the general appearance of a minute object like a diatom, in which case the camera may have to be specially increased in length, even perhaps to as much as six feet. Magnification then is the only object, for the N. A. of the inch is far too small to give much detail. Still, if it be desired to use the lens to the best advantage, critical light must be employed, and as the substage condenser will not spread out the light all over the entire field, the auxiliary condenser must be brought into use to do so effectually.

Having then centred the condenser and the lime, and broadened out the light with the paralysing if necessary, the green glass may be removed and the camera placed in its slides, taking care that the piece of brass tubing on the camera, which slips loosely into that portion attached to the microscope, does not touch it at any point of its circumference. The camera is then drawn out to 10 inches or more as desired. It is firmly fixed to the table by the wooden screws. Then, if we are not using the paralysing, we ask an assistant to turn the lime just a touch from side to side or up or down till we feel assured there is equal illumination; whereas if the auxiliary condenser has been employed, the same process must be adopted by shifting it by means of its two racks until the light is equally illuminated over the whole field as before described.

Focussing is the next operation. When employing the inch, it is best done at first with the coarse rack, being subsequently completed by the aid of the fine adjustment, which is turned (through the medium of the silk cord) by the brass handle running beside the camera. We then arrange the shutter so that it will drop a sufficient depth—such distance being regulated by the screw—to cover the entire substage condenser. The light is then temporarily turned down by means of the "cut-off" handle described when explaining the jet, whilst two plates are being "backed" previous to placing them in the dark slide, which, it may be here stated, can be done at once, even if they are not quite dry. The light is then again turned up, and, having given one final glance at the ground glass to make us feel assured the light has remained equally distributed over the field, and that the focus is perfect, the exposure is made. It is best to note the exact time by a watch for this object, under the circumstances narrated about two or three seconds. Note in lowering or raising the exposure shutter not to let it strike the microscope.

The second plate is then exposed in a similar manner, giving it double the time of the first, as by that means the operator is able to judge the more accurately the correct exposure.

It is possible when we have developed these pictures (about which I shall shortly speak), that although they are sharp there is still a lack of contrast; each negative looks, perhaps, flat, whilst the object does not "stand out" in the way it should. This is probably due to the fact that too much light has been admitted to the objective—it has been what is called "flooded." To obviate this we had better look at the object again and see if by shutting down the iris diaphragm a trifle we do not get a better contrasted effect. It must not be closed as to produce diffractive phenomena—such as bright lines around the hairs—for if so we obtain a photograph of optical phenomena, and not one of the proboscis of a blow-fly. If, however, we close our iris as much as we dare and yet are not satisfied with the picture on the ground glass, which experience will soon teach us to see at a glance, we must gently close the Davis diaphragm situated above the objective, just at the end of the microscopical tube. This must be used with much caution, for a very small amount of closing will produce

a great effect upon the picture, and it will be entirely spoilt if closed too much. If the objective be a good one, and the eye-piece equally so, and all extraneous light excluded from the camera at its juncture with the microscope, our picture should be now one full of brilliancy and sparkle.

Seeing that all the negatives will have to be developed much after the same fashion, it is desirable for once and for all to give the details of the process.

It will be best for the beginner to develop each of his plates separately, for which purpose he takes 3 drachms of each solution, details of which have already been given, 3 drops of bromide solution, filling up to 8 drachms with water. This is the proportion in ordinary cool weather, but when operations are conducted in summer months, when the heat of the dark room is very pronounced, it will be very necessary for the developing solutions to have stood for some hours in cold water, and it will be better to use $2\frac{1}{2}$ drachms of each solution with 3 drops of bromide, filling up to the ounce with water. The gas light of the dark room should be screened by two layers of ruby fabric, and if the burner be a very bright one, an additional one of yellow. Having wiped the backing off the plate, which is easily done by a rag—which should be kept in one corner of the sink—the negative is placed in its developing dish with the sensitive surface upwards, and the 8 drachms of developer flooded over it in one sweep. Till experience is gained it will be frequently found that the plate is not immediately uniformly covered. The dish then should be violently shaken laterally to ensure such a condition, for, if not, a stain will be produced on the final negative, hopeless to remove. The cover to the dish should be at once placed over it and not raised for, say, half a minute, one ruby fabric being removed from the gas. About this time, if the exposure be correct—in cold weather it may be considerably longer—just a faint outline of “something” appearing on the emulsion should be seen. I do not say this will always be the case, but I mean that within half a minute to one and a half minutes there should be some difference shown in the portions of the negative that has been exposed to the light, in contradistinction to the sides where the light has not reached. The re-covered dish is then rocked steadily to and fro, until slowly and uniformly the image appears. Notice should now be taken as to whether the background appears uniform. If the details rush up with great rapidity, it is a sure sign of over-exposure, and 3, 6, 9, or 12, or even 24 drops of the bromine solution should be rapidly added accordingly. If, however, the strongly-lighted portions of the picture appear grey at first, gradually deepening in density, and the whole picture comes out slowly, clearly, and uniformly, we may nearly always rest assured the exposure has been correct. On the other hand, if no picture comes for some minutes, and then exceedingly faintly, we may be equally certain the opposite condition of things obtains, and the exposure has been too short. Provided, first, that the exposure has been correct, we then continue rocking the developer over the negative, until the details, at first so bright and clear, fade into one common blackness over the whole plate. At this juncture it is raised from the dish and the back of the plate examined. We should expect to see the picture appearing there, not complete in detail, but an outlined effect. With correct exposure this effect is produced slowly, but with under-exposure very rapidly—an indication not to be overlooked. If, then, it comes slowly, we let it proceed by returning the plate to the dish, until, in point of fact, the picture can be moderately well seen on back although quite lost in blackness when looking at the front of the negative. Those commencing photo-micrography make here the frequent mistake of removing the plate too soon; it wants

much more development than an ordinary one. Presuming now the image is fairly well seen on the reverse side, the developer is poured off and the plate well washed under the tap. Washing completed, it is placed in the fixing solution, a bath composed of hyposulphite of soda and water. It is a convenient plan to obtain one of the large sweet jars used by pastrycooks, which are provided with a solid glass stopper surrounded with a band of cork, into which are placed the crystals of hyposulphite—commonly called “hypo”—to about one-third part of its depth, filling up to the brim with water. This is left for a few hours and forms a most convenient concentrated solution. Before taking a photograph the bottle is shaken, and two parts of the solution are added to one of water and put in the “fixing-bath dish.” Into this solution then we are supposed to have placed the developed and washed negative.

(To be continued.)

ON THE DETERMINATION OF ALCOHOL IN LIQUOR IODI FORTIS, B.P.

BY ALEX. GUNN, F.C.S.

Shortly after the publication of the new British Pharmacopœia, I had occasion to determine the spirit strengths of nearly all the preparations on which drawback was allowed. Among these were the two preparations of iodine, viz., liquor iodi fortis and tinct. iodi. These I had never before estimated by actual distillation, but on this occasion I tried to do so, and only succeeded after several attempts. I could find no reference in any books or journals to the estimation of alcohol in the presence of iodine, and it occurred to me that a reliable method would make a useful note for reference, and might, moreover, be of some educational interest, inasmuch as it would show students how some troublesome reactions may be brought under control.

Fixation of the iodine with a fixed alkali such as potash or soda naturally occurs to one as a likely method. But here it will be seen that the formation of iodoform on warming will at once vitiate the results. Sodium hyposulphite also suggests itself as a likely method until it comes to the actual distillation. Much sulphurous acid being formed on heating, the specific gravity of the spirituous distillate would of course be erroneous. These two substances, however, may be used together in such a way as to avoid any sensible decomposition, and thus ensure an accurate determination of the spirit. First of all add just sufficient of a strong aqueous solution of sodium hyposulphite to decolorise, and then a sufficiency of caustic potash to use up all sulphurous acid formed. This sufficiency will be found to be rather a large quantity. If 50 C.c. liq. iodi fort. have been used it will be necessary after decolorising with the hyposulphite to use at least 10 grammes of the potash, or it will save weighing if about $3\frac{1}{2}$ inches of the caustic potash in sticks is used. Distillation may then be proceeded with, and the usual calculations made.

Some little time after deciding upon this process for the determination of alcohol in iodine preparations, I had a conversation with one of the Chemical Staff of Somerset House, and was informed by him that that was the process they used.

It is possible that there is a slight decomposition even with this process, the distillate having a peculiar smell. At all events it meets the Revenue Authorities on their own ground, and that is a matter of some little comfort to the exporter.

These experiments were conducted in the analytical laboratory of Messrs. Lorimer and Company, Islington, N., to whom my thanks are due.

JOHN RADCLIFFE, M.D.

FOUNDER OF THE RADCLIFFE LIBRARY, OXFORD.

(Concluded from page 269.)

In 1710 Radcliffe thought of retiring, but was dissuaded from carrying out his purpose by the remonstrances of no less a personage than the Archbishop of York. In 1711 he lost one of his boon-companions of rank and station, Lord Craven, to whom he seems to have been much attached. His Lordship fell a victim to "excessive drinking," much of it done in Radcliffe's jovial company and enlivened by Radcliffe's pleasantry. Lord Craven's libations had brought on a malady of which Radcliffe cured him. It is observable that Radcliffe did not so much forbid him to drink as insist that while drinking he should take plenty of exercise. The noble patient seems to have neglected this monition, and, after his recovery, drinking harder than ever, he died accordingly. Pittis prints a curious letter on Lord Craven's melancholy end, written by Radcliffe to their common friend and boon-companion, the Duke of Beaufort. He holds up Lord Craven's fate as a warning to his Grace. But here again it is observable that he does not admonish the Duke to give up his libations. Such advice would have seemed odd from one who, though a physician, was a confirmed toper. What he does advise his Grace is to avoid Lord Craven's fate "by letting the exercises of the field share with the pleasures of the bottle."

In the same year Radcliffe had to prescribe for a new patient whose name and fame outweigh those of all the Lord Cravens and Dukes of Beaufort that ever existed. This was Jonathan Swift, then in London, hand-and-glove with Harley and Bolingbroke, and helping their Tory politics with his powerful pen. Radcliffe was probably made known to Swift by Arbuthnot, who was now Queen Anne's principal physician, and who knew Radcliffe well. Indeed, in his 'History of John Bull,' when the illness of John Bull's mother (she stood for the Church of England) is being debated by the Faculty, Radcliffe is introduced by name as High Church champion, with Garth, of the Dispensary, as Low Church ditto, and lays down the law in characteristically trenchant fashion. There are several references to Radcliffe in the 'Journal to Stella' for 1711, when Swift consulted him for the dizziness in his head and his other infirmities. "I took no snuff at all, but some herb snuff prescribed by Dr. Radcliffe." And, again, "I still drink Dr. Radcliffe's bitter, and shall continue it." In another entry of the 'Journal to Stella' Swift speaks with a slight acerbity of Radcliffe for a proceeding which is eminently significant of his high-handed and despotic ways as a physician. When Harley was stabbed at the Council Table by Guiscard, the Minister's own surgeon dressed the wound before Radcliffe was called in. But "that puppy Radcliffe," as Swift calls him in his wrath, would not meet Harley's surgeon in consultation, and, says Swift, "will admit none but his own surgeon." So that Harley, he adds, "has not been well looked after."

Swift's reference to Dr. Radcliffe's bitter suggests a few remarks. Like some other prominent physicians of his day, Radcliffe manufactured and procured to be vended, doubtless with great pecuniary profit to himself, specifics for which his name procured eager purchasers. As it happens, a placard or bill giving an account of Radcliffe's bitter, which Swift used, is in the library of the British Museum. It is surmounted by an elaborate engraving of the British lion and unicorn, with a figure representing Hygeia, and announces the varied promise of "Dr. Radcliffe's Royal Tincture, or the General Rectifier of the Nerves, Head, and Stomach. It corrects all irregularities of the head and stomach occasioned by hard drinking or otherwise." But it is commended to drinkers not only as a remedy for their excesses but as an aid to indulgence, for "these drops make the best purl in the world, in beer, ale, or wine, or purl royal in sack." Lastly, and to conclude, "Merchants and shopkeepers may be supplied with these drops, with good allowance to sell again, at Lloyd's Coffee House, Lombard Street, London, Price 1s. a bottle." Such were of the devices by which, in the reign of Queen Anne, the most fashionable, most successful, and the wealthiest physician in London did not disdain to add to his enormous professional gains.

A glimpse of Radcliffe's domestic hospitalities is afforded by the account of a banquet which he gave in 1712 to Prince Eugene, Marlborough's Eugene. The peace party had carried the day in the councils of Queen Anne, and Marlborough, as one of the heads of the war party, had been dismissed from all his employments. Eugene, Marlborough's old colleague in the field, came to London to see if he could not turn the tide in the direction of war

again. He brought with him a nephew, who fell ill, and Radcliffe was called in, but too late. Eugene, however, took to him, and was present at a dinner given in his honour by Radcliffe, who invited a party of his aristocratic friends to meet the distinguished foreigner. Radcliffe resolved to make the dinner a truly English one. "Ragouts and kickshaws" were rigidly excluded from the fare, which consisted of "barons of beef, jiggets of mutton, legs of pork, and other such substantial British dishes for the first course." Radcliffe's English guests, accustomed to dressed dishes, were surprised; but Eugene professed himself highly pleased with the entertainment, especially with some "beer seven years old," which was handed round with the wine, and which possibly had been sent from Badminton by the Duke of Beaufort.

In 1713 Radcliffe took a step which he had long been meditating. Years before he had bought an estate in the vicinity of the little town of Buckingham, the constituency of which he "nursed" in the usual way with an eye to representing it some day in the House of Commons. He succeeded very easily, as may be supposed. Two short, blunt, unimportant speeches of his are all that have been preserved, but his attendance in the House was more frequent than his oratory, and at last he determined to relax his professional exertions. He had taken a great fancy to his junior, Dr. Mead, though Mead was a Whig and as erudite as he himself was the reverse. He made many of his patients over to Mead, who succeeded him as chief London physician.

1714 was the closing year both of Radcliffe and of Queen Anne. During its course a severe blow was dealt him by the death of another of his friends and boon-companions, the Duke of Beaufort. His Grace was a very seasoned cask, and, unlike Lord Craven, took plenty of exercise in the hunting field. "His strength was unimpaired by the strongest liquors," and yet he died of a "draught of oat ale"—some brew no doubt peculiar to Badminton—taken when he was rather overheated. Radcliffe was called in, but again too late, and on seeing him, predicted, accurately we are asked to believe, that the medicines which other physicians had administered to him would kill him in six hours. His Grace's demise affected Radcliffe deeply. According to his biographer he assured a select circle of fellow-topers, assembled at the "Bull's Head" in Clare Market, that "he had lost the only person whom he took pleasure in conversing with. It was high time to retire from the world, to make his will, and set his house in order, for he had notice within that told him his abode in the world could not be twelve months longer." A prophecy which, if ever really made, was certainly fulfilled.

In this melancholy mood Radcliffe retired from London and practice to a rural home which he had made for himself at Carshalton, in Surrey. Doubtless one of the objects of this removal was to be out of the way of convivial temptation. A life of carousing had told on him. Gout had made a victim of him, and it became a case, baffling even his skill, of "physician cure thyself." One of his few visitors from the great world of London was Mead, who owed so much to him. Mr. Jeafferson quotes, from "The Lansdowne MSS. Brit. Mus.," as reported by Bishop Kennett, the following anecdote of Mead's intimacy with Radcliffe:—

"I remember what Dr. Mead has told to several of his friends, that he fell much into the favour of Dr. Radcliffe a few years before his death, and visited him often at Carshalton, where he observed upon occasion that there was no Bible to be found in the house. Dr. Mead had a mind to supply that defect without taking any notice of it; and therefore one day carried down with him a beautiful Bible which he had lately bought, which had lain in a closet of King William for His Majesty's own use, and left it as a curiosity that he had picked up by the way. When Dr. Mead made the last visit to him he found that Dr. R. had read in it as far as the middle of the Book of Exodus, from whence it might be inferred that he had never before read the Scriptures; as I doubt must be inferred of Dr. Linacre, from the account given by Sir John Clarke."

Radcliffe's library was, no doubt, the smallest possible—a great contrast to Mead's; but it is curious that so strenuous a High Churchman should not have in his possession a copy of the Bible.

On August 1, 1714, occurred that familiar event, the death of Queen Anne, from suppressed gout, ending in erysipelas and fever. Her illness was aggravated by the political and palace intrigues which shook her nerves during the last days of her life and reign. Of course, when the crisis arrived, many people thought of Radcliffe. London gossip said that he had been called in by authority,

but did not obey the summons. One of Swift's London correspondents, who kept him informed of what was said to be going on, wrote to him thus on July 31, the day before the Queen's death: "Radcliffe was sent for to Carshalton about noon, by order of Council, but said he had taken physic and could not come." So strong was the belief in his skill that, the same correspondent adds: "In all probability he had saved her life, for I am told the late Lord Gower had been often in the same condition with the gout in his head, and Radcliffe kept him alive many years after." That "the Council" sent for Radcliffe is improbable. The account given by his biographer, Pittis, is that two hours before the Queen's death, her favourite, Lady Masham, sent for him, after Mead, who with Arbuthnot, Sloane, and others was in attendance on Anne, had reported to him that her recovery was hopeless. According to Pittis, Radcliffe himself was prostrate at the time with gout in the head and stomach. But he sent word by the messenger that he would attend Her Majesty, if he had "proper orders for so doing," evidently hinting that he did not take his orders from an unofficial female like the Masham. He added "that from the Queen's known antipathy to him, his presence would do her more harm than good, and since her case was desperate, he was reluctant to disturb her last moments," concluding his message with the characteristic remark that "it would be an act of compassion to let Her Majesty die as easily as possible."

There was, however, an impression in the public mind that Radcliffe had been sent for by authority to the Queen, and had refused to go. He was a professed Jacobite, and the hopes of the Jacobites had been excited by the news that the Queen was dangerously ill. Hence, as some people suspected, a disloyal neglect of his sovereign. Letters were sent to him threatening him with assassination for having allowed the Queen to die when he could have saved her, an intimation which was very complimentary to his curative skill, but which added great perturbation of mind to his physical sufferings. Worse even than threatening letters, a motion was made in the House of Commons that he should attend in his place to be censured for having disobeyed a summons from the President of the Council, the Duke of Ormond, to attend her late Majesty in her extremity. Unkindest cut of all, the motion was made by an old friend and boon-companion, Sir John Pakington, with whom he had voted on many a division when our glorious Constitution in Church and State was assailed. Radcliffe, however, found an animated defender in another M.P. and friend, a certain "Tom Chapman," otherwise unknown to fame. Probably he proved that the charge against Radcliffe was baseless. In any case the matter was allowed to drop. Sir John Pakington's motion elicited from Radcliffe a letter to a common friend, in which he spoke of his devotion to Anne. "Ill as I was," he wrote, "I would have went (*sic*) to the Queen in a horse litter, had either Her Majesty or those in commission next to her have commanded me so to do." The letter contains one passage which is remarkable as indicating that on this occasion, if on this occasion only, Radcliffe did not indulge in his usual jeers at the physicians who had attended the patient. His friend and *protégé*—Mead—had fortunately been one of them. "I must do," he said, "that justice to the physicians who attended her in her last illness, from a sight of the method that was taken for her preservation, transmitted me by Dr. Mead, as to declare nothing was omitted for her preservation; but the people about her (the plagues of Egypt fall on them!) put it out of the power of physic to be of any benefit to her." Radcliffe concluded with a message to Sir John Pakington. He was to be told that "his zeal for Her Majesty will not excuse his ill-usage of a friend who has drunk many a hundred bottles with him." If Radcliffe had not drunk so many hundreds of bottles his years might, perchance, have approximated to those of the abstemious Sir Hans Sloane; as it was, he died at 64.

He lingered on in pain and comparative solitude at Carshalton for weeks and months. Reviewing his past career, he was visited by pangs of remorse not only for those carousals which had seemed so pleasant at the time, but for the bad example which he, a leading physician, had set to the young men of rank and station, whom by his presence and participation he had encouraged in drinking habits, with results fatal to some of them. Pittis prints a letter full of penitent thoughts which, a fortnight before his death, he addressed to one of his favourite boon-companions among the nobility, Lord Denbigh. "Your Lordship knows," he wrote, "how far an air of jollity has obtained among you and your acquaintances, and how many of them in a few years have died martyrs to excess. Let me conjure

you, therefore, for the good of your own soul, the preservation of your health, and the benefit of the public, to deny yourself the destructive liberties you have hitherto taken, and of which I must confess, with a heart full of sorrow, I have been too great a partaker in your company. You are to consider (would that I had done so!) that man was born to nobler exercises than those of eating and drinking." These, Radcliffe said in conclusion, are "the words of a dying man, who fears that he has been in a great measure an abettor and an encourager of your intemperance." The letter, it may be added, contains some devoutly-applied Scriptural texts, which indicate that Radcliffe's perusal of the Bible in his latter days had proceeded considerably further than "the middle of Exodus."

Radcliffe's will was made on September 13. On the following November 1, exactly three months after the demise of Queen Anne, he died of apoplexy, according to the carefully written notice of him in the 'Dictionary of National Biography,' but Pittis avers that he "fell a victim to the ingratitude of a thankless world and the fury of the gout." His body "lay in state" at Carshalton. Whether any or many visitors came from London to look at it we are not informed; but the magnificent benefactions in his will to his *alma mater*, Oxford University, were known to its authorities before his remains were transferred thither towards the end of the month. All that the Vice-Chancellor and his colleagues could do in the way of academic processions and oratory, with tolling of bells and so forth, was done to give him a public university funeral when his remains were borne with great pomp and solemnity to St. Mary's, where they were laid "near the north-west corner of the present organ gallery."

His principal bequests were to Oxford University, while he did not, in spite of posthumous calumnies to the contrary, forget his duty to his nearest relations. Among his letters printed by Pittis is one to his unmarried sister (he had another married), in which he expressed regret for having neglected them during his lifetime, but now made amends. He left her £500 a year, and the married sister £1000 a year. Nephews, friends, servants, executors, etc., had liberal legacies left them. Two thoughtful and kindly bequests were made to the inmates of St. Bartholomew's Hospital, of which he was a Governor, one of £500 a year for ever, to help in "mending their diet," another, also perpetual, "for buying of linen."

But the great bulk of his large fortune, consisting of money and of lands and houses in Yorkshire, Northamptonshire, Bucks, and Surrey, was left to his *alma mater*. He bequeathed £40,000 to build a library in Oxford—readers of our notice of Garth may remember his sarcasm at a bequest made for such an object by a man so little bookish as Radcliffe—with £150 a year for the salary of the librarian, and another yearly £100 for the purchase of books. The Radcliffe Library, one of the finest buildings in Oxford, was opened in 1749, and furnished mainly with medical and scientific books. The building has since been annexed to the Bodleian as a reading room, when the contents of the library, greatly increased in the course of years, were transferred to a building specially affected to them in the new University Museum. It is now a magnificent collection of books on medical, physical, natural, biological and general science, kept up to date, easily accessible, and has given a considerable impulse to scientific study at Oxford.

Though as a practical physician, depending almost wholly on his own common sense and intuitive medical sagacity, Radcliffe was indifferent to the literature of medicine and the theories of it broached either at home or abroad, he seems to have tacitly recognised the possible value of a knowledge of both wider than his own. Mead was familiar with the current theories of medicine as well as proficient in its practice, and among his professional brethren Mead was the favoured friend of Radcliffe, who, it has been often said, respected him for the erudition which he himself lacked. Then, on the Continent, among Radcliffe's contemporaries, there was Boerhave at Leyden, who enjoyed a European reputation, was consulted by patients of all countries, attracted to him many young English medical students, and Radcliffe could not despise Boerhave as he despised such of his professional brethren in England as "Nurse Gibbons" and the "touting" Sir Edward Hamey. Whether influenced by these considerations or possibly by a suggestion of Mead's, Radcliffe resolved that for select Oxford alumni studying medicine, there should be made some provision which might enable them to know what was doing in medical science abroad. For this purpose he made over for ever to his own first and favourite Oxford College—University—his Yorkshire estates, for the founda-

tion of two travelling fellowships of £300 a year each and tenable for ten years, to be given to carefully selected alumni studying medicine at Oxford. At present there are three such Radcliffe travelling fellowships, with an annual income of £200 each and tenable for only three years instead of the original ten. Besides this he left £5000 to enlarge the buildings of University College. Any surplus accruing from the Yorkshire estates after the foregoing objects were effected was to be applied to the purchase of advowsons to be given to members of University College. Finally, mention of minor benefactions to Oxford and to individuals being omitted, he left, after payment of his specified bequests, all his estates in the various counties already enumerated to trustees to be applied to such useful purposes as they in their discretion should think best. And well have the Radcliffe trustees fulfilled their duty, remembering the claims both of philanthropy and science. With the funds at their disposal was built the Oxford Public Infirmary, opened for the reception of patients in 1779, and the Radcliffe Observatory at Oxford, supplied with all the instruments and appliances of modern astronomy, and a dwelling house for the Observer, always an astronomer of promise. Of the Radcliffe Observatory, which has done much to advance the study of astronomy at Oxford, Dr. Munk, writing in 1884, says, "it is one of the buildings first asked for by foreigners who visit Oxford." Nor did the Radcliffe trustees forget, when opportunity offered, the London Royal College of Physicians, of which Radcliffe was so distinguished a member. When it migrated from Warwick Lane to its present domicile in Pall Mall East the Radcliffe trustees gave £2000 towards the £30,000 which the new building cost. There hangs Sir Godfrey Kneller's portrait of Radcliffe, and there is preserved the gold-headed cane with which in his hand Radcliffe mounted so many thousands of stairs, and which after him was proudly carried by Mead, Askew, Pitcairn, and Matthew Baillie, in succession, being finally presented to the College by Mrs. Baillie. Exploring the MS. Annals of the College, Dr. Munk made the discovery, one not at all surprising, that Radcliffe came often into collision with its authorities. But his faults, his egotism, his arrogance, rightly deserve to be condoned in consideration of the noble and useful institutions, which through his beneficent and munificent disposition of his wealth, John Radcliffe enriched his *alma mater*, the great University on the Isis.

THE VALUE OF PHOTOGRAPHIC RESIDUES.*

BY PROFESSOR ALEXANDER LAINER.

From correspondence, as well as from communications to home and foreign professional papers, I continue to hear complaints concerning the small sums paid to photographers for their silver residues. About a month ago a Hungarian photographer wrote to me that he had received only fl. 25 (£2 1s. 8d.) for three and a half kilos of silver chloride and eight kilos of paper ash, although these residues may have been worth fl. 100 (£8 6s. 8d.).

In my 'Guide to the Rational Collection of Silver, Gold, and Platinum Photographic Residues and the Determination of their Value,' there is a complete account of all the best methods of recovering the precious metals from photographic baths and washing waters. On page 2 there is a table of the theoretical and actual amount of silver contained in chloride-of-silver residues, likewise of the actual amount of silver contained in the trimmings of various kinds of silver paper. The following remarks will render these more complete:—

A kilogramme of dry, pure chloride of silver contains 750 grammes of metallic silver, which, at the market price of silver at the time of the publication of my book, was worth fl. 37 to fl. 38 (£3 1s. 8d. to £3 3s. 4d.).† In practice it has been found that chloride-of-silver residues, sent by photographers to the refiners, never contain this amount of metallic silver. In the following eight samples of silver residues I have calculated the actual amount of silver present per kilo:—

1. 645 grammes Ag.	5. 453 grammes Ag.
2. 687 " "	6. 541 " "
3. 475 " "	7. 673 " "
4. 628 " "	8. 627 " "

* Translated from the *Photographische Correspondenz* for the *British Journal of Photography*.

† One kilogramme of silver could then be sold for fl. 47 (£3 18s. 4d.), or bought for fl. 50 (£4 3s. 4d.).

The average amount of silver in these eight samples is 600 grammes, being equal to fl. 28 per kilogramme of chloride residue. But there is no reason why the photographer's residues should not be of the richest kind, if they are collected rationally. In the examples given, the largest amount of silver per kilogramme was 687 grammes, which was worth fl. 32 (£2 13s. 4d.). According to this, the three and a half kilogrammes of chloride residues, to which we have referred, should be worth fl. 112 (£9 6s. 8d.), if carefully collected and dried.

For precipitation of the silver chloride hydrochloric acid is preferable to common salt. Paper coated with emulsion, if washed in hard water, often gives an extraordinary amount of calcium salts, which is again soluble in hydrochloric acid. Silver is usually precipitated as sulphide from fixing baths by means of liver of sulphur. Herr Weiss received fl. 26.45 (£2 4s.) for a kilogramme of silver sulphide obtained in this way. This return compares less favourably, because there is usually a large amount of sulphur mixed with the silver sulphide, and therefore the value of the silver obtained from Ag₂S is less than from silver chloride. Nevertheless, the sum of fl. 26 per kilo for sulphide residues is well worth attention, and the various fixing baths should never be thrown away, which unfortunately is too often the case even in large establishments. Some employé or assistant in the business would, doubtless, be very glad to look after the waste, if some portion of the returns were given him for the trouble. We should mention here that sulphide of lead is also precipitated where combined toning and fixing baths are used; consequently the entire residue would contain, besides sulphide of silver, sulphide of lead, sulphur, a little sulphide of gold, and oxide of aluminium. Those photographers to whom the smell of sulphuretted hydrogen is objectionable I would recommend to use zinc dust for precipitating silver from the fixing baths.

The proportion of silver contained in the ash from silver papers varies very considerably. From practical experience the amount varies from 39 to 600 grammes per kilo, or in money from fl. 1.70 to fl. 27 per kilo (2s. 10d. to £2 5s.). From this it is evident that the value of the ash depends upon the source of supply. It may also be of interest to the professional photographer to know the value of the trimmings from collodio-chloride paper. As no particulars are to hand for reference, I have ascertained the amount of silver in a weighed quantity of unfixed collodio-chloride paper trimmings, and have found that 1 kilogramme gives 211 grammes of ash, which latter contains 56 grammes of silver. Consequently, 1 kilogramme of collodio-chloride trimmings is worth 1 krone (10s.), and 1 kilogramme of ash 5 kronen (£2 10s.).

It should also be remembered that a considerable amount of silver may be lost in burning the paper without proper appliances. It would therefore appear preferable to send the paper direct to the refiners, or to fix out the silver in old fixing baths. The silver can easily be recovered from old fixing baths.

The professional photographer is not so much at the mercy of the refiner as is usually supposed, and should observe certain rules, which I would summarise as follows:—

1. The residues should be collected in the purest form, and should be free from foreign substances, such as corks, etc.
2. The residues should be well dried by exposure to air before storage.
3. Chloride, sulphide, metallic silver, etc., should each be kept separate and stored apart.
4. Reliable average samples should be taken of each kind of residue and kept in bottles. Samples should be sent to the refiners for determination of the quantity of fine silver contained. The cost of these tests is small.
5. Before sending the residues to the refiner they should be weighed. The total value may then be ascertained from the sample tests. (Rule 4.)

The complaints to which we have referred may not cease if these rules are observed, but the latter will be of service to the professional photographer and to well-known reliable refiners. The publication of exact returns and of further particulars will bring about more regular conditions in the valuation of residues.

We would mention, in conclusion, that it is desirable to divide the residues in equal parts and send them to different refineries. Considerable difference will be found in the amount returned from each, notwithstanding the equality in value of the parcels sent.

THE STUDENTS' PAGE.

EXPLANATORY NOTES ON THE B.P.*

Acidum Carbolicum.—This is the hydroxyl derivative of the hydrocarbon benzene, and in this respect is comparable to ordinary alcohol, which is the hydroxyl derivative of the hydrocarbon ethane.

The term phenol is used not only to describe this particular body but also in an extended sense to include the hydroxyl derivatives of the benzene series, just as the term alcohol comprises the hydroxyl derivatives of the paraffin series, although in popular language the term alcohol is used to indicate the alcohol with which we are most familiar, viz., ethyl alcohol. The name carbolie acid, although phenol is not a true acid, is derived from its behaviour with bases, NaOH, e.g., with which it reacts to form the sodium compound known as sodium carbolate or phenate—

A similar reaction does not occur with ethyl alcohol or its homologues of the paraffin series, and this is due to the different influence exerted upon the hydroxyl groups by the hydrocarbon residues, phenyl and ethyl. Phenyl is electro-negative and it influences the associated hydroxyl group in such a manner as to make the hydrogen atom more easily replaceable by electro-positive elements like sodium. The acidifying influence of the C_6H_5 group is, however, not powerful enough to enable phenol to decompose sodium carbonate like the true acids. In the organic acids note that their behaviour as such is due to the carboxyl group $-CO \cdot OH$, in which the hydroxyl is associated with the strongly electro-negative group carbonyl CO. The term carboxyl, applied to the $-CO \cdot OH$ group, is obtained by combining the names of its two constituents, *carbonyl* and *hydroxyl*. Cresol, the body referred to in the last official test, is a homologue of phenol, one atom of hydrogen in the benzene nucleus being replaced by methyl CH_3 . Cresol being a di-substitution product of benzene, $C_6H_4 \cdot CH_3 \cdot OH$ exists in three isomeric forms, known as ortho-, meta-, and para-cresol. Compare in your text-book the chapter on di-substitution products of benzene. Note that the three names *alcohol*, *phenol*, and *cresol* end in *ol*: this termination is used in chemical nomenclature to indicate that these substances contain the hydroxyl group (OH).

Acidum Citricum.—The two colour tests for tartaric acid occurring as an impurity in citric acid will be discussed under Acidum Tartaricum.

Acidum Hydrobromicum.—Note that although hydrobromic acid is liberated from bromides by the action of sulphuric acid this does not provide a practical means of preparing a pure solution of HBr, because when heat is applied to distil the hydrobromic acid this body is oxidised by the sulphuric acid with liberation of bromine, the sulphuric acid being reduced to sulphurous acid.

The reaction (ii.) does not take place when the sulphuric acid is well diluted. We cannot, however, avoid the difficulty by distilling a dilute solution of KBr and H_2SO_4 , because the HBr is so soluble in water that it would only be expelled by concentrating the liquor until the limit was approached for oxidation of the HBr to commence. By using strong phosphoric acid, the hydrobromic acid can be obtained by distillation, since there is no secondary reaction between these two acids.

Acidum Hydrochloricum.—No difficulty occurs in the use of sulphuric acid—which is much cheaper than phosphoric—for the preparation of this acid, analogous to that mentioned under acidum hydrobromicum, because hydrochloric acid is not decomposed by the strongest sulphuric acid. Hydrochloric acid is a much more stable body than hydrobromic acid, while hydriodic is less stable than the latter, in accordance with the gradation of

properties observable among the three halogen elements. The test for chlorine depends upon the displacement of iodine by chlorine and subsequent formation of blue iodide of starch

Acidum Phosphoricum Concentratum.—When phosphorus is burned in air the main product is the pentoxide P_2O_5 , known also as phosphoric *anhydride*, because it combines with *water* to form phosphoric acid. At the same time one always obtains some of the lower oxide, P_2O_3 , known as trioxide or phosphorous anhydride, because it forms with water phosphorous acid.

The formation of ortho-phosphoric acid, H_3PO_4 , does not occur completely when the anhydride is merely added to water, for this body takes up successively one, two, and three molecules of water, forming the three acids distinguished by the prefixes meta-, pyro-, and ortho-, the last being the official acid.

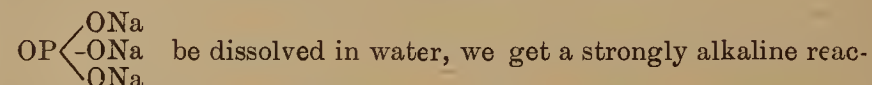

The complete hydration of the anhydride to the ortho acid is hastened by boiling, and a little nitric acid also aids the process besides providing for the oxidation of any phosphorous (see *ante*) to phosphoric acid. Nitric acid is one of the most commonly used oxidising agents. The products of its reduction are volatile, and any excess is easily removed by evaporation. Many other oxidising agents would convert the phosphorous to phosphoric acid, e.g., potassium permanganate. The reduction products of this, viz., the potassium and manganese salts, are not volatile, and could not be easily removed from the phosphoric acid.

Note that the strength of phosphoric acid solutions cannot be determined by titration with standard alkali, like hydrochloric and nitric acids, for example, because a sharp colour reaction to indicate the termination of the process cannot be obtained. This phenomenon is noticed with other polybasic acids, and is due to the varying facility with which the hydrogen atoms of such acid are successively replaced by bases. Phosphoric acid is a tribasic acid, as shown by its constitutional formula—

whole of the hydrogen is replaced by sodium, Na_3PO_4 or

tion, due probably to the dissociation of this phosphate, thus—

Even this di-sodium hydrogen phosphate Na_2HPO_4 has an alkaline reaction (see Sodii Phosphas, B.P.), although it is an acid salt in constitution, i.e., still contains replaceable hydrogen. The entrance of the two sodium atoms has, however, so weakened the acid character of the remaining hydrogen atom that it no longer responds like an acid to the indicators employed. A very good explanation of these facts is furnished by the ionic theory, and students who wish to know more about it should consult Ostwald's 'Foundations of Analytical Chemistry.' The quantitative test in the Pharmacopœia is based upon the formation of lead phosphate. An excess of lead oxide is employed, and since the phosphate may be regarded as a combination of PbO and P_2O_5 , the increase in weight described in the Pharmacopœia is due to phosphoric anhydride, which remains combined with the lead oxide after the water has been driven off by heat. Now since

it is evident that one molecular weight of P_2O_5 (141) is equivalent to two molecular weights of H_3PO_4 ($97.32 \times 2 = 194.64$). The observed increase in weight required by the official test, viz., 0.48 Gm., therefore indicates 0.663 Gm. H_3PO_4 in the 1 Gm. of acidum phosphoricum concentratum added to the lead oxide, for

$$0.48 : 0.663 :: 141 : 194.64,$$

and this, of course, is equal to 66.3 per cent.

* NOTE.—This series of articles should be read in conjunction with the series referring to the 1885 B.P., and published in the P. J. during 1897 and the earlier portion of the current

PUBLIC OPINION OF POISON LAW.

ON several occasions recently it has been necessary to point out various misconceptions in regard to the law regulating the sale of poisons and to the circumstances by which the administration of the law is rendered less effectual in securing its prime object—the safety of the public. Such misconceptions are met with in both Houses of Parliament, in the law courts and, above all, in the public press where the dangers arising from poisons and the measures supposed to be desirable for averting those dangers have, for some few weeks past, been frequently discussed. Among the most noteworthy of the articles which have appeared on the subject is one in the *Buchan Observer* of September 6, under the head of “The Free Sale of Deadly Poisons.” It is evidently written with a desire to point out the need for better regulation of the sale of articles which are dangerous by reason of their poisonous nature and it deals with the facts relating to some conspicuous cases of poisoning by accident, suicide and murder in a manner calculated to convince any ordinary reader that the facilities for obtaining poisonous articles are far too great. As a deduction from those facts the statement is made that “if you want to poison yourself you will still find no difficulty in buying dangerous drugs. Some poisons are cheaper than a four-pound loaf and as easily obtained. You have only to take a bottle for them, and if the chemist won't supply you the oilman will.” That is the gist of the writer's argument that there is need for more suitable regulation of the sale of poisons. In a sense there is much truth in his statement of the case, but it expresses only part of the truth. It ignores the fact that many dangerous drugs are not poisons within the meaning of the law, and consequently their sale is not regulated in the manner that would conduce to the prevention of accident or misuse.

A conspicuous instance of such a dangerous article that is not a poison within the meaning of the Pharmacy Act of this country is carbolic acid. The number of deaths caused

by it are annually greater than in the case of any other poisonous article, and many years ago the Council of the Pharmaceutical Society came to the conclusion that it ought to be added to the Schedule of Poisons coming under the operation of the Act. That conclusion was formed in the exercise of the public duty imposed upon the Council, but in order to become effective it was requisite that the conclusion arrived at by the Council should be approved by the Privy Council. That approval was not granted, nor has it been granted up to this time, notwithstanding several repetitions of the recommendation that carbolic acid should be added to the legal Poison Schedule, supported by the opinions of coroners' juries and medical authorities. There is probably little doubt that the reason for withholding approval of the recommendation is the fact that carbolic acid has been largely used as a disinfectant agent, and some fear may be entertained that if it were added to the Poison Schedule, its use for disinfecting purposes might be interfered with. Similar considerations have given rise to objections to add to the Schedule other poisonous articles which are largely used for various technical purposes. It is this difficulty of providing for the safety of the public without interference with technical occupations or hindering trade, that has had most influence in delaying the extension of the Poison Schedule. But now that the desirability of further protection against the dangers of poisonous articles has found strong expression in Parliament, there is reason for anticipating that an appropriate measure will be introduced during the coming session to meet the requirements of the case.

In regard to the Bill introduced in the House of Lords last session, the writer of the article in the *Buchan Observer* assumes that its intention was to further regulate the sale of poisonous articles in the manner which he considers to be necessary. In that assumption he is mistaken, for the provisions of the Bill were of such a nature that the sale of the articles in question would practically have been left in exactly the same position they have been—open to any person—without regard for the principle established by the passing of the Pharmacy Act, that the seller of articles, dangerous by reason of their poisonous nature, should be sufficiently conversant with their nature and dangers to be a safe medium for their supply to the public. Such persons alone are fit to be entrusted with the retail sale of articles which require to be labelled “Poison,” because their acquaintance with the nature of poisonous articles enables them to exercise discretion in their sale which cannot be expected of a grocer or an oilman. Even with such a limitation of the sale of poisonous articles—which does not in any way partake of the nature of a monopoly in favour of the sellers—there is actually no restriction of sale. Drugs or medicinal preparations of a poisonous or dangerous nature can be obtained from legally qualified chemists and druggists, with all requisite facility, under the conditions prescribed by law, with the object of preventing accident or misuse, to as great an extent as that may be possible, and with provision for tracing the purchaser in cases where improper use is made of the articles obtained. The kind of business carried on by grocers or oilmen and general dealers in household commodities is not adapted for the observance of such precautionary measures as are indispensable in the retail sale of poisons, or other articles which are sufficiently dangerous to be included in the Poison Schedule.

ANNOTATIONS.

LICENCES FOR THE SALE OF MEDICATED WINE are frequently applied for by chemists and druggists, and these applications appear to be a source of perplexity to the licensing magistrates, many of whom are not, perhaps, aware of the fact that the sale of medicated wine properly so-called is not held by the Excise authorities to require a licence, or, rather, they allow such wine to be sold without one. But many of the preparations sold as medicated wine are really of a different character, and they come within the description that they are capable of being consumed as beverages. For the sale of such preparations an Excise licence is absolutely necessary. In a recent number of the *British Medical Journal*, Dr. F. Coley, of Newcastle-upon-Tyne, writes to protest as a medical man against the general use of these preparations. He points out, in regard to coca wine, for instance, that even assuming the presence of cocaine in amount sufficient to produce effect, the use of it to relieve nerve fatigue is attended with considerable danger and is likely to lead to a pernicious abuse of the drug, with disastrous results. Another combination which he condemns as utterly absurd from a therapeutic point of view is the combination of meat extract, malt extract, and port wine, frequently recommended as a nutritive preparation, and even prescribed by medical men, who, Dr. Coley supposes, have become oblivious of physiology, and have thus been attracted by a formula which is more plausible than sound.

"ROUGH ON RATS," a preparation understood to contain a considerable proportion of arsenic, has caused the death of a young woman at Rotherhithe, who appears to have taken it voluntarily. According to the medical evidence at the inquest the actual cause of death was phosphorus poisoning, and the jury added to the verdict a rider to the effect that the attention of the Home Secretary should be directed to the unrestricted sale of poisons, with a view to something being done speedily to restrict such sale. So far as phosphorus is concerned there is, of course, no restriction upon its sale, but if arsenic were also present in the preparation that caused death the sale ought to have been registered, etc., in accordance with Part I. of the Poison Schedule. That, however, does not appear to have been done in this case. Commenting on the affair, a correspondent of the *Morning* remarks that a child can obtain "Rough on Rats" with the greatest ease, "whereas anyone going to a chemist and asking for a grain of phosphorus, pure and simple, would, without a doubt, be refused." Exception may be taken to both these statements, which are probably only partially correct. So far as chemists generally are concerned, it may be taken for granted that the greatest discretion is exercised in selling any substance of a poisonous nature; at the same time it would be unreasonable for a chemist to refuse to sell pure phosphorus or any other poisonous substance if a satisfactory reason were given for requiring it.

AS TO REMEDIES for the indiscriminate sale of rat poisons, etc., the writer referred to above mentions three, suggested to him by "a leading firm of manufacturing chemists." He would, first, include all poisonous drugs in the Schedule, and rigidly enforce the regulations provided by it. Secondly, where poisonous chemicals are necessary for trade purposes, he would make it obligatory on the workman purchasing them to produce an authorisation signed by his employer. Lastly, he would prohibit the sale of rat-bane *et hoc genus omne*. Continuing, he somewhat incorrectly observes that when a man wishes to poison a dog "he

must, under the present law, take it to a proper person to be put down. Let, in the case of vermin, a similar requisition of a expert be enforced. In conclusion, it should be added that to absolutely prevent people poisoning themselves is impossible, and not to be expected. What is not done at present, and what is needful to a degree, is to make the necessary means as inaccessible as can be managed, without in any way handicapping legitimate sales."

AN OVERDOSE OF SULPHONAL has caused the death of a woman at Kilburn who had been taken to the Hampstead Workhouse infirmary during an attack of illness, and remained there until August 22, when she took her discharge. The master of the workhouse persuaded her to leave behind a bottle of sulphonal tablets and a bottle of "phosphorine" which belonged to her, but she returned the same day, and claimed them. She then took a lodging in Palmerston Road, Kilburn. She complained of sleeplessness, and sent out for some more sulphonal tablets. After having taken some of them she went to sleep, and never regained consciousness. Dr. Cunningham, who attended her, said that sulphonal was regarded as a safe drug, but deceased probably took seventy-five grains. She was in a weak condition, and death was due to syncope, brought on by congestion of the lungs and an overdose of sulphonal. The jury returned a verdict of "death by misadventure." The increasing number of fatalities following the use of sulphonal seems to indicate the desirability of doing whatever is possible to check its indiscriminate use by persons who resort to the use of the drug without proper medical advice.

A SERIES OF FRAUDS that are not of a nature to reassure persons who may fall ill in Paris is reported by the *Morning Post* as having just been discovered. A chemist is stated to have recently purchased the goodwill of a shop in a populous quarter of the French capital, and he had not conducted the business for many days before he found, no little to his astonishment, that were he to sell his goods at the prices charged by his predecessor he would be providing the district with medicines at a constant loss to himself. On the other hand, to raise the tariff would be to lose his customers. "Confronted by this dilemma, he made a careful investigation of the methods which had enabled his predecessor to realise a handsome profit by making up prescriptions at what seemed to be less than cost price. The mystery proved to be simple in the extreme. The prescriptions never contained the ingredients of which they were supposed to be composed. Such of them as were costly were either omitted purely and simply or replaced by another and cheaper substance." The police have, it is stated, been put in possession of these facts, and their inquiries seem to indicate that frauds of this nature are comparatively common. This we imagine to be far from correct, however, and the probability is that the tale has been invented by the wags of the quarter, who are said to declare that the customers of the cheap chemist derived at least as much benefit from his fraudulent medicines as they would have done had they been genuine.

A WARNING TO CHEMISTS has been sent to the lay press by Mr. Robert J. Downes, President of the Pharmaceutical Society of Ireland, who states that what purports to be a medical prescription ordering a drug which is used for criminal purposes, is being taken to chemists to be dispensed. The drug specified is in Part I of the Poison Schedule, and it is pointed out that any chemist supplying it runs a very serious risk if he supplies it not knowing the medical man who orders it or the signature of the person to whose order he supplies

it. It is of the utmost importance that chemists should pay heed to such warnings as this, as nothing is easier than for a person with a smattering of medical knowledge to write what is apparently a genuine medical prescription for drugs required for criminal purposes. When the initials on a prescription are illegible or unfamiliar, great circumspection should invariably be exercised by chemists before dispensing it.

THE DEADLY DANGERS OF THE DRUG STORE are exercising the minds of some American journalists, who may or may not be exaggerating in the reports on which they enlarge. For example, the *New York World*, commenting on a coming meeting of druggists, asserts that serious and fatal mistakes in the compounding of prescriptions are continually made. In one case referred to, an individual is said to have brought a suit for damages against a firm of druggists at Pittsfield, Mass., for the death of his child. "He claims that he took a prescription to the store for syrup of ipecac., and that through someone's mistake laudanum was given, causing the death of his child." In another case an action for damages has been brought against a druggist, E. Lynn, at Canfield, Ohio, by a person who alleges that "some powerful poison" was sold him instead of tannin. The readers of the paper are next told that the wave of suicides and murders now sweeping over New York City is fostered by the chaotic condition in which the drug business is at present. The Druggists' League says the poison law is ignored, the liquor law undermined, and efforts made to protect the health of the public and the lives of the citizens, rich and poor alike, are ridiculed, misrepresented and maligned by opponents.

"THE RED DEVIL" is said to be "calisaya," a disguised intoxicant containing cochineal, 60 grains; quinine sulphate, 60 grains; alcohol, 1 quart; syrup, 1 quart; oil of coriander, 5 minims; oil of orange, 1 drachm; oil of cassia, 2 minims; water, 4 quarts. "Calisaya is a very dangerous disguised intoxicant, according to the League, and is taken by men, women, and children as a tonic. Constant indulgence results in paresis, cirrhosis of the liver, diabetes and death." A statement issued by the League says:—"Coca wine is stronger and worse still in its effects than calisaya. Whiskey and other liquors are not strong enough to tempt the confirmed coca wine and calisaya drinkers to give them up. Poisons for prospective suicides and dangerous drugs for drug fiends are easily obtained, as carbolic acid, Paris green, morphine, opium, chloral, chloroform, cocaine, and many others. Unless the strong hand of the law prevents the greed of unscrupulous men, druggists will always be found to sell these drugs and poisons. Not satisfied with encroaching upon the confectionery, candy, cigar, stationery, grocery, and many other businesses, the druggists are entering in ever-increasing numbers the liquor trade under the specious plea of selling liquor for medicinal uses. Small wonder that so many drug clerks are addicted to drugs or liquors to stimulate their energies when working fourteen, sixteen, and even eighteen hours a day." These facts may, of course, be as asserted, but why do the druggists of the district thus expose their own weaknesses, instead of setting to work steadily to overcome them, in a quiet and non-public way?

THE TRADE PROSPECTS IN CHINA AND JAPAN are dealt with in a recent issue of the *Pharmaceutical Era* by Mr. W. A. Peairs, the prospects of trade in drugs and medicines being the principal object of a tour of investigation in those countries. In China, Hong Kong is considered to lead the way in the wholesale drug

business, the large houses having branches in Shanghai, where a very good retail business is done. Some of the native stores manufacture their own preparations, one firm making an extensive line of tablets, the manager, who was trained to the business in the United States, having adopted many of the ideas prevalent there. If exporters or manufacturers at home expect to build up a profitable trade in China, or elsewhere in the East, it is held to be a positive necessity for them to have a representative on the ground all the time, as success depends upon attention to the many petty details which agents or wholesale houses cannot be expected to attend to.

WITH REGARD TO JAPAN, Mr. Peairs states that there is no country that claims to be a power that has such peculiar laws regarding pharmacy as Japan, the first step of a traveller being not to secure customers, as in other places, but to ascertain whether the Government will allow his products to be imported. If it is desired to interest one of the large native wholesale houses in certain products formal application must be made to the local government, giving the exact formulæ, proportions, directions for use, etc., and samples of the medicines must accompany the application to be analysed by the Government chemists. Any medicine found to be of the ordinary patent variety with no injurious ingredients, no opium or forms of the same, may be sold by native dealers, who must, however, affix a stamp, value 10 per cent. of the selling price. Should the chemists find any of the mentioned objectionable matters, it is classed as a dangerous compound, must be marked so, and sold only by orders of a medical man. The drug business of Japan is stated to be very large, drug stores abounding everywhere, it being estimated that there are more wholesale drug stores in that country than in all the rest of Asia combined. A large line of patents is manufactured, embracing remedies for all manner of disease. Mr. Peairs finds that the Japanese are great imitators, but there is no originality among them, the inventive genius being comparatively an unknown quantity. The bed-rock from which all great businesses are built up—commercial honour—is said to be lacking, a Japanese having no compunction whatever in breaking any contract he may have made. On the other hand the Chinaman will live up to his bargain, even if it breaks him. After personal investigation, Mr. Peairs is of opinion that, while Japan is by far the most intelligent, still, owing to the laws that govern her, she is not to be compared in any way to the prospects that loom up from China.

HONEY DEW.—H. W. Brice, writing to the *Bee-Keepers' Record*, xvi., 129, combats the idea that "honey dew" is either a dew or an excretion from aphides. A microscopical examination of thickly-coated leaves of the lime and sycamore revealed not more than three or four insects per leaf, while an hour after collection, the insects having been removed, the beads of honey dew were much thicker than when first gathered. He concludes that under certain climatic conditions the cells of the leaves of some trees become surcharged with saccharine matter, which on a change of temperature is unable to become absorbed with sufficient rapidity by the channels through which it flows, thus causing a rupture of the cells, or a copious exudation through the pores of the leaf. Being of a thick, glutinous nature, its evaporation is retarded, and aphidæ are attracted in the same manner as bees. The fact that "dew" gathered from the sycamore and the oak is much darker than that from the lime is held to prove that it partakes of the nature of the tree and not of the insects.

British Association.

THE PHYSICS OF SMELL.

Professor Ayrton, in his address as President of the Mathematical and Physical Section of the British Association, gave especial prominence to the following consideration of the mode in which the perception of smell is produced, and described some investigations of the subject by himself.

Of the three senses which enable us to detect the presence of things at a distance—viz., seeing, hearing, and smelling—the first two are highly cultivated in man, and probably for that reason the laws of the propagation of the disturbances which affect the eyes and ears have been the subject of much investigation. To many animals the sense of smell is of far greater importance than those of seeing or hearing, and even in the human brain, a whole segment—a small one in modern man, it is true—is devoted to the olfactory fibres, but the laws of the production and propagation of smell have received practically no attention from the physicist. For some time past it has, therefore, seemed to me to be of theoretical and practical importance to examine more fully into the physics of smell. Various other occupations have hitherto prevented my advancing much beyond the threshold of the subject, but, as it seems to me to open up what is practically a new field of inquiry for the physicist, I take this opportunity of putting on record some facts that have been already elucidated.

Various odoriferous substances have been employed in the experiments, and for several of these I am indebted to Mr. W. J. Pope. Although the physicist has been allowing the mechanical side of the subject to lie dormant, the chemist, I find, has been analysing flowers and other bodies used in the manufacture of scents, and then synthetically preparing the odoriferous constituents. In this way, Mr. Pope informs me, there has been added to the list of manufactured articles, during the past seven years or so, vanillin, heliotropin, artificial musk, irone, and ionone, which give the perfume of the violet; citral, that of lemongrass; coumarin, that of hay, and various others.

If it be a proof of civilisation to retain but a remnant of a sense which is so keen in many types of dogs, then I may pride myself on having reached a very high state of civilisation. But with the present investigation in view this pride has been of a very empty character, since I have been compelled to reject my own nose as quite lacking the sensitiveness that should characterise a philosophical measuring instrument. The ladies of my family, on the contrary, possess a nasal quickness which formerly seemed to me to be rather of the nature of a defect, since, at any rate in towns, there are so many more disagreeable odours than attractive ones. But on the present occasion their power of detecting slight smells, and the repugnance which they show in the case of so many of them, have stood me in good stead, and made it possible to put before you the following modest contribution to the subject.

There is a generally accepted idea that metals have smells, since if you take up a piece of metal at random, or a coin out of your pocket, a smell can generally be detected. But I find that, as commercial aluminium, brass, bronze, copper, German silver, gold, iron, silver, phosphor-bronze, steel, tin, and zinc are more and more carefully cleaned, they become more and more alike in emitting no smell, and, indeed, when they are very clean it seems impossible with the nose, even if it be a good one, to distinguish any one of these metals from the rest, or even to detect its presence. Brass, iron, and steel are the last to lose their characteristic odour with cleaning, and for some time I was not sure whether the last two could be rendered absolutely odourless, in consequence of the difficulty of placing them close to the nose without breathing on them, which, as explained later on, evolves the characteristic "copper" and "iron" smell. But experiment shows that, when very considerable care is taken both in the cleaning and the smelling, no odour can be detected even with iron or steel.

Contrary, then, to what is usually believed, metals appear to have no smell *per se*. Why, then, do several of them generally possess smells? The answer is simple; for I find that handling a piece of metal is one of the most efficient ways of causing it to acquire its characteristic smell, so that the mere fact of lifting up a piece of brass or iron to smell it may cause it to apparently acquire a metallic odour, even if it had none before. This experiment may be easily tried thus:—Clean a penny very carefully until all sense of odour is gone; then hold it in the hand for a few

seconds, and it will smell—of copper, as we usually say. Leave it for a short time on a clean piece of paper, and it will be found that the metallic smell has entirely disappeared, or at any rate is not so strong as the smell of the paper on which it rests. The smell produced by the contact of the hand with the bronze will be marked if the closed hand containing it be only opened sufficiently for the nose to be inserted, and it can be still further increased by rubbing the coin between the fingers.

All the metals enumerated above, with the exception of gold and silver, can be made to produce a smell when thus treated, but the smells evolved by the various metals are quite different. Aluminium, tin, and zinc, I find, smell much the same when rubbed with the fingers, the odour, however, being quite different from that produced by brass, bronze, copper, German silver, and phosphor-bronze, which all give the characteristic "copper" smell. Iron and steel give the strong "iron" smell, which, again, is quite different from that evolved by the other metals. In making these experiments it is important to carefully wash the hands after touching each metal to free them from the odour of that metal. It is also necessary to wait for a short time on each occasion after drying the hands, since it is not until they become again moist with perspiration that they are operative in bringing out the so-called smell of metals.

That the hands, when comparatively dry, do not bring out the smell of metals, is in itself a disproof of the current idea that metals acquire a smell when slightly warmed. And this I have further tested by heating up specimens of all the above-mentioned metals to 120° Fahrenheit, in the sun, and finding that they acquire no smell when quite clean and untouched with the hands.

Again, dealing with the copper group, or with aluminium, no smell is produced by rubbing any one of them with dry table salt, strong brine, or with wet salt, provided that a piece of linen is used as the rubber; but if the finger be substituted for the linen to rub on brine, a smell is observed with copper and German silver, this smell, however, being rather like that of soda; and whether dry salt, brine, or wet salt be rubbed on aluminium, a smell is noticed if the finger be used as the rubber, this smell being very marked in the case of the brine or wet salt. Again, although even when linen soaked in brine, or having wet salt on it, is used to rub tin, iron, or steel, a faint smell is noticed; this is much increased when the finger is substituted for the piece of linen.

As a further illustration of the part played by the skin in causing metallic smells, it may be mentioned that the explanation of certain entirely contradictory results, which were obtained in the early part of the investigation, when linen soaked in strong brine was rubbed on aluminium, was ultimately traced to one layer of moist linen of the thickness of a pocket-handkerchief, allowing the finger to act through it, so that an odour was sometimes noticed on rubbing aluminium with the piece of linen soaked in brine. For it was found that when two or more layers of the same linen soaked in the same brine were employed to separate the finger from the aluminium during the rubbing, no smell could be detected.

From the preceding it seems that the smell in these cases is evolved partly by contact with the finger, partly by the action of the solution of salt, and partly by the rubbing of the solid particles of salt against the metals. That the friction of solid particles against metals is operative in evolving smells is also illustrated by the smell noticed when iron is filed, or when aluminium, iron, or steel is cleaned with glass-paper or emery-paper in the air. Indeed, the smell thus evolved by aluminium Mrs. Ayrton finds particularly offensive. A slight smell is also noticed if iron or steel be rubbed in the air with even a clean piece of dry linen, and each specimen of the copper group, with the exception of the phosphor-bronze, which was tried in this way, give rise to a faint, rather agreeable smell. No indication of odour could, however, be thus produced with aluminium or zinc when both the metals and the linen rubber were quite clean. It should, however, be borne in mind that all these experiments, where very slight smells are noticed, and especially when the odour rapidly disappears on the cessation of the operation that produced it, are attended with a certain amount of doubt, for the linen rubber cannot be freed from the characteristic smell of "clean linen," no matter how carefully it may be washed.

Before, then, a metal can evolve a smell, chemical action must apparently take place, for rubbing the metal probably frees metallic particles, and facilitates the chemical action to which I shall refer. All chemical actions, however, in which metals take part do not produce smell; for example, no smell but that of soda, or of sugar, respectively, can be detected on rubbing any single

one of the series of metals that I have enumerated with a lump of wet soda, or a lump of wet sugar, although chemical action certainly takes place. Again, no metallic smell is observable when dilute nitric acid is rubbed on copper, German silver, phosphor-bronze, tin, or zinc, although the chemical action is very marked in the case of some of these metals. Weak vinegar or a weak solution of ammonia are also equally inoperative. On the other hand, merely breathing on brass, copper, iron, steel, or zinc, which has been rendered practically odourless by cleaning, produces a very distinct smell, while a very thin film of water placed on iron or steel evolves a still stronger odour. Such a film, however, produces but little effect with any of the metals except these two, and if the whole series is lightly touched in succession with the tongue, the iron and steel smell as strongly as when breathed on, the German silver more strongly than when breathed on, or covered with a water film, and the other metals hardly at all.

Now, as regards the explanation of these metallic smells, which have hitherto been attributed to the metals themselves. This, I think, may be found in the odours produced when the metals are rubbed with linen soaked in dilute sulphuric acid. For here, apart from any contact of the metal with the skin, the aluminium, tin, and zinc are found to smell alike; the copper group also smell alike, and the iron and steel give rise to the characteristic "iron" smell, which, in this case, can be detected some feet away. Now, it is known that when hydrogen is evolved by the action of sulphuric acid on iron, the gas has a very unpleasant smell, and this, Dr. Tilden tells me, is due to the presence of hydrocarbons, and especially of paraffin. I have been, therefore, led to think that the smell of iron or steel when held in the hand is really due to the hydrocarbons to which this operation gives rise; and it is probable that no metallic particles, even in the form of vapour, reach the nose or even leave the metal. Hence, although smell may not, like sound, be propagated by vibration, it seems probable that particles of the metal with which we have been accustomed to associate the particular smell may no more come into contact with the olfactory nerves than a sounding musical instrument strikes against the drum of the ear.

And the same sort of result may occur when a metal is rubbed, for, although in that case particles may very likely be detached, it seems possible that the function of these metallic particles may be to act on the moisture of the air, and liberate hydrogen similarly contaminated; and that in this case also it is the impurities which produce the smell, and not the particles of the metal with which we have been accustomed to associate it.

This view I put forward tentatively, and to further elucidate the matter I am about to begin a series of smell tests in various gases, artificially dried, with metals as pure as can be obtained.

I next come to the diffusion of smell. From the experience we have of the considerable distance at which a good nose can detect a smell, and the quickness with which the opening of a bottle of scent, for example, can be detected at a distance, I imagined that tubes not less than 15 or 20 feet in length would be required for ascertaining, even roughly, the velocity at which a smell travels. But experiment soon showed that when the space through which a smell had to pass was screened from draughts, it diffused with surprising slowness, and that feet could be replaced by inches in deciding on the lengths of the tubes to be used. These are made of glass, which are relatively easy to free from remanent smells.

When the room and tube had been freed from smell by strong currents of air blown through them, the tube was corked up at one end and taken outside to have another cork, to which was attached some odoriferous substance inserted at the other end. The tube was now brought back to the odourless room, and placed in a fixed horizontal or vertical position, and the unscented stopper was withdrawn. As a rule, immediately after the removal of the stopper, a smell was observed, which had been transmitted very quickly through the tube by the act of corking up the other end with the stopper carrying the odoriferous material. This first whiff, however, lasted only a very short time, and then a long period elapsed before any further smell could be detected at the free end of the tube, whether that end was left open or closed between times. Finally, however, after, for example, about eighteen minutes in the case of a three-foot horizontal tube, having a large cotton-wool sponge saturated with oil of limes attached to one cork, the smell became definite and recognisable.

It would, therefore, appear that the passage of smell is generally far more due to the actual motion of the air containing it than

to the diffusion of the odoriferous substance through the air. And, as a striking illustration of this, the following is interesting:—After the stopper had been in contact with the odoriferous substance for some time it, of course, acquired a smell itself, which gradually spread in the room in which the experiment was made. And although this smell was due simply to the exposed part of the stopper, while the air inside the tube was at one end in contact with a mass of the odoriferous substance itself, the only place where the smell could not be detected during the course of the experiment was the space inside the open end of the glass tube. And, what seemed very surprising, it was found necessary, in several cases, to blow air through the room to clear out the smell which emanated from the outside of the stopper before the smell coming along the tube from the mass of odoriferous substance which was inside it at the other end could be detected. A further proof of the important part played by the motion of the air in diffusing smell was the fact that a strong smell at the free end of the tube could at any time be caused by merely loosening the stopper to which the scented sponge was attached; for sniffing at the free end then made a draught through the tube which brought the scent with it.

Further, although the glass tubes were coated outside with a thick layer of non-heat-conducting material, so as to check the formation of convection currents, due to difference in the inside and outside temperature, caused by handling, the rate of travel of a smell from a given odoriferous material was found to be much quicker when the tube was vertical than when it was horizontal. But this, I am inclined to think, may have been caused by a small convection current which still was produced in spite of these precautions.

For, as suggested by Dr. Ramsay several years ago, a substance must have a molecular weight at least fifteen times that of hydrogen to produce a sensation of smell at all, and further, since camphor, with which many of my experiments have been made, has, when vaporised, a density about five times that of the air, it seems unlikely that scent vapour should diffuse much more quickly upwards through a vertical column of air than through a horizontal one. At the same time, not only are the tests with the glass tubes very striking, but the general impression which exists that smells rise, indeed, the very fact that the nasal channels of animals open downwards, tends to show that, whether due to draughts or not, smells have really a tendency to ascend. And the following result obtained with glass tubes closed at one end with stoppers carrying respectively camphor, menthol, oil of limes, etc., and at the other end with corks, is instructive on this point. For, on uncorking such a tube after it had been closed for a long time and allowing the odour to stream out of it through the open air towards the experimenter's face, it was always found that the tube had to be brought much closer when the scent stream was poured downwards than when she was in a vertical position and it was allowed to ascend, although, when it was poured downwards, the experimenter brought her nose into as favourable a position as possible for receiving the smell, by lying down with her head thrown well back.

As an illustration of the inefficiency of diffusion alone to convey a smell you will find that if you hold your breath, without in any way closing your nose either externally or by contracting the nasal muscles, you will experience no smelling sensation even when the nose is held close to pepper, or a strong solution of ammonia, or even when camphor on a minute tube is introduced high up into the nostril. Mere diffusion from the lower nasal cavity into the upper cannot apparently take place with sufficient ease to produce the sense of smell, so that an actual stream of air through the upper portion of the nose seems necessary even when the nose is a very sensitive one. This stream, for substances placed outside the nose, is produced by breathing in, no smell being detected while breathing out. On the other hand, if a substance be placed inside the mouth, its flavour is recognised when the air is forced outwards through the nostrils—that is, at each expiration. Hence we may experience alternately two totally different smells by placing one substance outside the nose and the other in the mouth, the one smell being noticed in inhaling and the other in exhaling. And the latter can be increased by smacking the lips, which, I think, has really for its object the forcing of more air through the nostrils at each expiration.

Experiments on the propagation of smells in a vacuum have also been commenced in my laboratory, and the results are no less surprising than those obtained with the propagation in air. A U tube, seven inches high, had the odoriferous substance placed

inside it at the top of one limb, and a very good vacuum could be made by allowing mercury to flow out of the tube. Then the two limbs were separated by raising the mercury column, and air being admitted at the top of the other limb, without its coming into contact with the odoriferous substance, the nose was applied at the top of this limb.

When liquids like ammoniated lavender, smelling salts, solution of musk, and amyl acetate were employed, and various devices were used for introducing the liquid and preventing its splashing when it boiled on exhausting the air, it was found that the time that it was necessary to leave the two limbs connected for a smell to be just observable was reduced from a few minutes or seconds when the tube was filled with air to less than half a second for a good vacuum; with solid camphor it was reduced from twenty minutes to one second, and when moist rose leaves were used, from fifty minutes to two seconds. But with solid particles of musk the time was not reduced below twenty minutes by taking away the air, while with dried lavender flowers and dried woodruff leaves no smell could be detected after the two limbs had been connected for many hours, and a good vacuum maintained. These experiments are, of course, somewhat complicated by variations in the amount of odorous surface exposed, but they seem to indicate that with these particular dried substances either the rate of evolution of the scent, or its rate of propagation, or both, are very slow even in a good vacuum.

I have also carried out some tests on the power of different substances to absorb various scents from the air. Lard, it is well known, is used to absorb the perfume from flowers in the commercial manufacture of scents, perhaps because it has little odour of its own, and because the scent can be easily distilled from it. But if lard, wool, linen, blotting-paper, silk, etc., be shut up for some hours in a box at equal distances from jasmine flowers, dried woodruff leaves, or from a solution of ammonia, I find that it is not the lard, but the blotting-paper, that smells most strongly when the articles are removed from the box. On the other hand, when solid natural musk is employed it is the wool that alone acquires much smell, even after the box has been shut up for days.

Another noteworthy fact is the comparatively rapid rate at which grains of natural musk are found to lose their fragrance when exposed to the air. The popular statement, therefore, that a grain of musk will scent a room for years supplies but another example of the contrast between text-book information and laboratory experience.

The power of a smell to cling to a substance seems to depend neither on the intensity of the smell nor on the ease with which it travels through a closed space. Musk has but a faint smell, but the recollection of the greeting of a rich Oriental survives many washings of the hands. The smell of rose leaves, again, is but faint, and it travels very slowly through air in a tube; and yet the experiments on its propagation in the glass vacuum apparatus were rendered extremely troublesome, by the difficulty experienced in removing the traces of the smell from the glass between the successive tests. Rubbing its surface was quite ineffectual, and even the mercury had to be occasionally shaken up with alcohol to free it from the remanent smell. In fact we found, as Moore put it:

"You may break, you may shatter the vase if you will,
But the scent of the roses will cling to it still."

This absorption of scents by glass, and the ease with which I found that jasmine flowers could be distinguished from woodruff leaves, even when each was enclosed in a series of three envelopes specially prepared from glazed paper, and when many precautions were taken to prevent an odour being given to any of the envelopes in the operation of closing, as well as to prevent its diffusion through the joins in the paper, led me to try whether an actual transpiration through glass could be detected with the nose. For this object a number of extremely thin glass bulbs were blown from soda and from lead glass, so thin that they exhibited colours like a soap bubble, and felt, when gently touched, like very thin oiled silk, and after a little ammoniated lavender, amyl nitrite, ethyl sulphide, mercaptan, solution of musk, oil of peppermint, and propylamine had been introduced into them respectively, they were hermetically sealed and placed separately in glass stoppered bottles.

In some cases, on removing the stopper from a bottle after many hours, a faint odour could be detected, but so, generally, could a minute flaw after much searching; the crack, however, being so slight that it did not allow sufficient passage of the air to prevent the bulb subsequently breaking, presumably from changes of

atmospheric pressure. And in those cases where a smell was detected without any flaw being found in the glass, the subsequent breaking of the bulb put an end to further testing. The question, therefore, remains unanswered.

In presenting this brief introduction to the physics of smell, I have aimed at indicating the vast territory that waits to be explored. That it will be found to contain mines of theoretical wealth there can be no doubt; while it is probable that a luxuriant growth of technical application would spring up later on. Already, for example, Mrs. Ayrton unintentionally picks out inferior glass by the repugnance she shows at drinking water out of certain cheap tumblers. To conclude, I may say that one of my fondest hopes is that an inquiry into the physics of smell may add another to the list of wide regions of knowledge opened up by the theoretical physicist in his search for answers to the questions of the technical man.

PHARMACY IN AUSTRALASIA.

[From our Melbourne Correspondent.]

ALTHOUGH NOT SUBJECT to the same amount of worry and uncertainty which the publication of the new Pharmacopœia seems to have entailed on you in the old country, Victorian pharmacists are nevertheless desirous that some specific understanding should be arrived at in the matter, and with that object in view the Victorian Pharmacy Board, as I think I have already mentioned, recently approached the Government with a recommendation that the 1898 Pharmacopœia should be formally gazetted as coming into operation in this colony on and after January 1, 1899. Since then, however, the medical profession have displayed some interest in the matter, and a special meeting, convened by Dr. Kent Hughes, of the British Medical Association, was held on July 13, to consider the question. Messrs. Francis and Lacey, who represented the Pharmacy Board, urged that in the interests of up-country pharmacists, who had not the same facilities of information as their metropolitan brethren, the date originally proposed should be adhered to. The medicos, however, seemed to consider that the mysteries of the new edition could or should be mastered in a shorter period of study; and eventually the following resolution was adopted:—"That it be agreed that the British Pharmacopœia for 1898 be used generally, on and after the 1st October next; that all prescriptions up to that date be dispensed from the Pharmacopœia of 1885, unless otherwise marked, and after that date all prescriptions to be dispensed from the new volume, unless otherwise marked." Dr. Kent Hughes was authorised to interview the Chief Secretary on the subject, and it remains to be seen which of the dates suggested will recommend itself to Governmental wisdom. In any case pharmacists are gratified that the medicos, no less than themselves, have thus evidenced their desire of having a definite understanding arrived at on the subject.

THE PHARMACY BOARD OF VICTORIA and the Government have recently been in negotiation, in connection with the legal business of the former. It appears, however, that the Attorney-General (Mr. Isaacs), while proposing that the legal business of the Board should in future be conducted by the Crown Law Department, the cost of such work to be deducted from the amount of the Government grant, stipulated that future prosecutions would only be undertaken under the sole control, supervision, and discretion of the Law Department. Naturally, as you may understand, the Board have declined to give themselves the "happy despatch" which the acceptance of these terms would involve, and, to quote from the official report in the *Australasian Journal of Pharmacy*, "the matter remains as formerly."

IN MY NEXT LETTER I may be able to give you further particulars in connection with the proposed amendment of our Poisons Act, 1890, the inefficiency of which has recently been so forcibly exemplified in connection with the Pink Pills case. An amending Bill was introduced into the Legislative Assembly on June 9, and read a first time, but has not yet been circulated. As the Bill was introduced by the Chief Secretary himself you will see that we have good reason to hope for the carrying of a measure that will place legitimate pharmacy on a higher, and illegitimate dabbling in poisonous preparations on a lower, plane than ever before in the colony.

AT THE ANNUAL MEETING of the Melbourne Dental College and Australian College of Dentistry, held on July 14, Messrs. J. Iliffe, McGregor, and Hall, the retiring members of Council, were re-elected. Among the recent successful applicants for registration by the Dental Board was a Mr. H. Hedley Ham, L.D.S. of England. Dentistry, as an organisation, is still almost in its infancy in this colony, but has made great strides in advance during the past year. An amendment of the Dental Act, now under consideration, will, when passed through Parliament, place matters on a sound foundation.

AN IMPORTANT TRADE MARK CASE was instituted in the District Court, Melbourne, on July 11, by the well-known firm of manufacturing chemists, Messrs. Felton, Grimwade and Co., against Mary Smith and John George Smith, Prahran (a suburb of Melbourne), against whom it was alleged that they were selling their own brand of fluid magnesia in bottles bearing the embossed words "Felton, Grimwade and Co, Melbourne, Kruse's Prize Medal Fluid Magnesia." From the evidence of Mr. F. S. Grimwade it appeared that while the defendants' label covered one side of the bottle, hiding the words "Kruse's prize medal fluid magnesia," the embossed words on the back of the bottle, "Felton, Grimwade and Co., Melbourne," were not covered; and it was urged that the public were thus being deceived into thinking that the defendants' fluid magnesia was Kruse's, manufactured by Felton, Grimwade and Co., the original proprietors. Further evidence was brought to show that the defendants had been warned against utilising the prosecutors' bottles in the manner objected to. The defendant J. G. Smith asserted that although he had put up his magnesia in Felton, Grimwade's bottles he had no intention of deceiving anyone. The other defendant was his wife, and the proprietor of the business. The Court decided that a breach of the Act had been committed, and Mary Smith was fined 1s., in default of six hours' imprisonment, with £15 15s. costs; and J. G. Smith £5, in default one month's imprisonment. A stay of seven days was granted. I do not know how witnesses' fees are regulated in your English Courts, but the following anecdote might give some of your budding pharmacists a "wrinkle." At one of our Suburban Courts (Carlton) the other day, a witness describing himself as a chemist's assistant claimed 10s. for expenses. He admitted only being a relieving assistant, but was also a student at the College of Pharmacy. "But you don't get paid for studying?" remarked the chairman of the Bench. "No, but I pay fees for the privilege of studying, sir," replied the witness. Result, an allowance of 3s.

OWING TO SOME LEGAL INFORMALITY the New South Wales Pharmaceutical Society has had to call another special meeting to adopt the proposed alteration in, or substitution for, Article 4 of their Articles of Association, regulating the admission to membership. The result was practically the same as before, 17 voting for and 5 against the motion. A somewhat novel protest against the chairman's ruling that the motion was carried was taken by Mr. Bellamey, who held that a three-fourths majority was required, "and that meant that there must be four votes for every vote against"!

THERE BEING APPARENTLY NO POSSIBILITY of the N.S.W. pharmacists succeeding in inducing the Government to supply the necessary funds for the establishment of an educational institution on the lines of the Melbourne College of Pharmacy, negotiations have been going on with the University authorities on the subject, and the proposals, made by the latter have now been definitely accepted by the Society. According to this convention, students under the Pharmacy Board will be permitted to attend the University lectures and examinations without matriculation, under the following regulations;—

"It shall be open to any non-matriculated student, who has attended the full courses of lectures upon any subject, to compete for honours or pass in the regular examinations upon his subject, and to have his name published and recorded in the regular class lists with a distinguishing mark; but he shall be incapable of holding any scholarship or receiving any prize of those already established for students proceeding to a degree. Each such student shall be entitled to receive a certificate of attendance upon the lectures or laboratory practice in the subjects which he has selected, and proficiency therein as ascertained by the regular and ordinary examinations within the University."

The courses of lectures which it is proposed shall be attended by students under the Pharmacy Board are as follows:—

Botany.—Fee, £2 2s.; Lent term, 11 a.m.; forty lectures. *Inorganic Chemistry*.—Fee, £6 6s.; Lent term, 12 noon, forty lectures; Trinity term, 11 a.m., forty

lectures. *Organic Chemistry*.—Fee, £3 3s.; Michaelmas term, 11 a.m., forty lectures. *Practical Chemistry*.—Fee, £5 5s.; Trinity term, 9 a.m. till 11 a.m., ninety hours. *Materia Medica*.—Fee, £3 3s.; Michaelmas term, 12 noon, fifty lectures. Total fees, £19 19s.

The course of lectures and the concluding examination may be taken altogether in one year, or in two or three years, or a greater number, at the option of the student. The annual examinations in all subjects are held in December, after the conclusion of the lectures. Those who fail to pass the annual December examination in any subject may, if the examiners think fit, be allowed a deferred examination in March. For every deferred examination a student is required to pay a fee of £2. Class examinations are also held during the courses of lectures to test the progress of students. No certificates are given for these, but only for the regular annual examinations.

THE NAME OF MR. LIONEL NELL, a chemist, at present in the employ of Mr. H. A. Rose, George Street, Sydney, well deserves to be recorded in your pages. In recognition of the plucky aid he has on several occasions given to the police Mr. Nell was recently handed, at the Inspector-General's office, a valuable open-faced keyless watch, bearing the following inscription:—"Presented to Mr. Lionel Nell by the Government of New South Wales in recognition of valuable services in aiding the police in the arrest of criminals, April, 1898." Later on this testimonial was supplemented by a gold chain and locket, bearing a suitable inscription, presented by the police themselves. Needless to say, during the presentations warm encomiums were passed on Mr. Nell for his gallant conduct in several instances, and there is no doubt that should he be in business on his own account he can rely for patronage on at least one section of the community, and that will not be the criminals.

ACCORDING TO THE ARRANGEMENT made when the N.S.W. Pharmacy Board was appointed by the Government about a year ago, two members recently had to retire by "lot," and the vacancies thus caused be filled by means of an election on the part of the registered pharmacists of the colony. Strange to say, the first "victims" were Mr. Williams, the President of the Pharmaceutical Society, and Mr. Butcher, a former President. That both of these gentlemen command the confidence of the craft has been evidenced by their re-election against two other candidates in the field, the voting resulting as follows: Williams, 193; Butcher, 175; Wells, 144; Kose, 141.

PHARMACY IN IRELAND.

[From our Dublin Correspondent.]

THE LOCAL GOVERNMENT BOARD has issued a new order regarding the supply of medicines to workhouses. The new Pharmacopœia has been adopted as indicating the standard by which drugs are to be ordered, and no drugs outside it will be sanctioned. The medical officers of the Unions are, it appears, to have no discretion in regard to the ordering of proprietary medicines, whether they are quack, so-called patents or not. A more useful part of the new rules provides for the periodical analysis of all medicines supplied. If some rule could be devised by which the prices for medicines could be submitted to experts, it would be no harm either. In tenders for the supplying of drugs to public institutions it is the complaint that a common practice is to estimate for the less commonly used drugs at prices much lower than they can be purchased by the contractors, and to "put it on" in the case of those in frequent demand. The Local Government Board would be doing a service if they could devise a scheme for putting an end to this system.

SEVERAL DRUGGISTS IN THE SOUTH were last week charged with selling linseed meal adulterated with ground linseed cake and foreign farinaceous matter, amongst them being Messrs. Quinlan and Nunan, of Newcastle West, who were each fined and condemned in costs.

DUBLIN HAS BEEN VISITED during the last few days by a representative of the P.A.T.A., whose mission is to consolidate the metropolitan pharmacists into a direct branch of the English brotherhood of chemists. Already there is a kindred association in Dublin, but it is worked on a more or less independent basis,

and it is to merge this Society into the parent organisation that the effort is being made. The next meeting of the Irish Association will be held in October, when the committee will report progress and draw up a code of rules for the future conduct of the body.

MR. H. C. BACKHOUSE, chemist and druggist, Dundalk, has been re-elected a member of the Harbour Board of that town.

FOR BEAUTIFUL ECCENTRICITY commend us to the Local Government Board, whose auditor has surcharged the Guardians of the Rathkeale Union the sum of £30 expended on medical appliances because the requisition therefor had not been made out in the proper form. The medical officer explained that time did not admit on the occasion to wait for the fortnightly meeting of the Dispensing Committee before ordering the articles, and that had he done so and the patient died in the interim he would have been liable to a criminal prosecution.

THE 'RATHMINES NEWS' is responsible for the statement that a syndicate has been formed for the purpose of starting a new wholesale drug and chemical establishment in Dublin, and that some of the best known and respected members of the trade are interested in the project. Up to the present the flotation has been kept a secret, and this is the first inkling of the matter received by the general body of pharmacists.

IN CONNECTION WITH THE TROUBLE recently in the Listowel Union over the selection of Mrs. English, pharmacist, Mullingar, as drug and medicine contractor to the workhouse, the Local Government Board, finding friendly advice and admonition thrown away, have written a sharp official letter, warning the guardians that if they appoint Mrs. English to be their contractor they must be prepared to abide by the consequences—a dire threat, only appreciated in its full import by those who have had legal experiences with the Local Government Board. The guardians have accepted the situation and have appointed the lady to be their contractor, but *nous allons*.

NEW REMEDIES.

TREATMENT OF PSORIASIS WITH HYDROGEN PEROXIDE.—A successful case is reported by E. Luton, in which a case of psoriasis was cured by washing with 20 per cent. hydrogen peroxide solution. Injections of 1 C.c. of the following mixture was also used and found eminently satisfactory: 10 per cent. sodium phosphate solution, 75 grammes; 20 per cent. peroxide of hydrogen solution, 25 grammes.—*Pharm. Centralh.*, xxxix., after *Les Nouveaux Remèdes*, 118.

PHOSPHOTE—Is the name given by J. Brissouet to a creosote compound which is obtained by the action of one molecule of phosphorus oxychloride on three molecules of creosote in the presence of an alkali. For instance, commercial sodium hydrate, 12, and creosote, 37, are mixed with water, 35, and gradually mixed in the cold with phosphorus oxychloride, 153. The oily product is well washed with water and diluted soda solution and then dried.—*Pharm. Ztg.*, xliii., 346, after *Ztschr. f. angew. Chem.*

AMMONIATED ACETANILIDE POWDER.—Acetanilide, 25; ammonium carbonate, 10; sodium bicarbonate, 5; milk sugar, 60. This hygroscopic powder is said to have a stimulating effect on the heart and circulation instead of the depression produced by acetanilide alone. It is employed in dysmenorrhœa, gastralgia, hyperacidity of stomach, and atonic dyspepsia.—*Zeit. d. allg. oest. Apoth. Ver.*, lii., 328, through *Apoth. Ztg.*

ARGENTAMINE IN OPHTHALMIC PRACTICE.—Hoor has employed argentamine in his clinic almost exclusively for several years in 328 cases of conjunctival diseases. In all cases good results were obtained and the remedy proved superior to silver nitrate, being less irritant, penetrating deeper, and acting more powerfully as an antiseptic. A five per cent. aqueous solution was employed, being painted on the surface or dropped into the eye twice daily. It may, if needed, be applied more frequently. Black stains produced by its use may be removed with potassium iodide.—*Therapist*, vii., 99, after *Wien Med. Woch.*

PHARMACEUTICAL SOCIETY OF IRELAND.

The monthly meeting of the Council was held on Wednesday, the 7th inst., at 67, Lower Mount Street, Dublin, at 3 o'clock. The PRESIDENT, Mr. R. J. Downes, was in the chair, and the other members who attended were the Vice-President (Mr. Beggs), Mr. Grindley (Treasurer), and Messrs. Wells, Kelly, Porter, Bernard, Conyngham, Hayes, and Dr. Walsh.—A letter of apology was read from Professor Tichborne.—The PRESIDENT reported that he attended the Health Congress, which had a very successful series of meetings in Dublin. Amongst the papers read was one by Professor Tichborne on the Food and Drugs Act, which was a matter of considerable interest, especially on account of the reference in the paper to the omission by the Government to provide in the recent Bill for the establishment of Boards of Reference, and the suggestion that there should be boards of administration for local purposes in different sections of the United Kingdom. He (the President) supported the recommendations of the paper. The paper also criticised the Local Government Board for not requiring the preparations of the new Pharmacopœia to be supplied to union workhouses, and it was interesting to be authoritatively informed that that work had been compiled as a book of reference exclusively with regard to the requirements of medical men and analysts, the pharmaceutical chemist being completely ignored. The paper which he (the President) read was very favourably received, and would be printed in the 'Proceedings of the Congress.' Professor Moore, who was in the chair at the sectional meeting at which his paper was read, pronounced it the most important that had been read in the section, and at once moved the adoption of the recommendations which it contained; the motion was seconded by Professor Thrift, and the recommendations were afterwards adopted at the final general meeting of the Congress, and would go forward with the weight of its approval to the Lord Chancellor of England and the Chief Secretary for Ireland, and would, he hoped, have some influence upon future legislation. The discussions on both papers were fully reported in the *Pharmaceutical Journal* and *British and Colonial Druggist*.—Mr. GRINDLEY moved that the paper read by the President at the Health Congress be inserted in the minutes.—Mr. WELLS seconded the motion.—Mr. CONYNGHAM thought that the motion should also apply to the paper read by Professor Tichborne at the Congress.—Mr. HAYES: Is it not unusual to enter papers read at other places on the minutes of the Council? Mr. WELLS: The President's paper was read at the request of the Council and on behalf of the Society.—Mr. HAYES said he did not mean in the slightest degree to undervalue the paper.—Mr. BERNARD: Would it not meet the difficulty to attach a copy of the paper to the minutes?—Mr. WELLS said that was what would be done.—Mr. KELLY, as having been present, referred to the favourable manner in which the President's paper was received by Professor Moore.—The motion was then put and unanimously agreed to.

BRITISH PHARMACEUTICAL CONFERENCE.

—The VICE-PRESIDENT reported on behalf of the delegates to the British Pharmaceutical Conference. The Council were well represented by Messrs. Conyngham, Wells, Kelly, Dr. Walsh, O'Connor, Johnston, and Montgomery. They were very well treated and had a most enjoyable time; and as far as he could see the relations between the members of the Conference were harmony itself. All seemed to take a deep interest in the papers that were read, and the lecture halls were well attended every morning.—Mr. CONYNGHAM: I think the papers were above the average in point of merit.—Mr. WELLS said very good papers were contributed by Mr. Kelly and Mr. Doran, and the pharmaceutical papers were put off to the end in order that the discussions upon them might be as full as possible.—The PRESIDENT said he had received the following letter, which he thought should be read to the Council:—

14, Hardman Street, Liverpool,
September 1, 1898.

Dear Sir,—I regret that we had not the pleasure of your company at Belfast during the Conference week, but no doubt you will have gathered that the meeting was a most successful and pleasant one. I have requested Messrs. Lafayette and Co. to send addressed to you a photograph of the Conference group, and trust it will be the pleasure of your Council to accept the same from me as a memento of the recent meeting in Ireland, and of the courtesy shown to us on that occasion.

Believe me,
Dear sir,
Faithfully yours,

R. J. Downes, Esq.

CHARLES SYMES.

He (the President) wrote in reply to Dr. Symes, saying that he should have great pleasure in placing his letter and the photograph before the Council, by whom he was certain that they would be received and acknowledged with thanks.—Mr. CONYNGHAM moved that the photograph be received, and that the best thanks of the Council be returned to Dr. Symes.—The VICE-PRESIDENT seconded the motion, which was unanimously agreed to.

PHOTOGRAPHS OF PAST PRESIDENTS.

Mr. BERNARD said that some time since a wish was expressed by members of the Council to have photographs of former Presidents of the Society; and in consequence he wrote to Lady Martin, who was a daughter of the late Sir Dominic Corrigan, Bart., and she had been kind enough to present to the Council the fine engraving of the first President of the Society which the members had now before them. He had great pleasure in moving that the best thanks of the Council be tendered to Lady Martin for the engraving and that it be suitably framed.—The VICE-PRESIDENT seconded the motion, which was unanimously agreed to.—The PRESIDENT remarked that they had only a sketch likeness of Dr. Aquila Smith, another of their Presidents. He thought the collection of portraits should include their first treasurer, Mr. Hodgson.—The VICE-PRESIDENT: Certainly. He took the deepest interest in the Society from the very first.

CERTIFICATES.

A letter from Mr. Richard Hobson, of London, asked the Council to accept certificates of a six months' course of lectures attended by him in the Westminster College of Chemistry and Pharmacy. The writer stated that he had only recently become aware that that college was not one of the institutions whose certificates were recognised by the Society; and he added that its certificates were accepted by the Pharmaceutical Society of Great Britain, the College of Surgeons, and other examining bodies in England.—The PRESIDENT: We have never granted applications of this sort. We have only granted applications for recognition made on the part of the school itself.—Mr. WELLS: I think that college applied to us, and we would not put it on the list.—VICE-PRESIDENT: Have we not passed a resolution that we will not increase the number of schools whose certificates we recognise?—Mr. HAYES said that applications like the present on the part of individuals had been granted before. What did the bye-law say?—Mr. WELLS: We may add any school we like.—Mr. HAYES: But can we not recognise an application unless the school has been added?—Mr. WELLS: No.—Mr. HAYES said the Westminster College was one of the best schools in England.—Mr. CONYNGHAM: We should not be bound by too strict a law in the matter. We are here for the advantage of the public and of students.—Mr. WELLS: The answer to that is that we have in past times put schools on our list that afterwards turned out not to be up to our standard, and we have no control over any of the schools that we recognise.—The PRESIDENT: I do not think we should accede to an application of this sort from an individual.—The application was refused.—A letter from Dr. David Huey submitted a certificate from the Apothecaries' Hall, and asked that he should be registered as a pharmaceutical chemist.—The application was refused, the Council holding that the applicant's qualification was insufficient.

DONATIONS OF BOOKS.

Donations were received from Mr. W. Martindale, of a copy of the 'Extra Pharmacopœia,' and from the United States Department of Agriculture of a copy of a Bulletin on the Principal Poisonous Plants of the United States.—On the motion of Mr. GRINDLEY, seconded by Mr. WELLS, thanks were voted to the donors.

ELECTION OF EXAMINERS.

On the motion of the VICE-PRESIDENT, seconded by Mr. WELLS, Dr. M. R. WHITLA was re-elected Examiner for the Practical Pharmacy Division of the Licence Examination.—An election was held of an Examiner to conduct the Pharmaceutical and General Chemistry Division of the Licence Examination. There were ten candidates.—On the motion of Dr. WALSH, seconded by Mr. CONYNGHAM, Mr. A. Forbes Watson, B.Sc., of Westmoreland Street, Dublin, was elected.—The PRESIDENT then brought forward a series of resolutions for the purpose of

AMENDING THE REGULATIONS RELATING TO THE ANNUAL MEETING,

with the result, after a short discussion, that the following

amendments were agreed to. The concluding sentence of Regulation 4 relating to the voting papers now reads:—

Each paper is to contain the names of the outgoing members of Council eligible for re-election and of those nominated under Regulation 9.

To Regulation 5 there has been added:—

Should a voter initial more than seven names his paper shall be cancelled. The Scrutineers of the ballot shall be two members of the Council nominated at the September meeting, with the President or Vice-President and the proposer or seconder of each new candidate. They shall meet at twelve o'clock on the day of the annual meeting to count the votes and deliver to the Registrar a record of the voting. The names of the elected shall be declared by the President at the annual meeting.

TIME OF EXAMINATIONS.

—The PRESIDENT moved a resolution standing in the name of Professor Tichborne that in future all the examinations should commence at 10 o'clock a.m.—Mr. WELLS thought it would be a hardship to oblige candidates to come up from the country the night before the first day of examination.—Mr. HAYES was of a similar opinion.—The proposal was not pressed.—A motion of the PRESIDENT to alter the hour for commencing the Preliminary examination fell through, not being seconded.

ELECTION OF MEMBERS AND ASSOCIATES.

—On the motion of Mr. GRINDLEY, seconded by Mr. WELLS, the following were elected members of the Society:—Mr. John Armstedt Ray, Rathgar, Dublin; and Mr. John Marlborough Whelan, Galway.—The following were nominated for membership:—Mr. James B. Bolger, Maryborough; Mr. John Cope-thorne, Skibbereen; Mr. William J. Savage, Newry; Mr. J. C. Payne, Belfast; and Mr. H. R. Rutherford, Ballybay.—On the motion of Mr. GRINDLEY, seconded by Mr. WELLS, the following were elected associate druggists:—Mr. Thomas Dunning, Kille-naule; and Mr. James Moughty, Ballinacargy.—The Council then adjourned.

EXTRACTS FROM CONSULAR REPORTS.

THE CHEMICAL PRODUCTS imported into St. Petersburg during 1897, owing to the development of native production, were supplied in considerably diminished quantities, the value in 1896 being £1,483,000, whereas in the following year the import only realised £1,352,000, a reduction of £131,000. The importation of such articles as sulphuric acid and soda, classified under the above heading, however, was greater than in 1896. The recent abolition of customs duties on chemical products and various agricultural implements, Consul-General Michell thinks, should result in a larger importation of these articles into Russia, and should not be lost sight of by British manufacturers.

THE PEOPLE OF BARBADOS are hoping that the Manjak industry, which is at present in its infancy, may tend to help the island out of its industrial troubles. "Manjak" is a bituminous substance, and is a species of asphalt. It varies in quality, being sold to local agents at from £3 10s. to £7 10s. per ton. The less valuable kinds of manjak are used for insulating purposes, but the superior qualities are said to be chiefly used for varnish. The export has risen from 878 tons in 1896, to 1880 tons in 1897, and it is hoped that in the future manjak may become an important item of export, and provide fresh employment to the overflowing population of the island.

THE STOCK OF OLIVE OIL at Gallipoli on June 30, 1897, was 3750 Imperial tuns, while on the same date this year it stood at 1800 Imperial tuns. The price per gallon of oil of the first quality on the first-named date is stated to have been £31 10s., and on June 30, 1898, £35 15s.

THE SULPHUR INDUSTRY at the Oliveto Citra mines, in the province of Salerno, Italy, has suffered greatly of late years owing to the use of explosives other than gunpowder, but recently there has been a boom in this mineral owing to its use in making chemical wood-pulp for paper-mills. The boom has inspired confidence in the owners of the mines, and they consider themselves justified in inviting foreign capital to extend their undertaking. The large amount of sulphur used in the immediate and surrounding country for agricultural purposes forms in itself a considerable

local market for the company's output. The chemical analysis of samples from the mines give from 60 to 75 per cent. of pure sulphur, which has been found to be very easily reducible to an impalpable powder.

BRITISH MEDICAL MEN and other foreign practitioners are evidently not wanted by the authorities in Italy. The Italian law states that "Foreign physicians and surgeons with diplomas of any university or foreign medical school have the right to exercise their profession among all foreigners inhabiting the kingdom without even having to register their titles in the municipal office where they reside, but they must exhibit their diplomas when required to do so by the local authorities." Thus a British medical man may attend strangers residing in or visiting Italy, but may not attend Italians unless he chooses to qualify as an Italian doctor. The delegates of the Italian medical associations at their meeting in Rome passed resolutions to the effect (1) That all foreign medical men who desire to practise in Italy must undergo all the examinations required by the present University regulations from the students of the Medico-Chirurgical Faculty by which they acquire the diploma for practice. (2) That a strict revision of the individual diploma of the present foreign medical practitioners be made, and efficacious oversight be kept over them to see that they do not practise, except among their own countrymen.

AS CONSUL NEVILLE-ROLFE points out, if these resolutions ever become law British medical practitioners must acquire sufficient knowledge of Italian to pass the medical and surgical examinations, which is no easy matter. Then the words "among his own countrymen" would narrow a man's practice down to a much lower level than the existing Act, which allows him to practise with the subjects or citizens of all the powers except Italy. The same delegates, when at Rome, also stated that there are 1500 foreign medical men practising in Italy. This, according to the British Consul, is an absurd figure, for, assuming that there are ten nationalities represented, and that all of them had as many representatives practising in Italy as Great Britain, viz., 29 (which is notoriously not the case), they would then only amount to 290.

ANOTHER MEDICAL GRIEVANCE in Italy is the way in which British doctors are assessed for income tax. A case recently came before the British Consulate, where the Syndic of a small neighbouring town, himself a doctor, caused his British colleague to receive a demand note for 230 lire for income tax. The Britisher lives in an hotel in the town and picks up an occasional fee, but it is predicated that his professional income cannot be sufficient to meet his expenses, which must be provided for out of his private means, which are not liable to the Italian income tax. His only resource is to pay and appeal, when, if an abatement is obtained, its amount will be swallowed up in costs, and the Syndic will triumph over his colleague, whom he looks upon as a poacher on his preserves.

ORANGES AND ESSENTIAL OIL, owing to the frost which greatly damaged the orange produce of Florida and to the scanty crop in Spain in 1897, commands the highest price ever known at Reggio, Italy, especially the orange fruit, which reached £3 per 1000 fruit, while the essential oil was sold at 6s. 6d. per lb. Olive oil sold at £5 5s. per 100 kilos., as against £3 10s. for the same quantity sold the previous year.

THE SPONGE FISHERIES at Castellamare were so fortunate during the year 1897, and were able to pay so good a dividend, that next season the number of fishing boats will be nearly doubled.

RUSSIAN VITICULTURISTS, farmers, fruit-growers and sugar beet-root growers have lately been giving special attention to the benefits accruing from the use of Chilian nitrate of soda. The newspapers in both North and South Russia have published articles on the subject, while an active propaganda by means of circulars and pamphlets is reported to be spreading throughout the country. According to the report of Acting-Consul General Mackie, orders in the rapidly-growing trade in nitrates are going almost exclusively to Germany, where Russians find they can buy on three or six months' credit as cheaply as they can from England upon cash against bills of lading, otherwise the Russians prefer to do business with English firms.

LETTERS TO THE EDITOR.

All Communications for the 'Pharmaceutical Journal' must be Addressed to the Editor, 17, Bloomsbury Square, London, W.C., and not in any case to individuals supposed to be connected with the Editorial Staff no responsibility can be accepted unless this rule be observed. Communications for the Current Week's Journal should reach the Office not later than Wednesday, but news can be Received by Telegraph until 4 p.m. on Thursday.

THE BRITISH PHARMACOPEIA, 1898.

Sir,—In perusing the new B.P., I observed the following apparent omissions and errors.

1. It is not stated under acid. lactic. and acid. phosph. concent. that the percentage strength is "by weight." This is expressly done in the case of every other acid, both strong and diluted.

2. Creosote is stated to be "freely soluble in . . . glycerin," and to "rotate the plane of a ray of polarised light to the left." These are directly the reverse of its previous "characters."

3. Liq. Calcis Sacch. In this preparation the calc. hydroxide is not directed to be washed and consequently the presence of chlorides is disregarded.

Now that the sugar is used in solution the washing of the hydroxide would bring the two liquors into line as regards purity. Why chlorides are objectionable in liquor calcis and not in liquor calcis sacch. seems an anomaly.

4. Potass. Sulphas. Under "tests" it says "It should yield no characteristic reaction with the tests for . . . chlorides or nitrates, and only the slightest reactions with the tests for chlorides." The first "chlorides" should be carbonates, I think, as under sod. sulphas, where the tests are practically the same.

5. Tr. Pruni Virg.—If this tincture is to be 1 in 5 no allowance has been made for the condensation of the water and alcohol, as has been done in every case (except tr. quin. amm.), where a condensed menstruum is not ordered.

I only observed one typographical omission. It occurs in the description of capsicum. As a literary production the 1898 Pharmacopœia is a distinct advance on that of 1885, which was teeming with errors and omissions.

Glasgow, September 8, 1898.

THOMAS DUNLOP.

THE VARNISH FOR PILULA PHOSPHORI, B.P., 1898.

Sir,—Under the head of "Pilula Phosphori, B.P., 1898," we are instructed to varnish the resulting pills, but in no place in the book is there mentioned what kind of varnish should be used. This is an important omission, for a common pill varnish which is much used by dispensers is made by dissolving sandarac or spent-tolu balsam (residue after making the syrupus toltanus) in ether, and I have seen repeated failures to obtain good-looking pills when this solution has been used. It exercises a solvent action upon them and is very penetrating. Would it not have been better to have stated that a varnish made with an alcohol solvent should be used? When covered with a suitable varnish I believe that these pills are to be preferred to those which are covered with "plaster."

Birmingham, September 12, 1898.

F. H. ALCOCK.

BITARTRATE OF POTASSIUM AND THE B.P., 1898.

Sir,—The molecular weight of bitartrate of potassium is 186.75 (calculating from the 1898 B.P. atomic weights). The B.P. says: "Each gramme of the dry salt should require for neutralisation at least 5.2 cubic centimetres of the volumetric solution of sodium hydroxide." ∴ $186.75 \times 5.2 = 97.11$ per cent. bitartrate of potassium, and yet, in the same paragraph, this figure is contradicted, as follows: "The total amount of impurities should not exceed $2\frac{1}{2}$ per cent. of the dried salt." We therefore have two limits allowed by the 1898 B.P., 97.11 per cent. and 97.5 per cent., differing by 0.39 per cent., and the question arises which of these is to be taken as the correct limit?

Liverpool, September 10, 1898.

EDWIN DOWZARD.

OBITUARY.

BURGESS.—On September 9, James Stanley Burgess, Chemist and Druggist, Salford. Aged 52.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Colloidal Gold.

By reducing a faintly alkaline solution of a gold salt with formaldehyde solution, and then submitting it to dialysis, Zzigmody has succeeded in obtaining gold in a colloidal condition. It is soluble in water, forming a ruby-red solution which leaves a brilliant residue of gold on evaporation. The metal is precipitated on the addition of sodium chloride, and is deposited on the positive pole on submitting the liquid to electrolysis.—*Chem. Zeit.*, xii., 332.

By condensing with dimethylaniline the ethylal or methylal produced on oxidising methyl alcohol mixtures of ethylic or methylic alcohols with potassium bichromate and sulphuric acid.

A. Trillat obtains from the latter tetra-methyl-diamido-diphenylmethane, which, on oxidation, gives a persistent blue colour, becoming more intense on warming. Ethylic alcohol gives a body which, under like conditions, gives a blue colour that is fugitive on warming. The detection of methyl alcohol in spirit, based on these reactions, is conducted as follows: Twenty C.c. of the alcohol are mixed in a flask with 300 C.c. of distilled water and 30 Gm. of potassium dichromate. When cold 100 Gm. of 20 per cent. sulphuric acid are added, and the mixture, after standing for an hour, is distilled, the first fraction being rejected. The distillate is exactly neutralised with soda, and again distilled almost to dryness. The distillate is diluted to 400 C.c.; 100 C.c. of this is taken and introduced into a small flask with 2 C.c. of pure dimethyl-aniline and 1 C.c. of 10 per cent. sulphuric acid. The flask is hermetically sealed and heated on the water bath to 65° to 70° C. for five hours. The liquid is then made alkaline and excess of dimethyl-aniline driven off with a current of steam. A small portion of the liquid is then acidulated with acetic acid and oxidised by means of lead dioxide suspended in water.—*Comptes rendus*, cxxvii., 234.

Bacteria and Dust.

Ncisser has lately published the results of an interesting research on the dispersing of pathogenic organisms by means of minute currents of air below that of a sensible current. He finds that the bacilli of diphtheria, typhoid, plague, cholera, and pneumonia are incapable of being carried as atmospheric dust. *Staphylococcus pyogenes aureus*, and *B. pyogenes*, *B. anthracis*, *B. tuberculosis*, are, however, capable of being so conveyed. These results have an important bearing on the question of efficient disinfection.—*Journ. State Med.*, vi. 310, and 330.

Iron in Plants.

Some years ago Molisch showed that the prevailing opinion that iron was an essential constituent of chlorophyll was incorrect, and Stoklasa later demonstrated that iron is not present in chloro-lecithin. The latter investigator now finds that the metal exists in the plants in the form of an organic compound, which possesses similar properties and constituents to the hæmatogen of animals, as isolated by Bunge. It is, however, richer in iron than that body. Originally it is chiefly stored up in the embryo or endosperm. During germination it is drawn upon to form the nucleus of the cells of the young organs; after this the plant procures it from its environment, and if it be deprived of the metal it dies. In those plants grown in a medium free from iron no vegetable hæmatogen can be detected. The

presence of iron in the nutritive pabulum is as essential to the chlorophyll-free fungi as to highly developed plants, and is, like phosphorus, an essential constituent of the cellular nucleus.—*Comptes rendus*, cxxvii., 232.

Therapeutic Activity of Ergot.

E. M. Houghton states in the course of a communication to the Michigan State Medical Society on a proprietary preparation of ergot, "ergot aseptic," that much of the ergot of commerce is deficient in active principles. He confirms the statement of Kobert and Gruenfeld that the most satisfactory test of the activity of the drug is that obtained by means of feeding fowls with it. When the drug is active, a very marked darkening of the combs and wattles is produced in fowls thus fed, and ultimately gangrene and sloughing off of these parts result. By this test the author finds that from 50 to 75 per cent. of the drug or its preparations are unfit for medicinal use. During the past three years he has examined several hundred samples by this method, and has rejected as more or less inert those representing in the aggregate two thousand pounds of the drug.—*Therapeut. Gazette* [3], xiv., 433.

M. de Toledo advocates this simple method of preparing bougies without the use of a urethral mould. The drug, iodoform for example, is massed in the ordinary way with powdered gum acacia and honey, to form a stiff mass,

which is weighed out into 1 gramme pieces and then rolled out into pointed cylinders on the pill machine in the ordinary way. In the meanwhile equal parts of white wax and cacao butter are melted together in a test tube; the bougies are impaled on a needle, plunged into the melted wax and withdrawn, finally cooled on a plate. The result is a bougie of firm consistence which is easy to use.—*L'Union Pharm.*, xxxix., 337.

Tunisian Beeswax.

From the results obtained from the examination of a large number of specimens of genuine Tunisian beeswax, Bertainchand and Marcille (*Bullet. de la Direction de l'Agricult. et du Commerce de la Régence*) find that this product gives analytical figures which show considerable divergence from the accepted standards for English and French beeswax, both in the free acid number and ester number and the iodine absorption. In thirty-three samples examined the lowest and highest figures obtained in each of these critical tests were: Free acid number, 17.4 to 20.6; ester number, 69.7 to 70.5; iodine absorption index, 6.7 to 17.12. The lowest melting point was 61° C., the highest 64° C.; in specific gravity the specimens ranged from 0.9685 to 0.972. From these data the waxes, although perfectly pure, would be regarded as adulterated if judged by the accepted standards.—*Moniteur Scient.* [4], xii., 533.

Iodo-Spongine.

Harnack finds that iodine occurs in common sponges in the form of an albuminous compound, the yield being 1.5 to 1.6 per cent. Iodo-spongine is obtained by macerating sponge for eight days in a 38 per cent. sulphuric acid in the cold. After this time the sponge is entirely disintegrated, leaving only a pulverulent residue. This is dissolved in soda solution, and precipitated with acid. It is then dissolved in ammonia, again precipitated by saturation with ammonia sulphate. The precipitate is purified by dialysis. Iodo-spongine is a light powder turning brownish black in the air. It is insoluble in water, sparingly soluble in alcohol, but readily dissolved by alkalis and ammonia, from which solutions it may be reprecipitated by acids and ammonium sulphate.—*Pharm. centr.*, xxxix., 451., after *Zeit. f. physiolog. Chem.*, xxiv., 570.

NOTES ON THE PHARMACOPŒIA OF 1898.

BY JOHN MOSS, F.I.C., F.C.S.

I purpose to offer the following observations as suggested for the most part by the discussion at the close of the Belfast Conference, when a tendency to partial views was noticeable, as of the wholesaler, or retailer, or dispenser. The more useful view is that of the pharmacist, which includes all three.

I take a pharmacopœia to be a register of remedies which medical men desire to prescribe. What it is and what it contains besides this, contribute to the realising of the dominant idea which makes such a register necessary—the desire for accuracy and uniformity in the remedies. To secure these two ends, the formulæ and instructions, the characters and tests are given; so that wherever the Pharmacopœia has its course medical men may obtain or prescribe and dispensers shall compound, remedies of the same nature, strength and appearance, under the same name. The most highly developed and specialised pharmacopœia, that which is simplest and most efficient for its purposes as a register, is the one which excludes most effectively all matters not essential to secure this end of uniformity. The pharmacopœia which best corresponds to this description is our own—the British Pharmacopœia—and we need not share the regret sometimes expressed that this volume does not more closely resemble certain others which, monuments of industry and erudition though they are, extend far beyond the lines of the above definition, and include matters which are more properly treated of in the text-books.

It is solely the prerogative of the medical man to say what remedies shall or shall not be included in the Pharmacopœia. Until recent years it would be admitted also that his instructions for the preparation of such remedies as require manipulation should be final, because previous to that time he was a better pharmacist than the druggist of the day. *De facto* his instructions are final now, but he recognises that the druggist has developed into the pharmacist, thanks to the fostering care of the Pharmaceutical Society, and he is ready to acknowledge the skill of the pharmacist as chemist, or botanist, or commercial man, and to take advantage of it in perfecting his Pharmacopœia. He admits the pharmacist to be his superior in devising new processes and improving existing ones; an admission which concedes the power and the right to criticise his own work in the past. He has not yet reached the point in this country of regarding and working with the pharmacist as *collaborateur*, but graciously condescends to accept, utilise, and acknowledge his services as those of an unpaid assistant. There is reason to hope that the relative position of medical man and pharmacist will be altered before the next British Pharmacopœia is issued, by such an arrangement as will give the latter an equal standing with the former, so far as his special work is concerned. The presenting of this claim firmly and respectfully is due to himself and the nation, and when conceded a national medicine book will be produced which shall have the authority of perfection, as well as of position.

Though the pharmacist may not say that a certain medicine shall be in the Pharmacopœia, it is quite proper for him to express a desire that instructions may be furnished for a remedy in general use, for which otherwise no recognised standard exists. That the book would be made more bulky is not to the point; compound syrup of the hypophosphites is very largely used, and that something worse than inconvenience has not resulted from the want of a standard is due to the loyalty of pharmacists to the formula published by their own Conference. Further, the pharmacist has exceptional facilities for acquiring information as to what remedies are most used in his own district, and what others have fallen into desuetude.

A pharmacopœia should be printed and issued before it acquires the force of law—say three or six months—so that medical men and pharmacists may become acquainted with its contents. That pharmacists should be liable to prosecution the very day the British Pharmacopœia is published, because they have not changed their stocks in conformity with it, is an intolerable absurdity. That it should be possible for those who are bound by it to discuss the date when it becomes operative, and each decide on a different one, is childishly absurd. If the above suggestions were adopted no temptations would remain to try the weakness of trade members of a pharmacopœia committee. The march of medicine and surgery calls for more frequent revision than sufficed formerly, and ten years hence would seem to be quite long enough to wait for the next volume.

Mr. Lloyd Howard's plea that greater consideration for the manufacturing chemist should be shown in the Pharmacopœia was as entertaining as his general remarks were interesting and instructive. If any producer has been too indulgently considered in the past it is the maker of Rochelle salt, Epsom salts, quinine, and camphor. Substances manufactured on a large scale, especially if they have an important use outside medicine, have in the past been taken by the Pharmacopœia constructors as found in commerce, and such characters and tests as applied have been attached to them. But there are several instances of manufacturers having been worked up to a higher standard of excellence by a pharmacopœia, just as there are instances known to Mr. Howard of chemical manufactures such as will satisfy any pharmacopœial requirements. Perhaps Mr. Howard, though, was generously pleading for those not so well placed as his own firm.

Mr. Martindale's remarks on "limits of adulteration" are contrary to the general sense of the community, which demands that though natural products (he instanced milk) may vary, the variation shall be natural and within reasonable and narrow limits. "Limits of adulteration" is thus seen to be a phrase which the impracticable purist uses to prejudice honest production, as was well shown in anticipation by Mr. Lloyd Howard.

The Pharmacopœial directions to evaporate extract of cascara "to dryness" are indefinite, and have given rise to question and debate. They should be supplemented by the words "and reduce to powder." A hard dry extract has inconveniences which do not pertain to the powder.

Liquid extract of cascara, or rather the new process for it, has been fortunate enough to secure unstinted and general approval. I see no reason for disagreeing with this, notwithstanding Mr. Martindale, who, while prominently associating my name with it, furnishes an exception and stands crying in the wilderness, with unheeded reiteration, that the preparation is not a good one. No man hearkens to his voice. If an alternative formula has been suggested, the approval and choice of the Committee have been withheld therefrom. We may pass the assumption contained in his words "a drug which depended for a good deal of its activity on its resinous matter," and consider the further one involved by the recommendation "should have a better solvent than distilled water as a vehicle for exhausting it." Is there a better solvent than distilled water? Mr. Martindale would prefer 20 per cent. alcohol, but where is his evidence that it is a better solvent? This is a matter of observation, not of preference or of opinion, and Mr. Martindale can easily satisfy himself of what I stated many years ago that water will completely exhaust cascara. Mr. Bird supported this the other day. After having exhausted over one hundred tons of cascara, I can confirm previous observations, by again saying that "after the bark is exhausted with cold water proof spirit will remove nothing more from it." Cold water will, there-

fore, remove everything that proof (or a weaker) spirit will remove. A spirituous menstruum, whether strong or weak, will remove nothing from cascara after exhaustion with water. Let Mr. Martindale try this and he will agree with me that liquid extract of cascara prepared by the present B.P. process realises the definition, "bark minus woody fibre," a phrase which the late Mr. Schacht made use of to describe the desideratum in the preparation of ext. cinchonæ liq.

In the very next observation (reported *P.J.*, August 20, p. 235), Mr. Martindale is delightfully inconsistent. He is meeting the complaint that in preparing liquid extract of belladonna the root is not fully exhausted. He demands what is the use of exhausting any drug when the game is not worth the candle? (Another assumption, by the way.) According to him, it is so absolutely essential that cascara should be exhausted that the solvent now used (which does exhaust it) should be replaced by a better solvent, whilst belladonna (a poisonous drug) is so unimportant that it does not matter about exhausting it.

I appear to have been very fortunate in my experience with liquid extract of liquorice. I know of no instance in which this preparation of the B.P., 1885, has in any way gone wrong, either at home or when exported, so that the increase in spirit seems unnecessary.

After having exhausted a very fair quantity of ipecac. root, I have no hesitation in saying that the strength of alkaloid required corresponds very closely with a pound of drug to a pound of liquid extract. Just before the Conference meeting, a seron of root was converted into extract. In the test room this gave 0.417 gramme of alkaloid from 20 C.c., or 2.085 grammes in 100 C.c.; re-solution and again shaking out with chloroform caused no difference. This is within the limits permitted by the Pharmacopœia. (By the way, would Mr. Martindale call these "limits of adulteration"? and can he shirk his responsibility for the Pharmacopœia permission?) Having compared the B.P. process for testing ipecac., and the excellent modification of the same by Mr. Harold Wilson published in your pages, I may say that I greatly prefer the latter. It yields the alkaloids in a more pure condition, with greater accuracy and expedition.

PHOTO-MICROGRAPHY.—VII.

(Continued from page 330)

BY EDMUND J. SPITTA, L.R.C.P. LOND., M.R.C.S. ENG., F.R.A.S.

Whilst the negative is fixing let us go back to the consideration of the plate which, we will suppose, was over-exposed, lying in the developer to which we have added the extra bromide. It has been soaking, we will presume, all the while. The developer is rocked to and fro until we begin to find the back of the plate turning slightly grey, the front of it having long ago turned black. At this juncture development must be stopped and the negative washed, or it may become so dense that the gas flame cannot be seen through it when taken out of the "hypo."

Great judgment is required to know how long to let the plate soak in this highly restrained developer, and it is not at all impossible the tyro will find his patience very severely taxed before learning how to save a plate having received too long an exposure, and it is an art to do this well in extreme cases. All negatives should be left in the hypo some little time—say five minutes—after the last trace of yellowness has vanished. Let us now examine our negative in front of a gas flame with a piece of ground glass interposed between the two—the flame and the negative. If the exposure and development have been correct the proboscis should be very clearly shown upon a black background, and if the focussing has been perfectly carried out, the

little hairs protruding from the lobes of the organ should be quite plainly seen sharply defined; so, too, ought the edges of the suctorial tubes, as well as the small hairs when looked at through the focussing glass, applied, of course, to the back of the negative. It should be noted that as the proboscis itself is not absolutely flat it is impossible for the whole of the object to be absolutely in one and the same focus. Should, however, the negative appear choked and the clear portions of glass between the rings of the suctorial tubes overcast with shadow—blotted out, in fact—and the background so pitch dark that the gas flame can scarcely be seen through it, we know that one of two things has taken place, either we have over-exposed our plate or else we have over-developed it—perhaps both. One other alternative may possibly be seen, a faint or perhaps a fairly defined image of the proboscis, visible upon a background far too transparent. This is a common fault and it occurs most frequently to those commencing. It produces a positive with a muddy background superimposed, upon which lies the image of the proboscis faintly and sickly defined. This arises from under-exposure, and nothing I know of will cure it save taking another picture.

Supposing we wish to save a picture which is overcast and evidently over-exposed or developed, we may do so in a great measure by allowing it to dry after washing a couple of hours in water, to rid it of its hypo, and then again placing it in water for a few minutes while we are preparing the thinning solution. Of these there are many, and each photographer may be said to have his pet formula; the one I prefer at this stage is that adopted by most photographers in the trade. It is simple enough to make, and efficacious to use, but, seeing it is desperately poisonous, must be handled with extreme care, and the operator must be provided with an indiarubber finger-stall for any finger with a hang-nail or open scratch. To make the solution one proceeds as follows: Place one or two pieces, about the size of a very small marble, of cyanide of potassium in about 1 oz. of water in a measure, and when dissolved or nearly so, add 20 or 30 drops of a very concentrated solution of iodine in spirits of wine. The brown solution of the iodine instantly disappears as it is added to the cyanide. The iodine solution must be very strong, at least three or four times that of the liq. iodi of the British Pharmacopœia. Having stirred well with a stirrer, the quarter-plate negative is placed in a half-plate dish, in which enough water has been added to just cover the plate. A fresh measure is then taken, the water out of the dish emptied into it and about a teaspoonful of the cyanide cum iodi solution added. The newly mixed solution is then poured over the plate as it lies in the half-plate dish and the effect carefully watched. If too strong the thinning will proceed at an alarming rate, and the negative must be taken out and washed in water or it will be completely destroyed. It is therefore well to proceed with some caution, adding but little of the cyanide solution at first until the learner has acquired a little experience. Directly it is lifted out, and before looked at, the plate should be rinsed very freely in water, for if not, streaks will be immediately formed where the fluid runs down the gelatin, which cannot possibly be removed. This precaution should certainly not be forgotten. After thorough rinsing hold it up to the light with the ground glass between it and the flame, and let the operator make up his mind whether he thinks it sufficiently thinned or not. If not, the process must be renewed; if sufficiently reduced return it to the sink, where it should have at least one or two hours' good washing, besides a gentle rubbing over the surface of the film as it lies under water with a piece of cotton wool. It is not a little curious that stains may arise which hopelessly spoil the final result at this stage if the washing be neglected, and therefore,

the operator is cautioned not to leave this portion of the treatment to chance.

If the photographer elects to thin the negative before the washing after fixing—that is to say, directly he has taken the plate out of the hypo bath—he may proceed as follows: The quarter-plate negative is placed in a half-plate dish and covered with water; this is returned to a measure, to which is added about a tablespoonful of the concentrated solution of hypo already mentioned and about a drachm of a solution of ferricyanide of potassium (150 grains to 20 ounces of water). When mixed thoroughly this solution is flooded over the negative, taking care not to pour it all over one portion of the same, as by so doing it is possible that that portion so treated will be more thinned than the rest. After a few seconds the film will appear more transparent, and if this process proceeds too rapidly the solution should be diluted with an equal bulk of water. Let the operator, until he gains experience, be careful to rinse the negative under the tap each time before he holds it up to examine it before the gas lamp, lest perchance his solution runs in tears down the negative. If it does this, streaks will be formed down the picture which will hopelessly spoil it. A good washing for two hours is necessary to eliminate the hypo, and let the plate be gently rubbed with cotton wool soaked in water before taking it out to dry.

The negative dried, we wish now to take a print. It is done as follows. Seeing that most of my readers may very possibly conduct their photography at evening time rather than during the day, I will describe first how to take a print on paper which can be exposed—perhaps requiring only half a minute—in front of a gas light. I refer to an excellent paper for all photo-micrographical work, namely, that sold under the name of Eastman's Nikko paper. There is not space here to describe many varieties of bromide paper, but having tried most of them, I have found that ordinary bromide paper gives too coarse a grain, and does not seem able to give the minute details which are readily shown with the Nikko. Taking a piece out of its case (of course in the dark room, one ruby fabric), it is laid face downwards on the negative placed in an ordinary printing frame. Advancing to a naked gas light, with the face of the printing frame resting against the coat, it is placed—the face of the negative—in front of the light at a distance of one foot, moving it in that plane up and down or in a circular motion, so that the bright part of the flame strikes upon all parts of the negative equally. If this be not done, it is very probable that the print will be unequally exposed, and the final result will appear uneven. One point must here be mentioned; it occasionally happens that a very good negative has been obtained so far as applies to the object, perhaps a most difficult diatom, but the light, through some oversight, or perhaps through a small portion of the lime spurting off during exposure, is not equal all over the plate, a most provoking occurrence; but it can, if not too bad, be readily remedied. Whilst exposing the print before the gas it is not difficult to hold a blackened card in such a manner as to shade the thinner part, whilst allowing the denser portion to be exposed. This requires a little practice, more especially to know how much more exposure the denser portion should have. Then, too, the card must not be held still but kept moving over the picture, otherwise a line of demarcation, hard and defined, will inevitably result across it at the junction of the covered and uncovered portions.

Having now exposed our print what we think a sufficient time (with a good negative of a proboscis it will probably only want from twenty to forty seconds), we at once return to the dark room, take out the paper, and immerse it in water, taking care that the whole of the paper is thoroughly covered. After a few

seconds, say about ten, the paper will stretch itself out, and this indicates it is ready for the developer. The water is drained off thoroughly, and the print placed paper side down upon the dish. Equal parts of the hydroquinone and soda developer (about half an ounce of each is sufficient for a quarter-plate print) are then flowed over it. After a few seconds, much quicker than in the case of the negative, a positive image comes into view. The photographer must keep his eye now fixed upon the picture and not let his attention be attracted to anything else. It should be developed till all the details of the image are well out, and then the developer instantly poured off and the picture allowed to drain for a few seconds, say five; in which interval, if he notices, he will detect a grey look coming over the whole print, which he is apt to think will spoil it. This is not so, for after washing well and placing in the hypo, such greyness entirely disappears, leaving a beautifully black and crisp image. Perhaps, on looking at the picture, it may be brown, although it appeared most beautifully black in the dark room. This is mostly due to one fault—over-exposure; remedy, try half the time. If, however, there is still a brownness, although the print is evidently under-exposed, the operator has made some mistake in the mixture of the solutions or has forgotten to shake up the soda solution before using. It may be here stated that this developing solution can be used over and over again on the same evening taking care to add equal parts of soda and hydroquinone to fill up the deficiency which will take place after developing each print. Browning or greying of the print which is properly exposed may sometimes arise from neglecting to keep up the strength of the solutions.

Having washed the print for fifteen to twenty minutes in running water it is thrown upon a piece of polished plate glass prepared as follows: Well wash first with soap and water to clean off all grease or dirt, thoroughly wipe with a clean towel and give as much polish as possible. Take a plug of wool, dip it in powdered French chalk, and rub over the surface of the glass, wiping off the superfluous amount with two or three, not twelve or thirteen, rubs of a handkerchief, rolled into a pad. By this means it will be understood an infinitesimally thin layer of French chalk really remains upon the glass; if too little perhaps the print will finally stick; if too much the thick pieces will leave little dents and ridges on the print. The print being taken out of the water is laid to drain for a few seconds, and then thrown on to the glass, being held gently by the first finger and thumb, a squeegee being passed over the whole, not with heavy pressure, however, or it may injure the delicate surface of the print, but with sufficient pressure to squeeze out the air between the print and the glass. Let the glass be lifted up and looked at in a strong light, No bubbles between the print and the glass should be seen. If there are the print must be squeegeed again; if not, it can be left six hours to dry. In winter it may need ten or twelve; in summer three or four, but no artificial heat of any kind must be employed; if it is, the gelatin surface of the Nikko will assuredly melt, and nothing but hot soap and water will remove it from the glass. When we wish to peel off the print take a knife and raise one edge, pulling the print rather than wrenching it off backwards. If cracked lines appear all over the surface it is because the paper has been bent backwards too much in pulling off. I mention this because it took me some time to find out the cause of the trouble. If it is desired to mount the print on a card it should be smeared over the back whilst wet on the plate with a solution sold by the Eastman Company for the purpose, such purpose being to prevent the moisture of the mounting medium getting through the substance of the paper, which if it does, instantly removes all

the polish. If, however, one is desirous of mounting a print that has not had applied to it the special mounting when wet, we may use a little strong solution of gum arabic, which will suffice for the purpose and answer fairly well.

As regards a suitable board upon which to mount Nikko prints, much depends upon taste, but I have usually found that a grey edging suits them better than a white, inasmuch as the Nikko paper nearly always has a slight tint of pink, although it may be procured absolutely white.

There are several, however, who think the best details that can be obtained from any negative can only be obtained by the use of the old-fashioned so-called "silver print," otherwise known as albumin paper positives. These are easily made but require daylight. The paper can be bought ready sensitised, but if the photographer desires to do this for himself it is easy enough. The best Saxe or Rives paper being procured, it is floated on to a solution of recrystallised nitrate of silver, about 60 grains to the ounce of distilled water. Having floated on this for about three minutes in cold weather, and about double the time in hot, the paper is carefully withdrawn so as to leave no bubbles on the surface, and dried in a dark place. Sensitising must also be done in subdued light. When dry the paper is placed in contact with the negative in the same way as when using Nikko paper, and exposed to diffuse daylight if the negative be a good one full of contrast and not choked in the high lights. If the plate has been over-exposed and is flat, subdued daylight is best, and on the contrary, if over-developed, being choked in all directions, nothing but direct sunlight will get through it, as half of the printing frame back can be lifted without disturbing the other half, so the paper can be examined to see how the print is getting on. It should be always over-printed because the toning and fixing baths, into which it has to be placed, always reduce its intensity considerably.

When sufficiently printed, it is taken into the dark room (one ruby fabric enough) and floated in clean water; after a few seconds the water will become milky. Throw it away, and continue washing until the milkiness has all but departed. The print is then transferred to the toning bath. Of these there are no end, each photographer having his pet formula, many of which are to be found in the text-books. One that is very good for the purpose in hand is made as follows:—

Trichloride of Gold	1 grain.
Chlorineted Lime (Chloride of Lime)	1 grain.
Chalk	$\frac{1}{2}$ teaspoonful.
Water	8 ounces.

If the water be hot, the bath may be used when cold; if not, a day should elapse between mixing and using it. This bath keeps well, but, of course, from time to time the ingredients must be freshly added. Another excellent formula, but which must be used on the day it is made, is as follows:

Borax	100 grains.
Trichloride of gold	1 grain.
Water	10 ounces.

This bath seems to suit the ready-made sensitised papers, to which I have referred, better than those made in the manner already described. Sixteen ounces should tone a whole so-called sheet of paper.

Printing with albuminised paper—although I practised it largely some twenty-five years ago—I have always considered is an art, and many bad prints must be made before the amateur can expect to be perfect at it.

After the print is placed face down in the gold bath it should be turned the other way—face up—moved frequently, and watched. The colour which is rapidly imparted to it should be the same

when the print is looked through as when looked at, for this will show the gold has permeated the film on the paper. Toning completed, another washing of the print is necessary, say, for ten minutes, before placing it in the fixing bath, consisting of "hypo," 4 ounces, to water, 1 pint. Here it must be left for ten to fifteen minutes, or even longer, if the paper be very thick. Another washing—this time for not less than an hour—here follows, and the print is then ready for drying.

As many mistakes are easily made in printing with albuminised paper, and as these articles are to be as instructive as possible, the following hints may be worth recording.

1. When sensitising the paper, if you know you have a weak, thin negative (usually arising from over-exposure and improper development), it is better to have a rather weak solution of silver nitrate, and to print in a feeble light.

2. Do not forget to wash the paper before and after toning, and at least an hour after fixing.

3. Do not try and economise by using a stale solution of hypo; use fresh each time.

4. If your fixing is not a success let it remind you it is a good plan to test your fixing bath before use, to see it is not acid. If so, add a little ammonia until neutrality is obtained.

5. Whenever you tone, wash, or fix your prints see they are kept well moving about and that there are no air-bubbles about.

6. Remember over-toning produces mealiness, and under-toning a reddish (brick-red) appearance.

7. Do not let any toning formula be too cold. Keep it say, always about 60° F. and certainly not lower than 57° F.

Albumin prints cannot be polished in the same way as Nikko paper—at least, not without the use of a special solution: which in my hands is not often a success. If it is desired to polish them they must be enamelled. Solutions are sold for this purpose with full directions.

Printing-out paper may also be used for prints from photomicrographic negative, but they mostly have to be exposed in daylight. Full directions are given with these papers, which are made by several firms. I confess to have a liking for that prepared by Otto Schölzig or by the Ilford Company. There is also an excellent class of paper sold by The Paget Prize Plate Company, called collodio-chloride, but it requires a little careful handling. Full directions are given with each packet.

A NEW COLORIMETRIC METHOD FOR THE DETERMINATION OF PHOSPHORIC ACID.—Jolles and Neurath publish the following method for the colorimetric determination of phosphoric acid. 20 C.c. of the fluid to be examined are diluted to contain no more than 0.001 gramme of phosphoric acid, and mixed with 1 C.c. of molybdic reagent (8 grammes potassium molybdate dissolved in 50 C.c. of water and 50 C.c. nitric acid, s.g. 1.2). Simultaneously, 20 C.c. of distilled water are filled into test tubes of equal calibre and mixed with sodium phosphate solution until the proportion is 0.001, 0.00075, 0.0005 gm., etc., P₂O₅. 1 C.c. of the reagent is now added, and all the test tubes, heated on the water bath to 80° C., after which the colours are compared. The method allows of exact distinction between 0.001, 0.00075, 0.0005, 0.000005, and 0.0000025 gm. P₂O₅. The authors specially recommend the method for the determination of phosphoric acid in human blood, where only a small volume of blood is available, also for the examination of foods containing only a little phosphoric acid, such as wine, beer, milk, and water. The presence of inorganic salts which occur in a natural water have no influence on the colorations, but inorganic salts in water rich in iron, etc., affects the exactness of the method.—*Pharm. Centralh.*, xxxix., 380.

PRACTICAL PHARMACOGRAPHY.

CINCHONÆ RUBRÆ CORTEX.

Red Cinchona Bark.—Quinquina rouge, Fr.—Rothe Chinarinde, Germ.

MACROSCOPIC CHARACTERS OF EAST INDIAN CULTIVATED BARK.

The red cinchona bark, which is now the only official kind, consists of the dried bark obtained from cultivated plants. It varies considerably in appearance, according to the part of the tree from which it is obtained. The bark of different varieties of the same species also presents certain distinctive characters.

Cinchonæ Rubræ Cortex.—*Cinchona succirubra*, E.I., Trunk Bark.

There are, however, a few features which may be regarded as fixed in all varieties. These are (1) a more or less abundance of longitudinal wrinkles, due to the comparatively rapid growth and therefore more succulent character of the young bark, which consequently shrinks more in drying than in the other species; (2) the presence of numerous warts or enlarged lenticels which often are more prominent along the ridges; (3) the more astringent taste, and a more quickly developed bitterness than in *C. officinalis* or *C. calisaya*, due to the presence of more cinchotannic acid, and to the more ready solubility in the saliva of the natural cinchonine salt. (4) The red colour of the powder and of the bark itself. The bark from India and Ceylon usually occurs in quills, varying in thickness. Those derived from the branches are thin (about $2\frac{1}{2}$ Mm.), strongly wrinkled longitudinally, and have very small but often numerous warts, and are often strongly inrolled. Those from the trunk are thicker (up to 6 Mm.), with fewer ridges, more prominent warts, and have often the thalli of lichens developed here and

Cinchonæ Rubræ Cortex.—*Cinchona succirubra*, E.I., Branch Bark.

there, these being nearly absent in the small branch quills. The Jamaica red cinchona bark is apparently largely derived from the variety *subpubescens*, and differs considerably in appearance from the East Indian kind in the very few warts present in the few longitudinal ridges and in the great number of small transverse cracks present in it. These are usually few in the East Indian bark, but are always present more or less in nearly all cinchona barks, except those of the *C. lancifolia* group, in which the outer layer is spongy and more or less silvery. But the taste and colour of the substance of the Jamaica bark renders it possible to recognise it as a red bark. It should be noticed also that the transverse cracks present have scarcely raised edges, so that the bark does not give the sensation of roughness that is experienced when the finger is run over the surface of the bark of *C. officinalis*, in which the cracks have

thickened and more or less raised edges. The red cinchona bark in chips now largely imported and obtained by the use of a spoke-shave naturally do not present macroscopic characters for recognition, except such as are afforded by the red colour and astringent and quickly bitter taste. The mossed red cinchona bark is now rarely imported. It has a darker or almost blackish tint between the ridges and presents no trace of lichen thallus. The renewed bark is similar in size, *i.e.*, usually about the thickness of

Cinchonæ Rubræ Cortex.—*Cinchona succirubra*, Jamaica Trunk Bark.

the little finger, but has a browner-red tint and is usually furnished with thicker ridges and better developed warts than the natural bark. Although bark of medium size is generally considered the best for pharmaceutical purposes, the different varieties in cultivation vary much in alkaloidal value,* so that the only safe guide to their agreement with the B.P. standard must depend on the analysis. Thus the hybrid between *C. succirubra* and *C. officinalis*, known to planters as *C. robusta*, is much richer in quinine than the ordinary bark. In macroscopic characters this bark shows its hybridity in the fewer warts, fewer longitudinal ridges, and in the presence of the thick-edged, rough, horizontal cracks, characteristic of *C. officinalis*. The distinctive structural characters of the other species of cinchona in commerce will be found carefully enumerated in the 'National Dispensatory,' p. 461 (1886).

MICROSCOPIC CHARACTERS OF EAST INDIAN CULTIVATED BARK.

Cork.—It is of considerable thickness and consists of cells which are well extended tangentially. It is split here and there into layers giving rise to well-marked elevations. The inner layers contain a dark red colouring matter.

Cortex.—Composed of thin-walled parenchyma with tangentially extended cells. It is not uncommon, however, to find cells divided by three or four radial division walls. The majority of cells contain numerous starch-grains or deposits of cincho-tannic acid and

Cinchonæ Rubræ Cortex.—*Cinchona succirubra*, E. I. cultivated.—Longitudinal section of inner part of cortex. *m.*—Laticiferous vessel. *n.*—Collapsed laticiferous vessel. (After Tschirch.)

cinchona red; some also contain sandy crystals of calcium oxalate. Stone cells and sclerotic fibres are absent. Near the inner limit of the cortex is a rather regularly arranged ring of laticiferous vessels not infrequently which are found in pairs. Generally they are destitute of cell contents, but some of them are filled with tyloses; some have succumbed to the pressure of the surrounding

* *Pharmaceutical Journal* [3], xiv., 666.

tissues and the lumen of them is quite obliterated, although the vessels themselves are easily recognised. They have a diameter of from 100μ to 355μ and are considerably larger and have much

up of thin-walled parenchyma and almost obliterated sieve tubes, with oblique sieve plates, which can only be observed in well-prepared longitudinal sections. In the phloem are situated the most

Cinchonæ Rubræ Cortex.—*Cinchona succirubra*, E. I.—cultivated.—Portion of transverse section. *c.*—Cork. *o.*—Cortex. *a.*—Phloem. *r.*—Medullary rays. *x.*—Crystallogenous cells. *l.*—Laticiferous vessels. *pp.*—Protophloem. *s.*—Bast fibres. *p.*—Soft phloem. (After Tschirch.)

thicker walls than those in other varieties of cinchona barks; the walls are traversed by narrow pores.

Cinchonæ Rubræ Cortex.—*Cinchona succirubra*, E. I.—cultivated.—Transverse section of inner portion of phloem. *b.*—Bast fibres. *s.*—Soft phloem (sieve tubes and parenchyma). *k.*—Crystallogenous cells. *m.*—Medullary ray. (After Tschirch.)

Phloem.—Immediately within the ring of laticiferous vessels is found the protophloem in small masses which are not easily distinguished. The fundamental tissue of the phloem is made

Cinchonæ Rubræ Cortex.—*Cinchona succirubra*, E. I.—cultivated. *a.*—Isolated bast fibres. *b.*—Ends of isolated bast fibres. (After Tschirch.)

important elements of the bark, namely, the bast fibres. These are remarkable on account of their short length, being probably the shortest known. In the cultivated and American barks they vary in length from 400μ to 880μ ; in the mossed and renewed barks they attain a length of from 1000μ to 1100μ . They are somewhat spindle shaped and have the external walls either even or indented by the surrounding parenchyma. The ends of them are generally pointed, but not always regularly so; still they are not subject to the knobby and horned irregularities prevailing in some other cinchona barks. The walls are strongly thickened, markedly striate in transverse section, and pierced by numerous canals; in transverse section the outline of them is usually polygonal or sometimes roundish and the lumen is very small. The fibres are either isolated or in short single radial rows separated by bands of parenchyma. The medullary rays are from one to four cells broad; in the inner phloem the cells are radially extended, but as the rays approach the periphery they become more and more extended tangentially, and thus cause an expansion of the rays. The greater proportion of the cells of the phloem contain starch and tannin deposits; some of them contain sand crystals of calcium oxalate. Crystallogenous cells are also found in the medullary rays, as are also starch granules. The phloem constitutes about three-fourths of the bark.

The starch-grains are small, round, mostly single, but sometimes compound. The alkaloids are located in the cell-walls of the parenchyma; but not in those of the sieve-tubes, the bast fibres, and the cork. Renewed barks do not conform to the foregoing description. In them is an excessive development of thin-walled parenchyma, while the bast fibres are found in small quantities only in the very innermost layers of the phloem. They contain no laticiferous vessels.

Distinctive Characters.—The cells of sand-like crystals. The large thick-walled laticiferous vessels with tyloses. The bast fibres; their short length and pointed ends. The round starch granules. The absence of stone cells and clustered and isolated crystals.

THE PHYSICO-CHEMICAL STATE OF CASEINOGEN IN MILK.*

BY DAVID FRASER HARRIS, M.D., C.M., B.SC.LOND., F.R.S.E.,

There may be said to be three views as to the conditions under which fat and caseinogen exist in milk: (1) That there is a layer or membrane of proteid material surrounding each oil-globule. This proteid was originally called alkali-albumin, then casein ("Ascherson's membrane"), the oldest view. (2) That the globules in milk are composed of fat, and have no envelope, while the particles in milk are composed of caseinogen—that is, are wholly proteid in nature. (3) That there exists around pure oil-globules a more closely "adherent layer of caseinogen solution, or rather milk plasma," so that the following phrase appears justified: "Milk globules contaminated with proteid."† My work has led me to conclusions, amongst which are the following:—

1. Caseinogen is not in solution in milk plasma, but
2. Is present, along with fats, in both the globules and the particles in a state of minute subdivision—that is, both the fat and the proteid is "particulate" or minutely granular.
3. The globules contain a maximum of fat and a minimum of caseinogen. The particles contain a minimum of fat and a maximum of caseinogen.
4. Thus the globules are not pure fat or oil, and the particles are not pure caseinogen.

The globules are spherical bodies with a diameter ranging from 0.005 Mm. to 0.0025 Mm.; occasionally very large ones, 0.0103 Mm. diameter, are met with; bodies with a diameter of less than 0.0025 Mm. may be called particles; their outline cannot be discerned. On optical grounds alone we cannot affirm that there is any difference, at least of composition, between these two varieties of solid body. It is highly improbable that there is any envelope, at least of caseinogen. Cream, which is an aggregation of the larger globules, contains as much caseinogen as does whole milk (3.5 per cent.). This fat-associated proteid in cream is, however, not present in it in proportion to the water (28.675 per cent.) of cream. If the caseinogen of cream were present in it in proportion to the water of cream, there ought to be only 1.3 per cent. of caseinogen, but there is actually present in cream 3.5 per cent. of caseinogen, that is, 2.2 per cent. more than is consistent with its being dissolved in the water. Chemists have for long agreed that if the proteid is present as an envelope it is "imponderable," and therefore *a fortiori* inadequate, to give rise to 3.5 per cent. of caseinogen; further, it is not "carried up mechanically," because in cream there is a notable absence of any solid bodies other than the larger globules. Thus, if it is not in solution in the watery basis of the cream, and not present as the envelopes of the globules, and is not carried up mechanically, it must in cream co-exist in an extremely intimate manner with the fat in the larger globules.

It is notoriously difficult to separate caseinogen from fat, and not at all easy to dissolve out the fat from its union with the proteid unless chemicals, calculated to disturb that union or mixture, have been previously added. Fat is at a maximum in cream, but fat exists in all the solid bodies of milk, for when treated with osmic acid they are all stained black or brown. Further, skimmed milk contains 1 per cent. of fat, and "centrifugalised milk" has from 0.1 per cent. to 0.5 per cent.: in both these forms of milk almost all the solid bodies are "particles," therefore the particles contain fat, that is, they are not pure caseinogen. In skimmed milk there is always a vast number of particles that never rise to the surface (that is, there is a limit to "creaming"), and in centrifugalised milk a like number which are never thrown to one end or other of the tube, therefore these particles cannot be pure fat else they would rise or would be thrown out. They are evidently of the same specific gravity as milk plasma (1033 to 1037); it must, then, be their associated proteid (caseinogen), which weights them down and raises their specific gravity from that of pure fat to that of milk plasma.

Buttermilk contains a larger percentage of caseinogen than whole milk does, because the particles of caseinogen previously in the large globules of the churned cream have been dissociated from the fat of those globules but left in the milk, the fat being removed as butter. This is essentially what happens after milk has been shaken for a very long time with ether; there is an increase in the number of proteid "granules" (Hoppe-Seyler) from the breaking up of the globules, the fat being dissolved, the

caseinogen particles set free.

100 C.cm. of cream weigh 97.2 g.

100 C.cm. of pure butter-fat weigh 91.5 g.

Difference 5.9 per cent., made up as follows:—

Lactose	1.7 per cent.
Salts	0.7 "
Proteid	3.5 "

This is a further proof that, over and above the lactose and salts, there is 3.5 per cent. of something that is not fat; this, which is proteid, is the caseinogen of cream.

In the clots of milk there are no fibres whatsoever nor any coalesced "oil drops"; a clot is an agglutination of globules to globules, globules to particles, and particles to particles; there is a diminution in the number of globules, as though they had disintegrated previously to their constituent particles adhering. There is no reason to believe that any of the particles of a clot or precipitate in milk are not either pre-existent in the milk or liberated from disintegrated globules.

Name of Cheese.	Antecedent Condition of Solid Bodies.	A. Casein per cent.	B. Fat per cent.	Total per cent.
Camembert (cream cheese)	The larger globules	19.0	21.5	40.5
Skim milk (American)	Mainly particles	32.0	8.5	40.5
Cheddar (whole milk)	Globules and particles	47.0	30.0	77.0

This furnishes additional proofs of what has been said above: (1) In particles there is most casein, least fat; whereas (2) in globules there is most fat, least casein. (3) Note that 21.5 + 8.5 = 30.0 per cent. (the percentages of fat). (4) Note that, taking averages in column A. instead of one case, 15.0 (for 19.0) + 30.0 (for 32.0) = 45.0 (for 47.0) per cent. (5) Lastly, taking these average figures, 15.0 + 21.5 = 36.5 and 30.0 + 8.5 = 38.5, then 36.5 + 38.5 = 75.0 per cent. = 45.0 + 30.0.

In other words, the casein plus fat of cream cheese plus the casein and fat of skim-milk cheese is equal to the casein and fat together of whole milk cheese.

Caseinogen is not in solution in the milk plasma, for the pressure filtrate through a diatomaceous clay filter (Berkefeld) leaves all the caseinogen outside; in short, all the globules and particles remain outside. All the fat and caseinogen is outside, and the filtrate will not clot with rennet; it contains lactose, salts, and of proteid only a trace of lactalbumin. It has been suggested that caseinogen might be in solution, but unable to pass through the pores owing to the "size of its molecule." Hæmoglobin has a very large molecule, and its solution passes through this filter, as also does egg-albumin (10 per cent. solution in water) and alkali-albumin. My inability on a previous occasion* to find egg-albumin in the filtrate arose from using not a high enough vacuum and a filter blocked with milk globules or particles.

Ringer's (so-called) solution of pure caseinogen is distilled water, holding in suspension a vast number of milk particles. This is no proteid in solution; the pressure filtrate is water; it is not pure caseinogen, because there is some fat present, a minimal quantity in the particles; the liquid is opalescent because of the particles; when they are dissolved, for example, with weak alkali, the liquid becomes clear, and now it will not clot with rennet.

In Nature "caseinogen" is never seen apart from fat, and in milk the fat never apart from caseinogen; the two substances are produced side by side by the metabolic activity of the protoplasm of the cells of the acini of the mammary gland, so that caseinogen is not a chemical entity *sui generis*, it and the fat together constituting a highly complex organic substance, which might provisionally be called an oleo-nucleo-proteid. The caseinogen, when artificially fat-free, is a nucleo-proteid; but the fat molecule is, I take it, an integral portion of the fully-elaborated product of the cells, which product (oleo-nucleo-proteid) is as much a unique animal substance as is lactose. There is evidence that the nucleus is the source of the particulate caseinogen of milk.

It is not that the caseinogen of the milk-clot is "contaminated by fat"; it is not that the fat is contaminated by proteid in the cream from milk, but it amounts to this, that caseinogen, apart from fat (even though it be but the minimal trace), is unknown in Nature, is a concept in the mind of the physiological chemist. Nor is such a body improbable from its complexity; hæmoglobin and lecithin are, if anything, more complex; and just as by chemical agencies they can be broken up into their constituents, so by chemical and physical agencies can the oleo-nucleo-proteid of milk. If the term "caseinogen" is to be retained its connotation must be extended so as to embrace the fat molecule.

* Abstract in the *British Medical Journal*.

† Schäfer, 'Text-Book of Physiology,' vol. i., p. 125, 1898.

* *Proc. Roy. Soc., Edin.*; Section 1895-96, vol. xxi.

NOTICES OF BOOKS.

'THE FUTURE WATER SUPPLY OF BIRMINGHAM,' by Thomas Barclay (Birmingham: Cornish Brothers; London: Simpkin, Marshall and Co.), is a handsome volume of more than two hundred pages, printed at the private press of Southall Brothers and Barclay, Ltd., a firm of which Mr. Barclay is one of the heads. He was at one time a member of the Water Committee of the Birmingham City Council, and in great measure the conception of the scheme by which the city is to be supplied with water from the Elan Valley is due to him. The present volume is the third and much enlarged edition of the original work; it is freely illustrated and, in addition to a complete account of the present water demand and supply of Birmingham, deals with the conditions of a suitable supply for large cities, the action of moorland water on lead, the steps taken to improve the Birmingham supply, and the new Liverpool and Manchester water undertakings. Londoners and others who may be interested in the improvement of their water supplies will read Mr. Barclay's useful work with much advantage to themselves.

'A POCKET DICTIONARY OF HYGIENE,' by C. T. Kingzett, F.I.C., and D. Homfray, B.Sc. (London: Baillière, Tindall and Cox. Price 2s. 6d.), is a small 18mo. volume, containing concise information respecting most of the subjects comprehended in the theory and practice of hygiene. The chief object of the authors has been to supply medical and sanitary officers with a pocket dictionary for reference in connection with their work, but the book will doubtless be found useful to many others interested in the subjects dealt with. Though the type employed is small it is clear, and the volume is well bound in French morocco.

'DEFECTIVE SIGHT AND ITS OPTICAL CORRECTION,' by W. D. Mason (Grimsby: Carr and Forman. Price 6d.), is a reprint of a useful series of articles that appeared in the *Watchmaker, Jeweller and Silversmith*, and is now in its second edition. It deals with the structure of the eye and the theory of vision, myopia, hypermetropia, astigmatism, presbyopia, asthenopia, odd sight, squint, and cataract, with a concluding section on spectacles. Chemists who are connected with the optical trade should possess copies of this little pamphlet.

'RADIATION,' by H. H. Francis Hyndman, B.Sc. (London: Swan, Sonnenschein and Co. Price 6s.), is an elementary treatise on electromagnetic radiation, and on Röntgen and cathode rays. According to Professor Silvanus P. Thompson, who has written a preface to the volume, it presents a summary of knowledge in the domain of which it treats, and is all the more useful because of the reference it affords to the original sources. "It helps to fill a void left by the artificial sub-division of Physics into separate class-subjects. To the real student of Physics, who pursues the subject for its own sake, it will be found most useful. It is much too good to be of use to one whose highest aim is to pass examinations." No stronger recommendation of a book could be given, and it can be fully endorsed. The first of the three parts into which it is divided, deals with material vibrations—longitudinal (sound), and transverse. Part 2 is devoted to a consideration of the ether and ethereal vibrations—longitudinal and transverse; the dimensions, production, detection, and recognition of vibrations, their penetrative power, reflection and refraction, interference and diffraction, polarisation, effect on distribution of electricity, chemical and physiological effects. Other forms of radiation are described in the third part, the five chapters of

which deal respectively with the phenomena connected with the vacuum tube, negative and cathode rays, Röntgen or X rays, Becquerel rays, and Le Bon's rays.

'DISEASES AND REMEDIES,' by Physicians and Pharmacists (London: The 'Chemist and Druggist,' 42, Cannon Street, E.C. Price 2s. 6d.), is described as a concise survey of the most modern methods of medicine, and appears to be intended as a guide to chemists when not to prescribe. In justification of the work it is affirmed that "the more the pharmacist knows of disease, of its symptoms and issues, the less eager will he be to assume carelessly the functions of the medical man." This statement may or may not be correct; but for the sake of the good feeling and of the better co-operation that is desirable between pharmacists and medical men, it could be wished that there was no necessity for the publication of such a book.

'NATURAL HYGIENE,' by H. Lahmann, M.D. (London: Swan, Sonnenschein and Co. Price 4s. 6d.), is a treatise for physicians and their patients on the predisposition to and prevention of disease. The essential condition of good health, according to the author, being healthy blood, he endeavours to show how that may be attained. Commencing with a description of the manner in which he thinks hygiene ought to be taught, he next proceeds to explain "dietetic dysæmia"—a condition said to arise from a wrong selection or wrong preparation of food, the abuse of common salt, and the excessive consumption of water—and discusses the constitutional predisposing causes of numerous diseases. As an example of the author's method, the words "anæmia," "scrofula," and "apoplectic tendency" are alleged to mean nothing, being incapable of explanation. The present book is offered as a contribution towards the preparation of the ABC of the branch of medical science of which it treats.

'THE TAX-PAYERS' CASH BOOK,' by Alfred M. Scarf (London: The Income Tax Adjustment Agency, 12 and 13, Poultry, Cheapside, E.C. Price 2s. 6d. net), has been referred to with approval in these pages on former occasions, and the third edition merits commendation no less than its predecessors. The plan on which the book is based enables anyone in business to see the result of each week's business in full detail at a glance, and the record will be available for comparison with those of corresponding weeks in other years. At the end of any given week the total amount of business done up to that date in the particular year is shown, and the use of the book saves much worry, by enabling the trader with a minimum of trouble to satisfy the Inland Revenue Authorities as to the amount of his trade profits. In connection with this third edition of the work, it is stated that during the last eighteen months the book has been found to provide a simple and satisfactory means of furnishing an accurate account of the transactions of various business concerns, the profits of which are not of sufficient magnitude to warrant the expense of keeping the usual books of account necessary to a proper system of double-entry bookkeeping. This can be readily believed, as the book is extremely well devised for its intended purposes.

'FORMULAIRE HYPODERMIQUE ET OPTHÉRAPIQUE,' par le Dr. E. Boisson et J. Mousnier (Paris: J. B. Baillière et Fils. Price 3fr.), is a handy little volume which treats of the preparation, sterilisation, etc., of hypodermic injections, alkaloids, animal extracts, and other medicaments which require to be administered with antiseptic precautions. Illustrations are given of the apparatus to be employed, and the instructions given are full and very practical.

THE STUDENTS' PAGE.

EXPLANATORY NOTES ON THE B.P.*

Acidum Hydrocyanicum Dilutum.—The official solution of this acid may lose its strength through careless storage: (1) by volatilisation; (2) by decomposition. The latter cause is particularly interesting. The hydrocyanic acid reacts with water, thus:—

the ammonium salt of formic acid being produced. This is known in organic chemistry as the *cyanide synthesis*, because it enables one to make from any given hydrocarbon the acid containing one atom of carbon more. Thus from ethane we can pass to propionic acid by preparing (1) ethyl chloride, (2) ethyl cyanide, and hydrolysing the latter. The essential feature of the change consists in the conversion of a cyanogen group into a carboxyl group—

The conversion of hydrocyanic acid into ammonium formate takes place slowly, but the hydrolysis of this and other organic cyanides can be quickly accomplished by boiling with sodium or potassium hydroxide.

Acidum Lacticum.—Lactic acid is also known as α -hydroxypropionic acid, since it is derived from propionic acid by substitution of hydroxyl for hydrogen combined with the carbon atom nearest the carboxyl group. This nomenclature is adopted in order to distinguish isomeric substances, the successive atoms in the carbon chain being distinguished by the Greek letters α , β , γ , proceeding from the end next to the characteristic group of the mother substance. Thus $\text{CH}_2(\text{OH})\cdot\text{CH}_2\cdot\text{COOH}$ is β -hydroxypropionic acid, otherwise known as hydracrylic acid. Inspection of the formula for lactic acid shows that it contains one asymmetric carbon atom, *i.e.*, carbon combined with four different groups or elements, in this case CH_3 , H, OH, and COOH.

It can therefore exist in three stereo-isomeric forms: (1) dextro-rotatory, (2) lævo-rotatory, and (3) racemic or inactive. The last is produced by mixing equal proportions of the dextro- and lævo- varieties, and is the kind obtained in the fermentation of lactose by means of putrid cheese. Read up in your text-book the chapter relating to stereo-isomerism. When lactic acid is heated cautiously, the *main products* are aldehyde, water, and carbon monoxide, the last mentioned being, of course, inflammable.

When oxidised by permanganate, aldehyde is also produced, carbon dioxide being formed here.

Note that the carbon chain is broken in both cases at the carbon atom combined with hydroxyl. Sarco-lactic acid, detected by the formation of an insoluble copper salt, is the dextro-rotatory variety referred to above, and is so called from its occurrence in the muscle plasma of flesh. Glycerin is detected by converting the lactic acid into its zinc salt; this, together with the excess of zinc carbonate, is insoluble in alcohol, while the glycerin easily dissolves and is left as a moist, sweet residue after the alcohol is evaporated.

Acidum Oleicum.—Oleic acid belongs to an unsaturated series of acids known as the acrylic series, from the name of the first and simplest member, acrylic acid. These acids take up *two* atoms of hydrogen when acted upon by reducing agents, such as hydriodic acid, and yield saturated acids containing the same number of carbon atoms. Acrylic acid, $\text{C}_2\text{H}_3\cdot\text{COOH}$, yields pro-

panoic acid, $\text{C}_2\text{H}_5\cdot\text{COOH}$, for example, and oleic acid, $\text{C}_{17}\text{H}_{33}\cdot\text{COOH}$, becomes stearic acid, $\text{C}_{17}\text{H}_{35}\cdot\text{COOH}$. These unsaturated acids also take up two atoms of bromine (or chlorine), yielding di-bromo derivatives of the corresponding saturated acids, just as the unsaturated hydrocarbons, *e.g.*, ethylene, C_2H_4 (the simplest hydrocarbon of the series) takes up bromine to form ethylene dibromide, $\text{C}_2\text{H}_4\text{Br}_2$, or *di-brom-ethane*. This faculty is utilised in analysis to distinguish the members of one series from those of another or to determine the proportion of each in a mixture. Not only the fatty acids but also their glyceryl esters, which constitute the main portion of fixed oils and fats, behave in this manner; and the amount of bromine, known technically as "bromine absorption," becomes an important factor in the identification or determination of purity of bodies of this class. In the unsaturated acids of the acrylic series, the existence of a double bond between two of the carbon atoms is assumed. (Compare in your text-book the chapter dealing with the constitution and behaviour of ethylene.) In a compound like oleic acid the determination of the exact position of this double bond in the carbon chain is difficult. The method adopted—and this has a general significance for all similarly constituted bodies, is to study the decomposition products obtained by oxidation. It has been found in the case of the simpler compounds that the chain is broken between the doubly-linked carbon atoms. In the case of oleic acid, however, the results obtained by the action of various oxidising agents are not concordant. When fused with caustic potash we get acetate and palmitate of potassium, which would show that the double bond is between the second and third carbon atoms.

On the other hand, certain oxidising agents, at comparatively low temperatures, yield, among other products, acids having eight carbon atoms in the molecule, and this would indicate that the double bond occurs in the middle of the carbon chain, as shown by the formula in the Pharmacopœia. The matter cannot be considered settled definitely at present, but the latter of the two formulæ discussed above is maintained by some to represent the constitution of oleic acid because its oxidation, by fusion with caustic potash, necessitates the application of a high temperature. At high temperatures atomic rearrangements in the molecule often occur, so that the constitution of a body cannot always be deduced correctly from the decomposition products obtained. Elaïdic acid, obtained by the action of nitrous acid on oleic acid and isomeric with it, probably owes its isomerism to an alteration in the position of the double bond. The same remark applies to the isomerism of the glyceride elaïdin with olein.

To detect stearic or palmitic acids the oleic acid is first converted, in alcoholic solution, into the sodium salt by caustic soda. A very *strong* aqueous solution of soda is used in order to add as little water as possible during the process, because the neutralisation of oleic acid does not occur either rapidly or completely in presence of water. This is partly accounted for by the insolubility of oleic acid in water, but it is also noteworthy that water partly hydrolyses soaps into fatty acid and alkali, so that such solutions are always alkaline. The slight excess of soda necessary to give the red colour with phenol-phthalein is then neutralised by acetic acid, because a turbidity—due to lead hydrate—would be produced by the sodium hydroxide on the addition of lead acetate solution. After the addition of ether lead acetate gives no precipitate in the case of pure oleic acid, because lead oleate is soluble in the mixture of alcohol and ether, while lead stearate or palmitate is insoluble.

Acidum Sulphurosum.—In the determination of the strength of sulphurous acid solutions by means of iodine the solution to be titrated must be very dilute (*vide* B.P. directions), because the reaction

is reversible in strong solutions, *i.e.*, sulphuric acid will decompose hydriodic acid, with production of sulphurous acid and iodine. (Compare action of strong sulphuric acid upon sodium or potassium iodide.) The water used for dilution should be previously boiled, to expel dissolved oxygen, which would oxidise a portion of the sulphurous acid.

* NOTE.—This series of articles should be read in conjunction with the series referring to the 1885 B.P., and published in the *P. J.* during 1897 and the earlier portion of the current year.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

LONDON: SATURDAY, SEPTEMBER 24, 1898.

AMERICAN PHARMACEUTICAL ASSOCIATION.

THE forty-sixth annual meeting of the American Pharmaceutical Association was held at Baltimore, on Monday, August 29, and the following days, some four hundred pharmacists from the various States of the Union assembling to exchange views, under the presidency of Mr. HENRY M. WHITNEY, of Massachusetts. In his opening address, the PRESIDENT said that, as time went on, he was more and more impressed with the value of the Scientific Section of the Association. The able papers published in the "Proceedings" exhibited study and research far beyond the ability or time of the average pharmacist, and he desired to place upon record his more than grateful recognition of the services of those who contributed the papers, with the assurance that if, upon certain occasions, their audience was small, their labour was not lost, for many members in the quiet of their homes, or in their places of business, free from the allurements of tempting pleasures, read and appreciated the papers and honoured the writers. At the same time, he urged pharmacists of scientific bent not to be too lofty in the high altitude of their special calling as instructors, and not to neglect the Commercial Section. For, he said, if there is no commercial value to come from the instruction given, the audience will be *nil*, and even a professor cannot live by words alone. Above all, it was urged that it is necessary to encourage and aid those who are striving against odds to make attractive the ranks for which the instructors are furnishing recruits. It was also pointed out by the President that there is no national body of pharmacists in the United States which in the least represents the commercial side of pharmacy. He said: "The great American Pharmaceutical Association, as represented by those most active and numerous at its annual meetings, has repudiated the pharmacist's occupation as a means of livelihood. Pharmacy, in the opinion of these editors and emissaries of the manufacturers (*sic*), is essentially a theatre for the display of their rare scientific attainments. The man who keeps a drug store and soils his palms with filthy lucre is no longer considered a pharmacist. The country is probably too large for a successful national association of the bread-winners of pharmacy." And though the speaker said it was not his purpose to pose as an alarmist, he earnestly asked his hearers to heed the warnings they were receiving and, if they desired to keep and increase the membership of their Association, to apply the science of sound business principles with good sense.

Of the reports presented at this meeting, the most interesting were those on national legislation and on weights and measures. In the former attention was chiefly directed to the way in which the makers of secret remedies are endeavouring to prevent others from copying their products, by registering the titles of the preparations as trade-marks. The point at issue in such cases as have been before the United States courts in this connection, has been whether the word claimed as a trade-mark is the generic name of the thing manufactured and sold, or a mark or name used to distinguish an article as made and sold by one manufacturer from the same article as put out by other manufacturers. In each case "it was held that because the word had become descriptive of the thing it could not be appropriated as a trade-mark." It was urged, therefore, in the report that the time is ripe for pharmacists all over the United States to act in this matter; that the question of patents and trade marks as affecting medicinal products should be brought before every national, state and local medical and pharmaceutical society for discussion, besides being taken up with like intent by every medical and pharmaceutical college in the United States. Subsequently, the sense of each organisation should be made known to the Secretary of the Interior in the form of proper memorials or resolutions which he can refer to the Commission appointed to deal with the matter. The committee on national legislation has already called the attention of the President of the United States to the work of the American Pharmaceutical Association in this connection and the matter has been referred, by him, to the Secretary of the Interior, who in turn referred, it to the Commission, so that another of the objects of the Association in appointing a special committee on national legislation is likely to bear fruit. Continuing, it is contended in the report that the trade-mark law should be such as to render it necessary for every article of commerce, when first introduced, to have a name given it for public use as a part of the common language. "It should also require that the common descriptive name of each article advertised should appear in advertisements equally prominent with its brand-name, so that the latter may be used by the public for the purpose of specifying a particular brand, when desired, and the former employed to designate the article itself as such, irrespective of who is the maker. . . Every kind of tincture, fluid extract and pill must have a specific name by which it may be described, and if the introducer does not supply it he has no reasonable complaint if the name claimed by him as a trade-mark ceases to perform its function as a brand-mark and falls into the public domain as a descriptive word or appellative. The trade-mark law should be so revised that its ambiguous wording will not protect those who desire to create perpetual monopolies of secret medicines by claiming that their commonly accepted names are trade-marks."

In the report of the special committee on weights and measures, it was pointed out that during the past year no action has been taken by Congress on the subject of the metric system. The Bill proposing to make that the legal system in the various departments of the Government remains in the hands of the Committee on Coinage, Weights and Measures, where it was sent more than a year ago. Reference was made to the recognition of the metric system of weights and measures in the recently issued British Pharmacopœia and to the fact that a Bill has passed both Houses of Parliament, legalising the system for purposes of trade in the United Kingdom. Russia has also made the

adoption of the metric system a certainty after a stipulated date. Regret was expressed that physicians in the United States do not more generally use the metric system in their every-day prescription writing, and the committee hopes for no rapid progress in the use of the system in medicine until the medical schools and colleges teach that system alone, and medical authors at least give it the preference, rather than merely state equivalents in metric terms. In view of that fact the chairman of the committee suggested that a resolution be passed by the Association to be presented to the American Medical Association at its next meeting to be held at Columbus, Ohio, requesting that Association to use its influence in bringing about the exclusive use of the metric system of weights and measures by all colleges and schools of medicine recognised by them in the United States. Such a step, it was thought, would only require such men as are engaged in scientific instruction or in teaching medicine to change their old-established methods of dosage and calculations, so that all students coming under their instruction would from their entrance in college know no other system of weights and measures. The resolution covering the suggestions of the committee was in the following terms:—"Whereas, the metric system of weights and measures has been adopted by the United States and British Pharmacopœias and is used exclusively in the Pharmacopœias of nearly all other nations; and, whereas it has become the almost universal system of weights and measures in scientific calculations, be it resolved that the members of the American Pharmaceutical Association request the American Medical Association to use its influence with all colleges and schools of medicine recognised by them in the United States, to use exclusively the metric system of weights and measures in the instruction of students, beginning with the classes entering said colleges and schools in the college year of 1900."

"PRESCRIBING CHEMISTS AND UNQUALIFIED ASSISTANTS."

THE above is the heading of a note in the organ of the British Medical Association, but inasmuch as the case commented on was not one of prescribing by a chemist, the connection is not obvious. According to the report of the case in the daily press, a young child had been taken to a chemist's shop at Tottenham, where apparently in the proprietor's absence an unqualified assistant gave the mother some medicine for the child, and told her to feed it on arrowroot. Four days later the child died and at the inquest it was shown that death was due to collapse, following summer diarrhoea. One of the jurymen remarked that, in his opinion, chemists ought to be stopped from practising as doctors and the *British Medical Journal* thinks the condition of affairs is one which calls for the consideration of the Apothecaries' Society. It acknowledges that the chemist himself had not prescribed in the case, but proceeds, nevertheless, to blame him by inference.

This medical writer somewhat sententiously remarks that "the medical practitioner is being deprived, and rightly so, of the services of unqualified assistants; here we have a child prescribed for by the unqualified assistant of a chemist, who himself has no right to prescribe." The word "who" in the sentence quoted presumably is intended to apply to the chemist, though it is actually made to refer to

the unqualified assistant. No explanation is given of the assumed lack of right in any individual to prescribe, and it would be difficult to find any British law forbidding anyone to do so. Without in the least degree attempting to defend the practice of counter-prescribing, we, therefore, fail to see what is to be understood by the statement that if the medical profession loyally obeys the ordinance of the General Medical Council with regard to the employment of only qualified assistants, the Council must see that "the legal rights of the profession are secured to them."

The medical profession has no legal rights in the matter of prescribing which are not shared by every member of the British public, but the proposal is seriously made, in the note referred to, that united action should be taken by the General Medical Council and the Apothecaries' Society "to protect the interests of the profession," presumably in the matter of prescribing. It is difficult to understand why the trouble experienced by medical practitioners with regard to cheap assistants should be brought up in connection with registered chemists, and one wonders whether the object of this invocation of the General Medical Council is to suppress chemists, or to prevent them employing unqualified assistants, or only to drive the dismissed unqualified assistants of medical men into the workhouse? It would appear, at least, that the idea is to strike a bargain with the medical authorities, which shall in some degree compensate medical practitioners for the compulsory loss of the services of unqualified assistants, for we are told that there are cases of such assistants who, being dismissed by their employers owing to the resolution of the General Medical Council, have started in practice in the same district as their former employers, defying any efforts to "restrain" them. It may be that these unqualified opponents are to be attacked, and if at the same time the stone can be made to hit chemists and druggists employing unqualified assistants who amuse themselves occasionally by prescribing on their own account, the result would be considered so much the better. But one would like to know wherein the chemists have offended against the law before further steps are taken, if the medical writer can so far unmix himself as to explain.

REFORM OF PHARMACY BY LAW.

AT last year's meeting of the American Pharmaceutical Association an excellent paper was read by J. H. BEAL on the relation of the pharmacist to pharmacy law (see *P. J.* [4], 5, 420), and the same pharmacist has now supplemented that by a more comprehensive paper on the reform of pharmacy by law. We hope to be able to publish the paper in full later, but it may be stated now that the author does not share the belief of those who hope to reform the practice of pharmacy by legislation. The present conditions of pharmacy, he points out, are the outgrowth of a century of a mistaken policy. They cannot be changed in a day or a year, but must be modified by a process of slow and gradual evolution which can only be hastened by bringing intelligent artificial selection to the aid of natural selection. Favourable variations should be perpetuated and unfavourable ones eliminated, for whether we will it or not, the evolutionary process will go on and no legislation can stop its operation. "Men have tried for ages to control the operation of economic laws by legal enactments and to force trade into artificial channels by trade combinations, by associations and by unions. They never have succeeded and they never will."

ANNOTATIONS.

SUBSCRIBERS TO THE BENEVOLENT FUND of the Pharmaceutical Society of Great Britain, who have not yet remitted the amount of their subscription for the year, and registered chemists who have not subscribed up to the present, are reminded that the benefits of the Fund are exclusively applicable in case of need to any of the fifteen thousand persons whose names appear on the registers of pharmaceutical chemists and chemists and druggists, and to the widows and orphan children of persons who have been so registered. Of those persons for whose exclusive benefit the Fund is available there are over ten thousand who contribute nothing towards it, and as the total annual relief granted is over £2500, a much larger amount of support is required to enable this expenditure to be maintained. Every registered person is urged to give a small annual contribution, and thus enable the Council to continue to deal with the numerous distressing appeals for assistance. It is scarcely credible that there is any registered person who could not spare at least half-a-crown a year for the Fund, or in other words who feels unable to devote a little over a halfpenny per week to support a mutual insurance fund—one of the best of its kind.

THE OFFICIAL STANDARD FOR CREAM OF TARTAR is the subject of a miniature discussion in our pages, the discrepancy between the required percentage of potassium bitartrate in cream of tartar and the amount of that salt corresponding to 5.2 cubic centimetres of volumetric solution of sodium hydroxide, pointed out by Mr. Dowzard last week, being shown by Mr. Duncan (see page 364) to be like some other apparent inconsistencies in the Pharmacopœia. That is to say, it is necessarily consequent to the practice of stating the measure of a volumetric solution requisite to complete a reaction with a stated quantity of the article to be tested as to a fixed standard of purity. As a revival, in another form, of the objectionable approximations distinguished by the word "about" that practice is calculated to mislead, as in the present instance, where the percentage of bitartrate corresponding to 5.2 C.c. sodium hydroxide solution is 97.11, and the required minimum percentage is 97.5. The statement of the measure of volumetric solutions required in testing percentages had better, therefore, have been omitted, for, if carried out decimally, the figures would have expressed quantities that cannot be measured with an ordinary burette. In the case of diluted hydrobromic acid, for instance, the percentage corresponding to either of the two quantities of volumetric solution, stated to be requisite for neutralising 4 grammes of the acid, is above 10 per cent., and it would have been more correct to say that *nearly* 5 C.c. of the volumetric solution should be required to neutralise 4 grammes.

THE USE OF IPECACUANHA IN EPILEPTIC CASES is suggested in a note contributed to the *Lancet* by C. Knox Bond, L.R.C.P., who records the results of the administration of the drug in one such case by Dr. Alfred Eddowes. The patient was an unmarried woman, aged twenty-nine years, and had been subject to epileptic fits from the age of eight years. For a long period she had taken continuously large doses of bromide, without any diminution in the number or severity of the fits. Dr. Eddowes decided, therefore, to reduce the doses of bromide taken to one-third, and added ipecacuanha wine to the medicine, beginning with a dose of ten minims of the wine, and gradually increasing the quantity until a dose of forty minims three times a day was being taken. With

each increase in the quantity of ipecacuanha there was a marked improvement in the patient's condition, the severity and frequency of the fits diminishing under the treatment until the beginning of May last, since when no fits have occurred. Dr. Eddowes was led to adopt this treatment partly as the result of his observation as to the value of ipecacuanha in convulsive attacks of children, due to gastro-intestinal irritation, but also because the drug suggested itself as a suitable remedy for checking the voracious appetite and neglect of mastication so frequently observed in epileptics. The results of the treatment, as recorded, may be described as perfectly satisfactory.

"FREE STAMP TRADING" is the subject of a communication signed by the chairman and secretary of the Federation of Grocers' Associations of the United Kingdom. The system referred to may be briefly described as follows: Agents go into a town and canvass the traders in different districts to take up their system of trading, then they open a shop or store where they keep a number of miscellaneous goods, varying from guitars to cheap copies of works of well-known authors, in which the copyright has expired. A trader is invited to buy certain stamps from the company, who supplies him also with books. The trader then gives a stamp to each purchaser of goods to the value of sixpence or a shilling, and the purchaser sticks the stamps so obtained into a book; when his book is filled he goes to the shop of the Company and selects from the goods stocked there the article he prefers. The company prints the names of the traders who do this kind of business in a book, and in addition, sends male and female canvassers around the district urging people to buy at the shop of the free stamp traders. On the face of it the plan appears attractive to some, especially as the trader is assured that if he will take up the system he will be the only trader in his district to whom the agency is given. It is alleged, however, that presently the trader finds some other member of the same trade has a similar agency for the stamps, and very shortly friction arises, and a great deal of annoyance is experienced. Some grocers who have taken up with the system are said to have been only too glad to cease their connection with it; but when they desired to do so they found they had unwittingly signed a stringently drawn legal agreement, and had in consequence to pay a penalty. The practical outcome of this objectionable scheme appears to be that the trader pays about six per cent. of his turnover to his customers in the form of presents, and unless he can add that to the selling price of his goods his expenses are increased to that extent. Obviously, therefore, the safer plan is to keep clear of any such entanglement, whilst, to say the least of the scheme, it puts a trader in an absurdly undignified position.

"PATENT MEDICINES AND MEDICAL SHAREHOLDERS" is the title of an editorial note in the *British Medical Journal*, in which it is stated that the conductors of that organ are often asked "whether a medical man should take a share or shares in a patent medicine, or be the owner of a proprietary medicine." And though it is stated to be obviously contrary to medical ethics for any medical man to associate himself in any way with such medicines, it is admitted by our contemporary that some members of the profession do reap profit from the sale of such articles without publicly associating their names with them. That, of course, it holds to be distinctly undesirable. With regard to dietetic preparations, it is suggested that a medical man might legitimately say to a patient, "I am a shareholder in this company, and I think its preparation a good one," but he should never accept offers to have

his portrait painted free on condition that the portrait be shown to patients and friends, nor accept gifts of wine on similar conditions. "It is deplorable and humiliating," says the *B. M. J.*, "that we should have to insist upon such elementary truths, but from our correspondence it is painfully evident that there is a very grave amount of misapprehension . . . as to what constitutes absolute fair dealing." Apparently, therefore, medical men are no more free from the trading instinct than any other class of the community, nor do they invariably trade with clean hands.

THE SOUTH AFRICAN REPUBLIC is so far advanced pharmaceutically as to possess a pharmaceutical society and to have an annual dinner. One of our Johannesburg correspondents has been good enough to send an account of the banquet which took place at the Masonic Hotel, on Wednesday, August 17, and at which about thirty prominent chemists of the Republic were present. The speech of the evening appears to have been given by Mr. Trembath in proposing "The Pharmaceutical Society, South African Republic," and it is interesting to gather from his remarks that in no State is a Pharmacy Act more badly wanted or a pharmaceutical society more essential than in the Transvaal. Under the present régime, he observed, chemists there have no laws and are much in the condition of the toad under the harrow—they never know what is going to happen. The object of the Society is to improve the status of the chemist and lift the calling from its present unsatisfactory and uncertain position. It does not appear from Mr. Trembath's speech that the individuals engaged in the calling have been very keen to support their Society in its laudable objects, so that one is forced to the sad conclusion that pharmaceutical human nature is pretty much the same under President Kruger as it is under Queen Victoria. Mr. Trembath is a pharmaceutical chemist of Great Britain and an old "Square man," and we feel that his association with South African pharmacy is a matter upon which South African chemists may be congratulated.

A BACTERIOLOGICAL LABORATORY FOR LONDON has been suggested by the London County Council, that body having recently addressed a communication to each of the vestries and district boards throughout the metropolis asking them whether they would be in favour of the Council applying for Parliamentary powers to establish such a laboratory. The idea is to appoint an expert or experts in connection with the projected institution, or otherwise to make arrangements whereby medical officers of health and medical practitioners in London could obtain, at the expense of the county, the examination by a competent bacteriologist of material from suspected cases of infectious disease, with a view to aiding in the diagnosis. Owing to the summer vacation of the various local authorities the proposition has not yet been fully considered by the majority, but, according to a correspondent of the *Times*, so far as those are concerned who have paid attention to the question, the scheme has met with unanimous approval. Among the authorities who have already pronounced in favour of the project are the vestries of Shoreditch and St. Pancras. In the case of Shoreditch the Health Committee of the Vestry points to the laboratory established by the city of New York some five years ago in connection with a scheme for general bacteriological examination of cases of diphtheria, and states that it has been received by the medical profession of that city with almost unanimous approval. In St. Pancras the Vestry has already made some progress in the direction indicated, since it appears early last year to have sanctioned the examination of pathological material in doubtful cases of diphtheria and typhoid fever, the examinations being made

when necessary, and they are considered essential to the proper notification and prevention of the spread of the disease to which they apply. The St. Pancras Vestry has come to the conclusion that a central bacteriological laboratory should be established rather than smaller local ones, and that such an institution could be provided by the Metropolitan Asylums Board, under the latter's Parliamentary powers, in the new premises now being built on the Victoria Embankment.

WHAT IS A PROFESSOR?—Doubtless everyone thinks he knows, but let the school children reply as they have done to Miss Catherine J. Dodd, who contributes "A Study of School Children" to the *National Review*. They were asked what is a policeman, a postman, a soldier, a king, and so forth. But the professor was the real crux. The country children avoided the question altogether or associated the professor with tricks at a show. Among the other replies were these: "A professor is someone who writes stories." "A man who makes a book." "A gentleman who publishes something." "A man who has passed a high examination." "A very clever man." "A learned man well-known." "One who can do his work easily." "A man skilled in sense." "A professor is a man who is well off." "A man who lives in a nice house." "A professor is a man who does something good." "A person who professes to do something." "A man who says he can do anything." "A professor teaches all kinds of instruments." "He is one who knows different languages." "A professor is a man or woman who teaches singing." "A man who knows clever tricks." There is something to be said in favour of each of these definitions, but the last one in particular seems particularly good.

MEDICINE STAMPS yielded the noble sum of £260,852 7s. 5d. net to the British Exchequer during the year ending March 31 last. The total number of stamps sold was 33,195,811, including 27,086,000 at 1½d., 5,167,588 at 3d., 833,957 at 6d., 98,894 at 1s., 4880 at 2s., and 4492 at 3s. The gross receipts derived from medicine stamp duty amounted to £260,950 0s. 3d., but nearly £100 must be deducted from that amount for repayments and allowances. The modest balance speaks well for the credulity of the British public and the prosperity of quacks.

DEATHS BY POISONING IN SCOTLAND during 1896, a report of which has only been published a few weeks, included seventy-nine due to accident and thirty-four attributed to suicide. The details, so far as regards the more important poisonous substances, are given below in tabular form:—

Poison.	ACCIDENTAL.		SUICIDES.	
	Males.	Females.	Males.	Females.
Opium	8	8	4	1
Laudanum	4	5	4	1
Morphine	1	—	—	—
Other Narcotics	2	—	—	1
Aconite	1	—	—	—
Arsenic	—	1	—	—
Carbolic Acid	5	3	3	6
Chloroform	3	—	—	—
Hydrocyanic Acid	2	—	2	—
Strychnine	—	1	1	—
Belladonna	—	—	—	1
Nitric Acid	—	—	1	—
Sulphuric Acid	—	—	1	1
Oxalic Acid	—	—	—	1
Mercuric Chloride	—	—	1	—
Mercuric Oxide	—	1	—	—
Phosphorus	—	—	1	—

The position occupied by carbolic acid, though not quite so prominent as in England, appears sufficiently so to justify its inclusion in the list of scheduled poisons.

British Association.

ADDRESS TO THE CHEMICAL SECTION

BY PROFESSOR F. R. JAPP, M.A., LL.D., F.R.S.

President of the Section.

STEREOCHEMISTRY AND VITALISM.

Of the numerous weighty discoveries which science owes to the genius of Pasteur, none appeals more strongly to chemists than that—with which he opened his career as an investigator—establishing the connection between optical activity and molecular asymmetry in organic compounds. The extraordinary subtlety of the modes of isomerism then for the first time disclosed; the novelty and refinement of the means employed in the separation of isomerides; the felicitous geometrical hypothesis adopted to account for the facts—an hypothesis which subsequent investigation has served to confirm; the perfect balance of inductive and deductive method and, lastly, the circumstance that in these researches Pasteur laid the foundation of the science of stereochemistry, are characteristics which, taken together, stamp it as the capital achievement of organic chemistry.

Physiologists, on the other hand, are naturally more attracted by Pasteur's subsequent work, in which the biological element predominates; in fact, I doubt whether many of them have given much attention to the earlier work. And yet it ought to be of interest to physiologists, not merely because it is the root from which the later work springs, but because it furnishes, I am convinced, a reply to the most fundamental question that physiology can propose to itself—namely, whether the phenomena of life are wholly explicable in terms of chemistry and physics; in other words, whether they are reducible to problems of the kinetics of atoms, or whether, on the contrary, there are certain residual phenomena, inexplicable by such means, pointing to the existence of a directive force which enters upon the scene with life itself, and which, whilst in no way violating the laws of the kinetics of atoms—whilst, indeed, acting through these laws—determines the course of their operation within the living organism.

The latter view is known as Vitalism. At one time universally held, although in a cruder form than that just stated, it fell, later on, into disrepute; "vital force," the hypothetical and undefined cause of the special phenomena of life, was relegated to the category of occult qualities; and the problems of physiology were declared to be solely problems of chemistry and physics. Various causes contributed to this result. In the first place, the mere name "vital force" explains nothing; although, of course, one may make this admission without thereby conceding that chemistry and physics explain everything. Secondly, the older vitalists founded force with energy; their "vital force" was a source of energy; so that their doctrines contradicted the law of the conservation of energy, and became untenable the moment that this law was established. I would point out, however, that the assumption of a purely directive "vital force," such as I have just referred to, using the word "force" in the sense which it bears in modern dynamics, does not necessarily involve this contradiction; for a force acting on a moving body at right angles to its path does no work, although it may continuously alter the direction in which the body moves. When, therefore, Professor J. Burdon Sanderson writes: "The proof of the non-existence of a special 'vital force' lies in the demonstration of the adequacy of the known sources of energy in the organism to account for the actual day by day expenditure of heat and work," he does not consider this special case. The application of the foregoing principle of dynamics to the discussion of problems like the present is, I believe, due to the late Professor Fleeming Jenkin. A third ground for abandoning the doctrine of a "vital force" was the discovery that numerous organic compounds for the production of which the living organism was supposed to be necessary, could be synthesised by laboratory methods from inorganic materials. It is the validity of some of the conclusions drawn from the latter fact that I wish especially to consider.

Recent years have, however, witnessed a significant revival of the doctrine of vitalism among the physiologists of the younger generation.

It is not my intention to offer any opinion on the various arguments which physiologists of the neo-vitalistic school have put

forward in support of their views; these arguments and the facts on which they are based lie entirely outside my province. I shall confine myself to a single class of chemical facts rendered accessible by Pasteur's researches on optically active compounds, and, considering these facts in the light of our present views regarding the constitution of organic compounds, I shall endeavour to show that living matter is constantly performing a certain geometrical feat which dead matter, unless indeed it happens to belong to a particular class of products of the living organism and to be thus ultimately referable to living matter, is incapable—not even conceivably capable—of performing. My argument, being based on geometrical and dynamical considerations, will have the advantage, over the physiological arguments, of immeasurably greater simplicity; so that, at all events, any fallacy into which I may unwittingly fall will be the more readily detected.

In order to make clear the bearing of the results of stereochemical research on this physiological problem, it will be necessary to give a brief sketch of the stereochemistry of optically active organic compounds, as founded by Pasteur and as further developed by later investigators.

Substances are said to be optically active when they produce rotation of the plane of polarisation of a ray of polarised light which passes through them. The rotation may be either to the right or to the left, according to the nature of the substance; in the former case the substance is said to be dextro-rotatory; in the latter, lævo-rotatory. The effect is as if the ray had been forced through a twisted medium—a medium with a right-handed or a left handed twist—and had itself received a twist in the process; and the amount of rotation will depend upon the degree of "twist" in the medium (that is, on the rotatory power of substance) and upon the thickness of the stratum of substance through which the ray passes, just as the angle through which a bullet turns in passing from the breech to the muzzle of a rifle will depend upon the degree of twist in the rifling and the length of the barrel. If the bullet had passed through the barrel in the opposite direction, the rotation would still have been in the same sense; since a right-handed (or left-handed) twist or helix remains the same from whichever end it is viewed, in whichever direction it is traversed. This also applies to optically active substances; if the polarised ray passes through the substance in the opposite direction, the rotation still occurs in the same sense as before. This characteristic sharply distinguishes the rotation due to optically active substances from that produced by the magnetic field, the latter rotation being reversed on reversing the direction of the polarised ray.

Optically active substances may be divided into two classes. Some, like quartz, sodium chlorate, and benzil, produce rotation only when in the crystallised state; the dissolved (or fused) substances are inactive. Others, like oil of turpentine, camphor, and sugar, are optically active when in the liquid state or in solution. In the former case the molecules of the substance have no twisted structure, but they unite to form crystals having such a structure. As Pasteur expressed it, we may build up a spiral staircase—an asymmetric figure—from symmetric bricks; when the staircase is again resolved into its component bricks the asymmetry disappears. (I will explain presently the precise significance of the terms symmetry and asymmetry as used in this connection.) In the case of compounds which are optically active in the liquid state the twisted structure must be predicated of the molecules themselves; that is, there must be a twisted arrangement of the atoms which form these molecules.

The earliest known experimental facts regarding the rotation of the plane of polarisation by various substances, solid and liquid, were discovered by Arago and by Biot.

After this preliminary statement as to what is understood by optical activity, we may consider Pasteur's special contributions to the solution of the problems involved.

Pasteur tells us, in the well-known "Lectures on the Molecular Asymmetry of Natural Organic Products," which he delivered in 1860 before the Chemical Society of Paris, that his earliest independent scientific work dealt with the subject of crystallography, to which he had turned his attention from a conviction that it would prove useful to him in the study of chemistry. In order to perfect himself in crystallographical methods, he resolved to repeat all the measurements contained in a memoir by De la Provostaye on the crystalline forms of tartaric acid, racemic acid, and their salts. These two sets of compounds have the same composition, except that they frequently differ in the number of molecules of water of crystallisation which they contain; but whereas tartaric

acid and the tartrates are dextro-rotatory, racemic acid and the racemates are optically inactive. It was probably this circumstance that decided Pasteur in his choice of a subject, for it appears that, even as a student, he had been attracted by the problem of optical activity. In the course of the repetition, however, he detected a fact which had escaped the notice of his predecessor in the work, accurate observer as the latter was—namely, the presence, in the tartrates, of right-handed hemihedral faces, which are absent in the racemates. Hemihedral faces are such as occur in only half their possible number; and in the case of non-superposable hemihedry, to which class that of the tartrates belongs, there are always two opposite hemihedral forms possible; a right-handed or dextro-form, and a left-handed or lævo-form. Which is right, and which is left, is a matter of convention; but they are opposite forms, and differ from one another exactly as the right hand of the human body differs from the left; that is, they resemble one another in every respect, except that they are non-superposable—the one cannot be made to coincide in space with the other, just as a right-hand will not fit into a left-hand glove. The one form is identical with the mirror image of the other, thus the mirror image of a right hand is a left hand. Such opposite hemihedral crystalline forms are termed *enantiomorphs*; they have the same faces and the same angles, but differ in the fact that all positions in the one are reversed in the other for one dimension of space, and left unchanged for the other two dimensions; this being the geometrical transformation which an object appears to undergo when reflected in a plane mirror. Enantiomorphism is possible only in the case of asymmetric solid figures; these alone give non-superposable mirror images. Any object which gives a mirror image identical with the object itself—a superposable mirror image—must have at least one plane of symmetry.

The hemihedry of the tartrates discovered by Pasteur is in every case in the same sense—that termed right-handed—provided that the crystals are oriented according to two of the axes which have nearly the same ratio in all the tartrates.

Pasteur was inclined to connect the molecular dextro-rotatory power of the tartrates with this right-handed hemihedry; since in the racemates both the hemihedry and the rotatory power were absent. A similar connection, which, however, held good only for the crystalline condition, had, as he points out, been already observed in the case of quartz, the crystals of which occasionally exhibit small asymmetric (tetartohedral) faces, situated in some specimens to the right and in others to the left; the former specimens being dextro-, the latter lævo-rotatory. The possibility of this connection was first suggested by Sir John Herschel.

Pasteur's views were confirmed by an unexpected discovery which he made shortly after. Mitscherlich had stated in 1844, in a communication to Biot, which the latter laid before the French Academy of Sciences, that sodium ammonium tartrate and sodium ammonium racemate were identical, not merely in chemical composition, but in crystalline form, in specific gravity, and in every other property, chemical and physical, except that the solution of the former salt was dextro-rotatory, that of the latter inactive. And, to make his statement still more definite, he added: "The nature and the number of the atoms, their arrangement, and their distances from one another are the same in both compounds."

At the time this passage appeared Pasteur was a student in the *École Normale*. He tells us how it puzzled him, as being in contradiction to the views universally held by physicists and chemists that the properties, chemical and physical, of substances depended on the nature, number, and arrangement of their constituent atoms. He now returned to the subject, imagining that the explanation would be found in the fact that Mitscherlich had overlooked the hemihedral faces in the tartrate, and that the racemate would not be hemihedral. He therefore prepared and examined the two double salts. He found that the tartrate was, like all the other tartrates which he had investigated, hemihedral; but, to his surprise, the solution of the racemate also deposited hemihedral crystals. A closer examination, however, disclosed the fact that, whereas in the tartrate all the hemihedral faces were situated to the right, in the crystals from the solution of the racemate they were situated sometimes to the right and sometimes to the left. Mindful of his view regarding the connection between the sense of the hemihedry and that of the optical activity, he carefully picked out and separated the dextro- and lævo-hemihedral crystals, made a solution of each kind separately, and observed it in the polarimeter. To his surprise and delight, the solution of the right-handed crystals was dextro-rotatory; that of the left-handed, lævo-

rotatory. The right-handed crystals were identical with those of the ordinary (dextro-) tartrate; the others, which were their mirror image, or enantiomorph, were derived from the hitherto unknown lævo-tartaric acid. From the dextro- and lævo-salts, thus separated, he prepared the free dextro- and lævo-tartaric acids. And having thus obtained from racemic acid its two component acids—dextro- and lævo-tartaric acids—it was an easy matter to recombine racemic acid. He found that, on mixing equal weights of the two opposite acids, each previously dissolved in a little water, the solution almost solidified, depositing a mass of crystals of racemic acid.

These two tartaric acids have the same properties, chemical and physical, except where their opposite asymmetry comes into play. They crystallise in the same forms, with the same faces and angles; but the hemihedral facets, which in the one are situated to the right, are, in the other, situated to the left. Their specific gravities and solubilities are the same; but the solution of the one is dextro-rotatory; of the other, lævo-rotatory. The salts which they form with inorganic bases also agree in every respect, except as regards their opposite asymmetry and opposite rotatory power. They are enantiomorphous.

Pasteur, discussing the question of the molecular constitution of these acids, anticipates in a remarkable manner the views at present held by chemists. "We know, on the one hand," he says, "that the molecular structures of the two tartaric acids are asymmetric, and on the other, that they are rigorously the same, with the sole difference of showing asymmetry in opposite senses. Are the atoms of the right acid grouped on the spirals of a right-handed helix, or placed at the solid angles of an irregular tetrahedron, or disposed according to some particular asymmetric grouping or other? We cannot answer these questions. But it cannot be a subject of doubt that there exists an arrangement of the atoms in an asymmetric order having a non-superposable image. It is not less certain that the atoms of the left acid realise precisely the asymmetric grouping which is the inverse of this."

The idea of the irregular tetrahedron is, it may be explained, derived from the hemihedral facets. Imagine these to develop in the case of dextro-tartaric acid until the other faces of the crystal disappear, and there results an irregular tetrahedron. Repeat the process with a crystal of lævo-tartaric acid, and the enantiomorphous tetrahedron—the mirror-image of the former—is obtained. We shall see later that the idea, on the one hand, of two asymmetric tetrahedra, and, on the other, that of two opposite helices, given as alternatives by Pasteur to explain the grouping of the atoms within the molecules of dextro- and lævo-tartaric acids, are in reality identical.

The precision of Pasteur's views as to the asymmetry of these acids enabled him to discover two further methods of separating them. Thus he points out that although these acids will possess equal affinity for any given symmetric base, such as potash, or ammonia, or aniline, yet their affinities will not be equal if the base, like quinine or strychnine, is itself asymmetric; because here the special one-sided asymmetry of the base will modify its mode of combination with the two enantiomorphous acids. The solubility is different in the case of the dextro- and lævo-tartrates of the same asymmetric base; the crystalline form, the specific gravity, the number of molecules of water of crystallisation, may be all different. Potassium dextro- and lævo-tartrates are mirror images of one another; quinine dextro- and lævo-tartrates are not. Pasteur employed in his experiments the asymmetric base cinchonine, which he converted into its acid racemate, and allowed the solution to crystallise. The first crystallisations consisted of pure lævo-tartrate of cinchonine, whilst the more soluble dextro-tartrate remained in the mother liquor, from which it finally crystallised in forms totally distinct from those of the lævo-tartrate.

Pasteur's third method is of physiological interest, and is, moreover, the stepping-stone to his later work on ferments. As we shall see presently, he regarded the formation of asymmetric organic compounds as the special prerogative of the living organism. Most of the substances of which the animal and vegetable tissues are built up—the proteids, cellulose—are asymmetric organic compounds, displaying optical activity. Pasteur had shown that two compounds of inverse asymmetry behaved differently towards a third asymmetric compound. How would they behave towards the asymmetric living organism?

It had frequently been noticed that impure calcium tartrate, when mixed with organic matters, as is the case when it is obtained in the process of preparing tartaric acid from argol, readily under-

went fermentation. Pasteur examined the action of the ferment (apparently a *Penicillium*) on ammonium tartrate—a substance which had the advantage over calcium tartrate of being soluble—and finding that the fermentation here followed a normal course, ending with the destruction of the tartrate, repeated the experiment with ammonium racemate, examining the solution from time to time with the polarimeter. The fermentation proceeded, apparently, as before; but the solution, originally optically inactive, became lævo-rotatory, the activity gradually increasing in amount until the maximum was reached. At this point the fermentation ceased. The whole of the dextro-tartrate had disappeared, and from the solution the lævo tartrate was obtained in a state of purity. The asymmetric living organism had selected for its nutriment that particular asymmetric form of tartaric acid which suited its needs—the form, doubtless, which in some way fitted its own asymmetry—and had left the opposite form either wholly or, for the most part, untouched. The asymmetric micro-organism, therefore, exhibits a power which no symmetric chemical substance, such as our ordinary oxidising agents, and no symmetric form of energy, such as heat, can ever possess: it distinguishes between enantiomorphs. If we oxidise racemic acid with nitric acid, for example, both the enantiomorphous constituents are attacked in exactly the same degree. If we heat racemic acid, whatever happens to its right-handed constituent happens equally to its left-handed constituent; the temperature of decomposition of both is the same. Asymmetric agents can alone display selective action in dealing with enantiomorphs.

By the action of heat Pasteur converted ordinary tartaric acid into racemic acid, in which process a portion of the right acid is converted into the left, an equilibrium being established; and lævo-tartaric acid may be converted into racemic acid in the same way, the inverse change taking place. At the same time, a new tartaric acid is formed in both cases: mesotartaric acid, or true inactive tartaric acid, which resembles racemic acid in having no action on the plane of polarisation, but differs from it in not being separable into two acids of opposite activity. According to our present views, it contains two equal and opposite asymmetric groups within its molecule. Racemic acid is thus inactive by inter-molecular compensation; mesotartaric acid, by intra-molecular compensation.

Pasteur, generalising somewhat hastily from the few cases which he had studied, came to the conclusion that all organic compounds capable of exhibiting organic activity might exist in the foregoing four forms—dextro, lævo, racemoid, and meso. As regards the dextro and lævo forms, this is correct; as regards the racemoid form it is generally correct; but the meso form, as we now know, is a very special case, implying that the molecule contains two structurally identical complexes of opposite asymmetry.

Were I following the exact historical order, I should introduce here Pasteur's view that compounds exhibiting optical activity have never been obtained without the intervention of life—a view which it is the object of the present address to consider. The later developments of stereochemistry, however, throw so much light on this question, and enable us to discuss it with such precision, that we shall turn our attention to these first. Before so doing, however, we may note that, in spite of the immense growth in the material of stereochemistry, and in spite of the development of the theoretical views of stereochemists, hardly any experimental method of fundamental importance for the separation and transformation of optically active compounds has been added to those described in Pasteur's classical researches, although it is almost forty years since these came to a close. Perhaps Walden's remarkable discovery of a method for the transformation of certain enantiomorphs into their optical opposites without previous racemisation, is the only one entitled to be so classed.

Pasteur was in advance of his time, and his theory of molecular asymmetry was a seed that lay for many years in the ground without germinating.

In 1858, just about the period when Pasteur was concluding his researches in the foregoing field, Kekulé published his celebrated theoretical paper, "On the Constitution and Metamorphoses of Chemical Compounds, and on the Chemical Nature of Carbon," in which he showed that, by assuming that the carbon atom had four units of affinity, the constitution of organic compounds could be satisfactorily explained. This was the starting-point of the theory of chemical structure, and from that time to the present day organic chemists have been engaged, with enormous expenditure of labour, in determining the constitution or molecular structure of the carbon compounds on the lines of Kekulé's theory.

In order that Pasteur's ideas should bear fruit it was only necessary that his purely general statements with regard to molecular asymmetry should be specialised, so as to include the recognised constitution of organic compounds. It was from this union of Pasteur's theory with that of Kekulé that modern stereochemistry sprang. The necessary step was taken, independently and almost simultaneously, by Van't Hoff and Le Bel, in 1874. I will briefly state their conclusions, so far as these bear on the subject of optical activity.

If we examine the structural formulæ of a number of thoroughly investigated optically active organic compounds, we shall find that the molecule of each contains at least one carbon atom of which the four affinities are satisfied by four different atoms or groups—an asymmetric carbon atom, as it is termed.

(To be continued.)

LEGAL INTELLIGENCE.

PROCEEDINGS UNDER THE PHARMACY ACTS.

PHARMACEUTICAL SOCIETY *v.* CROOK.

At the Oldham County Court on Thursday, September 15, the case of the Council of the Pharmaceutical Society of Great Britain against John Crook, grocer, 687, Manchester Old Road, Rhodes, came on for hearing before His Honour Judge Jones. Mr. T. R. Grey, instructed by Messrs. Flux, Thompson, and Flux, appeared for the Society, and Mr. Shimmeld, solicitor, for the defendant.

Mr. Grey, in opening, said the action was brought by the Pharmaceutical Society against John Crook, and the facts were simply these:—From information with regard to the sale of poisons at the shop in question a witness, who would be called, went there on July 4 to make a purchase, and he did purchase a substance called Kay's compound essence of linseed, which contained morphine, one of the poisons within the Act. The question as to whether Kay's essence did contain morphine would not, he was glad to say, come before His Honour, because the defendant admitted that if he did sell—and this he denied—that Kay's essence did contain morphine.

Mr. Shimmeld: We say we do not know what it contains, but we are not going to dispute the point.

Mr. Grey: It says on the bottle that it contains morphine and chloroform, and also the word "Poison." We wrote them in order to save bringing an analyst down from London, and they write that an analyst would not be necessary.

Mr. Shimmeld: I am not going to dispute that, your Honour.

The Judge: I should like to know what the defence is.

Mr. Shimmeld: The defence is that we have not sold it.

Mr. Grey said the Act under which the Society were suing was the 31 and 32 Victoria, chapter 120, and was an Act to regulate the sale of poisons. These Acts provided for registration, etc., and the defendant was not a registered man. Section 2 defined what poisons were within the meaning of the Act, and he referred His Honour to the schedule on page 24, where he would see that amongst the preparations were morphine, prussic acid, cyanide of potassium, etc. Mr. Grey quoted the sections referring to the keeping of the Register, and also the clause referring to the sale whereby the defendant had rendered himself liable to a penalty of £5.

The Judge: Wholesale dealers may supply poisons.

Mr. Grey: Of course, but if the defendant comes within any part of the section he must prove it. He added that he only need refer to one case, that of the Pharmaceutical Society *v.* Armson, which was taken to the Court of Appeal, and that decided that the prohibition in Section 15 against the sale of poisons was not confined to the sale of the scheduled poisons in their simple state or to preparations of such poisons, but extended to the sale of compounds containing the scheduled poison as one of its ingredients. Then the exception in Section 16 as to making or dealing in patent medicines did not extend to proprietary medicines. He did not propose to read the judgments unless it was necessary to do so in the course of the case.

Arthur Foulds, sworn, deposed: I was instructed by the Pharmaceutical Society to make a purchase in this case, and I went to the shop of John Crook, 687, Manchester Old Road, Rhodes. It was on July 4 this year. I asked for some coffee and a bottle of Kay's essence of linseed. A middle-aged woman with

a wedding ring on, whom I took to be Mrs. Crook, served me. There was no one in the shop besides her. On asking her for Kay's essence, she said, "I have only one left." I could see it before I asked for it in a glass case on the counter, similar to the glass cases used in confectioners' shops. It was the only article in the case and prominently shown. She took the bottle produced out of the glass case and handed it to me, and I paid her 10½*d.* The bottle is in the same condition as when handed to me, the whole practically sealed up. I handed it over to Mr. Harry Moon, putting on a little white label for purposes of identification.

Cross-examined by Mr. Shimmeld: I am an inquiry agent.

Mr. Shimmeld: How many inquiries of this kind have you made before?

Mr. Grey: I really must object. It has absolutely nothing to do with this case.

The Judge: It is not relevant to the issue.

Cross-examination continued: I went at 1.35, during the time Messrs. Schwabe's calico printing people were out at dinner. I took the woman there to be Mrs. Crook. She had a wedding ring on. [Mrs. Crook stood up in court at Mr. Shimmeld's request, and witness said he would not swear she was the lady.] I was dressed as an ordinary workman—I had a muffler and cap and other things. I am not sure about the number of the shop. It is a corner place. I looked at the door but did not see a number on. I looked at the shop next door, the one nearer Middleton, and I fix the number in that way. I could not say whether there was a shop on each side of the street or not. I had no reason to take notice of that. I saw the name Crook over the door of the shop. I cannot say whether there is a shop on this side, and whether they sell the same compound.

Mr. Harry Moon, clerk in the office of the plaintiff Society, deposed to instructing the last witness to make the purchase, and to receiving the bottle produced from him.

Cross-examined: It is not a patent medicine, and so far as I am aware has not been sold as such. A person in Mr. Crook's position would not be at liberty to sell it.

Mr. Grey put in the bottle, and also the Register, and said that was his case.

Mr. Shimmeld said that, as he had already intimated, the defence was that they had not sold the bottle, and in support of this he should call Mrs. Crook, who would swear they had never sold a single bottle of Kay's essence of linseed, and if she had been asked for it the answer she would have given would have been "We have not got it."

Sarah Ann Crook deposed: I am the wife of John Crook, and I usually serve in the shop, which is a grocer's. My husband takes out a patent medicine licence, and we sell such things as Owbridge's lung tonic, boxes of pills, and things of that kind. I have never sold any of Kay's essence of linseed.

The Judge: You say you have never sold any, but have you any in the shop?

Witness: No, sir, we have no sale, and we have always kept from selling poisons.

The Judge: That is not the question.

Mr. Shimmeld: I will call all the parties who have anything to do with the shop.

Examination continued: I think I remember July 4. It was a Monday. I looked at the calendar. I do not remember the first witness coming into the shop. It is only a small village, and if any stranger had come in I should have noticed it. On July 4 I did not sell any Kay's essence to Mr. Foulds or anyone else.

Cross-examined by Mr. Grey: My daughter and my husband look after the shop. My daughter is 19 years of age.

Mr. Grey: I understand you have got a licence to sell patent medicines; what kind of patent medicines do you sell?—Owbridge's, Beecham's pills, Whelpton's, and Fenning's powders.

And "Mother Seigel's syrup"?—Sometimes.

Are you aware whether "Mother Seigel's syrup" contains poison with the meaning of this Act?

I am not.

Have you sold Winslow's soothing syrup?

No, I have not sold that.

And do you know that Kay's essence is one of the same class of medicines?

I did not know what it was.

In reply to further questions, witness said she attended to the invoices and things of that kind on account of her husband's

eyesight. She was sure they had not sold any of Kay's essence of linseed during the past three years, but she could not remember or say that they had none in the shop at all. They had not a good many people coming into the shop. Her husband was at Oldham on July 4, and her daughter was at home. They had no servant.

John Crook (sworn) stated: I keep the shop in question, which is 685A really. There is one No. 687 at the other side of the street. It is a grocer's shop, and it is possible they may sell Kay's compound essence of linseed.

The Judge: Of course he will say yes to that. It is quite possible.

Examination continued: I do not keep Kay's essence, and had none in my shop on July 4. We have sold it, but I do not think we have sold a dozen bottles in eleven years. The last I sold was six or seven months ago. I was ordering some from Mr. Sharp in February or March, and he advised me to have no more, as the right to sell it was lost in some way by Kay's people, and it came under the Poisons Act. I took his advice. Prior to that I had acted quite innocently, and thought the licence included that. In the eleven years I have had the shop I may have sold a dozen bottles, but none on July 4. Looking at the price on the bottle—9½*d.*—I never had one of that size in. I do not keep books, as my eyesight is rather bad. I simply order the things and pay the bills when due, and file them.

Mr. Grey: Only two questions, Mr. Crook. You say six or seven months ago you purchased some Kay's essence from Sharp, chemist?—I was going to order and he warned me.

Are you aware that on this very bottle is "Sharp, chemist"?—Probably so.

Sarah Ellen Crook, daughter of the last witness, also swore they had no Kay's essence of linseed in the shop.

The Judge: Let me see your hand. You have no wedding ring on, have you?

Witness: No, sir.

Cross-examined: I know everything in the shop. We have cakes in the glass case at present. I cannot swear from my own knowledge that we have not had Kay's essence in the shop within the past two years, but I do not remember any. That is all I can say.

In reply to the Judge, Mr. Grey said the section with regard to the penalty was Section 15, of 31 and 32 Victoria.

The Judge: My reason for asking is this, "Shall be liable to pay a penalty of £5." In this case I certainly feel strongly that the defendant has made a mistake. I cannot treat his evidence as an answer to that. He has been acting in ignorance of the law, and under the circumstances I should like to deal with him as leniently as possible.

Mr. Grey: I am afraid it is a penalty of £5 or nothing. We are only suing here for one penalty. There is on the bottle "Sharp, chemist." We have had several cases lately with regard to that, and he is in that way holding himself out as a chemist and druggist.

The Judge: That is the man he bought it from?

Mr. Grey: Yes, and by selling it under that title—Sharp, chemist and druggist—he is leading people to believe he is himself a chemist and druggist.

The Judge: No, I do not think that—he says "Crook, Rhodes."

Mr. Grey: Further than that, he has also committed an offence under Section 17, because he has not put his own name and address on the bottle. You see he has really committed three offences. My object in calling attention to that fact is that we only sue for one penalty. Therefore, I submit in this case it is not such a hardship quite as you might think.

The Judge said he thought the defendant had acted somewhat in ignorance of the law, and he was anxious not to impose a penalty; but it seemed to him, under Section 15, the Court had no discretion, and that he must inflict the penalty provided in the Act. Take the evidence. The evidence of the first witness, Mr. Foulds, who was instructed to attend at the defendant's shop. He said he went to the shop, and did not notice any number over the door, but saw the name—Crook. He went in, and a woman certainly served him, she had a wedding ring on, and he concluded it was the owner's wife. Further than that, there was a remarkable statement on her part that it was the last bottle they had in the shop. The defendant, according to his own evidence, has been in the habit of selling this to a limited extent, but for the last six or seven months he had not sold any. This was not evidence he could rely on in face of the direct evidence of the person sent there with explicit instructions to buy a certain

article, which he did buy and paid for. The defendant trusted to his memory as to when the last bottle was sold. Then they came to the wife's evidence, which was equally uncertain. First of all she said she was there and had not sold any, and when further examined she said she could not remember having Kay's essence in the shop on that day. If that were so, it showed her memory was not to be relied upon, and when they came to the daughter, she said she could not remember seeing any of Kay's essence in the shop. It seemed to him that the first witness happened to go in, and he purchased the very last bottle they had. It seemed to him, therefore, that the penalty had been incurred, and the learned counsel gave defendant the information that he was selling something else which might render him liable to a penalty. The best way would be for him to ascertain his exact legal position at once as to what he could or could not sell. At the same time, he was compelled to impose the penalty, which would be £5.

Mr. Shimmeld asked that it should be paid by easy instalments.

The Judge asked what Mr. Grey suggested. He wished to deal leniently. The Chief Clerk had seen the shop, and it was a poor one.

Mr. Grey said he left it entirely to His Honour's discretion as to what would be right under the circumstances. He would be aware that the Society was put to enormous expense in these cases, and if the instalments were low there was great difficulty in collecting. They cost a great deal more than they got from the County Court, and it was a public duty imposed upon them to see that nobody offended against the Act.

The Judge: Clearly it is a public duty, and it is for the protection of the public.

Mr. Grey replied he now left the matter in His Honour's hands.

The Judge: The Chief Clerk knows the shop, Mr. Grey, and it is a very small business, and under the circumstances, seeing that the matter is in the discretion of the Court, I shall not allow costs. I am bound so far as regards the penalty.

Mr. Grey: I am sorry to carry this on, but by Section 13 the Court is also bound as regards the cost.

His Honour, on referring to the section, said that was so, and ultimately made an order for the payment of penalty and costs at the rate of 8s. per month.

PHARMACEUTICAL SOCIETY *v.* WILLIAMS.

At the Llanrwst County Court on Friday, September 16, a case was heard before His Honour Judge Sir Horatio Lloyd, in which the Pharmaceutical Society of Great Britain sued Elizabeth Williams, Llanddewi, near Llanrwst, for £5 penalty for having kept open an establishment for retailing poisons contrary to the Pharmacy Act, 1868. Mr. T. R. Grey (instructed by Messrs. Flux, Thompson, and Flux, London) appeared on behalf of the Society and Mr. David Jones (Messrs. David Jones and Roberts, Llanrwst) defended.

Mr. Grey having stated the facts,

Mr. David Jones said they were admitted. The defendant was a poor woman who acted in ignorance. He consented to judgment, and asked His Honour to make an order for 5s. per month.

Mr. Grey said it was this ignorance which was dangerous and which did damage.

His Honour: An order for 5s. per month will be a perpetual reminder, and the Act is not likely to be forgotten.

An order was made accordingly.

DETECTION OF FORMALDEHYDE IN FOOD.—According to E. Rinini, if 15 C.c. of a highly diluted aqueous formaldehyde solution are mixed with 1 C.c. 1 per cent. phenyl-hydrazin-chloral-hydrate solution and three or four drops of fresh sodium nitro-prusside solution, then rendered alkaline with concentrated sodium hydroxide solution, a marked blue coloration, changing later to a deep red, is given on warming. The aldehydes of acetic, isobutyric, valerianic, benzoic, cinnamic, salicylic acids; paraldehyde, chloral, grape sugar, furfural, acetone, aceto- and benzo-phenone, camphor, methyl alcohol, and formic acid similarly treated do not give this reaction, which may therefore be considered characteristic. The reaction is suitable for the detection of formalin in food-stuffs. Milk containing formaldehyde treated as above turns blue to ash grey, the colour disappearing after fifteen minutes, giving place to a red colour.—*Chem. Repert.*, xxii., 146, after *Ann. d. Farmacoterap. e Chim.* 1, 9.

LETTERS TO THE EDITOR.

All Communications for the 'Pharmaceutical Journal' must be Addressed to the Editor, 17, Bloomsbury Square, London, W.C., and not in any case to individuals supposed to be connected with the Editorial Staff; no responsibility can be accepted unless this rule be observed. Communications for the Current Week's Journal should reach the Office not later than Wednesday, but news can be Received by Telegraph until 4 p.m. on Thursday.

FRENCH LAVENDER OIL AND THE BRITISH PHARMACOPEIA, 1898.

Sir,—The letter from Mr. J. C. Umney which appeared in your issue of the 3rd inst., is valuable and interesting, and I should have replied to it before, but have been waiting to hear from the distiller whose words I quoted. I have just heard from him, but he does not give a satisfactory explanation of his former statement, which I think can only be accounted for by the use of a different standard. Mr. Umney suggests that I should give results of my own experiments. I append therefore the results of the application of the Pharmacopœial tests to the nine samples of ol. lavand. exot. :—

No.	Spec. Grav. at 60° F.	Solubility in official proportion of alcohol 70 per cent.
1	0.886	Soluble
2	0.880	Insoluble
3	0.883	Insoluble
4	0.885	Soluble
5	0.887	Soluble
6	0.885	Soluble
7	0.900	Insoluble
8	0.905	Soluble
9	0.883	Insoluble

From these results it will be seen that nearly half the samples did not conform to the B.P. standard, and although I must acknowledge that my statement at the Conference was too sweeping, it behoves pharmacists to examine their oil of lavender carefully to see if it is in accordance with the official requirements.

Exeter, September 21, 1898.

H. WIPPELL GADD.

THE FALLACY OF STARCH-FREE FOODS.

Sir,—The interesting record of analyses in the Journal of September 17 by Mr. A. J. Cownley is only another instance of how we medical men are often deluded by glowing testimonials and advertisements. We have to thank Mr. Cownley for taking the trouble to bring this matter before us. Last year I had a patient suffering from diabetes, who, being well to do, was able to obtain from London supplies of diabetic bread, biscuits, and flour. They were all certainly very expensive, and not very pleasant to the palate. After a time I bethought me to test these expensive articles, and I was astonished to find that they were practically, as far as starch was concerned, identical with ordinary bread or flour. I at once placed my patient on ordinary regulated diet, and found that the state of health differed in no respect from what it did when "diabetic" bread was prescribed, and I afterwards discarded these fancy preparations altogether and got the cook instructed in preparing bran bread, mixed with washed flour. I found that an intelligent woman could so wash the flour that most of the starch was removed, and this mixed with bran could be made into a loaf, and the patient could have it fresh instead of fusty. Several hours' washing of oatmeal, too, I found removed the starch in great part, and this could be made into an agreeable porridge and eaten with cream. This sort of dietary with meats of all kinds and fruits (allowable) is less irksome to the patient than might be supposed. The fact of foods being prepared at home has a good effect on a patient. Oranges in November I found contained from 4 per cent. of a sugar which does not readily reduce Fehling's solution. Baked apple pulp in the same month contains from 6 per cent. of a sugar readily reducing Fehling's solution. If pharmacists took up this branch of work they could help medical men in determining the true value of foods in diabetes as in other diseases, and it would bring grist to the mill in an indirect way.

Leeds, September 19, 1898.

GORDON SHARP, M.D.

POTASSIUM BITARTRATE AND THE B.P., 1898.

Sir,—In the Journal of last week Mr. Doward draws attention to what seems self-contradiction in the official characters and tests of this salt. Cream of tartar is now required to contain 97·5 per cent., yet the volumetric determination is equivalent to 97·11 only, a difference of 0·39. Similar apparent inconsistencies are met with throughout the Pharmacopœia, but an explanation of such is found in the preface, where it is stated that the quantities of volumetric solutions requisite in testing are given with such degrees of accuracy as are obtainable with an ordinary burette. It is impracticable to read to the second place of decimals on an ordinary burette, therefore the B.P. statement, "Each gramme of the dry salt should require for neutralisation at least 5·2 C.c. of the volumetric solution of sodium hydroxide" is preferable to 5·220883, etc., C.c., which theory demands. In a few cases, such as arsenious and hydrobromic acids, more exact readings are given, but they are the exception, not the rule.

Edinburgh, September 19, 1898.

WILLIAM DUNCAN.

CLASSES FOR PHARMACEUTICAL STUDENTS.

Sir,—I enclose a prospectus of our evening classes, and should like to call your attention to the classes on pharmaceutical chemistry and botany. I notice that in your Students' Number this institute is not mentioned as supplying pharmaceutical courses. We made a start last year with pharmaceutical chemistry, lectures and practical work. We enrolled eleven for the lectures, ten Minor and one Major, candidates, and for the practical twelve Minor and three Major candidates. This year we have added botany, and if successful shall add materia medica next session. You will notice the hours are late to suit chemists' assistants and the fees are low.

South-Western Polytechnic,
Manresa Road, Chelsea,
September 20, 1898.

J. B. COLEMAN,
Head of Chemical Section.

* * * The special class in pharmaceutical chemistry, referred to by Prof. Coleman meets on Wednesdays at 8.45 p.m., the fee for a course of about forty experimental lectures being 6s. only, or, with one evening's practical work per week, 10s. A similar class in pharmaceutical botany is held on Tuesdays at 7.30 p.m., the fee in the latter case, 10s.—also including practical work.—[Ed. P. J.]

RECTIFIED SPIRIT OLD AND NEW.

Sir,—Owing to the altered strength of rectified spirit in the new B.P., I should like to know if spirit. rect. B.P. 1885 (which is known also as 56 o. p.) can be transformed into spirit. rect. B.P. 1898 (approximately 58 o. p.) by the addition of absolute alcohol; if so, how is it to be done?

September 13, 1898.

ENQUIRER (16/15).

* * * The alcohol conversion table, by Mr. F. C. J. Bird, published in the *Pharmaceutical Journal* for May 21 1898, gives complete data for the required purpose. [Ed. P. J.]

A CAUTION.

Sir,—We have had stolen from us, among other things, a quantity of medicine stamps, 1½d., 3d., and 6d. Would you kindly warn chemists through your columns against purchasing stamps offered for sale, and ask them to at once give information to the police if such a case occurs.

Cranbourne Street, London.
September, 15, 1898.

FRIZELL AND CO.

PUBLIC INSTITUTIONS AND THEIR DRUG CONTRACTS.

Sir,—In last week's number of the *Pharmaceutical Journal*, under "Pharmacy in Ireland," your correspondent states that public institutions have some difficulty with their drug contracts. In an infirmary under the Local Government Board a system is in use which has worked well. The contractor is supplied with the usual tender form, on which is given (only for a guide) a short list of the articles most used, with quantities used during preceding contract. The contractor has to send in with his form a list (his current price-list) stating how much discount he is prepared to allow off all the articles in that list. In adjudging contract the lists are compared one with the other, individual items being compared. This has the advantage that "faking" the prices is almost entirely prevented, as it is very unlikely that a contractor would issue a special list for that contract, also, that almost all drugs, etc., come under the contract, as most druggists make their price-lists as complete as possible, thus preventing the charging of high prices for things out of the contract, and,

lastly, putting the competitors on a more even footing as regards the tendering.

London, September 19, 1898.

W. J. D. (143/31).

M.P.H.S.?

Sir,—Would it not be a wise thing for the Council of the Pharmaceutical Society to recommend its members to use a definite set of initials, such as M.P.S.G.B., in order to show their connection with the Society, in the same way that members of the Irish Society would be distinguished by the letters M.P.S.I.? I think that if every member would use the distinctive initials on all his labels, circulars, etc., the public would very soon look for those initials as indicating the keeper of a "chemist's shop," and those outside the Society would find it worth their while to become members.

September 17, 1898.

A LOCAL SECRETARY (143/16).

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the '*Pharmaceutical Journal*' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms, and the registered number added in each instance should be quoted in any subsequent communication on the same subject.

HOLIDAYS.—In the absence of a written agreement to that effect we are afraid you have no ground for claim. [Reply to No. 6.—16/10.]

FORMULA REQUIRED.—We cannot undertake to prescribe medicines in these columns. [Reply to W. J. W.—16/12.]

BOTANICAL.—Your plant is a specimen of *Hypericum elodes*. [Reply to A. L.—11/91.]

PHOTO-MICROGRAPHY.—Thanks for your suggestion, but the author is already arranging to republish the articles in book form. [Reply to J. H. B.—143/17.]

COMMERCIAL INFORMATION.—Matters such as you refer to hardly come within our scope. All you need to know about the points you mention can be gleaned from such a book as 'Every Man's Own Lawyer,' published by Crosby, Lockwood and Son at 6s. [Reply to W. B. W.—141/16.]

FREEDOM OF THE CITY.—If you receive the freedom of the city you become a citizen and are entitled to participate in the election of what ought to be, but is not, the representative governing body. To become a freeman of the city you must be elected a member of a city guild. [Reply to W. B. W.—16/4.]

EFFECTS OF OPIUM.—The headache and tendency to sickness are attributed by medical authorities to the excretion of some decomposition product of morphine—such as apomorphine—from the blood into the stomach. The simplest remedy is another dose of morphine, but stimulants such as alcohol or cocaine are sometimes preferable. [Reply to SEDATIVE.—16/18.]

CELLULOID.—It ought not to be difficult to prepare a solution that will leave a clear film on evaporation by using amyl acetate as a solvent, but you will not be able to produce transparent and polished sheets of celluloid except you combine partial solution with pressure, and employ special appliances. You will find details of one process in the first volume of Thorpe's '*Dictionary of Applied Chemistry*.' [Reply to H. J. P.—16/16.]

INFORMATION WANTED.

CELLULOSE ACETATE.—I shall be glad if any reader can give me the address of a firm from whom I can obtain cellulose acetate.—J. H. B. (16/19).

PRINTING INK ERASER.—Can any of your readers tell me of a liquid which erases printing ink and leaves no stain? Such a liquid is prepared and largely used in America.—W. (16/20).

PROPRIETARY ARTICLES TRADE ASSOCIATION.

At a meeting of the Council of the above Association, held on Thursday, September 15, there were present Mr. Shorrock (Messrs. Bovril and Co.), Mr. Gilligan (Messrs. Corneille, David and Co.), Mr. J. E. Garrett, Mr. C. Sanger (Lambert and Co.), Mr. G. R. Barclay (Barclay and Sons), Mr. W. Edwards (Messrs. W. Edwards and Sons), Mr. Pickering (Messrs. F. Newbery and Sons), Mr. E. P. Sanger (Messrs. J. Sanger and Sons), Mr. A. Tebbut (Messrs. Sutton and Co.), Mr. W. R. Barnes, Mr. Bunker, Mr. Cooper, Mr. T. S. Wokes, and Mr. T. P. Garrett, Newport. In the absence of the President, through indisposition, the chair was taken by Mr. C. Sanger, who, before commencing the ordinary business of the meeting, drew attention to the lamentable death of the late Mr. Seely, who was a former Vice-President of the Association, and one of its most active supporters. Mr. Seely, he said, had taken a very active part in all questions affecting trade organisation, and was one of those men whom the drug trade could least spare. The Secretary was instructed to write to Mrs. Seely expressing the deepest sympathy of the members of the Council. It was also decided to send a letter of condolence to the Halifax Chemists' Association.

The report of the Executive Committee was read and adopted. Amongst other things, it stated that, since the last meeting of the Council, five proprietors had joined the Association, and over 150 retail members. The Committee expressed its great satisfaction at having received the fullest assistance from the wholesale houses in tracing supplies to cutters, and through their help a number of firms who had been buying on behalf of firms on the stop-list had been traced, and their supplies withheld. It was also stated that a number of attempts had been made to purchase goods in unusually large quantities by firms who could not possibly want the goods ordered in the ordinary course of their business. The Committee had, in each case, insisted upon a stringent undertaking, rendering the firm so purchasing liable to damage if the article reached the firms on the P.A.T.A. stop-list, and it withheld supplies unless a satisfactory explanation was forthcoming. The Council were recommended to authorise a departure in regard to the Photographic Section, so that, in future, members of the Retail Drug Section of the Association, who were also photographic dealers, should be admitted members of the Photographic Section without further subscription. Most beneficial results were reported as a result of the visit of Mr. W. Johnston to the north of Ireland and certain Midland towns.

In reference to the Grocery Section, it was stated that considerable delay had arisen, owing to the necessity for waiting a reply from the secretary of the London Wholesale Spice and Rice Dealers' Association. The members of that Association had been invited by the Retail Grocery Section to co-operate with the view of forming a Wholesale Section of the P.A.T.A. A letter had, however, been received from the secretary of that Association, explaining that whilst they have every sympathy with the objects of the Association, they felt that the combination suggested would not be practical. The Retail Grocery Section would meet the proprietors early in October, and it would then be decided whether to form a Wholesale Section with the help of the country wholesalers, many of whom had written strongly in favour of such a course, or whether the grocery branch should only consist of two sections, namely, manufacturers and retail. On the motion of Mr. Tebbutt, seconded by Mr. E. P. Sanger, the report was unanimously adopted.

A recommendation to the Committee in reference to the Photographic Section was unanimously agreed to. The report of the Executive Committee in reference to the appointment of a solicitor to the Association was considered. The Committee recommended that Mr. F. W. Beck, of Messrs. Neave and Beck, should be appointed solicitor to the Association, so that the Secretary would be able to consult him at any time in connection with Association matters, and also to obtain, for any member of the Association, legal advice on any question arising in regard to their business. On the motion of Mr. Wokes, seconded by Mr. T. P. Garrett, Mr. Beck was unanimously appointed.

The question of the organisation by the Association, of a chemists' defence fund, was discussed, with the result that a sub-committee of the London retail members of the Association was appointed to draw up a scheme in detail, and submit it to the next meeting of the Council. The Secretary reported that he had

received inquiries from members of the Association as to whether they would be enabled, under the regulations laid down by the Association, to enter into an agreement with the United Service Association, Ltd. It was explained that this Association was inviting the public to become members at a small annual subscription, and in return were offering them various discounts upon the amount of their purchases made from certain traders who had entered into an agreement with the Association. It was unanimously decided that the trade be strongly urged not to enter into any arrangements by which companies or third parties were to assist them in dividing their profits with the public, and that it be pointed out that no such arrangements should be permitted by which purchasers obtained directly or indirectly a bonus or discount off the protected prices paid for P.A.T.A. articles.

PHARMACY IN IRELAND.

[From our Dublin Correspondent.]

THE CALM THAT PRECEDES A STORM is at present observed in the deliberations of the "pharmaceutical fathers" at Mount Street. The casual observer would scarcely gather from the report of last month's meeting of the Society how deep the fires are burning beneath the surface, or how near a crisis are matters affecting the future government of pharmacy in Ireland. Yet such is the case, and the result will be made manifest within the next few days. It is an open secret that the Society, as a body, has for some time past been "a house divided." That the remainder of the adage has not before this been exemplified is due mainly to the spirit of toleration and forbearance shown by those concerned. The leaven of discord is unfortunately working too well and time, instead of smoothing the difficulty, is only accentuating it.

BY THE TIME these notes reach my readers the war trumpet will have been sounded, and good men and true "from Fair Head in Antrim to Mizen Head in Cork," will be called on to show by their votes how much or how little they feel in connection with the leaven above referred to. In other words the annual elections of the Society will take place in a day or two, and the following councillors retire by rotation:—Messrs. Grindley, Wells, Montgomery, Kelly, Hayes, Conyngham, and Merrin. The first four may be taken to represent one side of the "House," and Messrs. Hayes, and Conyngham the other. Dr. Merrin, the remaining outgoing councillor, is a busy physician, and the proprietor of an extensive pharmacy in Dublin. For the seven vacancies on the Council there will probably be eleven candidates, namely the seven outgoing councillors already referred to, and Messrs. Tait (Belfast), Michie (Blackrock), Brittain (Drogheda), and Dr. McWalter (proprietor of Leonard's Medical Halls, Dublin). That all will actually go to the poll is however doubtful, as rumour has it that at least one of the candidates-elect is performing that sometimes difficult acrobatic feat of balancing himself on the hedge, and waiting to see who exactly are the "Richmonds" about to enter the field. The war-cry of Messrs. Grindley, Wells, Montgomery and Kelly is understood to be "*mort au compaignie; vive le pharmacie pur*," whilst that of the remaining warriors is varied. It may, however, be stated that Messrs. Tait, Michie and Brittain are the nominees of four of the outgoing members, Dr. McWalter being a free-lance and a powerful adversary by the same token.

IT WAS RECENTLY STATED that if the licentiates had been as wise when the elections were held last year as they were subsequently, the result would have been vastly different. The inference to be drawn is that votes given to some of the Councillors now retiring would have been otherwise disposed of, with the result that candidates who retired gracefully—or the reverse—from the contest then held, would have been probably returned on the Council. To those who made that statement the opportunity of mending their hand will now be offered, and with a view of testing the pharmaceutical chain by the link of company pharmacy, a circular signed by Messrs. Grindley, Wells, Montgomery, and Kelly is in course of issue to all voters of the Society, asking for their support to themselves, and also the three candidates whom they have nominated. The circular recapitulates all that the signatories have done for the good of pharmacy in general, and the licentiates in particular; and in addition to this, the three candidates referred to are each sending out strongly worded circulars of an election-

earing type, soliciting the suffrages of the "free and independent voters." To put it mildly, there will be a square fight, and on the result hangs the "company" question so far as the Society is concerned.

THOSE WHO HAVE AT HEART the best interests of the Society regard the present crisis as a melancholy instance of disunity. Formerly it was considered only courteous to re-elect the outgoing Councillors, and rarely, indeed, was a contest rendered necessary; but of late years all this has been changed, and not for the better of pharmacy or its followers. An erstwhile grave and dignified body has compromised its prestige by ways and means too well known to be dwelt upon. The ordinary rules of debate have on more than one occasion been violated, and the President literally shouted down by those who might reasonably be expected to assist him in preserving order. The explanation is unhappily expressed in one word—"self," and it is to bring matters to a head that the forthcoming extreme course has been resorted to.

OF THE OUTGOING COUNCILLORS some are sufficiently well known to need no word painting. None who were connected with pharmacy in 1875 but can remember Mr. William Hayes, whose popularity resulted in his election as President of the Society. Mr. Conyngham, an old and respective representative of pharmacy, is a director of the flourishing concern of Hayes, Conyngham, and Robinson, Limited, and has, throughout his career, vied with his co-director, Mr. Hayes, in maintaining the welfare of pharmacy from his experience of what it ought to be. Both gentlemen have spared no effort to cement the cordial relations between the trade and the public. Mr. Wells is also an ex-President of the Society, over the welfare of which he has presided with marked ability: he would still hold the reins of government but for his determined refusal to accept office again under existing conditions. He has the name of being a "fighting man," but it is right to say he fights with his head, or rather with his brains. Being a man with a will and determined on using it, he is apt to strike out vigorously in what he believes to be his mission, despite the odds. Mr. Wells may be fairly called the apostle of pure pharmacy and his worst enemies, of whom, for a belligerent, he has few, agree that all his actions are governed by *mens conscia recti*. Messrs. Grindley, Montgomery and Kelly are devoted followers of what has come to be known as "Wells' policy." In their personality they are highly estimable gentlemen. Mr. Grindley, though somewhat retiring in disposition, is counted one of the most valuable members on the Council—one who does good by stealth and blushes to find it fame. Mr. Montgomery hails from the "Northern Athens," and although not so well known to the Dublin craft he is always at hand when wanted. To Mr. Montgomery are entrusted the affairs of the society in Ulster, and to his zeal and watchfulness may fairly be ascribed the present satisfactory condition of pharmacy in the north of Ireland. Mr. Patrick Kelly is very popular with the licentiates, by whom he is regarded as *patriis boni*, having acted as their guide, philosopher and friend for many years past. Dr. McWalter, though a young man, has already made his mark in medical and pharmaceutical circles. An old chemist's assistant himself, he has that "fellow feeling" towards his quondam colleagues which makes him "wondrous kind" to all classes and conditions of assistants. Dr. McWalter's views on company pharmacy are extreme and it is the general belief that the welfare of the Society would be safe in his hands if elected to serve on the Council.

THROUGH THE SAD AND UNTIMELY DEATH last week at Clones of Mr. E. P. Murray, Councillor of the Pharmaceutical Society of Ireland, a report of whose tragic end appears elsewhere in these pages, a vacancy has been created on the Council which will probably be filled by the co-option of one of the four new candidates above referred to. In the event of Dr. McWalter not being returned for one of the seven vacancies it is not improbable he will be asked to allow himself to be co-opted in Mr. Murray's place.

IN THE EVENT OF DR. MCWALTER being elected M.C.P.S.I., the Pharmaceutical Society of Ireland will enjoy the distinction of having no fewer than five medical gentlemen on its Council, namely, Drs. Tichbourne, Merrin, Whitla, Walsh and McWalter, a striking sign that pharmacy and medicine are advancing hand in hand, and also that going with the times the old love has not

been cast off for the new, all being worthy sons of Galen before they became added to Æsculapius.

MINDFUL OF TIME'S PASSAGE, Mr. R. J. Downes, the energetic President of the Pharmaceutical Society of Ireland, is actively engaged in collecting material for the syllabus of the forthcoming evening meetings of the Society. Already, I understand, he has secured promises from eminent gentlemen to read papers or deliver lectures on subjects of interest to the members and the trade, and, as far as can be foreseen, a thoroughly successful session is already secured. It is to be hoped the President's efforts to inform, to instruct, and to amuse the licentiates will be recognised by an increased attendance at the meetings. Mr. Downes has not spared himself to make these gatherings popular, and it remains for the craft at large to make them populous by their presence. Last session the President foreshadowed a number of pleasing departures by the Society, including a botanical museum, and it was also suggested that a gymnasium be started for the benefit of the younger members. These and several other benefits are in store, and as a hearty welcome is extended by the President and the Council to all in the trade desirous of attending the meetings there is every reason to anticipate a cordial response.

ENCOURAGED BY THE SUCCESS which attended the first annual dinner in November last of the Pharmaceutical Society, the Council has decided on a "repeat" this year, and has fixed the date for the 4th proximo, when the President will "dispense" the hospitalities at the Shelbourne Hotel. The invitations will, I understand, be numerous and representative.

THE MANY FRIENDS of Mr. W. Vincent Johnston, M.P.S.I., honorary secretary of the Irish Pharmacists Assistants' Association, will be pleased to learn that he is about to open business on his own account in Ranelagh. Being well known and highly esteemed in that rising suburb of Dublin, Mr. Johnston is certain of success in his new venture.

APROPOS OF THE ASSISTANTS' ASSOCIATION, the opening meeting of that body for the ensuing winter session will be held the first week of next month, and much interest will be attached to the election of new office bearers. It is minus a President in consequence of the departure from Dublin to Belfast of Mr. W. J. Hardy, who so ably filled the chair for the past year. His successor has, I understand, been already named, and if the choice falls on the gentleman referred to, the right man will be in the right place. Like the parent body, the preparation of a syllabus is engaging attention, and a not less interesting literary menu is anticipated. A word of praise for so successfully conducting the affairs of the Association is due to Messrs. Turner, Johnston, and Hunt, through whose exertions may be ascribed its present strong position as a literary and social body.

THE LISTOWEL DRUG AND MEDICINE CONTRACT has assumed a new aspect. A fortnight or so ago the Local Government Board informed the Guardians of the Listowel Union that they regretted the medicine contract had been given to a Mrs. English, a Mullingar lady pharmacist, and the Guardians for the nonce cried *peccavi*. On reflection, however, they determined to stick to the contract, and accordingly appointed the lady, whose tender was not the lowest. This act of gallantry was quickly followed by an official mandate from the Local Government Board, that if the Guardians insisted on appointing Mrs. English, the Board would hold the Dispensing Committee responsible. This dire threat had the very opposite effect to that intended, and the Guardians once more displayed their chivalry by forthwith ratifying Mrs. English's tender. We may expect to see a sworn inquiry being held by the Local Government Board's Inspector.

THE TRAGIC DEATH of an Irish Pharmaceutical Councillor occurred at Clones on the 13th inst.; an accident occurred in the pharmaceutical concern of Mr. E. P. Murray, J.P., M.C.P.S.I., resulting in the death of the proprietor. It appears that on the evening in question he had been doing something in his pharmacy, regulating drugs on a shelf, when it gave way, and the contents fell about him. A large bottle of vitriol seems to have broken over his head and shoulders, his arms, head and face were burned black by the corrosive fluid, and he died on the following morning from shock, the effect of the burns.

NEW REMEDIES.

FERRIPTONE.—Ferriptone is a concentrated preparation of iron for subcutaneous injection or to be taken in water in the usual way. It is neutral, does not discolour the teeth, and is free from any marked taste or odour. Schuler has obtained good results with ferriptone in the treatment of various forms of anæmia and debility.—*Pharm. Zeit.*, xlii., 564.

AJACOL AND GUÄTHOL.—The dry distillation of the calcium salt of diethylprotocatechuic acid furnishes, according to Parthiel, besides the large amount of diethylprotocatechuic acid ethyl ester, pyrocatechin, and two other bodies, one of which the author classifies as diethylpyrocatechin—

This compound is a pale yellow oil, sinking in water without being dissolved. A few drops of alcohol, however, readily effect solution. It distils at 240°-249° C. The guäthol of Merck is pyrocatechin-mono-ethyl ester; it is prepared by heating molecular portions of pyrocatechin and alcohol with zinc chloride under a condenser or in closed vessels to 180°-220°C. The fluid is of an oily character and has an agreeable aromatic odour. In the cold it solidifies to colourless crystals, melting at 27°-28°C., boiling towards 215° C. Heyden has introduced a similar preparation in a crystallised state under the name of ajacol. The melting point of ajacol is 26° C., and boils at 209°-209°·5. The specific gravity of the liquefied ajacol is 1·0913 at 15° C., that of the guäthol 1·092. Ajacol crystallises very readily, but the guäthol much less so.—*Pharm. Zeit.*, xlii., 654.

FANGO.—Under this name a bluish-grey volcanic mud, derived from the hot springs of Battaglia, has been used as a cataplasm in rheumatism, gout, and similar affections. It is applied directly to the affected region first at 42° C., gradually raised to 56° C., and covered with cotton wool and gutta percha tissue. It is claimed to exert a chemical as well as a physical action, producing a profuse local diaphoresis.—*Rev. Med. Pharm.*, v., 138, after *Med. Mod.*

QUINOPYRINE.—Santesson gives this name to a highly concentrated solution of quinine hydrochloride and antipyrine. A mixture of the following composition has already been introduced by Laveran for subcutaneous injections:—Quinine hydrochloride, 3 grammes; antipyrine, 2 grammes; distilled water, 6 grammes; also a solution of about 30 per cent. of quinine and 20 per cent. of antipyrine. Both authors state that the pains usually following on quinine injections are entirely avoided by the use of quinopyrine. Although this is not an entirely new observation, yet the immunity from pain and other ill effects is very strange, seeing that subcutaneous injections of concentrated solutions of antipyrine are always followed by violent convulsions. The neutral hydrochlorate of quinine alone is only soluble in water to the extent of 3 per cent. On the addition of antipyrine, according to Santesson, a 50 per cent. solution of the quinine hydrochloride is perfectly stable. The small volume of water used for the preparation of the solution is insufficient to saturate the powder. On heating, however, the mass soon commences to melt to a clear syrupy light yellow or almost colourless fluid. This fluid does not deposit crystals, neither do crystals appear on evaporation, only a varnish-like substance remains. Pure dry antipyrine seems to act as a kind of solvent on the quinine hydrochloride. When mixed in a test tube and heated on the water bath they melt gradually to a clear tough substance which does not crystallise on cooling. Santesson is of opinion that a new chemical body is formed during the process, since the effect of quinopyrine is in many cases entirely different from that produced by its constituents.—*Pharm. Ztg.*, xlii., 623.

ETHYLENE-DIAMINECRESOL IN THE TREATMENT OF SKIN DISEASES.—Ekstein finds that ethylene-diaminecresol has more marked antiseptic properties than other remedies of the phenol group, and that it has a very powerful bactericidal action, penetrating deeply into the tissues. In the strength solution usually employed, 0·25 to 1·5 per cent., it does not cause much irritation. It is specially useful in eczema, the treatment of sycosis, and in ulcerated legs and the treatment of infected wounds.—*Nouv. Rem.*, xiv., July 8, 1898, 300, after *Vratch.*

EXTRACTS FROM CONSULAR REPORTS.

THE PRODUCTION OF INDIARUBBER in Lagos has suffered a serious falling off in 1897, owing to the reckless way in which it was collected, the amount shipped from the Colony in that year being 4,458,327 lbs., as against 6,484,365 lbs. in 1896. It is anticipated that the greed and guile of the small minority that collects and adulterates rubber, coupled with the apathy of the large majority of onlookers, must inevitably deal a severe blow at the trade, if it does not bring about the ultimate extinction of the industry in Lagos. The native chiefs are being encouraged, however, to have the rubber collected in a thrifty and systematic manner, which, it is hoped, will show good results in the near future.

THE EXPORT OF PALM OIL from Lagos during 1897 amounted to 1,858,968 gallons, showing a large decrease on the previous year, when 3,154,333 gallons were exported. There was also a decrease in the export of kernels. The dryness of the past two seasons is held to be responsible for the falling off in both cases. Cocoa and coffee are being cultivated with success in the Colony, and the Government is using every means in its power to encourage the cultivation of economic plants.

THE IMPORTS OF CAUSTIC SODA and potash and sulphates of iron and copper into Mexico during 1897 increased by nearly 40 per cent. over the previous year. This increase, however, was set off by a decrease in paints and colours and in miscellaneous drugs and chemicals. The values of the imports were:—Paints and colours, £54,419; miscellaneous drugs and chemicals, £191,655; caustic soda and potash and sulphates of iron and copper, £98,735.

THERE IS AN OPENING IN MEXICO, according to Consul Carden, for a good trade in English paints, which at present are not imported into that country. The paints that are now sold there are stated to be of inferior quality and very dear, all the colours being coarsely ground. It is also stated that no Japan gold size nor first quality paint or tinting brushes are obtainable in Mexico.

A BAD VANILLA CROP in 1897 caused the Mexican export of that product to be considerably less in quantity than in 1896, but a good rise in price tended in great measure to compensate for the loss. With regard to chicle, however, matters were exactly the reverse, the quantity exported in 1897 being nearly 500,000 lbs. more than the previous year, but a reduction of about 20 per cent. in price brought the total value of the exports to below that of 1896.

GREAT ATTENTION IS BEING PAID to the cultivation of the kola nut in the German colony of Togoland (Africa), also to the production of indiarubber. Regulations have been issued to prevent the wanton destruction of indiarubber trees, and the dealers receive licences from the Government. Only natives are allowed to collect this product, strangers being forbidden to ply the trade without a special licence, which costs £50 a year. The cultivation of the oil palm remains in the hands of the natives, Europeans not having as yet undertaken this branch of industry.

AN EXPERIMENTAL PLANTATION has been established at Sebbe, Togoland, where it is found that the trees which do the best are mangoes, eucalyptus, banana, bixa, orellana, oranges, and coffee. Another new garden is being started at Lome, where native gardeners are being trained.

THE METHOD OF CULTIVATION pursued by the natives in German East Africa is to burn tracts of country, cultivate the burnt tract, and then remove to another district, repeating the process. Efforts have been made to cure them of this primitive mode of procedure, and to introduce a more intelligent form of farming, but not with much success.

AN EXPERIMENTAL BACTERIOLOGICAL STATION has been established near Windhoek, South-West Africa, and it is hoped that a system of inoculation of the cattle to prevent a repetition of the recent outbreak of rinderpest will be successfully introduced and enforced. A similar station for the investigation of horse disease, it is reported, has been set on foot.

Announcements.

THE SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY will hold its Annual Dinner at the Masonic Hall, Sheffield, on Thursday, October 13, at 7.45 p.m. Earlier on the same evening, at 6.30, Mr. J. Rymer Young, of Warrington, Member of the Council of the Pharmaceutical Society, will deliver an address to the students, at the inaugural meeting.

MANCHESTER PHARMACEUTICAL ASSOCIATION.—The forthcoming session of this Association promises to be more than usually interesting. At the opening meeting on October 12 an address on "Pharmacy and Parliament" is to be given by Mr. John Harrison, J.P., of Sunderland. Mr. J. Rymer Young, another member of the Council of the Pharmaceutical Society, at the December meeting, is to discourse on "The Pharmacy Act, 1898, Literally Interpreted." Numerous contributions, critical or otherwise, on the new B.P. are promised, and a lantern lecture by Mr. H. Woolley, F.R.G.S., is also in the list of fixtures.

THE ROYAL PHOTOGRAPHIC SOCIETY will open its forty-third annual Exhibition at the gallery of the Royal Society of Painters in Water Colours, 5A, Pall Mall East, on Monday next, September 26, at 10 a.m. The exhibition will be open daily until November 12 next, from 10 a.m. to 5 p.m., and on Monday, Wednesday, and Saturday evenings from 7 to 10 p.m.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.—The annual meeting will be held at the Rooms, Whimble Street, on Wednesday, October 12, commencing at 2.30 p.m. The annual dinner will take place at Routly's Farley Hotel, Plymouth, on Wednesday, October 12, at 7.30 p.m., tickets 5s. 6d. each.

CHEMISTS' ASSISTANTS' UNION.—At a meeting of the Provisional Council, held at the Horse Shoe Hotel on Thursday night, September 15, it was decided that the first annual general meeting be held on October 6, at 9 p.m. at the Horse Shoe Hotel, when the opening address will be delivered by H. Dutch, Esq., M.D. Several patrons and a large number of members were elected, and a host of inquiries from all parts of the country were dealt with. Local secretaries were appointed in several towns, and a big meeting on the 6th prox. is anticipated.

AN EXHIBITION OF OPTICAL, scientific, and mathematical instruments will be opened by the Lord Mayor at the Mansion House, on Monday, October 3. There are so many persons, observes the *Daily Telegraph*, in London who either wear or expect to wear spectacles that the exhibition appeals to a fairly wide field. The new and the old style will be side by side, with many curious specimens of ancient optical instruments. The Astronomer-Royal, who has been for many years a member of the Spectacle-makers' Company (which is promoting the exhibition), will, it is expected, add to the interest of the collection by contributing some rare specimens from Greenwich Observatory. Most of the well-known firms of opticians are also sending exhibits, ancient and modern. The exhibition will be opened daily from October 3 to 7, from 2 o'clock until 9. Mr. H. C. Kemp, of Thavies-inn, who is a member of the guild, has been entrusted by the company with the organisation and management of the matter.

PHARMACEUTICAL SOCIETY OF IRELAND.—The last days for lodging applications for the October examinations will be:—For the pharmaceutical assistants, Monday, September 26; registered druggists, Tuesday, September 27; pharmaceutical licence, Wednesday, September 28.—The second annual dinner is, we hear, to take place on the evening of the 4th prox., and, judging from the inaugural one last year, a most enjoyable evening is in store for those privileged to be present.

OWING TO THE FAVOURABLE WAY in which the Liebig Company's Bonus Scheme has been taken up by the trade, the Company has decided to extend the period so as to include all orders received up to October 31 next, in order that buyers may take advantage of the 5 per cent. bonus when placing their seasons orders.

Accidental Poisoning Cases.

DISINFECTANT.—A verdict of "Poisoning by misadventure" was returned at an inquest held at the Durham County Asylum, Sedgfield, on Saturday last, with respect to the death of a patient named Geldard, who had found a bottle of disinfectant in a cupboard and drank some of the contents.

CARBOLIC ACID.—Norman Stead, aged two years, son of a journeyman stonemason, of 84, Wykham Street, Liverpool, died on Thursday, September 15, from the effects of drinking carbolic acid from a bottle temporarily placed upon the kitchen dresser. The mother had cautioned the children not to touch the bottle, but during her absence from the room the child drank some of its contents. A jury returned a verdict of "Accidental death," and the coroner remarked that no one was to blame.

SPIRIT OF SALT.—On Friday, September 9, John Preston, 60, builder, of Brent, drank a quantity of spirit of salt from a bottle which he supposed contained cider. Every effort was made to save life, but death occurred the next day.—At a subsequent inquest, the jury returned a verdict of "death by misadventure," and strongly condemned the keeping of such acids in bottles which are not labelled.

CARBOLIC ACID.—Another death due to the dangerous habit of keeping poisons in bottles not plainly labelled, together with medicine bottles and other articles in daily use, has occurred near Rooskey. A Mrs. Noble was unwell, and was taking medicine under doctor's orders. On Monday, September 12, she poured out and took a dose of what she supposed was her medicine, but which proved to be carbolic acid. Two doctors were quickly in attendance, but despite their efforts she died on Wednesday morning.

STRYCHNINE.—On Saturday last, Mr. R. Dobson, deputy coroner of the Warrington district, held an inquiry at Great Budworth, near Northwich, Cheshire, respecting the death by strychnine poisoning of Dr. W. Howard Clark, M.B. and C.M. Aberdeen, of Beccles, Suffolk. The evidence showed that on Thursday Dr. Clark, who had been in the village as *locum tenens* to Dr. Love for a fortnight, walked from Northwich, a distance of four miles. The heat was intense, and he reached home much exhausted. He went to his bedroom and then to the surgery, and afterwards sat down with Miss Muir (Dr. Love's sister-in-law), who was in charge of the house, to dinner. He had drawn the cork from a bottle of stout, and was just about to begin the meal when he called out, "I feel as if I had cramp all over," and presently fell back groaning. Miss Muir called for the groom, who endeavoured to unloose his collar and necktie. The doctor was then becoming black in the face, and he said, "Cut them." This was done, but afforded no relief, as he fell back unconscious and died in a few minutes. Subsequently it was found that the strychnine had been moved from the poison cupboard and stood on the surgery table, and an analysis of the dregs of a phial revealed a mixture of strychnine, ammonia, and gentian, which Dr. Haslewood, of Prescott, a friend of the deceased, said he had seen Dr. Clark take as a pick-me-up. The medical evidence disclosed the fact that a teaspoonful, or from half to three-quarters of a grain, of strychnine was found in the stomach. This was an absolutely fatal dose, and Dr. Mitchell, who conducted the post-mortem examination, stated that the exhausted condition of the deceased would render the poison more rapid in its effect. Letters were read to show that immediately prior to his death Dr. Clark was in the best of health and spirits. A verdict of "Death from misadventure due to the taking of an overdose of strychnine" was recorded.

OBITUARY.

ADLINGTON.—On September 7, William Benjamin Adlington, Chemist and Druggist, London. Aged 54.

WHITAKER.—On September 8, Thomas Whitaker, Chemist and Druggist, Ardwick.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

J. A. Belcher has reported in *Treatment* the results of experiments undertaken to determine the effect of various agents on the setting of plaster of Paris. He found that 2 drachms of plaster, mixed with 1 drachm of a 5 per cent. solution of sodium chloride, hardened in two minutes. Mixed with 1 drachm of a 5 per cent. solution of sugar, it hardened in three minutes and a half. Mixed with 1 drachm of a 1 per cent. sodium chloride solution, it hardened in five minutes. Mixed with 1 drachm of an 0.5 per cent. sodium chloride solution, it hardened in five minutes. Mixed with 1 drachm of a 5 per cent. calcium chloride solution, it hardened in six minutes and a half. Mixed with 1 drachm of tap water, it hardened in nine minutes. Mixed with 1 drachm of distilled water, it hardened in nine minutes. Mixed with 1 drachm of saturated solution of sodium chloride, it hardened in eighteen minutes. Mixed with 1 drachm of a 5 per cent. solution of glycerin in distilled water, it hardened in nineteen minutes. Mixed with 1 drachm of a 5 per cent. solution of white of egg in distilled water, it hardened in twenty minutes. Mixed with 1 drachm of a 10 per cent. solution of white of egg in distilled water, it hardened in twenty-five minutes. Mixed with 1 drachm of a 10 per cent. solution of glycerin in distilled water, it hardened in thirty-five minutes. Mixed with 1 drachm of a 25 per cent. solution of glycerin in distilled water, it hardened in sixty minutes. It would appear that where it is of importance to make plaster of Paris set rapidly it should be mixed with a 5 per cent. solution of common salt, such as may be made roughly by adding a table-spoonful of salt to a pint of water.—*Scient. Amer.*

J. U. Lloyd has completed an investigation undertaken under the auspices of the Research Committee of the American Pharmaceutical Association, with a view to establishing standards for black and white mustard. He considers that if not more than 1 per cent. of starch in the form of starch-bearing seeds, etc., is considered admissible in black mustard of commerce the U.S. Pharmacopœia should insist that no distinct blue starch reaction should be given when the sample is mixed thoroughly with nine times its weight of powdered black mustard seed previously ascertained to be free from starch, and 1 Gm. of the mixture is boiled with 10 C.c. of a 5 per cent. aqueous solution of potassium iodide, then cooled, and from one to three drops of 2 per cent. iodine test solution, U.S.P., allowed to flow down the side of the test-tube. In the case of white mustard seed, if not more than 1 per cent. of starch is considered admissible, the sample should be mixed with twenty-four times its weight of starch-free powdered white mustard seed, and submitted to the same test. If either black or white mustard is required to be absolutely free from starch there should be no bluish coloration whatever when the samples are submitted to the test.—*Am. Journ. Pharm.*, lxx., 433.

H. V. Army has prepared specimens of anise, camphor, cinnamon, fennel, peppermint, and spearmint waters, for comparative purposes, by absorbing the oil with absorbent cotton and precipitated calcium phosphate respectively, and finds that there is some ground for the complaint that those made by absorbing the oil with phosphate do not keep so well as those made with absorbent cotton. He also prepared aqueous solutions of oil of wintergreen by various processes and, assuming that such a solution can be taken

as typical of all aromatic waters, he has arrived at the conclusion that the quantity of oil actually dissolved by water is so small that no process has much advantage over any other on the score of strength of product. The cotton process yields a product no stronger than that made by simple agitation, and though hot solution yields the most concentrated product, that when absolutely clear will be scarcely stronger than the calcium phosphate product.—*Am. Journ. Pharm.*, lxx., 422.

J. F. Woolsey has recently examined some powdered gamboge of dull ochre colour, which was soluble to the extent of less than 40 per cent. in 95 per cent. alcohol, leaving more than 50 per cent. undissolved on the filter. The insoluble matter consisted largely of starch. Good gamboge, he points out, should contain about 75 per cent. of resin, and no starch should be normally present, though a trace may be found owing to the method of collecting and packing. Eberhardt's test for starch was adopted in this case, 1 Gm. of the powdered gamboge being dissolved with stirring in 5 C.c. of potash solution, and 45 C.c. of distilled water then added together with an excess of hydrochloric acid. After stirring the whole until uniformly of a bright yellow colour, the thin magma is poured upon a pellet of absorbent cotton loosely inserted into the neck of a small funnel, and the almost colourless liquid which filters through is tested with a drop or two of iodine solution. If more than 2 per cent. of starch be present a dark blue colour or precipitate is produced immediately. Commercial powdered gamboge usually gives a greenish tinge and a faint blue colour is only gradually developed. The presence of 1 per cent. of starch causes a faint blue coloration, which becomes darker on standing, and a slight precipitate is deposited; 2 per cent. gives a decided blue immediately and a precipitate after standing a few hours.—*Am. Journ. Pharm.*, lxx., 446.

Professor Hanausek reports on a sample of powdered pimento which was suspicious on account of its dark brown colour, microscopical examination showed that the adulterant consisted of washed cacao husks.—*Pharm. Centr.*, xxxix., 436, after *Ztsch. f. Unter. d. Nath. Gemismittel*, 345.

In a paper read before the British Association at Bristol, J. Burke referred to the luminosity produced by striking lumps of sugar—in which case a flash is produced of a somewhat bluish white colour, the light being instantaneous, yet spreading into the sugar itself far beneath the struck surface—and stated that an almost continuous luminosity has been produced by a hammer striking automatically the rim of a rapidly rotating wheel of sugar (obtained by cutting up a sugar-loaf into a number of discs). The wheels or discs were about an inch thick, so as to stand the violent hammering, and the hammer was of the nature of a pendulum about four feet in length, which was drawn aside by an electro-magnet and then let go. If the impact was given when the wheel was stationary, so that only an impulse was given without rubbing, or if, on the other hand, the wheel was set spinning and the hammer was stationary and merely allowed to rub up against the wheel, the phenomenon was insignificantly small compared to that obtained when both rubbing and knocking took place together; that is, when the wheel and hammer were both working. The spectrum of the luminosity was confined to the more refrangible end of the spectrum, commencing somewhere near F, but it was difficult to determine exactly. To overcome the difficulty caused by the sugar wearing rapidly, the whole apparatus was fixed on rollers moved slowly along at a suitable rate to compensate for the change

in the position of the sparks which would otherwise take place, and by that means the sparks or flashes of luminosity, which appeared almost continuous, were made to take place always along the axis of the collimator of the spectroscope. The light appears to be produced either by some change in the configuration of the crystals of sugar or by some sort of chemical action set up between the sugar and the surrounding air at the freshly formed surfaces.

R. Fischer and J. A. Anderson find that a large proportion of the gas measured as nitric oxide in Allen's method for the assay of spirit of nitrous ether is vapour of ethyl nitrite, but that this does not vitiate the results to any great degree. Since one molecule of ethyl nitrite yields one of nitric oxide, the vapour of ethyl nitrite and of the nitric oxide formed by its decomposition should approximately occupy the same space. The results obtained by the authors also explain the apparent rapid decomposition at ordinary temperatures of ethyl nitrite by water, or by a solution of potassium iodide, even though both be entirely neutral, the nitrite being in reality driven off in the form of vapour. In one experiment, when working at a temperature of nearly 25° with a 17 per cent. solution of ethyl nitrite, more than 50 C.c. of gas came off upon the addition of potassium iodide solution, but none of that was nitric oxide, as at a temperature of 0° it all liquefied.—*Pharm. Archives*, i., 161.

Gruettner states that the fat of *Hamamelis virginica* consists principally of the ester of a monatomic alcohol of the formula of $C_{25}H_{44}O + H_2O$, phytosterin, melting at 137° C., and traces of triglycerides. It contains oleic, palmitic acid, and probably small quantities of a higher fatty acid. The astringent bodies are gallic acid, and a tannin, hamamelis tannin, of the formula $C_{14}H_{14}O_9 + 5H_2O$. Under certain conditions this is only obtainable in an amorphous condition. The bark also contains a glucosidal tannin. Both this hamamelis tannin and the glucosidal tannin are derivatives of gallic acid. The hamamelis tannin molecule possesses five hydroxyl groups as well as one carboxyl group. It is optically active, having the spec. rot. $G + 35.43$. This tannin gives benzoyl substitution products with all its hydroxyl groups. The sugar of hamamelis bark is glucose.—*Archiv d. Pharm.*, 1898, 278.

A patent has been secured by the firm of Schering for the preparation of a starch-free highly nitrogenous food from fœnugreek seeds. The seeds are ground to powder, deprived of essential oil by treatment with ether or other solvent, and then extracted with ethyl or methyl alcohol to remove the bitter principle and resinous matter. The residue of these extractions is then dried, and is stated to afford a valuable food material.—*Pharm. Zeit.*, 556, 43.

This plant—the “Korarima Cardamom”—is widely distributed in tropical Africa, and *Amomum angustifolium*. J. Mahon, writing from Zomba, states that he has found it fairly common by stream sides and in moist gullies. The Yaos call the plant “Tambali” or “Tambala.” It flowers in November and the seeds possess a decided spicy flavour. The natives eat the ripe fruits raw occasionally and are believed to use the seeds as a flavouring agent. It is a handsome and striking plant, often attaining a height of fifteen feet. The flowers are of a tawny orange colour with some rose-coloured markings, and are produced in dense compact clusters. The fruits, often produced in clusters of three, are a brilliant, shining scarlet. The roots possess very slight aromatic properties, less than the leaves.—*Kew Bulletin*, 142, 288.

FURTHER NOTE ON THE CONSTITUENTS OF LEMON OIL.

BY JOHN C. UMNEY AND RALPH S. SWINTON.

In a paper read before the British Pharmaceutical Conference at Belfast (see *P.J.* [4], vii. 196), we pointed out that a constituent, which could not be without effect on the odour of lemon oil, had up to that time been overlooked. Working with Messina oil, from 1.2 to 1.4 per cent. of ester was obtained, the characters of which led us to believe that it was geranyl acetate, and approximately the same quantity of total ester was obtained from oil of the Palermo variety.

We have found that the physical characters of concentrated oils of the two varieties from which the aldehydes have been removed by the process described later are very markedly different, and it was in order to determine the reason of such variation that our experiments were considerably extended.

MESSINA OIL.—2000 C.c. of oil of Messina variety, from which the stearopten had been removed, and also 90 per cent. of the terpene by distillation under reduced pressure, was treated repeatedly with a solution of acid sulphite of sodium of 30 per cent. strength to remove the aldehyde, the solution being separated while warm so as to prevent the crystallising out of the insoluble citronellal sodium bisulphite compound. This treatment was repeated until the oil did not show any decrease of volume, and it was then thoroughly washed and dried by means of anhydrous sodium sulphate.

To ascertain the proportion of esters present in this non-aldehydic residue, 5 C.c. was saponified with excess of alcoholic potash solution, the saponification number indicated being 102, equivalent to 35.7 per cent. of ester calculated as geranyl acetate. The whole volume of the non-aldehydic concentrated oil was now saponified with the calculated quantity of alcoholic potash solution, the saponified oils separated and the alcoholic solution evaporated to dryness.

The crude salt so obtained was distilled with dilute sulphuric acid, the distillate neutralised with decinormal soda solution and evaporated to dryness. This was converted into the silver salt, washed and dried. The determination of silver in this salt gave the following result: 0.64 gramme of the salt gave 0.410 gramme of silver. Theory requires that 0.64 gramme silver acetate should give 0.413 gramme silver.

This process for the determination of acids was repeated on the Palermo oil, with practically the same result. It is evident, therefore, that the acid present in the form of an ester in the oils of both varieties is acetic acid, and we have not been able to trace the presence of any other acid radicle.

For the separation and identification of the alcohols in the two oils 10 litres of the Messina oil was concentrated and purified as previously stated. The oil was saponified with the theoretical quantity of semi-normal alcoholic potash solution, washed, thoroughly freed from alcohol, dried, and fractionated under reduced pressure.

This yielded a fraction boiling from 225° to 240° C., having the following characters:—

Sp. gravity at 15° C. 0.887
Optical rotation in a tube of 100 Mm. +5

From this by repeated fractionation and by treatment with chloride of calcium pure geraniol was obtained, and its identity proved by oxidation to citral.

PALERMO OIL.—The alcoholic bodies were separated from this oil in the same manner as already described, and by fractionation under reduced pressure a portion was obtained which distilled at a

temperature of between 200° and 240° C. under normal pressure, the characters of which were:—

Sp. gravity at 15° C. 0.880
Optical rotation in a tube of 100 Mm. -12

By the wide range of boiling point, as well as by the relative difficulty of the formation of citral by oxidation with bichromate of potassium and sulphuric acid, it was evident that this did not consist only of geraniol. By repeated fractionation a portion was obtained having a specific gravity of 0.876 and an optical rotation of -16. These characters are in very close agreement with those of linalool as separated from lime oil by Gildemeister. The characters, however, of the varieties of linalool separated from different oils are widely different, and all lævo-rotatory alcohols represented by the formula $C_{10}H_{18}O$, giving citral by oxidation, appear to be included under this general title.

Pure geraniol was separated by its chloride of calcium compound, but the difficulty in obtaining it appears to indicate that it is present to the extent of not more than 25 per cent., and these proportions, viz., about 3 parts linalool and 1 part geraniol, are borne out by the physical characters of the alcoholic portion referred to.

Special search has been made for citronellol, the alcohol obtained by reduction from citronellal, which is present in both varieties of lemon oil, but we have not up to the present been able to obtain any indication of its presence.

It is evident from these results that the difference in odour of Palermo and Messina varieties of lemon oil, although in part due to the different relative proportions of citral and citronellal, is also considerably affected by the nature of the esters present, and the small proportion of linalyl acetate is probably not without effect upon the odour and taste of the Palermo variety.

PERCOLATION AND FILTRATION UNDER PRESSURE.

BY ARTHUR W. NUNN, PH.C.

Without claiming any originality for the process of percolation and filtration under pressure, I venture to offer the following method as a simple and effective means of performing the above operation. I have recently tried it for making tr. cinchonæ, B.P., 1898, and I find that the bark is exhausted quicker and the whole process completed in a much shorter time. An ordinary percolator, as figured, is taken and packed with the substance to be exhausted in the usual way.

Instead of connecting the lower part with the upper with a tube, as is usually done, a bored cork is placed in each neck, C and D, and to the cork C is fitted a piece of bent glass tubing, to which is attached about 18 inches of rubber tubing, to the end of which is attached a pump E, such as is used for inflating the tyres of bicycles. Into the cork D is fitted a piece of glass tubing, drawn out to a point to allow a passage of air.

The substance having macerated sufficiently, the tap F is turned on and the pump started, when the liquid runs through at a rate which depends upon the air pressure, and which can be regulated to suit the operator. After the liquid is through it is drawn off by tap H and returned to the upper portion.

This process being repeated two or three times the liquid is finally drawn off and a fresh portion of solvent added, which undergoes the same treatment until exhaustion of the drug is complete. Of course the process can be altered as circumstances suggest, but if the pump be connected as described it will prove useful where filtration has hitherto been retarded.

If the percolator, as figure, be used, be sure and tie down stopper U to prevent it being forced out. It is needless to warn against using more air pressure than the glass will stand.

NOVELISTS IN THEIR TREATMENT OF THE SCIENCE AND POISON PLOT.

BY "PHARMACIST."

Whether it is the scarcity of interesting episodes in human life or paucity of ideas in the brain of the modern novelist, the fact is patent that magazinedom is being inundated with stories which affect to treat the sciences in a familiar and quite know-all-about-them way. A series of adventures which lately appeared, written by L. J. Meade and Clifford Halifax, M.D., remind me strongly of the Jack Harkaway and Broad-Arrow Jack tales of my schooldays—the only difference being that the latter were one penny, the former appearing in the *Strand* at sixpence. These adventures teem with technical terms stuck in at intervals to give the vagaries of Paul Gilchrist (the adventurer) a scientific vein. There is one ludicrous narrative regarding a new explosive which Gilchrist is inventing, but owing to the "instability of nitrous anhydride" he collaborates with two others. These latter rob him of his secret and kill him in a very "scientific" manner to be sure; that is, instead of knocking him on the head with a poker, they strap him to a balloon whose car is loaded with nitro-glycerin and a glass globe-ful of two gases which on mixture will at sunrise explode, and thus he will be reduced to "impalpable dust." Of course, he turns up next morning at breakfast as usual. As a piece of burlesque it might pass, but as a serious illustration of any phase of science it is absurd. Again, this scientific Quixote has a Röntgen Ray apparatus and a battery to generate the electricity! Just think! He believes that the X rays are destined to be of marvellous utility; then a Brahmin swallows a diamond and Paul Gilchrist locates it, not in any ordinary or ignorant position, but in the ileo-caecal valve. It is not explained whether this region is in the vicinity of Achilles' tendon, or the calf of the leg, but it is not intended to convey knowledge to the reader, merely to mystify.

In the July *Strand* there is a picture drawn of a bacteriologist that is a libel on the faculty. This renowned person lives in Devonshire Street, London; he has culture plates, in fact, the article has mention of little else; they are being broken or carried away on secret missions. The bacteriologist, although he is armed to the teeth with bacilli, has to resort to the vulgar fashion of choking his victim, who is a rival "scientist" who babbles about "nitrifying bacteria." But he does not choke him. He concocts a fiendish torturing death; at the critical moment the doomed man says: "My long scientific training enabled me now to think clearly and consecutively. . . . This much, at least, was obvious, I could not stop the tide." A lemma of Newton is child's play to this deduction. There is no harm in inculcating a little knowledge in the form of a story, but the above inculcate naught save ignorance. Then there have been fictions about a pair of gloves impregnated with some "secret Indian poison"; when drawn on, the wearer drops dead instantaneously! Electricity is not to be compared with this for rapidity of effect.

Another appeared in the *Idler*. An artist and baron quarrelled over a fair lady; baron won; artist visited lady for a few minutes; lady found dead; the whole family, including wicked baron, die one by one; secret discovered; hypodermic syringe; chair fast to the floor; being seated in chair, lean back on syringe and get injected with aconite through a top-coat, dress-coat, waistcoat, etc.

It is a notable fact that first-class novelists do not deal in poison and science wares, and properly so; the sphere of the fictionist is elsewhere. The exception is Bulwer Lytton, whose "Lucretia" is a horrible phantasmagoria of nightmares, a monstrous and unnatural creation. The least judging reader gradually begins to see that Lucretia was a mad woman from the beginning of the story, who poisons right and left, for no conceivable purpose, and everyone feels that when she is finally incarcerated it should have been done years ago.

Conan Doyle confines himself to the snake-bite and the poisoned darts of the savage. In the "Sign of Four," little Tonga discharges a two-inch thorn tipped with poison. It reminds one of the famous Wourali Indians of America, whom 'Waterton's Wanderings' chronicle. With their famous wourali poison they could destroy a buffalo in three minutes. It is to be remembered, however, that they used for this class of animal darts eighteen inches long, a somewhat destructive weapon in itself.

In Dickens poison is ignored, but I will quote the conclusion of the well-known passage-at-arms between the judge and the chemist from "Pickwick," on account of its historical interest to pharmacists:—"I merely wanted to observe, my Lord," said the chemist, taking his seat with great deliberation, "that I've left nobody but an errand-boy in my shop. He is a very nice boy, but he is not acquainted with drugs, and I know that the prevailing impression on his mind is, that Epsom salts means oxalic acid, and syrup of senna, laudanum." Happily the grievance of jury-serving by pharmaceutical chemists has long been abolished, though the chemist and druggist is not in the same fortunate position.

Dickens also gives us a glance at the position of medical practitioners in the first quarter of the present century. Mr. Bob Sawyer's premises are described as "a newly-painted tenement which has been recently converted into something between a shop and a private-house, and which a red lamp projecting over the fan-light would have sufficiently announced as the residence of a medical practitioner, even if the word 'Surgery' had not been inscribed in golden letters above the window." When Mr. Winkle remarks that it is "a snug little business," the doctor replies, "Very; so snug that at the end of a few years you might put all the profits in a wine-glass and cover 'em over with a gooseberry leaf." Moreover, the stock is non-existent, "Half the drawers don't open, the other half have nothing in 'em."

This Bristol physician, when "treating" his friends, gave the only tumbler he possessed as an honour to the visitor; his boon mate, Ben Allen, was content with a "funnel with a cork in the narrow end," and the doctor himself imbibed from a large fluid measure.

The present affluence and authority of medical men is in striking contrast with their quondam impoverishment. But it should be remembered that the Pharmaceutical Society came into being in 1841. Those who follow the adventures of Richard Cœur de Lion in the pages of the "Talisman" will recollect that when the muscular monarch was enfeebled with fever, that Saladin, the famous Saracen chief, entered the English king's camp in disguise and abated the fever by the administration of some drug. As is usual in such cases when curiosity is whetted, the novelist does not discover the secret—perhaps because he is himself ignorant. R. L. Stevenson has furnished, in "Dr. Jekyll and Hyde," a good

instance of this. The doctor, by doses of a certain drug, manages to "hide" his identity. It is a very good romance, but for the matter of that any other medium than the science of medicine would have answered equally well.

BOTANIC GARDENS OF THE WORLD.

THE CAMBRIDGE BOTANIC GARDEN.

As soon as possible after the foundation of the Cambridge Colleges, gardens were laid out, but they seem to have been primarily intended for the purpose of growing fruit and vegetables. Saffron, which was much used both in medicine and cookery, was planted in the Pembroke Gardens; Corpus Christi and Queens' had vineyards. Hops were grown at King's in the middle of the sixteenth century. Turner, the first English botanist, complained, while studying medicine, of the want of a physic garden, a need felt later by Ray, the great Cambridge systematist.

It was not till long after the founding of the Oxford Botanic Garden by the Earl of Danby, that Cambridge actually acquired a botanic garden, but as early as the year 1588, Burleigh appears to have drawn the attention of the University to the need for one. His action in the matter seems to have been due to Gerrard. In the Lansdowne MSS. a letter of his to the Treasurer is preserved which is endorsed "John Gerrard, a bill of his owne drawing for ye L. Ther. [i.e., Burleigh] to signe to ye Universitie of Cambridge, for planting of gardens." After mentioning the physic gardens of Padua, Montpellier, and Vienna, and the service they had proved to be to the science of medicine, Gerrard is recommended to the University as an expert herbarist, "who by reason of his travaile into farre countries, his great practise and long experience, is thoroughly acquainted with the generall and speciall differences, names, properties and privie marks of thousands of plants and trees."

In 1695-1696 the scheme of a physic garden took the Vice-Chancellor, Dr. Eachard, to London, probably to obtain the advice of Loudon, the King's gardener. Loudon visited Cambridge three times in 1696, and one Robert Grumbold was paid five shillings "for measuring the intended physick-garden." The scheme, however, came to nothing. Again, in 1731, the project came up for consideration, nor did the promise of Dr. Bradley, the Professor of Botany, to present the University with a botanic garden. This proposal he is said to have made to secure the post, and though he repeated it publicly in his lectures in 1789, nothing was done.

A Mr. Brownell, of Willingham, was desirous of presenting the University with a Botanic Garden. The ground was chosen and the advice of Philip Miller, of Chelsea, and Dr. John Martyn, taken, but the project dropped. Professor Bradley was more interested in horticulture and agriculture than in botany. He was the first botanist who instituted experiments on hermaphrodite plants with the view of establishing the sexuality of plants, and published a 'Historia Plantarum Succulentarum' which was known to Linnæus, but he took no interest in Cambridge studies and did not lecture. Dr. Sherrard and Sir Hans Sloane therefore recommended Mr. John Martyn, who had lectured in 1721, before the Botanic Society of London, to give a course in Cambridge. In a letter to Dr. Richardson, he writes on March 14, 1726-1727; "Mr. John Martyn, who gave a college of botany here last summer to several young gentlemen, goes next month to Cambridge, whither he is invited by above twenty scholars. He carries on at the same time his college here, spending April, May and part of June there, the rest of June and July here; August at Cambridge; and finishes there in September." In May, 1730, he entered Emmanuel College with the intention of taking a Cambridge degree in medicine, and read a course of lectures on botany and materia medica in the University. He took his pupils on botanical excursions into the country, and had printed Ray's 'Alphabetical Catalogue of Plants Growing in the Neighbourhood of Cambridge' for the use of his pupils, to which he made several additions. In 1733 he was unanimously chosen Professor of Botany, and read his last course of lectures in botany at Cambridge in 1735, "labouring under great disadvantages for want of a Botanic Garden, and not finding sufficient encouragement to warrant so long a neglect of his practice as the Course must necessarily occasion." In the year 1747-1748, Dr. Heberden gave a course of lectures on the medicinal plants of Cambridgeshire. He, too, very much felt the want of a botanic garden. In January, 1762, Dr. Martyn resigned the Professorship of Botany, and in August of the same year Dr. Walker conveyed

a piece of land to the University in trust for the purposes of a botanic garden. This land he had bought in July, 1760.

In his account of the donation, published in 1763, Dr. Walker states that acting on the advice of his friend, Philip Miller, "after several treaties that failed," the Mansion House in Free School Lane was purchased "with near five acres of garden about it, well walled round, quite open to the south, conveniently sheltered by the Town on the other quarters, with an antient water-course through the midst of it. Before this, in October, 1760, we find Dr. Thomas Martyn writing: "The foundation of the Greenhouse is laid, but the Garden is not yet in any order; another summer we hope will produce something." Foreign plants, he says, there were at that time some few, but so few that they had taken him but a little while to settle. In April, 1761, he writes to Pulteney: "Our Garden begins to flourish, shrubs and trees are already planted; plenty of seeds, both tender and hardy, are sown; a stove is building; and Stone is preparing to raise the superstructure of a greenhouse on the foundation which was laid last year. All this, I hope, will increase the number of botanists among us. Indeed, we already begin to grow considerable, for I never had more than one companion before this spring, but now I have three; and expect soon to have two or three more converts."

In 1762 Dr. Thomas Martyn succeeded his father as Professor of Botany, and was appointed Walker Reader in Botany. Mr. Charles Miller, the youngest son of Philip Miller, of Chelsea, was at the same time appointed Curator of the Garden, a post which he held till 1770, when he went to the East Indies. Dr. Martyn gave his first course of lectures to fifty students in April, 1763. As subscriptions to the new Garden came in but slowly, he announced that he "would read gratis to those who subscribe ten guineas towards the support of the Botanic Garden." He gave a course of lectures every year till 1796, except in 1779 and 1780, when he was abroad, and 1785, when his lecture room was pulled down. In July and August, 1763, he visited some of the continental botanic gardens, including those of Paris and Leyden.

There was little encouragement given to science at Cambridge still, and Dr. Martyn in 1766 complained that his pupils were few in number. "The Garden," he writes, "gets on very well in point of plants under the direction of Mr. Miller, but our income is still very scanty, so that we cannot finish our greenhouse, much less build stoves; indeed, we are obliged to use a degree of frugality not very consistent with the dignity of an University, or the usefulness of the design, but we keep it on foot for better times."

In 1770, Mr. Miller was sent to Sumatra; the curatorship being thus left vacant, and the Garden being very badly supported, Professor Martyn undertook without payment the duties of the curatorship for several years. He found that a manual of the Garden was badly wanted for his pupils, and therefore issued in 1771 a 'Catalogue of the Garden,' together with an outline of his botanical lectures. A portrait of the founder of the Garden, Dr. Walker, forms the frontispiece. In 1772 he published another 'Catalogue of the Garden,' which has a plan of the Garden prefixed to it. "The usual entrance to the Garden was from Free School Lane, through a small Renaissance archway. . . . There was a second entrance from Pembroke Street. . . . From these gates a broad gravel walk led straight across the Garden to the centre of a range of greenhouses built against the north wall. At a distance of about 175 feet from the gates this walk was carried by a wooden bridge over a long, narrow pond, which crossed the Garden from east to west, and divided it into two unequal divisions. That between the pond and the street contained the herbaceous plants, arranged in a series of herbaceous parallel beds; that between it and the greenhouses was laid out in other beds, not quite so formal, for less hardy plants. . . . Before the above-mentioned gates in Pembroke Street were set up, the entrance to the Garden on that side was through a small doorway at the south-west corner, the traces of which may still be seen in the boundary wall."

In 1771 an unsuccessful attempt was made by the Duke of Grafton, the Chancellor of the University, to endow the Professorship of Botany. For thirty-one years Dr. Martyn was Professor of Botany without salary, and after his marriage, which took place in 1773, he lived at Triplow, nine miles from Cambridge, coming in to lecture. In 1778, 1779, and 1780 he travelled in Switzerland and Italy. From Switzerland he sent over a large case of rare Alpine plants to the Cambridge Botanic Garden.

In 1782 he published 'Heads of a Course of Lectures in Natural History, read at the Botanic Garden,' and continued to lecture till 1796, though but little encouragement was given by the University to the study of botany. In 1804 he writes to Relhan, with whom he had been associated in the 'Flora Cantabrigiensis,' of 1785. "A violent attack upon my lungs during the summer has totally unfitted me for reading any more lectures. If the Governors of the Garden approved, I could have wished that it might be made worth your while to read a course, but there does not seem to be botanical spirit enough in the University to recompense you for the trouble that would attend it." The project came to nothing, and there ceased to be public botanical lectures in Cambridge for some years.

Sir Joseph Banks urged the president of the Linnæan Society, Sir J. E. Smith, to lecture, and Professor Martyn offered to resign the Walkerian Readership in his favour. As Dr. Smith was not either a member of the University or a member of the Church of England, this prevented his appointment, but Dr. Martyn proposed that he should lecture as his deputy with the sanction of the Vice-Chancellor. "As far as my power extends," he writes in 1818, "I am happy in giving you full authority to take such specimens of plants and flowers as you think requisite for your lectures, together with the use of the lecture room, at any time or times, that may be convenient, always under the control of the Vice-Chancellor, and with a complete reliance on your discretion in the use of the Garden." The Vice-Chancellor, Dr. Webb, consented and promised to attend the lectures. Dr. Smith then issued a printed notice of his course to commence on Monday, April 6, but eighteen tutors of colleges sent a written remonstrance against any of their pupils attending the public lectures of "any person who is neither a member of the University nor of the Church of England." Consequently the plan was abandoned. In 1821 he suggested that Henslow should be his deputy, but Dr. Walker's trustees refused their consent, nor would they consent to his resigning their Readership. He died in 1825. During the time he lectured publicly about five hundred students attended his lectures. He was an ardent Linnæan, and through his teaching the system of Linnæus supplanted that of Ray in Cambridge.

A year before Martyn's death Dr. Schultes, a professor at Landshut, in Bohemia, made a botanical tour, in the course of which he visited the Cambridge Garden. In a letter to Count Sternberg, to be found in Hooker's 'Botanical Miscellany' for 1830, he writes: "The Garden at Cambridge contains about five acres of very bad ground, and there are from five to six thousand species of plants, the greater part of them cultivated in beds. It does not present so pleasing an appearance as the Dutch botanic gardens, but is, however, kept very neat and is well arranged. . . . The care of the Garden is committed to Mr. Biggs, whom we did not find at home. The stoves are well built, and they may have been hitherto large enough; but the progress of the science will soon cause their size to be insufficient, as they extend only to 216 feet. A building was erected some years ago for the lecture rooms of the professors of botany, chemistry, mineralogy, and mechanics. The Alpine plants, among which are some rare species from the South Highlands, are very properly cultivated in small pots and placed during winter under glass. The assistant gardener who conducted me through the grounds was not able to tell me the annual expenditure of the institution. The workpeople receive two shillings a day."

Dr. Walker's gift to the University included on one side of the land devoted to the purpose of a botanic garden a building known at the time as "the great house in Free Schole Lane." He directed that two rooms on the ground floor should be appropriated to the use of the Reader on Botany and the reading of lectures on botany, "that the unfurnished room above stairs be set apart for the reception of books on botany and other sciences relating thereto and also of a Hortus Siccus, or collection of dried plants." In 1784 the great house was sold to Mr. John Mortlock. In 1787 there was erected in the Garden a lecture room, 40 feet long and 28 feet broad, with a private room for the Professor of Botany at the south end, and for the Jacksonian Professor at the north end. Subsequently provision was made in the same block of buildings for the Professors of Chemistry, Anatomy and Physics.

On the death of Dr. Martyn in 1825, Mr. Henslow, who together with Professor Sidgwick had founded the Cambridge Philosophical Society, was elected unanimously to the Professorship of Botany. Dr. Martyn held three distinct offices, (1) the University Professorship, which had no endowment; (2) the Regius Professorship, which was at first worth a hundred a year and was subsequently increased to two hundred; (3) the Walker Readership. Henslow

was appointed Regius Professor by the Crown, and Walker Reader by the Governors of the Botanic Garden, the mode of election to the University Professorship at the time of Dr. Martyn's death being under consideration by Sir John Richardson, to whom the question had been referred. After the death of Henslow the Regius Professorship became extinct, and the endowment was transferred to the University Professorship, which was vacant all through Henslow's time, and is now the only existing Professorship of Botany.

Though the Professorship of Botany and the Walker Lectureship were united as a matter of course, no necessary connection existed between the Professorship and the Garden establishment. The Professor was only entitled to use the Garden as Walker Reader.

Professor Henslow found the Botanic Garden in a condition "utterly unsuited to the demands of modern science." It was situated right in the heart of the town, the soil was bad, and there was no possibility of enlarging it. Only a limited number of species could from its size be cultivated in the open ground, and the greenhouses and stoves were small and few in number. He reported the need for a new garden to the Governors, and in 1841 they purchased about thirty acres of land, the present site on the Trumpington Road. Many years elapsed before the plants were actually transferred.

An interesting account of the Garden is contained in Loudon's 'Magazine of Natural History' for 1833.

"Jackdaws are comparatively numerous at Cambridge. The Botanic Garden there has three of its four sides enclosed by thickly built parts of the town and has five parish churches and five colleges within a short flight of it. The jackdaws inhabiting (at least for a certain time in each year) these and other churches and colleges had, in the years 1815 to 1818, . . . and since discovered that the wooden labels placed before the plants whose names they bore in the Botanic Garden would well enough serve the same purpose as twiggy sticks off trees, and that they had the greater convenience of being prepared ready for their use and placed very near home. A large proportion of the labels used in this Garden were made out of deal laths and were about nine inches long, and about an inch or more broad, . . . and although of this size, as they were thin when dry, pretty light. To these the jackdaws would help themselves freely whenever they could do so without molestation, and the time at which they could do this was early in the morning before the gardeners commenced work for the day, and while they were absent from the Garden at their meals, and the jackdaws would sometimes fetch away labels during the gardeners' working hours from one part of the garden, when they observed the gardeners occupied in another, as was often the case in their attending to the plants in the greenhouse, etc. . . . Those who are aware how closely some species of the grasses, garlic, umbelliferous plants, etc., resemble each other and also how needful it is to prefix labels to them, as remembrances of their names, will readily perceive that much inconvenience arose from the jackdaws appropriating some of the labels; and this especially when they removed, as they sometimes did, the labels from sown seeds, as the plants arising from those seeds must in some species grow for a year or more before their names could be ascertained. I cannot give a probable idea of the number of labels which the jackdaws annually removed, but have more than once been told by persons who had ascended the tower of Great St. Mary's Church and the towers or steeples of other churches that wooden labels bearing botanical inscriptions were abounding in these places. The house of the late Dr. Kerrick, in Freeschool Lane, was close beside the Botanic Garden; and the shaft of one of the chimneys of his house was stopped up below, or otherwise rendered a fit place of resort for jackdaws. From this chimney shaft Dr. Kerrick's man-servant got out on one occasion eighteen dozen of the said deal labels; and these he brought to Mr. Arthur Biggs, the Curator of the Botanic Garden. I saw them delivered and received. . . . This number of labels and the fact of the occurrence of plant labels on other buildings about the town prove that in general terms the aggregate of labels lost from time to time could not be inconsiderable."

In 1846 Professor Henslow published an 'Address to the Members of the University of Cambridge,' in which he expressed the need for raising the Cambridge Botanic Gardens to the level of Continental botanic gardens. "The larger the number of living species that are cultivated in a botanic garden the greater will be the facilities afforded, not merely for systematic improvement, but for anatomical and other experimental researches essential to the progress of general physiology. . . . The reason

why a modern botanic garden requires so much larger space than formerly is chiefly owing to the vastly increased number of trees and shrubs that have been introduced within the last half-century."

At the request of the Walker trustees Professor Henslow twice visited Kew and consulted Sir W. J. Hooker and Dr. Lindley about the practical details necessary to raise the Cambridge Garden to the level of those at Edinburgh, Glasgow, and Dublin.

Mr. Babbington, who had attended Professor Henslow's lectures on botany, and later on had arranged the European plants for the Edinburgh Botanical Society, was a member of the Syndicate appointed to superintend the new Botanic Garden. On March 11, 1845, he wrote to Professor Balfour, of Glasgow: "The place for the new garden is at present only a bare field, and the new curator will have to work out the details of a rough plan by himself, as Henslow is non-resident. We therefore want a good practical man, who has a considerable acquaintance with science. It seems to be a fine opening for a young and active man, where he may distinguish himself and obtain reputation." He was able to write in 1848, that he had obtained about 900 species of plants to add to the Cambridge Botanic Garden collection.

Mr. Murray became Curator and helped him in determining the arrangement of the Garden. The first tree was planted in the new Botanic Garden in October, 1846, by Dr. Tatham, the Vice-Chancellor. Some of the trees were planted in that year, but it took several years to get the funds necessary for planting the rest of the trees and stocking the beds with hardy shrubs and herbaceous plants. The first annual report of the Botanic Garden Syndicate, March 5, 1856, drew attention to the "very perfect and valuable collection of herbaceous plants much used by the members of the University who studied scientific botany." The trees were arranged in a belt surrounding the whole of the Garden, and were arranged as far as possible so that allied species and genera were placed near together. Nearly all the trees then known to be capable of withstanding the English climate were included. Mr. Murray died in 1850, and was succeeded in the Curatorship by Mr. Stratton, who suggested the scheme on which the plant houses were constructed. They were erected in 1855, and were considered capable of "containing a sufficiently numerous collection to be tolerably illustrative of the chief groups of the plants that inhabit the warmer regions of the earth." It also contained a number of fine specimens "of the older inhabitants of greenhouses now rarely to be seen, and also many very interesting species which, from possessing slight claims to beauty, have fallen out of cultivation." In May, 1857, the water was let into the pond in the Botanic Garden.

Professor Henslow's lectures were attended by an average of about fifty students, and were delivered in the Easter term. He made much use of illustrations and diagrams, and had living specimens placed in baskets in his lecture room, which his students dissected for themselves. Darwin was one of his pupils, and was recommended by him to join the "Beagle" expedition. He also organised botanical excursions with his pupils into the country, and the scientific evening meetings he organised at his house on Fridays were so much appreciated that, on his removal to Hitcham in 1837, the Ray Club was instituted.

On Professor Henslow's death in 1861, Mr. Babbington became Professor of Botany without opposition, but his first course in botany attended by seventeen students was not given till the next year. The next year his class had increased to between forty and fifty students. He was especially a systematist, and took great interest in the Botanic Garden. Of Mr. Mudd, the curator who succeeded Mr. Stratton, he wrote to Professor Balfour on June 20, 1865: "He is quite transforming our garden. It is so much better already as to be hardly like the same place."

In the division that took place in the Senate on May 25, 1881, to the opening of the Botanic Garden on Sundays, he was one of the opposers, but the openers gained their point by 88 to 76 votes. On the May 10, 1883, the question of opening the Garden for the summer months on Sundays was again raised, but it did not come before the Senate. During the curatorship of Mr. Lynch, a new corridor-house has been added to the greenhouse.

SUPRARENAL EXTRACT AS A HÆMOSTATIC.—Koenigstein states that suprarenal capsule extract is a useful hæmostatic. It is very suitable for hyperæmic patients, congestions, swellings, etc. Suprarenal extract is not an anæsthetic, but it increases the anæsthetic effect of cocaine when combined with it.—*Zahnart. Rundsch.*, vi., 3662.

REFORM OF PHARMACY BY LAW.*

BY J. H. BEAL.

It has not been uncommon of late years to learn from various sources that dispensing pharmacy has about reached the end of its existence as a separate calling and that forces are now at work which must produce its speedy disintegration, eliminating it from the list of recognised occupations whereby men may gain a livelihood.

The question which this prediction suggests is one of supreme importance and may well challenge our serious consideration.

Are we the remnants of a decaying cult, the leaders of a forlorn hope engaged in the desperate defence of a lost cause? Are we endeavouring to perpetuate a scientific art which has outlived its usefulness and despite all efforts to the contrary, is destined to extinction simply because society has no further need of its services?

Some, indeed, have reluctantly accepted this mournful conclusion as true and have advised that we set our professional households in order and prepare to make our exit gracefully. Others less easily discouraged anticipate that our art will again emerge from its present depression and will again demonstrate its right to existence and its ability to render valuable service to mankind.

Whichever conclusion be correct, it is important that we early recognise it and govern ourselves accordingly; if our calling is no longer necessary to society, that we may not uselessly put ourselves in the way of progress and waste our efforts in a fruitless contest with the inevitable; if it is destined to a regeneration, that we may be prepared to do our part in the work of transformation and hasten the day of its final accomplishment.

That dispensing pharmacy is at present in a very unsettled and unsatisfactory condition is a point upon which there is entire unanimity, but as to the causes of this condition or as to the remedies which should be adopted for its improvement there is a wide difference of opinion.

Within the United States there was, until a comparatively recent date, absolutely no legal restriction upon the character of those who might engage in the sale of drugs and medicines and assume the awe-inspiring title of pharmacist and chemist. Not only were there no laws upon the subject, but there was an almost entire lack of that public opinion which may frequently take the place of law. It was quite generally assumed, both inside and outside of pharmacy, that "any one could run a drug store" and that about the only qualifications necessary were some degree of familiarity with the table of apothecaries' weight, a slight acquaintance with the superficial appearance of the more common drugs and chemicals and the ability to interpret the abbreviated titles of the shop bottles. Indeed, it is not too much to say that very many of those engaged in the business at that period could not boast of possessing even these moderate accomplishments in perfection.

A calling which is not careful of its reputation will not long have a reputation worth caring for. When those who were engaged in pharmacy placed so low an estimate upon their vocation, it was not surprising that the public took them at their own appraisal and, at length, came to regard the "drug business" as a species of merchandising which differed from ordinary commercial ventures only in involving less risk and investment or in paying larger profits. As a business of this sort has an irresistible attraction for the average American, the ranks of pharmacy were speedily crowded by men unfitted for it by inclination, ability or training, but attracted solely by a desire to share in the fabulous profits attributed to it by common repute.

Of course there never has been a time when a large proportion of American pharmacists have not been intellectually and morally the peers of any who were engaged in any other calling, men who clearly foresaw the demoralisation which was coming over pharmacy and struggled against overwhelming odds to arouse public sentiment and procure restrictive legislation. To the efforts of these we, as pharmacists, owe what has been saved from the wreck of our profession and to them the public owes the tolerable measure of protection which it now enjoys, but unfortunately, before this restrictive legislation could be obtained the number of so-called pharmacists had increased much beyond the actual necessities of the population, many of them entirely unfit to handle drugs and medicines, a constant menace to the public health and a disgrace to the calling which they assumed to follow.

* Address to the Section on Legislation and Education of the American Pharmaceutical Association, at the Baltimore meeting.

Perhaps all of the measures of reformation which have been suggested have a germ of usefulness in them, some possibly more than a germ; nearly all are fatally defective, either from being based upon a too narrow or too superficial view of the situation, or because the remedies which they propose are not in harmony with natural and economic laws and are therefore futile.

Of the various plans which are advocated, the reformer by act of legislation is easily first in the vehemence with which he insists that his is the only true plan of procedure and that all pharmaceutical ills can be cured by a revision and extension of the law.

The advocates of this theory argue that since the demoralisation of pharmacy was largely the result of a lack of legal restriction, it should be possible by the passage of new laws of greater comprehension and of increased severity to reverse the process and bring about a reformation. This, however, does by no means follow. To check the development of an evil by timely legal enactment and to uproot that evil by law after it has grown deep into the manners and customs of a people, are quite different things. The first has sometimes been done, the second, we believe, has never yet been successfully accomplished.

That a properly constructed pharmacy law, wisely interpreted and honestly enforced, is capable of accomplishing great good is an opinion which we cordially endorse, but that it is possible to reform the practice of pharmacy by legislative fiat is a conclusion opposed to both reason and experience.

Active, useful legislation is but the formal expression of public opinion. The only effective law is that which has overwhelming public sentiment at the back of its enforcement and any legislative enactment which is not thus supported is law in name only. To this rule pharmacy laws are no exception.

Moreover, laying aside the impossibility of reforming society by legislative enactments, the fundamental principles of constitutional jurisprudence forbid invoking the powers of the legislature for the purpose of advancing the interests of a particular class or trade.

The only sound justification which can be alleged in support of pharmacy laws is their necessity to the public and general welfare. If they do not seek and support this end, then they are void under every constitution in the Union.

In the absence of statutory prohibition, every citizen has the same right to sell drugs as to sell agricultural products; the same right to dispose of his services in the treatment of diseases as to dispose of them for any other purpose. Any restriction upon the sale of his possessions or upon the disposal of his services is an interference with his natural rights and the only ground upon which such interference can be permitted is the necessity of protecting the public welfare. Even in securing this laudable end the legislature cannot arbitrarily exclude certain persons from an occupation or extend the privilege arbitrarily to certain others. The most that it can do is to prescribe a reasonable standard of proficiency which must be possessed by those who exercise a given employment and then leave the way open for any citizen to acquire that proficiency and to engage in that employment, if he so desires.

It is true that pharmacists sometimes carelessly speak of the necessity of protecting their calling against invasion; but this expression is only an unfortunate figure of speech which cannot be too quickly banished from the vocabulary of pharmacy. Such thoughtless statements give colour to the claim of many people that pharmacy laws are class legislation and an attempt to create a monopoly of drug sellers; a belief which is unfortunately shared to some extent by the courts who are called upon to construe the statutes.

What the pharmacist refers to when speaking of protection is the inequity of requiring him to qualify by examination and to pay an annual tax for the support of the pharmacy laws, while others are permitted to engage in substantially the same business without qualification and without tax. The pharmacist has an undoubted right to object to such unjust lack of discrimination, and to demand that the law which applies to him should apply to all others, but he should be careful to make his demand in terms which will express his real meaning and which will not place him in apparent conflict with rational jurisprudence.

In addition to fixing the competency of the pharmacist, the law may also prescribe reasonable regulations for the exercise of his business. It may, for example, prohibit the employment of incompetent help, forbid the sale of intoxicating liquors, or of narcotics and articles intended for immoral or criminal purposes, require the labelling of poisons, the registration of their sale, etc.

With these subjects provided for, the proper function of a pharmacy law is exhausted. Having secured the safety of the public by requiring the pharmacist to be competent and to conduct his business in a proper manner, the law has accomplished all that it can or ought to do. The pharmacist cannot expect favours from the legislature and, if wise, he will not ask for them. The prosperity of pharmacy as a specific calling cannot be considered by the law and the success or failure of those who are engaged in that occupation is a matter which must be determined by their individual capacities, by their abilities to adjust themselves to the changing conditions of society and by the law of supply and demand. Wise legislation will undoubtedly benefit the pharmacist indirectly and as a patriotic and public-spirited citizen he should join in obtaining such legislation, but the great reform in pharmacy which we hope for will depend more upon our knowledge and application of natural and economic laws than upon any which may be passed by the General Assembly.

While we believe it to be impossible to reform the practice of pharmacy by legislative enactment, nevertheless a properly constructed law is an important factor in the working of such a reformation and, in the writer's opinion, this Association can perform no more important service than in formulating and disseminating correct ideas upon this subject, especially by combatting certain erroneous notions which, if they should be enacted into law, would not only fail to reform pharmacy, but actually postpone its reform for years to come.

One of the changes proposed in some quarters is that the number of pharmacies should be limited by law according to population, a proposition which it is utterly impossible to realise under our present system of constitutional government. Such a law would be class legislation of the clearest type and in absolute opposition to the principle that pharmacy law is not to protect the pharmacist, but to restrict him and to protect the public.

Even should the American people consent to change a fundamental principle of their governmental system for our especial benefit, we would speedily find that, in obedience to the inexorable law of supply and demand, the franchise of a business protected by law against competition would be valued at such a figure that the profits could pay the purchaser only a small income on his investment. As a consequence the only person who could be benefited by such a law would be the fortunate owner who chanced to be in possession of the business at the time when the monopoly was created.

The folly and impossibility of such a proposition is so apparent that we need hardly give it serious attention.

Another proposition which has been pressed with some vigour by certain writers on the pharmacy laws and has rather more to commend it than the preceding, is that the law should create two classes of pharmacies to be in charge of licentiates of corresponding grades. To the pharmacist of the lower grade would be permitted the sale of a limited line of the less active medicinal agents and of the more active substances when sold in unbroken packages only. To the other, or pharmacist of the first-class, would be granted plenary powers to compound and sell medicinal agents of every sort.

For this division of pharmacists into classes having different degrees of qualification and possessed of different powers, we confess our inability to perceive any good or sufficient reason, believing that the experience of European countries where such a division has been tried argues more strongly against than in favour of its introduction into the United States.

In the first place we deny the truth of the alleged principle upon which such a separation is based, namely, that a man may safely be permitted to conduct a store for the sale of moderately poisonous drugs who could not be trusted with the sale of those which are dangerously poisonous. We contend that if a man is competent to dispense a drug the maximum dose of which is twenty grains he is also competent to dispense one of which the maximum dose is the one-twentieth of a grain. If he is not competent to dispense the one he is likewise incompetent to dispense the other.

The fact that a candidate for registration is or is not competent depends upon whether he has or has not received competent training in the art and science of pharmacy and not upon his recollection of doses. Modern pedagogics makes a distinction between education and the mere possession of information. One is the result of training and culture, the other of memory. Mere information makes the traditional learned fool; training makes the scholar. The man who is well trained in

the general and particular principles of pharmacy will make a safe pharmacist whether he is thoroughly posted on doses or not. The untrained man will be an unsafe pharmacist even if he should know the dose of every drug in the Dispensatory.

We can perceive no better reason why there should be a difference in the educational qualifications of pharmacists than that there should be a difference in the educational qualifications of attorneys and physicians. The education of each should fit him to serve the public to the fullest extent within the line of his occupation. Each should be educated not merely to the lowest permissible, but rather to the highest possible limit; not that he may barely reach the technical requirements of an examining board, but that he may possess a liberal margin of safety over and above such requirements.

Furthermore, if such a division of pharmacists were made, we submit that it would be practically impossible to prevent the constant infringement of the lower class upon the prerogatives of the higher class. Consequently the separation of functions would exist in name only and fail in achieving the first great object of pharmacy law, namely, in securing the public safety.

Finally, we have already with us the first or lower class of druggists in the dealers in general merchandise who are now permitted to sell non-poisonous drugs and we are opposed to giving them official recognition even as pharmacists of the lowest degree. Our efforts should be to procure the restriction of the sale of all medicinal articles to competent hands and not to still further increase the ranks of the incompetent.

We believe that the present popular division of licentiates into pharmacists and assistant pharmacists satisfies every practical requirement. The first only may be the responsible head of a pharmacy and the second may sell medicines only when in a pharmacy under such management. This division is already in existence in twenty-eight States and has been found to work very satisfactorily in practice.

We would favour, however, an important change in the law regarding registration, namely, that every applicant should be required to first register by examination as assistant pharmacist and to remain on the rolls as assistant for two or more years before coming up for registration as pharmacist. Besides other important reasons for the requirement, this compulsory registration as assistant is the only feasible way of enforcing a proper period of experience for those who wish to become managers and owners.

The point is often made that the same degree of education should not be demanded in a pharmacist doing business in a village or country place as in the case of those in the larger cities. Logically it would seem proper that the health and lives of the rural population should be as carefully looked after as those of the dwellers in cities. However, if it is practically necessary to make some concession to the rural districts, there might be inserted in the law permission for the boards of pharmacy to grant Minor certificates authorising responsible persons resident in small places to sell a specified list of articles, or to grant assistant pharmacists the right to conduct stores for the sale of such articles, these permits to be granted only in localities where there are no registered pharmacists within convenient distances.

Another most important point which the law must consider is the degree of competency which should be demanded from candidates for licence as pharmacist. Notwithstanding the number of splendid colleges of pharmacy which we possess, the general standard of admission to the practice of pharmacy in the United States is below that of Great Britain, Ireland, or Canada. While we have many American pharmacists who are the peers of any in the world, it is a lamentable fact that there are on the registers of the various State boards a vast number who are woefully incompetent. A large number of these were in business at the time of the passage of the laws, but many more have been admitted through too great laxity in the examinations. As the laws, with but few exceptions, permit the boards to fix their own standards, these official bodies have received general criticism for their failure to make their examinations severe enough to exclude the unfit. In their behalf, however, it should be remembered that whenever they have increased the severity of the examinations they have invariably been met with the outcry that raising the standard of admission to pharmacy would raise the wages of drug clerks, the objectors apparently forgetting that it is the abundance of cheap clerks which has caused the enormous multiplication of cheap drug stores with which they must compete.

On account of the opposition which will always be made to any

independent action of the boards of pharmacy in raising the requirements for admission, we believe that the law itself should set the standard and that this should be nothing less than graduation at a reputable college of pharmacy.

We are aware that many excellent pharmacists are not in harmony with this idea, contending that the education which was good enough for them is good enough for their clerks. Those who use this argument apparently overlook the fact that the educational value of store experience, at the present time, is very greatly below what it was a quarter of a century ago. Moreover, education in other professional lines has advanced so rapidly that nothing less than a college training will enable the pharmacist to obtain and hold that respect of the public which is absolutely essential to his professional and financial success. Certainly it would be greatly to the advantage of their patrons if future pharmacists should all be college graduates and we believe that it would be equally to the advantage of pharmacy.

We also believe it to be almost if not altogether demonstrable that the esteem in which a vocation is held by the community and the consequent honour and profit attached to its pursuit, depend more upon the character and education of the men who are engaged in that vocation than upon any other single factor, or, perhaps, more than upon all other factors combined.

Of all the influences which may operate to improve the condition of pharmacy in the future, there is none so important, in our opinion, as the thorough education of the rank and file of pharmacists; education not merely in the contents of the *Pharmacopœia*, but in the broadest and most liberal sense, a training which will help the future pharmacist to comprehend the relation of his profession to society and of his individual responsibility to both, which will enable him to adjust himself to the changing conditions of civilisation and to discover new outlets for his services. In short, an education which will lead him to no longer set himself in opposition to the laws of progress, as he has so often done in the past, but rather to acquaint himself with those laws and make them serve his purpose.

That graduation will at some future day be an essential for registration is doubted by few who have carefully studied present tendencies. The only difference of opinion seems to be as to the time when this reform should take place. Some say, now; others, twenty years from now. The sensible thing for us to do is to take up the agitation and to continue at it until we have convinced both the public and the body of pharmacists of the necessity of a higher educational requirement and have secured its enactment as a part of the formal laws of every state in the Union.

Lack of time forbids the discussion of many other features of the pharmacy law deserving of attention, but we would like to refer to the possibility of securing appropriate legislation in the several States.

One of the prerogatives of the American citizen is the right to grumble at the legislature, a trait, by the way, which we seem to have inherited from our British ancestry; but as there are about fifty times as many legislative bodies in this country as there are in Great Britain, we have to do a proportionately larger amount of grumbling. As pharmacists we have exercised this right quite liberally and have been free with our criticisms of the legislatures for what they have or have not given us in the way of pharmacy laws.

Candidly, however, very much of this criticism has been undeserved. As a rule our state legislative assemblies are composed of high-minded, honourable men who are desirous of enacting the best possible laws and when they fail in this respect it is generally because they have been misled by the persons to whom they have looked for information. The fact that we have not better pharmacy laws in the United States is chargeable more to the indolence and apathy of the pharmaceutical body than to the contumacy of the law-making bodies. It is the writer's belief that there is not a state in the Union where the enactment of a fairly good pharmacy law cannot be procured by determined, united effort on the part of the pharmaceutical profession. If the pharmacists of a state will unite upon a reasonable measure, one not too revolutionary in character, which does not ask for too much at once, which does not interfere with constitutional rights; if they will then take the pains to inform the members of the legislature individually as to the merits of the bill, their efforts will almost invariably meet with success. The main work in every case is to convince the individual members of the General Assembly of the honesty and propriety of the measure advocated. This

accomplished, the remainder of the task is comparatively easy.

In conclusion, we do not share the belief of those who hope to reform the practice of pharmacy by law. The law is one of the important factors of the reform and, as such, should be carefully studied and applied; but there are other and more important factors still.

The present conditions of pharmacy are the outgrowth of a century of a mistaken policy: they cannot be changed in a day or a year. They must be modified by a continuation of the process through which they came into existence—by a process of slow and gradual evolution. In this, however, we can borrow a method from the horticulturist and hasten the operation by bringing intelligent artificial selection to the aid of natural selection. To point out the favourable variations and perpetuate them, to discover the unfavourable and eliminate them, to prevent the taking of backward steps, to avoid development along lines which are too narrow or which do not promise tangible results, these it seems to me, are the principles which should direct our efforts.

Whether we will it or not, the evolutionary process will go on. Protests will avail us nothing. We can hasten or we can retard, but we cannot stop its operation. The struggle for existence among pharmacists, already keen and fierce, will become keener and fiercer. Nature punishes ignorance and weakness quite as sternly as crime. Those of us who are unable or unwilling to adjust ourselves to surrounding conditions, to harmonise with environment, will be crushed and eliminated from the contest.

Men have tried for ages to control the operation of economic laws by legal enactments and to force trade into artificial channels, by trade combinations, by associations and by unions. They never have succeeded, and they never will.

If pharmacy can find no better means than these by which to perpetuate itself, then it will perish from the earth. Unless the pharmacist can render the public a service which it cannot perform for itself and perform it better and cheaper than anyone else, the public will not avail itself of his services. Unless the pharmacist can make himself useful to the next century, the next century will have no use for him. And as the coming generation is no more likely to continue the use of the drugs and treatment of the present than it is to wear clothes of the same fashion, it is important that the pharmacist should be on the alert to anticipate and supply these new wants. If he shall sit idly by, as he has so often done in the past, and permit others to supplant him in this service, he will both invite and deserve the extinction which is sure to be his.

Nevertheless, we are not of those who despair of the future of pharmacy. We believe that what appears to us as chaos is merely the disorder attendant upon a new arrangement of things, just as a confusion of brick and mortar attends the conversion of a street of ancient tenements into one of modern business blocks. It is the transition period, when the old has lost its shape and before the new has appeared. Out of the present shapelessness we expect to see the new arise, on more substantial foundations, of more significant proportions, a nobler fabric and a fitter temple for the spirit of progress which typifies the age.

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

At a special meeting of the Council held on Wednesday, September 28, the chair was taken by the President, Mr. Walter Hills, and there were also present: Mr. G. T. W. Newsholme, Vice-President, Messrs. Allen, Atkins, Bottle, Martindale, Savory, and Warren.

The PRESIDENT, having explained that the meeting was called for the purpose of reading the proposed new Bye-laws of the Society a second time, moved that those Bye-laws be taken as read. This was seconded by Mr. BOTTLE and agreed to.

The PRESIDENT then moved that the proposed new Bye-laws, which were read a first time at the meeting of the Council held on August 3, 1898, and published in the *Pharmaceutical Journal* of August 6 last, be now read a second time and confirmed. The motion was seconded by the VICE-PRESIDENT and unanimously agreed to, and the meeting then terminated.

THE STUDENTS' PAGE.

EXPLANATORY NOTES ON THE B.P.*

Acidum Salicylicum.—The process by which this is prepared artificially is known as the "Kolbe synthesis." It is a general process for preparing the aromatic oxy-carboxylic acids from any given phenol. Ordinary phenol, $C_6H_5 \cdot OH$, gives, therefore, $C_6H_4 \cdot OH \cdot COOH$, oxy-benzoic acid. This, being a di-derivative, may occur in the usual three isomeric varieties, and the ortho-variety is known as salicylic acid. The process depends upon the reaction of carbon dioxide with the sodium derivative of phenol, $C_6H_5 \cdot ONa$, under certain conditions of temperature and pressure. In the original process of Kolbe the sodium phenate, very carefully dried, was heated in a current of dry carbon dioxide at a temperature of $110^\circ C.$, increasing finally to $200^\circ C.$ The first step is the entrance of CO_2 into the phenol molecule, forming a derivative of carbonic acid, phenyl-sodium carbonate.

This is analogous to ordinary sodium carbonate, one atom of sodium being replaced by the phenyl residue, C_6H_5 . As the temperature rises this is converted by intra-molecular re-arrangement into sodium salicylate. The oxygen atom connecting the carbon of the side chain with the benzene nucleus shifts its position and interpolates itself between the hydrogen and carbon of the next CH group of the nucleus.

The sodium salicylate so formed could not be isolated, because it reacted with more sodium phenate to give the basic sodium salicylate with regeneration of phenol

In Schmitt's modification of the Kolbe process the reaction between the carbon dioxide and sodium phenate takes place under pressure. Under these circumstances the intra-molecular rearrangement takes place as described and the further reaction—between the salicylate and a second portion of phenate—does not occur. Therefore, the whole of the phenol is finally obtained as sodium salicylate. It is interesting to note that if the temperature at which the reduction takes place be allowed to exceed $200^\circ C.$ the atom of oxygen which shifts its position takes up the para-position to the carboxyl group. In the official test for phenol advantage is taken of the difference between the behaviour of phenol and a true acid, like salicylic, towards alkali carbonates. The acid forms sodium salicylate, which is insoluble in ether, while the phenol does not react and may be extracted by shaking the mixture with ether.

Acidum Tannicum.—The term tannin really includes a large number of bodies having an astringent taste and certain points of analogy in their reactions and constitution. In the Pharmacopœia the term is used in a restricted sense to indicate the variety more exactly known as gallo-tannic acid. The group of tannins may be divided broadly into two classes:—

(1) Those which give a blue coloration with iron salts, and are derivatives of pyrogallol;

(2) Those which give a green colour with iron salts, and are derived from catechol.

Some of the tannins exist naturally as glucosides, which may be regarded as esters of glucose formed by elimination of water from the carboxyl group of the acid and one of the hydroxyl groups of the glucose—

Gallo-tannic is, however, not a glucose but a condensation product of two molecules of gallic acid one of the tri-hydroxy-benzoic acids, $C_6H_2(OH)_3COOH$.

When gallo-tannic acid is boiled with acidulated water hydrolysis occurs (*vide* method of preparing gallic acid), a molecule of water being taken up with formation of gallic acid. The reverse process, *i.e.*, the formation of tannic from gallic acid can be carried out by heating the gallic acid with certain reagents, like phosphorus oxychloride, which facilitate the elimination of the water. Such reagents react with the water as fast as it is liberated, forming other compounds which do not interfere with the progress of the reaction; thus

The tannins all precipitate with gelatin and albumin solutions. The alkaloidal tannates are also very insoluble in water and on this account tannic acid is sometimes used for separating alkaloids from solutions containing other substances not precipitated by tannic acid. The alkaloids may be recovered from such precipitates by digesting them with fresh moist lead hydrate which combines with the tannic acid. From the dried magma the free alkaloid may be then extracted by treatment with suitable solvents.

Acidum Tartaricum.—Tartaric acid furnishes one of the most interesting examples of physical isomerism. In order to fully comprehend the influence of the asymmetric carbon atom in producing physical isomerism, the student should construct two tetrahedra by joining four equilateral triangular pieces of cardboard by means of gummed paper. The four projecting points of the tetrahedra may be coloured red, blue, green, and yellow, to represent the four different elements or groups combined with the carbon atom. With these models before him the student should have no difficulty, after carefully reading the section on stereoisomerism in his text-book, in comprehending the constitution of dextro-, laevo-, meso-, and racemic tartaric acids. Note particularly that the optical inactivity of the meso and racemic acids is produced by *internal* and *external* compensation respectively.

The last test for tartrates given in the B.P. Appendix (p. 429) depends upon the formation by oxidation of a derivative, di-oxy-maleic acid, which gives the blue colour with caustic potash.

The oxidising agent is hydrogen peroxide, and the ferrous sulphate acts as a carrier of oxygen between the peroxide and the tartaric acid. The importance of the test lies in the fact that none of the allied organic acid (citric, malic, lactic, etc.) produce this particular substance when oxidised. Hence it serves to detect small quantities of tartaric in presence of citric acid—a procedure otherwise somewhat difficult.

The other test for tartaric acid in citric acid (*vide* tests for Acidum Citricum, B.P.) applies also to metallic particles, and to reducing agents generally. The blue colour is due to the reduction of the molybdate to a lower oxide. The metallic particles would be derived from the utensils used in the process of manufacture and they act as reducing agents in the acid solution by virtue of the hydrogen they are capable of liberating. The test for the detection of lead in both tartaric and citric acids, as described in the Pharmacopœia, depends upon the production of black lead sulphide. Addition of a saturated aqueous solution of sulphuretted hydrogen is said to give more delicate indications of traces of lead than are afforded by merely bubbling sulphuretted hydrogen gas through aqueous solutions of the acid.

* NOTE.—This series of articles should be read in conjunction with the series referring to the 1885 B.P., and published in the *P. J.* during 1897 and the earlier portion of the current year.

REFORM OF PHARMACY BY LAW.

CONSIDERING that the working of economic laws must needs be the same in effect in all free and civilised countries, it is without surprise that readers will gather from Mr. J. H. BEAL'S address, printed at page 375, how it has become common of late years for prophets of evil in the United States to lament the approaching termination of the existence of dispensing pharmacy as a separate craft across the Atlantic. There, as here, it is urged that forces are now at work which must produce the speedy disintegration of pharmacy as a distinct calling, eliminating it from the list of recognised occupations whereby men may gain a livelihood. The question which this pseudo-prediction suggests is, as Mr. BEAL remarks, one of supreme importance and worthy of serious consideration. For if the pharmacists of to-day constitute the remnant of a decaying cult, and are engaged in the defence of a lost cause, they would appear to be wasting energy. It is, however, much more reasonable to assume that the circumstances which have called forth the gloomy prognostications alluded to are but indications of certain unsatisfactory conditions that must be remedied. The old-time idea which yet prevails to a marked extent in some parts of America, that anyone can run a pharmacy, must be totally eliminated, as well as the prevalent notion that pharmacy is a craft requiring but little capital and whilst involving less risk than other commercial ventures, yielding much larger profits. The outcome of the existence of such ideas has tended to lower the status of pharmacy as a profession, and since, as Mr. BEAL pointedly observes, a calling which is not careful of its reputation will not long have a reputation worth caring for, it behoves all who are interested in the matter to do their utmost to uphold and advance that status.

The favourite remedy for existing evils is, of course, a resort to legislation, and reformers by Act of Parliament undoubtedly take the first place by the vehemence with which they insist that theirs is the only true plan of procedure, and that all ills, pharmaceutic or otherwise, can be cured by a revision and extension of the law. It is so easy to contend that the demoralisation of the craft is primarily due to the lack of legal restriction in the past and, assuming that to be correct, to argue that the passing of comprehensive and

severe laws now will counteract the evil and effect a complete reformation. As is pointed out in the address commented on, it is one thing to check the development of an evil by timely legal enactment, and quite a different matter to uproot that evil by law after it has grown deep into the manners and customs of a people. Indeed, in the latter case, it may well be doubted whether the original evil continues to be one, for the working of natural laws tends under such conditions as premised to convert and remove the objectionable aspects of what originally were undoubtedly evils. But be that as it may, it cannot be gainsaid that, though a properly constructed pharmacy law, wisely interpreted and honestly enforced, may be capable of accomplishing great good, it is altogether utopian to imagine that the practice of pharmacy at the present day can be reformed by legislation. "Active, useful legislation is but the formal expression of public opinion. The only effective law is that which has overwhelming public sentiment at the back of its enforcement, and any legislative enactment which is not thus supported is law in name only. To this rule pharmacy laws are no exception."

Would-be reformers must not lose sight of the fact that the fundamental principles of constitutional jurisprudence are opposed to the advancement of class interests by the aid of the law. In this country no less than in America experience has plainly shown that "the only sound justification which can be alleged in support of pharmacy laws is their necessity to the public and general welfare." That has been the contention of the leaders of British pharmacy, as represented in the Pharmaceutical Society, for the last sixty years, and the growth of experience has only tended to confirm that view as time has rolled on. Such restriction as has been placed upon the practice of pharmacy has been intended solely in the public interest. If the statutory privilege of carrying on the business of a chemist and druggist is attended with any advantage to those who have acquired that right, compensation for it has been demanded and paid in the shape of proof of the qualification held to be "expedient for the safety of the public." If greater restrictions should ever be imposed the compensation demanded may be expected to be greater, more perhaps than British pharmacists are prepared to agree to voluntarily. And in the end it is certain that the prevailing conditions will not meet the views of the majority of those concerned better than at present. The reform of the practice of pharmacy cannot be effected by law, but must proceed from within the craft. If the present conditions are in any degree evil, that is partly, perhaps mainly, the fault of those who have accepted them so long, and they cannot be radically altered off-hand. Time must be allowed to effect improvement, and efforts must not be lacking to proceed in a reasonable manner to devise and carry out that improvement. If the pharmacist takes no steps to prevent others supplanting him he will both invite and deserve the extinction which, in that case, is sure to be his. In self-defence he must be prepared to do much more in the matter of training those who, in the fulness of time, will naturally become his successors; he should also neglect no opportunity of increasing and rounding off his own stock of knowledge; and by combination with his fellow-craftsmen he ought to ensure such thorough organisation that all attempts to supplant him in the position of trust which he occupies in relation to the general public must needs be unsuccessful.

ANNOTATIONS.

THE SCHOOL OF PHARMACY will be re-opened, for the fifty-seventh session, on Monday next, October 3, when the President of the Pharmaceutical Society will distribute the prizes to the successful students of last session, and the inaugural sessional address will be delivered by Sir James Crichton Browne, M.D., F.R.S., Treasurer of the Royal Institution. The meeting will open in the lecture theatre at 17, Bloomsbury Square, at 3 p.m., and the attendance of all pharmaceutical students and their friends is cordially invited. The Dean of the School—Professor Collie—will attend on the same day, between the hours of 10 a.m. and 1 p.m., to receive students and to furnish information relating to the courses of study. Copies of the School Prospectus will be sent free on application being made to Mr. Richard Bremridge, 17, Bloomsbury Square, London, W.C.

A SPECIAL GENERAL MEETING of the Pharmaceutical Society will be held at the House of the Society, 17, Bloomsbury Square, London, on Wednesday next, October 5, at 3 p.m., for the purpose of considering and if thought proper of confirming and approving new Bye-laws to be submitted to the said meeting by the Council in accordance with the Provisions of the Charter of Incorporation of the Society and of the Pharmacy Acts, 1852 to 1898. The text of the new Bye-laws to be submitted to the meeting will be found in the *Pharmaceutical Journal* for August 3 last, at pages 137 to 148. They were read a first time at a meeting of the Council of the Society on August 3, and a second time at a special meeting on Wednesday last. They will be read a third time at the ordinary Council meeting on Wednesday next, and if confirmed and approved at the general meeting to be held the same day, they must then be submitted to the Privy Council for confirmation, after which the working machinery of the Society, as modified by the Pharmacy Acts Amendment Act, 1898, will be complete once more. Subsequently all registered chemists and druggists will be eligible as members of the Society and also as members of the Council, and registered apprentices will be eligible for election as "Student-Associates" of the Society.

LINSEED MEAL has served as the bone of contention in what is described in a local paper as one of the most keenly fought cases that have been heard in Cupar Sheriff Court for some time past. The St. Andrew's District Inspector summoned the manageress of a co-operative society for selling as linseed meal an article that was not of the nature, substance and quality of the article demanded. In fact, he had been supplied with ground linseed cake, whereas he thought he ought to have been supplied with linseed crushed without removal of the oil. The 1885 Pharmacopœia applied the term "linseed meal" to the crushed seed, but in the new B.P. the synonym is altered to "crushed linseed," and linseed meal is no longer an official article. That point was clearly brought out during the hearing of the case, and judgment was finally given for the defendant, but the reasons advanced by the Sheriff for so deciding, left the Pharmacopœia and its standards out of the question altogether. He said he was satisfied, after hearing the evidence, that whatever view the British Pharmacopœia might take there certainly were two substances known to commerce as linseed meal, the one being prepared from linseed cake and the other direct from the seeds. He could not adopt the suggestion of the inspector, who contended that on asking for linseed meal he was entitled to get the article described in the British Pharma-

copœia as crushed linseed and that, if he did not get that article, the seller rendered herself liable under the Sale of Food and Drugs Act. It seemed to him that, as there were two substances well known to the trade, if the inspector asked for linseed meal and the person who was selling across the counter produced one of the substances known by that name, and showed it to him, if the inspector accepted the linseed meal which was prepared from the cake, it was difficult to see how he could say that he did not get the article that he demanded. If there had been only one substance known to the trade and also described in the British Pharmacopœia as linseed meal, then the contention of the prosecution could have been understood. The Sheriff held the words of the Act to mean that it must be proved that the buyer did not get the article demanded, and it seemed to him in this particular case, looking at it from the seller's point of view, who did not know what the purchaser wanted, that the seller was quite justified in supplying the linseed cake meal, there being no specification of what was wanted except that linseed meal was asked for. There seemed no doubt whatever that there was a demand for the linseed cake meal, and it might be that there were persons who, knowing all the facts, thought that the better substance. If that were so, they were quite entitled to buy it and to use it. Therefore it seemed to him that, as facts had developed, he had no alternative but to find the charge not proven.

THE SUBJECT OF HUMAN CREDULITY has engaged the attention of a *Times* leader-writer this week, and in support of his arguments he quotes "a well-known story" of the founder of a vast pill business, which, he says, if not true, is *ben trovato*. A friend visiting the great medicine man in his shop, where the manufacture of pills by the thousand was in progress, said, "Do you really expect people to believe that this stuff will cure everything?" For answer, the proprietor took him to the door, which opened on to a crowded thoroughfare, and said, "You see all these people going by? How many of them do you suppose are wise, and how many fools?" It was, observes the writer in the *Times*, a cynical, but not ill-natured or untrue, appreciation of that ever-green credulity which the knowing ones of the world can generally exploit to their own profit, and the more readily so as it is not altogether ill-founded. For the desire for health is independent of education or of civilisation, and each successive age places confidence in its own medicine men or its special nostrums. Just in the same way all men in all ages desire more wealth. "Hope springs eternal in the human breast that by some means denied to others each one can increase his own store, and a ready credence is given to those who offer the means of doing so. We call it credulity; but it is only human nature. The company promoter, no less than the quack or the fortune-teller, will always find a wide field ready to his hand; for no amount of experience or reasoning seems able to press home the undoubted truth that high interest means bad security." The survival of credulity, it is pointed out, even in its most primitive forms, is not necessarily a sign of retrogression or of the failure of civilisation and culture to raise mankind. It is rather an illustration of the old truth that if human nature be driven out with a pitchfork it will always come back, and those who believe in human progress and the increasing purpose of the ages must accept human credulity as a permanent fact, if they would not despair of the improvement of mankind.

PARA RUBBER is exhaustively dealt with in the *Kew Bulletin* for October, and in view of the increasing demand for rubber and the alleged restriction of supplies, the article will doubtless be perused

with considerable interest by many readers. The information given is historical, botanical, and economic, the methods of propagation, collection and preparation being described at length. It is interesting to note that Mr. Consul W. A. Churchill, who has furnished to the Foreign Office the latest and most authentic information in regard to the Para rubber industry, states that, though some people suppose that the supply of Amazonian rubber may become exhausted in the near future, the most competent authorities are not at all of that opinion, but maintain that the supply is inexhaustible, because the *Hevea* tree, from which it is so largely obtained, is continually being reproduced by nature. Certainly, he says, some areas become exhausted when overworked, but when left alone for some time they recover. The district of Cametá, on the river Tocantins, gave an excellent quality of rubber, and there was a special quotation for it in the foreign markets. That district, however, is now exhausted, because for about forty years thousands of men have tapped its trees, all new-comers flocking to Cametá to make their fortunes. There are still many districts that have not been tapped, and the area that is known to produce Para rubber is at least a million square miles in extent. Further exploration will, it is anticipated, show that this area is under-estimated.

THE INTRODUCTION OF PARA RUBBER INTO THE EAST has been referred to by Dr. Trimen, in the Appendix to the Report of the New Products Commission. The Government of India having determined upon the enterprise, a commission was given to Mr. Wickham, then living at Santarem, to collect seed at the rate of ten pounds per thousand. He succeeded in obtaining seventy thousand seeds in the Siringals of the Rio Tapajos, which he packed with the greatest care and, with a full knowledge of their evanescent vitality, conveyed to Kew in June, 1876. The day after his arrival the whole number was sown, but not more than about $3\frac{1}{2}$ per cent. germinated, some as early as the fourth day after sowing; many in a few days reached a height of 18 inches. At Sir Joseph Hooker's suggestion, it had been previously arranged between the India and Colonial Offices that, owing to the want of any accessible and properly constituted botanical garden in any part of India suitable for the growth of this completely tropical species, the seedlings should be sent to Ceylon to be cultivated and propagated for subsequent distributions to Burma and other hot and moist districts of the Indian Empire. Owing to the plants' rapid growth, Wardian cases of a special form had to be made for their transmission, and some nineteen hundred plants were despatched from Kew in charge of a gardener. In due course they were received at Peradeniya in very good order, and the results of the subsequent experimental planting in Ceylon seem to indicate that in this case it is Ceylon which (from climatic causes chiefly) is likely to benefit most largely from the successful action of the Government of India.

THE CLIMATE OF BENGAL, where there is a distinct cold season, was soon found to be unsuitable for the cultivation of *Hevea brasiliensis*. After experimental efforts in other parts of India it was ultimately decided, according to the account in the *Kew Bulletin*, to establish rubber plantations at Mergui, in Lower Burma, and Nilambur, in Southern India. In accordance with the arrangement with the Government of India a first lot of plants propagated at Ceylon was despatched to Mergui in 1878. Those consisted of five hundred rooted cuttings. In 1887 there was sent a further consignment of plants and seeds. To Nilambur from 1878 to 1887 rooted cuttings and stumps were forwarded, as well as

several lots of seeds. Of the latter three hundred were sent in 1885. Further, in 1880, two plants were sent to the First Prince of Travancore; in 1881 a Wardian case with twenty-eight plants was forwarded to the Andaman Islands, and in 1888 about three thousand seeds were sent to the Commissioner of Agriculture at Nagpur, in the Central Provinces. There are now numerous trees both in Burma and Malabar producing regular supplies of seed. The introduction of *Hevea brasiliensis* trees into India has therefore been successfully accomplished. In British Guiana the *Hevea* does not appear to have taken well, but other rubber-yielding plants thrive there, and it is suggested that it is very desirable that all these rubber trees should be carefully and exhaustively investigated in order to find out their true value. It is thought probable that it may be found profitable to establish natural plantations in districts where the best rubber trees are already found. That could be done with little difficulty, and is said to offer the best means of immediately extending the area under rubber trees in different parts of the Colony. Where plants are plentiful it would only be necessary to clear away some of the other vegetation and allow the rubber trees more light and air, as well as thinning out when too crowded. Where the conditions are favourable, and the plants only sparsely found, wild seedlings might be transplanted or fresh seeds "dibbled in" at intervals to fill the vacant places. The cost of this plan would not be considerable, as the trees would require little attention after they are well started.

LIEUT.-COLONEL PROBYN, head of the firm of Hooper and Co., Pall Mall, has been the recipient, on election as Sheriff of the City of London, of a mark of the high esteem in which he is held by numerous friends, who assembled in the old Council Chamber at the Guildhall, on Tuesday last, for the purpose of presenting him with his shrieval chain and badge. Mr. H. S. Foster, M.P., the Master of the Pattenmakers' Company (of which Mr. Probyn is a past-master), presided. The Chairman, in making the presentation, alluded to the fact that he was associated with Mr. Probyn many years ago as a member of the School Board for London, while he was also a member of the first London County Council. Reference was also made to the fact that Mr. Probyn had borne upon his shoulders the chain of the office of Grand Treasurer of the Grand Lodge of Freemasons of England, and Mr. Foster pointed out that both that office and the position of sheriff were associated with traditions of great liberality and charity. Lieut.-Colonel Probyn, in acknowledging the gift, assured his friends that he would, by upholding the distinguished office to which he had been elected, merit their confidence and esteem. A portrait of Lieut.-Colonel Probyn, who was formally admitted to office as Sheriff on Wednesday, is being painted by Mr. Seymour Lucas, R.A., and is to be presented at an early date.

PROFESSOR HENRY TRIMBLE, A.M., Ph.M., Editor of the *American Journal of Pharmacy*, who died at Philadelphia on August 24, was an active worker, and the Philadelphia College of Pharmacy—to the advancement of which he gave much of his time and thought—is the poorer by his loss. His death, observes the *American Druggist*, has come as a severe blow to all who had the privilege of his acquaintance, and particularly to the members of the College with which he had been so long connected. Of his scientific work in relation to chemistry, that concerned with his work on the tannins will, perhaps, be most familiar to pharmaceutical readers, as he was a recognised authority on that subject and the author of a monograph which has passed into two editions.

The accumulation of five years' work, subsequent to the publication of the second edition of 'The Tannins' in 1894, was almost ready for publication when the lamented teacher was touched by the hand of death. His life was marked by unremitting industry and a devotion to duty which was unexampled.

THE NEXT COURSE OF GRESHAM LECTURES will treat of the borderland between health and disease, and they will be delivered at the Gresham College, Basinghall Street, E.C., by Dr. E. Symes Thompson, on Tuesday next, October 4, and the three following days. The subjects of the four lectures will be "the borderland between sleeping and waking," "on pain and ease," "on normal and abnormal nerves," and "the borderland between sanity and insanity." The lectures will be illustrated by diagrams, are free to the public, and will commence each day at 6 p.m. Time will be given during the last lecture to answer questions bearing on the subject of the course, and such questions should be sent in to the lecturer as early as possible.

THE BRITISH PHARMACOPEIA OF 1898 is to be formally adopted in the Colony of Victoria as from January 1 next, a Bill to that effect having been prepared by the Colonial Government. The effect of the Bill, if passed into law, will be to repeal the section of the Medical Act, 1890, referring to the Pharmacopœia of 1885, and to authorise the adoption of the new Pharmacopœia and any subsequent ones as published. It would have been well if a definite date for the legal adoption of the Pharmacopœia had similarly been fixed by Statute in this country. But for the present we must content ourselves with admiring what can be done in such matters by our Colonies.

OPTICAL, MATHEMATICAL, AND SCIENTIFIC INSTRUMENTS will be on view at an exhibition promoted by the Worshipful Company of Spectacle Makers, which will be formally opened at the Guildhall, London, by the Lord Mayor and Lady Mayoress on Monday next, at 3 p.m. As the holding of the exhibition practically coincides with the initiation of the scheme of the Company of Spectacle Makers for securing the proper qualification of dealers in optical appliances, it should be of special interest to chemists proposing to apply for certification by the Company.

AT THE COUNCIL MEETING last Wednesday, Mr. Atkins attended with his arm in a sling and by special permission of his medical attendant. Our readers will regret to learn that a fall while walking on a slippery pavement caused a fracture of a bone at the elbow, from which Mr. Atkins has suffered much inconvenience.

AN ATLAS OF BACTERIOLOGY is a desideratum at the present time, and many of our readers will be glad to learn that such a work is now in the press. It has been prepared by Chas. Slater, M.A., M.B., M.R.C.S., lecturer on bacteriology at St. George's Hospital Medical School, and E. J. Spitta, L.R.C.P., M.R.C.S., whose articles on photo-micrography are appearing in the *Pharmaceutical Journal*. The atlas will contain more than a hundred original photo-micrographs with explanatory text, and it should prove of value as a supplement to any text-book on bacteriology. The specimen pages show that both the photographs and text are being printed with the utmost care, and the types illustrated have been selected with a discretion that betokens full knowledge of the subject by the authors.

British Association.

ADDRESS TO THE CHEMICAL SECTION

BY PROFESSOR F. R. JAPP, M.A., LL.D., F.R.S.

President of the Section.

STEREOCHEMISTRY AND VITALISM.

(Concluded from page 361.)

The four affinities, or directed attractive powers, of the carbon atom are not to be conceived of as lying in one plane. The simplest assumption that we can make with regard to their distribution in space is that the direction of each makes equal angles with the directions of the three others. We may express this differently by saying that the four atoms or groups attached to the carbon atom are situated at the solid angles of a tetrahedron, in the centre of which the carbon atom itself is placed. If the four atoms or groups are all identical they will be equally attracted by the carbon atom; consequently they will be equidistant from it, and the tetrahedron will be regular. If they are all different the force with which each is attracted will be different; they will arrange themselves at different distances from the carbon atom; and the tetrahedron will be irregular; it will have no plane of symmetry. Any compound of the formula $CHX'Y'Z'$ can therefore exist in two enantiomorphs, applying this term to the molecules themselves—in two non-superposable forms, each of which is the mirror image of the other: thus—

(In these figures no attempt has been made to represent the tetrahedra as irregular; the opposite asymmetry is indicated merely by the opposite order of the four attached atoms or groups. In reality, however, they would be irregular. The carbon atom itself is not shown.)

If we consider any particular set of three atoms or groups—for example, H, Z', and Y'—looking towards that face of the tetrahedron about which they are arranged, any order, thus HZ'Y', which is clockwise in one figure, will be counter-clockwise in the other. In like manner, a continuous curve, passing through the four atoms or groups in any given sequence, will form a right-handed helix in the one case and a left-handed helix in the other. We thus find that the foregoing assumptions—the very simplest that could be made—regarding the distribution of the four affinities of carbon and the different degree with which four different atoms or groups will be attracted by the carbon atom to which they are attached, lead to the asymmetric structures postulated by Pasteur to account for optical activity—namely, enantiomorphous irregular tetrahedra, and right- and left-handed helices.

That a spiral arrangement, right- or left-handed, will produce rotation of the plane of polarisation in its own sense, may be shown by various experiments: thus in Reusch's optically active piles of plates of mica, produced by crossing successive plates of biaxial mica at an angle of 60° to one another; or in the twisted jute fibres recently described by Professor Bose, which, according to the direction of the twist previously imparted to them, rotate the plane of polarisation of electric waves either to the right or to the left.

If two of the four atoms or groups attached to carbon are identical, there is no asymmetry, and no optical activity. Thus, in a compound of the formula $CH_2X'Y'$, which we may represent by our tetrahedral scheme as shown in Fig. 3, the two hydrogen atoms are equidistant from the carbon atom; the system has a plane of symmetry passing through X'Y' and the carbon atom, and has therefore a superposable mirror image.

If the molecule contains only one asymmetric carbon atom, the latter may be either positive or negative, so that the substance may exist in two forms of opposite optical activity; in addition to which we may have the racemoid combination of the two, which will be inactive but separable. Mandelic acid, $C_6H_5 \cdot CH(OH) \cdot COOH$,* is a case in point: it is known in these three forms.

If, as in the case of tartaric acid,

the molecule contains two asymmetric carbon atoms, and at the same time consists of two structurally identical halves, then these two atoms may be either both positive or both negative, reinforcing each other's effect in either case; or one may be positive and the other negative, when, owing to the structural identity of the two halves of the molecule, the effect of the one will exactly compensate that of the other, and the compound will be inactive, but not separable. Furthermore, there may be the racemic combination of the bi-dextro-form with the bi-laevo-form: a combination inactive, but separable. We have thus the explanation of the four forms observed by Pasteur.

In fact all the complex cases of isomerism that have been met with among compounds of this class—compounds structurally identical, but configuratively distinct as it is termed—may be satisfactorily explained, and their possible number accurately predicted, by means of the theory of the asymmetric carbon atom.

I must apologise to the organic chemists among my audience for inflicting on them this very elementary exposition of what to them is a well-known theory. But outside the circle of organic chemists the theory is, I fear, far from well known. Thus, an eminent physicist, in his "Theory of Light," referring to the rotation of the plane of polarisation by liquid or dissolved substances, says: "I am not aware that any explanation of it has ever been suggested." And in the "Proceedings of the Royal Society" for the present year, another eminent physicist, after quoting with approval this personal confession, goes on to suggest the possibility of the molecules having a twisted structure, and points out that a right-handed twist "would appear right-handed when looked at from either end," apparently unaware that such conceptions have been commonplaces of stereo chemistry for the past quarter of a century at least.

This brief sketch of the theory was therefore necessary in order that we may now effectively discuss Pasteur's views on the relation between optical activity and life.

Whenever we prepare artificially, starting either with the elements, or with symmetric compounds, any organic compound which, when it occurs as a natural product of the living organism, is optically active, the primary product of our laboratory reactions, however closely it may in other respects resemble the natural product, differs from it in being optically inactive. Pasteur was greatly impressed by this fact. In the lectures delivered in 1860 he says "Artificial products have no molecular asymmetry; and I could not point out the existence of any more profound distinction between the products formed under the influence of life, and all others." And again, he refers to "the molecular asymmetry of natural organic products" as "the great characteristic which establishes perhaps the only well-marked line of demarcation that can at present be drawn between the chemistry of dead matter and the chemistry of living matter." He would not admit that even racemoid forms, optically inactive by intermolecular compensation, might be artificially prepared; thus, to the suggestion that the malic acid which he had obtained from Dessaignes's artificial aspartic acid might possibly be the racemoid form (as we now know that it is), he replied: "That is improbable, for then not only should we have made an active body from an inactive one, but we should have made two—a right and a left."

The view that racemoids could not be prepared artificially did not long remain tenable. In 1860, the year in which the foregoing lectures were delivered, Perkin and Duppa, and, independently, Kekulé, obtained from dibromosuccinic acid a form of tartaric acid, which Pasteur recognised as racemic acid. But the succinic acid employed had been prepared from amber, a substance of vegetable origin; and there was still the possibility that herein lay the source of the optical activity of the two constituents of the artificial racemic acid. This objection, which was raised by Pasteur himself, fell to the ground when, in 1873, Jungfleisch

prepared racemic acid from Maxwell Simpson's synthetic succinic acid, and separated it into its right and left constituents by means of the sodium ammonium salt.

"Thus falls the barrier," wrote Schützenberger, "which M. Pasteur had placed between natural and artificial products. This example shows us how reserved we must be in attempting to draw distinctions between the chemical reactions of the living organism and those of the laboratory."

To these words, which, although written a quarter of a century ago, may fairly be taken as representing the prevailing belief of chemists at the present day, Pasteur replied as follows:

"Contrary to M. Schützenberger's belief, this barrier still exists. . . . To transform one inactive compound into another inactive compound which has the power of resolving itself simultaneously into a right-handed compound and its opposite (*son symétrique*), is in no way comparable with the possibility of transforming an inactive compound into a single active compound. This is what no one has ever done; it is, on the other hand, what living nature is doing unceasingly before our eyes."

On this and subsequent occasions Pasteur did little more than reiterate opinions which he had previously expressed. As he himself stated, he was then occupied with other problems which absorbed his entire time and energies. The result has been that the opinions have suffered neglect and even misrepresentation. Thus Ostwald, in his *Allgemeine Chemie*, translating, or rather paraphrasing, the foregoing passage, omits the word "single"—which is the key to Pasteur's meaning—and then condemns the statement as illogical.

Pasteur's point is, that whereas living nature can make a single optically active compound, those laboratory reactions, to which we resort in synthesising such compounds, always produce, simultaneously, at least two, of equal and opposite optical activity; the result being intermolecular compensation and consequent optical inactivity. Not necessarily implied in Pasteur's statement, but entirely in harmony with it, is the fact that we can sometimes produce artificially a single compound containing within its molecule two equal and opposite asymmetric groups, and therefore inactive by intramolecular compensation; thus in the oxidation of maleic acid to mesotartaric acid.

Let us consider the cause of this limitation of our synthetic reactions. Why cannot we produce, by laboratory processes, involving the play of symmetric forces and the interaction of symmetric atoms and molecules, single optically active compounds? To answer that question, let us turn our attention to the mechanism of the change in which a symmetric carbon atom becomes asymmetric.

A simple case of such a change, typical of all similar changes, is the transformation of a compound, $CH_2X'Y'$, by substitution, into $CHX'YZ'$. If we follow this process by means of our tetrahedral model, we see at once why, in our ordinary laboratory reactions, both enantiomorphs must be generated in equal quantity. The molecule of the compound, $CH_2X'Y'$, of which the tetrahedral representation is given in Fig. 3, has, as we have already seen, a plane of symmetry passing through $X'Y'$ and the carbon atom; and from this plane of symmetry the two hydrogen atoms are equidistant on opposite sides. Any purely mechanical, symmetric force, therefore—any force, for example, such as comes into play in the motions of the symmetric molecules of a gas or a liquid—which affects one of these hydrogen atoms in one molecule of the compound $CH_2X'Y'$, has an equal chance of affecting the other hydrogen atom in another molecule. If the right-hand hydrogen atom in Fig. 3 is replaced by the radicle Z' , we obtain the enantiomorph represented in Fig. 1; if the left-hand hydrogen atom, that represented in Fig. 2. The chances in favour of these two events being equal, the ratio,

Number of occurrences of event I.

Number of occurrences of event II.

will, if we are dealing with an infinitely great number of molecules, approximate to unity. We therefore obtain a mixture, optically inactive by intermolecular compensation.

All cases of the conversion of symmetric into asymmetric compounds may be referred to the same category, no matter whether the chemical process is one of substitution or of addition, or whether the resulting molecule contains one or more asymmetric carbon atoms. Thus, in the reduction of a ketone of the formula $X'CO \cdot Y'$ to a secondary alcohol of the formula $X'CH(OH) \cdot Y'$; in the transformation of an aldehyde by the addition of hydrocyanic acid in a nitrile of an α -hydroxy-acid; in the oxidation of

*The asymmetric carbon atom is represented by an italic C.

fumaric acid to racemic acid—eases typifying the various additive processes in which asymmetric groupings are produced—there is one condition common to all: in the symmetric compound, with which we start, there are, in every case, two identical points of attack, equidistant from the plane of symmetry of the molecule, and the result is that the two possible events happen in equal number, so that the mixture of enantiomorphs obtained is optically inactive by compensation. We are, of course, in many cases able afterwards to separate these enantiomorphs by the methods devised by Pasteur, and thus obtain the single optically active compounds; but we cannot produce them singly as long as we have at our disposal only the symmetric forces which we command in the laboratory.

Precisely the same state of things prevails when symmetric molecules unite, under the influence of symmetric forces, to build up an asymmetric crystalline structure. When, for example, sodium chlorate crystallises from its aqueous solution, the number of right-handed crystals is, on the average, as was shown by Kipping and Pope, equal to the number of left handed crystals. The same fact was proved by Landolt by observing the optical inactivity of the mixture of microscopic right and left crystals obtained by adding alcohol to a concentrated aqueous solution of sodium chlorate. The two possible asymmetric events occur in equal number.

Non-living, symmetric forces, therefore, acting on symmetric atoms or molecules, cannot produce asymmetry, since the simultaneous production of two opposite asymmetric halves is equivalent to the production of a symmetric whole, whether the two asymmetric halves be actually united in the same molecule, as in the case of mesotartaric acid, or whether they exist as separate molecules, as in the left and right constituents of racemic acid. In every case, the symmetry of the whole is proved by its optical inactivity.

The result is entirely different, however, when we allow symmetric forces to act under the influence of already existing asymmetric, non-racemoid compounds.

Thus, if we start with an optically active compound—a compound containing one or more asymmetric carbon atoms and non-racemoid—and, by appropriate chemical reactions, render asymmetric some carbon atom in the compound which was not previously so, then it does not follow that the two forms represented by the two possible arrangements of this new asymmetric carbon atom will be produced in equal quantity. The compound with which we start has no plane of symmetry; and, although there are still two possible points of attack, one will be more exposed than the other; in fact, one mode of attack may so predominate that apparently only one asymmetric compound is formed, the other compound, if formed at all, escaping detection by the smallness of its amount. A case in point is the conversion of *d*-mannose by combination with hydrocyanic acid into the nitrile of *d*-mannoheptonic acid, studied by Emil Fischer, in which only one nitrile is formed, although there are two ways in which the hydrocyanic acid may attach itself to the aldehyde group of the mannose. On the other hand the same general reaction, in the union of hydrocyanic acid with ordinary aldehyde $\text{CH}_3\cdot\text{CHO}$ —a symmetric compound—yields the right and left forms of lacto-nitrile $\text{CH}_3\cdot\text{CH}(\text{OH})\cdot\text{CN}$ in equal quantity, the two asymmetric events occurring in equal number, and the resulting mixture of compounds being inactive. It is the difference between guidance and no guidance; the asymmetric group present in the mannose guides into a particular path the symmetric forces which bring about the addition of the hydrocyanic acid; in the case of the symmetric aldehyde the result is left to pure chance. The latter action is like that of tossing a perfectly balanced coin; in the former the coin is heavily weighted on one side. The saying, “*les dés de la Nature sont pipés*,” is certainly true of living nature and its products.

This guiding action displayed by asymmetric compounds may even impart a bias to the crystallisation of those molecularly symmetric substances already referred to, which crystallise in enantiomorphous forms. Thus Kipping and Pope have recently made the interesting observation that the crystals of sodium chlorate which were deposited from an aqueous solution containing 200 grammes of *d*-glucose to the litre consist, on an average, of 32 per cent. of right-handed to 63 per cent. of left-handed crystals, the asymmetric carbohydrate, by its mere presence, favouring the formation of the one asymmetric form of the inorganic salt at the expense of the other.

These observations possibly afford a clue to the mode of action

of the living organism in producing single enantiomorphs. This production of single asymmetric forms may be a result of the asymmetric character of the chemical compounds of which the tissues of plants and animals are built up. The optically active products of the organism—the carbohydrates, the terpenes, tartaric acid, asparagine, quinine, the serum of the blood, and countless others—have been formed in an asymmetric environment, and their asymmetry is an induced phenomenon. They have been cast, as it were, in an asymmetric mould. According to this view they are a result of the selective production of one of the two possible enantiomorphous forms. The same would hold good with regard to the organised tissues themselves, developed from inherited asymmetric beginnings in the ovum or the seed, or obtained by fission. The perplexing question of the absolute origin of these asymmetric compounds I will discuss later.

Another view has been put forward by Emil Fischer. In his lecture on “Syntheses in the Sugar Group,” delivered before the German Chemical Society in 1890, he says:—

“Starting with formaldehyde, chemical synthesis leads, in the first instance, to the optically inactive *acrose*. In contradistinction to this only the active sugars of the *d*-mannitol series have hitherto been found in plants.

“Are these the only products of assimilation [of carbon dioxide and water]? Is the preparation of optically active substances a prerogative of the living organism; is a special cause, a kind of vital force, at work here? I do not think so, and incline rather to the view that it is only the imperfection of our knowledge which imports into this process the appearance of the miraculous.

“No fact hitherto known speaks against the view that the plant, like chemical synthesis, first prepares the inactive sugars; that it then resolves them into their active constituents, using the members of the *d*-mannitol series in building up starch, cellulose, inulin, etc., whilst the optical isomerides serve for other purposes at present unknown to us.”

There are therefore, two opposite processes which would account for the presence of optically active compounds among the substances generated in the living organism, and which we may briefly describe as selective production and selective consumption. An instance of artificial selective production is the formation of only one nitrile of *d*-mannoheptonic acid already cited. Selective consumption, dissociated, however, from the previous production of the racemoid form, may be illustrated by the fermentation of dextro-tartaric acid in the action, studied by Pasteur and already referred to, of a mould on racemic acid, the *lævo*-tartaric acid remaining untouched, and by numerous similar fermentations since discovered. Selective consumption is not restricted to living ferments; various cases are known of enzymes, or soluble ferments, which can effect the hydrolysis of the glucoside, but not of its enantiomorph. As Emil Fischer, who studied this phenomenon, says: “Enzyme and glucoside must fit each other like key and lock, in order that the one may exercise a chemical action on the other.” And a similar selective action, embracing the much more complex phenomenon of alcoholic fermentation, is displayed by E. Buchner’s soluble zymase obtained from yeast cells.

It is true, moreover, that the organism sometimes produces both enantiomorphs. Thus the lactic ferment converts carbohydrates into racemoid lactic acid; ordinary or *lævo* rotatory, asparagine is accompanied in plants, as Piutti showed, by a small quantity of its optical isomeride; and there are other cases.

These facts might be taken as evidence in favour of Fischer’s view that selective consumption is the cause of the phenomenon we are discussing. But I do not think that, in the present state of our knowledge, we can decide between the two views. For that matter both may be correct, each may explain particular cases. What I wish to point out is that Fischer’s statement that the “miraculous” character of the phenomenon is eliminated by his assumption, appears open to question. It is just as much, or as little, miraculous after as before. The production of a single asymmetric form, and the destruction of one of two opposite asymmetric forms, are problems of precisely the same order of difficulty, and there are only two ways in which either of them has ever been solved; first, by the direct action of living matter, and, secondly, by the use of previously existing asymmetric non-racemoid compounds, which are, in the last resort, due to the action of life. Directly, or indirectly, then, life intervenes.

Doubtless this will appear a very extraordinary statement in view of Jungfleisch’s synthesis of racemic acid and its resolution into dextro- and *lævo*-tartaric acids by the crystallisation of the

sodium ammonium salts. The process does not take place in a living organism, nor is the aid of life invoked in the shape of a micro-organism, as in Pasteur's third method of separation. No asymmetric base of vegetable origin is employed, as in Pasteur's second method, so that the indirect action of life through its products is also excluded; sodium and ammonium are symmetric inorganic radicles, and no substance of one-sided asymmetry is introduced from beginning to end. The process is one of ordinary crystallisation; the two forms are deposited side by side, the operator afterwards picking out the right and left crystals and separating them. The reason why the two tartrates crystallise out, and not the racemate, is that at the ordinary temperature of the air at which the crystallisation is conducted they are less soluble than the racemate. At a higher temperature, on the other hand, these solubilities are reversed, and the racemate is deposited. The conditions are precisely those which govern the formation or non-formation of ordinary double salts.

Consequently the overwhelming majority of chemists hold that the foregoing synthesis and separation of optically active compounds have been effected without the intervention of life, either directly or indirectly. Every manual of stereochemistry emphasises this point.

I have already hinted that I hold a contrary opinion. I have held it for some time, but have not ventured to give public expression to it, except in lecturing to my students. I was deterred chiefly by the impression that I stood alone in my belief. I find, however, that this was a mistaken impression. In a lecture on "Pasteur as the Founder of Stereochemistry," which Professor Crum Brown delivered before the Franco-Scottish Society in July, 1897, and which is published in the *Revue française d'Edimbourg*, he says, referring to the separation of enantiomorphs by crystallisation:—

"The question has often occurred to me: Do we here get rid of the action of a living organism? Is not the observation and deliberate choice by which a human being picks out the two kinds of crystals and places each in a vessel by itself the specific act of a living organism of a kind not altogether dissimilar to the selection made by *Penicillium glaucum*? But I do not insist on this, although I think it is not unworthy of consideration."

It is this question, so precisely posed by Professor Crum Brown, that I would discuss in detail. I think we shall find that the answer to it will be in the sense which he indicates. The action of life, which has been excluded during the previous stages of the process, is introduced the moment the operator begins to pick out the two enantiomorphs.

It will doubtless be objected that, if this is the case, there can be no such thing as a synthesis of a naturally occurring organic compound without the intervention of life, inasmuch as the synthetic process is always carried out by a living operator.

Here, however, we must draw an important distinction. In the great majority of the operations which we carry out in our laboratories—such as solution, fusion, vaporisation, oxidation, reduction and the like—we bring to bear upon matter symmetric forces only—forces of the same order as those involved in the chance motions of the molecules of a liquid or a gas. All such processes, therefore, might conceivably take place under purely chance conditions, without the aid of an operator at all. But there is another class of operations, to which Pasteur first drew attention: those into which one-sided asymmetry enters, and which deal either with the production of a single enantiomorph, or with the destruction (or change) of one enantiomorph in a mixture of both, or with the separation of two enantiomorphs from one another. We have already seen that such processes are possible only under one-sided asymmetric influences, which may take the form either of the presence of an already existing enantiomorph, or of the action of a living organism, or of the free choice of an intelligent operator. They cannot conceivably occur through the chance play of symmetric forces.

We must, therefore, in classifying the actions of the intelligent operator, distinguish between those actions in which his services might conceivably be dispensed with altogether, and those in which his intelligence is the essential factor. To the former class belongs the carrying out of symmetric chemical reactions; to the latter, the separation of enantiomorphs.

Take the synthesis of formic acid—a symmetric compound—by the absorption of carbon monoxide by heated caustic alkali. Given a forest fire and such naturally occurring materials as limestone, sodium carbonate, and water, it would not be difficult to imagine a set of conditions under which a chance synthesis of sodium

formate from inorganic materials might occur. I do not assert that the conditions would be particularly probable; still, they would not be inconceivable. But the chance synthesis of the simplest optically active compound from inorganic materials is absolutely inconceivable. So also is the separation of two crystallised enantiomorphs under purely symmetric conditions.

The picking out of the two enantiomorphs is, moreover, to be distinguished from the process of similarly separating the crystals of two different non-enantiomorphous substances, although this distinction is commonly ignored by classing both processes together as mechanical, in opposition to chemical separations. In the case of the non-enantiomorphs there may be differences of solubility, of specific gravity and the like; so that other means of separation, involving only the play of symmetric forces, may be resorted to. Such a process may justly be regarded as "mechanical." But the two crystallised enantiomorphs, as we have seen, have the same solubility—at least in symmetric solvents; the same specific gravity; behave, in fact, in an identical manner towards all symmetric forces; so that no separation by such means is feasible. It requires the living operator, whose intellect embraces the conception of opposite forms of asymmetry, to separate them. Such a process cannot, by any stretch of language, be termed "mechanical." Conscious selection here produces the same result as the unconscious selection exercised by the micro-organism, the enzyme, or the previously existing asymmetric compound.

I need not point out that if the operator chooses to bring about the separation by an asymmetric solvent, or some other asymmetric means, he is still making use of his conception of asymmetry. He merely effects his end indirectly instead of directly. But in either case he exercises a guiding power which is akin, in its results, to that of the living organism, and is entirely beyond the reach of the symmetric forces of inorganic nature.

In like manner, it is not of the least consequence, for the purposes of the present argument, whether the micro-organism, with which we have compared the operator, acts directly in fermenting one or two enantiomorphs, or whether it acts indirectly by first preparing an asymmetric enzyme which displays this selective action. The contention, therefore, of E. Fischer, Buchner, and others, that the discovery of enzymes and zymases "has transferred the phenomena of fermentation from biological to purely chemical territory," is true only as regards the immediate process, and leaves intact the vitalistic origin of these phenomena.

We thus arrive at the conclusion that the production of single asymmetric compounds, or their isolation from the mixture of their enantiomorphs, is, as Pasteur firmly held, the prerogative of life. Only the living organism with its asymmetric tissues, or the asymmetric products of the living organism, or the living intelligence with its conception of asymmetry, can produce this result. Only asymmetry can beget asymmetry.

Is the failure to synthesise single asymmetric compounds without the intervention, either direct or indirect, of life, due to a permanent inability, or merely to a temporary disability which the progress of science may remove? Pasteur took the latter view, and suggested that the formation of chemical compounds in the magnetic field, or under the influence of circularly polarised light, would furnish a means of solving the problem; and Van't Hoff also thinks the latter method feasible. As regards magnetism, Pasteur's suggestion was undoubtedly based on a misconception; the magnetic field has not an asymmetric structure; it is merely polar, since the rotation which it produces in the plane of polarisation of a ray of light changes sign with the direction of the field. As regards circularly polarised light, I must confess to having doubts as to whether it can be regarded as an asymmetric phenomenon: the motion of the ether about the axis of the ray is circular, not spiral; and it is only by considering the difference of phase from point to point along the ray that the idea of a spiral can be evolved from it. In fact, are there such things as forces asymmetric in themselves? Is the geometrical conception of asymmetry applicable to dynamical phenomena at all, except in so far as these deal with asymmetric material structures, such as quartz crystals, or organic molecules containing asymmetric carbon atoms? But this is a question which I would submit to the judgment of mathematical physicists.

One thing is certain—namely, that all attempts to form optically active compounds under the influence of magnetism or circularly polarised light have hitherto signally failed. These forces do not distinguish between the two equally exposed points of attack which present themselves in the final stage of the transformation of a

symmetric into an asymmetric carbon atom. But even if such an asymmetric force could be discovered—a force which would enable us to synthesise a single enantiomorph—the process would not be free from the intervention of life. Such a force would necessarily be capable of acting in two opposite asymmetric senses; left to itself it would act impartially in either sense, producing, in the end, both enantiomorphs in equal amount. Only the free choice of the living operator could direct it consistently into one of its two possible channels.

I will briefly recapitulate the conclusions at which we have arrived. Non-living, symmetric matter—the matter of which the inorganic world is composed—interacting under the influence of symmetric forces to form asymmetric compounds, always yields either pairs of enantiomorphous molecules (racemoid form), or pairs of enantiomorphous groups united within the molecule (meso-form), the result being, in either case, mutual compensation and consequent optical inactivity. The same will hold good of symmetric matter interacting under the influence of asymmetric forces (supposing that such forces exist) provided that the latter are left to produce their effect under conditions of pure chance.

If these conclusions are correct, as I believe they are, then the absolute origin of the compounds of one-sided asymmetry to be found in the living world is a mystery as profound as the absolute origin of life itself. The two phenomena are intimately connected, for, as we have seen, these symmetric compounds make their appearance with life, and are inseparable from it.

How, for example, could lævo-rotatory protein (or whatever the first asymmetric compound may have been) be spontaneously generated in a world of symmetric matter and of forces which are either symmetric or, if asymmetric, are asymmetric in two opposite senses? What mechanism could account for such selective production? Or if, on the other hand, we suppose that dextro- and lævo- protein were simultaneously formed, what conditions of environment existing in such a world could account for the survival of the one form and the disappearance of the other? Natural selection leaves us in the lurch here; for selective consumption is, under these conditions, as inconceivable as selective production.

No fortuitous concurrence of atoms, even with all eternity for them to clash and combine in, could compass this feat of the formation of the first optically active organic compound. Coincidence is excluded, and every purely mechanical explanation of the phenomenon must necessarily fail.

I see no escape from the conclusion that, at the moment when life first arose, a directive force came into play—a force of precisely the same character as that which enables the intelligent operator, by the exercise of his Will, to select one crystallised enantiomorph and reject its asymmetric opposite.

I would emphasise the fact that the operation of a directive force of this nature does not involve a violation of the law of the conservation of energy. Enantiomorphs have the same heat of formation; the heat of transformation of one form into the other is *nil*. Whether, therefore, one enantiomorph alone is formed, or its optical opposite alone, or a mixture of both, the energy required per unit weight of substance is the same. There will be no dishonoured drafts on the unalterable fund of energy.

The interest of the phenomena of molecular asymmetry from the point of view of the biologist lies in the fact that they reduce to its simplest issues the question of the possibility or impossibility of living matter originating from dead matter by a purely mechanical process. They reduce it to a question of solid geometry and elementary dynamics; and therefore if the attempted mechanical explanation leads to a *reductio ad absurdum*, this ought to be of a correspondingly simple and convincing character. Let us see how far this is the case.

Life is a phenomenon of bewildering complexity. But in discussing the problem of the origin of life, this complexity cuts two ways. Whilst, on the one hand, it is appealed to by one set of disputants as an argument against the mechanical theory, on the other it affords shelter for the most unproved statements of their opponents. I will take a concrete instance from the writings of an upholder of the mechanical theory of the origin of life, the late Professor W. K. Clifford. He says:

“Those persons who believe that living matter, such as protein, arises out of non-living matter in the sea, suppose that it is formed like all other chemical compounds. That is to say, it originates in a coincidence, and is preserved by natural selection. . . . The coincidence involved in the formation of a molecule so complex as to be called living, must be, so far as we can make out, a very elaborate coincidence. But how often does it happen

in a cubic mile of sea-water? Perhaps once a week; perhaps once in many centuries; perhaps, also, many million times a day. From this living molecule to a speck of protoplasm visible in the microscope is a very far cry; involving, it may be, a thousand years or so of evolution.”

It was easy for Clifford to write thus concerning life itself, for it was difficult for any one to contradict him. But had he been asked whether any mechanical (symmetric) coincidence would suffice to convert an infinitely great number of molecules of the type shown in Fig. 3 into that shown in (say) Fig. 1, or to the exclusion of that shown in Fig. 2; or whether, given a mixture, in equal proportions, of molecules of the types shown in Figs. 1 and 2, any mechanical (symmetric) conditions of environment would bring about the destruction of one kind and the survival of the other, I think his exact mathematical and dynamical knowledge would have prevented him from giving an affirmative answer. But short of this affirmative answer, his other statements, it seems to me, fall to the ground.

I am convinced that the tenacity with which Pasteur fought against the doctrine of spontaneous generation was not unconnected with his belief that chemical compounds of one-sided asymmetry could not arise save under the influence of life.

Should anyone object that the doctrine of the asymmetric carbon atom is a somewhat hypothetical foundation on which to build such a superstructure of argument as the foregoing, I would point out that the argument is in reality independent of this doctrine. All that I have said regarding the molecular asymmetry of naturally occurring optically active organic compounds, and all the geometrical considerations based thereon, hold good equally of the hemihedral crystalline forms of these compounds, about which there is no hypothesis at all. The production of a compound crystallising in one hemihedral form to the exclusion of the opposite hemihedral form, as in the case of the tartaric acid of the grape, is a phenomenon inexplicable on the assumption that merely mechanical, symmetric forces are at work. Nor is this conclusion invalidated even if we ultimately have to admit that the connection between molecular and crystalline asymmetry is not an invariable one—a point about which there is no dispute.

At the close of the lectures from which I have so frequently quoted, Pasteur, with full confidence in the importance of his work, but without any trace of personal vanity, says:—

“It is the theory of molecular asymmetry that we have just established—one of the most exalted chapters of science. It was completely unforeseen, and opens to physiology new horizons, distant but sure.”

I must leave physiologists to judge how far they have availed themselves of the new outlook which Pasteur opened up to them. But if I have in any way cleared the view towards one of these horizons, I shall feel that I have not occupied this chair in vain.

Some of my hearers, however, may think that, instead of rendering the subject clearer, I have brought it perilously near to the obscure region of metaphysics; and certainly, if to argue the insufficiency of the mechanical explanation of a phenomenon is to be metaphysical, I must plead guilty to the charge. I will, therefore, appeal to a judgment—metaphysical, it is true, but to be found in a very exact treatise on physical science—namely, Newton's “Principia.” It has a marked bearing on the subject in hand:

“A cæca necessitate metaphysica, quæ utique eadem est semper et ubique, nulla oritur rerum variatio.”

This is certainly true of the particular “rerum variatio” in which optically active organic compounds originate.

EUROPHEN INUNCTIONS IN TUBERCULOSIS.—Lawrence Flick concludes, after eight years' experience, that incipient cases of tuberculosis may almost always be cured by inunction of europhen or iodoform. As the odour of europhen is much less objectionable than that of iodoform, and it is at least as efficacious, the former drug is to be preferred for use. The formula employed is europhen, 1 drachm; oil of rose, 1 ℥; oil of anise, 1 drachm; olive oil, 2 ozs. The patients are instructed to rub about a tablespoonful of this thoroughly into the insides of the thighs and into the armpits before retiring at night. The treatment should be persevered in until after acute symptoms have entirely disappeared and perfect health is established. The internal administration of creosote and of tonics should accompany this method of inunction.—*Therap. Gaz.*, xxii., 33.

SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY.

The annual meeting of this Society was held in the rooms, New Surrey Street, on September 21, Mr. G. SQUIRE, the President, in the chair. Among those present were Messrs. G. T. W. Newsholme, J. Preston, H. E. Ibbitt, W. Ward, and J. B. Pater (Hon. Sec.).—The annual report of the Council, which was presented by the Secretary, stated that the Society had a membership of thirty-seven and sixteen associates, a reduction of one member and eight associates. The programme of the past year consisted of the annual dinner and meeting, which proved one of the most successful of the series, eight Council meetings, five general meetings, and a ball. Papers had been read on the following subjects:—The Proprietary Articles Trade Association; The Proposed New Pharmacy Bill, and Poor Law Dispensers. The Council announces that it has arranged for the reading of a series of papers for the coming season, and appeals to both members and associates to show their interest in the work of the Society by attending the meetings. The working of the School of Pharmacy resulted in a balance in hand of nearly £5. After careful and earnest consideration the Council has decided to carry on the classes in future in conjunction with the Sheffield University College, at which place will be taught chemistry (practical and theoretical) and botany, whilst the classes for pharmacy and materia medica will for the present be taught at the Society's rooms as heretofore. It is hoped ultimately to arrange with Sheffield University College for a three years' curriculum and for all classes to be conducted there.—The PRESIDENT, in moving the adoption of the report, expressed his regret at the decreased membership. The past year had, however, been a successful one as regards the work done. The Council had decided that the University College was the place they must look to for education in the future.—Mr. WARD, in seconding, said he had known both better and worse years than the one which had ended.—Mr. NEWSHOLME drew attention to the fact that the Society had taken an advanced step in regard to education. They had gone in for a much more extended and useful system in connection with the College. Institutions, such as the College, were making great advances throughout the country, and were being used on all hands by public bodies and associations. He was glad Sheffield was not behindhand. It should not be supposed, however, that they were going to hand the whole thing over to the College. It was more important than ever that the chemists of the city should bring pressure upon their young men to attend the College. They wanted to adopt the Nottingham system in Sheffield, and he was sure it would tend not only to their educational but their financial benefit. The only other business was the re-election of the six members of the Council, viz, Messrs. W. Ward, C. O. Morrison, J. Preston, J. B. Pater, A. R. Fox, and J. F. Eardley.—A further meeting of the Society was held on Monday evening last, Mr. G. SQUIRE presiding, for the purpose of electing officers for the ensuing year. The voting resulted as follows:—President, Mr. Geo. Squire; Vice-Presidents, Mr. S. T. Rhoden and Mr. J. Austen; Treasurer, Mr. J. Preston; Hon. Sec., Mr. J. B. Pater; Hon. School Sec., Mr. S. T. Rhoden; Auditors, Mr. R. W. Watson and Mr. J. P. Hewitt; Curator and Librarian, Mr. C. F. Carr; Council, Messrs. J. F. Eardley, A. R. Fox, G. T. W. Newsholme, F. C. S., G. Owen, W. Ward, F. C. S., and H. E. Hewitt. Arrangements are in hand for the formal inauguration of the fourteenth session of the Society's School of Pharmacy, which is to be held on Thursday, October 13, at the Masonic Hall. The programme consists of the distribution of prizes by the President, an inaugural address by Mr. J. Rymer Young, of Warrington, and a dinner.

CONDURANGO IN GASTRIC AFFECTIONS.—Although condurango as a remedy for gastric cancer, has been shown to be without curative effect, it would seem that it is not without valuable properties, since it is stated by A. Robin to act most efficiently as an anodyne in many painful affections of the stomach. In ulcer of the stomach, and in painful dyspepsias, it relieves the distressing symptoms and diminishes the frequency and violence of vomiting where it occurs. In this way it enables the patient to take a certain amount of nourishment. It may be given in the form of tincture (10 or 20 grammes per diem) or, preferably, since alcohol is, as a rule, not a desirable vehicle in these cases, in the form of the powdered bark in pills or cachets containing 10 centigrammes, 8 or 10 of which may be taken daily.—*Les Nouv. Rem.*, xiv., 340.

LETTERS TO THE EDITOR.

All Communications for the 'Pharmaceutical Journal' must be Addressed to the Editor, 17, Bloomsbury Square, London, W.C., and not in any case to individuals supposed to be connected with the Editorial Staff; no responsibility can be accepted unless this rule be observed. Communications for the Current Week's Journal should reach the Office not later than Wednesday, but news can be Received by Telegraph until 4 p.m. on Thursday.

UROTROPINE: WHAT'S IN A NAME?

Sir,—One of the classics of pharmacy is contained in the thirty-fourth chapter of the "Papers of the Pickwick Club," and this is a precious possession to the pharmacist. His whole case for exemption from jury service, whether actual or possible, may not rest on Dickens' description of "the long chemist" and his errand boy who held a theory of the isomerism of Epsom salts and oxalic acid, but our claim could not well have been put so effectively as by this concrete instance. The same chapter tells us how Mr. Justice Stareleigh confused himself and one of the witnesses, whom he severely questioned whether he was "Nathaniel Daniel or Daniel Nathaniel." If synthetic remedies are to multiply at their present rate of increase we may reasonably ask that their parents shall give them names that will not actively suggest confusion with old-established drugs. A few days since I heard a telephonic conversation in which "eu-atropine" was asked for, and I felt a cold spinal shiver at the explanation that Dr. — had prescribed eight grains for a dose. Now, it may be reasonable that the substance hexamethylenetetramine (urotropine) should find a shorter name for daily use, but I deny its right to disregard the danger of confusion with a widely different drug. The Registrar of Trade Marks would carefully guard against encroachment on existing commercial rights before he allowed a new name on his protected list. It is straining the well-known carefulness of the dispensing chemist too far when such a new danger of confusion of names is thrown in his path, with the belief that he will pick his way safely as usual.

Lcds, September 27, 1898.

RICHARD REYNOLDS.

THE PREPARATION OF LIQUID EXTRACTS.

Sir,—In reply to Mr. Moss (*ante*, p. 346), distilled water appears to exhaust cascara too well by the B.P. process for liquid extract of cascara, as on the addition of the diluted alcohol to the concentrated liquor this deposits, and continues to deposit, much that is not taken up, if 20 per cent. alcohol and fractional percolation be employed. As a laxative it is also more active, if anything, if made by the latter process. Mr. Bird (*P. J.*, August 25, p. 240) is in error in saying I refer the B.P., 1885, process, in which successive boilings in distilled water were directed. In my opinion in both these official processes, by heating so long, the preparation become overcooked. In regard to liquid extract of belladonna, manufacturers will, no doubt, exhaust the belladonna further than the B.P. directs, if it pays, as in doing so they will not break the new commandment, and be "found out" by the public analyst, so long as the preparation contains not less than 2 or more than 2.25 per cent. by volume of alkaloids.

London, September 28, 1898.

W. MARTINDALE.

LONDON UNIVERSITY SCIENCE DEGREES.

Sir,—The writer of the article you quote from the *Chemical News* on this subject (*ante*, p. 315) has not taken account of the new regulations that will come into force next year. Thus, for the Matriculation examination, candidates will then not be approved unless they have shown a competent knowledge of each of the following subjects: (1) Latin; (2) English Language, History, and Literature; (3) Mathematics; (4) "General Elementary Science." One other subject must also be taken, and a competent knowledge shown in it. This fifth subject may be either (α) Greek, (β) French, (γ) German, (δ) Chemistry, (ε) Sound, Heat and Light, (ζ) Electricity and Magnetism, (η) Botany, or (θ) Mechanics. The examination in chemistry will include elementary metallic, as well as non-metallic chemistry. It will not be the first six successful candidates that receive an exhibition of £30 per annum, but the first candidate only. For the Intermediate Examination in Science,

practical work will be required in both the Pass and Honours examinations, both qualitative and quantitative. It should also be stated that candidates will be examined in organic chemistry as well as inorganic. Extensive and important alterations have been made in the regulations and the syllabus for the various examinations in science. These affect the Intermediate Scientific examination principally, but changes are also made with respect to the B.Sc. examination. The syllabus in chemistry for the former has been greatly altered, organic chemistry and volumetric analysis having been added where previously only inorganic chemistry and qualitative analysis were required. The syllabus in physics and that in biology have also been slightly changed, that in mathematics remaining the same. It is now necessary to take three subjects only out of the above four; up to the present it has been required of candidates to pass in all the four subjects mentioned.

London, September 22, 1898.

RICHARD A. ROBINSON, JUN.

PHARMACEUTICAL SOCIETY ELECTION (IRELAND).

Sir,—I beg to solicit the favour of the votes of your Irish readers for election on the Council of the Pharmaceutical Society of Ireland. If elected, I believe that I could forward their interests by pressing the following reforms:—

1. The classification of methylated spirit as a poison, and the consequent restriction of its sale to registered persons.
2. The better enforcement of the Pharmacy and Poisons Act by the appointment of local secretaries throughout Ireland.
3. The recognition of the Irish Licence as a pharmaceutical qualification by all the prison boards, hospitals, asylums, infirmaries, etc., in Great Britain.
4. A periodical inspection and report on the quality of the drugs sold by grocers and others.
5. The restriction of Poor Law Union contracts for drugs to chemists or druggists.

Dublin, September 27, 1898.

J. C. McWALTER.

CELLULOSE ACETATE.

Sir,—My attention has been called to an inquiry, under initials "J. H. B." in your issue of the 24th of this month, respecting cellulose acetate. I have pleasure in informing you that I am the sole manufacturer of that article in this country.

Salford, Manchester, September 27, 1898.

I. FRANKENBURG.

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms, and the registered number added in each instance should be quoted in any subsequent communication on the same subject.

BOTANICAL.—A kind of buckwheat. [Reply to A. B. M.—16/25.]

PETROLEUM EMULSION.—You will find a formula for this in the Journal for April 23 last, page 408. [Reply to W. W.—16/14.]

LINIMENTUM AMMONIÆ.—Try the official formula, with almond and olive oils, and after thorough emulsification add one fluid ounce of water. [Reply to LIQ. AMMON.—16/17.]

RESIDENTIAL CLUB.—The article referred to appeared in the Journal for June 5, 1897. The address you require is the Hampden Club, Phoenix Street, N. W. [Reply to J. S. H.—16/24.]

CHEMICAL COMPOSITION OF FEATHERS.—We know of no book solely devoted to the pigments of feathers. You will find most information on the subject in the Journal of the Chemical Society. Doubtless you know that copper has been found in the feathers of the hornbills. A series of papers on the chemistry of the pigments of insects (chiefly butterflies) appeared in the *Entomologist*, about eight years ago. [Reply to GRAVITAS.—16/13.]

REDUCTION OF PERMANGANATE.—The precipitate formed by the action of sucrose on potassium permanganate is hydrated manganese dioxide. [Reply to GLYCYRRHIZA.—16/6.]

STRONTIUM BROMIDE.—This compound contains six molecules of water of crystallisation, the formula being $\text{SrBr}_2 \cdot 6\text{H}_2\text{O}$. [Reply to GLYCYRRHIZA.—16/6.]

TO RESTORE FADED INK.—If the ink has an iron basis probably washing the paper over with a dilute aqueous solution of tannin will restore the colour. Dilute solution of potassium ferrocyanide will restore it with a blue tint, or very dilute ammonium thiocyanate as a dull red. Try the effect on a few letters first, before treating the whole sheet. [Reply to C. G. E.—16/21.]

BOOK ON THE PHARMACY OF THE B.P.—No text-book of the kind you require has yet been published but Umney's 'Short Guide' to the new Pharmacopœia may serve your purpose to some extent, and you will also find the *P. J.* 'Synopsis of the British Pharmacopœia, 1898,' extremely useful. [Reply to J. C. B.—16/28.]

VETERINARY WORK FOR A FARMER.—Armitage's 'Every Man his own Cattle Doctor,' 21s., and the same author's 'Every Man his own Sheep Doctor,' 10s. 6d., will probably be the best works for your client. We do not recommend him, however, to do much in the way of amateur veterinary work. It will, in the long run, pay him better to consult a qualified practitioner. For those who are farming abroad, where the existence of the qualified veterinary surgeon is not within a reasonable distance, the above-named books are very useful. [Reply to LETA.—16/23.]

PREPARATION OF SODIUM CARBONATE.—On the experimental scale probably the method you name of passing carbon dioxide into strong solution of sodium hydroxide until saturated, and then heating the sodium bicarbonate formed, would be the easiest, but it is too costly to be used in practice. We cannot quite understand what you mean by the carbon dioxide not being quickly absorbed it is probably so rapidly taken up, that you cannot observe the fact, and conclude that no gas is passing because you see no bubbles. You should interpose a wash-bottle between the gas generator and the vessel containing the soda solution. When the bubbles pass through the water in the wash-bottle, and through the solution at the same rate, without diminishing in size, you will know that the hydrate is fully converted into bicarbonate. [Reply to GLYCYRRHIZA.—16/6.]

MIST. BISMUTHI CO. ET. PEPSINÆ.—Scale pepsin, 240 grains; ammonio-citrate of bismuth, 480 grains; morphine hydrochloride 4 grains; dilute hydrocyanic acid, 6 fl. drachms; dilute hydrochloric acid, 3 drachms; chloroform, 2 fl. drachms.; glycerin, 1 fl. oz.; compound tincture of cardamoms, 2 fl. oz.; tincture of nux vomica, 1 fl. oz., 5 drachms, 20 m; distilled water to produce 20 fluid ounces. Dissolve the pepsin in the glycerin and hydrochloric acid with the addition of a small amount of water; dissolve the bismuth in another portion of the water; mix the chloroform with the tinctures, add the prussic acid, the morphine hydrochloride, also dissolved in a little warm water. Mix all the ingredients, add enough water to produce 20 fl. oz., let stand a few hours, then filter through powdered pumice stone so as to obtain a clear liquid. [Reply to W. W.—16/14.]

INFORMATION WANTED.

STICKY FLY-PAPER MACHINE.—Wanted the name of makers of a clean handy sticky fly-paper spreading machine.—NEMO (16/29).

OBITUARY.

CRAGG.—On September 17, James Cragg, Chemist and Druggist, Woodhouse, near Milnthorpe. Aged 61.

BOURNE.—On September 25, Charles Matthew Kemsey Bourne, Chemist and Druggist, West Bromwich. Aged 46. Mr. Bourne was an Associate of the Pharmaceutical Society.

ABSORPTION OF CARBONIC ANHYDRIDE BY MAGNESIA.

BY DR. B. H. PAUL AND A. J. COWNLEY.

In the course of an investigation as to the quality of commercial calcined magnesia it was considered expedient to extend the inquiry so as to ascertain the extent of the absorption of carbonic anhydride by calcined magnesia when exposed to air under ordinary atmospheric conditions. This inquiry was deemed more essential as it has been alleged, in order to explain the abnormal presence of magnesium carbonate in medicinal preparations stipulated to contain magnesia, that calcined magnesia so readily absorbs carbonic anhydride that the discrepancy between theoretical requirements and practical results is not surprising. It was found necessary, first of all, to consider the most suitable method of analysis that could be depended on to furnish results that would not only be readily comparable with one another, but which could be relied on when determining small quantities of carbonic anhydride.

It is hardly necessary to say that no attempt was made to determine carbonic anhydride from the loss obtained on ignition. In determining carbonic anhydride in weighable quantities, the usual method adopted is, as is well known, either by loss of CO₂, as yielded in an ordinary CO₂ apparatus, or by absorption of the gas in soda lime or in potash bulbs. For such determination, when operating on materials free from organic matter, the most suitable method for determining CO₂ and water, at one operation, we have found is by placing the substance in a tube with a centre bulb connected with drying and absorption tubes, through which the evolved gases are drawn by an aspirator. This method answers admirably when dealing with weighable quantities of carbonic anhydride. For our purpose, however, neither of these methods was considered sufficiently delicate.

Finally, we employed a method consisting in the measurement of the carbonic anhydride actually evolved by the action of acid on the substance under examination. Such a method is not altogether new, as Scheibler's is well known, and C. S. Dyer has lately also suggested it (*P. J.*, lxi., 181). But all the hitherto described methods have not been worked out satisfactorily.

The method we have adopted may be sufficiently interesting to warrant the following short description of it:—In the first place it may be stated that the carbonic anhydride is measured over mercury in an ordinary nitrometer. In operating with magnesia or magnesia preparations, 0.5 gramme is rubbed down with 3 C.c. of water in a small glass dish of about 10 C.c. capacity, and the contents conveyed to the cup of the nitrometer and run into the measuring tube, and two portions of 1 C.c. of water are used to wash out the dish and cup. Five C.c. of concentrated hydrochloric acid are then added, the measuring tube slightly agitated, and the gas measured in the usual way and corrected for temperature, pressure on the dry gas, and solubility. The solubility of CO₂ in the 10 C.c. of acid and saline liquor was found, after careful experiments, when working under the conditions specified, to be 1 C.c. at 60° F. and 758 Mm.

This method is a very ready one, and is a great improvement on the ordinary methods of determining CO₂ by loss or absorption. For the purpose of the examination of commercial calcined magnesia, samples were obtained from several well-known manufacturers and examined by the method above described.

The following were the results obtained:—

Sample of Calcined Magnesia.	CO ₂ per cent. by weight.	B.P. Magnesium carbonate. Per cent.
No. 1.....	0.62 × $\frac{382}{132}$	= 2.894 = 1.8
No. 2.....	0.72	= 2.1
No. 3.....	1.13	= 3.3
No. 4.....	1.13	= 3.3
No. 5.....	1.65	= 4.8

It is apparent, therefore, that commercial calcined magnesia is not contaminated with an undue admixture of magnesium carbonate.

For the purpose of ascertaining the degree of absorption of carbonic anhydride by freshly calcined magnesia a portion of sample No. 1 was calcined and then exposed to air as freely as possible at a temperature of 60° F. The increase in weight during exposure was noted, and after four days the amount of carbonic anhydride was determined. The following results were obtained:—

No. 1A.—Gain in weight in 48 hours	=	3.5 per cent.
" " 72 "	=	4.9 "
" " 96 "	=	5.8 "

The carbonic anhydride found in the magnesia after exposure for four days amounted to—

CO ₂ Per cent. by weight.	=	MgCO ₃ Per cent.	=	B.P. magnesium carbonate. Per cent.
2.0	=	3.8	=	5.7

Freshly calcined magnesia, therefore, only slowly absorbs carbonic anhydride when exposed to the air, even under the most favourable conditions for carbonation.

A sample of calcined magnesia which had been kept by a pharmacist for ten years in an ordinary stoppered bottle which was rarely opened gave the following result:—

No. 6.....	CO ₂ Per cent. by weight.	=	B.P. Magnesium carbonate. Per cent.
	3.38	=	9.8

The sample was then exposed for five days (nearly) to the air of the laboratory by being spread out on a large watch-glass, so as to absorb as much as possible. It was weighed at intervals, and the CO₂ determined at the end of the period. The results were as follow:—

Gain in weight in 16 hours	=	9.1
" " 64 "	=	14.7
" " 84 "	=	15.2
" " 108 "	=	16.9

The amount of carbonic anhydride in the material after five days' exposure amounted to

CO ₂ Per cent.	=	CO ₂	=	Mag. Carb.	=	B.P. Mag. carbonate. Per cent.	=	Increase in weight. Per cent.
8.34	=	24.2	=	24.2	=	24.2	=	16.9
Summarised thus:—								
After five days' exposure contained	8.34	=	24.2	=	24.2	=	24.2	=
Before being exposed	" 3.38	=	9.8	=	9.8	=	9.8	=
Gain in five days	4.96	=	14.4	=	14.4	=	14.4	=

There is, therefore, a greater absorption of carbonic anhydride by a very old hydrated sample under these conditions, but such results would not obtain in practice, as is shown by the analysis of sample No. 6, which had been kept for ten years without undue exposure, of samples Nos. 1 to 5, and by experiment No. 1A.

In medicinal preparations prepared with calcined magnesia, according to B.P. requirements, there is therefore no reason that the preparation should contain more than a small percentage of magnesium carbonate, as it is not to be supposed that medicinal drugs are to be exposed to atmospheric deterioration. That this view is correct may be shown by the following results, obtained in examination of Gregory's powder which, according to the B.P., should contain 66.6 per cent. MgO. These samples were obtained in the ordinary course from pharmacists:—

A.....	CO ₂ by weight. Per cent.	=	B.P. Magnesium carbonate. Per cent.
B.....	0.55	=	1.6
C.....	0.55	=	1.6
	1.34	=	3.9

Another sample was found to contain :—

	CO ₂ . Per cent.	Magnesium carbonate. Per cent.
D.	14.62	= 42.3

Evidently this sample had not been prepared with calcined magnesia, but chiefly with the carbonate.

These results show that freshly calcined magnesia becomes so slowly carbonated when freely exposed to the air that there is no justification for the presence in pharmacopœial preparations of an abnormal amount of a drug "which is not of the nature, substance, and quality of the article demanded," and certainly in calcined magnesia and its preparations the amount of carbonate should not exceed 5 per cent.

SEEDS OF OROXYLUM INDICUM.

In a recent number of the *Agricultural Ledger* (No. 6 of 1898), published by the Reporter on Economic Products to the Government of India, there is an interesting account of the use of the above seeds as a medicine for cattle. The seeds known in Almora as "damree" were identified by Dr. Watt as those belonging to *Oroxylum indicum*, and their peculiar use in veterinary medicine was communicated by the proprietor of a large tea factory and dairy farm in Almora. The disease for which the seeds were said to be a cure strangely bore the same vernacular name as the tree—viz., "damree," but whether the disease was named after the plant or the plant after the disease the informant was unable to discover. The malady partook of the nature of ringworm, and appeared on calves as well as full grown cattle. Little reddish coloured patches from half to one inch in diameter spread over the face, ears, and neck, and hardened lumps formed on the roof of the mouth. The spotted nature of the disease gave the animals, especially the calves, a most peculiar appearance; they looked as if they had been stamped all over with a seal. The cattle at first do not seem out of sorts, but as the number of rings increase they get thinner, lose their spirits, and the smaller ones die.

The natives recommended "damree" seeds as the only cure, but at the time none were available. Next year every precaution was taken to keep out the disease; the houses were cleaned and fumigated, and a large stock of seeds was laid in. The disease appeared as predicted, but on the first ring showing itself a few seeds ground up with "bhut" (*Glycine hispida*) were administered daily to all the calves. The result was that the cutaneous patches disappeared and none of the other calves were attacked. As soon as it showed itself afterwards the young animals were dosed with the seeds, and always with success.

The Inspector-General, Civil Veterinary Department, had his attention called to the subject, and was asked to identify the complaint that was known in Almora as "damree." His reply stated that the disease was similar to *Tinea tonsurans*, which is common among cattle in England. It is said to be caused by the fungus *Tricophyton tonsurans*.

It affects young animals especially when exposed to damp, or those with dirty skins, and it is readily transmissible from ox to ox, or to man, and other animals. This disease generally yields to such remedies as nitrate of mercury, nitrate of silver, or sulphurous acid, and surprise was expressed by the Inspector-General at the satisfactory results of following the employment of a vegetable substance such as seeds.

A supply of the seeds of *Oroxylum indicum* was obtained from Manbhum, Bengal, for the purpose of examination, and an analysis was made of them by Mr. D. Hooper, Officiating Reporter on Economic Products, Calcutta. The following remarks are reproduced from the *Agricultural Ledger*:—

"The seeds are thinly discoid, flat, and very light buff coloured. They are winged and translucent (hyaline) all round except at the base, and the largest measure 3 in. by 1½ in. When powdered they have a yellowish colour and a peculiar rancid or oily odour, and a bitter and acrid taste.

"The powdered seeds, exhausted with various solvents, and the moisture and ash at the same time estimated, gave the following proximate composition:—

Moisture.....	3.65
Oil.....	20.34
Resin and Bitter Principle.....	12.96
Mucilage and Albumin.....	20.54
Fibre.....	32.71
Ash.....	9.80

100.00

"The oil was green in colour, bitter in taste, and fluid above 70°. The bitterness was due to a principle found also in the spirit extract of the seeds, which had a distinctly yellow crystalline appearance. This principle was insoluble in water, and gave a peculiar reaction with caustic alkalies which consisted in assuming a red colour, passing into a green on exposure to the air. This yellow substance is no doubt the same as that which was detected in the bark of this tree by Messrs. Naylor and Chaplin, and called oroxylin (*Pharmaceutical Journal*, September 27, 1890; *Pharmacographia Indica*, vol. iii., p. 16).

"Werner (*Beitr. z. Kenntn. neuerer Drogen, Diss. Erlangen*, 1896), since the discovery of oroxylin, has made a minute anatomical examination of the bark, and has performed an elementary analysis of its bitter principle. He found 67.49 per cent. of carbon and 4.38 per cent. of hydrogen. At the same time he tried the physiological action of oroxylin. A frog after a subcutaneous injection of 150 Mgm., intimately mixed with water, exhibited no perceptible change. A rabbit treated in the same manner showed a rise of 1° of temperature in three or four hours, the respiration was accelerated and on the other hand there was a decrease of the pulsation from 170—160 to 130.

"However active the seeds may be when medicinally applied their potency is much reduced by heat and boiling. In Balrampur, during the famine of 1897, the seeds of *Oroxylum* were parched, ground into flour and made into bread. The agent of this district also reported that on some occasions the seeds were eaten raw. (Innes.) It would thus seem that there is nothing present of a decidedly poisonous nature in the seeds, and this opinion seems to be supported by physiological tests made by Werner.

"Bitter oils are much esteemed in India as applications for skin diseases. The oils of *Melia azadirachta* and *Pongamia glabra* are widely used for these purposes, both on men and animals, and, like many other remedies, the nut of the seed is given internally, while the oil is used as a lotion or liniment on the affected portion of the skin. Pityriasis and other parasitic affections have been removed by applying the bitter oils above mentioned, and there is reason to believe that the yellow active principle operates in the same manner as chrysophanic acid and destroys the growth of disease.

"Mr. Bellairs is quite satisfied with the results obtained in using 'damree' seeds for skin affections in cattle, and although the remedy might not accord with the usages of modern veterinary science, the publication of the facts may induce others to try a simple remedy within the reach of every Indian ryot."

YEAST FOR ACNE.—Brocq states that the internal administration of yeast to the extent of half to one teaspoonful suspended in water, taken before meals, is a useful remedy for acne. If fresh yeast cannot be obtained, a piece of compressed yeast the size of a nut may be substituted.—*Repertoire* [3], cx., July 10, 1898, 310.

PHARMACY, POISONS, AND HYGIENE.*

BY SIR JAMES CRICHTON BROWNE, F.R.S.

It is my privilege this afternoon to address to you a few words of exhortation and encouragement on the occasion of your entering on a course of study which is the appointed avenue to that manor of usefulness in which you propose to dwell and earn your subsistence. I cannot, in doing this, hope to speak to you with the insight and exactitude of one who has actually followed the calling which you have chosen, but I can, at any rate, bring to the performance of the duty I have undertaken, a sympathetic interest in your life-work, and a knowledge of its needs, trials and opportunities second only to that of those who have personally borne the burthen of them. For the view which a medical man takes of the business of the pharmacist is not altogether exoteric. He has been behind the scenes if not the counter. The mysteries of the mortar are well known to him. The language of drugs is ever on his lips; their actions and reactions daily occupy his thoughts, and the responsibility attaching to their use weighs upon him incessantly. It is indeed sometimes difficult to say where the doctor ends and the chemist and druggist begins, and while, for my own part, I trust that the line of demarcation between them will become more and more sharply defined as time goes on, so that we shall have fewer prescribing chemists on the one hand and fewer dispensing doctors on the other, there must always remain a close alliance between your calling and mine. They have common aims; they use the same weapons; they are complementary to each other; and it is to be hoped that they will be always animated by mutual good feeling.

Progress in Pharmacy.

Reviewing from my medical standpoint the movements which have taken place in your department of late years, I cannot but be struck by the great progress that has been accomplished—progress that has corresponded step by step with improvements in your training and equipment. It is less than sixty years since the first attempt was made at a uniform system of education for those who are to engage in the practice of pharmacy. It is just thirty years since adequate statutory powers were obtained for the examination and registration of chemists and druggists, and to-day I find you with a curriculum of study prescribed to you, and with ordeals by question awaiting you which ensure a general efficiency in your craft which, even ten years ago, was possessed by only a few of those who followed it. Without any change in the subjects of examination, there has been, I understand, of late years, a gradual advance in the requirements of the examiners, which has necessitated increased diligence on the part of candidates, and has elevated the tone and temper of your guild as a whole. Now, we must all welcome measures calculated to enhance the usefulness and trustworthiness of chemists and druggists. They are servants of the public in matters of vital concern—the lives of most of us are in their hands from time to time; they should advance pharmacy as well as practise it, and be capable of mastering the rapid developments that are taking place in sciences collateral to their art. It is of great public consequence that they should be in all respects well qualified men, and we must contemplate with satisfaction their improved discipline and skill, the dropping out from their ranks by efflux of time or penal expulsion

of miserable hucksters who brought on them discredit, and the filling up of the gaps thus made by recruits who are not intellectual starvelings, or mere smart tradesmen, but students tinctured with science, and imbued with a high sense of duty.

Necessity of Circumspection.

But while we rejoice at the rectification and sublimation of chemists and druggists that is going on, we must see that this process is not carried too far or unduly accelerated. In this, as in so many other matters, it may be well to hasten slowly, for remembering the very special circumstances under which the studies of embryo chemists and druggists are carried on, there would seem to be a special danger in submitting them to sudden or severe mental strain. They are earning their bread all the time. They are able to give to their studies but brief periods carved out of toilsome days. They bring to them brains, not fresh and nimble but fatigued and sluggish. They pursue them, not with entire devotion, but harassed by the petty troubles of the shop, and they are liable therefore to be injuriously affected by a degree of mental pressure that would be harmless and even stimulating to young men who have nothing but their studies and their pleasures to attend to, and whose daily life is ordered with a single eye to their schooling. We are suffering largely in this country to-day from stupidity that has been manufactured by examinations, and I do not doubt that a point may be reached in the examination of chemists and druggists that will conduce rather to dulness than alacrity of thought, that will sacrifice to temporary mental engorgement, with a subsequent life-long disgust at learning in any form more concentrated than the newspaper, the well-regulated and wholesome nutrition of all the faculties, and an enduring appetite for knowledge, and that will at the same time stunt bodily growth and sow the seeds of ill-health. I do not for one moment suppose that the examinations to which you are exposed have reached that point or are approaching it. As far as I am able to judge, they are moderate and reasonable. I only wish to indicate certain risks which lie ahead, risks which will, I trust, as they arise, be obviated by the wisdom and caution of the Council of the Pharmaceutical Society.

The "First," or Preliminary, examination, as it now stands, does not demand higher attainments in Latin, English, and arithmetic than are essential to the intelligent performance of a chemist and druggist's work, and the abolition of this examination in 1900 in favour of the entrance or Preliminary examination of various British universities and examining boards will be a gain by ensuring a greater breadth of early education, for all these examinations include other subjects besides the three named. The general standard of preliminary education has risen and is rising all round, and the chemist and druggist, if he is to maintain his social status and profit by technical instruction, must be well grounded in those subjects that form the basis of a liberal education. The really important point in connection with the Preliminary examination is, it seems to me, that it should invariably be surmounted before apprenticeship is begun, so that preparation for it may not interfere with strictly professional studies.

The Qualifying Examination.

The Minor examination, which is the crucial point in your educational career, for it is essential that you should pass it if you are to be registered as chemists and druggists, comes when you are twenty-one years of age, after you have been engaged in translating and dispensing prescriptions for three years, and embraces six subjects in which you have been instructed in your School of Pharmacy and during your apprenticeship. I have looked

* Inaugural Sessional Address to the students of the School of Pharmacy, delivered on Monday, October 1, 1898.

into the published reports of that examination, and am convinced that it is an excellent and a thorough one, and combines science and practice in proper proportions, but it is, I believe, in connection with it that apprehensions of over-pressure may possibly arise. It will not be disputed, I presume, that this examination has steadily increased in stringency, and now that it is to be the passport to membership of the Pharmaceutical Society, its severity is not likely to be reduced. At present it involves a pretty stiff effort for those who present themselves for it, and there is perhaps some little danger that it may by and by become onerous and distressing to a degree that would impair its utility. Now I venture to suggest that this examination, without being in any way lowered in character, might be made safe and salutary by being divided into two parts. I throw out that hint with doubt and trepidation. There may be insuperable objections to it that are unknown to me, but it certainly appears to me that the bisection of this Minor examination, in accordance with a principle which has been adopted with advantageous results in the case of medical examinations, would be judicious. The examination naturally resolves itself into two parts; chemistry, physics, and botany might be taken at the end of two years of work and study, and the student, then freed from the obligation of keeping up the more theoretical and purely scientific subjects, might apply himself for a year, with concentrated attention, to materia medica, pharmacy and practical dispensing, the subjects of the proposed second part of the Minor examination at the close of his third year. Of course, no claim to registration or to the use of the title chemist and druggist would be conferred by the passing of the first part of the Minor examination.

Alternation of Work and Play.

But, whatever may be decided on as to the mode of conducting this Minor examination, I trust those in authority will see that all chemist and druggist apprentices are afforded reasonable opportunities of preparing for it. I am not intimately acquainted with the internal economy of chemists and druggists' shops in this metropolis, or throughout the country. I have no doubt that in many of them, especially in the large establishments, a satisfactory time-table is observed, but I suspect that in some instances the apprentice's lot is a hard one, and that his private studies have to be carried on in brief and irregular snatches of leisure, or in hours stolen from necessary rest and recreation. This should not be. The apprentice, from seventeen to twenty-one years of age, is growing in mind and body, and he must be a hard task-master who will not afford facilities for both kinds of growth. The work of the pharmacy and laboratory must no doubt be attended to, and in these keenly competitive days that work must often be arduous enough; but apart from that, a fixed time should always be allowed for attendance on classes in the school of pharmacy and at evening science centres, for private study, for meals, for exercise, for amusement. The branching neurons of the brain, with their mobile tentacles—and it is upon them that you have to depend for a living—are the most exacting of all the elements that enter into the human constitution. They insist upon food in due season, repose, relaxation, and suitable and varied exercise, and if you stint them in any of those respects, especially when they are young and active, while you still require of them their full tale of work, they will sooner or later revenge themselves upon you by plagues dire and manifold as those of Egypt. Good bodily health is the primary condition of good brain work. You must always bear in mind that you are men as well as chemists and druggists—men with souls to be saved, minds to be cultivated,

and bodies to be built up, and you must not allow "the trivial round, the common task" to swallow up all your energies. Earnest in business you must ever be if you are to be happy and successful, but earnestness and avarice are not the same thing, and honest work does not mean slavish drudgery. Thanking God that you have work to do, and hands with which to do it, you should still be able to raise your eyes from that work now and again, and allow your vision to range afar. I would advise each of you, as a safeguard to mental health, to have some interest or pursuit outside your business, not an excuse for idleness or dissipation, but a restorative bath into which you may plunge when vexed and jaded. The glorious and refreshing fields of literature are ever open to your leisured footsteps. Art invites you into her ennobling palaces. The drama holds up her magic mirror that you may gaze into its pictured depths with ever new wonder and delight. Music is ready to lift you on her balmy pinions above all sublunary cares. And manly sports offer you invigoration, and may be commended to your favour so long as they are kept clear of the contamination of gambling, that "hastening ill" of our age that narrows the brain and hardens the heart and sets up a stream of tendency that makes for madness and crime. You will be none the worse chemist and druggist, nay, you will be all the better for having a quiet corner into which to retreat occasionally from the hubbub of the trade route.

The Major examination, the last barrier in the higher education of the chemist and druggist, although optional, and now no longer necessary for admission to the membership of the Pharmaceutical Society, will still, I trust, attract a large and growing number of candidates. It carries with it the distinctive and honourable title of "Pharmaceutical Chemist," the value of which will, I opine, be more and more appreciated by the public as time goes on, and it confers the by no means contemptible privilege of exemption from service on juries. It implies a comprehensive knowledge of chemistry, botany, and materia medica, and it marks out the *élite* of your department, the men to whom we have to look for its advancement and for progress in pharmacology.

The New British Pharmacopœia.

The mention of the *élite* of your department recalls to me a work in which a group of them has rendered signal service recently, a work which it would be unpardonable not to refer to on an occasion like this. I mean the new British Pharmacopœia, published during the current year. A Committee of the Pharmaceutical Society, consisting of Mr. Walter Hills, Mr. Newsholme, Mr. Carteighe, Dr. Inglis Clark, Mr. W. G. Cross, Mr. C. Ekin, Mr. Joseph Ince, Mr. N. H. Martin, Mr. W. Martindale, Mr. Charles Umney, and Mr. H. G. Greenish, has co-operated with a Committee of the General Medical Council and with a number of medical and scientific experts and referees, in the preparation of that work, carefully supervising all questions connected with pharmacy, and thus contributing to make it the valuable compendium it is; that Committee has amply deserved the encomium passed on it by a resolution of the General Medical Council, which also bestows well-earned praise on Dr. Tirard, for his ability and assiduity as secretary of the Committee, and on Dr. Attfield, the editor of the volume, for the comprehensive accuracy of his labours, upon which indeed the success of the undertaking mainly hinged. It would be difficult to over-estimate the value of the advisory and experimental assistance given ungrudgingly by the Pharmaceutical Committee at every stage in the process of revision, and while noting with satisfaction the concurrent and harmonious travail of medical and pharmaceutical representatives in this affair,

we may express the hope that they will soon renew their co-operation in order to furnish us with an Imperial Pharmacopœia applicable to our Colonies and Indian possessions as well as at home, thus forging one little rivet to help in the consolidation of our Empire.

Some discontent is always bred by the shifting of landmarks, and to those who, like myself, have reached or passed middle life, it is distasteful to abandon old methods for new ones. We must, therefore, be permitted to grumble a little, to sneer at new-fangled remedies, to mourn over departed pills, to predict disaster from changes in dosage and to denounce a dual system of weights and measures. And having had our grumble, we will cheerfully admit that the new Pharmacopœia is worthy of all acceptance, and that the alterations introduced into it are almost without exception improvements and simplifications. Enormous labour has been expended on it, and in all departures from existing standards, the convenience alike of the medical man and of the dispensing chemist has been consulted. In the recognition of useful but hitherto unofficinal substances that have forced their way into common use, in the establishment of greater uniformity of composition, especially in tinctures, in the provision of concentrated solutions, in the increased exactitude of its chemical nomenclature, in the greater succinctness and clearness of its descriptions, and in the amplification of its tests, it is vastly superior to previous issues, those of 1885 and 1867. You are not for the moment immediately concerned with this new Pharmacopœia, for the Council of the Pharmaceutical Society has, I understand, ordained that your acquaintance with it is to date from next year, but when you have to grapple with it you will, I am sure, find it simpler, more consistent and intelligible than was the Pharmacopœia it is superseding.

The Pharmacy Acts Amendment Act.

Another notable event of this year in your department, besides the appearance of the new Pharmacopœia, has been the addition to the Statute Book of a Pharmacy Amendment Act, which has survived the slaughter of the innocents owing to the determined exertions of your President, Mr. Walter Hills. It is a modest measure providing for the election of apprentices or students as student-associates, and for registered chemists and druggists as members of the Society, and for the retirement by rotation of members of the Council, and I have no doubt it meets felt requirements. Unlike all previous pharmacy enactments, it has nothing to say about poisons, which have invariably been the real motive power in legislative measures affecting your trade. It is not so much as pharmacists as vendors of poisons that you have secured the attention of Parliament, and as that branch of your avocations is the most anxious and hazardous of any, has a peculiar interest for the public, and is very likely to be made the subject of a Bill next session at Westminster, it occurs to me that I may, not inappropriately, make poisons and poisoning the theme of some remarks to you this afternoon.

What, it may be asked, is understood by the term poison? And the first answer to that question that presents itself is any substance which, when introduced into the body, produces injurious or fatal effects. But, for practical purposes, that definition is much too comprehensive, for certain articles of food and drink, when taken too freely, or in disordered states of the system, or by persons of peculiar idiosyncrasies, may prove detrimental and even kill, while almost all the drugs in common use, if given in excessive doses, may cause symptoms of poisoning and death. The question of quantity enters into our conception of a poison which may be described as a substance

that, in small amount and by chemical action, has hurtful or lethal effects on the animal economy. This description cannot pretend to strict accuracy, for some poisons perhaps act mechanically, as, for instance, certain microbes which block up the blood vessels, and ground glass, which, in some parts of the world, has been not infrequently used as a slow irritant poison. But the vast majority of poisons destroy the living tissues by means of chemical action. Even thus restricted, however, the word poison covers a multitude of agents, for on every shelf in your shops stand chemical assassins, capable in small bulk of undermining health or taking life, and, indeed, so numerous are the drugs that must be scientifically regarded as poisons that it has been said that to select and schedule a few of them, which may not be sold without reservations, while the rest are left unguarded, is like prohibiting the carrying of knives while allowing stilettoes. But although, as you and I know very well, there remain outside Schedule A many drugs as mortal as any included in it, and more difficult of detection, and although with the advance of science the field from which the poisoner may cull his simples is ever widening, and becoming more variegated in its crop, it must still be maintained that Schedule A has done great public service. It may be logically indefensible, but it is practically useful. During the present year, we have had an illustration in the St. Neot's case of the way in which a faithful observance of the regulations connected with it may bring a criminal to justice, for it is quite likely, I think, that Horsford would have escaped conviction had Mr. Payne failed in keeping an accurate record of the sale of strychnine to him. As a matter of fact, the poisons enumerated in Schedule A are those which have been and are almost invariably employed for felonious purposes.

Poisoning in Olden Times.

In looking into the history of poisoning—I am speaking now of homicidal poisoning—nothing strikes one more than the way in which this kind of history repeats itself from generation to generation. The same old implements are used again and again. There is an absence of anything like originality or ingenuity in the choice of ways and means. Servile, clumsy imitation is the rule—fashion reigns supreme. Little or no advantage has been taken of the discoveries of science. No doubt we hear about the subtleties and mysteries of slow and secret poisoning in bygone times. We are told that Henry VI. was killed by a pair of poisoned gloves, and that victims were in those days simply and expeditiously got rid of by causing them to smell a poisoned rose, or to wear a tainted ring, but such stories are on a level with those which we now sometimes read in the newspapers of the instantaneous production of insensibility by holding a chloroformed handkerchief to the nose. They are simply incredible. We cannot believe that in pre-scientific days, unscientific persons were in possession of powerful agents of which modern science knows nothing. And when we investigate such cases of secret poisoning in these days as we have any account of, we find, as I have said, that there was nothing occult or wonderful in the process, and that in nine cases out of ten it was some preparation of arsenic that was employed. It was arsenic that was used by Wonderton in 1384 in his attempt to poison King Charles the Sixth of France, and the Dukes of Valois, Berri, Burgundy, and Bourbon. It was arsenic that was the active constituent in La Sarpa's wonderful elixir; that played such havoc in Rome in the seventeenth century. It was arsenic that formed the basis of the acquetta or manna of St. Nicola of Bari of Toffania of Naples, which caused the death of six hundred persons; and it was arsenic which was the leading

ingredient in the succession powders of Sainte-Croix, which were used by the Marquise de Brinvilliers, and with which she removed her father, two brothers, a sister and several other persons. It was arsenic that was no doubt mainly instrumental in carrying off Sir Thomas Overbury in the Tower, although in his case it was combined with cantharides, lunar caustic, and spiders, the *coup-de-grace* being given by corrosive sublimate. Wherever we turn, in mediæval toxicology, or that of the Renaissance, it is arsenic, arsenic, arsenic which was the mainstay not merely of the murderous fortune-telling hag, but of homicides of commanding intellect and power, like the Borgias and Catherine de Medici.

Of course in these days, and well up to the early part of the present century, it was impossible to distinguish arsenic with any certainty in the bodies of persons who had died of it, while only the vaguest notions prevailed as the pathological effects caused by it in the viscera, so that it could be used as poison with considerable impunity. But since Orfila, Reinsch, Marsh, and others have carried out their researches, it has become of all poisons the most easily recognised by chemical tests, while its symptoms and morbid anatomy are familiarly known to the medical profession. And yet, notwithstanding this, it is still, no doubt owing to the facility with which it may be procured and its old-established reputation, a favourite with the homicide. Mrs. Cotton, who was executed at Durham in 1873, was arraigned on four separate charges of poisoning by arsenic. Mrs. Maybrick was convicted of having administered it to her husband in 1886. Mrs. Sherman, of New Haven, United States, was proved at her trial in 1885 to have disposed of three husbands and some seven or eight children and step-children by means of it, while in the same year Mrs. Robinson, of Somerville, Massachusetts, was shown to have been indebted to it for the disappearance of six members of her immediate family.

Some Notorious Poisoners.

I am sorry to have to say so, but it is true that women and doctors are the classes which have supplied the most numerous and notorious poisoners. Man—in this connection minus medical men—bold and militant, is disposed to crimes of violence; woman, weak and timid, when she stoops to crime, inclines to craft and cunning; and hence she has often sought, by the arrow that flieth in darkness, to remove a rival, resent infidelity, avenge her wrongs, hide her shame, or gratify her cupidity. At certain periods, poisoning by women has been epidemic, and has anticipated the decrees of our modern divorce court. About the middle of the seventeenth century it was observed that young widows were extraordinarily abundant in Rome, and that most of the unhappy marriages were speedily dissolved by the illness and death of the husband; and inquiries set on foot by the Catholic clergy, who felt bound to make representations to Pope Alexander VII., resulted in the discovery of a secret society of young matrons, who met at the house of a reputed sorceress for technical instruction in toxicology and mutual improvement in marital euthanasia. A little later a similar organisation was brought to light in Paris, again by the action of the clergy, and here it was shown that under the guidance of two nominal midwives, La Voisin and La Vigoroux, large numbers of married women had hastened the decease of their husbands. It was not until upwards of a hundred culprits of this description had died at the stake or on the gallows that this epidemic was stamped out. In Hungary, in the latter half of the seventeenth century, and again only a few years ago, extraordinary disclosures were made as to wholesale husband poisoning by women of the peasant

class, who, like the Roman and Parisian matrons, employed arsenic to compass their ends.

We can understand in some measure the partiality of female poisoners, acting individually or in numbers, for arsenic, and their rigorous adherence to ancient methods, by remembering that arsenic has been long employed in many countries as the most popular domestic exterminator of vermin, and has also been extensively recognised as an article of toilette, so that they have been able to obtain it and explain their possession of it on these pretexts, but it is difficult to comprehend why poisoners of the other group alluded to, medical men, should have displayed such poverty of resource as is manifest in their published misdeeds; and should have confined themselves so strictly to the contents of Schedule A. One would have thought that medical men, with their knowledge of drugs and command over them, would have been able to ring the changes in an infinite variety of ways, to employ alkaloidal and other organic poisons in such a manner and in such combinations as to perplex the clinical observer, baffle the pathologist, and set at nought the skill of the analyst. But not so. With what might almost be called infatuation they have all but invariably worked on the old grooves, and carefully prepared a net for their own ensnarement. For the most part they have trusted to the inorganic poisons, which, owing to their unalterable character, ease of purification, and definiteness of reaction can be identified in the body with mathematical certainty, and when an alkaloid has been essayed it has been strychnine, which, of all the alkaloids, in unalterability and definiteness of reaction, approaches most closely to the inorganic poisons, and to which, too, very conclusive physiological tests can be applied. The rarer and more fugacious alkaloids, which I am not even going to name, and which, when detected, it would be impossible to affirm, might not be putrefactive products—ptomaines, albuminoses, and peptones—which result from the decomposition of the tissues, or of ingested food, have, as far as we know, never been tried, and even nicotine, the most widely-diffused of alkaloids, with which, I suppose, a third of the population is always poisoned, more or less, has not been resorted to with premeditated malice, except in one case, that of the Count Bocarme, who poisoned with it, in five minutes, his wife's brother Fougnyes, although in the body of a murdered smoker it might well pass as a relic of the pipe or cigarette. I cannot recall a case in which a medical poisoner has gone beyond Schedule A. Palmer used strychnine, Smethurst antimony, Pritchard antimony, Cross arsenic, Lamson aconite, Chantrelle, who, although not a doctor was a chemist, morphia, and Tawell, who was a chemist and druggist, hydrocyanic acid. Such are the ignorance, stupidity, and rashness revealed in a review of the trials of these medical poisoners that one is forced to conclude that they were like the miscreants who carry on illicit lines of practice at the present day; medical men only in name, professional pariahs and failures, and that in them, as in the criminal classes generally, intellectual incapacity was associated with moral debasement. Not one instance have we amongst them of average ability, to say nothing of originality or genius, in their nefarious transactions.

Of Medical Poisoners.

True, it may be said, that the medical poisoners who have been brought to justice have been the clumsy and incompetent members of their class. The bunglers, it may be argued, have been caught, while the adepts have escaped suspicion. It is, I fear, correct that there have been and are cases of undetected poisoning. In almost every instance in which a medical poisoner

has been convicted there have been good grounds for believing that he had had other victims besides the one whose death was brought home to him, and several medical men in large practice have told me that in their professional experience they have come upon cases in which they have had grave misgivings that poisoning was being or had been attempted. It may be that medical men have availed themselves of the discoveries of modern science for wicked and unlawful ends; and have lived on in the odour of professional sanctity unsuspected; but there is some consolation in the reflection that the more scientific a man is the less likely is he to stoop to any abuse of power that science puts in his hands; and that the improved education of the medical profession renders its members more expert than they have hitherto been in the recognition of the symptoms of poisoning of various kinds.

But here I must point out to you that, as regards the future of toxicology, very serious considerations arise, for numerous new poisons are being yearly added to our list; and many of these it is, and must always be, impossible to track and identify. Henceforth, the medical man or scientific expert desiring to remove any human stumbling-block in his way, if able to shake off old traditions, will not, unless demented, select his weapon from Schedule A, but from the recently discovered organic poisons that may be used with absolute impunity as regards detection.

As you know, we have of late years been enlarging our views as to the part played by poisons in the causation of disease, and have remodelled our pathology on a toxæmic basis. We know now that the human body, even in its normal state, is a cupboard of poisons, harmless as long as they remain shut up in their own box, bottle, vessel, wrapper, or cover, but capable when let loose of inducing disastrous and even fatal consequences to their individual owner or to his neighbours, for human beings in too close aggregation poison each other. Many of the ordinary constituents of the blood and tissues, such as carbonic acid and potash salts, are poisons, and many of the ingredients of the secretions of glands and of the products of assimilation are toxic in their effects, and set up morbid states, such as cholæmia, uræmia, diabetic coma, and stercoræmia, when introduced into the general circulation. And not only is the human body packed with home-made poisons, but it is being constantly plied with poisons from without. The soil it dwells on, the air it breathes, the water it drinks, the food it eats, teem with micro-organisms, some of which are poison-mongers of a virulent type, that quickly avail themselves of any lodgment given them in the body under favourable conditions to carry on their vicious practices. It has been demonstrated that a large number of the diseases that figure most largely in our bills of mortality are due to the action of poisons of complex composition—some alkaloids, some modified proteids, some of unknown structure manufactured in the protoplasm of microbes of such infinite minuteness that thousands of millions of them may be present in a single grain of matter, and that find their way into the body from without. As regards these pathogenic or disease-causing microbes, it is now practicable to cultivate many of them in suitable artificial media outside the body, to reproduce the cultivations for many generations, each capable of causing all the symptoms of the original malady when inoculated into animals, and to separate from them the toxins to which their effects are due. The true upas tree turns out to be a microscopic fungus.

Pathogenic Microbes and Toxins as Poisons.

Now pray observe that pathogenic microbes and their toxins when introduced into the organism, either by accident or design, set up, not like old-fashioned poisons, organic or inorganic, a

group of symptoms distinctive and unique, easily recognisable and not attributable to natural causes, but a disease to which anyone is liable, which may be prevalent in the neighbourhood at the time, and which may be contracted in a variety of ways. Pray note further that these pathogenic microbes and their toxins, when they have proved fatal, leave behind them either no traces or only the usual post-mortem appearances of a disease, and not, as in the case of the old-fashioned poisons, distinctive lesions, and substances capable of chemical identification that could have no legitimate business in the body, unless taken as medicine.

It is highly probable then, I think, that the medical or scientific poisoner of the future will resort to the pathogenic microbes and their toxins, and will induce a disease which it would be impossible to say might not have been contracted in the usual way. As our knowledge of the life history and habits of these microbes extends, and our skill in manipulating them increases, the number of them available for felonious purposes will become considerable; but even now there are not a few that might be employed with homicidal intent. Of those microbes that have hitherto been cultivated outside the body, and that when administered to human beings, not immune, either naturally or by previous attacks, produce a specific disease, the tubercle bacillus, and that of actinomycosis would be too slow and uncertain in their actions for a murderer's purpose, and that of anthrax, would probably awaken suspicion if employed upon anyone not a wool-sorter or engaged in the slaughter of animals. But it is not inconceivable that the bacilli of typhoid fever, of pneumonia, of bubonic plague, of enteritis, and of malignant œdema, the vibrio of Asiatic cholera, the *Staphylococcus aureus* of suppuration, the spirillum of relapsing fever, might be made to find their way into the system by the digestive canal, and thus set up their destructive operations. A little disorder of the stomach having been first induced by some indiscretion in diet, the organism corresponding with typhoid fever or cholera reared in a test tube might be administered in apparently pure water so as to cause these diseases, and the water in which they were administered, although it teemed with them, might be submitted to the examination of the chemist and, in the absence of other organic matter, be pronounced by him of great organic purity. Mixed with milk, the bacilli of diphtheria and of glanders would readily find their way to the follicles of the tonsils, for which they have a special affinity, and thence diffuse their pernicious influence; while in cool beef tea, or broth, or gruel, several other pathogenic microbes could be smuggled into the citadel of life, where, once established, they would increase and multiply at a prodigious rate. When sterilised broth, to which typhoid fever bacilli have been added in the proportion of two hundred and forty-six to the cubic centimetre, is kept for twenty-four hours in the incubator at blood-heat, it is found that at the end of that time there are twenty millions of these bacilli to the cubic centimetre. The spores of certain pathogenic microbes which offer enormous resistance to inimical influence might be stored for an indefinite period, to be planted as death seeds at any convenient opportunity. A few pathogenic microbes even exist in Nature, ready to the murderer's hand, without any preparation. Infanticide might be practised with tolerable certainty with milk from the tuberculous udder of a cow. Even in the case of the larger parasites, as for example *Echinococcus veterinorum* and *Bellharazia hæmotibia*, their ova might be given in water and produce very severe illness and death.

The risk, from the poisoner's point of view, that pathogenic microbes, surreptitiously conveyed into the body, might not prove fatal, but induce an attack of disease ending in recovery,

may yet be obviated by the improvement of our cultural methods. Such microbes are exceedingly susceptible to the influence of external conditions and diet, and by a slight change of temperature or the addition of a minute quantity of a chemical substance to the fluid in which they are grown, or by associating them with other depraved bacilli, those of them that are comparatively benign may be raised to a high degree of virulence. The connoisseur in poisoning of the future might, therefore, having caught his microbe, nourish and train it into intense malignancy and ferocity, and make sure of its doing its deadly work.

The Poisonous Energy of Toxins.

I have been speaking of the possible use of disease-causing bacilli for homicidal purposes, and I would next remind you that the toxins derived from them are still more readily capable of being put to the same vile use. By the cultivation of certain specific microbes in special media powerful toxins have been produced which in very small quantities cause fatal results in a very short time, with symptoms difficult if not impossible to differentiate and refer back to their source. The toxins of tubercle, of glanders, of typhoid fever, of tetanus, of diphtheria, of plague, of cholera, have thus been separated, can be preserved for a longer or shorter period, and administered with lethal effects. Such toxins might be given by hypodermic injections, mixed with or in place of the medicines which are now so commonly administered in that way, or they might be planted on any small wound, scratch, or abrasion on the surface of the skin, and even should a medical attendant of unusually keen penetration suspect their criminal administration, he dare scarcely express his belief that there was anything wrong, for it might be that the poison came into the system quite innocently. Dr. Sims Woodhead has lately come across cases in which erysipelas and anthrax have been set up by the inoculation of the infective material carried by flies, gnats, and bugs, and his observation is one of great importance in its medico-legal aspect, and well justifies our insecticidal instincts, for it is clear that an army of toxiferous fleas, flies, or bugs manœuvring at large might do enormous damage.

The poisonous energy of some of these microbic toxins which I have mentioned is extraordinary, and far exceeds anything for which our knowledge of even the most potent of the old vegetable alkaloids has prepared us. Two-tenths of a milligramme of tuberculin injected into the human body, sixty trillion times its weight, raises the temperature of its whole mass several degrees, and one milligramme of tetanus toxin will kill a horse, or six hundred million times its own weight of living tissue. In order to cause death it is necessary to inject only one five-hundredth part as much tetanine as atropine and one hundred and thirtieth part as against strychnine. It is, therefore, obvious that we have, in these microbic toxins, poisons of tremendous energy, that by the very minuteness of the doses by which they demolish animal life lend themselves specially to criminal designs in the hands of those who are acquainted with their properties and are capable of preparing them.

But in addition to the pathogenic bacteria properly so called to which, with their toxins, I have been referring, there are others which, although they do not induce diseases known to our nosologies, yet fabricate strong toxins—ptomaines, and similar chemical bodies—which when administered to animals, cause rapid poisoning, and which presumably would have the same effect if administered to human beings. The common saprophytes, *proteus vulgaris*, *Bacillus coli communis*, *Bacillus mesentericus*, *Bacillus prodigiosus* and vibrio of Finkler, are known to produce

toxins, and "theoretically," says Professor Klein, "there is no reason why some specialist should not discover methods and media by, and in which these and other saprophytes might create powerful toxins which, even in small doses, would cause an acute fatal result."

About six weeks ago eight cases of serious illness and two deaths occurred at Surbiton from ptomaine poisoning, caused by a joint of lamb which was not itself offensive or unpalatable, but had stood near a tongue that was putrid and maggoty. "The poisons found in tinned meats, sardines, hams, veal pies, etc.—ptomaines, alkaloids, and toxins—may be derived," says Professor Crookshank, "from the action of putrefactive bacteria, or of specific bacteria, as for example in the meat of animals that have died of anthrax, and may be extracted from the suspected food and tested by administration to animals."

The Science of Toxicology.

You will admit, gentlemen, I think, after what I have said, that the science of toxicology is becoming infinitely more complex and intricate than it has hitherto been, and that very difficult and curious problems are not unlikely to arise in connection with it, in its relation to medical jurisprudence, problems that may puzzle the discernment of even a twentieth-century Sherlock Holmes. "Chemists," exclaimed Count Fosco with an eye to their toxicological attainments, "chemists—I assert it emphatically—might sway if they pleased the destinies of humanity. . . . On my sacred word of honour, it is lucky for society that modern chemists are by incomprehensible good fortune the most harmless of mankind. The mass are worthy fathers of families, who keep shops. The few are philosophers, besotted with admiration for the sound of their own lecturing voices, visionaries who waste their lives on fantastic impossibilities, or quacks whose ambition soars no higher than our corns. Thus society escapes, and the illimitable power of chemistry remains the slave of the most superficial and the most insignificant ends." But if Count Fosco thus estimated the empire of chemistry and the boundless power which it places in the grasp of its votaries, what would he not have said of bacteriology and of the hidden and thaumaturgic control over their fellowmen which those initiated into its mysteries possess? Into what rhapsodies would he not have risen over these microbic poisons of superlative virulence and subtlety to which we have now attained, the very existence of which may suggest to you that it is superfluous any longer to surround with special safeguards the sale of such comparatively harmless substances as are contained in Schedule A?—But in entertaining any such suggestion you would be in error, for whatever the future—the remote future—may bring forth, it is certain that for a long time to come a large majority of poisoners will cling to old methods, and stake their necks on arsenic, antimony, and strychnine. For one bacteriological Mephistopheles who can possess himself of a microbic poison, and use it dexterously, there will be at least a dozen despicable wretches who will take what comes to hand most readily in common life and blunder with it egregiously. And beyond all this, we must remember that Schedule A is not solely intended for the prevention of murder, but is meant to act as a check on suicide, and to avert, as far as may be, deaths due to carelessness and accident. Those bent on self-destruction are not likely, unless to cheat an insurance company, to attempt to induce a lingering illness, or to seek out an inaccessible and inscrutable toxin, but are certain to prefer "such soon speeding gear" of yours "as will despatch them straight," and the obstacles which this Schedule enables you to put in their way may occasionally

frustrate their object or afford them that brief interval for reflection in which the suicidal impulse, when it has reached a crisis, often suddenly dies out. And independently of this Schedule, members of your calling are, I believe, not rarely instrumental in preventing miserable beings from shuffling "off this mortal coil," for some of them have acquired a quick eye for a would-be suicide, and, as in instances which have fallen within my own knowledge, by refusing altogether to supply him with the poison asked for, or by substituting for it an innocuous fluid or powder not unlike it in appearance, have given him pause and so saved his life. Then, as regards accidental poisoning, which has become more frequent in recent years, as the demands of our advancing civilisation have become more complex and various, there can be no doubt that the provisions of the Pharmacy Act, when rigidly observed, tend to limit it, and that they will be still more efficacious in this direction when the recommendation which the Pharmaceutical Society have repeatedly pressed upon the Privy Council to include in the Schedule carbolic acid, to which so many deaths are now attributable has been adopted.

The Poisonous Substances Bill and its Fate.

A Bill to regulate the sale of certain poisonous substances was introduced into and passed through the House of Lords last session, but was withdrawn, I cannot regret to say, before it reached the House of Commons, for the Bill seemed to me to be retrogressive, in permitting the sale of the substances named in its Schedule, and of others that the Privy Council might from time to time add thereto, subject to certain regulations, by any person without licence or evidence of special qualification. The sale of poisons hitherto has been confined to chemists and druggists, who have been trained to caution in dealing with dangerous commodities, and who have proved their fitness for such work by passing a stringent examination; and the wise policy would seem to be to entrust to them the sale of other poisonous substances that have come into vogue and in regard to which the public require protection. No regulations, however carefully worded, can make up for the want of knowledge and a sense of personal responsibility; and free trade in poison is not to be desired any more than free trade in alcohol. Labelling alone is not a sufficient safeguard, and indeed it may be argued that whenever it becomes very general in its use it will in great measure cease to be protective for familiarity breeds contempt, and the warning word "Poison" is apt to lose its effect when it is incessantly cropping up. The fact that a particular substance has to be procured at a druggist's shop with certain formalities is, to my thinking, much more likely to create caution in its storage and use than the most glaring superscription of poison, if it can be purchased at any ordinary dealers. Of course one would wish to put no unnecessary obstacle in the way of the distribution of carbolic and cresylic acids, which are so largely used as disinfectants, or of the materials sold for the purpose of destroying insects and vermin, which are now acknowledged to play some part in the dissemination of disease, but it should always be borne in mind that cleanliness is the best of all disinfectants and vermin destroyers, and that sound sanitation should render the use of chemical antiseptics only occasionally necessary. There can, I think, be no hardship in confining the sale of these chemical antiseptics to properly qualified chemists and druggists; indeed there would seem to be great danger in permitting them to be retailed under any conditions by grocers, drysalters, oilmen, or general dealers in whose shops they would necessarily be mixed up with various other kinds of goods in regard to the vending of which no special care is requisite. The

habitual caution of the chemist and druggist counts for much; an habitual caution which has become second nature to him and enters into all his doings, even, I fancy, into the sale of a sponge or a bottle of perfume; for anyone who has bought such an article over a chemist's counter must have felt that the transaction was conducted with great circumspection and solemnity, and that in making the purchase, he was regarded almost as an object of suspicion.

I venture to believe that all the advantages sought by the Bill of last Session could be secured by the inclusion of the substances named in its Schedule in Schedule A of the Pharmacy Act, and I feel strongly that the Council of the Pharmaceutical Society should continue to advise the Privy Council as to the articles to be comprised in that Schedule. The Privy Council must have special technical guidance in such a matter, and I know not where they could obtain more trustworthy guidance than from the chosen representatives of that body of men who have an intimate practical acquaintance with all the difficulties and dangers attending the sale of poisons, and who will not, I am sure, allow their trade interests to stand in the way of the public welfare.

Pharmacists as Bacteriologists.

But whether your powers and duties in connection with poisons and poisonous substances are to be extended or curtailed, I have no hesitation in saying that the subject of poisons and poisoning generally must henceforth engage the attention of all who follow your calling to a far larger extent than they have ever before done, and, indeed, I feel sure that, however reluctant those responsible for the education of chemists and druggists may be to add to the brain burdens which already, as I have hinted, press somewhat heavily upon them, they will be compelled to provide some instruction in bacteriology in your schools of pharmacy, so that you may make acquaintance with those micro-organisms which have been shown to be influential in the production of disease, and which are certainly destined to play an important part in its diagnosis, prevention, and cure. I have spoken of the microbial origin of infectious diseases, and of the toxins which pathogenic microbes secrete or produce by their digestive operations, toxins which cannot be chemically defined, but which are in almost every case the efficient cause of the symptoms of the disease, and I would now call your attention to the fact that many of these toxins contain protective or remedial substances bound up with their toxic ingredients. The bane carries its own antidote, and by certain procedures the bane may be abolished while the antidote survives. It has been experimentally proved that animals that have been inoculated with the microbe of certain infectious diseases, and that have survived the illness thus induced, have become refractory to the action of the same microbe subsequently inoculated. It has been also proved that the same power of resistance has been conferred by the injection of the solutions in which pathogenic microbes had been grown, but from which they had been filtered out, so that only their toxins remain. And it has been further proved that the serum of the blood of animals protected by an attack of the disease artificially induced, although itself incapable of setting up the disease, yet communicates to unprotected animals into which it is injected a remarkable power of resisting it, so that large quantities of its toxin may be administered without poisonous effects. Whatever be the origin of antitoxins and antivenins, whether due to reaction set up in the tissues of the body, to proliferation of white blood corpuscles, or to a breaking up of the toxin, with destruction of its toxic constituents and retention of those that are antitoxic and protective, it is certain that

they possess a power of counteracting the effects of the toxin and venoms with which they correspond more decisive and far-reaching than that of any known antidotes in the case of mineral and vegetable poisons. A dose of a microbic toxin much larger than that which is necessary to produce a fatal issue is administered to an animal; several hours later, when the characteristic symptoms of the disease have clearly displayed themselves, the antitoxin derived from an animal which has suffered from the disease is injected, with the result that the symptoms of the disease vanish and the animal is none the worse. And the same thing occurs in human beings. The progress of a certain infective disease is arrested or modified by the administration of antitoxins drawn from animals that have been subjected artificially to attacks of the disease or have been immunised against it by repeated and graduated injections of its toxins. You are all familiar with the brilliant results achieved by Pasteur in the treatment of hydrophobia, during its incubation period, by the injection of emulsions formed from the spinal cords of rabbits that have suffered from the disease. You cannot be ignorant of what has been done in diphtheria, and how thousands of lives have been saved from that rancorous malady by means of the serum of the blood of the horse, immunised by a series of injections of the toxin. The authoritative judgment of a committee of the Clinical Society of London, that has, during the last three years, conducted an exhaustive investigation, is that in cases of diphtheria treated with antitoxin, not only is the mortality notably lessened, but the duration of life in the fatal cases is prolonged, while no prejudicial action beyond transient skin rashes has been shown to follow its use, even in large amounts. Doctors Sidney Martin and Bertram Hunt have demonstrated that in cases of diphtheria observed in University College Hospital, the total mortality in the whole, without distinction of ages or the sites of the local lesions, has fallen from between 33 and 43 per cent. in the years before the antitoxin treatment was inaugurated, to 29, 17.7 and 17 per cent. in the three years during which antitoxin has been used, and that in tracheotomy cases the mortality has been reduced from 65.5 to 26.4 per cent. The poison of tetanus may be overtaken by its antitoxin and prevented in many cases from killing, as it would otherwise do. Excellent results are reported from Naples obtained from anti-pneumonic serum in a recent epidemic of pneumonia there! Observations are accumulating tending to establish the utility of antistreptococcus serum in septicæmia, and two cases which I have myself watched, although not absolutely free from sources of fallacy, have deeply impressed me with its value in that fell disease. Experiments recently performed at Monte Video, by Sanarelli, indicate that the serum of the blood of the horse vaccinated with the *Bacillus icteroides*, in doses of gradually increasing intensity during twelve months, greatly diminishes the mortality and mitigates the severity of yellow fever. The poison of venomous snakes is counteracted by antivenin, and it may be reasonably expected that this remedy, which we owe to the admirably devised experiments of Fraser and Calmette, will enable us to cope successfully with the effects of the bites of venomous serpents which, in many countries cause widespread havoc.

Antitoxins as Remedial Agents.

Step by step, armed with our antitoxins and our serums and our lymphs, we are encroaching on the ghoulish regions of disease, and bringing hope and healing where before all was darkness and despair. There is no extravagance in the prediction that all the infective diseases will before long be brought under control more or less, and have their power of evil vastly

restricted if not abolished. And that means more than might at first sight appear—vast although even then is the prospect of benefit to mankind—for diseases hitherto not regarded as infective are being brought into that category or shown to be of toxic causation, and, therefore, amenable to our new methods of treatment. Should it prove, as Nissl and McLane Hamilton have alleged, that a considerable number of cases of mental disease are due to auto-intoxication, then antitoxins may be instrumental in checking that alarming increase of insanity that is going on amongst us, and that statistical ingenuity can no longer explain away. Should Dr. Westura Sambon be correct in maintaining that sunstroke is an infective disease we shall shortly be combating insolation by an antisiriasic serum. If Dr. Buzzard is right in arguing that anterior polio-myelitis is due to a bacterium, we shall soon teach that bacterium to circumvent itself and leave little limbs unwithered. It is within the bounds of possibility that by means of an antitoxin, we may yet restrain the course of cancer, that “perilous stuff which weighs upon the heart” of the present generation, for we may counteract a poison which it generates and which is perhaps more pernicious than the structural changes associated with it. And this brings me to a consideration in connection with antitoxins which should not be omitted in any survey of their therapeutic powers, and that is that in some instances, besides saving life, they mitigate the sequelæ which infective diseases so often leave behind them. Given therefore to patients who might survive without their aid they still promote speedy and complete recovery by warding off secondary structural alterations in muscle and nerve fibre and in the viscera. We are all aware of the disasters that small-pox leaves in its trail—blindness, deafness, and lameness—although happily we see less of these than our forefathers did and than our children may do, unless the faddists be effectually muzzled and effect be given to the conscientious objection of the nation to the conscientious objector. We know something of the kidney disorders and disorganisation of the middle ear that so often follow on scarlet fever, and of the paralysis that dogs the footsteps of diphtheria, but perhaps we scarcely realise that every infective disease leaves its mark upon the system. I have heard the late Sir William Gull say—and most of his sayings were worth remembering—that it takes a man ten years to recover perfectly from an attack of typhoid fever, and it is certain that the health and happiness and kinetic energy of the community at large will be sensibly augmented by the employment of medicaments that not merely diminish the mortality of a large group of diseases but limit their secondary ravages.

Preventives of Disease.

I have touched on the actions and uses of antitoxins and serums in the cure of disease (and I can but touch in passing on a subject already very voluminous and expanding daily), and I would next touch even more casually on the still more momentous rôle assigned to them in relation to its prevention.

Instances of constitutional insusceptibility to certain poisons in certain animals such as that of cows to belladonna and pigeons to opium, have been long recognised, and so has the tolerance of poisonous doses of many toxic substances, such as opium and arsenic, established in man and animals by their habitual use. It has been long known that many infectious diseases confer on those who have suffered from them an exemption, more or less complete and lasting, from subsequent attacks, but it is only since Pasteur taught us the “Open Sesame” of fermentation that we have come to understand that a power of resisting certain infectious diseases, analogous to that bestowed by vaccination

in the case of small-pox, may be secured by the injection of the microbe which causes them, of the fluid in which it has lived or of the blood serum of an animal in which it has lived, and died. An animal thus treated becomes proof against the particular disease, so that as much as fifty times the original minimum lethal dose may be injected without causing inconvenience. The duration of the immunity thus artificially induced has not yet been very precisely measured in any case, but this seems to be established, that the immunity conferred by a toxin is less than that conferred by the microbe itself, and feasibility is therefore given to Professor Fraser's theory that long-continued immunity depends on the continued existence in the body in an attenuated form of the microbes causing the disease, and on the continual manufacture by them of the antitoxin or immunising substance.

The grand instance of protracted immunity is, of course, small-pox, in which the mild attack brought on by vaccination protects completely for seven years and partially for a much longer period, and in which two such mild attacks give lifelong freedom from the major malady. In cholera and in typhoid fever prophylactic inoculations have been practised with encouraging results, and in other infective diseases experiments of much promise are being carried on, and we are entitled to hope that the microbes of a number of infective diseases may yet be so tamed and domesticated as to be changed from ravening wolves into faithful house-dogs, warding off all wolfish attacks. It may be that attenuated microbes of infective diseases do even now occasionally confer immunity upon certain persons spontaneously and by stealth, for, by their unsuspected reception into the body as well as by inherited insusceptibility we might account for the fact that a few individuals set at defiance the virus of certain infective diseases—yellow fever, malaria and typhoid fever, for example—even when exposed to it in the most intense concentration.

There are infective diseases—influenza, erysipelas, rheumatic fever, and others—attacks of which afford no guarantee against recurrence—nay, in which one attack almost seems to predispose to another by the debility or vicious habit it leaves behind it, but even in these we need not despair of ultimately reaching protection, for their microbes, which cannot apparently within the body be reduced from the toxin to the antitoxin phase of existence, may yet be capable of such conversion under the wider range of altered conditions to which it is easy to subject them during extracorporeal treatment.

Serotherapy and Organotherapy.

We are entering upon an era of serotherapy and organotherapy. Marvellous advances are in store for us. So rosy is the prospect that it increases one's constitutional disinclination to die. We should all much like to live and see the wonders that are to be revealed hereafter, when the new remedies are perfected. Of course, the new remedies cannot altogether supersede the old ones. They must supplement them and crown the edifice of medical science. When they have come in their fulness and strength, sanitary precautions will still be called for to prevent the multiplication and spread of pathogenic microbes, to ensure the purity of light, air, and water, to prevent the contamination and adulteration of our food and drink and physic. Hygienic measures will be none the less needful to maintain a high standard of health, which means effectual resistance to many microbial assailants. Eliminants will be as useful as ever in aiding the expulsion of poisonous products, and sedatives, antipyretics, stimulants, hypnotics, narcotics, tonics, alternatives, and specifics, will still retain their value in the alleviation

of symptoms and the correction of innumerable morbid aberrations. But beside and beyond those the new remedies will take their place and, unless we are strangely deceived, bring about an enormous diminution of preventable disease. That outlook, I am sure, causes you no dismay, for, like my own profession, of which you are an offshoot, you must not only regard with equanimity but hail with delight any falling off in your own earnings that corresponds with a prolongation of human life or an abatement of human suffering. Vaccination must have done immense damage to your trade. In pre-Jennerian days every case of small-pox—and they were plentiful enough—was good for six draughts and two boluses daily for a month, with a portentous number of ointments, lotions, and clysters as well, and now-a-days even a modified case of small-pox makes a substantial contribution to the druggist's till; but not the less earnestly on that account do you advocate vaccination, and pity the conscientious objector and his progeny who must become your proper prey. And so with other infective diseases, you will welcome the antitoxins that disarm them even although they should reduce your output and profits.

The Effects of Immunisation.

How far immunisation may go it is as yet impossible to foretell, but giving rein to our imagination, we can conceive of a time when sure and permanent protective antitoxins against all the more prevalent infectious diseases having been discovered, a course of immunisation will be made obligatory upon every child, as elementary education now is. Out of that course of immunisation the child will emerge, not as after a course of education docile, but refractory in the highest degree, proof for life against small-pox, tuberculosis, scarlet fever, diphtheria, whooping-cough, measles, and all the zymotics that do so easily beset us. In these apocalyptic days, too, a man going to the tropics will call on his doctor and take out a patent of protection against the dangerous diseases endemic in the region he is about to visit, and thus the West Coast of Africa will be stripped of its terrors, and yellow fever will cease to be a bugbear in Brazil.

But however triumphant immunisation may become, and however widely successful the antitoxic treatment of disease may prove, your occupation will not be gone. It will be merely enlarged, for new duties and responsibilities will devolve on you as purveyors of new remedies very difficult of preparation and requiring much technical skill and vigilance in their storage and distribution, and hence it is that I foresee the necessity of your having some bacteriological training. The preparation of vaccines and serums—a delicate process, involving biological experience and insight, and a tedious one, for it takes several weeks to produce the anti-diphtheritic serum and six months to elaborate the anti-pneumococcus serum—must always remain in the hands of medical bacteriologists, but as regards antitoxins, I have little doubt that they will finally fall within your sphere of operations. Professor Fraser holds that antitoxins originate not from vital reactions but from chemical changes in the toxins themselves, and prophesies that the time will come when they will be prepared not by inoculation of animals, but by chemical processes in the laboratory, and seeing that we can already in the case of some drugs so modify their action by the introduction of a new molecule that they not only lose their original properties, but become pharmacologically active in the reverse direction, there would seem to be good ground for his belief and prediction. When that time does come, those antitoxins will assuredly take their place beside the other potent and beneficent poisons of which you are the recognised custodians.

Concluding Remarks.

When I stood on the brink of this address, I proposed to myself, after a few preliminary remarks, to plunge into a subject of some depth but of great allurements and of special interest to you in relation to your present studies. I proposed to speak to you of a great philosopher who was also a practical pharmacist, and to show you how Bishop Berkeley's treatise on "Tar Water," published in 1744, has a bearing on the medicine and surgery as well as on the speculative thought of to-day. But my preliminary remarks have run away with me. What have, I fear, proved the ill-favoured and lean-fleshed kine of my introduction have eaten up what I flatter myself must have proved the well-favoured and fat-fleshed kine of my main discourse, and I find myself beyond bounds both as regards time and your patience, without having as much as mentioned Berkeley's name. I must postpone, therefore, to some future opportunity what I have to say about *Siris*, its rational empiricism, its optimism, its curious anti-septic anticipations, its learning, its lucidity, and its marvellous chain of philosophical inquiries and reflections, leading up from a humble nostrum to the throne of the Divine Ruler of the Universe. Meanwhile I may recommend it to the private reading of such of you as are not afraid of metaphysics, sure that you will find food for thought even in its therapeutical extravagance, and that it will help you in some measure to escape from that dreary materialism to which your avocation perhaps somewhat disposes you. Its pure and lofty idealism, which you may trace flowing on in a continuous but differently reflective stream in the writings of Carlyle and Emerson, may help you, as it has helped many a man, to lay hold of a sustaining faith. Berkeley said, "He who hath not meditated upon God, the human soul, and the *summum bonum* may possibly make a thriving earth-worm, but must indubitably make a sorry patriot and a sorry statesman." It is not perhaps within your visions of your lot to be statesmen, but one and all of you should aspire to be good patriots and something more than thriving earth-worms, and in all your laudable ambitions "Tar Water" will prove a safe stimulant and roborant. Let me thank you for the indulgent audience you have given me, and wish you all with my heart a prosperous and pleasant journey on the road that is opening out before you.

PHARMACEUTICAL POLITICS.

BY BARNARD S. PROCTOR.

The parties affected by pharmaceutical legislation are first the public, who have a care naturally and properly for only such changes as promote the public good, the general safety and convenience of the masses at the smallest cost.

Second, the small pharmacists, Minor men who have little anxiety but for their own profits, who have small qualifications and little intellectual ambition.

Third, the Major men, small in number but great in desire for professional status, who have pharmacy enough to keep them above money anxiety, unless it be an anxiety to get professional pay for trade transactions.

Each of these three parties aims at a different goal, consequently each goal has one advocate and two opponents. No one aim is calculated to acquire popularity till time, it may be generations, opens the eyes of all to the impracticability of accomplishing any one aim without having regard to the others, especially to the public safety and convenience.

So long as the forces are pulling in different directions it is better that they should not pull violently, but with such gentleness and observation as will enable them to see the good points in the two

parties which oppose them, while having sufficient reserve of energy to take care of their own well-being.

Our policies have thus different aspects according to the point of view from which they are contemplated, pharmaceutical politics no less so than the politics of church and state, or nation and nation.

In the beginning, Bell created the Pharmaceutical Society, and the Society was without Charter or Act of Parliament, and there was great darkness in the body; but chaos disappeared as fellowship grew; as life and light increased it was seen that one ray differed from another in kind, that these were red, yellow and blue rays. The blue or most refrangible rays were those most ready to leave the old course and, by their more rapid vibration, to stir up mental activity and promote chemical action. But the less refrangible were sluggish and could not be so much diverted from their old course; they were content with the golden medium when they could get it, their aim being to make this golden medium more easily obtainable by themselves. The red rays are made of tape and are represented in Parliament, they are the most difficult to move and they control the movements of the other two, preventing them from getting out of gear and beyond the range of useful action.

The efforts of the original movers were directed to uniting the whole body of pharmaceutical practitioners under the one grade of pharmaceutical chemists, but the Legislature only slowly and reluctantly gave power to the Society to control the procedure of those who did not choose to become members of the Society. What benefit was it to the public that chemists should become learned men? It might turn out a public inconvenience to require that none but pharmaceutical chemists should be allowed to carry on the old-established and customary trade of chemist and druggist. So when Parliament gave the pharmaceutical craft an Act it only sanctioned the Minor examination, as the requirement for being put on the Register of Chemists and Druggists, and restricted the privilege of registered men to dealing in and dispensing certain poisons. The title of pharmaceutical chemist and the consequent exemption from jury service being the special privilege which Parliament was willing should be given to the learned pharmaceutical chemists, including the unlearned who had vested interests in the title at the time the Act was passed. But though the Minor examination was to be the door to the title and privileges of the chemist and druggist, the quality of the examination was not defined, it had to satisfy the examiners and the inspector appointed by the Privy Council. The elasticity thus imported into the test is at once a source of power and of danger. Bell's aim was one grade of qualification for carrying on the craft of pharmacy, and the Council of the present day has very much the same view. It has so far influenced the scope and quality of the Minor that it is at least equal in severity to the Major of the earlier date. But however they may increase the severity of the Minor, it will never possess the value of the Major, which carries an honour, from showing that its graduates do not stop short at the lowest status which law requires for the practice of pharmacy. If the Council could see its way to so modify examinations and bye-laws, that in some not far distant future all who pass the Minor should be registered as pharmaceutical chemists. I should rejoice in the change, inasmuch as it would carry jury exemption to the men who stand most in need of that relief, and are as much entitled to it as the bulk of those who were on the Register of Pharmaceutical Chemists at the time the Juries Act was passed. If this were within the range, even of telescopic vision, I should not think it desirable to purchase it at the price of any considerable increase in the severity

of the Minor examination, but think it would have to be accompanied with the institution of a lower grade of druggster, to deal in "poisonous substances" such as recently suggested in Parliament. Increased difficulty of entering the pharmaceutical ranks would increase the temptation to carry on all the collateral trades not prohibited and no practicable widening of the protected field of work would secure to the qualified man so much of pharmacy as would enable him to make a living in a thinly populated district. On the other hand, if the numbers of qualified men became much reduced, the public would be inconvenienced and dispensing by medical men perpetuated, especially in outlying places.

This would not personally affect any individual on the Council, but is a point not to be overlooked in the interests of their country cousins, both lay and pharmaceutical. A town of three or four thousand inhabitants, with such villages as may be within driving range, will support three or four doctors, but not one pharmacist, unless he lives upon the solid pudding of sundry trades and cultivates his pharmacy, like parsley, as a garnish to more nourishing food. Under such conditions the chemist and druggist cannot be a skilful pharmacist, because he lacks the constant exercise of his processes which alone can keep his skill alive. He can scarcely be a warm supporter of the Society which has made his calling a thing of great price, but of little profit; which has made his path a path of labour but of labour lost, for want of opportunity of making use of the many clever things he learned at the school and the many square things that do not fit his all-round hole. To make a pint or two of tincture of opium by B.P. process would be an unreasonable and unprofitable waste of his time. It would be better and cheaper that he should buy the factory-made tincture than risk the errors of operating or assay consequent upon his interruption by frequent callers—unavoidable in a one-man pharmacy—and so of many other pharmaceuticals. The public do not like home-spun Bland's pills so well as those which are factory-made. No amount of argument is likely to outweigh the practical experience of the country chemist in dealing with his drugs and his customers. The natural laws of demand and supply settle what the supply must be. If ever the time is to come in which the small towns will demand and can maintain one or two expert pharmacists, it can only be in the far-distant future when the public have learned to pay more for what they require, or the pharmacist is willing to work more for less percentage of pay. In the large towns there will always be two grades of pharmacists. Even if all are passed through the same sieve, there will be an ascending and a descending class, the former increasing their skill and reputation, the latter reducing their prices and meeting the wants of the poor or parsimonious. Both may prosper and fill useful places in the social economy if their evolution and their environment are in harmony.

The Council may well set before itself a series of questions requiring definite replies upon which its policy should be based.

How many one-man pharmacies are in existence—pharmacies carried on by one qualified man with unqualified helps? And in such pharmacies what percentage of the income is made by dispensing, by pharmacy other than dispensing, by sale of drugs for medicinal use, by sale of poisons not for medical use, by sale of proprietary medicines, by sale of such goods as are altogether outside of pharmacy or the drug trade?

How often does the one-man pharmacist find useful application of the knowledge he required to pass him through his examination in syllabus subjects?

What is the value of examinations as appraised by the Army and Navy authorities, by guardians of the poor and prison governors, and by the public?

Why are there so many chemists and druggists indifferent to membership of the Society, and why so many members of the Society so indifferent to the election of Council?

Why is it so difficult to keep on the Register the numerous men entitled to be there, but not to be found when the Register is to be corrected?

Why are the failures in the exams. more numerous in the practical than in the theoretical departments?

Why is there so little union and patriotism in the kingdom of pharmacy?

What amount of pharmaceutical work is sufficient to keep a pharmacist in good working order, what population is likely to supply this amount of work and what is to be done for the small towns with insufficient population to provide this demand?

If it requires 4000 inhabitants to keep a good working pharmacist, what is to be the fate of towns of two or three thousand?

Parliament may provide that where the population will not support a pharmaceutical chemist another dealer in poisonous substances, cattle medicines, photo goods, etc., might be permitted, but who is to decide when a town is too small to require a pharmaceutical chemist? If a small town grows, what is to be done about the unqualified dealers? Are they to be hanged?

Some of these queries I know must be difficult to answer, but the American Pharmaceutical Association has found answers to many interesting queries, and so might our Council if it had the pluck of Joseph Jacobs the cutter to show what information can be collected by those who are willing. On the other hand, some queries almost suggest the replies that will come in response. For example, we would not expect the unqualified dealer to be either drowned or hanged when a pharmaceutical chemist is ready to try if he can make a living in Littleton. We would only suspend his licence and if the learned man could not make a living, allow the unqualified man to resume his operations.

The Pharmaceutical Council is conservative and its members are gentlemen. I am Rad. Gent. They regard my aim as a bitter end. I regard theirs as conserve of roses and concentrated rose water. They believe in the Government stamp for pharmacists. I believe in native worth.

The alleged moribund tendency of "Ph.C." indicates that its money value is judged to be less than it costs.

The money value of "C. and D." is estimated to be as much as it costs so long as the birth-rate of new candidates counterbalances the death-rate. But many investments turn out to be worth less than they were estimated. The "C. and D.," plus trade instincts, may be valuable, but the difficulty is to assess the value of each factor.

The Legislature regarded the Minor examination as sufficient for public safety when the Pharmacy Act was passed. Apparently it considers the Minor, as at present conducted, more than is requisite for dealers in poisonous substances and that holders of the Minor do not afford all desirable facility to the public for obtaining carbolic acid and sundry other useful poisons. The more the Minor examination is raised the more the numbers of Minor men will be restricted, the more will this Parliamentary view be justified and the more certain we are to have a lower grade dealing in drugs and dangers whether with or without a legal status.

PILLS OF POTASSIUM IODIDE.—M. de Toledo finds that if the potassium iodide be massed with light magnesia and honey, and the pills kept in light magnesia after rolling, they will be perfectly preserved.—*L'Union Pharm.*, xxxix., 363.

PHARMACEUTICAL SOCIETY.

MAJOR EXAMINATION QUESTIONS.

PHYSICS.

September 29.—Time allowed, three hours.

[Not more than six questions to be attempted.]

1. State briefly the meanings of the following terms:—Weight, Mass, Density, Specific Gravity, Vapour Density, Double Refraction.
2. Describe the methods employed for measuring temperature. How is a mercurial thermometer made, graduated, calibrated, and verified?
3. What is the meaning of the term latent heat! Give illustrations and show, in one instance, how it may be determined.
4. An object is placed in front of a convergent lens at a distance of twice the focal length of the lens. State and prove the relation between the size of object and image.
5. What is meant by achromatism, and how is it applied in the construction of optical instruments?
6. Describe the construction and the action of two of the following instruments:—Bennett's Doubler, Thomson's Replenisher, Thomson's "Mouse-Mill," Holtz's Machine, the Voss Machine, and Wimshurst's Machine.
7. What data are required in order to determine:—
 - (a) The resistance of a wire of length l ;
 - (b) The specific resistance of the same wire;
 - (c) The specific resistance of a solution of common salt?
8. Describe what happens when the same electric current is passed simultaneously through vessels containing respectively, dilute sulphuric acid, dilute hydrochloric acid, a mixture of dilute sulphuric and chromic acids, concentrated nitric acid, a solution of sulphate of copper, and a solution of nitrate of lead.
9. Describe the principle and construction of an electromotor.

CHEMISTRY.

September 29.—Time allowed, three hours.

[Not more than six questions to be attempted.]

1. 15 C.c. of hydrogen measured at 15° C. and 730 Mm. pressure, and 7.6 C.c. of oxygen, measured at 15° C. and 690 Mm. pressure are mixed and exploded. Is there any gaseous residue? And if so, what would be its volume at 0° C. and 760 Mm. pressure?
2. Describe exactly how you would test samples of (a) hydrochloric acid, (b) sulphuric acid, for each of the impurities commonly found in the crude commercial products.
3. Give two methods by which you could obtain nitrogen from nitric acid without employing any other substance containing nitrogen.
4. State what you know of the behaviour of the following substances when heated:—Oxalic acid, citric acid, lactic acid, ammonium sulphate, ammonium oxalate, benzoic acid, urea, potassium hydrogen sulphate.
5. How is the basicity of an acid determined? Illustrate your answer by examples, selecting for the purpose some cases where the principles are easily applied, and some in which the basicity may be considered doubtful.
6. Compare chromium and manganese in respect of the salts in which the metal forms the cation and also in respect of the salts in which the metal forms part of the anion.
7. Anhydrous ethyl alcohol is treated in separate portions with about ten times its weight of each of the following substances at ordinary temperatures:—(a) acetyl chloride, (b) phosphorus pentachloride, (c) concentrated hydriodic acid, (d) concentrated sulphuric acid. State what occurs, and give some indication of the extent to which the alcohol undergoes change in each case.
8. Write a short account of the alkaloids as a class, dealing more particularly with the following points:—Composition; physical and chemical properties; decomposition products.
9. Describe the preparation, properties, and more important reactions of acetylene.

BOTANY AND MATERIA MEDICA.

September 30.—Time allowed, three hours.

1. Describe in detail the features observable in a Dicotyledonous tree in winter and in summer respectively. Explain how these features are severally developed, and give reasons for the differences between the winter and summer form.
2. Enumerate the chief colouring matters occurring in plants. State where they are found and what service, if any, they discharge.
3. Write a concise account of the characteristic features—external and internal—of (a) Water plants, (b) Desert plants, (c) Parasitic plants. Mention three examples of, a, b and c. (Flowering plants only.)
4. Name the official Balsams and Balsamic Resins. How would you demonstrate their balsamic character and ascertain the purity and quality of each respectively?
5. What are the chief constituents of the following essential oils, viz.—Oils of Nutmeg, Cinnamon, Peppermint, Aniseed, Caraway, and Eucalyptus?

PRACTICAL BOTANY AND MATERIA MEDICA.

September 30.—Time allowed, three hours.

1. Give a description of the external morphological features presented by specimen A. Refer the plants C and D to their natural orders, giving reasons for your references.
2. Make a transverse section of D. From what group of plants and what part of the plant is it derived? Draw your preparation and give explanatory references to your sketch.
3. Prepare and leave for inspection not more than two slides of the root provided. Sketch and fully describe your preparations.
4. Identify the powder and state whether pure or adulterated.

LONDON: SATURDAY, OCTOBER 8, 1898.

THE COUNCIL MEETING.

THE resumption of official business transactions at the Council meeting last Wednesday was not marked by any occurrence more important than the third reading of the amended Bye-laws by which the provisions of the Pharmacy Acts Amendment Act, 1898, are to be carried into effect. At the opening of the meeting the PRESIDENT first referred to several letters which had been received since the last sitting—one from LORD HARDWICKE thanking the Council for the resolution passed in appreciation of the assistance given by him towards the passing of the Bill last session, and others of like nature from Mr. SMITH and Colonel BROOKFIELD. A letter from Mr. EDGAR M. CHAPMAN expressed his thanks for the award of the Burroughs Scholarship, one from Mr. HAROLD WILSON resigning his position as demonstrator in the Society's School, one from Mr. UPSHER SMITH in acknowledgment of the award of the Pereira Medal, one from Mr. HERBERT PAYNE in acknowledgment of the permission to continue his studies in the Research Laboratory, and one from Mr. J. I. SCOTT communicating his election to an exhibition at Merton College, and his consequent inability to take up the Bell Scholarship which had been awarded to him.

The PRESIDENT then moved that the scholarship rendered vacant by Mr. SCOTT's resignation should be awarded to Mr. P. B. GRAY, the candidate next in order and practically almost equal to Mr. SCOTT. This was seconded by Mr. CARTEIGHE, and agreed to.

The PRESIDENT then mentioned the death of a distinguished honorary member, Brigade-Surgeon AITCHISON, who has done much useful work in elucidating the natural history of drugs.

The report of the Finance Committee gave the usual information as to receipts during the last two months, and the payments recommended were adopted.

On the recommendation of the Benevolent Fund Committee nine grants, amounting in all to one hundred and two pounds, were ordered to be paid.

Particulars relating to the financial state of the Fund, the number of annuitants, and the deaths during the past year were submitted in a statement by the Secretary. On the recommendation of the Committee a resolution was passed that four annuitants should be elected on Tuesday, December 13 next, and that the names of six candidates should be placed on the approved list.

In moving the adoption of the report, the VICE-PRESIDENT referred to the large amount granted as being due to the circumstance that it covered the applications of two months and he especially urged the need for liberal provision of funds to enable the Committee to meet all the calls made upon it.

The VICE-PRESIDENT also referred to the unsuccessful attempt last year to get ROBERT KIRKBY into the London Orphan Asylum at Watford and mentioned that, as he is again bringing the case forward, he would be glad to have the assistance of the members of the Society.

The PRESIDENT reported that he had received a letter from Mr. WARD, of Sheffield, resigning his position as local secretary, and after speaking of the services rendered by Mr. WARD for many years, requested the Council to authorise him to write thanking Mr. WARD for his long and zealous services. Mr. CARTEIGHE added that he had a lively recollection of Mr. WARD's services, both in his official capacity and otherwise, when the Pharmaceutical Conference met in Sheffield and on other occasions. The VICE-PRESIDENT also expressed pleasure in having been associated with Mr. WARD during the past twenty years, and bore testimony to his loyalty to the Society, as well as to the success with which he overcame the many difficulties incident to the performance of the duties of local secretary.

In connection with the subject of local secretaries, the PRESIDENT drew attention to the fact that the nomination cards for the appointment of local secretary have just been sent out, and he pointed out that at the present time it is more than ever desirable that interest should be taken in the selection of the most suitable representatives of the Society to fill the office of local secretary. He hoped, therefore, that all members would do their utmost to secure the nomination of the best men in their immediate localities.

The PRESIDENT mentioned a letter received from Mr. COWLEY, the Honorary Secretary of the Federation of Local Associations, enclosing a resolution passed at a meeting held in Belfast, congratulating the Council on the passing of the Pharmacy Acts Amendment Act and urging it to press forward the question of company trading, as it affects the interests of registered chemists and druggists. A similar resolution was received from the Dewsbury and District Chemists' Association.

As one of the delegates to the Pharmaceutical Conference, Dr. SYMES reported that the meeting was fully as successful as had been anticipated. The papers read were numerous and good. The honorary secretaries displayed their usual untiring energy, and the excellent organisation arrangements of the Local Committee contributed to the success achieved. The hearty welcome and generous hospitality of the Lord Mayor (Alderman HENDERSON) and the Lady Mayoress, added a most agreeable feature to the meeting.

Dr. SYMES' remarks were endorsed by Messrs. ATKINS, MARTINDALE, WARREN and JOHNSTON, while the PRESIDENT expressed his regret that he was unfortunately unable to attend the Conference.

On the motion of the PRESIDENT the proposed Bye-laws were taken as read a third time, and confirmed in accordance with the provisions of the Charter and Acts of Parliament.

The report of the General Purposes Committee was considered, and resolutions were passed authorising the Registrar to take proceedings in various cases of alleged infringement of the Pharmacy Acts.

RECENT PROGRESS IN MEDICAL SCIENCE.

IN the Huxley lecture delivered by Professor RUDOLF VIRCHOW on Monday, it was stated that the greatest difficulty in the advance of biology has been the natural tendency for investigators to set the search after the unity of life in the forefront of their inquiries. Hence arose the doctrine of vital force, which still reveals its influence from time to time, although now discarded. Before satisfactory progress could be made it was necessary that highly-organised living things should cease to be regarded as units, and that they should be recognised as organisms, each constituent part of which has its special life. In the higher animals and plants alike, ultimate analysis brings us to the cell, and cells alone are to be regarded as the factors of existence. No gap now remains between isolated living cells and complete organisms, and the discovery of the development of complete beings from the ova of animals and the germ-cells of plants has enabled the study of isolated cells to be employed in elucidating the life of organisms. That the organism is not an individual but a social mechanism ought to be emphatically proclaimed in every medical school where the teaching is almost exclusively concerned with human beings, and two corollaries should also be stated—first, that every living organism, like every organ and tissue, contains cells; second, that those cells are composed of organic chemical substances which are not themselves alive.

VIRCHOW, studying the process of inflammation in vascular organs, succeeded in demonstrating that the presence of cells in inflammatory exudates is not the result of exudation, but of multiplication of pre-existing cells. Extending this to the growth in thickness of the long bones, VIRCHOW was thus eventually able to extend the biological doctrine of *omnis cellula e cellula* to pathological processes, every new formation pre-supposing a matrix or tissue from which its cells arise, and the stamp of which they bear. "Herein also lies the key to the mystery of heredity. The humoral theory attributed this to the blood, and based the most fantastic ideas upon this hypothesis; we know now that the cells are the factors of the inherited properties, the sources of the germs of new tissues, and the motive power of vital action." With regard to the occurrence of hereditary disease, that is now generally assumed to depend on the transmission of a predisposition which is present, though not recognisable, in the earliest cells, being derived from the paternal or maternal tissues. But the most elaborately constructed doctrines as to the hereditary nature of a given disorder may break down before the discovery of an actual *causa viva*, a notable example of that having been found in the case of leprosy, the transmission of which by inheritance was at one time so firmly believed in that a law was nearly passed in Norway, thirty years ago, forbidding the marriage of members of leprous families. It was found by VIRCHOW, however, that some cases at least were not due to hereditary transmission, and the subsequent discovery of the leprosy bacillus by HANSEN confirmed the view that the disease is actually acquired by contagion.

Parasitism has been shown to be the cause of many diseases, the occurrence of tropical fevers being explained by the detection of parasitic protozoa. But the chief infectious diseases are the work of the minutest kind of parasitic plants, bacteria, the study of which practically dates from PASTEUR's immortal researches upon putrefaction and fermen-

tation. In connection with this subject three important points, in VIRCHOW's opinion, require comment. One is the necessity for distinguishing between the cause and the essential nature of infectious diseases, the latter being determined by the reaction of the tissues and organs to microbes. Then there is the relation between the smaller parasites and the diseases determined by them, that relation being summed up in the general word "infection." Finally, there is the question as to the mode of action of infection. "It is only the larger parasites whose main effect is the devouring of parts of their hosts, the smaller act mainly by the secretion of virulent poisons. The recognition of this latter fact has led to the brilliant work of LISTER on the one hand and to the introduction of serum-therapeutics on the other." Before anyone had succeeded in demonstrating by exact methods the microbes which are active in different diseases, LISTER had discovered the means by which protection against the action of putrefactive organisms can be attained, and the consequence has been the opening up of further regions of clinical medicine to the knife of the surgeon, and a perfect revolution in the basis of therapeutics.

THE SOCIETY'S BYE-LAWS.

THE proposed new Bye-laws, having been read a third time at the meeting of the Council of the Pharmaceutical Society, on Wednesday, were submitted the same afternoon to the members of the Society for confirmation and approval at a special general meeting. The PRESIDENT explained that the proposed Bye-laws provided a better preliminary definition of terms, for the transfer of associates in business to the list of members, without troubling them to make special application, and for the abolition of the fine now payable on restoration to membership. The grade of "Associate" will be abolished, all registered chemists and druggists being eligible as "Members" and also for seats on the Council. Further changes that will be effected by the new Bye-laws include an alteration in the procedure with regard to Council elections, only one-third of the members retiring annually instead of two-thirds as at present; an extension of time will be allowed for persons, nominated for election to the Council, to signify their acceptance of the nomination; there will be no restriction in the number of chemists and druggists eligible for seats on the Council; and, finally, the appointment of the examiners will take place a month earlier than usual, in order to prevent any difficulty arising through the names submitted to the Privy Council not being approved in time for the January examinations. After this explanation by the PRESIDENT, it was agreed that the proposed Bye-laws should be taken as read, and they were then unanimously approved and confirmed. They must now be submitted to the Privy Council for confirmation and approval, after which they will become law.

HERR FRÖLICH, the talented President of the German Apotheker Verein, has been appointed advisory member (*dezernent*) of the Ministerial Department by which pharmaceutical affairs in Prussia are regulated, and at a recent very largely attended meeting of the Berlin apotheker, HERR FRÖLICH received the hearty congratulations of that body, together with a very complimentary expression of the feeling that, supported by the confidence of his colleagues, his services in that official position will be no less beneficial to the interests of the craft than his past labours in that direction have been.

ANNOTATIONS.

THE REVIVAL, IN A MORE SCIENTIFIC FORM, of the ancient hypothesis that diseases are caused by poisons, has not only given the art of medicine a new direction, but has opened up possibilities of danger which cannot be wisely ignored. In addressing an audience of persons who are the special custodians of public safety in connection with recognised poisons, Sir James Crichton Browne not unnaturally directed their attention to the possibility of their being called upon, in conjunction with the medical profession, to extend their function towards devising safeguards against misuse of the still more subtle poisons which modern research has made known.

THE HEAD LINES attached to some of the brief notices of Sir James's address which have appeared in the newspapers indicate facility of making paragraphs attractive, rather than appreciation of the address taken as a whole. "Hints to Poisoners" is the heading one London newspaper gives to its summary of Sir J. Crichton Browne's address to the students of the School of Pharmacy, and it would appear as though the lecturer's suggestive remarks on the possibilities that present themselves to the truly scientific poisoner have been singled out for comment in most of the daily papers. This is not surprising for the sensational is everything to the ephemeral press, and nothing more sensational could well be published than a statement to the effect that a connoisseur of poisons could, by keeping his own microbes, slaughter hundreds of innocent people without the slightest fear of his crime coming to light. Apparently, therefore, it is with a real sense of relief that the newspaper scribes note the expression of opinion that for a long time to come murderers will continue to stake their necks on the use of such old methods as arsenic and strychnine poisoning. Another leading London daily heads its summary of the address with the words, "Improved Methods of Poisoning," and a third adopts the heading "Folly to be Wise." On the whole then it would appear that the address has not been found lacking in the sensational element, and it is interesting to notice the unanimity with which all the newspapers have seized upon the same point—the suggestion that the intentional destruction of life by poison is still unlikely to rank either as a fine art or as a science.

THE WINTER SESSION is now fairly opened, and local associations all over the country are recovering from their summer slumbers. On Wednesday next the chemists of Plymouth and District begin the work of the session by holding their annual meeting, which will be followed by the fifth annual dinner, to be held at the Farley Hotel, Union Street, Plymouth. The guests on the latter occasion will include the President of the British Pharmaceutical Conference (Mr. J. C. C. Payne, J.P., of Belfast), and Mr. J. Burns Browne, B.Sc., head master of the Plymouth Technical Schools. On the same day Mr. John Harrison, of Sunderland, is expected to deliver an address on "Pharmacy and Parliament" at the opening meeting of the Manchester Pharmaceutical Association, and the Newcastle-on-Tyne and District Chemists' Association will be addressed by the President elect, Mr. F. E. Schofield, of Morpeth. The Sheffield and North Staffordshire Associations announce their opening meetings for Thursday next. At Sheffield the introductory address to the students will be delivered by Mr. J. Rymer Young, of Warrington, and the annual dinner will follow. At Stoke an address will be given by the President of the North Staffordshire Association, Mr. J. Averill, and a smoking concert will be held later in the evening.

THE CHEMISTS' ASSISTANTS' ASSOCIATION recommences operations on Thursday, October 13, when the President, Mr. F. W. Gamble, will deliver the inaugural address. A week later Mr. T. Morley Taylor is to read a paper on "Vegetable Secretions," and subsequent fixtures include short papers by members; a paper on "The Biology of Yeast," by Professor J. Reynolds Green; a discussion on "Advertising in Pharmacy"; and a demonstration of the Röntgen rays, by Mr. W. Coldwell. The social side of the programme has not been overlooked, Cinderella dances being announced for October 27 and December 8, the "Annual Reunion" for November 24, and a musical and social evening for December 15.

SCIENTIFIC CRITICISM OF PROPRIETARY ARTICLES now rests upon a firm legal basis in France, an important decision on this subject having been given in March last by the civil tribunal of first instance of the Department of Seine-Inférieure, and the time having elapsed during which an appeal might be lodged, so that the decision has now become an expression of the French law upon the point. According to a summary in the *Times*, the question arose in an action for damages, to the extent of 20,000 francs, brought by a firm of opticians in Paris against Dr. Javal, the Director of the Ophthalmological Laboratory of the Sorbonne. The plaintiffs were the proprietors of a glass containing baryta, from which they manufactured spectacle lenses, which were described as "isometric," and extensively advertised as possessing special excellencies. Dr. Javal instructed two of his assistants, MM. Durault and Tscherning, to institute a careful examination of the glass and of the lenses made from it, and to report fully to him upon the subject. They carried out his instructions, and reported that the differences between baryta glass and ordinary glass were insignificant, that they were not in favour of the former, and that the "isometric" lenses did not offer any advantages to purchasers. Dr. Javal having published this report by presenting it to the French Academy of Medicine, the action referred to was brought, and the Court decided that a scientific man might rightly examine and criticise on public grounds any manufactured article for which special merits were claimed. Accordingly they found for the defendant upon all the issues, condemning the plaintiff in costs. The decision has naturally been received with much satisfaction by the medical profession in France, and it is stated that the liberty thus secured is likely to be employed with reference to many pharmaceutical preparations and alleged remedies, as well as to the wares of opticians.

IN THE RECENT ACTION of the Pharmaceutical Society *v.* Acme Chemical Co., Ltd., heard at Tonbridge Petty Sessions, on September 6 last (see *ante* p. 323), judgment was given for the plaintiff Society with costs. The solicitor for the defence asked the Bench to state a case for a higher Court, on the point that the words of Section 17 of the Pharmacy Act, 1868, do not apply to a corporate body. A case was stated accordingly, but we are now informed that the solicitors to the Pharmaceutical Society have received an intimation that the proposed appeal will not be proceeded with.

THE PHARMACEUTICAL SOCIETY OF IRELAND has been successful in prosecutions instituted against certain Belfast druggists for breaches of the Pharmacy Act of 1875 (see p. 411), and the *Irish News* remarks that the Society deserved success for the pertinacity with which it followed up the cases, if for no other reason. It was not suggested that in any of the cases the prescriptions had been improperly compounded, but that the spirit of the Act had been violated. The decision of the magistrates is said to open up a question of great

interest to the general public, whose protection was contemplated by the Act, which requires that anyone compounding a prescription containing a scheduled poison shall be duly qualified and licensed by some recognised body, such as the Apothecaries' Hall or the Pharmaceutical Society. The question decided in the present instances, however, resolved itself into a matter of sale. Though a qualified man be on the premises and compound the prescription, it is held that the law has not been complied with if he does not personally hand the medicine over to the customer and effect the sale. This, observes the local newspaper, may seem hard lines for those who act *bonâ fide*, but if the strict letter of the law is not observed irregularities leading to abuse would be certain to develop. "It is said that a great many deaths are to be attributed to carelessly written prescriptions and improperly compounded and administered medicines, so that in order to maintain public confidence the law must be enforced. The dispensing of drugs has not escaped the keen competition of the present day, and cutting of prices has been a feature of the rivalry. It is just possible this might lead to the employment of cheap and unqualified assistants, and thereby endanger the lives of the public if stringent measures were not adopted."

FASHION IN MEDICINE was the theme of the discourse addressed by Dr. J. Walter Carr, senior physician to the Royal Free Hospital, to the students attending that institution, on Tuesday last. He spoke of the influence which had always been exerted upon medicine, and especially upon treatment, by fashion, custom, habit, and authority. At the beginning of the century bleeding was so universal that a doctor might well have been accused of malpractice if he had not bled for a fever; now he might be subject to the same accusation if, under precisely similar conditions, he were to bleed his patient. Then towards the middle of the century an actively stimulant treatment became fashionable, enormous quantities of alcohol being frequently administered to fever cases. Consequently, another reaction followed, of which the Temperance Hospital may be regarded as the outward and visible sign. Later came the fashion of trying to reduce the temperature in fever by powerful drugs, such as antipyrine. The public, learning of this, thought they could cure themselves of influenza, and disastrous results frequently followed their endeavour to improve upon the teaching of their medical advisers. At the present time the fashion is running on animal extracts, a result of the success, in suitable cases, with treatment of thyroid extract, and on antitoxins, a consequence of the benefits obtained from the use of an antitoxin in diphtheria. Both methods are undoubtedly useful in their place, but must have their limitations, and are in danger of being pushed to excess and so brought into discredit.

A NATIONAL PHYSICAL LABORATORY is definitely recommended by the committee appointed last year by the Treasury, with Lord Rayleigh as chairman, to consider the desirability of establishing such a laboratory. Many eminent scientists have been called as witnesses, and the committee in the report just issued recommends that a public institution should be founded for standardising and verifying instruments, for testing materials, and for the determination of constants. It is suggested that the institution should be established by extending the Kew Observatory in the Old Deer Park, Richmond, and the scheme should include the improvement of the existing buildings, and the erection of new buildings at some distance from the present observatory. A further recommendation is that the Royal Society should be invited to control the proposed

institution, and to nominate a governing body, on which commercial interests should be represented, the choice of the members of such body not being confined to Fellows of the Society. Finally, it is proposed that the permanent secretary of the Board of Trade should be an ex-officio member of the governing body, and that such body should be consulted by the Standards Office and the Electrical Standardising Department of the Board of Trade upon difficult questions that may arise from time to time or as to proposed modifications or developments.

A CASE OF PRACTICAL SPIRITUALISM is reported by the *Daily Telegraph* from Dewsbury, where one married woman brought an action against another to recover sixty-seven pounds. Defendant carried on business as an herbalist, and combined with this the profession of spiritualistic medium. The parties became acquainted in 1893, and defendant had borrowed from that time the whole amount, in sums varying from five pounds downwards. Spiritualistic services were held monthly at the plaintiff's house, and defendant, at the commencement of the series, told plaintiff that the spirit which was guiding the course of the universe at that particular time said she (defendant) must give up work and become a medium if someone could be found to advance her the money with which to live upon. Meanwhile plaintiff advanced her money at every meeting, defendant telling her more than once that all would come right in the end, as the spirit had told her she would receive the sum of five hundred pounds from a bachelor living at Thornhill. The defence was an absolute denial that money had been borrowed, but the verdict was for plaintiff for the full amount.

BRIGADE-SURGEON JAMES EDWARD TIERNEY AITCHISON, M.D., C.I.E., F.R.S., LL.D., Bengal Army (retired), who died on the 30th ult., at Priory Terrace, Kew Green, had been an honorary member of the Pharmaceutical Society since 1891. He was the son of the late Major J. Aitchison, H.E.I.C.S., and was born in 1835. After studying at Edinburgh University and graduating M.D. and L.R.C.P. in 1856 he entered the Bengal medical service in 1858, in which he remained for thirty years. He obtained the qualification of F.R.C.S. Edin. in 1863. In 1878 he served in the Afghan War. Finally, Edinburgh University conferred on him the degree of LL.D. in 1889.

AN EXPENSIVE DENTAL OPERATION was the subject of litigation in the Westminster County Court this week, when an action was brought by a dentist to recover thirteen pounds, the balance of an account for stopping five teeth. Plaintiff said it was arranged that payment should be by time, and at the rate of a guinea for each half-hour. There were twenty-eight half-hours, and he sent "a diagram" to the defendant, which Judge Lumley Smith compared to "a picture out of Euclid." Fourteen separate half-hours were devoted to one tooth, and there were often three operators at work upon it at the same time—one placed the gold, another fixed it in the tooth, and the third tapped it. The judge said he had heard of two men to one spade, but never of three men to one tooth. He also calculated that the fees charged worked out at six pounds a tooth. Defendant—a lady—said the arrangement she made was to pay ten pounds, but she had actually paid half as much again, and only five teeth had been treated. In the event judgment was given for the defendant with costs, the judge being of opinion that fifteen pounds was enough for the work done, *i.e.*, at the rate of three pounds per tooth.

PHARMACEUTICAL SOCIETY.

RE-OPENING OF THE SCHOOL OF PHARMACY.

The fifty-seventh session of the School of Pharmacy was opened on Monday, October 3, when the prizes of the last session were distributed by the PRESIDENT, Mr. Walter Hills. There was a large gathering of students, members of the Society, and friends. After briefly stating the purpose of the gathering, the PRESIDENT called upon Professor Norman Collie, Dean of the School, to read his report on the past session.

THE DEAN'S REPORT.

Professor COLLIE said that in reporting upon the progress of the School of Pharmacy during the past session he should like specially to draw attention to the manner in which the changes that had been made in the School curriculum had worked. Those changes, which had been instituted two years ago, enabled a student to spend eighteen months over the Minor and Major courses, and were instituted in order to relieve both the student and the teacher from the pressure of work under the old and shorter course. The end of the first complete course of eighteen months came last April, and, therefore, for the first time the staff was able to report on the effects of that change. It had been feared that the longer course would diminish the number of students; that, however, had not been found to be the case. Moreover, out of seventeen candidates who presented themselves for the Major examination last April fourteen passed. The success of the change, therefore, seemed quite assured. The number of students who had attended the School during the year was up to the average of recent years, there being a larger number of Major students and a rather smaller number of Minor students.

The School staff regretted the loss of the services of Mr. Harold Wilson, Demonstrator in Materia Medica and Pharmacy, who has recently obtained the post of Senior Dispenser to the University College Hospital. An able successor has been found, however, in Mr. F. A. Upsher Smith, the Pereira medallist of the last and Bell Scholar of the previous session.

Professor GREENISH had reported that thirty-eight students entered for the elementary, and twenty-one for the advanced course of lectures in materia medica, and that the work was maintained with unusual regularity throughout both courses. In the elementary course the Bronze Medal was awarded to Mr. T. E. Wallis, and Certificates of Honour to Mr. Nundy and Mr. Payne. In the advanced course Mr. Matthews obtained the Silver Medal, and Mr. Chapman and Mr. Perrédès won Certificates of Honour. The course of lectures in pharmacy had been attended by thirty-eight students, and in this class also a similar satisfactory report can be made. The Silver Medal was carried off by Mr. Payne.

The elementary class in botany was conducted with fair success during the session. Thirty-six students joined, and the average attendance during the year was thirty-two at the lectures and thirty-four at the laboratory work. The attention and demeanour of the students were satisfactory. At the end of the session the Bronze medal was awarded to Mr. T. E. Wallis and a Certificate of Honour to Mr. Jno. Evans. Twenty-one students attended the advanced course. The work was done throughout in an exemplary manner. Mr. Harold Matthews won the Silver Medal at the examination at the end of the session, and Certificates of Honour were awarded to Mr. Upsher Smith and Mr. Perrédès.

In the chemistry classes the work and general attendance of the students have been perfectly satisfactory. At the end of the elementary course the Bronze Medal for practical chemistry was awarded to Mr. T. Wooldridge and Certificates of Honour to Mr. A. W. Turner and Mr. J. Evans. In theoretical chemistry Mr. T. E. Wallis was awarded the Medal and Mr. W. J. Spurway and Mr. H. Payne received Certificates. At the termination of the advanced course the Silver Medal in theoretical chemistry was won by Mr. H. E. Matthews, and Certificates of Honour by Mr. T. Farrow and Mr. W. B. Nelson. In practical chemistry the Silver Medal was awarded to Mr. H. M. Morgan, and Certificates of Honour to Mr. E. M. Chapman, Mr. H. E. Matthews, and Mr. F. A. Upsher Smith. The work of the department had been carried out with the help of Dr. Lapworth, Mr. Dewhurst, and Mr. Frye in a thoroughly efficient manner.

The PRESIDENT then handed the prizes and certificates and the

books given by Mr. Thomas Hanbury to the successful candidates, adding a few words of encouragement to the recipients in doing so.

THE HERBARIUM COMPETITION.

Professor GREEN was next called upon to report on the Herbarium competition. He said he never remembered examining a better collection of herbaria than those submitted in July last; in fact, he was almost appalled at the amount of work before him, but, fortunately for him, three collections stood out prominently from the rest, and he was able to recommend the Council to award not only a Silver and Bronze Medal, but also a Certificate of Honour.

The PRESIDENT, in conferring these medals and the certificate, remarked that two out of the three successful competitors hailed from Plymouth, and suggested that such an unusual occurrence spoke very forcibly in praise of the good work which was being done by the local association there.

Mr. FARR, who was next called upon by the President, read the following report on

THE COUNCIL PRIZES EXAMINATION.

"On behalf of the examiners in the competition for the Council Prizes, I have the honour to report that nine candidates entered for the examination, all of them in London. Last year, it will be remembered, only a single candidate reached the standard necessary to secure a prize, and this year we regret that one of the Medals cannot be awarded. With reference to the work of the prize-winners, my colleague, Professor Harvey Gibson, reports that the botanical portion was quite above the average standard of Major work, and showed a good range of reading and practical acquaintance with botany. Professor McLeod was well satisfied with the chemistry paper of the candidate who obtained the highest place, but the others were somewhat disappointing, no doubt owing to the fact that the questions were of a rather advanced character. The knowledge exhibited was on the whole accurate, as far as it went, but in some cases it was by no means above the average of that of an ordinary Major candidate. In materia medica three of the candidates did excellent papers and showed a good practical knowledge of the subject, but the answers of the others were far from satisfactory."

The PRESIDENT then presented the Pharmaceutical Society's Silver Medal and Hills' prize of books to Mr. P. E. Perrédès, and the Pereira Medal and Hills' prize of books to Mr. F. A. Upsher-Smith.

Mr. SAUL was next asked to report on

THE JACOB BELL AND MANCHESTER ASSOCIATION SCHOLARSHIPS.

He said this was the fourth occasion on which he had had the honour to examine for the Bell Scholarship, and he never read a better set of papers, and Mr. Pinches, his colleague, with Mr. Phillips, expressed himself particularly pleased with the Arts papers. There were twenty-five candidates distributed over England and Wales, and no less than ten out of that number obtained sufficient marks to qualify for the Scholarship. The two foremost were Mr. John Irwin Scott and Mr. Horace Finnemore. For the Manchester Scholarship there were only two candidates, but one of these, Mr. A. W. Ryder, submitted a very satisfactory paper, and the Scholarship had been awarded to him.

The PRESIDENT said he could only formally present one Bell Scholarship on that occasion, as Mr. Scott, the gentleman who stood first, had been fortunate enough to obtain an open exhibition at Merton College, Oxford, and it was not quite certain whether he would be able to fulfil the conditions attached to the Bell Scholarship, in which case the Council might probably award the second scholarship to one of the other candidates who had obtained the requisite number of marks.

The following is a full list of the awards:—

Elementary Course.

CHEMISTRY.

Bronze Medal	Thos. Edward Wallis.
Certificates of Honour	{ Herbert Payne.
	{ Wm. James Spurway.

PRACTICAL CHEMISTRY.

Bronze Medal	Thos. Wooldridge.
Certificates of Honour	{ John Evans.
	{ Alfred Wm. Turner.

BOTANY.

Bronze Medal	Thos. Edward Wallis.
Certificate of Honour	John Evans.

MATERIA MEDICA.

Bronze Medal	Thos. Edward Wallis.
Certificates of Honour	{ Wm. L. Nundy. Herbert Payne.

PHARMACY.

Silver Medal.....	Herbert Payne.
-------------------	----------------

Advanced Course.

PRACTICAL CHEMISTRY.

Silver Medal.....	Harold Marston Morgan.
Certificates of Honour	{ Edgar M. Chapman. Harold E. Matthews. F. A. Upsher Smith.

CHEMISTRY AND PHYSICS.

Silver Medal.....	Harold E. Matthews.
Certificates of Honour.....	{ Tom Farrow. Wm. B. Nelson.

BOTANY.

Silver Medal.....	Harold E. Matthews.
Certificates of Honour.....	{ Pierre E. F. Perrédès. F. A. Upsher Smith.

MATERIA MEDICA.

Silver Medal.....	Harold E. Matthews.
Certificates of Honour	{ Edgar M. Chapman. Pierre E. F. Perrédès.

Council Prizes.

PEREIRA MEDAL (SILVER) AND PRIZE OF BOOKS.
F. A. Upsher Smith.

PHARMACEUTICAL SOCIETY'S SILVER MEDAL AND PRIZE OF BOOKS.
Pierre E. F. Perrédès.

Herbarium Competition.

Silver Medal	Wm. W. Hellyer.
Bronze Medal	J. G. Hawksworth.
Certificate of Honour	H. J. Reynolds.

Scholarships.

JACOB BELL MEMORIAL SCHOLARSHIPS.

Horace Finnemore.
John Irwin Scott.*

MANCHESTER PHARMACEUTICAL ASSOCIATION SCHOLARSHIP.

Arthur W. Ryder.

BURROUGHS SCHOLARSHIP.

Edgar M. Chapman.

The Inaugural Address.

The presentation of prizes and certificates having been completed, the PRESIDENT then called upon Sir Jas. Crichton Browne, M.D., to deliver the inaugural address, which will be found printed in full at page 391. At the conclusion of the address,

The PRESIDENT, in proposing a cordial vote of thanks to Sir J. Crichton Browne, said the lecturer had throughout shown considerable sympathy with the needs, trials, and opportunities of the pharmacist. He had also shown an intimate knowledge of the present condition of pharmacy and the difficulties under which it laboured. He should have liked to say something on several points referred to in the address, but must confine himself to one or two only. In the first place, as a body, he thought they all regretted that they were regarded by the Legislature as vendors of poisons rather than as pharmacists, they agreed with Sir J. C. Browne that almost everything on their shelves was a poison, and they thought that pharmacy, not the sale of poisons only, should be protected. He might further say that many of them concurred in the suggestion that it would be wise to make a further division in the qualifying examination. He (the President) had thought so for many years, and though it had been done to some extent—the practical part being separated from the oral—he felt that the latter still made very great demands on the candidate, and might with advantage be divided into two portions. He was glad to find that Sir J. C. Browne believed that, notwithstanding the wonderful changes which were coming, there would still be important duties left for the chemist to perform, not only for his own benefit but also for that of the public.

Mr. BOTTLE seconded the motion, which was carried by acclamation, and

Sir J. CRICHTON BROWNE, in responding, thanked the audience for their attention to his address. He said he had been agreeably surprised to find so many present, seeing that two such powerful competitors for public attention as Virchow and De Rougemont—and there could not be a greater antithesis—were both to speak on the same day.

* Since resigned and P. B. Gray appointed in his place.

MEETING OF THE COUNCIL.

WEDNESDAY, OCTOBER 5, 1898.

Present :

MR. WALTER HILLS, PRESIDENT.

MR. G. T. W. NEWSHOLME, VICE-PRESIDENT.

Messrs. Allen, Atkins, Bateson, Bottle, Carteighe, Corder, Cross, Grose, Harrison, Johnston, Martindale, Park, Savory, Southall, Storrar, Symes, Warren, and Young.

The minutes of the previous Council meeting of August 3, and of the special meeting of September 28, were read and confirmed.

The PRESIDENT read a letter he had received from Lord Hardwicke, thanking the Council for the resolution which had been passed in appreciation of his work on the passing of the Pharmacy Act (Amendment) Bill. Similar letters had been received from Mr. Smith, M.P., and Mr. C. L. Brookfield, M.P.

THE BELL SCHOLARSHIP.

The PRESIDENT said he had received a letter from Mr. John Irwin Scott, one of the recently appointed Bell Scholars, saying that he had been elected to an open exhibition at Merton College, Oxford, and he must therefore resign the Bell Scholarship. They would all unite in congratulating Mr. Scott on having obtained this exhibition and in wishing him a successful career, but it was considered desirable that the vacancy occasioned by his resignation of the Scholarship should be at once filled up by the appointment of one of the other candidates who had obtained the qualifying number of marks. The next man was practically almost on a line with the second Bell Scholar, and he would therefore move—

That P. B. Gray be appointed Bell Scholar for 1898-9 in place of Mr. John Irwin Scott, resigned.

Mr. Gray had been communicated with, and was quite prepared to come up at once and commence work.

Mr. CARTEIGHE seconded the proposition, which was at once agreed to.

DEATH OF BRIGADE-SURGEON AITCHISON.

The PRESIDENT said a few days ago information had been received of the death of one of their distinguished honorary members in the person of Brigade Surgeon Aitchison, late of the Bengal Army, who had been an honorary member of the Society since 1891. He died at the comparatively early age of 63, and it might have been hoped that he would have lived some time longer in order to add to the useful work he had already carried out. It was hardly necessary to remind the Council that the deceased was a distinguished traveller and botanist, and represented one of the very useful class who travelled with their eyes open, and being a scientific man, had been able to make very considerable additions to their knowledge of materia medica. His death would be very much regretted by all.

REPORT OF THE FINANCE COMMITTEE.

This report was read, and recommended the payment of various accounts.

Mr. MARTINDALE, in moving the adoption of the report, said although the accounts comprised practically two months of the Society's work there was nothing particular to refer to.

The resolution was carried unanimously.

REPORT OF THE BENEVOLENT FUND COMMITTEE.

The report of this Committee recommended grants to the amount of £102 in the following cases:—

A registered chemist and druggist (65), who has had four previous grants. (Pontefract.)

A registered chemist and druggist (69), who has had a grant annually for several years. (Landport.)

The widow (55) of a chemist and druggist, who has had several small grants from the Fund. (Earlsfield.)

A pharmaceutical chemist member (75), who has had two previous grants, and whose wife is invalided. (Sherborne.)

The widow (50) of a registered chemist and druggist, who is partly supported by her daughter, and suffers from ill health. (Cumb.)

An associate and member (67), 1852-84, who has had two previous grants. (Chatteris.)

A registered chemist and druggist (67), who has had two previous grants. (Peckham.)

A former member (70). (Anstruther.)

The widow (57) of a chemist and druggist member who died recently after a long illness. (London.)

Three other cases were considered, but the Committee deemed them ineligible, and another applicant was recommended to be placed on the list of approved candidates for an annuity.

ANNUITANTS.

The SECRETARY submitted a statement showing the financial condition of the Fund, the balance on the current account on September 30 being £717 7s. 6d., and on the donation account, £487 13s. 5d. The number of annuitants on the list in October, 1897, was forty-one, and six were added in December. Three had died during the year, and one had resigned, leaving forty-three annuitants on the list.

The Committee recommended that four annuitants be elected on Tuesday, December 13, and recommended that the following be put on the approved list:—

Biggs, Walter	70	Oxford.
Bosley, Emily J.	63	Forest Gate.
Bowman, Jane	67	Chelsea.
Field, Wm. C.	73	Mablethorpe.
Stangroom, Fredk.	63	Cley-next-the-Sea.
Young, Jas. J.	78	Ipswich.

The VICE-PRESIDENT, in moving the adoption of the report and recommendations, said the amount granted was large, but considering that the Committee had the applications for two months to deal with he did not know that the number was above the average. Every case was carefully considered—in fact, it was the longest Committee meeting he remembered. Of course, the Committee had to bear in mind the amount required for the annuities, and it was therefore very important that sufficient funds should be placed in its hands to enable it to deal with these applications from time to time.

Mr. ATKINS seconded the resolution, which was carried unanimously.

ELECTION OF ANNUITANTS.

The VICE-PRESIDENT moved that four additional annuitants of the Society should be elected in December next, and that the election should take place on Tuesday, December 13, at 12 o'clock. The Committee had spent considerable time in considering the names to be submitted for election, and felt that the funds would be sufficient to allow of the election of four additional candidates. There were six candidates for annuities, and the Committee would have been glad if they could have gone further and recommended the election of all. He regretted the unavoidable absence of Mr. Hampson from the Council that day, because he, no doubt, would have liked to give expression to his views that it was undesirable that the names of the candidates for annuities should be advertised. No doubt many of Mr. Hampson's colleagues shared his feelings in the matter, but after all it was a question of policy. Many people who gave money to the Fund liked to have something to say in the expenditure of it. It was the duty of the Council to decide on the best means of raising the necessary funds, and if subscribers did take the view that they ought to have something to say in the spending of it, and if money could only be raised on that basis, the existing policy was the best to adopt.

The resolution having passed unanimously,

The VICE-PRESIDENT reminded the Council that last year he had asked for assistance in getting a lad named Robert Kirkby into the London Orphan Asylum at Watford. Unfortunately, their efforts on that occasion, owing to the shortness of time, had been unsuccessful, and he now begged to bring the case again before the members. The mother of the boy was well known to the Benevolent Fund Committee. She was a very deserving woman, and had been left with a large family, one child being already provided for in the London Orphan Asylum, whom the mother wrote saying was very happy and comfortable.

RESIGNATION OF A LOCAL SECRETARY.

The PRESIDENT said he had received a letter from Mr. Ward, of Sheffield, resigning his office as local secretary, tendering his thanks for the confidence which had been reposed in him for so many years, and saying it would still be his pleasure to do what he could to further the interests of the Society. He was sure that the Council would receive this resignation with regret, because Mr. Ward had been a very loyal and energetic local secretary for many years, but he had well earned his retirement, and he would, with the approval of the Council, write to Mr. Ward thanking him for his long and zealous services.

Mr. CARTEIGHE said he had a lively recollection, not only of Mr. Ward's services to the Society in his official capacity, but also of his great courtesy and kindness privately on the occasion when the Conference met in Sheffield, and at other times when he had enjoyed his hospitality.

The VICE-PRESIDENT said it had been a great pleasure to him to be associated with Mr. Ward for twenty-one years, in fact, ever since he had been at Sheffield. They all knew how loyal Mr. Ward had always been to the Society. The work of a local secretary was not always pleasant, but Mr. Ward had managed to get over the difficulties which arose, and did the work admirably. He was also one of the oldest members of the local Society, and was still one of the most energetic.

The PRESIDENT, in connection with this subject, desired to call the attention of the members, through the press, to the nomination cards for local secretaries which had just been sent out. It was very desirable always, but especially at the present time, that general interest should be taken in the appointment of local societies, and he would therefore urge on all the members to do their best to find out the best man in their own locality for the office, and fill up the nomination cards accordingly.

CORRESPONDENCE.

The PRESIDENT said a letter had been received from Mr. Cowley, Hon. Secretary of the Federation of Local Pharmaceutical Associations, enclosing a resolution passed unanimously at a meeting of delegates held in Belfast during the Conference, congratulating the Council on the successful passing of the Pharmacy Acts Amendment Bill, and urging it to press forward the question of company trading, as it affects the legitimate interests of registered chemists.

A similar resolution of congratulation had also been received from the Hon. Secretary of the Dewsbury and District Chemists' Association.

THE BELFAST CONFERENCE.

Dr. SYMES, as one of the delegates appointed to attend the British Pharmaceutical Conference at Belfast in August last, rose to report. Prior to the meeting, the pharmaceutical press pointed out the great advantages to be gained by meeting at Belfast, and the hearty reception they were likely to get, and a successful meeting was prophesied, and that, no doubt, had in a great measure caused the prophecy to be fulfilled. His colleagues who had attended the Conference would bear him out when he said that it had been exceedingly successful. A number of very excellent papers were read, without which no conference could be regarded as a complete success. There was the usual untiring energy of the honorary secretaries, who were always alive to the advantages to be gained from making the Conference successful; also the splendid organisation and arrangements of the Local Committee were altogether beyond praise, and contributed very largely to the success of the gathering. He also referred to the hearty welcome by the Lord Mayor and his generous hospitality. The Conference had an excellent place for meeting, the Library of Queen's College being placed at their disposal by the Principal. Not only the members of the medical profession and pharmacists, but the citizens at large all concurred in giving the Conference a most hearty welcome. They had exceedingly fine weather; the social functions were of the most pleasurable kind, the excursion was most enjoyable, and on the Friday and Saturday also arrangements were made for those who could stay so long to visit certain works and the Giant's Causeway. He was exceedingly pleased to see that sixty-two members attended from Scotland, which he took to be partly the result of the successful meeting in Glasgow the previous year. He hoped that the meeting at Plymouth would be, if possible, more successful, and that many of their Irish friends would be present. He could not conclude without expressing his regret at the absence of several well-known faces, including the Presidents of the Pharmaceutical Societies of Great Britain and of Ireland, but when a suggestion was made that those two gentlemen were afraid to meet each other, it was at once repudiated. He would ask the Council to accept a framed photograph of the group outside the Queen's College.

Mr. ATKINS said one of the things which greatly contributed to the success of the recent Conference was having an excellent President. For himself he had been exceedingly delighted with his visit, and thought it would be well to go to Ireland more frequently, and so cement more firmly the good feeling between the two countries. He spent some five weeks in Ireland, and saw many

things which afforded much food for reflection. He was much impressed with the position occupied by the dispensing chemists in some of the large cities, Dublin, Belfast, and Cork, and probably it was similar in other places. There he found that dispensing was almost exclusively in the hands of the pharmacist, none practically being done by medical men. He could not speak in too high terms of the hospitality and sincerity of the Irish people, and it was quite out of his power to describe the beauties of the scenery.

Mr. MARTINDALE said he could thoroughly support what had been said by Dr. Symes as to the cordial reception the Conference received in Belfast, and with regard to the more serious side of the business, he thought the scientific character of the discussions had been well maintained. The new Pharmacopœia came in for a good deal of attention, and although there were some criticisms, he thought on the whole it had a very good reception.

Mr. WARREN also expressed his appreciation of the kindness with which all the members of the Conference were received in Ireland.

Mr. JOHNSTON, as the only Scotch member who attended the Conference, also added his testimony to the success of the gathering, especially the garden party given by the Lord Mayor of Belfast.

The PRESIDENT said he had no right to say anything on this subject, having unfortunately been unable to attend the Conference, which he much regretted, especially as he had a lively recollection of the meeting at Dublin. He was glad to hear from Dr. Symes that the idea that he and the President of the Irish Society were afraid to meet each other was indignantly repudiated, for in fact Mr. Downes and himself had met already and would have been only too pleased if they could have met again on the occasion referred to.

DATES OF COUNCIL MEETINGS.

The PRESIDENT moved that the Council meetings for January and April next be held on the 11th and 12th of those months respectively, instead of the first Wednesday in each month.

The proposition was agreed to,

THE NEW BYE-LAWS.

The PRESIDENT next moved that the proposed new Bye-laws be taken as read.

This having been agreed to,

The PRESIDENT then moved that the proposed new Bye-laws, read for the first time on August 3, published in the *Pharmaceutical Journal* of August 6, and read for the second time on September 28, be now read a third time and confirmed. This motion was in accordance with their Charter and Acts of Parliament, and it was quite unnecessary for him to make any remarks on the amended Bye-laws. The few remarks which were rendered necessary on the subject were made by him on the occasion of the first reading. The Bye-laws did not involve any new principles, other than those incorporated in the present Act of Parliament.

The resolution was carried unanimously.

REPORT OF THE GENERAL PURPOSES COMMITTEE.

The report of this Committee, which dealt with legal matters only, was read and considered in committee.

On resuming, the report and recommendations were received and adopted, and special resolutions passed authorising the Registrar to take proceedings against the persons named.

DETERMINATION OF ARSENIC IN ANTIMONY AND IN OTHER METALS.—Ducru finds that the method of Clark for the separation of arsenic from copper is equally available for antimony and other metals. About five grammes of the metal is distilled with 200 C.c. of pure hydrochloric acid and 100 C.c. of a solution of pure ferric chloride, containing 15 per cent. of metallic iron. The end of the delivery tube of the condenser is immersed in water in the receiver. Each time 100 C.c. have distilled over another 100 C.c. of acid are added. When 300 C.c. have been collected the whole of the arsenic will, as a rule, have come over. This distillate is freed from the small quantity of antimony by a second distillation with three successive additions of hydrochloric acid as before; or, if from 50 to 100 C.c. of pure concentrated H_2SO_4 be first added, all the arsenic will then, as a rule, distil over in the first 150 C.c. The method is equally applicable to other metals and alloys. The arsenic in the distillate is then precipitated as sulphide with H_2S .—*Comptes Rendus*, cxxvii.

SPECIAL GENERAL MEETING.

A special general meeting of the Pharmaceutical Society of Great Britain was held on Wednesday, October 5, at 17, Bloomsbury Square, for the purpose of confirming the new Bye-laws, as recommended by the Council, and read the third time on the morning of the same day.

The PRESIDENT took the chair at 3 o'clock, the number attending, apart from members of the Council, being small.

The SECRETARY having read the notice convening the meeting, The PRESIDENT said he did not propose to speak at any length on the various alterations suggested by the new Bye laws, as he had already referred to them on the occasion of their being read the first time at the Council. He would, however, briefly recapitulate the points contained. They included a better preliminary definition of terms, a provision for transferring associates in business to the list of members without troubling them to make a special application, the abolition of the fine payable on restoration, disappearance of the grade of associate, provision for altering the procedure with regard to the Council elections, one-third retiring annually, thus bringing the mode of election into line with that generally prevalent in municipal bodies, an extension of the time for the reception of voting papers, which, he thought, would be found convenient, an extension of the time for persons nominated for election to the Council to signify their acceptance, the disappearance of the restriction on the number of chemists and druggists eligible for seats on the Council, and lastly, a provision for appointing the Examiners in November instead of December, which was proposed in order to avoid difficulties which might arise if from any reason the approval by the Privy Council of the names submitted was not received before the commencement of the January examination. These amended Bye-laws were necessary in order to carry out the Act of Parliament passed last session. The principles of that Act had been fully discussed, both here and in Parliament, and he need not further allude to them. The Bye-laws had been read a third time that morning by the Council, and he had every hope that the meeting would approve and confirm them, so that they might be sent on to the Privy Council. He would first move that the proposed Bye-laws, which had already been circulated, be taken as read.

This was seconded by the VICE-PRESIDENT, and at once agreed to.

The PRESIDENT then moved that the proposed new Bye-laws now submitted be approved and confirmed.

The VICE-PRESIDENT seconded the motion.

Mr. MACEWAN said he was curious to know how the first Council was to be created. Did the present Council cease to exist?

The PRESIDENT said No; the present Council continued in office until May next.

Mr. CARTEIGHE said there was no alteration made in the Council, only in the mode of election, or rather in the manner in which the vacancies were created.

The SOLICITOR said the Charter fixed the month of May as the date for the election of the Council; there would be no election until then, and it would take place on the lines laid down by the new Act.

Mr. MACEWAN said it followed that chemists and druggists did not get complete enfranchisement at once; it was delayed for three years.

Mr. CARTEIGHE said in the case of enlargement of the political franchise it was usual to have a dissolution and a new election on the new principle, but the Pharmacy Amendment Act did not contemplate that. It simply provided that certain men were eligible for seats on the Council as vacancies arose.

The PRESIDENT then put the resolution, which was carried unanimously, after which

Mr. CARTEIGHE moved a vote of thanks to the President, not merely as Chairman of the meeting, but for his unwearied exertions in carrying through the Act which had rendered the new Bye-laws necessary.

Mr. BOTTLE seconded the resolution, which was carried by acclamation.

The PRESIDENT, responding, said his duties that day had been exceedingly light, much more so than on a former occasion when the amended Bye-laws were submitted. He sincerely trusted that the Act recently passed would have the effect of strengthening the position of the Society, and would help to make its work more useful, both to the country at large, and to every one who practised pharmacy.

LEGAL INTELLIGENCE.

PROCEEDINGS UNDER THE IRISH PHARMACY ACTS.

PROSECUTIONS AT BELFAST.

In the Summons Court on September 29, before Mr. F. G. Hodder, R.M., and other city magistrates, the Pharmaceutical Society in Ireland, having an office at 67, Lower Mount Street, Dublin, summoned several chemists' assistants in Belfast for selling and compounding medical prescriptions, they not being duly qualified—not being registered chemists themselves—to do so according to law.

It will be remembered that these summonses were heard about three weeks ago, when Mr. Hodder dismissed them, mainly on the grounds that it was not proved by the prosecution that the persons summoned (who were not properly qualified to compound prescriptions) had compounded them.

David Manser, assistant in a chemist's shop on Peter's Hill, a branch shop of the Ulster Chemists' Co., Ltd., was summoned for selling a medical prescription on July 6 to one Stewart McWilliams, and also for compounding the same.

Mr. Wm. McGrath, B.L. (instructed by Mr. Joseph Donnelly) prosecuted for the Society, and Mr. Norman Charley, Lisburn, defended.

Mr. McGrath, in stating his case, said the prosecution was instituted under Section 30 of the Pharmacy Act of 1875. That Section provided that it should be unlawful for any person to sell poisons or medical prescriptions unless such person be a registered chemist. On the date in question Mr. McWilliams entered the premises and found the defendant in sole management of the premises. He gave him a prescription, and asked that it should be compounded. Mr. Manser told him to call again. He did call again, and the bottle purporting to contain the ingredients in the prescription was given to him by Mr. Manser. Now, to his mind that constituted a distinct offence under Section 30 of the Pharmacy Act. The reason why the Act was passed seemed to him to have been put very well by Mr. Justice Hawkins in a case practically on all fours with the present cases. It was the case of the Pharmaceutical Society in England against Wheeldon. This was practically under the 15th Section of the English Pharmacy Act of 1868, which provided that any person who should sell poisons without being duly registered as a chemist should for every such offence be fined £5. It was held in the case that an unregistered chemist's assistant, who, in the absence of his master, sold any poison, was liable to a penalty, notwithstanding that he effected such sale on behalf of his master who was registered. That seemed to him conclusive.

Stewart McWilliams was then placed in the witness box, and in reply to questions, stated that he handed the prescription produced to Mr. Manser, who was alone in the shop. He asked him would he fill the prescription, and he said he would. He called again, and Mr. Manser handed him the bottle produced. It was then proved that Mr. Manser was not a registered chemist.

Mr. Hodder wished to know, did Mr. McGrath's contention go so far as this—that every person behind the counter in the shop of a chemist company must be registered?

Mr. McGrath: Yes, if he sells.

Mr. Charley, in his defence, quoted a regulation of the Pharmaceutical Society stating that before it could license a chemist he must have a certificate that for two years he had compounded in a chemist's shop. That was doing the very thing for which they were now prosecuted. He also urged that the decision in the case of the Queen against Wheeldon did not apply in the present case.

Mr. Hodder, in giving judgment, said he could not himself distinguish the case of the Queen against Wheeldon from the case presented there. The Bench had decided to convict on the selling summons, and defendant would be fined £5, the maximum penalty. Mr. McGrath then withdrew the summons for compounding.

Mr. James Hogg, York Street, was fined £5 for keeping open shop, he not being duly licensed, and Mr. H. McIntyre, assistant to Messrs. John Clark and Co., Ltd., was fined a similar amount for selling a medical prescription.

PHARMACEUTICAL SOCIETY OF IRELAND.

ANNUAL MEETING.

On Monday evening, the 3rd instant, the annual meeting of the members of this Society was held at the Society's House, 67, Lower Mount Street, Dublin, commencing at half-past seven o'clock. There were present: The President (Mr. R. J. Downes), the Vice-President (Mr. Beggs), the Honorary Treasurer (Mr. Grindley), and Messrs. Wells, Simpson, Bernard, Porter, Thomas O'Sullivan (Waterford), Ryan, Conyngham, Professor Tichborne, and Dr. Walsh (Members of Council), and also Messrs. Gibson, Turner, McKnight, J. T. Holmes, T. W. Robinson, J. Burnett, W. Corrigan, A. J. Allan, John Smith, T. J. Jackson, H. O'Connor, A. Farrington, J. C. McWalter, David O'Sullivan, J. S. Ashe, H. Hunt, H. C. Brady, Thomas Ball, and Miss A. Wyatt (Members of the Society).—The REGISTRAR (Mr. Ferrall) read the minutes of the last annual meeting, which were confirmed.—The Registrar announced that 113 members and 21 associate druggists had returned voting papers. The Vice-President was nominated by the President, and Messrs. Gibson, O'Connor, and Porter by the meeting as Scrutineers of the Ballot.—Mr. GIBSON: Is there to be no business transacted until we come back?—The VICE-PRESIDENT: That has been the rule, and I think we had better follow it.—Mr. KELLY: We were kept here until one o'clock at the last annual meeting.—Mr. GIBSON: I do not think we have any authority to take the voting papers out of the room.—The VICE-PRESIDENT: I have been at many public meetings and voting papers have invariably been taken into an ante-room. If the meeting does not think the Scrutineers honest enough to return a true statement we should give it up.—Mr. GIBSON: As long as the matter is in your hands it is all right, but I shall be satisfied if no business be transacted until we come back.—Mr. MCKNIGHT suggested that the business of the meeting should go on.

An Anonymous Circular.

Mr. GRINDLEY rose to bring under the notice of the meeting a matter which intimately concerned him and others who were up for election.—Mr. SMITH: Might I ask is Mr. Grindley in order?—The PRESIDENT: I think he is. He wants to repudiate a circular which should be repudiated before the Scrutineers retire.—Mr. GRINDLEY: An anonymous circular has been sent out to the voters of the Society purporting to be from the "Pharmaceutical Society of Ireland, Dublin, Lower Mount Street, September, 1898, Council Election," and at the end it recommends the members to vote for myself and other gentlemen. I wish, in the strongest language that I can command, to repudiate all knowledge of, sympathy with, or hand, act, or part in this circular. My notion is that our elections should be fought fairly and squarely, and that there should be no striking below the belt; and I think I can appeal to the testimony of anyone who knows me that I never at any time lent my name to anything underhand. I therefore repudiate in the strongest manner any knowledge of or sympathy with this circular, directly or indirectly. That is all I have to say.—Mr. ROBINSON: I think the opportunity that has been afforded to Mr. Grindley has been very well taken advantage of by him. No one that knows him would accuse him of any act or part in it. I do not care a straw what people think. I say it was with a thrill of satisfaction that I voted for Mr. George Henry Grindley at this election. But I regret that the officers of the Society did not think it was their duty to repudiate this scurrilous and slanderous thing. Last year, a day or two before the election, I got an anonymous communication saying, "serve you right for allowing scandalous libels to be published." It is not on the night of the election that the repudiation should come.—The VICE-PRESIDENT: Mr. Robinson, I may mention that if I had got the circular I would have decidedly repudiated it through the press, but unfortunately I did not get it until I came here to-night.—Mr. KELLY: As one of those named in the circular I wish to say that I knew nothing whatever about it. I spoke to Mr. Grindley about it and asked him would it be well to telegraph to the organ of the Society repudiating it; but Mr. Grindley said that telegrams were often misunderstood, and it would be better to wait for this opportunity of doing what he has done to-night. I think I can say with Mr. Grindley that those who know me will give me credit not only for telling the truth but for this also—that nothing would tempt me to put my name to anything dishonourable or unprincipled. I repudiate this circular on principle, as I would not use anything in

the shape of slander or take from the honour of my opponents.—Mr. WELLS: Mr. Grindley and Mr. Kelly have spoken for themselves, and I claim the right of speaking for myself and also for Mr. Montgomery, Mr. Tate, Mr. Michie, and Mr. Brittain. I say that none of us knew anything whatever about the circular in question—where it came from or who wrote it. The same thing applies to the circular of last year. I have not the remotest idea of where the one or the other came from. But it is only right to tell you that gentlemen who find fault with one man for committing a slander or a libel ought to be very careful themselves not to libel others. Limited companies may be—
—Mr. GIBSON: Excuse me, Mr. Chairman.—The PRESIDENT: Mr. Wells is in order.—Mr. GIBSON: Let me state my point of order and then you will see whether he is in order or not.—The PRESIDENT: State it—I am waiting for you.—Mr. GIBSON: My point is that he is going outside the liberty you gave to repudiate the circular. Mr. WELLS: I want to defend myself from an imputation which has gone abroad, cast in the circular signed by Mr. McKnight.—The PRESIDENT: That is another thing, and I think it would be well to let it stand by itself.—Mr. WELLS: I will, at all events, say that I know nothing about this circular, and I have already taken pains to let Mr. McKnight and his friends know that.—Mr. ROBINSON: In the interests of the Society the circular referred to has not been named by Mr. Grindley; but the circular now repudiated is that coming from the "Pharmacy Protection Association."—Mr. ALLAN: I would like to know what it is about.—Mr. BERNARD: It is a thorough insult to the Society. Its language is simply scandalous. It is an audacious attempt to belittle us made by some poltroon, and is a continuation of the system that was started last year. It speaks of a "nefarious system of trading"—of men who "basely betrayed" interests—and asks "were they honourable men," speaks of "common decency," and asks if the "slightest confidence could be placed in them." I think it is for our Society to find out who the persons are that call themselves the

"Irish Pharmacy Protection Association"

as a cover for their libels. There is no such society in existence. I addressed a letter to them, and it was delivered here, which brings it home to us. It is all very fine for gentlemen to dissociate themselves from it, but I go farther, and ask that this matter be placed in the hands of our solicitor with a view to the prosecution of the parties who have so acted. There is no doubt that by offering a reward and searching the printing offices in Dublin—for I believe it was printed in Dublin—they could be found out. I therefore propose that the matter be placed in the hands of our solicitor.—The PRESIDENT: I think that should come through the Council.—Mr. BERNARD: Very well. I will make the motion at the Council.—Mr. ROBINSON: Surely you are not throwing obstacles in the way of gentlemen who are repudiating it.—The PRESIDENT: I am throwing no obstacles. Legal proceedings cannot be taken by this meeting.—Mr. MCKNIGHT: As one of the persons named in this circular, I was thoroughly astonished that the names attached to it should be associated with such a scurrilous document. That Mr. Montgomery should be associated with it or Mr. Kelly—whom I thoroughly appreciate—or Mr. Wells, or Mr. Tate I could hardly believe when I read it. Not one of those gentlemen repudiated it until a letter was sent to two or three of them from a solicitor's office. I believe Mr. Wells has not repudiated it through that channel yet.—Mr. WELLS: On a point of order, Mr. President, you objected to my going into this matter, and it is not fair to allow the other side to go into it. I may say that I have replied to it. I got it on Saturday morning, and my solicitor got it on Saturday night.—Mr. MCKNIGHT: The repudiation only comes when the election is practically over. These gentlemen kept silent until every man had marked his paper. Is that fair or honourable? I say it is not fair to the honest candidate who tries to do the best he can for the Society. The point is: Who is this Society? Who or what are they or their office-bearers? You, as President of this Society, ought to be compelled to find out who they are and whether they are using the rooms of your Society. Is it using your rooms, and are you paying rent for them? The Society in question must exist, or else this circular is a lie. I think you should direct the solicitor of this Society to find out who they are; and if you do not, I shall find out for myself.—Dr. WALSH: As President of the Dublin Chemists' Federation, which has been recently formed, I wish to say that that Society

has nothing whatever to do with it.—Mr. O'SULLIVAN: I also may be allowed to say a few words. I am strongly identified with the Assistants' Association, and have on their behalf to repudiate any knowledge of the circular in dispute.—The PRESIDENT: Mr. Robinson has complained of the officers not having repudiated the matter. As far as I am concerned I never received a copy of the circular, and was practically in ignorance of it; and I do not see how your President and your Registrar could be called on to repudiate documents of which they had practically no knowledge. The President then mentioned that he had received a card from Mr. Wootton, the editor of the official organ of the Society, who was anxious to be present at the meeting.—Mr. GIBSON said the general press ought to be admitted to the annual meetings. The Pharmaceutical Society of Ireland was a public body, having public duties to discharge, and it was scandalous that its annual meeting should be held in a hole-and-corner manner. They knew from report how the Council meetings were reported—how pieces that did not suit were cut out.—The PRESIDENT.—That is not the fact. I repudiate it.—Mr. GIBSON: It has been proved.—Mr. WELLS: It has not been proved.—Mr. GIBSON: Our next annual meeting should be open to the public press.—Mr. WELLS: We admit Mr. Wootton on different grounds. The other question is one that will have to be dealt with in a different way—by a notice of motion.—A motion for the admission of Mr. Wootton was then put and unanimously assented to.—Mr. GIBSON: I think the repudiation has come from these gentlemen too late.—The VICE-PRESIDENT: I rise to order. We have had this debate quite long enough. We have had the matter spoken to by several speakers, and I object to the subject being opened up again.—The PRESIDENT: I think quite enough has been said on the matter, and I ask the Scrutineers to retire now.—The Scrutineers having withdrawn to an adjoining room, the PRESIDENT then requested the Registrar (Mr. Ferrall) to read his address, it having been understood that that might take place in the absence of the Scrutineers.—Mr. FERRALL proceeded to do so, and had got some way through it, when Mr. MCKNIGHT said the address contained a reference to the company with which one of the Scrutineers was connected, and it was hardly fair that he should not be present.—Mr. ROBINSON said that in order to prevent gentlemen from being disfranchised the scrutiny should be completed either after the termination of the business of the meeting or before it began.—The PRESIDENT: I am perfectly willing that the reading of the address shall remain over until the Scrutineers come in.—Mr. MCKNIGHT: Will you allow me to send a note to Mr. Gibson?—The PRESIDENT: I will not allow the Scrutineers to be interfered with. The matter is one at which Mr. Gibson should be present. I recognise the point.

Result of the Election.

At half-past nine o'clock the Scrutineers handed their report to the President. The PRESIDENT: The number of votes recorded for each candidate are as follows:—For Mr. Grindley, 121; Mr. Wells, 119; Mr. Kelly, 116; Mr. Montgomery, 116; Mr. Tate, 106; Mr. Brittain, 99; Mr. Michie, 99; Mr. Hayes, 30; Mr. Conyngham, 23; Dr. McWalter, 16; and Mr. McKnight 16. I declare the first seven gentlemen to be duly elected.—The reading of the presidential address was then proceeded with.

The President's Address.

Mr. DOWNES commenced by expressing his gratitude for personal health and the general advancement of the interests of the Society, and then detailed the history of the Society's recent action with regard to the question of company pharmacy. That action was based on the belief that limited companies have no legal right to carry on the business of a pharmacist or chemist and druggist, as in no sense could it be construed that seven unqualified persons combined for doing so were combined for a "lawful purpose," which is the primary condition required by the Companies Act. The Pharmaceutical Society of Great Britain was at one with the Irish Society in its action, but unfortunately it is not on the same legal level, and in England it is looked upon as only a question of "selling poisons," and even legal minds do not apprehend how much more comprehensive and important is the Irish Act. It was this confusion, he believed, which led the Lord Chancellor to propose the amendment to the Pharmacy Acts Amendment Bill, 1898. He clearly did not apprehend that the British Pharmacy Act did not extend to Ireland. The two Societies were practically one on the matter of poisons, and it was for that reason he (Mr. Downes) had confined all argument to that level, though they had much stronger ground when they applied the same

arguments to the practice of pharmacy. If they won on the low ground they carried the higher position, though the converse might not be the case, and he hoped the ventilation of the question would ensure to the Pharmaceutical Society of Great Britain the pharmacy privileges the Irish Society possesses. He then touched upon the Duke of Devonshire's Bill to "Regulate the Sale of Poisonous Substances," and the attitude of the two societies towards that Bill. Whatever legislation is attempted in the future he believed would be more rational and, at all events, based on "competent knowledge of the subject with which it deals." The action of the Society in respect to the bye-election for the Stephens Green Parliamentary Division was referred to, and it was urged upon the licentiates and registered druggists in various districts to secure the privileges of the franchise and to combine for the purpose of pressing their local representatives to take an interest in and to understand their claims. The bi-monthly meetings during the winter months were next reviewed, and a regret expressed that the evening meetings at which scientific lectures were given had not a larger attendance. Personally, Mr. Downes was not willing to be a party to again inviting gentlemen who are busy men to a sacrifice of their time in preparation and delivery of lectures, unless he had a promise of a better attendance. He felt that doing so must injure the reputation of the Society. In response to the frequent reports of Sir George Duffy as "Visitor" on behalf of the Privy Council, calling attention to weak points and low pass results in various subjects of the Preliminary examinations, the Council has, on the recommendation of the School Committee, resolved to raise the standard of that examination, subject to the approval of the Privy Council. Slight changes have also been made in the Licence Examination. The issue of the new Pharmacopœia in the course of the year was then referred to and a protest raised that a work with the suitability and practicability of which as most intimately concerned they were most competent to express an opinion, should not be irrevocably issued until the retail pharmacist has had an opportunity of at least expressing an opinion upon it, and of criticising those parts which he sees to be objectionable. They had it authoritatively asserted that not only was the pharmacist's opinion ignored, but that the book was not even compiled for him but, "it was a book of reference—first to the medical man, and indirectly for the analyst. Processes and their *modus operandi* were ignored, but standards of purity and strength were minutely detailed. It was a book for the expert," and as such, must be judged on its merits. It was not given to them as a book for the counter, or for the busy pharmacist, which all previous pharmacopœias were. It was one which will compel pharmacists to rely not on their own ability and material but on the wholesale manufacturer and his guarantee, one of the consequences of which will be that they will become less familiar with the crude drug, which there will be no necessity of handling. It might seriously affect the examinations and school classes, as their chief care must be to see to the ability of candidates to check the ready-made goods they buy. After mentioning that last year was inaugurated what is hoped will be the annual dinner of the Society, Mr. Downes referred to his visit this year to the Annual Dinner of the Pharmaceutical Society of Great Britain at the Hotel Cecil, and said that he was welcomed and received with all the cordiality and honour which the Society, of which he had the honour to be President, could expect, and he had every reason to believe that a more reciprocal feeling of goodwill had been fostered between the Societies. What he saw and heard during that visit convinced him that in Ireland they enjoyed a position, with regard to the medical profession, which is not the case with pharmacists anywhere in Great Britain, in that the Irish practitioner prescribes, and leaves the dispensing to the pharmacist. In fact, he thought he should be safe in saying that the idea of a dispensing physician would be tabooed. That, he thought, is a relation which they should be careful that no act of theirs should endanger. In England the reverse has been the long-established practice, and is difficult to uproot, particularly where each party asserts that their position is one of self-defence. When they were informed that in the important cathedral city of Salisbury every practising doctor dispenses his own medicine except one "firm," which sends all its prescriptions to one firm of chemists, it was only natural to expect the chemists to retaliate by keeping their customers out of the doctor's hands as long as possible. On the other hand, he (Mr. Downes) was recently speaking to a Minor, who was in treaty with a doctor who was about to employ an assistant to dispense for him, because the local chemist refused to fill his prescription after 11 o'clock, and he decided that if he must do

night dispensing and employ someone for the purpose he would do all his dispensing. They in Dublin might think such a state of things impossible to come to pass in Ireland, but they were not sure that the practice had already begun in country towns, and if anything like poaching begins they could not tell the limits of the consequences. As they wished their legal privileges preserved, they should carefully regard the privileges of other bodies, and as regards those privileges [he would impress on all that no amount of talk within their own ranks, trade-press writing, or clapping on the back would be of any use, unless they supported their leaders and second their efforts by bringing their case prominently before the public, their legislators and the Government, taking care to satisfy them that their claims are not antagonistic to the public interests, and that the public are not opposed to their claims. As public opinion is made up of educated or uneducated units, it becomes an influence on one side or the other as the units are educated, and education alone breaks down prejudices. Speaking of the Society's schools, Mr. Downes said it is the desire of the Council that the classes should not either encourage or facilitate a system of "cram," but that what is taught should be thorough, so that the student may be able to use the knowledge in any difficulty which is presented to him in after practice, and not be simply the possessor of a skimming sufficient to fool the examiner, but of no further use to himself. The requirements of the new Pharmacopœia will have their effect on the examinations, which in time will require extended knowledge, particularly as to standardisation and recognition of impurities, and will call for special attention in the schools. Whether this may be met by another special class or by distributing the subjects in the present classes he could not say, but he was afraid it will in any case increase the cost of education. However, betterment in education is of more importance than the saving of a few pounds. The former will be a continual gain, the latter involve continual anxiety and loss. The quarterly examinations had been held in compliance with the regulations. For the Preliminary, 95 candidates presented themselves for examination, of whom 51 passed, while 20 were entered on other certificates, making a total of 71, an increase of 6 registered over the preceding year. For the Licence, 60 candidates presented (the same number as last year) of whom 27 passed, being one more than the preceding year. Of those that presented themselves, 33 were re-examined, 21 more than twice. For the Registered Druggists Examination, 27 presented themselves for examination, 21 at Belfast, of whom 14 passed, and 6 at Dublin, of whom 4 passed. The total number of passes was 8 less than the preceding year. For the Assistants Certificates 7 presented and 5 passed, being one more than in 1897. Mr. Downes expressed his surprise that more advantage is not taken of this certificate, as it gives those who have passed the Preliminary and have had the four years' service an opportunity of possessing a qualification "to transact the business of a licentiate in his temporary absence," a qualification which must carry its money value and be of considerable advantage while an assistant might be taking out his lectures. The number of failures, he thought, indicates that candidates underestimate the requirements of the examinations, and are not sufficiently prepared, while the number who fail in practical pharmacy is much in excess of what might be expected from those who have been engaged as apprentices or assistants for a period of four years. The present fashion of working on "manufacturer's stock of ready-made articles," such as pills, suppositories, plasters, liquors, and concentrations, must be largely at the root of the failures. The gold medal of the Society still waits for a claimant. The winner of the silver medal this year nearly attained to the gold one, but from nervousness or excitement, or some freak of the will, he fell short by one mark. Mr. Archibald Clark Ross passed with 90 per cent. in botany and materia medica, 77 per cent. in chemistry, and 72 per cent. in pharmacy, a total of 239, or 79.66 per cent. Mr. Downes then referred to the loss of the services of Mr. A. E. Doran, L.P.S.I., as examiner in chemistry, and the election of Mr. Alec Forbes Watson, B.Sc., whose appointment has been approved by the Privy Council. The vital statistics of the Society are represented by the following figures:—

	On Register, September 30, 1897.	September 30, 1898.
Licentiates	549	577
Chemists and Druggists	299	294
Registered Druggists ..	424	440
Assistants	17	22

Members	148	161
Associate Druggists....	52	50
	200		211

The Society had lost by death 5 chemists and druggists, and 2 registered druggists. Reference was also made to the sad death of Mr. E. P. Murray, a licentiate and member of the Council. In conclusion, Mr. Downes acknowledged the support he had received from each member of the Council during the past year, especially from members of the various committees, and from the Vice-President, also the efficient and willing services of the Registrar, Mr. A. T. Ferrall, who, owing to the evening meetings and heavy parliamentary correspondence, was severely taxed throughout the time when preparing the calendar. Mr. Downes also took the opportunity, on behalf of the Council and members, of expressing their sympathy with Mr. and Mrs. Ferrall in the sorrow which has fallen on them through the death of his father.

The Ulster Chemists, Limited.

Mr. McKnight said the President's address was very able and brilliant but there was one statement in it which he would like to rectify. He did not believe that the President was capable of uttering anything that he did not believe to be true; but he was not accurate when he said that the "Ulster Chemists, Limited, was an amalgamation of discontented druggists combined with a few chemists and druggists, and one or two pharmaceutical chemists thrown in to give colour to it." What was the state of affairs? The Ulster Chemists, Limited, contained seven pharmaceutical chemists, licentiates of the Irish Society, and four chemists and druggists in connection with its branches, the pharmaceutical chemists being Messrs. McKnight, Bell, McKinney (Cookstown), Anderson (Lisburn), Fyvie (Coleraine), Dr. Galbraith, apothecary (Derry), and Acheson (Ballymena); and the chemists and druggists Messrs. Gibson (Belfast), McCrea (Newry), Lawson (Limavady), and Marshall (Dungannon). In only one of these houses was compounding tolerated, all the others being conducted as they were before the amalgamation, the instructions to the managers being not to compound. These were the facts of the case, and he was sure that the President did not desire to mislead the licentiates.—The PRESIDENT: I certainly accept the correction, but my regret is the greater that there are so many pharmaceutical chemists in the company.

Vote of Thanks.

Mr. ROBINSON said that, as a member of the Pharmaceutical Society, he was not particularly grateful to the members, and they did not care very much about him; but he thought there should be no acrimonious discussion on the President's address. He thought the President had admirably avoided contentious matter, and that it would have been beyond the brains of all the men he knew connected with the Society pounded into one to have said less than he had done in the nature of unpleasant reference to limited company trading. The Society and the Council had been exceedingly fortunate in their President of the past year. When the President took up the post he was an untried man. He had not been a prominent member of the Council, or anything but a quiet hard-working member. He was not even—and he said it with all respect—a prominent pharmacist. In that way, compared with previous presidents like Charles Evans, W. F. Wells, who had built up a noble pharmacy, and William Allen, who had succeeded to an extensive and important pharmacy, Mr. Downes came forward as a quiet hard-working member to take up a post of danger at a very critical time; and of all the presidents that he (Mr. Robinson) had known during his short connection with the Society, he had been second to none. The President for the past year had maintained the high traditions of his office, and had certainly put the Pharmaceutical Society more prominently before the country—whether for good or evil—than any president before him had done; and those who thought with him and approved of his policy—and they were evidently a very large proportion of the members—were indebted to him for the way in which he had done his work. He (Mr. Robinson) should be personally very glad to-night, as one of a little band of outsiders, also who were believed to be acting illegally, but who believed themselves to be not acting illegally, that the President's address should pass over to-night without any further discussion. The gentleman who had already spoken had pointed out that the President

laboured under a grievous error in one statement that he made, and they hoped to be able to show that he laboured under other errors also. But that could not detract from the great advantage he had been to the Pharmaceutical Society, or from the glory that he had shed upon his office during the past year. Therefore he (Mr. Robinson) had great pleasure in proposing that the very best thanks of the Society were due to the President for his very able address and for his conduct in the chair and the Council chair during the past year.—Mr. KELLY said it gave him the greatest possible pleasure to second the vote of thanks to their worthy President. During his year of office he had scarcely been absent from one meeting of the Council; he had attended every Committee meeting; and the forbearance—he might say the tenderness—with which he sometimes acted in cases showed that he was a man of deep thought, and evidently anxious to do what was right. As regarded the interest that he took in the youth of the Society, he was the best man that ever sat in the chair. He seemed to take the deepest interest in every feature connected with the education of the rising pharmacist; and if there was a man in Dublin who desired that the pharmacist should be a fit companion for the medical man he would say it was Robert J. Downes. He got up meetings for the benefit of the Society in the most finished manner, bringing the Presidents of the Colleges of Physicians and Surgeons and other men there to address them, and thus raising the status of the Society. The two gentlemen who won the silver medals were both educated in the Society's schools, in which he took such a deep interest; and another licentiate of the Society who was also educated in their schools had won an exhibition in the College of Science which entitled him to £50 a year for two years and free education in the College. With regard to the able paper of the President, most of them realised that his desire was that the interests of both the pharmaceutical chemist and the associate druggist should be looked after—that the man who owned the land should reap what he had sown, and that no one should be permitted to trespass on that ground without a positive legal right. That was the desire of Mr. Downes. He (Mr. Kelly) had the pleasure of hearing the paper read by the President in the section of the Health Congress and of witnessing the prominence which the President of the section, Professor Moore, assigned to him, speaking of him as the *beau-ideal* of a president of the Society.—The motion was put by the Vice-President and unanimously carried.—The PRESIDENT said he really felt more than he could express the very flattering way in which his address had been received and his services spoken of. When he undertook the office he feared very much that he should fail before the year was out. He had, however, done his best, and all that he did he did heartily and with a thorough idea and wish that the Society itself should prosper as opposed to what he might call individual interests. He never allowed individual interests—either his own or those of others—to conflict with what he considered to be for the good of the Society itself. With regard to his position on the pharmacy question, it had been clear throughout. He took his stand on the Act of Parliament, which required that the proprietor or proprietors of a pharmacy or of a drug business should be qualified men. On that he had fought the "company" question. It was a matter of personal regret to him that they should in future miss Mr. Hayes and Mr. Conyngham from their Council Board, but that was inevitable under the circumstances. He recognised that they and Mr. Robinson were fighting for the same contention that he and those who concurred with him were, namely, qualified partnerships; but they had been unfortunately too previous. Until the general pharmacy question was settled and as long as there could be a mixed company of pharmaceutical chemists under the Acts, they could not distinguish between one limited company and another. If the mixed company question were settled he did not say that they might not have room for a limited company of pharmacists, such as those gentlemen had endeavoured to start. But they were before their time; for as long as mixed company pharmacy was recognised under the Acts, one company could not be distinguished from another. That was his standing on the "company" question, and he thought it would be the standing of the Council. With regard to his address, he desired to acknowledge the way in which it had been received.

Statement of Accounts.

Mr. GRINDLEY, as Hon. Treasurer, then submitted a statement of accounts for the year, which gave details of receipt and expenditure,

as to subscriptions, pupils' fees, school outlay, professors' fees, etc., and showed a balance to credit in the capital account of £1217.—On the motion of the VICE-PRESIDENT, seconded by Mr. T. O'Sullivan, the accounts were unanimously adopted.

Registered Druggists and the Council.

—Mr. GIBSON, associate druggist, submitted the following motion pursuant to notice:—

That immediate steps be taken to amend Regulations 5, 9, and 10 relating to election of Council.

—The PRESIDENT: I rule that out of order, and ask Mr. Gibson to pass on to his second notice of motion.—Mr. GIBSON then moved:—

That this meeting requests the Council that, in co-opting new members, attention be given to the claims of the registered druggists to seven seats.

He said that this was not the first time he had advocated the claims of the druggists of Ireland at that board, and he was sorry to say that those claims had received scanty justice from the Society. There were at present on the Register 734 members of the druggists' body, whilst there were only 577 pharmaceutical chemists. Those numbers entitled the druggists to representation on the Council, and yet they had no representation at all. Nominally they were given two men; but had these gentlemen attended during the past year? Besides, they did not represent the cause of the north of Ireland druggists. They were not in sympathy with them; and until they were given representation on the board so that their voice could be heard, they would not be in sympathy with the Society. There would be an opportunity now of giving them representation by co-opting gentlemen who would not be voting machines. The druggists wanted independent men on the Council who would say what they thought and not be afraid of anybody. In this connection he must say that the members had by their vote that night cast discredit on themselves when they cast out Mr. Hayes, a gentleman who was an honoured President of the Society, and who, when it was incorporated, was thought fit to be an original member. It was passing strange that the members should have cast him aside after his long and laborious work in their behalf. The Society did not command the support of the north of Ireland simply because the druggists there had no representation on it. It was getting to be simply a Dublin Society. Its outside influence was departing altogether. Last year the travelling expenses of the country members amounted to £22. This year the amount was only £8 14s. Two-thirds of the members of the Council were Dublin gentlemen. If they wanted to command the respect of the country at large they should give representation to the whole country. Therefore, he appealed to them to give the druggists of the north of Ireland the representation on the Council that they were entitled to.—Mr. MCKNIGHT seconded the proposition, and after a somewhat animated discussion, in which Messrs. Conyngham, Bernard, Wells, Downes, and Gibson took part, the motion was put to the meeting, and negatived.—Dr. McWALTER having withdrawn the notice of motion standing in his name, the business of the annual meeting was concluded.

THE ANNUAL DINNER.

On Tuesday evening the annual dinner of the Pharmaceutical Society of Ireland was held at the Shelborne Hotel, Stephens Green, Dublin, at seven o'clock.—The PRESIDENT (Mr. R. J. Downes) occupied the chair, the Vice-President (Mr. Beggs) the vice-chair; and there were also present the President of the College of Physicians (Ireland), Sir George Duffey; the President of the College of Surgeons, Mr. Swan; Mr. James Campbell, Q.C., M.P.; Mr. William Field, M.P.; Professor J. W. Moore, M.D.; Sir Charles Cameron; Mr. R. K. Clay; Professor Tichborne; Messrs. Wells, Phillips, Butler, Murchison, McKnight, Gibson, D. Merrin, Grindley, Kelly, Simpson, Professor Stoker, H. G. Grindley, Bernard, A. T. Ferrall (Registrar), J. T. Smallman, Dr. O'Donovan, T. W. Robinson, N. E. Conyngham, W. B. Conyngham, J. S. Ashe, J. E. Connor, W. Gilligan, etc.—The usual loyal toasts having been duly honoured, the CHAIRMAN gave the toast of

The Houses of Parliament.

He said they had a grievance against both houses of Parliament because they addressed them in the last session, and they had not deigned to reply.—Mr. J. H. CAMPBELL, M.P., in responding, said the Pharmaceutical Society showed what a small body of earnest men could do when they combined for the protection of their own interests, more especially when those interests were for the benefit of the public at large. The occupation of

mixing drugs had been raised from the ordinary ruck of life to the dignity of a skilled profession. So long as he had the honour of being a representative of the city he would oppose as best he could any legislation calculated to interfere with or lessen that dignity and the position to which the Society had attained. He considered that any attempt to go back by legislation on what had already been done would be not only disastrous to the Society, but to the best interests of the community at large. It was therefore with pleasure that he gave them a pledge to oppose any attempt to deprive them of the privileges they already enjoyed.—The CHAIRMAN next gave the toast of

The Royal College of Physicians and Surgeons.

Sir GEORGE DUFFEY, President of the College of Physicians, in responding, said the medical profession recognised the assistance which was given to it by a body of well-educated and well-trained responsible men, such as the licentiates of the Society. The public appreciated the advantage and security it derived from being served by such men. He believed that the sister Society of Great Britain entertained a very friendly and cordial feeling towards that Society, although it did not yet—as he thought it ought—recognise its Licence examination. Much of the success that pharmacy as a calling had had in that country was the result of the examinations held by the Society. There had been a steady improvement in the examinations; and although there was still much to be regretted from an educational point of view in the superficial character of the instruction acquired—as shown by many of the candidates who presented themselves at the Preliminary examination—the general pass-result would, he thought, be found to have advanced satisfactorily and proportionately with the increased stringency of the examination. It had always appeared to him that improvements in the examinations, with which as their visitor he had to deal, should consist not in adding subjects to the curricula, or in making the pass standards in the different subjects too high, but in the examinations being made more thorough, practical, and searching. Last year, on the initiative of the Society, and after a conference between members of its Council and a committee of the College of Physicians, they were successful in getting carbolic acid and some other poisons scheduled. In all similar movements, whether for the safety of the public, or for the advancement of pharmacy and pharmaceutical science, the College of Physicians would, he was sure, always willingly co-operate with and assist the Society.—The President of the College of Surgeons, Mr. SWAN, also responded.

Other Toasts.

The toast of "The Pharmaceutical Society of Great Britain" was next given, and responded to by Mr. ROBERT SIMPSON.—Sir GEORGE DUFFEY proposed "The Health of the President," whom he styled the "Grand Old Man" of pharmacy in Ireland.—The PRESIDENT, in responding, said that the Society from its beginning had striven to secure for the public competent men to do the work given to them by Parliament to do, and so long as the Society should be permitted to exist that striving would not cease.—Sir CHARLES CAMERON, responding to the toast of "Science," adverted to the fact that some of the most distinguished contributors in the domain of pure science had been pharmaceutical chemists.—Professor MOORE also responded to the toast.—Mr. WILLIAM FIELD, M.P., replying to the toast of "The Guests," said that the licentiates of the Society had to discharge a dangerous function in carrying out the orders of medical men, because a mistake might lead to fatal results. He entirely agreed with the contention of the Society that none but qualified persons should be allowed to handle drugs that might be pernicious or fatal in their effects. He had endeavoured in the House of Commons to do some service to the Society, and he hoped to be of use to it in the future, because he felt that something yet required to be done. He would advise them to try to get a pharmaceutical chemist into the House of Commons as a member, and if they could swap an odd lawyer for a doctor it might be of advantage. He tried hard to swap his friend Mr. Campbell before he got in; but since he came to know him he found him to be a really good fellow. He strongly recommended the Society to try to get all its licentiates into an organised body.—Messrs. CLAY, Dr. O'DONOVAN, and BUTLER also responded.—The toast of "The Press" was responded to by Mr. A. C. WOOTTON.—Sir CHARLES CAMERON proposed in complimentary terms the health of the Registrar, Mr. FERRALL, and that gentleman having responded, the proceedings terminated.

LETTERS TO THE EDITOR.

OF CLINICAL THERMOMETERS.

Sir,—My recent note on the above subject has brought me a response from Messrs. Maw, Son and Thompson, stating that they keep in stock clinicals graduated down to 90° F. I feel that it is due to them, and perhaps to other makers, to acknowledge that the common neglect of low temperature observations lies with the users of the instruments; that was really my own conclusion, and the absence of low graduations was evidence that low temperatures were not commonly looked for. Since receiving one of Maw's clinicals graduated down to 90° 0, I have made a number of observations, but no new point of interest, beyond confirming my previous note of low temperatures before breakfast, of which I now have records so low as 92° 0 and 93° 0. My medical adviser in Newcastle told me one of his patients, a young lady, got so low as 91° 0, a point which he considered so serious that he sent for her father, but she recovered.

Bradford-on-Avon, September 30, 1898. BARNARD S. PROCTOR.

THE PREPARATION OF LIQUID EXTRACTS.

Sir,—For "not less than 2 or more than 2.25 per cent." in my letter (*ante*, p. 387) read "0.75 per cent."; my mind was dwelling on liquid extract of ipecacuanha at the time I wrote.

London, October 1, 1898.

W. MARTINDALE.

Sir,—Having elicited from Mr. Martindale (p. 387) an admission that distilled water exhausts cascara better than a 20 per cent. alcohol menstruum, it seems ungracious to press him further; but why does he say that liquid extract of cascara as a laxative is "more active, if anything, if made" with the above alcohol menstruum? The statement is put forward very doubtfully, and means, if anything, that the preparation is more laxative the less completely the drug is exhausted. If Mr. Martindale has evidence that concentration of the liquor by evaporation prejudices the properties of the liquid extract, ought he not produce it and not leave us with his opinion only? All the evidence tends to the conclusion that cascara is little affected by the heat necessary for concentration. Whether the concentration can be obviated is another question. The remainder of Mr. Martindale's letter not being pertinent to anything in my remarks on p. 316, I do not refer to it, except to say (1) that "belladonna" is obviously a slip for "ipecacuanha," and (2) that it is not worthy of Mr. Martindale's position that he should fling a cheap sneer at manufacturers (who are as much pharmacists as he is himself) after he has been worsted in discussion.

London, October 3, 1898.

JOHN MOSS.

A NOVEL ADULTERANT OF POWDERED RHUBARB.

Sir,—During the past few months I have examined several samples of powdered rhubarb microscopically, and in two instances a large proportion of maize starch was present. As I believe this is a novel adulterant it is well that a note should be made of it, that pharmacists may generally examine their stocks. For some time past maize flour has been largely sold in this country, and enters into the composition of many self-raising flours; objection by analysts has been made to it in these dietetic articles, and they and every pharmacist will certainly object to its presence in any of their powdered drugs.

Birmingham, October 4, 1898.

F. H. ALCOCK.

AN EXPLANATION.

Sir,—In your report at page 368c respecting my camphorated oil case, it is stated that defendant said cottonseed oil looked best. In so short a paragraph it was not possible to get in the whole defence, but just sufficient to be misleading. What I did say was that cottonseed oil made a better emulsion with solution of ammonia than the official preparation, also that I made this for some horsekeepers specially to meet their requirements, and that my assistant thought the boy came from some adjoining stables and sold what he thought the purchaser required. Many chemists know how frequently these gentlemen have their pet formula and "how carefully they guard their secret"; moreover, judge their white oils by its appearance only. There was no fraudulent intention on the part of the seller, it was an omission of a descriptive label. This is most important at the present time, since the inspector takes the B.P. 1898 into Court.

Stoke Newington, September 28, 1898.

J. EMSLEY.

TINCT. QUININÆ AMMON.

Sir,—It is not, I think, generally known that if this favourite preparation is taken in a little soda water, the carbon dioxide redissolves the precipitated quinine and makes a far more palatable and more presentable dose than if taken in water.

London, September 30, 1898.

J. H. (145/12).

ANSWERS TO QUERIES.

EMERALD GREEN POWDER.—The legal restrictions would not appear to apply in such a case. [*Reply to FEMINA.*—16/33.]

BOTANICAL.—It is the common lucerne, *Medicago sativa*, a scarcely naturalised plant. [*Reply to A. W. H.*—17/5.]

COURSE OF STUDY.—Full information on the subject was given in the "Students' Number" of the Journal, published so recently as September 10 last. [*Reply to APPRENTICUS.*—16/32.]

ORGANIC CHEMISTRY.—Both the books you mention are of exceptional merit, but the one recommended possesses certain advantages from a student's point of view. Either will serve your purpose well. [*Reply to NERO.*—17/4.]

PARRISH'S SYRUP.—You will find a formula in Martindale and Westcott's 'Extra Pharmacopœia,' or in Squire's 'Companion,' either or both of which works you can doubtless refer to readily. [*Reply to S. H. H.*—17/3.]

KNOWLEDGE OF FRENCH.—You should possess a fair knowledge of French accidence and elementary syntax, read one or two novels by Dumas or Daudet, and practise a little French composition, translating short paragraphs out of newspapers into French and having the translations checked by a competent person. No special books are necessary. [*Reply to EPISCOPUS.*—17/7.]

MUCILAGE CELLS.—There is no certain micro-chemical reaction for gums, but cell-walls containing gum assume a red colour when treated with Hanstein's aniline violet (equal parts of fuchsin and methyl violet dissolved in alcohol). Many gelatinous cell-walls and gums are also deeply stained by corallin freshly dissolved in a saturated aqueous solution of sodium carbonate. [*Reply to FEMINA.*—16/34.]

HYDROGEN PEROXIDE.—It may be produced (1) by decomposing various peroxides by dilute acids; (2) by shaking zinc or iron powder with water in the presence of air; (3) by the action of hydrogenised palladium on water in presence of oxygen; (4) during the electrolysis of fairly concentrated sulphuric acid; (5) by shaking ozone with ether, and then adding water; (6) by the oxidation of very dilute ammonia solution by ozonised oxygen; (7) by placing a solution of pyrogallol under a bell jar; (8) by burning hydrogen in air; (9) by shaking various essential oils containing terpenes with water, in presence of air; (10) during many processes of oxidation in presence of water. See Watts' 'Dictionary of Chemistry' for details. [*Reply to FEMINA.*—17/1.]

DECOMPOSITION OF PHOSPHORUS.—The crystals you have noticed cannot be phosphoric acid. In the first place, crystals of phosphoric acid can only be obtained under special conditions from aqueous solutions (compare the chapter on phosphoric acid in your text-book), and even when obtained they deliquesce very rapidly on exposure to air. As you say, "phosphoric acid is not volatile at common temperatures." You may extend this statement, because ortho-phosphoric acid is not volatile without decomposition. When ortho-phosphoric acid is heated it loses water and yields successively pyro- and meta-phosphoric acids. The meta-phosphoric acid melts at a low red heat, and forms a glassy residue, which may, however, be volatilised at very high temperatures. You do not say what tests you applied for the identification of the crystals, but presumably your method was at fault. In the absence of fuller details it is impossible to say what they really consisted of. [*Reply to J. E. J.*—16/22.]

INFORMATION WANTED.

EFFERVESCING SULPHUR LOZENGES.—Can any reader oblige with the name and address of makers (a London firm) of the effervescing sulphur lozenges, patent 10294.—LOZENGE (17/2).

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

C. H. Thompson gives figures of *A. lewini* and *A. williamsi*, the two species which are stated to yield the drug pellote or mescale, and distinguishes between them by *L. williamsi* usually having eight regular ribs or obtuse ridges, and *A. lewini* having commonly thirteen, which are irregular or much broken. Strictly speaking, the divisions are not ribs. The convex fleshy upper surface is divided into convex segments by somewhat shallow and narrow furrows. In *L. lewini* these are again divided transversely, more or less obliquely, by other furrows, so as to give the upper surface a more areolate appearance in *L. lewini* than in *L. williamsi*. But Mr. Thompson does not give any account of the flowers, nor state if any difference between them exists in the two plants. He follows Coulter's revision of the group in placing these two species in the genus *Lophophora*, in which the epidermis is flexible, and the tubercles or segments do not assume the form of projecting or leaf-like organs. The species of *Anhalonium* which possesses this character he places, following Schumann, in a separate genus *Ariocarpus*. Both genera are very distinct from *Echinocactus* and *Mamillaria* in being quite free from spines. Illustrations are also given of *Ariocarpus* (*Anhalonium*) *fissuratus*, *kotschubeyanus* and *furfuraceus*, so that the paper will be very useful for reference by students of the allied genera.—*Report Missouri Botanic Garden*, 1898, 127.

H. C. Irish has published a revision of the genus *Capsicum*, in which all the species (fifty-four according to the 'Index Kewensis') are reduced—with the exception of fourteen, which he has not seen—to two species, viz., *C. annuum* and *C. frutescens*. The former he divides into the varieties *conoides*, *fasciculatum*, *acuminatum*, *longum*, *grossum*, *abbreviatum*, and *cerasiforme*, and the latter into the type and the variety *baccatum*. Each of these are again subdivided into several forms. Judging from the figures and descriptions, the Japanese chillies seem to correspond with the orange-red form of the variety *conoides* of *C. annuum*, the Nepaul pepper, to the variety *acuminatum* of *C. annuum*. The sweet Spanish pepper and the Paprika of Hungary is the variety *grossum*, and the Cayenne pepper, or chillies of English commerce, are incorrectly so referred to *C. frutescens* (see 'Kew Bulletin,' July, 171). None of the illustrations resemble exactly the large capsicums of English commerce, apparently coming under *C. annuum*, variety *longum*, although no fruit so broad is figured under that name. Works on medicinal plants seem to have been ignored by the author, so that it is not possible to identify the species used in medicine exactly according to Mr. Irish's revision of the genus.—*Missouri Botanic Garden*, 1898, 53.

J. B. S. Norton points out that the following American plants contain enough of this colouring matter to stain the herbarium paper on which they are preserved, viz., *Echium vulgare*, *Eri-trichium glomeratum*, *Krynitzkia barbiger* (abundant in the leaves), *K. californica* (slight), *K. maritima*, *K. micrantha*, *K. pterocarpa*, *Lithospermum multiflorum*, *L. strictum*, *L. spathulatum*, *L. hirtum*, *L. canescens*, *L. angustifolium* (not abundant), *Plagiobothrys canescens* (in leaves), *P. nothofulvus* (in leaves), *P. tenellus*, *P. arizonicus* (abundant in stem and leaves as well as root), *P. torreyi* (very abundant in some specimens, hardly a trace in others). The

distribution of the colouring matter in this family is very unequal, even in species of the same genus, and of the use of it in the economy of the plant very little appears to be known.—*Report Missouri Botanic Garden*, 1898, 150.

The complicated reactions that Hübl's solution undergoes during preparation, preservation, of Iodine and absorption have received the careful attention of J. J. A. Wijs. His conclusions may be briefly summarised in the following equations:—

(3) In the absorption (by oleic acid)

and in a part of the fat

The hypiodous acid formed in (b) is being continually decomposed into iodic acid and free iodine, which substances, in presence of hydrochloric acid, again produce iodine monochloride. (4) On adding the potassium iodide and water to the solution before titration reactions ensue according to the equations:—

Theoretically the whole of the iodine should be found on titration in conducting a blank experiment; in practice, however, the older the solution the less is the iodine titre and the greater the acidity, the deficiency in iodine being equivalent to the acid formed. Equation (2) accounts for the alteration that occurs in the solution on keeping, through oxidation of the alcohol to aldehyde by means of hypiodous acid. Ordinarily each molecule of hypiodous acid gives on titration (equation (g)) two atoms of iodine, but when there is aldehyde formation only one atom is liberated and the titre is correspondingly smaller. On the other hand, for each molecule of hypiodous acid reduced a molecule of hydrochloric acid is set free, which is not neutralised as in equation (g), and is known as "excess acid." The stability of Hübl may therefore be increased by keeping the concentration of hypiodous acid as low as possible, as in Welman's method, in which alcohol is entirely or for the most part replaced by ether, ethyl acetate or anhydrous acetic acid. The author regards hypiodous acid as the principal agent in the addition.—*Zeit. angew. Chem.*, 1898, 291, through *Analyst*, xxiii., 238.

Iodine Absorption of Oils.

The same author, following up the conclusions arrived at in the study of Hübl's solution that hypiodous acid is the substance chiefly concerned with the addition, suggests a process by which hypiodous acid is more directly applied. It is too readily decomposed to be employed first hand according to the equation: $5\text{HIO} = \text{HIO}_3 + 2\text{H}_2\text{O} + 4\text{I}$. Good results were obtained by using a solution of iodide monochloride in 95 per cent. acetic acid. This was obtained by dissolving 13 grammes of iodine in a litre of the acid. The halogen content of the solution was then determined, and chlorine, free from hydrochloric acid, passed in until the halogen content was doubled. The mode of procedure was exactly the same as for Hübl's solution, except that the length of time was greatly modified. Thus in the case of oils of high iodine values the absorption was complete under ten minutes, whereas oils of low iodine values required no longer than from three to four minutes.—*Berichte*, xxi., 750, through *Analyst*, xxiii., 240.

At the Colonial and Indian Exhibition, a few years ago, specimens of a whitish resin, bearing some resemblance to Manilla elemi in appearance, were shown from the West Indies, and labelled "Gommier or Incense." These products are now referred to several trees of the natural order Burseraceæ. The Gommier or mountain Gommier, or Gommier rouge of Dominica and the Gommier à Canots of St. Lucia, appear to be *Dacryodes hexandra*, Griseb. Another species yielding a similar resin is *Bursera gummifera*, the birch tree of Jamaica, the Gommier of the Windward and Leeward Islands, and the Turpentine tree of St. Vincent. The resin of *Protium guineense* affords the Gommier à l'encens of St. Lucia, the Tacamahaque huilense inicolore, the encens of Cayenne, and the Tacamahacca of Venezuela.—*Kew Bulletin*, Sept., 239.

Lottermoser has obtained mercury in a soluble condition. Colloidal silver is made by mixing solutions of silver ammonio-nitrate with ferrous sulphate. Colloidal gold is produced by mixing diluted gold chloride solution with formaldehyde. Colloidal mercury cannot be prepared by either method; stannous nitrate is used as the reducing agent. A very dilute solution of mercurous nitrate is prepared and a similarly dilute solution of stannous nitrate is poured into it with constant stirring. A brown fluid is thus obtained, which is mixed with a concentrated solution of ammonium citrate, to precipitate the colloidal mercury. The solution is then exactly neutralised with ammonia, care being taken to avoid rise of temperature, and the precipitate collected and dried *in vacuo* over sulphuric acid.—*Pharm. Centr.*, xxxix., 553.

Kain has further examined the new body isolated by him from senega root, and finds it to be a glucoside. It is distinguished from saponin by its mild taste, solubility in absolute alcohol, in not giving a precipitate with barium hydrate, by its optical rotation, and by its reducing action on Fehling's solution. It is to the presence of this glucoside that the reducing action of aqueous extract of senega root on Fehling's solution is due, since the dextro-rotatory sugar present is saccharose. The crystals which Proctor named virginic acid, are nothing but saccharose. The three chief constituents of the aqueous extract of senega root may be fractionally precipitated from weak alcoholic solution by means of ether. Senega-saponin is first precipitated, then the new laevo-rotatory glucoside, and lastly the saccharose.—*Pharm. Zeit.*, xliii., 562.

The Department of Agriculture of the United States has published a bulletin on the distinctions between edible and poisonous fungi, written by Dr. W. G. Farlow, which is designed to be a sort of primer for the beginner who does not know fungi, but wants to eat them. The following rules cannot fail to be useful:—(1) Avoid fungi when in the button stage, also those in which the flesh has begun to decay, even if slightly; (2) avoid fungi which have stalks with a swollen base surrounded by a sac-like envelope, especially if the gills are white; (3) fungi with a milky juice are dangerous, unless the milk is reddish; also those which have a sort of spider-web or flocculent ring around the upper part of the stalk; (4) avoid those in which the pileus is thin in proportion to the gills, and in which the gills are nearly all of equal length, particularly if the pileus is brightly coloured; (5) all tube-bearing fungi should be avoided in which the flesh changes colour when cut or where the mouths are reddish; and in the case of other tube-bearing forms caution is necessary.—*Bot. Gazette*, xxvi., 221.

PERCOLATION AND FILTRATION UNDER PRESSURE.

BY R. C. COWLEY.

It is obvious to the most casual observer that the use of intermittent pressure, as described by Mr. A. W. Nunn (see *ante*, p. 371), has serious disadvantages. While not advocating the use of pressure in percolation, it has frequently occurred to me, when exhausting mucilaginous or finely powdered drugs, that the use of constant gentle pressure would be an advantage in hastening percolation.

For some time past I have made use of a simple contrivance to produce this effect, and doubtless the same plan is sometimes adopted by others. It consists in displacing air from the bottle A by allowing water to run into it from the reservoir B; the displaced air is conducted along the tube D into the space above the menstruum in the percolator E. Any cylindrical or slightly conical percolator is suitable, provided it can be accurately fitted with a perforated rubber bung. The connection C is fitted with a tap or an ordinary feeding bottle regulator, to open or shut off the supply of water.

It will be evident, that by raising or lowering the reservoir B, the pressure will be proportionately increased or diminished. When the stop-tap G is opened, the flow is at first rapid, but it gradually falls off until the internal air pressure is equivalent to the hydrostatic pressure. The percolate will then drop into the receiver at the same rate that the water drops from the reservoir. Maceration in the percolator is provided for in three ways, viz:—(a) By connecting the tube at the bottom of the percolator with the glass tube which passes through the rubber bung at the top. (b) By shutting off the flow of water. (c) By lowering the water reservoir to the level of the percolator.

It is advisable to stop percolation during the night, which may be done by the second or third process, otherwise, when the menstruum is forced out, air will pass through the marc and unduly dry it. It will be seen that pressure will be relieved only when a further supply of menstruum has to be added, and when the water in the bottle A requires to be removed. Some time ago I had occasion to filter a highly mucilaginous liquid that would not pass through filtering paper in the ordinary way, and was not amenable to any of the common methods of clarification. I tried filtering it through paper pulp by the above process, but found the pressure insufficient. The difficulty was got over by running the water direct from one of the laboratory taps, and using a one-gallon stone jar instead of the bottle A in the drawing. After seeing that the connections were secure, the water was carefully turned on and filtration proceeded at a rapid rate.

THE DIGNITY OF PHARMACY.*

BY J. RYMER YOUNG.

For some years it has been the custom to preface the studies upon which you—who are assembled here this evening—are about to enter—with an introductory welcome. The pleasant duty of extending this welcome has—this year—been entrusted to my hands, an honour which I greatly appreciate. Whilst I do not aspire to approach the eloquence—or to rival the fascination of many of the addresses delivered here, yet I am fully conscious that these occasions afford opportunities which might by many be made of the utmost service. I hope therefore that the time-honoured custom of commencing each new session with an inaugural address will survive for many years to come.

Causes of Non-Success.

And what shall I say to you? Your selection of a calling is a settled affair, that question is not now before us, otherwise I might have startled you—as Abernethy did his audience of embryo doctors—with “good heavens, gentlemen, what is to become of you all!” Undismayed by the all too abundant evidence of overcrowding, undeterred by the lamentations of the pessimists, you have “for weal or woe” elected for pharmacy, not, I presume, because it leads to any considerable pecuniary emolument, but because you think that with good and honest work it opens up a prospect of a sufficiency to live upon. Well, gentlemen, there are differences of opinion on that point. We hear different accounts of the joys of pharmacy as a whole, and it is related that a “pharmaceutical” magistrate not long ago, in sentencing a prisoner to a month’s retirement with hard labour—regretted that it was not in his power to give the rascal three months behind a chemist’s counter as a warning to all evildoers. This amounts, of course, to burlesque, but really, when one thinks of the terribly long hours, the utter absence of almost everything worth living for, and the miserable starvation pittance that seems to fall to the lot of some in our craft, one can understand and excuse the fervid and highly-flavoured (though often undeserved) anathemas occasionally hurled at the drug trade in general. And yet, is it not true, is it not “plainly writ” that much of this wretched experience is distinctly self-inflicted, or at any rate the direct and natural result of imperfect judgment, faulty education, and even gross ignorance? Is it reasonable to expect success where there is less culture than that possessed by the schoolboard pupil, less capital than that required by a costermonger—less tact than the errand boy can command? The uneducated pharmacist is handicapped out of the race, now-a-days; he has no chance, even for himself, and to the extent that he exists he is a positive burden on Society and a danger to his craft. If from any cause “you are unable to acquire the education and training necessary to the intelligent performance of work which an accomplished pharmacist is rightly expected to do, then you ought not to become a pharmacist at all. It is far better to be a good farmer, or a good anything, than an incompetent dispenser of medicines.” (Dr. Oscar Oldberg.)

Pharmacy an Honourable Calling.

Assuming, therefore, that you are all fairly equipped in the direction indicated, there is no reason why your choice should in any way turn out a mistake. It is an

honourable calling, there is a living to be got out of it, and it occasionally leads to fortune. Pharmacy abounds in interest (though capital be scarce), it offers material for the exercise of the higher faculties of mind, and it affords ample field for scientific research; but with these attractions it also makes great demands on those who desire to enter it. I trust that in making your choice you have kept in view those qualities of mind and body essential to success in it. In any walk of life ignorance and carelessness engender grievous trouble and annoyance; in pharmacy either ignorance or carelessness may involve ruin and loss of life. I trust you thoroughly realise and understand the responsibilities you propose to assume. We, all of us, of course, adopt our calling as a means of earning our “bread and cheese”; that goes without saying, but at the same time forget not, that in doing so, it is clearly our duty to acquire all the skill we can, that we may fairly merit the confidence reposed in us. I have placed duty first, but I do not hesitate to place interest and expediency before you, too. If you do not make the most of present opportunities of preparation for your life’s work, you will find yourselves lagging in the race, or, should you succeed in winning the confidence of a credulous public, yours will be the humiliation of knowing that you are not what you profess to be—that you are, in fact, a humbug and the dread of misadventure will haunt you like a perennial nightmare. Strive to like the business for its own sake, for without that, and without an intelligent knowledge of the sciences upon which it is founded, you will degenerate into mere hucksters, and your work can only be a round of toil, wearisome, monotonous, and uninteresting.

Intermediate Education.

I take it that you have all passed a preliminary scholastic examination. If this did not include mathematics (algebra and Euclid) and French or German, let me urge you to look up those subjects as soon as possible. Believe me, they are essential to complete success in the future. No scientific subject can now be fully treated without an acquaintance with mathematics, and I have, in my experience, found the want of French and German a serious drawback and inconvenience. To a pharmacist a fair knowledge of both languages is of extreme importance, if only to enable him to keep properly abreast of all that is going on in the various subjects allied to his art. You are greatly privileged in having available in your own city a complete and well-organised scheme of education, and I congratulate you on the new arrangements whereby courses in chemistry and botany may be taken at Sheffield University College. Let me suggest that these sciences should be studied on general lines, identical with other students, of whatever faculty, special application to pharmacy following in due and proper sequence. Materia medica and pharmacy should, in my opinion, be taught by competent pharmacists, for the pharmacist is distinctly a specialist in these departments, and I have still to learn that Sheffield lacks men willing and able to undertake this work.

Systematic and Enthusiastic Work Desirable.

Let your work be systematic, each fresh subject being taken up only after a fair grasp has been taken of the former one; the entire syllabus should thus be covered before entering upon a final revision course at some recognised institution, preferably, perhaps, but by no means necessarily, the Pharmaceutical Society’s School. There are some who consider that courses of lectures are no longer required, the excellent text-books of to-day giving all the information a student can possibly need. I look upon this view as a

* Inaugural Sessional Address to the students of the Sheffield School of Pharmacy, delivered on Thursday, October 13, 1898.

mistaken one; I believe in lectures. Old facts may strike you in a new light when clothed in the speaker's own words, and perhaps amplified and illustrated by his own experience. Discoveries which have not yet found a place in textbooks may be brought to your notice, and besides, there is a realism about the human voice; it can often drive home facts which letterpress cannot. But, better still, you will feel the stimulus of the lecturer's personality, and perhaps imbibe some of his enthusiasm. For goodness' sake, gentlemen, try to be enthusiastic over your work; it is "good" for you and "refreshing" for your lecturer. Professor Banks, of Liverpool, addressing some students, says he has "no liking for the modern superior person, with whom it is the height of good breeding to utter short sentences in a monotone, to preserve a frigid calmness, and to gaze with an equally stolid and bovine eye upon a drunken cabby, or a transcendent genius; only do his pulses quicken when he comes to the consideration of a shirt collar or the nice conduct of a clouded cane." I dislike a man who stifles his natural emotions, like a man sitting on the safety-valve of a boiler. Try to like your work for your own sake, and let other people see that you like it for their sake, for enthusiasm is contagious. Above all, let your instructors feel that you appreciate their endeavours in your interest, and remember that there is no more irksome or thankless task in the world than that of teaching a lot of students who either think they know everything or do not want to know anything.

The Highest Qualification Best.

Do not rest content with anything short of the Major qualification. If for no better than the very poor reason that it confers exemption from jury service, it is, commercially speaking, good value, as any chemist will tell you who has had ten or twenty days' assize work at nothing per week, and pay your own expenses including railway fare, but there are loftier and better reasons than that, obviously. If pharmacy is worth touching at all it is surely worth your best energies and capabilities. You have elected for pharmacy, then be satisfied with no dubious mediocre kind of half-way position, but push on till you stand firmly on the higher level. There is always a satisfaction which cannot be over-estimated in the consciousness that you are as well qualified as any of your competitors, and there is positive advantage if it happens that you are their superior in qualification. To the testimonial writer and mere vendor of other peoples' quack nostrums, the Major qualification will be a useless appendage, and for the matter of that one wonders why such a person qualified at all, since a so-called "patent medicine licence" is about all he needs, plus, perhaps, a good deal of cheek and a little caution. But those who are going in for pharmacy proper will find the qualification of pharmaceutical chemist a powerful factor in his favour. Most of the medical men with whom I have come in contact do recognise and understand the relative value of the Minor and Major, just as we understand the difference between M.B. and M.D., or between M.R.C.S. and F.R.C.S. My experience is, that the public, slowly, it may be, but surely, is beginning to exercise an intelligent discrimination in this matter, which, after all, is of importance to themselves. Lastly, on this point, is it not a fact that the best literature and best work in connection with pharmacy—just the literature and work which has given to the trade whatever of tone it has, or whatever of the professional it possesses, which has secured for us an honourable position in the estimation of the community—we owe mainly to the comparatively small body of men who have thought it worth while to become pharmaceutical chemists?

The Evils of Mere Cram.

Whether you remain content with the Minor or proceed to the Major, as I hope you will, take care that your qualification is the outcome and result of good sound systematic honest work, and not the monstrous product of what is known as cram, by which I mean the process of forcing mental pabulum into a subject at a greater rate than assimilation is possible. The person who neglects, or lacks (as many do lack) the opportunities which should be afforded by apprenticeship, and then suddenly realises that the Minor must be passed, endeavours in a frantic sort of way to acquire in a few months the knowledge that should have been gradually absorbed, as it were, in as many years. That is the man who needs the aid of the "grinder" or "crammer," and commences, as Professor Mitchell Banks puts it, "the edifying operation of shovelling down the victim's throat all sorts of eminently condensed and highly nutritious foods, Brand's botanical jelly, Valentine's chemical juice, and Liebig's extract of materia medica, and lastly (for there is nothing homœopathic in this system) a good heroic dose of peptonised pharmacy. Then advances the gentleman (who has quietly been watching the proceedings) armed with a stomach pump, 'pray open your mouth, young sir, and let me put this tube down your throat for a minute or two?' Inarticulate sounds are heard, and before you can say 'Jack Robinson' (which I understand is the correct expression indicating phenomenal celerity) all the juices and extracts are in the examiner's basin. Has the student had a good meal? Not a bit of it, he has not had time to digest anything. Is this good for the stomach? Of course it is not. Then neither is a similar proceeding good for his brain."

Work Versus Play.

Do not lose interest in current affairs and things mundane—national and local. Pharmacy is not the only thing in the universe worth knowing. It has been said that chemists deal in pennyworths and think in pennyworths, and I fear there is too much truth in the sneer, for they are, as you know, somewhat given to isolate themselves from the rest of the world. It must indeed be a poor sort of game when the shop is the only sphere in which to "live and move and have our being." Cultivate, I pray you, the goodwill and friendship of your colleagues in business, and be cheerful; you will find it much pleasanter to travel down the steep gradient of life laughing rather than crying. Make yourselves liked as well as respected; do not be jealous of the chemist over the way, "who must live," as the saying goes, though Talleyrand declined to admit the necessity implied in those words. Read the daily papers, as well as good books (not goody books), develop the artistic faculties, and continue to educate the mind in every possible way, keeping in view the ideal that the pharmacist must be fully abreast of the times, and if possible, should be a little ahead of anyone else. Take a reasonable amount of exercise, there is plenty of choice—tennis, cricket, golf, or cycling, or anything else that will help to keep the blood circulating and the muscles in strong and healthy condition. I was going to say do not overdo this, a needless piece of advice addressed to chemists, perhaps, whose hours of relaxation are few and far between, but there is now-a-days danger of overdoing this kind of thing, and to forget that after all the *corpus sanum* is merely the fleshly tabernacle of the *mens sana*. I strongly object to the too prevalent idea that the life of a mere athlete is the highest to which a human being can aspire. Brains are getting out of fashion; it is all cricket and football and golf in this country of ours. Well might the German schoolmaster say that "the English youth plays at his work and works at his play." Why, in some of our great public schools the very masters have to

be athletes. You have seen, I daresay, the usual style of advertisement for a "Junior master wanted, must be Church of England and a good cricketer," which reminds one of the emigrant ship of former days, which was advertised to carry a "cow and a doctor"—the cow first, you will notice (Professor Banks). The worship of bone and muscle has, in my opinion, gone a shade too far in this country. I trust the pendulum has taken its longest swing.

Loyalty to the Craft.

Having secured your qualification, try to remember the duty you owe to your craft. Do not be shortsighted and selfish, remember that it is in your power to scotch the gigantic injustice of unqualified joint-stock companies trading as chemists and druggists, for without your aid they could not possibly carry on business. I presume it is your ambition some day to possess pharmacies of your own? Are you likely to bring about such a proper and laudable object by selling your services to, and so covering, the otherwise illegal practices of a set of unregistered and unqualified men who are setting up branches innumerable on sites that ought in due season to have been occupied by yourselves? Avoid these unholy alliances. Shun the stores as you would Satan. Keep up the dignity of your craft. Decline to work for registered chemists who are guilty of unprofessional conduct, or for unqualified persons who would degrade pharmacy to the lowest depths of mere commercialism. Shun both classes, and especially the last mentioned, as you would the plague. I am quite aware of the fact that strong temptations may be offered to induce you to prostitute your qualification when obtained, such as increased salaries, shorter hours, and freedom from Sunday duty. But, seriously, are those advantages in themselves sufficient to induce you to trail your professional status in the dust; do those who are weak-minded enough to fall into the company-pharmacy snare fully realise how much mischief they do at the time and how they are ruining their own future prospects? For the evil does not end when any one of you who may be inveigled into a joint-stock drug store leaves the accursed spot to return to the cleaner path of legitimate pharmacy. Just as you may prove lacking in firmness of principle—even if only for a few weeks or months, and under the specious plea of learning how company pharmacy is carried on and so gaining useful experience—so may others be expected to follow your example. The fact that you have forgotten all sense of professional decency, if only for a single moment, may unfortunately serve as a fatal incentive to others who come after you, and the same baseless arguments will be urged in their case as in yours. No! the only safe, loyal and honest plan is to make up your minds to starve or break stones on the high-road rather than do anything, be it ever so little, to enable unqualified persons to make a profit out of your services as a registered chemist. The evils of legitimate pharmacy—small salaries and long hours—can only be redressed in that way, and the sooner in proportion to the number of qualified assistants who decline to sink their self-respect by throwing themselves with their professional qualification beneath the destroying wheels of the Juggernaut of unqualified company pharmacy and so imperilling the future of their craft. In fact, the matter is and will continue to be entirely in the hands of qualified assistants. Let them but be firm in declining all offers, however magnificent, made to them by the proprietors of unqualified joint-stock drug stores, and every registered chemist in business on his own account will at once be placed in a better position with regard to his ability to increase salaries and curtail hours. That step taken, there would obviously be no difficulty in applying suitable treatment to the black sheep of

pharmacy, for it would be open to anyone to decline to be sweated or unfairly treated by fellow-craftsmen in business on their own account, and with a much better prospect of successfully combating evils we are all conscious of than at present. As registered chemists and druggists the ball will be at your feet so long as you continue to act as assistants; if you do not kick it fairly and squarely and thus secure a goal, so much the worse for yourselves, and such pusillanimous conduct will have proved unfitness for the craft you are expected to adorn.

Education Always Proceeding.

But to return to my theme, let us suppose that after diligent study you have qualified in the most approved and orthodox style, and have loyally joined—as in duty bound—the Pharmaceutical Society, with a pious determination to take your share in moulding the future of that representative body. Well, you do not imagine that your education is ended, do you? Why! "heart alive," it is only just commencing. You will find it infinitely more difficult to satisfy and please a captious, erratic, often unreasonable public than ever you did the Board of Examiners, for it is possible to delude the latter occasionally. There is still the broader education of experience to attain, and that is attainable only behind the counter. No lecturer can teach you common sense and tact; this is something altogether beyond his control, and is entirely within your own. By "tact" I mean, of course, that instinctive-innate faculty, which enables you to see, mentally, at a glance, in the twinkling of an eye what sort of a person you have to deal with, how to manage him, and how to please him, to say the correct thing at the right time, and to do the right thing at the correct moment. Often a customer is banished by a silly meaningless phrase, an ill-timed or impertinent remark, by manifest incapacity to understand, or by defective judgment if not by downright stupidity. The assistant who brings out Turkey cups at half-a-guinea each for the inspection of some palpably poor woman obviously unpossessed of any such sum, or calmly exhibits a card of penny slate cleaners to the lady who drives up in her "coach and four," and desires to purchase a sponge; you know the kind of young man I mean, there are plenty of them, and they do not all come from Sheffield. Cultivate tact, gentlemen, it is a powerful lever in business.

The Study of Pharmacy Law.

There is just another point on which I should like to say a few words, and that is, the necessity of keeping yourselves thoroughly conversant with the laws which affect and govern pharmacy. You may some day be so unfortunate as to fall foul of some obtuse coroner who will vehemently lecture and threaten you for not having done something or other which the law does not require you to do at all. Occasionally coroners get terribly mixed in their ideas concerning the two parts of the Poison Schedule. Not long ago a chemist was smartly reprimanded for not registering the sale of a small quantity of laudanum, and the chemist, who was evidently as rusty in the law as the coroner, promised "never to do it any more." One of the trade papers some time ago indicated very plainly what should be done when such instances occur. There is really no occasion to take your undeserved flogging like the man in George Augustus Sala's story, "lying down." Be sure of your position, and civilly, but firmly, protest against these glaring misconceptions of pharmacy law, and be prepared, if need be, to give a correct version. The coroner's court is an antiquated institution that seems to have escaped the influence of this reforming age. The coroner himself possesses remarkable powers and privileges, which are dangerously liable to abuse, but you are perfectly safe so long

as you are polite and accurate. I do not for one moment think that coroners have any desire to get chemists into trouble. Witness, for instance, the handsome way in which one of them a few days ago withdrew some severe strictures he had made affecting one of our body, and which on reflection proved to be unwarranted; but they are sometimes quite at sea concerning ourselves and our laws, and unless chemists can defend themselves they are likely to have a bad time of it. Stand up for yourselves on all occasions; I do not suggest that you are to take offence when none is meant, nor do I mean that you should be unduly touchy or sensitive, but at any cost resent impertinence or intended slight, from whatever source it emanates.

The Dignity of Honest Labour.

And now, gentlemen, a few final words to those who are just commencing their career. You have probably mystified yourselves with endless details of what will be required of you; at any rate, you will have grasped the one appalling fact that examinations have to be passed before you can enter the privileged circle of pharmacy. The terrors of those examinations have doubtless been enhanced by your friends—by those who have failed—in order to impress you with the reasons of their failure; and by those who have passed, that you may properly realise the value of their achievements. To each one of you, I say: Heed them not, “they are fooling thee.” Remember from the very beginning of your work that the aim and object of study is not in any important degree to enable you to pass certain examinations, but to teach and train you in your work. A man who knows his work will certainly pass his examinations, some indeed scramble through, only to find later on to their own misery that they did not know their work. Do not let examinations occupy too much of your mind; do the work that your teachers direct you to do and do it well, and when the time comes for the final effort, then strain every nerve to collect all your knowledge in a concrete form, and go in and win—as you will. It is customary, and in accordance with tradition, I believe, to conclude an address of this kind with a panegyric on the high and noble aims of one’s calling, interspersed with complaints of inadequate recognition of its merits. It is not my intention to essay anything so unprofitable. It may be that our art—if art it is—has something of intrinsic nobility about it. Is not that true of all honest, useful work? But, after all, surely it is not the profession or calling which elevates the man; rather is it the man who ennobles his occupation. Some men work to make a living, and some, not many, perhaps, but certainly some, for the pure love of doing good to their fellow-creatures, and these men are “the salt of the earth.” But I may presume that the vast majority of us take up pharmacy with the object of making a living—in itself a very good object. I am not going to outrage your intelligence by pretending that the public good is our only stimulus. You wish to make your way in the world—that is your primary object. Then do it well, do it fairly, do it worthily, look to your own bearing. “Set not your sails to every passing breeze,” but earn and keep a character for independence and integrity. Thus shall you command respect, thus shall you deserve esteem, and so shall you secure for yourselves that position among men which is your right as members of an honourable profession, trade, or guild, call it what you will.

“A King can mak’ a belted Knight,
A Marquis, Duke, and a’ that,
But an honest man’s aboon his might,
Guid faith he maunna fa’ that!
The pith o’ sense and pride o’ worth
Are higher ranks than a’ that.”

REVIEWS AND NOTICES OF BOOKS.

GESCHICHTE DER PHARMAZIE, herausgegeben von Dr. J. BERENDES.
Erste Lieferung. Pp. 80. Price 2 M. Leipzig: Ernst Günthrs,
Verlag, 1898.

The first part of Dr. Berendes’ History of Pharmacy deals with its practice in the most ancient centres of civilisation—Egypt, Palestine, and Phœnicia, Arabia, Babylonia—clustering round the junction of Asia with Africa, and extending from the valley of the Nile to that of the Euphrates. No attempt is here made to illustrate the beginnings of medicine from modern, barbarous, or savage sources, nor its more advanced stages in ancient times from the far-off civilisations of China and India. Probably the scope of the whole work is limited to the documentary history of European pharmacy and of its dawn in the nearer East. Other aspects are, however, briefly referred to in the introduction.

Fifty pages out of a total of eighty are devoted to Egypt, and the proportion is just. It seems more than probable that the word “chemistry” is derived from the native name for Egypt, *Kemi(t)*, becoming in Greek *χημια*, and properly meaning the art of transmuting metals. Still more significant, the Greek, *φαρμακός*, “a poisoner” in the sense of a user of drugs *φάρμακα*, from which we have “pharmacy,” etc., is by some derived from Egyptian words meaning “the maker of protection,” the Egyptian word for protection, *mak*, being a general term for healing and preservative power used in the medical papyri and inscriptions. The derivation is etymologically attractive. At any rate from Egypt we have a considerable number of very ancient documents containing prescriptions for all kinds of diseases. One of these, called the “Papyrus Ebers” after its quondam owner the celebrated novelist and professor of Leipzig, is perhaps the finest and most perfect document on papyrus that has come down to us. Consequently its text has been ransacked by Egyptologists in search of rare words, although its literal sense is still far from being understood. The combination of several special branches of knowledge that is required for its interpretation cannot yet be attained, for neither is the Egyptian language nor is primitive medicine thoroughly understood, even by the few students concerned with them. The former branch of knowledge, however, is growing rapidly, and the present book is an indication of an increasing interest in the latter which cannot fail to bring about a fuller appreciation of these early medical documents.

Dr. Berendes takes the trouble to describe briefly the land and people of Egypt, also its religion and mythology, which enter so largely into the spells; for naturally the application of drugs without the employment of spells to ensure their proper effects would have been deemed very insufficient anciently. He touches on embalment by means of knife, drug, and bandage, on the language and the writing, the priestly caste, the priest-doctors and apothecaries male and female. He describes the medical papyri, and discourses on the methods of compounding and applying the doses and on the materials used, noticing especially the sacred or secret names given to them—chiefly in very late times it should be noted. He gives lists of animal, vegetable, and mineral products used in the Pharmacopœia, of the technical processes, with examples of elaborate recipes, and of the “weights and measures.” He also considers the position of Egypt in regard to the natural sciences as evinced by the Egyptian knowledge of metal-working, glazing, etc.

All this is very interesting and instructive up to a certain point, and particularly so to anyone unfamiliar with the ideas of a primitive age; for such this book must open up entirely new

views. Here and there, too, it will prove suggestive to the specialist; but one is impressed by the enormous disadvantages under which a writer labours in compiling information upon any subject involved in so progressive a science as Egyptology. Although Dr. Berendes has certainly done his work well, he has unfortunately confined his Egyptological reading to German books. Hence it is that the whole of the section on weights and measures (pp. 46-50) is founded on wrong ideas, and scarcely a word of it is correct. Practically it is an abstract of an article by Professor Ebers.

In the middle of it Dr. Berendes announces that according to a communication from the learned professor, the latter has entirely altered his opinion on the subject in conformity to an essay in our English *Proceedings of the Society of Biblical Archaeology* (xiii., 526-538; cf. also xiv., 431), in which his article was reviewed. Two facts abolish the whole of Berendes' five pages—more especially the “*Denat*,” the “*Ro*,” and the weights disappear. First, no weights were used at all in the early Egyptian pharmacy; secondly, the symbols of measurement belong to systems well understood from other documents. The rough balances which served sufficiently for weighing the precious metals in ancient Egypt were no better checks than were measures on the correctness of small amounts of lighter materials, and so it happened that measures alone were used for drugs (we hope they were not very powerful) when it was necessary to fix the proportions. After the Macedonian Conquest, however, in B.C. 330, weights were largely used, but it cannot yet be decided when they were first introduced into Egyptian pharmacy.

The “*Petrie Medical Papyrus*” from Kahun dates from about 2500 B.C.; the “*Ebers Papyrus*” from about 1650 B.C.; the “*Berlin Medical Papyri*” date from about 1250 B.C., and still show no sign of weights. As to the measures in these old papyri, besides vague terms such as “a little” and so forth, we have (1) the *hen*, $\frac{7}{8}$ th of a pint, with its divisions by halving down to $\frac{1}{64}$ th *hen*; (2) fractions of the *hekat*—which contained 10 *hen*, or over a gallon—similarly halved down to $\frac{1}{64}$ th. Naturally the *hekat* itself never occurs in a prescription, but the fraction of $\frac{1}{64}$ th is exceedingly common; $\frac{1}{8}$ th is frequent, and there is a single instance of $\frac{5}{8}$ th (written $\frac{1}{2}$, $\frac{1}{8}$) of a *hekat*. The larger quantities are generally of some liquid—water, wine, or beer.

The understanding of the measures makes Egyptian prescriptions vastly more intelligible, whether these be for the cure of diseases, wounds, etc., or for the manufacture of sweet scents and unguents, or for abolishing vermin, evil smells, etc. Take the following: “Instances of purging the belly, milk $\frac{1}{16}$ th, $\frac{1}{64}$ th ($\frac{5}{64}$ ths) *hekat*, *nekaut* $\frac{1}{4}$ th *hen*, honey $\frac{1}{4}$ th *hen*. Cook, strain, eat for four days.”—“*Pap. Ebers*,” i. “Another of emptying the belly, cow's milk 1 *hen*, *nekaut* 1 *hen*, honey 1 *hen*.”—“*Pap. Ebers*,” iii.

“For preventing flies from stinging.—Fat of bee-eaters, anoint with it.”—“*Pap. Ebers*,” xvii. (The reason for choosing this bird is obvious.)

Many of the prescriptions are far more elaborately compounded, but as it is often uncertain what were the substances intended to be used, not much would be gained by translating the recipes here.

When Homer speaks of Egypt as a land where grew all kinds of potent herbs, this probably indicates not only that Egyptian physicians were highly reputed, but also that the drugs of Arabia were carried by trade through their country. Perhaps many medicinal plants were cultivated in the gardens there, but the native flora was undoubtedly very poor. Highly cultivated alluvial soil and almost barren deserts afford little hold for wild plants, and

probably the conditions were much the same from remotest antiquity.

In the book before us there are many errors of detail and many doubtful assertions, *e.g.*, in the lists of materials and in the translations of words expressing technical processes; and generalisations often fail along with the details.

Note, by the way, that the medical papyri discovered some years ago by Flinders Petrië are just published in ‘*Hieratic Papyri of Kahun and Gurob*,’ Griffith, pls. v.-vi. It seems, especially from the “*Kahun Veterinary Papyrus*,” that formulæ were to be recited during the treatment, though the spells to be used are not often written down. Spells were of enormous importance in the earliest times, especially for the funerary ritual, and certainly no “*medicine man*” could have done without them.

Leaving Egypt we pass to Phœnicia, with a few notices from Egyptian sources and from Dioscorides, and on to Babylonia and Assyria, which are more important. Nevertheless, few medical tablets have as yet been found there and fewer still deciphered, an Englishman, Professor Sayce, being hitherto the only one to break ground in the study of them; no affirmations on the subject can safely be made. These difficult texts are inscribed in cuneiform on tablets of burnt clay.

Next, the author proceeds to treat of the Arabs as traders in precious gums and drugs, many of them produced in their own country. It is a pity that apparently these people were not above practising adulteration. Thirteen pages are filled with information gathered from the Bible and Talmud (at the end of the second century A.D.), concerning the pharmacy of the Hebrews. Their precautions against infection and rules against uncleanness—real, not merely ceremonial—are very remarkable. In fact, they appear to be the only people of the ancient world with any clear idea of there being such things as infectious diseases, and of endeavouring to guard against them by isolating the persons attacked. The treatment was by simple herbs as medicine, and attention to hygiene and diet.

Altogether, one would say that for such a book as this under review, more help from specialists was required. The documents in general are exceedingly scanty and require to be very cautiously utilised; also, where it is possible, strict separation should be made between early and late sources of information. But it is to be hoped that the work will arouse in many a profitable interest in the history of their profession, which is, as Berendes points out, the parent stem from which has sprung on the one hand chemistry, and on the other medicine.

DIE HEILPFLANZEN DER VERSCHIEDENEN VÖLKER UND ZEITEN.

By DR. G. DRAGENDORFF. Part 5. Price 6 marks. Stuttgart: F. Enke. 1898.

The fifth and concluding part of this work contains the natural orders Caprifoliaceæ, Adoxaceæ, Valerianaceæ, Dipsaceæ, Cucurbitaceæ, Campanulaceæ, Goodeniaceæ, Styliaceæ and Compositæ, a brief appendix including a few additions to the natural orders Sapindaceæ and Acanthaceæ, and a voluminous index of nearly two hundred pages. It is worthy of note that *Adoxa moschatellina* receives a natural order to itself, although placed after the Caprifoliaceæ, and that Cucurbitaceæ is moved from its usual position near Passifloraceæ and is placed next to Campanulaceæ. In the index the botanical names and vernacular names are not given in separate indices, but together in alphabetical sequence. The copious index will render the work more useful than it could possibly be otherwise in countries where the same arrangement of the natural orders is not followed, and the bibliographical references make it much more valuable than Rosenthal's work.

PHARMACEUTICAL SOCIETY.

EXAMINATIONS IN LONDON.

October, 1898.

MINOR EXAMINATION.

Candidates examined	266
„ failed	200
„ passed ..	66

Bancroft, Albert John Thomas	Magan, Frances
Barker, Thomas Henry	May, Ernest Douglas
Benny, Wallace Frederick	Miller, Edwin Frederick
Bingham, William Arthur	Millidge, Philip Henry
Birkett, Geo. Noel Matthew	Morgan, Richard James
Bishop, John Henry	Morgan, Thomas Alcwyn
Clay, Wm. Joseph Ogle	Morris, William David
Cowley, Harry James	Nursaw, Edward
Crofts, Lionel Gordon	Owen, William Lloyd
Davis, Richard Llewellyn	Pashley, E. F. Cuthbert
Dunn, Percy	Pattison, George
Dunstan, Sydney	Perkins, Francis George
Durbin, Herbert Samuel	Pilcher, Franklin
Edgar, William Ernest	Redman, Stanley Charles
Falconer, Campbell	Rees, Arthur Howell
Fawn, Frank	Ridyard, Clement William
Ford, William	Rix, Henry Grey
Francis, James Bowen	Robertson, Wilfred George
Giles, Frederick	Robson, Harold
Greening, Ernest Harcourt	Simpson, Robert Thorburn
Hall, Walter Hutchinson	Sletcher, Henry George
Hardcastle, Edward	Sloman, Frank
Hart, Walter Richard	Smith, Eliza Mary
Hawkins, Henry George	Steele, Grave Irving

Lamplugh, Robert Wright	Willeox, Harriett
Levin, Joseph Elkin	Williams, William John
Lownsborough, Robert E.	Wilman, Gertrude
McKinnell, Donald Forrest	Wilson, Thomas Herbert

FIRST EXAMINATION.

Certificates by approved examining bodies were received from the undermentioned in lieu of the Society's Examination:—

Allkins, Reginald Samson; Tamworth	Hawkey, Edgar; S. Molton
Aston, Spurgeon; Worthing	Ironmonger, Herbert Lovell; Spilsby
Barlow, Francis R.; Oxford	Keany, Thomas Timothy; London
Bell, Albert Edward; Sherborne	Knight, Frederick George; Winchester
Brackenbury, Frank Hayden; Bardney	Lane, Wilfred Charles; Bradford
Cofnan, Joseph; London	Nash, Ernest; Manchester
Cowburn, Joseph Robert; Boston	Nightingale, Herbert R.; Alnwick
Davies, Thomas Benjamin; Edinburgh	Palmer, Charles Ernest; Wingham
Eley, George William; Rugby	Postlethwaite, Richard Geo; Barrow
Evans, Albert David; Bath	Sloccock, Arthur Oliver; Slough
Gould, Christopher C.; S. Godstone	Spencer, Harry Herbert; Barnes
Hackney, Irene Mary; Middlesborough	Trythall, Thomas Arthur; Camborne
Hague, Ernest Harold; Widnes	Weall, Horace Graham; Maidenhead
Hatt, Harold Ernest; Kennington	Wilkins, Wm. Watson; Bournemouth

DONATIONS TO THE LIBRARY AND MUSEUM.

At a meeting of the Library, Museum, School and House Committee, on Wednesday, October 12, the Librarian and Curator presented the following reports of donations:—

To the Library (London).

- University of Edinburgh:—Calendar, 1898.
- University of Wales:—Calendar, 1897.
- University College, Bristol:—Calendar, 1898.
- University College, Liverpool:—Calendar, 1898.

- University of Durham College of Medicine, Newcastle-on-Tyne:—Calendar, 1898.
- Owens College, Manchester:—Calendar, 1898.
- Yorkshire College, Leeds:—Calendar, 1898.
- Dr. Attfield, London:—Chemistry, 17th ed., 1898.
- Mr. E. W. Lucas, London:—Practical Pharmacy, 1898.
- Dr. Jowett, London:—Characters and Methods of Assay of the Official Hypophosphites, etc., 1898.
- M. E. Collin, Paris:—Examen microscopique des farines de blé, 1898.
- Professor L. Planchon, Montpellier:—Indications générales sur la récolte et la conservation des drogues exotiques, 1898.
- Dr. A. Ernst, Caracas:—Farmacopea Venezolana, 1898.
- Mr. W. J. Patey, London:—Manuale del farmacista, del P. E. Alessandri, 2a ed., 1898.
- Mr. H. G. Smith, Sydney:—Notes on Myrticolorin, 1897; On the Saccharine and Astringent Exudations of the "Grey Gum," etc., 1897.
- Mr. J. H. Maiden, Sydney:—Report on the Botanic Gardens and Domains for 1897.
- Mr. F. M. Bailey, Brisbane:—Contributions to the Flora of Queensland; Edible Fruits Indigenous to Queensland; Contributions to the Flora of New Guinea.
- Royal Society of New South Wales:—Journal and Proceedings, vol. 31.
- Philosophical Society of Glasgow:—Proceedings, vol. 29.

To the Library (Edinburgh).

The Editor of the *Chemist and Druggist*, London:—Pharmaceutical formulas, by P. MacEwan, 1898.

Mr. W. Martindale, London:—The Extra Pharmacopoeia, 9th ed., 1898.

Pharmacy Board of Victoria:—Report for 1897.

Royal Societies Club, London:—Foundation and objects, Rules and Bye-laws, List of Members, 1897.

The Director, Central Sanitary Bureau, Home Department, Japan:—Pharmacopoea Japonica, ed. 2, 1891.

To the Museum (London).

Mr. H. E. Matthews:—Forty-eight micro slides illustrating the structure of plants.

Dr. Kerr Cross, British Central Africa:—A large case of specimens of native remedies and a series of specimens of the plants from which they are derived.

Mr. S. Acheson, Belfast:—Specimens of bauxite in three qualities, from the Antrim mine and of the pure alumina derived from it.

Mr. T. Wardleworth, Liverpool:—Specimens in fruit of false Maranham jaborandi.

Mr. M. Bateman:—Living specimen of *Luffa aegyptiaca* in fruit.

To the Herbarium (London).

Commendatore Thos. Hanbury, F.L.S.:—Nineteen specimens of medicinal plants cultivated at La Mortola.

Mr. J. Moss, F.I.C.:—Specimens in fruit of *Rhamnus purshiana* and seedling plants of the same species.

From the Curator:—Cultivated specimens of six medicinal plants.

"FIRST" EXAMINATION QUESTIONS.

October 11, 1898.

ARITHMETIC.

Time allowed—from 12.30 p.m. to 2 p.m.

[The working of these questions, as well as the answers, must be written out in full.]

1. Divide 1431 sq. yd. 2 sq. ft. 72 sq. in. by 72 (Factors).
2. If 25 men can do a piece of work in $13\frac{1}{2}$ days of 10 hours each, in how many days of 9 hours each will 30 men do four times as much?
3. A man devised $\frac{5}{7}$ of his estate to one of his sons, and $\frac{1}{7}$ of the remainder to another, and the rest to his widow. The difference between the sons' legacies was £784. How much did the widow receive?
4. Express $\frac{3}{4}$ of £9 6s. 10 $\frac{1}{2}$ d. + $\frac{1}{2}$ of £32 1s. 8d. as the decimal of £1 10s.
5. By selling 7 yards of linen for 5s. I gain 5 per cent. What shall I gain per cent. by selling the same linen at 9 yards for 7s.?
6. By investing £10,325 in the 2 $\frac{3}{4}$ per cents. I secure an income of £350 a year. At what price do I purchase this stock?

(The following question must be attempted by every candidate.)

7. If a loom produces 1.475 metres of cloth in an hour, find approximately how many yards of the same cloth it would produce in 5 weeks, working 10 hours a day, and 6 days a week?

ENGLISH.

Time allowed—from 3 p.m. to 4.30 p.m.

1. Analyse:—"Aristides, saying that the plan of Themistocles was useful, but not honourable, advised the Athenians not to adopt it."
2. Parse fully:—"I'll speak to it, though hell itself should gape."
3. What consonants are redundant in the English alphabet, and in what respects is our alphabet deficient in consonants?
4. In the following passage supply the necessary capital letters, and put in the stops and the inverted commas where necessary:—i knocked at the door

which was opened by a tall dark woman she was evidently a peasant woman but there was something striking about her appearance it might have been but the troubled hunted look in the great dark eyes can you tell me the way to the castle i asked i walked out into the forest this morning and have lost myself take that path you see there she replied and it will bring you on the high road.

The following question must be attempted by every candidate:—

5. Write a short Composition on *one* of the following subjects:—

- (i.) Recent legislation affecting Vaccination.
- (ii.) The Battle of Omdurman.
- (iii.) Naval Warfare in the time of Nelson and now.
- (iv.) "There's no place like home."

LATIN.

*Time allowed—*from 11 a.m. to 12.30 p.m.

I. For all candidates. Translate into Latin:—

1. The slaves will be seen by their master.
2. Will you give the book to me or to my brother?
3. He said he would come after six months.
4. He shuts the gate that no one may escape.
5. The soldiers, being conquered, sought for peace.

II. Translate into English *either* A (Caesar) *or* B (Virgil).

(Candidates must not attempt both authors).

A.—CAESAR.

1. *Cæsar, primum suo, deinde omnium ex conspectu remotis equis, ut aequato omnium periculo spem fugae tolleret, cohortatus suos, proelium commisit. Milites, e loco superiore pilis missis, facile hostium phalangem perforaverunt. Ea disjecta, gladiis destituti, in eos impetum fecerunt. Gallis magno ad pugnam erat impedimento, quod, pluribus, eorum scutis uno ictu pilorum transfixis et colligatis, quum ferum se inflexisset, neque evellere, neque sinistra impedita, satis commode pugnare poterant; multi ut, diu jactato brachio, praeoptarent scutum manu emittere, et nudo corpore pugnare.*

2. *Ita proelium restitutum est, atque omnes hostes terga verterunt, neque prius fugere destiterunt, quam ad flumen Rhenum milia passuum ex eo loco circiter quinquaginta pervenerunt. Ibi perpauca aut viribus confisi, tranare contenderunt; aut lintribus inventis sibi salutem repererunt.*

Grammatical Questions.

(For those only who take Caesar.)

1. Decline, in the singular, *loco superiore*; and, in the plural, *nudo corpore*. (Passage 1.)
2. Give the third person singular of the indicative perfect and of the subjunctive present, and the infinitive future, of all the verbs in Passage 2.
3. Name *three* prepositions which govern the ablative, and write sentences in illustration.
4. Parse fully.—"*Ea disjecta, gladiis destituti, in eos impetum fecerunt.*" (Passage 1.)

B.—VIRGIL.

1. *Haec ait: et Maia genitum demittit ab alto;
Ut terrae, utque novae pateant Carthaginis arces
Hospitio Teucris; ne fati nescia Dido
Finibus arceret. Volat ille per aëra magnum
Remegio alarum; ac Libyae citus astitit oris.
Et jam jussa facit; ponuntque ferocia Poeni
Corda, volente Deo. In primis regina quietum
Accipit in Teucros animum mentemque benignam.*
2. *Namque, sub ingenti lustrat dum singula templo,
Reginam opperients, dum, quae fortuna sit urbi,
Artificumque manus inter se, operumque laborem,
Miratur, videt Iliacas ex ordine pugnas,
Bellaque jam fama totum vulgata per orbem,
Atridas, Priamumque, et saevum ambobus Achillem.
Constitit; et, lacrimans, Quis jam locus, inquit, A hate,
Quae regio in terris nostri non plena laboris?
En Priamus! Sunt hic etiam sua praemia laudi;
Sunt lacrimae rerum; et mentem mortalia tangunt.
Solve metus; feret haec aliquam tibi fama salutem.*

Grammatical Question.

(For those only who take Virgil.)

1. Decline, in the singular, *novae arces*; and, in the plural, *mentem benignum*. (Passage 1.)
2. Give the third person singular of the indicative perfect and of the subjunctive present, and the infinitive future, of all the verbs in Passage 2.
3. Name *three* prepositions which govern the ablative, and write sentences in illustration.
4. Parse fully:—"Solve metus; feret haec aliquam tibi fama salutem." (Passage 2.)

ANALYTICAL NOTES.

DETECTION OF GELATIN IN CHOCOLATE.—It is possible to add 10 per cent. of water to chocolate which contains 5 per cent. of gelatin without materially altering the consistence of the product. A simple test for the presence of gelatin is therefore valuable. P. Onfroy employs the following method to detect this sophistication:—When the gelatin is present in notable quantities, 5 grammes of the sample are powdered and treated with about 50 C.c. of boiling water, 5 C.c. of 10 per cent. lead acetate solution are added, and the mixture filtered; to the filtrate a few drops of saturated aqueous solution of picric acid are added. If gelatin be present, a distinct precipitate will be obtained. Pure chocolates give no precipitates. When only a small quantity of gelatin has been added, the above method is not available, since the tannin naturally present in the chocolate will prevent the liberation of the gelatin. In this case 10 grammes of the sample are taken and treated with 125 C.c. of hot water, then with 5 to 10 C.c. of 10 per cent. solution of potash and lastly with the lead acetate solution as before. The filtrate from this mixture when neutralised will give the ordinary reactions for gelatin.—*Journ. de Pharm.* [6], viii., 7.

IODINE IN THE THYROID GLAND.—Baumann has made some remarkable investigations showing that considerable difference exists in the weight and iodine contents of the thyroid of various inhabitants of Germany. The following table illustrates the proportion:—

	Weight of the dry Gland.	Iodine in 1 gramme.	Iodine of the whole Gland.
Freiburg	8.2 grammes	0.33 Mg.	2.5 Mg.
Hamburg	4.6 "	0.83 "	3.83 "
Berlin	7.4 "	0.9 "	6.6 "
Silesia	7.2 "	0.50 "	4.0 "
Switzerland	97.6 "	0.916 "	8.23 "

Baumann drew from this the conclusion that a low percentage of iodine is favourable to the formation of goitres, especially as there is an epidemic of goitre in Freiburg, while the north of Germany is practically free from it. The opinion of the author was further strengthened by the success of the iodine treatment on the disease and the observation that goitres are mostly poorer in iodine than ordinary thyroids. With the view of determining if this hypothesis be applicable to all countries, Oswald collected similar statistics in Switzerland, but obtained vastly different results, as will be seen by reference to the above table. It is noteworthy that in those districts in Switzerland where goitres are most prevalent, the amount of iodine was found to be considerably higher and not lower, as was to be expected from the theory advanced by Baumann; the goitres themselves were also found to contain more iodine than ordinary thyroids. Whatever relation may exist in Germany between iodine and epidemic goitre the same inference cannot with safety be drawn for other countries.—*Pharm. Centr.*, xxxviii., 624.

DETERMINATION OF NICOTINE IN TOBACCO.—Rudolf Heferman advocates the following method for determining the nicotine in tobacco:—20 grammes of tobacco in powder is dried at 50 C., then 20 C.c. 6 per cent. alcoholic soda solution added to it, and the mixture shaken violently until the tobacco is evenly moistened, then adding to it, by means of a pipette, 200 C.c. ether, shaking again and leaving it until the ether solution is clear. Fifty C.c. of the clear ethereal solution are decanted into a porcelain dish, and the ether allowed to evaporate. The residue is then treated with water, and the nicotine determined by titration with standard acid, using cochineal as the indicator. Nicotine may also be determined by the following modification of Kissing's method in the ethereal residue by adding to it first a few drops of soda solution and then 10 C.c. of water and distilling it with steam until 400 C.c. have come over and titrating the distillate. To guard against splashing over of the soda solution, it is well to use a splash trap. In tobacco, the author has found from 0.35 per cent. nicotine, in cigars from 0.30 to 1.53 per cent., and in cigarettes, stated to be free from nicotine, 0.8 per cent., and more in the ordinary cigarettes.—*Pharm. Centr.*, xxxix., 523.

LOYALTY TO THE CRAFT.

No more useful message could be conveyed to those entering upon the path which leads to the practice of pharmacy than that embodied in the address delivered to the students of the Sheffield School of Pharmacy by Mr. J. RYMER YOUNG, on Thursday last, and of all he said on that occasion nothing singles itself out more for attention than his remarks about the duty each student—and, by inference, each registered chemist—owes to his craft. The severe strictures passed by Mr. YOUNG upon the conduct of registered chemists who, for a momentary advantage, help unqualified joint-stock companies to ruin the practice of pharmacy, were aimed at an evil that is exceptionally serious, and the remedy applied must be severe if it is to be efficacious. As Mr. YOUNG pointedly remarked, the matter is and will continue to be largely in the hands of qualified assistants, who can do much to remove one of the most serious difficulties that pharmacy, as a craft, has ever had to face. If they will only decide to be firm in declining all offers made to them by the unqualified proprietors of joint-stock drug stores, they and every registered chemist in business on his own account, will at once be placed in a better position, with regard to ability to increase salaries, curtail hours, and in other ways improve the position—now too often an unsatisfactory one—of assistants.

But this is only one way—though doubtless the most important and immediately useful—in which loyalty to the craft can be made to reveal itself in a generally advantageous manner. In the first place the registered chemist, in business on his own account, has power to show such loyalty in a variety of ways. If he will refuse to take any youth as pupil who has not passed a recognised preliminary examination, if he declines also to engage anyone, as assistant, who has not served, with a registered chemist in business on his own account, a regular apprenticeship or its equivalent, he will have done much to check the influx of the unfit into the ranks of pharmacy and to “scotch the gigantic injustice of unqualified joint-stock companies trading as chemists and druggists.” He may well go further,—by allowing sufficient time for study and insisting that

it shall be properly utilised for that purpose—thus ensuring that his pupils and junior assistants work steadily at the subjects in which they will subsequently be called upon to show themselves proficient. Moreover, every pupil at the expiration of the term for which he is engaged, should be at least in a fair way to become a safe and competent dispenser, with a sound knowledge of British pharmacy law and all the restrictions that affect a registered chemist in the conduct of his daily business. A sound business training, a fair basis of scientific and technical knowledge and a clear apprehension of the prospect before him, should be secured to every embryo pharmacist. Nothing could be better calculated to prevent him taking such false steps as are now only too frequently taken by those who see nothing but slight immediate benefits and take no heed for the future. The necessity of thorough organisation should also be inculcated, as the next best means of self-defence after securing individual qualification. The man who fits himself to deal with every possible eventuality in the exercise of his chosen life business is probably as well protected as—acting alone—it is possible for any individual to be; but by joining forces with others who are similarly situated he may improve his position enormously, the extent of the protection then enjoyed being only limited by the number who combine together.

Pupils and assistants should, therefore, be urged to join local associations from the very outset of their career, and it ought not to be difficult to convince them that it is also a duty they owe both to themselves and to their craft to join the chief organisation—the Pharmaceutical Society. In addition, loyalty to the craft requires that pupils and assistants should second the efforts of their employers to improve the status of pharmacists in every possible way. They should regard their education—both special and general—as ever incomplete, devote careful attention to the causes which tell against pharmaceutical progress, and hold themselves morally bound to do whatever lies in their power to root out the insidious evil which is steadily undermining the practice of pharmacy as established on the basis of individual qualification. Those assistants who are already registered as chemists and druggists can, as already stated, do more than anyone else to check that evil, and the manner in which Mr. YOUNG has so clearly put the matter before them should help them to arrive at a correct estimate of the present position. The company-pharmacy difficulty must be fairly faced, in the interest of the public as well as chemists and druggists, and it is a cause for congratulation that Mr. YOUNG should have spoken without any trace of uncertainty regarding the problem of the day. Nothing of greater moment on the subject has recently been uttered, and the fact that an active member of the Council of the Pharmaceutical Society has expressed himself so freely in the matter should induce registered chemists to take heart and not despair of the future of their craft. It has already weathered many storms, and if supported by the loyalty of all who may reasonably be expected to lend their support, it will outlast this and other existing difficulties, as well as many that may doubtless be expected to present themselves in the future. But everything in the shape of improvement will be dependent on loyal and united action, the advisability of which should be impressed upon pupils from their earliest years of service, whilst principals ought continually to enforce in practice what they inculcate by precept.

ANNOTATIONS.

SIR J. CRICHTON BROWNE'S ADDRESS has not only created a sensation in the lay press but his remarks about the possibility of criminal poisoning being effected by experts, without serious risk of detection, has distressed Mr. A. Braxton Hicks, who is well-known as one of the London coroners. Speaking at an inquest a few days ago, he said some people in authority in the criminal law had mentioned the matter to him, expressing their surprise, and he could not help calling attention publicly to the remarks made by Sir J. Crichton Browne in the course of his address to the Pharmaceutical Society. It was a public function at which the Press was admitted, and therefore the lecturer knew that a part at all events of his observations would be reported. Yet he alluded to the fact that there were organic poisons well known to medical men, which could be used with impunity without the slightest fear of detection, though they were rarely or never used illegitimately. A connoisseur in poisoning could, it was suggested, by keeping his own microbes, slaughter hundreds of persons without the slightest fear of his crime coming to light. Mr. Braxton Hicks thought Dr. Crichton Browne had gone out of his way to point out what people should do if they wished to poison others, adding that while coroners throughout England were endeavouring as much as possible to prevent poisons being used without detection, the address referred to was not likely to further the ends of justice. But in these days of enlightenment the more reasonable assumption is that the ostrich policy of concealment entails greater risk than intelligent appreciation of existing danger and that, no doubt, was the view taken by Sir James Crichton Browne in his address.

THE AUTHORITIES OF UNIVERSITY COLLEGE, LIVERPOOL, are to be congratulated on the opening of the Thompson-Yates Laboratories of Physiology and Pathology last Saturday. Those laboratories are the gift of the Rev. S. A. Thompson-Yates, and are estimated to have cost, with their equipment, £28,000. They include a class-room for practical morbid histology, a pathological museum, a room for bacteriology, a constant temperature room, and rooms for pathological chemistry and photography. On the first floor is a large theatre, which will be used in winter for physiology and in summer for pathology. There is also a large room for physiological chemistry, a balance room, preparation, research, and electrical rooms. On the second floor is a practical histology room, fitted to accommodate eighty students. Each worker has his own electric light and gas and water supplies. There is a small aquarium in this room, and on the same floor are an animal room, a preparation room, and combustion and photographic rooms. The basement contains a cold storage room, kept at a constant low temperature by the ammonia process, a laboratory for carrying on the work of the Clinical Investigation Society, and rooms for other experimental work. The students' common room is fitted up so that it can be used for the meetings of the Students' Debating Society. There is also a room for electric meters, electricity being provided throughout the building both for lighting and for motor purposes. Ample facilities are provided for photography in all the departments, that being a notable feature of the new laboratories, and provision is made in all the principal class-rooms for lantern demonstrations. The building is heated throughout with hot air, and appears to be completely fitted in every possible way.

LORD LISTER, who formally opened the new laboratories, after the degree of Doctor of Science of the Victoria University had been conferred upon him, referred to the opposition that exists to the practice of vivisection. He assured his hearers that the sacrifice

of animal life by science is absolutely nothing compared with that required by us for our daily sustenance, and that, owing to the use of anaesthetics, the amount of pain inflicted is insignificant. If those persons, he said, for whose humane feelings he had every respect, knew the truth, they would commend and not condemn. The *Standard*, in quoting those words approvingly, remarks that the opposition to what is called "vivisection" is largely based on a misconception, and most of those who are inclined to join in the outcry against it would entirely alter their views if they knew the truth. Some there are, no doubt, who do not want to know the truth, and prefer to cling to prejudice. But they are the fanatics, a class of persons afflicted by a sentimental extravagance which renders them almost incapable of reason and unwilling to examine facts. To their ears argument is addressed in vain, and they will only abuse Lord Lister for telling them the truth. Others, less prejudiced, but still uneasy on the subject, will listen with respect to a man whose humanity none can doubt, when he tells them that vivisection is not the awful thing they had supposed. "That utterly indefensible cruelties have been perpetrated in the name of science cannot be denied, and possibly they are still carried on in some countries. But that is not the case here, where a sound middle course has been taken and vivisection permitted under due control. Of the great benefits that have been conferred on man and beast by its instrumentality during recent years there is no need to speak."

AN EXPERIMENT IN EDUCATION, which is being conducted under the patronage of the Countess of Warwick, at Bigod's Hall, near Dunmow, Essex, has for its object the endeavour to stop, as far as Essex is concerned, the woeful depopulation of the country-side that is going on in so many districts throughout England. Boys and girls are taught together in this school, and the backbone of the curriculum is science, for science, it is contended, will make pupils experimenters, is liberal and democratic, presents new points of view, and by bringing people into touch with the spirit of the age, which is essentially material, gives them something to think about, something to sharpen their wits upon, and makes a cornfield more full of mysteries than a cotton factory. Science comes first in the course of instruction, a little later in the educational career, practice—that is to say, applied science—will follow. Systematic courses in chemistry, physics, botany, mathematics, and drawing have been arranged, and no pupils under the Sixth Standard are admitted. After a two years' course in these subjects, special attention will be given to agriculture and allied subjects. Practical instruction in farming, bee-keeping, poultry rearing, horticulture, fruit-growing, hot-house work, and cooking will be provided, and sports of all kinds will be arranged.

THE NEW LONDON UNIVERSITY SCHEME was the subject of an address delivered by Professor W. A. S. Hewins, at the London School of Economics and Political Science, on October 7. He explained that although the Act dealing with the matter had become law, it did not create a teaching university, but merely provided the opportunity for so doing. The Act placed powers in the hands of a number of Commissioners, such as had never been entrusted to any combination of persons before in relation to the education of the country. The new University, when established, would affect every educational institution throughout Great Britain, including the existing Universities, and would call into operation a system of sound secondary education, revolutionising almost everyone's ideas with regard to technical instruction. By its own momentum, he thought, the London University would become the greatest institution of its kind in the world. Other cities, both Continental and provincial, possessed excellent libraries, etc., in

which a large number of students gathered, but there was no city of such vast extent, or which contained a combination of all those advantages in such a degree, as London. The new University would become both an imperial and an international institution, and if all persons interested would only sink their petty differences and make some sacrifice, the scheme would be important, not only in relation to the educational system of the country, but with regard to the whole political and social future. The English people, it was remarked, suffer from a want of imagination, one reason for that being the lack of a system of university education which touched the greater part of the life of the people. Both at Cambridge and Oxford an ancient system of education was adhered to, but it was not an ideal one, such as that of the proposed teaching university of London might well become.

THE FOOD ADULTERATION LAWS were under consideration at a conference of representative retail grocers from all parts of the country, held at the Agricultural Hall, Islington, this week. The solicitor to the Federation introduced the subject, dealing specially with the proposals of the Government as embodied in the Bill introduced last Session by Mr. Chaplin. That Bill, he said, while it contained some useful proposals, would, if passed, have prejudiced the chances of getting the whole subject of food adulteration effectively dealt with. It was only too evident, he thought, that the Bill was introduced for the purpose of shelving the matter. The question of amending the Sale of Food and Drugs Acts was in no sense a party one, and, possibly, it was for that very reason that it was difficult to induce any Government to deal with it comprehensively. The fact which should be most strongly impressed upon the Legislature was that amendments of the present law were required by all sections of the community interested in the operation of the Acts. The retail trade was not seeking to minimise or check the operation of admittedly useful and necessary legislation, but they desired to strengthen the existing law and to ensure its prompt and effective operation against frauds. Mr. Kearley, M.P., who also spoke, moved:—"That this conference is of opinion that legislation on the subject of the adulteration of food products is urgently required, but that no legislation will be satisfactory unless it is comprehensive in character and includes the main recommendations of the Select Committee on this subject, and that a copy of this resolution be sent to the President of the Local Government Board." Mr. Jarvis, of Birmingham, seconded the motion, and complained that, in spite of the repeated assurances which Mr. Chaplin had given the trade that their representations would have proper consideration, they had been absolutely ignored. After a speech by Mr. R. Bannister, in which he pointed out that it was impossible to fix one standard of purity for food products which should be equally applicable to all parts of the country, the resolution was unanimously adopted.

THE TRIALS OF A PARLIAMENTARY CANDIDATE are great, as Mr. Gwilym Evans, J.P., a former member of the Council of the Pharmaceutical Society has found out. He was the selected candidate in the Liberal interest for the Carmarthen and Llanelly Boroughs, but has been so pestered by exacting electors that he has decided to resign his candidature, preferring a private and unfettered position in the Liberal party. In formally announcing his resignation, he dwelt at length on the undue impositions of an impoverished electorate, and said though he was not blind to the fact that there were certain obligations attached to and sacrifices to be made by Parliamentary candidates, he for one was not prepared to submit to the various demands made upon him. Men had called at his house practically demanding work, and if he was unable to

find some employment for them he was told "the election would some day come round, and then they would remember him." Others came, asking for subscriptions for every imaginary thing, and persons in temporary difficulties, in the small as well as the large way, sought assistance from the little he had been fortunate enough to make for himself. No candidate could satisfy all those applications, and he was not going to be such a fool as to part with what little private means he had for the benefit of anybody. Mr. Evans said he had also been attacked in an unreasonable manner by a local Radical paper, and though he had not taken action in the matter, he was not disposed to refrain from protecting himself in future.

THE ROYAL PHOTOGRAPHIC SOCIETY held its annual meeting this week, and the Earl of Crawford, who, as President, occupied the chair, delivered a short address, in the course of which he said that for some years past he had been very anxious that Her Majesty's Government should set up an establishment for the service of the public museums, which should be primarily devoted to photography. Faithful reproductions of what was rare and beautiful could thus, he thought, be spread widely over the country, and what was now inaccessible save to a few could then be found in all parts of the land. Lord Crawford's connection with the British Museum has rendered him familiar with this want, for requests are continually being sent in there for permission to photograph objects. The suggested establishment should, he urged, be attached to the British Museum, and he is convinced that a year's experience would lead the Government to extend its scope so that it would serve the wants of other and equally important collections. The South Kensington Museum has already recognised the importance of such work, and dealt with the want in a limited way, and if the Government were to set up the required establishment it would, within a very short time, be self-supporting. As proof of this it is only necessary to note what has been done at Berlin and Munich; if similar action were to be taken by the British Government, in due course, the cause of education would be greatly advanced.

THE BANQUET OF THE CHEMICAL SOCIETY to those of its past presidents who have completed fifty years' fellowship of the Society, which was postponed last June owing to the lamented death of the senior past president, Lord Playfair, has now been arranged to take place on Friday, November 11, at the Hôtel Métropole. The past presidents who will then be entertained are:—Sir J. H. Gilbert, F.R.S.; Sir Edward Frankland, F.R.S.; Professor Odling, F.R.S.; Sir F. A. Abel, F.R.S.; Dr. A. W. Williamson, F.R.S.; and Dr. J. H. Gladstone, F.R.S.

A STUDENTSHIP IN CHEMISTRY of the value of thirty pounds per annum has been offered by the directors of Nobel's Explosives Company, Limited. It will be awarded annually to a student in the chemical laboratory of the Glasgow and West of Scotland Technical College, who has passed through the usual course of training in that laboratory and, in the opinion of the professor of chemistry for the time being, is qualified to prosecute research. The holder of the studentship must engage in research work in the chemical laboratory of the Technical College, under the direction of the professor of chemistry for the period of one academical year, and the prize may be withheld in any year if there is at that time no student in the chemical laboratory with the necessary qualifications. In accepting the gift on the above terms, the governors of the College have resolved to grant a free studentship in their laboratory for one year to the Nobel Company's prizeman, thus raising the money value of the prize to about fifty pounds.

PHARMACEUTICAL SOCIETY OF IRELAND.

MEETING OF THE COUNCIL.

The monthly meeting of the Council, being the first after the recent elections, was held on Wednesday, October 5, at the Society's House, 67, Lower Mount Street, Dublin, at three o'clock. There were present: Messrs. R. J. Downes (in the chair), Beggs, W. F. Wells, jun., Porter, Bernard, Kelly, Thomas, O'Sullivan (Waterford), Simpson, Connor (Newry), Brittain, Michie, Dr. Walsh and Professor Tichborne.—The CHAIRMAN welcomed the new members of Council, Messrs. Brittain and Michie, who returned thanks.—Mr. WELLS, at the request of the Chairman, reported the results of the recent prosecutions in Belfast. On the first day there were not witnesses enough in attendance to secure convictions, and the magistrate first decided a case against them, and after a couple of hours sent word to their solicitor that he had withdrawn that decision and would give his decision on a subsequent day. On that day their solicitor had gone on his holidays and left another gentleman in charge, who asked for an adjournment for three weeks, but the Court would not grant it, and dismissed the case with costs against the Society. On a subsequent day they had the services of a new solicitor (Mr. Donnelly) and of a splendid counsel (Mr. McGrath), both of whom did their work well. The first case was against the Ulster Chemists, Limited, and the Society's inspector swore that when he went into the shop there was no one in it but a young man, and that he left a prescription with him, went away, and called again in three-quarters of an hour and got the prescription. The young man said he was the manager, and that he could personally fill the prescription. No witnesses were put up on the other side, and in that case a penalty of £5 was imposed for selling the prescription. It was understood that a contention to have been raised for the defence was, that the prescription was sent away to another establishment to be compounded. The next case was against a Mr. Hogg, a registered chemist and druggist, for unlawfully keeping open shop. It was sought to show that there was a shop within a shop. Young Mr. Hogg gave his evidence very fairly, saying that the shop belonged to his father who paid the rent and received half the profits. The Bench convicted with reluctance and imposed a fine of £5. The next case was against an unqualified assistant for making up a prescription and in it also they obtained a conviction. So that he thought they might be very well satisfied with the work that had been done. He thought the thanks of the Council were due to Mr. Montgomery, who took an immense amount of trouble in connection with those prosecutions.—The CHAIRMAN: I think we should pass votes of thanks not only to Mr. Montgomery but also to Mr. Wells, who left his business and went to Belfast at considerable inconvenience. Mr. Montgomery deserves our thanks for the able way in which he looks after our interests in Belfast. We know that his duty in that respect is not an enviable one to have to perform, and we are exceedingly indebted to him for exerting himself as he does in the matter. I move that our thanks be given to both Mr. Montgomery and Mr. Wells.—Mr. BEGGS said he had great pleasure in seconding the motion, and it was put and unanimously assented to.

Election of Officers.

Mr. WELLS said he would take upon himself the privilege of proposing that their friend Mr. Downes should be re-elected President. He was sure it was not necessary to say a word in order to ensure that this motion should be carried unanimously. It would be admitted that the work of the Society had been well done during the past year, and they were also aware that there had been a tremendous amount of unusual work during that period. Mr. Downes had done his work in a manner that they were all proud of. He had done what he could to further their interests in every way, and if they should not get what they were looking for it would not be through any want of energy or effort on his part.—Mr. BEGGS said he had great pleasure in seconding this nomination, and was sure he need add nothing to what Mr. Wells had said. The President's work had been so ably done that nothing had been left for the Vice President to do.—No other gentleman being proposed, Mr. Wells's motion was carried unanimously.—The PRESIDENT said he deemed it a great honour to have been permitted to fill the office, and a still higher one to be re-elected to it. He could hardly admit that the praise which had been given to him during the last three days was deserved. He had, however, done his best, and he would continue

to do so whilst he filled the chair.—The PRESIDENT then moved that Mr. Beggs be re-elected Vice-President. Mr. Beggs had modestly told them that he had been left nothing to do during the past year, but that was not so. He (Mr. Downes) was the first President of the Society who had said that the Vice-President should work; and he accordingly allocated to Mr. Beggs a share of the committees to take charge of, and he undertook the work of those committees and did it satisfactorily. He had also assisted the Society in other ways.—Mr. PORTER said he had very much pleasure in seconding this motion. He had worked on a great many occasions with Mr. Beggs and could testify as to his anxiety for the welfare of the Society.—The motion having passed unanimously, the VICE-PRESIDENT said he appreciated the honour of re-election very sincerely. He had no doubt that he should be able to discharge the duties as well as he did last year, because the President gave him very little to do. What he did, however, was done as a labour of love and with the desire to relieve the President from too constant attendance at the rooms of the Society. He need hardly add that anything that he should be able to do during the forthcoming year to advance the Society would be a pleasure to him.—The VICE-PRESIDENT then moved that Mr. George H. Grindley be re-elected Honorary Treasurer. His reports had been satisfactory in every respect, and from the amount of trouble he took with them he (Mr. Beggs) was certain that they would be wise in re-appointing him.—Mr. CONNOR seconded, and Professor TICHBORNE supported the motion, which was unanimously agreed to.—On the motion of the VICE-PRESIDENT, seconded by Mr. O'SULLIVAN, Mr. Robert Simpson and Dr. Walsh were re-appointed Honorary Auditors.—Dr. WALSH, in returning thanks, said he had had very little trouble in consequence of the excellent way in which the Registrar, Mr. Ferrall, had everything ready for the Auditors.

Committees.

The Committees were then constituted as follows:—The Law Committee of last year was re-elected with the addition of Messrs. Tate and Brittain.—The Committee to Inspect Candidates' Certificates was re-elected.—House and General Purposes Committee: Messrs. Bernard, Grindley, Porter, Ryan, Professor Tichborne, Connor and Michie.—School Committee: Messrs. Porter, Professor Tichborne, Turkington, Dr. Walsh, Michie and Connor.—Declaration Committee: Messrs. Grindley, Wells, Montgomery, Turkington, and T. O'Sullivan.—A letter from Dr. Ninian Falkiner, asking for certain drugs, chemicals and apparatus in connection with the new Pharmacopœia for the use of the School, was referred to the School Committee, with a request that they would confer with Dr. Falkiner on the subject, and afterwards report to the Council.—A letter was read from Mr. R. Watson, associate druggist, intimating that it was not his intention to renew his subscription to the Society.—Mr. WELLS: I am sorry for this. Mr. Watson is one of the good old chemists and druggists who has always taken an interest in the Society, and we should ask him to reconsider his decision. I move that that be done.—Mr. SIMPSON seconded the motion.—Mr. WELLS: I asked him at one time to allow me to nominate him for a seat on the Council, and he said he would if we could not get any other druggist, but that he would rather not.—The motion was unanimously agreed to.

Gold and Silver Medals.

A report of the School Committee related to the above subject. At the Licence examination the best answering for the year was that of Mr. Archibald Clarke Ross, whose total marks amounted to 239 out of a possible 300, his separate marks in each of the three divisional subjects being respectively 90, 77, and 72. This was one mark short of the standard for gold medal, and the Committee awarded him the silver medal. They at the same time recommended that a second silver medal should be awarded to the next best answerer, Mr. Mathew Campbell, whose total marks amounted to 237, his separate marks being 80, 91, and 66 respectively.—After a short discussion, in the course of which stress was laid on the fact that Mr. Ross's total was only a single mark short of the gold medal standard, it was resolved, on the motion of Mr. O'SULLIVAN, seconded by Mr. BERNARD, that Mr. Ross be presented with a gold medal and Mr. Campbell with a silver medal, the gold medal to be engraved, "For highest answering," and the silver one "For high answering."—Mr. BERNARD moved that a complete index of the various towns and cities in Ireland, and the names and addresses of the pharmaceutical chemists, licentiates of the Apothecaries' Hall, chemists and druggists, and registered druggists, who keep open shop for the sale of

poisons therein, be prepared and kept written up to date for reference. The Council were supposed to superintend the sale of poisons and the compounding of prescriptions, and no establishment should be open without its knowledge. If the Council agreed to the principle of this proposal, he desired that it should be referred to a committee to work out details.—Mr. O'SULLIVAN seconded the motion, which, after a short discussion, was agreed to.—On the motion of the HON. TREASURER, seconded by Mr. WELLS, the following gentlemen were elected members of the Society: Messrs. James B. Bolger (Maryborough), John Copithorne (Skibbereen), John C. C. Payne (Belfast), Hamilton Rutherford (Ballybag), and William J. Savage (Newry).—On the motion of Mr. WELLS, seconded by Mr. KELLY, Messrs. D. Bennett (Cork), and J. Allen, of Lisburn, were nominated for membership.—The Council then adjourned.

SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY.

INAUGURAL MEETING.

The fourteenth session of the Sheffield School of Pharmacy was inaugurated on Thursday, October 13, at the Masonic Hall. There was a good attendance of pharmacists and friends of the students to witness the presentation of awards to the successful students and to hear the address of Mr. J. Rymer Young, of Warrington.—Mr. G. SQUIRE, the President, occupied the chair.—Mr. T. S. RHODEN, the School Secretary, presented the following report of the thirteenth session:—In presenting the report of the Sheffield School of Pharmacy for the thirteenth session, extending from October 4, 1897, to the end of April, 1898, it is very satisfactory to have the pleasure to announce that it was a most successful session. The number of students who attended it was well maintained. Classes were held in the following subjects:—Theoretical chemistry and physics, practical chemistry, botany, and materia medica. The lecturers report that the attendance, diligence and interest of the students have been well maintained, and that progress was made is evidenced by the excellent results of the examinations. It is satisfactory to note that the bronze medal offered by the Council of the Pharmaceutical Society of Great Britain for a herbarium competition, open to the United Kingdom, Channel Islands, and the Isle of Man, was awarded to a student at the Sheffield School. The prize winners are as follows:—

THEORETICAL CHEMISTRY AND PHYSICS.—1st, T. T. Cocking; 2nd, J. W. P. x.
PRACTICAL CHEMISTRY.—First, W. Coulshed; second, W. Stather.
BOTANY.—First, Tom Hardy; second, W. Coulshed.
MATERIA MEDICA.—First, W. Coulshed; second, Edwin Richards.
NEWSHOLME HERBARIUM PRIZE.—T. T. Cocking.

The PRESIDENT then congratulated the prize winners and welcomed the new students, at the same time giving them a few words of encouragement to work with a will, as so much depended upon early study. He regarded the prospects of the School as exceedingly bright, and was confident that the new arrangements for carrying it on would prove of benefit and advantage to the public. The scheme they had adopted was in the nature of a preliminary step. He acknowledged the encouragement which they had received from the authorities of Sheffield University College, and said the Committee hoped to arrange for a definite system of education to comprise a three years, curriculum. It was to the universities they must look for education in the future, and he personally looked forward to the time when the classes for pharmaceutical students at the Sheffield University College, would take the first position in the country.—The PRESIDENT then distributed the prizes, after which he called upon Mr. Rymer Young to give the

Inaugural Sessional Address.

At the conclusion of the address, which is printed in full on page 419, *et. seq.* Mr. Rymer Young was heartily thanked for his address, on the motion of Mr. S. T. RHODEN, seconded by Mr. J. AUSTEN.

ANNUAL DINNER.

In the evening the annual dinner of the Sheffield Pharmaceutical and Chemical Society was held in the same hall.—Mr. SQUIRE

again presided, and the public life of Sheffield was well represented among the numerous guests. The toast-list was as follows:—

Proposed by		Responded to by
The President.	"The Queen."	
Mr. A. R. Fox.	{ "The Houses of Parli- ment."	Ald. Langley, M.P.
Mr. A. Eberlin (Hon. Sec. Nottingham and Notts. Chemists' Association).	{ "Sheffield Pharmaceutical and Chemical Society."	The President.
Mr. J. M. Furness.	{ "Pharmaceut'cal Society of Great Britain."	Mr. G. T. W. Newsholme. Mr. Rymer Young.
Mr. J. F. Eardley.	{ "The Medical Profession."	Dr. Robertson, B.Sc. Dr. Geo. Wilkinson, B.A., F.R.C.S.
Mr. A. H. Allen.	{ "Sheffield University Col- lege and Learned Societies."	Dr. Hicks (Principal, Sheffield University Col- lege).
Mr. W. Ward, F.C.S.	"The Visitors."	Mr. J. Humphrey.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.

PRESENTATION OF PRIZES.

The presentation of Medals, Prizes, etc., and the Inaugural Address by Deputy Inspector-General F. Browne, took place on Tuesday, October 11.—The President, Mr. Jas. Cocks, presided, and there was a large attendance.—Dr. BROWNE, in presenting the prizes, congratulated the students of the Association on the success which they had obtained; he thought that a large amount of the success was due to the energy which had been displayed by the teachers. Whilst congratulating those students who had obtained prizes, he would say a word of encouragement to those who had been unsuccessful. He regretted that the medical profession of the present day were accustoming themselves to rely upon patent medicines, etc., thus ignoring the chemist. He thought that the two professions (medical and pharmaceutical) should run together in harmony working mutually together for each other's good. The prizes were then presented to the following successful candidates:—

Prizes from the Pharmaceutical Society.

ADVANCED PRACTICAL CHEMISTRY.—Mr. H. M. Morgan (Silver Medal and Books).

HERBARIUM PRIZES (Pharmaceutical Society).—Mr. W. Hellyer (Silver Medal); Mr. H. J. Reynolds (Certificate).

Prizes Presented by the Association.

Mr. W. Hellyer and Mr. H. J. Reynolds (books, value 80s., in recognition of winning the Medal and Certificate of the Pharmaceutical Society).

BOTANY.—1. Mr. H. J. Reynolds; 2. Mr. H. Vibert. Juniors: 1. Mr. W. Pickard; 2. Mr. J. E. Poad.

LOCAL HERBARIUM COMPETITION.—Mr. W. Pickard.

Mr. C. J. PARK remarked that there had been a severe competition for the Pharmaceutical Society's herbaria prizes this year, and it had afforded him the greatest pleasure to see Plymouth students so well represented on the prize list of the Society.—Mr. C. BREEZE proposed and Mr. MORGAN seconded, a hearty vote of thanks to Dr. Browne.—Mr. J. R. JOHNSON announced that classes in pharmacy, materia medica, and pharmaceutical chemistry would be started on the following week. The Committee had not yet been able to come to a suitable agreement with the technical schools, but he hoped a large number would avail themselves of the special classes to be held at the rooms. Votes of thanks to the Chairman and Mr. C. A. Reade concluded the meeting.

ANNUAL MEETING.

The annual business meeting of the above Association was held at the rooms on Wednesday last, the 12th inst., at 2.30 p.m. The PRESIDENT, Mr. Jas. Cocks, occupied the chair, there being a good attendance.—The SECRETARY, Mr. C. T. Weary, read the annual report of the Committee, which was considered highly satisfactory. The social part of the year included the annual ball, smoking concert, and outing, from each of which functions a substantial balance had been handed over to the funds of the Association. Lectures had been delivered to the Junior Section by Dr. Cheyne Wilson, Messrs. J. D. Turney, O. A. Reade, and H. P. Hearder. The following gifts have been presented to the Association: Valuable books for the Library from Mr. Lambie, lantern slides by an Honorary Member, an excellent optical lantern by Mr. Jas. Maurice. The invitation from the chemists of this Association to the British Pharmaceutical Conference to hold its

session in Plymouth in 1899 was heartily accepted. The President, Mr. Jas. Cocks, has already obtained promises of £45 towards a guarantee fund. The following officers have been appointed on the executive of the Conference:—

CHAIRMAN.—Mr. C. J. Park.
LOCAL SECRETARY.—Mr. J. D. Turney.
LOCAL MEMBER OF THE EXECUTIVE.—Mr. G. Breeze, J.P.
AUDITOR.—Mr. F. Maitland.

Three of the £1 shares in furnishing the rooms have been paid off during the past year.

The TREASURER (Mr. Condy U'Ren), reported the highly satisfactory balance in hand of £7 13s. 9d.

Election of Officers.

The Report having been unanimously adopted, the following officers were elected for the ensuing year:—

President: C. J. Park.
Vice-President: Plymouth, James Maurice; Devonport, C. T. Weary; Stonehouse and District, O. A. Reade.
Committee: Plymouth, W. Condy U'Ren, R. F. Roper, J. Harvey Bailey; Devonport, H. D. Davey, Martin Johnson; Stonehouse, F. Maitland. Junior Section: H. M. Morgan, W. Reynolds (Secretary).
Hon. Treasurer: W. H. Woods.
Hon. Secretary: George Breeze.
Auditors: H. P. Header, W. H. Austin.
Past Chairman: James Cocks.

The Report of the Educational Committee

was read by Mr. J. R. Johnson (Hon. Sec.).

From an educational point of view the two past years may claim to have been most successful. Two junior members (Messrs. Hellyer and Reynolds) have been successful in gaining the Silver Medal and Certificate with Honour, awarded for the best herbaria collected in Great Britain by the Pharmaceutical Society. In appreciation of this most satisfactory result Messrs. J. Cocks, J. Maurice, H. Woods, and P. A. Kelly are presenting further prizes to the two young gentlemen, for the honour they themselves have gained, and, through them, the Association. The usual botany course had been again conducted by Mr. Reade during the summer, and comprised weekly evening classes and monthly rambles. The number of students who attended was 12, and the average attendance 11. Mr. Reade reported that among the rarer plants of the district found by members of the class during the summer were *Borago officinalis*, L., *Spiranthus autumnalis*, Rich., *Verbascum nigrum*, L., *Verbascum thapso-nigrum*, *Gymnadenia conopsea*, Br., *Gnaphalium sylvaticum*, *Nasturtium sylvestris*, Br., and the white-flowered *Digitalis purpurea*. An examination in botany was held on September 28, Messrs. J. Turney and O. A. Reade being examiners.

RESULTS.

SENIORS.—H. J. Reynolds, first; H. Vibert, second.
JUNIORS.—W. Pickard, first; J. E. Poad, second.

Herbarium Competition.

In the herbarium competition Mr. Pickard's was the only collection sent in. The plants were examined by Mr. E. M. Holmes, F.L.S., who writes as follows:—

The collection submitted to me shows evidence of very careful and painstaking work, very unusual with a young beginner, and gives promise of even better work in future when experience has shown possibilities of improvement in detail. If the gentleman bears in mind that all work should be of use to others, and that work into which forethought enters is worth a great deal more than work mechanically done, he will, I think, be proud of and take pleasure in his work in the future, even more than he may do in the work now before me.

(Signed) E. M. HOLMES.

Trade Section.

The HON. SECRETARY (Mr. F. Roper), reported that the trade has been largely used during the past year as a means of supplying members with goods in small quantities on best wholesale terms. A few proprietary articles have been added since the last report. Negotiations are now pending with regard to Kay's essence, Scott's emulsion, Mellin's food, etc., with a view to their being included in the scheme.

The Weekly Classes.

It was explained by Mr. JOHNSON that among other difficulties it had been found impossible to secure a sufficient number of students for the classes at the fees required by the Technical Schools, and therefore the project had to be reluctantly abandoned. It was therefore decided to continue weekly classes in pharmacy and materia medica, conducted by Messrs. O. A. Reade and J. R. Johnson respectively. B. P. chemistry conducted by Mr. H. M. Morgan at a fee of 10s. per student per class, the teachers to

retain two-thirds of the fees and one-third to be handed to the Treasurer of the Association. A vote of thanks was proposed by Mr. J. COCKS, seconded by Mr. KELLY, to Messrs. Reade and Johnson for their kindness in conducting the classes during the past year, from which such excellent results had been obtained. A hearty vote of thanks was accorded to the retiring officers for their services during their year of office. Several other questions were discussed, including the election of Local Secretaries of the Pharmaceutical Society.

THE ANNUAL DINNER.

The annual dinner of the Association was held at Routly's Farley Hotel, Plymouth, on Wednesday, October 12. Mr. C. J. PARK (President), occupied the chair. Those present including J. C. C. Payne, J.P. (President, British Pharmaceutical Conference), J. Cocks, W. H. Woods, O. A. Reade, C. T. Weary, G. Breeze, J. Maurice, J. R. Johnson, R.N., J. B. Swainson, H. D. Davey, A. D. Breeze, J. A. Lambie, H. J. Bailey, R. D. Doble (Tavistock), J. D. Turney, P. A. Kelly, S. A. Perkins, M. Johnson, H. P. Header, R. F. Roper, Dr. Cheyne Wilson, Dr. Burns Browne, F. Maitland, F. W. Hunt, T. Ginn, J. Barge, F. Luxon (Townsend and Co.), Dalgleish (Ford, Shapland and Co.), W. H. Pote (Silverlock and Co.), etc.—Letters of apology were received from Messrs. Kinton, Bond, Downing (Launceston), Matthew, Netting, Gadd (Exeter), Green, Richard Bembridge (Registrar of the Pharmaceutical Society), Walter Hills (President of the Pharmaceutical Society), and E. M. Holmes.—Mr. BREEZE, in proposing

The Pharmaceutical Society of Great Britain,

said it had passed through many vicissitudes. In 1868 great opposition by many chemists and druggists had limited the power of the Society at the present time. Latterly the Council had shown anxiety to identify itself with the trade interests of the country. During the past year it had succeeded in successfully opposing the Poisons Bill, also successfully introducing the Pharmacy Acts Amendment Bill, which ought to be a great means of strengthening the Society. The Benevolent Fund was most beneficial, and is conducted in a most satisfactory manner. The Society bearing all expenses, so that all amounts subscribed went direct to the recipients. He was sure all members were grateful for the great work which the Society had done in the past, and hoped for still greater in the future, but if great reforms are to be carried out, the Society must have the assistance of practically the whole of the chemists of the country.—Mr. PARK, in responding, regretted the absence of their very worthy President (Mr. Walter Hills), and referred to the unfairness of company trading, but he hoped by means of the Pharmacy Acts Amendment Bill there would be a great influx of new members, by means of which they would be able to approach Parliament and obtain the protection to which they were entitled in return for the very stiff qualifying examination which the Minor had now become. He was glad to say there were very few chemists in the Three Towns who did not support the Society. The majority also support the Benevolent Fund, which was doing a truly great work. He urged upon all present to persuade fellow-chemists who were non-members to join the Society, and regretted that only a little over one fifth of the qualified chemists in the country belonged to the Society. What they required was not so much the money as the moral support of chemists. Subscribers had their full value by receiving the *Pharmaceutical Journal* weekly, which had improved to such a large extent of late years.—Mr. PAYNE, in proposing

The Local Association,

said it reflected great credit on everyone connected with it. He commented upon the great advantages which Plymouth possessed as an educational centre. In this Association the seniors appeared to take a great interest in the junior section. One of the greatest difficulties in forming associations that used to exist was the mutual distrust of each other. Among chemists a large amount of the success was due to one or two members who worked indefatigably from the start, culminating now in such a large percentage of local chemists belonging to the Association, which had made itself felt such a great force in the country. He was pleased to see such a satisfactory balance, which proved that they had a good treasurer (Mr. Condy U'Ren). In proposing the toast he wished to couple the names of Messrs. Cocks, Park, Reade, and Johnson.—Mr. JAS. COCKS, in responding for the Local Association, wished to offer Mr. Payne a hearty welcome to the district, which the

members of the Association would have the pleasure of renewing in the ensuing year. The past year had been one of great success as seen on reading the Annual Report, and it was hoped the coming one would be a brilliant one. The Association had again been fortunate with the choice of Secretaries in the Local Section, with the usual result that each had been distinct successes. The Trade Section has further illustrated its financial advantages, while members are reaping daily benefits from the P.A.T.A. The Educational Section has outdistanced all former years owing to the thoughtful labours of Messrs. Reade and Johnson, culminating in two of the pupils distinguishing themselves in the Herbaria competition. In November last theirs was the first Association to discuss the proposed Pharmacy Acts Amendment Bill, and as it has become law he (the speaker) would suggest endorsing their action then by forming deputations, urging those in the district who are not members to become so. They had actively opposed the Government Poisons Bill, which was ultimately dropped; also a guarantee fund had been obtained locally for the coming Conference. They had also a substantial increase in membership and a favourable balance sheet, thanks to the Hon. Treasurer, who, he regretted to say, was not present owing to family bereavement.—Messrs. O. A. READE and J. R. JOHNSON also responded, both remarking what great pleasure it had been to them to have been of any service in furthering the education of the students of Plymouth.

The Visitors.

—Mr. J. D. TURNEY said he was sure they all felt complimented by the presence of Mr. Payne that night, it showed how anxious he was that the Conference of the ensuing year should be a successful one, as he had journeyed from Belfast to be present. His presence recalled to him the hearty welcome which he (the speaker) and Mr. Park had received at the hands of the Irish pharmacists when present at the Conference. He wished to couple with the toast of the visitors the names of Messrs. Payne, Dr. Burns Browne, Dr. Wilson, and T. W. GINN.—Dr. BROWNE, in responding, said although arrangements between the Association and the Technical Schools had fallen through for the present with regard to special classes, he hoped that at no very distant date a school of pharmacy would be established in Plymouth.—Dr. CHEYNE WILSON, in responding, wished that there were a better understanding between members of the pharmaceutical and medical professions. He would like to see doctors giving up dispensing their prescriptions and chemists abandoning prescribing. If this could be brought about, he felt that chemists would be in a much better position.—Songs, recitations, etc., were rendered by Messrs. P. A. KELLY, J. D. TURNEY, H. J. REYNOLDS, J. REYNOLDS, C. T. WEARY, J. R. JOHNSON.—The final toast of the Secretary of the dinner, Mr. A. D. BREEZE, was proposed by Mr. PARK, this concluding the business of the evening.

MANCHESTER PHARMACEUTICAL ASSOCIATION.

The annual general meeting of this Association was held on Wednesday, October 12, at the Victoria Hotel, Manchester. Mr. G. S. WOOLLEY, President of the Society, occupied the chair. Owing to the fact that only twelve gentlemen had been nominated to serve upon the Council for the ensuing year no ballot took place. An address was given by Mr. J. HARRISON, member of the Council of the Pharmaceutical Society, on—

Pharmacy and Parliament.

He said it was with great pleasure he had learnt since he came into that room that fifty-six years ago they had an Association in Manchester which laid down very broad principles, which they could not too strongly hold in their midst to-day. That resolution approved of the general principles of the Pharmaceutical Society of Great Britain. It was equally so now, for what were those principles? They were mainly three—the promotion of sound education amongst those who practised pharmacy and the protection of their interests and the provision of a benevolent fund for those who, through misfortune, were shipwrecked in the course of their career. They were carrying out those principles as energetically now as then, but their forefathers went further. They expressed an opinion that the Pharmaceutical Society was entitled to the support of the trade. It had not always been so since, but he was there to say that if they did not possess the entire confidence of the trade it was the trade which was at fault, rather than the Council of the Pharmaceutical Society. The past session of

Parliament so far as that Society's went was of unique interest to all engaged in the practice of pharmacy. It was unique that they should in one year promote and carry a Bill in Parliament, and also in one year oppose successfully a Bill which was inimical to their interests, and he thought the very great care and attention which the President of the Society had devoted to the promotion of that Bill entitled Mr. Walter Hills to the warmest thanks of the whole trade. It had been said in Manchester, What necessity was there for a Bill of that kind? He was sure they had all felt for many years that the constitution of the Society was not what it ought to be. The expression had been used in that room that evening, a little out of date. When they had a Society which purported to represent and should represent the entire body of pharmacists, it was a sorry spectacle when they went to Parliament and showed that not more than one-fourth were numbered in their Society. Out of 15,166 persons on the Register only 3800 of them belonged to their Society. Was it possible to estimate the loss of political power which followed from the fact that so few of their members were members of the Pharmaceutical Society? Now all those 3800 members were entitled to take office as members of the Council if elected. In 1897, at the election of the Council, 3677 voting papers were issued, and out of these only 2035 persons were sufficiently interested in the work of the Society to record their votes either for or against the candidates whose names were placed before them. This showed there was something absolutely wrong in their Society, and it was their duty as practical men to look for a remedy for such a state of things.

He believed the remedy was this: a large number of the fifteen thousand conceived themselves under some political disability in reference to the constitution of the Society that had gone on increasing from year to year, and it became their bounden duty to put an end to this anomaly. What they had done was to make every man on the Register in future entitled to the highest position in that Society if elected. He therefore trusted they would find that a large number of those who had not hitherto joined the Pharmaceutical Society would now deem it their duty to become members and increase the political power and influence of that Society, because there were still many problems to solve which could only be solved by a Council representing a large amount of public opinion behind it. So far at the sale of poisons was concerned he could place more reliance on the high conscientious discharge of his duty by a properly qualified chemist than on the regulations of any department of the State. He had great respect for governing bodies but he did not regard them as omnipotent, and he thought the pharmacist was more able to take steps for the protection of the public and the protection of himself than anything likely to come from a State department. The circumstances of the last few years did not show, he contended, that their trade should be interfered with as it had been. Could it be shown that the mistakes of chemists called for interference? He thought not. They all deplored mistakes, but there was no other calling of so responsible a character in which mistakes were so few, nor men more alive to the conscientious discharge of their duties. Instead of promoting the sale of poisons it was rather the desire of pharmacists to restrict their sales. The Government, he held, had not clean hands in the matter of the sale of poisons. Chemists knew that for a long time past one poison which was used for an unlawful purpose ought to have been scheduled among the list of poisons; he alluded to carbolic acid. Time after time they had pointed out to the Privy Council that carbolic acid ought to be scheduled, but the Privy Council persistently refused to recognise it as such. What were the reasons of the Privy Council for its action? The reply was that it had consulted the Local Government Board on the subject, and the Board was so impressed with the importance of carbolic acid as a disinfectant, and its use in infectious diseases, that it could not see its way to restrict the sale. The Board was convinced that no difficulties should be placed in the way of poor people obtaining this disinfectant. Considered in that light, what could be said of the poor people of Ireland, for in the sister isle carbolic acid could only be got from a qualified chemist?

The poor people in Ireland were protected, but in England the poor were not protected. He thought he could explain the matter and show how it had all been brought about. We in England prided ourselves on our powers of self-government and on our democratic institutions, but he could tell the meeting that we were governed to a much larger extent than they thought by Government officials. He had spent a great deal of his time with the officials of the Local Government Board, and he knew

a good deal of them. Parliament was not so strong as it was thought to be. A great deal of power rested in the hands of officials, and he thought they would have to look in vain to them in order to have carbolic acid scheduled in the list of poisons. He considered the Government remiss in its duties with regard to this acid. The Government was more strict in other departments. It was strict enough with regard to revenue, very keen indeed was it in that respect. Those who dealt in intoxicating liquors had to pay for their licences. There was no remissness with them, but on questions affecting the lives of women and children the Government took no notice. Chemists had been told that they had tried to get a monopoly in the sale of poisons. Well, he would reply, Did they want free trade in poisons? He believed the people would say that they did not, but that rather they wanted protection. If, then, they did not want free trade in poisons the best way was to place the sale of them in the hands of educated men who knew how to deal with them. Another question he wished to touch upon was that of company trading. That question had been before the country for a great many years. Some years ago an action was brought against a co-operative society for dealing in poisons. The case was taken from court to court until it finally reached the House of Lords, where it was decided that as a company could not be examined, it was outside the law and could not be touched by the Pharmacy Act. Altogether that seemed to his mind to be an extraordinary thing—that a company was outside this Act of Parliament. That seemed to be an anomalous position, yet it was the positive law of the country, for there was no appeal from the House of Lords, and only an Act of Parliament could deal with it. Unregistered men were not to be trusted with the business of a chemist and druggist. Justice demanded that before a limited company could use the title of pharmacists they should have qualified people on the directorate. There ought to be some qualification for the general conduct of the business, and that was a matter he should like to see local pharmaceutical associations taking up. He thought a solution could be found for the evil which existed. The widows' clause of the Act of 1868 ought also to be dropped, and must be repealed before they could expect to deal with the companies. He hoped they would be strong enough to suppress these one-man concerns.

It was necessary they should profit by the experience of the past. Their chief duty should be to find out their weak points, and, if possible, remove that weakness entirely. They had learnt something of the power of organisation. It was something that they had been able to influence Members of Parliament from Bloomsbury Square, and they had now grounds for asking the Legislature to extend the Act of 1868 so that a larger number of articles might be placed in the Poisons Schedule. He urged that they should demand their rights, so long withheld, and that, if possible, they should have a member of their body in the House of Commons. In support of this he had to remind them that they had to elect the late Mr. Jacob Bell before they could get the Pharmacy Act. Mr. Harrison expressed the pleasure it had afforded him to visit Manchester once more, and thanked those present for the attentive hearing they had given him.—At the close of the address Mr. HARRY KEMP moved a vote of thanks to Mr. Harrison, which was carried with acclamation and duly acknowledged.—In the course of formal business, the CHAIRMAN moved the adoption of the annual report read by Mr. BLACKBURN, which was seconded by Mr. JOHN BLYTON.—Mr. G. S. Woolley was re-elected President, Messrs. W. Kirkby and Harry Kemp as Vice-Presidents, and Mr. A. W. Pidd as Treasurer. Mr. W. J. Walton, Higher Broughton, was elected Secretary in the room of Mr. Blackburn, who was heartily thanked for his five years' services.

LEGAL INTELLIGENCE.

PHARMACEUTICAL SOCIETY *v.* KAHLE.

At the Whitechapel County Court, on Oct. 12, before his Honour Judge Bacon, the Council of the Pharmaceutical Society of Great Britain sued Martin A. G. Kahle, of 127, Leman Street, E., for two penalties of £5 each, one for keeping open shop for the retailing of poison, and the other for taking, using, or exhibiting the title of "Chemist," contrary to the Sections 1 and 15 of the Pharmacy Act, 1868.

Mr. T. R. Grey, instructed by Messrs. Flux, Thompson, and Flux, appeared for the Society; Mr. Arthur May, instructed by Mr. Peters, appeared for the defendant.

In opening the case Mr. Grey said that the penalties claimed were in respect of keeping open shop for the retailing of poison and for taking, using, or exhibiting the title of "Chemist," both being offences under the Sections of the Pharmacy Act, 1868, unless the person was a duly registered pharmaceutical chemist or chemist and druggist. The defendant carried on business at 127, Leman Street as a chemist and druggist, and he should prove that a poison included in the Schedule, namely, laudanum—a preparation of opium—had been purchased at his shop, and that labels used in the business bore upon them the title of "Chemist." The defendant's name was not upon the Register of Chemists and Druggists, and he should submit that he had incurred the penalties sued for.

J. Partridge, examined: Upon instructions received from the Registrar of the plaintiff Society, I went to 127, Leman Street, on July 23 last. The name over the shop was H. W. Langbeck. I purchased twopennyworth of laudanum and twopennyworth of soap liniment. The shopman referred to defendant before serving me as to the quantity of laudanum he was to give me. The bottle produced, when handed to me, had upon it the labels as they now appear.

Cross-examined: I recognise both the man who served me and the defendant.

H. Moon, examined: Partridge handed to me the bottle which has been produced, and I subsequently handed it over to the analyst. I produce certificate of death of Mr. H. W. Langbeck. He died on March 6 last in the German Hospital.

Alfred John Chater, examined: I saw defendant in the Society's office. At the interview he volunteered the statement that the business had been left to him and he wanted to pass his examination. He had been up for examination three times and failed.

Cross-examined: The last time was this month.

E. J. Eastes, F.I.C., proved making an analysis of the purchase, and he found it to contain laudanum, which was a preparation of opium.

T. R. Struthers (examined): I am Poor Rate collector for the South Ward. I produce the rate-book. The tenant of 127, Leman Street is Martin Kahle. Mr. Kahle is the occupier, and he has paid the rates for some time.

Mr. Grey: I put in the Register for this year, in which the defendant's name does not appear, and that is my case.

Mr. May, on behalf of the defendant, said that his case was that the business was being carried on by the executor of Mr. Langbeck, and that under Section 16 of the Act the executor of a qualified chemist was entitled to carry on the business so long as he employed a duly qualified assistant, and in this business a duly qualified assistant was employed.

J. G. Horsey, examined: I am the executor of Mr. H. W. Langbeck. I produce the probate of his will.

Cross-examined: The business belonged to Mr. Langbeck. There is no mention of the business in the will.

By the Judge: Have you been receiving the profits?

Witness: No. There was a peculiar arrangement between Langbeck and Kahle. Kahle conducted the business, paid all accounts, and paid Langbeck £40 a year out of the profits.

Examination continued.—I have not been carrying on the business. The business was sold to Kahle on July 26 last. It was transferred to him by myself. I was advised that the agreement ended with the death of Langbeck.

His Honour: Who paid the qualified man?

Witness: Kahle paid the qualified man.

His Honour: Then you were not conducting the business?

J. Vine, examined: I am a registered chemist, I was engaged by Kahle in May last as assistant. I sold the laudanum to plaintiff's witness.

Mr. May: I submit to your Honour that the executor was in possession of the business when the purchase was made, and that the sale was conducted by a duly qualified man. Section 16 says, "It shall be lawful for any executor of a pharmaceutical chemist or chemist and druggist to continue such business, if, and so long as it shall be *bonâ fide* conducted by a duly qualified assistant.

His Honour: Call the defendant.

To the Defendant: Who is carrying on the business now?

Defendant: I am.

Cross-examined by Mr. Grey: I had some envelopes printed with my name on like the one produced before I went up for my examination. I never used them. On August 9 I wrote the Society's solicitors, saying, "The shop is kept by Mr. William S. Hunter, a duly registered member of the Pharmaceutical Society."

His Honour : In this case the plaintiffs, who are very properly looking after the safety of the public, sue for penalties under the provisions of the Pharmacy Act. I am satisfied that defendant was carrying on the business for his own profit, and that he has incurred the penalty for keeping open shop. I entertained a little doubt as to the other penalty, but, although the title is used in conjunction with the name of Langbeck, I think it comes within the Statute, and in my opinion he has committed the breaches of the law complained of, and I must give judgment for the plaintiffs for the two penalties with costs.

NEW REMEDIES.

EUPHORBIVM RESIN IN THE TREATMENT OF SURGICAL TUBERCULOSIS.—A fine emulsion of euphorbium resin, containing a quarter of a milligramme in each C.c., has been found by Pénierès to be an excellent remedy in tuberculosis. In most cases one cubic centimetre will be found to be sufficient and gives rise to no undesirable secondary symptoms. The action of the resin is slow and persistent, one injection in eight days being sufficient; its bactericidal action is not attended by any induration of the tissue after the cure has been effected.—*Bullet. Comm.*, cxv., 519.

METHYLENE BLUE IN SPERMATIC NEURALGIA.—Three cases of severe neuralgia of the spermatic plexus have been cured by J. Domingo by the internal administration of methylene blue in doses of 10 centigrammes every other hour. Pain disappeared in one case after taking 120 centigrammes and did not recur.—*Amer. Med. Surg. Bull.*, through *Int. Med. Mag.*, xii., 67.

CALOMEL IN DIPHTHERIA.—Leonard Judd gives calomel in large doses, 10 grains for an initial dose followed by 5 grains every hour until eight doses have been given for a child aged 18 months, and 20 grains to commence for an adult for a first dose, followed by 10 grains every hour until 360 grains had been given. In two such cases excellent recoveries resulted, without any ill effects from the treatment.—*Annals of Hygiene and Medic.*, through *Intern. Med. Mag.*, vii., 43.

POTASSIUM BROMIDE IN WHOOPING COUGH.—Dr. T. M. Doolan has found the frequent administration of potassium bromide to be an excellent remedy in the treatment of pertussis; he prescribes it as follows: Potass. bromid., 2 drachms; water to 10 fluid ounces. For an infant, 3 fluid drachms; for children from two to three years, 6 fluid drachms; for children from five to ten years, 3 fluid ounces daily.—*Pediatrics*, v., 4.

LARGINE is the name given by Pezzoli to a new silver albumin compound which is recommended as a disinfectant. A 1:4000 dilution of largine has been found to destroy gonococci in about five minutes, and all bacteria in 10 minutes. Its action is more powerful than any silver albumin compound previously known.—*Weiner Klin. Rundsch.*, xii., 374, after *Pharm. Zeit.*, 29.

DECOCTION OF SCOPARIUS FOR ERYSIPELAS.—Testevin recommends a decoction of *Sarothamnus scoparius* for local application in cases of erysipelas. 100 parts boiling water are poured on 10 to 15 parts of the tops of *Sarothamnus scoparius* and boiled for ten minutes. When cold the decoction is strained, and 5 per cent. of salicylic acid is added to preserve the fluid. Two applications are made in twenty-four hours, and compresses saturated with the fluid are applied afterwards.—*Pharm. Post*, xxxi., 307, after *La Med. Mod.*

SODIUM SALICYLATE IN PLEURITIC EFFUSION.—In five grave cases out of six of pleuritic effusion Poliakov has achieved a cure with daily doses of 2 to 4 grammes of sodium salicylate. He finds it is well tolerated if a little alkaline mineral water, or, where there is a weak heart, caffeine is given as well.—*Semaine Med.*, through *Therapist*, viii., 22.

IODOFORM IN PHTHISIS.—E. de Renzi, in *Semaine Medicale*, recommends the following combination of iodoform in those cases in which diarrhoea is present:—Iodoform, 2 grammes; tannin, 4 grammes; for forty powders, two to four powders being the daily dose. Where constipation is present naphthalin, in the proportion of 2 to 4 grammes, should be substituted for the tannin.—*Therapist*, viii., 24.

LETTERS TO THE EDITOR.

DIVISION OF THE MINOR AND MAJOR EXAMINATIONS.

Sir,—I have read with considerable pleasure and interest the admirable address of Sir James Crichton Browne delivered to the students of the School of Pharmacy last week. It is very gratifying to find such an eminent member of the medical profession so well versed in the politics of the "Society" and the conditions under which the members of our craft are compelled to pursue their calling. I am particularly delighted that both Sir James and our esteemed President, Mr. Walter Hills, have given public expression to their opinions on the division of the Minor, because this has been a long-cherished idea of mine, and in my humble opinion would be a wise policy to adopt. I believe that not only would it cause less strain on the mental and physical powers of the student, but would ensure a more thorough and satisfactory study of the subjects of examination, and hence more capable pharmacists. All students of pharmacy are not in a position to spend long periods of time for study at the "Square" or other school of pharmacy, nor are all placed where hours of business are short or time is allowed for classes or study; but many worthy and industrious young men have to pursue their studies under very onerous and discouraging conditions, calculated to interfere with their health. It is on account of the latter class of students especially that I desire to see examinations divided, and I believe it would be a most welcome innovation. We have the example of the medical examining bodies for adopting such a course, as Sir James stated. Further, I would like to see the Major divided, as I believe many Minor men whose time is almost wholly occupied in business would proceed to the more honourable Major if it were divided, say, into two parts, one to include physics, theoretical and practical chemistry, and the other materia medica, botany, and microscopy. May I suggest to the various local associations that this subject is worthy of discussion at some of their meetings?

Hanley, October 11, 1898.

EDMUND JONES,
Hon. Sec. North Staff. Chemists' Association.

THE PROSECUTIONS AT BELFAST.

Sir,—As an Irish pharmacist and a subscriber to the *Pharmaceutical Journal* for some years past, I wish to draw your attention to a report of a pharmacy prosecution in Belfast, in which I figured as the unfortunate scapegoat. Towards the close of your article headed "Irish News" (*vide p. 402d*, last week's issue), you say: "Subsequently the Society summoned defendant's assistants, because, though unqualified, they had compounded and sold medical prescriptions." Now the word "unqualified" is what I take exception to. It is quite true as regards the proceedings against the limited companies, but absolutely false in my case, as the prescription was compounded by myself, *ab initio et in toto*. In the interests of truth, straightforwardness, honour, and fair-play, I ask you to spare me a few lines further, in which I shall briefly endeavour to throw light on some of the dark features in connection with this despicable persecution. Just imagine the Pharmaceutical Society of Ireland dragging one of its own licentiates into the police court for doing the very thing they license him for. Would it not have been more courteous for the Society to have informed me that it was the Council's opinion that I was acting illegally? Had they done so I would at once have had the matter set right. All the time I was under the impression that I was within my legal rights as a pharmaceutical chemist in compounding medical prescriptions in my father's place of business. The rider which Mr. Hodder, the resident magistrate, added when giving his decision no doubt exerted a mollifying influence, but no thanks to the Irish Society. Mr. Hodder's words were: "This case was at any rate straightforward and above board, and there had been no danger to the public health through the action of the defendant. An arrangement between the father and son would have obviated all trouble. . . ." In conclusion, I would briefly touch on the worst feature of the whole case—the onus of this prosecution was laid on Mr. Johnston Montgomery, who is one of my nearest rivals in business. Readers of the Journal by reading between these lines can now see the *fons et origo* of this dastardly attack on me, which I characterise as nothing more or less than personal animus and pure pique. *Verb. sat sap.*

Belfast, October 10, 1898.

SAMUEL HOGG, L.P.S.I.

QUININE WINE, B.P. (1898).

Sir,—The alteration in the formula of the above, by the substitution of hydrochloride of quinine for sulphate of quinine and citric acid, although from the theorist's point of view an improvement, does not appear satisfactory in practice. I have made several quantities of quinine wine with various samples of orange wines answering the characters and test of the Pharmacopœia, but have not been able to obtain it in a bright condition, and although it may be filtered, the product rapidly becomes turbid again; a slight change of temperature apparently being able to bring this about. Possibly one of your readers can suggest a means of overcoming the difficulty.

October 6, 1898.

AGNOSTIC (146/15).

TINCT. QUININÆ AMMON.

Sir,—I find the most elegant form for making a draught of the above is:—

Tinct. Quininæ Ammon.	ʒi.
Syrup. Limonis.....	ʒi.
Aquæ.	ad ʒiii.
Ft. haust.	

My customers prefer it to any other. It makes a beautifully clear and palatable draught.

Exeter, October 8, 1898.

T. H. NORTH.

Sir,—The idea recommended by "J. H." of taking this preparation with aerated water is a good one. It was published some time ago, and now appears in 'Martindale.' Many other medicines are made more palatable when taken with aerated, instead of plain, water.

October 8, 1898.

W. C. (146/28).

DISPENSING QUERY.

Sir,—I wish to ask your readers whether they would have dispensed the following prescription as written:—

R. Glycerini Hydrarg. Perchlorid	ʒi.
Glycerini Aluminis et Acid Tannici	ʒi.
Glycerin et Aq. Rosæ	ʒi.

M. Sig.: The lotion for gargle; ʒi. to a breakfast cup of water to be used as a gargle.

The preparation would contain about 13 grains of mercuric chloride in ʒi., and as formulæ for the other two articles are in the 'Extra Pharmacopœia' I presumed the first was also meant to be compounded from the formula in the same book.

October 7, 1898.

E. G. H. (146/26).

WHAT THE GROCER SUPPLIED.

Sir,—A list of wants dropped by a customer was found on the shop floor the other day. It is interesting as showing how many chemists' lines are now supplied to the public by grocers.

Chemist.—Powders on prescription.

Grocer.—Pain killer, Calvert's oint. 9½d., Bishop's caffeine 1s. 10d., camphorated oil, cotton wool, lint 3½d., oiled silk, glycerin, eucalyptus oil 4½d., indiarubber hot-water bottle, menthol cone, medicine spoon, cold cream, seidlitz powders.

October 8, 1898.

CHEMIST (146/27).

MEDICAGO SATIVA.

Sir,—I noticed in your notes to correspondents lately, you said lucerne, *Medicago sativa*, was "scarcely naturalised." I have known its habitat on Plymouth Hoe, a rocky portion of ground protruding through the original turf, over forty years; it is perfectly naturalised there. *Medicago maculata* and *M. denticulata* grow near by, and *Trifolium scabrum*, I think; whilst on the top and west side, now turfed, we used to get the rare *Trifolium subterraneum*. Mr. Holmes will, I expect, remember these. Some ten years since at the east end of the Hoe there were some large alterations and earth mounds raised. Carried there on one of these I found three seedlings of *Datura stramonium*, which I watched flower and fruit, each plant only small with a few flowers. Next year on an adjoining bank, near a new house with garden, were three or four plants which grew almost to bushes, with a large number of fruit, and in the turf adjoining was a solitary biennial *Hyoscyamus*. I do not know whence the earth came, probably the datura seeds came from Statten Heights where I have heard they have been found. Next year and the year after there were scores of datura plants

growing as a weed in a new cultivated bank facing the road in Freedom Park, Plymouth.

Nottingham, October 8, 1898.

F. P. BALKWILL.

** The term "scarcely naturalised" was quoted from Babington's 'Manual of British Botany' and as used by that botanist is quite appropriate. [Ed. P.J.]

RECTIFIED SPIRIT, B.P.

Sir,—Rectified spirit, B.P. 1898, is required to have a sp. gr. of 0.834, and is stated to contain 90 per cent. by volume, or 85.65 per cent. by weight of ethyl hydroxide. Rectified spirit, B.P. 1885, sp. gr. 0.838, contained 84.08 per cent. by weight of ethyl hydroxide, equivalent to 88.76 per cent. by volume. The difference in percentage strength is therefore (90 - 88.76 =) 1.24 per cent. by volume or (85.65 - 84.08 =) 1.57 per cent. by weight. On page 311 of the new Pharmacopœia the difference in strength is given as 1.35 per cent. by volume, or 1.65 per cent. by weight. Which is correct?

Holloway, N., October 12, 1898.

F. W. FLETCHER.

THE IRISH COUNCIL ELECTION.

Sir,—I am glad to see from the report of the annual meeting of the Irish Pharmaceutical Society that the gentlemen have repudiated the objectionable circular bearing their names. It was by error my name remained on the list of those seeking re-election. It was not my intention that it should be. I therefore did not reply to the several circulars issued. I cannot blame the electors for voting as directed by the several documents placed before them, in which I was represented as one unworthy of their confidence, being a supporter of store pharmacy and all that that term implies. I have now to say the statement is utterly false. No man in Ireland has worked harder against store pharmacy than I have, and had my advice been taken company pharmacy would have been now dead, but my advice was not taken, so we have what we have to-day. I consider store pharmacy most unfair. Under the present state of the law I have done what I consider my duty to do, that is, for chemists to combine amongst themselves to oppose store pharmacy. I have associated myself with gentlemen, all of whom are qualified pharmaceutical chemists; there is not a man in our firm but is legally qualified to keep open shop and compound prescriptions. More than this I could not do to uphold the prestige of our calling. I will at all times seek the welfare of our profession, and will be pleased to further any movement for our mutual benefit. There is one thing I deeply regret, that is, that the gentlemen whose names appear on the objectionable circular refrained from informing the electors that it was a forgery until the election was over, when their statement was of no practical use. I believe every fair-minded man would a thousand times rather be defeated than gain a victory by such unworthy weapons.

Dublin, October 11, 1898.

HENRY CONYNGHAM.

ANSWERS TO QUERIES.

DIPLOMAS.—Yes, every new member will receive one upon election. [Reply to ASSOCIATE.—17/6.]

CANDIDATE'S NAME.—He should give his legal name, i.e., the name he is generally known by. [Reply to MEMO.—17/13.]

LINNEAN SOCIETY.—Write to the Secretary, Burlington House, W., for particulars. [Reply to VERAX.—17/10.]

TEXT-BOOKS FOR MINOR.—See the article in the Journal for September 10 last, page 307, where full particulars are given. [Reply to BOWLING.]

BOOK ON ELECTRICITY.—The latest edition of Sprague's 'Electricity,' published by E. and F. N. Spon, at 15s., ought to meet your requirements. [Reply to W. W.—17/14.]

EUROPHEN.—It is di-isobutyl-ortho-cresol iodide, the formula attributed to it being (C₄H₉·CH₃·C₆H₃·O)₂HI. The method of preparing it is to treat isobutyl-*o*-cresol (methyl isobutyl-phenol—C₆H₃(CH₃)(C₄H₉)·OH), in alcoholic solution, with iodine (see P.J. [3], xxii., 81). The compound is non-poisonous, and may safely be used in ointments, etc. [Reply to A. W. S.—17/9.]

Pharmacy and the Allied Sciences.

21 OCT 98
A REVIEW OF CURRENT WORK.

Nitrogen from Urea. As recorded in *Phil. Trans.*, A., 1895, p. 188, it has already been shown by Rayleigh and Ramsay that nitrogen gas prepared from urea by the action of sodium hypobromite or hypochlorite is contaminated with an impurity heavier than nitrogen. Lord Rayleigh has returned to the research this summer, and still inclines to the view that the gas is nitrous oxide. Unfortunately, there is no direct test for nitrous oxide, but, so far as the examination has been carried, the behaviour of the gas is consistent with the view that this is the principal impurity. The gas has no smell; moreover, the proportion of nitrous oxide indicated by the refractometer is nearly the same as that deduced from the weight.—*Roy. Soc. Proc.* lxiv., 95, et seq.

Hevea Brasiliensis. Much valuable information is given in an article on this plant, which produces Para rubber and is now official in the Pharmacopœia. The most convenient means of propagating Para rubber trees is by seeds. They are, however, difficult to collect in their original habitat, the dense growth of the Amazonian forests, and further, there is no certainty that they are sound. On the other hand, seeds are readily obtained from trees now under cultivation in India, Ceylon, Straits Settlements, Zanzibar, Gold Coast, and other tropical parts. If quite fresh, they bear transport for a period of three or four weeks. The most suitable soil and situation for the tree is fairly flat land, at about sea level, with good alluvial soil, preferably jungle land, and not sandy. The land should not be subject to frequent floods or strong winds. *Hevea* forms a moderately tall tree, not very much branched. It begins to flower at about six years old, but for planting purposes the seed of more mature trees (about twelve years old) is preferable. About February, in Ceylon, the leaves mostly turn brown and drop off, and the flowers soon afterwards appear. They are followed by large woody fruits, each containing three seeds, which ripen in July and August. The fruits open explosively, usually in the hot part of the day, and scatter the seeds to some distance. The seed is very large, weighing about half-an-ounce; it has a hard seed coat, and the interior substance is very oily. Propagation with cuttings has hitherto been attended with only moderate success.—*Kew Bulletin*, cxlii., 241.

Bacteria in Hailstones. F. C. Harrison, of Guelph, Ontario, has examined hailstones bacteriologically on two separate occasions. The stones were washed in mercuric chloride solution (1 in 500), rinsed several times in sterilised cold water, and each stone thus treated was dropped into a tube of melted nutrient gelatin, the mixture thoroughly shaken, and plates were made in the usual way. Four days after the plates were counted, all the bacteria and a number of moulds were isolated, and their cultural characteristics determined. Among those present were *Penicillium glaucum*, *Mucor* sp., *Aspergillus* sp., *B. fluorescens liquefaciens*, *B. fluorescens non-liquefaciens*, a protean form of *Proteus vulgaris*, and two micro-organisms, a bacillus and a coccus, which do not agree with any published descriptions, and for which the author suggests the names *B. flavus grandinis* and *M. melleus grandinis*. Detailed descriptions of the two latter are given in the monograph. The repeated presence of the fluorescing germs lends support to Bujwid's surmise that surface water is

VOL. LXI. (FOURTH SERIES, VOL. VII.) No. 1478.

carried up by storms and frozen, producing hailstones. Bujwid, who probably was the first bacteriologist to investigate hailstones, arrived at this conclusion in the first place from consideration of the large number of germs found in the hail.—*Bot. Gaz.*, xxvi., 211.

Oil of Eucalyptus Punctata. R. T. Baker, and H. G. Smith, of the Technological Museum, Sydney, have entered upon an investigation of the eucalyptus oils on a scientific basis. Hitherto the oils distributed in commerce have not often been the product of one species. In their report for April, 1896, Messrs. Schimmelfrankly state: "No reliable information of any kind can be given concerning the botanical origin of the Australian oil which we supply, as it is notorious that the leaves of the different species of *Eucalyptus* are no longer kept separate during the distilling process in Australia." The first species investigated by the authors is *Eucalyptus punctata*, D.C., locally known as the grey gum tree, which grows plentifully in the colony of New South Wales, and gives an oil comparable to that of *Eucalyptus globulus*, a tree that does not occur in the colony to any extent. In the case of each species investigated, leaves, buds, fruits, bark, and timber of the trees from which the leaves are collected for distillation will be placed in the Museum, so that there may be no doubt as to the authenticity of the oils investigated. The leaves of *E. punctata* were distilled during May and June, and nine samples of oil obtained from trees of different sizes, from young and mature leaves, and from the leaves of suckers. A mixture of equal volumes of the nine oils yielded 55.11 per cent. of eucalyptol in the first fraction, and 62.6 per cent. in the second fraction. The oil does not contain phellandrene, but with the nitrite test it becomes of an emerald green colour, in which respect it differs from that of *E. globulus*. The crude oil contains aldehydes, amongst which cuminic aldehyde is present in small quantity. The amount of eucalyptol varies unless the leaves are taken from the same tree, averaging in the crude oils from 46 to 64.5 per cent.—*Journ. Roy. Soc. N.S. Wales*, xxxi., 260-280.

Urethral Bougies. Although much employed for the purpose, cacao butter alone is too fusible for use in urethral medication. A basis having a certain suppleness and softening at the body temperature is preferable to one which undergoes complete liquefaction in this special instance, since the medication is retained in contact with the urethral mucus membrane for a sufficient length of time to allow it to produce its full effect, and is not discharged until micturition is attempted. Such a basis has been devised by Soulard, and has been used with success in the Hôpital Saint André. It is composed of cacao butter, 2; lanolin, 1; white wax, 1; melted together and preserved for use. When required, the basis is medicated in the same manner as suppositories with the desired drug, and moulded into crayons of about 3 Mm. diameter, varying in length according to the requirements of the prescriptions. For moulding these the following simple method is employed:—An iron rod 3 Mm. in diameter and about 20 Mm. long, is fitted with a transverse piece at one end to serve as a handle, so that it resembles the letter T. A number of glass tubes of such diameter that the rod fits in them as a piston are then cut into suitable lengths; a small mouth-piece, one end of which has had the edges rounded off, is attached by means of a piece of rubber tubing. The medicated basis is melted on the water bath, and then aspirated up into one of these tubes by sucking, as in filling a pipette, and at the end of two minutes, before the mass has had time to set hard, the iron rod is introduced at one end, and the bougie forced out. In this way, with eight or ten tubes, any number of bougies may be rapidly made.—*Bull. de la Soc. de Pharm. de Bord.*, xxxviii., 136.

VISUAL OPTICS IN THEORY AND PRACTICE.

BY LIONEL LAURANCE,

Instructor in Visual Optics at the Official Classes of the Worshipful Company of Spectacle Makers.

The three essentials for the conduct of an optical business on proper lines are:—1, knowledge; 2, appliances; and 3, stock.

Any person may be a seller of spectacles, but only those who have the requisite knowledge of optics can become opticians, and no amount of stock or appliances can compensate for a lack of comprehension of the subjects the optician has to deal with. In fact, the possession of optical instruments without the knowledge of how properly to use them is often worse than allowing a customer to select glasses for himself. That part of the science of optics of absolute necessity to the retail optician is sufficiently limited to render its acquirement easily possible within a reasonable time to all earnest and fairly educated students. There is, therefore, no excuse for any member of the retail optical trade failing to make himself proficient, and genuine success as a practising optician can only be assured to those who, intending to take up the line, first obtain the necessary knowledge. It is indeed lamentable that the vast majority of spectacle dealers are, to use a mild term, extremely backward in the essential principles of visual optics, and it is truly astonishing, considering how general is the need for glasses, and how this need, and consequently the demand, is increasing, that many men of education and good business training should be content to conduct what, with the requisite knowledge, can be made so profitable a source of income, in almost greater ignorance than that permitted or even possible in any other industry. It is true that investigations into the science of visual optics are of comparatively recent date, although Donders, who is the father of refraction, published his celebrated work in England in the year 1864, and it is only of very late years that any attempt towards some real and practical advance has been made by those connected with optics as a trade. How inconsiderable this advance has been is shown by the condition of the industry at the present time, when, perhaps, 90 per cent. of the glasses in use have been sold by allowing customers to try on different pairs of varying strength, until they have found something presumedly suitable. How wrong this method is can hardly be appreciated by those optically uneducated; did they know, it is impossible to conceive that, for the sake of profit, they would lend themselves to a business likely to do infinite harm, be the means of preventing a cure, or, at the very least, be the cause of a fellow creature not deriving all the benefit possible from the use of his eyes. Reasons may, however, be found for the present system of optical trading in that—

(a) There is an extensive demand for glasses, whether fitted properly or improperly.

(b) The profits are large.

(c) The acquirement of a knowledge of practical optics has been, until recently, difficult, if not impossible, to obtain. The undirected reading, or study, in spare moments, of books on the subject not materially assisting men otherwise occupied with daily business affairs.

Considering these reasons in their order: The demand for visual aids is great, and it is only human nature which prompts a man, who lives by the purchase and sale of goods to handle those which he is constantly asked for. The primary causes of the ever increasing demand for glasses is civilisation and education, and the consequent application of the eyes to near pursuits. Except in near vision, the astigmat is not usually appreciably conscious of his defect, nor does the hypermetrope particularly feel the strain thrown on his accommodative muscles.

Presbyopia is of little material consequence unless one wishes to

read, write, sew or engage in other close occupations. Also a certain proportion of eyes must become myopic when, persistently and from an early age they are used in study and close work. All strains on the external muscular system are augmented and consequently noted when the eyes are engaged in near vision; optical defects, in general, are usually ignored for distance. Only in myopia, where a comparison can be made with the relatively good sight for near objects, is there a realisation of the defective distant vision, otherwise it is extremely rare that complaints are made in this respect, no matter how bad the distant sight may be. The hypermetrope or astigmat is usually not conscious of his defective sight for remote, because that for near objects is so much worse, consequently he considers that the former is quite good, while, in fact, it is frequently only somewhat less bad than the latter.

Those who seldom indulge in close work do not, therefore, feel the need for visual aids to the same extent as those who continually use their eyes for short distances, where strain is so much greater, and where difficulty in seeing, or actual inability to see, objects of a certain size, such as type, is so much more easily and decidedly noted. Thus it is with the extension of general education among the masses, with the augmentation of the quantity of literature daily read, with the increase of occupations involving constant adjustment of the eyes for close work, and generally with the great growth of city as compared with rural life and pursuits, that the demand for visual aids has gone up by leaps and bounds. And the city life, the education, and the improvement in the intelligence of the masses tend to this increase, because under these conditions people are more nervous, and feel effects more easily, and at the same time are prone to search for the cause of these effects, and so seek glasses when nature indicates their need. I do not think that children now-a-days are whipped at school because they cannot see the blackboard or the print; instead of this ancient method of improving the sight capacity they are taken to the oculist and optician to obtain that which is required to render the vision normal and therefore equal to all calls made upon it.

And if the increase in the demand for optical aids has been great up to the present, how much greater it can become by legitimate cultivation should not escape the mental grasp of those connected with the industry or of those who think of becoming so. A portion of the public has already learnt that optical aids are requisite and beneficial. Still, it is only a small proportion, and it is for the opticians themselves to inculcate among the people the appreciation of the existence of their visual errors, the means of correcting them, and the benefits derived from correction. It is difficult to compute what proportion of the British public might be wearing spectacles with benefit to health and working capacity, with increased comfort and greater enjoyment of life. But it is certainly by far the greater part of the population, whilst it is possible that not more than 10 per cent. of those under forty years of age are, as yet, spectacle wearers. Only a very small percentage have normal eyes, and, as is well known, so soon as the age of forty or forty-five is passed everyone, as a natural sequence, must become a wearer of glasses if he wishes to be able to continue the use of his eyes for close work with any sense approaching comfort.

Thus it will be seen that the field of operations is, for the optician, of practically illimitable extent. How best to induce the public to become a spectacle instead of a non-spectacle one, to the mutual benefit of the buyers and sellers of glasses, should be one of the principal aims of the educated and advanced optician.

It is doubtful whether any articles in equal demand bear proportionate to their cost so substantial a rate of profit as do glasses.

One reason for this is, that the buyer does not, as a rule, want cheap, or, rather, low-priced spectacles or eye-glasses. He knows instinctively that the best attention is demanded in the selection of aids for the sight, and combined knowledge of buyer and seller results in the purchase and sale of a very good grade or very high-priced article, as the case may be. The spectacle wearer, in his sublime innocence, is rather proud of pointing to the fact that he always did all that was possible to preserve his sight by buying real pebbles or periscopic lenses! He thinks because the retailer so thinks, and communicates unconsciously his convictions to his customers, that these special lenses with perhaps, fancy high-flown names, have peculiar virtues absent in other goods, and can preserve or restore the sight, no matter what the power of the glasses or what the nature of the defect. The retail optical trade is profitable, without any doubt, but when the optician is optically educated it can be made infinitely more so. The thorough optician knows what is required of him, and his very knowledge inspires confidence in his customer. Glasses selected are of real benefit to the wearer, and in consequence honestly worth a fair figure. Customers are more numerous, and there should be absolutely no dead stock.

What knowledge is requisite by the retail optician might almost be summed up in the following words: he requires to know what the public needs. Now, in order to know this, he must have some knowledge, elementary, it is true, of the anatomy and physiology of the eye, for without such knowledge he can neither advise as to the glasses required, nor can he, as is so very frequently necessary, counsel that the oculist be consulted. An elementary knowledge of the eye is as necessary for the optician as a complete knowledge is for the oculist. He requires to understand light, what it is, and how it travels, the laws of refraction and reflection, lenses, their formation, properties, how to analyse and neutralise, and transpose them. He has to understand the errors of refraction and accommodation and how to determine and measure them. For the latter he must comprehend the trial case and its use, test types and charts, and their principles, also the use of all the various instruments that are applicable for testing and examining the eye.

Further, the optician has to understand how to conduct an optical business, the stock that he should carry, both as regards quantity and variety, and under what conditions the various kinds of frames serve. He must know how properly to read and write optical prescriptions, and how to fit and manipulate frames so that the best effects be obtained from lenses prescribed, and how to take facial measurements for frames when needed.

In catering for trade in optics the great guiding principle of the optician should and must be, to do his best to serve the public; this principle must stand out pre-eminent and every other must be secondary. When a customer places himself unreservedly in the hands of the optician, there can be no doubt in the mind of any honest man, that he must receive the very best of care and attention, and that no advantage be taken of his confidence. No trouble should be too great to get at what is required, and when there is any doubt of it, when the case is not understood, no glasses should be sold; it cannot be right to trade on the ignorance of the buyer and so cause his confidence to be misplaced. And if this be true, and the proper course for every optical dealer to follow, it stands to reason that those who are not versed in visual optics should not sell glasses at all, because they can understand no case that presents itself to them.

It pays well to serve the public properly; when glasses are bought they are not wanted cheap; the cheap spectacle or eye-glass, in the opinion of the public, is the same as the article of

little or no value. The optician who understands his business and inspires, as he should, confidence in his customer, can always obtain for the article supplied a price commensurate with, not only the actual cost of the article, but also with the time and trouble required in finding the proper thing. In plain words, the customer pays not only for the spectacle or eye-glass which he buys, but also for the knowledge and time of the optician.

And in this connection of considering first and foremost, of doing one's duty to the public, it is of the very highest necessity that the optician should be able to discriminate between cases of defective sight which are due to error of refraction and those which, are due to pathological conditions. The optician must be capable of at once discriminating between the cases of refractive error and cases that indicate disease; between simple and purely optical cases for which he may supply glasses, and those which being complicated, require rather medical attention, or the latter in addition to optical corrections, and which, therefore, must not be treated by the optician, who has had no medical training.

THE DUTIES OF A LOCAL SECRETARY.*

BY J. SMITH.

Local Secretary of the Pharmaceutical Society of Great Britain.

It was my intention in the first instance to confer with the Liverpool chemists present at this meeting respecting the nomination of a local secretary to the Pharmaceutical Society for the coming year, but seeing that at the present time the question of organisation is more than usually pressing, I have chosen a title for the subject of my remarks which will enable me to take a wider field.

First with regard to the system of appointing honorary local secretaries. It is not by any means an ideal one, but on the whole it works fairly well. The only alternative scheme that has presented itself to my mind is the employment of paid officers in various parts of the country, but it is obvious that for this to be effective a large number of men would be required, otherwise, and perhaps even then, chemists in some districts would consider others were favoured and themselves neglected. Indifference if not ill-will to the Society would remain in many quarters. It is clear that the income of the Society would not bear the expense of salaried representatives. When the Society shall have its income increased by the larger number of members, the employment of paid representatives will be a suitable and proper subject to discuss; until then we must do what we can with voluntary workers.

I think it would be an advantage if the circulars requesting nominations of local secretaries were sent out a few weeks earlier than they are. In towns where there are local pharmaceutical associations, chemists in those districts would then be able more frequently to consult each other respecting the name to be submitted; that subject might be part of the business at a meeting of the Society early in the winter session. An opportunity would thus be provided for the local secretary to meet his brother chemists and consult them as to his duties. Every person occupying a semi-public office, honorary or otherwise, must expect criticism, and I am convinced that local secretaries would welcome criticism and advice, because they would be the means of sustaining interest in the duties of the office, and through that interest they would be able to fulfil the duties more efficiently. The principal duties of a local secretary are: To promote the interests of the Pharmaceutical Society in every possible way—and here I would say that no person would undertake the duties and would

* Read at a meeting of the Liverpool Chemists' Association, on Thursday October 13, 1898.

urge the claims of the Society upon non-supporters unless he himself were convinced of the advisability of such support. He is also expected to report changes of address of pharmaceutical chemists and chemists and druggists, and to assist the Registrar to keep a correct Register; to report infringements of the Pharmacy Acts; to collect subscriptions to the Society and to the Benevolent Fund, and to furnish such information as he is able, when required.

Now I would like to say a word on behalf of local secretaries. They are all, as you know, men in business, many having other claims upon their time and thoughts besides their business, and though they are willing to give some portion of their time in the interest of all following the profession of pharmacy, few can afford to neglect their own private business to any very large extent. It follows, therefore, that they must rely upon no small assistance from their fellow chemists in their districts. It is too often the custom to nominate the same person year after year until he expresses a wish to retire. I have been fortunate in meeting the local secretaries from some of the large towns and cities, whose assistance is of the highest value to the Society, and whose retirement would be a positive loss; to these my remarks do not apply, but as a general rule I think there should be a change in the office say once in three years. The first year a man enters upon the duties with some enthusiasm but finds he has something to learn, the second he is still enthusiastic and probably has some ideas respecting his duties which he is able to put into effect; before the end of the third year he begins to think that he has given as much of his time as he can properly spare and that somebody else should be appointed. I say again that this is not invariably the case, but it is what might be expected.

To accomplish the work that it might, the Pharmaceutical Society should have the support of every chemist and druggist on the Register, and no well-wisher of the Society, that is, no well-wisher of the vocation he follows, will consider that he has fulfilled his obligation to the Society when he has paid his annual subscription. A local secretary cannot be in close touch with every part of his district, and if registered chemists would more frequently inform the Society, either by direct communication or through the local secretary, of facts they have become acquainted with which would be useful in enforcing compliance with the Pharmacy Acts or in keeping a correct Register, and would urge the claims of the Society upon friends who are non-supporters, we would be better organised than we are. It would not heavily tax the funds of the Society if a member of the staff at Bloomsbury Square, qualified for the duty, was placed at the service of the local secretaries to call upon non-supporters of the Society in their company. There are many men in business whose acquaintance with the legal powers of the Society, and with the devotion of the Council to the interests of all registered persons is very meagre, such acquaintance as they have being in many cases derived from a source which may be described as critical rather than impartial. It is only fair that the case for the Society should be placed before these gentlemen by one familiar with its inner working. I am sure that many local secretaries would gladly give the necessary time, and would welcome such co-operation, and I am sure also that where such assistance is desired, the Council would most willingly do what they could to comply with the request. The difficulty, if not impossibility, of keeping a correct Register of addresses as well as names of registered persons is well known. It is a very serious hindrance to the proper administration of the Pharmacy Acts, and must give the Registrar many anxious moments.

The Register is taken as evidence of a person's qualification and of his legal authority to sell scheduled poisons. An important point

would be gained if the correct address of every registered person was known, but as it is hopeless to expect that a penalty could be imposed upon such a person who failed to notify the Registrar of his change of address, that part of the Register must always be more or less imperfect. The addresses of subscribers to the Society are known, and it might perhaps be of some use if reply post-cards or something of the kind were sent once a year to every non-supporter on the Register, requesting his correct address. Personally, I think the Registrar would be assisted very considerably if this were done. I have often thought that an annual meeting of local secretaries from all parts of Great Britain might be held with advantage. I am convinced that the comparing of notes and the exchange of opinions between men from places differing widely both in locality and in character would provide a stimulus and inspire increased energy which would undoubtedly be beneficial to the interests of the Pharmaceutical Society. It does not require much imagination to see that joint action on the part of a number of men, after a plan of campaign has been discussed and agreed upon, is likely to produce larger results than their isolated action. The meetings of the British Pharmaceutical Conference are attended by a good many of the local secretaries of the Pharmaceutical Society and they furnish excellent opportunities for such consultations. The business would probably not occupy more than one hour, and need not interfere in any way with the Conference meetings. The subject of better organisation is being hammered at continually, and perhaps I ought to offer an apology for occupying time by further reference to it, but it is probable that very soon, perhaps during the next session of Parliament, there will be more urgent need for better organisation than there has ever been.

The question of the selling of poisons is not settled. If, as is very likely, the Council of the Pharmaceutical Society should again approach the Privy Council with the object of getting carbolic acid and perhaps other dangerous substances scheduled as poisons, and should again be unsuccessful, we will be bound to assume that another attempt to regulate the sale of these substances will be made. In the light of what transpired during the discussion in both Houses of Parliament on the two Bills of last session it is quite possible that an important reform in the law relating to the sale of poisons is contemplated. It is conceivable that the Council of the Society may require from us the fullest and most active service, either to oppose an attack upon our position in the shape of a retrogressive Bill or to establish a claim to a forward move. It is, therefore, desirable that we should consider in good time how we may best organise ourselves to support our own interests. The appeal by the Council to local secretaries and others to communicate with their Parliamentary representatives with reference to the late Poisonous Substances Bill produced highly encouraging results. I am sure those communications, though they were not published or recorded, influenced members of Parliament very considerably. We have seen that we are not without influence even when the Society represents only a minority of those on the Register. How much greater would that influence be if the Society represented a large majority? The points I have dealt with appear to me to justify me in inviting a discussion upon local secretaries' duties and their bearing upon organisation.

VALERYDINE.—This compound of phenacetin and valerianic acid, which forms shining needles melting at 120° C., is introduced as a remedy in hysteria, neuralgias, and neurasthenia. It is given in doses of $\frac{1}{2}$ to 1 gramme.—*L'Union Pharm.*, xxxix., 291, after *Pharm. Rund.*

A TEXT-BOOK OF PRACTICAL PHARMACY.

PRACTICAL PHARMACY: AN ACCOUNT OF THE METHODS OF MANUFACTURING AND DISPENSING PHARMACEUTICAL PREPARATIONS, with a chapter on the analysis of urine. By E. W. LUCAS, F.C.S., Member of the Board of Examiners of the Pharmaceutical Society of Great Britain. Pp. 528, with 283 illustrations. Price 12s. 6d. London: J. and A. Churchill. 1898.

A work adapted to the modern requirements of British pharmacy has been a desideratum so long that the publication of Mr. Lucas's volume may be regarded as one of the important events of the year and calling for special notice. The work will certainly be welcomed by students preparing for their examinations; the fact that it comes from the pen of one of the Examiners of the Pharmaceutical Society gives confidence that it fairly covers the ground which the examination will take them over and this expectation will be strengthened by noting that the writer is connected with one of the most celebrated dispensing houses in London.

A general glance at the pages impresses one favourably with the scope of the work, and its capability of being a valuable magazine from which the student may draw information. The first three parts are devoted to the general operations of pharmacy, under the several heads of processes, preparations and dispensing. Part IV. treats of volumetric and gravimetric analysis, the assay of alkaloidal extracts, etc., so far as is necessary for testing materials and preparations as the Pharmacopœia directs, and as fully as most pharmacists will desire. Part V. gives useful tables of atomic and molecular weights, strengths and doses of preparations, synonyms, poisons, and antidotes, etc., all of which are useful. Part VI., on urine analysis, concludes the work.

The work contains, throughout, a great mass of useful information in tabular form compiled from various official sources, it also notes several legal points with which the student should be acquainted before he trusts himself with the management of a business. The illustrations are very numerous, and the author acknowledges the many friends from whom he has received useful blocks for the purpose. Readers will find many with which they are acquainted from the trade catalogues of Messrs. Fletcher, Maw, Toogood, York Glass Co., etc. That some of them are especially suggestive of operations on a large manufacturing scale was perhaps unavoidable, since the pharmaceutical laboratory is becoming more exclusively a feature of the wholesale druggist's establishment than a frequent adjunct of the chemist and druggist's shop. However, the consequent greater necessity for pharmaceutical testing has been wisely recognised by Mr. Lucas in the prominence he gives to that subject in his book.

The author has evidently aimed at assisting students to acquire a thorough knowledge of their art, at furnishing information useful to those engaged in business, and at maintaining for chemical pharmacy the credit to which it has some hereditary claim. Though pointing the way to manufacturing pharmacy much further than the average pharmacist can hope to follow him, the matter he supplies should be read with interest and profit by all engaged in the preparation of remedies. Everyone making his living by the drug trade may find matter in Mr. Lucas's pages, which should help him to meet the wants of his daily customers.

While the good intention he has thus given evidence of, claims this acknowledgment, the admission must be made that closer examination of details reveals a number of little matters which the author will necessarily revise at his first opportunity, as well as some obvious errors which, if they did not mislead students, might shake

their confidence in the writer's care and accuracy. In the following running commentary attention will be directed to these mainly with the object of enhancing the immediate utility of the work, especially for students.

The tabular statement showing the sensibility of scale beams and counter-weighing machines (page 16) is not so clearly expressed as it might be, and the author should not appear to imply that he would countenance an error of 5 grains in a weighing machine, the maximum load of which is 1 oz. The source whence he obtained the figures of glass measures, marked P^l 1 pint, 20 Pl. oz., P 1 Dr., 1 Dr. 8, is not mentioned, but the author should alter this before the next edition, which will certainly be called for. An unfortunate blunder occurs on page 336, where the numbers refer to the cuts of suppositories on the opposite page.

The paragraph on the use of specific gravity beads should have a caution to the student not to continue the evaporation till the contents of his dish bring the bead to the surface of the hot liquid. The description of the Westphal sp. gr. balance is not so full as it should be for the guidance of readers who are not already familiar with it. A small thermometer hangs at one end of the beam, and its counterpoise at the other. The student may fairly ask "Why a thermometer?" or "What thermometer?" and what weights are used as riders? From the expression "a small thermometer" he may suppose any one will do, and if he breaks it may replace it with any other. An intellectual student may make all these points clear for himself, but it is the duty of the writer of a manual to make clear the relation between the bulk of the thermometer and the weight of the riders, so that it may be appreciated by an average student.

The chapter on heating is fairly well put, though it bears some appearance of being compiled from illustrated catalogues, or written to fit their blocks, there being a little absence of point in the descriptions of less common appliances, thus of the evaporating tray described, page 48-9, it is said, "A tray of the capacity illustrated will evaporate twenty gallons of water an hour." But no dimensions are given, and no pressure of steam at which it is to be worked.

Page 58, on the use of "condensed water" in place of distilled water, there is a little confusion of ideas in the statement that if a boiler is fed by means of an injector, the condensed water may be sufficiently pure for all ordinary purposes; "but if fed by means of a pump, the distilled water nearly always contains traces of oil used for lubricating the working parts of the engine." It is well known to engineers that water obtained by condensation of steam, which has passed through a steam engine, is much contaminated with oil. If pure water be supplied to a boiler, the use of a pump does not contaminate it so much as to spoil the condense, but if oily water be fed to the boiler by an injector, the use of the latter in place of the pump would not improve the quality of the condense.

Extraction, page 79: Maceration is said to be a prolonged infusion, "except that alcohol, either strong or dilute, is substituted for water as a menstruum." Why the writer should limit the term to operations with alcoholic solvents is not obvious. In the old Pharmacopœias it was applied to aqueous menstrua, as in the B.P., 1867, instructions for making extracts, etc.; quassia is to be macerated in water, rhubarb is to be macerated in water with 10 per cent. of rectified spirit.

Under "Pressure Maceration" syrup of senna is taken for illustration, and it is stated to be made by "moistening the leaves with 60 per cent. alcohol." The B.P. says 20 per cent. alcohol.

Under "Percolation" more evidence is found of the writer's familiarity with his subject, and much information not only

valuable to the student, but of practical value to the working pharmacist. The chapter on dialysis is not so full as it might be. The preparation of dialysed solution of iron is taken for illustration, and the information copied from the B.P., 1885. Unfortunately the error in the gravity as it stood in the first issue of that edition has also been copied. Mr. Lucas says it is 1.407, evidently having overlooked the correction subsequently supplied, which says "For 1.407 read 1.047." The chapter on filtration is a good one, and shows evidence of practical experience. The sterilising filter made of Bath brick gives precisely the results that might have been predicted, but is a good illustration of the readiness to adopt and adapt common materials to uncommon purposes, which ought to be a characteristic of every pharmacist. On page 117 the mode of priming a syphon is described as if by a person not well acquainted with the task. Not many operators would cork the long leg as a preliminary, especially if it be fitted with a piece of rubber tube, as the figure seems to indicate, nor is the reason for the rubber tube and pinch-cock on the suction tube explained.

About one page is devoted to the separation of immiscible liquids. More might have been said with advantage on this subject, and the concluding lines suggesting the extemporising of a separating funnel by the use of a stout penholder had better have been unsaid, unless to condemn such use of a penholder where stirring-rods are sure to be available. The use of a glass rod mounted with a blind teat, or half an inch of rubber tube, has long been a common expedient for this purpose.

Referring to *lin. potassii iodidi c. sapone*, is it a necessary or legitimate suggestion to add a little soft soap? Or is it consistent that the teacher who does so should speak with something like holy horror of the use of concentrated infusions, and be pained at the introduction of concentrated vegetable liquors into the Pharmacopœia? "As they are neither tinctures nor fluid extracts," is it reasonable that he should question their utility? This is a pure prejudice, and is unworthy of any teacher of science.

Under *liq. ammon. acet.* (p. 166) the difficulty of determining neutrality in the presence of free carbonic acid is mentioned, but without noting that the application of heat to drive off the free carbonic acid is also capable of driving off ammonia, and converting a neutral solution of ammonium acetate into one holding an excess of acetic acid, and no mention is made of Proctor's test for this particular point. *Liq. sodii ethylatus* receives a very scanty notice, and as it is a preparation better made in small quantities as wanted, it should have had more particular description. *Liq. zinci chloridi* also might have had more particulars supplied with advantage.

The chapter on fats, etc., is a readable and useful article, rather brief, but good so far as it goes. The chapter on ointments would also have been better for a fuller treatment of some points. *Ung. zinci oleatis*, in the opinion of the writer, is not to be compared with the corresponding ointment of B.P., 1885 (p. 190), but he does not explain on what evidence he bases his opinion, or what are the faulty features of the new form. The statement at p. 194 that ordinary potash ley is now used in making hard soap is at least questionable.

Chapters 28 to 36 are short notices of tablet making, eye-discs, powders, cachets, capsules, medicated cotton, and gauzes, granular preparations, etc., which will be found to contain practical information useful to most pharmacists.

Chapter 38, treating of essential oils, though disproportionately long, contains matter which pharmacists should be able to refer to, but scarcely coming within the requirements of a student's manual. The processes described for the determination of aldehydes, ketones, esters, etc., belong to organic chemistry and the charac-

ters of the individual essential oils to treatises on chemistry and materia medica. Pharmacy is, however, so elastic a term that their presence cannot be objected to, unless it curtails matter of more general utility, as in the present instance.

Dispensing occupies Part III. of the work, that section being one of the least satisfactory. It contains lists of contractions common in prescriptions, incompatibles, explosive combinations, etc., also a very useful list of terms, likely to occur in French and German prescriptions, which will be a great assistance to many dispensers, especially in seaports. The chapter on emulsions is also worthy of commendation, though a few trifles want correction, as at page 309 "powdered gum arabic 2 fluid drachms," and on the next page, salolis to be emulsified with powdered acacia, 2 fluid drachms. At page 311 the author says, "Certain seeds, such as almonds, form excellent emulsions," but the mode of treatment he describes is inferior to that given in the Pharmacopœia for almond emulsion. To meet the case of a prescription requiring the production of an emulsion from some particular seed, without gum and sugar, a much fuller description of the mode of obtaining a good result should have been supplied.

Pills occupy Chapter 47. The writer runs so readily from dispensing counter appliances to the steam machinery of the factory, that dispensing might be looked upon as despicable, except as a step to the greater operations; however, he reverts to dispensing and gives many useful points, rather more briefly, perhaps, than desirable. On page 320 he gives countenance to the superstition that compound decoction of aloes has a special virtue in massing aloes with extract of colocynth, etc. Many of his dicta would have much greater value if he had quoted the experiments upon which they are founded. A pharmacist's creed should not be based simply upon the traditions of his elders. At page 322; dried sulphate of iron of the Pharmacopœia is said to be of uncertain composition, a statement which is scarcely justified. It is recommended to mass it with syrup, taking care to add enough at once. To say use the right quantity at once is scarcely guidance worthy of a teacher, unless he can state what proportion is the right quantity for a salt answering the B.P. requirements. The paragraph on amorphous phosphorus would have been better for a note that it is not to be substituted for the translucent variety. Without this it might mislead a student.

Some of the instances above mentioned may be attributed to oversight or too hasty production of the work, though many of them indicate that the desirability of more lucid exposition of scientific principles is a point requiring notice by the author in a future edition. Dry empirical rules of procedure, that can be learnt and applied without being understood, are too frequently substituted for the more instructive rational explanations necessary to induce students to think. This is especially noticeable in the description of volumetric analysis, the definitions of specific gravity, hydrolysis, and the directions given for diluting alcohol.

The chemical portion of the book is ambitious though generally the least satisfactory; but with careful revision and judicious pruning it might be made very useful. The explanations of very simple operations are over-elaborated. For example, the confusing half-page of calculation to explain the determination of phosphoric acid in *Acid. Phosph. Conc.* (p. 419), misses the essential point of showing how the observed increase of weight of the lead oxide used, is a means of ascertaining the desired result by an ordinary rule-of-three sum. The simple manner in which this calculation can be performed will be seen on comparing the author's problem with that given in the Students' Page of the Journal for September 17. Again, on the same page, the parade of unnecessary for-

mulae in the series of equations given to explain the determination of phosphoric acid with magnesia mixture, is calculated to confuse a student, while one simple equation would suffice to show the essential details, and the space occupied by unnecessary formulae might have been more usefully devoted to stating the necessity for adding ammonia and ammonium chloride. Moreover; in a work of the kind, the attempt to indicate molecular volumes in equations, as at pp. 137, 168, 170, 172, 360, 362, 363, and elsewhere, seems out of place, and such a formula as $\text{Na}_2(\text{OH})_2$ is surely unnecessary to express two molecules of sodium hydroxide (p. 383).

Mr. Lucas has been loyal to authority even to the extent of adopting errors, thus the statement that most oxalates are converted into carbonates on ignition (p. 445) is only partially correct—though taken from the Pharmacopœia—and it is insufficient information for a student. The description of potassio-mercuric iodide solution as Nessler (p. 432)—probably derived from the same source—really applies to a different test solution. No authority can be found for the statements that bleaching powder “may be considered as consisting of $\text{Ca}(\text{OCl})\text{Cl}$ ” (p. 171); that a solution of chlorinated soda contains calcium chloride (p. 171); that ethylic alcohol is always the product of vinous fermentation (p. 129); that in the preparation of ferric chloride, nitric oxide and oxygen are evolved together (p. 169); while in any case the statement that oxalic acid “decomposes cupric sulphate, liberating sulphuric acid” (p. 446), is not a happy mode of representing the formation of insoluble cupric oxalate.

Mr. Lucas has constructed, on the basis of the atomic weights adopted in the British Pharmacopœia, a table of co-efficients very convenient for use in volumetric analysis; but, unfortunately, instead of showing how easily these co-efficients can be applied for ascertaining the quantity of a substance to be determined in any particular operation, he has followed the practice of the Pharmacopœia by supplementing the specification of official standards of purity with a statement of the measures (in cub. cent.) of volumetric solutions requisite for stated quantities of the particular articles to be tested. Provided the operations of volumetric analysis are understood, no assistance is rendered by the practice referred to, and no useful purpose is served. It is rather a wooden device introducing apparent discrepancies which might perplex an inexperienced operator as much as the obscure explanation of it given in the preface to the Pharmacopœia, while it makes the use of refined atomic weights a mere unsubstantial semblance of precision. The student should, on the contrary, have been made to understand that statements as to a particular quantity of the article to be tested requiring so many cubic-centimetres of the corresponding volumetric solution, are merely approximate. Thus, in the testing of hydrocyanic acid the amount of HCN corresponding to 3.7 cubic-centimetres of the silver solution would be nearer 1.98 per cent. than 2 per cent. as officially required. The quantities stated in the case of arsenious oxide would correspond to over 100 per cent. As_2O_3 if the correct co-efficient were used, while in the case of acid potassium tartrate they correspond to a percentage less than that required. Altogether these calculations are roundabout and not free from errors.

The desirability of including urine analysis in a book professedly written for students is doubtful. The chapter on that subject contains a brief *résumé* of the information on chemical points more thoroughly furnished in Allen's treatise. At p. 494 the proportion of ammonium chloride to be used in the determination of uric acid is incorrectly given, and at p. 493 the description of Heller's blood test is contradictory.

Instances of lax phraseology and misuse of terms occur too

frequently, as at p. 34 “identical” for definite; p. 35 and other places “colourless” to describe a Bunsen flame; p. 93 “first discoverer”; p. 167 “perfectly cold”; p. 135 “transmitted” for reflected; p. 246 “fusion” of granulated preparations, and “sufficient as”; p. 305 “limpid” as the opposite of viscous, and in several places “estimation” instead of determination.

Notwithstanding the defects above mentioned, Mr. Lucas's ‘Practical Pharmacy’ contains much useful information, and it will no doubt be the text-book on that subject. Though students using it must remember that some of its statements require correction, even that necessity may be made a means of adding to the instruction otherwise to be derived from the book.

THE DETERMINATION OF THE COLOURING MATTER IN SAFFRON.

BY EDWIN DOWZARD, F.C.S., ETC.*

The value of saffron depends on its tinctorial power, and the only real method of valuation is to determine the amount of colouring matter present. There are, of course, several methods by which the colouring matter may be estimated, but they take up a considerable time, and are more or less laborious.

The following method has the advantage of being quick, and requires very little attention or manipulation, the results are not absolute, but they give an approximation which is quite near enough for commercial purposes. It is, of course, necessary to examine for the usual adulterants. The method about to be described is not designed to give evidence of adulteration, but to enable one to say the value of a sample of saffron as a colouring agent.

A standard solution of chromic acid is prepared containing 78.7 grammes chromic acid per litre.

100 C.c. of the above solution are equal in tinctorial power to 0.15 gramme crude crocin dissolved in 100 C.c. of water (crude crocin is obtained by extracting saffron with ether, drying, and exhausting the residue with 50 per cent. alcohol, the alcoholic solution is evaporated to dryness, and the residue taken as crude crocin).

The sample is reduced to a coarse powder by pestle and mortar, 0.2 gramme of the powder is transferred to a stoppered cylinder having a capacity of about 35 C.c.; 20 C.c. of 50 per cent. alcohol are then introduced into the cylinder, which is tightly stoppered, and placed in water at 50° C. for 2½ hours. The solution is cooled and filtered, 10 C.c. of the filtrate (= 0.1 gramme saffron) are diluted with water to 50 C.c., and the depth of colour compared with 50 C.c. of the standard chromic acid solution (for comparing the colours it is necessary to have two Nessler glasses of equal bore). If the chromic solution is deeper in tint than the solution under comparison, small quantities are removed until equilibrium is produced, and *vice versa*; the solutions are then measured, and the amount of crude crocin calculated.

Example:—10 C.c. of saffron solution (= 0.1 gramme saffron) diluted to 50 C.c. had a depth of colour equal to 40 C.c. of the standard chromic acid solution.

$$100 : 40 :: 0.15 : x$$

$$= 0.06.$$

∴ 50 C.c. contains 0.06 gramme crude crocin.

$$0.1 : 100 :: 0.06 : x$$

$$= 60.0.$$

The above example therefore contains 60 per cent. crude crocin.

The finest samples on the market contain upwards of 75 per cent. crude crocin, good samples of saffron should not contain less than 50 per cent.

* Read before the Liverpool Chemists' Association, on Thursday, October 13, 1898

SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY.

ANNUAL DINNER,

The annual dinner of the above Society was held on Thursday evening, the 13th inst., in the Masonic Hall, Sheffield.—Mr. GEO. SQUIRE, the President, occupied the chair, and the company included Alderman Langley, M.P.; Mr. J. Rymer Young, F.C.S., Warrington; Mr. G. T. W. Newsholme, Vice-President of the Pharmaceutical Society of Great Britain; Dr. Hicks, F.R.S., Principal of the Sheffield University College; Mr. J. Humphrey, *Pharmaceutical Journal*; Dr. Robertson, B.Sc., Medical Officer of Health for Sheffield; Dr. Geo. Wilkinson, B.A., F.R.C.S., President of the Sheffield Microscopical Society; Dr. Andrew Walker, M.A., B.Sc.; Mr. A. H. Allen, F.I.C., Public Analyst for Sheffield and West Riding County Council; Messrs. A. R. Fox, S. T. Rhoden, W. Ward, J. F. Eardley, J. Pater, J. Austen, T. Dobb, R. C. Gibson, J. Dale, H. T. Watts, C. O. Morrison, J. Parkes, etc.—The after proceedings were enlivened by an excellent programme of vocal and instrumental music and recitations.—The loyal toasts having been duly honoured, Mr. A. Fox, in submitting the toast of

The Houses of Parliament,

said that during the 22 years he had attended the annual dinner of the Society this was the first occasion on which they had been honoured by the presence of a member of Parliament, and as the Cutlers' Feast was near he wondered if this dinner would in the future assume an importance approaching that of the banquet he had referred to. Would the chemists' feast in the future be looked forward to with a similar amount of expectation and interest that was now excited by the approach of the Cutlers' Feast? He would aspire to something which would lead to that kind of thing, and then the newspapers would be speculating as to which member of the Government would be coming down to the pharmacists' banquet each October, just as they now speculated about the chief guests of the master cutler. When the time came those who were now present would recall this occasion of Alderman Langley's visit, and the fact that he (Mr. Fox) had the privilege of proposing the first toast of "The Houses of Parliament." He was glad to know that Mr. Langley fully grasped the idea that the Pharmacy Acts Amendment Bill which came before the House of Commons last session was not a measure that would interfere with the rights or privileges of the people, but something which was to cement pharmacists more closely together, and to ensure that the desires of those who years ago originated the Pharmaceutical Society should be rightly carried out. He was glad to know that that Bill was carried through and had now become law. They were greatly indebted to the member for Attercliffe (Mr. Langley), for his assistance in the passing of the measure. He (Mr. Fox) was far from claiming anything that was a monopoly for his craft, but he held that the Act in question was a good one from every point of view. It was calculated not only to cement pharmacists together, but also with the parent Society, which was so well represented that night. He understood that in the next session the Government were to introduce a new Poisons Bill, and he trusted that their members of Parliament would endeavour to secure the protection of the public by insisting that the men who dealt with potent drugs should be fully qualified by education for their work. By asking this pharmacists were not asking for the creation of any monopoly.—Alderman LANGLEY, M.P., who was very cordially received, designated himself an Imperialistic Radical, and said he always felt embarrassed when called upon to respond for the House of Lords. He was not connected with the House of Lords by family ties nor by political sentiment, but all unprejudiced men were compelled to acknowledge that the House of Lords contained a large number of men of commanding ability and intellect, and men who took a great interest in the nation's welfare. At the present time the House of Lords was in the happy position of having very little to do, which was always the case when the present political party happened to be in power. The peers grumbled sometimes at what the Government did, but they always gave way in the end. The House of Lords would not have much to do next year, but when the wicked Liberals returned to power they would have to bestir themselves and protect the interests of the Empire. Some years ago the House of Lords did yeoman service for the country, but he was of opinion that it might with advantage be mended without actually being ended. As to

the House of Commons, although they had had no heroic legislation, several valuable measures had been passed during the last session. The Government introduced a Food and Drugs Bill, but in such a way as to lead the members to suppose that there was no intention to proceed with it. In all probability the Poisons Bill would be reintroduced next session together with a Government measure dealing with the adulteration of food and drugs. It would be an advantage to the members of the House of Commons if the pharmacists, through their societies or individually, would pronounce on the Bill as soon as its provisions were made known. He was quite sure Parliament would heed their voices. In conclusion, Mr. Langley said he would reply to those who complained that there was too much legislation, that these were days of progress, and the country must not stand still in political progress any more than in that of commerce and education.

Mr. A. EBERLIN, Hon. Secretary of the Nottingham and Notts. Chemists' Association, gave the toast of

The Sheffield Pharmaceutical and Chemical Society.

He said the Society was his *alma mater*, and under its auspices he learned all the pharmacy he knew. It was the Sheffield Society which brought him out in the domain of pharmacy. Replying to the queries of unfriendly critics as to the functions of these local societies, he said as he understood the question, they were three in number. The first was to promote good fellowship. If anyone doubted their success in this direction let them come to this gathering and they would be convinced. The second function was that of a great educational machine. The Nottingham Society had, he claimed, done a great deal to educate the rising generation. It was a mistake to suppose that the ordinary commercial schools were sufficient to supply all the educational requirements of the young pharmacist who was studying for his examination. No school could supply it so well as an association like the Sheffield Pharmaceutical Society, which provided for a regular continuous course of study to a youth in the most critical part of his career, and he knew that the Sheffield Society was eminently doing its duty in this respect. He had been told that the school had made a distinct advance this year. Among other things, they had affiliated themselves with the Sheffield University College, a course which they in Nottingham adopted several years ago, and which had been attended with the greatest success. They were now conducting a series of classes for the training of young pharmacists, which he thought were not beaten by any in the land. They had a distinct curriculum extending over a three years' course, and forty students were regularly attending them year by year. The third function of the local society was to promote legislation in the interests of the public and of pharmacists. Last year a Pharmacy Acts Amendment Bill was passed—not a great measure in itself, but one which was a move in the right direction in consolidating pharmacists and bringing them more into harmony. As an instance of the value of an association he mentioned that the Nottingham society succeeded in completely changing the opinion of one of their local M.P.'s, who intended to oppose the measure. From being an opponent of the Bill he became a supporter at the last moment, and this change was entirely due to the efforts of the Association. Their member also promised that all future legislation in the interests of pharmacists should have his most hearty support.—The PRESIDENT, responding to the toast, said in looking over the old minute books he found it stated that the objects of the Society were threefold. They were to promote social intercourse among members of the craft; to give help to everything which stood for the progress and advancement of pharmacy; and, last but not least, it was to provide means by which their juniors might study during their early apprenticeship, and so qualify for their examinations. If asked if the Society was at present fulfilling these objects his reply would be "Yes, as far as possible." All must agree that the past session had been a successful one. That the classes had been well attended was evidenced by the number of students who had obtained prizes. The social side of their work had also been well attended to, and the ladies had gained a concession in the establishment of a ball. He could assure the gathering that the Council of the Society would spare neither time nor effort in order to fulfil all their objects, and more especially in regard to education. He must congratulate Mr. Eberlin on the position of his Society, for Nottingham certainly took the lead in education. It was to the universities pharmacists must look in the future for education. The Sheffield school had been a success as they had carried it on in the past, but they were looking forward to a much

greater success as the result of their amalgamation, as it were, with the Sheffield University College. One of the difficulties in the past had been that they could not rely upon having the services of their lecturers for any length of time, and they were frequently compelled to change them. The classes for materia medica and theoretical pharmacy would still be carried on at the school, as there was no one more capable of conducting these than a pharmacist. He held great hopes that the alteration would turn out a great success, and that they would eventually have a curriculum. No doubt that was what it would have to be before long. He thought a course of three or four years' study would be required before a student could enter for the "Minor," and it was his idea that the "Minor" should be divided into first and second classes, so that a student could get through it in reasonable time, and show that the apprentices and juniors had studied during their early training. Since their last gathering many changes had taken place in the world of pharmacy, and local associations had had a good deal to do. The Pharmacy Acts Amendment had been passed and the Sheffield members of Parliament had been well whipped up to support it. The Poisonous Substances Bill came on next and was stoutly opposed. Owing partly to the action of the chemists throughout the country, and to the societies, the measure was discarded altogether, and the result showed, at any rate, that the local associations were something to be reckoned with. Over these two Bills the chemists of the country had shown themselves a power, and if united they would be almost irresistible in any just cause they took up.

The PRESIDENT, in the absence of Mr. J. M. Furness, submitted the toast of

The Pharmaceutical Society of Great Britain,

and said it was the duty of local societies to assist the parent Society in its efforts to benefit their craft. The Society had done good work in the past and he was sure it would continue to do good work in the future. Last year was a red-letter year for the Society. There were many things which the Society might do, and he thought it would be a good thing if the Council carried a test case on the subject of company pharmacy right through to the House of Lords, and ascertain if these companies possessed any legal right to call themselves chemists and druggists. Individuals, as they all knew, were not allowed to use that title until they had passed the Minor or Major examination, and it was a great shame that this condition could be evaded by a small number of people combining together and calling themselves a company. This matter seemed to him to be worth trying for, even if they failed, and it would be something gained supposing the law required the name of the manager of the shop to be placed over the door in bold letters.—Mr. G. T. W. NEWSHOLME, who responded, at the outset of his remarks expressed regret at the absence of Mr. J. M. Furness, who, he said, gave him valuable help when he first became a member of the Council in taking up the question of the consolidation of the Pharmaceutical Society. From the first he (Mr. Newsholme) felt that those who had passed the Minor examination ought to have the same privileges in the Society as those who had passed the Major. As most of those present knew, only the pharmaceutical chemists were allowed to be members of the Society, with the exception of those who were in business prior to the year 1868. The law permitted a man who held only the Minor qualification to carry on the business of a chemist and druggist, and in fact to do everything that pertained to the qualification of a pharmaceutical chemist, with the exception that he could not use that title in science, which was reserved for those who had passed the higher examination. It had always recognised the right of the man who had passed the Minor to carry on business, and he had regarded it as an anomaly that such a man should be debarred from being a member of the Pharmaceutical Society and voting for the election of Council. It had taken them ten years to get through Parliament a Bill to remove this anomaly, and such a Bill became law last session. The members of the Council acknowledged that what they had accomplished had been largely due to the assistance they had received from the local societies and also to the great body of chemists throughout the country. The result of this movement, Mr. Newsholme contended, proved that after all the chemists were not such a disunited body as some would have them believe. It showed that when the interests of the craft were concerned, they could be united for their common good. He did not want anyone to get the impression that pharmacists were seeking legislation merely to benefit their craft, as they had in view the welfare and protection of the public, and

in his position as Vice-President of the Society he wished to impress upon all the members the fact that they were charged with public duties and responsibilities. It was also a fact that they were responsible to the Privy Council. He would remind those critics who complained that the members of Council did not do this or that, that they were bound by Act of Parliament, which told them their existence depended entirely upon the public good. One subject which loomed before them was that of company trading, and he wished to emphasise what had been already said on the subject. A prompt remedy for the evil was possessed by the qualified chemists. If these refused to sell themselves to the limited liability companies, the latter could not carry on their business for another day. It was not for the public good that this state of things should continue. It was perfectly well known that the General Medical Council possessed the power to prevent unqualified men from practising under the cover of a registered medical man by removing from the medical register any medical man lending himself to such arrangements, and he thought the Council of the Pharmaceutical Society ought to possess similar power. It seemed to him a very great anomaly that an individual grocer or ironmonger was not allowed to hire a qualified chemist and to carry on the business of a chemist by his aid, whereas seven ironmongers or grocers could combine together and do this. The law had been appealed to on the point, and the House of Lords ruled that limited companies were not contemplated when the Act was passed, and were therefore outside the Act. That might be very good law but it was not common sense. If it was right for seven persons to combine and act as chemists by simply engaging a qualified man, it was right for individuals to do the same thing. This company trading was certainly contrary to the spirit of the Pharmacy Act, and if each individual qualified chemist would keep in mind the duty to his craft and to the public which was imposed upon him, and would set up a high ideal of what was right and honourable, a remedy would soon be found. Alluding to criticisms of the Society, he said whatever feeling there might be against it, the organisation was charged with everything that pertained to the welfare of the pharmacist and his craft, and no good could be accomplished from anything outside it. He was, therefore, sorry that so many chemists failed to realise that it was their duty to join it. He acknowledged the indebtedness of the Council to Sir Howard Vincent, Alderman Langley, and other local members of Parliament for their assistance in the passing of the Pharmacy Acts Amendment Act. In connection with this legislation the chemists had demonstrated the power and influence they possessed, and having succeeded so well he asked what might be accomplished in the future if they acted in concert and used their powers to the fullest extent. It was possible for the members of the craft to secure a far better position than they had occupied up to the present time. Referring to the Poisonous Substances Bill introduced in the last session, the speaker said the Council could not see their way to accept it. Legislation on the subject was needed, but they wanted a Bill which would be both for the benefit of the public and of themselves. They contended that, charged as they were with duties upon which the safety of the public depended, chemists ought to be educated men. It was not sufficient to have a Bill dealing with the registration of poisons pure and simple, for they knew that the mere labelling of an article that was a poison was no protection. An educated pharmacist would use an intelligence when a customer asked for a deadly poison, in the direction of ascertaining the use that was going to be made of it. He would not be satisfied altogether in selling anything that was asked of him. He knew the value of poisons and their liability to misuse. If asked for prussic acid, for example, the educated chemist would inquire what it was intended for, and if the customer had the appearance of being a weak-minded individual, who might have conceived the idea of suicide, he would not sell the drug. The more experience one had in these matters the more one saw how much to the advantage of the public it was that the sale of poisons should be in the hands of suitably educated men. He disclaimed on the part of the chemists any desire for legislation in this direction for their own advantage, as in mere pounds, shillings, and pence it frequently occurred that legal restrictions of this kind were distinctly disadvantageous. The Government had undertaken to introduce next session a Bill to deal with the sale of poisonous substances. It was a large question, and there was a difficulty in drawing the line as to what were poisonous substances. Many things not now in the Poisons Schedule required handling

with very great care. However, no less a statesman than the Lord Chancellor, together with other members of the Government, had stated that they were prepared to do something more in protecting the public from poisons in the near future. The Council would like to see carbolic acid scheduled as a poison, but they could do no more than they had done. They were, however, fully alive to the fearful evils which might and did result from the facilities which existed for obtaining deadly poisons, and would miss no opportunity to remedy the matter.—Mr. J. RYMER YOUNG also replied, at the outset advising societies on all possible occasions to accept all the help they could get from their members of Parliament, whether Liberal or Tory, as there was not much difference between the two parties when it came to measures affecting their craft. He also described Mr. Newsholme as one of the most popular members of the Council, and thought Sheffield was distinguished by the fact that one of their citizens held the position of Vice-President of the Society. Appealing for increased support for the Society, he said that notwithstanding the ridicule which it was the fashion and the caprice of certain people to throw upon it the organisation was the only permanent power to be of the slightest assistance to the craft.

Mr. J. F. EARDLEY gave the toast of

The Medical Profession.

—Dr. ROBERTSON, replying, said the two professions were allied in several important respects. The medical profession admired the ability shown by the chemists in coming to their aid with new preparations, and in making more certain in composition the old ones. The profession also owed a debt of gratitude to the Pharmaceutical Society for the work it was doing to improve the education of its members, and to enable them to keep abreast of the times. The medical profession and the chemists, he thought, might, with great advantage to the State, join hands in an effort to stamp out the abominable and criminal use of *abortifacients*. It was an evil which required legislation.—Dr. GEORGE WILKINSON, who also replied, said the medical profession owed much to the Pharmaceutical Society, and sympathised with its attempt to amend the Pharmacy Act and to improve the regulations as to the sale of poisons. Dwelling upon the immense advance which had taken place in pharmacy in recent years, he said drugs were now prepared in much more simple and convenient forms, and new drugs were constantly being brought out; indeed, he thought pharmacists were making things too easy for the medical man. Everything he produced, both drugs and food, were in such beautiful form that the medical man had no need to compound his own formula or regulate the dose, or in fact to do anything but prescribe occasionally. As the interests of the two professions lay on parallel lines in many respects, he hoped they would work together in the future for the advancement of those objects which both had in common, and for the public good.

Mr. A. H. ALLEN gave the toast of

Sheffield University College and Learned Societies.

He said the learned societies were able to bring powerful influence to bear on public departments and officials, and they might exercise their power in such a way that the Pharmacopœia of the future—if they ever got one—would be compiled on reasonable, rational lines. The present one was irrational. In other directions the learned societies could help the pharmacists, and he was glad they were being brought together more than was formerly the case.—Dr. HICKS, F.R.S., in reply, said he had long thought it would be an advantage to the chemists and to the College to secure that connection which was being inaugurated this year. He regarded, as one of the most peculiar features of the time, the tendency to systematise all matters of knowledge, a tendency which he thought they owed to the German. We owed to them the idea of teaching in a methodical manner a profession or a calling—in fact, the whole idea of technical education. Pharmacists, like the other crafts and professions, have kept on improving their methods and curricula for education, and when the Society obtained the powers it was seeking, it would be able to enforce the proper education of the younger members of the profession. In that way they would secure systematic education throughout. The Professor alluded to the enormous confidence which the public placed in the chemist. The slightest mistake by the chemist might cause fatal consequences, yet his preparations were taken without the slightest doubt. He doubted if the extent of this confidence was fully realised, but it was there and it was due to that confidence that the pharmacists should see to it that the future members of the craft were

thoroughly educated.—The final toast was that of "The Visitors," proposed by Mr. W. WARD and replied to by Mr. J. HUMPHREY.—On the following day some of the officers of the local society and several of the visitors drove to Ashopton and spent a happy day in the beautiful Peak county. The weather was highly favourable.

SELECTED FORMULÆ.

QUININE URETHANE FOR INJECTION.

Professor Gaglio recommends a mixture of 2 parts quinine hydrochloride and one part urethane as a substitute for other quinine salts for subcutaneous injections. The mixture is readily soluble in water, also neutral and non-irritating. Quinine hydrochloride, 3; urethane, 1½; and distilled water, 3; form the injection recommended—*Ztsch. d. allg. oest. Apoth. Ver.*, lii., 358.

SYRUPUS CALCII PHOSPHOLACTICI CUM FERRO ET MANGANO.

Calcium phospho-lactate, 20; iron lactate, 5; manganese lactate, 1, are dissolved in 74 parts of water. After filtration, the fluid is mixed with simple syrup, 900. Two drops of lemon oil are added for every 1000 grammes of the syrup.—*Pharm. Cent.*, xxxix., 460.

LEATHER CREAM FOR BROWN OR YELLOW SHOES.

(a) Yellow wax, 2, and stearine, 1, are melted in linseed oil, 1, on the water bath; turpentine, 6, and yellow ochre, 1, is stirred in. (b) One part hard soap is melted separately in 10 parts water, with continued stirring, both solutions are mixed to a uniform milky fluid, which is made up to 30 parts with water. The mixture is stirred until cold and filled into bottles.—*Zeit. d. allg. oest. Apoth. Ver.*, lv., 442, after *W. Drog. Ztg.*

RUBBER CEMENTS.

(1) Gutta-percha, 2; caoutchouc, 4; fish glue, 1; carbon disulphide, 26. (2) Dissolve caoutchouc, 9, in chloroform, 60, and add powdered mastic, 15.—*Zeit. d. allg. oest. Apoth. Ver.*, lii., 442.

REMEDY FOR PEDICULI.

Sem. staphisagria, 5; ung. hydrarg. ammon., 40; chloroform, 5. M. f. ung. Rub in three times per diem and wash off at night with lukewarm water and carbolic soap.—*Zeit. d. allg. oest. Apoth. Ver.*, lii., 442, after *Pharm. Ztg.*

PRESERVATIVE.

Preservative for preserving meat is said to consist of sodium chloride, 9.07; nitre, 24.6; borax, 34.56; boric acid, 32.2.—*Pharm. Centr.*, xxxix., 425, after *Amala. d. Farmacolog.*, 1891, 19.

STRAWBERRY POMADE.

Prepared suet, 3, are melted with lard, 5, and cacao butter, 8; fresh strawberries, 3, are added and set aside for 24 hours at a moderate temperature. The solution is strained through linen and a little rose oil or neroli oil added before cooling.—*Zeit. d. allg. oest. Apoth. Ver.*, lii., 360, after *Natt. Drugg. Ap. Ztg.*

LIQUID DENTIFRICE.

Benzoin, 12; ol. menth. pip., 12; powdered cochineal, 0.6; alcohol (90 per cent.), 300. D.S. 20 drops in a glass of water.—*Zeit. d. allg. oest. Apoth. Ver.*, lii., 360, after *Ph. Ztg.*

ANODYNE APPLICATION FOR BURNS AND BLISTERS.

Menthol and chloral hydrate, āā 1; spermaceti and cacao butter, āā 2; spread on linen.—*Zeit. d. allg. oest. Apoth. Ver.*, lii., 359.

TINCTURE OF EUCALYPTUS FOR COVERING THE ODOUR OF FORMALIN.

Formalin (40 per cent.), 25; eucalyptus tincture, 5; spirit of wine, sufficient to make 200. The solution smells agreeably, each teaspoonful corresponding to 0.25 gramme of pure formalin.—*Zeit. d. allg. oest. Apoth. Ver.*, lii., 360, after *Pharm. Ztg.*

INDIAN CREAM.

White wax, 3, is melted on a water bath with spermaceti, 2; olive oil, 20, is added, in which alkanet root, 20, has been digested until a deep red colour results. The mixture is strained through muslin into a mortar, a little lavender oil and tincture of ambergris are added, and the whole is beaten until cold.—*Zeit. d. allg. oest. Apoth. Ver.*, lii., 360, after *Nat. Drugg.*

THE DUTIES AND NEEDS OF LOCAL SECRETARIES.

THE time is rapidly approaching when the appointment of local secretaries for the ensuing twelve months will be under consideration by the Council of the Pharmaceutical Society, and meanwhile voting papers have been sent to all members and associates in business residing in towns where such officers of the Society may be appointed. It may not be out of place to recall the fact that local secretaries may be appointed in all towns in Great Britain, except London and Edinburgh, which return one or more members to Parliament, or which contain not less three members of the Society or associates in business. Last year, however, no less than forty-eight towns, eligible to be represented by local secretaries, were distinguished by the fact that no nominations for the post were sent in from those places. Such a circumstance is deeply to be regretted, as it seems to indicate only too clearly that the chemists in business in the towns referred to were either ignorant of or indifferent to the advantages offered by complete organisation. This is the more remarkable when it is considered that, including assistant local secretaries and the divisional secretaries for London and Edinburgh, there are nearly three hundred and seventy voluntary officials of the Society, stationed throughout the whole country, and that if they were properly supported on all occasions, the results attained might be not only beneficial to the craft, but also far reaching and enduring. The voluntary principle is not the least valuable feature of these appointments, and it is open to doubt whether paid canvassers and collectors could effect all that it is possible for local and divisional secretaries, appointed as at present, to do.

Coming to the duties attaching to the office of local secretary, they are partly general and partly special. The special duties are to report the changes of address of registered chemists in the district, and so assist in keeping a correct Register; the notification of infringements of the Pharmacy Acts; the collection of subscriptions to the Society and its Benevolent Fund. The general duties are to furnish such information as may be required at headquarters from time to time, and the promotion of the interests of the Society in every other possible way. The reporting of changes of addresses should, of course, include the notification of

arrivals in, as well as departures from, the district, and that in the case of all registered chemists, whether principals or assistants, and whether subscribers to the Society or not. Infringements of the Pharmacy Acts may be committed by registered chemists as well as by unregistered persons, and it is necessary to bear in mind that, in accordance with Section XV. of the Pharmacy Act of 1868, it is not only illegal for unregistered persons to "sell or keep an open shop for the retailing, dispensing, or compounding poisons," and to "take, use, or exhibit the name or title of chemist, etc.," but it is also illegal for any person, whether a registered chemist or not, to "compound any medicines of the British Pharmacopœia, except according to the formularies of the said Pharmacopœia." The infringements dealt with in Section XVII. of the Act are, as is well known, omission by the retailer of any scheduled poison, whether a registered chemist or not, to label the poisons properly, and failure to record the sale of poisons in the first part of the Schedule, as provided by the Act. Here, then, are five distinct offences against the law, instances of which should be duly reported to headquarters by local secretaries whenever they are brought under their cognisance. Of the collection of subscriptions it is unnecessary to say anything beyond the fact that this duty is usually well performed by local secretaries.

The general duties of local secretaries, as distinct from their special duties, are best considered in connection with their needs. For local secretaries have peculiar needs as well as duties. As the capable and much esteemed local secretary for Liverpool pointed out a few days ago (see p. 439), they are men in business having many claims upon their time, and often ill able to afford to neglect their own private affairs to any large extent. They need, therefore, a fair measure of assistance from neighbouring chemists. Every registered chemist in a given town should consider it incumbent upon him to intimate, either through the local secretary or direct to headquarters, any breach of the Pharmacy Acts of which he is cognisant, or any alteration in the Register of Chemists and Druggists that may be required to secure accuracy in that all-important list. And this brings us to the local secretary's chief need—that of a complete and correct Register. The subscription-list for his town shows him how many of the local chemists in business on their own account subscribe to the Society, but he must usually depend upon the local directory, checked by the Register, to ascertain what other registered chemists are in business there, whilst he is quite at sea with regard to the registered assistants in the district, neither local directory nor Register affording him the least clue with regard to that class. The Register, unfortunately, frequently only records the addresses of assistants at the time they passed the qualifying examination, and any radical reform of that list would seem to require that the actual addresses at the time of publication should be given in all cases. More than that, quarterly lists of alterations in addresses might well be supplied to local secretaries, who, in turn, should do whatever they can, aided by their fellow-chemists in the district, to help the headquarters' staff to keep the list of addresses correct up to date. In fact, the ideal of a correct Register can only be realised by the cordial co-operation of local secretaries and registered chemists as a body with the Registrar. Another need of local secretaries is the opportunity of comparing notes with each other. It ought not be difficult for district conferences of local secretaries to take place three or

four times a year under the chairmanship of the nearest member of the Council of the Pharmaceutical Society. In addition, as Mr. SMITH suggests, representatives from all the districts in Great Britain might meet once a year—at the place and during the time selected by the British Pharmaceutical Conference. Such meetings would be of the greatest possible advantage to local secretaries, and through them to all the registered chemists in their respective districts. But, above all, it should be evident that if local secretaries are to do their best for pharmacy they must receive the cordial sympathy and co-operation of all the registered chemists around them, as well as of the headquarters' staff. Thus, and thus only, can they be expected to fulfil satisfactorily their general duties—furnishing such information as may be required from time to time in the interests of pharmacy and the general public, and in other ways doing all that is possible to promote the interests of the Pharmaceutical Society.

THE USE AND ABUSE OF MEDICINES.

IN an address to the Reading Pathological Society, Mr MALCOLM MORRIS has pointed out that the improvement in methods of local treatment of skin diseases is attended with certain disadvantages, since the very excellence of the numerous elegant applications, due to the inventiveness of UNNA and other skin specialists, has tempted medical men to rely too exclusively upon them. To some extent the best effects of internal remedies have been masked by polypharmacy, a superfluity of drugs being ordered in a prescription to conceal a possible want of knowledge on the part of the prescriber. But however useful as a cloak for the doctor's ignorance, to the patient polypharmacy is always more or less injurious, inasmuch as every drug taken into the stomach damages to some extent the delicate machinery of the body. "Nothing probably has hindered the progress of therapeutics as much as polypharmacy. If we fire charges of medicinal small shot at a disease, how are we to tell which of them hits the mark? And how is it possible to gain an accurate knowledge of the action of remedies if we administer them in mixtures as complex in their ingredients as the *bouillabaisse* so lovingly described by THACKERAY?"

After defining the sphere of influence of internal remedies, the lecturer proceeded to describe their action, classifying them as alteratives—arsenic, antimony, phosphorus, potassium iodide, the salicylates, thyroid extract; internal antiseptics—mercury and ichthyol; and nerve sedatives, such as opium, chloral, sulphonal and phenacetin. All were spoken of as useful remedies if administered under suitable conditions, and in conclusion it was stated that in dermatology, as in every other department of medicine, progress has been greatly hindered by blind adherence to tradition and authority, "Tradition tends to keep alive superstitions like the 'constitutional' bogey; authority creates fallacies of its own." These largely spring from an unscientific use of a multiplicity of remedies, which leads to effects being attributed to wrong causes. VOLTAIRE says it is unquestionable that certain words and ceremonies will effectually destroy a flock of sheep—if administered with a sufficient quantity of arsenic. Similarly "we have still a vast amount of 'words and ceremonies' to get rid of in dermatological practice before we learn to use with precision the arsenic or other agent which is the efficient cause of cure in skin diseases."

ANNOTATIONS.

COMMERCIAL MORALITY was, as pointed out by Mr. Mumbray (see p. 455), touched upon by the Bishop of Ripon in his recent inaugural address to the Church Congress. It was there remarked that when business and personal character go hand in hand, when a man trades in his own name and on his own responsibility, any deviation from truth and honesty is an impeachment of personal honour; but anonymous trading or trading under the impersonal title of a company has diminished the sense of personal responsibility. Sensitiveness to dishonour is blunted, the opportunity of gain without the loss of personal prestige being a powerful persuasive which sweeps away many scruples. "An anonymous society feels less need of a conscience than an individual, and a company is too often more limited in honour than in capital. The theory that trade is not a system for the interchange of needful commodities, but a method of predatory warfare is too often tacitly accepted; and the principle in this warfare that anything is fair is, alas, frequently adopted in practice. And so it happens that men who would be expelled from a club for cheating at cards may be held blameless members of society, though they have been responsible for a seductive and inaccurate circular followed by inflated prices, and the ruin of those whose only fault was the weak faith which led them to believe that noble names were a guarantee of honourable dealing."

DISPENSERS IN H.M. NAVAL HOSPITALS must, according to the latest regulations, (a) have passed the Minor or Major examination of the Pharmaceutical Society of Great Britain, or (b) hold "the certificate of competency granted by the Pharmaceutical Society of Ireland." Whether the certificate referred to implies that the holder is a L.P.S.I. or not is left to the imagination. What is quite clear is that an individual legally qualified to dispense anywhere in Great Britain will not be accepted for service in a Royal Naval Hospital without further examination. The candidates must not be more than twenty-five years old, they must pay an examination fee of ten shillings each, and if successful will be required to satisfy the Civil Service Commissioners as to their physical fitness to serve on foreign stations. The subjects of examination are pharmaceutical chemistry, materia medica, poisons, recognition of chemicals and drugs, and practical pharmacy. "Pharmaceutical chemistry," as understood by the Civil Service Commissioners, treats of the sources, adulteration, and active principles of drugs, the principles of dosage and dispensing, flavouring agents, incompatibility and antagonism, idiosyncrasy, toleration and habit, accumulation, weights and measures, including the metric system. Such a jumble could have emanated only from the brain of a naval medical crank, and the duty of interpreting this part of the syllabus should be rewarded by the granting of a special decoration, not the Victoria Cross, but something equally distinctive.

OF THE OTHER SUBJECTS, the only useful one is that of "poisons," and no reasonable objection could be taken if the Minor syllabus required candidates to show an acquaintance with "the symptoms produced by the commoner poisons, the modes of evacuating the contents of the stomach, emetics and their mode of administration, antidotes and their mode of preparation." In "materia medica" a knowledge is required of "the physical and chemical characters, preparations, actions and doses" of the elements and compounds usually dealt with in an elementary course of chemistry; "the physical and chemical characters, mode of administration or application, actions and doses" of "synthetical compounds,"

including alcohol and alcoholic drinks, anæsthetics, anti-septics, salicylates, iodoform and its substitutes, chloral and butyl-chloral hydrates, sulphonal and its congeners, nitro-glycerin and amylnitrite; "the source, physical characters, preparations, actions, doses and uses" of some forty drugs of vegetable origin, together with cod-liver oil and cantharides. The "recognition of chemicals and drugs" is to be confined to those commonly employed in medicine, a very wise limitation, most readers will think. Finally, in the practical pharmacy examination, the candidate "may" have to dispense mixtures, pills, suppositories, etc., and to spread plasters; but he "must" be able to dispense percentage solutions. Where this practical examination is to be held is not stated, nor who amongst the Civil Service Commissioners is to apply the necessary tests. The date, however, is fixed for November 8, and to ensure the attendance of some candidates, such temporary men as are at present engaged at the Royal Naval Hospitals have received orders to present themselves for examination, doubtless to avoid causing disappointment to the expectant examiners as might be the case if they had no one to operate upon.

AT THE SANITARY INSTITUTE the introductory lecture to the sessional course of lectures and practical demonstrations in sanitary science for sanitary officers and students was recently delivered by Sir Douglas Galton, who explained that the passing of the Public Health Act, 1875, was the first effort made by the Legislature to deal with the health of this country as a whole, though that Act has since been supplemented by numerous others, as well as by bye-laws. One of the first problems which occupied the attention of the founders of the Sanitary Institute was that of improving the knowledge and, through that, the status of the sanitary inspectors. In the Public Health Act of London, 1891, Parliament required that sanitary inspectors should possess a certificate of competency for the performance of their duties from some examining body approved by the Local Government Board, and that Board has determined that in future there shall be a single examining body, composed of delegates representing the Sanitary Institute, the medical officers of health, the municipal and county engineers, the Royal Institute of Public Health, the National Health Society, and the Carpenters' and Plumbers' Companies. The Sanitary Institute, however, will continue to hold examinations generally for persons who desire certificates of proficiency in sanitary knowledge without reference to any official posts in London.

THE GOVERNMENT LABORATORY REPORT, for the year ended March 31 last, shows that the number of analyses and examinations made during the year amounted to 65,313, being a slight increase over the previous year, notwithstanding the interruption caused by the removal of the Department from Somerset House to the new laboratory which the Treasury had directed should be built. The first part of the Report relates to work in connection with the Revenue Department, and gives particulars of the numerous samples of tobacco and alcoholic liquors examined. The second part shows that 3480 samples were received from other Departments than those of Inland Revenue and Customs. Those samples were of a very miscellaneous description, ranging from butter and gold lace to soaps, cements, metals, milk, and sealing-wax. Such samples of drugs as were examined during the year were referred to the Somerset House authorities in accordance with the provisions of the Sale of Food and Drugs Act. They numbered sixty-five in all, and so far as registered chemists were concerned the results of the check analyses proved distinctly favourable on the whole. In one case it was alleged that there was a deficiency

on the average of 45 per cent. of each of three ingredients, but Dr. Thorpe reports that two of them were present in full proportion, and the third entirely absent. A sample of glycerin alleged to be diluted with water was found to come up to the B.P. standard, olive oil said to be adulterated with cotton-seed oil was in reality mixed with sesame oil, and glycerin was found to be present in samples of "lime juice and glycerin" and "lime cream and glycerin," reported by public analysts to be innocent of that ingredient. Under the circumstances it is not to be wondered at that registered chemists and other traders are sometimes septical about analytical results produced as evidence in courts of law.

THE PUBLICATION OF SCIENTIFIC CRITICISM of proprietary articles is now, as recently stated in the Journal (*ante*, p. 405), legally justified in France. The *Lancet* joins with other leading organs in agreeing that nothing could be more satisfactory than the legal decision reported, and expresses the wish that a similar example may be followed in this country. Presumably, however, our medical contemporary does not expect to be taken seriously when it suggests that it would be instructive and useful to the whole community if the Fellows of the Royal and Chemical Societies could be induced "to leave abstruse pursuits for a while, and present papers, say, on the composition of 'Munyon's Remedies,' 'Pink Pills,' 'Seigel's Syrup,' 'Blood Mixture,' 'Microbe Killer,' and so on *ad nauseam*." Still more will readers be inclined to doubt that, could such an ideal be realised, "the scales would be removed from the eyes of a remarkably gullible public." Judging from experience, the probability is rather that the "remarkably gullible public" would simply copy the results of the analyses and, whilst congratulating itself upon its smartness in getting the mixtures concocted at a considerable reduction upon the prices of the original articles, consume vastly larger quantities of unnecessary and unsuitable physic than even now.

THE MEDICAL SOCIETY OF LONDON inaugurated its one hundred and twenty-sixth session last week, when an introductory address was delivered by Mr. Edmund Owen, surgeon to St. Mary's Hospital, who remarked that amongst the many treasures of the Society's library were fifteen volumes of manuscript which had formed the diary or common-place book of the Rev. John Ward, who was vicar of Stratford-on-Avon from 1662 to 1681. Having taken his M.A. degree in 1652, Ward left Oxford for London to study anatomy at the Barber-Chyrurgeons Hall in Monkwell Street (where Dr. Scarborough, the friend of Harvey, was giving demonstrations), and to acquire a general knowledge of the healing art, for not very many years ago it was quite usual for the professions of Divinity and Medicine to be combined in the one individual. On taking up his work in Stratford-on-Avon, in the forty-sixth year after Shakespeare's death, Ward must, both as vicar and doctor, have been told of many facts concerning the bard by those who had been intimately acquainted with him. Unfortunately, he did not record much about him in those memorandum books; what he did say had been seized upon by Halliwell Phillipps, and duly recorded in his 'Life of Shakespeare.' One extract was given, the duodecimo volume being handed round so that it might be seen just as Ward had written it, nearly two centuries and a-half ago:—"Shakspear, Drayton, and Ben Johnson had a merry meeting, and, itt seems, drank too hard, for Shakspear died of a feavour there contracted." In those times it was customary to call obscure diseases "feavours," just as they were now called "influenzas" or "neuroses"; but, whatever the actual causes of Shakespeare's death might have been, it was evident that local tradition ascribed it, rightly or wrongly, to the effects of that "merry meeting." For a "merry meeting" it doubtless was.

CHEMISTS' ASSISTANTS' ASSOCIATION.

The inaugural meeting of this Association was held at 73, Newman Street, London, W., on Thursday, October 13. There was a very good muster of members, and the new PRESIDENT (Mr. F. W. Gamble) was accorded a hearty ovation on taking the chair. —Mr. H. E. MATTHEWS, the Hon. Secretary, having read the minutes of the last meeting, Mr. H. S. Wellcome was proposed for election as a patron of the Association; four new members were also nominated, and the PRESIDENT then delivered the inaugural address, the subject of which was

Education in Pharmacy.

Mr. GAMBLE expressed his consciousness of the great honour done him in his election as President of the Association, and his intention to make every endeavour to maintain the traditions of the Association, and with the help of the members to widen its sphere of influence. He proposed to speak principally of education in pharmacy, with particular reference to the post-examen period, when the fruits of previous study are ripening and their value is receiving a tardy appreciation. Most of the members of the Association had undergone the training necessary to obtain a pharmaceutical qualification and had attained to a degree of knowledge in some of the most alluring branches of science. But, examinations safely negotiated, books are often cast away to the farthest corner, and the little sum of learning acquired with so much labour is allowed to slowly melt away. This, Mr. Gamble deplored, because degeneration necessarily follows disuse of a faculty, and as training is necessary to its development, so is exercise essential to the maintenance of its efficiency. Hence it becomes incumbent upon the student to continue his studies after the post-examen period is reached. That this is not a habit amongst chemists might be conceded from the records of the Association, inasmuch as it is a matter of the greatest difficulty to obtain a dozen papers on pharmaceutical subjects from about a hundred and fifty members. Any man of ordinary ability who has continued to take an interest in the advances made in pharmacy and its cognate sciences, Mr. Gamble was of opinion, should be able to write a paper on some subject for which he has a special liking, without the slightest difficulty. A consideration of the reasons for this neglect of what might be called secondary education showed that the one of paramount importance is the apathy which appears to permeate the pharmaceutical body politic, and which receives encouragement in the change from compulsory study to optional reading. In the opinion of the speaker many men who have the will would continue their work if they could receive efficient assistance. It was, he thought, a striking fact that there is not, to his knowledge, a single course of post-graduate instruction given in any school of pharmacy in, for instance, pharmacognosy, or the analysis of water, urine, foods, or drugs. He did not know whether this is due to lack of energy on the part of students or of teachers, but he was sure that an analytical class could be formed if teaching and accommodation were good. Again, the present method of preparation for the examinations chokes any desire for the acquirement of knowledge for knowledge' sake, and prevents the development of that scientific enthusiasm which is the true basis of post-graduate study; the attempt to assimilate an inchoate mass of fact in the shortest possible time results in a species of mental indigestion not favourable to later work. Mr. Gamble then went on to show how that the progress of pharmacy is bound up with the progress of every other science, each advance being reflected upon pharmacy through the medium of *materia medica*, which is the chemist's cynosure, the whole course of his education tending to a thorough comprehension of the substances which form the armentarium of the physician. He strongly emphasised the necessity for continual diligence on the part of chemists by noticing in some detail this influence of science upon *materia medica*, and showed how a more complete understanding of the physiological function and use of certain secreting glands in the human economy has aided to *materia medica* several preparations of great interest, such as the products of the salivary, gastric, and thyroid glands and of the pancreas. The enormous influence upon *materia medica* of the growth of bacteriology was mentioned, it being shown that the science of preventive medicine is entirely based on the knowledge accruing from the study of these minute forms of vegetable life. Mr. Gamble next referred to the branch of chemical research which deals with the substances forming the cells and tissues of

the body and with the chemical nature of its secretions and excretions, which has added some new remedies to *materia medica*, Lecithin was instanced as being the most complex and apparently of the greatest importance of the fats of the body, containing as it does, in addition to carbon, hydrogen and oxygen, nitrogen and phosphorus, and yielding as products of its artificial decomposition glycerophosphoric acid, in addition to stearic acid and the alkaloid choline. The efforts of synthetic chemists to produce imitations of natural products were then spoken of, and Mr. Gamble remarked that there appears to be no theoretical obstacle to the production of any organic substance, beyond the curious fact that it has been found impossible to produce any single substance possessing optical activity by purely artificial means, this requiring the intervention of the life process. The recently introduced proteid compounds of silver were next noticed, and the chemistry of digestion as applied to the production of readily assimilable and palatable concentrated foods. The few examples given, Mr. Gamble said, were but a tithe of what could be adduced to show the influence of progressive science upon *materia medica*, but they were sufficient to show that for a proper study of this subject some versatility is required, and that continual application is necessary if a pharmacist would possess an adequate knowledge of his business. He ventured to maintain that the average newly-qualified chemist is not prepared to give this application, and he concluded his address by emphasising one point which he believed to be a great factor in causing this apathetic condition. To quote a well-worn platitude, the thorough pharmacist is made in the days of his apprenticeship; but usually the three or four years of pupilage are not only wasted themselves, but are generally spent in forgetting all the book-learning of the schools. As almost every town of importance possesses facilities for technical education, Mr. Gamble urged that it is the duty of the pharmacist to see that in addition to receiving a proper training in shop routine, his pupil avails himself of the opportunity of the study of scientific subjects. The subject of the training of apprentices is of such importance that in his opinion, seeing that a gradual acquirement of the necessary knowledge during three or four years is infinitely preferable to entire dependence upon a course of training of six or even twelve months' duration, there should be required on entry for the Minor examination in addition to a certificate of training for three years in a chemist's shop, certificates of attendance on science lectures during the days of apprenticeship.—Mr. T. MORLEY TAYLOR, the ex-President, said he rose with great pleasure to propose a hearty vote of thanks to Mr. Gamble for his interesting and instructive admonitory address, in which he had given very good reasons for suggesting the extension of knowledge amongst chemists after they had got their diploma. There could be no doubt that it would greatly improve the status of pharmacists all round. The President had asked whether the absence of any post-graduate course is due to the apathy of students or of teachers. He was afraid the fault did not lie with teachers, but with pupils. The study of physiology and physiological products had been dealt with at some length in the address, and although the Pharmacy Act contained a clause to the effect that no subject dealing with the theory and practice of medicine should be included in pharmaceutical examinations, Mr. Gamble had proved that it is almost impossible for a pharmacist to understand many branches of his calling or even to have a true appreciation of vegetable physiology without some knowledge of human physiology. He (Mr. Taylor) thought all would agree that Mr. Gamble, as President of the Association, was the right man in the right place, and the man, above all, competent to give them the admonitory address he had given.—Mr. G. PEARSON, in seconding the vote of thanks, said he was very much surprised that pharmacists do not take up even an elementary course of bacteriology and therapeutics. He believed that a knowledge of those subjects would improve their position very much, as many valuable posts are open to pharmacists who make themselves masters of such subjects.—The vote of thanks was carried with acclamation.—The PRESIDENT acknowledged the thanks and took the opportunity to refer to the irreparable loss the Council and Association have suffered by the death of one of the Council, Mr. F. Cooper. He was perhaps little known to many of the members, but by his gentle courtesy he had endeared himself to all who had to work with him.—In response to a question by Mr. STROTHER, the PRESIDENT said the Council, on behalf of the Association, had sent a letter to Mr. Cooper's relatives, accompanied by a wreath and expressing sympathy with them in their bereavement.

MANCHESTER PHARMACEUTICAL ASSOCIATION.

At the annual general meeting of the above Association, held on Wednesday, October 12, at the conclusion of Mr. Harrison's address (see *ante*, p. 433), Mr. A. Blackburn, the Secretary, submitted a report of the work of the past session, which had been a successful one.—The PRESIDENT (Mr. G. S. Woolley), in moving its adoption, said that, although it had been stated that this was the thirty-first meeting in the history of the Association, a Manchester association was founded twenty-six years before that, and he held in his hand a small relic showing that the first meeting was held at the Manchester Mechanics' Institution, on November 18, 1841, when a resolution was passed, "approving of the general principles of the Pharmaceutical Society of Great Britain." They ought never to forget the names of the gentlemen engaged in the work of those early days, and the names of those present at the meeting were most interesting. The President was Mr. George Danson, a very old pharmacist. He (the President) thought he had a pharmacy subsequently held by Mr. Pyne, and their friend, Mr. Hampson. They elected certain officers. The President was Mr. John Mottershead. The names followed of Danson, Simpson, C. Standing, Wright (he supposed that was old Mr. Wright of Oxford Street), Pickup, now of Piccadilly; Lett, Lynch, Roberts, Mason, Sharp, James Woolley, Bowker (who he supposed would be the same Bowker who was subsequently Mayor of Manchester), Richards, Booth, of Rochdale; G. Le French, of Bolton; Simms, Stockport; Hargreaves, Oldham; Kenworthy, Ashton; Crompton, Bury; Bowman of Bury. On the other side was an autograph letter written by his (the President's) father, who was appointed Honorary Secretary, calling the meeting together; he should be glad to show it to any gentleman who might desire to see it afterwards. In regard to the session just gone by, it had been one of considerable interest. There had been a great deal of good work, and at the first meeting alluded to in it, Dr. Paul was present, and a resolution was passed supporting the Council in its efforts to obtain desirable legislation. He thought Manchester lent considerable assistance in obtaining the passing of

THE PHARMACY ACTS AMENDMENT ACT,

and they might congratulate themselves that that Act was now passed and was on the Statute Book. He thought it one of the most important steps which had been taken since the passing of the Act of 1868. It gave them the means of consolidating the Society—making the whole trade into the Society, in fact—and did away with the cry which many of them had been familiar with, What was the Pharmaceutical Society doing? That cry no longer held good. The Pharmaceutical Society now consisted of the whole body of pharmacists, and those who would not join the Society had no right to complain if they did not approve of the gentlemen who were giving their time and their labour on the Council in London. If they did not approve, then let them take steps for finding others to carry the work out to their satisfaction, but they had no longer grounds for asking what was the Pharmaceutical Society doing unless they were members of that Society and took some part in the government of the affairs of the Society. A very interesting event already alluded to was the banquet to the Lord Mayor of Manchester. He could assure everyone present on that occasion that the Lord Mayor was very much gratified with the reception they gave him. The occasion was unique, and the banquet was a great success. In moving the report he had to say that before it was printed he tried to get the complimentary allusions to himself struck out, but was not allowed his own way. The rejection of

THE POISONOUS SUBSTANCES BILL,

was an instance of what they could obtain if they were only united. He supposed the number of pharmacists on the Register stood at something like 15,000. If they only numbered 10,000, such a body of men when united must be a great power, but unless they were united that power was entirely lost. In regard to the syllabus for next year, although they had an interesting syllabus last year, he thought the present one excelled it. The papers were all of interest and high character, and he hoped they would be able to secure large audiences when the gentlemen came before them with their papers. He had to express his thanks to the gentlemen who addressed them last year for their efforts to advance the interests of that Association and to interest the members, and he could assure them that they had the thanks of the latter as well. He had great pleasure in moving the

adoption of the report and the Treasurer's statement.—Mr. J. BLYTON, in seconding the motion, said he was pleased to attest the fact that the accounts were perfectly correct.—The resolution was carried unanimously.

ELECTION OF COUNCIL AND OFFICERS.

The following retiring members of the Council having been nominated without any opposition, there was no ballot, and they were declared duly elected:—Messrs. F. W. Bates, A. Blackburn, H. Kemp, W. Kirkby, W. Lane, A. J. Pidd, J. W. Walton, G. H. Westmacott, J. Wild, G. S. Woolley, E. Yates, J. Rymer Young; and auditor, Mr. J. Blyton.—Mr. H. KEMP moved that the month of April be substituted for October in Rule XI., which was seconded by Mr. C. SWINN, and agreed to.—Mr. KIRKBY moved in substitution of Rule X., "that the President, Vice-Presidents, Treasurer, and Secretary shall be elected at the Annual General Meeting by the members present from among the newly elected Council. Each nomination shall be seconded, and the election shall be by ballot." Referring to the Chairman's remarks, he said they should remember that the meeting in question was called with the object of establishing a direct branch of the Pharmaceutical Society of Great Britain, and if they could only have branches up and down the country which should be in constant official touch with headquarters, more interest would be taken by the members at large. Another point he should like to speak of was that there was a Chemists' and Druggists' Society in Manchester and Salford in 1826. He had in his possession a members' list, at the beginning of which there were the rules for the government and welfare of the Society, and it dealt with the times at which they should close on Saturdays and Sundays, and so on. He thought it was interesting to know that there was at that time an organised Society in this district.—Mr. A. J. PIDD seconded the motion, which was carried by nineteen votes to three.—The CHAIRMAN (Mr. G. S. Woolley) pointed out that the effect of the resolution would be that they would have to elect all the officers named that evening. He added that Professor Huxley said that men over sixty became fossilised, and that they ought to be relegated to some spot where they could consider as to the preparation for their latter end, and Professor Max Müller had also said that they ought to make room for the younger ones and give them a chance. He did not think that the office of President should be held for any long term by any one individual. He trusted that they would take this in a friendly manner, but in any case his interest in the Society would continue. He was willing to serve on the Council or in any other capacity.—Mr. KIRKBY nominated Mr. G. S. Woolley, who, he said, was not in danger of becoming fossilised.—Mr. A. BLACKBURN had great pleasure in seconding the nomination of a gentleman who might be regarded as a very young fossil, and he hoped they might see him in the same position for a very long time. He was sure those who had been on the Council and knew the good work which Mr. Woolley had done for the Association would regret if he retired from the position. He for one should be very sorry indeed to see anyone else take it at present.—The CHAIRMAN: We will not have a contest for this office, gentlemen.—On the suggestion of Mr. KIRKBY, the nomination was endorsed by acclamation.—The CHAIRMAN expressed his obligations, and said that no effort should be wanting on his part to secure the future success of the Association. The Chairman then said the next business was the election of two vice-presidents, and as they had made no change in the President he trusted they would make no change in the vice-presidents. He had great pleasure in nominating Messrs. W. Kirkby and Harry Kemp.—Mr. SMITH (Radcliffe) seconded the motion, which was supported by Mr. J. BLYTON, Mr. J. RYMER YOUNG, and others, and carried unanimously.—The CHAIRMAN said they must be very "conservative" that night and make no changes. He had to nominate Mr. A. J. Pidd as Treasurer. Although he shook his head at one time over the financial statement, it had actually come out with a balance. They could not afford to pass by a gentleman like that, and he trusted he would kindly consent to undertake the duties of the office.—The resolution was seconded by Mr. HARRY KEMP and carried.

CHANGE OF SECRETARY.

The CHAIRMAN said he was sorry to monopolise these resolutions, but he must say a word about the election of secretary. They would remember that last year they had the greatest difficulty in getting Mr. Blackburn to act again. As they knew, his time was very fully occupied, and as he had served the office

for five years, it seemed to him that he had right on his side in asking to be relieved of the duties. He would presently propose a resolution of thanks to Mr. Blackburn for his services, but he might say they were very much obliged to him for what he had done for them, and particularly for filling the position at great sacrifice to himself during the past year. They had been casting about for a gentleman who would take the office of Secretary, and was pleased to say that they had induced Mr. J. W. Walton, of Higher Broughton, to accept. Mr. Walton had been a member of the Council, and had shown considerable interest in the welfare of the Association. He was sure they would have a very effective Secretary in Mr. Walton, and he had great pleasure in proposing his election for the coming year.—Mr. BLACKBURN seconded. He had known Mr. Walton for some years past, and was sure they could not have made a wiser selection. He had no doubt that Mr. Walton would have the same help and support that he had had during the past year or two. He thought a good syllabus had been prepared by the Sub-Committee, and he trusted that under Mr. Walton, the Association would increase in numbers and usefulness in the future.—The resolution was carried, and Mr. WALTON expressed his acknowledgments.—The CHAIRMAN moved that the best thanks of the Association be given to Mr. Blackburn for his services during the past five years. He did not know that he could add anything to what he had already said, but the Association was greatly indebted to him for his services.—Mr. HARRY KEMP, in seconding the vote of thanks to Mr. Blackburn, said those who were members of the Council during the years he had acted as Secretary to the Association, were fully alive to the fact that at times he had worked under considerable disadvantages, and it had been often a great trial with his business and domestic ties to do justice to the duties of the office.—Mr. SLACK said he knew something of secretarial duties, and if he might use the comparison, he seemed to him he was the chief engineer of the whole ship.—The resolution was carried with great cordiality, and Mr. BLACKBURN said it was a difficult thing to reply to a vote of thanks of that kind, because during the past year or two he had not really had the time or the energy to devote to the duties, and he therefore told Mr. Woolley that if they could get a gentleman with more time to devote to the affairs of the Association it would be a great advantage. He had to thank the President and other gentlemen for the very great help they had given him in the work, and he also thanked those who had spoken so kindly of him that evening. He should always think with pleasure of the time he had devoted to the work of the Association, and he should always do his best to promote its welfare in the future. He hoped it would become a power and continue to flourish. This concluded the formal business of the meeting.

NORTH STAFFORDSHIRE CHEMISTS AND DRUGGISTS' ASSOCIATION.

The inaugural meeting of the third session of the North Staffordshire and District Chemists and Druggists' Association was held at the Copeland Hotel, Stoke-on-Trent, on Thursday, October 13. The PRESIDENT (Mr. J. Averill, J.P., Stafford) was in the chair, and amongst others there were present: Messrs. Edmund Jones (Hon. Secretary, Hanley), Weston Poole (Treasurer), E. Croydon, C. J. Wain (Newcastle), R. Prince (Longton), W. Jenkins (Stone), W. Allison (North Staffordshire Infirmary), and Anderson (Hanley). Letters of apology for absence were read from Mr. T. C. Cornwell (Hanley), and Mr. W. H. Hartley (Leek).

Presidential Address.

The PRESIDENT in opening the meeting said: It is my privilege this evening to address a few words to you at the commencement of the third session of our Association, and I think I cannot do better than refer to two or three of the most notable events which have taken place since our last meeting in the spring. The first may fairly be said to be the Pharmacy Acts Amendment Bill, which was discussed and approved of by this Association previous to its introduction into Parliament, and has since become law. The Bill was introduced into Parliament by the Hon. W. Smith, member for the Strand division, and read a first time in the House of Commons on February 24, the second reading being passed on March 7. Then came the opposition, which was said to be personal rather than otherwise, and at one time it was feared the Bill might

be wrecked. But, many thanks to the persistent energy and frequent presence in the Lobby of the House of Commons of our highly esteemed and valued President, Mr. W. Hills, and the impression made by him and others on the members of the House that the Bill was essential in the interests of pharmacists, it was safely steered through the storms which beset it, and finally received the sanction of the House of Lords. The effect, then, of the Act is that the Society will now comprise only two grades of supporters, namely, members and student associates, membership being available to all who pass the qualifying examination, and giving them a vote in the election of the governing body. It will also render them eligible for election as members of the Council. I trust, therefore, the passing of the Bill will be the means of bringing every qualified pharmacist into membership of the Society, which is the only organisation of chemists recognised by the Legislature, and which, if cordially and loyally supported by the craft, will be able to speak with great weight on matters connected with our trade, and have an enormous influence in bringing about such measures as may be for the advancement of the trade generally.—I claim it to be not only a privilege, but a duty that we should be associated together as members of the Society, thereby assisting not only ourselves, but the general body to which we belong. I have a great idea of unity. The saying that unity is strength is perhaps trite, but it is positively true. I trust then that whatever differences of opinion may have existed in the past they will now be removed, and that every chemist and druggist will become a member; if that is done I shall have no fear that the future of pharmacy will be brighter than at the present and far greater than it has been in the past. I would strongly urge upon all chemists who are not already members—especially the members of this Association—to join the Society, bearing in mind that the work of the Society is carried on for the benefit of all engaged in the business. Another measure which engaged our attention for a time was the Poisonous Substances Bill—a Bill which was read three times in the House of Lords, and only required to go before the House of Commons to become law. I think you will agree with me that the Bill, as it stood, constituted a danger not only to ourselves, but to the public at large. Its intention was to allow certain poisonous substances to be sold retail by any person who chose to deal in them. Happily, the Bill did not pass, and possibly will not be heard of again. If its introduction served no other purpose it has at least been the means of bringing chemists and druggists together for the defence of their class, and at the same time afforded an opportunity of convincing legislators that the support or opposition of the craft is not a thing to be despised. A new Pharmacopœia has been introduced during our recess, and taking it for all and all, I think the British Pharmacopœia of 1898 is an improvement on its predecessors. Hitherto new pharmacopœias have appeared in a rather erratic manner, and I must confess it is difficult to understand what good can be achieved by revising the work in this manner, or keeping secret the date on which its appearance may be expected. It surely might be revised at definite and regular intervals of ten years, and if necessary a list of additions made five years after each issue. Another reform is needed as to the exact time at which a new edition becomes official. The present Pharmacopœia became official and binding when its publication was announced in the *London Gazette*, but there was a kind of tacit understanding amongst some pharmacists that the work should not be deemed to come into force for some months. It was doubtful, therefore, whether a prescription, written immediately after the edition became official, should be dispensed according to the new or the old. My own view is that a reasonable but definite interval—say, three months—should elapse between the circulation of a new Pharmacopœia and the date it shall become official. Both physicians and pharmacists would then have an opportunity of gaining a knowledge of its contents before it came into general use. There are a few old formulæ which we miss in the new book, and some alterations which may be advisable, but I must say one is rather at a loss to know why the good old tincture aurantii is replaced by one made with fresh peel instead of the dried peel, fresh peel being only obtainable for a short period in the year, and the tincture is little used. The introduction of liquors is an advantage if the profession will prescribe them in place of infusions. I am sorry to notice that there is a growing tendency amongst members of the medical profession to study advertisements of proprietary articles and prescribe them

instead of making the Pharmacopœia their standpoint. One more topic I will refer to, and that is the gross injustice caused to the qualified chemist by allowing limited liability drug companies to carry on the business of chemists and druggists without the members being qualified, whereas an individual is prevented from doing so. I think for these companies to style themselves "cash chemists" and the "largest chemists in the world" is a direct contravention of the Pharmacy Act of 1868, and it ought to be stopped. It would appear that some of our legislators are beginning to see the injustice, for when the Pharmacy Acts Amendment Bill was before the Standing Committee of the House of Lords the Lord Chancellor directed attention to the fact that the Pharmacy Act did not cover the case of drug stores carried on by joint-stock companies, and he urged that, looking at it from a common-sense point of view, it was necessary that such bodies should be treated in the same way as individuals. Lord Herschel supported this view. This is exactly what we claim in justice to ourselves, and we must hope that some day our claim may have effect. I hope the coming session of our association will be profitable and agreeable.—Mr. WESTON POOLE moved a vote of thanks to the President for his address. Speaking with reference to the Pharmacy Acts Amendment Act he said he thought it would prove to be very beneficial. He wished it could have included a clause making it compulsory that youths should pass their Preliminary examination before they entered upon an apprenticeship, because it was only too evident that the system of taking poorly educated youths resulted in increasing the number of drug stores and various other malpractices. He looked upon the new Pharmacopœia as a step in the right direction, for it helped them to become more and more scientific. The Poisonous Substances Bill aimed at placing chemists and druggists on the same level with ordinary persons who had no qualifications.—Mr. JENKINS seconded the resolution. In regard to the Pharmacopœia, he considered it a mistake to have altered the old form of using strychnine and nux vomica. The old form was far better for the safety of the public. The thanks were heartily accorded, and the PRESIDENT briefly acknowledged the compliment.

Classes for Pharmaceutical Students.

—The SECRETARY (Mr. Ed. Jones) stated that at the beginning of the winter sessions of the Hanley evening continuation classes he was sorry to find that there were no classes of interest to pharmaceutical students in chemistry or botany; at least, such classes were not held at opportune times. He had, he was glad to say, been able to arrange with Dr. Reid, the Chairman of the Hanley School Board, and Mr. Wilson, M.A., Master of the Higher Grade School, for classes to be held in advanced chemistry and botany, both theoretical and practical, and there were already a dozen young pharmacists in attendance. He thought masters ought to take an interest in their young men beyond being merely satisfied with their manual labour, and help and guide them in their studies as far as practical. He complimented Mr. Weston Poole upon the fact that one of his young men, Mr. Finmore, had won the Jacob Bell Memorial Scholarship. This was the third time that scholarship had been won in North Staffordshire. Mr. Jones added that he had asked Messrs. Southall Brothers and Barclay, Limited, to help the Association in encouraging the study of pharmacy, and the firm had promised a gift of one of their students' series of materia medica specimens and a copy of the book on the subject by Mr. Barclay.—Mr. Jones was thanked for his service in connection with arranging the classes, and on the motion of the PRESIDENT, seconded by Mr. CROYDON, the kindness of Messrs. Southall Brothers and Barclay was acknowledged.—Following a suggestion made by Mr. Jones, it was decided, on the motion of the PRESIDENT, seconded by Mr. CROYDON, to appoint Messrs. Jones, Poole and Wain a committee to purchase two microscopes, subject to Mr. Jones making satisfactory arrangements for an instructor and room where students could meet.—Mr. JONES moved that a letter of condolence be sent to the family of Mr. George Viggars, of Tunstall, who died during the summer. Mr. Viggars, who was only thirty-six years of age, was a member of the Association. He also moved that the sympathy of the Association be expressed to Mr. T. C. Cornwell who, a fortnight ago, met with a serious accident.—Mr. WAIN seconded, and the motions were carried.—It was decided to hold future meetings on the third Thursday in each month. Mr. Jones gave notice of two motions for the next meeting—one dealing with the advisability of

every chemist and druggist joining the Pharmaceutical Society, and the second in reference to Minor and Major examinations.—The CHAIRMAN announced that at the next meeting Mr. Allison would give a paper on the "Preparation of Emulsions."

NEWCASTLE ON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION.

The second annual meeting of this Association was held at the Métropole Hotel, Newcastle, on Wednesday evening, October 12. There was a good and representative attendance, the chair being occupied by Mr. T. MALTBY CLAGUE, retiring President.—The minutes of last annual meeting were read and confirmed, several new members were elected, and the Treasurer's and Secretary's reports adopted. These latter were considered satisfactory, the balance in hand being £8 odd, somewhat larger than the previous year. In all eight meetings were held, and the average attendance at each meeting was over eighty. Mr. F. E. Schofield (Morpeth) was elected President for the year. Messrs. Clague, Owen, Ridley, and Rose were elected Vice-Presidents. Messrs. R. Wright and Geo. Whitehead are the Auditors. The Treasurer, Mr. Kerse, and the Hon. Secretary, Mr. G. F. Merson, 24, Newgate Street, were re-elected. The Committee is as follows:—Messrs. R. Brand (Wallsend), R. Cubey (Blaydon), W. Buckley (North Shields); J. Gibson, Jun. (Hexham), and G. Duncan, F. R. Dudderidge, W. Pescod, L. Williamson (Newcastle).—The newly-elected President gave the following short address:—

President's Address.

In days of yore an "ancient" of my father's was sent to the moors with a cartload of bees. Such an expedition abounds in dangers and delights! Presumably to ward off the one and heighten the other, a "Drappie in the E'e" is indispensable to the equipment. Night was falling fast when in hope they began their long journey; but with the usual like of mice and men, on the road they missed a turning, and ere the gleams of the rising sun had gilded the purple hills, Jack and his companion were wandering about the classic region of Elsdon Rigg, fogged outside and in. In their aimless perigrinations they chanced upon a rickety old sign-post—but neither of them could read! They looked at the post; then looked at each other, conscious that the centuries looked down upon them! There is a kind of courage the product of chagrin, and a patriotism begotten wholly of the pest! 'Twas on these very hills that—

"The Douglas and the Percy met—
Two captains of might and main."

No Northumbrian could say die on such a field. Fired with a new hope from the eternal spring, they addressed the sign-post in words of appropriate endearment, fell upon it and slew it, stuck it in the cart among the hives, and triumphantly drove away rejoicing in the thought of meeting some one who could read it and show them the road to the "Birkie Burn." I am inclined to think that you gentlemen of the Newcastle and District Chemists' Association, with the kindest and best of intentions, have unconsciously, to some extent, been playing Jack! Like the sign-post, in a place of comparative obscurity, your newly-elected President might be of some little service to the wanderers who come his way, but you have transported him to the precincts of your proud city; you have pulled up the sign-post—certainly to his discomfiture and probably to your own disappointment! Nevertheless, though he be but lumber in your cart he highly appreciates the compliment, and will endeavour to keep in the centre. In my youthful days I used to take a great interest in sign-posts, and I am afraid the county council has cremated many a unique venerable friend. But there are sign-posts worthy of your attention other than those graven by men's hands. I like to think of our grand old county—kingdom should I not call it?—of Northumbria as a sign-post. Who can ever read of Paulinus, of Edwin, of Oswald, of Aidan, or of Cuthbert without seeing the kingdom of Northumbria pointing the kingdoms of the earth to Christianity and civilisation? My own good little town (Morpeth) gave to the scientific world Turner—its earliest botanical sign-post. In science and in commerce what a prodigality of sign-posts has been reared on the good old banks of "Coaly Tyne"! In what better pose could we wish to see Henry Brady, with his transparent purpose and enlightened and enlightening views, than as a pharmaceutical sign-post? And has the grand old man of pharmacy, who is

still happily with us—Barnard Proctor—not spent the best of his days in playing the part of a sign-post? These might we not call Watling Street signs—known and read of all men!

“Ye who boast in your free veins the blood of Sires like these—lose not their lineaments!”

But I would have you look on the ordinary rank and file of pharmacists to-day each in his own sphere, on high-road or on bye-road as so many sign-posts. Are we not all by tradition and training expected to be such? Are we sufficiently alive to the greatness of our heritage in this respect? Sometimes I doubt it, and sometimes I think we are too much so. Probably in both views I am correct. In these competitive days the race is coming more and more to the swift, and the battle to the strong. At the very sound of “store” the spirits of some men are stifled, but if we would keep our match alight we must face the wind!

“How can men die better
Than in fighting fearful odds?”

If we would successfully fight the fight, it must be with our commercial morality kept up to sign-post standard. Conscience is only a coward revealer, not a coward maker, whatever “will” might say, and this matter of conscience should be the chemist’s special property, proverbially expensive to keep, but more get-at-able than the ambergris.

I can conceive of nothing more demoralising than what appears to be the established customs of some branches of modern business. The wholesale tipping of servants is perfectly astounding, and must sooner or later become a public question. Not long ago I had the offer of the account of a large house, provided I would allow the particular servant 10 per cent. upon the total and work it in. Live-stock auctioneers tell me it is an every-day story with them. Of course, I know that “canny Newcastle” would not tolerate such a system, but I feel it my duty to warn you, for the practice is rife enough in your immediate neighbourhood. The material influence of the “stores” is bad enough, the moral influence of such a practice is infinitely worse. It is only by maintaining a high sense of individual duty, by keeping the sign-post erect in its place and clean, that we can hope for our profession—for profession I consider it—to maintain its high character. The potsherds of the earth may strive with the potsherds of the earth, but ours is a higher, nobler, calling. There is something greater and grander than mere gold-getting, though this generation does not seem to believe it! “Dark and true and tender is the North” sang the Poet Laureate, and in thanking you for the honour conferred upon one so unworthy, may I express the sincere hope that the sturdy sign-posts of the North may long maintain their reputation for moral worth and scientific attainments.—At the conclusion of the address, a circular was read from the secretary of the Federation of Local Pharmaceutical Associations, asking the discussion of various matters decided upon at the meeting of representatives of local associations held in Belfast during the Conference week.

LIVERPOOL CHEMISTS’ ASSOCIATION.

The first meeting of the winter session of this Association was held on Thursday evening, October 13, in the Royal Institution, Colquitt Street, the PRESIDENT, Mr. J. Bain, in the chair.—After reading the minutes of the last meeting the SECRETARY, Mr. Wardleworth, mentioned that he had received from Monsieur A. Serée, of Le Vésinet, France, a communication thanking the Association for having honoured him by electing him a corresponding member, and expressing his appreciation of their courtesy. The library and museum of the Association being in need of a thorough revising and indexing, the Secretary announced that Mr. Prosper H. Marsden had offered to undertake the task, providing another member would assist him one evening a week, and Mr. H. Wyatt, jun., was detailed for the purpose.—Mr. WARDLEWORTH as one of the delegates to the Conference meeting at Belfast gave a short *résumé* of the work done there, and the hearty reception the English delegates received at the hands of Irish pharmacists generally, his remarks being further emphasised by Dr. SYMES.

NOMINATION OF PRESIDENT.

The question of the nomination of a president for the next session was then introduced by Mr. T. F. ABRAHAM, who said that in view of the fact that next year would be the jubilee of the Association, many members thought it would be as well to make a new departure, and instead of electing a president in the ordinary

way from amongst their active members it would be a graceful act and one by which they would at the same time honour themselves, and afford no small amount of gratification to one of their very oldest supporters, if they were to appoint Mr. Edward Evans, of Wrexham, to the office. One of the original founders of their Association, Mr. Evans had always shown a lively interest in it, and was for many years a regular attendant at its meetings until his retirement from business a few years since. In making this nomination Mr. Abraham thought they would recognise the worth of Mr. Evans personally and the great assistance they had invariably received at the hands of his firm.—Dr. SYMES, in seconding the nomination, endorsed cordially the remarks made by Mr. Abraham.—Other members supported the nomination, amongst others being the PRESIDENT and Messrs. J. SMITH and T. S. WOKES, and on putting to the vote was carried with unanimity.—Mr. J. SMITH then contributed a paper on

THE DUTIES OF A LOCAL SECRETARY,

which is printed at p. 439.—A hearty vote of thanks was awarded Mr. Smith for his paper, and he was congratulated upon the opportune moment he had chosen for its reading.—In the absence of the author, Mr. Edwin Dowzard, F.C.S., the SECRETARY read a communication entitled

THE DETERMINATION OF THE COLOURING MATTER IN SAFFRON, which is printed at p. 443—At the close a discussion took place, during which Dr. SYMES remarked upon the practical character of the paper and its utility to pharmacists, who were at times considerably troubled by variability in saffrons. For dispensing he had been in the habit for some years past of making a saccharate of saffron by pouring a strong aqueous infusion upon sugar and carefully evaporating to dryness. The resulting powder, used in the proportion for syrupus croci, gave a product which was of uniform colour, even after the saccharate had been made some time.—Mr. Dowzard’s method of determination was, in Mr. R. C. COWLEY’S opinion, preferable to that of the German Pharmacopœia, from its more definite character.—The meeting, which was very well attended, then came to a close.

WESTERN CHEMISTS’ ASSOCIATION OF LONDON.

The annual meeting of this Association was held at the Westbourne Restaurant, Paddington, W., on Wednesday last, when the chair was taken by the retiring PRESIDENT, Mr. J. H. Mathews. The minutes of the previous meeting having been read, Mr. E. M. Holmes was proposed as a member, and, after the Chairman had explained that there was a deficit on the river excursion account owing to lack of support by members, scrutineers were appointed to deal with the voting papers for the

ELECTION OF A COMMITTEE

for the ensuing year. As the result of the scrutiny, Messrs. Andrews, Cracknell, Dyson, Gulliver, Harrington, Hyslop, Martindale, Mathews, Parker, Philp, Phillips, Smith, Taplin, Warren, and Worsley were elected to form the new Committee. The accounts for the past year were then submitted and adopted, satisfactory balances being shown both on the general and entertainment accounts. A communication from Mr. R. C. Cowley, the Hon. Secretary of the Federation of Local Pharmaceutical Associations, was next read. This directed attention to a report of the Federation meeting at Belfast and a list of subjects suggested for discussion. The Hon. Secretaries having been directed to acknowledge the receipt of the communication, the Chairman then proceeded to review the work of the Association during the past session, stating that both the business and social meetings had been very successful, and proffering the thanks of the Association to Mr. Worsley for his valuable services. The annual dinner, he announced, will be held at the Café Royal, Regent Street, on November 16. At the conclusion of Mr. Mathews’ remarks, he was cordially thanked for his services as President during the past session. The next business was brought before the Association by Mr. Humphrey, who suggested that a small provisional committee should be appointed to consider the advisability of inviting the

BRITISH PHARMACEUTICAL CONFERENCE

to London in 1900. The suggestion was warmly taken up, and Messrs. Mathews, Cracknell, and Harrington were appointed as a committee, with power to add to their number and instructions to report to the Association at an early date. Thanks were then awarded to the Hon. Secretaries for their arduous labours on behalf of the Association, after which the meeting terminated.

NOTICES TO CORRESPONDENTS.

All Communications for the 'Pharmaceutical Journal' must be Addressed to the Editor, 17, Bloomsbury Square, London, W.C., and not in any case to individuals supposed to be connected with the Editorial Staff; no responsibility can be accepted unless this rule be observed. Communications for the Current Week's Journal should reach the Office not later than Wednesday, but news can be Received by Telegraph until 4 p.m. on Thursday.

ADVERTISEMENTS AND ORDERS for copies of the 'PHARMACEUTICAL JOURNAL' must be addressed to the Publishers, 5, Serle Street, Lincoln's Inn, London, W.C. Cheques and money orders should be made payable to "Street Brothers."

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size; clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

QUERIES addressed to the Editor will be replied to in the Journal as early as possible after receipt, though not necessarily in the next issue. Replies cannot be sent by post, even though stamped envelopes accompany the queries.

LETTERS TO THE EDITOR.

LOYALTY TO THE CRAFT.

Sir,—Your appeal to the craft at large ought to be productive of some good results—backed as it is by the practical and eloquent address of Mr. Young. The great difficulty to contend with is demonstrated in a note from one of your correspondents in the last issue of the Journal. Grocers, imitative of company traders or co-operative stores, steal in the character of brigands, who not merely rob, but also destroy. During a tour not long since, I recommended my friends to keep certain remedies at hand in case of emergencies. The general inquiry was: "Shall we send to the grocer or to the chemist—for you know it is a great saving to buy of the grocer—and he is so very obliging?"—another word for pushing and touting for orders. At one friend's I asked for a little bicarbonate of soda. On tasting it I remarked "There must be some mistake here."—"It was supplied by the family grocer, a most respectable man."—"At what price?"—"4d. a lb. My doctor told me it was just as good as the chemist's, who charges exorbitantly for every article." It is difficult to say what a chemist can do for the best, for however loyally disposed, he is so heavily handicapped that he cannot move. Compete he cannot, for the law forbids him to sell any drug or chemical that will not abide the ordeal of Somerset House. The great root evil of this debasement is that the professions of law, physic, and divinity have given not only their sanction but their support to the nefarious system which by reaction will recoil upon themselves. Thousands of honest industrious men and women are being brought to poverty and ruin day by day, tradesmen of all grades are filled with "envy, hatred, and uncharitableness" against their oppressors, and are ready to compete with each other for a crust of bread. I could give numerous illustrations of this grievous stern fact, but will content myself with referring your readers to the remarks of the Bishop of Ripon at the Church Congress, in which he showed how company trading appears to encourage commercial immorality. I trust that more able pens will take up the subject, and by united effort and loyalty to the principles of our Society secure a scientific rather than a haphazard frontier.

Kew, October 17, 1898.

R. GOODWIN MUMBAY.

Sir,—I have read with great interest the address of Mr. Rymer Young, and perhaps as a "blackleg" you will allow me a little space to give you some personal experiences as a reply to his onslaught. A few years ago, after having spent a considerable term in one of the historic houses, I went into business, lost my own savings and some of my friends' as well, and then turned my attention again to London. After vainly endeavouring to procure a living wage at legitimate pharmacy, I took a situation in the

stores, strongly as I felt and still feel that it is a wrong principle of business (I make Mr. Young a present of that admission), but a man with a wife and child is not enamoured of starving or stone-breaking for the honour of the craft. Some of my experiences while I was fondly hoping to find a means of salvation might interest your readers. One gentleman in the S.E. district offered me thirty shilling per week and two rooms—a bedroom of unknown dimensions and a "living room" (save the mark) of about 4 ft. square. Another hailing from Hammersmith "tempted" me with a similar offer and a commission on the returns when they reached £1000, which I was assured would rapidly be the case in competent hands. They were then £300. A third feared I had been too long in the historic house aforesaid, and might have imbibed too extravagant notions of the professional side of the craft, and could not soil my hands with penny-worths. I could multiply instances, but the above, which are *bona fide*, forced me to find refuge and a living in the stores. The fact is that for the majority of assistants (and the majority must remain assistants) a situation in the stores offers better prospects of success, with easier conditions of life altogether, than obtains in the legitimate retail. May I ask Mr. Young were the evils of legitimate pharmacy—"small salaries and long hours"—unknown before the advent of the stores, or have the stores forced chemists, if not to pay better salaries, at least to modify the hours of their assistants? Why the case only wants plainly stating, and it is obvious on which side the truth lies. The fact is there is a great deal of nonsense talked and written ignorantly or thoughtlessly about the stores. How many men outside the stores are getting salaries of £200 or over? Very few. No. I may be called all sorts of naughty names, but why should I starve or break stones so that others may have their bread buttered on both sides?

London, October 18, 1898.

C. P. (148/8).

TINCTURÆ QUININÆ AMMONIATA.

Sir,—When Mr. North gives a fluid drachm of ammoniated tincture of quinine and a fluid drachm of syrup of lemons with water, he gives a draught with an acid reaction, and so changes the chemical constitution and therapeutic action of the tincture. The draught will contain ammonium and quinine in combination with sulphuric and citric acids. The method most in vogue for prescribing tinct. quin. ammon. for the last eight years in Edinburgh, so far as I have experienced it, has been in a draught of aerated water, the only means of fairly retaining the therapeutic action of the ammonia, as well as rendering the quinine soluble and so ensuring the full dose. The alteration in the tincture is the momentary solution of the alkaloid and the temporary saturation of the ammonium by the carbonic anhydride.

Edinburgh, October 15, 1898.

GEORGE LUNAN.

MEDICAGO SATIVA.

Sir,—Mr. L. P. Balkwill's letter suggests that the term "scarcely naturalised" does not apply to this plant. The term is applied to it in Babington's 'Manual of British Botany,' pp. 74, 81. If the word naturalised is assumed to mean, as represented in English dictionaries, "become like a native," the term "scarcely naturalised" is quite appropriate. A few of the remarks given in local floras under this plant will show that to be the case:—

1. Sowerby, 'English Botany' (1864), vol. iii. p. 22, says: "Not uncommon in districts where lucerne is cultivated, but having no claim to be considered indigenous."

2. Ley, 'Flora of Herefordshire' (1889), p. 66: "Comes up amongst clover crops and maintains its ground for a season, and then dies out." (This description perhaps best explains the meaning of the words "scarcely naturalised.")

3. Druce, 'Flora of Berkshire' (1897), p. 133: "Denizen," *i.e.*, not indigenous. P. CC.

4. Pryor, "Flora of Hertfordshire": "Scarcely wild, being only the remains of cultivation." Townsend, 'Flora of Hampshire' (1887), p. 84: "Occasionally naturalised on banks and field sides."

5. 'Flora of Leicestershire' (1886), p. 37: "Alien; occasionally cultivated, and no doubt an escape."

6. Murray, 'Flora of Somerset' (1896), p. 77: "Alien; how quite naturalised in many places."

7. Bagnall, 'Flora of Warwickshire' (1891), p. 56: "Alien; in many of the stations this plant appears to be more a casual than a denizen, but in others it is well established."

8. Lees, 'Flora of Yorkshire,' 1888, p. 190: "Alien, not naturalising readily."

9. Griffiths, 'Flora of Carnarvon,' 1895, p. 34: "Alien or casual."

My acquaintance with the botany of Plymouth Hoe only extends to about thirty-six years, but I do not ever remember seeing *Medicago sativa* there, although I have often gathered *Medicago denticulata*, *M. maculata*, and *Trifolium scabrum*, as well as *Poa bulbosa*, nor have I ever seen *Datura stramonium* there. The only place where I noticed *Medicago sativa* at Plymouth was on railway banks, but I could never depend on finding it more than three years in the same place. It may interest some Plymouth readers of this Journal if I state that, so far as my experience goes, the common maple (*Acer campestre*) and the comfrey (*Symphytum officinale*) were quite rare twenty-five years ago around Plymouth. *Sevenoaks, October 15, 1898.*

E. M. HOLMES.

DIVISION OF THE MINOR AND MAJOR EXAMINATIONS.

Sir,—In reference to Mr. Edward Jones's letter in your issue of October 15, in which he draws attention to the fact of Sir J. C. Browne and Mr. W. Hills having expressed their opinions on the division of the Minor, I quite agree with him, the more especially as I have previously advocated the following plan:—There should be a compulsory curriculum of three years at some recognised school, and the subjects should be passed either singly or in pairs, a student not being allowed to go on to other subjects until he had passed in the previous ones. Of course, the knowledge required of a subject would be considerably more than that required now. There may be objections raised to this as to how the poorer students are going to manage. My answer is, we want to raise the standard of a qualified pharmacist, and I think that the only way it can be done. I still hold to that idea, in spite of having been derided by some critics, one of whom wrote all the way from Cape Town to say he could not help feeling disgusted and pained at the last few sentences in my letter, and remarking that he has even heard this abominable heresy of "Scriven's" openly preached "in the Council's meetings." "New Age," living as he does at Cape Town, is not, I think, properly able to appreciate the present wants and necessities of a man living in London, in the midst of tremendous competition. The average pharmacist requires assistance to enable him to hold his own with the stores, on all sides endeavouring to take everything they can out of his hands. If the examination is divided, made harder, and with a compulsory curriculum, as in the medical profession, qualified pharmacists would be fewer and better able to combine to thwart the efforts of those unqualified men who trade under the "name" of a company. That every owner in whole or part of a business in which drugs of any sort are sold should be qualified is my decided opinion.

London, October 18, 1898.

SCRIVEN (147/41).

"PROGRESS" (148/3), who also writes on this subject, has omitted to enclose his name and address. Further, he has ignored our rule which requires that all communications intended for publication must be written on one side of the paper only.—[ED. P.J.]

ANSWERS TO QUERIES.

LEAVES OF "LUNGWORT."—The leaves are insufficient to identify the plant. [Reply to E. F.—17/33.]

POWDER FOR SOFTENING WATER.—It is a mixture of dried sodium carbonate and slaked lime. With this information you will doubtless be able to determine the proportions yourself. [Reply to A. F.—16/31.]

COCAINE HABIT.—The simplest remedy is to abstain totally from the use of the drug, but the probability is that some other stimulant would require to be taken at intervals. Possibly very strong coffee or tea might serve. [Reply to G. G.—17/19.]

COIL FOR X-RAY WORK.—Any of the makers you mention will supply you with a satisfactory article, but you might do well to communicate with Reynolds and Branson, of Leeds, who make a specialty of such apparatus, and could also give you useful hints with regard to literature, etc. [Reply to C. S. F.—17/11.]

MONSEL'S SOLUTION.—This is solution of persulphate of iron.—[Reply to D. M.—18/2]

HYPODERMIC INJECTIONS.—We are not disposed to furnish any information on the subjects concerning which you write.—[Reply to G. W. B.—17/27.]

MACERATION PROCESS OF THE NEW B.P.—You must follow the instructions exactly and not dilute the liquid by making up to any particular quantity. [Reply to F. G. P.—17/32.]

MINOR EXAMINATION.—The regulations will presumably be strictly adhered to, but you will do well to make yourself practically acquainted with all the official assay processes.—[Reply to IPECAC.—17/22.]

SPRAY FOR VINES.—The preparation you require is Bouillie Bordeaux. To prepare it take copper sulphate, 6 lbs.; lime, 4 lbs.; soft water (preferably rain water), 22 gallons. Dissolve the copper in 16 gallons of water, slake the lime, and mix it with the 6 gallons. Mix the two solutions. [Reply to W. W. M.—17/20.]

MAKERS OF PILL MACHINERY.—Werner, Pfeleiderer and Perkins, Ltd., 17, Queen Victoria Street, London, E.C.; J. W. Pindar and Co., 75, New Church Road, Camberwell, London, S.E.; Bennett, Sons and Shears, Ltd., 167, Kingsland Road, London; Death and Harris, Leicester. [Reply to LIQ. AMMONIÆ.—17/21.]

ASSOCIATES AND M.P.S.—All associates in business are now virtually members, and will be formally elected such as soon as the new Bye-laws have been approved by the Privy Council. No further subscription will be required for the current year from any class of subscribers, nor will any further payment be expected from life subscribers. [Reply to S. H.—17/23.]

DOSES OF DRUGS.—Gadd's 'Synopsis of the British Pharmacopœia, 1898,' gives the doses of all official medicaments in tabular form, and is small enough to go into the waistcoat pocket. You will find the doses of unofficial remedies conveniently arranged in the index to Martindale and Westcott's 'Extra Pharmacopœia.' [Reply to STUDENT.—17/30.]

BOOKS.—There are very good accounts of the progress of chemistry in the introduction to Roscoe and Schorlemmer's 'Treatise on Chemistry,' in Rodwell's 'Birth of Chemistry,' and in Thomson's 'History of Chemistry,' all in the Society's Library. We do not know of any English translation of Berthelot's book. Do you mean animal or vegetable histology? [Reply to HOLOZOON.—17/26.]

SODIUM BENZOATE IN GOUT.—In cases where patients suffer from decomposition of urine in the bladder, so that it becomes ammoniacal and irritant, sodium or ammonium benzoate fending the urine acid may prevent or dissolve concretions. The benzoate, passing out of the system as hippuric acid, tends to act as a vesical antiseptic, and thus renders the urine more nearly normal. [Reply to F. P. B.—17/17.]

PSORALEA CORYLIFOLIA.—These seeds, commonly known in India as "Bauchee" seeds, are used in various skin diseases, especially leucoderma and lepra. The oleo-resinous extract of the seeds is used after being diluted with simple ointment. After application for a few days the oil appears to act as an irritant or stimulant, the white patches in leucoderma becoming red, and a little pain is produced. Little vesicles or pimples sometimes appear, and, drying up, leave a small spot of pigmentary matter, which forms a nucleus, others developing at the margin of the patch and ultimately coalescing. There is little doubt, therefore, that it acts as a stimulant to the skin. The seeds contain volatile oil, resin, tannin, and a bitter principle, but do not appear yet to have been sufficiently analysed, nor to have received the attention they merit (see 'Pharmacographia Indica,' i., p. 412; *Pharm. Journ.* [3], vol. xii., p. 257; xx., p. 183; Watt, 'Dict. Econ. Prod. India,' vol. vi., pt. 1, p. 355). It may possibly be obtained from Christy and Co., 25, Lime Street, London, E.C., or any other firm which deals in Indian drugs. [Reply to S. K.—17/15.]

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

Sterilisation of Catgut. Dr. J. H. Dauber describes the method of sterilising catgut by dry heat adopted by Professor Tscherning, of Copenhagen. Ordinary commercial catgut is placed on trays in the steriliser, between sheets of cellulose paper, and heated for six hours, the temperature for the first hour being 60° C., for the second and third hours 100° C., and for the fourth, fifth, and sixth hours 140° C. On removing the catgut from the steriliser it is wrapped up and closely sealed in an envelope of cellulose paper, and that in turn is enclosed in a similar envelope of larger size. The closed packet is then placed in the steriliser and heated for two hours at 140° C., after which it need not be opened until the contents are required for use. Sterilisation by dry heat possesses advantages over the wet methods, and by keeping the catgut as described it does not tend to become soft and lax as when kept in antiseptic aqueous solutions, or slippery as when kept in glycerin. Moreover, the gradual raising of the temperature prevents the catgut becoming brittle, the grease and oil naturally present being driven off gradually at the lower temperatures.—*Lancet*, 3921, 1055.

Bacterial Cultures on Artichokes. M. Roger is of opinion that the artichoke possesses several advantageous qualities as a medium for bacterial cultures. After having stripped of the scales the thick part of the artichoke is cut up into little cubes, care being taken to preserve the fibres (*foin*). The pieces are then placed in tubes plugged with damp wadding, the fibres being uppermost, so that the culture medium is represented by a fleshy mass surmounted by a sort of tuft. When the wadding is inserted the whole is heated in an oven to 115° C. for a quarter of an hour. In making an inoculation the germs must be deposited at the point of insertion of the flowers.—*Lancet*, 3909, 285.

Pharmacology of the Mescal Plant. Dr. W. E. Dixon, Salters Research Fellow in Pharmacology at St. Thomas's Hospital, has studied the pharmacology of the alkaloids obtained from *Anhalonium lewinii*. Four crystalline alkaloids were prepared from the so-called "mescal buttons" by Edmund White, B.Sc., pharmacist at St. Thomas's Hospital, by a method modified from Heffter's. The alkaloids and percentages obtained were as follows:—

1. Mescaline	}	1.16 per cent.	
2. Anhalonidine			
3. Anhalonine			0.46 "
4. Lophophorine			0.13 "

All were found to be freely soluble in water and to possess a remarkable similarity in their physiological actions. They proved to be absolutely non-irritant when applied to the skin, hence injection would appear to be a suitable mode of administering the alkaloids. A 5 per cent. solution of any of them has no effect when applied directly to the conjunctiva. In the mouth the substances behave as specific sialogogues. After large doses nausea and vomiting may occur. Small doses are apt to cause constipation, but, when the dose is large, diarrhoea sometimes occurs, and in exceptional cases even bloody stools have been observed. These results are produced whether the alkaloids are given by injection or by the mouth. Small doses slow the heart and cause it to beat much more vigorously, whilst after a varying period, dependent on the dose, the heart recovers

its normal rate, and generally exceeds it, but is never very rapid. There is also a considerable rise in arterial pressure. In toxic doses paralysis of the nerve endings of the vagus and subsequently of the nerve cells occurs. The respiration is not effected by moderate doses, but toxic doses give rise to rapid shallow respiration, and death subsequently occurs from failure of the respiratory centre. This is the main danger to be apprehended when experimenting with the drug in the human subject. As regards the effects upon the nerves, there is a preliminary stage of excitement, talkativeness, and exuberance of spirits followed by a stage of intoxication. Like Indian hemp the effects vary considerably in different individuals. During the stage of intoxication there are increased reflexes, wide dilatation of pupils, auditory and nasal hyperæsthesia, inco-ordination, tremors, blunting of cutaneous sensation, a rapid flow of ideas with difficulty in concentrating the attention, and sensory hallucinations, especially visual, the latter consisting of a kaleidoscope play of colours ever in motion and the tints constantly changing. The movements may be linear, rotatory, or pulsating. The visions generally are only seen with closed eyes. Colouring of external objects is exaggerated. Intellection and introspection seem to the experimenter to be normal. Occasionally there is an indescribable sensation of dual existence. Lethal doses produce complete paralysis, and death is due to respiratory failure. Post mortem, a faradic current applied to the motor nerves produces contraction. The important effects of these alkaloids in therapeutic doses would appear to be: (1) A direct stimulation of the intracardiac ganglia, (2) an initial slowing of the heart, (3) an elevation of arterial tension, and (4) a direct stimulation of the brain and motor centres of the cord, as shown by the increase in reflex excitability.—*British Medical Journal*, 1971, 1060.

Preparation of Caoutchouc. M. L. Lindet, in a paper on the researches of Aimé Girard, upon the latex of rubber-producing trees, deals at length with the various methods adopted in different countries for the coagulation of the latex. Heat, as is well known, is the commonest agent employed: the juice may be heated to boiling, as is done in Mexico, or spread on tiles and exposed to the action of smoke (Brazil and Venezuela), or thickening may be accomplished by direct action of the sun's rays (West Africa, the Congo, etc.). In order to bring about coagulation, the inhabitants of Brazil use alum, on the Ivory Coast salt is used, sulphuric acid in Maranhão, the juice of the citron in Madagascar, and vegetable infusions in Peru and Madagascar.—*Bull. Soc. Chim. de Paris*, xviii.-xix., 812.

Labels for Bottles. Horace Jervis describes a method of labelling bottles with a solution of sealing-wax, recommended by him in *Chem. News*, lxxvii., 133. The solution is made by grinding sealing-wax first in the dry state, and then with a small quantity of a mixture of alcohol and ether in such proportions as to make a thick liquid. Instead of lettering with a stiff brush, as suggested in the original paper, it is better to use a piece of glass tubing drawn out at one end. This gives the letters a beaded appearance. When the above solution is partially evaporated and somewhat thickened a rubber tube joining the pen and the lips enables the solution to be forced out as required. In this way one can letter as well as with pen and ink. The wax is not brittle when dry, and forms a durable and ready means of lettering the backs of note-books. It may be used also for such purposes as waxing the calcium chloride tubes of Geissler potash bulbs, where heating tends to fracture the ground-glass joint. Such articles should then be dried in a water-oven.—*Chem. News*, lxxviii., 63.

The three Chilian Solanums, *S. crispum*, *S. gayanum* and *S. tomatillo*, have been examined by F. Ramdohr and F. Neger, who find the alkaloid present to be the same as in European species, but it exists in considerably greater quantity, one per mille of solanine having been obtained from the fresh leaves. Known as "Natre," these plants are employed by the natives as a remedy for measles, scarlet fever, and other febrile diseases.—*Pharm. Central.*, xxxix., 521.

The juices of most fruits, in addition to the ordinary reducing sugars, are stated by Aderhold and Heintze to contain a substance which powerfully reduces Fehling's solution. It is obtained by fractional precipitation with alcohol, the pectin at first thrown out being removed by filtration. On adding stronger alcohol to the filtrate, the reducing body is precipitated in flakes, which, on drying, yield a yellowish-brown resinous substance. This substance was found in all fruits examined, and in larger amount in those not fully ripe. The body entirely loses its reducing power after exposure for some hours on the water bath.—*Chem. Zeit.*, xxii., 632.

NOTES ON ESSENTIAL OILS.*

In reference to the statement of Flatau and Labbé (*Compt. rend.*, 126, 1876) that they have obtained from palmarosa oil (Indian geranium) a saturated fat acid, $C_{14}H_{28}O_2$, melting at $28^{\circ}C.$, Messrs. Schimmel remark that in all their investigations they never found such an acid in oil of undoubted purity, and they suggest that the French chemists have operated on an oil adulterated with cocoanut oil or some similar material. In Réunion oil Flatau and Labbé found an oily acid, $C_{10}H_{18}O_2$, but they could not obtain tiglic acid, which was found in that oil by Messrs. Schimmel some years since.

The wood exported from Buenos Ayres under the name of "Palo balsamo," and the source of the oil now largely used for perfumery purposes, is, according to Dr. E. Paetzold, of Strasburg, the produce of *Bulnesia sarmienti*, Lor., belonging to the family Zygophyllæ, and closely related to guaiacum. It is indigenous, according to Grisebach, in the extreme north-west provinces, Oran and Gr. Chaco, of the Argentine republic. This oil is the most recent adulteration of Turkish rose oil: as it consists for the most part of an alcohol melting at $91^{\circ}C.$ it has the property of assuming a beautiful crystalline appearance at the ordinary temperature, and therefore serves for giving rose oil largely adulterated with geranium oil, the requisite crystalline character which is always relied upon in Bulgaria as the measure of good quality. The mild agreeable smell of the oil allows its admixture in large proportion without being recognisable.

Messrs. Schimmel are of opinion that the leaves and the buds met with commercially are not always derived from the same plant. Of late they have been unable to obtain from the distilled oil the readily crystallisable matico camphor, but in its place a substance melting at $62^{\circ}C.$ (after re-crystallisation from petroleum spirit), which proved to be asarone. When dissolved in petroleum spirit it assimilates a molecule of bromine, forming a crystalline dibromide melting at 85° to $86^{\circ}C.$; oxidised by permanganate, it yields asarylic acid, melting at $144^{\circ}C.$ (silver salt,

33.82 Ag). The oil seems to contain some methyl eugenol, as it yields, on oxidation, a small quantity of an acid melting at $174^{\circ}C.$ (veratric acid?).

Messrs. Schimmel point out that the statement in the *Kew Bulletin*, No. 140, p. 206, as to *Lemongrass Oil*, *Andropogon nardus*, L., being the source of this oil is in opposition to Flückiger and Hanbury (*Pharmacogr.*, 2nd ed., p. 725), as well as Dymock (*Pharmacog. Indica* [3], 564), who state that it is the produce of *Andropogon citratus*, D.C., and that *Andropogon nardus*, L., yields citronella oil.

In reference to the statement in the British Pharmacopœia that this oil is obtained from "the full-grown unripe green fruit," Messrs. Schimmel say that such oil is never made in that way on the large scale. According to an antiquated statement by Zeller, unripe berries are said to yield most oil, but the oil distilled from unripe material would be very inferior in quality to that obtained from ripe fruit. The statement in the B.P., that the oil dissolves in four times its volume of alcohol (equal parts absolute alcohol and 90 per cent. alcohol) is also disputed as being applicable only when juniper oil is quite freshly distilled. After a few weeks it becomes less soluble, and then forms with four times its volume of 95 per cent. alcohol a sensibly turbid mixture.

For the determination of methyl salicylate, the chief constituent of natural wintergreen oil, Kremers and James (*Pharm. Rev.*, 16, 131) have recommended a process long since described by Messinger and Vortmann—converting the salicylic acid into diiod-salicylic acid by adding excess of iodine solution to a very alkaline solution of the acid and then ascertaining the quantity of iodine unconsumed by titrating with thiosulphate solution. But although the oil of *Gaultheria procumbens*, as well as that of *Betula lenta*, contains, beside methyl salicylate, other esters which are expressed as methyl salicylate in saponification, Messrs. Schimmel are of opinion that simple saponification is preferable to the more troublesome method recommended by Kremers and James. The observations of Dr. van Romburgh at the Buitenzorg Botanic Garden show that methyl salicylate is of very much more frequent occurrence than has been supposed. Out of 900 plants examined as to their volatile products, 160 yielded the ester. It is remarkable that in all instances the distillates from fresh leaves gave no indication of methyl salicylate, but only the distillates from leaves which had been kept some days before being distilled. This circumstance appears to favour the view of Bourquelot, Schneegans, and Gerock that in the plants the ester is in a state of glucoside combination. Methyl salicylate occurs very frequently in the Leguminosæ, also in several species of Aurantiaceæ, Celastrineæ, Compositæ, Cupuliferæ, Ebenaceæ, Euphorbiaceæ, Gramineæ, Jasmineæ, Lonicereæ, Meliosmeæ, Myrtaceæ, Olacineæ, Polygaleæ, Rhamneæ, Rosaceæ, Rubiaceæ, Sapindaceæ, Staphyleaceæ, and Tiliaceæ. Its occurrence is not confined to any particular part of the plants, but is common to the roots, leaves, flowers, and bark.

Besides limonene, of which Wallach showed that this oil consists chiefly, it contains some citral and minute proportions of an oxygenated substance. No other constituents, accounting for its peculiar odour, have been detected until quite recently. Flatau and Labbé (*Bull. Soc. Chim.* [3], 19, 361) have studied the oxygenated constituents. They obtained traces of citronellal with a minute proportion of another aldehyde having the characteristic orange smell. On saponification a small quantity of alkali was

* From Schimmel and Co.'s Semi-Annual Report.

neutralised, indicating the presence of an acid or an ester. The acid, as well as its ethyl ester, is very sparingly soluble in alcohol, and it can be obtained by distilling off 95 per cent. of the more volatile portion of the oil, then adding alcohol to the residue when the sparingly soluble ester separates as a brown pulverulent precipitate, melting at 64° to 65° C., and having the agreeable odour of orange peel.

In addition to the oil of *E. punctata*, D.C.

Eucalyptus (grey gum) examined by R. T. Baker and Oil. H. G. Smith (*Journ. Roy. Soc. N. S. Wales*, 31, 259), and the oil of *E. toxophleba* described by

E. J. Parry (*Ph. J.*, lxi., 198), three samples of oil from the eucalyptus plantations in Portugal have been examined by Messrs. Schimmel:

(1) *Eucalyptus rostrata*, Schlecht, sp. gr. 0.921 [α]_D - 1° 8' at 30° C., soluble in 2 parts 70 per cent. alcohol, no phellandrene reaction, high percentage of cineol, and agreeable odour.

(2) *Eucalyptus resinifera*, Smith (?), contains cineol, phellandrene, and a terpene not hitherto found in the oil of *E. rostrata*; specific gravity 0.893 [α]_D - 17° 8' at 30° C., insoluble in 70 per cent. or 80 per cent. alcohol.

(3) *Eucalyptus obliqua*, L'Herit, sp. gr. 0.914 [α]_D - 7° 28', soluble in an equal volume of 80 per cent. alcohol; contains cineol and phellandrene.

Caparrapi Oil.

This is described by B. F. Tapia as the produce of a Laurinaceous tree *Nectandra caparrapi* growing in Columbia, and there called "canelo," probably on account of the cin-

namon odour of the bark. The oil is obtained, in the same manner as turpentine, by making incisions in the trunk of the tree, and it is used as a substitute for copaiba balsam. As met with commercially it is more or less coloured. It contains a monobasic acid, C₁₅H₂₆O₃—obtainable from pale samples of the oil in a crystallisable form, melting at 84°·5 C.—and a sesquiterpene alcohol, C₁₅H₂₆O, readily convertible by dehydrating agents into a hydrocarbon, C₁₅H₂₄, caparrapene. Both the alcohol and the hydrocarbon are readily polymerised, and by distillation with steam three-fourths of the oil resinifies.—*Bull. Soc. Chim.* [3], 19, 638, through Schimmel's *Bericht*, October, 1898.

Citronella Oil.

From the examination of several samples of Ceylon oil, Messrs. Schimmel conclude that there are two kinds differing in physical characters and in the percentage of geraniol (and citronellal), as shown by the following figures, No. 8 being a sample from the Straits Settlements.

	Rotation at 20° C.	Specific Gravity at 15° C.	Amount of Geraniol per cent.	Solubility in 80 per cent. Alcohol.
1	- 0° 46'	0.892	88.6	1:7 clear
2	- 0° 54'	0.892	80.9	"
3	- 0° 48'	0.892	82.5	"
4	- 1° 18'	0.890	85.4	1:4.5 clear
5	- 1° 32'	0.886	85.1	"
6	- 2° 20'	0.888	83.4	"
7	- 1° 25'	0.894	81.8	1:8 clear
8	- 0° 53'	0.890	90.6	1:10 "
9	- 7° 10'	0.919	56.9	1:4 "
10	- 0° 34'	0.888	86.4	"
11	- 9° 53'	0.915	65.5	1:10 "
12	- 20° 37'	0.896	50.4	1:3 "
13	- 7° 13'	0.918	54.1	"
14	- 9° 36'	0.908	61.1	1:4 "

In connection with the view that high specific gravity and a low percentage of geraniol result from the presence of a hitherto unknown sesquiterpene (Umney and Swinton, *Ph. J.*, lix., 139),

Messrs. Schimmel state that they have obtained from No. 5 a considerable quantity of a highly rotatory camphene, as well as a high boiling fraction of 0.915 sp. gr., having the smell of methyl-eugenol and yielding, on oxidation by permanganate, an acid melting at 179° C., like veratric acid, but further experiments are requisite for the purpose of deciding whether the high specific gravity of citronella oil, poor in geraniol, can be explained by the presence of methyl-eugenol, the specific gravity of which is 1.055 at 15° C. While adhering to the opinion that the relative value of citronella oil can be determined by acetylation, notwithstanding the presence of citronellal, which is converted into isopulegol acetate, isomeric with geranyl acetate, Messrs. Schimmel doubt whether 60 per cent., suggested by Umney as a minimum, is not too low a standard for oil of good quality.

Dill Oil.

Messrs. Schimmel give the following determinations to show that dill oil may have a specific gravity lower than 0.900, and that English oil has not always the high specific gravity required by the British Pharmacopœia (0.905 to 0.920).

	Specific Gravity.	Rotation.
1. Thuringian	.911	
2. "	.907	
3. "	.906	
4. "	.909	
5. "	.910	+76°
6. "	.902	+78° 32'
7. "	.899	+79° 13'
8. "	.908	+76° 17'
9. Russian	.909	
10. English	.906	+80° 2'
11. Spanish	.913	+50° 21'
12. Indian	.970	+41° 30'

In view of these data Messrs. Schimmel consider that Umney's suggestion as to the abstraction of carvol from German dill oil is not justified, and that the relatively low specific gravity of dill oil affords no evidence of adulteration (see *ante*, 176). The samples No. 10 and 11 contained so much phellandrene that they gave the characteristic reaction with sodium nitrite and acetic acid, but this terpene could not be detected in the German oil until after fractionating.

Caraway Oil.

In reference to the specific gravity (0.910 to 0.920) specified in the British Pharmacopœia, Messrs. Schimmel state that while normally ranging between 0.905 and 0.915 it is generally below 0.910, and they suggest that a preferable plan would have been to introduce pure carvol in place of the natural oil, as the present Pharmacopœia requirement necessitates the partial removal of limonene from the lighter oil.

Lemon Oil.

In reference to the data on which Umney and Swinton infer the presence in lemon oil of a hitherto unobserved constituent (see *antè*, 196, 370), Messrs. Schimmel remark that they are inconclusive, and that, even though the oily substance they obtained had been proved to be geraniol, the treatment adopted would have left a doubt whether the geraniol had not been produced in the operation, since the possibility of such a result of the reaction of citral with alcohol potash cannot be ignored in view of the fact that under those conditions, isovaleric aldehyde is convertible into amyl alcohol. They also think the same uncertainty would exist as to the origin of the acetic acid found in the saponification liquor. Since formation of acetic acid is a conceivable result of the destruction of aldehydes, on these grounds Messrs. Schimmel consider that the existence of geranyl acetate as a constituent of lemon oil, though possible, is still doubtful.

SAMSHU.

BY FRANK BROWNE, PH.C., F.C.S.

Acting Government Analyst, Hong Kong.

Samshu is a name which is derived from the Chinese word "Sam Shiu," or thrice burnt. The term Samshu refers to that variety of Chinese liquor known as Sam Ching Chau, or thrice-distilled liquor, but as now used it covers the three spirits known as Leu Pun Chau, Sheung Ching Chau, and Sam Ching Chau, all of which are obtained from rice. Moreover, the name Samshu is frequently loosely applied so as to include any spirit of Chinese production, such as beverages in which either Leu Pun Chau, Sheung Ching Chau, or Sam Ching Chau forms a part, and also to the liquor known as Fa Chau—a spirit obtained from molasses, and to the beverages prepared from Fa Chau; but in this report Samshu should be understood to mean only Leu Pun Chau, Sheung Ching Chau, and Sam Ching Chau.

There are three well-known varieties of Samshu:—

1. Leu Pun Chau (half materials liquor) or Mei Chau (rice liquor).
2. Sheung Ching Chau, or twice-distilled liquor.
3. Sam Ching Chau, or thrice-distilled liquor.

These three kinds are not made by all distilleries; in several of the nine Samshu distilleries in Hong Kong only Leu Pun Chau is made.

APPARATUS USED FOR DISTILLATION.

LEU PUN CHAU.

To make Leu Pun Chau, the chief beverage, 180 catties* of rice are mixed with 180 catties of water, and the mixture is placed in an iron pan heated direct by means of a wood fire and boiled for half an hour. The softened rice is spread out on a large wooden tray placed at an angle so that the rice water drains away. The cooled rice is now put into twenty pots, together with the rice water. To each pot is added one and a half catties of a substance known as Chau Pang, together with 10 catties of water. "Chau Pang" is a substance composed of rice, bean flour, red earth, and leaves which are stated to be cassia leaves. It is imported from Canton, but it is manufactured in Honan. Chau Pang is usually in dry flat cakes, about 8 inches square by 1 inch thick. An analysis showed that 100 parts contain:—

* One catty equals $1\frac{1}{2}$ pounds (Avoir.).

Moisture 7.24.
Ash 44.01.

Chau Pang is the fermenting material. It has no particular odour. The mixture of rice, Chau Pang, and water is allowed to stand for a period varying from 23 to 28 days, after which the contents of three pots are transferred to a still heated direct by means of wood. The still is composed of three parts.

1. A circular iron pan furnished with an iron cover, in the centre of which is a large orifice. On the top of this perforated cover is

2. The adapter, which is merely a coil of cane plaited very thickly and closely, so as to be impervious to moisture. Sometimes two or more adapters are used. On the top of the adapter is

3. The condenser, which is a cylindrical metal apparatus greatly resembling an alembic with a reservoir above the upper surface of the alembic to contain water for cooling purposes. A piece of metal piping carries off the spirit, which has been condensed and run down into the upturned inner rim of the alembic, while a much larger piece of piping serves to let out the water from the reservoir, which serves as a condenser (see figure).

The contents of the three pots having been put into the pan, a rope basket containing thick, crude, earth-nut oil is situated on the adapter by means of a piece of wood so as to swing in the orifice of the pan. This arrangement is to prevent bumping and spurting. The condenser is then put in position, and the reservoir having been filled with water, the distillation commences. The weight of water in the condenser keeps it firmly pressed on the adapter. Thirty catties of samshu are collected in about one and a half hours. The water in the condenser is changed three times during this period, the hot water being run off completely from the bottom by the large pipe in a few seconds. The distillation being finished, the pan is almost emptied of its contents by means of a large ladle, three more pots of liquid are emptied into it, and another distillation proceeds. Thus it will be seen that to make 200 catties of Leu Pun Chau it is necessary to take—

Rice 180 catties.
Chau Pang 30 catties.

To distil this quantity 200 catties of firewood are allowed.

SHEUNG CHING CHAU.

This liquid is a little stronger than Leu Pun Chau. It is made by placing in the still 3 pots of the usual fermented liquid and 10 catties of Leu Pun Chau, and distilling 30 catties.

SAM CHING CHAU.

This liquid is the strongest samshu. It is made by placing in the still 3 pots of the usual fermented liquid and 30 catties of Leu Pun Chau, and distilling 30 catties.

COMPOSITION OF SAMSHU.

The following table shows the nature of samshu. The ethers and higher alcohols were determined by the method as used by Bell in his investigations for the Select Committee on British and Foreign Spirits, 1891, as described in Appendix No. 4 of their report.

Description.	Strength of Sample.	Total Solids dried at 100° C. in 100 fluid parts.	In 100 fluid parts of proof strength.		
			Free acid as acetic.	Compound ethers as acetic ether.	Higher Alcohols.
Leu Pun Chau, 1	58.7 u.p.	0.015	0.279	0.230	0.032
Do. 2	50.9 u.p.	0.006	0.127	0.205	0.034
Sheung Ching Chau, 1	53.5 u.p.	0.035	0.217	0.231	0.062
Do. 2	42.4 u.p.	0.008	0.123	0.321	0.035
Sam Ching Chau, 1 ...	15.0 u.p.	0.012	0.078	0.242	0.034
Do. 2 ...	22.6 u.p.	0.018	0.073	0.205	0.068

All the samples contain a faint trace of furfuraldehyde.

The amount of compound ethers is noteworthy, but it is not a

surprising amount considering the nature of the materials used for the production of Samshu.

The strength of Leu Pun Chau somewhat varies, as will be seen from the following analyses.

Sample	Strength.
Leu Pun Chau 1	58.7 u.p.
" 2	50.9 u.p.
" 3	52.2 u.p.
" 4	53.7 u.p.
" 5	59.0 u.p.
" 6	62.6 u.p.

Leu Pun Chau is the staple beverage, and is preferred to the others, which are not liked for habitual use on account of their greater strength in alcohol. Samshu is never diluted; when Sheung Ching Chau or Sam Ching Chau is drunk very small sips only are taken. Drunkenness is very uncommon amongst the Chinese. Many do not drink Samshu except on festival days. It is a common thing on such occasions for some Chinese to drink a catty or even more of Leu Pun Chau without being intoxicated.

Samshu is a colourless liquid of characteristic odour. It may be defined as a spirit consisting of plain spirit or ethylic alcohol mixed with the bye-products derived from rice and Chau Pang. Leu Pun Chau and Sheung Ching Chau are usually slightly opalescent. The opalescence disappears when alcohol is added. It is usually stored in jars and it is said not to improve by keeping.

By mixing Samshu with certain substances a number of well-known Chinese beverages are prepared. The names and composition of these liquors are as follows:—

Ching Mui Chau is composed of Leu Pun Chau, sour plums, and sugar.

Mau Kan Chau from *Triticum repens*, Leu Pun Chau, and sugar.

Chang Chau from oranges, Leu Pun Chau, and sugar.

Mui Kwai Chau from roses, Leu Pun Chau, and sugar.

Ka Pi Chau from Ka Pi (a bark used for rheumatism), Leu Pun Chau, and sugar.

Ning Mun Chau from limes, Leu Pun Chau, and sugar.

Muk Kwa Chau from papaws, Leu Pun Chau, and sugar.

OTHER LIQUORS.

Several distilleries are making a liquor known as Fa Chau. Of this 100 catties are prepared from:—

Molasses	165 catties.
Tso Sui (contents of pots for making Leu Pun Chau), ..	165 "

Of coal 90 catties are allowed.

Two samples of Fa Chau were 41.5 u.p. and 38.9 u.p. respectively.

Fa Chau is used for making several of the wines in which Leu Pun Chau is ordinarily used. Shüt Li Chau is made from Fa Chau and Tientsin pears.

No Mei Chau is a liquid of varied composition. Fa Chau is used for it together with No Mei or full-grown rice, or No Mei Chau is frequently sweetened Leu Pun Chau, in the preparation of which No Mei or full-grown rice has been used. Shan Kut Chau is a wine prepared from Shan Kut—a very small hard bitter orange—and Fa Chau.

OTHER INDUSTRIES CARRIED ON BY SAMSHU MAKERS.

All distillers make sauce by converting Leu Pun Chau or Fa Chau into vinegar and adding the appropriate ingredients.

One distiller makes vinegar for the purpose of making white-lead as well as for sauce-making.

COST OF MATERIALS IN HONG KONG.

Rice	3.00 dols. for 100 catties.
Chau Pang	4.50 " "
Firewood	0.70 " "
Coal	10.00 " a ton. "

Labour. A coolie gets 42 cents for every 100 catties of Samshu made.

PRODUCTION AND CONSUMPTION.

The following statistics show the amounts of Chinese liquors distilled in, imported into, sold in, and exported from Hong Kong during 1897, by Chinese holders of distillery licences, and other particulars. It should be remembered that the statistics refer only to the business done by Chinese holders of distillery licences. There are also in Hong Kong 289 holders of Chinese spirit licences who sell, export, and import Chinese liquors:—

Amount of Chinese liquor distilled	1,979,831 C.
" " " " imported	20,800 C.
" " " " sold for export	
" and local consumption	2,011,885 C.
Amount of Chinese liquor known to have been exported	323,057 C.
C. = Catty.	

The 323,057 C. of Chinese liquor were received by Australia, British North Borneo, China, Sandwich Islands, Japan, Philippine Islands, Straits Settlements, Peru, and the United States of America.

COST TO CONSUMERS.

Samshu is a cheap beverage.	
Leu Pun Chau ..	costs 5 cents a catty
Sheung Ching Chau	" 7 " "
Sam Ching Chau ..	" 10 " "
Fa Chau ..	" 7 " "
Ching Mui Chau ..	" 8 " "
Mau Kan Chau ..	" 8 " "
Chang Chau ..	" 8 " "
Mui Kwai Chau ..	" 40 " "
Ka Pi Chau ..	" 30 " "
Ning Mun Chau ..	" 8 " "
Muk Kwa Chau ..	" 8 " "
Shüt Li Chau ..	" 8 " "
No Mei Chau ..	" 7 " "
Shan Kut Chau ..	" 8 " "

A visit was paid to each distillery in order to observe the processes used and the quality of the materials. The processes are practically the same in all. The rice in all factories is the cheapest kind, known as Choo Mei; in no case was it unsound. The Chau Pang was of good quality. The factories were kept in a clean condition.

RECENT WORK IN BOTANY.

GLUTAMIN IN PLANTS.—According to Herr E. Schulze, asparagin is often replaced by glutamin as the soluble nitrogenous food-material of plants. He found it in twenty-two species belonging to ten different families, e.g., in *Lepidium sativum*, *Raphanus sativus*, *Camelina sativa*, *Spergula arvensis*, *Spinacia glabra*, and *Pinus excelsa*. It is especially frequent in the Cruciferae, the largest proportion being 2.5 per cent. of the dried substance. In all cases where glutamin has at present been found, the seeds contain much oil; though the seedlings of some oily seeds, such as *Papaver* and *Tropaeolum*, contain asparagin and not glutamin.—*Landwirthsch. Versuchs-Stat.*, 1898, p. 442.

ARTIFICIAL PRODUCTION OF ALPINE CHARACTERS IN PLANTS.—M. G. Bonnier has made a series of experiments at Fontainebleau, from which he concludes that it is possible to produce artificially the special characters of alpine plants by subjecting them to alternations of temperature similar to those which they experience at high altitudes. He compared cultures of the same species obtained from the same stock:—(1) Kept constantly at a low temperature (4° to 9° C.); (2) subjected to the normal alternations of temperature in the neighbourhood of Paris; (3) exposed to a very low temperature at night and to strong insolation by day. In comparison with lots 1 and 2, those of lot 3 were found to exhibit a decrease in stature; the internodes becoming proportionately shorter, the leaves smaller, thicker, and of firmer consistency, with a more rapid production of flowers.—*Comptes rendus Acad. Sci. Paris*, cxxvii., 1898, p. 307.

British Institute of Preventive Medicine.

THE new building which has now become the permanent home of the British Institute of Preventive Medicine has been erected on a site on the Thames Embankment, near Chelsea Bridge, from designs by Messrs. Waterhouse and Son. The building is completely detached, and stands in its own grounds, which were acquired from the Duke of Westminster, who is a member of the Council of the Institute.

ADMINISTRATION.

The board room and general offices, together with a waiting-room, are situated on the ground floor, near the main entrance, to the right of which is the Director's private office, together with two laboratories for himself and his assistants. These laboratories will accommodate six workers, and are fitted up with the usual appliances for bacteriological investigation. A lift is provided for goods and passengers, and there is lavatory accommodation on every floor.

BACTERIOLOGICAL LABORATORY.

The main bacteriological laboratory is situated at the back on the ground floor, and occupies the entire length of the building. It has accommodation for twenty-five students, and has the advantage of a north light for microscopical work. The working benches are of teak, impregnated with paraffin, and are provided with gas, water, and electric light. Each worker is provided with a complete set of apparatus for his work, as well as with a set of drawers and lock-up cupboards. For dissections and aseptic operations a slate-topped table is provided. The incubators stand on slate slabs, and a special glass-blowing table has been provided. At one end of the room is a fume chamber, and a wash-up sink with hot and cold water. A small room in connection with this laboratory will admit of operations being carried out under the best conditions for aseptic work. The floor is concrete, the benches are of slate, and the walls covered with opalite. This laboratory will be mainly utilised for instruction. The Institute has already attracted workers from all parts of the

world, and the number will no doubt greatly increase with the enhanced facilities of its new building. The courses of instruction are attended by qualified medical men, army surgeons, and students of hygiene. The students of hygiene will receive a course of bacteriological instruction specially suited to their requirements, and dealing with the bacteriological examination of water, soil, and air, food-stuffs, etc. A course of systematic bacteriology will also be given, and will comprise lectures and practical work. This practical instruction will extend over three months, and, following the method adopted at the Institut Pasteur, will touch on all the phases of bacteriological work. From time to time six weeks'

courses will be given, dealing especially with bacteriology in relation to clinical work. This laboratory will also be utilised to give those desiring it a thorough grounding in bacteriological methods, with a view to subsequent research work. A room in the basement has been specially fitted up for the preparation of the culture media. There is a stone bench with hood for the steam sterilisers, stone benches for the autoclaves and serum inspissators, tables, shelves, etc., two large sinks, and a large copper with counterpoised top for boiling out old tubes and plates. In this room the student will be instructed in the methods of the preparation of the various culture media, such preparation of media being regarded as an essential part of the training. Adjacent to this room is another which will be maintained at incubation temperature.

BRITISH INSTITUTE OF PREVENTIVE MEDICINE.

The convenience of this will be recognised by all bacteriological workers. Such a room will be particularly useful for the preparation of tuberculin, mallein, and similar fluids on a large scale. There is further a large room which will be fitted up as a workshop for general repairs. The same room will contain a large centrifugal machine, and a water distilling apparatus.

THE PHOTOGRAPHIC LABORATORY.

The back of the basement is devoted to photography. In a large room are provided two complete photo-micrographic cameras, one for use with the electric arc light and constructed to carry out work with the highest powers, and the

other to be used for lower power work, and also for purposes of preliminary instruction. The larger form of apparatus is of the latest design, with some new features introduced to facilitate its working. Thus, to ensure firmness and freedom from vibration, there are two brickwork and masonry supports for the cameras, each of which is so placed that a curtain can be drawn at any moment to effectually screen off either apparatus. Attention will be given to the application of photography to spectroscopy, so far as it is applicable to bacteriological research, and apparatus will also be provided for photometric observations. It is hoped later to establish a lantern-slide library, when illustrations for lectures on any branch of work carried on at the Institute will be available. This department is under the care of Mr.

J. E. Barnard, who is responsible for many of the fittings.

THE CHEMICAL LABORATORY.

The large chemical and water laboratory is situated on the first floor. It contains all appliances for chemical work, and working accommodation for twenty students. The two fume chambers contain water and gas supply which can be regulated without opening the chambers. In these, distilling and evaporating operations can readily be carried on. There is also a special hooded chamber for water baths. The teak benches have ample water and gas supply, as well as taps and wastes for distilling purposes, and an electric light supply. The centre bench also contains an experimental main which will allow of electric currents of any strength being used. This main is regulated by means of a motor transformer in the basement. Provision is likewise made in the basement for elementary organic analyses in the shape of a combustion

furnace. In this room investigations of a chemical character and bearing on hygiene and preventive medicine will be conducted, and it is hoped the laboratory will become a centre for the investigation of matters concerning public health. The chemical analyses of water are conducted in this room, and a number of samples are received from local authorities for this purpose. Here also the necessary instruction in chemistry and physics for public health work is carried on, and special instruction also given in water analyses. It is intended that the general training given shall be of a thorough character, and compare with that given in hygienic institutes on the Continent. A small meteorological station will be erected for the use of the students. The laboratory is in charge of a trained chemist, who devotes his whole time to this work

BACTERIOLOGICAL LABORATORY.

THE BIOLOGICAL-CHEMICAL LABORATORY.

A fine room on the same floor will be completely equipped for instruction and research in the chemistry of fermentation and bacterial products, a branch of investigation from which the most important results may be anticipated in the future.

PRIVATE RESEARCH.

At the back of the building on the same floor are two rooms for private research work, a private chemical laboratory and the balance room. Further provision for private research is made on the floor above, where are a series of rooms, which will be fitted up as occasion demands.

VACCINE LABORATORY.

On the same floor are the laboratories and office that are to be used by the Local Government Board for the preparation and storage of glycerinated calf lymph.

CHEMICAL LABORATORY.

MUSEUM AND LECTURE THEATRE.

The museum is situated on the third floor. It consists of a

large room with a gallery and two bays. It is hoped in course of time to form a collection of pathological specimens. Attached to the museum is a preparation room. On the third floor is the lecture theatre, with accommodation for 150. The room can be darkened, and the lecture table is designed to afford facility for demonstrations. It is furnished with a sink, water, electric light, and a terminal of the experimental main. Ample provision is also made for lantern demonstrations.

CREMATORIUM AND ANIMAL HOUSE.

In the yard behind the Institute is a large crematorium in which all infective material will be destroyed. There is also a large animal house with loose boxes, and with a small laboratory attached. The construction of the animal house allows of thorough disinfection, and the cages for the smaller forms are made of galvanised iron, so that they can be sterilised.

ELECTRIC SUPPLY.

The whole block of buildings is lighted electrically, the current being taken from the mains of the local company. Current is supplied for experimental purposes by a distinct system of mains, which are carried into the various laboratories to terminals, to which temporary connection can be readily made. This main is fed by a motor transformer, taking current from the supply at a pressure of 200 volts, and allowing it to be supplied at any pressure from 5 to 50 volts. The whole of the electrical engineering has been carried out by Mr. C. V. Middleton.

GENERAL WORK OF THE INSTITUTE.

At present a large amount of diagnosis work is being undertaken for sanitary authorities, and a staff is kept constantly engaged in examining and reporting on waters, diphtheria specimens, sputa, and various organic fluids. A volume of transactions was published at the end of last year. The aim of the director is to make the Institute a national home for bacteriology in all its branches.

The present staff is as follows: Director and Honorary Secretary: Dr. Allan Macfadyen, the bacteriologists are Dr. R. T. Hewlett and Mr. Foulerton, F.R.C.S. Dr. Arthur Harden is chemist, Dr. Morris will lecture on technical mycology, Dr. Priestley is teacher of hygiene, Mr. J. E. Barnard is in charge of the photographic department, and Mr. G. Cooper assistant secretary. The department for the preparation of antitoxins remains at Sudbury, near Harrow, and is in charge of Dr. Dean, assisted by Dr. Salter.

CIMICIFUGA IN TINNITUS.—Extract of cimicifuga, in doses of 30 minims per diem, is said to relieve the distressing tinnitus which accompanies many aural affections. It appears to act as a sedative on the nervous system.—*Therap. Monats.*, xii., 414.

VEGETABLE SECRETIONS.*

BY T. MORLEY TAYLOR.

Life may be considered to be a state of chemical and physical unrest. Sachs, in his text-book, says that the essence of life is that organised structures are capable of constant internal change in contact with water and oxygen, only such part of the chemical and physical forces being in equilibrium as is necessary to determine the form of framework of the whole. If we accept this view, then, we may define life as a perpetual state of solution and precipitation, of synthesis and analysis, of composition and resolution.

The biological unit is the living matter of the cell, protoplasm a transparent more or less viscid mass, supposed to consist of a network of extremely attenuated fibrils, saturated with a fluid containing many substances. A published analysis of protoplasm suggests something like a score of different compounds, the elements of which are carbon, hydrogen, oxygen, nitrogen, phosphorus, and sulphur, besides some of the metals. It requires little imagination, therefore, to conceive that the great forces of nature, light and heat, plus the action of air and water; may perform a never-ending series of reactions.

If the student wades through the chapters devoted to metabolism in the various text-books published during the last ten years or so, he is likely to become so utterly muddled by the various conjectures, reiterations and contradictions as to give it up and seek relief in either, say, geometry or tobacco. One of his troubles will be the exact definition of the terms secretion and excretion. He finds these terms used synony-

mously and in opposition. He finds them both applied to active and also to inert matter, to useful and useless substances, whether they are collected internally or externally; an article in a well-known encyclopædia under this heading leaves nothing else of the plant to be considered after we have done with the "secretions." If we argue from analogy in the animal body, we must in the spirit of common sense define a secretion as something put aside by the organism as useful, and an excretion as something put aside as useless. Green, in his late text-book, as a matter of fact, gives us this definition, but he appears not to stick altogether to the letter of it.

We may now classify the vegetable secretions as follows:—

First, substances destined to form the framework of the plant, as cellulose and its modifications. Secondly, reserve food materials such as starch, proteid, and oils. Thirdly, special secretions, as unorganised ferments, chlorophyll and certain other

* Read before the Chemists' Assistants' Association, on Thursday, October 20, 1898.

A RESEARCH ROOM.

colouring matters and substances secreted by glands or specially differentiated cells.

A vegetable cell consists of a mass of protoplasm which has secreted for its own benefit a transparent elastic membrane of cellulose, the cell wall. This secretion commences by the granulation of part of the protoplasm, the granules forming a layer gradually changing into cellulose which, in a full grown plant, is destined to play several parts, to do which it adapts itself by partial decomposition or absorption of other matters. Cellulose is insoluble in the ordinary media used in histology, alcohol, water, glycerin or in dilute alkalis and acids, but is destroyed by strong sulphuric acid and is soluble in Schweitzer's cuprammonia solution. It is stained blue by iodine after treatment with sulphuric acid. Lignified cellulose, forming the woody tissue of the plant, is insoluble in cuprammonia, but is thoroughly disintegrated by Schultze's macerating fluid. After treatment with hydrochloric acid, phloroglucin will stain it red. Cutin is formed in the outer wall of the epidermis to prevent evaporation; both it and suberin, the principal constituent of cork cells, are disintegrated by nitric acid and Schultze's fluid.

Before passing on to reserve food material, we must notice chlorophyll and its action. In the protoplasm of living cells there are formed certain granules called plastids, which take on various duties, according to their position in the plant. These are: chloroplasts, which secrete the pigment chlorophyll, and of course found in all green parts; leucoplasts, which secrete starch grains, and are found in reservoirs, such as tubers, roots, and bulbs; chromoplasts, which secrete colouring matter other than chlorophyll, such as some of the colours in petals and occasionally in some seeds; elaioplasts, or oil-forming bodies. The chloroplasts, in the presence of suitable light, suitable temperature, secrete chlorophyll, for the production of which iron is also necessary; etiolin, the pale yellow colouring-matter of plants grown in the dark, is a primary stage in the formation. Chlorophyll is the most important of the secretions, as through its intervention sugar is formed from the carbon dioxide and water taken up. It is a green pigment collected in the meshes of the chloroplastids, from which it may be dissolved out by alcohol, ether, or carbon bisulphide, but not by water, a fact which suggests that it occurs in an oily solution in the plastid. Such a solution is fluorescent, red by reflected light and green by transmitted light. The function of chlorophyll is to absorb certain rays of the light which reaches it. It therefore gives a very characteristic spectrum, and may decompose into other colouring matters of a red and yellow character, to which decomposition the reds and yellows of autumn tints are due. The formation of sugar is the ultimate result of the physical action of chlorophyll, and it is supposed that formic aldehyde is an intermediate product in this formation, and combines with the nitrogen obtained from salts carried up from the roots to form amides of the fatty acids.

These nitrogenous and non-nitrogenous food materials are carried away to be taken up by the protoplasm at the points of growth or are transferred to various reservoirs, where they are absorbed and secreted in an insoluble form for future use.

Of course it may be argued that food under any circumstances cannot be called a secretion, but there are points of analogy between these reserve plant foods and the superfluous fat and muscle in animals which are certainly secretions, moreover, the secreted food material in plants is formed at the seat of storage by specially differentiated protoplasmic granules. The soluble sugar is here taken up by the leucoplasts and secreted in the form of starch in lamellated grains, the hilum being formed first and layer after layer poured out until the plastid is exhausted.

If the secretion remains in the mass of the protoplasm the grain will be spheroidal in shape, but if secreted externally the grains become more or less ovoid, the hilum being furthest away from the leucoplast at the end of the process.

But non-nitrogenous matter may be secreted in the form of oils and also in the form of glucosides. Oils are formed by the decomposition of the protoplasm, small drops being secreted in its mass which in time run together and fill the whole cell, or it has been observed in some seeds, that oils have been poured out like starch from special granules, and these granules have been termed elaioplasts. Glucosides may or may not be of use to the plants, those that are not must be classed with the excretions, such as resins, alkaloids, etc. Others contained in roots and seeds are certainly secreted as nutritive food material, their value in this direction being due to the glucose or other sugar produced when they are subjected to ferment action. Some of the glucosides contain nitrogen, as amygdalin, and myrotic acid.

The nitrogenous reserves take the form of proteids or albuminoids, generally soluble in sodium chloride solution and precipitable by heat. They may be secreted in an amorphous form, or in the form of crystalloids, and in some particular cases in grains of a peculiarly complex formation known as aleurone grains. These aleurone grains appear to be made up of three different forms of albuminoid, the outer coat being soluble in water, the rest of the body of the grain in dilute sodium chloride solution, leaving a crystal of proteid associated with a granule of amorphous mineral matter, which proteid is soluble in a strong solution of sodium chloride. They may be demonstrated by macerating sections of the seed of *Ricinus* in a 2 per cent. solution of mercuric chloride in absolute alcohol for twenty-four hours, the alcohol removing oily matters, the mercuric chloride rendering the whole grain insoluble in water.

Leaving reserve food materials, we naturally pass on to the first class of special secretions, which are used for converting them into soluble form, easily assimilable by the living matter of the growing embryo or shoot. These unorganised ferments occur in many forms, each having its particular substance to act upon and duty to perform. The protoplasm of the cell, amongst its many decomposition products, forms the enzymes, which are derived from zymogen secreted in its substance as a granular deposit. They are found wherever food-stuffs are stored, generally in the same cells, but often in special cells or aggregations of cells specially set apart. Such special cells in some plants develop into true glandular structures, as in the leaf surfaces of *Drosera*, *Pinguicula*, and the pitcher plants, all of which are carnivorous. The chief of these ferments are diastase, converting starch into maltose; invertase, converting cane sugar into dextrose, emulsin and other special enzymes having the power to decompose glucosides; and the proteid digesting ferments, trypsin and pepsin. These enzymes may be extracted from the tissues by means of glycerin or sodium chloride solution.

The glands in some of the insect-catching plants appear not to act until stimulated by contact with nitrogenous matter, when a violent agitation occurs in their cells and a copious fluid, with generally an acid reaction, is poured out. Other glandular secretions are the glutinous saccharine fluid exuding from the surface of the stigma and the nectar of leaves. This nectar is called an excretion in many text-books, but it is of considerable use to the plant, and is as much a secretion as the sticky exudation from the fly's foot, the web of a spider, and the odorous secretion of the musk deer and other animals. The specialised parenchymatous cells, which secrete this saccharine fluid, occur not only in the flower, but frequently at the base of bracts, and, in a few cases, in the flower stem

itself. Finally, we must notice the colouring matters and odours of petals, whose object, like that of nectar, is to attract the insects, which are the essential indirect aids to reproduction. The colours are in part due to the secretion of granular plastids, similar to those which secrete chlorophyll, and in part to pigments in the cell sap of the epidermis. This completes a rough outline of the substances secreted by plants for their present or future benefit. They form in themselves a study in natural economy. Their history accentuates the greatness of the infinitely little, and is another proof that nothing in nature is despicable.

REVIEWS AND NOTICES OF BOOKS.

A SHORT MANUAL OF ANALYTICAL CHEMISTRY. By JOHN MUTER, Ph.D., F.R.S.E., F.I.C., F.C.S. Eighth edition. Pp. 230. Price, 6s. 6d. London: Simpkin, Marshall, and Co., and Baillière, Tindall, and Cox. 1898.

The scope of this book is well expressed in the heading of the first chapter, "The Processes Employed by Practical Chemists." There is no discussion of "crystalline verities" or statement by the author as to an attempt at a "slight broadening of the horizon of his readers and students," nor as to "the mode of reasoning which from childhood onward teaches us that two separate things, *e.g.*, two pennies, are similar things," as in a well-known manual addressed to pharmaceutical students. It is essentially a short manual of analytical chemistry written by a master of his subject. It matters little where the book is opened. Everywhere it bears the stamp of the laboratory bench as distinct from arm-chair chemistry.

The student is led on by an explanation of the chief laboratory processes, such as solution, extraction, precipitation, etc., as preliminary to applied processes in the reactions and detections of the metals and acids. The chief organic acids, including oleic, malic, benzoic, salicylic, and the detection and separation of the halogens, sulphides, thiosulphates, nitrites, cinnamic acid, hippuric acid, are all dealt with in a manner as if in anticipation of the students' queries and difficulties. In the general preliminary examination in qualitative analysis the student is well reminded that it "should also be remembered that in many cases these inferences require subsequent confirmation, and therefore a student should be taught not to jump too readily at conclusions from the preliminary investigation." This is commonly the pitfall of a student, and perhaps it would have been as well to have warned him in the same way in the chapter on the detection of alkaloids and other organic bodies used in medicine by the colour tests, as, for example, that "a vivid emerald green" with H_2SO_4 and potassium bichromate is not invariably indicative of pilocarpine, or an evanescent "dirty red, followed by pinkish buff and gradual formation of green streaks" of cocaine. In fact, the colour tests for alkaloids, with a few exceptions, are more apt to lead the student into difficulties than to assist him. The five pages on the qualitative detection of organic bodies commonly employed in medicine and in the arts contain a very concise and accurate summary of the means for the ready detection of these bodies.

In the quantitative part there are useful descriptions of the methods adopted in practice for the taking of the specific gravities of liquids, solids, and gases, and vapour densities, and for the carrying out of volumetric analysis. In describing the operations of quantitative analysis, the author follows a vicious but not uncommon practice in speaking of the results as "estimations," as though they involved the exercise of judgment or opinion on the part of the operator, as would be the case in the procedure of an appraiser in valuing property, or of an architect in stating the probable cost of a building. Such an application of the term

estimation appears distinctly improper in the case of quantitative analysis, the results obtained being more correctly designated by the term "determinations," inasmuch as they are based on definite fixed values. The introduction of a standard Mayer's solution is hardly worthy of the author, as it is time that pharmaceutical students were disabused of the belief that all that is thrown down by Mayer's reagent is to be regarded as an alkaloid. The quantitative examples in Division II. describe the methods as usually carried out in analytical laboratories, and can therefore be accepted with confidence by students as examples for practical acquaintance with quantitative analysis. In the Dumas process of determining nitrogen the collection of the nitrogen in the manner described is, however, rather antiquated when it is much more easily collected in Schiff's nitrometer.

The chapter dealing with the analysis of water, air, and food is more or less the outcome of practical work, although in some instances, here as elsewhere, the methods adopted and inferences drawn may not be generally accepted, as, for example, the determination of starch in mustard by difference, on the assumption that genuine mustard contains as a minimum 33 per cent. of oil, that the specific gravity of chicory solution is invariably 1021.7, and that Marsh's test will detect one part of As in two hundred millions. The author very properly states, in describing the methods for the analysis of beeswax, that the B.P. test for paraffin "is unfortunately not always successful with the kind of paraffin now used for adulterating beeswax."

This edition contains the alterations necessary to bring it abreast of the new Pharmacopœia, as is essential in a work specially adapted for pharmacists, even to the latest refinement of atomic weights to the second place of decimals, as there adopted.

In conclusion, as the result of a careful perusal, it may be stated that Muter's 'Short Manual' should be the laboratory companion of all students of analytical chemistry in its relation to pharmacy.

GENERAL ELEMENTARY SCIENCE. Edited by WILLIAM BRIGGS, M.A., F.C.S., F.R.A.S. Second edition. Pp. 139 + 128 + 136. Price, 3s. 6d. London: W. B. Clive. 1898.

The inclusion of general elementary science as a compulsory subject for the matriculation is a wise decision on the part of the London University, since in no respect can the study of the elements of science be regarded as labour lost even by students who do not intend reading for a science degree. It is evident that there was the need of a book that should deal in a concise manner with the principles of science, from the issue of a second edition of this book within five months of the first edition. The book is divided into three parts, dealing respectively with Mechanics, Heat, Light and Electricity, and with Chemistry, each part by specialists such as Professors Bryan, D.Sc., F.R.S., Cracknell, M.A., and Don, M.A., B.Sc., and Drs. Bailey and Beddow. The method adopted is, first of all, to give definitions, then explanation of scientific terms with illustrations, whilst at the end of each chapter is a summary of the essential matter, and exercises thereon in the form of questions. Such as, for example, in the article dealing with the parallelogram of forces, there is, first, the proposition, then an experiment to verify it, geometrical construction, observed facts, and deductions. In this way, scientific terms that are frequently merely names to students, who use them glibly enough as examiners know, and the facts connected with them are clearly explained. The chemical portion, consisting of one hundred and thirty-six pages treats, in a manner very intelligible to the student, of the atomic theory, chemical calculations, equations, formulæ, then with the chemical properties of the atmosphere, of solution and distillation,

oxides and salts, chlorine, sulphur, etc. The book has the stamp throughout of an honest endeavour to give the student a clear conception of the fundamental principles of the chief subjects of elementary science that may be the ground work for future study without merely straining after examination results.

FORMULÆ, METHODS, AND REACTIONS, KNOWN BY THE NAMES OF THEIR AUTHORS.

Supplementary List.*

Barbier (ALCOHOL).—On the addition of an excess of potassium acetate to an essential oil, if much alcohol be present, the liquid becomes denser. Compare Bernouilly's test.

Baumann-Goldman (CYSTINE).—Benzoyl chloride, dissolved in aqueous sodium hydroxide solution, throws down a precipitate of benzoyl-cystine.

Bechamps (NITROBENZOL).—Essential oil of bitter almonds adulterated with nitrobenzol yields a blue colour on distilling it with ferric acetate, and adding chlorinated lime to the distillate.

Bedson (APOMORPHINE).—On boiling a solution of morphine containing apomorphine with potassium hydroxide, a brown colour is produced.

Behrens (OLIVE OIL).—A yellow colour should be produced on adding a cold mixture of equal weights of concentrated nitric and sulphuric acids to an equal weight of olive oil.

Beilstein (HALOGENS).—The presence of chlorine, bromine or iodine may be detected in organic substances by a green or blue colour being produced on dipping cupric oxide beads into the suspected substance, and heating it in the lower part of a Bunsen flame.

Béla von Bitto (ALDEHYDES AND KETONES).—A fine greenish fluorescence is produced after a few minutes on adding to the suspected solution an aqueous or alcoholic solution (0.5 to 1 p. c.) of a meta-diamine salt. The fluorescence disappears on adding an alkali and reappears on acidulating the solution.

Bellamy (COPPER AND IRON).—On adding tincture of logwood a blue colour is produced.

Bergman (MINERAL ACIDS).—If wine or vinegar contains free mineral acid, calcium oxalate is not precipitated on adding 5 drops of normal ammonium oxalate solution, followed by 5 drops of normal calcium sulphate solution.

Bernouilly (ALCOHOL).—Essential oils adulterated with alcohol form dense solutions on adding dry potassium acetate. Compare Barbier's test.

Berthelot (PHENOL).—On adding a little sodium hypochlorite or solution of chlorinated lime to the slightly ammoniacal liquid (urine) and warming, a blue coloration is produced if phenol be present. Acid changes the colour to red, and ammonia subsequently added restores the original blue. Compare with the reactions of Bodde, Jacquemin, Lee, and Salkowski.

Bertoni and Raymondi (NITROUS ACID).—On dialysing blood containing nitrous acid, evaporating the dialysate, and adding hot alcohol, the acid may be detected in the usual way with starch paste and potassium iodide.

Berzelius (ARSENIC).—A mirror is formed and an alliaceous odour given off on heating arsenic in a test-tube with charcoal.

Berzelius (MUSK).—An aqueous infusion of pure musk should not precipitate a solution of mercuric chloride.

Betelli (FUSEL OIL).—Mix alcohol, 5 C.c.; water, 6 C.c.; chloroform, 15 drops. Shake well, and on standing, any fusel oil present in the alcohol can be detected on evaporating the separated chloroform.

Bieber (FIXED OILS).—On mixing 5 volumes of a fixed oil with 1 volume of a mixture of equal weights of concentrated sulphuric acid, fuming nitric acid and water, a colour reaction is produced, which varies with the kind of oil.

Bieber (PEACH KERNEL AND ALMOND OILS).—With Bieber's reagent peach kernel oil gives a deep orange colour, whilst true almond oil forms a yellowish zone.

Biel (BENZIN AND BENZOL).—These two liquids differ in their behaviour to iodine (colour), alcohol (solubility), asphaltum (solubility), nitric acid (nitrobenzol), and in their specific gravity.

* After Wilder, Schneider, Altschul, Lee, Squire, Crookshank, etc. Continued from p. 119 of last volume.

Bill (BROMIDES).—A yellow to dark orange-red colour is produced on adding to a bromide 1 drop each of hydrochloric acid and gold chloride solution.

Biltz (IODIC ACID).—If iodic acid be present in nitric acid a blue colour is developed on diluting the acid with an equal volume of water, adding a few drops of starch solution and then a few drops of sulphuretted hydrogen water.

Biltz (SODIUM CARBONATES).—An aqueous solution of pure sodium bicarbonate (1 in 15) gives a white cloudiness when one-sixth its volume of an aqueous solution of mercuric chloride (1 in 20) is added. If, however, any monocarbonate be present, a brownish-red precipitate is thrown down.

Blachez (ALCOHOL).—If alcohol be present in chloroform, a precipitate is formed on adding a small piece of potassium hydroxide, agitating, pouring off the chloroform after standing five minutes, shaking it with an equal volume of water, then decanting the water and adding a solution of copper sulphate.

Blaise (QUININE).—See Vogel's reaction.

Blanc (FIXING INFUSORIA).—For larvæ of Echinodermata, Medusæ, and Porifera, mix saturated solution of picric acid, 100, sulphuric acid, 2, water, 600. For Rhizopoda and Infusoria, add 2 or 3 drops of 1 p. c. acetic acid to every 15 C.c. of the above mixture. Wash out with 80 p. c. alcohol, followed by 90 p. c., and absolute alcohol; then stain with tincture of saffron (saffron, 5 Gm.; absolute alcohol, 15 C.c.), wash out with 80 p. c. alcohol, and pass through absolute alcohol into clove oil.

Blanchard (STAINING BACTERIA).—A cover-glass preparation is treated with osmic acid, the cover placed in position on a slide, and a drop of methyl-violet solution run under. After the lapse of half an hour, complete the preparation by running in glycerin or saturated calcium chloride solution, tinted with a small quantity of methyl violet. If hæmatoxylin be used as the stain, it should be allowed to act for 24 hours, and the preparation must then be washed repeatedly before mounting.

Blarez (ANILINE COLOURS).—On shaking 20 C.c. of wine with 5 Gm. of lead peroxide for one minute, colour due to natural colouring matter disappears, but aniline colours are unaffected.

Bloxam (ALKALOIDS).—Distinctive colour reactions are given by various alkaloids on dissolving them in dilute hydrochloric acid and adding bromine water drop by drop.

Bloxham (UREA).—If a nitrate be present add a few drops of ammonium chloride solution, but if absent acidulate with hydrochloric acid. Evaporate to dryness in a watch glass and heat cautiously as long as thick white fumes are evolved. Dissolve the residue in a drop or two of ammonia, add a drop of barium chloride and stir. If urea be present crystalline streaks of barium cyanurate will be formed in the track of the rod.

Blum (ALBUMIN).—From 0.03 to 0.05 Gm. of manganous chloride is dissolved in a little water acidulated with hydrochloric acid and treated with 100 C.c. of 10 per cent. solution of sodium metaphosphate. Lead dioxide is then added in small quantities at a time, the liquid is allowed to settle, and is then filtered. The resulting pink solution of manganic metaphosphate is used to detect albumin in urine. The reagent is placed in a test-tube and the urine filtered into it.

Blyth (LEAD).—When present in potable water lead precipitates the colouring matter on adding tincture of cochineal (1 p. c.).

Boas (HYDROCHLORIC ACID).—A solution of 1 Gm. of resorcin and 3 Gm. of cane sugar in 100 Gm. of alcohol (50 p. c.) gives a red coloration on adding one drop to a solution containing free hydrochloric acid, and evaporating to dryness. Compare Conrady's test.

Boas (LACTIC ACID).—This test for the presence of lactic acid in the gastric juice depends upon the oxidation of the acid to aldehyde and formic acid by carefully acting on it with sulphuric acid and manganese. The aldehyde can be detected by the addition of Nessler's reagent or by the formation of iodoform when iodine solution is added. This test for lactic acid is more delicate than that of Uffelmann, which see.

Bobierre (LEAD).—If lead be present in tin, a yellow stain is produced on applying a drop of glacial acetic acid, heating, and adding a drop of potassium iodide solution (5 p. c.).

THE STUDENTS' PAGE.

EXPLANATORY NOTES ON THE B.P.*

Aqua Chloroformi.—It is difficult to see why the strength of this should have been reduced. The 1 in 200 solution may have had a taste too pungent for many people; it could, however, always be diluted if required. As an antiseptic vehicle for drugs liable to go bad, the present chloroform water will be sometimes found inefficient.

Aqua Destillata.—The colour test for ammonia with Nessler solution is the one commonly employed in water analysis. The reaction is obviously very delicate. The ammonia present may be determined by comparison with the colour produced by the addition of the Nessler solution to ammonia-free water to which a known quantity of ammonia has been added. The ammonia-free water is obtained by distilling ordinary water, rejecting the first portions of the distillate until they cease to give the faintest yellow colour on the addition of the Nessler solution. The student should carefully distinguish between Mayer's reagent and Nessler's reagent. They both contain the double iodide of mercury and potassium obtained by adding solution of mercuric chloride to solution of potassium iodide in certain proportions. The Nessler's reagent, however, is made strongly alkaline with sodium hydroxide. The yellow tint produced in very weak ammonia solutions is due to the formation of dimercuric-ammonium iodide, NHg_2I , which may be regarded as derived from ammonium iodide, NH_4I , by the substitution of two divalent mercury atoms for four univalent hydrogen atoms. In stronger solutions of ammonia Nessler's reagent produces a brown precipitate of dimercuricammonium iodide. Mayer's solution, *i.e.*, potassio-mercuric iodide without alkali, is used as an alkaloidal reagent.

Bismuthi Carbonas.—The detection of the impurities commonly found in bismuth and its salts have been already explained in the Students' Page (*P.J.*, Feb. 27, 1897).

Bismuthi Subnitras.—The detection of calcium phosphate in this salt depends upon the fact that acid solutions containing bismuth are not precipitated by the addition of ammonia if a sufficient quantity of citric acid be previously added. Bismuth forms a soluble ammonio-citrate, while the calcium phosphate after solution in acid is reprecipitated when the solution is made alkaline with ammonia.

Caffeina.—Solution of potassio-mercuric iodide (Mayer's reagent) produces no precipitate in caffeine solutions. Mayer's reagent precipitates all the other alkaloids in dilute solutions, the reaction with morphine being the least delicate. In using Mayer's solution as an alkaloidal reagent these facts should be remembered.

Calcii Phosphas.—Calcium oxalate and phosphate dissolve easily in diluted hydrochloric or nitric acid. When sodium acetate is added in excess, thus substituting free acetic for free hydrochloric or nitric acid, the calcium phosphate is still held in solution while calcium oxalate is precipitated.

Calx Sulphurata.—When treated with sulphate of copper solution and hydrochloric acid as directed in the Pharmacopœia there should be no copper salt in the filtrate. Ferrocyanide of potassium is a very delicate reagent for copper; it produces a distinct red precipitate (or red coloration if the solution be very dilute) of copper ferrocyanide with solutions in which the blue colour of the copper salt is no longer visible. Calcium sulphide is soluble in water, for sulphuretted hydrogen produces no precipitate, in acid, alkaline or neutral solutions of calcium salts. The calcium sulphide in calx sulphurata is not readily extracted by water, first, because it is intimately mixed with the sparingly soluble calcium sulphate and, secondly, exposure of a substance to a high temperature—as in the process of preparation of calx sulphurata—often renders it less soluble than it is found to be in the non-ignited condition. For these reasons a little hydrochloric acid is added. It facilitates the reaction by liberating sulphuretted hydrogen from the sulphide, and this precipitates the corresponding quantity of copper sulphide.

The student should verify the Pharmacopœia requirements by calculation from these equations, remembering that the crystals of copper sulphate contain water of crystallisation ($\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$).

Cera Flava.—The composition of beeswax and the methods commonly used to determine its purity and detect adulterants will be found fully described in the articles on "Fats and Waxes," published in the Students' Pages for September 11, 1897, and following numbers.

Cetaceum.—Pure spermaceti consists almost entirely of cetyl palmitate, with small quantities of closely allied homologous esters. It should contain only a minute quantity of free fatty acid, hence the alcoholic solution should be made alkaline almost immediately by the addition of normal soda solution. Spermaceti dissolves in boiling 90 per cent. alcohol, but is re-deposited on cooling. The *cold* filtrate from the re-deposited spermaceti will still contain any free fatty acid present as an impurity in the sample examined. This is detected by adding water to the alcoholic filtrate, because the higher fatty acids are soluble in strong alcohol but not in water; hence they are precipitated when the alcohol is diluted.

Creosotum.—Creosote is obtained from the portion of wood-tar heavier than water. This is treated with caustic soda solution, which dissolves the numerous varieties of phenols, *i.e.*, hydroxy aromatic derivatives, occurring in the tar, forming the soluble sodium derivatives, known as phenates. The alkaline solution is filtered to remove the insoluble hydrocarbons, etc., and the phenols liberated by addition of sulphuric acid to the filtrate. Those phenols which are easily soluble in water remain in the aqueous liquor, while the less soluble ones are deposited as an oily layer. This oily layer is separated and fractionally distilled, and the portion distilling between 200° and 220° C. constitutes the substance known as creosote. The phenols obtained from wood tar are for the most part methoxy derivatives, *i.e.*, they contain the methoxy group $-\text{O} \cdot \text{CH}_3$ linked to the benzene nucleus, while the coal tar phenols are simple phenols. The aqueous layer in the distillate obtained by the destructive distillation of wood contains, as is well known, considerable quantities of methyl alcohol. This indicates that the action of heat upon the organic substances in wood is very prolific in the production of methyl derivatives as compared to the action of heat upon coal. The two chief constituents of good creosote are guaiacol and cresol. The former is the methyl ether of pyrocatechin and is so-called because it was first obtained by the destructive distillation of guaiacum. Pyrocatechin is the ortho variety of the three isomeric di-hydroxy-benzenes, *i.e.*, it contains the two hydroxyl groups linked to adjacent carbon atoms in the nucleus.

Benzene.

Pyrocatechin.

Guaiacol.

Creosol is the corresponding derivative of one of the two possible homologues of pyrocatechin.

(1)

(2)

It is the methyl ether of the methyl-pyrocatechin shown by formula (1), and may be distinguished as methyl-1-methoxy-3-oxy-4-benzene. The figures placed *after* the prefixes in this systematic name indicate the relative position of the substituting groups in the benzene ring. In addition to these two bodies methyl ethers of trihydric phenols and also simple phenols occur in small quantities in creosote. Guaiacol boils at 200° C. and cresol at 221° C., hence the fraction collected between 200° and 220° will naturally contain these two bodies in abundance. Distinguish carefully between creosol and cresol. Cresol is a monohydric phenol—hydroxy toluene $\text{C}_6\text{H}_4(\text{CH}_3)(\text{OH})$, the next higher homologue of ordinary phenol (carbolic acid). The methyl ethers differ from the simple phenols in being less soluble in water, and also less caustic and poisonous. The green colour produced by addition of ferric chloride to a dilute solution of creosote is characteristic of the ortho-oxy derivatives of benzene. Compare the colour given by ferric chloride with resorcin and hydroquinone.

* NOTE.—This series of articles should be read in conjunction with the series referring to the 1885 B.P., and published in the *P. J.* during 1897 and the earlier portion of the current year.

LONDON: SATURDAY, OCTOBER 29, 1898.

THE FEDERATION PROGRAMME.

THE greater number of the leading local pharmaceutical associations in Great Britain are now, as should be well known, federated to some extent, and once a year delegates from those associations meet at the same time and place as the British Pharmaceutical Conference for the purpose of comparing notes on the previous year's work and drawing up a programme for the coming winter session. The Federation of Local Pharmaceutical Associations is not a separate body, such as the Pharmaceutical Society, Proprietary Articles Trade Association, or any of the federated associations, but it has a real existence as a bond of union between local associations, bringing them into close touch with each other, and serving an extremely useful purpose in securing simultaneous discussion of all subjects of pressing importance to registered chemists at one and the same time. At the annual meeting of delegates an opportunity is afforded for bringing under the notice of representatives of the craft from all parts of Great Britain any topic that has been suggested as being worthy of special discussion, and if it be the opinion of those present that such general discussion should take place, the Hon. Secretary of the Federation notifies all parties interested in due course, and suggests a date for the simultaneous discussions to take place.

At the Belfast meeting several subjects were held to be of sufficient importance to be generally discussed by all the pharmaceutical associations in the country during December next, and Mr. R. C. COWLEY, the recently appointed Honorary Secretary, has duly intimated that fact to the bodies interested. The first question suggested for discussion is embodied in the form of a resolution, which states, "that it is desirable in the interests of pharmacy that firms trading under ancient titles should also use the names of the present proprietors in conjunction therewith." The idea underlying this proposition is apparently that "any person who shall sell, or keep open shop for the retailing, dispensing, or compounding poisons," or "who shall take, use, or exhibit the name or title of chemist and druggist, etc.," ought to sell or keep open shop in his own name, displaying that name over his pharmacy and printing it upon all his labels. It is a moot point whether

a strict interpretation of the law would not compel every registered chemist in business on his own account to practise under his own name, and as there is much to be said in favour of such a practice, the more especially as it need not involve the entire abolition of the ancient titles of historic houses, a general expression of opinion on the matter would be very useful. In view of the passing of the Pharmacy Acts Amendment Act, 1898, the Federation next suggests that local associations should use their best efforts "to induce all registered chemists to become members of the Pharmaceutical Society." This suggestion should not require much in the shape of argument to commend it to those who have already shown their adherence to the principle of trade organisation by joining a local association. No national association exists for the protection of the interests of registered chemists but the Pharmaceutical Society, and all that is required to make it as powerful as such an organisation can be is for it to become more fully representative of the craft than at present. At present it includes only sixty per cent. of the pharmaceutical chemists of Great Britain, and less than forty per cent. of the registered chemists in business on their own account, but if every member can induce one other person to become a member, nothing much better need be required.

In the third place, the Federation invites local associations to elicit the opinion of their members as to whether the recommendations issued by the Pharmaceutical Society regarding the keeping and storing of poisons, should become bye-laws of the Society. This raises anew a question that was very decidedly negatived by the members of the Pharmaceutical Society some twenty-seven years ago, but which is yet persistently brought forward by the Privy Council. It may be confidently asserted that the adoption of the Society's (not the Council's) recommendations as regulations would not inflict any hardship on registered chemists, since the vast majority of them already have similar regulations in force in their pharmacies, and the only immediate effect of compulsory regulations would be to secure unanimity in the matter. As an indirect effect, the views of the Privy Council would be met, and the sympathy of that body with the Society's objects might, as a consequence, assume a more practical form than we have been accustomed to of late years. Finally, the Secretary of the Federation was instructed to send a communication to all local associations, suggesting that during the ensuing winter session each association should consider "in committee" the whole question of company trading, as it affects the legitimate interests of registered chemists and the protection of the public safety aimed at in the Pharmacy Acts, and that an effort should be made "to formulate some definite line of policy on which all registered chemists could agree to act." This is perhaps the most important item in the Federation programme, and it calls for very serious consideration, as it is quite time some definite line of policy was agreed upon. The suggestion that this matter should be considered in private merits the most cordial approval, for nothing can be more absurd than for individuals engaged in a life and death struggle to reveal all their views and intentions to their opponents through the medium of the public press. Let the subject be thoroughly discussed in the absence of reporters and let the conclusions arrived at be submitted to the Hon. Secretary of the Federation, who will communicate them to everyone legitimately interested, at a proper time and in a proper manner.

ANNOTATIONS.

THE CHEMISTS' BALL will be under consideration at a general meeting to be held, by permission, at 16, Bloomsbury Square, London, on Monday, November 7, at 2.30 p.m. A Committee will then be appointed and other preliminary arrangements made for the ball to be held in January next. Any one who may be willing to act as steward, but unable to be present at the meeting, will oblige by writing to the Honorary Secretary, Chemists' Ball Committee, 17, Bloomsbury Square, London, W.C.

THE PHARMACEUTICAL SOCIETY OF IRELAND will inaugurate the winter session by the opening of the Society's schools and the presentation of gold and silver medals to successful students, on Monday next, October 31. An interesting feature of the meeting will be the delivery of an address on the new Pharmacopœia by Professor C. R. Tichborne, LL.D., who is to illustrate his comments by some experiments. The chair will be taken by the President of the Society, Mr. R. J. Downes, at 8.15 p.m., and we understand that the Lord Mayor of Dublin and the President of the Royal College of Physicians (Ireland) have notified their intention of being present.

A SCIENTIFIC EXPEDITION TO SOKOTRA will, according to the *Times*, leave England in the course of the next few days. It will be a small but well-organised and well-equipped expedition, and it is intended to visit the almost unexplored island of Sokotra, situated about one hundred and fifty miles east-north-east of Cape Guardafui. The party will consist of Mr. W. R. Ogilvie Grant, of the department of zoology in the British Museum; Dr. H. O. Forbes, the director of the Liverpool Museums; and Mr. Cutmore, taxidermist attached to the latter institution. The Royal Society, the Royal Geographical Society, and the British Association have provided part of the funds for the undertaking, while the trustees of the British Museum and the Museums Committee of the Liverpool Corporation have officially countenanced the project by granting the necessary leave of absence to their officers and otherwise giving it their support. The expedition will sail for Aden, proceeding thence to Sokotra by the Indian Marine guardship "Elphinstone," which, in compliance with a request made by the authorities of the British Museum, has been kindly placed at the disposal of Mr. Grant and Dr. Forbes for the purpose of conveying them to the island and back to Aden on the termination of their stay.

THE MAIN OBJECT OF THE EXPEDITION is to investigate thoroughly the fauna of Sokotra and make large and complete collections in every branch of zoology. In order to work the island thoroughly, the party will probably remain there for at least four months. The botany of Sokotra is fairly well known owing to the visit made to it by Professor Balfour in 1880, when he gave special attention to the flora, but from a zoological standpoint the island is almost unexplored. Sokotra being the largest island in the world of which it can be said that nothing is known of its mammal fauna, while its position off the interesting Somali country, the peculiarity of some of its birds, and the unexpected fact that the only mammal as yet recorded from it is of Indian and Mascarene, not African, affinities, combine to render an investigation of its mammal fauna a work of the highest scientific interest. It is anticipated that the expedition will yield unusually valuable and important results, and greatly enrich the collections of the two museums concerned. Sokotra is 72 miles by 22 miles, and

has a population of about 4000, of Arab descent. It was formally placed under British protection by agreement with the Sultan in 1886, together with the neighbouring Abdal Kute and Bromers Islands.

THE LEICESTER MEDICAL SOCIETY must include more progressive men than average medical practitioners usually are, for a circular letter has been printed intimating that it is the wish of the members of the Society that all prescriptions should be dispensed according to the British Pharmacopœia of 1898, unless otherwise specified. It would be well if other representative medical bodies, and particularly the British Medical Association, would act in a similar manner. In the circular letter referred to, by the way, the "new edition" of the Pharmacopœia is spoken of; that is hardly correct, as the book is not a new edition but an entirely new work and, for the time being, "the" British Pharmacopœia.

AN 'ATLAS OF BACTERIOLOGY' was recently referred to in these pages, as being in the press, and we are now able to announce that it has been published. The book is the joint production of Chas. Slater, M.A., M.B., etc., lecturer on bacteriology at St. George's Hospital Medical School, and Edmund J. Spitta, L.R.C.P., M.R.C.S., the author of the very complete series of articles on photo-micrography now appearing in the *Pharmaceutical Journal*. The 'Atlas' contains one hundred and eleven original photo-micrographs, which exceed in clearness anything of the kind that has yet been published. Excellent photographs have been taken for typical specimens in the first place, and the screen employed in the reproduction process (half-tone) is so exceedingly fine that the network does not in any degree interfere with details. In fact, everyone concerned in the production of the book has done his work exceptionally well, and the Scientific Press, Ltd., which has published the 'Atlas' at the moderate price of 7s. 6d. net, is to be congratulated on being able to produce such a useful addition to the bacteriologist's library so cheaply. There is a brief photographic introduction, in which the method of procedure adopted is explained; then follows a bacteriological introduction, which is an excellent summary of the whole subject. Each organism illustrated is then very carefully and fully described in the explanatory text. Without going into further details, it may safely be said that the 'Atlas' will be found indispensable by every practical bacteriologist. It can be used with advantage as a supplement to any modern text-book of bacteriology, and should specially commend itself to the readers of this Journal.

LADY DISPENSERS have at length become the subject of attention in the *British Medical Journal*, which states that it is possible for ladies to earn a living by acting as dispensers to medical men, hospitals, etc., though the demand for their services at hospitals is not great. That is quite correct, and it might have been truthfully added that the total demand for lady dispensers is very small. Proceeding, the editor of the *B. M. J.* rightly observes that to become a qualified pharmacist it is necessary to pass the Minor examination of the Pharmaceutical Society after passing a preliminary examination, but he misses the mark when he states that a three years' apprenticeship must be served, and that further study in some school of pharmacy "is always required." Whilst pointing out that the Apothecaries' Society, Blackfriars, grants certificates for competency in dispensing upon passing its examination in chemistry, materia medica, pharmacy, and dispensing, it is stated that "this certificate has no legal value," but that "it suffices for some hospital dispenserships." The latter statement is scarcely based on fact.

THE TECHNOLOGICAL EXAMINATIONS conducted under the auspices of the City and Guilds of London Institute are dealt with in a report recently published, which states that the progress in the work of the department shown in previous reports was fully maintained last year. The satisfactory relations established between the Institute and the technical education committees of county councils and various trade societies has been continued, with the result that the number of technical classes registered by the Institute have increased, and the instruction given has been brought into closer touch with industrial requirements. Further progress has been made in organising practical tests in connection with the written examinations in different subjects, and special reference is made in the report to the success attending the efforts to adapt the schemes of different trades and sections of trades. The total number of students in attendance at the classes registered by the Institute in technology and manual training was 34,990, as against 32,566 in the previous year, and the total number of candidates examined in separate subjects was 14,148, as against 12,868. In technology the number of students attending the classes was 32,899, an increase of 2833; the number of classes was 1569, an increase of 82; the number of candidates for examination was 13,062, an increase of 1194; and the number of passes 7553, an increase of 833. The number of centres has decreased from 406 to 369, owing to the closing of smaller centres of examination and to the transfer of the candidates, and in some cases of the students, to schools which are better staffed and equipped for the teaching of technical subjects. There has been a marked increase in the number of candidates from the London polytechnic institutes, and of 2505 candidates who presented themselves 1537 passed, the numbers in the previous year being 1811 examined and 1114 passed.

DR. EWALD GEISSLER, who was for many years editor of the *Pharmaceutische Centralhalle*, died somewhat suddenly, on October 15 last. In his position as a journalist he was held in the highest esteem by German apothekers as an able and laborious promoter of the interests of pharmacy.

MR. ALEXANDER CROSS, M.P., really ought to be more sure of his facts than he appears to have been at an Agricultural Conference recently held at Edinburgh. According to a report in a local paper, he brought forward the question of the restrictions on the sale of sheep dips and insecticides, and "complained that such an article as carbolic acid (*sic*) and other poisons in common use by farmers could only be purchased from members of the Pharmaceutical Society." Naturally, he condemned this assumed monopoly as unjust and as having the effect of raising prices, while he also quite erroneously inferred that the existence of this hypothetical hindrance to the free sale of carbolic acid, etc., circumscribed the opportunities which the farmer had of taking advantage of the knowledge which science might bring to his aid. He asked the Chamber to join in a petition to the Government to remove the restrictions on the sale of such articles of commerce, and the resolution, having been seconded, was agreed to. Apparently, therefore, the honourable gentleman's ignorance was shared by everyone else present on the occasion.

THE PLAGUE has got loose in Vienna, where general uneasiness has been aroused on account of the death of a servant at the Pathological and Anatomical Institution. The man's business was to clean the place, and also to feed the animals required for bacteriological studies connected with the plague in the laboratory of the Institution, where the medical men worked who were sent last year, as delegates of the Austrian Government, to join the

expedition for the scientific observation of the plague in India. The investigators remained for a considerable time in Bombay, and at present are occupied in Vienna in working out their scientific observations, the plague bacilli being used for experimental injections into animals, for the purpose of discovering a serum. It is supposed that the servant, who had frequently to assist with these bacilli, became infected, and, as a matter of fact, after a microscopic examination of the intestines of the patient, micro-organisms were found which resembled the plague bacilli. Stringent precautions were immediately taken. All persons who had been in contact with the deceased were isolated for medical inspection, and the room in which the man died was sealed up by the authorities. In spite of all precautions, however, several persons have since been attacked, and a medical man engaged at the Institution has since succumbed to the same dread disease.

THE SO-CALLED DRUG PEST has engaged the attention of a writer in the *Outlook*, who appears to have been studying Dr. J. Walter Carr's recent address on the influence of fashion on medicine and the taking of dangerous drugs, and remarks that women have earned the reputation of being the greatest offenders in the wholesale taking of injurious and often dangerous drugs. This is particularly so, he contends, amongst that class whose time is taken up in the pursuit of social pleasures. "Women resort to these drugs from over-exhaustion, when the need of a stimulant is felt; many, perhaps, whom nothing would induce to touch either whisky or brandy (not in themselves to be recommended), have recourse to some one or more of these drugs, much more subtle and dangerous in their action, whether it be morphia, antipyrin, cocaine, or some of the hundred-and-one 'cures' which gain favour now and then among the decidedly weaker sex." In a certain section of society, it is alleged, a number of women carry "restoratives" in their *bonbonnières*, and to illustrate this it is stated that some time ago a lady at a fashionable "at home" was heard to offer a friend a tabloid from a small silver box—just as one person might offer a cigarette to another—with the words, "Do have one, dear—they are only cocaine. Personally I find them a necessity, and I do not know how I should get through the day without my 'tabs.'" This is not cited as a common case; but, all the same, it is significant.

A CLASS IN PRACTICAL BACTERIOLOGY is now being held in the Hygienic Laboratory (Ashton Hall), University College, Liverpool, and Mr. Prosper H. Marsden writes to say that he has been requested by Professor Boyce to direct attention to the fact. The meetings are on Monday evenings at 7.45, and the fee is one guinea. These classes are particularly well suited to the requirements of pharmacists who are anxious to obtain a general knowledge of bacteriological processes and methods, and they have been attended by local pharmacists in previous sessions.

THE SALE OF LAUDANUM, as of all other scheduled poisons, should be—and usually is—conducted with circumspection by registered chemists, but if the facts are as stated in a report of an attempted suicide at Grantham, there would appear to have been some lack of discretion exhibited by a chemist in that town. A lad of sixteen was charged with having attempted to commit suicide by taking a quantity of laudanum, and it was stated in evidence that he had been supplied, without question, by a local chemist with two ounces of that preparation. One of the magistrates, a medical man apparently, commented on the indiscriminate way in which the poison had been sold, and most people will agree with him that the existence of such a state of affairs is not very creditable to the chemists concerned.

SELECTED PRACTICAL FORMULÆ.

BY A REGISTERED CHEMIST AND DRUGGIST.

Certain journals connected with the drug trade have from time to time published collections of recipes for the use of chemists and druggists, and I have bought several of them, but have always been disappointed to find that the recipes were of no practical use. Indeed the bulk of them seem to have been devised by people who have never made the preparations. The following formulæ, however, for medicinal and toilet preparations, etc., in common use, I have found thoroughly satisfactory in practice, and I use them regularly in my own pharmacy. It will be noted that all the quantities are given in parts and fluid parts, so that either metric or imperial weights and measures may be employed as desired. The solid ingredients should be weighed and the liquids measured; if therefore the gramme be taken as the unit of weight, the millilitre (C.c.) should be taken as the unit of measure. The ounce (Avoirdupois) and the fluid ounce correspond exactly, whilst for smaller quantities the Troy drachm and fluid drachm approximate sufficiently for the purpose of these recipes, as also do the grain and minim or drop.*

Lavender Water.—Oil of lavender, 2; essence of musk, 1; distilled water, 2; rectified spirit to 20. If put in 2-oz., 3-oz., and 4-oz. white glass panelled bottles these make a nice series to sell at 1s., 1s. 6d. and 2s. Cost: 2s. 9d. per pint (exotic oil at 7s. 6d. per lb.).

NOTE.—This preparation would be improved by the addition of essence of bergamot, otto of rose, and orange flower water, in suitable proportions. The best French oil of lavender should be used.—[Ed. P. J.]

Essence of Musk.—Grain musk, 6; solution of ammonia, 3; distilled water, 200; rectified spirit to 1000. Should be allowed to macerate in a warm place for a month. A good grain musk can be obtained for 100s. per oz., which will make the essence cost about 15s. a pint.

NOTE.—The solution of ammonia is unnecessary in this preparation.—[Ed. P. J.]

Toothache Tincture.—Chloroform (Meth.), 1; creosote, 1; oil of cloves, 1; camphor, 1; solution of cochineal, *q.s.*; rectified spirit to 10. Put up in 2-drachm vials, 6d. Cost: 1s. 7d. for 10 ounces.

NOTE.—Phenol would be a useful addition in this case.—[Ed. P. J.]

Rose Tooth Powder.—Carmine, 60; oil of rose geranium (French), 60; oil of lavender, 60; oil of cloves, 20; powdered orris root, 440; precipitated chalk to 7000. Put up in 2-oz. screw metal top bottles, retail at 9d. Cost: 1s. 2d. per lb.

Camphor Ice.—Spermaceti, 3; white wax, 3; bleached almond oil, 8; powdered camphor, 2. Put up in tin-foil lined boxes to retail for 1d. to 6d. Cost: 1s. 9d. per lb.

* In the case of the first formula given, all the ingredients are liquid; hence, having decided whether minims, fluid drachm, fluid ounces, or millilitres (C.c.) are to be taken, all that is necessary is to measure the specified number of minims, etc., of each ingredient. The third formula includes a solid—camphor—as an ingredient; if ounces are to be taken, weigh an ounce (Avoirdupois) of camphor and measure the specified number of parts of each of the other ingredients as fluid ounces, also making up the bulk to ten fluid ounces. If a smaller quantity of product is required, we may weigh a drachm (Troy) of camphor and measure the parts of the liquid ingredients as fluid drachms. Grains of solids require fluid grains of liquids to ensure strict accuracy, but the difference will mostly be inappreciable if an equal number of minims, or even drops, be taken. For instance, if a pound (7000 grains) be required of the preparation, for which the third formula is given, the quantities of solids should evidently be regarded as grains, but it will probably prove most convenient to measure the essential oils as minims, whilst if smaller quantities are required to be taken, the fluid parts might be regarded as drops. Another approximation suggests itself in connection with the formula for violet powder, for if the “fluid parts” be regarded as drops, and the “parts” as grains, the product might with advantage be made to weigh exactly one ounce.

Diarrhœa Mixture.—Tincture of opium, 1; dilute sulphuric acid, 2; chloroform water to 40. Dose: One tablespoonful every three hours until relieved. Six-ounce bottle sells for 1s.

NOTE.—Tincture of catechu, aromatic powder of chalk, and essence of peppermint might be substituted for the dilute sulphuric acid with advantage.—[Ed. P. J.]

Adults' Cough Mixture.—Chlorodyne (B.P., 1885, form.), 1; ipecacuanha wine, 1; syrup of squills, 4; distilled water to 20; solution of cochineal, *q.s.* Dose: One tablespoonful every four hours. A six-ounce bottle sells for 1s. 3d. Cost: 6d. per pint.

NOTE.—It would be better to reduce the quantity of water, and make the dose one teaspoonful.—[Ed. P. J.]

Children's Cough Mixture.—Sweet spirit of nitre, 1; strong solution of ammonium acetate, 1; ipecacuanha wine, 1; syrup of tolu, 4; dill water to 20; solution of cochineal, *q.s.* Dose: One to two teaspoonfuls, according to age. Put up a “Cherry Pectoral” in 3 and 6 oz. bottles to sell at 9d. and 1s. 3d. Cost: 7d. per pint.

NOTE.—The solution of ammonium acetate should be replaced by ammonium bromide, and some syrup of Virginian prune might well be added.—[Ed. P. J.]

Cold Cream.—White wax, 32; triple rose water, 32; oil of rose geranium (French), 1; almond oil to 64. Mix in the usual manner and put up in 1-oz. pots to retail at 6d. Cost: 1s. 6d. per lb.

Quinine and Iron Tonic.—Citrate of iron and quinine, 1; syrup of orange, 2; chloroform water, to 20. Put up in 6-oz. bottles as “Aromatic Quinine and Iron Tonic,” to retail at 1s. Cost: 8d. per pint.

Violet Powder.—Oil of rose geranium, 1; oil of neroli, 1; powdered orris root, 50; powdered starch, to 400. Put up in 4-oz. round boxes to retail at 6d. Cost: 9d. per lb.

Indigestion Mixture.—Dilute nitro muriatic acid, 1; tincture of nux vomica, 1; concentrated infusion of gentian (1 to 7), 2½; chloroform water, to 20. Dose: One tablespoonful three times a day in a little water after food. A 6-oz. bottle sells for 1s. 3d. Cost: 6d. per pint.

Antiseptic Foot Powder.—Oil of lavender, 3; oil of cloves, 1; powdered boric acid, to 400. Put up in small round tins, with sprinkler tops, to retail at 6d. Cost: 6d. per lb.

Syrup of Figs.—Fluid extract of cascara, 200; tincture of orange, 50; oil of cassia, 1; simple syrup, to 1000. Put up in 2-oz. panelled flats for 1s. Cost: 10d. per pint.

NOTE.—This preparation should contain some syrup of figs, and is better made by mixing that syrup with fluid extract of senna pods, and flavouring with pimento.—[Ed. P. J.]

Corn Solvent.—Salicylic acid, 4; extract of Indian hemp, 1; methylated flexile collodion, to 40. Put up in 2-drachm vials fitted with brush, each in box to retail at 9d. Cost: 4s. per pint.

Carbolic Tooth Powder.—Pure liquid carbolic acid, 12; powdered cuttlefish bone, 24; powdered orris root, 24; carmine, 3; oil of rose geranium, 3; precipitated chalk to 400. Put up in 1½ and 3-oz. flat tins to retail at 4½d. and 7½d. Cost: 1s. per lb.

Sulphur Skin Lotion.—Precipitated sulphur, 1; oxide of zinc, 2; glycerin, 4; rose water, to 40. Put up in 4-oz. flat poisons to retail at 1s. Cost: 1s. per pint.

Bay Rhum.—Oil of *Myrcia acris*, 1; acetic acid, 1; rectified spirit, 20; water, to 40. Put up in 3-oz. panelled white glass flats, retailing at 1s. Cost: 1s. 9d. per pint.

Nursery Hair Lotion.—Borax, 1; concentrated infusion of quassia, 4; rose water, to 20. Put up in 4-oz. flats to retail at 1s. Cost: 9d. per pint.

Effervescing Saline.—Tartaric acid, 30; bicarbonate of soda, 30; dried Epsom salts, 3 chlorate of potash, 1; icing

sugar to 120. Put up in 6-oz. saline bottles to retail at 1s. Cost : 7d. per lb.

NOTE.—The proportion of magnesium sulphate in this formula is much too large; one-tenth to one-fifth the quantity specified would be ample, and the chlorate may, with advantage, be omitted. —[Ed. P. J.]

Erasmus Wilson's Hair Wash.—Almond oil, 5; solution of ammonia, B.P., 5; oil of rosemary, 1; rectified spirit, 16; water, to 40. Put up in 4 and 8-oz. round-shouldered vials retailing at 1s. and 1s. 9d. Cost: 1s. 4d. per pint.

Nutritive Pomade for the Hair.—White wax, 50; spermaceti, 50; ess. of bergamot, 3; oil of lavender, 3; oil of cloves, 1; benzoated lard, to 800. Put up in 2-oz. screw metal bottles retail at 6d. Cost: About 1s. 2d. per lb.

Furniture Cream.—Castile soap, 2; carbonate of potash, 1; yellow wax, 16; turpentine, 60; water, 60. Dissolve the potash and soap in the water by the aid of heat, strain into large jar then melt the yellow wax, take the vessel from the fire and add turpentine. Then mix two solutions and stir well. Put up in 6 and 12-oz. round-shouldered wide bottles at 9d. and 1s. 6d. Cost: 7d. per pint.

Eau de Cologne.—Essence of bergamot, 6; essence of lemon, 3; oil of neroli, 2; oil of rosemary, 2; distilled water, 100; rectified spirit to 1000. Put up in usual 2 and 4-oz. bottles. Sells readily at 10½d. and 1s. 6d. Cost: About 2s. 9d. per pint.

HALIFAX AND DISTRICT CHEMISTS' ASSOCIATION,

A meeting of this Association was held on Thursday, October 20, at the Old Cock Hotel, Halifax.—The chair was taken by Mr. G. M. COBB, President, and there was a good attendance of members. A discussion took place as to the attitude taken by various owners of proprietary articles in reference to the P.A.T.A.—The PRESIDENT proposed—

That no literature of any description be distributed or show-cards exhibited belonging to non-P.A.T.A. firms, and that the members of this Association discourage the sales of such articles until the proprietors thereof see fit to place their goods on the P.A.T.A. list.

—This was seconded by Mr. W. S. THOMPSON, and carried unanimously.—Messrs. Comyns, Tiffany, J. B. Brierley, Gibson, Dixon, Fielding, and the Hon. Secretary, H. C. Brierley, etc., took part in the discussion. It was pointed out that as all the chemists in the district were members of the P.A.T.A., the effect of such a resolution will certainly be felt so far as the drug trade in Halifax was concerned. The Secretary was instructed to send to the leading non-P.A.T.A. proprietors a copy of this resolution, and to request them to join the P.A.T.A. A letter from Messrs. J. and E. Atkinson to Mr. Dixon, of Halifax, was read, in which the firm in question regretted "the cut-throat policy adopted by many traders in these days," and stated that they were not in a position to alter things. Much indignation was expressed by the meeting at the arguments laid down. It was pointed out that another perfumery business, Messrs. John Gosnell and Co., had decided to meet the difficulty by placing their articles on the P.A.T.A., and the members felt that what Messrs. Gosnell could do other perfumery proprietors could also accomplish. A letter was read from the P.A.T.A. condoling with the Halifax Association, and referring to the great loss which they had sustained from the death of Mr. Seely. The Secretary was instructed to write expressing the thanks of the Halifax Association for the sympathy expressed by the P.A.T.A.—The HONORARY SECRETARY read a letter received from the Bradford Association, inviting the Halifax Association to be present at an address to be given by Mr. G. T. W. Newsholme, Vice-President of the Pharmaceutical Society, on pharmaceutical topics, the date being February 21, 1899. Many members expressed a hope that they would be able to be present, and thanked the Bradford Association for their kindness.—The PRESIDENT proposed and the SECRETARY seconded that Mr. Clement

Fielding's name be submitted to the Pharmaceutical Society as a fit and proper person for the post of local secretary now vacant through the death of Mr. H. W. Seely, F.C.S. It was felt by the members that Mr. Fielding would be a great success in that position.—During the winter session meetings of this Association will be held on the first Thursday in the month.

CHEMISTS' ASSISTANTS' ASSOCIATION.

On Thursday, October 20, at a meeting of this Association, held at 73, Newman Street, W., the PRESIDENT, Mr. F. W. Gamble, in the chair, Dr. Charles Symes and Mr. T. A. Ellwood were proposed for election as patrons of the Association; three new members were also nominated.—Mr. H. E. MATTHEWS, the Hon. Secretary, having read the minutes of the previous meeting, the PRESIDENT called upon Mr. T. Morley Taylor to read a paper on

Vegetable Secretions.

Before proceeding with his paper Mr. Taylor offered a word of warning to those members who at any time propose to read papers before the Association. He advised them to refrain from putting off writing their paper until within two or three weeks prior to the date of the meeting at which it should be read. In writing a paper on any subject a man ought to be certain that he can devote the time to it he intends to do, and in order to accomplish that he (Mr. Taylor) found it to be absolutely necessary to allow ample time for the preparation of matter for the paper, otherwise various unforeseen circumstances might occur at the last moment to prevent the satisfactory completion of the work. Unfortunately that had been the case in the present instance, consequently he had only got together an elementary account of the subject he had intended to deal with more fully. Hence his warning to those who might be tempted to do likewise. Mr. Taylor then read his paper, which is printed in full at page 464. It was illustrated by a number of enlarged diagrams, prepared by the author, and exhibited on the wall, also by several sections under the microscope.—Mr. H. E. MATTHEWS proposed that a hearty vote of thanks be accorded to Mr. Taylor for his admirable paper. It was not, as he had given them to understand, an elementary paper, but one which required a deep dive into the subject to obtain the information contained therein. Personally he had enjoyed the paper very much. Mr. Matthews then made a few remarks with respect to the formation of formaldehyde and carbohydrates in plants, stating that he was inclined to be heretical in his opinion on the subject, as it was a question concerning which there was at present insufficient proof. The part played by the calcium salts in plants was another point that required elucidation, it being known that calcium chloride was very fatal to plants.—The PRESIDENT seconded the proposition although, he said, it was not strictly in accordance with the rules to propose a vote of thanks to a member of the Association for any service he might render by way of reading papers. But he thought Mr. Taylor deserved their heartiest thanks for the excellent paper he had brought before them, also for the excellent diagrams with which it was illustrated. With regard to the subject matter of the paper, Mr. Taylor had told him beforehand that it would be merely a *résumé* of information concerning vegetable secretions. It struck him at the time that a *résumé* of the subject would be much more interesting than a paper which went more deeply into the subject. He did not quite agree with Mr. Taylor's definition of secretions and excretions when he said that excretions in plants are useless and secretions are useful. They did not find anything haphazard in nature. Of course it was a nice distinction to draw, to say that the one is useless and the other useful; but he thought it raised a difficult point to say that resins and alkaloids are of no use in the plant.—Mr. TAYLOR said his definition of secretions and excretions was made in the hope that it might lead to some discussion on the subject, because it was a question for discussion.—Mr. MATTHEWS said that the definition of a secretion given by Mr. Taylor was one likely to make them go for him on first thought, but if they went into the matter more deeply, he thought they would be inclined to agree with him.—Mr. TAYLOR having replied to several other points raised by Messrs. Pearson, Gamble, and Matthews, and acknowledged the vote of thanks, the meeting adjourned.

MIDLAND CHEMISTS' ASSISTANTS' ASSOCIATION.

This Association opened its fifth winter session on the 19th inst. with a meeting at the Exchange Rooms, Birmingham. The chair was taken by the VICE-PRESIDENT, Mr. J. Selby, who was called upon to take the place of the President, Mr. F. J. Walton, and deliver the opening address. He explained that since his election Mr. Walton had given up the chemists' profession, and had temporarily left the town in order to pursue medical studies. A few days previously he had sent in his resignation, which would be considered at a future meeting. Reviewing the work of the last session Mr. Selby expressed the opinion that members had every reason to congratulate themselves. He reminded them that their Association was one of the first to suggest the formation of

AN ASSISTANTS' UNION.

Such an association had already been formed, with headquarters at London, and during the present session the Birmingham Association would be asked to consider its aims and objects and appoint a local secretary. The Association could not, however, live on the past, and if it was to be made one of the leading associations of the country its motto must be "Forward." Touching upon the programme for the first part of the present session he pointed out that it contained subjects well worthy of their attention and of interest to every one connected with pharmacy. Among those who had promised to assist were Mr. Alcock, Mr. Barclay, Mr. Liversedge, and Mr. Dencer Whittles, all gentlemen of high scientific attainments. He urged the members to attend the meetings regularly. Some assistants he knew were more favourably situated in this respect than others. He spoke in condemnatory terms of those employers who sought to take fourteen business hours out of the day. The system of late hours had been growing year by year, until now in some places the hours of the chemist were outrageous. Legislation on the question would not affect the chemist on account of the peculiar nature of his business, and he therefore saw no hope in this direction. He was, however, led to ask why assistants should want legislation when the matter was entirely in their own hands? Twelve hours a day he considered the outside limit, and he urged assistants to refuse to engage with any man who tried to get more. With sound combination those employers who existed by sapping the health and strength of the young men of to-day would either have to change their principles or cease to exist. He advised assistants first of all to approach their masters in a friendly spirit, intimating their desire to leave business earlier on certain nights in order to attend the meetings of their Association. Mr. Selby next touched upon the question of unnecessary Sunday trading, and said that whilst they were all conscious of the reasonableness of some one being in attendance for urgent cases, such a provision did not make it necessary that a chemist should draw up his blinds, brilliantly light up his shop, and invite any passer-by to purchase scented cachous, perfume, and such articles. The assistants of to-day could, if they chose, exert considerable influence upon the evils he had referred to. Mr. Selby went on to speak of the new Pharmacy Act, pointing out that it made all Minor men eligible for

MEMBERSHIP OF THE PHARMACEUTICAL SOCIETY.

He thought the Society should receive the support of every chemist in the country. All the little prejudices of the past should be entirely swept away, and the Society should be made to represent the entire trade—not a fraction of it, as had been the case hitherto. He advised the members not to be influenced by the grumblers of old, but to think and act for themselves, bearing in mind that the Council of the Pharmaceutical Society would in the future be composed of those who were to-day assistants. If the different assistants' associations throughout the country united to support one or more candidates for the Council success was assured. In conclusion, Mr. Selby appealed to those present to exert themselves in the direction of obtaining new members, and so make the session more successful than any preceding it.—On the motion of Mr. JESSOP, seconded by Mr. THOMAS, a hearty vote of thanks was accorded Mr. Selby for his address.

LANOLIN VACCINE.—W. G. King recommends the use of purified lanolin in the place of the usual glycerin for preserving lymph. This has been well tried in different climates. Carefully prepared lanolin vaccine retains its efficacy from six to nine months, sometimes longer.—*Pharm. Central.*, xxxix., 536.

IRISH PHARMACISTS' ASSISTANTS' ASSOCIATION.

At Dublin, on the 21st inst., the third annual meeting of this Association was held in the Pharmaceutical Society's House, 67, Lower Mount Street, the VICE-PRESIDENT, Mr. Henry Hunt, in the chair. There was a large attendance.—The HON. SECRETARY read the notice convening the meeting and also the minutes of the last meeting, which were adopted. The correspondence included several letters of apology for non-attendance.—The CHAIRMAN said he was glad to see so many present. It was very gratifying to know that there was no lack of interest taken in the work of the Association, and he regarded the attendance that evening as a favourable augury for the success of the ensuing season. In accordance with the terms of the circular convening the meeting, he purposed varying slightly the usual order of procedure, and with the object of giving new members a voice in the Association that evening before the election of new office-bearers, he would be glad if candidates were forthwith proposed for election and balloted for. Two new members were then proposed for membership and declared duly elected. The Chairman now declared all offices in the Association vacant, and vacated the chair, which, on the motion of Mr. JOHNSTON, seconded by Mr. TURNER, was taken by Mr. G. G. Fetherston, who congratulated the Association on its vitality. He referred to the work of the past session, and said the meetings had been very well attended, and were successful in every respect. He deplored the loss of their valued President, Mr. Hardy, but was glad to know that he was doing well in his new sphere of work. He now called upon the Hon. Secretary to read

The Annual Report.

Mr. JOHNSTON said, in presenting to the members the third annual report of the Association, it was pleasing to see that their numbers were far in advance of any previous session. A brief summary of the work of the last session was then given, and it was stated that, so far as the Committee saw, they could offer no suggestions as to how they could improve or increase the interest taken during the past session by the members, and as last year's work had proved so very successful it was thought the same lines might be followed during the ensuing year. The attendance at meetings was next referred to, and a hope expressed that all would endeavour not only to keep up the good average attendance of the previous session, but to increase it. The various Committees were also urged to make every effort to ensure a successful session. The Secretaries wished to express their thanks on behalf of the Association to those outside the ranks of pharmacy for their kindness in assisting the Association. They were also indebted to the country members for their support, inasmuch as they were, unfortunately, prevented through distance from taking an active part in the working of the Association. The payment of subscriptions was next dealt with, and reference made to the suggestion made at the beginning of last session that an employment agency in connection with the Association would prove useful and beneficial to employers and assistants alike. The subject was very freely discussed, and circulars sent out to all employers resident in the city and suburbs, but the replies received were not at all in proportion, some being for and some against the scheme. It was found that an employment agency could only be worked satisfactorily by having an office and a registrar in constant attendance, and this, it was regretted, was beyond the scope of the Association at present, so it was decided to abandon the idea indefinitely. It was with pleasure they acknowledged the kindness received at all times at the hands of the Pharmaceutical Society's President and Council, and they trusted the existing cordial relations between the Society and the Association would long continue. The trade press deserved special thanks, as on former occasions it was always ready to extend its generosity and meet the wishes of the Association in every way, but in the matter of the supply of trade papers it would be advisable, if they could see their way, to include the *Pharmaceutical Journal*. The report concluded with kind references to the President, Mr. Hardy, and to the Committee generally, and was signed by the reader on behalf of himself and his co-Secretary, Mr. Dunwoody.

The Treasurer's Statement of Accounts

showed that the Association started the session of 1897-98 with a credit balance of £11 19s., which, together with the receipts from various sources, including subscriptions, concerts, dance, etc., amounted to £84 odd, out of which the expenses, as enumerated

in detail, came up to £74 odd, leaving a balance in hand of £9 10s. 5d. An explanation was given of the falling off of the credit balance. This was due to the fact that during the session of 1897-98 a large number of wholesale houses had subscribed to the Association, in response to a circular inviting them to do so. This circular had not however been issued during the first session, hence the decrease. The number of subscriptions from members had greatly increased, and it was thought, considering the heavy expenses of the past session, the Association had reason for self-congratulation. The money in hand would be something to meet the immediate expenses of the coming winter.—Mr. O'SULLIVAN moved the adoption of the reports. He referred to the employment agency, and said, being the author of the scheme, he still felt kindly disposed to it. He did not think the difficulty in arranging for an employment registry was so great as represented. The scale of operation need not necessarily be a large one, and perhaps the suggestion might yet be put into practical shape. He hoped the new Committee would take up the question on its merits, and try to meet the wishes of not only himself, but a large section of the members.—Mr. JOHNSTON, in seconding the adoption of the report, concurred with Mr. O'Sullivan as regards the employment agency, but when it was remembered that, out of 120 circulars sent out to the employers, only five had replied—two of them being for, two against the scheme, and the fifth indefinite—it would be seen how great was the difficulty of putting the vacancy register into practice. No doubt a large number of verbal promises to support the agency had been given by the employers, but saying and doing were often two very different things. Personally he would be glad to see an employment office in direct connection with the Association.—A discussion here arose as to the auditing of the Treasurer's report, with the result that, on the suggestion of Mr. WILLIAMS, it was agreed to print the Treasurer's report in future.

Election of Officers.

Mr. JOHNSTON had pleasure in proposing Mr. Henry Hunt to act as President during the ensuing year.—Mr. SAVAGE seconded the motion, which was carried unanimously.—Mr. HUNT thanked the members for the confidence reposed in him, and hoped they would not find it misplaced.—On the motion of Mr. JONES, seconded by Mr. M'CLEAN, Mr. J. Eyrie was elected Vice-President; Messrs. Savage and Jessop were elected Honorary Secretaries, and Mr. W. M. McCarthy consented to act as Honorary Treasurer, in succession to Mr. Turner. The following were appointed a committee of management:—Miss Wyatt, Miss Jessop; Messrs. Williams, Aubrey, O'Sullivan, W. U. Smith, M'Clean, Jones, Maxwell, O'Farrell, Barrett, Bowles, Warren, Nagle, Meyrick, Dunwoody, Watson, Chamberlain, Taylor, and Yoxall. A suggestion to reduce the number forming a quorum was rejected, on the ground that to reduce the existing number (seven) would lend colour to the possible unkind suggestion that the Association was run by a clique.—At this juncture a letter from Mr. H. C. Meyrick, Galway, the founder of the Association, was received, in which the writer conveyed his kind regards to the members and best wishes for the continued prosperity of the Association. Mr. Meyrick's sentiments were hailed with applause.—Mr. WILLIAMS spoke at some length on the condition of pharmacists in Ireland, their pay, prospects and hours of duty. He emphasised the necessity of keeping closely united, as otherwise the thin edge of the wedge of disruption would be let into the crevices occasioned by individual apathy. Mr. Williams' remarks applied to all classes and conditions of the trade, employers, and assistants alike. He suggested a closer bond of unity between the Council and the Association, and ventured to hope in the future that an official recognition of the latter would be given at the Council meetings of the Society. If the assistants could send a representative to the Council to voice their views and vote thereon, it would be a distinct gain to everybody. The Council was the Parliament of pharmacy in Ireland, and seeing that most of those connected with the Association were electors, it seemed not unreasonable to hope that the day would soon come when the Association would have at the Council a chair reserved for its delegate. He urged the formation of an employment agency, and the want in Dublin for a reading-room where the young men of the craft could meet and spend their leisure hours.—Mr. JOHNSTON deemed it right to say that the Association was formed for the elevation of assistants, intellectually and socially, and its relations with questions approaching trade unionism were happily kept at arm's length. The desire was to work hand-in-hand with the employers, and there was no reason why this should

not always continue.—Mr. Hunt having been moved to the chair, votes of thanks were accorded to the outgoing officers, and responded to by Messrs. TURNER and JOHNSTON.—A special vote of thanks was passed to the President and Council of the Pharmaceutical Society for the unvarying kindness experienced by the Association from that body, and a copy of the same was directed to be sent to the Society's Registrar. An additional vote of thanks to Mr. Fetherston for presiding for the third year in succession at the annual meeting was passed to that gentleman, who suitably responded.—At this stage of the meeting Councillor Kelly entered and was received with applause. He addressed a few kindly words of encouragement to the members, and assured the Association of his support on every occasion it was wanted. The meeting then adjourned.

DUBLIN CHEMISTS' FEDERATION.

At Dublin, on the 19th inst., a general meeting of this newly formed Association was held in the Pharmaceutical Society's House, 67, Lower Mount Street, the PRESIDENT, Dr. J. A. Walsh, in the chair. The following were present:—Messrs. J. Smith, D. O'Sullivan, J. Tyrie Turner, R. T. White, J. N. Hardy, J. A. Ray, — Campbell, — Thompson, G. Brown, Dr. J. C. McWalter, E. M. Darcy, F. J. Jackson, J. T. Smallman, etc., etc.—The Hon. SECRETARY, Mr. J. Smith, read the minutes of the last meeting, which were adopted. He also gave a *résumé* of the work done by the Committee since the general body of members last met, and the results were heard with satisfaction. Apologies for non-attendance were received from Messrs. W. F. Wells, Samuel P. Boyd, M.A., J. B. Alister, and from the representatives of Messrs. P. A. Leslie and Co., Bride Street, Gordon's Medical Hall, Ranelagh. All the letters contained promises to support the Federation.—Mr. G. BROWN, Hon. Treasurer, gave an account of the funds in hand, and said he had not yet sent out circulars asking for subscriptions, that being in reality the first meeting of the year. The money in his possession had been subscribed by the members of the Committee.—The PRESIDENT said they had met together to frame rules for

THE PROPER WORKING OF THE FEDERATION.

and to take such steps as might be decided upon to get their brother chemists to help on the Society. In order to save time he had jotted down such rules as had occurred to him as having a bearing on the Society's aim and object, and he would now read the draft prepared by the Committee. Each rule could be fully discussed and altered or otherwise in accordance with the voice of the meeting. The rules were then read as follows:—

- (1) That the Association be called the Dublin Chemists' Federation.
- (2) That its members embrace the wholesale chemists, pharmaceutical chemists, apothecaries, chemists and druggists, and registered druggists of Dublin and surrounding district.
- (3) That the object of the Federation be the consideration and furthering of all matters of trade interest.
- (4) That the Federation act in sympathy with the objects of the Proprietary Articles Trade Association.
- (5) That the annual subscription be 2s. 6d per member.
- (6) That general meetings of the members be held quarterly (the dates to be settled by the Committee).
- (7) Extra-ordinary general meetings may be summoned on the requisition of three members, or by the Committee.
- (8) That the officers consist of a President, Vice-President, Treasurer, Honorary Secretary, and eight members of a Committee, and that these office-bearers be elected at the October general meeting each year.
- (9) That new members be elected at any of the Committee meetings on their expressing a wish to join and paying the current year's subscription.
- (10) That the Honorary Secretary have power to convene a Committee meeting by circular at any time it appears necessary.
- (11) That five members form a quorum for a Committee meeting.
- (12) That at all meetings the Chairman have a casting vote in case of a tie.

—The CHAIRMAN said that in November of last year, when Mr. Glyn-Jones came over to Dublin, a meeting of the trade was held in the Hibernian Hotel, and after discussing the aims and objects of the P.A.T.A., Mr. Glyn-Jones asked them to try and form

A TRADE PROTECTION SOCIETY

as a standing memorial of his visit. He (the speaker) was appointed convener. The object of similar institutions in England seemed to be for festive and literary gatherings, but it was felt that the Dublin Federation would be doing

better if it confined itself to trade matters. It was the matter of trade pure and simple that interested the members at the present time, and he thought that the formation of the Dublin Society would help to strengthen the hands of their friends of the P.A.T.A. in England. In stating that their object was purely a trade one, discretion, of course, would have to be used as to what matters would be included in these terms.—Mr. SMALLMAN said the wording of Rule 3 was sufficiently elastic to suit their purpose.—Mr. HARDY concurred, and said it was desirable to steer clear of the discussion of pharmaceutical politics.—Dr. WALSH said that with regard to membership it would not, in his opinion, be necessary for members of the Dublin Federation to belong necessarily to the parent association, the P.A.T.A. He wanted to get in the new members locally at first, and then if later on they wished to join the Central Association they would be at liberty to do so, but if there was any objection to joining the latter it would in no way interfere with local membership.—In reply to Mr. Hardy, the PRESIDENT said that every chemist was bound by the rules of the P.A.T.A., whether he liked it or not. If a chemist would not join the Federation, and insisted on underselling his goods, the source of the supply would soon be dried up.—Mr. HARDY observed that the intention had been to regard the Federation as the auxiliary of the P.A.T.A. He would like to know the President's mind in respect of the term "auxiliary."—Dr. WALSH explained his feeling in the matter. There was a price-list which was sent to every one in the trade. They would approach manufacturers whose names did not already appear in the list and ask them to insert therein

A LIST OF THE MINIMUM PRICES

at which their goods might be retailed, and if the Association became eventually so strong, it would bring the necessary pressure to bear on the manufacturers generally, with the result that all articles sold by chemists would be duly scheduled on the P.A.T.A. list. As the mouthpiece of a number of chemists, the Federation would get much greater attention than if the question were raised by an individual, however important he might be.—Mr. SMALLMAN: In point of fact it would show them that it would be to their own interest to meet the views of the Federation.—The PRESIDENT said he had purposely omitted from the rules any mention of place and date of meeting, and for the present these particulars could be inserted on the circular convening the meetings. So far as he could judge by inquiry, he found that the second Wednesday in each quarter would be the most suitable for all parties.—In reply to a question by Mr. WHITE, as to whether the meetings would be held in the daytime or in the evening, Dr. WALSH said evening meetings were more satisfactory, as, the work of the day being over, one's whole attention could be given to the meeting without the desire to perhaps rush the business and get back to the shop or office.—Attention was called by Dr. O'SULLIVAN to the vacancy for a vice-president, and the mode of procedure to be followed in making the selection was the subject of some discussion.—The PRESIDENT said the usual way was to send out ballot papers, but in the present instance there was not, he thought, any necessity for so doing.—On the motion of Mr. HARDY, Mr. Samuel P. Boyd, M.A., was unanimously elected vice-president *in absentia*.—Mr. WHITE asked, was it to be understood that the Federation would be bound by any decision a quorum of the Committee might arrive at?—The PRESIDENT answered Yes, within the bounds of reason.—It was resolved, on the motion of Dr. McWALTER, seconded by Mr. WHITE:—

That the members of the Federation bind themselves to push the sale of articles on the P.A.T.A. list, rather than those not appearing thereon.

A copy of this resolution was directed to be sent to a number of wholesale houses named.—A vote of thanks to the Pharmaceutical Society of Ireland for the use of its room was then carried with applause, and the proceedings terminated.

IODOHÆMOL.—This combination of hæmoglobin and iodine contains 16.6 per cent. of iodine, for the most part in the form of a definite chemical compound. It has the same therapeutic action as potassium iodide, to which, however, it is preferable, since it liberates its iodine less rapidly, does not derange the digestion, and is more readily absorbed. It is given in the form of pills thus: Iodohæmol, 10 grammes; sugar, 90 grammes; to make 100. [As these pills contain each 1 gramme of material they are at least three times larger than the largest usually prescribed in this country, a cachet would be a preferable means of administering them.—ED. P. J.]—*Rev. Med. Pharm.*, iv., 261, after *Med. Mod.*

NORTH-EAST LANCASHIRE CHEMISTS' ASSOCIATION.

A special general meeting of the members of this Association was held on Tuesday night at the White Bull Hotel, Blackburn, to receive a report from the delegates to the annual meeting of the Federation of Local Associations, and to discuss resolutions demanding more vigorous action by the Pharmaceutical Council, and discussing the questions of "company pharmacy" and unqualified practitioners. Mr. Councillor CRICKLEY (Blackburn) presided, and there was a good attendance.—Mr. HOLT, who with Mr. Shorrocks represented the Association at the Belfast meeting, presented a long report as to the impressions and ideas gained at the Conference. The first was the imperative necessity for every chemist in the kingdom to support the Pharmaceutical Society, and to join a local association. In legislative matters the Society was forced to admit that it represented only a miserable minority of the trade. Much more unfortunate than the apathy of the Society was the apathy of the chemists of the country, although they did not think that the Society had done all it might have done even with its limited membership; nor did they think that the recently amended Pharmacy Act would lead to any important increase of membership, because it was such a small thing. Among matters requiring attention was the so-called "Widows' Clause" of the Pharmacy Act, which allows trustees of deceased chemists to carry on business. It followed that if trustees could carry on business with no qualification themselves any outsider could do the same. Then as to trading companies, they did not know who the proprietors were, or whether they were qualified or not. Every director of such a company should be a qualified man and have his name on signs and labels. It was necessary to appeal to the qualified chemists who prostituted themselves by acting as cover to limited companies. If they were not amenable to reason they must urge upon the Pharmaceutical Society the necessity of acquiring power—if it had not it already—to

ERASE THE NAMES OF SUCH MEN FROM THE REGISTER.

They had been given to understand that the Pharmaceutical Society was prepared to take action for the curtailment of the privileges of these illegitimate companies if the local associations would agree upon some feasible plan. In conclusion, he appealed to the rank and file of the Association to take a deeper interest in the work of the Association than they had done recently. They had a capital Executive, whose report at the annual meeting would show that they had done "good business" during the year.—Mr. SHORROCK also reported on the Federation meeting. He remarked that he was impressed with the miserably disorganised condition of the trade, or what ought to be called a profession. They had been hoodwinked by an incomplete Act of Parliament, promoted by a body of men whom they erroneously thought were watching over their interests. If they were to fight the great battle of company trading, the Pharmaceutical Society would need more—and many more—members. It had been attacked for not doing its duty, but they must not forget to blame themselves as the rank and file. He personally believed that the Society had done a lot more work than had been made known, but he hoped in future they would hear more of the doings of the Society and of its intentions. One way of getting that information would be to write asking members of the Council to attend the meetings of the Association. As for the so-called "Widows' Clause," that was the gate by which companies entered the trade, but it would be very hard to disqualify a widow with a qualified assistant. As to the qualified chemists engaged with companies, he believed the Pharmaceutical Society could settle the matter itself by disqualifying such men by erasing their names from the Register. If the Society could not do this, he did not think that Parliament would do it for them. He suggested that the Dental and Medical Societies should be asked to help them with the matter. The dental people, he thought, would agree, but he was not quite certain that the medical men were altogether in their favour. Still, he thought if the chemists' case was fairly represented to Parliament and the public, they would obtain the protection they desired.

THE PHARMACEUTICAL COUNCIL AND LEGISLATION.

—Mr. LOMAX (Darwen) moved—

That all local associations be urged to unite in demanding more vigorous action by the Pharmaceutical Council, more information of its intentions, and that these be persistently pressed forward to legislation, and that they invite the assistance and co-operation of the Medical Council.

He could not believe that any professional man would deal with

companies if they only understood the matter properly.—Mr. BROWN (Burnley), who seconded the motion, said a very necessary first step was for chemists to put their own houses in order. Many chemists promoted their errand boys into assistants, and when those young men grew up the only opening left to them was in the companies. He regretted very much that in his own town the Association was so badly supported. There ought to be at least thirty members instead of half-a-dozen.—Mr. HAWORTH (Blackburn) also supported the motion, and suggested that Mr. Brown should be sent as a delegate to Burnley, to bring the chemists into the Association. He thought that if chemists properly backed up the Pharmaceutical Society they would find that that body was by no means moribund. The resolution was carried unanimously.

COMPANY PHARMACY.

Mr. W. WELLS (Blackburn) proposed the following resolution :

This meeting appeals to all chemists in the United Kingdom to discuss the question of "company pharmacy," recognising qualified companies (in such cases urging the proprietors to use their names on labels, etc.), and to pass resolutions declaring that all unqualified practice of pharmacy, either collectively or singly, should be illegal.

In this question he thought chemists had a real grievance. The time was opportune for a supreme effort to remove it. Coroners and members of Parliament had declared that the condition of things was entirely unsatisfactory, and it lay with local associations to instruct the Pharmaceutical Society how it was to be remedied.—Mr. H. HINDLE (Blackburn) seconded the resolution. He urged that "one man one shop," should be aimed at, and if they only put down children's teething powders they would do good.—Mr. JOSEPH HINDLE (Blackburn) supported. It seemed a pity to him that the so-called "Widows' Clause" should have to go, but if they wanted to get rid of company pharmacy it was inevitable. Some speakers had expressed the opinion that they might expect help from the doctors, but he did not think the medical profession had much sympathy with their trade or their aims.—Mr. BROWN thought the indifference of doctors on this point was confined to Lancashire and East Lancashire principally.—The motion was agreed to *nem. con.*

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.

The first general meeting of the session was held at the County Restaurant, on Tuesday, October 25, when the PRESIDENT, Mr. Waddington, delivered

The Annual Address.

After a few preliminary remarks upon the work and success of the Bradford Association he went on to speak of the Pharmaceutical legislation that had been promoted since the year 1802 up to the present time. After dealing with each Bill that had been brought before Parliament, he went on to say that they were constantly told that the Pharmaceutical Society has done nothing, but these instances showed that it has been constantly fighting since the year 1841, and to some extent successfully. It was more easy to prevent bad than to pass good legislation. Ten thousand chemists could make themselves felt as a power in the land, and all should now join and help to shape the legislation of the future, and not stand aloof and criticise men who are devoting time and money to their interest. The legislation of the future must be demanded because education, abilities, and requirements of individuals are increased, and demands greater privileges in order to induce them to take up the business. All legislation in the past has been for the benefit of the public and not for the trade, and if chemists wish anything for the future they must see that the public share the benefit with them, or they would have no chance of obtaining it. Mr. Waddington went on to say that their privileges are as follows:—A title, the sale of poisons on Schedule, and pharmaceutical chemists free from jury service. In his opinion their requirements were increase of Poison Schedule, chemists and druggists to be made equal to pharmaceutical chemists in regard to jury service, the making of company pharmacy illegal, branch shops without qualified managers to be made illegal, and that chemists should have the sole right to dispense doctors' prescriptions. After a few remarks on the Patent Medicines Stamp Act, Mr. Waddington concluded a very interesting address, and after a short debate the meeting terminated.

LETTERS TO THE EDITOR.

All Communications for the 'Pharmaceutical Journal' must be Addressed to the Editor, 17, Bloomsbury Square, London, W.C., and not in any case to individuals supposed to be connected with the Editorial Staff; no responsibility can be accepted unless this rule be observed. Communications for the Current Week's Journal should reach the Office not later than Wednesday, but news can be Received by Telegraph until 4 p.m. on Thursday.

LOYALTY TO THE CRAFT.

Sir,—I have to thank your correspondent "C. P." for his magnanimous admission that company trading is a "wrong principle," for "consciousness of guilt" is said to be "halfway to repentance," and there might have been hope even for "C. P.," who, however, hastens to demonstrate that his is no ordinary case. Well, the habitual inebriate will agree in a general sort of way that sobriety is a fairly good thing. The convicted thief will usually concede that honesty is perhaps the correct policy, criminals of every type have a hazy indefinite notion of what is right and proper, but with them, as with "C. P.," virtues are abstract quantities, only to be entertained when it involves strain on pockets (in particular) or on conscience. Under these circumstances it would be unwise to attach any value to "admissions" that cost nothing. There is nothing of the martyr about "C. P." He is not going to burn at the stake if the sacrifice of a little principle will save him; rather would he fiddle with Nero whilst Rome is consuming. It would be interesting to know why your correspondent's efforts in business on his own account resulted in such disaster. Was he killed by some neighbouring store; was he "out-pharmaced" by his legitimate competitors, or was he the victim of his own incapacity, and did the public find him out? Evidently his friends were not prepared for any further experiments in money-lending, nor do the historic houses seem to have been anxious to regain their lost sheep. Why? Your correspondent coolly tells us that he was asked to occupy living rooms only 4 feet square, and assures us that he could multiply instances of this kind, a remark I am not going to dispute; this one will suffice, I think. Human credulity will stand a good deal, but these *bonâ-fide* statements of "C.P." are a little exacting, surely. Further, his remarks about hours and salaries do not accord with my own and my friends' experience. I know several assistants in this district who are paid £200 per annum, or more. I also know that it is exceedingly difficult to get a really competent and experienced senior for less, and such a person has no need to take less; further, he is in a position to dictate terms as regards hours, no good man need be overworked, and I repeat that the well-qualified, able assistants are masters of the situation; with them rests the future of pharmacy and the whole question of salaries and hours. The fact is, Mr. Editor, in "C. P." we have a sample of the modern store assistant. Incompetent to conduct successfully a pharmacy on his own account, probably married before even qualifying, or at any rate, as in this instance, before being fairly established in business—a preposterous procedure—he finds himself hard pressed and heavily handicapped, and is ultimately "forced to find refuge and a living with the stores," who cannot pick and choose, but must needs have him—a perfectly natural gravitation to a lower level. I quite agree that "the case only wants plainly stating, and it is obvious (very) on which side the truth lies" (I make "C.P." a present of that admission). In conclusion, may I suggest that "C.P." should append his name to his communications, as anonymous letters are seldom worth answering, and are never quite fair. Stone breaking he objects to, let him also forswear stone throwing, especially as practised from behind a wall.

Warrington, October 24, 1898.

J. RYMER YOUNG.

Sir,—Admitting the truth of your correspondent's (C. P., 148/8) remarks in his letter, I feel it due to Mr. Young that your correspondent should have it pointed out that the address was delivered to students, not to those who had been in the business for years and had known where they failed to reach the goal of success. There is no doubt that in the past chemists have treated their assistants unfairly as to pay and hours, and I think by now they have learnt a salutary lesson in that direction, since they offer better terms; and I would hope that for the coming time the

students will ponder well the words of wisdom uttered by Mr. Young and set store by them. If after the report of the last Minor examination those who have passed do not set some value on their qualification they ought, and be above encouraging a system to their utter discomfiture. The number of failures (200), if they were traced I wonder where they would be found? If the spirit of the Pharmacy Act had been carried out and due consideration been paid to the wants of assistants by employers, I do not think that the trade would have been in the hopeless helpless muddle it is in to-day. Selfishness on all hands has proved the ruin.

Torquay, October 21, 1898.

W. J. RAWLING.

Sir,—Had the drug companies not been supplied with qualified assistants for the last twenty-five years, it is quite possible C. P. would have succeeded in getting a living and perhaps handed down an historic business. Our forefathers saw qualification was the best aid to progress. Let the present generation look ahead and act.

October 22, 1898.

G. W. (148/34).

THE DIVISION OF THE MINOR AND MAJOR EXAMINATIONS.

Sir,—There seems to be a growing desire for a division of the Minor examination. There is a division at present—candidates being brought up for examination two or three times at intervals of a week or more. Why these intervals should not be extended to three or six months with beneficial results has not yet been shown. An examination in practical chemistry, botany, and dispensing following a theoretical one in these and other subjects at intervals of not less than six months would go far to abolish the cram system, whereby a candidate is made to contain a headful of badly assorted facts. As the standard of pharmaceutical education is soon to be raised it is important that the Society should provide for a graduated progressive course of study. A splitting up of the Minor exam. would be the best means towards this end. A three years' curriculum, advocated by "Scriven" in your issue of 22nd inst., may be desirable, but it is not practicable at present. Pharmacy could not bear such a strain; besides, "Scriven" does not show how such a curriculum would benefit the trade. If a curriculum would enable the average pharmacist to hold his own with the stores, let us have it to-morrow. But what are the facts of history? Examinations have been made harder and more expensive, and what are the results? One of the results is that the stores are flourishing more and more. They are outbidding the respectable pharmacists in the market of qualified labour. Have assistants diminished in number? If so, the stores are still able to procure the best for the best price. With a curriculum would assistants be likely to set aside such considerations as the shorter hours and larger salaries of the stores for the sake of the dignity and future prospects offered by respectable pharmacists? I am afraid not. Parliament for years to come, if ever, is not likely to deal in a satisfactory manner with the store question. But its solution is simple and in our own hands. Qualified assistants may form a union, fix reasonable hours and salaries, and refuse to qualify the stores, and this method I commend to their consideration.

Edinburgh, October 24, 1898.

W. S. GLASS.

Sir,—“Scriven” in your last issue suggests a compulsory three years' curriculum in order to raise the standard of a qualified pharmacist, as it would exclude many of limited means who to-day are able to enter the trade and pass the examinations. Surely there is no greater error than in the supposition that men of limited means tend to lower the standard of a trade of which they are members, and that money rather than brains should be necessary in order to enter the trade? Are we also in such a state of panic because of company trading that we must raise up an arbitrary and unnecessarily severe standard of examination in order to keep down the numbers of qualified men? Qualified men would no doubt become scarcer, but masters would begin to complain of the difficulty of obtaining assistants, and would cry out for the modification or abolition of the curriculum. A three years' curriculum would most assuredly do away with the present system of apprenticeship, and the qualified man would no longer have a previous practical acquaintance with the routine of a pharmacy. He would be over-educated and too full of theories to be of much use for the general work of a shop. But supposing a three years' curriculum be made compulsory, what is there in the trade or profession of a chemist to entice men to spend so much time and

money in acquiring the necessary qualifications? The standard of a profession or trade cannot be raised by such unnatural means.

London, October 24, 1898.

L. (149/13).

Sir,—I entirely fail to see how the division of the Minor, as advocated by "Scriven," would benefit the craft. Considering that many pass it as now constituted, with but six months' coaching in a good school, a man of very ordinary mental capacity would be successful, taking, say, two subjects per year, provided he had the necessary cash for a three years' curriculum, even if the knowledge required of the subjects be made more thorough than at present; this, I believe, would not raise but lower the standing of the pharmacist, for money does not necessarily mean brains in the vast majority of instances. Having a very shrewd idea as to the identity of "Scriven," I can well understand why he proposes this scheme. Is it not because, after two sessions at the "Square," he still remains one of the "great unqualified," and herein lies his sole hope of ever becoming a chemist and druggist? I am entirely in favour of a compulsory curriculum, but save us from piece-mealing the Minor for the benefit of incompetent would-be pharmacists.

October 21, 1898.

EX-SQUARE MAN (148/23).

THE NEW TEXT-BOOK OF PRACTICAL PHARMACY.

Sir,—As I hope that Lucas's 'Practical Pharmacy,' coupled with the "Students' Pages" of the Journal, will pilot me safely through the intricacies of the 1898 Pharmacopœia, I welcome all aid in the shape of the necessary criticism of a first edition. In addition to those mentioned in last week's Journal, I would like to point out to those in possession of copies of the work a few other rather misleading statements and omissions. On page 143, line 14, the word "liquid" might be inserted before "extracts"; in line 18, an asterisk is missing, and the word "soft" might read "firm"; line 20, "soft" might read "firm"; line 21, the word "powder" or the words "and powdered" might be added after "dried"; line 27, "soft" might read "firm"; line 28, "soft" might read "firm"; line 35, the "55°·4 C." might read "54°·4 C." On page 144, line 2, "firm" might read "soft"; line 11, "firm" might read "soft." Of course any one reading the Pharmacopœia side by side with the new 'Practical Pharmacy,' would at once become aware of these and possibly other necessary corrections. Trusting the latter will soon come to light.

London, October 22, 1898.

WM. C. SPOONER.

Sir,—I think with you that Lucas's 'Pharmacy' contains much useful information, but yet it might have been better corrected, and for the sake of students who may have purchased the book I send notes on a few points that have struck me in perusing it. Page 89, Fig. 100: The valve is on the wrong glass tube in the illustration, although correctly described in the text. Page 174: In the formula for syr. ferri iod., glucose, a sufficiency, is rather indefinite. Page 241: Carbolic gauze with 10 per cent. will only contain about 6 per cent. In addition boric wool, salicylic gauze, boric gauze, although described as 10 per cent., will only contain about 9 per cent. The chapter on granules is not elaborate, information on sterilisation is lacking, and the section on dispensing is sadly deficient from a practical point of view. Page 249: Under ferri quin. cit. the author says dissolve the iron hydroxide and quinine in the citric acid solution, and add ammonia little by little, so as to allow the quinine to re-dissolve in excess of the reagent, but the reagent is never in excess, inasmuch as the finished product is slightly acid. Page 279: He says that mixtures less than 6 ozs. are generally sent out in white glass vials. This is certainly not the rule; less than 3 ozs. would be correct. I do not quite agree with his idea of dispensing bottles, but should say mixtures in green flint flats or ovals, gargles and spray solutions for throat or nose in squares, lotions and liniments for external use in dark-coloured fluted bottles, hexagons or octagons. I might refer to many other deficiencies of the book, but the few I have specified, added to those so discreetly singled out in your review, suffice to show that students using the book must be prepared to criticise as they read.

October 24, 1898.

PHARMACIST (149/21).

THE CHEMISTS' ASSISTANTS' UNION.

Sir,—Kindly allow me, through the medium of your columns, to call the attention of your readers to the C.A.U., as I think it is time there should be some expression of our views through the Society's official organ. The Union is certainly as yet in its

infancy, and, shall I say, in its days of adversity; its moral success, however, is undoubtedly assured, and although it may seem a small beginning, we confidently predict for it a great end. I think that the objects of the Union ought to commend themselves to all the thoughtful members of the trade, employers and employed, based as they are on the principles so forcibly advocated by Mr. Rymer Young, and emphasised in your columns, viz., "Loyalty to the Craft." The difficulties that present themselves in the trade at the present day call for immediate and united action, and we propose banding ourselves together and presenting an unbroken line to fight the common enemy. How some of our brethren can stand unconcerned and look at the sweeping currents which are so disastrous to our mutual interests I cannot understand. To define a policy within the limits of these few lines would be impossible, and in reply to the many inquiries as to "what we are going to do," we can only say that we are most anxious to do all we can for the promotion of our general welfare, but without combination and unity we can do nothing. We therefore ask employers to give us a little encouragement, by sending an expression of their appreciation of our efforts in the direction of minimising existing evils to our mutual advantage. We also respectfully solicit their patronage in a more substantial form—patrons' subscriptions being 10s. 6d. Prominent members of the medical profession have expressed their views strongly in our favour, and Mr. H. Dutch, L.R.C.P., Berkeley Square, has kindly led the way with a subscription of 10s. 6d. A pharmaceutical chemist whose name I will withhold at present has followed suit unsolicited, strongly expressing his approval of our objects. It will be a great encouragement for us to have as many more as possible, as we want to make the Union a financial as well as moral success. Further, we ask employers to assist us by arranging for their assistants to attend our meetings (which are announced from time to time), and those in the provinces to point out to their employés the advantages of such an organisation. By waiting to see whether the Union "will prove a success," and "what we are going to do" we cannot possibly expect to do anything, but if every assistant will make it his own personal duty to join and thereby help to make it a success, we may be able to accomplish a great deal. It is highly probable that we who are taking active steps in the matter will, in the long run, get more kicks than thanks for our efforts, and we should recognise the fact that the five shilling subscription should for the present be sacrificed for the principles at stake. We, however, challenge anyone to deny but that we are actuated by the best of motives for the protection of the honour and best interests of legitimate pharmacy.

Chemists' Assistants' Union, Tottenham
Court Road, W., October 24, 1898.

H. LLOYD,
Hon. Secretary.

VINUM QUININÆ, B.P. 1898.

Sir,—I have been able to examine a deposit found in a 54-gallon batch of the above preparation, and there is no doubt from my experiments that the complaints already recorded are well founded. It does yield a deposit in cold weather. The sediment I received dissolved in diluted HNO₃ and did not respond to sulphate nor chloride, and on further examination was found to be citrate. The intention of the authorities was to introduce a very soluble quinine salt, as in the tinctura quininæ, but then tinctura aurantii is not vinum aurantii, and the citric acid present reacts to produce citrate of quinine, which is precipitated.

Birmingham, October 24, 1898.

F. H. ALCOCK.

VISUAL OPTICS IN THEORY AND PRACTICE.

Sir,—I was somewhat surprised, as one engaged in retail houses where large quantities of visual aids are supplied, to read the article in your last issue upon visual optics in theory and practice. Mr. Laurance's dismal and plaintive remarks insinuate there is difficulty for persons suffering with defective vision getting competent attention from the present knowledge of opticians. He having made the suggestion, perhaps he will be good enough to give the districts where he has gained the impression. I think it will be found he is confounding the trade with the numerous hawker "opticians," whose methods are now well known to the public. His extraordinary assertion that 90 cent. of the glasses in use are haphazardly supplied is easily refuted when it is considered that probably more than 60 per cent. of the glasses in use are supplied to ophthalmic surgeons and hospital directors, who take care, as the trade know, their orders are faithfully carried through, and at very moderate prices. Mr. Laurance's general

remarks being of a purely commonplace nature it does not seem necessary to waste your valuable space in discussing them. but I should like to be allowed to reply to "reasons" B and C, as they seem worthy of attention. B reminds me of the constant wearisome visits of the Hebrew representative of the wholesale vendors, who always puts this forward, calling attention to his sight-testing appliance and circulars, which stated his special crystal lenses prolonged vision, but always pointed out the measure of success depended upon the amount of stock purchased. C, This appears very ungrateful to ophthalmic professors and qualified science writers and teachers who have taught the subject for years, and I should not think the Spectacle Makers' Company will feel proud of their instructor's literary effort when it is found their whole syllabus is based upon text-books of those who have made visual optics the exact science it now is. I only trouble you in the matter because it seems to me that Mr. Laurance's remarks cast a slur upon chemists who have devoted much attention and care to fitting spectacles, and have met with success in every district in London and provincial towns.

London, October 24, 1898.

D. JONES.

PRESCRIBING UP-TO-DATE.

Sir,—The following is a copy of one of our lady doctor's prescriptions:—

R̄ Ferri Sulph.	gr. 1
Strychn. Sulph.	gr. 1/4
Ext. Nucis Vomicae.....	4.

S. : One thrice daily after food.

Oppenheimer Bipalatinoid.

If dispensed, say, in pill form, how many doses would the patient survive?

October 23, 1898.

J. A. F. (148/14).

RECTIFIED SPIRIT, B.P.

Sir,—With regard to Mr. Fletcher's letter of October 12, I should like to point out that reference to any reliable alcohol tables will at once make it clear that the statements concerning spiritus rectificatus in the 1885 Pharmacopœia were not concordant, inasmuch as a spirit containing 84 per cent. by weight of alcohol has a specific gravity of 0.8382. I believe the Excise authorities consider 0.8382 to be the specific gravity of 1885 rectified spirit. Expression of this fact may be found in the alcohol tables given by Allen in his 'Commercial Organic Analysis.' Seeing that spirit of this gravity contains 84 per cent. by weight of alcohol and 88.65 per cent. by volume, the differences given on page 311 of the new Pharmacopœia appear to be quite correct.

Manchester, October 24, 1898.

WILLIAM KIRKBY.

MEDICAGO SATIVA.

Sir,—I am much interested in the remarks of my friend Mr. Holmes. Curiously I never found this plant on any railway embankment near Plymouth, though in Jersey in the eighties I saw it plentifully by the line from St. Heliers to Orgueil Castle, but the habitat where *Medicago sativa* seems permanently located on the Hoe is on a steep declivity on the eastern side of its southern face, sheltered by a low wall to the north and growing luxuriantly in the angle formed by this wall and the edge of a small disused quarry or place where the rock is perpendicular and shelters a snug nook where trees grow. When in Plymouth from 1887 to 1890, I gathered it each year and had certainly obtained it there before, but whether before I left Plymouth for Ireland, in 1873, I could not say from memory. The 'Flora Devonensis,' of J. W. N. Keys, will have it if it then grew there, I sent him habitats for all rare plants I met with in S. Devon and Cornwall from 1858 to 1872, including, 1867, *Acanthus mollis*, naturalised and growing most luxuriantly in and around a former orchard at Rosenithon, near the Manacles, and two miles from Manaccan. The farmhouse and garden had disappeared for many years, and some of the inhabitants were curious to know what the strange plant was! They had asked their various ministers in vain. It grew most vigorously outside the bottom of the former orchard, on ground four feet lower, and the glorious spikes were five feet high. I carried a root and grew it in my garden, carrying it from place to place, and left two plants with my brother, A. P. Balkwill, in Plymouth; in 1887. The brush-like anthers of the didynamous stamens, the three-lobed white corolla bearing them, with its other portion cut away nearly to the bottom, i.e., two of the five coalescing petals abnormally deficient, the three beautiful bracts; two lateral lanceolate acuminate, the central one broadly ovate, scolloped, the veins

forming prominent teeth between, and the woody hook appendages of the placenta bearing the seeds with its wonderful leaves, from which Greek sculptors took the design for the capital of the Corinthian columns, make it peculiarly interesting. It had been known to grow wild there as long as they could remember. Some time after I saw it growing in a garden near Passage, on the River Fal, about four miles from Penryn, and I suppose that from that or some other garden these specimens and those on the Scilly Islands have been derived the seeds, possibly carried by birds.

Nottingham, October 25, 1898.

F. P. BALKWILL.

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the 'Pharmaceutical Journal' will be furnished by the Editor as far as practicable, but he cannot undertake to reply by post. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of senders. Questions on different subjects should be written on separate slips of paper, each of which must bear the sender's initials or pseudonym. Replies will, in all cases, be referred to such initials or pseudonyms, and the registered number added in each instance should be quoted in any subsequent communication on the same subject.

MINOR FEE.—Everyone who enters for examination for the first time, after July, 1900, must pay the ten-guinea examination and registration fee. [Reply to A. H. P.—18/14.]

MORPHINE SUPPOSITORIES.—Injurious effects may certainly follow their continued use, to say nothing of the risk of the individual acquiring the morphine habit. [Reply to HUGO.—18/7.]

BISMUTH.—Johnson, Matthey and Co., Hatton Garden, London, E.C., are smelters of bismuth. [Reply to B. S. and Co.—18/10.]

OPTICIAN.—We should strongly advise you to have a course of practical tuition. Communicate with Mr. Lionel Laurance, 1, Vernon Place, Bloomsbury Square, London, W.C., on the subject. [Reply to STRABISMUS.—18/15.]

SOLUBLE ESSENCE OF LEMON.—Lemon peel, cut fine, 10 ounces; rectified spirit, 20 fl. oz. Macerate fourteen days, strain, press, add terpenless oil, 1 drachm, and filter bright through powdered pumice stone. [Reply to GALEN.—15/34.]

PARAMECIUM AURELIA.—You will find an excellent account of the process of development in the latest edition, edited by Dallinger, of Carpenter's book on 'The Microscope and its Revelations,' pp. 710-711. The description is illustrated, and seems to accord generally with what you have observed. [Reply to HOLOZOON.—17/24.]

MINOR EXAMINATION.—(1) Candidates who have already presented themselves for examination and failed to pass will be required to pay a fee of three guineas only on any future occasion. (2) If you will refer to the printed regulations, as given in the last Students' Number of the Journal, you will find a list of plants which you may be called upon to recognise. [Reply to STUDENT.—18/1.]

BLUE BLACK INK.—Tannin, 200 grains; gallic acid, 50 grains; ferrous sulphate, 1 ounce; mucilage of acacia, $\frac{1}{2}$ fluid ounce; indigo carmine, 320 grains; carbolic acid, 10 minims; rain water to produce 16 fluid ounces. Dissolve the tannin and the gallic acid in one portion of water, the iron salt in another. Mix, dissolve the indigo carmine in the mixture, then add the mucilage and the phenol with sufficient rain water to make up the required volume. [Reply to H. C.—17/31.]

DUSTING POWDER.—The material sent contains 58 per cent. of silica and 28 per cent. of alumina, with a perceptible trace of iron oxide, and only a trace of magnesia. It is more of the nature of kaolin, with an excess of silica. In its present condition it is certainly not fine enough for dusting purposes, but it can readily be made into an impalpable powder by suitable grinding. When so ground it might serve as a dusting powder similar to Fullers' earth, although the most suitable earths for absorbent and emollient purposes are those in which magnesia is the predominant base. [Reply to W. J.—17/29.]

BOTANICAL.—It is a species of *Chara*, but it cannot be properly determined unless a sample of fruit is sent. [Reply to J. T.—18/5.]

BOOK ON HOME CHEMISTRY.—You will find the information you require in Harrison and Bailey's 'Chemistry for All,' published by Blackie and Son at 1s. 6d. [Reply to PAX VOBISCUM.—17/18.]

PRELIMINARY EXAMINATION.—A complete list was published in the Students' Number of the Journal, published on September 10 last (see page 308). [Reply to J. B. F.—18/12.]

BEASLEY'S 'FORMULARY.'—We understand that Messrs. J. and A. Churchill hope to publish the new edition—the twelfth—of this book, which has been thoroughly revised and brought up to date by Mr. J. Oldham Braithwaite, at the end of next month. [Reply to FORMULÆ.—18/35.]

SEIDLITZ POWDERS.—The term "seidlitz powder" is not given in the B.P. as a synonym for the official "effervescent tartarated soda powder," and it is not clear that there is such a thing as "Seidlitz Powder, B.P." In any case, there is nothing illegal in supplying powders containing more than the usual quantity of tartarated soda, so long as that fact is made clear to the purchaser. [Reply to E. H. W.—18/11.]

NON-ALCOHOLIC ALKALOIDAL TINCTURES.—You will probably find acetic acid to be a satisfactory solvent for the alkaloids in the drugs you name. It has been widely experimented with in America by such prominent pharmacists as Squibb and Remington. See *P. J.* [4] iv., 288, and vi., 131 and 409. The acidity need not in most cases be greater than that of dilute acetic acid. It is hardly correct, however, to call such preparations tinctures. Remington finds that valoid fluid extracts can be prepared from many alkaloidal drugs by the use of acetic acid as a menstruum. [Reply to SPES.—18/8.]

STANDARDISATION OF TINCTURE OF DIGITALIS.—In the present state of chemical and therapeutic knowledge with regard to the digitalis glucosides the value of many of the processes for assaying the leaves is open to question. Since, too, those bodies are present in such small quantities in the tincture, it is preferable to make this from standardised leaves, rather than to attempt to standardise the tincture. Every pharmacist should collect and dry his own digitalis leaves, renewing the stock each year. Those so obtained are generally much more active than the dried leaves of commerce. See *P. J.* [4], v., 62, 283. [Reply to SPES.—18/8.]

SPECIFIC GRAVITY WITH HYDROMETERS.—The "general rule" you ask for is to have the liquid at exactly 60° F. when reading the hydrometer. The different liquids you name, pharmaceutical tinctures, syrups, liquors, etc., vary so greatly in their co-efficients for expansion that there is no rule applicable to all. Of course, with such definite mixtures as alcohol and water, or sugar and water, these co-efficients have been worked out and tables constructed, but these are only applicable to the particular substances to which they relate. It is failing to carefully adjust the temperature to the right degree that often causes discrepancies between the sp. gr. observed on the hydrometer and that obtained by weighing. With a good series of correctly graduated hydrometers it is easy to read specific gravities correctly to the third decimal, and that is generally sufficient for all practical purposes. [Reply to STUDENT.—18/9]

ICE CREAM AND FRUIT ICES.—The basis for this may be made as follows: New milk, 3 pints; best condensed milk, 1 tin; the yolk of 4 eggs. Mix and heat gently to make a custard, then cool and freeze in the usual manner. Flavour with vanilla, orange, lemon, or almond. If you want a specially rich ice cream, use instead of above milk, two pints of raw cream, one pint of new milk. Fruit ices may be made by using fruit jams with the above, and pulping through a sieve before freezing. Preserved pineapples in tins, cut into small pieces and bruised in a mortar, will be found very good. When jams are used the juice of one lemon should be added for every pound of preserve used. A round 7 lb. tin surrounded by alternate layers of ice and salt makes a very good extempore freezer. As the mixture freezes it should be worked down from the sides of the tin with a wooden spoon or spatula, so as to make the mass of uniform consistence. The tin should be whirled round for several minutes at a time to expedite freezing. [Reply to A. W. H.—18/4.]

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

- 4 NOV 98

The following general method is that employed by Adrian and Trillat for the preparation of organic glycerophosphates:—A solution of neutral calcium glycerophosphate is

treated with dilute sulphuric acid until it gives an acid reaction with helianthin; it is then again neutralised with a few drops of the neutral calcium salt. The solution is warmed to throw out the calcium sulphate, and after filtration the alkaloidal base is added in ethereal solution, followed by a large excess of alcohol. This is heated for some minutes and filtered to remove the precipitated calcium glycerophosphate; the filtrate is concentrated at the lowest possible temperature, the residue dried *in vacuo* over sulphuric acid. It is then treated with water and the aqueous solution washed out several times with ether to remove any free base. After this it is again evaporated, and the residue triturated with several successive portions of strong alcohol. The alcoholic solutions are filtered and dried between 50 and 60°. Strong bases such as quinine and cocaine are alone capable of completely replacing the lime in the glycerophosphates. Weaker bases, such as aniline, phenyl-hydrazine, etc., appear to form double salts with the lime compound.—*Nouv. Rem.*, xiv., 434.

The following process of A. Wroblewski, for the preparation of pure diastase is based on the fact that diastase is insoluble in alcohol above 65 per cent., but is dissolved in that below 50 per cent. 3000 grammes of finely crushed malt are macerated for a day with 6 litres of alcohol, 68 per cent. The residue, after strong expression, is again macerated in the same quantity of 45 per cent. alcohol, for twenty-four hours. The liquid is strained, the mass pressed and again macerated in the same menstruum. After again decanting and pressing, the two liquids are mixed, and sufficient alcohol (96 per cent.) added to them, to bring up the alcoholic strength of the mixture to 70 per cent. This is set aside for a day to allow the precipitate to settle; it is then collected, first washed with alcohol, 70 per cent., then dissolved by trituration with 6 litres of alcohol, 45 per cent., filtered and precipitated by the addition of strong alcohol, as before. The precipitate is now dissolved in the smallest possible quantity of water and again thrown down, by the addition of magnesium sulphate to saturation; the precipitate is collected, washed with a small quantity of saturated magnesium sulphate solution, redissolved in the smallest possible quantity of water, and dialysed. The yield of pure diastase is about 2.82 grammes from 3 kilos. of malt.—*Jour. Ph. Chim.* [6], viii., 316.

M. Kubli states that the official test of the German Pharmacopœia for the presence of sodium mon carbonate in sodium bicarbonate is not sufficiently delicate to show 2 per cent. of the impurity. For the indication of alkalinity by means of phenolphthalein in this test, the author substitutes a solution of quinine hydrochloride (0.4 gm. to 100 C.c.). A 6 per cent. solution of the salt is prepared without heat, and is added to an equal volume of the quinine hydrochloride solution. If the bicarbonate is pure no immediate and permanent turbidity is produced. On standing, a cloud appears on the surface of the liquid, due to formation of mon carbonate. If 2 per cent. of that impurity be present, a distinct permanent turbidity is obtained at once.—*Archiv der Pharm.*, 236, 321.

A new combination of tungsten and iodine, the tetra-iodide, WI_4 , has been obtained by E. Defacqz by heating tungsten hexachloride with excess of hydriodic acid to 110° C. On removing the hydrochloric acid formed, and the excess of hydriodic acid, after reaction has ceased, and heating the residue thus obtained *in vacuo* to between 50° and 60° C. until iodine ceases to be liberated, a black crystalline body is obtained, which is the tetra-iodide.—*Comptes rendus*, cxxvii., 511.

A. Wroblewski employs the following method for the preparation of soluble starch. One hundred grammes of rice starch is triturated with a 2 per cent. solution of caustic potash, so as to obtain a fluid mass. This is left for several hours, with occasional agitation. The volume is then gradually made up to 600 or 800 C.c., with more potash solution. The mixture is heated on the water bath until the mass becomes perfectly fluid; it is then boiled on a naked flame for twenty or thirty minutes, filtered, made strongly acid by the addition of acetic acid, and precipitated with an equal volume of 95 per cent. alcohol. The precipitate thus obtained is purified by re-solution and re-precipitation, once with 95 per cent. alcohol and finally with absolute alcohol. It is then washed with alcohol and ether, and dried *in vacuo*. The yield is between 50 and 60 per cent. of the starch employed. Its solubility in water is from 3 to 4 in 100.—*Jour. Ph. Chim.* [6], viii., 314.

When pure crystalline metallic calcium is heated to dull redness in an atmosphere of nitrogen it combines with that gas with incandescence, forming the nitride Ca_3N_2 . H. Moissan, who has lately prepared this compound, states that when the combination takes place at about 1200° C. the nitride is obtained in minute brown crystals. With absolute alcohol the nitride forms calcium ethylate and ammonia,

$$6C_2H_5HO + Ca_3N_2 = 3(C_2H_5O)_2Ca + 2NH_3,$$

and when treated with water it evolves large volumes of ammonia, and forms calcium hydrate, thus— $Ca_3N_2 + 6H_2O = 2NH_3 + 3Ca(OH)_2$.—*Comptes rendus*, cxxvii., 497.

Liebermann (*Chem. Centralblat.*) again issues a note of warning with regard to the alkaline reaction given by certain glass apparatus. Delicate vegetable colouring agents, such as alizarin and brazilin kept in vessels of this glass would be spoiled, and water boiled in such vessels has a markedly alkaline reaction. The apparatus is elegant in appearance, has a high finish, and does not easily crack.—*Pharm. Zeit.*, xliii., 660.

According to a recently published patent, iso-eugenol may be obtained quantitatively from the acid eugenol phosphoric ester,

which is obtained by heating eugenol with phosphorous oxychloride, and removing the chlorine in the combination

by treatment with water. If this eugenol phosphoric ester be saponified with alcoholic potash, or if its alkaline salts be merely heated to 150 C., the eugenol is converted into iso-eugenol. Iso-eugenol phosphoric ester crystallises with one molecule of water, in which form it melts at 105° to 106° C. The anhydrous acid melts at 133° C.—*Chem. Zeit.* xxii., 714.

IODINE IN THYROID GLANDS.

BY R. S. SWINTON.

The suggestions for the testing of thyroid gland by its indication for iodine, as referred to by Dr. McWalter (*P. J.* [4], vii., 159), at the meeting of the British Pharmaceutical Conference at Belfast, as well as the subsequent correspondence on the subject (*P. J.* [4], vii., 259, 279), and the introduction of several organic compounds of iodine standardised to their iodine value, appears to indicate that there is an impression that the activity of thyroid preparations is proportionate to the amount of iodine in organic combination that they contain.

It seemed, therefore, of sufficient interest to determine the iodine content of well-selected thyroid glands as well as the relative solvent powers of water and the mixed solvent official in the B.P., 1898, especially as Stanford has reported in his paper on "Thyroidin" (*P. J.* [4], vii., 166) that glycerin extraction does not dissolve out the thyroidin.

The first step was to determine the percentage of iodine in the gland itself, adopting the following process:—

Twenty-five fresh glands weighing 104 grammes, finely cut up, were impregnated with a solution containing 0.5 per cent. NaHCO_3 and 0.5 per cent. KNO_3 and then completely charred. The charred mass was now repeatedly exhausted with water and filtered, the filtrate evaporated to 15 C.c., allowed to cool and mixed in separator with 7.5 C.c. concentrated sulphuric acid, the separator meanwhile being kept cool by allowing a stream of cold water to flow over it. The mixture was now thoroughly agitated with 5 C.c. phenol (90 per cent.) then with 25 C.c. saturated bromine water, the separated iodine being removed by repeated agitation with chloroform, the phenol-bromine treatment being repeated till no more iodine separated. The chloroform-iodine solution was now bulked, covered with a layer of water and titrated against N/10 thiosulphate of sodium.

The mean of three determinations of different lots of glands was found to equal 0.0295 per cent. iodine, the different lots varying from 0.028 to 0.031 per cent., thus agreeing with the results obtained by various investigators, who give 0.03 per cent. as the proportion of iodine in the fresh gland.

The amount of iodine in the extract, made according to the British Pharmacopœia directions, was now determined by the same process, and it was found that the iodine equalled 0.0293 per cent., calculated on the fresh glands, thus proving that practically all the organic iodine compound is present in the B.P. extract, this result seemingly contradicting Stanford's statement.

In order to ascertain the proportion of iodine extracted by water, which has been stated to extract only the "iodo-globulin," and not the iodo-thyrin, the same number of glands were now extracted by allowing them to macerate for three days in 200 C.c. cold water. The filtrate from this was evaporated, and, when examined, found to equal 0.0285 gramme iodine, no iodine being found in the residue, so that it seems that an aqueous extract should prove as therapeutically efficient as the gland itself.

I find, on examining the precipitated extract made according to the formula suggested by Edmund White (*P. J.* [3], xxiv., 195), and which, so far as I can learn, is largely used in the leading London hospitals, its extreme value having been proved beyond all doubt by well-authenticated cases of successful treatment, that it contains practically only the minutest proportion of iodine, and not more than about one-fortieth of that originally present in the glands.

I have repeated these experiments several times and have only been able to confirm the result. The doubt, therefore, whether the value of thyroid preparations is in any way directly dependent

upon the amount of iodine in organic combination contained in them is very great, and the doubt is, moreover, strengthened by the results obtained by the Continental investigators, Messrs. Bauman and Oswald (see *P. J.*, [4], vii., 425).

The former has found that myxœdema is most prevalent in districts in which there is deficiency of iodine in the glands of the inhabitants, but the latter has found that, if anything, the deficiency points to a freedom from that particular disease.

It will be interesting, therefore, to have the results of the use of preparations of thyroid gland prepared by precipitation and other processes carefully tabulated, and a comparison made as to their relative activity, in order to determine whether it can in any way be said to be in proportion to iodine value.

My thanks are due to Messrs. Wright, Layman, and Umney, in whose laboratory the above experiments were conducted.

RECENT WORK IN BOTANY.

INFLUENCE OF MINERAL SALTS ON THE GROWTH OF PLANTS.—M. Ch. Dassonville lays down the general law that the mineral solutions most favourable to the growth of plants are those which induce the greatest degree of differentiation. He finds, as the result of a large series of experiments, that salts of potassium and sodium have opposite effects on the tissues, the former retarding the differentiation of the supporting elements, while the latter increase the rigidity of the plant. The effect was tested of the influence of a great variety of mineral salts, in different degrees of concentration, on various cultivated plants, both in water and in the open ground. The first effects of a mineral salt on the development of a plant are frequently in opposition to the final result, the exuberance of growth being due, at least in part, to an accumulation of water.—*Bonnier's Revue Gén. de Botanique*, 1898.

INFLUENCE OF CARBON DIOXIDE ON THE GROWTH OF PLANTS.—The effect on the form and structure of plants of an atmosphere containing a larger proportion of carbon dioxide than atmospheric air is compared by M. Téodorisco with that of an air deprived as far as possible of that gas. He states that the effect of an excess of carbon dioxide is to shorten the hypocotyl or the first internodes, but to lengthen the succeeding internodes, the total result being usually an increase in length of the stem. As a rule, the internodes are larger in diameter, with an increased number of vascular bundles, and a fuller development of xylem, phloem, and cambium in each bundle; the cells of the palisade tissue are more elongated, and the air-chambers larger. The plants chiefly experimented on were *Lupinus albus*, *Phaseolus multiflorus*, *Pisum sativum* and *Faba vulgaris*.—*Comptes rendus Acad. Sci. Paris*, vol. cxxvii., 1898, p. 335.

PROTECTION OF FRUIT AGAINST PARASITIC FUNGI.—Herr A. Tschokke describes the mode in which cultivated fruits—especially species of *Pyrus*, *Malus*, *Sorbus*, *Cydonia*, and *Mespilus*—are protected against the attacks of parasitic fungi, among which the most destructive are *Monilia fructigena*, *Botrytis cinerea*, *Penicillium glaucum*, *P. olivaceum*, *Mucor pyriformis*, and *M. stolonifer*. None of these fungi can penetrate the uninjured cuticle. By the growth of the fruits the stomates by which they enter become very sparsely distributed, and largely converted into lenticels. There is frequently a general or local formation of cork-layers, as in the russet apple. But since it is very rarely that the epiderm is not locally injured, the chief protection against fungi is the chemical nature of the fruit itself, especially the presence of tannic and malic acids in the peripheral layers of cells.—*Landwirthsch. Jahrb. der Schweiz.*, vol. xi., p. 153.

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, NOVEMBER 2, 1898.

Present :

MR. WALTER HILLS, PRESIDENT.

MR. G. T. W. NEWSHOLME, VICE-PRESIDENT.

Messrs. Allen, Atkins, Bateson, Bottle, Carteighe, Corder, Cross, Grose, Savory, Southall, Symes, Warren, and Young.

The minutes of the previous meeting were read and confirmed.

RESIGNATION OF MR. HAMPSON.

The PRESIDENT then said his first duty was to read the following letter which he had received from the Treasurer, Mr. Hampson, which was dated from St. Leonards, October 25.

"Dear Mr. President,—When last I met you and my colleagues on the Council I had no thought that it would be the last occasion I should have of being present with you to take part in the business of the Society. I regret to say that, owing to a severe attack of illness, I find it necessary to retire from the Council. It is quite impossible for me to tell you, sir, how deeply I feel this severance from my friends, for all the members of the Council I venture so to designate. I feel it a privilege to have for so many years taken a part, however small, in the intimate working and administration of the affairs of the Society. The remembrance of those years and the friendship of my friends on the Council will be a treasured inheritance and a continual pleasure. I have, however, one particular cause of regret in saying adieu—that I have not been able to effect the reformation I had so long desired in the administration of the Benevolent Fund of the Society. I cannot resist pleading with those of the Council who have thought with me in the matter to take up the merciful campaign and bring it to a successful issue. I need scarcely say that my interest in the progress and well-being of the Society and in pharmacy remains undiminished. I shall watch the Council proceedings with untiring interest, and welcome every step taken that will give stability and importance to the Pharmaceutical Society.

"I am, dear Mr. President,
"Yours most sincerely,
"ROBERT HAMPSON."

The PRESIDENT said he felt that he was only acting as the mouth-piece of the Council when he said that he received this letter with the most extreme regret. He need hardly add, perhaps, that he had taken steps to ascertain that the letter represented Mr. Hampson's determination, and that Mr. Hampson felt it was quite impossible for him to remain any longer as a member of the Council, bearing in mind the very unsatisfactory condition of his health. Those who had known him for a good many years had been aware that he had suffered very considerably from weakness of body, and they had often admired his pluck in coming there from time to time when they knew that all the time he was suffering very considerably. When he looked around him he saw few who were members of the Council prior to Mr. Hampson's election, and this made it all the more a matter of regret to lose one of those who had been connected with the Council so long. His (the President's) earliest recollection of Mr. Hampson was in connection with the question which was exercising the minds of the Pharmaceutical Society very considerably before he was connected with the Council, and that was the question as to the admission of women as Members and Associates of the Society. They all knew what an interest Mr. Hampson took in that question, and he (the President) was glad to think that he, as a Member of the Society, at the general meeting supported Mr. Hampson's views, and voted for the admission of women. That was one of his earliest recollections of Mr. Hampson. They knew that about the time of the passing of the Act of 1868, matters were somewhat strained between the different individuals connected with their calling, but he would rather speak of Mr. Hampson during the time that he had been associated with him on the Council, which was now something like seventeen years. He was sure they would all agree with him that Mr. Hampson was thoroughly interested in the work of the Society and in the progress of pharmacy. In recent years Mr. Hampson had not spoken at any great length on any burning topic that had come before them, but he had taken an intense interest in every subject that had come under their consideration. He might here, perhaps, say that Mr. Hampson had been a most useful member of their Committees, for after all a great deal of the work of the Society was done in Committee. Mr. Hampson had been especially active on the Benevolent Fund Committee, and also on that very important Committee which met on

the second Wednesday in the month. Mr. Hampson had shown a deep interest in the advancement of education, especially with reference to their School, and in everything connected with the advancement of the interests of the Society which was brought specially before that Committee. He regretted that he was unable to say all that he felt with regard to their friend. He should miss him very much. He had often differed from Mr. Hampson on many points, but that fact had never disturbed in the least the good feeling that had existed between them, because he thought it was impossible to come to loggerheads with a man of Mr. Hampson's temperament. He was thoroughly conscientious in all the views that he adopted, but he was thoroughly liberal too, and could bear with the views of others in opposition to his own. He was a man utterly free from cynicism, and thoroughly conscientious in all that he said and did, and they would miss him very much from the Council. The point to which Mr. Hampson referred in his letter, with reference to the manner in which the annuitants were elected on the Benevolent Fund, was one which had found a response in the hearts of all the members of the Council, and it was only when they came to deal with the matter practically that some of them hesitated about taking the step which he thought everyone round the table would like to take, and which some of them hoped would some day be taken. It was to be hoped that the change of climate which Mr. Hampson contemplated seeking, and more complete rest, would help to build up his health again, that he would be saved from future pain, and that his life might be prolonged. They knew that Mr. Hampson had many other resources besides the interests of the Pharmaceutical Society. They knew that he had literary and artistic tastes, which, they trusted, would be a source of great pleasure and comfort to him for many long years to come. As he had said, he was sorry that he could not more fully express, as he would wish to do, his feelings of deep regret at the loss the Council had sustained in the resignation of Mr. Hampson, the Treasurer. He would, therefore, move :

That the Council accepts, with very sincere regret, the resignation of Mr. Robert Hampson as a member of the Council, and as Treasurer of the Society. This regret is much intensified by the consideration that his resignation is rendered necessary by the unsatisfactory condition of his health. His colleagues sincerely hope that his strength will be renewed and his life long spared with the change of residence and the more complete rest which he contemplates. They desire to place on record their cordial appreciation of his devotion to the best interests of the Society, and especially of the conspicuous services he has rendered as member of the Council for twenty-six years, and for eight years as Treasurer of the Society.

The VICE-PRESIDENT said he had pleasure and, at the same time, regret in seconding the motion—pleasure because by the resolution they paid a deserved tribute to Mr. Hampson, and regret on account of the necessity to accept the resolution. It had been stated that he was never a robust man; in fact, he had said himself that he was never really well, but what they admired was the immense amount of pluck which, notwithstanding his weakness, enabled him to do his duty, not only to the Society but to other people. It was known that early in life Mr. Hampson had met with a severe accident, which had upset him all his life, and yet month by month and week by week he had come to that house to do his duty to the Society. Mr. Hampson had always the welfare of the Society at heart, and particularly the administration of the Benevolent Fund. Probably they did not all agree with Mr. Hampson in his views on this latter matter, but he had sufficient independence of mind to think for himself. It was sometimes observed that delicate health and sickness did tend to make people somewhat irritable, but in Mr. Hampson's case the sickness and suffering that he experienced had quite a refining influence upon him. The members of the Council would agree that they had all benefited by their association with him. They had lost an exceedingly valuable member of the Society, and it was to be hoped that with a change of residence and more complete rest he would be spared for a great number of years to enjoy the retirement which he so richly deserved.

Mr. BOTTLE said he could not let the vote pass without rising to make a few observations with reference to it. He could add nothing to the kind words with which the President and the Vice-President had expressed their regret in the loss sustained by Mr. Hampson's withdrawal from the Council. He could go back to the time when Mr. Hampson and Mr. Scott Brown joined the Council, and remember the ability, zeal, and devotion to the Society of those two men. He had enjoyed the closest friendship with Mr. Hampson for twenty-six years. On Mr. Hampson's earliest entry on the Council, perhaps no two men

differed more than he (Mr. Bottle) and Mr. Hampson, but their differences were always differences of opinion, and not differences of friendship. Mr. Hampson's earliest view was not the introduction of women as Associates and Members of the Society, but as students. But their friend, with his perseverance and ability, succeeded in getting women admitted to the House, and when that was done he felt that he could no longer resist their admission as Associates and Members of the Society. He would not detain the Council longer, but he most sincerely regretted the resignation, and hoped that under the influence of quiet and retirement Mr. Hampson might regain his health and strength and live for many years to come.

Mr. ATKINS said, as one of the oldest friends of Mr. Hampson on the Council, he should be false to his convictions if he did not rise to support the resolution. One of the charms attached to his monthly visit to London had been the friendships he formed there, which would be lifelong, and one of the deepest and longest had been that of Mr. Hampson. He well remembered when he first came on the Council, in days when the sittings were much longer than at present, and when some members were accustomed to very elaborately and oratorically discuss the question, which came forward, asking himself, when he listened to Mr. Hampson, who made no attempt at oratory, how it was that he always produced so deep an impression. It was simply owing to the intensity of his convictions and the sincerity of his opinions. That strongly attracted him to Mr. Hampson, and he found that they had many opinions in common, though there were matters on which they differed, and from that time onward they had kept up a warm and close friendship, which he rejoiced to think would not be severed, although their opportunities of personal intercourse had come to an end. He dare not say more with regard to his own personal loss, but the public loss they had all sustained was very serious. Mr. Hampson brought to the Council a mind well stored he loved art and literature and many other things outside pharmacy and science, and they all felt the influence of that refined and cultured mind at the Council table. While some possessed only the critical faculty, others possessed a constructive power which was even more important, and Mr. Hampson's record was of that kind. Looking back more than a quarter of a century his name was associated with aggressive and progressive measures, and his loss was distinctly a public one. He heartily endorsed every kind expression which had fallen from previous speakers, and sincerely hoped that with leisure and repose, combined with the softer air of the south coast, his health might be so much benefited that his valuable life might be prolonged for many years.

The PRESIDENT said he had received a letter from Mr. Harrison, expressing his regret at not being able to be present, and speaking of Mr. Hampson, he said "his manly courage, his sympathy with the suffering, and his loyalty to the Society have secured for him the love of many of his colleagues and the regret of all." He was quite sure that all would concur in those sentiments.

The resolution was then put and carried unanimously.

ELECTION OF A TREASURER.

The PRESIDENT said the next business was to elect a Treasurer, which would be by ballot in the usual way.

The ballot having been taken,

The PRESIDENT declared that Mr. William Martindale had been duly elected Treasurer of the Society. He might say that it would afford him great pleasure to have Mr. Martindale associated with him for the remainder of his term of office. They all knew that he took a great interest in all that concerned pharmacy, and in fact, though he was now abroad in the neighbourhood of the Mediterranean, he had not forgotten the Society, for he had sent a copy of a new Ordinance regulating the sale of drugs in Gibraltar, which came into force on October 15, and to which he believed reference would be made in an early number of the Journal.

Mr. CARTEIGHE moved that authority be given to the President to sign cheques in the absence from England of the newly appointed Treasurer, Mr. Martindale. On moving this resolution he might be allowed to say how gratified he was that the Council had made this appointment so unanimously. The friends of Mr. Martindale would also feel that it was pleasant to have an opportunity of conferring an honour upon him. Since the death of Mr. Peter Squire, he took it, Mr. Martindale represented the all-round educated pharmacist in the highest sense, in activity and loyalty to the craft, and his desire to be useful, made everyone wish that he might have a bright career before him, and that possibly ere long another and perhaps a higher office might be conferred upon him. He

had known Mr. Martindale probably longer than anyone in the room. They two with Mr. Umney had been associated with everything done in the Society for very many years, even when they were not on the Council, and Mr. Martindale formed one of a small band of men who, like Richard Reynolds and others, had worked hard in days gone by to keep waverers loyal to the Society, and make it strong.

The resolution was seconded and carried unanimously.

Mr. BOTTLE suggested that this resolution should be communicated to Mr. Martindale at the same time as he received notice of his appointment as Treasurer. Otherwise he feared that with his well-known sense of duty to the Society he might cut short his holiday.

The PRESIDENT suggested that the election of a member of Council in the place of Mr. Hampson should be deferred to another meeting.

This was agreed to.

REPORT OF THE FINANCE COMMITTEE.

The report of this Committee was of the usual character, and recommended certain accounts for payment.

The PRESIDENT moved the adoption of the report and recommendations, which, he said, needed no comment, the receipts and payments both being of the usual character at this time of year. He was glad to say, however, that a donation of five guineas to the Benevolent Fund had been received from Mr. Dennis, local secretary for Louth.

The resolution was carried unanimously.

REPORT OF THE BENEVOLENT FUND COMMITTEE.

The report of this Committee included a recommendation of grants to the amount of £76 in the following cases:—

The widow (61) of a Member (1870 to 1889), who has had several previous grants. (London.)

The widow (65) of a Chemist and Druggist who has had a grant annually for several years past, and is practically dependent on the aid given her from the Fund, though she does a little needlework. (Crewe.)

An Associate (1869 to 1897) and subscriber (74) who carried on business in London for fifteen years, and is now unable to do anything. (Ipswich.)

The widow (48) of an Associate, who had three small grants prior to his death in 1866. She has an only daughter earning 4s. a week. (Wrexham.)

The widow (53) of an Associate in Business (1860-97) and subscriber. Applicant carried on her late husband's business for a year, but it did not pay. She has six children, who contribute what they can. (Clifton.)

An Associate in Business (61) from 1871 to 1890 and subscriber to the Fund. He carried on business for twenty-nine years in Camden Town, but had to close, owing to the competition of neighbouring stores. He is out of employment, and has two young children. (London.)

The widow (64) of a Chemist and Druggist, who is in ill health and entirely dependent on her children, who can do but little. (Auchterarder.)

The VICE-PRESIDENT moved the adoption of the report and recommendations, which was at once agreed to.

The VICE-PRESIDENT again rose to ask the assistance of members and friends who had votes or influence in connection with the United Kingdom Beneficent Association, in obtaining a grant for Miss Frances Wells, who was born in 1836, and was the daughter of a chemist who died some years ago. The Secretary had drawn his attention to the case, having already interested himself in the case of a sister of the lady. He did not quite know what the amount of the grant or pension was, but he was sure it was a case in which their friends throughout the country would be pleased to help.

Mr. ATKINS said the grants from the Beneficent Association were small compared with those made from their own Benevolent Fund, for which this lady was not eligible, but the competition for them was enormous. Some time ago his wife was concerned in trying to get a lady elected, and ultimately succeeded, but only after what must be called gigantic efforts. He believed the grant was about £20 a year, and he cordially supported the Vice-President's appeal.

REPORT OF THE LIBRARY, SCHOOL, AND HOUSE COMMITTEE.

The report of this Committee stated that the Librarian had presented his usual report, including the following particulars regarding attendance at the Library:—

	Attendance.	Total.	Highest.	Lowest.	Average.
July	Day	285	22	1	11
	Evening	28	5	0	3
August	Day	74	6	1	3
September	Day	92	12	4	7

Circulation of Books.	Total.	Town.	Country.	Carriage paid.
July	134	71	63	11s. 11d.
August	111	51	60	13s. 10d.
September	113	48	65	12s. 5d.

The Committee recommended that the undermentioned books be purchased :—

For the Library in London :—

Lucas, Practical Pharmacy, 1898.
Aldous, Elementary Course of Physics, 1898.
Hyndman, Radiation, 1898.
Allen, Commercial Organic Analysis, 3rd ed.
Attfield, Chemistry, 17th ed.

For the Library in Edinburgh :—

Lucas, Practical Pharmacy, 1898.
Allen, Commercial Organic Analysis, 3rd ed.
Attfield, Chemistry, 17th ed.
Bernthsen, Organic Chemistry, 2nd ed.

The Curator's report had also been received, and included the following particulars regarding attendance at the Museum :—

	Attendance.	Total.	Highest.	Lowest.	Average.
July	Day	373	28	1	15
	Evening	19	8	1	1
August	Day	52	6	1	2
September	Day	169	25	5	11

Several donations to the Library and Museum had been received (see *P. J.*, October 15, p. 424), and the Committee had directed that the usual letters of thanks be sent to the respective donors. The report of the Committee further stated that the Librarian had presented a report on the meeting of the Librarians' Association at Southport; and he also reported that he had examined the Society's Library and found that no books were missing. The Committee, recommended that, seeing the small number of persons visiting the Museum and Library in the evening during the year 1898, they should be open from 9 to 7, except on Saturday, when the hour of closing should be 2, but that on the occasion of evening meetings they should remain open till 8. The Dean of the School had reported that the School was over-full, and the Committee made certain recommendations as to the use of the Octagon laboratory and some of the laboratories in Galen Place to meet the difficulty. The Dean also reported a lack of apparatus for the physical science lectures, and the Committee recommended the expenditure of £50 on such apparatus. Mr. Carteighe had been re-appointed School visitor.

The PRESIDENT, in moving the adoption of the report, said the Committee had had a record meeting on the last occasion in point of length; therefore it would be easily understood that it was necessary to defer the consideration of some of the items which came before it. Perhaps the most important matter on the present occasion was that with reference to the Library and Museum. For some time the Committee had felt that the facilities offered for the attendance of Members and Associates during the evening hours had not been taken advantage of to the extent that was desired. There were many reasons for this, and it was unnecessary for him to hazard any opinion on the point. There were now many counter attractions, in the shape of associations, to which some of their young friends naturally turned in the evening, no doubt to their advantage. Having regard to the long hours of the staff necessitated by the present arrangements, and having regard to the expense of the lighting and warming of the room entailed, it was felt advisable that they should, at least for a year, have the Museum and Library closed at 7, except on the evening when the Evening Meeting was held. The School was over-full; he did not object to this, but it might become necessary to make some temporary alteration, involving no outlay of money, by which they could accommodate more students, and give a little more room to those working in the Research Laboratory. The Committee had recommended that a sum not exceeding £50 should be expended in the purchase of physical apparatus. The apparatus now at the disposal of their lecturer was somewhat out of date, and the Committee felt that it was highly important in a school which professed to teach its students and not to cram them that they should have proper apparatus, to enable the experiments to be performed by the lecturers.

THE RECOMMENDATIONS FOR THE STORAGE OF POISONS.

Dr. SYMES said as there was no report of the Law and Parliamentary Committee, he would like to put a question. They were

now approaching a new Parliamentary session, and might be called upon at any moment to act or to oppose action on the part of others; therefore, he wished to ask the President whether the time had now arrived for taking any action with respect to adopting the recommendations for the storage of poisons. The matter had been fully discussed in that room some ten years ago, and at that time the Council were not unanimous in the opinion that it was desirable to take action, but to-day he thought the whole Council would support the recommendations which had been made for the keeping, storing and dispensing of poisons. He did not wish to move any resolution on the present occasion. He thought they would all feel that if they had to take any action or oppose any action with reference to Parliamentary matters they would be immensely stronger if they first set their house in order, and fulfilled one of the conditions of their Act by adopting the recommendation that had been made to them. He merely wished to ask if the President thought there would be any hope of the Society passing the necessary regulations, and so give them a greater power than they now had of dealing with any question which would benefit the whole trade in dealing with poisons, or any other subject that might arise.

The PRESIDENT said Dr. Symes had rightly said that there was no report of the Law and Parliamentary Committee. That Committee had sat and considered one or two important matters, but they were not in a position at the present time to report. With reference to the point raised by Dr. Symes, his (the President's) friends knew what his opinion was with reference to poison regulations. He had never had but one opinion on the point, and he had reason to believe with Dr. Symes that their colleagues were pretty well unanimous in the desirability of framing regulations in conformity with the existing recommendations. This being the position of matters, it was highly desirable that their views should be supported by their friends throughout the country. He believed it was competent for any thirty members of the Society to ask for a special meeting to be summoned to consider such a question. The Council of a previous time did suggest that certain recommendations should be made regulations in conformity with the Act of Parliament, but, as they all knew, whatever the intention of the framers of the Act of Parliament was, it had been left for the Society itself to make such regulations. He was not present at the historical meeting to which reference had often been made, though he had often heard of it, but on that occasion the Society would not accept the recommendations as regulations, though he fancied opinions had undergone a change in that respect. With Dr. Symes, he felt most strongly on the matter that their position would be very much better if they could, even at that late hour, set their house in order and, as a Society, pass these regulations, which he for one believed were intended to be made when the Pharmacy Act, 1868, was passed. As Dr. Symes had referred parenthetically to the subject of company trading, he would, if he might be allowed, take this opportunity of saying that he believed this was a subject which it had been suggested should be discussed throughout the country by local associations during the coming winter. He might be allowed to ask that their friends throughout the country should discuss this matter with the greatest thought and consideration, ever bearing in mind what was possible and what was practicable, what they themselves would be able to go to a member of Parliament and advocate, not only in their own interests, but in the interests of the public. Parliament would not legislate merely for pharmacists or for any class of professional or trading people, but the first consideration with every member of Parliament would be what was best for the public. He mentioned this because he had before him in the current number of the *Pharmaceutical Journal* the report of a meeting of the Nottingham and Notts. Chemists' Association, which was a very active Association and doing very good work. That Association had passed a resolution asking the Council to secure the amendment of the Pharmacy Act in the direction of preventing companies doing that which it was illegal for an individual to do. Judging from the remarks of one or two of the gentlemen who were present at that meeting, it was thought by some to be practicable to stop stores carrying on business as chemists and druggists. He (the President) hoped that his friends throughout the country would not feel that he was taking too dictatorial a view in the matter; he only wanted them to consider the question very carefully, and in a way in which they could themselves place it before their own members of Parliament, because after all, if they did at any time suggest a Bill for the con-

sideration of Parliament, someone would have to go down and try and get members to interest themselves in the matter, and their friends throughout the country would have to do the same; therefore it was highly desirable that they should not only pass abstract resolutions, but such resolutions as would have a fair chance of being made practicable in a future draft Bill.

Mr. Cross suggested that the pharmaceutical press should be asked to take notice of the poison recommendations, and of what had been said there that day. They had, of course, in the Calendar a ready reference to these recommendations, which all present felt might with advantage be adopted as compulsory regulations for the storage of poisons. The provisions were so very simple that the rank and file of chemists throughout the country would adopt them; and he felt sure that the statement that they had heard about being tied down by absurd regulations would not be repeated. The suggested regu-

lations were really of such a character that they were even now generally adopted by pharmacists. No doubt all pharmacists did not possess a copy of the Calendar, but those who did not received week by week the *Pharmaceutical Journal* and other papers, and if they were to see the recommendations *in extenso*, it would prepare their minds to submit to regulations of this kind, lest something worse should come upon them.

Mr. SOUTHALL asked if the recommendations could be made compulsory by a vote of the Council.

The PRESIDENT said it would have to be done by a vote of the Society.

APPOINTMENT OF LOCAL SECRETARIES.

The portion of the report of the General Purposes Committee dealing with the appointment of local secretaries having been read,

The PRESIDENT moved that the following appointments be made:—

List of Local Secretaries of the Pharmaceutical Society for 1898-99.

Aberdeen	Strachan, Alexander.	Cromer	Davison, Daniel.	Huddersfield	King, William.
Abingdon	Smith, William F.	Croydon	Clarke, Josiah.	Hull	Bell, Charles Bains.
Altrincham.....	Burgess, A. H.	Cupar	Robertson, Wm. G.	Huntly	Chalmers, George.
Andover	Bienvenu, J.	Darlington	Robinson, James.	Hyde	Wild, Joseph.
Arbroath	Jack, James.	Dartford	Goff, Walter E.	Hythe	Lemmon, Robert Alce.
Ashbourne.....	Wardle, T.	Darwen	Shorrock, Ralph.	Ilfracombe.....	Crang, Walter.
Ashby-de-la-Zouch ..	Bullen, Geo. W.	Derby	Cope, John A.	Ilkley	Worfolk, George W.
Ashford	Ingall, Joseph.	Devonport	Rendle, Richard H.	Inverness	Ogston, Wm.
Ashton-under-Lyne ..	Bostock, John W.	Dolgelly	Williams, Richd. W.	Ipswich	Anness, Samuel Richd.
Aylesbury	Palmer, Edwin T.	Doncaster	Howorth, James.	Jersey	Cole, George.
Ayr	McGregor, Adam.	Douglas (Isle of Man).	Radcliffe, John C.	Jarrow	Rose, J. D., junr.
Banbury	Bartlett, Hubert.	Dover	Bottle, Alexander.	Keith	Pirie, James.
Banff	Alexander, William.	Droitwich	Harris, Stephen.	Kelso	Maxton, Wm. M.
Bangor	Jones, Owen.	Dudley	Gare, Charles Hazard.	Kendal	Severs, Joseph.
Barnsley	Eastwood, Lewis.	Dumfries	Allan, William.	Kidderminster	Smith, Maurice.
Barnstaple ..	Goss, Samuel.	Dundee	Kerr, Charles.	Kilmarnock	Borland, John.
Bath	Appleby, Edward J.	Dunfermline	Gilmour, D.	Kinross	Dow, William.
Bedford	Taylor, James B.	Ealing	Lewis, D. L.	Kintore	Keith, Alfred G.
Belper	Burkinshaw, Wm. T.	Eastbourne	Crook, Herbert.	Kirkcaldy	Storrar, David.
Berwick	Lyle, William.	Eccles	Howie, Wm. Lamond.	Kirkwall (Orkney) ..	Stewart, Duncan.
Birmingham	Thompson, Charles.	Egremont	Ireland, E. J.	Knareborough	Lawrence, William P.
Bishop Auckland	Dobinson, Thomas.	Elgin	Robertson, Alex.	Knutsford	Silvester, Henry T.
Blackburn	Critchley, Thomas.	Ely	Howard, Arthur.	Lancaster	Vince, James.
Blackpool	Laurie, John.	Epping	Rowland, Thomas W.	Leamington	Barrett, Josephus T.
Blandford	Groves, Richard H.	Exeter	Lake, John Hinton.	Leeds	Reynolds, Richard.
Bolton.....	Knott, Percy.	Falkirk	Forgie, Wm.	Leek	Hartley, W. H.
Bootle	Wyatt, Harold, junr.	Faversham.....	Laxon, Matthew.	Leicester	Goodess, Fredk. W.
Boston	Grimble, Albert.	Finchley	Freeman, Fredk. Wm.	Leigh (Lancs.)	Boardman, F. J.
Bournemouth	Hardwick, Stewart.	Flint ..	Jones, Owen W.	Leith	Garvie, Alexander.
Bradford (Yorkshire).	Waddington, Alfred H.	Folkestone.....	Knight, John.	Lewes	Higham, Thomas.
Brecon	Forfar	Fowler, George R.	Leytonstone	Bennett, Cornelius.
Brentford	Wood, A.	Frome	Green, Edmund C. F.	Lichfield.....	Perkins, John Jaquest
Bridgnorth	Deighton, Thomas M.	Galashiels	Ross, William.	Lincoln	Birkbeck, J. Thomas.
Bridgwater	Basker, John Anthony.	Glasgow	Currie, William L.	Liverpool	Smith, John.
Bridlington	Purvis, John B.	Gloucester	Minchin, William.	Llanrwst	Jones, Owen.
Brighton	Gwatkin, James Ross.	Goole	Timm, Edmund.	Louth	Dennis, F. Woodrow.
Bristol	Keen, Benjamin.	Grantham	Whysall, William.	Ludlow	Woodhouse, George.
Burnley	Cowgill, Bryan H.	Gravesend	Clarke, R. Feaver.	Luton	Duberley, George S.
Burslem	Oldham, Wm.	Great Grimsby	Cook, Robert.	Maidenhead	Walton, Ralph.
Bury St. Edmunds ..	Clark, Owen A.	Great Yarmouth	Pol, Wm. Sheppard.	Maidstone	Corfe, A. Fred.
Buxton	Wright, Robert.	Greenock	McNaught, Archibald.	Maldon	Crick, George E.
Camborne	Tonking, Charles H.	Guernsey	Nickolls, John B.	Malvern	Mander, Alfred.
Cambridge	Deck, Arthur.	Haddington	Watt, James.]	Manchester, etc.	Kemp, Harry.
Canterbury	Bing, Edwin.	Halifax	Fielding, Clement.	Mansfield	Patterson, Douglas J.
Cardiff	Munday, John.	Harrogate	Davis, R. Hayton.	March ..	Davies, Peter H.
Carlisle	Hallaway, John.	Harrow	Gunn, Samuel John.	Margate	Harvey, Wm. Sutton.
Carmarthen	Lloyd, Walter.	Harwich	Bevan, Charles F.	Market Harborough...]	Maynard, Henry R.
Carnarvon	Jones, John.	Hastings and St. } Leonards.....	Tharle, Charles A.	Merthyr Tydvil	Harris, Evan W.
Carshalton	Carter, Francis.	Hawick	Maben, Thomas.	Middlesborough	Robson, J. Crosby.
Castle Douglas	Veitch, Andrew.	Heckmondwike	Stead, Walter.	Montrose	Davidson, Alexander.
Cheltenham	Barron, William.	Helensburgh	Harvie, George.	Morecambe	Whitehead, Fredk. N.
Chester	Shepherd, Wm. F. J.	Hendon	Goldfinch, George.	Morpeth.....	Schofield, Fredk. E.
Chesterfield	Barfoot, John R. D.	Hereford	Kemp, C. T.	Motherwell	Scott, Robt. A.
Chichester	Long, William Elliott.	Hertford	Durrant, G. R.	Newark	Cherrington, Geo. W.
Chorley	Hill, William.	Hexham	Gibson, John Pattison.	Newcastle-on-Tyne ..	Clague, Thomas M.
Cockermouth	Scott, Walter S.	Hitchin	Ransom, Francis.	Newcastle, Staffs	Poole, Weston.
Colchester	Weddell, Arthur.	Horncastle	Kemp, Herbert W.	Newport (Mon.)	Garrett, Thomas P.
Coldstream	Elliot, William M.	Hornsea	Morrow, Charles.	Newtown ..	Owen, Edward.
Coventry.....	Hinds, James.	Houghton-le-Spring...]	Rowell, Robert H.	Northampton.....	Bingley, John.
Crewe	Dale, J. A.			Northwich	Humphreys, Griffith.

Norwich	Sutton, Francis.	St. Andrews	Kermath, William R.	Taunton	Kirkpatrick, James.
Nottingham	Sergeant, F. Ross.	St. Austell	Binks, Burcham.	Teddington	Stacey, Peter.
Nuneaton	Iliffe, George.	Salisbury	Atkins, Wm. Ralph.	Tiverton	Havill, Paul W.
Oakham	Wellington, James.	Scarborough	Whitfield, George.	Totnes	Morse, Charles H. S.
Oban	Lawrence, Saml.	Sevenoaks	Pain, Edwin.	Tottenham	Tanner, Alfred E.
Oldham	Bates, Hiram.	Sheerness	Sturdy, Jno. R.	Tunbridge Wells	Hobbs, Alfred E.
Oxford	Prior, George Thomas.	Sheffield	Squire, George.	Twickenham	Peake, Henry F.
Paisley	Fraser, Alexander.	Shrewsbury	Cross, William Gowen	Uxbridge	Coles, Arthur.
Peebles	Lindsay, Robert.	Southampton	Dawson, Oliver R.	Ventnor	Littlefield, Wm. H.
Penrith	Cowper, Joseph.	Southport	Righton, James.	Wakefield	Chaplin, John Henry.
Penzance	Symons, Netherton H.	South Shields	Noble, John.	Walsall	Elliott, E. Matthew.
Perth	Ayre, Geo. M.	Spalding	Bell, E. Wightman.	Walthamstow	Saunders, Arthur.
Peterborough	Heanley, Marshall.	Stafford	Averill, John.	Warrington	Greenough, Hugh F.
Peterhead	Tocher, James F.	Stalybridge	Simpson, Allwood.	Warwick	Pratt, Henry.
Petersfield	Edgcler, William B.	Stirling	Raffan, John.	Waterloo	Pearson, William.
Plymouth	Hunt, Freeman W.	Stockport	Orton, Wm. Billing.	Watford	Chater, Edw. Mitchell.
Pontypridd	Arnott, Daniel.	Stockton-on-Tees	Brayshay, Thomas.	Wednesbury	Gittoes, S. James.
Portsmouth, etc.	Brewis, Thomas.	Stoke-on-Trent	Adams, Frank.	West Ham	Barnes, W. R.
Preston	Williamson, F. A.	Stone, Staffs	Jacks, Frederick	Weston-super-Mare ..	Cooper, John.
Ramsgate	Baily, Edward.	Stonehaven	Wood, A. Lyon.	Whitehaven	Kitchin, Archibald.
Reigate	Woodward, Moses M.	Stonehouse (Devon) ..	Maitland, Frank.	Wick	Banks, John.
Rhyl	Davies, Thomas M.	Stourbridge	Selleck, William R.	Wigan	Phillips, Jonathan.
Richmond (Surrey) ..	Parrott, John.	Stowmarket	Gostling, G. Jas.	Winchester	Chaston, Alfred Edw.
Ripon	Senior, William F.	Stranraer	Ker, Richard.	Windsor and Eton ..	Oldham, William.
Rochdale	Highley, William.	Stratford	Holford, Thos. C.	Wolverhampton	Gibson, Frederic John
Romford	Lasham, John W.	Stratford-on-Avon ..	Hawkes, Richard.	Worcester	Turner, Chas. W.
Rothsay	Duncan, William.	Streatham	Shacklock, J. H.	Worthing	Cortis, A. Brownhill.
Runcorn	Weston, John H.	Sunderland	Ranken, Charles.	Wrexham	Caldecott, Clement G.
Ryde	Pellard, Henry Hindes.	Swaffham	Christopherson, Fred.	Yeovil	Wright, Alfred.
Saffron Walden	Gilling, John.	Swansea	Grose, Nicholas M.	York	Sowray, Joseph.
St. Albans	Ekins, Arthur, E.	Tain	Fowler, Donald.		

The PRESIDENT also proposed that in the following districts, from which no replies had been received, the appointments be deferred for a month:—

Aberystwith	Keighley	Ross
Barnet	King's Lynn	Rugby
Barrow-in-Furness	Kingston	St. Helen's
Bodmin	Leominster	Shipley
Burton-on-Trent	Llandudno	Southend, Essex
Chelmsford	Longton	Stroud
Chippenham	Malton	Tamworth
Dartford	Melton Mowbray	Tavistock
Deal	Newton Abbot	Torquay
Enfield	Oswestry	Treherbert
Evesham	Pembroko Dock	Wellington, Somerset
Guildford	Pontefract	Wimbledon
Hartlepool	Reading	Wokingham
Heywood	Richmond, Yorks.	Woodbridge

He said it was with very considerable regret that he noticed the apparent apathy shown in this matter in many districts, though he saw with pleasure that there were indications that in some quarters at least, a little more energy had been displayed, there having been a larger number of votes returned than in former years. Still there were 42 places from which no reply had been received, either to the circular sent to the present local secretary or to the voting cards sent to the members. On previous occasions he had called attention to this matter, when he had said that in some cases there might be reasons for the silence and that it did not necessarily follow that it was the result purely of apathy; but as years went on he was thrown back more and more upon that as the only possible reason. This year the Committee suggested that instead of writing to the local secretaries asking the reason why no reply had been received, the list of places thus in default should be published in the proceedings, and the appointments deferred in order to give the members in those districts an opportunity of indicating whether they had any desire to be represented, and he earnestly hoped that from some places at least a reply would be received. Whilst it was highly desirable that there should be local secretaries throughout the country, it might be better to have none than to have one who was utterly apathetic. The attention now called to the matter, would, he hoped, result in some indication being afforded that these districts really desired to have a representative, and that they would nominate some one for appointment in December. At the same time, he must, on behalf of the Council, tender their best thanks to all the local secretaries, and there were very many who had done good work during the year. They were much indebted to them for their assistance in various ways.

Mr. ATKINS said he could state from personal knowledge that some of the local secretaries were hardly deserving of the thanks

of the Council. He must say he was amazed at some of the names appearing in the second list, particularly one important town in the west, which in former times was very prominent in pharmaceutical matters. There were many places in which the constituencies were small and the interests very limited, and in such cases he believed it would be better, if there were a local secretary at all, that he should be appointed from headquarters, and not on the spot. His conviction was that the evil times which had fallen on pharmacy largely accounted for the present state of affairs, and he knew of more than one place in which pharmacy was being crushed out by that gigantic evil to which reference was frequently made, and some of their best men were losing heart.

Dr. SYMES said he was sure the whole Council felt their indebtedness to those local secretaries who really did good work for the Society, notwithstanding the many difficulties they had to encounter. At the last meeting of the Liverpool Chemists' Association Mr. Smith, the local secretary, read a paper on "The Duties of a Local Secretary," and concluded by asking that he might be allowed to retire. He (Dr. Symes) thought the paper he had read was the best evidence that he should remain, which he kindly consented to do. In the course of next year he hoped there would be a large accession of members, so that there would be a larger number to select from, and he hoped this would result in greater interest being taken in the elections. Mr. Smith suggested that if the circulars and cards were sent out rather later, associations would have a better chance of meeting and discussing the matter. He also thought it would be useful if some official from headquarters could occasionally visit the local secretaries and discuss matters with them; and, further, that once a year the local secretaries from various districts should meet together. He suggested that this should be done at the Conference, which no doubt the Executive of the Conference would be glad to facilitate, but, as he suggested some years ago, a similar opportunity might be afforded every year or every two years at the meeting of the Society in London.

The PRESIDENT having endorsed what had been said as to the value of the services rendered by many of the local secretaries, then put the resolution, which was carried unanimously.

DIVISIONAL SECRETARY FOR EDINBURGH.

The PRESIDENT said with regard to the local secretaries for Scotland, the Council was glad to avail itself of the help of the Executive of the North British Branch, and one of their suggestions was that Mr. John Nesbit, of Portobello, should be appointed divisional secretary for Edinburgh. Many of them knew Mr. Nesbit, and he was sure they would all agree with the resolution which he would move that he be appointed accordingly.

The resolution was agreed to.

RESTORATIONS TO REGISTER.

The names of the following persons who have severally made the required declarations and paid a fee of one guinea, were restored to the Register :—

- Charles Henry Fentiman, 58, Terminus Road, Eastbourne.
- Thomas Brigstocke Humphrey, 1, Arlesford Road, Stockwell, S. W.
- Harry Laing Spink, 337, Kentish Town Road, N. W.

SUPERINTENDENTS OF WRITTEN EXAMINATIONS.

The PRESIDENT moved that superintendents of written examinations be appointed in the following centres, and that appointments be offered to the local secretaries in these centres. There was no alteration in the list.

Aberdeen	Exeter	Newcastle
Birmingham	Glasgow	Northampton
Brighton	Guernsey	Norwich
Bristol	Hull	Nottingham
Cambridge	Inverness	Orkney (Kirkwall)
Canterbury	Isle of Man (Douglas)	Oxford
Cardiff	Jersey	Penzance
Carlisle	Lancaster	Peterborough
Carmarthen	Leeds	Plymouth
Carnarvon	Lincoln	Sheffield
Cheltenham	Liverpool	Shrewsbury
Darlington	London	Southampton
Dundee	Manchester	York
Edinburgh		

The resolution was carried.

REPORT OF EXAMINATIONS.

October, 1898.

Candidates.

	Candidates.		
	Examined.	Passed.	Failed.
England and Wales :—			
Major	18	9	9
Minor	266	66	200
Scotland :—			
Major	2	2	0
Minor	106	42	64
First Examination	241	121	120

Thirty-three certificates were received in lieu of the Society's examination.

MEETING OF THE BOARDS OF EXAMINERS IN 1899.

It was resolved that the Boards of Examiners meet to conduct the oral portion of the Major and qualifying examinations in January, April, July, and October, 1899, or as near to those months as conveniently may be.

CORRESPONDENCE.

The PRESIDENT said he had received a letter from Mr. Ward, of Sheffield, acknowledging the letter of thanks sent him last month. He had also received a letter from Mr. Joseph Ince, in which he asked the Society to accept his private collection of prescriptions arranged for class teaching. On behalf of the Council he had accepted the offer, and they would all agree in thanking Mr. Ince for his thoughtful kindness. He had, further, received a copy of a resolution passed at a meeting of the Chemists' Assistants' Union on October 6, 1898 :—

That the attention of the Pharmaceutical Society be respectfully drawn to the practice of dispensing poisons by unqualified persons in doctors' surgeries, and that they be urged to take every possible step to minimise the evil.

That resolution might be referred to a Committee, but it seemed to refer to a matter which could not be dealt with. If the surgeries referred to were ordinary surgeries in which a medical man's prescriptions were dispensed for his own patients they were exempted from the Pharmacy Acts altogether.

Mr. BOTTLE said it might refer to open surgeries.

The PRESIDENT said the Council was in the habit of dealing with such cases. He thought perhaps it would be better to inform the Union of that fact.

Mr. CARTEIGHE said gentlemen who formed themselves into a union for the purpose of protecting members should, before passing resolutions, ascertain the existing condition of the law before asking for something which was impracticable. He should have thought that every registered assistant at any rate knew perfectly

well that the rights and privileges of medical men and apothecaries were respectively exempted from the provisions of the Pharmacy Acts, so that a doctor could deal in his own surgery as he thought fit. If, however, he kept an open shop, he was bound by the same law as the chemist, and could only have poisons sold or dispensed by a registered assistant. The Society had dealt with numbers of such cases, and recovered penalties.

The SECRETARY said a letter had been received from Mr. Rutherford Hill, containing a resolution passed by the Executive of the North British Branch, on Friday last, in which they placed on record their warmest thanks to the President for his unwearied efforts in getting the Pharmacy Acts Amendment Bill through Parliament. It also stated that the consideration of what steps could be taken to increase the membership in Scotland had been remitted to the General Purposes Committee.

FIRST EXAMINATION.

The following list of centres at which examinations had been held during the past three years, with the number of candidates at each centre, was ordered to be entered on the minutes.

REPORT OF THE GENERAL PURPOSES COMMITTEE.

The Council then went into committee to hear and consider the report of this Committee on legal matters.

On resuming, the report and recommendations were adopted, and resolutions passed authorising the Registrar to take proceedings against the parties named therein.

NORTH BRITISH BRANCH.

MEETING OF THE EXECUTIVE.

A meeting of the Executive of the North British Branch was held in the Society's House, 36, York Place, Edinburgh, on Friday, October 28, at 11.30 a.m., Mr. J. LAIDLAW EWING in the chair.

Present: Messrs. Ayre, Boa, Bowman, Coull, Currie, Ewing, Fisher, Haidie, Henry, Johnston, Kermath, Kerr, Lunan, McAdam, McLaren, Mitchell, Moir, Russell, Storrar, and Strachan.

The minutes of last meeting were read and approved.

The Report of the General Purposes Committee was read.

EVENING MEETINGS.

It had been arranged that the winter session of evening meetings should be opened on Wednesday, November 23, 1898, when the inaugural address would be delivered by Dr. Ralph Stockman, Professor of Materia Medica and Therapeutics in the University of Glasgow. Professor Stockman intended to give an address on "Arrow Poisons," a subject which he had specially studied and on which he was a recognised authority. The Committee found insuperable objections to the holding of these meetings on Tuesdays, which was a class night at the Pharmacy Schools, and it had been decided to hold them on the third Wednesday of each month, namely, December 21, January 18, February 15, March 15, and April 19. Several promises of communications had been received, but the Committee would be glad to hear from anyone who had anything to communicate.

VENTILATION OF LABORATORIES.

The Committee had had fitted in the chemical laboratory a 14-inch Blackman fan and electric motor at a cost of £21 15s. The fan had been tested in operation at the October examinations, and proved satisfactory for ventilation. But objection was taken to the noise, and the contractor had undertaken to remove this objection by an alteration in the method of fixing.

On the motion of Mr. KERR, seconded by Mr. McADAM, the report was approved of.

NOMINATION OF EXAMINERS.

The Executive then went into Committee to consider the question of the nomination of examiners for the year 1899. On resuming, the CHAIRMAN declared that, on the motion of Mr. Fisher, seconded by Mr. Johnston, the following resolution was unanimously adopted:—

That Isaac Bayley Balfour (Regius Professor of Botany in the University of Edinburgh), Leonard Dobbin (Lecturer on Chemical Theory and Assistant to the Professor of Chemistry in the University of Edinburgh), Alexander Davidson (Montrose), James Laidlaw Ewing (Edinburgh), James Jack (Arbroath), George Lunan (Edinburgh), Thomas Maben (Hawick), and John Nesbit (Portobello), be nominated for election by the Council as members of the Board of Examiners for Scotland for the year 1899.

THE CONFERENCE DELEGATES.

The CHAIRMAN said he had pleasure in reporting, on behalf of those who attended the Belfast Conference, that they had been most hospitably entertained by their Irish friends and everything possible had been done to promote their comfort. Their Irish brethren seemed to be pleased to see a large attendance from Scotland. The Local Committee deserved very hearty thanks for the excellent way in which the arrangements were carried out.

The VICE-CHAIRMAN concurred in the statement just made. Dr. Symes had particularly mentioned to him his satisfaction at seeing so many friends from Scotland. No less than sixty-three Scotch representatives braved the dangers of the briny deep. They were very fortunate in regard to weather. It rained all the way going, but they were favoured with sunshine all the time they were on Irish soil, and the rain began to fall again the moment they departed. He believed he spoke the sentiments of all the Scottish visitors when he said they had thoroughly enjoyed themselves.

LOCAL SECRETARIES IN SCOTLAND.

The ASSISTANT-SECRETARY stated that the Secretary had again found it necessary to intimate that there had been a failure to nominate local secretaries in several centres in Scotland, many of them being the same centres that were behind last year. It was to be regretted that local chemists did not take the small amount of trouble required to make a suitable nomination. The Executive

considered the matter and instructed the Assistant-Secretary to report their suggestions to the Secretary with a view to having all the centres filled up.

THE GOVERNMENT POISONS BILL.

The VICE-CHAIRMAN said it was a matter of satisfaction to them that the prompt action taken by the Society throughout the country had resulted in the abandonment of the projected Poisons Bill since their last meeting. He had observed that Mr. Cross, M.P., was still on the war-path, and he had apparently induced the Scottish Chamber of Agriculture to pass the other day a resolution on the lines he wished in the direction of free sale of deadly poisons. He had also most unjustifiably misrepresented the Pharmaceutical Society by stating that they were actuated by a desire to secure for the members of the Society a monopoly in the sale of certain poisons which was to be denied to registered chemists who were not members.

The CHAIRMAN said the matter had been fully explained to Mr. Cross, and that gentleman was hopelessly wrong in his facts and assertions.

BENEVOLENT FUND.

The ASSISTANT-SECRETARY directed attention to some recent grants made to aged chemists in Scotland. Mr. Johnston said he hoped Scotchmen would note these cases. He felt that, speaking generally, the returns from Scotland to the Fund were smaller than they ought to be. There could be no doubt that in the disbursement of the Fund Scotland would get her share. He would like to say that in Aberdeen their excellent local secretary, Mr. Strachan, accompanied by another who would be nameless, went round the town and called on every chemist. They were well received everywhere, and the result was, he thought, a fair indication of the good that might be done by a very complete canvass of all the chemists. He thought if what was done in Aberdeen was done all over Scotland they would get a larger amount for this most deserving Fund.

THE NEW PHARMACY ACT.

The VICE-CHAIRMAN said they were all gratified by the fact that since their last meeting what was then the Pharmacy Acts Amendment Bill had been placed on the Statute Book. It was the more pleasing to them because it was the embodiment of a resolution passed by this Executive and forwarded to the Council. The measure was one in which Scottish pharmacists had taken a special interest. He moved:—

That they place on record an expression of their warmest thanks to the President, Mr. Walter Hills, for his unwearied efforts to secure the passing of the Bill. And, further, that the Executive consider what steps may be taken by them to increase the membership of the Society in Scotland, and remit the matter with powers to the General Purposes Committee.

He had just returned his nomination paper to the Secretary, agreeing to fill the office of local secretary for Glasgow for another year, and it would be his endeavour in that capacity to make an earnest effort in the direction of increasing the membership in the western city as well as in the district around. He thought it would be well if all the local secretaries would make a special effort at the present juncture.

Mr. C. F. HENRY seconded the motion, and it was unanimously agreed to.

Mr. HENRY then gave notice that at the next meeting he would move the resolution which he formerly intimated but withdrew, pending the passing of the Pharmacy Acts Amendment Act, namely:—

That in the opinion of this Executive steps should be taken to prevent limited liability companies using and exhibiting the title "chemist" or "druggist," or "chemist and druggist," and that the attention of the Council be called to the increasing use made of such titles by such companies, with the view of their taking action in the matter.

The meeting then closed.

NITRATE OF SILVER FOR TYPHOID.—Arnaudet reports having obtained very good results in twenty-one cases of typhoid by treatment with silver nitrate. One or two pills containing 0.005 to 0.01 grm. taken hourly with 1 grm. quinine sulphate per diem arrest diarrhoea in a short time and lower the fever. The malady is cured in three weeks. This favourable effect the author believes to be due to the antiseptic properties of the silver which are exerted in the lower portions of the rectum, the chief seat of infection.—*Pharm. Centrall.*, xxxix., 341, after *Sem. Med.*, 1898,

"FIRST" EXAMINATION RESULTS.

A meeting of the Board of Examiners for England and Wales was held at 17, Bloomsbury Square, London, on Tuesday, November 1.

Certificates by approved examining bodies were received from the undermentioned in lieu of the Society's examination.

Bishop, Archibald R. ; Shotley Bridge
Dannatt, Norman H. ; Huddersfield
Willecock, Walter W. ; Exeter

The report of the College of Preceptors on the examination held on October 11 was received. 241 candidates had presented themselves for examination, of whom 120 had failed.

The following 121 passed, and the Registrar was authorised to place their names upon the Register of Apprentices and Students:—

Anderson, Thomas Lamb ; Prestonkirk
Archer, Arthur Ernest ; Epworth
Barber, Robert ; Newcastle-on-Tyne
Bateley, Alfred Earnest J. T. ; Blyth
Belton, John Pearson ; Leicester
Booth, Mitchell Kempt ; Aberdeen
Bourne, Thomas Poucher ; Horncastle
Bradbury, Constance ; Ryde
Brierley, Thomas ; Oldham
Browning, Henry Webb ; Plymouth
Burgess, James Ernest ; Eccles
Carmichael, Francis M. ; Kilmichael
Carrington, Harold G. ; Stockport
Casterton, Walter C. ; Market Rasen
Cheetham, Thomas H. ; Sunderland
Cherrington, G. E. ; Newark-on-Trent
Collins, Frederick R. ; Cheltenham
Cooper, William Joseph ; Leicester
Cranshaw, Walter Wilkinson ; Bingley
Crockart, Fred B. ; Blairgowrie
Daniel, Reginald ; Derby
Davis, Frederic T. S. ; Teignmouth
Deane, Annie M. ; Cradley Heath
Dickinson, Edmondson ; Penrith
Docter, John Anderson ; Arbroath
Dodd, Alfred John ; Ripley
Drummond, George Campbell ; Ayr
Dwyer, Walter James ; London
Eymer, Harry ; Stafford
Falcon, John ; Carlisle
Fancourt, William ; Doncaster
Farmer, David F. ; Kirkcaldy
Fawcett, John William ; Northallerton
Finlayson, Christopher ; Inverness
Fisher, James ; Kinghorn
Forrester, Andrew, jun. ; Glasgow
Forrester, Ethel M. G. ; Edinburgh
Fox, Clara Minnie ; Birmingham
Gabb, Leslie ; Birmingham
Gibbins, Richard Ernest ; Derby
Giles, Arthur Alexander ; Aboyne
Gordon, John ; Monkton
Greenwood, Parker Astin ; Preston
Hall, John William ; Middlesbro'
Harper, William ; Montrose

AN ORDINANCE TO REGULATE THE SALE OF MEDICINES AND DRUGS IN GIBRALTAR.

BE it enacted by His Excellency the GOVERNOR of the City and Garrison of Gibraltar, as follows:—

1. This Ordinance may be cited as "The Pharmacy Ordinance, Gibraltar, 1898."

2. From and after the coming into operation of this Ordinance it shall be unlawful for any person to sell or keep open shop for retailing, dispensing, or compounding any medicine or drug, or any preparation thereof, or to assume any title purporting to describe him as a dispenser of medicines or drugs in Gibraltar, without having been granted a certificate of registration for that purpose by the Governor.

3. A certificate of registration shall not be granted unless the applicant—

- has in Gibraltar, prior to the coming into operation of this Ordinance, carried on for a period of not less than three years the business of a dispenser of medicines or drugs, and is able to satisfy the Governor that he has during that period made up prescriptions of any legally qualified medical practitioner, or
- is qualified to practise medicine or surgery in Gibraltar under "The Medical Ordinance, Gibraltar, 1885," or
- is registered under the Imperial Pharmacy Act, 1868, or
- after due examination has obtained a certificate of competency from a board of examiners appointed by the Governor.

An applicant for examination shall pay into the Treasury a fee of One Pound.

Provided always that no person shall be granted a certificate of registration under this Ordinance who is not a subject of Her Majesty.

4. Every such certificate of registration shall be registered in the manner, and shall be in the form the Governor may, from time to time, prescribe.

5. Any person who shall himself, or by any person in his service or on his behalf, sell or keep open shop for retailing, dispensing or compounding any medicine or drug, or any preparation thereof, or who shall assume or use any title purporting to describe him as a dispenser of medicines or drugs in Gibraltar without having obtained a certificate of registration under this Ordinance shall be liable on summary conviction to a penalty not exceeding Ten Pounds.

6. Every person who has been granted a certificate of registration under this Ordinance shall number consecutively every medical prescription which shall be made up in his establishment, and shall also register in a book, to be called the "Register of

Prescriptions," the number and date of such prescription, the names of the person for whom, and of the medical practitioner by whom the same was prescribed, and shall insert in the Register of Prescriptions a copy of such prescription. Provided that where a medical prescription is initialed, but not signed by a medical practitioner, the registration of such initials shall be deemed a sufficient registration of the name of such practitioner, unless such name can otherwise be ascertained.

The Register of Prescriptions shall be produced whenever required by any person appointed by the Governor or by any Court in the course of any judicial inquiry or investigation.

7. If any person who has been granted a certificate of registration under this Ordinance shall refuse or neglect to produce his Register of Prescriptions when lawfully required to do so, or if, on being produced, such register shall be found to have been improperly or negligently kept, such person shall for the first and every subsequent offence be liable on summary conviction to a penalty not exceeding Twenty Pounds, and for the second and any subsequent offence shall, in addition, be liable to the revocation of his certificate of registration; and if any injury shall occur to any person by the use of any Poison or deleterious medicine or drug sold or dispensed by any such person in consequence of his having neglected the precautions required by this Ordinance, such person shall, for any such offence, be liable to indictment for a misdemeanour, and on conviction shall be punished as other misdemeanours are by law punishable.

8. The several articles named and described in the Schedule A hereto shall be deemed to be poisons within the meaning of this Ordinance, and the Governor may from time to time by notice in the Official Gazette add to such Schedule any article which he may decide ought to be deemed Poison under the Ordinance.

9. No person shall sell any Poison, either by wholesale or retail, unless the box, bottle, vessel, wrapper, or cover in which such poison is contained be distinctly labelled with the name of the article and the word "Poison," and with the name and address of the seller of the poison; and where the poison is in the form of a liquid supplied for external application such bottle or vessel shall be of hexagonal shape and coloured dark blue; and it shall be unlawful to sell any poison of those which are in the First Part of Schedule A hereto, or which may hereafter be added thereto, to any person unknown to the seller, unless introduced by some person known to the seller; and on every sale of any such article the seller shall, before delivery, make, or cause to be made, an entry, in a book to be kept for that purpose, stating, in the form in the Schedule B hereto, the date of the sale, the name and address of the purchaser, the name and quantity of the article sold, and the purpose for which it is stated by the purchaser to be required, to which entry the signature of the purchaser and of the person (if any) who introduced him shall be affixed; and any person selling poison otherwise than is hereby provided shall be liable on summary conviction to a penalty not exceeding Five Pounds for the first offence, and to a penalty not exceeding Ten Pounds for the second or any subsequent offence; and for the purposes of this section the person on whose behalf any sale is made by any apprentice or servant shall be deemed to be the seller; but the provisions of this section shall not apply to any article when forming part of the ingredients of any medicines dispensed on the prescription of any legally qualified medical practitioner, provided such medicine be labelled in the manner aforesaid with the name and address of the seller, and provided also that the prescription be duly entered as required by Section 6 of this Ordinance.

10. A proceeding or conviction for any act punishable under this Ordinance shall not affect any civil remedy to which any person aggrieved by the act may be entitled.

11. This Ordinance shall not apply to the public dispensary maintained at the Colonial Hospital under Session 21 of "The Colonial Hospital Ordinance, Gibraltar, 1889," or to any person employed therein.

12. This Ordinance shall come into operation forthwith.

By Command,

Passed, 15th October, 1898.

H. M. JACKSON.

Colonial Secretary.

SCHEDULE A.

PART 1.

Arsenic, and its preparations.
Aconite, and its preparations.

Alkaloids: all poisonous Vegetable Alkaloids and their Salts.

Atropine, and its preparations.

Cantharides.

Corrosive Sublimite.

Cyanides of Potassium, and all Metallic Cyanides and their preparations,

Emetic Tartar.

Ergot of Rye, and its preparations.

Prussic Acid, and its preparations.

Savin, and its oil.

Strychnine, and its preparations.

Vermin Killers, if preparations of poison the preparations of which are in Part 1 of this Schedule.

PART 2.

Almonds, Essential Oil of (unless deprived of Prussic Acid).

Belladonna, and its preparations.

Cantharides, Tincture and all vesicating liquid preparations of.

Chloroform.

Chloral Hydrate, and its preparations.

Corrosive Sublimite, preparations of.

Morphine, preparations of.

Nux Vomica, and its preparations.

Opium, and its preparations, and preparations of Poppies.

Oxalic Acid.

Precipitate, Red (Red Oxide of Mercury).

Precipitate, White (Ammoniated Mercury).

Vermin Killers (see Part 1). Compounds containing "Poisons" prepared for the destruction of vermin, if not subject to the provisions of Part 1 are in Part 2.

SCHEDULE B.

Date.	Name and address of Purchaser.	Name and quantity of Poison sold.	Purpose for which it is required.	Signature of Purchaser.	Signature of Person introducing Purchaser.

DENTAL NOTES.

SALUBROL IN DENTISTRY.

F. Berger states that salubrol (dimethylene-antipyrine bromide) is preferable for dental work as an anseptic to even a one per mille solution of sublimate, since its action is more prompt. It is moreover a good hæmostatic, but is perfectly free from action on the mucous membrane. It is specially useful in treating cavities after extraction.—*Therap. Woch.*, iv., 1094.

GILT COPPER CROWNS.

Where the expense of a gold crown cannot be incurred, Mahoney substitutes a gilt copper crown, which must, of course, be kept scrupulously clean. The crown is strengthened on the inside with a solder consisting of 2 parts silver and 1 part brass. If sufficient borax is used the mixture may be easily fused.—*Zah. Ref. Org.*, xviii., 1576.

VULCANITE AND VULCANISATION.

Black-looking caoutchouc owes its dark colour before vulcanisation to the admixture of lamp black. White or grey caoutchouc often contains lead. Dental vulcanite has about the following composition: Caoutchouc, 10 parts; sulphur, 6 to 8; cinnabar, 12 to 16. The haste with which the temperature needful for vulcanisation is usually attained is detrimental to the vulcanite, inasmuch as the proper amalgamation of the sulphur and caoutchouc is interfered with. Caoutchouc containing little sulphur takes longer time to vulcanise than caoutchouc which is rich in sulphur.—*Journ. f. Zahnheit.*, xiii., 2, through *Dental Record*, 1898, i., p. 1.

ODOL.

Odol is said to be composed of salol, 3.5; rectified spirit, 90; distilled water, 4; saccharine, 0.2; ol. menth. pip., gtt. 60; ol. anisi stell., ol. fœnicul., aa gtt. 6; ol. caryophyll, gtt. 2; ol. cinnam., gtt. 1. The reports published are all distinctly unfavourable to odol, and great care is recommended in its use.—*Oest. ung. Viertelj Zahnzeit.*, xiv., 137.

THE STUDENTS' PAGE.

EXPLANATORY NOTES ON THE B.P.

Chloral Hydras.—The quantitative test for purity is based upon the decomposition of chloral hydrate by caustic alkalies into chloroform and alkali formate.

The 1885 B.P. directed that the chloroform produced should be separated by distillation, collected, and weighed. This method involves two obvious sources of variation in the result, viz., the difficulty of collecting the whole of the volatile chloroform, and its solubility in the supernatant water, which distils with it. The present Pharmacopœia directs that the determination shall be made in another way. A measured quantity of normal soda solution is added, and the quantity in excess of that required by the 4 grammes of chloral hydrate is titrated by normal acid. According to the equation given above, 1 M. Wt. NaOH (39.76) reacts with 1 M. Wt. chloral hydrate (164.15). Each C.c. of normal soda solutions contains 0.03976 gramme NaOH, and will be equivalent to 0.16415 gramme of chloral hydrate. Therefore, the 24 C.c. of soda solution in the official test (30—6) indicate $0.16415 \times 24 = 3.9396$ grammes of chloral hydrate in the 4 grammes taken for analysis, or 98.49 per cent. The iodoform test is intended to detect the presence of chloral alcoholate, one of the intermediate bodies produced in the preparation of chloral. It is an ethyl derivative of chloral hydrate, and when decomposed by alkali, splits off alcohol (compare preceding equation) instead of water.

The alcohol thus produced then reacts with iodine in presence of alkali to produce a crystalline deposit of iodoform.

Cinchonæ Rubræ Cortex.—The student is referred to the "Students' Page," vol. 58, p. 336, for an explanation of the process of assay of cinchona bark. It may be noted that although *Cinchona rubra* is still official, and contains a larger proportion of cinchonidine and cinchonine than quinine, yet cinchonidine and cinchonine sulphates are now omitted from the B. P. The proportion of the various alkaloids in a red bark of average quality is about as follows:—Quinine, 1.5 per cent.; cinchonidine, 2.5 per cent.; cinchonine, 1.0 per cent.; amorphous alkaloids, 0.8 per cent.; total, 5.8 per cent.

Cocainæ Hydrochloridum.—Coca leaves contain besides cocaine several other alkaloids nearly related to it; some of these have no local anæsthetic effect and others, while exhibiting anæsthetic properties, have an irritant action. All these bases undergo hydrolysis when heated with hydrochloric acid or alcoholic potash, and by a study of these hydrolytic products a knowledge of the constitution of cocaine and its relation to the allied bases has been obtained. The hydrolysis of cocaine takes place in two stages:—

(i.) Cocaine + 1 mol. water = Benzoyl-ecgonine + methyl alcohol.

(ii.) Benzoyl-ecgonine + 1 mol. water = Ecgonine + benzoic acid.

The nitrogen remains in the ecgonine, which is a basic body derived from tetra-hydro-pyridine.

Pyridine.

Tetra-hydro-pyridine.

Ecgonine is methyl-tetrahydro-pyridyl- β -hydroxy-propionic acid.

Its constitution will be understood from the following description:—Propionic acid is the next homologue to acetic acid,

Acetic Acid.

 β α
Propionic Acid.

In propionic acid and the higher homologues possessing a carbon chain of three or more carbon atoms the carbon atoms are distinguished by the Greek letters α , β , γ , etc., starting at the one next the carboxyl group. This is done in order to systematise the nomenclature of the derivatives. For instance, there are two isomeric hydroxy-propionic acids, $\text{C}_2\text{H}_4(\text{OH})\text{COOH}$, and these are distinguished as α and β acids, having the following formulæ:—

There are several possible formulæ for methyl-tetrahydro-pyridine according to the relative position of the four added hydrogen atoms and the substituting methyl group. The tetra-hydro-pyridine nucleus in ecgonine probably has the constitution expressed by the formula—

and ecgonine itself

Cocaine is then methyl-benzoyl-ecgonine: the hydrogen in the alcoholic hydroxyl of the side chain of the ecgonine being substituted by benzoyl ($\text{C}_6\text{H}_5\text{CO}-$), the acid radicle of benzoic acid (compare acetyl $\text{CH}_3\text{CO}-$ and acetic acid $\text{CH}_3\text{CO}\cdot\text{OH}$), while the hydrogen of the carboxyl group is replaced by methyl. Its constitution and hydrolysis will be easily understood from the next formula, to which two molecules of water are apposed, the dotted lines indicating the manner in which the hydrolytic products are formed.

The other alkaloids of cocaine are similarly constituted derivatives of ecgonine. The two chief accompanying alkaloids are (1) cinnamyl-cocaine, so called because it contains the cinnamyl radicle, $\text{C}_6\text{H}_5\cdot\text{CH}\cdot\text{CH}\cdot\text{CO}$, in place of benzoyl, and consequently yields cinnamic acid instead of benzoic acid on hydrolysis, and (2) cocamine. The last mentioned has also been described as isotropyl-cocaine and truxilline. By hydrolysis it yields an acid called cocaic or isotropic acid, instead of benzoic. The occurrence of these in impure cocaine hydrochloride is shown by the rapid reduction of potassium permanganate and consequent decolorisation when a solution of this salt is added to the cocaine solution. Cocaine forms permanganate of a violet colour, which is somewhat unstable. Cinnamyl-cocaine, cocamine, and amorphous coca alkaloids (like many other alkaloids and organic substances generally) are rapidly oxidised by the permanganate. The test for cocaine in the Pharmacopœia is based upon the following facts:—The alkaloid cocaine is very slightly soluble in water. If we take a solution of the hydrochloride of such a strength that it will yield, on the addition of ammonia, *slightly more* cocaine than the water will retain in solution, then the excess will be deposited slowly in a distinctly crystalline form. In the presence of the impurities mentioned, the crystalline character of the precipitate will be wanting; the precipitate will be sticky, and if much impurity be present the supernatant fluid will be milky instead of clear.

LONDON: SATURDAY, NOVEMBER 2, 1898.

THE COUNCIL MEETING.

AFTER the minutes of the previous meeting had been read, the PRESIDENT drew attention to an intimation he had received of Mr. HAMPSON's intention to retire from the Council, and he read a letter from Mr. HAMPSON (see p. 483), explaining that his retirement had become necessary in consequence of a severe attack of illness, and expressing his deep regret at being compelled to relinquish the part he has for so many years taken in the working and administration of the Society's affairs and to sever his active association with the friends engaged in that work.

The PRESIDENT added that he was sure he would be acting as the mouth-piece of all in saying that he had received this intimation with extreme regret, and he spoke in warm terms of admiration of the intense interest taken by Mr. HAMPSON in the general work of the Society, the advancement of education and the transaction of Committee work, finally moving that his resignation should be accepted with sincere regret, and an expression of his colleagues' desire to place on record their high appreciation of the services Mr. HAMPSON has rendered during twenty-six years as a Member of Council and Treasurer of the Society.

The motion was seconded by the VICE-PRESIDENT, who expressed pleasure that a deserved tribute had been paid to Mr. HAMPSON, and regret that his resignation was a necessity. Mr. BOTTLE and Mr. ATKINS, speaking in support, referred to the personal characteristics by which Mr. HAMPSON had gained the esteem and friendship of his colleagues, and had acquired considerable influence as a Member of Council. A letter from Mr. HARRISON—who was prevented from being present—conveyed a similar sentiment, and the motion was unanimously agreed to.

A ballot was then taken for the election of Treasurer, and in announcing that Mr. WILLIAM MARTINDALE was duly elected, the PRESIDENT said it would afford him great pleasure to have Mr. MARTINDALE associated with him in that capacity. Mr. CARTEIGHE, in moving that the PRESIDENT be authorised to sign cheques during the absence of Mr. MARTINDALE from England, expressed his gratification that his appointment as Treasurer had been so unanimously supported, and that an honour had been conferred on him which would be pleasing to his friends. Since the death of Mr. PETER SQUIRE the position of representing the all-

round educated pharmacist had been well occupied by Mr. MARTINDALE. Having been associated with him and Mr. UMNEY for many years in connection with the work of the Society, he felt that Mr. MARTINDALE's loyal desire to be active and useful in promoting the interest of the craft made every one wish that he might have a bright career before him, and possibly ere long a higher office conferred upon him.

The election of a Member of Council in place of Mr. HAMPSON was deferred. The Finance Committee report was of a routine nature and was adopted without comment.

The PRESIDENT announced that a donation of five guineas to the Benevolent Fund had been received from Mr. DENNIS, local secretary for Louth, and on the recommendation of the Committee seven grants amounting to seventy-six pounds were ordered to be paid.

The Vice-President mentioned that Miss FRANCES WELLS, the daughter of a deceased chemist, is a candidate for a grant from the United Kingdom Beneficent Association, and he asked the assistance of members who had votes or influence, on her behalf.

The report of the Library, Museum, School, and House Committee recommended that the Museum and Library should be closed at an earlier hour in consequence of the small number of persons visiting them in the evening, and that use should be made of the laboratories in Galen Place to meet the requirements of the School of Pharmacy, consequent on the large number of students. These recommendations were adopted, and it was resolved that physical apparatus for the lectures should be provided to the extent of fifty pounds. Mr. CARTEIGHE was re-appointed School Visitor.

There being no report from the Law and Parliamentary Committee, Dr. SYMES asked whether at the present moment it might not be opportune to move the adoption, as regulations, of the recommendations made some years ago as to the storage of poisons, he thought the position of the Society would be stronger in that case if the Society had to take action with reference to Parliamentary matters.

In reply the PRESIDENT said that his own opinion was, and always had been, in favour of regulations, and he believed his colleagues were now almost unanimous as to the desirability of adopting them. As a special meeting could be summoned at the request of thirty members he thought the question should be considered in that way to ascertain whether opinions had not undergone a change since the time when the proposal of the Council was objected to. He agreed with Dr. SYMES in thinking this desirable, and that the adoption of regulations would very much strengthen the position of the Society.

In connection with Dr. SYMES' incidental reference to the subject of company trading, the PRESIDENT suggested that in the discussion of the subject by local associations it was desirable to consider what would be practicable and possible, not only in the interest of registered chemists but also in the interest of the public, in order to obtain the support of members of Parliament.

Mr. Cross supported the proposition that the desirability of adopting compulsory regulations as to storage of poisons should be pressed upon the consideration of all registered chemists, inasmuch as the regulations were in reality adopted very generally, and they imposed no hardship.

The appointment of local secretaries for the places enumerated at page 486, was then agreed to, and on the motion of the PRESIDENT it was resolved that a list of the

places from which no nominations or replies had been received should be published in the Journal, so that general attention might be directed to the fact that considerable apathy was shown in many places. At the same time he wished, on behalf of the Council, to thank all the local secretaries who had done good work during the past year.

Mr. ATKINS expressed astonishment at some of the instances mentioned in the list, and regarded this inactivity as a sign that pharmacy is being crushed by the gigantic evil, which is causing some of the best men to lose heart.

Dr. SYMES referred to the excellent paper read by Mr. SMITH at the last meeting of the Liverpool Association on the subject of local secretaries as offering several suggestions for improvement that deserved consideration.

Mr. JOHN NESBIT, of Portobello, was appointed divisional secretary for Edinburgh. It was resolved that the appointments of Superintendents of Written Examinations, named in the list at page 488, should be offered to the local secretaries, and that the Boards of Examiners meet to conduct the oral portion of the Major and qualifying examinations in January, April, June, and October, 1899, as nearly as may be convenient.

Among the correspondence mentioned was a letter from Mr. WARD, acknowledging the thanks of the Council for his services as local secretary at Sheffield.

Mr. JOSEPH INCE's presentation of a collection of prescriptions arranged for class teaching was accepted with thanks.

A copy of a resolution passed at a meeting of the Chemists' Assistants' Union, requesting the attention of the Council to the dispensing of poisons by unqualified persons in doctors' surgeries was considered to refer to a matter that could not be dealt with by the Council, Mr. CARTEIGHE remarking on the desirability of ascertaining the conditions existing before asking what is impracticable, as it should be known that the Pharmacy Act exempted the rights and privileges of medical men and apothecaries from the provisions of the Act unless they kept open shop, and he, as well as the PRESIDENT, mentioned that, in such instances, the Society had dealt with infringements of the Act and recovered penalties from offenders.

A resolution passed by the Executive of the North British Branch was received from Mr. RUTHERFORD HILL, expressing thanks to the PRESIDENT for his efforts in getting the Pharmacy Acts Amendment Bill passed, and stating that the consideration of the steps to be taken for increasing the membership of the Society in Scotland had been remitted to the General Purposes Committee.

After the report of the General Purposes Committee had been read and considered, it was adopted, and, in accordance with its recommendations, resolutions were passed authorising the Registrar to take proceedings in various cases of alleged infringement of the Pharmacy Act.

PHARMACY LAW AT GIBRALTAR.

WE are indebted to the courtesy of Mr. J. A. GARIBALDI, of Gibraltar, for forwarding, at the request of Mr. W. MARTINDALE, a copy of the Pharmacy Act which came into force there on October 15 last. It is entitled the Pharmacy Ordinance, Gibraltar, 1898, and is intended to regulate the sale of medicines and drugs. It generally bears evidence of having been drawn up on the lines of the Pharmacy Act, 1868, but in one very important particular it also bears evidence that its provisions have been influenced by the

more enlightened policy, which commonly prevails on the Continent, of making regulation of the practice of pharmacy a comprehensive reality instead of being, as it is with ourselves, limited only to the sale and dispensing of scheduled poisons. That important characteristic is made apparent by the second section relating to the registration of vendors of medicine, which provides that it shall be unlawful for any person to sell or keep open shop for retailing, dispensing, or compounding any medicine or drug or preparation thereof, or to assume any title purporting to describe him as a dispenser of medicines or drugs in Gibraltar without having been granted a certificate of registration for that purpose by the Governor. This provision is in strict accordance with the principle which the Pharmaceutical Society has always endeavoured to obtain legislative recognition of in this country, that as the practice of pharmacy requires special scientific and technical qualification it should be restricted to those who have given evidence of possessing due competence for the performance of the duties attaching to that occupation.

The Ordinance has attached to it a schedule of articles which are to be deemed poisons within its meaning, and by Section 8 the Governor is empowered to add to the Schedule any article which he may decide ought to be deemed a poison. Such decision is absolute and not subject to confirmation by any other authority. The Schedule itself is identical with that of the Pharmacy Act, 1868, and the special provisions of the Ordinance in regard to the sale of articles in the Schedule are for the most part the same as those in Section 17 of the Pharmacy Act, 1868, but the sale of such articles is not restricted to the persons lawfully qualified to sell or keep open shop for retailing, dispensing, or compounding medicines or drugs or their preparations. By this difference from the Pharmacy Act, 1868, the Gibraltar Ordinance establishes a distinction between poisons, in the general acceptance of the term, and most of the articles enumerated in the Schedule, which are drugs or medicines the sale of which would on that account be unlawful for any persons not qualified as the Ordinance requires.

This distinction appears at first sight trivial and it seems to leave the sale of all scheduled poisons open to unqualified persons; but when more carefully considered it appears to be consistent with the principle recognised in Section 2, that legislative restriction of trade in certain articles should be imposed not merely because those articles are poisons, but on the ground that they are drugs or medicinal preparations and therefore come exclusively within the province of persons duly qualified as pharmacists for supplying them. According to that view of the matter, provision for regulating the sale of such articles as oxalic acid or vermin killers, which would in any case be subject to the provisions of Section 9, would not come within the scope of pharmacy law, but would be more properly an affair of police, as in the case of other trades affecting public safety. The want of proper recognition of that important principle is the great defect of the Pharmacy Act, 1868, and though the mistaken attempt to regulate the practice of pharmacy by a "wretched Poisons Act" was a natural result of the conditions prevailing when the Act was passed, the confusion of two entirely distinct objects has been a serious obstacle to progress in the practice of pharmacy. The new light thrown upon this important subject by the Gibraltar Ordinance may be the first step towards the much-needed amendment of pharmacy law which is at the present time a source of dissatisfaction to all it concerns most intimately.

ANNOTATIONS.

THE BRITISH PHARMACOPŒIA, 1898, was the subject selected by Professor Tichborne for his address to the Pharmaceutical Society of Ireland, on the occasion of the opening of the winter session in Dublin. He classified the criticisms on the book that have been published as (1) criticisms on errors discovered, (2) criticisms of divergence of opinion, and (3) hypercriticisms. The first and second, he thinks, should be carefully noted in view of the preparation of future pharmacopœias, but the third he would ignore. Though Professor Tichborne does not claim that the new Pharmacopœia is a perfect book, he regards it, to use his own words, as "an up-to-date work." Dealing with the chief principles adopted in constructing the book, the lecturer explained that the reason why certain articles had been included and others omitted was that such was the decision of the medical practitioners of the country and their representative bodies. He then proceeded to refer at length to the official alcohol strengths, standardised preparations, the regulation of doses, and the adoption of the metric system as an alternative system in weights and measures. The chemical formulæ in the book were also briefly referred to, and in conclusion several points of importance regarding the analysis and purity of drugs were touched upon. Pressure on our space unfortunately prevents the lecture being published in full.

LOYALTY TO THE CRAFT is not, as our correspondence columns show, a subject on which all registered chemists are at one, and it is a great pity that such should be the case. It was not, of course, to be expected that either registered chemists now engaged in bolstering up the system of unqualified company pharmacy, or those who, in the past, contributed to its evolution, should concur with Mr. Rymer Young's strictures, and "C. P.," in his letter published a fortnight ago, probably made out as good a case for the unfortunate class he represents as is possible under the circumstances. The facts he discloses about himself in this week's issue render his eccentricity in supporting his worst business opponents all the more curious. Though he doubts that any chemists' assistants receive the salary mentioned by Mr. Young, such scepticism does not disprove the fact. Doubtless the majority do not receive, or perhaps deserve, so much, but a number do, and many more might be in the same position if "C. P." and others similarly circumstanced would only relinquish their false position. The attitude assumed by Mr. Feaver is perhaps comprehensible in the case of one whose connection with pharmacy "cannot be much further prolonged," but such sentiments as he gives expression to are not likely to do much in the direction of suppressing the evil aimed at in the portion of Mr. Young's address to which exception has been taken. "Live and let live" is a useful maxim, but why should registered chemists let unqualified persons live on them?

AT THE MIDDLESBROUGH HIGH SCHOOL technical classes have been established for chemists' assistants and for medical and dental students, the arrangements having been made with a view to preparing candidates for the Minor examination and the first professional examination of the Royal College of Surgeons. The subjects to be taught are chemistry and physics, botany, materia medica, theoretical and practical pharmacy. The full course, the fee for which is five pounds, will extend over six months, and it is satisfactory to note that the classes in materia medica and pharmacy will be conducted by a pharmacist, Mr. E. C. Bennison. Attendance at the classes will be recognised by the Royal Colleges of Physicians and Surgeons, and medical and dental students will be permitted to join a class in one subject only. The

hours of meeting are not stated in the syllabus sent to us, but the classes would appear to be held in the evening. It is greatly to be hoped that such a favourable opportunity will be freely taken advantage of by pharmaceutical students in and about Middlesbrough and Stockton-on-Tees. The High School, we are informed, is a commodious building with large laboratories—the chemical laboratory being capable of accommodating eighty students at one and the same time, and the physics laboratory having accommodation for fifty students.

THE PREVENTION OF TUBERCULOSIS is seriously engaging attention at present, and Sir William Wilks, President of the Royal College of Physicians, London, Sir William M'Cormac, President of the Royal College of Surgeons, England, and Sir W. H. Broadbent have addressed a letter to the Chairman of the London County Council, on the subject. In this communication it is stated that the attention of the Organising Committee of the National Association for the Prevention of Tuberculosis has been directed to the recommendations of the Public Health Committee of the County Council, with reference to the establishment in London of an administration for the prevention of disease conveyed by milk and meat. As the Association is more particularly interested in the question of the prevention of tuberculosis, and understands that the Committee recommends that the Council should be empowered to take the necessary steps for preventing the sale of tuberculous milk and meat, the opinion is expressed that there is urgent necessity for such measures, and that if the Council takes steps to prevent the sale of tubercle infected milk in London, and to ensure the proper examination of meat by the substitution of public for private slaughter-houses, there is every prospect of reducing the present mortality from tuberculosis, especially among the poor, who more particularly suffer from the effects of milk and meat of dangerous qualities. The County Council is urged, therefore, to recognise the eminent necessity of adopting the recommendations of its Public Health Committee.

THE SALE OF POISONS IN HONG KONG is dealt with in some new bye-laws, now in force, made under the Ordinance which regulates such sales in the Colony. The list of poisons within the meaning of the bye-laws is divided into two parts, which correspond closely with parts 1 and 2 of the British poison schedule. In part 1, however, are added *Datura alba* and its preparations, *Gelsemium elegans* and its preparations, and orpiment; carbolic acid is added to part 2. No poison included in either part of the list is to be sold by retail, unless distinctly labelled with its name, the word "Poison," in both English and Chinese characters, and the name and address of the seller. The sale of poisons included in part 1 is to be formally registered as in Great Britain, and there are special regulations with regard to arsenic and its preparations; thus, the purchaser must be "apparently not less than 16 years of age," and the "occupation," as well as the name and address, of the purchaser must be entered in the poison book.

THE SYNOPSIS OF THE 1898 PHARMACOPŒIA, published at the *Pharmaceutical Journal* Office, 5, Serle Street, W.C., which has had a surprisingly large sale, can no longer be obtained in paper covers, but a limited number bound in cloth can yet be purchased at one shilling each, post free. The fact that this little pocket guide to the processes, formulæ and doses, of the new British Pharmacopœia has run through seven editions in as many months should suffice to prove its value, and such of our readers—particularly students—as have not yet procured copies should hasten to do so. The type having been distributed, no further copies can be printed.

THE LIST OF LOCAL SECRETARIES of the Pharmaceutical Society for the ensuing twelve months is published in this week's Journal, and in connection therewith it seems desirable to direct attention to the fact that the names of a number of towns for which local secretaries might be appointed are missing from the list. That is owing to the fact that the registered chemists in those towns have not taken the trouble to fill up and return the nomination cards sent to them some weeks ago. The number of such towns, a list of which will be found at page 487, is no less than 42. It is much to be regretted that such should be the case, and possibly the mere direction of attention to the omission may cause it to be speedily remedied in most instances.

THE EDITOR OF THE "PRACTITIONER" thinks Mr. Braxton Hicks, who "evidently considers it part of his duty as a coroner to discuss things in general," was slightly at fault in his recent observations on Sir James Crichton Browne's address. That address, it is pointed out, was delivered to chemists and druggists—the legally recognised vendors of poisons, with whom those substances may properly be considered in all their bearings. If the accounts that appeared in the lay press were harmful, that was the fault of the reporters, who chose to select and publish in a mutilated and misleading form a few sentences from the address; and, by directing attention to those garbled reports, Mr. Braxton Hicks must have increased that harmfulness tenfold. If, on the other hand, the matter complained of was harmless, there was no justification for Mr. Braxton Hicks's remarks. Having thus neatly put the coroner out of court, the *Practitioner* remarks that "whatever interpretation may be put upon isolated passages, there can be no doubt that the address to the Pharmaceutical Society, taken as a whole, makes for public safety. It is a plea for greater stringency in the sale of poisons and for that bacteriological research which alone can bring pathogenic microbes under control."

THE CARELESS HANDLING OF POISONS was forcibly illustrated in an incident referred to by Dr. Danford Thomas whilst holding an inquest at the Hampstead Dispensary with reference to the death of a ward servant at the North-Western Fever Hospital, Haverstock Hill, who had died from the effects of nitric acid taken with suicidal intent. Commenting on the fact that it is always easy to get poison, especially carbolic acid, the coroner proceeded to state that, a few days ago, some carbolic acid was ordered for use in his house, and it was sent by the oilman in a vinegar bottle covered with vinegar labels. One of his servants used it to fill the vinegar-cruet, and it was served at table, where the poison was only detected by its odour. It would have been interesting if Dr. Danford Thomas had explained why he allows carbolic acid, when required for use in his house, to be ordered from a tradesman who knows nothing about poisons and their effects, for by so doing he undoubtedly encourages that carelessness which he, as a coroner, objects to when lecturing other people about their shortcomings. It may be suggested, by the way, that as the poisoning of a coroner by carbolic acid might go far to hasten the scheduling of that dangerous fluid as a poison, a distinct opportunity would appear to have been missed in this case.

THE SPECTACLE MAKERS' COMPANY has been engaged for several months past, as is well known to our readers, in perfecting a scheme for the granting of optical diplomas to those who pass an examination, as in this way it is believed that the public interest will be well served, the possession of the diploma insuring that the vendor of spectacles and other aids to the sight will have at least some practical knowledge of optics. The Company appointed

as examiners Professor Silvanus Thompson, Dr. G. Lindsey Johnson, and Mr. G. Paxton, and the first examinations have been held at the Northampton Institute, Clerkenwell, this week, the number of candidates attending being about one hundred and fifty.

THE PHARMACEUTICAL SOCIETY will hold its first evening meeting for the session at 17, Bloomsbury Square, London, on Tuesday evening next, November 8, when the chair will be taken by the President at 8 o'clock precisely, and Professor William Ramsay, D.Sc., F.R.S., will deliver a lecture on "The New Gases of the Atmosphere." The lecture will be illustrated by experiments, and all members and other subscribers of the Society are invited to attend and bring their friends.

THE WESTERN CHEMISTS' ASSOCIATION (OF LONDON) will hold its eighth annual dinner on Wednesday, November 16, at the Café Royal, 68, Regent Street, at 7 p.m. precisely. The retiring President, Mr. J. H. Mathews, will take the chair, and tickets (7s. 6d. each, exclusive of wine) can now be obtained from either of the Hon. Secretaries—Mr. Herbert Cracknell, 17, Craven Road, W., and Mr. W. J. I. Philp, 34, High Street, Notting Hill, W. Application should be made as early as possible, not later than November 14, and instructions forwarded with regard to the arrangement of seats.

THE COUNCIL OF THE PHARMACEUTICAL SOCIETY OF IRELAND some time ago refused to allow a candidate to present himself for the Irish Licence examination, on the ground that he had not served his apprenticeship with an individual pharmaceutical chemist, or a firm of pharmaceutical chemists, but to a joint-stock company. He appears originally to have been apprenticed to his father, who was a member of the firm which subsequently became registered as a joint-stock company, but after nine months had elapsed he was transferred as an apprentice to another member of the firm, whom he served for two years and two months. His apprenticeship was then re-transferred to his father, with whom he served for a further period of nine months, and after the registration of the firm as a company he served the rest of his term of apprenticeship with his father, as a member of that company. An action having been brought against the Council of the Irish Society to decide the matter, the case came on for hearing in the Queen's Bench Division of the High Court of Ireland on Friday, October 28, when the plaintiffs contended that under their regulations the term of four years' apprenticeship should be served to an individual pharmaceutical chemist, and that the regulations were not satisfied by a limited company, to which there could be no apprenticeship. The case of the applicant, on the other hand, was that the regulation about apprenticeship was *ultra vires*, and that the fact of it having been sanctioned by the Privy Council did not preclude the Court from now inquiring as to whether it was *ultra vires* or not; but that even if it were not *ultra vires* the apprenticeship of the applicant was sufficient, all the seven members of the defendant company being qualified pharmaceutical chemists, and all others being excluded from membership by the company's articles. The arguments were adjourned until Tuesday this week, and at their conclusion judgment was deferred.

A NEW PUBLIC LIBRARY FOR WANDSWORTH, which was formally opened by Sir John Lubbock a few days ago, owes its existence in great measure to the generosity of the late Mr. George Nind, pharmaceutical chemist, who bequeathed the sum of two thousand pounds for the purpose. It will be remembered that the Benevolent Fund of the Pharmaceutical Society also benefited under Mr. Nind's will to the extent of two thousand pounds.

EXTRACTS FROM CONSULAR REPORTS.

THE SPONGE FISHERY OF THE BAHAMAS, it has been frequently alleged, would ultimately become a decayed industry, because of the exhaustion of the sponge beds. The record for 1897 shows, however, that the industry is still flourishing. Prices ruled high, and the various kinds exported, weighing 1,228,000 lbs., were valued at £90,000. Over 500 small schooners and a large number of men and boys are engaged during nine months of the year in the sponge fishery. The vessels are usually owned by capitalists, and the proceeds of a voyage are divided into a number of shares, which are distributed in varying proportions between owner, captain, and crew. The voyages, which usually last from six to eight weeks, are frequently very profitable to all parties, small schooners having been known to come into port after a six weeks' voyage with sponges worth from £300 to £400. The sponges are sold by auction in an exchange at Nassau, and are chiefly purchased by agents for firms in New York. The use of dredges or diving apparatus is forbidden by law, consequently the fishery is restricted to those shallow banks where the sponges growing on the bottom can be reached by a long pole furnished with an iron hook. In Mr. Hesketh Bell's (the Acting-Colonial Secretary) opinion, it is probable that at greater depths the yield would be much richer and the sponges of finer texture.

FOR THE CULTIVATION OF CITRUS FRUITS, Mr. Hesketh Bell states that the Bahamas possess hundreds of thousands of acres of land thoroughly suited for the purpose. He is of opinion that young energetic Englishmen with small capital might do much worse than consider those islands as an encouraging locality for the speedy development of a moderate investment. The climatic conditions of the Bahamas and their coralline soil appear to be particularly favourable to the successful cultivation of all citrus fruits, while many of the adversities against which orange planters in Florida and California have to contend are not to be encountered in those islands. Frost is unknown, excessive droughts are rare, insect pests and diseases may be kept within bounds, while the price of land and the rates of labour are much below those current in the Southern States. Dr. Morris, C.M.G., when Assistant Director of the gardens at Kew, visited the colony in 1895, and expressed himself very hopefully concerning the favourable prospects of orange growing in the Bahamas.

CONCENTRATED TURTLE SOUP, Mr. H. Bell thinks, would probably prove a profitable article of commerce for the manufacturer who has enterprise enough to establish a factory in the Bahamas for its preparation. The edible turtle, known as the "green" one, is said to be plentiful in the shallow seas around the Bahama Islands, while turtle meat is sold in the local markets at 3d. per lb.

A MODEST WAGE of about 1s. 3d. per week for breaking eggs and separating the white from the yolk at the first German "duck-egg house" (primitive Chinese for albumin factory), opened at Wuhu on April 21, 1897, proved to be a great temptation to the country lasses from the surrounding district. So keen was the competition for employment that the premises were invaded by about 200 girls, or ten times as many as were required. A second factory was established in September of the same year.

BUT FOR THE ADULTERATION OF CHINESE OPIUM with sesamum-cake and other matter, more native smokers would use it, whereas by this practice they are driven to the foreign drug. Foreign opium is sold in Wuhu for about 8 taels a ball, weighing a little more than 18 ounces; hence 20 taels, which will buy 100 ounces old native and about 140 ounces of new season's native, will only purchase 45 ounces of foreign drug, which is a great consideration to the impecunious Chinese.

THE BRITISH EXPORTS OF CHEMICALS and chemical and medicinal preparation for the month of September amounted in value to £672,238, an increase of £35,860 compared with the same period last year, when the export was valued at £636,378. For the nine months ending September 30, however, there was a decrease of £138,322, the totals being £6,313,356, as against £6,496,678. The imports of chemicals, etc., show a decrease for both periods of £30,319 and £505,937 respectively.

PHARMACEUTICAL SOCIETY OF IRELAND.

The annual meeting for the opening of this Society's schools and the presentation of the gold and silver medals was held at the Society's rooms, 67, Lower Mount Street, on October 3. There was a large attendance of students, and the visitors included the Right Hon. the Lord Mayor, the President of the College of Physicians, the President of the College of Surgeons, Sir George Duffey, Dr. A. H. Jacob, and the Vice-President of the Society (Mr. Beggs). The following members of the Council were also present:—Dr. Walsh, Professor Tichborne, Mr. Wells, Mr. Kelly, Mr. Simpson, and Mr. Michie.—Mr. R. J. DOWNES (President of the Society) occupied the chair.—The REGISTRAR read a letter from Mr. T. Ross (the father of Mr. A. T. Ross, to whom the gold medal for the best answering at the licensing examination had been awarded, but who was unable through illness to be present) acknowledging the receipt of the medal, and expressing thanks for the good wishes of the Council for his son's recovery. There was also an apology for inability to attend from Mr. Mathew Campbell, to whom the silver medal had been awarded for the next best answering.—The PRESIDENT said that an address would be delivered by Professor Tichborne on a subject of special interest to pharmacists. It was a matter of satisfaction that the medical profession was so well represented on that occasion. It was not often they had a new subject of address, and it was one with which no one was more competent to deal with than the lecturer, Dr. Tichborne. It was also appropriate that the citizens should be represented by the Lord Mayor.—Professor TICHBORNE said he had to apologise to those not particularly interested in the subject for its dry character. The British Pharmacopœia was never a very popular book, although the prescriber might look upon it with favour; but even he occasionally rebelled against it. In the new British Pharmacopœia the metric system had been introduced, as far as was compatible with safety. Some very important points had been adopted in the new book; and he ventured to think that all were moves in the right direction. He might say that the book so far had stood the criticisms well. Great changes were not desirable in a pharmacopœia, and those which had been made were on the lines of a necessity or improvement. Professor Stoeder, of Amsterdam, had published an elaborate analysis of the work from a foreigner's point of view, and had made some really good points, but it might all be summed up in his concluding remarks. He said: "In short, this Pharmacopœia of 1898 cannot escape the reproach that it has considered the interests of the practitioner too much, and those of modern science too little, in virtue of which it loses that strictly methodical character which ought not to be wanting in such a standard book in these days." Quite so! observed the lecturer, the Pharmacopœia was written in the interests of the practitioner, and if it has achieved that, well that is its whole function.—The PRESIDENT of the College of Physicians (Dr. William J. Moore), in proposing a vote of thanks to the lecturer, said it gave him great pleasure that on the first occasion that he had appeared before the public since he took over the reins of office from his friend Sir George Duffey at the Royal College of Physicians, he should be attending a meeting of the Pharmaceutical Society of Ireland. That Society sprang into existence and was cradled and spent its infancy within the walls of the Royal College of Physicians, and the friendliest relations had existed between that Society and the College. The immediate object of his remarks was to record in their name a very hearty vote of thanks to the lecturer for his very admirable and lucid address. In the short period of an hour Professor Tichborne had conveyed an enormous amount of the valuable information on the new Pharmacopœia, in the building up of which Dr. Tichborne had himself taken no unworthy part.—The PRESIDENT of the College of Surgeons seconded the motion, which was supported by Dr. WILLIAM SMITH, and adopted by acclamation.—Professor TICHBORNE having returned thanks, the PRESIDENT then asked the Lord Mayor to present the medals, or rather the silver medal. He regretted that the winner of the gold medal was so seriously ill that it had been thought desirable to send it by post some time ago. The winner of the silver medal was somewhere in the north of Ireland, but a deputy was present to receive the medal for him.—The LORD MAYOR having congratulated the Society on its progress, formally presented the medal, after which a cordial vote of thanks (proposed by Mr. BEGGS and seconded by Mr. KELLY) was passed to the Lord Mayor for his presence on the occasion.—The LORD MAYOR having returned thanks, the proceedings terminated.

GLASGOW AND WEST OF SCOTLAND PHARMACEUTICAL ASSOCIATION.

The winter session of this Association was opened on Thursday, October 27, when Dr. RALPH STOCKMAN, F.R.C.P.E., Professor of *Materia Medica* and Therapeutics in the University of Glasgow, lectured on

The Evolution of Our Pharmacopœia.

The lecture excited much interest and Mr. W. L. CURRIE, the President of the Association, presided over a large audience.—The CHAIRMAN in his opening remarks, said that since they last met matters pharmaceutical had been booming. The Pharmacy Acts Amendment Bill, which had been discussed so long and so earnestly, had become law, and the Poisons Bill, which had been sprung upon them by the Government and had not been received with the acclamation expected, had been dropped. In view of the appearance of the new Pharmacopœia they had been very fortunate in securing the services of Dr. Stockman to open the session.—Professor STOCKMAN said that he had a very small share in the preparation of the present edition of the British Pharmacopœia, and while engaged on that work his attention had been drawn to the fact of his ignorance with regard to all pharmacopœias except our own, and more especially with regard to what he might call the evolution of the modern pharmacopœia out of the more ancient compilations of the same class. He had, therefore, made a slight effort to extend his knowledge in that direction, and he proposed to lay before them a part at least of the result.

The origin of the use of natural substances as remedial agents had given rise to a good deal of speculation. It was probable, however, that primeval man originally acquired some such knowledge and practice as they saw in dogs when they eat grass, and that this knowledge gradually became extended by experience, and resulted ultimately in the large mass of information we now possessed. Amongst the most primitive peoples there was always a certain knowledge of domestic medicine, the practice of which was largely in the hands of women, but very early in the upward development they usually found it transferred to special medicine men, or combined with priestly functions. The earliest written documents they possessed were Egyptian, the most ancient dating from 2700 B.C. These contained formulæ, often complex, for the treatment of various ailments, the drugs being chiefly native plants and a few common mineral substances. Few were potent and they were essentially the same kind of medicines which were found in herbal and other medical treatises down to about 150 years ago. The introduction of incantations as remedial measures—a species of cure which still existed under such names as Christian science, faith healing, and so on—was almost certainly traceable to the priest-physician, while witchcraft as a factor in medicine had been held responsible for the appearance of snakes, toads, vipers, and other repulsive objects in ancient and mediæval *materia medica*. Not to go further back than the Christian era, we found such authors as Celsus (died 50 A.D.), Pliny (died 79 A.D.), Dioscorides (first century), Galen (died 201 A.D.), and others who left behind them a mass of reliable medical information, which was still to some extent an active force. Later came the works of Arabian physicians, which took a prominent position as authorities, the greatest of these being Avicena, who died in 1036, in Persia, and whose works held an authoritative position till the end of the fifteenth century. Avicena's account of nutmeg, he instanced, was practically the same as that given in our most modern text-books, but unfortunately he was not always so reliable.
